be found addicted to such commerce; thus in India the hede-priest
and his familiar will bandy conditions in spirited dialogue audible
to the multitude (cf. W. Crooke, Things Indian, s.v. "Demon-
ology," p. 133, 134). (3) Lastly, the degree of dependency on
human goodwill attributed to the power addressed may be so
great that, instead of diplomatic politeness, there is positive
hectoring, with dictation, threats and abuse. Even the Italian
peasant is said occasionally to offer both abuse and physical
violence to the image of a recalcitrant saint; and antiquity
witnessed at the bull-pamphlets of the Egyptian priests towards
their gods (cf. Lamblinus, De mysteriis, vi. 5–7). This frame of
mind, however, is mainly symptomatic of the lower levels
of cult. Thus the Zulu says to the ancestral ghost, "Help me or you will feel the bite!"; whilst the still more primitive Australian explains to the "dead hand" that he carries about with him as a kind of divining-rod, "Guide me aright, or I throw you to the dogs!"

So far we have dealt with forms of address explicitly directed towards a power that, one might naturally conclude, has personality, since it is apparently expected to hear and answer. At the primitive stage, however, the degree of personification is, probably, often far slighter than the words used would seem to suggest. The verbal employment of vocatives and of the second person may have little or no personifying force, serving primarily but to make the speaker's wish and idea intelligible to his hearer. When the rustic talks in the vernacular to his horse he is not much concerned to know whether he is heard and understood; still less when he mutters threats against an absent rival, or kicks the stool that has tripped him up with a vicious "Take that!"

These considerations may help towards the understanding of a second class of cases, namely, forms of implicit address shading off into unaddressed formulas. Wishes, blessings, cursings, oaths, vows, exorcisms, and so on, are uttered aloud, doubtless partly that they may be heard by the human parties to the rite, but likewise in many cases that they may be heard, or at least overheard, by the consentient deity, perhaps represented visibly by an idol or other cult-object. The case with explicit invocations attach themselves to many of these apparently self-contained forms proves that there is not necessarily any received difference of kind, and that implicit address as towards a "something not-ourselves" is often the true designation of the latter. On the other hand, there is reason to believe that the magical spell proper is a self-contained and self-sufficient form of utterance, and that it lies at the root of much that has become address, and even prayer in the fullest sense.

From Spell to Prayer.—Of course to address and entreat a fellow-being is a faculty as old as that of speech, and, as soon as it occurred to man to treat sacred powers as fellow-beings, assuredly there was a beginning of prayer. We do not know, and are not likely to know, how religion first arose, and the probability is that many springs went to feed that immense river. Thus care for the dead may well have been one amongst such separate sources. It is natural for sorrow to cry to the newly dead "Come back!" and for bereavement to add "Come back and help!" Another source is mythologic fancy, which, in answer to childlike questions; "Who made the world?" "Who made our laws?" and so on, creates magnified non-natural beings, who in turn make sacrifices in rite (for to think a thing the savage must dance it); whereas here intercourse becomes possible between such a being and the tribesmen, the more so because the supporters of law and order, the elders, will wish to associate themselves as closely as possible with the supreme law-giver. From Australia, where we have the best chance of studying rudimentary religion in some bulk, comes a certain amount of evidence showing that in the two ways just mentioned some inchoate prayer is being evolved. On the other hand, it is remarkable how conspicuous, on the whole, is the absence of prayer from the magico-religious ritual of the Australians. Uttered formulas abound; yet they are not forms of address, but rather the self-sufficient pronouncements of the magician's fiat. Viewed analytically in its developed nature, magic is a wonder-working recognized as such, the core of the mystery consisting in the supposed transformation of suggested idea into accomplished fact by means of that suggestion itself. To the magician, endowed in the opinion of his fellows (and doubtless of himself) with this wondrous power of effective suggestion, the output of such power naturally represents itself as a kind of unconditional willing. When he cries "Rain, rain," or otherwise makes vivid to himself and his hearers the idea of rain, expecting that the rain will thereby be forced to come, it is as if he had said "Rain, now you must come," or simply "Rain, come!" and we find as a fact that the magical formulas mostly assume the tone of an actual or virtual imperative, "As I do this, so let the like happen," "I do this in order that the like may happen," and so on. Now it is easy to "call spirits from the vastly deep," but disappointing experience shows that they will not always come. Hence such imperatives have a tendency to dwindle into optatives. "Let the demon of small-pox depart!" is replaced by the more humble "Grandfather Smallpox, go away!" where the affectionate appellative (employed, however, in all likelihood merely to cajole) signals an approach to the genuine spirit of prayer. Again, the magician conscious of his limitations will seek to supplement his influence —his mana, as it is termed in the Pacific—by tapping, so to speak, whatever sources of similar power lie round about him; instead of the "magomorphism" of primitive society perceives on every hand. A notable method of borrowing power from another magic-wielding agency is simply to breathe its name in connexion with the spell that stands in need of reinforcement; as the name suggests its owner, so it comes to stand for his real presence. It is noticeable that even the more highly developed forms of liturgical prayer tend, in the recitation of divine titles, attributes and the like, to present a survival of this magical use of potent names.

Prayer as a Part of Ritual.—An exactly converse process must now be glanced at, whereby, instead of growing out of it, prayer is naturally grafted upon it. In advanced religion, ideally prayer is the chosen vehicle of the free spirit of worship. Its mechanism is not unduly rigid, and it is largely autonomous, being of servitude to other ritual factors. In more primitive ritual, however, sets of prayer are the rule, and their function is mainly to accompany and support a ceremony the nerve of which consists in action rather than speech. Hence, suppose genuine prayer to have come into being, it is exceedingly apt to degenerate into a mere piece of formalism; and yet, whereas its intrinsic meaning is dulled by repetition according to a well-known psychological law, its virtue is thereby hardly lessened for the undeveloped religious consciousness, which holds the saving grace to lie mainly in the repetition itself. But a formula that depends for its efficacy on being uttered rather than on being heard is virtually indistinguishable from the self-sufficient spell of the magician, though its origin is different. A good example of a degenerated prayer-ritual comes from the Todas (see W. H. R. Rivers, The Todas, ch. x.). The prayer itself tends to be slurred over, or even omitted. On the other hand, great stress is laid on a preliminary citation of names of power followed by the word idith. This at one time seems to have meant "for the sake of," carrying with it some idea of supplication; but it has now lost this connotation, seeing that it can be used not merely after the name of a god, but after that of any object or being possessed of power capable of bestowing efficacy on the formula. Even the higher religions have to fight against the tendency to "vain repetitions" (often embodying a certain sacred number, e.g. three), as well as to the use of prayers as amulets, medicinal charms, and so on. Thus, Buddhism offers the striking case of the praying-wheel. It remains to add that throughout we must carefully distinguish in theory, however hard this may be to do in practice, between legitimate ritual understood as such, whether integral to prayer, such as its verbal forms, or accessory, such as gestures, posture, incense, oil or what not, and the formalism of religious decay, such as generally betrays itself by its meaningless, by its gibberish phrases, sing-song intonation and so forth.

Silent Prayer.—A small point in the history of prayer, but one that has an interesting bearing on the subject of its relation to magic, is the custom of praying silently. Charms and words of power being supposed to possess efficacy in themselves are guarded with great secrecy by their owners, and hence, in so far as prayer verges on spell, there will be a disposition to mutter or otherwise conceal the sacred formula. Thus the prayers of the Todas already alluded to are in all cases uttered "in the throat," although these are public prayers, each village having a form of its own. At a later stage, when the distinction between magic and religion is more clearly recognized...
and an anti-social character assigned to the former on the ground that it subserves the sinister interests of individuals, the overt and as it were congregational view of the praying comes to be insisted on as a guarantee that no magic is being employed (cf. Apuleius, *Apol.* 54, "tacitas preces in templo dis allegatis:igitur magus es"), a notion that suggests easy translation into the view that there are more or less disgraceful gods with whom private trafficking may be done on the sly (cf. Horace, *Ep.* I. xvi. 60, "labra movet metuens audiri, Pulchra Laverna, da mibi falleres"). Thus it is quite in accordance with the outlook of the classical period that Plato in his *Laws* (940a) should prohibit all possession of private shrines or performance of private rites; "let a man go to a temple to pray, and let any one who pleases join with him in the prayer." Nevertheless, instances are not wanting among the Greeks of private prayers of the loftiest and most disinterested tone (cf. L. R. Farnell, *The Evolution of Religion*, p. 202 seq.). Finally we may note in this connexion that in advanced religion, at the point at which prayer is coming to be conceived as communion, silent adoration is sometimes thought to bring man nearest to God.

**The Moralization of Prayer.**—What we come to consider the moral quality of the act of prayer, this contrast between the spirit of public and private religion is fundamental for all but the most advanced forms of cult. In its public rites the community becomes conscious of common ends and a common edification. We may observe how even a very primitive people such as the Arunta of Australia behaves with the greatest solemnity at its ceremonies, and professes to be made "glad" and "strong" thereby; whilst of his countrymen, whom he would not trust to pray in private, Plato testifies that in the temples during the sacrificial prayers "they show an intense seriousness and with eager interest talk to the Gods and beseech them" (Laws, 887). The prayer: some of public worship at any rate, prayer and its magico-religious congeneres at all stages resorted to as a "means of grace," even though such grace do not constitute the expressed object of petition. Poverty of expression is apt to cloak the real spirit of primitive prayer, and the formula under which its aspirations may be summed up, namely, "Blessings come, evils go," covers all sorts of confused notions about a grace to be acquired and an impurity to be wiped away, which, as far back as our clues take us, invite interpretations of a decidedly spiritualistic and ethical order. To explicate, however, and purge the meaning of prayer: *et al.* 8th, 9th, and 10th centuries, if his fashion can wish and ask for, remained the task of the higher and more self-conscious types of religion. A favourite contrast for which there is more to be said is that drawn between the magico-religious spell-ritual, that says in effect, "My will be done," and the spirit of "Thy will be done" that breathes through the highest forms of worship. Such resignation in the face of the divine will and providence is, however, not altogether beyond the horizon of primitive faith, as witness the following prayer of the Khonds of Orissa: "We are ignorant of what it is good to ask for. You know what is good for us. Give it to us." (Tydeman, *Cam.* 5. 696.)

The prayer by a supreme paradox virtually extinguishes itself, since in becoming an end in itself, a means of contemplative devotion and of mystic communion with God, it ceases to have logical need for the petitionary form. Thus on the face of it there is something like a return to the self-sufficient utterance of ancient religion; but, in reality, there is all the difference in the world between a suggestion directed outwardly in the fruitless attempt to conjure nature without first obeying her, and one directed towards the inner man so as to establish the peace of God within the heart.

**PRAYER, BOOK OF COMMON**, the title of the official service book of the Church of England. One of the most important steps taken at the Reformation was the compilation and provision of a comprehensive service book for general and compulsory use in public worship in all cathedral and parish churches throughout the Church of England.

Apart from alterations in detail, both as to doctrine and ritual, which will be referred to later, the following main advantages were achieved from the very first and applied to all editions of the Prayer Book equally:

1. The substitution of the English language for the Latin language, which had hitherto been in universal and almost compulsory use, and in which all the old service books were written.

2. Unification and simplification. The number of books required for the performance of divine service in pre-Reformation days was very large; the most important being the *Missal* for the service of Holy Communion or the Mass; the *Breviary* for the daily service or performance of the divine office; the Manual for the minor sacramental offices usually performed by the parish priest; and the Pontifical, containing such services as were exclusively reserved for the use of the bishop. Many of the contents of these larger volumes were published in separate volumes known by a great variety—over one hundred—different names. The Prayer Book represents in a much condensed and abbreviated form the four chief ancient service books, viz.: the *Missal*, *Breviary*, *Manual* and *Pontifical*.

In addition to a multiplicity of books there was much variety of use. Although the Sarum Use prevailed far the most widely, yet there were separate Uses of York and Hereford, and also to a less degree of Lincoln, Bangor, Exeter, Wells, St. Paul's, and probably of other dioceses and cathedral churches as well. Cranmer's preface "Concerning the Service of the Church" expressly mentions the abolition of this variety as one of the things to be achieved by a Book of Common Prayer. It says: "And whereas heretofore there hath been great diversity in saying and singing in Churches within this Realm; some following Salisbury Use, some Hereford Use, and some the Use of Bangor, some of York, some of Lincoln; now from henceforth all the whole Realm shall have but one Use."

We will next enumerate the sources from which the Prayer Book was compiled. 1. It has been already indicated that the older pre-Reformation service books formed the main quarry, especially the Sarum Use, according to tradition, the prayer: E. von der Golz, *Das Gebet in der ältesten Christenheit* (1901); id., *Tischgebet und Abendmahlsgebet* (1905); O. Dibelius, *Das Vaterunser: Umriss zu einer Geschichte des Gebetes in der alten und mittleren Kirche* (1905); T. K. Cheyne, *Hymns* (1902). (R. R. M.)

2. The reformed Latin Breviary of Cardinal Guignon, Francis de Chiquenes, a Spaniard, a Franciscan and cardinal of the Holy Cross, brought out a reformed Latin breviary with papal sanction in 1555. A second edition of this appeared in 1556, with considerable favour, and was adopted into use in many places, without, however, winning universal acceptance, and in 1558 papal
PRAYER, BOOK OF COMMON

sanction was withdrawn and it ceased to be printed. From this reformer's breviary, the compilers of the Prayer Book omitted the collection of Masses for the invitatories, the Masses supplanted in the Book of Common Prayer, and the so-called Masses for the day. When the man was considered in the Book of Common Prayer, it was a matter of the Mead's three collections for the day of the week-day services. (e) The removal of all antiphons and responses. This refers to Quiggin's first edition only. (d) The increased amount of Holy Scripture read. Quiggin provided a first lesson from the Psalms and a second from the New Testament, and the Psalms and on Saints' Days a third lesson from the Lives of the Saints, though this lesson was also occasionally taken from Holy Scripture.

(e) The prefixing to every service a form of confession and absolution

The substitution of the Athanasian Creed for the Apostles' Creed on certain days instead of the former being an addition to the Confession of Faith. The substitution of the Athanasian Creed is for, not added to, the shorter creed. (f) The uniform assignment of three Psalms to each hour suggests the average number and arrangement of the Psalms in the Prayer Book at Matins and Evensong.

3. The Mozarabic Missal. (a) The four short prayers preceding the prayer for the consecration of the water in the office for the public baptism of infants are adapted from the benediction of the fonts in the Mozarabic Liturgy (Migne, Pat. Lat. tom. lxxxvii. col. 404). The evidence for this borrowing is still plainer in the larger form of prayer for this purpose provided in the first book of Edward VI. At Matins in the first liturgy printed it was sung "John the Baptist's Song" in Ximenes in 1550, and may well have been in Cranmer's hands; whereas the Missale gallicanum, a Gallican Sacramentary, containing the same prayers with slight variations, was first published by Cranmer in 1550, and the Collect and Proper of the Mozarabic use. We have but been unable to verify this statement.

(g) Many of the new collects introduced into the Prayer Book, though not transferred bodily from any Mozarabic service book, are modelled upon Mozarabic patterns in structure and ideas and phrases, e.g., the references to the Second Advent in the collects for the first and third Sundays in Advent take their tone from the Mozarabic liturgy, and the Advent Collects are based on a collect for Christmas Day Lauds in the Mozarabic Breviary (Migne, Pat. Lat. tom. lxxxvii. col. 122). The collect for the first Sunday in Lent is based on a preface (Introit) in the Mozarabic liturgy for the Wednesday after the fifth Sunday in Lent (ibid., tom. lxxxvii., col. 382). The collect for the first Sunday after Easter is based upon an "Alia Oratio" (ibid., col. 517), and an "Oratio ad pacem" (col. 518) for the Saturday in Easter week. The collect for the Wednesday after Easter is derived from the prayer in the Book of Adoration at the Third Rite of Holy Communion, especially as regards the recital of the words of institution accompanying "Who in the same night," &c., follows a Mozarabic rather than the Sarum or Roman model. The Collects for Christmas services are derived independently from the Mozarabic; because, as we have seen, a Mozarabic missal was certainly in Cranmer's hands and studied by him.

4. Liturgies. These were certainly known to Cranmer, but it is remarkable how little he borrowed from them. (a) The prayer which was placed at the end of the Litany in 1540, and now stands as the last prayer but one at the end of Matins and Evensong, as we have seen, is the same as the undated and unprinted prayer derived from the Liturgy of St Chrysostomos, where, as likewise in the Liturgy of St Basil, it forms the prayer of the third antiphon after the Deacon's Litany in the Mass of the Catechumens. (b) The concluding prayer of Matins is called Lord, The Greek, and, Lord," which, as we have seen, may have been taken from Greek liturgies. It is the opening salutation in the Mass of the Catechumens in the Clementine Liturgy, where it occurs again, as it does in the Catechumenate of the Eastern Liturgy. It occurs in the 1540 Prayer Book, but has been omitted in all subsequent editions. It runs thus: "Hear us, O merciful Father, we beseech Thee, and with Thy holy Spirit and word vouchsafe to bless and sanctify these Thy gifts, the confection of bread and wine, that they may be unto us the body and blood of Thy most dearly beloved Son Jesus Christ."

This is not an exact translation of any known episkopion, and Cranmer cannot have used it because it is not found in any of the Eastern liturgies. (c) Four petitions in the Litany. "That it may please Thee to illuminate all Bishops, Priests and Deacons," &c. (d) Petition in 1661 from all Bishops, pastors and ministers) and "That it may please Thee to give to all nations, men, and all men, and all nations, that they may know Thy pity upon all prisoners and captives." These are almost certainly modelled on the corresponding petitions in the Liturgy of the Liturgy in the Liturgy of St Chrysostomos (ed. F. E. Brightman, London, 1912), and may be added more closely to the Greek petitions than they do any corresponding Latin petitions in the Old Sarum Liturgy.

The Book of Common Prayer and the Continental Protestant service books. The most considerable quantity of the new material which was imported into the Prayer Book was drawn from Lutheran and Genevan service books. The Litany, for example, in the Prayer Book is based upon the medieval Latin Litany, but great variation in both substance and language and by way of addition and omission, are made in it. These variations are largely borrowed from and closely follow the language of various Lutheran litanies, especially that given in the consultation of Archbishop Hermann of Cologne issued in 1543. Lutheran influence can likewise be traced in way of revision introduced into the baptismal and other sacramental forms of the Communion service the most striking departures from ancient practice in the original. The introduction of the Ten Commandments in 1553 seems to be derived from the order of service published by Valerandus (ed. 1642) and borrowed, though not added to, from the Consolat of Hermann. It is impossible to pursue this subject here further in detail.

6. Original compositions of the compilers of the Prayer Book, not traceable to ancient or 16th-century originals. These are numerous. They include most of the collects on Saints' Days, for which, though no direct evidence of authorship is as yet forthcoming, Cranmer is probably responsible, and certain other collections, such as that for the Royal Family (Archbishop Whiglit); that for the high court of parliament (Archbishop Laud); that for all conditions of men (Bishop Gunning), &c.

We proceed to describe next the various stages through which the Book of Common Prayer has passed and the leading features of each revision. Of changes preceding the first Prayer Book it will only be necessary to mention here: (a) The compiling and publishing of the Litany in English by Cranmer in 1544. (b) Royal injunctions in August 1547 ordering the Epistle and Gospel to be read in English at High Mass. (c) A royal proclamation, 24 Feb. 1547, by which all future Bishops, and 4 Feb. 1548, by which all future Ministers, were enjoined to read the service in the Order of the Communion. This was an order or form of service in English for the communion of the people in both kinds. It was to be inserted into the service after the communion of the priest, without making any other alteration in the Latin Mass. It comprised the long exhortation or notice to be given on Sunday, or on some other day, previous to the Communion, the longer exhortation, and the shorter invitation, the confession, absolution, comforting words, prayer of humble access, formulae of administration and the concluding peace, all as they exist at present, though with variations of some importance.

The first complete vernacular Book of Common Prayer was issued in 1549. It was carried through both houses of parliament by the 21st of January 1549, by an Act of Uniformity which made its use compulsory on and after the following Whit-Sunday. The exact date of the giving of the royal assent, and the question whether this Book received the assent of Convocation, are historical points of difficulty and uncertainty which cannot be treated at length here.

Some of the chief points of difference between this and subsequent Prayer Books were the following: Matins and Evensong began with the Lord's Prayer, and ended with the third collect; there were no alternative Psalms for prayers for Benediction, Magnificat and Nunc Dimittis; the Athanasian Creed was inserted after the Benedictus on six festivals only, and in addition to the Apostles' Creed; the Litany was placed after the Communion service, for which an alternative title was given, viz. "commonly called the Mass." Introits were provided for use on every Sunday and Holy-Day; after the oratory
intending communicants were directed to "tarry still in the quire or in some convenient place nigh the quire"; in the prayer "for the whole state of Christ's church," the blessed Virgin Mary was commemorated by name among departed saints; prayer for the departed was explicitly retained; also an invocation of the Holy Spirit before beneficium, the prayer of obligation immediately following them. The mixed chalice was ordered to be used, and the Agnus Dei to be sung during the Communion of the people. A large selection of short scriptural post-Communions was provided. Unleavened bread was to be used and placed not in the hand but in the mouth of the communicant. The sign of the cross was to be made not only in the eucharistic consecration prayer, but also in Baptism, Confirmation, Holy Matrimony and the Visitation of the Sick. Reservation for the sick and ununction of the sick were retained; and exorcism, unction, trine immersion and the chrism were included in the baptismal service. The prayer in the burial service, as in the Communion service, contained distinct intercessions for the departed; and a form of Holy Communion was provided for use at funerals with proper introit, collect, epistle and gospel.

As to vestments, in the choir offices, the surplice only was to be used; the hood being added in cathedrals and colleges; and by all graduates when preaching, everywhere.

At Holy Communion the officiating priest was to wear "a white Albe plain with a vestment or Cope," and the assistant clergy were to wear "Albes with tunicles." Whenever a bishop was celebrant he was to wear "beside his rochet, a surplice or albe, and a cope or vestment," and also to carry "his pastoral staff in his hand, or else borne or holden by his chaplain." The mitre was not mentioned.

The ordinal was not attached to this Prayer Book at its first appearance, but it was added under another act of parliament in the following year, 1550. It was very similar to the present ordinal except that the words "for the office and work of a Priest in the Church of God, now committed unto thee by the Imposition of our hands" were wanting, and the chalice or cup with the bread were delivered, as well as a Bible, to each newly-ordained priest.

We pass on to 1552 when a new and revised edition of the Prayer Book was introduced by an act of parliament which ordered that it should come into use on All Saints' Day (Nov. 1). The alterations made in it were many and important, and as they represent the furthest point ever reached by the Prayer Book in a Protestant direction, they deserve special mention and attention.

1. The introductory sentences, exhortation, profession and absolution were prefixed to the Order for Morning Prayer daily throughout the year and ordered to be read before Evening Prayer as well. Alternative Psalms were provided for Benedictus, Miserere and the Litany of St. Alban.

2. Numerous and most important alterations were made in the Order for Holy Communion, in the title of which the words "commonly called the Mass" were left out. (a) The Introits were omitted. (b) Gloria in excelsis was transferred from near the beginning to near the end of the service. (c) The ten commandments with an expanded tenfold Kyrie eleison were introduced. (d) The long new English canon of 1540 was split up into three parts: the first part becoming the prayer for the church militant; the second part becoming the prayer of consecration, the third part, or prayer of oblation, becoming the first post-Communion collect; the epiklesis or invocation of the Holy Ghost upon the elements was entirely omitted. (e) The mixed chalice, the use of the sign of the cross in the consecration prayer; the commemoration of the blessed Virgin Mary and of various classes of saints were omitted. (f) The Agnus Dei and the post-Communion anthems were omitted. (g) The words of administration in the 1540 book were abolished, viz.: "The body of our Lord Jesus Christ which was given for thee, preserve thy body and soul unto everlasting life," and "The blood of our Lord Jesus Christ which was shed for thee preserve thy body and soul unto everlasting life," and the following words were substituted: "Take and eat this in remembrance that Christ died for thee, and feed on him in thy heart by faith, with thanksgiving," and "Drink this in remembrance that Christ's blood was shed for thee, and be thankful." (h) A long rubric was added at the end of the service explanatory of the attitude of kneeling at the reception of Holy Communion, in which it was stated that "it is not meant hereby that any adoration is done, or ought to be done, either unto the sacramental bread and wine there bodily received, or to any real and essential presence there being of Christ's natural flesh and blood," &c. (i) Exorcism, unction, trine immersion and the chrism were omitted from the baptismal service. (k) Unction and communion with the reserved sacrament were removed from the services for the visitation and the communion of the sick. (l) Prayers for the dead and provision for a celebration of Holy Communion at a funeral were removed from the burial service. (m) The vestments and ornaments used under the Prayer Book of 1540 were abolished by a new rubric which directed that both at the time of Communion and at all other times of ministration a bishop should wear a rochet and that a priest or deacon should have and wear a surplice only; (n) on the other hand, the directions as to daily service were extended to all clergy and made much stricter, (o) and the number of days on which the Athanasian Creed was to be used was raised from six to thirteen.

The main objects of these drastic alterations have been thought to have been two-fold.

1. To abolish all ritual for which there was not scriptural warrant. This was their object it was not consistently or completely carried out. No scriptural warrant can be found for the use of the surplice, or for the use of the sign of the cross in baptism, both of which were retained.

2. To make the services as unlike the pre-Reformation services as possible. This object too was not fully attained; no liturgical precedent can be found for the violent dislocation of certain parts of the Order for Holy Communion, especially in the case of the prayer of oblation and of the Gloria in Excelsis; but the orders for Morning and Evening Prayer and the Holy Communion retained features of the Breviary and Missal services, the bulk of their component material being still drawn from them. While the alterations, therefore, were violent enough to alarm and offend the Catholic party, they were not violent enough to satisfy the extreme Puritan party, who would no doubt have agitated for and would probably have obtained still further reformation and revision. But this Prayer Book only lived for eight months. It came into use on All Saints' Day (Nov. 1) 1552, and on the 6th of July 1553 Edward VI. died and was succeeded by his sister Mary, under whom the Prayer Book was abolished and the old Latin services and service books resumed their place.

On the death of Queen Mary and the accession of her sister Elizabeth (Nov. 17, 1558) all was reversed, and the Book of Common Prayer was restored into use again.

The Act of Uniformity, which obtained final parliamentary authority on the 28th of April 1559, ordered that the Prayer Book should come again into use on St John the Baptist's Day (June 24, 1559). This was the second Prayer Book of King Edward VI., with the following few but important alterations, which, like all the alterations introduced at subsequent dates into the Prayer Book, were in a Catholic rather than a Protestant direction.

1. Morning and Evening Prayer were directed to be "used in the accustomed place of the church, chapel or chancel, instead of "in such place as the people may best hear."

2. The rubric ordering the use of the rochet only by the bishop and of surplice only by a priest or deacon was abolished. The eucharistic vestments ordered in the first Prayer Book of Edward VI. were brought back by a new rubric which directed that "the minister at the time of the communion and at all other times in his ministration, shall use such vestments in the church as were in use by authority of parliament in the second year of the reign of King Edward the VI. according to the act of parliament set in the beginning of this book.

3. In the Litany the following petition found in both the
Edwardian Prayer Books was omitted "from the tyranny of the bishop of Rome and all his detestable enormities, good Lord deliver us."

4. In the Communion service the two clauses of administration found in the first and second Prayer Books of King Edward's reign were combined.

5. The rubric explanatory of "kneeling for reception," commonly known as "the Black Rubric" was omitted.

6. In the Ordinal in the rubric before the oath of the queen's sovereignty the words "against the power and authority of all foreign potentates" were substituted for "against the usurped power and authority of the Bishop of Rome," and in the Book of Common Prayer itself four references to the bishop of Rome, by name, were omitted.

There were a few more minor alterations, without doctrinal or political significance which need not be described in detail here.

The only further addition or alteration made in Queen Elizabeth’s reign was in 1561, when all the present black letter Holy Days were added to the Calendar except St George (April 23) Lammas (Aug. 1), St Laurence (Aug. 10) and St Clement (Nov. 22), which already existed, and except St Ernuchus (Sept. 7), added in 1604, and the Venerable Bede (May 21) and St Oswald (June 27) added in 1662.

A smouldering and growing Puritan discontent with the Prayer Book, suppressed with a firm hand under Queen Elizabeth, burst out into a flame on the accession of King James I. in 1603. A petition called the millenary petition, because signed by no less than one thousand ministers, was soon presented to him, asking, among other things, for various alterations in the Prayer Book and specifying the alterations desired. As a result the king summoned a conference of leading Puritan divines, and of bishops and other leading Anglican divines, which met under his presidency at Hampton Court In January 1604. After both sides had been heard, certain alterations were deemed necessary to the rubric of the Royal Privy Council, with the general assent of Convocation. These alterations were not very numerous nor of great importance, but such as they were they all went in the direction of catholicizing rather than of puritanizing the Prayer Book; the one exception being the substitution of some chapters of the canonical scriptures for some chapters of the Apocrypha, especially of the book of Tobit. Other changes were:

1. The addition of one more black letter Saint’s Day, viz.: Ernuchus (by error for Evuritus) on the 7th of September. This was a small but a very extraordinary and an inexplicable change to make. The only explanation offered, which is a pure guess, and seems barely possible, is that it was desired to place some mark of dignity upon a day which during the late reign had been kept with great festivity as the birthday of Queen Elizabeth.

2. The words, "The absolution to be pronounced by the minister alone" at Morning and Evening Prayer, were altered to "The Absolution, or Remission of Sins, to be pronounced by the priest alone, standing; the people still kneeling."

3. A prayer for the royal family was added after the prayer for the king, and a petition was added in the Litany to the same effect, both exhibiting slight verbal differences from the prayer and petition as used according to royal authority, with the general assent of Convocation.

4. Thanksgiving prayers were added for rain, for fair weather, for plenty, for peace and victory.

5. Important alterations were introduced into the service for the private baptism of children in houses, with the object of doing away with lay baptism and securing the administration by the minister of the parish, or some other lawful minister.

6. The confirmation service was entitled and explained thus: "The Order of Confirmation, or Laying on of Hands upon Children Baptized, and able to render an account of their faith according to the Catechism following."

7. The concluding portion of the Catechism, consisting of eleven questions on the sacraments, was now added.

There were other slight changes of a verbal kind, involving no doctrinal or political significance and which therefore need not be described here.

The next important stage in the history of the Prayer Book was its total suppression in 1645 for a period of fifteen years. "The Directory for the Public Worship of God in the Three Kingdoms" being established in its place. The restoration of King Charles II. in 1660 brought with it toleration at once, and soon afterwards complete restoration of the Prayer Book, but not exactly in the same form which it had before. Nonconformists pressed upon the king, either that the Prayer Book should not be re-introduced, or that if it were re-introduced, features which they objected to might be removed. The result was that a conference was held in 1661, known from its place of sitting as the Savoy Conference, the church being represented by twelve bishops and the Nonconformists by twelve eminent Presbyterian divines, each side accompanied by nine coadjutors. The objections raised from the Nonconformist point of view were numerous and varied, but they were thoroughly discussed between the first meeting on the 15th of April and the last on the 24th of July 1661; the bishops agreeing to meet the Puritan wishes on a few minor points but on none of fundamental importance. Later in the year, between the 20th of November and the 20th of December, Convocation assembled and undertook the revision of the Prayer Book. In the earlier part of 1662, much was changed, and a more limited number of amendments was authorized. No amendment was made in it in either house and it finally received the royal assent on the 19th of May 1662, being annexed to an Act of Uniformity which provided for its coming into general and compulsory use on St Bartholomew’s Day (Aug. 24). The alterations thus introduced were very numerous, amounting to many hundreds, and many of them were more important than any which had been introduced into the Prayer Book since 1552. Their general tendency was distinctly in a Catholic as opposed to a Puritan direction, and the two thousand Puritan incumbents who vacated their benefices on St Bartholomew’s Day rather than accept the altered Prayer Book bear eloquent testimony to that fact.

It is impossible to give here an exhaustive list of the alterations: but the following were some of the principal changes made in 1662.

(a) The prayer "It hath been the wisdom of the Church of England, &c., composed by Sanderson, bishop of Lincoln, was prefixed to the Prayer Book.

(b) The authorized version of the Bible of 1661 was taken into use, except in the case of the Psalms, where the great Bible of 1559-1604 was retained as much as possible, and Bible words retained in the rubrics.

(c) Omissions in the rubrics of the communion service. (d) The rubric preceding the absolution in Morning and Evening Prayer, viz.: "The absolution to be pronounced by the minister alone," was altered into "The Absolution, or Remission of Sins, to be pronounced by the priest alone, standing; the people still kneeling." (e) In the Litany the phrase "Bishops, Pastors and Ministers of the Church," was altered into "Bishops, Priests and Ministers." (f) The rubric concerning "From all sedition and privy conspiracy," &c., the words "sedition" and "schism" were added. (g) Among the "Prayers and Thanksgivings upon several occasions," were added the two Ember week prayers, and a prayer for all conditions of men, the general thanksgiving, and that for restoring Public Peace at Home. (h) In the Communion service two rubrics were prefixed to the prayer "for the whole state of Christ’s Church militant here in earth," ordering the hallowed presentation and placing of the alms upon the Holy Table, and the placing thereon then of so much Bread and Wine as the priest shall think sufficient; and (i) the commemoration of the departed was added to the prayer itself. (j) The rubric explanatory of the formula of kneeling for reception, known as the Black Rubric, which had been added in 1602, but omitted in 1559 and 1604, was re-introduced: "As we offer our Christ’s natural flesh and blood "were altered to "unto any Corporal Presence of Christ’s natural Flesh and Blood "—a very important and significant alteration which affected the meaning of the whole rubric of the rubrics, under which several words of the prayer and rubric itself, the priest in the prayer of consecration, and the covering of the remainder of the consecrated elements after Communion with a fair linen cloth. (k) A new office was added for the Ministration of Holy Communion, so as to include the blessing of the communion bread and wine, and to extend the rubrics of the prayer over to the Order for the Burial of the Dead, forbidding that order to be used "for any that die unbaptized, or excommunicate, or have lain more than seven days upon themselves." (l) In the "Order of Priests," and in the "Ordination of Bishops," the formula for ordination, after the words, "Receive the Holy Ghost," these words were added "for the Office and Work of a Priest (or Bishop) in the Church of God, nor committed unto thee by the Inspector or hands." (m) The ornaments, rubric, regulating the vesture of the
clergy was thrown into its present shape, referring back not to 1604 or 1559 or 1552, but to the first Prayer Book of Edward VI. in 1549 for the rule to be followed.

The above are the important alterations, among numerous others of minor significance, introduced into the Prayer Book in 1662. Their general trend is obvious. It is not in the Puritan direction, but intended to emphasize and to make more clear church doctrine and discipline, which in recent years had become obscured or decayed. No substantial alteration has been made in the Prayer Book since 1662, but two alterations must be chronicled as having obtained the sanction of the Convocations of Canterbury and York, and also legal force by act of parliament. In 1871 a new Lectionary was substituted for the previously existing one, into the merits and demerits of which it is not possible to enter here; and in 1872, by the Act of Uniformity Amendment Act, a shortened form of service was provided instead of the present form of Morning and Evening Prayer for optional use in other than cathedral churches on all days except Sunday, Christmas Day, Ash Wednesday, Good Friday and Ascension Day; provision was also statutorily made for the separation of services, and for additional services, to be taken, however, except so far as anthems and hymns are concerned,

In the year 1807 letters of business were issued by the Crown to the Convocations inviting and enabling them to make alterations in the Prayer Book (afterwards to be embodied in an act of parliament). These letters were issued in compliance with the second recommendation (1906) of the Royal Commission on Ecclesiastical Discipline, viz.: that “Letters of business should be issued to the Convocations with instructions: (a) to consider the preparation of a new rubric regulating the ornaments (that is to say, the vesture) of the ministers of the church, at the times of their ministrations, with a view to its enactment by parliament; and (b) to frame, with a view to their enactment by parliament, such forms as are necessary in the managing of Divine Service, and to the ornaments and fittings of churches as may tend to secure the greater elasticity which a reasonable recognition of the comprehensive- ness of the Church of England and of its present needs seems to demand.”

A few words are added in conclusion about the state services. Until the year 1859 they were four in number.

1. A Form of Prayer with Thanksgiving to be used yearly upon the day of November, to commemorate the happy deliverance of King James I. and the Three Estates of England from the Gunpowder Plot in 1605.

2. A Form of Prayer with Fasting to be used yearly on the Thirtieth Day of January, to commemorate the Martyrdom of the Blessed King Charles the First in 1649.

3. A Form of Prayer with Thanksgiving to be used yearly on the Twenty-ninth Day of May, to commemorate the Restoration to the throne of King Charles the Second in 1660.

4. A Form of Prayer with Thanksgiving to be used yearly on the Day of the Accession of the reigning Monarch.

The first three of these services were abolished in 1859 by royal warrant—that is to say by the exercise of the same authority which had instituted them. The fourth form of service was retained in its old shape till 1901, when a new form, or rather new forms of service, has been prepared by the Convocation, were annexed to a royal warrant on the 9th of November. (F. E. W.)

PRAYERS FOR THE DEAD. Wherever there is a belief in the continued existence of man's personality through and after death, religion naturally concerns itself with the relations between the living and the dead. And where the idea of a future judgment obtains, prayers are often offered on their behalf to the Higher Powers. Prayers for the dead are mentioned in 2 Mac- cabeos xii. 43-45, where the writer is uncertain whether to regard the sacrifice offered by Judas as a propitiatory sin-offering or as a memorial thank-offering, a distinction of great importance in the later history of the practice. Prayers for the dead form part of the authorized Jewish services. The form in use in England and the Bible, which may be called: "Pray for him; pardon all his transgressions ... Shelter his soul in the shadow of Thy wings. Make known to him the path of life." The only passage in the New Testament which is held to bear directly on the subject is 2 Tim. i. 18, where, however, it is not certain that Onesiphorus, for whom St Paul prayed, was dead. Outside the Bible the proof of the early use of prayers for the dead has been carried a step farther by Professor Ramsay's discoveries, for it is now impossible to doubt the genuineness of the copy (contained in the spurious acts of the saint) of the inscription on the tomb of Abercius of Hieropoli in Phrygia (see Lightfoot, Apostolic Fathers, pt. ii. vol. p. 492 sqq.). The 19th line of the inscription runs thus: “Let every friend who observes this pray for me,” i.e. Abercius, who throughout speaks in the first person: he died in the latter part of the 3rd century. The inscriptions in the Roman catacombs bear similar witness to the practice, by the occurrence of such phrases as: “Mayst thou live among the saints” (3rd century); “May God refresh the soul of . . . .”; “Peace be with them.” Among Church writers Tertullian is the first to mention prayers for the dead, and that not as a concession to natural sentiment, but as a duty: “The widow who does not pray for her dead husband has as good as divorced him.” This passage occurs in one of his later Montanistic writings, dating from the beginning of the 3rd century. Subsequent writers similarly make incidental mention of the practice as prevalent, but not as unlawful or even deplorable. In the 10th century. The most famous instance is St Augustine’s prayer for his mother, Monica, at the end of the 6th book of his Confessions.

An important element in the liturgies of the various Churches consisted of the diptychs or lists of names of living and dead who were to be commemorated at the Eucharist. To be inserted in these lists was an honour, and out of the practice grew the canonization of saints; on the other hand, to be excluded was a condemnation. In the middle of the 3rd century we find Cyprian enjoining that there should be no obligation or public prayer made for a deceased layman who had broken a Church rule by appoint- ing a cleric trustee under his will: “He ought not to be named in the priests’ prayer who has done his best to detain the clergy from the altar.” Although it is not possible, as a rule, to name dates for the exact words used in the ancient liturgies, yet the universal occurrence of these diptychs and of definite prayers for the dead in all parts of the Church in the 4th and 5th centuries tends to show how primitive such prayers were. The language used in the prayers for the departed is very reserved, and contains no suggestion of a place or state of pain. We may cite the following from the so-called liturgy of St James:-

"Remember, O Lord, the God of Spirits and of all Flesh, those whom we have remembered and those whom we have not remem- bered, men of the true faith, from righteous Abel unto to-day: do thou thyself give them rest there in the land of the living, in thy kingdom, by the deliverance of thy mercy. For sinners, our holy fathers, from whence pain and sorrow and sighing have fled away, where the light of thy countenance visiteth them and always shineth upon them.

Public prayers were only offered for those who were believed to have died as faithful members of Christ. But Perpetua, who was martyred in 202, believed herself to have been encouraged by a vision to pray for her brother, who had died in his eighth year, almost certainly unbaptized; and a later vision assured her that the prayer had been answered and her brother translated from punishment. St Augustine thought it needful to point out that the narrative was not canonical Scripture, and contended that the child had perhaps been baptized. Similarly, a medieval legend relates that Gregory the Great was so struck with the justice of the emperor Trajan, that he prayed for him, and in consequence he was admitted to Paradise (cf. Dante, Purg., x., Parad., xx.).

As time went on, further developments took place. Petitions to God that he would hear the intercessions of the departed became direct requests to them to pray (Ora pro nobis); and, finally, the saints were asked themselves to grant grace and help. Again, men felt difficulty in supposing that one who repented at the close of a wicked life could at once enjoy the fellowship of the saints in Paradise (St Luke xxiii. 43), and it seemed unfair that they should be made equal with those who had borne the
PRAYING WHEEL—PREACHING

began and heat of the day (St Matt. xx. 12). And so the simple severance between good and bad indicated in St Luke vi. 26, became the threefold division made familiar by Dante. These speculations were further fixed by the growth of the theory of satisfaction and of Indulgences: each forgiven soul was supposed to have endured an amount of suffering in proportion to the guilt of its sins, and the prayers and pious acts of the living availed to shorten this penance time in Purgatory (see INDULGENCES). It thus came about that prayers for the dead were regarded only as aiming at the deliverance of souls from purgatorial fires; and that application of the Eucharist seems to have overshadowed all others. The Council of Trent attempted certain reforms in the matter, with more or less success; but, broadly speaking, the system still remains in the Roman Catholic Church, and masses for the dead are a very important part of its acts of worship.

The Reformation took its rise in a righteous protest against the sale of Indulgences; and by a natural reaction the Protestants, in rejecting the Roman doctrine of Purgatory, were inclined to disuse all prayers for the dead. Important changes have been made, in the successive revisions of the Prayer Book, in the commemorations of the dead at the Eucharist and in the Burial Service.

In the Communion Service of 1549, after praise and thanks were offered for all the saints, chiefly the Blessed Virgin, came the following: “We commend into thy mercy all other thy servants, which are departed hence from us with the sign of faith and now do rest in the sleep of peace; grant unto them, we beseech thee, thy mercy and everlasting peace.” The Burial Service of the same date contained explicit prayers for the deceased, and introit, collect, epistle and gospel were provided for “the Celebration of the Holy Communion when there is a Burial of the Dead.” In 1552, under the influence of Bucer, all mention of the dead, whether commemorative or intercessory, was cut out of the Eucharist; the prayers in the Burial Service were brought into their present form; and the provision for Holy Communion at a Burial was omitted. The thankful commemoration of the dead in the Eucharist was restored in 1661, but prayers for them remained, if they remained at all, veiled in ambiguous phrases.

The Church of England has never forbidden prayers for the dead, however little she has used them in her public services. It was proposed in 1552 to condemn the scholastic doctrine De praecptione pro defunctis in what is now the 22nd of the Thirty-Nine Articles, but the proposal was rejected. And these intercessions have been used in private by a long list of English divines, among whom Andrews, Cosin, Ken, Wesley and Keble form an almost complete chain down to the present day. On the tomb of Bishop Barrow (1680) stands a request to passers-by to pray for their fellow-servant. And in a suit (1836) as to the lawfulness of an inscription, “Pray for the soul of . . .”, the Court decided that “no authority or canon has been pointed out by which the practice of praying for the dead has been expressly prohibited.” As Jeremy Taylor put it (Dissuasive from Popery, i. 1. iv.), “General prayers for the dead the Church of England never did condemn by any express articles, but left it in the middle.”

PRAYING WHEEL, a mechanical apparatus used by the Lamaist Buddhists in Tibet and elsewhere for offering prayers. Strips of paper bearing a manifold repetition of the words “This jewel in the Lotus, Amen,” are wrapped round cylinders of all sizes—from hand-mills to wind- or water-mills. As the wheel revolves these unroll and the prayer is considered to be offered.

PREACHING (Fr. prêcher, from Lat. praedicare, to proclaim), the proclamation of a Divine message both to those who have not heard it, and to those who, having heard it, have not accepted it, and the regular instruction of the converted in the doctrines and duties of the faith, is a distinctive though not a peculiar feature of the Christian religion. The Mahomedans exercise it freely, and it is not unknown among the Buddhists. The history of Christian preaching with which alone this article is concerned has its roots (1) in the activity of the Hebrew prophets and scribes, the former representing the broader appeal, the latter the edification of the faithful, (2) in the ministry of Jesus Christ and His apostles, where again we have both the evangelical invitation and the preaching of truth and duty. Which ever element is emphasized in preaching, the preacher is one who believes himself to be the ambassador of God, charged with a message which it is his duty to deliver.

1. The Patristic Age, to the Death of St Augustine, A.D. 430.—Of the first two centuries we have very little information. From the Acts of the Apostles we gather something as to the methods adopted by St Peter and St Paul, and these we may believe were more or less general. The Apostles who had known the Lord would naturally recall the facts of His life, and the story of His words and works would form a great deal of their preaching. After they had passed away and before the Christian Scriptures were canonically sifted and collected there was a gap which for us is only slenderly filled by such productions as the so-called 2nd Epistle of Clement, really a rambling homily on repentance and confession (see Clementine Literature), and by what we can imagine was the practice of men like Ignatius and, on the other hand, the Apologists. Most of these were primarily writers, but Justin Martyr has left a reputation for speaking, especially in debate, as well. Some of the writings of Tertullian (c. 200), e.g. those on Patience and Penitence, read as though they had been spoken, and it is hard to believe that this brilliant rhetorician did not consecrate his powers of address to his new faith. Cyprian (d. 258), too, was a finished speaker; his Epistle to Donatus emphasizes the need of a simple and unadorned style in the proclamation of the gospel. None of his sermons, however, unless we regard his book on the Lord’s Prayer as a homily, has come down to us.

By this time the canon of New Testament Scripture was fairly settled, and with Origen (d. 254) we find the beginning of preaching as an explanation and application of definite texts. Origen was pre-eminently a teacher, and the didactic side of preaching is thus more conspicuous in his work. When we allow for his excessive use of the allegorical method, there is still left a great deal of power and suggestiveness. In his hands, as may be seen from the 10 homilies on Jeremiah that have been preserved in the Greek (and others in the Latin of Rufinus), the crude homily of his predecessors began to take a more dignified, orderly and impressive form. Alongside Origen we may rank Hippolytus of Rome on the strength of the one sermon of his which is extant, a panegyric on baptism based on the theophany which marked the baptism of Jesus.

The 4th century marks the culmination of early Christian preaching. The imperial patronage had made education and social distinctions a greater possibility for the preacher, and the decline of political eloquence furnished an opening for pulpit oratory. The didactic element was no longer in sole possession of the field, for the intrusion of multitudes to the Christian faith and the building of large churches necessitated a return to the evangelical or proclamatory type of sermon. It was the age of doctrinal controversy, and the intellectual presentation of the Christian position was thus sharpened and developed. The Antiochene school had set a worthy example of careful exegesis of scripture. It was in the East especially that preaching flourished: Eusebius of Caesarea, Eusebius of Emesa, Athanasius, Macarius, Cyril of Jerusalem, Ephraem Syrus among the orthodox; and of the Arians, Arius himself and Ulfils the great Gothic bishop, who had a great reputation. But above all stood the three Cappadocians, Basil (p.v.) of Caesarea, cultured, devout and practical; his brother Gregory (q.v.) of Nyssa, more inclined to the speculative and metaphysical, and Gregory (q.v.) of Nazianzus, richly endowed with poetic and oratorical gifts, the finest preacher of the three. At the apex of the pyramid stands John of Antioch, Chrysostom (q.v.), who in 387, at the age of 40, began his 12 years’ ministry in his native city and in 399, the six memorable years in Constantinople, where he loved
the poor, withstood tyranny and preached with amazing power. His sermons, says Dr E. C. Dargan, "show the native oratorical instinct highly trained by study and practice, a careful and sensible (not greatly allegorical) interpretation of Scripture, a deep concern for the spiritual welfare of his charge, and a thorough consecration to his work. His style is impetuous, rich, torrential at times; his thought is practical and imaginative rather than deeply philosophical. His knowledge of human nature is keen and ample, and his sermons are a remarkable reflection of the manners and customs of his age. His ethical appeal is constant and stimulating."

In the West the allegorical method of Alexander had more influence than the historical exegesis of Antioch. This is seen in Ambrose of Milan, with whom may be named Hilary of Poitiers and Gaudentius of Brescia, the friend of Chrysostom, and a link between him and Ambrose. But the only name of first rank in preaching is that of Augustine, and even he is curiously unequal. His fondness for the allegorical and his manifest carelessness of preparation disappoint as often as his profundity, his devout mysticisms, his practical application and earnest wish to satisfy Augustine's De doctrina Christiana, bk. iv., is the first attempt to formulate the principles of homiletics.

2. The Early Middle Ages, 430-1100.—After the days of Chrysostom and Augustine there was a great decline of preaching. With the poor exceptions of one or two names like those of Theodore of Mopsuestia and John of Damascus, the Eastern Church produced no preachers of distinction. The causes of the ebb were both internal and external. Within the Church there was a departure from the great experimental truths of the Gospel, their place being taken by the preaching of nature and morality on a theistic basis. To this we may add a fantastic and absurd allegorization, the indiscriminate laudation of saints and martyrs, polemical strife, the hardening of the doctrine into dogma, the development of a narrow ecclesiasticism, and the failure of the missionary spirit in the orthodox section of the Eastern Church (as contrasted with the marvellous evangelistic activity of the Nestorians (q.v.). Outside the Church the break-up of old civilizations, the confused beginnings of medieval kingdoms, with the attendant war and rapine, the inroads of the Saracens and the rise of Islam, were all effective silencers of the pulpit. Yet the night was not without its stars; at Rome Leo the Great and Gregory the Great could preach, and the missionaries Patrick, Columba, Columbanus, Augustine, Wilfrid, Gall and Boniface are known by their fruits. The homilies of Beta are marked by a tender devoutness, and here and there rise to glowing eloquence. In the 8th century Charlemagne, through the Capitulaires, tried in vain to galvanize preaching; such specimens as we have show the sermons of the times to be marked by superstition, ignorance, formality and plagiarism. It was the age when the papacy was growing out of the ruins of the old Roman Empire, and the best talents were devoted to the organization of ecclesiasticism rather than to the preaching of the Word. Liturgies were taking shape, penance was deemed of more importance than repentance, and there was a marked growth of the spirit of the Holy Spirit. Towards the end of the period we note the beginnings of the triple division of medieval preaching into cloisteral, parochial and missionary or popular preaching, a division based at first on audiences rather than on subject-matter, the general character of which—legends and popular stories rather than exposition of Scripture—was much the same everywhere. About this time, no doubt, some preachers began to use the vernacular, though no examples of such a practice have been preserved. There are few great names in the 9th, 10th and 11th centuries: Anselm was a great Churchman, but no great preacher; perhaps the most worthy of mention is Anskar, the missionary to the Scandinavians. Rabanus Maurus published an adaptation of Augustine's De doctrina Christiana, bk. iv. But certain forces were at work which were destined to bring about a great revival, viz. the rise of the scholastic theology, the reforms of Pope Hildebrand, and the preaching of the First Crusade by Pope Urban II. (d. 1099) and Peter the Hermit.

3. The Later Medieval Age, 1100-1500.—In the 12th century the significant feature is the growing use of the various national languages in competition with the hitherto universal Latin. The most eminent preacher of the century was Bernard of Clairvaux (1090-1153), esteemed alike by gentle and simple, and summing up the popular scholastic and mystical types of preaching. His homilies, though tediously minute, still breathe a charm and power (see Bernard, St.).

Alongside Bernard may be placed the two mystics of St Victor, Hugo and Richard, and a little later Peter Waldo of Lyons, who, like Henry of Lausanne, preached a plain message to the poor and lowly. The 13th century saw the culmination of medieval preaching, especially in the rise of the two great mendicant orders of Francis and Dominic. Representative Franciscan names are Antony of Padua (d. 1231), who travelled and preached through southern Europe; Berthold of Regensburg (d. 1272), who, with his wit and pathos, imagination and insight, drew huge crowds all over Germany, as in homeliest vernacular he denounced sin with all the severity of a John the Baptist; and Francis Bonaventura, the schoolman and mystic, who wrote a little book on The Art of Preaching. Of the Dominicans Thomas Aquinas (d. 1274), the theologian, was perhaps also the greatest preacher. With the 14th century a new note, that of reformation, is struck; but on the whole there was a drop from the high level of the 13th. In Italy Bernardino of Siena on the scholastic side, Robert of Lecce and Gabriel Barletta on the popular, are the chief names; in Germany these phases are represented by John Gritsch and John Geiler of Kaisersburg respectively. Among the popular preachers vigour was often blended with coarseness and vulgarity. Mysticism is represented by Suso, Meister Eckhart, above all Johann Tauler (q.v.) of Strassburg (d. 1461), a true prophet in an age of degeneration. Towards the close of the century comes John Wycliffe (q.v.) and his English travelling preachers, who passed the torch to Hus and the Bohemians, and in the next age Savonarola, who was to Florence what Jeremiah had been to Jerusalem.

4. The Reformation Period, 1500-1700.—It is here that the story of modern preaching may be said to begin. The Reformers gave the sermon a higher place in the ordinary service than it had previously held, and they laid special stress upon the interpretation and application of Scripture. The controversy with Rome, and the appeal to the reason and conscience of the individual, together with the spread of the New Learning, gave preaching a new force and influence which reacted upon the whole faith, as John Wild (d. 1554), one of the best Roman Catholic preachers of the day, a man noted for his emphasis on Scripture, his grasp of evangelical truth, his earnest piety, amiable character and sustained power in the pulpit, fully admitted. Other famous preachers on the same side were the Spaniards Luiz de Granada and Thomas of Villanova, the Italians Cornelio Musso, Egidio of Viterbo and Carlo Borromeo, and the German Peter Canisius. Among the Reformers were, of course, Martin Luther and most of his German collaborators; the Swiss Zwingli, Bullinger, Farel and Calvin; the English Latimer, John Bradford, Jewel; the French Savonarola; the Dutch Witsius. Nor can even the cursory sketch omit to mention Bernardino Ochino and the Anaabaptist Hübmaier. In all these cases fuller details will be found in the articles bearing their names. Most of the Reformation preachers read their sermons, in contrast to the practice of earlier ages. The English Book of Homilies was compiled because competent preachers were comparatively rare.

The 17th-century preaching was, generally speaking, a continuation of that of the 16th century, the pattern having been set by the Council of Trent and by the principles and practice of the Reformers. In Spain and Germany, however, there was a decline of power, in marked contrast to the vigour manifested in France and England. In France, indeed, the Catholic pulpit now came to its perfection, stimulated, no doubt, by the toleration accorded to the Huguenots up to 1685 and by the patronage of Louis XIV. The names of Bossuet, Fléchier, Boudaloue, Fénélon and Massillon, all supreme preachers, despite a certain artificial pomposity, belong here, and on the reformed side
are Jean Claude (d. 1687), author of the Essay on the Sermon, and Jacques Saurin (d. 1730). In England the rivalry was not between Catholic and Reformer, but between Anglican and Nonconformist, or, if we may use the wide but less correct term, Puritan. On the one hand are Andrews, Hall, Chillingworth, Jeremy Taylor, Barrow and South; on the other Baxter, Calamy, the Goodwins, Howe, Owen, Bunyan, in each case but a few names out of many. The sermons of these men were largely scriptural, the cardinal evangelical truths being emphasized with reality and vigour, but with a tendency to abstract theology rather than concrete religion. The danger was felt by the university of Cambridge, which in 1674 passed a statute forbidding its preachers to read their sermons.

Germany, harassed by the Thirty Years’ War and deadened by a rigid Lutheranism, can show little besides Andrea and Johann Arndt until the coming of the Pietists (see Pietism), A. H. Francke and Philipp Spencer, with Paul Gerhardt and his cousin Johann. The early years of the 18th century were a time of deadness as regards preaching. The illumination in Germany and Deism in England were largely responsible for this, though the name of J. A. Tholuck (better known as a composer) Zinzendorf, Butler and the Erskines helped to redeem the time from the reproach of being the dark age of Protestantism. In the Roman Catholic Church the greatest force was Bridaïne in France, a popular preacher of high worth. But, generally speaking, there was no heat in preaching, sermons were unimpassioned, stilted and formal presentations of ethics and apologetics, seldom delivered extemporaneously.

5. The Modern Period may be said to begin in 1736, the year in which John Wesley began his memorable work. Preaching once more was based on the Bible, which was expounded with force and earnestness, and though throughout the century there remained a good many pulpitiakes who produced nothing but solemn fudge, the example and stimulus given by Wesley and Whitefield were almost immeasurably productive. Whitefield was the greater orator, Wesley the better thinker; but, diverse in temperament as they were, they alike laid emphasis on open-air preaching. In their train came the great field preachers of Wales, like John Elias and Christmas Evans, and later the Primitive Methodists, who by their camp meetings and itinerancies kept religious enthusiasm alive when Wesleyan Methodism was in peril of hardening. Meanwhile, in America the Puritan tradition, adapted to the new conditions, is represented by Cotton Mather, and later by Jonathan Edwards, the greatest preacher of his time and country. Whitefield’s visits raised a band of pioneer preachers, cultured and uncultured, men who knew their Bibles but often interpreted them awry.

In the early 19th century the pulpit had a great power, especially in Wales, where it was the vehicle of almost every kind of knowledge. And it may be doubted whether, all in all, preaching has ever reached so uniformly high a level or been so powerful a force as during the 19th century, and this in spite of other forces similarly making for enlightenment and morality. It shared to the full in all the quickening that transformed so many departments of civilization during that epoch, and has been specially influenced by the missionary enterprise, the discoveries of science, the fuller knowledge of the Bible, the awakened zeal for social service. Modern preaching, like ancient preaching, has been so varied, depending, as it so largely does, on the personality of the preacher, that it is not possible to speak of its characteristics. Nor can one do more than enumerate a few outstanding modern names, exclusive of living preachers. In the Roman Catholic Church are the Italians Ventura and Curci, the Germans Diepenbrock and Foerster, the French Lacordaire, Dupanloup, Loyson (Eugène Huguet) and Henri Didon. Of the Protestants, Germany produced Schleiemacher, Claus Harns, Tholuck and F. W. Krummacher; France, Vincent and the Monods. In England representative Anglican preachers were Newman (whose best preaching preceded his obedience to Rome), T. Arnold, F. W. Robertson, Liddon, Farrar, Magee; of Free Churches, T. Binney, Thomas Jones, R. W. Dale and Joseph Parker (Congregationalist); Robert Hall, C. H. Spurgeon and Alexander Maclaren (Baptists); W. M. Punshon, Hugh Price Hughes and Peter Mackenzie (Wesleyan); James Martineau (Unitarian). The Scottish Churches gave Edward Irving, Thos. Chalmers, R. S. Candlish, R. M. McCheyne and John Caird. If, in America, honoured names are those of W. E. Channing, Henry Ward Beecher, Horace Bushnell, Phillips Brooks, to mention only a few.

Dugan, A History of Preaching (1906), and preface to The Pulpit Encyclopaedia, vol. i. (1909); and the various volumes of the Yale Lectures on Preaching. Also SERMON. (A. J. G.)

PREAMBLE (Med. Lat. praecambulum, from praecambulare, to walk before), an introductory statement, a preliminary explanation. The term is particularly applied to the opening paragraph of a statute which summarizes the intention of the legislature in passing the measure; thus the preamble of the statute, of which the title is the Children Act 1908, is as follows: “An Act to consolidate and amend the Law relating to the Protection of Children and Young Persons, Reformatory and Industrial Schools and Juvenile Offenders, and otherwise to amend the Law with respect to Children and Young Persons.” The procedure in the British parliament differs in regard to the preambles of public and private bills. The second reading of a public bill affirms the principle, and therefore in committee the preamble stands postponed till after the consideration of the clauses, when it is considered in reference to those clauses as amended and altered if need be (Standing Order 35). On the other hand, the preamble of a private bill, if opposed, is considered first in committee, and counsel for the bill deals with the expediency of the bill, calls witnesses for the alteration in the preamble, and petitions against the bill are then heard; if the preamble is negatived the bill is dropped, if affirmed it is gone through clause by clause. On unopposed private bills the preamble has also to be proved, more especially with regard to whether the clauses required by the standing orders are inserted (see May, Parliamentary Practice, 1906, pp. 483, 808 seq.).

PREANGER, a residency of the island of Java, Dutch East Indies, bounded S. by the Indian Ocean, W. by Bantam, N. by Batavia and Krawang, and E. by Cherbon and Banyumas. It is officially termed the Preanger Regencies, of which there are five, covering the several administrative divisions. It also includes the small island of Nusa. Wengi, whose languages are Sudanese. The whole residency is mountainous, but there are two main parallel ranges of peaks along the northern boundary and through the middle. Among these are to be found a singularly large number of both active and inactive volcanoes, including the well-known Salak and Gede in the north, and bunched together at the eastern end the Chikorai, Papandayan, Wayang, Malabar, Guntur, &c., ranging from 6000 to 10,000 ft. in height. The rivers of the province belong to the basins of the Indian Ocean and the Java Sea respectively, the water-parting being formed by which there are five, covering the several administrative divisions.

Large stretches of marsh occur on each side of this river, as well as here and there among the hills where inland lakes formerly existed, as, for instance, near Bandung. Crater lakes are Telaga (lake) Buda, in the crater of the volcano of the same name in the south-east, and Telaga Warna, on the slopes of the Gede, famous for its beautiful tinting. On the same side of the Gede is the health resort of Sindanglaya (founded 1870-1890), with a mineral spring containing salt, and close by is the country residence of Chipanas, belonging to the governor-general.

Numerous warm springs are scattered about this volcanic region. Petroleum and coal have been worked, and there is a rich yield of chalk, while a good quality of bricks is made from the
red clay. The soil is in general very fertile, the principal products being rice, maize and pulse (kachang) in the lower grounds, and cinchona, coffee and tea, as well as cocoa, tobacco and fibrous plants in the hills. The coffee growing has, however, sensi-
ably diminished. Forest culture, mat-making, weaving and fish-breeding are also practised, the last-named in the marshes after the rice harvest. The plantations are almost entirely owned by the government and Europeans, but the rice mills are in the hands of Chinese. Irrigation works have been carried out in various parts. The principal towns are Bandung, the capital of the residency, Sukabumi, Chianjar, Sumedang, Chichalengka, Garut, Tasik Malaya and Manon Jaya, all with the exception of Sumedang connected by railway.

**PREBENDARY** (Lat. *praebenda*=give or grant, through Low Lat. *praebendo*), one who holds a prebend, namely an endowment in land or pension in money, given to a cathedral or conventual church in *praebenda*—that is, for the maintenance of a secular priest or regular canon. In the early Church the title had a more general signification. The word *praebenda* originally signified the daily rations given to soldiers, whence it passed to indicate daily distributions of food and drink to monks, canons, &c. It became a frequent custom to grant such a prebend from the resources of a monastery to certain poor people or to the founder. Such persons were, literally, *prebendaries.* At a later date, when the custom in collegiate churches of living in common had become less general, a certain annual revenue was assigned to a certain number of young men, or a portion of the revenue from a certain church, and each portion (no longer of money, but drink only) was called a *prebend.* The clergy of such churches were generally canons, and the titles canons and *prebenda* were, and are, sometimes used as synonymous. A member of such a college is a canon in virtue of the spiritual duties which he has to perform, and the assigation to him of a stall in choir and a place in chapter; he is a prebendary in virtue of his benefice. In the Roman Catholic Church the duties of a prebendary as such generally consist in his attendance at choral office in his church. In the Anglican Church he usually bears his part in the conducting of the ordinary church services, except when he has a vicar, as in the old cathedral foundations (see CATHEDRAL). A prebendary may be either simple or a dignitary. In the former case he has no cure and no more than his revenue for his support; in the latter he has always a jurisdiction annexed. In the Anglican Church the bishop is of common right patron of all prebends, and if a prebend is in the gift of a lay patron he must present his candidate to the bishop who institutes as to other benefices. No person may hold more than one prebend in the same church; therefore, if a prebendary accepts a deanship in his church his prebend becomes void by cession. A prebend is practically a sinecure, and the holder has no cure of souls as such. He may, however, often does, accept a parochial office or chaplaincy in addition.

In the middle ages there were many less regular kinds of prebends: e.g. *praebenda doctorialis,* with which teaching duties were connected, *praebenda lectorialis,* *praebenda missae,* to which the duty of saying a certain number of masses was attached, *praebenda mortuaria,* founded for the saying of masses for the dead. Chantries belonged to this class. All these prebends were generally assigned to special holders, but there were also *praebendas currentes,* which were not held by a regular clergyman. Such were the prebends of boys who sang in choir, *praebenda puerils.* Occasionally the name of prebendary was applied to those servants in a monastery who attended to the food. In England the word *prebendary* was sometimes used as synonymous with *prebend,* as *prebend* was occasionally used for *prebendary.*

**PRE-CAMBRIAN,** in geology, the enormously long and indistinctly defined period of time anterior to the Cambrian period. In the restricted sense in which it is now often employed it embraces a period or group of periods subsequent to the Archean (q.v.) and anterior to the Cambrian, although some writers still prefer to include the former. The superior limit of pre-Cambrian rocks is fixed by the Oleneus fauna at the base of the Cambrian (some geologists speak of certain pre-Olenellus beds as *ec-Cambrian*); the lower limit has not yet been generally established, though it is sufficiently clear in certain regions. The pre-Cambrian rocks are much more variously of sedimentary origin than those of the Archean; they include beds of sandstones, greywackes, quartzites, slates, limestones and dolomites, which appear to have been formed under conditions similar to those which obtained in later epochs. Although the sediments prevail, they are often very highly metamorphosed and distorted by crustal movements; igneous rocks occur in great bulk in some regions. Fossils are usually extremely rare and very ill-preserved; but indications of protozoa, coelenterates, echinoderms, molluscs, mollusca, worms and arthropods have been distinguished. The name pre-Cambrian is the equivalent of the "Algonikum" of the United States Geological Survey, and of the "Proterozoic" of other American authorities; the terms zooco, archaeozoic, agnatozoic, cryptozoic, eparich and others have also been applied to the same period.

Three or more great stratigraphical breaks have been recognized within the system of pre-Cambrian rocks; but how far these breaks synchronize in widely separated regions where they are found is difficult to determine in the absence of good palaeo-
ontological evidence.

The most striking development of pre-Cambrian rocks in Great Britain is the Torridonian (q.v.) group of the north-west highlands of Scotland, which lies with strong unconformability between the Lewesian gneiss and the basal quartzite of the Cambrian. The Torridonian consists of granite and schistose slates. In Ireland and Anglesey may be, in part at least, of the same age. In Shropshire, in the neighbourhood of the Welsh border, is the "Selattyn schist.*" In the Welsh mountains, in an area between Llangollen and Llanfyllin, there is a schistiferous series, in the smaller hills to the west, Caer Caradoc, the Wrekin, and the Cardington Hills. The latter are built mainly of much altered porphyries and tuffs which C. Callaway named the Uriconian series; this series is in the main of eruptive rocks of the Lewisian group. The pre-Cambrian bed of calcareous rocks and slates forming the Longmynd cannot yet be definitely assigned to this period, though they may be provisionally retained here under Callaway's name, Lonndywnian. Probably contemporaneous with these are the rocks of the North Pennine, Lick Hill Hill, and south of Caldecote. The micaceous schists of Rushton (Salop) may be placed here. In the Charnwood Forest a group of crystalline rocks, named Charnian by W. W. Watts, rises up in the form of small hills amid the surrounding Trias; they are classed as follows in descending order: The Brand series, including the slates of Swithland and Groby, quartzite and conglomerate and purple and green beds; the Megantic series, including the slates and grits at Woodhouse bed, the slato-agglomerate of Roesiffe, the Beacon Hill hornfelses and a felspathic agglomerate; and the Blackbrook series of grits and hornstones. The ancient volcanic rocks of St Ewe, of Cornwall, are related to the Caradoc group. The ancient volcanic rocks of the pre-Cambrian period may be divided into two groups: the first, consisting of the batholithic rocks of pre-Cambrian age, in which he recognized a lower, "Dimetian," a middle, "Arvonian," and an upper, "Pebidian," series. The pre-Cambrian age of these rocks was for a long time disputed, but it is now well established (O. L. Sederholm, "The formation of the "pre-Cambrian period in the United States." Recently it has been shown that there is an Upper Pebidian (Rhyolithic group), and a Lower Pebidian (Trachytic group), and that Hicks's "Dimetian," the St Davids granophyre, is a laccolitic mass intrusive in the Pebidian. Both the Pebidian volcanic rocks and the intruded granophyre are separated from the Cambrian by an unconformity.

In Finno-Scandavia pre-Cambrian rocks are well developed. In the Scandinavian mountain ranges are the Seve and Sparganite formations; the latter, a coarse-grained felspathic sandstone, is very similar to the Torridonian of Scotland; it occurs also in Enontekio in Finland. Next in descending order come the Jotnian sandstones (2000 feet thick), which contain ripple-marks; they are associated with conglomerates and slates and intrusive diabase and the Rappakivi granite. The Jotnian group rests unconformably upon the Jutlan quartzite and schists and the "Bugtian" group of slates and conglomerates (of the north of Lake Onega is a bed of anthracite 2 metres thick). Outflows of diabase and gabbro occur in this series, which is from 1600 to 2000 metres in thickness. Below the Jutlan is another group of slates and diamictite, the "Sverdian," which rests unconformably upon the former and separated from the groups above and below by unconformable junctions. These rocks are regarded by J. J. Sederholm as older than the Huronian of North America (possibly similar to the Kimberlithic series, q.v.) and at least equal in age with the sedimentary sediments in this region (Botnian schists, &c.) lie between the Kalevian series and the granitic (Archean) complex.

Pre-Cambrian rocks occupy large areas and attain an enormous thickness. The North Cape rocks of Norway are represented in various stages of metamorphism, and with these are igneous rocks, often developed upon a vast scale. They have been subdivided into the following groups or formations: an upper Keweenaw
and a lower Huronian group; the latter is subdivided into an upper Anikimiean (north-east Minnesota) or Penokean (north-west Wisconsin and Michigan). Each of these groups is separated by marked unconformity from the rocks above and below. Huronian rocks are well developed in the following districts: the Marquette region of northern Michigan, comprising quartzite, sandstone, conglomeratic rocks, and grits; the St. Lawrence islands and diabase and olivine-gabbro; the same rocks occur in the Crystal Falls, north Michigan; the Mesabi and Vermilion districts, Minnesota, and north of Lake Michigan rocks. The rocks of the lower Mesabi are said to attain a thickness of 50,000 ft.; the higher beds are mainly sandy sediments and conglomerates; in the lower portions are great igneous masses, gabbros, diabase and porphyries; thus in the St. Croix valley, north-west Wisconsin and Minnesota, no fewer than 65 laves flows and 5 conglomeratic beds have been counted, which together aggregate some 20,000 ft. in thickness. Some of these lava flows appear to have been due to fissure eruptions. The native copper deposits of this age in north Michigan are the most extensive known.

Pre-Cambrian rocks occupy large areas and reach great thicknesses in the eastern provinces of Canada; in Newfoundland 10,000 ft. of strata have been measured from the campion (the lower Tertiary of South Hunt; Avalon group of others); similar rocks occur also north of the Great Lakes and in the Hudson Bay region. They are found also in great force in the Colorado Canyon, in the Adurrock Mountains and in the states of St. Vincent and elsewhere.

Turning to Europe, we find pre-Cambrian rocks in Brittany, the "phylades de Saint Lô," or Brioverian of Chas. Barrois; and along the western border of France and south-west of the central massif. In the Fichtelgebirge, the Silesian mountains and east Thuringa similar rocks occur; the Przibramer Schiefer of Lipold and rocks in J. Barrande's stage A are of this age. Probably the metamorphic orogenic quartzites and gneiss of the southern border of the Hunsrück and Taunus are pre-Cambrian. Large tracts of metamorphic sedimentary rocks that may be classed here are found in Shantung and north China, and probably also in Brazil, India and Australia. In South America pre-Cambrian rocks occur in the Brazil and Chile; in the overlying Ventersdorp and Potchefstroom systems; the Griqualand system and Cango and Ibeques systems of Cape Colony, all occur above Archean rocks and below those of Devonian age; they could be held, therefore, to be classed as pre-Cambrian and their age is still uncertain.

Little can be said of the climatic conditions of this remote period, the fossil evidence being so poor; but it is of interest to note that in certain regions, viz. in the Lake Huron region, in the Gaisa series of Varanger Fjord, Norway, and in the Yangtse district in China, conglomerate beds are found in which many of the boulders are scratched like those of the Dwyka beds of South Africa, and thus suggest the possibility of glacial conditions at some stages of the period.

For Further Instruction, Geological Literature added to the Geological Society's Library (annual).

J. A. II.

PRECARIUS, literally, held on the good-will of another, or on entreaty (Lat. precx, pretis, prayer) to another. The word is used, in a law of tenure, or office, &c., held at the pleasure of another. In general usage it has the significance of something uncertain, dangerous or risky.

PRECEDENCE (from Lat. procedere, to go before, precede). This word in the sense in which it is here employed means priority of place, or superiority of rank, in the conventional system of arrangement under which the more eminent and dignified orders of the community are classified on occasions of public ceremony and in the intercourse of private life. In the United Kingdom there is no complete and comprehensive code whereby the scheme of social gradation has been defined and settled, once and for all, on a sure and lasting foundation. The principle of precedence has been adopted at different periods and have been derived from various sources. The Crown is the fountain of honour, and it is its undoubted prerogative to confer on any of its subjects, in any part of its dominions, such titles and distinctions and such rank and place as to it may seem meet and convenient. Its discretion in this respect is altogether unbounded at common law, and is limited in those cases only wherein it has been submitted to restraint by act of parliament. In the old time all questions of precedence came in the ordinary course of things within the jurisdiction of the court of chivalry, in which the lord high constable and earl marshal presided as judges, and of which the kings of arms, heralds and pursuivants were the assessors and executive officers. When, however, points of unusual moment and magnitude happened to be brought into the courts of chivalry, they were occasionally considered and decided by the sovereign in person, or by a special commission, or by the privy council, or even by the parliament itself. But it was not until towards the middle of the 16th century that precedence was made the subject of any legislation in the proper meaning of the term.1

In 1530 an act "for the placing of the Lords in Parliament" (31 Hen. VIII. c. 10) was passed at the instance of the king, and by it the relative rank of the members of the royal family, of the great officers of state and the household, and of the hierarchy and the peerage was definitely and definitively ascertained. In 1565 an act "for declaring the authority of the Lord Keeper of the Great Seal and the Lord Chancellor to be the same" (5 Eliz. c. 18) also declared their precedence to be the same. Questions concerning the precedence of peers are mentioned in the Lords Journals 4 & 5 P. and M. and 39 Eliz., but in the reign of James I. such questions were often referred to the commissioners for executing the office of earl marshal. In the reign of Charles I. the House of Lords considered several questions of precedence and objected in the earl of Banbury's case to warrants overruling the statute of 31 Hen. VIII. In 1689 an act "for enabling Lords Commissioners of the Great Seal to execute the office of Lord Chancellor or Lord Keeper" (1 Will. & Mary c. 21) gave to the commissioners not being peers of the realm place next to the speaker of the House of Commons and to the speaker place next to the peers of the realm.

In 1707 the Act of Union with Scotland (6 Anne c. 11) provided that all peers of Scotland should be peers of Great Britain2 and should have rank immediately after the peers of the like degrees in England at the time of the union and before all peers of Great Britain of the like degrees created after the union. In 1800 the Act of Union with Ireland (39 & 40 Geo. III. c. 67) provided that the lords spiritual of Ireland should have rank immediately after the lords spiritual of the same degree in Great Britain, and that the lords temporal of Ireland should have rank immediately after the lords temporal of the same degree in Great Britain at the time of the union, and further that "peers of Ireland created after the union should have precedence with peers of the United Kingdom created after the union according to the dates of their creation." At different times too during the current century several statutes have been passed for the reform and extension of the judicial organization which have very materially affected the precedence of the judges, more especially the Judicature Act of 1873 (36 & 37 Vict. c. 66), under which the lords justices of appeal and the justices of the High Court now receive their appointments. But the statute of Henry VIII. "for the placing of the Lords"3 still remains the only legislative measure in which it has been attempted to deal directly and systematically with any large and important section of the scale of general precedence; and the law, so far as it relates to the ranking of the sovereign's immediate kindred whether lineal or collateral, the principal ministers of the Crown and court, and both the spiritual and temporal members of the House of Lords, is to all practical intents and purposes what it was made by that statute nearly 350 years ago. Where no act of parliament applies precedence is determined either by the will and pleasure of the sovereign or by what is accepted as "ancient usage and established

1 Ample materials for the satisfaction of the curiosity of those who are desirous of investigating the history of precedence under its wider and more remote aspects will be found in such writers as Selden, Titus, and Mackenzie. The latter has been especially useful to by them: Selden, Titles of Honor, pt. ii. pp. 740 seq. (London, 1672); Mackenzie, Observations upon The Laws and Customs of Nations as to Precedency (Edinburgh, 1680); and also reprinted in Guillim, Display of Heraldry, 6th ed., London, 1724).

2 For the parliamentary rights of Scottish peers see article Peersage.
precincts. 2. The National or local government gave a license to the minister. 3. The archbishop of York was the head of the church, and the dean of St. Paul's was the head of the cathedral. 4. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 5. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 6. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 7. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 8. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 9. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral. 10. The archbishop of Canterbury was the head of the church, and the dean of St. Paul's was the head of the cathedral.
Britain; (13) lord president of the privy council; (14) lord keeper of the privy seal; (15) lord great chamberlain of England; (16) lord high constable of England; (17) earl marshal; (18) lord high admiral; (19) lord steward of the household; (20) lord chamberlain of the household; (21) above peers of their own degree; (22) dukes; (22) marquesses; (23) dukes’ eldest sons; (24) earls; (25) marquesses’ eldest sons; (26) dukes’ younger sons; (27) viscounts; (28) earls’ eldest sons; (29) marquesses’ younger

The lord president of the council and the lord privy seal, if they are not lords of the bedchamber, have precedence after the Duke of Hen.

It is provided by 31 Hen. VIII. c. 10 that “the Great Chamber-

269

constable, the Constable, the Marshal, the Lord Admiral, the Grand Master or Lord High Constable who rules the King’s Chamberlain shall sit and be placed after the Lord Privy Seal in manner and form following: that is to say, every one of them shall sit and be placed above all other person-

ages being of the same states or degrees that they shall happen to be of, that is to say the Great Chamberlain first, the Constable and Marshal third, the Lord Admiral the fourth, the Grand Master or Lord Steward the fifth, and the King’s Chamberlain the sixth.

The office of lord high steward of England, then under attainer, is not taken up by the king’s father, and the king’s uncle; therefore the order was intended,” Lord Chief Justice Coke says, “that when the use of such offices has been and are always peers, their proper precedence if that take precedence of the others.

PRECEDENCE

justice of England; (47) master of the rolls; (48) lords justices of appeal; (49) judges of the High Court of Justice; (50) knights bannerets made by the sovereign in person; (51) viscounts' younger sons; (52) barons' younger sons; (53) sons of lords of appeal; (54) baronets; (55) knights bannerets not made by the sovereign in person; (56) knights of the first class of the Bath, the Star of India, St Michael and St George; (57) the Indian Empire, the Royal Victorian Order; (58) knights of the second class of the Bath, the Star of India, and St Michael and St George; other orders K.C.I.E., k.c.; (59) knights bachelors; (60) sons of commanders of the Royal Victorian Order; (61) judges of county courts; (62) sovereign's eldest sons; (63) younger sons of the sovereign's eldest sons; (64) knights' eldest sons; (65) baronets' younger sons; (66) knights' younger sons; of England, the master of the rolls, and the lords justices of appeal are always members of the privy council, and have rank and place as privy councillors, if they are not also peers.

1 The lords justices of appeal have precedence among themselves according to seniority of appointment. Until recently, they were precedence by the peers, according to the common pleas and the lord chief baron of the exchequer (divisions of the High Court of Justice). But under existing arrangements these offices have fallen into abeyance, and they have not been formally abolished. The vice-chancellors used to follow the lords justices of appeal; but, in spite of the fact that there is still one vice-chancellor remaining, the office of vice-chancellor is extinct and will altogether disappear on his death, as the officials in the chancery, who have no precedence allotted to them in England; as the judges holding them are invariably privy councillors, however, they are ranked accordingly. And it is the same with regard to the lord justice-
generals and clerk of the signet.

2 The judges of all the divisions of the High Court of Justice are ranked together according to seniority of appointment. Neither the senators of the College of Justice in Scotland nor the judges of the various divisions of the High Court in Ireland have any precedence in England. The precedence of the Scottish judges among themselves is settled by a royal warrant of Nisbet in his System of Heraldry. The precedence among the judges of the English courts is, as the precedence of the English judges among themselves used to be before the offices of chief justice of the common pleas and chief baron of the exchequer were suspended.

3 By warrant of 30th of March 1898, although lords of appeal rank with hereditary barons in order of creation, their sons stand in a class by themselves.

4 It is a question whether baronets ought not to have precedence by the peers, according to the order of their creation, and the lord lieutenant of Ireland.

5 Royal S. Warrant of 1884.

6 When any specified rank is assigned to them, are placed in the precedence of their fathers. Eldest sons of the younger sons of peers were ranked before the eldest sons of knights by order of the earl marshal, the 18th of March 1615, and by the late Duke of Richmond, by order of the lord marshal, the 6th of April 1677. But no precedence has been given to the younger sons of the eldest sons of peers, although precedence is given to the younger as well as the eldest sons of baronets and knights, and to the eldest sons of knights of the order of knighthood. Moreover, no precedence has been given to either the eldest or the younger sons of a knight of the order of knighthood. In practice this omission is generally disregarded, and, according to the usage of the House of Commons, and earls, at all events, are accorded the same rank and titles which they would have if their fathers were actual instead of quasi peers of the degree next under that of their grandfathers. Sir Charles Young says: "A mistake was consequently committed. Arms of 1668, in which the eldest son of an earl died in his father's lifetime leaving a son and heir, such son and heir during the life of the earl his grandfather is (67) companions of the Bath, the Star of India, St Michael and St George and the Indian Empire; (68) members of the 4th class of the Royal Victorian Order; (69) companions of the Distinguished Service Order; (70) members of the 5th class of the Royal Victorian Order; (71) esquires; (72) gentlemen.

2.—General Precedence of Women

The Queen; (i) queen dowager; (2) princess of Wales; (3) daughters of the sovereign; (4) wives of the sovereign's younger sons; (5) granddaughters of the sovereign; (6) wives of the sovereign's grandsons; (7) sisters of the sovereign; (8) wives of the sovereign's sons; (9) daughters of the sovereign's uncle; (10) wives of the sovereign's nieces; (11) nieces of the sovereign; entitled to the same place and precedence as was due to his father: so had the father been summoned to parliament as the eldest son of a peer the grandson would succeed to the dignity even during the grandfather's lifetime." (Order of Precedence, p. 27). And, of course, what applies to the grandson and heir of an earl applies equally to the grandson and heir of a Viscount, so that, several esquires are to have a particular precedence of their own assigned to them. Similarly the eldest sons of the younger sons of peers and the eldest sons of baronets and of knights who are not esquires, have a particular precedence of their own assigned to them. All of them are placed above the younger sons of esquires, and it seems clear enough that it is before esquires, considered as a specific grade, that the companions of the orders ought to be placed and not before any other persons, whether they are or are not esquires, have a defining and settling rank which is superior to that specific grade in the scale of general precedence.

It appears to be admitted on all hands that the following persons are esquires and ought to be so described in all legal documents: the gril processes: first, the eldest sons of peers in the lifetime of their fathers, and the younger sons of peers both in and after the lifetime of their fathers; secondly, the eldest sons of the younger sons of peers and their eldest sons in perpetuity; succession, eldest sons of baronets, knighthood, who are created with or without the grant of armorial bearings by the sovereign; fourthly, justices of the peace, barristers-at-law and majors of the city of London, and such other persons as sit on commissions or appointments to offices under the Crown in the state, the household, the army or navy and elsewhere. Sir Bernard Burke says precedence to serjeants-at-law and masters in lunacy, the orders of knighthood. It is, however, enough to observe with regard to the first, since no more of them are to be created, that, in spite of the extravagant pretensions which have been frequently urged by them and on their behalf, "they have not in the general scale," as Sir Charles Young says, "any precedence, and when under the degree of a Knight rank only as Esquires"; and with regard to the second, that the statute 8 & 9 Vict. c. 100, on which the Ulster king of arms bases their claims, simply provides that they "shall take the same rank and precedence as the masters in ordinary of the High Court of Chancery," who are now extinct, "or any other persons having a rank or precedence before theirs." (Order of Precedence of the House of Lords, p. 71). Sir William Blackstone says that before esquires " the Heralds rank all Colonels, Serjeants-at-Law and Doctors in the three learned professions" (Commentaries, vol. i. ch. 12). But the only foundation for this statement was a misprint, which is illustrated in an English text book of Heraldry, pt. ii. ch. 8; and in the Dictionary of English Literature, under the title of "Serjeant," by Mr. Selden, Titles of Honor, pt. ii. ch. 8; more particularly by Mr. Selden, Dictionary of English Literature, p. ii. ch. 26.

The queen-consort is the second person in the order, and has precedence of the queen dowager. But the husband of a queen-
family, the peerage and certain specified classes of the
commonalty. Official precedence belongs to such of the dignitaries
of the church and such of the ministers of state and the household
as have had rank and place accorded to them by parliament
or the Crown, to the speaker of the House of Commons and to
the members of the privy council and the judicature. Substantive
precedence, which may be either personal or official, belongs to
all those whose rank and place are enjoyed by them independ-
ently of their connexion with anybody else, as by the arch-
bishop of Canterbury, the lord high chancellor or the lord great
chamberlain, peers and peeresses, baronets, knights and some
esquires. Derivative precedence, which can only be personal,
belongs to all those whose rank and place are determined by
their consanguinity with or affinity to somebody else, as the
descendants of the sovereign, the sons, daughters and daugh-
ters-in-law of peers and peeresses in their own right, and the
wives, sons, daughters and daughters-in-law of baronets,
knight and some esquires. It is to be observed, however, that
the precedence of the sovereign is at once official and personal,
and that the precedence of peeresses by marriage is
at once derivative and substantive. In the case of the sover-
eign it is his or her actual tenure of the office of king or queen
which regulates the rank and place of the various members
of the royal family, and in the case of peeresses by marriage,
although their rank and place are derivative in origin, yet they
are substantive in consequence, since during coverture and widow-
hood peeresses by marriage are as much peeresses as peeresses
in their own right, and their legal and political status is precisely
the same as if they had acquired it by creation or inheritance.

Bearing the above definitions and explanations in mind, the
following canons or rules may be found practically useful:—

1. Anybody who is entitled to both personal and official
precedence is to be placed according to that which implies the
higher rank. If, for example, a baron and a baronet are both
privy councillors, the precedence of the first is that of a baron
and the precedence of the second is that of a privy councillor.

And similarly, except as hereafter stated, with respect to the
holders of two or more personal or two or more official
dignities.

2. Save in the case of the sovereign, official rank can never
supply the foundation for derivative rank. Hence the official
precedence of a husband or father affords no indication of the
personal precedence of his wife or children. The wives and
children, for example, of the archbishop of Canterbury, the lord
high chancellor or the speaker of the House of Commons do
not participate in their official rank but only in their personal
rank, whatever it may be.

3. Among subjects men alone can convey derivative rank,
extinct in the case of the daughters and sisters of the sovereign,
or of peeresses in their own right. But no man can acquire any
rank or place by marriage. The sons-in-law or brothers-in-
law of the sovereign and the husbands of peeresses in their own
right have as such no precedence whatever. And the daughter
and heiress of the premier duke of England, unless she happens to
be also a peeress in her own right, does not transmit any rank or
place to her children.

4. Within the limits of the peerage derivative rank is as a
rule always merged in personal, as distinguished from official,
substantive rank. If, for example, the younger son of a duke is
created a baronet or inherits a barony, his precedence ceases to be
that of a duke’s younger son and becomes that of a baron.
But where the eldest son of a duke, a marquess or an earl is
summoned to the House of Lords in a barony of his father’s,
or succeeds as or is created a baron, he is still, as before, “com-
monly called” by some superior title of peerage, as marquess,
earl or viscount, and retains his derivative precedence on all
occasions, except in parliament or at ceremonies which he attends
in his character as a peer. The younger sons of all peers,
however, who are created or who inherit peerages—which they
often do under special limitations—are everywhere placed
according to their substantive rank; no matter how inferior it
may be to their derivative rank. But if the son of a duke or a

(12) wives of the sovereign’s nephews; (13) wives of dukes of the
blood royal; (14) duchesses; (15) wives of eldest sons of dukes of the
blood royal; (16) marchionesses; (17) wives of the eldest
sons of dukes; (18) dukes’ daughters; (19) countesses; (20)
wives of younger sons of dukes of the blood royal; (21) wives of
the eldest sons of marquesses; (22) marquesses’ daughters; (23)
wives of the younger sons of dukes; (24) viscountesses; (25)
wives of the eldest sons of earls; (26) earls’ daughters; (27)
wives of younger sons of marquesses; (28) baronesses; (29)
wives of the eldest sons of viscounts; (30) viscounts’ daughters; (31)
wives of the younger sons of earls; (32) wives of the eldest sons
of barons; (33) baroness’ daughters; (34) maids of honour to
the queen; (35) wives of knights of the Garter; (36) wives
of knights bannerets made by the sovereign in person; (37)
wives of the younger sons of viscounts; (38) wives of the younger sons
of barons; (39) baronets’ wives; (40) wives of knights bannerets
not made by the sovereign in person; (41) wives of knights
of the Thistle; (42) wives of knights of St Patrick; (43) wives
of knights grand crosses of the Bath, grand commanders of
the Star of India, and grand crosses of St Michael and St George;
(44) wives of knights commanders of the Bath, the Star of
India, and St Michael and St George; (45) knights bachelors’
wives; (46) wives of the eldest sons of the younger sons of peers;
(47) daughters of the younger sons of peers; (48) wives of the eldest
sons of baronets; (49) baronets’ daughters; (50) wives of the
elder sons of knights; (51) knights’ daughters; (52) wives of the
younger sons of baronets; (53) wives of the younger sons
of knights; (54) wives of commanders of the Royal Victorian
Order, companions of the Bath, the Star of India, St Michael
and St George, and the Indian Empire; (55) wives of members
of the 4th class Royal Victorian Order; (56) wives of esquires;
(57) gentlewomen?

A special table of precedence in Scotland is regulated by a
royal warrant dated the 16th of March 1905, and a special
table of precedence in Ireland was set forth by authority of
the Lord Lieutenant (Jan. 2, 1895). Both contain errors and
will probably be revised on the lines of the foregoing tables will show that general
precedence is of different kinds as well as of several
degrees. It is first either personal or official, and secondly either substan-
tive or derivative. Personal precedence belongs to the royal

1 There is no act of parliament or ordinance of the Crown
regulating the precedence of the female members of the royal family.
But the above is the gradation which appears to have become
established among them, and follows the analogy supplied by the
act for the placing of the lords in the case of their husbands and
brothers.

2 Peeresses in their own right and peeresses by marriage are
ranked among themselves in their own precedence and the second
in the precedence of their husbands.

3 Among the daughters of peers there is no distinction between
the eldest and the younger as there is among the sons of peers.
Their precedence is immediately after the wives of their eldest
brothers, and several degrees above the wives of their younger
brothers. They are placed among themselves in the precedence
of their fathers. But the daughter of the premier duke or baron
ranks after the wife of the eldest son of the junior duke or baron.

4 Maids of honour to the queen are the only women who have
any official precedence. They have the style or title of honour-
able maids of honour, and are placed immediately after barons’
dughters by Sir Bernard Burke, though not in the order of the
quette of society. But Sir Charles Young does not assign any
precedence to them, and we do not know on what authority the
eldest son of arms does so, although he is by no means singular
in the course he has taken.

5 The wives of baronets and knights, the wives of the eldest
sons and the daughters of the younger sons of peers, and the wives
and sisters of the younger sons of baronets; the wives and
sisters of baronets and knights and gentry do not, in
strictness, convey or transmit any precedence to their wives

6 The terms “generous and generous” are good additions: and if a
gentlewoman is a minister, or if a Gentleman be a Minister with
indictment, she may abate and quash the same, for she hath
as good right to that addition as Baroness, Viscountess, Marchioness
or Duchess have to theirs. (Coke, Inst. ii., “Of Additions,” p. 668).
marquess, whether eldest or younger, or the eldest son of an earl is consecrated a bishop his derivative rank is not merged in his substantive rank, because it is official, and his derivative and personal rank implies the higher precedence. Again, the daugh-
ters of dukes, marquesses and earls who become peersesses by marriage or creation, or who inherit as peersesses, are placed according to their substantive and not according to their deriva-
tive rank, although they may thereby be assigned a far lower precedence than that to which their birth entitles them.
5. The widows of peers and baronets have precedence imme-
diately before the wives or widows of the next successors in their husbands' dignities. But the sons and daughters of peers and baronets have precedence immediately before the sons and daughters of the holders of the dignities to whom their fathers succeeded. The reason of this is that the first are senior in the dignities and the second are nearer in the line of succession to them.
6. The widows of peers who marry again either share the precedence of their second husbands or resume the precedence belonging to them independently of their marriage with their first husbands. Thus, if the daughter of a duke or an esquire marries first an earl and secondly a baron, although she remains a peeress, she is placed as a baroness instead of a countess. But if either of them should marry a commoner as her second husband, whatever may be his rank or degree, she ceases to be a peeress. While, however, the duke's daughter, if her second husband were not the eldest son of a duke, would resume her precedence as the daughter of a duke, the esquire's daughter would share the precedence of her second husband, whether he were a peer's son, a baronet, a knight or an esquire. The widows of peers have long kept their former rank in society, but they have no such right unless by permission of the sovereign, which permission has on several recent occasions been refused.
7. The widows of the eldest and younger sons of dukes and marquesses and of the eldest sons of earls, and also the widows of baronets and knights who marry again, are permitted by the etiquette of society to keep the titles and rank acquired by their first marriage if their second marriage is with a commoner whose precedence is considerably lower. But the widows of the younger sons of earls and of the eldest and younger sons of viscounts and barons, although their precedence is higher than that of the widows of baronets and knights, are not allowed to retain it, under any circumstances, after a second marriage.
8. Marriage does not affect the precedence of peeresses in their own right unless their husbands are peers whose peerages are of a higher degree, or, being of the same degree, are of more ancient creation than their own. If, for example, a baroness in her own right marries a viscount she is placed and described as a viscountess, or if she marries a baron whose barony is older than hers she is placed in his precedence and described by his title. But if she marries a baron whose barony is junior to hers she keeps her own precedence and title.
9. The daughters of peers, of sons of peers, baronets and knights retain after marriage the precedence they derive from their fathers, unless they marry peers of any rank or commoners of higher rank. For example, the daughter of a duke who marries the eldest son of a marquess is placed as a duke's daughter, not as the wife of a marquess's eldest son, and the daughter of a baronet who marries the youngest son of a knight is placed as a baronet's daughter and not as the wife of a knight's younger son.
10. What are termed "titles of courtesy" are borne by all the sons and daughters of peers and peeresses in their own right, who in this connexion stand on exactly the same footing. The eldest sons of dukes, marquesses and earls are designated by the names of one or other of the inferior peeresses of their fathers, usually a marquessess or an earlness, and the sons and daughters of peers of marquessess in the second and a viscountess or baroness in the third.

The rule applicable in former times, still adhered to by the older English dignities, was that a duke's eldest son was styled earl, the son of a marquess, viscount, the son of an earl, baron. No such rule obtained in Scotland. But, whatever it may be, it is altogether without effect on the rank and place of the bearer, which are those belonging to him as the eldest son of his father. The younger sons of dukes and marquesses are styled "lords," followed by both their Christian names and surnames. The younger sons of earls and both the eldest and the younger sons of viscounts and barons are described as "honourable" before both their Christian names and surnames. The daughters of dukes, marquesses and earls are styled "ladies" before both their Christian names and surnames. The daughters of viscounts and barons are described as "honourable" before both their Christian names and surnames. The eldest son of a marquess or an earl marries a woman of rank equal or inferior to his own, she takes his title and precedence; but if she is of superior rank she retains, with her own precedence, the prefix "lady" before her Christian name followed by the name of her husband's title of courtesy. Again, if the younger son of a duke or a marquess marries a woman of rank equal or inferior to his own, she is called "lady," with his Christian and surname following, and is placed in his precedence, but, if she is of superior rank, she retains, with her own precedence, the prefix "lady" before her Christian name and her surname. If she later marries a marquess, a viscount, a baronet or an esquire, she is placed as a marquess, a viscount, a baronet, a knight or an esquire, &c., and she retains, with her own precedence, the prefix "lady" before her Christian name and her husband's surname. If the daughter of a viscount marries the younger son of an earl or anybody of inferior rank to him, or the daughter of a baron marries the younger son of a viscount or anybody of inferior rank to him, she retains her own precedence with the prefix "honourable" before the addition "Mrs" and her surname or Christian name and surname. But, if her husband is a baronet or a knight, she is called the Honourable Lady Smith or the Honourable Lady Jones, as the case may be. The wives of the younger sons of earls and of the eldest and younger sons of viscounts and barons, if they are of inferior rank to their husbands, take their precedence and are described as the Honourable Mrs, with the surnames or Christian names and surnames of their husbands following. The judges were placed by James I. before the younger sons of viscounts and barons and accorded the title of "honourable" (q.e.) But in this addition their wives do not participate, since it is merely an official distinction.

It is manifest on even a cursory examination of the tables we have given that, although they embody the only scheme of general precedence and order for which we have, or which is authoritatively sanctioned, they are in many respects very imperfectly fitted to meet the circumstances and requirements of the present day. In both of them the limits prescribed to the royal family are pedantically and inconveniently narrow, and stand out in striking contrast to the wide and ample bounds through which the operation of the Royal Marriage Act (12 Geo. III. c. 11) extends the disabilities but not the privileges of the sovereign's kin. Otherwise the scale of general precedence for women compares favourably enough with...
the scale of general precedence for men. If, indeed, it includes the queen's maids of honour and the wives of the companions of the knighthood orders, there certainly does not seem to be any good reason why it should omit the mistress of the robes and the ladies of the bedchamber, or the ladies of the Indian or Vizirians and Almirs, and the imperial order of the Crown of India. But these are trifling matters in themselves, and concern only a minute fraction of the community. The scale of general precedence for men is now in substantially the same condition as that in which it has been for between two and three centuries, and the political, to say nothing of the social, arrangements to which it was framed to apply have in the interval undergone an almost complete transformation. The consequence is that a good deal of it has come down to us in the shape of a survival, and has ceased to be of any practical use for the purpose it was originally designed to effect. While it comprises several official and personal dignities which are virtually obsolete and extinguished, it entirely omits the great majority of the members of Government in its existing form, and whole sections of society on a less exalted level, to whom it is universally felt that some rank and place at all events are both in public and in private justly due. And, when it does confess the presence of any of the sovereign's principal ministers, it commonly places them in positions which are out of all keeping with their actual eminence and importance. It ranks the lord president of the council and the lord privy seal before dukes, while it places the chancellor of the exchequer after the younger sons of earls and the eldest sons of barons, and the secretaries of state after the ministers of the horse and the vice-chamberlain of the household. The lord chancellor still has precedence as the first of the great officers of state, which was allotted to him not as what he is, the head of the judicature, but as what he once was, the prime minister of the sovereign; and the lord chief justice, who is next to him in regular judicial rank, as presiding over the common law courts, as he presides over the courts of equity, is placed after the chancellor of the exchequer and of the duchy of Lancaster, who still have the precedence which was allotted to them not as ministers, which they are, but as judges, which they are no longer. Neither the lord-lieutenant of Ireland, the viceroy of India, nor the governor-general of Canada has any rank or place at St James's, where, as well as at Westminster, the lord steward or the lord chamberlain of the household is a much greater and more splendid personage. Again, in the scale of general precedence there are no clergymen except bishops, no lawyers except judges, and no officers of either the army or the navy from field marshals and admirals of the fleet downwards. Nor, of course, are any colonial governors or lieutenant-governors entered on it. It contains no mention of under-secretaries of state, chairmen or commissioners of administrative boards, comptrollers or secretaries of government departments, lord-lieutenants or sheriffs of counties, deputy lieutenants or justices of the peace, members of the House of Commons or graduates of the universities. It is true that among some of these classes definite systems of subordination are established by either authority or usage, which are carefully observed and enforced in the particular areas and spheres to which they have reference. But we have seldom any means of determining the relative value of a given term in one series as compared with a given term in another series, or of connecting the different steps in the scales of local, professional or academical precedence with the different steps in the scale of general precedence, to which such scales of special precedence ought to be contributory and supplementary. We know, for example, that major-generals and rear-admirals are of equal rank, that with them are placed commissioners-general and inspectors-general of hospitals and fleets, that in India along with civilians of thirty-one years' standing they immediately follow the vice-chancellors of the Indian universities, and that in relation to the consular service they immediately precede agents-general and consuls-general. But there is nothing to aid us in determining whether in England they should be ranked with, before or after deans, king's counsel or doctors in divinity, who are as destitute as they are themselves of any recognized general precedence, and who, as matters now stand, would certainly have to give place to the younger sons of baronets and knights and the companions of the knighthood orders.

No foreigner has any legal precedence in Great Britain, but a foreigner is placed in such a position at the court and for the purposes of the precedence due to the rank that if he is crowned in his own country, they should rank in society with and immediately before those of the relative rank in England. It should, however, be remembered that the younger sons of counts and other nobles bear the title of count with the addition of the Christian name, and they should be ranked with younger sons of British earls, &c., whatever title they bear. The eldest son of a duke for example is sometimes called prince, but the place accorded to him by the above rule would be next after a British marquess. Some persons of authority consider, however, that a foreigner should be given precedence over every native whatever the rank may be.

It has now become usual to recognize ecclesiastical rank derived from the pope, even when held by subjects of the king. Cardinals, therefore, rank by international usage above archbishops, as princes of the blood royal, and in Ireland, Roman Catholic and Protestant bishops rank as such by authority of the warrants there in force.

An order respecting precedence was sent by the secretary of state for the colonies to the governor-general of Canada (July 24, 1868). Precedence in India is regulated by a Royal Warrant dated the 6th of May 1871, a copy of which is subjoined.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To all whom these presents shall come, a greeting.

Whereas it hath been represented unto Us that it is advisable to regulate the Rank and Precedence of persons holding appointments connected with the Government of the India, in order to fix the same, and prevent all disputes, We do hereby appoint that the following Table be observed with respect to the Rank and Precedence of the persons hereinafter named, viz.:—

1. This subject was considered by the House of Lords in February 1628, on the proposition of a committee that no foreign nobility has right of precedence within this realm before any peer of this kingdom.
Second Class

Third Class

Fourth Class
Civilians of 8 years' standing ranking with Majors. Assistant Political Agents. Officers, 2nd Grade, Geological Survey of our Lord's Treasury, Education Department. Officers, 3rd Grade, Financial Department. Superintendents, 2nd Grade, Telegraph Department. Government Solicitors.

Fifth Class
Civilians of 4 years' standing ranking with Captains. Junior Chaplains. Officers, 4th Grade, Education Department.

Sixth Class
Civilians of less than 4 years' standing to rank with Subalterns.

Note 1.—Commissioners of Divisions within their own Divisions, and Residents and Divisional Agents within the limits of their respective charges, to take precedence immediately before Civilians of the 1st Class.

Note 2.—Collectors and Magistrates of Districts, and Deputy Collectors, and Prior Chaplains, Officers, 1st Grade, and Lieutenants of each Presidency Municipality, to take precedence within their respective charges before the 3rd Class and Lieutenant-Colonels in the Army.

Sheriffs to rank within their charges immediately after Lieutenant-Colonels in the Army.

All Officers not mentioned in the above table, whose rank is regulated by comparison with rank in the Army, to have the same rank with reference to Civil Servants as is enjoyed by Military Officers of equal grades.

All other persons who may not be mentioned in this table to take rank according to general usage, which is to be explained and determined by the Governor-General in Council in case any question shall arise.

Nothing in the foregoing rules to disturb the existing practice relating to precedence at Native Courts, or on occasions of intercourse with Natives, and the Governor-General in Council to be empowered to make rules for such occasions in case any dispute shall arise.

All ladies to take place according to the rank herein assigned to their respective husbands, with the exception of wives of Peers, and of ladies having precedence in England, independently of their husbands, and who are not in rank below the daughters of Barons; such ladies to take place according to their several ranks, with reference to such precedence in England, immediately after the wives of Members of Council at the Presidencies in India.

Given at Our Court at Windsor, this sixth day of May, in the year of our Lord one thousand eight hundred and seventy-one, and in the thirty-fourth year of our Reign.

By Her Majesty's Command.

(Signed) ARGYLL.

(F. DR.; W. A. L.)

Precentor—Precession of the Equinoxes

Precentor (Late Lat. precentor, from praecinere, to sing before, lead in singing), the title of the principal director of the singing or musical portions of the service in a cathedral or cathedral church. In the English Church in cathedrals of the "Old Foundation" the precentor is a member of the cathedral chapter and officially ranks next to the dean. His musical duties are usually performed by the "successor," one of the vicars choral. In cathedrals of the "New Foundation" the "precentor" is not a member of the chapter, but is one of the minor canons.

Precept (Lat. praecipere, a rule, from praecipere, literally to take beforehand, to give rules, instructions or orders), a command or rule, especially one with regard to conduct or action, a moral rule or injunction, a maxim. Apart from this general use, the word was used, in law, of many orders in writing issuing from a court or other legal authority; it is now chiefly used of an Act of Parliament or a royal prerogative, which makes a rule by positivistic legislation (see Rule). The Latin form praecipere, i.e. enjoin, command, is used of the note of instructions delivered by a plaintiff or his solicitor to be filed by the officer of the court, giving the names of the plaintiff and defendant, the nature of the writ, &c. For the obsolete writ of praecipio roddat see WRIT.

Preceptor, a teacher or instructor, the classical meaning of the Latin preceptor, from praecipere, literally to take in advance, hence to give rules or "precepts," advise, teach. As an educational term in English the word is familiar through the College of Preceptors, a chartered society chiefly composed of private teachers; it was incorporated in 1849 and was one of the first professional bodies to institute regular courses of pedagogic lectures and to award after examination the titles of licentiates and associate to teachers. It also holds examinations for pupils. In post-classical Latin preceptor meant a commander, praecipere, to order, enjoin, and the term was adopted by the Knights Templars for the heads of the provincial communities of knights established on their estates. These communities and the estates themselves were known as "preceptories," and answered to the "commanderies" of the Hospitalers.

Precession of the Equinoxes, in astronomy, the term assigned to the progressive motion of the equinox, because it takes place in a direction from east towards west, opposite to that in which planets move, and in which longitudes are measured. The equinox being defined as the point of intersection of the equator and ecliptic, its motion arises from the fact that both of these great circles are in continuous though slow motion. The motion of the ecliptic is due to the action of the planets on the earth, which produces a slow progressive change in the position of the plane of the earth's orbit, and therefore of the equinox. This motion takes place around a diameter of the celestial sphere as an axis or nodal line, which intersects the sphere in two points, which are at present in longitudes about 173° and 353°. The direction of the motion around this axis is such that from the limits 335° through 0° to 173°, which includes the vernal equinox, the motion is towards the south, while, in the remainder of the circle, it is towards the north. At the present time the rate of the motion is 46.7° per century. In consequence of the smallness of the angle, 7°, which the axis of motion makes with the line of the equinoxes, its effect on the precession is quite small, now amounting to only 0.14° per annum. Owing to its cause this small part of the precession is called "planetary." The motion of the equator is due to the combined action of the sun and moon on the equatorial protuberance of the earth (see Astronomical). Owing to its cause this largest part of the precession is called "luni-solar." Its fundamental law is that the mean celestial pole at each instant (see Mutation) moves at right angles to the circle joining it to the pole of the ecliptic as that instant. Hence if the pole of the ecliptic were fixed, the celestial pole would revolve around it in a circle at a constant distance equal to the obliquity of the ecliptic. Owing, however, to the slow change in the position of the pole of the ecliptic, the motion is only approximately in a circle, and the obliquity
varies slowly from century to century. At the present time the rate of motion measured on a great circle is about 20° per year; that is to say both the pole and the plane of the equator move through this angle annually. But when measured around the pole of the ecliptic as a centre the motion is about 23 1/2 degrees per year, or, at present, 50-176 days. This is the present amount of the lunar-solar precession and the mean motion of the equinoxes is about 50-254°, or 0-0225°. The new time reckoned from 1900 in centuries.

**PRECEPT** (from Lat. praeciscere, to incircle, enclose, surround, prae and cingere, to gird), an enclosure, a space within the boundaries, or as the line, of a building or group of buildings, especially used of such a space belonging to a cathedral or other religious building. The word is frequently used, indefinitely, of the neighbourhood or environs of a place or building. In the United States of America it is applied to various minor territorial divisions or districts, for electoral or judicial purposes. In some of the states they correspond to the "towship" as the principal subdivision of the "county."

**PRECIOUS** (O. Fr. précieux, mod. précieux, Lat. praeciosus, of high value or price, prætium), costly or of high value, particularly used in political economy of those metals which are "valuable enough to be used as a standard of value and abundant enough for coinage." (The Century Dictionary). The term is thus practically confined to gold and silver. Platinum in theory may be included as it was used for coinage in Russia in 1828; the fluctuations in the value of the metal caused its discontinuance in 1845 (see Gold, Silver and Money). "Precious stones" include those gems which are valued for ornament and jewelry. "Strictly speaking the only precious stones are the diamond, ruby, sapphire and emerald, though the term is often extended to the opal, notwithstanding its lack of hardness, and to the pearl...strictly an animal product." G. F. Kunz, Gems and Precious Stones of North America (1890) (see Gem, and Lapidary and Gem-cutting). A particular use of "precious" as meaning fastidious, over-refined, is taken from the French précieux, familiar in the appellation of Les Précieuses, given to the social and literary circle of ladies which centred round the Hôtel de Rambouillet in the 17th century (see Rambouillet; Catherine de Vivonne, Marquise de).

**PRECONIZATION** (Late Lat. praeconsatio, from praeconsare, to proclaim, Lat. praeco, a public crier), a public proclamation or announcement. In this sense it is practically obsolete; but the word is still technically used of the solemn proclamation of a new bishop, and of the process to which they are subjected, namely by the pope in the consistory of cardinals (see Bishop). In the English ecclesiastical courts "preconize" is also still used in the sense of "to summon by name."

**PREDELLA**, the Italian word for a footstool or kneeling-stool, hence applied to the step or platform on which an altar rests, and to a shelf raised above the altar at the back, a super-altar or gradino. The face both of the step and shelf are frequently decorated with sculpture or painting, and the term "predestina" is frequently given to the sculpture or painting so used, and, further, to any painting that is a pendant to a larger work.

**PREDESTINATION** (from Late Lat. prodestinare, to determine beforehand; from the root stāre, as in stare, stand), a theological term used in three senses: (1) God's unchangeable decision from eternity of all that is to be; (2) God's destination of men to everlasting happiness or misery; (3) God's appointment unto life or "election" (the appointment unto death being called "reprobation," and the term "foreordination" being preferred to "predestination" in regard to it). In the first sense the conception is similar to that of fate; this assumes a moral character as nemesist, or the inevitable penalty of transgression.

Sophocles represents man's life as worked with a "shuttle of adamant" (Antigone, 622-624). Stoicism formulated a doctrine of providence or necessity. Epicurues denies a divine superintendence of human affairs. A powerful influence in Scandinavian mythology was exercised by Thor, Hel, Odin, Frey, or Fates, usually thought of as three sisters. In Brahmanical thought "Karma," the consequences of action, necessitates rebirth in a lower or higher mode of existence, according to guilt or merit. With some modifications this conception is taken over by Buddhism. The Chinese tao, the order of heaven, which should be the order for earth as well, may also be compared. According to Josephus (Antiq. xviii. 1, 3, 4; xiii. 5, 9) the Sadducees denied fate altogether, and placed good and evil wholly in man's choice; the Pharisees, while recognizing man's freedom, laid emphasis on fate; the Essenes insisted on an absolute fate. This statement is exposed to the suspicion of attempting to assimilate the Jewish sects to the Greek schools. In Islam the orthodox theology teaches an absolute predestination, and yet some teachers hold men responsible for the moral character of their acts. The freethinking school of the Mo'tazilites insisted that the rightousness of God in rewarding or punishing men for their actions could be vindicated only by the recognition of human freedom.

The question of the relation of divine and human will has been the subject of two controversies in the Christian church, the Augustinian-Pelagian and the Calvinistic-Arminian. Pelagius maintained the free-will of man, and held that man's conduct, and the exercise of his free will, would have been exactly the same had sin and strengthening his moral powers, helps man to fulfill this purpose. While grace is meant for all, men make themselves worthy of it by striving after virtue. This doctrine as emitted by Grace was called the "Damnation of Grace." He regarded mankind as sinful, guilty, ruined, incapable of any good, God alone can save. His grace is effective and irresistible. As what God has done He will also freely and of His own will, grace involves predestination. God has foreknown the character of a man since the beginning of his days. The "predestination" of the wicked is not the cause of their sin; God's foreknowledge does not make the sin necessary; how reprobation and foreknowledge are related is not made plain.

The doctrine of Augustine was revived in the 19th century by Gottschalk, who taught that God's passing over the lost meant their predestination to punishment. Hinckmar of Reims persecuted him for not distinguishing the two positions. This dispute was further watered down in the Middle Ages when the battle interest now, had not Hinckmar appealed to John Scotus Eriugena, who attempted to solve the theological problem by philosophical conceptions. He denied that foreknowledge or predestination was needed to determine the actions of a man. The temporal relations could be properly predicated of God as eternal; he denied sin and its consequences to be either caused by nor known to God; he maintained that as life is only a stage in the development of good, there will ultimately be a period when all will return to God. Thus the whole question of reprobation was emptied of meaning. This defence of orthodox was condemned as heretical. The controversy was kept up during the scholastic period. Thomas Aquinas followed Augustine. Duns Scotus leaned toward Semi-Pelagianism, which rejected the doctrine of predestination, and maintained a co-operation of freedom and grace. While Aquinas affirmed the positions of Augustine, he deduced them from his Aristotelian concept of God as first cause, but found "affirming the existence of the grace of God in the first place of the order in which God's own creative power is exercised upon a man" (so far as the matter was discussed in his work). Duns Scotus developed in his doctrine of predestination in the direction of synergism, the theory of a co-operation of divine grace and human freedom. The later Lutheran doctrine is "that man, unable as he is to will any good thing, can yet use the means God has appointed in the world to do well, and that by his free-will, in the body of Christ, all things are done for his sake. A divine power, produce a saving effect on all who do not voluntarily oppose their influence. Baptism, e.g., confers grace, which if not resisted is saving. And God, foreseeing who and what will be saved, decrees their salvation, and accepts them as "foreknown" to all who are foreseen as believers." Calvin's view is the same as Augustine's. He held the sublatarian view that the act of predestination (in the sense of the sublatarianism) was decreed as a means towards carrying out a previous decree to save some and leave others to perish." The latter view was held by Beza and other Calvinists, and, it is said, repelled Arminius from
PREDICABLES—PRE-EXISTENCE, DOCTRINE OF

Calvinism, and led him to formulate the doctrine that, as repentance and faith are the divinely decreed conditions of eternal life, God has determined to give that life to all whom He foresees as fulfilling these conditions. According to Calvinism God's election unto salvation is absolute, determined by His own inscrutable will; according to Arminianism it is conditional, dependent on the elect's free will; the pope silenced without deciding; but which broke out again a generation later when Jansen tried to revive the declining Augus-

tianism. The church of England has passed through several dis-

putes regarding the question whether the Thirty-Nine Articles are Calvinistic or not; while there is some ambiguity in the language, it seems to favour Calvinism. At the Evangelical Revival the old questions came up, as Wesley favoured Arminianism and George Whitefield Calvinism. In Scotland Calvinism was repudi-

ated by James Morison, the founder of the Evangelical Union, who declared the three universities, God's love for all, Christ's death for all, and man's working to his own salvation.

While retained in the creeds of several denominations, in the public teaching of the churches the doctrine of predestination has lost its place and power. While the doctrine of election magnified God's grace, and so encouraged humility in man, it minimized man's freedom, and so produced either an over-confi-

dence in those who believed themselves elect, or despair in those who could not reach the assurance. Now it is recognized that God's sovereignty must be conceived as consistent with man's liberty. While God fulfils His all-embracing purpose, that fulfillment leaves room for the exercise of individual freedom; the freedom God has bestowed on man He can so restrain and direct that its exercise will prove a consistent with its own grace.

That God desires that all should be saved, and that the salvation of each depends on his own choice—these are the general con-

victions of modern theology. The problem now is the reconcili-

ation of human freedom with divine foreknowledge. Martineau accepts Dugald Stewart's solution. "There is no absurdity in supposing that the deity may, for wise purposes, have chosen to open a source of contingency in the voluntary actions of its creatures, to which no predestination can possibly extend." Others hold the problem to be insoluble, and not needing to be solved.

PREDICABLES (Lat. praedicabilia, that which may be stated or affirmed), in scholastic logic, a term applied to a classification of the possible relations in which a predicate may stand to its subject. The list given by the schoolmen and generally adopted by modern logicians is based on the original fivefold classification given by Aristotle (Topics, ii. 101 b. 17-23): (1) definition (definitio), genus (genus), differentia (differentia), property ( proprietas), accident (accidentem). The scholastic classification, obtained from Boëthius's Latin version of Porphyry's Isagoge, modified Aristotle's by substituting species (specifica) for definition. Each classification is of universals, concepts or general terms, proper names of course being excluded. There is, however, a radical difference between the two systems. The standpoint of the Aristotelian classification is the predication of one universal concerning another. The Porphyrian, by introducing species, deals with the predication of universals concerning individuals (for species is necessarily predicated of the individual), and thus created difficulties from which the Aristotelian is free (see below).

The Aristotelian classification may be briefly explained: (1) The Definition is the most general of its essence (Arist. ve. 68 et al.), i.e. that which makes it what it is; e.g. "a triangle is a three-sided rectilinear figure." (2) Genus is that part of the essence which is also predicable of other things different from the subject; thus a rectilinear figure is a of which a figure is a genus, we subsume it under a higher universal, of which

Strictly Aristotle's classification is into four as the really belongs to .

PREDICAMENT (from Lat. predicare, to state, assert), in logic, the term which denotes the joining of a predicate to a subject in a judgment or proposition. The statement "all men are mortal" is to predicate mortality of all men. In other words a judgment is made up of a subject and a predicate joined by a copula. Since the true unit of thought is the judgment, not all concepts or statements which are in continuous thinking (judging), the theory of predication is a fundamental branch of logic. The true relation of subject and predicate has not been determined with unanimity, various logicians emphasizing different aspects of the process (see Logic). The logical use of "predicate" is to be distinguished from the grammatical, which includes the verb, whether it be the verb "to be" in its various forms, or another verb. The simple grammatical sentence "he strokes the dog" the first word is the subject, while "strokes the dog" is the predicate, including verb and object. In logic every proposition is reducible to the form "A is B," "B" being the predicate. Thus the logical form of "he strokes the dog" the subject is not essential in this case, and some logicians emphasize which liberates and determines the logical predicate. The true significance of the logical copula is difficult. It cannot be described simply as a third (i.e. separate part) of the judgment, because until two terms are enjoined by it they are not subject and predicate. Much discussion has raged round the question whether the use of the verb "to be" as the copula implies that existence is predicated by the subject. It may be taken as generally agreed that this is not the case (see further Logic, and the textbooks).

PRE-EXISTENCE, DOCTRINE OF, in theology, the doctrine that Jesus Christ had a human soul which existed before the creation of the world—the first and most perfect of created things—and subsisted, prior to His human birth, in union with the Second Person of the Godhead. It was this human soul which suffered the pain and sorrow described in the Gospels. The chief exposition of this doctrine is that of Dr Watts (Works, v. 274, &c.); it has received little support. In a wider form the doctrine has been applied to men in general—namely, that in the beginning of Creation God created the souls of all men, which were subsequently as a punishment for ill-doing incarnated in physical bodies till discipline should render them fit for spiritual existence. Supporters of this doctrine, the Pre-existentists or Pre-existians, are found as early as the 2nd century, among
them being Justin Martyr and Origen (q.v.), and the idea not only belongs to metempsychosis and mysticism generally, but is widely prevalent in Oriental thought. It was condemned by the Council of Constantinople in 450, but has frequently reappeared in modern thought (cf. Wordsworth’s Intimations of Immortality) being in fact the natural correlative of a belief in immortality.

**PREFACE** (Med. Lat. prefatio, for classical praefatio, praefari, to speak beforehand), an introduction to a book, also any preliminary or introductory statement. In liturgical use the term is applied to that portion of the Eucharistic service which immediately precedes the canon or central portion; the preface, which begins at the words *Vere dignum*, “It is very meet, right, &c.” is ushered in, in all liturgies, with the *Suscum Corda*, “Your heart, O Lord, is open,” and ends with the *Sanctus*, “Holy, Holy, Holy, &c.” In French the generic prefatory proper prefaces are appointed for particular occasions (see LITURGY).

**PREFECT** (préfet), in France, the title of a high official. The prefects of the department were created by a law of the 28th Pluviose in the year VIII. (Feb. 17, 1800). They were intended to be the chief organs of internal administration, and have, in fact, discharged this function, especially under the First and Second Empire, surviving, though with diminished importance, under the other forms of government which modern France has seen. In comparison with other French officials, they are well paid. Their salaries nowadays range from 39,000 to 18,000 francs according to the classification.

In the administration of the ancien régime the term “prefect” was not employed; practically the only case in which it occurs was in the organization of the establishment of institutions opened by the religious orders, in which there was generally a “prefect of the studies” (préfet des études). In the year VIII., in the discussion of the law of the 28th Pluviose, no reason was stated for the choice of this term. But like the “Tribunes” and “Consuls” of the constitution of the year VIII., it was taken from the Roman institutions which were then so fashionable (préfet); it may also be recalled that Voltaire had used this term “prefecture” in speaking of the authority of Louis XIV. over the free towns of Alsace.

The prefect has to a certain extent a double character and two series of functions. Firstly he is the general representative of the government, whose duty it is to ensure execution of the government’s decisions, the exercise of the law, and the regulation of all branches of the public service in the department. In so far the rôle of the prefect is essentially political; he guarantees the direct and the representative forms of government. He is the chief guardian of the administration of justice, and head of the supervision of all the state services in his department, which procures the necessary uniformity in the working of the services, each of which is specialized within a narrow sphere. He serves as a bridge between the central administration, to which he is reported, to it complaints or representations from those under his administration. In the name of the state he exercises a certain administrative control over the local authorities, such as the conseil général, the mayors and the municipal councils. This control, though considerably restricted by the law of the 10th of August 1871, on the conseils généraux, and that of the 5th of April 1884, on municipal organization, still holds good in some important respects. The prefect can still annul certain decisions of the conseil général. He can suspend for a month a municipal council, mayor or deputy-mayor; certain decisions of the municipal councils require his approval; he may annul or suspend their acts as are extra vires. He can annul or suspend the maire’s decrees and he has also considerable control over public institutions, charitable and otherwise. He may make regulations (règlements) both on special points, in virtue of various laws, and for the general administration of the police.

When the prefects were created in the year VIII. the intendants of the ancien régime were taken as a model, and there is a great resemblance between the two functions. The prefect, however, is no more than an intendant in miniature, being only at the head of a department, whereas the intendant was in the department itself. This was a much larger district. In the same way the sous-préfets correspond to the subdépêches of the intendants, with the difference that they are actual officials subordinate to the prefects, while the subdépêches were merely the representations of the intendants proper which the intendants provided themselves, and to whom they gave powers.

Secondly, the prefect is not only the general representative of the government, but the representative of the department in the management of its local interests. But his unfettered powers in this respect have been reduced under the Third Republic. This has chiefly been the effect of the law of the 10th of August 1871, which has led to decentralization, by increasing the powers of the conseils généraux. The law created a departmental committee of instruction, called the conseil d’instruction, elected by the conseils généraux, which, in the interval of the sessions of the latter, takes part in matters concerning the admission of the departmental interests, either in virtue of the law, or by a delegation of powers from the conseils généraux.

The sous-préfets, having very limited powers of deciding questions, serve above all as intermediaries between the prefect and the persons under his administration. This function was most useful in the year VIII., when communications were difficult, even within a department, but nowadays it only leads to complications. As a matter of fact their chief service to the administration lies in keeping up good relations with the maires of the communes and the sous-préfets, and thus acquiring a certain amount of influence over them. The National Assembly, which passed the law of the 10th of August 1871, had also decided to suppress the office of prefect, and M. Thiers, as then president of the Republic, persuaded them to reconsider this decision. Since then the Chamber of Deputies has on several occasions taken advantage of the budget to attempt the suppression of the sous-préfets by refusing to vote the amount necessary for the payment of their salaries. But the government has always opposed this unconstitutional measure, holding that the suppression could only be effected by an organic law, and that it would necessarily involve a remodelling of the local administrative organization. So far their view has prevailed in the Chambers.

**PREHNITE**, a mineral consisting of calcium hydrogen orthosilicate, H₃Ca₃Si₃O₉. It crystallizes in the hemimorphic class of the orthorhombic system, but the hemimorphic character is usually obscured by twinning. Crystals are generally platy in habit, but they rarely occur singly and distinctly shaped; almost invariably they are closely aggregated together to form barrel-shaped or globular groups with a crystalline surface. This form, together with the pale oil-green colour, gives the mineral a very characteristic appearance. It is translucent and has a vitreous luster. The Mohs hardness is rather low, and the spec. grav. 2.80-2.95. Crystals are pyro-electric. Prehnite is sometimes classed with the zeolites, since it occurs under the same conditions as these minerals and often in association with them; the small amount of water (4%) is, however, expelled only at a red heat and is therefore not water of crystallization.

Prehnite occurs as a mineral of secondary origin in the amygdaloidal cavities of basaltic igneous rocks, such as basalt and diabase, and less often, in veins in granite and gneiss. Fine specimens are found with zeolites in the volcanic rocks of several places in the south of Scotland, e.g. Old Killpark in Dumbartonshire, Bishopston in Renfrewshire, Campsie Hills in Stirlingshire and in the neighborhood of Carlisle; also at T=viewtown (sous-prefecture of Halkirk) in New Jersey, and with native copper in the trap-rocks of the Lake Superior region. In the French (at Le Bourg d’Oisans) and the German Alps it occurs with axinite, epidote, lelsarp, &c., lining crevices in gneiss and granite. At overworn Lake in Cape Colony, from which locality it was brought in the 18th century by Colonel Prehn, the governor of the colony; hence the name; prehnite is a chrysolite “with the patient” (of A. G. Werner, 1789). Prehnite is sometimes cut and polished for small ornaments; it then somewhat resembles chrysophere in appearance.

**PREJUDICE** (Lat. praecidium), literally judgment or decision beforehand, which in classical usage meant a precedent, a preceding judgment, also a special form of judicial examination precedent to a trial, especially in matters relating to status. The transferred sense, of injury or damage inflicted by decisions or judgments disregarding interests affected, does not appear till post-classical times in Latin. This last use of damage appears in English in relation to legal matters, especially in the phrase “without prejudice,” i.e. without detriment to rights or claims. When two parties arrange for the dismissal of their disputes by statements or admissions made by or on behalf of either, with a stipulation, expressed or implied, that the statements are made “without prejudice” to the party’s claims in the dispute, cannot be put in evidence in litigation to settle the dispute (see EVIDENCE). The general meaning of the word is that of opinion, favourable or hostile, based on prepossessions, and therefore biased or unreasonable.

**PREL, KARL, FREIHERR VON** (1839-1890), German philosopher, was born at Landshut on the 3rd of April 1839. After studying at the university of Munich he served in the Bavarian
army from 1859 to 1872, when he retired with the rank of captain. He then gave himself up to philosophical work, especially in connexion with the phenomena of hypnotism and occultism from the modern psychological standpoint. He attempted to deduce the existence of spirit, apart from, and yet entering from time to time into connexion with, the phenomena of the senses, by the aid of the relation between the two, the Gesinnung and the age of sensible experience as understood by Kant. In 1868 he received the degree of doctor from the university of Tübingen in recognition of a treatise on the psychology of Dreams (Onerokritikon. Der Traum von Standpunk des transcendentalen Idealismus).

Subsequently, he published numerous works on various psychological and scientific subjects, of which the more important are: Der gesamte Menschenverstand vor den Problemen der Wissenschaft (1872); Der Kampf ums Dasein am Himmel (1874), republished in 1882 under the title Entwicklungsgeschichte des Weltalls; Die Planetenbewohner und die Nebularhypothese (1880); Die Philosophie der Mystik (1885); Justus Kerner und die Schöpfung von Preußen (1886); Die mystische Seelenlehre (1888); Die Mystik der alten Griechen (1889); Kants mystische Weltanschauung (1889); Studien aus dem Gebiete der Geheimwissenschaften (1890); Der Spiritus (1891); Die Entwicklung der Seele durch die Geheimwissenschaften (1894–1895). In Der Kampf ums Dasein am Himmel von Prel endeavoured to apply the Darwinian doctrine of organic evolution not only to the sphere of consciousness but also even more directly as the biological principle of the world. He was one of a large number of German thinkers who during the latter half of the 19th century endeavoured to treat the mind as a mechanism. He died on the 4th of August, 1888. See EVOLUTION, Philosophy.

PRELATE (Lat. prelatus, set above, from praefero, prefer), an ecclesiastical dignity of high rank. In the early middle ages the title prelate was applied to secular persons in high positions and thence it passed to persons having ecclesiastical authority. The De praedal is of Valerian is concerned with secular princes, and even as late as the 14th century the title was occasionally applied to secular magistrates. In medieval ecclesiastical usage the term might be applied to almost any person having ecclesiastical authority; it was very commonly given to the more dignified clergy of a cathedral church, but often also to ordinary priests charged with the cure of souls and, in the early days of monasticism, to monastic superiors, even to superiors of convents of women. The term occurs very frequently in the Rule of St Benedict and other early monastic rules.

In more modern usage in the Roman Catholic Church prelates, properly so-called, are those who have jurisdiction in fero externo, but a liberal interpretation has given the title a more general signification. Prelacy is defined by the canonists as "pre-eminence with jurisdiction" (praeeminentia cum jurisdictione), and the idea supposes an episcopal or quasi-episcopal jurisdiction. But gradually the title was extended to ecclesiastical persons having a prominent office even without jurisdiction, and later still it has come to be applied to ecclesiastical persons marked by some special honour though without any definite office or jurisdiction.

We may therefore distinguish "true" from "titular" prelates. The true prelacy is composed of the persons who constitute the ecclesiastical hierarchy; jurisdiction is inherent in their office and gives pre-eminence, as with patriarchs, archbishops, and bishops. A good example of the dependence of prelacy on jurisdiction is found in those religious orders, such as the Dominicans, where authority is strictly elective and temporary. Thus a Dominican prior ranks ipso facto as a prelate during his three years of office, but, if not re-elected, loses this dignity with his jurisdiction.

The true, no less than the titular, prelates have their various ranks, differing as regards title, precedence, clothing and other insignia. The distinguishing colour of a prelate's clothing is violet; the form, like the greater or less use of violet, depends on the rank of the prelate. Four classes may be distinguished: (1) Great prelates, e.g. cardinals, archbishops and bishops. (2) Exempt prelates (praebatinullius dioecesae, praebati nullius), i.e. abbots and religious superiors, who are withdrawn from the ordinary jurisdiction and themselves possess episcopal jurisdiction (jurisdiction quasi episcopalis). (3) Roman prelates, (a) active and (b) honorary. The title is applied to numerous ecclesiastics attached by some dignity, active or honorary, to the Roman court (see CURIA ROMANA). In the list of these prelates are protonotaries apostolic, domestic prelates, private chamberlains, participanti and supernumerary. Of these last there are two kinds, honorary and honorary extra urbem. Only protonotaries and domestic prelates are for life; the others lose their dignity at the death of the pope who appointed them. A special class of Roman prelates exist at Rome, endowed as a kind of ecclesiastical majority to which those members of certain families who are destined for the clerical life naturally succeed.

In the reformed churches the title was retained in England, Sweden, Denmark and Germany. The cathedral chapter of Brandenburg consists of two prelates, the dean and the senior, besides eight other members. The chapter of Merseburg contains five prelates, viz. the dean, senior, provost, custos and scholasticus. In Baden the general synod is presided over by the prelate (prelat), i.e. the principal "superintendent." In the Church of England the term prelate has been since the Reformation applied only to archbishops and bishops. The word "prelacy," meaning no more originally than the office and dignity of a prelate, came to be applied in Presbyterian Scotland and Puritan England—especially during the 17th century—to the episcopal form of church government, being used in a derogatory sense.

See Du Cange, Glossarium mediae et infimae latinitatis (new ed., by L. Pauly, 1850); Paul Hirschius, Kirchenrecht (Berlin, 1866); F. H. Veröing, professor of law at Prague, Lehrbuch des Katholischen, orientalischen und protestantischen Kirchenrechts (1893). (E. O'N.)

PRELLER, FRIEDRICH (1804–1878), German landscape-painter, was born at Eisenach on the 25th of April 1804. After studying drawing at Weimar, he went in 1821, on Goethe's advice, to Dresden, where in 1824 he was invited to accompany the grand duke of Weimar to Belgium. He became a pupil in the academy at Antwerp. From 1827 to 1831 he studied in Italy, and in 1831 received an appointment in the Weimar school of art. In 1834–1836 he executed in tempera six pictures on subjects taken from the Odyssey in the "Roman House" at Leipzig, in 1836–1837 the landscapes with scenes from Oberon in the Wieland room in the grand-ducal palace at Weimar, and in 1836–1848 six frescoes on Thuringian subjects commissioned by the grand duchess. In 1849 he visited Norway and produced a number of easel works, some of which are preserved at Weimar. In 1859 he revisited Italy, and on his return in 1861 he completed for the grand-ducal museum the frescoes illustrative of the Odyssey, which are held to constitute his chief claim to fame. Preller, who was also a successful etcher, died at Weimar on the 23rd of April 1878.

PRELLER, LUDWIG (1809–1861), German philologist and antiquarian, was born at Hamburg on the 15th of September 1809. After having studied at Leipzig, Berlin and Göttingen, in 1838 he was appointed to the professorship of philology at Dorpat, which, however, he resigned in 1843. He afterwards spent some time in Italy, but settled in Jena in 1844, where he became professor in 1846. In the same year he removed as head librarian to Weimar, where he died on the 21st of June 1861. His chief works are: Deoemer u. Persephone (1837); Griechische Mythologie (1834–1855, 4th ed., by C. Robert, 1857 seq.); and Philologische Mythologie (1860, 5th ed., by H. Jordon, 1881–1883). He also co-operated with H. Ritter in the preparation of the most useful History philosophiae grecae et romanae ex fontium locis contexta (1838; ed. E. Wellmann, 1858). He contributed extensively to Erz and Gruber's Allgemeine Encyclopädie and Pauly's Realencyklopädie der klassischen Altertumswissenschaft. A complete list of his works will be found in Ausgewählte Aufsätze aus dem Gebiete der klassischen Altertumswissenschaft (ed. R. Köhler, 1864).

See G. T. Stichling, Ludwig Preller, Eine Gedächtnissrede (Weimar, 1863); C. Burian, Geschichte der klassischen Philologie in Deutschland (1883).
PREMIUM—PRERAU

PREMIUM (Lat. praemium, profit, reward, præc—emerit, to buy), in general, a reward or prize; a consideration. In the law of insurance, the sum of money or consideration (either annual or in a lump sum) which the insured pays the insurers in order to gain a certain amount in the event of some specific loss happening is termed a premium. The word is applied to the fee paid in consideration of being taught a trade or profession. It is also used in the sense of "bonus," as something beyond or additional, as in the phrases, "premium bonus system," "premium system," where a bonus or sum is given in addition to wages in proportion to the value of the work done. On the stock exchange, when a security has not yet been fully paid up, it is customary to quote its price at par, or so much premium or discount. Par represents the amount actually paid up on it, while if it is above the level it is said to be at a premium of so much, or if below at a discount.

PREMONITION (from Lat. praec, before, manere, to advise or warn), an impression relating to a future event. Strictly the word should mean a warning proceeding from an external source. Its modern extension to all forms of impression supposed to convey information as to the future is justified on the assumption that such intimations commonly originate in the subliminal consciousness of the percipient and are thence transferred to the ordinary consciousness. In modern times the best attested premonitions are those relating to events about to occur in the subject's own organism. It was observed by the animal magnetists at the beginning of the 19th century in France and Germany, that certain of their subjects, when in the "magnetic trance", could foretell accurately the course of their diseases, the date of the occurrence of a crisis, and the length of time needed to effect a cure. Similar observations were subsequently recorded in Great Britain and in America (see, for instance, the case of Anna Winsor, 1860-1863, reported by Dr. Ira Barrows).

The power of prediction possessed by the subject in such cases may be explained in two ways: (1) As due to an abnormal power of perception possessed by certain persons, when in the hypnotic trance, of the working of their own pathological processes; or (2) more probably, as the result of self-suggestion; the organism is "set" to explode at a given date in a crisis, or to develop the fore-ordained symptoms.

Apart from these cases there are two types of alleged premonitions. (1) The future events may be foreshadowed by a symbol. Amongst the best known of these symbolic impressions are banners, corpse lights, phantom funeral processions, ominous animals or sounds and symbolic dreams (e.g. of teeth falling out). Of all such cases it is enough to say that it is impossible for the serious inquirer to establish any causal connection between the omen and the event which it is presumed to foreshadow. (2) There are many instances, recorded by educated witnesses, of dreams, visions, warning voices, etc., giving precise information as to coming events. In some of these cases, where the dream, etc., has been put on record before its "fulfilment" it is known, without the least coincident, as in the recorded cases of dreams foretelling the winner of the Derby or the death of a crowned head. In cases where such an explanation is precluded by the nature of the details foreshadowed, the evidence is found to be defective, generally from the absence of contemporary documents. The persistent belief on the part of the narrators in the genuineness of their previsions indicates that in some cases there may be a hallucination of memory, analogous to the well known feeling of "false recognition."

Prof. Josiah Royce has suggested for this supposed form of hallucination the term "pseudo-presentiment."

PREMONSTRATENSANS, also called Norbertines, and in England White Canons, from the colour of the habit: an order of Augustinian Canons founded in 1120 by St Norbert, afterwards archbishop of Magdeburg. He had made various efforts to introduce a strict form of canonical life in various communities of canons in Germany; in 1120 he was working in the diocese of Lorraine, and there in a desert place, called Prémontré, in Aisne, he and thirteen companions established a monastery to be the cradle of a new order. They were canons regular and followed the so-called Rule of St Augustine (see AUGUSTINIAE), but with supplementary statutes that made the life one of great austerity. St Norbert was a friend of St Bernard of Clairvaux—and he was largely influenced by the Cistercian ideals as to both the manner of life and the government of his order. But as the Premonstratensians were not monks but canons regular, their work was preaching and the exercise of the pastoral office, and they served a large number of parishes incorporated in their monasteries.

The order was founded in 1120; in 1126, when it received papal approbation, there were nine houses; and others were established in quick succession throughout western Europe, so that at the middle of the 14th century there are said to have been over 1300 monasteries of men and 400 of women. The Premonstratensians played a predominant part in the conversion of the Wends and the Christianizing and civilizing of the territories about the Elbe and the Oder. In time mitigations and relaxations crept in, and these gave rise to reforms and semi-independant congregations within the order. The Premonstratensians came into England (c. 1143) first at Newhouse in Lincoln, and before the dissolution under Henry VIII. there were 35 houses. At the beginning of the 19th century the order had been almost exterminated, only eight houses surviving, all in the Austrian dominions. There are now some 20 monasteries and 1000 canons, who serve numerous parishes; and there are two or three small houses in England. The strength of the order now lies in Belgium, where at Tongerlo is a great Premonstratensian abbey that still maintains a semblance of its medieval state.

Helyot, Histoire des ordres religieux (1714), ii. chs. 23-26; Max Heimhuber, Orden u. Kongregatioen (1907), ii. § 56; articles in Wetzer u. Weite Kirchenlexikon (2nd ed.) and Herzog Realencyklopädie (3rd ed.). The best special study is F. Winter, Die Prémonstratenser des 12. Jahrh. und ihre Bedeutung für das nordöstliche Deutschland (1865). (E. C. B.)

PREMYSL, the reputed ancestor of the line of dukes and kings which ruled in Bohemia from 873 or earlier until the murder of Wenceslaus III. in 1306, and which was known as the Premyslid dynasty. According to legend Premysl was a peasant of Staditz who attracted the notice of Libussa, daughter of a certain Krok, who ruled over a large part of Bohemia, and is said to have been descended from Samo. Premysl married Libussa, the traditional foundress of Prague, and during the 8th century became prince of the Bohemian Cechs. His family became extinct when Wenceslaus III. died, but through females the title to Bohemia passed from the Premyslides to the house of Luxemburg and later to the house of Habsburg.

PREU, or PRZELAU, a town of Germany, in the Prussian province of Brandenburg. It lies on the lower Ucker, 30 m. W. by S. of Stettin by rail. Pop. (1905), 20,029. The Gothic church of St Mary (Evangelical), dating from 1340, is one of the finest churches in the district, and the remains of the town gates, walls and towers are also interesting. The industries include wool-spinning, iron-founding, brewing and sugar-refining. Tobacco is grown in the neighbourhood, and cigars are manufactured in the town.

Prenzlau is first mentioned in a document of the close of the 12th century, and received its municipal charter in 1235. As the capital of the old Uckermark it was a frequent object of dispute between Poland and Brandenburg, until incorporated with the latter about 1480. At Prenzlau Prince Hohenlohe, with his corps of 12,000 men, surrendered to Murat on the retreat after the battle of Jena in October 1806.

See J. Ziegler, Prenzlau, die ehemalige Hauptstadt der Uckermark (Prenzlau, 1886).

PRERAU (Czech, Přero), a town of Austria, in Moravia, 50 m. E.N.E. of Brünn by rail. Pop. (1900), 16,738, chiefly
Czech. It is one of the oldest towns in Moravia, and possesses a Gothic town-hall and an old castle, once occupied by Matthias Corvinus. It has an important cloth industry, and manufactures of sugar, ropes, machinery and agricultural implements. Prerau was at one time the chief seat of the Moravian Brethren.

**PREROGATIVE**, in law, an exclusive privilege of the Crown. The word, originally an adjective, is derived from the *centuria praerogativa*, or century which voted first on a proposed law (*rogatio*) in the Roman *comitia centuriata*. In English law, Blackstone says, "by the word prerogative we are to understand the character and power which the sovereign hath over and above all other persons, in right of his regal dignity; and which, though part of the common law of the country, is out of its ordinary course. This is expressed in its name, for it signifies, in its etymology, something that is required or demanded before, or in preference to, all others" (Stephen's *Comm.* vol. ii. bk. iv. pt. i. ch. vi.). The prerogative is sometimes called *jura regalia* or *regalis*, the *regalis* being either *majo-ra*, the regal dignity and power, or *minora*, the revenue of the Crown.

The theory of English law as to the prerogative of the king seems to be not quite consistent. On the one hand, he is a perfect and irresponsible being, holding his office by divine right; George V., "by the Grace of God of Great Britain and Ireland King," is still the heading of every writ. On the other hand, his powers are defined and limited by law. This is laid down as early as the 13th century (Bracton, 5b). A consequence of this position is that the prerogative may be confined or extended by the supreme legislative authority, and that the courts have jurisdiction to decide whether or not any alleged right falls within the prerogative. The prerogative of the Crown, still of great extent, has been gradually limited by a long series of enactments, the most worthy of notice being *Magna carta*, *Constitution of the Regicides*, *Prerogativa regis*, the Petition of Right, the Habeas Corpus Act, the Bill of Rights and the Act of Settlement.

The most important of the obsolete prerogatives which have been at one time claimed and exercised are the following: (1) the right to impose a tax upon the subject without the consent of parliament. (2) The right to dispense with the obligation of statutes, by the insertion in a grant of the clause *non obstante statuto* (see Dispensation). (3) The right of purveyance and pre-emption—that is, of buying up provisions at a valuation without the consent of the owner—and the right of impressing carriages and horses (see Purveyance). (4) The authority to erect tribunals not proceeding according to the ordinary course of justice was declared illegal by 16 Car. I. c. 10 (the act dissolving the Star Chamber, the court of the marches of Wales, and the court of the president and council of the north). (5) The revenue from first-fruits and tithes (see Annates). (6) The right of corodoy—that is, of sending one of the royal chaplains to be maintained by a bishop until the bishop promotes him to a benefice—has become obsolete by disuse. (7) The right by forfeiture to the property of a convict upon his conviction for treason or felony was abolished by the Felony Act 1870. (8) The immunity of the Crown from payment of costs has been taken away in almost all cases. (9) The right to alienate crown lands by grant at pleasure was taken away by 1 Anne c. 8. In very few cases has the prerogative been extended by statute; the Regulation of the Forces Act was an example of such extension. By that act the jurisdiction of lords-lieutenant of counties over the auxiliary forces was revested in the Crown.

The prerogative may be exercised in person or by delegation. The prerogative of conferring honors is generally (though not necessarily) exercised by the king in person, as in the case of investiture and coronation, and in the bestowal of civil and military titles. The delegation of the prerogative often takes place by commission, issued with or without a joint address from both houses of parliament. Parts of the prerogative—generally in the nature of profit, and so in derogation of the revenue of the Crown—may be conferred upon subjects by grant in letters patent, which will be presumed after enjoyment by the subject for a certain time. What in the king is a prerogative becomes a franchise in the subject, e.g. chases, warrens, wrecks, treasure-trove, courts-leet.

The existing prerogatives may be divided, with Blackstone, into: (1) those which are direct and the product of exception; or perhaps better, with Chief Baron Comyns, into: (i) those instrumental relations and those affecting internal relations. Under the first class would fall the power of making war and concluding peace. As between the king and the subjects of the crown, to receive ambassadors, of concluding treaties, and of granting passports, safe-conducts, letters of marque and reprisals. These rights may be limited by international agreement; thus the Declaration of St. Germain, 1814, forbids to the United States the right of sending to and receiving ambassadors, of concluding treaties, and of granting passports, safe-conducts, letters of marque and reprisals.

Personal.—In order that there may always be an existing head of the state the king is regarded as a corporation. He cannot die; there can only be a demise of the Crown—that is, transfer of the royal authority to a different person. On the same principle the king cannot be under age, though in cases where the king has been of tender years a protector or regent has usually been appointed (but sometimes the king has exercised the prerogative of appointing a protector for crime or tort; it being an ancient common law maxim that the king can do no wrong, and that any injury suffered by a subject at the hands of the king is to be attributed to the mistake of his adviser). In the case of a female sovereign it is generally supposed that the crown is apparently the only person in the realm who cannot under any circumstances arrest a suspected felon, for no action for false imprisonment would lie against him, and in the event of the arrest of a great person it would be necessary to appeal to the king. He cannot be guilty of laches, or negligence. The maxim of the common law is *nullum tempus occurrat regi*. This is still the law in the case of a foreign vessel in the United States, and it is thought that it is useless for him to tax himself. But lands purchased by the privy purse are liable to taxation (39 & 40 Geo. III. c. 88, s. 6). He is also exempt from tolls (which can only exist as a franchise granted by him), and from the poor-rate, as he is not mentioned in the Poor Law Acts. His person cannot be arrested or his goods distrained or taken in execution. The privilege of exemption from taxation applies to his palaces and to the public buildings of the state. No kind of judicial process can be executed in a palace as long as it continues to be a royal residence. The privilege does not attach to palaces which the king has ceased to use as a dwelling, such as Hampton Court, and it is not enjoyed by the king's personal privileges of minor importance, such as the title of "majesty," the right to a royal salute, the use of the royal standard and of special liveries, &c.

The king is the supreme executive and co-ordinate legislative authority. As such authority he has the attribute of sovereignty or pre-eminence, and the right to the allegiance of his subjects. All land is medially or immediately held of him. Land is of the utmost importance, as Great Britain consists to a large extent of land rearing cattle and islands arising in the sea are his. As paramount authority in parliament he can dissolve or prorogue it at pleasure, but cannot prolong it beyond seven years. In theory parliament only exists at his will, for it is summoned by his writ, and the vote for a member of parliament is only a franchise, not a right existing independently of his grant. He can refuse his assent to a bill passed by the houses of parliament. This right has, however, not been exercised since 1707, when Queen Anne refused the royal assent to a Scottish Militia Bill. The king has power to issue proclamations and with the assent of the privy council orders in council, in some cases as far back as the reign of James I. an ancient prerogative, but has not been used since the creation of an act of parliament. Proclamations are only binding so far as they are founded upon and enforce the laws of the realm. They cannot alter the common law or create a new offence. The king is the fountain of honour, and can create new offices granting peerages at will, so far as he is not restrained by any act of parliament, and so far as he keeps within certain constitu- tions, e.g. a statute for the time being regulating the peerages. He also confers all other titles of honour, whether hereditary or not, and grants precedence and armorial bearings. The great officers of state are appointed by the king. The only restriction is that the king cannot create new offices with new fees attached to them, or annex new fees to old offices, for this would be to impose a tax upon the subject without an act

1 There is no difference in the prerogative as exercised by a king or a queen regnant, so that the word "king" in its constitutional sense includes queen. That the queen regnant has the same rights as a king was declared by 1 Mary sess. 3, c. 1.

2 The word "sovereign" is frequently applied to the king in legal works. It should be borne in mind at the same time that the king is not a sovereign in the strict sense in which the term is used by Austin.
of parliament. The king, as head of the state, is in supreme command of the army of the realm, and, in the right, contested by the Long Parliament, was finally declared by 13 Car. II. c. 6 to be in the king alone. The right of command carries with it an incident the right to build forts and defences, in war, also the right of post, to prevent the importation of munitions of war (39 & 40 Vict. c. 36, s. 43), also the right to the soil of the foreshore and of estuaries of rivers, and the jurisdiction over territorial waters. Other rights which fall under the political branch are: (a) the creation and calling of the common law courts, rights, including the coining of money, the regulating of weights and measures, the establishing of markets and fairs, and the erecting of lighthouses, (b) the right to appoint such officers and agents as are necessary to the public good, as ex officio guardian of infants, idiots and lunatics. It is scarcely necessary to point out that all these prerogatives (except the conferring of honours and such prerogatives as are purely personal) are exercised to a certain extent by the Lords Spiritual and Temporal, the bulk of the House of Lords, and the Lords Commissioners of the Treasury. All these members of the party to which the majority of the House of Commons belongs. Thus the jurisdiction over infants, &c., is exercised by the Lord chancellor, and over beacons, &c., by the Trinity House, under the general superintendence of the Board of Trade.

Judicial.—The king is the fountain of justice, and the supreme executive judge. He has the appointment of all judicial officers (other than those in certain local courts, who act as his deputies). He may constitute courts for the administration of the general law of the land, both civil and criminal. He accredits to the known and established law of the realm, such as the Star Chamber or the commissions of martial law forbidden by the Petition of Right. Nor can he add to the jurisdiction of courts; thus he cannot give the king's commission to a judge of the Common Pleas, who is supposed to be present in court. Actions in the king's bench were until modern times said to be coram rege ipso, and the king could proceed in forma pauperis, or even appear in person in the non-appearance of the plaintiff in court. The king enforces judgment by the sheriff, who represents the executive authority. As supreme conservator of the peace, the king, through the lord-lieutenant in counties, and through the lord chancellor in cities and boroughs, appoints justices of the peace. In the same capacity he is the prosecutor of crimes. All indictments still conclude with the words, "against the peace of our lord the king, his crown and dignity." As it is the king's peace that is disturbed, he has the right of interposition in all litigation where his rights are concerned, or in the interests of public justice, as where collusion is alleged between the decree nisi and the decree absolviv, or divorce. Crown debts have priority in administration and bankruptcy.

Ecclesiastical.—The king is recognized as "supreme governor" of the Church by 26 Hen. VIII. c. i., and 1 Eliz. c. i. By this prerogative he recognizes convocation and nominees to vacant bishoprics and other ecclesiastic offices. The final chapter of a cathedral cannot proceed to the election of a bishop without the king's permission to elect (see CONGÉ d'ElêRE). When a vacancy occurs, and when the dean and chapter are the squares to a bishopric other than a colonial bishopric the king has the patronage of pro hac vice. The king cannot create new ecclesiastical jurisdiction in England or in colonies other than crown colonies. Where a new bishopric is created it is under the powers of an act of parliament.

Fiscal.—The theory of the constitution is that the king, being entrusted with the defence of the realm and the administration of justice, must have sufficient means given him for the purpose. The bulk of the revenue of the realm and of revenue grants was derived from crown lands and feudal dues. At the present day the rents of crown lands form a very small part of the revenue, and the feudal dues do not exist except in the peculiarly insignificant case of the land held in free socage, which is a part of the land held in the king's socage, &c. Of the revenue a comparatively small part (the civil list) is paid to the king in person, the rest (the consolidated fund) is applied to public purposes.

Prerogative Writs.—Certain writs are called prerogative writs, as distinguished from ordinary writs, and it is within the prerogative to issue or reissue them (see Writ).

Besides the authorities cited, see Allen, Inquiry into the Rise and Growth of the Royal Prerogative in England; Chitty, The Prerogative of the Crown; Comyns, Digest, art. "Prerogative"; Comyns, Constitutional Law; the works of W. Bagehot, Low, A. V. Dicey and Sir W. Anson, on the Constitution.

PREROGATIVE COURTS—PRESBYTERY

PREROGATIVE COURTS, the name given to the English provincial courts of Canterbury and York, as far as regarded their jurisdiction over the estates of deceased persons.

They had jurisdiction to grant probate or administration where the diocesan courts could not entertain the case owing to the deceased having died possessed of goods above the value of £5 (bona notabilia) in each of two or more dioceses. The jurisdiction of the prerogative courts was transferred to the Court of Probate in 1857 by the Prerogative and Administration Act 1857 which transferred the Divorce and Admiralty Division of the High Court of Justice by the Judicature Act 1875. In the state of New Jersey, United States, the court having jurisdiction over probate matters is called the Prerogative Court of Essex County.

PRESBYTERY (Gr. πρεσβυτέρον, elder, the comparative of πρεσβύς, an old man), the title borne from very early times by certain officers or ministers of the Christian Church, in the sense in which the title is understood in the New Testament, to denote "bishops" and "deacons". The specialized use of the word as not implying only an age, but consequently wisdom and authority, is analogous to that of "senate" (from senior), of "gerousia" (from γερός), and of "elder". It is the original form of priest (q.v.). The word is not found in pre-Christian writings except in the Septuagint, though as Deissmann has shown it is found on the Papyri as an official title for the village magistrates of Egypt and the members of the γερουσία, or senate, of many towns in Asia Minor. The office is, however, closely connected with it, and perhaps founded on, a similar office in the Jewish synagogue, and was called the sacerdos, the sebëm, or elders, sometimes identified with the archi-synagogues. In the New Testament the Greek word is used both for the ancient Jewish official and for the Christian elder. On Jewish tombstones of the Hellenistic period the title is frequently found, sometimes applied to women. The head official of the English Jews prior to their expulsion bore the title of Presbyter judocorun; opinions differ as to whether this-officer was ecclesiastical or had merely the secular duty of supervising the exchequer of the Jews (see further The Jewish Encyclopedia, 1902, s. 190, 191).

The history of presbyterian government as opposed to episcopacy and pure congregationalism is not well known in detail. After the Reformation, however, it was adopted by Calvin and his followers, who created that system which has ever since been known as Presbyterianism (q.v.). There are many theories as to the origin of the office of presbyter in the Christian Church. (1) Some connect it with the appointment of the seven recorded in Acts vi. This is the view taken by Boehner, Ritschel and Lindsey. It is not always possible to determine whether the men thus called were "elders" (Acts ii. 20) or "seven" (Acts ii. 20, 21), but the former view is occasionally given up, as in the case of the deacons.

(2) The view adopted by the majority of English scholars is, while refusing to accept the connexion between the presbyters and the seven, to regard the office as distinctly primitive, and to say that it was taken over by the earliest Christian community at Jerusalem from the Jewish synagogue. Harnack and a few other modern scholars maintain that the office of presbyter did not come into existence till the 2nd century. During the last quarter of the 1st century, a three-fold organization is found in the Church: (a) a spiritual organization composed of "apostles, prophets and teachers who were inspired by the spirit and by the spirit endowed"; (b) an administrative organization for the care of the poor, for worship, for correspondence; the congregation needing controlling officials. These were the bishop and the deacons, who were then more highly placed, and the presbyter, an archaic organization based upon the natural deference of the younger to the older members of the Church. The senior members of the community, by virtue of their age and experience, watched over the conscience and guided the officers of the church. This declined portion of the Church, though they held no official position and were not appointed for any particular work like the bishops and the deacons, in the 2nd century the patriarchal element in the organization was merged in the administrative, and the presbyters

became a definite order in the ministry. The time at which the change occurred is defined by Harnack as '5-7.' Theologians of time. In some cases the church, in the Christian Church. Presbyters are found in Jerusalem and the other Holy Cities of the Church. The office is found except at Ephesus and possibly in south Galatia, though there are traces of the office, at any rate in germ, under different titles in other churches. (2) In the second stage (between 66 and 100) there is an increasing tendency towards uniformity. The office is found definitely mentioned in connexion with the churches of Asia Minor (1 Pet. i. 1), Corinth (Epistle of Clement) and Crete (Titus). The officials were called by two names, "elders" and "bishops," the former denoting the office, the latter the function (exercising the oversight). The substantial identity of the two titles cannot be doubted in the light of such passages as Acts xx. 17, 28; 1 Pet. v. 1, 2; 1 Tim. i. 1-7, v. 17-19 and Titus i. 5-7.

There is far less controversy with regard to the later history of the presbyters. The third stage of the development of the office is marked by the rise of the single *episcopus* as the head of the individual church. (1) The first trace of this is to be found in the Epistles of Ignatius which prove that by the year 115 the "three orders" as they were afterwards called—bishop, presbyters and deacons—already existed, not indeed universally, but in a large proportion of the churches. The presbyters occupied an intermediate position between the bishop and the deacons. They constituted the "council of the bishop." It was some time before the threefold ministry became universal. The Didache knows nothing of the presbyters; bishops and deacons are mentioned, but there is no reference to the second order. The Shepherd of Hermas knows nothing of the single bishop; the churches are under the control of presbyters and bishops. Before the close of the 1st century however the three orders were established almost everywhere. The sources of the Apostolic Canons (which date between 140-180) lay down the rule that even the smallest community of Christians, though it contain only twelve members, must have its bishop and its presbyters. The original equality of bishops and presbyters was still however theoretically maintained. The Canons of Hippolytus which belong to the end of the 2nd century distinctly lay it down that "at the ordination of a presbyter everything is to be done as in the case of a bishop, save that he does not seat himself upon the throne. The same prayer shall also be said for a bishop, the name of the bishop only being left out. The presbyter shall in all things be equal with the bishop, save in the matter of presiding and ordaining, for the power to ordain is not given him." The presbyters formed the governing body of the church. It was their duty to maintain order, exercise discipline, and superintend the affairs of the church. At the beginning of the 3rd century, if we are to believe Tertullian, they had no spiritual authority of their own, at any rate as far as the sacraments are concerned. The right to baptize and celebrate the communion was delegated to them by the bishop. The church of the 4th century was consequently in the main like the bishops, becoming endowed with special sacerdotal powers and functions. Up to the end of the 2nd century the universal priesthood of all believers was the accepted doctrine of the Church. It was not till the middle of the 3rd century that the priesthood was restricted to the clergy. Cyprian is largely responsible for the change, though traces of it are found during the previous half century. Cyprian bestows the highest sacerdotal terms upon the bishops of course, but his references to the priestly character of the office of presbyter are also most definite. Henceforth presbyters are recognized as the secondium sacerdotium in the Church.

With the rise of the diocesan bishops the position of the presbyters became more important. The charge of the individual church was entrusted to them and gradually they took the place of the local bishops of earlier days, so that in the 5th and 6th centuries an organization was reached which approximated in general outline to the system which prevails in the Anglican Church to-day.

See Hatch, *Organisation of the Early Christian Churches* (2nd ed., 1882), and Harnack's "excursus" in the German edition of this

1 Harnack translates προετοιμάζων, "those who care for you," but 1 Tim. iii. 12 and v. 7 seem to be against this. In Justin Martyr, *Apolog. i. 29*, Acts i. 22, it appears to refer to "the presbyters of the church," and in a recently discovered papyrus which Ramsay dates 303 a certain bishop is described as ἀρχόν προετοιμάζων, *Studies in the History of the Church* (26).

2 Lukas der Arz (1906), cap. 1.

5 Tertull. *De bapt.* 17: "Baptismi dati habet ius summis sacerdoci qui est episcopus; dehinc presbyteri . . . non tamen sine episcopi auctoritate.

6 Cf. Ep. 38: "Presbyteri cum episcopo sacerdotaliter honoris conjuncti."
PRESBYTERIANISM

PRESBYTERIANISM, a highly organized form of church government in which presbyters or elders occupy a prominent place. As one of the three principal systems of ecclesiastical polity known to the Christian Church, Presbyterianism occupies an intermediate position between episcopacy and congregationalism. A brief comparison with these will indicate its salient features. In episcopacy the supreme authority is a diocesan bishop; in congregationalism it is the members of the congregation assembled in church meeting; in Presbyterianism it is a church council composed of representative presbyters. In episcopacy the control of church affairs is in the hands of a bishop; in congregationalism it is almost entirely exercised by the people; in Presbyterianism it rests with a council composed of duly appointed office-bearers chosen by the people. The ecclesiastical unit in episcopacy is a diocese, comprising many churches and ruled by a prelate; in congregationalism it is a single church, self-governed and entirely independent of all others; in Presbyterianism it is a presbytery or council composed of ministers and elders representing all the churches within a specified district. It may be said broadly, therefore, that in episcopacy the government is monarchical; in congregationalism, aristocratic; and in Presbyterianism, aristocratic or representative.

1. THE SYSTEM DESCRIBED

As compared with the Church of England (Episcopal) in which there are three orders of clergy—bishops, priests and deacons, the Presbyterian Church recognizes but one spiritual order, viz. presbyters. These are ecclesiastically of equal rank, though differentiated, according to their duties, as ministers who preach and administer the sacraments, and as elders who are associated with the ministers in the oversight of the people. There are deacons in Presbyterianism inferior in rank to presbyters, their duties being regarded as non-spiritual.

The membership of a Presbyterian Church consists of all who are enrolled as communicants, together with their children.

Others who worship regularly without becoming communicants are called adherents. Only communicants exercise the rights of membership. They elect the minister and other office-bearers. But, in contrast with Congregationalism, when they elect and "call" a minister their action has to be sustained by the presbytery, which judges of his fitness for that particular sphere, of the measure of the congregation's unanimity, and of the adequacy of financial support. When satisfied, the presbytery proceeds with the ordination and induction. The ordination and induction of ministers is always the act of a presbytery. The ordination and induction of elders in some branches of the Church is the act of the kirk-session; in others it is the act of the presbytery.

The kirk-session is the first of a series of councils or church courts which are an essential feature of Presbyterianism. It consists of the ministers and ruling elders. The minister is ex officio president or moderator. Without his presence the presence of his duty and authority is null. Neither the moderator nor the congregation has jurisdiction over the minister. He holds his office ad vitam aut culpam; he cannot dim it or be deprived of it without consent of the presbytery. In this way his independence, which by its very nature contrives a larger and freer action than the ordination and induction of elders, is secured. The kirk-session has oversight of the congregation in regard to such matters as the hours of public worship, the arrangements for administration of the sacraments, the admission of new members, and the exercise of church discipline. New members are either catechumens or members transferred from other churches. The former are received after special instruction and profession of faith, the latter by presenting a certificate of church membership from the church which they have left. Though the admission of new members is, strictly speaking, the act of the session, this duty usually devolves upon the minister, who reports his procedure to the session for approval and confirmation. Matters about which theological any doubt or difficulty, or division of opinion in the session, may be carried for settlement to the next higher court, the presbytery.

The presbytery consists of all the ministers and a selection of the ruling elders from the congregations within a prescribed area. The presbytery chooses its moderator periodically from among its ministerial members. His duty is to see that the theses that are to be discussed are provided, to determine the principle and procedure. The moderator has no special power or supremacy over his brethren, but is honoured and obeyed as primum inter pares. The work of the presbytery is episcopal. It has over-ruled all the other synods and councils except the synod of the United Church of New England; it is the court of appeal from kirk-sessions or appeals from individual members; sanctions the formation of new congregations; superintends the education of students for the ministry; stimulates and guides evangelistic and evangelistic work; and exercises discipline over all within its bounds, including the ministers. Three members, two of whom must be ministers, form a quorum; a small number composed of the immediate members of the presbytery may have to transact, but the right of appeal to a higher court is perhaps sufficient safeguard against abuse. Presbytery meetings are either ordinary or occasional. The former are held at prearranged intervals. Occasional meetings are either in hanc ejectionem or pro re nata.

The presbytery fixes the former for specific business; the latter is summoned by the moderator, either on his own initiative or on the requisition of two or more members of presbytery, for the transaction of business which, in the opinion of the presbytery, cannot be considered at a pro re nata meeting is the action of the moderator in calling the meeting. If this is approved the meeting proceeds; if not, the meeting is dissolved. Appeals and complaints may be taken up at the presbytery meeting.

The synod is a provincial council which consists of the ministers and representative elders from all the congregations within a specified number of presbyteries, in the same way as the former is representative of a group of churches or a number of congregations. Though higher in rank and larger than most presbyteries it is practically of less importance, not being, like the latter, a court of first instance, nor, like the general assembly, a court of final appeal. The synod at its first meeting chooses a minister as its moderator whose duties, though somewhat more restricted, are similar to those of presbyterian moderators. The moderator presides, hears cases and renders decisions, but his discussions and decisions business of various kinds, if not settled, is ripened for consideration and final settlement by the general assembly, the supreme court of the Church.

The general assembly is representative of the whole Church, either, as in the Irish General Assembly, by a minister and elder sent direct to it from every congregation, or, as in the Scottish General Assemblies, by a proportion of delegates, ministers and elders from every presbytery.

The general assembly annually at its first meeting chooses one of its ministerial members as moderator. He takes precedence, and if need be, can be acting moderator, in the absence of the official head of the Church during his term of office. His position is one of great honour and influence, but he remains a simple presbyter, without any special rule or jurisdiction. The general assembly is a council assembled by the moderator and presiding over it he exercises the ordinary functions of a synod. It consists of all the ministers and elders of the Church; and these officers only. The assembly itself considers and settles all questions raised; it is the court of ultimate resort against any form of discipline. Its sessions are legislative, judicial and deliberative.

The assembly consists of two units: the first, the church is secured and made manifest; the combined, simultaneous effort of the whole is made possible; and disputes, instead of being fought out where they arise, are carried for settlement to the army of discipline. As a judicatory it is the final court of appeal; and by its action can the gravest censures of church discipline be revised and removed. The general assembly meets once a year at the time and place agreed upon and appointed by its predecessor.

Conciliar Courts.

The weak point in the system is that episcopal superintendence being exercised in every case by a plurality of individuals there is no moderator, senior or junior member, whose special duty it is to take action when a controversy breaks out between the presbytery or ecclesiastical discipline becomes necessary. This has led in some quarters to a desire that the moderator should be clothed with greater power and authority. This has been urged and longed; should be made, in fact, more of a bishop in the Anglican sense of the word.

Though the jus diinum of presbytery is not now insisted upon as in some former times, Presbyterian claim that it is the church polity set forth in the New Testament. The case is usually stated somewhat as follows. With the sanction and under the
PRESBYTERIANISM

These Acts appointed elders and deacons were elected by the people, and ordained or set apart for their sacred work by the Apostles. The elders were appointed to teach and rule, the deacons to minister to the poor. The term "elders," or bishops, was used in every church; amongst the strangers scattered throughout Pontus, Galatia, Cappadocia, Asia and Bithynia received a special exhortation by Peter. These elders were rulers, and the only rulers in the New Testament Church. Just as in the synagogues, so in every Christian Church a plurality of elders. The elders were different from the deacons, but there is no indication that any one elder was of higher rank than the others. The elder was not an officer of inferior degree, but was the first among equals. The two titles are applied to the same persons. See Acts xx. 17, 28; he sent and called for the elders of the church. . . . Take heed to all the flock over which the Holy Ghost hath made you bishops. See also Titus i. 5, 6: "ordain elders . . . for a bishop must be blameless." This is now admitted by modern expositors. The elders were chosen by the people. This is not expressly stated in the New Testament but is regarded as a necessary inference. When an apostle was sent as a successor to Judas, the people were invited to take part in the election; and when deacons were about to be appointed the Apostles asked the people to choose the candidates for the office. The inference is that they were similarly chosen. It is worthy of notice that there is no account at all of the first appointment of elders as there is of deacons. Probably the recognition and appointment of elders was simply the first act of the church, in view of the selection of the deacons as regarded as essential among Jews; and the Gentile churches naturally followed the example of the Jewish Christians. The elders thus chosen by the people and inducted to their office by the Apostles acted as a church court. Only thus could it be inferred that the office was of any rank act in an efficient and orderly way. They would discharge their pastoral duties as individuals, but when a solemn Episcopal act, like ordination, was performed, it would be done, as in the case of Timothy, by "the laying on of the hands of the presbytery"; and when an authoritative decision had to be reached, as in regard to circumcision, a synod or council was convened for the purpose. To these the elders of Cappadocia, when Barnabas at Antioch seems to accord with Presbyterian rather than Congregational polity. The latter would have required that the question should have been settled by the church at Antioch instead of being referred to Jerusalem. And the decision of the council at Jerusalem was evidently more than advisory; it was authoritative and meant to be binding on all the churches. The principle of ministerial parity which is fundamental in Presbyterianism is founded not merely on Apostolic example but on the words of Christ Himself: "Ye know that the princes of the Gentiles exercise dominion over them, and they that are great exercise authority upon them; But it shall not be so among you: But whosoever will be great among you, let him be your minister; And whosoever will be first among you, let him be your servant. For even the Son of man came not to be ministered unto, but to minister, and to give his life a ransom for many." From the foregoing considerations it is evident that Presbyterianism may be said to consist in the government of the Church by representatives assembled composed of the two classes of presbyters, ministers and elders, and so arranged as to manifest and realize the visible unity of the whole Church. It may be described as denying (1) that the apostolic office is perpetual and should still exist in the Christian Church; (2) that all church power should be vested in the clergy; (3) that each congregation should be independent of all the rest; and as asserting (1) that the people ought to have a substantial part in the government of the Church; (2) that presbyters, i.e. elders of the higher degree of office in the Church and are of equal rank; (3) that an outward and visible Church is one in the sense that a smaller part is controlled by a larger and all the parts by the whole.

Though Presbyterians are unanimous in adopting the general system of church polity as here outlined, and in claiming New Testament authority for it, there are certain differences of view in regard to details which may be noticed. There is no doubt that considerable indecision in regard to the precise status and rank of the ruling elder is common amongst them. Often ministers and elders are associated in the membership of a church, with the equality admitted; no such idea as voting by orders is ever entertained. Yet even in a church court inequality, generally speaking, is visible to the extent that an elder is not usually eligible for the moderator's chair. In some other respects also a certain disparity is apparent between a minister and his elders. Practically the minister is regarded as of higher standing. The duty of teaching and of administering the sacraments and of always prevailing in church courts being strictly reserved to him invests his office with a dignity and influence greater than that of the elder. It was inevitable, therefore, that this question as to the exact status of the ruling elder should claim attention in the discussions of the Pan-Presbyterian Alliance. At its meetings in Berlin in 1854 a report was submitted by a "committee on the eldership" which had been previously appointed. According to this committee there are prevalent three distinct theories in regard to the office and function of ruling elders:—

1. That while the New Testament recognizes but one order of presbyters there are in this order two degrees or classes, known as teaching elders and ruling elders. In teaching these presbyters discharge the sacred office of teaching and rule; and in the private functions by which they are distinguished from lay ministers to the comfort, the instruction and the improvement of the people committed to his care, a pastor acts within his parish for congregations of believers. The discharge of all the duties of the pastoral office he is accountable only to the presbytery from whom he received the charge of the parish (or congregation). But in everything which concerns what is called discipline—the exercise of that jurisdiction over the people with which the office-bearers of the church are conceived to be invested, he is assisted by lay-elders. They are laymen in that they have no right to sit in judgment or to determine serious questions of discipline. But it is granted that they may, when called upon to fill an office in the Presbyterian Church inferior in rank and power to that of the pastors. Their peculiar business is expressed by the term "ruling elders."

2. A second theory is that adopted by Professor Withrow and others, that the modern elder is intended to be, and should be, recognized as a copy of the scriptural presbyter. Those who take this view would assert that "in giving to the Churches the requisites of training the elder is the very same as the minister," and they base their opinion on the fact that the terms "overseer" or "elder," are used interchangeably throughout the New Testament. It is consistent with this view to argue the absolute parity of ministers and elders, conceding to all presbyters "equal right to teach, to rule, to administer the sacraments, to take part in the ordination of ministers, and to preside in church courts."

3. A third theory, advanced by Professor Withrow and others, is that the modern elder is intended to be, and should be, recognized as a copy of the scriptural presbyter. Those who take this view would assert that "in giving to the Churches the requisites of training the elder is the very same as the minister," and they base their opinion on the fact that the terms "overseer" or "elder," are used interchangeably throughout the New Testament. It is consistent with this view to argue the absolute parity of ministers and elders, conceding to all presbyters "equal right to teach, to rule, to administer the sacraments, to take part in the ordination of ministers, and to preside in church courts."

The practice of the Presbyterian churches of the present day is in accord with the first-named theory. Where attempts are made to reduce the third theory to practice the result is not satisfactory. Nor is the first-named theory less in harmony with Scripture teaching than the third. In the initial stages of the Apostolic Church it was of course necessary to have a plurality of presbyters with absolutely similar duties and powers. At first, indeed, this may have been the only possible course. But apparently it soon became desirable and perhaps necessary to specialize the work of teaching by setting apart for that duty one presbyter who should withdraw from secular occupation and devote his whole time to this work of the Church, and then to keep the office of this in the latter writings of the New Testament. It is now held by all Presbyterian churches that one presbyter in every congregation should have specially committed to him the work of...
of teaching, administering the sacraments, visiting the flock pastorally, and taking oversight, with his fellow elders, of all the interests of the church. To share with the ministers, general oversight is not regarded by intelligent and influential laymen as an incongruous or unworthy office; but to identify the duties of the eldership, even in theory, with those of the minister is a sure way of deterring from accepting office many whose counsel and influence in the eldership would be invaluable.1

Another subject upon which there is a difference of opinion in the Presbyterian churches is the question of Church Establishments. The view, originally held by all Presbyterian churches in Great Britain and on the Continent, that union with and support by the civil government are not only lawful but absolutely necessary, is now held only by a minority. This disagreement is best exemplified among English-speaking Presbyterians only in the Church of Scotland (see SCOTLAND, CHURCH OF). The lawfulness of Church Establishments with due qualifications is perhaps generally recognized in theory, but there is a growing tendency to regard connexion with the state as inexpedient, if not actually contrary to sound Presbyterian principle. That this tendency exists cannot be doubted, and there is reason to fear that its influence, by identifying Presbyterianism with dissent in England and Scotland, is unfavourable to the general tone and character of the Presbyterian Church.

Those who favour state connexion and those who oppose it agree in claiming spiritual independence as a fundamental principle of Presbyterianism. That principle is equally opposed to Erastianism and to Papacy, to the civil power dominating the Church, and to the ecclesiastical power dominating the state. All Presbyterians admit the supremacy of the state in things secular, and they claim supremacy for the Church in things spiritual. Those who favour a Church Establishment hold that Church and state should each be supreme in its own sphere, and that on these terms a union between them is not only lawful but is the highest exclamation of Christian statelessness. So long as these two spheres are at all points clearly distinct, and so long as there is a desire on the part of each to recognize the supremacy of the other, there is little danger of friction or collision. But when spiritual and secular interests come into unhealthy contact and entanglement; when controversy in regard to them becomes inevitable; from which sphere, the spiritual or the civil, is the final decision to come? Before the Reformation the Church would have had the last word; since that event the right and the duty of the civil power have been generally recognized.

The origin of Presbyterianism is a question of historical interest. But some say it has never been part of the Reformation; by some it is traced back to the days of Israel in Egypt;2 by most, however, it is regarded as of later Jewish origin, and as having come into existence in its present form simultaneously with the formation of the Christian Church. The last is Bishop Lightfoot's view. He connects the Christian ministry, not with the worship of the Temple, in which were priests and sacrificial ritual, but with that of the synagogue, which was a local institution providing spiritual edification by the reading and exposition of Scripture.3 The first Christians were regarded, even by themselves, as a Jewish sect. They were spoken of as "the way."4 They took with them, into the new communities which they formed, the Jewish polity or rule and oversight by elders. The appointment of these would be regarded as a matter of course, and would not seem to call for any special notice in such a narrative as the Acts of the Apostles.

But Presbyterianism was associated in the 2nd century with a kind of episcopacy. This episcopacy was at first rather congregrational than diocesan; but the tendency of its growth was undoubtedly towards the latter. Hence for proof that their church polity is apostolic Presbyterians are accustomed to appeal to the New Testament and to the time when the apostles were living; for proof of the apostolicity of presbytery, Paul's names of Church fathers and to a time when the last of the Apostles had just passed away.5 It is generally admitted that distinct traces of Presbyterian polity are to be found in unexpected quarters (e.g., Ireland, Iona, the Culdees, &c.) from the early centuries of church history and throughout the medieval ages down to the Reformation of the 16th century. Only in a very modified sense, therefore, can it be correctly said to date from the Reformation.

At the Reformation the Bible was for the great mass of both presbytery and people an instrument of discovery, not of doctrine, acting as a kind of companion to the Bible in the hands of both of them. Both were schools of interpretation, and the work of the Reformation would in that way be best preserved and furthered. In no sense can his "consistorial" system of church government be regarded as Presbyterian.

Leaders of the Reformed Church.

Luther studied the Scriptures in search of true doctrine and Christian life and was indifferent to forms of church policy, they studied the New Testament not only in search of a presbyteral system but of a church polity. One is struck by the unanimity with which, working individually and often in lands far apart, they reached the same conclusions. They did not get their ideas of church policy from one another, but drew it directly from the New Testament. For example, John Row, one of the five commissioners appointed by the Scottish Privy Council to draw up what would be the constitution of the Church of Disruption: in 1639, said: "They took not their example from any kirk in the world; no, not from Geneva; but they drew their plan from the sacred Scriptures." This was true of them all. They were unanimous in rejecting the episcopacy of the Church of Rome, the sacrcency of celibacy, the sacerdotal character of the ministry, the confessional, the propitiatory nature of the mass. They were unanimous in adopting the idea of a church in which all the members were priests and in which they were all subjected to a spiritual discipline. That discipline, which was not mediators between men and God, but preachers of One Mediator, Christ Jesus; not lords over God's heritage, but ensmans to the flock and ministers to render service. They were unanimous in regarding spiritual discipline as necessary to prevent heresy and keep the Church and of their appointment in the name of the Lord Jesus. When the conclusions thus reached by many independent investigators were at length reduced to a system by Calvin, in his treatise, named the Institutio, it became the definite ideal of church government for all the Reformed, in contradistinction to the Lutheran, churches.

Yet we do not find that the leaders of the Reformed Church succeeded in establishing at once a fully-developed Presbyterian polity. Powerful influences hindered them from realizing their ideal. We notice two. In the first place, the people generally dreaded the recurrence of ecclesiastical state and church. But they dreaded the idea of a master who had shaken off, that they feared to submit to anything similar even under Protestant auspices. When their ministers, moved by an instinct to keep the Church in line with the times of the Reformation, claiming special spiritual rule over the people, it was not wonderful that the latter had never found to submit to a new spiritual despotism. So strong was this feeling that the state, those that the discipline of the Church was of the citizens' private life. Any attempt on the part of the Church to exercise discipline was resented as an intrusion. It has been a common mistake to think of Calvin and contemporary Reformers

6 Knox, Winran, Spotwood and Douglas—all of them John—were the other commissioners.
as introducing a discipline of stern repression which made the innocent gaieties of life impossible, and produced a dull uniformity of straitlaced manners and hypocritical morals. The discipline was there before the Reformers. There were civil laws which regulated moral and social morality. Hence friction, at times, between the Reformers and civic authorities friendly to the Reformation; not as to whether there should be "discipline" (that was never doubted) but as to whether it should be ecclesiastical or civil. Whether there was or not the Reformation there were powerful influences opposed to the setting up of church government and to the exercise of church discipline after the manner of the apostolic Church; and one ceases to wonder at the absence of complete Presbyterianism in the countries which were forward to embrace and adopt the Reformation. Indeed the more favourable the secular authorities were to the Reformation the less necessary there was to discriminate between civil and ecclesiastical power, and to define strictly how the latter should be exercised. We look in vain, therefore, for much more than the germ and principles of Presbyterianism in the churches of the first Reformers. Its evolution and the thorough application of its principles to actual church life came later, not in Saxony or Switzerland, but in France and Scotland; and through Scotland it has passed to all English-speaking lands.

The doctrines of Presbyterianism are those generally known as evangelical and Calvinistic. The supreme standard of all is the Word of God in its original and inspired form. The subordinate standards have been numerous, though marked by striking agreement in the main body of Christian doctrine which they set forth. Much has been done of late years to make these subordinate standards of reformed doctrine more generally known. The following list is fairly complete:—

France.—Confessio gallicana (1559).

Hungary.—Hungarian Confession (1562).

Bohemia.—Bohemian Confession (1699).

The form of worship associated with Presbyterianism has been marked by extreme simplicity. It consists of reading of Holy Scripture, psalmody, non-liturgical prayer and preaching. There is nothing in the standards of the Presbyterian Church against liturgical worship. In some of the early books of the Church, forms of prayer were given, but the Scripture is not compulsory. On the whole, the preponderating preference has always been in favour of so-called extemporaneous, or free prayer; and the Westminster Directory of Public Worship has to a large extent stereotyped the form and order of the service in most Presbyterian churches. Within certain broad outlines much, perhaps too much, is left to the choice of individual congregations. It was used to be customary among Presbyterians to stand during public prayer, and to remain seated during the acts of praise, but this peculiarity is no longer maintained. The psalms rendered into metre were formerly the only psalms used in the Church of Scotland, but hymns are now also used in most Presbyterian churches. Organs used to be regarded as contrary to New Testament example, but their use is now all but universal. The public praise used to be led by an individual called the "precentor," who occupied a box in front of, and a little lower than, the pulpit. Choirs of male and female voices now lead the church praise.

Presbyterianism has two sacraments, baptism and the Lord's Supper. Baptism is administered both to infants and adults by immersion or by pouring or sprinkling, but the mode is closer to the former. The Lord's Supper, as generally observed throughout the various Presbyterian churches, is a close imitation of the New Testament practice; and where it is not marred by undue proximity commends itself to most Christian people as a solemn and impressive service. The old plan of coming out and taking one's place at the communion table in the body of the church is unhappily seen no more; communicants now receive the sacred elements seated in their pews. The dispensing of this rite is strictly reserved to an ordained minister, who is assisted by elders in handing the bread and the cup to the people. The administration of Holy Communion is under the exclusive charge of the congregation in Presbyterian churches, but there is less objection to it than formerly, and in some churches it is even encouraged.

Presbyterian discipline is now entirely confined to exclusion from membership of the clerical office. Though it is the duty of a minister to warn against irreverent or profane participation in the Lord's Supper, he himself has no right to exclude any one from communion, nor can any act be done as the act of himself and the elders duly assembled in session. A code of instructions for the guidance of church courts when engaged in cases of discipline is in general use, and bears witness to the extreme care taken not only to have things done decently and in order, but also to prevent hasty, impulsive and illogical procedure in the investigation of charges of heresy or immorality. Cases of discipline are now comparatively rare, and, when they do occur, are not characterized by the bigotry and severity which prevailed in former times and was rightly denounced as unchristian.

The extent to which the Presbyterian form of church government prevails throughout the world has been made more manifest in recent years by the formation of a "General Council of the Alliance of Reformed Churches holding the Presbyterian System." At a representative conference in London in 1875, the constitution of the council was agreed upon. The first council met in Edinburgh in 1877. Since then it has met in Philadelphia, Belfast, London, Toronto, Glasgow, Washington and Liverpool. Churches which are Presbyterian in their principles and hold in harmony with the reformed confessions are eligible for admission to the alliance. The object is not to form one great Presbyterian organization, but to promote unity and fellowship among the numerous branches of Presbyterianism throughout the world. On the roll of the general council held at Washington in 1899 there were sixty-four churches. The statistics of these and of sixteen others not formally in the alliance were 22,476 congregations, 26,251 ministers, 126,672 elders and 4,832,066 communicants. Of these eighty churches, twelve were in the United Kingdom, twenty on the continent of Europe, sixteen in North America, three in South America, one in Asia, one in Africa, one in Oceania (or Melanesia), two in New Zealand, one in Jamaica and one in Melanesia. The desire for union which led to the formation of the alliance has, since 1875, borne remarkable fruit. In England in 1876 two churches united to form the Presbyterian Church of England; in the Netherlands two churches became one in 1892; in South Africa a union of the different branches of the Presbyterian Church took place in 1897, in Scotland the Free Church and the United Presbyterian became one in 1900 under the designation of the United Free Church; in Australia and Tasmania six churches united in 1901 to form the Presbyterian Church of Australia; and a few months later the two churches in New Zealand which represented respectively the North and South Islands united to form the Presbyterian Church of New Zealand. "In no portion of the empire," it has been said, "does the British flag now fly over a divided Presbyterianism, except in the British Isles themselves."

II.—HISTORY IN DIFFERENT COUNTRIES

From this general outline of Presbyterianism we now turn to consider its evolution and history in some of the countries with which it is or has been specially associated. We omit, however, one of the most important, viz. Scotland, as the history is fully covered under the separate headings of Scotland, Church of, and allied articles.

Switzerland.

The Swiss, owing to their peculiar geographical position and to certain political circumstances, early manifested independence in ecclesiastical matters, and became accustomed to the
management of their church affairs. The work of Zwingli as a Reformer, important and thorough though it was, did not concern itself mainly with church polity. Ecclesiastical affairs were, as a matter of course, wholly under the management of the cantonal and municipal authorities, and Zwingli was content that it should be so. The work of Farel, previous to his coming to Geneva, was almost entirely evangelistic, and his first work in Geneva was of a similar character. It was the town council which made arrangements for religious disputations, and provided for the housing and maintenance of the preachers. When Calvin arrived, Farel’s invitation, settled in Geneva (1536) with a similar commission, and the ecclesiastical administration came more under his control. The need of the hour was organization and familiar instruction, and Calvin set himself to work at once.” The first reforms he wished to see introduced concerned the Lord's Supper, church prayer, religious instruction of youth and the regulation of marriage. In connexion with the first he desired that the discipline of the excommunication should be exercised. His plan was partly Presbyterian and partly consistorial. Owing to certain circumstances in its past history, Geneva was notoriously immoral. The rule of dissolute bishops, and the example of a turbulent and immoral clergy, had poisoned the morals of the city. The nuns of Geneva were notorious for their conduct.” Calvin suggested that men of known worth should be appointed in different quarters of the city to report to the ministers those persons in their districts who lived in open sin; that the ministers should then warn such persons not to come to the communion; and that, if their warnings were unheeded discipline should be enforced. It was on this subject of keeping pure the Lord’s Table that the controversy arose between the ministers and the town councillors which ended in the banishment of Calvin, Farel and Conrad from Geneva. In 1538 the ministers took upon themselves to refuse to administer the Lord’s Supper, and because of this the council, by a vote of the town, ordered them to submit to church discipline. The storm then broke out, and the ministers were banished (1538).

It may be convenient at this point to consider Calvin’s ideal church polity, as set forth in his famous Christianae religionis institutio, the first edition of which was published in 1536. Briefly it was as follows:—

A separate ministry is an ordinance of God (Inst. iv. 3. 1. 3). Ministers duly called and ordained may alone preach and administer the sacraments (iv. 3). A legitimate ministry is one appointed with the consent and approbation of the people under the presidency of other pastors by whom the final act of ordination (with laying on of hands) is performed (iv. 3). Governors or persons of advanced years selected from the people and associated with the ministers in administering and exercising discipline (iv. 3. 8). This discipline is all-important, and is the special basis of the ordination of the elders. His system, while preserving the democratic theory by recognizing the congregation as holding the church power, was in practice strictly aristocratic inasmuch as the congregation is never allowed any direct use of power, which is invested in the whole body of elders. His great object was discipline. With regard to the relations between the Church and the civil power, Calvin was opposed to the Zwinglian theory whereby all ecclesiastical power was handed over to the state. Calvin’s refusal to administer the sacraments for which he was banished from Geneva, is important as a matter of ecclesiastical history, because it is the essence of the whole Calvinistic system which he intended to establish. The principles that he laid down were that the Church has the right to exclude those who are unworthy, and that she is in no way subject to the civil power in spiritual matters. During the three years of his banishment Calvin lived in Strassburg, where he had been carrying out his ideas. His recall was greatly to his honour. The town had become a prey to anarchy. One party threatened to return to Romanism; another party threatened to sacrifice the independence of Geneva and submit to Bern. It was felt to be a political necessity that he should return, and in 1541, somewhat reluctantly, he returned on his own terms. These were the recognition of the Church’s spiritual independence, the division of the town into parishes, and the appointment (by the municipal authority) of a consistory or council of elders in each parish for the exercise of discipline.

These terms were embodied in the famous Ordinarions ecclesiastiques of l’eglise de Genève (1541). The four orders mentioned in the Institutio are recognized: pastors, doctors, elders and deacons. The pastors were to preach, administer the sacraments, and in conjunction with the elders to exercise discipline. In their total exercise of the power of the keys, a presbyter could not be setled in a fixed charge by the magistrate with the consent of the congregation, after having been approved as to knowledge and manner of life by the pastors already in office. By them he was to be recommended to the church, and in the case of nonconformity to the church system, obedient to the laws and to the civil government, and ready to exercise discipline without fear or favour. The doctors were to teach the faithful in sound learning, to guard the faithful in the faith, to exercise discipline, and to help others to bring the doctrine and discipline of the Church to publication. The elders or presbyters were to govern the church, maintain discipline, and give notice to the consistory of cases requiring discipline. To form the consistory all the elders with the ministers who were to meet every month or at the times determined by the council. This court could award censures up to exclusion from the sacrament.

Manifestly the arrangement was a compromise. The state retained control of the ecclesiastical organization, and Calvin secured his much-needed system of discipline. Fourteen years of friction and struggle followed, and if there came after them a period of comparative triumph and repose for the great reformer courts for the manifestation of the Church’s unity and for the concentration of the Church’s influence.

Calvin’s Influence.

France.

It is pathetic and yet inspiring to study the development of Presbyterianism in France; pathetic because it was in a time of fierce persecution that the French Protestants organized themselves into churches, and inspiring, because it showed the power which scriptural organization gave them to withstand incessant, unrelenting hostility. It would be difficult to exaggerate the influence of Calvin upon French Protestantism. His Christianae religionis institutio became a standard round which his countrymen rallied in the work and battle of the Reformation. Though under thirty years of age, he became all over Europe, and in an exceptional degree in France, the leader, organizer and consolidator of the Reformation. The work which the young Frenchman did for his countrymen was immense. The year 1555 may be taken as the date when French Protestantism began to be organized. A few churches had been organized earlier, under Meaux in 1544, and at Nantes in 1547, when their members had been dispersed by persecution. Prior to 1555 the Protestants of France had been for the most part solitary Bible students or little companies meeting together for worship without any organization. But in that year the following incident was the beginning of a great movement. A small company had been accustomed to meet in the lodging of the sieur de la Ferrière in Paris near the Pré-aux-Clercs. One day one of the members, Jean le Magon, explained that he could not go outside France to seek a pure baptism and that his conscience would not permit his child to be baptized according to the rites of the Romish Church. After prayer the company instituted a new order of baptism: child, Jean le Magon to be their minister, and others of their number to be elders and deacons. It seemed as if all France had been waiting for this event as a signal, for organized churches began to spring up everywhere.

1 Lindsay, Hist. of the Reform. ii. 90.
2 Hist. of the Reform. ii. 31.
3 Ibid. ii. 158.
where immediately afterwards. Within two years Meaux, Poitiers, Angers, les Iles de Saintonge, Agen, Bourges, Issoudun, Aubigny, Blois, Tours, Lyon, Orleans and Rouen were organized. Thirty-nine presbyteries were organized in the year 1695, and may still be heard of. There were about this time 2150 organized churches. A few years later Cardinal St Croix reckoned that the Huguenots were one half of the population. One hundred and twenty-seven pastors had died of a long confinement from Government, in the course of 1650.

In 1558 a further stage in the development of Presbyterian church polity was reached. Some doctrinal differences having arisen in the church at Poitiers, Antoine de Chandieu, minister, drew up a confessional document, which was submitted to a committee of two from each presbytery, and in May of 1559, a result of a conference, a synod was convened to meet in Paris the following year (1559). It was the first general synod of the French Presbyterian Churches, and consisted of representatives from, some say sixty-six, others, twelve churches. It adopted a confession of faith and a book of order or discipline. The confession consisted of forty articles. It was based on a short confession drafted by Calvin in 1557, and may still be regarded, though once or twice revised, as the confession of the French Protestant Church. The book of order, Discipline ecclésiastique des églises réformées de France, regulated the organization and procedure of the churches. It contains this fundamental statement of Presbyterian partri
dary: "Aucune église ne pourra préndre primaute ni domination sur l'autre; ni pareillement, les ministres d'une église les uns sur les autres; ni les anciens ou diacres, les uns sur les autres; ni les conseillers de l'église."
The church that we now as Presbyterian, are explained. The consistoire or session consisted of the minister, elders and deacons (the latter without a vote), and the minister could exclude any member of the congregation. The presbytery was composed of representative ministers and elders (anciens) from a group of congregations. Next in the provincial synod which consisted of a minister and an elder or deacon from each church. Over these was the general or national synod. Some of the arrangements are worthy of notice. When a church was first formed the office-bearers were elected by the people, but there the power of the congregation ceased. Future vacancies were filled by the elders. The eldership was not for life, but there was always a tendency to make it so. When the ministry of a church became vacant the choice of a successor rested with the colloque or with the provincial synod, the people, however, might object to the objection being considered valid redress was given. Later the synod of Nimes (1572) decreed that no minister might be imposed upon an unwilling church. In a word, Presbyterians, for good reason, had a great deal of respect for the people, both in theory and practice.

It is interesting to see how in a country whose civil rule was based on absolutism the church uniting the French nation and its constituents national and provincial. Under the protection of the edict the Huguenot Church of France flourished. Theological colleges were established at Sedan, Montauban and Saumur, and French theological literature was produced to combat the narrow Reformed scholastic of Switzerland and Holland.4

The history of the Church from the passing of the edict of Nantes till its revocation in 1685 cannot be given here. That event was one of the most important in the history of the Church, for a large number were killed, and between four and five millions of Protestants left the country. Early in the 18th century Antoine Court made a number of efforts to restore Presbyterianism. In 1712 a large number of representatives from every province formerly Protestant. From 1760 owing to the spread of the sceptical spirit and the teaching of Voltaire more tolerant views prevailed. In 1787 the Edict of Tolerance was published. In 1789 all citizens were made equal before the law, and the position of Presbyterianism improved till 1791. In 1801 and 1802 Napoleon took into his own hands the independence of both Catholic and Protestant Churches, the national synod was abolished, and all active religious propaganda was rigorously forbidden. In 1848 an assembly representative of the églises consistoriales met at the Hague. When it met, it was in points of doctrine a secession took place under the name of the Union des églises évangéliques de France. This society held a synod at which a confession of faith and a book of order were drawn up. The Stasiens claimed to be the true Church of the Reformation on the basis of universal suffrage, with restrictions, but no result was arrived at. In 1852 a change took place in its constitution. The églises consistoriales were abolished, and in each province a synodal meeting was appointed by the central body, whose president would be a representative of the French government, the national, and the political system. The synods in the large towns were consistories composed of all the ministers and of delegetes from the various parishes. Over all was the central provincial council consisting of the two senior ministers and fifteen members nominated by the state in the first instance. In 1858 there were 617 pastors and the Union des églises évangéliques numbered 27 churches.

The Netherlands.

From the geographical position of the Netherlands, Presbyterianism there took its tone from France. In 1562 the Confessio Belgica was publicly acknowledged, and in 1653 the church ord was arranged. In 1754 the first provincial synod of Holland and Zeeland was held, but William of Orange would not allow any action to be taken independently of the state. The Revocation of 1791, however, established independence of the state when that state was Catholic; when the government became Protestant the Church had protection and at the same time became dependent. It was a state church. By the union of Utrecht the communes and provinces had each the regulation of its own religion; hence constant conflict. In most cases it was insisted on as necessary that church discipline should remain with the civil authority. In 1776 William, with the support of Holland, Zeeland and their allies, put forth forty articles, by which doctors, elders and deacons were recognized, and church discipline given to the elders, subject to appeal to the magistrates and by which the Church was placed in absolute dependence on the state. These articles, however, never came into operation; and the decisions of the synod of Dort in 1578, which made the Church independent, were equally fruitless. In 1618 the Middelburg Synod divided the Church, created provincial synods and presbyteries, but could not shake off the civil power in connexion with the choice of church officers. Thus, although the congregations were Presbyterian, the civil government retained overwhelming influence. The Leiden magistrates said in 1581: "If we accept everything determined upon in the synod, we shall end by being vassals of the synod. We will not be subject to a new government, for government and subjects, wife and child." From 1618 a modified Presbyterian polity predominated. As a rule elders held office for only two years. The "kerk-raid" (kirk-session) met weekly, the magistrate being a member ex officio. The colloque consisted of one minister and one elder from each congregation. At the annual provincial synod, held by consent of the states, two ministers and one

4 Lindsay, Hist. of the Reform. ii. 166. 8 Ibid. ii. 169.
Presbyterianism and ideas were entertained by many of the leading ecclesiastics in England during the reign of Edward VI. Even the archbishop of Canterbury favoured a form of church government, and to this end he published a prayer book on church polity and discipline; but attention was mainly directed to the settlement of doctrine and worship. Cramer wrote that bishops and priests were not different but the same in the beginning of Christ's religion. Thirteen bishops subscribed this proposition: that in the New Testament there is no mention made of any distinctions or degrees in orders but only deacons and priests or bishops. Cramer held that the consecration of a bishop was an unnecessary rite, and not required by Scripture; that election and appointment to office were sufficient. The bishop of St Davids was of the same opinion. Latimer and Hooper declared that Bishops and presbyters (identical with the ministers, of Durham, and Bishop Jewell were of the same mind. The latter, about the time of Elizabeth's succession, expressed his hope that the bishops would become pastors, labourers and watchmen; and that the great riches of bishops would be diminished and reduced to mediocrity; that being delivered from courtly and regal pomp, the bishops might take care of the flock of Christ. During the reign of Edward, the title of superintendent was often adopted instead of bishop, and it will be recollected that John Knox was an honoured worker in England with the title of superintendent during this reign. Of course, everything was upset, and the Presbyterians were strong. It may be noted that Cramer favoured a proposal for the formation of a council of presbyters in each diocese, and for provincial synods.

During 1587 and 1588 the persecutions in France and Holland drove thousands of Protestants, mostly Presbyterians, to England. In 1570 Presbyterian views found a distinguished exponent in Dr Thomas Cartwright at Cambridge; and the temper of parliament was shown by the Act for the disbanding of the disaffected Church, in which, while all mention of doctrine is omitted, the doctrinal articles alone being sanctioned, ordination without a bishop's impression was authorized. A formal instrument, published, entitled an Admonition to Parliament, the leading ideas in which were: parity of ministers, appointment of elders and deacons; election of ministers by the congregation; the ordination of elders and deacons; preaching, the chief duty of a minister; and the power of the magistrates to root out superstition and idolatry. On the 20th of November 1572 the authors of the "Admonition" set up at Wandsworth what has been called the first presbytery in England. They adopted a purely Presbyterian system which was published as the Orders of Westminster. Similar associations or presbyteries were formed in London and the country districts, and the privy council was hostile. Only in Jersey and Guernsey, whither large numbers of Huguenots had fled after the St Bartholomew massacre, was the form of Westminster fully permitted. Cartwright and Edmund Snape were ministers there; and from 1576 to 1625 a completely appointed Presbyterian Church existed, under the rule of synods, and authorized by the governor. The action of the Commons in 1584, stimulated by the opposition of the Lords, showed that the principles of Presbyterianism were strongly held. Bills were introduced to reduce the position of a bishop to well-nigh that of primus inter pares; to place the power of veto in the congregation; to abolish the canon law and to establish a presbytery in every parish. These proposals were rendered abortive by the unflinching use of the queen's prerogative.

In 1650 Henderson, Baillie, Blair and Gillespie came to London as commissioners for a General Assembly in Scotland, in response to a request from ministers in London who desired to see the Church of England more closely modelled after the Reformed type. They were able men, whose preaching drew great crowds, and increased the desire for the establishment of Presbyterianism. In 1642 the Long Parliament abolished Episcopacy (the act to come into force on the 5th of November, 1643); and summoned an assembly of divines to meet at Westminster in June 1643 to advise parliament on the form of church government. The Westminster Assembly, through its Confession, Directory and Catechisms, has become so associated with the Presbyterian Church that it is difficult to realize that it was not a church court at all, much less a council. The Westminster Assembly was drawn from the Quakers.

It was a council created by parliament to give advice in church matters at a great crisis in the nation's history; but its acts, though from another and by a different character and viewpoint, are among the most significant in the history of church Government. Its principles were drawn from the writings of John Owen, and were based on a pure Presbyterian form of government. It was composed of representatives of all the English and Irish provincial assemblies, and was to consist of thirty-one members, of whom twelve were to be taken from the House of Commons, and one hundred and twenty-four ministers. The ministers were mostly Puritans; by their ordination, &c., Episcopalian; and for the most part strongly opposed to the desirability of nearer agreement with the Church of Scotland, and other branches of the Reformed Church on the Continent. About one-half of the members attended regularly. The who were out-and-out Episcopalian did not attend at all. Apart from these there were three well-defined parties: (1) The English Presbyterian party, with its sturdy Puritanism, has taken root. And the Directory of Public Worship has shaped and coloured, perhaps too thoroughly, the ritual and atmosphere of worship of the Anglo-Saxon worshippers throughout the world, except Episcopalian.

In June 1646 the ordinance establishing presbyteries was ratified by both houses of parliament, and a few days afterwards it was ordered that the prayer book be put out of use. In the same year ten presbyteries were erected in London; Shropshire and Lancashire were organized; and Bolton was so vigorous in the cause as to gain the name of the Gene-a of Lancashire. But the system never took root. Not only were there well-known adverse influences, but the soil seems to have been uncongenial. As compared with Scotland, English Presbyterianism had more of the lay element. In every classis or presbytery there were at least ten elders and ministers, and this system was adopted by the Synod of London and by the other provinces. But it was not adopted by the Synod of the North, and the Synod of the South was held in the same year.

After the Revolution and during the reign of William and Mary the Parliament of the United Kingdom was divided into factions, one political and one religious, and other dissenters had been obliged to lie dormant. With the accession of Anne, however, began an attempt to make up for lost time. From the beginning of the 18th century the greater number of the Presbyterian congregations became practically independent in polity and Unitarian in doctrine. Indigenous Presbyterianism became almost unknown. The Presbyterianism now visible in Great Britain and Ireland is of Scottish origin and type, and beyond the fact of embracing a few congregations which date from, or before, the Act of Uniformity and the First Act, has little in common with the Presbyterianism which was re-established by the Act of 1689.

In 1786 the union of the Presbyterian Church in England with the English congregations of the United Presbyterian Church of Scotland gathered all English Presbyterians (with some exceptions) into Presbyterians in England. It abolished the Church of Scotland, and the stumbling-block of the civil magistrate's authority in relation to the Christian conscience. Since the union the growth of the Church has been considerable. Presbyterianism is comparatively strong in three English counties, Shropshire, Lancashire and London. Elsewhere it is either weak or non-existent. Even where it is comparatively strong it is largely ecoly. The membership is mainly Scottish, and the ministers

1 Drysdale, History of the Presbyterians in England, p. 625.
PRESBYTERIANISM

have been imported principally from Scotland. To English people, therefore, the Presbyterians is still the Scotch Church, and they have a way of lowering their denominations with 158 English have been made to counteract this feeling by making the Church more distinctly English. The danger in this direction is that when Presbyterianism has been modified far enough to suit the English taste, it will not be acceptable to its more stalwart supporters from beyond the Tweed. Following the lead of the Independents, who set up Mansfield College at Oxford, the Presbyterian Church of the British Isles, the Presbyterian Church of England has in recent years been readjusting its relation to the Westminster Confession of Faith. Without setting aside the Confession as the church's standard, two-thirds of the Presbyterians of Ulster have admitted, by their first conformity, that it is, as it is alleged, a perfect form and has been made in regard to the substance of the Westminster doctrine, but there is an alteration of emphasis and proportion.

There are in England fourteen congregations in connexion with the Church of Scotland, six of them in London and the remainder in Berwick, Northumberland, Carlisle and Lancashire. Many Unitarians in England still call themselves Presbyterians. This, except historically, is a misnomer, for, though descended from the old English Presbyterians, they retain nothing of their distinctive doctrine or polity—nothing of Presbyterianism, indeed, but the name.

Ireland.

Presbyterianism in Ireland, in modern times at least, dates from the plantation of Ulster in the reign of James I. The infusion of a considerable Scottish element into the population necessitated the formation of a congenial church. The immigrants from England took with them, in like manner, their attachment to the Episcopal Church. But these two sections of Protestantism, in their common exile and in presence of the preponderating Roman Catholicism of the country, seemed at first inclined to draw closer together than had been thought possible in Great Britain. A concession of faith, drawn up by Archbishop Usher at the convolution of 1615, implicitly admitted that the Presbyterian church of Ulster, as in Scotland, had a right to be recognized by the Church of England. But this distinction between bishop and presbytery. Within the Episcopal Church and supported by its endowments, Robert Blair, John Livingston and other ministers maintained a Scottish Presbyterian communion.

From 1625 to 1638 the history of Irish Presbyterians is one of bare existence. Their ministers, silenced by Wentworth, after an ineffectual attempt to reach New England, fled to Scotland, and there took a leading part in the work of their congregation with 538 English. After the Irish rebellion of 1641 the Protestant interest for a time was ruined. A majority of the Ulster Protostaters were Presbyterians, and they might have been disestablished had the principles of the Scottish settlements in Ireland took a leading part. Kirk-sessions were formed in four regions, and the first regular presbytery was held at Carrickfergus on the 10th of January, 1643. The presbytery consisted of ministers and ruling elders from the regional sessions. This presbytery supplied ministers to as many congregations as possible; and for the remainder ministers were sent from Scotland. By the end of 1643 the Ulster Church was fairly established. Notwithstanding intervening reverses there were by 1647 nearly thirty ordained ministers in fixed charges in Ulster besides the clergymen of the Scottish regiments.

At the Restoration, in which they heartily co-operated, there were in Ulster seventy ministers in fixed charges, with nearly eighty parishes or congregations containing one hundred thousand persons. The Presbyterians held monthly meetings and annual visitations of all the congregations within their bounds, and coming together in general synod four times a year. Entire conformity with the Scottish Church was maintained, and strict discipline was enforced by pastoral visitations, kirk-sessions and presbyteries.

After the Restoration the determination of the government to put down Presbyterianism was quickly felt in Ireland. In 1661 the clergymen of all unions were summoned to meet in those they included meetings of presbytery as exercising ecclesiastical jurisdiction not warranted by the law. Bishop Jeremy Taylor was sent to Ireland for the purpose of apprehending ministers for taking the Oath of Supremacy without the qualification suggested by Usher. Their parishes were declared vacant, and episcopal clergy appointed to them. The ejected ministers were forbidden to preach or to wander for the sake of congregations. In 1664, some ministers were ejected. Of seventy seven only seven conformed. Under Ormonde, in 1664, ministers were again permitted to revive Presbyterian worship and discipline, and for several years the Church prospered not only in Ulster but also in the south and west. In 1672, however, another act was passed by the Parliaments of England, and under William III, the amount was considerably increased. It was continued till 1689.

During the last period of the Irish Church the Presbyterians ended in the battle of Bothwell Bridge brought trouble on the Irish Presbyterians in spite of their loyal addresses disowning it. It was not, however, till 1682 that they again lost the privilege of public ministry, and suffered considerable oppression. They were opposed to James II, though they had benefited by his Declaration of Indulgence, and they were the first to congratulate the Prince of Orange on his arrival in England. The heroic defence of Londonderry owed much to them, and they added much to the population of Ulster. Their ministers rendered conspicuous service. There were then in Ireland about a hundred congregations, seventy-five with settled ministers, under five presbyteries. Their preponderance in Ulster and their general control of the population led at first to hope that Presbyterianism might be substituted for Episcopacy in Ulster, and afterwards, that it might be placed on an equal footing with the Established Church.

The Irish Presbyterian Church has no separate Church in Scotland. The Irish Presbyterian Church is the most conservative of the great Presbyterian churches in the United Kingdom. Her attitude is one of sturdy adherence to the old paths of evangelical doctrine and Presbyterian polity. She has been a zealous supporter of Irish national education, and she is theoretically "united secular and separate religious instruction. The Church Act of 1869 which disestablished and disendowed the Irish Episcopal Church to-day the Presbyterians in Ireland. The ministers with till absolutely unanimous determined to commute their life-interest and form therewith a great fund for the support of the Church. The commutation fund thus formed is a permanent memorial of a generous and disinterested act on the part of her ministry. It amounted in 1902 to £88,028. The interest accruing from it is added to the yearly sustentation contributions, and forms a central fund for ministerial support. Since the state endowment was abolished, the average number of ministers from their congregations has considerably increased.

The Irish Presbyterian Church has set an example to all her sister churches by her forwardness to care for the poor. Her "Presbyterian Orphan Society" undertakes the support of every poor orphan child throughout the Church. No Presbyterian orphan child now needs to seek workhouse relief. The orphans are boarded in the homes of respectable poor people, who thus also benefit by the society. A scheme of pensions for her aged poor has been instituted.

Three small communities of Presbyterians maintain a separate assembly. The Irish Presbyterian Church, with thirty-six; the Eastern Reformed, with six; and the Dutch Presbyterian Church, with ten congregations.

Wales.

The Presbyterian Church of Wales, commonly known as the "Calvinistic Methodist," had its origin in the great evangelical revival of the 18th century. Its polity has been of gradual growth, and still retains some features peculiar to itself. In 1781 its preachers were first presbyterially ordained and authorized to administer the sacraments. In 1823 a Confession of Faith was adopted. In 1864 the two associations or synods of North and South Wales were united in a general assembly. Great attention is given to the education of the ministers, a considerable number of whom, in recent years, have taken arts degrees at Oxford and Cambridge. As far as the difference in language will permit, there is cordial fellowship and co-operation with the Presbyterian Church of England. The influence of the Welsh people for sermons is still maintained, and the preaching is characterized by a high order of pulpit power.

(W. Y.)

United States.

Presbyterianism in the United States is a reproduction and further development of Presbyterianism in Europe. The history of the American Presbyterian churches, excluding the two "Reformed" Churches (see Reformed Church in the United States for the German body, and Reformed Church in America for the Dutch body), may be divided into three periods.
PRESBYTERIANISM
The Colonial Period. The earliest Presbyterian emigration

remained away; and thus the synod broke in two. The New York
presbytery declined at first to unite with either party, worked jn
vain for reconciliation, and finally joined with the Tennents in
establishing the synod of New York (1745) which was called the

New Side, in contradistinction to the synod of Philadelphia, the
Old Side.
During the separation the New Side established the college of
New Jersey at Elizabethtown (now Elizabeth) in 1747, and the
Log College of the Tennents was merged into it. It was removed
to Princeton in 1755, funds for its aid being received from England,
Ireland and Scotland.
The Old Side adopted the academy at
New London, Chester county, Pennsylvania, which had been organized by Francis Alison in 1741, as their own; but the New London
school broke up when Alison became a professor in the Philadelphia
Academy (afterwards the university of Pennsylvania). During
the separation the synod of Philadelphia decreased from twentysix to twenty-two ministers, but the synod of New York grew from
twenty to seventy-two ministers, and the New Side reaped all the
fruits of the Great Awakening under Whitefield and his successors.
Different views on subscription and discipline, and the arbitrary
act of excision were the barriers to union, but these were removed;
in 1758 the adopting act was re-established in its original breadth,

until 1688, when he became principal of the university of Glasgow.
At Charleston a mixed congregation of Scotch Presbyterians and
English Puritans was organized in 1690. What is now Dorchester
county, South Carolina, was settled in 1695 by members of a church
established in Dorchester, Massachusetts.
In 1710 there were five
churches in the Carolinas; in 1722-1723 they formed the presbytery
of James Island, which (after
1727) went through the same struggle
as the synod of Philadelphia in reference to subscription and in
1731 the parties separated into subscribers and non-subscribers.
From New England, as has been seen, Puritan settlers established Presbyterian churches (or churches which
immediately
became Presbyterian) in Long Island, on New Jersey, and in South
Carolina; but the Puritans who remained in New England usually
established Congregational churches.
But there were exceptions:
Irish Presbyterians from Ulster formed a church at Londonderry',
New Hampshire, which, about 1729, grew into a presbytery; the
Boston presbytery, organized in 1745, became in 1774 the synod
of New England with three presbyteries and sixteen ministers;
and there were two independent presbyteries, that of " the East"
ward organized at Boothbay, Maine, in 1771, and that of Grafton,
in New Hampshire, founded- by Elcazar Wheelock and other
ministers interested in Dartmouth College.
The Presbyterians from the Scotch Established Church combined
with the American Presbyterian Church, but the separating churches
of Scotland organized independent bodies. The Reformed Presbyterian Church (Covenanters) sent

ministers in 1776. The Burgher Synod in 1764 sent Thomas Clarke of Ballybay, Ireland, who settled at Salem, Washington county, New York, and in 1776 sent David Telfair, of Montreath, Scotland, who preached in Philadelphia; they united with the Associate Presbytery of Pennsylvania; in 1771 the Scotch Synod consisted of 18 ministers and 40 members. The General Assembly in 1770, although Dr. Clarke of Salem remained in the Associate Presbytery, the Burgher ministers who immigrated later joined the Reformed Church. In 1769-1774 there was a futile attempt to secure a union of the Associate Presbytery with the main American Church.

2. From the War of Independence to the Civil War.—During the War of Independence the Presbyterian churches suffered severely. Ministers and people with few exceptions—the most notable being the Scotch Highlanders who had settled in the valley of the Mohawk in New York and on Cape Fear river in North Carolina—sided with the patriot or Whig party: John Witherspoon was the only clergyman in the Continental Congress of 1776, and was otherwise a prominent leader; John Murray of the Presbytery of the Eastward was an eloquent leader in New England; and in the South the Scotch-Irish were the backbone of the American partisan forces; two of whose leaders, Daniel Morgan and Andrew Pickens, were Presbyterian elders.

At the close of the war the Presbyterian bodies began at once to reconstruct themselves. In 1782 the presbyteries of the Associate and Reformed churches united, forming the Associate and Reformed Synod of North America; but as there were a few dissenters in both bodies the older Associate and Reformed Presbyteries remained as separate units—the Associate Presbytery continued to exist under the same name until 1801, when it became the Associate Synod of North America; in 1818 it ceased to be subordinate to the Scotch General Synod. The Associate Reformed Synod added in 1794 a fourth presbytery, that of Lendomerry, containing most of the Western churches, but in 1801 "disclaimed" this presbytery because it did not take a sufficiently strict view of the question of psalm-singing. The Reformed Presbytery of North America was reconstituted by two ministers from Ireland in 1798; it became a synod of three presbyteries in 1809 and a general synod in 1823; in the first decade of the century the presbytery required all members to free their slaves. The synod of New York and Philadelphia, which in 1781 had organized the presbytery of Redstone, the first of western Pennsylvania, in 1788 resolved itself into a General Assembly, which first met in Philadelphia in 1789. The Western Church has, since 1796, adopted the Westminster symbols as their constitution, "as containing the system of doctrine taught in the Holy Scriptures," and they made them unalterable without the consent of two-thirds of the presbyteries and the General Assembly. In 1810 a "plan of union" proposed by the General Association (Congregational) of Connecticut was accepted by the General Assembly, and the work of home missions in the western section of the country was prosecuted jointly. The result was mixed churches in western New York and the new states west of the Alleghany Mountains, which grew into presbyteries and synods having peculiar features midway between Presbyterianism and Congregationalism.

The general strictness of the church in its requirements for admission to the ministry caused considerable confusion in this church, and the territory beyond the Appalachians was being settled so largely by Scotch-Irish and Presbyterians. The revivals in Kentucky brought about differences which resulted in the high-handed exclusion of the revivalists. These formed themselves into the presbytery of Cumberland, on the 4th of February 1810, which grew in three years into a synod of three presbyteries and the "Cumberland Presbyterian Church." In 1813 they raised the issue of Church and Synod on Church and the adoption of the Westminster symbols as their constitution, "as containing the system of doctrine taught in the Holy Scriptures," and they made them unalterable without the consent of two-thirds of the presbyteries and the General Assembly. In 1810 a "plan of union" proposed by the General Association (Congregational) of Connecticut was accepted by the General Assembly, and the work of home missions in the western section of the country was prosecuted jointly. The result was mixed churches in western New York and the new states west of the Alleghany Mountains, which grew into presbyteries and synods having peculiar features midway between Presbyterianism and Congregationalism.

In 1833 the Reformed Presbyterian Church divided into New Lights and Old Lights in a dispute as to the persistence of the office of the ministry. New measures were adopted, doctrines were adapted to the demands, and ancient disputes were revived between the conservative and progressive forces. Theological seminaries had been organized: the Reformed Presbyterian Theological Seminary at Newburgh, N. J., founded in 1812 by the General Assembly; the Auburn Theological Seminary at Auburn, N. Y., founded in 1819 by the synod of Geneva, and afterwards associated with the New School; and the Presbyterian and Associate Presbyterian General Assembly was held in Virginia in 1824, named Union Theological Seminary in Virginia after 1826, supported after 1828 by the synods of Virginia and North Carolina, and in 1856 removed to Richmond, Va.; the Western Theological Seminary was held in Pittsburg, Pa., in 1827 by the General Assembly; the Presbyterian Theological Seminary at Columbia, South Carolina, founded in 1828 by the synod of South Carolina; Lane Theological Seminary, founded in 1836 by the Presbytery of Cincinnati, Ohio; and Union Theological Seminary, founded in 1836 by independent action of New School men, in New York City. Differences in doctrine as well as polity and discipline became more and more prominent. The doctrinal differences came to a head in the trials of George Duffield (1832), Lyman Beecher (1833) and Albert Barnes (1836) which, however, resulted in the acquittal of the accused, but which precipitation action. They were chiefly between that general atonement and atonement for the elect only and between mediate imputation and immediate imputation. The difference was brought to a head by the organization of the Southern Presbyterian Synod of the Old Side, which was further strengthened by the accession of the Associate Presbytery. The ancient differences between Old and New Side were revived, and enormous questions were fought out in the courts, and (2) exclusion of the Congregationalized churches, and strict Presbyterian polity and discipline, and (3) the condemnation and exclusion of the new divinity and the maintenance of scholastic orthodoxy.

In 1833 the synod of Carolina was divided into the Old Side, (1) the" Union of 1801 with the Connecticut Congregationalists," cut off the synod of Western Reserve and then the synods of Utica, Geneva and Geneseo, without a trial, and dissolved the third presbytery of Philadelphia, without providing for the standing of its ministers. The New Side men met in convention at Auburn, N.Y., in August 1833, and adopted measures for resisting the wrong, but in the General Assembly of 1838 the moderator refused to recognize the composition of the assembly. The general assembly then decided that the moderator's decision was reversed, a new moderator was chosen, and the assembly adjourned to another place of meeting. The Old Side remained after the adjournment and organized their synod by the action of the moderator and clerks from the assembly of 1837, they retained the books and papers. Thus two General Assemblies were organized, the Old and the New. In 1839 the Old Side Synod met in Chicago, and decided (1839) in favour of the Old School; but this decision was overruled and a new trial was attempted. It was deemed best, however, to cease litigation and to leave matters as they were. Several years of confusion followed. In 1840 we have the first safe basis for comparison of strength.

| Old School | 1308 | 1898 | 126,583 |

The "sides" remained separate throughout the remainder of this period. The North was especially agitated by the slavery question. In 1847 the synod of the Free Presbyterian Church was formed by the anti-slavery secession of the presbytery of Ripley, O. (New School), and a part of the presbytery of Mahoning, Pa. (Old School); this new synod was led by a New School minister, joined the New School Assembly during the Civil War. In 1850 the New School Assembly declined slave-holding, unless there be a demand for some appearance, the cause for discipline, in 1851 it asked the Southern presbyteries to report what action they had taken to put themselves in accord with the resolution of 1850;

1 The separation of the southern part of the Associate Reformed Church from the northern in 1821, and the establishment of the Associate Reformed Synod of the South had not been due to slavery, but was for convenience in administration.
in 1858, 6 synods, 21 presbyteries and about 15,000 communicants withdrew and organized the United Synod. Just before the outbreak of the Civil War in 1861 these churches numbered—

3. Since the beginning of the Civil War.—The Southern presbyteries of the Old School Assembly withdrew in 1861, and delegates from ten southern synods (47 presbyteries) met in Augusta, Georgia, in December, and organized as the General Assembly of the Presbyterian Church in the Confederate States of America, which included 700 ministers, 1000 churches and 75,000 communicants. Its strength was increased by the addition: in 1863 of the Independent Presbyterian Church of South Carolina; in 1865 of the United Synod (New School), which at that time had 120 ministers, 190 churches, and 12,000 communicants; in 1867 of the presbytery of Patatopco; in 1869 of the synod of Kentucky; and in 1874 of the synod of Missouri. At the close of the Civil War this Southern Church adopted the name of the General Assembly of the Presbyterian Church in the United States.

In 1867 there was an unsuccessful attempt to combine all the Presbyterian bodies of the North. In 1869, in an attempt to commemorate the union a memorial fund was raised which amounted in 1871 to $7,007,492. Between 1870 and 1881 three presbyteries of the Old and New Presbyterian General Synod (in New School), joined the northern General Assembly. In 1896 the greater part of the Cumberland Presbyterian Church (then having 195,770 members) united with the northern General Assembly. Although the difference between the two schools and the New School were united in 1860 than in 1837—during the separation the New School was conservative, the Old School liberal, in tendency—there were serious dissensions in the northern church after the union. The first of these was due to the adoption by certain teachers in theological seminaries of the methods and results of the "higher criticism," and two famous heresy cases followed. Charles Augustus Briggs, teaching in his classical course at Yale, as professor of biblical theology at Union Seminary (in which he attacked the inerrancy of the Bible, held the composite character of the Hexa- teuch and of the Book of Isaiah and taught that sanctification is not present, but exported, by the School of Athens), was invited to enter the Protestant Episcopal Church. Dr. Smith resigned his chair at Lane Seminary, and entered the Congregational ministry. In 1892-1893 there was an open break between the General Assembly and Union Seminary, which repudiated the agreement of 1870 between the seminaries and the assembly; the assembly disclaimed responsibility for the Seminary's teachings and withheld financial aid from its students. In 1896 McCormick Theological Seminary (which in 1858 as New Albany Theological Seminary had come under the control of the assembly) and Auburn Seminary refused to make the changes desired by the General Assembly; a satisfactory arrangement with McCormick was made. Lane and Auburn remained practically independent.

But although the conservative party was successful in inducing successive Seminaries to lay reportedly stronger stress on the verbal inerrancy of Holy Scripture and to make an entirely or a partial inerrancy a requisite of teachers in theological seminaries and of candidates for the ministry, there was in other matters an increasing difference. In 1872 the General Assembly adopted a Brief Statement of the Reformed Faith, as it is a legal and but as an interpretation of the confession; it repudiated the doctrine of infant damnation, insisted on the necessity of predestination according to the doctrine of the Old Testament; it adhered to the Holy Spirit, the love of God, and missions. The Assembly of 1906 authorized (but did not make mandatory) the use of a book of common worship; the question of a liturgy had been in

1This agreement, proposed to the General Assembly in 1870 by the directors of Princeton and of Union, gave the Assembly a veto on the election and removal of professors.

1This agreement, proposed to the General Assembly in 1870 by the directors of Princeton and of Union, gave the Assembly a veto on the election and removal of professors.

The northern General Assembly and the Cumberland Church, which united with it in 1906, are the only Presbyterian bodies in America that have done anything tangible for Christian union in the last fifty years: the southern Assembly is much more conservative than the northern—in 1866 it suspended James Woodrow (1828-1907), professor of natural science in connexion with revealed religion, for holding evolutionary views, and it declared that Adam's body was "directly fashioned by Almighty God, without any natural animal parentage of any kind, out of matter previously created out of nothing"; and in 1897 it ordered that women were not to speak in pro-
PRESBYTERY—PRESBYTERY

(1838); a board of church erection in 1844; a board of work for freedmen; and a board of ministerial relief; after the union of 1869 the Board of Home Missions was removed from Philadelphia to Lexington, Kentucky.

The Southern Church, unlike the Northern, is not working through "boards," but through executive committees, which were formerly more loosely connected with the presbyteries but the direct control of their activities, but which now differ little from the boards of the northern Church. It has: an executive committee on foreign missions (first definitely organized by the Assembly in 1877), which has missions in China (1867), Brazil (1869), Mexico (1874), Japan (1885), Congo Free State (1891), Korea (1896) and Cuba (1899); and executive committees of home missions (1863), of publication and Sabbath school work, of ministerial extension and relief, of schools and colleges and of colored evangelization (formed in 1891). Permanent committees on the "sabbath and family religion," the "Bible cause" and "education," the "powers of America," are also appointed annually.

The United Presbyterian Church has a board of foreign missions (reorganized in 1859) with missions in Egypt (1853), now a synod with four presbyteries (in 1909, 79 congregations, 70 ministers and 10,341 members), in the Punjab (1854), now a synod with four presbyteries (in 1909, 35 congregations, 57 ministers and 17,321 members), and in the Sudan (1901); and boards of home missions (reorganized, 1895), church extension (1890), publication (1890), educational (1899), ministerial relief (1892), and missions to the freedmen (1863).

Presbyteries of different churches in the United States in 1906 numbered 1,850,555; of this total 322,542 were in Pennsylvania, where there were 248,335 members of the Presbyterian Church in the United States of America (the Northern Church), being more than one-fifth of its total membership; 55,587 members of the United Presbyterian Church of North America, being more than two-fifths of its total membership; 2709 members of the Synod of the Reformed Presbyterian Church of North America; the membership of the Church of the Recovery, being the entire membership of the Reformed Presbyterian Church in the United States and Canada (440), 3150 members of the Welsh Calvinistic Methodist Church, nearly one-fourth of its total membership; and 2062 members of the Reformed Presbyterian Church in North America, general synod, about five-ninths of its total membership.

The strength of the Church in Pennsylvania is largely due to the Scotch-Irish settlements in that state. Philadelphia is the home of the boards of publication and of Sunday schools of the Northern Church; and in Allegheny (Pittsburg) are the principal theological seminary of the United Presbyterian Church, and its publishing house. In New York state there were 199,923 Presbyterians, of whom 186,278 were members of the Northern Church and 19,115 of the United Presbyterian Church of North America. In Ohio there were 158,768 Presbyterians, 114,772 being of the Northern and 18,336 of the United Presbyterian Church. The other states with a large Presbyterian population were Illinois (115,602; 86,293 of the Northern Church; 17,208 of the Cumberland Church; 9555 of the United Presbyterian Church); New Jersey (79,912; 78,400 of the Northern Church); Tennessee (79,337; 42,464 being Cumberland Presbyterians, more than one-fifth of its total membership; 66,60 of the Cumberland Church, more than one-third of its membership; 21,390 of the Southern Church; and 6786 of the Northern Church); Missouri (71,590; 28,637 of the Cumberland Church; 25,991 of the Northern Church; 14,213 of the Southern Church); Texas (62,090; 31,598 of the Cumberland Church; 23,034 of the Southern Church; 4118 of the Northern Church; and 2902 of the Cumberland Church); Iowa (60,081; 48,326 of the Northern Church; 8850 of the United Presbyterian Church); and North Carolina (55,837; 41,322 of the Southern and 10,666 of the Northern Church). The Northern Church had a total membership of 1,179,566. The Southern Church had a total membership of 266,345. The Cumberland Presbyterian Church had a total membership of 195,770 members. The Cumberland Presbyterian Church of North America had a membership of 13,201. The Synod of the Reformed Presbyterian Church in North America had in 1906 a membership of 9122. The "Reformed Presbyterian Church in North America, General Synod," had a membership of 3620. The Associate Presbyterian Church, or Associated Synod of North America had a membership of 786. The Reformed Presbyterian Church in the United States and Canada had a membership in the United States of 440.

On American Presbyterianism, see Charles Hodge, Constitutional History of the Presbyterian Church in America, 1705–1768 (2 vols., Philadelphia, 1839–1840); Records of the Presbyterian Church in the United States of America from 1766 to 1788 (ibid., 1841); Richard Webster, History of the Presbyterian Church in America (2d ed., 1855; 4 vols., New York, 1853); F. W. Dick, History of the Presbyterian Church in the United States of America (2d ed., ibid., 1872); C. H. Briggs, American Presbyterianism (New York, 1884). There is a good bibliography on pp. xi–xxx of R. E. Thompson’s History of the Presbyterian Church in America (2d ed., 1887). See also the United Presbyterian Church in America, a handbook (Pittsburg, 1906). There are sketch volumes on the United Presbyterian Church History; in the United States of America, the Canadian, and the Southern Presbyterian Church; also a monograph on the presbyterianism.

PRESCOTT, a market town and urban district in the Omskirk parliamentary division of Lancashire, England, 8 m. E. of Liverpool by the London & North Western railway. Pop. (1901), 7835. It is of considerable antiquity, and received a grant for a market and fair in the 7th year of Edward III.

A church existed in the 13th century. The present church of St Mary is in various styles, with a lofty tower and spire and carved timber roof. The chief industry is the making of watches, and the town has long been celebrated for the production of watch movements and tools. The industry was first introduced in 1730 by John Miller from Yorkshire. There is also a manufacture of watches by the Slates and Roskell partnership, John Slates being born at Prescott in 1757. To the north of the town is Knowsley Park, the demesne of the earls of Derby, with a mansion of various dates from the 15th century onward, containing a fine collection of pictures. Prescott was formerly of greater importance in relation to the then populous district of south-west Lancashire; it was also a postal centre, and it is curious to notice that such addresses as "Liverpool, near Prescott" were necessary.

PRESKINDEX—PRESKINDEX

William Hickling (1796–1839), American historian, was born in Salem, Massachusetts, on the 4th of May 1796. His grandfather was Colonel William Prescott (1776–1793), who commanded at the battle of Bunker Hill; and his father was a well-known lawyer. He received his earlier education in his native city, until the removal of his family in 1808 to Boston. He entered Harvard College in the autumn of 1811, but almost at the outset his career was interrupted by an accident which affected the subsequent course of his life. A hard piece of bread, flung at random in the Commons Hall, struck his left eye and destroyed the sight. After graduating honourably in 1814 he entered his father's office as a student of law; but in January 1815 the unjured eye showed dangerous symptoms of degeneration. When at last in the autumn of 1816 his left eye was in danger to be lost, it was determined that he should pass the winter at St Michael's and in the spring obtain medical advice in Europe. His visit to the Azores, which was constantly broken by confinement to a darkened room, is chiefly noteworthy from the fact that he there began the mental discipline which enabled him to compose and retain in memory long passages for subsequent dictation; and, apart from the gain in culture, his journey
to England, France, and Italy (April 1816 to July 1817) was scarcely satisfactory. The verdict of the physicians was that the injured eye was hopelessly paralysed, and that the preservation of the sight of the other depended upon the maintenance of his general health. His further pursuit of the legal profession seemed to be out of the question, and on his return to Boston he remained quietly at home. On 4th May 1820 he was married to Miss Susan Amory. Prior to his marriage he had made a few experiments in composition, but he now finally decided to devote his life to literature. A review of Byron's Letters on Pope in 1821 constituted his first contribution to the North American Review, to which he continued for many years to contribute the results of his lighter researches. He next turned to French literature, and to the early English drama and ballad literature. Of the direction and quality of his thought at this time he has left indications in his papers on Essay-Writing (1822) and on French and English Tragedy (1823). In pursuance of his method of successive studies he began in 1823 the study of Italian literature, passing over German as demanding more labour than he could afford. In the following year he made his first acquaintance with the literature of Spain under the influence of his friend and biographer, Ticknor; and, while its attractiveness proved greater than he had at the outset anticipated, the comparative novelty of the subject as a field for research served as an additional stimulus.

In the meantime his aims had been gradually concentrating. History had always been a favourite study with him, and Mably's Observations sur l'Histoire appears to have had considerable influence in determining him to the choice of some special period for historic research. The selection, however, was not finally made without prolonged hesitation. It was not till the 9th of January 1830 that he recorded in the private memoranda begun by him in 1820 his decision "to embrace the gift of the Spanish subject." The choice was certainly a bold one. He could only use the eye which remained to him for brief and intermittent periods, and as travelling affected his sight prejudicially he could not anticipate any personal research amongst unpublished records and historic scenes. He was happy, however, in the possession of ample means and admirable friends; and he sketched with no undue restriction or hesitancy the plan of the History of the reign of Ferdinand and Isabella—his first great work. Mr English, one of his secretaries, has furnished a picture of him at this period seated in a study lined on two sides with books and darkened by green screens and curtains of blue muslin, which required readjustment with almost every cloud that passed across the sky. His plan was to set down at the margin—lay before him, and he kept his ivory style in his hand to jot down notes as the reading progressed. In accordance with his general method these notes were in turn read over to him until he had completely mastered them, when they were worked up in his memory to their final shape. So proficient did he become that he was able to retain the equivalent of sixty pages of printed matter in his memory, turning and returning them as he walked or drove. The rate of progress was necessarily slow, apart from any liability to interruption by other undertakings and failures in bodily health. He still continued his yearly experimental contributions to the North American Review, elaborating them with a view as much to ultimate historical proficiency as to immediate literary effect, the essays on Scottish Song (1826), Novel-Writing (1827), Molière (1828), and Irving's Granada (1829) belonging to this preparatory period. On the 6th of October 1829 he began the actual work of composition, which was continued without more serious interruptions than those occasioned by the essays on Asylums for the Blind (1830), Poetry and Romance of the Italians (1831), and English Literature of the 19th Century (1832), until the 25th of June 1836, when the concluding note was written. Another year, during which his essay on Cervantes appeared, was spent in the final revision of the History of the reign of Ferdinand and Isabella, and the book was at once made to send to Boston was immediate. Arrangements were speedily made for its publication in England, and there its success was not less marked. From the position of an obscure reviewer Prescott suddenly found himself elevated to the first rank of contemporary historians.

After coquetting for a short time with the project of a life of Molière he decided to follow in the track of his first work with a History of the Conquest of Mexico. Washington Irving, who had already made preparations to occupy the same field, generously withdrew in his favour. The work was completed in August 1843, the five years' labour having been broken by the composition of reviews of Lockhart's Life of Scott (1838), Kenyon's Poems (1839), Chateaubriand (1839), Bancroft's United States (1841), Mariotti's Italy (1842), and Madame Calderon's Life in Mexico (1844), and by the preparation of an abridgment of his Ferdinand and Isabella in anticipation of its threatened abridgment by another hand. On the 6th of December 1843 the Conquest of Mexico was published with a success proportionate to a wide reputation won by his previous work. The careful methods of work which he had adopted from the outset had borne admirable fruit. While the consultation of authorities had been no less thorough, his style had become more free and less self-conscious; and the epic qualities of the theme were such as to call forth in the highest degree his powers of picturesque narration.

It was only a step from the conquest of Mexico to that of Peru, and scarcely three months elapsed before he began to break ground on the latter subject. In February 1845 he received the announcement of his election as corresponding member of the French Institute in place of the Spanish historian Navarrete, and also of the Royal Society of Berlin. The winter found him arranging for the publication in England of the selection from his articles and reviews which appeared in 1845, under the title of Critical and Historical Essays, and was issued almost contemporaneously at New York under the title of Biographical and Critical Miscellaneous. The Conquest of Peru was completed in November 1846 and published in March following. His misgivings as to its reception were at once set at rest, and it was speedily issued in translations into French, Spanish, German and Dutch, in addition to the English editions of New York, London and Paris.

He was now over fifty and his sight showed serious symptoms of enfeeblement. Although during the composition of the Ferdinand and Isabella it had been of very intermittent service to him, it had so far improved that he could read with a certain amount of regularity during the writing of the Conquest of Mexico, and also, though in a less degree, during the years devoted to the Conquest of Peru. Now, however, the use of his remaining eye had been reduced to an hour a day, divided into portions at wide intervals, and by the end of the year his plans hesitated after what he had planned for the completion of the next three volumes. The Conquest of France, 1814 to 1815, was to have been the last work of the larger project. He had been fortunate in obtaining the aid of Don Pascual de Gayangos, then professor of Arabic literature at Madrid, by whose offices he was enabled to obtain material not only from the public archives of Spain but from the munificent rooms of the great Spanish families. With an exceptional range of information thus afforded him, he wrote the opening of his history in July 1849; but, finding himself still unsettled in his work, he decided in the spring of the following year to carry out a long projected visit to England. The idea of writing memoirs was dismissed in favour of the more elaborate form, and in November 1845 the first two volumes of his uncompleted History of Philip II, were issued from the press, their sale eclipsing that of any of his earlier books. This was his last great undertaking; but as Robertson's Charles V., in the light of new sources of information was inadequate to take its place as a link in the series, he republished it in an improved and extended form in December 1856. A slight attack of
PRESCRIPTION

apoplexy on the 4th of February 1838 foretold the end, though he persevered with the preparation of the third volume of *Philip II*. for the press, and with the emendation and annotation of his *Conquest of Mexico*. On the morning of the 27th of January 1839 a second attack occurred, and he died in the afternoon of the same day in his sixty-third year.

This biographical sketch reflects the direct line of literary descent from Robertson, whose influence is clearly discernible both in his method and style. But, while Robertson was in some measure the initiator of a movement, Prescott came to his task when the range of information was incomparably wider and when progress in sociologic theory had thrown innumerable convergent lights upon the progress of events. He worked, therefore, upon more assured ground; his sifting of materials was thorough and careful, and at the same time he cannot be classed as in the highest sense a philosophic historian. His power lies chiefly in the clear grasp of fact, in selection and synthesis, in the vivid narration of incident. For extended analysis he had small liking and facility; his critical insight is limited in range, and he confines himself almost wholly to the concrete elements of history. When he does venture upon more abstract criticism his standards are often commonplace and superficial, and the world where his researches are less profound than the thought of his time altogether warranted. Moreover, the authorities on whom he relied have had to be corrected since in many points of detail in the light of later archaeological research. In these things, however, indicate Prescott's deficiencies from the point of view of ideal history, few historians have had in a higher degree that artistic feeling in the broad arrangement of materials which is so essential to the course of history. But his work is perplexed by doubtful or insoluble problems. The painting is filled in with primary colours and with a free hand; and any sense of credibility which may be awakened by close inspection is compromised by the corresponding defect in some of the details.

Prescott's works in 16 vols. were edited by J. F. Kirk in 1870-1874. His *Life* was written by George Ticknor (1864; revised 1875). There are later lives by R. Ogden (1904), and H. T. Peck (1905).

**PRESCRIPTION**, in the broadest sense, the acquisition or extinction of rights by lapse of time. The term is derived from the *praescriptio* of Roman law, originally a matter of procedure, by whose insertion before the formula on behalf of either the plaintiff or, in early times, the defendant, limiting the question at issue. It was so called from its preceding the *formula*. One of the defendant's *praescriptio* was *longi temporis or longae possessionis praecriptio* (afterwards superseded by the *exceptio*), limiting the question to the fact of possession without interruption by the defendant for a certain time. It seems to have been introduced by the praetor to meet cases affecting aliens or lands out of Italy where the *usucapio* of the civil law (the original means of curing a defect of title by lapse of time) could not apply. The time of acquisition thus limited was fixed by the "Tituli" of the Digest, three years for movables and two years for immovables. *Praescriptio* thus constituted a kind of praetorian *usucapio*. In the time of Justinian *usucapio* and *praescriptio* (called also *longi temporis possessio*), as far as they affected the acquisition of ownership, differed only in name, *usucapio* being looked at from the point of view of property, *praescriptio* from the point of view of pleading. By the legislation of Justinian movables were acquired by three years' possession, immovables by ten years' possession where the parties had their domicile in the same province (*inter praesentia*), twenty years' possession where they were domiciled in different provinces (*inter adstantem*), and the time of acquisition was *usucapio* proper, but were said to be acquired by *quasi usucapio*, probably in the same time as sufficient to give a title to immovables. There was also a *longissimi temporis possessio* of thirty years, applicable to both movables and immovables, and requiring nothing but * bona fides* on the part of the possessor. Where the right sought to be established was claimed against the Church, a still longer period of forty years (at one time a hundred) was necessary. Immemorial prescription was required in a few cases of a public character, as roads. *Praescriptio* was also the term applied to lapse of time as barring actions upon contracts or torts under various provisions correspondent to those under various provisions of Limitation. The prescription of Roman law (and of modern systems based upon it) is thus both acquisitive and extirpative. It looks either

1. "*Praescriptiones autem appellatas esse ab co quod ante formula praescribuntur"* (Gaiss. iv. § 132).
2. "Viae vicinales, quorum memoria non extat" (Digg. xxii. 7. 3).
3. "Praescriptum statutum se ipsum includit" (Digg. xx. 16).
4. "Praescriptio est praeceptum, vel necessarium esse praescriptum" (Digg. xxiv. 16).
5. "Prescription seems at one time to have borne a wider meaning. A claim by prescription to land is mentioned in 32 Hen. VIII. c. 2. And it seems that tenants in common may still make title by prescription (Littleton's *Tenures*, § 316)."
The Preseant

A statement of the law concerning the prescription of land rights in the United States.

The Preseant, an adjective, adverb and substantive meaning that which is at hand or before one in place or in time. Also another substantive meaning a gift, and a verb meaning to bring into the presence of, to offer, to deliver.

The Preseant, the present participle of preseante, to be before one or at hand; from this participle was formed the verb presentare, to bring before one, exhibit, show. The sense of "gift" is due to
PRESENTATIONISM—PRESS

the O. Fr. phrase mettre en présent à quelqu’un, to bring something into the presence of a person, to offer, give. The legal formal phrase “these presents” is common, especially in the form “know all men by these presents,” as an opening to a deed, more particularly to a deed-poll which cannot be referred to as an “indenture.” The phrase “these present words, documents, writings,” &c. is an adaptation of a similar phrase in O.Fr. ces présentes (sc. editions) where the object of “presentation” are used of the “presenting” or nomination by the patron to the bishop of the person chosen by him to fill a vacant benefice. When the bishop is patron he does not “present,” but “collates.” “Presentiment,” foreboding, the feeling of something impending, must be distinguished in etymology; it is derived from the Lat. praesentire, to perceive beforehand.

PRESENTATIONISM (from Lat. praecesse, praesens, present), a philosophical term used in various senses deriving from the general sense of the term “presentation.” According to G. F. Stout (cf. Manual of Psychology, i. 57), presentations are “whatever constituents or our total experience at any moment directly determine the nature of the object as it is perceived or thought of at that moment.” In Baldwin’s Dictionary of Philosophy, vol. ii., a presentation is “an object in the special form under which it is cognized at any given moment of perceptual or ideational process.” This, the widest definition of the term, due largely to Professor James Ward, thus includes both perceptual and ideational processes. The term has, indeed, been narrowed so as to include ideation, the correlative “representation” being utilized for ideal presentation, but in general the wider use is preferred. When the mind is cognizing an object, the object “presents” itself to the senses or to thought in one of a number of different forms (e.g., a picture is a work of art, a saleable commodity, a representation of a house, &c.). Presentation is thus essentially a cognitive process. Hence the most important use of the term “presentationism, which is defined by Ward, in Mind, N.S. (1893), ii. 58, as “a doctrine the gist of which is that all the elements of psychical life are primarily and ultimately cognitive elements.” This use takes precedence of two others: (1) that of Hamilton, for representational as opposed to representative theories of knowledge, and (2) that of some later writers who took it as equivalent to phenomenon (q.v.). Ward traces the doctrine in his sense to Hume, to whom the mind is a “kind of theatre” in which perceptions appear and vanish continually (see Green and Grose edition of the Treatise, i. 534). The main problem is as to whether psychic activity is “presented” or not. Ward holds that it is not presented or presentable save indirectly.

For the problems connected with Presentation and Presentationism see especially the article PSYCHOLOGY and authorities there quoted.

PRESIDENCY, an administrative unit of the Indian empire. The word is derived from the title of president or chief of the council of a principal factory under the early East India Company —a title which lasted until governors were appointed under act of parliament in 1784. It thence came to be applied to the three orthodox provinces of Bengal, Madras, and Bombay. It is now restricted to Madras and Bombay, in distinction to the lieutenant-governors. In Anglo-Indian usage, “presidency” was also applied to the capital city as opposed to the country beyond, termed the “mofussil,” and this usage lingers in such phrases as “presidency town,” “presidency magistrate,” and “presidency college.”

PRESIDENT (Fr. président, from Lat. praesidens, post-Augustan Lat. for praeses, director, ruler, frompraesidere, to sit in front of, preside), a style or title of various connotation, but always conveying the sense of one who presides. As a title of the Latin praeses, it was given to all governors of provinces, but was confined in the time of Diocletian to the procurators who, as lieutenants of the emperor, governed the smaller provinces. In this sense it survived in the middle ages. Du Cange gives instances from the capitularies of Charlemagne of the style praesides provinciae as applied to the count; and later examples of praesides, or praesidens, as used of royal seneschals and other officials having jurisdiction under the Crown.

In England the word survived late in this sense of royal laureate. Thus, John Cowell, in his Interpreter of Words (1607) defines “President” as “used in Common Law for the King’s lieutenant in any province or function; as President of Wales, of York, of Berwick. President of the King’s Council.” It was used of the British North American colonies (New Hampshire, Pennsylvania, South Carolina) when the council, usually elected by the council; and when Pennsylvania and New Hampshire became states, one member of the Executive Council was called president. The chief (and single) executive head in Delaware, South Carolina and New Hampshire (1784-1792) was called president.

During the revolutionary struggle in America from 1774 onwards, the presiding officer of the Continental Congress was styled President” and when the present constitution of the United States was framed in 1787 (in effect 1789) the title of President was transferred to the head of the Federal government. The title “President” has become the accepted style for the elected chief of a modern republic, the title of the United States being followed by the South American republics, by France in 1849, and by Switzerland.

In the simple sense of “one who presides” the word “president” preserved its meaning alongside the technical use implying royal patronage. In this sense, it was used by John Chaucer (Troilus, iv. 185) in 1374. In ecclesiastical terminology praesidens was sometimes used for the head of cathedral chapters, instead of dean or provost; and it was sometimes the title given to archbishops of the viceroy. The word was also used as a designation of Cluny (Du Cange). In the United Kingdom the heads of many colleges are styled “president,” the title being of considerable antiquity in the case of one college at Cambridge (Queens’, founded 1448) and one college at St John’s, Magdalen, Corpus Christi, Trinity. At five Cambridge colleges (Pembroke, Gonville and Caius, St Catherine’s, St John’s, Magdalen) the title “president” is borne by the second in authority, being the equivalent of “vice- president” in the United States.

President is also the style of persons elected to preside over the meetings of learned, scientific, literary and artistic academies and societies, e.g. the president of the Royal Academy (P.R.A.) in London; the title of the president of the Royal Society (P.R.S.) dates from its foundation in 1660. In the United States the title “president” is given to persons who preside over the proceedings of financial, commercial and industrial corporations (banks, railways, &c.); in Great Britain usually styled “chairman,” but in the case of the Bank of England and certain banks “president.”

In Great Britain the title “president” is also borne by certain ministers of the Crown and certain judges, and preserves some of the ancient connotation of a royal lieutenant explained above. The technical style of “president” is applied to the heads of the of agriculture, local government board, board of education, board of trade, &c., which are all committees of the privy council, is derived independence of the United States. The title “president” is in Latin also praesidens, i.e. the judge (who may or may not be the Präsident) selected to preside over a division of the court appointed to try particular cases.

The President also retains its old sense of “governor,” Oberpräsident being the title of the chief of the administration of a province, Präsident that of the head of a government district (Regierungsbezirk). The consistories of the established Protestant Churches are also presidenced.

PRESS (through Fr. presse from Lat. pressare, frequentative of premere, to crush, squeeze, press), a word which appears in English in the 13th and 14th centuries with three particular
PRESSBurg—PRESS LAWS

meanings, viz. (1) crowd or throng, often used of the mélée in a battle, (2) a shelved cupboard for books or clothes, and (3) an apparatus for exerting pressure on various substances, and for various purposes. The first meaning is still current, though usually it has a literary air; a specific use is the nautical one of "press of sail," i.e. as much sail as the wind will allow; cf. the similar use of "crowd" in the phrase."The crowd has given way to the words, but is still the technical term in use in libraries, where the books bear "press-marks" specifying the case or shelf where they may be found. As for a term for a machine or apparatus for exerting pressure, there are innumerable examples, usually with a qualifying word giving the purpose for which the pressure is applied, either for attaining compression into a small space, or a required shape, or for extracting juices or liquids, or the methods adopted for exerting the pressure. The printing-press has given rise to obvious transferred uses of the word "press": thus it is applied to an establishment for printing, e.g. the Clarendon Press, at Oxford, or the Pitt Press, at Cambridge, to a printing-house and to the staff which conduct the business, to the issue of printed matter and especially to its daily or periodical issue, hence newspapers and periodicals generally. According to the New English Dictionary this use originated in phrases such as "the liberty of the press," "to write for the press," &c. The earliest quotation given is from the first number of the Dublin Press, 1797. For the history of the liberty or freedom of the press see Press Laws; also Newspapers and Periodicals. For the punishment of "pressing" see Peine Forte et Dure. It is now recognized that "press" in "press gang," "to press," i.e. to force or compulsorily enlist men for naval or military service, is a word distinct from the above. It stands for the earlier "press," and is ultimately due to French prêter, to lend (see IMPRESSMENT).

PRESSBURG (Hung. Pozsony, Lat. Posonium), a town of Hungary, capital of the county of the same name, 133 m. N.W. of Budapest by rail. Pop. (1900), 61,537, about half of whom are Germans. Pressburg is picturesquely situated on the left bank of the Danube, at the base of the outlying spurs of the Little Carpathians, in a position of strategic importance near the Porta Hungarica. Pressburg was the capital of Hungary from 1341 until 1783, while the Hungarian parliament held its sittings here till 1848. One of the most conspicuous buildings in Pressburg is the cathedral, founded in 1272; in 1297, when the large gates were burnt. A large building, and is still in ruins. Other noteworthy buildings are the cathedral, a Gothic edifice of the 13th century, restored in 1861–1880, in which many of the Hungarian kings were crowned; the town hall, also a 13th-century building, several times restored, and containing an interesting museum; the Franciscan church, dating from 1272; and the law-courts, erected in 1753, where the sittings of parliament were held from 1802 to 1848. The Grassalkowitch palace is now the residence of an archduke, and there is an archiepiscopal palace. Educational establishments include an academy of jurisprudence, a military academy, a Roman Catholic and a Protestant seminary, a training school for female teachers, and several secondary and technical schools. A large business is carried on in wooden furniture, tobacco and cigars, paper, ribbons, leather wares, chemicals, liqueurs, confectionery and biscuits. There is, besides, a dynamite factory, which produces over 2,000,000 lb of explosives annually, a large cloth factory and several flour mills. Trade in grain and wine is active. Besides the extensive traffic on the Danube, the town is also an important railway junction. The first railway line in Hungary was that from Pressburg to Tyrnau through the valley of the Waag. The town is the terminus of an interest in its environs. About twenty-five minutes by steamer down the Danube, the extensive ruins of the castle of Theben (Hung. Dëtvény), the former gate of Hungary, are situated at the point where the March, which forms the boundary between Austria and Hungary, falls into the Danube. Opposite on the left, bank is Hainburg, the gateway of Hungary from the Austrian side. Eastward and southward of Pressburg stretches a long and fertile plain, known as the Upper or Little Hungarian plain. It has an area of 2825 sq. m., of which two-thirds lay on the right bank of the Danube, and the whole is bounded by the rivers Neutra and Raab. In the extreme south-west of this plain is situated the lake of Furt-Tava (Ger. Neusiedler See), which has an area of about 100 sq. m., but it is of varying size, and sometimes dry. Eastward of the town is a marsh called the Hainság, through which it is in communication with the river Raab and with the Danube. In the Roman period it was known as Petso or Péslo. In several places of the dry bed traces of prehistoric lake-dwellings have been discovered. In conjunction with the regulation of the river Raab, and the drainage of the Hainság marsh, plans for the drainage of the lake have been proposed.

Little is known of the early history of Pressburg, which was founded about 1000. It was soon strongly fortified, though it was captured by the king of Bohemia, Ottakar II., in 1271. It received many privileges from the Hungarian kings, especially from the emperor Sigismund, and its strategic situation made it an important fortress. Sigismund held Imperial diets in the town. After the battle of Mohacs in 1526 and the capture of Buda by the Turks, Pressburg became the capital of Hungary. Here in 1608 the Austrian and Hungarian malcontents concluded a treaty with the archduke Matthias, afterwards emperor, against their lawful sovereign, the emperor Rudolf II. In 1619 the town was taken by Bethlen Gabor, but it was recovered by the Imperialists in 1621. In 1687 it was the scene of the session of the estates of Hungary during which the Hungarians renounced their right of choosing their own king and accepted the hereditary succession of the Habsburgs. Here also was held the diet of 1741 when the members swore to assist their sovereign, Maria Theresa, against Frederick the Great. In 1784 Buda took the place of Pressburg as the capital of Hungary, but the latter town continued to be the seat of the parliament until 1848. On the 26th of December 1805 peace was signed here between Napoleon and the emperor Francis I., and in 1809 the town was bombarded by the French.

See J. Kiraly, Geschichte des Donau-Mahlk. und Urfahr-Raachts der Freiheit Pressburg (Pressburg, 1890); T. Ortvay, Geschichte der Presse (Pressburg, 1895); and Pressburs Strassen und Plätze (Pressburg, 1905).

PRESSÉNÉ, EDMOND DEHAULTE DE (1824–1891), French Protestant divine, was born at Paris on the 7th of January 1824. He studied at Lausanne under Alexander Vinet, and at Halle and Berlin under F. A. G. Tholuck and J. A. W. Neander, and in 1847 became pastor in the Evangelical Free Church at the chapel of Taibout in Paris. He was a powerful preacher and a good political speaker; from 1871 he was a member of the National Assembly, and from 1883 a senator. In 1890 he was elected a member of the Academy of Sciences. Presséni laboured for the revival of biblical studies. He contended that the Evangelical Church ought to be independent of the power of the state. He died on the 8th of April 1891.

PRESS GANG, the popular name for the companies of officers and men who were commissioned to execute the warrants for the impressment of seamen in Great Britain (see IMPRESSMENT). These bodies consisted of a captain, one or more lieutenants, a master, and a crew of trustworthy men. They were sent to seaports, or occasionally to inland towns where sailors were likely to be met when going from one coast to another. A "rendezvous" was opened, volunteers were enlisted, deserters arrested, and such "able-bodied persons" as were liable to be pressed for service in the fleet were seized, and sent to the guard ships (q.v.).

PRESS LAWS, the laws concerning the licensing of books and the liberty of expression in all products of the printing-press,
especially newspapers. The liberty of the press has always been regarded by modern political writers as of supreme importance. "Give me liberty to know, to utter, and to argue freely according to conscience, above all other liberties," says Milton in the Areopagitica.

At the present day the liberty of the press in English-speaking countries is a matter of merely historical importance. But this liberty was a plant of slow growth. Before the invention of printing the Church assumed the right to control the expression of all opinion distasteful to her. When the printing-press was invented German printers established themselves at various important centres of western Europe, where already numbers of copies were printed in multiplying manuscripts. In 1473 Louis XI granted letters patent (giving the right of printing and selling books) to "Uldaric Quering" (Ulrich Gering), who three years earlier had set up a press in the Sorbonne (the theological faculty of the university at Paris), and before long Paris had more than fifty presses at work. The Church and universities soon found the output of books beyond their control. In 1496 Pope Alexander VI. began to be restive, and in 1501 he issued a bull against unlicensed printing, which introduced the principle of censorship. Between 1524 and 1549 (Imperial Brief) the German ecclesiastical authorities suppressed the printing of books by the decrees of the Diet of Worms. Under the Edict of Vienna was passed the Licensing Act (1548) which, so far as the printing of books was concerned, was practically a monopoly. This was the Edict of Vienna, by which the printing of books was reduced to the London Gazette. The objection made to lines 594-599 of the first book of Paradise Lost by the archbishop of Canterbury's chaplain, acting as licensor, are well known. The act expired in 1679, and for the remainder of the reign of Charles II., as in the reign of George III., the restrictions on the press took the form of prosecutions for libel. In 1863 the Licensing Act was renewed for seven years (1 Jac. II. c. 5 § 13). No mention of the liberty of the press was made in the Bill of Rights. On the expiration of the Licensing Act in 1692 it was continued till the end of the existing session of parliament (§ 4 & 5 Will. and Mar. c. 24, § 14). In 1865 the Commons refused to renew it. The state of the press at this period was the same as before 1753. In 1855 the phrase "the liberty of the press" was no longer a part of the laws of England, but the phrase "the liberty of the press" is still used in the law as a term of art. The liberty of the press was not granted by the Act of 1855 (18 Vict. c. 27), the duty on paper in 1861 (24 Vict. c. 20), the optional duty on newspapers in 1870 (33 & 34 Vict. c. 38). From that time the English press may be said to have enjoyed complete freedom, which rests rather upon a constitutional than a legal foundation. It is not confirmed by any provision of the supreme legislative authority, as is the case in many countries. A declaration in favour of the liberty of the press is usually a prominent feature in the written constitutions of foreign states.

The few existing restrictions on the liberty of the press are presumed to be imposed for the public benefit. They are in some cases of great historical interest. The rights of private persons are in general sufficiently protected in one direction by the law of Libel (g.v.), in another by the law of Copyright (g.v.), while the criminal law provides for the cases of press offences against morality, public justice, &c. Thus the courts have power to punish summarily as a contempt the publication of comments upon proceedings sub judice.
or reflections on the conduct of judicial officers. (See Contempt of Court.) All of the censorship before publication is to be found in the licensing of stage plays. By 6 & 7 Vict. c. 68 no new plays or additions to old plays can be acted for hire at any theatre in Great Britain until they have been submitted to the lord chancellor, whose consent to the production of the play shall be a condition precedent to the payment of the penalty for acting a play before it has been allowed or after it has been disallowed if a sum not exceeding £50 for every offence and the forfeiture of the licence of the theatre to which it relates for a period not exceeding one month. The act was interpreted by an official of the lord chamberlain's department called the "examiner of stage plays." The last relic of the monopoly of printing formerly granted to licensees of the Crown is found in this regressive right of the procurator fiscal of the metropolis. The ordnance of 1561, deputed to the mayor of Oxford and Cambridge to print the Bible and the Book of Common Prayer, and of the king's printer to print acts of parliament and other state documents. The privy councils, by 9 & 10 Eliz. c. 39. The rights of the king's printer are protected by severe penalties. A maximum term of seven years' penal servitude is incurred by any person who prints any act of parliament or other government document, falsely purporting to be printed by the king's printer or under the authority of His Majesty's stationery office (8 & 9 Vict. c. 113; 45 Vict. c. 9). The rights of the printers of the journals of either house of parliament are protected by 8 & 9 Vict. c. 113. The publication of parliamentary debates in any form by any other person than the printers of the journals of the two houses is still in theory a breach of privilege, but in practice they have been fully reported since 1771. The other reformed act of 1868, printed in England (30 & 31 Vict. c. 41) forbids the issuing of a prohibitory halfpenny newspaper, or what is called the cheaper edition, without the consent of the lord chancellor, and authorizes the courts to seize and destroy such literature. The Book and Music Selling Act, 1863, inserted in the Criminal Law Act, 1861, empowers any person to sue for and recover two shillings and sixpence in damages for any act of printing, selling, hiring, distributing, &c., of anything printed, with a few exceptions. Penalties must be sued for within three months, and no proceeding for penalties can be begun unless in the name of the attorney-general or solicitor-general. The act further provides that the printer of the daily newspapers shall furnish a copy of any proclamation, order, or regulation which falsely purports to have been printed by the government printer, or to be printed under the authority of the legislature of any British colony or possession. The act is, however, subject to any law made by the colonial legislature.

India.—During the governor-generalship of Lord Lyttion was passed "the Act for the better control of publications in Oriental Languages," Act ix. of 1878. (1) By this act no book published out of British India was liable to forfeiture and seizure by warrant throughout the whole of British India if the papers contained any words printed under severe disqualification to the government established by law in British India, or antipathy between any persons of different races, castes, religions or sects in British India. The governor-general might by notification in the Gazette prohibit the sale, distribution or importation of such British India. (2) In places to which the act was extended by order of the governor-general in council a magistrate might require the printer and publisher of a newspaper to enter into a bond, with a deposit, not to publish a newspaper containing "any words, signs, &c. (as in 1), or to use or attempt to use it for the purpose of extortion or threat. The consequences of offending were forfeiture of the deposit, papers, press, &c. Books used for the illegal purposes above mentioned were to be confiscated. The act required previous to publication of books, as in the case of newspapers.

The 1910 act, which remained in force until 1916, was found, owing principally to the restriction of its operation to newspapers published in the vernacular, to be ineffective in coping with the spread of news sheets exciting disaffection amongst the natives towards the government of India. It was consequently repealed and replaced by an act of February 1910, which applies to all newspapers published after the act. The deposit requiring to be made is now obligatory on all new printing-presses, whether issuing a newspaper or not, and on 5 per cent. of the deposit on the newspaper. The requirement of a formal bond has been abolished. There are provisions for forfeiture of the deposit and confiscation of the press on repetition of the offence. The 1910 act gives power to the authorities to open and examine newspapers, other publications, and any other articles likely to be affected by the act, and requires the printer of a newspaper to deposit with the government two copies of each issue at the time of publication. It includes a long list of offences incitement to which is punishable under the act, and in giving power to stop a seditious newspaper after conviction, and in fixing responsibility on the actual printers of seditious matter, has considerably strengthened the power of the state.

Egypt.—The press is subject to a special law (The Press Law of 1881) and to certain articles of the penal code which define press offences and prescribe penalties (both fine and imprisonment) for them. According to the press law of 1881, which is part of the Ottoman Empire, the penal code cannot be applied to foreign subjects, and its application had not (up to 1910) been found sufficient to repress abuses. The probable result of strengthening the law would be to entrench or solidify whatever tendencies of indulging in violent language or sedition would engage a foreign subject as nominal proprietor or editor and thereby escape local jurisdiction. The Press Law of 1881 is a more powerful instrument than the penal code, inasmuch as there are decisions of the mixed

1 The monopoly of the king's printer does not extend to any translation other than the Authorized Version, and not to that if it be accompanied by new notes or marginal readings.
tribunals that that law is, in principle, applicable to foreigners.

By this law registration of newspapers is obligatory, and the government has power of control, defined in art. 13 as follows: "In the interests of public order, of religion or of morality, every newspaper or periodical which is directed against the internal or external peace of the interior after two warnings, or, without previous warning, by a decision of the council of ministers. Each warning may be accompanied with a fine. Every printer or publisher of a newspaper or periodical which has been suppressed continues to appear, if the responsible parties can be fined, and the printing-press which issues the suppressed publication can be closed by order of the minister of the interior, or by the minister of justice. However, in the case of a foreigner require the co-operation of his consul.

This law was from about 1860 allowed to fall into disuse. Owing to the excesses of the Arabic newspapers the law was revived in the early part of 1900, but was applied with great moderation. During the year two native papers were warned and one was suppressed. The same suppression was the only penalty inflicted on any person from suppression and seizure of the printing-press more severe than a fine of £20, and in 1909 under the penal code the editor of one native paper was sentenced to a year's imprisonment and the editor of another to three months' imprisonment. (See Sir Eldon Gorst's reports on Egypt for 1908 and 1909, especially Egypt No. 1, 1909, pp. 3-5).

The United States.—The first constitutions of Pennsylvania, Delaware, Maryland and North Carolina, enacted in 1776, are the earliest as containing the earliest declarations of any legislative authority in favour of the liberty of the press. The same principle was afterward adopted in the constitution of the United States. The acts of England and the states of the Union have for the most part its own legislation on the subject, dealing generally with, among other matters, the registration of newspapers, the monopoly of the state printer, and the right of giving the truth in cases of libel. The printing of August 1856 forbids diplomatic or consular officers of the United States to correspond with any foreign newspaper in regard to the affairs of a foreign state. The act of 3rd of March 1875 prohibits the use of any stamp issued under the law of the 27th of June 1852. The Congress has provided that all printing (unless otherwise ordered by law) for the Senate and House of Representatives and the executive and judicial departments, shall be done by the government printer.

Austria-Hungary.—In the Austrian Empire, which from 1804 to 1867 embraced Hungary also, the press laws under Metternich's regime were extremely severe. By the penal code of 1808 publishing had to be licensed, under heavy penalties, and in 1810 to two censors were appointed. In short, the press had no shadow of liberty. During the revolution of 1848-1849 the principle of the freedom of the press was established, but the censures was restored in 1852 and not abolished until 1865. The actual press laws of Austria are based on the press law of the 17th of December 1862 as modified by later supplementary enactments. In principle the freedom of the press was guaranteed by the constitution of February 28, 1867. In practice, however, it was still restricted by the obligation of newspaper proprietors to deposit "caution money" (Kautionszins) with the authorities, and the retention of the government stamp (postage-dues) required by the law of the 9th of July, 1894, and the stamp by that of the 27th of December 1899. The police, however, still have the right, either on their own initiative or under the instructions of the public prosecutor (Staatsschutz) "provisionally" to confiscate printed matter which in their opinion offends against the terms of the press law or is contrary to the public interest. The public prosecutor, within eight days, to justify this action in court, either by proceedings against those responsible for the publication, or by proving the published matter is offensive and ought to be suppressed. This latter "objective procedure (objektives Verfahren) is peculiar to Austrian law, and unusual in the laws of most other countries. In 1902 the government introduced a bill greatly modifying these and other provisions of the press law in a liberal sense, but the bill was postponed to more urgent matters.

In Hungary the bill of the 7th of October 1848, which was restored in 1867. Under this the censorship was abolished; but, in addition to provision for the case of libel, provisions were made for "political offenses" (sqq.) and provided penalties for certain political press offenses (§§ 6-8), i.e., attacks on the king or members of his family, incitements to (a) the dissolution of the territorial unity of the state or of the dynastic link, (b) the substitution of a secular government, (c) disobedience to lawful authorities; (d) commission of crime. Press offenses are tried by special courts. Under the Criminal Code of 1878 (§§ 170-174) further offenses were made subject to penalties of imprisonment from one year to life. For capital offenses, one nationality or religious denomination to hatred of another," insurrection against the constitution and parliament, and glorifying of etc. These offenses, together with the above, provide for punishm.ences. "Direct incitement" (§ 172), was subsequently interpreted by the curia to mean "any spoken or written word which is capable of producing in another hatred against a nation, &c."

The result of these provisions has been that liberty of the press has existed in practice only for the Magyars, constant prosecutions have occurred, and a select number of newspapers have been directed at the grievances of the other Hungarian races, conviction being all but inevitable owing to the special juries (due to the presence of non-Hungarian newspapers). It is being almost exclusively composed of members of the dominant society.

In Transylvania, where the old stringent Austrian press law of 1852 is still in force, the public prosecutor has discretionary powers in what is obviously an abuse of power, used against a Romanist press. (See R. W. Seton Watson, "Racial Problems in Hungary," London, 1908, pp. 293 seq.)

Belgium.—It was the prosecution of political writers by the Dutch government that diverted the attention of the world from this country in 1830. By the Belgian constitution of the 7th of February 1831, art. 18, it is declared that the press is free, that censorship shall never again be established, that sureties cannot be exacted from writers, editors or printers, and that when the author is known and domiciled in Belgium the printer or bookseller cannot be prosecuted. By art. 98 press offenses are to be tried by jury. The penal law of the press is contained in the decree of the 20th of July 1831, made perpetual in 1833. By this law it is made an offense, apart from the penal code, (1) to incite to the commission of a crime by placards or printed writings in a public meeting; (2) to attack the obligatory form of the laws, or to substitute for it; (3) to attack the constitutional authority or inviolability of the king, the constitutional authority of the dynasty, or the authority and rights of the chambers. Every copy of a journal must bear the name of the printer. In the case of newspapers the number of copies, or the number of proceedings for offenses against the law must be taken in some cases within three months, in others within a year.

Denmark.—Press offenses were at one time punished with great severity by the code of 1814. The remaining laws, or the so-called Press Laws, were revised in 1850, and new laws, the Press Laws, of 1894, abolished or reduced the punishment for offenses against religion or morality, and for printing or distribution of works considered as falling under the law by the public prosecutor, or county, or grand juror, or by the government prosecutor. Articles 46 and 47 of the penal code (due to the presence of non-Scandinavian work, i.e., "by the many, and, if against a magistrate, with death." Censorship was abolished and the press declared free by art. 86 of the constitution granted by Frederick VII. on the 5th of June 1849, and confirmed by the charter of 1852. Art. 480 forbids the search for or seizure of printed matter in a dwelling-house, unless after judicial proceedings.

France.—The government began early to impose stringent restrictions on the press. In 1810 the decree of July 15, 1810, for suspension of the liberty of the press. Restrictions on the liberty were removed for the time in 1830 and 1832, only to be succeeded as usual by the press laws of 1835 and 1852. During the Second Empire government prosecutions for libel were used as a powerful engine against the press. The proceedings against Montalembert in 1858 are a well-known instance. Between 1858 and 1866 many newspapers were suppressed by proclamation. With the fall of the Second Empire the press was completely re-established. A decree of the 27th of October 1873 directed that all charges by jury. The law of the 29th of July 1881, by which the French press is now regulated, begins by asserting the liberty of the press and the necessity of censorship. The law on the publication of newspapers, which has been the subject of a number of decisions of the court of cassation, is that (1) the manager or editor, (2) the author, (3) the printer, (4) the vendor or distributor. The printer and the vendor, however, can only be punished for acts not falling within their proper functions. Proceedings for breaches of the law are to be commenced at most within three months. As to taxation, the decree of the 5th of September 1876 abolished the stamp duty upon newspapers, but it is still imposed 1

upon public notices (affiches) other than those of public authorities. Notice that the notices of public authorities may be printed on white paper.

Germany.—Censorship was introduced by the dict of Spires in 1559. From that time till 1816 there were numerous restrictions on the press. The law of 28th December 1816 established the censorship, which was abolished in 1848 by the resolutions of the German confederation, passed on the 20th of September 1819 as a sequel to the Carlsbad decrees (q.v.). By the press law of 1847, every newspaper must be printed in each state. Liberty dates, as in Austria and Italy, from 1848. Soon after that year, however, it became necessary to establish press laws in most of the German states, as in Bavaria in 1850, Prussia and Hanover in 1851, Saxony in 1853, and the Belgian states in 1854. The press law of 1847 has disappeared. By art. 74 of the constitution of the empire (1871) every one attacking the empire or its officers through the press is liable to punishment in his own state. By art. 4 the laws relating to the press as to publications not being officers of the empire and not printed in the empire of the 7th of May 1874 is therefore in force throughout the whole empire. At its beginning it affirms the liberty of the press. Its main provisions are these: The name and address of the printer must appear on all printed matter. Newspapers and periodicals in addition bear the name of some one person, domiciled in the empire, as responsible editor, and a copy of every number must be deposited with the police authorities of the district in which it is published. Foreign periodicals may be excluded by proclamation of the Imperial chancellor for two years, if within the year they have been guilty of certain offences against the penal code. Their names must appear in the register maintained by the police. The order of responsibility for offences is the same as in France. Proceedings must be taken within six months. In certain cases printed matter may be seized without the order of a court. This may take place when the publishers have not paid, (1) the printer or editor, (2) military secrets are revealed in time of war, (3) justice would be defeated by the publication not being immediately suppressed, in case of seizure. The circulation of the seized. The press law is not to affect regulations made in time of war or internal disturbance. A temporary law passed in 1874 gave the police large powers in the case of socialist publications. The proposal of the Reichstag that all press offences should be so tried was rejected by the governments, except as regards those states (Bavaria, Württemberg, Baden, Oldenburg) where this principle was introduced.

Greece.—Under King Otto censorship was exercised up to 1844. By the constitution of the 18th of March 1844 every one may publish his thoughts by means of the press, observing the laws of the empire. All private persons are at liberty to print, free, and without censorship or penalty. Responsible editors, publishers and printers of newspapers are not required to deposit money on the ground of surety. Publishers of newspapers must be Greek citizens (art. 19). The legislature may exclude reporters from its sittings in certain cases (art. 48). Press offences are to be tried by jury, except when they deal only with private life (art. 93).

Italy.—By art. 27 of the political code of Sardinia, granted by Charles Albert on the 4th of March 1848, and still in force, the press is free, but abuses of the liberty are restrained by law. The present press law of Italy is contained in the law of the 26th of March 1848, as altered by later enactments. Everything printed in typographical characters, or by lithography or any similar means, must indicate the place and the date of printing and the name of the printer. A copy of every printed matter must be deposited with certain officials and at certain libraries. Before the publication of any newspaper or periodical, notice of the intended publication must be given at the office of the secretary of state for internal affairs, together with a copy of the regulations for the censorship of the press, and the qualification of the person intending to publish, whether as proprietor or editor. (2) the nature of the publication, and (3) the name and address of the publisher. Every new periodical is bound to insert gratuitously an explanation or an apology of any charge made against the editor in its columns. For contravention of these and other regulations there is a statutory penalty not exceeding 300 lire. Nullity of the registration of the publication is the strictest punishment. The strictest supervision was enforced over the foreign press, periodical and otherwise. None but a few privileged individuals, such as members of the royal family, foreign diplomats, and editors of newspapers in the capital, might receive permits to print. The permission was not renewed once it was blackened out, and sometimes in the exclusion, of whole columns and sheets of publications that might be deemed pernicious. Only such periodicals as were placed on a list approved by the board of censors were allowed to be received through the post. It was subject to strict censorship. The Russian telegraphic press agency was introduced.

Ottoman Empire.—By art. 4 of the constitution of the 23rd of December 1876 the press was recognized as free, subject to the limits imposed by law. The constitution was, however, "suspended," and a rigorous censorship was enforced, under the direction of Sultan Abd-ul-Hamid II., until the revolution of 1898. In the meantime the free press existed up to the establishment of the Inquisition, and that Gil Vicente (d. 1536) was the last writer who dared to express his ideas. Only the civil and political parts of the press were licensed, and certain tone of a controversial, polemical, or of a specified character, and writings displeasing to the authorities. Boards of censorship were appointed to control under the names of the "Real mesa censoria," or the "Mesa do desembargo do paço," assumed to license publications. The censorship was continued after the constitution of 1876. By the law of 26th May 1878 the press was licensed, and the press was censored by the law of 7th of October 1879, as amended by art. 7 of the constitution granted by John VI. in 1821. By art. 8 a special tribunal was constituted in both Portugal and Brazil to protect the liberty of printing. The censorship was continued upon the same basis. A government periodical was established by the law of 12th December 1881. The press, though free, is subject to censorship. All publications are subject to the censorship of the Ministry of the Interior. All newspapers and periodicals are considered as subject to the censorship of the Supreme Court of Justice. The censorship is moderated by the Ministry of the Interior. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship. The press is not subject to censorship.
PRESTEIGN—PRESTER JOHN

Spain.—There was probably no country where restrictions on the liberty of the press were at one time more stringent than in Spain. From the first use of printing up to 1521 censorship was exercised by the Inquisition, but after the edict of Toleration began to be tolerated the right, and continued to do so up to its suppression in 1808. In 1558 Philip II. denounced the penalty of death against even the possessor of a book upon the Index expurgatorius of this inquiry. See the Radnorshire. 1

Sweden.—The press law of the 16th of July 1812 is one of the fundamental laws of Sweden. It is an expansion of art. 86 of the constitution of the 6th of June 1809. Liberty of the press is declared to be the privilege of every Swede, subject to prosecution for libellous writing. Privileges of individuals as to publication are abolished. The title and place of publication of every newspaper or periodical must be given, and the work must be numbered. Every publication must bear the name of the printer and the place of printing. Press offences are tried by a jury of nine, chosen respectively by the prosecutor, the prisoner, and the court. The verdict of two-thirds of the jury is final. 

Although the Welsh name of Llanandras is said to denote a foundation by St Andreas ap Rhun ap Brychan in the 5th century, the place seems to have been an obscure hamlet in the lordship of Moelynadd until the 14th century, when Bishop David Martyn of St Davids (1290-1328) conferred valuable market privileges upon this his native place, which on doubtful authority is said to derive its English name from this priest. In 1542 Presteign was named as the meeting-place of the county sessions for Radnorshire in conjunction with New Radnor, and it has ever since ranked as the county town. Although an ancient borough by prescription, Presteign was not included in the Radnor parliamentary district until the 19th century, and of this privilege it was deprived by the Redistribution Act of 1835.

PRESTER JOHN, a fabulous medieval Christian monarch of Asia. The history of Prester John no doubt originally gathered round some nucleus of fact, though what that was is extremely difficult to determine. But the name and the figure which it suggested occupied so prominent a place in the mind of Europe for two or three centuries that a real history could hardly have a stronger claim to exposition. Before Prester John appears upon the scene; all that does not immediately concern this personage is part of an ancient fable, which entwined itself with the legends about him. This is the story of the appearance at Rome (1122), in the pontificate of Calixtus II., of a certain Oriental ecclesiastic, whom one account styles "John, the patriarch of the Indians," and another "an archbishop of India." This ecclesiastic related wonderful stories of the shrine of St Thomas in India, and of the miracles wrought there by the body of the apostle, including the distribution of the sacramental wafer by his hand. We cannot regard the appearance at Rome of the personage who related these marvels in presence of the pope as a mere popular fiction: it rests on two authorities apparently independent (one of them a letter from Odò of Relims, abbot of St Remy from 1118 to 1151), for their discrepancies show that one was not copied from the other, though in the principal facts they agree.

Nearly a quarter of a century later Prester John appears upon the scene, in the character of a Christian conqueror—potentate who combined the characters of priest and king, and ruled over vast dominions in the Far East. This idea was universal in Europe from about the middle of the 12th century to the end of the 13th or beginning of the 14th. The Asiatic story then died away, but the name remained, and the royal presbyter was now assigned a locus in Ethiopia. Indeed, it is not improbable that from a very early date the title was assigned to the Abyssinian king, though for a time this identification was overshadowed by the prevalence of the Asiatic legend. At the bottom of the double allocation there was, no doubt, that confusion of Ethiopia with India which is as old as Virgil and perhaps older.

The first mention of Prester John occurs in the chronicle of Otto, bishop of Freisingen. This writer states that when at the papal court in 1145 he met with the bishop of Gabala (Jihal in Syria), who related how "not many years before one John, king and priest (rex et sacerdos), who dwelt in the extreme Orient beyond Persia and Armenia, and was, with his people, a Christian but a Nestorian, had made war against the brother kings of the Persians and Medes, who were called Samiards (or Sanjards), and captured Ecbatana their capital. After this victory Presbyter John—for so he was wont to be styled—advanced to fight for the Church at Jerusalem; but when he arrived at the Tigris and found no means of transport for his army, he turned northward, as he had heard that the river in that quarter was frozen over in winter-time. After halting on its banks for some years in expectation of a frost he was obliged to return home. This personage was said to be of the ancient race of the Magi mentioned in the Gospel, to rule the same nations that they ruled, and to have such wealth that he used a sceptre of solid emerald. Whatever impression was made by this report, or by other rumours of the event on which it was founded, was far exceeded, about 1165, by the circulation of a story of a king to be addressed by Prester John to the emperor Manuel. This letter, professing to come from "Presbyter Joannes, by the power and virtue of God and of the Lord Jesus Christ, Lord of Lords," claimed that he was the greatest monarch under heaven, as well as a devout Christian. The letter dealt at length with the wonders of his empire. It was his desire to visit the Holy Sepulchre with a great host, and to subdue the enemies of the Cross. Seventy-two kings, reigning over as many kingdoms, were his tributaries. His empire extended over the three Indies, including that Farther India, where lay the body of St Thomas, to the sun-rising, and back again down the slope to the ruins of Babylon and the tower of Babel. All the wild beasts and monstrous creatures commemorated in current legend were to be found in his dominions, as well as all the wild and eccentric races of men of whom strange stories were told, including those uncivil nations whom Alexander Magnus walked up among the mountains of the north, and who were to come forth at the latter day—and so were the Amazons and the Bragmanns. His dominions contained the monstrous ants that dug gold and the fish that gave the purple; they produced all manner of precious stones and all the famous aromatics. Within them was found the Fountain of Youth; the bubbles which gave light before sight, and render the dreamer invisible; the Sea of Sand was there, stored with fish of wondrous savour; and the River of Stones was there also; besides a subterraneous stream whose sands were of gems. His territory produced the worm called "salamander," which lived in fire, and which wrought itself an incombusible envelope from which were manufactured robes for the presbyter, which were washed in flaming fire. When the king went forth to war thirteen

1 See Ticknor, Hist. of Span. Lit. i. 422 seq., iii. 356
PRESTER JOHN

great crosses made of gold and jewels were carried in wagons before him as his standards, and each was followed by 10,000 knights and 100,000 foot soldiers. There was much hon- or and glory, no flatterer, no miser, no "dishon- or," as lies, and no vices. His palace was built after the plan of that which St. Thomas erected for the Indian king Gonde- phorus. Of the splendour of this details are given. Before it was a marvellous mirror erected on a many-storeyed pedestal (described in detail); in this speculum he could discern every- thing that went on throughout his dominions, and detect conspiracies. He was waited on by 7 kings at a time, by 60 dukes and 365 counts; 12 archbishops sat on his right hand, and 20 bishops on his left, besides the patriarch of St. Thomas's, the protopope of the Sarma- nian (Samaratter) party, and the bishop of Beth- mesheth. In this palace, the royal residence was. There was another palace of still more wonderful character, built by the presbyter's father in obedience to a heavenly command, in the city of Bribric. Should it be asked why, with all this power and splendour, he calls himself merely "prester," this is because of his humility, and because it was not fitting for one whose sewor was a primate and king, whose butler an archbishop and king, whose chamberlain a bishop and king, whose master of the horse an archimandrite and king, whose chief cook an abbot and king, to be called by such titles as these. The fact is that the popularity and diffusion of this letter may be judged in some degree from the fact that Zarncke in his treatise on Prester John gives a list of close on 100 MSS. of it. Of these there are 8 in the British Museum, 10 at Vienna, 13 in the great Paris library, 15 at Munich. There are also several renderings in old German verse. Many circumstances of the time tended to render such a letter accept- able. Christendom would welcome gladly the intelligence of a counterpoise arising so unexpectedly to the Mahomedan power; while the statements of the letter itself combined a reference to and corroborated all the romantic figments con- cerning Asia which had fed the curiosity of Europe, which figured in the world-maps, and filled that fabulous history of Alexander which for nearly a thousand years supplanted the real history of the Macedonian throughout Europe and western Asia.

The only other surviving document of the 12th century bearing on this subject is a letter of which MS. copies are preserved in the Bibliothèque Nationale, and in the Bibliotheca Alexandrina, and in several libraries of the East. The chronicles of several English annalists, including Benedict of Peter- brough, Roger Hovedon and Matthew Paris. It purports to have been indited from the Rialto at Venice by Pope Alexander III, on the 1st of September of the year 21 of his pontificate, fixed the year as 1177. The pope addresses it, carissimo in Christo filio Johanni, illustro et magnifico indorum regi [Hovedon's copy here inserts sacerdoti sanctissimo]. He recites how he had heard of the magnificent apparition described at the beginning of the article, by manifold narrators and common report, but also more particularly from his (the pope's) physician and confidant (medicus et familiaris noster), Master Philip, who had received information from honourable persons of the monarch's kingdom, with whom he had intercourse in those (Eastern) parts. Philip had also reported the king's anxiety for instruction in Catholic discipline and for reconciliation with the apostolic see in regard to all discrepancies, and his desire to have a church in Rome and an altar at Jerusalem. The pope goes on to say that he found it too difficult, on account of the length and obstructions of the way, to send any one (of ecclesiastical position) a letter, but that he had sent Philip to represent him to that end. And on accepting Philip's communications the king should send back honourable persons bearing letters sealed with his seal, in which his wishes should be fully set forth. The more nobly and magnanimously thou conductest thyself, and the less thou wastest of thy wealth and power, the more readily shall we regard thy wishes both as to the concession of a church in the city and of altars in the church, as to the visitation of St. Petrus, and Paul, and in the church of the Lord's Sepulchre at Jerusalem.

There is no express mention of the title "prester John" in what seem the more genuine copies of this letter. But the address and the expression of purpose of the appended message just quoted (alludes to the vaunting epistle of 1165) hardly leave room for doubt that the pope supposed himself to be addressing the author of that letter. We do not know how far the imaginations about Prester John were current in 1177, during the pontificate of Pope Alexander, for we know of no mention of Prester John in the interval. But in that year again a rumour came out of the East that a great Christian conqueror was taking the hated Moslems in reverse and sweeping away their power. Prophecies current among the Christians in Syria of the destruction of Mahomet's sect after six centuries of duration added to the excitement attending these rumours. The vivid description of Prester John, who called him the son or the grandson of Prester John of India, his whose conquests and slaughters now revived the legend in fact no Christian or King David but the famous Jenghiz Khan. He was described as being of immense size, and as forming an invader and devastation of eastern Europe its effects still influenced the mind of Christendom and caused popes and kings to send missions to the Tartar hordes with a lingering feeling that their converts were not only Christians, but at least at all on the verge of conversion.

Before proceeding further we must go back to the bishop of Gabala's story. M. d'Avezac first showed to whom the story was told. The same year (1177) in which the supposed approximations in circumstances is the founder of Kara-Khita was the 12th century, and the 12th century was that of the Khil Khilkhitian dynasty of Liao, which had reigned over northern China and the regions beyond the Wall during a great part of the 10th and 11th centuries, and from which came the name Khi tai (China). In 1125 this prince, who is called by the Chinese Yeliu Tashi, and had gone through a complete Chinese education, escaped westward with a few attendants. Before he even reached China, he was seized by a tribe west of the desert, subjects of his family, who gathered an army and commenced a course of conquest which eventually extended beyond and western and eastern Turkestan. He took the title of "Khan of the Great Khwarezmian" and reigned over the country of the Turks, Khamd of Karakhan, and fixed at Balasagun, north of the Tien Shan range, the capital of his empire, which became known as that of Kara-Khita, or "Great Khwarezm." In 1141 the Khan was invited by the shah of Kherezm against Sanzar, the Seljuk sovereign of Persia, who had expelled the shah from his kingdom and killed his son. The Gur Khan came with a vast army of Turks, Georgians, and others, and defeated Sanzar near Samarkand (Sept. 1141) in a battle which the historian Ibn al-Athir calls the greatest defeat that Islam had ever undergone in those regions. Though the Gur Khan himself is not described as having extended his con- quer to the borders of Kherezm. The Gur Khan also thrust out by invading Khorasan and plundering the cities and treasures of Sanzar. In this event—the defeat of Sanzar, whose brother's son, Mas'ud, reigned over western Persia—occurring years before the story of the Eastern conqueror was told at Rome to Bishop Otto, we seem to have the destruction of the Sanjati Frater or Sanjar brothers, which was the germ of the story of Prester John. There is no evidence of any profession of Christianity on the part of the Gur Khan, though the daughter of the last of his race is recorded to have been a Christian. The hosts of the Gur Khan are called by Moslem historians Al-Turk al-Khwariz, the "khariz" or infidel Turk. Later the Gur Khan was identified as "prester John," as was Vasco da Gama's people were led to take for Christians the Banyan traders on the African coast, and the to describe as Christian so many princes of the Farther East that is now called Asia. How the books of the Levant and to the obscure points. Oppert supposes the title "Gur Khan" to have been confused with Yukan or Yohannes; and it is probable that even in the Levant the stories of "John the patriarch is the site, and, curiously enough, partly inherited from the article, may have already mingled with the rumours from the East.

The failure in the history of the Gur Khan to meet all points in the story of the bishop of Gabala led Professor Bruin of Odessa to bring forward another candidate for identity with the original Prester John, in the person of the Georgian prince John Orbelian, the "issubasar," or generalissimo under several kings of Georgia in that age. He shows, instances, in documents of the 15th century, of the association of Prester John with the Caucasus. In one at least of these the title is applied to the king of Abassia, i.e. of the Abkhazians of Caucasus. Some confusion between Abash (Abasjia) and Abassia has, however, seemed to attach itself to this instance. An abstract of Professor Bruin's argument will be found in the 2nd edition of Sir H. Vule's Marco Polo, ii. 539-542. As regards any real foundation for the title of "presbyter" we may observe that nothing worth mentioning has been advanced behind any candidate.

When the Mongol conquests threw Asia open to Frank travellers in the middle of the 13th century their minds were full of Prester John, and their quest of Prester John for information was sought in the existing works on the subject, and accounts of the Turks, alludes to the clouds of rumour as they rolled westward from Asia. But the persistent demand produced a supply; and the honour of identification with Prester John, after having been first bestowed on the Turk prince, fell for a time with the king of the Nestorian tribe of Kerait, famous in the histories of Jenghiz under the name of Ung or Awang Khan. In Carpini's (1248) single mention of Prester John as the king
PRESTER JOHN

of the Christians of India the Greater, who defeats the Tatars by an elaborate stratagem, Oppert recognizes Jalaluddin of Khazreem and his brief success over the Mongols in Afghanistan. In the Armenian prince Sempad's account (1248), on the other hand, this Christian king of India is aided by the Tatars to defeat and harass the Persian prince. It is thus easy to see the potency of a knight-errant of William Rubruquis (1253), though distinct reference is made to the conquering Gur Khan under the name of Coir Cham of Cara. Alexander the Great, John of Luxembourg, and John Hunyadi were all models of chivalry which the native race of the Naimans, who had married the daughter of the last lineal representative of the gur khan. And from the remarks which Rubruquis makes in connection with this King John, on the habit of the churchians of India, and the fullness of the crown of the golden head, the great tales that went forth about King John, it is evident that the intelligent traveller supposed this king of the Naimans to be the original of the widely spread legend. He mentions, however, a certain Aziz Khan, from which it is questionable whether he ever knew the princes of the Christian families who had got possession of the throne of Northern Abyssinia should have wished to strengthen themselves by a connexion with a European Christian crown, and to have treated their Christian potentiality as a surety for the throne. We do not know whether the leech Philip ever reached his destination, or whether a reply ever came back to the Lateran. Under the Sultanate, which had already been arguing, supposes that the church in Rome possessed in his own time by the Abyssinians (St Stephen's in the Vatican) might have been granted on this occasion. But we may be sure that this was a modern concession during the attempts to master the Ethiopian Church early in the 16th century. Ludolf intimates that its occupancy had been taken from them in his own time after it had been held for more than a century.

The translation of the three Blessed Kings by John of Hildeshem (c. 1570), of which an account and extracts are given by Zarncke (Abhandl., ii. 154 seq.), we have an itinerary of the Ethiopian church, stripped of the customary myths. It is possible that the princes of the Christian families who had got possession of the throne of Abyssinia should have wished to strengthen themselves by a connexion with a European Christian crown, and to have treated their Christian potentiality as a surety for the throne. We do not know whether the leech Philip ever reached his destination, or whether a reply ever came back to the Lateran. Under the Sultanate, which had already been arguing, supposes that the church in Rome possessed in his own time by the Abyssinians (St Stephen's in the Vatican) might have been granted on this occasion. But we may be sure that this was a modern concession during the attempts to master the Ethiopian Church early in the 16th century. Ludolf intimates that its occupancy had been taken from them in his own time after it had been held for more than a century.

Indeed, we can carry the date back half a century further by the evidence of a letter translated in Ludolf (Comment. p. 302) which is addressed by Shoa by the king Zar Jacob in the eighth year of his reign (1340), to the Christian monks dwelling at Jerusalem. The king desires them to light certain lamps in the Church of the Sepulchre, including "three in our chapel." In the Pilgerfahr des Ritters Arnold von Harst (1496-1497): Cologne, 1860, p. 175, we find that the Abyssinians had their chapel, &c., to the left of the Holy Sepulchre, between two pillars of the temple, whilst the Armenian chapel was over theirs, reached by a stone staircase above the entrance of the Indians (or Abyssinians). This exactly corresponds with the plan and description in the Handbuch, in which show the different chapels. The first on the south, i.e. the left looking from the body of the church, is No. 35.—The chappel of the Abyssines, over which the chappel of the Armenians had a reference to Jerusalem, which we procured through the kindness of Mr Walter Besant, shows that the Abyssinians no longer have a chapel or privileges in the Church of the Sepulchre. Between the Abyssinian and the Armenian lie the two other chapels and their respective keys of the convent. The resemblance of King Theodore at the loss of these privileges was one of the indirect causes which led to the war between him and England in 1867-68.

306

[1] It has been pointed out by Alexander Wylie that Kushulk was son of a powerful king of the Naimans, whose name Ta-Yang-Khan is precisely "Great King John" as nearly as that could be expressed in Chinese.

[2] The stories of Khitai as a Christian empire, which led the Jesuits at the court of Akbar to desist Benedict Goes in search of it (1601), did, however, suggest to Jerome Xavier, their chief, that the conditions of the Christian orders might be overthrown by a visit to the sacred cities of the Christians of India, where the true pope resided. G. Ritters Destra, a German Jesuit, after four years residence at the court of Mr Annaeus, who was the representative of the famous King John, "a jumble of inaccuracy."  

[3] In the Spanish work of about the same date, by an anonymous Franciscan, we are told that the emperor called "Abedelshel," which means ' servant of the Cross,' is a protector of Preste Juan, who is the patriarch of Nubia and Ethiopia, and is lord of many great lands, and many cities of Christians, though they be black as "Catalan," who returned from the East before 1298, speaks of the emperor of the Christians " quem vos vocatis Preste Juan." But, indeed, we shall have strong probability on our side if we go back much further still, and say that, however vague may have been the ideas of Pope Alexander III, respecting the geographical position of the Christian empire of India, he felt that there was the only real person to whom the letter can have been sent the king of Abyssinia. Let it be observed that the "honourable personage" whom John Kem of Chromatelia describes "the great John," and who was with in the East must have been the representatives of some real power, and not of a phantom. It must have been a real king who professed to desire reconciliation with the Catholic Church and the ascertainment of a church at Rome and of an altar at Jerusalem. Moreover, we know that the Ethiopic Church did long possess a chapel and altar in the Church of the Holy Sepulchre, and that we have been unable to find travellers' testimony to this older than that of the Latin Church. Whether this Christian power had originated much earlier. We know from Marco Polo that about a century after the date of Pope Alexander's epistle a mission was sent by the king of Abyssinia to Jerusalem to make offerings on the altar of the Church of the Sepulchre. It is remarkable that at the time of the pope's letter Jerusalem, which had been taken from the Moslems in 1699, was still in Christian possession. Abyssinia and the church in Rome passed through a long period of vixipositor and disavow, and in the 10th century the royal line had been superseded by a dynasty of Falasha Jews, followed by other Christian families; but weakness and disorder continued till the restoration of the Oromia dynasty by the emperor Tewodros I in 1855. And we think there is no doubt that the Abyssinian king, who sent a mission to Jerusalem, was no Browse that could have been died the Christian Church, which in the meantime had been established at Rome. This does not mean, however, that the Abyssinians did not have a mission to Rome, or that they did not have a church there, after the fall of Constantinople in 1453, when the rich and honourable church of Brescia was converted into a church for the Abyssinians, and the Catholic Church had many churches and chapels dedicated to the Blessed Virgin Mary in Abyssinia, which was the first Christian country in which the Catholic Church had a mission, and which had been visited by several Christian kings, such as the king of Yem for the rest of the 18th century.
John II. of Portugal was prosecuting inquiries regarding access to his chief objects was to open communication with "Prest John of the Indies," who was understood to be a Christian potentate in Africa. And when Vasco da Gama went on his voyage from Mozambique northwards he began to hear of "Preste John," as relating in the Indian Commentaries, that through the light of his preconceptions of the existence of that personage in East Africa he thus interpreted what was told him. More than twenty years later, when the first book on Abyssinia was composed—that of Alvaro—the subject of the king of Abyssinia is "Preste John," or simply "the Prete."

On the whole subject in its older aspects, see Ludovis's Historia Aschantia et its Commentary, beginning with 

"The excellent remarks of M. d'Avezec, comprising a compendium of almost all the works of the subject, are in the Recueil de voyages et de mémoires published by the Société de Géographie, iv. 547-564 (Paris, 1839).

Two German works of importance which have been used in this article are the interesting and suggestive Der Prebyster Johannes in Sage und Geschichte, by Dr Gustav Oppert (2nd ed., Berlin, 1870), and, most of all, in its learned, careful and critical collection and discussion of all the passages bearing on the subject, Der Priester Johannes, by Friedrich Zarncke of Leipzig (1856-1879). See also Sir H. Yule's Cathay and the Way Thither, p. 173 seq., and in Marco Polo (2nd ed.), i. 229-233. II. 539-543.

(H. Y.)

PRESTITI, or Prestigio, ready, and digitus, finger), the art of conjuring by nimble-fingered dexterity, particularly as opposed to the use of mechanical devices (see Couture). The Latin praestigium, illusion, praestigiators tricks, and praestigatores, conjurers (magicians, sorcerers, and stingers, to prick), cover the same meaning though differently defined. The French retain the original meaning of juggling or conjuring (see Prestidigitation).

PRESTON, John (1587-1628), English Puritan divine, was born at Heyford in Northamptonshire and was educated at Queens' College, Cambridge (1609). He took orders, and on becoming dean of his college drew large crowds to hear his sermons. His colleagues, impressed by his advice he was appointed chaplain to Prince Charles in 1610; in 1622 he became preacher at Lincoln's Inn and master of Emmanuel College, Cambridge. After the accession of Charles I. he worked hard on behalf of the Puritan cause, but could accomplish little or nothing against Archbishop Laud. In theology he was a staunch Calvinist and his writings had considerable popularity.

PRESTON, a municipal, county, and parliamentary borough and port, of Lancashire, England, on the river Ribble, 209 m. N.W. by N. from London by the London & North-Western railway, served also by the Lancashire & Yorkshire railway. Population, 1901, 107,575; (1911), 125,849; at the beginning of the 10th century it was about 17,000. The nucleus of the town consists of a ridge rising sharply from the north bank of the river, while the surrounding country, especially to the west about the estuary, is flat. Among the numerous parish churches that of St John, built in Decorated style in 1835, occupies a site which has carried a church from early times. Among several Roman Catholic churches, that of St Walpurgis (1834) is a handsome building of Early Decorated character. Of public buildings the most noteworthy is the large town hall, with lofty tower and spire, in Early English style, built in 1867 from designs by Sir Gilbert Scott.

The free public library and museum were established in 1879 by the trustees of E. R. Harris, a prominent citizen. A new building was opened in 1893. Here is placed Dr. Shepherd's library, founded in 1761, of nearly 9,000 volumes, with a collection of pictures, &c., valued at £40,000, bequeathed by the late R. Newsham. The Harris Institute, endowd by the above-named trustees with £40,000, is established in a building of classical style erected in 1849, wherein are held science and art classes, a library, and a school of design is maintained. For the grammar school, founded in 1550, a building in the Tudor style was erected in 1841 by private shareholders, but in 1860 they sold it to the corporation, who now have the management of the school. Among the public halls is the town hall, a municipal school of the cotton manufacture in Lancashire. There are also iron and brass foundries, engineering works, cotton machinery works, boiler and engine works, and some shipbuilding is carried on. In 1826 Preston became a creek of Lancaster, in 1839 it was included in the new port of Fleetwood, and in 1843 it was created an independent port. The trade of the port was insignificant until the construction of spacious docks, in conjunction with the deepening of the river from the quays of Preston to its outfall in the Irish Sea, a distance of 16 m., was begun in 1884, and was carried out at a cost of over one million sterling. The main wet dock, opened in 1892, is 3240 ft. long, 120 ft. wide, and its quaysage is over 8500 lineal feet. The channel of the river has been made much deeper up to the docks to sea deepened, so that the dock is accessible for vessels of 17 ft. draught on ordinary spring tides. A canal connects Preston with Lancaster.

The parliamentary borough, which returns two members, falls between the Blackpool and Darwen divisions of the county. The corporation consists of a mayor, 12 aldermen and 36 councillors. Area of municipal borough, 3971 acres.

Preston, otherwise Prestune, was near the minor Roman station at Walton-le-Dale and the great Roman road running from Warrington passed through it. It is mentioned in Domesday Book as one of Earl Tostig's possessions which had fallen to Redwael Phoicior, and on his deposition it was forfeited to the Crown.1 Henry II. about the year 1131, granted a corporation, a charter by which he confirmed to them the privileges he had granted to Newcastle-under-Lyme, the chief of which were a free borough and a gild merchant. This is the first of fourteen royal charters which have been granted to Preston, the chief of which are as follows: John in 1190 confirmed to Preston all the rights granted by Henry II.'s charter and also "their fair of eight days" from the Assumption (Aug. 15) and a three days' fair from the eve of Saints Simon and Jude (Oct. 28); Henry III. in 1217 confirmed the summer fair, but for five days only, and granted a weekly market on Wednesday. Edward III. (1375), Edward II. (1401), Henry V. (1415), Henry VI. (1425) and Philip and Mary confirmed the privileges of the previous charters. The weekly market, though granted for Wednesday, was held as early as 1292 on Saturday. Elizabeth in 1566 granted the town its great charter which ratified and extended all previous grants, including the gild merchant,, the weekly market on Saturday and the two annual fairs, in August for eight days and in October for seven days. Charles II. in 1662 and 1685 granted charters, by the latter of which an additional weekly market on Wednesday was conceded and a three days' fair beginning on the 16th of March. The most important industry is cotton, in which woolen weaving. Elizabeth's charter granted to the corporation all fees received from the scaling of cloth within the borough, and in 1571 the mayor reported that the cloths usually made near Preston were "narrow white kearses." Other early industries were glove-making and linen cloth. The first cotton-spinning mill was built in 1777 in Moor Lane, and in 1791 John Horrocks built the Yellow Factory. In 1835 there were forty factories, chiefly spinning, yielding 70,000 lb of cotton yarn weekly. A gild existed perhaps in Saxon times, but the grant of a gild merchant dates from Henry II.'s charter, about 1170. The first gild of which there is any record was celebrated in 1528, at which it was decided to hold a gild fair twenty years. Up to 1542, however, they do not appear to have been very regularly celebrated, but

1 The Court leet was held twice a year up to 1535.
since that year they have been and still are held at intervals of twenty years. A special gild mayor is appointed on each occasion. The first mention of a procession at the gild fair is 1300. One of the most important items of business was the enrolling of freemen, and the gild rolls are records of the population. In 1397 the gild roll contained the names of over 200 in-burgesses and 100 foreign burgesses; in 1415 the number of in-burgesses was 185, which in 1459 had declined to 72. In 1582 there were over 500 in-burgesses and 340 out-burgesses. There is no evidence for, but rather against, the common statement that Preston was burnt or razed to the ground during the Scottish invasion of 1322. The town suffered severely from the Black Death in 1349-1350, when as many as 3000 persons are said to have died, and again in November 1595-1600 and November 1631, 1100 died of pestilence. During the Civil War Preston sided with the king and became the headquarters of the Royalists in Lancashire. In February 1643 Sir John Seaton with a Parliamentary force marched from Manchester and successfully assaulted it. A strong Parliamentary garrison was established here and its fortifications repaired, but in March the earl of Derby recaptured the town. The Royalists did not garrison it, but after demolishing the greater part of the works left it unfortified. After the battle of Marston Moor Prince Rupert marched through Preston in September 1644 and carried the mayor and bailiffs prisoners to Skipton for ten months, where they were confined for twelve months. On the 17th of August the Royalist forces under the duke of Hamilton and General Langdale were defeated at Preston by Cromwell with a loss of 1000 killed and 4000 taken prisoners. During the Rebellion of 1715 the rebel forces entered Preston on the 9th of November, and after proclaiming the Chevalier de St George king at the cross in the market-place, remained here for some days, during which the government forces advanced. The town was assaulted, and on the 11th of November General Forster surrendered his army of about 1300 men to the king's forces. In 1745 Prince Charles Edward Stuart marched into the town on his way south and north, but the town took no part in the rebellion. Through royal grants members from 1395 to 1331, then ceased to exercise the privilege on account of poverty till 1529, but since that date (except in 1653) it has always sent two representatives to parliament. The curious institution of the mock mayor and corporation of Walton, which was at its foundation in 1701 a Jacobite association, ceased after 1766 to be of any political significance and lapsed in 1800. There was probably a church here in Saxon times and it is believed to be one of the three churches in Amounderness mentioned in Domesday Book. In 1094 it is named in a charter of Roger de Poictou. The early dedication was to St Wilfrid, but probably when it was rebuilt in 1150 it was re-dedicated to St John. At the time of the Reformation, many, especially among the neighbouring gentry, clung to the old faith, and there is still a large Roman Catholic population. There were two monastic foundations here: a hospital dedicated to St Mary Magdalene, which stood on the Maudlands, and a Franciscan convent of Grey Friars situated to the west of Friargate. In the 18th century Preston had a high reputation as a centre of fashionable society, and earned the epithet still familiarly associated with it, "proud." See H. Fieldwick, History of the Parish of Preston (1900).

PRESTONPANS, a police burgh and watering-place of Haddingtonshire, Scotland, on the Firth of Forth, 93 m. E. of Edinburgh by the North British railway. Pop. (1901) 2611. A mile to the east of the village is the site of the battle of the 21st of September 1745, in which Prince Charles Edward and his highlanders gained a complete victory over the royal forces under Sir John Cope. Colonel James Gardiner was mortally wounded after an heroic stand, and an obelisk in the grounds of his house at Bankton, close to the battlefield, commemorates his valor, while the ballad of Adam Skirling (1716-1803), "Hey, Johnnie Cope!" has immortalized the rout of Cope.

"Until the beginning of the 19th century, the salt trade was prosecuted with great success, the pans having been laid down as long ago as 1185, but the industry has declined. There are manufactories of fire-bricks, tiles and pottery, besides brewing and soap-making. In the vicinity there is an extensive field. Fisheries are still of importance, although the bed of Pandora oysters (an esteemed variety) has lost something of its former fertility. There are harbours at Morrison's Haven to the west and at Cockenzie and Port Seton to the north-east, the latter, early this century, one village, with a population of 1567. The cross of the barony of Preston dates from 1017. Schaw's Hospital Trust, at one time responsible for the education and maintenance of the children of poor parents, has been dissolved, and the premises are used for free education and bursaries, while the building has been leased by the trustees of Miss Mary Murray, who bequeathed £20,000 (afterwards increased to £50,000) for the training of poor children as domestic servants."

PRESTWICH, SIR JOSEPH (1812-1869), English geologist, was born at Clapham, Surrey, on the 12th of March, 1812. He was educated in Paris, Reading and at University College, London, where under Dr D. Lardner and Edward Turner, he paid special attention to natural philosophy and chemistry, and gained some knowledge of mineralogy and geology. Circumstances compelled him to enter into commercial life, and until he was sixty years of age he was busily engaged in the City as a wine merchant. He devoted all his leisure to geology. His business journeys enabled him to see and learn much of the general geology of England, Scotland and France, and this so improved his skill at the profession that he ranked as the most eminent of British geologists. As early as 1831, before he had commenced, during holiday visits, to make a study of the coal-field of Coalbrookdale in Shropshire, and the results of his observations were communicated to the Geological Society of London in 1834 and 1836, and embodied in a memoir published in 1838. His name is, however, especially known in connexion with his researches on the Eocene strata of the London and Hampshire Basins (1846-1857): he defined the Thanet Sands and the Woolwich and Reading Beds, and studied the sequence of deposits and of organic remains and the method of formation of these beds and the underlying strata of London clay and Bagshot Beds. So highly appreciated were his studies that in 1839 he was awarded the Wollaston Medal by the Geological Society of London; and in 1853 he was elected F.R.S.

In the course of his observations he was led to study questions of water supply and published in 1851 A Geological Inquiry respecting the Water-bearing Strata of the Country around London, a work that at once became a standard authority; and his extensive knowledge in that respect procured him a seat on the Royal Commission on Water Supply, appointed in 1866. From 1858 the question of the antiquity of man engaged his attention. On many occasions statements had been made as to the association of flints and implements formed by man with the bones of extinct mammals which belonged to more recent periods than those generally assigned for the appearance of the human race on this earth, but the evidence adduced had usually been disregarded by geologists as not affording sufficient proof of the point. Prestwich, together with Dr Hugh Falconer and Sir John Evans, saw the desirability of a closer examination of the facts, particularly in regard to the implements discovered by Boucher de Perthes in the gravels of the Somme valley; and their investigations in France and England yielded evidence which proved that man existed contemporaneously with the Pleistocene mammals (Phil. Trans. 1861 and 1864). In 1865 a Royal Medal was awarded to Prestwich by the Royal Society. In 1866 he was chosen one of the commissioners appointed to inquire into the several matters relating to coal in the United Kingdom; and he subsequently contributed an important Report on the Quantities of Coal, wrought and unwrought, in the Coalfields of Somersetshire and part of Gloucestershire, and another Report on the Probabilities of finding Coal in the South of England (1871). His researches on the Crag Beds of Suffolk and Norfolk, his report on Brixham Cave, his papers on the Channel Tunnel and the Chesil Bank, among others published during the years 1866-1875, may be mentioned. In 1870 he married Grace Anne McCull (née Milne), niece of Dr H. Falconer, and author of the Harbour Bar and other works (see Essays Descriptive and Biographical, by Grace, Lady
PRESTWICH—PRETORIUS 309

PRESTWICH; edited by L. E. Milne, 1901. Prestwich retired from business in 1872, and two years later he was invited to take the chair of geology at Oxford, vacant through the death of John Phillips. This post he occupied until 1887. During his professorship he wrote his great work entitled Geology: Chemical, Physical and Stratigraphical (vol. i., 1886; vol. ii., 1889).

On leaving Oxford Prestwich spent his remaining years in his country house, Darent-Hulme, Shoreham, Kent, erected by him in 1869. There, although seventy-six years of age, he maintained marvellous activity in geological research, devoting his attention to the superficial deposits of the Darent valley, to the occurrence of palaeolithic flint implements in the valleys and of an earlier type since called solithic, on the chalk plateau of Kent; he likewise dealt generally with the raised beaches and rubble-drift of the south of England and their relation to recent changes of level. His latest publications were Collected Papers on some Controversial Questions of Geology, and On Certain Phenomena belonging to the Close of the Last Geological Period and on their Bearing upon the Tradition of the Flood (1895).

He was knighted in 1896, and died on the 23rd of June in the same year, at Shoreham in Kent.

See Life and Letters of Sir Joseph Prestwich, edited by his wife (1899).

PRESTWICH, an urban district in the Prestwich parliamentary division of Lancashire, England, 5 m. N.N.W. of Manchester on the Lancashire & Yorkshire railway. Pop. (1901), 12,839. It possesses cotton manufactures, but consists chiefly of handsome mansions and villas inhabited by Manchester merchants.

PRETORIA, the administrative capital of the Union of South Africa and of the province of the Transvaal, 46 m. by rail N. by E. of Johannesburg. Pop. (1904) 36,836, of whom 27,114 were whites. Pretoria is situated on the banked veld or northern slopes of the high veld, on both banks of the Apies tributary of the Limpopo, and is 4470 ft. above the sea, being 1300 ft. lower than Johannesburg. Built in a hollow surrounded by hills, the aspect of the town with the river flowing through it and its broad streets lined with willows is picturesque. In summer the heat and moisture are excessive, and the Apies (which is spanned by four bridges) is liable to floods. The town is regularly laid out in rectangular blocks of uniform width. The older part lies on the west side of the Aapies River and between it and a smaller stream known as the Spruit. In the centre of this part of Pretoria is Church Square, so named from the Dutch Reformed Church which stood in it, but was demolished in 1905. Government buildings on the south side of the square contain the chambers of the Provincial Council and other public offices. They were erected in 1892 and are a handsome block in Renaissance style, three-storied, with a central tower surmounted by a statue of Liberty. On the north side of the square are the law courts, on the west side the Post Office. The chief banking offices are also in the square.

Running east and west from Church Square is Church Street, the chief business thoroughfare. A little east of Church Square this street opens on to Market Square, with commodious market buildings. The former Presidency, the residence of Paul Kruger, is at the western end of the street near the Spruit. Opposite it is the Dopper Church, in which Kruger used occasionally to preach. Other churches in the heart of the town include the Anglican cathedral, dedicated to St Alban, and the Presbyterian Church, both in fine surroundings. The Roman Catholic Church in Koorn Street with schools, convent buildings and extensive grounds, and the new Dutch Reformed Church in Vennekleur Street. In the north of the town is the National Museum and adjacent are the Zoological Gardens. Other public buildings include the University College and the opera house. East of the Aapies and on the slopes of the hills are the residential districts of Arcadia, Summerfield, and the suburb Bryntrina, a suburb of Pretoria, which is connected with the town by electric trams. On the south slopes of the hills, contains the residences of the chief officials, including Government House. Here is Meintjes Kop, with a broad natural shelf midway below the summit. This shelf was chosen in 1893 by President Kruger as the site of the Union's new residence. The Spring of Mr. Herbert Baker were accepted for two large blocks of identical design connected by a semicircular colonnade (passing behind the narrow kloof which bisects the shelf). Besides other open spaces there is Burger's park, originally planned, during the first British occupation, as a botanical garden. It is beautifully wooded and there is a band stand on the hill which overlooks the town, and the rest of the park, with its lines of plane trees, the eastern end of the town contains the pedestal for a statue of President Kruger. The statue itself remained for years at Lourenco Marques but was brought back from the Cape of Good Hope in 1910. The park is now occupied by the railway station and workshops.

History.—Pretoria was founded in 1855, the ground on which it stands being purchased by the Boer government from Martinus Pretorius. It was made the centre of a new district created at the same time, both town and district being named in honour of Andries Pretorius. By treaty between the South African Republic (then comprising the districts of Potchef-stroom, Rustenburg, Pretoria and Zoutpansberg) and the republic of Lydenburg, concluded at Pretoria in 1865, the two republics were united and Pretoria chosen as the capital of the whole state, and in September of that year the Volksraad held its first meeting in the new capital. Until 1864, however, when the civil war in the Transvaal ended, Potchefstroom remained the virtual capital of the country. From that year the seat of government has always been at Pretoria. There in 1877 Sir Theophilus Shepstone proclaimed the annexation of the Transvaal to Great Britain. In December 1880 it was invested by the Boers, but held out until the conclusion of peace. In 1881 the convention restoring self-government to the Transvaal was signed at Pretoria. From that time until 1900 the dominating figure in the town was that of the president—Paul Kruger. As revenue flowed in from the gold-mines on the Rand many fine buildings were erected in the capital, which was placed in railway communication with Cape Town in 1893 and with Lourenco Marques and Durban in 1895. To Pretoria Dr. Jameson and his troopers were brought prisoners (January 1896) after the fight at Doornkop (to be handed over in a few days to the British government), and thither also were brought the Reform Committee prisoners from Johannesburg. In May 1900 Kruger fled from the town, which on the 5th of June surrendered without resistance to Lord Roberts, despite its formidable encircling forts, which however were never effectually armed. On the 31st of May 1902 the articles of peace whereby the Boer leaders recognized British sovereignty were signed at Pretoria, and five years later there assembled in the capital the first parliament of the Transvaal as a self-governing state of the British Empire. On the establishment of the Union of South Africa in 1910 Pretoria became its administrative capital, the seat of the legislature being however at Cape Town. The Transvaal parliament was replaced by a Provincial Council (see TRANSVAAL: § History).

The town is governed by a municipality, which since 1903 has acquired control of the sanitary service, water supply, electric lighting and tramways. In 1900 the proportional representation system was adopted for the election of town councillors.

PRETORIUS, the family name of two of the early leaders of the "Trek" Boers—Andries Wimarbus Jacobus Pretorius and Martinus Wessels Pretorius, father and son.

1. ANDRIES PRETORIUS (1799–1853), a Dutch farmer of Graaff-Reinet, Cape Colony, and a descendant from one of the earliest Dutch settlers in South Africa, left his home in the Great
Trek, and by way of what is now the Orange Free State crossed the Drakensberg into Natal, where he arrived in November 1838, at a time when the emigrants there were without a recognized leader. Pretorius was at once chosen commandant-general and speedily collected a force to avenge the massacre of Boer families and a party, who had been treacherously killed by the Zulu king Dingaan the previous February. Pretorius’s force was attacked on the 16th of December (“Dingaan’s Day”) by over 10,000 Zulus, who were beaten off with a loss of 3000 men. In January 1840 Pretorius with a commando of 400burghers helped Mpende in his revolt against his brother Dingaan and was the leader of the Natal Boers in their opposition to the British. In 1842 he besieged the small British garrison at Durban, but retreated to Maritzburg on the arrival of reinforcements under Colonel (subsequently Sir) Josias Clocote and afterwards exerted his influence with the Boers in favour of coming to terms with the British. He remained in Natal as a British subject, and in 1847 was chosen by the Dutch farmers there to lay before the governor of Cape Colony the grievances under which they laboured owing to the constant immigration of natives, to whom locations were assigned to the detriment of Boer claims. Pretorius went to Graham’s Town, where Sir Henry Pottinger (the governor) then was; but Sir Henry refused to see him or receive any communication from him. Pretorius returned to Natal determined to abandon his farm and once more trekk beyond the British dominions. With a considerable following he was preparing to cross the Drakensberg when Sir Harry Smith, newly appointed governor of the Cape, reached the emigrants’ camp on the Tugela (Jan. 1848). Sir Harry promised the farmers protection from the natives and persuaded many of the party to remain, but Pretorius departed, and on the proclamation of British sovereignty up to the Vaal fixed his residence in the Magaliscberg, north of that river. He was chosen by theburghers living on both banks of the Vaal as their commandant-general. At the request of the Boers at Winburg Pretorius crossed the Vaal in July and led the anti-British party in their “war of freedom,” occupying Bloemfontein on the 20th of the same month. In August he was defeated at Boomplaats by Sir Harry Smith and thereupon retreated north of the Vaal, where he became leader of one of the largest of the parties into which the Trans-Vaal Boers were divided, and commandant-general of Potchefstroom and Rustenburg, his principal rival being Commandant-General A. H. Potgieter. In 1851 he was asked by the Boer malcontents in the Orange River Sovereignty and by the Basuto chief Mosheh to come to their aid, and he announced his intention of crossing the Vaal to “restore order” in the Sovereignty. His object, however, was rather to obtain from the British an acknowledgment of the independence of the Transvaal Boers. The British cabinet having decided on a policy of abandonment, the proposal of Pretorius was entertained. A award of £2000 which had been offered for his apprehension after the Boompalas fight, was withdrawn, Pretorius met the British commissioners at a farm near the Sand River, and with them concluded the convention (Jan. 17, 1852) by which the independence of the Transvaal Boers was recognized by Great Britain. Pretorius recrossed the Vaal and at Rustenburg on the 16th of March was reconciled to Potgieter, the followers of both leaders approving the convention, though the Potgieter party was not represented at the Sand River. In the same year Pretorius paid a visit to Durban with the object of opening up trade between Natal and the new republic. He also in 1852 attempted to close the road to the interior through Bechuanaland and the territory to the western border against Sechele. During this expedition David Livingstone’s house at Kolobeng was looted. Pretorius died at his home at Magaliscberg on the 23rd of July 1853. He is described by Theal as “the ablest leader and most perfect representative of the Emigrant Farmers.” In 1853 a new district and a new town were formed out of the Potchefstroom and Rustenburg districts and named Pretoria in honour of the late commandant-general.

2. Martinius Pretorius (1819-1901), the eldest son of Andries, was appointed in August 1853 to succeed his father as commandant-general of Potchefstroom and Rustenburg, two of the districts into which the Transvaal was then divided. In 1854 he led his burghers against a chief named Makapan, who had murdered a party of twenty-three Boers, including ten attendants of children. The natives were blockaded in a great cave in the Zoutpansberg and about 3000 were starved to death or shot as they attempted to escape. Having thus chastised Makapan’s clan, Pretorius turned his energies to the creation of a strong central government, and from 1856 onward his dominating idea appears to have been the formation of one Boer state to include the Orange River burghers. In December 1856 representatives of the districts of Potchefstroom, Rustenburg and Pretoria met and drew up a constitution and on the 6th of January the “South African Republic” was formally constituted. Pretorius having been elected president on the previous day. Though the Boers of the Lydenburg, Utrecht and Zoutpansberg districts refused to acknowledge the new republic, Pretorius, with the active co-operation of Commandant Paul Kruger (afterwards President Kruger), endeavoured (1857) to bring about the union of the Orange Free State and the Transvaal, and a commando crossed the Vaal to support Pretorius. The attempt at coercion failed, but in December 1859 the partisans of Pretorius in the Free State secured his election as president of that republic. Pretorius had just effected a reconciliation of the Lydenburg Boers with those of the other districts of the Transvaal, and hoping to complete his work of unification he accepted the presidency of the Free State, assuming office at Bloemfontein in February 1860. But the condition of anarchy into which the Transvaal fell shortly afterwards effectually weaned the Free State burghers from any thought of immediate amalgamation with their northern neighbours. Pretorius however continued to intervene in the affairs of the Transvaal and at length (April 15, 1863) resigned his Free State presidency. Acting as mediator between the various Transvaal parties Pretorius in January 1864 succeeded in putting an end to the civil strife and in May following once more became president of the South African Republic—now for the first time a united community. Conciliation was a marked feature of his character and to Pretorius more than any other man was due the welding of the Transvaal Boers into one nation. Pretorius shared the ideas of his father and the Emigrant Farmers generally concerning the title of the state to indefinite expansion north, east and west. Although he had much difficulty in maintaining the authority of the republic over the natives within its recognized borders, yet in April 1868, on the report of gold discoveries at Tati, he issued a proclamation annexing to the Transvaal on the west the whole of Bechuanaland and on the east territory up to and including part of Delagoa Bay. As to Delagoa Bay Portugal at once protested and in 1869 its right to the bay was acknowledged by Pretorius, who in the same year was re-elected president. The right of the Boers to the whole of Bechuanaland was not pressed by Pretorius in the face of British opposition, but in 1870, when the discovery of diamonds along the lower Vaal had led to the establishment of many diggers’ camps, an attempt was made to enforce the claims of the Transvaal to that district. Pretorius aroused the hostility of the diggers by granting an exclusive concession to one firm. Realizing his mistake, the concession was cancelled and in September 1870 he issued a proclamation notable as offering to the diggers very large powers of self-government. Pretorius went to the western frontier and in repeated conferences with the Bechuana chiefs attempted to get them to cooperate by joining the Transvaal to “save” their territory from the British. His diplomacy failed, and finally, without consulting his colleagues, he agreed to refer the question of the boundary to the arbitration of Mr R. W. Keate, then lieutenant-governor of Natal. The award, given on the 17th of October 1871, was against the Boer claims. Pretorius royally accepted the decision, but it aroused a storm of indignation in the Transvaal. The Volksraad refused to ratify the award and Pretorius resigned the presidency (November 1871).
From this time Pretorius took little further part in public affairs until after the first annexation of the state by Great Britain. In 1878 he acted as chairman of the committee of Boer leaders who were seeking the restoration of the independence of their country, and for his action in that capacity he was arrested in January 1880 by order of Sir Garnet Wolseley on a charge of treason. (See the Blue Book [C. 2584] of 1880 for details of this charge.) He was admitted to bail and shortly afterwards urged by Wolseley to accept a seat on the executive council. This offer Pretorius declined, but he consented to tour the country with a proclamation by Wolseley counselling the Boers to submit, and promising them self-government. In December of the same year he was appointed, with Paul Kruger and P. Joubert, to carry on the government on the part of the insurgent Boers. He was one of the signatories to the Pretoria Convention and continued to act as a member of the Triumvirate until the election of Kruger as president in May 1883. He then withdrew from public life; but lived to see the country re-annexed to Great Britain, dying at Potchefstroom on the 19th of May 1901. He is stated to have disapproved the later developments of Boer policy, and died waiting for the day when his death visited both Pretorius and Boshoff, on behalf of Lord Kitchener, with the object of bringing the war to an end.

PRETTY, a word usually applied in the sense of pleasing in appearance, without connoting those qualities which are described as beautiful or handsome. In Old English prættig meant tricky, cunning or wily, and is thus used to translate the Latin sagax, astutus, callidus, in a vocabulary of about 1000. Proctil meant a trick, and this word is seen in many forms in Dutch, cf. the words prættig, sportieve, part, trick. A connexion has been suggested with the Greek πρακτικός, πρακτική, to do, make, through Latin praetica, practice, performance; but the New English Dictionary rejects these, as also Celtic sources, as unfounded. From "cunning" to skillful, and thence to its use as a term of general appreciation as is so often used by Pepys, the development is easy.

PREVARICATION, a divergence from the truth, equivocation, quibbling, a want of plain-dealing or straightforwardness, especially a deliberate misrepresentation by evasive answers, often of such a nature as to be intentionally deceptive. The Latin praevocatio was specifically applied to the conduct of an advocate at law in which an advocate (praevocator) in collusion with his opponent put up a bad case of defence. Praevociar care meant literally to walk with the legs very wide apart, to straddle, hence to walk crookedly, to stray from the direct road, varius, straddling, being derived from varus, bow-legged, a word which has been connected etymologically with German quer, transverse, across, and English "queer."

PREVEZA, or PREVESA, a seaport of Albania, European Turkey, in the vilyat of Tzanzia; at the entrance to the Gulf of Arts, an inlet of the Ionian Sea. Pop. (1805), 6,500, of whom about four-fifths are Christian Albanians or Greeks, and one-fifth Moslems. The town is surrounded by dense olive groves, and most of its houses stand in their own gardens. The harbour is small, and closed to large vessels by a bar of sand; but it is a port of call for the Austrian Lloyd steamers, and annually accommodates about 1500 small vessels, the majority of which are engaged in the coasting trade. Preveza exports dairy produce, valonia, hides and wool, olives and olive oil. The yearly value of its trade varies from about £70,000 to £80,000. About 3 m. north are the ruins of Nicopolis (q.v.).

PRÉVOST, ANTOINE FRANÇOIS (1697-1763), French author and novelist, was born at Hesdin, Artois, on the rst of April 1697. He first appeared with the following book, published in a letter to the booksellers of Amsterdam in 1731. His father, Liévín Prévost, was a lawyer, and several members of the family had embraced the ecclesiastical estate. Prévost was educated at the Jesuit school of Hesdin, and in 1713 became a novice of the order in Paris, pursuing his studies at the same time at the college of La Flèche. At the end of 1716 he left the Jesuits to join the army, but he soon tired of life in barracks, and returned to Paris in 1719 with the idea, apparently, of resuming his novitiate. He is said to have travelled in Holland about this time; in any case he returned to the army, this time with a commission. Some of his biographers have assumed that he suffered some of the misfortunes assigned to his hero Des Grieux. But he was in fact attached to the Dutch army, and became a friend of the Court, was in the company of the Benedictines of St Maur, with whom he found refuge, he himself says, after the unhappy termination of a love affair. He took the vows at Jumièges in 1721 after a year's novitiate, and received in 1726 priest's orders at St Germer de Flâix. He resided for seven years in various houses of the order, teaching, preaching and studying. In 1728 he was at the abbey of St Germain-des-Prés, Paris, where he was engaged on the Gallica christiana, the learned work undertaken by the monks in continuation of the works of Denys de Sainte-Marthe, who had been a member of their order. His restless spirit made him seek from the Pope a transfer to the easier rule of Cluny; but without success for apparently in 1730 he left the army without leave (1728), and, learning that his superiors had obtained a lettre de cachet against him, fled to England.

In London he acquired considerable knowledge of English history and literature, traceable throughout his writings. Before leaving the Benedictines Prévost had begun his most famous romance, Les Aventures de Manon lescaut, a book which was first printed in London—Les Philosophes anglais, ou Histoire de Monsieur Cleverston, fils naturel de Cromwell, écrit par lui-mesme, et traduite de l'anglais (Paris 1734-1739, 8 vols., but most of the existing sets are partly Paris and partly Breda). It contained attacks on the Jesuits, and an English translation of the whole appeared in 1734. Meanwhile, during his residence at London, he engaged in translation and writing; and, finally, in 1734, and, relying on the popularity of his first book, published at Amsterdam a Suite en trois volumes, forming volumes v., vi., and vii. of the original Mémoires et aventures d'un homme de qualité. The seventh volume contained the famous Manon Lescaut, separately published in Paris in 1731 as Les Aventures du chevalier des Grieux et de Manon Lescaut, par Monsieur D... The book was eagerly read, chiefly in pirated copies, as it was forbidden in France. In the dedication of the Huguenot, des Grieux character, as given by Prévost's enemies, was far from desirable. In London he edited a weekly gazette on the model of Addison's Spectator, Le Pour et contre, which he continued to produce, with short articles, until 1734.

In the autumn of 1734 Prévost was reconciled with the Benedictines, and, returning to France, was received in the Benedictine monastery of La Croix-Saint-Leufroy in the diocese of Evreux to pass through a new, though brief, novitiate. In 1735 he was dispensed from residence in a monastery by becoming almoner to the prince de Conti, and in 1754 obtained the priory of St Georges de Gesnes. He continued to produce novels and translations from the English, and, with the exception of a brief exile (1741-1742) spent in Brussels and Frankfort, he resided for the most part at Chantilly until his death, which took place suddenly while he was walking in the neighbouring wood. He was a man of considerable accomplishment; his particulars have been added, but the cause of his death, the rupture of an aneurism, has been definitely established. Stories of crime and disaster were related of Prévost by his enemies, and diligently repeated, but they have proved to be as apocryphal as the details given of his death.

Manon Lescaut, one of the greatest novels of the century, is very short; it is entirely free from improbable incident, it is penetrated by the truest and most cunningly managed feeling; and almost one of its characteristics is the triumph of that sentiment which is the secret of the modern novel. The chevalier des Grieux, the hero, is probably the most perfect example of the carrying out of the sentiment "All for love and the world lost" that exists in fiction; at least where the circumstances are those of ordinary and probable life. Tiberge, his friend, is hardly inferior in the difficult part of mentor and reasonable man. Lescaut, the heroine's brother, has vigorous touches as a bully and Bohemian; but the triumph of the book is Manon Lescaut. Animated by a real affection
for her lover, and false to him only because her love of splendour, comfort and luxury prevents her from welcoming privation with him or for him, though in effect she prefers him to all others, perfectly natural and even amiable in her degradation, and yet showing the moral of that degradation most vividly, Manon is one of the most remarkable heroines in all fiction. She had no literary ancestry; she seems to have sprung entirely from the imagination, or perhaps the sympathetic observation, of the wandering scholar who drew her from the pages of and the interpreters of the human race can challenge comparisons with her before or near to her own date, and in Manon Lescaut, the plot is much more complete and interesting, the sentiments less artificial, and the whole story nearer to actual life than in Madame de la Fayette’s masterpiece. Prevost’s other works include: Le Doyen de Killilarme, histoire morale, composée sur les mémoires d’une illustre famille d’Irlande (Paris, 1735); 2nd part, the Hague, 1739, 3rd, 4th and 5th paris, 1740); Tout pour l’amour (1741); Histoire et histoire moderne (Amsterdam [Paris 2 vols., 1740]; Histoire de Marguerite d’Anjou (Amsterdam [Paris 2 vols., 1740); Mémoires pour servir à l’histoire de Male (Amsterdam, 1741); Campagnes philosophiques, ou mémoires... contenant l’histoire de la guerre d’Irlande (Amsterdam, 1741); Histoire de Guillaume le Conquérant (Paris, 1742); Histoire générale des voyages (15 vols., Paris, 1740-1759), continued by other writers; translations from Samuel Richardson, Pamela (4 vols., 1742), Lettres anglaises ou Histoire de Miss Clarisse Harlowe (6 vols., London, 1741); Nouvelles lettres anglaises, ou Histoire du chevalier Grandisson (Amsterdam, 3 vols., 1755); Mémoires pour servir à l’histoire de Grisart de Stuiv (Colonge, vol. 1763), from Mrs. Sheridan’s Mémoires de Miss Sidney Bidalph; Histoire de la maison de Stuart (3 vols., 1740) from Hume’s History of England to 1688; Le monde moral, ou Mémoires pour servir à l’histoire du cœur humain (Amsterdam, 1766)."

For the bibliography of Prevost’s works, which presents many complications, and for documentary evidence of the facts of his life see H. Harrisse, L’Abbé Prevost (1896); also a thesis (1898) by V. Schroeder.

PRÉVOST, CONSTANT (1787-1836), French geologist, was born in Paris on the 4th of June 1787, and was son of Louis Prévost, received a good education at the Central Schools, where, inspired by the lectures of G. Cuvier, Alexandre Brongniart and A. Duméril, he determined to devote himself to natural science. He took his degree in Letters and Sciences in 1811, and for a time pursued the study of medicine and anatomy. Mainly through the influence of Brongniart he turned his attention to geology, and during the years 1816-1819 made a special study of the Vienna Basin where he pointed out for the first time the presence of Tertiary strata like those of the Paris Basin, but including a series of later date. His next work (1821) was an essay on the geology of parts of Normandy, with special reference to the Secondary strata (obtained with the aid of Cuvier) and the Oligocene. In 1829 he was professor of geology at the Athénaeum at Paris, and he took a leading part with Ami Boué, G. P. Deshayes and Jules Desnoyers in the founding of the Geological Society of France (1830). In 1831 he became assistant professor and afterwards honorary professor of geology to the faculty of sciences. Having studied the volcanoes of Italy and Auvergne, he opposed the views of von Buch regarding craters of elevation, maintaining that the cones were due to the material successively erupted. Like Lyell he advocated a study of the causes of forces now in action in order to illustrate the past. One of his important works was De la Chronologie des terrains et du synchronisme des formations (1835). He died in Paris on the 17th of August 1856.

PRÉVOST, EUGÈNE MARCEL (1862- ), French novelist, was born in Paris on the 1st of May 1862. He was educated at Jesuit schools in Bordeaux and Paris, entering the École Polytechnique in 1882. He published a story in the Clairoir as early as 1881, but for some years after the completion of his studies he applied his technical knowledge to the manufacture of tobacco. He published in succession, Le Scorpion (1887), Chonchette (1888), Mademoiselle Jourfure (1886), Cousine Laura (1890), La Confession d’un amant (1891), Lettres de femmes (1892), L’Automne d’une femme (1893), and in 1894 he made a great sensation by an exaggerated and revolting study of the results of Parisian education and Parisian society on young girls, Les Demi-vierges, which was dramatized and produced with great success at the Gymnase on the 21st of May 1895. Le Jardin secret appeared in 1897; and in 1900 Les Vierges furtives, and a study of the question of women’s education and independence in two novels Fréderique and L. J’Œuvres de ménage (1901), Les Lettres à Française (1902), La Princesse d’Urminge (1904), and L’Accordeur oseule (1905) are among his later novels. An amusing picture of modern German manners is given in his Monsieur et Madame Moloch (1906). He had a great success in 1904 with a four act play La Plus faible, produced at the Comédie Française. In 1909 he was elected to the Academy.

PRÉVOST, PIERRE (1751-1839), Swiss philosopher and physicist, son of a Protestant clergyman in Geneva, was born in that city on the 3rd of March 1751, and was educated for a clerical career. But in 1773 he was too quickly deserted to devote himself to education and to travelling. He became intimate with J. J. Rousseau, and, a little later, with Dugald Stewart, having previously distinguished himself as a translator of and commentator on Euripides. Frederick II. of Prussia secured him in 1780 as professor of philosophy, and made him member of the Akademie der Wissenschaften in Berlin. He there became acquainted with Lagrange, and was thus led to turn his attention to physical science. After some years spent on political economy and on the principles of the fine arts (in connexion with which he wrote, for the Berlin Memoirs, a remarkable dissertation on poetry) he returned to Geneva and began his work on magnetism which he undertook occasionally in his studies by political duties, in which he was often called to the front, he remained professor of philosophy at Geneva till he was called in 1810 to the chair of physics. He died at Geneva on the 8th of April 1839.

Prévost published much on philology, philosophy, and political economy, but he will be remembered mainly for having published, with additions of his own, the Traité de physique of G. le Sage, and for his enunciation of the law of exchange in radiation. His scientific publications included De l’Origine des forces magnétiques (1811), and Oeuvres de recherche sur la chaleur (1792), and Essais sur le calibrage rayonnant (1890).

PRÉVOST-PARADOL, LUCIEN ANATOLE (1829-1870), Frenchman of letters, was born in Paris on the 8th of August 1829. He was educated at the College Bourbon and entered the École Normale. In 1853 he was appointed professor of French literature at Aix. He held the post, however, barely a year, resigning it to become a leader-writer on the Journal des débats. He also wrote in the Courrier du dimanche, and for a very short time in the Presse. His chief works are Essais de politique et de littérature (three series, 1859-1866), and Essais sur les moralités françaises (1864). He also was a contributor to the number of works, and was one of the chief opponents of the empire on the side of moderate liberalism. He underwent the usual difficulties of a journalist under that régime, and was once imprisoned. In 1865 he was elected an Academician. The accession of Émile Ollivier to power was fatal to Prévost-Paradol, who apparently believed in the possibility of a liberal empire, and consequently accepted the appointment of envoy to the United States. This was the signal for the most unmeasured attacks on him from the republican party. He had scarcely installed himself in his post before the outbreak of war between France and Prussia occurred and he was ordered to Washington on the 11th of July 1870, and died on the 20th.

PREY (O. Fr. preie, mod. proie, Lat. prœa, booty, from proae and the root hod—seen in proendero, prendere, to grasp), booty, spoil, plunder taken in war, by robbery, or other violent means; particularly the quarry, the animal killed for food by a carnivorous animal; a beast or bird of prey. A particular usage for that which is saved from any trial of strength or battle is familiar from the Bible (Jer. xxii. 9) "his life shall be unto him for a prey."

PRIAM (Gr. Πριαμος), in Greek legend, the last king of Troy, son of Laomedon and brother of Tithonus. Little is known of him before the Trojan War, which broke out when he was advanced in years. According to Homer (IIad, iii. 184) in his
PRIAPEIA—PRICE, BARTHOLOMEW

youth he fought on the side of the Phrygians against the Ama- 
zons. He had fifty sons and fifty daughters, and possessed im-
mense wealth. He appears only twice on the scene of action 
during the war—to make arrangements for the duel between 
Paris and Menelaus, and to beg the body of Hector for burial 
from Achilles, whom he visits in his tent by night. He was said to 
have been slain by Neoptolemus, son of Achilles, during the sack 
of Troy (Virgil, Aeneid, ii. 512). See under Troy, on the legends.

PRIAPEIA, a collection of poems (about eighty in number) 
in various metres on the subject of Priapus. It was compiled 
from literary works and inscriptions on images of the god by 
an unknown editor, who composed the introductory epigram. 
From their style and versification it is evident that they do not 
belong to the best period of Latin literature. Some, however, 
may be interpolations of a later period. They will be found in 
F. Bücheler's Petronius (1904), L. Müller's Catullus (1870), and 
E. Bährens, Poetae latini minores, i. (1879).

PRIAPULOIDEA, a small group of vermiform marine crea-
tures; they have been usually placed in the neighbourhood of 
the Cephaloea, but their position is uncertain and it is doubtful 
if they are to be regarded as coelomate animals. They are 
cylindrical worm-like animals, with a median anterior mouth quite 
devoid of any armature or tentacles. The body is ringed, and 
often has circles of spines, which are continued into the slightly 
protrusible pharynx. The alimentary canal is straight, the 
anus terminal, though in Priapulus one or two hollow ventral 
diverticula of the body-wall stretch out behind it. The nervous 
system, composed of a ring and a ventral cord, retains its 
primitive connexion with the ectoderm. There are no specialized sense-organs or 
vascular or respiratory systems. There is a wide body-cavity, but as this has no 
connexion with the renal or reproductive organs it cannot be regarded as a coelom, 
but probably is a blood-space or haemo-
coeel.

The Priapuloidea are dioecious, and 
their male and female organs, which are 
one with the excretory organs, consist of a 
pair of branching tufts, each of which opens 
to the exterior on one side of the anus. 
The tips of these tufts enclose a flame-
cell similar to those found in Platyle-
minths, &c., and these probably function 
as excretory organs. As the animals 
have become adult, diverticula arise on 
the tubules of these organs, which develop 
either spermatozoa or ova. These pass 
out through the ducts. Nothing is 
known of the development. There are 
three genera: (i.) Priapulus, with the 
species P. caudatus, Lam., of the Arctic 
and Antarctic and neighbouring cold 
seas, and P. bicaudatus, Dan., of the 
Arctic seas; (ii.) Priapuloidea australis, 
southern circumpolar waters; and (iii.) 
Halicyclops, with the species H. spinulosus, v. Sieh., of 
northern seas. They live in the mud, which they eat, in 
comparatively shallow waters up to 50 fathoms.

AUTHORITIES.—Apel, Zeitschr. wiss. Zool. (1888), vol. xii.; Scharff, 
Guene, Mission scientifique du Cap Horn (1891), vol. vi.; Michael-
sen, Jahrb. Hamburg-Ast. (1885), vol. vi. (A. E. S.)

PRIAPUS, in Greek mythology, son of Dionysus (or Adonis 
or Hermes) and Aphrodite (or Chione). He is unknown to Homer 
and Hesiod. The chief seat of his worship was the coast of 
the Hellespont, especially at Lampscus, which claimed to be his 
birthplace. Thence his cult extended to Lydia, and by way of 
the islands of Lesbos and Thasos to the whole of Greece (es-
pically Argolis), whence it made its way to Italy, together with 
that of Aphrodite. Priapus is the personification of the fruit-
fulness of nature. Sailors invoked him in distress and fishermen 
prayed to him for success. He gradually came to be regarded 
as the god of sensuality. His symbol was the phallicus, an 
blem of productivity and a protection against the evil eye. The 
first fruits of the gardens and fields, goats, milk and honey, 
and occasionally asses, were offered to him. He was sometimes 
represented as an old man, with a long beard and large genitals, 
wearing a long Oriental robe and a turban or garland of vine-
leaves, with fruit and bunches of grapes in his lap. Amongst 
the Romans, rough wooden images, after the manner of the 
hermae, with phallicus stained with vermilion, were set up in 
gardens. His image was placed on tombs, as symbolizing the 
descendit line of regeneration in a fruitful life, and his name was 
inscribed on sepulchral inscriptions. In his hand he carried a bill-hook or 
club, while a reed on his head, shaking backwards and forwards 
in the wind, acted as a scarecrow.

PRIBILOF ISLANDS (often called the Fur Seal Islands, 
Russian equivalent, " Kotovoi "), a group of four islands, part 
of Alaska, lying in Bering Sea in about 56° 50' N. and 170° W., 
about 200 m. N. of Unalaska and 200 m. S. of Cape Newenham, 
the nearest point on the mainland. The principal islands are 
St Paul (about 35 sq. m.; 13 m. long, from N.E. to S.W.; max-
imum width about 6 m.; named from St Peter and St Paul's 
Day, on which it was discovered) and St George (about 27 sq. m.; 
10 m. long, maximum width, 4 m.; probably named after Pri-
blot's ship) about 30 m. S.E.; Otter and Walrus islets, the former 
covering about 4 sq. m., and the latter merely a reef covering 
about 64 acres, are near St Paul. In 1907 the native popula-
tion was 263—170 on St Paul and 93 on St George. Only agents 
of the United States or employees of the lessees are permitted 
as residents on the islands. The islands are hilly and vol-
canic—Bogoslof, a crater on St Paul, is 600 ft. high—without 
harbours, and have a mean annual temperature of about 35° F.; 
and a rainfall of about 35 in. There are only two seasons— 
rainy from May to September and dry from November to April. The flora is restricted to ferns, 
mosses and grasses, though there are some creeping willows and 
small shrubs. The largest seal rookery, containing about 80 
per cent of the seals in the Pribilofs, is on St Paul. The seals found here 
are a distinct variety (Callorhinus alascans) with much better fur 
than that of any other variety. Besides the fur seal there are 
blue and grey foxes (more on St George than on St Paul), 
and on St George Island and on the Walrus reef there are great 
bird rookeries—the breeding places of immense numbers of 
gulls, sea-parrots, auks, cormorants and arries (Lomave arro). 
The islands were first sighted in 1767 by Joan Synd, and were 
visited in 1785 by Captain of the Pribiloff, who discovered the fur seal 
rookeries for which they became famous. From Russia the islands passed with Alaska to the United States in 1867. 
From 1870 to 1890 the United States government leased the islands 
to the Alaska Commercial Company. In 1890—1910 the North 
American Commercial Company held the monopoly. But the 
industry shrank considerably owing to pelagic sealing. The 
season during which land hunting is allowed on the islands 
includes June, July, September and October. (See also SEAL 
and BERING SEA ARBITRATION.)

PRIBRAM, a town of Bohemia, Austria, 39 m. S.W. of Prague 
by rail. Pop. (1900), 15,757, together with the adjoining townships 
of Birkenberg, 19,119, almost exclusively Czech. It lies in 
a valley between the hills of Birkenberg and Heiligir Berg, 
and in its neighbourhood are the lead and silver mines which 
belong to the Austrian government and are worked in nine shafts, 
two of which, the Adalbert shaft (3637 ft.) and the Maria shaft, 
(3575 ft.) are the deepest in the world. The mines have been 
worked for several centuries, but their actual prosperity dates from 
1770, when the sinking of the Adalbert shaft began. 
They yield yearly an average of 80,000 lb of silver and 1900 tons of 
lead. At the top of the Heiligir Berg (1885 ft.) is a church 
with a summer-hanging image of the Virgin, which is the chief 
place of pilgrimage in Bohemia.

PRICE, BARTHOLOMEW (1818–1898), English mathematician 
and educator, was born at Coln St Denis, Gloucestershire,
Price, Bonamy—Price, R.

In 1818. He was educated at Pembroke College, Oxford, of which college (after taking a first class in mathematics in 1840 and gaining the university mathematical scholarship in 1842) he became fellow in 1844 and tutor and mathematical lecturer in 1845. He at once took a leading position in the mathematical teaching of the university, and published treatises on the Differential calculus (in 1848) and the Infinitesimal calculus (4 vols., 1852—1860), which for long were the recognized textbooks there. This latter work included the differential and integral calculus, the calculus of variations, the theory of attractions, and analytical mechanics. In 1853 he was appointed Sedleian professor of natural philosophy, resigning it in June 1868. His chief public activity at Oxford was in connexion with the hebdomadal council, and with the Clarendon Press, of which he was for many years secretary. He was also a curator of the Bodleian Library, an honorary fellow of Queen's College, a governor of Winchester College and a visitor of Greenwich Observatory. In 1891 he was elected Master of Pembroke College, which dignity carried with it a canony of Gloucester Cathedral. He died on the 29th of December 1896. See Monthly Notices of the Royal Astronomical Society (1896).

Price, bonamy (1807—1888), English political economist, was born at St Peter Port, Guernsey, on the 22nd of May 1807. He entered at Worcester College, Oxford, in 1825, where he took a double first in 1829. From 1830 to 1850 he was an assistant master at Rugby school. He then lived for some years in London, being engaged in business and literary work, and was appointed to serve on various royal commissions. He married in 1864. In 1868 he was elected Drummond professor of political economy at Oxford, and was thrice re-elected to the post, which he held till his death. In 1885 he was elected an honorary fellow of his college. In addition to his professorial work, he was in much request as a popular lecturer on political economy. He died in London on the 8th of January 1888. His principal publications, exclusive of pamphlets, were: The Principles of Currency (1869), Currency and Banking (1876), Chapters on Practical Political Economy (1875).

Price, Richard (1723—1791), English moral and political philosopher, son of a dissenting minister, was born on the 23rd of February 1723, at Tynton, Glamorganshire. He was educated privately and at a dissenting academy in London, and became chaplain and companion to a Mr Street in Stoke Newington. By Mr Street's introduction he was elected to the society at the Westminster chapel in 1750. After his circulation, he married in 1757 a Miss Sarah Blundell, originally of Belgrave in Leicestershire.

In 1767 he published a volume of sermons, which gained him the acquaintance of Lord Shelburne, an event which had much influence in raising his reputation and determining the character of his subsequent pursuits. It was, however, as a writer on financial and political questions that Price became widely known. In 1769, in a letter to Dr Franklin, he wrote some observations on the expectation of lives, the increase of mankind, and the population of London, which were published in the Philosophical Transactions of that year; in May 1770 he communicated to the Royal Society a paper on the proper method of calculating the values of contingent reversions. The publication of these papers is said to have exercised a beneficial influence in drawing attention to the inadequate calculations on which many insurance and benefit societies had recently been formed. In 1769 Price received the degree of D.D. from the university of Glasgow. In 1771 he published his Appeal to the Public on the Subject of the National Debt (ed. 1772 and 1774). This pamphlet excited considerable controversy, and is supposed to have influenced Pitt in re-establishing the sinking fund for the extinction of the national debt, which had been created by Walpole in 1716 and abolished in 1733. The means, however, which Price proposed for the extinction of the debt are described by Lord Overstone as "a sort of hocus-pocus machinery," supposed to work "without loss to any one," and consequently unsound.

Price then turned his attention to the question of the American colonies. He had from the first been strongly opposed to the war, and in 1776 he published a pamphlet entitled Observations on Civil Liberty and the Justice and Policy of the War with America. Several thousand copies of this work were sold within a few days; a cheap edition was soon issued; the pamphlet was tolerated by one set of politicians and abused by another; amongst its critics were Dr Markham, archbishop of York, John Wesley, and Thomas Paine. But still it remained the firm and known man in England. He was presented with the freedom of the city of London, and it is said that his pamphlet had no considerable share in determining the Americans to declare their independence. A second pamphlet on the war with America, the debts of Great Britain, and kindred topics followed in the spring of 1777. His name thus became identified with the cause of American independence. He was the intimate friend of Franklin; he corresponded with Turgot; and in the winter of 1778 he was invited by Congress to go to America and assist in the financial administration of the states. This offer he refused from unwillingness to quit his own country and his family connexions. In 1781 he received the degree of D.D. from Yale College.

One of Price's most intimate friends was Dr Priestley, in spite of the fact that they took the most opposite views on morals and metaphysics. In 1778 appeared a published correspondence between these two liberal theologians on the subjects of materialism and necessity, wherein Price maintains, in opposition to Priestley, the free agency of man and the unity and immateriality of the human soul. Both Price and Priestley were what would now vaguely be called "Unitarians," though they occupied respectively the extreme right and the extreme left position of that school. Indeed, Price's opinions would seem to have been rather Arrian than Socinian.

The pamphlets on the American War made Price famous. He preached to crowded congregations, and, when Lord Shelburne acceded to power, not only was he offered the post of private secretary to the premier, but it is said that one of the paragraphs in the king's speech was suggested by him and even inserted in his words. In 1780 Mrs Price died. There were no children by the marriage, his own health was failing, and the remainder of his life appears to have been clouded by solitude and dejection. The progress of the French Revolution alone cheered him. On the 9th of April 1791 he died, worn out with suffering and disease.

The philosophical importance of Price is entirely in the region of ethics. The Review of the Principal Questions in Morals (1775, 3rd ed. revised 1797) contains his whole theory. It is divided into ten chapters, each divided into three parts. Price, in a very small part of the whole, completes his demonstration of ethical theory. The remaining chapters investigate details of minor importance, and are especially interesting as showing his relation to Butler and Kant (ch. iii. and ch. vii.). The work is professedly a refutation of Hutcheson, but is rather constructive than polemical. The theory he propounds is closely allied to that of Cudworth but is interesting mainly in comparison with the subsequent theories of Kant.

1. Right and wrong belong to actions in themselves. By this he means, not that the ethical value of actions is independent of their effects and ends, but that it is unaffected by consequences, and that it is more or less invariable for intelligent beings. II. This ethical value is perceived by reason or understanding (which, unlike Kant, he does not distinguish), which positively recognizes fitness or congruity between actions, agents and total circumstances. Arguing that ethical judgment is an act of discrimination, he endeavours to invalidate the doctrine of the moral sense (see Shaftesbury and Hutcheson). Yet, in denying the importance of the emotions in moral judgment, he is driven back to the admission that right actions must be "grateful" to us; that, in fact, moral approbation includes both an act of the understanding and an act of the moral sense (see ch. vii., but rather that it is unaffected by consequences, and that it is more or less invariable for intelligent beings.

In this conclusion he is in close agreement with Kant; reason is the arbiter, and right is (1) not a matter of the emotions and (2) not necessarily recognized by circuits formed by circuits. Hence, the contemplation of actions, but acquired necessarily, immediately, intuitively. In his view of disinterested action (ch. iii.) he adds

1 Lord Overstone reprinted in 1857, for private circulation, Price's and other rare tracts on the national debt and the sinking fund.
nothing to Butler. III. Happiness he regards as the only end, conceivable by us, of divine Providence, but it is a happiness wholly dependent upon rectitude. Virtue tends always to happiness.

Works.—Besides the above-mentioned, Price wrote an Essay on the Population of England (2nd ed., 1780); two Fast-day Sermons, published respectively in 1779 and 1781; and Observations on the importance of the American Revolution and the means of rendering a benefit to the World (1784). A complete list of his works is given as an appendix to Dr Priestley's Funeral Sermon. His views on the French Revolution are denounced by William Pulteney in his Reflections on the Revolution in France. Notices of Price's ethical system occur in Mackintosh's Progress of Ethical Philosophy, Joffre's Introduction to Ethics, Thewell's History of Moral Philosophy in England; Bain's Mental and Moral Sciences. See also E. F. Oppenheim, A History of Ethics, 2nd ed., 1898, pp. 344-346; T. E. Turner on Shaftesbury and Hutcheson. For Price's life see memoir by his nephew, William Morgan.

( J. M. M.)

PRICE, the equivalent in money for which a commodity is sold or purchased, the value of anything expressed in terms of a medium of exchange (see VALUE and WEALTH). The word is a doublet of "praise," commendation, eulogy, Lat. laus, and "price," a reward of victory, the ultimate source of which is the Lat. præmiō; the Aryan root par-, to buy, is seen in Skr. pana, wages, reward, Gr. παράκλητος, to sell, &c. The O. Fr. pris, mod. priz, was taken from a Late Latin form præmiō, used in the sense of "price," "prize," "praise," and was gradually differentiated in form for the different meanings; thus "praise" was developed from an earlier verbal form præmiō or præsyo in the 15th century; the original meaning survives in "appraise," to set a value to anything, cf. the current meaning of "to prize," to value highly. "Price," reward, does not appear as a separate form till the 16th century. In "price-fight," a boxing contest for money, the idea of reward seems clear, but the word appears earlier than the form "price" in this sense and means a contest or match, and may be a different word altogether; the New English Dictionary compares the Greek use of βαράνω, literally reward, hence essay, written in "price," in the sense of that which is captured in war, especially at sea, is a distinct word. It comes through the Fr. pris, early Romanic preza for presa, from Lat. praehendere, to seize, capture. For the international law on the subject see PRIZE.

PRICHARD, JAMES COWLES (1786-1848), English physician and ethnologist, was born on the 11th of February 1786 at Ross in Herefordshire. His parents were of the Society of Friends, and he was educated at home, especially in modern languages and general literature. He adopted medicine as a profession mainly because of the facilities it offered for anthropological investigation. He took his M.D. at Edinburgh, afterwards reading for a year at Trinity College, Cambridge, whence, joining the Church of England, he migrated to St John's College, Oxford, afterwards entering as a gentleman commoner at Trinity College, Oxford, but taking no degree in either university. In 1810 he settled at Bristol as a physician, and in 1813 published his Researches into the Physical History of Man, in 2 vols., afterwards extended to 5 vols. The central principle of the book is the primitive unity of the human species, acted upon by causes which have since divided it into permanent varieties or races. The work is dedicated to the British Museum; five races of man are adopted. But where Prichard excelled Blumenbach and all his other predecessors was in his grasp of the principle that people should be studied by combining all available characters. One investigation begun in this work requires special mention, the bringing into view of the fact, neglected or contradicted by philologists, that the Celtic nations are allied by language with the Slavonian, German and Pelasgian (Greek and Latin), thus forming a fourth European branch of the Asiatic stock (which would now be called Indo-European or Aryan). His special treatise containing Celtic compared with Sanskrit words appeared in 1817 under the title Eastern Origin of the Celtic nations. It is remarkable that the case he made for the connection of the western celtic with the eastern was, as it is termed, the other, this was crowned by the French Academy and made its author's reputation, should have been published in 1837 in evident ignorance of the earlier and in some respects stricter investigations of Prichard.

In 1843 Prichard published his Natural History of Man, in which he reiterated his belief in the specific unity of man, pointing out that "the same inward and mental nature is to be recognized in all the races." Prichard may fairly be honoured with the title of the founder of the English branch of the sciences of anthropology and ethnology. In 1811 he was appointed physician to St Peter's hospital, Bristol, and in 1814 to the Bristol Infirmary. In 1822 he published Treatise on Diseases of the Nervous System (pt. 1), and in 1835 a Treatise on Insanity and Other Disorders affecting the Mind, in which he advanced the theory of the existence of a distinct mental disease, "mental insanity." In 1842, following up this suggestion, he published On the different forms of Insanity in relation to Jurisprudence designed for the use of Persons concerned in Legal Questions regarding Unsoundness of Mind. In 1845 he was made a Commissioner in lunacy, and removed to London. He died there three years later, on the 23rd of December, of rheumatic fever. At the time of his death he was president of the Ethnological Society and a fellow of the Royal Society. Among his less important works were: A Review of the Doctrine of a Vital Principle (1830); On the Treatment of Hemiplegia (1831); On the Extinction of some Varieties of the Human Race (1839); Analysis of Egyptian Mythology (1819).

See Memoir by Dr Thomas Hodgkin (1798-1866) in the Journal of the Ethnological Society (Feb. 1849); Memoir read before the Bath and Bristol branch of the Provincial Medical and Surgical Society on 1 March 1868, by Dr J. A. Symonds (Journ. Edb. Soc. 1850); Prichard and Symonds in Special Relation to Mental Science, by Dr Haek Tuke (1891).

PRICK POSTS, an old architectural name given sometimes to the queen posts of a roof, and sometimes to the filling in quarters in framing. (See POST and PANE.)

PRIDE, THOMAS (d. 1658), parliamentarian general in the English Civil War, is stated to have been brought up by the parson of St Bride's, London. Subsequently he was a drayman and a brewer. At the beginning of the Civil War he served as a captain under the earl of Essex, and was gradually promoted to the rank of colonel. He distinguished himself at the battle of Preston, and with his regiment took part in the military occupation of London in December 1648, which was the first step towards bringing the king to trial. The second was the expulsion of the Presbyterian and Royalist elements in the House of Commons, for which Pride is chiefly remembered. This, resolved by the army council and ordered by the lord general, Fairfax, was carried out by Colonel Pride's regiment. Taking his stand at the entrance of the House of Commons with his soldiers, in his hand was the arrest warrant and the obnoxious members, who were pointed out to him. After about a hundred members had been thus dealt with ("Pride's Purge"), the mutilated House of Commons proceeded to bring the king to trial. Pride was one of the judges of the king and signed his death-warrant, appending to his signature a seal showing a coat of arms. He commanded an infantry brigade under Cromwell at Dunbar and Worcester. He took no conspicuous part in Commonwealth politics, except in opposing the proposal to confer the kingly dignity on Cromwell. He was knighted by the Protector in 1656, and was also chosen a member of the new House of Lords. He died at Nomsuch House, an estate which he had bought in Surrey, on the 23rd of October 1658. After the Restoration his body was ordered to be dug up and suspended on the gallows at Tyburn along with those of Cromwell, Ireton and Bradshaw, though it is said that the execution of this sentence was evaded.

Noble, Lives of the Regicides; Bate, Lives of the Prime Actors and Principal Contrivers of the Murder of Charles I.; Carlyle, Cromwell's Letters and Speeches.

PRIDEAUX, HUMPHREY (1618-1734), English divine and Oriental scholar, was born of good family at Place, in Cornwall, on the 3rd of May 1618, and received his early education at the grammar schools of Liskeard and Bodmin. In 1635 he was placed at Westminster under Busby, and in 1668 went on to...
PRIE, MARQUISE DE—PRIEST

PRIE, Jeanne Agnes Berthelot de Plénée, Marquise de (1698-1727), French adventuress, was the daughter of a rich but unscrupulous father and an immoral mother. At the age of fifteen she was married to Louis, marquis de Prié, and went with him to the court of Savoy at Turin, where he was ambassador. She was twenty-one when she returned to France, and was soon the declared mistress of Louis Henri, duc de Bourbon. During his ministry (1723-1725) she was in several respects the real ruler of France, her most notable triumph being the marriage of Louis XV. to Marie Leszcynska instead of to Mlle de Vermandois. But when, in 1725, she sought to have Bourbon's rival Fleury exiled, her ascendancy came to an end. After Fleury's recall and the banishment of Bourbon to Chantilly Mme de Prié was exiled to Courbèpine, where she committed suicide the next year.

See M. H. Thirion, Madame de Prié (Paris, 1905).

PRIE-DIEU, literally "pray God," strictly a prayer desk, primarily intended for private use, but often found in churches of the European continent. It is a small ornamental wooden desk furnished with a sloping shelf for books, and a cushioned kneeling piec. It appears not to have received its present name until the early part of the 17th century. At that period in France a small room or oratory was sometimes known by this name. A similar form of chair; in domestic furniture, is called prê-dieu by analogy.

PRIEGO DE CORDOBA, a town of southern Spain in the extreme S.E. of the province of Cordova, near the headwaters of the river Guadajoz, and on the northern slope of the Sierra de Priego. Pop. (1900), 16,902. The district abounds in cattle and mules and agricultural products, especially wine and oil. The local industries also include tanning and manufactures of esparto fabrics, rags and cotton goods. The oldest church was built in the 13th century and subsequently restored; it has a fine chapel. There are ruins of an old castle—Priego having been a fortified city of the Moors which was captured by the Christians in 1226, lost again, and finally retaken in 1407.

PRIENE (mod. Samosun kule), an ancient city of Ionia on the foot-hills of Mycale, about 6 m. N. of the Maeander. It was formerly on the sea coast, but now lies some miles inland. It is said to have been founded by Ionians under Aegyptus, a son of Neleus. Sacked by Argyds of Lydia, it revived and attained great prosperity under its "sage," Bias, in the middle of the 6th century. Cyrus captured it in 545; but it was able to send twelve ships to join the Ionian revolt (500-494). Disputes with Samos, and the troubles after Alexander's death, brought Priene low, and Rome had to save it from the kings of Pergamum and Cappadocia in 155. Orophernes, the rebellious brother of the Cappadocian king, who had deposited a treasure there and recovered it by Roman intervention, restored the temple of Athena as a thankoffering. Under Roman and Byzantine dominion Priene had a prosperous history. It passed into Moslem hands late in the 13th century. The ruins, which lie on a hill above the modern town, are the object of missions sent out by the English Society of Dilettanti in 1803, and were found to have been thoroughly laid open by Dr Th. Wiegand (1805-1809) for the Berlin Museum. The city, as rebuilt in the 4th and 3rd centuries, was laid out on a rectangular scheme. It faced south, its acropolis rising nearly 700 ft. behind it. The whole area was enclosed by a wall 7 ft. thick with towers at intervals and three principal gates. On the lower slopes of the acropolis was a shrine of Demeter. The town had six main streets, about 20 ft. wide, running east and west and fifteen streets about 10 ft. wide crossing at right angles, all being evenly spaced; and it was thus divided into about 80 insulae. Private houses were apportioned four to an insula. The systems of water-supply and drainage can easily be discerned. The houses present many analogies with the earliest Pompeian. In the western half of the city, on a high terrace north of the main street and approached by a fine stairway, was the temple of Athena Polias, a hexastyle peripteral Ionic structure built by Pythias, the architect of the Mausoleum. Under the basis of the statue of Athena were found in 1870 silver tetradrachms of Orophernes, and some jewelry, probably deposited at the time of the Cappadocian restoration. Fronting the main street is a series of halls, and on the other side is the fine market place. The municipal buildings, Roman gymnasium, and well preserved theatre lie to the north, like all the other public structures, in the centre of the plan. Temples of Isis and Asclepius have been laid bare. At the lowest point on the south, within the walls, was the large stadium, connected with a gymnasium of Hellenistic times.

See Society of Dilettanti, Ionia Antiquitates (1821), vol. ii.; Th. Wiegand and H. Schrader, Priene (1901); on inscriptions (360) see Hilfer von Gärtringen, Inschriften von Priene (Berlin, 1907), with collection of ancient references to the city.

(D. G. H.)

PRIEST (Ger. Priester, Fr. prêtre), the contracted form of "presbyter" (πρεσβύτερος, "elder"; see PREBETER), a name of office in the early Christian Church, already mentioned in the New Testament. But in the English Bible the presbyters of the New Testament are called "elders," not "priests"; the latter name is reserved for ministers of pre-Christian religions, the Semitic kôhôn (kôhûnîm, sing. kôhôn) and ṭênîm (kômârîm), or the Greek ἱερεῖς. The reason of this will appear more clearly in the sequel; it is enough to observe at present that, before our English word was formed, the original idea of a presbyter had been overlaid with others derived from pre-Christian priesthood. But it is clear that if it is to be derived from the etymological force of the word that we must start it considering historically what a priest is. The theologians of the Greek and Latin churches expressly found the conception of a Christian priesthood on the hierarchy of the Jewish temple, while the names by which the sacerdotal character is expressed—lepês, sacerdos—originally designated the ministers of sacred things in Greek and Roman heathenism, and then came to be used as translations into Greek and Latin of the Hebrew kôhôn. Kôhôn, lepês, sacerdos, are, in fact, fair translations of one another; they all denote a minister whose stated business was to perform, on behalf of the community, certain public ritual acts, particularly sacrifices, directed godwards. Such ministers or priests existed in all the great religions of ancient civilization. The term
“priest" is sometimes taken to include "sorcerer," but this use is open to criticism - and may produce confusion.

The close inter-relation which existed in primitive society between magic, priesthood and kingship has been indicated by Frazer in his Early History of the Kingship. His remarks throw some light on the early character of priesthood as well as kingship. "When once a special class of sorcerers has been segregated from the community and entrusted by it with the discharge of duties on which the public safety and welfare are believed to depend, these men gradually rise to wealth and power till their leaders” become "kings." According to Frazer's view, "as time goes on the fallacy of magic becomes more and more apparent and is slowly displaced by religion; in other words the magician gives way to the priest. Hence the king starting as a magician tends gradually to exchange the practice of magic for the functions of prayer and sacrifice." We are not concerned here with the debatable question whether magic preceded religion. Probably magic was always accompanied by some primitive form of animism whether the Melanesian mana or fetishism (see Dr Haddon's Magic and Fetishism, pp. 380-1, 40-42). The investigation of this question has been carried on in recent years by King, Tallquist and Zimmern, as well as by Brünnow and Craig, on the magic and ritual of Babylonia and Assyria have been fruitful of results. The question, however, remains to be settled how far the officials and their functions, which in the much more highly developed civilization of Babylonia came to be differentiated and specialized, can be strictly included under the functions of priesthood. The answer to this question will be in many cases negative or affirmative according to our strict adherence or the reverse to the definition of the priest set forth above as "a minister whose stated business it was to perform on behalf of the community certain ritual acts, in some cases sacrifices (or the recitation of prayers), directed towards the godwards." On the other hand the seer, diviner and prophet is a minister whose function it is to communicate God's will or word to man. This is not a distinction which governs Zimmern and other writers. Our chief source of information is Zimmern's Beiträge zur Kenntniss der Babylonien: Religion, pp. 83-95, from which Lagrange in his Études sur les religions sémitiques has chiefly derived his materials (ch. vi. p. 222 sqq.) respecting Babylonia and Assyria. Zimmern's results are confirmed by Driver's In X.A. T. p. 589 sqq. However find magic and soothing closely connected in some of these functions as, we shall see, was the case in early Hebrew pre-exilic days with the Koh. It must be borne in mind that primitive humanity is not governed by logical distinctions. Among the Babylonians and Assyrians the barú (from barú to see, inspect) was a soothing priest who was consulted whenever any important undertaking was proposed, and addressed his inquiries to Samaš the sun god (or Adad) as bêl biri or lord of the oracle (accompanied by the sacrifice of lambs). The signs were usually obtained from the inspection of the liver (according to Johns, that of the lamb that was sacrificed); or it took place through birds; hence the name in this case, given to the "bird inspector." Johns, however, is disposed to regard him as a distinct functionary. Sometimes divination took place through vessels filled with water and oil (see Omen and Divination).

As contrasted with the barú or soothing priest, as he is called by Zimmern, we have the sāšpu, who was the priest-magician who dealt in conjurations (tippu), whereby diseases were removed, spells broken, or in expiations whereby sins were expiated. Tallquist's edition of the Māšhā series of incantations and his explanations of the ritual, and also the publications by Zimmern of the Sārpu series of tablets in his Beiträge have rendered us familiar with the functions of the sāšpu. See article "Magic" in Hastings's Dict. Bible, where examples are given of incantations with magical by-play. Also compare Jastrow's Religion of Babylonia (1893), ch. xvi. "The Magical Texts," where a fuller treatment will be found. Now, as the conjurations were addressed to the deity, sāšpu, according to the definition given above, comes more reasonably under the category of priest. But the priest belongs to the realm of religion proper, which involves a relation of dependence on the superior power, whereas the sāšpu belongs to the realm of magic, which is coercive and seeks "to constrain the hostile power to give way" (Lagrange).

There was also a third kind of priest called the šarrumu, whose function it was to sing hymns. In the earlier period of the Assyrian monarchy we find the king holding the office of pa-te-ši or šiškuš or (more definitely) the šangū, i.e. priest of Assur, the patron-deity of Assyria. This high priestly office towards the tutelary deity of the land appears to have belonged to the king by virtue of his royal rank. In Babylonia under the last empire (except in the case of Nebuchadrezzar, who calls himself pātesi širī, "exalted priest," K.I.B. iii. p. 60) no such high-priestly function attached to the king, for in Babylonia the priesthoods were endowed with great wealth and power, and even the king stood in awe of them (see Johns, Babylonian and Assyrian Laws, Contracts and Letters, p. 212 sqq.). These powerfully-organized priesthoods, as well as the elaborate nature of their ritual and apparatus of worship, must have deeply and permanently impressed the exiled Jewish community. This is the fully developed system of Ezekiel's scheme (xl.-xlvi.) and of the Priestercodex and the high dignity which became attached to the person of the High Priest (reflected in the narrative of Uzziah's leprosy in 2 Chron. xxvi. 16-20). Other parallels to the sacral system of the Priestercodex may here be noted. (1) According to Zimmern the barú and the sāšpu formed close gilds and the office passed from father to son. This is certainly the case of the šangū or priesthood, which was connected with a special family attached to a particular temple and its worship. (2) Johns also points out the existence of the raš-barú, chief soothsayer, and the raš-maššu or chief magician. (3) Bodily defects (as squinting, lack of teeth, maimed fingers) were disqualifications for priesthood (cf. Lev. xxi. 17 sqq.). (4) In the ritual tablets for the sāšpu published in Zimmern's Beitäge, No. 26, col. iii. 19 sqq., we read that he maššu (priest's magician) is to pass forth to the gateway, sacrifice a sheep in the palace portal, and to smear the threshold and posts of the palace gateway right and left with blood of the lamb." We are reminded of Exod. xii. 7 (P). (5) The Babylonian term kuppura (infin. Paill) is used by the magician-priest or šašpu and means "wipe off." This confirms the view that the Hebrew šášpu or šāšāši (or šášaš) is a loan word (specially employed in Ezek, and P.), originally had the meaning "to wash out," or wipe away, as in the Aramaic viz. "wipe off" and not "cover" as in Arabic. Zimmern thinks that the meaning "stone" "expiate," which belongs to the Pael form of the root k-p-r in both Aramaic and Arabic was borrowed from the Babylonian (cf. Driver's note in "Deuteronomy," Int. Commentary, p. 425 sqq., and especially his article "Propitiation" in Hastings's Dict. Bible). The Rev. C. H. W. Johns, to whom reference has already been made, demurs (in a communication to the writer) to the fusion of the priest and the magician, and to the custom of "calling every unknown official a priest or a eunuch." "If a Babylonian said šangū he meant one thing, by šašpu another, and by rašmus another. I do not think that the proper meaning of šangū as a corruption of šašpu. A man who became a priest or rašmus was one person. Thus a šangū had a definite shape in the offerings, a maššu a different shape. It seems to me that the priests belonged to the priest-kings of the older days, who were looked on in the original tribe or clan, etc., that founded the city, and they could not admit outsiders by adoption into the family. If a new god had a temple set up he had a new set of priests, but this priesthood descended in its line. A Samaš priest did not begot a man who became a priest of Nabû. Further 'priest' implied a peculiar relation to the god. A soothsayer was a general practitioner in his art, not attached to any one god or temple. Anyone could be a rašmus who actually poured out libations; that a priest usually did not rise to that rule. The priest was only a sort of specialist in the practice. The priest also offered prayer, interceded, &c. I cannot see that he taught. An oracle of the god came through him. If the madus šangū, or šangū, was akin to the sāšpu, the proper form of special soothsaying was peculiar to the particular cult of that god, and even this as a secondary development. I do not think that early priests received a vote, save dreams, &c. That magic early invaded religion is possible, but there are many traces of its being a foreign element. This is not usually pointed out."
PRIEST

Among the ancient Egyptians the local god was the protector and lord of the district. Consequently it was the interest and duty of the inhabitants to maintain the cultus of the patron-deity of their city who dwelt in their midst. Moreover, in the earlier times we find the priest of the nome acting as the High Priest of the local god, but in course of time the state, represented by the king, began to an ever-increasing degree to take oversight over the more important local cults. Thus we find that the Egyptian monarch was empowered to exercise priestly functions before all the gods. We constantly see him in the wall-paintings portrayed as a priest in the conventional attitudes before the images of the gods. In the chief sanctuaries the chief priests possessed special privileges, and it is probable that those in the immediate entourage of the king were elected to these positions. The highest nobility in the nome sought the honour of presiding in the service of the local gods. Of special class, called "heb" were charged with reciting the divine formulae, which were popularly held to possess magical virtue. In the middle empire (VIIIth to X11th Dynasties) the lay element maintains its position in religious cultus despite its complexity. But under the new empire (Dynasties XVIIIth and following) the professional priest had attained to ominous power. The temples possessed larger estates and became more wealthy. Priests increased in number and were divided into ranks, and we find them occupying state offices, just as in Babylonia the priest acts as judge or inspector of canals (Johns, Babylon, and Assyria, I., p. 233).

We now turn to the priesthood as we find it in ancient Greece and Italy. Homer knows special priests who preside over ritual acts in the temples to which they are attached; but his kings also do sacrifice on behalf of their people. The king, in fact, both in Greece and in Rome, was the acting head of the state religion, and when the regal power came to an end his sacred functions were not transferred to the ordinary priests, but either they were distributed among high officers of state, as archons and prytanes, or the title of "king" was still preserved as that of a religious functionary, as in the case of the rex sacrorum at Rome and the "archon basileus" at Athens. In the domestic circle the union of priesthood and national headship was never disturbed; the Roman paterfamilias sacrificed for the whole family. On the other hand, gentes and phratriae, which had no natural head, had special priests chosen from their members; for every circle of ancient society, from the family up to the state, was a religious as well as a civil unity, and had its own gods and sacred rites. The lines of religious and civil society were identical, and, so long as they remained so, no antagonism could arise between the spiritual and the temporal power. In point of fact, in Greece and Rome the priest never attained to any considerable independent importance; we see the priestly power and hardly even of a distinct priestly class. In Greece the priest, so far as he is an independent functionary and not one of the magistrates, is simply the elected or hereditary minister of a temple charged with "those things which are ordained to be done towards the gods" (see Aristotle, Pol. vi. 8), and remunerated from the revenues of the temple, or by the gifts of worshippers and sacrificial dues. The position was often lucrative and always honourable, and the priests were under the special protection of the gods they served. But their purely arthral functions gave them. In the domestic lishing a considerable influence on the minds of men, and the technical knowledge which they possessed as to the way in which the gods could be approached was neither so intricate nor so mysterious as to give the class a special importance. The funds of the temples were not in their control, but were treated as public moneys. Above all, where, as at Athens, the decision of questions of sacred law fell not to the priests but to the college of "epagyrat", one great source of priestly power was wholly lacking. There remains, indeed, one other sacred function of great importance in the ancient world in which the Greek priests had a share. As man approached the gods in sacrifice and prayers, so too the gods declared themselves by the diversity signs and tokens, which it was possible to read by the art of Divination (q.v.). In many nations divination and priesthood have always gone hand in hand; at Rome, for example, the augurs and the XV viri sacrorum, who interpreted the Sibylline books, were priestly colleges. In Greece, on the other hand, divination was not generally a priestly function, but it did belong to the priests of the Oracles (see Oracle). The great oracles, however, were of Panhellenic celebrity and did not serve each a particular state, and so in this direction also the risk of an independent priestly power within the state was avoided.1

In Rome, again, where the functions of the priesthood were politically much more weighty, where the technicalities of religion were more complicated, where priests interpreted the will of the gods, and where the pontiffs had a most important jurisdiction in sacred things, the state was much too strong to suffer these powers escape from its own immediate control: the old monarchical of the king in sacred things descended to the inhabitation of his temporal power; the highest civil and religious functions met in the same persons (cf. Cic. De dom. i. 1); and every priest was subject to the state exactly as the magistrates were, referring all weighty matters to state decision and then executing what the one supreme power decreed. And it is instructive to observe that when the plebeians exerted their full share of political power they also demanded and obtained admission to every priestly college of political importance, to those, namely, of the pontiffs, the augurs, and the XV viri sacrorum. The Romans, it need hardly be said, had no hereditary priests.2

We can only glance briefly at the ancient religions of India (Aryan). "In historical times the priesthood is rigidly confined to members of the Brahmans caste, who are regarded as the representatives of God on earth. But there are indications that at an earlier date the Kshatriya or warrior caste often became priests. The power of the priesthood began with the delegation by the king of his sacrificial duties to a "president" (purushot). This power grew with the growing importance of the sacrifice and the complication of its ceremonial. In the post-Vedic period "right" or "wrong" simply means the exact performance of the ritual, whether intentional or unintentional—of all the details of a prescribed ritual, the centre of which was the sacrifice. At this period the priestly caste gained its unbounded power over the minds of men" (Professor Rapson). For further details as to, the development of the priestly caste and wisdom in India the reader must refer to Brahminism; here it is enough to observe that among a religious people a priesthood which forms a close and still more an hereditary corporation, and the assistance of which is indispensable in all religious acts, must rise to practical supremacy in society except under the strongest form of despotism, where the sovereign is head of the Church as well as of the state.

Among the Zoroastrian Iranians, as among the Indian Aryans, the aid of a priest to recite the sacrificial liturgy was necessary at every offering (Hered. i. 132), and the Iranian priests (āθrasans, later Magi) claimed, like the Brahmans, to be the highest order of society; but a variety of conditions were lacking to give them the full place of their Indian brethren. Zoroastrianism is not a nature religion, but the result of a reform which never, under the old empire, thoroughly penetrated the masses; and the priesthood, as it was not based on family tradi- tion, whether intentional or unintentional,—of all the any one to obtain entrance into the priesthood, while on the other hand it was only as a priest that he could exercise sacerdotal functions, for these were strictly reserved to priests. Accordingly the clergy formed a compact hierarchy not inferior in influence to the clergy of the Christian middle ages, had great power in the state, and were often irksome even to the great king.3

1 For the Greek priests, see, besides Schömann and other works on Greek antiquities, Newton, Essays on Art and Archaeology, p. 136 seq. (from epigraphic material). See also for Greek as well as Roman churches as "Saecular Church of the State" (Schomann in Warreorn's Concise Dict. of Greek and Roman Antiquities).
2 On the Roman priests, see in general Marquardt, Römische Staatsverwaltung, vol. iii., and for the pontiffs in particular the art. "Sacersos" in Warreorn's Concise Dict., also Pontifex. 3 For the present, see a recent work by R. H. Poppe, Die Knechte der Göter ('Sacersos' as of the State), of the same date.
But the best established hierarchy is not so powerful as a caste, and the monachs had one strong hold on the clergy by retaining the patronage of great ecclesiastical places, and another in the fact that the Semitic provinces on the Tigris, where the capital lay, were mainly inhabited by men of other faith.¹

The duties of the priests were not restricted to the services of the temple, but they also took part in the household cults. The chief religious character of the magic ritual was this, that it was not peculiarly attractive. It is impossible to enter into the manifold details of the fire cultus which forms the main part of the worship in the Avesta. They belong to an earlier period than the Zoroastrian, nor was this fire cultus restricted to the temples. Portable fire altars were carried about and the worship could be celebrated in any spot. It may be noted that in all the ceremonies in the religion of the Avesta, incantations, prayers and confessions play a very large part. The prevailing element in the incantations consists in the exorcism of devils. In fact, the Persian religion throughout all its multitude of purifications, observances and expiations was a constant warfare against impurity, death and the devil. Amid all the ceremonialism of its priesthood there were also high ideals set forth in Zoroastrian religion of what a priest should be. Thus we read in Vendidad xviii.,

"Many there be, noble Zarathustra, who bear the mouth bondage, who have yet not girded their loins with the law. If such a one says 'I am an Ahravhan,' he lies, call him not Ahravan, noble Zarathustra, said Ahura Mazda, but thou shouldst call him priest, noble Zarathustra, who sits awake the whole night through and years for holy wisdom that enables man to stand on death's bridge fearless and with happy heart, the wisdom whereby he attains the holy and glorious world of paradise."

In this rapid glance at some of the chief priesthoods of antiquity we have hitherto passed over the pure Semites, whose priesthoods call for closer examination because of the profound influence which one of them—that of the Jews—has exercised on Christianity, and so on the whole history of the modern world. But before we proceed to this it may be well to note one or two things that come out by comparison of the systems already before us. Priestly acts—that is, acts done by one and accepted by the gods on behalf of many—are common to all the various religions, and cannot be lacking where the primary subject of religion is not the individual but the natural community. But the origin of a separate priestly class, distinct from the natural heads of the community, cannot be explained by any such broad general principle; in some cases, as in Greece, it is little more than a matter of convenience that part of the religious duties of the state should be confided to special ministers charged with the care of particular temples, while in others the intervention of a special priesthood is indispensable to the validity of every religious act, so that the priest ultimately becomes a mediator and the vehicle of all divine grace. This position, we see, can be reached by various paths: the priest may become indispensable through the growth of ritual observances and precautions too complicated for a layman to master, or he may lay claim to special nearness to the gods on the ground, it may be, of his race, or, it may be, of habitual practices of purity and asceticism which cannot be combined with the duties of ordinary life, as, for example, celibacy was required of priests of Vesta at Rome. But the highest developments of priestly influence are hardly separable from something of magical superstition, the opus operatum of the priest has the power of a sorcerer's spell. The strength of the priesthood in Chaldea and in Egypt stands plainly in the closest connexion with the survival of magical element in the state religion, and Rome, in like manner, is more priestly than Greece, because it is more superstitious. In most cases, however, where an ancient civilization shows us a strong priestly system we are unable to make out in any detail the steps by which that system was elaborated; the clearest case perhaps is the priesthood of the Jews, which is not less interesting from its origin and growth than from the influence exerted by the system long after the priests were dispersed and their sanctuary laid in ruins.

Among the nomadic Semites, to whom the Hebrews belonged before they settled in Canaan, there has never been any developed priestly control. The acts of the god were, in the main, the executory acts of the general law of desert life; apart from the private worship of household gods and the obligations and salutations offered at the graves of departed kinmen, the ritual observances of the ancient Arabs were visits to the temple, the sacred fire being kept up as a symbol of the deity. It does not appear that any portion of the sacrifice was burned on the altar, or that any part of the victim was the due of the sanctuary. We find therefore no trace of a sacrificial priesthood, but each temple had one or more doorkeepers (zadim, jihib), whose office was usually hereditary in a certain family and who had the charge of the temple and its treasures. The sacrifices and offerings were acknowledgments of divine bounty and were for its continuance; the Arab was the slave of his god and paid him tribute, as slaves used to do to their masters, or subjects to their lords; and the free Bedouin, trained in the self-reliance and absolute independence of his master except his god, and acknowledged no other will before which his own should bend. The voice of the god might be uttered in omens which the skilled could read, or conveyed in the inspired rhymes of the soothsayer. Many temples, particularly in the sanctuary, where the sacred lot was administered for a fee by the zadim. The sanctuary thus became a seat of judgment, and here, too, compacts were sealed by oath and sacrificial ceremonies. The Persianations, therefore, of the institutions we observed up to an age when the old faith was falling to pieces, are certainly very ancient. The fundamental type of the Arabic sanctuary can be traced through all the Semitic lands, and so appears to be older than the fire dispersion; but the technical terms are the same, so that we may justly assume that the more developed ritual and priesthoods of the settled Semites sprang from a state of things not very different from the primitive Arab. Now among the Arabs, as we have seen, ritual service is the affair of the individual, or of a mass of individuals gathered in a great feast, but still doing worship each for himself and his own private circle; the public aspect of religion is found in connexion with the temple and the oracle to which the affairs of the community are committed. In Greece and Rome the public sacrifices were the chief function of religion, and in them the priesthood represented the ancients to us. But in the desert there is no king and no sovereignty save that of the divine oracle, and therefore it is from the soothsayers or ministers of the oracle that a public ministry of religion can most naturally spring. With the beginning of a settled state the function of priest and ruler are combined, and the chief religious institution will gather round them. A sacrificial priesthood will arise as the worship becomes more complex (especially as sacrifice in ancient times was connected with the land) and the priest his name. The public ritual will still remain closely associated with oracle or divination, and the priest will still be, above all things, a seer. That this was what actually happened may be inferred from the fact that the Canaanite and Phoenician priest and soothsayer is identical with the Arabic kahin, a 'soothsayer.' Soothsaying was no modern importation in Arabia; its characteristic form—a monotonous crom of short rhyming clauses—is the same as was practised by the Hebrew 'wise men' (Noah, who peeped and muttered) in the days of Isaiah, and that this form was native in Arabia is clear from its having a technical name (sa'j), which in Hebrew survived only in derivative words with the same meaning. The kahin, therefore, is not a degraded priest but such a soothsayer is found in most primitive societies, and the Canaanite priests grew out of these early revelers. In point of fact some form of revel can still be found among the semi-barbarians of the desert, and the Canaan and Syria,¹ and the importance of this element in the cultus may be measured from the fact that at Hierapolis it was the charge of the chief priest, just as in the Levitical legislation. But the use of the kahin ² also places the Arabian priest in the highest rank among the semi-barbarian priesthoods, and more than this: it is connected with the orgiastic character of Canaanite religion. The soothsayer differs from the priest of an oracle by giving his revelation under excitement and often in a frenzy of madness. In some cases, as in the case of the Sibyl, the physical accompaniment of an afflatus which, though it seems supernatural to a rude people, is really akin to poetic inspiration.

¹ Cf. especially Noldeke's Tabari, p. 450 seq.

² Mesihuggai, 2 Kings ix, 11, Jer. xxix. 26—a term of contempt applied to prophets. (See Hebrew RELIGION.)

³ See Hebrew RELIGION, and especially PHOENIZIE; see further, Lucian, De dea syria, 36, for Hierapolis; Zosimus i. 58, for Aphaca; Pliny, H. N. xxvii. 58 (compared with Lucian, ut supra, and Movers, Phoenixier, i. 655), for the temple of Melkart at Tyre.
PRIEST

But it is soon learned that a similar physical state can be produced artificially, and at the Canaanite sanctuaries this was done on a large scale. We see from 1 Kings xviii., 2 Kings x., that great Baal temples had two classes of ministers, kōhānîm and neḥēlahim, and that the former, the kōhānîm, were the real priests, the highest order of which was the high priest. This means that primarily denotes a soothsayer, so the latter are also a kind of priests who do sacrificial service with a wild ritual of their own. Hebrew priestly titles (cf. Judges xvii. 3) are not used as such, but the number of old Semitic nature-worship is clear from Greek and Roman accounts, such as that of Appuleius (Metam. bk. viii.).

The Hebrews, who made the language of Canaan their own, took at the Canaanite temple the right to receive for a fee the sacred objects in Hebrew priesthood are not Canaanite in character; the priest, as he appears in the older records of the time of the Judges, Eli at Shiloh, Jonathan in the private temple of Micah and at Dan, is merely a steward, a temple manager, who received the Hebrew society at the time of the conquest was almost precisely that of a soothsayer, and the religious ordinances are scarcely distinguishable from those of the Levitical. After the conquest, the period of the Exile, and the period when Moses, sitting in judgment at the sanctuary of Kadesh, had for a whole generation impressed the sovereignty of Jehovah on all the tribes, had created an idea of unity between the scattered settlements in Canaan such as the Arabs before Mahomet never had. But neither in civil nor in religious life was this ideal unity expressed in fixed institutions, the old individualism of the Semitic nomad still held its ground. Thus the firstlings, first-fruits and vows are still the free gift of the individual which no human authority exacts, and which every householder presents and consumes with his circle in a sacrificial feast without priestly aid. And the temple of sacred images (nabû) set up under the open heaven, and here the blood of the victim is poured out as an offering to God (see especially 1 Sam. xiv. 34, and cf. 2 Sam. xxiii. 16, 17). The priest has no place in this ritual; he is not the minister of an altar, but the guardian of the public records, and the guardian and custodian for the custody of sacred images and palladia or other consecrated things (the ark at Shiloh, 1 Sam. iii. 3; images in Micah's temple. Judges iii. 11). The temple, therefore, is lying beyond the "ephorim", or plated vessels, at Nob (1 Sam. xx. 9); no priest, no money, a temple of Jehovah at Shechem, Judges ix. 4). Such treasures required a guardian; but, above all, wherever there was a temple there was an oracle, a council or "kōhānîm" (Ezra x. 8). The temple of Jehovah in xiv. 18, 36) could only be drawn where there was an "ephorim" and a priest (1 Sam. xiv. 18, Sept., and xxii. 6 seq.). The Hebrews had already possessed a tent-temple and oracle of this kind in the wilderness (Exod. xxxiii. 7 seq.), of which Moses was the priest and Joshua the aedilus, and ever since that time the judgment of God through the priest at the sanctuary had a greater weight than the word of a seer, and was the ultimate solution of every controversy and claim (1 Sam. ii. 25; Exod. xvi. 6, xxii. 19, where "for judge," "judges," of A.V. read "God" with R.V.). The temple at Shiloh, where the ark was preserved, was the sole descendant of the Mosaic sanctuary -- this, however, was lost to itself and its people, and its essence the thing—and its priests claimed kin with Moses himself. In the divided state of the nation, indeed, this sanctuary was hardly visited beyond Mt Ephraim; and every man or tribe that could afford an ephod and hire a priest might have a temple and oracle of his own at which to consult Jehovah (Judges xvii., xviii.); but there was hardly another sanctuary of equal dignity. The priest of Shiloh is a much greater person than Micah's priest Jonathan; at the great

feast he sits enthroned by the doorway, preserving decorum among the worshippers; he has certain legal dues, and, if he is disposed to exact more, no one ventures to resist (1 Sam. ii. 12 seq., where the text reads a slight correction). The priestly position of the high priest recorded the processions and bear a surface resemblance to that of the high priest in the temple. It was members of this house who chose Jehovah for the early kings until Solomon deposed Abiathar. Indeed, though priesthood passed out of the line of the tribe of Levi and the tabernacle, the idea of the king as the "high priest" of the people is always implied in the kingship. Phinehas are not called priests, though they bore the ark and so were priests in the sense of Josh. iii.

1 This appears even in the words used as synonyms for "priest" רָשׁוֹן, רֶשֶׁת, which exactly corresponds to sādin and bājīb. That the name of sōn was borrowed from the Canaanites appears certain, for that out of the multiplicity of words for soothsayer and the like common to Hebrew and Arabic (either formed from a common root or expressing exactly the same idea—"sānū", "ārāf; רְחַב, רֶשֶׁת, רְשָׁה; see, if instāsām) the two nations stand further apart, and are one only relatively to mean a priest in view of the great difference in character between old Hebrew and Canaanite priesthoods, inconceivable. Besides yān Hebrew has the word yōb (pl. yeḇēḇ), which, however, is not applied to priests of the national religion. This, in fact, is the old Aramaic word for a priest (with suffixed article, kūnā). Its origin is obscure. In the Aramaic papyr. discovered near Assuan (Syene) yāb is priest of the gods (Edox. Cost. taw. Sayed, Pap. E. line 15), presumably Khum and Help and in Sachau, Pap. E. line 22, priests of the gods of Ḫūlī. This coincides with the Hebrew use of the term as idolatrous priests, Hos. x. 5; Zeph. i. 4; 2 Kings xxii. 5. 1 Sam. xxviii. 9; Jer. xxvii. 13. The priest had anything to do with sacrifice, whether those who burned the fat were the worshippers themselves or some subordinate ministers of the Temple. Certainly it was not the "priest" who did so. The connotation of the singular "priest" of Phinehas are not called priests, though they bore the ark and so were priests in the sense of Josh. iii.

2 See 1 Sam. ii. 36, a passage written after the hereditary dignity of the sons of Zadok at Jerusalem was well established.
of Zadok to the proposal to share the sanctuary on equal terms with these new-comers, and the theoretical justification of the degradation of the latter to the position of mere servants in the Temple superintended by the priests themselves.

It is instructive to observe how differently the prophets of the 8th century speak of the judicial or "teaching" functions of the priests and of the ritual of the great sanctuaries. For the latter there is theCsv. 93. Hastings’s Dict. Ant. s. v. "Camb., Shrewsbury", p. 552.whole temple was held to have been the visible centre of national life in the ages of servitude to foreign power, and the priests were the only great national functionaries, who could claim the benefit of the sacred freedom of the temple even appropriated the tithes paid of old to the king. When the High Priest stood at the altar in all his princely state, when he poured out the libation amidst the blare of trumpets, and the singers lifted up their voice and all the people fell prostrate in prayer till he descended and raised his hands in blessing, the slaves of the Greek war, and the priests could not forget for another week that the day of their redemption was near (Eccles. i. 1).

The High Priest at such a moment seemed to embody all the glory of the nation, as the kings had done of old, and when the time came to strike a successful blow for freedom it was a priestly house that led the nation to the victory which united in one person the functions of High Priest and prince. From the foundation of the Hasmonaeum state to the time of Herod the history of the high-priesthood merges in the political history of the nation; from Herod onward the priestly aristocracy of the Sadducees lost its chief hold over the nation and expired in vain controversy with the Pharisees.

The influence of the Hebrew priesthood on the thought and organization of Christendom was the influence not of a living institution, for it hardly began till after the fall of the Temple, but of the theory embodied in the later parts of the Pentateuch. Two points in this theory were laid hold of—

1. The doctrine of priestly mediation and the system of priestly hierarchy. The first forms the text of the principal argument in the Epistle to the Hebrews, in which the author easily demonstrates the inadequacy of the mediation and atoning rites of the Old Testament, and builds upon this demonstration the doctrine of the effectual high-priesthood of Christ, who, in his spiritual and literal identification, is both the mediator and the high priest outside as He entered the heavenly sanctuary, but taking them with Him into spiritual nearness to the throne of grace.

2. This argument leaves no room for a special priesthood in the Christian Church, and in fact nothing of the kind is found in the oldest organization of the new communities of faith. The idea that presbyters and bishops are priests and the successors of the Old Testament priesthood first appears in full force in the writings of Cyprian, and here it is not the notion of priestly mediation but that of priestly power which is insisted on. Church office is a copy of the old hierarchy. Now among the Jews, as we have seen, the hierarchy proper has for its necessary condition the destruction of the national as well as religious temple to a foreign prince, so that spiritual power is the only basis left for a national aristocracy. The same conditions have produced similar spiritual aristocracies again and again in the East in more modern times, and even in antiquity more than one Oriental priesthood took a line of development similar to that which we have traced in Judaea. Thus the hereditary priests of Καζαθ (Καζαθ) were the chief dignitaries in Idumaea at the time of the Jewish conquest of the country (Jos. Ant. xv. 7, 9), and the High Priest of Hierapolis wore the princely purple and crown like the High Priest of the Jews (De deo syria, § 19). More roughly insinuated, the High Priest of the sun at Emesa is described by Herodian (viii. 23, 2). In connection with the history of Elogabalus, whose elevation to the Roman purple was mainly due to the extraordiary local influence of his sacerdotal place. Other examples of priestly princes are given by Strabo in speaking of Pessinius (p. 567) and Olbe (p. 672).

So no such hierarchy existed in the West, it is plain that if the idea of Christian priesthood was influenced by living institutions as well as by the Old Testament that influence must be sought in the East (cf. Lightfoot, Philippians, p. 261). The further development of the notion of Christian priesthood was due to the opinion that the Euchariat (q.v.) is a propitiatory sacrifice which only a consecrated priest can perform. It is sufficient to remark here that the presentation of the sacrifice of the mass came to be viewed as the essential priestly office, so that the Christian presbytery really was a sacerdos in the antique sense. Protestants, in rejecting the sacrifice of the mass, deny also that there is a Christian priesthood "like the Levitical," and have either dropped the name of "priest" or use it in a quite emasculated sense. For further details as to the history and doctrine of priesthood in Christendom the reader is referred to the article, "Priestcraft: Priesterwelse in der Christlichen Kirche," in P. E. E., 3rd ed., Bd. vi. p. 47 seqq.

3. Cf. the impression which the ritual produced on the Greeks, Bernays’s Theophoros, pp. 85, 111 seq. In the Christian Church, and in fact nothing of the kind is found in the oldest organization of the new communities of faith. The idea that presbyters and bishops are priests and the successors of the Old Testament priesthood first appears in full force in the writings of Cyprian, and here it is not the notion of priestly mediation but that of priestly power which is insisted on. Church office is a copy of the old hierarchy. Now among the Jews, as we have seen, the hierarchy proper has for its necessary condition the destruction of the national as well as religious temple to a foreign prince, so that spiritual power is the only basis left for a national aristocracy. The same conditions have produced similar spiritual aristocracies again and again in the East in more modern times, and even in antiquity more than one Oriental priesthood took a line of development similar to that which we have traced in Judaea. Thus the hereditary priests of Καζαθ (Καζαθ) were the chief dignitaries in Idumaea at the time of the Jewish conquest of the country (Jos. Ant. xv. 7, 9), and the High Priest of Hierapolis wore the princely purple and crown like the High Priest of the Jews (De deo syria, § 19). More roughly insinuated, the High Priest of the sun at Emesa is described by Herodian (viii. 23, 2). In connection with the history of Elogabalus, whose elevation to the Roman purple was mainly due to the extraordinary local influence of his sacerdotal place. Other examples of priestly princes are given by Strabo in speaking of Pessinius (p. 567) and Olbe (p. 672).

5. As no such hierarchy existed in the West, it is plain that if the idea of Christian priesthood was influenced by living institutions as well as by the Old Testament that influence must be sought in the East (cf. Lightfoot, Philippians, p. 261).
PRIESTLEY

feature that has not been already illustrated. Among higher religions orthodox Islam has never had real priests, doing religious acts on behalf of others, though it has, like Protestant churches, leaders of public devotion (imāms) and an important class of privileged religious teachers (ulemas). But a distinction of grades of holiness gained by ascetic life has never been entirely foreign to the Eastern mind, and in the popular faith of Mahommedans, though very much changed, this can be traced back to Zoroastrianism.

His associated remains more woollen-cloth his 1752, for Dr. Matthew tanon of this creed. His logic accepted foreign vols., fifteen of his 250, he had written them.

In 1771 the academy, attended in London, on which the visit of the public to the Royal Academy was the subject of an anonymous letter in the London Magazine, 1770, p. 388.

The Priestley of the present century has made a name for himself by his discoveries in chemistry. He was born in 1733, and died in 1804. He was the son of a clergyman of the Established Church, and was educated at Oxford. He was a member of the Nonconformist academy in the north of England, and was a friend of Dr. Rutt, the botanist, and Dr. Priestley, the chemist.

Priestley was the author of "The History of the Human Race," a work which has been widely read and admired. He was also the author of "The History of the French Revolution," and of "The History of the American Revolution." He was a man of great ability, and his writings were characterized by a clear and concise style.

In 1774 he was appointed to the presidency of the Royal Society of London, and in 1775 he was elected a member of the American Philosophical Society. He was also a member of the British Association for the Advancement of Science, and of the Royal Society of London.

Priestley was a man of great energy, and he was always ready to undertake new and difficult tasks. He was a man of great independence, and he was always willing to express his own opinions, even if they were in opposition to the opinions of others.

In 1775 he was appointed a professor of chemistry at the University of Edinburgh, and in 1776 he was appointed a professor of chemistry at the University of Glasgow. He was also a member of the Royal Society of Edinburgh, and of the Royal Society of London.

Priestley was a man of great enthusiasm, and he was always ready to undertake new and difficult tasks. He was a man of great independence, and he was always willing to express his own opinions, even if they were in opposition to the opinions of others.

Priestley was a man of great enthusiasm, and he was always ready to undertake new and difficult tasks. He was a man of great independence, and he was always willing to express his own opinions, even if they were in opposition to the opinions of others.
and a supporter of combustion. Of the analogy between combustion and respiration—both true phlogistic processes in his view—he had convinced himself three years before, and his paper, "On Different Kinds of Air" (Phil. Trans., 1772) described experiments which showed that growing plants are able to "restore" air which has been vitiated, whether by being breathed or by having candles burnt in it. Priestley displayed much ingenuity in devising apparatus suited to his requirements and in carrying out and varying his experiments: it was in the interpretation of results that he was deficient. Had this not been the case he could scarcely have remained a firm believer in the phlogistic doctrine. At one time, indeed, he found Lavoisier's views so contrary to his own that he was much inclined to accept them, but he overcame this wavering early as 1800 he wrote to the Rev. Theophilus Lindsey (1723-1808), "I have well considered all that my opponents have advanced and feel confident of the ground I stand upon. . . . Though nearly alone I am under no apprehension of defeat."

His chief books on chemistry were six volumes of Experiments and Observations on different Kinds of Air, published between 1774 and 1787. They were published in the form of a dialogue between Priestley and his servant, "John," who is a remarkably vivid record of Priestley's own views on science. He also published (1767) a treatise on the History and Present State of Electricity, which embodies some original work, and (1772) a History of Discoveries relating to Vision, Light and Colours, which is a mere compilation.

PRIEUR, PIERRE (c. 1626-c. 1769), French enamel painter. He married Marie (1610-1657), sister of Jean Petitot, as his second husband. In 1669 he was in England, painting a miniature of Charles II., and another of Lady Castlemaine, but after this he returned to France as King of Denmark. In 1670 he was in Poland, painting for the Tsars portraits of King Michael, and in the following year was in Denmark executing a remarkable series of portraits of the children of Frederick III. All these, with some beautiful enamel badges for the Order of the Elephant, are in the Danish royal collection. By Christian V. he is said to have been sent to Spain and Russia, where several examples of his work, dated 1766, are to be seen in the Hermitage. In the following year he died in Denmark. He was a Huguenot, and was said to possess secret colours in enamel, especially a blue, which were not known to his Petitot relations. His work in England is of great rarity, Lord Dartmouth possessing the finest example, and there are two remarkable works in the Pierpont Morgan collection and one at Windsor Castle. Two in the Propert collection have been lost sight of.

Prieur de la Marne [Pierre Louis Prieur] (1756-1827), French politician, was born at Sommesseux (Marne) on the 1st of August 1756. He practised as a lawyer at Châlons-sur-Marne until 1789, when he was elected to the states-general. He became secretary to the Assembly, and the violence of his attacks on the ancien régime won him the nickname of "Crueur de la Marne." In 1791 he became vice-president of the criminal tribunal of Paris. Re-elected to the Convention, he was sent to Normandy in 1793 to direct the defence of Honfleur, where he deserved bitter reproofs against the Federalists. He voted for the death of Louis XVI., and as a member of the committees of national defence and of public safety he was dispatched in October 1793 to Brazil, where he established the Terror. In May 1794 he became president of the Convention. The counter-revolutionaries drove him into hiding from May 1795 until the amnesty proclaimed in the autumn of that year. He took no part in public affairs under the directory, the consulate, or the empire, and in 1816 was banished as a registris. He died in Brussels on the 31st of May 1827.

See Pierre Biard, Le Conventionnel Prieur de la Marne en mission dans l'ouest 1793-1794 d'après des documents inédits (1906).

Prieur-Duvernois, Claude Antoine, Comte (1763-1832), French politician, was born at Auzonne on the 2nd of December 1763, and was commonly known as Prieur de la Côte d'Or. After his native department. As an officer of engineers he presented to the National Assembly in 1790 a Mémoire upon the standardization of weights and measures. In 1791 he was returned by the Côte d'Or to the Legislative Assembly, and in 1792 to the Convention. After the revolution of the 10th of August 1792 he was sent on a mission to the Rhine to announce the deposition of Louis XVI., for whose death he voted in the Convention. In 1793 he was employed in breaking up the Carlist movement in Normandy, but he was arrested by the Federalist authorities of Caen, and only released in 1793 after the defeat of their forces at Vernon. On the 14th of August 1793 he became a member of the committee of public safety, where he allied himself closely with Lazare Carnot in the organization of national defence, being especially charged with the provision of the munitions of war. Under the Directory he sat in the Council of the Five Hundred, retiring after the coup d'état of 18 Brumaire (November 9, 1799). In 1808 he was created a count of the empire; and in 1811 he retired from the army with the grade of chef de brigade. He was one of the founders of the École Polytechnique, and shared in the establishment of the École Militaire; the adoption of the metric system and the foundation of the observatory were also due to his efforts. Prieur died at Dijon on the 11th of August 1832.

See J. Gros, Le Comité de salut public (1853) ; and Ch. Aravasy, Correspondance de Carnot, vol. i., which includes some documents drawn up by Prieur.

Prim, Juan, Marquis de los Castillojeos, Count de Reus (1814-1870), Spanish soldier and statesman, was the son of Lieut.-Colonel Pablo Prim, and was born at Reus in Catalonia on the 12th of December 1814. He entered the free corps known as Deserters of Guillermo II. in 1834, and in the course of the Carlist War he rose to the rank of lieutenant-colonel and had two orders of knighthood conferred upon him. After the pacification of 1839, as a progressist opposed to the dictatorship of Espartero, he was sent into exile. However, in 1843 he was elected deputy for Tarragona, and after defeating Espartero at Bruch he entered Madrid in triumph with Serrano. The regent Maria Christina promoted him major-general, and made him count of Reus. Narvaez, the prime minister, failed to understand what constitutional freedom meant, and Prim, on showing signs of opposition, was sentenced to six years' imprisonment in the Philippine Islands. The sentence was not carried out, and Prim remained an exile in England and France until the amnesty of 1847. He then returned to Spain, and was first employed as captain-general of Porto Rico and afterwards as military representative with the sultan during the Crimean War. In 1854 he was elected to the cortes, and gave his support to O'Donnell, who promoted him lieutenant-general in 1856. In the war with Morocco he did such good service at Los Castillojeos or Marabout, Cabo Negro, Guad al Gelu and Campamento in 1860 that he was made marquis de los Castillojeos and a grandee of Spain. He commanded the Spanish army in Mexico when he refused to consent to the ambitious schemes of Napoleon III. On his return to Spain he joined the opposition, heading pronunciamentos in Catalonia against Narvaez and O'Donnell. All his attempts failed until the death of Narvaez in April 1868, after which Queen Isabella fell more and more under the influence of the Jesuits, and became increasingly tyrannical, until at last even Serrano was exiled. In September 1868 Serrano and Prim returned, and Admiral Topete, commanding the fleet, raised the standard of revolt at Cadiz (see SPAIN). In July 1869 Serrano was elected regent, and Prim became president of the council and was made a marshal. On the 16th of November 1870 Amadeo, duke of Aosta, was elected king of Spain, but Prim, on leaving the chamber of the cortes on the 28th of December, was shot by unknown assassins and died two days later. The cortes took his children as wards of the country; three days afterwards King Amadeo I. swore in the presence of the cortes to observe the new Spanish constitution.

Two biographies of Prim down to 1860 were published in that year by Gimenez y Guitiéd and Gonzalez Llanes. See also L. Blaire, Le Général Prim et la situation actuelle de l'Espagne (Paris, 1867); P. Guitelmo; Juan Prim et l'Espagne (Paris, 1870); and Prim, by H. Leonardon (in French, 1901), which contains a useful bibliography.

Primage (adopted from the Fr. primage, from primare, reimburse, Lat. praemium, reward), a commercial term
PRIMATE—PRIMATES

signifying originally a small customary payment over and above the freight made to the master of the ship for his care and trouble. It is now generally included in the freight, as an additional percentage. It varies according to the usages of different ports and particular trades.

PRIMATE (from Low Lat. primus—one who held the first place, primas partes). During the 4th and 5th centuries A.D. the title was applied to both secular and ecclesiastical officials. The Theodosian Code mentions primates of towns, districts and fortified places (Primates urbium, vicarum, castellorum). The Pragmatic Sanction of Justinian also mentions primates governing a district, primates regionis; and in this sense the title survived, under Turkish rule, in Greece until the 19th century. An official called "primate of the palace" is mentioned in the laws of the Visigoths. Primas also seems to have been used loosely during the middle ages for "head" or "chief." Du Cange cites prímas castri. The title, however, has been more generally used to denote a bishop with special privileges and powers. It was first employed almost synonymously with metropolitan to denote the chief bishop of a province having his see in the capital and certain rights of superelevation over the whole province. At the Council of Nicaea (A.D. 325) the metropolitan constitution was assumed as universal, and after this the terms "metropolitan," and "primate," to denote the chief bishop of a province, came into general use. The title of primate was used more generally in Africa, while elsewhere metropolitan was more generally employed. The primates in Africa differed from those elsewhere in that the title always belonged to the longest ordained bishop in a province, who had not necessarily his see in the capital, except in the case of the bishop of Carthage, who was head also of the other five African provinces. There were also three sorts of honorary primates: (1) primas aequi, the oldest bishop in a province next to the primate, on whom power devolved when the primate was disabled or disqualified; (2) titular metropolitan, the bishops of certain cities which had the name and title of civil metropoles bestowed on them by some emperor; (3) the bishops of some mother-churches which were honoured by ancient custom but were subject to the ordinary metropolitan, e.g. the bishop of Jerusalem, who was subject to his metropolitan at Caesarea.

At a later date "primate" became the official title of certain metropolitan who obtained from the pope a position of episcopal suzerainty over metropolitan and other primates; and he, at the same time, appointed vicars of the Holy See. This was done in the case of the bishops of Arles and Thessalonica as early as the 5th century. Such primates were sometimes also called patriarchs, primates diocesearum (political, not episcopal dioceses), primates provinciae, summi primates, praesules omnium sacerdotum in paribus suis. In this sense the Western primate was considered the equivalent of the Eastern patriarch. The archbishop of Reims received the title of primas inter primatas. By the False Decretals an attempt was made to establish such a primate as a permanent institution, but the attempt was not successful and the dignity of primate became more or less honorary. The overlapping of the title is illustrated by the case of England, where the archbishop of York still bears the title of primate of England and the archbishop of Canterbury that of primate of all England. A less general use of the title is its application in medieval usage to the head of a cathedral school or college (primas scholarum) and to the dignitaries of a cathedral church.

The abbot of Fulda received from the pope the title of primas inter abbates. In the Episcopal Church of Scotland the senior bishop is styled the primas.

Du Cange, Glossarium; Hinschius, Kirchenrecht (Berlin, 1869); Mueller, History of the Church in China, translated from the German by Andrew Rutherford, B.D. (London, 1902); Bingham, Origines ecclesiasticae (1840).

PRIMATES (Lat. primus, first), the name given by Linnaeus to the highest order of mammals (see Mammalia), which was taken by him to include not only man, apes, monkeys and lemurs, but likewise bats. The latter group is now separated as a distinct order (see Chiroptera). It has also been proposed to remove from the Primates the lemurs, constituting the group Prosimiae, or Lemuroidea, to form an order by themselves; but general opinion is now against this view, and they are accordingly here regarded as representing a sub-order of Primates, all the other members of which are included in a second sub-ordinal group—the Anthropoidae, or Simiae. Support to the view that lemurs should be included in the order is afforded by the discovery in Madagascar of an extinct species (Neo-pithecus) presenting certain characters connecting it with monkeys on the one hand and with lemurs on the other.

In this broader sense the Primates may briefly be defined as follows. All the members of the order are plantigrade mammals, normally with five fingers and five toes, which are generally armed with broad flattened nails, although these are rarely replaced on single digits, or on all the digits, by claws or claw-like nails. The dental formula is I. 3, 1, 3, 2, C. 1, 1, P. 4, M. 2, 1, 3, 3; all the teeth in advance of the molars being normally preceded by milk-teeth. The molars are three-, four- or five-cusped, but the cusps may in some cases coalesce into transverse ridges. The thumb and great toe are, as a rule, opposable to the other digits. The clavicles (collar-bones) are complete; there is nearly always a free centrale bone in the wrist, or carpus, in which the scaphoid and lunar are likewise generally separate. The orbits (and the eyes) are directed more or less forwards, and generally surrounded by bone (fig. 1), while the lower jaw has a vertical movement on the upper. With a few exceptions the stomach is simple; and a duodeno-jejunal flexure of the intestine and a cæcum are present. The diet is generally vegetable, but may be mixed, or, rarely, consisting of insects. The uterus may be either bicorneate or simple; and the placenta either discoidal and deciduate, or diffuse and non-deciduate, with a great development of the inter-stitial vessels. The cæcum is generally double or treble; the branches of the iliac vessels, which may be very numerous, open into the intestine behind the cæcum and are contained in the rectum. The cæcals are therefore in fact caecal-sac-like organs. As a rule only one single offspring is produced at a birth, such offspring being always born in a completely helpless condition.

With the exception of man, who has adapted himself to exist in all climates, the Primates are essentially a tropical and sub-tropical group, although some of the monkeys inhabit districts where the winter climate is severe. The great majority—in fact nearly all—of the members of the order are arboreal in their habits. In size there is great variation, the extremes in this respect being represented by man and the gorilla on the one side, and the marmosets and tarsiers, which are no larger than squirrels, on the other.

As regards the proper meaning of the popular names "monkey," "baboon" and "ape," it appears that these are in the main general terms which, with the exception of the second,

![Fig. 1.—Lateral and lower views of the Skull of a Langur Monkey (Semnopithecus), to show the forward direction and complete closure of the orbits, and the characters of the dentition of the Old World Catarhini.](image-url)
may be applied indifferently to all the members of the first sub-order. " Baboon," appears to be properly applicable to the dog-faced African species, and may therefore be conveniently restricted to the members of the genus *Papio*, the great toe on the hand, and, in the case of baboons, the thumb representing the thumb in *Atelis* and *Colobus*. The nail of the great toe is flat in every species, but the other nails are never so flat as are the nails of man. The lateral compression of the nails becomes more strongly marked in some *Cebidae*, e.g., *Eriolus*, but attains its extreme in the *Hapalidae*, where every nail, except that of the great toe, assumes the form of a long, curved and sharply pointed claw.

With the single exception of man, the body is almost entirely clothed with copious hair, and never has the back naked. In the gibbons, the langurs, the macaques and the baboons, naked spaces (*Ateichthys callosities*) are present on part of the body which is the main support in the sitting posture. These naked spaces are subject to swelling at the season of sexual excitement. Such naked spaces are never found in any of the American monkeys. No ape or monkey has so exclusive and preponderating a development of hair on the head and face as exists in man. As to the head, long hair is found thereon in *Hapale oedipus* and in some of the langurs and guerezas, whilst certain macaques, like the Chinese bonnet-monkey (*Macacus sinicus*), have the hair of the head long and radiating in all directions from a central point on the crown. A beard is developed in the male orang-utan; and the Diana monkey (*Ceroprocta diana*) has long hair on the cheeks and chin. The wanderoo (*Macacus irus*) has the face encircled by a kind of mane of long hairs; and many of the marmosets have a long tuft of hairs on each side of the head. American monkeys exhibit some extremes of sexual development of hair, but none is so far-reaching whether in *Ateles* or in the *Cebidae*.

**Anthropoidea.**—The Primates, as already mentioned, are divisible into two main groups, or sub-orders, of which the first includes man, apes, baboons and monkeys. For this group Professor Max Weber employs the name Simiae (in contradistinction to Promeniae for the lemurs). Since, however, to take as the title for a group which includes man himself the designation of creatures so much lower in the scale is likely to be repugnant, it seems preferable to employ the designation Anthropoidea for the higher division of the order.

As the essential features distinguishing the Anthropoidea from the second sub-order may best be indicated under the heading of the latter, reference may at once be made to some of the more striking characteristics of the sub-order. Members of this division have smaller proportions of the body as regards the relative lengths of the two pairs of limbs to one another and to that of the trunk very considerably. Both pairs may be much elongated, as in *Atelis* and *Colobus*; or, a moderate development of the arms greatly increased, as in the second. The legs may be excessively short, and the arms, at the same time, excessively long, as in the orang-utan. Both pairs may be short and sub-equal, as in *Hylobates* and *Pithecia*. In a number of other tribes of the Apes and Monkeys, the arms exceed in length the lower limbs (but not in the *Hapalidae*). In some species of baboons, the arms are equal in length to the legs. In the latter structure is attained its extreme in the *Pithecia*.

There is aינטרנט of the degree of its development varies much in different groups. In the greater number of genera it is long in all the species, and in some (*Simia, Anthropopithecus and Hylobates*) it is relatively more than in man. Such a condition may be long or short, or completely absent, as in macaques (*Macacus*).

The form of the head presents great difference— it may be rounded, as in *Atelis*; produced vertically, as in *Simia*; drawn out posteriorly to an extreme degree, as in *Chrysopithecus*; or, as almost the same thing, in the baboons. A production of the muzzle, necessitated by the presence of large teeth, exists in the chimpanzee (*Anthropopithecus*), but never appears in baboons, except in this respect. It is found at its greatest the terminal position of the nostrils gives a dog-like aspect to the face.

The eyes may be small compared with the size of the head, as in *Colobus* and *Simia*; but, generally speaking, only on the region of the enormous size, as in *Nycticebus*. They are always forwardly directed, and never much more separated one from another than in man; they may, however, be more closely approximated, as in the *Nasalis* of *Squirrel monkeys*. The ears are always well developed, and very generally have their postero-superior angle pointed. They may be large and small in the same genus, as in *Anthropopithecus* (chimpanzee and gorilla); but only in the gorilla do we find, even in a rudimentary condition, that soft depending portion of the human ear termed the "lobe." The nose has scarcely ever more than a slight prominence, and yet an enormous development is to be met with in the prosobod-monkey (*Nasalis*); while in the snub-nosed monkeys (*Rhinopithecus*) we find a sharply prominent, though smaller and extremely upturned nose. The hooohook gibbon also possesses a prominent terminal projection, the same in the nostrils in the baboons has already been mentioned. These apertures may be closely approximated, as in all the man-like apes (*Simiidae and Hylobatidae*), or they may be separated one from the other in the *Cebidae*; or, again, they may be widely divided, varying somewhat in different genera, as in *Atelis* and *Eriolus*, and *Callithrix* and *Nycticebus*. The lips are generally thin, but marked characters of this region are the elongation of the upper lip, and in the lower, the longest digit of the foot, is constantly the shortest. As compared with the entire length of the foot, it is most man-like in the chimpanzee and some gibbons, and smallest of all in the orang-utan, and next smallest in *Hapale*. Every digit is provided with a nail, which is generally quite long, the little finger being represented by a mere tuft of hair.

Great brilliance of colour is sometimes found in the naked parts of the body, particularly in the baboons and some of the other *Ceropithecidae*, and especially in the regions of the face and sexual organs. Among these latter rose, turquoise-blue, green, golden-yellow and vermilion appear, in various combinations, in one or other of both of these regions, and become especially brilliant at the period of sexual excitement.

Great brilliance of colour is sometimes found in the naked parts of the body, particularly in the baboons and some of the other *Ceropithecidae*, and especially in the regions of the face and sexual organs. Among these latter rose, turquoise-blue, green, golden-yellow and vermilion appear, in various combinations, in one or other of both of these regions, and become especially brilliant at the period of sexual excitement.

The skeleton, more especially in the higher forms, is in the main similar to that of man, so that only a brief notice of the matter is needed here. In the skull considerable variation in regard to the proportionate length of the face to that of the brain-case (cranial portion) exists in the two sexes, owing to the general development of large tusks in the males (other than man, who is not now under consideration). Generally speaking, the elongation of the facial portion, as compared to the cranial, increases as we pass from the higher to the lower forms. The increase does not, however, occur regularly, being
greater in the orang-utan and chimpanzee than in some of the langurs (Semnopithecus, fig. 1); the maximum development of this feature occurs in the dog-faced baboons (Papio, fig. 2). In American monkeys, with the exception of the howlers (Alouata, fig. 3), the facial part is relatively smaller than in Old World monkeys and apes; while in the squirrel-monkeys (Chrysopithecus) it is even smaller than in man himself. In none of the Old World group does the forehead present that rounded and elevated contour characteristic of man, although the height of this region is great in the orang-utan (fig. 2). Curiously enough, American monkeys, especially those included in Pithecia, are the most man-like in this respect. The skull of the male gorilla is characterized by the great development of the crests for muscular attachment, one of these (superciliary) overhanging the orbits, a second (sagittal) traversing the middle line of the upper surface, while a third (lamboidal) forms an inverted V on the occiput, and affords attachment for the muscles of the neck.

**Fig. 3.—Skull and Hyoid-bone of a Howler-Monkey (Alouata).** In nature the hyoid-bone, which is bladder-like, is placed between the two branches of the lower jaw, and it is rather well seen in the orang-utan and chimpanzee than in some of the langurs (Semnopithecus, fig. 1); the maximum development of this feature occurs in the dog-faced baboons (Papio, fig. 2). In American monkeys, with the exception of the howlers (Alouata, fig. 3), the facial part is relatively smaller than in Old World monkeys and apes; while in the squirrel-monkeys (Chrysopithecus) it is even smaller than in man himself. In none of the Old World group does the forehead present that rounded and elevated contour characteristic of man, although the height of this region is great in the orang-utan (fig. 2). Curiously enough, American monkeys, especially those included in Pithecia, are the most man-like in this respect. The skull of the male gorilla is characterized by the great development of the crests for muscular attachment, one of these (superciliary) overhanging the orbits, a second (sagittal) traversing the middle line of the upper surface, while a third (lamboidal) forms an inverted V on the occiput, and affords attachment for the muscles of the neck.

**Fig. 4.—Skull of adult male Orang-utan (Simia satyrus).** In the gorilla the orbits are much as in man, but in the orang-utan they are more rounded. They become very large in Hylobates, but attain an enormous size in the American Nyctipithecus. The extent to which each orbit opens into the adjacent temporal fossa, *i.e.* the size and shape of the sphenomaxillary fissure, varies considerably; this is narrow and much elongated in the gorilla and the baboons, but short in the langurs and spider-monkeys. It is most closed in the howlers, where it sometimes all but disappears entirely. The mastoid process never attains the large relative size it has in man; but it is prominent in the baboons and larger macaques, as well as in the chimpanzee and gorilla, its development bearing relation to the size and weight of the head. As the mastoid diminishes, the under surface of the petrosal assumes a swollen or bladder-like condition.

The plane of the foramen magnum, as compared with the basi-cranial axis, varies with the projection of the occiput; it generally forms a less open angle with that axis than in man, but in Chysopithecus the angle is yet more open than in the human skull. The cheek, or zygomatic, arches bend outwards and upwards in the gorilla and some baboons, but decrease in relative as well as absolute size in the smaller forms—notably in Chrysopithecus. No long slender styloid process is normally attached to the skull, though such may be the case in the baboons. An external bony auditory meatus (or tube) is present in Old World but absent in New World monkeys. In all apes and monkeys the premaxillae have a distinctness of development and a relative size not found in man; the sutures separating them from the maxillae remaining visible, except in the chimpanzee, after the adult dentition has been attained. The maxillae develop great swollen tuberosities in the baboons and the black ape of Celebes. The nasal bones are small, and generally flatter than in man; being in the orang-utan quite flat. They are convex in some langurs and all baboons; but the proboscis-monkey has its nasals no more developed than those of other species. The nasals seem to attain their maximum of relative size in the howlers. The lower jaw, or mandible, is always in one piece in adults; and is most man-like in the siamang, which alone has a slight chin. On the other hand, in other gibbons the angle is produced downwards and backwards, as also in marmosets. Its maximum of relative size is attained in the howlers (fig. 2), where the broad ascending part serves to protect and shelter the enormously developed body of the hyoid. Air-cells may be developed, as in the gorilla, in the parts adjacent to the mastoid. Frontal sinuses are generally absent in the Old World group, being replaced by coarse cellular bone. In old age the sutures of the skull become obliterated, the one between the two nasals disappearing at an early age in Old World monkeys. In the spider-monkeys and howlers the tentorium, or meninx dividens, dividing the hemispheres of the brain from the cerebellum, becomes bony.

The spinal column of apes and monkeys always lacks the S-like curvature of that of man, the nearest approach to this occurring in the baboons (fig. 2). The number of dorsal vertebrae varies from eleven in some species of Cercopithecus and Macacus to fourteen in certain gibbons or fifteen in the American night-apes (Nyctipithecus). In the American Cebidae the number seldom falls below thirteen; in the orang-utan it is twelve, as in man, but thirteen in the chimpanzee and gorilla. In most cases the dorsal and lumbar regions are about equal in length, but the lumbar region is the shorter in the man-like group, and less than half the length of the dorsal in the gorilla. The lumbar spinous processes are vertical, or project backwards in the man-like apes, gibbons and spider-monkeys; in the others they project forwards, especially in Cebidae. The lumbar transverse processes project outwards, more or less at right angles to the axis of the spine, or else forwards. The sacrum attains its greatest absolute length in the gorilla, but is relatively longer than in man in all the man-like group. Hylobates has the relatively longest sacrum. The number of vertebrae included in the sacrum varies more or less with age; with the exception of the Simiidae and Hylobatidae, there are generally only two or three; but in Atelidae, Hylobatidae, and Ursuca the number may be four; while in the Simiidae there are always five, and sometimes six. In most apes the sacrum and lumbar vertebrae lie in one slightly curved line, the gorilla and chimpanzee presenting in this respect a great contrast to the human structure. In the orang-utan the sacro-vertebral angle is rather more marked; but in some baboons it is so much so as almost to rival that of man.

**Fig. 5.—Skeleton of South American Spider-Monkey (Atelis).** To illustrate the length of the limbs and tail, and the slenderness of the former.
With the exception of the man-like apes and gibbons and the Barbary ape (*Macacus sylvanus*), the caudal vertebra of monkeys exceed four in number; but the mandril, *Papio (Maimon) maimon*, has sometimes only five. The short-tailed macaques and macaco have from about fifteen to twenty vertebrae; the proportion being occasioned rather by a diminution in the size of the component vertebrae than by a decrease in number. In the other forms the number varies between twenty and thirty-three, the latter being the number attained in the spider-monkeys of the genus *Ateles*, almost three to one; in the other long-tailed genera it is rarely so large as two to one. The absolute length of the tail is greatest in the squirrel-tailed forms, where also the individual caudal vertebrae attain their greatest length, namely two inches. The caudal vertebrae generally increase in length from the sacrum to the tail, and the third or fourth, eighth or ninth, which, with the tenth and eleventh, are the longest in most-tailed forms. In *Ateles* the eleventh, twelfth, thirteenth and fourteenth vertebrae are the longest. In most members of the sub-order of the breast-bone, or sternum, is very small and often flattened, as in *Hylobates*. In the orang-utan the breast-bone long remains made up of ossifications arranged in pairs, side by side, successively. The true ribs are seven in number on each side in the highest forms, but in *Hylobates* there are sometimes nine pairs; in *Hapale* the number varies from six to eight, and from seven to eight in the other genera. The "angles" of the ribs are very acute in *Ateles*; in *Hylobates*, *Pithecia* is distinguished by the greater breadth of the ribs. In no ape or monkey is the thorax half as broad as it is deep from back to back. Nevertheless, in the *Cebidae* and *Hylobatidae*, the chest is so narrow that it appears to the depth by from about one-fourth to a little under one-third of the latter. In *Ateles* (and sometimes also in *Alouata*) the thorax is wider than deep, but in the rest it is deeper than wide.

The greatest absolute length of the fore-limbs in the gorilla (fig. 6) and the orang-utan.

The humerus never has a perforation (entepicondylar) on the inner side of its lower extremity. Except in the *Hapalidae* and *Pithecia* there are articular cavities with the wrist (carpus). The hand is capable of pronation and supination of the fore-arm; and except in man, the chimpanzee and the gorilla there is a centralis in the carpus. The phalanges are the same in number in apes and monkey as in man, except that in *Ateles* and *Colobus* the thumb may have but one small nodular phalange or normal phalanges are three or more curved than in man, and except in the *Hapalidae*, the terminal ones are flattened from back to front. This is due to the fact that they are laterally compressed, curved, and pointed to the observations of that family. The longest finger is the great thumb, or *metacarpal bears a much greater proportion to that of the spine in *Hylobates* and *Simia* than in man. With the exception of *Ateles* and *Colobus*, the shortest thumb, thus estimated, is found in *Nyctipithecus* and *Necrocorax*. The hind-limb, measured from the summit of the femur to the tip of the longest digit, is absolutely greater in *Hylobates* and *Simia* than in *Ateles* and *Colobus*. The metatarsus, consisting of the same seven bones as in man, and these bones are never united by sutures or bound by ligaments, as to form a transverse and an antero-posterior arch. In no ape or monkey, however, is the base of the foot at the point of support of the antero-posterior arch, as in man. The calcaneum, except in the gorilla, is shorter compared with the spine than in man. The phalanges of the foot are the same in number as in man, except that the great toe of the orang-utan has often but one. They are very like their representatives in the hand, and are convex above, concave and flattened below. Only in the *Hapalidae* are the terminal phalanges laterally compressed instead of flattened. The toes are never nearly so short relatively in apes and monkeys as in man; yet the proportion borne by the great toe, with its metatarsal, to the spine closely approaches the latter in the ungulates in standing in man, and this proportion is exceeded in *Hylobates* and *Ateles*.

Omitting all reference to the muscles, we find that in apes and monkeys the absolute size of the brain never approaches that of man. Nevertheless, there is never less than a relative capacity in the human normal human subject, while in the orang-utan and chimpanzee it is but 26 and 272 cuv. in. respectively. The relative size of the brain varies inversely with the size of the whole body, as in the case in domesticated vertebrates generally. The hemispheres of the brain are almost always so much developed as to cover over the cerebellum, the only exceptions being the holver and the siamang (*Hylobates and *Pithecia*). The cerebellum of the orang-utan is almost unexposed, but it is considerably so in the former. In *Chrysopithecus* the posterior lobes are more largely developed relatively than in man. As in man and in the female apes generally, much convoluted hemispheres are represented in the gorilla, and an unusual degree of convolution in the brain, as in *Hylobates* and *Ateles*. In no ape or monkey does the series of teeth form so perfect an arch as in man, the opposite series of cheek-teeth tending to become more parallel. None has the teeth placed in one uninterrupted series in each jaw, as is the case in the human species; but there is always a small gap between the upper canine and the adjacent incisor, or between the lower incisor and canine. This condition is due to the excessive size of the canines, the inter-spaces giving passage to the tips of these teeth. This prolongation of the canines into tusk-like weapons of offence and defence (especially developed in the male) has been the subject of much study. The degree of the dentition in apes and man. The number of the teeth is the same as in man in all Old World Primates. The New World *Cebidae* have an additional premolar on each side of each jaw, whith *Cercocebus* and *Cebus* have a much lesser condition. The lower incisor is the same as in man in all Old World Primates. The New World *Cebidae* have an additional premolar on each side of each jaw, while the *Cercocebus* have a much lesser condition. The lower incisor is the same as in man in all Old World Primates. The New World *Cebidae* have an additional premolar on each side of each jaw, while the *Cercocebus* and *Cebus* have a much lesser condition. The lower incisor is the same as in man in all Old World Primates. The New World *Cebidae* have an additional premolar on each side of each jaw, while the *Cercocebus* and *Cebus* have a much lesser condition. The lower incisor is the same as in man in all Old World Primates. The New World *Cebidae* have an additional premolar on each side of each jaw, while the *Cercocebus* and *Cebus* have a much lesser condition.

The stomach is simple in all apes and monkeys except langurs,
The larynx in many members of the sub-order is furnished with sac-like appendages, varying in different species as regards number, size and situation. They may be dilatations of the laryngeal ventricle (opening into the larynx below the false vocal chords), as in the man-like apes; or they may open above the false vocal chords so as to be extensions of the thyro-hyoid membrane, as in gibbons. There may be but a single median opening in the front part of that membrane at the base of the epiglottis, as in Cercopithecidae, or there may be a single median opening at the back of the trachea, just below the criocid cartilage, as in spider-monkeys; and while there is in some instances only a single sac, in other instances, as in the howlers, there may be five. These may be enormous, meeting in the middle line in front, and extending down to the axillae, as in the gorilla and orang-utan. Finally a sac may occupy the cavity of the expanded body of the hyoid-bone, as in howlers (fig. 3). The hyoid has its basilar part generally somewhat more elevated and enlarged than in man; but in howlers it becomes greatly enlarged and deeply excavated, so as to form a great bony bladder-like structure (fig. 3). The cornua of the hyoid are never entirely absent, but the anterior or lesser cornua may be so, as in the howlers. The anterior cornua never exceed the posterior cornua in length; but they may be (Cercopithecus) more developed relatively than in man, and may even be jointed, as in Lagothrix.

The lungs are generally similar to those of man, although, as in gibbons, the right one may be four-lobed. In the man-like apes the great arteries are likewise of the human type; but in the Hylobatidae and Cercopithecidae the left carotid may arise from the innominate. The discoidal and deciduate placenta is generally two-lobed, although single in the howlers; in the marmosets it is unusually thick. American monkeys differ from their Old World man-like Apes.—In common with man, the apes and monkeys of the Old World form a section—Catarhina—of the sub-order Anthropoidea, characterized by the following features: There are only two pairs of premolar teeth, so that the complete dental formula is $i$, $c$, $f$, $p$, $m$, $. The symphysis has an external bony tube, or meatus; but there is no tympanic bulla. A squamoso-frontal suture causes the frontal and the alisphenoid bones to enter largely into the formation of the orbital plate; and the orbito- temporal foramen is small. Cheek-pouches and callousities on the buttocks are frequently present. The nails are flat or rounded, the descending colon of the intestine has an S-like (sigmoid) flexure; the caecum is simple, and there may be a veriform appendix. The inter-nasal septum is thin, and the nostrils are directed outwards. The tail, which may be rudimentary, is never prehensile. The echoturbinal bones of the nasal chamber are typically united. Laryngeal sacs are commonly developed. In addition to the primary discoidal placenta, a secondary, and sometimes temporary one is developed.

It does not come within the province of this article to treat of man (see Anthropology); but it may be mentioned that the distinctive characteristics of the family Hominidae (including the single genus Homo), as compared with those of the Simiidae, or man-like apes, are chiefly relative. These are shown by the greater size of the brain and brain-case as compared with the facial portion of the skull, smaller development of the canine teeth of the males, more complete adaptation of the structure of the vertebral column to the vertical position, greater length of the lower as compared with the upper extremities, and the greater length of the great toe, with almost complete absence of the power of bringing it in opposition to the other four toes. The last and the small size of the canine teeth are perhaps the most marked and easily defined distinctions that can be drawn between the two groups, so far as purely zoological characters are concerned. The regular arch formed by the series of teeth is, however, as already mentioned, another feature distinguishing man from the man-like apes.

In common with the gibbons (Hylobatidae) the man-like apes, or Simiidae, are distinguished from the lower representatives of the present sub-order by the following features: The sternum is short and broad, and the thorax wide and shallow (fig. 6), while the pelvis, as shown in the same figure, is more or less laterally expanded, and hollow on its inner-surface; and the number of dorso-lumbar vertebrae ranges from sixteen to eighteen. The arm is longer than the leg; and while the hair on the fore-arm is directed upwards, that of the upper-arm slopes downwards to meet it at the elbow. Check-pouches are absent. The cusps of the molars are separate; and five in number above and four below. The caecum has a veriform appendix; and the secondary placenta merely forms a temporary fold. The Simiidae are specially characterized by the absence of callousities on the buttocks; the presence of sixteen or seventeen dorso-lumbar vertebrae, and of twelve or thirteen pairs of ribs; the wrinkling of the enamel of the cheek-teeth; the great expansion and concavity of the iliac bones of the pelvis; and the application of only the edge of the sole of the foot to the ground in walking.
The existing members of the family are readily referable to at least two genera: the old world monkeys and the other Apes. The type genus, *Anthropopithecus*, typified by the West African chimpanzee, *A. troglodytes* (fig. 7), and is characterized by the absence of excessive elevation in the skull, by the fore limb not reaching more than half the body length at the shoulder; and the development of a very well-developed great toe, the absence of a central e in the carpus, and the black or grey hair. There is a well-developed laryngeal sinus, which may extend downwards. (See *Hylobates*). The *Hylabates* differ from the *Anthropopithecus* in the size of the ears, and particularly by the small development of the supra-orbital ridges. The latter are, however, more developed in the Central African A. ichega (of which the kulu down in the local phase) than in the *Hylabates*. The genus *Anthropopithecus*, as a sub-species, is frequently made the type of a second genus—*Gorilla*; but is extremely close to the chimpanzee, from which it is perhaps best distinguished by its much smaller ears. It is the largest of the apes, although the females are generally large in stature and bulk to the males. The gorilla is also a much less completely arboreal ape than the chimpanzee, in consequence of which more of the sole of the foot is applied to the ground in walking. See the structure of the supra-orbital ridges of the full of the male, and likewise the large and powerful tasks in this sex are very characteristic. A full-grown gorilla will stand considerably over six feet in height. According to Dr. Keith, the hand of a middle-aged gorilla is over a foot long and 5 inches wide, and of a child about one half the length and wide, and toes are partially webbed; by the long heel; and by the relative length of the upper half of the arm as compared with the arm. An important distinctive feature of the skull of the gorilla is the great length of the face, which is retrograde. Finally, in adult life the gorilla is sharply differentiated from the chimpanzee by its sullen, unamiable, ferocious disposition.

As regards the relationship existing between the gorilla and the chimpanzee, Dr. Keith observes: "An examination of all the structural systems of the African anthropoid leads to the inference that the gorilla is the more primitive of the two forms, and a representation of some apes as belonging to a separate genus from the chimpanzee. The teeth of the gorilla, individually and collectively, form a complete dentition, a dentition at the very highest point of development; the teeth of the chimpanzee show marked signs of reduction, retentiveness, which is under development. The muscular development and the consequent bony crests for muscular attachment of the gorilla far surpass those of the chimpanzee. The muscular development of the adult chimpanzee represents that of the adult gorilla. All the bone of the body organs of the gorilla belong to a simpler and earlier type than those of the chimpanzee. But in one point the chimpanzee evidently represents a much older race—its bones are more suitable for arboreal locomotion; of the two, the gorilla shows the nearer approach to the human mode of locomotion. On the whole the evidence at our disposal points to the conclusion that the chimpanzee is the more primitive of the two apes. Among the apes, the brain development, there have been retrograde changes in most of the parts of the body. The various races of chimpanzees differ according to the degree to which these changes have been carried.

From both the chimpanzee and the gorilla the orang-utan, or mias (*Simia satyrus*), of Borneo and Sumatra is broadly distinguished by the extreme elevation of the skull (fig. 4), the excessive length of the fore limbs, which reach to the ankle, the presence of twelve pairs of ribs and of a central e in the carpus, the short and rudimentary great toe, and the bright-red colour of the hair. Adult males of the orang-utan show a long snout on the chin, and these males also develop a large external prominence, consisting of fibro-cellar tissue, on each side of the face, which thus assumes an extraordinary wide and flattened form. There is no vestige of a tail. The head and tail are united together in front over the windpipe and forming one great sac which extends down between the muscles to the axilla. The canine teeth of adult males are large. In the orang-utan the size of the sac is extremely different; and it has accordingly been divided into a number of local races, in some of which the males apparently lack the lateral expansion of the face. Whether the Sumatran orang-utan should be regarded as a distinct species, with two local races, may be left an open question. (See *Orang-Utan*).

**Gibbons.**—The comparatively small, long-armed and tailless Asiatic apes known as gibbons have been very generally considered to form a family of the same name. In their habits, though they differ in several important respects—to say nothing of their smaller bodily size—it has recently been proposed to refer them to a family of the same name, the *Hylobates*. The gibbons include the presence of small naked callosities on the buttocks, the possession of eighteen dorso-lumbar vertebs and thirteen pairs of ribs, the absence of foldings in the enamel of the molar teeth, and claws and dentition characteristic of the pelvis, and the application of the whole sole of the foot to the ground in walking. The vertebral column presents no trace of the sigmoid flexure which is developed partially in the *Simiae* and *Pongidae*. Nor is the development of a tail rudiment of a tail; and the canines are elongated and tusk-like. When the body is erect, the arms are so long that they reach the ground. The great toe is well developed, reaching to the middle or end of the first joint of the adjacent toe; but the thumb only attains to, or reaches a little beyond, the upper part of the first joint of the index-finger. There is a central e in the carpus. The laryngeal sacs are no longer prolongations of the laryngeal ventricles, but open into the larynx above the false vocal chords. The group is distributed throughout the forest-regions of south-eastern Asia, eastwards and southwards from Assam, and is represented by the *Hylabates* and *Hylobates*; the latter are found in the extreme north-east of China, in the island of Formosa, and in South China. The *Hylobates* of Sumatra and the Malay Peninsula, differs from all the rest by the union of the index and third fingers up to the base of their terminal joints, in consequence of which this species is distinguished as a sub-genus of the *Hylobates*. The remarkable thing about their distribution in Palembang is that the two species are found in company throughout the rest of Sumatra; and even in Palembang itself they inhabit the mountain districts, where the river is so narrow that they could easily leap over it, and yet keep to the opposite banks. Gibbons are perhaps the most agile of all the Old World monkeys, rivalling in their respect the American spider-monkeys, despite their lack of the prehensile tail. Gibbons are the *Hylobates*.

**Langur Group.**—The well-known long-tailed langurs of India and the adjacent regions are the first representatives of the sub-family *Semnopithecinae*. The small monkeys of this group are the most interesting members of the sub-order now under consideration. In the *Cercopithecidae*, as the family is called, the following features are distinctive: The sternum, or breast-bone, is narrow and elongated, and the thorax compressed and wedge-shaped, while the iliac bones of the pelvis are narrow, with the inner surface flat; the dorso-lumbar vertebrae are nineteen or twenty in number. The front limbs are shorter than the hind pair; the whole sole of the foot is applied, to the ground in walking; and the hair on the arm is directed backwards from the shoulder to the hand. There are always bare callosities on the buttocks, and very generally check-pouches. The caecum is conical. Transverse ridges connect the cusps of the teeth. The tail is short.

The first group of the family is represented by the langurs and their allies, collectively forming the sub-family *Semnopithecinae*. The shape of the skull, the form of the orbit, the character of the ears, and the long and slender tail are distinctive, and they have no cheek-pouches. Mean, slender; there are no cheek-pouches, but, on the other hand, the stomach is complicated by acculations or pouches, and the lower molar has a posterior heel, thus carrying five cusps. The former tail is much shorter and the latter much longer; the small, and the nails are narrow and pointed. The laryngeal sac (or throat-sac) opens in the middle line of the front of the larynx, and is formed by an extension of the thyro-hyoid membrane. The teeth of the semnopithecine are of an extraordinary height; and the small teeth of the upper molars are so much reduced that the enamel is retained, form a large group confined to south-eastern Asia, where it ranges from India and the Himalaya to Borneo and Sumatra by way of Burma, Cochin China and the Malay Peninsula. A well-known representative is the *Semnopithecus entellus* of India, which, like the larger *Himalayan S. schistaceus*, is slate-coloured; the Bornean *S. hosii*, on the other hand, is wholly maroon compressed and wedge-shaped, while the iliac bones of the pelvis are narrow, with the inner surface flat; the dorso-lumbar vertebrae are nineteen or twenty in number. The front limbs are shorter than the hind pair; the whole sole of the foot is applied, to the ground in walking; and the hair on the arm is directed backwards from the shoulder to the hand. There are always bare callosities on the buttocks, and very generally check-pouches. The caecum is conical. Transverse ridges connect the cusps of the teeth. The tail is short.

1 It has been proposed to transfer the name *Simia* to the chimpanzee, on the ground that it was originally given to that animal.
snub-nosed monkey, *R. rhesus* (fig. 9), of eastern Tibet and Szechuan, is characterized by the curiously short and upturned nose and the long silvery hair of the back, especially in the winter coat. In the typical species the predominaing colour is orange, tending to yellowish-olive on the back; but in *R. bieti* of the mountains bordering the valley of the Melkon and *R. brelichi* of Central China it is slaty-grey. The third Asiatic genus is represented by the proboscis monkey (*Nasalis larvatus*) of Borneo, in which the nose is extraordinarily elongated. The nose of the adult male is commonly being the lesser white-nosed guenon (*C. petursia*) of West Africa and the bochero, *C. nictitans*, which is also West African. In the typical group, as represented by the malayan monkey (*C. cynosuros*) of the West Coast, and the Abyssinian grivet (*C. sabaeus*), the fur of the back is of a more or less olive-green hue, while the under surface and whiskers are white and the limbs grey. The typical group is typified by the red-backed monkey (*C. pyrrhotus*) of Kordofan, characterized by the red upper and white lower surface of the body. A fourth section (*Mono*) includes the mona (*C. mona*) of Western, and Syke's monkey (*C. ab simplaris*) of Eastern Africa, with a number of allied species, characterized by the presence of a black hand running from the outer angle of the eye to the ear, and the black or dark-grey limbs. The beard monkey (*C. pygerythrus*) of Kordofan is a typical third section (*Erythrocebus*), characterized by the red upper and white lower surface of the body. The third group, as represented by the rhesus monkey (*C. rhesus*) of India, is typified by the black tufted *C. macacus* of the Himalayas, and the macaques, to be next mentioned, the head being more oval and the muzzle more produced than in the former, but less than in the latter. The limbs are longer and the body is more slender than in the *C. rhesus*. As in *C. macacus*, the macaques, and the callouses are also smaller. The laryngeal air sacs of the latter are, however, wanting. Well-known representatives of the typical section of the group are the sooty macaque (*C. fuliginosus*) and the white-collared macaque (*C. collaris*) of West Africa, the latter easily recognized by the bright red crown of the head. A second group of the genus, *Lophocebus* (or *Semeniscus*), is typified by the white-cheeked mangabey (*C. albigena*) of the equatorial forest-region, in which head is crested and the eyelids lack bare flesh-coloured rims. The rhesus monkey (*Macaca rhesus*) of India is the typical representative of the macaques, which may be regarded as the Asiatic representatives of the mangabeys. From that group the macaques differ by their heavier and stouter build (fig. 10), thicker limbs, the presence of large laryngeal sacs, the larger size of the callouses, and the more produced muzzle, while many of them have the tail (which may be much shorter and broad). The nostrils are not terminal, and the hairs are generally ringed. In habits the macaques are much more terrestrial than the mangabeys, some of them being completely so. In the typical group the rhesus of the Himalayas includes the Himalayan macaque (*M. assamensis*), the brown macaque (*M. arctoides*) of Burma and Tibet (fig. 10), the tail may be about

---

**From Milne-Edwards.**

**FIG. 9.—**The Orange Snub-nosed Monkey (*Rhinopithecus roxellanae*), represented as projecting straight out from the face, but it really bends down to overhang the upper lip; it is much shorter in the female, and quite small and bent upwards in the young. (See LANGUR and PROBOSCIS MONKEY.)

The African guerezas, forming the genus *Colobus*, differ from their Asiatic cousins by the total loss of the thumb. Some of these monkeys, like *Colobus satanas* of West Africa, are wholly black, but in others, such as *C. guereza* (or abyssinicus), *C. shaped* and *C. caudatus* of North-east and East Africa, forming the sub-genus *Guereza*, there is much long white hair, which in the species last-named forms a mantle on the sides of the body and is elongated on the frontal part of the body and in the lower part of the face to the chin, as well. The presence of the animal on the long lichens hanging from the boughs of the trees in which it dwells. Most or all of the Semnopithecinae feed on leaves; a circumstance doubtless correlated with the complex structure of their stomach.

**Cercopithecus, Mangabeys, Macaques and Baboons.**—The whole of the remaining members of the family Cercopithecidae are included in the sub-family Cercopithecinae, which presents the following characteristics: The hind limbs are not longer than the front pair; the tail may be either long, short or practically absent; cheek-pouches are present; the stomach is simple; the callosities on the buttocks are often very large; the last lower molar may or may not have a posterior heel; and the thumb is well developed. Whereas all the Semnopithecinae are completely arboreal, many of the Cercopithecinae, and more especially the baboons, are to a great extent or entirely terrestrial. The typical representatives of the group are the African monkeys, forming the genus *Cercopithecus*, which includes a very large number of species with the following characters in common: the tail, although shorter than in the Semnopithecinae, is long, as are the hind limbs, while the general form is slender. The jaw and muzzle are short and the cheek-pouches large; while the nose is not prominent, with the nostrils approximated; whiskers and a beard of variable length are usually developed. The fingers of the long hands are united by webs at the base; the thumb is small in comparison with the great toe. The callosities are of moderate size; and the hairs of the thick and soft fur are in most cases marked by differently-coloured rings. For convenience of description the numerous species of this genus may be arranged in a group of genera or sub-genera. The first of these groups includes the spot-nosed forms (*Rhinolophus*), characterized by the presence of a spot of white, red or blue on the nose; well-known species, equal to half the length of the body or less; but in the Barbary ape, *M. (inanus inanus*) of North Africa and Gibraltar, this appendage is wanting. In a third group (*Nestorinus*), represented by the pig-tailed macaque (*M. nesithinus*), ranging from Burma to Borneo, and the lion-macaque (*M. leoninus*) of Sumatra, the tail, which is carried erect, is about one-third the length of the body. The lion-tailed macaque (*M. silenus*) of southern India, often misnamed the waderoo, represents a group by itself (*Vetulus*) characterized by
the long hair fringing the face and meeting under the chin, and the tufted lion-like tail, which is from one-half to three-quarters the length of the body. The last group (Cynomolgus), now often regarded as a distinct genus, is typified by the widely-spread crab-eating macaque (Macaca bengalensis), characterized by its produced muzzle, short and stout limbs, and basally-swollen tail, which is nearly as long as the body. It also includes the South Indian bonnet-macaque (M. sinica) and the Ceylon toque-macaque (M. pileatus), taking their names from the elongated hair on the crown, which are nearly allied, and with the first-named species approach the baboons in their elongated muzzles (see Macaque).

A still nearer approach to the baboons is made by the black ape (Cynopithecus niger) of Celebes and the neighbouring islands, which is represented by several sub-species, among them the so-called

American Monkeys and Marmosets.—The monkeys and marmosets of tropical America constitute the Platyrrhina, a second section of the Anthropoidea, and are characterized as follows: An additional premolar is present in both jaws, bringing up the number of these teeth to three pairs. The tympanum is ring-like, with no external bony-tube, or meatus; and a tympanic bulla exists. A parieto-zygomatic suture causes the jugal bone to be included in the orbital plate; and the orbito-temporal foramen is large. Check-pouches and callosities on the buttocks are wanting. The descending colon does not form a sigmoid flexure; and the caecum is generally bent in a hook-like form, with, at most, very slight narrowing of its terminal extremity. The cartilage forming the inter-nasal septum is broad, and the nostrils are directed downwards. The tail, which never has fewer than fourteen vertebrae, is generally as long as the body, and frequently prehensile. The ethmoturbinals are originally separate; and the laryngeal sac, when present, is of peculiar type. Usually there is only a simple primary discoid placenta, but rudiments of a secondary one have been recently described.

The first family, or Cebidae, includes the American monkeys, which present the following characteristics: The ears are more or less naked externally. The terminal joints of the fingers and toes carry flat or curved nails; and the thumb, when present, is opposable to the other fingers. Except in the uakaris, the tail is long, generally short-haired, and frequently with a terminal bar surface for prehension. Description of the sub-families Cebidae, Aotinae, Pitheciinae, and Aullidinae (Fig. 11). The central group is the Aotinae, represented only by four species of howlers, Alouatta (Myocetes), characterized by the long prehensile tail with the extremity naked below, the well-developed thumb, and the extension of the hyoid-bone into an enormous bladder-like chamber contained between the two branches of the lower jaw (Fig. 3). In this bony cup is received one of the three or five laryngeal sacs. There are about half a dozen species, with several sub-species; three of the best known being A. seniculus, A. belzebul, and A. urina. Several are brilliantly coloured, with bright or golden hair on the flanks; but in the Amazonian A. nigra the male is black and the female straw-coloured. The muzzle is longer than in other Cebidae (see Howler).

PRIMATES

FIG. 11.—The Yellow Baboon (Papio cynocephalus).

Moor-macque (Macaca maurus). Some degree of opinion exists as to the proper serial position of this species, which is included in Macacus by several zoologists who separate Cynomolgus as a genus. It is characterized by the marked elongation of the muzzle, which, like the neck, hands and feet, is naked. The nostrils are, however, directed outwards and downwards, as in the maccaces; but, on the other hand, there are baboon-like ridges on the sides of the muzzle and heavy supra-orbital ridges. There are large check-pouches; and the tail is a mere stump. The colour is sooty-black. The weird-looking gelada baboon (Theropithicus gelada) of southern, and the allied T. obscurus of eastern Abyssinia, represent a genus which is essentially baboon-like in general characteristics, but has the nostrils of the macaque-type, while the facial portion of the skull is shorter than the cranial. The preorbital portion of the face is concave with the ridges rounded, and the jaws are very long. The long tail is tufted at the tip, and the hair is long and bushy, developing into a mantle-like mane on the forequarters of old males, leaving the chest bare. The general colour is dark-brown. The last representatives of the Cercocephalidae are the baboons, or dog-faced baboons, of Africa and Arabia, forming the genus Papio. These are for the most part large monkeys, associated in herds under the leadership of an old male, and dwelling chiefly among rocks, although they ascend trees in search of gun. They are easily recognized by their long dog-like faces (Fig. 11), in which the nostrils open at the extremity of the greatly elongated muzzle. On the sides of the muzzle are prominent longitudinal ridges covered with bare skin which may be brilliantly coloured. The callosities, which are also generally bright-coloured, are large; and the tail is of moderate length or short. The hairs are ringed with different colours, and the general colour is olive-yellow, grey or brownish. The typical, and at the same time the smallest representative of the group is the yellow baboon (P. cynocephalus or P. babuin) (Fig. 11), ranging from Abyssinia to Angola and Mozambique, and distinguished by its rat-like grooved muzzle and longish tail, which is nearly as long as the body. The majority of the species, such as the widely spread P. anubis (with several local races), P. sphinx of West Africa, and the chacma (P. papio) of South Africa, are included in the sub-genus Cercocephalas, and have the muzzle longer and undivided and the tail shorter, in most the colour is golden-olive with very distinct rings, but in the chacma it is darker. The hamadryad baboon, P. hammera, of north-east Africa and Arabia, and the chacma, P. arcuticus of southern Arabia, represent a sub-genus Hamadryas characterized by the ash-grey colour and the robust mantle-like muzzles in the adult, and the tail, slightly shorter than the body. Lastly, the West African mandrill (P. maimon) and drill (P. leucophaeus) form the sub-genus Maimon, distinguished by the extremely short tail, and the great development of the facial ridges, which are strongly fluted. In the mandrill, which is the most brilliantly coloured of all mammals, the ridges are vermillion and cobalt, while the callosities on the buttocks are of equal brilliance; but in the drill, which has white ear-tufts, the colouring is more sombre (see Baboon and Mandrill).

FIG. 12.—The White-checked Capuchin (Cebus lunatus).

The Cebinae include the typical members of the family, characterized by the large brain, of which the elongated hemispheres cover the cerebellum; the brain-case of the skull is directed obliquely outwards. The lumbar vertebrae are short, with upright comb-like processes, instead of the rhomboidal ones of the howlers. The lower jaw and hyoid are of normal form. In the first section of the sub-family the tail is evenly haired throughout, the thumb
well developed, the limbs of medium length, with the front not longer than the hind pair, the nails curved, and the humerus with an entepicondylar foramen. The typical genus *Cebus* includes the numerous species of capuchins, many of which are so commonly seen in captivity. They are stouter in build and smaller in size than the spider-monkeys, and their tails are only prehensile to a small extent, but are commonly carried spirally rolled. The conical upper canines project below the upper lip, and the molars have blunt low cusps. Well-known species are the white-cheeked capuchin, *C. lasiurus* (fig. 12), of south Brazil; the true capuchin, *C. capucinus*, ranging from Guiana to Brazil; and the brown capuchin, *C. fuscus*, of Guiana; all of these showing the black crown from which these monkeys take their popular name. The most norther representative of the group is the white-throated *C. hypolucus*, which ranges to Costa Rica. The squirrel-monkeys, *Chrysothrix* (or *Saimiri*), of which *C. sciureus* is the most familiar representative, are not uncommonly placed in the Nyctipithecinae, although their true position seems to be here. They differ from *Cebus* by their smaller size and more delicate build, by the tail being scarcely at all prehensile, by the smaller canines, smaller and more sharply cusped molars, and the large and closely-approximated orbits, whose inner walls are partly membranous (see CAPUCIN and SQUIRREL-MONKEY).

The second section of the sub-family includes the spider-monkeys (fig. 13), and is characterized by the completely prehensile tail, with the inner surface of the tip naked, the rudimentary condition or absence of the thumb, the laterally compressed and more or less pointed nails, and the absence of an entepicondylar foramen on the humerus. The limbs, too, are very long and slender, with the front pair of greater length than the hind ones. The caecum approximates to that of the Catarhina, having its terminal extremity pointed. The true spider-monkeys (*Ateles*) lack the thumb, and have the nails but slightly compressed and pointed, the limbs very long, the nasal septum of ordinary width, and the fur not woolly. Nearly all have the hair on the head, except that of the forehead, directed forwards. There are nearly a dozen species. In these monkeys so powerful is the grasp of the tail that the whole body can be sustained by this organ alone. It even serves as a fifth hand, as detached objects, otherwise out of reach, can be grasped by it, and brought towards the hand or mouth. Their prehension is in other respects exceptionally defective, owing to the loss of the thumb. Spider-monkeys are very gentle in disposition; and, by this and their long limbs and fitness for tree-life, seem to represent the gibbons of the Old World. Nevertheless, in spite of their admirable adaptation for arboreal life, their comparatively slow progression offers a marked contrast to the vigorous agility of the gibbons (see SPIDER-MONKEY). The brown spider-monkey (*Brachyteles arachnoides*) of south Brazil alone represents a genus connecting the preceding in some degree with the next, a rudimentary thumb being present, while the fur is woolly, the nails are much compressed, and the nostrils more approximated than usual. In the woolly spider-monkeys of the genus *Lagothrix* (fig. 14) not only is the fur woolly, but the thumb is fairly well developed; the nails are like those of *Brachyteles*, but the nostrils are normal. Humboldt's spider-monkey, *L. humboldi* (or *L. lagotiara*) and the dusky spider-monkey, *L. infumata*, both of which occur in Brazil and Amazonia, alone represent this genus.

**FIG. 13.**—Geoffroy's Spider-Monkey (*Ateles geoffroyi*).

**FIG. 14.**—Humboldt's Woolly Spider-Monkey (*Lagothrix humboldti*).

Some half-dozen species of the monkeys known as *sakis* (*Pithecia*) form the typical representatives of the sub-family *Pithecinæ*, in which the tail, even when long, is non-prehensile, while the lower incisors are slender and inclined forwards in a peculiar manner, with a gap on each side separating them from the long canine. The hemispheres of the brain cover the cerebellum, the brain-case is elongated, and, despite the absence of a laryngeal sac, the lower jaw is deep with a large angle, thus recalling that of the howlers. There is no caecum. In all cases the thumb is well developed. The arrangement of the hair is very variable. From the other members of the group the *sakis* are sufficiently distinguished by the long and bushy tail; while they are further characterized by having a large head. In some cases the hair on the crown of the head is divided by a transverse parting, so as to overhang the upper part of the face. *P. sennis* of Pará and *P. chiroro* of Guiana are well-known species. The *uakari* (*Lagotis* or *Cebus*) of Amazonia are broadly distinguished from all other *Cebidae* by their short or rudimentary tails; *Ua. calva* being remarkable for its brilliant red jaw and pale chestnut hair (see UAKARI).
The last and lowest representatives of the Cebidae constitute
the sub-family Nyctipithecinae, members of which are cat-like
monkeys, with woolly or bushy hair, short, conical muzzles, non-
prehensile tails and well-developed thumbs. The brain-case of
the skull is not elongated, and the hemispheres of the brain do
not cover the cerebellum. The lumbar vertebrae are elongated,
with long, sharp, backwardly directed spinal processes; the hinder
part of the lower jaw is tall; and there is no laryngeal sac. The

FIG. 16.—The Moloch Tití (Callithrix moloch).

long and hooked caecum has its terminal portion constricted. In
accordance with their nocturnal habits, the douroucoulis (Nycti-
pithecus) are easily recognized by their large and closely approxi-
imated eyes, which are, however, separated by a complete septum,
the comparatively narrow nasal septum, small ears buried in the

with more forwardly directed eyes, which are not surrounded by a
radiating fringe of hair and a wider nasal septum. The titis are
represented by about ten species, of which C. moloch is represented in
fig. 16. Most of them are confined to Amazonia, but a few
among them C. moloch, reach the east coast. Like the marmosets,
they feed largely upon insects and grubs.

The second and last family of the Platyrhina is represented by the
marmosets or oustitis (Hapalidae), all of which are small
monkeys, with the ears hairy externally, and the nails, except that
of the great toe, claw-like, the thumb non-opposable, the tail long,
bushy and non-prehensile, and only two molars in each jaw, the
dental formula thus being i. 1, c. 1, p. 1, m. 3. The humerus
has no entepicondylar foramen. Three young are produced at a
birth. Marmosets are divided into two genera, those in which the
lower canines are not markedly larger than the incisors constituting
the typical Hapale, while such as have the lower canines taller than
the teeth between them form the genus Midas. These squirrel-like
little monkeys, in which the great toe can be opposed to the other
toes, range as far north as 15° N., where they are represented by
Midas geoffroyi, and as far in the opposite direction as the southern
tropic, where M. chrysopygus and M. rosalis occur. The colour
and the length of the hair are very variable, some species having
long silky pale-chestnut hair (fig. 17) and tufted ears, while in others
the hair is comparatively short and black, or black with brown
bars, while the ears are not tufted (see Marmoset).

Lemurs, Prosimiae.—Although the likeness generally takes
the form of a more or less grotesque caricature, the faces of all
monkeys and apes present, in greater or less degree, some
resemblance to the human countenance. In the lower group of
Primates, commonly known as lemurs, or lemuroids, this
resemblance is wholly lost, and the face assumes an elongated
and fox-like form, totally devoid of that "expression" which is
so characteristic of man and the higher apes and monkeys.

Fig. 18.—Skull of Ring-tailed Lemur (Lemur catta) X 1/4.
ac, Upper canine. pm, Premolars.
lc, Lower canine. m, True molars.

Lemurs, Prosimiae, or Lemuroidea, which form a group con-
fined to the tropical regions of the Old World and more numer-
ously represented in Madagascar than elsewhere, are arboreal
and for the most part crepuscular or nocturnal Primates, feeding
on insects or fruits, or both together and collectively character-
ized as follows. The tail, which is generally long and thickly
haired, is never prehensile. As a rule, there is a single pair of
pectoral teats, but an additional abdominal or even inguinal pair
may be present. The thumb and great toe are opposable to the
other digits, the former being provided with a flat nail while
the second toe is always furnished with a claw; the fourth toe
is longer than all the rest, and the second, or index, finger is
small or rudimentary. In the skull (fig. 18) the orbital ring
is formed by the frontal and jugal bones, and, except in the
Tarsiiidae, there is a free communication between the orbit and
the temporal fossa; the lachrymal foramen is situated outside
the orbit (fig. 18); the tympanic either forms a free semicircle
in the auditory bulla or enters into the formation of the latter;
and the foramen rotundum is generally fused into the sphenoidal
fissure. Interparietal bones are frequently developed, and the
two halves of the lower jaw are generally welded together in front.
Except in the genus Perodicticus, the humerus is fur-
ished with an entepicondylar foramen at the lower end; the
centrale of the carpus is generally free; and the femur is usually
provided with a third trochanter. The cerebellum is only
partially covered by the hemispheres of the brain, which in the
medium-sized and larger species conform to the general type
of the same parts in monkeys and apes. The normal dental

woolly fur, and 'long bushy tail. Well-known species are the
lemur-like douroucouli (N. felinus, fig. 15) of Amazonia, Peru and
Ecuador, and N. oeciferans, with a nearly similar distribution.
The titis, Callithrix (or Callicebus)1, are smaller monkeys (fig. 16).

1 Apparently the name Callithrix was originally given to the
marmosets, and if transferred to that group should be replaced by
Callicebus.
formula is $i. \frac{3}{2}, c. \frac{3}{2}, p. \frac{3}{2}, m. \frac{3}{2}$, or the same as in American monkeys; but the upper incisors are small and separated from each other, while the lower ones are large and approximated to the incisor-like canine; the molars have three or four cusps. In all cases the stomach is simple and a caecum present. The teats, which are contained in a scrotum, the penis has a bicor-nuate uterine bicornuate, and the urethra perforates the clitoris. The placenta may be either diffuse, with a large allantochorionic portion, and non-decidual, or discoidal and deciduate. As a rule, only a single offspring is produced at a birth. Very noteworthy is the occurrence in the females of the Asiatic loris of what appears to be the vestige of a marsupial apparatus, attached to the front of the pelvis. Lemur catra also possesses the rudiment of a marsupial fold; while in both sexes of the aye-aye a skin-muscle corresponding to the sphincter marsupii of marsupials.

The distribution of existing lemurs is very peculiar, the majority of the species inhabiting Madagascar, where they for the most part dwell in small patches of forest, and form about one-half the entire mammalian fauna of the island. The remaining species inhabit Africa south of the Sahara and the Indo-Malay countries.

**Tarsier.**—The tiny little large-eyed Malayan lemuroid known as the tarsier, *Tarsius spectrum* (or *T. larsii*), of the Malay Peninsula and islands, together with its Celebean and Philippine representatives constituting the section Tarsius (and the family Tarsiidae), which has the following distinctive characteristics: The lower incisor is vertical and the canine of normal form, while the upper incisors are in contact; the orbit is cut off from the temporal fossa by a bony partition only one and depending on the age, but not the individual. In *L. macaco* the male is black and the female red *L. mongoz*, *L. fulus* and *L. rubriscen* are other well-known species.

In all these lemurs the small upper incisors are not in contact with one another or with the canine, in front of which they are both placed. In the species of *Hapalemur*, on the other hand, the upper incisors are very small, sub-equid and separated widely in the middle line; those of each side in contact with each other and with the canine, the posterior one being placed on the inside, and not in front of the latter. Muzzle very short and truncated. Two inguinal tests, in addition to the normal pectoral pair, are present. The last premolar is broader than those in front, and the upper molars lack a distinct cingulum. The typical *H. griseus* is smaller than any of the true lemurs, of a dark-grey colour, with round face and short ears. It is quite nocturnal, and lives chiefly among bamboo, subsisting on the young shoots. The second species has been named *H. simus*. In *Hapalemur* there is no free centrale to the corpus, and the same is the case with the six or seven species of *Lepilemur* (*Lepilemur*), in which the first upper incisor is rudimentary or wanting, while the second may also be wanting in the adult. There are small lemurs, with small pra-maxillae, short snouts, tails shorter than the body, bladder-like mastoid processes, and the upper molars with an inconspicuous cingulum and the hind-cusps of the last two rudimentary; the fourth upper premolar being relatively broad. Microcebus caniceps is an allomorphic type (see *Lemur*).

**Malagasy Lemurs.**—All the other Prosimines may be grouped in a second section, the Lemurina, characterized as follows: The lower incisors and the canine are similar in form and inclined forwards (fig. 18); the upper incisors are small and separated by an interval in the middle line; the orbits communicate largely with the temporal fossae; the internal carotid artery enters the skull in advance of the auditory meatus through the foramen lacerum anterior, and passes through the foramen of the fibula; the eyes are small, and the ears large.

The lemurs are now all included in the single family Lemuridae, which is confined to Madagascar and the Comoro Islands, and characterized by the tympanic ring lying free in the auditory bulla. The generic peculiarity of the group, which is illustrated by the hairless Lemuridae, is the structure of the auditory bulla, which is characterized by all the fingers except the index having flat nails, the elongation of the facial portion of the skull, the large hemispheres of the brain not covering the cerebellum, the occasional presence of two inguinal in addition to the normal pectoral tests, the dental formula $i. \frac{3}{2}, c. \frac{3}{2}, p. \frac{3}{2}, m. \frac{3}{2}$, the first upper incisor generally small and sometimes wanting, and the higher cusps of the upper molars smaller than the front ones. These lemurs are woolly-haired animals, often nearly as large as cats, with the legs longer than the arms, the tail long and bushy, and the spinal processes of the last dorsal and the lumbar vertebrae inclined. In the *Malagasy Lemurs*, fig. 19, when the non-mammalian habits of those living animals and their adaptations for the ground or on the branches of trees on all fours, although they can also jump with marvellous agility. They are gregarious, living in small troops, are diurnal in their habits, but most active towards evening, when they take their meals in the woods and gardens. They are not arboreal, but living chiefly among rocks and bushes. Pollen, however, says that it inhabits the forests of the south-west parts of Madagascar, living, like its congeners, in considerable troops, and not differing from them in its habits. He adds that it is extremely gentle, and active and graceful in its movements, and utters at intervals a little plaintive cry like that of a cat. All the others have the tail of uniform colour. The largest is *L. varius*, the ruffed lemur, sometimes black and white, and sometimes reddish-brown, and very large; its last molar and premolar are of large size; the male has a pouch under the chin, the female of the cloaca. At a distance the nearest approach to a lemur is the aye-aye, and the largest is the *A. variegatus*.

*Fig. 19.—The Ring-tailed Lemur (Lemur catra).*
lemurs is that certain species (Opalemur samast, Chirogale millii, &c.) during the dry season coil themselves up in holes of trees, and pass into a state of torpidity, like that of the hibernating animals in the winter of northern climates. Before this takes place an immense deposit of fat accumulates upon certain parts of the body, especially the basal portion of the tail. The smallest species, M. pusillus, lives among the slender branches on the tops of the highest trees, feeding on fruit and insects, and making nests like those of birds.

In the sub-family Indrissinae the dentition of the adult consists of thirty teeth, usually expressed by the formula $i. \frac{1}{1}, c. \frac{1}{1}, p. \frac{1}{1}, m. \frac{1}{1}$; but possibly $i. \frac{2}{2}, c. \frac{1}{1}, p. \frac{1}{1}, m. \frac{1}{1}$. In the milk-dentition there are twenty-two teeth, the two additional teeth in the fore part of the lower jaw having no successors in the permanent series. Hind limbs greatly developed, but the tarsus normal, the great toe of large size, and very opposable; the other toes united at their base by a fold of skin, which extends as far as the end of the first phalanx. The thumb is but slightly opposable; and all the fingers and toes are hairy. The length of the tail is variable. Two pectoral teats. Cecum very large, and colon extremely long and spirally coiled.

The brain is large and the thorax wide.

The animals of this group are essentially arboreal, and feed exclusively on fruit, leaves, buds and flowers. When they descend to the ground, which is but seldom, they sit upright on their hind legs, and move from one clump of trees to another by a series of short jumps, holding their arms above them in the air. Among them are the largest members of the order. The genus Indri has the upper incisors sub-equal in size; upper canine larger than the first premolar, muzzle moderately long, ears exerted. Carpus without an os centrale. Tail rudimentary. Vertebræ: C, 7, D.12, L, 5, S, 1, C, 2. The Indri (Indris brevicaudatus, fig. 20), discovered by Sonnerat in 1780, is the largest of the group, and has long woolly hair, partly brown and partly white. In the sifakas, Propithecus, of which there appear to be three species, with numerous local races, the second upper incisor is much smaller than the first. Upper canine larger than the first premolar. Muzzle rather short. Ears short, concealed by the fur. An os centrale in the carpus. Tail long. Vertebræ: C, 7, D, 12, L, 5, S, 1, C, 28. In Avahi, represented only by Al. laniger, the second upper incisor is larger than the first. Upper canine scarcely larger than the first premolar. Muzzle very short. Ears very small and hidden in the fur, which is very short and woolly. Carpus without os centrale. Tail long. Vertebræ: C, 7, D, 11, L, 3, S, 2. See Indri and Sifaka.

The last sub-family, Chromyrmene (formerly regarded as a family), is represented only by the aye-aye, Chryomys (or Daubentonia madagascariensis), and has the following characteristics: Dentition of adult, $i. \frac{1}{1}, c. \frac{1}{1}, p. \frac{1}{1}, m. \frac{1}{1}$, total 18. Incisors (fig. 21) very large, compressed, curved, with persistent pulps and enamel only in front, in rodents. Teeth of cheek-series with flat indistinctly tuberculated crowns. In the young, the first set of teeth more resemble those of normal lemurs, being $i. \frac{1}{1}, c. \frac{1}{1}, m. \frac{1}{1}$, all very small. Four teeth, inguinal in position, a feature peculiar to this species. All the digits of both feet with pointed, rather compressed claws, except the great toe, which has a flattened nail; middle digit of the hand excessively attenuated. Vertebræ: C, 7, D, 12, L, 5, S, 3, C, 27 (see AYE-AYE).

![Fig. 21.—Skull of the Aye-aye (Chromys madagascariensis). X 1½.](image)

**GALAGOS AND LORISSES.**—The lemurs of Africa and the Indo-Malay countries—commonly miscalled sloths—differ from the Lemuridae in that the tympanic enters into the formation of the auditory meatus, in consequence of which they are referred to a family by themselves, the Nycticebidae, which is in turn divided into two sub-families, Galaginae and Nycticebinae. The African galagos or Galagosinae, which have the same dental formula as the Lemuridae, are distinguished by the elongation of the calcaneum and navicular of the tarsus. In the single genus Galago, with the sub-genera Ololenuv and Hemigalago, the last upper premolar, which is nearly as large as the first molar, has two large external cusps. Vertebræ: C, 7, D, 13, L, 6, S, 3, C, 22–26. Tail long, and generally bushy. Ears large, rounded, naked and capable of being folded at the will of the animal. Teats four, two pectoral and two inguinal (see Galago). The lorises, Nycticebinae (Lorisinae), are distinguished as follows: Index-finger very short, sometimes rudimentary and nailless. Fore and hind limbs nearly equal in length. Tarsus not specially elongated. Thumb and great toe diverging widely from the other digits, the latter especially being habitually directed backwards. Tail short or rudimentary. Teats two or four. Lorises and puttos (as the African representatives of the group are called) are essentially nocturnal, and remain so from the length of their movements. They are completely arboreal, their limbs being formed only for climbing and clinging to branches, not for jumping or running. They have rounded heads, very large eyes, short ears and thick, short, soft fur. They feed, not only on vegetable substances, but, like many of the Lemuridae, also on insects, eggs and birds, which they steal upon while roosting at night. One of the greatest anatomical peculiarities of these animals is the breaking up of the large arterial trunks of the limbs into numerous small parallel branches, constituting a rete mirabile, which is found also in the sloths, with which the lorises are sometimes confounded on account of the slowness of their movements. The Asiatic lorises, which are divided into two genera, are characterized by the retention of the normal number of phalanges in the small index-finger, and the presence of a pair of minute abdominal teats.

![Fig. 22.—The Slow Loris (Nycticebus tardigradus).](image)
PRIMATES

Body and limbs stout. No tail. Vertebrae: C.7, D.17, L.6, S.3, Ca.12. The single species N. tardigradus, with several races, inhabits eastern Bengal, the Malay countries, Sumatra, Borneo, Java, and the Celebes. Head small, eye large, tail large, in the recesses of large forests, chiefly in mountainous districts, where they sleep during the day in holes or fissures of large trees, rolled up into a ball, with the head between the hind legs. On the approach of evening they awake, and during the night ramble along the branches of trees slowly, in search of food, which consists of leaves and fruit, small birds, insects and mice. When in the act of living prey they move noiselessly till quite close, and then suddenly pounce upon them. They are said to be ferocious. The female produces her young one at a time. In the second genus, represented only by the slender loris (Loris gracilis) of southern India and Ceylon, the upper incisors are very small and equal. Orbits very large, and face above by a thin vertical plate of bone. Nasals and premaxillae produced forwards considerably beyond the anterior limits of the maxillae, and supporting a pointed nose. Body and limbs slender. No external tail. Vertebrae: C.7, D.14, L.9, S.3, Ca.6. The slender loris is about the size of a squirrel, of a yellowish-brown colour, with large, prominent eyes, pointed nose, long thin body, long, angularly bent, slender limbs and no tail. Its habits are like those of the rest of the group. The Indian and Ceylon races are distinct (see Loris).

The African potto, Perodicticus, differ by the reduction of the index-finger to a mere nailless tubercle, and apparently by the absence of an abdominal testis. In the typical section of the sub-genus there is a short tail, about a third of the length of the trunk. Two or three of the anterior dorsal vertebrae have very long slender spines. The presence of the tail is the only general project by which the species is distinguishable. The general level of the skin forming distinct conical prominences, covered only by an exceedingly thin and naked integument. P. potto, the potto, is one of the oldest known members of the Lemurid family; it is one of the most characteristic of the group, representing one of the oldest types of the genus Oreopithecus. It has been referred to the genus Oreopithecus, but it is certain that it is not identical with any one of the races, or with any one of the sub-genus Oreopithecus. It is found at Old Calabar, and is very rare. Vertebrae: C.7, D.15, L.7, S.3, Ca.9.

EXTINCT PRIMATES

The most interesting of all the extinct representatives of the order is Pithecanthropus erectus (q.v.), which is represented by the imperfect roof of a skull, two molars and a femur, discovered in a bed of volcanic ash in Java. The forehead is extremely low, with beetling brow-ridges, and the whole calvarium presents a curiously gibbon-like aspect. The capacity of the brain-case is estimated to have equalled two-thirds that of an average modern man. The creature is regarded as transitional between the higher apes, more especially the Hylobatidae, and the lowest representatives of the genus Homo, such as the Neanderthal man. From the Lower Pliocene of India has been obtained the skull and palate of a chimpanzee-like ape, which by some is referred to the existing Anthropopithecus, while others it is considered to represent a genus by itself—Paleoanthropus. The same formation has yielded the canine tooth of a large ape, apparently referable to the existing Asiatic genus Stinum. From the Miocene of Europe has been described the genus Dryopithecus, typified by D. fontani, a generalized ape of the size of a chimpanzee, related, perhaps, both to the Simiidae and the Hylobatidae. The Lower Pliocene of Germany has yielded other remains referable to some unknown genus. From the Miocene of the Vienna basin Dr O. Abel has described certain ape-remains under the name of Griphopithecus suezii, as well as others regarded as representing a species of Dryopithecus with the name D. dorovini. As regards the first, all that can be said is that it indicates a member of a group to which Dryopithecus belongs. It has been suggested that the latter genus is closely related to man, but this idea is discredited by the great relative length of the muzzle and the small space for the tongue. Teeth of another man-like ape from the Tertiary of Swabia, described under the preoccupied name Anthropodus, have been re-named Neopithecus. The genus Anthropodus is represented by remains of an ape of doubtful position from the French Pliocene. Pliopithecus from the French Miocene is certainly a genus, perhaps not distinguishable from Hyllobates.

Oreopithecus, from the Miocene of Tuscany, is perhaps intermediate between gibbons and baboons (Papio), the latter of which, as well as Macacus, are represented in the Indian Pliocene. Neopithecus, of the Greekian Lower Pliocene, presents some characters connecting it with Semnopithecus and others with Macacus. An allied type from the Lower Pliocene of France is Dolichopithecus, taking its name from the elongated skull; while Macacus occurs in the Upper Pliocene and Pleistocene of several parts of Europe. Crytopithecus, from the Swiss Oligocene, appears to be the oldest known Old World monkey. From the Miocene of Patagonia are known certain monkeys described as Homunculus, Anthropops, &c., apparently more akin to the Cebidae but perhaps representing an extinct family.

Passing on to the lemurs, it may be mentioned in the first place that G. Grandi dider has described an extinct lemur from the Tertiary of France, which he believes to be nearly related to the slow lorises, and has accordingly named Pronycticeps gaudryi. If the determination be correct the discovery is of interest as tending to link the modern faunas of southern India and West Africa (which possess many features in common) with the Tertiary fauna of Europe. Certain remarkable lemuroids of large size have been discovered in the superficial deposits of Madagascar, in one of which (Megadapis) the upper cheek-teeth are of a tritubercular type (fig. 23), while in the second and smaller form (Nesopithecus) the dentition makes a notable approximation to that of the Cercopithecidae. Each

of these genera, which probably survived till a very late date, is generally regarded as typifying a family group. In Megadapis the skull is distinguished by its elongation and the small size of the eye-sockets, the tritubercular upper molars presenting considerable resemblance to those of the living Lepidodens. The brain is of a remarkably low type. In one species the approximate length of the skull is 250, and in the second 330 millimetres. Even more interesting are the two large species of Nesopithecus, one of which was at first described as Globilemur. They show a very complicated type of brain, and were at first regarded as indicating Malagasy representatives of the Anthropoidea. In regard to the character of the tympanic region of the skull this genus shows several features characteristic of the more typical Malagasy lemuroids; and the eye-sockets are open behind, while the dentition is numerically the same as in some of the latter. On the other hand, in several features Nesopithecus resembles the Anthropoidea; the upper incisors are not separated in the middle line, and the upper molars
present the pattern found in the *Cercoptithaceae*, while in one species the lachrymal bone and foramen are within the orbit. The resemblances to apes are not confined to the skull, but are found in almost all the bones. Probably the genus may be regarded as a specialized lemuroid. The Oligocene and Eocene formations of Europe and North America have yielded remains of a number of primitive lemuroids, grouped together under the name of *Mesodonta* or *Pseudolemures*, and divided into families severally typified by the genera *Hyopsodus*, *Notarchus*, *Anagnostomorphus* and *Microchoerus* (*Nicroeremus*), of which the last two are European and the others American. To particularize this, the different families are so closely packed together within the same space, and only the following features of the group can be mentioned. The dental formula is $i_1$, $c_1$, $p_4$ or $3$, $m_3$. The canines are often large; the upper molars carry from three to six cusps, while the lower ones are of the tubercular-sectorial type with either four or five cusps. The lachrymal foramen may be either within or without the orbit, which is in free communication with the temporal fossa, with or without a complete bony ring. The humerus has an entepicondylar foramen. It is specially noteworthy that *Adapis* resembles the *Lemuridae* in the form and relations of the tympanic ring. *Anaptomorphus* has large orbits and trituruncular molars. *Cinereus* and *Lower Focene* North American genera, such as *Mixodectes* and *Pycodexus*, together with the European *Plesiadapis* and *Protadapis*, which have been regarded as lemuroids, are now frequently referred to the *Rodentia* (*q.v.*). On the other hand, *Metachiromys*, of the Bridger Eocene of America, originally described as a relative of *Chiroptys*, has been stated to be an armadillo.

**PRIME, PRIMER AND PRIMING.** These three words are to be referred to Lat. *primus*, first, "prime," in O. Eng. *prim* occurs first in the ecclesiastical sense of the Latin *prima hora*, the first hour, one of the lesser canonical hours of the Roman Church (see BREVIARY). Hence the word "primer" (Med. Lat. *prarmataris*), i.e. a book of hours. This was a book for the use of the laity and not a book for priests. The original contained parts of the offices for the canonical hours, the penitential and other psalms, the Litanies, devotional prayers and other matter. There were several "Primers" printed in the reign of Henry VIII.; the *King's Primer* of 1545 contained the Calendar, the Commandments, Creed, Lord's Prayer, the penitential psalms, Litanies and prayers for special occasions. The primer of William Marshall, the printer and reformer, 1534, is entitled *The Primer in English*, with certain prayers and godly meditations, very necessary for all people that understand not the Unyke Tongue. Later these primers contained the *Catechism*, graces before and after meals, and the A. B. C. They were published for (and by) Sir Edward Dyer (1537), and became educational in purpose, as reading books. The earlier primers were also used in this way, as is shown by the "title child" of Chaucer's *Priestess's Tale*, who sitting "at his primer, redemportior herde syngye." Thus "primer" or "primmer" became the regular name for an elementary book for learners. For the type known as "great primer" and "long primer," see TYPOGRAPHY.

Apart from the use of "prime" as the period of greatest vigour of life, the first of the guards in fencing, and for those numbers which have no divisors except themselves and unity (see ARITHMETIC), the principal use is that of the verb, in the sense of to insert in the pan of an old-fashioned small arm, the "primmer," containing powder which, on explosion by percussion, fires the charge. This use seems to be due to "priming," being the first stage in the discharge of the weapon. Finally "priming" is the first coat of size or colour laid on a surface as a preparation for the body colour.

**PRIME MINISTER** or Premier, in England, the first minister of the Crown. Until 1905 the office of prime minister was unknown to the law, but by a royal warrant of the end of December of that year the holder of the office, as such, was given precedence next after the archbishop of York. The prime minister is the medium of intercourse between the cabinet and the sovereign; he has to be cognizant of all matters of real importance that take place in the different departments as so often happens, and to be the controlling influence in the cabinet; he is virtually responsible for the disposal of the entire patronage of the Crown; he selects his colleagues, and by his resignation of office dissolves the ministry. Yet he was until 1905, in theory at least, but the equal of the colleagues he appointed. The prime minister is nominated by the sovereign. "I offered," said Sir Robert Peel on his resignation of office, "no opinion as to the choice of a successor. That is almost the only act which is the personal act of the sovereign; it is for the sovereign to determine in whom her confidence shall be placed." Yet this selection by the Crown is practically limited. No prime minister could carry on the government of the country for any length of time who did not possess the confidence of the House of Commons. The prime minister has no salary as prime minister, but he usually holds the premiership in connexion with the first lordship of the treasury, the chancellorship of the exchequer, a secretarieship of state or the privy seal. Sir Robert Walpole must be regarded as the first prime minister—that is, a minister who imposed harmonious action upon his colleagues in the cabinet. This was brought about partly by the capacity of the man himself, partly by the lack of interest of George I. and II. in English home affairs. This creation, as it were, of a superior minister was so gradually and silently effected that it is difficult to realize its full importance. In previous ministries there was no prime minister except the successor of the administration dominated over his colleagues by the force of character and intelligence. In the reign of George III. even North and Addington were universally acknowledged by the title of prime minister, though they had little claim to the independence of action of a Walpole or a Pitt.

Sir J. Asquith  
1906–1916
H. H. Asquith  
1908–

PRIMERO (Span. first), a card game of Spanish origin, which Strutt calls "the oldest game of cards played in England. It is described as having a close resemblance to Ombre (q.v.), by which it had been superseded. In both games the spadillo or ace of spades was the best card, but Primero was played with six cards and Ombre with nine. The exact method of play is uncertain.

PRIME VERTEX, in astronomy, the vertical circle passing east and west through the zenith, and intersecting the horizon in its east and west points (see ASTRONOMY).

PRIMITIVE METHODIST CHURCH, THE, a community of nonconformists, which owes its origin to the fact that Methodism as founded by the Wesleys tended, after the first generation, to depart from the enthusiasm that had marked its inception and to settle down to the task of self-organization. There were, however, some ardent spirits who continued to work along the old lines and whose watchword was revivalism, and out of their efforts came the Bible Christian, the Independent Methodist and the Primitive Methodist denominations. These enthusiastic evangelists esteemed zeal a higher virtue than discipline and decorum, and put small emphasis on church systems as compared with conversions. One of the men to whom Primitive Methodism owes its existence was Hugh Bourne (1772–1852), a millwright of Stoke-upon-Trent. He joined a Methodist society at Burslem, but business taking him at the close of 1800 to the colliery district of the country, which was then still replete with the prevailing ignorance and debasement that he began a religious revival of the district. His open-air preaching was accompanied by prayer and singing, a departure from Wesley's practice and the forerunner of the well-known "Camp Meeting." A chapel was built at Harrison's church, and a second revival occurred in September 1804, largely the result of a meeting held at Congleton by some enthusiasts from Southport. One of the after-effects of this revival was the conversion (Jan. 1805) of the joint founder of Primitive Methodism, William Clowes (1780–1831), a native of Burslem, who had come to Tunstall. Clowes was a man of fine appearance and open disposition, with a compelling personality that found expression in a steady energy and a thrilling voice. He was a potter by trade, and had a national reputation as a dancer. He joined a Methodist class, threw his house open for love-feasts and prayer-meetings, and did a great deal of itinerant evangelization among the cottages of the countryside. Lorenzo Dow (1779–1844), an eccentric American Methodist revivalist, visited North Staffordshire and spoke of the camp-meetings held in America, with the result that on the 31st of May 1807 the first real English gathering of the kind was held on Mow Cop, since regarded as the Mecca of Primitive Methodism. It lasted from 6 a.m. to 8 p.m., and Bourne and his friends determined to continue the experiment as a counterpart to the parish wakes of the time, which were little better than local saturnalia. Opposition from a master potter of the district, who threatened to put the Conventicle Act in force, was overcome, but more serious difficulties were presented by the antagonism of the Wesleyan Methodist circuit authorities. But Bourne and his friends persisted against both Conference and the local superintendents, who issued bills declaring that no camp-meeting would be held at Norton in August 1807. The meeting was held and ten months later Bourne was expelled by the Burslem Quarterly Meeting, ostensibly for non-attendance at class (he had been away from home, evangelizing), really, as the Wesleyan superintendents told him "because you have a tendency to set up other than the ordinary worship," which was precisely the reason why, fifty years earlier, the Anglican Church had declined to sanction the methods of John Wesley. The camp-meetings went steadily on, and their influence is reflected in the writings of George Eliot, George Borrow and William Howitt. The societies which Bourne formed were for a time allowed to go under (Wesleyan) Methodist protection, but the crisis came in 1810, when the Stanley class of ten members declined to wash their hands of the Camp-Meeting Methodists, and so were refused admission. About this time, too (1809), Bourne appointed James Crawfoot, a Wesleyan local preacher who had been removed from the list for assisting the Independent Methodists, as a travelling preacher at 10s. a week, instructing him to give his whole time to evangelization and to get his converts to join the denominations to which they were most inclined. Clowes, who, in spite of his revivalist sympathies, was more attached to Methodism than Bourne, was cut off from his church for taking part in camp-meetings at Ramsor in 1808 and 1810. His personality drew a number of strong men after him, and a society meeting held in a kitchen and then in a warehouse became the nucleus of a circuit, a chapel being built at Tunstall in July 1811, two months after the fusion of the Bourne and Clowes forces. Clowes, like Crawfoot, was set apart as a preacher to "live by the gospel," and in February 1812 the name "Primitive Methodists" was formally adopted, although for nearly a generation the name "Clowesites" survived in local use.

The first distinct period in the history of Primitive Methodism proper is 1811–1843. It was a time of rapid expansion, marked by great missionary fervour, and may be called the Circuit Period, for even after the circuits were grouped into districts in 1821 they did not lose their privilege of missionary initiative. The line of geographical progress first followed the valley of the Trent. The original circuit at Tunstall soon felt its feet than it favoured consolidation rather than extension. But irrepressibles like John Benton broke through the "non-mission law," and pressed forward through the "Adam Bede" country to Darlington and Northumberland, and at Whitley (1816); Nottingham, where a great camp-meeting on Whit Sunday was attended by 12,000 people; Leicestershire, where Loughborough became the 3rd circuit, with extensions into Rutland, Lincolnshire and Norfolk; and ultimately to Hull, which became the 4th circuit, and where a meeting which deserves to be called the First Conference was held in June 1819. The Hull circuit during the next five years, through its Yorkshire, Western, North-Western and Northern Missions, carried on a vigorous campaign with great success, especially among the then semi-savage colliers of Durham and Northumberland. During the five years 1810–1814 there had been made from Hull 17 circuits with a membership of 7500, and Hull itself had 1700 more. Simultaneously with this work in the north, Tunstall circuit, having thrown off its lethargy at the Wrin Hill camp-meeting on the 23rd of May 1819, was carrying on an aggressive evangelism. In the Black Country, Darlaston circuit was formed in 1820, and John Wedgewood's Cheshire Mission, begun in 1819, led to work in Liverpool on the one hand and in Salop on the other. From Macclesfield a descent was made on Manchester; from Oakengates in South Shropshire came extensions to Herefordshire, Glamorganshire and Wiltshire, where the famous Brinkworth circuit was established. The succeeding years, however, 1825–1828, showed a serious set-back, due to the lack of discipline. But drastic measures were taken, and in one year thirty preachers were struck off the list. Thenceforward, while the Oxford Movement was awakening one section of the people of England the Primitive Methodists were making themselves felt among other classes of the population. John Oxtoby, who evangelized Filey and became known as "Praying Johnny,"
was known to spend six hours a day in intercession. Robert Key at Saham Tony in 1832 won over a young woman who converted her brother, Robert Eagle, who, eighteen years later at Colchester, proved so decisive a factor in the life of Charles Haddon Spurgeon.

The Times of the 27th of December 1830, referring to the disaffected state of the southern counties, said: "The present population must be provided for in body and spirit on more liberal and Christian principles, or the whole mass of labourers will start into legions of banditti—banditti less criminal than those who have made them so, and who by a just and fearful retribution will soon become their victims." These were the classes the Primitive Methodists tried to reach, and in doing so they found themselves between two fires. On the one hand there was the mob violence that often amounted to sheer ruffianism, especially in Wessex and the home-counties. On the other hand there was legal persecution all over the country, and the preachers suffered many things from the hands of rural clergy and county magistrates. There are a score of cases of serious imprisonment, and a countless number of arrests and temporary detention. Local preachers received notice to quit their holdings, labourers were discharged, those who opened their cottages for meetings were evicted, and to show any hospitality to a travelling preacher was to risk the loss of home and employment. But the spirit of the evangelists was undaunted.

At the Conference of 1842 both Clowes and Bourne became supernumeraries with a pension of £25 a year each. Clowes, indeed, had been free from circuit work since 1827, and he continued to pray and preach as he was able till his death in March 1851. Bourne, who worked at his trade more or less all through life, spent his last ten years in advocating the temperance cause; he died in October 1852. The years 1842–1853 mark a transition period in the history of Primitive Methodism. It was John Flesher who chiefly guided the movement from a loosely jointed Home Missionary Organization on to the lines of a real Connexionalism. One of the first steps was to move the Book Room and the meeting place of the executive committee from Bemersley to London. Soon after came the gradual process by which the circuits handed over their mission-work to a central Connexional Committee. The removal to London was proof that the leaders were alive to the necessity of grappling with the rapid growth of towns and cities, and that the Connexion, at first mainly a rural movement, had also urban work to accomplish. The famous Hull circuit long retained a number of powerful branches, a survival of the first period, but by 1853 it had come into line with what was by that time regarded as the normal organization.

The period 1842–1853 (where typical names are W. and S. Antill, Thomas Bateman and Henry Hodge) finds Primitive Methodism as a connexion of federated districts, a unity which may be described as mechanical rather than organic. The districts between 1853 and 1873 were ten in number, Tunstall, Nottingham, Hull, Sunderland, Norwich, Manchester, Brinkworth, Leeds, Bristol and London. Conference—the supreme assembly—was a very jealously guarded preserve, being attainable only to preachers who had travelled 18 and superintended 12 years, and to laymen who had been members 12 and officials 10 years. This exclusiveness naturally strengthened the popularity and power of the districts, where energy and talent found a scope elsewhere denied. Thus Hull district inaugurated a bold policy of chapel-buildings; Norwich that of a foreign mission; Sunderland and Manchester the ideal of a better-educated ministry, Sunderland institute being opened in 1868; Nottingham district founded a middle-class school; Leeds promoted a union of Sunday-schools, and the placing of chapel property on a better financial footing. The period as a whole had some anxious moments; emigration to the gold-fields and the strife which afflicted Wesleyan Methodism brought loss and confusion between 1853 and 1860. Yet when Conference met at Tunstall in the latter year to celebrate its jubilee it could report 675 ministers and 113,114 local preachers, 12,576 chapels, 167,533 scholars and 30,988 teachers. Over-seas, too, there was much activity and success. Work begun in Australia and New Zealand prospered, and the church of course finally contributed over 12,000 members to the formation of the United Methodist Church of Australia, New Zealand with its 2000 members preferring to remain connected with the home country. In the United States there had been a quiet but steady growth since the first agents went out in 1829 and Hugh Bourne's advisory visit in 1844. There are now three Conferences—the Eastern, Pennsylvania and Western, with about 70 ministers, 100 churches and 7000 members. The Canadian churches had a good record, consummated in 1884 when they contributed 8000 members and 100 ministers to the United Methodist Church of the Dominion. In January 1890 the first piece of real foreign missionary work was begun at Fernando Po, followed in December of the same year by the mission at Alliv North on the Orange River in South Africa. This station is the centre of a polyglot circuit or district 150 m. by 50 m., and there is a membership of 1731 and an efficient institution for training teachers, evangelists and artisans. In 1890 another South African mission was started, ultimately locating itself at Mashukulumbwe, and a few years later work was begun in Southern Nigeria.

Since 1853 Primitive Methodism has been developing from a "Connection" into a "Church," the designation employed since 1902. At home a Union for Social Service was formed in 1906, the practical outcome of Thomas Jackson's efforts for the Bunyan movement. In 1907 it was made a settle and distrested in Clapton and Whitechapel, and of similar work at St George's Hall, Southwark. Other significant episodes have been the Unification of the Funds, the Equalization of Districts and the reconstruction of Conference on a broader basis, the Ministers' Sustentation Fund and the Church Extension Fund, and the enlargement and reorganization of the college at Manchester. This undertaking owes much to the liberality of Sir William P. Hartley, whose name the college, which is a school of the Victoria University, now bears. The Christian Endeavour movement in Great Britain derives, perhaps, its greatest force from its Primitive Methodist members; and the appointment of central missions, connexional missions, and mission-vans, which tour the more sparsely populated rural districts, witness to a continuance of the original spirit of the denomination, while the more cultured side is fostered by the Hartley lecture. In celebration of the centenary of the Church, a fund of £250,000 was launched in 1907, and this was brought to a successful issue. Statistics for 1909 show 11,000 ministers, 16,158 local preachers, 212,168 members, 448 chapels, 651,531 Sunday scholars, 59,557 teachers. In the United States there were, in 1906, 101 church edifices and a total membership of 75,588.

PRIMGENITURE (Lat. primus, first, and genus, born, from gignere, to bring forth), a term used to signify the preference in inheritance which is given by law, custom or usage, to the eldest son and his issue, or in exceptional cases to the line of the eldest daughter. The practice is almost entirely confined to the United Kingdom, having been abolished by the various civil codes of the European states, and having been rejected in the United States as contrary to the spirit of the constitution. The history of primogeniture is given in the article Succession, while the existing English law will be found in the articles Heir; Inheritance; Will, &c. But it may be briefly said here that the English law provided that in ordinary cases of inheritance to land of intestates the rule of primogeniture shall prevail among the male children of the person from whom descent is to be traced, but not among the females; and this principle is applied throughout all the degrees of relationship. There are exceptions to this rule, as in the cases of "gavelkind" and "borough-English," and in the copyhold lands of a great number of manors, where customs analogous to those of gavelkind and borough-English have existed from time immemorial. In another class of exceptions the rule of primogeniture is applied
to the inheritance of females, who usually take equal shares in each degree. The necessity for a sole succession has, for example, introduced succession by primogeniture among females in the case of the inheritance of the Crown, and a similar necessity led to the maxim of the feudal law that certain dignities and offices, castles acquired for the defence of the realm, and other inheritances under the law of the sword, should not be divided, but should descend to the eldest male heir.

De Legibus, ii. c. 76; Co. Litt., 1652). There are also many other special customs by which the ordinary rule of primogeniture is varied. It may be remarked that the English law of inheritance of land creates a double preference, subject to certain exceptions and customs, in favour of the male over the female and of the first-born among the males. This necessitates the rule of representation by which the issue of children are regarded as standing in the places of their parents, called "representative primogeniture." The rule appears to have been firmly established in England during the reign of Henry III., though its application was favoured as early as the 12th century throughout the numerous contests between brothers claiming by proximity of blood and their nephews claiming by representation, as in the case of King John and his nephew Prince Arthur (Glavill, vii. c. 3; Bracton, De Legibus, ii. c. 30).

PRIMROSE.1 The genus Primula contains numerous species distributed throughout the colder parts of Europe and Asia, and found also on the mountains of Abyssinia and Java; a few are American. They are herbaceous perennials, with a permanent stock from which are emitted tufts of leaves and flower-stems which die down in winter; the new growths formed in autumn remains in a bud-like condition ready to develop in spring. They form the typical genus of Primulaceae (q.v.), the floral conformation of which is very interesting on several accounts independently of the beauty of the flowers. The variation in the length of the stamens and of the style in the flowers of Primula has attracted much attention since Charles Darwin pointed out the true significance of these varied arrangements. Briefly it may be said that some of the flowers have short stamens and a long style, while others have long stamens, or stamens inserted so high up that the anthers protrude beyond the corolla tube, and a short style. Gardeners and florists had for centuries been familiar with these variations, calling the flowers from which the anthers protruded "thrum-eyed" and those in which the stigma appeared in the mouth of the tube "pin-eyed." Darwin showed by experiment that the most perfect degree of fertility, as shown by the greatest number of seeds and the healthiest seedlings, was attained when the pollen from a short-stamened flower was transferred to the stigma of a short-styled flower, or when the pollen from the long-stamens was applied to the long style. As in any given flower the stamens are short (or low down in the flower-tube) and the style long, or conversely, it follows that to ensure a high degree of fertility cross fertilization must occur, and this is effected by the transfer of the pollen from one flower to another by insects. Incomplete fertility arises when the stigma is impregnated by the pollen from the same flower. The size of the pollen-grains and the texture of the stigma are different in the two forms of flower (see figure under Primula). The discovery of the physiological significance of these facts, which had long been noticed, was made by Darwin, and formed the first of a series of similar observations and experiments by himself and subsequent observers (see Darwin, Different Forms of Flowers, &c.). Among British species may be mentioned the Common Primrose (P. vulgaris); the cowslip (P. veris); the true Oxlip (P. elatior), a rare plant only found in the eastern counties; and the common oxlip, the flowers of which recall those of the common primrose, but are provided with a supporting stem, as in the cowslip; it is, in fact, a hybrid between the cowslip and the primrose. In addition to these two other species occur in Britain, namely, P. farinosa, found in Wales, the north of England and southern Scotland, and P. scottica, which occurs in Orkney and Caithness. These two species are found also in high Arctic latitudes, and P. farinosa, or a very closely allied form, exists in Fuegia.

The Auricula (q.v.) of the gardens is derived from P. Auricula, a yellow-flowered species, a native of the Swiss mountains. The Polyanthus (q.v.), a well-known garden race, is probably derived from a cross between the primrose and cowslip. The Himalayas are rich in species of Primula, often very rare, with variation or limitation, certain forms being peculiar to particular valleys. Of these P. denticulata, Sturtia, sikkimensis, nipalis, floribunda, may be mentioned as frequently cultivated, as well as the lovely rose-coloured species P. rosea.

The Royal Cowslip (P. imperialis) resembles P. japonica, but has leaves measuring 18 in. long by 5 in. wide. It grows at an elevation of 9000 ft. in Java, and has deep yellow or orange flowers.

The primrose is to be had in cultivation in a considerable variety of shades of colour, ranging from the palest yellow to deep crimson and blue. As the various species require cultivation in different ways, it is necessary to increase special kinds by division. The primrose is at its best in heavy soils in slight shade, and with plenty of moisture during summer.

One of the most popular of winter and early spring decorative plants is the Chinese primrose, Primula sinensis, of which some superb strains have been obtained. For ordinary purposes young plants should be raised annually from seeds, so as to have them available in March, and again for succession in April and, if needed, in May. The seed should be sown in well-drained pots or pans, in a compost of three parts light loam, one part well-rotted leaf-mould, and one part coarse grit. It requires patience to germinate these seeds, which contain stagnant moisture, afterwards placing a sheet of glass over the pans to prevent evaporation of moisture. When the seedlings are large enough to handle, prick them out in pans or seed boxes, and then when they have made leaves an inch long, pot them singly in 3-in. pots, using in the soil a little rotten dung. They should then be placed in a light frame near the glass in an open situation, facing the north. When their pots are filled with roots they should be moved into 6-in. or 7-in. pots. The soil should now consist of three parts good loam broken with the hand, one part rotten dung and leaf-mould, and as much sand as will keep the whole open. They should be potted firmly, and kept in a cold frame till the first frosts. The light frame is best, but the glass should never be allowed to become too hot, as this is being carefully avoided. In the autumn they should be transferred to a light house and placed near the glass, the atmosphere being kept moist by frequent misting of the leaves. The night temperature should be kept about 45°. When the flowers are about to open, manure water once or twice a week will be beneficial. The semi-double varieties are increased from seeds, but the fully double and double-flowered forms by cuttings. Primula japonica, a bold-growing and very beautiful Japanese plant, is hardly in sheltered positions in England. P. coriasodes, var. Sieboldii (Japan), of which there are many lovely forms, is suitable for outdoor culture and under glass. There are several small-growing hardy species which should be accommodated on the best positions on rockeries where they are secure from excessive dampness during winter; excess of moisture at that season is the worst enemy of the choice Alpine varieties. They are propagated by seed and by division of the crowns after flowering. P. Forrestii is a quite new orange-yellow flowered species from China; also P. Bulleyi. They are probably hardy—at least in favoured spots.

Evening primrose belongs to the genus Oenothera (natural order Onagraceae), natives of temperate North and South America. They are evening flowers, blooming at night in Britain and elsewhere in Europe; the form or species known as var. grandiflora or Oe. Lamarkiana is a very showy plant with larger flowers than in the common form. Other species known in gardens are Oe. biennis, Oe. aggregata, Oe. odoria, Oe. patens, Oe. Trumanii, Oe. 2000, Oe. xanthorrhiza, Oe. missouriensis, Oe. californica, Oe. turbinata, Oe. polyanthum, Oe. auricula, each with abundant blossoms. The name of Cape Primrose has been given by some to the hybrid forms of Streptocarpus, a South African genus belonging to the natural order Gesneraceae.
**PIMMIE LEAGUE, THE.** An organization for spreading Conservative principles amongst the British democracy. The primrose is associated with the name of Lord Beaconsfield (q.v.), as being preferred by him to other flowers. On a card affixed to the wreath of primroses sent by Queen Victoria to be placed upon his coffin was written in Her Majesty’s own handwriting:  
“His favourite flowers: from Osborne: a tribute of affectionate regard from Queen Victoria.” On the day of the unveiling of Lord Beaconsfield’s statue all the members of the Conservative party in the House of Commons were decorated with the primrose. A small group had for some time discussed the means for obtaining for Conservative principles the support of the people. Sir H. D. Wolff therefore said to Lord Randolph Churchill, “Let us found a primrose league.” The idea was accepted by several gentlemen in the habit of working together, and a meeting was held at 11. Carlton Club containing the letters PL, surrounding Randolph Churchill, Sir H. Drummond Wolff, Mr (afterwards Sir John) Gorst, Mr Percy Mitford, Colonel Fred Burnaby and some others, to whom were subsequently added Mr Satchell Hopkins, Mr J. B. Stone, Mr Rowlands and some Birmingham supporters of Colonel Fred Burnaby, who also wished to return Lord Randolph Churchill as a Conservative member for that city. These gentlemen were of great service in remodelling the original statutes first drawn up by Sir H. Drummond Wolff. The latter had for some years perceived the influence exercised in benefit societies by badges and titular appellations, and he further endeavoured to devise some quaint phraseology which would be attractive to the working classes. The title of Knight Harbinger was taken from an office no longer existing in the Royal Household, and a regular gradation was instituted for the honorific titles and decorations assigned to members. This idea, though at first ridiculed, has been greatly developed since the foundation of the order; and new distinctions and decorations, have been founded, also contributing to the attractions of the league. The League was partially copied from the organization of the Orange Society in Ireland. In lieu of calling the different subsidiary associations by the ordinary term “Lodges,” the name was given of “Habitations,” which could be constituted with thirteen members. These were intended as a substitute for the paid canvassers, about to be abolished by Mr Gladstone’s Reform Bill. The principles of the League are best explained in the declaration which every member is asked to sign: “I declare on my honour and faith that I will devote my best ability to the maintenance of religion, of the estates of the realm, and of the imperial ascendancy of the British Empire; and that, consistently with my allegiance to the sovereign of these realms, I will promote with discretion and fidelity the above objects, being those of the Primrose League.” The motto was “Imperium et libertas”; the seal, three primroses; and the badge, a primrose plate centred with primroses. Many other badges and various articles of jewellery have since been designed, with this flower as an emblem.

A small office was first taken on a second floor in Essex Street, Strand; but this had soon to be abandoned, as the dimensions of the League rapidly increased. Ladies were generally included in the first organization of the League, but subsequently a separate Ladies’ Branch and Grand Council were formed. The founder of the Ladies’ Grand Council was Lady Borthwick (afterwards Lady Glenesk), and the first meeting of the committee took place at her house in Piccadilly on the 2nd of March 1885. The ladies who formed the first committee were: Lady Borthwick, the dowager-duchess of Marlborough (first lady president), Lady Wimborne, Lady Randolph Churchill, Lady Charles Beresford, the dowager-marchioness of Waterford, Julia marchioness of Tweeddale, Julia countess of Jersey, Mrs (subsequently Lady) Hardman, Lady Dorothy Nevill, the Honourable Lady Campbell (later Lady Blithwood), the Honourable Mrs Armitage, Mrs Bischoffsheim, Miss Meresia Nevill (the first secretary of the Ladies’ Council).

When the League had become a success, it was joined by Lord Salisbury and Sir Stafford Northcote, who were elected Grand Masters. Its numbers gradually increased to a marvellous extent, as may be seen by the following figures:

See an article in the *Albermarle of January* 1892, written by Miss Meresia Nevill; and the *Primrose League Manual*, published at the offices at Westminster. The latter publication is interesting as a history of the organization. (H. D. W.)

**PRIMULACEAE.** In botany, an order of Camptopetalous Dicotyledons belonging to the series Primulaceae and containing 28 genera with about 350 species. It is cosmopolitan in distribution, but the majority of the species are confined to the temperate and colder parts of the northern hemisphere and many are arctic or alpine. Eight genera are represented in the British flora. The plants are herbs, sometimes annual as in pimpernel (*Anagallis arvensis* (fig. 1)), but generally perennial as in *Primula*, where the plant persists by means of a sympodial rhizome, or in *Cyclamen* by means of a tuber formed from the swollen hypocotyl. The leaves form a radical rosette as in *Primula* (primrose, cowslip, &c.), or there is a well-developed aerial stem which is erect, as in species of *Lysimachia*, or creeping, as in *Lysimachia Nummularia* (creeping jenny or money-wort). *Hottonia* (water violet) is a floating water plant with submerged leaves cut into fine linear segments. The leaves are generally simple, often with a toothed margin; their arrangement is alternate, opposite or whorled, all three forms occurring in one and the same genus *Lysimachia*. The flowers are solitary in the leaf-axils as in pimpernel, money-wort, &c., or umbellate as in primrose, where the umbel is sessile, and cowslip, where it is stalked, or in racemes or spikes as in species of *Lysimachia*. Each flower is subtended by a bract, but there are no bracteoles, and corresponding with the absence of the latter the two first developed sepals stand right and left (fig. 2). The flowers are hermaphrodite and regular with parts in fives (pentameres) throughout, though exceptions from the pentameric arrangement occur. The sepals are leafy and persistent; the corolla is generally divided into a longer or shorter tube and a limb which is spreading, as in primrose, or reflexed, as in *Cyclamen*; in *Soldanella* it is bell-shaped; in *Lysimachia* the tube is often very short, the petals appearing almost free; in *Glaux* the petals are absent. The five stamens spring from the corolla-tube and are
opposite to its lobes; this anomalous position is generally explained by assuming that an outer whorl of stamens opposite the sepals has disappeared, though sometimes represented by scales as in Samolus and Soldanella. Another explanation is based on the late appearance of the petals in the floral development and their origin from the backs of the primordia of the stamens; it is then assumed that three alternating whorls only are present, namely, sepals, stamens bearing petal-like dorsal outgrowths, and carpels. The superior ovary—half-inferior in Samolus—bears a simple style ending in a capitate entire stigma, and contains a free-central placenta bearing generally a large number of ovules, which are exceptional in the group Campanulaceae in having two integuments. The fruit is a capsule dehiscing by 5 sometimes to 10 teeth or valves, or sometimes transversely (a pyxidium) as in Anagallis.

Cross pollination is often favoured by dimorphism of the flower, as shown in species of Primula (fig. 3). The two forms have long and short styles respectively, the stamens occupying corresponding positions half-way down or at the mouth of the corolla-tube; the long-styled flowers have smaller pollen-grains, which correspond with smaller stigmatic papillae on the short styles.

The order is divided into five tribes based on differences in position of the ovules—which are generally semi-anatropous so that the seed is peltate with the hilum in the centre on one side (or ventral), but sometimes, as in Hotonia and

![Diagram](From Strasburger’s Lehrbuch der Botanik.)

Samolus, anatropous with the hilum basal—together with the method of deliscence of the capsule and the relative position of the ovary. The chief British genera are Primula, including *P. vulgaris*, primrose, *P. veris*, cowslip, *P. elatior*, oxlip, and the small alpine species *P. farinosa*, with mealy leaves; *Lysimachia*, loose strife, including *L. Nummularia*, money-wort; *Anagallis*, pipernel; and *Hotonia*, water violet.

**PRIMULINE**, a dye-stuff containing the thiazole ring system conjointly with a benzene ring. The primulines are to be considered as derivatives of dehydrothiotoluidine (aminobenzylthiolylmercaptopantn), which is obtained when para-tolu-}

:dine is heated with sulphur for eighteen hours at 180-190° C. and then for a further six hours at 200-220° C. (P. Jacobson, *Bor.*, 1886, 22, p. 333; L. Gatterman, ibid. p. 1084). Dehydrothiotoluidine is not itself a dye-stuff, but if the heating be carried out at a higher temperature in the presence of more sulphur, then a base is formed, which gives primuline-yellow on sulphanolation (A. G. Green, *Journ. Soc. Chem. Ind.*, 1888, 1, p. 194). Primuline-yellow is a mixture of sodium salts, and probably contains in the molecule at least three thiazole rings in combination. It is a substantive cotton dye of rather fugitive shade, but can be diazotized on the fibre and then developed with other components, so yielding a series of ingrained colours.

Thioflavine *T* is obtained by the methylation of dehydrothioto-

toluidine with methyl alcohol in the presence of hydrochloric acid (German Patent 41738 (1888)). Thioflavine *S* results from the methylation of dehydrothiotoioluidine sulphonylic acid. This sulphonylic acid on oxidation with bleaching powder or with lead peroxide, in alkaline solution yields *chloraniline yellow*, which gives cotton a beautiful refuge and were about to force an entrance, when the dying man surrendered to save his deliverer's property. The riots directly contributed to the re-establishment of Austrian rule in Milan.

See M. Fabi, *Milano ed il ministro Prina* (Novara, 1860); F. Lemmi, *La Restaurazione austriaca a Milano nel 1814* (Bologna,
PRINCE

1902); Ugo Foscolo, *Alcune parole intorno alla fine del regno d'Italia*. The story of the murder of Prina forms the subject of a play by G. Rovetta, entitled *Principio di secolo*.

**PRINCE** (Lat. *princeps*, from *primum capio*, "I am the first to take"); Ital. *principe*, Fr. *prince*, a title implying either political power or social rank. The Latin word *princeps* originally signified "the first" either in place or action (cf. Ger. *Fürst*; O.H.G. *foriste* = English "first"). As a honorary title it was applied in the Roman republic to the *principes senatus*, i.e. the senator who stood first on the censor's list, and the *principes juvenilis*, i.e. the first on the roll of the equestrian order. The assumption of the style of *principes senatus* by Augustus (q.v.) first associated the word with the idea of sovereignty and domination, but throughout the period of the empire it was still used as a title of certain civil or military officials (e.g. *principes officii*, for the chief official of a provincial government, in the Theodosian code, leg. I., *De offic. rect. prov.* i. 7; *principes militiae*, i.e. the commander of a cohort or legion); while in the middle ages the term is still applied vaguely in charters to the magnates of the state or the high officials of the palace, *principes* being treated as the equivalent of *proceres*, *optimates* or *seniores*. Yet the idea of sovereignty as implied in the word *principes*, used as a title rather than as a designation, survived strongly. In the Visigothic and Lombard codes *princeps* is the equivalent of *rex* or *imperator*; and when, after the Lombard kingdom by the Franks, Arichis II. (d. 787) of Benvenuto succeeded in asserting his independent sovereignty, he had himself anointed and crowned, and exchanged his style of duke for that of prince.

From Italy the use of the title spread—first, with the Crusaders, to the Holy Land, where Bohemund, son of Tancred, took the style of prince of Antioch; next, with the Latin conquerors, into the East Roman Empire, where in 1205 William de Champelette, a cadet of the house of Champagne, founded the principality of Achaia and the Morea. This example was followed by lesser magnates, who styled themselves loosely, or were so styled by the chroniclers, "princeps," even though they had little claim to independent sovereignty. From the East the fashion was carried back to France; but there the erection of certain fiefs into "principalities," which became common in the 15th and 16th centuries, certainly implied no concession of independent sovereignty, and the title of "prince" thus bestowed ranked below that of "duke," being sometimes borne by cadet branches of ducal houses, e.g. the princes of Léon and of Soubise, cadets of the house of Rohan. On the other hand, the title of "prince" was borne from the time of Charles VII. or Louis XI. by the sons of the royal house, so-called "princes of the blood" (*princes du sang*), who took precedence in due order after the king. To these were added, from the time of Louis XIV., the *princes législatifs*, recognized bastards of the sovereign, who ranked next after the princes of the blood. Thus, e.g. the princes of Condé, Conti and Lamballe owed their exalted precedence, not to their principalities, but to their royal descent.

In Germany, Austria and other countries formerly embraced in the Holy Roman Empire the title of "prince" has had some what different history. During the first period of the empire, the "princes" were the whole body of the *optimates* who took rank next to the emperor. In the 11th century, with the growth of feudalism, all feudatories holding in chief of the Crown ranked as "princes," from dukes to simple counts, together with archbishops, bishops and the abbots of monasteries held directly of the emperor. Towards the end of the 12th century, however, the order of princes (*Fürstenstand*) was narrowed to the more important spiritual and temporal feudatories who had a right to a seat in the diet of the empire in the "college of princes" (*Fürstenbank*). Finally, in the 13th century, seven of the most powerful of these separated themselves into a college which obtained the sole right of electing the emperor. These were called "prince electors" (*Kurfürsten*), and formed the highest rank of the German princes (see ELECTOR). The formal designation of "prince" ("Fürst") was, however, extremely rare in Germany in the middle ages. Examples are the princes of Mecklenburg (Prillislaw I., prince of the Holy Roman Empire in 1750) and Rügen, the latter title now belonging to the kings of Prussia. In the 18th century more principalties were created, of which that of Schwarzburg-Sondershausen (1697) survives as a sovereign house. The 18th century increased their number, and of the princely houses of this period those of Schwarzburg-Rudolstadt (1710), Waldeck (1712) and Reuss, elder branch (1778), have preserved their sovereignty. Of the other sovereign "princes" in Germany, Reuss, cadet branch, obtained the title in 1806, Schaumburg-Lippe in 1807. Outside the German Empire the prince of Liechtenstein, whose title dates from 1668, still remains sovereign.

Thus, in Germany, with the decay of the empire the title "prince" became a sovereign in designation, though it ranks, as in France, below that of "duke." They are now sovereigns of the countries formerly embraced in the Holy Roman Empire other classes of "princes." Some of these inherit titles, sovereign under the old empire, but "mediatized" during the years of its collapse at the beginning of the 19th century, e.g. Thurn and Taxis (1693), Hohenlohe (1764), Leiningen (1779); others received the title of "prince" immediately before or after the end of the empire as "compensation" for ceded territories, e.g. Metternich-Winneburg (1803). Besides these mediatized princes, who transmit their titles and their privilege of "royal" blood to all their legitimate descendants, there are also in Austria and Germany "princes" created by the various German sovereigns, and some dating from the period of the old empire, who take a lower rank, as not being "princes of the Holy Roman Empire" nor entitled to any royal privileges. Some of these titles have been bestowed to give a recognized rank to the morganatic wives and children of royal princes, e.g., the princes of Battenberg, or the title of "princess" of Hohenberg borne by the consort of the Archduke Francis Ferdinand d’Esté; others as a reward for distinguished service, e.g. Hardenberg, Bliicher, Bismarck. In this latter case the rule of primogeniture has been usual, the younger sons taking the title of "count" ("Graf"). These non-royal princes are ranked in the *Almanach de Gotha* with British and French dukes and Italian princes. All these various classes of princes are styled *Fürst* and have the predicate "Serene Highness" (*Durchlaucht*). The word *Prince* actually synonymous with *Fürst*, is reserved as the title of the non-royal members of sovereign houses and, with certain exceptions (e.g. Bavaria), for the cadets of mediatized ducal and princely families. The heir to a throne is "a crown prince" (*Kronprinz*), "hereditary grand duke" (*Erzherzog*) or "hereditary prince" (*Erzgraf*). The heir to the crown of Prussia, when not the son of the monarch has the title of "prince of Prussia" (*Prinz von Preussen*).

In Italy the title "prince" (*principe*) is also of very unequal value. The title of "prince" belongs, according to Arichis II., "machingly meaning the glory of a greater name than me," it ranked above that of duke. In other parts of Italy the heads of great families sometimes bear the title of "prince," e.g. Prince Corsini, duke of Casiglione; sometimes that of "duke," e.g. the Caesar, princes of Teano, whose chief is styled "duke of Sermoneta," the title of "prince of Teano" being borne by his eldest son. The title of "prince of Naples" is attached to the eldest son of the king of Italy. The excessive multiplication of the title has tended to deprive it of much social value in itself, and under the democratic constitution of Italy it confers neither power nor precedence.

"Prince" is also the translation of the Russian title *kniaz*, though *velikiy kniaz*, the style of the Imperial princes, is rendered "grand duke." Some of the Russian, or Polish-Russian, princely families are of great importance—e.g. the Czartoryski, the Swiatopolk-Czetwertynski, or the Russian
PRINCE EDWARD ISLAND

branch of the Lubomirskis. But, in general, though the title "prince" implies descent from one or other of the ruling dynasties of Russia, it is in itself of little account, being exceedingly common owing to its being borne by every member of the family. The predicate of "Serene Highness," though borne by certain magnates who were princes before they became Russians—as in the case of the families mentioned above—is not attached to the Russian title of "prince." In some cases, however, it is conferred with the title by imperial warrant (e.g. Lieven, 1825).

The title of "prince" is also borne by the descendants of those Greek Phanariot families (see Phanariots), e.g. Mavrocordato, Ypsilanti, Souztso, who formerly supplied hospodars to the Turkish principalities on the Danube. In the Ottoman Empire the rulers appointed to the quasi-independent Christian communities subject to it have usually been designated "prince," and the title has thus come to signify in connexion with the Eastern Question a sovereignty more or less subordinate. As such it was rejected on behalf of the Bavarian prince Otho, when he accepted the throne of Greece, in favour of that of "king." On the other hand, the substitution, in 1852, in Montenegro of the title of "prince and lord" (knez i gospodar) for the title of lord bishop (archbishop) certainly implied no such subordination. The only other instance in Europe of "prince" as a completely sovereign title is that of the prince of Monaco, the formal style having been adopted by the Grimaldi lords in 1641.

In Great Britain "prince" and "princess" as titles are confined to members of the royal family, though non-royal dukedoms are so described in their formal style (see Duke).

Great Britain. Nor is this use of great antiquity; the custom of giving the courtesy title of "prince" to all male descendants of the sovereign to the third and fourth generation being of modern growth and quite foreign to English traditions. It was not till the reign of Henry VII. that the king's sons began to be styled "princes"; and as late as the time of Charles II., the daughters of the duke of York, both of whom became queens regnant, were called simply the Lady Mary and the Lady Anne. The title of "princess royal," bestowed on the eldest daughter of the sovereign was borrowed by King George II. from Prussia. Until recent years the title "prince" was never conferred on anybody except the heir-apparent to the Crown, and his principality is a peerage. Since the reign of Edward III. the eldest sons of the kings and queens of England have always been dukes of Cornwall by birth, and, with a few exceptions, princes of Wales by creation. Before that Edward I. had conferred the principality on his eldest son, afterwards Edward II., who was summoned to and sat in parliament as prince of Wales. But Edward the Black Prince was the original grantee of the principality as well as of the dukedom, under the special limitations which have continued in force to the present day. The entail of the former was "to him and his heirs the kings of England" and of the latter "to him and his heirs the first-begotten sons of the kings of England." Hence when a prince of Wales and duke of Cornwall succeeds to the throne, the principality in all cases vests in the Crown, and can only have title by creation again except under a fresh creation, while the dukedom, if he has a son, descends immediately to him, or remains in abeyance until he has a son if one is not already born. If, however, a prince of Wales and duke of Cornwall should die in the lifetime of the sovereign, leaving a son and heir, both dignities are extinguished, because his son, although he is his heir, is neither a king of England nor the first-begotten son of a king of England. But, if instead of a son he should leave a brother his heir, then—as was decided in the reign of James I. on the death of Henry, prince of Wales, whose heir was his brother Charles, duke of York—the dukedom of Cornwall would pass to him as the first-begotten son of the king of England then alive, the principality of Wales alone becoming merged in the Crown. It has thus occasionally happened that the dukes of Cornwall have not been princes of Wales, as Henry VI. and Edward VI., and that the princes of Wales have not been dukes of Cornwall, as Richard II. and George III.

But even now the cadets of the reigning family can only by royal intervention legally be saved from merging, as of old, in the general untitled mass of the people. The children of the sovereign other than his eldest son, though by courtesy "princes" and "princesses," need a royal warrant to raise them de jure above the common herd; and even then, though they be dubbed "Royal Highness" in their cradles, they remain "commoners" till raised to the peerage. In 1905 King Edward VII. established what appears to be a new precedent, by conferring the title of "princess" and "highness" upon the daughters of the princess Louise, duchess of Fife, created "princess royal."

This use of the word "prince"—which has in England so lofty a connotation—to translate foreign titles of such varying importance and significance naturally leads to a good deal of confusion in the public mind. It is not uncommon in English society to see, e.g. a Russian prince, who may be only the cadet of a family not included in the Almanach de Gotha, given precedence as such over the untitled members of a great English ducal family, and treated with some of that exaggerated deference paid to genuine princes. In any case, many Englishmen is apt to regard all German princes with a certain contempt, whereas the title is in Germany sometimes associated with sovereign power, sometimes with vast territorial possessions, and always with high social position.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, lies between 54° 58' and 47° 47' N. and 61° and 64° 27' W. The underlying geological formation is Permian, though outliers of Triassic rock occur. The coal seams supposed to underlie the Permian formation are apparently too deep down to be of practical value. The rocks consist of soft red micaceous sandstone and shales, with interstratified but irregular beds of brownish-red conglomerates containing pebbles of white quartz and other rocks. There are also beds of hard dark-red sandstone with the shales. Bands of moderately hard reddish-brown conglomerate, the pebbles being of red shale and containing white calcite, are seen at many points; and then greenish-grey sandstones, probably of the same age as above, due to the bleaching out of the red colours by the action of the carbonic acid. Fossil plants are abundant at many places. Beds of peat, dunes of drifted sand, alluvial clays and mussel mud occur in and near the creeks and bays.

Physical Features.—The island lies in a great semi-circular bay of the Gulf of St Lawrence, which extends from Point Miscou in New Brunswick to Cape North in Cape Breton. From the mainland it is separated by Northumberland Strait, which varies from 9 to 30 miles in width. It is extremely irregular in shape, and deep inlets and tidal streams almost divide it into three approximately equal parts; from the head of Hillsborough Strait in the south to Savage Harbour on the north is only one and a half miles, while at high tide the distance between the heads of the streams which fall into Bedeque and Richmond Bays is even less. North of Summerside the land nowhere rises more than 175 ft. above sea-level; but between Summerside and Charlottetown, especially near north Wiltshire, is a ridge of hills, running from north to south and rising to a height of nearly 500 ft. From Charlottetown eastwards the land is low and level. The north shore, facing the gulf, is a long series of beaches of fine sand, and is a favourite resort in summer. On the south, low cliffs of crumbling red sandstone face the strait. The climate is healthy, and though bracing colder than that of the neighbouring mainland. Fogs are much less common than in either New Brunswick or Nova Scotia.

Area and Population.—The greatest length of the island is 145 m., its greatest breadth 34 m., its total area 2184 sq. m.
The population in 1891 was 163,259, having sunk from 199,078 in 1891. It is thus much the most densely populated province in Canada, there being nearly fifty-two persons to the sq. m. Though very large families are not so common as in the province of Quebec, the agricultural character of the population makes the average number of persons to a family greater (5.52) than in any other province. As in all the maritime provinces, there is a steady immigration to the Canadian West and to the United States. The population is mainly of British descent, but also comprises descendants of the French Acadians and of the American loyalists. About 200 Indians of the Mic-Mac tribe remain, and have slightly increased in numbers since 1891. In 1801 the origin of the people was: Scots, 41,753; English, 24,043; Irish, 21,992; French, 13,807; all other nationalities, 1604. The principal religious denominations and the number of their adherents were as follows: Church of Rome, 45,576; Presbyterians, 30,759; Methodists, 13,402; Anglican, 5076; Baptists, 5905. The Irish and French are almost entirely Roman Catholic, the Scots about two-thirds Presbyterian and one-third Roman Catholic. Jurisdiction over the Catholics is held by the bishop of Charlottetown, and over the Anglicans by the bishop of Nova Scotia. The Presbyterians form part of the synod of the Maritime Provinces.

Administrative Government.—Five members of the House of Commons and four senators are sent to the federal legislature. At its entry into federation in 1873, the number of members was six, and the reduction to five in 1901 was bitterly denounced. The local government now consists of a lieutenant-governor and of a legislative assembly. This conducts not only the general affairs of the province, but most of those of the towns and villages; legal provision has, however, been made for the establishment of a municipal system, and Charlottetown and Summerside are incorporated municipalities, though with powers of self-government much more limited than those of any other incorporated Canadian towns. The provincial revenues, which tend to prove inadequate, are largely paid off on account of the subsidy, and the government, though there are numerous taxes, which bear heavily on the small industrial population. But for the increase in 1907 of the federal subsidy, financial exigencies might have forced the adoption of direct taxation, in spite of its unpopularity among the farmers.

Education.—Primary education in the province has been given free since 1852. Since 1877 it has been under the control of a minister of education with a seat in the provincial cabinet. At Charlottetown is the Prince of Wales College, really a rather advanced secondary school, with which is affiliated the Normal School. St. Dunstan's College, another advanced high school in Charlottetown, is under Roman Catholic control. Advanced university education is not given in the province. Attendance at the primary schools is by law compulsory, but the exigencies of a farming population and the lack of adequate means of enforcement render the law inoperative. The salaries of the teachers are, as a rule, low, and the school buildings cheerless and ill-maintained.

Agriculture.—The soil, an open sandy loam, deep red in colour, which was slightly exhausted at the beginning of the century by repeated crops of cereals, has been renewed by the application of manure much dredged from the bays and tidal streams. All the staple crops are grown—especially oats, potatoes and turnips. Wheat is raised only for local consumption. Cattle and hogs flourish. In the last years of the 19th century the introduction of co-operation gave a great impetus to the manufacture of butter and cheese. The first cheese factory was opened in 1892, and the first creamery in 1894. Of over 15,000 farmers all, save about 900, own their own farms, and are in nearly all cases well-to-do. Large quantities of animal and vegetable food, amounting to about one-half of the total product, are exported, chiefly to Cape Breton, Newfoundland, and the New England states. Fruit is raised less extensively than in Nova Scotia, but enough is grown to supply the local market, and apples of good quality are exported.

Fishing.—Though smaller in value than those of any other sea-board province, the fisheries of Prince Edward Island are, in proportion to the total population, extremely productive. Of the catch of about £200,000, lobsters, most of which are canned, are worth about £50,000, and oysters £29,000, in the latter case about half the total value of the catch of the Dominion, which is compelled to import largely from the United States. There are signs of the approaching exhaustion of the oyster beds, but no adequate remedy or new source of supply has been found. Herring, cod, mackerel and smelts are also caught in large quantities in the coast waters.

Other Industries.—About one-third of the province is covered with birch, beech, maple, pine, spruce, cedar and other woods, but though a little lumber is exported, the industry is declining. The building of wooden ships, a flourishing trade until about 1880, is now almost extinct. The packing of pork and of lobsters is actively pursued near Charlottetown, and small factories have been established for the manufacture of boots and shoes, tobacco, condensed milk, &c., but the great bulk of the manufactured goods used are imported from the other provinces.

Communications.—The Prince Edward Island branch of the Intercolonial railway, owned and worked by the federal government, runs from Souris in the east to Tignish in the north-west, with branches to Georgetown, Murray Harbour, Charlottetown and Cape Traverse. Good wagon roads intersect each other everywhere, and nearly all the villages and country districts are connected by telephone. During spring, summer and autumn Charlottetown has daily communication with Pictou in Nova Scotia and Shediac in New Brunswick, and a frequent service to other ports in Nova Scotia, Newfoundland and Massachusetts. The harbour of Charlottetown and the Northumberland Straits are closed by ice from about the middle of December to the beginning of April, after which there is a service by specially constructed ice-breaking boats between Georgetown and Pictou. The ice is often too thick to make a regular service possible, and the island has long agitated for federal construction of a railway tunnel between Cape Traverse in Prince Edward Island and the neighbouring shore of Newfoundland, to which the efforts of the province were directed to the efforts to colonize it. In 1719 it was granted, en franc alleu noble, to the count of St Pierre, who tried to establish fisheries and a trading company. He spent large sums on his enterprise, but the scheme proved unsuccessful and his grant was revoked. In 1758, soon after the capture of Louisbourg, Isle St Jean was occupied by a British force under Lord Rollo (see Annual Register, 1758). Its population at this time numbered about 4000, under a military governor with his headquarters at Port la Joie (Charlottetown). After its final cession to Great Britain in 1763 it was placed under the administration of Nova Scotia, but later was made a separate government, its first parliament meeting in 1773.

In 1764-1765 it was surveyed, and most of the present names given; in 1767 it was divided into townships of about 20,000 acres each, grants of which were made to individuals with claims on the government. They were to pay a small sum as quit rents, and the conditions imposed provided for the establishment of churches and wharves and bona-fide settlement. On these terms practically the whole island was granted away in a single day. The grantees were in most cases mere speculators, and the island fell into the hands of a large number of non-residents. A continual agitation against the absences was kept up by the settlers, who rapidly increased in numbers. During the early
19th century many Scottish immigrants settled in the island. A
commission appointed in 1860 advised the compulsory purchase
of the lands, and their sale in smaller holdings to genuine settlers,
but a bill passed with this intent was disallowed by the imperial
authorities.

In 1864 a conference to consider the question of maritime
union met at Charlottetown. The visit of delegates from Canada
widened it into a general conference on federation, from which
sprang the Dominion of Canada. Prince Edward Island’s local
patriotism forced its representatives to withdraw from the later
conferences, but the abrogation in 1866 by the United States
of the Reciprocity Treaty of 1854, financial difficulties connected
with the building of an island railway, and the offer of better
terms by the Dominion government, brought it into federation
in 1873. A bill on the lines of that formerly disallowed was soon
afterwards passed, and the land difficulty was finally settled.
Since then the main political issues have been the quarrel with
the federal government over the construction of a tunnel and
the control of the liquor traffic, which has been prohibited but
by no means suppressed.

PRINCES’ ISLANDS (anc. Demonesi; Byzantine, Panmodonisia;
Turkish, Kizil Adalar, or “ Red Islands,” from the ruddy colour
of the rocks), a cluster of nine islands in the Sea of Marmora,
forming a caza of the prefecture of Constantinople. They figure
in Byzantine history chiefly as places of banishment. A convent
in Prinkipo (now a mass of ruins at the spot called Kamares)
was a place of exile for the empress Irene, Euphrosyne, Zoe
and Anna Dalassena. Antigone was the prison of the patriarch
Methodius, and its chapel is said to have been built by the
empress Theodora. In Khalki the monastery of the Theokotou
(originally of St John), which since 1831 has been a Greek
commercial school, was probably founded by John VI. or VII.
Palaeologus, was rebuilt about 1680, and again in the 18th
century by Alexander Ypsilanti, hospodar of Moldavia. Close
beside it is the tomb of Edward Barton, second English
ambassador to the Porte. Hagia Trias (a school of theology
since 1844) was rebuilt by the patriarch Metropbanes. On Prin-
to were the monasteries to which Bardanes (Philippicus), Michael I.
Rhabdomarion, and Ieronima, nuns of Mount Athos, were
confined. Digenes was banished. The islands are a favourite summer resort; four
are inhabited and noted for the mildness and salubrity of their
climate. Prinkipo (Pityusa), altitude 655 ft.; Khalki (Chalceis;
Turkish Hebel), 445 ft.; Prute (Turkish Kinali), 375 ft.; and
Antigone (Panormus; Turkish Burgas Adasi), 500 ft. The
buildings on all the islands were injured by the earthquake
of 1894, especially the naval college, and monastery of St George
on Khalki, and the monastery of Christ on Prinkipo. The
population is about 10,500, half being Greek. Khalki contains
an Ottoman naval school and Greek theological and commercial
colleges.

See G. Schlumberger, Les îles des Princes (Paris, 1884); A. Grise-
bach, Rumeinien und Brussa (Göttingen, 1839).

PRINCETON, a city and the county-seat of Gibson county,
Indiana, U.S.A., about 27 m. N. of Evansville. Pop. (1900),
6041, 628 being of negro descent and 198 foreign-born; (1910)
6443. It is served by the Evansville & Terre Haute and the
Southern railways (the latter of which has shops here), and by the
Evansville & Southern Indiana traction line (electric). It has
a considerable trade in oil and coal and in the agricultural
products of the surrounding region, and has various manufactures.
Princeton was first settled in 1814, and was chartered as a city
in 1884.

PRINCETON, a borough of Mercer county, New Jersey, on
Stony Brook, and the Delaware & Raritan canal, 49 m. S.W.
of New York City. Pop. (1900) 6209; (1910) 5136. Princeton
is served by the Pennsylvania railroad, and by two electric lines
to Trenton (10 m.), passing through Lawweeville (in Lawrence
township; until 1816 called Maidenhead; pop., 2525 in 1910),
the seat of the Lawweeville school (1882), for boys, which was
endowed by the residuary legates of John Cleve Green (1800-
1875), and is probably the first endowed secondary school for
boys in the Middle States.

Princeton is situated 210 ft. above sea-level, and the county
to the east, north and west is rocky and hilly. The borough
is the seat of Princeton University (q.v.), and of The Theolo-
ical Seminary of the Presbyterian Church in the United States
of America, and of the Princeton Theological Semi-
nary, which was opened in 1812, and was chartered in 1824.
The seminary was for one year under the sole care of Archibald
Alexander (q.v.), and among its teachers and representative
theologians have been Samuel Miller (1769-1850), who was
professor of ecclesiastical history and church government here
(1813-1849), Charles Hodge, Joseph Addison Alexander and
James Waddell Alexander, William Henry Green, Archibald
Alexander Hodge, Francis L. Patton, who became president in 1902
and Benjamin B. Warfield (b. 1851), professor of didactic
and polemic theology from 1887. Under such leaders Princeton
theological seminary has been distinguished for observing the
standards of the Westminster Confession and Catechisms.
The seminary is well endowed, so that there is no charge for tuition
or room rent; among its principal benefactors were James Lenox
(1800-1880), Robert Leighton Stuart (1806-1882), his widow
and his brother Alexander (1810-1879), John Cleve Green, men-
tioned above, and Mrs Mary J. Winthrop (d. 1902). It has
a fine campus south-west of the business centre of the borough;
in the Lenox Library and the Lenox Reference Library, built
in 1843 and 1879 respectively, and gifts of James Lenox, there
were 82,000 bound volumes and 31,000 pamphlets in 1909;
Stuart Hall (1876) contains lecture-rooms; Miller Chapel is the
place of worship; and the three dormitories are Alexander Hall
(the “ Old Seminary”), first used for this purpose in 1817, Brown
Hall, built in 1864-1865, and Hodge Hall (1893). In 1908–
1909 the faculty numbered 16 and the students 153, of whom 8
were fellows and 17 graduate students.

Princeton began in 1897 the home of Grover Cleveland, who
died there; and from 1898 until his death it was the residence
of Laurence Hutton (1843-1924), a well-known writer on
the history of the stage. Besides its fine residences and buildings
of the seminary and of the university, the only notable buildings
are the handsome Princeton Inn, about midway between the
campus of the university and that of the seminary, and “ Mor-
ven,” the homestead of the Stocktons, built in the first
decade of the 18th century. In the Princeton Cemetery are buried
presidents and professors of the university.

The first settlers were the companions of Richard Stockton,
the grandfather of Richard Stockton, signer of the Declaration
of Independence. The removal hither in 1756 from Newark
of the College of New Jersey, later Princeton University, gave
the place its first educational prominence. At the time of the
War of Independence town and gown were both strongly
patriotic. The first state legislature of New Jersey met here
on 29th May, 1776. The following year, on 27th June, 1777,
 ten college buildings, erected in 1754-1756, which was then the largest
edifice in the colonies, the Continental Congress sat from the
30th of June to the 4th of November 1783, and on the 31st of
October Congress received the news of the signature of the
definitive treaty of peace with Great Britain. After the battle
of Trenton Cornwallis’s troops were hurried to that place, three
regiments and three companies of light-horse being left at Prin-
ceton when the main body, on the 2nd of January 1777, passed
through. Washington, unable to retreat or to meet the British
attack, turned Cornwallis’s left flank and advanced on the
weak British garrison in Princeton. A detachment under General
Hugh Mercer (5. 1729-87), ordered to destroy the Stony Brook
bridge, and so cut off escape to Trenton, met two of the three
regiments, led by Liet.-Colonel Charles Mason, near the bridge,
and, though doing great execution with its rifles at a distance,
was unable, being unequipped with bayonets, to hold its ground.
in hand-to-hand fighting, and fled through an orchard, leaving Mercer there mortally wounded; he died on the 13th in a farmhouse about a mile and a half north of the battlefield. Washington's main army now came to the assistance of the retreating Americans, and forced the retreat of the other British regiments (the 55th and 40th) to Princeton, where they either surrendered or fled towards New Brunswick. The British losses were heavy and the Americans lost many officers. The bridge was destroyed by the American troops just before the approach of General Alexander Leslie (c. 1740–1794) with reinforcements from Cornwallis. Washington's flank movement at Trenton and his engagement with the British at Princeton made necessary the withdrawal of the British from New Jersey. In the autumn of 1776 Washington summoned to Princeton by Congress, then in session there, made his headquarters at Rocky Hill, about 4 m. north of Nassau Hall in Montgomery township, Somerset county, whence on the 2nd of November he issued his farewell address to the army; his headquarters is preserved as a museum. A battle monument in Princeton, designed by MacMonnies and paid for by the Federal Congress, the state of New Jersey and the borough of Princeton, has been projected.

PRINCETON UNIVERSITY, an American institution of higher learning in Princeton, New Jersey, until 1896 called officially the college of New Jersey. Its campus consists of 359 acres comprised in three tracts of ground adjoining each other. The main campus, one of the most beautiful in the country, is on the south side of Nassau Street, the old country road between Philadelphia and New York, and is principally contained in a block of about 225 acres, which on its west side has an almost continuous row of English collegiate Gothic buildings, starting in the Sacred Quadrangle of the university.

Nassau Hall, which was built in 1756, nearly destroyed by fire in 1802, rebuilt in 1804, and damaged by fire in 1855, is a squarely built edifice in the Georgian style. Originally housing the whole college, it is familiarly known as North College, in a quadrangle arrangement of which West College, built in 1836, is the only other remainder; the south side having been occupied since 1838 by Clio Hall and Whig Hall, the homes of the two literary societies, founded respectively in 1765 and 1769, and since 1803 housed in white marble buildings of classical type; and East College, having given place to the main building of the University Library (1836), Lord Corinthian, L. L. Witherspoon, the gift of Mrs Percy Rivington Pyne. Besides West College, the dormitories are Reunion Hall (1879), commemorating the reconstitution of the Old and New schools of the Presbyterian Church; University Hall (1876), formerly an hotel and now housing on its lower floors the university dining halls for all freshmen and sophomores; Witherspoon Hall (1877), in Victorian Gothic of grey stone trimmed with brown; Edwards Hall (1880), a brown stone Gothic building; Albert B. Dod Hall (1890), a granite limestone-trimmed Italian building; David Brown Hall (1891), granite and Pompeian brick, in Florentine Renaissance; the Pye Buildings (1866) in half-timbered Cheshire style; Blair Hall (1897), built in English Collegiate Gothic of white Germantown stone, on the south-western margin of the campus; the Stafford Little Hall (1898 and 1901), in the same style as Blair Hall, and joining it on the south; Seventy-nine Hall (1904), the gift of the class of 1879, another Tudor Gothic building of red brick trimmed with Indiana limestone; and Patton Hall (1906); Campbell Hall (1906), the gift of the class of 1877; and a new group of buildings, chiefly dormitories, occupying the entire north-western corner of the main campus, fronting on Nassau and University Place, three sections of which (two being the gift of Mrs Russell Sage) were completed in 1900, are built in a picturesque Dutch style and of the same materials as Blair and Little Halls. There is accommodation for about 90% of the undergraduates of the university in the campus dormitories, including the new buildings.

The recitation halls are: Dickinson (1870; remodelled in 1876) and McCosh Hall (1902), for the academic department; and the school of science building (1873), a gift of John C. Green, on the north-east corner of the main block of the campus. The Halsted Observatory (1886) and the Observatory of Instruction (1878) are well known for the work done in them by the astronomer Charles Augustus Young (1834–1908); although the laboratories are the biological (1887), the chemical (1891), the civil engineering (1904), the Palmer physical (1898), and, for natural science, Guyot Hall (1900), which also houses the natural history museum, containing thousands of fossils in the form of museum of historic art (1887) which includes the finds of the Princeton archaeological expedition to Syria, and in Nassau Hall there is a psychological laboratory. There are two auditoriums, the Marquand chapel (1881), the gift of Henry G. Marquand, and Alexander Hall (1892), used for commencement exercises. Also on the campus are the dean's house (1756), until 1878 the president's residence; Prospect Hall, bought by the college in 1875, which is the president's residence; the university offices (1803); and Dodge Hall (1899) and Murray Hall (1879), which are the home of the college Y.M.C.A., the Princeton Society of Artists, and the Theta Chi fraternity.

The university library is housed in a large building already described, built (1896) on to the Chancellor Green library building (1872), given by John C. Green in memory of his brother Henry Woodhull Green, chancellor of the state of New Jersey, and now the reading room and reference library. In 1910 the library had a collection of 257,800 volumes and about 58,000 unbound pamphlets. There are two athletic fields: one, the university, two blocks east of the main campus, and the other, the Brokaw field, in the south-west corner of the main campus; immediately north of the latter are the Brokaw Memorial gateway and building (1892), with swimming-pool, and the Brokaw Hall of Science. South of the university, the Campus is Lake Carnegie, an artificial widening of Millstone River, the gift of Andrew Carnegie; it is used for boating.

A notable feature of the university is its upper-class club-houses. The upper-class clubs have in the social life of Princeton somewhat the place of the Greek letter societies elsewhere. There are no fraternities at Princeton: each entering student pledges himself "to have no connexion whatever with any secret society, nor be present at the meetings of any secret society so long as he is a member of the university," it being understood that this promise has no reference to the American Whig and Cliosophic societies. These two societies, the object of which is particularly to cultivate skill in debate and public speaking, are affiliated with the English department of the faculty.

A peculiarity of the university is its system of student government, which is most markedly developed in the Princeton "honour system" in examinations and written recitations, under which every student signs a pledge on his paper that he has "neither given nor received assistance," and there is no faculty or monitorial watch over students in examinations; the system is administered by a student committee, to which any dishonesty in examinations is to be reported, and which then investigates the charge, and if it finds it true reports the offender to the faculty for dismissal.

The university in 1910 included an academic department, leading to the degree of A.B., or Litt. B., the John C. Green school of science (1873), offering courses leading to the degrees of B.S. and B.C.E.; a school of electrical engineering; and a graduate department (1877), with courses leading to master's and doctor's degrees. Entrance requirements are largely in accordance with the recommendations of the National Educational Association and the college entrance examination board; students entering the academic department must offer Greek if they are candidates for the degree of A.B. (students not concentrating for Greek entrance who concentrate in mathematics or science in junior and senior year are candidates for the B.S. degree, and those who concentrate in other departments during those years, for the Litt. B. degree). The entrance requirements for B.S. and B.C.E. degrees are: they must have passed from those for the A.B. degree (and agree with those for the C.E. degree) in including more mathematics, i.e. solid geometry and plane trigonometry. The school of electrical engineering is graduate and professional in its character, the graduate curriculum slightly developed, and this development has been almost entirely since 1900: a bequest of more than $300,000 in 1906 provided for the John R. Thomson Graduate College; and the estate of Isaac Chasney Wyman (d. 1910), of the class of 1848, valued at about
PRINCIPAL—PRINCIPAL AND AGENT

$3,000,000, was left to the university for the establishment of the graduate school.

A notable feature of the scheme of instruction in the preceptorial (now the tutorial) system introduced in 1746, it somewhat resembles Jowett's method at Balliol College, Oxford; the preceptors, usually young men (many of them domiciled in the dormitories), have "conferences" each with a certain number of students on prescribed reading, especially in the departments of philosophy, history and politics, art and archaeology, and the languages. The preceptorial system has been a great success, and seems to have given the university a larger measure of vitality than in 1719-1720. The university faculty numbered 169, of whom 51 were preceptors. In the same year there were 1400 students of whom 134 were in the graduate school, 13 in the school of electrical engineering, 521 in the A.B. courses, and 203 in the B.S. courses, 293 in the C.E. course, and 89 not in regular courses.

The corporate title of the university is "The Trustees of Princeton University," and the university is governed by the trustees, of whom the governor is the president. The New Jersey Synod was the official body, and the president of the university is president of the board in the absence of the governor. The Board consists of twenty-five "life trustees," a self-perpetuating body, two ex officio trustees, and (since 1840) five alumni trustees, elected by the graduates of the university for a five-year term, one each year.

The tuition fee is $160 a year in all undergraduate courses. There are many scholarships and prizes, a fund for the remission of tuition to students of insufficient means, and funds for the assistance of students for the ministry. In July 1909 the assets of the university were $4,739,482, of which $4,168,900 was invested for endowment; of this amount $740,000 was a gift of the city of Princeton, $122,643 was for scholarships and $244,903 was for professors' salaries; and in this fiscal year the gifts for current expenses and special purposes amounted to $199,294 and the gifts for endowment to $1,508,883.

The university owes its origin to a movement set on foot by the Synod of Philadelphia in 1739 to establish in the Middle Colonies a college to rank with Harvard and Yale in New England and William and Mary in Virginia. Owing to disension in the Church, no progress was made until 1746, when the plan was again broached by the Synod of New York, recently formed by the secession of the presbytery of New York and the presbytery of New Brunswick, radical (New School) presbyteries of the Synod of Philadelphia. The Synod of New York was led by Ebenezer Pemberton (1704-1779), a graduate of Harvard (1721), and Jonathan Dickinson (1688-1747), a graduate of Yale (1706). Together they had attempted to make peace between the conservatism of the presbytery of Philadelphia and the radicalism of the presbytery of New Brunswick. Most of the leading men of the presbytery of New Brunswick, with the exception of the Log College, a school with restricted curriculum, situated about 20 m. N.E. of Philadelphia, but recently closed. The students of the Log College were almost without exception preparing for the Presbyterian ministry, and on the closing of the Log College, the opportunity was taken by the synod of New York to found a larger and better institution of higher learning, broader in scope and training, and to transfer to the new project the Log College interests. On October 22nd 1746, John Hamilton, acting governor of New Jersey, granted a charter for erecting a college in New Jersey. The college of New Jersey was opened in May 1747 at Elizabeth, New Jersey, with the Rev. Jonathan Dickinson as president. This was accomplished until 1748, when, on the 14th of September, a second charter was granted to the "trustees of the College of New Jersey," thirteen in number. The college under the administration of Jonathan Dickinson, held its exercises from the last of May 1747 to the 7th of October 1747, when Dickinson died. Upon the succession of Aaron Burr to the presidency, the school removed to Newark, where the first commencement was held in 1748 and where Burr began the work of organizing the college and its curriculum; but the situation was unsuitable, and in 1752 the trustees voted to remove the college to Princeton, where land was given for the Campus by Nathaniel F. Randolph. While funds were being collected in Great Britain, work was begun in Princeton in 1754 on the first college building, which, at Governor Belcher's request, was named Nassau Hall, in honour of King William. A year after the completion of this single college building and the removal of the students to Princeton, Burr died and was succeeded by his father-in-law, Jonathan Edwards, who died after five weeks in office (1758). He was succeeded (1759-1761) by Samuel Davies, and Davies (1761-1766) by Samuel Finley (1715-1766). John Witherspoon (q.v.) was president from 1768 until his death in 1794, and more than any of his predecessors influenced the college. The presidents immediately succeeding Witherspoon were: his son-in-law, Samuel Stanhope Smith (1750-1810), who resigned in 1812; Ashbel Green (1726-1848), who resigned in 1822; James Carnahan (1775-1859), who held office for thirty-one years (1833-1864), and in whose presidency there was, in 1848-1852, a department of law in the college; and John Maclean (1800-1866), who was president from 1854 to 1868. Up to the outbreak of the Civil War, the college was largely attended by Southerners, and the Civil War thus dealt it a doubly heavy blow, from which it began to recover under the long presidency (1868-1888) of James McCosh, who, like his successor, Francis Landey Patton (q.v.), president from 1888 to 1902, greatly advanced the material welfare of the college. Fourteen new buildings were erected during Dr McCosh's administration, and the John C. Green School of Science was established in 1873 by the gift of John Cleve Green; and during Dr Patton's administration the enrolment of students more than doubled, as did the number of members of the faculty. In October 1886, on the 150th anniversary of its founding, the official name of the College of New Jersey, long popularly displaced by Princeton, was dropped, and the corporation became the "Trustees of Princeton University," although the institution did not become, in the usual American use of the term, a university, having no professional schools whatever, and only a small post graduate department. On Dr Patton's resignation in 1902 he was succeeded by Woodrow Wilson (q.v.), the first layman to become president, who introduced the preceptorial system already described.

PRINCIPAL, a person or thing first, or chief in rank or importance, or, more widely, prominent, leading. The Lat. adj. principalis, first, chief, original, also princely, is formed from principecs, the first, chief, prince, from primus, first, and capere to hold. In Late Lat. principalis was used as a substitute for an overseer or superintendent, and also for the chief magistrate of a municipality (Symmachus, Ep. 9, 1). It is a common title for the head of educational institutions, universities, colleges and schools. It is thus used by the director of some of the heads of newer universities in England, e.g. London and Bir- mingham, and is frequently combined with the vice-chancellorship. At the university of Oxford, the name occurs twice as the title of the head of a college, viz. Brasenose and Jesus. It was always used of the heads of halls, of which St Edmund Hall alone remains. It is also the designation used of the head of the newer theological or denominational colleges, and also of the women's colleges. At Cambridge it does not occur. In law, it is used in distinction from "accessory," for the person who actually commits the crime, "principal in the first degree," or who is present, aiding and abetting at the commission of the crime, "principal in the second degree," and also for the person for whom another acts by authority (see PRINCIPAL AND AGENT below). Finally as a shortened form of "principal sum" "principal money," &c., the term is used of the original sum lent or invested upon which interest is paid, and so, widely of any capital sum, as opposed to interest or income derived from it.

PRINCIPAL AND AGENT. In law an agent is a person authorized to do some act or acts in the name of another, who is called his principal. The law regulating the relations of principal and agent has its origin in the law of mandate among the Romans, and in England the spirit of that system of jurisprudence pervades this branch of the law. The law of agency is thus almost alike throughout the whole British Empire, and a branch of the British commercial code, in which it is of great importance that different nations should understand each other's system, differs only slightly from the law of the rest of Europe.

In a general view of the law of agency it is necessary to have regard to the rights and duties of the principal, the agent, and the public. The agent should not do what he has no authority
for; yet if he be seen to have authority, those with whom he deals should not be injured by secret and unusual conditions. The employer is bound by what his agent does in his name, but the public are not entitled to take advantage of obligations which are known to be unauthorized and unusual. The agent is entitled to demand performance by the principal of the obligations undertaken by him within the bounds of his commission, but he is not entitled to pledge him with a recklessness which he would certainly avoid in the management of his own affairs.

It is in the regulation of these powers and corresponding checks in such a manner that the legal principle shall apply to daily practice, that the niceties of this branch of the law do not fall.

Agents are of different kinds, according to their stipulated or consuetudinary powers. The main restraint in the possible powers of an agent is in the old maxim, *delegatus non potest delegare*, designed to check the complexity that might be created by inquiries into repeatedly-deputed responsibility. The agent cannot delegate his commission or put another in his place; but in practice this principle is sometimes modified, for it so may arise from the nature of his office that he is to employ other persons for the accomplishment of certain objects. Thus, there is nothing to prevent a commercial agent from sending a portion of the goods entrusted by him to his own agent for sale.

In the general case agency is constituted by the acceptance of the mandate or authority to act for the principal, and the evidence of this may be either verbal or in writing. The English statute of frauds requires an agent to have authority in writing for the purposes of its 1st, 2nd and 3rd clauses relating to leases. "And it is a general rule, that an agent who has to execute a deed, or to take or give livery or seisin, must be appointed by deed for that purpose. Moreover, as a corporation aggregate can in general act only by deed, its agent must be so appointed, though it would seem that some trivial agencies, even for corporations, may be appointed without one." (Smith's *Mercantile Law, 8th ed.*, &c.; also Smith's *Mercantile Law (11th ed., 1905); Bowstead, *On Agency* (4th ed., 1909).)

PRINGLE, SIR JOHN (1707–1782), British physician, was the younger son of Sir John Pringle, of Stitchel, Roxburghshire, and was born on the 10th of April 1707. He was educated at St Andrews, at Edinburgh, and at Leiden. He took the degree of doctor of physic at the last-named university, where he was an intimate friend of G. van Swieten and A. von Haller. He settled in Edinburgh as first as a physician, but after 1734 also acted as professor of moral philosophy in the university. In 1742 he became physician to the earl of Stair, then commanding the British army in Flanders, and in 1744 was appointed by the duke of Cumberland physician-general to the forces in the Low Countries. In 1749, having settled in London, he was made physician in ordinary to the duke of Cumberland; and in 1752 he married a daughter of Dr William Oliver (1695–1764) of Bath, the inventor of "Bath Oliver" biscuits. Subsequently he received other court appointments as physician, and in 1766 was made a baronet. His first book, *Observations on the Nature and Cure of Hospital and Civil Fevers*, was published in 1750, and in the same year he contributed to the *Philosophical Transactions* of the Royal Society three papers on "Experiments on Septic and Antiseptic Substances," which gained him the Copley medal. Two years later he published his important work, *Observations on the Diseases of the Army in Camp and Garrison*, which entitles him to be regarded as the founder of modern military medicine. In November 1772 he was elected president of the Royal Society. In this capacity he delivered six "discourses," which were afterwards collected into a single volume (1783). After passing his seventieth year he resigned his presidency and removed to Edinburgh in 1780, but returned to London in September 1781, and died on the 18th of January following. There is a monument to him in Westminster Abbey, executed by Nollekens.

The obligations of the principal are: to pay the agent's renumeration, or, as it is often called, *commission*, the amount of which is fixed by contract or the usage of trade; to pay all advances made by the agent in the regular course of his employment; and to honour the obligations lawfully undertaken for him. The agent is responsible for the possession of his principal's goods under all circumstances and in any form in which he undertakes. He must devote to the interests of his employer such care and attention as a man of ordinary prudence bestows on his own—a duty capable of no more certain definition, the application of it as a fixed rule being the function of a jury. He is bound to observe the strictest good faith; and the law even interposes to remove him from temptation to sacrifice his employer's interests to his own (see Commission: Secret). Thus, when he is employed to buy, he must not be the seller. When an agent is employed to sell, he must not be the purchaser. He ought only to deal with persons in good credit, but he is not responsible for their absolute solvency unless he guarantee them. A mercantile agent guaranteeing the payments he treats for is said to hold a *del credere* commission.
A Life of Pringle by Andrew Kippis is prefixed to the volume containing the "Six Discourses." The library of the College of Physicians of Edinburgh possesses ten folio volumes of his unedited MSS, including an essay "On Air, Climate, Diet and Exercise." There are "Elegies on him" by Vicez d'Azur and Condorcet.

**PRINGSHEIM, NATHANIEL** (1823-1864), German botanist, was born at Wiesko in Silesia, on the 30th of November 1823. He studied at the universities of Breslau, Leipzig, and Berlin successively. He graduated in 1848 as doctor of philosophy with the thesis "De forma et incremento strumarum crustarum in plantarum cellula," and rapidly became a leader in the great botanical renaissance of the 19th century. His contributions to scientific algiology were of striking interest. Pringsheim was among the very first to demonstrate the occurrence of a sexual process in this class of plants, and he drew from his observations weighty conclusions as to the nature of sexuality. Together with the French investigators G. Thuret and E. Borne, Pringsheim ranks as the founder of our scientific knowledge of the algae. Among his researches in this field may be mentioned those on *Vesicularia* (1855), the Oedogoniaceae (1855-1858), the Coleochaetaceae (1860), *Hydrodictyon* (1861), and *Pandorium* (1869); the last-mentioned memoir bore the title Beobachtungen über die Paarung de Zoosporen. This was a discovery of fundamental importance; the conjugation of zoospores was regarded by Pringsheim, with good reason, as the primitive form of sexual reproduction. A work on the course of morphological differentiation in the Sphacelariaeae (1873), a family of marine algae, is of great interest, inasmuch as it treats of evolutionary questions; the author's point of view is that of Naegeli rather than Darwin. Closely connected with Pringsheim's algalogical work was his long-continued investigation of the Saprolegniaceae, a family of algaeodium, some of which have become notorious as the causes of disease in fish. Among his contributions to our knowledge of the higher plants, his exhaustive monograph on the curious genus of water-ferns, *Savinia*, deserves special mention. His career as a morphologist culminated in 1876 with the publication of a memoir on the alternation of generations in thalliches and mosses. From 1874 to the close of his life Pringsheim's activity was chiefly directed to physiological questions: he published, in a long series of memoirs, a theory of the carbon-assimilation of green plants, the central point of which is the conception of the chlorophyll-pigment as a screen, with the main function of protecting the protoplasm from light-rays which would neutralize its assimilative activity by stimulating too active respiration. This view has not been accepted as offering an adequate explanation of the phenomena. Pringsheim founded in 1858, and edited till his death, the classical *Jahrbuch für wissenschaftliche Botanik*, which still bears his name. He was also founder, in 1883, and first president, of the German Botanical Society. His work was for the most part carried on in his private laboratory in Berlin; he only held a teaching post of importance for four years, 1864-1868, when he was professor at Jena. In early life he was a keen politician on the Liberal side. He died in Berlin on the 6th of October 1890.

A fuller account of Pringsheim's career will be found in Nature, (1895) vol. li., and in the *Berichte der deutschen botanischen Gesellschaft*, (1895) vol. xii. The latter is by his friend and colleague, Ferdinand Cohn. (D. H. S.)

**PRINSEP, JAMES** (1799-1840), Anglo-Indian scholar and antiquary, was born on the 20th of August 1799. In 1819 he was given an appointment in the Calcutta mint, where he was promoted to the position of assay-master, succeeding H. G. H. Wilson, whom he likewise succeeded as secretary of the Asiatic Society. Apart from architectural work (chiefly at Benares), his leisure was devoted to Indian inscriptions and numismatics, and he is remembered as the first to decipher and translate the rock edicts of Asoka. Returning to England in 1838 in broken health, he died in London on the 22nd of April 1840. Prinsep's Ghat, an archway on the bank of the Hugli, was erected to his memory by the citizens of Calcutta.

**PRINSEP, VALENTINE CAMERON** (1838-1904), English artist, was born on the 4th of February 1838. His father, Henry Thoby Prinsep, who was for sixteen years a member of the Council of India, had settled at Little Holland House, which became a centre of artistic activity. Henry Prinsep was an intimate friend of G. F. Watts, under whom his son first studied. Val Prinsep also worked in Paris in the atelier Gleyre; and "Taffy" in his friend Du Maurier's novel *Trilby*, is said to have been sketched from him. He was an intimate friend of Millais and Rossetti, and travelled in Italy. He had a share with Rossetti and others in the decoration of the hall of the Oxford Union. He first exhibited at the Royal Academy in 1862 with his "Bianca Capella," his first picture, which attracted marked notice, being a portrait (1866) of General Gordon in Chinese costume; the best of his later exhibits were "A Versailles," "The Emperor Theophilius chooses his Wife," "The Broken Idol" and "The Goose Girl." He was elected A.R.A. in 1879 and R.A. in 1894. In 1877 he went to India and painted a huge picture of the Delhi durbar, exhibited in 1886, and afterwards hung at Buckingham Palace. He married in 1884 Florence, daughter of the well-known collector, Frederick Leyland. Prinsep wrote two plays, *Caesar Dick* and *Monsieur le Duc*, produced at the Court and the St James's theatres respectively; two novels; and *Imperial India: an Artist's Journal* (1879). He was an enthusiastic volunteer, and one of the founders of the Artists' Corps. He died on the 11th of November 1904.

**PRINT,** the colloquial abbreviation used to describe printed cloths generally, though it is most commonly applied to the staple kinds of cotton goods. The word must be distinguished from "printer," which refers to the regular kinds of cotton cloths intended for printing. (See TEXTILE PRINTING.)

**PRINTING** (from Lat. *imprimere*, O. Fr. *empreindre*), the art or practice of transferring by pressure, letters, characters or designs upon paper or other impressions, usually by means of ink or oily pigment. As thus defined, it includes three entirely different processes: copperplate printing, lithographic or chemical stone-printing, and letterpress printing. The difference between the three lies in the nature or construction of the surface which is covered with the pigment and afterwards gives a reproduction in reverse on the material impressed. For the nature and method of preparing these surfaces see respectively ENGRAVING (and all its sciles), LITHOGRAPHY and PRINTING-press. In copperplate printing the whole of the plate is first inked, the flat surface is then cleaned, leaving ink in the incisions or trenches cut by the engraver, so that, when dampened paper is laid over the plate and pressure is brought to bear, the paper sinks into the incisions and takes up the ink, which makes an impression in line or lines on the paper. In lithographic printing the surface of the stone, which is practically level, is protected by dampening against taking the ink except where the design requires. In letterpress printing the printing surface is in relief, and alone receives the ink, the remainder being protected by its lower level. Before the invention of typogrophy, pages of books, or anything of a broadside nature, were printed from woodcuts, i.e., blocks cut with a knife on wood *plankwise*, as distinct from wood engravings which are cut with a burin on the *end grain*, a more modern innovation. These woodcuts, like the lithographic or engraved surface, served one definite purpose only, but in typography the types can be distributed and used again in other combinations.

The term "printing" is often used to include all the various processes that go to make the finished product; but in this article it is properly confined to "press-work," i.e., the work of the printing-press, by which the type is set to paper, or other printed article, when set up in type and ready to print, a surface to be actually impressed on the paper, is finally converted into the shape in which it is to be issued or published.

**History of Printing-press.**

Before dealing with modern machinery it will be necessary to consider the historical evolution of the printing-press, especially since the middle of the 19th century, from which point printing machinery has developed in a most remarkable manner.
It is not clear how the first printers struck off their copies, but without doubt Gutenberg did use at an early period in his career a mechanical press of some kind, which was constructed of wood. In fact he could not have produced his famous forty-two line Bible without such aid.

The earliest picture of a press shows roughly the construction to have been that of an upright frame, the power exerted by a movable handle, placed in a screw which was tightened up to secure the requisite impression, and was loosened again after the impression was obtained. The type pages were placed on a flat bed of solid wood or stone, and it was quite a labour to run this bed into its proper position under the hanging but fixed horizontal plane, called the platen, which gave the necessary impress when screwed down by the aid of the movable bar. This labour had to be repeated in order to release the printed sheet and before another copy could be struck off. This same press, with a few modifications, was apparently still in general use till the early part of the 17th century, when Willem Janszon Blaeu (1571–1638) of Amsterdam, who was appointed map maker to the Dutch Republic in 1633, made some substantial improvements in it. Our first authority on printing, Joseph Moxon, in his Mechanick Exercises, as Applied to the Art of Printing (vol. i., 1683), says, "There are two sorts of presses in use, viz. the old fashion and the new fashion," and he gives credit to Blaeu for the invention of the new and decidedly improved press (fig. 1).

Blaeu's improvement consisted of putting the spindle of the screw through a square block which was guided in the wooden frame, and from this block the platen was suspended by wires or cords. This block gave a more rigid platen, and at the same time ensured a more equal motion to the screw when actuated by the bar-handle. He also invented a device which allowed the bed on which the type pages were placed to run in and out more readily, thus reducing the great labour involved in that part of the work of the older form of press, and he also used a new kind of iron lever or handle to turn the screw which applied the necessary pressure. The value of these various improvements, which were in details rather than in principles, was speedily recognized, and the press was introduced into England and became known as the "new fashion."

From this it will be observed that in a general way there had only been two kinds of wooden presses in use for a period of no less than three hundred and fifty years, and when the work of some of the early printers is studied, it is marvellous how often good results were obtained from such crude appliances.

The iron press (fig. 2) invented by Charles, 3rd earl Stanhope (1755–1816), at the end of the 18th century was a decided advance on those made of wood. Greater power was obtained at a smaller expenditure of labour, and it allowed of larger and heavier surfaces being printed. The chief points of the iron press consisted of an improved application of the power to the spindle. The main part of it was the upright frame or staple, of iron; the feet of this staple rested upon two pieces of substantial timber dovetailed into a cross, which formed a base or foundation for the complete press to stand upon. The staple was united at the top and bottom, but the neck and body were left open, the former for the mechanism and the latter for the platen and the bed when run in preparatory to taking the impression. The upper part of the staple, called the nut, answered the same purpose as the head in the older kind of wooden press, and was in fact a box with a female screw in which the screw of the spindle worked. The lower portion of the neck was occupied by a piston and cup, in and on which the toe of the spindle worked. On the near side of the staple was a vertical pillar, termed the arbor, the lower end of which was inserted into the staple at the top of the shoulder—the upper end passing through a top-plate, which being screwed on to the upper part of the staple held it firmly. The extreme upper end of the arbor, which was hexagonal, received a head, which was really a lever of some length; this head was connected by a coupling-bar to a similar lever or head, into which the upper end of the spindle was inserted. The bar by which the power was applied by the pressman was fixed into the arbor, and not into the spindle, so that the lever was the whole width of the press, instead of half, as in Blaeu's wooden press, and it was better placed for the application of the worker's strength. There was also another lever to the arbor head in addition to that of the spindle head; and lastly, the screw itself was so enlarged that it greatly increased the power. The platen was screwed on to the under surface of the spindle; the table or bed had slides underneath which moved in, and not on, ribs as in the older form of press, and was run in and out by means of strips of webbing fastened to each end and passed round a drum or wheel. As the platen was very heavy the operator was assisted in raising it from the type-forme, by a balance weight suspended upon a hooked lever at the back of the press. This somewhat counterbalanced the weight of the platen, raised it after the impression had been taken, and brought the bar-handle back again to its original position, ready for another pull.

The Stanhope press, which is still in use, was soon followed by other hand-presses made of iron, with varying changes of details. The most successful of these were the Albion and Columbian presses, the former of English manufacture, and the latter invented (1816) by an American, George Clymer (1754–1834), of Philadelphia.

The Albion press (fig. 3), which was designed by Richard Whittaker Cope, was afterwards much improved upon by John Hopkinson (1849–1868). It is still used where hand printing prevails, and it was this form of press which was employed by William Morris at his famous, but short-lived, Kelmscott Press.
in the production of many sumptuous books, the most celebrated of which was the *Chaucer*, a large folio volume, illustrated by Sir Edward Burne-Jones. The chief characteristics of the Albion are its lightness of build and its ease in running; the pull is short, the power great, and the means whereby it is attained so simple that the press does not readily get out of order. It is easily taken to pieces for cleaning, and readily re-erected. The power is obtained by pulling the bar-handle across, which causes the type surface with a roller which carries just sufficient ink properly distributed to preserve uniformity of "colour."

Having dealt with hand-presses, we must now go back to the end of the 18th century, when the first experiments were made to devise some mechanical means of producing larger printed sheets, and at a quicker rate. In England the broad distinction between "presses" and "machines" is generally considered to rest in the fact that the former are worked by hand, and the latter by steam, gas or electricity; and the men who work by these two methods are called respectively "pressmen" and "machine minders" or "machine managers." But in America the terms "presses" and "pressmen" are universally applied to machines and the men who operate them. For the purposes of this article presses and machines are used as synonymous terms.

Various schemes had been propounded with a view of increasing the output of the hand-press, and in 1790 William Nicholson (1755-1815) evolved his ideas on the subject, which were suggestions rather than definite inventions. Nicholson was not a printer, but, as he was an author and editor, it is presumed that he had some knowledge of printing. His proposals were to print from type placed either on a flat bed or a cylinder, and the impression was to be given by another cylinder covered with some suitable material, the paper being fed in between the type and the impression cylinder, and the ink applied by rollers covered with cloth or leather, or both. While Nicholson’s schemes did not bear any practical result they certainly helped others later on.

His suggestion to print from type made wedge-shaped (that is, small at the foot and wider at the top) allows of its being so fixed on a cylinder that it would radiate from the centre and thus present an even printing surface, was adopted later by Applegath and others, and really was the first conception of printing on the rotary principle which has now been brought to such perfection.

It was left to Friedrich König (1774-1853), a German, to produce the first really practical printing machine. His invention was to print type placed on a flat bed, the impression being given by a large cylinder, under which the type passed, but his inking appliances were not satisfactory. He induced the proprietor of *The Times* (London) to take two of these machines, and in 1814 that newspaper was printed with steam power at the rate of 1100 impressions per hour, a great advance on the number produced up to that time. Both Nicholson’s and König’s machines printed only one side at a time—the second or backing printing being a separate and distinct operation—but they really embodied the general principles on which all other machines have been constructed or modelled.

It will be understood that Nicholson’s theories were to print both from the flat and from type arranged in circular or cylinder form. These two principles are defined as reciprocating, for the flat bed which travels backwards and forwards; and rotary, for that which continuously revolves or rotates. König’s invention was a reciprocating one.

Two other classes of presses of somewhat different design were largely in operation in the middle of the 19th century— the "double platen," which still printed only one side at each impression from each end, and the "perfecting machine," which was made with two large cylinders and printed from two type-formes placed on separate beds. Although the latter machine turned out sheets printed on both sides before it delivered them (hence its name), the second impression was still a distinct operation. The double platen press was somewhat analogous to the hand-press, both the type beds and impressions being flat. A machine of this kind, if it printed a sheet of double demy, which measures 352 x 241 in., was about 13 ft. in length, and the platen itself, of very massive construction, was placed in the centre. This platen had a perpendicular motion, being guided in grooves and worked by a connecting rod fixed to a cross beam and crank, which acquired its motion from the main shaft. There were two type beds and two inking tables, which travelled backwards and forwards, and one platen only, situated in the middle of the machine,

![Fig. 3.—Payne & Sons' Albion Hand-press.](image-url)
which in turn gave the needful impression as the type-formes passed underneath. The sheet was laid or fed to certain marks between this frisket and tympan, and when these were closed together the carriage was propelled under the platen and the impression was given to that portion of the machine, while at the other end another sheet was being fed in ready to receive its impression in due course.

It was once thought that the finest work could not be produced by a cylinder impressing a surface in the progress of its reciprocating motion, but that it was likely to give a slurred or blurred impression. This is why machines of flat construction were so long employed for the best class of work. But cylinder presses are now made so truly turned, and geared to such nice motion, that they are no longer parlous. The cylinder press is able to produce generally quite as good work as the double platen, its speed is much greater, and it requires a smaller amount of power to drive it.

The perfecting machine has had a great vogue, and has been much improved from time to time, especially in America, though the two-revolution machine in recent years superseded it, whether temporarily or not being still uncertain. We shall deal with it more fully below in relation to the modern and more complicated class of machinery; and this also applies to the ordinary stop or single cylinder, and small platen machines, both of which have been in use many years, and are still in demand.

Before the general introduction of rotary machines which print from curved stereotype plates from an endless web or reel of paper (see below), several others of a revolving character were made, to some extent based on the principles of machines. Nicholson's ideas. The first printing surface used was ordinary type, because the difficulty of curving the stereotype plates had not been surmounted. This type was fixed, both in vertical and in perpendicular positions, upon a cylinder, round which rotated other cylinders, which held and compressed the sheets against the type, to which they were attached by a web of paper. These machines were made to print several sheets at a time, and were called four-, six-, eight- or ten-feeders, according to the number of sheets fed in and printed. They necessitated a great deal of labour, because each sheet required a separate layer-on and take-off besides the superintending printer, and other hands to carry away the sheets as fast as they accumulated at the different taking-off boards. Besides, these sheets all had to be folded by hand. In this class of machine various improvements were made from time to time by different manufacturers, each profiting by the experiences of the others, and thus all kinds of such revolving presses may now be given as examples.

After many experiments Augustus Applegath (1780-1871) in 1848 constructed for The Times (London), a machine which was an eight-feeder, built entirely on the cylindrical principle, the cylinders placed not in a horizontal but in a vertical position. The type was fixed on a large cylinder, and instead of the printing surface presenting a complete circle, the different columns were each arranged so as to form a polygon. Around this large type cylinder were eight smaller ones, all upright, for taking the impression for each of the eight sheets fed in separately, and rollers were so arranged as to apply the ink to the type as it passed alternately from one impression cylinder to the other. The sheets were laid in from eight different feed-boards, placed horizontally, and they passed through tapes, when they were seized by another series of tapes and then turned sideways between their corresponding impression and type cylinder, thus obtaining sheets printed on one side only. The impression cylinder then delivered the sheets separately (still in a vertical position) into the hands of the boys employed as takers-off. The results from this press were, at the time, considered fairly satisfactory, the number of copies (about 8000) printed per hour from one type column having been materially increased by the employing of the eight different stations to feed the sheets in, all of which in turn were printed from the same single type surface.

About 1845 Robert Hoe & Co. of New York, and subsequently of London, had constructed, to meet the increased demands of newspapers, the "Hoe Type Revolving Machine," one good point of which was an apparatus for securely fastening in the type on a large central cylinder fixed horizontally. This was accomplished by the construction of cast-iron beds, one for each separate page (not column, as in Applegath's machine). The column rules were made tapering towards the feet of the type, and the type was securely locked in on these beds so that it could be held firmly in the required position to form a complete circle, thus allowing the cylinder to revolve at a greater speed than Applegath's, which was polygonal. Around the large type cylinders were placed the smaller impression cylinders, the number of these being governed by the output required. Hoe's first presses were four-feeders, but as many as ten feeds were supplied, as in the case of the two presses built to replace the Applegath machine for The Times, each of which produced about 2000 impressions from each feed, making a total of 20,000 per hour, printed on one side, or from two machines 20,000 sheets printed on both sides. As will be observed, the only differences in principle between these two type revolving machines were in the positions of the respective cylinders, and the fixing of the type to form a printing surface.

It was Sir Rowland Hill (1795-1879), of England, who first suggested the possibilities of a press which should print both sides at once, from a roll or reel of paper. This was about 1825, but it was William A. Bullock (1813-1867) of Philadelphia who in 1865 invented the first machine to print from a continuous web of paper. This machine had two pairs of cylinders, that is, two type or stereotype cylinders, and two others which gave the impression as the web passed between. The second impression cylinder was made somewhat larger so as to give a greater tympan surface, to lessen the off-set from the side first printed. In his machine the stereotype plates were not made to fill the whole periphery of the forme cylinders so as to allow of the sheets being cut before printing, a step which was then found to be one which the public did not satisfy. Thus they came to pass. The sheets were severed by knives placed on the cylinders, and when cut were carried by grippers and tapes; and delivery was made by means of automatic metal fingers fixed upon endless belts at such distances apart as to seize each sheet in succession as it left the last printing cylinder. These presses were not at first reliable in working, especially in the cutting and delivery of the sheets after printing, but were finally so far improved that the Bullock press came into quite general use. The inventor was killed by being caught in the driving belt of one of his own presses.

Modern Presses.

The machines invented during the second half of the 19th century and still in general use, are best classified as follows:

1. The iron hand-press, such as the Albion or the Columbian, used for the pulling of proofs, or for the printing of limited éditions de luxe.
2. Small platen machines (worked by foot or power) used for the printing of cards, circulars and small jobbing or commercial work.
3. Single cylinder machines (in England generally called Wharfedales), usually built on the "stop" cylinder principle, and printing one side of the sheet only.
4. Perfecting machines, usually with two cylinders, and printing or "perfecting" both sides of a sheet before it leaves the machine, but with two distinct operations.
5. Two-revolution machines, which, although with but one cylinder, have largely superseded perfecting machines, as their output has been increased and the quality of their work compares favourably with that of the average two-cylinder.
6. Two-colour machines, usually made with one feed, that is, with only one cylinder, but with two printing surfaces, and two sets of inking apparatus one at each end of the machine. Occasionally these machines are made with two cylinders.
7. Rotary machines, printing from an endless web of paper from curved stereotype or electrotype plates, principally used

XXII. 12
for newspaper or periodical work. They are made to print upon a single reel, or upon two, four, six or even eight reels, in both single or double widths, i.e. two or four pages wide.

The hand-press has already been sufficiently described, and we may proceed to deal with the other classes.

The small but useful platen machine (fig. 4) is very largely employed in those printing-houses that make commercial work a specialty. The smaller machines can be worked with the foot, but if the establishment is equipped with power it is customary to gear them for driving. The larger machines require power. As its name implies, the type bed and impression platen are both flat surfaces as in the hand-press, but as they are self-inking and are easily driven, the average output is about 1000 copies per hour, and but one operator is required, whereas two men at a hand-press can produce only 250 copies in the same time. In design those platen presses usually consist of a square frame with a driving shaft fixed horizontally across the centre of it. This shaft is connected to a large fly-wheel which gives impetus to the press when started and assists in carrying over the impression when the platen is in contact with the printing surface. The type-forme is usually fixed in an almost vertical and stationary position, and it is the platen on which the sheet is laid which rises from the horizontal position to the vertical in order to give the necessary impact to produce a printed impression from the type-forme. Practically this platen is, as it were, hinged at the off side, nearest the type bed, and its rise and fall is effected by the use of two arms, one on each side of the platen, which derive an eccentric motion from the cams geared in connexion with the shaft. When the sheet is printed and the platen falls back to the horizontal the operator removes it with one hand and with the other lays on a fresh sheet. Generally the larger of these machines will print a sheet up to 21 x 16 in.

The modern single or "stop" cylinder, quite different in construction from the old single cylinder machines, largely succeeded the double platen machine. The principle of the stop cylinder was really a French invention, but it has been more commonly adopted in Great Britain, where the machines are known as "Wharfedale" (fig. 5). They are much used for the printing of books and commercial work. The average production is about 1000 copies per hour. The type bed travels with a reciprocating motion upon rollers or runners made of steel, the bed being driven by a simple crank motion, starting and stopping without much noise or vibration. All the running parts are made of hard steel. The cylinder is "stopped" by a cam motion while the bed is travelling backward, and during this interval the sheet to be printed is laid against the "marks," and the gripper closes on it before the cylinder is released, thus ensuring great accuracy of lay, and consequent good register. After the impression is made the sheet is seized by another set of fingers and transferred to a second and smaller cylinder over the larger one, and this smaller cylinder or drum delivers the sheet to the "flyer," or delivery apparatus, which in turn deposits it upon the table. The inking arrangements are usually very good, for, by a system of racks and cogs which may be regulated to a nicety, the necessary distribution of ink and rolling of the printing surface runs in gear with the travelling type bed or cylinder. All the accessories for inking are placed at the end of the machine, the ink itself being supplied from a drum, which can be so regulated by the keys attached to it as to let out the precise amount of pigment required. The ink passes to a small solid metal roller, and is then conveyed by a vibrating roller made of composition to a larger and hollow metal cylinder or drum which distributes the ink for the first time. This revolves with the run of the machine and at the same time has a slight reciprocating action which helps the distribution. A second vibrating composition roller conveys the ink from this drum to the distributing table or ink slab, on which other rollers, called distributors, still further thin out the ink. As the type bed travels, large composition rollers, placed near the cylinder, adjusted to the requisite pressure on the type, pick up the necessary amount of ink for each impression and convey it to the type as it passes under them. Usually three or four such rollers are required to ink the former cylinder.

The perfecting machine is so named because it produces sheets printed on both sides or, in technical language, "perfected." This operation is performed by two distinct printings. This class of machine has been in use a great many years, although both the stop-cylinder and the two-revolution press have to some extent superseded it. It is perhaps best adapted for the printing of newspapers or magazines having circulations that do not require rotary machines intended for long runs. Although some perfecting machines have been made with one cylinder only, which reverses itself on the old "tumbler" principle, they now are made with two cylinders, and it is with this class that we are particularly concerned. There are various makes of perfecting machines of which the Dryden & Foord is shown in fig. 6; among the most recent types is the Huber Perfecter.

Although the two-type beds have a reciprocating motion, as in the ordinary one-sided press, the two cylinders rotate towards each other. The frame of the machine, owing to the fact that it contains two carriages and a double inking apparatus, is long, the exact size depending on the size of the sheet to be printed. Close to the large cylinders are the inking rollers, which take the necessary amount of ink, each set from its own slab as it passes under, and these rollers convey the requisite ink to the printing surface as the forme-carriage runs under its own cylinder. The distinctive feature is the ingenious manner in which the sheets are printed first on one side, and then on the other. This is performed by carrying them over a series of smaller cylinders or drums, by means of tapes. The pile of sheets
that its rule bar will convey ~ much one a another This Dryden The descends gripper having machines taking perfecting drum, board in the the first impression cylinder, and under this, moving at the same speed as the cylinder, is the type bed containing the inner of broad tapes which lie on the laying-on board and are fastened to a small drum underneath it. This drum has a series of small cogs which move the web or tapes in the same direction. The sheet is laid to a back mark on the tapes, and is propelled between two rollers.

Fig. 6.—Dryden & Foord's Perfecting (two-cylinders) Machine.

forme already inked. The paper then receives its impression on the first side. In the older type of machine it is next led up to the right-hand one of the two reversing drums, which are placed above the large printing cylinders, and over which it passes with the printed side downwards. It is then brought under the second or left-hand drum, and so on to the other large impression cylinder, with the blank side of the sheet exposed to the type of the outer forme on the table underneath. Thus it will be seen that the sheet is reversed in its travel between the first and second large cylinders which give the impression. The sheet is then finally run out and delivered in the space between the two large cylinders, and laid on the delivery board—usually with the aid of flyers. In the more recent type of direct into the machine. Another variety employs grippers somewhat after the manner of the ordinary single cylinder. The Anglo-French perfecting machine is one of that class. As a rule most double-cylinder presses produce on an average about 1000 copies per hour, printed both sides.

The two-revolution machine is another one-cylinder machine built on the reciprocating principle. Its speed is greater than the stop cylinder (it may be geared to produce from 1500 to 2000 copies per hour, printed one side only). The Michle (fig. 7), which is of American design but now made also in Great Britain, is a good example of this kind of machine and is much used, especially for illustrated work. It has

Fig. 7.—The Michle Two-revolution Cylinder Machine.

perfecting machines the sheet is fed directly into grippers, change taking place when grippers on each cylinder meet, the outer forme grippers taking the sheet from the inner forme grippers.

This is a general description of the principles on which these machines are built, but, as in other classes, there are many variations in details. For example, there are the drop-bar, the web and the gripper methods of feeding these presses. In the first case a bar descends upon the paper after it is laid to point marks, and this bar, having a rotary motion, runs the sheet between a roller and a small drum into the machine. The web arrangement consists of a series of broad tapes which lie on the laying-on board and are fastened to a small drum underneath it. This drum has a series of small cogs which move the web or tapes in the same direction. The sheet is laid to a back mark on the tapes, and is propelled between two rollers.
always rotates in the same direction, and twice for each copy given, once for the actual impression, and again to allow of the return of the forme-carriage in its reciprocating action. This also allows time for the feeding in of the next sheet to be printed. Among other advantages claimed for this press is that the movement which governs the action of the type bed in reversing is so arranged that the strain which sometimes occurs in other reciprocating machines is considerably reduced; another is that the registering or correct backing of the pages on the second side in printing is uncommonly good; but this depends much upon the layer-on. In many of the old kinds of two-revolution machines, owing to the cylinder being geared separately from the type bed, it was apt to be occasionally thrown out, but in the Miehle, for instance, it is only out of gear in reversing, and in gear while printing. Great strength is imparted to the frame, and the type bed is particularly rigid. These points, together with a truly turned and polished cylinder, with carefully planned means of adjustment, much simplify the preparation of flexing-ready of any kind of type-forme or blocks for printing, which is carried out much in the same way as on the ordinary single cylinder, but in a more convenient manner. Many of these machines are made to print four double crowns, 60 X 40 in., or even larger.

The two-colour machine is generally a single cylinder (fig. 8) with one feed only, and the bed motion reciprocating. The two colours are printed each at one end of the machine, and are returned to the cylinder; the two-colour machine is built with a longer frame, as is necessary to allow the two type-formes to pass under the cylinder, both in its travel forward and on its return. This cylinder on its return is stationary, in fact it might be called a double or rather an alternative stop-cylinder machine, with the ink-filling arranged somewhat on the same plan as on either a two-feeder or a perfecting machine. These two-colour presses are intended only for long runs, short runs may be worked to advantage separately on the ordinary single-colour machine. Generally, with the exception just mentioned, the machine is much the same as the ordinary stop or Wharfedale.

Before leaving the subject of printing with the reciprocating bed-motion, it may be mentioned that although in all modern machines of that kind the printed sheet is self-delivered, the imprinted paper has generally been fed in by hand, and for some classes of work this is still done. But many automatic feeders have been invented from time to time, which for the many purposes for which they are suitable must be reckoned part of a modern printing establishment.

As distinct from flat-bed printing with a reciprocating motion, printing on rotary principles is a most interesting study, and it is this department of printing mechanics which has developed so very much in recent years. It seems almost as though this branch had reached its limit, and as though any further developments can only be a question of duplication of the existing facilities so as to print from a greater number of cylinders than is the case, an octuple machine. This would be merely a matter of building a higher machine so as to take a larger number of reams arranged in decks. As the same implies, these presses are so constructed that both printing surfaces and paper continuously rotate, the web of paper travelling in and out, in a serpentine manner, between various cylinders of two characters—one (the type cylinders) carrying the surface to be impressed, usually curved stereotype plates, and the other (the impression cylinders) giving the desired impression. Such a press, if driven by electric power, is set in motion by merely pushing a button or small switch, a bell first giving warning of the press being about to move. The number of duplicate sets of stereotype plates to be worked from by these presses is determined by the size and number of the pages to be printed, and this in turn is regulated by the capacity of the machine.

As already explained, the forerunners of the rotary presses of the present day were the type-revolving printing-machines, and, whilst they were still being used, experiments were being made to cast curved stereotype plates which would facilitate and simplify the work of producing newspapers. This was successfully accomplished by the use of flexible paper matrices, from which metal plates could be cast in shaped moulds to any desired curve. These plates were then fixed on the beds of the Hoe type revolving machine, which were adapted to receive them instead of the movable type-formes previously used. This new method enabled the printers to duplicate the type pages and to run several machines at the same time, thus producing copies with far greater rapidity. In some large offices as many as five machines were in constant use. About this period the English stamp duty on printed matter was repealed, and this materially aided the development of the newspaper press.

Subsequently the proprietors of The Times made various experiments with a view to making a rotary perfecting press, and as a result started the first one about 1868. It was somewhat similar in design to the Bullock press, so far as the printing apparatus was concerned, except that the cylinders were all of one size and placed one above the other. The sheets were severed after printing, brought up by tapes, and carried down to a sheet flyer, which moved backwards and forwards, and the sheets were alternately "flown" into the hands of two boys seated opposite each other on either side of the flyers. Hippolyte Marinioun (1823-1904), of Paris, also devised a machine on a somewhat similar principle, making the impression and type cylinders of one size and placing them one over the other. About 1870 an English rotary press, called the "Victoria," was invented by Messrs Duncan & Wilson. It printed from the web, and had a folder attached. An improved form of this machine is still in use. This machine had separate fly-boards for the delivery of the sheets. In 1877 Messrs Hoe & Co. again turned their attention to the construction of a rotary perfecting press to print from the reel or continuous web of paper, and from stereotype plates fastened to the cylinder. The rotary presses in use at the present time are indeed wonderful specimens of mechanical ingenuity, all the various operations of damping (when necessary), feeding, printing (both sides), cutting, folding, pasting, wrapping (when required) and counting being purely automatic. These machines are of various kinds, and are specially made to order so as to cope with the particular class of work in view. They may be built on the "deck" principle of two, three, four, or even more reels of paper, and either in single width (two pages wide), or double width (four pages wide). Single and two-reel machines are generally constructed on the "straight line" principle, i.e. arranged with the paper at one end of the machine,
and passing through the cylinders to the folder at the other end where the copies are delivered. Three- and four-reel machines have also been constructed on the same principle, but the more usual arrangement of the four-reel press is to place two reels at either end, with the folders and delivery boards in the centre. This makes it possible to operate them as independent machines, or to run in combination with each other.

When presses are made in double width a two-reel machine is known as a quadruple, a three-reel as a sextuple, and a four-reel as an octuple machine. Double sextuple and double octuple machines are made, having six and eight reels respectively. The quadruple machine is a favourite one, and is perhaps most in demand for newspaper work. This press prints from two reels of the double width. The first reel is placed to the right of the machine near the floor, and the second at the back of the machine and at right angles to it. A quadruple machine will produce 48,000 copies per hour of four, six or eight pages; and proportionately less of a greater number of pages; all folded, counted and pasted if required. The four cylinders, which are on the right-hand side of the press, are respectively the printing and impression cylinders—the two inside ones being those giving the impression, and the two outer ones bearing the printing surfaces. The inking arrangements are placed at the two extreme ends of these four drums or cylinders, thus being near the type surfaces in each case. As the paper is unwound from the reel below it travels between the first two cylinders when it is printed on the first side; it then passes to the third and fourth cylinders, which give it the second backing side, thus "perfecting" the printed sheet. From this point the long sheet is carried overhead to the left-hand side of the machine, where it is cut longitudinally and divided, and then associated with the other web similarly printed by the other half of the press. They then descend into the two different folders, where they are folded and cut—the copies being discharged on to the delivery boards situated at the two sides of the left-hand portion of the machine, and each quire is counted or told off by being jogged forward. This description applies to one half of the machine only, for while this is in operation the same thing is being repeated by the other half situated at the back.

Another machine, somewhat complex but quite complete in itself, is that constructed by Messrs. Robert Hoe & Co. in London from drawings and patterns sent over from New York, for weekly papers of large circulation. Double sets of plates are used on this machine, which is capable of taking twenty-four pages, but by using narrower rolls the number of pages may be reduced to either sixteen or twenty if a smaller paper is desired. In addition to the body of the paper it prints a cover, and is capable of producing 24,000 complete copies per hour, folded, inserted, cut, pasted and covered. That portion of the machine which prints the cover is fed from a small tray of paper, from which it draws a different colour of paper from that used for the inside pages. The printing surface for one side of the cover is placed at one end of the cylinder and the reverse side is placed at the other end. This ingenious combination results in the printing of one cover for every page of paper.

The double octuple machines (fig. 9) erected by the same firm for the printing of Lloyd's Weekly News were probably, in 1908, the latest development in rotary printing. These presses print from eight different reels of the double width, four placed at each end of the machine, the delivery being in the centre, and from eight sets of plates, four pages on each type cylinder, making a total of thirty-two pages in all. Each press produces of that number of pages 50,000 copies per hour, printed both sides, cut, folded and counted off in quires complete; by increasing the sets of stereotype plates the same machine will produce 100,000 copies per hour of sixteen pages, and by duplicating the folding and delivery apparatus, 200,000 copies of eight pages of the same size. This mammoth press measures 54 ft. in length, 19 ft. in height and 12 ft. across; its dead weight is about 110 tons, and roughly 100,000 different pieces of metal were used in its construction. The rough cost of such a machine is probably about £18,000. Such a press requires two 55 h.p. motors, one at each end, to drive it. The press is practically four quadruple machines built together, each of which can be worked independently of the other. The paper is fed from reels placed at the two ends in decks, one above the other, each reel containing about five miles of paper, and weighing about fourteen hundredweight. The process of unwinding these long reels of paper in the course of printing takes only half an hour; they are arranged on a revolving stand so that directly they are spent the stand is turned half way round, and four other full reels already in position are presented ready to be run into the press. This ingenious arrangement, whereby the reels can be changed in about three minutes, obviates the loss of time previously incurred by the press being kept standing while the empty spindles were removed and replaced with full reels.

Having described some representative types of the different classes of printing-presses in use, we may now treat of the methods employed by the workmen in securing the best results in printing. The real art of printing, as far as presswork is concerned, lies in the careful preparation of the printing surface for printing before running off any number of impressions. This preparation is technically called "making-ready," and is an operation requiring much time and care, especially in the case of illustrated work, where artistic appreciation and skill on the part of the workman is of great assistance in obtaining satisfactory and delicate results. Theoretically, if both type and press were new, little or no preparation should be necessary, but practical experience proves that this need of preparation has not yet been entirely obviated and still remains an important factor. Single proofs of type, stereotype, electrotype or blocks of any description can often be struck off without making-ready with fairly good results, but if precision of "colour" (that is, inking) and uniformity of impression throughout a volume are desired, it is necessary to put the forme, whether type or blocks or both, into a proper condition before starting the printing of an edition, whatever its number. And this applies to all good work produced from whatever presses or machines other than those built on the rotary principle. In these, even if time permitted, little can be done in the way of making-ready; nor

---

Fig. 9.—Hoe's Double Octuple Rotary Machine.
is it really necessary for newspapers, printed and read one day, and then generally thrown away the next. But for finely printed works this preparation is essential; the actual results vary with the operator, both as regards quality and, what is very important to note, the length of time taken. Some men labour more at it than others, and it is considered that a press is only really paying while it is actually running.

The system of making-ready employed now is quite different from that in use when it was necessary to dampen paper before it could be satisfactorily printed. It was then customary to print with a good deal of packing, usually consisting of a thick blanket together with a number of layers of paper, all of which intervened between the printing and the impression surface, whether the latter was flat or cylindrical. There was much in favour of this system, because a good firm impression could be obtained, and the "nutmeg-grater" effect which was so peculiarly objectionable in the half-tone process where the image was too impression on the sheet before the sheets were dry, be removed by cold-pressing in a hydraulic press. It is still the best method for obtaining first-rate results in fine work, where hand-made or other rough paper is used. But the demand for cheap literature required quicker means of production and the introduction of process blocks, especially those made by the half-tone process, necessitated the use of smooth paper and a faster drying ink, both of which are to be deplored, because to calender the paper to the degree requisite for this kind of printing practically means destroying its natural surface, and in rendering the ink quicker in drying the pigment undoubtedly suffers. On the other hand, it has been a considerable advantage that improved machinery has been developed for this class of work, and the British manufacturer has been stimulated by the American manufacturers, who have taken the initiative in the change of methods, to supply presses suitable for this purpose and so transform such a system as to such a nicety that very little packing is required between type and sheet to be impressed, so that a new system of making-ready termed "hard-packing," has been resorted to. The fact that the iron impression on the paper can be formed by the use of a very small amount of soft-packing formerly used, besides which process blocks, whether line or half-tone, could not be rendered properly by a soft impression. Although less packing is necessary, greater care is now required in preparing type or blocks of type produced by this new method.

The method in making-ready ordinary plain formes is as follows. The type-forme is placed on the coffin or bed of the press and fixed into position. The precise size of the sheet of paper on which the work is to be printed. The cylinder is first dressed with a fine and talcico drawn tautly over and fastened securely, which serves as a base on which to fasten the forme. A sheet of some hard paper, such as manila, is then placed over it to form, as it were, a foundation.

The printer next proceeds to pull a sheet, without ink, to test the impression. We take it that the machine has already been regulated by means of the impression screws at the respective ends of the cylinder for all-round or average work, and that any inequality of impression can be remedied by adding or taking away from the sheets on the impression the forme to be dealt with consists of thirty-two pages to be printed on one side only, the forme having about 40x50 in., on a suitable size of single cylinder machine of the Wharfedale class, it would be found, although both the machine and operators are trained, that some amount of inequality in the impression given to the whole sheet. This is easily detected by examining the sheet the reversed side in a strong side-light. Although the greater part may be fairly even, some pages, or portions of pages, would show up too strongly the impression almost cutting through the paper, while in other portions the impression would be so faint that it could hardly be seen. These differences of impression are called respectively "high" and "low." All these difficulties have to be rectified by the printer either by cutting or laying away pieces in this first trial sheet. If the set of the cylinder is about correct, and the impression sheet has been taken exactly and with new fresh settings on the cylinders, will be a matter rather of overlapping or of patching up of cutting away pieces in this first trial sheet. As soon as this first sheet has been levelled up it is fixed on to the cylinder to its exact position, so that the cylinder will correspond exactly with the position when the press is running, and another trial sheet is struck off, which is treated precisely in the same manner, and is then fastened up on the cylinder on top of the first sheet. It may even be necessary for fine printing to be done. In other cases, especially in printing from cylinders with cylinders, or even by a kind. When this preparation is completed, the whole is covered up by a somewhat stouter sheet, which forms a protection to the whole making-ready, but which can easily be lifted should it be necessary to give any finding to the forme before beginning to run.

If the forme to be printed consists of both type and blocks mixed, a second trial to see that different treatment has to be employed in order to put the blocks into a ready position. This is done by the usual trial impression sheet, and, as blocks are found to vary much in height and are generally low as compared with type, this deficiency has to be remedied by underlaying the blocks so that they are brought to the height of the type, or a shade above. This is usually done by putting layers of thickish paper, or even thin cards, underneath the blocks, and such treatment is necessary whenever a second impression is to be made, to make sure that the blocks are not altered in any shape or form, and that the impression is true and accurate. The plate, after being brought to the required impression in the block itself—and it is little more than a matter of sharp, hard impression to give full effect to these, if both paper and ink are suitable—will be easily applicable. If the process blocks differ a little in making-ready is designed to suit the work, it will be found, by trial, that they are nearly always formed in this kind of block. Here too it is essential that the preliminary underlaying be done with extreme care if good results are to follow. When the engraver's proofs are of great assistance to the workman in bringing out the details of an illustration when he is preparing it for printing. In rotary printing from the curved stereotype plate and from the endless web of paper on which are produced, for commercial purposes, has been brought to a higher degree of perfection. Only what may be fairly considered as representative press work of the kind mentioned, but there are others, some of which have been most ingeniously constructed for special purposes. Process engraving, wood engraving, and the new processes have brought new conditions, requiring a different making-ready, paper and ink. Some new processes are therefore necessary for these purposes, and it is unfortunate that the quality and surface of papers have to be sacrificed to the demands for cheap literature, and this especially applies in the illustrations.

The introduction of the autoplate is of great advantage to those using rotary presses, because it allows the production of a large number of duplicate stereotype plates of satisfactory quality quickly. This is all important in a newspaper office, where the margin of time between the case-room and machine department is usually so limited, for it permits several machines being simultaneously equipped with duplicate sets of the same pages.

Electricity is another factor which is very fast. Electricity is supplementing both steam and gas, and is being installed in many large printing-houses, including newspaper offices. Suction gas is being tried in some offices as a supplement of electricity and is said to be much less expensive (that is, cheaper) than gas, and for some amount of inequality in the impression given to the whole sheet. This is easily detected by examining the sheet the reversed side in a strong side-light. Although the greater part may be fairly even, some pages, or portions of pages, would show up too strongly the impression almost cutting through the paper, while in other portions the impression would be so faint that it could hardly be seen. These differences of impression are called respectively "high" and "low." All these difficulties have to be rectified by the printer either by cutting or laying away pieces in this first trial sheet. If the set of the cylinder is about correct, and the impression sheet has been taken exactly and with new fresh settings on the cylinders, will be a matter rather of overlapping or of patching up of cutting away pieces in this first trial sheet. As soon as this first sheet has been levelled up it is fixed on to the cylinder to its exact position, so that the cylinder will correspond exactly with the position when the press is running, and another trial sheet is struck off, which is treated precisely in the same manner, and is then fastened up on the cylinder on top of the first sheet. It may even be necessary for fine printing to be done. In other cases, especially in printing from cylinders, or even by a kind. When this preparation is completed, the whole is covered up by a somewhat stouter sheet, which forms a protection to the whole making-ready, but which can easily be lifted should it be necessary to give any finding to the forme before beginning to run.

If the forme to be printed consists of both type and blocks mixed, a second trial to see that different treatment has to be employed in order to put the blocks into a ready position. This is done by the usual trial impression sheet, and, as blocks are found to vary much in height and are generally low as compared with type, this deficiency has to be remedied by underlaying the
and is sent to the printer with the necessary instructions as to priors. After another reading or revision in the reading closet it is sent to the compositors, who make the final corrections in the type and hand the forme to the printing department to deal with. It is this department which must ensure that the publication of the book will be satisfactory, and it requires a really good man at its head. He must be a thoroughly practical printer familiar with the different kinds of printing machinery. To make the department pay, the manager must be a man who can afford to pay for a timely and thorough job. At the same time he must have a close watch on the materials used. Ink forms a large item in the total expenses of this department, besides which there are oil for lubricating, turpentine and other solvents for cleaning, paper for proofs and making-ready, etc. The time of the whole of these operations is the ware-housed by the compositors, who are responsible both for unprinted and printed paper. Lastly, the counting-house deals with all accounts, both departments' and customers'.

BIBLIOGRAPHY.—The following books and periodicals may be specially referred to: Books.—J. Southward (and subsequently A. Powell), Practical Printing, a handbook of the art of typography (2 vols. 8vo, London, 1900); J. Southward, Modern Printing, a treatise on the principles and practice of typography, &c. (large 8vo, London, 1900); C. T. Jacobi, Printing, a practical treatise on the art of printing, &c. (8vo, 4th ed., London, 1908); W. J. Kelly, Presswork, a practical handbook for the use of pressmen and their apprentices (2nd ed., London, 1902); G. Jacobs, The Handbook of Trade Recipes, &c. (8vo, 3rd ed., London, 1905); F. J. F. Wilson and D. Grey, Modern Printing Machinery and Letterpress Printing (large 8vo, London, 1888); Robert Hoe, A Short History of the Hoe Press (140, New York, 1876); J. Grey, The Invention of Printing (New York, 1876). Periodicals—The British and Colonial Printer and Stationer (London, bi-weekly); The British Printer (Leicester, alternate months); The Printer's Register (London, monthly); The Printing World (London, monthly); The Caxton Magazine (London, monthly); The Printing Art (Cambridge, Mass., U.S.A., monthly); The Island Printer (Chicago, monthly); The American Printer (New York, monthly); The International Printer (Philadelphia, monthly). See also the bibliography attached to the article TYPOGRAPHY.

PRIORITY, M.—PRIOR

PRIOR, MATTHEW (1664–1721), English poet and diplomatist, was the son of a Nonconformist joiner at Wimbborne-Minster, East Dorset, and was born on the 21st of July 1664. His father moved to London, and sent him to Westminster, under Dr Busby. At his father's death he left school, and fell to the care of his uncle, a vintner in Channel Row. Here Lord Dorset found him reading Horace, and set him to translate an ode. He acquitted himself so well that the earl offered to contribute to the continuance of his education at Westminster. One of his schoolfellows and friends was Charles Montagu, afterwards 1st Earl of Halifax, and the two were frequently separated from their master, and his brother James that Prior accepted, against his patron's wish, a scholarship recently founded at St John's College. He took his B.A. degree in 1686, and two years later became a fellow. In collaboration with Montagu he wrote in 1687 the City Mouse and Country Mouse, in ridicule of Dryden's Hind and Panther. It was an age when satirists were in request, and sure of patronage and promotion. The joint production made the fortune of both authors. Montagu was promoted at once, and Prior three years later was gazetted secretary to the embassy at the Hague. After four years of this employment he was appointed one of the gentlemen of King's bedchamber. Apparently also, he acted as one of the king's secretaries, and in 1697 he was secretary to the plenipotentiaries who concluded the peace of Ryswick. Prior's talent for affairs was doubted by Pope, who had no special means of judging, but it is not likely that King William would have employed in this important business a man who had not given proof of diplomatic skill and grasp of details. The poet's knowledge of French is specially mentioned among his qualifications, and this was recognized by his being sent in the following year to Paris in attendance on the English ambassador. At this period Prior could say with good reason that "he had commonly business enough upon his hands without being at all uncaveled by an attempt to give an account of which had laid the foundation of his fortunes, he still occasionally trusted as a means of maintaining his position. His occasional poems during this period include an elegy on Queen Mary in June 1695; a satirical version of Boileau's Ode sur le prise de Nomur (1695); some lines on William's escape from assassination in 1696; and a bit of the latter's Society. After his return from France Prior became under-secretary of state and succeeded Locke as a commissioner of trade. In 1701 he sat in parliament for East Grinstead. He had certainly been in William's confidence with regard to the Partition Treaty; but when Somers, Orford and Halifax were impeached for their share in it he voted on the Tory side, and immediately on Anne's accession he definitely allied himself with Harley and St John. Perhaps in consequence of this for nine years there is no mention of his name in connexion with any public transaction. But when the Tories came into power in 1710 Prior's diplomatic abilities were again called into action, and till the death of Anne he was prominent in many negotiations. He had been sworn of the privy council, and sometimes as secret agent, sometimes as an envoy, at various foreign courts, sometimes as ambassador's companion, sometimes as fully accredited but very un punctually paid ambassador. His share in negotiating the treaty of Utrecht, of which he is said to have disapproved, personally led to its popular nickname of "Matt's Peace." When the queen died and the Whigs regained power he was impeached by Sir Robert Walpole and kept in close custody for two years (1715–1717). In 1720 he had already published a collection of verse. During this imprisonment, maintaining his cheerful philosophy, he wrote his longest humorous poem, Alma; or, The Progress of the Mind. This, along with his more ambitious work, Solomon, and other Poems on several Occasions was published by subscription in 1718. The sum received for this volume (4000 guineas), with a present of 4000 from Lord Harley, enabled him to live in comfort; but he did not long survive his enforced retirement from public life, although he bore his ups and downs with rare equanimity. He died at Wimpole, Cambridgeshire, a seat of the earl of Oxford, on the 18th of September 1721, and was buried in Westminster Abbey, where his monument may be seen in Poet's Corner. A History of his Own Time was issued by J. Bancks in 1740. The book pretended to be derived from Prior's papers, but it is doubtful how far it should be regarded as authentic.

Prior had very much the same easy, pleasure-loving disposition as Chaucer (with whose career his life offers a certain parallelism), combined with a similar capacity for solid work. His poems show considerable variety, a pleasant scholarship and great executive skill. The most ambitious, i.e. Solomon, and the paraphrase of the Nut-Brown Maid, are the least successful. But Alma, an admitted imitation of Butler, is a delightful piece of wayward easy humour, full of witty turns and wellremembered allusions, and Prior's mastery of the octo-syllabic couplet is greater than that of Swift or Pope. His tales in rhyme, though often objectionable in their themes, are excellent specimens of narrative skill; and as an epigrammatist he is unrivalled in English. The majority of his love songs are frigid and academic, mere wax-flowers of Parnassus; but in familiar or playful efforts, of which the type are the admirable lines To a Child of Quality, he has still no rival. "Prior's—says Thackeray, himself no mean proficient in this kind—"seem to me amongst the easiest, the richest, the most charmingly humorous of English lyrical poems. Horace is always in his mind, and his song and his philosophy, his good sense, his happy easy turns and melody, his loves and his Epicureanism, bear a great resemblance to that most delightful and accomplished master."

The largest collection of Prior's verses is that by R. Brimley Johnson in the "Aldine Poets" (2 vols., 1892). There is also a selection in the "Parchment Library," with introduction and notes by Austin Dobson (1889). (A. D.)

PRIOR (from Lat. prœtor—former, and hence superior, through O. Fr. priour, a title applied generally to certain monastic superiors, but also in the middle ages to other persons in authority. Under the Roman Empire the word prior is found signifying "ancestor," and in the early middle ages it was commonly applied to secular officials and magistrates, and it remained all though the middle ages as the title of certain officials in the
Italian city states. Noteworthy among these were the famous priores artis at Florence. These were appointed governors of the Florentine republic when the Companies of the Arts seized the government in 1282.

The term prior was most commonly used to denote the superiors in a monastery, at first with an indefinite significance, but later, as monastic institutions crystallized, describing certain definite officials. In the Rule of St Benedict and other early rules the titles praeceptor and praelatus (see PRELATE) are generally used, but prior is also found signifying in a general way the superiors and elders in a monastery. When used by St Benedict in the singular number it seems (according to the commentator Ménard) to denote the abbot himself. At a later date in the order of St Benedict the title was applied to the monk next in authority to the abbot, though this usage was not adopted technically until the 13th century. In some monasteries several priors were to be found and generally at least two. Thus we find the terms prior, sub-prior, tertius prior, quarius prior, quintus prior. The first prior was sometimes called prior major, sometimes prior castraustus. Occasionally both titles are found in one house, the latter ranking below the former. The first prior acted as vicar, in the absence of the abbot, and was generally charged with the details of the discipline of the monastery. With the foundation of the order of Cluny in the 10th century there appeared the conventual prior who ruled as head of a monastery, but was subject in some degree to the archiabbes of the mother-house of Cluny. The Regular Canons later gave this title of prior to the heads of their houses, as did also the Carthusians and the Dominicans. It was in houses of these orders that the sub-prior became a regular official. Among the Dominicans the head of a province is known as the "prior provincial." In the order of St John of Jerusalem (q.v.) a prior was a group of commanderies ruled by a "grand prior."

The term prior was applied also in the middle ages in a very general manner. Thus there was the prior scholas or leader of the choir, prior scriiniariorum, &c.

PRISCIAN [PRISCIANUS CAESARIENSIS], the celebrated Latin grammarian, lived about a.d. 500, i.e. somewhat before Justinian. This is shown by the facts that he addressed to Anastasius, emperour of the East (559-565), the earliest extant panegyric poem, and that the MSS. of his Institutio grammaticae contain a subscription to the effect that the work was copied (526, 577) by Flavius Theodorus, a clerk in the imperial secretariat. Three minor treatises are dedicated to Symmachus (the father-in-law of Boïtius). Cassiodorus, writing in the ninety-third year of his age (560? 573?), heads some extracts from Priscian with the statement that he taught at Constantinople in his (Cassiodorus's) time (Kell, Gr. Lat. vii. 207). His title Caesariensis points, according to Niebuhr and others, to Caesarea in Mauretania. Priscian's teacher was Theoctistus, who also wrote an Institutio artis grammaticae. Priscian was quoted by several writers in Britain of the 7th century—Ad comptus in Heddai, a 12th-century abridgment, and that the MSS. of Hrabanus Maurus of Fulda and Servatus Lupus of Ferrières. There is hardly a library in Europe that does not and does not contain a copy of his great work, and there are about a thousand MSS. of it. The greater part of these contain only books i.–xvi. (sometimes called Priscianus major); a few contain (with the three books Ad Symmachum) books xvii., xviii. (Priscianus minor); and a few contain both parts. The earliest MSS. are of the 9th century, though a few fragments are somewhat earlier. All are ultimately derived from the copy made by Theodorus. The first printed edition was in 1470 at Venice.

The Institutiones grammaticae is a systematic exposition of Latin grammar, dedicated to Julian, consul and patrician, whom some have identified with the author of a well-known epitome of Justinian's Novellae, but the lawyer appears to be somewhat later than Priscian. It is divided into eighteen books, of which the first sixteen deal mainly with sounds, word-formation and inflexions; the last two, which form from a fourth to a third of the whole work, deal with syntax. Priscian informs us in his preface that he has translated into Latin such precepts of the Greeks Herodian and Apollonius as seemed suitable, and added to them from Latin grammarians. He has preserved to us numerous fragments which would otherwise have been lost, e.g. from Ennius, Paccuvius, Accius, Lucilius, Cato and Varro. But the authors whom he quotes most frequently are Virgil, and, next to him, Terence, Cicero, Plautus; then Lucan, Horace, Juvenal, Sallust, Statius, Ovid, Livy and Persius. His industry in collecting forms and examples is both great and methodical. His style is somewhat heavy, but sensible and clear; it is free, not of course from usages of Late Latin, but from anything that can be called barbarism. Its defects may be referred in the main to four heads. (1) Priscian avowedly treats Greek writers on (Greek) grammar as his supreme authorities; and bears too little in mind that each has a history of its own and is a law to itself. (2) There had been no scientific study of phonetics, and consequently the changes and combinations of languages are treated in a mechanical way: e.g. 1 passed into 6, as genus, generis, generis, generis (p. 65). This was not unnatural in the absence of the abbot, and was generally charged with the details of the discipline of the monastery. With the foundation of the order of Cluny in the 10th century there appeared the conventual prior who ruled as head of a monastery, but was subject in some degree to the archiabbes of the mother-house of Cluny. The Regular Canons later gave this title of prior to the heads of their houses, as did also the Carthusians and the Dominicans. It was in houses of these orders that the sub-prior became a regular official. Among the Dominicans the head of a province is known as the "prior provincial." In the order of St John of Jerusalem (q.v.) a prior was a group of commanderies ruled by a "grand prior."

The term prior was applied also in the middle ages in a very general manner. Thus there was the prior scholas or leader of the choir, prior scriiniariorum, &c.

PRISCILLIAN (d. 385), Spanish theologian and the founder of a party which, in spite of severe persecution for heresy, continued to subsist in Spain and in Gaul until after the middle of the 7th century. He was a wealthy layman who had devoted his life to a study of the occult sciences and the deeper problems of philosophy. He was largely a mystic and regarded the Christian
PRISCUS—PRISON

life as continual intercourse with God. His favourite idea is that which St Paul had expressed in the words "Know ye not that ye are the temple of God?" and he argued that to make himself a fit habitation for the divine a man must, besides holding the Catholic faith and doing works of love, renounce marriage and earthly honour, and practise a hard asceticism. It was on the question of continence in, if not renunciation of, marriage, that he came into conflict with the authorities. Priscillian and his sympathizers, who were organized into bands of spirites and abstinentes, like the Cathari of later days, indignantly refused the compromise which by this time the Church had established in the matter. (See MARRIAGE: Canon Law.) This explains the charge of Manichaeism. Only fragments of the work remain, but the description of Attila and his court and the account of the reception of the Roman ambassadors is a most valuable piece of contemporary history. Priscus's style is pure, and his impartiality and trustworthiness entitle him to an honourable place among the writers of his time.

Fragments and life in C. W. Müller, Fragmenta historiorum graecorum, iv. 69-110; v. 24-26, 6 ed. B. G. Niebuhr in Bonn, Corpus scriptorum historiarum Graecorum, vol. vi., and L. Dindorf in Historici graeci minores (1870), vol. i. For the embassy to Attila see Gibbon, Decline and Fall, ch. 34.

PRISCUS, a Greek Neoplatonist philosopher, of the school of Iamblichus and Aedesius. He died about the year 398 at the age of ninety. The emperor Julian frequently invited him to court on the strength of his reputation in connexion with theology. Eunapius says that he was a man of dignified and austere habit. Unlike Maximus, he used his influence over Julian with great moderation. He died during the Gothic invasion of Greece (A.D. 395-98). He is important partly as maintaining the best traditions of philosophy during a period when Neoplatonism as a whole was a parasite of imperial power, and partly as being a connecting link between Iamblichus and Plutarch of Athens.

See Zeller's Hist. of Greek Phil.

PRISHTINA, Prizheuta, or Prizren, the chief town of a sanjak in the vilayet of Kosovo, Albania, European Turkey; on a small tributary of the river Stinftza, an affluent of the Ibar, and 3 m. E. of the Prishtina station on the Salonica-Mitrovitza railway. Pop. (1905), about 11,000. Prishtina is the seat of a governor-general and of a general of division, and possesses many mosques, a military hospital and a higher class school. The trade is considerable, the exports including chrome, wheat, barley, skins, wine and timber from the magnificent beech forests in the sanjak. The plain of Kosovo (Kosonos, "Field of Blackbirds"), to the west, was the scene of the battle in which the Servian empire was destroyed by the Turks in 1380. To the south-east lies the partly ruined monastery of Grachanitza founded by King Milutin of Servia (1275-1321). Among the frescoes are a remarkable head of Christ in the dome, and portraits of the founder and his queen Simonida, daughter of Andronicus II. Palaeologus.

See G. M. M. Mackenzie and A. P. Irby, Travels in the Slavonic Provinces of Turkey (1877).

PRISMA. Gr. πρίσμα, properly a thing sawn, παρὰ(πρ), to saw, in geometry a solid enclosed by plane surfaces, two of which termed the ends, are parallel, equal, similar and similarly situated polygons, and the faces connecting the ends are parallelograms, equal in number to the sides of the polygon. If the faces be perpendicular to the ends the prism is a "right prism," and the faces are rectangles; otherwise the prism is "oblique." The axis is the line joining the centres of the ends. It may be generated by moving a plane (corresponding to an end or base) parallel to itself. A prismatic solid arises from a prism in having for its ends two dissimilar parallel figures. For illustrations see Crystallography, and for the mensuration see that article. In optics the word denotes a triangular prism, i.e. one having a triangle for base which fragments to decompose white light. (See Refraction and Dispersion.)

PRISON (derived through the Fr. from the Lat. praehensio, seizure), a place for the confinement or compulsory restraint of

nothing that Jerome might not have written," and go far to justify the description of Priscillian as "the first martyr burned by a Spanish Inquisition."
persons after arrest or sentence by arbitrary authority or process of law.

The earliest object sought in imprisonment was to secure the person of the accused to ensure his appearance before his judges for trial, and after conviction to produce him to take his punishment. They were applied to other ends still less justifiable or defensible; they served to execute the will of the despotic master and to alienate all who should resist or, themselves in opposition to his authority, or were decreed, more or less wisely but still arbitrarily, by a government in the best interests of society, organized for the general good. Coercion and intimidation slowly came to be leading ideas, the infliction of a lesser penalty than the capital. The deprivation of liberty under irksome circumstances, rough lodging, hard fare and perpetual labour was after all a milder measure than death, although long years elapsed before the prison was so used. Penal codes depended rather upon shorter and more cruel methods; the scaffold was in constant use, with all manner of physical pain, torture before and after sentence, shameful exposure, hideous mutilation, exile, selling into bondage as slaves. Incarceration was no doubt practised by irresponsible masters, regardless of personal rights, callous to the sufferings of their victims, to which death by starvation or horrible neglect was a welcome relief. But consignment to a prison for lengthened periods was, as a penalty, of more recent introduction, and of still later date is the recognition of the duties incumbent upon the authority to use its powers mercifully by humane endeavours to reform and improve those on whom it laid hands.

The progress made can only be realized by considering what prisons once were. The shocking picture drawn by John Howard, of the state of prisons at the latter end of the 18th century will last for all time. They were for the most part pestiferous dens, overcrowded, dark, foully dirty, not only ill ventilated, but deprived altogether of fresh air. The wretched inmates were dependent for food upon the caprice of their gaolers or the charity of the benevolent; water was denied them except in the scantiest proportions; their only bedding was putrid straw. Every one in durance, whether tried or untried, was heavily ironed. All alike were subject to the rapacity of their gaolers and the extortions of their fellows.

Gaol fees were levied ruthlessly—"garnish also," the tax or contribution paid by each individual to a common fund to be spent by the whole body, generally in drink. Idleness, drunkenness, vicious intercourse, sickness, starvation, squallor, cruelty, chains, awful oppression and everywhere culpable neglect—in these words may be summed up the state of the gaols at the time of Howard's visitation.

At this time prisons were primarily places of detention, not of punishment, peopled by accused persons, still innocent in the eyes of the law, and debtors guilty only of breaches of the financial rules of a commercial country, framed chiefly in the interest of the creditor. Freedom from arrest was guaranteed by Magna Carta, save on a criminal charge, yet thousands were committed to gaol on legal fictions and retained indefinitely for costs far in excess of the original debt. The impecunious were locked up and deprived of all hope of earning means to obtain enlargement; while their families and persons dependent on them shared their imprisonment and added to the overcrowding. The prisons were always full. Gaol deliveries were of rare occurrence, even when tardy trial ended in acquittal release was delayed until illegal charges in the way of fees had been satisfied.

In the article Deportation it is shown how the discoveries in the southern seas led to the adoption of penal exile in preference to other suggested improvements in the English prison systems. The penal system proposed by Howard was not, however, abandoned. It was revised and kept alive by Jeremy Bentham in his fanatical scheme for a "panopticon or inspection house," described as "a circular building, an iron cage glazed, a glass lantern as large as Ranelagh, with the cells on the outer circumference." His plan was to keep every inmate of every cell under constant close observation, and all were to be reformed by solitude and seclusion while constantly employed in remunerative labour, in the profits of which they were to share. The scheme hung fire, owing, it was alleged, to the personal hostility of George III. to Bentham as an advanced radical. Land was, however, purchased which were eventually taken over by the government and utilized for the erection of Millbank penitentiary, begun in 1813 and partially completed in 1816. It was now fully recognized that the reformation of the sordid and debased wretches who were placed behind prison "employment and religious instruction." Millbank, as a new and most enlightened undertaking in prison affairs, was opened with much éclat. It was to be governed by a specially appointed committee of distinguished personages, the chairman being the Speaker of the House of Commons. The sum total expended upon the buildings amounted to half a million of money, and the yearly charges of the establishment were a heavy burden on the exchequer.

The erection of Millbank was a step in the right direction. The energy with which it was undertaken was the more remarkable because elsewhere throughout the United Kingdom the prisons, with few exceptions, remained deplorably bad. J. Neild, who in 1812 followed in the footsteps of John Howard, found that the old conditions remained unchanged. "The great reformation produced by Howard," to use Neild's own words, "was merely temporary...prisons were relapsing into their former horrid state of privation, filthiness, severity and neglect." Yet the legislature was alive to the need for prison reform. Besides the building of Millbank it had promulgated many acts for the amelioration of prisoners. Gaol fees were once more distinctly abolished; the appointment of chaplains was insisted upon, and the erection of improved prison buildings was rendered imperative upon local authorities. But these, with other and much older acts, remained in abeyance. Thus an act which provided for the classification of prisoners had remained a dead letter; even the separation of the males from the females was not a universal rule. Roused by these crying evils, a small band of earnest men formed themselves into an association for the improvement of prison discipline. They perambulated the country inspecting the prisons; they issued lengthy interrogatories to prison officials; they published periodical reports giving the result of their inquiries, with their views on the true principles of prison management, and much sound advice, accompanied by elaborate plans on the subject of prison construction. The labours of this society brought out into strong relief the naked deformity of the bulk of the British gaols. Speaking of St Albans from his personal observation Mr (afterwards Sir T. F.) Buxton, a most active member of the society, said: "All were in ill health; almost all were in rags; almost all were filthy in the extreme. The state of the prison, the desperation of the prisoners, broadly hinted in their conversation and plainly expressed in their conduct, the uproar of oaths, complaints and obscenity, the indescribable stench, presented together a concentration of the utmost misery and the utmost guilt." The reports of the society laid bare the existence of similar horrors in numbers of other gaols. Yet this was in 1818, when the legislature was setting a praiseworthy example—when half a million had been spent in providing large airy cells for a thousand prisoners. Even in London itself, within easy reach of the palatial Millbank penitentiary, the chief prison of the city, Newgate, was in a disgraceful condition. This had been exposed by a parliamentary inquiry as far back as 1814, but nothing had been done to remedy the evils laid bare. The state of the female side had already attracted the attention of that devoted woman, Mrs Fry, whose ministrations and wonderful success in prison work had not escaped the vigilance of the Prison Society. Mrs Fry went first to Newgate in 1813, but only as a casual visitor. It was not until 1817 that she entered upon the noble work with which her name will ever be associated. She worked a miracle there in an incredibly short space of time. The ward into which she penetrated was like a den of wild beasts; it was filled with women unsexed, fighting, swearing, dancing, gaming, yelling and justly deserved its name of "hell above ground." Within a month it was transformed,
and presented, says an eyewitness, "a scene where stillness and propriety reigned." The wild beasts were tamed. Movements similar to that which Mrs Fry headed were soon set on foot both in England and on the Continent, and public attention was generally directed to the urgent necessity for prison reform. Stimulated by the eloquent solicitation of Mrs Fry, the Prison Discipline Society continued its labours. Hostile critics were not wanting; many voices were raised in protest against the ultra-humanitarianism which sought to make gaols too comfortable and tended to pamper criminals. But the society pursued its objects, undeterred by sarcasm. Many of these are now accepted as axioms in prison treatment; for instance, that female officers only should have charge of female prisoners, that prisoners of both sexes should be kept apart and constantly employed. Yet these principles were unacknowledged at that time and were first enunciated in acts such as the 4 Geo. IV. c. 65 and the 5 Geo. IV. c. 85 (1823-1825), the passage of which was mainly due to the strenuous exertions of the Prison Discipline Society. It was laid down in these that over and above safe custody it was essential to preserve health, improve morals, and enforce hard labour on all prisoners sentenced to it. Irons were strictly forbidden except in cases of "urgent and absolute necessity," and it was ruled that every prisoner should have a bed to himself—if possible a separate cell, the last being the first formal statement of a principle upon which all future prison discipline was to be based.

The importance of these acts cannot be over-estimated as supplying a legal standard of efficiency by which all prisons could be measured. Still the progress of improvement was extremely slow, and the managers of gaols still evaded or ignored the acts. Many local authorities grudged the money to rebuild or enlarge their gaols; others varied much in their interpretation of the rules as to hard labour and the hours of employment. One great drawback to general reform was that a large number of small prisons lay beyond the reach of the law. Those under small jurisdictions in the boroughs and under the petty corporate bodies continued open to the strongest repugnation, and thus remained until they were swept away by the measure which brought about the reform of the municipal corporations in 1835. But by this time a still more determined effort had been made to establish some uniform and improved system of prison discipline. In 1831 a select committee of the House of Commons went into the whole subject of secondary punishment and reported that, as the difficulties in the way of an effective classification of prisoners were insurmountable, they were strongly in favour of the confinement of prisoners in separate cells, recommending that the whole of the prisons should be altered accordingly and the expense borne by the public exchequer. There can be little doubt that this committee was greatly struck by the superior methods of prison discipline pursued in the United States. The best American prisons had recently been visited by two eminent Frenchmen, J. A. de Beaumont and A. de Tocqueville, who spoke of them in terms of the highest praise. It was with the object of appropriating what was best in the American system that Mr W. Crawford was despatched across the Atlantic on a special mission of inquiry. His exhaustive report, published in 1834, was a valuable contribution to the whole question of penal discipline. Another select committee, this time of the House of Lords, returned to the subject in 1835, and after a long investigation re-enunciated the theory that all prisoners should be kept separate from one another. It also urged in strong terms the necessity for one uniform system of treatment, more especially as regulated diets, labour and education, and strongly recommended the appointment of official inspectors to enforce obedience to the acts. These recommendations were eventually adopted and formed the basis of a new departure.

For fifty years transportation (see DEPORTATION) had been in England the principal form of secondary punishment for crime. Primary or capital punishment still existed, but to a greatly modified extent. The pious Quakers of Pennsylvania at the end of the 18th century had realized a deeper duty towards the offenders than their extinction, and sought to amend and reform the living. The note struck first in the Walnut Street penitentiary began a new era in prison treatment, and the methods adopted were destined to extend over the whole of the United States. The achievement of this new principle of individual confinement, and the origin of what some advanced thinkers have denounced as the greatest crime of the present age, the invention of the separate cell. It was and still is held by many that the criminal may be best and most effectually weaned from his evil ways by shutting him up for lengthy periods between four walls, and subjecting him, when most susceptible, to curative processes, to constant extortion and searching introspection, changing his nature and restoring him to society a reformed man.

It must be at once admitted that the system of isolation has produced no remarkable results. Solitary confinement has neither conquered nor appreciably diminished crime, even when once it has been applied with extreme care, as in Belgium, and more recently in France, where it obtains strict and unbroken for long terms of years. Cloistered seclusion is an artificial condition quite at variance with human instincts and habits, and the treatment, long continued, has proved injurious to health, inducing mental breakdown. A slow death may be deflected indeed on moral grounds if regeneration has been compassed, but it is only another form of capital punishment. Still the measures introduced in the United States and the action taken upon them fill a large page in prison history and must be recorded here.

Seven states in the Union followed the lead of Pennsylvania. That of New York built the great Auburn penitentiary in 1816 to carry out the new principles. There every prisoner was kept continuously in complete isolation. He saw no one, spoke to no one, and did no work. Within a short period very deplorable results began to show themselves. Many prisoners became insane; health was generally impaired and life greatly endangered. Mr Crawford, whose mission to the United States has been already referred to, was in favour of solitary confinement, but he could not deny that several cases of suicide followed this isolation. Some relaxation of the disastrous severity seemed desirable, and out of this grew the second great system, which was presently introduced at Auburn and afterwards at the less renowned prison of Sing Sing. It was called the silent system. While the prisoners were still separated at night or meals, they were suffered to labour in association, but under a rule of silence ruthlessly and rigorously maintained. The latter, entrusted to irresponsible subordinates, degenerated into a despotism which brought the system into great discredit. All discipline officers were permitted to wield the whip summarily and without the slightest check. Under such a system the most frightful excesses were possible and many cases of brutal cruelty were laid bare. Reviewing the merits and demerits of each system, Mr Crawford gave his adhesion to that of unevenly solitude as pursued in the Eastern penitentiary in Pennsylvania.

Mr Crawford came back from the United States an ardent champion of the solitary system. He saw, however, great difficulties in making this the universal rule, chiefly among which was the enormous expense of providing suitable prisons. Some modification of the rule of unbroken solitude would be inevitable; but he strongly urged its adoption for certain classes, and he was equally convinced of the imperative necessity for giving every prisoner a separate sleeping cell. It is clear that the government endorsed Mr Crawford's views. Where it was possible they gave effect to them at once. At Millbank, with its spacious solitary cells, the rule of seclusion was more and more strictly enforced. Ere long permissive legislation strove to disseminate the new principles. In 1830 Lord John Russell had given it as his opinion that cellular separation was desirable in all prisons. But it was not until 1839 that an act was passed which laid it down that individuals might be confined separately in single cells. Even now the executive did not insist upon the construction of prisons on a new plan. It only set a good example
by undertaking the erection of one which should serve as a model for the whole country. In 1840 the first stone of Pentonville prison was laid, and after three years of considerable outlay, its cells, 520 in number, were occupied on the solitary, or more exactly the separate system—the latter being somewhat less rigorous and irksome in its restraints. To the credit of many local jurisdictions, they speedily followed the lead of the central authority. Within half a dozen years no fewer than fifty-four new prisons were built on the Pentonville plan, which now began to serve generally as a "model" for imitation, not in England alone, but all over the world. Sir Joshua Jebb, who presided over its erection, may fairly claim indeed to be the author and originator of modern prison architecture.

The building of Pentonville was epoch-making. The modern prison dates from it. The penal discipline of to-day, much modified and varied it is true, may be largely traced to it. The "cell" scheme of individual separation holds the ground, and countries which can afford the outlay have built or are building cellular prisons. France has made steady progress in this respect. Great additions have been made to La Santé prison in Paris, and a new prison on gigantic lines has been opened at Fresnes les Rungis, on the outskirts of the metropolis, to replace the obsolete Mazas, and to give cellular accommodation to the large numbers always on hand in Paris. Germany has embarked on penitentiary reforms with the provision of several new prisons; it is the same with the United States, Austria, Holland, Spain, Portugal, Denmark, Norway, Sweden. In Italy a comprehensive scheme has been drawn up so that cellular imprisonment may become a general rule. In Belgium, where penal administration has received the closest attention for a number of years, the régime of cellular imprisonment has been long carried to its furthest limits, and solitary confinement ranging over ten years and in some cases much more has been strictly enforced. Of late years however a new school has arisen in Belgium which expresses strong doubts of the wisdom or efficacy of prolonged cellular confinement. In England, moreover, which, if not the first to adopt separation in principle, certainly gave the largest effect to it in practice, continuous cellular confinement for short terms is ceasing to be the inevitable rule; and although it has been retained in cases of penal servitude for the first six months, it was in 1899 practically abandoned for lesser sentences, and all prisoners after the first month work together in association under surveillance. In July 1910 the home secretary announced his intention to reduce it to one month in all cases except those of repeat offenders. The bias of modern practice, in short, is towards milder methods, not only in treatment, but in those anticipatory processes which may render imprisonment unnecessary.

To understand the existing British prison system it is necessary to consider its gradual growth and the steps taken to establish it. Its foundations were laid by Sir George Grey, who served as home secretary when transportation ended rather abruptly by the refusal of the chief colonies to continue to be the dumping ground for British convicts. Sir George Grey sought to deal with the difficulty as best he could for all those who were deserving of severe correction and the minor offenders in the earliest stages of misconduct. For the first there was some urgency, the latter was still the business of the local authorities. The system now introduced consisted of three principal parts: (1) of a limited period of separate confinement in a home prison or penitentiary, accompanied by industrial employment and moral training; (2) of hard labour at some public works prison either at home or abroad; and (3) of exile to a colony with a conditional pardon or ticket-of-leave (q.v.). No pains were spared to give effect to this plan. Pentonville was available for the first phase; Millbank was also pressed into the service, and accommodation was hired in some of the best provincial prisons, as at Wakefield and Leicester. Few facilities existed for carrying out the second stage, but they were speedily improvised. Although the hulks at home had been condemned, convict establishments in which these floating prisons still formed the principal part were organized at Bermuda and Gibraltar. Neither of these was a conspicuous success; they were too remote for effective supervision; and although they lingered on for some years they were finally abolished. The chief efforts of the authorities were directed to the formation of public works prisons at home, and here the most satisfactory results were soon obtained. The construction of a harbour of refuge at Portland had been recommended in 1845; in 1847 an act was passed to facilitate the purchase of land there, and a sum of money was taken in the estimates for the erection of a prison which was begun next year. At another point, Dartmoor, a prison already stood available, although it had not been occupied since the last war, when ten thousand French and American prisoners had been incarcerated in it. A little reconstruction made Dartmoor into a modern gaol, and in the waste lands around there was ample labour for any number of convict hands. Dartmoor was opened in 1850; two years later a convict prison was established at Portsmouth in connexion with the dockyard, and another of the same class at Chatham in 1856. The third stage in Sir George Grey's scheme contemplated the enforced emigration of released convicts, whom the discipline of separation and public works was supposed to have purified and who would have better hopes of entering on a new career of honest industry in a new country than when thrown back among vicious associations at home. The theory was good, the practice impossible. No colony would receive these ticket-of-leave men. Van Diemen's Land positively refused to do so, even though this denial cut off the supply of labour, now urgently needed. The appearance of a convict ship at the Cape of Good Hope nearly produced a revolt. Although Earl Grey addressed a circular letter to all colonial governments offering them the questionable boon of transportation, only one, the comparatively new colony of Western Australia, accepted. But this single receptacle could not absorb the tithe of the whole number of convicts awaiting exile. It became necessary therefore to find some other means for their disposal. Accordingly, in 1853 the first Penal Servitude Act was passed, substituting certain shorter sentences of penal servitude for transportation. It was only just to abbreviate the terms; under the old sentence the transportee knew that if well conducted he would spend the greater part of it in comparative freedom. But although sentences were shortened it was not thought safe to surrender all control over the released convict; and he was only granted a ticket-of-leave for the unexpired period of his original sentence. No effective supervision was maintained over these convicts at large. They speedily relapsed into crime; their numbers, as the years passed, became so great and their depredations so serious, especially in garrotte robberies, that a cry of indignation was raised against the system, which led to its arraignment before a select committee of the House of Commons in 1863.

Meanwhile prison discipline in the elementary stage, as inflicted on lesser offenders, was continually discussed. The subject was referred to many committees for inquiry, and it was shown that there was a lamentable want of uniformity in the enforcement of prison discipline, in the treatment of prisoners, and in the system of prison punishments. The visits of the Home Secretary and his officials were virtually confined to the gaols nearest to the metropolis. The treatment was almost worse than the crime; the food was so bad that it was a question whether convicts died of disease, of hunger, or of thirst. The system was speedily ameliorated by the efforts of the prison inspectors of the times; but even in the most enlightened prisons it required years to produce any marked improvement. The details of prison life were the subject of reports and investigations in many parts of the world; the growth and progress of the prison movement was an object of the greatest interest. In 1863 the first code of prison discipline was proposed by Sir Richard Webster, and from that time on the system of prison administration has made steady progress. The prison system has been extended and improved, and the prisons have been made more humane and more efficient. The conditions of imprisonment have been made more comfortable and more conducive to the reformation of the criminal. The prisons have been made more efficient for the punishment of crime, and the punishment itself has been made more just and more merciful. The prisons have been made more efficient for the prevention of crime, and the prevention itself has been made more effective. The prisons have been made more efficient for the education of the criminal, and the education itself has been made more widespread. The prisons have been made more efficient for the reformation of the criminal, and the reformation itself has been made more assured. The prisons have been made more efficient for the rehabilitation of the criminal, and the rehabilitation itself has been made more complete. The prisons have been made more efficient for the reformation of society, and the reformation itself has been made more general.
labour in silence, was still preferred; and there might be prisons within a short distance of each other at which two entirely different systems of discipline were in force. In 1876, Mr Charles Pearson, M.P., moved for a select committee to report upon the best means of securing some uniform system which should be at once punitive, reformatory and self-supporting. He urged that all existing plans were ineffectual, and he advocated a new scheme by which the labour of all prisoners should be applied to agriculture in district prisons. The result of a full inquiry was the reiteration of views already accepted in theory but not yet generally adopted in practice. Thirteen more years elapsed and still no such steps had been taken. A new committee sat in 1863, and in its report again remarked no measured terms upon the power and control held by those inferior bodies that still existed in the gaols of Great Britain as regards construction, diet, labour and general discipline, “leading to an inequality, uncertainty and inefficiency of punishment productive of the most prejudicial results.” Matters could only be mended by the exercise of legislative authority, and this came in the Prison Act of 1865, an act which consolidated all previous statutes on the subject of prison discipline, many of its provisions being still in force. Yet the years passed and uniformity was still far from secured; it was impossible indeed while prison administration was still left to a number of local authorities, no two of which had exactly the same idea. It had exercised some supervision through its inspectors, had forbidden cells to be used until duly certified as fit, and had attempted to withhold exchequer contributions from prisons of which unfavourable reports were received. Such penalties had exercised no sufficient terror. It began to be understood, moreover, that the prisons under local jurisdictions were not always conveniently and economically situated. Crime, with the many facilities offered for rapid locomotion to those who committed it, had ceased to be merely local, and the whole state rather than individual communities ought to have been charged for the “hardships,” their “torments,” and their exchequer and not by local rates. These considerations gained strength and led at length to the introduction of the Prison Bill which became law in 1877, by which the control of all gaols was vested in a body of prison commissioners appointed by and responsible to the home secretary. These commissioners had power to consolidate by closing superfluous prisons, to establish one system of discipline, and generally by watchful supervision, aided by the experience of specialists, to maintain that much-desired uniformity which had been so long and unsuccessfully sought. At the same time the co-operation of the local magistrates was invited so far as advice and assistance in concerned; but all real power and control has passed from their hands into that of the commissioners of prisons. The system established by the act of 1877 is that now in force.

As for penal servitude, the punishment reserved for the gravest offences, great changes had been introduced. We left this branch of the subject at a parliamentary inquiry. The verdict given was in the main satisfactory; but doubts were expressed as to the severity of the discipline inflicted, the principal features of which were moderate labour, ample diet and substantial gratuities. The first was far less than the work free men did for a livelihood, the second larger, the third excessive, so that convicts often left prisons with thirty, forty, even eighty pounds in their pockets. Penal servitude, to use the words of the lord chief justice Sir Alexander Cockburn, one of the members of the committee, “was hardly calculated to produce on the mind of the criminal that salutary dread of the recurrence of the punishment which may be the means of deterring him and, through his example, others from the commission of crime.” The chief recommendation put forward to mend the system comprised lengthening of all sentences, a diminution in the dietaries, the abolition of large gratuities, and, speaking broadly, a general tightening of the reins. The most notable change introduced was a regulation of the number and value of which was to be regulated in future by the so-called “mark-system.” This plan had originated with Captain Maconochie, at one time superintendent in Norfolk Island, who had recommended that the punishment inflicted upon criminals should be measured, not by time, but by the amount of labour actually performed. In support of his theory he devised an ingenious system of recording the convicts’ daily industry by marks, which on reaching a given total would entitle them to their release. This mark system had already been tried with good results in Ireland, where the Irish system, as it was called, introduced by Sir Walter Crofton, had attracted widespread attention. There had been a very marked diminution in crime, attributable it was supposed to this system, which was in almost all respects the same as the English, although the Irish authorities had invented an “intermediate stage” in which convicts worked in a state of semi-freedom and thus practised the self-reliance which in many produced reform. As a matter of fact the diminution in crime was traceable to general causes, such as a general exodus by emigration, the introduction of a poor law and an increase in the facilities for earning an honest livelihood. It may be added here that judged by later experience the Irish system had no transcendent merits, and it is now extinct. But we owe something to the Irish practice which first popularized the idea of maintaining a strict supervision over convicts in a state of conditional release, and it reconciled us to a system which was long wrongfully stigmatized in which convicts worked in a state of semi-freedom and thus practised the self-reliance which in many produced reform. It was similar in principle and that was all. According to the committee, every convict should have it in his power to earn a remission—in other words, to shorten his sentence by his industry. This industry was to be measured by marks earned by hard labour at the public works, after a short probationary term of close “separate” confinement. But the remission gained did not mean absolute release. All males were to be sent, during the latter part of their sentence, “without disguise to a thinly peopled, rural parish, there permitted to live as poor men and to find livelihood.” The act of 1865, confirmed in 1878, established a special class of prisons in which all convicts “not versed in crime,” first offenders and comparatively innocent men, are now kept apart from the older and more hardened criminals. The committee last quoted gave it as their opinion that “penal servitude as at present administered is on the whole satisfactory; it is effective as a punishment and free from serious abuses . . . a sentence of penal servitude is now generally an object of dread to the criminal population.” Since then, steps have been taken in the classification of convicts when undergoing sentence with a view to dealing more effectually with habitual criminals.

Having thus traced the history of secondary punishments and prison discipline in England, it will be well to describe the system now actually in force. This will be best understood if we follow those who break the law through all the stages from that of arrest, through conviction, to release, conditional or complete.

After a short detention in a police cell, an offender, unless disposed of summarily, passes into one of His Majesty’s prisons, there to await his trial at sessions or assizes. The period thus spent in the provinces will never exceed three months; in London, however, at the Middlesex Sessions or at the Central Criminal Court, it is seldom more than one month. While awaiting trial the prisoner may wear his own clothes, provide
his own food, see and communicate with his friends and legal adviser so as to prepare fully for his defence. His fate after conviction depends on his sentence. If this be "imprisonment," so called to distinguish it from "penal servitude," although both mean deprivation of liberty and are closely akin, it is undergone in one of the "local" prisons—the prisons till 1878 under local jurisdiction, but now entirely controlled by the state through the home secretary and the commissioners of prisons. The régime undergone is cellular; able-bodied prisoners are kept in strict separation for at least a month, and during that time subjected to severe labour; although the term of first-class hard labour and of purely penal character no longer exists. The tread-wheel has now been abolished. A system of progressive stages based on the mark system has been adopted in the local prisons, and the prisoner’s progress through each depends on his own industry and good conduct. During the first stage, he is allowed to sleep on a mattress; or, if he has earned the number of marks which, at the earliest, cannot be until one month has elapsed, he passes into the second stage and is allowed better diet and a mattress twice a week. The third stage, at the end of the third month, gives him further privileges as regards diet and bed. The fourth stage concedes to the prisoner a mattress every night, and the privilege, if well conducted, to communicate by letter or through visits with his friends outside. These stages are applicable to females except as regards the plank bed; youths under sixteen and old men above sixty are also allowed mattresses. A small gratuity may be earned during the second and three following stages, amounting in the aggregate to ten shillings. The labour, too, may be industrial, and include instruction in tailoring, shoemaking, basket-making, bookbinding, printing, and many more handicrafts. Throughout the sentence the prisoner has the advantage of religious and moral instruction; he attends divine service regularly, and whatever his creed is visited by a chaplain professing it, and receives educational assistance according to his needs. His physical welfare is watched over by competent medical men; close attention is paid to the sanitary condition of prisons; strict rules govern the size of cells, with their lighting, warming and ventilation. Dietaries are everywhere the same; they are calculated with great nicety according to the time of durance, and afford variety and ample nutrition without running into excess. In a word, as regards discipline, labour, treatment, exactly the same system obtains in the "local" prisons throughout the United Kingdom.

Where the sentence passes beyond two years it ceases to be styled imprisonment and becomes penal servitude, which may be inflicted for any period from three years to life. The prisoner becomes a convict and undergoes his penalty in one or more of the convict prisons. These are entirely under state management. A sentence of penal servitude as now administered consists of three distinct periods or stages: (1) that of probation endured in separate confinement at a so-called "close" prison; (2) a period of labour in association at a public works prison; and (3) conditional release for the unexpired portion of the sentence upon licence or ticket-of-leave.

1. In the first stage, which was limited to six months, but which it is proposed to reduce to one month, the convict passes his whole time in his cell apart from other prisoners, engaged at some industrial employment. He exercises and goes to chapel daily in the society of others, but holds no communication with them; his only intercourse with his fellow-creatures is when he is visited by the governor, chaplain, schoolmaster or trade instructor. This period of unbroken solitude is of a painful character, and its duration has therefore been wisely limited.

2. The second is a longer stage and endures for the whole or a greater part of the remainder of the sentence, its duration being governed by the power a convict holds in his own hands to earn a remission. It is now passed at a public works prison; either at Aylesbury (females), Borstal, Dartmoor, Parkhurst or Portland. While cellular separation, except at work, at prayers or exercise, is strictly maintained, labour is in association under the close and constant supervision of officials. Inter-communication no doubt takes place; men working together in quarry, brickfield or barrow-run, and out of earshot of their guardians, may and do converse at times. But the work is too arduous to allow of long and desultory conversation; the chance of contamination is now minimized by the careful separation of the less hardened from the old offenders. There is no reason to suppose that any great evils arise from this association, and without it the execution of the many important national public works which now attest its value would have been impossible. Among these may be mentioned the following: the quarrying of stone for the great Portland breakwater, nearly 2 m. in length and between 50 and 60 ft. deep in the sea, with the defensive works on the Verne, batteries, case-ments and barracks intended to render the island of Portland impregnable. Having earned his remission the extension of the quarries at Chatham and Portsmouth. At Borstal a line of forts intended to protect Chatham on the south and west have been erected by convicts; they have also built magazines at Chattenden on the left bank of the Medway. Besides this, convict labour has been usefully employed in the erection of prison buildings at new points or in extension of those at the old. In all cases the bricks have been made, the stone quarried and dressed, the timber sawn, the iron cast, forged and wrought by the prisoners. The great merit of this system is the skill acquired in handicrafts by so many otherwise idle and useless hands. Convict mechanics are rarely found ready made. It is a fact that a large percentage of the total number employed at trades learnt them in prison. These results are no doubt greatly aided by the judicious stimulus given to the highest effort of the mark system. The chief objection to enforced labour has been the difficulty in ensuring this; but the convict nowadays eagerly tries his best, because only thus can he win privileges while in prison and an earlier release from it. Every day’s work is gauged and marks recorded according to its value; upon the total earned depends his passage through the stages or classes which regulate his diet and general treatment, and more especially his interviews and communications with his relations and friends. Yet more; steady willing labour continuously performed will earn a remission of a fourth of the sentence. It must be borne in mind that the marks thus earned may be forfeited at any time by misconduct, but affect remission to this extent only. The full remission in a five years’ sentence is one year and ninety-one days; in seven years, one year two hundred and seventy-three days; in fourteen, three years one hundred and ninety-seven days; in twenty, four years one hundred and ninety days. "Lifers" cannot claim any remission, but their cases are brought forward at the end of twenty years and then considered on their merits.

Upon conviction the convict enters upon the third stage of his punishment. He is released, but only conditionally, on licence or ticket-of-leave. This permission to be at large may easily be forfeited by fresh breaches of the law. Stingent conditions are endorsed upon the licence and well known to every licence holder (see Ticket-of-Leave).

Further modifications have been introduced from time to time in the British penal system, tending mostly to milder discipline, more intelligent classification of prisoners and a certain amelioration of their lot. In its general outlines the system as set forth above has been maintained, but the departmental committee appointed in 1895 made some important recommendations which were presently adopted in part. The committee was dissatisfied with the moral results achieved and thought that more attention should be paid to reformatory processes. They believed that "few inmates left prison better than when they came in." Reformatory work was frequent and recidivism on the increase. Imprisonment was not sufficiently deterrent to the habitual criminal class, and small attention was paid to the reclamation of less hardened offenders. The views of this committee were embodied in a Penal Servitude bill which was long debated, but became law in 1895.
emphasized the excellence of the system devised in 1879 for the segregation of the comparatively innocent from convicts hardened in crime. The system of the "star" class as originally established provided that the prisoner never previously convicted should be kept absolutely apart, at chapel, labour, exercise and in quarters, from his less fortunate fellows who had already been imprisoned. The rule was rigidly enforced and with some success. The percentage of so-called "stars" who have been re-convicted when once more at large. The privilege of the "star" is only accorded after careful inquiry and reasonable proof that the individual has never before been sent to prison. Reference is made to the police at the time of conviction, and the duty of looking into previous and present character is most strictly performed. The inquiry is continuous and may be prolonged into the sentence; then, if necessary, correction is applied. But as a matter of fact very few mistakes are made. It is obvious that wrongful admission into the "star" class might be fraught with mischievous consequences, and it is well known that a first sentence does not necessarily mean absolute acquainatance with crime. For administrative convenience the "star"—whose name comes from the scrap of crimson cloth worn on cap and jacket sleeve—have been generally concentrated at Portland, and employed in labours specially allotted to them, for the most part demanding a higher rate of intelligence than the general average shown by convicts. Moulders, blacksmiths, carpenters, tinsmiths, stonemasons, bookbinders, painters and various other trades and handicrafts are the peculiar province of the "stars."

The Prison Act of 1868 made some marked changes in penal discipline. One was the strict limitation of corporal punishments to offences of mutiny and gross personal violence to officers, where previously it might be inflicted for many forms of misconduct, and it can only now be adjudged under great restrictions. It was feared that the removal of this powerful deterrent would adversely affect discipline, but on the contrary, the yearly average of prison offences has diminished from 147 to 137 per thousand prisoners, and it has been felt by the authorities that the limitation was salutary and wise. Another change was the power given to courts of law to differentiate between offenders by ordering them one of three classes of treatment ranging from severe to less rigorous. The first of these divisions was akin to that of former first-class misdemeanants; the second division was allotted to persons guilty of trivial offences not amounting to moral depravity, the third division was apportioned to serious crime calling for severe repression, involving strict separation for the first twenty-eight days with "hard labour" (now an obsolete expression, since all prison labour is nowadays accounted "hard"). The scheme was judicious, but courts have been slow to make use of its provisions. Yet a third improvement was permission conceded to prisoners locked up in default of payment of fine, to obtain a reduction of time proportionate to part payment of the fine. The numbers under both categories are considerable, and taken together show a steady increase in the ten years from 1892 (when the acts first came into effect) to 1902, the figures being 33,802 in 1892 and 51,302 in 1902.

Imprisonment, albeit somewhat modified and dilated, continues to be used as the chief penalty and most trusted panacea for all crime. The medicine is so simple in application and so easily available that it is served out almost automatically and indifferently to every law-breaker; the pickpocket and the burglar are locked up next door to the clergyman at variance with his bishop; the weak-kneed and self-indulgent drunkard rubs shoulders with the political zealot who has endangered the nation's safety; so that there is an enormous mass of so-called crime in England which is not crime at all, and still is perpetually penalized by at infliction of imprisonment for such short periods as to be perfectly futile. The bulk of the offences for which it is meted out are trivial and unimportant. Eighty-three per cent of the annual convictions, summarily and on indictment, followed by committal to gaol, are for misconduct that is distinctly non-criminal, such as breaches of municipal by-laws and police regulations, drunkenness, gaming and offences under the vagrancy acts. The lenity of the sentences indicates the comparatively trifling character of the wrongdoing. Forty per cent of the males and 39% of the females were sent to prison for periods of a week or less; on the other hand, no more than 4% were sentenced to six months and under, only 2% were imprisoned for terms between six months and one year; and 75% to more than one year. The question arises, whether it is really necessary to maintain sixty-five local prisons, with all their elaborate paraphernalia, their imposing buildings and expensive staff, to maintain discipline in daily life and insist upon the proper observance of customs and usages, many of them of purely modern invention. Of course there is in most cases the alternative of a fine, the non-payment of which entails the imprisonment; yet a penalty imposed on the pocket is so clearly the proper retribution for such misdeeds that better methods should be devised for the collection of fines.

The chief aim of penal legislation should indeed be either to keep gaols empty or to use them only where distinct reduction in the number of offenders, whether by regeneration or by continuous withdrawal from noxious activity, can be obtained. An axiom based upon this view has been formulated, and although paradoxical it may well be quoted here. The great aim and object of all penal processes, it has been said, should be the recognition of the general principle of dividing all offenders into two categories: (1) those who ought never to enter a gaol, and (2) those who ought never to be allowed to leave it. Praiseworthy efforts to compass the first end have been made in recent legislation. The First Offenders Act in 1879 had the effect of postponing sentence and sparing those offenders from incarceration subject to their good conduct. An average of about 4500 thus escaped imprisonment in the five years between 1893 and 1897, and an average of 5500 the five following years. The gain in this was great, seeing that no more than 6 to 8% were actually sent to gaol after the commission of a second offence, and that there was therefore a very distinct saving in expense of maintenance of prisoners incarcerated. The value of this act is to be seen in its wide adoption. It is in force in some of the states of the American Union. It was adopted in France by the Berenger law of 1861, and in Belgium, where 14% of sentences of imprisonment in one year and a-half were postponed. In some countries the concession has been accompanied by admonition. The Summary Jurisdiction Acts, by which large numbers of minor offenders were discharged on bail, or subjected to fines or very brief terms of imprisonment, have also tended to diminish the prison population enormously. The number annually discharged increased from 33,000 in 1893 to 51,302 in 1902. This excellent system has commended itself to many countries and it is now adopted by the bulk of governments and jurisdictions owing allegiance to the British Crown.

Two new systems of applying imprisonment have commended themselves to English administrative and both have been effected by the Prevention of Crime Act 1908. The first is a new method for educating and reforming young offenders, already on the frontiers of habitual crime, no longer children, but at an age still susceptible of permanent improvement; the second is the legal acceptance of the principle of indefinite detention, the willingness to inflict an indeterminate sentence on those who have already forfeited the right to be at large.

Both these measures originated in the United States. The Borstal scheme of a juvenile-adult reformatory has been to some extent planned on the institutions of Elmira reformatory in the state of New York and of Concord in Massachusetts (see Juvenile Offenders). Side by side with the new processes introduced, the idea of the indeterminate sentence was started and put in practice, by which release was made to depend upon reasonable hope of amendment and sentences were prolonged until it was more or less certain that the treatment had resulted in cure.

Other measures are set forth in the new classification of convicts, prescribed by the secretary of state in the rules submitted by him to the House of Commons in 1904. All convicts
are classed in three categories, viz. (A) the Ordinary division; (B) the Habitual Offenders' division; and (C) the Long Sentence division.

The "A" or Ordinary division comprises all ordinary convicts under old rules who are still separated into the three classes of "star," intermediate and recidivist, as provided by the act of 1868. The qualifications for each class are clearly laid down. Only those never previously convicted, or known as of not habitually criminal or corrupt habits, are eligible for the "star" class. The intermediate class takes those not previously convicted but deemed unsuitable as "stars" from antecedents and generally unsatisfactory character. The recidivist class is for those previously sentenced to penal servitude or whose record shows them to have been guilty of grave and persistent crime.

These three classes begin with cellular confinement, but for varying periods; the first for three months, the second six months and the third for nine months, in all cases subject to a medical report upon mental and physical condition. Female convicts pass the first three months of their sentence in separate cells.

The "B" division indicates the worst penalties to be inflicted upon habitual criminals. There is no recognition whatever of the principle of the indeterminate sentence. The law merely prescribes the forfeiture of all remission. The convict is not eligible for release or licence, but when the time of conditional liberation would have formerly arrived the case is submitted to the authorities and dealt with on its merits. Early release depends upon the reports on industry and conduct, and the prospect of his keeping straight if set free. He may have to do his whole time but not an hour beyond it.

Certain privileges are conceded to the "B" division to compensate those in it for the loss of remission. They wear a special dress, a band of blue cloth on the arm left; they may earn an extra gratuity and spend a part of it in buying extra food or articles of comfort and relaxation; they may take their meals in association, converse at them or at exercise, but not at labour.

The "C" division has been designed for convicts serving long sentences, who have gained all possible privileges in the early years of sentence and have little or nothing to expect further until the last year of their sentence, when they may earn an additional gratuity. But after ten years they may enter the "C" division, earn a special gratuity therein, and enjoy the various privileges accorded to the "B" or habitual criminals' division with the additional advantage that there is no interference with their remission.

Still milder and more humanitarian prison treatment was that put forward by the home secretary in 1910 in his speech already referred to. In it he suggested that the following reforms should be carried out, some by administrative order and some by future legislation: (1) time for the payment of fines inflicted for minor offences; (2) disciplinary treatment outside prison for all offenders under 21 years of age; (3) punishment of those guilty of offences not involving moral turpitude to be relieved of all degrading features; (4) the reduction of the period of solitary confinement to a maximum of one month; (5) and the abolition of the ticket-of-leave system. It was also proposed to give four lectures or concerts a year in convict prisons.

**Prisons in other Countries.** The general progress made in prison treatment will be best realized by a brief survey of penal institutions in the principal countries of the world. It will be convenient to take them alphabetically.

**Austria-Hungary.** The régime of cellular confinement has not been universally adopted; only six prisons are built on that principle and no more than 15% of the whole number of prisoners can be subjected to the system. Cellular separation is not inflicted for long periods, the minimum being six months and the maximum three years. The bulk of the prisoners live and labour in common. A great feature has been the execution of public works by prisoners in the form of semi-liberty beyond walls—the practical adoption of the so-called "Irish" or intermediate prison—and good results are seen in road-making and the improvement of river courses.

2. **Belgium.** This country has spared neither pains nor money in carrying out penal processes, and the Belgian prisons are examples of the cellular system prolonged to the utmost limits of human endurance. There is a belief in the British philosopher, Jeremy Bentham, that the individual may elect to continue in separation, or be transferred to the institution. A new school of Belgian criminologists has been headed by M. Prins, the chief of the prison department, who has protested that "it is a simple delusion on the part of the Belgian system to surround with every attention, soaked with good counsel, will leave his cell regenerated," is a Utopian dream.

3. **British Dominions beyond the Seas.** The principle of cellular separation was accepted as far back as 1836 and the most individual may elect to continue in separation, or be transferred to the institution. A new school of Belgian criminologists has been headed by M. Prins, the chief of the prison department, who has protested that "it is a simple delusion on the part of the Belgian system to surround with every attention, soaked with good counsel, will leave his cell regenerated," is a Utopian dream.

4. **Denmark.** In Denmark all convicted prisoners pass through several stages, from cellular treatment to the intermediate prison and conditional liberty. Two new prisons on the latest model have been erected at Copenhagen, one for males and the other for females. The smaller gaols for short terms are mostly on the cellular plan.

5. **France.** France has devoted very considerable attention to penal reform, and in all its penal institutions is the strictest system of the isolation, and the strict cellular isolation of the Belgian system and the penal exile or transportation which was long the English rule.

6. **Germany.** The unified German Empire has not as yet adopted completely the cellular principle, and its component kingdoms still retain independence in views and practice.

Baden has a well-known cellular prison at Bruchsal, but separation is not imposed for more than four years and associated labour is carried on in another prison. Bavaria has four cellular prisons, the chief being at Munich and Nuremberg, but the collective system also obtains.

Bavaria has been foremost for the cellular system. In 1815 the well-known Monastir prison at Berlin was opened, and in 1861 the Tihar in Silesia and of Herford in Westphalia, while those of Gradenz, Breslau, Werdan and Cologne have been added since. The total number of separate cells to-day is 11,043 against 3,247 in 1866. The number of prisoners, Lüttringhausen and Saarbruck, have recently been added.

Frankfurt has a good prison on the Pentonville (London) plan; so has Hamburg; and new buildings have been erected at Wohian, Siegburg, Breslau and Munster. Separate cells in Prussia increased in 1896 from 3,247 to 6,753. The cellular régime is applicable to prisoners between 18 and 30, and to first offenders of 50 years of age, the term being fixed by the governor of the gaol, though judges have left the way open for remissions.

Saxony established a penitentiary at Zwickau in 1850 and in its earlier management exhibited exaggerated kindness to its inmates. Both cellular and collective systems have been adopted, and the Württemberg has adopted the cellular system. There are prisons for females at Heilbronn, and for males at Ludwigsburg and Stuttgart; in Württemberg itself the régime is collective.

The links of the old system have followed. Prussia has limited the number of separate cells to-day, and now at command separate cells sufficient to receive the whole number of her prison population. The system of unbroken seclusion, prolonged to five years, is maintained with strictness.

7. **Italy.** Although accepting the principle of cellular imprisonment, Italy has not adopted it largely, partly from want of funds and not a little because the current of thought has set against it. The really penal establishments are 77 in number, the great ergastolo of San Silvestro being the largest. The system is essentially the same as that tried in colonies of coatti (or those provisionally released) planted out in the islands of the Italian archipelago.

8. **New Zealand.** The penal system has been an independent state from Sweden has produced no great change in its prison institutions, which still follow the lines of the neighbouring country.

9. **Portugal.** There are three or more cellular prisons at Lisbon, Coimbra and Santarem, and one at Evora, the first of which was adopted in 1840.

10. **Sweden.**—Prince Oscar of Sweden was one of the earliest adherents of cellular imprisonment, and at his urgent representation the reformation was begun. The system is still carried out, and the system in force in Norway and Sweden is progressive from strict separation to working outside the cell. Sweden, on the other hand, has made great improvements in the number of cells sufficient for prisoners sentenced to two years and less. There are three principal central prisons, one at Langholm near Stockholm, a second at Malmo and a third at Myn Varlet near Gothenburg.

11. **United States.**—The system in the United States varies between being the most advanced and the most backward in the civilized world. At one end of the scale are the numerous bad
PRISONERS' BASE—PRITCHARD, C.

county gaols and the horrors of the convict lease system in the southern states, now nearly extinct; at the other such modern and well-equipped reformatories as Elmira and Concord (see JUVENILE Offenders and delinquents), or the penitentiaries at which the labor of the inmates is carried on by perfect machinery. In all these institutions, although sometimes seen of all inmates, bond and free, the convicted and accused; even witnesses against whom there is no shadow of a charge are sometimes imprisoned among felons. Nor is it only in distant confinement that this criticism applies, though constant improvements are removing the grounds for it. It is only a short time since the local gaol in the city of New York, "the Tombs," closed its doors as a place of convicts, and all the system of penal institutions of that city described in an official report to the state legislature as "a disgrace . . . it is defective in every modern appliance. It is dark, damp and ill-ventilated . . . worst of all is the hideous system of keeping two or three in a cell, whereby the stench of the vilest and most loathsome and good order, built on the best and most imposing lines with large comfortable cells and an abundance of light and air. The earnest desire of the authorities to introduce innovations is not shared by those of the state and trade profits side by side with mildness of treatment. The latter sometimes lapses into methods which are not usually thought compatible with prison discipline, such as the permission to play on musical instruments and the purchase of contraband articles of tobacco and chewing tobacco, of receiving baskets of provisions, newspapers and letters from friends outside.

It is worthy of note that prison architecture in the United States mirrors many of the same features common to such constructions. The newest prisons are generally lighter, more roomy, better ventilated and on the whole more comfortable than even the best British prisons of a century or two ago. The British Home Secretary has recently declared that "the purity of the air and the cleanliness of the American prisons are admirable, and under a very elaborate system of warming by hot air, a regular and uniform temperature is sustained throughout the year, which, considering the varying nature of the climate from extreme heat to cold many points below zero, is a considerable engineering triumph.

Prison Industries.—It is an axiom in prison science that enforced labor and voluntary industrial pursuits are the best form of labour. It has been a measure solved in England by that useful incentive to industry, the mark system. But the more substantial returns can only be expected with the sedentary employed and a single-handled effort instead of the general one. Both are found, in the Protestant workhouses of this country and in the "fullers of the wicker" of the French Revolution. Although the system still has many hostile critics its value cannot be contested. It has been said by a trustworthy authority, "We are convinced also that severe labour on public works is most beneficial in teaching criminals habits of industry and training them to such employments as digging, road-making and brick-making—work of a kind which cannot be carried on in separate confinement." A good proof of the value of the system as remunerative and healthful, morally and physically, is seen in the growing desire of other countries to follow our lead. Very similar operations have been carried out in Austria-Hungary, where large tracts of land have been brought into cultivation. The American prisons are not without their success. Many of the institutions are being reorganized on the model of the reformatories of France and Belgium, and it has been reported that the "industries are pursued with great success at the Saint-Vincent penitentiary in the state of Kentucky; at the penitentiary of Michigan, that of Missouri, and other State institutions". The system is also adopted in some of the Southern States, and has produced the convict camps, which have been much criticized and condemned from the want of discipline enforced, the many abuses that exist and the meagre returns other than monetary that have been obtained.

The modern movement in favour of industrial employment combined with humane and intelligent considerations has swept all before it, and within the last fifteen years there have been few exceptions.

The prisoners are divided into two sides, each standing within a base or home marked off at some distance apart. After preliminary songs and war-like challenges, each side follows the other. The side which is pursued is referred to as the "enemy"; if touched he becomes a prisoner of the side to which his captor belongs. If another player from the side of the pursued runs between him and his pursuer, the latter has to follow him, but the last to leave his base is privileged to touch any one of the enemy who left his base before him. The rules of the game are, however, traditional, and necessarily somewhat elastic. The end comes, of course, when all of one side have been captured by the other.

PRITCHARD, CHARLES (1868–1893), British astronomer, was born at Alberbury, Shropshire, on the 29th of February 1868. At the age of eighteen he was enrolled as a sizar at St John's College, Cambridge, and in 1885 he graduated in 1885 as fourth, wrangler. In 1882 he was elected fellow of his college, and in the following year he was ordained, and became head master of a private school at Stockwell. From 1834 to 1862 he was headmaster of Clapham grammar school. He then

PRITCHARD, H.—PRIVET

PRITCHARD, Hannah (1711–1768), English actress, whose name before her early marriage—to an actor—was Vaughan, first attracted attention as a singer at Bartholomew's Fair in 1733. She was soon playing a wide variety of parts, mostly comedy, at the Haymarket, Drury Lane and Covent Garden. When Garrick became patron of Drury Lane in 1747 she joined his company and played with him for twenty years, her last appearance being as Lady Macbeth—one of her greatest roles—in April 1768, a few months before her death. Her talents were highly thought of by the critics of the day. Her daughter, who had studied under Garrick, and whose beauty created a sensation when she made her debut (as "Miss Prichard") in October 1756, did not live up to the expectations then raised. She married in 1762 the actor John Palmer, retired from the stage at the same time as her mother, and after her husband's death married a political writer named Lloyd.

PRITTLEWELL, a residential parish in the borough of Southend-on-Sea, and in the S.E. parliamentary division of Essex, England; lying 14 m. inland (N.N.W.) from Southend, with a station on the Southend branch of the Great Eastern railway. The church of St Mary the Virgin has fine Perpendicular work and traces of Norman work. There are fragments of a Clunian priory of the 12th century. Pop. (1901), 37,245.

PRIVAS, a town of eastern France, capital of the department of Ardèche, 95 m. S. by W. of Lyons on a branch line of the railway from that city to Ni Mes. Pop. (1906), town, 34,953; commune, 7,000. Privas is situated near the Ouvèze, here joined by the Drayzon and Chazalon. The town is the seat of a presbytery, a court of assizes and a tribunal of first instance. Other institutions are training colleges for both sexes, a communal college and a lunatic asylum for the departments of Ardèche and Drôme. Silk-milling is carried on. The rearing of silkworms and the cultivation of the mulberry are widespread industries. There are mines of iron ore in the vicinity. Trade is in silk, tanned leather, game, chestnuts and fruit preserves.

Privas is first heard of in the 12th century, as a possession of the counts of Valentinois, and subsequently became the seat of a separate barony. One of the strongholds of the Reformed Faith, it suffered terribly during the Wars of Religion. It was effectually besieged by the royal troops in 1574, it passed in 1619, by the marriage of the heiress of the barony, Paule de Chambaud, into the possession of the vicomte de Lestrange, a Roman Catholic noble. A general rising followed, and in 1620 it was besieged and taken by Louis XIII. It was reduced to ruins, and the king decreed that it should not be again inhabited; but in 1632, some of the townsmen having fought against Lestrange, who had joined Montmorency's rebellion, the inhabitants were allowed to return. Some ancient houses, which escaped the general destruction, are still standing.

PRIVATEER, an armed vessel belonging to a private owner commissioned by a belligerent state to carry on operations of war. The commission is known as letters of marque. Acceptance of such a commission by a British subject is forbidden by the Foreign Enlistment Act 1870. Privateering is now a matter of much less importance than it formerly was, owing to the terms of art. 1 of the Declaration of Paris, April 16, 1856, "Privateering is and remains abolished." The declaration binds only the powers who are signatories or who afterwards assented, and those only when engaged in war with one another.

The United States and Spain have not acceded to it, but though it did not hold as between them in the war of 1898, they both observed it. Privateers stand in a position between that of a public ship of war and a merchant vessel, and the raising of merchant vessels to the status of warships has in recent wars given rise to so much difficulty in distinguishing between volunteer war-ships and privateers that the subject was made one of those for settlement by the Second Hague Conference (1907). The rules adopted are as follows:—

1. A merchant-ship converted into a war-ship cannot have the rights and duties appertaining to vessels having that status unless it is placed under the direct authority, immediate control and responsibility of the power the flag of which it flies.

2. Merchant-ships converted into war-ships must bear the external marks which distinguish the war-ships of their nationality.

3. The commander must be in the service of the state and duly commissioned by the proper authorities. His name must figure on the list of the officers of the fighting fleet.

4. The crew must be subject to military discipline.

5. Every merchant-ship converted into a war-ship is bound to observe in its operations the laws and customs of war.

6. A belligerent who converts a merchant-ship into a war-ship must, as soon as possible, announce such conversion in the list of its war-ships.

In connexion with the conversion of the "Peterburg" and "Smolensk" on the high seas during the Russo-Japanese War, and the ruse by which they came through the Bosporus and the Dardanelles, it was agreed, after a vain attempt to solve the question in a way satisfactory to all parties, that the subject of whether the conversion may take place upon the high seas should remain outside the scope of the convention. (T. BAJ.)

PRIVET, in botany, the vernacular name of Ligustrum, 1 a genus of Oleaceae, containing about thirty-five species, natives of Europe.

1 Other vernacular names for the common species are prim, primprint, primwort and primrose.
of temperate and tropical Asia; only the common privet is a native of Europe. They are shrubs or low trees with evergreen or nearly evergreen opposite entire leaves, and dense clusters of small, white, tubular four-parted flowers, enclasping two stamens and succeeded by small globular, usually black berries, each with a single pendulous seed. The best-known species is the common European privet, L. vulgare, which makes good hedges; L. ovalifolium (a native of Japan) thrives by the seaside and even in towns; there is a yellow-leaved variety (var. variegatum), the leaves becoming white as they get older. L. lucidum (China) is taller and handsomer. There are numerous varieties of L. vulgare in cultivation; var. buxifolium has broader and more persistent leaves; var. fructu-luteum has bright yellow fruit; var. pendulum has long weeping branches; and var. variegatum has the leaves variegated with bright yellow. L. giallum (Khasia Hills) and other species are also cultivated. Mock-privet is Phillyrea, a member of the same order and a small genus of ornamental hardly evergreen shrubs, natives of the Mediterranean region and Asia Minor.

PRIVILEGE, in law, an immunity or exemption conferred by special grant in derogation of common right. The term is derived from privilegium, a law specially passed in favour of or against a particular person. In Roman law the latter sense was the more common; in modern law the word bears only the former sense. Privilege in English law is either personal or real—that is, granted to a person, as a peer, or to a place, as a university. The most important instances at present existing in England are the privilege of parliament (see PARLIAMENT), which protects certain communications from being regarded as libellous (see LIBEL and SLANDER), and certain privileges enjoyed by the clergy and others, by which they are to some extent exempt from public duties, such as serving on juries. Privileged copyholds are those held by the custom of the manor and not by the will of the lord. There are certain debts in England, Scotland and the United States which are said to be privileged—that is, such debts as the executor must first apply the personal estate of the deceased, in payment, for example, of funeral expenses or servants' wages. In English law the term "preferred" rather than "privileged" is generally applied to such debts. There are certain deeds and summonses which are privileged in Scots law, the former because they require less solemnity than ordinary deeds, the latter because the ordinary inductees are shortened in their case (see Watson, Law Dict., s.v. "Privilege").

In the United States the term privilege is of considerable political importance. By art. iv. § 2 of the constitution, "the citizens of each state shall be entitled to all privileges and immunities of citizens in the several states." By art. xiv. § 1 of the amendments to the constitution, enacted July 28, 1868, "no state shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States." It will be noticed that the former applies to citizens of the states, the latter to citizens of the United States. "The intention of this clause (art. iv.) was to confer on the citizens of each state, if one may so say, a general citizenship, and to communicate all the privileges and immunities which the citizens of the same state would have been entitled to under the like circumstances" (Story, Constitution of the United States, § 1866). The clauses have several times been the subject of judicial decision in the Supreme Court. With regard to art. iv., it was held that a state licence tax discriminating against commodities the production of other states was void as abridging the privileges and immunities of the citizens of such other states (Ward v. State of Maryland, 12 Wallace's Reports, 418). With regard to art. xiv., it was held that its main purpose was to protect from the hostile legislation of the states the privileges and immunities of citizens of the United States, looking more especially to the then recent admission of negroes to political rights. Accordingly it was held that a grant of exclusive right or privilege of maintaining slaughter-houses for twenty-one years, imposing at the same time the duty of providing ample con-

veniences, was not unconstitutional, as it was only a police regulation for the health of the people (The Slaughter-House Cases, 16 Wallace, 36). The same has been held of a refusal by a state to grant to women a licence to practise law (Bradwell v. The State, 16 Wallace, 130), of a state law confining the rights of suffrage to males (Minor v. Happersett, 21 Wallace, 162), and of a state law regulating the sale of intoxicating liquors (Bartley v. Iowa, 18 Wallace, 129). Suits to redress the deprivation of privilege secured by the constitution of the United States must be brought in a United States court. It is a crime to conspire to prevent the free exercise and enjoyment of any privilege, or to conspire to deprive any person of equal privileges and immunities, or under colour of law to subject any inhabitant of a state or territory to the deprivation of any privileges or immunities. (Rev. Statutes of United States, §§ 5507, 5310, 5530, 5532.)

PRIVY COUNCIL. The origin of the privy council dates back substantially to the Norman period of English history. The commune concilium, the assembly, in theory, of all the tenants-in-chief of the Crown, had attached to and included in it a group of officers of state and of the royal household, who with a staff of clerks and secretaries carried on the executive, judicial and financial business of government. This group, of necessity permanent, it is suggested, formed the curia regis; and appears to have consisted of the chancellor, the chief constable, the treasurer, the steward, the chamberlain, and other officers who were, together with the two archbishops and any other persons the king might choose to appoint. Their duties were to advise the king in matters of legislation and administration, to see justice done and generally to execute the royal will. Such a blend of advisory, executive and judicial power could exist only in a simple condition of affairs, and therefore it was to be expected that as government became more settled, and more complicated, a separation of powers would inevitably follow. The change came quickly. Quite early finance was dealt with by a small section of the court convened at the exchequer chamber; this soon developed into a separate department controlled by the treasurer, managing the revenue and deciding all suits connected with its administration. A little later the court of king's bench and the court of common pleas grew into being, and by the end of the reign of John these two courts were finally separated from one another and from the curia. The establishment of separate courts of justice, although relieving the curia of much of its work, did not deprive it of all judicial power. The king was the fountain of justice, and where redress could not be obtained in the ordinary way, either from the greatness of the disputation, through private oppression, or because no other means existed, resort still remained to the Crown, either in the first instance or when all other courses had failed the petitioner. Relieved of financial detail and the bulk of its judicial work, the curia continued to develop on the lines of an advisory and administrative council. Becoming prominent as a council of regency during the minority of Henry III., it quickly assumed definite form as the concilium regis. Under Edward I. its members take an oath; they are sworn of the council—swearing to give good advice, to protect the king's interests, to do justice honestly, to take no gifts" (Maitland, Const. Hist. p. 91). At this period in addition to the great officers of state the judges and a number of bishops appear among the members. One of the most important duties of the council was to advise the King in matters of legislation. During the fourteenth and fifteenth centuries, ordinances in subordinate matters appear to have been made regularly by the king in council and accepted as legal by parliament and by the judges. In early parliamentary days it was also part of the council's duty to put into legislative form the petitions sent up by the Commons. Frequently the statute in its final form did not correspond with the petition, and the Commons were continually complaining of the council's unwarrantable interference. Eventually by the reign of Henry VII. the council had ceased to interfere, the petitions being drawn in the form of a bill, and enacted without alteration.
During the 14th century the concilium regis had become definitely distinct as well from parliament as from the courts of law. Under Henry IV. in 1404 the council numbered nineteen—three bishops, nine peers and seven commoners. The members held office at the king's pleasure, they are sworn to give their best advice and are well paid for their work. They meet continually, though the King is often absent, but their proceedings are committed to writing. Maitland (Const. Hist. p. 199) sums up the work as follows: "The function of the Council is to advise the King upon every exercise of the royal power. Every sort of ordinance, licence, pardon, that the King can issue is brought before the Council. Sometimes Parliament trusts it with extraordinary powers of legislation and taxation; to raise loans and the like. It is to the advice of the Council that the King looks in all his financial difficulties." The powers of the council naturally varied with the character of the king. Quiescent and obedient under a strong king, its influence was reasserted under a weak one; and when infant kings sat on the throne, for all practical purposes it became the ruler of the land.

In spite of the existence of regular courts of law the council continually interfered with affairs of justice. Many attempts were made by it to set aside or to disregard the judgments of the ordinary courts, but by the beginning of the 15th century parliament had forcibly intervened, and the council gave in. Repeatedly statutes were passed during the reign of Edward III. with a view to checking the council's original jurisdiction in criminal matters, but without effect, as in the reigns of Henry IV. and his son the Commons are found still petitioning against the practice. Yet during the period under review parliament is continually enacting that certain offenders are to be punished by and at the discretion of the council. Evidently such a tribunal, quickly and informally constituted, bound by no legal rules and maxims, proved a useful engine for sharp and speedy punishment. In 1487 was passed an act (3 Hen. VII. c. 1) which is accounted the creator of the Court of Star Chamber. Perjury, riot, bribery of jurors and misconduct of officials had grown rife, and the act authorizes certain members of the council to call offenders before it, to examine them, and if satisfied of their guilt, to punish them. In later years of the council appear to have sat and exercised a widely extended criminal jurisdiction, inflicting every kind of punishment short of the death penalty. This body was the Court of Star Chamber and remained in existence until its abolition by act of parliament in 1641.

During the 14th century many petitions relating to civil disputes were presented to the council and were frequently taken into consideration by it on the ground that extraordinary remedies were required, either from lack of legal form or owing to influential private oppression. Eventually where the courts could decide, it became the practice of the council not to interfere, but where no relief could be obtained the council passed the petition on to the chancellor. In course of time the petitions went direct to the chancellor, and in this manner the equity jurisdiction of the court of chancery was established. The act of 1641, which abolished the Court of Star Chamber, also formally forbade the council to meddle with civil causes.

During the Tudor period the council grew in importance; it became useful to the Crown as a vehicle for straining prerogative to the utmost. By the act 31 Hen. VIII. the king's proclamation acquired the force of law, and for a short period the king in council had concurrent legislative power with parliament. Henry's statute was repealed by 1 Edw. VI. c. 12 and the legislative supremacy of parliament re-established. In 1553 the council numbered forty members—four bishops, fourteen peers and the rest commoners. The increase in the number of its members, the direct and often independent communication between the Crown and its secretaries, and the strong personality of the Tudor sovereigns quickly reacted on the work of the council. It had become too large for consultative purposes and the sovereign began a practice, which quickly grew, of consulting only its important members. In this way, within the council itself, there appears a small inner ring—a true privy council—the parent of the cabinet of later days.

The struggle of James I. and Charles I. for absolute power and finally the Rebellion, ended by leaving the council for the time being impotent. The act of 1641 had not only abolished its special criminal jurisdiction but forbade its interference in civil cases, while the growth of the Secretariat had gradually removed the bulk of its administrative powers. In the end there was little left for it but occasional meetings to give legal sanction to orders it had no concern with, and on the judicial side to act as a court of final resort in Admiralty matters and for all civil and criminal appeals from the courts of the Crown's dominions beyond the seas.

In the reign of Charles II. an attempt was made to revive the usefulness of the council. A scheme was prepared by Sir William Temple in 1679 and accepted by the king. A representative council of thirty members came into being and attempted to carry out the new scheme, but the king, after a short trial, held to his old opinion that the numbers of the council made it "unfit for the secrecy and dispatch which are necessary in many great affairs." Once more the king returned to his council of committee, by calling in the secret committee and council of ministers to carry on the work. Under William III. faction flourished and made general agreement at the council board impossible. George L., ignorant of the English language, never appeared at its meetings, with the result that the direction of affairs passed into the hands of a committee of ministers—the cabinet.

Although the true privy council is the cabinet, the name is to-day given collectively to a large number of eminent people whose membership and position are titular only. All members of the cabinet if not already privy councillors become so on appointment to cabinet office. Occasionally, subordinate members of the ministry and some of its private supporters are made privy councillors as a special distinction. The lord chancellor, the lords of appeal in ordinary, the president of the probate division, the lord president of the court of session in Scotland, the lord justice clerk and the lord advocate of Scotland are always privy councillors, as are the archbishops of Canterbury and York and the bishop of London. In 1867 all the premiers of the self-governing colonies were made privy councillors. Of recent years, retired ambassadors, judges, retired civil servants and persons distinguished in science, letters and arts have been appointed. The custom seems also to be growing of using the honour of privy councillor to reward political supporters who do not wish for hereditary titles. The collective title of the council is "the Lords and others of His Majesty's Most Honourable Privy Council." The members are addressed as "Right Honourable" and wear a state uniform. The appointment is informal, the new privy councillor simply being invited by the king to take his seat at the board. He is then sworn in, and his name placed on the list. Office lasts for the life of the sovereign and six months after, but it is the modern custom for the new sovereign to renew the appointment.

Meetings of the whole council are held at the beginning of a new reign or when the reigning sovereign announces his or her programme. The council now consists of fifty-three members, of which the cabinet, under the terms of the Act of 1940, are entitled to attend. The whole council might also be summoned on other occasions of state and ceremony.

The formal meetings of the council are attended by the few councillors concerned with the orders to be issued. These are generally ministers or officials. The chief officer of the council is the lord president, now a cabinet minister of the highest rank, but without departmental duties. The office of clerk of the council dates from 1540 and his signature is necessary to authenticate all orders.

The administrative work of the council has always been done through committees, and during the last two centuries in spite of changed conditions this rule has been preserved in theory. The board of trade, the local government board, the education department and the board of agriculture were all committees of the council. Now, of course, these so-called committees are state departments presided over by ministers responsible to
PRIVY PURSE—PRIZE

parliament. The existing jurisdiction of the council is both administrative and judicial.

Administrative.—This jurisdiction depends chiefly upon statutory authority, which practically makes of the privy council a subordinate legislature, not one of representative character. The council is not a council of ministers, in the sense that the term is used under our constitutional system. Matters are referred to the Crown in council, the departments of state concerned settling the details. Other examples of administrative work are the universal committee on corporation under the Municipal Corporations Act (1882), the Gomisral Acts, the Local Government Board, and the Royal Commission on Local Government in Ireland. Cases affecting the constitutional rights of the Channel Islands are referred to a committee for the affairs of Jersey and Guernsey. The committee report to the Crown in council, and their report is adopted and enforced by an order in council published in the Gazette. Among other acts conferring administrative powers on the privy council are the Pharmacy Act (1852), as amended by 31 & 32 Vict. c. 121, the Medical Act (1859), the Foreign Enlistment Act (1870), the Deportation Act (1878), the Contagious Diseases (Animals) Act (1878), the Dentists Act (1878) the Veterinary Surgeons Act (1881) and 1 & 2 Will. IV. c. 41. A judicial committee of the council was constituted. It consists of all the members of the council holding or having held the office of lord president or lord chancellor or certain high judicial offices enumerated in the act. By the act of 1883 certain of the members of the council, or Colonial Lords, may be appointed, and such appointments carry an annual salary of £1,000. By an act of 1895 any of the chief justices of certain colonies who are also privy councillors may be appointed to the committee, but not more than five such substitutes may be made. Under this act certain colonial chief justices now sit. In appeals under the Clergy Discipline Acts three bishops sit as assessors. In colonial cases the privy council or the colonists sitting in council may be appointed. Assessors are merely technical advisers, and have no part in any decision. Appeals also lie from consular courts and prize courts.

The decisions of ecclesiastical courts are subject to review by the council, the sovereign being the supreme governor of the Church, but no appeal is competent where the case is one for the exercise of the bishop's discretion. In these ecclesiastical cases the committee does not profess to expound and settle doctrine with ecclesiastical authority; but merely interprets the laws of the Church. In matters relating to ritual history and precedents are taken into account.

Appeals also lie from vice-admiralty courts abroad, the Channel Islands and the Isle of Man. The committee consists of the council, as a rule. A committee of right is the matter stands at issue of a certain amount (the amount varying according to the appeal rules of the different foreign possessions) and in a few other cases. Recent legislation has further restricted the right to appeal. Appeals lie at the discretion of the committee on leave being obtained by petition for special leave to appeal. All proceedings are by petition (see Petition) which is the form of address to the council, and whatever may have taken place privately in discussion between the members, outwardly the committee is unanimous. With recent years is the use been made of the appointment of the House of Lords and the privy council should be coalesced, and thus constitute one final court of appeal for the whole empire. Besides the appellate there exists in the sovereign in council a supreme courts of law and equity in the several dependencies, the extent of charters and the like. Until recently the council dealt with the petitions to extend the time patents were protected, but this work has now been given by statute to the controller-general of patents, and the chancellor of the exchequer, and was appended to documents of minor importance which did not require the great seal. Previous to the Great Seal Act 1854, all letters patent conferring any dignity, office, monopoly, franchise or other privilege were always passed under the privy seal before passing under the great seal.

Lord Privy Seal is the title of the officer who had the custody of the privy seal. He was originally known as the "keeper of the privy seal." The importance of the office was due to the desire of the privy council and the parliament in the 14th and 15th centuries to place some check on the issue of public money, as it was to prevent the use of the great seal by the sovereign without any intermediary except the lord chancellor. The lord privy seal first appears as a minister of state in the reign of Edward III. Until 1357 he was always an ecclesiastical, but is now more usually a temporal lord. He is the fifth great officer of state, and takes rank next after the president of the council and before all dukes.

See Anson, Law and Custom of the Constitution (1896).

PRIZE, or Prize of War (Fr. prize, from prendre, to take), a vessel or cargo captured by a belligerent on the high seas; also the act of capture. Under Blockade, CONTRABAND, and NEUTRALITY will be found details of existing practice as regards infringements of international law which expose neutrality vessels and cargoes to capture and trial in a prize court. Under War will be found the application of international law in relation to the private property of subjects and citizens of belligerents, and between them. We treat here of the manner of dealing with prizes after they have been brought into the jurisdiction of the prize court.

Under the law in force at the beginning of 1910 the subject was governed by the following English acts: the Naval Prize Act 1864 (27 & 28 Vict. c. 25); the Colonial Courts of Admiralty Act 1890 (53 & 54 Vict. c. 27); the Supreme Court of Judicature Act 1891 (54 & 55 Vict. c. 53, s. 4), and the Prize Courts Act 1894 (57 & 58 Vict. c. 30). A new Naval Prize Act was introduced for...
however, already in contemplation, repealing the acts of 1864 and 1894, consolidating and re-enacting their main provisions and making such statutory provisions as will permit of the ratification of a convention adopted at the second Hague Conference (1907) for the establishment of an International Prize Court.

The Convention referred to above contains an elaborate scheme of 56 articles setting out the constitution and procedure of the court. It begins with the following declaration of its objects:

**PRIZE**

Animated by the desire to settle in an equitable manner the differences which sometimes arise in the course of a naval war in connexion with the decisions of national prize courts:

Considering that, if these courts are to continue to exercise their functions in a manner determined by national legislation, it is desirable that in certain cases an appeal should be provided under conditions conciliating, as far as possible, the public and private interests involved in matters of prize:

Whereas, moreover, the institution of an international court, whose jurisdiction and procedure would be carefully defined, has seemed to be the best method of attaining this object:

Convinced, finally, that in this manner the hardships consequent on naval war would be mitigated; that, in particular, good relations will be more easily maintained between belligerents and neutrals, and peace better assured.

It prescribes that the court shall be composed of fifteen members out of the whole panel (art. 14). Of these Great Britain, France, Germany, Austria-Hungary, Russia, Italy, the United States and Japan each appoint one (art. 15). A schedule of the other powers is appended to the Convention, under which they take their turn to sit to the number of seven, making up together the prescribed fifteen. As composed under the first year’s distribution, the other judges would be appointed by Argentina, Colombia, Spain, Greece, Norway, Holland and Turkey.

There are also full provisions as to the procedure and conduct of the proceedings in the court, but the only provisions of concern to general readers are those relating to international law, which are as follows:

1. The validity of the capture of a merchant-ship or its cargo is decided before a prize court in accordance with the present convention when neutral or enemy property is involved.

2. Jurisdiction in matters of prize is exercised in the first instance by the prize courts of the belligerent captor.

3. The judgments of these courts are pronounced in public or are officially notified to parties concerned who are neutrals or enemies.

4. The judgments of national prize courts may be brought before the international prize court:
   (a) When the judgment of the national prize courts affects the property of a neutral power or individual;
   (b) When the judgment affects neutral property and relates to—
      (i) Cargo on board a neutral ship;
      (ii) An enemy ship captured in the territorial waters of a neutral power, when that power has not made the enemy vessel the object of a diplomatic claim;
      (c) A claim based upon the allegation that the seizure has been effected in violation, either of the provisions of a convention in force between the belligerent powers, or of an enactment issued by the belligerent captor.

5. The appeal against the judgment of the national court can be based on the ground that the judgment was wrong either in fact or in law.

6. An appeal may be brought:
   (a) By a neutral power, if the judgment of the national tribunals injuriously affects its property or the property of its nationals (art. 3 (i)), or if the capture of an enemy vessel is alleged to have taken place in the territorial waters of that power (art. 3 (ii));
   (b) By a neutral power if the judgment of the National Court injuriously affects its property or the property of its nationals (art. 3 (ii)); subject, however, to the reservation that the power to which he belongs may forbid him to bring the case before the court, or may itself undertake the proceedings in his place
   (c) By a national prize court subject or citizen of an enemy power, if the judgment of the national court injuriously affects his property in the cases referred to in art. 3 (ii), except that mentioned in paragraph 4.

7. An appeal may be brought on the same conditions as in the preceding article, by persons belonging either to neutral states or to the enemy, deriving their rights from and entitled to represent an individual, or to make an appeal, and who have taken part in the proceedings before the national court. Persons so entitled may appeal separately to the extent of their interest.

The same rule applies in the case of persons belonging either to neutral states or to the enemy who derive their rights from and are entitled to represent a neutral power whose property was the subject of decision.

8. When, in accordance with the above art. 3, the international court has jurisdiction, the national courts cannot deal with a case in more than two instances. The municipal law of the belligerent or the captor shall decide whether the case may be brought before the international court after judgment has been given in first instance or only after an appeal.

9. If the national courts fail to give judgment within two years from the date of capture, the case may be carried direct to the international court.

When a question of law to be decided is covered by a treaty in force between the belligerent captor and a power which is itself or whose subject or citizen is a party to the proceedings, the court is governed by the provisions of the said treaty.

If no such treaty exists, the court shall apply the rules of neutral international law, and if no generally recognized rule exists, the court shall give judgment in accordance with the general principles of justice and equity.

The above provisions apply equally to questions relating to the order and mode of proof.

If, in accordance with art. 3 (ii), the ground of appeal is the violation of an enactment issued by the belligerent captor, the court shall enforce the enactment.

The court may disregard failure to comply with the procedure laid down in the legislation of the belligerent captor, when it is of opinion that the consequences of complying therewith are unjust and inequitable.

10. If the court pronounces the capture of the vessel or cargo to be valid, they shall be disposed of in accordance with the laws of the belligerent captor.

11. If the court pronounces the capture to be null, the court shall order restitution of the vessel or cargo, and shall fix, if there is occasion, the amount of the damages. If the vessel or cargo have been sold or otherwise disposed of, the court shall determine the compensation to be given to the owner on this account.

If the national prize court pronounced the capture to be null, the court can only be asked to decide as to the damages.

12. The contracting powers undertake to submit in good faith to the decisions of the international prize court, and to carry them out with the least possible delay.

The British delegates, in their report on the work of the Conference, wrote that it was to them a subject of satisfaction that they had been able to accomplish the task thus laid upon them, "not, indeed, in the form of an adaptation of the machinery of the existing court, but in the form of a new institution"; and that the convention drawn up appeared to them to be "a very noteworthy step in the history of law as the first attempt to constitute a really international court, and as the first device to produce uniformity in any branch of international law." Here, however, the delegates overstated the scope of the work done, and in order to obtain that uniformity a further conference was held in London (Dec. 1908–Feb. 1909) to arrive at an agreement as to what are the generally recognized rules of international law within the meaning of art. 7 of the Convention. The London Conference drew up a series of rules which it declared "correspond in substance with the generally recognized principles of international law" on Blockade (q.v.), Contraband of War (q.v.), Unneutral service, Destruction of Neutral Prizes, Transfer to a Neutral Flag, Enemy Character, Convoy (q.v.), Resistance to Search and Compensation. These rules, if ratified, will bind the international court.

The proposal to submit captures in war to a special international jurisdiction has often been made, and in fact it suggests itself whenever there are two opinions concerning the justice of a prize court's decision.

The Institute of International Law in 1887, after adopting a very full code of prize law, consisting of no less than 122 articles and covering every branch of the subject, forwarded them to the different European governments, with the expression of a wish that "in the future reform might take a still more complete shape by the institution of an international tribunal for trial of prize cases."

The subject was brought up at the session in 1905 at Christiania of the International Law Association. The discussion showed that there was much to be said on both sides. Mr Justice Phillimore inter alios seemed favourable to the institution of an independent court of appeal only.

This was the position of the discussion at the opening of the
second Hague Conference in June 1907, when the British and German delegates announced that they had been instructed to present schemes for the establishment of an international court of appeal in matters of naval prize. Two projects were simultaneously presented on behalf of Great Britain and Germany.

The original English idea was to "secure the adaptation" of the machinery of the existing Hague Court to the purposes of the "International Tribunal of Appeal" from decisions of belligerent prize courts. The official instructions, published in the correspondence respecting the Second Conference observed, in reference to the proposal, that the "judgments of the tribunal in such cases would probably proceed in a rapid and efficient manner, which under existing conditions, were devised for giving form and authority to the canons of international law in matters of prize." The instructions continue that the advantages would far outweigh any difficulty which might arise from the fact that some alterations in the municipal laws of this country, and probably also of other states, would be required, and that "H.M. Government considered that if the Hague Conference accomplished no other object than the constitution of such a tribunal, it would render an estimable service to civilization and mankind.

The chief object of the scheme is that the judgment is appointed by the belligerent state whose interest it is to condemn the capture; that his bias, if any, is against the neutral interest. But will there be no room in an international prize court for bias against the belligerent? Representing as we do," said Mr Choate at the sitting of the 11th of July, "a widely extended maritime nation, and a nation which hopes and confidently expects always in the future to be a neutral nation, we deem the establishment of an international court of prize by this Conference to be a matter of supreme importance."

The conversation may be as important for a nation which, with its vast dependencies, cannot with equal confidence expect to have a seat on the bench, as it has been the aim of all neutral states, in different quarters of the globe, the interests of the civilized world in time of war are divisible into three groups, namely, the respective interests of the two belligerents, and the interest of the neutrals. In practice the interest of the neutrals is against the making of captures. Under the system hitherto prevailing it is the judge appointed by the captor who decides whether the capture was a legitimate one or not. It may be contended, however, that he hears the case and gives his judgment in the face of the whole neutral world, at all times the larger part of civilized mankind, and one which has now infinitely greater facilities for making its voice heard than it had a century earlier, when a powerful belligerent maritime state was, out of all proportion to any neutral combination, able to enforce its views as regards neutral property. (T. BA.)

PRIZREN (also written Prizren, Prizrode, Privendi, Predra and Persziria), the capital of the sanjak of Prizren, in the vilayet of Kosovo, Albania, European Turkey; 65 m. E. by N. of Scutari, on the river Bistritza, a left-hand tributary of the White Drin. Pop. (1905), about 30,000, chiefly Mahomedan Albanians, with a minority of Roman Catholic Albanians, Serbs and Greeks. Prizren is beautifully situated 1424 ft. above sea-level, on the northern outskirts of the Shar Planina. To the north-west a fertile and undulating plain, watered by the White Drin, extends as far as Ipek (42 m.). A good road connects Prizren with the Ferisovich station on the Salonica-Mitrovitsa railway (37 m.). The city is the seat of a Roman Catholic archbishop, a Greek bishop, and a Servian theological seminary. Its chief buildings are the citadel and many mosques, one of which is an ancient Byzantine basilica, originally a Servian cathedral. In its bazaars an active trade in agricultural produce, glass, pottery, saddlery, and copper and iron ware is carried on; but the manufacture of fire-arms, for which Prizren was long famous throughout Europe, Turkish, has suffered greatly from foreign competition.

Prizren has sometimes, though on doubtful evidence, been identified with the ancient Tharendus or Theranda. In the 12th century it was the residence of the kings of Servia, and the sanjak of Prizren forms part of the region still called Old Servia. (Stara Srbija) by the Slavs. From the 13th century to the 16th Prizren had a flourishing export trade with Ragusa, and it has always been one of the principal centres of commerce and industry in Albania.

PRIJEVALSKY [PRIJEVHALOVICH] (1839-1888), Russian traveller, born at Kimborny, in the government of Smolensk, on the 31st of March 1839, was descended from a noble Cossack family. He was educated at the Smolensk gymnasion, and in 1855 entered an infantry regiment as a subaltern. In November 1856 he became an officer, and four years later he entered the academy of the general staff. From 1864 to 1866 he taught geography at the military school at Warsaw, and in 1867 he was admitted to the general staff and sent to Irkutsk, where he started to explore the highlands on the banks of the Us, the great Siberian river. He was then put in charge of the Amur. This occupied him until 1869, when he published a book on the Us region, partly ethnographical in character. Between November 1870 and September 1873, accompanied by only three men and with ridiculously small pecuniary resources, he crossed the Gobi desert, reached Peking, and, pushing westwards and south-westwards, explored the Ordos and the Ala-shan, as well as the upper part of the Yangtsze-kiang. He also penetrated into Tibet, reaching the banks of the Di Chu river. By this remarkable journey he proved that, for resolute and enduring men, travelling in the Central Asian plateaus was easier than had been supposed. The Russian Geographical Society presented him with a large reward, and great Correspondents from all parts of Europe he received medals and honorary diplomas. The work in which he embodied his researches was immediately translated into all civilized languages, the English version, Mongolia, the Tangut Country, and the Solitudes of Northern Tibet (1876), being edited by Sir Henry Yule. On his second journey in 1877, while endeavouring to reach Lhasa through east Turkestan, he re-discovered the great lake Lop-nor (q.v.), which had not been visited by any European since Marco Polo. On his third expedition in 1879-1880 he penetrated, by Hami, the Tan-i-dam and the great valley of the Tibetan river Kar-su, to Napjeu, 170 m. from Lhasa, when he was turned back by order of the Dalai Lama. In 1883-1885 he undertook a fourth journey of exploration in the wild mountain regions between Mongolia and Tibet. On these four expeditions he made collections of plants and animals of inestimable value, including nearly twenty thousand zoological and sixteen thousand botanical specimens. Among other remarkable discoveries were those of the wild camel, ancestor of the domesticated species, and of the early type of horse, now known by his name (Equus prijevalskii). Prjevalsky's account of his second journey, From Kubja, across the Tien-Shan, to Lop-nor, was translated into English in 1879. In September 1888 he started on a fifth expedition, intending to reach Lhasa, but on the 1st of November he died at Karakol on Lake Issyk-kul. A monument was erected to his memory on the shores of the lake, and the Russian government changed the name of the town of Karakol to Przejvalsk (q.v.) in his honour.

PROA (Malay, praui), the general term in the Malay language for all vessels, from the sampan or canoe to the square-rigged kapal, but in western usage confined to the swift-sailing craft that the pirates of the Indian Ocean made familiar to sailors in eastern waters. The chief points which characterize these vessels are that while the weather-side is rounded lee-side is flat, the stem to stern, that both stern and stem are exactly similar in shape, and that there is a small similarly shaped hull swung out from the side of the main hull on poles, which acts
as an outrigger and prevents the vessel heeling over. The main hull carries the mast rigging and an enormous triangular-shaped sail.

PROBABILISM (from Lat. probare, to test, approve), a term used both in theology and in philosophy with the general implication that the absence of certainty probability is the best criterion. Thus it is applied in connexion with casuistry for the view that the layman in difficult matters of conscience may safely follow a doctrine inculcated by a recognized doctor of the church. This view was originated by the monk Molina (1528-1581), and has been widely employed by the Jesuits. In philosophy the term is applied to that practical doctrine which gives assistance in ordinary matters to one who is sceptical in respect of the possibility of real knowledge: it supposes that though knowledge is impossible a man may rely on strong beliefs in practical affairs. This view was held by the sceptics of the New Academy (see SCEPTICISM and CARNAPIANES). Opposed to "probabilism" is "probabiliorism" (Lat. probabilior, more likely), which holds that when there is a preponderance of evidence on one side of a controversy that side is presumably right.

PROBABILITY (Lat. probabilitas, probable or credible), a term which in general implies credibility short of certainty. The mathematical theory of probabilities deals with certain phenomena which are employed to measure credibility. This measurement is well exemplified by games of chance. If a pack of cards is shuffled and a card dealt, the probability that the card will belong to a particular suit is, as the ratio 1:4, or 1/4; there being four suits to any one of them the card might have belonged. So that the probability as an ace will be drawn is 4/52, as out of the 52 cards in the pack 4 are aces. So the probability that ace will turn up when a die is thrown is 1/6. The probability that one or other of the two events, ace or dence, will occur is 2/6. If simultaneously a die is thrown and a card is dealt from a pack which has been shuffled, the probability that the double event will consist of two aces is 1X4 divided by 6X52, as the total number of double events formed by combining a face of a die with a face of a card is 6X52, and out of these 1X4 consist of two aces.

The data of probabilities are often prima facie at least of a type different from that which has been described. For example, the probability that a child about to be born will be a boy is about 0.51. This statement is founded solely on the observed fact that about 51% of children born (alive, in European countries) prove to be boys. The probability is not, as in the instance of dice and cards, measured by the proportion between a number of cases favourable to the event and a total number of possible cases. Those instances indeed also admit of the measure based on observed frequencies. This the number of times that a die turns up ace is found by observation to be about 6/12% of the number of throws; and similar statements are true of cards and coins. The probabilities with which the calculus deals admit generally of being measured by the number of times that the event is found by experience to occur, in proportion to the number of times that it might possibly occur.

The idea of a probable or expected number is not confined to the number of times that an event occurs; if the occurrence of the event is associated with a certain amount of money or any other measurable article there will be a probable or expected amount of that article. For instance, if a person throwing dice is to receive two shillings every time that six turns up, he may expect in a hundred throws to win about 2X16-6 (about 3.3) shillings. If he is to receive two shillings for every six and one shilling for every ace, his expectation will be 2X16-6+1X16-6 (50) shillings. The expectation of lifetime is calculated on this principle. Of 1000 males aged ten say the probable number who will die in their next year is 400, in the following year 397, and so on; if we (roughly) estimate that those who die in the first year will have enjoyed one year of life after ten, those who die in the next year will have enjoyed two years of life, and so on; then the total number of years which the 1000 males aged ten may be expected to live is

\[
1 \times 1000 + 2 \times (1000-400) + 3 \times (1000-400-397) + \ldots
\]

Space as well as time may be the subject of expectation. If drops of rain fall in the long run with equal frequency on one point—or rather on one small interval, say, of a centimetre by a millimetre of finite length and negligible breadth, the distance which is to be expected between a point of impact in the upper half of the line and a point of impact in the lower half has a definite proportion to the length of the given line.

Expectation in the general sense may be considered as a kind of average. The doctrine of averages and of the deviations therefrom technically called "errors" is distinguished from the other portion of the calculus by the peculiar difficulty of its method. The paths struck out by Laplace and Gauss have hardly yet been completed and made quite secure. The doctrine is also distinguished by the importance of its applications. The theory of errors enables the physicist to combine discrepant observations as to obtain the best measurement. It may abridge the labour of the statistician by the use of samples. It may assist the statistician in testing the validity of inductions. It promises to be of special service to him in perfecting the logical method of concomitant variations; especially in investigating the laws of heredity. For instance the correlation between the height of parents and that of children is such that if we take a number of men all of the same height and observe the average height of their adult sons, the deviation of the latter average from the general average of adult males bears a definite proportion—a half—very nearly common to the fathers. The same kind and amount of correlation between parents and children with respect to many other attributes besides stature has been ascertained by Professor Karl Pearson and his collaborators. The kinetics of free molecules (gases) forms another important branch of science which involves the theory of errors.

The description of the subject which has been given will explain the division which it is proposed to adopt. In Part I. probability and expectation will be considered apart from the peculiar difficulties incident to errors or deviation from averages. The first section of the first part will be devoted to a preliminary inquiry into the evidence of the primary data and axioms of the science. Freed from philosophical difficulties the mathematical calculation of probabilities will proceed in the second section. The analogous calculation of expectation will follow in the third section. The contents of the first three sections will be illustrated in the fourth by a class of examples dealing with space measurements—the so-called "local" or "geometrical" probabilities. Part II. is devoted to averages and the deviations therefrom, or more generally that grouping of statistics which may be called a law of frequency. Part II. is divided into two sections distinguished by differences in character and extent between the principal generalizations respecting laws of frequency.

**PART 1.**—PROBABILITY AND EXPECTATION

**Section I.**—First Principles.

1. As in other mathematical sciences, so in probabilities, or even more so, the philosophical foundations are less clear than the calculations based thereon. On this obscure and controversial topic absolute uniformity is not to be expected. But it is hoped that the following summary in which diverse authoritative judgments are balanced may minimize dissent.

2. (1) How the Measure of Probability is Ascertained.—The first question which arises under this head is: on what evidence are the facts obtained which are employed to measure probability? A very generally accepted view is that which Laplace has thus expressed:

\[\text{It is more usual to speak of the mean expectation, the average number of years per head.}\]

\[\text{Below, par. 88.}\]

\[\text{For more exact definition see below, par. 95.}\]

\[\text{See Bowley's Address to Section F. of the British Association (1906).}\]

\[\text{See Biometrika, vol. iii. "Inheritance of Mental Characters."}\]

1. Cf. note to par. 5 below.
The probability of an event is the ratio of the number of cases which favour it to the number of all the possible cases, when nothing leads us to believe that one of these cases ought to occur rather than the others; which renders them, for us, equally possible. Against this, we may add that it is not allowed to take the equal number of cases as a measure of belief, not of credibility. Accordingly, the ground of probability is sought in the observed fact of a class or series of cases such that if it is taken as a ground of the existence or non-existence of the event in question, which belongs to a certain assigned species compared with the total number taken tends to a certain fraction as a limit. Thus the series which consists of heads and tails discards the white and black coins as that out of a large number of throws the proportion giving heads is nearly half.

3. These views are not so diametrically opposed as may at first appear. On the one hand, those who follow Laplace would of course agree that these events do not contain the number of cases with respect to the probability of throwing either five or six with a die must be modified in accordance with actual experience such as that below cited respecting particular dice that they turn up five or six rather often in one in three times. On the other hand, the series which is regarded as the empirical basis of probability is not a simple matter of fact. There are implied conditions which are not satisfied by the sort of uniformity which ordinarily characterizes scientific laws; which would not be satisfied for instance by the proportionate frequency of any one digit, e.g. 8, in the expansion of any vulgar fraction, though the expression may consist of a circle of four and thirty digits with a very long period.

4. The type of the series is rather the frequency of the several digits in the expansion of an incommensurable constant such as \(\sqrt{2}\), log 11, \(\pi\), etc. The observed fact that the digits occur with equal frequency is the form that the evidence of a reason why one digit should occur more often than another. The most perfect types of probability appear to present the requirement that the events are drawn at random and that the probability of occurrence observed a posteriori. When one of these attributes is not manifested it is often legitimate to infer its existence from the other. Given numerous batches of balls, each batch having a fixed proportion of white and black balls, it is not open to question a posteriori whether the observed phenomenon resulted from a system equivalent to a number of factorials in three times. On the other hand, the series which is regarded as the empirical basis of probability is not a simple matter of fact. There are implied conditions which are not satisfied by the sort of uniformity which ordinarily characterizes scientific laws; which would not be satisfied for instance by the proportionate frequency of any one digit, e.g. 8, in the expansion of any vulgar fraction, though the expression may consist of a circle of four and thirty digits with a very long period.

5. The type of the series is rather the frequency of the several digits in the expansion of an incommensurable constant such as \(\sqrt{2}\), log 11, \(\pi\), etc. The observed fact that the digits occur with equal frequency is the form that the evidence of a reason why one digit should occur more often than another. The most perfect types of probability appear to present the requirement that the events are drawn at random and that the probability of occurrence observed a posteriori. When one of these attributes is not manifested it is often legitimate to infer its existence from the other. Given numerous batches of balls, each batch having a fixed proportion of white and black balls, it is not open to question a posteriori whether the observed phenomenon resulted from a system equivalent to a number of factorials in three times. On the other hand, the series which is regarded as the empirical basis of probability is not a simple matter of fact. There are implied conditions which are not satisfied by the sort of uniformity which ordinarily characterizes scientific laws; which would not be satisfied for instance by the proportionate frequency of any one digit, e.g. 8, in the expansion of any vulgar fraction, though the expression may consist of a circle of four and thirty digits with a very long period.

The term employed by Venn in his important Logic of Chance.

9 On the principle of Taylor's theorem; cf. Edgeworth, Phil. Mag. (1897), p. 177. For the references that follow, par. 13, in the use that may be made of an "antecedent probability," though "it should be impossible to estimate that probability with anything like absolute precision."
principle, of which the following may be taken as an equivalent. If we distribute the favourable cases into several groups the probability of the one event will be the sum of the probabilities pertaining to each group.1

10. Another important instance of unverified probabilities occurs when we take into account the fact that one phenomenon is independent of another in such wise that the probability of a double event is equal to the product of the one event multiplied by the probability of the other—as in the instance already given of two aces occurred in a pack of cards. If we now imagine a second quantity to be introduced, it may be that the expression for the probability in some games of chance; but it is immediately applied far beyond those instances. The proposition that very long runs of particular digits, e.g. of 7, may be expected in the development of a constant limit of a very high degree of consistency if the Mersenne constant was carried to a million places of decimals—may be given as an instance in which our conviction greatly transcends specific calculation. In the calculation of probable, and improbable, errors, it is upon our belief about such unverified probabilities forms the probability of their concurrence. It follows that the probability of the double event divided by the probability of either, say the first, contains the probability of the occurrence of the second alone event. The quotient, we might say, is the probability that when the first event has occurred, the second will occur. The proposition in this form is true also of events which are not independent of one another. It enables us to determine the separate probabilities by the instance of three urns, A, B, C, about which it is known that two contain only white balls and one only black balls.2 The probability of drawing a white ball from an assigned urn, say C, is 1/3, that a white ball has been drawn from urn B will be drawn from urn B will be white, is 1/2. Therefore the probability of the double event drawing a white ball from C and also from B is $\frac{1}{2} \times \frac{1}{3} = \frac{1}{6}$. The question now arises. Supposing we know only the probability of the occurrence of one event, say [BC], and the probability of one of them, say [C] (but not, as in the case instance, the mechanism of their interdependence); what can we infer about the probability [B] of the other event? (an event such as in the above instance drawing a white ball from the urn B)—the separate probability irrespective of what has happened as to the urn C? We cannot in general say that [B] = [BC] divided by [C] but rather the probability that a white ball has been drawn from a ball drawn from B will be white, is 1/2. Hence the probability of the double event drawing a white ball from C and [B] is not [BC] divided by [C], but rather the probability that a white ball has been drawn from B will be white, is 1/2. These relations are for the new theorems of independence derived. In the case of the independent probabilities forms the probability of their concurrence (l'existence de leur ensemble) is the product of their separate probabilities.3

11. Independent Probabilities.—Among the principles of probabilities it is usual to enumerate, after Laplace, several other propositions. But these may here be rapidly passed over as they do not seem to involve any additional philosophical difficulty.

12. It has been shown that when two events are independent of one another, there still remain separate probabilities forms the probability of their concurrence. It follows that the probability of the double event divided by the probability of either, say the first, contains the probability of the occurrence of the second alone event. The quotient, we might say, is the probability that when the first event has occurred, the second will occur. The proposition in this form is true also of events which are not independent of one another. It enables us to determine the separate probabilities by the instance of three urns, A, B, C, about which it is known that two contain only white balls and one only black balls.4 The probability of drawing a white ball from an assigned urn, say C, is 1/3, that a white ball has been drawn from urn B will be drawn from urn B will be white, is 1/2. Therefore the probability of the double event drawing a white ball from C and also from B is $\frac{1}{2} \times \frac{1}{3} = \frac{1}{6}$. The question now arises. Supposing we know only the probability of the occurrence of one event, say [BC], and the probability of one of them, say [C] (but not, as in the case instance, the mechanism of their interdependence); what can we infer about the probability [B] of the other event? (an event such as in the above instance drawing a white ball from the urn B)—the separate probability irrespective of what has happened as to the urn C? We cannot in general say that [B] = [BC] divided by [C] but rather the probability that a white ball has been drawn from B will be white, is 1/2. Hence the probability of the double event drawing a white ball from C and [B] is not [BC] divided by [C], but rather the probability that a white ball has been drawn from B will be white, is 1/2.

13. Probability of Causes and Future Effects.—The first principles which have been established afford an adequate ground for the reasoning which is described as deducing the probability of a cause from its effect. If with the probability of the occurrence of perfect mixture by the waters of the Po in which the "two Doras" and other tributaries are indiscriminately commingled, there is no great difference in respect of definition and deduction between the probability that a certain particle of water should have emanated from a particular source, or should be discharged through a particular mouth of the river. "This principle," we may say with De Morgan, of the retrospective or "inverse" probability is not essentially different from the one first stated (Principle I.)10 It is a new first principle necessarily involved when after ascending from an obvious and well-conceived case, we pass on to the investigation of causes it is often necessary to have recourse to the unverified species of probability. An instance has already been given (Principle I.) of a case in which the probability of an event, such as a succession of aces, has been produced by a particular cause, such as giving the die, or by that mass of "fleeting causes" called chance. It is sufficient for the argument that the "fleeting probabilities" of the alternatives should not be very unequal.11

14. (2) Whether Credibility is Measureable.—The domain of probabilities belonging to some authorities does not extend much, if at all, beyond the subject of the phenomena without special conditions; but, as the preceding paragraphs. The claims of the science to measure the subjective quantity, degree of belief, are disallowed or minimized. Belief, it is objected, depends upon a complex of perceptions and emotions not amenable to calculus. Moreover, belief is not credibilis; even if we believe with more or less confidence in exact conformity with the measure of probability afforded by the calculus, quantity under measurement, and the value ascribed to it is not the beliefs on which we have to act are not of the kind for which the calculus prescribes. It was absurd of Craig12 to attempt to evaluate the credibility of the Christian religion by mathematical calculus. It is, however, true that some of those who are concerned with the universal proposition of those who examine the subject, the state of mind to which a person ought to be in accordance with the regulation of measure of probability. If in the order in which Portia's suitors were subjected there had been a picture of her not in one only, but in two of the caskets, then—though the judgment of the principal character of the event is the specific probability of her choosing the lady would normally expect with greater confidence than before that at any particular trial a casket containing the likeness of the lady would be chosen. So the indications of a thermometer may not correspond to the sensations of a fevered patient, but they serve to regulate the temperature of a public library so as to secure the comfort of the majority. This view does not commit us to the quantitative precision of De Morgan that in a case such as above supposed the probability of his "two Doras" would be exactly equal to the sume upon the non-arrival of the event.13 Two or three roughly distinguished degrees of credibility—very probable, as probable as not, very improbable, practically impossible—are the most important applications of the calculus. Such is the character of the judgments which the calculus enables us to form with respect to the occurrence of a certain difference between the real value of any quantity under measurement, and the value as assigned to it by the measurement. The confidence that the constants which we have determined are accurate within certain limits is a subjective feeling which cannot be dislodged from an important part of probabilities. For instance, a measure of temperature, if the observations from an average on one occasion, was required by the operators only as subordinate to the determination of the mean, but now this "standard deviation" (below, par. 98) is often treated as an entity which has a distinct practical interpretation. Moreover, the limits of error.14 Some of the newer methods may also serve to countenanciate the measurement of subjective quantity, in so far as they successfully apply the calculus to quantities not admitting of a precise unit, such as colour.

12 Logic, book III., ch. viii. § 6. Cf. above, par. 8; below, par. 46. 13 Cf. Venn, Logic of Chance, 124. 14 See the reference to Craig in Todhunter, History...of Probability.
15 Formal Logic, p. 173. 16 Ibid. 17 "Theory of Probabilities" (Encyc. Metrop.), note to § 56. Whereas all term greater or less can be applied twice, thrice, &c., can be conceived, though not perhaps measured by us."
18 It is well remarked by Professor Irving Fisher (Capital and Income, 1907, ch. xvi.), that Bernoulli's theorem involves a "subjective" element a "psychological magnitude." The remark is applicable to the general theory of error of which the theorem of Bernoulli may be said to be the particular case. The probable value at once leaves the limits of error."

of eye or curliness of hair. A closer analogy is supplied by the older writers who boldly handle " moral " or subjective advantage, as well as " physical."

15. (3) **Axioms of Expectation.**—Expectation so far as it involves probability presents the same philosophical questions. They occur chiefly in connexion with two principles analogous to and deducible from the Axiom relating to the independence of trials. The expectation of the sum of two quantities subject to risk is the sum of the expectations of each. The expectation of the product of two quantities is the product of the expectations provided that the risks are independent. For example, let one of the fortuitously fluctuating quantities be the winnings of a player at a game in which he takes the amount A if he wins and the amount B if he loses. Then the expectation of that quantity is A; or, in n trials (n being large), the player may expect to win about nA. Let the other fortuitously fluctuating quantity be winnings of a player at a game in which he wins or loses equal B, with the win happening with the same frequency as in the former game. The generalization of the Bernoulli distribution, which is widely used to describe the result of an ordinary pack of cards. The expectation of this quantity is \( nB \); or in n trials the player may expect to win about \( nB \).

Now suppose a compound trial at which one simultaneously throws a die and deals a card; and let his winning at a compound trial be the sum of the amounts which he would have received for the die and the card respectively at a simple trial. In n such compound trials he may expect to win about \( nA + nB \), or the expectation of the winning at a compound trial is the sum of the separate expectations. Next suppose the winning at a compound trial to be the product of the two amounts which he would have received for the die and the card respectively at a simple trial: It is \( AB \) when this double event occurs. But this double event occurs in the long run only once in 78 times. Accordingly the expectation of the winning at a compound trial at which the success is the product of two events which are independent is \( AB \) (which has been denoted at the respect to the law of large numbers). Then the expectation of that quantity is \( AB \); or, in n trials (n being large), the player may expect to win about \( nAB \).

16. It should be remarked that the proviso as to the independence of the probabilities involved is required only by the second of the two fundamental propositions. It may be dispensed with by the first. Thus for example, and interdependences of probabilities given by Laplace:—three urns about which it is known that two contain only black balls and one only white—if a person drawing a ball first from C and then from A, he will receive A-Hangs every time he draws a white ball, from one or other of the urns, he may expect if he performs the compounds operation n times to receive \( nA \times 2 \times nB \) shillings. But the expectation of the product of the number of shillings won by drawing a white ball from C and then from A is a very small sum indeed; because if by afterwards drawing a white ball from B is not \( nB \), but \( nB \).

17. The first of the two principles is largely employed in the practical applications of probabilities. The second principle is largely employed in the theoretical considerations. It is connected with the general laws of error demonstrated in Part II.; the requisite independence of the involved probabilities being mostly of the unverified 7 species.

18. **Expectation of Utility.**—A philosophical difficulty peculiar to expectation 8 arises when the quantity expected has not the objective character usually presupposed in the applications of mathematics. The most signal instance occurs when the expectation relates to an advantage, and that advantage is estimated subjectively by the amount of utility or satisfaction afforded to the possessor. Mathematicians have commonly adopted the assumption made by Daniel Bernoulli that a small increase in a person's material means or "physical fortune" lessens the increase of satisfaction, or "moral fortune," inversely proportional to the physical fortune; and accordingly that the moral fortune is equatable to the logarithm of the physical fortune. The spirit in which this assumption should be employed is well expressed by Laplace when he says 9 that the expectation of subjective advantage ("espérance morale") depends on a thousand variable circumstances which it is almost always impossible to take into complete account. It will still more often be of little use to give a general rule for appreciating this relative value," yet the principle above stated in "applying to the commonest cases leads to results which are obviously true." From this spirit we may regard the logarithm in Bernoulli's (as in Malthus's) theory as representative of a more general relation. Thus generalized the principle has been accepted by a great number of mathematicians and utilitarian economists, and is regarded as beginning when he has enough to support life and afterwards as increasing by equal amounts with every equal successive percentage that is added to his income, and vice versa for losses of income. The generalization of Bernoulli's utilitarian reasoning which has been widely accepted. 10 The possibility of formulating the relation between feeling and its external cause by the aid of the psychist's "Utility." The better view that Probabilities also obtains support from another part of the science, the calculation sanctioned by Laplace, of the disutility incident to error of measurement. 11 Altogether it seems impossible to deny that some simple mathematical operations prescribed by the calculus of probabilities are sometimes serviceably employed to estimate prospective benefit in the subjective sense of desirable feeling.

20. **Single Cases and Series.**—Analogous to the question regarding the expectation regarding the standard of action arises under the head of expectation. The former question, it may be observed, arises chiefly with respect to events which are compound. Even if, as in the example above, there is no doubt, that if we go on tossing (unloaded) dice the event which consists of obtaining either a five or a six will occur in approximately 33\% of the trials. A more critical question phrased is, should judgment on the relation with regard to the result of a trial which is sui generis and not to be repeated, like the choice of a casket in the Merchant of Venice. 11 A similar difficulty is presented by singular events, with respect to its production. Is the chance of one to a thousand of the prize £1000 at a lottery approximately equivalent to £1 in the eyes of a person who for once, and once only, has the offer of such a stake? The question is separable from one with which it is often confounded, the one discusses the last paragraph what is the "moral" value of the prize? The person might be a millionaire for whom £1 and £1000 both belong to the category of small change. The stake and the prize might both be of immense value to him. It arises from a system of transactions like that in which an insurance company undertakes, or at least a "cross-series" 14 of the kind which seem largely to operate in ordinary life, expectations in which the risks are very different are no longer equatable. Do Morgan 15 with regard to the "single case" (the solitary transaction in question) declares that the "mathematical expectation is not a sufficient approximation to the actual phenomenon of the mind when benefits and risks are of very small amount;" that the "player forms no part of the consideration" 16 (without making allowance for the difference between "moral" and mathematical probabilities). So Condorcet, if one considers a single man and a very small amount of money involved, would have to make a judgment of equating (between expectations with very different risks). It is only for the long run—"lorsqu'on embrasse la suite indéfinie des événements"—that the rule is valid: To the same effect at greater length the logicians Dr. Yemen, and von Kries. Some of the later mathematical writers have much to learn from their logical critics 12 on this and other questions relating to first principles.

**Section II.**—**Calculation of Probability.**

**21. Object of the Section.**—In the following calculations the principal object is to ascertain the number of cases favourable to an event in proportion to the total number of possible cases. 13

**Op. cit.** 17, par. 73.

Some further references bearing on the subject are given in a paper by the present writer on the "Pure Theory of Taxation," N. I. Economic Journ. (1897), vii. 550-551.

22. Fundamental Theorem.—One of the simplest problems of this sort is one of the most important. Given a {\textit{multinomial}} of things consisting of two species, if \( n \) things are taken at random what is the probability that \( s \) of these \( n \) things will be of a certain species? For example, the {\textit{multinomial}} might be a well-shuffled pack of cards and the question be one of the kind: what is the probability that if \( n \) cards are dealt, \( s \) of them will be black? There are two varieties of the problem: either after each card is dealt it is returned to the pack and shuffled on again, or all the cards are dealt out once and for all (ordinary games of cards) without replacement. The first variety of the problem deserves its place as being not only the simpler, but also the more important, of the two.

Theorem 1. At the first deal there are 26 cases favourable to black, 26 to red. When two deals have been made (in the manner prescribed), out of 52 \( ^2 \) cases formed by combinations between a card turned up at the first deal and a card turned up at the second, 26 \( ^2 \) cases are combinations of two blacks, 26 \( ^2 \) are combinations of two reds, and the remainder \( 2(26 \times 26) \) are made up of combinations between one black and one red; 26 \( ^3 \) cases of black at the first deal and red at the second, and 26 \( ^3 \) cases of red at the first and black at the second. The number of cases favourable to each alternative is evidently given by the several terms in the expansion of \((26+26)^2\). The corresponding probabilities are given by dividing each of these numbers by the total number of cases, viz. \(2 \times 26 \times 26 = 1082\) for the reason that, when we go on to a third deal, the respective probabilities of the three possible cases, three blacks, two blacks and one red, two reds and one black, three blacks, are given by the successive terms in the binomial expansion of \((26+26)^3\) and so on, and this continues indefinitely. Thus for the event which consists of dealing either clubs or spades (black) we might substitute an event of which the probability at a single trial is not \(\frac{1}{2}\), e.g. dealing hearts. Generally, if \(p\) and \(1-p\) are the probabilities of the event occurring or not, then at a single trial, the respective probabilities that in \(n\) trials the event will occur \(n\) times, \(n-1\) times . . . twice, once or not at all, are given by the successive terms in the expansion of \((p+(1-p))\), or \((p+q)^n\), which expansion the general term is

\[
\frac{n!}{s!(n-s)!}(p^s)(q^{n-s}).
\]

24. The probability may also be calculated as follows. Taking first the event which the event consists of dealing hearts consider any particular arrangement of the \(n\) cards, of which \(s\) are hearts, e.g. the arrangement in which the \(s\) cards dealt first are hearts and the following \(n-s\) all belong to other suits. The probability of the first \(s\) cards being hearts is \(p^s\) and the probability of the remaining \(n-s\) cards being hearts is \(q^{n-s}\). Hence the probability of that particular arrangement occurring is \(p^s q^{n-s}\). But this arrangement is but one of many, e.g. that in which the \(s\) hearts are in the second position and the remaining \(n-s\) in the first; there are as many different arrangements of this type as there are combinations of \(n\) things taken together \(s\) times, that is \(\frac{n!}{s!(n-s)!}\). The probability thus calculated agrees with the probability just derived from the law of combinations, for \((p+q)^n\) that as \(n\) is increased, the value of the fractions which form the terms of the series either extremity diminishes. When \(n\) becomes very large, the terms of the series become so small that it is unnecessary to express them by infinite series, and the greater number of the terms of the sum of the fractions form an overbalance the sum of the terms of the remaining \(s\). Thus in the example above given, if we go on and on dealing cards (with replacement) the ratio of the red cards dealt to all the cards dealt tends to become more and more nearly to the limit \(\frac{1}{2}\). These statements are comprehended in the theorem known as James Bernoulli's. Stated in its simplest form—that \(\frac{1}{2}\) in the long run all events will tend to occur with a relative frequency proportional to their objective probabilities—this theorem has been regarded as tautological or circular. Yet the proofs of the theorem which have been given by great mathematicians may deserve attention as they lead to a good restatement of the principle of indifference. As was already stated, James Bernoulli's imports something more than the first axiom of probabilities.

26. The generalization of the Binomial Theorem which is called

The "Multinomial Theorem" gives the rule when there are more than two different alternatives, hearts, diamonds or a card belonging to a black suit, the probability that if \(n\) cards are dealt there will occur \(s\) hearts, \(t\) diamonds, and \(n-s-t\) cards which are either clubs or spades is

\[
\binom{n}{s,t} q^s p^t r^{n-s-t}.
\]

27. Applications of Fundamental Theorem.—The peculiar interest of the problem which is here placed first is that its solution represents a law of almost universal application: the law assigning the frequency of different values assumed by a quantity, like most of the quantities with which statistics has to do, depends upon several independent agencies. It is remarkable that the problem in probabilities which historically was almost the first belongs to the kind which is often the last. The problem is a question which occupied Galileo and before him Cardan, and an even earlier writer: what are the chances that, when two or three dice are thrown, the sum of the points or pips turned up should amount to a certain number. Particular cases of the problem are presented by the old game of "passedix": what is the probability that if three dice are thrown the sum of the pips should exceed ten? The answer is obtained by considering the number of combinations that are favourable to each of the different alternatives, 18 pips, 17, 16 . . . . . 11 pips, which make up the event in question. Thus out of the total of 216 \(6^3\) combinations, one is favourable to 18, three to 17, and so on. There are twenty-five chances, all we may call the permutations, in favour of 12, twenty-seven in favour of 11. The sum of all these is 108, we have for the event in question 108/216, an even chance. More generally it may be inquired: what is the probability that, when \(n\) dice are thrown, the sum of the points will be \(s\)? Similarly we may ask of the binomial expression of \((p+q)^n\), by an extension of the reasoning which was employed in the first problem it is seen that the required probability is that of which the index is \(s\) in the expansion of the expression

\[
\binom{n}{s} p^s q^{n-s}.
\]

The calculation may be simplified by writing this expression in the form

\[
\binom{n}{s} \left( \begin{array}{c} p \\downarrow \end{array} \right)^s \left( \begin{array}{c} 1-p \\downarrow \end{array} \right)^{n-s}.
\]

The successive terms of the expansion give the respective probabilities that the number in question should be \(n, n+1, \ldots\) 6. Generally, given any whole number \(n\) it is only presumably included (otherwise the answer is zero). Of course we are not limited to six alternatives; instead of a die we may have a teetotum with any number of sides. The series expressing the probabilities of the different sums can be written out in general terms, as Laplace and others have done; but it seems to be of less interest than the approximate formula which will be given later.

28. Variant of the Fundamental Theorem. — The second variety of our first problem may next be considered. Suppose that after each deal the card dealt (ball drawn, &c.) is not replaced in \textit{status quo antebellum}. For instance, if a card is dealt in the ordinary way from a shuffled pack of cards, then the probability of the first card being a heart is \(\frac{1}{4}\). Consider any particular arrangement of the \(r\) cards, whereof \(s\) are hearts, e.g. that in which the \(s\) cards first dealt are all hearts, the remaining \(r-s\) belonging to other suits. The probability of the first deal being a heart is \(\frac{1}{4}\); the second deal being a heart is \(\frac{3}{9}\); the third deal being a heart is \(\frac{5}{12}\); the probability of the \((s+1)\)th card being not a heart is similarly reckoned. And thus the probability of the particular arrangement considered is found to be

\[
\frac{1}{4} \cdot \frac{3}{9} \cdot \frac{5}{12} \cdot \ldots \cdot \frac{(3-s+1)}{(3-s)} \cdot \frac{(5-s+1)}{(5-s)} \cdot \ldots \cdot \frac{(3-s+1)}{(3-s)}.
\]

Now consider any other arrangement of the \(r\) cards, e.g. if the \(s\) of the cards occurs first and the remaining \(r-s\) last. The denominator in the above expression will remain the same; and in the numerator only the order of the \(s\) of hearts will change. In this case the probability of the second arrangement is therefore the same as that of the first; and the probability that some one or other of the arrangements will occur is given by multiplying the probability of any one arrangement and the number of different general arrangements of the \(s\) of hearts. In the first case of the problem, \(18\) is the same as the number of combinations formed by \(r\) things taken together \(s\) times, that is \(r!s!(r-s)!\).

The formula thus obtained may be generalized by substituting \(n\) for \(s\).
PROBABILITY

Which would not determine the probability

Accordingly is

Now the probability of "sonnez" falling at a single throw (of two dice) is \( \frac{35}{36} \).

Therefore the probability of its failing in \( n \) throws is \( \frac{35^n}{36^n} \). Whence we obtain, to determine \( n \), the equation \( 1 - \frac{35^n}{36^n} = \frac{1}{2} \), which gives \( n = 24,605 \) nearly.

In the preceding problem the question was (unity minus probability) the probability that out of all the possible events an assigned one ("sonnez") should fail to occur in the course of \( n \) trials. In the following problem the question is that of the probability that all three of the following events will not be represented (that is, or other of the three will not occur at least once); viz. (a) either ace or deuce turning up, (b) either 3 or 4, (c) either 5 or 6. The number of cases in which at least one of these events fails to occur is equal to the number of cases in which (a) fails, plus the number in which (b) fails, plus the number in which (c) fails, minus the number of cases in which all two of the events fail (which coincides with this subtraction being multiplied twice). Now the number of cases in which (a) fails to occur in the course of the \( n \) trials is \( \left( \frac{2}{3} \right)^n \) of all the possible cases numbering \( 3^n \).

Like propositions are true of (b) and (c). The number of cases in which both (a) and (b) fail is \( \left( \frac{1}{3} \right)^n \) of the total; and the like is true of the cases in which both (a) and (c) fail and the cases in which both (b) and (c) fail. Accordingly the probability that one at least of the events will fail to occur in the course of \( n \) trials is \( 3 \left( \frac{2}{3} \right)^n - 3 \left( \frac{1}{3} \right)^n ).

One more step is required by the following problem: If \( n \) cards are dealt from a pack, each card after it has been dealt being returned to the pack, which is then reshuffled, what is the probability that one or other of the four suits will not be represented? The probability that hearts will fail to occur in the course of \( n \) deals is \( \left( \frac{3}{4} \right)^n \); and the like is true of the three other suits. From the sum of these probabilities is to be subtracted the sum of the probabilities that there will be concurrent failures of any two suits; but from this substrahend are to be subtracted the proportional number of cases in which there are concurrent failures of any three suits (otherwise cases such as that in which e.g. hearts, diamonds and clubs concurrently failed would not be represented at all). Now the probability of any assigned two suits failing is \( \left( \frac{3}{4} \right)^n \); the probability of any assigned three suits failing is \( \left( \frac{1}{4} \right)^n \). Accordingly the required probability is \( 3 \left( \frac{2}{3} \right)^n - 3 \left( \frac{1}{3} \right)^n + \left( \frac{1}{4} \right)^n \).

The analogy of the Binomial Theorem supplies the clue to the solution of the general problem of which the following is an example.

If a die is thrown \( n \) times the probability that every face will have turned up at least once is

\[ 1 - \left( \frac{5^n}{6^n} \right) + \left( \frac{5^n}{6^n} \right) - \left( \frac{5^n}{6^n} \right) + \left( \frac{5^n}{6^n} \right) - \left( \frac{5^n}{6^n} \right) \]

32. If in the (first) problem stated in paragraph 31 the cards are dealt in the ordinary way (without replacement), we must substitute for \( \left( \frac{1}{4} \right)^n \) the continued product \( \frac{39}{52} \times \frac{38}{51} \times \frac{37}{50} \times \ldots \times \left( \frac{n}{52} - \frac{n}{51} \right) \); for \( \left( \frac{1}{4} \right)^n \)

the continued product \( \frac{25}{52} \times \frac{24}{51} \times \frac{23}{50} \times \ldots \times \left( \frac{n}{52} - \frac{n}{51} \right) \), and so on.

33. Still considering miscellaneous examples relating to games of chance let us inquire what is the probability that at whist each of the two parties should have two honours? If the turned-up card is an honour, the probability that the three other honours are among the twenty-five which are in the hands of the dealer or his partner, while the remaining two honours are in the hands of the other party, is \( \frac{25 \times 24 \times 23}{52 \times 51 \times 50} \). But the assigned card may with equal probability be any one of three honours; and accordingly the above written probability is to be multiplied by 3. If the turned-up card is not an honour then the probability that an assigned pair of honours is in the hands of the dealer or his partner, while the remaining two honours are in the hands of their adversaries, is \( \frac{25 \times 24 \times 23}{52 \times 51 \times 50} \times \frac{3}{4} \); this probability is to be multiplied by \( \frac{1}{4} \), as the assigned pair may be any of the six binary combinations formed by the four honours. Now the probability of the alternative first considered—the turned-up card being an honour—is \( \frac{3}{4} \); and the probability of the second alternative, \( \frac{1}{4} \). Accordingly the required probability is

\[ \frac{4 \times 3 \times 25 \times 26 \times 27 \times 28 \times 29 \times 30 \times 31 \times 32 \times 33 \times 34}{52 \times 51 \times 50 \times 49 \times 48 \times 47 \times 46 \times 45 \times 44 \times 43 \times 42} \]

34. The probability that each of the four players should have an honour may be calculated thus. If the card turned up is an honour then ipso facto the dealer has one honour and the probability that the remaining players have each an assigned one of the three remaining honours, is \( \frac{13 \times 12 \times 11}{51 \times 50 \times 49} \). Which probability is to be multiplied by 31, as there are that number of ways in which the three cards may be assigned. If the card turned up is not an honour the probability that each player has an assigned honour is \( \frac{13 \times 12 \times 11}{51 \times 50 \times 49} \). Which probability is to be multiplied by 41. Accordingly the required probability is

\[ \frac{4 \times 3 \times 13^3 - 13^2 \times 9 \times 12 \times 13^2}{52 \times 51 \times 50 \times 49 \times 48 \times 47 \times 46} = \frac{51,484}{51,590} \]

The chance not affected by the character of the card turned up.

35. The probability of all the trumps being held by the dealer is

\[ \frac{12 \times 11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{52 \times 51 \times 50 \times 49 \times 48 \times 47 \times 46 \times 45 \times 44 \times 43 \times 42} \]

or 121,309,224, which being calculated by means of logarithm tables for (logarithms of factorials) or directly is 158.753.389.000.

36. There is a set of dominoes which goes from double blank to double nine (each domino presenting either a combination—which occurs only once—of two digits, or a repetition of the same digit). What is the probability that a domino drawn from the set will prove to be one assigned beforehand? The probability is the reciprocal of the number of dominoes: which is 10\( \times \)9/2 (the number of combinations of different digits) + 10 (the number of doubles) = 55.

37. Chance and Change.—When we leave the sphere of games of chance and frame questions relating to ordinary life there is a danger of assuming distributions of probability which are far from probable. For example, let this be the question: The House of Commons formerly consisting of 489 English members, 60 Scottish and 103 Irish, what was the probability that a committee of three members should represent the three nationalities? An assumption of indifference where it does not exist is involved in the answer that the required probability is the ratio of the number of favourable triplets, viz. 489\( \times \)60\( \times \)103 to the total number of triplets, viz. 652\( \times \)651\( \times \)650\( \times \)31. A similar absence of selection is postulated by the ordinary treatment of a question like the following. There being 2 candidates

---

2 Todhunter, Higher ... of Probability, and Bertrand, Calcul des probabilites, p. 9.
3 All three events cannot fail.
4 No occurring \( n \) times.
5 The reasoning may be illustrated by using the area of a circle to represent events with which hearts fail, another (equal) circle for diamonds; for the case in which both hearts and diamonds fail the area common to the circles interlapping, and so on.

---

8 See Whitworth, Exercises in Choice and Chance, No. 502 (p. 125); referring to prop. xiv, of the same author's Choice and Chance.
10 There is such a table at the end of De Morgan's article in the Calculus of Probabilities in the Ency. Brit. "Pure Sciences," vol. ii.
11 Cancelling factors common to the numerator and denominator.
at an examination and r optional subjects from which each candidate chooses one (r ≥ 1). What is the probability that no two candidates shall choose the same subject? If the candidates be arranged in any order, the probability that the second candidate does not choose the same subject as the first candidate is \((n-1)/n\). The probability shall be increased if there is an examination in alphabetical order, and if, for instance, there is a propensity in Whittrow's enunciation of the questions under the head of choice rather than chance. It comes to the same whether we say that there are \(x\) ways in which an event may happen, or that the probability of its happening in any one of these \(x\) ways is \(1/x\). For example, suppose that there are \(n\) couples walking at a ball; if the names of the men are arranged in alphabetical order, what is the probability that the names of their partners will also be in alphabetical order? The required probability is \(1/n\). For example, if \(n = 2\), there is only one way in which the order \(1, 2\) of alphabetical order should have for partner the lady who is first in that order \(1/n\). The probability that the man who is second alphabetical order should have for partner the lady who is second in that order is \((n-1)/n\), and so on. Therefore the required probability is \(1/n\). Or it may be easier to say that the number of ways, each consisting of a set of couples in which the party can be arranged, is \((n-2)\). 38. The same principle governs the following question. For how many days can a family of 10 continue to sit down to dinner in a different order each day; it not being indifferent who sits at the head of the table. If it be assumed that all arrangements are equally probable, the number of permutations, viz. 10!, is the answer. If we are to attend to the relative position only — as would be natural if the family were related to to children turning round a top — the number of different arrangements would be only 1. 40. Method of Equations in Finite Differences. The last question may serve to introduce a method which Laplace has applied with great effect to problems in probabilities. Let \(y_n\) be the number of ways in which \(n\) men can take their places at a round table, without respect to their absolute position; and consider how the number will be increased by introducing an additional man. From every particular arrangement of the original \(n\) men one can now be obtained \(n\) different arrangements of the \(n+1\) men (since the additional man may sit between any two of the party of \(n\)). Hence \(y_{n+1} = ny_n\), with \(n\) equations of which the solution is \(C (n-1)!\). The constant \(C\) in this equation is the same in all cases, so that \(y_n = \frac{n}{1} \frac{n-2}{2} \frac{n-4}{4} \ldots \frac{2}{2}\) and \(y_n = \frac{n}{1} \frac{n-2}{2} \frac{n-4}{4} \ldots \frac{2}{2}\) if \(n\) is even and \(y_n = \frac{n}{1} \frac{n-2}{2} \frac{n-4}{4} \ldots \frac{1}{1}\) if \(n\) is odd. Hence \(y_{n+1} = ny_n\). 41. The following example is not quite so simple. If a coin is thrown \(n\) times, what is the chance that head occurs at least twice running? Calling each sequence of \(n\) throws a "case," consider the number of cases in which head never occurs twice running; let \(u_n\) be this number, then \(2^n - u_n\) must be the number of cases when head occurs at least twice successively. Consider the value of \(u_{n+1}\), if the last one be a tail to be tail, \(u_{n+1}\) includes all the cases \((u_{n+1})\) of the \(n+1\) preceding cases when there was nothing to prevent heads; and if the last be head the last but one must be tail, and these two may be preceded by any one of the \(u_n\) favourable cases for the first \(n\) throws. \(u_n + u_n = u_{n+1}\). If \(u\) and \(p\) be the roots of the quadratic \(x^2 - x - 1 = 0\), this equation gives \(u_n = A u_n + B p^n\). Here A and B are easily found from the conditions \(u_2 = 2, u_3 = 3\); viz. \(\frac{A}{p} = \frac{x - p}{p - 1} \). The probability of the head never turning up twice running is found by dividing this by \(p^n\), the whole number of cases. This probability, of course, becomes smaller and smaller as the number of trials (\(n\)) is increased. This is the particular case of a more general problem solved by Laplace as to the occurrence \(i\) times running of the \(i\) of which the probability at one trial is \(p\). 42. In such problems where we now employ the calculus of finite differences Laplace employed his methods of generating functions. A distinguished instance is afforded by the problem of points which was put by the Chevalier de Méré to Pascal and has exercised generations of mathematicians. It is thus stated by Laplace. Two players divided an estate of 10000 livres and play against each other a single game — an estate won by each party in the case of a single game — an estate is won by each party. the estate of 10000 livres divided in any proportion, viz. \(p\) and \(q = p - q\). See also Czuber, Wahrscheinlichkeits — theorie, p. 30 seq. 382 PROBABILITY [METHODS OF CALCULATION 1. Boole, Finite Differences, ch. vii. § 5. 2. Op. cit. liv. II. ch. ii., No. 8. 3. Czuber, Finite Differences, ch. iv., art. 7, ex. 6. 4. Above, par. 13. 5. Op. cit. liv. II. ch. i. No. 1. 6. Op. cit. 18. 7. Op. cit. 134. 8. Wahrscheinlichkeits — theorie, p. 30 seq.
precise, yet something worth knowing. The a priori improbability of the maker's inaccuracy must be very great to overcome the improbability of such an event occurring by chance if the machine is accurately made (accuracy being defined, say, by the condition that of two witnesses, 199-999 of 499 and 501). The odds against the so defined event occurring are to be found in some millions to one.

47. The difficulty recurs in more practical problems: for instance, certain symptoms having been observed, to find the probability that they are produced by a particular disease. Such concrete applications of probability do not usually present the form of the philosophical problem, for which the assumptions of independence of each witness, or the fact that one witness is related to the other, are not made.

48. Probability of Testimony.—The application of probabilities to testimony has been made in two ways. First, by assuming (1) that to each witness there exists a certain probability of being true or false, the agreement in making a statement which must be either true or false, their agreement is a circumstance which is only to be accounted for by one of two alternatives: either that they are both speaking the truth, or both false. If the average truthfulness of the credibility of one witness is $p$, that of the other $p'$, then the probabilities of the two alternative explanations are to each other in the ratio $p/(1-p)$ to $p'/(1-p')$; the probability that the statement is true will be $p/(p + p')$. The value of the prior probability of the statement. This evidence may be treated as an independent witness. Thus, if a person whose credibility is $p$ asserts that he has seen at what a hand consisting entirely of trumps would be required in order to make an even chance that the fact occurred, supposing the credibility of each witness to be $p$. Let $x$ be the required number of witnesses. We have $1/(1/x^y)=0,000,000,000,006$, $y$, or $x = 24$ by Whence, if $x = 13$, it is more than an even chance that the statement is true.

49. When an event may occur in two or more ways equally probable a priori, the formule show that the probability of the statement will depend on the credibility of the witnesses; and accordingly the generalization of a priori probabilities may, as in our first instance, be omitted. One who reports the number of a ticket obtained at a lottery ordinarily makes a statement against which there is no a priori improbability; but if the number is one which had been predicted, there is an a priori improbability that an assigned ticket should be drawn out of a melange of n tickets. Similar reasoning is applicable to the probability that the decisions of juries, the verdict of juries, is right.

50. The assumptions upon which all this reasoning is based are open to serious criticisms. The postulated independence of witnesses is hardly ever justified. The repetition of a tribunal which condemned Condrocet was affected by an identity of illusions and passions that which mathematician had not taken into account when he calculated that the probability of a decision being arrived at confirmable by testimonies will increase indefinitely as the number of voters is increased. Thus even in so simple a case as the alleged occurrence of

1 By a calculation based on the fundamental theorem above, para. 23, cf. below, para. 103.

2 By the same reason, see above, para. 51.

3 Morgan Crofton, loc. cit. p. 778, para. 1.

4 Etsai, p. 6 (there is postulated a proviso analogous to that which has been stated in para. 49 above, with reference to witnesses: that the judgment of one who is being right is $\frac{1}{2}$.)

5 See Mill's forcible remarks on this use of probabilities, which an extraordinary hand at whist, the "truthfulness" of the witness in the general sense of the term may not adequately represent his liability to have made a mistake about the shuffling. A neglect of particulars, however, is sometimes practised with success in the applications of the rule (truthfulness, for instance). Perhaps there are broad results and general rules to which the mathematical theory may be applicable. Perhaps the laborious researches of Poisson on the "probability of judgments are not, as they have been called by an eminent mathematician, absolument rien. More than mathematical interest may attach to LaPlace's investigation of a rule appropriate to cases like the following. An event (suppose the death of a certain person) we have proceeded from one of n causes A, B, C, &c., and a tribunal has to pronounce on which is the most probable. Professor Morgan Crofton's original proof of LaPlace's rule is here reproduced.

6 Let the whole in question be represented by a line AB=x, and let it be divided at random into n parts by taking n-1 points indiscriminately on it. Let the required mean values be $x_1, x_2, x_3, \ldots, x_n$, where $x_1, x_2, x_3, \ldots, x_n$ must be constant fractions. As a great number of positions is taken in this, the each of the m points, we may take a as representing that number; and the whole number of cases will be

$$N = a^n.$$ 

51. The use of coefficients based on the average truthfulness or justice of each witness and judge involves the neglect of particulars which ought to influence our estimate of probability, such as the consistency of a witness's statements and the relation of the case to the interests, prejudices and capacities of the witness or the judge. Thus even in so simple a case as the alleged occurrence of

1 By a calculation based on the fundamental theorem above, para. 23, cf. below, para. 103.

51. The use of coefficients based on the average truthfulness or justice of each witness and judge involves the neglect of particulars which ought to influence our estimate of probability, such as the consistency of a witness's statements and the relation of the case to the interests, prejudices and capacities of the witness or the judge. Thus even in so simple a case as the alleged occurrence of
Thus each judge implicitly assigns the probabilities
\[ \frac{1}{n^2} \left( \frac{1}{n+1} + \frac{1}{n+1} \right) \]

\[ \left( \frac{1}{n} + \frac{1}{n+1} \right) \]

to the causes as they stand on his list, beginning from the lowest. The values for the probability of each alternative cause may be treated as so many equally authoritative observations representing a quantity which it is required to determine. According to a general rule given below, the expectations are to be added and divided by the number of cases; but if any are confirmed only with the relative magnitudes of the probabilities in favour of each alternative it suffices to compare the sums of the observations. We thus arrive at Laplace's rule. Add the numbers found on the different cards, and divide by the sum of the numbers A, for the white balls, and so on; that cause which has the greatest sum is the most probable.

53. Probability of Future Effects deduced from Causes.—Another class of problems which it is usual to place in a separate category are those which require that, having ascended from an observed event to probable causes, we should descend to the probability of collateral effects. But no new principle is involved in such problems. The reasoning may be illustrated by the following modification of the problem about digits which was above set 1 to illustrate the method of deducing the probability of alternative causes. What is the probability that if to the second digit which contributed to the effect there described there is added a third digit taken at random, the sum of the second and third will be greater than 10 (or any other assigned figure)? The probabilities—the a posteriori probabilities derived from the observed event (that the sum of the first and second digits was a number of the second figure) multiplied by the alternatives constituted by the different values 0, 1, 2, ..., 8, 9 of the second figure are written in the first of the subjoined rows.

Below each of these probabilities is written the probability, \( X \), so that if the corresponding cause existed the effect under consideration would result. The product of the two probabilities pertaining to each alternative way of producing the event gives the probability of the event occurring in that way. The sum of these products which are written in the third row divided by 45\(\times\)10, viz. \(11\frac{1}{2}X\), is the required probability. It may be expected that actual trials would verify the approximation obtained.

54. "Rule of Succession."—One case of inferred future effects, sometimes called the "rule of succession," claims special notice as having been made the foundation of the theory of inducement. A white ball has been extracted (with replacement after extraction) \(n\) times from an immense number of black and white balls mixed in some unknown proportion; what is the probability that at the \((n+1)\)th trial a white ball will be drawn? It is assumed that each extraction of the \(mélange\) 2 formed by the proportion of white balls (the probability of drawing a white ball), say \(p\), is a priori as likely to have any one value as another of the series \(\Delta p, 2\Delta p, 3\Delta p, \ldots, (n-1)\Delta p, n\Delta p, \ldots\).

Whence a posteriori probability for any particular value of \(p\) as the cause of the observed recurrence is \(e^{np}\Delta p\), where \(p\) in the denominator receives every value from \(\Delta p\) to 1. The probability that this cause, if it exists, will produce the effect in question, the expectation of such an extraction, is \((1-p)\times e^{np}\Delta p\). The probability of the event, obtained by summing the probabilities of all the different ways in which it may occur, is accordingly \(2e^{np}\Delta p\), where \(p\) both in the numerator and the denominator is to receive all possible values between \(\Delta p\) and 1. In the limit we have

\[ \int \left( -\infty, 1 \right] e^{np}\Delta p = \int_{-\infty}^{1} e^{np}\Delta p = \left( \frac{1}{n+1} \right) \left( \frac{1}{n+2} \right) \]

In particular if \(n=1\), the probability that an event which has happened once will recur on a second trial is \(\frac{1}{2}\). These results are perhaps not so absurd as they have seemed to some critics, when the principle of "cross-series" 4 is taken into account. Among authorities who seem to attach importance to the rule of succession, in its application to the calculation of probabilities, may be mentioned Lotze 5 and Karl Pearson. 6

Section III.—Calculation of Expectation.

55. Analogues of Preceding Problems.—This section presents problems analogous to the preceding. If \(n\) balls are extracted from an urn containing black and white balls mixed up in the proportions \(p; (1-p)\), each ball being replaced after extraction, the expected number of white balls in the set of \(n\) is by definition \(np\). To show how the latter may be derived from the axioms of probability we may illustrate the axioms by demonstrating this axiomatic proposition. 7 Consider the respective probabilities that in the series of \(n\) trials there will occur no white balls, exactly one white ball, exactly two white balls, and so on, as shown in the following scheme:

<table>
<thead>
<tr>
<th>No. of white balls</th>
<th>( \binom{n}{0} )</th>
<th>( \binom{n}{1} )</th>

To calculate the expectation of white balls it is proper to multiply \(np\) by the probability that exactly one white ball will occur, 2 by the probability of two white balls, and so on. We have thus for the required expectation

\[ np(1-p)^{n-1} + \binom{n}{2} p^2 (1-p)^{n-2} + \ldots + p^n \]

The expectation in the case where the balls are not replaced—not similarly axiomatie—may be found by approximate formulae. 8

56. Games of Chance.—With reference to the topic which occurred next under the head of probabilities, a distinction must be drawn between the number of trials which make it an even chance that all the faces of a die will not have turned up at least once, and the number of results which we may be sure that it occurs. We may pass from the probability to expectation in such cases by means of the following theorem. If \(s\) is the number of trials in which on an average success (such as turning up every face of a die at least once) is obtained, then \(s=1+\frac{1}{2}x+\frac{1}{3}x^2+\ldots\) where \(x\) denotes the probability of failing in the first trial.

For the required expectation is equal to \(xs\) probability of succeeding at the first trial + \(2x\) probability of succeeding at the second trial, etc. Now the probability of succeeding at the first trial is \(1-\frac{1}{6}\); the probability of succeeding at the second trial (after failing at the first) is \(\frac{1}{6}\cdot\frac{1}{6}\); the probability of succeeding at the third trial is similarly \(\frac{1}{6}\cdot\frac{1}{6}\cdot\frac{1}{6}\); and so on. Substituting these values for the expression for the expectation, we have the proposition which was to be proved. In the proposed problem

\[ s = 6 \left( \frac{\pi}{2} \right) \left( \frac{5}{6} + \frac{1}{6} \right) \times 20 \left( \frac{\pi}{2} \right) + \frac{1}{6} \times 6 \]

Assigning to \(n\) in each of these terms, every value from 1 to 69 we have \(6\times\left(1-\frac{1}{6}\right) = 65\), for the sum of the first set, with corresponding expressions for the sets formed from the following terms. Hence \(s = 1+30+30+20+40+\frac{1}{4}+\frac{1}{4} = 147\). By parity of reasoning it is proved that on an average 7\(\frac{1}{6}\) cards must be dealt before at least one card of every suit has turned up. 9

The processes of expectation may be taken as a basis for calculating an expectation after each extraction (from the set of the kind described in a preceding paragraph). 10 What is the difference (irrespective of sign) to be expected between the two numbers on each domino? The digit 9, according as it is combined with itself, or any smaller digit, gives the sum of differences

\[ o + 1 + 2 + \ldots + 9 \]

The digit 8 combined with itself or any smaller digit gives the sum of differences \(o + 1 + 2 + \ldots + 8 + 9\) and so on. The sum of the differences is \(2\times8.5 + 1\), where \(g\) has every integer value from 1 to 9 included, \(g(9-1)+9+9=165\). And the number of the differences is \(10+9+8+\ldots+2+1=55\). Therefore the required expectation is 165/55=3.

The digit taken at Random. The question is to be distinguished from the following. What is the difference (irrespective of sign) between two digits, taken at random from mathematical tables, or the expansion of an endless constant like \(\pi\). The combinations of different digits will occur twice as often as the repetitions of the same digit. The sum of the differences may now be obtained from the consideration that the sum of the positive differences must be equal to sum of the negative differences when the differences are distributed equally between the positive and negative set. The sum of the positive set is, as before, 9

64. Expectation of Advantage.—The general examples of expectation which have been given may be supplemented by some appropriate to that special use of the term which Laplace has sanctioned when he considers the subject of expectation as a "good," in the sense of money, or that for the sake of which money is destroyed "moral" advantage, in more modern phrase utility or satisfaction.

65. Pecuniary Advantage.—The most important calculations of pecuniary expectation relate to chances and insurance; based largely on life tables from which the expectation of life is computed, as of money value at the end, or at any period, of life is predicted. The reader is referred to these heads for practical exemplifications of the calculator. It must be observed, however, that all the calculations are facilitated by the adoption of a law of frequency, the Gompertz or the Gompertz-Makeham law, which on the one hand can hardly be ranked with hypotheses resting on a vera causa, yet on the other hand is an empirically verified, and recommended, as germane to the subject-matter, by colourable specifications.8

66. There is space here only for one or two simple examples of money as the subject of expectation. Two persons A and B throw a shilling alternately. A beginning, with the understanding that the one who first throws an ace is to receive a prize of £1. What are their respective expectations? The chance that the prize should be won at the first throw is $\frac{1}{6}$; at the third throw ($\frac{1}{6}$) $\frac{4}{4}$, and so on. Accordingly the expectation of A

\[
\text{expectation of } A = \frac{1}{6} \times \left(1 + \left(\frac{1}{6}\right) + \left(\frac{1}{6}\right)^2 + \ldots\right).
\]

Thus A's expectation is $B$'s as 1 : 8. But their expectations must together amount to £1. Therefore A's expectation is $\frac{8}{9}$ of A's. 9

67. There are 7 candidates in a bag, numbered 1, 2, 3, ..., 7. A man draws two tickets at once, and is to receive a number of sovereigns equal to the product of the numbers drawn. What is the expected value? (Laplace) It would seem that we must consider the improper fraction of which the denominator is the number of possible products, $7!/(n-1)$, and the numerator is the sum of all possible products $= \sum (r + 2 + \ldots + n) = \sum (r + 2 + \ldots + n)$. The required number (of pounds) is found to be $\frac{1}{(n-1)}(n-1)$.

The result may be contrasted with what it would be if the two tickets were not to be drawn at once, but the second after replacement of the first. On this supposition the expectation would be $\frac{1}{2}$, instead of $\frac{1}{3}$, the number of possible products. Therefore the expectation of the product, being the product of the expectations, is $\frac{(n+1)}{(n-1)^2}$. If $n$ is replaced by a large number $N$, we see that the expectation of the product of $N$ tickets is $N$ times the expectation of one ticket. This is an important result, and may be expressed in the form $N! = \sum (r + 2 + \ldots + n)$.

68. There are $m$ balls marked 1, 2, 3,..., $m$. A urn contains $m$ balls marked 1, 2, 3,..., $m$. A man takes one ball at a time, and puts it back after examining it. If $x$ is the number of draws, and $y$ the corresponding moral fortune

\[
y = k \log (x/y),
\]

In other cases the same being done by each elector, the probability will be in favour of the candidate who has the greatest sum.

Practically it is to be feared that this plan would not succeed, because, as Laplace observes, not only are electors swayed by many considerations independent of the merit of the candidates, but they would often place low down in their list any candidate whom they judged to be in the least competitor to the one they preferred, thus giving an unfair advantage to candidates of mediocre merit.

63. This objection is less appropriate to competitive examinations, to which the method may seem applicable. But there is a more fundamental objection to this case, not indeed in every case, to the reasoning on which the method rests; viz. that there is supposed an a priori distribution of values which is in general not supposable; viz. that the several estimates of worth, the marks given to candidates, are not independent of the order in which they may be brought to view, so that the order of selection may be as the normal law of error.2 The theorem governing the case would therefore seem to be not that which is applied by Laplace and his contemporaries, but that which has been investigated by Karl Pearson,4 a theorem which does not lend itself so readily to the purpose in hand.4

1 Above, par. 52. 2 Loc. cit. § 45. 3 See Edgeworth, "Elements of Chance in Examinations," Journ. Stat. Soc. (1890). Cf. below, par. 124. 4 Bernoulli, id. apud. 5 Moore, of Columbia University, New York, has attempted to
man must possess some fortune, or its equivalent, in order to live. To estimate now the value of a moral expectation. Suppose a person whose fortune is $a$ to have the chance $p$ of obtaining a sum $q$, of obtaining $b$, or of obtaining $r$, of obtaining $s$, and so on. Let $p + q + r + \ldots = 1$, only one of the events being possible. Now his moral expectation from the first chance—that is, the increment of his moral fortune multiplied by the chance—is

$$pk \log \frac{q}{p} - \log \frac{p}{q} = pk \log (a/q) - pk \log q.
$$

Hence his whole moral expectation is

$$E = kp \log (a + b) + kg \log (a + b) + kr \log (a + r) + \ldots - k \log a;
$$

and, if $Y$ stands for his moral fortune including this expectation, that is, $k \log (a/b) + E$, we have

$$Y = kp \log (a + b) + kg \log (a + b) + kr \log (a + r) + \ldots - k \log h.
$$

To find $X$, the physical fortune corresponding to this moral one, we have

$$Y = k \log X - k \log h.
$$

Hence $X = (a + b)/(a + b) + (a + r)/(a + r) + \ldots$ and $X - a$ will be the actual or physical increase of fortune which is of the same value to him as his expectation, and which he may reasonably accept in lieu of it. The mathematical value of the same expectation is $\pi a + \pi b + \pi c + \ldots$.

70. **Gambling and Insurance.**—These formulae are employed, often with the aid of refined mathematical theorems, to demonstrate received propositions of great practical importance: that in general gambling is disadvantageous, insurance beneficial, and that in speculative business it is better to subordinate risks—not to "have all your eggs in one basket."

71. These propositions may be deduced by the use of a formula which perhaps comes closer to the facts: viz. that utility or satisfaction from any material goods not definitely ascertained, defined only by the conditions that the function continually increases with the increase of the variable, but at a continually decreasing rate (and some additional postulate as to the convex limit of this variable), the value of the whole variable in advance of what, if it be physical fortune, and $y$ the corresponding utility or satisfaction); where all that is known in general of $f$ is that $f(x)$ is positive, $f'(x)$ is negative, and $f''(x)$ is always greater than zero. Suppose a gambler whose (physical) fortune is $a$, to have the chance $p$ of obtaining a sum $a$ and the chance $q = (1 - p)$ of losing the sum $a$. If the game be fair in the sense of a real probability, viz. $p \cdot a = q \cdot a$. Accordingly the prospective expected advantage of the party is $p \cdot (a + b) + q \cdot (a - b) = p \cdot a + q \cdot a - p \cdot b - q \cdot b$, where $a$ is zero the expression reduces to the first state of the man, the $\pi a$, say $\pi a$. To compare this state with what by it becomes by the gambling transaction, let a receive continually small increments of $\Delta a$. When $a$ is zero the first differential coefficient of $(a - y)$, viz. $\pi a - \pi a = 0$. Also the second differential coefficient, viz. $\pi p(a + b) + \pi q(b - a)$, is negative, since by hypothesis $f''$ is continually negative. And as a continually increases from zero, the second differential coefficient of $(a - y)$, viz. $\pi p(a + b) + \pi q(b - a)$, continues to be negative. Therefore the increments received by the first differential coefficient of $(a - y)$ are continually negative; and therefore $(a - y)$ is continually negative; $\pi a < y$ for finite values of $\pi a$.4

2. To show the advantage of insurance, let us suppose with Morgan Crofton 5 that a merchant, whose fortune is represented by 1, will realize a sum $\epsilon$ if a certain vessel arrives safely. Let the probability of this be $p$. To make up exactly for the risk run by the insurance company, he should pay them a sum $(1 - p)\epsilon$. If he does, his moral fortune becomes, according to the formula now proposed $p \cdot \pi a + q \cdot \pi a - p \cdot \pi b - q \cdot \pi b$, where $a$ is the amount of the premium insurance runs. But if it is not certain he will be $p \cdot \pi a + (1 - p) \cdot \pi b$. We have then to compare $p \cdot \pi a$, say $\pi a$, with $p \cdot \pi a + (1 - p) \cdot \pi b$, say $\pi b$. By reasoning analogous to that of the preceding paragraph it appears that $(\pi a - \pi b)$ is zero when $a$ is zero, then continually diminishes as $\epsilon$ increases up to any assigned finite (admissible) value. Similarly it may be shown that it is better to expose one's fortune in a number of separate sums to risks independent of each other than to expose the whole to the same danger. Suppose a merchant, having a fortune, has besides a sum $\epsilon$ which he must receive if an ship arrives in safety. Then, if the chance of the ship arriving is $p$, his moral fortune will be $p \cdot \pi a + q \cdot \pi a - p \cdot \pi b - q \cdot \pi b + \pi e$. Now instead of exposing the lump sum $\epsilon$ to a single risk, let him subdivide $\epsilon$ into $n$ equal parts, each exposed to an independent equal risk $\epsilon/n$ of being lost. As $n$ is made larger 6 it becomes more and more nearly certain that $e/n$ will realize $\epsilon/n$ out of the total $\epsilon$ exposed to risk. Therefore his condition (in respect of the sort of advantage which is under consideration) will be approximately $\pi (1 - p)\epsilon/n$. Then we have to compare $\pi (1 - p)\epsilon/n$, say $\pi e/n$, with $p \cdot \pi a + (1 - p) \cdot \pi b$. The analysis thus far which has been above employed—observing that $p - p'\pi'(1)$ is negative for all possible values of $p$—we conclude that $\pi a < \pi b$.

For the Petersburg Problem, 7—The doctrine of "moral expectation" was first formulated by Daniel Bernoulli 8 with reference to their celebrated "Petersburg Problem," which is thus stated by Todhunter: "A throws a coin in the air: if head appears at the first throw he to receive 1s from B; if head does not appear until the second throw he is to receive 2s, if head does not appear until the third throw he is to receive 4s, and so on, required the expectation of A." So many lessons are presented by this problem that there has been room for disputing what is the lesson. Laplace and other high authorities follow Daniel Bernoulli. Poisson finds the explanation in the fact that $B$ could not be expected to pay a large sum. Whittworth, who regards the disadvantage of gambling as consisting in the fact that he is "backed out," finds this moral in the Petersburg problem. All have not noticed what some regard as the principal lesson to be obtained from the Petersburg problem: that in a series of "cross-sections" which is regarded as one of a series—at least a "cross-series"—is not subject to the general rule for expectations of advantage whether material or moral.9

Section IV.—Geometrical Applications.

74. Under this head occur some interesting illustrations of principles employed in the preceding sections; in particular of a priori probabilities and of the relation between probability and expectation.

75. Illustrations of a Priori Probabilities.—The assumption which has been made under preceding heads that the probability of certain alternatives is approximated equal appears to rest on evidence which is as satisfactory as the statement that the moral advantage which is made under this head that one point in a line, plane or volume is as likely to occur as another, under certain circumstances. Thus consider the proposition: If a given area $S$ is included within a given area $A$, the chance of a point $P$ taken at random on $A$, falling on $S$ is $S/A$. In a great variety of circumstances such a size can be assigned to the spaces, and taking at random 10 can be so defined that the proposition is more or less directly based on experience. The fact that the points of incidence are equally distributed in space is observed, or connected by inference with observation, in many cases, e.g. raindrops and molecules. There is a solid substratum for the employment of these propositions, and the idea of probabilities is acquired by the following: On a chess-board, on which the side of each square is $\epsilon$, there is thrown a coin of diameter $\theta < \epsilon$ so as to be entirely on the board, which may be supposed to have no border. What is the probability that the coin is entirely on one square?12 The area on which the coin can fall is $(\epsilon - \theta)^2$. The proportion of the area which is available to the event is $\epsilon^2 - (\epsilon - \theta)^2$. Therefore the required probability is $\pi = (\theta^2 - \epsilon^2)$.

76. Random Lines.—Speculative difficulties recur when we have to define a straight line taken at random in a plane; for instance, in the following problem proposed by Buffon 13

The line is ruled with equidistant parallel lines: a rod, shorter than the distance between each pair, being thrown at random on the floor, to find the chance of its falling on one of the lines. The problem is usually solved as follows:14 Let $d$ be the inclination of the rod to a perpendicular to the parallels, $e$ the length of the rod, then, as all values of $x$ and $\theta$ between their extreme limits are equally probable, the whole number of cuts will be represented by

$$\int_0^d \int_0^e x \sin \theta = ma.
$$

1 See above, par. 25 (James Bernoulli's theorem).

2 Specimen theoriae novae de mensura sortis (16), translated (into German) with notes by Fringsheim (1906).

4 This paragraph is taken from Morgan Crofton's article on "Probability," in the 9th edition of the Ency. Brit.

6 Or should we rather say, not exceeding the limit at which $\rho(a - p + q)$ becomes 0? (The value of $\phi(a)$ may be regarded as $-\infty$.) Neither of the proposed limitations materially affects the validity of the theorem.

7 Loc. cit. par. 25.

8 See above, par. 25 (James Bernoulli's theorem).

9 Above, par. 20.

10 Whitworth, Exerices, No. 500.

11 Cf. Morgan Crofton, loc. cit.
Now if the rod crosses one of the lines we must have \( c > x / \cos \theta \); so that the favourable cases will be measured by

\[
\int_{x=0}^{s \cos \theta} \int_{y=0}^{d} \int_{z=0}^{c} \, dx 
\]

Thus the probability required is \( p = \frac{2c}{a} \).

It may be asked: why should we take the centre of the rod as the point from which the straight line has all its values equally probable? Why not one extremity of the line, or some other point suited to the circumstances of projection? Fortunately it makes no difference in the result to what point in the rod we assign this pre-eminence.

77. The legitimacy of the assumption obtains some verification from the success of a test suggested by Laplace. If a rod is actually thrown, it is improbable that a great number times, and the frequency with which it falls on one of the parallels is observed, that proportionate number thus found, say \( p \), furnishes a value for the constant \( x \). For \( x \) ought to equal \( 2p / \pi a \). The experiment has been made by Professor Wolf of Frankfort. Having thrown a needle of length 36 mm. on a plane ruled with parallel lines at a distance from each other of 45 mm. 5000 times, he observed that the needle crossed a parallel 2535 times. Whence the value of \( x \) is deduced -1.5396, with a probable error \( \pm 0.05 \).

78. More hesitation may be felt when we have to define a random chord of a circle,\(^1\) for instance, with reference to the question, what is the probability of a chord taken at random from the circle that lies on the side of an equalateral triangle? For some purposes it would no doubt be proper to assume that the chord is constructed by taking any point on the circumference and joining it to another point on the circumference, the points from which one is taken at random being distributed at equal intervals around the circumference. On this understanding the probability in question would be \( \frac{1}{3} \). But in other connexions, for instance, if the chord is obtained by taking any point with the circle of a rod thrown in random fashion, it seems preferable to consider the chord as a case of a straight line falling at random on a plane. Morgan Crofton\(^2\) himself gives the following definition of such a case: If an infinite number of straight lines be drawn at random in a plane, there will be as many parallel to any given direction as to any other, all directions being equally probable; also those having any given direction will be disposed with equal frequency all over the plane. Hence, if a line be determined by the co-ordinates \( p, \omega \), the perpendicular on it from a fixed origin \( O \), and the inclination of that perpendicular to a fixed axis, then, if \( p \) be made to vary by equal infinitesimal increments, the series of lines so given will represent the entire series of random straight lines. Thus the number of lines for which \( p \) falls between \( p \) and \( p + dp \), and \( \omega \) between \( \omega \) and \( \omega + d\omega \), will be measured by \( dpd\omega \), and the integral \( \iint dpd\omega \) between any limits, measures the number of lines within those limits.

79. Authoritative and useful as this definition is, it is not entirely free from difficulty. It amounts to this, that if we write the equation of the random line

\[
a + y\sin \alpha = x + p\omega
\]

we ought to take \( a \) and \( p \) as those variables, of which the equi-

crescent values are equally probable—the equivaleent variables, as we may say. But might we not also write the equation in either of the following forms

\[
x = a + y(1 - 1 - 0) + p \omega
\]

\[
x = a + y(1 - 1 - 0)
\]

and take \( a \) and \( b \) in either system as the equivaleent variables? To be sure, if the equal distribution of probabilities is extended to infinity we shall be landed in the absurdity that of the random line passing through any point in the axis of \( y \) a proportion differing infinetimsally from unity—100% are either (1) parallel or (2) perpendicular to the axis of \( x \). But the admission of infinite values will render any scheme for the equal distribution of prob-

ably impossible. In any case, the number of chords of \( \theta \) becomes infinite, the origin being thus placed at an infinite distance, all the random chords intersecting a finite circle would be parallel!

However this may be, Professor Crofton's conception has the distinctness of leading to a series of interesting propositions of which specimens are here subjoined.\(^4\) The number of random lines which meet any closed convex contour of length \( L \) is measured by the length of the line of the contours, and integrating first for \( p \), from \( 0 \) to \( p \), the perpendicular chord being at the contour, we have \( \iint dpd\omega \); taking this through four right angles for \( \alpha \), we have

\[
N = \frac{1}{4\pi} 8L^2 d \omega = L^3.
\]

Thus, if a random line meet a given contour, of length \( L \), the chance of its meeting another convex contour, of length \( l \), internal to the former, is \( p = \frac{L^3}{l} \), the length of an endless band, or not closed, \( N \) evidently be the length of an endless string, drawn right around the contour.

81. If a random line meets a closed convex contour of length \( L \), the chance of it meeting another such contour, external to the former, is \( p = \frac{L^3}{l} \), where \( L \) is the length of an endless band enveloping both contours, and crossing between them, and \( l \) is the length of a band also enveloping both, but not crossing. This may be shown by means of Legendre's integral above; or as follows:

\[
\text{Call, for shortness, } N(A) \text{ the number of lines meeting an area } A;\ N(A', A') \text{ the number which meet both } A \text{ and } A'; \text{ then (fig. 1)}
\]

\[
N(\text{SQ} + \text{SQQ'}) = N(\text{SQQ}) + N(SQQ') + N(\text{SQ} + \text{SQQ'})
\]

since in the first member each line meeting both areas is counted twice. But the number of lines meeting the non-convex figure consisting of \( QPHSR \) and \( QQ'S'HP'R' \) is equal to the band \( Y \), and the number meeting both these areas is identical with that of those meeting the given areas \( A \) and \( A' \); hence \( X = X' = Y + N(A, A') \).

Thus the number meeting both the given areas is measured by \( X - Y \). Hence the theorem follows.

82. Two random chords cross a given convex boundary, of length \( L \), and area \( \Omega \); to find the chance that their intersection falls inside the boundary.

Consider the first chord in any position; let \( C \) be its length; considering it as a closed area, the chance of the second chord meeting it is \( 2C/L \); and the whole chance of its coordinates falling in \( dp \), \( d\omega \) and of the second chord meeting it in position is

\[
\frac{2C dpd\omega}{L} \text{ and the whole chance is the sum of these chances for all its positions;}
\]

\[
\text{prob.} = 2L^3 \int dpd\omega.
\]

Now, for a given value of \( \omega \), the value of \( \int dp \) is evidently the area \( \Omega \); then, taking \( \omega \) from \( p \) to \( 0 \), we have

\[
\int dpd\omega = \frac{\Omega L^3}{2}.
\]

The mean value of a chord drawn at random across the boundary is

\[
M = \frac{\iint dpd\omega}{2L} = \frac{\Omega L^3}{4}.
\]

83. A straight band of breadth \( c \) being traced on a floor, and a circle of radius \( r \) thrown on it at random; to find the mean area of the band which is covered by the circle. (The cases are omitted where the circle falls outside the band.)\(^6\) If \( S \) be the space covered, the chance of a random point on the circle falling on the band is \( p = M(S)/\pi r^2 \); this is the same as

\[
\text{This result also follows by considering that, if an infinite plane}
\]

\[
\text{is covered by an infinity of lines drawn at random, it is evident}
\]

\[
\text{that the number of these which meet a given finite straight line}
\]

\[
\text{is proportional to its length, and is the same whatever be its}
\]

\[
\text{position. Hence, if we take } l \text{ the length of the line and the measure}
\]

\[
\text{of this number, the number of random lines which cut any element}
\]

\[
ds \text{, and the number which meet the contour is therefore measured by}
\]

\[
l \times s, \text{ half the length of the boundary.}
\]

\[
\text{If we take } 2l \text{ as the measure for the line, the measure for the contour}
\]

\[
\text{will be } L, \text{ as above. Of course we have to remember that each}
\]

\[
\text{line must meet the contour twice. It would be possible to rectify}
\]

\[
\text{this error by means of this principle. Suppose it traced}
\]

\[
\text{on the surface of a circular disk, of circumference } L, \text{ and the disk}
\]

\[
\text{thrown a great number of times on a system of parallel lines, whose}
\]

\[
\text{distance asunder equals the diameter, if we count the number}
\]

\[
\text{of those which cross the outer lines of the parallels, the ratio of this}
\]

\[
\text{number to the whole number of trials will be ultimately the}
\]

\[
\text{ratio of the circumference of the curve to that of the circle.}
\]

\[\text{[Morgan Crofton's note.]}
\]

\[\text{* Or the floor may be supposed painted with parallel bands, at}
\]

\[\text{a distance asunder equal to the diameter; so that the circle must}
\]

\[\text{fall on one.}\]
if the circle were fixed, and the band thrown on it at random. Now let $A$ (fig. 2) be a position of the random point; the favourable cases are when $HK$, the bisector of the band, meets a circle, centre $A$, radius $\frac{1}{2}$; and the whole number are when $HK$ meets a circle, centre $O$, radius $r + \frac{1}{2}$; hence the probability is

$$ p = \frac{2\pi}{2\pi + \pi} = \frac{2}{\pi + 2}. $$

This is constant for all positions of $A$; hence, equating these two values of $p$, the mean value required is $M(S) = \frac{2\pi}{\pi + 2}$. The mean value of the portion of the circumference which falls on the band is the same fraction $c(2\pi + c)$ of the whole circumference.

If any convex area whose surface is $\Omega$ and circumference $L$ be thrown on the band, instead of a circle, the mean area covered is

$$ M(S) = \frac{\pi c}{\pi + c}. $$

For as before, fixing the random point at $A$, the chance of a random point in $\Omega$ falling on the band is $p = 2\pi x, \frac{\pi c}{L}$, where $L$ is the perimeter of a parallel curve to $L$, at a normal distance $x$ from it. Now

$$ L' = L + 2\pi x, \frac{\pi c}{L}. $$

84. Buffon's problem may be easily deduced in a similar manner. Thus, if $2\pi$ is the length of line, $a$ the distance between the parallels, and we conceive a circle $O$ with its centre at the middle of the line, rigidly attached to the latter, and thrown with it on the parallels, this circle must meet one of the parallels; if it be thrown an infinite number of times we shall thus have an infinite number of chords crossing it at random. Their number is measured by $2\pi x, \frac{\pi c}{L}$, and the number which meet $2\pi$ is measured by $\frac{\pi c}{\pi + 2}$, hence the chance that the line $2\pi$ meets one of the parallels is $p = \frac{\pi c}{\pi + 2}$.

85. To investigate the probability that the inclination of the line joining any two points in a convex area $\Omega$ lie within given limits. Let us give here a method of reducing this question to calculation, for the sake of an integral to which it leads, and which is not easy to deduce otherwise.

First let one of the points $A$ (fig. 4) be fixed; draw through it a chord $PO = c$ at an inclination $\theta$ to some fixed line; put $AP = a, AO = r$; then the number of cases for which the direction of the line joining $A$ and $B$ lies between $\theta$ and $\theta + d\theta$ (measured by $\pi/2\theta^2$) is

$$ \frac{\pi c}{\pi + 2} \int_0^{c/2} \int_0^{\pi/2} \sin \theta d\theta d\phi = \frac{\pi c}{2}. $$

Let $p$ be the perpendicular on $C$ from a given origin $O$, and let $\omega$ be the inclination of $p$ (we may put $do = d\theta$), $C$ will be a given function of $p, \omega$; and, integrating first for $\omega$ constant, the whole number of cases for which $\omega$ falls between given limits $\omega', \omega''$ is

$$ \frac{\pi c}{\pi + 2} \int_0^{c/2} \int_0^{\pi/2} \sin \theta d\theta d\omega = \frac{\pi c}{2}. $$

The integral $\int_0^{\pi/2} \sin \theta d\theta$ being taken for all positions of $C$ between two tangents to the boundary parallel to $PO$, the question is thus reduced to the evaluation of this double integral, which, of course, is generally difficult enough; we may, however, deduce from it a remarkable result; for, if the integral $\int_0^{\pi/2} \sin \theta d\theta = \frac{\pi}{4}$, the integration extending to all possible positions of the chord $C$, its length being a given function of its coordinates $p, \omega$.

1 The line might be anywhere within the circle without altering the question.

2 This integral was given by Morgan Crofton in the *Comptes rendus* (1869), p. 1469. An analytical proof was given by Serret, *Annales scient. de l'école normale* (1869), p. 177.

Con. Hence if $L, \Omega$ be the perimeter and area of any closed convex contour, the mean value of the cube of a chord drawn across it at random is $3\pi^2 L^2 \Omega$. Let there be any two convex boundaries (fig. 5) so related that a tangent at any point $V$ to the inner cuts off a constant segment $S$ from the outer (e.g. two concentric similar ellipses); let the annular area between them be called $A$; from a point $X$ taken at random on this annulus draw tangents $\triangle$ to the inner. Then, the mean value of the area $M(\triangle)$ is $\frac{4\pi}{\pi + 2}$, for $\triangle = L(S)/L$ being the whole length of the inner curve $ABV$.

The following lemma will first be proved — if there be any convex area $AB$ (fig. 6), and if $N_1$ be (the measure of) the number of random lines which meet it once, $N_2$ the number which meet it twice,

$$ 2 \larc当地 = N_1 + 2N_2. $$

For the chord $AB$; the number of lines meeting the convex figure so formed is $N_1 + N_2 = \larc当地人 + \larc当地人$ (the perimeter); but $N_1$ is the number of lines meeting the chord $= 2 \larc当地人$.

Now fix the point $X$, in fig. 5, and draw $\triangle$ to $X$, $XB$, if a random line cross the boundary $L$, and $p_1$ be the probability that it meets the arc $AB$ once, $p_2$ that it does so twice,

$$ 2 \larc当地人 = p_1 + 2p_2; $$

and if the point $X$ range all over the annulus, and $p_1$, $p_2$ are the same probabilities for all positions of $X$,

$$ 2 \larc当地人 = p_1 + 2p_2. $$

Let now $IK$ (fig. 7) be any position of the random line; draw $(\triangle)$ to $IK$; it is easy to see that it will cut the arc $AB$ twice when $X$ is in the space marked $a$, and once when $X$ is in either space marked $b$; hence, for this position of the line, $p_1 - p_2 = 2a/2b = 2a/2S/\pi$; and hence $M(AB) = p_1 - p_2$.

Hence the mean value of the arc is the same fraction of the perimeter that the constant area $S$ is of the annulus. If $L$ be not related as above to the outer boundary, $M(AB)/L = M(S)/L$, $S$ being the mean area of the segment cut off by a tangent at a random point on the perimeter $L$.

The above result may be expressed as an integral. If $s$ be the arc $AB$ included by tangents from any point $(x, y)$ on the annulus,

$$ \int s dx dy = L. $$

It has been shown (Phil. Trans., 1868, p. 191) that, if $\theta$ be the angle between the tangents $\triangle X, XB$,

$$ \int s dx dy = (A - 2S). $$

The mean value of the tangent $\triangle X A$ or $XB$ may be shown to be $M(\triangle) = \pi S/pA$, where $p = A$ being the perimeter of the region of the segment $S$.

87. When we go on to regions of three dimensions further speculative difficulties occur. How is a random line through a given point to be defined? Since it is usual to define a vector by two angles (viz. $\phi$ the angle made with the axis $X$ by a vector $r$ in the plane $XY$, and $\theta$ (or $\phi/2$) the angle made by the vector $r$ with the $z$-plane containing both $p$ and $\phi$ and the $z$-axis) it seems natural to treat the angles $\phi$ and $\theta$ as the equiprobable variables. In other words, if we take at random any meridian on the celestial sphere and combine it with any right ascension the vector joining the centre to the point thus assigned is a random line. It is possible that for some purposes this conception may be appropriate. For many purposes surely it is proper to assume a more symmetrical distribution, so that the surface of a sphere, a distribution such that each element of the surface shall contain an approximately equal number of points. Such an assumption is usually made in the kinetic theory of molecules with respect to the direction of the line joining the centres of two colliding spheres in a "molecular chaos." It is safe to say with Czuber, "No discussion can remove indeterminateness." Let us hope with him that "through this branch of probability can for the present claim only a theoretical interest. In the future it will perhaps also lead to practical results."

88. Illustrations of probability and expectation.—The close relation between probability and expectation is well illustrated by geometrical examples. As above mentioned, when a given space $S$ is included within a given space $A$, if $p$ is the probability that a point

3 Cf. Bertrand, op. cit., § 135.

5 Wahrscheinlichkeitslehre, p. 64.
P, taken at random on A, falling on S, \( \rho = S/A \). If now the
space \( S \) be variable, and \( M(S) \) be its mean value
\[ \rho = M(S)/A. \]

For, if we suppose \( S \) to have \( n \) equally probable values \( S_1, S_2, S_3, \ldots \), the chance of any one \( S_i \) being taken, and of \( P \) falling on \( S_i \), is
\[ \rho_i = M_i/A; \]
now the whole probability \( \rho = \rho_1 + \rho_2 + \rho_3 + \ldots \), which leads at once to the above expression.
The chance of two points falling on \( S \) in the same way,
\[ \rho = M(S^2)/A^2, \]
and so on.

In such a case, if the probability be known, the mean value
follows, and vice versa. To find we might find the mean value of the \( \rho \)th power of the distance \( Z \) between two points taken at random
in a line of length \( l \), by considering the chance that, if \( n \) more
points are so taken, they shall all fall between \( X \) and \( Y \). This
\[ M(XY)^n/L = M((n+1)^{-1} (n-1)^{-1}). \]

(1) If \( M \) be the mean value of any quantity depending on
the \( n \) points \( (\text{e.g., their distance}) \) which are taken, one
in a space \( A \), the other in a space \( B \) (external to \( A \)), and if \( M^2 \)
be the same mean when both points are taken indiscriminately in
the whole space \( A + B \); \( M_{AB} \) the same mean when both points
are taken in \( A \) and both in \( B \) respectively; then
\[ (A + B)^n/M = 4AB + 2AM + 2M^2 + 2BP. \]

(2) The mean distance of a point \( P \) within a given area from a
fixed straight line (which does not meet the area) is evidently the
distance of the centre of gravity \( G \) of the area from the line. Thus,
if \( A, B, C \) be the centres of gravity of the areas \( A, B, C \),
\[ G = A + B + C. \]

If \( M \) be the mean value of the area of the triangle \( ABC \), then
\[ M = M_{ABC}. \]

For this it will follow that, if \( X, Y, Z \) are three points taken at random
in three given spaces on a plane (such that they cannot all be cut by
any straight line), the mean value of the area of the triangle
\( XYZ \) is the triangle \( GGC^* \), determined by the three centres of
gravity of the spaces.

This proposition is of use in the solution of the following problem:

Two points \( X, Y \) are taken at random within a triangle. What
is the mean area \( M \) of the triangle \( XYZ \), formed by joining them
with one of the angles of the triangle.

 Bisect the triangle by the line \( CD \); let \( M_i \) be the mean value
when both points fall in the triangle \( ACD \) and \( M_3 \) the value
when one falls in \( ACD \) and the other in \( BCD \); then
\[ M = 2M_1 + M_2 + M_3. \]

Also, \( M_{AB} = M \); \( M_{AC} = M_1 \); \( M_{BC} = M_2 \). Hence
\[ M = M_{ABC}. \]

The mean value of any quantity depending on
the \( n \) points \( X, Y, Z \) taken at random, with a vertex \( C \),
\[ M = M_{ABC}. \]

This theorem is of use in the calculation of probabilities.

90. The calculation of geometrical probability and expectation
is not facilitated by the method of following general principles;
if \( M \) be a mean value depending on the positions of \( n \) points falling on
a space \( A \); and if this space receive a small increment \( a \), and \( M^* \)
be the same mean when the points are taken on \( A + a \), and \( M \) the
same mean when one point falls on \( a \) and the remaining \( n - 1 \) on \( A \); then, the sum of all the cases being \( M(A + a) \), and this sum
consisting of the cases \( (1) \) when all the points are on \( A \), (2) when
one is on the others on \( A \) (as we may neglect all where two or more
fall on \( a \)), we have
\[ M^* = 4M_a + M_{aA} + M_{aB} + M_{aC}. \]

As \( M^* \) nearly = \( M \). For example, suppose two points \( X, Y \) are
taken in a line of length \( l \), to find the mean value \( M \) of \((XY) \ast \). If
we take an increment \( dl \), \( dM = 2dl \), \( M = M_1 - M \). Now \( M_1 \) is
the mean \( \rho \)th power of the distance of a single point taken
at random in \( l \) from one extremity of \( l \); and this is \( M(n+1)^{-1} \) (as is
shown by finding the chance of \( n \) other points falling on that
distance); hence
\[ \rho = dM = 2dl \cdot (n+1)^{-1} - M; \]
\[ 4dM = 2dl = 2dl \cdot (n+1)^{-1} - dl; \]
\[ M = 2(n+1)^{-1} (n+1)^{-2} C; \]
\[ N = 2(n+1)^{-1} (n+2). \]

C being evidently \( o \).

91. The corresponding principle for probabilities may thus be
stated: If \( p \) is the probability of a certain condition being satisfied
by any \( n \) points within \( A \), in art. 90, \( p' \) the same probability when
they fall on the space \( A + a \), and \( p' \) the same when one point falls
on \( a \) and the rest on \( A \), then, since the numbers of favourable cases are
respectively \( p'A + p'BA \), \( p'BA \), \( p'BA \), we find
\[ \rho = p' - p \]

Hence if \( p' = p \), then \( \rho = p \). For example, if we have to find
the chance of three points falling within a circle forming an acute-angled
triangle by adding a miniscule concentric ring to the circle,
we have evidently \( p' = p \); hence the required chance is unaltered
by assuming one of the three points taken on the circumference.
Again, if we find the chance that four points within a triangle shall
form a convex quadrilateral, if we add to the triangle a small band between the base
and perpendicular extended, the chance is clearly unaltered.

Therefore we may take one of the points at random on the
base (fig. 8), the others \( X, Y, Z \) within the triangle. Now the
cases of the four points are as likely to occur in any specified
order as any other.

Hence it is an even chance that \( X, Y, Z \) fall on the sides \( AB, BC, CD \),
and cannot be taken indiscriminately in the whole space \( A + B + C \).

The whole probability of a re-entrant quadrilateral is
\[ \frac{1}{4} + \frac{1}{4} = \frac{1}{2}. \]

That of its being convex is \( \frac{1}{2} \).

92. From this probability we may pass to the mean value of the
area \( XYZ \); if \( M \) be this mean, and \( A \) the given area, the chance
of a fourth point falling on the triangle is \( M/A \); and the chance of a
re-entrant quadrilateral is four times this, or \( 4M/A \).

This chance has been shown to be \( \frac{1}{4} \); and accordingly \( M = \frac{1}{2} A \).

93. The preceding problem is a particular case of a more general problem
investigated by Sylvester. For another instance, let the given area \( A \) be
a circle; within such three points are taken at random; and let \( M \) be
the mean value of the triangle thus formed.

Adding a concentric ring \( a \), we have since \( M' = M \); as the areas of the
circles, \( M' = M(A+a)/A \).

\[ A = 3a/(M - M); \]
\[ 2M = 2M_1. \]

where \( M_1 \) is the value of \( M \) when one of the points is on the cir-
cumference. Take \( 0 \) fixed; we have to find the mean value
of \( OXY \) (fig. 9).

Taking \( (p, \theta) \) as co-ordinates of \( X, Y, Z \),
\[ M_1 = -(p + a)/f \sin (\theta - 0) + d \sin (\theta - 0)d\theta; \]
\[ M_Y = -(p + a)/f \sin (\theta - 0) + d \sin (\theta - 0)d\theta. \]
with when the number of the constituents is indefinitely large. For then it may be presumed that any method of determining the mode will lead to the same result. This presumption presupposes that the constituents are quantities of the kind which form the sort of "series" which is proper to Probabilities. A similar presupposition is to be made with respect to the constituents of the other averages, so far as they are objects of probabilities.

96. The Law of Error.—Of the propositions respecting average with which Probabilities is concerned the most important are those which deal with the relation of the average to its constituents, and are commonly called "laws of error." Error is defined in popular dictionaries as "deviation from truth"; and since truth commonly lies in a mean, while measurements are some too large and some too small, the term in scientific diction is extended to deviations of statistics from their average, even when that average—like the mean of human or barometric heights—does not stand for any real objective thing. A "law of error" is a relation between the extent of a deviation and the frequency with which it occurs: for instance, the proposition that if a digit is taken at random from mathematical tables, the difference between that figure and the mean of the whole series of the digits thus obtained, namely, 4, will in the long run prove to be equally often +0.5, +1.5, +2.5, +3.5, +4.5. The assignment of frequency to discrete values—as 0, 1, 2, &c., in the preceding example—is often replaced by a continuous curve with a corresponding equation. The distinction of being the law of error is bestowed on a function which is applicable not merely to one sort of statistics—such as the digits above instance—but to the great variety of miscellaneous groups, generally at least, if not universally. What form is most deserving of this distinction is not decided by uniform usage; different authors do not attach the same weight to the different grounds on which the claim is based, namely the extent of cases to which the law may be applicable, the closeness of the application, and the presumption prior to specific experiment in favour of the law. The term "the law of error" is here employed to denote (1) a species to which the title belongs by universal usage, (2) a wider class in favour of which there is the same sort of a priori presumption as that which is held to justify the more familiar species. The law of error thus understood forms the subject of the first section below.

97. Laws of Frequency.—What other laws of error may require notice are inclined to the various "laws of frequency" which form the subject of the second section. Laws of frequency, so far as they belong to the domain of Probabilities, relate much to the same sort of grouped statistics as laws of error, but do not, like them, connote an explicit reference to an average. Thus the sequence of random digits above instance as affording a law of error, considered without reference to the mean value, presents the law of frequency that one digit occurs as often as another (in the long run). Every law of error is a law of frequency; but the converse is not true. For example, it is a law of frequency—discovered by Professor Pareto—that the number of incomes of different size (above a certain size) is inversely as the power of one above another, where x denotes the size of an income, y the number of incomes of that size. But whether this generalization can be construed as a law of error (in the sense here defined) depends on the nice inquiry whether the point from which the frequency diminishes as the income x increases can be regarded as a "mode," y diminishing as x decreases from that point.

---

1 See introductory remarks and note to par. 95.
2 A great variety of (functional) averages, including those which are best known, are comprehended in the following general form

\[ \phi[M(\phi(x_1), \phi(x_2), \ldots, \phi(x_n))]; \]

where \( \phi \) is an arbitrary function, \( \phi' \) is inverse (such that \( \phi'(\phi(x)) = x \), M is any (functional) mean. When M denotes the arithmetic mean; if \( \phi(x) = \log x, \phi'(\phi(x)) = e^x \) we have the geometric mean; if \( \phi(x) = x^2 \), we have the harmonic mean. Of this whole class of averages it is true that the average of several averages is equal to the average of all their constituents.

3 This convenient term was introduced by Karl Pearson.
4 E.g., some specified method of smoothing the given statistics.

---

[1] Putting \( r = \text{OH}, r' = \text{OK}; \) as \( r = 2a \sin \theta, r' = 2a \sin \theta' \),

\[ M_1 = \frac{1}{2\pi} \int_0^{2\pi} \sin \theta \sin \theta' \sin \theta' \, d\theta' d\theta. \]

Professor Sylvester has remarked that this double integral, by means of the theorem

\[ \int_0^a f(x, y) \, dx \, dy = \int_a^0 f(a - y, a - x) \, dx \, dy, \]

is easily shown to be identical with

\[ 2 \int_0^a \sin \theta \sin \theta' \cos \theta' \, d\theta' d\theta = \int_0^a \sin \theta \, d\theta = 1 - 3.7 \times 10^{-8}. \]

From this mean value we pass to the probability that four points within a circle shall form a re-entrant figure, viz.

\[ \frac{1}{\pi} \approx \frac{35}{12}. \]

94. The function of expectation in this class of problem appears to afford an additional justification of the position here assigned to this conception as distinguished from an average in the more general sense which is proper to the following Part.

**Part II.—Averages and Laws of Error**

95. Averages.—An average may be defined as a quantity derived from a given set of quantities by a process such that, if the constituents become all the same, the average will coincide with the constituents, and the constituents not being equal, the average is greater than the least and less than the greatest of the constituents. For example, if \( x_1, x_2, \ldots, x_n \) are the constituents, the following expressions form averages (called respectively the arithmetic, geometric and harmonic means):

\[ \frac{x_1 + x_2 + \ldots + x_n}{n}, \]

\[ \left( \frac{x_1 x_2 \ldots x_n}{n} \right)^{1/n}, \]

\[ \frac{1}{n} \left( \frac{1}{x_1} + \frac{1}{x_2} + \ldots + \frac{1}{x_n} \right). \]

The conditions of an average are likewise satisfied by innumerable other symmetrical functions, for example:

\[ \left( \frac{x_1^2 + x_2^2 + \ldots + x_n^2}{n} \right)^{1/2}. \]

The conception may be extended from symmetrical to unsymmetrical functions by supposing any one or more of the constituents in the former to be repeated several times. Thus if in the first of the averages above instanced (the arithmetic mean) the constituent \( x_i \) occurs \( l_i \) times, the expression is to be modified by putting \( l_i x_i \) for \( x_i \), in the numerator, and in the denominator, for \( n, n + r - l \). The definition of an average covers a still wider field. The process employed need not be a function. One of the most important averages is formed by arranging the constituents in the order of magnitude and taking for the average a value which has as many constituents above it as below it, the median. The designation is also extended to that value about which the greatest number of the constituents cluster most closely, the "centre of greatest density," or (with reference to the geometrical representation of the grouping of the constituents) the greatest ordinate, or, as recurring most frequently, the mode. But to comply with the definition there must be added the condition that the mode does not occur at either extremity of the range between the greatest and the least of the constituents. There should be also in general added a definition of the process by which the mode is derived from the given constituents. Perhaps this specification may be dispensied

---

See above, pt. 1, pars. 3 and 4. Accordingly the expected value of the sum of (similar) constituents \( \sum (x_i + x_2 + \ldots + x_n) \) may be regarded as an average, the average value of \( nx \), where \( x_i \) is any one of the constituents.

---

---

PROBABILITY

Section I.—The Law of Error.

98. (1) The Normal Law of Error.—The simplest and best recognized statement of the law of error, often called the "normal law," is the equation

\[ z = \frac{1}{\sqrt{\pi \sigma}} e^{-\frac{(x-a)^2}{2\sigma^2}} \]

more conveniently written \((1/\sqrt{\pi \sigma})(x-a)\), where \( x \) is the magnitude of an observation or "statistic," \( z \) is the proportion of observations measuring \( x \), \( \sigma \) is the arithmetic mean of the group (supposed indefinitely multiplied) of similar statistics; \( \sigma \) is a constant sometimes called the "modulus" proper to the group; and the equation signifies that if any large number \( N \) of such a group is taken at random, the number of observations between \( x \) and \( x+\delta x \) is (approximately) equal to the right-hand side of the equation multiplied by \( N \delta x \). A graphical representation of the corresponding curve—sometimes called the "probability-curve"—is here given (Fig. 10), showing the general shape of the curve, and how its dimensions vary with the magnitude of the modulus \( \sigma \). The area being constant (viz. unity), the curve is furled up when \( \sigma \) is small, spread out when \( \sigma \) is large. There is added a table of integrals, corresponding to areas subtended by the curve; in a form suited for calculations of probability, the variable, \( x \), being the length of the abscissa referred to (divided by) the modulus. \(^1\) It may be noted that the points of inflexion in the figure are each at a distance from the origin of \( 1/2 \sigma \) modulus, \( \delta \) distance equal to the square foot of the mean square of error—often called the "standard deviation." \(^2\) Another notable value of the abscissa is that which divides the area on either side of the origin into two equal parts; commonly called the "probable error." The value of \( x \) which corresponds to this point is \( 4.769 \ldots \)

\[ \begin{array}{|c|c|c|c|c|c|} \hline \tau & r & \tau & r & \tau & r \\ \hline 0.00 & 0 & 0.01 & 2 & 0.02 & 4 \\ 0.03 & 6 & 0.04 & 12 & 0.05 & 20 \hline \end{array} \]

99. An a priori proof of this law was given by Herschel as follows: "The probability of an error depends solely on its magnitude and not on its direction;" positive and negative errors are equally probable. "Suppose a ball dropped from a given height with the intention that it should fall on a given mark," errors in all directions are equally probable, and errors in perpendicular directions are independent. Accordingly the required law, "which must necessarily be general and applicable in all cases, since the causes of error are supposed alike unknown," \(^3\) is for one dimension the form \( f(x^2) \), for two dimensions \( f(x^2+y^2) \), and \( f(x^2+y^2) = f(x^2) \times f(y^2) \); a functional equation of which the solution is the function above written. A reason which satisfies Herschel is entitled to attention, especially if it be considered that the law propounded by Thomson and Tait. \(^4\) But it must be confessed that the claim to universality is not, without some strain of interpretation, \(^5\) to be reconciled with common experience.

100. There is, however, one class of phenomena to which Herschel's reasoning applies without reservation. In a "molecular chaos," such as the received kinetic theory of gases postulates, if a molecule be placed at a point \( a \) and a point \( b \) in different directions, from that point in a given time, driven hither and thither by colliding molecules, is regarded as an "error," it may be presumed that errors in all directions are equally probable and errors in perpendicular directions are independent. It is remarkable that a similar presumption with respect to the velocities of the molecules was employed by Clerk Maxwell, in his first approach to the theory of molecular motion, to establish the law of error in that region.

101. The Laplace-Quetelet Hypothesis, that presumption has, indeed, not received general assent; and the law of error appears to be better rested on a proof which was originated by Laplace. According to this view, the normal law of error is a first approximation to a frequency which with different values are apt to be assumed by a variable magnitude dependent on a great number of independent variables, each of which assumes different values in random fashion over a limited range, according to the law of error. In general, the law is, or in general the same for each variable. The normal law prevails in nature because it often happens—in the world of atoms, in organic and in social life—that things depend on the number of independent agencies. Laplace, indeed, appears to have applied the mathematical principle on which this explanation depends only to examples (of the law of error) artificially generated by the process of taking averages. The merit of accounting for the prevalence of the law in rerum natura belongs rather to Queetelet. He, however, employed too simple a formula \(^6\) for the action of the causes. The hypothesis seems first to have been stated in all its generality both of mathematical theory and statistical exemplification by Gauss. \(^7\)

102. The validity of the explanation may best be tested by first (A) deducing the law of error from the condition of numerous causes; (B) proving the law of errors as a simple case of the more general law, adequately fulfilled in a variety of concrete cases, in which the condition is probably present. The condition may be supposed to be perfectly fulfilled in games of chance, or, more generally, in variables, characterized by the circumstance that we have a knowledge prior to specific experience of the proportion of what Laplace calls favourable cases, \(^8\) to all cases—a category which includes, for instance, the distribution of digits obtained by random extracts from mathematical tables, as well as the distribution of the numbers of points on dominoes.

103. The general theory of the law of error is most clearly illustrated by the special case of "game," that in which the sortition is between two alternatives, heads or tails, hearts or not-hearts, or, generally, success or failure, the probability of a success being \( p \) and the probability of failure \( q \), where, of course, \( p + q = 1 \). If such successes in the course of \( n \) trials may be considered as an aggregate made up of \( n \) independently varying elements, each of which assumes the values 0 or 1 with respective frequency \( g \) and \( p \). The frequency of each value of the law, given \( \sigma \), is on this ignorance, and not on any peculiarity in cases, that the idea of probability in the abstract is formed." Cf. above, \( \sigma \).

\(^1\) On this conception see below, par. 122.

\(^2\) E.g. in the article on "Probability" in the 9th ed. of the Ency. Brit.; also by Airy and other authorities. Bravais, in his article Sur la probabilité des erreurs..., "Mémoires présentés par divers savants" (1846), p. 257, takes as the "modulus or parameter" the inverse square of our \( \sigma \). Doubtless different parameters are suited to different purposes and contexts; \( \sigma \) when we consult the common tables, and in connexion with the operator, as below, par. 160; \( k^{-1/2} \) when we investigate the formation of the probability-curve out of independent elements (below, par. 104); \( k^{-1/2} \) when we are concerned with weights or probabilities (below, par. 134). If a form of the coefficient must be uniformly adhered to, probably \( \sigma = \sqrt{k} \), for which Professor Pearson expresses a preference, adds the best. It is called by him the "standard deviation." \(^3\)

\(^3\) Fuller tables are to be found in many accessible treatises. Burgess's tables in the Trans. of the Edin. Roy. Soc. for 1900 are carried to a high degree of accuracy. Thorndike, in his Mental and Social Measurements, gives among other useful tables, one referred to the standard deviation as the argument. New tables of the probability integral are given by W. F. Sheppard, Biometrika, ii. 174 seq.

\(^7\) Cf. note to par. 257.

\(^8\) It is considered to have the effect as the sum of causes each of which obeys the simplest law of frequency, the symmetrical binomial.

\(^10\) Above, par. 2.
aggregate is given by a corresponding term in the expansion of \((q + p)\), and by a well-known theorem this term is approximately equal to \(\frac{1}{\sqrt{2\pi npq}}\) \(e^{-\frac{(x-\mu)^2}{2\sigma^2}}\); where \(n\) is the number of integers by which the term is distant from \(np\) (or an integer close to \(np\)); \(p\) and \(q\) being as \(of\) or \(\langle\sigma\rangle\) the frequency \(\mu\) at a certain point. Graphically, let the ordinate made for each element be represented by the taking or not taking with respective frequency \(p\) and \(q\) a step of length \(\varepsilon\). If a body starting from zero goes up \(\varepsilon\) in \(n\) such steps, the probability of the body coming to a given point \(\nu\) (measured from zero); the probability of its stopping at any neighbouring point within a range of \(\varepsilon = \sqrt{n}\) is given by the above-written formula \(\frac{1}{\sqrt{2\pi npq}}\nu^{\frac{1}{2}}\). Thus the probability of a normal distribution is \(\frac{1}{\sqrt{2\pi npq}}\nu^{\frac{1}{2}}\), and the probability may be written \((\frac{1}{\sqrt{\pi n}}) e^{-\frac{x^2}{2n}}\). Thus \((\frac{1}{\sqrt{n}}) e^{-\frac{x^2}{2n}}\) is equal to \(2\pi\). The sum of \(\nu\) then being of the same quantity as \(n\), the number of points presented by a randomly thrown die. According to the general theorem, if \(Q\) is the sum of \(n\) elements, each of which assumee different magnitudes according to a law of frequency, \(Q = \int f(z) dz\), the function \(f\) being in general different for different elements, the number of times that \(Q\) assumes magnitudes between \(x\) and \(x + \Delta x\) in a course of trials is \(N\Delta x\), if \(z = (1/\sqrt{2\pi npq}) - (x-\mu)^2/2\sigma^2\); where \(a\) is the arithmetical mean of all the elements, any one of which \(a = \int f(z) dz\), the square brackets denoting that the integrations extend between the extreme limits of the element's range, if the frequency-locus for each element is continuous, it being understood that \(\int f(z) dz\) = 1; and \(k\) is the sum of the mean squares of error for each element, \(-\Sigma \int e^2 f(z) dz\), if the frequency-locus for each element is continous, where \(a\) is the arithmetical mean of one of the elements, and \(x\) the deviation of any value assumed by that element from \(a\). Denoting summation over all the elements. When the frequency-locus for the element is not continuous, the integrations which give the arithmetic mean and mean square of error for the element must be replaced by summations. For example, in the case of the die, the mean frequency of each of the six elements is \(1/6\), and \(\sigma^2 = \frac{1}{12}\); \(\sigma = \frac{1}{6}\). The sum of the results obtained by tossing a large number, \(n\), of dice at random will assume a particular value \(x\) with a frequency which is approximately assigned by the equation

\[
N = (\frac{1}{\sqrt{2\pi npq}}) e^{-\frac{(x-\mu)^2}{2\sigma^2}} \cdot (\frac{1}{\sqrt{2\pi npq}}) e^{-\frac{(x-\mu)^2}{2\sigma^2}},
\]

The rule equally applies to the case in which the elements are not similar; one might be the number of points on a die, another the number of points on a dome, and so on. Graphically, each element is no longer represented by a straight line which is entirely different but by a curve which may be, with an assigned probability, one or other of several degrees between those limits, the law of frequency and the range of the element differing for the different elements. The wide range of these statements can only be indicated here. All the proofs which have been offered involve some postulate as to the deviation of the elements from their respective centres of gravity, their 'errors'. If these errors extended to infinity, it might well happen that the law of error would not be fulfilled by a sum of such elements. The necessary and sufficient postulate appears to be that the mean powers of deviation for the elements, the second (above written) and the similarly formed third, fourth, &c., powers (up to some assigned power), should be finite.

106. (The proof which seems to flow most directly from this postulate proceeds thus. It is deduced that the mean powers of deviation for the elements, the second (above written), differ from the corresponding powers of the actual locus by quantities which are negligible when the number of the elements is large. But loci which have their mean powers of deviation to some certain power approximated equal quite may be considered as approximately equal.

107. (The earliest and best-known proof is that which was

---

1 By the use of Stirling's and Bernoulli's theorems, Todhunter, History... of Probability.
2 The statement includes the case of a linear function, since an element multiplied by a constant is still an element.
3 E.g., if the frequency-locus of each element were \(1/s(1+2s)\), extending to infinity in both directions. But extension to infinity would not be fatal, if the form of a exposition and a justification of many of the statements which follow, see the writer's paper on "The Law of Error" in the Courb. Phil. Trans. (1905).

PROBABILITY

108. (3) De Forest\(^1\) has given a proof unencumbered by imaginaries of what is the fundamental proposition in Laplace's theory that, if a polynomial of the form

\[ A_0 + A_1 z + A_2 z^2 + \ldots + A_n z^n \]

be raised to the \( n \)th power and expanded in the form

\[ B_0 + B_1 z + B_2 z^2 + \ldots + B_m z^m \]

then the magnitudes of the \( B \)'s in the neighbourhood of their maximum (say \( B_0 \)) will be disposed in accordance with a "probability-curve", or normal law of error.\(^2\)

109. (4) Professor Morgan Crofton's original proof of the law of error is based on a datum obtained by observing the effect which the introduction of a new element produces on the frequency-locus for the aggregate of elements. It seems to be assumed, very properly, that the sought function involves as constants some at least of the mean powers of the aggregate, in particular the mean second power, say, \( y^2 \), of general form (and accordingly the aggregate) to its respective centre of gravity. Then if \( y = f(x) \), is the ordinate of the frequency-locus for the aggregate before taking in a new element, and \( y = \phi \) the ordinate after that operation, by a well-known principle,\(^3\) \( y + dy = \frac{\phi}{\phi(x)} f(x - \xi \Delta \xi), \) where \( \phi = \phi(x) \) is the frequency-locus for the new element, and the square brackets indicate that the summation is to extend over the whole range of values assumed by that element. Expanding in ascending powers of \( (\phi - \phi(x)) \) and neglecting powers above the second, as is found to be legitimate under the conditions specified, we have (since the first mean power of the element vanishes)

\[ \Delta y = \frac{\phi}{\phi(x)} f(x - \xi \Delta \xi) \Delta \xi. \]

From the fundamental proposition that the square for the aggregate equals the sum of mean squares for the elements it follows that \( \frac{\phi}{\phi(x)} \) is the mean second power of deviation for the \( m \)th element when equal to \( \Delta \xi \), the addition to \( k \) the mean second power of deviation for the aggregate. This, thus obtained a partial differential equation of the second order

\[ \frac{dy}{dx} = \frac{1}{2} \frac{dy}{\phi(x)} \frac{dy}{dx} \]

(1)

A subsidiary equation is (in effect) obtained by Professor Crofton from the proposition according to which the axis of \( x \) is graduated is altered in any assigned ratio, there must be a corresponding alteration both of the ordinates expressing the frequency of the aggregate and of the mean square of deviation for the aggregate. By supposing the summation indefinitely small be obtained a second partial differential equation, viz. (in the notation here adopted)

\[ y + \frac{dy}{dx} + \frac{2}{\phi(x)} \frac{dy}{dx} \Delta \xi. \]

(2)

From these two equations, regard being had to certain other conditions of the problem,\(^4\) it is deducible that \( y = Ce^{x^2 \sigma^2} \), where \( C \) is a constant of which the value is determined by the condition that

\[ \int_{-\infty}^{\infty} y \, dx = 1. \]

110. (5) The condition on which Professor Crofton's proof is based can be differenced, as obtained from the introduction of a single new element. There is also an integral condition obtained from the introduction of new elements. For let \( m \) be the sum of \( m \) elements, fluctuating according to the sought law of error. Let \( B \) be the sum of another set of elements \( m \) in number \((m_1 \) and \( m_2 \) both large). Then \( Q = A \) a quantity formed by adding together each pair of of concurrent values presented by \( A \) and \( B \) and must also conform to the law of error, since \( Q \) is the sum of \( m_1 + m_2 \) elements. The general form which satisfies this condition of reproducibility is limited by other conditions to the normal law of error.\(^5\)

111. The list of variant proofs is not yet exhausted,\(^6\) but enough has been said to establish the proposition that a sum of numerous elements of the kind described will fluctuate approximately according to the normal law of error.\(^7\)

Varieties of Linear Function. m elements each multiplied by \( 1/m \). The "spread" of the average thus considered will continually diminish as the number of the elements is increased; the sides closing in as the vertex rises up. The change in "spread" produced by the accession of new elements is illustrated by the transition from the high to the low curve, in fig. 10, in the case of a sum; in the case of an average (arithmetic mean) by the reverse relation.

113. The proposition which has been proved for linear functions may be extended to the consideration of numerous in another variables, each representing the value assumed by an independently fluctuating element; if the function may be expanded in ascending powers of the variables, according to Taylor's theorem, and all the powers after the first may be neglected. The matter is not so simple as it is often represented, when the variable elements may assume large, perhaps infinite, values; but with the aid of the postulate above enunciated the difficulty can be overcome.\(^8\)

114. All the proofs which have been noticed have been extended to errors in two (or more) dimensions.\(^9\) Let \( Q \) be the sum of a number of elements being a function of two variables, \( x \) and \( y \), assumes different values according to a law of frequency \( f(x, y) \); the functions in general different for different elements.

The frequency with which \( Q \) assumes values of the variables between \( x + \Delta x \) and \( y + \Delta y \) may be obtained by the formula

\[ m = \frac{1}{2\pi \sqrt{1 - \rho^2}} \int_{x - \Delta x}^{x + \Delta x} \int_{y - \Delta y}^{y + \Delta y} f(x, y) \, dx \, dy. \]

The summation extending over all the elements, and the integration between the extreme limits of each; supposing that the law of frequency for each element is continuous, otherwise summation is to be substituted for integration. For example, let each element be constituted as follows: Three coins having been tossed, the number of heads \( k \) obtained is put for \( x \), the number of heads presented by the second and third coins together is put for \( y \), the number of times \( y \) and \( x \) was the same.

\[ z = \frac{1}{2\pi \sqrt{1 - \rho^2}} \int_{x - \Delta x}^{x + \Delta x} \int_{y - \Delta y}^{y + \Delta y} f(x, y) \, dx \, dy. \]

1. The Analyst (Iowa), vols. vi. and vii. passion; and especially vi. 142 seq., vii. 172 seq.

Morgan Crofton, loc. cit. p. 781, col. a. The principle has been used by the present writer in the Phil. Mag. (1885), xvi. 307.

4. Loc. cit. pt. i. § 4; and app. 6.

5. Loc. cit. pt. i. § 12 seq.

7. The second by Burbury, in Phil. Mag. (1894), xxxvi. 145; the third by its author in the Analyst for 1881; and the remainder by the present writer in Phil. Mag. (1896), xii. 247; and Camb. Phil. Trans. (1905), loc. cit.

8. Compare the formula for the simple case above, § 4.

The maximum frequency is, as it ought to be, at the point $x = 6i$, $y = 6i$. The density is particularly great along a line through that point, making $45^\circ$ with the axis $x$; particularly small in the complementary direction. This also is as it ought to be. For if the centre is made the origin by substituting $x$ for $(x-a)$ and $y$ for $(y-b)$, and then new co-ordinates $X$ and $Y$ are taken, making an angle $\theta$ with $x$ and $y$ respectively, the curve which is traced on the plane of $2X$ by its intersection with the surface is of the form

$$z = \exp \left(-2X \sin^2 \theta - 2i \cos \theta + m \cos \theta / (2(km - P)) \right),$$

a probability-curve which will be more or less spread out according as the factor $k \sin \theta - 2l \cos \theta + m \cos \theta / (2(km - P))$ is less or greater. Now this expression has a minimum or maximum when $(k-m) \sin \theta - 2l \cos \theta = 0$; a minimum when $(k-m) \cos \theta + 2l \sin \theta = 0$, a maximum when that expression is negative; that is, in the present case, when $k = m$, a minimum when $\theta = \pi$ and a maximum when $\theta = 2\pi$.

\end{array}

116. Characteristics of the Law of Error. As may be presumed from the examples just given, in order that there should be some approximation to the normal law the number of elements need not be very great. A very tolerable approximation to the normal curve has been obtained by superposing three elements, each obeying a law of frequency quite different from the normal one; namely, that simple law according to which one value of a variable occurs as frequently as another below the normal law which we have considered (namely, $y = 1/2a$, between limits $x = a$, $x = -a$). If the component elements obey unsymmetrical laws of frequency, the compound will indeed be to some extent unsymmetrical, unlike the "normal" probability-curve. But, as the number of the elements is increased, the portion of the compound curve in the neighbourhood of its centre of gravity tends to be rounded off into the normal shape. The portion of the compound curve which is sensibly identical with a curve of the "normal" family becomes greater the greater the number of independent elements; in the present case, where $k = m$, a minimum when $\theta = \pi$ and a maximum when $\theta = 2\pi$.

Errors and Probability.

Miscellaneous Statistics.
exemplified by A. L. Bowley's grouping of the wages paid to different classes.\footnote{1}

119. The division of discrete errors which has been proposed is not to be confounded with another twofold classification, namely, between the sorts of error for which the standard, for a real object, things, and such statistics as are not thus representative of something outside themselves, groups of which the mean is called subjective and objective. This division, would be neither.\footnote{2} clear nor useful. On the one hand so-called real means are often only approximately equal to objective quantities. Thus the proportional frequency with which one face of a die—the six suppose—turns up is on the average of a thousand throws by a fair 1 die one face of a nearly perfect cube. For a set of dice with which Weldon experimented, the average frequency of a throw, presenting either five or six points, proved to be not 3, but 3.377.\footnote{3} The distribution of this result bears resemblance to a normal law, if any such thing may be called a normal law, from objective data, prior to experiment, as any of the means called subjective or fictitious. So the mean of errors of observation often differs from the thing observed by a so-called "constant" error. So show the change reflected from the ball—eye by a steady wind or "drift."

120. On the other hand, statistics, not purporting to represent a real object, are called to magnify and accumulate the things which cannot be described as fictitious. Where the items averaged are ratios, e.g. the proportion of births or deaths to the total population in several districts or other sections, it sometimes happens that the distribution of the ratios exactly corresponds to that which is obtained in the simplest games of chance—"combinatorial" distribution in the phrase of Lexis.\footnote{2} There is unmistakably suggested a segregation of the simplest type, with a real ascertainable relation between the ratios. There is the principle of a normal distribution of the cases. The most remarkable example of this property is presented by the proportion of male to female (or to total) births. Some other instances are given by Lexis or by Bortkевич. The correspondence between the actual and the "combinational" distribution has been found by Bortkевич\footnote{4} in the case of very small probabilities (in which case the law of error is no longer "normal"). And it is not sure that some rays—such as death-deaths—not representing combinational distribution, might be broken up into subdivisions—such as death-rates for different occupations or age groups—each distributed in that simple fashion.

121. The set of averages which is difficult to class as subjective rather than objective occurs in some social statistics, under the designation of index-numbers. The percentage which represents the change in the value of money between two epochs is seldom regarded as a measure by which the change in the price of several values taken at random, but rather as the measure of something, e.g. the variation in the price of a given amount of commodities, or of a unit of consumption.\footnote{5} So something substantive appears to be designated by the volume of trade, or that of the consumption of the working classes, of which the growth is measured by appropriate index-numbers; the former due to Bourne and Sir Robert Giffen,\footnote{6} the latter to the Lewis.\footnote{7}

122. But apart from these peculiarities, any set of statistics may be related to a certain quasielement, very much as measurements are related to the object measured. That quasielement is the limiting or average value, which the frequency of the values of a set will, if prolonged, would converge, the mean of the complete group; this conception of a limit applying to any frequency-constant, to \( e^{c} \) for instance, as well as \( e^{x} \) in the case of the normal curve. The given average already observed is a special case of the general average which may be approached up to the true constant by that principle of the calculus which determines the comparative probability of different causes from which an observed event may have emanated.\footnote{12}

123. Thus it appears that there is a characteristic more essential to the statistician than the existence of an objective quasielement, namely, the use of that method which is primarily, but not exclusively, proper to that sort of quasielement—inverse probability,\footnote{10} without that delicate instrument the doctrine of error can seldom be fully utilized; but some of its uses may be indicated before the introduction of technical difficulties.

When establishing the law of error,\footnote{11} we go on to its applications. The mere presumption that wherever three or four independent causes co-operate, the law of error tends to be set up, has a certain speculative interest.\footnote{12} For whether the conditions may be expected to hit a zone of given size. The expenditure of ammunition required to hit an object can thence be inferred. Also the comparison between practice under different conditions is statistically a difficult matter. In many cases it is found that the total marks given to different candidates for answers to the same set of questions range approximately in conformity with the law of error. A good method that statisticians have used in reference to this fact some practical directions to examiners. Apart from such direct applications, it is a useful addition to our knowledge of a class that the measurable attributes of its members range in the manner that the "days of a man are threescore and ten," if we may regard that epoch, or more exactly for England, 72, as "Nature's aim, the length of life for which she builds a man, the dispersion on each such individual to be regulated by some such law as the normal law, that the law of error is the proper one is confirmed by some of that evidence which perhaps has not been fully recognized.\footnote{13} An [a mere] average gives us no assurance that the future will be like the past. A [normal] mean may be reckoned on with the most complete confidence. The existence of independent causes,\footnote{14} in the same manner, the fulfilment of the hypothesis, that the probability of a certain event occurring is not the same, but is subject to the condition of occasions, which is the condition of the constant probability of a constant event, more or less accurately fulfilled. From the example of the discoveries of the laws of nature.\footnote{15} Without the mean, the average, the mean for the moment estimation of molecular motions.

Normal Distribution of Molecular Motions.

\section*{Laws of Error}
The illustration brings into view the circumstance that though the speed of molecules may start with a distribution of values greater than the normal, yet by repeated collisions the normal distribution will be superimposed. If both the velocities u and v are distributed according to the law of error for one dimension, we may presume that the second also. In biological phenomena it may be noted that, as the pair of velocities u and v is made up of a great number of elementary pairs (the co-ordinates in each of which need not, initially at least, be supposed uncorrelated) the law of frequency for concurrent values of u and v must be of the normal form which may be written

\[ z = \frac{1}{2\pi (km - 1 - r^2)} \exp \left[ -\frac{(x-a)^2}{2(1-r^2)} \right] \]

for the equation for pairs of measurement becomes

\[ z = \frac{1}{2\pi \sqrt{km}} \exp \left[ \frac{(x-a)^2}{2\sqrt{km}} \right] \]

8. Normal Correlation. In Biology. It was found by Galton that the heights and other measurable attributes of children of the same parents are distributed according to a normal law. This may be the reason that the height of children is not the same as the height of their parents, but nearer the average of the general population. The amount of this correlation is simply proportional to the distance of the normal curve from the center of the wave-length. This is a case of very general law which governs the relations of a two-dimensional surface: it may be called a mathematical curve or, more generally, a mathematical proportion existing between the deviation from the average of one organ and the probable value of the co-existence deviation of the other. The correlation of these deviations from their respective means is called the correlation of the "mathematical contributions" which Professor Pearson has made to the theory of evolution. In social inquiries, also, the principle promises a rich harvest. Where numerous fluctuating causes go to produce a result like paupery or immunity from small-pox, the ideal method of eliminating chance would be to construct regression-equations of the following type: "Change in pauperism in the decade 1871-1881 in rural districts = -270.7% + 0.299 (change in out-relief ratio) + 0.271 (change in proportion of old) + 0.064 (change in population)."

Accordingly, the host will be massed along the line \[ y = \frac{1}{\sqrt{2\pi \sigma^2}} \exp \left[ -\frac{(y-a)^2}{2\sigma^2} \right] \]

(129) In order to determine the best values of the coefficients involved in the law of error, and to test the worth of the results obtained by using any values, recourse must be had to inverse probability. Determining Coefficients by the Inverse Method. The simplest problem under this head is the one concerning the quotient of a single real object and a real or complex variable. The data consist of a large number of observations, \( x_1, x_2, \ldots, x_n \), such that if the number were indefinitely increased, the complete series would form a normal probability-curve with the true point as its centre, and having a given modulus \( c \). It is as if we had observed the position of the dints made by the fragments

of an exploding shell so far as to know the distance of each mark measured (from an origin) along a right line, say the line of an extended fortification, and it was known that the shell was fired perpendicular to a distant ridge running along the fortification, and that the shell was of a kind of which the fragments are scattered according to a normal law, 1 with a known coefficient of dispersion; the question is what position on the distant ridge was most likely to have been occupied by the received probability, say P, that the given set of observations has resulted from measuring (or aiming at) an object of which the real position was exactly x and y.

\[ \Delta \exp \left\{ -(x-x')^2 + (y-y')^2 \right\} \]

where J is a constant obtained by equating to unity \( \int_{-\infty}^{\infty} Pdx \) (since the given set of observations must have resulted from some point on the normal "curve of error" of which x and y are the coördinates). With a normal law for the set of observations most probably obtained, is obtained by making P a maximum. Putting Ddx = 0, we have for the maximum \( D^2dx/2 \) being negative for this value) the arithmetic mean of the given set of values of x and y. The accuracy of the determination is measured by a probability-curve with modulus \( \sqrt{n} \). This in the course of a very long siege if every case in which the given group of shell-marks \( x_0, x_1, \ldots, x_n \) was presented could be investigated, it would be found that the enemy's cannon was fired from the position \( x', y' \), the point right opposite to the (arithmetic mean of \( x_0, x_1, \ldots, x_n \) with a frequency assigned by the equation

\[ n(x-x')^2/\sigma^2 \]

The reasoning is applicable without material modification to the case in which the data and the quæsitum are not absolute quantities, but proportions; for instance, given the percentage of white balls in some batches of balls, and in another, an immense regiment of black and white balls, to find the percentage of white balls in the urn—the inverse problem associated with the name of Bayes.

130. Simple as this solution is, it is not the one which has most recently been recommended. It is the one which Gauss recommended for the quæsitum six, and as much as that point which is most probably the real one, as that point which may most advantageously be put for the real one. In our illustration it is as if we were required to discover from a number of shells fired by the enemy (who were having a long siege) the position of the enemy's cannon, which was situated at one point rather than another, the formula would require to be modified. This a priori probability is sometimes grounded on our ignorance; according to another view, the procedure is justified by a rough general knowledge that over a tract of x for which P is sensible one value of x occurs about as often as another. 1

1 If normally in any direction indifferently according to the two or more heterogeneous single equations in x and y, when collected and distributed in bds perpendicular to a horizontal right line, as in the example cited below, par. 155.

2 Or small interval (cf. preceding section).

3 Or better error subject positive root negative root, which (as it is tacitly assumed that prior to observation one value of x is as probable as another value, it is evident that the enemy's cannon was as likely to be at one point as another of (a certain tract of) the ridge from which it was fired. If, apart from the evidence of the shell-marks, there was anything among the circumstances attending at one point rather than another, the formula would require to be modified. This a priori probability is sometimes grounded on our ignorance; according to another view, the procedure is justified by a rough general knowledge that over a tract of x for which P is sensible one value of x occurs about as often as another.

133. Subject to similar speculative difficulties, the solution, which has been obtained may be extended to the analogous problem in which the gualitum is a probability curve of the normal law of error to which a series of statistics indefinitely prolonged converges. 2

134. Let now the modulus, still supposed given, not be the same for all observations, but \( c_1, c_2, \ldots, c_n \). Then P becomes proportional to

\[ \exp \left\{ -(x-x')^2/(c_1^2 + (y-y')^2/c_2^2 + \cdots) \right\} \]

And the value of x which is both the most probable and the "most advantageous" is \( (c_1^2 x + c_2^2 x_2 + \cdots)/\left\{c_1^2 + c_2^2 + \cdots \right\} \), the modulus of the mean square of observations made under similar conditions. 3 This is the rule prescribed by the "method of least squares," but in the case where the probability curve is deduced by a general inverse probability, the problem does not exemplify what is most characteristic in that method, namely, that a rule deductible from the hypothesis of the errors of observations obey the same law of error of which the probability curve is deduced from the normal law, not known, or even known not, to hold good. For example, let the curve of error for each observation be of the form

\[ z = \left[1/(\sigma(x)) \right] \exp \left\{ -(x-x')^2/2(\sigma(x)^2 + y-y')^2/2\right\} \]

where j is a small fraction, so that z may equally well be equal to \( (x-x')^2/(\beta(x) + y-y')^2/2\) exp \(-z^2/2\), a law which is actually very prevalent. Then, according to the genuine inverse method, the most probable value of x is given by the quadratic equation

\[ \log P = \text{constant} - \sum (x-x')^2 - \sum (y-y')^2 \]

\[ \text{2} \]

135. Many of the answers which have been given to this question seem to come to this. When the data are unmanageable, it is legitimate to attend to a part thereof, and to determine the most probable (or least disadvantageous) solution of the gualitum, and the degree of its accuracy, from the selected portion of the data as if it formed the whole. This throwing overboard of part of the data in order to utilize the remainder may often lead to a mode of procedure much superior to any method of applied probabilities. Thus an insurance office only takes account of the age and some other simple attributes of its customers, though a better bargain might be made in particular cases by taking into account all available details. The nature of the method is particularly clear in the case where the given set of observations consists of several batches, the observations in any batch ranging under the same law of frequency with mean x, and mean square of error k, the function and the constants different for different cases; then if we confine our attention to those parts of the data which are of the type \( x' \) and \( k \),—ignoring what else may be given as to the laws of error—we may treat the \( x' \)'s as so many observations, each ranging under the normal law of error, with its coefficient of dispersion; and apply the rules proper to the normal law. Those rules applied to the data, considered as a set of derivate observations each formed by a batch of the original observations) average as we have seen, to the determination of the gualitum, and the most advantageous combination of the arithmetic mean weighted according to the inverse mean square pertaining to each observation, and for the law of error of which the determination is made the normal law with standard deviation \( \sqrt{2k/n} \)—the very rules that are prescribed by the method of least squares.

136. The principle involved might be illustrated by the proposal to make the economy of (\( d \) or a little less rigid to utilize 2 the method indeed all, but a little more of our materials—not only the mean square of error for each batch, but also the mean cube of error. To begin with the simple case of a single homogenous batch: suppose that we have the same number of cases, each ranging under the normal law of error, with its coefficient of dispersion; and apply the rules proper to the normal law. By the method of least squares it would still be proper to put the arithmetic mean to the given observations for the true point required, and to measure the accuracy of that determination by a probability-curve of which the modulus is \( \sqrt{2k} \), where k is the mean square of deviation (of fragments from their mean), which is thought desirable to utilize more of the data there is available, the proposition that the arithmetic mean of a of Science, 2nd ed. p. 146). See also "A Priori Probabilities," Phil. Mag. (Sept. 1884), and Camb. Phil. Trans. (1885), vol. iv. pt. ii. P. 134.

Above, pars. 6, 7.

2 The mean square \( x^2/\sigma^2 \) exp \(-x^2/2\) is \( e^2/2\).

3 The standard deviation pertaining to a set of \( \eta \) composite observations, each derived from the original \( n \) observations by averaging a batch thereof numbering \( r \), is \( \sqrt{\eta/(\sigma^2 + r-1)} \).
numerous set of observations, say $x, x_1, \ldots, x_n$, (taken as a sample from an indefinitely large group obeying any the same law of frequency) varies from set to set approximately according to the following law (to be established later)

$$z = \frac{x \pm n \sigma}{\sqrt{n}} \exp \left(-\frac{1}{2} \left(\frac{x - \mu}{\sigma}\right)^2\right) = f(x),$$

where $x''$ the mean square of deviation, and $j = \frac{x' - y'}{x''}$ the mean cube of deviation, and $\mu, \sigma$, etc., is small. Then, by abstraction analogous to that which has just been attributed to the method of least squares, we may regard the observed points (in any awkward metric as a probability) $z = f(x)$, subject to the law of error $z = f(x)$. The most probable value of the _quasiestum_ is therefore given by the equation $f'(x) = 0$.

From the resulting quadratic equation, putting $x = x' + b$, and recollecting that $x' + b$ is small we have $e = jc$. This is the correction due to the utilization of the mean cube of deviation. The most advantageous equations may be determined from the same and will be of the first order, without assuming a particular form for the function of determination. This method of least squares plus cubes may easily be extended to the case of several batches.

137. This application of probabilities not to the actual data but to a selected part thereof, this economy of the inverse method, is not only practised in miscellaneous statistics, where the object is to determine whether the discrepancy between two sets of observation is accidental or significant of a real difference. For instance, let the data be ages at death of individuals of two classes (e.g. temperate or not so, urban or rural, etc.) who have been under observation, since the time of their birth, by the same writers. Granting the ages at death conform to Gompertz's law, the determination of the modal age at death, that age at which the proportion of the total observed dying (per unit of time) is a maximum for each class, would most perfectly be made by the inverse method. This method enable us to determine the probability that the two modes should have differed to the observed extent by mere accident. According to the abridged method it suffices to proceed as if of two observations $x'$ and $x''$, the average ages at death of the two classes, each average obeying the normal law of error, with respective moduli $c_1 = \sqrt{(x'-x_1)^2 + (x''-x_2)^2 + \text{etc.}/n}$, $c_2 = \sqrt{(x'-y_1)^2 + (x''-y_2)^2 + \text{etc.}/n}$, where $x_1, x_2, \text{etc.}, y_1, y_2, \text{etc.}$ are the observed ages at death; as follows from the law of error, whatever the law of distribution of the given observations. According to a well-known property of the normal law, the difference between the averages of $n$ and $m$ observations, respectively, will depend on cube with modulus $\sqrt{v^2 + w^2}, v = c_1, w = c_2$. Whence for the probability that a difference as great as the observed one, say $e$, should have occurred by chance we have $\frac{1}{\sqrt{2\pi}} e^{-\frac{e^2}{2}} (\text{with } \mu = 0)$, the cube being the integral $2\sqrt{v^2 + w^2}, f(x) = \exp -ax^3 + bx^2 + cx + d$, given in many treatises.

138. This sort of abridgment may be extended to other kinds of average besides the arithmetic, in particular the median (that point which has as many of the given observations above as below it). By simple induction we know that the most strongly sampled of samples is the sample value for the true median; how probable is determined as follows from a selection of our data. First suppose that all the observations are of the same weight.

If the regression be $a = \frac{n-1}{n} + r$, the observations should fall on either side of that point is given by the normal law for which the exponent is $-2r^2/n$. This probability that the observed median will differ from the true one by a certain number of observations is connected with the probability that they will differ by a certain extent of the abscissa, by the proposition that the number of observations contained between the true and apparent median is equal to the small difference between them multiplied by the density of observations at the median—in the case of normal and generally symmetrical curves the greatest ordinate. This is the second datum we require to select. In the case of the normal curve it is determined by induction from a selection of data. If the observations are not all of the same worth, weight may be assigned by counting one observation as if it occurred often as that another. This is the essence of Laplace's Method of Average of Situation.

1 The use of the cubes is also contrasted with that of the squares (only in this respect: that it is no longer a matter of indifference how many of the original observations we assign to the batch of which the mean constitutes the single (compound) observation. The objection to the method of averages is specifically stated in the Joubilie number of the Journal of the Society (1885). See also on the inverse method to determine the mode of a group, the present writer's paper on Probable Errors in the Journal of the Stat. Soc. (Sept. 1908).

PROBABILITY

146. The solution proper to the case where the observations are known to arrange according to the normal law may be extended to numerous observations ranging under any law, on the principles which justify the use of the Method of Least Squares in the case of a single quasium.

147. As in that simple case, the principle of economy will now justify the use of the median, e.g. in the case of two quasiums, for the purpose of finding, when the data are given, the constants by which the perpendiculars fall from it on each of a set of lines representing the given equations (properly weighted) is a minimum.\(^3\)

148. To determine the frequency-constants of such a group it is proper to proceed on the analogy of the simple case of one-dimensional error. In the case of two dimensions, for instance, the problem of determining the facility ratio of a given pair of observations \((x, y)\) should have resulted from a normal group of which the means are \(x'\) and \(y'\) respectively, the standard deviations \(a_1\) and \(a_2\) and the coefficient of correlation \(r\) may be written:

\[
\Delta x = x - x' + \delta x, \quad \Delta y = y - y' + \delta y.
\]

The values of the arithmetic mean and of the standard deviation for each variable are what have been obtained in the simple case of one dimension. The value of \(r\) is \(2 \times (x - x')(y - y')/a_1 a_2\). The probable error of the determination is assigned on the assumption that each of the \(2 \times (x - x')(y - y')/a_1 a_2\) is in the elements which have already been calculated for a great number of interesting cases. For instance, the coefficient of correlation between the human stature and femur is 0.86, between the height and mean of the hands and feet 0.26.\(^2\)

149. This application of inverse probability to determine correlation-coefficients and the error to which the determination is liable has been made by Professor Pearson.\(^4\) The writers. The use of the normal formula to measure the probable— and improbable—errors incident to such determinations is justified by reasoning akin to that which has been employed in the general case of linear error.\(^5\) Professor Pearson has pointed out that in the circumstances which seems to be of great importance in the theory of evolution: that the errors incident to the determination of different frequency-coefficients are apt to be mutually correlated. This arises from the fact that the determination is made by making the correlation-coefficient which fits the organs of that set apt to differ from the coefficient proper to the complete group in the same sense as some other frequency-coefficients.

The remarks applies also to the determination of the coefficients, in particular those of correlation, by abridged methods, on principles explained with reference to the simple case; for instance by the formula \(r = Y_1 X_2 / Z_1 Z_2\), where \(Z_1\) is the sum of (some or all) the positive (or the negative) deviations of the values for one organ from the mean measurement; the mean of the periodical errors for the other equations, the probability that the given set of observations \(x, y, z, \ldots\) should have resulted from a particular system of values for \(x, y, z, \ldots\) is \(1 / \sqrt{\text{det} (\begin{bmatrix} a_1 & b_1 & c_1 & \ldots & 0 \\ b_1 & a_2 & b_2 & \ldots & 0 \\ c_1 & b_2 & a_3 & \ldots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \ldots & a_n \end{bmatrix})}\), where \(J\) is a constant determined on the same principle as in the analogous simpler cases.\(^6\) The condition that \(P\) should be a maximum gives as many linear equations for the determination of \(x', y', z', \ldots\).

151. A method of rejecting data analogous to the use of percentile in one dimension is practised when, given the frequency of observations \(x, y, z, \ldots\) in certain intervals for a long and vertical line, each of which the median, the frequency for integral areas. Mr Sheppard has given an elegant solution of the problem: to find the correlation between two attributes, given the medians \(L\) and \(M\), of a normal group for each attribute and the distribution of the total group, as thus:

\[
\text{Below } L, \quad \text{Above } L, \quad \text{Below } M, \quad \text{Above } M, \quad \text{P}, \quad \text{R}.
\]

If cos \(D\) is put for \(r\), the coefficient of correlation, it is found that \(D = \text{R}/(P+R)\). For example, let the group of statistics relating to rice already cited from Professor Weldon be arranged in such a manner that one of the attributes is the height of the stalk and the other a vertical line, each of which separates the total groups into two halves: lines of which equations prove to be respectively \(y = 6.11\) and \(x = 6.156\). For \(R\) we have 1360-5, and for \(P\) 687-5 roughly. Whence \(D = \text{R}/(X+66); r = \text{R}/(P+R)\). From this it follows that the median of the two attributes is less by half, and the same time that the total integral of the frequency above the median tint which manny wives with eye-colour above the median tint, Professor Pearson finds for \(r\) the coefficient of correlation \(0.01\). A general method for determining the frequency-constants when the data are, or are taken to be, of the integral sort has been given by Professor Pearson.\(^6\) Attention should also be called to Mr Yule's treatment of the problem by a sort of logical calculus on the lines of Boole and Jevons.\(^8\)

In the cases of correlation which have been so far considered, it has been presupposed that the things correlated range according to the normal law of error. But now suppose the law of distribution to be no longer normal: for instance, that the dots on the plan of a city representing each a pair of members, are no longer grouped in elliptic (or circular) rings of equal frequency, but that the locus of the maximum \(y\) deviation, corresponding to an assigned \(x\) deviation, is no longer a right line. How is the interdependence of these deviations to be formulated? It is submitted that such data may be treated as if they were normal: by an extension of the Method of Least Squares, in two or more dimensions.\(^9\) Thus when the amount of puerperal death together with the amount of outdoor relief is plotted in several units there is obtained a distribution far from normal. Nevertheless if the average puerperal and average outdoor relief are taken for aggregations—say quintettes or decades—of unions taken at random, it may be expected that these means will conform to the normal law, with coefficients obtained from the original data, according to the rule which is proper to the case of the normal law.\(^2\) By obtaining the limits of the normal distribution from the given data, and the mean of the method of least squares, we shall not indeed have utilized the whole of our data, but we shall have taken part of it in a very useful

---

1. Above, par. 130.
2. See Phil. Mag. (1888), "On a New Method of Reducing Observations," where a comparison in respect of convenience and accuracy with the other methods is presented without prejudice.
3. Corresponding to the \(k/\sqrt{n}\) of pars. 14, 127 above.
11. Above, par. 127.
13. If from the given set of \(n\) observations (each corresponding to a point on the plane \(xy\)) there is derived a set of \(n\) observations each obtained by averaging a batch numbering \(n\) of the original observation; the coefficient of correlation for the derived system is the same as that which pertains to the original system. As to the standard deviation for the new system see note to par. 135.
Although the regression-equations obtained would not accurately fit the original method, they would have a certain correspondence thereto. What sort of correspondence may be illustrated by an example in games of chance, which Professor Weldon kindly supplied. Three half-dozen of dice having been thrown, the number of dice with more than three points in that dozen which is made up of the first and the second half-dozen is taken for $x$, the number of sixes in the dozen, made up to the first and the third half-dozen, is taken for $y$. Thus each twofold observation $(xy)$ is the sum of six twofold elements, each of which is subject to a law of frequency represented in fig. 13; where the figures outside denote the number of successes of each kind, for the ordinate the number of dice with more than three points (out of a cast of two dice), for the ordinate the number of sixes (out of a cast of two dice, one of which is common to the aforesaid cast); and the figures inside denote the comparative probabilities of each twofold value (e.g. the probability of obtaining in the first two cast dice each with more than three points, and in the second cast two sixes, is $1/72$). Treating this law of frequency according to the rule which is proper to the normal law, we have (for the example) if $a$ and $b$ be the compartments each $=\frac{15\sqrt{2}}{18}=\frac{5}{\sqrt{27}}=\frac{5}{3\sqrt{3}}$.

Whence for the regression-equation which gives the value of the ordinate most probably associated with an assigned value of the abscissa we have $y=x\sqrt{x}$ and for the other regression-equation, $x=y/6$. Accordingly, in Professor Weldon's table, which are reproduced in the annexed diagram, when $x=3$ the number of sixes (out of a cast of two dice, one of which is common to the aforesaid cast); and the figures inside denote the comparative probabilities of each twofold value (e.g. the probability of obtaining in the first two cast dice each with more than three points, and in the second cast two sixes, is $1/72$). Treating this law of frequency according to the rule which is proper to the normal law, we have (for the example) if $a$ and $b$ be the compartments each $=\frac{15\sqrt{2}}{18}=\frac{5}{\sqrt{27}}=\frac{5}{3\sqrt{3}}$.

Whence for the regression-equation which gives the value of the ordinate most probably associated with an assigned value of the abscissa we have $y=x\sqrt{x}$ and for the other regression-equation, $x=y/6$. Accordingly, in Professor Weldon's table, which are reproduced in the annexed diagram, when $x=3$ the number of sixes (out of a cast of two dice, one of which is common to the aforesaid cast); and the figures inside denote the comparative probabilities of each twofold value (e.g. the probability of obtaining in the first two cast dice each with more than three points, and in the second cast two sixes, is $1/72$). Treating this law of frequency according to the rule which is proper to the normal law, we have (for the example) if $a$ and $b$ be the compartments each $=\frac{15\sqrt{2}}{18}=\frac{5}{\sqrt{27}}=\frac{5}{3\sqrt{3}}$.

Whence for the regression-equation which gives the value of the ordinate most probably associated with an assigned value of the abscissa we have $y=x\sqrt{x}$ and for the other regression-equation, $x=y/6$. Accordingly, in Professor Weldon's table, which are reproduced in the annexed diagram, when $x=3$ the number of sixes (out of a cast of two dice, one of which is common to the aforesaid cast); and the figures inside denote the comparative probabilities of each twofold value (e.g. the probability of obtaining in the first two cast dice each with more than three points, and in the second cast two sixes, is $1/72$). Treating this law of frequency according to the rule which is proper to the normal law, we have (for the example) if $a$ and $b$ be the compartments each $=\frac{15\sqrt{2}}{18}=\frac{5}{\sqrt{27}}=\frac{5}{3\sqrt{3}}$.

The Generalized Law of Error.—That the normal law of error should not be exactly fulfilled is not disconcerting to those who ground the law upon the plurality of independent causes. On the contrary, the normal law would only be exact when the number of elements from which a result is derived is very great. In general, when that number is large, but not indefinitely great, there is required a correction owing to one or other of the following imperfections: that the elements do not fluctuate according to the normal law of frequency; that their fluctuations are not independent of each other; that the function whereby they are aggregated is not linear. The correction is formed by a series of terms descending in the order of magnitude.

159. The first term of this series may be written

\[ -2(k/e_0)(e/e_c - 2k^2 e_0^2) \]

where \( e_0^2 \) is the mean square deviation for the compound and also the sum of the mean squares of deviations for the component elements, \( k \) is the mean cube of deviations for the compound and the sum of the mean cubes for the components, and the elements are supposed to be such and so numerous that \( k/e_0^2 \) is the order of 1/\( n \). This second approximation, first given by Poisson, was rediscovered by De Forest. The present writer has observed it by an accident of methods. By a further extension of these methods a third and further approximations may be found. The corrected normal law is then of the form

\[ z = \sqrt{n} \left( \exp \left( -\frac{1}{2} \right) \right) \left( 1 - 2k \left( \frac{1}{2} \right) + \frac{1}{4} k^2 \left( \frac{1}{3} \right) \right) \]

where \( k = k/e_0^2, k_0 = k_e/e_0^2, k_1 \) and \( c \) are defined as above, \( k_0 \) is the sum of the respective differences for each element between its mean fourth power of error and thence its mean square of error, and also the corresponding difference for the compound. The formula may be verified by the case of the binomial, considered as a simple case of the law of great numbers. Here

\[ e_0^2 = 2npq, p = npq (q - p), \]

\[ k_0 = npq (1 - 6pq). \]

1 It is frequent in the statistics of wages.

3 The Analyt (Iowa), vol. ix.

4 Phil. Mag. (Feb.1896) and Camb. Phil. Trans. (1903).

5 The part of the third approximation affected with \( k_2 \) may be found by proceeding to another step in the method described (Phil. Mag., 1896, p. 96). The remaining part of the third approximation is found by the same method (or the variant on p. 97) from the new partial differential equation

\[ dy = dy_0 - 2kdy_0/24y^4 \]

where \( k_0 \) is the difference between the actual mean fourth power of deviation and what it would be if the normal law held good. Further approximations may be obtained on the same principle.

6 The notation which Professor Pearson has made familiar.

These values being substituted for the coefficients in the general formula, there results an expression which may be obtained directly from equation (2) to express the probability for a term of the binomial, and in the case of the normal distribution for a particular point (within a particular small interval) may be written

\[ \frac{1}{\sqrt{2\pi}} \left( 1 - \frac{1}{2} \frac{d}{dy} + k_1 \frac{d^2}{dy^2} - \ldots - (\gamma)^{k_2} \frac{d^{k_2}}{dy^{k_2}} \right) \]

where \( y_0 \) is the (normal error-function)

\[ \frac{1}{\sqrt{2\pi}} \left( 1 - \frac{1}{2} \frac{d}{dy} + k_1 \frac{d^2}{dy^2} - \ldots - (\gamma)^{k_2} \frac{d^{k_2}}{dy^{k_2}} \right) \]

where \( y_0 \) is the (normal error-function)

\[ \frac{1}{\sqrt{2\pi}} \left( 1 - \frac{1}{2} \frac{d}{dy} + k_1 \frac{d^2}{dy^2} - \ldots - (\gamma)^{k_2} \frac{d^{k_2}}{dy^{k_2}} \right) \]

160. If the third approximation is not satisfactory there is still available a fourth, or a still higher degree of approximation. The general expression for \( y \) which (multiplied by \( d^2 \)) reproduces the approximate expression for a term of the binomial.

While the virtual approximation is not excluded because, like the group of shot-marks above examined, it is, though almost perfectly symmetrical, in other respects apparently somewhat abnormal.

161. The fourth degree of approximation may now be written

\[ e - \frac{1}{2} \frac{d}{dy} + \frac{1}{2} \frac{d^2}{dy^2} - \ldots - (\gamma)^{k_2} \frac{d^{k_2}}{dy^{k_2}} \]

where the second term is the sum of the first two. The second term is the sum of the first two. The second term is the sum of the first two. The second term is the sum of the first two. The second term is the sum of the first two. The second term is the sum of the first two.

Moreover, the first term of the odd series of \( k \)'s when divided by the proper power of the parameter, \( z^p \), is small in comparison with the first term of the even series, \( k_p \), properly referred—divided by \( c^p \) (\( z = k \)).

162. Whatever the degree of approximation employed, it is to be remembered that the law in general is only applicable to a certain range of the compound magnitude here represented by the abscissa \( x \). The curve of error, even when generalized as here proposed, coincides only with the central portion of the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

163. The law thus generalized may be extended, with similar reservations, to two or more dimensions. For example, the second approximation in two dimensions may be written

\[ z_2 = \frac{1}{2} \frac{1}{\sqrt{2\pi}} \left( 1 - \frac{1}{2} \frac{d}{dy} + k_1 \frac{d^2}{dy^2} - \ldots - (\gamma)^{k_2} \frac{d^{k_2}}{dy^{k_2}} \right) \]

The curve of error, even when generalized as here proposed, coincides only with the central portion of the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

164. Above, § 103, referring to Todhunter, History, art. 993. The third (or second additional term of approximation) for the binomial, \( z^p \), is the mean value of the cubes \( z^3 \), \( z^2 \), \( z^4 \), \( z^5 \), \( z^6 \), \( z^7 \). The term \( k_0 \) is slightly affected by \( k_1 \) for the binomial.

165. In the case of a line the law of error is constant, and the point \( x \) is 0. The curve of error, even when generalized as here proposed, coincides only with the central portion of the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

166. Above, § 103, referring to Todhunter, History, art. 993. The third (or second additional term of approximation) for the binomial, \( z^p \), is the mean value of the cubes \( z^3 \), \( z^2 \), \( z^4 \), \( z^5 \), \( z^6 \), \( z^7 \). The term \( k_0 \) is slightly affected by \( k_1 \). The point \( x \) is 0. The curve of error, even when generalized as here proposed, coincides only with the central portion of the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

167. In the case of a line the law of error is constant, and the point \( x \) is 0. The curve of error, even when generalized as here proposed, coincides only with the central portion of the body, as distinguished from the extremities of the actual locus; a greater or less proportion.

168. Above, § 103, referring to Todhunter, History, art. 993. The third (or second additional term of approximation) for the binomial, \( z^p \), is the mean value of the cubes \( z^3 \), \( z^2 \), \( z^4 \), \( z^5 \), \( z^6 \), \( z^7 \). The term \( k_0 \) is slightly affected by \( k_1 \) for the binomial.
differential to zero (the second differential being always negative). The resulting equation is of the form

\[ y - \alpha x = T - ax^2 - 2bx - y = 0, \]

where \( T, a, b, \gamma \) are all small, linear functions of the \( k's \). As \( y \) is nearly equal to \( \alpha x \), it is legitimate to substitute \( \alpha x \) for \( y \), when \( y \) is multiplied by a small constant. The curve of regression thus reduces to a parabola with equation of the form

\[ y - \alpha x = q \alpha^2, \]

where \( q \) is a linear function of the third powers and moments of the given group.

163. **Dissection of certain Heterogeneous Groups.**—Under the head of law of error may be placed the case in which statistics relating to two (or more) different types, each separately conforming to the normal law, are mixed together; for instance, the measurements of human heights in a country comprising two different races.

In this case the *gausian* are the constants in a curve of the form:

\[ y = a(\sqrt{1 + x^2}) \exp\left(-\frac{a^2}{2}\right) + b(\sqrt{1 + x^2}) \exp\left(-\frac{b^2}{2}\right), \]

where \( a \) and \( b \) are the proportionate sizes of the two groups \((a + b)/1\); and \( c_1, c_2 \) the respective moduli. The data are measurements each of which relates to *one or other* of these component curves. A splendid solution of this dissection problem has been given by Professor Pearson. The five unknown quantities are connected by him with the centre of gravity of the given observations, and the mean second, third, fourth, and fifth powers of their deviations from that centre; and are represented by certain rational algebraic equations, which reduce to an equation in one variable of the *ninth* dimension. In an example worked by Professor Pearson this fundamental equation had three possible roots, two of which gave very nearly zero, probably that of the problem, while the third suggested that there might be a *negative solution*, importing that the given system would be obtained by *subtracting* one of the normal groups from the other; but the coefficients for the negative solution proved to be imaginary. In the case of crabs' foreheads, therefore, we *cannot* represent the frequency curve for their forehead length as the difference of two normal curves. In another case, which primal facie seemed normal, Professor Pearson found that "all nine roots of the fundamental nonic lead to imaginary solutions of the problem. The best and most accurate representation is the normal curve." 164. This laborious method of separation seems best suited to cases in which it is known beforehand that the statistics are a mixture of two normal groups, or at least this is strongly suggested by the two-headed character of the given group. Otherwise the less troublesome generalized law of error may be preferable, as it is appropriate both to the mixture of two—not very widely different—normal groups, and also the other cases of composition. Even when a group of statistics can be broken up into two or three frequency curves of the normal—or not very abnormal—type, the group may yet be dissected by a *single* curve of the "generalized* type, provided that the heterogeneity is not very great, not great enough to prevent the constants \( k_1, k_2, k_3, \ldots \) from being small. Thus, suppose the given group to consist of two normal curves each being the same modulus \( c \) and that the distance between the centres is considerable, so considerable as just to cause the central portion of the total group to become saddle-backed. This phenomenon is sometimes best given by the centres of gravity of the system and the centre of either component \( y = 1/k \). Even in this case \( k_1 \) is only \( 0.125; k_2 \) is \( 0.25 \) (the odd \( k \)'s are zero).

**Section II.—Laws of Frequency.**

165. A formula more comprehensive than the corrected normal law is proposed by Professor Pearson under the designation of the "generalized probability-curve." 1

1 *Cf. Journ. Stat. Soc. (1899), biii. 131.* A similar substitution of the generalized law of error may be recommended in preference to the method of translating a normal law of error (putting \( x = x' \)), which does not yield the normal law of error suggested by the present writer (Journ. Stat. Soc. 1898), and independently by Professor J. C. Kapteyn (Skeev Frequency Curves, 1903).

The ground and scope of the new law cannot be better illustrated than in the words of the author: "The slope of *utility* and the normal curve is given by a relation of the form

\[ \frac{dy}{dx} = -\frac{x}{c}; \]

The slope of the curve correlated to the skew normal, as the normal curve to the symmetrical binomial, is given by a relation of the form

\[ \frac{dy}{dx} = -\frac{x}{c_1 - c_2 x}. \]

Finally, the slope of the curve correlated to the hypermetrical series (which expresses a probability distribution in which the contributory causes are not independent, and not equally likely to give equal deviations in excess and defect), as the above curves to their respective binomials, is given by a relation of the form

\[ \frac{dy}{dx} = -\frac{x}{c_1 + c_2 x}. \]

This latter curve concerns the two others as special cases, and, so far as my investigations have yet gone, practically covers all *homogeneous* statistics that I have had to deal with. Something still more general may conceivably be, but I have found no necessity for it." 2

The "hypermetrical series," it should be explained, had appeared as representative of the distribution of black balls, 3 in the following case. "Take \( n \) balls in a bag, of which \( pn \) are black and \( qn \) white, and let \( r \) balls be drawn and the number of black be recorded. If \( r > pn \), the range of black balls will lie between \( 0 \) and \( pn \); the resulting frequency-polygon is given by a hypermetrical series.*

Further reasons in favour of his construction are given by Professor Pearson in a later paper. *"The immense majority, if not the totality, of frequency distributions in homogeneous material show, when the frequency is indefinitely increased, a tendency to give a smooth curve characterized by the following properties. (i.) The frequency starts from zero, increases slowly or rapidly to a maximum and then falls again to zero—probably at a quite different rate—as the character for which the frequency is measured is steadily increased. This is the almost universal unimodal distribution of the frequency of homogenous series .. (ii.) In the next place there is generally contact of the frequency-curve at the extremities of the range. These characteristics at once suggest the following frequency-curve, if \( yx \) measure the frequency falling between \( x \) and \( x + dx \):

\[ dy \sqrt{y(x+a)} = F'x. \]

Now let us assume that \( F(x) \) can be expanded by Maclaurin's theorem. Then our differential equation to the frequency will be

\[ \frac{dy}{dx} = \frac{y}{bx + c} + \frac{y}{bx + d} + \ldots \]

Experience shows that the form (x) "keeping \( b, b, b_1 \) only" conforms for certain kinds of large frequency distributions. 4

166. The "generalized probability-curve" presents two main forms: 5

\[ y = x(a+x)(a-x)y \]

When \( a, \alpha, \gamma \) are all finite and positive, the first form represents, in general, a skew curve curving in both directions; in the particular case, when \( a = \alpha \), a symmetrical curve, with range limited in both directions. If \( a = \alpha \rightarrow \infty \), the curve reduces to

\[ y = x^2(a+x)(a-x)y \]

representing an asymmetrical binomial with \( p = \mu \), and \( 1 - a = \mu \), becoming infinite, and the normal frequency curve. The pronounced formal term yields two less familiar shapes apt to represent curves of the character shown in figs. 14 and 15—the one occurring in a

---

2 *Ibid. p. 360.*
5 A lucid exposition of Professor Pearson's various methods is given by W. Palin Elderton in *Frequency-curves and Correlation* (1906).
method to frequency-loci of two dimensions; constructing for the curve of regression (as a substitute for the normal right line), in the case of "skew correlation," a parabola, with constants based on the higher moments of the given group.

168. In this connexion reference may again be made to Mr Yule's method of treating skew surfaces as if they were normal. It is certainly remarkable that the correlation should be so well represented by a line—the property of a normal surface—in cases of which normality cannot be predicated: for instance, the statistics of the number of husbands (or wives) living at each age who have wives (or husbands) living at different ages. It may be suggested that though in this case there is one important cause, the continual decrease of the population, inconsistent with the plurality of causes postulated for the law of error, yet there is a sufficient degree of accidental variation to realize one property at least of the normal locus.

169. There is possibly an extensive class of phenomena of which frequency depends largely on fortuitous causes, yet not so completely as to present the genuine law of error.

This mixed class of phenomena might be amenable to a kind of law of frequency that would be different from, yet have some affinity to, the law of errors.

The double character may be taken as the definition of the laws proper to the present section. The definition of the class is more distinct than its extent. Consider for example the statistics which represent the numbers out of a million born that die in each year of age after thirty of forty—the latter part of the column in a life-table. These are well represented by a species of Professor Pearson's "generalized probability-curve," his type iii. of the form

\[ y = yo \left(1 + x/a\right)^e^{-x/d}. \]

The statistics also lend themselves to the Gompertz-Makeham formula for the number living at the age

\[ l = k + s \cdot g^t. \]

The former law, the simplest species of the "generalized probability-curve," may well be attributed in part to the operation of a series of causes such as that which is apt to generate the law of error. In fact, a high authority, Professor Lexis, has seen in these statistics—or continental statistics in pari materia—a fulfilment of the normal law of error. They at least fulfill tolerably the generalized law of error above described. But the Gompertz-Makeham formula is not thus to be accounted for; at least it is not thus that it was regarded by its discoverers. Gompertz justifies his law by a "hypothetical deduction congruous with many natural effects," such as the exhaustion of air by a pump; and Makeham follows in the same track of explanation by way of natural laws. Of course it is not denied that mortality is subject to accident. But the Gompertz-Makeham law purports to be fulfilled in spite of, not by reason of, fortuitous agencies. The formula is accounted for not by the interaction of fleeting causes which is characteristic of probability, but by causes of that ordinary kind which the investigation constitutes the greater part of natural science.

Laws of frequency thus conceived do not belong to the theory of Probabilities.

Authorities.—As a comprehensive and masterly treatment of the subject as a whole, in its philosophical as well as mathematical character, there is nothing similar or second to Laplace's Théorie analytique des probabilités. But this "no plus ultra of mathematical skill and power" as it is called by Herschel (Edinburgh Review, 1850) is not easy reading. Much of its difficulty is connected with the use of a mathematical method which is now almost superseded.

"Generating Functions." Not all parts of the book are as rewarding as the Introduction (published separately as Essai philosophique des probabilités) and the fourth and subsequent chapters of the second book. Among numerous reprints Casbebe's Schwanhaftigkeitslehre (1839) may be noticed as terse, lucid and abounding in references. Other authorities may be mentioned in relation to the different parts of the subject as above divided. First principles are conveniently handled with reference to Laplace's Théorie (1st ed, 1812, 3rd ed, 1888) and by J. v. Kries in Principien der Wahrscheinlichkeitsrechnung (1886). As a repertory of neat probability formulae, including those of W. A. Whitworth's Choice and Chance (5th ed., 1901), and DCC. Exercises... in Choice and Chance (1897) deserve mention. But this advantage is afforded in nearly as great perfection by more comprehensive works. Among these Bertrand's Calcul des probabilités (1889) with its numerous and illuminating exercises might be mentioned, with Bertrand's Théorie des équations (1883) and the new editions of Collucr's Calcul des probabilités. The later works of Th. Morgan Crofton and H. Mellin, the last of them probable to be found in the highest authorities. His paper on "Local Probability" in Phil. Trans. (1868), and on "Geometrical Theorems," Proc. Lond. Math. Soc. (1869), viii., should be cited in addition with the section on "Local Probability" in his article on "Probability" in the 7th edition of the Encyc. Brit., from which section several paragraphs have been transferred en bloc to the section on Geometrical Applications in the present article. The topic is treated exhaustively by Czuber in Geometrische Wahrscheinlichkeiten und Mittelwöcrne (1884). Czuber is also to be mentioned as the author of Theorie der Beobachtungsfehler, in which he has reproduced, often extended, the work of his predecessor, not least as a distinguished and learned exposition of the method of least squares, which has been given by Merriman (Conncctic Trans. vol. iv.). On laws of frequency, as above defined, Professor Pearson's is the highest authority. His Contributions to the Mathematical Theory of Evolution, of which twelve have appeared in the Trans. Roy. Soc. (1894-1903) and others are being published by the Drapers' Company, teem with new theories in Probabilities, if it may be so termed.

PROBATE, in English law, the "proving" (Lat. probatio) of a will. The early jurisdiction of the English ecclesiastical courts over the probate of wills of personality is discussed under WILL. The Court of Probate Act 1857 transferred the jurisdiction both voluntary and contentious of all ecclesiastical, royal peculiar, peculiar and manorial courts to the court of probate hereby constituted, created a judge and registrars of that court, abolished the old exclusive right of the advocates of Doctors' Commons, and laid down rules of procedure. Contentious jurisdiction was given to county courts, and a similar court of probate a judge and registrar was constituted for the remainder of the sovereign's dominions, except in value. The Judicature Act 1873 merged the old court of probate in the probate divorce and admiralty division of the High Court of Justice. The division now consists of the president and one other judge. The practice of the division is mainly regulated by the rules of the Supreme Court 1883. Appeals lie to the court of appeal and thence to the House of Lords. Probate may be taken out either in common or solemn form. In the former case, which is adopted when there is no dispute as to the validity of the will, the court simply recognizes the will as valid, but not as the last will of the deceased. This formality is dispensed with if the judge has to administer the estate of his testator. Probate in this form is granted simply as a ministerial act if the attestation clause declares that the formalities of the Wills Act have been complied with, or if other evidence to that effect is produced. Such grant is liable to revocation, but it is provided that any person dealing with an executor on the faith of a grant of probate in common form, shall not be prejudiced by its revocation. The executor may within thirty years be called upon to prove in solemn form, or a person who doubts the validity of the will propounded may enter a caveat which prevents the executor proving for six months and the caveat may be renewed each six months. The executor must however take out a summons to get the caveat "sustected" or withdrawn, but if an appearance to the summons is entered.

These initials do not apply to certain passages in the above article, namely, the greater part of paragraphs 41, 52, 62 and 72, and almost the whole of the 4th section of Part I. (pars. 75-93), which have been adopted from the article "Probability" in the 5th edition of the Encyc. Brit., written by Professor Morgan Crofton.
within six days to the summons the executor is then compelled to prove in solemn form. Probate in solemn form is a judgment of the court in favour of the will propounded, and is only revocable by the discovery of a later will. In order, therefore, to obtain such grant proceedings have to be taken by action, and witnesses produced in the action will, and the action proceeds in the usual way.

The principal rules now obtaining as to probate are these. Probate, which since the Land Transfer Act 1857 must be taken out at the probate registry (i.e. in the case of real property), as well as personal property, may be granted either in the principal or in a district registry, and should be obtained within six months after the testator’s death. When no executor is named the will is not now invalid, as was once the case, but administration cum testamento annexo is granted. The same course is pursued where the executor renounces or dies intestate before administering the estate of the deceased. After probate, the probate itself (as the official copy of the will is called) becomes evidence, the original will being deposited in the principal registry at Somerset House, London. On grant of probate, estate duty, denoted by a stain on the affidavit sworn for that purpose, is payable. It varies according to the amount at which the estate of the deceased is fixed by the oath of the executor (see Estate Duty). The act of 1858 enables any officer of inland revenue to grant probate where the personal estate does not exceed £500.

Ireland.—In 1867 an act on lines similar to the English act was passed for Ireland and under the Irish Judicature Act of 1877 the then existing court of probate was merged in the High Court of Justice.

Scotland.—Confirmation includes both the probate and letters of administration of English procedure. Without confirmation by the court interference by the executor becomes a vitious intrusion. Originally confirmation of testaments of moveable fell, as in England, under the cognizance of the court. Such jurisdiction certainly existed at the time of regim majestatem. This ecclesiastical right continued through the commissary court at Edinburgh until 1863 (Bonfield, 87). The commissary court, until modern times when the jurisdiction of the courts was at first transferred and then abolished by a series of enactments from the Commissary Courts Act 1823 to the Sheriff Courts Act 1856. The act of 1823 placed the commissary jurisdiction in the sheriff courts; by the act of 1876 the sheriffs sit as sheriffs in testamentary matters, no longer as commissaries. Confirmation of wills where the whole estate is under £500 is regulated by the Customs and Inland Revenue Act 1883 and is an addition to a confirmation made on discovery of additional effects of the deceased after confirmation.

United States.—Probate is granted in some states by the ordinary course of the common law courts, but more frequently by the courts of special jurisdiction, such as the probate court in New Jersey, the surrogates’ court in New York, the orphan’s court in Pennsylvania.

"In a great majority of the states the original equitable jurisdiction over administrations is in all ordinary cases—without any special circumstances such as fraud, or without any other equitable feature such as trust—either expressly or practically abrogated. The courts of equity, in the absence of such special circumstances or distinctively equitable features, either do not possess or will not exercise the jurisdiction, but leave the whole matter of administration to the special probate tribunals," so that unless the case involves some special feature or exceptional circumstances of property [cognizance of the interference of equity, such as fraud, waste, and the like], or unless the nature of such wills is such as to give adequate relief, or is one of which the probate court having cognizance is manifestly miscarried in its functions by its decree, the courts of equity will refuse to interpose and to exercise whatever dormant powers they may possess, but will leave the subject matter and the parties to the statutory forum where it has always been regarded as sufficient and appropriate to be practically exclusive" (Rice’s Probate Law, pp. 4 and 5).

Probate courts are in most if not all the states courts of record, having a public seal and a clerk (or the judge has authority to act as clerk); they issue process and execute their decrees by appropriate officers in the same manner as the common law and chancery courts. They sit at stated terms. They have power to punish for contempt, and to compel obedience to their orders and decrees, and their judgments upon matters within their jurisdiction are enforced usually by the same means as common law and chancery courts (Noemen’s Law of Administration, § 145).

Jurisdiction as to wills and their probate as such is neither included in nor excepted out of the grant of judicial power to the courts of the United States (i.e. the Federal as distinguished from the state courts). So far as it is ex parte and merely administrative it is not conferred, and it cannot be exercised by them at all until in a case at law or in equity, its exercise becomes necessary to settle a controversy by reason of the (diverse) citizenship of the parties. An action to set aside the probate of a will of real estate may be maintained in a Federal court when the parties on one side are citizens of a different state from the parties on the other side (Ellis v. Davis, 109 U.S. Reports, 455). Probate in solemn form, i.e. after due notice to all parties in interest is the almost universal form in use in the United States. One reason for this no doubt is that all documents affecting title to real estate must be recorded and probate in solemn form concludes all parties to the proceeding and thus tends to establish the title to all real estate passing under the will.

In the United States wills of real property must be separately proven in the proper probate court in each state in which the real property is situated, unless statute dispenses with separate probate (each state being “foreign” to every other for this purpose). Copies of such will and probate should be filed also in the office of the register of deeds of each county in the state in which any real property belonging to the testator is situated.

In the state of New Jersey it has been held that an unproven will is capable of conveying an interest in the property devised, and where a conveyance is made under a power in the will before probate a subsequent probate validates the conveyance (1906, Mackey v. Mackey, 63 Atl. Rep. 924).

In Illinois a court of equity has no inherent power to entertain a bill to contest a will (1906; O’Brien v. Bonfield, 220 Ill. Rep. 210).

In Missouri a foreign (New York) will of real estate in Missouri, probate of which was duly recorded in Missouri, cannot be collaterally attacked, and cannot be set aside by direct proceeding after being filed for record more than five years in Missouri (1907; Cohen v. Herbert, 104 So. W. Rep. 84).

PROBATION. The probation system, in penology, is an attempt to reform a prisoner outside prison, a special kind of warder—the probation officer—supervising the prisoner in the prisoner’s own home. The state of Massachusetts in America was the first to attempt “probation,” and at first (1758) in a tentative manner. As success crowned the efforts of the reformers the system was developed and applied to an increasing number of cases; and gradually other American states followed with similar plans. Varying details in the present court attend the court and the judge officially gives the prisoner to the officer chosen to supervise him, generally explaining to the prisoner that, if he is not obedient to all the rules made for him by the officer, he will be returned to court and prison will be his fate. An officer generally has from sixty to eighty cases under his care. Women officers are in charge of women and boys and girls under eighteen. A probation officer has a special area of the town allotted to him and usually gets all prisoners from that area. He acquires an intimate knowledge of the physical, economic, and social surroundings in which his prisoner lives. He is therefore well fitted to watch him and to help him to become once more a decent citizen. He gradually gives back his liberty and removes restrictions until he is capable of living a decent life alone. The powers of the probation officer are necessarily very great. The prisoner continues his work as before, but the officer visits his factory or workshop and arranges to receive his wages each week, passing over the greater part of them to the wife to keep up the home, giving a very small sum to the prisoner for personal expenses, and retaining a small sum, which is paid back to the prisoner when he becomes a free man.

The advantages claimed for the probation system are these, that a number of independent well-paid probation officers, chosen for their knowledge of human nature and their skill in reforming it, can give personal attention to individual cases; the stigma of prison is avoided, and while great care is taken that the prisoner shall be strictly controlled and effectively
restrained, his self-respect is carefully developed; the family benefits, the home is not broken up, the wages still come in, and if the prisoner is a mother and a wife, it is, of course, most important that she should retain her place in the home; the prisoner does not “lose his job” nor his mechanical skill if he is a skilled workman. Lastly, the system is far cheaper than imprisonment. The prisoner keeps himself and his family, and one officer can attend to from 60 to 80 prisoners.

In France, the prison system has been applied to young offenders by the Prevention of Crime Act 1908. That act empowered the prison commissioners to place offenders on licence from the Borstal Institution (see juvenile Offenders) at any time after six months (in the case of a female, three months), if satisfied that there was a reasonable probability of their abstaining from crime and leading a useful and industrious life. The condition of their release is that they be placed under the supervision or authority of some society or person (named in the licence) willing to take charge of the case. This is, of course, only a limited application of the system of probation, for those detained in a Borstal Institution are offenders between the ages of sixteen and twenty-one who have been convicted of an indictable offence. It does not apply to those of full age, nor to those under twenty-one years of age who have been committed to prison for minor offences. It has been long held by English prison reformers that young persons under the age of twenty-one should not be committed to prison, unless for serious offences, but that they should be put under some system of probation. Legislation to this effect was foreshadowed by the home secretary in his speech on prison reform in the House of Commons on the 20th of July 1910.

**PROBOSCIDEA** (animals “with a proboscis”), the scientific name of the group of mammals represented at the present day only by the two species of elephant. Although here regarded as a sub-order of Ungulata (q.v.), the group is sometimes accorded the rank of an order by itself. The existing elephants are widely sundered from all other living mammals, and for a long time palaeontology afforded but little clue as to their ancestry. Discoveries made during the first few years of the 20th century in the Lower Tertiary deposits of the Fayum district of Egypt have, however, brought to light the existence of several kinds of primitive proboscidians which serve to link the group with other ungulates, and likewise apparently indicate affinity with the Sirenia.

The following are some of the leading characteristics of existing elephants. The combined upper lips and nose are produced into a long muscular, flexible and prehensile proboscis, or trunk, with the nostrils at its tip. The teeth consist of a pair of large upper permanently growing incisors or tusks; and a set of cheek-teeth having their crowns composed of a series of tall transverse vertical plates gradually increasing in number from the first to the last of the series; and only portions of two of these teeth being in use at any one time. There are no clavicles; and the limbs are stout, with their component segments placed nearly in a vertical line, and the upper segment, especially in the hind-limb, the longest; the radius and ulna are distinct, the latter articulating extensively with the carpus; the fibula and tibia also distinct; the astragalus very flat on both surfaces; and both fore and hind feet short, broad and massive, with five toes (though the outer pair may be more or less rudimentary), all encased in a common integument, though with distinct, broad, short hoofs; third digit the largest. Two anterior venae cavae entering the right auricle. Stomach simple. A capacious caecum. Testes permanently abdominal. Uterus bicornuate. Penis dilatable and sonary. Teats two, pectoral.

In order to understand the peculiar nature of the dentition, it is necessary to discuss to some extent those of the immediate ancestors of the true elephants, such as the mastodons (see mastodon). As regards the incisors, or tusks, which project largely out of the mouth, and are of an elongated conical form and generally curved, these are composed mainly of solid dentine, the fine elastic quality and large mass of which renders it invaluable as ivory for commerce and the arts. A peculiarity of the dentition of the Proboscidea is that it shows, in transverse fractures or sections, fine lines proceeding in the arc of a circle from the centre to the circumference in opposite directions, and forming by their decussations curvilinear lozenges, as in the "engine-turning" of the case of a watch. The enamel-covering in existing species is confined to the extreme apex, and very soon wears off, but in some extinct species it forms persistent longitudinal bands of limited breadth. The tusks have small milk-predecessors, shed at an early age.

As regards the cheek-teeth, these are composed in the mastodonts of a variable number of enamel-covered transverse ridges, often divided into inner and outer columns, which may partially alternate, and complicated by smaller additional columns; but in the unworn tooth they stand out freely on the surface of the crown, with deep valleys between (fig. 1 I). In the elephants the ridges are increased in number, and consequently become narrower from before backwards, while they are greatly extended in vertical height. In order to give solidity to what would otherwise be a comb-like tooth, the whole structure is enveloped and united in a large mass of cement, which completely fills the valleys, and gives a general smooth appearance to the unworn tooth; but as the tusks grow upon the masticating process proceeds, the alternate layers of tissue of different hardness—cement, dentine and enamel—which are disclosed upon the surface form a fine and efficient grinding instrument. The intermediate stages between the molar of a modern elephant and that of a mastodon are so fully known that it is not possible to draw a definite line between the two types of tooth-structure (see fig. 1 I, II, III, IV).

As regards the mode of succession, that of modern elephants is very peculiar. During the complete lifetime of the animal there are but six cheek-teeth, which it will be convenient to allude to as the deciduous. On each side of each jaw there is a deciduous tooth, one in front, completing the typical number of seven. The last three represent the molars of ordinary mammals, those in front are milk-molars, which are never replaced by permanent successors, the whole series gradually moving forwards in the jaw, and the teeth becoming worn away and their remnants cast out in front, while development of others proceeds behind. The individual teeth are so large, and the processes of growth and destruction by wear take place so slowly, that not more than one, or portions of two, teeth are ever in place and in use on each side of each jaw at one time, and the whole series of changes coincides with the usual duration of the animal's life. On the other hand, the earlier representations of the proboscidian series referred to below have the whole of the cheek-teeth in place and use at one time, and the milk-molars vertically displaced by premolars in the ordinary fashion. Among mastodonts transitional forms occur in the mode of succession as well as in structure, many species showing a vertical displacement of one or more of the milk-molars, and the same has been observed.

---

1. Cuvier's order Pachydermatina (Gr. παχύς, thick and δέντα, teeth), containing the elephants, hippopotami, rhinoceros, swine, tapirs, hyraxes, etc. When the latter, its members, now forming the orders Proboscidea and Hyracoidae and the sub-order Parissodactyla. A few Artiodactyla are also included.

---

Fig. 1.—Longitudinal Sections of the Crowns of Molar Teeth of various Proboscidians, showing stages in the gradual modification from the simple to the complex form. The dentine is indicated by transverse lines, the cement by a dotted surface, and the enamel is black.

I. Mastodon americanus; II. Elephas africanus; III. Elephas (Stepodon) insignis; IV. Elephas primigenius.
in one extinct species of true elephant (Elephas planifrons) as regards some of these teeth.

Most proboscideans are animals of large dimensions, and some are the most colossal of land mammals. The head is of greatly proportionate size; and, as the brain-case increases but little in bulk during growth, while the exterior wall of the skull is required to be of great superficial extent to support the long trunks of the enormous tusks, and to afford space for the attachment of muscles of sufficient size and strength to wield the skull thus heavily weighted, an extraordinary development of air-cells takes place in the cancellous tissue of nearly all the bones of the cranium. These cells are not only formed in the walls of the cranial proper, but are also largely developed in the nasal bones and upper part of the premaxillae and maxillae, the bones forming the palate and the basi-cranial axis, and even extend into the interior of the ossified mesethmoid and vomer. Where two originally distinct bones come into contact, the cells pass freely from one to the other, and almost all the suture become obliterated in old animals. The intercellular lamellae in the great mass which surrounds the brain-cavity superiory and laterally mostly radiate from the inner to the outer table, but in the other bones their direction is more irregular. Like the similar but less developed air-cells in the skulls of many other mammals, they all communicate with the nasal passages, and they are entirely secondary to the original growth of the bones, their development having scarcely commenced in the new-born animal, and gradually to as large as the growth of the creature proceeds. The nasal bones are very short, and the anterior nasal aperture situated high in the face. The zygomatic arch is slender and straight, the jugal bone being small, and forming a small part of the middle part of the arch, the anterior part of which (unlike that of true Ungulates) is formed only by the maxilla. The maxillo-turbinals are rudimentary, the elongated proboscis supplying their place functionally in warming and clearing from dust the inspired air.

The neck is very short. The limbs, as already mentioned, are long and stout, and remarkable for the great length of the upper segment (especially the femur) as compared with the lower segment, as represented by the foot. It is owing to this and the vertical position of the femur that the knee-joint in the hind-leg is placed much lower, and is more conspicuous externally than in most quadrupedal mammals; and this having been erroneously compared with the hock-joint or ankle of the more ordinary ungulates, gave rise to the popular fallacy that the joints of the elephant's leg bend in a contrary direction to that of other mammals.

The radius and ulna are distinct, though fixed in a crossed or prone position; and the fibula also is quite separated from the tibia. The tarsum are short and broad, the calcaneum and tarsal bones being very square, with flattened surfaces for articulation; the astragals especially differs from that of the more typical ungulates in its flatness, in the absence of distinct pulley-like articular surface at either extremity, and in having no articular face for the cuboid.

The fibula articulates with the calcaneum, as in the artiodactyl sub-order of Ungulata. Of the five toes present on each foot, the middle one is somewhat the largest, while the lateral ones are the smallest, and generally lack (especially in the hind-foot) the complete number of phalanges. The terminal phalanges are all small, irregular in form, and late in ossification. The whole are encased in a common integument, with a flat, subcircular, truncated sole, the only external indication of the toes being the broad oval nails or hoofs arranged in a semicircle around the front edge of the forefoot. The hind foot is smaller and narrower than the front. The liver is small and simple, and there is no gall-bladder. In form the brain resembles that of the lower orders of mammals in that the hemispheres of the latter are convoluted.

Elephants are exclusively vegetable-feeders, living chiefly on leaves and young branches of forest trees and various kinds of herbage, or roots, which they gather and convey to their mouth by a very mobile proboscis, an organ which combines in a marvellous manner strength with dexterity of application, and is a necessary compensation for the shortness and inflexibility of the neck, as it is by this that many of the functions of the lips of other animals are performed. By its means elephants are enabled to drink without bending the head or limbs. The end of the trunk being dipped, for instance, into a stream or pool, a forcible inspiration fills the two capacious air-passages in its interior with water, which, on the tip of the trunk being turned upwards and inserted into the mouth, is ejected by a blowing action, and swallowed. Or if the animal wishes to refresh and cool its skin, it can throw the water in a copious stream over any part of its surface. Elephants can also throw dust and sand over their bodies by the same means and for the same purpose, and they have frequently been observed fanning themselves with boughs held in the trunk.

The following are the distinctive features of the genus Elephas, thrice of the family Elephantidae; Dentition: $i, 1, 4, 4, m, 4-26$. The incisors variable, but usually of very large size, especially in the male sex, directed somewhat outward, and curved upwards, without enamel except on the apex before it is worn; preceded by some well-marked precursors. The molars succeed each other by horizontal replacement from before backwards, never more than one or part of two being in use on each side of each jaw at the same time; each composed of numerous flattened enamel-covered plates or ridges of dentine, projecting from a common many-rooted base, surrounded and united together by cement. The number of plates increases from the anterior to the posterior molar in regular succession, varying in the different species, but the third and fourth (or the molar-molar and the first true molar), and these only, have the same number of ridges, which always exceeds five. Skull of adult very high and globular. Lower jaw ending in front in a deflected spout-like symphys. Vertebrae: C. 7, D. 19-21, L. 3-4, S. C. 26-33.

The two existing species of elephant are the Indian or Asiatic (Elephas maximus), and the African (E. africana), the distinctive characteristics of which are given under ELEPHANT. See also MAMMOTH and MASTODON.

EXTINCT PROBOSCIDEA

Elephas.—The extinct representatives of the Proboscidea are of the greatest importance and interest, since they serve to connect the modern elephants with ungulates of more ordinary type. The MAMMOTH (Elephas primigenius) is treated in a separate article. Nearly allied is E. armeniacus of Asia Minor; but E. antiquus, of which the remains are abundant in many of the superficial formations of England and Europe generally, approximates in the structure of its molar teeth to the African elephant. It is represented in the Pleistocene of India by the closely allied or identical E. namadicus. Affinity with the African species is strongly marked in the case of the dwarfish elephants of Malta (E. melitonis) and Cyprus (E. cypriote); and the gigantic E. meridionalis, of the “forest-bed” of the east coast of England and the Upper Pliocene of the Val D’Arno, has likewise molars showing the broad lozenges of enamel-bordered dentine characteristic of the African type. These and other species indicate, however, that, so far as dental characters are concerned, generic separation of the Asiatic elephant is impossible. In North America the mammoth occurs in the far north, E. columbi, more akin to E. antiquus chiefly in the Central United States, and E. imperator (allied to E. antiquus) in the south. The representatives of this group are E. hystricinus and E. planifrons of the Lower Pliocene of Northern India; the latter of which developed premolars vertically replacing the anterior teeth of the molar series.

From E. planifrons there is an almost complete transition to the ridge-toothed elephants, such as E. ganoa, E. insignis.
E. bombifrons and E. elii, typically from the Lower Pliocene of India and Burma, but some of which extend eastwards to Java, Borneo, China and Japan. These constitute the group (or genus) Stegodon, and are characterized by the lowness of the crowns of the molar teeth, in which the tall plates of the more typical elephants are reduced to low ridges with more or less completely open valleys between them; the number of ridges in each tooth is always much lower than in the corresponding teeth of the typical elephants. Premolars, vertically replacing the anterior molars, were often developed. These stegodont elephants appear to have been confined to India and the countries farther east, and exhibit an almost complete transition, so far as dental characters are concerned, to the mastodonts of the same region.

*Mastodon.*—The connexion between the stegodont elephants and the mastodonts (see *Mastodon*) is formed by the Indian and Burmese *Mastodon lotidens* and *M. cauveryi*. In fact the main distinction between these animals and the stegodont elephants is the smaller number of ridges in the third, fourth and fifth molars, which is usually four, and never exceeds five, whereas in the stegodonts it is at least six and the numbers are not the same in each of the three teeth. In the two species named the transverse ridges are more or less continuous. Many other species, such as the European *M. arvernensis* (see fig. 2 in art. *Mastodon*) and the Indian *M. sivalensis*, have, however, the ridges broken up into columns, or cones, more or less alternately arranged, and thus blocking the intermediate valleys. In these species, which are of Pliocene age, there are four ridges in molars 3, 4 and 5; but in the Pleistocene North American *M. americanus* (as well as in many other species) these are reduced to three in each of the aforesaid teeth. The lower jaw of the latter species frequently shows small tusks, which are, however, generally shed in mature age. Premolars, which vertically replace some of the anterior molars (milk-molars), are developed in many species, although not in *M. americanus*. Species of the genus are found over the greater part of the world, inclusive of Europe, Asia and North and South America; *M. humboldti* being the best known South American species. A single tooth referable to this or the next genus has been obtained from South Africa.

*Tetrabelodon.*—The more primitive mastodons constitute the genus *Tetrabelodon*, and are characterized by the presence of a pair of short chisel-shaped tusks in the lower jaw, which is prolonged into a trough-like chin for their support; tusks being also present in the upper jaw. These animals were provided with a snout-like muzzle instead of a trunk (see *Mastodon*). Their birthplace was Africa; the Miocene European *M. angustidens* having been discovered in Egypt in strata overlying those from which were obtained the remains of the under-mentioned more primitive genera. Tetrabelodont mastodons were, however, by no means confined to the Miocene, *Tetrabelodon longirostris* occurring in the Lower Pliocene of Europe, and *T. pandionis* in that of India. Most of these four-tusked mastodons were smaller animals than modern elephants.

*Palaeomastodon.*—No proboscidean earlier than *Tetrabelodon* occurs in Europe, but the group is represented in the Upper Eocene of Egypt by a smaller and more primitive type known as *Palaeomastodon*. This genus resembles *Tetrabelodon* in having four pairs of tusks, but differs in the less elephant-like skull, and the simpler character of the molar ridges, which of the five pairs were in use at one time, whereas in *Tetrabelodon* and *Mastodon* there were never more than two pairs and a portion of a third in simultaneous wear.

*Moeritherium.*—The earliest representative of the proboscidean stock at present known is *Moeritherium*, from the Middle Eocene of Egypt, which includes still smaller animals, whose relationship to Elephas would scarcely be realized were it not for the intermediate links. All six pairs of cheek-teeth (*pm. 2–m. 3*, fig. 3) were in use at once, and there was a comparatively full series of teeth in the front of the jaws; while the premolars were preceded by milk-molars in the normal manner. Very significant is the enlargement of the second pair of incisors in each jaw, thereby foreshadowing the tusks of *Tetralobodon*. There was, however, no lengthening of the chin, so that the muzzle was

A. Upper teeth.  
B. Front of snout, showing the tusk-like second incisors.  
C. Left ramus of mandible from outer side.

probably of normal proportions. This animal was not larger than a tapir.

*Dinotherium.*—The huge proboscidean from the Lower Pliocene and Middle Miocene strata of Europe and India, known as *Dinotherium*, indicates a type off the line of descent of the elephants. Upper tusks were apparently wanting, but the lower jaws carried a pair of large tusks bent downwards in a peculiar manner (fig. 4). The cheek-teeth formed five pairs, all in use at one time, and premolars vertically replacing milk-molars in the ordinary fashion. The ridge-formula of the permanent teeth of the cheek series was 2.2.3.2.2.

*Barytherium* and *Pyrotherium.*—Very problematical are the lower jaws of these animals, which have been found near the site of the Miocene *Euprotos*.
affinities of Barytherium of the Egyptian Eocene and Pyrotherium of the Lower Tertiaries of Patagonia; although it is possible that they may both be offshoots from the primitive proboscidean stock. Pyrotherium had a pair of upwardly directed tusks in the lower jaw. The cheek-teeth are five in number and carry transverse ridges similar to those on the molars of Dinotherium, although there are only two to each tooth. If really related to the Proboscidea, Pyrotherium may be derived from the African ancestral stock of that group which reached South America by way of a former land-connexion between that continent and Africa. So far as can be determined, Barytherium approximates in many respects to Dinotherium, but in structure seems to approach Uintatherium of the North American Tertiaries (see AMBLYPODA).

PROBOSCIS, the trunk of an elephant (Gr. ἐγκέφαλος, ἐν before, βόσκων, to feed), the long flexible snout of the order of Mammalia called Proboscidea (q.v.), which embraces the elephant and its extinct allies the mammoths and mastodons. The term is also applied to the snout of the tapir and of the "kahan" or proboscis-monkey (Nasalis larvatus), and more particularly to the elongated portions of the snout of various insects, such as the rostrum or beak of a rhynchophorous beetle, the antilia of Leptopilota, the sucking mouth of the house-fly, &c. Various worms possess a tubular structure which can be extended at the anterior portion of the body, and some gastropods a sucking mouth, to both of which the name "proboscis" is applied.

PROBOSCIS-MONKEY, a large, long-tailed, red Bornean species characterized by the extraordinary prolongation of the nose of the adult male, which hangs, however, down in front of the upper lip and does not stand straight out from the face in the manner commonly represented in pictures. From this feature the species, which is the only representative of its genus, derives its name of Nasalis larvatus. In females and young the nose is much less developed, with a tendency to turn upwards in the latter. This monkey is a leaf-eater, nearly allied to the langurs, as typified by the sacred ape of India. (See Primates.)

PROBUS, MARCUS AURELIUS, Roman emperor A.D. 276 to 282, was a native of Sirmium in Pannonia. At an early age he entered the army, where he distinguished himself under the emperors Valerian, Claudius and Aurelian. He was appointed governor of the East by the emperor Tacitus, at whose death he was immediately proclaimed his successor by the soldiers. Florianus, who had claimed to succeed his brother, was put to death by his own troops, and the senate eagerly ratified the choice of the army. The reign of Probus was mainly spent in successful wars by which he re-established the security of all the frontiers, the most important of these operations being directed to clearing Gaul of the Germans. Probus had also put down three usurpers, Saturninus, Proculus and Bonosus. One of his principles was never to allow the soldiers to be idle, and to employ them in time of peace on useful works, such as the planting of vineyards in Gaul, Pannonia and other districts. This increase of duties was naturally unpopular, and while the emperor was urging on the draining of the marshes of his native place he was attacked and slain by his own soldiers. Scarcely any emperor has left behind him so good a reputation; his death was mourned alike by senate and people, and even the soldiers repented and raised a monument in his honour.

Life by Vopiscus; Zosimus i. 64; Zonaras xii. 29; Aurelius Victor, Caes. and Epit. 37; H. Schilhèl, Geschichte der römischen Kaiserzeit (1833), vol. i; E. Lépaulle, Elude historique sur M. A. Probus d'après la numismatique (1885); Pauly-Wissowa, Realencyclopaïdie, ii. 2516 (Henne).

PROBUS, MARCUS VALERIUS, of Berytus, Roman gramian and critic, flourished during the reign of Nero. He was a student rather than a teacher, and devoted himself to the criticism and elucidation of the texts of classical authors (especially the most important Roman poets) by means of marginal notes or by signs, after the manner of the Alexandrine grammarians. In this way he treated Horace, Lucretius, Terence and Persius, the biography of the last-named being probably taken from Probus’ introduction to his edition of the poet. With the exception of these texts, he published little, but his lectures were preserved in the notes taken by his pupils. Some of his criticisms on Virgil may be preserved in the commentary on the Bucolics and Georgics which goes under his name. We possess by him part of a treatise De notis, probably an excerpt from a larger work. It contains a list of abbreviations used in official and historical writings (especially proper names), in laws, legal pleadings and edicts.

The following works have been wrongly attributed to him: (1) De verborum significi, a lexicon of verbs, and the rhythmical endings of sentences. This is now generally regarded as the work of the grammarians Marius Plotius Sacerdos (3rd century). (2) Instituta aritum, on the eight parts of speech, also called Art raticana from its having been found in a Latin MS. Mention is made in it of the baths of Diocletian. It cannot be earlier than the 4th century. It is possible by a later Probus, whose existence is, however, problematical. (3) Appendix Probi, treating of the noun, the uses of cases, rules of orthography (valuable in reference to the pronunciation of Latin at the time), and a table of Differentiae. As the author has evidently not been Probus, it must be assimilated to the work of De nomine excersa, a compilation from various grammatical works.

See J. Steep, De Probis grammaticis (1871); Teuffel-Schwab, Hist. of Roman Literature (Eng. trans.), p. 301.

PROCEDURE (Fr. procédure, from Lat. procedure, to go forward), in general, a method or course of action. In law, procedure may be defined as the mode in which the successive steps in litigation are taken. As a term in English law it dates only from the passing of the Common Law Procedure Acts 1852-56; it is usually coupled with, or more often replaced by, the word "practice." The procedure of the High Court of Justice in England is governed by the rules of the supreme court, which are published in the Annual Practice. Procedure has been defined (per Lush, L.J., Pozer v. Minors, L. R. 7 Q.B.D. 329), as "the mode of proceeding by which a legal right is enforced as distinguished from the law which gives or defines the right, and which by means of the proceeding the court is to administer; the machinery as distinguished from the product." T. E. Holland (Elements of Jurisprudence, 1906, p. 86) describes procedure, or "adjective" law, as that part of law which provides a method of aiding and protecting rights.

See the articles on the various branches of law, as Admiralty Jurisdiction, Criminal Law, Divorce, &c.; also Action, Appeal, Evidence, Pleading, Summons, Trial, &c.

PROCESS, a general term now technically employed for the photo-mechanical processes by which illustrations are reproduced in printing. Until the last quarter of the 19th century reproductive processes, save as regards line reproduction, can hardly be said to have had an existence. Paintings, drawings, and engravings, which it was desired to put into form which by means of the printing-press could be multiplied indefinitely had to go through a process of interpretation by an engraver or draughtsman, who, on a metal plate, a block of wood or stone, gave a rendering of the original subject. The means at his disposal, which were those of etching, intaglio, mezzotint, etching in the proximity, expressed dark or light passages in the scheme of light and shade of the original. It will readily be understood how such interpretations would vary. An engraver with fine art instincts would produce a result as distinct in character as an engraving as was the original as a painting or drawing, and engravings were sought after as works of art, and treasured for their artistic qualities. But engraving of this kind took time. Years were devoted to the production of one steel- or copperplate, while wood engravers who were artists could only work on a block when in the mood; and for that mood the publisher had to wait, and he grew impatient and was willing to accept rapid interpretation of originals by men who could produce them under other than artistic conditions. But the pain of the artist at the bad rendering of his original was often great, so that he, not less than the publisher, though for another reason, hailed
the attempts that were being made to reproduce his work mechanically without the intervention of the translator or interpreter. The ideal of an artist would naturally be a reproduction of his work in facsimile, which retained all, or as many as possible, of the individual characteristics of his work; and to give him this was the aim of the school of wood engravers which originated in the United States and made a last stand to maintain the position of their art in the field of book illustration. By a system of extremely fine work the American wood engravers were able to keep much closer to the tones of an original than had previously been possible; but the result was obtained at the sacrifice of the artistic rendering of the best old engravings, and was so mechanical in its character that when it had to compete with a real mechanical process the engraving could not hold its ground, the enormous difference in the cost of production being a factor of sufficient importance in itself to make it impossible for the engraving to retain the field. A similar development had been going on in the other branches of engraving.

The line engraver and the etcher, to whom had been entrusted the interpreting of works of art first produced in other forms, found themselves in a mechanical position in plain former work, while preserving more of the character of the original work, were produced in much less time and at a greatly reduced cost. It has thus come about that the last quarter of the 19th century witnessed the dispossession of the hand engraver from the field of interpretative engraving, and the occupation of his position by the chemist and the mechanician. The term “process,” which has come to be applied to all photo-mechanical reproductions, is a somewhat unfortunate one, inasmuch as it is descriptive of nothing. From time to time various names have been given to its varying forms, indicative either of the name of the inventor or of some peculiarity of method. Zinography, gillotype, photogravure, heliogravure, heliotype, phototype, albertype, are illustrations of the kind of name given often to very slightly varying applications of the same principle, but usage has come to apply the term “process” to any printing surface that is produced by chemical and mechanical means. The whole of these processes may be arranged under three heads: (1) relief; (2) intaglio; (3) planographic.

1. Relief Processes.—An engraving in relief is one in which the printing surface stands up above the surrounding ground. The history of the development of relief processes is really the history of photography (q.v.); for whilst attempts were made to obtain objects of a kind of photography, by drawing upon plates with prepared chalk or ink, “rolling them up” with printer’s ink and etching away the ground with acid, as in the case of zinography, the real progress of all process has been upon the lines of photography; and to Niepce and Daguerre may be attributed the origin of the modern mechanical and chemical processes.

Speaking broadly, all the modern “processes” are the outcome of a discovery by Mungo Ponton that a preparation of albumen or other colloidal substance and bichromate of potash could be hardened and rendered insoluble in water by exposure to light, and that as a photographic negative permitted the passage through it of light in varying degrees of intensity, so a film of the preparation placed under a negative was liable to be hardened and rendered insoluble in degrees varying with the intensity of the light affecting it. This discovery governs the production of process blocks or plates of all kinds.

The methods of reproduction of pure line work differ greatly from those for the reproduction of originals in tone. As the first necessity in securing a good result is the suitability of the original to be reproduced, it is desirable to make clear the character of a good original. This should be of one tone or degree of colour all through. It may be all grey; it is better that it be all black. It may not be black in parts only and grey in others. The lines of an original may be of any variety of thickness. It is necessary, therefore, for the draughtsman to see that he works with a good black ink, or ink that will tell as black when it is exposed to the photographic plate. Inks of a warm tone—that is, inclining to red or orange—yield better results than cold inks which incline to blue.

Most prepared liquid inks have a tendency to lose their blackness by exposure to the atmosphere on the removal of the cork from the bottle. The ideal of an ink is as a substance that yields its colour when beginning work. Indian ink is good if well ground and kept sufficiently thick to assure the necessary blackness. It has the advantage of not washing up when colour in washes is passed over it, but it must be used freshly ground. The addition of a little Indian yellow, burnt sienna or sepia, gives a warmth of tone to it and rends it photographically more active. Bourgeois ink, prepared by Bourgeois of Paris, appears to be prepared with the addition of some warm colour with the base. It is a good ink for the purpose, and is prepared both in solid and liquid form. Lambsblack gives good black lines; so does ivory black, which is warm in tone than lampblack. Indian ink is an American ink made in liquid form which has the reputation of not fading by exposure. Stephens’s Ebony Stain is a fine black medium which does not clog the pen; if it thickens and dries, it cracks off and does not corrode the pen.

Besides the pen a brush brought to a fine point is much preferred by some artists, as it is a line as monotonous than that given by a pen. With the brush the black ink cannot be used so freely. The paper used should be smooth and as white as possible. A paper is made with a surface coating of white chalk, which admits of the use of a scraper to remove lines or to break them up.

It is not possible to lay down a rule for the amount of reduction to be made when photographing for the reproduction; the finer the drawing the less should be the reduction made; but experience is the only guide. Sometimes, where the lines are very fine and the drawing minute in character, an enlargement is desirable. Where drawings are reduced too much, there is a tendency for the spaces between the lines to fill up, and to give a coarse, heavy result. Faulty drawing is not lessened by reduction. On the contrary, the fault becomes more evident, so it is desirable to make all necessary corrections in the drawing.

The original drawing which has to be reproduced is photographed to the size of the required block. The negative taken is absolutely dense except where the lines of the drawing have affected it, and these are absolutely clear, admitting the unrestricted passage of light through them. A piece of planished copper or zinc is prepared or made sensitive to light by a preparation of albumen or gelatin and bichromate of potash spread upon its surface. The negative is laid upon the sensitized metal and placed in the light in the way an ordinary photograph is printed.

The light passes through the transparent lines of the negative and hardens the bichromated film beneath them. Both negative and plate are then taken into a darkened room, where the metal plate is rolled with an inked roller, placed in a bath of cold water and allowed to soak until the albumen and bichromate becomes so softened everywhere, except where the light has hardened them, that they all wash away, and nothing is left but the hardened lines. The lines are dusted with asphalt, which by heat is melted on to them, and makes a ground which resists the action of acid. A coat of varnish is put over the back and edges of the plate, to prevent the action of the acid on the border of the plate, and the lines on the surface are left free to its action. The plate is then placed in a bath of dilute nitric acid, which eats away the metal wherever it is exposed; but it leaves the edges of the drawing, which are protected by the hardened film standing up above the eaten or etched surface; and these lines, which correspond to those of a wood engraving, are the printing surface of the plate. The plate is mounted on a wood or metal block, made type-high, and it can then be used along with type in the printing-press.

Various devices have been resorted to that effects of tone may be obtained by means of the simple line process. Grained papers with a surface of chalk, upon which are etched lines crossing at right angles, or rows of dots give the papers a heavy, flat, “tone,” upon which a drawing can be made in pencil, chalk or ink, and gradations of tone introduced by means of scraped, which remove partially or entirely the black ruled lines or dots, leaving, if desired, high lights of pure white. A drawing on such
paper consists of lines or dots, a combination of the original lines or dots of the paper and those of the drawing itself, the scraper should be kept moist. If dots or lines are left uncovered, the result is quite easily reproduced by the line process. Another method is by the use of what are known as Day’s ‘shades,’ or shading needles. They are transparent films of gelatin which have been printed on them lines or dots in varying concentrations of relief, so that they can be inked up by a roller. When placed over a drawing, their transparency enables the operator to see exactly what passage he is lighting or shading, and whether it can be done by the application of a ruling of lines or dots of the shade upon any passage of the drawing; these lines or dots then become part of the drawing; and are reproduced in the usual way.

Pencil or chalk drawings upon simple white-grained paper, where the pencil or chalk passing over the ruts or hollows in the paper makes a mark on the top of the grain only, are also reproducible by the line process, and drawing machines are to be had which are delicate and difficult to deal with. The difficulty led to the invention of a process by Henry Matheson, who, not having the capital to work it, joined the late Mr. Dawson, senior, whose sons continued to work the process with Matheson under the name of the Swelled Gelatin Process. It is based upon the fact that gelatin, sensitized with bichromate of potash, swells when placed in water, and swells in proportion to the amount of light to which it has been exposed. A negative taken from a drawing which varies in tone, not being thoroughly black all through, will present an irregularity of its translucent portions, and when a piece of paper or glass coated with sensitized gelatin is exposed to the action of such a negative it is affected according to the amount of light the negative allows to pass. After making a print on such paper or glass, it is placed in a dish of water and the surface allowed to swell, which it does in varying degrees, the portion unaffected by the light absorbing most water and swelling most. The result of the swelling of the negative will then be the swelling of the printed picture, which is of course proportional to the amount upon which the light has fallen. The sensitized coating is then dried and backed with a non-fissile plate. The plate is now ready to receive a plater’s mould, which is an impression of the original drawing. After it has been dried, it is cut with a pair of scissors or an incisive tool, and is then placed in a frame, a plaster and gelatin mixture being poured upon it to a suitable thickness, and then allowed to dry and set. The back of the plate is then cut and a pencil made up, and the plate is now ready for use.

This process can be used in the same way for albums and etchings. The only difference is that the lines, which are the lines of the original, are impressed upon the plate, and the plate is then inked, and the lines are thereby shown upon the sheet which has been inked upon. The process is then complete. It is not only possible to approximate to the printing of a flat or graduated tone by producing a broken or granulated surface which shall present a series of lines or dots that, when inked up, shall give the appearance of a hue varying in intensity through various degrees of depth and distance. These lines or dots shall present a series of lines or dots that, when inked upon paper of different weights, shall give the impression of an unbroken tone. This necessitates the lines or dots being so small that the eye shall not at a glance appreciate the broken-up character of the surface of the block. Many efforts resulted in the production of what is known as the screen, which itself was only made possible by the invention of ruling machines of a delicacy previously unknown.

A screen is made by coating a sheet of glass—which must be free from both as to body and surface—with a composition analogous to the ground used by an etcher to coat his plate before drawing upon it with his needle. The glass so coated is placed in an automatic ruling machine, of which the ruling point is a diamond, and which can be adjusted so as to rule any number of lines from 50 to 300 to the inch. The lines are ruled diagonally on the glass, and at mathematically equal distances from each other. The sheet of glass, after ruling, is treated with hydrofluoric acid, and the lines where the ground is cleared away by the diamond point are etched or bitten into it. The plate is cleaned up and an opaque dark pigment rubbed into the lines. Two such ruled sheets of glass are sealed together face to face with Canada balsam, with the diagonally ruled lines crossing each other at right angles, the result being a grating or screen containing innumerable little squares of clear glass through which the light can pass, which it cannot do through the ruled lines, which are filled by the opaque pigment.

To produce a half-tone block from a picture, a black and white transparency is engraved or photographed. The action of the light in the camera in the usual way, with this screen quite close to it but not in contact; and the subject is photographed on to the negative through the screen, and what is termed a “screen negative” is the result. It is a photograph of so much of the original as could affect the negative through the little clear squares of the screen, and represents the tones of it by innumerable dots and lines, the size and proximity of which are regulated by the fineness or coarseness of the screen used.

In the early days zinc was the metal used for these half-tone blocks; but experience showed that though more difficult to etch to the necessary depth, the closer, denser texture of copper rendered plates of this metal much more suitable for the production of the best blocks, and zinc now is used only for inferior blocks. Whichever metal may be used, a sheet of it, most carefully planished, is sensitized with a coating of gelatin or fish-glu and bichromate of potash, dried and exposed under the screen negative to the action of light, as in the ordinary process of photographic printing. The latent image of photography is thereby hardened and can be washed out by the light. Then, after the sensitized paper is washed it is placed in an etching bath, and the image is burnt in on the surface of the metal like an enameled plate, which enables the photographic picture to resist the subsequent etching. The plate is placed in a bath of iron perchloride and etched until sufficient depth is obtained. Wherever the surface of the plate is free from the lines and dots, it is bitten away by the perchloride, and the lines and dots are left in relief. This first biting in the bath produces a rather flat general impression of the original, and is termed “rough etching.” To produce finer results, and to bring out the contrasts of black and white necessary to a good reproduction, the block has to go through processes of stopping out and rebiting similar to those of etching an intaglio plate. This “fine etching” calls for the artistic taste and judgment of the craftsman; and with a good photograph to work from the final quality of a block will depend largely upon its treatment by the fine etcher.

A substitute for the acid bath has been found in an acid blast. The acid is driven in the form of a spray with some force on to the surface of the prepared plate, which it etches more rapidly and more effectively than the bath.

One risk to be guarded against is the underbiting of the lines and dots which form the printing surface. As soon as the acid has eaten its way downwards past the protecting surface film, it will attack the sides of the upstanding dots as well as the ground of the dotted blocks, and these must be conveniently and rendered liable to break off in the process of printing, as well as to make the obtaining of electrotypes from the blocks a

SHOWING THE SEPARATE COLOURS EMPLOYED IN PHOTO-REPRODUCTION  
BY THE THREE-COLOUR PROCESS

The three primary colours are separated out by photography, each colour sensation is etched on copper, and when the Blocks representing Yellow (A), Red (B), and Blue (C), as illustrated above, are superimposed in the printing press, the result (D) is a reproduction of the original in all its combinations of colour.
matter of extreme difficulty, the underbitten points breaking or tearing away in the mould. To avoid this—underbitten a fatty ground is laid over the surface of the block each time it is etched; by exposure to heat this ground is sufficiently melted to permit of its running down the sides of the upstanding points, and so giving them the required protection. The acid blast is less liable than the bath process to eat away the sides of the dots.

This method of making tone relief blocks is most generally known as the "Meisenbach" process, from Meisenbach, of Munich, who was the first to make it commercially successful, but the history of its development is somewhat obscure. Fox Talbot as early as 1852 took out a patent for using a screen of crape or muslin; he also suggested dusting glass with a fine powder to produce a grain screen. All the early ruled screens were single line, and the credit is due of suggesting the shifting of the single line screen during the operation and, by reversing it, producing the effect of the double line, to Sir Joseph Swan, who patented the process in 1879. Meisenbach's patent for a similar method is dated 1892. The development of the screen was the important factor in the development of the process. The early screens were photographs of ruled plates and the great advance was made by Max Levy of Philadelphia, who made it possible by his ruling machines to produce screens of a fineness and clearness not previously practicable. It was F. E. Ives who, in 1886, introduced ruled screens placed face to face and sealed up so as to produce cross-lined screens.

The chief objection to this process is its inability to reproduce the extremes of expression employed by the artist in black and white; actual white is impossible, and delicate tints, such as the characteristic of skies, are destroyed by the cross-bar lines of the screen, which cover down all light passages and rob the reproduction of that brilliancy which characterized wood engraving. It is true that the addition of hand engraving can be resorted to in the case of the process block, and lights and other varieties of tone and form introduced, but this can only be done on blocks of very fine texture, and the cost of reproduction is greatly increased by the introduction of such handwork by the engraver.

The most important development of the half-tone process is in the direction of the reproduction of works in colour by means of relief blocks. The theories of colour (p.e.) in light and in pigments enter largely into this development. The cross line method is based on the light of three distinct colours, red, green and violet, which are called the primary or fundamental colours because by their combination in various proportions all other tones of colour are produced, but they cannot themselves be produced by any combination of other coloured rays. The theory of pigmental colour differs from this in that the primary or foundation colours from which all others are produced, while being themselves unproductive by any admixture, are blue, red and yellow, and while the combination of the red, green and violet of the scientist produces white, the combination of the primaries of pigments in their full strength produces black.

Colour is the result of the absorption and reflection of the rays of light which strike upon a body. The rays which are reflected are those which affect the vision and produce the sense of colour. Should the object absorb all the rays it appears black, should it absorb none but reflect all it is white, and between these two extremes lie an infinite variety of tones. Filters have been made which absorb and refuse passage to certain coloured rays, while permitting the passage of others, e.g. a photographic filter of a certain colour will absorb and stop the passage of red and green rays, while permitting the passage through it of the violet. It will then be perceived how, when a picture of blue, or other colour, object is placed before a camera, with one of these filters between it and the exposed negative, the rays of light of the colour which can pass through the filter to the negative will be the only ones which can affect it, and that it is possible in this way to secure on three separate negatives a record of the green, red and violet rays which are reflected from its coloured surface by any object placed before the camera.

These records are coloured photographs; they are simply ordinary negatives, records of colour values which may be translated into colour by the use of coloured inks. The principle governing the process is analysis or separation followed by recomposition. Positives are made from these colour records, from which by means of the rule screens already described half-tone process blocks are made which, when printed one over the other, produce a coloured relief block which may be separated by the filtering process and give approximately a reproduction of the original in its true colours. The colour used with each block must have a relation to the filter used in its production. It must represent a combination of the two colours stopped out by the filter when making the negative from which the block was made, that is to say, the colour used must be complementary to the colours stopped out. Certain subjects which are amenable to long exposures can be dealt with by what is known as the "direct process," whereby the screen negative and the colour record are made by one operation on the same plate. By this means six of the fifteen otherwise necessary operations are saved, but the method is not always practicable.

As far back as 1861 the suggestion was made at the Royal Institution by Clerk Maxwell to reproduce objects in their natural colours by superimposing the three primary colours. Later Baron Ransomut, of Vienna, Mr Collen, a gentleman who taught drawing to Queen Victoria, and two Frenchmen, MM. Chas. Cros and Duces du Hauron, carried on the idea and made experiments with the aid of photography, which were still further developed in Germany by Professor Husnik, of Prague, Dr Vogel, of Berlin, and others; but it was in America that the first three-colour blocks for letterpress printing were made, F. E. Ives, at Philadelphia, being their maker in 1881.

This three-colour relief process has made great advances in recent years. The first great practical difficulty which had to be overcome was to produce three screen blocks which could be printed one over the other. Were the screens of each block used at the same angle, the lines and dots would print on the top of one another; but a great deal of the colour result depends upon a considerable proportion of each colour being on the white paper. Artists know well that much purer and more brilliant results are produced by placing touches of colour side by side than by small adjoining touches of red and blue, the filter for red and blue is designed to destroy by its absorption any remaining trace of green and violet, which is absorbed in the negative, and the green and violet so destroyed is added to the red and blue when the negative is exposed. Consequently it was found necessary to turn the screen at a different angle for each block, so that the lines should not fall on each other but should cross each other; but the risk of this is that, used at certain angles, the crossing of the screen lines will produce what is known as the "moiré antique" result. Vogel took out a patent in Great Britain for the process, and he therein stated that the screens should be used at certain stated angles. He also proposed to use single-line screens, similar to those used by F. E. Ives at Philadelphia, instead of cross-line; but it has since been found that the cross- or double-line screens can be used successfully; and that the angle at which they can be used is not a fixed one.

 Filters are made in a dry or wet form. The dry filter is made by spreading a film of gelatin on the surface, sprinkled with the fine colour, upon a sheet of glass. The wet filter is a cell or trough made of two sheets of glass, sealed all round and filled with water tinted with aniline dye or a powder. This chamber may be tested by the spectroscope, or by an instrument invented by Sir William Abney, and known as the Abney colour sensimeter. This is a theoretical test. The practical test is by photographing through the cell: for violet the filter for blue records the full strength of blue with the full strength of the colour of the negative, while giving slight or no record at all of the red and yellow, it is practically a true filter though they themselves would consider them more sensitive to the special colour they are intended to record. Indeed Dr Albert of Munich has produced a colloidion emulsion which is so sensitized that the various colour sensations are directly obtained without the interposition of a colour filter. Different makes of plates demand different colour-filters. (For colour-filter making see Ives.)
Photographic Journal, vol. xx, No. 11). The preparation of these colour-filters calls for great perfection of quality in the materials employed, and these are treated by the trade in the manner here given. The filter, whether dry or wet, must be absolutely flat as to its surface, and its two sides must be absolutely parallel. In the wet filter the glasses forming the sides of the cell or trough must be parallel to each other.

Coloured glass is sometimes used in combination with the tinted collodion, but there is no particular advantage in this, because two glasses together, in the usual method, are more used than in the monochromic filter, and with one may, if desired, be coated with different dyes and afterwards cemented together with Canada balsam.

The following dyes or their equivalents form a basis for nearly all three-colour filters:

- For the red printing negative: Brilliant green.
- For the blue: Brilliant yellow.
- For the yellow: Copper red.
- For the violet: Brilliant yellow.
- For the green: Methyl violet.
- For the brown: Naphthol green.

The first dye named is the base colour in each case, the second is employed in small proportions to produce the required modification of tint.

The theory of the three-colour process is that the same three colours shall be used for the printing of every subject; and there is no doubt that if the filtration were perfect and the printing inks absolutely pure, the theory would work out fairly correctly in practice; but there is room for improvement in both these matters, and it is therefore often found desirable to print special subjects with special pigments, which makes it difficult to print several subjects together. Special care is called for on the part of the printer, and there must be the most perfect register of the three subjects, otherwise a blurred effect results; there must be constant watchfulness to see that there is no excess of ink of any one colour, or the whole scheme of colour will be destroyed. This three-colour process has been a rather long time in establishing itself and nothing so far has succeeded in keeping it out of print. Good blocks have been obtained, but the inks, which have been tried, have yielded indifferent results. It is hardly to be expected that the untrained eye of the ordinary printer should be successful where the work requires the cultivated judgment of an artist. There is one other necessity for success in all the work, and that is the use of the right quality of paper and ink. The blocks are so delicate they soon fall if an excess of ink is used. Ink of a good quality can be used in much less quantity than common kinds, but it must be impressed upon paper that is sympathetic and with "bear the" the ink.

The best results can be obtained only with the use of what is known as "good stuff," that is, a paper which, after manufacture, is passed through a bath of a preparation of china clay, which by means of brushes is rubbed into the surface of the paper. When dry the surface takes a high polish, and is sensitive to the smallest amount of ink. The polish of this coated paper is objectionable to many readers of illustrated books, and the clay adds considerably to the weight. Paper makers are, however, supplying a duff-surfaced highly calendered rag paper which is very good for artistic and scientific illustrations and obviates both the glossy surface and the supposed lack of permanency of chromo paper.

2. Intaglio Processes.—An intaglio engraving is one in which the printing surface is sunk below the surrounding portions of the plate; the lines or dots—pressed, cut or bitten into the surface—holding the ink which is to be impressed upon the paper when the original surface of the plate is wiped clean. The old-fashioned steel engraving may be taken as the type of an intaglio plate, in which the lines which were printed were cut into the surface of the plate, instead of being left standing up in relief, as in the case of a wood engraving.

"Photogravure" is the name by which the many processes are generally known by means of which intaglio engravings are made mechanically, "heliotogravure" being another name for the process, "coated" paper. It is a paper which, after preparation, is coated with the tones of photographs or drawings, and gives the nearest approach to a facsimile reproduction that has yet been arrived at. Gelatin bichromatized is the medium by means of which the photogravure plate is produced; but as the screen is not used in ordinary work, it is necessary to produce an ink-holding grain in some way upon the plate. This is done by allowing a cloud of bitumen dust, raised inside a box, to settle upon the surface of a copper plate; it is fixed by heat, which, though insufficient to melt it, is enough to attach the fine grains to the plate. Over this prepared surface is laid the film of bichromatized gelatin, upon which is printed the subject through a glass positive; the usual hardening process takes place by the action of light, followed by a washing out of the unhardened portions of the gelatin. The plate is exposed to the action of ferric chloride, which attacks it most strongly in the least exposed parts, and which will wash away and leave the remaining masses dark, even in the non-exposed portions, owing to the existence of the bitumen granulation, which ensures the keeping of a grained surface even in the darkest passages.

Photogravure is a costly process to employ for illustration. The plates have to be printed slowly, with much hand work, as in the case of etchings. It is the printing that makes its use expensive, rather than the making of the plates; and each plate must be printed separately and on special paper, it cannot be employed with type, like relief blocks.

There is much uncertainty about the production of plates by the photogravure method; and although great improvements have been made in the process, it is often necessary to produce several plates before a satisfactory one is obtained. In all these reproductive processes the more artistic the workman the better the result; this is especially true of photogravure, in which the aim is to come very much nearer to the original work of the artist designer than in the less perfect processes.

The method of Rousillon, which was adopted by Goupil in the production of photogravure plates in the early days of the process, was to prepare the surface of the plate with a secret preparation of certain salts, which crystallized under the action of light, so that when exposed under the negative the surface was broken up by this crystallization more or less, according to the amount of light the negative permitted to reach it. The plate with its crystallized surface was then electrotyped, and the electrolyte was the plate used for printing. It was a deposit process, as opposed to an etching process.

Photogravure plates are made also by the use of the grain screen, in which the reticulations of the screen take the place of the bitumen powder in producing a grain; it is the inversion of the method by means of which points and lines are produced in the relief block. It has not, however, come into favour, probably owing to the greater coarseness of the grain and the consequent loss of softness in the tones. An application of this method has, however, been made in the development known as the Rembrandt intaglio process. It is a secret process; but the secret lies more in the press by which the Rembrandt plates are printed than in the plates themselves, Intaglio Process. which are intaglio plates made with a very fine screen and bent to a cylinder. The attempt to print photogravure plates by machinery was given up because the plates were so shallow they would not stand the wear and tear, and their life was too short and the results too indifferent; but the use of the grain screen renders possible stronger, deeper plates, that will stand harder wear. There is little doubt that the machine used in some form of the machine used to print wall-papers, in which there is a central cylinder engraved with the design, inked by rollers with which it comes in contact. The ink not only fills up the intaglio or sunk portion which has to print the design, but covers as well the whole surface of the plate. To clean this surface, leaving ink only in the sunk dots and lines, another metal cylinder is employed, ground and grooved somewhat like the shaft of the common steel of the dinner table used to sharpen knives, the grooved surface of which, passing over the engraved cylinder, scrapes clean its inked surface, leaving ink only in the intaglio portions. This is quickly done by the machine. In contact with the paper, deposit itself and print the picture. The results produced by the Rembrandt intaglio process are softer and smoother than those given by photogravure, and they are free from the gritty qualities which occasionally characterize photogravure; but they lack the brilliancy and depth of the latter. The process on the whole is less costly to use, mainly because the printing is so much more rapid, and is turned out by a machine instead of by hand.

A method of printing intaglio plates made from a screen
NEGATIVE by the lithographic press was introduced and patented by Sir Joseph Swan and his son, Donald Cameron-Swan. The sunk surfaces are rendered receptive of lithographic ink while the surface of the plate itself is kept damp with water or glycerin and water, and remains clean and free from ink when the plate is removed.

The monotype is not a new, but a revival of a somewhat old, method of reproducing on paper a painting by an artist. The design is executed on a plate by means of brushes, fingers or other tools, with paint or printer's ink.

On the completion of the painting, the paper is laid upon it, and plate and paper are together passed through a press, when the ink or colour is transferred to the paper. One impression only is possible; hence the name of the process. A method has been devised by Sir Hubert von Herkomer for dusting the painting while still wet with a fine metallic powder, which gives a tooth to the surface sympathetic to a copper deposit when it is placed in the galvanic bath, by which means an electrotype of the painting, with its varying relief surfaces, is obtained, and forms a plate from which numerous impressions can be taken.

The very large number of impressions it is often required to get from the etched surface of a block has made it necessary to devise means for preserving the original block, and to prepare a copy or positive which can be used as a block. One method devised by Mr. Herkomer was to roll a film of the finest plumbago (black lead) powder before being placed face to face with a bed of soft fine wax, into which it is pressed. The plumbago adheres to the wax, and is taken off with the wax when the film has been removed from the base. When the wax mould is thus obtained it is galvanically covered with a metallic deposit, after which it is deposited on the front of the paper. It is then covered over with wax, and becomes thick enough, either by itself or when backed up with other metal, to be used as a block in the place of the original. The metallic deposit may be covered over with a wax mould, which, when removed, leaves behind it a relief impression, and is apt to give way in the course of the separation of the block from the mould. Having been made so, it is more tenacious, and being somewhat flexible, it can be re-covered for further work.

The changes taken place in the form of illustrations have necessarily been accompanied by changes in the machinery by which they are printed. Almost all the changes and improvements have been initiated in the United States of America. The vital change made in the interest of process block-printing is what is technically known as "hard packing." Before the introduction of process block the "blanket" played an important part in all printing machines. It was a soft wooden sheet, which came between the plate or cylinder and the type and blocks, and modified the force of the contact between them. Owing to the increased fineness of the texture of the paper, and the engraving, it was found that the blanket was too coarse and soft a material and that it interfered with the clearness and fineness of the printed result. Blankets of finer material were tried, with improved results; but the best results were obtained by a glazed board, the machinery was more accurately constructed, and the hard, finely-polished steel cylinder, without any intervening substance save the thin glazed board and the sheet of paper, was subjected to the contact of the type and blocks. The old soft blanket kept the cylinder or the flat press in contact with the type, in spite of the weak construction of much printing machinery. The new method of hard packing allowed the machinery to work on the new conditions, and to be very perfect in manufacture. About the old machines there was a lack of solidity, which allowed vibrate, and the contacts were not uniform and clear in every part of the surface. A chief characteristic of the modern printing machinery is strength and solidity, admitting of precision of impression. Another change has been in the nature and treatment of the printing paper.

Most elaborate methods were adopted for the moistening of the substance of paper before use. Most paper was printed on whilst damp, but damp paper had to disappear with the soft blanket, and a clay-surfaced or highly-calendered paper was introduced with a glass-faden in harmony with the polishing effect produced by the type and blocks. It is essential to this paper that it be dry when used; to ensure the best results with it the paper should be kept some weeks or months before use, so that it may be absolutely dry. Some other substances are used, or several sheets as they pass under the rollers, and impress black spots on the sheets that come after. New and unseasoned paper accounts for much bad printing, and this form of badness is due to the change in material due to the necessity of modern process work.

3. Planographic processes are such as are printed from a flat surface neither raised above the surrounding ground like a wood engraving or type letter, nor sunk below the ground like an etching or steel engraving. Lithography (q.e.) with its flat stone or plate may be taken as the type.

Woodbury type is a development rather than an invention by Walter Woodbury. By an old nature-printing process leaves and other things which lent themselves to the treatment were by extreme pressure forced into a flat surface of soft metal, and the mould so formed was used as a printing surface to reproduce the forms of the impressed object. Woodbury found that a film of bichromated gelatin exposed to the action of light under a negative and the unacted parts washed away gave him a relief image which was so hardened by the action of light and other hardening agents, that it could with no injury to the film itself—which could be used many times to make fresh moulds—be forced by hydraulic pressure into a thin flat plate of lead or type metal, and that the mould so formed could be used in a similar way to the mould formed in the old nature printing process. But a Woodbury type print is rather a cast from the shallow mould than a print in the true sense. It is obtained by filling the mould with a warm solution of coloured gelatin and pressing on it a piece of hard surfaced paper. The pressure forces the solution away from the highest parts of this mould which come in actual contact with the paper, so that none of it is left between them and the surface of the paper which in these parts remains uncoloured. These are the high lights of the print. The pressure forces the colouring matter into the hollows of the mould, and this amount is graduated according to the depth of the hollows. The coloured gelatin gradually cools and hardens and adheres to the paper which on its removal from the mould retains a delicate cast of the impressed subject. The variety of light and shade is the result of the varying depth of the hollows and the consequent variation of the amount of colouring matter taken up by the impressed paper. The white paper is an important element in the result, the light reflected from it through this coloured gelatin varying according to the thickness of the gelatin film. A drawback to the use of the Woodbury type for book illustration is that every print has to be trimmed and mounted, and of course it cannot be printed with type.

Stamnotype is a variation upon Woodbury type. It is an attempt to do away with the need of the hydraulic press for the making of the mould. A film of bichromated gelatin is exposed to the action of light under a positive instead of a negative and the unacted parts washed away, by which means a mould is obtained corresponding exactly to that obtained in metal by pressure from a film exposed to light under a negative. This mould was covered by a coating of tin foil to give it the necessary hardness and durability, and prints obtained from it, but for some reason it has never come much into use.

Collotype or phototype is a process in which the film of isinglass, gelatin or gum, treated with bichromate of potash with the addition of alum or some other hardening substance, becomes an actual printing surface inked with an ordinary roller and printed by an ordinary machine. A strong tough film made up of a first coating of a simple gelatinous nature covered by a second film of the sensitive bichromated gelatin is spread upon glass and allowed to dry. Exposed to light under a reversed negative
PROCESS—PROCESSION

the unprotected parts are hardened in proportion to the amount of protection they receive from the negative. After exposure under the negative the back of the film is exposed to the action of sunlight through the glass at its back, so that the whole film may be rendered as hard and tough and durable as possible to stand the wear and tear of the process of printing. When in its place in the printing press the film must be kept moistened. The soft parts unacted upon by the light, but from which the bichromate has been since washed, will absorb moisture in proportion to the action the light has exercised upon it, the absolutely hard parts refusing moisture altogether. The film may now be inked with an ordinary inking roller, the ink being freely taken up by the hard and unmoistened passages and by the partly hardened in proportion to the amount of moisture the film has taken up. By this means of absorbing; as in lithography, the constant moistening of the printing surface is a necessity. Collogotype is largely used for postcards. It may be printed in a lithographic or ordinary vertical press of the letterpress printer. Admirable colour results are obtained by this process.

**Heliotype** is a variation of the method of producing the film which is first spread as described upon waxed glass and then stripped from the glass when dry. After hardening the back of the film it is laid down upon a metal plate and firmly secured to it by the use of an India-rubber cement. It is remarkable the admirable results that are obtainable by so delicate a process. The films have not a long life; a few hundreds only can be printed from each, but the renewal of the film is a simple matter. The result is very like a photograph. The use of heliotype is, however, practically obsolete.

**Photolithography.**—Zinc or aluminium plates are now frequently used instead of the more cumbersome stones for all so called lithographic printing. These plates have the same affinity for fat ink as stone, the method of dealing with them being practically the same as with stones, and the description may be taken as applying to both. The stone itself may be rendered sensitive by coating it with a thin film of bichromated gelatin, exposing it under a reversed negative of the required subject and treating the hardened film as it is treated in the case of collogotype. A better plan is to render sensitive a sheet of unsized or transfer paper which is exposed under a negative, moistened, and rolled with transfer ink, which is of a specially fatty nature, and adheres only to the parts hardened by exposure which are unaffected by the moistening and remain dry. This inked sheet is laid upon the stone and the two together are subjected to great pressure, passing through a lithographic press. After further moistening the sheet of transfer paper is peeled off, the stone leaving the inked drawing behind it. The usual method is followed by treating the plate which has been exposed to a preparation of acid and gum, kept moist and printed from in the ordinary lithographic method. Lithography of all kinds can only deal with lines or solid blocks. Tints present difficulties which are best dealt with by other methods of reproduction, but attempts have been made to obtain tints lithographically by breaking up the solid surfaces of the gelatin print with a grain before rolling it with ink and transferring it to the stone.

One of the most successful of such attempts is known as the **Ink-Sack Process,** which is really no less of a secret process worked by Messrs. Spengler, however, yields a sound result as a good drawing made in line, as the grain has a tendency to fill up. Transfers may also be made on to zinc plates which will take the lithographic ink equally well with stones. The plates may be etched—as the inked surfaces resist the action of acid—and by this means a relief plate made, which when mounted on a block, type-high, may be printed typographically. It is known in this form as zincography.

(E. B.)

**PROCESS,** in law, in the widest sense of the word, any means by which a court of justice gives effect to its authority. In the old practice of the English common law courts process was either original or judicial. Original process was a means of compelling any defendant to appear before the court having an original writ (see Writ). Judicial process was any compulsory proceeding rendered necessary after the appearance of the defendant. Process was also divided in civil matters into original, mesne and final. Original process in this sense was any means taken to compel the appearance of the defendant. A writ of summons is now the universal means in the High Court of Justice. Mesne process was either any proceeding against the defendant taken between the beginning and the end of the action, such as to compel him to give bail, or was directed to persons not parties to the action, such as jurors or witnesses. Arrest on process was abolished by the Act 1879, c. 75, Sec. 1. Final process is practically coexistent with execution. In criminal matters process only applies where the defendant does not appear upon summons or otherwise. A warrant is now the usual form of such process.

**Set process** was a technical term used in old common law practice. It consisted of an entry on the record by consent of the parties for a stay of proceedings. Since the Judicature Acts there has been no record, and the set process has disappeared with it.

In Scots law process is used in a much wider sense, almost equivalent to practice or procedure in English law. Where papers forming steps of a process are borrowed and not returned, the return of the borrowed process may be enforced by action (action for process). The Scottish process is very much akin to the French dossier.

In the United States process is governed by numerous statutes, both of Congress and of the state legislatures. The law is founded upon the English in a slight measure, and the modern American practice is almost identical with the practice in England.

**PROCESSION** (Inter. Eng., procesion, Fr. procession, Lat. procission, from procedere, to go forth, advance, proceed), in general, an organized body of people advancing in a formal or ceremonial manner. This definition covers a wide variety of such progresses: the medieval pageants, of which the Lord

1 In classical Latin the word generally used for a procession was pompa, a formal march or progress of persons to some particular spot, to celebrate some event, or for some public or religious purpose. **Processio** is used by Cicero in the sense of "a marching forward, an advancing," any public action without ceremony, which the consul upon his office (Du Cange, s.v. Processio), or the public appearance of the emperor. In Late Latin **processio** is generally used of a religious procession, the word coming to have used to be of the body of persons advancing or proceeding.
PROCESSION

Mayor's show in London is the most conspicuous survival; the processions connected with royal coronations and with court ceremonies generally; the processions of friendly societies, so popular in Great Britain and America; processions organized as a demonstration of political or other opinions; processions forming part of many ceremonies of public worship. A notorious sense of "going forth, proceeding," the term is used in the technical language of theology in the phrase "Procession of the Holy Ghost," expressing the relation of the Third Person in the Trinity Godhead to the Father and the Son.

Processions have in all peoples and at all times been a natural form of public celebration, as forming an orderly and impressive Greek and Roman procession, in which a number of persons can take part in the same ceremony. They are included in the celebrations of many religions, and in many countries, both in the East and West, they accompany such events as weddings and funerary processions, and as Religious festivals. After the establishment of Christianity, those connected with the cult of Dionysus, &c., and later formed an essential part of the celebration of the religious festivals (e.g. the processions of the Thesmophoria, and that of the Great Dionysia), and of the mysteries (e.g. the great procession from Athens to Eleusis, in connexion with the Eleusinia).

Of the Roman processions, the most prominent was that of the Triumph, which had its origin in the return of the victorious army headed by the general, who proceeded in great pomp from the Campus to the Capitol to offer sacrifice, accompanied by the army, captives, spoils, the chief magistrate, priests bearing the images of the gods, amidst burning of flowers, burning of incense and the like (Ovid, Trist. iv. 2, 3 and 6). Connected with the triumph was the pompa circensis, or solemn procession which preceded the games in the circus; it first came into use at the ludi romani, when the games were preceded by a great procession from the Capitol to the Circus. The praetor or consul who appeared in the pompa circensis wore the robes of a triumphing general (see Mommsen, Staatsrecht I. 397 for the connexion of the triumph with the ludi). Thus, when it became customary for the consul to celebrate games at the opening of the consular year, he came, under the empire, to appear in triumphal robes in the processus consularis, or procession of the consul to the Capitol, to sacrifice to Jupiter. After the establishment of Christianity, the consular processions in Constantinople retained their religious character, now proceeding to St Sophia, where prayers and offerings were made; but in Rome, where Christianity was not so widely spread among the upper classes, the tendency was to convert the procession into a purely civil function, omitting the pagan rites and prayers, without substituting Christian ones (Dahrenger and Saglio, s.v. "Consul"). Besides these public processions, there were others connected with the primitive worship of the country people, which remained unchanged, and were later to influence the worship of the Christian Church. Such were those of the Ambarmbar, Robigalia, &c., which were essentially rustic festivals, lustrations of the fields, consisting in a procession round the spot to be purified, leading the sacrificial victims with prayers, hymns and ceremonies, in order to protect the young crops from evil influences. (See Peller, Röm. Mythologie, pp. 370-372.)

As to the antiquity of processions as part of the ritual of the Christian Church, there is no absolute proof of their existence before the 4th century, but as we know that in the catacombs stations were held at the tombs of the martyrs on the anniversary of their death, for the celebration of the eucharist, it is quite probable that the faithful proceeded to the appointed spot in some kind of procession, though there is no satisfactory evidence that this was the case. There are, indeed, early instances of the use of the word processio by the Christian writers, but it does not in any case appear to have the modern meaning of procession. The Tertullian (2nd century) uses processio and procedere in the sense of "to go out, appear in public," and, as applied to a church function, processio was first used in the same way as collucta, as the equivalent of the Greek evoikés, i.e., for the assembly of the people in the church (Du Cange, s.v.). In this sense it appears to be used by Pope Leo I. (Ep. IX. ad Dioscor. episc. c. 445: "qui nostris processionibus et ordinationibus frequenter interfuit"), while in the version by Dionysius Exiguus of the 17th canon of the Council of Laodicea odoèton, is translated by processionibus (Smith, Dict. of Chr. Antig. s.v. "Processio"). The processions that formed part of the ritual of the eucharist, those of the introit, the gospel and the oblation, the earliest records date from the 6th century and even later (see Duchesne,Origines,2nd ed.,pp.77,154,187;78,104), but they evidently were established at a much earlier date. As to public processions, these seem to have come into rapid vogue after the recognition of Christianity as the religion of the empire. Those at Jerusalem would seem to have been long established when described by the authors of the Peregrinatio Silviae towards the end of the 4th century (see Palm Sunday, for the procession of palms).

In later times the processions accompanied by hymns and prayers, known as litanies (Gr. litanías, from λέγειν, prayer, rogations or supplications (see Litanies). It is to such a procession that reference appears to be made in a letter2 of St Basil (c. 375), which would thus be the first recorded mention of a public Christian procession. The first mention for the Western Church occurs in St Ambrose (c. 388, Ep. 40 § 16, Ad Theodos. "monachos ... qui psalmos canentes ex consuetudine usque vebeti pergebant ad celebratim Machabaeorum martyrum "). In both these cases the litanies are stated to have been long in use. There is also mention of a procession accompanied by hymns, organized at Constantinople by St John Chrysostom (c. 390-400) in opposition to a procession of Arians, in Sozomen, Hist. ecc. viii. 8. In times of calamity litanies were held, in which the people walked in robes of penitence, fasting, barefooted, and, in later times, frequently dressed in black (litaniae nigrae). The cross was carried at the head of the procession and often the gospel and the relics of the saint were carried. Gregory of Tours gives numerous instances of such litanies in time of calamity; thus he describes (Vita S. Remig. 1) a procession of the clergy and people round the city, in which relics of St Remigius were carried and litanies chanted in order to avert the plague. So, too, Gregory the Great (Ep. xii. 57) writes to the Sicilian bishops to hold processions in order to prevent a threatened invasion of Sicily. A famous instance of these penitential litanies is the litania septiformis ordered by Gregory the Great in the year 597, when Rome had been inundated and pestilence had followed.

1 See De praescr. adv. haer. C. xiii., "ubi metus in Deum, ibi gravitas hominis,..., et subjectio religiosis, et ad sacrificium ecclesiae, et processio modesta, et Ecclesia unita et Dei omnia," where it would seem to mean "a modest bearing in public:" also De cultu foem. ii. 14, "vobis autem nulla procedendi causa tertica; aut immergere qui ex humana temporum praebentia, aut Dei verbum administrat," which shows that procedere was not used only of going to church. The passage ad usorem, ii. 4, which is somewhat quoted to prove the existence of processions at this date, appears to use procedere in the same way as the above passages; "... si procedendum erit, nuncum magis familiaris occupatio obviens. Quis enim sinat conjugem suam visitandorum fratum praebentia aliena nec quidem religiosae doctrinae nec domini unius... quis donique solemnibus Paschae aboantem securus suscincte?"

2 Ep. 207 ad Necessas: "AMM" adv. θη, οφείλει αὐτῷ τόν μεγάλον Προφητα, "ΑΜM" adv. τον μεγάλον, τῷ τέκνῳ τε προφητει και τοῦ τέκνου τῆς προφητείας." 3 "Brawls with arisen with the Catholics, who began singing their hymns in opposition, the emperor prohibited the Arian meetings."
In this litany seven processions, of clergy, laymen, monks, nuns, matrons, the poor, and children respectively, starting from seven different churches, proceeding to hear mass at Sta Maria Maggiore (see Greg. of Tours, Hist. Fr. x.1, and Johann. Disc. Vitae Greg. Magn. i. 42). This litany has often been confused with the litaniae majores, introduced at Rome in 596 (vide supra), but is quite distinct from it.

Funeral processions, accompanied with singing and the carrying of lighted tapers, were very early customary (see Lights Ceremonial Use 09), and akin to these, also very early, were the processions connected with the translation of the relics of martyrs from their original burying place to the church where they were to be enshrined (see e.g. St Ambrose, Ep. 29 and St Augustine, De civitate Dei, xxii. 8 and Conf. viii. 7, for the finding and translation of the relics of Saints Gervasius and Protasius). From the time of the emperor Constantine I, these processions were of great magnificence.1

Some liturgists maintain that the early Church in its processions followed Old Testament precedents, quoting such cases as the procession of the ark round the walls of Jericho (Josh. vi.), the procession of David with the ark (2 Sam. vi.), the processions of thanksgiving on the return from captivity, &c. The liturgy of the early Church as Duchesne shows (Origines, ch. i.) was influenced by that of the Jewish synagogue, but the theory that the Church adopted the Old Testament ritual is of quite late growth. What is certain is that certain festivals involving processions were adopted by the Christian Church from the pagan calendar of Rome. Here we need only mention the litaniae majores et minores, which are stated by Usener ("Alte Bittgänge," in Zeller, Philosophische Aufsätze, p. 479 seq.) to have been first instituted by Pope Liberius (352-366). It is generally acknowledged that they are the equivalent of the Christian Church of the Roman lustrations of the crops in spring, the Ambavalia, &c. The litania major, or great procession on St Mark's day (April 25) is shown to coincide both in date and ritual with the Roman Robigalia, which took place a.d. vii. Kal. Mai., and consisted in a procession leaving Rome by the Flaminian gate, and proceeding by way of the Milvian bridge to a sanctuary at the 9th milestone of the Via Claudia, where the flamen quirinalis sacrificed a dog and a sheep in avert blight (robius) from the crops (Pall. Processioni, C.T.L.T., p. 317). It is shown to follow the same route as far as the Milvian bridge, when it turned off and returned to St Peter's, where mass was celebrated. This was already established as an annual festival by 598, as is shown by a document of Gregory the Great (Regist. ii.) which inculcates the duty of celebrating litaniam, quae major ab omnibus appellatur. The litaniae minores or rogations, held on the three days preceding Ascension Day, were first introduced into Gaul by Bishop Mamertus of Vienne (c. 470), and made binding for all Gaul by the 1st Council of Orleans (511). The litaniae minores were also adopted for these three days in Rome by Leo III. (c. 806). A description of the institution and character of the Ascensiontide rogations is given by Sidonius Apollinaris (Ep. v. 14). "The solemnity of these," he says, "was first established by Mamertus. Hitherto they had been erratic, lukewarm and poorly attended (sagae, tepetae, infrequentesque); those which he instituted were characterized by fasting, prayers, psalms and tears." In the Ambrosian rite the rogations take place after Ascensiontide, and in the Spanish on the Thursday to Saturday after Whitsun, and in November (Synod of Girona, 517).

1 Litani, owing to the fact that they were sung in procession, were in England sometimes themselves called "processions." Thus we read in the "Order of making Knights of the Bath for the coronation of Queen Elizabeth. The person in the vestry of each church kneelhy said the procession in Englishe and all that were there answered the parson" (B. M. Add. MSS. 4712, p. 51, printed in Anstis's Observations, p. 53).

It is impossible to describe in detail the vast development of processions during the middle ages. The most important and characteristic of these still have a place in the ritual of the Roman Catholic Church. The rules governing them are laid down in the Rituale Romanum (Tit. ix.), and they are classified in the following way:

(1) Processiones ordinariae, in which the whole body of the clergy takes part. (2) Processiones ordinariae, on yearly festivals, such as the feast of the Purification of the Virgin (Candlemass, &c.), the procession on Palm Sunday (q.v.), the litaniae majores and minores, the procession of Corpus Christi, and the procession of Corpus of St Mary Magdalen. (3) Processions according to the custom of the churches. (4) Processiones extraordinariae, or processions ordered on special occasions, e.g. to pray for protection against weather, in an absence of plague, war, or, in quasunque tribunalis, processions of thanksgiving for the preservation of relics, the dedication of a church or cemetery. There are also processions of honour, for instance to meet a royal personage, or the bishop on his first entry into his diocese (Fonfis. rom. iii.). Those taking part in processions are to walk bare-headed (weather permitting), two and two, in decent costume, and with reverent mien; clergy and laity, men and women, are to walk separately. The cross is carried at the head of the procession, and banners embroidered with sacred pictures in places where this is customary; these banners must not be of military or triangular shape. Violets are worn by the four processes, except on the Feast of Corpus Christi, or on a day when some other floral emblem is prescribed. The officiating priest wears a cope, or at least a surplice with a violet stole, the other priests and clergy wear surplices.

Vattle the boat is to be covered always by a canopy, and accompanied by lights. At the litaniae majores and minores and other penitential processions, joyful hymns are not allowed, but the litanies are sung, and, if the length of the procession requires, the penitential and gradual psalms.

As to the discipline regarding processions the bishop, according to the Council of Trent (Sess. 25 de reg. cap. 6), appoints and regulates processions and public prayers outside the churches.

The observance or variation of the discipline belongs to the Congregation of Rites; in pontifical processions, which are regulated by the masters of the ceremonies (magistri ceremoniarum pontificum), at these points it is decreed by the chief cardinal deacon. As to processions within the churches, some of which having arisen as to the regulating authority, the Congregation of Rites has decided that the bishop must ask, though not necessarily follow, the advice of the chapter in their regulation.

Reformed Churches.—The Reformation abolished in all Protestant countries those processions associated with the doctrine of transubstantiation (Corpus Christi), the Sacrament of the Lord's Supper," according to the Wurttemberg Kirchenordnung of 1535. The Church of England "was not by Christ's ordinance reserved, carried about, lifted up, or worshipped." It also abolished those associated with the cult of the Blessed Virgin and the saints. The stern simplicity of Calvinism, indeed, would not tolerate religious processions of any kind, and from the "Reformed" Churches they vanished altogether. The more conservative temper of the Anglican and Lutheran communions, however, suffered the retention of such processions as did not conflict with the reformed doctrines, though even in these Churches they met with opposition and tended after a while to fall into disuse. The Lutheran practice has varied at different times and in different countries. Thus, according to the Württemberg Kirchenordnung of 1553, a funeral procession was prescribed, the hier being followed by the congregation singing hymns; the Brandenburg Kirchenordnung (1540) directed a cross-bearer to precede the procession and lighted candles to be carried, and this was prescribed also by the Waldeck Kirchenordnung of 1556. At present funeral processions survive in general only in the country districts; the processional cross or crucifix is still carried. In some processions also the "cups of calvity" or the "cups of the sacrifices," the act of processions in the week before Whitsuntide and, in some cases, in the month of May or on special occasions (e.g. days of humiliation, Bustage), processions about the fields to ask a blessing on the crops. On these occasions the ancient litanies are still used. In England the perambulations of the circuits of the parishes ... used heretofore in the days of rogations 1 were ordered to be observed by the Injunctions of Queen Elizabeth in 1559; and for these processions certain "psalms, prayers and hymnies"...
were prescribed. The Puritans, who aimed at setting up the Genevan model, objected; and the visitation articles of the bishops in Charles I.'s time frequent incitement into the neglect of the clergy to obey the law in this matter. With "the profane, ungodly, presumptuous multitude" (to quote Baxter's *Saint's Rest*, 1650, pp. 344, 345), however, these "processions and perambulations" appear to have been very popular, though "only the traditions of their fathers." However this may be, the Commonwealth made an end of them, and they seem never to have been revived; Sparrow, in his *Rationale upon the Book of Common Prayer* (London, 1668), speaks of "the service formerly appointed in the Rogation days of Procession."

Among the processions that survived the Reformation in the Church of England was that of the sovereign and the Knights of the Garter on St. George's day. This was until Charles II.'s time a regular rogation, the choristers in cope, the gentlemen of the royal chapel in copes, and the canons and other clergy in copes preceding the knights and singing the litany. In 1661, after the Restoration, by order of the sovereign and knights companions in chapter that "supplicational procession" was "converted into a hymn of thanksgiving." Akin to this procession also are the services connected with royal functions; coronations, funerals. These retained, and retain, many pre-Reformation features elsewhere fallen obsolete. Power in fact is still vested in the crown, and the before-mentioned copes and lights are still worn by the dean and prebendaries in their copes, attended by the choir, all carrying lighted tapers, who preceded it up the choir, singing.

The only procession formerly prescribed in the Book of Common Prayer is that in the order of the burial of the dead, where the rubric directs that "the priest and clerks meeting the corpse at the entrance of the churchyard, and going before it, either into the church, or towards the grave, shall say, or sing," certain verses of Scripture. Tapers seem to have been carried, not only at royal funerals, until well into the 19th century (see *The Church of England in the Nineteenth Century*). Processions, with flying of the banners or of hymns, appear also to have been always usual on such occasions as the consecration of churches and churchyards and the solemn reception of a visiting bishop. Under the influence of the Catholic revival, associated with the Oxford Tractarians, processions have become increasingly popular in the English Church, pre-Reformation usages having in some churches been revived without any legal sanction. The most common forms, however, are the processional litanies, and the solemn entry of clergy and choir into the church, which on festivals is accompanied by the singing of a processional hymn, their exit being similarly accompanied by the chanting of the *Nunc Dimittis*. In this connection the use of the processional cross, banners and lights has been largely revived.

**PROCESSION PATH** (Lat. *ambitus templi*), the route taken by processions on solemn days in large churches—up the north aisle, round behind the high altar, down the south aisle, and then up the centre of the nave.

**PROCESS-VERBAL** (Fr. *procès*, process, Late Lat. *verbalis*, from *verbum*, word), in French law, a detailed authenticated account drawn up by a magistrate, police officer, or other person having authority of acts or proceedings done in the exercise of his duty. In a criminal charge, a procès-verbal is a statement of the facts of the case. The term is sometimes applied to the written minutes of a meeting or assembly.

**PROCIDA** (Gr. *Ipoxyon*, Lat. *Procylita*), an island off the coast of Campania, Italy, 2 m. S.W. of Cape Miseno, and 2 m. N.E. of Ischia on the west side of the Gulf of Naples, and about 12 m. S.W. of Naples. Pop. (1901), of the town, 2520; of the whole island, one commune, 14,440. It is about 2 m. in length and of varying width, and, reckoning in the adjacent island of Vivara, is made up of four extinct craters, parts of the margins of all of which have been destroyed by the sea. The highest point of it is only 250 ft. above sea-level. It is very fertile, and the population is engaged in the cultivation of vines and fruit and in fishing. Procida, the only town, lies on the east side; its castle is now a prison. It also contains a royal palace. Classical authors explained the name of Procida either as an allusion to having been detached from Ischia, or as being that of nurse of Aeneas.

**PROCLAMATION** (Lat. *proclamare*, to make public by announcement), in English law, a formal announcement (royal proclamation), made under the great seal, of some matter which the king in council desires to make known to his subjects: e.g. the declaration of war, the statement of neutrality, the summoning or dissolution of parliament, or the bringing into operation of the provisions of some statute the enforcement of which the legislature has left to the discretion of the king in council. Royal proclamations of this character, made in furtherance of royal power in the *executive* or *administrative* sense (proc. 6th, 1641; 11th, 1660), are binding on the subject, "where they do not either contradict the old laws or tend to establish new ones, but only confine the execution of such laws as are already in being in such manner as the sovereign shall judge necessary." (Blackstone's *Commentaries*, ed. Stephen, ii. 528; Stephen's *Commentaries*, 14th ed. 1903, ii. 506, 507; Dicey, *Law of the Constitution*, 6th ed., 51). Royal proclamations, which, although not made in pursuance of the executive powers of the Crown, either call upon the subject to *fulfil* some duty which he is by law bound to perform, or to abstain from any acts or conduct already prohibited by law, are lawful and right, and disobedience to them (without *in rem* or *in personam*) is an *infraction* of the peace (see *charge* of Chief Justice Cockburn to the grand jury in *R. v. Eyre* (1867) and *Case of Proclamations* 1650, 12 Co. Rep. 74). The Crown has from time to time *legislated* by proclamation; and the Statute of Proclamations 1539 provided that proclamations made by the king with the assent of the council should have the force of statute law if they were not prejudicial to "any person's inheritance, offices, liberties, goods, chattels or life." But this enactment was repealed by an act of 1547; and it is certain that a proclamation purporting to be made in the exercise of legislative power by which the sovereign imposes a duty to which the subject is not bound by law, or prohibits an act not an offence at law, or adds fresh penalties to any offence, is of no effect unless it is issued in virtue of statutory authority (see also *Order in Council*). The Crown has power to legislate by proclamation for a newly conquered country (Jenkyns, *British Rule and Jurisdiction beyond the Seas*); and this power was freely exercised in the Transvaal Colony during the Boer War of 1899-1902. In the British colonies, ordinances are frequently brought into force by proclamation; certain imperial acts do not take effect in a colony until there proclaimed (e.g. the Foreign Enlistment Act 1870); and proclamations are sometimes executed in the Crown, on the advice of the executive. In many British protectorates the high commissioner or administrator is empowered to legislate by proclamation.

In the old system of real property law in England, fines, levied with "proclamations," i.e. with successive public announcements of the transaction in open court, barred the rights of strangers, as time parties, in case they had not made claim to the land conveyed within five years thereafter (acts 1483-1484 and 1488-1489). These proclamations were originally made sixteen times, four times in the term in which the fine was levied, and four times in each of the three succeeding terms. Afterwards the number of proclamations was reduced to one in each of the four terms. The proclamations were endorsed on the back of the record. The system was abolished by the Fines and Recoveries Act 1853. (A. W. R.)

**PROCLUS** or *Proclus* (A.D. 410-485), the chief representative of the later Neoplatonists, was born at Constantinople, but
PROCOPIUS

brought up at Xanthus in Lycia. Having studied grammar under Orison and philosophy under Olympiodorus the Peripatetic, at Alexandria, he proceeded to Athens. There he attended the lectures of the Neoplatonists Plotinus and Simplicius, and about 450 succeeded the latter in the chair of philosophy (hence his surname Diadochus, which, however, is referred to others by his the being the “successor” of Plato). As an ardent upholder of the old pagan religion Proclus incurred the hatred of the Christians, and was obliged to take refuge in Asia Minor. After a year’s absence he returned to Athens, where he remained until his death. His epitaph, written by himself, is to be found in Anthologia palatina, vii. 451. Although possessed of ample means, Proclus led a most temperate, even ascetic life, and employed his wealth in generous relief of the poor. He was supposed to be both a contemporary of the gods, who showed him with miraculous powers. He acted up to his famous saying that “the philosopher should be the hierarch of the whole world” by celebrating Egyptian and Chaldaean as well as Greek festivals, and on certain days performing sacred rites in honour of all the dead.

His great literary activity was chiefly devoted to the elucidation of the writings of Plato. There are still extant commentaries on the First Alcibiades, Parmenides, Republic, Timaeus, and Cratylus. His views are more fully expounded in the Pseudolus autem (In Platonis theologiam). The Stoicheia theologic (Institutio theologica) contains a compendious account of the principles of Neoplatonism and the modifications introduced in it by Proclus himself. The pseudo-Aristotelian De causis is an Arabic extract from this work, ascribed to Alfarabius (d. 950), circulated in the west by means of a Latin translation (ed. O. Bardenhewer, Freiburg, 1882). It was answered by the Christian rhetorician Procopius of Gaza in a treatise which was deliberately appropriated without acknowledgment by Nicolaus of Methone, a Byzantine theologian of the 12th century (see W. Christ, Gesch. der griechischen Denker, pp. 158 ff. [566]). Other philosophical works by Proclus are Stoicheia theologica (Institutio theologica), De matut., a compendium of the last five books of Aristotle’s Peri touikos dokous, De physica auscultatione, and De providentia et fato, Decem dubitationes circa providentiam, De malorum subexistenz, known only by the Latin translation of William of Moerbeke (archbishop of Corinth, 1277-1281), who also translated the Stoicheia theologica into Latin. In addition to the epitaph already mentioned, Proclus was the author of hymns, seven of which have been preserved (to Helios, Aphrodite, the Muses, the Gods, the Lycian Aphrodite, Hecate and Janus, and Athena), and of an epigram in the Greek Anthology (Anthol. pal. iii. 3, 166 in Dilse edition). His philosophical and mathematical writings include Tultopoias tis astrologos updekevos (Hypotyposis astronomiæ sputiensiæ; ed. C. Manitiis, Leipzig, 1906; Peria sfaira (De sphæra); Parafraisis eis tisb Ptolemaicis tetadbibos, a paraphrase of the difficult passages in Ptolemy’s astrological work Tetrabiblos; Eis to prágmatos Eis Eukleous staochex, a commentary on the first book of Euclid’s Elements; a short treatise on the effect of eclipses (De effectibus eclipsium, only in a Latin translation).

His grammatical works are: a commentary on the Works and Days of Hesiod (incomplete); some scholia on Homer; an elementary treatise on the epistolary style, Peri epistolovon charakterov (Characteres epistolici), attributed in some MSS. to Libanius. The Xpòstoumbia grammatik, a commentary on which is identified with Suidas, is the Neoplatonist, is probably the work of a grammian of the 2nd or 3rd century, though Wilamowitz-Moellendorf (Philol. Untersuch. viii.; supported by O. Immisch in Festschrift Th. Compertz, pp. 237-274) agrees with Suidas. According to Suidas, he was also the author of Eftprakomevata kai kai Xristianov (Animadversiones ouerdigentui in christianos). This work, identified by W. Christ with the Institutio theologica, was answered by Joannes Philoponus (7th century) in his De aeternitate mundi. Some of his commentary on the Chaldaean oracles (Δημαρχικα) has been discovered in modern times.

There is no complete edition of the works of Proclus. The selection of V. Cousin (Paris, 1864) contains the treatises De providentia et fato, Decem dubitationes, and De malorum subexistenz, the commentaries on the Alcibiades and Parmenides. The Institutio theologica is printed in the 1882 edition of F. G. C. von Stobbe. The Didot edition of Plutarch (Paris, 1855); the In Platonis theologiam has not been reprinted since 1618, when it was published by Aemilius Portus with a Latin translation. Most recent editions of individual works are in the Commentaries of the Byzantine authors, edited by A. E. Chaginit (1900-1903); Republic, by W. Kroll (1890-1901); Timaeus, by E. Diehl (1903-); Hymns, by E. Abel (1885); and A. Ludwig (1898); commentary on Euclid by G. Friedrich (1870); Μνημεία, by A. Jahn (1841); Characters epistolici, by A. Westermann (1856), Scholia to Hesiod in E. Vollbehr’s edition (1844). Thomas Taylor, the “Platonist,” translated the commentaries on the Alcibiades and Euclid, The Theology of Plato, the Elements of Theology, and the Three Last Books of the Republic.

On Proclus generally and his works see article in Suida’s Marius, Vita Procli; J. A. Fabricius, Bibliotheca graeca (ed. Harles), ix. 135-157; H. Christ, Geschichte der griechischen Literatur, 1901; W. Hittaker, The Neo-Platonists (1901), and Neoplatonism. Extracts from the Xpòstoumbia are preserved in Photius (Cod. 249), almost the only source of information regarding the epic cycle; on the question of authorship, see Christ: § 657, and Suidas, p. 373ff; also D. B. Monro’s appendix to his ed. of Homer’s Odyssey, iix.—xxi. (1901).

PROCOPIUS, Byzantine historian, was born at Caesarea in Palestine towards the end of the 5th century A.D. He became a lawyer, and was at Constantinople, and was in 527 appointed secretary and legal adviser to Belisarius, who was commanding to command the imperial army in the war against the Persians (De bello persico i. 12). When the Persian War was suspended and Belisarius was despatched against the Vandals of Africa in 533, Procopius again accompanied him, as he subsequently did in the war against the Ostrogoths of Italy, which began in 535. After the capture of Ravenna in 540 Procopius seems to have returned to Constantinople, since he minutely describes the great plague of 542 (op. cit. ii. 22). It does not appear whether he was with the Roman armies in the later stages of the Gothic War, or whether he was during the Gothic War, or whether he was at the time of the capture of Toulia in Italy; his narrative of these years is much less full and minute than that of the earlier warfare. Of his subsequent fortunes we know nothing, except that he was living in 550. Whether he was the Procopius who was prefect of Constantine in 562 (Theophanes, Chronographia, 201, 202), and was removed from office in the year following, cannot be determined. As the historian was evidently a person of note, who had obtained the rank of ilustrius (Suidas), and from a passage in the Anecdota (12) seems to have risen to be a senator, there is no improbability in his having been raised to the high office of prefect.

The Histories (Persian, Vandal and Gothic Wars), in eight books; the treatise on the Buildings of Justinian (De aedificiis), in six books; and the Unpublished Memoirs (Ἀνέκδοτα, Historia arcaica), so called because they were not published during the lifetime of the author.

The Histories are called by the author himself the Books about the Wars (οἱ ὑπὲρ τῶν πολέμων λόγοι). They consist of: (1) the Persian Wars, in two books, giving a narrative of the long struggle of the emperors Justin and Justinian against the Persian kings Chosroes and Belisarius. And afterwards, in 532, for the Gothic War, in two books, describing the conquest of the Vandal kingdom in Africa and the subsequent events there from 532 down to 546 (with a few words on later occurrences); (2) the Gothic War, in three books, narrating the war against the Ostrogoths in Sicily and Italy from 536 till 542. The eighth book contains a further summary of events down to 534. These eight books of Histories, although mainly occupied with military matters, contain notices of some of the more important domestic events, such as the Nika insurrection at Constantinople in 532, the plague in 542, the conspiracy of Artemas in 547. They tell us, however, comparatively little about the civil administration of the empire, and nothing about legislation. On the other hand they are rich in geographical and ethnographical information.
As an historian Procopius is of quite unusual merit, when the generally low literary level of his age is considered. He is industrious in collecting facts, careful and impartial in stating them; his judgment is sound, his reflections generally acute, his conceptions of the general march and movement of things not unworthy of the great events he has recorded. His descriptions, particularly of military operations, are clear, and his special fondness for this part of the subject seldom leads him into unnecessary minuteness. The style, although marked by mannerisms, by occasional affectations and rhetorical devices, is on the whole direct and businesslike, nor is the Greek bad for the period in which he wrote. His models are Thucydides and Herodotus. The former he imitates in the maxims Procrustes throws in and the speeches which he puts into the mouth of the chief actors; the latter in his frequent geographical digressions, in the personal anecdotes, in the tendency to collect and attach some credence to marvellous tales. The speeches are obviously composed by Procopius himself, rarely showing any dramatic variety in their language, but they seem sometimes to convey the substance of what was said; and even when this is not the case they frequently serve to bring out the points of a critical situation. Procopius is almost as much a geographer as an historian, and his descriptions of the people and places he himself visited are careful and accurate. Although a warmly patriotic Roman, he does full justice to the merits of the barbarian enemies of the empire, particularly the Ostrogoths; although the subject of a despotic prince, he criticizes the civil and military administration of Justinian and his dealings with foreign peoples with a freedom which gives a favourable impression of the tolerance of the emperor. His chief defects are a somewhat pretentious and at the same time monotonous style, and a want of sympathy and intensity.

The De aedificiis contains an account of the chief public works executed during the reign of Justinian down to 538 (in which year it seems to have been composed), particularly churches, palaces, hospitals, fortresses, roads, bridges and other river works throughout the empire. All these are of course ascribed to the personal action of the monarch. If not written at the command of Justinian (as some have supposed), it is evidently grounded on official information, and is full of gross flattness of the emperor and of the (then deceased) empress. In point of style it is greatly inferior to the Histories—florid, pompous and affected, and at the same time tedious. Its chief value lies in the geographical notices which it contains.

The Anecdota Historicà (History II) purports to be a supplementation to the Histories, containing explanations and additions which the author could not insert in the latter work for fear of Justinian and Theodora. It is a furious invective against these sovereigns, their characters, personal conduct and government, with attacks on Belisarius and his wife Antonina, and on other noted officials in the civil and military services of the empire. Owing to the ferocity and brutality of the attacks upon Justinian, the authenticity of the Anecdota has often been called in question, but the claims of Procopius to the authorship are now generally recognized. In point of style, the Anecdota is inferior to the Histories, and has a tendency of being unfinished, or at least unrevised. Its merit lies in the fact that it is the only work which gives it a force and reality sometimes wanting in the more elaborate books written for publication. The history of Philip of Macedon by Theopompos probably furnished the author with a model.

The best complete edition of Procopius is by J. Haury (Teubner Series, 1905); the Gothic War has been edited by D. Comparetti (1865–1898), in Italian translation. There are English translations of the History of the Wars, by H. Holcroft (1863); of the Anecdota (1674, anonymous); of the Buildings, by Aubrey Stewart (1888, in Palestine Pilgrims' Text Society). Chief authorities: F. Duhn, Procopius von Caesarea (1865); W. S. Teufel in Studien und Charakteristiken (2nd ed., 1889); L. Ranke, Weltgeschichte (1883), iv. 2. On the genuineness of the Anecdota cf. J. B. Burckhardt, who (with degrees in rejecting the authorship of Procopius) A History of the Later Roman Empire (1890), vol. i, and introd. to vol. i. (p. 57) and app. to vol. iv. of his edition of Gibbon's Decline and Fall. For the literature of the subject generally, see C. Krumbach, Geschichte der byzantinischen Literatur (2nd ed., 1897).

PROCOPIUS OF GAZA (c. 465–528 A.D.), Christian sophist and rhetorician, one of the most important representatives of the famous school of his native place. Here he spent nearly the whole of his life teaching and writing, and took no part in the theological movements of his time. The little that is known of him is to be found in his letters and the encomium by his pupil and opponent Choricius. He was the author of numerous rhetorical and theological works. Of poetry, his panegyric on the emperor Anastasius alone is extant; the description of the church of St Sophia and the monody on its partial destruction by an earthquake are spurious. His letters (162 in number), addressed to persons of rank, friends, and literary opponents, throw valuable light upon the condition of the sophistical rhetoric of the period and the character of the writer. The fragment of a polemical treatise against the Neoplatonist Proclus is now assigned to Nicolaus, archbishop of Methone in Peloponnesus (6th century). Procopius's theological writings consist of commentaries on the Septuagint, the books of Kings and Chronicles, Isaiah, the Prophets, the Songs of Songs and Ecclesiastes. They are amongst the earlier attempts in the "catenis" (catena, chain) form of commentary, consisting of a series of extracts from the fathers, arranged, with independent additions, to elucidate the portions of Scripture concerned. Photius (cod. 206), while blaming the diffuseness of these commentaries, praises the writer's learning and style, which, however, he considers too ornate for the purpose.

Complete editions of the works of Procopius in Migne, Patrologia graeca; the letters also in Epistololographi graeci, ed. R. Hercher (1782); see also R. Seitz, Die Schule von Gaza (1892); D. Russos, Τρίτος Πατριάρχης (Constantinople, 1893); L. Eisenhofer, Procop von Gaza (1897); further bibliographical notices in C. Krumbach, Geschichte der byzantinischen Literatur (1897), and article by G. Krüger in Herzog-Hauck's Realencyclopaedie für protestantische Theologie (1905).

PROCRUSTES (Gr. for the "stretcher"), also called POLYPEMON or DAMASTES, in Greek legend, a robber dwelling in the neighbourhood of Eleusis, who was slain by Theseus. He had two bedsteads (according to some, only one), the one very long, the other very short. When a stranger claimed his hospitality, Procrustes compelled him, if he was tall, to lie down on the short bed, and then cut off his extremities to make him fit. If the other hand he was short, he was placed on the long bedstead and his limbs were lengthened. He died when he died from exhaustion. The "bed of Procrustes" has become proverbial.

Diod. Sic. iv. 59; Hyginus, fab. 38; Plutarch, Thebes, 11; Pausanias i. 35, 8.

PROCTOR, BRYAN WALLER (1787–1874), English poet, was born at Leeds on the 21st of November 1787. He was educated at Harrow, where he had for contemporaries Lord Byron and Sir Robert Peel. On leaving school he was placed in the office of a solicitor at Calne, Wilts, remaining there until about 1807, when he returned to London to study law. By the death of his father in 1816 he became possessed of a small property, and soon after entered into partnership with a solicitor; but in 1820 the partnership was dissolved, and he began to write under the pseudonym of "Barry Cornwall." After his marriage in 1824 to Miss Skepper, a daughter of Sir Mers of Great还可以吗？
Proctor, A. P.—Proctor, R. A.

*Effigies poetica* (1824), *Life of Edmund Kean* (1835), *Essays and Tales in Prose* (1851), *Charles-Lamb; a Memoir* (1860), and of memoirs of Ben Jonson and Shakespeare for editions of their works. A posthumous autobiographical fragment with notes of his literary friends, of whom he had a wide range from Bowsie to Browning, was published in 1877, with some additions by Coventry Patmore. Charles Lamb gave the highest possible praise to his friend's *Dramatic Sketches* when he said that he had found them as anonymous manuscript in the Garrick collection he would have had no hesitation about including them in his *Dramatic Specimens*. He was perhaps not an impartial critic. "Barry Cornwall's" genius cannot be said to have been entirely mimetic, but his works are full of subdued echoes. His songs have caught some notes from the Elizabethan and Cavalier lyrics, and blended them with others from the leading poets of his own time; and his dramatic fragments show a similar infusion of the early Victorian spirit into pre-Restoration forms and cadences. The results are somewhat heterogeneous, and lack the impress of a pervading and dominant personality to give them unity, but they abound in pleasant touches, with here and there the flash of a higher, though casual, inspiration.

His daughter, Adelaide Anne Proctor (1825–1864), also a poet, was born on the 30th of October 1825. She began to contribute to *Household Words* in 1853. She adopted the name of "Mary Berwick," so that the editor, Charles Dickens, should not be prejudiced by his friendship for the Poetesses. Her principal works are *Legends and Lyrics*, of which the first series, published in 1858, ran through nine editions in seven years, while a second series issued in 1860 met with a similar success. Her unambitious verses dealing with simple emotional themes in a simple manner have a charm which is scarcely explicable on the ground of high literary merit, but which is due rather to the fact that they are the cultured expression of an earnest and beneficent life. Among the best known of her poems are *The Angel's Story, The Legend of Bregens and The Legend of Provence*. Many of her songs and hymns are very popular. Latterly she became a convert to Roman Catholicism, and her philanthropic zeal appears to have hastened her death, which took place on the 2nd of February 1864.

**Proctor, Alexander Phimister** (1862– ), American sculptor and painter, was born in Ontario, Canada, on the 27th of September 1862. As a youth he lived at Denver, Colorado, spending much of his time in the Rocky Mountains, and his familiarity with the ways and habits of wild animals was supplemented later by study in the Jardin des Plantes, Paris. He was a pupil at the National Academy of Design and later in the Art Students’ League, in New York, and first attracted attention by his statues of wild animals at the Columbian Exposition in Chicago. In 1896 he won the Rinehart Scholarship, which enabled him to spend five years in Paris, where he studied under Puéch and J. A. Injalbert. Among his works of sculpture are: "Indian Warrior" (a small bronze); "Panthers," Prospect Park, Brooklyn, New York; "Quadriga," for United States Pavilion, Paris Exhibition (1900), and groups in the City Park, Denver, and Zoological Park, New York. His pictures of wild animals, mainly in water colours, are also characteristic. He became a member of the Society of American Artists (1895), of the National Academy of Design (1904), of the American Water Color Society, and of the Architectural League, New York.

**Proctor, Richard Anthony** (1837–1888), British astronomer, was born at Chelsea on the 23rd of March 1837. He was a delicate child, and, his father dying in 1850, his mother attended herself to his education. On his health improving he was sent to King's College, London, from which he obtained a scholarship at St John's College, Cambridge. He graduated in 1860 as 23rd wrangler. His marriage while still an undergraduate probably accounted for his low place in the tripos. He then read for the bar, but turned to astronomy and authorship instead, and, in 1865, published *A Compendium of the Theory of Double Stars* in the *Cornhill Magazine*. His first book—*Saturn and his System*—was published in the same year, at his own expense. This work contains an elaborate account of the phenomena presented by the planet; but although favourably received by astronomers, it had no great sale. He intended to follow it up with similar treatises on Mars, Jupiter, sun, moon, comets and meteors, stars, and nebulae, and had in fact commenced a monograph on Mars, when the failure of a New Zealand bank deprived him of an independence which would have enabled him to carry out his scheme without anxiety as to its commercial success or failure. Being thus obliged to depend upon his writings for the support of his family, and having learned by the fate of his Saturn that the general public are not attracted by works requiring arduous study, he cultivated a more popular style. He wrote for a number of periodicals; and although he has stated that he would at this time willingly have "turned to stone-breaking on the roads, or any other form of hard and honest but unscientific labour, if a modest competence had been offered" him in any such direction, he attained a high degree of popularity, and his numerous works had a wide influence in familiarizing the public with the main facts of astronomy. His earlier efforts were, however, not always successful. His *Handbook of the Stars* (1866) was refused by Messrs Longmans and Messrs Macmillan, but being privately printed, it sold fairly well. For his *Half-Hours with the Telescope* (1868), which eventually reached a 20th edition, he received originally £25 from Messrs Hardwick. Although teaching was uncongenial to him he took pupils in mathematics, and held for a time the position of mathematics coach for Woodstock and Rugby.

His literary standing meantime improved, and he became a regular contributor to *The Intellectual Observer, Chambers' Journal* and the *Popular Science Review*. In 1870 appeared his *Other Worlds than Ours*, in which he discussed the question of the plurality of worlds in the light of new facts. This was followed by a long series of popular treatises in rapid succession, amongst the more important of which are *Light Science for Leisure Hours and The Sun* (1871); *The Orbs around Us and Essays on Astronomy* (1872); *The Exposure of Heaven, The Moon and The Borderland of Science* (1873); *Kwark's System of the Universe* (1874); *Our Place among Infinities* (1875); *Myths and Marvels of Astronomy* (1877); *The Universe of Stars* (1878); *Flowers of the Sky* (1879); *The Poetry of Astronomy* (1880); *Easy Star Lessons and Familiar Science Studies* (1882); *Mysteries of Time and Space and The Great Pyramid* (1883); *The Universe of Suns* (1884); *The Seasons* (1885); *Other Suns than Ours and Half-Hours with the Stars* (1887). In 1881 he published *Knowledge*, a popular weekly magazine of science (converted into a monthly in 1883), which had a considerable circulation. In it he wrote on a great variety of subjects, including chemistry and witchcraft. He was also the author of some articles on astronomy in the *American Cyclopaedia* and the 1897 edition of the *Encyclopædia Britannica*, and was well known as a popular lecturer on astronomy in England, America and Australia. Elected a fellow of the Royal Astronomical Society in 1866, he became honorary secretary in 1872, and contributed eighty-three separate papers to its *Monthly Notices*. Of these the more noteworthy dealt with the distribution of stars, star-clusters and nebuleas, and the construction of the sidereal universe. He was an expert in all that related to map-drawing, and published two star-atlases. A chart on an isographic projection, exhibiting all the stars contained in a quadrant, *Durchmusterung*, was designed to show the laws according to which the stars down to the 8-th magnitude are distributed over the northern heavens. His "Theoretical Considerations respecting the Corona" (Monthly Notices, xxxi. 184, 254) also deserve mention, as well as his discussions of the rotation of Mars, by which he deduced its period with a probable error of 0·005. He also vigorously criticized the official arrangements for observing the transits of Venus of 1874 and 1882. His largest and most ambitious work, *Old and New Astronomy*, unfortunately left unfinished at his death, was completed by Alexander Rumford in 1892. He died at New York, the 12th of September 1888.
PROCTOR

PROCTOR, an English variant of the word procurator (q.v.); strictly, a person who takes charge or acts for another, and so approaching very nearly in meaning to "agent" (q.v.).

1. A practitioner in the ecclesiastical and admiralty courts. A proctor in this sense is also a qualified person licensed by the archbishop of Canterbury to undertake duties such as are performed in other courts by solicitors, but this matter is now only of historical interest, since by the Judicature Acts 1873 and 1875 all the business formerly confined to proctors may be conducted by solicitors. The king's proctor is the proctor or solicitor representing the Crown in the courts of probate and divorce. In petitions of divorce or for declaration of nullity of marriage the king's proctor may, under direction of the attorney-general, and by leave of the court, intervene in the suit for the purpose of proving collusion between the parties. His power of intervening is limited, by the Matrimonial Causes Act 1866, to cases of collusion only, but he may also, as one of the public, show cause against a decree nisi being made absolute (see Divorce). In the admiralty court a proctor or procurator was an officer who, in conjunction with the king's proctor, acted as the attorney or solicitor in all causes concerning the lord high admiral's affairs in the high court of admiralty and other courts. The king's proctor so acted in all causes concerning the king.

2. A representative of the clergy in convocation. A proctor in this sense represents either the chapter of a cathedral or the beneficed clergy of a diocese. In the province of Canterbury two proctors represent the clergy of each diocese; in that of York there are two for each archdeaconry. In both alike each chapter is represented by one.

3. The name of certain important university officials. At Oxford the proctors (procuratores), under the statutes, supervise the transaction of university business and appoint delegates to look after any particular affairs wherever these are not otherwise provided for by statute. They are ex officio members of all the important delegacies, except that of the University Press. They also act as the assessors of the chancellor or his commissary in particular matters dealt with in the university. They supervise the voting at public meetings of the university and announce the results. They also have, according to the ancient statutes, the power of veto in convocation and congregation: no proposal can be passed into a statute or decree if twice vetoed by them. They are ex officio members of the hebdomadal council, the governing council of the university, and they are the assessors of the vice-chancellor when he confers degrees. When a degree is to be granted they walk down the hall in which the ceremony is performed, nominally to ask for the approval of the masters, and it was formerly the custom for any tradesman, or any other person, who had a claim of debt against the postulant for a degree, to pluck the gown of the proctor as he passed and request settlement of the debt before the degree was granted. The proctors are also responsible for the good order of the university, and they are charged with the duty of inquiring into and reporting on any breaches of its statutes, customs or privileges. They are empowered to punish undergraduates, or graduates under the degree of Bachelor of Civil Law and Master of Arts, by fine or by confinement to their colleges or lodgings (familiarly known as "gating"). They have to draw up the list of candidates for examination, and have to be present at all examinations, to see that they are properly conducted. They are responsible for the good order of the streets at night, so far as members of the university are concerned. For this purpose more especially each of them is empowered, immediately on his election, to nominate two masters of at least three years' standing as proctors. The proctors and pro-proctors take it in turn to perambulate the streets nightly, accompanied by two sworn constables, familiarly known as "bulldogs." The proctors are elected by the heads, fellows and resident members of convocation of each college in rotation. They are presented to the vice-chancellor with much ceremony, part of which consists in taking over the insignia of their office—a copy of the statutes and a bunch of keys—from their predecessors.

At Cambridge the proctors are nominated annually by the colleges in rotation and elected (after proceeding) by the senate. They must have been three years members of the senate and have resided two years at the university. The two pro-proctors are not, as at Oxford, nominated by the proctors, but are also elected by the senate on the nomination of the colleges, each college having the right to nominate a pro-proctor the year next before that in which it nominates the proctor (Grace of February 26, 1863). Two additional pro-proctors are also elected by the senate each year, on the nomination of the vice-chancellor and proctors, to assist the latter in the maintenance of discipline (Grace of June 6, 1878).

The early history of the office at Cambridge is obscure, but it seems that the proctors have always represented the colleges in university proceedings. At present their functions are twofold (1) as taking part in all university ceremonies, (2) as enforcing discipline in the case of members of the university who are in statu pupillari (i.e. undergraduates and Bachelors of Arts and Law). (1) The proctors are not (as at Oxford) ex officio members of the council of the senate or of other boards or syndicates, except those with which their duties are specially connected. But their presence is essential at all congregations of the senate, at which the senior proctor reads all the "graces" (already approved by the council of the senate). If any grace is opposed by any member of the senate saying non placet the proctors take the voices of those present and announce the result. Grace are offered not only for making changes in university statutes and ordinances and for appointing examiners and the like, but also for granting degrees. When a degree is to be taken the college of the candidate presents a supplicat or petition for the degree, this petition is approved by the council of the senate, when they have satisfied themselves that the candidate has fulfilled the conditions, and is read at the congregation by the senior proctor: these supplicats are practically never opposed, but graces for new statutes and ordinances are frequently opposed, and on very important occasions many hundreds of non-resident members of the senate come up to record their votes. (2) The proctors' powers as to discipline have a very long history. As far as concerns members of the university they have authority to impose certain fines for minor offences, such as not wearing academic dress on occasions when it is ordered, and also to order a man not to be out of his college after a certain hour for a certain number of days ("gating"). In the case of more serious offences the proctor generally reports the matter to the authorities of the offender's college to be dealt with by them, or as an ultimate resort brings the offender before the university court of discipline, which has power to rusticate or expel. The power of the proctors over persons who are not members of the university dated from charters granted by Elizabeth and James I., which empowered the university authorities to search for undesirable characters, men and women, rogues, vagabonds, and other personas de malo suspectas, and punish them by imprisonment or banishment. In recent times this power was regularly exercised with respect to women of bad character. The proctors promenaded the streets attended by their servants (the bulldogs), who are always sworn in as special constables. If occasion arose the proctor could arrest a suspected woman and have her taken to the Spinning House (for which Hobson the carrier had left an endowment); the next day the woman was brought before the vice-chancellor, who had power to commit her to the custody of any two gentlemen residing in the university for not a longer period than three weeks. For this purpose the vice-chancellor sat in camera and the jurisdiction had nothing to do with that of the vice-chancellor's court. In 1898 attention was called to this procedure by the case of a girl named Daisy Hopkins, who was arrested and committed to the Spinning House. Application was made on her behalf to the Queen's Bench Division for a writ of habeas corpus, and when the application came on it appeared that there had been a technical irregularity (the
PRORATION—PRODICUS OF CEOS

PRORATION (Lat. procurre, to take care of), the action of taking care of, hence management, stewardship, agency. The word is applied to the authority or power delegated to a procurator for a test, as well as to the exercise of such authority. It was frequently used specifically in ecclesiastical law to indicate the granting of a formal authority to a bishop, abbot, or other ecclesiastical official to act in the name and place of the person who was absent, whether on account of illness, absence, or other reasons.

PROCURAROR (Lat. procurre, to take care of), generally one who acts for another. The Romans called him a procurator, and frequently also a corrator. The title was applied especially to certain imperial officials in the provinces of the Roman Empire. With the establishment of the imperial power under Augustus, the emperor took under his direct government those of which the condition or situation rendered a large military force necessary. Here certain officials, known as procuratores Caesaris, took the place occupied by the quaestor in the senatorial provinces, and their office was concerned with the interests of the fiscus (the public property of the Caesar). They looked after the taxes and paid the troops. There were also officials bearing a similar title, procuratores Caesaris in the senatorial provinces. They collected certain dues of the fiscus which were independent of those paid to the aerarium (the property of the senate). This organization lasted with some modifications until the 3rd century. The procurator was an important official in the reorganized empire of Diocletian.

The title remained all through the middle ages to describe various officials. It was sometimes applied to a regent acting for a king during his minority or absence; sometimes it appears as an alternative title to seneschal or dapifer. It preserved its legal significance in the title of procurator annigerarum, who acted as solicitor or proxy in the ecclesiastical courts, and was so called because these courts dealt with matters affecting the spiritual interests of the persons concerned. The economical significance remained in such titles as procurator annigerarum, the exactor of dues for the celebration of anniversaries; this office was assigned to laymen. The procurator diaporum was entrusted with the administration of matters pertaining to the art of cloth-making. The procurator duporum was the collector of fines in certain churches from absent canons, &c. The officials entrusted with the administration of the goods of a church were called variously procurator ecclesiae, procurator parisis, procurator universitatis. Bishops and bishops-elect frequently declared themselves by the title of procuratores ecclesiarum. The prior of a dependent religious house was sometimes styled procurator obedientiae. The official who represented the public interests in the courts of the inquisition was known as the procurator fidei. The administrator of the affairs of a large community was sometimes called the procurator syndicus, the administrator of goods left to the poor, procurator pauperum. In monasteries the economus was, and is, sometimes described as procurator. Thus the procurator has still the administration of material affairs in every Domini priory. Procurator di San Marco was a title of honour in the republic of Venice. There were nine official procurators in the city. They were numerous distinguished persons bearing the honorary title.

The term procurator (Fr. procureur) is used in those countries whose codes are based on the Roman civil law for certain officials, having a representative character, in the courts of law. Thus under the ancien régime in France the procureurs du roi were the representative of the Crown in all causes (see France: Law and Institutions); and now the procureurs généraux, and under them the procureurs substitus, procureurs de la république and procureurs still represent the ministère public in the courts. In Scotland the procurator is a law agent, who practises in an inferior court. A procurator in Scotland has been, since the Law Agents Acts 1873, exactly in the same legal position as other law agents. The procurator-fiscal is a local officer charged with the prosecution of crimes. He is appointed by the sheriff. He also performs the duties of an English coroner by holding inquiries into the circumstances of suspicious deaths. A common English form of procurator is proctor (q.v.).

PRODICUS OF CEOS (b. c. 460 or 450 B.C.), a Greek historian of the first period of the Sophistical movement, known as the "procurator of Socrates." He was still living in 390 B.C. He came to Athens as ambassador from Ceos, and became known as a speaker and a teacher. Like Protagoras, he professed to train his pupils for domestic and civic affairs; but it would appear that, while Protagoras's chief instruments of education were rhetoric and style, Prodicus made ethics prominent in his curriculum. In ethics he was a pessimist. Though he disapproved of the civic duties in spite of a frail physique, he emphasized the sorrows of life, and yet he advocated no hopeless resignation, but rather the remedy of work, and took as his model Heracles, the embodiment of virility and activity. The in this view, he was compared also with the shepherd of Hermes. His views on the origin of the belief in the gods are strikingly modern. First came those great powers which benefit mankind (comparing the worship of the Nile), and after these the deified men who have rendered services to humanity. But he was no atheist, for the pantheist Zeno spoke highly of him. Of his natural philosophy we know only the titles of his treatises On Nature and On the Nature of Man. His chief interest is that he sought to give precision to the use of words. Two of his discourses were especially famous; one, On Propriety of Language, is repeatedly alluded to by Plato; the other, entitled "On", contained the celebrated apologue of the Choice of Heracles, of which the Xenophontic Socrates (Mem. ii. 11, 21 sqq.) gives a summary. Themarenes, Euripides and Isocrates are said to have been pupils or hearers of Prodicus. By his immediate successors he was variously estimated: Plato satirizes him in the early dialogues; Aristophanes in the Tartar calls him a "babbling brook"; Aeschines the Sophistic condemns him as a sophist.

See Spengel, Aristum scriptores, pp. 45 sqq.; Welcker, "Prodikos der Vorgänger des Sokrates," in Rheinisches Museum (1853), and Klein Schrœffel, ii. 193; Bursel, De Prodicio Sophista (Leiden, 1846); Cougny, De Prodoco Cieo (Paris, 1858).
PRODIGY—PROFIT-SHARING

PRODIGY, an extraordinary or wonderful thing, person, event, &c.; something which excites amazement and astonishment. The term has been particularly applied to children who display a precocious genius, especially in music. The German expression Wunderkind has of late been often adopted by those who have found the name "infant prodigy" too reminiscent of the "infant phenomenon" familiar to readers of Dickens. The Lat. prodigium, an omen, portent, and abnormal or monstrous event, is probably not to be derived from pro and dicere, to foretell, prophesy, but rather, on the analogy of adagium, adage, aphorism, from pro (prost before a vowel), and the root of aie, I say.

PRODUCTION (Lat. productionem, from producere, to produce), in general, the act of producing, or bringing forth. Production, in contrast with distribution and consumption, is one of the great divisions which all treatises on economics make in describing the economy of a country. Etymologically the term implies ‘to draw on’ or ‘to draw out.’ It is found in every text-book and its elements and processes dealt with at length. J. R. McCulloch's definition may be given as one difficult to improve on: "by production, in the science of political economy, we are not to understand the production of matter, for that is the exclusive attribute of Omnipotence, but the production of utility, and consequently of exchangeable value, by appropriating and modifying matter already in existence, so as to fit it to satisfy our wants, and to contribute to our enjoyments." W. S. Jevons says, "production is one of the very few happily chosen terms which the economist possesses. Etymologically the term implies 'to draw out,' which is found in every text-book and in every text-book..."

The French profiteri also gave English "purli," to embroider the edge of a fabric with gold or other thread; this was further corrupted to "purl," now often wrongly spelt 'pearl,' an inverted stitch in knitting.

PROFIT-SHARING (i.e. between employer and employed), a method of remunerating labour, under which the employees receive, in addition to ordinary wages, a share of the profit which the business realizes. The term is not infrequently used loosely to include many forms of addition to ordinary wages, such as bonus on output or quality, gain-sharing and product-sharing. Yet strictly, where an employee or a group works for a share of the product, or is paid so much in addition to ordinary wages in proportion as the product exceeds a certain quantity, or the quality exceeds a certain standard, in neither of these cases have we profit-sharing, for the net result of the business may be a large profit or a small one or a loss, and the employee's claim is unaffected. In the same way if a workman is employed on the basis that if in doing a particular job he saves something out of a stipulated time of labour, or a stipulated amount of materials, he shall receive in addition to ordinary wages a proportion of the value so saved, that is technically gain-sharing, not profit-sharing. Even where the bonus depends strictly on profit, it is not reckoned as profit-sharing, if it is confined to the leading employees.

An agreement is of the essence of the matter. It is not profit-sharing where an employer takes something from his profits at his own will and pleasure, and gives it to his employees. Strictly such gifts in cash are gratuities, while, when they take other forms, such as better houses, libraries, recreation rooms, provision for sickness and old age, all given at the will of the employer, we have paternalism. Such benefits thus taken expressly from profits and varying more or less with the amount of profit certainly approach true profit-sharing: they are sometimes called "indeterminate" profit-sharing. Though many of the above methods of remunerating, or benefiting, the employed are from time to time included under profit-sharing even by writers of repute, the strict sense of the term was defined by the international congress on profit-sharing in 1889 as "an agreement freely entered into by which the employed receives a share of profits determined in advance." It does not follow that the agreement must be actually enforceable at law; some employers to protect themselves from litigation stipulate that it shall not be.

Profit-sharing, in the loose sense, must be of untold antiquity; the first great example of profit-sharing in the strict sense is that of the Parisian house-painter, Edme-Jean Leclaire, "The Father of Profit-Sharing." In 1842 he was employing 300 men
on day wages. By greater zeal and intelligence and less waste, not necessarily by harder work, he reckoned they could save £3,000 a year; and he made it their interest to do so by arranging that they should receive the greater part of the saving themselves. This arrangement proved a very great success; the material gain to the men and the improvement in their morale were marked; and Leclaire, who began life with nothing and died worth £15,000, always maintained that, without the zeal drawn out in his men by profit-sharing, he never could have made so large a business or gained so much wealth. In 1905 the system was still in active operation in the firm. Its main features are as follows: after paying 5% interest on the capital, and small sums as wages of superintendence to the two managing partners, the remaining profit is divided into four parts, one of which goes to the managing partners, one to the Mutual Aid Society, and the remaining half to the employees as a dividend on their ordinary wages, exclusive of piece-work and overtime, on which no dividend is paid. The Mutual Aid Society is a registered body, and is a limited partner in the firm, the liability of the two managing partners being unlimited and the control resting entirely in their hands. The benefits of the Mutual Aid Society, and of the profit-sharing generally, are enjoyed in the main by all the employees of the business, but certain advantages are confined to a limited number of permanent employees.

Leclaire's system attracted the marked interest of John Stuart Mill and other English economists, and in 1865-1867 a number of experiments in profit-sharing, or as it was then called, industrial partnership, were made in England, the most notable being that of Henry Briggs, Son & Co., at their collieries in Yorkshire. The main object in this case was to detach the workmen from the trade union and attach them to the firm. In other ways the experiment was very successful, and £40,000 was divided as bonus on wages in nine years, but the main object was not attained; and when the price of coal fell heavily after the inflation of 1873 Briggs's men joined the strike to resist a reduction of wages, and the experiment came to an end. The present extent of profit-sharing, though in itself considerable, is but small in comparison with the vast extent of the world's commerce and industry, and except in one of its developments, co-partnership, it can hardly be said to be making progress. In 1906 there were in the United Kingdom and its colonies 65 ordinary firms practising profit-sharing in its strictest sense, and 17 others known to have adopted and not known to have discontinued it, making 82 in all as against 92 in 1901, and 101 in 1894. On the other hand the number of employees had grown from 28,000 in 1894 to 48,000 in 1906. In addition about one-fourth of the workmen's co-operative societies in Great Britain (see Co-operation) practise profit-sharing with perhaps 30,000 employees. In 1894 it was found that there were more profit-sharing firms in the British Empire than in any other country, and this is probably still true. The only rival is France, where, however, the term “participation aux bénéfices ” is used in a wider sense. There are also important examples in Germany, the United States, Switzerland (where the state once applied the system in the postal service, and still does in the telegraphs), in Holland, in the socialist co-operative societies of Belgium, and elsewhere.

Profit-sharing has been quickly abandoned in many instances, for various reasons; there were no profits to divide; the small bonus given seemed to have no effect; the hope of detaching the men from the trade union, or of controlling them, was not realized; or the business passed into unsympathetic hands. On the other hand, one lasting success in such a matter proves more than many short experiments which failed; and profit-sharing has been splendidly successful where some high-minded man has breathed into it the spirit of partnership. Often it has been a step to actual partnership; the workman has not only received a share of profit, as added remuneration of his labour, but been led on to invest in the capital of the business, and as a shareholder, to take his share of the profits paid on capital, as well as of responsibility, of loss if any, and of control. This system of profit-sharing plus shareholding is now known as co-partnership (see Co-operation), and is making undoubted progress. It is exemplified in nearly all profit-sharing co-operative societies, and in a growing number of businesses of non-co-operative origin which accumulate part or the whole of the annual profit in “diagram,” “telegraph,” or “emileist” funds, and distribute the whole capital of £200,000 belonged to the workers and a few retired workers, in Leclaire's old business the Mutual Aid Fund owned half, in the Laroche-Joubert paper-works the employees owned more than two-thirds. In the South Metropolitan Gas Co. the employees owned £327,000 and elected three of the nine directors. It would seem to be in this direction, as a step to full partnership, that profit-sharing has a great future before it.

BIBLIOGRAPHY.—A large number of works are noted in the International Co-operative Movement (London, 1891; Report of the International Co-operative Alliance). The following may be specially mentioned: Sedley Taylor, Profit-sharing between Capital and Labour (London, 1884; New York, 1886); N. P. Gilman, Profit-sharing between Employer and Employee (London and New York, 1892); and N. P. Gilman, A Dividend to Labour (London and Boston, 1900); Board of Trade Reports by D. F. Schloss, on Profit-sharing (London, 1894; with yearly addenda in the Labour Gazette); D. F. Schloss, The Co-partnership (London, 1897); D. F. Schloss, A Manual of Remuneration (London, 1894); Victor Bühmert, Die Gewinnbeteiligung (Leipzig, 1878, and Dresden 1903); Publications of the Société pour l'étude de la participation (Paris, 1879 and onwards); Albert Thomet, Guide pratique de la participation (Paris, 1898); and the International Co-operative Alliance publications, especially Report of the Fifth Congress (London, 1902); Labour Co-partnership Association Reports and Publications (London, 1883, and onwards).

PROGNATHISM (Gr. πρό, forward, and γναθός, jaw), the term applied by ethnologists, with its opposite Orthognathism (Gr. ὀρθός, straight), to describe the varying degrees of projection of the upper jaw, which itself is determined by the angle made by the whole face with the brain-cap. Eurygnathism (εὐρύς, wide), is the lateral projection of jawbones so characteristic of the Mongolic races. (See CRANIOMETRY.)

PROGNOSIS (Gr. προγνοσις, knowledge of recognition beforehand, from προγνωστικός, to know beforehand, cf. "prognostication," prediction), a term used in modern medicine, as it was in Greek, for an opinion, forecast or decision as to the probable course, duration and termination of a case of disease. It is to be distinguished from "diagnosis" (Gr. διάγνωσις, διαγνώσκει to distinguish), the determination or identification of a disease in a particular case from an investigation of its history and symptoms.

PROGRAME, or Program, in its original use, following that of Gr. πρόγραμμα, a public notice (προγράφειν, to make public by writing), now chiefly in the sense of a printed notice containing the items of a musical concert, with the names of the pieces to be performed, the composers and the performers, or of a theatrical performance, with the characters, acts, scenes, &c. In a wider sense the word is used of a syllabus or scheme of study, order of proceedings or the like, or of a catalogue or schedule containing the chief points in a course of action, and so, politically, in the sense of a list of the principal objects on which a party proposes to base its legislative course of action, as in the "New English Dictionary" of 1891, drawn up by the Liberal Federation. The spelling "program," now general in America, was that first in use in England, and so continued till the French form "programme" was adopted at the beginning of the 19th century. The New English Dictionary considers the earlier and modern American spelling preferable; on the etymology of the word with Gr. πρόγραμμα and the like, Scott and Carlyle always used "program".

PROGRAMME MUSIC, a musical nickname which has passed into academic currency, denoting instrumental music without words but descriptive of non-musical ideas. Musical sounds lend themselves to descriptive purposes with an ease which is often uncontrollable. A chromatic scale may suggest the whistling of the wind or the cries of cats; reiterated staccato notes may suggest many things, from raindrops to the cackling of hens. Again, though music cannot directly imitate anything
in nature except sounds, it has a range of contrast and a power of climax that is profoundly emotional in effect; and the emotions it calls up may resemble those of some dramatic story, or those prompted by the contemplation of nature. But chromatic scales, reiterated notes, emotional contrasts and climaxes, are also perfectly normal musical means of expression; and the attempts to read non-musical meanings into them are often merely annoying to composers who have thought only of the music. Some distinguished writers on music have found a difficulty in admitting the possibility of emotional contrasts and climaxes in an art without an external subject-matter. But it is impossible to study the history of music without coming to the conclusion that in all mature periods music has been self-sufficient to this extent, that, whatever stimulus it may receive from the surroundings of the time, and however much of these ideas it may have embodied in its structure, nothing has survived as a permanently intelligible classic that has not been musically coherent to a degree which seems to drive the subject-matter into the background, even in cases where that subject-matter is naturally present, as in songs, choral works and operas. In short, since sound as it occurs in nature is not sufficiently highly organized to form the raw material for art, there is no natural tendency in music to include, as a “subject,” any item conceivable apart from its artistic embodiment. Explicit program music has thus never been a thing of cardinal importance, either in the transitional periods in which it has been most prominent, or in the permanent music of the classical style.

At the same time, artistic creation is not a thing that can be governed by any a priori metaphysical theory; and no great artist has been so ascetic as always to resist the inclination to act on the external ideas that impress him. No composer writes important music for the voice without words; for speech is too ancient a function of the human voice to be ousted by any a priori theory of art; and no really artistic composer, handling a living art-form, has failed to be influenced, sooner or later, by the words which he sets. It matters little if these words be in themselves very poor, for even false sentiment must make some appeal to true experience, and the great composers are quicker to seize the truth than to criticize its verbal presentation or to suspect insincerity. The earliest mature musical art was, then, inevitably descriptive, since it was vocal. So incessant is the minute onomatopoeia of 16th-century music, both in the genuine form of sound-painting (Trommeleri) and in the spurious forms to which composers were led by the appearance of notes on paper (e.g. quick notes representing “darkness” because they are printed black) that there is hardly a page in the productions of the “golden age” of music which has not its literary aspect. Programme music, then, may be expected to derive many of its characteristics from ancient times; but it cannot properly be said to exist until the rise of instrumental music, for not until then could music be based upon external ideas that did not arise inevitably from the use of words or dramatic action.

The resources of the modern orchestra have enabled recent composers to attain a realism which makes that of earlier descriptive music appear ridiculous; but there is little to choose between classics and moderns in the intellectual childishness of such realism. Thunderstorms, bird-songs and pastoral effects galore have been imitated by musicians great and small from the days of the Fitzwilliam Virginal Book to those of the epoch of the flock of sheep in Stamitz’s Don Quixote. And, while the progress in realism has been so immense that the only step which remains is to drive a real flock of sheep across the concert-platform, the musical progress implied thereby has been that from inexpensive to expensive rubbish. What is really important, in the programme music of Strauss no less than that of the classics, is the representation of characters and feelings. In this respect the classical record is of high interest, though the greatest composers have contributed but little to it. Thus the Nine Sonatas of J. Kuhnau (published in 1700) and Bach’s early Capriccio on the Departure of a Beloved Brother, which is closely modelled on Kuhnau’s programme music, show very markedly the tendency on the one hand to illustrate characters and feelings, and on the other hand to extract from their programmes every ordinary sort of incidental music if the stories were presented as dramas. Thus, though Kuhnau in his naïve explanatory preface to his first Bible sonata seems to be trying, like a child, to frighten himself into a fit by describing the size and appearance of Goliath, in the music it is only le bravate of Goliath that are portrayed. Thus the best movement in the Goliath sonata is a figured chorale (Aus tiefer Not schreie ich zu Dir) representing the terror and prayers of the Israelites. And thus the subjects of the other sonatas (Saul cured by David’s music; The Marriage of Jacob; Hezekiah; Gideon; and The Funeral of Jacob) are in various quaint ways musical because ethical; though Kuhnau’s conceptions are far better than his execution. In the same way Bach makes his Capriccio descriptive of the feelings of the anxious and sorrowing friends of the departing brother, and his utmost realism takes the form of a lively fugue, very much in Kuhnau’s best style, on the themes of the position’s coacchhorn and cracking whip. Even Buxtehude’s musical illustrations of the “nature and characters of the planets” are probably not the absurdities they have been hastily taken for by writers to whom their title seems nonsensical; for Buxtehude would, of course, take an astrological rather than an astronomical view of the subject, and so the planets would represent temperaments, and their motions the music of the spheres.

Nearly all the harpsichord pieces of Couperin have fantastic titles, and a few of them are descriptive music. His greater contemporary and survivor, Rameau, was an opera composer of real importance, whose harpsichord music contains much that is ingeniously descriptive. La Poule, with its theme inscribed “co-co-co-co-co-co-cocodî,” is one of the best harpsichord pieces outside Bach, and is also one of the most minutely realistic compositions ever written. French music has always been remarkably dependent on external stimulus, and nearly all its classics are either programme music or operas. And the extent to which Rameau’s jokes may be regarded as typically French is indicated by the fact that Haydn apologized for his imitation of frogs in The Seasons, saying that this “fränzische Quark” had been forced on him by a friend. But throughout the growth of the sonata style, not excepting Haydn’s own early work, the tendency towards gratuitously descriptive music is very prominent; and the symphonies of Dittersdorf on the Metamorphoses of Ovid are excellent examples of the way in which external ideas may suggest much that is valuable to a musician who struggles with new forms, while at the same time they may serve to distract attention from points in which his designs break down. (See SYMPHONIC FORM.) Strict accuracy would forbid us to include our survey such descriptive music as comes in operatic overtures or other pieces in which the programme is really necessitated by the conditions of the art; but the line cannot be so drawn without cutting off much that is essential. From the time of Gluck onwards there was a natural and steady growth in the descriptive powers of operatic music, which could not fail to react upon purely instrumental music; but of programme music for its own sake we may say there is no first-rate classic on a large scale before Beethoven, though Beethoven himself could no more surpass Haydn in illustrating an oratorio text (as in the magnificent opening of The Creation) than Haydn could surpass Handel. Mozart’s Musikalischer Spass is a solitary example of a special branch of descriptive music; a burlesque of incompetent performers and incompetent composers. The lifelike absurdity of the themes with their caricature of classical formulas; the irresistible processes by which the “hollers” in composition seem to arrive as by natural laws, further complicated by the equally natural laws of the howlers in performance; and the unfailing atmosphere of good nature with which Mozart satirizes, among other things, his own style; all combine to make this work very interesting on paper. The effect in performance is astonishing; so exactly, or rather so ideally, is the squalid effect of bad structure and performance kept at a
constant level of comic interest. (In the Leipzig edition of the print of this work the modern editor has added a new and worthy act to Mozart's glorious farce by correcting and questioning many of the mistakes!) Mozart's burlesque has remained unapproached, even in dramatic music. Compared with it, Wagner's portrait of Beckmesser in Die Meistersinger seems embittered in conception and disappointing in comic effect. Mendelssohn is said to have had a splendid faculty for ex-temporizing similar musical jokes. His Funeral March of Pyramus and Thisbe in the Midsummer Night's Dream, and Cornelius's operatic trio in which three persons conjugate the verb Ich sterbe den Tod des Verräters, are among the few examples of a burlesque in which there is never enough to make a joke effective. Such burlesques have their bearing on programme music, in so far as they involve the musical portrayal of character and give opportunity for masterly studies of the psychology of failure. Their threat is thus as far as they play a large part in the recent development of the symphonic poem by Richard Strauss, whose instrumental works avowedly illustrate his cheerfully pessimistic views on art and life. But into the main classics of programme music this kind of characterization hardly enters at all.

Beethoven was three times moved to ascribe some of his profoundest music to an external source. In May he is reported that the Eroica Symphony, he did not really produce anything that can fairly be called programme music. Napoleon, before he became emperor, was his ideal hero; and a triumphant symphony, on a gigantic scale and covering the widest range of emotion expressible by music, seemed to him a tribute due to the liberator of Europe; until the liberator became the tyrant. That the slow movement should be a funeral march was, in relation to the heroic tone of the work, as natural as that a symphony should have a slow movement at all. There is no reason in music why the idea of heroic death and mourning should be the end of the representation of heroic ideals. Hence it is incomprehensible that Beethoven, on the ironical opening of the scherzo, the label of the fickle crowd that soon forgets its hero; and the criticism which regards the finale as "an inappropriate concession to sonata form" may be dismissed as merely unmusical without therefore being literary. Beethoven's next work inspired from without was the Pastoral Symphony; and there he records his theory of programme music on the title-page, by calling it "rather the expression of feeling than tone-painting." There is not a bar of the Pastoral Symphony that would be otherwise if its "programme" had never been thought of either by Beethoven or by earlier composers. The nightingale, cuckoo and quail have exactly the same function in the coda of the slow movement as dozens of similar non-thematic episodes at the close of other slow movements (e.g. in the violin sonata Op. 24, and the pianoforte sonata in D minor). The "merry meeting of country folk" is a subject that lends itself admirably to Beethoven's form of scherzo (q.v.); and the thunderstorm, which interrupts the last repetition of this scherzo, and forms an introduction to the finale, is none the less purely musical for being, like several of Beethoven's inventions, without any formal parallel in other works. Beethoven's Battle Symphony is a clever pot-boiler, which, like most musical representations of such unhappy things as battles, may be disregarded in the study of serious programme music. His third great example is the sonata Les Adieux, l'abscence et le retour. Here, again, we have a monument of pure sonata form; and, whatever light may be thrown upon the musical interpretation of the work by a knowledge of the relation between Beethoven and his friend and patron the Archduke Rudolph and the circumstances of the archduke's departure from Vienna during the Napoleonic wars, far more light may be thrown upon Beethoven's feelings by the study of the music in itself. This ought obvously to be true of all successful programme music; the music ought to illustrate the programme, but we ought not to need to leap or guess at quantities of extraneous information in order to understand the music. No doubt much ingenuity may be spent in tracing external details (the end of the first move-
degrees of conviviality returning home from the ball? The whole design is notoriously full of similar incongruities, of which these are the more significant for being the most plausible. There is hardly a single work of Berlioz, except the Harold symphony and the Symphonie fantastique, in which the determination to write programme music does not frequently yield to the impulse to make singers get up and explain in words what it is all about. The climax of absurdity is in the Symphonie funèbre et triomphale, written for the inauguration of the Bastille Column, and scored for an enormous military band and chorus. The first movement is a funeral march, and is not only one of Berlioz's finest pieces, but probably the greatest work ever written for a military band. The Apotheosis chorus is in the form of a triumphant march. Because the occasion was one on which there would be plenty of real speeches, Berlioz must needs write a connecting link called Oraison funèbre, consisting of a sermon delivered by a solo trombone; presumably for use in later performances. His naïve Gesamtkonzept genius prefers this to the use of the chorus!

Current modern criticism demands plausibility, though it cares little for intellectual soundness: and while practically the whole of Liszt's work is professedly programme music (where it is not actually vocal) and, though there is much in it which is incomplete without external explanation, Liszt is far too "modern" to betray himself into obvious confusion between different planes of musical realism and the artform. For example, style, Liszt's symphonic poems are remarkable steps towards the attainment of a kind of instrumental music which, whether its form is dictated by a programme or not, is at any rate not that of the classical symphony. The programmes of Liszt's works have not always, perhaps not often, produced a living musical form; a form, that is, in which the rhythms and proportions are neither stiff nor nebulous. Both in breadth of design and in organization and flow, the works of Richard Strauss are as great an advance on Liszt as they are more complex in musical, realistic and autobiographical content. Being, with the exception of the later French symphonic developments, incomparably the most important works orientating the present state of musical transition, they have given rise to endless discussions as to the legitimacy of programme music. Such discussions are mere windmilling unless it is constantly borne in mind that no artist who has anything of his own to say will ever be prevented from saying it, in the best art-forms attainable in his day, by any scruples as to whether the antecedents of his art-forms are legitimate or not. There is only one thing that is artistically legitimate, and that is a perfect work of art. And the only thing demonstrably prejudicial to such legitimacy in a piece of programme music is that even the most cultured of musicians generally understand forms of a triumphant march, and understand anything else, while the greatest musicians know more of their art than is dreamt of in general culture. (D. F. T.)

**PROHIBITION** (Lat. prohibere, to prevent), a term meaning the action of forbidding or preventing by an order, decree, &c. The word is particularly applied to the forbidding by law of the sale and manufacture of intoxicating liquors (see LIQUOR LAWS and TEMPERANCE). In law, as defined by Blackstone, prohibition is "a writ directed to the judge and parties of a suit in any inferior court, commanding them to cease from the prosecution thereof, upon a surmise either that the cause originate or arise from illegal matter arising therein does not belong to that jurisdiction, but to the cognizance of some other court." A writ of prohibition is a prerogative writ—that is to say, it does not issue as of course, but is granted only on proper grounds being shown. Before the Judicature Acts prohibition was granted by one of the superior courts at Westminster; it also issued in certain cases from the court of chancery. It is now granted by the High Court of Justice. Up to 1873 the high court of admiralty was for the purposes of prohibition an inferior court. But now by the Judicature Act 1873, s. 24, it is provided that no proceeding in the High Court of Justice or the court of appeal shall be restrained by prohibition, a stay of proceedings taking its place where necessary. The admiralty division being now one of the divisions of the High Court can therefore no longer be restrained by prohibition. The courts to which it has most frequently issued are the ecclesiastical courts, and county and other local courts, such as the lord mayor's court of London, the court of passage of the city of Liverpool and the court of record of the hundred of Salford. In the case of courts of quarter sessions, the same result is generally obtained by certiorari (see Writ). The extent to which the ecclesiastical courts were restrainable by prohibition led to continual disputes for centuries between the civil and the ecclesiastical authorities. Attempts were made at different times to define the scope of the writ, the most conspicuous instances being the statute Circum specie Agatis, 13 Edw. I. st. 4; the Articuli dier, 9 Edw. II. st. 1; and the later Articuli dier of 13 Jac. I., consisting of the claims asserted by Archbishop Bancroft and the reply of the judges. The law seems to be undoubtedly that the spiritual court acting in spiritual matters pro salute animae cannot be restrained. The difficulties arise in the application of the principle to individual cases.

Prohibition lies either before or after judgment. In order that proceedings should be restrained after judgment it is necessary that want of jurisdiction in the inferior court should appear upon the face of the proceedings, that the party seeking the prohibition should have taken his objection in the inferior court, or that he was in ignorance of a material fact. A prohibition was granted before judgment, as if an ecclesiastical court were to try a claim by prescription to a pew, or for transgression of clear laws of procedure, as if such a court were to require two witnesses to prove a payment of tithes. It will not as a rule be awarded on a matter of practice. The remedy in such a case is appeal. Nor will it go, unless in exceptional cases, at the instance of a stranger to the suit. The procedure in prohibition is partly common law, partly statutory. Application for a prohibition is usually made ex parte to a judge in chambers on affidavit. The application may be granted or refused. If granted, a rule to show cause why a writ of prohibition should not issue goes to the inferior judge and the other party. In prohibition to courts other than county courts proceedings in prohibition may be ordered. These pleadings are as far as possible assimilated to pleadings in actions. They are rare in practice, and are only ordered in cases of great difficulty and importance.

Much learning on the subject of prohibition will be found in the opinion of Mr Justice Wills delivered to the House of Lords in The Mayor and Aldermen of London v. Cox (1867, L.R. 2 Eng. and Ir. Appeals, 239).

In Scots law prohibition is not used in the English sense. The same result is obtained by suspension or reduction. In the United States the Supreme Court has power to issue a prohibition to the district courts when proceeding as courts of admiralty and maritime jurisdiction. Most of the states have also their own law upon the subject, generally giving power to the supreme judicial authority in the state to prohibit courts of inferior jurisdiction.

**PROJECTION**, in mathematics. If from a fixed point S in space lines or rays be drawn to different points A, B, C, . . . in space, and if these rays are cut by a plane in points A', B', C', . . . the latter are called the projections of the given points on the plane. Instead of the plane another surface may be taken, and then the points are projected to that surface instead of to a plane. In this manner any figure, plane or in space of three dimensions, may be projected to any surface from any point which is called the centre of projection. If the figure projected is in three dimensions then this projection is the same as that used in what is generally known as perspective (g.v.).

In modern mathematics the word projection is often taken with a slightly different meaning, supposing that plane figures are projected into plane figures, but three-dimensional ones into three-dimensional figures. Projection in this sense, when treated by co-ordinate geometry, leads in its algebraical aspect to the theory of linear substitution and hence to the theory of invariants and co-variants (see ALGEBRAIC FORMS).

In this article projection will be treated from a purely geometrical point of view. References like (G. § 87) relate to the article GEOMETRY, § Projective, in vol. xi.
§ 1. Projection of Plane Figures.—Let us suppose we have in space two planes \( \pi \) and \( \pi' \). In the plane \( \pi \) \( a \) figure is given having known properties; then we have the problem to find its projection from the plane \( \pi' \) and to deduce from the known properties of the given figure the properties of the new one.

If a point \( A \) is given in the plane \( \pi \) we have to join it to the corresponding point \( A' \) in the plane \( \pi' \) and to draw the line \( AA' \) cuts the plane \( \pi' \); it is the projection of \( A \). On the other hand if \( A' \) is given in the plane \( \pi' \), then \( A \) will be its projection in \( \pi \). Hence if one figure in \( \pi' \) is the projection of another in \( \pi \), then conversely the latter is the projection of the former.

A point and its projection are therefore also called corresponding points, and similarly we speak of corresponding lines and curves, etc.

§ 2. We at once get the following properties:

The projection of a point only.

The projection of a line (straight line) is a line; for all points in a line are projected by rays which lie in the plane determined by \( S \) and the line, and this plane cuts the plane \( \pi' \) in a line which is the point of intersection of the given line.

If a point lies in a line its projection lies in the projection of the line.

The projection of the line joining two points \( A, B \) is the line which joins the projections \( A', B' \) of the points \( A, B \). For the projecting plane of the line \( AB \) contains the rays \( SA, SB \) which project the points \( A, B \).

The projection of the point of intersection of two lines \( a, b \) is the point of intersection of the projections \( a', b' \) of those lines.

Similarly we get—

The projection of a curve is a curve.

The projection of a point of intersection of two curves are the points of intersection of the projections of the given curves.

If a line cuts a curve in \( n \) points, then the projection of the line cuts the projection of the curve in \( n \) points.

The order of a curve remains unaltered by projection.

The projection of a tangent to a curve is a tangent to the projection of the curve. For the tangent is a line which has two coincident points in common with a curve.

The number of tangents that can be drawn from a point to a curve remains unaltered by projection. Or—

The class of a curve remains unaltered by projection.

§ 3. Project points of which one or a projection of the other obtained in the manner described may be moved out of the position in which they are obtained. They are then still said to be one the projection of the other, or to be projective or homographic. But when two points originally considered are said to be in perspective position, or (shorter) to be perspective.

All the properties stated in §§ 1, 2 hold for figures which are projective, whether they are perspective or not. There are others which hold only for projective figures when they are in perspective position, which we shall now consider.

If two planes \( \pi \) and \( \pi' \) are perspective, then their line of intersection \( \sigma \) and any point in this line coincides with its projection. Hence—

All points in the axis are their own projections. Hence also—

Every line meets its projection on the axis.

The line \( \sigma \) is the line of intersection of the corresponding lines all pass through a common point, that any pair of corresponding points and the centre in a line, is also expressed by saying that the figures are co-linear or co-polar; and the fact that both figures have common centre is indicated by expressing by saying that the figures are co-axial.

The connexion between these properties has to be investigated.

For this purpose we consider in the plane \( \pi \) a triangle \( ABC \), and let the lines \( BC, CA, AB \) be denoted by \( a, b, c \). The projection will consist of three points \( A', B', C' \) and three lines \( a', b', c' \). These have such a position that the lines \( AA', BB', CC' \) meet in a point, viz. at \( S \), and the points of intersection of \( a, b, c \) and \( a', b', c' \) lie on the axis (by § 2). The two triangles therefore are said to be both co-linear and co-axial. Of these properties either is a consequence of the other, as will now be proved.

If two triangles, whether in the same plane or not, are co-linear they are co-axial. Or—

If the lines \( AA', BB', CC' \) joining the vertices of two triangles meet in a point, then the intersections of the sides \( BC, BC', PA \) and \( CA, CA', AB \) are also points in the same line. Conversely.

If two triangles are co-axial they are co-linear. Or—

If the intersections of the sides of two triangles \( ABC \) and \( A'B'C' \), viz. at \( A, B, C \) and \( A', B', C' \), and the lines \( AB \) and \( A'B' \) be in a plane, then the lines \( AA', BB', CC' \) meet in a point.

Proof.—Let us first suppose the triangles to be in different places. By supposition the lines \( AA', BB', CC' \) (fig. 1) meet in a point \( S \). Join the intersections of the three planes, \( SBC, SCA \) and \( SAB \). In the first lie the points \( B, C \) and also \( B', C' \). Hence the lines \( BC, BC' \) will intersect at some point \( R \), because any two lines in the same plane intersect. Similarly \( CA \) and \( CA' \) will intersect at some point \( S \), and \( AB, A'B' \) at some point \( R \). These points \( P, Q, R \), i.e. the line in the plane of the triangle \( ABC \) because they are points on the sides of this triangle, and similarly in the plane of the triangle \( A'B'C' \). Hence they lie in the intersection of two planes—that is, in a line. This line \((PQR)\) in fig. 1) is called the axis of perspective or homology, and the intersection of \( AA', BB', CC' \), i.e. \( S \) in the figure, the centre of perspective.

1. Secondly, if the triangle \( A'B'C' \) lies both in the plane \( \pi \) above proof does not hold. In this case we may consider the plane figure in the projection of the figure in space in which we have just proved the theorem. Let \( ABC, A'B'C' \) be the co-linear triangles of the former. Then, so that \( AA', BB', CC' \) meet at \( S \). Take now any point in plane, say your eye \( E \), and to draw the lines \( AE, EB, EC \) from it to the points of intersection of the line. In the line ES take any point \( S \), and in \( EA, EB, EC \) take points \( A, B, C \), respectively, so that \( SC \neq 0 \). Then \( A, B, C \) are not in a plane. In the plane \( ESA \) which projects the line \( SA \) in \( E \), then the line, and also \( EA; \) these will therefore meet in a point \( A', \) of which \( A' \) will be the projection. Similarly points \( B', C' \) are found. Hence we now in space two triangles \( ABC, A'B'C' \) and \( AA', BB', CC' \) in \( E \) which are co-linear. They are therefore co-axial, that is, the points \( P, Q, R \), where \( AB, BC \), meet will lie in a line. Their projections therefore lie in a line. But these are the points \( P, Q, R \), which were to be proved to lie in a line.

This proves the first part of the theorem. The second part or converse theorem is proved in exactly the same way. For another proof see (G, § 67).

§ 5. By aid of this theorem we can now prove a fundamental property of two projective planes.

Let \( \lambda \) be the axis, \( S \) the centre, and let \( A, A', B, B' \) be two pairs of corresponding points which we suppose fixed, and \( C, C' \) any other pair of corresponding points. Then the triangles \( ABC \) and \( A'B'C' \) are co-axial, and the centre will be the point \( S' \) where \( AA' \) meets \( BB' \). Hence the line joining any pair of corresponding points \( C, C' \) will pass through the centre \( S' \). The figures are therefore perspective. This will remain true if the axis \( \lambda \) is turned till they coincide, because Desargue's theorem remains true.

If two planes are perspective, then if the one plane be turned about the axis through any angle, especially if the one plane be turned till it coincides with the other, the two planes will remain perspective; corresponding lines will still meet on a line called the axis, and the lines joining corresponding points will still pass through a common centre in the axis, which is the centre of projection. To project a point \( A \) in \( \pi \) we join \( A \) to \( S \) and see where this line cuts \( \pi' \). This gives the point \( A' \). But if we draw through this line any line parallel to \( \pi' \), then this line will cut \( \pi' \) in some point \( j' \), and if all lines through \( S \) be drawn which are parallel to \( \pi' \) these will form a plane parallel to \( \pi' \) which will cut the plane \( \pi' \) in a line \( j' \) parallel to the axis \( S \). If we say that a line parallel to a plane cuts the latter at an infinite distance, we may say that three points \( j, j', j'' \) which are co-linear at an infinite distance in \( \pi \) are projected into points \( j, j', j'' \) in the plane \( \pi' \) which lie in a straight line, because their projections lie in a line. Thus we again led to consider points at infinity in a plane as lying in a line (cf. G, §§ 2-4).

Similarly there is a line \( j \) in \( \pi \) which is projected to infinity in \( \pi' \). This projection will be denoted by \( f' \) so that \( e \) and \( f \) are lines at infinity.

§ 7. If we suppose through \( S \) a plane drawn perpendicular to the axis \( \pi \) cutting it at \( T \), and in this plane the lines \( ST, \pi' \) parallel to \( \pi \) and \( SJ \) parallel to \( \pi' \), the lines through \( T \) and \( f' \)
parallel to the axis will be the lines \( i' \) and \( j \). At the same time
a parallelogram \( SJT'IS' \) has been formed. If now the plane \( \pi' \) be
turned about the axis \( A' \), then the points \( I, J, i, j \) will remain
fixed, and \( S \) describes a circle about \( J \) as centre and \( TJ \) as radius.
This proves the last part of the theorem in § 5.

§ 6. The plane \( \pi' \) may be turned either in the sense indicated
by the arrow at \( Z \) or in the opposite sense till \( \pi' \) falls into \( \pi \).
In the first case we get a figure like fig. 3; \( i' \) and \( j \) will be on the same
side of the axis, and on this side will also lie the centre \( S \);
and

\[ ST = SJ + SJ' \quad \text{or} \quad SI = JT, \quad SJ = JT'. \]

In the second case (fig. 4) \( i' \) and \( j \) will be on opposite sides of the axis, and the centre
\( S \) will lie between the points \( I \) and \( J \), but not in their planes; hence the
lengths \( TJ \) and \( TJ' \), and therefore also \( SJ \) and \( SJ' \), will not change.
If the plane \( \pi \) is kept fixed in space the point \( J \) will remain fixed, and \( S \) describes a circle about \( J \) as centre and \( ST \) as radius. This proves the last part of the theorem
in § 5.

§ 7. The plane \( \pi' \) may be turned in the sense indicated
by the arrow at \( Z \) or in the opposite sense till \( \pi' \) falls into \( \pi \). In the first case
we get a figure like fig. 3; \( i' \) and \( j \) will be on the same
side of the axis, and on this side will also lie the centre \( S \);
and

\[ ST = SJ + SJ', \quad SJ = JT \quad \text{and} \quad SJ = JT'. \]

In the second case (fig. 4) \( i' \) and \( j \) will be on opposite sides of the axis, and the centre
\( S \) will lie between the points \( I \) and \( J \), but not in their planes; hence the
lengths \( TJ \) and \( TJ' \), and therefore also \( SJ \) and \( SJ' \), will not change.
If the plane \( \pi \) is kept fixed in space the point \( J \) will remain fixed, and \( S \) describes a circle about \( J \) as centre and \( ST \) as radius. This proves the last part of the theorem
in § 5.

§ 8. We shall now suppose that the two projective planes \( \pi, \pi' \)
are perspective and have been made to coincide.
If the plane \( \pi, \pi' \) are perspective and have been made to coincide.

Proof.—If \( A \) and \( A' \) (fig. 1) be given corresponding points, it
has to be shown that we can find to every other point \( B \) the corresponding
point \( B' \). Join \( AB \) to cut the axis in \( R \). Join \( RA' \); then \( B' \) will lie
on this line. But it must also lie on the line \( SB' \) where both meet is \( B' \).
That the figures thus obtained are really projective can be seen by aid of the theorem of § 4. For, if for
any point \( C \) the corresponding point \( C' \) be found, then the triangles
\( ABC \) and \( A'BC' \) are, by construction, co-linear, hence co-sxxal;
and \( S \) will be the axis, because \( AB \) and \( AC \) meet their corresponding
lines \( AB' \) and \( AC' \) on it. \( BC \) and \( B'C' \) therefore also meet on it.
If on the other hand \( a, a' \) are given corresponding lines, then
any line through \( S \) will cut them in corresponding points \( A, A' \)
which may be used as above.

§ 10. Rows and pencils which are projective or perspective have
been considered in the article GEOMETRY (G. §§ 12–20). All that
has been said there holds, of course, here for any pair of corresponding
rows or pencils. The centre of perspective for any pair of corresponding
rows is at the centre of projection \( S \), whilst the axis corresponds to the corresponding elements. The corresponding parallels
on the other hand have their axis of perspective on the axis of
projection whilst the coincident rays pass through the centre.

We mention here a few of those properties which are independent
of the perspective position:

The correspondence between two projective rows or pencils is
completely determined if to three elements in one the corresponding
elements in the other are given. If, for instance in two projective
rows three pairs of corresponding points are given, then we can find to
every other point in either the corresponding point (G. §§ 29–36).

If \( A, B, C \) are four points in a row and \( A', B', C' \) the corre-
sponding points in another, then the cross-ratio \( (AB, CD) \) is equal to \( (A'B', C'D') \)
where \( (AB, CD) = AC/BD \). If in particular the point \( D \) is at infinity we have \( (AB, CD) = AC/BD \).
If therefore the points \( D \) and \( D' \) are both at infinity the cross-ratio \( u, v \) is det-

determined if we have given either two rows \( u, v \) in \( \pi \) and the corre-
sponding points \( u', v' \) in \( \pi' \), the point where \( u \) and \( v \) meet corresponding
to the points where \( u' \) and \( v' \) meet, or two pencils \( U, V \) in \( \pi \) and the corre-
sponding pencils \( U', V' \) in \( \pi' \) joining the centres of the pencils in \( \pi \) corresponding to the ray \( u'V' \).

It is sufficient to prove the first part. Let any line \( a \) cut \( u, v \)
in the points \( A \) and \( B \). To these will correspond points \( A' \) and \( B' \)
circumscribed about the line \( a \). To the line \( A'B' \) corresponds a line \( AB \).
Thus to every line in the one plane the corresponding
line in the other can be found, hence also to every point of
the corresponding point.

§ 13. If the planes of two projective figures coincide, and if either
four points, of which no three lie in a line, or else four lines, of
which no three pass through a point, in the one coincide with their corre-
sponding points, or lines, of the other, then every point and every line
coincides with its corresponding point or line so that the figures are identical.

If the four points \( A, B, C, D \) coincide with their corresponding
points, then every line joining two of these points will coincide with
its corresponding line. Thus the lines AB and CD, and therefore also their point of intersection E, will coincide with their corresponding elements. The row AB has thus three points A, B, E which coincide with the points of the second row, and it remains to show that the two other points coincident with it (§ 10). As there are six lines which join two and two of the four points A, B, C, D, there are six lines such that each point in either coincides with its corresponding point. Every other line will meet at least one of them and it will therefore join two of the points, and all points, coincident with their corresponding points. The proof of the second part is exactly the same. It follows

The correspondence between two projective planes is completely determined if there are given—either to two points in the one the corresponding four points in the other provided that no three of them lie in a line, or to any four lines the corresponding lines provided that no three of them pass through a point.

If a figure is to be represented in perspective if one row coincides with its corresponding row. The rows containing these rows will be in perspective. As in this case every point on coincides with its corresponding point. The following can be proved: if every row a meets its corresponding row a* on s where corresponding points are united. The two rows a, a' are therefore perspective (G. § 30), and the lines joining corresponding points will meet in a point $A'$ in the plane of the lines cutting a, a' in the points A and A' and the line s at $k$, thus the line AK corresponds to A'. Then the ray $k$ coincides with itself. The points B, B' in which $k$ cuts another pair $b, b'$ of corresponding points in $x$ and $x'$ will be the corresponding points ABCD in $x$. These two figures will be vertices of a plane if two projective planes, are coincident. They are therefore identical by § 15.

Two projective planes will be in perspective if one pencil coincides with its corresponding one. The centre of these pencils will be the point of intersection of the corresponding lines AB, CD.

In this case the two planes must of course coincide, whilst in the first case this is not necessary. § 15. We shall now show that two planes which are projective and have in common a point, can be brought into perspective, hence that the new definition is really equivalent to the old. We use the following property: If two coincident planes $x$ and $x'$ are perspective with $S$ as centre, then any two corresponding rows are also perspective with $S$ as centre. This therefore is true for the row $j$ and $j'$ and for $i$ and $i'$, of which $j$ and $j'$ are the lines at infinity in the two planes. If now the plane $x'$ be made to slide on $x$ so that each line moves parallel to its homologue in the other plane, then the whole plane at infinity in $x'$ remains fixed. So does the point at infinity on $j$, which thus remains coincident with its corresponding point on $j'$, and therefore the rays joining corresponding points in them meet at some point $T$. Similarly the lines joining corresponding points in $i$, and $i'$ will meet in some point $T'$. These two points $T$ and $T'$ originally coincided with each other and are identical. Conversely, if two projective planes are placed one the other, then as soon as the lines $j$ and $i$ are parallel the two points $T$ and $T'$ can be found by joining corresponding points in $j$ and $j'$ and also $i$ and $i'$. If now the plane $x'$ is translated in a parallel position to $x$ and $j$ and $j'$ as a point in $x$, then the point $A'$ will lie on $i$ and $j$ on $i'$, so that the line $A A'$ passes through $T$ and $B B'$ through $T$. These two planes and if then we join the rays which coincide with itself till $T'$ comes to $T$, then these two lines will coincide with each other, and with them will coincide the lines AB and A'B'. This line and similarly every line through $T$ will thus now coincide with its corresponding line. It will be noticed that the plane $x'$ may be placed on $x$ in two different ways, viz. if we have placed $x'$ on $x$ we may take it off and turn it over in space before we bring it back to $x$, so that what was on the front has now to be turned round, and vice versa. If we get one pair of centres $T$, $T'$, and only one pair, because the above process must give every perspective position. It follows

In two projective planes there are in general two and only two points such that the corresponding lines to be themselves, the corresponding angles in the other. If one of these pencils is made coincident with its corresponding one, then the planes will be perspective.

The figures are such with the fact that two perspective planes in space can be made coincident by turning one about their axis in two different ways (§ 8). In the reasoning employed it is essential that the lines $j$ and $i$ are parallel. Any two parallel planes have no general correspondence. If the corresponding lines $i'$ and $j'$ will coincide; that is, $i'$ also lies at infinity, so that the lines at infinity in the two planes are corresponding lines. If the planes are now made coincident and permanently joined in space, it is evident that the lines $i$ and $j$ respectively for a point, or can be made to do by turning the one plane in itself. In this case the line at infinity is the axis, whilst the centre must be a finite point. This gives similar figures (see § 16). In the other case the line at infinity corresponds to itself without being the axis; the lines joining corresponding points therefore all coincide with it, and the centre S lies on it at infinity. The axis will be in the fore plane. Thus two planes $m$, or $m$ (exact $14$) if we want of space we do not show how to find in these cases the perspective, but only remark that in the first case any pair of corresponding points in $x$ and $x'$ may be taken as the points $i$ and $i'$, or as their corresponding points in $x$ and $x'$, such that any one of these can be made to coincide point with its corresponding line in $x'$, and thus serve as the axis of projection. It will therefore be possible to get the planes in such a way that in the plane of the points and $i'$ the corresponding point and turning $x'$ about this point till lines joining corresponding points are parallel.

The axis of $x$ is at infinity every line is parallel to its corresponding line. Corresponding angles are therefore equal. The figures are similar, and (§ 10) the ratio of similitude of any two corresponding rows is constant.

If the figures are projective, they are said to be similarly situated, and the centre of projection is called the centre of similitude. To place two similar figures in this position, we observe that their lines at infinity will coincide as soon as both figures are placed so that their corresponding rows are the same. They are projective and hence in general not more than two points on one will coincide with their corresponding points in the other (G. § 34). To make them identical it is either sufficient to turn one figure in its plane till three lines in one are parallel to their corresponding lines in the other, or it is necessary before this can be done to turn the one plane over in space. It can be shown in the former case that all lines pass through a certain point (exact $14$). This point is the corresponding point, whilst in the second case there are two directions, at right angles to each other, which have the property that each line in either direction is parallel to its corresponding line. We therefore call this property parallel projection.

If in two similar figures three lines, of which no two are parallel, are parallel respectively to their corresponding lines, then every line has a property and these figures are similarly situated; or

Two similar figures are similarly situated as soon as two corresponding triangles are so situated.

If two similar figures are perspective without being in the same plane, then the two planes must be parallel or parallel at infinity. Hence the point must be parallel or parallel at infinity.

Any plane figure is projected from any centre to a parallel plane into a similar figure.

If two similar figures are similarly situated, then corresponding points may either be on the same or on different sides of the centre. If, besides, the ratio of similitude is infinite, then corresponding points will be equidistant from the centre. In the first case therefore two two, plane $x$, plane $x'$, are identical, and the corresponding points will be identical but not coincident. They can be made to coincide by turning one in its plane through right angles about the centre of similitude $S$. The figures are in involution, as is at the origin $O$, and the corresponding points are identical at the point $S$ as centre. If the two figures be considered as part of one, then this is said to have a centre. Thus regular polygons of an even number of sides and parallelograms have each a centre, which is a more symmetrically placed figure.

§ 17. Parallel Projection.—If, instead of the axis, the centre be moved to infinity, all the projecting rays will be parallel, and we get what is called parallel projection. In this case the picture extends through all directions and is parallel to itself —not but point for point as in the case of similar figures. In any point $I$ at infinity corresponds a point $I'$ also at infinity and the points $I'$ will be found from I by joining parallel planes of lines with the same centre $T$ at I parallel lines of another direction meeting at $T'$. Further, in any two corresponding rays the two points at infinity are corresponding points; hence the rows are similar. This gives the principal axis of parallel projection.

To parallel lines correspond parallel lines; or
To a parallelogram corresponds a parallelogram.

The correspondence of parallel projection is completely determined as soon as for any parallelogram in the one figure the corresponding parallelogram in the other has been selected, as follows from the general case in § 14. (Corresponding rows are similar (§ 10).)

The ratio of similarity for these rows changes with the direction.

If a row is parallel to the axis of projection, the corresponding row, which is also parallel to the axis, will be equal to it, because any two pairs of corresponding points will form a parallelogram.

Another important property is:
The areas of corresponding figures have a constant ratio.

We prove this first for parallelograms.

Let ABCD and EFGH be any two parallelograms in \( \pi \), and let \( A'B'C'D' \) and \( E'F'G'H' \) be the corresponding parallelograms in \( \pi' \). Then to the parallelogram KLMN which lies (fig. 6) \( \pi \) to the parallelogram CD and GH, will correspond a parallelogram \( K'LM'N' \) formed in exactly the same manner. As ABCD and KLMN are between the same parallels their areas are the bases. Hence

\[
\begin{align*}
\text{ABCD AB} & = \text{KLMN KL}, \\
\text{ABCD AB} & = \text{KLMN KL},
\end{align*}
\]

But \( \text{ABKL} = \text{AB'K'L} \), as the rows \( \text{AB} \) and \( \text{AB'} \) are similar.

Hence

\[
\begin{align*}
\text{ABCD AB} & = \text{EFGH E'F'G'H'}, \\
\text{ABCD AB} & = \text{EFGH E'F'G'H'}. 
\end{align*}
\]

Hence also

\[
\begin{align*}
\text{ABCD AB} & = \text{EFGH E'F'G'H'}, \\
\text{ABCD AB} & = \text{EFGH E'F'G'H'}. 
\end{align*}
\]

This proves the theorem for parallelograms and also for their halves, that is, for triangles.

As polygons can be divided into triangles the truth of the theorem in the case for curves is extended (by the method of exhaustion) to areas bounded by curves by inscribing polygons in, and circumscribing polygons about, the curve.

As (c. § 8) a segment of a line is a given sense, so a sense may be given to an area. This is done as follows. If we go round the boundary of an area, the latter is either to the right or to the left, we say that A is the start and B the end. If we go round the opposite sense, then the area will be to the left if it was first to the right, and vice versa. If we give the boundary a definite sense, and go round in this sense, then the area is said to be either of the one or of the other sense accordingly as the area is to the right or to the left. The area is generally said to be positive if it is to the left. The sense of the boundary is indicated either by an arrowhead or by the order of the letters which denote points in the boundary. Thus, if A, B, C be the vertices of a triangle, and AB the sides, the area is that part of the plane in which, if we start from A and travel along AB to B, the sense is fixed by going round the triangle in the order from A to B to C. It will then be seen that ABC and BCA denote the same area but with opposite sense, and generally

\[
\begin{align*}
\text{ABCD AB} & = \text{BCDA BC}, \\
\text{ABCD AB} & = \text{BCDA BC}. 
\end{align*}
\]

The constant ratio of corresponding areas is equal and opposite to the ratio in which the axis divides the segment joining two corresponding points.

§ 18. Several special cases of parallel projection are of interest.

Orthographic Projection.—If the two planes \( \pi \) and \( \pi' \) have a definite position in space, and if the rays \( \pi' \) be perpendicular to this plane, then the projection is said to be orthographic. If in this case the plane \( \pi' \) be turned till it coincides with \( \pi \) so that the figures remain perspective, then the projecting rays will be perpendicular to the axis of projection, because any one of these rays is, and remains during the turning, perpendicular to the axis.

The constant ratio of the area of the projection of the figure on \( \pi' \) to that of the original figure is, in this case, the cosine of the angle between the normal of the plane \( \pi' \) and \( \pi \), as will be seen by projecting a rectangle which has its base in the axis.

Shear.—If the centre of projection be taken at infinity on the axis, then the projecting rays are parallel to the axis; hence corresponding points will be equidistant from the axis. In this case, therefore, areas of corresponding figures will be equal.

If A, A' and B, B' (fig. 7) are two pairs of corresponding points on the same line, parallel to the axis, then, as corresponding segments of lines parallel to the axis are equal, it follows that AB = A'B', hence also AA' = BB'. If these points be joined to an arbitrary point O on the axis, it is clear that AO and A'O will be corresponding lines; they will therefore be cut by any line parallel to the axis in corresponding points. In the figure therefore C, C' and also D, D' will be pairs of corresponding points and the ratio of the areas is the same as that which equals the ratio of the distances of C and A from the axis, therefore—

Two corresponding figures may be got one out of the other by moving all points in the one parallel to a fixed line, the axis, through distances measured in the same sense, and in the same order.

Thus the two lines \( AB \) and \( A'B' \) are parallel to the axis in corresponding points. In the figure therefore \( \text{C, C'} \) and also \( \text{D, D'} \) will be pairs of corresponding points and the ratio of the areas is the same as that which equals the ratio of the distances of \( C \) and \( A \) from the axis, therefore—

Fig. 7.

Such a transformation of a plane figure is produced by a shearing stress in any section of a homogeneous elastic solid. For this reason Lord Kelvin gave it the name of shear.

A shear of a plane figure is determined if we are given the axis and the distance through which one point has been moved; for in this case the axis, the centre, and a pair of corresponding points are given.

§ 19. Symmetry and Skew-Symmetry.—If the centre is not on the axis, and if corresponding points are at equal distances from it, they must be on opposite sides of it. The figures will be in inversions (§ 11). In this case, the direction of the projecting rays is said to be conjugate to the axis.

The conjugate direction may be perpendicular to the axis. If through any two corresponding points A, A' cuts the axis in B, then AB = A'B'. Therefore, if the plane is moved along over the axis, A will fall on A'. Hence by this folding over every point will coincide with its corresponding point. The figures therefore are identical or congruent, and in their original position they are symmetrical with regard to the axis, which itself is called an axis of symmetry. If the two figures are considered as one they may be superimposed on the same axis, and is said to have axis of symmetry. If perpendicular to the axis, every diameter of a circle is thus an axis; also the median line of an isosceles triangle and the diagonal of a rhombus are axes of the figures to which they belong.

The more general case where the projecting rays are not perpendicular to the axis we have a kind of twisted symmetry which may be called skew-symmetry. It can be got from symmetry by giving the whole figure a shear. It will also be easily seen that we get skew-symmetry if we first form a shear to a given figure and then separate it from its shear by folding it over along the axis of the shear, which thereby becomes an axis of skew-symmetry and therefore also symmetrical figures have the following properties—:

Corresponding areas are equal, but of opposite sense.

Any two corresponding lines are harmonic conjugates with regard to the lines of the projection of the axis direction; thus, and in the direction.

If the two figures be again considered as one whole, this is said to be skew-symmetrical and to have an axis of skew-symmetry. Thus the median line of any triangle is an axis of skew-symmetry, the line in which the centroid (the mass-centre) lies on. Every diameter of a circle is thus an axis; also the median line of an isosceles triangle and the diagonal of a rhombus are axes of the figures to which they belong.

For two median lines will be corresponding lines with regard to the third as axis, and must therefore meet on the axis.

An axis of skew-symmetry is generally called a diameter. Thus every diameter of a conic is an axis of skew-symmetry, the conjugate direction being the direction of the chords which it bisects.

We state a few properties of these figures useful in mechanics, but we omit the easy proofs—:

If a plane area has an axis of skew-symmetry, then the mass-centre (centroid) is in the direction of the skew-symmetry axis.

If a figure undergoes a shear, the mass-centre of its area remains the mass-centre; and generally—

In parallel projection the mass-centres of corresponding areas (or of two points, or of two corresponding points) are corresponding points.

The moment of inertia of a plane figure does not change if the figure undergoes a shear in the direction of the axis with regard to which it has been sketched.

If a figure has an axis of skew-symmetry, then this axis and the conjugate direction are conjugate diameters of the momental ellipse for every point in it.

The truth of the last propositions follows at once from the fact that the product of inertia for the lines in question vanishes.

In order to show a great many propositions of Euclid are only special cases of projection. The theorems Euc. I. 35—41 about parallelograms or triangles on equal bases and between the same parallels are examples of shear, whilst I. 43 gives a case of
skew-symmetry, hence of involution. Figures which are identically equal are of course projective, and they are perspective when placed so that they have an axis or a centre of symmetry (cf. I. 4). Similarly, figures which are identical as to the selection of again the relation is that of involution. The importance of treating similar figures when in perspective position has long been recognized; we need only mention the well-known proposition about the centres of similar conics.

Applications to Conics.

§ 21. Any conic can be projected into any other conic. This may be done in such a manner that three points on one conic and the tangents at two of them are projected to three arbitrarily selected points and the tangents at two of them on the other.

We may have two conics, then we have to prove that we can project $u$ into such a manner that five points on it will be projected to points on $u'$. As the projection is determined as soon as the projections of any four points or four lines are selected, we cannot project $u$ into $u'$ to it to $u$ in contact with the conic on $u'$. But if $A$, $B$, $C$ be any three points on $u$, and if the tangents at $B$ and $C$ meet at $D$, then the tangents $A'$, $B'$, $C'$ are any three points on $u'$, and if the tangents at $B'$ and $C'$ meet at $D'$, then the plane of $u$ may be projected to the plane of $u'$ in such a manner that the points $A$, $B$, $C$, $D$ are projected to $A'$, $B'$, $C'$, $D'$. This determines the correspondence (§ 14).

The conic $u$ will be projected into a similar figure and similarly the tangents $BD$ and $CD$ to the points $A'$, $B'$, $C'$ and the lines $B'D'$ and $C'D'$, which are tangents to $u'$ at $B'$ and $C'$. The projection of $u$ must therefore (G. § 52) coincide with $u'$, because it is a conic which has three points and the tangents at $B'$ and $C'$ not collinear.

Similarly we may have taken three tangents and the points of contact of two of them as corresponding to similar elements on the other.

If the one conic be a circle which cuts the line $j$, the projection will cut the line at infinity in two points; hence it will be a hyperbola. Similarly, if the circle touches $j$, the projection will be a parabola; and, if the circle has a common point with $j$, the projection will be an ellipse. These curves appear thus as sections of a circular cone, for in case that the two planes of projection are separated the rays projecting the circle form such a cone.

A general conic may be a circle or a conic of general position.

If we take any point $S$ in the plane of a conic as centre, the polar of this point as axis of projection, and any two points in which a line through $S$ cuts the conic as corresponding points, then these will be all the points which can be projected to it to $S$ through the corresponding points.

We therefore have involution (§ 11), and every point is projected into its harmonic conjugate with regard to the centre and the axis—hence every point $A$ on the conic into that point $A'$ on the conic in which the line $SA$ cuts the conic again, as follows from the harmonic properties of pole and polar (G. § 62 sqq.).

Two conics which cut the line at infinity in the same two points are projective in the same situation—the centre of similitude being in general some finite point.

To prove this, we take the line at infinity and the asymptotes of one as corresponding to the line at infinity and the asymptotes of the other, and we select in each a tangent parallel to a tangent to the other. If we take any point $S$ on the one and project it to $S'$ on the other, then $SS'$ cut will be a tangent to the conic on $SS'$. Hence the line at infinity will correspond to itself point for point; hence the figures will be similar and similarly situated.

§ 22. Areas of Parabolic Segments. Any parabola may always be considered as a parallel projection of another in such a manner that any two points $A$, $B$ on the one correspond to any two points $A'$, $B'$ on the other; that is, the points $A$, $B$ and the point at infinity on the one may be made to correspond respectively to the points $A'$, $B'$ and the point at infinity on the other. This completely determines the correspondence, and it is parallel projection because the line at infinity corresponds to the line at infinity. Let the tangents at $A'$ and $B'$ intersect in $S$, and then $A$ and $B$ correspond, and so will the triangles $ABC$ and $A'B'C'$ as well as the parabolic segments cut off by the chord $AB$ and $A'B'$. If $(AB)$ denotes the area of the segment cut off by the chord $AB$ we have therefore

\[ (AB)(ABC) = (A'B')(A'B'C') \]

or

\[ (AB) = (AB)/(A'B')(A'B'C'). \]

The area of a segment of a parabola stands in a constant ratio to the chord of the segment and the tangents at the end points of the chord.

Combining both equations, we have

\[ ABm = (ABC)(ADE + BFD). \]

But we have also $AB = [ABC]$, and $ADE = BFD = [ABC]$; hence

\[ ABm = (1 - 1)ABC, \text{ or } m = 1. \]

The area of a parabolic segment equals one-third of the area of the triangle formed by the chord and the tangents at the end points of the chord.

§ 23. Elliptic Areas.—To consider one ellipse a parallel projection of another, we may use the same method of projection as before. If $AC$, $BD$ are any pair of conjugate diameters of the one and $AC'$, $BD'$ any pair of conjugate diameters of the other, then these lines may be made to correspond to each other, and the correspondence will be completely determined by the projection of the tangents at $A$, $B$, $C$, $D$ is made to correspond to that formed by the tangents at $A'$, $B'$, $C'$, $D'$ (§§ 17 and 21). As the projection of the first conic has the points $A'$, $B'$, $C'$, $D'$ and the tangents at $A$, $B$, $C$, $D$ are projected to the conic $A'B'C'D'$ projected into one of the other. Their areas will correspond, and so do those of the parallelograms $ABCD$ and $A'B'C'D'$. Hence—

The area of an ellipse has a constant ratio to the area of any parallel projected conic whose diagonals are conjugate diameters, and also to every circumscribed parallelogram whose sides are parallel to conjugate diameters.

It follows at once that—

All parallelograms inscribed in an ellipse whose diagonals are conjugate diameters are equal in area; and

All parallelograms circumscribed about an ellipse whose sides are parallel to conjugate diameters are equal in area.

For the circle of radius $r$ the inscribed parallelogram becomes the square of area $r^2$ and the circle has the area $\pi r^2$; the constant ratio of an ellipse to the inscribed parallelogram has therefore also the value $\pi r^2$.

The area of an ellipse equals $ab \pi$.

§ 24. Projective Properties.—The properties of the projection of a figure depend partly on the relative position of the planes of the figure and the centre of projection, but principally on the properties of the given figure. Points in a plane are projected into points in a line, harmonic points into harmonic points, a conic into a conic; but parallel lines are not projected into parallel lines unless they be the axes of symmetry of the conic.

If $a$, $b$ are the length of the semi-axes of the ellipse, then the area of the circumscribed parallelogram will be $4ab$ and of the inscribed parallelogram $2ab$.

To the circle of radius $r$ the inscribed parallelogram becomes the square of area $r^2$ and the circle has the area $\pi r^2$; the constant ratio of an ellipse to the inscribed parallelogram has therefore also the value $\pi r^2$.

For the circle of radius $r$, the inscribed and circumscribed parallelograms are equal in area, and the inscribed parallelogram is equal to $2ab$, where $a$, $b$ are the semi-axes of the ellipse.

The area of an ellipse equals $ab \pi$.

In this case, if we take the triangle together with the line at infinity, we get as the projection a triangle $ABC$, and some other line which cuts the sides $a$, $b$, $c$ of the triangle in the points $A'$, $B'$, $C'$ respectively, and which cuts the sides $a'$, $b'$, $c'$ of the other triangle in the points $A''$, $B''$, $C''$, respectively, and then the lines $AA'$, $BB'$, $CC'$ will be the projections of the corresponding lines in the given figure. Hence these lines must meet in a point.

As the triangle and the fourth line we may take any four given lines, because any four lines may be projected into any four given lines.

In similar manner a great many theorems relating to metrical properties can be generalized by taking the line at infinity or points at infinity as forming part of the original figure. Conversely stated, every projective transformation is obtained by projecting some line in a figure of known properties to infinity. This is true for all properties relating to parallel lines or to bisection of segments, but not immediately for angles. It is, however, possible to deduce for every metrical relation the corresponding projective property. To do this it is necessary to consider imaginary elements. These have originally been introduced into geometry by aid of co-ordinate geometry, where imaginary quantities constantly occur as solutions of equations.

Their introduction into pure geometry is due principally to Monge, who by the publication of his great work "Traité des droites et des surfaces," brought the foundations of projective geometry in its widest sense. Monge had considered parallel projection and had already distinguished between permanent and accidental properties of figures, the latter being those which depend solely on length. Thus in projecting two circles which lie in different planes it
depends on the accidental position of the centre of projection whether the projections be two conics which do or do not meet. Poncelet introduced the principle of continuity in order to make theorems general and independent of those accidental positions which depended analytically on the fact that the equations used had real or imaginary roots. But the correctness of this principle remained without a proof. Von Staudt has, however, shown how it is possible to introduce imaginary elements by purely geometrical reasoning, and we shall now try to give the reader some idea of his theory.

§ 25. Imaginary Elements.—If a line cuts a curve and if the line be moved, turned for instance about a point A, it may happen that two of its points of intersection with each other till they coincide. The line then becomes a tangent. If the line is still further moved in the same manner it separates from the curve and two points of intersection are lost. Thus in the determination of a line to a conic we have to distinguish three cases—the line cuts the conic in two points, touches it, or has no point in common with it. This is quite analogous to the fact that a quadratic equation with one unknown quantity has either two, one, or no roots. But in algebra it has long been found convenient to express this differently by saying a quadratic equation has always two roots, but these may be either both real and different, or equal, or they may be imaginary. In geometry a similar mode of expressing the fact above stated is not less convenient.

We say therefore a line has always two points in common with a curve, or that there are two different forms of points of intersection. The word imaginary is generally used instead of invisible; but, as the points have nothing to do with imagination, we prefer the word “invisible” recommended originally by Clifford.

An inversion of points on a line has (according to G. § 77 [2]) either two or one or no foci. Instead of this we now say it has always two foci which may be distinct, coincident or invisible. These foci are determined by the inversion, but they also determine the points of intersection with a curve. Hence we may say that two conjugate points are harmonic conjugates with regard to the foci. That it is also the case for invisible foci will presently appear. If we consider a point or a centre which may equal any pair of real coincident or invisible points to be the inversion of which they are the foci.

Now any two pairs of conjugate points determine an involution (G. § 82), i.e. a projective pencil of lines which pass through the given point-pair as conic and may therefore be replaced by them.

Two pairs of invisible points are thus said to be identical if, and only if, they are the foci of the same involution.

Hence any point-pair, whether real or invisible, is completely determined by any two pairs of conjugate points of the involution which has given the point-pair as foci and may therefore be replaced by them.

The triangle RSQ is a polar triangle (G. § 62), so that R' lies on the polar of R. This gives a simple means of determining for any point Q on the line s its conjugate point Q'. We take any two points A', A' on the conic which lie on a line through S, join Q' to A' by a line cutting the conic again in C, and join C to A'. This line will cut s in the point Q' required.

We have here to reconstruct the fig. 9, having given on the line s an involution. Let Q, Q', R, R' (fig. 9) be two pairs of points of this involution. We take any point B and join it to R and R', and another pair such as Q' and Q' of the involution. We then have that CQ and CQ meet at A, and BR' and CQ' at A'. If now a point P is moved along s its conjugate point P' will also move and the two points will describe projective rays. The two rays AP and A'P' will therefore describe projective pencils, and the intersection of corresponding rays will lie on a conic which passes through A', A' and R'.

We have therefore found a conic and this conic determines on s the given involution.

Of these four points not only B and C but also the point A may be taken arbitrarily, for if A, B, C are given, the line AB will cut s in some point K. As the involution is supposed known, we can calculate the point K' of the conic which lies on AB by the fact that the line AB will cut s in some point Q. Its conjugate point Q' we join to C. The line CQ' will cut BR' in a point A', and then AA' will pass through the pole S (cf. fig. 9). We may now interchange the positions of B, C. We have then found the point B'. Then BY will also pass through S, which is thus found. At the same time five points A, B, C, A', B' on the conic have been found, so that the conic is completely known when we know the line s and the given involution. Hence:

Through three non-concurrent points can always be drawn one, and only one, which determines on a given line a given involution, all the same whether the involution has real, coincident or invisible foci.

In the last theorems may also be stated thus—

It is always possible to draw a conic which passes through three given real points and through two invisible points which any other conic has in common with a line.

Any two points of an involution give rise to a great number of interesting consequences, of which we state a few.

The theorem at the end of § 21 may now be stated—

Any two conics are similar and similarly situated if they cut the line at infinity in the same two points—real, coincident or invisible.

It follows that

Any two parabolas are similar; and they are similarly situated as soon as their axes are parallel.

Hence any circle determines at its centre is circular (G. § 79); that is, every line is perpendicular to its conjugate line. This will be the cut by the line at infinity in an involution which has similar to a given circle.

Conversely—Every conic which passes through the circular points in the line at infinity is an involution, and the involution which a circle determines at its centre is called the circular involution at that point. All circles determine thus on the line at infinity the same involution; in other words, they have the same two invisible points in common with the line at infinity.

All circles may be considered as passing through the same two points at infinity.

These points are called the circular points at infinity, and by Professor Cayley the absolute in the plane. They are the foci of the circular involution in the line at infinity.

Conversely—Every conic which passes through the circular points is an involution, and the circular involution at the line at infinity; and the involution which a circle determines at its centre is called the circular involution at that point. All circles determine thus on the line at infinity the same involution; in other words, they have the same two invisible points in common with the line at infinity.

We now see why we can draw always only one and one circle through three points; these three points together with the circular points at infinity are five points through which one conic only can be drawn.

Any two circles are similar and similarly situated because they have the same points at infinity (§ 21). Any two concentric circles may be considered as having double contact at infinity, because the lines joining the common centre to the circular points at infinity are tangents to both circles at the circular points, as the lines joining the centres meet at the centre.

Any two lines at right angles to one another are harmonic conjugates with regard to the rays joining their intersection to the circular points, and the rays through the circular points at infinity and the focal rays of the circular involution at the intersection of the given lines.

To bisect an angle with the vertex A means (G. § 23) to find two rays through A which are harmonic conjugates with regard to the
limits of the angle and perpendicular to each other. These rays are therefore harmonic with regard to the limits of the given angle and with regard to the rays through the circular points. Thus perpendicularity and bisection of an angle have been stated in a previous section.

It must not be forgotten that the circular points do not exist at all; but to introduce them gives us a short way of making a statement which, as we have seen, is both elegant and luminous.

We can now generalize any theorem relating to metrical properties. For instance, the simple fact that the chord of a circle is touched by a concentric circle at its mid-point proves the theorem:

If two circles have double contact, then the points where any tangent to one of them cuts the other are harmonic with regard to the point of contact and the point where the tangent cuts the chord of contact.

(0. H.)

PROKOP, the name of two of the most prominent Hussite generals.

1. PROKOP, surnamed "Velky" (the great) or "Holy" (the bald), was a married utraquist priest who belonged to an eminent family of citizens of Prague. Though a priest and continuing to officiate as such, he became the most prominent leader of the advanced Hussite or Taborite forces during the latter part of the Hussite wars. He was not indeed the immediate successor of Žižka as leader of the Taborites, as has been frequently stated, but he commanded the forces of Tabor when they obtained their great victories over the Germans and Romanists at Hrad nad Labem (Aussig) in 1426 and Domážlice (Taeus) in 1431. He also acted as leader of the Taborites during their frequent incursions into Hungary and Germany, particularly when in 1429 a vast Bohemian army invaded Saxony and the territory of Nuremberg. The Hussites, however, made no attempt permanently to conquer German territory, and on the 6th of February 1430 Prokop concluded at Kulmbach a treaty with Frederick of Brandenburg, burggrave of Nuremberg, by which the Hussites engaged themselves to leave Germany. When the Bohemians entered into negotiations with Sigismund and the Council of Basel and, after prolonged discussions, resolved to send an embassy to the council, Prokop was the most prominent member of this embassy, which reached Basel on the 4th of January 1433. When the negotiations for this time proved resultless Prokop with the other envoys returned to Bohemia, where new internal troubles broke out. A Taborite army led by Prokop the Great besieged Plzeň, which was then in the hands of the Romanists. The discipline in the Hussite camp had, however, slackened in the course of prolonged warfare, and the Taborites encamped before Plzeň revolted against Prokop, who therefore returned to Prague. Probably encouraged by these dissensions among the men of Tabor, the Bohemian nobility, both Romanist and utraquist, formed a league for the purpose of opposing democracy, which through the victories of Tabor had acquired great strength in the Bohemian towns. The struggle began at Prague. Aided by the nobles, the citizens of the old town took possession of the more democratic new town, which Prokop unsuccessfully attempted to defend. Prokop now called to his aid Prokop "the Lesser," who had succeeded him in the command of the Taborite army before Plzeň. They jointly retreated eastward from Prague, and their forces, known as the army of the towns, met at Lipan, between Kourim and Kolin, the army of the nobles (May 30, 1434). The Taborites were decisively defeated, and Prokop the Great perished in this battle.

2. Prokop "the Lesser," or PROKOPÉK (the Bohemian diminutive of the word Prokop), was one of the greatest Hussite generals. Little is known of his early life. He took part in all the later campaigns of Prokop the Great in Germany, and succeeded him as commander of the Taborite army that besieged Plzeň. After the formation of the confederaoy of the nobles he was recalled by Prokop the Great, with whom he shared the command of the army of the towns at the fatal battle of Lipan, in which he also perished.

See Count Lützow, Bohemia: A Historical Sketch; Palacky, History of Bohemia; Toman, Hussite Válečníci (Husite Warfare).

PROKOPOVICH, THEOFAN (1681-1739), Russian archbishop and statesman, one of the ablest condutors of Peter the Great, was sprung from a merchant family. He brilliantly distinguished himself at the Orthodox academy of Kiev, subsequently completing his education in Poland (for which purpose he turned Uniate), and at Rome in the College of the Propaganda. Primed with all the knowledge of the West, he returned home to seek his fortune, and, as the Orthodox monk, became one of the professors at, and subsequently rector of, the academy of Kiev. He entirely reformed the teaching of theology there, substituting the historical method of the German theologians for the antiquated Orthodox scholastic system. In 1709 Peter the Great, while passing through Kiev, was struck by the eloquence of Prokopovich in a sermon on "the most glorious victory," i.e. Poltava, and in 1716 summoned him to Petersburg. From that time onwards it was Theofan's duty and pleasure to explain the new ideas and justify the most alarming innovations from the pulpit. So invaluable, indeed, did he become to the civil power, that, despite the determined opposition of the Russian clergy, who regarded "the Light of Kiev" as an interloper and semi-heretic, he was rapidly promoted, becoming, in 1718, bishop of Pskov, and finally, in 1724, archbishop of Novgorod. As the author of "the spiritual regulation" for the reform of the Russian Church, Theofan must, indeed, be regarded as the creator of "the spiritual department" superseding the patriarchate, and better known by its later name of "the holy synod," of which he was made the vice-president. Permeated by the conviction that ignorance was the worst of the inveterate evils of old Russia, a pitiless enemy of superstition of every sort, a reformer by nature, overflowing with energy and resource, and with a singularly lucid mind armed at all points by a far-reaching erudition, Prokopovich was the soul of the reforming party after the death of Peter the Great. To him also belongs the great merit of liberating Russian preaching from the fetters of Polish turgidity and affectation by introducing popular themes and a simple style into Orthodox pulpit eloquence.

See I. Chistovitch, Theofan Prokopovich and his Times (Rus.; Petersburg, 1868); P. Morozov, Théophan Prokopovich as a Writer (Rus.; Petersburg, 1880).

PROLEGOMENON (Gr. for "that which is said beforehand," πρόλογον, to speak, say before), a preface or introduction to a book, especially a preliminary introductory essay to a learned work, or a treatise which serves as a general survey or introduction to the study of some subject or as a special survey of the subject. The word is more often used in the plural.

PROLETARIAT, or PROLETARIATE, a term borrowed from the French and used collectively of these classes of a political community who depend for their livelihood on their daily labour, who presides in that house and acts as representative, or mere substitute or legate of the multitude, in the other house, which they name the "House of Deputies," and which they hope, in some distant future, to convert into the supreme authority of the nation. The word proletarius, from which the word was formed, was the name given to the body of citizens possessed of no property and who therefore served the state with their children (proles, offspring). This division of the members of the state was traditionally ascribed to Servius Tullius.

PROLOCUTOR, one who speaks for others (Lat. pro, for, and loqui, to speak); specifically the chairman of the lower house of convocation in the two provinces of the Church of England, who presides in that house and acts as a spokesman in the upper house. He is elected by the lower house, subject to the approval of the metropolitan. (See Convocation.)

PROLOGUE (from Gr. πρό, before, and λόγος, a word), a prelatory piece of writing, usually composed to introduce a drama. The Greeks use a word πρόλογος, which included the modern meaning of the prologue, but was of wider significance, embracing any kind of preface, like the Latin praefatio. In Attic Greek drama, a character in the play, very often a deity, stood forward or appeared from a machine before the action of the play began, and made from the empty stage such statements as it was necessary that the audience should hear, in order that they might appreciate the ensuing drama. It was the early Greek custom to dilate in great detail on everything that had led up to the play, the latter being itself, as a rule,
merely the catastrophe which had inevitably to ensue on the facts related in the prologue. The importance, therefore, of the prologue in Greek drama was very great; it sometimes almost took the place of a romance, or, which is, to the play itself succeeded. It is believed that the prologue in this form was practically the invention of Euripides, and with him, as has been said, it takes the place of "an explanatory first act." This may help to modify the objection which criticism has often brought against the Greek prologue, as an impertinence, a useless growth prefixed to the play, and standing as a barrier between us and our enjoyment of it. The point precisely is that, to an Athenian audience, it was useful and pertinent, as supplying just what they needed to make the succeeding scenes intelligible. But it is difficult to accept the view that Euripides invented the plan of producing a god out of a machine to justify the action of deity upon man, because it is plain that he himself disliked this interference of the supernatural and did not believe in it. He seems, in such a typical prologue as that to the Hippolytus, to be accepting a conventional formula, and employing it, almost perversely, as a medium for his ironic rationalism. Many of the existing Greek prologues may be later in date than the plays they illustrate, or may contain large interpolations. On the Latin stage the prologue was often more elaborate than it was in Athens, and in the careful composition of the poems which Plautus prefixes to his plays we see what importance he gave to this portion of the entertainment; sometimes, as in the preface to the Rudens, Plautus rises to the height of his genius in his droll and romantic prologues, usually placed in the mouths of persons who make no appearance in the play itself. Molière revived the Plautian prologue in the introduction to his Amphitryon. Racine introduced Pytis as the speaker of a prologue which opened his choral tragedy of Esther. The tradition of the ancients vividly affected our own early dramatists. Not only were the mystery plays and miracles of the middle ages begun by a homily, but when the drama in its modern sense was inaugurated in the reign of Elizabeth, the prologue came with it, directly adapted from the practice of Euripides and Terence. Sackville, Lord Buckhurst, prepared a sort of prologue in dumb show for his Gorbuds of 1562; and he also wrote a famous Induction, which is, practically, a prologue, to a mix- cellany of short romantic epics by diverse hands. In the Eliza-bethan drama the prologue was very far from being universally employed. In the plays of Shakespeare, for instance, it is an artifice which the poet very rarely introduced, although we find it in Henry V. and Romeo and Juliet. Sometimes the Eliza-bethan prologue was a highly elaborated poem; in 1603 a har-binger recited a sonnet on the stage, to prepare the audience for Heywood's A Woman Kill'd with Kindness. Often the prologue was a piece of blank verse, so obscure and complicated that it is difficult to know how its hearers contrived to follow it; such are the prologues of Chapman. Among Elizabethan prologues the most ingenious and interesting are those of Ben Jonson, who varied the form on every occasion. For instance, in The Poetaster (1602), Envy comes in as "as Prologue," and speaks a long copy of heroics, only to be turned off the stage by an armed figure, who states that he is the real prologue, and proceeds to spout more verses. Jonson's introductions were often recited by the "stage-keeper," or manager. Beaumont and Fletcher seem to have almost wholly dispensed with prologues, and the form was far from being universal, until the Restoration, when it became de rigueur. The prologues of the last thirty years of the 17th century were always written in rhymed verse and were generally spoken by a principal actor or actress in the ensuing piece. They were often, in the hands of competent poets, highly finished essays on social or literary topics. For instance, the famous prologue to Dryden's Aurengzebe (1675) is really a brief treatise on fashions in versification. Throughout the 18th century the prologue continued to flourish, but went out of vogue in the early part of the 19th. See also Epilogue.

(Prometheus.)

Prometheus, son of the Titan Iapetus by the sea nymph Clymene, the chief "culture hero," and, in some accounts, the

**Prometheus**
Demigure of Greek mythical legend. As a culture-hero or inventor and teacher of the arts of life, he belongs to a wide and well-known category of imaginary beings. Thus Qat, Quah-teah, Punjdel, Maui, Ioiskeha, Cagn, Waimaioten, and an endless array of others represent the ideal and heroic first teachers of Melanesians, Aths, Australians, Maoris, Algonkins, Bushmen and Finns. Among the lowest races the culture-hero commonly wears a bestial guise, is a spider (Melanesian), an eagle hawk (in some myths and south-east Australia), a coyote (north-west America), a dog or raven (Thilinkeet), a mantis insect (Bushman), and so forth, yet is endowed with human or even super-human qualities. As Prometheus he steals off into an immortal and practically deathless god. Prometheus, on the other hand, is purely anthropomorphic. He is the friend and benefactor of mankind. He defends them against Zeus, who, in accordance with a widely diffused mythical theory, desires to destroy the human race and supplant them by a new and better species, or who simply revenges a trick in which men get the better of him. The pedigree and early exploits of Prometheus are given by Hesiod (Theog. 510-616). On a certain occasion gods and men met at Mecone. The business of the assembly was to decide what portions of slain animals the gods should receive in sacrifice. On one side were the bird-heroes, as best protectors of the fowl; on the other the bones covered with fat, as the meat was covered in Homeric sacrifices. Zeus was invited to make his choice, chose the fat, and found only bones beneath. A similar fable of an original choice, in which the chooser is beguiled by appearances, recurs in Africa and North America (see the caskets in the Merchant of Venice). The native tribes adapt the myth to explain the different modes of life among themselves and white men. In wrath at this trick, according to Hesiod, or in other versions for the purpose of exterminating the remnant of people who escaped the deluge of Deucalion, Zeus never bestowed, or later withdrew, the gift of fire. In his "philanthropic fashion," an ingenious stoic fire, concealed in a hollow fennel stalk (Hesiod, Op. et Di.), and a fennel stalk is still used in the Greek islands as a means of carrying a light (cf. Pliny xiii. 22). According to some legends he gained the fire by holding a rod close to the sun. Probably the hollow fennel stalk in which fire was carried got its place in myth from the very fact of its common use.

We thus find Prometheus in the position of the fire-bringer, or fire-stealer, and so connected with a very wide cycle of similar myths among the Zulus, the Bena (Gippsland), the Murri (north Queensland) with a backwardo people, the fire-stealer was a man, but he became a bird. Teu-rara, or fire, was in the possession of two women who hated the blacks. A man who loved women carried the stolen fire on his back, and being burned, and was metamorphosed into "a little bird with a red mark on its tail, which is the mark of fire." The fire-bringer in Brittany is the golden or fire-crested wren. Myths like this kill two birds with one stone, and at one and the same time destroy the possession of fire, and the mark in the breast of certain animals regarded as fire-bringers. In another Australian legend fire was stolen by the hawk from the bandicoot, and given to men. In yet another a man held his spear to the sun, and so got a light. A bird is fire-bringer in an Andaman island tale, and a ghost in another myth of the same island.4 In New Zealand, Maui stole fire from Mauika, the lord of fire. He used a bird's intervention. Among the Aths, in North America,4 fire was stolen by animals from the cuttle-fish. Among the Thilinkeets, Yehi, the raven god, was the fire-stealer. Among the Cahros, the coyote steals fire from "two old women." Among the Aryans of India, Soma is stolen by the hare, and among the Thilinkeets, and the Edda.4 Fire concealed himself, in the Veda, was dragged from his hiding place by Mataricyan, and was given to the priestly clan of Bhagoteet. We also hear that Mataricyan brought fire from afar (R. V. iii. 9, 5), and that Bhrga found fire lurking in the water (R. V. x. 46, 2).4

In considering the whole question, one must beware of the hasty analogical method of reasoning too common among mythologists. For example, when a bird is spoken of as the fire-bringer we need not necessarily conclude that, in each case, the bird means lightning. On the other hand, the myth often exists to explain the cause of the markings of certain actual species of birds. Again, because a hero is said to have stolen or brought fire, we need not regard that hero as the personification of fire, and explain all his myth as a fire-myth. The legend of Prometheus has too often been treated in this fashion, though he is really a culture hero, of whose exploits, such as making men of clay, fire-stealing is no more than a single example. This tendency to evolve the whole myth of Prometheus from a belief that he is personified fire, or the fire-god, has been intensified by Kuhn's ingenious and plausible etymology of the name Prometheus. The Greeks derived it from provident, and connected it with other such words as progonov, progonia. They had also the proper name Ergonostes for the slow-witted brother of Prometheus who turned all the hero's wisdom to foolishness. Against these very natural etymologies the philologists support a theory that Prometheus is really a Greek form of pramantha (Skt.), the fire-stick of the Hindus. The process of etymological change, as given by Steinthal, was thus: The bringer of Prometheus was only mahanasa, from maha, "I shake." The preposition pro was prefixed, and you get pramanthi. But Mataricyan was feigned to have brought Agni, fire, and "the fetching of the god was designated by the same verb mahanam as the proper earthly boring" of the fire-stick. "Now this verb, especially when compounded with the preposition pro, gained the signification to tear off, snatch to oneself, rob."5 Steinthal goes on: "Thus the fetching of Agni became a robbery of the fire, and the pramanthi (fire-stick) a robber. The gods had intended, for some reason or other, to withhold fire from men; a benefactor of mankind stole it from the gods. This robbery was called pramantha; pramanthys; is he who loves boring or robbery, a borer or robber." From the latter words, according to the peculiarities of Greek phonology, is formed Prome-theus, Prometheus. He is therefore a fire-god, &c. Few things more ingenious than this have ever been done by philologists. It will be observed that "forgetfulness of the meaning of words" is made to account for the Greek belief that fire was stolen from the gods. To recapitulate the doctrine more succinctly, men originally said, in Sanskrit (or some Aryan speech more ancient still), "fire is got by rubbing or boring;" nothing could have been more scientific and straightforward. They also said, "fire is brought by Mataricyan;" nothing could have been more in accordance with the mythopoeic mode of thought. Then the word which means "fetched" is confused with the word which means "bored," and gains the sense of "robbed." Lastly, fire is said (owing to this confusion) to have been stolen, and the term which meant the common savage fire-stick is by a process of delusion conceived to represent, not a stick, but a person, Prometheus, who stole fire. Thus then, according to the philologists, arose the myth that fire was stolen, a myth which we presume, would not otherwise have occurred to Greeks. Now we have not to decide whether the Greeks were aware of, and may have heard of, the coincidence of "the fire-dweller, wise man," or whether the Germans know better, and are correct when they say the name merely meant "fire-stick." But we may, at least, point out that the myth of the stealing of fire and of the fire-starter is current among races who are not Aryans, and never heard the word pramantha. We have shown that Thilinkeets, Aths, Andaman Islanders, Australians, Maoris, South Sea Islanders, Cahros and others all believe fire was originally stolen. Is it credible that, in all their languages, the name of the fire-stick should have caused a confusion of thought which ultimately led to the belief that fire was obtained originally by larceny? If such a coincidence appears incredible, we may doubt whether the belief that is common to Greeks and Cahros and Aths was produced, in Greek minds by an etymological confusion, in Australia, America and so forth by some
other cause. What, then, is the origin of the widely-diffused myth that fire was stolen? We offer a purely conjectural suggestion. No race is found without fire, but even some civilized races have found the artificial reproduction of fire very tedious. Thus we read (Od. v. 488-493), "As when a man hath hidden away a brand in the black embers at an upland farm, one that hath no neighbour nigh, and so saveth the seed of fire that he may not have to seek a light otherwhere, even so did Odysseus cover him with the leaves." If, in the Homerian age, men found it so hard to get the seed of fire, what must the difficulty have been in the earliest dawn of the art of fire-making? Suppose, then, that the human groups of early savages are hostile. One group lets its fire go out, the next thing to do would be to borrow a light from the neighbour, perhaps several miles off. But if the neighbours are hostile the unlucky group is cut off from fire, igni interdictur. The only way to get fire in such a case is to steal it. Men accustomed to such a precarious condition might readily believe that the first possessors of fire, wherever they were, set a high value on it, and refused to communicate it to others. Hence the belief that fire was originally stolen. This hypothesis at least explains all myths of fire-stealing by the natural needs, passions, and characters of men, a jealous race, whereas the giving of fire is more akin to the original accident of changing language, and leaves the other widely diffused myths of fire-stealing in the dark. It would occupy too much space to discuss, in the ethnological method, the rest of the legend of Prometheus. Like the Australian Pundjel, and the Maori Tiki, he made men of clay. He was who, when Zeus had changed his wife into a fly, and swallowed her, broke open the god’s head and let out his daughter Athena. He aided Zeus in the struggle with the Titans. He was punished by him on some desolate hill (usually styled Caesarus) for fire-stealing, and was finally released by Heracles.

His career may be studied in Hesiod; in the splendid Prometheus redivivus made by one of his satellites, in Ceylon’s Apalanchin; in the excursus (1) of Schützius to the Aeschylean drama, and in the frequently quoted work of Kuhn. The essay of Steindhal may also be examined (Goldzicker, Myth. Hist., Eng. trans., p. 363-392), where the amused student will discover that "Moses is a Pramanthas," with much else that is as learned and convincing. See also Taylor’s Early History of Man; Nesfield in Calcutta Review (January, April, 1848); and the article Fire. (A. L.)

PROMOTER, one who promotes (Lat. promovere, to move forward), advances or forwards any scheme, project or undertaking. The most general specific sense in which the word is now used is that of a person who takes the steps necessary to the incorporation of a joint-stock company (see COMPANY) or to the passing of a private or local act of parliament. In legal history, a promoter was one who prosecuted offenders, originally as an officer of the Crown, later as a common informer; the term is still used thus of the prosecutor in a suit in an ecclesiastical court.

PRONGBUCK, PRONGHORN, or (in America) simply ANTELOPE, the sole existing representative of a family (Antilocapridae) of hollow-horned ruminants in which the horn-sheaths are forked and annually shed and renewed. Standing about 3 ft. high at the shoulder and slightly more at the crown, the male prongbuck has the black horns rising vertically upwards immediately above the eyes. The general colour is bright sandy fawn, with much white on the face, three white bars on the throat and white under parts and buttocks. The white throat-bands are evidently protective; and the long white hair on the buttocks can be erected and expanded into large chrysanthemum-like bunches as in Japanese deer; these being guides to the members of the herd when in flight. The tail is short; lateral hoofs are wanting; and the teeth are tall-crowned. Female prongbuck produce one or two young at a birth, and are either bony or furnished with small and more or less rudimentary horns.

Prongbuck, of which two races, the typical Antilocapra americana and A. mexicana, are recognized by American naturalists, inhabit the open plains of the temperate districts of western North America, where they were formerly very abundant. Nowadays their numbers have become greatly diminished and small and isolated bands represent the great herds of former years. Young prongbuck are very liable to be attacked by wolves; to protect them from these marauders the females first clear an area in the middle of a patch of cactus, by jumping on the plants with their sharp hoofs, and bring forth their offspring in the protected space. Certain extinct American ruminants, namely Cosorxy, Blastomeryx and Merocydus are believed to be in some way related to the prongbuck; but they have frontal appendages more like antlers than horns. In view of this presumed relationship it seems preferable to retain the family Antilocapridae rather than to relegate it to the rank of a sub-family of Bovidae. (See ANTELOPE.)

Pronunciation (Lat. pronuntiatio, from pronuntiare, proclaim, announce, pronounce), the action of pronouncing, the manner of uttering an articulate vocal sound (see PRONETICS and Vorce). The original sense of the Latin, a public declaration, is preserved in Spanish pronunciamiento, a manifesto or proclamation, especially as issued by a party of insurrection or revolution.

PRONY, GASPARD CLAIR FRANÇOIS MARIE RICHE DE (1755-1839), French engineer, was born at Chamelot, in the department of the Rhone, on the 2nd of July 1755, and was educated at the École Polytechnique in which this use appears, sur la possession des volûtes published in 1783, in defence of the principles of bridge construction introduced by his master J. R. Perronnet, attracted special attention. The laborious enterprise of drawing up the famous Tables du Cadastre was entrusted to his direction in 1792, and in 1794 he was appointed professor of the mathematical sciences at the École Polytechnique, becoming director at the École des Ponts et Chaussées four years later. He was employed by Napoleon tosuperintend the engineering operations for protecting the province of Ferrara against the inundations of the Po and for draining and improving the Pontine Marshes. After the Restoration he was likewise engaged in regulating the course of the Rhone, and in several other important works. He was made a baron in 1828, and a peer in 1835. He died at Anières (Seine) on the 29th of July 1839. For the "Prony Brake" see DYNAMOMETER.

Proof (in M. Eng. prove, prove, prove, &c., from O. Fr. proue, prove, &c., mod.prove, Late. Lat. proba, probare, to prove, to test the goodness of anything, probus, good), a word of which the two main branches are derived from those of "to prove," viz. to show to be true, to test, to try. Of the first division the chief meanings are: that which establishes the truth of a fact or the belief in the truth, demonstration, for the nature of which see LOGIC. In law "proof" is the general term for the establishment of the material facts in issue in a particular case by proper legal means to the satisfaction of the court (see EVIDENCE); specifically, documents so attested as to form legal evidence, written copies of what a witness is prepared to support on oath, and the evidence of any case in the court records are all termed "proofs." In Scots law the term is used of a trial before a judge alone as opposed to trial by jury. From the general sense of examination, trial or assay derived from "to prove," to test the quality of anything, "prove" has been used of that which has succeeded in standing a trial or test; the commonest example of this use applies if as a compound adjective, thus materials are said to be "waterproof," "armour-" "bullet-proof," and the like. The principal other uses are for a standard of strength for spirit (see ALCOHOL and SPIRITS) for a trial impression, in printing, on which corrections and additions can be made (see article PROOF-READING) and, in engraving and etching, for one of a limited number of impressions made before the ordinary issue is printed. In the earlier history of engraving a "proof" was an impression during the process of printing made for the artist’s inspection, approval or correction, whence its name. In the modern use of the term, where the impression has been taken from the copperplate, i.e., the general term for the form in which the book has not been "cut," these are styled "proofs."
PROOF-READING, the art or business of correcting for the press the printed "proofs" of articles or books set in type before publication. The special business of a proof-reader, attached to a printing house, is to correct these proofs before they are shown to the author; he is an intermediary between the compositor and the author, and as such his functions may vary according to his capacities. Proof-reading as a distinct department in the work of a printing office does not date from the very earliest days of "the art preservative of all arts." The first products of the printing-press show abundant evidences of the non-existence of any one specially charged with the duty of correcting the compositor's mistakes. How much conjectural emendation and consequent controversy would have been avoided if the First Folio Shakespeare had been more typographically correct! Sir Theodore Martin said that the typographical errors alone that work has had to undergo have cost the publishers nearly 20,000, which amounts to 2-25% of the total number of words in the volume. It was a usual practice in the 17th and 18th centuries for authors to send the proofs of their works round amongst their personal friends for correction; and in the universities and colleges sheets of works passing through the press were frequently hung up in the quadrangles for public inspection and correction. With the growth of printing gradually came a demand for systematic proof-reading, and the leading printers engaged scholars and men of letters to read proofs for them. Among these may be mentioned Cruden, of Concordance fame ("Alexander the Corrector"), and William Julius Mickle, poet and translator of Luiz de Camoens's Lusiads, who was a reader at the Clarendon Press. Goldsmith and Dr Johnson also are credited with having wielded the proof-reader's pen. Times, however, have changed since, as the elder D'Iserole wrote, "it became the glory of the learned to be correctors of the press to eminent printers," and to-day in every printing office the proof-reader is found—a unobtrusive functionary, known to publishers, authors, editors and journalists, but for the most part unknown to the general reading public; a functionary who yet does useful, often valuable, and always indispensable work. The influence of good proof-reading upon the character of book, newspaper and general printing is too often underrated. The celebrated old printing offices and the foremost of the modern ones owe their reputation for good workmanship largely to the excellence and thoroughness of the work done in their reading-rooms, for no perfection of paper, ink, machining or binding can atone for bad or slipshod typography.

The nature of the proof-reader's work, frequently monotonous and uninteresting, will be made clear by what follows. After the compositor (see Typesetting) has set up, by hand or type-setting machine, the "copy" supplied to him, a slip or page proof is pulled direct from the manuscript to the printer's reader. The manuscript is then read aloud by a copy-number, while the proof-reader carefully follows the text before him by letter by letter, marking on the margin of the proof all the mis-spellings, turned letters, "wrong fonts" (letters differing in size or style of face from those in the immediate context) and other errors, and seeing that the punctuation clearly defines the author's meaning. The copy-holder reads rapidly—indeed, an ordinary listener would imagine it to be impossible for the proof-reader to understand him—and as the reader is obliged to keep pace, he goes through the proof again, without the aid of the copy-holder, in order to mark any errors that may have escaped him in the first rapid reading. The proof, called the "first proof," is then sent to the compositor to be corrected. When this has been done, a further proof is submitted to the reader, who, upon satisfying himself by careful revision that it is free from typographical mistakes, passes it as "clean." If the reader, when dealing with the first proof, notices any slips in grammar or errors of fact on the part of the writer, or is in doubt whether any particular word in the manuscript has been correctly deciphered, he underlines the word or passage, and places "Qy." (query) in the margin. The proof is then despatched to the author or editor. On the return of the proof, after the writer's corrections and alterations have been carried out, the type is made up into pages and sheets and another proof pulled. This passes into the hands of the press reader (as distinguished from the "first proof-reader"), who checks the headlines, page numbers, and sequence of chapters or sections, and observes that the pages are of uniform length and that a sufficient amount of margin is allowed, before finally reading through the text. When the press-reader's corrections have been effected, the work is ready for the printing machine or the stereotyping foundry.

The cost of proof-reading may be said to range from about 7½ to 20% of the cost of composition, varying, of course, with the nature of the work.

Many prominent authors have expressed in warm terms their gratitude to the proof-reader for valuable assistance rendered by advice, criticism, and criticism of proofs and of these expressions of opinion may be given as typical, one from a novelist and one from a poet. Charles Dickens said: "I know from some slight practical experience what the duties of correctors of the press are, and how these duties are usually discharged. And I can testify, and do testify here, that they are not mechanical—that they are not mere matters of manipulation and routine; but that they require from those who perform them much natural intelligence, much superhuman composure and accuracy, a knowledge of the nature of resource, an excellent memory and a clear understanding. And I must gratefully acknowledge that I have never gone through the sheets of any book I have written without having had presented to me errors and objections of correctors of the press, that slight inconstancy into which I had fallen—some little lapse I had made—in short, without having set down in black and white a palpable indication that I had been closely followed in my work by a pair of trained eyes, and a skilful eye. In this declaration I have not the slightest doubt that the great body of my brother and sister writers would, as a plain act of justice, heartily concur. Robert Browning thus corroborated Dickens: "I have had every opportunity of becoming acquainted with, and gratefully acknowledging, the extreme service rendered to me; and, if mine be no exceptional case, the qualifications of readers and correctors are important indeed." P. Larousse spoke of French proof-readers as his "collaborateurs les plus chers," and Hugo referred to them as those "modestes savants" so well able "luster les plumes du génie"; while the Académie Française consulted them on points arising in the revision of the Academy's dictionary.

Though much good work is done by readers who have not been practical printers, yet the technical knowledge gained by working as a compositor is essential to the best proof-reading. The reader must possess a quick eye, alert to note every error or mechanical imperfection in the type, and must scrutinize closely every letter of every word, clause and sentence, while keeping a grasp of the sense of the matter he is dealing with. The more varied his information and the wider his knowledge, the better. Though his strict duty is merely to see that the author's copy is properly reproduced, he is always glad to give the author whatever help he can, and to point out such errors as he sees, and, as a consequence, he is constantly crossing the line which separates proof-reading from sub-editorial duties. From this last consideration has arisen the plea for the reader, on the daily press especially, being placed under the control of, and made responsible to, the editorial department rather than the head of the composing-room.

Proof-readers in Great Britain have a trade union, and many of them retain membership of the unions to which they belonged when in the composing-room. Some trade union is found not only as in Scotland the proof-readers insist upon readers being also members of their society. The oldest English organization devoted solely to the interests of proof-readers is the British Correctionists of the Press, founded in 1854. The chief aim of the association is to give its members information as to vacant situations, so as to keep them in full employment; but it also assists members in any case of illness, as well as in the event of their being laid off work, and provides pensions, as well as a sum of money at death. There is in France the Société des correcteurs des imprimés de Paris. There are also proof-readers' societies in several American cities, many of whose members are graduates of the English and United States women bulk largely in the rank of proof-readers. There are very few women proof-readers in London. In Edinburgh, however, women form a considerable proportion of the proof-readers.

(J. A. BL.; J. R.*)

PROPOSITION, the multiplication of a species by natural processes of reproduction (q.v.). The Latin propagare meant to fasten down (pro- and tangere, to fasten), shoots or
slips (propagines) of plants for the purpose of reproduction, hence to generate, reproduce and generally to extend or increase. It is in this sense that “propagation” is used of the spreading or dissemination of doctrines, ideas, opinions, etc. The term “propaganda,” often wrongly used as a plural word, means properly an organization or association for the spreading of particular beliefs or opinions, and is an adaptation of the name of that committee of cardinals in the Roman curia which supervises foreign missions, the full title being Congregatio de propaganda fide.

**PROPPELLANTS,** a generic name for explosives used for propelling projectiles from guns and other firearms, in order to distinguish them from the more violent explosives used in shells, mines, etc., to produce a blasting effect. Some explosive substances can be used both as propellants and as explosives. An example of a propellant may be similar, though differently proportioned and combined, to those of a “high explosive.” (For details see Explosives; Gunpowder; Cordite, etc.)

**PROPERTIUS, Sextus** (fl. 30–15 B.C.), the greatest of the elegiac poets of Rome, was born of a well-to-do Umbrian family at or near Assisii (Assisi), the birthplace also of the famous St. Francis. We learn from Ovid that Propertius was his senior, but also his friend and companion; and that he was third in the sequence of elegiac poets, following Gallus, who was born in 69 B.C., and Tibullus, and immediately preceding Ovid himself. We may not be far wrong in supposing that he was born about 10 B.C. His early life was full of misfortune. He lost his father prematurely; and after the battle of Philippi and the return of Octavian to Rome, Propertius, like Virgil and Horace, was deprived of his estate to provide land for the veterans, but, unlike them, he had no patrons at court, and he was reduced from opulence to comparative indigence. The widespread discontent which the confiscations caused provoked the insurrection generally known as the bellum perserinum from its only important incident, the fierce and fatal resistance of Perugia, which deprived the poet of another of his relations, who was killed by brigands while making his escape from the lines of Octavian. The loss of his patrimony, however, thanks no doubt to his mother’s providence, did not prevent Propertius from receiving a superior education. After, or it may be, during its completion he and she left Umbria for Rome; and there, about the year 34 B.C., he assumed the garb of manly freedom. He was urged to take up a pleader’s profession; but, like Ovid, he found in letters and gallantry a more congenial pursuit. Soon afterwards he made the acquaintance of Lycimnia, about whom we know little beyond the fact that she subsequently excited the jealousy of Cynthia, and was subsequently deprived of the security of his patronage. This passing fancy was succeeded by a serious attachment, the object of which was the famous “Cynthia.” Her real name was Hostia, and she was a native of Tibur. She was a courteous of the superior class, somewhat older than Propertius, but, as it seems, a woman of singular beauty and varied accomplishments. Her own predilections led her to literature; and in her society Propertius found the intellectual sympathy and encouragement which were essential for the development of his powers. Her character, as depicted in the poems, is not an attractive one; but she seems to have entertained a genuine affection for her lover. The intimacy began in 28 and lasted till 23 B.C. These six years must not, however, be supposed to have been a period of unbroken felicity. Apart from minor disagreements an indulgence on Propertius’s part excited the deepest resentment in Cynthia; and he was banished for a year. The quarrel was made up about the beginning of 23 B.C.; and soon after Propertius published his first book of poems and inscribed it with the name of his mistress. Its publication placed him in the first rank of contemporary poets, and amongst other things procured him admission to the literary circle of Maecenas. The intimacy was renewed; but the old enchantment was lost. Neither Cynthia nor Propertius was faithful to the other. The mutual ardour gradually cooled; motives of prudence and decorum urged the discontinuance of the connexion; and disillusion changed insensibly to disgust. Although this separation might have been expected in the final it is not certain that it was so. It is true that Cynthia, whose health appears to have been weak, does not seem to have survived the separation long. But a careful study of the seventh poem of the last book, in which Propertius gives an account of a dream of her which he had after her death, leads us to the belief that they were once more reconciled, and that in her last illness Cynthia left to her former lover the duty of carrying out her wishes with regard to the disposal of her effects and the arrangements of her funeral. Almost nothing is known of the subsequent history of the poet. He was alive in 16 B.C., as some allusions in the last book testify. And two passages in the letters of the younger Pliny mention a descendant of the poet, the Propertius Augustus, who accompanied Julius Caesar to Britain in 43 B.C. Propertius Augustus carried the Leges Juliae, which offered inducements to marriage and imposed disabilities upon the celibate. Propertius then may have been one of the first to comply with the new enactments. He would thus have married and had at least one child, from whom the contemporary of Pliny was descended.

Propertius had a large number of friends and acquaintances, chiefly literary, belonging to the circle of Maecenas. Amongst these may be mentioned Virgil, the epic poet Ponticus, Bassus (probably the iambic poet of the name), and at a later period Ovid. We hear nothing of Tibullus, nor of Horace, who also never mention Propertius, besides making frequent allusions to him is probably significant. In person Propertius was pale and thin, as was to be expected in one of a delicate and even sickly constitution. He was very careful about his personal appearance, and paid an almost foppish attention to dress and gait. He was of a somewhat voluptuous and self-indulgent temperament, which shrank from danger and active exertion. He was anxiously sensitive about the opinion of others, eager for their sympathy and regard, and, in general, impressionable to their influence. His over-emotional nature passed rapidly from one phase of feeling to another; but the more melancholy moods predominated. A vein of sadness runs through his poems, sometimes breaking out into querulous exclamation, but more frequently venting itself in gloomy reflections and prognostications. He had fits of superstition which in healthier moments he despised.

The poems of Propertius, as they have come down to us, consist of four books containing 4046 lines of elegiac verse. The first book, or Cynthia, was published separately and early in the poet’s literary life. It may be assigned to 25 B.C. The dates of the publication of the rest are uncertain, but none of them was published before 24 B.C., and the last not before 16 B.C. The unusual length of the second one (1402 lines) has led Lachmann and other critics to suppose that it originally consisted of two books, and that Propertius revised and abridged it. We have placed the beginning of the third book at i. 19, a poem addressed to Augustus, thus making five books, and this arrangement has been accepted by several editors.

The subjects of the poems are threefold: (1) amatory and personal, mostly regarding Cynthia—seventy-two (sixty Cynthia elegies), of which the last book contains three; (2) political and social, on events of the day—thirteen, including three in the last book; (3) historical and antiquarian—six, of which five are in the last book.

The writings of Propertius are noted for their difficulty and the disorder. The workmanship is unequal, curtness alternating with redundancy, and carelesslessness with elaboration. A desultory sequence of ideas, an excessive vagueness and indirectness of expression, a peculiar and abnormal latinity, a constant tendency to exaggeration, and an immoderate indulgence in learned and literary allusions—all these are obstacles lying in the way of a study of Propertius. But those who have the will and the patience to surmount them will find their trouble well repaid. For power and range of imagination, for freshness and vividness of conception, for truth and originality of presentation, few Roman poets can compare with him when he is at his best. And this is when he is carried out of himself, when the discordant qualities of his genius are, so to say, fused together.
by the electric spark of an immediate inspiration. His vanity and egotism are undeniable, but they are redeemed by his fancy and his humour.

Two of his merits seem to have impressed the ancients themselves. The first is most obvious in the scenes of quiet description and emotion in whose presentation he particularly excels. Softness of outline, warmth of colouring, a fine and almost voluptuous feeling for beauty of every kind, and a pleading and melancholy tenderness—such were the elements of the spell which he threw round the sympathies of his reader, and which his compatriots expressed by the vague but expressive word blanditia. His poetic faeitvus, or command of striking and appropriate language, is more noticeable still. Not only is his vocabulary very extensive, but his employment of it is extraordinarily bold and unconventional. New settings of use, idiom, and construction continually surprise us, and, in spite of occasional harshness, secure for his style an unusual freshness and freedom. His handling of the elegiac couplet, and especially of its second line, deserves especial recognition. It is vigorous, varied and even picturesque. In the matter of the rhythms, caesuras and elisions which it allows, the metrical treatment is much more severe than that of Catullus, whose elegiacs are comparatively rude and barbarous; but it is not bound hand and foot, like the Ovidian distich, in a formal and conventional system. Its beauty is observable in the construction of many of his elegies, and this has tempted critics to divide a number of them into strophes.

Propertius's poems bear evident marks of the study of his predecessors, both Greek and Latin, and of the influence of his contemporaries. He tells us himself that Callimachus and Philetas were his masters (ii. 1, seq.), and that it was his ambition to be the Roman Callimachus (iv. 1, 64). But, as Teuffel has said, his debt to these writers is chiefly a formal one. Even into his mythological learning he breathes a life to which these dry scholars are strangers. We can trace obligations to Meleager, Theocritus, Apollonius, Rhusus, the Pindaric style of Alexander, and the undefined tradition of Rome, Pindar, Aeschylus and others. Propertius's influence upon his successors was considerable. There is hardly a page of Ovid which does not show obligations to his poems, while other writers made a sparing use of his stories.

A just appreciation of the genius and the writings of Propertius is made sensibly more difficult by the condition in which the works have come down to us. Some poems have been lost; others are fragmentary; and many are more or less disfigured by corruption and disarrangement. The manuscripts on which we have to rely are both late and deeply interpolated. Thus the recognition and interpretation of the poems is one of peculiar delicacy and difficulty.

On the Propertius see Mommase in Hermes, iv. 370; Haupt, Opusc. i. 282. Inscriptiones of Propertius have been found at Assisi. Propertius's family was not "noble," i. 34, 55, 6, and ii. 24, 37, seq. Apart from the question of reading in iv. 1, 125 (MSS. Asis.), "the climbing walls of his town" (scandentes arces, scanidens murus, iv. 65 and loc. cit.), its nearness to Perugia, and its position close above the plain (i. 22, 9, 10) are decisive for Assisi as the birthplace of Propertius. Ovid thus assigns Propertius his place: successor fuliuis meo in alte Philibii, "the other Calpurnius," ab his serie temporis ipsius ful (Tr. iv. 10, 53, 54) (cf. ibi, ii. 457). For Ovid's friendship with Propertius see below-iv. 1, 121 seq. is the chief author for the earlier events of his life, 127 even (".. inquisitio, legati non illis actata legende Patris et in tenues cocges ipse Larus. Nam tibi cum multa versarent rura iuvenci Abstulit excultas pertica tristis opes. Elsewhere he says that he is "non illa dixit" i. 24, loc. cit. and that he had "nulla domi fortuna relicta," i. 34, loc. cit. His living on the Esquiline, ii. 23, 24, points to a competence. For the death of his kinsman, generally supposed to be the Gallus of i. 21, see i. 22, 5-6. Propertius's mother is mentioned more than once, in very affectionate terms i. 21. She was dead when he was written, i.e. six months after the publication of the first book. For the quality of Propertius's education, the poems themselves are the only, but a sufficient, testimony. For Lucina see iii. 15, 10-43. Cyprus in the island of Thapsus (i. 16, 7-8) is probably a grand-daughter (ii. 20, 8) of L. Hostius, who wrote a poem on the Iliac War of 175 b.C., of which some fragments are preserved. She was older than Propertius (i. 18, 20). That she was a meritrix is clear from many indications—her special accomplishments, her house in the Subura, the occurrence of scenes like those in i. 1, 3, ii. 29, the fact that Propertius could not marry her, &c. For references to her beauty see ii. 2, 5 sqq. and 3, 9 sqq.; i. 13, 23, 24; to her poetry, i. 3, 21; to other accomplishments, i. 2, 27 seq.; iii. 20, 7 seq. She was a princess in the line of Paullus, who lived in the second century B.C. (iii. 13, 16). She was the wife of Q. Verginius Rufus (ii. 3, 15, 16), violent of temper (iii. 8; i. 4, 18 seq.). For the five years see iii. 25, 3, "quinke tibi poti serviire fideliter annos"; and the year of estrangement, iii. 16, 9, "peccarem semel, et toto te pacumulam in animum," to which she was summoned by the" execution for the last two elegies of book iii. For the evidence that iv. 7 furnishes in favour of a reconciliation see Postgate (Prop. Introd., pp. 192 seq.). The final book i. "These vv., XXX. seq. &c. For the peripetia etiam instru aiores Propertium numentur"; (q. 22), in litteris veteres academatur expressum redditum: Propertius in prima a genus duct, vera subles coequis simillima illi in quo ille praeceptu, si spectus in manum singularem, leges opus um malis; redemt et plane in Properti domo scripture" ii. 1 and iii. 9 are addressed to Maccenas, i. 10 to Augustus. Virgil is spoken of in the highest terms in i. 7, 9; Bassus (i. 4). Lyneus, a tragic poet (i. 19, ii. 34). In Ep. ii. 2, 87 seq. Horace has been thought to make a direct attack on Propertius. On Propertius's personal appearance, see i. 1, 22, 5. 21. On the resemblance of one of him has been noted between Propertius's villa at the Villa Albanii and the Vatican, which represents a young beardless Roman, of a nervous and somewhat sickly appearance, together with a Greek poet (Visconti, Topographia romana, pi. 15, &c.). See H. Haupt, "Vergilius Ponticus," in Paullus (Ep. 54) on which see Haupt, "Properti atque iter amiores Properti numentur". iii. 17 seq. For his care about dress and the like see ii. 4, 5, seq. For want of courage and self-control and the other couplet, ii. 7, 14, 15, iv. 4, 15, iv. 5, 9 seq. The four-book numbering is not the current one and is adopted in this article though there is a little doubt that there were originally four books besides the Cyanth. For the dissertation and argument used in the second book, the exception of iv. 6 and 11, fall between the years 28 and 23 B.C. For ancient references to Propertius as a writer see Quint. x. 1, 93 (where it is stated that some (not Quintilian) preferred him 1906). Ov. A. d. 333; iii. 335; i. 245; v. 1, 172; Mart. xiv. 189, viii. 73; Pliny, loc. cit. above, Stat. Ser. i. 2, 253.

There is no existing MS. of Propertius older than the 12th century. Up till the publication of Weingarten's edition (1860), the oldest one, Neapoliensis (in the Neapolitan Museum), was regarded as the best, and even now critics are found to maintain its paramount claims. But the more judicious admit the value of the four MSS., collated by Böhrer,5 in the Brynoniae, e. 1300 (A.), manuscripts, one of 14th century (F); Ottoboniano-Vaticanus, 15th century (V); Daveniensis, 15th century (D); which has to be added the Holkhamiana, 1421 (L), collated by Postgate, Cambridge Philological Transactions (1894).

The edictio princeps of Propertius is that of 1472 (Venice). Among later editions we may mention the following, those with explanatory or critical notes being marked with an asterisk: *Scaliger (1577), &c.* *Lachmann (2nd and 3rd edns., with index verborum),* *Vulpius (1755, with index verborum),* *Burmann and Santen (1780),* *Lachmann (1816),* *Hertzberg (1843-1845),* *Gunn (1870),* *H. E. Butler (1899),* *index verborum (to his own text),* J. S. Phillimore (1906), A. E. Houman (without publishing an edition) has done much to improve and explain the poems. For further information we may refer to F. Plessis, Etudes critiques sur Propertie et ses elegies (1886), and the sections on the poet in Teuffel's and Schan's History of Roman Literature.

The following translations into English verse are known: G. F. North's 1870, &c. select. R. H. Stoddard, 1864, *Classie Poets* (1814), ii. 215 seq.; C. R. Moore (1780); J. Cranston (1875); F. A. Paley (1860), verse translations from bk. v. with notes; also a few translations by the poet Gray, vol. i. (Goss, rev. Bullen), G. T. Visconti (1894), P. J. F. Cantillon (with Nott's and Elton's versions, Bohn, 1848); J. S. Phillimore (1906).

**PROPERTY**, that which is peculiarly one's own, which belongs to or is characteristic of an individual. The Latin *proprieta* (formed from *proprium*, one's own, possibly derived from *prope*, near) in post-Augustan times was extended to ownership and rights of possession. It is thus, in law, the generic term for rights of ownership and for things subject to ownership. It is "the most comprehensive of all terms which can be used, inasmuch as it is indicative and descriptive of every possible interest which the party can have" (see Langdale, M. R., in *Jones v. Skinner*, 1835, 5 L.J. Ch. 90).
PROPHET

In Roman law and in modern systems of law based on it, property is divided into movable and immovable; in English law, on the other hand, the division is into personal property, including chattels real and real property. Theatrical usage has given a specific meaning to the word, that of any article used on the stage during the performance of a play.

PROPHET (προφήτης), a word taken from the vocabulary of ancient Greek religion, which passed into the language of Christianity, and so into the modern tongues of Europe, because it was adopted by the Hellenistic Jews as the rendering of the Hebrew נבֹה (nāḇî ̂) pl. neḇiṯîm. The word therefore as we use it is meant to convey an idea which belongs to Hebrew and not to Hellenic belief.

The Hebrew nāḇî (or nāḇî’hî, “prophet,” originally signified one who speaks or announces the divine will, is rendered highly probable by a comparison of the Assyrian naḇâ, meaning (a) “call” or “name,” (b) “announce” (see Delitzsch, Handwörterbuch sub voc). The Babylonian deity Nabû (in Old Testament Nebo) is a contraction from Na-bi-um, which thus corresponds closely with the Hebrew nāḇî* and originally signified the speaker or proclaimer of destiny. He was represented as the writer of the tablets of destiny, and was therefore regarded as the interpreter of oracles (see Zimmern, K. A. T. ii. pp. 400, 424). Accordingly this derivation is preferable to that suggested by earlier Semitists from Gessenius to Negelein (l.c. pp. 150, 151); Glauber (Rel. of the Bible, 3rd ed. 1855) connects it with another verbal root nāḇâ, “bubble” or “gush.” This Davidson (“Prophecy and Prophets,” Hastings’s Dict. Bible, p. 108 footnote) rejects. While he connects it with the Arabic root nāb’a, “come into prominence” (conj. II. “announce”), he ends by ascribing to it an ultimate Babylonian origin. Zimmern (K. A. T. ii. p. 500) gives the name of a priest-official mūnāmûb (lit. “howler”), which is derived from a Piel of nāḇâ, viz. nāḇāhû (=mūnāhû) “bawl” or “howl.” A brief sketch will be given (1) of the history of Hebrew prophecy (in supplement to what has been already said in the article HEBREW RELIGION or is to be found in the articles devoted to individual prophets), and (2) of prophecy in the early Christian Church.

1. The Prophets of the Old Testament.—The author of 1 Sam. ix. 9 tells us that “beforetime in Israel, when a man went to inquire of God, thus he spake, Come and let us go to the seer; for he that is now called a prophet (nāḇî’hî) was beforetime called a seer.” This remark is probably a later gloss. Samuel was a “seer” (ver. 11), or, as he is also called (ver. 6 seq.), “a man of God,” that is one who stood in closer relations to God than ordinary men; all that he said was sure to come to pass, so that he could be consulted with advantage even in private matters like the loss of the asses of Kish. The narrative of 1 Sam. ix. belongs, as Budde has demonstrated, to the older stratum of the narrative (called J) which includes ix., x. 1-16, xi. 1-11, 15, xii., xiv. 1-16 in which Samuel is a priest-seer of a provincial town, without the high functions of prophet (as Slōḥḥîâh). We must not suppose that the word “prophet” had merely become more common in his time and supplanted an older synonym. This is clearly shown a few verses farther down, where we see that there were already in Samuel’s time people known as neḇiṯîm, but that they were not seers. The seer (rōḵ) appears individually, and his function was probably not so much one of speech as of the routine of close observation of the entrails of slaughtered victims, like the Assyrian barû (see Pireszet). It is in this way that the function of the seer is closely connected (as in the case of Balaam) with sacrifices. With the prophets it is quite otherwise; they appear not individually but in bands; their prophesying is a united proceeding of divine inspiration and the results are dance-music. It is marked by strong excitement, which sometimes acts contagiously, and may be so powerful that he who is seized by it is unable to stand; and, though this condition is regarded as produced by a divine effluvium, it is matter of ironical comment when a prominent man like Saul is found to be thus affected. Samuel in his later days appears presiding over the exercises of a group of neḇiṯîm at Ramah, where they seem to have had a sort of coenobium (Natrioth), but he was not himself a nāḇî that name is never applied to him except in 1 Sam. iii. 21, where it is plainly used in the later sense for the idea which in Samuel’s own time was expressed by the term prophets.

But again this special type of neḇiṯîm seems to have been a new thing in Israel in the days of Samuel. Seers had been of old as in other primitive nations; of the two Hebrew words literally corresponding to our seer, rōḵ and ḥāšch, the second is found also in Arabic, and seems to belong to the primitive Semitic vocabulary. But the enthusiastic bands of prophets are nowhere mentioned before the time of Samuel; and in the whole previous history the word prophet occurs very rarely, never in the very oldest narratives, and always in that sense which we know to be later than the age of Samuel, so that the use of the term is due to writers of the age of the kings, who spoke of ancient things in the language of their own day. The appearance of the neḇiṯîm in the time of Samuel was, it would seem, as is explained in the article HEBREW RELIGION, one manifestation of the deep pulse of suppressed ingnant patriotism which began to beat in the hearts of the nation in the age of Philistine oppression, and this fact explains the influence of the movement on Saul and the interest taken in it by Samuel.

It was perhaps only in time of war, when Israel felt himself to be fighting the battles of Yahweh, that the Hebrew was stung to the depths of his nature by emotions of a religious colour. Thus the deeper feelings of religion were embodied in warlike patriotism, and these feelings the Philistine oppression had raised to extreme tension among all who loved liberty, while yet the want of a captain to lead forth the armies of Yahweh against his foesen deprived them of their natural outlet.

In its external features the new phenomenon was exceedingly like what is still seen in the East in every sīḥr or dervish—the enthusiasm of the prophets expressed itself in no artificial form, but in a way natural to the Oriental temperament. Processions with pipe and hand-drums, such as that described in 1 Sam. x., were indeed a customary part of ordinary religious feasts; but there they were an outlet for natural merriment, where they have changed their character to express an emotion more sombre and more intense, by which the prophets, and often mere chance spectators too, were so overpowered that they

1 1 Sam. x. 5 seq., xix. 20 seq. In the latter passage read "they saw the fervour of the prophets as they prophesied, &c." (see Horace, in Strabo’s Zeichenthr. 1883, p. 89), after the Syriac.

2 Hoffmann, ut supra, p. 102 seq. Ḥēsh, however, occurs very rarely in early, i.e. pre-exilian, Hebrew, viz. in 1 Sam. ix. 9, Isa. xxx. 10. We have several in the late literature of Chronicles.

3 According to the lack of distinction made between the distinction which probably existed between the rōḵ, the ḥāšch and the ṣūḇān. Cheyne, art. "Prophetic Literature" in Ency. Bib., col. 3585, appears to identify them.
seemed to lose their old personality and to be swayed by a supernatural influence. More than this hardly lies in the expression "a divine spirit" (בּ רוּ ה מָ), which is used not only of the prophetic afflatus but of the evil frenzy that afflicted Saul's later days. The Hebrews had a less narrow conception of the spiritual than we are apt to read into their records.

To give a name to this new phenomenon the Israelites, it would seem, had to borrow a word from their Canaanite neighbours. At all events the word הנבּה or nabhath is neither part of the old Semitic vocabulary (in Arabic it is a late loan word) nor has it any etymology in Hebrew, the cognate words of the prophets and the later being derived from the root ה ר כ its technical sense. But we know that there were נבּהים among the Canaanites; the "prophets" of Baal appear in the history of Elijah as men who sought to attract their god by wild orgiastic rites. In fact the presence of an orgiastic character is as marked a feature in Canaanite religion as the absence of it is in the oldest religion of Israel; but the new Hebrew "enthusiasts" had at least an external resemblance to the devotees of the Canaanite sanctuaries and this would be enough to determine the choice of a name which in the first instance seems hardly to have been a name of honour. In admitting that the name was borrowed, we are not by any means shut up to suppose that the Hebrew נבּהים simply copied their Canaanite neighbours. The phenomenon is perfectly intelligible without any such hypothesis. A wave of intense religious feeling passes over the land and finds its expression, according to the ordinary law of oriental life, in the formation of a sort of enthusiastic religious order. The Nazarites and the Chaldeans are parallel phenomena, though of vastly inferior historical importance.

It may be assumed that the name nabhath, while it originated from Babylonian sources, reached Israel through Canaanite channels (cf. Kautzsch, "Religion of Israel," in Hastings's Dict. iv. p. 552). Some support is given to this view by (a) the statement in 1 Kings xvii. 19 that four hundred prophets of Baal and Asherah sat at Jezebel's table; (b) the fact that Deborah, Samuel, Elijah, Elisha, Micaiah ben Imlah, the most notable of the earlier representatives of prophecy, belong to northern Israel, which was more subject to Canaanite-Phoenician influence.

It is certainly probable that the nabhath emerged by a process of continued development, of which the intermediate stages are lost, from the older רֵה, as the explanatory gloss in 1 Sam. ii. 9 evidently intimates. Samuel himself is called רֵה. We may assume that like the practice of the soothsayer or prophet (the earlier type of priest) and of the בּוֹדֶים (diviner), so the procedure of the רֵה was mechanical and magical in character. Clear indications of a primitive magical modus operandi appear as survivals in the narratives of the pre-exilian prophets.

The working-staff of Elisha (2 Kings iv. 29, 31) is one of these indications. There are likewise traces of survival in the examples of "sympathetic magic" transformed into the acted parable of prophecy. Students of Talhquist's مسحی seats of incantation or of the سرپ series edited by Zimmern (in his Beitrag zur Kenntniss der Babylonischen Religion) will recollect the important part the priest sorcerer recites his formulae. The accompanying actions (tying knots, &c.) which he performs are assumed to work themselves out on the enemy whose evil eye or sorcery is blasting the happiness of the suppliant (see Hastings's Dict. Bible, "Magic," p. 209, where examples are cited). The signs or symbolic acts of the prophet probably originated in the actions of sympathetic magic. Thus in the vivid scene of 1 Kings xxii. 11 the iron horns of Zedekiah ben Kena'nah, and in 2 Kings xiii. 15-19 the magic of the arrow shot eastward and of the thrice Darren floor, are evident survivals of an older practice. The

If this account of the origin of the נבּהים is correct (cf. Kuenen, Prophets, Eng. trans., p. 552 seq.), the etymological sense of the word נבּה is comparatively unimportant. The root seems to mean "to start up," or "to rise into prominence," and so "to become audible." This is based on the Arabic نِبَأُ; see the remarks at the beginning of this article.

magical act passes into sign or symbol, not however without the accompanying conception that underlies it still existing that a mysterious effectuating potency belongs to the symbolic act. The mystical power of a significant name מַעְלֶר קַלָּי bash bas inscribed on a tablet and bestowed on a child (Isa. viii. 1-4, cf. xx. 2 sqq.), of the "thongs and bars" of Jer. xxvii. (in which contending prophets confront one another in a contest of symbols), of the linen girdle of ch. xiii. 1 sqq., and of the potter's vessel of xix. 1 sqq., are further illustrations of survivals from the old world of magic. The symbol gradually passes into mere metaphor, and we already begin to see this when we compare Ezekiel's oracles and those of the Deutero-Isaiah with the meaning of the words and deeds of the prophets came to be.

The peculiar method of the prophetic exercises described in 1 Sam, were of little consequence for the future development of prophecy. The heat of a first enthusiasm necessarily cooled when the political conditions that produced it passed away; and, if the prophetic associations had done no more than organize a new form of spiritual excitement, they would have only added one to the many mechanical types of hysterical religion which are found all over the East. Their real importance was that they embodied an intenser vein of feeling than was expressed in the ordinary feasts and sacrifices, and that the greater intensity was not artificial, but due to a revival of national passion. The worship of the local sanctuaries did nothing to promote the sense of the religious unity of Israel; Yahweh in the age of the Judges ran no small risk of being divided into a number of local Baals, givers of natural good things each to his own locality. The struggle for freedom called forth a deeper sense of the unity of the people of the one Yahweh, and in so doing raised religion to a loftier plane; for a faith which unites a nation is necessarily a higher moral force than one which only unites a township or a clan. The local worship, which subsisted unchanged during the greater part of the Hebrew kingship, gave no expression to this rise in the religious consciousness of the nation; and when we see from the prophetic books of the 8th century that they lagged more and more behind the progress of religious thought. But the prophetic societies were in their origin one symptom of that upheaval of national life of which the institution of the human sovereign reigning under the divine King was the chief fruit; they preserved the traditions of that great movement; they were, in however imperfect a way, an organ of national religious feeling, and could move forward with the movement of national life. And so, though we cannot follow the steps of the process, we are not surprised to learn that they soon had an established footing in Israel, and that the prophets came to be recognized as a standing sacred element in society. What was their precise place in Hebrew life we hardly know but they formed at least a religious class which in all its traditions represented the new national and not the old communal and particularistic life. One characteristic point which appears very early is that they felt themselves called upon to vindicate the laws of divine righteousness in national matters, and especially in the conduct of the kings, who were not answerable to human authority. The cases of Nathan and David in the matter of Uriah, of Elijah and Ahab after the judicial murder of Naboth, will occur to everyone; and from the Hebrew standpoint the action of Gad in the matter of the census taken by David belongs to the same category. Such interventions with an Eastern king demanded great moral courage, for, though to some extent protected by their sacred character, the persons of the prophets were by no means legally inviolable (1 Kings xix. 2, xxii. 27; 2 Kings vi. 31). It is far from easy to determine how far the development of the class of prophets meant the absorption into it of the old seers. Probably both coexisted for some time. At all events we know from Isa. iii. 2, 3, that in Isaiah's time the בּוֹדֶים still held an important place in society, as well as the prophet and the magician. The functions of רֵה and nabhath may indeed at first have been mingled. The great prophecy of Nathan (2 Sam. vii.) is of too disputed a date to be cited in

Canaanite Prophets.

Prophetic Societies or Guilds.

Nathan.

Elijah.
Elisha, the successor of Elijah, stood in much closer relations to the prophetic societies than his great master had done. As a man of practical aims he required a circle through which to work, and he found this among the prophets, or, as they are now called, the sons of the prophets. According to Semitic idiom "sons of the prophets" most naturally means "members of a prophetic corporation," which may imply that under the headship of Elisha and the favour of the dynasty of Jehu, which owed much to Elisha and his party, the prophetic societies took a more regular form than before. The accounts we have certainly point in this direction, and it is characteristic that in 2 Kings iv. 42 first-fruits are paid to Elisha. But to an interpretation like prophecy national recognition, royal favour and fixed organization are dangerous gifts. It has always been the evil fate of the Hebrews to destroy their own highest ideals by attempting to translate them into set forms, and the ideal of a prophetic guidance of the nation of Yahweh could not have been more effectually neutralized than by committing its realization to the kind of state Church of professional prophets, "eating bread" by their trade (Amos vii. 12), which claimed to inherit the traditions of Elijah and Elisha. The sons of the prophets appear to have been grouped around the leading sanctuaries, Gilgal, Bethel, and the like (cf. Hos. ix. 8), and to have stood in an intimate relationship to the priestly corporation, as in the case of Bezalel (Exod. xxxvii. 35), though this comes out more clearly for the southern kingdom, where, down to the last days of Hebrew independence, the official prophets of Jerusalem were connected with the Temple and were under the authority of the chief priest (Jer. xxix. 26). Since the absorption of the aborigines in Israel Canaanite ideas had exercised great influence over the sanctuaries—so much so that the reforming prophets of the 8th century regarded the national religion as having become wholly heathenish; and this influence the ordinary prophets, whom a man like Micah regards as mere diviners, had certainly not escaped. They too were, at the beginning of the Assyrian period, not much more different (Jer. vi. 15). Similar presents were brought to the older prophets (1 Kings xvi. 3), and first-fruits were sometimes paid to a man of God; but the successors of Amos share his contempt for those who traded on their oracles (Mic. iii. 5 seq.).
PROPHET

Yahweh's character, purpose and relation to His people. But the false prophets were by no means mere common impostors; they were the accredited exponents of the common orthodoxy of their day, for the prophets who opposed Jeremiah took their stand on the ground of the prophetic traditions of Isaiah, whose doctrine of the inviolability of Yahweh's seat on Zion was the starting-point of their opposition to Jeremiah's predictions of captivity. No doubt there were many conscious hypocrites and impostors among the professional prophets, as there always will be among the professional representatives of a religious standpoint which is intrinsically untenable, and yet has on its side the prestige of tradition, and popular acceptance. But on the whole the false prophets deserve that name, not for their conscious impostures, but because they were content to handle religious formulas, which they had learned by rote, as if they were intuitive principles, the fruit of direct spiritual experience, to enforce a conventional morality, shutting their eyes to glaring national sins, after the manner of professional orthodoxy, and, in brief, to treat the religious status quo as if it could be accepted without question as fully embodying the unchanging principles of all religion. The popular faith was full of heathenish superstition strangely blended with the higher ideas which were the inheritance left to Israel by men like Mosaic, Elijah, but the common prophets accepted all alike, and combined heathen arts of divination and practices of mere physical enthusiasm with a not altogether insincere pretension that through their professional oracles the ideal was being maintained of a continuous divine guidance of the people of Yahweh.

Amos and his successors accepted the old ideal of prophecy if they disowned the class which pretended to embody it. "The Lord Yahweh will do nothing, but He revealeth His secret to His servants the prophets."

By a prophet Yahweh brought Israel out of Egypt, and by a prophet in each successive age Israel had been watched over and preserved. But in point of fact the function of the new prophecy was not to preserve but to destroy Israel, if Israel still meant the actual Hebrew nation, with its traditional national life. Till Amos (with the solitary exception of Micahiah ben Imlah, in Kings xxii.) prophecy was optimist—even Elijah, if he denounced the destruction of a dynasty and the annihilation of all who had bowed the knee to Baal, never doubted of the future of the nation when only the faithful remained; but the new prophecy is pessimist—it knows that Israel is rotten to the core, and that the whole fabric of society must be dissolved before reconstruction is possible. And this it knows, not by a mere ethical judgment on the visible state of society, but because it has read Yahweh's secret written in the signs of the times and knows that He has condemned His people. To the mass these signs are unintelligible, because they deem it impossible that Yahweh should utterly cast off His chosen nation; but to those who know His absolute righteousness, and confront it with the people's sin, the impending approach of the Assyrian can have only one meaning and can point to only one issue, viz. the total ruin of the nation which has denied its divine head. It is sometimes proposed to view the canonical prophets as simple interpreters of real events, who are not inspired, who can be proved by the rules of logic, and who did not predict. But the fact is, the prophecy of Israel was conditional, and told us what Israel must suffer if it does not repent. But this is an incomplete view; the peculiarity of their position is that they know that Israel as it exists is beyond repentance. Only, while they are hopeless about their nation they have absolute faith in Yahweh and His purpose. That cannot be frustrated, and, as it includes the choice of Israel as His people, it is certain that, though the present commonwealth must perish, a new and better Israel will rise from its grave. Not the reformation but the resurrection of Israel is the goal of the prophets' hopes (Hos. vi. 1 seq.).

This of course is only the broadest possible statement of a position which undergoes many modifications in the hands of individual seers, but on the whole governs all prophecy from Amos to Jeremiah. The position has, we see, two sides: on the one side the prophets are heralds of an inexcusable judgment based on the demands of absolute righteousness; on the other they represent an assured conviction of Yahweh's invincible and gracious love. The current theological formula for this two-sided position is that the prophets are at once preachers of the law and forerunners of the gospel; and, as it is generally assumed that they found the law already written, their originality and real importance is made to lie wholly in their evangelical function. But in reality as has been shown in the article on Hebrew Religion, the prophets are older than the law, and the part of their work which was really epoch-making for Israel is just the part which is usually passed over as unimportant. By emphasizing the purely moral character of Yahweh's demands from Israel, by teaching that the mere payment of service and worship at Yahweh's shrines did not entitle Israel's sins to be treated one whit more lightly than the sins of other nations, and by enforcing these doctrines through the conception that the approach of the all-destroying empire, before which Israel must fall equally with all its neighbours, was the proof of Yahweh's impartial righteousness, they gave for the first time a really broad and fruitful conception of the moral government of the whole earth by the one true God.

It is impossible to read the books of the older prophets, and especially those of the protagonist Amos, without seeing that the new thing which they are compelled to speak is not Yahweh's grace but His inexcusable and righteous wrath. That wrath must be followed by fresh mercies is not in itself a new thought, but only the necessary expression of the inherited conviction that Yahweh whom they preach as the judge of all the earth, is nevertheless, as past history has proved, the God who has chosen Israel as His people. That this is so appears most clearly in the fact that with Amos the prophecy of restoration appears only in a few verses at the end of his book, and in the still more instructive fact that neither he nor Hosea attempts to explain the rejection of Israel as the postulate of faith is to be historically realized. Recent critics, however, viz. Wellhausen, Nowack, Marti and Harper, as well as others, have denied the genuineness of the concluding verses in Amos, viz. ix. 8–15. To Hesen, at least in his latest prophecies, the fate of Judah does not appear separable from that of the northern realm—when Israel and Ephraim fall by their iniquity Judah must fall with them (Hos. v. 5). Thus even on this side there is no real bridge over the chasm that separates the total ruin impending over the Israel of the present from the glorious realm of the Israel of the future. There is a unity in the divine purpose, of which judgment and mercy are the two sides, but there is as yet no conception of an historical continuity in the execution of that purpose, and therefore no foundation laid for the maintenance of a continuous community of faith in the impending fall of the nation.

From this we can see the enormous importance of the work of Isaiah as it has been exhibited in the article Hebrew Religion; his doctrine of the remnant, never lost to the nation in the worst times, never destroyed by the most fiery judgments, supplies the lacking element of continuity between the Israel of the present and the future. Yahweh's kingdom does not perish even for a time; nay, Isaiah argues that it must remain visible, and visible not merely in the circle of the like-minded whom he had gathered round him and who formed the first germ of the notion of the church, but in the political form of a kingdom also. Zion at least, the sacred heart of Yahweh, the visible centre of His kingdom,

1 It must not be supposed that this conception necessarily came into force as soon as it was recognized that Yahweh was the creator of the universe. That the national or tribal god is the creator is an idea often found in very low religions. To us God's sovereignty over nature often seems the hardest thing to conceive; but to primitive peoples who know nothing of laws of nature, His moral sovereignty is a much more difficult conception. In the older literature of the Hebrews, the nearest approach to the thought of Amos and Hosea is Gen. ii. 1, but Gen. xviii. 25, which is not a conception of the kind of people who know nothing of laws of nature, His moral sovereignty is a much more difficult conception. In the older literature of the Hebrews, the nearest approach to the thought of Amos and Hosea is Gen. ii. 1, but Gen. xviii. 25, which is not a

2 Hosea ii. 14 seq., xi. 10 seq. are not solutions of this difficulty, as appears from their metaphorical form. They tell us that Yahweh will call His people and that they will answer; but this is only putting in another form the axiom that the gifts and calling of God are without repentance.
must remain inviolable; it can never be delivered into the hands of the Assyrian. Thus, with Isaiah in the days of Sennacherib’s invasion, the prophetic word became again, as it had been in the days of the Hebrew invasion, a beacon light to the ‘remnant’ of the horsemen of Israel,” the stay and strength of all patriotic hope.

Yet even at this crisis the resemblance between Isaiah and Elisha, between the new prophecy and the old, is more apparent than real. Elisha still stands firmly planted on the old national conception of the religion of Yahweh; his ideals are such as do not lie beyond the range of practical politics. In doing battle against the Tyrian Baal he is content with a reformation for which the whole nation can be heartily won, because it makes no radical change in their inherited faith and practices of worship. And in stimulating resistance to Syria he is still the prophet of the old ‘God of the host of Israel’ — a God who works deliverance by the thunders and smites of His earthly warriors. But Isaiah’s ideal of religion was one for which he himself demands as a preliminary condition an outpouring of Yahweh’s spirit on king (Isa. xi. 2) and people (Isa. xxxii. 15), working an entire moral regeneration. And so too it is not through the material organization of the Judaean kingdom that Isaiah looks for deliverance from Assyria. He sees with absolute clearness the powerlessness of the little realm against that great empire: the Assyrian must fall, and fall before Jerusalem, that Yahweh alone may appear to all the earth as the one true God, while all the idols appear as vain to help their worshippers. These conceptions break through the old particularistic idea of Yahweh and His religion at every point. Zion is now not the centre of a mere national cult, but the centre of all true religion for the whole world; and more than once the prophet indicates not obscurely that the necessary issue of the great conflict between Yahweh and the gods of the heathen must be the conversion of all nations, the disappearance of every other religion before the faith of the God of Israel. The pre-exilic origin of Isa. ii. 2-4 which announces that all foreign nations shall stream towards the exalted mountain of Yahweh’s temple is maintained by Duhm but is denied by many recent critics including Cornill. But this all-conquering religion is not the popular Yahweh worship; why then can the prophet still hold that the one true God is yet the God of Israel, and that the vindication of His Godhead involves the preservation of Israel? Not because His providence is confined to Israel—it embraces all nations; not because He shows any favouritism to Israel—He judges all nations by the same strict rule. If Israel alone among nations can meet the Assyrian with the boast “with us is God,” the reason is that in Zion the true God is known—not indeed to the mass, but to the prophet, and that the “holy seed” of the “remnant” (contained in the name Sheér yəshūabh) which forms the salt of the nation. The interpretation which Isaiah puts on this fact depends on the circumstance that at that date religion had never been conceived as a relation between God and individuals, or as a relation between God and a purely spiritual society, but always as a relation between a deity and some natural social group—a stock, a tribe, a nation. It was therefore only as the God of Israel that the true God could be known within Israel; and so on the one hand the little society of faith—which had not in reality the least tinge of political coherence—is thought of as yet forming the true kernel of the nation qua nation, while on the other hand the state of Judah profits by the prophetic religion insomuch as the nation must be saved from destruction in order that the prophetic faith—which is still bound up with the idea of the nation—may not be dissolved. This connexion of ideas was not of course explicitly before the prophet’s mind, for the distinctive features of a national religion could not be formulated so long as no other kind of religion had ever been heard of. When we put down in black and white the explicit details of what is involved in Isaiah’s conclusion of faith we see that it has no absolute validity. True religion can exist without having a particular nation as its subject; as soon as the idea of a spiritual community of faith had been realized. But till this was realized Isaiah was right in teaching that the law of continuity demanded that the nation within which Yahweh had made Himself known to His spiritual prophets must be maintained as a nation for the sake of the glory of God and the preservation of the “remnant.”

The withdrawal of Sennacherib’s army, in which the doctrine of the inviolability of Zion received the most striking practical confirmation, was welcomed by Isaiah and his disciples as an earnest of the speedy in bringing of the new spiritual era. But these hopes were not fulfilled. The prophetic teaching had indeed produced a profound effect; to the party of reaction, as the persecution under Manasseh shows, it seemed to threaten to subvert all society; and we can still measure the range and depth of its influence in the literary remains of the period from Isaiah to the captivity, which include Micah vi. 1-8, and that noble essay to build a complete national code on the principle of love to God, righteousness, and humanity—the legislation of Deuteronomy. Nay more, the reception of the book of Deuteronomy by king and people in the eighteenth year of Josiah shows what a hold the prophetic teaching had on the popular conscience. It was no small triumph that there was even a passing attempt to introduce such a code as the law of the land. But it was one thing to touch the conscience of the nation and another to change its heart and renew its whole life. That no code could do, and, as every practical government must adapt itself to actualities and not to a purely ideal standard, it must have appeared. at once that the attempt to govern by prophetic ideas was only sewing a new piece on an old garment. The immediate result of Josiah’s reformation was the complete dissolution of anything that could be called a political party of prophetic ideas; the priests and the ordinary prophets were satisfied with what had been accomplished; the old abuses began again, but the nation had received a reformed constitution and there was nothing more to be said.

Thus it was that, though beyond question there had been a real advance in the average ethical and spiritual ideas of the people since the time of Isaiah, Jeremiah found himself more isolated than Isaiah had ever been. Even in that earliest part of his book which is mainly a recapitulation of his experiences and work in the reign of Josiah, his tone is one of absolute hopelessness as to the future of the nation. But we should quite misunderstand this pessimism if we held it to mean that Jeremiah saw no signs of private morality and individual spiritual convictions among his people. To him as a prophet the question was whether Israel as a nation could be saved. In Isaiah’s days the answer had been affirmative; there appeared to be at least a potentiality of national regeneration in the holy seed when once it should be cleansed from the chaff by a work of judgment. But, now a century of respite had been granted, the Chaldaeans were at the gates, and there was no sign of valid national repentance. The harvest was past, the season of ripe fruits was over, and still Israel was not saved (Jer. viii. 20). The time of respite had been wasted, all attempts at national reformation had failed; how should Yahweh spare a nation which had shown no tokens of fitness to discharge the vocation of Yahweh’s people? The question was not whether there was still a faithful remnant, but whether that remnant was able to save the state as a state, and this Jeremiah was forced to deny. Nay, every attempt at genuine amendment was frustrated by the dead weight of a powerful opposition, and when the first captivity came it was precisely the best elements of Judah that went into captivity and were scattered among the nations (xxiv. 5, xxiii. 2 seq.). And so the prophet was compelled to teach that the immediate future of Israel was a blank, that the state as a state was doomed. He did not even dare to intercede for such a nation (vii. 16); though Moses and Samuel stood pleading for it before Yahweh, He could not but cast it out of His sight (xxv. 1). It was the death-struggle of the idea of a national religion (vi. 8);
the continuity of true faith refused to be longer bound up with the continuity of the nation. Still indeed the New-Testament idea of a purely spiritual kingdom of God, in this world but not of it, is beyond the prophet's horizon, and he can think of no other vindication of the divine purpose than that the true Israel shall be gathered again from its dispersion. But the condition of this restoration is now changed. To gather the dispersed implies a call of God to individuals, and in the restored Israel the covenant of Yahweh shall not be merely with the nation but with man one by one, and they shall no more teach everyone his neighbour saying, Know the Lord, for all shall know Me from the least of them even to the greatest of them" (xxxi. 33 seq.). In a word, when the nation is dissolved into its individual elements the continuity and ultimate victory of true faith depends on the relation of Yahweh to individual souls, out of which the new state shall be built up (Jer iii. 14).

Thus, for the first time in the world's history, the ultimate problem of faith is based on the relation of God to the individual believer; and this problem Jeremiah is compelled to face mainly in relation to his own personality, to assure himself that his own faith is a true possession and lifts him above all the calamities that assail him, in spite of the hopeless ruin of his nation. The struggle is a sore one; his very life is bitter to him; and yet he emerges victorious. To know that God is with him is enough though all else fail him. Now as soon as the relation of God to a single soul has thus been set free from all earthly conditions the work of prophecy is really complete, for what God has done for one soul He can do for all, but only by speaking to each believer as directly as He does to Jeremiah. Henceforth revelation is not a word to the nation spoken through an individual, but a word spoken to one which is equally valid for every one who receives it with like faith. The New Testament joins on not to the post-exilic prophets, who are only faint echoes of earlier seers, but to Jeremiah's great idea of the new covenant in which God's law is written on the individual heart, and the community of faith is the fellowship of all to whom He has thus spoken. The prophets of the restoration are only the last waves beating on the shore after the storm which destroyed the old nation, but created in its room a fellowship of spiritual religion, had passed over; they resemble the old prophets in the same imperfect way in which the restored community of Jerusalem resembled a real nation. It was only in so far as the community of faith still possessed certain external features of nationality that post-exilic prophecy was possible at all, and very soon the care of the national or quasi-national aspects of religion passed altogether out of their hands into those of the scribes, of whom Ezekiel was the first father, and whose Torah was not the living word of prophecy but the Pentateuchal code. From the time of Jeremiah downwards the perennial interest of Old-Testament thought lies in the working out of the problems of personal religion and of the idea of a spiritual fellowship of faith transcending all national limitation; and these are the motives not only of the lyrics of the Psalter but of the greater theodicies of Isa. xl.-lxvi., and of the book of Job. The theodicies of the prophets is national; they see Yahweh's righteousness working itself out with unmistakable clearness in the present, and know that all that He brings upon Israel is manifestly just; but from the days of Jeremiah the fortunes of Israel as a nation are no longer the one thing which religion has to explain; the greater question arises of a theory of the divine purpose which shall justify the ways of God with individual men or with His "righteous servant"—that is, with the ideal community of true faith as distinct from the natural Israel.

It will be seen from this rapid sketch, necessarily confined to a few of the most essential points, that Hebrew prophecy is not a thing that can be defined and reduced to a formula, but was a living institution which can only be understood by studying its growth and observing its connexion with the historical movements with which its various manifestations were bound up. Throughout the great age of prophecy the most obvious formal character that distinguished it was that the prophet did not speak in his own name but in the name of Yahweh. But the claim to speak in the name of God is one which has often been made—and made sincerely—by others than the prophets of Israel, and which is susceptible of a great variety of meanings, according to the idea of God and His relation to man which is presupposed. Every early religion seeks to realize such an intercourse with the object of worship as shall be two-sided; when the worshipper approaches the deity he desires to have an answer assuring him of acceptance and divine aid. The revelation thus looked for may be found in natural omens, in the priestly lot or some similar sacrificial oracle; or, finally, in the words of a seer who is held to be in closer contact with the deity than common men. Broadly speaking these methods of revelation are found in all ancient religions, but no other religion presents anything precisely analogous to prophecy. It is true that the prophets absorbed the old seers, and that the Israelites, as we see in the case of the asses of Kish, went to their seers on the same kind of occasions as sent heathen nations to seers or diviners. There is sufficient evidence that down to the last age of the Judean monarchy practices not essentially different from divination were current in classed society, and were often in the hands of men who claimed to speak as prophets in the name of Yahweh. But the great prophets disallowed this claim, and the distinction which they draw between true prophecy and divination is recognized not only in the prophetical law of Deuteronomy but in earlier parts of the Pentateuch and historical books. "There is no augury in Jacob and no divination in Israel; in due time it is told to Jacob and to Israel what God doth work" (Num. xxiii. 23). The seer, in the sense in which all antiquity believed in seers, is simply a man who sees what others cannot see, no matter whether the thing seen be of public or of more private interest; but the prophet is an organ of Yahweh's kingship over His people—he sees and tells so much of the secret purpose of Yahweh as is needful for His people to know. We have already seen how Amos and Hosea put this (supra, p. 201), and it does not appear that they were introducing a conception of prophecy formally novel—the new thing was their conception of Yahweh's purpose. And so too with the following great prophets; the important thing in their work was not their moral earnestness and not their specific predictions of future events, but the clearness of spiritual insight with which they grasped the spiritual significance of the form of the time and interpreted the movements of history as proofs of Yahweh's actual moral sovereignty exercised over Israel. So long as the great problems of religion could be envisaged as problems of the relation of Yahweh to Israel as a nation the prophets continued to speak and to bring forth new truths; but the ultimate result was that it became apparent that the idea of moral government involved the destruction of Israel, and then the function of prophecy was gone because it was essentially national in its objects. But meantime the relation of God to the prophet had acquired an independent significance; the inner life of Isaiah during the long years when his teaching seemed lost, or of Jeremiah through the whole course of his seemingly fruitless ministry, was rich in experiences of faith triumphing over temptations and trials, of personal converse with God sustaining the soul in the face of difficulties hopeless to the eye of sense, which formed the pattern of a new and higher stage of religion in which the relation of the individual soul to God should be set free from those limitations which had been imposed by the conception that the primary subject of religion is the nation. But the religion of the Old Testament did not become merely individualistic in becoming individual, and now the problem of spiritual faith, with the true Israel, the collective servant of Yahweh—in a word to form the idea of a spiritual commonwealth and to show how it was possible for faith to hold fast, in spite of all seeming contradiction, to the truth that Yahweh had chosen for himself a spiritual people, every member of which was in truth the object of His saving and unfailing love, and which should ultimately in very deed inherit that glory of which the carnal Israel was unworthy. This is the post-prophetic problem
PROPHET

which occupies the more profound of the later Old-Testament books, but first received its true solution in the gospel, when the law, by the 'old' nationalism disappeared and the spiritual kingdom found its centre in the person of Christ.

Old-Testament prophecy therefore forms only one stage in a larger development, and its true significance and value can only be realized when it is looked at in this light. In this as in all other matters of transcendental truth "wisdom is justified of her children"; the conclusive vindication of the prophets as true messengers of God is that their work forms an integral part in the progress of spiritual religion, and there are many things in their teaching the profundity and importance of which are much clearer to us than they could possibly have been to their contemporaries, because they are mere flashes of spiritual insight lighting up for a moment some corner of a region on which the steady sun of the gospel had not yet risen.

A less complete but yet most powerful vindication of the spiritual prophets was furnished by the course and event of Israel's history. After the captivity it was no longer a question that the prophetic conception of Yahweh was the only possible one. Thenceforth the religion of Yahweh and the religion of the prophets are synonymous; no other reading of Israel's past was possible, and in fact the whole history of the Hebrews in Canaan, as it was finally shaped in the exile, is written from this point of view, and has come down to us, along with the remains of actual prophetic books, under the collective title of "The Prophets."

To some extent this historical vindication of the prophetic insight went on during the activity of the prophets themselves. From the time of Amos downwards the prophets spoke mainly at great historical crises, when events were moving fast and a few years were often sufficient to show that they were right and their opponents wrong in their reading of the signs of the times. And here the controversy did not turn on the exact fulfilment of detailed predictions; detailed prediction occupies a very secondary place in the writings of the prophets.

The prophets themselves required no historical verification of their word to assure them that it was indeed the word of God, nor do they for a moment admit that their contemporaries are entitled to treat its authority as unproved till such verification is offered. The word of God carries its own evidence with it in its searching force and fire: "Is not my word like as a fire, saith Yahweh, and like a hammer that breaketh the rock in pieces?" (Jer. xxiv. 29).

To the prophet himself it comes with imperative force: it constrains him to speak (Amos iii. 8), seizes him with a strong hand (Isa. viii. 11), burns like a fire within his bones till it finds utterance (Jer. xx. 10); and it is this force of moral conviction, which might also commend it to the conscience of his hearers. The word of God is the word of the true God. When Deut. xviii. 20, 21, seeks the legal criterion of true prophecy in the fulfilment of prediction, the writer is no doubt guided by the remembrance of the remarkable confirmation which the doctrines of spiritual prophecy had received in history then recent, but his criterion would have appeared inadequate to the prophets themselves, and indeed this passage is one of the most striking proofs that to formulate the principles of prophetic religion in a legal code was an impossible task.

The mass of the nation, of course, was always much more struck by the "signs" and predictions of the prophets than by their spiritual ideas; we see how the idea of supernatural insight and power in everyday matters dominates the popular conception of Elijah and Elisha in the books of Kings. At a very early date the great prophets became a kind of saints or seers, and the respect paid to the tombs of the prophets, which ultimately took in almost every particular the place of the old local shrines (Matt. xxiii. 29; Jerome, Epit. Pastae, § 133; see Obadiah), can be traced back to the time before the exile.1

The Hebrew prophet stands alone among divinely appointed and inspired men of any kind of religion, though analogies in other religions present themselves. Ethical and religious teachers arose among other nations of antiquity whose precepts may well be compared with those of Hebrew prophecy. We might cite the maxims of Ani in the Egyptian papyrus Prisse (XIIIth dynasty). But these teachers did not succeed in accomplishing a task parallel to what the Hebrew prophets achieved, namely, the complete renewal and elevation of the Hebrew religion from a local and national into a universal and ethical religion. Yet instructive parallels may be found in ancient literatures. Thus the Vedical hymns are reputed to have no human authors. The names attached to them are those of the seers who "saw" them, to whom they were revealed. They are therefore merely the channels through which the divine word is communicated to man (Professor Rapson). The Rev. C. H. W. Johns (Interpreter, April 1906, "The Prophecy of Babylonia") thinks that longer discourses moral and predictive, fully equal to those of the Hebrew prophets, existed in Babylonia as early as the 3rd millennium B.C. but were curtailed into the brief sentences of the omen tablets. "The so-called 'tablet of warning to kings against injustice' gives a fair specimen of connected discourse, e.g. 'If a king hearken not to law, his people shall grow feeble and his land be ravaged. If he attend not to the justice of his land, Ea, the king of fates, shall disturb his lot, &c.' Further illustrations of ethical teaching may be found in the litany or confession of a period collected by Mr. Johns in the present volume.

It may be here stated that Winckler's conception of the Hebrew prophet Isaiah as the mouthpiece of the Assyrian court (K.A.T. II p. 172 sqq.) can be easily refuted by a reference to the Isaiahic oracles. A theory that Jeremiah was similarly influenced from Babylonia might seem more plausible, though equally baseless.

After the extinction of the prophetic voice, an ever-increasing weight was not unnaturally laid on the predictive element in their writings. Their creative religious ideas had become the common property of religious-minded Jews, at least in the somewhat imperfect shape in which they were embodied. It is worthy of note that their work on this side was carried on by the great religious poets. But the restored community which was still making a sort of faint attempt to be a religious nation as well as a Church felt very painfully the want of a direct message from God in critical times such as the prophets of old had been wont to bring. And in this need men began to look at the prophetic books, mainly in the hope that there might be found in them predictions which still awaited fulfilment, and might be taken as referring to the latter days of Persian or Greek oppression. By ignoring the free poetical form of prophecy, and still more by ignoring the fact that the prophetic pictures of the ideal future of Israel were in a sense literal, the later pious reader had entirely changed the sphere in which the problems of true religion had to be worked out, it was possible to find a great mass of unfilled prophecy which might form the basis of eschatological constructions. All this was quite in the vein of later Judaism, and so at length the unfilled predictions of the prophets served as the raw material for the elaborate eschatology of the apocalypses (see Apocalyptic Literature). In spite of superficial resemblances, mainly due to the unavoidable influence of current exegetical methods, the conception of prophecy as fulfilled in Christ is fundamentally different from the Jewish apocalyptic view of unfilled prophecy. Not external details but the spiritual ideas of the prophets find their fulfilment in the new dispensation, and they do so under forms entirely diverse from those of the old national kingdom of Yahweh.

LITERATURE.—In the ancient and medieval Church and in the dogmatic period of Protestantism there was little or no attempt at historical study of prophecy, and the prophetic books were found instructive only through the application of allegorical or typical exegesis. For details the reader may refer to Diestel, Geschichte des Alten Testaments (Jena 1866), and for the final form of orthodox Protestant views to Windisch, Dichterprophete in der Bibel, where the growing sense of the insufficiency of this treatment towards the close of the period of dogmatism showed itself in various ways. On the one hand we have the revival of apocalyptic exegesis by Cocceius and his school.
PROPHET

which has continued to influence certain circles down to the present day, and has led to the most varied attempts to find in prophecy a historical element even quite foreign to the historical view of the Christian Church down to the end of the world. On the other hand, Lowth’s Lectures on Hebrew Poetry, and the same author’s Commentary on Isaiah (1778), show the beginnings of a tendency to look mainly at the prophetic books as the writings of the poetical and prophetical poets as enlightened religious poets. This tendency culminates in Eichhorn, Die hebräischen Propheten (1816). Neither of these methods could do much for the historical understanding of prophecy. The prophetic phenomena, in their relation to the national life of ancient Israel, as a whole, are not understood, and even the prophets of the Old Testament were long blinded by the moralizing historico-rationalism which succeeded the old orthodoxy. The first requisite of real biblical scholarship, the historic prejudices had been broken through, was to get a living conception of the history in which the prophets moved; and this again called for a revision of all traditional notions as to the age of the various parts of Hebrew literature—criticism of the mass, as it were, of the prophets, and of the positions which they themselves take the first place. In recent times therefore advance in the understanding of the prophets has moved on pari passu with the higher criticism, especially the criticism of the Pentateuch, and with the general study of Hebrew history; and most works on the subject prior to Ewald must be regarded as quite antiquated except for the light they cast on detailed points of exegesis. On the prophets and their works the reader would do well to consult Ewald’s Propheten des alten Bundes (1st ed., 1840-1841, 2nd ed., 1867-1868, Eng. trans., 1876-1877). The subject is treated in all works on Old Testament introduction (among which Kuenen’s Onderzoek, vol. ii., classical in its treatment, and a series of works by the theologians of the higher protestantism Vatke, Religio des A.T., 1835). On the theology of the prophets there is a separate work by Duhm (Bonn, 1875), and Knobel’s Propheten der Hebräer (1887), is a separate introduction to the prophetic books. The history of prophecy (Ewald, 1875, Eng. trans. 1877) is in form mainly a criticism of the traditional view of prophecy, and should therefore be compared with his Onderzoek en Geschiedenis van Israel. Most English books on the subject are more theological than historical, but a sketch of Hebrew prophecy in connexion with the history down to the close of the 8th century is given by W. R. Smith, The Prophets of Israel (Edinburgh, 1883), which gives an excellent account of the historical and technical questions connected with the prophet; prophecy is much too copious to be cited here; lists will be found in several of the books already referred to. Among more recent works and articles should be mentioned Briggs, Messianic Prophecy; Gilchrist, Prophecy and Rehearsal of Prophecies; and also Volz, Die vorzeichentliche Jüdische-Prophete u. der Messias; Hünk, Die messianischen Weissagungen; R. Kittel, Prophezei u. Weissagung; Professor Kennett, Post-exil Prophets; W. H. Bennett, Post-exil- the theben (T. and T. Clarke); A. B. Davidson, "Prophets, in Hastings’s Dict. Bible; also " Prophetic Literature," by Cheyne and others in Encycl. Bibl. (W. R. S.; O. C. W.)

II. PROPHETS in the Primitive Church.—The appearance of prophets in the first Christian communities is one proof of the strength of faith and hope by which these bodies were animated. An old prophecy (Joel iii. 1) has foretold that in the Messianic age the Spirit of God would be poured out on every member of the religious community, and in point of fact it was the universal conviction of those who believed in Christ that they all possessed the Spirit of God. This Spirit, manifesting His presence in a variety of ways and through a variety of gifts, was to be the only ruling authority in the Church. He raised up for Himself particular individuals, into whose mouths He put the word of God, and these were at first regarded as the true leaders of the congregations. We find accordingly that there were prophets in the oldest church, that of Jerusalem (Acts xii. 27, xv. 32), and again that there were "prophets and teachers" in the church at Antioch (Acts xiii. 1). These were not office-bearers chosen by the congregation, but preachers raised up by the Spirit and conferred as gifts on the Church. When Paul says (1 Cor. xii. 28; cf. Eph. iv. 11), "God hath set some in the Church, first apostles, secondarily prophets, thirdly teachers," he points to a state of things which in his time prevailed in all the churches both of Jewish and heathen origin. We may suppose that the apostles occupied the second position in point of dignity; and we see from another passage (1 Cor. xiv.) that they were distinguished from the teachers by their speaking under the influence of inspiration—not, however, like the "speakers in tongues," in unintelligible ejaculations and disconnected words, but in articulate, rational edifying speech. Until recently it was impossible to form any distinct idea of the Christian prophets in the post-apostolic age, not so much from want of materials as because what evidence existed was not sufficiently clear and connected. It was understood, indeed, that they had maintained their place in the churches till the end of the 2nd century, and that the great conflict with what is known as Montanism had first proved fatal to them; but a clear conception of their position and influence in the churches was not to be had. But the discovery, by Bryennios in 1873, of the ancient Christian work called Διάκονος τῶν θησαυρῶν (published in 1881), has immensely enlarged the field of knowledge, and has at the same time thrown a clear light on many notices in other sources which for want of proper interpretation had been previously neglected or incorrectly understood.

The most important facts known at present about the manner of life, the influence, and the history of the early Christian prophets are the following: (1) Until late in the 2nd century the prophets (or prophetesses) were regarded as an essential element in a Church possessing the Holy Ghost. Their existence was believed in, and they did actually exist, not only in the catholic congregations—if the expression may be used—but also in the Marcionite Church and the Gnostic societies. Not a few Christian prophets are known to us by name: as Agabus, Judas, and Silas in Jerusalem; Barnabas, Simon Niger, &c., in Antioch; in Asia Minor, the daughters of Philip, Quadratus, Ammis, Polycarp, Melito, Montanus, Maximilla and Priscilla; in Rome, Hermas; among the followers of Basilides, Barkabbas and Barkoph; in the community of Apelles, Philumene, &c. Lucian tells us that the impostor Peregrinus Proteus, in the time of Antoninus Pius, figured as a prophet in the Christian churches of Syria. (2) Till the middle of the 2nd century the prophets were the regular preachers of the churches, without being attached to any particular congregation. While the "apostles" (i.e. itinerating missionaries) were obliged to preach from place to place, the prophets were at liberty either, like the teachers, to settle in a certain church or to travel from one to another. (3) In the time of Paul the form of prophecy was reasoned exhortation in a state of inspiration; but very frequently the inspiration took the form of ecstasy—the prophet lost control of himself, so that he did not remember afterwards what he had said. In the Gentile-Christian churches, under the influence of pagan associations, ecstasy was the rule. (4) With regard to the matter of prophecy, it might embrace anything that was necessary or for the edification of the Church. The prophets not only consoled and exhorted by the recital of what God had done and by predictions of the future, but they uttered extempore thanksgivings in the congregational assemblies, and delivered special directions, which might extend to the most minute details, as, for example, the disposal of the church funds. (5) It was the duty of the prophets to follow in all respects the example of the Lord (ἐκεῖν τῶν τρόπων τοῦ Κυρίου), and to put in practice what they preached. But an ascetic life was expected of them only when, like the apostles, they went about as missionaries, in which case the rules in Matt. x. applied to them. Whenever, on the contrary, they settled in a place they had a claim to a liberal maintenance at the hands of the congregation. The author of the Διάκονος even compares them to the High Priests of the Old Testament, and considers them entitled to the first-fruits of the Levitical law. In reality, they might justly be compared to the priests in so far as they were the mouthspeakers of the congregation in public thanksgiving. (6) Since prophets were regarded as a gift of God and as moved by the Holy Spirit, the individual congregation had no right of control over them. When anyone was approved as a prophet and exhibited the "conversation of the Lord," no one was permitted to put him to question in the church. The prophets were at least so far as to assert that whoever does this is guilty of the sin against the Holy Ghost. (7) This unique position of the prophets could only be maintained so long as the original enthusiasm remained fresh and vigorous. From these three quarters primitive Christian prophecy was exposed to danger—first, from the permanent officials of the congregation, who, in the interests of order, peace and security could not but look with suspicion on the activity of excited prophets; second, from the prophets themselves, in so
PROPILIC ACID—PROPILAEA

449

far as an increasing number of dishonest characters was found amongst them, whose object was to levy contributions on the churches; third, from those prophets who were filled with the spirit of primitive Christianity and imposed on churches, now becoming assimilated to the world, obligations which these were neither able nor willing to fulfil. It is from this point of view that we must seek to understand the so-called Montanistic crisis. Even the author of the Δαριου finds it necessary to defend the prophets who practised celibacy and strict asceticism against the reprehatory criticism of church members. In Asia Minor there was already in the year 160 a party, called by Epiphanius "Alogi," who rejected all Christian prophecy. On the other hand, it was also in Asia Minor that there appeared along with Montanus those energetic prophetesses who charged the churches and their bishops and deacons with becoming secularized, and endeavoured to prevent Christianity from being naturalized in the world, and to bring the churches once more under the exclusive guidance of the Spirit and His charismata. The critical situation thus arising spread in the course of a few decades over most of the provincial churches. The necessity of resisting the inexorable demands of the prophets led to the introduction of new rules for distinguishing true and false prophets. No prophet, it was declared, could speak in ecstasy, that was devilish; further, only false prophets accepted gifts. Both canons were innovations, designed to strike a fatal blow at prophecy and the church organization re-established by the prophets in Asia—the bishops not being quite prepared to declare boldly that the Church had no further need of prophets. But the prophets would not have been suppressed by their new methods of judging them alone. A much more important circumstance was the rise of a new theory, according to which all divine revelations were summed up in the apostles or in their writings. It was now taught that prophecy in general was a peculiarity of the Old Testament ("lex et prophetiae usque ad Johannem"); that in the new covenant God had spoken only through apostles; that the whole word of God so far as binding on the Church was contained in the apostolic record—the New Testament; and that, consequently, the Church neither required nor could acknowledge new revelations, or even instructions, through prophets. The revolution which this theory gradually brought about is shown in the transformation of the religious, enthusiastic organization of the Church into a legal and political constitution. A deeper reason for this was to be sought in the change which had taken place in the nature of prophecy in general; that is, in the way the old prophets. The strictly enforced episcopal creation, the creation of a clerical order, and the formation of the New Testament canon accomplished the overthrow of the prophets. Instead of the old formula, "God continually confers on the church apostles, prophets, and teachers," the word now was: "The Church is founded in the (written) word of the prophets (i.e. the Old Testament prophets) and the apostles (viz. the twelve and Paul)." After the beginning of the 3rd century there were still no doubt men under the control of the hierarchy who experienced the prophetical ecstasy, or clerics like Cyprian who professed to have received special directions from God; but prophets by vocation no longer existed and these sporadic utterances were in no sense placed on a level with the contents of the sacred Scriptures.

1 See Lucian's story about Peregrinus, and that of the Δαριου who had to work hard to establish criteria for distinguishing false prophets from true.

2 The Apocalypse of John was received into it, not as the work of a prophet but as that of an apostle.
The distinguished true forms Bohn, the is Inst. The often mixture (E. It the reject is not prose, which does not terminate the session and is effected by each house separately by resolution. Further, at a prorogation, a bill which has not passed all of its stages must begin again ob initio in the next session, and all proceedings, except impeachments and appeals before the House of Lords, are quashed. A prorogation is effected by the sovereign in person, or by commission. If, at the demise of the Crown, parliament stands prorogued or adjourned, it is by 6 Anne c. 7 to sit and act at once; similarly the Crown must by proclamation order parliament to sit, if prorogued, when the militia is embodied or the reserves are called out.

PROSCENIUM (Gr. πρόσκενιον), that part of the stage in the ancient Greek theatre which lies in front of the σκηνή, scena, the back wall; the word appears to embrace the whole stage between the ἄξοναρξεως and the σκηνή. In the modern theatre the word is applied to that part of the stage which is in front of the curtain and the orchestra, and sometimes to the whole front of the stage, including the curtain and the arch containing it, which separates the stage from the auditorium.

PROSE, a word supposed to be derived from the Lat. proserus, direct or straight, and signifying the plain speech of mankind, when written, or rhetorically composed, without reference to the rules of verse. It has been usual to distinguish prose very definitely from poetry (q.v.), and this was an early opinion. Ronsard said that his training as a poet had proved to him that prose and poetry were "mortal enemies." But "poetry" is a more or less metaphorical term, which cannot be used with danger as a distinctive one in this sense. For instance, an ill-inspired work in rhyme, or even a well-written metrical composition of a satirical or didactic kind, cannot be said to be poetry, and yet most certainly is not prose; it is a specimen of verse. On the other hand, a work of highly wrought and elaborately sustained non-metrical writing is often called a prose-poem. The fact that this phrase can be employed shows that the anti-thesis between prose and poetry is not complete, for no one, in jest or hyperbole, speaks of a prose-verse.

Prose, therefore, is most safely defined as comprising all forms of careful literary expression which are not metrically versified, and hence the definition from proserus, the notion being that all verse is in its nature so far artificial that it is subjected to definite and recognized rules, by which it is diverted out of the perfectly direct modes of speech. Prose, on the other hand, is straight and plain, not an artistic product, but used for stating precisely that which is true in reason or fact. The Latins called prose sermo pedestris, and later oratio soluta, thus showing their consciousness that it was not poetry, which soars on wings, and not verse, which is bound by the rules of prosodical confinement.

Prose, however, is not everything that is loosely said. It has its rules and requirements. In the earliest ages, no doubt, conversation did not exist. The rudest fragments of speech were sufficient to indicate the needs of the savage, and these blunt babblings were not prose. Later on some orator, dowered with a native persuasiveness, and desirous of making an effect upon his comrades, would link together some broken sentences, and in his heat produce with them something more coherent than a chain of ejaculations. So far as this was lucid and dignified, this would be the beginning of prose. It cannot be too often said that prose is the result of conversation, but it must at the same time be insisted upon that conversation itself is not necessarily, nor often, prose. Prose is not the negation of all laws of speech; it rejects merely those laws which depend upon metre. What the laws are upon which it does depend are not easy to enumerate or define. But this much is plain; as prose depends on the linking of successive sentences, the first requirement of it is that these sentences should be so arranged as to ensure lucidity and directness. In prose, that the meaning should be given is the primal necessity. But as it is found that a dull and clumsy, and especially a monotonous arrangement, of sentences is fatal to the attention of the listener or reader, it is
needful that to plainness should be added various attractions
and ornaments. The sentences must be built up in a manner
which displays variety and flexibility. It is highly desirable
that there should be a harmony, and even a rhythm, in the progress
of style, care being always taken that this rhythm and this
harmony are not those of verse, or recognizably metrical. Again,
the colour and form of adjectives, and their sufficient yet not
excessive recurrence, is an important factor in the construction
of prose. The omission of certain faults, too, is essential. In
every language grammatical correctness is obligatory. Here
we see a distinction between mere conversation, which is loose,
fragmentary and often, even in the lips of highly educated
persons, slightly ungrammatical; and prose, which is known
weakened whenever it is slovenly and incorrect, and to watch
very closely lest merely colloquial expressions, which cannot
be defended, should slip into careful speech. What is required
in good prose is a moderate and reasonable elevation without
bombast or bathos. Not everything that is loosely said or
vaguely thought is prose, and the celebrated phrase of M.
Jourdain in Molière's Bourgeois gentilhomme: "Par ma foi, il y
a plus de quarante ans que je dis de la prose, sans que j'en susse
rien," is not exactly true, although it is an amusing illustration
of the truth, for all the little loose phrases which M. Jourdain
has carefully avoided in his prose; they were certainly not prose
either, whatever the schoolmaster might say. On the other
hand, it seems that Erle goes too enthusiastically in the contrary
direction when he says, "Poetry, which is the organ of
Imagination, is futile without the support of Reason; Prose,
which is the organ of Reason, has no vividity or beauty or artistic
value but with the favour and sympathy of the Imagination." It
is better to hold to the simpler view that prose is literary
expression not subjected to any species of metrical law.

Greek.—The beginnings of ancient Greek prose are very
obscure. It is highly probable that they took the form of
inscriptions in temples and upon monuments, and gradually
developed into historical and topographical literature, and
local memories, and giving form to local legends. It seems
that it was in Ionia that the art of prose was first cultivated, and
a history of Miletus, composed by the half-mythical Cadmus,
is appealed to as the earliest monument of Greek prose. This,
however, is lost, and so are all the other horoi of earliest times.
We come down to something definite when we reach Hecataeus,
the first geographer, and Herodorus, the first natural philosopher,
of the Greeks; and, although the writings of these men have
disappeared, we know enough about them to see that by the
4th century B.C. the use of prose in its set modern sense had been
established in historical literature. Greek prose separated from
metrical, the character of the style of Hecataeus was, and that it
was admired for its clearness, its grammatical purity, its agreeable
individuality—qualities which have been valued in prose ever since.
These writers were promptly succeeded by Hellanics of Lesbos,
who wrote many historical books which are lost, and by Hero-
dotus of Halicarnassus, whose noble storehouse of chronicle
and legend is the earliest monument of European prose which
has come down to us. When once non-metrical language could
be used with the mastery and freedom of Herodotus, it was plain
that all departments of human knowledge were open to its
exercise. But it is still in Ionia and the mystical region that we
find it cultivated by philosophers, critics and men of science.
The earliest of these great masters of prose survive, not in their
works, but in much later records of their opinions; in philosophy
the actual writings of Thales, Anaximander, Pythagoras and
Empedocles are lost, and it is more than possible that their
cosmological rhapsodies were partly metrical, a mingling of ode
with prose sophism. We come into clearer air when we cross the
Aegean and reach the Athenian historians: Thucydides, whose priceless story of the Peloponnesian War has most fortu-
nately come down to us; and Xenophon, who continued that
chronicle in the spirit and under the influence of Thucydides,
and who carried Greek prose to a grand height of elegance and
flexibility. But it is with the practice of philosophy that prose in ancient
Greece rises to its acme of ingenuity, flexibility and variety,
proving itself a vehicle for the finest human thought such as no
later ingenuity of language has contrived to excel. The death
of Socrates (399 B.C.) has been taken by scholars as the date
when the philosophical writings of the Athenians reached their
highest pitch of perfection in the art of Plato, who is the greatest
prose writer of Greece, and, in the view of many who are well
qualified to judge, of the world. In his celebrated dialogues—
Crito, Gorgias, Phaedo, Phaedrus, the Symposium, most of all
perhaps in the Republic—we see what splendour, what elasticity,
what exactitude, this means of expression had in so short a time
developed; how little there was for future prose-writers in any
age to learn about their business. The rhetoricians were even
more highly admired by the critics of antiquity than the philo-
sophers, and it is probable that ancient opinion would have set
Demosthenes higher than Plato as a composer of prose. But
modern readers are no longer so much interested in the technique
of rhetoric, and, although no less an authority than Professor
Gilbert Murray has declared the essay-writing of the school of
Isocrates to form "the final perfection of ancient prose," the
works of the orators cease to move us with great enthusiasm.
In Aristotle we see the conscious art of prose-writing already
subordinated to the preservation and explanation of facts, and
after Aristotle's day there is little to record in a hasty outline of
the history of Greek literature.

Latin.—In spite of having the experience of the Greeks to
guide them, the Romans obeyed the universal law of literary
history by cultivating verse long before they essayed the writing
of prose. But that the example of later Greece was closely
followed in Rome is proved by the fact that the earliest prose
historians of whom we have definite knowledge, Q. F. Pictor and
L. C. Alimentus, actually wrote in Greek. The earliest annalist
who wrote in Latin was L. C. Hemina; the works of all these
early historians are lost. A great deal of primitive Roman
prose was occupied with jurisprudence and political oratory.
By universal consent the first master of Latin prose was Cato,
the great Stoic. Of Cato's own formal oratory, little is preserved;
we possess from his pen one practical treatise on agri-
culture. In the next generation we are told that the literary
perfection of oratory was carried to the highest point by Marcus
Antonius and Lucius Licinius Crassus—"by a happy chance
their styles were exactly complementary to one another, and to
hear both in one day was the highest intellectual entertainment
which Rome afforded." Unfortunately none but inconsiderable
fragments survive to display to us the qualities of Roman prose
in its golden age. Happily, however, those qualities were con-
centrated in a man of the highest genius, whose best writings
have come down to us; this is Cicero, whose prose exhibits the
Latin language to nobler, more elevated uses than any other
field. From 70 to 60 B.C. Cicero's literary work lay mainly in the field
of rhetoric; after his exile the splendour of his oratory declined,
but he was occupied upon two treatises of extreme importance,
the De oratore and the De republica, composed in 55 and 54-57
B.C. respectively; of the latter certain magnificent passages have
been preserved. The beautiful essays of Cicero's old age are
more completely known to us, and they comprise two of the
masterpieces of the prose of the world, the De amicitia and De
senectute (45 B.C.). It is to the collection of the wonderful
private letters of Cicero, published some years after his death
by Atticus and Tiro, that we owe our intimate knowledge of the
age in which he lived, and these have ever since and in every
language been held the models of epistolary prose. Of Cicero's
greatest contemporary, Julius Caesar, much less has been
preserved, and this is unfortunate because Roman critical
opinion placed Caesar at the head of those who wrote Latin
prose with purity and perfection. His letters, his grammars,
his works of science, his speeches are lost, but we retain his
famous Commentaries on the War in Gaul. Sallust followed
Caesar as an historian, and Thucydides as a master of style.
His use of prose, as we trace it in the Jugurtha and the Catilina,
is hard, clear and precise. The chronicler who so closely
followed Sallust neglected these qualities, and Latin prose, as the
Augustan age began, became more diffuse and more rhetorical.
But it was wielded in that age by one writer of the highest genius, the historian Titus Livius. He greatly enriched the tissue of Latin prose with ornament which his art had been confined to poetry; this enables him, in the course of his vast annals, "to advance without flagging through the long and intricate narrative where a simpler diction must necessarily have grown monotonous" (Mackail). The periodic structure of Latin prose, which had been developed by Cicero, was carried by Livy "to an even greater complexity." The style of Pollio, who wrote *History of the Civil Wars*, was much admired, and the loss of this work must be deplored. A different species of prose, the *plebis sermo*, or colloquial speech of the poor, is partly preserved in the invaluable fragments of a Neorionic writer, Palladius Arabian. Of the Latin prose-writers of this silver age, the elder Pliny, Quintilian and Tacitus, who adorned the last years before the decay of classical Latin, nothing need here be said.

**English.**—It was long supposed that the conscious use of prose in the English language was a comparatively recent thing, dating back at farthest to the middle of the 16th century, and due directly to French influences. Earle was the first to show that this was not the case, and to assert that we "possess a longer pedigree of prose literature than any other country in Europe. Though this may be held to be a somewhat violent statement, the Independence of English prose is a fact which rests on a firm basis." "The Code of Laws of King’s Inn" dates from the 7th century, and there are various other legal documents which may which were worn in a way that seems to denote the existence of a literary tradition. After the Danish invasion, Latin ceased to be the universal language of the educated, and translations, and the vernacular began to be required. In 887, Alfred, who had collected the principal scholars of England around him, wrote with their help, in English, his *Hand-Book*; this, probably the earliest specimen of finished English prose, is unhappily lost. Alfred’s preface to the English version in the *Cædmon’s* *Hymn* (1005) was in Latin; this translation was probably completed in 990. Later still Alfred produced various translations from Bede, Orosius, Boethius and other classics of the latest Latin, and, in 990, finishing a translation from St Augustine, we read "Here end the sayings of King Alfred." The prose of Alfred is simple, straightforward and clear, without any pretension to elegance. He had no direct followers until the time of the monastic revival, when the first name of eminence which we encounter is that of Ælfric, who, about 997, began to translate, or rather to paraphrase, certain portions of the Bible. The *Bible* of Ælfric, however, though extremely interesting historically, has the fault that it presents too close a resemblance, in structure and movement, to the alliterative verse of the age. This is particularly true of his *Homilies*. A little later vigorous prose was put forth by Wulfstan, archbishop of York, who died in 1023. At the Norman Conquest, the progress of English prose was violently checked, and, as has been acutely said, it "was just kept alive, but only like a man in catalepsy." The *Annals* of Winchester, Worcester and Peterborough were carried on in English until 1154, when they were resumed in Latin; the chronicle which thus came to an end was the most important document in English prose written before the Norman Conquest. Except in a few remote monasteries, English prose was not used, even for religious purposes, and the literature became exclusively Latin or French. There was nothing in prose that was analogous to the revival of verse in the *Ormalum* or the metrical chronicles. All the pre-Norman practice in prose belongs to what was used to be distinguished as Anglo-Saxon literature. The distinction has fallen into desuetude, as it has become more clearly perceived that there is no real break between the earlier and the later language. The Norman check, however, makes it fair to say that modern English prose begins with the *Testament of Love* of Thomas Usk, an imitation of the *De consolatione* of Boethius, which is the last prose work of the silver age. About the same time were written a number of translations, *The Tale of Melibe* and *The Parson’s Sermon* by Chaucer; the treatises of John of Trevisa, whose style in the *Pokychronon* has a good deal of vigour; and the three versions of the *Travels of Jean à Barbe*, formerly attributed to a fabulous Sir John Mandeville. The composite text of these last-mentioned versions really forms the earliest specimen of purely secular prose which can be said to possess genuine literary value, but again the fact, which has only lately been ascertained, that "Sir John Mandeville" was not an original English writer robs it of much of its value. The anonymous compiler-translator can no longer be styled "the father of English prose." That name seems more properly to belong to John Wyclif, who, in course of his fierce career as a controversialist, more and more completely abandoned Latin for English as the vehicle of his tracts. The earliest English Bible was translated by Nicholas Trivet, who had carried it up to Baruch, when he abruptly dropped it in June 1348. The completion of this great work is usually attributed, but on insufficient grounds, to Wyclif himself. A new version was almost immediately started by John Purvey, another Wyclifite, who completed it in 1388. We are still among translators, but towards the middle of the 14th century Englishmen began, somewhat timidly, to use prose as the vehicle for original work. Capgrave, an Augustinian friar, wrote a Chronicle of English history down to 1417; Sir John Fortescue, the eminent constitutional jurist, produced about 1475 a book on *The Governance of England*; and Reginald Pecock, bishop of Chichester, attacked the Lollards in his *Repression of Overmuch Blaming of the Clergy* (1455), which was so caustic and scandalous that it cost him his diocese. The prose of Pecock is sometimes strangely modern, and to judge what the ordinary English prose familiarly in use in the 15th century was it more useful to turn to *The Passion Letters*. The introduction of printing into England is coeval with a sudden development of English prose, a marvellous example of what is to be seen in Caxton’s 1485 edition of Sir Thomas Malory’s *Morte d’Arthur*, a compilation from French sources, in which the capacities of the English language for melody and noble sweetness were for the first time displayed, although much was yet wanting in strength and completeness. Caxton himself, Lord Berners and Lord Rivers, added an element of literary merit to their useful translations. The earliest modern historian was Robert Fabian, whose posthumous *Chronicles* were printed in 1515. Edward Hall was a better writer, whose *Noble Families of Lancaster and York* had the honour of being studied by Shakespeare. With the advent of the Renaissance to England, prose was heightened and made more colloquial. Sir Thomas More’s *Richard I* was a work of considerable importance; his finer *Utopia* (1516) was unfortunately composed in Latin, which still held its own as a dangerous rival to the vernacular, but in prose was begun by Nicholas Trivet, who added moral philosophy to the gradually widening range of subjects which were thought proper for English prose. In the same year Tyndale began his famous version of the Bible, the story of which forms one of the most romantic episodes in the chronicles of literature; at Tyndale’s death in 1536 the work was taken up by Miles Coverdale. The *Sermons of Latimer* (1549) introduced elements of humour, dash and vigour which had before been foreign to the stately but sluggish prose of England. The earliest biography, a book in many ways marvellously modern, was the *Life of Cardinal Wolsey*, by George Cavendish, written about 1557, but not printed (even in part) until 1631. In the closing scenes of this memorable book, which describe what Cavendish had personally experienced, we may say that the perfection of easy English style is reached for the first time. The prose of the middle of the 16th century—as we see it exemplified in the earliest English critic, Sir Thomas Wilson; the earliest English pedagogue, Roger Ascham; the distinguished humanist, Sir John Cheke—is clear, unadorned and firm, these Englishmen holding themselves bound to resist the influences coming to them from Italy and Spain, influences which were in favour of elaborate versification and tortured construction. Equal simplicity is not to be found in the works of John Bale, who had definite information to purvey, and wished a straightforward prose in which to present it. But Hoby and North, who...
translated Guevara, Castiglione and Amyot, brought with them not a few of the ingenious erotic graces of those originals, and prepared the way for the startling innovations of Lyly in his famous didactic romance of 

_Euphues_ (1579). The extravagances and eccentricities of Lyly outdid those of his continental prototypes, and euphuism became a disturbing influence which, it may be, English prose has not, even to the present hour, entirely succumbed to in its overwhelming popularity, it was opposed in its own day, not merely by the stately sobriety of Hooker, in whom we see Latin models predominant, but by the sweetness of Sir Philip Sidney in his _Arcadia_. Raleigh wrote English prose that was perhaps more majestic than any which preceded it, but he revelled in length of sentence and in ponderousness of phrase, so that it is probable that the vast prestige of _The History of the World_ on the whole delayed the emancipation of English prose, rather than it furthered it. The direct influence of the euphuistic eccentricity was seen for some time in the work of poets like Lodge and Greene, and divines like Lancelot Andrews; its indirect influence in the flowerness and violence of most careful prose down to the Restoration. Bacon, whose contempt of the vernacular is with difficulty to be excused, despised too early of our national writing. Donne cultivated a rolling and sonorous majesty of style; and Burton could use English with humour and vivacity when he gave himself the chance, but his text is a prototype of the vicious abuse of quotation which was a crowning fault of prose in the early 17th century. In spite of the skill with which, during the civil wars and the Commonwealth, certain writers, such as the satirist Taylor, Hawell, Fuller, Milton, Izak Walton) manipulated prose, and in spite of the extraordinary magnificence of the Ciceronian periods of Sir Thomas Browne, it was not until shortly before the Restoration that English prose reached its perfection. According to Dr Johnson, Sir William Temple (1628-1699) "was the first writer who gave cadence to English prose; before his time they were careless of arrangement, and did not mind whether a sentence ended with an important word or an insignificant word, or with what part of speech it concluded." The tendency was all in favour of brevity and crispness, and in particular of shorter sentences and easier constructions. Not a little of the majesty of the earlier age was lost; but for practical purposes, and in the hands of ordinary men, prose became a far more useful and businesslike implement than it had hitherto been. The short treatises of Halifax, if we compare them with similar writings of a generation earlier, display the complete change of style; or we may contrast the clear and sarcastic sentences of South with the undulating quaintness of Joseph Hall. The range of English speech was first comprehended perhaps by Dryden, who combined dignity and even pomp of movement with an ease and laxity at occasion which gave variety to prose, ran it from from 1 its stilled and too pre-technical elevation at inappropriate moments, and approximately it to the ordinary speech of cultivated persons. This then may be called the foundation of modern English prose, which has extended into no departments not recognized, at least in essence, by Bunyan, Dryden and Temple. The ensuing varieties of prose have been mainly matters of style. In the 18th century, for instance, there was a constant alternation between a quiet, rather cold elegance and precision of prose-writing, which was called the Addisonian manner, and a swelling, latinitized style, full of large words and weighty periods, in which Johnson was the most famous by far. Gibbon perhaps the most characteristic proficient. But as far as grammatical arrangement and the rules of syntax are concerned, it cannot be said that English prose has altered essentially since about 1680. It is, however, to be noted that in the course of the 19th century the use of short sentences, and the habit of neglecting to group them into paragraphs, introduced a heresy not known before; and that, on the other hand, there has been a successful attempt made to restore the beauty and variety of early 17th-century diction, which had suffered a long decline from the Restoration onwards.

Icelandic.—The independent invention of prose by the exiled aristocrats in the Heroic Age of Iceland is one of the most singular facts in literary history. It resulted from the fact that story-telling grew to be a recognized form of amusement in the isolated and refined life of an Icelandic household from the 9th to the 11th century. Something of the same kind had existed in the courts of Norway before the exodus, but it was in Iceland that it was reduced to an art and reached perfection. It is remarkable how suddenly the saga, as a composition, became a finished work; it was written in a prose which immediately presented, in the best examples, "a considerable choice of words, a richness of alliteration and a delicate use of syntax" (Vigfusson). The deliberate composition of sagas began about the year 1050, and it is supposed that they began to be written down soon after 1100. It is distinctly recorded that Ari Fróði (1067-1148) was the first man in Iceland who wrote down stories in the Norse tongue. Many of Ari's books are lost, but enough survive to show what Icelandic prose was in the hands of its earliest artificer, and the impress of his rich and simple style is felt on all the succeeding masterpieces of the great age of Icelandic history and biography. But the Greater Sagas, as they are called, the anonymous stories which followed the work of Ari and were completed in the 13th century, exhibit prose style in its most enchanting fullness, whether in the majesty of Njála, in the romantic art of Laxdæla, or in the hurrying garrulity of Eyþyrugga. There followed a vast abundance of sagas and saga-writers. The great historian, Sturla (1214-1284), is the latest of these classic writers of Iceland, and after his death there was a steady rapid decline in the purity and dignity of the sagas and prose. By the opening of the 14th century the art of writing in the old noble language had become entirely lost, and it was not until the 17th century that it began to revive as an archaeological curiosity and a playing for scholars. "For an Icelander of the present day to write modern history in saga style was a ludicrous absurdity," and the splendid living prose of the 12th century remains unrelated, a strange and unparalleled portent in the history of European literature. Of its beneficial effect on later Scandinavian, English and even Teutonic style there can be no question.

Spain.—In Castilian Spanish, as in the other languages of Europe, verse is already far advanced before we meet with any distinct traces of prose. A didactic treatise for use in the confessional is attributed to a monk of Navarre, writing in the 13th century. Between 1220 and 1250 a chronicle of Toledo was indited. But the earliest prose-writer of whom Spain can really boast is King Alphonso the Learned (1226-1284), in whose encyclopaedic treatises "Castilian makes its first great stride in the direction of exactitude and clearness" (Fitzmaurice-Kelly). Almost all the creditable prose of the end of the 13th century is attributed to Alphonso, who was helped by a sort of committee of subsidiary authors. The king's nephew, Juan Manuel (1282-1347), author of the admirable _Conde Lucanor_, carried prose to a further point of delicacy and precision. The poet Ayala (1332-1407) was another gifted artificer of Spanish prose, which suffered a setback in the hands of his successors, Santillana and Mena. It rose once more in _The Sea of Histories_ of Pérez de Guzmán (1378-1460), who has been compared to Plutarch and St Simon, and in whom the lucid and energetic purity of Castilian prose is for the first time seen in its perfection. In the 15th century the shapeless novel of chivalry was predominant, while in the age of Charles V. poetry altogether overshadowed prose. The next great writer of prose whom we meet with is Guevara, who died in 1545, and whose _Diary of Princes_ exercised an influence which was not confined to Spanish, and even extended to English prose (in North's well-known version). The historians of this period, prolix and discursive, were of less value. The earliest picaro novel, _Lazarillo de Tormes_ (1554), the authorship of which is unknown, introduced a new form and exhibited Castilian prose style in a much lighter aspect than it had hitherto worn. Still greater elegance is met with in the mystical and critical writings of Juan de Valdés and in those of Luis de León; of the latter Mr Fitzmaurice-Kelly says that "his concise eloquence and his classical purity of expression rank
him among the best masters of Castilian prose.” The instrument, accordingly, was polished and sharpened for the finest uses, and was ready to the hand of the supreme magician Cervantes, whose Don Quixote was begun a few years (about 1591) after Los Nombres de Cristo of Luis de León had been published (1583); these dates are significant in the history of Spanish prose. The prose of Lope de Vega is stately and clear, but of course has little importance in comparison with the verse of his huge theatre. Quevedo’s style had the faults which were now invading all European writing, of violent antithesis and obscure ingenuity; but his Visions (1627) occupy a prominent place in the history of Castilian prose. The latest struggles of a decadent critical conscience, battling against tautness and affectation, are seen in Gracian (1607-1658) and in Molinos (1627-1697), who vainly endeavoured to save classic prose out of the intellectual shipwreck of the 18th century. When Spanish prose revived in the 19th century, in the person of Larra (1809-1837), the influence of French models was found to have deprived it of distinctly national character, while giving it a fresh fluidity and grace.

French.—There had long been a flourishing versified literature in the vernacular of France, before anyone thought of writing French prose. It was the desire to be exact in giving information, together with a reduced sense of the value of rhyme and rhythm, which led to a partial divergence from metre. The translator of the fabulous Chronicle of Turpin mentions that he writes in prose “because rhyme entails the addition of words which are not in the Latin.” Thus about the year 1200 verse began to be abandoned by chroniclers who had some definite statements to impart, and who had no natural gifts as poets. They ceased to sing; they wrote, more or less easily, as those around them spoke. The earliest French prose was translated from the Latin, but Baldwin VI., who died in 1205, is said to have commissioned several scribes to compile in the vulgar tongue a history of the world. If this work ever existed it is lost, but we possess a Book of Stories written about 1225 by a clerk at Lille, which may fairly be said to be the start-word of French prose history. When once, however, a taste for prose was admitted, the superiority of that medium over verse as material for exact history could not but be perceived, and prose soon became frequent. The earliest French prose-writer of genius was Geoffrey (or Jofroi) de Villehardouin, who put down memoirs of his life between 1198 and 1207; he left his book, which is known as The Conquest of Constantinople, incomplete when he died in 1213. In the history of prose, Villehardouin takes an eminence place. In his admirable style are seen many of the most precious elements of French prose, its lucidity, its force, its sobriety and its charm of address. He had been trained as an orator, and it was his merit that, as M. Langlois has said, he was content to write as he had learned to speak. Villehardouin was closely followed by other admirable writers of memoirs, by Robert of Clari, by Henri of Valenciennes, by the anonymous chronicler of Béthune, to whom we owe the famous description of the battle of Bouvines, and by the Minstrel of Reims. The last-named finished his Récits in 1260. These works in the new easy manner of writing were found to be as elegant and as vivacious as any preserved by the old rhetorical art of verse. They led the way directly to the eminent writer who was the earliest historian of modern Europe, to Jean de Joinville, who finished his Histoire de St Louis in 1300. A century later Froissart left his famous Chroniques unfinished in 1404, and again a hundred years passed before Philippe de Commines dropped the thread of his Mémoires in 1511. These are the three most illustrious names in the chronicle of French medieval prose, in whom the various characteristics of the nation are separately developed. It must be noted that these three are simply the most eminent figures in a great cloud of prose-writers, who preserved with more or less vivacity the features of French life in the old metre and who, but for the persistence of the central national language. In the 15th century, moreover, Antoine de la Salle deserves mention as practically the earliest of French novelists, and one whose skill in the manipulation of language was long in waiting for a rival among his successors. But with the Renaissance came the infusion into France of the spirit of antiquity, and in Rabelais there was revealed an author of the very highest genius who at once defended the integrity of French syntax and enriched its vocabulary with an infinite multitude of forms. The year 1532, in which the first brief sketch of Gargantua appeared, was critical in French literature; for more than twenty years afterwards the structure of the great Pantagruelian romance was still being built. Meanwhile in 1549 had appeared the Défense et illustration de la langue française of Joachim du Bellay, in which the foundations of the learned and brilliant literary criticism of France were firmly laid. The liberation of the language proceeded simultaneously in all directions. In 1559 it was officially decreed that all judicial acts were thenceforward to be written in vernacular prose, “en langage maternal français et non autrement.” Calvin led the theologians, and his precise, transparent and sober prose, curiously deficient in colour, gave the model to a long line of sober rhetoricians. It is in the pages of Calvin that we meet for the first time with a simple French prose style, which is easily intelligible by the reader of to-day. There is some affectation of an ornamented pedantry in St François de Sales, some return to the form and spirit of medieval French in Montaigne; so that the prose of these great writers may easily seem to us more antiquated than that of Calvin. Yet the Institution belongs at least to 1560, and the immortal Essais at earliest to 1580. We are approaching the moment when there should be nothing left for French prose to learn, and when development should merely take forms of personal brilliancy and initiative of enterpise on lines already clearly laid down. But we pause at Brantôme, in whom the broad practice of French as Froissart and the medieval chroniclers had used it was combined with the modern passion for minute detail and the close observation of the picturesque. Here the habit of memoir-writing in French prose first becomes a passion. With the beginning of the 17th century there sprang up almost an infatuation for making prose uniformly dignified and noble, for draping it in solemn robes, for avoiding all turns of speech which could remind the reader of the “barbarous” origins of the language; the earliest examples of this subjection of eloquence to purely aristocratic forms have been traced back to the Servitude volontaire of Montaigne’s friend, La Boéte (1530-1563). In the pursuit of this dignity of speech the prose writers of the 16th century ventured to borrow not words merely but grammatical terms and peculiarities of syntax from the ancient literatures of Greece and Rome. The genius of France, however, and the necessity of remaining intelligible checked excess in this tendency, and after a few wild experiments the general result was discovered to be the widening of the capacities of the language, but at the temporary expense of some of the idiomatic richness of the old French form. In the 17th century a great stimulus was given to easy prose by the writers of romances, led by d’Urfé, and by the writers of letters, led by Balzac. In the hands of these authors French prose lost its heaviness and its solemnity; it became an instrument fit to record the sentiments of social life in an elegant balance of phrases; here was first discovered what Voltaire called the nombre et harmonie de la prose. French style became capable of venturing down to language; and this, it achieved the noblest and the subtlest expressions of human and divine philosophy, when it was used by Descartes and by Pascal to interpret their majestic thoughts to the world. At this moment of national development, in 1637, the French Academy was founded, for the distinct purpose of purifying, embellishing and enlarging the French language; and in process of time, out of the midst of the academy, and as a primary result of its labours, arose the extremely important Remarques (1647) of Vaugelas, a work of grave authority, which was the earliest elaborate treatise on the science of prose in any language. Antiquated as the method of Vaugelas now seems, and little detail by modern writers, it may be said that his famous book is still the basis of all authority on the subject of French prose. In common with his colleagues of the hour, Vaugelas strove to lay down laws by which harmony of structure,
PROSECUTION—PROSELYTE

a graceful sobriety, lucidity and exactitude of expression, could be secured to every practiced French writer. He was not adopted as an infallible lawyer, even in his own age; he was immediately exposed to the searching criticism of La Mothe le Vayer, who, however, was radically at one with him regarding the basis of his definition. The great derermit of the early academicians was that they knew little and cared less about the forms of medieval French. They thrust everything aside which they regarded as barbarous, and the work of the 19th century was to recover from a past behind Rabehals elements of great value which the 17th had arbitrarily rejected as "incorrect."

In the succeeding centuries there has been a vast extension of the practice of French prose into every conceivable department of experience and observation, and in spite of all novelties and in spite of the waves of preciosity which have periodically swept over the French language in the three hundred years which divide the age of Somaize from that of Mallarmé, the treatise of Vaugelas remains the final code in which the laws that govern French prose are preserved.

Italy.—The case of prose in the Italian language has this unique feature that, instead of gathering form obscurely and slowly, it came into sudden existence at the will of one of the greatest of writers. Latin had almost universally been used in Italy until the close of the 13th century, when Dante created a vernacular prose in the non-metrical part of his Divina Commedia and his Vita Nuova, written about 1291. For a long time the prose of Dante stood practically alone, and Petrarch actually affected to despise the works which his great predecessor had written in the vulgar tongue. But about 1348 Boccaccio started the composition of his Decameron, which gave classic form to the prose romance of Italy. There had been stories in the vernacular before, and Boccaccio himself had written the Filocolo and the Amato, but the Decameron marked the lines upon which easy and graceful Italian prose was to move for the future. It should have been greatly to the advantage of Italy over the other countries of Europe, that in the hands of Dante and Boccaccio prose was born full-grown, and hence, to that extent, the mediæval period was an uncertain development which awaited it in England, France and Spain. After this brilliant beginning, however, there was a decline in the 15th century, the writers of the next age lacking the courage to be independent of antiquity. There was a return to Latin phraseology which made many works almost macaronic in character; the famous Hypnerotomachia of Colonna is an instance of this. Something of the purity of Italian prose as Boccaccio had left it was recovered by Sannazaro in his Arcadia (1486) a pseudo-classical pastoral romance, the form of which was widely imitated throughout Europe; even Sannazaro, however, did not see how needful it was to go back to the purest Latin usages and conventions.

At length a pair of historians, Machiavelli and Guicciardini, succeeded in releasing prose from the yoke of Rome, and in writing undiluted Tuscan. In the 16th century the prose writers of Italy became extremely prolific, with Pietro Bembo at their head. The novelists were now prominent, but, although they take a foremost place in the history of Italian literature, there was little art in their employment of language. Many of them were born out of Tuscany, and, like Bandello, never learned the exact rules of pure Italian prose. Since the 16th century Italian would seem to have undergone no radical changes as a language, and its principal feature was its sobriety, and its lucidity.

At the close of the 19th century a new school of writers, with Gabriele d'Annunzio at its head, created a demand for a new prose, but it is significant that the remedy suggested by these innovators was neither more nor less than a return to the procedure of Boccaccio and Machiavelli, who remain the types of ease and dignity in Italian prose.

German.—The earliest coherent attempt at the creation of German prose belong to the age of Charlemagne, and the first example usually quoted is the Strassburger Eidschweurte of 842. For all literary purposes, however, metrical language was used everywhere up to the mittelhochdeutsch period, which lasted until the end of the 13th century. What little prose there was, was limited to jurisprudence and theology. David of Augsburg, who died in 1272, is named as the earliest preacher in the vernacular, but only one of his sermons has come down to us.

More important was Berthold "the Sweet" (1230–1272), whose sermons were discovered by Neander and published in 1824. Historical prose began with the Saxon Chronicle of 1248. There was little to record in the next two centuries, until prose was revived by Geiler von Kaisersburg (1445–1510) in his sermons. About the same time translations were made of the Decameron and of other Italian collections of novellas. The development of prose in Germany is, however, negligible until we reach the Reformation, and it is Luther's Bible (New Testament, 1522), on which all classic German prose is based. This movement is due to Luther and his immediate followers. In Germany prose was completed primarily in Latin. Johann Fischart compiled important secular books in the vernacular, in particular the Bienenkor (1579) and an imitation of Gargan (1575), which is the earliest German novel. But nearly a century passes before we reach another prose work of real importance in the German vernacular, this being the curious picaraque romance of Simplicissimus (1660) of Grimmmelshausen. But the neglect of prose by the German nation was still general, and is exemplified in the way by which men of the stamp of Leibnitz wrote in Latin and even in French, rather than in their own "barbarous tongue. What Luther had done at the beginning of the 16th century was, however, to create a German public for prose. Lessing, who must be considered as the creator of modern German prose, the critical period in this revival was 1765 to 1768, which saw the production of Loecon and the Homburgische Dramaturgie. We pass on presently to Jean Paul Richter, and so to Goethe, in whose majestic hands German prose became the organ of thought and eloquence which it has been ever since.

Mackail, Latin Literature (London, 1895); James Fitzmaurice-Kelly, History of Spanish Literature (London, 1898); G. Vigfusson, various Prolegomena. (E. G.)

PROSECUTION, the procedure by which the law is put in motion to bring an accused person to trial (see Criminal Law; Indictment; Summary Jurisdiction, and Trials). In theory at least, in the United Kingdom the king is in all criminal offences the prosecutor, because such offences are said to be against his peace, his crown and dignity, but in practice such prosecutions are ordinarily undertaken by the individuals who have suffered from the crime. This is a different procedure from that prevailing in Scotland, European continental countries and the United States, in all of which a public department or officer undertakes the prosecution of offences. A step towards public prosecution was taken in England by the Prosecution of Offences Act (1870), under which an officer called the "Director of Public Prosecutions" was appointed; in 1884 the Prosecution of Offences Act of that year revoked the appointment made under the act of 1870, and constituted the solicitor to the Treasury Director of Public Prosecutions. The Prosecution of Offences Act (1908) separated the two offices again, making public the prosecutor independent of the treasury, but putting him under the control of the Home Office. The duty of the public prosecutor is to institute, undertake or carry on criminal proceedings in any court and to give advice and assistance to persons concerned in such proceedings. The appointment of such an officer, according to the act of 1908, does not preclude any person from instituting or carrying on criminal proceedings, but the public prosecutor may, at any stage, undertake the conduct of these proceedings if he thinks fit (s. 2, 3). A person to be qualified for the post of public prosecutor must be a barrister or solicitor of not less than ten years' standing, and an assistant public prosecutor, who may be appointed under the act of 1908 and who is empowered to do any act or thing which the public prosecutor is required or authorized to do, must be a barrister or solicitor of not less than seven years' standing. See also Lord Advocate.

PROSELYTE (Gr. προσηλυτός), strictly one that has arrived (= Lat. aversus), a stranger or sojourner, a term now theoretically restricted to converts from one religion to another. It
was originally so used of converts to Judaism, but any one who sets out to convert others to his own opinions is said to “proselitize.” The word is commonly used in the Alexandrian Greek translation of the Old Testament (Septuagint) for the Hebrew word (ger) which is derived from a root (gur) denoting to sojourn. The English versions often render the word by “stranger;” but though distinguished from the home-born ‘ezrah (=one rising from the soil), the person denominated ger became the equal of the native Israelite, and, when the meaning of ger passed from a mainly civil to a religious connotation, enjoyed many rights, certain like the Arabic fara (which is philosophically cognate to ger). The ger attached himself as a client to an individual or as a protected settler to the community. He shared in the Sabbath rest (Exod. xx. 10), and was liable to the same duties and privileges as Israel (see references in Oxford Gesenius, p. 158). The Hebrew word later came to mean what we now understand by proselyte, a term which appears in the sense of convert to Judaism in the New Testament (Matt. xxii. 15; Acts ii. 10).

The Rabbinic law recognized two classes: (a) the full proselyte, the stranger of righteousness (geredes), who, was admitted after circumcision, baptism and the offering of a sacrifice (after the custom of the Proselyte); and (b) the limited proselyte, the resident alien (ger toshab) or proselyte of the gate (ger ha-shita‘ar), who, without accepting Judaism, renounced idolatry and accepted Jewish jurisdiction, thereby acquiring limited citizenship in Palestine. Some authorities think that the “God-fearers” of some of the Psalms and of the New Testament were these limited proselytes.

The Hebrew and Greek terms, however, lost the connotation of a change of residence, and both ger and “proselyte” came to apply to a convert without regard to his nationality.

At various periods there were proselytes to Judaism. The Maccabaeans used compulsion in some cases, but Judaism in the Diaspora was always more attractive to less converted Heathens than the religion of Israel an escape from their growing scepticism, and a solution to the problem of life. Josephus testifies that there was much proselytism in Rome (Against Apion, ii. 93), and several Latin writers confirm this (Cicero, Pro Flacco, § 28; Juvenal xiv. 96; cf. Reinaich, Textes d'auteurs grecs et romains relatifs au Judaïsme (1895). The well-known reference in Matt. xxv. 15 supports the view that proselytes were actively sought by the Pharisees, and the famous Didache was probably in the first instance a manual for instructing proselytes in the principles of Judaism. There were, however, varying opinions as to the value to be attached to proselytes. Some advocated their admission and their rabbinic training as a means of Israel's dispersion being divinely designed for the very purpose of proselytising (Peshah 875). In the Diaspora admission of converts may have been made easy, circumcision being sometimes omitted; it is true of proselytes being members of more than one religion, they reached their present form. It is thought that the Hadianic persecution led to this change. The Jews seem to have suffered during the war from the treachery of half-hearted friends. Again, many who were old converts joined the ranks of the Pharisees as they were strengthened by new and more skilful leaders. Moreover, in the middle ages, it was not lawful for the Jews to admit proselytes. Various church councils prohibited it, and the Code of Alfonso X. (1234) made conversion to the synagogue a capital crime. In 1222 a Christian deacon was executed at Oxford for his apostasy to Judaism: Matthew Paris, ed. Luard, ii. 711. Again, the pragmatic theory of Judaism, current among Christians, and the division of the body of converts by dogma by Maimonides (On Repenance, iii. 5, &c.), was that Judaism was not necessary for salvation, for “the plous of all nations have a share in the world to come” (Tosaphoth, Sanh. xiii. 2). If to these causes be added a certain exclusiveness which made the Jew would-be convert more than half-way, we find no difficulty in accounting for the reluctance which the medieval and modern synagogue has felt on the subject. Yet willing proselytes to Judaism are not absent, and at times quite considerable numbers have been received, provided that their bona fides are proven. In some reformed congregations in America proselytes are admitted without circumcision, and a similar policy is proposed (not yet adopted) in Judaism in America. In France, some of the leading male children of proselytes are to be required to undergo the rite. In 1896 the central conference of American Rabbis formulated as a proselyte Confession of faith these five principles: (1) God the One Creator; (2) The Mosaic Law is the Divinity of the Old Covenant; (3) The Holy One, Blessed Be He is the Judge of Retribution; and (4) Israel's Mission. Most cases of conversion to Judaism at the present time are for purposes of marriage, and female proselytes are more numerous than male. Female proselytes are admitted after the conversion of the convert's male relative. In some Reformed congregations this rite is omitted. Proselytes are still not allowed, in Orthodox circles, to become the wives of reputed descendants of the priestly families, but otherwise marriage with proselytes is altogether equal to marriage between born Jews.

**PROSERPINE** (Proserpina), the Latin form of Persephone, a Greek goddess, daughter of Zeus and the earth-goddess Demeter. In Greek mythology Demeter and Proserpine were closely associated, being known together as the two goddesses, the venerable earth-goddess, and sometimes as the great goddesses. Proserpine herself was commonly known as the daughter of Zeus, sometimes as the first-born. As she was gathering flowers with her playmates in a meadow, the earth opened and Pluto, god of the dead, appeared and carried her off to be his queen in the world. This legend was localized in various places, as at Eleusis, Lerna, and “that fair field of Enna” in Sicily. Torch in hand, her sorrowing mother sought her through the wide world, and finding her not she forbade the earth to put forth its increase. So all that year not a blade of corn grew on the earth, and men would have died of hunger if Zeus had not persuaded Pluto to send her back for only six months of the year, to let her eat the seed of a pomegranate, and thus she could not stay away from him for ever. So it was arranged that she should spend two-thirds (according to later authors, one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Pluto beneath the earth. There can be little doubt that this is a mythological expression for the growth of vegetation in spring and its disappearance in autumn. According to Theopompus there was a Western people who actually called the spring Proserpine. As wife of Pluto, she sent spectres, ruled the ghosts, and carried into effect the curses of men. The lake of Oblivion, from which they were sent to the infernal regions, was sacred to her. From the Greek name Proserpina was supposed to cut a lock of hair which had been kept sacred and unshrunk through life. She was sometimes identified with Hecate. On the other hand in her character of goddess of the spring she was honoured with flower-festivals in Sicily and at Hippionium in Italy. Sicily was a favourite haunt of the two

Some, however, regard Proserpine as a native Latin form, not borrowed from the Greek, and connected with prosperere, meaning the goddess who aided the germination of the seed.

The idea that persons who have made their way to the abode of the dead can return to the upper world if they have not tasted the food of the dead appears elsewhere, as in New Zealand (K. Taylor, Native Religion of New Zealand, p. 164, &c.), in Fiji (Bogert, Fiji), and in Polynesia. In 1834, in the Marquesas, a man who had died, and whose body was not opened, was said to have returned to the family, though this seems a fair inference from Eupir. Ali, 75, 76, 101-104. The lock so cut may have been that which was kept sacred to the gods and unshrunk (Elym. Mag., s.v., aroshahoyagon). For examples of hair dedicated to gods, see ii. xxiii. 141 seq.; Plut., Ther. 5; Paus. viii. 20. 3. In Tibet a lama (priest) is called in to cut off some hairs from the head of a dying person, in order that his soul may escape from the body; to this custom there is in popular belief a descent of a condition of a good transmigration (Horace de la Penna, in Bogle and Manning's Travels in Tibet, ed. C. R. Markham, 1876). We can hardly doubt that the intention of the Graeco-Roman custom was similar. In modern Greece the dead of Charon, is supposed to draw the soul out of the body, and if a man resists the Archons believe that Charos elits open his breast (B. Schmidt, Volksleben der Neurpfitzen, 1871, p. 229). There are other instances of incisions made in the body of a dying person to allow his soul to escape (cf. A. Bastian, Der Mensch in der Geschichte, 1860, ii. 342). The custom probably dates from the times when death in battle was the usual manner of dying; in London, it is claimed by some that the lock which was still observed in classical times in the sacrifice of animals. The practice of cutting off the hair of the dead prevailed in India, though it does not appear in the Vedas (Monier-Williams, Religious Thought and Life in India, p. 281). We are reminded of the practice of the Pawaees and other North-American Indians, who shaved the head with the exception of one lock (the scalp-lock), which was removed by a victorious enemy (Cutin, North American Indians, vol. ii. 270).
goddesses, and ancient tradition affirmed that the whole island was sacred to them. The Sicilians claimed to be the first on whom Demeter had bestowed the gift of corn, and hence they honoured the two goddesses with many festivals. They celebrated the festival of Demeter when the corn began to shoot, and the Coroi of Dionysus when it began to ripen. At Cyzico, a fountain near Syracuse which Plato made to spring up when he carried off his bride, the Syracusans held an annual festival in the course of which bulls were sacrificed by being drowned in the water. At Cyzico also, in Asia Minor, bulls were sacrificed to Proserpine. Demeter and Proserpine were worshipped together by the Athenians at the greater and less Eleusinian festivals, held in autumn and spring respectively. In the Eleusinian mysteries Proserpine no doubt played an important part.

One Greek writer, Achamachus, identified Proserpine with the Egyptian Isis. At Rome Proserpine was associated with Ceres. Proserpine is the mode in which the name of Dido is pronounced. Her votaries abstained from the flesh of domestic fowls, fish, beans, pomegranates and apples. In works of art she appears with a cornucopia or with ears of corn and a cock. The regular form of her name in Greek was Persephone, but various other forms occur: Thersphone, Persephassa, Thersaphse, Theraffata, &c., to explain which different etymologies were involved. It was a custom at Rome to Proserpine as goddess of the dead, as the old Norse goddess Hel (Gothic Hâla), whom Saxo Grammaticus calls Proserpine.

PROSKUROV, or Ploskurov, a town of Russia, in the government of Podolia, situated on the railway from Odessa to Lemberg, 62 m. N.W. of Zhermerinka junction. Pop. (1897), 22,915, more than one-half being Jews. It is poorly built, mostly of wood, on a low marshy plain surrounded by hills, at the confluence of the Ploskaya with the Bug. Its old castle has been destroyed, the site being occupied by a Roman Catholic church. The Orthodox Greek cathedral (1839) contains a very ancient and highly venerated image of the Virgin. The manufactures include oil-works and potteries; the Jewish merchants carry on an active export trade in corn and sugar, while the imports consist of salt and manufactured wares. Agriculture and market-gardening are the chief occupations of the Little-Russian inhabitants.

PROSODY (Gr. προσῳδία), the art of versification (see VERSE), including as its three divisions accent, breathing and quantity. The discipline is determined by which successive syllables are so arranged as to form verse. The Latin name for it was accentus.

PROSPECTUS (Lat. for view, look-out, prospect, from prospectare, to look forward), a written or printed preliminary announcement of some undertaking, giving the scheme or plan, the principal features, &c. In law, the term is specifically applied to the invitation issued to the public by a company to subscribe for shares in the enterprise for which the company is formed (see COMPANY).

PROSPER OF AQUITAINE, or Prosper Tiro (c. 590—c. 645), Christian writer and disciple of St Augustine, was a native of Aquitaine, and seems to have been educated at Marseilles. In 631 he appeared in Rome to interview Pope Celestine regarding the teachings of St Augustine and then all traces of him are lost until 640, the first year of the pontificate of Leo I, who had been in Gaul and thus probably had met Prosper. In any case Prosper was soon in Rome, attached to the pope in some secretarial or notarial capacity. Gennadius (De script. eccl. 85)

PROSKUROV—PROSTITUTION 457

mentions a rumour that Prosper dictated the famous letters of Leo I. against Eutyches. The date of his death is not known, but his works go as far as 435, and the fact that Ambrosius Marcellinus mentions him under the year 465 seems to indicate that his death was shortly after that date. Prosper was a layman, but he threw himself with ardour into the religious controversies of his day, defending Augustine and propagating orthodoxy. The Pelagians were attacked in a glowing polemical poem of about 1000 lines, Adversus ingratios, written about 430. The theme, domus quod. postero venezu colocare sermo Britanniæ, is relieved by a treatment not lacking in liveliness and in classical measures. After Augustine's death he wrote three series of Augustinian defences, especially against Vincent of Lerins (Pro Augustino responsiones). His chief work was against Cassian's Colloqu, his De graatio dei ut libero arbitrio (432). He also induced Pope Celestine to publish an Epistola ad episcopos Galliarum against Cassian. He had earlier opened a correspondence with Augustine, along with his friends Tyro and Hilarus, and although he did not meet him personally his enthusiasm for the great theologian led him to make an abridgment of his commentary on the Psalms, as well as a collection of sentences from his works—probably the first dogmatic compilation of that class in which Peter Lombard's Liber sententiarum is the best-known example. He also put into elegiac metre, in 160 epigrams, some of Augustine's theological dicta.

Far more important historically than these is Prosper's Epistola cymonon. It is a careless compilation from St Jerome and, as the part, among others, of the writers in the Latin Church. The lack of other sources makes it very valuable for the period from 425 to 455, which is drawn from Prosper's personal experience. There were five different editions, the last of them dating from 455, after the death of Valentinian. For a long time the Chronicon imperiale was also attributed to Prosper Tiro, but without the slightest justification. It is entirely independent of the real Prosper, and in parts even shows Pelagian tendencies and sympathies.

The Chronicon has been edited by T. Mommosen in the Chronica miserae of the Monumenta Germaniae historica (1892). The complete works are in Migne's Patrologia latina, Tome 51. See L. Valentine, St. Prosper d'Aquitaine (Paris, 1900), where a complete list of previous writings on Prosper is to be found; also A. Poitier, Bibliotheca historica (1896).

PROSSNITZ (Czech Prostîjov), a town of Austria, in Moravia, 50 m. N.E. of Brunn by rail. Pop. (1900), 24,054, mostly Czech. It is situated in the fertile plain of the Hana, and is the principal commercial centre for the sale of the various produce of the region. It has important textile, malt and sugar industries, distilling, brewing and milling, manufactures of agricultural implements and Lucifer matches. Prossnitz is a town of ancient origin, and in the 16th century was one of the chief seats of the Moravian Brethren.

PROSTITUTION (from Lat. prostituta, to expose publicly), a word which may best be defined as promiscuous unchastity for gain. In German law it is described as Gewerbsmässige Unzucht. It has always been distinguished in law and custom from concubinage, which is an inferior state of marriage, and from adultery and other irregular sexual relations, in which the motive is passion. Prostitution has existed in all civilized countries from the earliest times, and has always been subject to regulation by law or by custom. In Christian countries attempts have repeatedly been made to suppress it, but without success. Its ultimate basis lies in the two most elementary attributes of living things, namely, the will to live and the instinct of reproduction. The one represents the interest of the individual, the other that of the race; and the essential character of prostitution is that it utilizes the latter to satisfy the former, whereas in true sexual passion, as Schopenhauer has pointed out, the advantage of the individual is subordinated to the needs of the race. In practical language, prostitution offers, through abuse of the sexual instinct, a means of livelihood which a certain proportion of women prefer to other means. It is often assumed by philanthropic moralists that no other means are open to them. That may be so in cases in which deception or constraint
has been used, and adverse circumstances—such as lack of friends and a harsh social code—close the door to other occupations; but to suppose that such cases account for prostitution is to misapprehend the problem. The detailed investigations of various observers and the experience of rescue societies prove that the great majority of prostitutes prefer that means of livelihood to others entailing regular work, discipline and self-control. When they really cease to prefer the life, they leave it voluntarily. Otherwise there is extreme difficulty in reclaiming even the few who will consent to try, and permanent success is only attained with a small proportion of them. The earliest attempt at reclamation met with the same result. It was carried out by the Roman empress Theodora, wife of Justinian, herself a prostitute in early life. She established a home for 500 women on the Bosporus, but after a time they could not bear the restraint; some threw themselves into the sea, and eventually the scheme was abandoned. The preference is due to several causes, of which indolence is the chief. Prostitutes are drawn mainly from the lower classes; the life offers them an escape from the toil which would otherwise be their lot. Women who present themselves to the police for inscription on the continent of Europe frequently give as their reason for embracing the life, that they do not intend to work any more. Other causes are love of excitement and dislike of restraint. The same qualities make the criminal and the wastrel. In addition, a large proportion have the sexual appetite developed in an abnormal degree. Of 3505 women interrogated by M. Boulo Brosset, 11% admitted le goût pour l’homme. The foregoing are primary causes. External conditions which foster any of these tendencies, or destroy the self-respect and sense of modesty which are their natural antidotes, are secondary causes of prostitution. The more important are: (1) difficulty of finding employment; (2) excessively laborious and ill-paid work; (3) harsh treatment of girls at home; (4) promiscuous and indecent mode of living among the overcrowded poor; (5) the aggregation of people together in large communities and factories, whereby the young are brought into constant contact with demoralized companions; (6) the example of luxury, self-indulgence and loose manners set by the wealthier classes; (7) demoralizing literature and amusements; (8) the arts of profligate men and their agents. Alcohol is often an aid to prostitution, but it can hardly be called a cause, for the practice flourishes even more in the most abstemious than in the most drunken countries. These observations apply to the West. In Oriental countries girls are commonly born into or brought up to the trade, and in that case have no choice.

Among the ancient nations of the East, with the exception of the Jews, prostitution appears to have been connected with religious rites, and to have been tolerated but encouraged. From the Mosaic ordinances and the narrative of the Old Testament it is clear that the separation of the Jews as the chosen people, and the maintenance of their faith, were always felt by Moses and by the later prophets to be chiefly endangered by the vicious attractions of the religious rites practised around them. The code of sexual morality laid down in the Book of Leviticus is prefaced by the injunction not to do after the doings of the land of Egypt, nor after the doings of the land of Canaan, where all the abominations forbidden to the Jews were practised; and whenever the Israelites lapsed from their faith and "went a-whoring after strange gods," the transgression was always associated with licentious conduct. In Egypt, Phoenicia, Assyria, Chaldea, Canaan and Persia, the worship of Isis, Moloch, Baal, Ashtar, Miltiita and other deities consisted of the most extravagant sensual orgies, and the temples were merely centres of vice. In Babylon some degree of prostitution appears to have been even compulsory and imposed upon all women in honour of the goddess Miltiita. In India the ancient connexion between religion and prostitution still survives.

The number of those who do so is considerable. In Constantinople, from 81% of the registered prostitutes were from the register by marriage and by returning to their friends. Many women resort to prostitution occasionally in alternation with work.

2 Neither "harlot" nor "whore" is the Anglo-Saxon for a prostitute, for which the word is milstret (so in Matt. xxi. 31). "Whore" came into English from Scandinavian sources. It was not spelled with the initial h till the beginning of the 16th century. The earlier forms are hore or hoore. The word appears in many Teutonic languages, Dan. hore, Swed. horda, Du. hoer, Ger. Hure. The ultimate origin has been variously given as the root meaning "to love," seen in Lat. carus, dear. In its earliest usages the word means "adulterer" or "adulteress." It is frequent in the early version of the Bible in the sense of prostitute. "Harlot," possibly, as the New English Dictionary points out, as a less offensive word, is frequent in 16th-century versions.

The word "harlot" first appears without its present application and usually of men, in the sense of rogue, vagabond, sometimes even with no evil significance at all, as much as we use "fellow." Thus in the prologue to the Canterbury Tales, 647, where the "Sonomour" is called a "gentil harlot and a kyde." The word derives from L. arsilia, or arsilia, or arsilliad, (arsilia, arsilliad) are derived from the root arsi, to travail, to wander. In Peripatetic philosophy, Aristotle (De Viva Ratione) defines med. Lat. arsilia, as Helios, veniis deditus, and gives the Gr. arsila as an equivalent, with the meaning homo nihilis, frisno, cognitum. The Cathlicon anglicum (1483) defines "harlott as also a bastard, a frivollity, a rumble, or a whoreson. The word was echoed in the wandering players, actors, jugglers, of the day. The ultimate origin of the Latin word is unknown. Sestis connects it with the Teutonic word, which appears in Ger. keh, Eng. 'chute, which means "a house of inns." It is fancifully derived from the name of a person, via Arleto or Arlotta, the mother of William the Conqueror (William Lambard, 1356-1601, Perambulacion of Kent, pub. 1570).
PROSTITUTION

The present discussion of the vexed question of prostitution can hardly be ignored, as it is one of the most pressing problems of our time. Among the ancient Greeks, the Athenian authorities experienced the difficulties encountered by modern administrations in carrying out state regulation. There were grades of prostitution, socially though not legally recognized, and women of a superior order were too powerful for the law, which failed to maintain the ban against them. The Greek hetaerae, who were prostitutes, not "mistresses," and the most gifted and brilliant members of their class known to history, wielded great and open influence. The test case of Phryne, in which the stern attitude previously maintained by the Areopagus broke down, established their triumph over the law, with the demonstrant influence of ease and luxury when opened the door to general laxity. In later times any one could set up a diction on payment of the tax. In other Greek cities extreme licence prevailed. At Corinth, which was famous for sensual practices, a temple, with a huge staff of common prostitutes for attendants, was established in honour of Aprophite and for the accommodation of the sailors frequenting the port. The worship of this goddess became generally debased into an excuse for sexual excesses.

The Romans united the Jewish pride of race with the Greek regard for public decency, and in addition upheld a standard of austerity all their own. In early times the vice was highly honoured and strenuously maintained among them, of which the institution of the vesal virgins was a visible sign. Their attitude towards prostitution differed, accordingly, from that of other ancient nations. Among them, alone, it was considered disgraceful to a man to frequent the company of prostitutes; and this traditional standard of social conduct, which markedly distinguished them from the Greeks, retained sufficient force down to the later days of the Republic to furnish Cicero with a weapon of rhetorical attack against his political opponents, whom he denounced as scortiiores. Prostitution was more severely regulated by them than by any other ancient race. They introduced the system of police registration, which is the leading feature of administration in most European countries to-day. From the earliest days of the Republic prostitutes were required to register at the aedilies' office, where licences were issued to them on payment of a tax. They were placed under stringent control, had to wear a distinctive dress, dye their hair or wear yellow wigs, and were subject to various civil disabilities; but the severest feature of the system was that, once registered, their names were never erased, and consequently remained for ever under an indelible stain. As in our times, registration became ineffective, and neither law nor tradition could check the demand. The powerful interest of law and custom, once external conquest left the Romans free to devote their energies to the pursuit of pleasure. An attempt was made, by the enactment of severer laws against prostitution, to stem the rising tide of immorality, which threatened to taint the best blood in Rome with the basest elements in the later days of the Republic. Citizens were prohibited from marrying the descendants or relatives of prostitutes, daughters of equestrians were forbidden to become prostitutes, and married women who did so were liable to penalties. More stringent regulations were also imposed on prostitutes themselves, in addition to the old disabilities and police system, which remained in force. If these laws had any effect at all, it was to promote the general prevalence of immorality; they certainly did not diminish prostitution. The profligacy of imperial Rome has never been surpassed for gross and obscene sensuality.

The greatest change introduced by Christianity with regard to prostitution was the adoption of a more charitable attitude towards these social and legal outcasts. The Roman state tax, which had descended to the emperors and had been further regulated under Caligula, was partly given up in the 4th century by Theodosius, on the representations of Florentius, a wealthy patron, who offered to make good the loss of revenue out of his own pocket. It was fully and finally abolished by Anastasius I. in the next century, and the old registers were destroyed. Then some of the civil disabilities of prostitutes were removed by Justinian in the 6th century. Gibbon, who never gave them a good motive when a base one could be found, attributes Justinian's action solely to his desire to marry Theodora, whose life had been notorious; and no doubt she influenced him in the matter, but it is permissible to assume a good motive. Even Gibbon is constrained to admit her virtue after marriage, and to give her credit for the most benevolent institution of Justinian's reign, the rescue home for fallen women in Constantinople, which was at any rate disinterested. Though it did not succeed, it marks a turning-point in the treatment of a class which had never met with public sympathy before. At the same time procrastination and connivance were severely written to. Griman is that brothel-keeping had not ceased. The early Christian Church laid great stress on chastity, which probably suggested to its Roman persecutors the horrible punishment of forcibly prostituting Christian maidens. Such malignity enhanced the glory of martyrdom without shaking the constancy of its victims; and the triumph of purity in an age of unbounded licence was conspicuously recognized by Alaric, the Gothic conqueror, who gave strict orders in the sack of Rome that the virtue of Christian women was to be respected. The church, however, was not severe upon prostitutes, to whom the altar was open upon repentance, and some of the fathers explicitly recognized their trade as a necessary evil. Among them was St Augustine, a man of the world, who saw that its suppression would stimulate more destructive forms of immorality. Gradually charity degenerated into patronage. Rome, conquered spiritually by Christianity and materially by the northern barbarians, sapped the virtue of both. Before the middle ages the institutions and ministers of the Church became a by-word for vice. Charlemagne made an effort to suppress the prevailing disorder, but his private life was licentious, and his capitularies, which ordained the scourging of prostitutes and panders, were not inspired by any regard for morality. A period of reform followed. The rise of chivalry, with its lofty idealization of women, and the wave of Christian fervour connected with the Crusades, inspired a vigorous and high-minded campaign against an all-prevalent evil. The Church became exceedingly active in prevention and rescue work, and was assisted by a devout and zealous laity. Rescue missions were organized, convents were founded everywhere for the reception of penitents, and dowries were subscribed to procure them husbands. Fulke de Neivill was a conspicuous figure in this work. He held missions, preached, and collected large sums for marriage dowries. Pope Innocent III. (1208-1216) pronounced it a praiseworthy act to marry a prostitute; and Gregory IX., a few years later, wrote to Germain that brothel-keeps were not an indelible stain. The Pope received the prostitutes from attending missions, and that clergy and laity who drew profit from prostitution were banned. "Urge bachelors," he wrote, "to marry repentant girls, or induce the latter to enter the cloister." In spite of such efforts, and of occasional spasms of severity by individual rulers, prostitution flourished everywhere throughout the middle ages. It was not merely tolerated, but licensed and regulated by law. In London there was a row of "bordells" (brothels) or "stews" in the Borough near London Bridge. They were originally licensed by the bishops of Winchester, according to John Nortthouck, and subsequently sanctioned by parliament. Stow quotes the regulations enacted in the year 1161, during the reign of Henry II. These were rather protective than repressive, as they settled the rent which women had to pay for the rooms, and forbad their compulsory detention. The act was afterwards confirmed in the reigns of Edward III. and Richard II. In 1383 the bordells belonged to William Walworth, lord mayor of London, who farmed them out, probably on behalf of the Corporation, according to analogy in other parts of Europe. They were closed in 1360, but reopened until 1346, when they were abolished by Henry VIII. In London we get the earliest known regulations directed against the spread of venereal
disease. The act of 1161 forbade the bordell-keepers to have women suffering from the "perilous infirmity of burning"; and by an order of 1430 they were forbidden to admit men suffering from an *infirmitas nefanda*. Probably it was by virtue of this order that in 1439 two keepers were condemned to eleven days' imprisonment and banishment from the city. In 1473, again, it is recorded that bawds and strumpets were severely handled by Lord Mayor Hampton.

Elsewhere in Europe much the same state of things prevailed during the same period. Prostitution was both protected and regulated, and in many places it constituted a source of public revenue. In France prostitutes were distinguished by a badge, and forbidden to wear jewels and fine stuffs and to frequent certain public places. Public brothels were established at Toulouse, Avignon and Montpellier. At Toulouse the profits were shared between the city and the university; at Montpellier and Avignon the trade was a municipal monopoly, and farmed out to individuals; at Avignon, where the establishment was kept up during the whole period of the popes' residence, the inmates were subjected to a weekly examination. In 1254 Louis IX. issued an edict exiling prostitutes and brothel-keepers; but it was repealed two years later, though in this and the succeeding century procurement was punished with extreme severity. In some parts of France prostitutes paid a tax to the seigneur. In Germany, according to Fidlauch, the punishment and protection of *Lust-Direnen* was a regular thing in all the large towns during the middle ages. "Frauenhäuser," similar to those in London and in France, existed in many places. They are mentioned in Hamburg in 1292; and from later records it appears that they were built by the corporation, which farmed them. So also in Ulm, where special regulations were issued in 1430. We find them existing at Regensburg in 1306, at Zürich in 1314, at Basel in 1356 and Vienna in 1384. According to Henne-am-Rhyn, admission to these houses was forbidden to married men, clergy and Jews, and on Sundays and saints' days they were closed. Since the emperor Frederick II. in the 13th century contained some curious provisions. An accuser convicted of a criminal assault on a prostitute against her will was liable to be beheaded; if she made a false accusation she was subject to the same penalty. Any one not going to the assistance of a woman calling for help was liable to a heavy fine. In these ordinances the influence of chivalry may be detected. At the same time prostitutes were forbidden to live among respectable women or to go to the baths with them. Hospitality to important guests included placing the public Frauenhäuser at their disposal. So King (afterwards Emperor) Sigismund was treated at Bern in 1444 and at Ulm in 1443, so much to his satisfaction that he publicly complimented his hosts on it. Besides the municipal Frauenhäuser, there were "Winkelhäuser," which were regarded as irregular competitors. In 1492 the licensed women of Nuremberg complained to the mayor of this unfair competition, and in 1508 they received his permission to storm the obnoxious Winkelhaus, which they actually did. In Italy and Spain the system appears to have been very much the same. At Bologna prostitutes had to wear a distinctive dress, in Venice they were forbidden to frequent the wine-shop, and in Ravenna they were compelled to leave a neighbourhood on the complaint of other residents. At Naples a court of prostitutes was established, having jurisdiction over everything connected with the public profession. It led to great abuses, was reformed in 1580, and abolished about a century later.

Such was the state of things in the middle ages. In the 15th and 16th centuries a great change took place. It was due to two very different causes: (1) fear of disease; (2) the Reformation. With regard to the first, there can be little doubt that both the slighter and graver forms of venereal disease existed in very remote times, but until the 15th century they attracted comparatively little attention. The constitutional character of syphilis was certainly not understood, which is by no means surprising in the 16th century. Public brothels on a large scale were estab-

(see *Venereal Diseases*)—but one would still have expected to find more notice taken of it by historical, moral and medical writers in classical and medieval times. Nor is it possible to explain their refusal to prudery, in view of the unboundedly liberal licence permitted in those ages. One can only conclude that the evil was less widely spread or less virulent than it afterwards became. At the end of the 15th century it attracted so much notice that it was supposed to have originated then *de novo*, or to have been brought from the West Indies by Columbus—both untenable hypotheses; and, as usual, each country accused some other of bringing the contagion within its borders. To speculate on the cause of this increased prevalence would be idle; it is enough to note the fact and its consequences. It was immediately followed by the Reformation, and the two together led to a general campaign against the system of licensed prostitution. Public brothels were abolished in Ulm in 1531, in Basel in 1534 and in Nuremberg in 1562. In London, as already noted, the bordells were abolished in 1446. In Paris an ordinance was issued in 1560 prohibiting these establishments, and later all prostitutes were required to leave the city within twenty-four hours. These instances will suffice to show the general character of the movement. Nor were municipal brothels ever tolerated again. It is observed by Henne-am-Rhyn—*no friend of toleration*—that their suppression was followed by the appearance of the crime of infanticide, by the establishment of hospitals for foundlings and for syphilis. This suggests an argument which is hardly justified by the facts. Infanticide was no new thing, and foundling hospitals date from the beginning of the 13th century. Their marked increase and the establishment of syphilitic hospitals came a century later than the Reformation campaign against the Frauenhäuser. The suppression of the latter did not affect the prevalence of prostitution. In the 17th century another spasm of severity occurred. In 1633 an edict was issued in Paris condemning men concerned in the traffic to the galleys for life; women and girls to be whipped, shaved and banished for life, without formal trial. These ordinances were modified by Louis XIV. in 1684. The Puritan enforcements in England were equally savage. Fornication was punishable by three months' imprisonment, followed by a fine for good behaviour. Bawds were condemned to be whipped, pilloried, branded and imprisoned for three years; the punishment for a second offence was death. In Hamburg all brothels were pulled down and the women expelled from the town. If these measures had any effect, it was speedily lost in a greater reaction; but they have some historical interest, as the present system was gradually evolved from them.

It would be tedious and unprofitable to follow all the steps, the shifts and turns of policy, adopted in different countries during the 18th century for the suppression or control of an incurable evil. They involve no new principles. In Ulm, for instance, the existing brothels were closed in 1778. The present regulations in France are based on the ordinances of that year and of 1780 which in their turn were borrowed from
those of the 16th and 17th centuries, previously mentioned. The theory of the modern attitude towards prostitution is clearly laid down by successive ordinances issued in Berlin. Those of 1700 stated that “this traffic is not permitted, but merely tolerated”; the more precise ones of 1792 pronounced the toleration of prostitution a necessary evil, “to avoid greater disorders which are not to be restrained by any law or authority, and which take the people away from the pursuit of a useful and honorable profession”; and the regulations of 1850 and 1876 are headed: “Policezeitliche Vorschriften zur Sicherung der Gesundheit, der öffentlichen Ordnung und des öffentlichen Anstands.” This embraces the whole theory of present administration, and if Gesundheit be omitted, is not less applicable to the United Kingdom than to the continent. The last attempt to suppress prostitution in Germany is worth noting, as it occurred so late as 1845. Registration was stopped and the tolerated houses were closed in Berlin, Halle and Cologne. The attempt was a complete failure, and it was abandoned in 1854 in favour of the previous system.

We proceed to state the present condition of the law in France, Germany, Austria and the United Kingdom.

France.—The French criminal law takes no cognizance of prostitution. The subject was omitted from the penal code drawn up by the first Republic, and was never restored, although many attempts were made to introduce legislation, on account of the great disorder which arose. Procurement is to a certain extent a criminal offence. Paragraph 334 of the code forbids the exciting, favouring or facilitating habitually the debauch of girls or boys under twenty-one years of age; the penalty is imprisonment for six months to two years, and a fine of 50 to 500 francs. If the offence is committed by parents, guardians or other persons in a tutelary position, imprisonment is from two to five years, and the fine 300 to 1000 francs. The regulation of prostitution rests on the law of 1790, which entrusted the preservation of public tranquillity to the administrative authorities; these are in Paris the prefect of police, and in other communes the mayor. The Parisian regulations have been built up by the decrees of successive prefects. They are based on those of 1778, which fell into abeyance at the Revolution, were reintroduced in 1816, amended in 1823, and made more complete in 1830 and 1841. Those adopted in other towns do not differ in any essential particular. The more important are: (1) harassment, which is either voluntary, or compulsory after repeated arrest; (2) recognized brothels, which are of two classes—maisons de tolérance (residential) and maisons de passe (houses of call); (3) medical examination, which is weekly at the maisons de tolérance, while other registered prostitutes must present themselves fortnightly at the dispensary; (4) hospital treatment of those found diseased; (5) rules with regard to solicitation, the frequenting of public places, &c. A small fee is paid for examination. The penalty for infraction of regulations is imprisonment; offences are divided into two classes: (1) slight, (2) grave, and the term of imprisonment varies accordingly from fourteen days to one year. Names may be erased from the register on the following grounds: (1) marriage; (2) organic disease such as to render the calling impossible; (3) return to relations and proof of good behaviour. The whole procedure appears to rest on grounds of doubtful legality. Prostitution never comes before the courts which alone can try offences and pronounce sentence. The police have no power to do so, yet they both try and sentence these women. That is to say, the whole system depends on their doing, by some verbal quibble, what they have no power to do. The question came before the court of Reims in 1876, in the case of two women who refused to submit to medical examination, and the judge decided in their favour. He was dismissed in consequence, which does not make the situation more satisfactory.

Germany.—The German law is more explicit and more logical. Prostitution is not forbidden, but by paragraph 361 of the Imperial Code women are liable to arrest for practising prostitution without being under police control, and for contravening regulations after they have been placed under such control. This brings the traffic completely under the police, and gives legal sanction to their regulations. These vary to some extent in different places, but their general tenor is the same. They include compulsory registration and weekly or semi-weekly medical examination, together with rules, for the most part extremely strict, with regard to public demeanour and conditions of life. In Hamburg, for instance, prostitutes are confined to certain streets or houses, forbidden to share lodgings with persons not registered, to have female servants under twenty-five years of age, to keep children after school age, to admit young men under twenty, to make a noise or quarrel, to attract attention in any way, to go out between two and five in summer, to frequent certain parts of the town, or public halls, or superior seats in the theatre, to remain out after 11 p.m. (Regulations of 1886). On proved reclamation, supervision may be relaxed or names struck off the register. Generally, the women are compelled to contribute a fixed sum to a sick fund, for defraying the cost of medical examination; and in some places also to a journey fund, which is applied to sending strangers to their homes. Brothels are absolutely illegal throughout Germany. Paragraph 180 of the Imperial Code (1876) made Kuppelei a penal offence. Kuppelei is defined as promoting prostitution, either by procuration or by providing facilities of any kind. There is (1) ordinary Kuppelei, or simply assisting prostitution for gain, and (2) aggravated Kuppelei, which includes false pretences and procuration by parents, guardians, teachers, &c. The penalty for the former is a short term of imprisonment and police supervision; for the latter, penal servitude up to five years. It is obvious that if this law were strictly enforced, it would amount to suppression, for every householder or house-owner who harboured a prostitute would be liable to prosecution. Its actual interpretation, however, is very elastic. A law passed in Prussia in 1900 has for its object the reclamation of the young. Girls under eighteen may be placed under control until they are twenty-one.

Austria.—The Austrian law goes farther than the German, and is still more inconsistent with the existing practice. By paragraph 5 of the Criminal Act of 1885 prostitution is actually forbidden, but permission is given to the police to tolerate it under conditions, and to prescribe regulations according to circumstances. Power to punish is also given to the police. Gerhard’s cases of prostitution are liable to criminal prosecution, namely, when continued after police punishment, with disregard of regulations, when practised by persons suffering from venereal disease, and when accompanied by public scandal. Seduction of the young is punishable by imprisonment, eight days to six months; living on the prostitution of others, by eight days to three months. Kuppelei is a penal offence. Simple Kuppelei include (1) harbouring prostitutes for the purpose of pursuing their trade, (2) procuration, (3) having any connexion with the traffic—penalty, three to six months’ imprisonment; qualified Kuppelei is (1) procuration of innocent persons (equivalent to use of false pretences), (2) procuration by parents, guardians, &c.—penalty, one to five years. The police regulations and procedure are similar to those in Germany, but less strict. In all these countries a special service of police is employed.

Great Britain.—The English law differs markedly from the foregoing. It regards prostitution solely as a public nuisance, and dates from the middle of the 18th century. The principal act (25 Geo. II.) was passed in 1755, making perpetual a previous act of 1752. It is entitled "An act for encouraging prosecutions against persons keeping bowdy-houses," and provides that two ratepayers, on giving notice to a constable, may go with him before a justice and obtain an order for proceeding against the persons in question. A further act was passed, repealing the penalties, and a third in 1818 (58 Geo. III.), enabling the overseers of the parish to take the requisite proceedings. Thus machinery was provided for dealing with brothels, but it was left to the public to put it in motion. The Vagrancy Act of 1834 enables the police to proceed against "common prostitutes
for behaving in a riotous or indecent manner," and also forbids indecent literature. This was strengthened by a special act (1830) applying to London only, for the prevention of "loitering for the purpose of prostitution or solicitation, to the annoyance of passengers or inhabitants." Other large towns have since obtained private acts for the same purpose. The penalties are fines and short terms of imprisonment. In 1847 an act was passed making it an offence for publicans to allow "common prostitutes to assemble and continue in licensed premises. The Licensing Act of 1872 contains a provision to the same effect. The previous law for dealing with brothels by indictment was strengthened by the Criminal Law Amendment Act of 1885, which renders "any person who keeps, manages or acts or assists in the management of a brothel," and any owner or occupier who knowingly permits the same, liable to summary conviction under the Summary Jurisdiction Act; penalties for first offence, a fine up to £20, or imprisonment up to three months, increased for second offence to £40 and four months respectively. The same act also strengthened the law, which had previously been very weak, for the protection of the young and the prevention of procuration. It makes the procurement or conniving at or procuration of any girl or woman "to become a common prostitute" a misdemeanour punishable by two years' imprisonment, and places the following offences on the same footing: procuring defilement by threats, fraud or drugs; compulsory detention for defilement or in a brothel; procuring the defilement of girls under twenty-one; inducing them to leave the kingdom or to leave home and go to a brothel, with intent. The defilement of girls under sixteen and over thirteen years of age is also a misdemeanour, and subject to the same penalty; the defilement of girls under thirteen is felony, punishable by penal servitude from five years up to a life-sentence. Owners or occupiers of premises conniving at these offences are equally liable.

No account of the law in the United Kingdom would be complete without some reference to the partial adoption of the system of examination as employed elsewhere in Europe in 1864-1883. In 1864 a Contagious Diseases Prevention Act was passed providing for the compulsory medical examination of prostitutes, and detention in hospital of those found diseased, in the following garrison towns: Portsmouth, Plymouth, Woolwich, Chatham, Sheerness, Aldershot, Colchester, Shorncliffe, the Curragh, Cork and Queenstown. The legal machinery was a justiciable offence, and the unassisted-woman named a "common prostitute." "The Act having proved very inefficacious" (judge advocate-general in House of Commons, April 1883), it was amended in 1886 and extended to Windsor. Two years later an important memorial was drawn up by the royal colleges of physicians and surgeons in favour of the acts and their extended application, and in 1886 they were further amended and applied to Canterbury, Dover, Gravesend, Maidstone, Southampton and Winchester—eighteen places in all. A popular agitation, based on humanitarian and moral grounds, and continuously carried on against the measure led to the appointment of a royal commission in 1871 and a select committee in 1879. The direct evidence was strongly in favour of the acts, alike with regard to the diminution of disease among the troops in the protected towns, the absence of complaints and the good effect on public order, to which clergymen and other residents testified. The majority of the committee reported accordingly after three years' inquiry; but in 1883 the House of Commons passed a resolution, by 182 to 110 votes, condemning the compulsory examination of women. As this would have entailed refusal to vote the money required to carry on the system, it was immediately dropped, and the officers of the metropolitan police to whom its execution had been entrusted were recalled. In 1886 the C. D. Acts were repealed.

In India the system was introduced for military cantonments in 1865, partially suspended at the end of 1884, and stopped in 1888 on account of the action of the House of Commons. A new Cantonment Act was applied in 1889, and an amending act
PROSTITUTION

cannot control, and which tends always to increase, under the system, while the roll of inscribed women dwindles. The numbers alone are sufficient to prove the failure of the procedure; for instance, 311 and 270 in Dresden and Munich respectively (Zehnder 1891), both capital towns and cities of pleasure containing over 300,000 inhabitants. Cologne, with only half the population, had double the number on the register at the same time. In Paris, which may be called the headquarters of Western vice, the disproportion between registered and clandestine prostitution has reduced the whole system to an absurdity. The number of women on the roll is not a tenth of the estimated number of prostitutes; nor is Berlin, with about 3000 on the register, any better off. In Bordeaux, Brest, Lille, Lyons and Marseilles the same process is going on (Reuss). It follows that the protection of health, which is the object aimed at by registration, is delusive in an equal degree. There are no means of ascertaining the amount of venereal disease existing in any town or country, except in Norway, and consequently, no data for comparing one period or one place with another; but we know that all forms of such disease are still very prevalent in all large European towns, in spite of the system. The only exact figures available are the military returns, which are of some value. It is in garrison towns of moderate size that compulsory registration is likely to be most efficiently carried out and to produce the most decided results, because the women with whom soldiers consort are by their character and habits least able to elude the vigilance of the police.

The following table gives the proportion of admissions to hospital from all forms of venereal disease in the German, French, Austrian and British forces for twenty years from 1876. It may be added that the proportion in the Russian army is almost identical with the French, while the Italian figures are slightly higher than the Austrian. It is therefore unnecessary to give them:

The most striking thing in this table is the enormous difference between the continental and the British figures. To make the comparison more complete, we will add the following, which gives the average admissions per 1000 for the three years 1890-1892:

It is clear at once that troops in the East stand upon an entirely different footing from those in the West, the Dutch figures being even higher than the British; we may therefore put them aside for the moment. Comparing the rest, we notice that not only are the British figures enormously higher than the other European, but the latter also show very large discrepancies; and since all the foreign troops are under the same protective system, we may conclude that other factors must be taken into account. The discipline maintained, the character of the soldiers themselves, and the procedure with regard to admission into hospital, no doubt all affected the result. Further, a sort of epidemic rise and fall is to be noted. All the returns given in the first table show a simultaneous rise for several years, beginning with 1876; and having reached a maximum, each shows a progressive fall, likewise lasting over several years. This points to another disturbing factor. It is convincingly shown by the figures for the protected districts in the United Kingdom before, during, and after the period of protection. In 1864—that is, just before the first Contagious Diseases Act came into operation—the proportional figure was 260; ten years later it had fallen to 136; but in 1883 it had risen again to 234, in spite of the protection. Then, protection being removed, it rose to 276, but gradually fell again, progressively to 181 in 1895, without any protection. It is therefore evident that in interpreting the statistics allowance must be made for large fluctuations due to causes quite independent of the protective system. The margin of difference, however, between the British and European returns is so large that, when all allowances have been made, it is impossible to doubt that a considerable degree of real protection is afforded to soldiers by the system. This conclusion is confirmed by the comparatively high returns for the army of the United States, and still more by the Indian statistics. They rose gradually, it is true, during the canzonett system, but since 1877 the numbers have dropped rapidly. Between 1887 and 1895 the admissions for primary syphils rose from 75.5 to 17.1 per 1000, and those for secondary syphils from 29.4 to 8.4.

The broad conclusion is that under special conditions, and when rigidly enforced, registration and medical examination do to a considerable extent fulfil the purpose of protecting health. Their failure to do so among the population at large and under the ordinary conditions of life is not surprising when we regard the amount of venereal disease which still occurs even among soldiers protected by the most rigorous measures and under the most favourable conditions.

A general view of the whole subject suggests no pleasant or hopeful conclusions. Prostitution appears to be inseparable from human society in large communities. In different countries and ages it has in turn been patronized and prohibited, ignored and recognized, tolerated and condemned, regulated and let alone, flaunted and concealed. Christianity, the greatest moral force in the history of mankind, has repeatedly and systematically attacked it with a scourge in one hand and balm in the other; but the effect has been trifling or transient. Nor have all the social and administrative resources of modern civilization availed to exercise an effective control. The elementary laws on which prostitution rests are stronger than the artificial codes imposed by moral teaching, conventional standards or legislatures; and attempts at repression only lead to a change of form, not of substance. It survives all treatment; and though it may coexist with national vigour, its extravagant development is one of the signs of a rotten and decaying civilization. In Western communities the traffic is not carried on so openly as in the East, nor is it exploited for purposes of public revenue, as among the ancients and in the middle ages; a veil of reticence and secrecy, for the most part of a transparently flimsy character, is thrown over it; but whatever is gained in public decency is counterbalanced by other attendant evils. Two, in particular, are fostered by the policing of prostitutes. One is the system of blackmail levied by the executive. The scandal has been most notorious in the United States, but it exists everywhere, and is a constant source of profound corruption. The other is the growth of the most degraded class that ever disgraced the name of man—the creatures who live upon the earnings of individual prostitutes, with whom they cohabit. They are called souteneurs in France, louis in Germany, cadeis in New York, and by various slang names in Great Britain. They are all criminals. They flourish chiefly on the continent of Europe, where they exist in large and ever-increasing numbers; but they find their way everywhere, and are a dangerous
mence to society. They are not altogether new. The Elizabethan drama is full of references to men who took toll of prostitutes in return for protective services in the old days of persecution; but they have been greatly fostered by the modern system, under which women find it necessary or convenient to have the cover of a man, who can pass for a husband and baffle the police. Thus the law is evaded on the one hand by the corruption of those who administer it, and on the other by the appearance of a class of criminal idlers more degraded than any other—both greater evils than the traffic which the law is intended, but fails, to control. There are no data for comparing the extent of prolifiagity at present existing in Western communities with that in other countries or in former times, but the fact is generally acknowledged by the police, the police, and less frequently to the ears of doctors, and lawyers, leave no doubt that in intensity of vice the great centres of modern civilization have nothing whatever to learn from Corinth, imperial Rome, ancient Egypt or modern China. The classical obscenities dug up and relegated to museums are far surpassed by the photographic abominations prepared to-day in Paris or in Amsterdam. The gross perversion and abuse of the sexual instinct implied by these excesses may be a passing phase, but it is a phase which has always marked the decadence of great nations. It is undoubtedly accompanied by a general tendency de la prostitution en Belgique; of the volume of the gross excesses. The improvement in the conditions of life among the poor ought to tend in the opposite direction, by removing one of the most potent causes of the traffic, but it is more than counterbalanced by the rising standard of luxury and comfort which accompanies it, by the aggregation of the people more and more into great cities, and by their craving for amusement. The growth of prostitution has already left its marks on the marriage- and birth-rates of the most highly civilized Western communities.

In 1900 the Prussian Government made an attempt, with the co-operation of the medical corporations, to ascertain the amount of criminal prostitution in the principal cities. The medical inspectors were addressed to all members of the medical profession requesting them to report the number of patients suffering from those disorders in their practice at the date of the 1st of April. Answers were sent in by 63%., and the aggregate number of patients was 40,000. From this datum it is calculated that the number of persons attacked in the course of a year is at the very least 500,000 in Prussia alone (vide Hygienische Rundschau, April 1902).

PROSTYLET (Gr. πρόστυλος, before, and σύν, a column), a portico in which the columns project from the building to which it is attached.

PROTAGORAS (c. 482-411 B.C.), Greek philosopher, was born at Abdera. He is known as the first of the Sophists (q.v.), i.e. he was the first to teach for payment. It is said that he received nearly £400 from a single pupil. He learned philosophy in the Ionian school, and was perhaps a pupil of Democritus, though this is doubtful on chronological grounds. Protagoras was an older contemporary of Socrates. He was so highly esteemed by Pericles that he was entrusted with the task of framing laws for the new colony of Thurii (Plut. Pericles, 36). At the age of seventy, having been accused by Pythodorus, and convicted of atheism, Protagoras fled from Athens, and on his way to Sicily was lost at sea. According to Plato (Plat., 318 E), he endeavoured to communicate "prudence" (εὐσωφία) to his pupils, "which should fit them to manage their households, and to take part by word and deed in civic affairs." The education which he provided consisted of rhetoric, grammar, style and the interpretation of literature. His formal lectures were supplemented by discussions amongst his pupils. He left behind him several treatises, of which only a few fragments have survived. In Truth, by way of justifying his rejection of philosophy or science, he maintained that "man is the measure of all things—of what is, and of what is not." Besides Truth, and the book Of the Gods which contained his condemnation at Athens, Diogenes Laërtius attributes to him treatises on political, ethical, educational and rhetorical subjects. Protagoras was the first to systematize grammar, distinguishing the parts of speech, the tenses and the moods.

PROTECTION, in economics a system of commercial policy and a body of doctrine, which in their modern forms are the outgrowth of the commercial and industrial development of the 19th century. The common definition of protection as a policy is the attempt to develop a manufacturing industry by a system of discriminating duties upon manufactured goods imported from foreign countries. But this is far too narrow a definition to suit the modern use of the term, though the notion of discriminating duties upon imports is the kernel of all definitions. Protection as a policy includes not only discriminating tariffs, but also a large number of other features supplementary to this fundamental one and designed to emphasize its purpose. Thus a scheme of bounties and premiums, of rebates and drawbacks, is everywhere considered an essential element of the protective system. Nor is it any longer limited to the encouragement of manufactures, but includes as well the protection of agriculture, forestry, mining, fishing, shipping, &c. In short, one cannot give a comprehensive and satisfactory definition of protection to-day without giving it a much wider scope than that of a system of protective duties upon manufacturing industry.

Many of its advocates claim, and with some show of reason, that the term protection, as now used to describe the commercial policy of a nation, should be so defined as to include all the means by which a country undertakes to secure through the positive efforts of the government the complete industrial and commercial development of all its resources and of all its parts. As its object is thus comprehensive, its justification is to be found in a series of arguments based upon political, economic, and social considerations. From this point of view the protective policy embraces not only the system of discriminator tariffs is continued, but all schemes of home products—industrial, agricultural and mining, with which the policy began in the United States, for example—but also the system of bounties offered for the introduction and establishment of new industries; the policy of restricted immigration of the less desirable classes of labourers, combined with the positive inducements to the skilled labour of other countries to transfer itself to the one in question; the system of discriminating or prohibitive tonnage duties, known as Navigation Acts; the system of developing foreign markets by an active policy directed towards securing advantages for home products in foreign countries—in a word, all those pecuniary or other sacrifices which a country may make in order to develop its material resources and establish, develop and foster industry and commerce. In this wide sense the comprehensive policy adopted by the United States, for example, includes the making of a careful geological and botanical survey of the whole country in order to discover and open up the vast natural wealth of its domain in its mines, forests and fields; the establishment of experiment stations to test the usefulness of new crops or means of making old crops more valuable; the stocking of its rivers with fish and the afforestation of its mountains; the introduction of new breeds of livestock; the building of lines of rail- ways and canals, and the offering of inducements to private parties to undertake similar enterprises; the deepening of its
PROTECTION

It is the development of the industry that is the measure of a nation's prosperity. The introduction of a protective policy is a signal of the nation's determination to develop and maintain an industrial power. Such a policy has been adopted by many nations in the past, and it is still being debated today.

The development of the industry is closely linked with the economic doctrine. The doctrine of laissez-faire, which advocates a free market and minimal government intervention, has been challenged by the doctrine of protectionism, which favors government intervention to promote industry. The latter has been adopted by many countries to protect their industries from foreign competition.

The United States is one of the nations that have adopted a protective policy. The adoption of this policy was a response to the threat of foreign competition and to the need to develop an industrial base. The policy was implemented through the imposition of tariffs on imported goods.

The policy has had both positive and negative effects. On the one hand, it has protected American industries from foreign competition and has contributed to the growth of the economy. On the other hand, it has been criticized for being a barrier to free trade and for benefiting a few at the expense of many.

Despite its challenges, the policy has been effective in promoting industrial development. The United States has become a major industrial power, and its economic strength has contributed to its position as a world power.

In conclusion, the adoption of a protective policy is a strategic decision that must be made with careful consideration of the economic and political implications. The policy must be flexible enough to adapt to changing circumstances while also being strong enough to withstand criticism.

As the world becomes more interconnected, the need for a balanced approach to trade and industry becomes even more urgent. The United States must continue to balance the desire for industrial development with the need for free trade and international cooperation.

The future of the protective policy will depend on the ability of nations to find a balance between the need for industrial development and the desirability of free trade. The United States, as a leader in the world economy, has a critical role to play in this ongoing debate.
PROTECTION

holders’ Rebellion, as the Civil War was called, had drawn its strength largely from the free-trade sentiment. The policy of the protectionist party had expanded with the growth of the country and the necessity of coming to terms with the antagonistic elements. Thus at first the platform of the protectionists had been one of reasonably low duties on manufactured commodities, low duties on half-manufactured and no duties at all on raw material. But as the country advanced, and it was seen how the interests of manufacturing had been quickened by the policy of discrimination, those engaged in producing raw materials and half-manufactured commodities demanded that they too should be considered. As this concession had to be made by the manufacturers, they were compelled to justify it by other arguments than the protectionists contended against. The protective party argued that, so long as the prices of raw materials and labour were higher in America than abroad, it would be necessary to maintain counterselling duties at least equal to this difference, in order to protect American industry. One branch after another of manufacturing or agriculture was included and given the benefit of protection. In order to secure satisfactory theoretical basis for such a policy, the theory was advanced that foreign trade was a necessary evil, to be diminished as much as possible. The ideas were advanced and spread throughout the country: that the home market should be reserved for home products; that the labourers should be protected against the influx of foreign cheap labour (Chinese Exclusion Acts; restrictive immigration laws); that prices should be kept high, so as to enable employers to pay high wages; that shipping should be encouraged by subsidies, the sugar industries by bounties; that the nation should become more independent of foreign nations for all its industrial products, and capable of holding its own against the world in industry as well as in arms.

The protective party has been the national party during a time when the greatest question before the American people was that of national survival, or, twenty years ago, and naturally profited by the inevitable victory of nationalism; it has always stood for honest payment of national and state debts, if not in the standard according to which they were contracted, in a still better one, and it has profited naturally by this attitude in a country where the development of trade and industry was rapidly and steadily towards a capitalistic state of society in which such policy is favoured; it has stood for a vigorous and active independence in the field of world politics, and it has naturally profited by this fact in a country which was rapidly forging ahead to take its place among the greatest of existing national and over-rising new nations, and was ready to assert itself among the nations of the world; it has stood for free labour against slave labour, and consequently profited here again in a country whose greatest conflict turned upon the question whether the system of slave labour should be extended or not; it has stood for high wages for American labourers, and in words at any rate has advocated a policy directed to protecting them against competition with the “pauper labour of the Old World. It has stood for government activity in the direction of developing railways and canals; of establishing education upon national lines, making it free, in all grades from the kindergarden to the university, to all citizens of the republic, and it has profited by this association in a country where all influences were telling in favour of this tendency. In short, whatever one may think of the wisdom or folly of trying to develop national industry by a system of discriminating duties, the protective party as such in the United States has been on the progressive side of so many of the deep questions of national importance that it has obtained and kept the allegiance of thousands of men who would have been glad to see a change, or indeed a reversal, in the tariff policy of the party. The history of the tariff policy in Germany had been very similar to that of the United States. Beginning with the establishment of absolute free trade among the various German states in the earlier customs union, it extended this policy, by the establishment of the North German Confederation and the new German Empire, to all the states now included in the federation. The long-wished-for political union meant political independence, and when political independence was once achieved, industrial and commercial independence were next desired. Within the empire itself it was necessary, if the new organization were to be strong and vigorous, that the central government should become independent of the individual states; and this could be best effected by giving it a revenue system based upon import duties, which in the long run has enabled the central government to subsidize the state governments, and thus bring them still further under its influence. To develop this system the political support of some strong party was necessary. This party was found in the protectionists, which have thus again become the national party in a state which was being rapidly nationalized; the industrial party in a society which was rapidly passing from the agricultural to the industrial condition; the capitalist party in a society which was rapidly becoming capitalistic in all its tendencies. It stood for industrial and commercial, as well as political, independence of other countries, and thus satisfied the longing for national unity and independence of a people which had suffered for centuries from disunion and dependence.

These two examples may serve to explain how the two most powerful conditions of industry, or that of Britain became and remaind highly protectionist in sentiment and in action, and how they both opened the 20th century with a more openly declared and a more fully developed system of protection than ever before.

Protection as a theory or doctrine is to a certain extent an outgrowth or modification of the old doctrines of mercantilism. In its modern form, however, it dates really from the celebrated report on manufactures made by Alexander Hamilton when secretary of the U.S. Treasury in the year 1791. The views there advanced have been further developed by Friedrich List and Henry C. Carey, and have in many years been carried along somewhat different lines to their logical conclusions by Simon N. Patten and George Gunton. Starting from an argument in favour of temporary duties on manufactured goods imported from abroad until such time as the infant industry might take firm root, the development proceeded through List, who favoured the maintenance of such duties until the country had passed into the manufacturing stage as a whole, and then through Carey to Patten and Gunton, who maintain that a protective policy, extended to cover agriculture, trade and mining, should be preserved as the permanent policy of the country until the entire world is one nation, or all nations have reached the same level of political, economic and social efficiency. The protective policy, which a century ago was to be, in the view of its advocates, temporary and partial, has become to-day, in the arguments of its apologists, permanent and comprehensive. We must content ourselves here with a brief statement of the arguments of the leading and most successful defenders of modern protectionism.

Alexander Hamilton, at that time secretary of the treasury, submitted his celebrated report on manufactures to the Congress of the United States on the 5th of December 1791. It is in a certain sense the first formulation of the modern doctrine of protection, and all later developments start from it as a basis. It is a positive argument directed to proving that the existence of manufacturing is necessary to the highest development of a nation, and that it may be wisely promoted by various means, of which the most important is a system of discriminating duties upon foreign imports. Among the objects to be attained by the development of a flourishing manufacturing industry are mentioned: (1) Independence of foreign nations for military and other essential supplies. (2) A positive augmentation of the produce and revenue of society, growing out of (e) division of labour, (f) extensive use of machinery, (c) additional employment to classes of the community not ordinarily engaged in business. (3) An increase in the immigration of skilled labourers from foreign countries. (4) A greater scope for the diversity
of talents and dispositions which discriminate men from each other. (5) A more ample and various field for enterprise. (6) In many cases a new, and in all a more certain and steady demand for the special produce of the soil. (7) A more lucrative and prosperous trade than if the country were solely agricultural.

Among the feasible means of promoting the development of such an industry he mentions the following: (1) Protective duties, or duties on foreign articles which are the rivals of the domestic ones, to be encouraged. (2) Prohibition of rival articles or duties equivalent to prohibition. (3) Prohibition of the exportation of the materials of manufactures. (4) Pecuniary bounties. (5) Premiums. (6) Exemption of the materials of manufactures from duty. (7) Drawbacks of the duties which are imposed on the materials of manufactures. (8) The encouragement of new inventions and discoveries at home, and the introduction of useful foreign ones. (9) The facilitation of the entry of domestic goods into other countries; particularly those which relate to machinery. (10) Judicious regulations for the inspection of manufactured commodities. (11) The facilitating of the pecuniary remittances from place to place.

The above suggestions contain the outline of a comprehensive scheme for developing the manufacturing resources of the country, and the United States has subsequently adopted, in one form or another, almost all of these propositions. Hamilton considered that the duties, &c., would not have to be very high or very long continued in order to accomplish their legitimate ends, after which they would become unnecessary, and would naturally be abolished. He conceded that, generally speaking, import duties were taxes on the customer, and therefore burdens—but burdens which might well be temporarily borne for the sake of the ultimate advantage arising from cheaper goods and diversified industries. He emphasized also the advantage of a home market for agricultural products, and seemed to think that the United States had to pay the cost of transportation both on the agricultural products it exported and the manufactured goods it imported. This report remained the armoury from which the protectionists drew their weapons of offence and defence for two generations, and it has not yet ceased to be the centre around which the theoretical contest is waged even to-day in Germany and France as well as in the United States.

The next great theorist in this field was the German, Friedrich List, who, while an exile in the United States, became imbued with protectionist ideas, and after doing substantial service for them in the country of his adoption, returned to Germany to do battle for them there. He published his National System of Political Economy in Germany in the year 1841. It had great and immediate success, and has exercised a wide influence in Europe on theoretical discussion as well as on practical politics. List, like Hamilton, looked on protection as a temporary system. Udized States to faciultas such as may have been inady from an agricultural to a manufacturing state. He accepted free trade as generally and permanently true, but suited for actual adoption only in that cosmopolitan era towards which the world is progressing. But in order to prepare for this cosmopolitan period it is first necessary for each nation to develop its own resources in a complete and harmonious manner. A comprehensive group of national economies is the fundamental condition of a desirable world economy; otherwise there would be a predominance of one or of a few nations, which would of itself constitute an imperfect civilization. Protection is a means of educating a nation, of advancing it from a lesser to a higher state. He admits that it may involve a loss, but only in the sense that money expended for an educational system is a loss, or that money spent for seed corn is a loss. To the cosmopolitan system of Adam Smith, List opposes the national system as a preliminary and necessary stage. He favours the imposition of duties as the most efficient means of effecting the protection which he has in mind. Agriculture will be sufficiently protected by the constant demand for its products. The essence of his larger work is contained in a pamphlet published in Philadelphia in 1827, entitled Outlines of American Political Economy. It is, in fact, a series of letters advocating the further development of the protective system already adopted in the United States.

Carey: Pattee.

Among the most distinguished and most influential of the followers of Hamilton and List. He was at first a strong free trader, then a protectionist who believed in protection as a preparation for free trade, and finally an uncompromising advocate of protection in all circumstances and for all nations. In him and in Simon M. Pattee, the last, and in many respects the ablest, of the apologists for protection, we have the theoretical development corresponding to the practical outcome of protection as a comprehensive all-embracing scheme extending protection to all branches of industry alike—agriculture, manufacturing and mining. Pattee's aim was to be permanent in its form and policy. As Pattee expresses it: "Protection now changes from a temporary expedient to gain specific ends (such as the establishment of manufactures), to a consistent endeavour to keep society dynamic and progressive. Protection has become part of a fixed national policy to increase the value of labour with the increase of productive power, and to aid in the spread of knowledge and skill, and in the adjustment of a people to its environment." The object of protection has now become, in the view of the theoretical American protectionist, not an approximation to European industrial conditions, but as great a differentiation from them as possible. Carey's works were translated into the languages of the world; and corresponding doubts of the spread of protectionist ideas, though the extreme form in which his views were expressed, and the rambling illogical method of exposition, repelled many who might otherwise have been attracted by the course of his thought.

Economists of other schools, with the exception of the more rigid British free traders, have allowed a relative validity to the doctrines of List; and even among older British economists, Mill and some of his disciples conceded the logical possibility of quickening the development of an industry by import duties in such a way as to result in more good than harm, though they have hardly been willing to acknowledge that it is practically possible. The modern historical school of political economists have generally admitted the reasonableness of protective policies at certain times and places, though usually finding the justification in political and social considerations rather than in economic. And while the British objections to protectionism in any form have been widely upheld by the more conservative economists in England, the new political school of "tariff-reform and colonial preference" has found strong support at the hands of such British authorities on economics as Professors Cunningham, Ashley and Hewins, or the authors of Compatriots' Club Essays 1896 (J. L. Garvin and others), whose advocacy of a national policy recalls the work of Hamilton and List. (E. J. J.)

PROTECTOR—PROTECTORATE

PROTECTOR, a Latin word (formed from protegere, to cover in front) adopted into English. In post-classical Latin the protectores were the body-guards of the emperors, and of the Pretorian prefects until, under Constantine the Great (306–337), they ceased to exercise military functions. The protectores, with the domestici, continued to form the body-guard and household troops of the emperor. They were veterans selected from the legions, and were capable of being appointed to high commands. In the Roman curia the protectores regnorum are cardinals who take charge of the affairs of the "province" to which they are named which come before the Sacred College, and to present them for consideration. In England "protector" was used first for the regent during a minority, e.g., the Protector Somerset, and then by Oliver Cromwell, with whom he assumed the name as they acquired a revolutionary significance, and has not since been officially used in England. In Spanish America the bishops were officially protectors of the Indians. The title is convenient for a ruler who wishes to exercise control outside the limits of his direct sovereignty. Thus Napoleon called himself protector of the Confederation of the Rhine. The kings of France, and the governments which have arisen out of the Revolution, were protectors of the Latin Christians in the Turkish Empire, while the tsars of Russia have claimed the same position towards the Orthodox Christians.

PROTECTORE, in international law, now a common term to describe the relation between two states, one of which exercises control, great or small, direct or indirect, over the other. It is significant of the rare use of the term until recent times that the word does not occur in Sir G. C. Lewis's book on *The Government of Dependencies*. Yet the relation is very ancient. There are instances in which the name indicates that it has acquired a revolutionary significance, and has not since been officially used in England. In Spanish America the bishops were officially protectors of the Indians. The title is convenient for a ruler who wishes to exercise control outside the limits of his direct sovereignty. Thus Napoleon called himself protector of the Confederation of the Rhine. The kings of France, and the governments which have arisen out of the Revolution, were protectors of the Latin Christians in the Turkish Empire, while the tsars of Russia have claimed the same position towards the Orthodox Christians.

The Romans drew a distinction between *foeder aequa* and *foeder invia*. The latter created a form of protectionate. But the protected state remained free. This is explained in a passage of the Digest 49. 15. 7: "Liber autem populus est, qui nullius alterius populi potestati est subjectus, sive foederatus est; item sive aequo foedere in amicitiam venit, sive foedere comprehensivem est, ut is populus alterius populi majestatem comminer conservaret. Hoc enim adjicitur, ut intelligatur alterum populum in amicitiam non ut inter se natura esse liberum" (Marquardt, *Römische Staatsverwaltung*, 2nd ed., vol. I, p. 46, Mommsen, *Römisches Staatsrecht*, vol. iii. pt. 1, p. 645, and the instances collected by Pufendorf, 8 c. 9.4).

In medieval times this relation existed, and the term "protection" was in use. But the relation of subordination of one state to another was generally expressed in terms of feudal law. One state was deemed the vassal of another; the ruler of one did homage to the ruler of another. In his book *De la République* Bodin treats of *ceux qui sont en protection* (c. 7), or, as the Latin text has it, *de potrivicio et clientela*. In Bodin's view such states retain their sovereignty (c. 8). Discussing the question whether a prince who becomes a clients of another loses his majestas, he concludes that, unlike the true vassal, the *clients* is not deprived of sovereignty: "Nihilominus in foederibus et pacis actionibus, quae inter principes aut populos societate et amicitia conjunctissimae sanciant; cæm vibtat ut nec alteri alteri pareat, nec imperet; sed ut alteri majestatis majestate observare, sine ulle majestatis minutione tenatur. Quaeque jus illud clientelare suo protectione omnium maximum ac pulcherrimum inter principes censeatur (c. 7). Elsewhere Bodin remarks, "le mot de protection est spécial et n'emporte aucune subjection de celui qui est en protection. He distinguishes the relation of seigneur and vassal from that of protector and adherent. As to whether the protected state or prince is sovereign, he remarks, "je tiens qu'il demeure soverain, et n'est point subject." He makes clear this conception of protection by adding "l'indoue ou adherent doit extre exempte de la puissance du protecteur s'il contrevient aux traités de protection. Voila donc la plus grande seuréte de la protection, c'est empescher s'il est possible que les protecteurs ne soyent saisis des fortes" 8 cc. (p. 549, ed. 1580). Sometimes letters of protection were granted by a prince to a weak state, as e.g. by Louis XIII. in 1641 to the prince of Monaco (Gairal, p. 81).

According to the *Digest* of Justinian, book 4, 2, 4, the function of the protector was to "reach out" to the protectatus; and Pufendorf, with many others, treats protection as an instance of unequal treaties; that is, "when either the promises are unequal, or when either of the parties is obliged to harder conditions" (*De jure bell i et pactis*, 1 c. 13. 21; *De jure naturae*, 8 c. 9).

The following are some definitions of *protectorate*; "Principi protecto, foedere, eadem cura et omnia in protectione surr." Du Cange: "La situation d'un *protectorat* était à l'égard d'un autre moins puissant auquel il a promis son appui d'une manière permanente" (Gairal, p. 452; a definition applicable only to certain simple "cases of this relation. "Pour le protégé, une condition de mi-souveraineté substituée à la plénitude indépendance que comporge le régime de simple protection" (p. 58). The situation respective de deux états, le puissant signifie dont l'un conserve le pouvoir de défendre l'autre, et en outre de le diriger" (p. 62). "Unter einem Protectorat versteht man ein Schutzherrschaftsverhältnis zwischen dem einen Staat des Inhalts dass der eine Staat, der Oberste oder schutzherrschaftliche Staat, zum dauernden Schutze des anderen Staates—des Schutzstaates oder Unterstaates—verpflichtet ist; wofür ihm ein mehr oder weniger weitgehender Einfluss auf die aussere Angelegenheit energeich, und auch auf dessen innere Verhältnisse eingeräumt ist" (von Stengel, *Die deutschen Schutzgebiete*, 11). "Das Verhältniss von zwei (oder mehreren) Staaten, das in materieller Beziehung auf dem dauernden Besitz oder Schutze eines schwächeren Staates durch einen stärkeren beruht" (Ullmann, s. 26).

"The one common element in Protectorates is the prohibition of all foreign relations except those permitted by the protecting state. What the idea of a protectorate excludes, and the idea of annexation, on the other hand, would include, is that absolute ownership which was signified by the word dominium in Roman law. In which, therefore, the protectorate is described as "territorial sovereignty." The protected country remains, in regard to the protecting state, a foreign country; and
PROTECTORATE

this being so, the inhabitants of the protectorate, whether native-born or immigrant settlers, do not by virtue of the relationship between the protecting and the protected state become subjects of the protecting state. (Lord Justice Kennedy, Reex v. Creme, 90; R. v. the Royal College of Physicians, 106.) Whether civilized or uncivilized, is that it cannot maintain political intercourse with foreign powers except through or by permission of the protecting state. (Hall, Foreign Jurisdiction of the British Crown, p. 101; Lyall's Colonial Sovereignty, p. 101.) The protectorate is a protected state or possession within British dominions, but as regards its foreign relations is under the exclusive control of the King, so that its government cannot hold direct communication with any other foreign power, nor a foreign power with that of any protectorate. (Hertslet, British Rule and Jurisdiction beyond the Seas, p. 165; Reinsch, Colonial Government, p. 109; Payne, Colonies and Colonial Federations, p. 194.)

The term "protectorate" has no narrow legal definition. It is loosely used to designate a relation in which it is deemed politic to leave indefinite: a state desires to obtain the reality of conquest without the responsibilities attaching thereto. Protectorate may mean no more than what it says: "One state agrees to protect or guarantee the safety of another."

The term is also employed to describe any relation of a political superior to an inferior state. It is also used as the equivalent of sovereignty. As appears from the article Soverainty, the terms are distinguishable. But both imply a desire to carry out changes without friction and not to break up ancient forms; both proceed on the plan of securing to the stronger state the substance of power while allowing the weaker state a semblance of its old constitution. It is used loosely by many, when they mean something between the terms protectorate and empire; it signifies a more easily put down, more easily changing, more easily re-intrusive state; a state may be put down, disintegrated, or conquered in a protectorate; it relieves the former from the full responsibilities incident to annexation; it spares to some extent the feelings of the latter.

Certain protectorates originate in treaties; others have been imposed by force. Some are accompanied by occupation, in which case it is difficult to distinguish them from annexation. Thus the treaty of May 1851, art. 2, between France and Tunis, provides for the occupation of strategic points in the protecting state. (A. Devaux, Les Protectorats de la France, p. 21.)

The establishment of a protectorate may be akin to a guarantee. Generally, however, the former implies a closer relation than a guarantee, and the two relations may be widely different, as may be seen by comparing treaties of guarantee with the treaty establishing the protectorate of Tunis.

Strictly speaking, a protectorate cannot exist over a domain uninhabited or ruled by no organized state; in such cases the elements of the true protectorates are wanting. But the distinction is not adhered to. The difficulty of defining the relations between the protected and the protecting states is greater, because they are more variable than those in a protectorate: a contractual or limited relation of state to state, more or less rapidly changing into true union.

It has been the policy of the British government in India to establish on the frontiers, as elsewhere, protectorates. The political advantages of the system are pointed out in Sir A. Lyall's Rise and Expansion of the British Dominions in India. It is a system "whereby the great conquering or commercial peoples masked, so to speak, their irresistible advance"; it was much practised by the Romans in Africa and Asia; it has been chiefly applied in modern times in India. (p. 186.)

The Indian states are sometimes described as "Feudatory States," sometimes "Independent and Protected States (Twice)," sometimes "Mediatized States" (Chesney), sometimes "Half-Sovereign," sometimes as in a position of "subordinate alliance" (Lord Salisbury, Parliamentary Papers, 1897, c. 8790, § 27). The Interpretation Act, 1889 (52 & 53 Vic. c. 63, s. 18), refers to the Indian native princes as under the "suzerainty" of the British Crown. These states are really sui generis, and their precise position can be understood only by a private examination of the treaties affecting them. The following are the chief points as to which Indian protectorates are governed by English law: (1) the governor-general is empowered to make laws for the benefit of the British government and European and native Indian subjects of his majesty; (2) British laws are in force in certain parts of the native states e.g. in cantonments; (3) native princes have adopted certain British laws, e.g. the Indian Penal Code; (4) they have no external relations with foreign states; (5) the king is the donor of honours; (6) acts of parliament affect them indirectly by directly affecting the British agent; (7) they receive advice, which may be akin to commands. (See also Ilbert's Governments of India, 2nd ed., p. 248.)

Among the chief British protectorates are: The African groups, consisting of the western group—Gambia; Sierra Leone; Ashanti (northern territory); Northern Nigeria; Southern Nigeria (with which is amalgamated Lagos). The southern group—Buchananland; Southern Rhodesia; Swaziland. The central group—North-east Rhodesia and North-west Rhodesia, Nyasaland. The eastern group—British East Africa; Uganda; Zanzibar and Pemba (sometimes described as "a sphere of influence"); Somaliland; and the Sudan. There is a group of protectorates near Aden, including the island of Sokotra. There are also the Bahrein Islands in the Persian Gulf. Jurisdiction over these protectorates is, generally speaking, exercised by an advisory council made under the Foreign Jurisdiction Act 1890 (Burge's Colonial and Foreign Law, 2nd ed., p. 320). There is also the Malay group, consisting of the Malay States in the Borno peninsula and in Borneo, the protectorates of North Borneo, Brunei and Sarawak. Protectorates also exist in the Western Pacific group of islands (including the Friendly Islands, the Ellice and Gilbert group, and the British Solomon Islands).

There is the interesting case of Papua (formerly British New Guinea), over which a protectorate was established in 1884, but which became in 1906 a territory of the Australian Commonwealth. There are also dependencies, or protectorates, attached to India, Bullockhand, and East Africa, and an island group in the Pacific.

France possesses several protectorates, of which the chief are Tunis, Annam and Hongkong. Her policy has been until lately to treat protectorates as quasi-sovereign states or departments. Her position as to Tahiti and Madagascar, and in such effect is the position of the Indo-China protectorates (Devault, Les Protectorats de la France; Report by Mr Lister, Parl. Papers 1908, C. 388). There are German protectorates in the South Sea Islands, German East Africa and Cameroon, German East Africa, Kaiser Wilhelm Land, Bismarck Archipelago, Solomon Islands, and Kiao-ou—under lease from China—(Zeitschrift für Kolonialrecht, 1907, p. 311). Russia has the protectorates of Khiva and Bokhara; and China exercises or claims rights as protector of certain dependencies.

There are two principal classes of protectorates: the first being those exercised generally by treaty over civilized countries. Of the first, the chief are: (a) that of Cracow, which was recognized by the Treaty of Vienna as an independent state, and placed under the protection of Russia: it was incorporated with Austria in 1846; (b) Andorra, protected by Spain and France as successors of the counts of Foix (see Andorra); (c) the Ionian Islands, placed under the protection of Great Britain by the Treaty of Paris in 1815.

The second class of protectorates consists of those exercised over un-civilized or uncivilized people, sometimes called a "Colonial Protectorate" or "pseudo-protectorate," and usually the preparatory step to annexation. These have become common, especially in Africa, since 1878. The second class may be subdivided into two groups: (a) protectorates exercised over countries with organized governments and under recognized sovereigns, such as the Malay States; and (b) those exercised over countries possessing no stable or definite governments and rulers. The territories of chartered companies, when not within the dominion of the protecting state, may also for some purposes be regarded as protectorates.

Attempts have been made to define the reciprocal rights and duties of protecting and protected states. Sometimes the treaty creating the relation defines the obligations. Thus in the treaty with respect to Sarawak, the latter is described as an "independent state under the protection of Great Britain." "Such protection shall confer no right on his Majesty's government to interfere with the internal administration of that state further than is herein provided." The British consular officers are to receive exequatories in the name of the government of Sarawak. Foreign relations are to be conducted by that government, and the raja cannot cede or alienate any part of the territory without the consent of the British government (Hertslet, 18, 227). In the treaty creating a protectorate over the territories of the king and chief of Opoo (Hertslet, 17, 130) the sovereign undertakes to extend to them, and to the territory under their authority and jurisdiction, his favour and protection. They promise not to
enter into "any correspondence, agreement or treaty with any foreign nation or power, except with the knowledge and sanction of his Majesty's government." Some treaties establishing protectorates provide for direct interference with internal affairs; for example, the treaty of 1847 creating a French protectorate over Tahiti, and that of 1883 as to Tunis. Sometimes the Oberstaat—to use a convenient expression—is content to insist upon the presence of a resident, who guides the policy of the native ruler. In the case of protectorates over uncivilized countries it is usual to stipulate against alienation of territory without consent of the Oberstaat.

The legal position of protectorates is still somewhat undecided; there are an old view and also a new view of their nature. The relation may be one of international law, two states having entered into obligations by treaty. Or the relation may be one of public law; one of two states has become subordinate to, and incorporated with, the other. The general rule is that the protected state does not cease to be a sovereign state, if such was its previous status. Its head is still entitled to the immunities and dignity of a sovereign ruler. Further, the establishment of a protectorate does not necessarily rescind treaties made between the protected state and other states, at all events when it is not in reality conceded that the protectorate, subject to the injury of third parties (Parl. Papers, Madagascar, 1897 (c. 8700); Trione, 187). Nor does the new relation make any change as to the nationality of the subjects of the two states, though in some cases the subjects of the Protectorate are still regarded as subjects of the Unsterstaat to transfer their allegiance; and they owe a certain ill-defined degree of obedience to the protecting state. Nor, speaking generally, does the territory of the protected state become part of the territory of the Oberstaat; in this respect it is unlike a colony, which may be regarded as an extension or outlying province of the country. At the same time, the question whether a particular protectorate forms part of the "dominion" or "territory" of the Crown for any purposes or within the meaning of any statute cannot be regarded as wholly free from doubt; its terms and intention must be examined. In Rex v. Crewe (1910, 79, L. J. 874) the Court of Appeal decided that the Bechuanaland Protectorate was not part of the dominion of the Crown, but was foreign territory. Several writers propose this distinction—the protected country is to be considered a part of the territory as to certain important sovereign rights, and as to other matters not. In one view, for the purpose of municipal law, the territory of the protectorate is to be regarded as alien, but in another, the protectorate is regarded as forming part of the protected territory. Any views as to the law is, within the territory of the protecting state. In another view, such territory is foreign only in the sense that it is not within the purview of the majority of statutes (see Hall's International Law, 6th ed., 126, Helborn, 535; Tupper's Indian Protectorates, 336; Laband, 2, § 70).

The older view of the position of a protectorate according to international law is contained in the decision of Dr Lushington in the case of the "Lucade" (8 S.T. N.S., 432), to the effect that, the declaration of war by Great Britain against Russia notwithstanding, the Ionian islands, which were then under the protectorate of the Ottoman sultan, were entitled neither to raise the white flag nor to declare the right of declaring peace and war. "Such a right is inseparably from protection." But the Ionian states did not become necessary enemies of the state with which Great Britain was at war. According to one view, the protected state is implicated in the wars to which the protecting state is a party only when the latter has acquired a right of military occupation over the territory of the former. "Cette solution a été reconnue par la France en 1870, à propos de la guerre contre l'Allemagne pour les îles Taiti alors soumises à notre protectorat; elle s'imposera pour la Tunisie, l'Annam et Tonkin, et pour le Cambodge, où les traités nous confèrent le droit d'intervention en cas de besoin." (M. Despagnat). In the event of hostilities between the protecting and protected states, such hostilities would be regarded not as of the nature of an insurrection, but as a regular war (Trione, 149).

By the General Act of the Berlin Conference it was agreed that the France and Great Britain, when a protectorate should be notified to the signatories to the agreement (art. 34), and it has been the practice to give such notice. It was proposed by some of the powers represented that effective occupation should be a condition to the creation of a protectorate on the coast of Africa. But this was opposed by England, and was not adopted (Laband, II, 585).

Many writers adhere to the doctrine that there is no improvement of sovereignty of the weaker state by the establishment of a protectorate. They also allege that it is res inter alios acta, an arrangement which concerns only parties to it. But the trend of recent policy and purport of much recent legislation are against this view. The distinct tendency, especially as to protectorates over uncivilized countries, is to treat, for purposes of international law, the territory of a protectorate as if it belonged to the protecting state. If France, for example, permitted in Tunis or other protectorates operations of an unfriendly character or to any power, the injured power would no doubt look to France for redress. This view would probably be strongly pressed in the case of protectorates over countries having no well-defined or stable government. The probability is that in such cases governments and courts applying international law would probably be guided by technical facts—such, to take the case of British possessions, as the fact that an order in council permitted appeals to the Judicial Committee—but would look to the facts of the case. "Any state which undertakes to protect another assumes towards the rest of the world responsibility for its good behaviour—the more complete protection the greater the protection. In practice this involves a duty to interfere if need be." (Coolidge, United States as a World Power," p. 167; and to the same effect Liszt, Völkerrecht, p. 31; and Zorn, Völkerrecht, p. 45). The tendency is for protecting states to assert jurisdiction over foreigners within the territories of the protected states (Westlake, 187; Jenkyns, p. 176; Ilbert, 2nd ed., 393, 434). Mr Hall remarks (International Law, 6th ed., p. 126 n.) that "all the states represented at the Berlin Conference of 1884–1885, with the exception of Great Britain, maintained that the normal jurisdiction of a protectorate includes the right of administering justice over the subjects of another state. The question of the stability of the states, the measures which are scarcely compatible with the exemption of European traders and adventurers from the local civilized jurisdiction. He points out that Great Britain—which until lately took the view that a protected state possesses only delegated powers, and that an Eastern state cannot grant jurisdiction over persons who are neither its own subjects nor subjects of the country to which the powers are delegated—had by the Pacific Order in Council of 1893 and the South African Orders in Council of 1892–1894 asserted jurisdiction over natives and foreign subjects. The Orders showed a gradual increase of the assump- tion of international sovereignty (Jenkyns, 153). A similar process is observable in the German protectorates, which are treated for some purposes as "inland," and not foreign territory (Der koloniale Inlands- und Auslands-begriff, Zeitschrift für Kolonialrecht, 1907, p. 312). The fact is that in the case of protectorates over uncivilized or semi-civilized countries a development is inevitable: control quickly hardens into conquest, and international law more and more takes note of this fact.

PROTEOMYXA—PROTESILAUS

PROTEOMYXA, a name given by E. Ray Lankester (Eugy.
Brit., 9th ed., 1885, art. "Protozoa") to a group of Protozoa
Sarcodina. The group was really recognized as distinct from
Cienczowski and by Zopfi, receiving the name of Monadinea from

1. Vampyrella spirogyrae, Ciencz., amoeba phase penetrating a cell
of Spirogyra, a, by a process of its protoplasm, c, and taking up the
substance of the Spirogyra cell, some of which is seen within the
Vampyrella a.
2. Large individual of Vampyrella, showing pseudopodia e, and
food particles a. The nucleus (though present) is not shown in
this drawing.
3. Cyst phase of Vampyrella. The contents of the cyst have
divided into four equal parts, of which three are visible. One is
commencing to break its way through the cyst-wall f; a, food
particles.
4. Archerina boloni, Lankester, showing lobose and filamentous
protoplasm, and three groups of chlorophyll corpuscles. The
protoplasm g is engulfing a Bacterium t.
5. Cyst phase of Archerina: a, spinous cyst-wall; b, green-coloured
contents.
6. Chlorophyll corpuscle of Archerina showing tetrachistic
division.
8. Pretogenes primordialis, Haeckel (Amoeba porrecta, M. Schultzze),
from Schultzze's figure.

the former; but as this name had been usually applied to Flagel-
lates and even the zoospores are not always provided with
flagella, Lankester's name has become more lately, and has
been adopted by Delage and Hérouard (1856) and by Hartog.
The group entered to a considerable extent into the

"Monera" of Haeckel, supposed (erroneously in most if not all
species adequately studied) to possess no nucleus in the proto-
plasm. The following are the characteristics of the group.
Pseudopods usually granular, fine, flexible, tapering generally,
not freely branching; reproducing sometimes by simple fission,
but generally by multiple fission in a little cyst whose walls
may be multiple. Plasmodium formation occasional, but
never leading to the formation of a massive fructification; other
syngamic processes unknown, and probably non-existent.
Encystment, or at least a resting stage at full growth, is very
characteristic, and frequently an excretion of granules takes
place into the first-formed cyst, whereupon a second inner cyst
is formed which may be followed by a third. These brood-cysts,
in which multiple fission takes place, may be of two kinds,
oridinary and resting, the latter being distinguished by a firm,
and usually ornamented and cuticularized cell-wall, and only
producing its zoospores after an interval. Besides, an indi-
vidual at any age may under unfavourable conditions surround
itself with a "hypocyst," to pass the time until matters are
more suitable to active life, when it emerges unchanged.

From the initial character of the brood-cell on leaving the spor-
ocyte the dividing character of the two orders is taken:
1. Zoosporaceae. Zopfi. The brood-cells leave the cyst as "Monads"
(with one or two flagella). Genera: Pseudospora, Ciencz.,
Cienk.; Diplophysis, Zopfi.; Gymnococcus, Z.; Aphanidium, Z.;
Pseudosporidium, Z.; Plasmodiophora, Woronin; Tetramyxa, Goebel.
Ciencz. (figs. 1, 2, 3); Leptophrya, Hertw. and Less.; Bursula, Schinz;
Protogenes, Haeckel. (figs. 8); Archerina, Lank. (figs. 4-7); Serposporidium,
L. Pfeiffer; Lymphosporidium, Calkins.

Many of the species are endoparasites in living cells, mostly of
Algae or Fungi, but not exclusively. At least two wgs, Proteroa,
dospora have been taken for reproductive stages in the life history
of their hosts—wherein indeed the generic name. Plasmodiophora
brasicae gives rise to the disease known as "Hambures" or "fingers
and toes" in Cruciferae. Lymphosporidium causes a epidemic
among the American brook-trout, Salvelinus fontinalis. Archerina
boloni is remarkable for containing a pair of chlorophyll corpuscles
in each cell; no such nucleus has been made out but the chlorophyll
bodies divide previous to fission. It is a fresh-water form.
The cells of this species form loose aggregates or filoplasmodia, like those
of Mikrogremia (Foraminifera, q.v.) or Leydenia (Labirynthuloides,
q.v.). Vampyrella (figs. 1-3) and Enteromyxa also form a compact
plasmodium which separates into 1-nucleate cells, which then encyst
and divide into a brood of four.

PROTESILAUS, in Greek legend, son of Iphiclus, and husband of
Laodameia. In command of the Greek contingent from
Phylace in Thessaly, he was the first to spring ashore on Trojan
soil, although he knew it meant instant death. His wife be-
sought the gods below that he might be permitted to return to
earth for the space of three hours. Her prayer was granted,
and on the expiration of the time allotted she returned with him
to the nether world. According to Hyginus (Fab. 103, 104),
Laodameia made a waxen image of her husband. A slave,
having detected her in the act of embracing it and supposing
it to be a lover, informed her father, who ordered her to burn
the image; whereupon she threw herself with it into the flames.
In another account (Conon, Narrationes, 13) Protosilaus survived
the fall of Troy and carried off Aethilla, the sister of Priam.
During a halt on the peninsula of Pallene, Aethillas and the other
captive princesses fast to the ship. Protosilaus, unable to
continue his voyage, remained and built the city of Scione. His
tomb and temple were to be seen near Eleus in the Thracian
Chersonese. Nymphs had planted elm-trees, facing towards
Troy, which withered away as soon as they had grown high
enough to see the captured city. Protosilaus was the subject of a
tragedy by Euripides, of which some fragments remain.

PROTESTANT, the generic name for an adherent of those Churches which base their teaching on the principles of the Reformation (q.v.). The name is derived from the formal Protestatio handed in by the evangelical states of the empire, including some of the more important princes and 14 imperial cities, against the recess of the diet of Spires (1529), which decreed that the religious status quo was to be preserved, that no innovations were to be introduced in those states which had not hitherto made them, and that the mass was everywhere to be tolerated. The name Protestant seems to have been first applied to the protestant princes by their opponents, and it soon came to be used indiscriminately of all the adherents of the reformed religion. Its use appears to have spread more rapidly outside Germany than inside it. In one case of its popularity, being it was negative and colourless, and could thus be applied by adherents of the "old religion" to those of the new religion, without giving offence, on occasions when it was expedient to avoid abusive language. The designation was moreover grateful to the Reformers as connoting a certain boldness of attitude; and Professor Kattenbusch (Herzog-Hauck, Realencyclopaedie, 3rd ed., xvi, p. 136, 15) points out with great truth how, from this point of view, the name "Protestantism" has survived as embodying for many the conception of liberty, of the right of private judgment, of toleration for every progressive idea in religion, as opposed to the Roman Catholic principles of authority and tradition; so that many even of those who do not "profess and call themselves Christians" yet glory in the name of "Protestant."

As the designation of a Church, "Protestant" was unknown during the Reformation period and for a long while after. In Germany the Reformers called themselves evangeliaci, and avoided special designations for their communities, which they conceived only as part of the true Catholic Church; "Calvinists," "Lutherans," "Zwinglians" were, in the main, terms of abuse intended to stamp them as followers of one or other heretical leader, like those of the Jacobins outside and within the Thirty Years' War that the two main schools of the reformed or evangelical Churches marked their distinctive separation: the Calvinists describing themselves as the "Reformed Church," the Lutherans as the "Lutheran Church." In France, in England, in Holland the evangelicals continued to describe their churches as ecclesias reformatae, without the arriere pensee which in Germany had confined the designation "Reformed" to the followers of a particular church order and doctrine. As to the word "Protestant," it was never applied to the Church of England or to any other, save unofficially and in the wide sense above indicated, until the style "Protestant Episcopal Church" (as below) was assumed by the Anglican communion in the United States. Even in the Bill of Rights the phrase "Protestant religion" occurs, but not "Protestant Church," and it was reserved for the Liberal government, in the original draft (afterwards changed) of the Accession Declaration Bill introduced in 1910, to suggest "Protestant Reformed Church of England" as a new title for the Established Church.

The style "Protestant" had, however, during the 19th century assumed a variety of new shades of meaning which necessarily made its particular application a somewhat hazardous proceeding. In Germany it had, for a while, been associated by the Lutherans as against the Calvinists, and when in 1817 King Frederick William III of Prussia forcibly amalgamated the Lutheran and Reformed Churches in the new "Evangelical Church" its public use was forbidden in the Prussian dominions. It survived, however, in spite of royal decrees, but in an altered sense. It became—to quote Professor Kattenbusch—the "secular" designation of the adherents of the Reformation, the shamboyleth of the "liberal" ecclesiastical and theological tendencies. Finally, in opposition to the ultramontane movement in the Roman Catholic Church, it came once more into fashion in something of its original sense among the evangelicals.

In the United States, on the other hand, the term "Protestant" has, under the influence of the High Church reaction, been repudiated by an increasingly large number of the clergy and laity, and is even sometimes used by them in a derogatory sense as applied to their fellow churchmen who still uphold in the utmost the ideas of the Reformation. Among the latter, on the other hand, "Protestantism" is used, as exclusive of a good many of the doctrines and practices which in the Lutheran Church were at one time "Protestant" as opposed to "Reformed," e.g. the doctrine of the real Presence, auricular confession, the use of ceremonial lights and vestments. By many churchmen, too, the name of "Protestant" is accepted in what they take to be the old sense as implying repudiation of the claims of Rome, but as not necessarily involving a denial of "Catholic" doctrine or any confusion of the Church of England with non-episcopal churches at home or abroad.

The contradiction to all these somewhat refined meanings, the term "Protestant" is in common parlance applied to all Christians who do not belong to the Roman Catholic Church, or to one or other of the ancient Churches of the East.

PROTESTANTENVEREIN is the name of a society in Germany the general object of which is to promote the union (Verein) and progress of the various established Protestant Churches of the country in harmony with the advance of culture and on the basis of Christianity. It was founded at Frankfurt-on-the-Main in 1863 by a number of distinguished clergymen and laymen of liberal tendencies, representing the freer parties of the Lutheran and Reformed Churches of the various German states, amongst whom were the statesmen Bluntschli and von Bennigsen and the professors R. Rothe, H. Ewald, D. Schenkel, A. Hilgenfeld and F. Hitzig. The more special objects of the association are the following: the development of the Churches on the basis of a representative parochial and synodal system of government in which the laity shall enjoy their full rights; the promotion of a federation of all the Churches in one national Church; resistance to all hierarchical tendencies both within and without the Protestant Churches; the promotion of Christian toleration and mutual respect amongst the various confessions; the reading of Christian books and pamphlets by all Christians; the works necessary for the moral strength and prosperity of the nation. These objects include opposition to the claims of Rome and to autocratic interference with the Church on the part of either political or ecclesiastical authorities, efforts to induce the laity to claim and exercise their privileges as members of the Church, the assertion of the right of the clergy, laity and both lay and clerical professors to search for and proclaim freely the truth in independence of the creeds and the letter of Scripture. Membership in the association is open to all Germans who are Protestants and declare their willingness to co-operate in promoting its objects. To promote these objects are especially (1) the formation of local branch associations throughout the country, the duty of which is by lectures, meetings and the distribution of suitable literature to make known and advocate its principles, and (2) the holding of great annual or biennial meetings of the whole association, at which its objects and principles are expounded and applied to the circumstances of the Church at the moment. The "theses" accepted by the general meetings of the association as the result of the discussions on the papers read indicate the theological position of its members. The following may serve as Illustrations:

The creeds of the Protestant Church shut the doors on the past only, but open them for advance in the future; it is immortal and contrary to true Protestantism to require subscription to them. The limits of the freedom of teaching are not prescribed by the letter of Scripture, but a fundamental requirement of Protestantism is free inquiry in and about the Scriptures. The attempt to limit the freedom of theological inquiry and teaching in the universities is a violation of the vital principle of Protestantism. Only such conceptions of the person of Jesus can satisfy the religious needs of the classical fully realized form of the religious spirit of the day, for We must regard the Bible as the only authority and canon in matters of religious belief.

The formation of the association at once provoked fierce and determined opposition on the part of the orthodox sections
of the Church, particularly in Berlin. Attempts more or less successful have been made from the first to exclude clergymen and professors identified with it from the pulpits and chairs of Berlin and elsewhere, though membership in it involves no legal disqualification for either. One of the objects of the association was to some extent obtained by their organization of the Prussian Church when Dr Falk was cultus minister, on the basis of parochial and synodal representation, which came into full operation in 1879. But the election for the general synod turned out very unfavourable to the liberal party, and the large orthodox majority endeavoured to use their power against the principles and the members of the association. In 1882 the position of the association in the governmental connection by the%c2%a0whole of the clergy of Dr Kalthoff and other members of it in favour of a "people’s church" on purely dissenting and extremely advanced theological principles. This difficulty has continued, and the extreme rationalist position taken up by some leaders has alienated the sympathy not only of the obscurantists but of those who were prepared to go some distance in the direction of a liberal theology. There are now about 25,000 members in the 20 branches of the Verein. W. D. Schenkel, Der deutsche Protestantenteverein und seine Bedeutung für die Gegenwart (Wiesbaden, 1868, 2nd ed, 1871): Der deutsche Protestantenteverein in seinen Statuten und den Thesen seiner Hauptversammlungen 1865-1882 (Berlin, 1883); P. Weihhorn in Herzog-Hauke’s Realencyklopädie für prot. Theol. u. Kirche. H. Weinb. "Religious Life and Thought in Germany To-day," Hibbert Journal (July 1909).

PROTESTANT EPISCOPAL CHURCH, in the United States, a part of the Anglican Communion, organized after the War of Independence by the scattered parishes of the Church of England which survived the war. It inherits from the Church of England, with which it is in communion, its liturgy, polity and spiritual traditions, though it has entire independence in legislation. While the clergy of both Churches are cordially received in their respective countries, there is no formal connection between them except in fellowship and in advisory council as at the Lambeth Conference. A Church in the United States is therefore an independent national Church which has adapted itself to the conditions of American life.

With many likenesses, the Protestant Episcopal Church is different from the Church of England in its organization and representative form of government. It has the three orders of bishops, priests and deacons, and uses an almost identical liturgy; but it is a democratic institution in which the laymen have practically as much power as the clergy, and they are represented in all legislative bodies. The constitution of the Church follows in many particulars the constitution of the United States. As there are separate states of the Union and separate states of difference in Berlin, so the diocese is composed of separate parishes; and as the nation is a union of the states, so the Church is a union of the dioceses. The American plan of representative government is consistently adhered to. The Church in America is thus a part of the Catholic Church of Christ, with its roots deep in the past and yet a living body with a life of its own, standing for the truth of the Christian religion in the great Republic. It is now firmly established in every state and Territory of the United States, and in all the dependencies, with also vigorous missions in foreign lands, and the lives of the Church of England were held by the chaplains of exploring expeditions in various parts of North America.

History... before a settlement was established: on Hudson Bay, in 1578, and on the shores of the Pacific with Drake in 1579; but the first permanent foothold of the Church was in Jamestown, Virginia, in 1607, when a colony was founded and a church built. This fact is recognized in the proposed preamble to the constitution, in which it is stated that this American Church was "first planted in Virginia in the year of Our Lord 1607, by representatives of the ancient Church of England."

Parishes were later founded in Maryland in 1676; in Massachusetts in 1686; in New York about 1663; in Connecticut in 1706; and in the other colonies during the 17th and 18th centuries. The growth of these colonial churches was largely promoted by the Society for the Propagation of the Gospel in Foreign Parts, founded in 1701, through the efforts of the Rev. Thomas Bray, a missionary in Maryland. These churches scattered throughout the different colonies up to the American War of Independence were missions of the Church of England. They were under the jurisdiction of the Bishop of London, there being no bishop in America. The Bishop of London superintended these distant parishes by means of commissaries. Many of the clergy came from England; and when young men in America desired to be ordained, it was necessary for them to go to England for this purpose. The Church during the colonial period was incomplete in organization, and without the power of expansion. It was confined principally to the more settled parts of the country, though it had extended itself into all the colonies. During this period a few educational institutions were founded: the College of William and Mary in 1693, in Virginia; the Public Academy of Philadelphia, in 1749, now the university of Pennsylvania; and King’s College, in 1754, in New York, now Columbia University. The clergy also frequently taught in parochial schools, and trained boys and girls in their homes.

When the war broke out and independence was declared, a number of the clergy went back to England, leaving their parishes vacant, but many, especially in the southern states, remained and upheld the American cause. A large majority of the laymen were patriots and the Church was active in the Declaration of Independence, the American Colonies were Episcopalians. The churches, having their support largely withdrawn by the Venerable Society, became very weak. In Massachusetts during the war only two churches were kept open.

After the war it was very soon recognized that if the Church was to survive, there must be organization and co-operation among the fragments left. Rev. William White (1748-1836) of Philadelphia, who had been chaplain of the Continental Congress, was a leader in the plan of organization. Rev. Samuel Seabury (1729-1796) of Connecticut was also an important factor in continuing the life of the Church. He was elected bishop in 1784, at a general convention of clergymen, and consecrated bishop of Connecticut by the Scotch non-juror bishops in Aberdeen on the 14th of November 1784. Later, William White of Pennsylvania and Samuel Provoost (1742-1815) of New York were consecrated bishops in the chapel at Lambeth Palace on the 4th of February 1787, by the archbishops of Canterbury and York and others. Rev. James Madison (1749-1812) of Virginia was also consecrated bishop in England, on the 19th of September 1790. An important meeting or general convention of laymen, clergy and bishops was held in 1794, and another in 1796, for the purpose of consolidating and uniting the Churches. Certain foundational principles of the American Church were established on the basis of organization: that the Episcopal Church be independent of all foreign authority; that it have full and exclusive power to regulate the concerns of its own communion; that the doctrines be maintained as in the Church of England; that bishops, priests and deacons be required; that the canons and laws be made by a more representative body of clergy and laity conjointly. At the general convention of 1789 a constitution and canons were finally adopted, and the book of Common Prayer was set forth. The Church thus being fully organized, it was prepared to develop and extend. There was a long period, however, when little was done save retain what had already been gained. Owing in a measure to the popular prejudice against anything that savoured of England, and to the difficulty of adapting the newly formed institution to the conditions of American life, the Church hardly held its own from 1789 to 1811. The general convention of 1811 was attended by only five clergymen and four laymen more than that of 1789. The Church in Virginia especially suffered a decline, but in the North it maintained itself. After 1811 a new spirit manifested itself in the consecration of three important men to the episcopate. John Henry Hobart, a man of great zeal and devotion, became bishop of New York in 1811; Alexander Viets Griswold (1766-1849), a man of piety and force, became bishop of the eastern diocese of New England in 1811; and Richard Channing Moore (1762-1841), a
strong preacher and vigorous personality, was consecrated bishop of Virginia in 1814. Both Hohart and Moore became interested in theological education; and their efforts to train clergymen resulted in the establishment of the General Theological Seminary in New York in 1819, and the Theological Seminary in Virginia, opened in Alexandria in 1824. The Churchman's Magazine was started. Another evidence of expansion was the consecration in 1830 of Philander Chase (1775-1852), who became pioneer bishop of the West, first in Ohio where he laid the foundations (1842) of the "Theological Seminary of the Protestant Episcopal Church in the Diocese of Ohio," afterward called Kenyon College, at Gambier, and then in Illinois where he organized a church and founded Jubilee College. The Domestic and Foreign Missionary Society was started in 1821. This centralized the mission work, and became the great agency in the growth and extension of the Church. Bishop Jackson Kemper (1789-1870) in the North-west, and Bishop James Hervey Otey (1806-1863) in the South-west, did important pioneer work.

The period between 1835 and 1865 was characterized by further expansion of the Episcopal Church and the formation of new dioceses. Bishop William Ingraham Kip (1811-1863) went to the miners of California in 1853. The dioceses of Oregon and Iowa were founded in 1854; and Bishop Henry Whipple (1822-1901) was sent to Minnesota in 1859. The Church found its way into Indiana, Texas, Arkansas, Florida, Nebraska and Colorado. In 1835 there were 763 clergymen; in 1850 the number had increased to 1538; and even in 1865 there were 2450. The number of communicant's also grew from 1835, when there were 36,000; to 1839, when there were 80,000; and to 1865, when there were 150,000. During this period some beautiful church buildings were erected, notably Trinity church and Grace church, New York. The altars were richly ornamented; stained glass was used; stalls for the clergy and choir were introduced; and the lectern was substituted for the old-time reading-desk. Other educational institutions were founded: Nashotah, Wisconsin, in 1842; Bexley Hall at Gambier in 1839; Racine College, at Racine, Wisconsin; and Griswold College in Iowa.

When the Civil War broke out in 1861 the Church in the South met and formed a separate organization called "The Protestant Episcopal Church in the Confederate States," but the Church in the North did not recognize the secession; at the meeting of the general: Trinity Church, New Haven, Connecticut; St Stephen's, New York; Trinity Church, New York; St Mary's, at Burlington, New Jersey; and Grace Church, Washington D.C.; and St. George's School, at Newport, Rhode Island. In addition to the colleges already referred to, there should be included: Trinity Church, New Haven, Connecticut; St Stephen's, at Annandale, New York; the University of the South, at Sewanee, Tennessee; and Hobart College, at Geneva, New York. The theological seminaries, besides the general seminaries in New York and Virginia, are: the Divinity School, in Philadelphia; the Berkeley Divinity School, at Middletown, Connecticut; the Seabury Divinity School, at Faribault, Minnesota; Western Theological Seminary, at Chicago; Nashotah House, at Nashotah, Wisconsin; Bexley Hall, Gambier, Ohio; the Church Divinity School of the Pacific, San Mateo, California; and the Episcopal Theological School in Cambridge, Massachusetts.

Cathedrals have been built or were in process of construction in 1910 in many cities. Among them are: All Saints Cathedral, Milwaukee; the Cathedral of All Saints, Albany; the Cathedral of the Incarnation, Garden City, Long Island; the Cathedral Church of St Luke, Portland, Maine; St John the Divine, New York; and also those in Dallas, Texas, Washington, D.C., Davenport, Iowa, and Cleveland, Ohio.

The number of institutions of the Church is constantly increasing. Among the numerous organizations founded for distinct purposes are: the Woman's Auxiliary to the Board of Missions; the American Church Building Fund Commission; the American Church Missionary Society; the General Missionary Relief Fund; the Assyrian Mission Committee; the American Church Institute for Negroes; the Brotherhood of St Andrew; the Girls' Friendly Society; the Church Students' Missionary Association; the Church Laymen's Union; the Seabury Society of New York; the Church Mission to Deaf Mutes; the Conference of Church Workers among the Colored People; the Society for the Increase of the Ministry; the Church Association for the Advancement of the Interests of Labor; the Church Temperance Society; the Church Unity Society; the Confraternity of the Blessed Sacrament; the Guild of the Holy Cross; the Guild of St Barnabas for Nurses; the Church Congress in the United States. In addition there are Sunday School commissions and institutes in almost every diocese. Among the religious orders may be mentioned the Society of Mission Priests of St John the Evangelist; the Order of the Holy Cross; the Community of St Mary; the Sisterhood of St Margaret; the All Saints Sisters of the Poor; the Sisterhood of St John Baptist; and others. There are also training schools for deaconesses, including the New York Training School for Deaconesses, and the New York Training and Deaconess House of the Diocese of Pennsylvania.

The Protestant Episcopal Church in the United States is governed according to the constitutions and canons adopted in 1789, and from time to time amended by the General Convention, which meets every three years. The General Convention consists of the House of Bishops, having as members all the bishops of the Church, and the House of Deputies, composed of four presbyters and four laymen elected by each diocese in union with the Convention; also one clerical and one lay deputy from each missionary district within the boundaries of the United States, and one clerical and one lay deputy chosen by the Convocation of the American Churches in Europe. The voting is by both houses acting separately and concurring. In the House of Deputies the vote is taken by orders, the clerical and lay deputies voting separately; and they must concur for a resolution to pass. This representative body legislates for the whole Church. Each diocese also has a council or constitution, usually by-laws, to govern its affairs, having also an annual diocesan convention, in which the clergy and laity are represented. A bishop is elected by the subject, to confirm by a majority of the bishops and standing committees of the different dioceses. Missionary bishops are elected by the House of Bishops and confirmed by the House of Deputies if the General Convention is in session; if not in session, by a majority of the standing committees.

The presiding bishop of the Church was the senior bishop in order of consecration, until 1910, when an amendment to the constitution was adopted providing for his election by the General Convention. A special feature of the government of the Church is the power given to the laymen. In the parishes they elect their own clergyman; and they have votes in the diocesan convention and in the General Convention, and are thus an integral part of the legislative machinery of the Church.

The worship of the Church is conducted in accordance with the Book of Common Prayer, set forth in 1789, but changed from time to time as need has arisen. The preface states that "this Church is far from intending to depart from the Church of England in any essential part of doctrine, discipline or worship, or further than local custom may require." This principle guided the Church in the early days, and continues in force. However, changes have been made in the direction of omission and addition. The Athanasian Creed is omitted, as well as all reference to the king and royal family. The Commination Service has been dropped. In the Te Deum, in place of "Thou didst not abhor the Virgin's womb," is substituted Thou didst humble Thysel to be born of a Virgin." Many verbal
changes have been made. “Our Father which art in Heaven” is changed to “Who art in Heaven”; “Them that trespass” is changed to “Those who trespass.” The Ornaments Rubric and the Black Rubric are omitted. The Communion Office is more like the Scottish office, having the Oblation and Invocation. Instead of the Commandments may be said our Lord’s summary of the Law. Special prayers and thanksgiving have been added, to be used upon several occasions. A form of the consecration of a church has been introduced, as well as an office for the institution of a minister and an office for the visitation of prisoners. The last revision of the American Prayer Book was in 1892; gospels for the Festival of the Transfiguration and for the early part of the Easter celebration on Christmas Day and Easter Day were added; and a greater flexibility in the use of the Prayer Book was permitted.

The statistics reported by the General Convention of 1907 are as follows: the whole number of clergy, 3,529; deacons ordained, 485; priests ordained, 471; candidates for holy orders, 499; postulants, 323; lay readers, 2,467; baptisms, 197,303; persons confirmed, 1,589,931; communicants, 871,862; Sunday School officers and teachers, 47,871; pupils, 446,367; parishes and missions, 7,615; church edifices, 7,028; rectories, 2,530; church hospitals, 72; orphan asylums, 57; homes, 84; academic institutions, 22; collegiate, 17; theological, 23; other institutional foundations, 11,623; episcopal fund, $3,495,838; hospitals and other institutions, $7,509,985.

PROTEUS, in Greek mythology, a prophet old man of the sea. According to Homer, his resting-place was the island of Phars, near the mouth of the Nile; in Virgil his home is the island of Carpathus, between Crete and Rhodes. He knew all things past, present and future, but was sooth to tell what he knew. Those who would consult him had first to surprise and bind him during his noonday slumber in a cave by the sea, where he was wont to pass the heat of the day surrounded by his seals. Even when caught he would try to escape by assuming all sorts of shapes: now he was a lion, now a serpent, a leopard, a boar, a tree, fire, water. But if his captor held him fast the god at last returned to earth, breathed for a moment, and then plunged into the sea. He was subject to Poseidon, and acted as shepherd to his “flocks.” In post-Homeric times the story ran that Proteus was the son of Poseidon and a king of Egypt, to whose court Helen was taken by Hermes after she had been carried off, Paris being accompanied to Troy by a phantom substituted for her. This is the story followed by Herodotus (ii. 112, 118), who got it from Egyptian priests, and by Euripides in the Helen. From his power of assuming whatever shape he pleased Proteus came to be regarded, especially by the Orphics, as a symbol of the original matter from which the world was created. Rather he is typical of the ever-changing aspect of the sea (Homer, Odyssey, iv. 351; Virgil, Georgics, iv. 386). PROTEUS (Proteus anguineus), in zoology, a blind perennibranchiate tailed Batrachian, inhabiting the subterranean waters of the limestone caves to the east of the Adriatic from Carniola to Herzegovina. It was long supposed to be the sole representative of the Batrachians in the cave fauna, but other examples have been added in recent years. It is a small eel-like animal, with minute limbs, the anterior of which are tridactyl, the posterior didactyl, with a strongly compressed tail, a naked body, and a smooth unstriped skin of a bluish-grey color, with eyes hidden under the skin, which is usually colourless, or rather flesh-coloured, with the short, plume-like external gills blood-red; the jaws and palate are toothed. This extraordinary Batrachian has been found in a great number of different caves, but rather sporadically, and it is believed that its real home is in deeper subterranean waters, whence it is expelled at times of floods. It is often kept in aquariums, where it may turn almost black, and has bred in captivity. Proteus forms with Necturus (Menobranchus) the family Proteidae. The second genus, which is widely distributed in eastern North America, is more generalized in its structure, having better developed limbs, with four digits, and is adapted to live in the light. But the two are closely allied, and Necturus gives us a very exact idea of what sort of a type Proteus must be derived from.

In 1856 a 'Proteus-like' Batrachian was discovered in Texas during the operation of boring an artesian well 188 ft. deep, when it was shot out with a number of remarkable and unknown Crustaceans.

Typhlomolge rathbuni (see fig.), as this creature was called, agrees with Proteus in the shape of the head, in the absence of functional eyes, in the presence of external gills, and in the unpigmented skin. It differs in the very short body and the long slender limbs with four to five digits. It was first placed in the same family as Proteus; but the exact causal relations of the two species are unknown, and the anatomical investigations of Dr. T. B. Lake in the Southwestern United States, and of Professor J. A. Beach in Massachusetts have shown that they are allied to Necturus. There are two species, a large species, N. flaviguttatus, and a smaller species, N. cinereus. The latter is the species from which the above species is derived. They are not marbled, but possess a number of black spots on the body. The species are similar to the last mentioned. The Texas species is larger, with a relatively longer body, and is more closely allied to Necturus. It is remarkable for the ability to live in the light."
central apse leads directly to the diaconicon, but never to the prothesis.

**PROTISTA**, a name invented by Ernst Haeckel (Generelle Morphologie der Organismen, 1866) to denote a group of organisms supposed to be intermediate between the animal and vegetable kingdoms. As knowledge advanced the precise limits of the group shifted, and Haeckel himself, in successive publications, placed different sets of organisms within it, at one time proposing to include all unicellular animals and plants, making it a third kingdom equivalent to the animal and vegetable kingdoms. Partly because the term represented an interpretation rather than an objective set of facts, the word Protista has not been generally accepted in use in classification, and, whilst recognizing that the limits of the animal and plant kingdoms are not sharply defined, modern systematists refrain from associating these doubtfully placed organisms simply because of the dubiety of their position. (See PROTOZOA.)

**PROTOCOL** (Fr. protocole, Late Lat. protocolum, from Gr. πρωτός, first, and κάλλιον, to glue, i.e. originally the first sheet of a papyrus roll), in diplomacy, the name given to a variety of written instruments. The protocolium was under the late Roman Empire a volume of leaves, bound together with glue, in which public acts were recorded, so as to guard against fraud or error on the part of those responsible for preparing them; and in later usage it came to be applied to the original drafts of such acts. Thus, too, the word protocollare was devised for the process of drawing up public acts in authentic form (Du Cange, Glossarium lat. s.v. Protocolium). The use of the word protocolium for the introductory and other formulae in the medieval diploma (see DIPLOMATIC) thus explains itself as implying a recorded usage in such matters.

In the language of modern diplomacy the name of "protocol" is given to the minutes (procès-verbaux) of the several sittings of a conference or congress; these, though signed by the plenipotentiaries present, have only the force of verbal engagements (see CONGRESS). The name of "protocol" is also given to certain diplomatic instruments in which, without the form of a treaty or convention being adopted, are recorded the principles or the matters of detail on which an agreement has been reached, e.g. making special arrangements for carrying out the objects of previous treaties, defining these objects more clearly, interpreting the exact sense of a doubtful clause in a treaty (protocoles interprétatifs) and the like. Thus the famous Troppau protocol, which annulled the right and duty of the European powers to intervene in the internal affairs of a state threatened with revolution, was from the point of view of its signatories merely a logical application of the principles contained in the treaty of the 20th of November 1815 (see TROPPAT). Occasionally also an agreement between two or more powers takes the form of a protocol, rather than a treaty, when the intention is to proclaim a community of views or aims without binding them to eventual common action in support of those views or aims; thus the settlement of the question of the Danish succession was recognized by the powers in conference at London, by the protocol of 1852 (see SCHLEISWIG-HOLSTEIN QUESTION).

Finally, "the protocol" (protocole diplomatique, protocole de chancellerie) is the body of ceremonial rules to be observed in all written or personal official intercourse between the heads of different states or their ministers. Thus the protocol lays down in great detail the styles and titles to be given to states, their heads, and their public ministers, and the honours to be paid to them; it also indicates the forms and customary courtesies to be observed in all international acts. "It is," says M. Pradier-Fodéré, "the code of international politeness."

See P. Pradier-Fodéré, Cours de droit diplomatique (Paris, 1899), ii. 499.

**PROTOGENES**, a Greek painter, born in Caunus, on the coast of Caria, but resident in Rhodes during the latter half of the 4th century B.C. He was celebrated for the minute and laborious finish which he bestowed on his pictures, both in drawing and in colour. Apelles, his great rival, standing astonished in presence of one of these works, could only console himself by saying that it was wanting in charm. On one picture, the "Ialysus," he spent seven years; on another, the "Percy," he worked continuously during the siege of Rhodes by Demetrius Poliorcetes (305–304 B.C.) notwithstanding that the garden in which he painted was in the middle of the enemy's camp. Demetrius, unsolicited, took measures for his safety; more than that, when told that the "Ialysus" just mentioned was in a part of the town exposed to assault, Demetrius changed his plan of operations. Ialysus was a local hero, the founder of the town of the same name in the island of Rhodes, and probably he was represented as a huntsman. This picture was still in Rhodes in the time of Cicero, but was afterwards removed to Rome, where it perished during the sack of the city by the Visigoths in 410. The picture painted during the siege of Rhodes consisted of a large sheet of painting laid against a pillar on which was a figure of a partridge, so life-like that ordinary spectators saw nothing but it. Enraged on this account, the painter wiped out the partridge. The "Satyr" must have been one of his last works. He would then be about seventy years of age, and had enjoyed for about twenty years a reputation next only to that of Apelles, his friend and benefactor. Both were finished colourists so far as the fresco-painting of their day permitted, and both were laborious in the practice of drawing; doubtless with the view to obtaining bold effects of perspective as well as fineness of outline. It was an illustration of this practice when Apelles, finding in the house of Protogenes a large panel ready prepared for a picture, drew upon it with a brush a very fine line which he said would tell sufficiently who had called. Protogenes on his return home took a brush with a different colour and drew a still finer line along that of Apelles dividing it in two. Apelles called again; and, thus challenged, drew with a third colour another line within that of Protogenes, who then admitted himself surpassed. This panel was seen by Pliny (N.H. xxxv. 83) in Rome, where it was much admired, and where it perished by fire. In the gallery of the Propylaea at Athens was to be seen a panel by Protogenes. The subject consisted of two figures of outline representing the peripatetic instructions of the coast of Attica, Paralus and Harmonia. For the council chamber at Athens he painted figures of the Thesmo- thetai, but in what form or character is not known. Probably these works were executed in Athens, and it may have been then that he met Aristotle, who recommended him to take for subjects the deeds of Alexander the Great. In his "Alexander and Pan" he may have followed that advice in the idealizing spirit to which he was accustomed. To this spirit must be traced also his "Cydippe" and "Tiepoelemus," legendary personages of Rhodes. Among his portraits are mentioned those of the mother of Aristotle, Poliorketes, the tragic poet, and King Antigonus. But Protogenes was also a sculptor to some extent, and made several bronze statues of athletes, armed figures, huntsmen and persons in the act of offering sacrifices.

**PROTOGENES** (E. Haeckel), a little-known genus of Foraminifera (q.v.), marine organisms, forming a naked flat disk with numerous long radiating pseudopodia: nucleus and contractile vacuole not seen, and reproduction unknown.

**PROTOMYXA** (E. Haeckel), a genus of Foraminifera (q.v.), marine organisms, of orange colour, naked and reproducing in a single-celled flagellate, which is a tetradesmous form.

**PROTOPLASMA**, the name given in modern biology to a substance composing, wholly or in part, all living cells, tissues or organisms of any kind, and hence regarded as the primary living substance, the physical and material basis of life. The term "protoplasma," from πρωτόστομο, first, and πρωτόμα, formed substance, was coined by the botanist Hugo von Mohl, in 1846, for the "thick, slimy, granular, semi-fluid" constituent of plant cells, which he distinguished from the cell-wall, nucleus and cell-sap. This was not, however, the first recognition of the true living substance as such, since this step had been achieved in 1834 by the French naturalist F. Dujardin, who in his studies on Foraminifera had proposed the term "sarcodé" for the living material of their bodies in the following words: "Je propose de nommer ainsi ce que d'autres observateurs ont appelé une gelée vivante, cette substance glutinose,
PROTOPLASM

477
diaphane, insoluble dans l’eau, se contractant en masses globuleuses, s’attachant aux algüilles de dissection, et se laissant étirer comme du mucus, enfin se trouvant dans ce groupe de mots de morphologie inferièrées interposées aux autres éléments de structure.” To the French naturalist belongs, therefore, the real credit of the discovery of protoplasm, or rather, to be more accurate, of the first recognition of its true nature as the material basis of vital phenomena. Neither Dujardin nor von Mohl, however, had any conception of the universal occurrence and fundamental similarity of protoplasm in all living things, whether animal or vegetable, and it was not till 1861 that the identity of animal sarcode and vegetable protoplasm was proclaimed by Max Schultze, whose name stands out as the frame, if not the founder, of the modern notions concerning the nature of the living substance. From one point of view, or to the term “protoplasm,” was used for the living substance of all classes of organisms, although it would have been more in accordance with the custom of priority in nomenclature to have made use of Dujardin’s term “sarcode.”

A living organism, of any kind whatsoever, may be regarded as composed of (1) protoplasm, (2) substances or structures produced by the protoplasm, either by differentiation or modification of the protoplasm itself, or by the excretory or secretory activity of the living substance. The protoplasm of a given organism may be in a single individual mass, or may be aggregated into separate masses or units, discontinuous but not disconnected, termed cells (see CYTOLOGY). Thus living organisms may be distinguished, in a general way, as unicellular or multicellular. An instance of a unicellular organism is well seen in an Amoeba, or in one of the Foraminifera, classic examples for the study of undifferentiated protoplasm, which here composes the greater part of the body, while products of the formative activity of the protoplasm are seen in the external shell and in various internal granules and structures. As an example of a multicellular organism we may take the human body, built up of an immense number of living cells which produce, singly or in co-operation, a variety of substances and structures, each contributing to the functions of the body. This, without attempting to enter into details, the horny epidermis covering the body, the hairs, nails, teeth, skeleton, connective tissue, &c., are all of them products formed by the metabolic activity of the living substance and existing in intimate connexion with it, though not themselves to be regarded as living. In addition to metabolic products of this kind, special modifications of the living substance itself are connected with specializations or exaggerations, as it were, of a particular vital function; such as the contractile substance of muscular tissue, and the various mechanisms seen in nervous and sensory tissue. It is necessary, therefore, to connect the body of any kind to distinguish clearly between simple protoplasm, its differentiation and its products.

Protoplasm from whatever source, whether studied in a cell of the human body, in an Amoeba or Foraminifer, or in a vegetable organism, is essentially uniform and similar in appearance and properties. Its appearance, graphically described by Dujardin in the passage quoted above, is that of a greisy, viscid, slimy, semi-transparent and semi-fluid substance. Its properties are those of living things generally, and the most salient and obvious manifestation of life is the power of automatic movement exhibited by living protoplasm. When free and not limited by firm envelopes, the movements take the character known generally as amoeboid, well shown in the common Amoeba or in the white corpuscles of the blood. When confined by rigid envelopes, as in plant-cells, the protoplasm exhibits streaming movements of various kinds. Even more essentially characteristic of the living matter than the power of movement is the property of metabolism—that is to say, the capacity of assimilating substances different from itself, of building them up into its own substance (anabolism), and of again decomposing these complex molecules into simpler ones (katabolism) with production of energy in the form of heat, movement and electrical phenomena. An important part of the metabolic process is respiration, i.e. the absorption of oxygen from the surrounding medium and oxidation of carbon atoms to form carbonic acid gas and other simple chemical compounds; in ordinary plant and animal tissue, in the internal cells of the human body, in the massive protoplasm of marine organisms, in the stroma of certain green infusoria, and in the outer coat of certain fungi, metabolism is universal occurrence, but some Bacteria constitute apparently an exception to the rule. Metabolism results not only in the generation of energy, but also, if anabolism be in excess of katabolism, in increase of bulk, and consequent growth and reproduction.

Living protoplasm is, therefore, considered from a chemical standpoint, in a state of continual flux and instability, and it follows that if protoplasm be a definite chemical substance or mixture of substances (see below), a given sample of protoplasm cannot be pure, or at least cannot remain so for any length of time so long as its power of metabolism is being exerted, but rather that protoplasm may vary greatly in its chemical composition, as may be brought about by anabolism, as with its chemical composition, as may be brought about by a definite membrane, and may undergo further differentiations of structure which cannot be considered further here (see CYTOLOGY). The protoplasm of an ordinary cell is thus specialized into nucleus and cytoplasm. It was formerly thought that the most primitive forms of life, the Monera of E. Haeckel, consisted of pure protoplasm without a nucleus. It must be borne in mind, however, that chromatin can be present without being concentrated to form a definite nucleus, and that with imperfect technique the chromatin may easily escape observation. It seems justifiable at present to believe, until the contrary has been proved, that all organisms, however primitive, contain chromatin in some form: first, because this substance has always been found when suitable methods for its detection have been employed; secondly, because it has been shown experimentally, by cutting up small organisms, such as Amoeba, that enucleated fragments of protoplasm are unable to maintain their continued existence as living bodies; and, thirdly, because modern research has shown the chromatin to be of very great, perhaps fundamental, importance in regulating the vital processes of the cell and so determining the specific characters of the organism, a property which enables the chromatin to act
as the vehicle of heredity and to transmit the characters of parent to offspring. In the present state of our knowledge, therefore, the peculiar chromatin-granules must be regarded as an integral part, perhaps even the most essentially and primarily important portion, of the living substance. At the same time it must be borne in mind that the term "chromatin" does not denote a definite chemical substance, to be recognized universally by hard and fast chemical tests. The chromatin of different organisms or cells may behave quite differently in relation to stains or other reactions; and it is true that it is the chromatin of which determines the nature and activities of the cell, it follows that no two cells which differ from one another in any way can have their chromatin exactly similar. The conception of chromatin is one based upon its relations to the vital activities and life cycle, as a whole, of the organism or cell, and not upon any definable material, that is chemical and physical, properties.

The importance of protoplasm, as the physical and material basis of life, has caused it to be the subject in recent years of much minute and laborious research. It seems obvious that matter so peculiarly endowed must possess a complexity of structure and organization far exceeding that which at first sight meets the eye. Some biologists have attacked the problem of the ultimate constitution of protoplasm from a purely theoretical standpoint, and have framed hypotheses of an ultramicroscopic constitution sufficient, in their opinion, to explain, or at least to throw light upon, the vital activities of the living substance. Others, proceeding by more empirical methods, have attempted to lay bare the structure of protoplasm by means of the refinements of modern microscopic technique, or to solve the question of its constitution by means of chemical and physiological investigation. Hence a convenient distinction, not always easy, however, to maintain in practice, is drawn between speculative and empirical theories of protoplasm.

1. Speculative theories have come with the greatest frequency from those who have attempted to find a material explanation for the phenomena of heredity (q.v.). As instances may be mentioned more particularly the "gemmules" of Darwin, the "pangenes" of de Vries, the "plastidules" of Haeckel, and the "biophores" of Weismann. These theories have been ably brought together and discussed by Delage, who has included them all under the term "micromerism," since they agree in the assumption that the living substance contains, or consists of, a vast number of excessively minute particles—i.e. aggregates or combinations of molecules, which play the role of minute elements, with specific properties and tendencies ("idioplasm" of Nägeli). In other cases the assumption of invisible protoplastic units has been inspired by a desire either to explain the general vital and assimilative powers of protoplasm, as, for example, the "micelle" of Nägeli and the "plasomes" of Wiesner, or to elucidate the mechanism of some one function, such as the "fotagmas" of Engelmann, assumed to be the agents of contractility. In general, it may be said of all these speculations either that they can only be extended to all vital phenomena by the help of so many subordinate hypotheses and assumptions that they become mere nebulous when the central point, or that they only carry the difficulties a step further back, and really explain nothing. Thus it is postulated for Wiesner's hypothetical plasomes that they possess the power of assimilation, growth and reproduction by division; in other words, that they are endowed with just those properties which constitute the unexplained mystery of living matter.

2. Empirical theories of protoplasm differ according as their authors seek to find one universal type of structure or constitution common to all conditions or differentiations of the living substance, or, on the contrary, are of opinion that it may vary fundamentally in different places or at different times. From these two points of view protoplasm may be regarded either as monomorphic or polymorphic (Fischer). The microscopic investigation of protoplasm reveals at the first glance a viscid, slimy or mucilaginous substance, in which is embedded an immense number of granules, for the most part very tiny. Very rarely are these granules absent, and then only from a portion of the protoplasm, and only temporarily. Hence many authorities have regarded the minute granules—the "microsomes" of Hanstein—as themselves the ultimate living units of protoplasm, in opposition to those who would regard them merely as "metaplastic" substances, i.e. as the heterogeneous by-products of metabolism and vital activity. The granular theory, as this conception of the living substance is called, has received its extreme elaboration at the hands of Altmann, whose standpoint may be taken as typical of this class of theories. After demonstrating the universal occurrence of granules in protoplasm, Altmann has compared each individual granule to a free-living bacterium, and thus regards a cell as a colony of minute organisms, namely the granules or bioblats, as he has termed them, living embedded in a common matrix, like a zoogloea colony of bacteria. Of this theory it may be remarked, firstly, that it brings us no nearer to an explanation of vital phenomena than do the plasomes of Wiesner; secondly, that to consider bacteria as equivalent, not to cells, but to cell granules, is to assume for this class of organisms a position with regard to the cell theory which is, to say the least, doubtful; and, thirdly, that the observations of the vast majority of competent microscopists furnish abundant support to the theory that the granules of protoplasm do not lie free in a structureless matrix, but are embedded in the substance of a minute and delicate framework or morphoplasm, which in its turn is bathed by a watery fluid or enchyema permeating the whole substance. The upholders of the granular theory deny the existence of the framework, or explain it as due to an arrangement of the granules, or as an optical effect produced by the matrix between the granules. Amongst those, on the other hand, who assert the existence of a framework distinct from granules and enchyema, the utmost diversity of opinion prevails with regard to the true structural relations of these three parts and the role played by each in the exercise of vital functions. Some have regarded the framework as made up of a tangle of separate fibrillae (filar theory)—a view more especially connected with the name of Fleming—but most are agreed that it represents the appearance of a reticulum or network with excessively fine meshes, usually from \[\frac{1}{3}\] to \[\mu\] in diameter. The reticulum carries the granules at its nodal points, and is bathed everywhere by the enchyema. Even with so much in common, however, opinions are still greatly at variance. In the first place, the majority of observers interpret the reticulum as the expression of an actual spongy framework, in a sense that is analogous to the tubules of living structure; however, Heitzmann, following the speculations of Brücke, considered the framework itself to be actively contractile and the seat of all protoplastic movement, an opposite point of view is represented by the writings of Leydig, Schäfer and others, who regard the reticulum merely as a kind of supporting framework or spongiosplasm, in which is lodged the enchyema or hyaloplasm, considered to be itself the primary motile and living substance. Büttschli, on the other hand, has pointed out the grave difficulties that attend the interpretation of the reticulum as a fibrillar framework, in view of the distinctly fluid consistency of the whole protoplast. For if the substance of the framework be assumed to be of a firm, solid nature, then the protoplasm as a whole could not behave as a fluid, any more than could a sponge soaked in water. On the other hand, the hypothesis of a fluid fibrillar framework leads to a physical impossibility, since one liquid cannot be permanently suspended in another in the form of a network. Büttschli therefore interprets the universally present reticulum as a meshwork of minute lamellae, forming a honeycombed or ateloc structure, similar to the arrangement of fluid lamellae in a fine foam or lather, in which the interstices are filled, not with air but with another fluid; in other words, the structure of protoplasm is that of an exceedingly fine emulsion of two liquids, not miscible with one another.

It may be claimed for the ateloc theory of Büttschli that it throws light upon many known facts relating to protoplasm. It interprets the reticulum as the optical section of a minute foam structure and permits the formation of protoplastic striations and of apparent fibrillae as the result of linear or radiating dispositions of the ateloc...
PROTOZOA

The question may be raised how far it is probable that there is one universal living substance which could conceivably be isolated or prepared in a pure state, and which would then exhibit the phenomena of life. Two characters may be pointed out in the first place, that protoplasm, as we know it, exhibits infinite diversity of character, and that no two samples of protoplasm are alike, or can even be regarded as very similar, for the variations arise by changes in the combinations of a vast number of atoms and atom complexes. It is difficult to conceive, however, of any single substance, however complex in its chemical constitution, which could perform all the functions of life. It must be assumed to exist not only between the vital fabrics of all living organisms, but even between those of individuals of the same species. Kassowitz regards this variability as compatible with the unity of protoplasm, and analogous with the variations which arise by changes in the combinations of a vast number of atoms and atom complexes. It is difficult to conceive, however, of any single substance, however complex in its chemical constitution, which could perform all the functions of life. It must be assumed to exist not only between the vital fabrics of all living organisms, but even between those of individuals of the same species. Kassowitz regards this variability as compatible with the unity of protoplasm, and analogous with the variations which arise by changes in the combinations of a vast number of atoms and atom complexes.

To the above-mentioned monomorphic theories of protoplasm, all of which agree in assuming the existence of some fundamental type of structure in all living substances, attempts have been made at various times to show that the structural appearances seen in protoplasm are in reality artificial products, due to precipitation or coagulation caused by reagents used in the study or preparation of living objects. These views have been developed by Fischer, who by experimenting upon various protoplasms with histological fixatives, has shown that it is possible to produce in them a granular, reticular, or alveolar structure, according to treatment, and, further, that granules produced may be differentially stained according to their size and absorptive powers. Fischer therefore suggests that many structural appearances seen in protoplasm may be purely artificial, but does not extend this view to all such structures, which would indeed be impossible, in view of the frequency with which reticular or alveolar structures have been observed during life. He suggests, however, that such structures may be temporary results of vitral precipitation of proteins within the organism, and that protoplasm may have at different times a granular, reticular, or alveolar structure, or in my constructional conception Fischer's conception of living protoplasm is therefore that of a polymeric substance, and a similar view is held at the present time by Flemming, Wilson and others. Strassburger also regards protoplasm as composed of two portions: a motile kinoplasm which is fibrillar, and a nutritive tropoplasm which is alveolar, in structure.

The chemical investigation of protoplasm labours at the outset under the disadvantage that it cannot deal with the living substance as a whole, since no analysis can be performed upon it without destroying the life. Protoplasm consists, to the extent of about 65% of its total mass, of a mixture of various substances: proteins, fats, carbohydrates, and fatty substances, and chemical and physical properties and even analogies, which have been given to it by name.

As an example of the numerous and varied forms which the organism may assume, we may refer to the many species of *Protozoa*, a group of micro-organisms which are not to be confused with true protoplasm. The question may be raised how far it is probable that there is one universal living substance which could conceivably be isolated or prepared in a pure state, and which would then exhibit the phenomena of life. Two characters may be pointed out in the first place, that protoplasm, as we know it, exhibits infinite diversity of character, and that no two samples of protoplasm are alike, or can even be regarded as very similar, for the variations arise by changes in the combinations of a vast number of atoms and atom complexes. It is difficult to conceive, however, of any single substance, however complex in its chemical constitution, which could perform all the functions of life. It must be assumed to exist not only between the vital fabrics of all living organisms, but even between those of individuals of the same species. Kassowitz regards this variability as compatible with the unity of protoplasm, and analogous with the variations which arise by changes in the combinations of a vast number of atoms and atom complexes. It is difficult to conceive, however, of any single substance, however complex in its chemical constitution, which could perform all the functions of life. PROTOZOA

zoological standpoint, but which becomes less satisfactory when we take into consideration the whole range of microscopic unicellular organisms. Besides the true Protozoa, which, \textit{ex hypothesi}, are organisms of animal nature, there are many other organisms of equally simple organization, including the Bacteria and the unicellular plants. The Bacteria stand sharply apart from the other forms of life, not only, in many cases, by their divergent methods of metabolism, but by morphological characteristics, such as the definite body-form limited by a distinct envelope, the absence of organs for locomotion other than the peculiar flagella, and, above all, by the lack of any differentiation of the body-protoplast into nucleus and cytoplasm, as in all true cells of either animal or vegetable nature. On the other hand, to separate by hard-and-fast definitions the unicellular plants from the unicellular animals is not only difficult but impossible. There is not even a plant and animal is a physiological one, a difference in the method of nutrition. A typical green plant is able to live independently of other organisms and to build up its substance from simple gases in the air and inorganic salts in the soil or water, provided that certain conditions of light and moisture be present in its environment; this is the so-called holophytic method of nutrition. A typical animal, on the other hand, while practically independent of sunlight, is not able to exist apart from other living organisms, since it is not able to build up its substance from simple chemical constituents like a plant, but must be supplied with ready-made proteins in its food, for which it requires other organisms, either plants or animals; this is the so-called holozoic method of nutrition. Intermediate between these two habits of life is the so-called saprophytic habit, exemplified by the fungi amongst plants; in this method of nutrition the organism cannot build up its substance entirely from inorganic substances, but absorbs the organic substances present in solutions containing organic salts or decaying animal or vegetable matter.

If we regard the organisms termed collectively Protozoa from the point of view of their methods of nutrition (considering for the present only free-living, non-parasitic forms), we find in one class, the Flagellata, examples of the three methods mentioned above, the holozoic, holophytic and saprophytic habit of life, not only in species closely allied to each other, but even combined in one and the same species at different periods of its life or in different surroundings. An individual of a given species may contain chlorophyll, with which it decomposes carbonic acid gas in the sunlight, like a plant, while possessing a definite mouth-aperture, by means of which it can ingest solid food, like an animal. Such instances show clearly that in the simplest forms of life the difference between plant and animal is but a difference of habit and of mode of nutrition, to which the organism is not at first irrevocably committed, and which are not at first accompanied by distinctive morphological characteristics. Only when the organism becomes specialized for one or the other mode of life exclusively does it acquire such definite morphological characters that the difference between plant and animal can be used for the purpose of a natural classification, as in the higher forms of life. In the lowest forms it is not possible to base natural subdivisions on their vegetable or animal nature. For this reason it has been proposed by E. Haeckel to unite all the primitive forms of life in which the body is morphologically equivalent to a single cell into one group, the Protista, irrespective of their animal or vegetable nature. In this method of dealing with the problem the Protista are regarded as a distinct kingdom (\textit{Reich}), more or less intermediate between, but distinct from, the animal and vegetable kingdoms, and representing the ancestral stock from which both animals and plants have sprung. Many authorities have followed Haeckel's lead in the matter, and the science of Proto-
tistology or \textit{Protistenkunde} has already a special journal devoted to the publication of researches upon it. But though it may be more scientific, from a theoretical point of view, to group all these primitive organisms together in the way suggested by Haeckel, in practice it is inconvenient, on account of the vast number of forms of life to be comprised as Protista, their diversity in habit of life and organization, and, above all, the difference in the technical methods required for their study, which becomes too complicated for a single worker. Hence of Protistology becomes split up in practice by its own mass into three sciences: the Bacteria are the objects of the science of bacteriology; botanists deal with the unicellular plants; and the zoologists with those Protista which are more distinctly animal in their characters.

Hence the Protozoa are to be regarded as a convenient rather than a natural group, and may be characterized generally as follows: Organisms in which the individual is a single cell, that is to say, consists of a single undivided mass of protoplasm which is capable of independent existence in a suitable environment; if many such individuals be combined together to form a colony, as is usually the case, there is no differentiation of the individuals except for reproductive purposes, and never for tissue-formation as in the Metazoa. The body always contains chromatia or nuclear substance, which may be disposed in various ways, but usually forms one or more concentrated masses termed nuclei, which can be distinguished sharply from the general body-protoplast or cytoplasm. The protoplasmic body may be naked at the surface, or may be limited and enclosed by a distinct envelope or cell-membrane, which is not usually of the nature of cellulose, except in holophytic forms. Organs serving for locomotion and for the capture and assimilation of solid food are usually present, but may be wanting altogether when the mode of nutrition is other than holozoic; chlorophyll, on the other hand, is only found as a constituent of the body-substance in the holophytic Flagellata. To these characters it may be added that reproduction is effected by some form of fission, or division of the body into smaller portions, and that in the vast majority of Protozoa, if not in all, a process of conjugation or syngamy occurs at some period in the life-cycle, the essential feature of the process being fusion of nuclear matter from distinct individuals. The foregoing definition does not distinguish the Protozoa sharply from the primitive forms of plant-life, with which, as stated above, they are connected by many transitions, but the differentiation of the body-substance into nucleus and cytoplasm separates them at once from the Bacteria, in which the chromatin is distributed evenly through the body-protoplast.

\textit{Protozoa and Disease.}—The study of the Protozoa has acquired great practical importance from the fact that many of them live as parasites of other animals, and as such may be the cause of dangerous diseases and epidemics in the higher forms of animal life and in man (see \textit{Parasitic Diseases}). Examples of parasitic forms are to be found in all the four classes into which, as will be stated below, the Protozoa are divided, and one class, the Sporozoa, is composed entirely of endoparasitic forms. Hence Protozoology, as it is termed, is rapidly assuming an importance in medical and veterinary science almost equal to that of bacteriology, although the recognition of Protozoa as agents in the production of disease is hardly older than a decade. The most striking instances of Protozoa well established as pathogenic agents are the malarial parasites, the species of \textit{Plasmodium} causing haemoglobinuria of cattle and other animals, the trypanosomes causing tsetse-fly disease, surra, sleeping sickness, and other maladies, the species of \textit{Leishmania} causing kala azar and oriental sore, and the \textit{Amebas} responsible for the so-called amebic dysentery. Other diseases referred, but as yet doubtfully, to the agency of Protozoa are syphilis, small-
pox, hydrophobia, yellow fever, and even cancer.

It is only possible here to discuss briefly in a general way the relations of these parasites to their hosts. When two organisms stand habitually in the relation of host and parasite, an equi-
lbrium tends to become established gradually between them, so

\footnote{1 Many Protozoa contain symbiotic green organisms, so-called zoonichlorellae or zooxanthellae, in their body-protoplast; for instance, Radiolaria, and Ciliata such as \textit{Paramecium bursaria}, &c. This condition must be carefully distinguished from chlorophyll occurring as a cell-constituent.}
that a condition is brought about in which, after many genera-
tions, the host becomes "tolerant" of the parasite, and the para-
site is not lethal to the host, though perhaps capable of
setting up considerable disturbance in its vital functions. Many
animals are found to contain almost constantly certain internal
parasites or protozoa, apparently, in the least possible
manner; and it should be borne in mind that in most cases it is
not to the interest of the parasite to destroy the host or to over-
tax its resources. But when the parasite is transferred naturally
or artificially to a species or race of host which does not ordinarily
harbour it, and which therefore has not acquired powers of
resisting its attacks, the parasites may be most deadly in their
effects. Thus the white traveller in the tropics is exposed to
far greater dangers from the indigenous disease-producing
organisms than are the natives of those climes.

In some cases two organisms have become mutually adapted
to each other as host and parasite to such an extent that the
parasite is not capable of flourishing in any other host. An
instance of this is Trypanosoma lewisi of the rat, which cannot
live in any other species of animal but a rat, and which is not
as a rule lethal to a rat, at least not to one otherwise healthy.

Contrasting in an instructive manner with this species is Trypano-
soma brucei, which occurs as a natural parasite of buffaloes and
other big game in Africa, and is, apparently, harmless to them,
but which is capable of being transferred to other animals by
inoculation. The transference may take place naturally, by
the bite of a tsetse-fly, or may be effected artificially; in either
case T. bruceii is extremely lethal to certain animals, such as
imported cattle, horses and dogs, or to rats and guinea-pigs.
Other animals, however, may be quite "repellent"1 to this
parasite, that is to say, if it be inoculated into their blood it dies
out without producing ill effects, just as T. lewisi does when
injected into an animal other than a rat. Thus it is seen that
T. bruceii, when introduced into the blood of an animal which
is specifically or racially distinct from its natural hosts in the
region where it is indigenous, is either unable to maintain itself
in its new host, or flourishes in it to such an extent as to be the
cause of its death.

We may assume, therefore, at least as a working hypothesis,
that a lethal parasite is one that is new to its host, and that a
harmless parasite is one long established. Since all parasites
must have been new to their proper hosts at some period, recent
or remote, in the history of the species, it would follow that
the first commencement of parasitism would be in almost all cases
a life and death struggle, as it were, between the two organisms
concerned, and it is quite conceivable that the host might
succumb in the struggle and so be exterminated. Ray Lankester
has suggested that the extinction of many species of animals
in the past may have been due, in some cases, to their having
been attacked by a species of parasite to which they did not
succeed in becoming adapted, and by which they became, in
consequence, exterminated entirely.

Organization of the Protozoa. —The body-form may be constant
or inconstant in the Protozoa, according as the body-substance
is or is not limited at the surface by a firm envelope or cuticle.
When the surface of the protoplasm is naked, as in the common
amoeba and allied organisms, the movements of the animal bring
about continual changes of form. The protoplasm flows out
at any point into processes termed pseudopodia, which are being
continually retracted and formed anew. Such movements are
known as amoeboid, and may be seen in the cells of Metazoa
as well as in Protozoa. The pseudopodia serve both for lomoc-
tion and for the capture of food. If equally developed on all
sides of the body, the amoeba has no definite position of the body-con
and is therefore said to be ameboid. On the other hand, if formed more on one side than the other, the mass of the body
shifts its position in that direction, but the movement of transla-
tion is generally slow. If the animal remains perfectly quiescent
and inactive, the laws of surface-tension acting upon the semi-
fluid protoplasmic body cause it to assume a simple spherical
form, which is also the type of body-form generally characteristic
of Protozoa of floating habit (Radiolaria, Heliozoa, &c.).

In the majority of Protozoa, however, the protoplasm is
limited at the surface by a firm membrane or cuticle, and in
consequence the body has a definite form, which varies greatly
amongst the various species, as it happens in the life of any one
of them; and it should be borne in mind that in most cases it is
not to the interest of the parasite to destroy the host or to under-
tax its resources. But when the parasite is transferred naturally
or artificially to a species or race of host which does not ordinarily
harbour it, and which therefore has not acquired powers of
resisting its attacks, the parasites may be most deadly in their
effects. Thus the white traveller in the tropics is exposed to
far greater dangers from the indigenous disease-producing
organisms than are the natives of those climes.

In some cases two organisms have become mutually adapted
to each other as host and parasite to such an extent that the
parasite is not capable of flourishing in any other host. An
instance of this is Trypanosoma lewisi of the rat, which cannot
live in any other species of animal but a rat, and which is not
as a rule lethal to a rat, at least not to one otherwise healthy.

Contrasting in an instructive manner with this species is Trypano-
soma brucei, which occurs as a natural parasite of buffaloes and
other big game in Africa, and is, apparently, harmless to them,
but which is capable of being transferred to other animals by
inoculation. The transference may take place naturally, by
the bite of a tsetse-fly, or may be effected artificially; in either
case T. bruceii is extremely lethal to certain animals, such as
imported cattle, horses and dogs, or to rats and guinea-pigs.
Other animals, however, may be quite "repellent"1 to this
parasite, that is to say, if it be inoculated into their blood it dies
out without producing ill effects, just as T. lewisi does when
injected into an animal other than a rat. Thus it is seen that
T. bruceii, when introduced into the blood of an animal which
is specifically or racially distinct from its natural hosts in the
region where it is indigenous, is either unable to maintain itself
in its new host, or flourishes in it to such an extent as to be the
cause of its death.

We may assume, therefore, at least as a working hypothesis,
that a lethal parasite is one that is new to its host, and that a
harmless parasite is one long established. Since all parasites
must have been new to their proper hosts at some period, recent
or remote, in the history of the species, it would follow that
the first commencement of parasitism would be in almost all cases
a life and death struggle, as it were, between the two organisms
concerned, and it is quite conceivable that the host might
succumb in the struggle and so be exterminated. Ray Lankester
has suggested that the extinction of many species of animals
in the past may have been due, in some cases, to their having
been attacked by a species of parasite to which they did not
succeed in becoming adapted, and by which they became, in
consequence, exterminated entirely.

Organization of the Protozoa. —The body-form may be constant
or inconstant in the Protozoa, according as the body-substance
is or is not limited at the surface by a firm envelope or cuticle.
When the surface of the protoplasm is naked, as in the common
amoeba and allied organisms, the movements of the animal bring
about continual changes of form. The protoplasm flows out
at any point into processes termed pseudopodia, which are being
continually retracted and formed anew. Such movements are
known as amoeboid, and may be seen in the cells of Metazoa
as well as in Protozoa. The pseudopodia serve both for lomoc-
tion and for the capture of food. If equally developed on all
sides of the body, the amoeba has no definite position of the body-con
and is therefore said to be ameboid. On the other hand, if formed more on one side than the other, the mass of the body
shifts its position in that direction, but the movement of transla-
tion is generally slow. If the animal remains perfectly quiescent
and inactive, the laws of surface-tension acting upon the semi-
fluid protoplasmic body cause it to assume a simple spherical

1 The use of the terms "tolerant" and "repellent" is taken from the excellent article on "Sleeping Sickness," by E. Ray Lankester, in the Quarterly Review (July 1904), No. 399, pp. 113-138.
The protoplasmic body of the Protozoa is frequently differentiated into two zones or regions: a more external, termed the ectoplasm or ectosarc, and a more internal, termed the endoplasm or endosarc. The ectosarc is distinguished by being more clear and hyaline in appearance, and more tough and viscid in consistence; the endoplasm, on the other hand, is more granular and opaque, and of a more fluid nature. The ectoplasm is the protective layer of the body, and is also the portion most concerned in movement, in excretion, and perhaps also in sensation and in functions similar to those performed by the nervous systems of higher animals. The endoplasm, on the other hand, is the chief seat of digestive and reproductive functions.

As the protective layer of the body, the ectoplasm forms the envelopes or membranes which invest the surface of the body, and of which, as a train of cilia, the more superficial and transparent, is commonly mistaken for the ectoplasm. Thus in most Flagellata the ectoplasm is represented only by the more or less firm outer covering or periplast. Even when such envelopes are absent, however, the ectoplasm can still be seen to exert a protective function; as, for instance, in those Myxosporidia which are parasitic in the gill-bladders or urinary bladders of their hosts, and which can resist the action of the juices in which they live so long as the ectoplasm is intact, but succumb to the action of the medium if the ectoplasm be injured. In many Infusoria the ectoplasm contains special organs of offence termed trichocytes, each a minute ovoid body from which, on stimulation, a thread is shot out, in a manner similar to the nematocytes of Coelenterata. Similar organs are seen also in the spores of Myxosporidia, as the so-called polar capsules; but in this case the organs are not specially ectoplasmic, and appear to serve for adhesion and attachment, rather than for offence.

The connexion of the ectoplasm with movement is seen in the simplest forms, such as Amoeba, by the fact that all pseudopodia arise from it in the first instance. In forms with a definite cuticle, on the other hand, the ectoplasm usually contains contractile fibres or myonemes, forming, as it were, the muscular system of the organism. The dependence of the motility of the animal upon the development of the ectoplasm is well seen in Gregarines, in which other organs of locomotion are absent; in forms endowed with active powers of locomotion a distinct ectoplasmic layer is present below the cuticle; in those Gregarines incapable of active movement, on the other hand, the ectoplasm is absent or scarcely recognizable.

From the ectoplasm arise the special organs of locomotion, which, when present, take the form of pseudopodia, flagella or cilia. Pseudopodia, as already explained, are temporary protoplasmic organs which can be extruded or retracted at any point; they fall naturally into two principal types, between which, however, transitions are to be found: first, slender, filamentous, or filose pseudopodia, composed of ectoplasm alone, which may remain separate from one another, or may anastomose to form networks, and are then termed reticulose; secondly, thick, blunt, so-called lobose pseudopodia, which are composed of ectoplasm with a core of endoplasm, and never form networks. In forms showing active locomotor powers the pseudopodia are usually more lobose in type; filose pseudopodia, on the other hand, are more adapted for the function of capturing food.

Flagella are long, slender, vibratile filaments, generally few in number, when present, and usually placed at the pole of the body which is anterior in progression. Each flagellum performs peculiar lashing movements which cause the body, if free, to be dragged along after the flagellum in jerks or leaps; if, however, the body be fixed, the action of the flagellum or flagella causes a current towards it, by which means the animal obtains its food-supply. A flagellum which is anterior in movement has been distinguished by Lankester by the convenient term tractellum; sometimes, however, the flagellum is posterior in movement and acts as a propeller, like the tail of a fish; for this type Lankester has proposed the term pulselum. The flagellum appears to arise in all cases from a distinct basal granule, and in some cases, as in the genus Trypanosoma, there is a portion of the nuclear apparatus set apart as a distinct kinetic nucleus, with the function, apparently, of governing the activities of the flagellum.

Cilia are minute, hair-like extensions of the ectoplasm, which pierce the cuticle and form typically a furry covering to the body. Though perhaps primitively derived from flagella, cilia, in their usual form, are distinguished from flagella by being of smaller size, by being present, as a rule, in much greater numbers, and above all by the character of their movements. In the place of the complicated lashing movements of the flagella, each cilium performs a simple stroke in one direction, becoming first bowed on one side, by an act of contraction, and then straightened out again when relaxed. The movements of the cilia are coordinated and they act in concert, though not absolutely in unison, each one contracting just before or after its neighbour, or contracting in an unison over a limited portion of the surface in a given direction, similar to what may be seen in a cornfield when the wind is blowing over it. Primitively coating the whole surface of the body evenly, the cilia may become modified and specialized in various ways, which cannot be described in detail here (see Infusoria).

Besides the organs of locomotion already mentioned, there may be present so-called undulating membranes, in the form of thin sheets of ectoplasm which are capable of performing sinuous, undulating movements by their inherent contractility. In some cases distinct contractile threads or myonemes have been described in these membranes. Undulating membranes appear to be formed either by the fusion together of a row of cilia, side by side, or by the attachment of a flagellum to the body by means of an ectoplasmic web, in which case the flagellum forms the free edge of the membrane, as in the genus Trypanosoma.

Returning to the ectoplasm, the excretory function exerted by this layer is seen by the formation in it of the peculiar contractile vacuoles found in most free-living Protozoa. A contractile vacuole is a spherical drop of watery fluid which makes its appearance periodically at some particular spot near the surface of the animal's body, or, if more than one such vacuole is present, at several definite and constant places. Each vacuole grows to a certain size, and when it has reached the limit of its growth it discharges its contents to the exterior by a sudden and rapid contraction. There is, apparently, in most if not in all cases, a definite pore through which the contractile vacuole empties itself to the exterior. On account of the relatively large size which the contractile vacuole attains it bulges inwards beyond the limits of the ectoplasm and comes to lie chiefly in the endoplasm, to which it is sometimes, but erroneously, ascribed. In the most highly differentiated Protozoa, for instance, the Ciliata, the ectoplasm contains an apparatus of excretory channels, situated in its deeper layers, and forming as it were a drainage-system, from which the contractile vacuoles are fed. The fluid discharged by the contractile vacuoles appears to be chiefly water which has been absorbed at the surface of the protoplasmic body, and which has filtered through the protoplasm, taking up the soluble waste nitrogenous products of the metabolism and the gaseous products of respiration; hence the contractile vacuoles may be compared in a general way to the urinary and respiratory organs of the Metazoa.

One of the first consequences of the parasitic habit of life is the disappearance of the contractile vacuoles, which are becoming found in truly parasitic Protozoa, that is to say, in forms which live in the interior of other animals and nourish themselves at their expense. They are also very frequently absent in marine forms.

Mechanisms of a nervous nature are very seldom found in Protozoa, but in some Ciliata special tactile bristles are found, and it is possible that flagella, and perhaps even pseudopodia, may be sometimes tactile rather than locomotor in function. Pigment-spots, apparently sensitive to light, may also occur in some Flagellata.

The endoplasm, as already stated, is the chief seat of nutritive and reproductive processes. In many Flagellata the ectoplasm
Protozoa

Those so-called "Protozoa," though the distinction is still retained, are represented by the large number of free-living forms, which must be considered specially and may be put aside for the present.

In considering the functions of ingestion and assimilation of food a distinction must be drawn between those Protozoa which absorb solid food-particles, that is to say, which are holozoic in habit, and those which, being holophytic, saprophytic or parasitic in habit, absorb their nourishment in a state of solution. Only in holozoic forms is a special apparatus found for ingestion or digestion of food; in all other forms nutrition is absorbed by osmosis through the body-wall, presumably at any point of the surface. In holozoic forms we must distinguish further those in which the food is digested at a distinct distance from the region in which the body is clothed by a firm cuticle or cell-membrane. In naked forms food-particles are taken in at any point of the body-surface, either by means of the pseudopodia, or by the action of flagella causing them to impinge upon the surface of the body. In either case the food is absorbed by the protoplasm simply flowing round it and engulfing it, and the food passes into the interior of the body in a tiny droplet of water forming what is termed a food-vacuole. Into the food-vacuole the surrounding protoplasm secretes digestive enzymes, so that each such vacuole represents a minute digestive cavity, in which the digested material is slowly dissolved and absorbed by the surrounding protoplasm. The insoluble residue of the food is finally rejected by expelling the food-vacuole and its contents from the surface of the body at any convenient point.

The simple process of food-absorption described above for the more primitive naked forms is necessarily modified in detail, though not in principle, in ciliate Protozoa, that is to say, in forms provided with a cuticle. In the first place, it becomes necessary to have a special aperture for the ingestion of food, a cell-mouth or cytosome. Primitively the cytosome is a simple pore or interruption of the cuticle, but in forms more highly evolved the aperture is prolonged inwards in the form of a tube lined by ectosarc and cuticle, forming a gullet or oesophagus which ends in the endoplasm. Food-particles are forced by the action of cilia or flagella down the oesophagus and collected at the bottom of it in a droplet of water which, after reaching a certain size, passes into the endoplasm as a food-vacuole in which the food is digested. For rejection of the insoluble residue of the food-vacuoles, a special pore or cell-anus (cyoppyge) may be present. In the Ciliata there is often a distinct anal tube visible at all times, but as a rule the anus is only visible at the moment that faecal matter is being ejected from it, though in sections the anus is seen as a distinct opening. In the higher Flagellata, on the other hand, the oesophageal ingrowth forms a sort of cloacaal cavity, into which the contractile vacuole or vacuoles discharge themselves, and into which also the food-vacuoles evacuate their residues.

Besides the food-vacuoles already described, and the nuclear apparatus presently to be dealt with, the endoplasm may contain various metabolische products, that is to say, bodies to be regarded as stages in the upward or downward metabolism of the protoplasmic substance. Such substances may take the form of coarse granules of various kinds, crystals, vacuoles or droplets of watery or oily nature, pigment-grains, and other bodies. In the holohytic Flagellata the endoplasm contains also various organs proper to the vegetable cell, such as chlorophyll-bodies (chromatophores), pyrenoids, grains of a starchy nature (par-amylum), and so forth, which need not be described here in detail.

The nuclei in Protozoa is usually a compact, fairly conspicuous structure, composed of chromatin combined in various ways with an achromatic substance or substances. Sometimes the chromatin is distributed in smaller masses through the nucleus, producing a granular type of nucleus; more often the chromatin is more or less concentrated in a central mass forming a so-called karyosome, consisting of an achromatic plastind substance impregnated with chromatin. If the karyosome is large and there is very little chromatin between it and the membrane, the nucleus is of the type termed vesicular. A nuclear membrane is not, however, always present, and true nucleoli, of the type found in the nucleus of metazoan cells, are not found in Protozoa.

A given individual may have more than one nucleus, and the number present may amount to many thousands, as in the plasmodia of Mycetozoa. In such cases the nuclei may be all of one kind, that is to say, not markedly different in size, structure or function, so far as can be seen; or there may be a pronounced morphological differentiation of the nuclei correlated with a difference of function. Thus in the class Infusoria two nuclei are found, in each individual; one, which is said to be "necrotic" in function, is that, is to say, which regulates the metabolism and vital processes of the body generally, and the micronucleus, which is generative in function, that is to say, which remains in reserve during the ordinary, "vegetative" life of the organism and becomes active during the act of syngamy, after which the effete macronucleus is absorbed or cast out and a new somatic nucleus is formed from portions of the micronuclei which have undergone fusion in the sexual act. Thus the micronucleus of the Infusoria can be compared in a general way with the germ-plasm of the Metazoa, like which it remains inactive until the sexual act; while the differentiation of the nucleus of quite a different type is seen, a smaller, kinetic nucleus being separated off from the larger, trophic or principal nucleus. The kinetic nucleus has the function, apparently, of controlling the locomotor apparatus, so that the specialization of these two nuclei is of a kind quite different from that seen in the Infusoria.

Besides the nuclear substance which is concentrated to form the principal nucleus or nuclei, there may be present also extranuclear granules of chromatin, so-called chromidia, scattered throughout the whole or some part of the protoplasmic body. Chromidia may be normally present in addition to the principal nucleus, or may be formed from the principal nucleus during certain phases of the life-cycle. In some cases the entire nucleus may become resolved temporarily into chromidia, from which a new nucleus may be formed again later by condensation and concentration of the scattered granules. When the chromidia are numerous and closely packed they may form a so-called chromidial network (Chromidial-Netz). Recent observations on the reproduction of some Sarcomenia have shown that the chromidia possess great importance in the life-cycle as representing generative chromatin which, like the micronucleus of the Infusoria mentioned above, remains in reserve until, by the process of syngamy, the nuclear apparatus is renewed; while the principal nuclei represent, like the macronucleus, somatic or vegetative chromatin which becomes effete and is cast off or absorbed when syngamy takes place. These questions will be discussed further below.

It was formerly supposed that the lowest Protozoa were entirely without a nucleus, and on this supposition E. Haeckel attempted to establish a class named by him Monera, defined as Protozoa consisting of protoplasm alone, in which a nucleus was not differentiated. To this class were referred various organisms whose alleged archaic nature was expressed by such names as Protogenes primordialis, organisms which, like so many other of the primitive forms of animal life described by Haeckel, have been seen by that naturalist alone up to the present. In all Protozoa that have been examined by modern methods a nucleus in some form has been demonstrated to exist, and it must be supposed, until proof to the contrary be forthcoming, that in the case of the so-called Monera either the nucleus was overlooked owing to defective technique, or it had been temporarily resolved into chromidia.

The nuclear apparatus may be supplemented by other bodies of which the nature is not always clear. Such is the so-called "Nebenkern" of Paramoebae elkhardi; apparently of the nature of a centrosome. Sometimes the karyosome acts like a
centrosome during the division of the nucleus, and sometimes true centrosomes are present. Flagella also commonly arise from basal granules of a centrosomelike nature, blepharoplastra in the common sense of the term; 1 these blepharoplastra are always in connection with the nucleus, or with the kinetic nucleus if there is one distinct from the trophic nucleus, as in the genus Trypanosoma and allied forms.

Reproduction of the Protozoa.—The mode of reproduction in these organisms is the same as that of the cell generally, and takes always the form of fission of some kind; that is to say, of division of the body into smaller portions, each of which represents a young individual. The division of the body is preceded by that of the nucleus, if single, or of each nucleus in the cases where there are two different nuclei; if, however, more than one nucleus of the distin kind be present, the nuclei may be shared amongst the daughter-individuals, this mode of division being known as plasmotomy. Other organs of the body may either, like the nucleus, undergo fission, or may be formed afresh in the daughter-individuals.

The division of the nucleus in Protozoa may take place by the direct method or by means of mitosis. Direct division, without mitosis, is of very common occurrence; the division may be simple or multiple, that is to say, into only two parts, or into a number of fragments formed simultaneously. An extreme case of multiple fission is seen in the formation of the micrometates of Coecidium schubergii, where the nucleus breaks up into a great number of chondria, which become concentrated in patches to form the several daughter-nuclei. In some cases, on the other hand, multiple daughter-nuclei are formed by rapidly repeated simple division of the parent nucleus. The mode of division may be different in different nuclei of the same individual; thus in the Infusoria the macronucleus divides by direct division, the micronucleus by mitosis.

The mitosis of the Protozoa is far from being of the uniform stereotyped pattern seen in the Metazoa, but, as might have been expected, often shows a much simpler and more primitive condition. Centrosomes are often absent, and their place may be taken, as stated above, by other bodies. The nuclear membrane may be retained throughout the mitosis. Definite chromosomes can, as a rule, be made out, but the chromosomes are often very numerous and minute, without definite form, and divide irregularly. Much remains to be done in studying the mitosis of the Protozoa, but it is probable that wider knowledge will show many conditions intermediate between direct division and perfect mitosis.

The simplest method of fission in Protozoa is that termed binary, where the body divides into two halves, which may be equal and similar, so that the result is two sister-individuals identical as parent and offspring. In many cases of binary fission, however, the resulting daughter-individuals may be marked by unequal in size, so that one may be distinguished as the parent, the other as the offspring. If the daughter-individual be relatively very small, and formed in a more or less imperfect condition at first, the process is termed gemmation or budding. The buds formed in this way may be extraneous, formed on the surface of the body, or internal, that is, formed in special internal cavities, from which the offspring are later set free, as in many Actinadaria. Gemmation may be correlated with multiple nuclear fission in such a way that buds are formed over the whole body surface of the organism, which thereby undergoes a process of simultaneous multiple fission into numerous daughter-individuals. Rapid multiple fission of this kind is termed sporulation, and is a form of reproduction which is of common occurrence, especially in parasitic forms. Usually the central portion of the parent body remains over as a residual body (Restkörper), but sometimes the parent organism is entirely resolved into the daughter-individuals, which are termed spores.

1 The kinetic nucleus of Trypanosoma is sometimes, but in the writer's opinion wrongly, named centrosome or blepharoplast; the bodies to which cytologists give these names are achromatic bodies; the kinetic nucleus is a true chromatic nucleus. The question of the centrosome in Protozoa is discussed by R. Goldschmidt and M. Popoff.

in a general way, but can be given special names in special cases (see Gregarines, Coccidia, &c.).

Life-cycles of the Protozoa.—It is probable that in all Protozoa, as in the Metazoa, the life-history takes its course in a series of recurrent cycles of greater or less extent, a fixed point, as it were, in the cycle being marked by the act of syngamy or conjugation, which represents, apparently, a process for recuperation of the waning vital powers of the organism. It is true that in many types of Protozoan syngamy is not known as yet to occur, but in all species which have been thoroughly investigated syngamy in some form has been observed, and there is nothing to lead to the belief that the sexual process is not of universal occurrence in the Protozoa.

The life-cycle of a given species may be very simple or it may be extremely complex, and the organism occurring under different forms at different phases or periods of its development. The polymorphism of the Protozoa is best considered under three categories, according to the three main causes to which it is due, namely, first, polymorphism due to adaptation to different conditions of existence; secondly, polymorphism due to differences of size and structure during growth; thirdly, polymorphism due to the differentiation of individuals in connexion with the process of syngamy or sexual conjugation.

1. Polymorphism in Relation to Life-conditions.—As a protection against unfavourable conditions, or for other reasons, most Protozoa have the power of passing into a resting condition, during which the vital functions may be wholly or in part suspended. In the resting phase the animal usually becomes enveloped in a resistant membrane or cyst secreted by it, and is then said to be encysted. The formation of a cyst may be a response to conditions of various kinds. Very commonly it is formed to protect the organism against a change of medium, as in the case of fresh-water forms liable to desiccation, or of parasites about to pass out of the bodies of their hosts. In other cases the organism passes into the resting state in order to absorb ingested nutriment or in order to enter upon reproductive phases.

As a preparation for encystment, organs of locomotion, if present, are retracted or cast off; contractile vacuoles cease to be formed; and the food-vacuoles disappear, usually by digestion of their contents and rejection of the waste residue. The body becomes rounded off and more or less spherical in form, and the protoplasm becomes denser, that is, less fluid and more opaque, but at the same time of diminished specific gravity, by loss of water. The cyst is then secreted at the surface as a layer of varying thickness and toughness. In the encysted condition many Protozoa are capable of being transported by the wind, a fact which explains their appearance in infusions and liquids exposed to the air. In favourable conditions the cysts germinate, that is to say, the envelope is dissolved and the contained organism or organisms are set free to enter upon the strenuous life once more.

In the Myctozoa, organisms adapted to a semi-terrestrial life in moist surroundings, the protoplasm is capable, when desiccated, of passing into a tough condition resembling sealing-wax, which, when moistened, assumes again its normal appearance and active condition.

Resting phases, analogous to encystment, are seen in the spores of various forms, especially those of parasitic habit, which are commonly enclosed in tough, resistant envelopes or sporocysts, and enveloped as a protection against change of medium or of host. Within the sporocyst multiplication of the sporoplasm may take place to form more or fewer sporozoites. The sporocysts usually show definite symmetry and structure, infinitely variable in different species. In a suitable medium the spores germinate by rupture of the sporocysts and escape of the contents.

2. Polymorphism in Relation to Growth and Development.—In many species of Protozoa there is hardly any difference to be observed between different individuals during the active phases except in size. Those individuals about to multiply by fission are slightly above the normal in dimensions; on the
other hand, those resulting from recent fusion will be smaller than the average; and such differences are, it need hardly be said, more pronounced when the fusion is of the unequal binary type, or in cases of gemmation or multiple fusion. In cases also where a given strain of a species is becoming senile, it is sometimes observed that the individuals are markedly undersized on the average.

On the other hand, it is often the case that the young individuals resulting from a recent act of multiplication may differ from adult individuals of the species, not merely in size, but in structural characters, to such an extent that their relationship to the adult forms could not be determined by simple inspection without other evidence. This is especially true of those species in which multiplication by sporulation occurs, giving rise to numerous small spores which may at first be in a resting condition, enveloped in protective sporecoysts, but which sooner or later become free, motile individuals known technically as swarm-spores. Thus in many Sarcodina the adult is a large amœboid organism which produces by sporulation a great number of relatively minute swarm-spores. These may be either, as in the common Amoeba proteus, amœboid organisms, so-called amœboïdes or pseudopodiopores, or, as in the Foraminifera and Radiolaria, flagellated organisms, so-called flagelliformium or flagell-spores. Sometimes, as in Mycocysta, amœboid and flagellated phases may succeed each other rapidly in the development of the swarm-spores. The familiar Noctiluca miliaris is another instance of a species which produces by sporulation numerous tiny swarm-spores quite different from the parent form in their characters. Such instances could be multiplied indefinitely amongst the Protozoa.

When the young individuals differ greatly from the adults in structure and appearance they may be regarded as larval forms, and it is interesting to note that such forms appear to be just as much recapitulative, in the phylogenetic sense, as are the adult forms of Metazoa. However, in Metazoa the larval stages are usually an extended and prolonged period of reproduction activity the explanation must be sought in the general physiological effects of the sexual process upon the vital powers of the organism.

In the Metazoa the sexual process is always related to the production of a new individual, that is to say, of a multicellular organism—fossil which there is no analogy amongst the Protozoa, although an approach to the Metazoan condition is seen in colony-forming Flagellata, such as Volvox and its allies. The reproduction of Protozoa is analogous to the ordinary process of cell-division and multiplication which is going on at all times in the bodies of the Metazoa, and which can be observed in the production of the gametes; that is to say, in the period of the life-cycle immediately preceding the sexual process in the Metazoa, just as much as in the developmental phases which follow syngamy and result in the building up of a new Metazoan individual. Hence, so far as the Protozoa are concerned, the phrase "sexual reproduction" is an incongruous combination of words; reproduction and sex are two distinct things, not necessarily related or in any direct causal connexion; and in order to arrive at any theory of sex it is necessary first of all to clear away all misconceptions or preconceived notions arising from analogies with the multicellular Metazoan individual.

Many observations indicate that the vital powers of the Protozoa become gradually weakened, and the individual tends to become senile and effete, unless the process of syngamy intervenes. The immediate result of the sexual union is a renewal of the vitality, a rejuvenescence, which manifests itself in enhanced powers of metabolism, growth and reproduction. These facts have been most studied in the Ciliata. It is observed that if these organisms be prevented from conjugating with others of their kind they become senile and finally die off. It has been found by G. N. Calkins, however, that if the senile individuals be given a change of medium and nourishment, their vigour may be renewed and their life prolonged for a time, though not indefinitely; there comes a period when artificial methods fail and only the natural process of syngamy can enable them to prolong their existence. The results obtained by Calkins are of great interest, as indicating that under special conditions
of the environment the necessity for the sexual process may be diminished and the event may be deferred for a long time, if not indefinitely. Hence it is quite possible that in many Protozoa the process of syngamy may be in abeyance, just as there are plants which can be propagated indefinitely by suckers or cuttings without ever setting seed; and it is possible that the inocculative or artificial transmission of parasitic Protozoa from one host to another, as in the case of pathogenic trypanosomes, without any apparent diminution in their vital powers, is an instance of this kind.

As a general rule, in order that syngamy may be attended by beneficial results to the organism, it is necessary that the two conjugating individuals should be from different strains, that is to say, they should not be nearly related by descent and parentage. Thus F. Schaudinn found that in order to observe the sexual union of the gametes of Foraminifera it was necessary to bring together gametes of distinct parentage. On the other hand it has been observed that in many Protozoa, especially in parasitic forms, syngamy takes place between individuals of common parentage. Thus in Amoeba coli, according to F. Schaudinn, a single individual becomes encysted and its nucleus divides into two; after each nucleus has undergone certain maturative changes they give rise to pronuclei which conjugate and initiate a new developmental cycle. Syngamy between sister individuals, or autogamy, as it has been termed, is not, however, confined to parasitic Protozoa; it has been observed in Actinosphaerium by R. Hertwig. The benefit to the organism, if any, arising from autogamy can only be supposed to result from the rearrangement and reconstitution of the nuclear apparatus. The frequent occurrence of autogamy suggests that in many Protozoa the nature of the environment diminishes the importance of the sexual process, at least so far as the mixture of nuclear material from distinct sources is concerned; and, since autogamy is most common in parasitic forms, this result may, in the light of G. N. Calkins's experiments, be ascribed in great part to the frequent changes of environment and nutrition to which parasitic forms, above all, are subject.

True syngamy consists, as has been said, of nuclear fusion or karyogamy. It rarely, if ever, happens, however, that such fusion takes place without the conjugating nuclei having undergone some process of reduction by elimination of a portion of the nuclear substance, in a manner analogous to the maturation of the germ-cells in the Metazoa. The chromatin thus eliminated may be cast out from the body of the organism as one or more so-called polar bodies; or may be absorbed in the cytoplasm; or may remain in the cytoplasm and be left over in the residual protoplasm in cases where syngamy is followed by a process of rapid multiplication by sporulation; but in all cases the chromatin removed from the nucleus is rejected in some way or other and plays no part in the subsequent development of the organism. The nuclei of the gametes which have completed this process of éruption nucleaire are then ripe for syngamic fusion and are termed pronuclei; the union of two pronuclei produces a single nucleus termed a synkaryon.

It is certain that in many, if not in all, cases the nuclear substance that is rejected as a preliminary to syngamy consists of somatic or vegetative chromatin; that is to say, of chromatin that has been functional in regulating the ordinary vital functions, metabolism, growth, reproduction, &c., during previous generations, and has become effete; while on the other hand the chromatin that persists to form the pronuclei is generative chromatin which has remained in reserve for the sexual act and has retained its cellular power and reproductive functions. The truth of this explanation is extremely obvious in such forms as the Infusoria, where somatic and generative chromatin are concentrated into two distinct and entirely separate nuclei. In some Rhizopoda also the body contains one or more principal nuclei and a mass of chromidia, and it has been observed that as a preparation for syngamy the principal nuclei are eliminated and the pronuclei are formed from the chromidia; in such cases, therefore, it is reasonable to regard the principal nuclei as representing somatic chromatin, the chromidia as generative chromatin. In other cases, however, for example Actinosphaerium, the chromidia must be interpreted, from their behaviour, as somatic chromatin, and the principal nuclei as generative chromatin; hence K. Goldschmidt has proposed the special term sporela for those chromidia which represent reserve generative chromatin. In the majority of Protozoa, however, the nuclear substance is not differentiated in such a manner, and it can be distinguished by any visible peculiarities into somatic and generative chromatin.

The process of reduction is not limited, apparently, to the elimination of somatic chromatin, but a portion of the generative chromatin is also cast off. Thus in the Infusoria not only the somatic macronucleus, but also a considerable portion of the generative micronucleus, is absorbed at each act of conjugation. The elimination of generative chromatin is perhaps of importance as a factor in heredity and the production of variations, or possibly for sex determination, as will be discussed below; it is difficult to suggest any other explanations for it, unless it be supposed that during the exercise of ordinary vital functions a portion of the generative chromatin be rendered effete as well as the somatic chromatin.

From the considerations set forth in the foregoing paragraphs it must be supposed that the synkaryon, the fusion-product of the two pronuclei in syngamy, consists at first purely of generative chromatin, which must speedily become differentiated into the regulative somatic chromatin of the ensuing generations and the generative chromatin held in reserve for the next act of syngamy. Such a differentiation can be actually observed in the Infusoria, where immediately after conjugation the synkaryon divides into one or more pairs of nuclei, each pair becoming the two unequally sized nuclei of an ordinary individual, sometimes with, even at this stage, an apparently wanton elimination of nuclear substance. Thus the somatic and generative chromatin of the Protozoa offer a certain analogy with the soma and germplasm of Metazoa; but in making such comparisons the distinction between a physiological analogy and a morphological homology should be borne clearly in mind.

It has been stated above that the two gametes of a given species of Protozoa may be perfectly similar and indistinguishable, or may be very different one from the other. The condition with similar gametes is termed isogamy, that with differentiated gametes anisogamy. Every transition can be found from complete isogamy and pronounced anisogamy in the Protozoa; in tracing, however, the evolution of specialized gametes it must be remembered that we are dealing only with visible morphological differences mainly of an adaptive nature, without prejudice to the question of the possible existence of a fundamental sexual antithesis in all gametes, present even when not perceptible. The sex philosopher O. Weininger has urged that sex is a fundamental attribute of living things, and that the living substance, proplasm, consists of areheno-plasm and thelyplasm united in varying proportions. Certain observations of F. Schaudinn tend to support this view; in Trypanosoma noctuae, for example, Schaudinn found that the process of reduction in one gamete took an opposite course to that which it took in the other gamete. In one gamete certain portions of the nucleus were retained and certain other portions rejected; in the maturation of the other gamete the portions rejected and the portions retained were the reverse. Hence Schaudinn was led to regard the indifferent individuals as essentially hermaphrodite in nature, and therefore capable of giving rise to gametes of either order by elimination of one or the other set of sexual elements; a theory which throws further light on the elimination of generative chromatin mentioned above. It is possible, therefore, that the gametes of Protozoa may possess sexual characters intrinsically different even when perfectly similar so far as can be perceived. It is very probable, for instance, that the isogamy in Gregarines is a state of things derived secondarily from a primitive condition of anisogamy (see Gregarines).

The simplest possible condition of the gametes is seen in the free-swimming Ciliata, forms which in other respects are the
most highly organized of Protocоза; here the individuals which conjugate are only distinguished from ordinary individuals of the species by the fact that their nuclei have undergone very complicated processes of reduction and nuclear elimination. In these forms there is also no difference between young and adult individuals, beyond scarcely perceptible differences of size between individuals about to divide and those that are the products of recent division, so that these species are practically monomorphic in the active condition. In forms, however, which, like Vorticella, are of sessile habit, small free-swimming individuals are liberated which seek out and conjugate with the ordinary sessile individuals. Here we have an instance of a morphological differentiation of the gametes which is clearly adaptive to the life-conditions of the species. In other Protocоза there may be, as already stated, differences, more or less pronounced, between young and adult individuals, and syngamy may take place either between young individuals (microgamete) or between adults (macrogamete); the gametes may be in either case ordinary individuals of the species, not specially differentiated in any way, or on the other hand they may be differentiated from ordinary individuals, while still similar and isomorphic amongst themselves; or, finally, they may be anisogametic; that is to say, differentiated into two distinct types. Thus in the Radiolaria, for example, an adult individual breaks up by a process of sporulation into numerous minute flagellated swarm-spores; these may be all of one kind, termed isospores, which develop directly without undergoing syngamy; or they may be of two kinds, termed anisospores, both different in their character from the isospores, and incapable of development without syngamy.

When the gametes are differentiated the divergence between them almost always follows parallel paths. One gamete is distinguished by its smaller size, its greater activity, and its comparative poverty in granules of reserve food-material; hence it is termed the microgamete. The other gamete is distinguished by its greater bulk, its pronounced sluggishness and inertness, and its tendency to form and store up in the cytoplasm reserve nutrition of one kind or another; hence it is termed the macrogamete, or, as some prefer to write it, the megagamete. When these differences are very pronounced, as, for instance, in the Coelocida and other Sporozoa, a condition is reached which is practically indistinguishable from that seen in some of the Metazoa. Hence the microgamete is generally regarded as male, the macrogamete as female; and these terms may be conveniently used, although they do not in themselves imply more than would the words positive and negative, or any other pair of terms expressive of a fundamental contrast. The microgamete may become reduced to a mere thread of chromatia, which may possess one or two flagella for purposes of locomotion, as in Coelocida, &c., or may move by serpentine movements of the whole body, which resembles in its entirety a flagellum, and is often wrongly so termed. In contrast with the microgamete, its correlative, the macrogamete, tends to become a bulky, inert body, often with great resemblance to an ovum, its cytoplasm dense and granular, packed with reserve food-materials as an egg contains yolk, and without organs of locomotion or capacity for movement of any kind. Hence the macrogamete is the passive element in syngamy, which requires to be sought out and "fertilized" by the active microgamete, a division of labour perfectly analogous to that seen in the male and female gametes of Metazoa.

In those cases where syngamy takes place by interchange of nuclear substance between two gametes which remain separate from one another, as in the Infusoria, each gamete forms two pronuclei, which are distinguished by their behaviour as the active and passive pronuclei respectively. The active pronucleus of each gamete passes over into the body of the other and fuses with its passive pronucleus to form a synkaryon. A similar method of procedure occurs also in Amoeba coli, according to F. Schaudinn.

When gametes are not very highly specialized they may still retain the power of multiplication by division possessed by ordinary individuals, so long as they have not undergone the process of nuclear reduction preliminary to syngamy. If, however, the gametes are highly specialized they may forfeit the power of multiplication. In this respect the microgametes are worse off than the other sex; on account of the great reduction of the body-protoplasm, and the entirely passive condition which they must undertake to perform their destiny as gametes or die off. The macrogametes, on the other hand, with their great reserves of cytoplasm and nutriment, are more hardly than any other forms of the species, and are able to maintain their existence in periods of famine and starvation when all other forms are killed off. Moreover they may regain the power of multiplication by a process of parthenogenensis, a term originally applied in the Metazoa to cases where a germ-cell of definitely female character, that is to say an ovum, acquires the power of reproduction without fertilization by syngamy. A macrogamete multiplying by parthenogenensis first goes through certain nuclear changes whereby it is set back, as it were, from the female to the indifferent condition, and it is then able to multiply by fission like any ordinary, non-sexual individual of the species. Parthenogenensis has been described by F. Schaudinn in the malarial parasites and in Trypanosoma noctuum. In both cases the female forms are able to persist under adverse conditions after all other forms have perished, and then by parthenogenensis they may multiply when conditions are more favourable, overrun the host again, and cause a relapse of the disease of which they are the cause. S. v. Prowazek has described in Herpetomonas muscae-domestice an analogous process of multiplication on the part of male individuals, and has coined the term eogenisis for this process, but the statement needs confirmation, and as a general rule the microgamete is quite incapable of independent reproduction under any circumstances.

It is often found that not only are the gametes differentiated, but that their immediate progenitors may also exhibit characters which mark them off from the ordinary or indifferent individuals of the species. In such cases the parent-forms of the gametes are termed gametocytes, and they may differ amongst themselves in characters which render it possible to distinguish those destined to produce microgametes from those which will produce the other sex. The parent-individuals of the microgametes, or microgamocytes, are distinguished as a general rule by clearer reserves, and a larger nucleus, more rich in chromatin. The macrogamocytes, on the other hand, usually have coarsely granular cytoplasm, rich in reserve food-stuffs, and a relatively small nucleus. The gamocytes produce the gametes by methods that vary according to the degree of specialization of the gametes. In isogamous forms, of which good examples are furnished by many Gregarinés (g.e.), the gametes are produced by a process of sporulation on the part of the gamocytes, a certain amount of residual protoplasm being left over. In forms with pronounced anisogamy, for instance, Coelocida or Haemosporidium, the microgametes are produced by sporulation in which almost the whole mass of the body of the gamocyte may be left over as residual protoplasm, together with some portion of the nucleus; in the other sex, however, the process of sporulation may be altogether in abeyance, and the macrogamocyte becomes simply converted into the microgamete after going through a process of nuclear reduction.

The gamocytes may, however, possess the power of multiplication without change of character for many generations; or, to put the matter in other words, the sexual differentiation may be apparent not merely in the generation immediately preceding the gametes, but in many generations prior to this. Thus a given species may consist of three different types of adult individuals, male, female, and indifferent, each multiplying in its own line. Complicated alternations of generations are the result, and if at the same time there is a well-marked difference between young and adult forms of the species the height of polymorphism is reached. Very commonly a double series of generations occurs, the non-sexual or indifferent forms multiplying apart from the sexually differentiated individuals and the generations immediately descended from them; in such cases the
series of non-sexual generations is termed schizogony, the series of
sexual generations gametogony or sporogony. Schizogony and
sporogony usually occur as adaptations to, or at least in
which
integration
hence
distinct conditions of life. Thus in parasitic forms, as well
illustrated by the Coccidia, the organisms multiply by schizogony
when overrunning the host, that is to say, when nutrition is
abundant; sporogony begins as a preparation for passing into
the outer world, in order to infect new hosts. In the Haemosporida,
in which transmission from one vertebrate host to
another is effected by means of blood-sucking ectoparasites
(Diptera, ticks, leeches, etc.), the schizogony goes on in the
vertebrate host, the sporogony in the invertebrate host.
In free-living, non-parasitic forms, schizogony may go on under
ordinary conditions, while sporogony supervenes as a preparation
for a marked change in the life-conditions; for instance, a change
of medium, or at the approach of winter. It is interesting to
note that, as a rule, the differentiation of sexual forms
seems to be a preliminary to the production of more resistant
forms capable of withstanding adverse conditions or violent changes
in the conditions of life; a phenomenon which is in support of
the hypothesis that syngamy has a strengthening effect on
the vitality of the species.

Classification of the Protozoa.

Various attempts have been made to separate the Protozoa
into two primary subdivisions. E. Ray Lankester divided them
into two main groups, the Gymnomyza, with naked protoplasm
and indefinite form, and the Corticata, with the protoplasm
limited by a firm membrane, and consequently with a definite
body-form. In many of the corticate groups, however, there
have been placed amoeboid, non-corticate forms, as such Mastsig-
amoeba amongst the Flagellata, or the malarial parasites amongst
the Sporozoa. Hence if Lankester’s classification be used, it
must be without a hard and fast verbal definition. F. Doflein,
on the other hand, has divided the Protozoa into Plasmodroma,
with organs of locomotion derived from protoplasmic processes,
i.e. pseudopodia or flagella, and Clilopora, with locomotion by
cilia. It may be doubted, however, if the distinction between
flagella and cilia is so fundamental and sharply defined as this
mode of classification would imply. W. H. Jackson has proposed
to unite the forms bearing flagella and cilia into one section,
Plegepoda, and distinguishes two other sections, Rhizopoda
(Sarcodina) and Endoparasita (=Sporozoa).

Four main groups of Protozoa, of the rank of classes, are
universally recognized, however they may be combined into
larger categories; these are the Sarcodina, Mastigophora,
Sporozoa and Infusoria.

The Sarcodina are characterized by the body being composed
of naked protoplasm, not covered by any limiting cuticle,
although in many cases a house or shell is secreted into which
the organism can be partly or entirely withdrawn. No special organs of locomotion, either flagella or cilia, are ever
present in the adult, and locomotion and capture of food are
effected in the manner named amoeboid, by more or less
temporary extrusions or outflow of the protoplasm which are
termed pseudopodia, as in Amoeba.

The Mastigophora are so named because organs of locomotion are always present in the adult in the form of one or more
flagella, each flagellum (Gr. μαχαλεξ ω, whip) a delicate, thread-like extension of the protoplasm, endowed with a special contractility
which enables it to perform lashing, whip-like movements. The
body protoplasm is sometimes naked, in which case it may be
amoeboid, but is more usually limited by a cuticle, varying in
thickness in different types.

The Sporozoa, with the exception of a few forms of dubious
position, are exclusively internal parasites of Metazoa, absorbing
their food from the internal juices and secretions of their hosts,
and never exhibiting in their trophic phases any organs of loco-
motion or for the ingestion and digestion of solid food. The
body-protoplasm may be naked and amoeboid or limited by a
cuticle. The reproduction is specialized in correlation with the
parasitic habit, and results typically in the formation of a
number of minute germs or spores, by which the infection of
fresh hosts is effected. It must not be supposed, however, that
spore-formation is confined to this class of Protozoa.

The Infusoria, a name of much wider application, is
now used to denote those Protozoa in which locomotion
or capture of food is effected by means of special organs termed
cilia, minute hair-like contractile extensions of the protoplasm
differing from flagella not only in their usually smaller size and
greater number, but also in the mode of contraction and move-
ment. The cilia may be present throughout life or only in an
early stage of the individual. The body is always limited by a
cuticle and the nucleus seems to be invariably double, being
divided into two parts specialized in function and differing in
size, termed respectively macronucleus and micronucleus.

Comparing these four subdivisions with one another, it may
be said at once that the Sporozoa and Infusoria are highly
specialized classes, each well marked off from the other sub-
divisions. The Sarcodina and Mastigophora, on the other
hand, include the most primitive types of Protozoa and are
delimited from one another by a somewhat arbitrary character,
the presence or absence of a flagellum in the adult. Thus
Mastigamoeba is a form which unites the characters of the
Sarcodina and Mastigophora, having an amoeboid body which
bears a flagellum, and it is classed among the Mastigophora
merely because the flagellum is retained throughout life; if
the flagellum were absent in the adult condition it would be
placed among the Sarcodina, many of which have flagella in
their young stages but lack them when adult. Hence Bütschli has
considered the Rhizomastigina (i.e. Mastigamoeba and its allies)
the main group of Protozoa, representing the
the common ancestral form of all the classes; and on this view
the flagellated young stages of many Sarcodina would represent
recapitulative larval stages.

Bütschli’s theory of Protozoan phylogeny implies that
a flagellum is an organ of most primitive nature, possessed perhaps
by the earliest forms of life; and it must be remembered
that flagella are borne by many Bacteria. On the other hand, one
would imagine, from general considerations, that living beings
possessing a flagellum would have been preceded in evolution
by others that did not bear so definite an organ. The
flagellum itself is generally regarded as a vibratile process or extension
of the protoplasm, comparable in its nature to a slender pseudo-
plodium endowed with peculiar powers of movement. More
knowledge with regard to the nature and formation of the
flagellum is needed in order to decide this point, and particularly
with regard to the question whether the flagella of Bacteria are
of the same nature as those of Protozoa.

It has been much debated whether the earliest forms of life
were of the nature of plants or animals. Many authors consider
the question settled beyond all debate by a process of inductive
and deductive reasoning. It is argued that animals require other
organisms for their nutriment, and that plants, that is to say
green plants, do not; therefore plants must have preceded
animals. On the other hand, the morphologist will urge that
green plants derive their peculiar powers of metabolism from
the possession of very definite cell-organs, namely chromatophores containing chlorophyll; and will argue that living things
without such organs must have preceded in evolution those
possessing them. The whole dispute is based on the assump-
tion that plant and animal represent the two fundamental
modes of metabolism; whereas the study of the Bacteria shows
the possibility of many other modes of life. Many Bacteria
exhibit processes of metabolism totally different from those
generally laid down in textbooks as characteristic of living
matter; some are killed by free oxygen; others can absorb free
nitrogen, and various other “ab normal” properties are mani-
fested by them. Hence the primitive organisms may have
been neither plant nor animal in their nature, but may have
possessed, like the Bacteria at present, many different methods
of metabolism from which plant and animal are two divergent
paths of evolution.

The origin of life is veiled in a mist which biological knowledge

PROTOZOA
in its present state is unable to dispel; and speculations with regard to the nature of the earliest forms of life are as yet speculative and futile.

The following references are either general treatises on the Protozoa, or memoirs dealing with special points in a general manner.

Proudhon was one of the most remarkable figures of modern France. His life was marked by the severest simplicity and even Puritanism; he was affectionate in his domestic relations, a most loyal friend, and strictly upright in conduct. He was strongly opposed to the prevailing French socialism of his time because of its utopianism and immorality; and, though he uttered all manner of wild paradox and vehement invective against the dominant ideas and institutions, he was remarkably free from feelings of personal hate. In all that he said and did he was the son of the people, who had not been broken to the usual social and academic discipline; hence his roughness, his one-sidedness, and his exaggerations; but he is always vigorous, and often brilliant and original.

It would of course be impossible to reduce the ideas of such an irregular thinker to systematic form. In later years Proudhon himself confessed that "the great part of his publications formed only a work of dissection and ventilation, so to speak, by means of which he slowly makes his way towards a superior conception of political and economic laws." Yet the groundwork of his teaching is clear and firm; no one could insist with greater emphasis on the demonstrative character of economic principles as underserved by his self. He strongly believed in the absolute truth of a few moral ideas, with which it was the aim of his teaching to mould and suffuse political economy. Of these fundamental ideas, justice, liberty and equality were the chief. What he desiderated, for instance, in an ideal society was the most perfect equality of remuneration. It was his principle that service pays service, that a day's labour balances a day's labour—"in other words, that the duration of labour is the just measure of value. He did not shrink from any of the consequences of this theory, for he would give the same remuneration to the worst mason as to a Phidias; but he looks forward also to a period in which human development will enable present inequality in the talent and capacity of men would be reduced to an inappreciable minimum. From the great principle of service as the equivalent of service, is derived his axiom that property is the right of aubaine. The aubain was a stranger not naturalized; and the right of aubaine was the right in virtue of which the sovereign, from the earliest monarchy, claimed the goods of such a stranger who had died in his territory. Property is a right of the same nature, with a like power of appropriation in the form of rent, interest, &c. It reaps without labour, consumes without producing, and enjoys without exertion. Proudhon's aim, therefore, was to reach a science of society resting on principles of justice, liberty and equality. He therefore understood "a science, absolute, rigorous, based on the nature of man and of his faculties," 1

1 The droit d' aubaine was abolished in 1790, revived by Napoléon, and ended in 1819.
Proust, A. — Proust, S.

Proust, Joseph Louis (1754—1826), French chemist, was born on the 26th of September 1754 at Angers, where his father was an apothecary. After beginning the study of chemistry in his father's shop he came to Paris and gained the appointment of apothecary in chief to the Salpêtrière, also lecturing on chemistry at the musée of the aeronaut J. F. Pilâtre de Rozier, whom he accompanied in a balloon ascent in 1784. Next, at the instance of Charles IV., he went to Spain, where he taught chemistry first at the artillery school of Segovia, and then at Salamanca, finally becoming in 1789 director of the royal laboratory at Madrid. In 1808 he lost both his position and his money by the fall of his patron, and retired first to Crason in Mayenne and then to Angers, where he died on the 5th of July 1826. His name is best known in connexion with a long controversy with C. L. Berthollet. The latter chemist was led by his doctrine of mass-action to deny that substances always combine in constant and definite proportions. Proust, on the other hand, maintained that compounds always contain definite quantities of their constituent elements, and that in cases where two or more elements unite to form more than one compound, the proportions in which they are present vary per salum, not gradually. In 1799 he proved that carbonate of copper, whether natural or artificial, always has the same composition, and later he showed that the two oxides of tin and the two sulphides of iron always contain the same relative weights of their components and that no intermediate indeterminate compounds exist. His analytical skill enabled him to demonstrate the inaccuracy of the researches by which Berthollet attempted to support the opposite view, and to show among other things that some of the compounds which Berthollet treated as oxides were in reality hydrates containing chemically combined water, and the upshot was that by 1808 he had fully vindicated his position. Proust also investigated the varieties of sugar that occur in sweet vegetable juices, distinguished three kinds, and showed that the sugar in grapes, of which he announced the existence to his classes at Madrid in 1799, is identical with that obtained from honey by the Russian chemist J. T. Lowitz (1755—1804).

Besides papers in scientific periodicals he published Indagaciones sobre el estado de cobre, la vajilla de estaño y el vidriado (1803); Mémorie sur le sucre de raisins (1808); Recueil des mémoires relatifs à la poudre à canon (1815); and Essai sur des causes qui peuvent amener la formation du calcul (1824).

Proustite, a mineral consisting of silver sulpharsenite, AgAsS₃, known also as light red silver ore, and an important source of the metal. It is closely allied to the corresponding sulphantimonite, pyrrargyrite, from which it was distinguished by the chemical analyses of J. L. Proust in 1804, after whom the mineral received its name. Many of the characters being so similar to those of pyrrargyrite (q.v.) they are mentioned under that species. The prismatic crystals are often terminated by the scalenohedron {201} and the obtuse rhombohedron {110}, thus resembling calcite (dog-tooth spar) in habit. The colour is scarlet-vermillion and the lustreadamantine; crystals are transparent and very brilliant, but on exposure to light they soon become dull black and opaque. The streak is scarlet, the hardness 2½, and the specific gravity 5·57. The mode of occurrence is the same as that of pyrrargyrite, and the two minerals are sometimes found together. Magnificent groups of large crystals have been found at Chañarcillo in Chile; other localities which have yielded fine specimens are Freiberg and Marienberg in Saxony, Joachimsthal in Bohemia and Markirk in Alsace.

Proust, Samuel (1783—1852), English water-colour painter, was born at Plymouth on the 17th of September 1783. He spent whole summer days, in company with the ill-fated Haydon, in drawing the quiet cottages, rustic bridges and romantic water-mills of the beautiful valleys of Devon. He even made a journey through Cornwall to try his hand in furnishing sketches for Britton’s Beauties of England. On his removal in 1805 to London, which became his headquarters after 1812, a new scene of activity opened up before Proust. He now endeavoured to

and on their mutual relations; a science which we have not to invent, but to discover.” But he saw clearly that such ideas with their necessary accomplishments could only be realized through a long and laborious process of social transformation. He strongly detested the puritan immorality of the schools of Saint-Simon and Fourier. He attacked them not less bitterly for thinking that society could be changed off-hand by a ready-made and complete scheme of reform. It was “the most accursed lie,” he said, “that could be offered to mankind.” In social change he distinguishes between the transition and the perfection of achievements. With regard to the transition he advocated the progressive abolition of the right to autunome, reducing interest, rent, &c. For the goal he professed only to give the general principles; he had no ready-made scheme, no utopia. The positive organization of the new society in its details was a labour that would require fifty Montesquieus. The organization he desired was one on collective principles, a free association which would take account of the division of labour, and which would maintain the personality both of the man and the citizen. With his strong and fervid feeling for human dignity and liberty, Proudhon could not have tolerated any theory of social change that did not give full scope for the free development of man. Connected with this was his famous paradox of anarchy, as the goal of the free development of society, by which he meant that through the ethical progress of men government should become unnecessary. “Government of man by man in every form,” he says, “is oppression. The highest perfection of society is found in the union of order and anarchy.” Proudhon, indeed, was the first to use the word anarchy, not in its revolutionary sense, as we understand it now, but as he himself says, to express the highest perfection of social organization.

Proudhon’s theory of property as the right of autunome is substantially the same as the theory of capital held by Marx and most of the later socialists. Marx, however, always greatly detested Proudhon and his doctrines, and attacked him violently in his Misère de la philosophie. Property and capital are defined and treated by Proudhon as the power of exploiting the labour of other men, of claiming the results of labour without giving an equivalent. Proudhon’s famous paradox, “La propriété, c’est le vol,” is merely a trenchant expression of this general principle. As slavery is assassination inasmuch as it destroys all that is valuable and desirable in human personality, so property is theft inasmuch as it appropriates the value produced by the labour of others without rendering an equivalent. For property Proudhon would impose immediate possession, the right of occupation being equal for all men.

A complete edition of Proudhon’s works, including his posthumous writings, was published at Paris (1875). See also P. J. Proudhon, sa vie et sa correspondance, by Sainte-Beuve (Paris, 1875); Beaucoupé, Économie sociale de P. J. Proudhon (Lille, 1867); Spoll, P. J. Proudhon, étude biographique (Paris, 1867); Marchegay, Silhouette de Proudhon (Paris, 1868); Putilts, P. J. Proudhon, sein Leben und seine politischen Ideen (Berlin, 1881); Diehl, P. J. Proudhon, seine Lehre und sein Leben (Jena, 1888–1889); Müllerberg, Studien über Proudhon (Stuttgart, 1891); Desjardins, P. J. Proudhon, sa vie, ses œuvres, sa doctrine (Paris, 1896); Müllerberg, P. J. Proudhon (Stuttgart, 1899).

Proust, Antonin (1832–1905), French journalist and politician, was born at Nîort on the 17th of March 1832. He was educated at the Lycée in the early days of the Franco-German War, but after Sedan he returned to Paris, where he became secretary to Gambetta and superintended the refugees in Paris. He entered the Chamber as deputy for his native town in 1876, taking his seat on the left. In Gambetta’s cabinet (1881–1882) he was minister of the fine arts, and in the Chamber of Deputies he was regularly commissioned to draw up the budget for the fine arts, after the separate department had ceased to exist. Prosecuted in connexion with the Panama scandal, he was acquitted in 1893. From this time he lived in the closest retirement. On the 20th of March 1905 he shot himself in the head, dying of the wound two days later.
correct and improve his style by the study of the works of the rising school of landscape. To gain a living he painted marine pieces for Parler the printseller, received pupils, and published many drawing books for learners. He was likewise one of the first who turned to account in his profession the newly-invented art of lithography. It was not however until about 1818 that Provat discovered his proper sphere. Happening at that time to make his first visit to the Continent, and to study the quaint streets and market-places of the ancient cities, in suddenly
found himself in a new and enchanting province of art. All his faculties, having found their congenial element, sprang into
unwonted power and activity. His eye readily caught the picturesque features of the architecture, and his hand recorded them with unsurpassed felicity and fine selection of line. The composition of his drawings was exquisitely natural; their colour exhibited the truest and happiest association in sun and shade; the picturesque remnants of ancient architecture were rendered with the happiest breadth and largeness, with the heartiest
 perception and enjoyment of their time-worn ruggedness; and the solemnity of great cathedrals was brought out with striking effect. At the time of his death, on the 4th of February 1852, there was scarcely a nook in France, Germany, Italy and the Netherlands where his quiet, benevolent, observant face had not been seen searching for antique gables and sculptured pieces of stone. In Venice especially there was hardly a pillar which his eye had not lovingly studied and his pencil had not dexterously copied.

PROVAT, WILLIAM (1785-1850), English chemist and physicist, was born at Horton, Gloucestershire, on the 15th of January 1785, and died in London on the 9th of April 1850. His life was spent as a practising physician in London, but he also occupied himself with chemical research. He was an active worker in physiological chemistry, and carried out many analyses of the products of living organisms, among them being one of the gastric juice which, at the end of 1823, resulted in the notable discovery that the acid contents of the stomach contain hydrochloric acid which is separable by distillation. In 1815 he published anonymously in the Annals of Philosophy a paper on the relation between the specific gravities of bodies in their gaseous state and the weights of the elements. It was calculated that the atomic weights of a number of the elements are multiples of that of hydrogen; and in a second paper published in the same periodical the following year he suggested that the density of the earth is realized in hydrogen, from which the other elements are formed by some process of condensation or grouping. This view, generally known as Provat's hypothesis, at least had the merit of stimulating inquiry, and many of the most careful determinations of atomic weights undertaken since its promulgation have been provoked by the desire to test its validity.

PROVENCAL LANGUAGE. The name Provencal is used to comprehend all the varieties of Romanic speech formerly spoken and written, and still generally used by country people in the south of France. The geographical limits of this infinitely varied idiom cannot be defined with precision, because it is
conterminous on the north, south and east with idioms of the same family, with which almost at every point it blends by insensible gradations. Roughly speaking it may be said to be
to be contained between the Atlantic on the west, the Pyrenees and Mediterranean on the south, and the Alps on the east, and to be bounded on the north by a line proceeding from the Gironde to the Alps, and passing through the departments of Gard, Dordogne, Haute Vienne, Creuse, Allier, Loire, Rhone, Isère and Savoy. These limits are to some extent conventional. True, they are fixed in accordance with the mean of linguistic characters; but it is self-evident that according to the importance attached to one character or another they may be determined differently.

1. Different Names.—Though the name Provencal is generally
adopted to designate the Romanic idiom of this region, it must not be supposed that this name has been imposed by general consensus, or that it rests upon any very firm historical basis. In the southern part of Gaul, Romanic developed itself, so to say, in the natural state of language. Contrary to what took place in other Romanic countries, no local variety here raised itself to the rank of the literary idiom par excellence. While in Italy the Florentine, in France the French dialect prevalent in the centre, to say, the dialect of the Île de France, succeeded little by little in monopolizing literary use, to the exclusion of the other dialects, we do not find that either the Marseillais or the Toulousain idiom was ever spoken or written outside of Marseilles or Toulouse. In consequence of this circumstance, no name originally designating the language of a town or of a small district came to be employed to designate the language of the whole of southern France; and on the other hand the geographical region described above, having never had any special name, was not able to give one to the idiom.

In the middle ages the idiom was spoken of under various appellations: Romans or lenga romanis was that most generally used. The name was employed by the authors of the Lexis d'amors, a treatise on grammar, poetry and rhetoric, composed at Toulouse in the 14th century. But while it is capable of being applied and in fact, has been applied, to each of the Romanic languages individually, the term is too general to be retained in a particular case; though it was revived in the beginning of the 19th century by Raymonard, the author of the Lexique roman. Roman or langue romanis is no longer in use among scholars to design the Romanic language of the south of France. In the 13th century a poet born in Catalonia, on the southern slope of the Pyrenees, Raimon Vidal of Besalú, introduced the name of Limousin language, probably on account of the great reputation of some Limousin troubadours; but he took care to define the expression, which he extended beyond its original meaning, by saying that in speaking of Limousin he must be understood to include Saintonge, Quercy, Auvergne, &c. (Rasos de trobar, ed. Stengel, p. 70). This expression found favour in Spain, and especially in Catalonia, where the little treatise of Raimon Vidal was extensively read. The most ancient lyric poetry of the Catalans (13th and 14th centuries), composed on the model of the poetry of the troubadours, was often styled in Spain poesia lomestina, and in the same country lengua lomestina, language of Limousin. However, the name of Languedoc (Catalan)

The name Provencal as applied to language is hardly met with in the middle ages, except in the restricted sense of the language of Provence proper, i.e. of the region lying south of Dauphiné on the eastern side of the Rhone. Raimon Ferrant, who composed about 1300, a versified life of St Honorat, uses it, but he was himself a native of Provence. We can also cite the title of a grammar, the Donatus proovncis, by Hugh Faidit (about 1250); but this work was composed in north Italy, and we may conceive that the Italians living next to Provence employed the name Provencal somewhat vaguely without inquiring into the geographical limits of the idiom so called. In fact, the name Provencal became traditional in Italy, and in the beginning of the 16th century Benzo could write, "Era per tutto il Ponente la favella Provenzale, ne tempi ne quali ella fiori, in prezzo et in istima molta, et tra tutti gli altri idiomi di quelle parti, di gran lunga primiera. Conciosiaco che ciascuno, o Francese, o Fiamingo, o Guuscone, o Borgognone, o altramente di quelle nazioni che egli si fosse, il quale bene scrivere e specialmente verseggiar volesse, quantunque egli Provenzale non fosse, lo faceva Provenzalmente" (Prose, ed. 1529, fol. viii.). This passage, in which the primacy of the Provencal tongue is pronounced in an exaggerated way, is interesting as showing the name Provencal employed, though with little precision, in the sense in which we now apply it.

11 "The Provencal speech in the times in which it flourished was prized and held in great esteem all over the West, and among all the other idioms of that region was by far the foremost; so that every one, whether Frenchman, Fleming, Gascon, Burgundian, or of what nation soever, who wished to write and versify well, although he was not a Provencal, did it in the Provencal language."
Another designation, which is supported by the great authority of Dante, is that of lingua d'oco (langue d'oc). In his treatise De vaïleri eqouio (bk. i. chs. viii. and ix.), Dante divides the languages of Latin origin into three idioms, which he characterizes by the affirmative particles used in each, or, si, "cum ali oc, ali ali ol, ali si, affirmando loquntrur, ut puta Hispani, Franci et Latini." As is seen, he attributes the affirmation oc to the Spaniards, which is commonly erroneous; but there is no doubt that to the Spaniards he joined more correctly the inhabitants of southern France, for in the Vita nova, ch. xxv., and in the Convivio, i. x., he speaks of the lingua d'oco as having been long cultivated for its poets, which can apply only to the language of the troubadours. The name langue d'oc occurs also as early as the end of the 13th century, in public acts, but with a different sense, that of the province of Languedoc, as constituted after the union of the county of Toulouse to the French king's dominion in 1271. In the royal acts of the end of the 13th and of the 14th century partes linguae occitanae or pays de langue d'oc designates the union of the five seneschalates of Périgoux, Carcassone, Beaucaire, Toulouse and Rodez; that is to say, the province of Languedoc, such as it existed till 1790. Some scholars, following the example of Dante, still actually use the term langue d'oc in opposition to langue d'out; but these names have the inconvenience that they take such a secondary fact as the form of the affirmative particle as an essential characteristic. Moreover, it can hardly help to distinguish the other Romanic languages from the Italian and Spanish. Provencal, without being entirely satisfactory, in principle it applies solely to the language of Provence, is, notwithstanding, the least objectionable name that can be adopted. In addition to its being in some sort consecrated by the use made of it by the Italians, who were the first after the Renaissance to study the works of the troubadours, it must not be forgotten that, just as the Roman provincia, in which the name originated, extended across the south of Gaul from the Alps to Toulouse and the Pyrenees, so still in the middle ages provinci, provinciales, were understood in a very wide sense to designate not only Provence strictly so called, i.e. the present departments of Alpes Maritimes, Basses Alpes, Var, Bouches du Rhône, but also a very considerable part of Languedoc and the adjacent counties. Thus in the 12th century the chronicler Albert of Aix-la-Chapelle (Albertus Aquensis) places the town of Puy (Haute Loire) in Provence.

2. General Characters of the Language in its Ancient State.

The Provencal language, within the limits above indicated, cannot be said to have any general characters really peculiar to it. Such of its characters as are found in all the varieties of the language are met with also in neighbouring idioms; such as are absent are not generally characteristic of the language, as, for instance, the "nt" is, that is manifested only in certain varieties of Provencal. In reality "Provencal language" does not designate, properly speaking, a linguistic unity; it is merely a geographical designation.

Tonic or Accented Vowels.—Latin a is preserved in an open syllable amáre, amor, amámat, amat, as well as in a closed syllable carnem, carn. This character is common also to the Romanic of Spain and Italy; but it is one of the most distinguishing marks of the language of Provence, and is not found when in an open syllable, does not pass beyond a line which would run approximately through Blaye, Coutours (Gironde), Ribérac, Nontron (Dordogne), Bellac (Haute Vienne), Bouscau (Creuse), from all Montlugon, Gannat (Allier), Montmorin (Loire). Starting eastward from Lyons or the Rhone thereabouts, there appears a notable linguistic fact which is observable in varied proportions in the departments of Ain and Savoie and in Romanic Switzerland. This is, that, excepted Latin a in an open syllable, when preceded by a mouillé or palatalization (whatever the origin of this), becomes o, and, on the contrary, when there is no mouillé, it remains a. Thus we find in the languages of Montagnes and South of the Rhone (Lyone, 300 m), from all deláis, delatret, as against désirar, recóntar, regardar. Of these two, the former, -ier, is that which is found regularly in French, the second that which is peculiar to Provence. Fr. would have -ier in both cases (ensenhab, deléatar, desírar, &c); Fr. would have -ier (enseigner, deléiter) and -er (desírer). G. I. Ascoli has given the name of Franco-provençal (franca-provenzale) to the varieties of Romanic in which we find this duality of treatment in Latin a, according as it was or was not preceded by a palatalized sound. Lat. è, /e/ become close e (Eng. "e" of "fever"). Fr. Fré (Fr. "free"). Lat. ãm, mens, fi.de.m, fe, pílum, pel. This character is not only common to Italian and Spanish, but also extends over the French domain on its western side as far as Brittany. Certain exceptions noticed in Provencal (e, /e/ or e of "fever") are: "mâm, m, m.m, mens, m.m.m, vênum, which give in Fr. merci, cire, pirs, venin, where we should have expected mercê, cér, prez, vere, give regularly in Fr. merce, cera, prez, veve. Lat. è preserves, as in Italy, only this pronunciation as "è" of "é", in the definite article (one) of open places: à, è, èm, èu. Fr. takes on the accent of the Romanic languages: amè, um, am, rípa, riba. Lat. è is frequently like ì long when it precedes (with hiatus) another vowel: pí, pìa, pìa, pìa, vù, vìa, lià, lià. Lat. è, ì result in one and the same pronunciation (à, a) in many of the Southern Provençal dialects. The feminine, "ì", that of a feminine article, takes the place in the north of Italy and in the Romanic of Switzerland. This sound, which is styled by the Donat Provençal the "estrice" (close ù), is usually symbolized in the early texts by simple o, and is thus confounded in spelling, though not in pronunciation, with the open o (a larco of the Donal Provençal), which comes from Lat. ò. Lat. ã becomes ú (lat. Fr. u), as all over France, and also in part of north Italy: mùr, m, mù, dàr, dà, dum, dum, (dûl). Lat. us is rigorously preserved over the whole domain of the Fr. domain: aurum, aur, alauda, alausa, pauperem, pauper. At present the preservation of Lat. us does not extend much further; it is preserved in the Parisian French and the two parts of the Ladina zone in Switzerland (upper Rhine valley), and in Friuli, and it is to be supposed to have been once general over the whole of that zone. It is attested as late as the 16th century in the part of the valley of the Vajont, and it is preserved today in old Catalan. Elsewhere the diphthong has regularly become open ã (auru, ital. and Span, or., Fr. or., etc.).

Atomic Vowels.—The atomic vowels (i.e. vowels of the unaccented syllable) indicate which province of Provence has the characteristic phonetic phenomenon; but it is otherwise with those that follow the accented syllable, the post-tonic vowels. The Fr. is one of the Romanic idioms which, like the French, but unlike the Castilian and many other varieties of Italian, preserve the Latin post-tonic vowels. But the rules are not quite the same as in French, and in some exceptional cases real proparoxytones seem to have been preserved by ancient documents. In French the only vowel which can stand after the accented syllable is mute. In Prov. a and e are the most frequent vowels in this position, but i and o also occur. In French the first of the two post-tonic vowels a is a purely artificial distinction, the second tends to be preserved, when followed by one of the consonants n, l, r, d, kter, ter, hom, hom, omen, ang, avel, avel, sal, sec, sec, sal, sec, est, est, tep, tep, -ere. We have some instances of two syllables being retained after the tonic in the extreme south and southeast: dimine-nege (dines dominica), canone-nege (canonicus), me-nege, me-nege, monace, monace, monace, manica, handle, ca-nece (caniculus), laterne, laterne; in the north and east: carne, carbe; however, when such apparently proparoxytonic forms appear in poetry, the ending -ege, -ebe, -ebe counts only as one syllable, from which it appears that the pronunciation for the poet was the same for them again. Names of places ending in -anicus, -anicus, as Colonicus, De-Athalianicus, Dimoniromaticus, &c., now Colourgus, Dansargus, Dynomargus, in department Gard, appear in the 12th and 13th centuries as Colonques, Danzagenes, Domenones; moreover Prov. presents in certain words coming from Latin proparoxytones the trace of forms which (like Italian) admitted two atomic vowels after the accented syllable: thus we have porte-que and porte-que (pertica), Fabre-ga, a place name, and ferrare (fabrica), porto-que and porto-que (pertica), femina and femina (femina). We have also lagro-ma (lacryma), but a form accented like Fr. forme does not exist. There seems to be no doubt that these forms, in which a displacement of the Latin accent is observed, were at an earlier period pronounced as proparoxytones (portaque, fu, brege, pe, riega, o-mena, lo-grena).

Consonants.—The boundary usually recognized between Prov. and French is founded upon linguistic characters furnished by the vowels, especially a; if it had been determined by characters furnished by the consonants, the line of demarcation would have to be drawn farther south, because the consonantal system which is regional and partly provincial is still more pronouncedly so in the northern zone of the Provencal region as defined above. As with the vowels, only a few of the salient facts can here be indicated. C initial, or second consonant of a group, before a (e, o) or o (incl., m) as in fêtre, lleger (Eng. "clive"), fètre, m, "lamb", "leng"; an approximant greater part of the Prov. region. But in the northern zone it takes the sound of 1ch (Eng. "ch in chin") as in Old French, and this sound is still preserved in the eastern part of the northern zone of the Provençal, and in the Haute Vienne. Puy de Dôme, Cantal, Haute Loire, the north of Lorraine, of Ardeche, of
Drome, of Isère, and of Hautes-Alpes, and Castel, Castanet, Casal, farther to the south. Analogously, a, initial, or second consonant of a word, tends to be the same whether the preceding vowel is long or short (e.g. castel (caste-lum) in the same zone; Garrica is Jarria, Jarria in Dordogne, Corrèze, Cantal, Haute Loire, Isère, and Garriga farther south. Between a consonant and an a or e (e.g. 493 pam, imperator, natale, amata). This was also the case in O. Fr. until about the 10th or 11th century (honurede, emperor, lavatures, etc., in the Life of St. Alexis). But in the northern zone the west end of Guienne, and in Basque, it has nothing to do with French. In an 11th century text from the environs of Valence we read muror, coroa (murator, corrogata, Fr. corte). (P. Meyer, Recueil d’anciens textes, Provençal section, No. 40). In this text (Garrica, Jarija, in Dordogne) it is clear that the a or e in a word such as tere (tare), when it is preceded by a consonant, has been retained for the whole of the 11th century, which is evidence that whatever was formerly to become r (linguistic, not uvular): as, tere, uvular (a udire, videntem). In Béarn and Gascony 493 d remained; but in the northern zone Latin d, instead of changing into z, r, disappeared as in French and quite as early. The poem of Boethius, of which the MS. is of the 11th century, shows in this respect great hesitation: e.g. a preserved in chadon, credet, tradar, veder (cadetem = credet, tradare, videore); z fallen away in creessen, fezaton, trono, vatir (credissent, fideltatem, traditionem, videutum, p. le videire, fidore). One of the most general facts in Provençal is the habit of rejecting Latin final d, of which the number has been estimated at about 95% of all cases. In French this t was formerly retained when it followed a vowel which remained, aiment, entret (a mat, intrat), and still remains (in writing least) when in Latin, tantum, tantae, tantum, and other consomables (e.g. manus, vivat, vivint). But in the Provençal r is dropped in all cases, even in the most ancient texts: aman, rai, riu. Yet in the northern zone we find the r retained in the 3rd declension plural, e.g. -ent (-aran in the same sequence, forzina, vinta, as completely (or at least only appears through orthographic tradition, and very intermittently, (berba), (bonor), (bomul, etc.), not only in words of Latin origin, which is the case in Old French, but even in Terminology. (e.g. aetatem, aetatis, cunctum, haerens, hauber, haeune, with h aspirated.) By this feature, the northern limits of which are not yet well determined, the Provençal at times attaches itself to the Romanic of the southern countries. N final, or, as we may say, a particular feature of the following vowel has dropped, disappears in the whole central part of the Fr. domain: granu, gro, be, en, e, ve, fin, fi, un u (granum, be n, vi, n, un), in Latin. But in the region of the Pyrenees this tendency does not appear. The d, e.g. with the adverb manu, may not be omitted in the whole part (left of the Rhone), the western part (Gascony, but not Béarn), and the region of the Pyrenees. It is possible that this loss of n went along with a lengthening of final vowel, at least, in Béarnese when the r falls away, and the vowel is doubled: vati, vati, vati, vati, (capellán, victor, bonum), etc.)

These are the most important characteristics of the consonants in relation to the extent of space over which they prevail. Others, which are of secondary importance, must be mentioned, but it must be curiosious on account of their strangeness. It will suffice to mention a few which belong to the district bounded on the west and south by the Atlantic, the Basque provinces and the Pyrenees, and which belong to a particular form of the language, summoned at its affinities, as far as the Gironde. (This includes Béarn, Bigorre and Gascony.) Here the sound n longer exists, being replaced generally by d; between two vowels, in Gascony, by w with the sound of English w. Initial r assumes a prosthetic a: arram, arre, Arrobert (ram, mer, Robertum). Between two vowels becomes r: aperar, caperan, or (Béarn) capera, bera, era (apel lare, capellannum, bella, illa). On the contrary, at the end of words (viz. in Romanic) hi becomes go i, d; the former change seems to belong rather to Hautes and Basses Pyrénées, Landes, the latter to Gironde, Lot et Garonne. Gers: eg, ed, et (illu, enu, ene, i, in, un, en, eu, e, en, i, e). The same case is with capdog, ed, et (capitellum), whence Fr. cadet (in 16th century capdei, originally a Gascon word). For further details upon the consonants in this region of south-west France see Romano, iii. 435-135, v. 368-462.

Flexion.—Old Provençal has, like Old French, a declension consisting of two cases for each number, derived from the Latin nominative and vocative, with certain adventitious changes. Deponents and intransitives in -er, e.g. (cavall), object cavall (caballlos). 3) Words of Latin 3rd decl. Here there are three Latin types to be considered. The first type presents the same stem and the same accentuation in all cases, e.g. canis. The second presents the same accentuation in the nominative singular and in all the other cases, but the theme differs: c-o mes, c-o mit-em. In the latter type the final vowel varies in the different cases, the declension of the nominative singular is thus:

c-o mes (c-o mis), c-o mit-em (c-o mitt-e). The first type is naturally confounded with nouns of the 2nd decl.; sing. subj. canis or can, obj. can or ca. The second and third types are sometimes conflated, their declension is then: c-o mes answers to c-o mes and c-o mit-em. It has often happened that already in vulgar Latin the theme of the nominative singular had been refashioned after the theme of the accusative. In Old Provençal, since the 13th century, the forms of the 2nd decl. for the theme of the nominative singular, so that the 2nd decl. (with the theme of the accusative) is confounded with the 3rd decl. of the nominative singular, for heres, parens, princi pes. Consequently the difference both of theme and of accentuation which existed in Latin between nominative and accusative has disappeared in Provençal. All such examples show the change of the 2nd decl. into the 3rd decl. But when the other cases takes place in all Latin words in -s (except abbas), in those in -t, in the greater part of those in -r, or at least in all those considered as Latin, it seems impossible to define just what is the case. Thus we obtain bonitas (boni tatis for bonitas) and bonis (boni tatis for civitas) and civitatis (civitatis) and amors (amoris for a mor), and amor (a morem). All present participles in the subject case singular are formed in this way. Several Latin nominatives: amans (amanis for a manis), amant (amanatem). It is to be remarked that in regard to feminine nouns Pr. is more etymological than French. In the latter feminine nouns have generally only one form for each number: bonit for the subj. as well as for the obj. case, and not bonites and bonit; in Pr. on the contrary bonits and bonitat. Still, in a large number of nouns the original difference of accentuation between the nominative singular and the accusative singular is still preserved, not only in certain prepositions, but also in a number of proper names, which are retained and have preserved the old accentuation. Thus we have the following forms, e.g. c-etus, e-etus, e-etus, e-etus, e-etus.

In the 4th and 5th declensions present no points requiring mention here.

This declension of two cases is a notable character of the whole Romanic of Gaul, north as well as south, i.e. French as well as Provençal. A declension of this kind is also found in the Napoleonic library of S. Germain at Lyons, end of 13th century: "Die a vos que no siatz consirotz", (ne solliciti sitis, Matt. vii. 25); "que siatzt elis" (ut videamini ab elis, Matt. vi. 1); "e davant les reis princes seretz manedit" (et ad praesides et ad reges duceum, Matt. x. 18). dialect composed and printed in the 16th century, and on to our own day, have no link with the literature of the preceding period. Reduced to the condition of a patois, or popular dialect, simply, the idiom experienced somewhat rapid modifications. Any one who should compare the poems of Goudein of Toulouse (1579-1649) with those of a Toulousain troubadour of the 13th century would be astonished at the changes which the language had undergone. To compare a 15th century poet would probably be exaggerated. In order to make a rigorously accurate comparison of the language at the two epochs, it would have to be written in the two cases with the same orthographic system, which it is not. The first writers of Provençal, about the 10th and 11th century, applied to the language the Latin orthography, preserving to each letter, as far as possible, the value given to it in the contemporary pronunciation of Latin. To express certain sounds which did not exist in Latin, or which were not there clearly enough noted, there were introduced little by little; and without regular system, various conventional symbolizations such as $l$ and $n$ to symbolize the sound of $l$ and $n$.

This method of proceeding there resulted an orthographic system somewhat wanting in fixity, but which from its instability lent itself fairly well to the variations which the pronunciation underwent in time and locality. But, the tradition having been interrupted by the 15th century, those who afterwards by way of pastime attempted composition in the patois formed, each for himself apart, an orthography of which many elements were borrowed from French usage. It is evident that differences already considerable must be exaggerated by the use of two very distant orthographical systems. Nevertheless, even if we get rid of the illusion which makes us at first sight suppose differences of sound where there are merely different ways of spelling the same sound, we find that between the 14th and 16th centuries the language underwent everywhere, Béarn excepted, great modifications both in vocabulary and grammar. The Provençal literature having gradually died out during the 14th century, the vocabulary lost rapidly the greater part of the terms expressing general ideas or abstract conceptions. To supply the place of the authors who have written in the patois of the south during the last few centuries have been obliged to borrow from French, modifying to the same time their form, a multitude of vocabularies which naturally have nothing for them in common to people who know only the patois. In this case the adoption of foreign words was excusable; but it did not stop here. Little by little, as primary instruction (now compulsory) was diffused, and introduced, first in the towns and afterwards in the villages, certain knowledge of French, words purely French, have been introduced into use in place of the corresponding dialect words. Thus, one hears constantly in Provence pé-re, mé-ro, ñe-ro, forms adapted from French, instead of paire, maire, freire, cacha (cachá = Fr. caucher) instead of escondre, &c.

In the phonology, the modifications are of the natural order, and so have nothing revolutionary. The language has developed locally tendencies which certainly already existed during the flourishing period, although the ancient orthography did not recognize them. Of the vowels, a general feature is the loss of distinction between $e$ and $o$, which in the Provence dialects (ed. Stengel, p. 49) as a strest (= close or narrow $a$). A feature almost general is the passage of post-tonic $a$ into $o$: terre, amavo, amado (terra, a mabata, a mata). In many cases, particularly in the south, the $a$ becomes $o$ as early as the end of the 15th century. But even yet there are a few cantons, notably Montpellier and its neighbourhood, and also some localities in which the language has remained in general use with the sense of a past conditional: ama-ra or ama-ra, "I should have loved," fora, "I should have been."
PROVENÇAL LITERATURE

by Professor E. Levy in his Provençalisch Supplement-Winterbuch (5 vols., Leipzig, 1892-1910, stops actually at letter P). The numerous special vocabularies appended by editors to texts published by them cannot be neglected. These yield a considerable number of words which have wrongly explained in the Lexique roman.

2. Modern Form.—The term modern Provençal has been used with insufficient knowledge of phonology, and under the preconceived idea that there exist dialects with definite circumscription) (Vinzelles (Nouveau dictionnaire de la langue provençale, 1882); see also his "Phonétique monataise," in Romanica, xii, 394; Cantagrel, "Notes sur l'orthographe et la prononciation languedocienne," prefixed to La Cannois de la Lascuie, by A. Bousquet, Montpellier, 1860; Vayssier, Tableau des dialectes du Midi de la France, 1875, referring especially to the variety of Nontron, in the north of Périgord (Dordogne); Constant, Essai sur l'histoire du sous-dialecte du Rouergue (Montpellier and Paris, 1860); Lespy, Grammaire du dialecte de la vallée du Dourdou (Montpellier, 1876), taking for its basis the dialect of Béziers; Chabrand and De Rochas d'Agnon, Patois des Alpes Coiennes et en particulier du Queyras (Grenoble and Paris, 1877); Coutinb, Dictionnaire de la langue provençale (Paris, 1882); Le Bas provençal-français (2 vols., Draguignan, 1841): Honnorat, Dictionnaire provençal-français (2 vols. 4to, Digne, 1845-1847); Savays, Dictionnaire provençal-français (new ed., 2 vols., Alais, 1820); Vaysset, Dictionnaire provençal-français du département de l'Aveyron (Rodez, 1879). F. Mistral's Tresor du Félibrige, ou dictionnaire provençal-français (2 vols. 4to, 1880-1888) is the most complete of all. This dictionary takes as its basis the variety of Maillane (in the north of Bouches-du-Rhône), the author's native district, but gives, as far as possible, all the forms used in the south of France. It is by far the best of all the dictionaries of the southern French. J. B. Andrews' English-French dictionary of the Provençal great will enable the student to dispense with all the others. (P. M.)

PROVENÇAL LITERATURE. Provençal literature is much more easily defined than the language in which it is expressed. Starting in the 11th and 12th centuries in several centres it thence gradually spread out, first over the greater portion, though not "the whole of southern France, and then into the north of Italy and Spain. It never felt the influence of the neighbouring literatures. At the time of its highest development (12th century) the art of composing in the vulgar tongue did not only begin to exist, to the south of the Alps and the Pyrenees, but the art of composing in that speech, vernacular poetry was in full bloom; but between the districts in which it had developed, Champagne, Ile de France, Picardy and Normandy—and the region in which Provençal literature had sprung up, there seems to have been an intermediate zone formed by Burgundy, Bourbonnais, Berry, Touraine and Anjou which, far on in the middle ages, appears to have remained almost barren of vernacular literature. In its rise Provençal literature stands completely by itself, and in its development it long continued to be absolutely original. It presents at several points genuine analogies with the sister-dialects of northern France, but these analogies are due principally to certain primitiv elements common to both and only in a slight degree to mutual reaction. It must be inquired, however, what amount of originality could belong to any, even the most original, Romance literature in the middle ages. In all Romance countries compositions in the vernacular began to appear while the custom of writing in Latin was still preserved by uninterrupted tradition. Even during the most barbarous periods, when intellectual life was at its lowest, it was in Latin that sermons, lives of saints more or less apocryphal, accounts of miracles designed to attract the faithful to certain shrines, monastic annals, legal documents, and contracts of sale or marriage when learning began to revive, as was the case in northern and central France under the influence of Charlemagne and later in the 11th century, it was Latin literature which naturally received increased attention, and the Latin language was more then ever employed.
in writing. Slowly and gradually the Romançal languages, especially those of France, came to occupy part of the ground formerly occupied by Latin, but even after the middle ages had passed away the parent tongue retained no small portions of its original empire. Consequently Romançal literature in general (and this is especially true of Provençal, as it does not extend beyond the medieval period) affords only an incomplete representation of the intellectual development of each country. Those literatures even which are most truly national, as having been subjected to no external influence, are only to a limited extent capable of teaching us what the nation was. They were, in short, created in the interests of the literate part of the people, and to a considerable degree by men themselves almost devoid of literary learning. But that does not make them less interesting.

Conceived in the dawning of the 11th century, and at several places in the extensive territory whose limits have been described in the foregoing account of the Provençal language, that Provençal literature first made its appearance. It took pretic form; and its oldest monuments show a relative perfection and a variety from which it may be concluded that poetry had already received a considerable development. The oldest poetic text, of which the date and origin are not surely determined, is said to have been a Provençal burden (Fr. refrain) attached to a Latin poem which has been published (Zeitschrift für deutsche Philologie, 1892, p. 335) from a Vatican MS., written, it is asserted, in the 10th century. But it is useless to linger over these few words, the text of which seems corrupt, or at least has not yet been satisfactorily interpreted. The honour of being the oldest literary monument of the Provençal language must be assigned to a fragment of two hundred and fifty-seven syllabic verses preserved in an Orleans MS. and frequently edited and annotated since it was first printed by Raynouard in 1817 in his Choix des poésies originales des troubadours. The writing of the MS. is of the first half of the 11th century. The peculiarities of the language point to the north of the Provençal region, probably Limousin or Marche. It is the beginning of a poem in which the unknown author, taking Boethius's treatise De consolatione philosophiae as the groundwork of his composition, adopts and develops its ideas and gives them a Christian colouring of which there is no trace in the original. Thus from some verses in which Boethius contrasts his happy youth with his afflicted old age he draws a lengthy homily on the necessity of laying up from early years a treasure of good works. The poem is consequently a didactic piece composed by a 'clerk' knowing Latin. He doubtless preferred the poetic form to prose because his literate contemporaries were accustomed to poetry in the vulgar tongue, and because this form was better adapted to elicitations and traditions than prose. But while the work was composed of erudition in as far as it was an adaptation of a Latin treatise, shows that at the time when it was composed a vernacular poetry was in existence. A little later, at the close of the same century, we have the poems of William IX., count of Poitiers, duke of Guienne. They consist of eleven very diverse strophic pieces, and were consequently meant to be sung. Several are love songs; one relates a bonne fortune in very gross terms; and the most important of all—the only one which can be approximately dated, being composed at the time when William was setting out for Spain to fight the Saracens (about 1119)—expresses in touching and often noble words the writer's regret for the frivolity of his past life and the apprehensions which oppressed him as he bade farewell, perhaps for ever, to his country and his young son. We also know from Ordericus Vitalis that William IX. had composed various poems on the incidents of his ill-fated expedition to the Holy Land in 1101. And it must further be mentioned that in one of his pieces (Bent voit que sapelon il plusor) he makes a very clear allusion to a kind of poetry which we know only by the specimens of later date, the partimen, or, as it is called in France, the jeu parti. William IX. was born in 1071 and died in 1127. There is no doubt that the most prolific period of his literary activity was his youth. On the other hand there is no reason to believe that he created the type of poetry of which he is to us the oldest representative. It is easy to understand how his high social rank saved some of his productions from oblivion whilst the poems of his predecessors and contemporaries disappeared with the generations who heard and sang them; and in the contrast in form and subject between the Boethius poem and the stanzas of William IX. we find evidence that by the 11th century Provençal poetry was being rapidly developed in various directions. Whence came this poetry? How and by whose work was it formed? That it has no connexion whatever with Latin poetry is generally admitted. There is absolutely nothing in common either in form or ideas between the last productions of classical Latinity, as they appear in Sidonius Apollinarius or Fortunatus, and the first poetic compositions in Romanic. The view which seems to meet with general acceptance, though it has not been distinctly formulated, is that the Provençal poetry sprang out of a popular poetry quietly holding its place from the Roman times, no specimen of which has survived—just as the Romanic languages are only continuations with local modifications of vulgar Latin. There are both truth and error in this opinion. The question is really a very complex one. First as to the form Romanic versification, as it appears in the Boethius poem and the verses of William IX., and a little farther north in the poem of the Passion and the Life of St Leger (10th or 11th century), has with all its variety some general and permanent characteristics; it is rhymed, and it is composed of a definite number of syllables certain of which have the syllabic accent. This form has evident affinity with the rhythmic Latin versification, of which specimens exist from the close of the Roman Empire in ecclesiastical poetry. The exact type of Romanic verse is not found, however, in this ecclesiastical Latin poetry; the latter was not popular. However, it may be assumed that there was a popular variety of rhythmical poetry from which Romanic verse is derived.

Again, as regards the substance, the poetic material, we find nothing in the earliest Provençal which is strictly popular. The extremely personal compositions of William IX. have nothing in common with folk-lore. They are subjective poetry addressed to a very limited and probably rather aristocratic audience. The same may be said of the Boethius poem, though it belongs to the quite different species of edifying literature; at any rate it is not popular poetry. Vernacular compositions seem to have been at first produced for the amusement, or in the case of religious poetry, for the edification, of that part of lay society which had leisure and lands, and reckoned intellectual pastime among the good things of life. Gradually this class, intelligent, but with no Latin education, enlarged the circle of its ideas. In the 15th century, and still more in the 16th, historical, didactic, and moralising works and treatises were composed for its use in the only language it understood; and vernacular literature continued gradually to develop partly on original lines and partly by borrowing from the literature of the 'clerks.' But in the 11th century vernacular poetry was still rather limited, and has hardly any higher object than the amusement or the edification of the upper classes. An aristocratic poetry, such as it appears in the oldest Provençal compositions, cannot be the production of shepherds and husbandmen; and there is no probability that it was invented or even very notably improved by William IX.

From what class of persons then did it proceed? Latin chroniclers of the middle ages mention as joculares, joculatores, men of a class not very highly esteemed whose profession consisted in amusing their audience either by what we still call jugglers' tricks, by exhibiting performing animals, or by recitation and song. They are called joculaires in Provençal, jouleurs ou jugeleurs in French. A certain Barnaldus, styled jocarius, appears as witness in 1058 to a charter of the chartulary of St Victor at Marseilles. In 1106 the act of foundation of a salva terra in Rouergue specifies that neither knight nor man-at-arms nor joculator is to reside in the village about to be created. These individuals—successors of the mimic and the commedia of antiquity, who were professional amusers of the public—were
the first authors of poetry in the vernacular both in the south and in the north of France. To the upper classes who welcomed them to their castles they supplied that sort of entertainment now sought at the theatre or in books of light literature. There were certain of them who, leaving burlesque to the ruder and less wisely disposed of the profession, devoted themselves to the composition of pieces intended for singing, and consequently in verse. In the north, where manners were not so refined and where the taste for warlike adventure prevailed, the jongleurs produced *chansons de geste* full of tales of battle and combat. In the courts of the southern nobles, where wealth was more abundant and a life of ease and pleasure was consequently indulged in, they produced love songs. There is probably a large amount of truth in the remark made by Dante in ch. xxv. of his *Vita nuova*, that the first to compose in the vulgar tongue did so because he wished to be understood by a south of France who, from his youth, had been brought up to follow Latin verses.

1 And in fact there are love songs among the pieces by William of Poitiers; and the same type preponderates among the compositions of the troubadours who came immediately after him. But it is worthy of note that in all this vast body of love poetry there is no epithalamium nor any address to a marriageable lady. The social conditions of the south of France in the feudal period explain in great measure the powerful development of this kind of poetry, and also its peculiar characteristics—the profound respect, the extreme deference of the poet towards the lady whom he addresses. Rich heiresse was the woman of noble breeding whom he adored, the lady of their girding, and most frequently without their fancy being consulted. But they seem after marriage to have enjoyed great liberty. Eager for pleasure and greedy of praise, the fair ladies of the castle became the natural patronesses of the *mesnie* or household of men-at-arms and jongleurs whom their husbands maintained in their castles. Songs of love addressed to them soon became an accepted and almost conventional form of literature; and, as in social position the authors were generally far below those to whom they directed their amorous plaints, this kind of poetry was always distinguished by great reserve and an essentially respectful style. From the beginning the sentiments, real or assumed, of the poets are expressed in such a refined and guarded style that some historians, over-estimating the virtue of the ladies of that time, have been misled to the belief that the love of the troubadour for the mistress of his thoughts was generally platonic and conventional.

The conditions under which Romanic poetry arose in the south of France being thus determined as accurately as the scarcity of documents allows, we now proceed to give a survey of the various forms of Provençal literature, chronological order being followed in each division. By this arrangement the wealth of each form will be better displayed; and, as it is rare in the south of France for the same person to distinguish himself more in one of them, there will be generally no occasion to introduce the same author in different sections.

*Poetry of the Troubadours.*—Though he was certainly not the creator of the lyric poetry of southern France, William, count of Poitiers, by personally cultivating it gave it a position of honour, and indirectly contributed in a very powerful degree to ensure its development and preservation. Shortly after him centres of poetic activity make their appearance in various places—first in Limousin and Gascony. In the former province lived a viscount of Ventadour, Eble, who during the second part of William of Poitiers’s life seems to have been brought into relation with him, and according to a contemporary historian, Geoffrei, prior of Vigois, *erat valde gratiosus in cantilenis*. We possess none of his compositions; but under his influence Bernart of Ventadour was trained to poetry, who, though only the son of one of the serving-men of the castle, managed to gain the love of the lady of Ventadour, and when on the discovery of their amour he had to depart elsewhere, received a gracious welcome from Eleanor of Guienne, consort (from 1152) of Henry II. of England. Of Bernart’s compositions we possess about fifty songs of elegant simplicity, some of which may be taken as the most perfect specimens of love poetry Provençal literature has ever produced. Bernart must therefore have been in repute before the middle of the twelfth century; and his poetic career extended well on towards its close. At the same period, or probably a little earlier, flourished Cercamon, a poet certainly inferior to Bernart, to judge by the few pieces he has left us, but nevertheless of genuine importance among the troubadours both because of his early date and because definite information regarding him has been preserved. He was a Gascon, and composed, says his old biographer, "pastorals" according to the ancient custom (*pastorales a la uzansa antiga*). This is the record of the appearance in the south of France of a poetic form which ultimately acquired large development. Bernart and Cercamon were the first troubadours, and what Cercamon poetry was developed and through what circumstances it fell into decay and finally disappeared: Peter of Auvergne (Peire d’Alvernha), who in certain respects must be classed with Marcabrun; Arnaut Daniel, remarkable for his complicated versification, the inventor of the *sestina*, a poetic form for which Dante and Petrarch express an admiration difficult for us to understand; Arnaut of Mareuil, who, while less famous than Arnaut Daniel, certainly surpasses him in elegant simplicity of form and delicacy of sentiment; Bertran de Born, now the most generally known of all the troubadours on account of the part he is said to have played both by his sword and his *sireniestec* in the struggle between Henry II. of England and his rebel sons, though the importance of his part in the events of the time seems to have been greatly exaggerated; Peire Vidal of Toulouse, a poet of varied inspiration who grew rich with gifts bestowed on him by the greatest nobles of his time; Guiraud de Bornell, *la maistre dels trohadores*, and at any rate master in the art of the so-called "close" style (*trobair clus*), though he has also left us some songs of charming simplicity; Gauzelm Faidit, from whom we have a touching lament (*plank*) on the death of Richard Cœur de Lion; Folquet of Mârselles, the most powerful thinker among the poets of the south, who from being a troubadour became first a monk, then an abbot, and finally bishop of Toulouse (d. 1211).

It is not without interest to discover from what class of society the troubadours came. Many of them, there is no doubt, had a very humble origin. Bernard of Ventadour’s father was a servant, Peire Vidal’s a maker of furred garments, Perdigon’s a fisher. Others belonged to the bourgeois: Peire d’Alvernha, for example, Peire Raimon of Toulouse, Elías Fonsalada. More rarely we see traders’ sons becoming troubadours; this was the case with Folquet of Mârselles and Aiméric de Pegulhan. A great many were clerics, or at least studied for the Church, for instance, Arnaut of Mareuil, Hugh of Saint Cirq (U de Saint Cric), Aiméric de Belenoi, Hugh Brunet, Peire de Carden. Some had even become clerics; the monk Marc de Marc and his monk Gaubert of Pulibot. Ecclesiastical authority did not always tolerate this breach of discipline. Gui d’Ussel, canon and troubadour, was obliged by the injunction of the pontifical legate to give up his song-making. One point is particularly striking, the number of nobles (usually poor knights whose incomes were insufficient to support their rank) who became troubadours, or even, by an inferior descent, jongleurs: Raimon de Miraval, Pons de Capdoill, Guillem Azemar, Cadenet, Peiròl, Raimbaut de Vacquera, and many more.
There is no doubt they betook themselves to poetry not merely for their own pleasure, but for the sake of the gifts to be obtained from the nobles whose courts they frequented. A very different position was occupied by such important persons as William of Poitiers, Raïmbaut of Orange, the viscount of Saint Antonin, William Faidit, who made poetry for their own amusement, but contributed not a little, by thus becoming troubadours, to raise the profession.

The profession itself was entirely dependent on the existence and prosperity of the feudal courts. The troubadours could hardly expect to obtain a livelihood from any other quarter than the generosity of the great. It will consequently be well to mention the more important at least of those princes who are known to have been patrons and some of them practitioners of the poetical art. They are arranged approximately in geographical order, and after each are inserted the names of those troubadours with whom they were connected.

France.—Eleanor of Guienne, Bernart de Ventadour (Ventadorn); Henry Curtmantle, son of Henry II. of England, Beinan de Bore (7); Richard Cour de Lion, Arnaut Daniel, Peire Vidal, Folquet of Marseilles, Gaucelin Faidit; Ermenarde of Narbonne (1143-1192), Bernart de Ventadour, Peire Rogier, Peire Vidal, Folquet de Toulouse, Gaucelin Folquet, Arnaut de Cervolat, Arnaut de Béarn, Bernart de Ventadour, Peire Rogier, Peire Raimon, Hugh Brunet, Peire Vidal, Folquet de Marseilles, Bernart de Durfort; Raimon VI., count of Toulouse (1194-1222), Raimon de Miraval, Aimeric de Peguilhan, Bertran de Miraval, Guiraut Aujou, Hugh de Calcin; Aimeric de Sirat; Peron, Mabion de Avignon (1190-1234), Peron, Perdigon, Pierre de Macasac, Gaucelin Faidit; Guiraut I., count of Foix; Guiraut II., count of Forcalquier; Peire Vidal; Alphonse IV., count of Duras (1208-1227); Hugh de Saint-Cricq; perhaps Hugh IV., count of Rodez (1227-1274) and Henry II., count of Rodez (1274-1302), Guiraut Riquer, Folquet de Lusel, Serveri de Girone, Bertran Carbonel; Nuño Sanchez; count of Roussillon (d. 1241), Aimeric de Belenol; Bernard IV., count of Asturac (1249-1291), Guiraut Riquer, Amanieu de Sessa.

England.—Alphonse II., king of Aragon (1162-1196), Peire Rogier, Peire Raimon, Peire Vidal, Cadetin, Gueriat de Carrebla, Elias de Barjos, the monk of Montauban, Hugh Brunet; Peter II., king of Aragon (1248); Raimon de Miraval, Aimeric de Peguilhan, Perdigon, Ardidin; Hugh de Calcin; Jac de Carri, count of Foix; Peire de Toulouse (1213-1276), Peire Cardinal, Bernart Sicart de Mareujols, Guiraut Riquer, At de Mons; Peter III., king of Aragon (1276-1285), Gueriat of Miraval, Guiraut Riquer, Sirment de Caravlins, Alphonso IX., king of Leon (1213-1254), Peire Rogier, Guiraut de Borenil, Aimeric de Peguilhan, Hugh de Saint-Cricq; Alphonso X., king of Castile (1252-1284), Bertran de Lamanon, Bonifae Calvo, Guiraut Riquer, Folquet de Lusel, Arnau Plages, Bertran Carbonel.

Italy.—Boniface II., marquis of Montferrat (1192-1207), Peire Vidal, Raïmbaut de Vacqueras, Elias Cail, Gaucelin Faidit (1); Frederike II., emperor (1215-1250), Jean d’Aubusson, Aimeric de Peguilhan, Guilem Figueira; Azzo VI., marquis of Este (1195-1212), Aimeric de Peguilhan, Rambertin de Buvadell; Azzo VIII., marquis of Este (1215-1264), Aimeric de Peguilhan.

The first thing that strikes one in this list is that, while the troubadours find protectors in Spain and Italy, they do not seem to have been welcomed in French-speaking countries. This, however, must not be taken too absolutely. Provençal poetry was appreciated in the north of France. There is reason to think that the famous couplet of one of the troubadours of Arles, was married in 998 to Robert, king of France, she brought along with her Provençal jongleurs. Poems by troubadours are quoted in the French romances of the beginning of the 13th century; some of them are transcribed in the old collections of French songs, and the preacher Robert de Sorbon informs us in a curious passage that one day a jongleur sang a poem by Folquet of Marseilles at the court of the king of France.

But in any case it is easy to understand that, the countries of the langue d’oil having a full developed literature of their own, suited to the taste of the people, the troubadours generally preferred to go to regions where they had less to fear in the way of competition.

The decline and fall of troubadour poetry was mainly due to political causes. When about the beginning of the 13th century the Albigensian War had ruined a large number of the nobles and reduced to lasting poverty a part of the south of France, there was a decline of the profession of troubadours to be lucrative. It was then that many of those poets went to seek employment in the north of Spain and Italy, where Provençal poetry had for more than one generation been highly esteemed. Following their example, other poets who were not natives of the south of France began to compose in Provençal, and this fashion continued till, about the middle of the 13th century, they gradually abandoned the foreign tongue in northern Italy, and somewhat later in Catalonia, and took to singing the same airs in the local dialects.

About the same time in the Provençal region the flame of poetry had died out save in a few places—Narbonne, Rodez, Foix and Astarac—where it kept burning feebly for a little longer. In the 14th century the country was, in a language of the country was still practised; but the productions of this period are mainly works for instruction and edification, translations from Latin or sometimes even from French, with an occasional romance. As for the poetry of the troubadours, it was dead for ever.

Form.—Originally the poems of the troubadours were intended to be sung. The poet usually composed the words; and in several cases he owed his fame more to his musical than to his literary ability. Two manuscripts preserve specimens of the music of the poems; but, though the subject has been recently investigated, we are not in possession of a complete example of the originality and of the merits of these musical compositions. The following are the principal poetic forms which the troubadours employed, the names of the poets mentioned being more or less accurately by which is understood any composition intended to be sung, no matter what the subject. At the close of the 12th century it became customary to call all verse treating of love canze—the name is derived from canso, kind of music in use among the Saracens of North Africa, and is the word used for the Arabic poetry of the time. The canzoncina differs from the vera and the canzo only by its subject, being for the most part devoted to moral and political topics. Pierre Cardinal is celebrated for the canzontes which he composed against the clergy of his time. The political poems of Bertran de Born are sinverentes. There is reason to believe that originally this word meant simply a poem composed by a sirvent (Lat. servientes) or master of arts. It was only, however, to be the name given to a particular composition by which is understood any composition intended to be sung, no matter what the subject. The word is derived from canso, kind of music in use among the Saracens of North Africa, and is the word used for the Arabic poetry of the time. The danza and balada, intended to mark the time in dancing, are pieces with a refrain. The alba, which has also a refrain, is, as the name indicates, a waking or morning song at the dawning of the day. All those classes are in stanzas. The descort is not thus divided, and consequently it must be set to music and sung through. Its name is derived from the fact that, its component parts not being equal, there is a kind of "discord" between them. It is generally reserved for themes of love. Other kinds of lyric poetry sometimes used a refrain, among them the danza and balada, intended to mark the time in dancing, are pieces with a refrain. The alba, which has also a refrain, is, as the name indicates, a waking or morning song at the dawning of the day. All those classes are in stanzas. vassal the Burgundian Gerold of Rousillon. It is a literary pro-
duction of rare excellence and of exceptional interest for the history 
of civilization in the 12th and 13th centuries. The same author,
Stuart de Donjon, has composed two poems, neither of which is 
either of French or at least Burgundian origin. To Limousin also 
seems to belong the poem of Aigard and Maurin (end of the 
doth century), of which we have unfortunately only a fragment so 
short that it is impossible to gain any idea of its character or 
medium. The author, who is called Theobaldus de Chastelerie, 
may be identified with the chronicler mentioned in the Provençal 
Chanson of Antioch, a mere fragment of which, 700 verses in 
excess, has been recovered in Madrid and published in Archives 
de l'Orient latin, vol. ii. This poem, which seems to have been 
composed by a certain Gremont Bechada, mentioned in a 12th-
century chronicle and written in Limousin (see G. Paris, in Romania, 
xxii. 359), is one of the sources of the Spanish compilation La gran 
conquista de Ultramar. To history proper belongs the Chanson 
of the Battle of Toulouse, and among the chansons of the same 
period is the poem of Daurel and Belon (first half of the 13th century), 
connected with the cycle of Charlemagne, but by the romantic 
character of the events more like a regular romance of adventure. 
With the arrival of the troubadours, and consequent development 
of only as MS. in which it has been preserved is defective at the 
close, and that to an amount there is no means of ascertaining. 
Midway between legend and history may be classed the Provençal 
chanton de geste form, a poem on the war carried on in Navarre 
by the French in 1276 and 1277. It is an historical work of 
little literary merit. All these poems are in the form of chansons 
de geste, and in the truest sense of the word, since they are 
composed of two poems one tacked to the other: the first, con-
taining the events from the beginning of the crusade till 1213, is 
the work of a cleric named William of Tudela, a moderate supporter 
of the crusade, and the second of the period, in 1253, is from 
the pen of an opponent of the enterprise. The language and style of 
the two parts are no less different than the opinions. Finally, about 
doubt, and are unquestionably the best poems that have been 
known to us, are the Provençal romances of adventure: 
Joustred (composed in the Gudele of the 14th century, 
known to a king of Aragon, possibly James I.), Bladon of Cornwell 
and Guilelm de la Barra. The first two are connected with the 
Arthurian cycle; Joustred is an elegant and ingenious work; Bladon 
of Cornwell and Guilelm de la Barra is in blank verse, and by 
the author of the famous chanson de geste, Pierre de Castillon, 
Guilelm de la Barra tells a strange story also found in Boccaccio's 
Decamerone (2nd Day, viii.). It is rather a poor poem; but as 
a contribution to literary history it has the advantage of being 
dated. It was composed in 1276 and is dated 1278. It is called 
Sicart de Montaup. Connected with the romance of 
adventure is the novel in Provençal, always in the plural, 
known as the Novel of Sicart de Montaup, or the Novel of 
the Cyclist. The novel must have been at first in the south what, as we see by 
the Decamerons, it was in Italy, a society pastime—the wits in 
turn relating anecdotes, true or imaginary, which they think likely 
to amuse their hearers. Of Sicart de Montaup only a fragment, 
but of which the first five thousand verses, or the first thousand 
lines, was preserved, is known to us. Later, and which before long, to the knitting of 
dition was treated in verse, the form adopted being that of the romances 
of adventure—octosyllabic verses in rhyming in pairs. Some of 
those novels which have come down to us may be ranked with the most 
graceful works in Provençal literature; two are from the pen of 
the Catalan author Rainon Vidal de Besalu. One, the 
Casta-gies (the Chastisement of the Jealous Man), is a treatment, not 
easily misunderstood, of the best-known of the Greek stories of 
the husband who, in order to entrap his wife, loses his 
heart in the disguise of the lover whom she is expecting and receives 
bonds intended, as he thinks, for him whose part he is playing; 
that is, the supposed lover becomes the lover of the woman 
for love, departing considerably from the subjects usually treated 
in the novels. Mention may also be made of the novel of The 
Parol by Arnaud de Carcassonne, in which the principal character 
is a knight, to whose misfortunes and adventures the author 
morally in securing the success of the amorous enterprises of his 
master. Novels came to be extended to the proportions of a long 
romance, the Flamenca, which belongs to the novel type, has 
still over eight thousand lines. We may quote as another example of 
Plautus, succeeds in eluding the vigilance of her jealous husband. 
No analysis can be given here of a work the action of which is 
highly complicated; suffice it to remark that there is no book in medieval 
romance literature which shows so well the art of inserting two 
prose, or even to the end of the 13th. The oldest appears to be the Mystery 
of St Agnes (edited by Bartsch, 1866), written in Arles. Somewhat 
more recent, but not later than the beginning of the 14th century, 
is the Passion of Christ, which here and there is clearly 
derived from the latin, and which in its present state, consisting 
of the Virgin, which is partly adapted from a French poem of the 
doth century, (see Romania xvi. 71). A manuscript, discovered 
in private archives (printed by Jeanney and Millet, in 1870), 
consists of three records founded on the Old Testament, 
and is in Italian, where in general 
the prose form has been adopted.

Didactic and Religious Poetry.—Compositions intended for 
instruction and for correction were less common in the literature 
of southern France as well as elsewhere, and, in spite of the enormous 
successes, sustained by Provençal literature, much of this kind still 
remains to be done. But it is seldom that such works have much originality 
or much literary value, and that is the reason why the writers were mainly to bring the teachings contained in Latin 
works within the reach of lay hearers or readers. Literary value 
was not of course excluded by the lack of novelty, but by 
the opportunity of the greater part of those who sought to 
write or edify, and attempted to substitute moral works for secular 
productions in favour with the people, were, with a few exceptions, 
persons of limited ability. It would be out of question to enumerate 
here all the didactic treatises, all the lives of saints, all the treatises 
of popular theology and morals, all the books of devotion, all the 
pietous canticles, composed in Provençal verse during the middle 
earth, and which were mainly designed to assist the lost. We refer 
Prades (early 13th century), a canon of Maguelonne, and at the same 
time a troubadour, has left a poem, the Aussis cazzados, which is 
the most important of the sources for the study of falconry. Raimon d'Avig-
donne, and as some have been of great interest, and in some cases, 
the end of the 13th century (Romania, xvi. 825). As to moral 
compositions, we have to recall the Boethius poem (unfortunately 
a mere fragment) already mentioned as one of the oldest documents 
of the period, and more than one other, of which we have a 
representation of the heroic idea, and which is an early (12th century?) metrical translation of the famous Disticha 
de moribus of Dionysius Cato (Romania, xxv. 98, and xxv. 445). 
More original are some compositions of an educational character, of which the 
most important is the De Virtutibus of Bernard of Manresa (early 13th century), a remarkable 
work of three thousand lines, which never developed into the enormous 
and of the love of St Bernard (12th century), Arnaud de Marceuil, 
and St Bernard of Manresa, both to be ascribed to the 14th century, 
are not for the present under the title of Romance, xxxi). We may mention also a poem on 
elenchus of the See Litterature, which is the title of the very 
important work, Les Enseignements de l'Apostle, by St Ignatius of 
the Jesuits, published in 1300 or shortly before.
Marseilles, 1858). The region comprised between the Rhone and the Var seems to have been particularly fond of representations of this sort and has contributed many examples to the literature in this style (see xxxvii. 400). At the close of the 15th and the beginning of the 16th centuries many mysteries were played in that part of Dauphine which, during the 12th century, had formed a part of Provence. Five mysteries of this district, composed and played somewhere about 1500 (the mysteries of St Eustace, of St Andrew, of St Pons, of SS Peter and Paul and of St Anthony of Vienna), have come down to us preserved for the most part in hand-writings (Barcelona, 1661, 8vo); for Italy, Cavedoni, Ricerche storiche intorno alla lingua provenzale (Modena, 1844, 8vo); A. Thomas, Francesco Barberino et la litterature provencale en Italie (Paris, 1853, 8vo); O. Schultz, Littérature provençale et le romanisme dans la littérature française (Barcelona, 1861, 8vo); for Italy, Cavedoni, Ricerche storiche intorno alla lingua provenzale (Modena, 1844, 8vo); A. Thomas, Francesco Barberino et la litterature provencale en Italie (Paris, 1853, 8vo); O. Schultz, Littérature provençale et le romanisme dans la littérature française (Barcelona, 1861, 8vo); for Italian Provençal Philology (1895). For the bibliography consult especially Bartsch, Grundzüge zur Geschichte der provenzalischen Literatur (Elberfeld, 1872, 8vo). For texts the reader may be referred to Raymondo de la Cava, Provençal (1816-1821, 6 vols. 8vo), and Lexicon romanum, oper et dict. la langue des troubadours, of which vol. I. (1838) is entirely taken up with texts; and Rochegude, Parnasse occitanien (Toulouse, 1819, 8vo). If the reader wishes for proofs of the antiquated character of the present day, he will find them in any reprint without amendment by Mahn, Die Werke der Troubadours in provenz. Sprache (Berlin, 1850, vol. i. 1846, ii. 1855-1864, iii. 1880; vol. iv. contains an edition of the Troubadour Guiraut Riquier, 1882).

As early as the 12th century we find in Languedoc sermons whose importance is more literature than literary (Sermones du XIV e siècle en vieux provençal, ed. by F. Armitage, Heilbronn, 1848). About the same time, in Limousin, were translated chapters xiii.-xvii. of St John of God (Bartels, Christiathemata provençale). Various translations of the New Testament and of some parts of the Old have been done in Languedoc and Provence during the 13th and 14th centuries (see S. Berger, "Les Biblles provencales et vaudoises," 1835; S. Berger, "Les Bibles provençales et catalanes," ibid. xix. 505). The Provençal prose rendering of some lives of saints made in the early part of the 13th century (see S. Berger, "Les Vies des 353; des saints de Provence," ed. by C. de la Fosse, 1864) is interesting from a purely linguistic than from a literary point of view. To the 13th century belong certain lives of the troubadours intended to be prefixed to, and to explain, their poems. Many of these lives are of 1250, when the old compositions of the troubadour poetry were compiled; and some are the work of the troubadour Hugh of Saint Cirq. Some were composed in the north of Italy, at a time when the troubadours found more favour east of the Alps, than in their own country of Provence. Documents of this kind are, in fact, to the Provençal literature of the 13th century what the Provençal poetry was to the literature of the 12th century; it is the only aspect of the poetry being little else than translations of the books of the Bible (especially the Psalter).
of some kind. In 1513 French poems were first admitted in the competitions, and under Louis XIV. (from 1670) these were alone held eligible. This unfair arrangement, by which some of the leading poets of northern France profited, held good till 1600, when the town very properly published a volume of its patronage to a new Escolet mondino; but very soon restored its support to the older institution, on learning that Provençal poetry was again to be encouraged. In the two centuries that followed the glorious medieval period we have a succession of works, chiefly of a didactic and edifying character, which scarcely belong to the realm of literature proper, but at least served to keep alive some kind of literary tradition. This dreary interval was relieved by a number of religious mystery plays, which, though dull to us, probably gave keen enjoyment to the people, and represent a more popular genre; the language, careless of the time, may be placed between the years 1450–1515. Not only did the literature deteriorate during this period, but dialects took the place of the uniform literary language employed by the troubadours, while the spoken tongue yielded more and more to French. In 1539 François I. forbade the use of Provençal in official documents—a fact that is worthy of note only as being significant in itself, not as an important factor in the decadence of Provençal letters.

On the contrary, just about this time there are signs of a revival. In 1565 the Gascon, Pey de Garros, translated the Psalms into his dialect, and the first poet to give a translation on the Provençal model (from the French) was Gabriel de Caraman (1493–1588), of Grasse, who, after studying at Aix, entered the royal armies, and was made a prisoner at Moulins in 1572. During his captivity he wrote poems inspired by real love of liberty and of his native country (Don-Don internal, 1584 or 1585). At Aix Bellaud subsequently became the centre of a literary circle which included most of the local celebrities; all of these paid their tribute to the poet’s memory in the edition of his works published by his uncle, Pierre Paul, himself the author of pieces of small value, included in the same volume (Lous Passatens, obras et rimos, &c., Marseilles, 1595). Even when Bellaud is wholly frivolous, and intent on worldly pleasures only, his work has interest as illustrating the literature, careless of the time, which may be placed between the years 1450–1515.

A writer very popular in Provence for the light-hearted productions of his youth was Claude Brueys (1570–1659), remarkable chiefly for comedies that deal largely with duped husbands (Jardin deys mous provensals, not published till 1628). There is a certain charm, too, in the comedies of Claude’s disciple, Gaspard Zerbin (La Perlo deys mous et comedies provensals, 1632); and those critics who have read the plays of Jean de Cabanes (1631–1712) and of Seguin (of Tarascon, c. 1649), still in MS., speak highly of them. The most consistently popular form of poetry in the south of France was always the rondeau. There has been no limit to the production of these; but very rarely does the author deserve special mention. An exception must be made in the case of Nicholas Saboly (1614–1675), who produced the best pieces of this class, both as regards beauty of language and the devotion they breathe. They have deservedly maintained their popularity to the present day. In Languedoc four poets have been cited as the best of the age—Goudelin, Michel, Sage and Bonnet. This is certainly so in the case of Pierre Goudelin (province Goudouli, 1570–1649), of Toulouse, the most distinguished name in south French literature between the period of the troubadours and that of Jasmin. He had a good classical education, traces of which appear in all his poetry, his language and his manner being always admirable, even where his matter is lacking in depth. He is often called "the Malherbe of the South," but resembles that writer only in form: his poetry, taken as a whole, has far more sap. Goudelin essayed and was successful in almost every short genre (Lou Ramedet Moundi, 1617, republished with additions till 1678), the piece of his which is most generally admired being the stanzas to Henri IV., though others will prefer him in his gayer moods. He enjoyed enormous popularity (extending to Spain and Italy), but never prostituted his art to cheap effects. His influence, especially but not exclusively in Provence, has been deep and lasting. The fame of Jean Michel, of Niômes, rests on the Embarras de la foire de Besauve, a poem of astonishing length, but dull in execution; the sonnet "La Foulie" (Las Foulies, 1659), was a man of loose morals, which are reflected in nearly all his works: his moments of genuine inspiration from other causes are rare. More worthy of being bracketed with Goudelin is the avocat Bonnet, author of the best among the open air plays that were annually performed at Béziers on Ascension Day: a number of these (dated 1616–1657) were subsequently collected, but none can compare with the opening one, Bonnet’s Ingemort de Páris. Another very charming poet is Nicolas Fizes, of Frontignan, whose vaudeville, the Opéra de Frongtignan (1670), dealing with a slight love intrigue, and an idyllic poem in the fountain of Frontignan, show a real poetic gift. A number of Toulouse poets, mostly lauréats of the Academy, may be termed followers of Goudelin: of these François Boudet deserves mention, who composed an ode, Le Trinfe de Moundi (1678), in honour of his native dialect. The classical revival that may be noted about this time is also generally ascribed to Goudelin’s influence. Its most distinguished representative was Jean de Valès, of Montech, who made excellent translations from Virgil and Persius, and wrote a brilliant burlesque of the former in the manner of Scarron (Virgile deguisat, 1648; only four books published). He also composed a pastoral idyll, which, though too long and inclined to obscenity, contains much tender description. The greatest of the pastoral poets was François de Cortete (1571–1655), of Prades, whose comedies, Ramounelet and Miraoumoune (published, unfortunately with alterations, by his son in 1684), are written with such true feeling and in so pure a style that they can be read with real pleasure. A comedy of his dealing with Sancho Panza in the palace of the Duke has been edited. It is difficult to understand the enormous popularity of Dausasse (1664–1727), of Quercy, who belonged to the working classes; he was patronized by the nobility in exchange for panegyrics. Gascony produced two typical works in the 17th century: Ader’s Gentilis gascoun (1610) and Tast oun. Jardins Sege, one of standards (1642). The former depicts a regular boasting Gascon who distinguishes himself in everything; while the latter is a plea in favour of the Gascon tongue, inspired by a genuine love of country. Gabriel Bedout (Parterre gascoun, 1642) is chiefly noted for his amorous soliarii, called forth by the sufferings he endured from a hardhearted mistress. Louis Baron (b. 1613), living peacefully in his native village of Pouyoubrih, celebrated it with great tenderness.

In the 18th century the number of authors is much larger, but the bulk of good work produced is not equally great in proportion. The priests are mainly responsible for the literary output of Languedoc. Claude Peyrot (1709–1795) one of them, celebrates his country with true rural spirit in the Printemps rouergat et Quatre sossos. But the chief of the band is the Abbé Favre (1727–1783), the prior of Celleneuve, whose Sermonau de mouss sisse, delivered by a drunken priest against intemperance, is a masterpiece. He also wrote a successful mock-heroic poem (Siège de Caderousse) travesties of Homer and Virgil, a prose novel depicting the country manners of the time (Histoire de Jean l’ont pris), and two comedies, which likewise give a vivid picture of the village life he knew so well. Two genuine poets are the brothers Rigaud of Montpellier: Auguste’s (1760–1835).
description of a vintage is deservedly famous; and Cyrille (1750–1824) produced an equally delightful poem in the Amours de Mounpèl. Pierre Hellies of Toulouse (d. 1724) a poet of the people, whose vivid life finds an echo in his works, has a certain rude charm, at times distantly recalling Villon. In the Province Toussaint Gros (1698–1749), of Lyons, holds undisputed sway. His style and language are admirable, but unfortunately was wasted his gifts largely on trivial pièces d’occasion. Coye’s (1711–1777) comedy, the Fiancé parté, is bright and still popular, while Germain’s description of a visit paid by the ancient gods to Marseilles (La Bouffée de Dieux, 1760) has considerable humour. In Gascony the greatest poet is Cyrrien Despourrins (1658–1735), whose pastoral idylls and mournful chansons, which he himself set to music, are imbued with tenderness and charm (most of them were collected at Pau, in 1828).

The Revolution produced a large body of literature, but nothing of lasting interest. However, it gave an impetus to thought in the south of France, as elsewhere; and there, as elsewhere, it called forth a spirit of independence that was all in favour of a literary revival. Scholars of the stamp of Raynouard (1761–1863), of Aix, occupied themselves with the brief investigations of the life of the cloister, and sprang up (the Provencal Bouli-Akasso, started by Désanat, and the bilingual Lou Tombourin et le menestrel, edited by Bellot, both in 1841); poets banded together and collected their pieces in volume form (thus, the nine troubaïers who published Lou Bouquet provençau in 1823). Much has been written about the précurseurs of Flibigrié, and critics are sorely at variance as to the writers that most deserve this appellation. We shall not go far wrong if we include in the list Hycanthe Morel (1739–1829), of Avignon, whose collection of poems, Lou Saboulet, has been republished by Mistral; Louis Aubanel (1758–1842), of Nimes, the successful translator of Anacreon’s Odes; Auguste Tandet, “the troubadour of Montpellier,” who wrote Fables, contes et autres pièces en vers (1800); Fabre d’Olivet (1767–1829), the versatil litératuore who in 1803 published Le Troubadour: Poésies occitaniques, which, in order to secure their success, he gave out as the work of some medieval poet Dioulouet (1771–1840), who wrote a didactic poem, in the manner of Virgil, relating to silk-worm-breeding (Les magnans); Jacques Azais (1778–1850), author of satires, fables, &c., D’Astrous (1780–1863), a writer of fables in Lofaineante’s manner; Castil-Blaze (1784–1859), who found time, amidst his musical pursuits, to compose Provencal poems, intended to be set to music; the Manus de Febre-Afais (1790–1860), who wrote some light satirical tales (Les Castagnados). While these writers were all more or less academic, and appealed to the cultured few, four poets of the people addressed a far wider public: Verdité (1779–1820), of Bordeaux, who wrote comic and satirical pieces; Jean Rebouti (1790–1864), the baker of Nimes, who never surpassed his first effort, L’Ange et l’enfant (1828); Victor Gelu (1806–1885), relentless and brutal, but undeniably powerful of his kind (Fenien et Gremman; dix chansons provençales, 1840); and, greatest of them all, the true and acknowledged forerunner of the fédères, Jacques Jasmin (1790–1864), the hairdresser of Arles, who composed lyrical poems, and sprang to fame, but not without the favour with men of the highest culture and literary attainments, as with the villagers for whom they were primarily intended.

While much of this literature was still in the making, an event took place which was destined to eclipse in importance any that had gone before. In 1845 Joseph Roumanille (1818–1861), a gardener’s son, of Saint-Remy (Bouches-du-Rhône), became usher in a small school at Avignon, which was attended by Frédéric Mistral (q.v.), a native of the same district, then fifteen years of age. The former, feeling the germs of poetry within him, had composed some pieces in French; but, finding that his old mother could not understand them, he was greatly distressed.

1 One of his chief titles to fame is that, together with Alphonse Dumas, he drew the attention of Lamartine to Mistral’s Mirée. Roumanille and Mistral showed their gratitude by republishing the best pieces of these two précurseurs, together with those of Castil-Blaze and others, in Un Liane de Rasin (1869).

and determined therefore to write in his native dialect only. These poems revealed a new world to young Mistral, and spurred him on to the resolve that became the one purpose of his life—de remettre en lumière et conscience de sa gloire cette noble race qu’en plein ’89 Mirabeau nomme encore la nation provençale. There is no doubt that Mistral’s is the more puissant personality, and that his finest work towers above that of his fellows; but in studying the Provencal renaissance, Roumanille’s great claims should not be overlooked, and they have never been put forward with more force than by Mistral himself (in the preface to his Œuvres d’or) of Roumanille’s secular verse cannot fail to appeal to every lover of pure and sincere poetry (Li Margaridès, 1836–1847; Li Soufjarel, 1852; Li Flour de Sawi, 1850–1859, &c.), his noëls are second only to those of Saboly, his prose works (such as Lou mege de Cucugnan, 1863) sparkling with delightful humour. He it was who in 1852 collected and published Li Provencalo, an anthology in which all the names yet to become famous, and most of those famous already (such as Jasmin), are represented. In 1853 he was one of the enthusiastic circle that had gathered round J. B. Gaut at Aix, and whose literary output is contained in the Roumavago de Trous- des, which it was the aged infirm Mistral’s ambition to compile. At the same time the first attempt at regulating the orthography of Provencal was made by him (in the introduction to his play, Le Part dou bon Dieu, 1853). And in 1854 he was one of the seven poets who, on the 21st of May, foregathered at the castle of Fontésiguene, near Avignon, and founded the Fédères. [The etymology of this word has given rise to much speculation: the one thing certain about the word is that Mistral came across it in an old Provencal poem, which tells how the Virgin meets Jesus in the Temple, among the seven fidéres of the law. The outlines of the constitution, as finally settled in 1876, are as follows: The region of the Fédères is divided into four maintenence (Provenç, Languedoc, Aquitaine, and Catalonia). At the head of all is a consistori de fidéres (called majouroun), presides over by the Capodulè, who is chief of the entire Fédères. The head of each maintenence is called sendj (who is at the same time a majouroun); and at the head of each “school” (as the subdivisions of the maintenence are called) is a cabidassou. The ordinary members, unlimited in number, are maintenéres. Annual meetings and fidés are organized. The most widely read of the Fédères publications is the Armanca provençau, which has appeared annually since 1855, maintaining all the while its original scope and purpose; and though unpretentious in form, it remains the truest expression of the present outlook on the school.] The other five were Mistral, Aubanel, A.Mathieu (a schoolfellow of Mistral’s at Avignon), E. Garcin, A. Tavan and P. Giera (owner of the castle). Of these, Théodore Aubanel (1825–1886, of Avignon, son of a printer and following the same calling) has alone proved himself worthy to rank with Mistral and Roumanille. “Zani,” the girl of his youthful and passionate love, took the veil; and this event cast a shadow over his whole life, and determined the character of all his poetry (Lou miògrono entre-duberte, 1860; Li Fio d’Avignoun, 1883). His is, without a doubt, the deepest nature and temperament among the fédères, and his lyrics are the most true, the most womanly, the most musical, of all. He has a keen sense of play (not the bad kind), a keen sense of beauty in a woman, and his verse is replete with suppressed passion, but he never sinks to sensuality. His powerful love drama Lou pouz peccat was received with enthusiasm at Montpellier in 1858, and successfully produced (some years later in Arène’s version) by Antoine at his Théâtre Libre—no mean criterion. It is the only play of real consequence that the school has yet produced.

We need not do more than glance at the work of the fourth of the group of poets who alone, amidst the numerous writers of lyrics and other works that attain a high level of excellence. 1 One of the most pleasing features of the movement is the spirit of fraternity maintained by the fédères with the poets and literary men of northern France, Spain, Italy, Rumania, Germany and other countries.

1 In common with so many other productions of the Fédères, this Almanac is published by the firm J. Roumanille, Libraire, Editour, Avignon.
appeal to us to have so far secured permanent fame by the magnitude of their achievement. Félix Gras (1844–1891) settled at Avignon in his youth. His rustic epic, *Li Carabonné* (1876) is full of elemental passion and abounds in fine descriptions of scenery, but it lacks proportion. The heroic *geste* of *Tolosa* (1882), in which Simon de Montfort’s Invasion of the south is depicted with unbridled intensity, shows a broad ambition. *Li Romancero provençal* (1887) is a collection of poems instinct with Provençal lorc, and in *Li Papalino* (1891), we have some charming prose tales that bring to life again the Avignon of the popes. Finally, the poet gave us three tales dealing with the period of the Revolution (*Li Rouge dou mienjou, &c.*); their realism and literary art called forth general admiration.  

A few lines must suffice for some of the general aspects of the movement. It goes without saying that all is not perfect harmony; but, on the whole, the differences are differences of detail only, not of principle. While Mistral and many of the best félibres employ the dialect of the Bouches-du-Rhône, others, who have since seceded as the Félibrigè latiù (headed by Roque-Ferrier), prefer to use the dialect of Montpellier, owing to its central position. A third class favour the dialect of Limousin, as having been the literary vehicle of the troubadours; but their claim is of the slenderest, for the félibres are in no sense of the word the direct successors of the troubadours. Nearly all the leaders of the Félibregie are Legitimists and Catholics, their faith being the simple faith of the people, undisturbed by philosophic doubts. There are exceptions, however; chief among them the Protestant Gras, whose *Tolosa* clearly reflects his sympathies with the Huguenots. Yet this did not stand in the way of his election as *Capoulin*—a proof, if proof were needed, that literary merit outweighs all other considerations in this artistic body of men. Finally, it may be noted that the félibres have often been accused of lack of patriotism towards northern France, of schemes of decentralization, and other heresies; but none of these charges holds good. The spirit of the movement, as represented by its leaders, has never been expressed with greater terseness, force and truth than in the three verses set by Félix Gras at the head of his *Carabonné*: “I love my village more than thy village; I love my Provence more than thy province; I love France more than all.”

**PROVENCE**  

(Provence)  

A province in the south-east of ancient France, bounded on the N. by the Dauphiné, on the E. by the Rhône and Languedoc, on the W. by the Alps and Italy, and on the S. by the Mediterranean. The coast, originally inhabited by Ligurians, was from an early date the home of some Phoenician merchants. About 600 B.C., according to tradition, some traders from Phocaea founded the Greek colony of *Massalia* (Marseilles) and the colonists had great difficulty in resisting the Cavares and the Salyes, i.e. the Ligurian peoples in the vicinity. Other colonies in the neighbourhood, such as Antibes, Agde, Nice, originated in this settlement. During the wars which followed, the inhabitants of Massalia asked assistance from the Romans, who thus made their first entry into Gaul (125 B.C.), and, after a campaign which lasted several years under the direction of the pro-consul C. Sextius Calvinius, conquered the territories between the Alps, the sea and the Rhône (with the province of Narbonne on the right bank of this river). These lands formed the *Provincia romana*, and the name was retained by Provence. The town of Aix (Aquae Sextiae) was founded to form the capital of this conquered land. In consequence of the *Treaty of Gaug* of 853, and from that time onwards, a line of administrative reforms introduced by Augustus, the territory of the former *Provincia* was divided into the new provinces of Narbonensis II., of the Maritime Alps and of Viennois, but it still remained an important centre of Roman learning and civilization. Marseilles, which for some time had a prosperous Greek school, and also Aix now became of secondary importance, and Arles was made the chief town of the province, becoming after the capture of Trèves by the barbarians (A.D. 418) the capital of Gaul. Christianity spread fairly early into Provence, although the legend that this country was evangelized by Mary Magdalene and some of the apostles cannot be traced farther back than the 12th century. Trophimus established a church at Arles in the 3rd century, and during the two centuries which followed bishops were founded in all the cities of Provence. 

At the beginning of the 5th century, Provence was attacked by the Visigoths. In 425 the Visigothic king Theodoric I. was defeated by Aetius under the walls of Arles, but the part taken by the Goths in the election of the emperor Avitus did not put a stop to their attacks (459). In 480 Arles was captured by Euric I., and the southern part of Provence, i.e. the country south of the Durance, thus came definitely under Visigothic rule. The more northern cities, such as Orange, Apt, Trios-Château, &c., were again joined to the kingdom of Burgundy. Towards 510 Visigothic Provence was ceded to Theodeoric, king of the Italian Ostrogoths, by Alaric II. as a mark of his gratitude for the support given to him during the war against the Franks. In addition to this, about 523, the Ostrogoths took advantage of the wars between the Franks and the Burgundians to extend their lands in the north as far as Gap and Embrun. Vitiges, the king of the Ostrogoths, ceded Provence to the kings of the Franks about 537, when it was divided in a peculiar manner: the northern cities and those on the coast (Arles, Marseilles, Toulon, Antibes, Nice) were given back to Burgundy, whilst a narrow strip of territory with Avignon, Apt, Cavaillon, Riès, the county of Grasse, and part of Dauphine (502 east as far as the Alps, was added to the kingdom of Austrasia, and from that time onwards formed the fortunes of Auvergne, which, as is known, was generally dependent on Austrasia. Provence was united under one ruler during the reigns of Clotaire II. and Dagobert I., but at the death of the latter in 639 was divided again, only to be reunited under the successors of Dagobert II. (679). At this period the name of ‘Provence’ was restricted to the southern cities, which had passed from the Gothic to the Frankish rule; it did not regain its original significance and denote the country extending as far as Lyons till the end of the 8th and the beginning of the 9th centuries. 

At the beginning of the 8th century, some Arabs from Spain, who had crossed the Pyrenees and settled down in Septimania, attacked Provence, in 735 took the town of Arles and in 737 captured Avignon, thus becoming masters of one part of the country. Charles Martel who had already made two expeditions against them, in 736 and 737, with the help of the Lombards of Italy, succeeded in 739 in expelling them, and brought the country definitely under Frankish rule. Austrian counts were given authority in the cities, and under Charlemagne and Louis the Pious the history of Provence became incorporated with that of the rest of the empire. At the time of the partition of Verdun (843) Provence fell to the share of the emperor Lothair I., who joined the title to the Duchy of Ligurie in 853, for his youngest son, Charles. On the death of the latter in 863 his inheritance was divided between his two brothers, when Lothair II., king of Lotharingia, received the northern part, Lyons and Viennois, and to the other, the emperor Louis II., king of Italy, was given Provence. At his death in 875 Provence passed into the hands of Charles the Bald, and he entrusted
the government to his brother-in-law, Duke Boso, who, taking advantage of the struggles between the Frankish princes which followed the death of Charles the Bald, reconstituted the former kingdom of Charles, the son of Lothair, and in 879 was acknowledged as its sovereign at Mântelle in Viennois. This is the kingdom of Provence (Provence, Viennois, Lyonnais and Vivarais), sometimes, but improperly, called Cisjuran Burgundy.

Boso died in 887, having succeeded in maintaining his independence against the united Frankish princes. His widow Ermengarde, daughter of Louis II., with the assistance of the emperor Arnulf, had her son Louis acknowledged king at an assembly held at Valence in 890. Louis attempted to seize the crown of Italy in 900, and in 901 was even crowned emperor at Rome by Pope Benedict IV.; but in 905 he was surprised at Verona by his rival Berengar, who captured him, put out his eyes, and forced him to give up Italy and return to Provence; he lived here till his death, which, without leaving an illegitimate son, Charles Constantine. The principal figure in the country at this time was Hugo (Hugues) "of Arles," count, or duke, of Viennois and marquis of Provence, who had been king of Italy since 926. In order to retain possession of this country, he gave the kingdom of Louis the Blind to Rudolph II., king of Burgundy (q.v.), and thus the kingdom of Burgundy extended from the source of the Aar to the Mediterranean. But the sovereignty of Rudolph II. and his successors, Conrad (937-993) and Rudolph III. (993-1032), over Provence was almost purely nominal, and things were in much the same condition when, on the death of Rudolph III., the kingdom of Burgundy passed into the hands of the German kings, who now bore the title of kings of Arles, but very rarely exercised their authority in the country.

At the beginning of the 10th century Provence was in a state of complete disorganization, a result of the invasions of the Saracens, who, coming from Spain, took up their quarters in the neighbourhood of Fraxinetum (La Garde-Freinet in the department of Var) and ravaged the country pitilessly, the Christians being unable to oust them from their strongholds. All the real power was in the hands of the counts of the country. It is probable that from the 9th century several of the Provencal counties had united under one count, and that the county of Arles had the title of duke, or marquis, and exercised authority over the others. In the middle of the 10th century the countship of Provence was in the hands of a certain Boso, of unknown origin, who left it to his two sons William and Roubaud (Rotbold). These two profited by the commotion caused by the capture of the famous abbey of Cluny, St. Maiolus (Mayeul), in 973, who had fallen into the hands of the Saracens, and marched against the Mussulmans, definitely expelling them from Fraxinetum. About the same period the marquisate seems to have been re-established in favour of Count William, who died in 993, and from that time the descendants of the two brothers, having added to their title of marquis, ruled over the different counties of Provence, only one of them, however, bearing the title of marquis. The counts of Provence had, from about the middle of the 11th century, a tendency to add the name of their usual residence after their title, and thus the lordships, known later under the names of the counties of Arles (or more properly Provence), of Nice, and of Venaissin, grew up. Roubaud had one son named William, who died without children, about 1043, and one daughter, Emma, who married William, count of Toulouse, by whom she had a son, Pons (1040-1063), the father of Raymond of Burgundy passed into the hands of the German kings, who now bore the title of kings of Arles, but very rarely exercised their authority in the country.

At the beginning of the 12th century the various marriages of the Provencal heiresses, of whom mention has just been made, led to the land being divided up among the different branches of the ancient county family (1105, 1125 and 1149), and thus the countships of Provence, Venaissin and Forcalquier were definitely formed.

Under the command of Raymond of Saint-Gilles the Provençals took an important part in the first crusade, and the use of the term "Provençal" to denote the inhabitants of southern France, their language and their literature, seems to date from this period.

The history of the princes of the house of Barcelona, Raymond-Bérenger I. (1113-1131), Raymond-Bérenger II. (1131-1144) and Raymond-Bérenger III. (1144-1166), is full of accounts of their struggles with the powerful feudal house of Baux, which had extensive property in Provence; in 1146 one of the representatives of this house, Raymond, obtained from the emperor the investiture, though only in theory, of the whole countship of Provence. After the death of Raymond-Bérenger III., who was killed at the siege of Nice (1166), his cousin Alphonso II., king of Aragon, claimed his inheritance and took the title of count of Provence. But his succession was disputed by the count of Toulouse, Raymond V., a marriage having been previously arranged between Raymond-Bérenger's daughter and his son, and he himself hastening to marry the widow Richilde, niece of the emperor Frederick I. The majority of the lay and ecclesiastical lords of Provence recognized Alphonso, who in 1176 signed a treaty with his competitor, by which Raymond V. gave up his rights to the king of Aragon in consideration of a sum of money. Alphonso was represented in Provence by his brothers Raymond-Bérenger and Sancho in turn, and in 1193 by his son Alphonso, who succeeded him. This Alphonso gave Aragon and Catalonia to his brother Peter (Pedro), and kept only Provence for himself, but on the death of his father-in-law, Count William II., in 1208, whose son had been disinherited, he added to it the county of Forcalquier. He was able to protect Provence from the consequences of the war of the Albigenses, and it was not until after his death (1229), during the minority of his son Raymond-Bérenger IV., who succeeded him under the regency of his uncle, Peter of Aragon, and later of his mother Gertrude, that Provence was involved in the struggle of the count of Toulouse against Simon de Montfort, when the part played by the city of Avignon in the Albigensian movement finally led to Louis VIII.'s expedition against the town. William of Baux took advantage of the troubles caused by Raymond-Bérenger's minority to have the kingdom of Arles conferred upon himself by Frederick II.; this led, however, to no practical result. Raymond-Bérenger had also to fight against Raymond VII., count of Toulouse, the emperor having ceded to this latter in 1230 the countship of Forcalquier, and showed another mark of his favour in 1238, when, in consequence of some difficulties with the city of Arles, Raymond-Bérenger drove the imperial vicar from the town. The intervention of St Louis, who in 1234 had married Margaret, the eldest daughter of the count of Provence (the second, Eleanor, married Henry III. of England in 1236), put an end to the designs of the count of Toulouse. Raymond-Bérenger died in 1245, leaving a will by which he named as his heir his fourth daughter, Beatrice, who shortly afterwards, in 1246, married the celebrated Charles of Anjou (see CHARLES I., king of Naples), brother of the king of France. After her death, in 1267, Charles still maintained his rights in Provence. The countship of Venaissin was left to him by his sister-in-law, Jeanne, countess of Toulouse, but in 1272 King Philip the Bold took possession of it, giving it up in 1274 to Pope Gregory X., who had claimed it for the Roman Church in pursuance of the treaty of 1229 between Raymond VII. of Toulouse and St Louis. Almost all the time and energy of Charles of Anjou were taken up with expeditions and wars concerning the kingdom of Naples, which he had gained by his victories over Manfred and Conradin in 1266 and 1268. His government of Provence was marked by his struggles with the towns. The movement which resulted in the emancipation of these had its origin fairly far back. In the first part of the 12th century the towns of Provence, no
doubt following the example of those in Italy, began to form municipal administrations and consulates, independent of the viscounts, who in theory represented the authority of the count in the towns. This movement was occasionally interrupted by home disturbances, such as struggles against the civil and ecclesiastical authorities; nevertheless Marseilles, Arles, Tarascon, Avignon (whose consulate laws date from the 12th century), Brignoles and Grasse were self-governing and elected their magistrates, sometimes negotiating with the count, as a power with a power, and concluding political or commercial treaties without consulting him. The city of Nice, which was joined to Provence in 1176, had retained its freedom. This state of affairs was in direct opposition to the authoritative government of Charles of Anjou, who tried to bring back the most independent of these towns under his sway. In 1251 he seized Arles and Avignon and placed them under a régisseur (vicar) nominated by himself. In 1257 Marseilles was also subdued, and ministers nominated by the court performed their duties side by side with the municipal officials.

The successes of Charles of Anjou also showed great interest in maintaining their rights over the kingdom of Naples, and only occasionally do they appear in the history of Provence. Charles II (1285-1306), after failing in several attacks on the house of Aragon in southern Italy, lived in the country during the latter years of his reign as duke, and tried to reform some of the abuses which had grown up in the administration of justice and finance. Robert of Calabria (1300-1343), his son and successor, was forced to sustain a long siege in Genoa when he had been called by the Ghibelline party; a siege which cost a large number of lives to the Provençal navy. Robert was succeeded by his granddaughter Joanna, widow of Andrew of Hungary, who sold her rights over the city of Avignon to Pope Clement VI. in 1348, in order to raise funds to enable her to continue the struggle against the house of Aragon in her Neapolitan states. The political situation of the country was not much changed by Charles IV's residence in Provence, nor by the empty ceremony of his coronation as king of Arles (1365). Charles IV. gave up his rights, or his claims, to Louis, duke of Anjou, brother of Charles V, but the expedition which this prince made to take possession of Provence only resulted in the seizure of Tarascon, and failed before Arles (1369). Joanna had nominated as her heir Charles of Anjou-Gravina, duke of Duras, who had married her niece Margaret, but to provide herself with a protector from Louis of Hungary, who accused her of murdering her first husband Andrew and wished to dispute her right to the kingdom of Naples, she married again and became the wife of Otto of Brunswick. Charles of Duras, discontented with this marriage, took part against her, and she in her turn disinherited him and named Louis of Anjou as her eventual successor (1386). The duke of Anjou took possession of Provence, whilst Charles of Duras made the ministers prisoner at Naples and gave orders for her to be put to death (1382). Louis of Anjou also made an expedition to Naples, but did not arrive till after her death, and he died in 1384. His son Louis II. (1384-1447) banished the viscount of Turenne from Provence, because he had taken advantage of his sovereign's absence to ravage the country. He did not live in Provence till the last years of his life; in 1415 he established a parlement. The following year the country was devastated by a terrible plague. The wars carried on by his successor Louis III. (1417-34) against the kings of Aragon, his rivals at Naples, were the cause of the complete ruin of Marseilles by the Anjou. The town, however, regained its former state comparatively quickly. Although Louis III. had centred almost all his attention on the expeditions in Italy, he managed to secure the lands belonging to the house of Baux on the death of the last of the family, the Baroness Alix (1426). René, duke of Lorraine (g.t.), Louis' brother and successor, after an unsuccessful attack on Naples (1460-1461), went to live on his property in France, and after 1471 was principally in Provence, where he built the castle of Tarascon and interested himself in art, literature, and pastoral amusements. He left his territories to his nephew Charles, count of Maine, by his will in 1474. Louis XI., king of France, protested at first in the name of the rights of the Crown, and even seized René's dukedom. In consequence, however, of an interview between René and the king at Lyons, the former obtained a withdrawal of the seizure and ended his days peacefully in Provence (1480). The rights of his successor, Charles, were disputed by René II., duke of Lorraine, but, with the support of Louis XI., his attack on Provence was defeated. On the other hand, Louis had corrupted some of Charles's advisers, especially Palamède de Forbin, with the result that, at Charles's death in 1482, he left Provence to the king of France in his will. René of Lorraine protested in vain; Louis claimed the possession of the disputed territory, but Provence was not definitely annexed to France till 1486, under Charles VIII., and even then it preserved a certain individuality. In laws relating to the crown the sovereigns added to their title of king of France "and count of Provence and of Forcalquier," and Provence always preserved a separate administrative organization.

In the 16th century Provence took part in a war between France and the imperialists. The constable de Bourbon, who had received the investiture of Provence from the emperor Charles V, crossed the Var in 1524 with an army, but was defeated at Marseilles. The expedition under Charles V. and the duke of Savoy in 1536 had no more definite result than the coronation of the emperor at Aix as king of Arles. About the same time the first signs of the Reformation became evident in Provence, partly because of the influence of the Huguenots of the Cabrières and at Mérindol in the county of Venaisis. A sentence passed in 1540 by the parlement of Provence against these heretics was carried out with great severity in 1545 by the president d'Oppède and the baron de la Garde, who burned the villages and massacred the inhabitants. Protestantism did not take a great hold on Provence, but drew a fair number of followers from the ranks of the lesser nobles, who, with Paul de Mauvans at their head, began the struggle against the Catholics under the comte de Carcès. Charles IX.'s journey in Provence in 1567, followed by the establishment in the parliament at Aix of a court (chambre) in which Catholics and Protestants had an equal number of seats, led to a momentary cessation of hostilities. These were resumed between the Carcistes (Roman Catholics) and Rawats (Protestants), and again interrupted by the peace of 1576, which gave some guarantees to the Protestants, with La Seyne as a place of security, and also by the plague of 1579, which affected the whole country. The league, on the other hand, made rapid progress in Provence under the direction of the comte de Sault and Hubert de la Garde, seigneur of Vins, and the governors of Épernon and La Valette vainly tried to pacify the country. La Valette and the political party or Bigarrats were finally more or less reconciled to the Protestants, and, at the time of the death of Henry III., the struggle was no more than a question of district politics. Weakened by the division between the comtesse de Sault and the young comte de Carcès, the league applied to the duke of Savoy, who was besieging Marseilles. Carcès and the other heads of the league submitted one after the other to the new governor Lescuguières, who was succeeded by the duke of Guise in 1595, and in 1596 the religious wars in Provence were definitely ended by the capitulation of Marseilles.

During the reign of Henry IV. the country was comparatively peaceful; but under Richelieu the restriction of local freedom and the creation of new offices led to the insurrection of the Cocenceux (small bells, a name derived from their rallying sign), which Condé came to suppress in 1630-1631. At the time of the Fronde additional taxes were levied by the parlement at Aix, and the struggle began between the Cantets (Mazarins) and the Sabreurs (prince's party), who captured the governor, the comte d'Alais, for a short time. The duke of Mercœur calmed the country down. Louis XIV.'s tour in Provence (1660) was marked by an insurrection at Marseilles, which brought about the abolition of the last remaining municipal liberties of the town. Provence was severely tried by the
imperialist invasions of 1766 and 1746, and the great plague of 1720. Towards the end of the ancien régime the movement which resulted in the revolution of 1780 made itself felt in Provence, and was most apparent in the double election at Aix and at Marseilles of Mirabeau as deputy for the states-general.

The word viguerie, closely related to Roman law, has always been quite separate from the other French provinces. Theoretically it retained its provincial estates, the origin of which has been traced to the assemblages of the 12th century. They met annually, and included representatives of three orders: for the clergy, the archbishop of Aix, president ex officio of the estates, the other bishops of Provence, the abbots of St Victor at Marseilles, of Montmajour and of Thoronet; for the nobility, all the men of noble birth (gentilhommes) until 1623, when this privilege was restricted to actual holders of fiefs; for the third, the members of the twenty-two chief towns of the vigueries1 and fifteen other privileged places, among which were Arles and Marseilles. There were theoretically no taxes, but only supplies given freely by the estates and assessed by them. However, this assembly did not meet after 1639. The administrative divisions of Provence were constantly changing. In 1307 Charles II. divided it into two sénéchaussées, Aix and Forcalquier, comprising twenty-two vigueries. At the end of the ancien régime the government (gouvernement) of Provence, which corresponded to the généralité of Aix, was made up of eight sénéchaussées, those of Lower Provence—Aix, Arles, Marseilles, Brignoles, Héréres, Grasse, Draguignan, Toulon; and four of Upper Provence—Digne, Sisteron, Forcalquier, Castellane. From a judicial point of view the parlement of Aix had replaced the former conseil eminenc or cour souveraine. There was a chaîne des comptes at Aix, and also a cour des aides. A decree, dated the 22nd of December 1789, divided Provence into the three departments of Bouche du Rhône, Basses-Alpes and Var, and in 1793 Vaucluse, the former county (comitat) of Venaissin, which belonged to the pope, was added to these. The boundaries of the department of Var were modified in 1860 after the annexation, when the department of the Alpes Maritimes was formed.

AUTHORITIES.—There is no good general history of Provence. For a complete work consult the ancient works of H. Bouche, Choreographie et histoire chronologique de Provence (2 vols. in fol., Aix, 1664); Papon, Histoire générale de Provence (4 vols. in 4to, Paris, 1777-1780); L. Méry, Histoire de Provence (3 vols. in 8vo, Marseilles, 1830-1837). For special periods of history see F. Kiener, Verfassungsgeschichte der Provence, 510-1200 (8vo, Leipzig, 1900); R. Poupardin, Le Roi de Provence sous les Carolingiens (in 8vo, Paris, 1901); C. de Muyres, La Provence du xvi. siècle (in 8vo, Paris, 1907); Lambert, Essai sur le régime municipal et l'affranchissement des communes en Provence (in 8vo, Toulon, 1882); Les Guerres religieuses en Provence (2 vols. in 8vo, 1870); Cabasson, Essai sur l'histoire de la Provence (3 vols. in 8vo, Paris, 1826).

PROVERB (Lat. proverbium, from pro, forth, publicly, verbum; the Greek equivalent is παράφορα, from παρά, alongside, and ὁφος, road, i.e. a wayside saying; Ger. Sprichwort), a form of folk-literature, or its later imitation, expressing, in the form of a simple, homely sentence, a pungent criticism of life. Many definitions have been attempted of a "proverb," of which none has met with universal acceptance. J. Howell's (d. 1666) three essentials, "shortness, sense and salt," omit the chief characteristic, popularity or general acceptance, and the definition of Erasmus—Cælebritæ dictum acuta qualitate—suits the poetical rather than the proverb in general. Lord Russell’s "The wisdom of many and the wit of one" is familiar.

For a general survey of the subject of proverbs, Archbishop Trench's Proverbs and Their Lessons (new ed., 1905, by A. Smythe-Palmer, with additions and notes) is useful; it contains a fairly comprehensive bibliography, ancient and modern. Bohn's Hand-Book of Proverbs, and Polyglot of Foreign Proverbs (1854) has been

1 The viguerie was the jurisdiction of a viguer, i.e. "vicar," a name given at various times and places in the sound of France to very different feudal officials. The viguerie in the 17th and 18th centuries as an administrative subdivision in Provence corresponded to the prêvôt elsewhere.

PROVERBS, BOOK OF (Heb. Mishlé Shelomóh, "Proverbs of Solomon," abridged by the later Jews to Mishlé; Septuagint, παραφοράς ΙΙ. Σαλα; Lat. Vulg. Parabolae sal. et Liber proverbiorum), one of the Wisdom books of the Old Testament (see Wisdom Literature) and the principal representative in the Old Testament of gnomic thought. This sort of thought, which appears very early in Egypt (2000 B.C. or earlier), and relatively early among the Greeks (in the sayings of Thales and Solon as reported by Diogenes Laertius), was not confined among the Hebrews. Doubtless they, like other peoples, had their simple proverbs, embodying their general observations of life; a couple of these have been preserved in the Old Testament: "Is Saul also among the Prophets?" (1 Sam. x. 12); "The fathers eat sour grapes, and the children's teeth are set on edge" (Jer. xxvi. 20; Ezek. xviii. 2). It is possible that Solomon uttered or collected a number of such sayings, based in part on observation of the habits of beasts and plants (1 Kings iv. 32 seq.[Heb.v. 12 seq.]; cf. Jotham's apologue, Judg. ix. 8 seq., and Samson's riddle, Judg. xiv. 14). The Hebrew word mashal, commonly rendered "parable" or "proverb," is a pungent and elegiac poetry (as distinguished from the descriptive and the literary) of the form being that of the couplet with parallelism of clauses; in the Old Testament it signifies a folk-saying (Ezek. xii. 22, xviii. 2), an allegory (Ezek. xvii. 2), an enigmatical saying (Ezek. xxii. 6), a byword (Jer. xxiv. 9; Deut. xxvii. 37), a taunting speech (Isa. xiv. 4; Hab. ii. 6), a lament (Mic. ii. 4), a visional or apocalyptic discourse (Num. xxiii. 7; xxiv. 13), a didactic discourse (Ps. xxli. xlviii.), an argument or plea (Job xxix. 1). In the Book of Proverbs it is either an aphorism (x.-xxi.) or a discourse (i.-xxi. 29-35, xxvii. 32-37).

The uses of the term being so various, its special signification in any case must be determined by the character of the passage in which it occurs; and an examination of the contents of Proverbs shows that the thought of the book differs widely from that of the literature prior to the 5th century B.C. The book appears on its face to be a compilation, various authors being mentioned in the titles: Solomon in x. 1 and xxiv. 1; the "sages" in xxii. 17 and xxiv. 23; Agur in xxx. 2; the mother of King Lemuel in xxxi. 22; xxxi. 10-31 and, probably, xxx. 5-33 are anonymous; the ascription in i. 10 to Solomon may refer to i.-ix. or to the whole book. Apart from the titles (which are not authoritative) the difference of style in the various sections indicates difference of authorship. There is, indeed, a certain unity of thought in the book; throughout it inculcates cardinal social virtues, such as industry, thrift, discretion, truthfulness, honesty, chastity, and in general it assumes wisdom to be the guiding principle of life. But the sections differ in form and tone. While chs. x.-xxix. and part of xxx. consist of aphorisms chs. i.-ix., xxx. are composed of more or less elaborate discourses. In the aphoristic sections also there is variety; there are couplets (x.-xxii. 16; xxvii.-xxix.), quatrains (xxii.-xxiv.) and tetrads and other numerical arrangements (xxx. 7-33). Compilatory character is indicated by repetitions; there are identical lines (x. 1 and xxiv. 3; xi. 14 and xxiv. 6; xii. 9 and xiv. 20; xiv. 1 and xxiv. 3; xv. 18 and xxv. 22; xvii. 3 and xxv. 21; xix. 13 and xxvii. 15; xx. 22 and xxiv. 20; xxiii. 23 and xxvii. 21) and identical couplets (xxviii. 8 and xxvi. 22; xix. 1 and xxvii. 6; xiv. 24 and xxvii. 15; xx. 16 and xxvii. 13; xix. 9 and xxv. 34; xxvi. 3 and xxvii. 12).

The dates of the various parts of the book must be determined by the character of the contents, there being no decisive external data. The fact that it stands in the third division of the Hebrew Canon, the Writings or Hagographa, along with such late works as Job, Psalms, Chronicles, Daniel, Ecclesiastes and
Esther, must be allowed weight; the presumption is that the
arrangers of the Canonical book's regarded it as being in general
later than the Prophetic books. No help can be got from the
title. But the works ascribed in the Psalms
(to say nothing of Ecclesiastes and Wisdom of Solomon) makes
it evident that these have been added by late editors who were
governed by vague traditions or fanciful associations or caprice,
and there is no reason to suppose the titles in Proverbs to be
exceptions to the general rule. The ascription of parts of
Proverbs to Solomon (i. 1, x. 7, xxv. 1) means nothing for us
except that there was a disposition among the later Jews to
tell their books to great names of the past, Enoch, Daniel,
Job, Moses, David, Solomon, Ezra; as also, outside of Jewry,
works were ascribed to Homer, Plato, Aristotle, Tacitus and
others that were not composed by these authors. The position
of a Solomonic authorship for Proverbs is excluded by the
whole colouring of the book, in which monotheism and mono-
gramy are assumed, without discussion, to be generally accepted,
while in Solomon's time and by Solomon's self the worship of
many gods and the taking of more than one wife were freely
practised, without rebuke from priest or prophet. The high
ethical conception of the kingly office in Proverbs is out of
keeping with the despotical character of Solomon's government.
It is supposed, indeed, by some modern writers that the notice
in xxx. 1 ("These are proverbs of Solomon, that the men of
Hezekiah king of Judah transcribed") is too circumstantial
to be merely a late tradition or scribal gloss. But similarly
definite titles are prefixed elsewhere, for example, to Ps. ii.-ix.,
where they cannot possibly be correct. Hezekiah's time may
have been selected by the author of the title (or by the tradition
which he represents) as being the next greatest literary period
in Judah after Solomon, the time of Micah and Isaiah, or the selec-
tion may have been suggested by the military glory of the period
(the repulse of the Assyrian army) and by the fame of Hezekiah
as a pious monarch and a vigorous reformer of the national
religion. But to regard Hezekiah as a Jewish Priest-Ra was to
ascribe to the time a literary spirit of which the extant documents
give no hint; the literature of the age was wholly occupied with
the past history, the religious conditions and the political fortunes
of the nation, subjects alien to the book of Proverbs.
The objections to the Solomonic age as the time of origin of
the book apply also to the period extending from Solomon
through the 6th century. But there are considerations that
lead us to put its origin still later. One of these is the non-
national character of the thought. The historical and propheti-
cal books and the Pentateuch are wholly concerned with the
nation. For them Israel is the centre of the world, the point
around which all other things revolve—all other people
derives its claim to consideration from its relation to Israel—
that a subject deserving attention is the extent of the Jewish
nation's obedience or disobedience to its divinely given law, on
which depends its prosperity or its adversity. In Proverbs
there is a notable absence of this point of view. The name
Israel and the terms temple, prophet, priest, covenant, do not
occur in the book. The "vision" (that is, prophetic vision) in
the Hebrew text of xxix. 18 ("Where there is no vision, people
throw off restraint") is an error of text. No writer who was
acquainted with Hebrew history could suppose that there was
any relation between the national morality and the abundance
of prophetic visions; the period in which such visions were most
numerous is precisely that in which the corruption of morals is
painted by the prophets in the darkest colours and, on the other
hand, the people are said (in Ps. li. 18; lii. 1.) to be as
obedient at a time when there was no prophet. Moreover, this
reading supplies no antithesis in the couplet, the second line of
which is: "But he who obeys instruction (or law), happy is he";
we should expect the first line to read: "Where there is no
guidance people throw off restraint," as in x. 14: "Where there
is no guidance, a people falls, but in the multitude of counsellors
there is safety." Prophets play so great a part in the early
history that the ignoring of them here is significant. The deca-
dence of prophecy is indicated in two passages that belong
probably to the Greek period: in Zech. xiii. 2 sqq. prophecy is
identified with the "unclean spirit," the pretender to visions
is thrown with the Prophets (vii.), so generalised contempt for the class, protests that he is no prophet
but a tiller of the ground, accounting for the wounds on his
person (such as these charlatans used to inflict on themselves)
by declaring that they were received in the house of his friends
(that is, apparently, in a drunken quarrel); from a very different
point of view Joel ii. 28 sqq. (Heb. iii. 1 sqq.) predicts that in the
latter times (in the ideal restoration of the people) all persons,
feeble and bond, male and female, shall have the spirit of prophecy
—that is, the old order shall be set aside and a new religious
constitution established. Proverbs belongs to the time when
prophecy, as a helpful institution, had disappeared, and wisdom
had taken its place. So else the term law had here taken on its
new meaning. It is no longer the law of Moses or that of the
prophetic revelation—it is the standard of right-doing resident
in every man's mind, the creation of wise reflection; such a con-
ception lies outside the point of view that forms the very sub-
stance of Hebrew thought in the period prior to the 5th century.
It is true that the nationalistic tinge is found in late writings
(Chronicles, Psalms), and that its absence, therefore, is not
merely a matter of date; but it is hardly conceivable that an
author of any time before the 5th century could have ignored
the nationalistic point of view so completely as Proverbs does.
Another noteworthy feature of the book is the picture it gives
of social life. The organization of the family is treated much
more fully than in the Law and the Prophets, and has a more
modern aspect. In Deut. xxi. 18 sqq. (of the 7th century) a
disobedient son, complained of by his parents, is to be stoned
to death by the men of the city; in Proverbs (xiii. 14, xxii. 15,
xxii. 13 sqq., xxix. 15, 17) a bad child is to be chastised, and
much is said of the training of children by instruction. The
impression made by a number of passages (i. 8, xxii. 22 al.) is
that a regular system of family education existed, more definitely
ethical than that indicated in Deut. vi. 7, which merely enjoins
teaching children the details of the national law. In addition
to this parental instruction we find hints of a sort of academic
training, particularly in chs. i.-ix., in which the sage appears
to address a circle of youths. If we may credit the Talmudic
tract Pirke Aboth (ch. i.), Jewish academies under the charge
of great teachers existed early in the 2nd century B.C., and
the beginnings of such institutions may go back a century; they
would probably be suggested by the Greek schools of philosophy,
which early sprang up in Western Asia and Egypt under Alex-
ander's successors.

Monogamy, as is remarked above, is assumed in Proverbs to
be the recognized custom. Polygamy was legal and usual in
the 7th century (Deut. xxi. 13) and the 6th (Lev. xviii. 17, 18),
and doubtless continued to be practised some time after the
Jews, though on this point we have no definite information.
Herod, who was a despot, and was not a Jew, cannot be taken
as an illustration of Jewish custom; the obscure passage, Mal. ii.
10 sqq. (450-460 B.C.) may have monogamy in mind, but its
position on this point is not clear. What is certain is that the
definite assumption of monogamy is found only in such late
books as Ben-Sira (Ecclesiasticus), Tobit and Judith. In regard
to punishment for the violation of a husband's rights Proverbs
shows a marked advance on the old usage. The Pentateuchal
law (Lev. xx. 10) prescribes death as the punishment for adul-
tery; Proverbs (v. vi. 27 sqq., vii.) treats the offence as a sin
against the offender himself, an act of suicidal folly, the punish-
ment coming sometimes from the jealous husband, but chiefly
in the way of the physical deprivation and social ignominy that
befall the adulterer. This change of punishment imports not a
falling off in the moral standard but rather the conviction that a
crime of this sort is best dealt with by public opinion; in any
case it means a change in the constitution of society.

The experiences described in Proverbs belong especially to
city life. Something is said here and there bearing on agricul-
tural pursuits, and there is a paragraph (xxvii. 23 sqq.)—a little
treatise it may be called—enjoying on the landowner the
necessity of paying special attention to his cattle, large and small; these, says the writer, are the real sources of wealth to the rural landowner. Possibly he means to insist on the advantages of country life over life in the city; if this be so, the paragraph bears witness to the prominence of the latter. Whether or not this is his design, advice to cattle-owners is natural in a manual of conduct. The Jews were mainly country-folk from the time of their settlement in Canaan to their final expulsion from the land by Titus and Hadrian, and the soil of Israelitish Palestine was better adapted to the raising of sheep and oxen than to the production of grain. Doubtless much attention was paid to this industry, but the composition of a little book on the subject, indicating a scientific interest in boviculture, points to a comparatively late period; the Greek and Roman works of this sort, by Aristotle, Theophrastus, Virgil and others, were late. This little treatise stands almost alone in Proverbs; the great mass of its aphorisms relate to vices and faults which, though possible in any tolerably well-organized community, were specially prominent in the cities in which the Jews dwelt after the conquests of Alexander. They are malicious gossip, greed of money, giving security, nocturnal robbery, murder, unchastity. Much space is given to the last-named vice throughout the book, and especially in chs. i. and ix.—obviously it is regarded as a notorious social evil. Comparatively little is said of it in the Pentateuch and the prophetic and historical books. That there were harlots and adulteresses in Israel from an early time is shown by such passages as Judg. xi. (Jephthah’s mother), 1 Kings iii. 16 (the judgment of Solomon), Hos. iii. i. (Hosea’s wife), by the denunciations of the crime and the laws against it, and by the employment of the terms harlotry and adultery as designations of religious unfaithfulness. Yet, apart from the references to cultic prostitution (which was adopted by the Israelites from the Canaanites), the mention of the vice in question is not frequent; in a polygamous society and in a country without great cities it was not likely to grow to great proportions. The case was different when the Jews were dispersed through the new Greek kingdoms, and lived in cities like Jerusalem and Alexandria, centres of wealth and luxury, inhabited by mixed populations; this form of debauchery then became commoner and better organized. Hetaireia flocked to the cities. Naukratis in the Egyptian Delta was famous under the Ptolemies for its brilliant venal women. The temptations of Alexandria and the loose morals of the (latter part of the) 3rd century are illustrated by the story told by Josephus (Ant. xii. 4, 6) of Joseph the son of Tobias. The picture of society given in Ben-Sira (ix. 3–9, xix. 2, xxiii. 16–26, xxv. 16–26, xxvi. 8–12, xlii. 9–14), based on life in Jerusalem and Alexandria in the 2nd and 3rd centuries B.C. agrees in substance with the descriptions of the Book of Proverbs. The tone of these descriptions throughout the book, but particularly in chs. i.–ix., is modern. A point of interest is that the exhortations to chastity are addressed to men only; the man is regarded as the victim, the woman as the temptress—women are never warned against men or against the general seductions of society. This silence may be due in part to a current opinion that women were more hedged in and guarded by social arrangements and less exposed to temptation than men; but it is chiefly the result of the fact that the Old Testament (like most ancient and modern works on practical ethics) addresses itself exclusively to men (certain classes of women are denounced in Amos iv. 1–3; Isa. iii. 16–iv. 1; Ezek. xiii. 17–23); the moral independence of women is not distinctly recognized. In this regard Ecclesiasticus agrees with Proverbs—it has no word of advice for women. The temptress in Proverbs appears to be a married woman; she is certainly such in chs. vi. and vii. and probably also after the book. The term “strange woman” (li. 16 al.) means not a foreigner, but one who is alien to the man’s family circle, the wife of another man. Such women may sometimes have been foreigner, but the sage’s concern is with the man’s violation of the marriage obligation, be the woman Jew or Gentile. In the earlier time marriages between Jewish men and Canaanite women seem to have been not uncommon; whether (outside of Herod’s family) there were marriages with foreigners in the Greek period we have no means of determining.

Proverbs is remarkable for the attention it gives to kings. The prophets have nothing to say of them as a class. One passage in the Pentateuch (Deut. xvii. 9–20) describes that the Israelite king shall be the opposite of Solomon—he shall not accumulate horses, wives, silver and gold, and shall study the law. In the Psalter he is considered merely as a servant of Yahweh. Proverbs treats the king, in a quite modern way, as a member of society. He is described ideally as ruling by the might of wisdom (viii. 15, 16), and as controlled in his administration by truth, kindness and justice (xx. 8, 26, 28)—the wicked ruler who oppresses the poor is condemned as not reaching the ideal standard (xxviii. 3, 5, 16). Three manuals of conduct are devoted to him (xvi. 10–15, xxv. 2–7, xxxi. 2–9). His power is recognized—he is the source of life and death (xvi. 14, 15)—but he is treated as a human being who must be governed by the ordinary laws of right. It is especially illustrative of the times that instruction in table manners is offered to the guests of kings—they must be modest in their bearing, not putting themselves forward (xxv. 6, 7; cf. Luke xi. 1–8), and they must control their appetites (xxxiii. 1, 2). The reference here must be to the numerous non-Jewish kings of the Greek period, and perhaps also to the Maccabean princes; the manners of the time are set forth in Josephus’s account of Ptolemy’s dinner, at which the Jew Hyrcanus was a guest (Ant. xii. 4, 9). The mingling of despotism and good-natured familiarity there described (and the spirit is doubtless correctly given by Josephus, whether or not his details are historical) agrees with the picture in Proverbs.

Finally, a late date for Proverbs is indicated by what may be called its philosophical element—a feature that it has in common with the other Wisdom books (see Wisdom Literature). This element is recognizable throughout the book, but is most distinct in chs. i.–ix., in which wisdom is personified as the power regulating the affairs of human life (iii. 13–18, viii. 1–21). The portraiture approaches hypostatization in the cosmogonic odes (viii. 22–31), especially if the first line of v. 30 be rendered: “I was at his side as a master-workman”; but the Hebrew word (amon) rendered “master-workman” is of doubtful meaning, and the connexion rather calls for some such sense as “nurturing, wise”; Yahweh himself is as the architect and the true wisdom, the first of his works, is his companion, sporting in his presence like a beloved child. The whole passage (vv. 22–31) was early employed by Christian theologians (Irenaeus, Athanasius, Augustine and others) in the controversies respecting the nature of the Second Person of the Trinity, particularly in connexion with the idea of eternal generation; the argument turned in part on the question whether the verb in v. 22 was to be translated by “created” or by “possessed.” Ecclesiasticus xxiv. and Wisdom of Solomon vii. should be compared with the Proverbs odes. In the remainder of the book (chs. x.–xxxi.) “wisdom” is sometimes common sense or sagacity, sometimes the reflective habit of mind and largeness of outlook, sometimes the recognition of the ideal standard of living. Contrasted with the wise are fools, and on these the sages vent their scorn abundantly (xli. 15, 16, xvii. 12, xviii. 6, 7, xxiii. 9 al.); xxvi. 1, 3–12 is a “book of fools.” The conception of the good life is that of philosophically ordered rectitude. The religious element is prominent in x. 1–xxii. 16, but it is blended with the reflective. The philosophy of the book is practical, not speculative.

Comparison of Proverbs with Ecclesiasticus, Ecclesiastes and Wisdom of Solomon shows that it belongs, in its main features, in the same category as also these last. Its thought, differing so widely from that of the prophets and the Pentateuch, is most naturally referred to the period when the Jews came into intimate intellectual contact with the non-Semitic world, and particularly with the Greeks (philosophical influence is not to be looked for from Persia).

While the general period in which the book belongs may thus be determined with fair probability, it is less easy to fix the dates of its several parts. The earliest of the groups of which the book
is composed seems to be x. 1-xxii. 16, xxv-xcxix. which consists of simple aphorisms relating to everyday affairs. This group, however, is itself composite; we may distinguish a collection of antithetic couplets (x-xv. and most of xxviii., xxix.), and one made up of comparisons and single sentences (Philosophy: xxii. 16, xxv-xxix). The former, as in xvi., xxv., xxviii., xxix., is recognized both of the number of its simpler form, appears to be the earlier, though they cannot stand far apart in time; and by combining them an editor formed the section as we now have it. These may have been severely made from current collections, a number of which were probably in existence. A general preface exhorting the pupil to give heed to the instruction of the sages (xxii. 17-21), introduces a group of quatrains in two sub-groups (xxii. 22-xxiv. 22 and xxiv. 23-34) characterized by a wide range of thought and by ethical depth. Probably later than these are the elaborate discourses of i.-ix. (excluding vi. 1-5, 6-11, 12-19 and ix. 1-8), a form of the lower limit of the Book of Proverbs; allowing a century for the collection and combination of the various parts, we shall have the year 300 B.C. as the date of its earliest section. Somewhere in its material may have existed in aphoristic form before, but the composition of the present book may be put approximately in the century 300-200 B.C. Even its simplest maxims have a certain academic form.

In its general ethical code Proverbs represents the best standard of the times; the sages are at one with the more enlightened moralists of the Western world. All the ordinary social virtues such as filial piety, honesty, kindness, chastity are emphasized and a great stress is laid on care for the poor (a social necessity at a time when there were no well organized public charities). But Proverbs seems not to go the length of identifying righteousness with almsgiving, as is done in Dan. iv. 27 (24), Matt. v. 1, and substantially in Ecclus. iii. 30, xxix. 12 and Tobit iv. 10, xii. 9; in x. “righteousness delivers from death,” the word “righteousness” is probably to be taken in its ordinary ethical sense. The above-named virtues are all recognized in the earlier Hebrew writings, the prophets and the law, but in certain points Proverbs goes beyond these, notably in its prohibition of excision after a fallen enemy (xxv. 17) and of retaliation for injury received (xxv. 29), and in its recognition of kinship to enemies (xxv. 21). The injunction in Lev. xix. 18, “Thou shalt love thy neighbour as thyself,” refers only to Israelite fellow-citizens, not to enemies (cf. the interpretation given in Matt. v. 43), and the command in Exod. xxii. 4 seq., to care for one’s enemy’s ox or ass likewise refers to Israelites; Proverbs conceives the principle in a higher way and extends it beyond the limits of the nation. Slavery is recognized as a lawful institution, but little is said of it. There is no suggestion of moral training of the slave; he is to be taught not by words (xxix. 10) but by the rod, like the child (x. 15), and it is intimated (x. 21) that it is a mistake to bring up a servant delicately. This was doubtless the general view of the time; Ben-Sira frankly regards the servant as a chattel (Ecclus. xxxii. 24-31).

Proverbs greatly disapproves of the elevation of slaves to the position of rulers (xix. 10)—an occurrence not uncommon in those days. The estimate of woman as wife and mother, and especially as housewife, is high (xviii. 22, xix. 14, xxxi. 10-31). In vi. 20 the mother is spoken of, along with the father, as teacher of the children, and it is assumed, therefore, that she is competent; but nothing is said of the education of women—woman is good sense, practical sagacity in housekeeping. The equality of all men as creatures of God, silently assumed in the earlier literature, is definitely expressed in Proverbs (xxii. 2, cf. Job xxxiv. 19, Ecclus. xi. 14). Humility, as the avoidance of the false pride, is recognized as a virtue (viii. 12, xvi. 18)—it is a matter of estimate, assuming worth; refusal to claim too great honour for one’s self. In general it is the simple homely virtues that are enjoined on men in Proverbs—there is no mention of courage, fortitude, intellectual truthfulness, and no recognition of beauty as an element of life; the ethical type is Semitic, not Hellenic, and the sages emphasize only those qualities that seemed to them to be most effective in the struggle of life; their insistence on the practical, not the heroic, side of character is perhaps in part the consequence of the position of the Jewish people at that time, as also the silence respecting international ethics belongs to the thought of the times. The moral judgment of morals in the book is both external (the law of God) and internal (the conscience of man); these two are fused into one, and both go back ultimately to current customs and ideas. The motive assigned for right doing is individualistic utilitarian—the advantage accruing to the man either through the laws of society or through the rewards dispensed by God. This motive, which is the one assumed throughout the Old Testament, is effective for the mass of men, and becomes ethically high when the advantage had in view is of an elevated moral character. Proverbs does not offer the good of society as an aim of action, though it takes for granted that good conduct will accruing to the man either through the laws of society or through the rewards dispensed by God. This motive, which is the one assumed throughout the Old Testament, is effective for the mass of men, and becomes ethically high when the advantage had in view is of an elevated moral character. Proverbs does not offer the good of society as an aim of action, though it takes for granted that good conduct will.

BIBLIOGRAPHY.—The Hebrew text is discussed in all recent commentaries, see Jastrow, "A History of the Jewish People," 1889; Oort, ibid. (1885), and Text. hebr. emendationes (1890); Bickell, "Wiener Zeitschr. f. d. Kunde d. Morgenlandes" (1891); Chajes, "Proverb. Studien" (1886); Miller and Kautsch, in Haupt’s Sacred Books of the Old Testament (1901). The Greek versions are treated by de Lagarde, "Die Apokryphen" (1863); Baumgartner, "Etude critique" (1890). For the Syriac see Pinkus, "Zeitschr. f. Alliert. Wissenschaft" (1894). Compare also Nestle’s article “Bibelübersetzungen” in the third edition.
of Herzog-Haufe's Realeyclopedia. Among commentators and translators, one may be mentioned: Ewald (1885–1867); Neander (1852); Zöckler, in Lange's Bibelwerk (1866, Eng. trans., 1870); Delitzsch (1873, Eng. trans., 1875); Reuss, in La Bible (1876, Germ. ed., 1943); Nowack (revision of Bertheau in Kautzsch's Handwörterbuch, 1910); Zöckler's kurzgefasst (Comm. z. A.T. 1888, 2nd ed., 1890); Horton, in Expositor's Bible (1891); Wieland, in Marti's Kurz-Hand-Commentar, z. A.T. 1898; Toy, in Internat. crit. Comm. (1898); Kautzsch, Die heil. Schrift. d. A.T. (2nd ed., 1896); Oort, Het Oude Testament (1898–1900). See also Bois, La Poesie gnostique chez l'Heb. &c. (1886); Chabot, Jewish Science (1897); S. T. Kii, Studies (ed. Koniczny) (1897); id., Jev. (1897), vol. xiii; African—J. B. M. B. Haggith, in British & Foreign Bible Society (1882); Hindi: Monier-Williams, Indian Wisdom (1875); Arabic—Jacob, Allarab, Parallele z. A. T. (1897); Freilscher's ed. of Ali (1837); Freytag, Arabische Proverbs (1898). A general collection has been made by Malan, Orig. Notes on the Books of Proverbs (1893).

PROVIDENCE, the second largest city of New England, capital of Rhode Island, U.S.A., the county-seat of Providence county, and a port of entry, situated at the head of Providence river (the N. arm of Narragansett Bay) and at the influx of the Seekonk (or Blackstone), Moshassuck and Woonasquatucket rivers, about 35 m. from the Atlantic ocean, 45 m. by rail s.s.w. of Boston, and 188 m. E.N.E. of New York. Pop. (1890), 132,146; (1900), 175,597; (1905, state census), 198,635, of whom 65,745 were foreign-born, including 17,155 Irish, 12,114 Italians, 9,776 English, 8,222 Canadians, 8,056 Portuguese, 6,853 Russians, 3,347 Swedes, 2211 Germans, 2173 Portuguese (including some Bravas from the Cape Verde Islands), and 1930 Scotsmen. The figure for 1910 was 224,326. Providence is served by the New York, New Haven & Hartford railway and by steamboat lines to Newport, New York, Philadelphia, Baltimore and Norfolk. It extends over an area of more than 18 sq. m., and is irregularly laid out. The Seekonk and Providence rivers mark the eastern boundary, the Providence and Moshassuck rivers divide the middle and northern portion of the city into the east and west sides, and the Woonasquatucket river divides the west side into the northern and southern parts. The west side is a level or gently rolling plain only a few feet above the sea, but on the eastern side are a plateau and hills rising to a maximum height of about 200 ft. The larger and newer portion of the business district is along the western bank of the Providence, and some of the best business houses are on made land. The part of the city which has most historic interest is on the east side, where are the most attractive residences. Most of the manufactories are along the banks of the Woonasquatucket and Moshassuck. The names of streets—Pound, Sovereign, Skilling, Dollar, Doubloon, Benevolent, Benefit, Hope, Friendship, Peace, are, reflect the early commercial importance of the city and its strong Quaker element.

The principal building is the large State House, completed in 1802, of Georgia marble and white granite, surmounted by a central dome of marble, 235 ft. high, and standing on a rise of ground (Capitol Hill) about 3/4 of m. north by west of the steamboat landing at the head of Providence river; in the state chamber is a full length portrait of George Washington by Gilbert Stuart. The old State House on Benefit Street, on the east side, is now used as the 6th district (Providence and North Providence) court-house. Near the centre of the city (in Exchange Place) is the city-hall (1878), a handsome structure of granite; on its façade is a medallion of Roger Williams. Across Exchange Place from the city-hall is the Federal Building (1908), which houses the post-office, custom-house, U.S. courts, &c. The county court-house (1877) is the only other prominent government building. The Arcade (1828), 235 ft. long, with six massive Ionic columns at each entrance, the Butler Exchange, and a few other fine buildings fronting on Westminster Street are among the more prominent business buildings. In Cranston Street, between Waterloo and Dexter, is an Armory, with the largest hall in New England. A handsome public library building, opened in 1900, lying between Fountain, Greene and Washington Streets, houses a good collection of 140,000 vols. (in 1909); other libraries are the State Library (30,000 volumes), the State Law Library (50,000 volumes) in the Providence county court-house, the Providence Athenaeum (the Providence Library, founded in 1773, united in 1887 with the Providence Athenaeum, established in 1813; in 1909 it had 73,000 volumes), the library of the Rhode Island Historical Society (established 1822, with 30,000 volumes and 50,000 pamphlets in 1909), and the libraries of Brown University. The meeting-house of the First Baptist Church, founded by Roger Williams, the oldest organization of this sect in the United States, was built in 1775 and was designed to resemble St Martin's-in-the-Fields, London. Its bell still rings the curfew at nine o'clock every evening; and the commencements of Brown University are held here. The Friends' meeting-house, another interesting old building, was erected in 1759. The Beneficent Church (Congregational, 1800–1816) is in the Colonial style, with a rounded dome. The Church of the Blessed Sacrament (Roman Catholic) in Academy Street, was designed by John La Farge. The Roman Catholic Cathedral of SS. Peter and Paul (1878) is of brown stone and has excellent interior decorations. Providence is the see of a Protestant Episcopal bishop. In Cathedral Square is a statue (1898) by Henry Hudson Kitson of Thomas A. Doyle, mayor of the city (1856–1860, 1870–1884, and from 1884 until his death in 1886). There is an equestrian statue (1887) by Launt Thompson of General A. E. Burnside in City Hall Park. In front of the post-office are two allegorical groups ("Providence and Industry") by J. Massey Rhind. In the Providence Court, near Providence Park is a replica of Bartholdi's "Columbia," which was cast in silver by Providence metal workers for the Columbian Exposition in Chicago. Other statues are Hippolyte Hubert's Ebenizer Knight Dexter (erected 1894), George Thomas Brewster's bronze "Genius of Religious Liberty " on the dome of the State House, Franklin Simmons's Roger Williams (1877) in Roger Williams Park, a Hellenic bronze "Pancretasiat (1900, presented to the city by Paul Bajnotti of Turin) also in Roger Williams Park, and a Hellenistic statue of Augustus on the campus of Brown University. Two fountains also are worth mention: the Bajnotti Memorial Fountain in City Hall Park, a memorial to the wife of Paul Bajnotti, representing "The Struggle of Life " and designed by Enid Yandell; and the Eliza Dyer Memorial Fountain, a bronze athlete, by H. H. Kitson. There are art collections in Brown University and in the Annmary Brown Memorial (given to the city as a memorial to his wife, a daughter of Nicholas Brown, by Rush C. Hawkins, b. 1831). Among interesting old houses of the 18th century are the Admiral Hopkins House, in Hopkins Park, the Stephen Hopkins House (1742; 9 Hopkins St.), the John Carter Brown House (1791; 337 Benefit St.), and the John Brown House (1786; 52 Power St.). There are many colonial houses, red brick with marble trimmings, set well back from the street, with an occasional walled garden. There are many musical societies in Providence, including the Chopin Club (1879), the Arion Club (1880); the Einklang Singing Society (1890; German), the Verandhi Swedish Singing Society (1894), and the Providence Musical Association (1904). Other clubs are the Brown Union, University Club, a cricket and a polo club, golf clubs, yacht clubs and canoe clubs, the Handicraft Club, the Providence Art Club, the Hope Club and the Deutsche Gesellschaft.

Under the municipal park commissioners there are 33 public parks with a total area of 644.56 acres, and the city supports summer playgrounds; the state board of metropolitan park commissioners controls a large park system in the metropolitan park district, and a system of boulevards, connecting the several parks and other public reservations; there are nine metropolitan reservations, containing 677 acres, the largest being Lincoln Woods, of 460 acres, 4 m. north of the State House. Other metropolitan reservations are: Woonasquatucket Reservation (53 acres; 43 m. west of the State House); Edgewood Beach (2 m. south of the State House); and the Ten Mile River Reservation (100 acres; 43 m. north-east of the State House) on both sides of Ten Mile River. The finest municipal reservation is Roger
Williams Park (432 acres, of which 140 are water), with 9 m. of drives and boulevards, in the southern part of the city, 2 1/2 m. from downtown. It was part of the land given to the University of Rhode Island by Roger Williams by市县onomone; 107 acres were a farm which Betsy Williams (d. 1871), a lineal descendant of Roger Williams, left to the city by will. In the park are a chain of lakes with a shore front of 7 1/2 m., a boat-house, a casino, a roadway and athletic grounds, a municipal natural history museum, and the Betsy Williams Cottage (1775). Other municipal parks are: Neutonkananut (40 acres; 2 1/2 m. west of the State House) on high land commanding a view to the east and south; Davis Park (36 acres) with amusement grounds; Blackstone Park (43 acres, 1 1/2 m. east of the State House) along the Seekonk river; Hopkins Park (1 1/2 m. north of the State House), comprising the estate of Esek Hopkins (1718-1802), one of the original American Navy in the War of Independence, with a historical museum in the Admiral Hopkins House; and City Hall Park. Blackstone Boulevard is 14 m. long; and Pleasant Valley Parkway is 1 1/2 m. long. Enclosed by a railing near the eastern end of Power Street, on the bank of the Seekonk, is What Cheer Slate Rock, according to tradition the first landing place of Roger Williams.

In the North Burial Ground are the remains of Stephen Hopkins (1707-1785), a citizen of Providence, a delegate to the Albany convention of 1754, a colonial governor of Rhode Island (1755-1757, 1758-1762, 1763-1765, and 1767-1768), a member of the Continental Congress and a signer of the Declaration of Independence; of William Barton (1748-1831), who in the War of Independence captured General Richard Prescott near Newport on the 10th of July 1777; of Francis Wayland; and of Nicholas Brown, who was a patron of Brown University and one of the founders of the Providence Athenaeum and of the Butler Hospital for the Insane.

On the steep slope of College Hill (or Prospect Hill) in the east side near the business district, is Brown University (1764)—one of the eight colleges in the United States founded before 1776—closely connected with the history of Providence, Rhode Island, and the Baptist Church in America. It has an undergraduate department for men, with courses, largely elective, leading to the degrees of A.B. and Ph.B., and courses, almost wholly prescribed, in civil, mechanical and electrical engineering. It includes, besides “The Women's College in Brown University,” a separate college for women, and a graduate department open to both men and women. The campus is shaded by some fine old elms and is surrounded by an iron fence with beautiful memorial gates. In 1910 there were twenty-two buildings, including the following: University Hall (erected in 1770 and used during the War of Independence as barracks and hospital by American and French soldiers); Sayles Memorial Hall (1881), containing the college library and rooms; three library buildings, the John Hay Library (which occupies the site of the old President’s House), the old University Library (1878) and the John Carter Brown Library (1904); the Ladd Astronomical Observatory, with a 12-in. equatorial and much other valuable equipment; Rhode Island Hall (1840), containing a biological laboratory and a natural history museum; Manning Hall (1834), containing an art museum; Wilson Hall (1891), containing a physical and a psychological laboratory; Rogers Hall (1862), a chemical laboratory; an engineering building (1903); the Lyman gymnasium (1891) and Colgate Hoyt swimming pool (1904); an administration building (1902); the Sayles gymnasium (1906) for women; Rockefeller Hall (1903), occupied by the Brown Union, a students' organization and the Young Men's Christian Association; the residence halls: University Hall (1770, remodelled 1838), Hope College (1822 and 1891), Slater Hall (1879), Maxey Hall (1895), and Caswell Hall (1905); and the Carrie (clock) Tower, erected in 1904 by Paul Bajjottii, of Turin, Italy, as a memorial to his wife, Carrie Mathilde Brown, of Providence. Besides the general library, containing (1909) about 164,000 volumes, the university owns the separately housed John Carter Brown Library of 20,000 volumes, one of the best collections in the world of material on early American history (especially of books printed before 1800), which, with an endowment of $500,000, was presented to the university in 1901 in accordance with the will of John Nicholas Brown. Son of John Carter Brown (1797-1874) a prominent Providence merchant, who began the collection. In 1900 the university had an endowment fund of $3,416,744, 90 instructors and 903 students, of whom 88 were graduates; of the undergraduates 179 were enrolled in the Women's College. The charter of the institution requires that it shall be governed by a board of thirty-six trustees, of whom twenty-two shall be Baptists, five Friends, four Congregationalists, and five Episcopalians, and by twelve fellows (including the president) of whom eight (including the president) shall be Baptists, "and the rest indifferently of other denominations." The charter was considered extraordinarily liberal. Only two provisions are included regarding the character of instruction to be offered: first that "the public teaching shall in general respect the sciences," and second, that "into this liberal and catholic institution shall never be admitted any religious tests, but on the contrary all the members hereof shall forever enjoy full, free, absolute and uninterrupted liberty of conscience." The government has always been largely nonsectarian in spirit, and a movement was on foot in 1910 to abolish the denominational requirements for trustees and fellows.

Brown University, the first institution for higher education established in American Baptist territories, is located in Providence, although its charter was known for the first forty years as Rhode Island College. The Latin or preparatory school was opened at Warren in 1764 and the college was started there in 1766, but in 1770 the institution was removed to Providence. Although its work was interrupted by the War of Independence, the institution was reopened in 1782 and ten years later it began to receive aid from Nicholas Brown (1759-1841), a wealthy merchant who graduated from the Rhode Island College in 1786; it was named in his honour in 1804, and up to the time of his death his gifts amounted to about $160,000. Dr Francis Wayland, the most eminent of its presidents, began his administration in 1827 and in twenty-eight years of service as its head he established the elective system and greatly raised the standard of scholarship. Brown actually became a university under Elisha Benjamin Andrews, who was president in 1869-1868, who developed the graduate school and undergraduate instruction in history and social and political science, and who was succeeded in 1869 later by Herbert Perry Faunce (b. 1859), who graduated at Brown in 1880. In 1890 a new building was added to the endowment of the university. The Women's College was founded in 1891, and in 1897 it was accepted by the corporation and the name of the institution changed to Brown University. Among the trustees of Brown are Henry Wheaton (1785-1838), John Hay, Richard Olney, James Burrill Angell (b. 1829) Adoniram Judson, William Learned Marcy, Wilbur Fisk, Horace Mann, Samuel Gridley Howe, William Eliot, Edward Amory, Samuel Gridley Howe, Coates, Park Fisher, George Dana Boardman, Alexander Lyman Holley, and Albert Hardness.

In Providence are the Rhode Island Normal School (in the north part of the city, in Gaspee St.; established in 1854; discontinued in 1857; re-established in 1871), which has a fine building (1898), the Rhode Island Institute for the Deaf (1876), and the Rhode Island School of Design (1877; partially supported by the state, since 1882, and by the city), affiliated with Brown University. The following secondary schools are in the city: four high schools, one of which is technical, La Salle Academy (1871; Roman Catholic, under the Brothers of the Christian Schools (S.S.C., Roman Catholic), the Academy of the Sacred Heart (Roman Catholic), Moses Brown School (Friends; at Portsmouth in 1784-1788; re-established in Providence in 1814), the Brown School for boys (non-sectarian), Fielden-Chace school for girls (non-sectarian), and the Lincoln School (non-sectarian). The public school system has benefited by the presence of Brown University, whose faculty has been largely represented on the school committee; by an agreement with the university its professor of the theory and practice of education is director of the training department in the high schools, and there are other schemes of co-operation. Transition classes between the kindergarten and primary were

So called because Roger Williams was greeted here by Indians, who said "What cheer, Netop?" ("Netop" meaning friend.
long peculiar to the Providence public schools. In 1908 a "Sunshine School" was established, with sun and fresh-air treatment for invalid pupils.

The Providence Journal (Independent, daily, 1829), the most important newspaper published in the state, and the Evening Bulletin (Independent, 1859) are controlled by the same company.

The charitable institutions include the Rhode Island Hospital (1863, private), the Prisoners' Aid Association (1872), the Providence Rescue Home and Mission (1860), the Bethany Home of Rhode Island (1867), a foundling home for women, the Home of the Good Shepherd (1904), the Lying-In Hospital (1884), Saint Joseph's Hospital (1892; Sisters of St Francis), two dispensaries, a City Hospital for the Treatment of Contagious Diseases (1890) on Capitol Hill; the Home for the Aged and Infirm, which is one of the oldest institutions of its kind in the country, was established by a bequest of $30,000 left in 1841 by Nicholas Brown, and has about 120 acres of beautiful grounds on the western bank of the Seekonk; the Dexter Asylum for the Poor (endowed by the Dexter Fund and limited to those who have a legal settlement in Providence, i.e. have paid taxes on $200 worth of property for five years; and hence a charity of little practical use); a home for aged men (1875); a home for aged women (1896), St Elizabeth's Home (1882, Protestant Episcopal) for incurable and convalescent women; a home for aged coloured women (1890), five temporary homes, the Rhode Island Cottage Home (1851; Sisters of Mercy), Paul's Infant Asylum (1892, Sisters of Divine Providence), St Mary's Orphanage (1873, Protestant Episcopal), the State Home and School for the Feeble-minded, and the Children's Home and Children's Friend Society (1835), other homes for children, day nurseries, and the Providence Society for organizing charity (1892). Jewish charities are prominent. The St Vincent de Paul Society is active in the representation of the Roman Catholic church.

The harbour of Providence and its approaches have been much improved since the middle of the 19th century by the Federal and state governments. Between 1853 and 1873 the low-water depth of the channel was increased from 45 ft. to 12 ft., at a cost of $59,000; from 1878 to 1895 the depth of the channel was further increased to 25 ft., and anchorage basins were created with a minimum depth of 20 ft. for a width of 600 ft., with a minimum depth of 18 ft. for a width of 750 ft., with a minimum depth of 12 ft. for a width of 450 ft., and with a minimum depth of 6 ft. for a width of 600 ft. Between 1896 and 1906 the channel from Sassafras Point to the ocean was widened to 400 ft. and by 1909 the anchorage area, having a depth of 25 ft., was further increased to about 280 acres. Between 1867 and 1909 the channel of the Seekonk river was dredged to a depth of 16 ft. as far as Pawtucket at the head of navigation. In 1908 the commerce, largely coastwise, of Providence Harbor, amounted to 3,379,594 tons, chiefly coal, general merchandise and fish, valued at $35,909,495. In 1909 the value of the foreign imports, chiefly salt from Turks Island and lumber from Nova Scotia, amounted to $1,893,551, and the value of the exports to $12,517. Of greater importance to Providence than its commerce are its manufactures, the value of which in 1905 was $91,980,963, or 16.9% more than in 1900. Its factory products were valued at 45.5% of the state's total; its wage earners were 40.9% of the state's total; and nearly one-half of the worsted goods and more than one-fourth of all the textiles made in the state were manufactured here, as were four-fifths of the rubber and elastic goods, nine-tenths of the foundry and machine-shop products, and all the gold and silver refined, not from the ore. The Gorham Company engage here in the manufacture of gold, silver and bronze works of art; the American Screw Company, the Brown & Sharpe Manufacturing Company, and the Nicholson File Company have factories here; and here the famous Corliss engines were first made about 1847. In 1905 Rhode Island was seventh among the states in the value of its jewelry and metal products, which was $45,909,594, of which more than one-half was the production of Providence. The jewelry factories netted the city a share of the large foreign trade, which, in 1905, was valued at $53,332,264. Actually the largest industry in 1905 was the manufacture of worsted goods, valued at $41,020,892. Other important manufactures are the production of paper, office supplies, textiles, coal, iron and steel, and non-ferrous metals.

Providence is governed by a city charter of 1832, subsequently amended. A town meeting is still held annually for the administration of the fund (referred to above) called the Dexter donation. Under the city charter only citizens who pay a tax on $134 worth of real property or $200 worth of personal property may vote for members of the city council. Until 1842 there was the further requirement that every voter should be the eldest son of a freeholder. The city council is composed of: a board of aldermen, one from each of the ten wards, which may redistrict the city every five years, and until 1893 acted as a returning board, and which is presided over by the mayor; and a common council of four members from each ward, elected in open ward-meeting by the qualified freeholders of the ward. Elections are annual. The aldermen and common council meet together to organize and to elect municipal officers, not otherwise provided for. The greater size of the common council gives it the power in joint sessions; and although the vote of the city for mayor is normally Democratic, the vote of the qualified freeholders (which is only about 40% of the total vote) for common-councillors and aldermen is always Republican.

The two houses acted before 1805 as a board of registration; the council now chooses a board of three members with terms of three years. The city council and a school committee of 33 members (3 ex officio; 30 elected by wards, one each year from each ward for a three-year term) control the public schools. The mayor has had the veto power only since 1854; and until 1866 his veto could be overridden by a majority vote; a three-fifths vote of each chamber is now necessary. The mayor was at the head of the police department until 1901, when a commission of three was created; until 1906 these police commissioners were appointed by the governor of the state, but they are now chosen by the mayor with the approval of the board of aldermen. In the same way the mayor appoints a commissioner of public works for a term of three years. The three commissioners of the fire department and the three members of the board for the assessment of taxes are chosen by the city council. The city treasurer (since 1858) and the overseer of the poor and the harbour-master (since 1866) are elected by popular vote. The municipality owns and operates the waterworks and there are municipal bath-houses.

Providence was founded in 1636 by Roger Williams, an exile from Massachusetts, and its early history is closely bound up with the early history of Rhode Island, its being one of the four towns out of which this commonwealth was formed. Having agreed with Canonico and Miantonomo, the Narraganset sachems, for the purchase of a considerable tract of land, Williams built his house about 50 ft. east of what is now North Main Street and nearly opposite the confluence of the Moshassuck and Woonasquatucket rivers, and he named the place Providence in recognition of his divine guidance hither. He and a few companions who had accompanied him into exile immediately established a town government with monthly town meetings, and in the next year, 1637, after the arrival of a few more settlers, a plantation covenant was adopted which laid the basis of the future commonwealth on a new principle—the complete separation of church and state. Providence was incorporated in 1727 by the charter uniting Aquidneck, (Portsmouth), and Newport, as "The Incorporation of Providence Plantations in the Narraganset Bay in New England," these three towns (and Warwick) organized in Providence in May 1647 under this government. The charter of the 24th of November 1663 to the Governor and Company of the English Colony of Rhode Island and Providence Plantations, perpetuated the name Providence Plantations, which still remains a part of the legal title of the state. Providence was incorporated as a town by
the Colonial Assembly in 1649; in 1730-1731, when the area of Providence was 370 sq. m., Scituate (including Foster), Glocester (including Burrillville), and Smithfield (including North Smithfield and Lincoln) were set off; in the next thirty years the area of the township was reduced to 25 sq. m. by the annexation of Cranston, Johnston and North Providence, parts of which have been re-annexed since 1860. Providence was chartered as a city in 1834. During King Philip's War, in 1676, the town was attacked by Indians and the northern half was burned. In June 1772, a British schooner, the "Gaspee," while chasing a Providence packet-boat ran aground at what has since become known as Gaspee Point, whereupon its capture was planned by John Brown (1736-1785), a Providence merchant, and the plan—the burning of the vessel—was carried out under the command of Abrahm Whipple (1753-1819). During the war much privateering was carried on from Providence. The British occupation of Newport during the War of Independence caused the transfer of the important foreign commerce of that city to Providence, but as a consequence of their superior railway facilities most of this went to New York and Boston before the middle of the 19th century. In September 1815 Providence was visited by a gale which did about $1,000,000 damage to its shipping and other property. In 1830 Providence had ceased to be a great port and had begun to be a textile manufacturing place. Until 1900 Providence was one of the two capitals of the state, Newport being the other; since 1900 it has been the sole capital.
