Superintendent of North Star Mining Company, California.

A. E. G.* REV. ALFRED ERNEST GARYE, M.A., D.D.  
Principal of New College, Hampstead. Member of the Board of Theology and the Board of Philosophy, London University. Author of Studies in the Inner Life of Jesus; &c.

A. E. H. A. E. HOUGHTON.  

A. E. S. ARTHUR EVERETT SHIPLEY, M.A., D.Sc., F.R.S.  

A. G. MAJOR ARTHUR GEORGE FREDERICK GRIFFITHS (d. 1908).  
H.M. Inspector of Prisons, 1878-1896. Author of The Chronicles of Newgate; Secrets of the Prison House; &c.

A. Ha. ADOLF HARNACK, PH.D.  
See the biographical article: Harnack, Adolf.

A. J. G. REV. ALEXANDER JAMES GRIEVE, M.A., B.D.  
Professor of New Testament and Church History, Yorkshire United Independent College, Bradford. Sometime Registrar of Madras University, and Member of Mysore Educational Service.

A. L. ANDREW LANG.  
See the biographical article: Lang, Andrew.

A. McA. ALEXANDER MCAFALAY, M.A.  
Professor of Mathematics and Physics, University of Tasmania. Author of Utility of Quaternions in Physics; &c.

A. M. Cl. AGNES MURIEL CLAY (Mrs Edward White).  
Formerly Resident Tutor of Lady Margaret Hall, Oxford. Joint-author of Sources of Roman History, 133-70 B.C.

A. N. ALFRED NEWTON, F.R.S.  
See the biographical article: Newton, Alfred.

1 A complete list, showing all individual contributors, appears in the final volume.
A. S. P.-P.  
Andrew Seth Pringle-Pattison, M.A., LL.D., D.C.L.  
Professor of Logic and Metaphysics in the University of Edinburgh. Gifford Lecturer in the University of Aberdeen, 1911. Fellow of the British Academy. Author of Man’s Place in the Cosmos; The Philosophical Radicals; &c.

A. S. Wo.  
Arthur Smith Woodward, LL.D., F.R.S.  
Keeper of Geology, Natural History Museum, South Kensington. Secretary of the Geological Society of London.

A. T. H.  
Arthur Twining Hadley, LL.D.  
See the biographical article: Hadley, Arthur Twining.

A. W. Po.  
Alfred William Pollard, M.A.  

A. W. R.  
Alexander Wood Renton, M.A., LL.B.  

B. B. A.  
Braman Blanchard Adams.  
Associate Editor of the Railway Age Gazette, New York.

C. B.*  
Charles Bémont, D.Litt.  
See the biographical article: Bémont, C.

C. E. W.  
Major-General, Royal Engineers. Served in Indian Mutiny, 1857–1860; Egyptian Expedition, 1889; &c. Founder (with late Sir Francis Bolton) and Past President of the Institute of Electrical Engineers.

C. F. A.  
Charles Francis Atkinson.  
Formerly Scholar of Queen’s College, Oxford. Captain, 1st City of London (Royal Fusiliers). Author of The Wilderness and Cold Harbour.

C. G. Cr.  
Charles George Crump, M.A.  

C. Hi.  
Charles Hiatt.  
Author of Picture Posters; &c.

C. H. Ha.  
Carlton Huntley Hayes, A.M., Ph.D.  
Assistant Professor of History in Columbia University. New York City. Member of the American Historical Association.

C. H. T.*  
Crawford Howell Toy, A.M., LL.D.  
See the biographical article: Toy, Crawford Howell.

C. R. B.  
Professor of Modern History in the University of Birmingham. Formerly Fellow of Merton College, Oxford, and University Lecturer in the History of Geography. Lothian Prioryman, Oxford, 1889. Lowell Lecturer, Boston, 1908. Author of Henry the Navigator; The Dawn of Modern Geography; &c.

C. T. J.  
Charles T. Jacob.  
Managing Partner of the Chiswick Press, London. Author of Printing; &c.

T. H. THOMAS HODGKIN, D.C.L., LITT.D.
See the biographical article: HODGKIN, THOMAS.

Superintendent, Frontier Surveys, India, 1892-1898. Gold Medallist, R.G.S., London, 1887. Author of *The Indian Borderland; The Countries of the King's Award*; *India; Tibet*.

Assistant-Secretary to the Treasury, London. Fellow of Trinity College, Cambridge. Author of *Apollonius of Perga; Treatise on Conic Sections; The Nineteen Books of Euclid's Elements*; &c.

T. Se. THOMAS SICCOMBE, M.A.

T. Wo. THOMAS WOODHOUSE.
Head of the Weaving and Textile Designing Department, Technical College, Dundee.

W. A. B. C. REV. WILLIAM AUGUSTUS BREVORIGHT COOLIDGE, M.A., F.R.G.S., P.H.D.

W. A. P. WALTER ALISON PHILLIPS, M.A.
Formerly Exhibitor of Merton College and Senior Scholar of St John's College, Oxford. Author of *Modern Europe*; &c.

W. Ba. WILHELM BACHER, PH.D.
Professor at the Rabbinical Seminary, Budapest. Knight of the Iron Crown. Author of *Die Agada der Tannaiten*; &c.

W. B. P. WILLIAM BARCLAY PARSONS, C.E., LL.D.
Formerly Chief Engineer, Rapid Transit Commission, New York. Advisory Engineer, Royal Commission on London Traffic. Author of *Track; Turnouts*; &c.

W. E. D. WILLIAM ERNEST DAVY, M.A., M.Inst.C.E.
Professor of Civil and Mechanical Engineering at the City and Guilds of London Institute Central Technical College, South Kensington. Formerly University Demonstrator in the Engineering Department, Cambridge. Author of *The Balancing of Engines; Valves and Valve-Gear Mechanism*; &c.

W. F. C. WILLIAM FEILDEN CRAIES, M.A.

W. G. WILLIAM GARNETT, M.A., D.C.L.
Educational Adviser to the London County Council. Formerly Fellow and Lecturer of St John's College, Cambridge. Principal and Professor of Mathematics, Durham College of Science, Newcastle-on-Tyne. Author of *Elementary Dynamics*; &c.

W. H. F. SIR WILLIAM HENRY FLOWER, F.R.S.
See the biographical article: FLOWER, SIR W. H.

Barker Professor of Cryptogamic Botany, University of Manchester.
W. L. G.  WILLIAM LAWSON GRANT, M.A.
Professor at Queen's University, Kingston, Canada. Formerly Beit Lecturer in Colonial History at Oxford University. Editor of Acts of the Privy Council (Colonial Series); Canadian Constitutional Development (in collaboration).

W. M.  WILLIAM MINTO, M.A., LL.D.
See the biographical article: MINTO, WILLIAM.

W. M. F. P.  WILLIAM MATTHEW FLINDERS PETRIE, F.R.S., D.C.L., LITT.D.
See the biographical article: P ETRI E, W. M. F.

W. O. E.  VEN, WINFRED OLDFIELD BURROWS, M.A.

Formerly Professor of Russian and the other Slavonic Languages in the University of Oxford. Curator of the Taylorian Institution, Oxford. Author of Russia; Slavonic Literature; &c.

W. R. S.  WILLIAM ROBERTSON SMITH, LL.D.
See the biographical article: SMITH, WILLIAM ROBERTSON.

W. W. F.*  WILLIAM WARDE FOWLER, M.A.
Fellow of Lincoln College, Oxford. Sub-Rector, 1881–1904. Gifford Lecturer, Edinburgh University, 1908. Author of The City-State of the Greeks and Romans; The Roman Festivals of the Republican Period; &c.

W. Y.  REV. WILLIAM YOUNG.
Minister, Higher Broughton Presbyterian Church, Manchester, 1877–1901, and Association Secretary for the Religious Tract Society in the North of England.

POLLOCK, the popular name of the brothers Antonio and Piero di Jacopo Benci, Florentines who contributed much to Italian art in the 15th century. They were called Pollaiuolo because their father was a poulterer. The nickname was also extended to Simone, the nephew of Antonio.

ANTONIO (1429-1498) distinguished himself as a sculptor, jeweller, painter and engraver, and did valuable service in perfecting the art of enamelling. His painting exhibits an excess of brutality, of which the characteristics can be studied in the "Saint Sebastian," painted in 1475, and now in the National Gallery, London. A "St Christopher and the Infant Christ" is in the Metropolitan Museum, New York. But it was as a sculptor and metal-worker that he achieved his greatest successes. The exact ascription of his works is doubtful, as his brother Piero did much in collaboration with him. The museum of Florence contains the bronze group "Hercules strangling Cacus" and the terra-cotta bust "The Young Warrior"; and in the South Kensington Museum, London, is a bas-relief representing a contest between naked men. In 1493 Antonio took up his residence in Rome, where he executed the tomb ofSixtus IV. (1493), a composition in which he again manifested the quality of exaggeration in the anatomical features of the figures. In 1496 he went to Florence in order to put the finishing touches to the work already begun in the sacristy of Santo Spirito. He died in 1498, having just finished his mausoleum of Innocent VIII., and was buried in the church of San Pietro in Vinzola, where a monument was raised to him near that of his brother.

PIERO (1445-1496) was a painter, and his principal works were his "Coronation of the Virgin," an altar-piece painted in 1483, in the choir of the cathedral at San Gimignano; his "Three Saints," an altar-piece, and "Prudence" are both at the Uffizi Gallery.

SIMONE (1457-1508), nephew of Antonio Pollaiuolo, a celebrated architect, was born in Florence and went to Rome in 1484; there he entered his uncle's studio and studied architecture. On his return to Florence he was entrusted with the completion of the Strozzi palace begun by Benedetto de Maiano, and the cornice on the façade has earned him lasting fame. His highly coloured accounts of Rome earned for him the nickname of il Cronaca (chronicler). About 1498 he built the church of San Francesco at Monte and the vestibule of the sacristy of Santo Spirito. In collaboration with Giuliano da Sangallo he designed the great hall in the Palazzo Vecchio. He was a close friend and adherent of Savonarola.

See also Maud Cruttwell, Antonio Pollaiuolo (1907).

POLLAN (Coregonus pollan), the name given to a species of the Salmonid genus Coregonus (whitefish) which has been found in the large and deep loughs of Ireland only. A full account of the fish by its first describer, W. Thompson, may be found in his Natural History of Ireland, iv. 168.
POLLARD, EDWARD ALBERT (1828-1872), American journalist, was born in Nelson county, Virginia, on the 27th of February 1828. He graduated at the university of Virginia in 1849, studied law at the College of William and Mary, and in Baltimore (where he was admitted to the bar), and was engaged in newspaper work in California until 1855. In 1857-1861 he was clerk of the judiciary committee of the National House of Representatives. By 1859 he had become an outspoken Secessionist, and during the Civil War he was one of the principal editors of the Richmond Examiner, which supported the Confederacy but was hostile to President Jefferson Davis. In 1864 Pollard sailed for England, but the vessel on which he sailed was captured as a blockade runner, and he was confined in Fort Warren in Boston Harbour from the 29th of May until the 12th of August, when he was paroled. In December he was placed in close confinement at Fort Monroe by order of Secretary Stanton, but was soon again paroled by General B. F. Butler, and in January proceeded to Richmond to be exchanged there for Albert D. Richardson (1833-1869), a well-known correspondent of the New York Tribune, who, however, had escaped before Pollard arrived. In 1867-1869 Pollard edited a weekly political pamphlet, and he co-authored the Political Pamphlet there during the presidential campaign of 1868.

His publications include Black Diamonds Gathered in the Darkey Homes of the South (1859), in which he advocated a reopening of the slave trade; The Southern History of the War (3 vols.: First Year of the War, with B. De Witt, 1863; Second Year of the War, 1864; Third Year of the War, 1864); Observations in the North: Eight Months in Prison and on Parole (1865); The Lost Cause (1866); Lee and His Lieutenants (1867); The Lost Cause Regained (1868), a southern view of reconstruction urging the necessity of white supremacy: The Life of Jefferson Davis (1869), an arraignment of the Confederate president; and The Virginia Tourist (1870).

POLLENTIA (mod. Pollenzo), an ancient town of Liguria, Italy, 10 m. to the north of Augusta Bagniennorum, on the left bank of the Tanarus (mod. Tanaro). Its position on the road from Augusta Taurinorum to the coast at Vada Sabatia, at the point of divergence of a road to Hasta (Asti) gave it military importance. Decimus Brutus managed to occupy it an hour before Mark Antony in 43 B.C.; and it was here that Stilicho on the 29th of March 403 fought the battle with Alaric which though undecided led the Goths to evacuate Italy. The place was famous for its brown wool, and for its pottery. Considerable remains of ancient buildings, an amphitheatre, a theatre and a temple still exist. The so-called temple of Diana is more probably a tomb.

POLLINATION, in botany, the transference of the pollen from the stamen to the receptive surface, or stigma, of the pistil of a flower. The great variety in the form, colour and scent of flowers (see FLOWER) is intimately associated with pollination which is effected by aid of wind, insects and other agencies. Pollen may be transferred to the stigma of the same flower—self-pollination (or autogamy), or to the stigma of another flower on the same plant or another plant of the same species—cross-pollination (or allogamy). Effective pollination may also occur between flowers of different species, or occasionally, as in the case of several orchids, of different genera—this is known as hybridization.

The method of pollination is to some extent governed by the distribution of the stamens and pistil. In the case of unisexual flowers, whether monocious, that is, with stamine and pistillate flowers on one and the same plant, such as many of our native trees—oak, beech, birch, alder, &c., or dioecious with stamine and pistillate flowers on different plants, as in willows and poplars, cross pollination only is possible. In bisexual or hermaphrodite flowers, that is, those in which both stamens and pistil are present, though self-pollination might seem the obvious course, this is often prevented or hindered by various arrangements which favour cross-pollination. Thus the anthers and stigmas in any given flower are often mature at different times; this condition, which is known as dichogamy and was first pointed out by Sprengel, may be so well marked that the stigma has ceased to be receptive before the anthers open, or the anthers have withered before the stigma becomes receptive, when cross-pollination only is possible, or the stages of maturity in the two organs are not so distinct, when self-pollination becomes possible later on. The flower is termed protandrous or protogynous according as anthers or stigmas mature first. The term homogamy is applied to the simultaneous maturity of stigma and anthers. Spontaneous self-pollination is rendered impossible in some homogamous flowers in consequence of the relative position of the anthers and stigma—this condition has been termed heterogamy. Flowers in which the relative position of the organs allows of spontaneous self-pollination may be all alike as regards length of style and stamens (homomorphy or homostyly), or differ in this respect (heteromorphy) the styles...
between the effects of external pollen and that from the same flower.

Cross-pollination may occur between two flowers on the same plant (geitonogamy) or between flowers on distinct plants (xenogamy). The former, which is a somewhat less favourable method than the latter, is effected by air-currents, insect agency, the actual contact between stigmas and anthers in neighbouring flowers, where, as in the family Compositae, flowers are closely crowded, or by the fall of the pollen from a

Many plants produce, in addition to ordinary open flowers, so-called cleistogamous flowers, which remain permanently closed but which notwithstanding produce fruit; in these the corolla is inconspicuous or absent and the pollen grows from the anther on to the stigma of the same flower. Species of *Viola* (see fig. 3), *Oxalis acerosa* (wood sorrel) and *Lamium amplexicaule* are commonly occurring instances. The cleistogamous flowers are developed before or after the normal open flowers at seasons less favourable for cross-pollination. In some cases flowers, which open under normal circumstances, remain closed owing to unfavourable circumstances, and self-pollination occurs as in a typical cleistogamous flower—these have been distinguished as pseudo-cleistogamous. Instances occur in water-plants, where flowers are un-gynous, anther; 1, pistil; able to reach the surface (e.g. *Altissima* and style; 2, stigmatic *nautans*, water buttercup, &c.) or surface, where flowers remain closed in dull or cold weather.

Systems of classification of flowers according to the agency by which pollination is effected have been proposed by Delpino, H. Müller and other workers on the subject. Knuth suggests the following, which is a modification of the systems proposed by Delpino and Müller.

A. Water-pollinated plants, Hydrophilae. A small group which is subdivided thus:

a. Pollinated under the water; e.g. *Najas* where the pollen grains are rather heavier than water, and sinking down are caught by the stigmas of the extremely simple female flowers.

b. Pollination on the surface, a more frequent occurrence than (a). In these the pollen floats on the surface and reaches the stigmas of the female flowers as in *Callitriche, Ruppia, Zostera, Elodea*. In *Vallisneria* (fig. 4) the male flowers become detached and float on the surface of the water, the anthers are thus brought in contact with the stigmas of the female flowers.

B. Wind-pollinated plants, Anemophilae. In these the pollen grains are smooth and light so as to be easily blown about, and are produced in great quantity; the stigmas are brush-like or feathery, and usually long and protruding so as readily to catch the pollen. As no means of attraction are required the flowers are inconspicuous and without scent or nectar. The male inflorescence is often a pendulous catkin, as in hazel and many native English trees (fig. 5); or the anthers are loosely fixed on long thread-like filaments as in grasses (fig. 6).

(From Darwin's *Divers Form of Flowers* by permission.)

**Fig. 2.**—Diagram of the flowers of the three forms of *Lythrum salicaria* in their natural position, with the petals and calyx removed on the near side. (X 6 times.)

The dotted lines with the arrow show the directions in which pollen must be carried to each stigma to ensure full fertility.

higher on to the stigmas of a lower flower. Anton Kern has shown that crowded inflorescences such as those of Compositae and Umbelliferae are especially adapted for geitonogamy. Xenogamy is of course the only possible method in diclinous plants; it is also the usual method in monoclinous plants, owing to the fact that stamens and carpels often mature at different times (dichogamy), the plants being proterandrous or proterogynous. Even in homogamous flowers cross-pollination is in a large proportion of cases the effective method, at any rate at first, owing to the relative position of anther and stigma or the fact that the plant is self-sterile.

The subject of heterostyly was investigated by Darwin (see his *Forms of Flowers*) and later by Hildebrand. In the case of a dimorphic flower, such as *Primula*, four modes of pollination are possible, two distinguished by Darwin as legitimate, between anthers and stigmas on corresponding levels, and two so-called illegitimate unions, between anthers and stigmas at different levels (cf. fig. 1). In a trimorphic flower such as *Lythrum salicaria* there are six possible legitimate unions and twelve illegitimate (see fig. 2). Experiment showed that legitimate unions yield a larger quantity of seed than illegitimate.
b. Bird-pollinated, Ornithophilae.—Humming-birds and honey-suckers are agents of pollination in certain tropical plants; they visit the generally large and brightly-coloured flowers either for the honey which is secreted in considerable quantity or for the insects which have been attracted by the honey (fig. 7).

c. Snail or slug-pollinated flowers, Malacophilae.—In small flowers which are crowded at the same level or in flat flowers in which the stigmas and anthers project but little, slugs or snails creeping over their surface may transfer to the stigma the pollen which clings to the slimy foot. Such a transfer has been described in various Aroids, Rehdea japonica (Lilaceae), and other plants.

POLLINATION

Fig. 5.—Catkin of Male Flowers of Hazel.

Fig. 6.—Grass Flower showing pendulous anthers and protruding hairy stigmas.

d. Insect-pollinated, Entomophilae, a very large class characterized by sticky pollen grains, the surface of which bears spines, warts or other projections (fig. 8) which facilitate adhesion to some part of the insect's body, and a relatively small stigma with a sticky surface. The flowers have an attractive floral envelope, are scented and often contain honey or a large amount of pollen: by these means the insect is enticed to visit it. The form, colour and scent of the flower vary widely, according to the class of insect whose aid is sought, and there are also numerous devices for protecting the pollen and nectar from rain and dew or from the visits of those insects which would not serve the purpose of pollination. Several (fig. 9, q). The following subdivisions have been suggested.

A. Pollen Flowers.—These offer only pollen to their visitors, as species of anemone, poppy, rose, tulip, &c. They are simple in structure and regular in form, and the generally abundant pollen is usually freely exposed.

B. Nectar Flowers.—These contain nectar and include the following groups:

1. Flowers with exposed nectar, readily visible and accessible to all visitors. These are very simple, open and generally regular flowers, white, greenish-yellow or yellow in colour and are chiefly visited by insects with a short proboscis such as short-tongued wasps and flies, also beetles and more rarely bees. Examples are Umbelliferae as a family, saxifrages, holly, Acer, Rhamnus, Euonymus, Euphorbia, &c.

2. Flowers with nectar partly concealed and visible only in bright sunshine. The generally regular flowers are completely open only in bright sunshine, closing up into cups at other times. Such are most Cruciferae, buttercups, king-cup (Caltha), Potentilla. White and yellow colours predominate and insects with a proboscis of medium length are the common pollinating agents, such as short-tongued bees.

3. Flowers with nectar concealed by pouches, hairs, &c. Regular flowers predominate, e.g. Geranium, Cardamine pratensis, make-drops, Oxalis, Orchis, &c., but many species show more or less well-marked median symmetry (zygomorphism) as Euphrasia, Orchis, thyme, &c., and red, blue and violet are the usual colours. Long-tongued insects such as the honey-bee are the most frequent visitors.

4. Social flowers, whose nectar is concealed as in (3), but the flowers are grouped in heads which render them strikingly conspicuous, and several flowers can be simultaneously pollinated. Such are Compositae as a class, also Scabiosa, Armeria (sea-pink) and others.

5. Hymenopterid flowers, which fall into the following groups: Bee-flowers proper, humble-bee flowers requiring a longer proboscis to reach the nectar, wasp-flowers such as fig-wort (Scrophularia nodosa) and ichneumon flowers such as tway-blade (Littrella ovata).

The shapes and colours are extremely varied; bilaterally symmetrical forms are most frequent with red, blue or violet colours. Such are Papilionaceous flowers, Violaceae, many Labiatae, Scrophulariaceae and others. Many are highly specialized so that pollination can be effected by a few species only. Examples of more special mechanisms are illustrated by Salvia (fig. 9). The long connective of the single stamen is hinged to the short filament and has a shorter arm ending in a blunt process and a longer arm bearing a half-anther. A large bee in probing for honey comes in contact with the end of the short arm of the anther and causes the longer arm to descend and the pollen is deposited on the back of the insect (fig. 9, 1). In a later stage (fig. 9, 2) the style elongates and the forked stigma occupies the same position as the anther in fig. 9, 1.

(From a drawing in the Botanical Gallery at the British Museum.)

Fig. 7.—Flower of Datura tanguinosa visited by humming-bird Docimastes ensiferus. (About ¼ nat. size.)

(From Strasburger's Lehrbuch der Botanik, by permission of Gustav Fischer.)

Fig. 9.—Pollination of Salvia pratensis.

1. Flower visited by a humble-bee, showing the projection of the curved connective bearing the anther from the helmet-shaped upper lip and the deposition of the pollen on the back of the humble-bee.

2. Older flower, with connective drawn back, and elongated style.

3. The same, when disturbed by the entrance of the proboscis of the bee in the direction of the arrow: f. filament; c. connective; s. the obstructing half of the anther.

4. The staminal apparatus at rest, with connective enclosed within the upper lip.

5. The same, when disturbed by the entrance of the proboscis of the bee in the direction of the arrow: f. filament; c. connective; s. the obstructing half of the anther.

1 See A. Kernier, Plants and their Unbidden Guests.
In Broom there is an explosive mechanism; the pressure of the insect visitor on the keel of the corolla causes a sudden release of the stamens and the scattering of a cloud of pollen over its body.

6. Lepidoptera flowers, visited chiefly by Lepidoptera, which are able to reach the nectar concealed in deep, narrow tubes or spurs by means of their long slender proboscides. Such are: (a) Butterfly-flower, usually red in colour, as Dianthus carthusianorum; (b) Moth-flowers, white or whitish, as honeysuckle (Lonicera periclymenum).

7. Fly flowers, chiefly visited by Diptera, and including very different types:—

a. Nauseous flowers, dull and yellowish and dark purple in colour and often spotted, with a smell attractive to carrion flies and dung flies, e.g. species of Saxifraga.

b. Pitfall flowers, such as Arum, Aristolochia and Arum maculatum, when the insect is caught and detained until pollination is effected (fig. 10).

c. Pinch-trap flowers, as in the family Asclepiadaceae, where the proboscis, claw or bristle of the insect is caught in the clip to which the pairs of pollinia are attached. Bees, wasps and larger insects serve as pollinating agents

d. Deceptive flowers such as Parnassia, where the conspicuous coronet of glistening yellow balls suggests a plentiful supply of nectar drops (fig. 11).

e. Hoverfly flowers, small flowers which are beautifully coloured with radiating streaks pointing to a yellow disc or floral centre in which is the nectar, as in Veronica chamaedrys (fig. 12).

LITERATURE.—Joseph Gottlieb Körner (1799) was the first to study the pollination of flowers and to draw attention to the necessity of insect visits in many cases; he gave a clear account of cross-pollination by insect aid. He was followed by Christian Sprengel, whose work Das entdeckte Geheimnis der Natur im Bau und in der Befruchtung der Blumen (Berlin, 1793), contains a description of floral adaptations for insect visits, and experiments on nearly 300 species of plants. Sprengel came very near to appreciating the meaning of cross-pollination of the life of plants when he states that "It seems that Nature is unwilling that any flower should be fertilized by its own pollen." In 1799 an Englishman, Thomas Andrew Knight, after experiments on the cross-fertilization of cultivated plants, formulated the conclusion that no plant fertilizes itself through many generations. Sprengel's work, which had been almost forgotten, was taken up again by Charles Darwin, who concluded that no organic being can fertilize itself through an unlimited number of generations, but that a cross with other individuals is occasionally—perhaps at very long intervals—indispensable. Darwin's works on dimorphic flowers and the fertilization of orchids gave powerful support to this statement. The study of the fertilization, or as it is now generally called "pollination," of flowers, was continued by Darwin and taken up by other workers, notably Friedrich Hildebrand, Federico Delpino and the brothers Fritz and Hermann Müller. Hermann Müller's work on The Fertilization of Flowers by Insects and their Reciprocal Adaptations (1873), followed by subsequent works on the same lines, brought together a great number of observations on floral mechanisms and their relation to insect visits. Müller also suggested a modification of the Knight-Darwin law, which had left unexplained the numerous instances of continued successful self-pollination, and restated it on these terms: "Whenever offspring resulting from crossing comes into serious conflict with offspring resulting from self-fertilization, the former is victorious. Only where there is no such struggle for existence does self-fertilization often prove satisfactory for many generations." An increasing number of workers in this field of plant biology in England, on the Continent and in America has produced a great mass of observations, which have recently been brought together in Dr Paul Knuth's classic work, Handbuch der Blütenpollination, an English translation of which has been published (1908) by the Clarendon Press.

POLIO, GAIVUS ASINUS (76 B.C.-A.D. 5; according to some, 75 B.C.-A.D. 4), Roman orator, poet and historian. In 54 he impeached unsuccessfully C. Porcius Cato, who in his tribunate (56) had acted as the tool of the triumvirs. In the civil war between Caesar and Pompey Pollio sided with Caesar, was present at the battle of Pharsalus (48), and commanded against Sextus Pompeius in Spain, where he was at the time of Caesar's assassination. He subsequently threw in his lot with M. Antony. In the division of the provinces, Gaius fell to Antony, who entrusted Pollio with the administration of Gallia Transpadana. In superintending the distribution of the Mantuan territory amongst the veterans, he used his influence to save from confiscation the property of the poet Virgil. In 40 he helped to arrange the peace of Brundisium by which Octavian (Augustus) and Antonius were for a time reconciled. In the same year Pollio entered upon his consulship, which had been promised him in 43. It was at this time that Virgil addressed the famous fourth eclogue to him. Next year Pollio conducted a successful campaign against the Parthians, an Illyrian people who adhered to Brutus, and celebrated a triumph on the 25th of October. The eighth eclogue of Virgil was addressed to Pollio while engaged in this campaign. From the spoils of the war he constructed the first public library at Rome, in the Atrium Libertatis, also erected by him (Pliny, Nat. hist. xxxv. 10), which he adorned with statues of the most celebrated
I, regnec succesful tax Field named 22) is (London, Teuffel-Schwaben, connected baronet Tacitus, 1861), is poll-tax practice one Julius Appian appears and Florus speeches to have haps by burg, valuable up 1894); 1734), 1841-1843, a translation Roman prosperous to of Caesar, 10) Breslau, many a military works which were used in a translation of his native Padus (Quintilian, i. 5, 56, viii, 3); he attacked the Commentaries of Julius Caesar, accusing their author of carelessness and credulity, if not of deliberate falsification (Suet. Caesar, 56). Pollio was the first Roman author who recited his writings to an audience of his friends, a practice which afterwards came common at Rome. The theory that Pollio was the author of the Bellum africanum, one of the supplements to Caesar's Commentarii, has met with little support. All his writings are lost except a few fragments of his speeches (H. Meyer, Grauf. rom. frag. 1842), and three letters addressed to Cicero (Ad. Fam. x. 31-33).

Suetonius Pompae. Pat. ii. 36, 63, 73, 76; Florus iv. 11, 12; Dio Cassius xiv. 10, xivili. 15; Appian, Bell. cit. V. Gardthausen, Augustus und seine Zeit (1891), i.; F. Grobe, in Pauly-Wissowa's Realencyclopaedie (1896), ii. pt. 2; Teuffel-Schlicht, Histoire romaine (1898); R. W. Schanze, der römischen Literatur, pt. 2, p. 20 (5th ed. 1899); Cicero, Letters, ed. Tyrell and Purser, vi. introd. p. 80.

PÖLNTZ, KARL LUDWIG, FREIHERR VON (1602-1773). German adventurer and writer, was born at Issum on the 25th of February 1602. His father, Wilhelm Ludwig von Pölnitz (d. 1693), was in the military service of the elector of Brandenburg, and much of his son's youth was passed at the electoral court of Berlin. He proved to be of rambunctious and adventurous disposition, unscrupulous even for the age in which he lived, visited many of the European courts, and served as a soldier in Austria, Italy and Spain. Returning to Berlin in 1735 he obtained a position in the household of King Frederick William I. and afterwards in that of Frederick the Great, with whom he appears to have been a favourite; and he died in Berlin on the 23rd of June 1775.

Pölnitz's Mémoires (Liège, 1734), which were translated into German (Frankfurt, 1735), give a lively picture of the manners and customs of the people whom he met, but they are very untrustworthy. He also wrote Nouveaux mémoires (Amsterdam, 1737); État abrégé de la cour de Saxe sous le règne d'Auguste III. (Frankfort, 1734; Ger. translation Munich, 1736); Histoire de la maison de Brabant, published by F. L. Brunn (Berlin, 1791; Ger. trans., Berlin, 1791). Perhaps his most popular works are La Saxe galante (Amsterdam, 1734), an account of the private life of Augustus the Strong, elector of Saxony and king of Poland; and Histoire secrète de la duchesse d'Anjou, épouse de Georges I. (London, 1732). There is an English translation of the Mémoires (London, 1738), by J. P. von Pölnitz, Stammfamilen der Familie von Pölnitz (Berlin, 1844); and J. G. Droysen, Geschichte der preussischen Politik, pt. iv. (Leipzig, 1870).

POLLOCK, the name of an English family which has contributed many important members to the legal and other professions. David Pollock, who was the son of a Scotsman and built up a prosperous business in London as a saddler, had three distinguished sons: Sir David Pollock, 1718-1780, chief justice of Bombay; Sir Jonathan Frederick Pollock, Bart. (1783-1870), chief baron of the exchequer; and Sir George Pollock, Bart. (1786-1872), field-marshal. Of these the most famous were the two last. Field Marshal Sir George Pollock, who rendered valuable military service in India, and especially in Afghanistan in 1841-1843, ended his days as constable of the Tower of London, and was buried in Westminster Abbey; his baronetcy, created in 1782, descended to his son Frederick (d. 1874), who assumed the name of Montagu-Pollock, and so to his heirs. Chief Baron Sir J. Frederick Pollock, who had been senior wrangler at Cambridge, and became F.R.S. in 1861, was raised to the bench in 1864, and created a baronet in 1866. He was twice married and had eight sons and ten daughters, his numerous descendants being prominent in many fields. The chief baron's eldest son, Sir William Frederick Pollock, and Bart. (1815-1888), became a master of the Supreme Court (1856) and queen's remembrancer (1874); his eldest son, Sir Frederick Pollock, 3rd Bart. (b. 1845), being the well-known jurist and legal historian, fellow of Trinity College, Cambridge, and Corpus professor of jurisprudence at Oxford (1883-1903), and the second son, Walter Herries Pollock (b. 1850), being a well-known author and editor of the Saturday Review from 1883 to 1894. The chief baron's third son, George Frederick Pollock (b. 1821), became a master of the Supreme Court in 1851, and succeeded his brother as queen's (king's) remembrancer in 1886; among his sons were Dr W. Rivers Pollock (1850-1909), Ernest Murray Pollock, K.C. (b. 1861), and Lady Pollock, R.B. (d. 1899), and after her father's death in 1894, and previously head master of Wellington College from 1893 till 1910. The chief baron's fourth son, Sir Charles Edward Pollock (1823-1897), had a successful career at the bar and in 1873 became a judge, being the last survivor of the old barons of the exchequer; he was thrice married and had issue by each wife.

POLLOK, ROBERT (1758-1827), Scottish poet, son of a small farmer, was born at North Moorhouse, Renfrewshire, on the 19th of October 1758. He was trained as a cabinet-maker and afterwards worked on his father's farm, but, having prepared himself for the university, he took his degree at Glasgow, and studied for the ministry of his native Kirk. He published Tales of the Covenants while he was a divinity student, and planned and completed a strongly Calvinistic poem on the spiritual life and destiny of man. This was the Course of Time (1827), which passed through many editions and became a favourite in serious households in Scotland. It was written in blank verse, in ten books, in the poetic diction of the 18th century, but with abundance of enthusiasm, impassioned elevation of feeling and copious force of words and images. The poem at once became popular, but within six months of its publication, on the 18th of September 1827, its author died of consumption.

POLLOKHAWS, a parochial law and tax of the county of Renfrewshire, Scotland, on the White Cart, now virtually a suburb of Glasgow, with which it is connected by electric tramway and the Glasgow & South-Western and Caledonian railways. Pop. (1901), 11,183. It is named from the shaws or woods (and is locally styled "the Shaws") and the lands of Pollock, which have been held by the Maxwellts since the 13th century. The family is now called Stirling-Maxwell, the estate and baronetcy having devolved in 1865 upon Sir William Stirling of Keir, who then assumed the surname of Maxwell. Pollock House adjoins the town on the west. The staple industries are cotton-spinning and weaving, silk-weaving, dyeing, and cachet-calico-printing, and the manufacture of Chelsea and tapestry, besides paper mills, potteries and large engineering works. Pollockshaws was created a burgh of barony in 1813, and is governed by a council and provost. About 2 m. south-west is the thriving town of Thornliebank (pop. 24,52), which owes its existence to the cotton-work establishments established towards the end of the 18th century.

POLLOCK, a tax levied on the individual, and not on property or on articles of merchandise, so-called from the old English poll, a head. Raised thus per capita, it is sometimes called a capitation tax. The most famous poll-tax in English history is the one levied in 1380, which led to the revolt of the peasants under Wat Tyler in 1381, but the first instance of the kind was in 1377, when a tax of a groat a head was voted by both clergy and laity. In 1379 the tax was again levied, but on a graduated scale. John of Gaunt, duke of Lancaster, paid ten marks, and the scale descended from him to the peasants, who paid one groat each, every person over sixteen years of age being liable. In 1380 the tax was also graduated, but less steeply. For some years after the rising of 1381 money was only raised in this way from aliens, but in 1513 a general poll tax was imposed. This, however, only produced about £5,000, instead of £15,000 as was expected, but a poll-tax levied in 1641 resulted in a revenue of about £40,000. During the reign of
Charles II. money was obtained in this way on several occasions, although in 1675–1677 especially there was a good deal of resentment against the tax. For some years after 1688 poll-taxes were a favourite means of raising money for the prosecution of the war with France. Sometimes a single payment was asked for the year; at other times quarterly payments were required. The poll-tax of 1697 included a weekly tax of one penny from all persons not receiving alms. In 1698 a quarterly poll-tax produced £321,397. Nothing was required from the poor, and those who were liable may be divided roughly into three classes. Persons worth less than £500 paid one shilling; those worth £500, including the gentry and the professional classes, paid twenty shillings; while tradesmen and shopkeepers paid ten shillings. Non-jurors were charged double these rates. Like previous poll-taxes, the tax of 1698 did not produce as much as was anticipated, and it was the last of its kind in England.

Many of the states of the United States of America raise money by levying poll-taxes, or, as they are usually called, capitalization taxes, the payment of this tax being a necessary preliminary to the exercise of the suffrage.

POLUX, JULIUS—POLO, MARCO

POLUX, JULIUS, of Naucratis in Egypt, the Greek grammarian and the first known to have taught at Athens, where, according to Philostratus (Vit. Soph.), he was appointed to the professorship of rhetoric by the emperor Commodus on account of his melodious voice. Suidas gives a list of his rhetorical works, none of which has survived. Philostratus recognizes his natural abilities, but speaks of his rhetoric in very moderate terms. Polux is probably the person attacked by Lucian in the Leiphanes and Teacher of Rhetoricians. In the Teacher of Rhetoricians Lucian satirizes a worthless and ignorant person who gains a reputation as an orator by sheer effrontery; the Leiphanes, a satire upon the use of obscure and obsolete words, may conceivably have been directed against Polux as the author of the Onomasticon. This work, which we still possess, is a Greek dictionary in ten books, each dedicated to Commodus, and arranged not alphabetically but according to subject-matter. Though mainly a dictionary of synonyms and phrases, chiefly intended to furnish the reader with the Attic names for individual things, it supplies much rare and valuable information on many points of classical antiquity. It also contains numerous fragments of writers now lost. The chief authorities used were the lexicographical works of Didymus, Tryphon, and Pamphilus; in the second book the treatise extensive of Rufus of Ephesus On the Names of the Parts of the Human Body was specially consulted.

The chief editions of the Onomasticon are those of W. Dindorf (1824), with the notes of previous commentators, I. Bekker (1846), containing the Greek text only, and Beete (1900). There are monographs on special portions of the vocabulary; by E. Rohde (on the theatrical terms, 1870), and F. von Sorjentin (on constitutional antiquities, 1875).

POLUX, or POLLUCITE, a rare mineral, consisting of hydrous caesium and aluminium silicate, NaCsAl(SiO3)2. Caesium oxide (Cs2O) is present to the extent of 30–36 %, the amount varying somewhat owing to partial replacement by other alalils, chiefly sodium. The mineral crystalizes in the cubic system. It is colourless and transparent, and has a vitreous lustre. There is no distinct cleavage and the fracture is conchoidal. The hardness is 6 1/2 and the specific gravity 2.90. It occurs sparingly, together with the mineral "castor" (see PÉLAITE), in cavities in the granite of the island of Elba, and with beryl in pegmatite veins at Rumford and Hebron in Maine.

POLO, GASPAR GIL (1535–1591), Spanish novelist and poet, was born at Valencia about 1530. He is often confused with Gil Polo, professor of Greek at Valencia University between 1560 and 1573; but this professor was not named Gaspar. He is also confused with his own son, Gaspar Gil Polo, the author of De origine et progressu juris romanì (1619) and other legal treatises, who pleaded before the Cortes as late as 1636. A notary by profession, Polo was attached to the treasury commission which visited Valencia in 1571, became coadjutor to the chief accountant in 1572, went on a special mission to Barcelona in 1580, and died there in 1591. Timoneda, in the Sarao de amor (1561), alludes to him as a poet of repute; but of his miscellaneous verses only two conventional, eulogistic sonnets and a song survive. Polo finds a place in the history of the novel as the author of La Diana enamorada, a continuation of Montemayor's Diana, and perhaps the most successful continuation ever written by another hand. Cervantes, punning on the writer's name, recommended that "the Diana enamorada should be guarded as carefully as though it were by Apollo himself"; the book is not wholly, nor even mainly, ironical.

The book is one of the most agreeable of Spanish pastoralists; interesting in incident, written in fluent prose, and embellished with melodious poems, it was constantly reprinted, was imitated by Cervantes in the Canto de Calpeo, and was translated into English, French, German and Latin. The English version of Bartholomew Young, published in 1598 but current in manuscript fifteen years earlier, is said to have suggested the Felisisma episode in the Two Gentlemen of Verona; the Latin version of Caspar Barth, entitled Erotodoscalus (Hanover, 1675), is a performance of uncommon merit as well as a bibliographical curiosity.

POLO, MARCO (c. 1254–1324), the Venetian, greatest of medieval travellers, Venetian genealogies and traditions of interpolated value trace a family line of prominent Dalmatian and before the end of the 11th century one Domenico Polo is found in the great council of the republic (1094). But the ascertained line of the traveller begins only with his grandfather. Andrea Polo of S. Felice was the father of three sons, Marco, Nicolo and Maffeo, of whom the second was the father of the subject of this article. They were presumably "noble," i.e. belonging to the families who had seats in the great council, and were enrolled in the Libro d'Oro; for we know that Marco the traveller is officially so styled (nobilis vir). The three brothers were engaged in commerce; the elder Marco, resident apparently in Constantinople and in the Crimes (especially at Sagad), suggests, by his celebrated will, a long business partnership with Nicolo and Maffeo.

About 1260, and even perhaps as early as 1250, we find Nicolo and Maffeo at Constantinople. Nicolo was married and had left his wife there. The two brothers went on a speculation to the Crimea, whence a succession of chances and openings carried them to the court of Barka Khan at Sarai, further north up to Bolghar (Kazan), and eventually across the steppes to Bokhara. Here they fell in with certain envoys who had been on a mission from the great Khan Kublai to his brother Hulagu in Persia, and by them were persuaded to make the journey to Cathay in their company. Under the heading CINA the circumstances are noted of which I brand last half of the 13th century and first half of the 14th threw Asia open to Western travellers to a degree unknown before and since—until the 19th century. Thus began the medieval period of intercourse between China and catholic Europe. Kublai, when the Polos reached his court, was either at Cambaluc (Khanbaligh, the Khan's city), i.e. Peking, which he had just rebuilt, or at his summer seat at Shagtu in the country north of the Great Wall. It was the first time that the khan, a man full of energy and intelligence, had fallen in with European gentlemen. He was delighted with the Venetian brothers, listened eagerly to all they had to tell of the Latin world, and decided to send them back as his envoys to the Pope, with letters requesting the despatch of a large body of educated men to instruct his people in Christianity and the liberal arts. With Kublai, as with his predecessors, religion was chiefly a political engine. Kublai, the first of his house to rise above the essential barbarism of the Mongols, had perhaps discerned that the Christian Church could afford the aid he desired in taming his countrymen. It was only when Rome had failed to meet his advance that he fell back upon Buddhism as his chief civilizing instrument.

The brothers arrived at Acre in April 1269. They learned that Clement IV. had died the year before, and no new pope had yet been chosen. So they took counsel with an eminent churchman, Tedaldo, archdeacon of Liége and papal legate for the
whole realm of Egypt, and, being advised by him to wait patiently, went home to Venice, where they found that Nicoło's wife was dead, but had left a son Marco, now fifteen. The papal interregnum was the longest that had been known, at least since the dark ages. After the Polos had spent two years at home there was still no pope, and the brothers resolved on starting again for the East, taking young Marco with them. At Acre they again saw Tedaldo, and were furnished by him with letters to authenticate the causes that had hindered their mission. They had not yet left Lajazzo, Layas, or Ayas on the Cilician coast (then one of the chief points for the arrival and departure of the land trade of Asia), when they heard that Tedaldo had been elected pope. They hastened back to Acre, and at last were able to execute Kublai's mission, and to obtain a papal reply. But, instead of the hundred teachers asked for by the Great Khan, the new pope (styled Gregory X.) could supply but two Dominicans; and these lost heart and turned back, when they had barely taken the first step of their journey.

The second start from Acre must have taken place about November 1271; and from a consideration of the indications and succession of chapters in Polo's book, it would seem that the party proceeded from Lajazzo to Sivas and Tabriz, and thence by Yezid and Kirman down to Hormuz (Hurmuz) at the mouth of the Persian Gulf, with the purpose of going on to China by sea; but that, abandoning their naval plans (perhaps from fear of the flimsy vessels employed on this navigation from the Gulf eastwards), they returned northward through Persia. Traversing Kirman and Khorasan they went on to Balkh and Badakshan, in which last country young Marco recovered from illness. In a passage touching on the climate of the Badakshan hills, Marco breaks into an enthusiasm which he rarely betrays, but which is easily understood by those who have known what it is, with fever in the blood, to escape to the exhilarating mountain air and fragrant pine-groves. They then proceeded through the upper Oxus through Wakhan to the plateau of Pamit (a name first heard in Marco's book). These regions were hardly described again by any European traveller (save Benedict Goes) till the expedition in 1383 of Lieut. John Wood of the Indian navy, whose narrative abounds in incidental illustration of Marco Polo. Crossing the Pamir the travellers descended upon Kashgar, Yarkand and Khotan (Khutan). These are regions which remained almost absolutely closed to our knowledge till after 1866, when the temporary overthrow of the Chinese power, and the enterprise of British, Russian and other explorers, again made them known.

From Khotan the Polos passed on to the vicinity of Lop-Nor, reached for the first time since Polo's journey by Prjevalsky in 1871. Thence the great desert of Gobi was crossed to Tangut, as the region at the extreme north-west of China, both within and without the Wall, was then called.

In his account of the Gobi, or desert of Lop, as he calls it, Polo gives some description of the terrors and superstitions of the waste, a description which strikingly reproduces that of the Chinese pilgrim Suán Ts'ang, in passing the same desert in the contrary direction six hundred years before.

The Venetians, in their further journey, were met and welcomed by the Great Khan's people, and at last reached his presence at Shangtu, in the spring of 1275. Kublai received them with great cordiality, and took kindly to young Marco, by this time about twenty-one years old. The "young bachelor," as the book calls him, applied himself diligently to the acquisition of the divers languages and written characters chiefly in use among the multifarious nationalities subject to the Khan; and Kublai, seeing that he was both clever and discreet, soon began to employ him in the public service. G. Pauthier finds in the Chinese annals a record that in the year 1277 a certain Polo was nominated as a second-class commissioner or agent attached to the imperial council, and was even made one of the messenger bearers to the young Venetian. Among his public missions was one which carried him through the provinces of Shansi, Shensi, and Szechuen, and the wild country on the borders of Tibet, to the remote province of Yunnan, called by the Mongols Karajang, and into northern Burma (Mien). Marco, during his stay at court, had observed the Khan's delight in hearing of strange countries, of their manners, marvels, and oddities, and had heard his frank expressions of disgust at the stupidity of envoys and commissioners who could tell of nothing but their official business. He took care to store his memory or his note-book with curious facts likely to interest Kublai, which, on his return to court, he related. This south-western journey led him through a country which till about 1860 was almost a terra incognita—though since the middle of the 19th century we have learned much regarding it through the journeys of Cooper, Garnier, Richthofen, Gill, Baber and others. In this region there existed and still exists in the deep valleys of the great rivers, and in the alpine regions which border them, a vast ethnological garden, as it were, of tribes of various origin, and in every stage of semi-civilization or barbarism; these afforded many strange products and eccentric traits to entertain Kublai.

Marco rose rapidly in favour and was often employed on distant missions as well as in domestic administration; but we gather few details of his employment. He held for three years the government of the great city of Yangchow; on another occasion he seems to have visited Kangchow, the capital of Tartary, just within the Great Wall, and perhaps Karakorum on the north of the Gobi, the former residence of the Great Khans; again we find him in Ciamara, or southern Cochín-China; and perhaps, once more, on a separate mission to the southern states of India. We are not informed whether his father and uncle shared in such employments, though they are mentioned as having rendered material service to the Khan, in forwarding the capture of Siang-yang (on the Han river) during the war against southern China, by the construction of powerful artillery engines—a story, however, perplexed by chronological difficulties.

By this time the Polos were gathering wealth which they longed to carry back to their home, and after their exile they began to dread what might follow Kublai's death. The Khan, however, was deaf to suggestions of departure and the opportunity only came by chance.

Arghun, khan of Persia, the grandson of Kublai's brother Hulagu, lost in 1286 his favourite wife, called by Polo Bulgana (i.e. Bulushan or "Sable"). Her dying injunction was that her place should be filled only by a lady of her own Mongol tribe. Ambassadors were despatched to the court of Peking to obtain such a bride. The message was courteously received, and the choice fell on the lady Gocun (Kukachin), a maiden of the north of the Gobi, the former residence of the Great Khans; again we find him in Ciamara, or southern Cochín-China; and perhaps, once more, on a separate mission to the southern states of India. We are not informed whether his father and uncle shared in such employments, though they are mentioned as having rendered material service to the Khan, in forwarding the capture of Siang-yang (on the Han river) during the war against southern China, by the construction of powerful artillery engines—a story, however, perplexed by chronological difficulties.

sometimes contradict his statements, but he often adds detail, evidently authentic, of great interest and value, and we need not hesitate to accept it generically when it is not disavowed by us. The"Polo's arrears are at their family mansion in St John Chrysostom parish in worn and outlandish garb, of the scornful denial of their identity, and the stratagem by which they secured acknowledgment from Venetian society.

We next hear of Marco Polo in a militancy capacity. Jealousy was growing in bitterness between Venice and Genoa throughout the 13th century. In 1298 the Genoese prepared to strike at their rivals on their own ground, and a powerful fleet under Lamba Doria made for the Adriatic. Venice, on hearing of the Genoese armament, equipped a fleet still more numerous, and placed it under Andrea Dandolo. The crew of a Venetian galley at this time amounted, all told, to 250 men, under a capitano or master, but besides this officer each galley carried a sopracomito or gentleman-commander, usually a noble. On one of the galleys of Dandolo's fleet Marco Polo seems to have gone in this last capacity. The hostile fleets met before Curzola Island on the 9th of September, and engaged next morning. The battle ended in a complete victory for Genoa, the details of which may still be read on the façade of S. Matthew's church in that city. Sixty-six Venetian galleys were burnt in Curzola Bay, and eighteen were carried to Genoa, with 7000 prisoners, one of whom was Marco Polo. The captivity was of less than a year's duration; by the mediation of Milan peace was made, on honourable terms for both republics, by July 1399; and Marco was probably restored to his family during that or the following month.

But his captivity was memorable as the immediate cause of his Book. Up to this time he had doubtless often related his experiences among his friends; and from these stories, and the frequent employment in them (as it would seem) of grand numerical expressions, he had acquired the nickname of Marco Millions. Yet it would seem that he had committed nothing to writing. The narratives not only of Marco Polo but of several other famous medieval travellers (e.g. Ibn Battuta, Friar Odoric, Nicolo Conti) seem to have been extorted from them by a kind of pressure, and committed to paper by other hands. Examples, perhaps, of that intense dislike to the use of pen and ink which still prevails among ordinary respectable folk on the shores of the Mediterranean.

In the prison of Genoa Marco Polo fell in with a certain person of writing propensities, Rusticiano or Rustichello of Pisa, also a captive of the Genoese. His name is otherwise known as that of a respectable literary hack, who abridged and recast several of the French romances of the Arthurian cycle, then in fashion. He wrote down Marco's experiences at his dictation.

We learn little of Marco Polo's personal or family history after this captivity; but we know that at his death he left a wife, Donata (perhaps of the Loredano family, but this is uncertain), and three daughters, Fantina and Bellella (married, the former to Marco Bragadino), and Moreta (then a spinster, but married at a later date to Ranuzzo Dolfino). One last glimpse of the traveller is gathered from his will, now in St Mark's library. On the 9th of January 1324 the traveller, in his seventieth year, sent for a neighbouring priest and notary to make his testament. We do not know the exact time of his death, but it fell almost certainly within the year 1324, for we know from a scanty series of documents, beginning in June 1325, that he had at the latter date been some time dead. He was buried, in accordance with his will, in the Church of S. Lorenzo, where the family burying-place was marked by a sarcophagus, erected by his filial care for his father Nicolo, which existed till near the end of the 18th century. On the renewal of the church in 1792 this seems to have disappeared.

The archives of Venice have yielded a few traces of our traveller. Besides his own will just alluded to, there are the wills of his uncle Marco and of his younger brother Maffeo; a few legal documents connected with the house property in St John Chrysostom, and other papers of similar character; and two or three entries in the record of the Maggior Consiglio. We have mentioned the sobriquet of Marco Millioni. It was probably used as an abbreviation for Marco Millions, and not the name of his parents, as proposed in the public books of the commonwealth, and this statement has been verified in an entry in the books of the Great Council (dated April 10, 1305), which records as one of the securities in a certain case the "Nobilis vir Marchus Paulo Millon." It is alleged that long after the traveller's death there was always in the Venetian masques one individual who assumed the character of Marco Millioni, and told Munchausen-like stories to divert the vulgar. There is also a record (March 9, 1318) of the judgment of the court of requests (Curia Petitionum) upon a suit brought by the "Nobilis vir Marcus Polo" against Paolo Girardo, who had been an agent of his, to recover the sum of money he charged as unpaid after their money transaction, and not accounted. Another document is a catalogue of certain curiosities and valuables which were collected in the house of Marino Faliero, and this catalogue comprises several objects that Marco Polo had given to one of the Faliero family.

The most tangible record of Polo's memory in Venice is a portion of the Ca' Polo—the mansion (there is reason to believe) where the three travellers, after their long absence, were denied entrance. The court in which it stands was known in Ramusio's time as the Corte del millioni, and now is called Corte Sappioniera. That which remains of the ancient edifice is a passageway with a decorated archway of Italo-Byzantine character pertaining to the 14th century.

No genuine portrait of Marco Polo exists. There is a medallion portrait on the wall of the Sala dello Scudo in the ducal palace, which has become a kind of type; but it is a work of imagination no older than 1761. The oldest professed portrait is one in the gallery of Monsignor Badia at Rome, which is inscribed Marcus Polus venetus lotius orbis et Indie peregrinator primus. It is a good picture, but evidently of the 16th century at earliest. The Europeans at Canton have absurdly attached the name of Marco Polo to a figure in a Buddhist temple there containing a gallery of "Arhans" or Buddhist saints, and popularly known as the "temple of the five hundred gods." The Venetian municipality obtained a copy of this on the occasion of the geographical congress at Venice in 1881.

The book indited by Rusticiano is in two parts. The first, or prose part, as it is termed, is unfortunately the only part which consists of actual personal narrative. It relates in an interesting though extremely brief fashion the circumstances which led the two elder Polos to the Khan's court, together with those of their return. The second part is a list (which was perhaps introduced by Marco Polo's father) of the cities in the East, from the west by the Indian seas and Persia. The second and staple part consists of a series of chapters of unequal length and un系统atical structure, descriptive of the different states and provinces of Asia Minor, the countries of the Near Indies, Africa, Egypt, and the islands of the Mediterranean, with notices of their sights and products, of curious manners and remarkable events, and especially regarding the Emperor Kublai, his court, wars and administration. A series of chapters near the close treats of sundry wars that took place between various branches of the house of Jenghiz in the latter half of the 13th century. This last series is either omitted or greatly curtailed in all the MS. copies and versions except one (Paris, National Library, Fonds Fr. 1110).

It was long doubtful in what language the work was originally written. That this had been some dialect of Italian was a natural presumption, and a contemporary statement could be alleged in confirmation; but there is now no doubt that the original was French. This was first indicated by Count Baldelli-Boni, who published an elaborate edition of two of the Italian texts at Florence in 1827, and who found in the oldest of these indisputable signs that it was a translation from the French. The argument has since been followed up by others; and a manuscript in rude and peculiar French, belonging to the National Library of Paris (Fonds Fr. 1210), which was published 1864 by Socleaux, was evidently either the original or a close transcript of the original dictation. A variety of its characteristics are strikingly indicative of the unrevised product of dictation, and are such as would necessarily have disappeared either in a transcription or in a revised copy. Many illustrations could be adduced of the fact that the use of French was not a circumstance of surprising or unusual nature; for the language had at that time, in some points of view, even a wider diffusion than at present, and examples of its literary employment by writers who were not Frenchmen (like Rusticiano himself, a compiler of French romances) are very numerous.
Eighty-five MSS. of the book are known, and their texts exhibit considerable differences. These fall under four principal types. Of these, type i is the only complete version, and has been edited by Grynaeus, which has been mentioned (Paris, National Libr., Fr. 1116). Type ii, is shown by several valuable MSS. in purer French (Paris, Nat. Libr., Fr. 982) and by a text in the Fr. Libr. at Florence (L.125), which formed the basis of the edition prepared by the late M. Pauthier in 1865. It exhibits a text condensed and revised from the rude original, but without any exactness, though perhaps under the direction of Marco Polo himself, as his name appears at the conclusion prefixed to certain MSS. (Bern, Canton Libr. 125; Paris, Nat. Libr., Fr. 5649) records the presentation of a copy by the traveller himself to the Seigneur Thibaudat de Cépy, a distinguished French historian, at Paris, in 1506. Type iii, is that of a Latin version prepared in Marco Polo's lifetime, though without any sign of his cognisance, by Francesco Pipino, a Dominican of Bologna, and translated from an Italian copy. In this version, Marco Polo appears as a guide and not as an author. Type iv, is a very early Latin translation of the third part of the text, and is perhaps the best known of all. It is not only the earliest Latin translation, but it is the only one which is also a version of the third part. It was published in the middle of the 16th century were translations from Grynaeus's Latin. Hence they complete this curious and vicious circle of transmission—French, Italian, Pipino's Latin, Portuguese, Grynaeus's Latin, French.

Type iv deviates rather from those already mentioned; its history and true character are involved in obscurity. It is only recognized by some modern scholars as a version due to the Dominican, Baptista Ramusio, with interesting preliminary dissertations, and published at Venice two years after his death, in the second volume of the Navigazioni e Viaggi. Its peculiarities are great. Ramusio seems to imply that he made some use of Pipino's Latin, and various passages confirm this. But many new circumstances, and anecdotages occurring in no other copy, are introduced; many names assume a new shape; the whole style is more copious and literary than the previous versions. With respect to the supposed interpolations seem to carry us farther from the truth, others contain facts of Asiatic nature or history, as well as of Polo's alleged experiences, which it is difficult to ascribe to any hand but the traveller's own.

We recognize to a certain extent tampering with the text, as in cases where Polo's proper names have been identified, and more or less forms substituted. In some other cases, the editorial spirit has gone astray. Thus the age of young Marco has been altered to correspond with a date which is itself erroneous. Ormus is described as an island, contrary to the old texts, and to the fact in Marco Polo's narrative that ambassadors from Ormus went from there to China. A later edition of the story of the voyage of the Chinese and Indian vessels, swimming across the Indian Ocean, has been altered to suit the old text. The phrase "camel-loads" has been substituted for "ship-loads," in ignorance that the site was Baku on the Caspian. But, on the other hand, there are a number of new circumstances connected with the voyage of Polo to the East, and of Polo himself. Such is the account which Ramusio's version gives of the oppressions exercised by Kublai's Mahomedan minister Ahmad, telling how the Cathayans rose against him and murdered him, while the turquoise and coral were left to be taken by Polo himself. Such is the account which Ramusio's version gives of the yams in Montreal and in the French colonies, and how the gold of the Spanish, from the discovery of the Azores to the navigation, has been discovered by the French. Such is the account which Ramusio's version gives of the yams in Montreal and in the French colonies, and how the gold of the Spanish, from the discovery of the Azores to the navigation, has been discovered by the French.

Of Polo, it was the first traveller to trace a route across the whole longitude of Asia, naming and describing kingdom after kingdom which he had seen; the first to speak of the new and brilliant court which had been established at Peking; the first to reveal China in all its magnitude; the first to tell of the dynasties and the nations on its borders; the first to tell more of Tibet than its name, speaking of the great unknown land, of the size of its land and of its partial exploration; the first to meddle in the times to give any distinct account of the unexplored Christian Empire of Abyssinia, and the first to describe the Christian island of Socotra, and to speak, however, dynamically, of Zanzibar, of the trade on the coast of India, whilst he carries us also to the remotely opposite region of Siberia and the Arctic shores, to speak of dog-sledges, white bears and reindeer.

The diffusion of the book was hardly so rapid as has been sometimes alleged. We know from Gilles Mallet's catalogue of the books collected in the Louvre by Charles V., dating 1537-1578, that five of the Middle Ages were taken on the spot, and during the other hand, the 202 known MSS. and the numerous early printed editions of "Mandeville," with his lying wonders, indicates a much greater popularity. Dante, who lived twenty-three years after the fall of the last of the Pisans, met the page that never was. In the three Paris MSS. (Nat. Libr. Fr. 2810; Fr. 5631; Fr. 5649; see above) and accompanied by a commentary of great value; Baldelli-Boni's Italian edition, giving the oldest text of Polo (1622), and being generally read in its final shape, as revised and augmented by Henri Corder (Marco Polo. London, 1810).
storehouse of Polo learning in existence, embodying the labours of all the best students of the subject, and giving the essence of such works as that of Major P. Molesworth Sykes (Ten Thousand Miles in Persia, &c.) so far as these touch Marco Polo: the Archimandrite Palladinius Katharow’s "Elucidations of Marco Polo" (from the original in the Biblioteca Marciana at Venice); the Journal of the North China Branch of the Royal Asiatic Society (1876), pp. 1-54; F. von Richthofen, Letters to Shanghai Chamber of Commerce; E. C. Baber, Travels ... in Western China; G. Phillips, Identity of ... Zalim with Chang-shou in T’oung Pao (Oct. 1890), and other studies in T’oung-Pao (Dec. 1895 and July 1896). There are in all 10 French editions of Polo as well as 4 Latin editions, 27 Italian, 9 German, 4 Spanish, 1 Portuguese, 12 English, 2 Russian, 1 Dutch, 1 Bohemian (Chelbk), 1 Danish, and 1 Chinese. See also, Researches from Eastern Asiatic Sources, i. 239, 167; ii. 5, 71, 81-84; 184; Léon Cahun, Introduction à l’histoire de l’Asie, 339, 380; C. Raymond Beazley, Dawn of Modern Geography (H. Y.: C. R. B.).

POLO (Tibetan pulu, ball), the most ancient of games with stick and ball. Hockey, the Irish national game of hurling (and possibly golf and cricket) are derived from polo.

History. The latter was called hockey or hurling on horseback in England and Ireland respectively, but historically hockey and hurling are polo on foot.

The earliest records of polo are Persian. From Persia the game spread westward to Constantinople, eastwards through Turkestan to Tibet, China and Japan. From Tibet polo travelled to Gilgit and Chitral, possibly also to Manipur. Polo also flourished in India in the 16th century. Then for 200 years its records in India cease, till in 1854 polo came into Bengal from Manipur by way of Cachar and in 1862 the game was played in the Punjab.

There have been twelve varieties of the game during its existence of at least 2000 years. (1) A primitive form consisting of feats of horsemanship and of skill with stick and ball. (2) Early Persian, described in Shakhnama, a highly organized game with rules, played four aside. (3) Later Persian, 16th century, the grounds 300 by 170 yds. Sir Anthony Shirley says the game resembled the rough football of the same period in England. (4) The game in the 17th century in Persia. A more highly organized game than No. 3, as described by Chardin. (5) The Byzantine form played at Constantinople in the 12th century. A leather ball the size of an apple and a racquet were used. (6) The Chinese game, about A.D. 600 played with a light wooden ball. The ball was formed by two posts 6 ft. 9 in. high and the latter post being cut in a net attached to it in the form of a bag. The side which hit the ball into the bag were the winners. Another Chinese form was two teams ranged on opposite sides of the ground, each defending its own goal. The object of the game was to drive the ball through the enemy’s goal. (7) The Japanese game, popular in feudal times, still survives under the name of Dakuiki, or ball match. The Japanese game has a boarded goal; 5 ft. from the ground is a circular hole 1 ft. 2 in. in diameter with a bag behind. The balls are of paper with a cover of pebbles or bamboo fibre, diameter 1-7 in., weight 1½ oz. The sticks are racket shaped. The object is to lift over or carry the ball with the racket and place it in the bag. (8) Called rol, played with a long stick with which the ball was dribbled along the ground. (9) Another ancient Indian form in which the sides ranged up on opposite sides of the ground and the ball was thrown in. This is probably the form of the game which reached India from Persia and is represented at the present day by Manipur and Gilgit polo, though these forms are probably rougher than the old Indian game. (10) Modern English with heavy ball and sticks, played in England and the colonies and wherever polo is played in Europe. Its characteristics are: offside; severe penalties for breach of the rules; change of players; betting, and a strong defence. (11) Indian polo has a lighter ball, no boards to the grounds, which are usually full-sized; a modified offside-rule, but the same system of penalties. It is a quicker game than the English. (12) The American game has no offside and no penalties, in the English sense. The attack is stronger, the passing longer, the pace greater and more sustained. American players are more certain goal-hitters and their scoring is higher. They defeated the English players in 1909 with ease.

Polo was first played in England by the 10th Hussars in 1869. The game spread rapidly and some good play was seen at Lillie Bridge. But the organization of polo in England dates from its adoption by the Hurlingham Club in 1873. The ground was boarded along the sides, and this device, which was employed as a remedy for the irregular shape of the Hurlingham ground, has become almost universal and has greatly affected the development of the game. The club committee, in 1874, drew up the first code of rules, which reduced the number of players to five a side and included offside. The next step was the foundation of the Champion Cup, in 1877. Then came the rule dividing the game into periods of ten minutes, with intervals of two minutes for changing ponies after each period, and five minutes at halftime. The height of ponies was fixed at 14½ in. and a little later an official measurer was appointed, no pony being allowed to play unless registered at Hurlingham. The next change was the present scale of penalties for offside, foul riding or dangerous play. A short time after, the crooking of the adversary’s stick, unless in the act of hitting the ball, was forbidden. The game grew faster, partly as the result of these rules. Then the ten minutes’ rule was revised. The period did not close until the ball went over the boundary. Thus the period might be extended to twelve or thirteen minutes, and although this time was deducted from the next period the strain of the extra minutes was too great on men and ponies. It was therefore laid down that the ball should go out of play on going out of bounds or striking the board, whichever happened first. In 1910 a polo handicap was established, based on the American system of estimating the number of goals a player was worth to his side. This was modified in the English handicap by assigning to each player a handicap number as at golf. The highest number is ten, the lowest one. The Hurlingham handicap is revised during the winter, again in May, June and July, each handicap coming into force one month after the date of issue. In tournaments under handicap the individual handicap numbers are added together, and the team with the higher aggregate concedes goals to that with the lower, according to the conditions of the tournament. The handicap serves to divide seconds from first class tournaments, for the former teams must not have an aggregate over 25.

The size of the polo ground is 300 yds. in length and from 160 to 200 yds. in width. The larger size is only found now where boards are not used. The ball is made of willow root, is 3½ in. in diameter, weight not over 2½ oz. The polo stick has no standard size or weight, and square or cigar-shaped heads are used at the discretion of the player. On soft grounds, the former, on hard grounds the latter are the better, but Indian and American players nearly always prefer the cigar shape.

The goal posts, now generally made of papier mâché, are 8 yds. apart. This is the goal line. Thirty yards from the goal line a line is marked out, nearer than which to the goal no one of a fouled side may be when the side fouling has to hit out, as a penalty from behind the back line, which is the goal line produced. At 50 yds. from each goal there is generally a mark to guide the man who takes a free hit as a penalty.

Penalties are awarded by the umpires, who should be two in number, well mounted, and with a good knowledge of the rules of the game. The Hurlingham and Ranelagh clubs appoint official umpires. There should also be a referee in case of disagreement between the umpires, and it is usual to have a man with a flag behind each goal to signal when a goal is scored. The Hurlingham clubs have jurisdiction to enforce and make some local modifications, in force in the United Kingdom, English-speaking colonies, the Argentine Republic, California, and throughout Europe. America and India are governed by their own polo associations.

The American rules have no offside, and their penalties consist of subtracting a goal or the fraction of a goal, according to the offence, from the side which has incurred a penalty for fouling. The differences between the Hurlingham and Indian rules
are very slight, and they tend to assimilate more as time goes on.

Polo in the army is governed by an army polo committee, which fixes the date of the inter-regimental tournament. The semi-finals and finals are played at Hurlingham. The earlier ties take place at centres arranged by the army polo committee, who are charged by the military authorities with the duty of checking the expenditure of officers on the game. The value of polo as a military exercise is now fully recognized, and with the co-operation of Hurlingham, Ranaghan and Roehampton the expenses of inter-regimental tournaments have been regulated and restrained.

The County Polo Association has affiliated to it all the county clubs. It is a powerful body, arranging the conditions of county tournaments, constructing the handicaps for county players, and in conjunction with the Ranaghan club holding a polo week for county players in London. The London clubs are three—Hurlingham, Ranaghan and Roehampton. Except that they use Hurlingham rules the clubs are independent, and arrange the conditions and fix the dates of their own tournaments. Ranaghan has four, Roehampton three and Hurlingham two polo grounds. There are about 400 matches played at these clubs, besides members' games from May to July during the London season. At present there are 24 clubs at whom which seven are internationals. In 1886. In 1902 an American team made an attempt to recover it and failed. They lacked ponies and combination; but they bought the first and learned the second, and tried again successfully in 1909, thus depriving England of the championship of the world.

Polo in England has passed through several stages. It was always a game of skill. The cavalry regiments in India in early days, the 5th, 6th, 12th and 17th Lancers, the 16th Hussars and the 15th Hussars, had all the value of combination. In very early days regimental players had learned the value of the game. When they went on to give opportunities to their own side. The duty of supporting the other members of the team and riding off opponents so as to clear the way for players on the same side was understood. This combination was made easier when the teams were reduced from five a side to four. Great stress was laid on each man keeping his place, but a more flexible style of game existed from early days in the 17th Lancers and was improved and perfected at the Rugby Club by the late Colonel Gordon Renton and Captain E. D. Miller, who had belonged to that regiment. For a long time the Rugby style of play, with its close combination, short passes and steady defence, was the model on which other teams formed themselves. The secret of the success of Rugby was the close and unselfish combination and the hard work done by every member of the team. After the American victories of 1899 a bolder, harder hitting style was adopted, and the work of the forwards became more important, and longer passes are now the rule. But the main principles are the same. The forwards lead the attack and are supported by the half-backs and back when playing towards the adversaries' goal. In defence the forwards hamper the opposing No. 3 and No. 4 and endeavour to clear the way for their own No. 2 and No. 3, who are trying not merely to keep the ball out of their own goal but to turn defence into attack. Each individual player must be a good horseman, able to make a pony gallop, must have a control of the ball, hitting hard and clean and in the direction he wishes it to go. He must keep his eye on the ball and yet know where the goal-posts are, must be careful not to incur penalties and quick to take advantage of an opportunity. Polo gives no time for second thoughts. A polo player must not be in a hurry, but he must never be slow nor dwell on his stroke. He must be able to hit when galloping his best pace on to the ball and able to use the speed of the pony in order to get pace. He must be able to hit a backhander or to meet a ball coming to him, as the tactics of the game require.

Polo has given rise to a new type of horse, an animal of 13 hands 2 in. with the power of a hunter, the courage of a racehorse and the docility of a pony. At first the ponies were small, but now each pony must pass the Hurlingham official measurer and be entered on the register. The English system of measurement is the fairest and most humane possible. The pony stripped of his clothing is led by an attendant, not his own groom, into a box with a perfectly level floor and shut off from every distraction. A veterinary surgeon examines to see that the pony is neither drugged nor in any way improperly prepared. The pony is allowed to stand easily, and a measuring standard with a spirit-level is then placed on the highest point of the wither, and if the pony is not more than 14 2 in. is five years old it is registered for life. Ponies of mixed breeds There are Arabs, Argentines, Americans, Irish and English ponies, the last two being the best. The Polo and Riding Pony Society, with headquarters at 12 Hanover Square, looks after the interests of the English and Irish pony and encourages their breeders. The English ponies are now bred largely for the game and are a blend of thoroughbred blood (the best are always the race-winning strains) or Arab and of the English native pony.

There are many allusions to polo in the poets, notably Nizami, Jami and Omar Khayyam.

Constantine C. C. Paskevicius, Jomnus eponome rerum ab Alexio Comnenus gest, (Ionn, 1836).

Dale, Polo in Gigli and Chirol: "Polo in Baltistan," The Field (1888); Polo in Mengpur, Captain McCulloch, Mengpuris and the Adjacent Tribes (1899). (T. F. D.)

POLONAISE (i.e., Polish, in French), a stately ceremonial dance, usually written in 3/4 time. As a form of musical composition it has been employed by such composers as Bach, Handel, Beethoven, and above all by Chopin. It is usual to date the origin of the dance from the election (1573) of Henry duke of Anjou, afterwards Henry III. of France, to the throne of Poland. The ladies of the Polish nobility passed in ceremonial procession before him at Cracow to the sound of stately music. This procession of music became the regular opening ceremony at royal functions, and developed into the dance. The term is also given to a form of skirted bodice, which has been fashionable for ladies at different periods.

POLONNARUWA, a ruined city and ancient capital of Ceylon. It first became a royal residence in A.D. 368, when the lake of Topawewa was formed, and succeeded Anuradhapura as the capital in the middle of the 6th century. The principal ruins date chiefly from the time of Prakrama Bahu (A.D. 1153–1186). The most imposing pile remaining is the Jetawanna temple, a building 177 ft. in height and 12 ft. thick. The city is now entirely deserted, and, as in the case of Anuradhapura, its ruins have only recently been rescued from the jungle.
POLOTSK—POLTAVA

POLOTSK, a town of Russia, in the government of Vitebsk, at the confluence of the Polota with the Dvina, 62 m. by rail N.W. of the town of Vitebsk. Pop. 20,751. Owing to the continuous wars, of which, from its position on the line of communication between central Russia and the west it was for many centuries the scene, scarcely any of its remarkable antiquities remain. The upper castle, which stood at the confluence of the rivers and had a stone wall with seven towers, is in ruins, as is the lower castle formerly enclosed with strong walls and connected with the upper castle by a bridge. The cathedral of St Sophia in the upper castle, built in the 12th century, fell to ruins in the 18th century, whereupon the United Greek bishop substituted a modern structure. Upwards of two-thirds of the inhabitants are Jews; the remainder have belonged mostly to the Orthodox Greek Church since 1839, when they were compelled to abandon the United Greek Church. Flax, linseed, corn and timber are the leading articles of commerce.

Polotsk or Poltse is mentioned in 862 as one of the towns given by the Scandinavian Rurik to his men. In 980 it had a prince of its own, Ragnvald (Rogvolod or Rognvald), whose daughter married a prince of Poland, and maintained an independent principality until the 12th century, resisting the repeated attacks of the princes of Kiev; those of Pskov, Lithuania, and the Livonian Knights, however, proved more effective, and Polotse fell under Lithuanian rule in 1320. About 1385 its independence was destroyed by the Lithuanian prince Vitovt. It was five times besieged by Moscow in 1500–18, and was taken by Ivan the Terrible in 1563. Recaptured by Stephen Bathory, king of Poland, sixteen years later, it became Polish by the treaty of 1582. It was then a large and populous city, and carried on an active commerce. Pestilences and conflagrations were its ruin; the plague of 1566 wrought great havoc among its inhabitants, and that of 1600 destroyed 15,000. The castles, the town and its walls were burned in 1607 and 1642. The Russians continued their attacks, burning and plundering the town, and twice, in 1633 and 1705, taking possession of it for a few years. It was not definitely annexed, however, to Russia until 1772, after the first dismemberment of Poland. In 1812 its inhabitants resisted the French invasion, and the town was partially destroyed.

POLTAVA, a government of south-western Russia, bounded by the government of Chernigov on the N., Kharkov on the E., Ekaterinoslav and Kherson on the S., and Kiev on the W., and having an area of 19,360 sq. m. Its surface is a undulating plain, 600 ft. above sea-level, with a few elevations reaching 670 ft. in the north, and gently sloping to 300 and 400 ft. in the south-west. Owing to the deep excavations of the rivers, their banks, especially those on the right, have the aspect of hilly tracts, while low plains stretch to the left. Almost the whole of the surface consists of Tertiary deposits; Cretaceous rocks appear in the north-east, at the bottom of the deeper ravines. The government touches the granitic region of the Dnieper only in the south, below Kremenchug. Limestone with dolerite veins occurs in the isolated hill of Isachev, which rises above the marshes of the Sula. The whole is covered with a layer, 20 to 60 ft. thick, of bouder clay, which again is often mantled with loam. Under Polish rule the land was chiefly used for livestock, with a few fields for cultivated crops, and large areas for pastures. Wheat, barley, and rye are now cultivated, and the land has been drained and partly cultivated. Poltava has been noted, however, for the production of wool, tobacco, and linseed.

The estimated population in 1906 was 3,372,400. The great majority are Little Russians. Agriculture is the principal pursuit, 60% of the total area being arable land. The crops chiefly grown are wheat, rye and oats; the sunflower is largely cultivated, especially for oil, and the growing of tobacco, always important, has made a great advance. Kitchen gardening, the cultivation of the plum, and the preparation of preserved fruits are important branches of industry. At Lubny, where an apothecaries' garden is maintained by the Crown, the collection and cultivation of medicinal plants are a specialty. The main source of wealth in Poltava has always been, and still is, its live-stock breeding—horses, cattle, sheep, pigs. Some of the wealthier landowners and many peasants rear finer breeds of horses. The land is chiefly owned by the peasants, who possess 52% of the cultivable area; 42% belongs to private persons, and the remainder to the Crown, the clergy, and the municipalities.

Among the manufacturing districts hold the leading place, after which come flour-mills, tobacco factories, machine-making, tanneries, saw-mills, sugar-works and woollen manufactures. In the Dnieper valley there are numerous flour-mills, and several districts for the manufacture of spirits, wool, tallow, skins and woollen cloth. The Dnieper is the principal artery for the exports and for the import—timber. The chief river-ports are Kremenchug and Poltava. Steamers ply between Kiev and Ekaterinoslav; but the navigation is hampered by want of water and becomes active only in the south. Traffic mostly follows the railway. Poltava is divided into fifteen districts, of which the chief towns are Poltava, Gadyach, Khorol, Kobelyaky, Konstantinograd, Kremenchug, Lokhitva, Lubny, Mirgorod, Pereyaslav, Friyatyn, Priluki, Romny, Zenkov and Zolotonskha.

History.—At the dawn of Russian history the region now occupied by Poltava was inhabited by the Slave tribe of the Syveryanes. As early as 988 the Russians erected several towns on the Sula and the Trubezh for their protection against the Turkish Petchenegs and Polovtsi, who held the south-eastern steppes. Population extended, and the towns of Pereyaslav, Lubny, Priluki, Priyatyn, Romny, begin to be mentioned in the 11th and 12th centuries. The Mongol invasion of 1239–42 destroyed most of them, and for two centuries afterwards they disappear from Russian annals. About 1331 Gedimin, prince of Lithuania, annexed the so-called "Syevers towns" and on the recognition of the union of Lithuania with Poland they were included in the united kingdom along with the remainder of Little Russia. In 1476 a separate principality within the Polish state was allotted to the princes of Poltava, and in 1600 it was formally ceded out of Little Russia, and remained so until the rising of the Cossack chief Bogdan Chmielnicki in 1654. By the Andrusovsko Treaty, the left bank of the Dnieper being ceded to Russia, Poltava became part of the dominions of the Zaporogian Cossacks, and was divided into "regiments," six of which (Poltava, Pereyaslavl, Priluki, Gadyach, Lubny and Mirgorod) lay within the limits of the present government. They lost their independence in 1764. (P. A. K.; J. T. Be.)

POLTAVA, a town of Russia, capital of the government of the same name, on the right bank of the Vorskla, 88 m. by rail W.S.W. of Kharkov. Pop. 53,060. The town is built on a plateau which descends by straight slopes on nearly every side. Several suburbs, inhabited by Cossacks, whose houses are built amid gardens, and a German colony, surround the town. The oldest buildings are a monastery, erected in 1650, and a wooden
church visited by Peter the Great after the battle of Poltava. There are a military school for cadets, a theological seminary and two girls' colleges; also flour-mills, tobacco works and a tannery.

Poltava is mentioned in Russian annals in 1714, under the name of Lutava, but does not again appear in history until 1430, when, together with Glinisk, it was given by Gedimin, prince of Lithuania, to the Tatar prince Leksada. Under the Cossack chief, Bogdan Chmielnicki, it was the chief town of the Poltava "regiment." Peter the Great of Russia defeated Charles XII of Sweden in the immediate neighbourhood on the 27th of June 1709, and the victory is commemorated by a column 50 ft. in height.

**POLTERGEIST** (Ger. for "racketing spirit"), the term applied to certain phenomena of an unexplained nature, such as movements of objects without any traceable cause, and noises equally untraceable to their source; but in some "cases exhibiting intelligence, as when raps answer a question by a code. In the word *Poltergeist*, the phenomena are attributed to the action of a *Geist*, or spirit: of old the popular explanation of all residuary phenomena. The hypothesis, in consequence of the diffusion of education, has been superseded by that of "electricity"; while sceptics in all ages and countries have accounted for all the phenomena by the theory of imposture. The last is at least a *tota causa*: imposture has often been detected; but if it is not so certain that this theory accounts for all the circumstances. To the student of human nature the most interesting point in the character of poltergeist phenomena is their appearance in the earliest known stages of culture, their wide diffusion, and their astonishing uniformity. Almost all the beliefs usually styled "superstitious" are of early occurrence and of wide diffusion: the lowest savages believe in ghosts of the dead and in wrathings of the living. Such beliefs when found thriving in our own civilization might be explained as mere survivals from savagery, memories of all

"The superstitious idle-headed oldReceived and did deliver to our age."

But we have not to deal only with a belief that certain apparently impossible things may occur and have occurred in the past. We are met by the evidence of sane and credible witnesses, often highly educated, who maintain that they themselves have heard and beheld the unexplained sounds and sights. It appears, therefore, that in considering the phenomena of the poltergeist we are engaged with facts of one sort or another; facts produced either by skilled imposture, or resting on hallucinations of the witnesses; or on a mixture of fraud and of hallucination caused by "suggestion." There remains the chance that some agency of an unexplained nature is, at least in certain cases, actually at work.

A volume would be needed if we were to attempt to chronicle the phenomena of the poltergeist as believed in by savages and in ancient and medieval times. But among savages they are usually associated with the dead, or with the medicine-men of the tribes. These personages are professional "mediums," and like the mediums of Europe and America, may be said to have domesticated the poltergeist. At their séances, savages or civilized, the phenomena are reported to occur—such as rappings and other noises, loud or low, and "movements of objects without physical contact." (See, for a brief account, A. Lang, *Cock Lane and Common Sense*, "Savage Spiritualism"; and see the Jesuit *Lettres édifiantes*, North America, 1620-1770, and Kohl's *Kitchi Gami*.) But "induced phenomena," where professional mediums and professional medical men are the agents, need not here be considered. The evidence, unless in the case of Sir William Crooke's experiments with Daniel Dunglas Home, is generally worthless, and the laborious investigations of the Society for Psychical Research resulted only in the detection of fraud as far as "physical" manifestations by paid mediums were concerned.

The spontaneous poltergeist, where, at least, no professional is present, and no séance is being held, is much more curious and interesting than the simple tricks played in the dark by impudent charlatans. The phenomena are identical, as reported, literally "from China to Peru." The Cierd de Lescot (1540) tells us that the cacique of Pirza, in Poypany, during his conversion to Christianity, was troubled by stones falling mysteriously through the air (the mysterious point was the question of whence they came, and what force urged them), while Christians saw at his table a glass of liquor raised in the air, by no visible hand, put down empty, and replenished! Mr Denny (Folk Lore of China, 1876, p. 79) speaks of a Chinese householder who was driven to take refuge in a temple by the usual phenomena—throwing about of crockery and sounds of heavy footsteps—after the decease of an aggrieved monkey. This is only one of several Chinese cases of poltergeist; and the phenomena are described in Jesuit annals of the 17th century in China. In these papers no explanation is suggested. There is a famous example in a nunnery, recorded (1528) by a notable witness, Adrien de Montalembert, almoner to Francis I. The agent was supposed to be the spirit of a sister recently deceased.

Among multitudes of old cases, that of the "Drummer of Tedworth" (1662-1663; see Glanvil, *Sadducismus triumphatus*, 1666); that at Rerrick, recorded by the Rev. Mr Teller in 1695; that of the Wesley household (1716-1717) chronicled in contemporary letters and diaries of the Wesley family (Southey's *Life of John Wesley*); that of Cideville (1852), from the records of the court which tried the law-suit arising out of the affair (Proc. Soc. Psychical Research, xvii. 454-463); and the Alresford case, attested by the great admiral, Lord St Vincent, are among the most remarkable. At Tedworth we have the evidence of Glanvil himself, though it does not amount to much; at Rerrick, Teller was a good chronicler and gives most respectable signed vouchers for all the marvels: Samuel Wesley and his wife were people of sense, they were neither alarmed nor superstitious, merely puzzled; while the court which tried the Cideville case, only decided that "the cause of the events remains unknown." At Alresford, in Hampshire, the phenomenon occurred before the Lord Chief Justice, who was the brother of Mrs Ricketts, who occupied the house, were peculiarly strange and emphatic: the house was therefore pulled down. At Willington Mill, near Morpeth (1831-1847), the phenomena are attested by the journal of Mr Procter, the occupant, a Quaker, a "tee-totaler," and a man of great resolution. He and his family endured unspeakable things for sixteen years, and could find no explanation of the sights and sounds, among which were phantasms of animals, as at Epworth, in the Wesley case.

Of all these cases that of the Wesleys has attracted most critical attention. It was not, in itself, an extreme instance; but at Alresford, at the close of the 18th century, and at Willington Mill in the middle of the 19th, the disturbances were much more violent and persistent than at Epworth, while our evidence is, in all three examples, derived from the contemporary narratives, letters and journals of educated persons. The Wesleys, however, were people so celebrated and so active in religion that many efforts have been made to explain their "old Jeffrey," as they called the disturbing agency. These attempts at explanation have been fruitless. The poet Coleridge, who said that he knew many cases, explained all by a theory of contagious epidemic hallucination of witnesses. Dr Salmon, of Trinity College, Dublin, set all down to imposture by Hetty Wesley, a vivacious girl (Fortnightly Review, 1866). The documents on which he relied, when closely studied, did not support his charges, for he made several important errors in dates, and on these his argument rested. F. Podmore, in several works (e.g. *Studies in Psychical Research*), adopted a theory of exaggeative memory in the narrators, as one element, with a dose of imposture and of hallucination begotten of excited expectation. The Wesley letters and journals, written from day to day, do not permit of exaggeative memory, and when the records of 1716-1717 are compared with the reminiscences collected from his family by John Wesley in 1726, the discrepancies are seen to be only such as occur in all human
evidence about any sort of events, remote by nine or ten years. Thus, in 1726, Mrs Wesley mentioned a visionary badger seen by her. She did not write about it to her son Samuel in 1717, but her husband and her daughter did then describe it to Samuel, as an experience of his mother at that date. The whole family, in 1717, the same family, and were fond of the word of Samuel’s questions. (Mr Podmore’s arguments are to be found in the Journal of the Studies of Psychological Research, iv. 40-45. Some dates are misprinted.) The theory of hallucination cannot account for the uniformity of statements, in many countries and at many dates, to the effect that the objects mysteriously set in motion moved in soft curves and swerves, or “wobbled.” Suppose that an adroit impostor is throwing them, suppose that the spectators are excited, why should their excitement everywhere produce a uniform hallucination as to the mode of motion? It is better to confess ignorance, and remain in doubt, than to invent such theories.

A modern instance may be analysed, as the evidence was given contemporaneously with the events (Podmore, Proc. Soc. Psychological Research, xii. 45-58: “Poltergeist”). On the 20th or 21st of February 1893 a Mrs White, in a cottage at Workop, was “washing up the tea-things at the table,” with two of her children in the room, when “the table tilted up at a considerable angle,” to her amazement. On the 26th of February, Mr White being from home, Mrs White extended hospitality to a girl, Eliza Rose, “the child of an imbecile mother.” Eliza is later described as “half-witted,” but no proof of this is given. On the 1st of March, White being from home, at about 11.30 p.m., a number of things “which had been in the kitchen a few minutes before” came tumbling down the kitchen stairs. Only Mrs White and Eliza Rose were then in the kitchen. Later some hot coals made an invasion. On the following night, White being at home in the kitchen, with his wife and Eliza, a miscellaneous throng of objects came in. Mr White made vain research upstairs, where his brother Tom. On his return to the kitchen “a little china woman left the mantelpiece and flew into the corner.” Being replaced, it repeated its flight, and was broken. White sent his brother to fetch a doctor; there also came a policeman, named Higgs; and the doctor and policeman saw, among other things, a basin and cream jug rise up automatically, fall on the floor and break. Next morning, a clock which had been silent for eighteen months struck; a crash was heard, and the clock was found to have leapt over a bed and fallen on the floor. All day many things kept flying about and breaking themselves, and Mr White sent Miss Rose about her business. Peace ensued.

Mr Podmore, who visited the scene on the 7th and 8th of April and collected deposits, says (writing in 1883): “It may be stated generally that there was no possibility, in most cases, of the objects having been thrown by hand. . . . Moreover it is hard to conceive by what mechanical appliances, under the circumstances described, the movements could have been effected. To suppose that these various objects were all moved by mechanical contrivances argues incredible stupidity, amounting almost to imbecility, on the part of all the persons present who were not in the plot,” whereas Higgs, Dr Lloyd and a miner named Curass, all “certainly not wanting in intelligence,” examined the objects and could find no explanation. White attested that fresh invasions of the kitchen by inanimate objects occurred as Eliza was picking up the earlier arrivals; and he saw a salt-cellar fly from the table while Eliza was in another part of the room. The amount of things broken was valued by White at £5. No one was in the room when the clock struck and fell. Higgs saw White shut the cupboard doors, and instantly burst open, and a large glass jar flew into the yard and broke. “The jar could not go in a straight line from the cupboard out of the door; but it certainly did go” (Higgs). The depositions were signed by the witnesses (April 1883).

In 1896, Mr Podmore, after thirteen years of experience in examining reports of the poltergeist, produced his expana-

cations. (1) The witnesses, though “honest and fairly intelligent,” were “imperfectly educated, not skilled in accurate observation of any kind.” (They described, like many others, in many lands, the “wobbling” movement of objects in flight.) (2) Mr Podmore took the evidence five weeks after date; there was time for exaggerated memories. (Mr Podmore did not consult, it seems, the contemporary evidence of Higgs in the Retford and Gainsborough Times, 9th of March 1883. On examination it proves to tally as precisely as possible with the testimonies which he gave to Mr Podmore, except that in March he mentioned one or two miracles which he omitted five weeks later! The evidence is published in Lang’s The Making of Religion, 1898, p. 356.) (3) In the evidence given to Mr Podmore five weeks after date, there are discrepancies between Higgs and White as to the sequence of some events, and as to whether one Coulter was present when the clock fell; he asserts, Higgs and White deny it. (There is never evidence of several witnesses, five weeks after an event, without such discrepancies. If there were, the evidence would be suspected as “cooked.”) Higgs in April gave the same version as in March.) (4) As there are discrepancies, the statements that Eliza was not always present at the abnormal occurrences may be erroneous. “It is perhaps not unreasonable to conjecture that Eliza Rose herself, as the instrument of mysterious agencies, or simply as a half-witted girl gifted with abnormal cunning and love of mischief, may have been directly responsible for all that took place.” (Hewif, if as we have seen, the theory of mechanical appliances is abandoned, “under the circumstances described”? We need to assume that all the circumstances are wrongly described. The evidence that the witnesses were lamentable, and we ask how could the most half-witted of girls manage so much property undetected, under the eyes of the owner, a policeman, a medical practitioner and others? How could she throw things from above into the room where she was picking up the things as they arrived? Or is that a misdescription? No evidence of Eliza’s half-wittedness and abnormal cunning is adduced. If we call her “the instrument of mysterious agencies,” the name of these agencies is—poltergeist! No later attempt to find and examine the abnormal girl is recorded.)

The explanations are not ideally satisfactory, but they are the result, in Mr Podmore’s mind, of examination of several later cases of poltergeist. In one a girl, carefully observed, was detected growing thinner; this was attributed to the unusual events, and was confirmed. The events occurred, in her absence, at another place and time, is discounted. In several other cases, exaggerations of memory, malobservation and trickery combined, are the explanations, and the conclusion is that there is “strong ground” for believing in trickery as the true explanation of all these eleven cases, including the Workop affair. Mr Podmore asserts that, at Workop, “the witnesses did not give their testimony until some weeks after the event.” That is an erroneous statement as far as Higgs goes, the result apparently of malobservation of the local newspaper. More or less of the evidence was printed in the week when the events occurred. Something more than unconscious exaggeration, or malobservation, seems needed to explain the amazing statements made by Mr Newman, a gamekeeper of Lord Portman, on the 23rd of January 1895, at Durmeston in another case. Among other things, he said that on the 18th of December 1894, a boot flew out of a door. “I went and put my foot on the boot and said ‘I defy anything to move this boot.’ Just as I stepped off, it rose up behind me and knocked my hat off. There was nobody behind me.” Gamekeepers are acute observers, and if the narrative be untrue, malobservation or defect of memory does not explain the fact. In this case, at Durmeston, the rector, Mr Anderson, gave an account of

1 The present writer criticized Mr Podmore’s explanation in The Making of Religion. Mr Podmore replied (Proc. Soc. Psychological Research, xv. 131, 135), pointing out an error in the critic’s presentation of his meaning. He, in turn, said that the writer

1 champions the supernatural interpretation,” which is not exact, as the writer has no theory on the subject, though he is not satisfied that “a naughty little girl” is a uniformly successful solution of the poltergeist problem.
POLTERGEIST

some of the minor phenomena. He could not explain them, and
gave the best character to the Nonconformist mother of the
child with whom the events were associated. No trickery
was discovered.

The phenomena are frequently connected with a person,
often a child, suffering from nervous malady or recent nervous
shock. No such person appears in the Alresford, Willington,
Epworth and Tedworth cases, and it is not stated that Eliza
Rose at Worksop was subjected to a medical examination. In
a curious case, given by Mrs Crowe, in The Night Side of Nature,
the young person was the daughter of a Captain Molesworth.
Her own health was bad, and she had been depressed by the
death of a sister. Captain Moresworth occupied a semi-detached
villa at Trinity, near Edinburgh; his landlord lived next door.
The phenomena set in: the captain bored holes in the wall to
discover a cause in trickery, and his landlord brought a suit
against him in the sheriff's court at Edinburgh.

The papers are preserved, but the writer found that to
discover them would be a herculean labour. He saw, how-
ever, a number of documents in the office of a firm of
sollicitors employed in the case. They proved the fact of the
lawsuit but threw no other light on the matter. We often
find that the phenomena occur after a nervous shock to the
person who may be called the medium. The shock is frequently
consequent on a threat from a supposed witch or wizard.
This was the case at Ciderville in 1830—1831. (See an abstract of
the documents of the trial, Proceedings S.P.R. xviii. 454-463.
The entire report was sent to the writer.) In 1901 there
was a case at Great Grimsby; the usual flying of stones and
other objects occurred. The woman of the house had been
threatened by a witch, after that the poltergeist developed.
No explanation was forthcoming. In Proc. S.P.R. xvii.
340 the Rev. Mr Deanley gives a curious parallel case
with detection of imposture. In Miss O'Neal's Devonshire
Idylls an excellent account of the phenomena which occurred
after a Devonshire girl of the best character, well known to Miss
O'Neal, had been threatened by a witch. In the famous instance
of Christian Shaw of Bargarran (1607) the child had been thric
formally cursed by a woman, who prayed to God that her soul
"might be hurled through hell." Christian fell into a state
which puzzled the medical faculty (especially when she floated
in the air), and doubtless she herself caused, in an hysterical
state, many phenomena which, however, were not precisely
poltergeist phenomena. An American writer giving an account
of movements of objects, recently occurred in the Hudson Bay
territory, after a half-breed girl had received a nervous shock
from a flash of lightning that struck near her. Heavy weights
automatically "toboggan," as Red Indian spectators said,
and there were the usual rappings in tent and wigwam. If we
accept trickery as the sufficient explanation, the uniformity of
tricks played by hysterical patients is very singular. Still
more singular is a long series, continued through several years,
of the same occurrences where no hysterical patient is known
to exist. In a very curious example, a carpenter's shop being
the scene, there was concerned nobody of an hysterical temperament,
not even the joiners or glaziers, and there was no explanation.
An excellent case of hysterical fraud by a girl in France is given
by Dr Grasset, professor of clinical medicine at Montpellier (Proc.
S.P.R. xviii. 464-480). But in this instance, though things
were found in unusual places, nobody over eight years old saw
them flying about; yet all concerned were deeply superstitious.

On the whole, while fraud, especially hysterical fraud, is a
viva causa in some cases of poltergeist, it is not certain that the
explanation fits all cases, and it is certain that detection of
fraud has often been falsely asserted, as at Tedworth and
Willington. No good chronic case, as at Alresford, Epworth,
Spraion (Bovet's Pandaemonium), Willington, and in other
classical instances, has been for months sedulously observed by
skeptics. In short-lived cases, as at Worksop, science appears
on the scene long enough after date to make the theory
of exaggeration of memory plausible. If we ask science to explain
how the more remarkable occurrences could be produced by a
girl ex hypot hese half-witted, the reply is that the occurrences
never occurred, they were only "described as occurring" by
untrained observers with "patent double magnifying" mem-
ories; and with a capacity for being hallucinated in a uniform
way all the world over. Yet great quantities of crockery
and furniture were broken, before the eyes of observers, in a
house near Ballarmina, in North Ireland, in January 1907.
The experiment of exhibiting a girl who can break all the
crockery without being detected, in the presence of a medium
and a policeman, who can, at the same time, induce
the spectators to believe that the flying objects waver, swerve
and "wobble," has not been attempted.

An obvious difficulty in the search for authentic information
is the circumstance that the poor and imperfectly educated are
much more numerous than the well-to-do and well educated.
It is therefore certain that most of the disturbances will occur
in the houses of the poor and ill educated, and that their evidence
will be rejected as insufficient. When an excellent case occurs
in a palace, and is reported by the margravine of Bayreuth, sister
of Frederick the Great, in her Memoirs, the objection is that her
narrative was written long after the events. When we have
contemporary journals and letters, or sworn evidence, as in the
affairs of Sir Philip Francis, Ciderville and Willington, criticism
can probably find some other good reasons for setting these
testimonies aside. It is certain that the royal, the rich and the
well-educated observers tell, in many cases, precisely the same
sort of stories about poltergeist phenomena as do the poor
and the imperfectly instructed.

On the theory that there exist "mysterious agencies" which
now and then produce the phenomena, we may ask what these
agencies can possibly be? But no answer worthy of considera-
tion has ever been given to this question. The usual reply is
that some unknown but intelligent force is disengaged from
the personality of the apparent medium. This apparent medium
need not be present; he or she may be far away. The
Highlanders attribute many poltergeist phenomena, inexplicable
sounds, sounds of viewless feet that pass, and so forth, to **tārādh**, an
influence exerted unconsciously by unduly strong wishes on the
part of a person at a distance. The phrase **fālāh ar āfārsāi** ("going
uncontrolled") is also used (Campbell, Witchcraft and Second Sight in the Scottish Highlands, 1902, pp. 144-147). The
present writer is well acquainted with cases attributed to
the **tārādh**; one house near a village was often in a state of
alarm, their cause being well understood. We may call this
kind of thing *telekoryb*, a racket produced from a distance.
A very marked case in Illinois would have been attributed in
the Highlands to the **tārādh** of the late owner of the house, a
dipsomania in another state. On his death the disturbances
ceased (first-hand evidence from the disturbed lady of the
house, May 1907). It may be worth while to note that the
phenomena are often regarded as death-warnings by popular
belief. The early incidents at the Wesleys' house were thought
to indicate the death of a kinsman; or to announce the
approaching decease of Mr Wesley *ibid*, who at first saw and heard
nothing unusual. As for the others, it is sometimes suggested
that the phenomena were guessed to be "warnings" of the death
of a sick child of the house. The writer has first-hand evidence from a lady and her son (afterwards a priest) of
very singular movements of untouched objects in their presence,
which did coincide with the death of a relation at a distance.

Bibliography.—The literature of the subject is profuse, but
scattered. For modern instances the Proceedings of the Society
for Psychical Research may be consulted, especially an essay by
Mr Gurney and Dr Myers, also by Mr Gurney, Dr Podmore, already quoted. Books like Dale Owen's *Footsteps
on the Boundary of Another World*, and Fresnoy's *Recueil des
di sertations sur les apparitions*, are stronger in the quantity of anec-
dotes than in the quality of the evidence. *D Expedition of the Lancashire
Ghost*, contains outlandish and Celtic examples, and Telfair's
*The Teller's A True Relation of an Apparition* (1664-1666) shows
unusual regard for securing signed evidence. *Kiesewetter's Geschicht des neuener Occultismus* and Graham Dalby's *Darker Super-
stitions of Scotland*, with any collections of trials for witchcraft.
may be consulted, and Bovet's *Pandæmonium* (1684) is very rich in cases. The literature of the famous drummer of Tedworth (March 1662–April 1663) begins with an abstract of the discourse of his widow, which was printed in the April 1663 edition of The Earl of Orrery's *Pamphlet* (London, 1660). Glanvill's dates and, save for his own experiences, merely repeats the statements current in 1662–1663. The ballad and Mompesson's deposition are given in *D. B. C. a. A. R. M.* (1661), and in *A Discourse between Mr. II. and Mr. Podmore*. The diary and contemporary narrative of Procter in the *Willington Mill case* (1835–1847), is printed in the *Journ. S.P.R.* (Dec. 1892), with some contemporary letters on the subject. The earliest references to Glanvill are dated six years before he retreated from the place. There was no naughty little girl in the affair; no nervous or hysterical patient. The Celtic hypothesis of *lārōdch*, exercised by "the spirit of the living," includes visual apparitions, and many a so-called "ghost" of the dead may be merely the lārōdch of a living person. (A. L.)

**POLYANTRON**, a coward, a worthless rogue without courage or spirit. The word comes through Fr. *poltron* from Ital. *pollrone*, an idle fellow, one who lolls in a bed or couch (Milanese *poller*, Venetian *pollona*, adapted from Ger. *Polter*, a pillow; cf. English "bolster"). The old guess that it was from Lat. *pollutrice* (*pollutrix*), one which pollutes, is now abandoned. A man who avoided military service by self-mutilation, gave rise probably to the French application of *poltron* to a falcon whose talons were cut to prevent its attacking game.

**POLYRTE, JEAN DE** (c. 1537–1562), sieur de Méré or Mérey, a nobleman of Angoumois, who murdered Francis, duke of Guise. He had lived some time in Spain, and his knowledge of Spanish, together with his swarthy complexion, which earned him the nickname of the "Espagnolet," procured him employment as a spy in the wars against Spain. Becoming a fanatical Huguenot, he determined to kill the duke of Guise, and gained admission as a deserter to the camp of the Catholics who were besieging Orleans. In the evening of the 18th of February 1563 he hid by the side of a road along which he knew the duke would pass, fired a pistol at him, and fled. But he was captured the next day, and was tried, tortured several times, and sentenced to be drawn and quartered. On the 18th of March 1563 he underwent a frightful punishment. The horses not being able to drag off his limbs, he was hacked to pieces with cutlasses. He had made several contradictory declarations regarding the complicity of Coligny. The admiral protested emphatically against the accusation, which appears to have had no foundation.

**POLYAEUS**, a Macedonian, who lived at Rome as a rhetorician and pleader in the 2nd century A.D. When the Parthian War (162–5) broke out, Polyaeus, too old to share in the campaign, dedicated to the emperors Marcus Aurelius and Lucius Verus a work, still extant, called *Strategica* or *Strategemata*, a historical collection on stratagems, a famous news-sheet of 162 (Anthony and stragodium together in the form of anecdotes. It is not strictly confined to warlike stratagems, but includes also examples of wisdom, courage and cunning drawn from civil and political life. The work is uncritically written, but is nevertheless important on account of the extracts it has preserved from histories now lost. It is divided into eight books (parts of the sixth and seventh are lost), and originally contained nine hundred anecdotes, of which eight hundred and thirty-three are extant. Polyaeus intended to write a history of the Parthian War, but there is no evidence that he did so. His works on Macedonia, on Thebes, and on the Colchians (perhaps identical with the *Strategia*) are lost.

His *Strategica* seems to have been highly esteemed by the Roman emperors, and to have been handed down by them as a work of heirloom. From Rome it passed to Constantinople; at the end of the 9th century it was diligently studied by Leo VI, who, himself a great work on tactics, and who founded, in the 10th century Constantinople Porphyrogenitus mentioned it as one of the most valuable books in the imperial library. It was used by Stobaeus, Suidas, and the anonymous author of the work *Beul Jerusalem* (see *De bello Judaeico*).

It is arranged as follows: bks. i., ii., iii., stratagems occurring in Greek history; bk. iv., stratagems of the Macedonian kings and successors of Alexander the Great; bk. v., stratagems occurring in the history of Sicily and the Greek islands (Pandecte, with a whole new body of evidence [Lacedaemonians, Argives]), together with some individuals (Philopoemen, Pyrrhus, Hannibal); bk. viii., stratagems of the barbarians (Medes, Persians, Egyptians, Thracians, Scythians, etc.). This distribution is not, however, observed very strictly. Of the negligence or haste with which the work was written there are many instances: *Tacticon* (parts xvi. and xxi.), in which Mithradates satrap of Artaxerxes and Mithradates the Great. Scipio the elder and Scipio the younger, Perseus, king of Macedonia and Perseus the companion of Alexander; he mixes up the stratagems of Caesar and Pompey; he brings into immediate connexion events which were totally distinct; he narrates some events twice over, with variations according to the different authors from whom he draws. Though he usually abridges, he occasionally amplifies arbitrarily the narratives of his authorities. He never mentions his authorities, but amongst authors still extant he used Herodotus, Thucydides, Xenophon, Polybius, Diodorus, Plutarch, Frontinus and Suetonius; amongst authors of whom only fragments now exist, Cato, Livy, Dionysius of Halicarnassus, Polybius, Josephus, and Nicolaus Damascenus. His style is clear, but monotonous and inelegant. In the forms of his words he generally follows Attic usage.

The best edition of the text is Wöflin and Melber (*Teubner Series*, 1887, with bibliography and editio princeps of the *Strategemata* of the emperor Leo); annotated editions by Isaac Casaubon, G. Mack, Conington, W. B. C. Hambly, and F. J. M. de la Marche, and *Werk der Strategemassammlung Polyäus* (1885); *Knott, De parte et fontibus Polyaei* (1883), who largely reduces the number of the authorities consulted by Polyaeus. *Eng. trans.* by R. Shepherd (1793).

**POLYANDRY** (Gr. *polo&omicron;ys, many, and *apex, man), the system of marriage between one woman and several men, who are her husbands exclusively (see *FAMILY*). The custom locally legalizing the marriage of one woman to more than one husband at a time has been variously arranged for the result of poverty and of life in unfertile lands, where it was essential to check population as the consequence of female infanticide, or, in the opinion of J. F. McLennan and L. H. Morgan, as a natural phase through which human progress has necessarily passed. Polyandry is to be carefully differentiated from communal marriage, where the woman is the property of any and every member of the tribe. Two distinct kinds of polyandry are practised: one, often called Nair, in which, as among the Nairs of India, the husbands are not related to each other; and the second, the Tibetan or fraternal polyandry, in which the woman is married to all the brothers of one family. Polyandry is practised by the tribes of Tibet, Kashmir and the Himalayan regions, by the Todas, Koroos, Nairs and other peoples of India, in Ceylon, New Zealand, by some of the Australian aborigines, in parts of Africa, in the Auleitian archipelago, among the Koryaks and on the Orinoco.

**POLYANTHUS**, one of the oldest of the florists' flowers, is probably derived from *P. variabilis*, itself a cross between the common primrose and the cowslip; it differs from the primrose in having the umbels of flowers carried up on a stalk. The florists' polyanthus has a golden margin, and is known as the gold-laced polyanthus, the properties being very distinctly laid down and rigidly adhered to. The chief of these are a clear, unshaded, blackish or reddish ground colour, an even margin or lacing of yellow extending round each segment and cutting through its centre down to the ground colour, and a yellow band surrounding the petals. A distinctly white or golden ground is rare. The plants are quite hardy, and grow best in strong, loamy soil tolerably well enriched with well-decayed dung and leaf-mould;
POLYBIUS

they should be planted about the end of September or not later than October. Plants for exhibition present a much better and cleaner appearance if kept during winter in a cold well-aired frame.

For the flower borders what are called fancy polyanthuses are adopted. These are best raised annually from seed, the young crop each year blooming in succession. The seed should be sown as soon as ripe, the young plants being allowed to stand through the winter in the seed bed. In April or May they are planted out in a bed of rich garden soil, and they will bloom abundantly the following spring. A few of the better "thrum-eyed" sorts (those having the anthers in the eye, and the pistil sunk in the tube) should be allowed to ripen seed; the rest may be thrown away. In some remarkable forms which have been cultivated for centuries the ordinarily green calyx has become petalloid; when this is complete it forms the hose-in-hose primrose of gardeners. There are also a few well-known double-flowered varieties.

POLYBIUS (c. 204-172 B.C.), Greek historian, was a native of Megapologia in Arcadia, the youngest of Greek cities (Faus. viii. 9), which, however, played an honourable part in the last days of Greek freedom as a stanch member of the Achaean League (q.v.). His father, Lycurtus, was the intimate friend of Philopoemen and on the death of the latter, in 182, succeeded him as leader of the league. The date of Polybius's birth is doubtful. He tells us himself that in 182 he had not yet reached the age (73 years, Polyb. xxix. 9) at which an Achaean was legally capable of holding office (xxiv. 6). We learn from Cicero (Ad Fam. v. 12) that he outlived the Numantine War, which ended in 133, and from Lucian (Macrobr. 22) that he died at the age of eighty-two. The majority of authorities therefore place his birth between 214 and 204 B.C. Little is known of his early life. As the son of Lycurtus he was naturally brought into close contact with the leading men of the Achaean League.

With Philopoemen he seems to have been on intimate terms. After Philopoemen's tragic death in Messenia (182) he was entrusted with the honourable duty of conveying home the urn in which his ashes had been deposited (Plut. Phil. 21). In 181, together with his father, Lycurtus and the younger Aratus, he was appointed, in spite of his youth, a member of the embassy which was to visit Ptolemy Epiphanes, king of Egypt, a mission, however, which the sudden death of Ptolemy brought to a premature end (xxv. 7). The next twelve years of his life are a blank, but in 160 he reappears as a trusted adviser of the Achaeans at a difficult crisis in the history of the League. In 171 war had broken out between Rome and the Achaean confederacy, and the Achaean cause was divided as to the policy to be pursued; there were good reasons for fearing that the Roman senate would regard neutrality as indicating a secret leaning towards Macedon. Polybius therefore declared for an open alliance with Rome, and his views were adopted. It was decided to send an Achaean force to cooperate with the Roman general, and Polybius was selected to command the cavalry. The Roman consul declined the offered assistance, but Polybius accompanied him throughout the campaign, and thus gained his first insight into the military system of Rome. In the next year (168) both Lycurtus and Polybius were sent by the Achaean League to take service in Egypt against the Syrians, when an intimation from the Roman commander that armed interference was undesirable put a stop to the expedition (xxix. 23). The success of Rome in the war with Persius was now assured. The final victory was rapidly followed by the arrival in Achaea of Roman commissioners charged with the duty of establishing Roman interests there. Polybius was arrested with 1000 of the principal Achaean, but, while his companions were condemned to a tedious incarceration in the country towns of Italy, he obtained permission to reside in Rome. This privilege he owed to the influence of L. Aemilius Paullus and his two sons, Scipio and Lucilius. On being received into Aemilius's house, and became the instructor of his sons. Between Scipio (P. Cornelius Scipio Africanus the younger), the future conqueror of Carthage, and himself a friendship soon sprang up, which ripened into a lifelong intimacy, and was of inestimable service to him throughout his career. It protected him from interference, opened to him the highest circles of Roman society, and enabled him to acquire a personal influence with the leading men, which stood him in good stead when he afterwards came forward to mediate between his countrymen and Rome. It placed within his reach opportunities for a close study of Rome and the Romans such as had fallen to no historian before him, and secured him the requisite leisure for using them, while Scipio's liberality more than once supplied him with the means of conducting difficult and costly historical investigations (Pliny, v. 12). In 157 the few surviving exiles were permitted to return to Greece. But the stay of Polybius in Achaea was brief. The estimation in which he was held at Rome is clearly shown by the anxiety of the consul Marcus (or Manlius) Manilius (149) to take him as his adviser on his expedition against Carthage. Polybius started to join him, but broke off his journey at Corcyra on learning that the Carthaginians were inclined to yield (xxxvi. 3). But when, in 147, Scipio himself took the command in Africa, Polybius hastened to join him, and was an eye-witness of the siege and destruction of Carthage. During his absence in Africa the Achaeans had made a last desperate attempt to assert their independence, and had renewed the siege of Corinth. The Romans were at this time engaged in the war with Carthage. The Romans occupied Corinth, the fairest cities of Achaia at the mercy of the Roman soldiery, and the famous Achaean League shatterd to pieces (see Achaean League). All the influence he possessed was freely spent in endeavouring to shield his countrymen from the worst consequences of their rashness. The excesses of the soldiery were checked, and at his special intercession the statues of Aratus and Philopoemen were preserved (xxxix. 14). An even more difficult task was that entrusted to him by the Roman authorities themselves, of persuading the Achaeans to acquiesce in the new régime imposed upon them by their conquerors, and of settling the new machinery in working order. With this task he was entrusted, which work, by the power of his friendship and sense of gratitude of his countrymen (xxxix. 16), his public career seems to have closed. The rest of his life was, so far as we know, devoted to the great history which is the lasting monument of his fame. He died, at the age of eighty-two, of a fall from his horse (Lucian, Macrobr. 22). The base of a statue erected to him by Elia was found at Olympia in 1877. It bears the inscription ἥτις ὁ πόλεμος Πολίβιος Ἀνδρέα Ἡμερολόγιτη, of the forty books which made up the history of Polybius, the first five alone are extant, as we have only more or less copious fragments. But the general plan and scope of the work are explained by Polybius himself. His intention was to make plain how and why it was that "the knowledge of the causes of things is to the statesman what a complete knowledge of his surroundings is to the captain of an army" (ii. 1). This empire of Rome, unprecedented in its extent and still more so in the rapidity with which it had been acquired, was the standing wonder of the age, and "who," he exclaims (i. 11), "who can have the power that is the fruit of so great a work, and who has understanding enough of what means, and thanks to what sort of constitution, the Romans subdued the world in something less than fifty-three years?" These fifty-three years are those between 220 (the point at which the work of Aratus ended) and 168 B.C., and extend therefore from the outbreak of the Hannibalic War to the defeat of Perseus at Pydna. To this period then the main portion of his history is given, drawn from the official records of the Athenians and others for clearness' sake he prefixs in bks. i. and ii. such a preliminary sketch of the earlier history of Rome, of the First Punic War, and of the contemporary events in Greece and Asia, as will enable his readers more fully to understand what follows. This seems to have been his original plan, but at the opening of bk. iii., written apparently after 146, he explains that he thought desirable to add some account of the manner in which the Romans exercised their authority, and thus the work was expanded to its final catastrophe which destroyed Carthage and for ever broke up the Achaean League (iii. 4, 5). To this appendix, giving the history from 168-146, the modern books are generally referred. Whatever fault may be found with Polybius, there can be no question that he had formed a high conception of the task before him. He lays repeated stress on two qualities as distinguishing his work from the ordinary histories of his day. The first of these, its synoptic character, was partly necessitated by the nature of the period. The various states fringing the basin of the Mediterranean had become so inextricably interwoven that it was no lie go so-called deal with them in isolation from Polybius.
view of the whole course of events in the civilized world, within the limits of the period (i. 4). He thus aims at placing before his readers at each stage a complete survey of the field of action from Spain to Syria and Egypt. This synoptic method proceeds from a conception of the Roman Empire (i. 32) and of the War (i. 10) which is new. It is this originality that enables Polybius to be given the credit of having first firmly grasped and clearly enfolded a lesson which the events of his own time were especially well calculated to teach. It is the great merit of his work, which in his day was known as 'the history of the last century, B.C. as no series of special narratives could have supplied.

The second quality upon which Polybius insists as distinguishing his history from all others is its 'pragmatic' character. It deals, that is, with the why and the how in each case, not confusing causes and occasions, or dragging in old wives' fables, prodigies and marvels (ii. 16, iii. 48). He will omit nothing which can help to explain the events he is dealing with: the genius and temperament of the Roman character, the way in which it developed from its beginning, the geographical and political conditions of the country, the habits and customs of the peoples, the evolution of his own language and institutions, the rise and fall of the Empire, the effect of his foreign policy on Rome, the conduct of his own times with all the details within the limits of the account. This 'pragmatic method' (ix. 2) makes history intelligible by explaining the how and the why; and, secondly, it is only in this way that the history can be written. There is no room for the kind of instructing and guiding tone which Histoire Naturelle gives to study it. For the great use of history, according to Polybius, is to contribute to the right conduct of human life (i. 35). But this it will do only if it is written in a style both true and sound (i. 14), and is intended to make the reader think, and not to soothe his appetite or engage his indolence, as was so often the case with Histoire Naturelle. To make his work, Polybius says, 'instructive and effective, and to serve the useful purpose of inculcating and guiding the reader' (i. 36). To this end, he says, every event must be given in its true light, and must be considered and narrated in such a way as to strengthen the reader's own convictions.

Polybius is equally explicit as regards the personal qualifications necessary for a good historian, and in this respect too his practice is in close agreement with his theory. Without a personal knowledge of the events he is writing about, he would not be able to write a just and true history of them. The fact is that he must have a thorough knowledge of the facts of history, and an accurate knowledge of the people and the places with which the events he is dealing are concerned. He must have a personal acquaintance with the places and persons he is writing about. He must take care to make his work accurate, and to be as objective as possible in his judgments. He must be careful not to be influenced by personal feelings or prejudices, and to be as impartial as possible in his reports.

In the estimation of Polybius, the highest qualification for a good historian is to be truthful. This is the point to which he alludes when he says that a good historian is one who can 'tell the truth as he sees it' (i. 3). This is a higher standard than that of the merely truthful, and requires a much greater degree of truthfulness. It means not only that the historian must be truthful, but that he must also be able to write about the events of his time in such a way as to give a true picture of them. This is an important point, because the historian is not only a historian, but also a writer, and must be able to write in such a way as to make his work interesting and instructive. Polybius himself was a great writer, and his work is still read and studied to this day. It is easy to see why he was so successful as a historian, and why he is so highly regarded by later writers. He was able to write about the events of his time in such a way as to give a true picture of them, and to make his work interesting and instructive. This is a high standard, and one that is still held in high estimation by writers today.
him maintained by Quintilian and by Lucian may reasonably be taken to imply their agreement with Dionysius as to its merits as a master of a style. On the other hand, Cicero (De off. iii. 32) describes him as "bonus auctor in primis"; in the De republica (ii. 138) he is called the "auctor maior"). His younger contemporary, Marcus Brutus, was a devoted student of Polybius, and was engaged on the eve of the battle of Pharsalia in compiling an epitome of his histories (Suuids, s.s.; Plutarch, Brutus). Although Polybius, however, never adds to his text any such details or observations as to which he used his writings (see Livy), speaks of him in such qualified terms as to suggest that his ideas were still held in high esteem over a century after his death. In fact, his reputation is such that he is "by no means contemptible" (xxx. 45), and "not an untrustworthy author" (xxxii. 10). Posidonius and Strabo, both of them Stoics like Polybius himself, fully recognize the value of his historical works, s.s.; Strabo p. 515). Arrian in the early part of the 2nd and Aelian in the 3rd century both speak of him with respect, though with reference mainly to his excellence as an authority on the art of war. In addition to his Histories Polybius wrote another smaller work: a life of Philipocmen (Polyb. x. 24), a history of the Numantine War (Cic. Ad Fam. v. 12), a treatise on tactics (Polyb. ix. 20; Arrian, Tactica; Aelian, Tact. i.), the geographical treatise, referred to by Gemius, is possibly identical with the thirty-fourth book of the Histories (Sweigheusser, Proef. p. 184).

1. The works of Polybius:—The complete books (i.-v.) of the Histories were first printed in a Latin translation by Nicholas Perrot in 1473. The date of the first Greek edition, that by Obsopoeus, is 1530. For a full account of these and of later editions, as well as of those of the fragments, see the Schweighäuser edition. Our knowledge of the contents of the fragmentary books is derived partly from quotations in ancient writers, but mainly from two collections of excerpts; one, probably the work of a late Byzantine compiler, was first printed at Basle in 1540, and contains extracts from books vi.-xvii. (πολλοὶ παραδοτοὶ πολλοὶ περιγραφὲς καὶ καταρακτίς); the other consists of two fragments from the "select passages" from Greek historians compiled by the directions of Constantine Porphyrogenitus in the 10th century. To these must be added the Vatican excerpts edited by Angelo Mai in the present century.

POLYCARP (c. 69-c. 155), bishop of Smyrna and one of the Apostolic Fathers, derives much of his importance from the fact that he links together the apostolic age and that of nascent Catholicism. The sources from which we derive our knowledge of the life and activity of Polybius are: (1) a few notices in the writings of Irenaeus, (2) the Epistle of Polybius to the Church at Philippi, (3) the Epistle of Ignatius to Polycarp, (4) the Epistle of the Church at Smyrna to the Church at Philomelium, giving an account of the martyrdom of Polycarp. Since these authorities have all been more or less called in question and some of them entirely rejected by recent criticism, it is necessary to say a few words about each.

1. The Statements of Irenaeus are found (a) in his Adversus haereses iii. 4. 9, in the letter to Victor, where Irenaeus gives an account of Polycarp's visit to Rome, (b) in the letter to Florinus—a most important letter which describes the intercourse between Irenaeus and Polycarp and sheds some light on the subject. The objection has been made against the genuineness of the statements in the Adversus haereses, but the authenticity of the two letters has been generally conceded. It is clear that the main attack is directed against the Epistle to Florinus, doubtless because of its importance. "The manifest exaggerations," says van Manen, "coupled with the fact that Irenaeus never shows any knowledge of the activities of Polycarp, forces us to believe clearly that a writer otherwise unknown is speaking to us here." The criticism of van Manen has, however, found no supporters outside the Dutch school. The epistle is quoted by Eusebius (v. 20), and is accepted as genuine by Harnack and Kruger. The relevant statements in the letter, moreover, are supported by the references to Polycarp which we find in the body of Irenaeus's great work.

2. The Epistle of Ignatius to Polycarp.—Though Irenaeus states that Polycarp wrote many "letters to the neighbouring churches or to certain of the brethren," only one has been preserved, viz., the well-known letter to the Philippians. The epistle is largely involved in the Ignatian controversy, and without any very outstanding interest affords to the Ignatian Epistles is so striking that those scholars who regard these letters as spurious are bound to reject the Epistle of Polycarp altogether, or at any rate to look upon it as largely interpolated. The former view has been adopted by Schweiger, Zeller, and Hilgenfeld; the latter by Ritschl and Lipsius. The rehabilitation of the Ignatian letters in modern times has, however, practically restored the Epistle of Polycarp to its place. It must be pointed out that the external evidence in its favour is of considerable weight. Irenaeus (iii. 3, 4) expressly mentions and commends a "very adequate" (ιακούρα) letter of Polycarp to the Philippianians, and we have no reason for doubting the identity of this letter mentioned by Irenaeus with our epistle. Eusebius (iii. 36) quotes extracts from the epistle, and some of the extracts contain the very passages which the critics have marked as interpolations, and Jerome (De Vir. Ill. xviii.) testifies that in his time the epistle was publicly read in the Asiatic churches. The internal evidence is equally strong. There is absolutely no motive for a forgery in the contents of the epistle. As Harnack says, the author "has pursued an immediate purpose of maintaining the true Christian life in the church and warning it against covetousness and against an unbrotherly spirit. The occasion of the letter was a case of embroilments, particularly in the church at Smyrna. Before the arrival of Polycarp he had made a fine combination of mildness with severity; the language is simple but powerful, and, while there is undoubtedly a lack of original ideas, the author shows remarkable skill in weving together pertinent maxims to each other and to each other, and to the apostolic epistles and the first Epistle of Clement. In these circumstances it would never have occurred to any one to doubt the genuineness of the letter, and that it had been composed by Polycarp to prove that certain allusions in the epistle imply the rise of the heresy of Marcion and that it cannot therefore be placed earlier than 140. Lightfoot, however, has proved that Polycarp's statement may be extremely well be derived from a passage in one or two special arguments have been brought against the Epistle to Polycarp. Uscher, for instance, while accepting the other six epistles, rejected this on the ground that Jerome says that Ignatius only sent these letters in time of persecution and that it had been composed by Eusebius. Some modern scholars (among whom Harnack was formerly numbered, though he has modified his views on the point) feel a difficulty about the peremptory tone which Ignatius adopts towards Polycarp. There was some force in this argument when the Ignatian Epistles were dated about 140, as in that case Polycarp would have been an old and venerable man at the time. But now that the date is put back to about 112 the difficulty vanishes, since Polycarp was not much older forty when he received the letter. We must remember, too, that Ignatius was writing under the consciousness of impending martyrdom and evidently felt it gave him the right to criticize the bishops and churches of Asia.

3. The Epistle of Ignatius to Polycarp.—This epistle has of course been subjected to the same criticism as has been directed against the other epistles of Ignatius (see IGNAIUS). Over and above the general criticism, which may now be said to have been completely answered by the work of Zahn, the genuineness of the XIII. 20) has been more recently questioned by the interpretation of Eusebius. Some modern scholars (among whom Harnack was formerly numbered, though he has modified his views on the point) feel a difficulty about the peremptory tone which Ignatius adopts towards Polycarp. There was some force in this argument when the Ignatian Epistles were dated about 140, as in that case Polycarp would have been an old and venerable man at the time. But now that the date is put back to about 112 the difficulty vanishes, since Polycarp was not much older forty when he received the letter. We must remember, too, that Ignatius was writing under the consciousness of impending martyrdom and evidently felt it gave him the right to criticize the bishops and churches of Asia.

4. The Letter of the Church at Smyrna to the Philomeliumians is a most important document, because we derive from it all our information with respect to that class of epistles which preserved the greater part of this epistle (iv. 15), but we possess it entire with various concluding observations in several Greek MSS., and we possess it in a Latin version. The epistle gives a minute description of the persecution in Smyrna, of the last days of Polycarp and of his trial and martyrdom; and as it contains many instructive details and proves to have been written not long after the events to which it refers, it is a precious document of the most precious remains of the 2nd century. Certain recent critics, however, have questioned the authenticity of the narrative.

Ency. Bibl. iii. 3490.
POLYCARP

Lipius brings the date of the epistle down to about 260, though he admits many of its statements as trustworthy. Keim, 100, endeavours to show that, although it was based on good information, it could not have been composed till the middle of the 3rd century. A similar position has also been taken up by Schürer, Gebhardt, Réville and Holtzmann. The last named regards the document "as a decorated narrative of the saint's martyrdom framed after the pattern of Jesus' martyrdom," though he thinks that it cannot be put as late as 250, but that it fell within the limits of the 2nd century, and is therefore invalid. However, the case against the document has been at all substantiated, and the more moderate school of modern critics (e.g. Lightfoot, Harnack, Krüger) is unanimous in regarding it as an authentic document, though it recognises that here and there a few slight interpolations have been inserted. Besides these we have no other sources for the life of Polycarp; the Vita S. Polycarpi sancte Pionio (published by Duchesne, Paris, 1877) and Lightfoot Ignatius and Polycarp (1877, 5-1047) is worthless.

Assuming the genuineness of the documents mentioned, we now proceed to collect the scanty information which they afford with regard to Polycarp's career. Very little is known about his early life. He must have been born not later than the year 60, for on the day of his death (c. 155) he declared that he had served the Lord for sixty-eight years (Martyrium, 9). The statement seems to imply that he was of Christian parentage, though he cannot have been older than eighty-six at the time of his martyrdom, since he had paid a visit to Rome almost immediately before. Irenaeus tells us that he was a remarkable figure in the early life of Polycarp "& had been so remarkable an object that he lived in familiar intercourse with many that had seen Christ" (iii, 3, 4). This testimony is expanded in the remarkable words which Irenaeus addresses to Florinus: "I saw thee when I was still a boy (παιδίς ἢν λύποι) in Lower Asia in company with Polycarp ... I can even now point out the place where the blessed Polycarp used to sit when he discoursed, and describe his going out and his comings in, in his manner of life and his personal appearance and the discourses which he delivered to the people, how he used to speak of his intercourse with John and with the rest of those who had seen the Lord, and how he would relate their words and what he had heard from them about the Lord, about His miracles and about His teaching. Polycarp used to tell us as one who had received it from those who had seen the Word of Life with their own eyes, and all this in perfect harmony with the Scriptures. To these things I used to listen at the time, through the mercy of God vouchsafed to me, noting them down, not on paper but in my heart, and constantly by the grace of God I brood over my accurate recollections." These are priceless words, for they establish a chain of tradition (John-Polycarp-Irenaeus) which is without a parallel in early church history. Polycarp thus becomes the living link between the Apostolic age and the great writers who flourished at the end of the 2nd century, and has to be used to destroy the force of the words of Irenaeus. Harnack, for instance, attacks this link at both ends. (a) The connexion of Irenaeus and Polycarp, he argues, is very weak, because Irenaeus was only a boy (παιδίς) at the time, and his recollections therefore carry very little weight. The fact too that he never shows any signs of having been influenced by Polycarp and never once quotes his writings is a further proof that the relation between them was slight. (b) The connexion which Irenaeus tries to establish between Polycarp and John the apostle is probably due to a blunder. Irenaeus has confused John the apostle and John the presbyter. Polycarp was the disciple of the latter, not the former. In this second argument Harnack has the support of a considerable number of modern scholars who deny the Ephesian residence of John the apostle. But, as Gwatkin has pointed out, Harnack's arguments are by no means decisive. (a) When Irenaeus describes himself as a boy (παιδίς), he need not have meant a very young lad, under thirteen, as Harnack makes out. Lightfoot has cited many instances which prove that the word could be used of a man of thirty. Nor does the alternative phrase which Irenaeus uses in iii. 3, 4 (διά καὶ ἡμέρας ἐκκοσμημένος εἰς τὶ προτήριον ἡμῶν ἡμῖν) militate against this interpretation, for elsewhere Irenaeus himself distinctly says "triginta annorum, actas prima indoles et juvenum" (ii. 22, 5). It is true that Harnack has adduced arguments which cannot be dismissed here to prove that Irenaeus was not an apostle till about 160; but against this we may quote the evidence of Lipsius, who puts the date of his birth at 150, while Lightfoot argues for 120. The fact that Irenaeus never quotes Polycarp does not count for much. Polycarp wrote very little. He does not seem to have been a man of great mental capacity. "His influence was that of saintliness rather than that of intellect." (b) A discussion of Harnack's second line of argument is impossible here. His theory with regard to the confusion of names is a gratuitous assumption and cannot be proved. The tradition of St John's residence at Ephesus is too strong to be easily set aside. In spite therefore of much modern criticism there seems to be no solid reason for rejecting the statements of Irenaeus and regarding Polycarp as the link between the Apostolic age and the first of the Catholic fathers.

Though Polycarp must have been bishop of Smyrna for nearly half a century we know next to nothing about his career. We get only an occasional glimpse of his activity, and the period between 115 and 155 is practically a blank. The only points of sure information which we possess relate to (1) his relations with Ignatius, (2) his protests against heresy, (3) his visit to Rome in the time of Amicus, (4) his martyrdom.

1. His Relations with Ignatius.—Ignatius, while on his way to Rome to suffer martyrdom, halted at Smyrna and received a warm welcome from the church and from Polycarp. Upon reaching the other addressed personally to Polycarp. In these letters Ignatius charged Polycarp to write to all the churches between Smyrna and Syria (since his hurried departure from Trosa made it impossible for him to do so in person) urging them to send letters and delegates to the church at Antioch to congratulate it upon the cessation of the persecution and to establish it in the faith. The letters of Ignatius illustrate the commanding position which Polycarp had already attained in Asia. It was in the discharge of the task which had been laid upon him by Ignatius that Polycarp was brought into correspondence with the Philippians. The Church at Philippi wrote to Polycarp asking him to forward their letters to Antioch. Polycarp replied, promising to carry out their request and enclosing a number of the letters of Ignatius which he had in his possession.

2. Polycarp's Attack on Heresy.—All through his life Polycarp appears to have been an uncompromising opponent of heresy. We find him in his epistle (ch. vii.) uttering a strong protest against certain false teachers (probably the followers of Cerinthus).

For every one who shall not confess that Jesus Christ is come in the flesh is an antichrist; and whosoever shall not confess the testimony of the Cross is of the devil; and whosoever shall pervert the oracles of the Lord to his own lusts and says that there is neither resurrection nor judgment, that man is the first-born of Satan. Wherefore let us forsake their vain doing and their false teaching and turn unto the word which was delivered unto us from the beginning.

Polycarp lived to see the rise of the Marcionite and Valentinian sects and vigorously opposed them. Irenaeus tells us that on
one occasion Marcion endeavoured to establish relations with him and accepted him with the words, "Recognize us." But Polycarp displayed the same uncomprising attitude which his master John had shown towards Cerinthus and answered, "I recognize you as the first-born of Satan." The steady progress of the heretical movement in spite of all opposition was a cause of deep sorrow to Polycarp, so that in the last years of his life the words were constantly on his lips, "Oh good God, to what times hast thou spared me, that I must suffer such things!"

3. **Polycarp's Visit to Rome.**—It is one of the most interesting and important events in the church history of the 2nd century that Polycarp, shortly before his death, when he was considerably over eighty years old, undertook a journey to Rome to visit the bishop Anicetus. Irenaeus, to whom we are indebted for this information (Hær. iii. 3, 4; Epist. ad victorem, ap. Euseb. v. 24), gives as the reason for the journey the fact that differences existed between Asia and Rome "with regard to certain things" and especially about the time of the Easter festival. He might easily have told us what these "certain things" were and given us fuller details of the negotiations between the two great bishops, for in all probability he was himself in Rome at the time. But unfortunately all he says is that with regard to the certain things the two bishops speedily came to an understanding, while as to the time of Easter, each adhered to his own custom, without breaking off communion with the other. We learn further that Anicetus as a mark of special honour allowed Polycarp to celebrate the Eucharist in the church, and that many Marcionites and Valentinians were converted by him during his stay in Rome.

4. **Polycarp's Martyrdom.**—Not many months apparently after Polycarp's return from Rome a persecution broke out in Asia. A great festival was in progress at Smyrna. The proconsul Statius Quadratus was present on the occasion, and the asarch Philip of Tralles was presiding over the games. Eleven Christians, including Polycarp, were brought to Philadelphia to be put to death. The appetite of the populace was inflamed by the spectacle of their martyrdom. A cry was raised "Away with the atheists. Let search be made for Polycarp." Polycarp took refuge in a country farm. His hiding-place, however, was betrayed and he was arrested and brought back into the city. Attempts were made by the officials to induce him to recant, but without effect. When he came into the theatre the proconsul urged him to "revile Christ," and promised, if he would consent to abjure his faith, that he would set him at liberty. To this appeal Polycarp made the memorable answer, "Eighty and six years have I served Him and He hath done me no wrong. How then can I speak evil of my King who saved me?" These words only intensified the fury of the mob. They clamoured for a lion to be let loose upon him there and then. The asarch however refused, urging as an excuse that the games were over. When they next demanded that their victim should be burned, the proconsul did not interfere. Timber and faggots were hastily collected and Polycarp was placed upon the pyre. With calm dignity and unfainting courage he met his fate and crowned a noble life with an heroic death.

The question as to the date of the martyrdom has caused considerable controversy. Eusebius in his Chronicon gives A.D. 166 as the date of Polycarp's death, and until the year 1867 this statement was never questioned. In that year appeared Waddington's Mémoire sur la chronologie de la vie du rév. Aelius Aristide, in which it was shown from a most accurate combination of circumstances that the Quadratus whose name is mentioned in the Martyrium was proconsul of Asia in 155-156, and that consequently Polycarp was martyred on the 23rd of February 155. Waddington's conclusion has received overwhelming support amongst recent critics. His views have been accepted by (amongst many others) Renan,1 Hilgenfeld,2 Gebhardt,3 Lipsius,4 Harnack,5 Zahn,6 Lightfoot, Randell,7 Against this 1Antickritis (1873), 7; 2Zeitschr. f. hist. Theol. (1874), p. 325. 3Zeitschr. f. hist. Theol. (1875), p. 356. 4

array of scholars only the following names of importance can be quoted in support of the traditional view—Keim,8 Wieseler9 and Uh horn.10 The problem is too complex to admit of treatment here. There seems to be little doubt that the case for the earlier date has been proved. The only point upon which there is division of opinion is as to whether Waddington's date 155—or, as is suggested by Lipsius and supported by C. H. Turner—the following year 156 is the more probable. The balance of opinion seems to favour the latter alternative, because it leaves more room for Polycarp's visit to Anicetus, who only became bishop of Rome in 134. Harnack, however, after careful investigation, prefers 155.

The name of Polycarp in the history of the Church is out of all proportion to our knowledge of the facts of his career. The violent attack of the Smyrnaean mob is an eloquent tribute to his influence in Asia. "This is the teacher of Asia," they shouted, "this is the father of the Christians: this is the destroyer of our gods: this is the man who has taught so many no longer to sacrifice and no longer to pray to the gods."12 And after the execution they refused to deliver up his bones to the Christians for burial on the ground that "the Christians would now forsake the Crucified and worship Polycarp."13 Polycarp was indeed, as Polycrates says,14 one of the great luminaries (υπέρτατος άγιος) of the time. It was in no small degree due to his stanch and unwavering leadership that the Church was saved from the peril of being overwhelmed by the rising tide of the pagan revival which swept over Asia during the first half of the 2nd century, and it was his unflagging allegiance to the Apostolic faith that secured the defeat of the many forms of heresy which threatened to destroy the Church from within. Polycarp had no creative genius. He was a "transmitter, not a maker," but herein lies his greatness. Much occurred between the Apostolic age and the age when the faith of the Church was fixed in the earliest creed and protected by the determination of the canon of the New Testament. This intervening period was the most perilous epoch in the history of the ante-Nicene Church. The Apostolic tradition might have been perverted and corrupted. The purity of the Gospel might have been defiled. The Christian ideal might have been lost. That the danger was so largely averted is to no small extent the result of the faithful witness of Polycarp. As Irenaeus says (iii. 3, 4), "Polycarp does not appear to have possessed qualifications for successfully conducting a controversial discussion with erroneous teachers... but he could not help feeling how unlike their speculations were to the doctrines which he had learned from the Apostles, and so he met with indignant reprobation their attempt to supersede the truths of their own devising." It is this that constitutes Polycarp's service to the Church, and no greater service has been rendered by any of its leaders in any age.

**POLYCLITUS**, the name of two Greek sculptors of the school of Argos; the first belonging to the fifth century, the second to the early part of the fourth.

1. The elder and best known Polyclitus was a contemporary of Phidias, and in the opinion of the Greeks his equal. He made a figure of an Amazon for Ephesus which was regarded as superior to the Amazon of Phidias made at the same time; and his colossal Hera of gold and ivory which stood in the temple near Argos was considered as worthy to rank with the Zeus of Phidias.

POLYCRATES—POLYGAMY

It would be hard for a modern critic to rate Polyclitus so high; the reason is that balance, rhythm and the minute perfection of bodily form, which were the great merits of this sculptor, do not appeal to us as they did to the Greeks of the 5th century. He worked mainly in bronze.

As regards his chronology we have data in a papyrus published by Grenfell and Hunt containing lists of athletic victors. From this it appears that he made a statue of Cynicus, a victorious athlete of 464 or 460 B.C., of Pythocles (452) and Aristion (451). He thus can scarcely have been born as late as 450 B.C. His statue of Hera is dated by Pliny to 430 B.C. His artistic activity must thus have been long and prolific.

Copies of his spearman (doryphoros) (see GREEK ART, Plate VI. fig. 80), and his victor waving a ribbon round his head (diadumenus) have long been recognized in our galleries. We see their excellence, but they inspire no enthusiasm, because they are more fleshly than modern figures of athletes, and want charm. They are chiefly valuable as showing us the square forms of body affected by Polyclitus, and the scheme he adopted, throwing the weight of the body (as Pliny says of him) on one leg. We must not, however, judge of a great sculptor by a copy. The point to which the original work had been enforced by the discovery at Delos, by the French excavators, of a diadumenus of far more pleasing type and greater finish, which also goes back to Polyclitus. The excavations at Olympia have also greatly widened our knowledge of the sculptor. Among the bases of statues found on that site were three signed by Polyclitus, still bearing on their surface the marks of attachment of the feet on the statues. This at once gives us their pose; and following up the clue, A. Furtwangler has identified several extant statues as copies of figures of boy athletes victorious at Olympia set up by Polyclitus. Among these the Westmacott athlete in the British Museum is conspicuous. And it is certain that these boys, although the anatomy of their bodies seems to be too mature, yet have a real charm, combining beauty of form with modesty and unaffected simplicity. They enable us better to understand the spirit of the sculptor.

The Amazon of Polyclitus survives in several copies, among the best of which is one in the British Museum (for its type see GREEK ART, fig. 40). Here again we find a certain heaviness; and the womanly character of the Amazon scarcely appears through her robust limits. But the Amazon of Phaidias, if rightly identified, is no better. The masterpiece of Polyclitus, his Hera of gold and ivory, has of course totally disappeared. The copy of the statue in the British Museum and in Rouen is very bad. Many archaeologists have tried to find a copy of the head. The most defensible of all these identifications is that of C. Waldstein, who shows that a head of a girl in the British Museum (labelled as Polyclitan) corresponds so nearly with that of Hera on 4th century coins of Argos that we must regard it as a reflex of the head of the great statue. It seems very hard and cold beside such noble heads of the goddess as those in the Ludovisi Gallery (Terme Museum) Rome. American archaeologists have in recent years conducted excavations on the site of the Argive temple of Hera (Arcos and GREEK ART, fig. 39); but the sculptural fragments, heads and torsos, which seem to belong to the temple erected in the time of Polyclitus, have no close stylistic resemblance to other statues recognized as his; and at present their presence in the history of art is matter of dispute.

The want of variety in the works of Polyclitus was brought as a reproach against him by ancient critics. Varro says that his statues were square and almost of one pattern. We have already observed that there was small variety in their attitudes. Except for the statue of Hera, which was the work of his old age, he produced scarcely any notable statue of a deity. His field was narrowly limited; but in that field he was unsurpassed.

2. The younger Polyclitus was of the same family as the elder, and is known only by a few bits of two Columbi which have not survived. Some existing bases, however, bearing the name are inscribed in characters ofwe 4th century, at which time the elder sculptor cannot have been alive. The most noted work of the younger artist was a statue in marble of Zeus Milichius (the Merciful) set up by the people of Argos after a shameful massacre which took place in 370 B.C. The elder artist is not known to have worked in marble.

(P. G.)

POLYCRATES, tyrant of Samos (c. 535-515 B.C.). Having won popularity by donations to poorer citizens, he took advantage of a festival of Hera, which was being celebrated outside the walls, to make himself master of the city (about 535 B.C.). After getting rid of his brothers Pantagnotus and Syloson, who had at first shared his power, he established a despotism which had a great importance in the history of the island. Realizing clearly the value of sea-power for a Greek state, he equipped a fleet of 100 ships, and so became master of the Aegean basin. This ascendency he abused by numerous acts of piracy which made him notorious throughout Greece; but his real purpose in building his navy was to become lord of all the islands of the archipelago and the mainland towns of Ionia. The details of his conquests are uncertain, but it is known that in the Cyclades he maintained an alliance with the tyrant Lygdamis of Naxos, and curried favour with the Delian Apollo by dedicating to him the island of Rheneia. He also encountered and quitted a number of enthusiasts who had raised a coalition of two great naval powers of the Asiatic coast, Miletus and Lesbos. Doubtless with the object of expanding the flourishing foreign trade of Samos, he entered into alliance with Amyntas, king of Egypt, who, according to Herodotus, renounced his ally because he feared that the god, in envy of Polycrates' excessive good fortune, would bring ruin upon him and his allies. It is more probable that the breach of the compact was due to Polycrates, for when Cambyses of Persia invaded Egypt (525) the Samian tyrant offered to support him with a naval contingent. This squadron never reached Egypt, for the crews, composed as they were of Polycrates' political enemies, suspecting that Cambyses was under agreement to slay them, put back to Samos and attacked their master. After a defeat by sea, Polycrates repelled an assault upon the walls, and subsequently withstood a siege by a joint armament of Spartans and Corinthians assembled to aid the rebels. He maintained his ascendency until about 515, when Oroetes, the Persian governor of Lydia, who had been reproached for his failure to reduce Samos by force, lured him to the mainland by false promises of gain and put him to death by crucifixion.

Beside the political and commercial pre-eminence which he conferred upon Samos, Polycrates adorned the city with public works on a large scale—an aqueduct, a mole and a gigantic wall of stone. The splendour of his palace is attested by the proposal of the Roman emperor Caligula to rebuild it. Foreign artists worked for him at high wages; from Athens he brought Democedes, the greatest physician of the age, at an exceptional salary. He was also a patron of letters: he collected a library and lived on terms of intimate friendship with the poet Anacreon, whose verses were full of references to his patron. The philosopher Pythagoras, however, quitted Samos in order to escape his tyranny. (M. O. B. C.)

POLYCRATES, Athenian sophist and rhetorician, flourished in the 4th century B.C. He taught at Athens, and afterwards in Cyprus. He composed a work on Encomium on Cleomenes, an Accusation of Socrates, an Encomium on Busiris (a mythical king of Egypt, notorious for his inhumanity); also declamations on mice, pots and counters. His Encomium on Busiris was sharply criticized by Isocrates, in a work still extant, and Dionysus of Halicarnassus characterizes his style as frigid, vulgar and inelegant.

POLYGAMY (Gr. πολυγία, many, and γάμος, marriage), or as it is sometimes termed, POLYGYNY (πολυγύνη, woman), the system under which a man is married to several women at the same time. Derivatively it includes the practice of polyandry, but it has become definitely restricted to expressing what has been, and still is, almost universal in some parts of the world. (See Family and Marriage.) Among Oriental nations plurality of legal wives is customary. Mahomedans are allowed four. A Hindu can have as many as he pleases: the high-caste sometimes having as many as a hundred. Polygamy is the rule among
African tribes, and is common among those of Australia and Poly-
nesia. In China, however, only one wife is lawful. In many
polygamous countries the practical obstacle of expense prevents
men from taking advantage of their privileges. While poly-
gamy was the rule in biblical days among the ancient Jews, and
was permitted and even enjoined in certain cases by the Mosaic
law, the comparative approach of the modern world has led to
its not being thought fit to persist for "bishops," in the New Testa-
ment, has always set its face against it. There have, however, been
divines who dissented from this general disapproval. The Anabaptists insisted
on freedom in the matter, and Bernardino Ochino conditionally
defended plurality of wives. When in 1540 Philip the Magnani-
mous, the reforming Landgrave of Hesse, determined (with
his wife's approval, she being a confirmed invalid) to marry a second
wife, Luther and Melanchthon approved "as his personal friends,
though not as doctors of theology"; while Martin Bucer assisted
at the marriage. In later times the Mormons (q.v.) in America
provide the most notable instance of the revival of polygamy.

**POLYGENISTS**, the term applied to those anthropologists
who contend that the several primary races of mankind are
separate species of independent origin. (See MONOGENISTS.)

**POLYGLOTT** (Gr. πολύγλωττος, many, and γλώττα, tongue), the term
for a book which contains side by side versions of the same text
in several different languages; its most important polyglotts are
editions of the Bible, or its parts, in which the Hebrew and
Greek originals are exhibited along with the great historical
versions, which are of value for the history and text of the com-
prehension. The first enterprise of this kind is the famous
**Hecata** of Origen in which the Old Testament Scriptures were
written in six parallel columns, the first containing the Hebrew
text, the second a transliteration of this in Greek letters, the
third and fourth the Greek translations by Aquila and Sym-
machus, the fifth the Septuagint version as revised by Origen,
the sixth the translation by Theodotion. Inasmuch, however,
and only two languages, Hebrew and Greek, were employed the work
was rather diglott than polyglott in the usual sense. After the
invention of printing and the revival of philological studies,
polyglotts became a favorite means of advancing the knowledge
of Eastern languages (for which no good helps were available) as
well as the study of Scripture. The series began with the
**Complutensian** printed by Arnaldus Guilelmus de Brocroia at
the expense of Cardinal Ximenes at the university of Alcalá de
Henares (Complutum). The first volume of this, containing the
New Testament in Greek and Latin, was completed on the 10th
of January 1514. In vols. ii.-v. (finished on July 10, 1517)
the Hebrew text of the Old Testament was printed in the
first column of each page, followed by the Latin Vulgate and
then by the Septuagint version with an interlinear Latin trans-
lation. Below these stood the Chaldee, again with a Latin
translation. The sixth volume containing an appendix is dated
1525, but the work did not receive the papal sanction till March
1526, and was apparently not issued till 1532. The chief editors
were Juan de Vergara, Lopez de Zuñiga (Stunica), Nuñez de
Guzman (Pincianus), Antonio de Librixa (Nebriissensis), and
Demetrios Lucas. About half a century after the **Complu-
tensian** came the **Antwerp Polyglott**, printed by Christopher
Plantin (1560-1572, in 8 vols. folio). Of this the principal editor
was Arias Montanus aided by Guido Fabricius Boderianus,
Raphelengius, Masius, Lucas of Bruges and others. This work
was under the patronage of Philip II. of Spain; it added a new
language to those of the **Complutensian** by including the Syriac
New Testament; and, while the earlier polyglott had only the
Targum to the Psalms and Proverbs, the Antwerp added also the
Targum on the Prophets, and on Esther, Job, Psalms and
the Salomonic writings. Next came Le Jay's **Paris Poly-
glott** (1644), which embraces the first printed texts of the Syriac
Old Testament (edited by Gabriel Sionita, a Maronite, but
the book of Ruth by Abraham Ecchelesis, also a Maronite) and
of the Samaritan Pentateuch and version (by Morinus). It has
also an Arabic version, or rather a series of various Arabic versions.
The last great polyglott is Brian Walton's (London, 1657),
which is much less beautiful than Le Jay's but more complete
in various ways, including, among other things, the Syriac of
Esther and of several apocryphal books for which it is wanting
in the Paris Bible, Persian versions of the Pentateuch and Gospels,
and the Psalms and New Testament in Ethiopic. Walton was
aided by able scholars, and used much new manuscript material.
His prolegomena, too, and collections of various readings mark an
important advance in biblical criticism. Walton, with this polyglott that E. Castell produced his famous **Heptaglott
Lexicon** (2 vols. folio, London, 1660), an astounding monument of
industry and erudition even when allowance is made for the fact
that for the Arabic he had the great MS. lexicon compiled and
left to the university of Cambridge by the almost forgotten
W. Bedwell. The liberality of Cardinal Ximenes, who is said
to have spent half a million ducats on it, removed the
**Complutensian** polyglott from the risks of commerce. The other three
editions all brought their promoters to the verge of ruin. The
later polyglotts are of little scientific importance, the best
recent texts having been confined to a single language; but every
biblical student still uses Walton and, if he cannot get it, Le Jay.
Of the numerous polyglott editions of parts of the Bible it may
suffice to mention the Genoa psalter of 1516, edited by Giustini-
ani, bishop of Nebbio. This is in Hebrew, Latin, Greek, Chaldee
and Arabic, and is interesting from the character of the Chaldee
text, being the first specimen of Western printing in the Arabic
character, and from a curious note on Columbus and the dis-
covery of America on the margin of Psalm xix. (A. W. Po.)

**POLYGNOTS**, Greek painter in the middle of the 5th century
B.C., son of Aglaophon, was a native of Thassos, but was adopted
by the Athenians, and admitted to their citizenship. He painted
for them in the time of Cimon a picture of the taking of Ilium
on the walls of the Stoa Poecile, and another of the marriage
of the daughters of Leucippus in the Anacenum. In the hall at
the entrance to the Acropolis other works of his were preserved.
The most important, however, of his paintings were his frescoes
in a building erected at Delphi by the people of Cnidus. The
subjects of these were the visit to Hades by Odysseus, and the
taking of Ilium. Fortunately the traveller Pausanias has left
us a careful description of these paintings, figure by figure
(Paus. x. 23-31). The foundations of the building have been
recovered in the course of the French excavations at Delphi.
From this evidence, some modern archaeologists have tried to
reconstruct the paintings, excepting of course the colours of them.
The best of these reconstructions is by Carl Robert, who by the
help of vase-paintings of the middle of the fifth century has
succeeded in recovering both the perspective of Polygnota and
the character of his figures (see GREEK ART, fig. 20). The
figures were detached and seldom overlapping, ranged in two or
three rows one above another; and the farther were not smaller
nor dimmer than the nearer. The designs are repeated in
Frazer's Pausanias, v. 360 and 372. It will hence appear that
paintings at this time were executed on almost precisely the
same plan as contemporary sculptural reliefs. We learn also that Polygnota employed but few colours, and
those simple. Technically his art was primitive. His excellence
lay in the beauty of his drawing of individual figures; but
especially in the "ethical" and ideal character of his art. The
temporary, and perhaps the teacher, of Pheidias, he had the
same grand manner. Simplicity, which was almost childlike,
sentiment at once noble and gentle, extreme grace and charm
of execution, marked his works, in contrast to the more
animated, complicated and technically superior paintings of
a later age. (F. C.)

**POLYHEDRON** (Gr. πολύς, many, and γείδων, an angle or
geometry, a figure enclosed by any number of lines—the sides—
which intersect in pairs at the corners or vertices. If the sides
are coplanar, the polygon is said to be "plane"; if not, then it is
a "skew" or "gauche" polygon. If the figure lies entirely
to one side of each of the bounding lines the figure is "convex";
if not it is "re-entrant" or "concave." A "regular" polygon
has all its sides and angles equal, i.e. it is equilateral and
equilangular; if the sides and angles be not equal the polygon is
"irregular." Of polygons inscribable in a circle an equilaterial
POLYGON

Figure is necessarily equiangular, but the converse is only true when the number of sides is odd. The term regular polygon is therefore restricted to "convex" polygons; a special class of polygons (regular in the wider sense) has been named "star polygons" on account of their resemblance to star-rays; these are, however, concave.

Polycyces, especially of the "regular" and "star" types, were extensively studied by the Greek geometers. The problem of constructing regular polygons is especially important in connection with Euclid's Elements relating to polygons. Having proved that the sum of the angles of a triangle is a straight angle, i.e., two right angles, it is readily seen that the sum of the internal angles of a polygon (necessarily convex) of $n$ sides is $2n-2$ straight angles ($2n-2$ right angles), for the polygon can be divided into $n-2$ triangles by lines joining one vertex to the other vertices. The second corollary is that the sum of the external angles is the internal plus the same direction, is 4 right angles, and is thus independent of the number of sides.

The systematic discussion of regular polygons with respect to the inscribed and circumscribed circles is given in the fourth book of the Elements. (We may note that the construction of an equilateral triangle and square appear in the first book.) The triangle is discussed in props. 2-6; the square in props. 6-9; the pentagon ($n$-side) in props. 10-17; the hexagon ($n$-side) in prop. 15; and the decagon in prop. 16. The triangle and square call for no special mention here, other than that any triangle can be inscribed or circumscribed to a circle. The pentagon is of more interest. Euclid bases his construction on the fact that the diagonal of a square is equal to the circle drawn about it, and his procedure is formed by joining the extremities of one side of a regular pentagon to the opposite vertex has each angle at the base double the angle at the vertex. He constructs this triangle in prop. 10, by dividing the line in median section, i.e., the square of one part equal to the product of the other part and the whole line (a construction given in book ii. 11), and then showing that the greater segment is the base of the required triangle, the remaining sides being each equal to the whole line. The inscription of a pentagon in a circle is effected by inscribing an isosceles triangle similar to that constructed in prop. 10, bisecting the angles at the base and producing the bisecting lines to the sides of the triangle. In this way those lines and the three vertices of the triangle are the vertices of the required pentagon. The circumscription of a pentagon is effected by constructing an inscribed pentagon, and drawing tangents to the circle at the vertices. This supplies a general method for circumscribing a polygon if the inscribed be given, and conversely. In book XIII., prop. 10, an alternative method for inscribing a pentagon is indicated, for it is there shown that the sum of the squares of the sides of a square and hexagon inscribed in the same circle equals the square of the side of the pentagon. It may be incidentally noticed that Euclid's construction of the isosceles triangle which has its basin angle, or the vertical angle, equal to the double terminal angle will satisfy the problem of quadratics, that is, a right angle; moreover, the base of the triangle is the side of the regular decagon inscribed in a circle having the vertex as centre and the sides of the triangle as radius. The inscription of a hexagon in one of the Pythagorean results from the fact that six equilateral triangles placed about a common vertex form a plane; hence the bases form a regular hexagon. The side of a hexagon inscribed in a circle obviously equals the radius of the circle. The inscribed hexagon in a circle having a center inscribed in a circle is that radius. The fact that the difference of the arcs of a circle intercepted by vertical sides of a regular pentagon and equilateral triangle is $\frac{1}{3} \pi$, of the whole circumference, and hence the bisected of this intercepted are (by book III., 30) gives the side of the quinquagone.

The methods of Euclid permit the construction of the following series of inscribed polygons: from the square, the 8-side or octagon, 16-32-... or generally $2^n$-side; from the hexagon, the 12-side or dodecagon, 24, 48-... or generally the $6^n$-side; from the pentagon, the 10-side or decagon, 20, 40-... or generally 5-$2^n$-side; and from the octagon, 16-32-... or generally $8^n$-side. It was long supposed that no other inscribed polygons were possible of construction by elementary methods (i.e., by the ruler and compasses); Gauss disproved this by forming the 17-side, and he later utilized his method for the $(2^{n+1})$-side, when this number is prime.

The problem of the construction of an inscribed heptagon, nonagon, or generally of any polygon having an odd number of sides, is readily reduced to the construction of a certain isosceles triangle. Suppose the polygon to have $(n+1)$ sides. Join the extremities of one side to the opposite vertex, and consider the triangle so formed. It is readily seen that the angle at the base is $\pi$ times the angle at the vertex. In the heptagon the ratio is 3, in the nonagon 4, and so on. Calling the radii of the circle, $a$, the radii of the heptagon required the solution of a cubic equation, thus resembling the Pythagorean problems of "duplicating the cube" and "tre-acting an angle." Edmund Halley gave solutions for the heptagon and nonagon by means of the parabola and circle, and by a parabola and hyperbola respectively.

Although rigorous methods for inscribing the general polygons in a circle are wanting, many approximate ones have been devised. Two such methods are here given: (1) Divide the diameter of the circle into as many parts as the polygon has sides. On the diameter construct an equilateral triangle; and from its vertex draw a line through the second division along the diameter, meeting an extremity of the polygon. Proceed in the same way from the other side of the circle. Then the chord joining this point to the extremity of the diameter is the size of the required polygon. (2) Divide the diameter into 10 equal parts, and also the horizontal diameter. Take points on these diameters beyond the circle and at a distance from the circle equal to one division of the diameter. Join the points so obtained; and draw a line from the point nearest the divided diameter where this line intersects the circle to the third division from the produced extremity; this line is the required length.

The construction of any regular polygon on a given side may be readily effected with the help of an arc. It is only necessary to lay off from the extremities of the given side lines equal in length to the given base, at angles equal to the interior angle of the polygon, and repeating the process at each extremity so that the angle of the angle is the same as the side; or lines may be laid off at one half of the interior angles, describing a circle having the meet of these lines as centre and their length as radius, and then measuring the given base around the circumference.

Star polygons.—These figures are studied by the Pythagoreans, and subsequently engaged the attention of many geometers—Boethius, Athelard of Bath, Thomas Bradwardine, archbishop of Canterbury, Johannes Kepler and others. Mystical and magical properties were assigned to them. It is important that Pythagoreans regarded the pentagram, the star polygon derived from the pentagon, as the symbol of health, the Platonists of well-being, while others used it to symbolize a victory over death, or the immortal, &c., it is worn in almost every country as a charm or amulet.

The pentagon gives rise to one star polygon, the hexagon two, the heptagon one, and the nonagon two. In general, the number of star polygons which can be drawn about the vertices of an n-point regular polygon is the number of numbers which are not factors of $n$ and are less than $\frac{n}{2}$.
POLYGONACEAE, in botany, a natural order of Dicotyledons, containing 30 genera with about 700 species, chiefly in the north temperate zone, and represented in Great Britain by three genera, Polygonum, Rumex (Dock, q.v.) and Oxyria. They are mostly herbs characterized by the union of the stipules into a sheath or ocrea, which protects the younger leaves in the bud stage (fig. 1). Some are climbers, as, for instance, the British Polygonum Convolutus (black bindweed). In Muehlenbeckia platyclada, a native of the Solomon Islands, the stem and branches are flattened, forming ribbon-like cladodes jointed at the nodes. The leaves are alternate, simple and generally entire; the edges are rolled back in the bud. They are generally smooth, but sometimes, especially in mountain species, woolly. The small regular, generally hermaphroditic flowers are borne in large numbers in compound inflorescences, the branches of which are cymose. The parts of the flower are whorled (cyclic) or acyclic. The former arrangement may be derived from a regular trimerous flower with two whorls of perianth leaves, two staminal whorls and a three-sided ovary—such a flower occurs in the Californian genus Pierostegia (fig. 2). The flower of rhubarb (Rheum) is derived from this by doubling in the outer staminal whorl (fig. 3), and that of the dock (Rumex) by doubling in the outer staminal whorl and suppression of the inner (fig. 4). In Koensiga, a tiny annual less than an inch high, native in the arctic and sub-arctic regions and the Himalayas, there is one perianth and one staminal whorl only. Dimerous whorled flowers occur in Oxyria (mountain sorrel), another arctic and alpine genus, the flowers of which resemble those of Rumex but are dimerous (fig. 5). In the acyclic flowers a 5-merous perianth is followed by 5 to 8 stamens as in Polygonum (fig. 6). The perianth leaves are generally uniform and green, white or red in colour. They are free or more or less united, and persist till the fruit is ripe, often playing a part in its distribution, and affording useful characters for distinguishing genera or species. Thus in the docks the three inner leaves enlarge and envelope the fruit as three membranous wings one more or one of which bear on the back large fleshy warts. Less often, as in the South American genus Triplaris, the three outer perianth leaves form the agent of distribution, developing into long flat membranous wings, the whole mechanism suggesting a shuttlecock. The number of the carpels is indicated by the three-sided (in dimerous flowers two-sided) ovary, and the number of the styles; the ovary is unilocular and contains a single erect ovule springing from the top of the floral axis (fig. 7). The fruit is a dry one-seeded nut, two-
POLYGONAL NUMBERS—POLYHEDRON

12 species; *Rumex* (fig. 8) (11 species) includes the various species of dock (q.v.) and sorrel (*R. acetosa*, *R. sanguinea*). *Ötvös elegans*, an alpine plant (mountain sorrel), takes its generic name (Gr. ἐλέγας, sharp) from the acidity of its leaves. *Rheum* (*Rhubarb*, 2 a.) is central Asiatic.

**POLYGONAL NUMBERS**, in mathematics. Suppose we have a number of equal circular counters, then the number of counters which can be placed on a regular polygon so that the tangents to the outer rows form the regular polygon and all the internal counters are in contact with its neighbours, is a "polygonal number" of the order of the polygon. If the polygon be a triangle it is readily seen that the numbers are 3, 6, 10, 15 ... and generally \( n(n + 1) \); if a square, 4, 9, 16, ... and generally \( n^2 \); if a pentagon, 5, 12, 22 ... and generally \( n(n+1) \); if a hexagon, 6, 15, 28, ... and generally \( n(n-1) \); and similarly for a polygon of \( r \) sides, the general expression for the corresponding polygonal number is \( n(n-1) (r-2)+2 \).

Algebraically, polygonal numbers may be regarded as the sums of consecutives terms of the arithmetical progressions having \( n \) for the first term and \( 1, 2, 3, ... \) for the common differences. Taking unit common difference we have the series: \( 1+2+3 = \frac{n^2+n}{2} ; 1+2+3+4+5 = \frac{n(1+n)}{2} \); and generally \( 1+2+3+4+5+...+n = \frac{n(n+1)}{2} \). More generally we have \( 1+2+3+4+5+...+(2n-1) = \frac{n^2}{2} \); and generally for the polygonal number of the \( r \)th order we take the sums of consecutives terms of the series \( \sum_{i=1}^{n} i \), \( \sum_{i=1}^{n} (i+r-2) \), and generally the \( r \)th polygonal number of the \( n \)th order is the sum of \( n \) terms of this series, i.e.,

\[
\begin{align*}
1 + 1 + 2 + (r-2) + 2 & = n + n + n - r - 2 \\
\text{(the series)} & \text{or generally } n, \text{ are the so-called "linear numbers" (cf. Figure Numbers).}
\end{align*}
\]

**POLYHEDRAL NUMBERS**, in mathematics. These numbers are related to the polyhedron (see POLYHEDRON) in a manner similar to the relation between polygonal numbers (see above) and polygons. Take the case of tetrahedral numbers. Let \( AB, AC, AD \) be three covertical edges of a regular tetrahedron. Divide \( AB, AC, AD \) ... into parts each equal to \( A \), so that tetrahedra having the common vertex \( A \) are obtained, whose linear dimensions increase arithmetically. Imagine that we have a number of spheres (or shot) of a diameter equal to the distance \( A \). It is seen that 4 shot having their centres at the vertices of the tetrahedron \( A \) will form a pyramid. In the case of the tetrahedron of edge \( A \) we require 4 along each side of the base, i.e., 6, 3 along the base of \( A \), and 1 at \( A \), making 10 in all. To add a third layer, we will require 4 along each base, i.e., 9, and 1 in the centre. Hence in the tetrahedron \( A \) we have 20 shot. The numbers 1, 4, 10, 20 are polyhedral numbers, and from their association with the tetrahedron are termed "tetrahedral numbers".

This illustration may serve for a definition of polyhedral numbers: a polyhedral number represents the number of equal spheres which can be placed within a polyhedron so that the spheres touch one another or the sides of the polyhedron.

In the case of the tetrahedron we have seen the numbers to be 1, 4, 10, 20; the general formula for the \( n \)th tetrahedral number is \( \frac{n(n+1)(n+2)}{3} \). Cubic numbers are 1, 8, 27, 64, 125, &c., or generally \( n^3 \). Octahedral numbers are 1, 6, 19, 44, &c., or generally \( \frac{n(n+1)(2n+1)}{3} \). Dodecahedral numbers are 1, 20, 84, 220, &c.; or generally these are triangular numbers. With a common difference \( \frac{n(n-1)}{2} \). Icosahedral numbers are 1, 12, 48, 124, &c., or generally \( \frac{n(n^2-3n+2)}{2} \).

**POLYHEDRON** (Gr. πολύεδρον, many, ἑπατή, a base), in geometry, a solid figure contained by plane faces. If the figure be entirely to one side of any face the polyhedron is said to be "convex," and it is obvious that the faces envelop the centre one; if, on the other hand, the figure is to both sides of every face it is said to be "concave," and the centre is multiply enveloped by the faces. "Regular polyhedron" are such as have their faces all equal regular polygons, and all their solid angles equal; the term is usually restricted to the five forms in which the centre is singly enclosed, viz. the Platonic solids, while the four polyhedra in which the centre is multiply enclosed are referred to as the Kepler-Poinsot solids. Kepler having discovered three, while Great-discovered the fourth. Another group of polyhedra are termed the "Archimedean solids," named after Archimedes, who, according to Pappus, invented them. These have faces which are all regular polygons, but not all of the same kind, while all their solid angles are equal. These figures are often termed "semi-regular solids," but it is more convenient to restrict this term to solids having all their angles, edges and faces equal, the latter, however, not being regular polygons.

**Platonic Solids.** The names of these five solids are: (1) the tetrahedron, enclosed by four equilateral triangles; (2) the cube or hexahedron, enclosed by 6 squares; (3) the octahedron, enclosed by 8 equilateral triangles; (4) the dodecahedron, enclosed by 12 pentagons; (5) the icosahedron, enclosed by 20 equilateral triangles.

The first three were certainly known to the Egyptians; and it is probable that the icosahedron and dodecahedron were added by the Greeks. The cube may have originated by placing three equal squares at a common vertex, so as to form a trihedral angle. Two such sets can be placed so that the free edges are brought into coincidence while the vertices are kept distinct. This solid has therefore 6 faces, 8 vertices and 12 edges. The equilateral triangle is the basis of the tetrahedron, octahedron and icosahedron. If three equal triangular faces be placed in a vertex, the two sides being in contact, then it is seen that the base is an equal equilateral triangle; hence four equal equilateral triangles enclose a space. This solid has 4 faces, 4 vertices and 6 edges. In a similar manner, four covertical equilateral triangles stand on a square base. Two such sets placed base to base form the octahedron, which consequently has 8 faces, 6 vertices and 12 edges. Five equilateral triangles covertically placed would stand on a pentagonal base, and it was found that, by forming several sets of such pyramids, a solid could be obtained which had 20 triangular faces, which met in pairs to form 30 edges, and in fives to form 12 vertices. This is the icosahedron. That the triangle could give rise to no other solid followed from the fact that six covertically placed triangles formed a plane. The pentagon is the basis of the dodecahedron. Three pentagons may be placed at a common vertex to form a solid angle, and by forming several such sets and placing them in juxtaposition a solid is obtained having 12 pentagonal faces, 30 edges, and 20 vertices.

These solids played an important part in the geometry of the Pythagoreans, and in their cosmology symbolized the five elements: fire (tetrahedron), air (octahedron), water (icosahedron), earth (cube), universe or ether (dodecahedron). They were also discussed by the Platonists, so much so that they became known as the "Platonic solids." Euclid discusses them in the thirteenth book of his *Elements*, where he proves that no more regular bodies are possible, and shows how to inscribe them in a sphere. This latter problem received the attention of the Arabian astronomer Abul Wefa (10th century A.D.), who solved it with a single opening of the compasses.

**Measurement of the Platonic Solids.**—The measurement of the regular polyhedra is readily investigated by the methods of elementary geometry. The solids that these may be inscribed in and circumscribed to concentric spheres being especially useful.

If \( F \) be the number of faces, \( n \) the number of edges per face, \( m \) the number of faces per vertex, \( l \) the length of an edge, and if we denote the angle between two adjacent faces by \( l \), the area by \( V \), the volume by \( V \), the radius of the circum-sphere by \( R \), and of the in-sphere by \( r \), the following general formulae hold, \( a \) being written for \( \pi m \), and \( b \) for \( \pi m l \):

\[
\sin \gamma = \cos \beta \cos \alpha \sin \gamma.
\]

1. In the language of Proclus, the commentator: "The equilateral triangle is the proximate cause of the three elements, "fire", "air" and "water"; but the square is annexed to the "earth"."
POLYHEDRON

The following Table gives the values of $A$, $V$, $R$, $r$ for the five Polyhedra:

Kepler-Poinsot Polyhedra.—These solids have all their faces equal regular polygons, and the angles at the vertices all equal. They bear a relation to the Platonic solids similar to the relation of “star polygons” to ordinary regular polygons, inasmuch as the centre is multiply enclosed in the former and singly in the latter. Four such solids exist: (1) small stellated dodecahedron; (2) great dodecahedron; (3) great stellated dodecahedron; (4) great icosahedron. Louis Poinsot discussed these solids in his memoir, “Sur les polygones et les polyèdres” (Journ. École poly. [iv.] 1810), three of them having been previously considered by Kepler. They were afterwards treated by A. L. Cauchy (Journ. École poly. [ix.] 1832), who showed that they were derived from the Platonic solids, and that no more than four were possible. A. Cayley treated them in several papers (e.g. Phil. Mag., 1839, 17, p. 123 seq.), considering them by means of their projections on the circumscribing sphere and not, as Cauchy, in solido.

The small stellated dodecahedron is formed by stellating the Platonic dodecahedron (by “stellating” is meant developing the faces contiguous to a specified base so as to form a regular pyramid). It has 12 pentagonal faces, and 30 edges, which intersect in fives to form 12 vertices. Each vertex is singly enclosed by the five faces; the centre of each face is doubly enclosed by the succession of faces about the face; and the centre of the solid is doubly enclosed by the faces. The great dodecahedron is determined by the intersections of the twelve planes which intersect the Platonic icosahedron in five of its edges; or each face has the same boundaries as the basal side of five converging faces of the icosahedron. It is the reciprocal (see below) of the small stellated dodecahedron. Each vertex is doubly enclosed by the succession of convergent faces, while the centre of the solid is repeatedly enclosed by the faces. The great stellated dodecahedron is formed by stellating the faces of a great dodecahedron. It has 12 faces, which meet in 30 edges; these intersect in threes to form 20 vertices. Each vertex is singly enclosed by the succession of faces about it; and the centre of the solid is quadruply enclosed by the faces. The great icosahedron is the reciprocal of the great stellated dodecahedron. Each of the twenty triangular faces subtends at the centre the same angle as is subtended by four whole and six half faces of the Platonic icosahedron; in other words, the solid is determined by the twenty planes which can be drawn through the vertices of the three faces contiguous to any face of a Platonic icosahedron. The centre of the solid is septuply enclosed by the faces.

A connexion between the number of faces, vertices and edges of regular polyhedra was discovered by Euler, and the result, which assumes the form $e + 2 = f + v$, where $E$, $F$, $V$, $E$ are the number of edges, faces and vertices, is known as Euler’s theorem on polyhedra. This formula only holds for the Platonic solids. Poinsot gave the formula $E + 2e = F + v$, in which $e$ is the number of triangular projections of the faces from the centre on to the surface of the circumscribing sphere make up the spherical surface, the area of a stellated face being reckoned once, and $e$ is the ratio “angles at a vertex $\pi/2$” as projected on the sphere, $E$, $F$, $V$, $E$ being the same as before. Cayley gave the formula $E + 2D = F + v + e$, where $e$, $E$, $V$, $F$ are the same as before, $D$ is the same as Poinsot’s $k$ with the distinction that the area of a stellated face is reckoned as the sum of the triangles having their vertices at the centre of the face and standing on the sides, and $e$ is the ratio: “the angles subtended at the centre of a face by its sides $\pi/2$.”

The following table gives these constants for the regular polyhedra: $n$ denotes the number of sides to a face, $n_i$ the number of faces to a vertex:

</table>

Archimedean Solids.—These solids are characterized by having all their angles equal and all their faces regular polygons, which are not all of the same species. Thirteen such solids exist.

1. The truncated tetrahedron is formed by truncating the vertices of a regular tetrahedron so as to leave the original faces hexagons. (By the truncation of a vertex or edge we mean the cutting away of the vertex or edge by a plane making equal angles with all the faces composing the vertex or with the two faces forming the edge.) It is bounded by 4 triangular and 4 hexagonal faces; there are 18 edges, and 12 vertices, at which each of two hexagons and one triangle are covertexal.

2. The cuboctahedron is a tesseract-octahedron (Gr. κυβερνητική-κτεινή, fourteen) formed by truncating the vertices of a cube so as to leave the original faces squares. It is enclosed by 6 square and 8 triangular faces, the latter belonging to a coaxial octahedron. It is a common crystal form.

3. The truncated cube is formed in the same manner as the cuboctahedron, but the truncation is only carried far enough to leave the original faces octagons. It has 6 octagonal faces (corresponding to the original cube), and 8 triangular ones (belonging to the coaxial octahedron).

4. The truncated octahedron is formed by truncating the vertices of an octahedron so as to leave the original faces hexagons; consequently it is bounded by 8 hexagonal and 6 square faces.

5. Rhombicuboctahedron.—Two Archimedean solids of 26 faces are derived from the coaxial cube, octahedron and semi-regular (rhombic) dodecahedron (see below). The “small rhombicuboctahedron” is bounded by 12 pentagonal, 8 triangular and 6 square faces; the “great rhombicuboctahedron” by 12 decagonal, 8 triangular and 6 square faces.

6. Rhombicosidodecahedron or icosidodecahedron (Gr. ῥόμβοι-κοσμείον, thirty-two), is a 32-faced solid, formed by truncating the vertices of an icosahedron so that the original faces become triangles. It is enclosed by 20 triangular faces belonging to the original icosahedron, and 12 pentagonal faces belonging to the coaxial dodecahedron.

7. The truncated icosahedron is formed similarly to the icosidodecahedron, but the truncation is only carried far enough to leave the original faces hexagons. It is therefore enclosed by 20 hexagonal faces belonging to the icosahedron, and 12 pentagonal faces belonging to the coaxial dodecahedron.

8. The truncated icosidodecahedron is formed by truncating the vertices of a dodecahedron parallel to the faces of the coaxial icosahedron so as to leave the former decagons. It is enclosed by 20 triangular faces belonging to the icosahedron and 12 decagons belonging to the dodecahedron.

9. The rhombicuboctahedron is formed by truncating the vertices of a dodecahedron parallel to the faces of the coaxial dodecahedron so as to leave the former decagons. It is enclosed by 20 triangular faces belonging to the icosahedron and 12 decagons belonging to the dodecahedron.

10. The snub cube is a 38-faced solid having at each corner 4 triangles and 1 square; 6 faces belong to a cube, 8 to the coaxial octahedron, and the remaining 24 to no regular solid.

11. The rhombicosidodecahedron.—Two 62-faced solids are derived from the dodecahedron, icosahedron and the semi-regular
triacanthahedron. In the "small rhombikosidodecahedron" there are 12 pentagonal faces belonging to the dodecahedron, 20 triangular faces belonging to theicosahedron and 30 square faces belonging to the triacontahedron. In the great rhombikosidodecahedron the triacontahedron occurs in any octahedron. This polyhedron, having the icosahedral faces and the triacontahedral squares; this solid is sometimes called the "truncated icosidodecahedron."

13. The snub dodecahedron is a 92-faced solid having 4 triangles and 32 pentagonal faces. The pentagons belong to a dodecahedron, and 20 triangles to an icosahedron; the remaining 60 triangles belong to no regular solid.

**Semi-regular Polyhedra.**—Although this term is frequently given to the Archimedean solids, yet it is a convenient designation for solids which have all their angles, faces, and edges equal, the faces not being regular polygons. Two such solids exist: (1) the "rhombic dodecahedron," formed by truncating the edges of a cube, is bounded by 12 equal rhombs; it is a common crystal form (see CRYSTALLOGRAPHY); and (2) the "semi-regular triacontahedron," which is enclosed by 30 equal rhombs.

The interrelations of the polyhedra enumerated above are considerably elucidated by the introduction of the following terms: (1) Correspondence. Two polyhedra correspond when the radii-vectors of the centre of gravity towards the faces are in the same ratio as the edges and, to the vertices, can be brought into coincidence. (2) Reciprocal. Two polyhedra are reciprocal when the faces and vertices of one correspond to the vertices and faces of the other. (3) Isometric. Two polyhedra are said to be isometric if they have the same radii-vectors or facial holohedra of another (B) when the faces or vertices of A correspond to the edges of B, and the vertices or faces of A correspond to the vertices and faces together of B. (4) Hemihedral. A polyhedron is said to be hemihedral if it can be divided into two equal or facial holohedra of another (B) when the faces of A correspond to the alternate faces of the latter or holohedral form; consequently a hemihedral form has half the number of faces of the holohedral form. Hemihedral forms, being of special importance in crystallography, to which article the reader is referred for a fuller explanation of these and other modifications of polyhedron (tetrahedral, enantiotropic, &c.). It is generally true that the tetrahedron is its own reciprocal, i.e. it is self-reciprocal; the cube and octahedron, the dodecahedron and icosahedron, the small stellated dodecahedron and great dodecahedron, and the great stellated dodecahedron and great icosahedron are reciprocal to one another. Of the other solids: the truncated tetrahedron, truncated cube, and truncated dodecahedron, are the reciprocals of the crystal forms triakis-tetrahedron, triakis-icosahedron and triakis-icosidodecahedron. Since the tetrahedron is the hemihedral form of the octahedron, and the octahedron and cube are reciprocal, we may term these two latter solids "reciprocal holohedra" of the tetrahedron. Other examples of reciprocal holohedra are: the rhombic dodecahedron and cubooctahedron, with regard to the cube and octahedron; and the regular triacontahedron and icosidodecahedron, with regard to the dodecahedron and icosahedron. As examples of facial holohedra we may notice the small rhombicuboctahedron and rhombic dodecahedron, and the small rhombikosidodecahedron and the semi-regular triacontahedron. The correspondence of the faces of polyhedra is also of importance, as may be seen from the manner in which one of them may be derived from another. Thus the faces of the cuboctahedron, the truncated cube, and truncated octahedron correspond; likewise with the truncated dodecahedron, truncated icosahedron, and icosidodecahedron; and with the small and great rhombikosidodecahedron.

The general theory of polyhedra properly belongs to combinatorial analysis. The determination of the number of different polyhedra of n faces, i.e. n-hedrons, is reducible to the problem: In how many ways may the 2n multiple points, i.e. triplets, midpoint triplets, &c., be made up of n symbols, so that (1) every contiguous pair of symbols in one multiplet are a contiguous pair in some other, the first and last of any multiplet being considered contiguous, and (2) no three symbols in one multiplet shall occur in another. This problem is treated by the Rev T. P. Kirkman in the Manchester Memoirs (1855, 1857- 1860); and in the Phil. Trans. (1857).

---

**POLYMETHYLENES.** In chemistry, cyclic compounds, the simplest members of which are saturated hydrocarbons of general formula CₙHₙ, where n may be 1 to 9, and known as tri-, tetra-, penta-, hexa- and hepta-methylene, &c., or cylo-propane, -butane, -pentane, -hexane, -heptane, &c.—

CH₃-CH₂-CH₂-CH₃, CH₃-CH₂-CH₂-CH₂-CH₃, CH₃-CH₂-CH₂-CH₂-CH₂-CH₃,
Cyclo-propane, -butane, -pentane, -hexane, &c.

The unsaturated members of the series are named on the Geneva system in which the termination "ene" is replaced by "-ene, -diene, -triene," according to the number of double linkages in the compound, the position of such double linkages being shown by a numeral immediately following the suffix "ene;" for example I. is methyl-cyclo-hexadiene—r. 3. An alternative method employs A. v. Baeyer's symbol Δ. Thus Δ 2,4 indicates the presence of two double bonds in the molecule situated immediately after the carbon atoms 2 and 4; for example II. is Δ 2,4 dihydrophthalic acid.

(1)CH₃—CH=CH₂, (2)CH₂=CH₂, (3)HO—CH=CH₂, (4)CH₂—OH

The trans compound is perfectly asymmetric and so its mirror image (I) should exist, and, as all the trans compounds synthetically prepared are optically inactive, they are presumably racemic compounds (see O. Aschan, Chemie der alicyclischen Verbindungen, p. 346 seq.).

**General Methods of Formation.**—Hydrocarbons may be obtained from the dihalogen paraffins by the action of sodium or zinc dust, provided that the halogen atoms are not attached to the same or to adjacent carbon atoms (A. Freund, Monats., 1883, 2, p. 625; W. H. Perkins, jun., Journ. Chem. Soc., 1888, 53, p. 213):

CH₃-CH₂-Br + 2Na = 2NaBr + CH₃-CH₂-H,

by the action of hydriodic acid and phosphorus or of phosphonium iodide on benzene hydrocarbons (F. Wreden, Ann., 1877, 187, p. 153; A. v. Baeyer, ibid., 1870, 155, p. 266), benzene giving methylpentamethylenic; by passing the vapour of benzene hydrocarbons over finely divided nickel at 180-290° C. (P. Sabatier and J. B. Senderens, Comptes rendus, 1901, 132, p. 210 seq.); and from hydrzones of the type CH₂=NH-NH₂ by oxidation with alkaline potassium ferricyanide (N. Kijner, Journ. prakt. Chem., 1901, 64, p. 113). Unsaturated hydrocarbons of the series may be prepared from the corresponding alcohols by the elimination of a molecule of water, using either the xanthogen ester method of L. Tschugaeff (Ber. 1899, 32, p. 3332): CH₂=CH-OH → CH₂=CH-OC=S+R-SH; or simply by dehydrating with anhydrous oxalic acid (N. Zelinsky, Ber., 1901, 34, p. 3249); and eliminating by the halogen acid from mono- or di-halogen polyethylene compounds by heating them with quinoline.

Alcohols are obtained from the corresponding halogen compounds by the action of moist silver oxide, or by warming them with silver acetate and acetic acid; by the reduction of ketones with metallic sodium; by passing the vapours of monohydric phenols and hydrogen over finely divided nickel (P. Sabatier and J. B. Senderens, loc. cit.) by the reduction of cyclic esters with
sodium and alcohol (L. Bouveault and G. Blanc, *Comptes rendus*, 1903, 136, p. 176; 137, p. 60); and by the addition of the elements of water to the unsaturated cyclic hydrocarbons on boiling with dilute acids.

**Aldehydes and Ketones.**—The aldehydes are prepared in the usual manner from primary alcohols and acids. The ketones are obtained by the dry distillation of the calcium salts of dibasic saturated aliphatic acids (J. Wilsicenus, *Ann.*, 1893, 275, p. 309): [HC=CH₂CO₂Ca→(CH₂CH₂)₂CO] by the action of sodium on the esters of acids of the adipic and pimelic acid series (W. Dieckmann, *Ber.*, 1894, 27, pp. 103, 2475):

\[ \text{CH}_2\text{CH}_2\text{CH}_2\text{CO}_2\text{R} \rightarrow \text{CH}_2\text{CH}_2\text{CH}_2\text{C}=\text{O} \]

by the action of sodium ethylate on δ-ketonic acids (D. Vör-\ländner, *Ber.*, 1895, 28, p. 2348):

\[ \text{CH}_3\text{CH}_2\text{CH}_2\text{CO}_2\text{H} \rightarrow \text{CH}_3\text{CH}_2\text{CH}_2\text{COH} \]

from sodio-malic ester and α-unsatuated ketonic or keto esters:

\[ (\text{RO})\text{CH}=\text{O} \]

by the action of aceto-acetic ester and esters of αβ-unsaturated acids, followed by elimination of the carboxyl group:

\[ \text{CH}_2\text{CO}-\text{CH}_2\text{CO}_2\text{R}+\text{R'=CH}-\text{CH}=\text{CH}-\text{CO}_2\text{R} \rightarrow \text{CH}_2\text{CH}=\text{CH}_2\text{C}=\text{O} \]

\[ 2\text{CH}_2\text{CO}_2\text{H}+\text{CH}_2\text{CHO} \rightarrow \text{CH}_2\text{CH}=\text{CH}_2\text{C}=\text{O} \]

from α,β-diketones which contain a methyl group next the keto-group (W. Kerp, *Ann.*, 1896, 290, p. 123):

\[ 3\text{CH}_3\text{CH}=\text{O} \]

by the condensation of succinic acid with sodium ethylate, followed by saponification and elimination of carbon dioxide:

\[ 2\text{CH}_2\text{CO}_2\text{H} \rightarrow \text{CH}_2\text{=CH}-\text{CO} \]

and from the condensation of ethyl oxalate with esters of other dibasic acids in presence of sodium ethylate (W. Dieckmann, *Ber.*, 1897, 30, p. 1479; 1899, 33, p. 1939):

\[ \text{CO}_2\text{R}+\text{CH}_2\text{CHO} \rightarrow \text{CO}_2\text{H}+\text{CH}_2\text{=CH}-\text{CO} \]

**Acids** may be prepared by the action of dialkyl paralins on sodio-malonic ester, or sodio-aceto-acetic ester (W. H. Perkin, *Journ. Chem. Soc.*, 1888, 53, p. 194): [\(\text{C}_4\text{H}_8\text{Br}+2\text{NaCH}_2\text{(CO}_2\text{R})\rightarrow(\text{CH}_2\text{CH}=\text{CH}_2)\text{CO}_2\text{R}+2\text{NaBR}\)]

ethyl butane tetracarboxylate is also formed which may be converted into a tetramethylene carboxylic ester by the action of bromine on its disodium derivative (W. H. Perkin and Sinclair, ibid., 1892, 61, p. 36). The esters of the acids may also be obtained by condensing sodio-malonic ester with α-halogen derivatives of unsaturated acids:

\[ \text{CH}_2\text{CH}=\text{CH}_2\text{C}=\text{O} \]

by the action of diazomethane or diazoacetic ester on the esters of unsaturated acids, the pyrazine carboxylic esters so formed losing nitrogen when heated and yielding acids of the cyclo-propane series (E. Buchner, *Ber.*, 1890, 23, p. 703; *Ann.*, 1895, 208, p. 212; H. v. Pechmann, *Ber.*, 1894, 27, p. 1891):

\[ \text{CH}_2=\text{CH}_2\text{CO}_2\text{R} \rightarrow \text{CH}_2=\text{CH}_2\text{CO}_2\text{H} \]

POLYMERENES

fuchenes, substances characterized by their intense orange-red colour
(HC;CH2;CH)2
(J. Thiele, Ber., 1900, 33, p. 669). Phenylfuchenes,

HC:CH
obtained from benzaldehyde and cyclo-pentene, forms dark red plates.

Diphendyliden, from benzophenone and cyclo-pentadiene, crystallizes in deep red prisms. Dimethylenfuchenes is an orange-red
cyclo-pentane and cyclo-hexane. Concentrated sulphuric acid converts
it into a deep red tar.

Cyclo-pentanone, C5H8O, first prepared by the distillation of
calcium adipate (J. W. Wislicenus, Ann., 1893, 275, p. 312), is also
obtained from attention to the ketonic compound and from the
form of cyclo-pentanone carboxylic acid, obtained by condensing acetaldehyde
and aldehyde esters in the presence of sodium ethylate. Reduction gives cyano-

C5H9ONa.

Croctonic acid (dioxo-cyclo-pentene-trione), C5H4O6, is formed when
triquinoyl is boiled with water, or by the oxidation of hexa-oxybenzene
acid with potassium permanganate. Concentrated hydrochloric acid,

HCl

forms the trichloride, which melts at 180°C.

Camphoradiene, C10H14, is the lactone of trimethyl-2,2,3-cyclo-
pentanol-5-carboxylic acid-3. For an isomer, isocamphoradiene
(the lactone of trimethyl-1-2,2-cyclo-pentan-3-carboxylic acid-1)
W. Pypoff, J. phys. Chem., 1902, 3, 157. 2-Acetylcyano-

C5H8C=CH

isocamphoradiene, C5H8O, is formed by the action of acetyl chloride
on the lactone of camphoradiene. Acetylation gives the diacyl

C5H8O, 2-acetylcyanoisocamphoradiene, 2-acetylcyanoisocamphoradiene

C5H8O, 2-acetylcyanoisocamphoradiene, 2-acetylcyanoisocamphoradiene

C5H8O, 2-acetylcyanoisocamphoradiene, 2-acetylcyanoisocamphoradiene

C5H8O, 2-acetylcyanoisocamphoradiene, 2-acetylcyanoisocamphoradiene

C5H8O, 2-acetylcyanoisocamphoradiene, 2-acetylcyanoisocamphoradiene
POLYMETHYLENES

Acid, obtained by heating the anhydride of the trans-acid, forms prisms which melt at 192° C. When heated with hydrochloric acid it passes into the dihydrochloride. The reduction of the dihydrobromide of $\Delta^{4}$-tetrahydrophthalic acid or $\Delta^{4}$-dihydrophthalic acid is split into its active components by means of its quinine salt (A. Wernher and H. E. Conrad, Ber., 1899, 32, p. 3040). The tetrahydrobromides (cyclo-hexane-1,4-dicarboxylic acids) are obtained by the action of methylamine on diacid-pentane tetrahydroxycarboxylic ester (W. H. Perkins, Journ. Chem. Soc., 1891, 59, p. 798) by the action of trimethylene bromide on diacid-pentane tetrahydroxycarboxylic ester (J. H. Elder, Chem. Soc., 1904, 83, p. 472). Shikimic acid (3-4-triroy-cyclo-hexanocarboxylic acid) is found in the fruit of *Pirus radiata* L. of the Angioportus family. It yields para- and meta-xylene, and naphthalene. Sedanonic acid, $C_6H_6O_2$, found in profusion in *C. Sedana*, higher in boiling fractions of celery oil, is an ortho-xylenic acid of the analog to shikimic acid being ortho-xylenic-$\Delta^4$-tetraphenzylic acid (G. Clamanian and P. Sibler, Ber., 1897, 39, pp. 492, 501, 1419 seq.). Sedanonic acid readily decomposes into water and its lactone sedanolide, $C_6H_5O_2$, the odorless component of celery. Tetrahydroxycarboxylic acids (cyclo-hexene dicarboxylic acids), $C_9H_{14}O_2$. Of the ortho-series four acids are known. The $\Delta^4$-acid is obtained as its anhydride by heating the $\Delta^2$-acid to 220° C, or in alcoholic solution in trans-form. The $\Delta^4$-acid is produced by the reduction of the dihydrochloride. The $\Delta^2$-acid is obtained as its anhydride by heating the $\Delta^4$-dihydrophthalic anhydride with acetic anhydride. When boiled with caustic soda it isomerizes to a mixture of the $\Delta^2$- and $\Delta^6$-dihydrophthalic acids. The $\Delta^4$-acid is obtained by boiling the dihydrobromide of the $\Delta^2$-acid with alcoholic potash or by continued boiling of the $\Delta^4$-acid with caustic soda.

The $\Delta^2$-acid is produced when phthalic acid is reduced in the cold by sodium amalgam or by heating the $\Delta^4$-acids with caustic soda. The trans-modification of $\Delta^4$-acid is produced when phthalic acid is reduced by sodium amalgam in the presence of acetic acid. When heated for some time with acetic anhydride it changes to the cis-form. The trans-acid has been resolved by means of its styrchaine salts into two optically active isomers, both of which readily pass to $\Delta^4$-dihydrophthalic acid (A. Neville, Journ. Chem. Soc., 1906, 89, p. 1744).

Of the dihydrophthalic acids, the $\Delta^2$-acid is obtained by heating the dibromide of the $\Delta^2$-tetrahydro acid with alcoholic potash. It cannot be prepared by a direct reduction of terephthalic acid. On warming with caustic soda it is converted into the $\Delta^4$-acid. The $\Delta^4$-acid is also obtained by the direct reduction of terephthalic acid. It is the most stable of the dihydro acids. The $\Delta^2$-acid is obtained by boiling the cis- and trans-$\Delta^2$-acids with water, which are obtained on reducing terephthalic acid with sodium amalgam in faintly alkaline solution. The relationships existing between the various hydrophthalic acids may be shown as follows:

Cyclo-heptane Group.

Cyclo-heptane (suberate), $C_6H_{14}$, obtained by the action of suberyl iodide, is a liquid which boils at 117° C. On treatment with bromine in the presence of aluminium bromide it gives chiefly pentabromotoluene. When heated with hydrochloric acid to 290° C, it gives methylethylene tetrabromide. On oxidation with nitric acid (sp. gr. 1.4) it yields pimelic acid, *Ditubery*, $C_6H_4(C_2H_5)CH_3$, a thick oily liquid, boiling at 290° C, is obtained by the reduction of suberyl bromide.

Cyclo-heptanol, $C_6H_{14}OH$, is obtained by the action of alcoholic potash on suberyl iodide; and from cyclo-heptane carboxylic acid, the amide of which by the action of sodium hypobromite is converted into cyclo-heptanamine, which, in its turn, is destructively methylated (R. Willsäther, Ber., 1901, 34, 131). Cyclo-heptadienol t. $C_6H_{14}$, is obtained from cyclo-heptane (Willsäther, loc. cit.). It is identical with the hydratropidine, which results from the destructive methylation of tropine.

Eastertene (trimethyl-1,4-1-cyclo-heptane-1.5), $C_6H_{14}OH$ is prepared from ethylene, by the action of hydrobromic acid (in glacial acetic acid solution) and reduction of the resulting product with benzoyl peroxide. (R. Willsäther, Ber., 1901, 34, p. 2075). Cyclo-epi-patriene (trilopidine), $C_6H_{14}$, is formed on distilling tropine with baryta; and from cyclo-heptadiene by forming its addition product with bromine and heating this with quinoline to 150° C. (R. Willsäther, loc. cit.). Chronic acid oxidizes it to benzoic acid and benzyaldehyde. With bromine it forms a dibromide, which when heated to 110° C. decomposes into hydrobromic acid and benzaldehyde.

Cyclo-heptanol, $C_6H_{14}OH$, is formed by the action of suberene, and by the action of silver nitrate on the hydrochloride of cyclo-heptanene (N. Demjanow, Centralblatt, 1904, 1, 1214). Cyclo-heptadienol (in. $C_6H_{14}OH$ is formed by the distillation of suberic acid with lime, and from a-bromo-cyclo-heptane carboxylic acid by treatment with baryta and subsequent distillation over lead peroxide (R. Willsäther, Ber., 1898, 31, p. 2507). It is a colourless liquid having a peppermint odour, and boiling at 178° C. Nitric acid oxidizes it to *n*-pimelic acid.
Tropine, CH₃(CH=CH₂)₂, obtained in small quantities by the distillation of α-methyl tropine methyl hydroxide, and by the hydrolysis of β-methyl tropine with dilute hydrochloric acid. It is an oily liquid, with an odour resembling that of benzaldehyde. It forms a benzo compound, and gives an oxyquinoline derivative and cannot be oxidized to an acid; reactions which point to it being a ketone containing the grouping -CH₂CO-. It is thus to be regarded as a cyclo-heptene-1-one-7.

Cyclo-heptene carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo- heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

The corresponding oxycyclopentane is obtained by the hydrolysis of the nitrole, which is formed by the addition of hydrocyanic acid to suberone (A. Spiegl, Ann., 1892, 211, p. 117).

Four cyclo-heptene carboxylic acids are known. Cyclo-heptene-1-carboxylic acid-1 is prepared from oxysuberican acid. This acid when heated with concentrated hydrochloric acid to 120-130°C yields a chloro-acid, which on warming with alcoholic potassium is transformed into the cyclo-heptene compound. Cyclo-heptene-2-carboxylic acid-1 is prepared by a modification of the benzene method (see also V. Buchner, Ber., 1898, 31, p. 2242)

Cyclo-heptatriene carboxylic acids, CH₂₃₀H₂₀CH₂₀. All four are known. According to F. Buchner (1899, p. 312) they are as follows:

- Cyclo-heptane carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo-heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

Cyclo-heptene carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo-heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

Cyclo-heptene carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo-heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

Cyclo-heptene carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo-heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

Cyclo-heptene carboxylic acid (suberanic), CH₂₃₀H₂₀CH₂₀ is obtained by the reduction of cyclo-heptene-1-carboxylic acid; from brom-cyclo-heptane by the Grignard reaction; and by the reduction of pentaglutine carboxylic acid by sodium solution (R. Willstätter, Ber., 1898, 31, p. 295a).

POLYNESIA

support the theory that the first Polynesian settlement in the East Pacific was in Samoa, and that hence the various branches of the race made their way in all directions. Most likely Samoa was the first group permanently occupied by them. Owing to the admixture of the Polynesians with the Papuans in Fiji some authorities have thought the first settlement was in those islands, and that the settlers were eventually driven thence by the Papuan occupiers. We can, however, account for the presence of Polynesian blood in Fiji in another way, viz. by the intercourse that has been kept up between the people of Tonga and Fiji. If the first resting-place of the Polynesians was in that group, there is good reason to believe that Samoa was the first permanent home of the race.

It used to be doubted whether these people could have gone from the Indian archipelago so far eastward, because the prevailing winds and currents are from the east. But it is now well known that at times there are westerly winds in the region over which they would have to travel, and that there would be no insuperable difficulties in the way of such a voyage. The Polynesians are navigators. There is ample evidence that in early times they were much better seamen than they are at present. Indeed their skill in navigation has greatly declined since they have become known to Europeans. They used to construct decked vessels capable of carrying one or two hundred persons, with water and stores sufficient for a voyage of some weeks duration. These vessels were made of planks well fitted and sewn together, the joints being caulked and pitched. It is only in recent times that the construction of such vessels has ceased. The people had a knowledge of the stars, of the rising and setting of the constellations at different seasons of the year; by this means they determined the favourable season for making a voyage and directed their course.

The Polynesians were by no means a savage people when they entered the Pacific. Indeed their elaborate historical legends show that they possessed a considerable amount of civilization. Those who are familiar with these legends, and have studied native manners and customs, see many unmistakable proofs that the Polynesians had, at their migration, considerable knowledge and culture, and that the race has greatly deteriorated.

The Polynesians are physically a very fine race. On some islands they average 5 ft. 10 in. in height. De Quatrefages, in a table giving the stature of different races of men, puts the natives of Samoa and Tonga as the tallest people in the world. He gives 5 ft. 9½ in. as their average height. They are well developed in proportion to their height. Their colour is a brown, lighter or darker generally according to the amount of their exposure to the sun—being darker on some of the atolls where the people spend much time in fishing, and among fishermen on the volcanic islands, and lighter among women, chiefs and others less exposed than the bulk of the people. Their hair is dark brown or black; smooth and curly, very different from the frizzly mop of the Papuan or the lank straight locks of the Malay. They have very little beard. Their features are generally regular and often beautiful. They have great eyes and in some persons oblique; jaws not projecting, except in a few instances; lips of medium thickness; the noses are naturally long, well shaped and arched, but many are artificially flattened at the bridge in infancy. Their foreheads are fairly high, but rather narrow. The young of both sexes are good-looking.

The men often have more regular features than the women. Formerly the men paid more attention to personal appearance than the women. Polynesians generally are of singularly cleanly habits, love bathing, and have a taste for neatness and order. Their clothing is simple: a loin cloth for the men and for the women a girdle or petticoat of leaves. Sometimes women cover the shoulders, and on great occasions the men robe themselves in tapa, bark-cloth. The men are usually tattooed in elaborate designs from the neck to the head, and often around mouth and eyes.

As a race the Polynesians are somewhat apathetic. An enervating climate and lavish natural resources incline them to lead easy lives. On the more barren islands, and on those more distant from the equator, they show more energy. Under certain circumstances they become excitable, and manifest a kind of care-for-nothing spirit. As savages they were strict in their religious observances and religion came into almost every action of life, and they have been, in most instances, easily led to accept Christianity. Their essential trait is their poverty. They are self-sacrificing,ifully industrious, and every sort of amusement. They are shrewd, intelligent and possess much common sense. Where they have from early years enjoyed the advantages of a good education, Polynesian youths have proved themselves to possess intellectual powers of no mean order. They are almost invariably fluent speakers; with many of them oratory seems to be a natural gift; it is also carefully cultivated. An orator will hold the interest of his hearers for hours together at a political gathering, and in his speech he will bring in historical allusions and precedents, and will make apt quotations from ancient legends in a manner which would be thoughtcred to be perfectly ordinary orators. Many of them are very brave, and think little of self-sacrifice for others where duty or family honour is concerned.

Polynesian society is divided into the family and the clan. Each clan has a name which is usually borne by one of the oldest members, who is the chief or head for the time being. This clan system no longer actively prevailed; it is but a relic, in which the principal chiefships. But changes have been made in most of the islands. In some the head of one clan has become king over several. In many cases large clans have been divided into sections or sub-tribes, to form secondary chiefships.

As a rule near relations do not intermarry. In some islands this rule is rigidly adhered to. There have been exceptions, however, especially in the case of high chiefs; but usually great care is taken that the marriage should be with the uncircumcised, in many cases the simple term for grandchild. A man speaks of his grandchild as his son or daughter, or simply as his child. Polygamy was often practised, especially by chiefs, and was also customary in some places. A woman was either taken by the brother of her deceased husband, or, failing the brother, by some other relative of the deceased, as an additional wife. Divorce was an easy matter, and of frequent occurrence; but, as a rule, was preceded by threats, and often ended in a marriage with the wife of the father. In Hawaii there was a peculiar system of marriage

1 Coco-nut fibre and the gum which exudes from the bread-fruit tree are generally used for "caulking" and "pitching" canoes.

2 The Human Species (International Scientific Series), pp. 57-60.

8 Wrestling and boxing, a kind of hockey and football, canoe and foot rowing, wrestling, hand-fightinig, fishing-matches and pigeon-catching are among their pastimes. Of indoor games they have a number, many being of a gambling nature. Much time is spent, especially after the evening meal, in dancing and the consumption of riddles, in which the revenge of some one who has been tricked is a common amusement, and on special occasions there is dancing. The night-dances were generally accompanied by much indecency and indecorum.

4 Dr Lewis H. Morgan, in Ancient Society, pp. 419-423, makes the Polynesians to have distinctive terms for grandfather, grandmother, grandson and granddaughter. In this he is mistaken. It is evident from his own lists that the Hawaiian kupuna means the same as an ancestor. In like manner moopuna simply means a descendant of any generation after the first.
Changes which are comparatively rare among the Polynesians. In most groups they have great influence and are treated with respect. In some cases they take hereditary titles and hold high offices. As among their congers in Madagascar, there is a tendency for a man to possess a title in his own right; and a woman in high position will command as much respect, and will exercise as great authority, as a man would in the same position. Everywhere infanticide prevailed; in some of the Polynesian groups a child was legally recognized as the property of another. It was also a very common practice to destroy the fetus, but parents were affectionate towards their children. The practice of adopting children was, and still is, common. Often there is an exchange made between members of the same clan; but sometimes there is adoption from without. Tattooing generally prevailed among the men, different patterns being followed in different groups of islands. In some a larger portion of the body is tattooed than in others. A youth was considered to be in his minority until he was tattooed, and in former times he would have no chance of marrying until he had, by submitting to this process, proved himself worthy. An infant born to a chief was eschewed and marked by feasting, or some other demonstration, among the female friends. Old age is generally honoured. Often an inferior chief will give up his title to a younger man, yet he himself will lose little or none of his power, and will continue to enjoy some influence. Property belonging to a clan is held in common. Each clan usually possesses land, and over this no one member has an exclusive right, but all have an equal right to use it. The chief or recognized head may, however, by avenging the wrong done to any of its members, call a stop to another's use of such land, according to its use for a time to an outsider; and even he is expected to obtain the consent of the heads of families before he alienates the property. Thus land is handed down through successive generations under the nominal control of the recognized head of the clan. Changes have been made in many islands in this respect; but there can be little reason to doubt that the joint ownership of property in clans was common on each of the three steps in Polynesian progress.

In early times the head of each clan was supreme among his own people, but in all matters he had associated with him the principal men or heads of families in the clan. Their united authority was limited only by that of the chief of the respective clans. It was only possible, however, for the Polynesian migration from the Malay Archipelago, where there was a single tribe which does not possess the art. It may, however, be that, moving among small coral islands for scores of generations and during all the sea voyages, the Polynesians learned the art. They possessed pottery obtained it from the Papuans. In most of their manufactures they were, however, in advance of the Papuans. They made use of the vegetable flours abounding in the islands, the women manufacturing cloth. They made good use of the bark of the paper mulberry (Morus papyrifera), but also in some islands from the bark of the bread-fruit tree and the hibiscus. This in former times furnished them with most of their clothing. They also made various kinds of mats, baskets and fans from the leaves of the pandanus, the bark of the hibiscus, species of bôhmeria or other Urticaeae plants. Some of their mats are very beautifully made, and in some islands they are the most valuable property the people possess. Some of the Polynesians have not only possessed the manufacture of ropes, coarse string and fine cord, and for making fishing nets. The nets are often very large, and are netted with a netting made of grass as in the South Sea Islands.

1 Morgan has founded one of his forms of family—the consanguineous union—on the supposed existence in former times among the Malays and Polynesians of birth and marriage, brothers and sisters being own and collateral, in a group. All the evidence he finds in support of this is (1) the existence of the custom above mentioned in Hawaii; and (2) the occurrence of special terms for the relationship of uncle, aunt and cousin, this indicating, he thinks, that these were regarded as fathers, mothers, brothers and sisters. He admits that "the usage with respect to marriage which prevailed when the system was in its prime, is the same now." This is probably true.

"To sustain the deduction it is not necessary that they should" (Ancient Society, p. 408). Morgan has given special terms for father-grandfather and mother-grandmother, because it would prove too much to show the consanguinity of all these terms for ancestors of any generation. The terms used for grandchildren, in like manner, are used for any generation of descendants. He says (p. 406) the terms of husband and wife are used in common by a man and woman only in the presence of their relatives, the wife of a husband and wife in Hawaii simply mean male and female, in some islands there are terms used for wife in the most strict sense. The wife's name is not used more exclusively among us than among some Polynesian people.

2 See a remarkable example in Fornander's Account of the Polynesia Race, ii. 89.
such as dishes or deep bowls, head-rests and stools. Having no metal or other vessels in which to boil water, all cooking is done by boiling water or Chronic in the ashes of the fire, where they also keep gongs, drums. They used to make wooden fishhooks, clubs, spears and bows. They still make wooden fishspears and carved and inlaid combs. They employ the bamboo for making drums and fluting them in various sizes, which were mainly used for calling the birds and other species then used for that purpose. In the manufacture of these things they employed adzes made of stone, shell or hard wood, and a wooden drill pointed on stone, shell or bone. They made mother-of-pearl feathers, and they yet set up a part of these feathers in their headdresses. It may it be removed without breaking the rind or shell. Their drinking cups are made of half a coco-nut shell. Sharks’ teeth and parts of the teeth are the only grindstone used as cutting instruments for shaving and surgical operations. They employ vegetable dyes for painting their bark-cloth, calabashes, &c. In some islands they also use a red earth for this purpose. Their cloth is generally ornamented with geometrical patterns. The drawings of animals, &c., which they make are exceedingly inartistic, and no attempt is made at perspective. Their musical instruments are few and rude—consisting of the drums and flutes already mentioned, and shell trumpets.

The Polynesians were all polytheists. Without doubt many of their gods are deified men; but it is clear that some are the forces of Nature personified, while others appear to represent human passions. There were gods, among the Polynesians, who have a existence in their historical myths. But the conception they had of Tangaloa (Taaroa and Kanaloa in some islands) is a higher stage of the conception that may be viewed as the “first and principal god, uncreated and existing from the beginning, or from the time he emerged from po, or the world of darkness.” He was said to be the father of all the gods, and creator of all things. He was scarcely regarded an object of worship. Dr Turner says, “the unrestricted, or unconditioned, may fairly be regarded as the name of this Samoan Jupiter.”

The worship of certain of the great gods was common to all the Polynesians. One of the gods of the Tahitian families, while others were gods of individuals. The gods of clan were probably the spirits of the ancestors in their own line. In some islands, when the birth of a child was expected, the aid of the god was asked by sacrifices. The god was invoked, beginning with the god of the father. The god prayed to at the instant of birth became the god of the child. In other places the name of the child’s god was declared when the umbilical cord was cut. The system of taboo was connected with their religious rites. There were two ways by which things might become taboo: (1) by contact with anything belonging to the god, as his visible representation or his priest. Probably it was thought that a portion of the sacred essence of the god, or of a sacred person, was directly communicable to objects which they touched. (2) Things were made taboo by being dedicated to the god; and it is this form of taboo which is still kept up. If a thing is to be preserved in its pristine condition, he will put something upon the trees to indicate that they are sacred or dedicated. They cannot then be used until the taboo is removed. Disease and death were often connected with the violation of taboo, though the group of gods punishing the offenders. Disease was generally attributed to the anger of the gods. Hence offerings, &c., were made to appease their anger. The first-fruits of a crop were usually dedicated to the gods to prevent them from being angry; and the offerings of victors, &c., were dedicated to the gods, in order that the gods might be propitious to their owners in their use.

The Polynesians invariably believe in the existence of the spirit of man after the death of the body. Their traditions on the condi-
the too sudden adoption of European clothing, rendering the body supersensitive to changes of temperature; lastly, the action of over-zealous missionaries in suppressing the dances, merrymaking and free joyous life of pagan times, and the preaching of a sombre type of Christianity, with deadening effects on the buoyant temperament of these children of Nature. Most of these abuses have been checked or removed, and the results may perhaps be detected in a less accelerated rate of decline, which no longer proceeds in geometric proportion, and seems even almost arrested in some places, as in Samoa and New Zealand. If such be indeed the case, perhaps the noblest of all primitive races may yet be saved from what at one time seemed inevitable extinction; and the Maoris, the Hawaiians, and Tabians may, like the Hawaiians, take their place beside the Europeans as free citizens of the various states of which they are now subjects.

POLYP, the name given by zoologists to the form of animal especially characteristic of the subphylum Coelentera (q.v.). In the subdivision Anthozoa, comprising the sea-anemones and corals, the individual is always a polyp; in the Hydrozoa, however, the individual may be either a polyp or a medusa (q.v.).

A good example of a polyp may be seen in a common sea-anemone or in the well-known fresh-water polyp, Hydra (fig. 1). The body may be roughly compared in structure to a sac, the wall of which is composed of two layers of cells. The outer layer is known technically as the ectoderm, the inner layer as the endoderm. Between ectoderm and endoderm is a supporting layer of structureless gelatinous substance termed mesogloea, secreted by the cell-layers of the body-wall; the mesogloea may be a very thin layer, or may reach a fair thickness, and then sometimes contains skeletal elements formed by cells which have migrated into it from the ectoderm. The sac-like body built up in this way is attached usually to some firm object by its blind end, and bears at the upper end the mouth surrounded by a circle of tentacles. Each tentacle is a stiff, nearly circular ring of the whole wall of the sac and contains typically a prolongation of its internal cavity, so that primarily the tentacles are hollow; but in some cases the tentacle may become solid by obliteration of its cavity. The tentacles are organs which serve both for the tactile sense and for the capture of food. By means of the stinging nettle-cells or nematocysts with which the tentacles are thickly covered, living organisms of various kinds are firmly held and at the same time paralysed or killed, and by means of longitudinal muscular fibrils formed from the cells of the ectoderm the tentacles are contracted and convey the food to the mouth. By means of circularly disposed muscular fibrils formed from the endoderm the tentacles can be protracted or thrust out after contraction. By muscle-fibres belonging to the same two systems the whole body may be retracted or protruded.

We can distinguish therefore in the body of a polyp the column, circular or oval in section, forming the trunk, resting on a base or foot and surmounted by the crown of tentacles, which enclose an area termed the peristome, in the centre of which again is the mouth. As a rule there is no other opening to the body except the mouth, but in some cases excretory pores are known to occur in the foot, and pores may occur at the tips of the tentacles. Thus it is seen that a polyp is an animal of very simple structure.

The name polyp was given to these organisms from their supposed resemblance to an octopus (Fr. polype), with its circle of whirling arms round the mouth. This comparison, though far-fetched, is certainly more reasonable than the common name "coral-insects" applied to the polyps which form coral. It cannot be too emphatically stated that a coral-polyp is far removed in organization from either an octopus or an insect as it is from man himself.

The external form of the polyp varies greatly in different cases. In the first place the column may be long and slender, or may be on the contrary, so short in the vertical direction that the body becomes disk-like. The tentacles may number many hundreds or may be very few, in rare cases only one or two, or even absent altogether; they may be long and filamentous, or short and reduced to mere knobs or warts; they may be simple and unbranched, or they may be feathery in pattern. All these types are well illustrated by different species of British sea-anemones. The mouth may be level with the surface of the peristome, or may be projecting and trumpet-shaped. As regards internal structure, polyps exhibit two well-marked types of organization, each characteristic of one of the two classes, Hydrozoa and Anthozoa.

It is an almost universal attribute of polyps to possess the power of reproducing themselves non-sexually by the method of budding. This mode of reproduction may be combined with sexual reproductiveness, or may be the sole method by which the polyp produces offspring, in which case the polyp is entirely without sexual organs. In many cases the buds formed do not separate from the parent but remain in continuity with it, thus forming colonies or stocks, which may reach a great size and contain a vast number of individuals. Slight differences in the method of budding produce great variations in the form of the colonies, which may be distinguished in a general way as spreading, massive or arborescent. The reef-building corals are polyp-colonies, strengthened by the formation of a firm skeleton. For further details of colony-formation the reader is referred to the articles ANTHOZOA and HYDROMEDUSA.

POLYPERCHON (incorrectly Polysperchon), one of Alexander's generals, and the successor of Antipater as regent in Macedonia in 319 B.C. He was driven out by Cassander in 317 B.C. (See PIATOCR.)

POLYPHEMUS, in Greek mythology, the most famous of the Cyclopes, son of Poseidon and the nymph Thoosa. He dwelt in a cave in the south-west corner of Sicily, and was the owner of large flocks and herds. He was of gigantic stature, with one eye in the middle of his forehead, a consumer of human flesh, without law or order. Odysseus, having been cast ashore on the coast of Sicily, fell into the hands of Polyphemus, who shut him up with twelve of his companions in his cave, and blocked the entrance with an enormous rock. Odysseus at length succeeded in making the giant drunk, blinded him by plunging a burning stake into his eye while he lay asleep, and with six of his friends (the others having been
devoured by Polyphemus) made his escape by clinging to the bellies of the sheep let out to pasture. Euripides in the Cyclops essentially follows the Homeric account. A later story associates Polyphemus with Galatea (see Acis).

 Homer, Odyssey, ix.; Ovid, Metam. xiii. 749; Theocritus xi. See W. Grimm, Die Sage von Polyphem. (1857); G. R. Holland, in Leipziger Studien (1884), vii. 139-212.

POLYPodium, in botany, a large genus of true ferns (g.v.), widely distributed throughout the world, but specially developed in the tropics. The name is derived from Gr. πολύς, many, and πτέρος, a little foot, on account of the foot-like appearance of the rhizome and its branches. The species differ greatly in size and general appearance and in the character of the frond; the sor! or groups of sori (sporangia) are borne on the back of the leaf, globeose and naked, that is, are not covered with a membrane (indusium) (see fig. 1). The common polypody (fig. 2) (P. vulgaris) is widely diffused in the British Isles, where it is found on walls, banks, trees, &c.; the creeping, densely-scaly rootstock bears deeply pinnately cut fronds, the fertile ones bearing on the back the bright yellow naked groups of sporangia (sori). It is also known as adder's foot, golden maidenhair and wood-fern, and is the oaken fern of the old herbalists.

![Fig. 1.—Portion of a pinna of leaf of Polypodium bearing sori, s, on its back.](image)

![Fig. 2.—Polypodium vulgaris, common polypody (about 1/4 nat. size).](image)

These are a large number of varieties, differing chiefly in the form and division of the pinnae; var. combricum (originally found in Wales) has the pinnae themselves deeply cut into narrow segments; var. cornubiensc is a very elegant plant with finely-divided fronds; var. cristatum is a handsome variety with fronds forking at the apex and the tips of all the pinnae crested and curled. P. dryopteris, generally known as oaken fern, is a very graceful plant with delicate fronds, 6 to 12 in. long, the three main branches of which are themselves pinnately divided; it is found in dry, shady places in mountain districts in Great Britain, but is very rare in Ireland. P. phegopteris (beechfern) is a graceful species with a black, slender root-stock, from which the pinnae frond on long stalks, generally about 12 in. long, including the stalk; it is characterized by having the lower pinnae of the frond deflexed; it is generally distributed in Britain, though not common. Many other species from different parts of the world are known in greenhouse cultivation.

POLYPUS, a term signifying a tumour which is attached by a narrow neck to the walls of a cavity lined with mucous membrane. A polypus or polypoid tumour may belong to any variety of tumour, either simple or malignant. The most common variety is a polypus of the nose of simple character and easily removed. Polypi are also met with in the ear, larynx, uterus, bladder, vagina, and rectum. (See TUMOUR.)

POLYTECHNIC (Gr. πολύς, many, and τέχνη, an art), a term which may be held to designate any institution formed with a view to encourage or to illustrate various arts and sciences. It has, however, been used with different applications in several European countries. In France the first école polytechnique was founded by the National Convention at the end of the 18th century, as a practical protest against the almost exclusive devotion to literary and abstract studies in the places of higher learning. The institution is described as one "où l'on instruit les jeunes gens, destinés à entrer dans les écoles spéciales d'artillerie, du génie, des mines, des ponts et chaussées, créé en 1794 sous le nom d'école centrale des travaux publics, et en 1795 sous celui qu'elle porte aujourd'hui" (Litté). In Germany there are nine technical colleges which, in like manner, have a special and industrial rather than a general educational purpose. In Switzerland the principal educational institution, with evening schools or administrated by local authorities, is the Polytechnikum of Zurich. In all the important towns of the Federation there are trade and technical schools of a more or less special character, adapted to the local industries; e.g. schools for silk-weaving, wood-carving, watchmaking, or agriculture. But the Zurich Polytechnikum has a wider and more comprehensive range of work. It is a college designed to give instruction and practical training in those sciences which stand in the closest relation to manufactures and commerce and to skilled industry in general and its work is of university rank.

To the English public the word polytechnic has only recently become familiar, in connexion with some London institutions of an exceptional character. In the reign of William IV. there was an institution in London called after the Polytechnic the name of his consort—"The Adelaide Gallery in England. "—and devoted rather to the display of new scientific inventions and curiosities than to research or to the teaching of science. It enjoyed an ephemeral popularity, and was soon imitated by an institution called the Polytechnic in Regent Street, with a somewhat more pretentious programme, a diving-bell, electrical and mechanical apparatus, besides occasional lectures on the more abstract departments of science. From its earliest days this institution threw itself heart and soul into the character. In the popular mind this institution is inseparably associated with "Professor" Pepper, the author of The Boy's Playbook of Science and of Pepper's Ghost. Both of these institutions, after a few years of success, failed financially; and in 1880 Mr. Quintin Hogg, an active and generous philanthropist, purchased the disused building in Regent Street, and reopened it on an altered basis, though still retaining the name of Polytechnic, to which, however, he gave a new significance. He had during sixteen years been singularly successful in gathering together young shopmen and artisans in London in the evenings and on Sunday for religious and social instruction, and in acquiring their confidence. But by rapid degrees his enterprise, which began as an evangelistic effort, developed into an educational institution of a novel and comprehensive character, with classes for the serious study of science, art, and literature, a gymnasium, library, reading circles, laboratories for physics and chemistry, conversation and debating clubs, organized country excursions, swimming, rowing, and natural history societies, a savings bank, and choral singing, besides religious services, open to all the members, though not obligatory for any. The founder, who from the first took the closest personal interest in the students, well describes his own aims: "What we wanted to develop our institute into was a place which should recognize that God had given men more than one side to his character, and where we could gratify any reasonable taste, whether athletic, intellectual, spiritual or social. The success of this effort was remarkable. In the first winter
Later institutions of this Class.

The principal resources for the foundation and maintenance of these institutions have been derived from two funds—that administered under the City Parochial Charities Act of 1833, and that furnished by the London County Council, at first under the terms of the Local Taxation (Customs and Excise) Act of 1890, and the Technical Instruction Act 1889, but since the 1st of May 1904 under the Education Act 1902, as applied to London by the act of 1903. More detailed reference to these two acts seems to be necessary in this place. The income of the parochial charities of London was appointed in 1878, mainly at the instance of Mr James Bryce, and under the presidency of the Duke of Northumberland. Its report appeared in 1880, giving particulars of the income of the parishes, and revealing the fact that the funds had largely outgrown the original purposes of the endowments, which were ill adapted to the modern needs of the class for whose benefit they were intended. The act of parliament of 1853 was designed to give effect to the recommendations of the commissioners. It provided that while five of the largest parishes were to retain the management of their own charitable funds, the endowments of the remaining 107 parishes in the city should be administered by a corporate body, to be entitled "the Trustees of the London Parochial Charities" (otherwise known in relation to the polytechnics as "the Central Governing Body"), this body to include five nominees of the Crown and four of the corporation of London. The remaining members were to be chosen under a subsequent scheme of the charity commission, which added four nominees of the London County Council, two of the Ecclesiastical Commissioners, and one each appointed by the university of London, University College, King's College, the City and Guilds Institute, and the governing bodies of the Bishopsgate and Cripplegate foundations. For the purpose of framing the scheme, a special commissioner, Mr James Anstie, Q.C., was temporarily attached to the charity commission, and it thus became the duty of the commission to prepare a statement of the charity property possessed by the 107 parishes, distinguishing between the secular and the ecclesiastical parts of the endowments. The annual income derived from the ecclesiastical fund was £35,000, and that from the secular portion of the fund £50,000. The scheme assigned capital grants amounting to £155,000 to the provision of open spaces, and £149,500 to various institutions, including free libraries in Bishopsgate and Cripplegate, the People's Palace, the Metcalfe Institute, the Governing Body of the Victoria Hall. A capital sum of £49,355 out of the ecclesiastical fund was devoted to the repair of city churches; and the balance of the annual income of this fund, after allowances for certain vested interests, was directed to be paid to the Ecclesiastical Commissioners. This balance has varied by slight increases from year to year, and amounted in 1906 to £20,875. The remaining fund thus set free for secular purposes was by the scheme largely devoted to the erection and maintenance of polytechnic institutions, or "industrial institutes," as they were at first called. It was the opinion of Mr Anstie and his fellow-commissioners that in this way it would be possible to provide an educational training for young men and women belonging to the poorer classes by the following means:

1. Instruction in:
   a. The general rules and principles of the arts and sciences applicable to any handicraft, trade or business.
   b. The practical application of such general rules and principles in any handicraft, trade or business.
   c. Branches or details of any handicraft, trade or business, facilities for acquiring the knowledge of which cannot usually be obtained in the workshop or other place of business.

The classes and lectures shall not be designed or arranged so as to be in substitution for the practical experience of the workshop or place of business, but so as to be supplementary thereto.

2. Instruction suitable for persons intending to emigrate.

3. Instruction in such other branches and subjects of art, science, language, literature, and general knowledge as may be approved by the governing body.

4. Public lectures or courses of lectures, musical and other entertainments and exhibitions.

5. Instruction and practice in gymnastics, drill, swimming and other bodily exercises.

6. Facilities for the formation and meeting of clubs and societies.

7. A library, museum and reading room or rooms.

Within the limits prescribed, the governing body may from time to time, out of the funds at their disposal, provide and maintain buildings and grounds, including workshops and laboratories suitable for all the purposes herein specified, and the necessary furniture, fittings, apparatus, models and books, and may provide or receive by gift or on loan works of art or scientific construction, or objects of interest and curiosity, for the purpose of the institute, and for the purpose of temporary exhibition.

Other provisions in the scheme require: (1) that the educational benefits of the institute shall be available for both sexes equally, but that common rooms, refreshment rooms, gymnasium and swimming-baths may be established separately, under such suitable arrangements as may be approved by the governing body; (2) that the fees and subscriptions shall be so fixed as to place the benefits of the institute within the reach of the poorer classes; (3) that no principle other than that of charity shall be allowed in any part of the building; (4) that the buildings, ground and premises shall not be used for any political, denominational or sectarian purpose, although this rule shall not be deemed to prohibit the discussion of political subjects in any debating society approved by the governing body; (5) that no person under the age of sixteen or above twenty-five shall be admitted to membership except on special grounds, and that the number thus specially admitted shall not exceed 5% of the total number of members.

These and the like provisions have formed the common basis for all the metropolitan polytechnics. In 1850 a large sum was placed by the London County Council (Customs and Excise) Act at the disposal of the county council from the county borough councils for the general purposes of technical education, and in 1893 the London County Council determined to devote a considerable portion of this revenue to the further development and sustentation of polytechnics. While the funds granted by the Central Governing Body may be employed in aid of the social and recreational as well as the educational purposes of the various institutions, it is a statutory obligation that the sums contributed by the London County Council should be applied to educational work only.

Dr William Garner, the educational adviser of the London County Council, has, in a published lecture delivered before the International congress on technical education in June 1897, thus described the conditions under which the council offers financial help to the London polytechnics:
The objects which the technical education board has had in view in its dealings with the polytechnics have been:

1. To allow to the secondary building bodies the greatest possible freedom in the pursuit of social, recreative and even religious work within the provisions of the schemes of the Charity Commissioners.

2. To secure to each polytechnic the services of an educational principal, who should be responsible to his governing body for the organization and conduct of the whole of the work of the institution.

3. To provide in each polytechnic a permanent staff of teachers, who should be heads of their respective departments and give their whole time to the work of the institution, and thus to establish a corporate or collegiate life in the polytechnic.

4. To ensure that all branches of experimental science are taught experimentally, and that the students have the opportunity of carrying out practical laboratory work, at an inclusive fee not exceeding ten shillings for any one subject.

5. To provide efficient workshop instruction in all practical trade subjects.

6. To secure that the number of students under the charge of any one teacher in laboratory or workshop classes, or in other classes in which personal supervision is of paramount importance, shall not exceed a stated limit (fifteen in the workshop, or twenty in the laboratory).

7. To exclude from classes students who, for want of preliminary training, are incapable of profiting by the instruction provided; and to this end to restrict the attendance at workshop classes to those who are actually engaged in the trades concerned, and have thus an opportunity of acquiring the necessary manual dexterity in the performance of their daily duties.

8. To furnish an adequate fixed stipend for all teachers, in place of a contingent interest in fees and other private subscriptions and donations.

9. To establish an efficient system of inspection.

10. To facilitate the advertisement of polytechnic classes, and especially to invite the co-operation of trade societies in supporting their respective classes.

11. To encourage the higher development of some special branch of study in each polytechnic.

12. To utilize the polytechnic buildings as far as possible in the daytime by the establishment of technical day schools, or otherwise.

13. To secure uniformity in the keeping of accounts.

The regulations under which the council has attempted to secure its objects by means of grants have been changed from time to time as the work of the polytechnics has developed, but they provide that the council's aid should be partly in the form of a fixed grant to each institution, partly a share of the salaries of the principal and the permanent teachers, partly a grant on attendance, the scale depending on the subject and character of the instruction, and partly a subsidy (15%) on voluntary contributions. In addition to the annual grants for maintenance, substantial grants for building and equipment are made from time to time.

The scale of grants adopted by the council for the session 1907-1908 was the following:

i. A fixed grant assigned to each polytechnic.

ii. Three-fourths of the salary of the principal (subject to certain conditions).

iii. Fifty per cent. of the salaries of heads of approved departments.

iv. Ten per cent. of the salaries of other teachers.

v. Fifteen per cent. on (voluntary) annual subscriptions or donations.

vi. Attendance grants on evening classes varying from £1 to id. per student-hour (subject to certain conditions of minimum attendance, eligibility, &c.).

vii. Special grants not exceeding £50 for courses of lectures on particular subjects required or approved by the council.

viii. Special grants towards any departments which the council may desire to see established or maintained.

ix. Equipment grants and building grants in accordance with the special requirements of the institutions.

The above grants are independent of any contributions which the council may make towards secondary day schools or day schools of domestic economy or training colleges of domestic economy in the polytechnics.

With a view to a due division of labour, and also to the cooperation of the public bodies concerned, the "London Polytechnic Council" was created in 1894. It was composed of representatives of the Central Governing Body, the technical education board of the London County Council, and the City and Guilds of London Institute, and its duty was to consult as to the appropriation of funds, the organization of teaching, the holding of needful examinations, and the supervision of the work generally.

After ten years of work the London polytechnic council was dissolved in the summer of 1905 in consequence of the abolition of the technical education board of the London County Council, when the council became responsible for all grades of education. A statement below shows the number and names of the several institutions, and the extent to which they have been severally aided by the Central Governing Body and the London County Council.

The "People's Palace" owes its origin in part to the popularity of a novel by Sir Walter Besant, entitled All Sorts and Conditions of Men, in which the writer pointed out the sore need of the inhabitants of East London for social improvement and healthy recreation, and set forth an imaginary picture of a "Palace of Delight," wherein this need might be partly satisfied. Much public interest was awakened, large subscriptions were given, and the Central Governing Body aided the project; but the munificence of the drapers' company in setting aside £7,000 a year for its permanent maintenance released the London County Council from any obligation to make a grant. Apart from the social and recreative side of this popular institution, the educational section, under the name of the East London Technical College, steadily increased in numbers and influence under the fostering care of the drapers' company and has now been recognized as a "school" of the university of London under the title of "The East London College" and is being utilized by the London County Council in the same way as other schools of the university.

Grants to the London Polytechnics during the Session 1906-1907.

In the above table the grants are given to the nearest pound. Up to July 1907 the total expenditure of the council upon the polytechnics, apart from the May schools for training colleges, &c., conducted in them, was about £325,000, almost exactly the same as that of the Central Governing Body. The voluntary grants from the central governing body include a contribution towards a compassionate fund, and a pension fund based on endowment assurances for all permanent officers of the polytechnics in receipt of salaries of not less than £10 a year.

The grants received from the board of education amount to about £10,000 a year, while the fees of students and members produce about £45,000. Voluntary subscriptions, including those from city companies and other sources of income, produce about £50,000 in addition, so that out of a total expenditure of about £500,000 a year the council now contributes 30% of the Central Governing Body 18%, fees 22%, the board of education 15% and city companies and other subscribers 15%.
The Goldsmiths' Institute at New Cross owed its existence and its annual maintenance to the generous initiative of the ancient city gold whose name it bore. It was therefore entirely independent of pecuniary subsidy from any other public body. In the year 1800 the number of class-entries to this institute was 7,574. In 1904 the goldsmiths' company presented the premises, together with an annual subsidy, to the university of London for the purposes of a training college for teachers, so that from that date it ceased to be one of the London polytechnics, although, pending the provision of other premises, many of the technical evening classes have been continued under the London County Council by permission of the university with the approval of the company. The clothworkers' company has also contributed £18,000 to the Northern Polytechnic at Holloway.

In all these institutions the general aims have been practically the same, although special features have been differentiated in order to meet the local needs and the wishes of the inhabitants. In all there are laboratories and lecture rooms, trade classes, art studios, gymnasium, provision for manual training and domestic economy and applied science. In nearly all, at first, mechanical and manual instruction were the prominent objects in view, partly owing to the conditions under which grants were made by the science and art department. But of late increased attention has been paid year by year to literary and humaner studies, and to general mental cultivation, pursued pari passu with technical and scientific training. The aid of the London organization for university extension, now a department of the university, has been especially serviceable in providing courses of lectures and classes in literary subjects at nearly all the polytechnics. As subsidiary to their main work, some of them have established junior continuation schools, with a view to provide suitable instruction for scholars who have left the public elementary schools and are not yet prepared to enter the technical and trade classes. Although the workshops and the classes for artisans are used chiefly in the evenings, there is an increasing number of day students: e.g. at the Northampton Polytechnic Institute in Clerkenwell there is a very important day school of engineering conducted on the "sandwich system," the students entering engineering works for the summer months and returning to the polytechnic for the winter session; at the Battersea Polytechnic there is a very important training college for teachers of domestic economy; at Regent Street there are day schools in engineering, architecture, photo-process and carriage-building; at the South-Western Polytechnic there are important schools of mechanical and electrical engineering and a training college for women teachers of physical exercises; at the Northern Polytechnic, as at Battersea, there is a training college for teachers of domestic economy, and there are departments of commerce and of physics and chemistry, while the Woolwich Polytechnic receives in the daytime, by special arrangement with the war office, a large number of engineering apprentices employed in the arsenal. In short, the schemes of the several institutions are so elastic that the governing bodies are at liberty to open any classes or to try any educational or recreative experiment for which they can find a genuine local demand. The total number of scholars in the polytechnics and their branch institutions is variously estimated at from 40,000 to 50,000, and the total number of regular scholars in the evening schools of the council does not exceed 100,000. These figures may be usefully compared with the census returns, which show that within the metropolitan area there are 76,000 of those of thirty and twenty-one. It is a noteworthy fact that, whereas in the population statistics for the whole of England and Wales the number at each year of age is regularly diminished by death from eight years onwards, there is a steady increase in London, year by year, from fourteen up to the age of thirty. This fact is owing to the constant immigration of young men and women from the provinces to the metropolis. The census commissioners in their report for 1901 (p. 15) computed that more than one-third of the population of London were not natives. They show also that, if all England and Wales be taken together, the number of persons between twenty and twenty-one is less by 12-8% than the number between thirteen and fourteen; but that taking London alone, the number of persons between twenty and twenty-one is greater by 14-9% than the number between thirteen and fourteen. Hence, the proportion of the inhabitants who are of an age to benefit by polytechnics and continuation schools is in London exceptionally large. It would not be right for Londoners to complain that there is thus cast upon them the duty of providing suitable instruction for so many immigrants, for if the great city drains the rural districts of some of their best brain and muscle, she gains much from their industry and productive power. The figures, however, point to the necessity for taking every means possible to raise the standard, both physical and intellectual, of the London boy. The immigration into London of youths and young men means to a great extent the substitution of the provincially trained imposter or artisan for the less fit London boy, who consequently falls into the ranks of the unskilled, then of the unemployed and ultimately of the unemployable.

But it follows from the particulars thus given that neither the supply of suitable provision for mental improvement and rational recreation for the wage-earning classes, nor the demand for such provision on the part of the workers themselves is commensurate with the moral and intellectual needs of a community of nearly seven millions of people (four and a half millions within the administrative county). The provision in evening schools, institutes, classes and polytechnics is still far in some respects inferior to that which is to be found in most German and Swiss towns, and needs to be greatly increased. In matters relating to the higher life, demand does not always precede supply; it is simply which is needed not only to satisfy the public demand, but to create it. As new and well-devised opportunities for mental culture are placed within reach, they will be more and more appreciated, new and healthier appetites will be stimulated, the art of employing leisure wisely and happily will be more systematically studied, and the polytechnics will become still more important centres of civilizing and educating influence than they hitherto have been.

In particular, the reconstituted university of London has been placed in new and most helpful relation to the best of the polytechnics. By the statutes the senate of the university is empowered to include in the list of "schools of the university" all institutions which are duly equipped and able to furnish suitable instruction of an advanced and scholarly type; and also to recognize all thoroughly qualified professors in their several faculties and subjects as "teachers of the university," although some of their classes may meet in the evening only, and no student is to be prevented from taking a degree as an internal student of the university solely because he can attend classes only in the evening. There is thus a way open for the due recognition of the polytechnics as part of the teaching machinery of the university, and for the admission of the best students as undergraduates, with all the rights of internal students. The great possibilities of the metropolitan university under its new conditions were at first hardly revealed or accurately foreseen. But there were during the session 1906-1907 no less than eighty-six recognized "teachers of the university" on the staffs of the London polytechnics and more than 750 students who were working for London University degrees in the polytechnic classes. There is no reason to fear that the recreational, social, manual and industrial training, to which a special attention was badly due at the New University when Polytechnic was directed, will suffer from a fuller expansion of the academic and literary side of "polytechnic" life. Rather it may be hoped that the due co-ordination of the practical with the purely intellectual purposes of these institutions will serve to give to all the students, whatever their future destination may be, a truer and broader conception of the value of mental culture for its own sake.
POLYXENA—POLYZOA

See also a paper by Mr Sidney Webb, The London Polytechnic Institute, in the second volume of special reports on educational subjects (1898) issued by the Education Department; the Report of the Central Governing Body of the London Parochial Charities; the Annual Reports of the London County Council; the Polytechnic Magazine, published from time to time at the institute in Regent Street; and various memoirs and papers contained in the Proceedings of the International Congress on Technical Education (1897), especially two—that by Mr Quintin Hogg, detailing his own early experience in founding the first polytechnic, and that of Dr William Garnett, then secretary of the Technical Education Board.

(J. G. F.; W. G.)

POLYXENA, in Greek legend, daughter of Priam, king of Troy, and Hecuba. She had been betrothed to Achilles, who was slain by Paris in the temple of Apollo Thymbraeus, where the marriage was to have been celebrated (Hyginus, Fab. 110). The shade of Achilles afterwards appeared to the returning Greeks in the Thracian Chersonese and demanded the sacrifice of Polyxena, who was put to death by Neoptolemus, son of Achilles, on his father's grave (Ovid, Metam. xiii. 440 sqq.).

The tragic story is the subject of the Hecuba of Euripides, the Troades of Seneca and the Polyxena of Sophocles, of which only a few fragments remain. According to Philostratus (Herol. 20, 18), Polyxena fled to the Greeks after the murder of Achilles and committed suicide on his tomb.

POLYZOA, in zoology, a term (introduced by J. V. Thompson, 1839) synonymous with Bryozoa (Ehrenberg, 1831) for a group commonly included with the Brachiopoda in the Moluscoidea (Milne Edwards, 1843). The correctness of this association is questionable, and the Polyzoa are here treated as a primary division or phylum of the animal kingdom. They may be defined as aquatic animals, forming colonies by budding; with ciliated retractile tentacles and a U-shaped alimentary canal. The phylum is subdivided as follows.

Class I. ENTOPROCTA (Nitsche), Lophophore circular, including both mouth and anus. Tentacles infolded, during retraction, into a vestibule which can be closed by a sphincter. Body-wall not calcified, body-cavity absent. Definite excretory organs present. Reproductive organs with ducts leading to the vestibule. Zooids possessing a high degree of individuality. Loxosoma Pedicellina (fig. 1), Uristella.

Class II. ECTOPROCTA (Nitsche), Lophophore circular or horse-shoe shaped, including the mouth but not the anus. Tentacles retractile into an introvert ('tentacle-sheath'). Body-wall ciliated in form, or calcified, or cavity distinct. Specific excretory organs absent, with the doubtful exception of the Phylactolaemata. Reproductive organs not continuous with ducts. Zooids usually connected laterally with their neighbours.

Order I. GYMNOLEMACTA (Allman).—Lophophore circular, with no epistome. Body-cavities of zooids not continuous with one another. Body-wall not muscular. Sub-order 1. TREPSTOMATA (Ulrich).—Fossil.—Zoocoon, long and coherent, prismatic or cylindrical, with terminal orifices, their wall thin and simple in structure proximally, thickened and complicated distally. Cavity of the zoocoon subdivided by transverse diaphragms, most numerous in the distal portion. Orifices of the zoocoon often separated by pores (mesopores).

Sub-order 2. CRYPTOZOMATA (Vine).—Fossil.—Zoocoon usually short. Orifice concealed at the bottom of a vesicular shaft, surrounded by a solid or vesicular calcareous deposit.

Sub-order 3. CYCLOSTOMATA (Busk).—Zoocoon prismatic or cylindrical, with terminal, typically circular orifice, not protected by any special organ. Zoocoon modified zoecia may contain numerous embryos which in the cases so far investigated arise by fission of a primary embryo developed from an egg. Zoocoon (fig. 3), Tabulipora, Hornora, Liathena.

Sub-order 4. CTENOSTOMATA (Busk).—Zoecia with soft uncalcified walls, the external part of the introvert being closed during retraction by a membranous collar. Zoecia either arising from a stolon, without lateral connexion with one another, or laterally united to form sheets. Acoselium, Flustrella, Bowerbankia (fig. 3), Parrella, Viciotella, Paludicella.

Sub-order 5. CHEILOSTOMATA (Busk).—Zoecia with more or less calcified walls. Orifice closed by a lid-like operculum. Individuality usually occurs, certain species having the form of avicularia or vibracula. The aviculae commonly found as globular swellings surmounting the orifices are not direct modifications of zoecia, and each typically contains a single egg or embryo. Membranipora, Flustra, Onychocella, Lunulites, Stegoporella, Scrupella, Adelocella, Memipora, Caberea, Bicellaria, Bagula, Brinna.

Hatschek (1888) treated the Entoprocta as a division of his group Scolecida, characterized by the possession of a primary body-cavity and of protonephridia; while he placed the Ectoprocta, with the Phoronida and Brachiopoda, in a distinct group, the Tentaculata. Against this view may be urged the essential similarity between the processes of budding in Entoprocta and Ectoprocta (cf. Seiliger, Zeit. f. wiss. Zool. xli. 168; l. 560), and the resemblances in the development of the two classes.

Of the forms above indicated there is no palaeontological evidence with regard to the Entoprocta. The Trepostomata are in the main Palaeozoic, although Heteropora, of which recent species exist, is placed by Gregory in this division. The Cryptostomata are also Palaeozoic, and include the abundant and widely-distributed genus Paremostoma. The Cyclostomata are numerous in Palaeozoic rocks, but attained a specially predominant position in the Cretaceous strata, where they are represented by a profusion of genera and species; while they still survive in considerable numbers at the present day. The Ctenostomata are ill adapted for preservation as fossils, though remains referred to this group have been found.
POLYZOA

43

described from Palaeozoic strata. They constitute a small proportion of the recent Polyzoa. The Cheilostomata are usually believed to have made their appearance in the Jurassic period. They are the dominant members of the two-laminar group, and are represented by a large number of genera and species. The Phylactolaemata are a small group confined to fresh water, and possess similar adaptations of the thallus to that habitat. The fresh-water fauna also contains a representative of the Entoprocta (Uracoidea), which is often present in the colonies of Polyzoa. This is a group of a lophophore-bearing group, which usually develops from the inner side of the zooid wall, and soon occupies the place of the previous polypide. The inner layer of the polypide-bud gives rise to the structures usually regarded as endodermic and epidermic, the outer layer to the mesodermic organs.

The polypide consists of a "lophophore" bearing a series of ciliated tentacles by which Diatoms and other microscopic bodies are collected as food; a "polypide-bud," which usually develops from the inner side of the zooid wall, and soon occupies the place of the previous polypide. The inner layer of the polypide-bud gives rise to the structures usually regarded as endodermic and epidermic, the outer layer to the mesodermic organs.

through perforated "rosette-plates" in the dividing walls. In the Phylactolaemata a single definite follicle passes from the body-wall to the apex of the stomach. This latter organ is pigmented in all Polyzoa, and is in the Ectoprocta, the Ectoporela, beyond the point where the intestine leaves it into a conspicuous cæcum (fig. 6, 9). The nervous system is represented by a ganglion situated between the mouth and the tentacle (i) of Ectoprocta are developed on the body-wall, on the stomach, or on the follicle. Both kinds of reproductive organs may occur in a single zoecium, and the reproductive; elements pass when ripe into the body-cavity. Their mode of escape is unknown in most cases. In some Gymnolaemata, polypides which develop an ovary possess a flask-shaped "intertentacular organ," situated between two of the tentacles, and affording a direct passage into the intestine for the eggs or even the spermatozoa developed in the same zoecium. In other cases the reproductive cells pass out by the atrophy of the polypide, whereby the body-cavity may become continuous with the exterior. The statoblasts of the Phylactolaemata originate on the follicle, and are said to be derived directly from an ectodermic core possessed by this organ and partly from its external mesoderm (Braem), the former giving rise to the chitinous envelope and to a nucleioid layer (fig. 7, 9), which later invaginates to form the inner vesicle of the polypide-bud. The mesodermic portion becomes charged with a yolk-like material (y), and, on the germination of the statoblast, gives rise to the outer layer (mes) of the bud.

The production of a polypide by the statoblasts is essential from the formation of a polypide in an ordinary zooecium. The statoblasts require a period of rest before germination, and Braem has shown that their property of floating at the surface may be beneficial to them by exposing them to the action of frost, which in some cases improves the germinating power. The occurrence of Phylactolaema in the tropics would show, however, without further evidence that frost is not a factor essential for germination. The withdrawal of the expanded polypide bud, effected by the contraction of the retractor muscles (fig. 6, 9), mesoderm, is probably due to a relative decrease in the volume of the contents of the body-cavity. The alternation of increase and diminution of volume is easily understood in forms with flexed life-history. Thus in the Phylactolaemata the contraction of the muscular mesoderm protrusion is the cause of the protrusion of the body-cavity and is important in the propagation of the species. In the contraction of the parietal muscles, which pass freely across the body-cavity from one part of the body-wall to another. In the branching Ctenostomes the whole body-wall is flexible, so that the contraction of the parietal muscle acts equally on the two points with which it is connected. In encrusting Ctenostomes and in the stenostomes (figs. 8 A, 9 A) the free surface of the body-wall exerts a pressure on the fluid in the body-cavity and is important in the propagation of the species. In these forms the protrusion of the body-cavity is probably due to the contraction of the muscles which act equally on the two points with which it is connected. In these forms the protrusion is rendered possible by the occurrence of a "compensation-sac," in communication with the external water.

In its most developed condition (fig. 9, C) the compensation-sac (c.s.) is a large cavity which lies beneath the calcified frontal wall and opens to the exterior at the proximal and distal ends. The compensation-sac is an essential part of the structure of the body-cavity. The mechanism of protrusion in the Ctenostoma is a subject which requires further examination.

The evolution of the arrangements for protruding the polypide seems to have proceeded along several distinct lines: (1) In certain species of Membranipora the "frontal membrane," or membranous membro sac, is protected by a series of calcareous spines, which form from its periphery and arch inwards. In Cribriolina similar spines are developed in the young zoecium, but they soon unite with one another laterally, leaving rows of pores along the sutureal lines (fig. 10). The operculum retains its continuity with the frontal membrane (fig. 9, B) into which the parietal muscles are still inserted. As indications that the conditions described in Membranipora and Cribriolina are of special significance may be noted the fact that the ancestral animal of many genera which have well-developed compensation-sacs in the rest of their zoecium is a Membranipora-like individual with a series of marginal calcareous spines, and the further fact that a considerable proportion of the Cretaceous Chelostomata belong either to the Membraniporidae or to the Cribriolinae. (ii) In Scrupocellaria, Menippea and Cabea a single, greatly dilated marginal spine, the "scutum" or "forixin," may protect the frontal membrane (fig. 9, B). (iii) In the frontal membrane and parietal muscles of the young zoecium are like those of Membranipora, but they become covered by the growth, from the proximal and lateral sides, of a calcareous lamina covered externally by a soft membrane. The arrangement is perhaps derivable from a Cribriolina-like condition in which the outer layer of the spines has become membranous while the spines themselves are laterally united from the first. (iv) In the Microporidae and Steganoporellideae the body-cavity becomes partially subdivided by a calcareous lamina ("cryptocyst," Jullien) which grows from the proximal and lateral sides in a plane parallel to the frontal membrane and not far below it. The parietal muscles are usually reduced to a single pair, which may pass through foramina ("pupilæae") in the calcareous lamina just referred to. There is no compensation-sac in these families. (v) Many of the Leptolaedid forms offer special difficulties, but the calcareous layer of the frontal surface is probably a cryptocyst (as in fig. 9, C), the compensation-sac being developed round its distal border. The "epithica" noticed above is in this case the persistent frontal membrane. (vi) In Microporella the opening of the compensation-sac has become separated from the operculum by a calcareous matter, and is known as the "median pore." Jullien believed that this pore opens into the tentacle-shaft, but it appears probable that it really communicates with the compensation-sac and not with the tentacle-shaft. The mechanism of protrusion in the Ctenostoma is a subject which requires further examination. The most singular of the external appendages found in the Polyzoa are the avicularia and vibracula of the Chelostomata. The avicularium is so called from its resemblance, in its most highly differentiated condition, to the head of a bird. In Bugula, for instance, a calcareous avicularium of this type is attached by a narrow neck to each zooecium. The avicularium can move as a whole by means of special muscles, and its chitinous lower jaw...
or "mandible" can be opened and closed. It is regarded as a modified zooecium, the polypide of which has become vestigial, although it is commonly represented by a sense-organ, bearing tactile hairs, situated on the oral tentacles. It is generally supposed that the possession of a pair of shells protecting the sides, the presence of an organ known as the "pyriform organ," and the occurrence of a sucker in a position corresponding with the depression seen between the mouth and pharynx, is a vestige of the ventral sucker, which is erected for the purpose, part of its epithelium becoming the basal ectoderm of the ancestor. The pyriform organ has probably assisted the larva to find an appropriate place for attachment, but this is somewhat doubtful. In all but the most of the other larval organs, it undergoes a process of histolysis, and the larva becomes the anastomus, containing the primary zooecial bud, derived from the apical sense-organ. The stalk of theיפי, which is formed, as in an ordinary zooecium after the loss of its polypide, from a polyplide-bud.

The Cyphonautes type has been shown by Prouho (24) to occur in three species of Cheilostomata and Gymnolactidae in which the eggs are laid and develop in the external water. In most Ectoprocta, however, the development takes place internally or in an ovicell, and a considerable quantity of yolk is present.

The alimentary canal, which may be represented by vestigial structure, is accordingly not functional, and the larva does not become pelagic. A pyriform organ is present in most Gymnolactidae as well as the sucker by which fixation is effected. As to the mode of Chaetopoda, in which the larva becomes the anastomus from which a polypide is developed as a bud. In the Cheilostomata the primary embryo undergoes repeated divisions within the egg, and a certain number of pieces so formed becomes a free larva, which possesses no alimentary canal. Finally, in the Phylactolaemata, the larva becomes an anastomus before it is hatched, and one or several polypide buds may be present externally.

The development of the Ectoprocta is intelligible on the hypothesis that the Entoprocta form the starting-point of the series. On the view that the Phylactolaemata are nearly related to Phoroneis (see Phoroneisidea), it is extremely difficult to draw any conclusion with regard to the significance of the facts of development. If the Gymnolactidae were evolved from the type of structure represented by Phoroneis or the Petrobranchia (q.e.), the Gymnolactidae should show a further development of this type, and the comparative study of the embryology of the two orders would appear to be meaningless. It seems more natural to draw the conclusion that the resemblances of the Phylactolaemata to Phoroneis are devoid of phylogenetic significance.

BIBLIOGRAPHY.—For general accounts of the structure and development of the Polyzoa the reader's attention is specially directed to 14, 15, 25, 1, 3, 17, 26, 18, 23, in the list given below, or for an historical account to 1; for a full bibliography of the group, to 22; for fresh-water forms, to 1-3, 7-10, 17; for an indispensable synonymic list of recent marine forms, to 15; for Entoprocta, to 10, 11, 19; for the marine Gymnolactidae, to 21, 14, 4, 13, 20; for Paleontology, to 27, 22.

PORA PILOSA, the pelagic larva is known as Cyphonautes, and it has the structure not unlike that of the larval Pedicellina. The principal differences are the complication of the ciliated band, the absence of the second branchial organ, and the position of the ocellus, which in the possession of a pair of shells protecting the sides, the presence of an organ known as the "pyriform organ," and the occurrence of a sucker in a position corresponding with the depression seen between the mouth and pharynx. When the larva has hatched, this sucker, which is erected for the purpose, part of its epithelium becoming the basal ectoderm of the ancestor. The pyriform organ has probably assisted the larva to find an appropriate place for attachment, but this is somewhat doubtful. In all but the most of the other larval organs, it undergoes a process of histolysis, and the larva becomes the anastomus, containing the primary zooecial bud, derived from the apical sense-organ. The stalk of the larva, which is formed, as in an ordinary zooecium after the loss of its polypide, from a polyplide-bud.

POMADE, or Pomatum, a scented ointment, used formerly for softening and beautifying the skin, as a lip-salve, &c., but now principally applied to the hair. It was made originally from the juice of apples (Lat. pomum), whence the name.

POMANDER (from Fr. pomme d'ambré, i.e. apple of amber), a ball made of perfumes, such as ambrette (whence the name), musk, civet, &c., and formerly worn or carried in a case, also known by the same name, as a protection against infection in times of pestilence or merely as a useful article to modify bad smells. The globular cases which contained the "pomanders" were hung from a neck-chain or attached to the girdle, and were usually perfumed and made of gold or silver. Sometimes they contained several partitions, in each of which was placed a different perfume. There is an early Spanish pomander set with emeralds, and a fine 16th century one, dredged from the Thames, in the British Museum.

POMBAI, SEBASTIÃO JOSE DE CARVALHO E MELLO, MARQUES DE (1699-1782), Portuguese statesman, was born at Soure near Pombal, on the 13th of May 1699. He was the son of Manoel de Carvalho e Athayde, a country gentleman (fidalgo) and of his wife D. Theresia Luíza de Mendonça e Mello. He studied law at Coimbra University, served for a short time as a private in the army, and afterwards lived the life of a man about town, in Lisbon, sharing in the diversions of the "Mohocks" who then infested the streets. In 1733 he abduced and married D. Theresia de Noronha, a widow belonging to one of the most distinguished families in Portugal. He then retired to Soure, where, on the recommendation of Cardinal de Motta, King John V. commissioned him to write a biographical studies of both.

In 1739 he was sent as Portuguese ambassador to London, where he remained until 1745. He was then transferred to Vienna. His first wife having died on the 7th of January 1739, he married, on the 18th of December 1745, Leonor Ernestina Daun, daughter of General Count Daun. In 1749 he was recalled to take up the post of secretary of state for foreign affairs and war. The appointment was ratified on the 3rd of August 1750, by King Joseph, who had succeeded John V, in that year. Carvalho's career from 1750 to 1777 is part of the history of Portugal. Though he came into power only in his 51st year, without previous administrative experience, he was able to reorganize Portuguese education, finance, the army and the navy. He also built up new industries, promoted the development of Brazil and Macao, and expelled the Jesuits. His complete ascendancy over the mind of King Joseph dates from the time of the great Lisbon earthquake (Nov. 1, 1755). Though the famous words "Burly the dead and feed the living" were probably not spoken by him, they summarize his action at this time of calamity. In June 1759 his suppression of the so-called "Tavora plot" gained for him the title of count of Oeiras; and in September 1770 he was made marquess of Pombal. His severe administration had made many enemies, and his life had been attempted in 1769. Soon after the death of King Joseph, in 1777, Pombal was dismissed from office; and he was only saved from impeachment by the death of his bitterest opponent, the queen-mother, Mariana Victoria, in January 1781. On the 16th of August a royal decree forbade him to reside within twenty leagues of the court. He died at Pombal on the 8th of May 1782.

POMEGRANATE. The pomegranate (Punica Granatum) is of exceptional interest by reason of its structure, its history, and its utility. It forms a tree of small stature, or a bush, with opposite or alternate, shining, lance-shaped leaves, from the axes of some of which proceed the brilliant scarlet flowers. These are raised on a short stalk, and consist of a thick fleshy cylindrical or bell-shaped calyx-tube, with five to seven short lobes at the top. From the throat of the calyx proceed five to seven roundish, crumpled, scarlet or crimson petals, and below them very numerous slender stamens. The pistil consists of two rows of carpels placed one above another, both rows embedded in, and partially inseparable from, the inner surface of the calyx-tube. The styles are confluent into one slender column. The fruit, which usually attains the size of a large orange, consists of a hard leathery rind, enclosing a quantity of pulp derived from the costs of the numerous seeds. This pulp, filled as it is with refreshing acid juice, constitutes the chief value of the tree. The more highly cultivated forms contain more of it than the wild or half-wild varieties. The great structural peculiarity consists in the presence of the two rows of carpels one above another (a state of things which occurs exceptionally in apples and oranges), and in the fact that, while in the lower series the seeds are attached to the inner border or lower angle of the cavity, they occupy the outer side in the upper series, as if during growth the upper whorl had become completely bent over.

By Bentham and Hooker the Punica is included as an anomalous genus in the order Lythraceae; others consider it more nearly allied to the myrtles; while its peculiarities are so great as, in the opinion of many botanists, to justify its inclusion in a

separate order, Punicaceae. Not only is the fruit valuable in hot countries for the sake of its pulp, but the rind and the bark and the outer part of the root (containing the alkaloid pellitine) are valuable as astringents. The bark of the root is likewise valued as an anthelmintic in cases of tape-worm.

The tree is wild in Afghanistan, northwestern India, and the districts south and south-west of the Caspian, but it has been so long cultivated that it is difficult to say whether it is really native in Palestine and the Mediterranean region. It has been cited as wild in southern Africa, but this appears to be a mistake. Professor Bayley Balfour met with a wild species, heretofore unknown, in the island of Socotra, the flowers of which have only a single row of carpels, which suggests the inference that it may have been the source of the cultivated varieties. But, on the other hand, in Afghanistan, where Aitchison met with the tree truly wild, a double row of carpels was present as usual. The antiquity of the tree as a cultivated plant is evidenced by the Sanskrit name Dādīmba, and by the references to the fruit in the Old Testament, and in the Odyssey, where it is spoken of as cultivated in the gardens of the kings of Phæacia and Phrygia. The fruit is frequently represented on ancient Assyrian and Egyptian sculptures, and has a religious significance connected with several Oriental cults, especially the Phrygian cult of Cybele (Arnob. v. 5 seq.; see also Baudissin, Studien, ii. 207 seq.). It was well known to the Greeks and Romans, who were acquainted with its medicinal properties and its use as a tanning material. The name given by the Romans, mārum punicum, indicates that they received it from Carthage, as indeed is expressly stated by Pliny; and this circumstance has given rise to the notion that the tree was indigenous in northern Africa. On a review of the whole evidence, botanical, literary, and linguistic, Alphonse de Candolle (Origin of Cultivated Plants) pronounces against its African origin, and decides in favour of its source in Persia and the neighbouring countries. According to Saporta, the pomegranate existed in a fossil state in beds of the Pliocene epoch near Mexmieux in Burgundy. The pomegranate is sometimes met with in cultivation against a wall in England, but it is too tender to withstand a severe winter. The double-flowered varieties are specially desirable for the beauty and long duration of their flowers.

**POMERANIA** (German, Pommern), a territory of Germany and a maritime province of Prussia, bounded on the N. by the Baltic, on the W. by Mecklenburg, on the S. by Brandenburg, and on the E. by West Prussia. Its area is 11,630 sq. m., and the population in 1905 was 1,653,115, showing a density of 143 inmates to the square mile. The province is officially divided into the three districts of Stralsund, Stettin, and Köslin, but more historical interest attaches to the names of Vorpommern and Hinterpommern, or Hither and Farther Pomerania, the former being applied to the territory to the west, and the latter to that to the east of the Oder. Pomerania is one of the flattest parts of Germany, although east of the Oder it is traversed by a range of low hills, and there are also a few isolated eminences to the west. Of the west coast, which is very irregular, lie the islands of Rügen, Usedom, and Wollin; the coast of Farther Pomerania is smooth in outline and is bordered with dunes, or sandhills. Besides the Oder and the Peene and its affluents, the chief rivers are the Peene, the Ücker and the Ihna, there are several smaller rivers flowing into the Baltic; a few of these are navigable for ships, but the greater number only carry rafts. Many of them end in small lakes, which are separated from the sea by narrow strips of land, through which the water escapes by one or more outlets. The interior of the province is also thickly sprinkled with lakes, the combined area of which is equal to about one-twentieth of the entire surface.

The soil of Pomerania is for the most part thin and sandy, but patches of good land are found here and there. About 55% of the whole is under tillage, while 16% consists of meadow and pasture, and 14% of wood. The Peene and its affluents are used for the production of 145,000 bales of flax, and 22,500 tons of potatoes, rye and oats, but wheat and barley are grown in the more fertile districts; tobacco, flax, hops and beetroot are also cultivated. Agriculture is still carried on in a somewhat primitive fashion, and as a rule the livestock is of an inferior quality, though the breed of horses, of a heavy build and mostly used in agriculture, is held in high esteem. Large flocks of sheep are kept, both for their flesh and their wool, and there are in the province large numbers of horned cattle and of pigs. Geese and goose feathers form lucrative articles of export. Owing to the long line of coast and the numerous lakes, fishing forms an important industry, and large quantities of herrings, eels and lampreys are sent from Pomerania to other parts of Germany. With the exception of the almost inexhaustible layers of peat, the mineral wealth of the province is insignificant. Its industrial activity is not great, but there are manufactures of machinery, chemicals, paper, tobacco and sugar; these are made chiefly in or near the large towns, while linen-weaving is practised as a domestic industry. Ship-building is carried on at Stettin and at several places along the coast. The commerce of Pomerania is in a flourishing condition, its principal ports being Stettin, Stralsund and Swinemünde. Education is provided for by a university at Greifswald and by numerous schools. The province sends 14 members to the German Reichstag, and 26 to the Prussian house of representatives. The heir to the Prussian crown bears the title of governor of Pomerania.

**History.**—In prehistoric times the southern coast of the Baltic seems to have been occupied by Celts, who afterwards made way for tribes of Teutonic stock. These in their turn migrated to other settlements and were replaced, about the end of the 5th century of our era, by Slavonic tribes, the Wizil and the Pomerani. The name of Pomore, or Pommern, meaning "on the sea," was given to the district by the latter of the tribes about the time of Charlemagne, and it has often changed its political and geographical significance. Originally it seems to have denoted the coast district between the Oder and the Vistula, a territory which was at first more or less dependent on Poland, but which, towards the end of the 12th century, was ruled by two native princes, who took the title of duke about 1170 and admitted the authority of the German king in 1181. Afterwards Pomerania extended much farther to the west, while being correspondingly curtailed on the east, and a distinction was made between Slavia, or modern Pomerania, and Pomerellen. The latter, corresponding substantially to the present province of West Prussia, remained subject to Poland until 1309, when it was divided between Brandenburg and the Teutonic Order. Christianity was introduced in the 12th century, a bishopric being founded in the Island of Wollin, and its advance went rapidly hand in hand with the Germanizing of the district.

The history of Pomerania, as distinct from that of Pomerellen, consists mainly of an almost endless succession of divisions of territory among the different lines of the ducal house, and of numerous expansions and contractions of territory through constant hostilities with the elector of Brandenburg, who claimed to be the immediate feudal superior of Pomerania, and with other neighbouring rulers. The names of Vorpommern and Hinterpommern were at first synonymous with Pomerania proper, or Slavonia and Pomerellen, but towards the close of the 14th century they were transferred to the two duchies into which the former was divided. In 1635 the Pomerellen was transferred to Sweden, and the modern Pomerania to Bogislaus XIV, and on his death without issue, in 1637, Brandenburg claimed the duchy by virtue of a compact made in 1571. In the meantime, however, Pomerania had been devastated by the Thirty Years' War and occupied by the Swedes, who had taken possession of its towns and fortresses. At the peace of Westphalia they claimed the duchy, in opposition to the elector of Brandenburg, and the result was that the latter was obliged to content himself with eastern Pomerania (Hinterpommern), and to see the western part (Vorpommern) awarded to Sweden. In 1726, by the peace of Stockholm, Swedish Pomerania was curtailed by extensive concessions to Prussia, but the district to the east of the Peene kept the possession of Sweden until the general European settlement of 1815. Then Sweden assigned her German possessions to Denmark in exchange for Norway, whereupon Prussia, partly by purchase and partly by the cession...
of the duchy of Lauenburg, finally succeeded in uniting the whole of Pomerania under her rule.

POMEROY, a village and the county-seat of Meigs county, Ohio, U.S.A., on the Ohio river, about 85 m. S.S.E. of Columbus. Pop. (1890) 4726; (1900) 4639. Including 453 foreign-born and 280 negroes; (1910) 4023. Pomeroy is served by the Hocking Valley and across the river Baltimore & Ohio railways, by inter-urban electric railway, and by passenger and freight boats to the leading river ports. It occupies a strip of ground between the river and a range of steep hills. Bituminous coal and salt abound in the district, and there are deposits of building stone, fireclay and glass sand. The first settlement here was established in 1816, coal mining was begun three years later, and in 1827 a town was laid out and named Nyesville. There was little progress, however, until 1833, when Samuel W. Pomeroy (in whose honour the present name was adopted) formed a company, which began mining coal on a large scale. Pomeroy was incorporated as a village and was made the county-seat in 1841. In 1850 the first of several salt wells, from 1000 to 1200 ft. in depth, was operated.

POMFRET, JOHN (1667-1702), English poet, son of Thomas Pomfret, vicar of Luton, was born in 1667. He was educated at Bedford grammar school and at Queens' College, Cambridge. He became rector of Maulden, Bedfordshire, in 1695, and of Millbrook in the same county in 1702. Dr Johnson says that the bishop of London refused to sanction preferment for him because in his Choice he declared that he would have no wife, although he expressed a wish for the occasional company of a modest and sprightly young lady. The poet was married in real life all the same, and—while waiting to clear up the misunderstanding with the bishop—he died in November 1702. The Choice or Wish: A Poem written by a Person of Quality (1700) expresses the epicurean desires of a cultivated man of Pomfret's time. It is smoothly written in the heroic couplet, and was widely popular. His Miscellany Poems were published in 1702.

POMMEL (through O. Fr. pomel, from a diminutive pomelle of Lat. pomum, fruit, apple), any rounded object resembling an apple, e.g. the rounded termination of a saddle-bow; in architecture, any round knot, as a boss, finial, &c.; more particularly the rounded end to the hilts of a sword, dagger or other hand weapon, used to prevent the hand from slipping, and as a balance to the blade. "Pommel" is also a term used of a piece of grooved wood used in graining leather. This word may be the same in origin, or more probably from Fr. paume, the hand, palm.

POMMER, or BOMBARD (Fr. haubeis; Ital. bombardo, bombardone), the alto, tenor and basses of the shawm or Schalmey family, and the forerunners respectively of the cor-anglais, bassoon or fagotto, and double bassoon or contrabassotto. The main difference to the casual observer between the medieval instruments and those of our orchestra which were evolved from them, lies in the too small size. In the Pommers no attempt had been made to bend the tube, and its length, equal to that of an open organ pipe of the same pitch, was outstretched in all its unwieldiness in an oblique position in front of the performer. The great contrabass Pommer was 9 ft. long without the crook and reed, which, however, were bent downwards. It had five open fingerholes and five keys working inside a perforated case; in order to close the holes within reach of the finger, they were cut obliquely through the tube. The compass extended from F below 8 ft. C to E or F in the bass stave, two octaves in all. The other membranes of the family were the bass Pommer, from 8 ft. C to middle C, corresponding to the modern bassoon or fagotto; the tenor or basset Pommer, a fifth higher in pitch; the alto pommer or nicole, a fourth or a fifth above the tenor; and the high alto, or Klein Alt Pommer, an octave higher than the tenor, corresponding approximately to the cor-anglais.

For the history of the Pommer family see BONE and BASSOON.

POMONA, an old Italian goddess of fruit and gardens. Ovid (Met. xiv. 623) tells the story of her courtship by the silvan deities and how Vertumnus, god of the turning year, wooed and won her. Corresponding to Pomona there seems to have been a male Italian deity, called Pomunus, who was perhaps identical with Vertumnus. Although chiefly worshipped in the country, Pomona had a special priest at Rome, the flamen Pomonals, and a sacred grove near Ostia, called the Pomonal. She was represented as a beautiful maiden, with fruits in her bosom and a pruning-knife in her hand.

POMONA, a city of Los Angeles county, in southern California, U.S.A., about 33 m. E. of the city of Los Angeles. Pop. (1890) 3634; (1900) 5266 (567 foreign-born); (1910) 10,207. It is served by the Southern Pacific, the San Pedro, Los Angeles & Salt Lake, and the Atchison, Topeka & Santa Fe railways, and by an inter-urban electric line. The city is about 850 ft. above sea-level, and has a Carnegie library and several parks, including Ganesha park (45 acres), which commands a fine view. At Claremont, about 3 m. north, is Pomona College (1888, co-educational), which in 1908 had 34 instructors and 488 students. Pomona is in the midst of a prosperous fruit region, devoted especially to the growing of oranges. Orchards of oranges, lemons, apricots, peaches and prunes surround the city for miles, and some olives are grown; alfalfa and sugar-beets are raised in large quantities in the immediate neighbourhood. Pomona was settled by a colony of fruit-growers in 1875, and was chartered as a city in 1888.

POMONA, or MAINLAND, the central and largest island of the Orkneys, Scotland. Pop. (1901) 16,235. It is 25 m. long from N.W. to S.E. and 15 m. broad from E. to W.; area, 190 sq. m.; but where the coast is cut into, on the N. by Kirkwall Bay and on the S. by Scapa Flow, the land is less than 2 m. across. Consequently, the portion of the island to the west of the waist of Pomona is sometimes described as the West Island, and the portion to the East as the East Island. The west coast is almost unbroken, the bays of Birsay and Skawill being the only bays of any importance. The east and south shores, on the other hand, are extensively carved out. Thus on the east side are found Eynhallow Sound, Wood Wick, the bays of Isbister, Firth, Kirkwall, and Inganas and Dee Sound, and on the south Holm Sound, Scapa Bay, Swansester Bay and Bay of Ireland. The highest points of the watershed from Costa Head to the Scapa shore are Millodie (734 ft.) to the north-east of Isbister and Wildeford Hill (740 ft.) to the west of Kirkwall. There are also a few eminences towards the south-west, Ward Hill (880 ft.) in the parish of Orphir being the highest peak in the island. There are numerous lakes, some of considerable size and most of them abounding with trout. Loch Harray is 4½ m. long by ¾ m. to about 2 m. wide, and Loch Stennis 3½ m. long by from ½ to 2½ m. wide. Lochs Swannay, Boardhouse and Hunderseland are situated in the extreme north, while Loch Kirkister lies near the south coast and Loch Tankerness adjoins Deer Sound. Off the east coast lie the islands of Rousay, Eglishay, Viera, Eynhallow, Gairsay and Shawpiness, and off the south Copinsay and Lamb Holm. The hilly country, mostly moorland, and peat-mosses are met with in some of the low-lying land, but many of the valleys contain fertile soil, and there are productive tracts on the eastern and northern seaboard. Kirkwall, the capital of the Orkneys, and Stromness are the only towns.

In Harray, the only parish in the Orkneys not trenched at some point by the sea, Norse customs have survived longer than elsewhere in the group save in North Ronaldsay. In Deerness
was Maecenas. The antiqulities of Pomona are of great interest. The
examples of Pictish remains include brochs or round towers, chambe-
red mounds, or buildings of stone covered in with earth, and weems, or
undeground dwellings afterwards roofed in. At Saverock, on the west
wing of Kirkwall Bay, a good specimen of an earth-
house will be found, and at Quanterness, 1 m. to the west of it, a
chambered mound, containing seven rooms with beehive roofs.
Further west and 5 m. by road north-east of Stromness, and
within a mile of the stone circles of Stenness, stands the great
barrow or chambered mound of Maeshowe. The tumulus has the
form of a blunted cone, is 36 ft. high, 300 ft. in circum-
ference and 92 ft. in diameter, and at a distance of 90 ft. from its
base is encircled by a moat 40 ft. wide and from 4 ft. to 8 ft. deep.
The ground-plan shows that it was entered from the west by a path, 54 ft. long, and from 23 ft. to 45 ft. high, which led to a central apartment about 15 ft.
square, the walls of which ended in a beehive roof, the spring of
which began at a height of 13 ft. from the floor. This room
and the passage are built of undressed blocks and slabs of sand-
stone. About the middle of each side of the chamber, at a
height of 3 ft. from the floor, there is an entrance to a small
cell, 3 ft. high, 43 ft. wide and from 5 ft. to 7 ft. long. Mr.
James Farrer explored the mound in 1861, and discovered on the
walls and certain stones rude drawings of crosses, a winged
dragon, and a serpent curled round a pole, besides a variety of
Runic inscriptions. One of these inscriptions stated that the
tumulus was erected in memory of Niall Grimnig, a skald or
poet, who was sent by the King of Norway with the stones on
their way to Jerusalem under Jarl Rognvald in the 12th
century. There can be little doubt but that it was a
sepulchral chamber. Joseph Anderson ascribes it to the Stone
Age (that is, to the Picts), and James Fergusson to Norsemen of
the 10th century.

The most interesting of all those links with a remote past are
the stone circles forming the Ring of Brogar and the Ring of
Stenness, often inaccurately described as the Stones of Stenness.
The Ring of Brogar is situated to the north-west and the Ring of
Stenness to the south-east of the Bridge of Brogar, as the narrow
causeway of stone slabs is called which separates Loch Harry
from Loch Stenness. The district lies some 45 m. north-east
of Stromness. The Ring of Brogar, once known as the Temple
of the Sun, stands on a raised circular platform of turf, 340 ft.
in diameter, surrounded by a moat about 6 ft. deep, which in
turn is invested by a grassy rampart. The ring originally
comprised 60 stones, set up at intervals of 17 ft. Only 13 are
now erect. Ten, still entire, lie prostrate, while the stumps of
13 others can yet be recognized. The height of the stones
varies from 9 ft. to 14 ft. The Ring of Stenness—the Temple
of the Moon of local tradition—is of similar construction to the
larger circle, except that its round platform is only 104 ft. in
diameter. The stones are believed to have numbered 71,
varving in height from 15 ft. to 17 ft. but only two remain up-
right. In the middle of the ring may be seen the relic of what
was probably the sacrificial altar. The Stone of Odin, the
great monolith, pierced by a hole at a height of 5 ft. from the
ground, which figures so prominently in Scott's 'Pirate', stood
150 yds. to the north of the Ring of Stenness. The stones of
both rings are of the native Old Red Sandstone.
surer way, by encouraging the king in his debaucheries, and Louis
wept over her kindness to his various mistresses. Only once,
when the king was wounded by Damiens in 1757, did she receive
a serious shock, and momentarily left the court; but on his
recovery she returned more powerful than ever. She even
infringed herself with the queen, and was made a lady-in-waiting; but
the end was soon to come. "Ma vie est un combat," she said,
and for it she worked with business and pleasure; she gradually grew
weaker and weaker, and when she did that death was at hand she
dressed herself in full court costume, and met it bravely on
the 15th of April 1764, at the age of forty-two.

See Capefigue, Madame la marquise de Pompadour (1858); E.
and J. de Goncourt, Les Maîtresses de Louis XIV., vol. ii. (1860); and
Campardon, Madame de Pompadour et la cour de Louis XIV.

POMPEII, an ancient town of Campania, Italy, situated near
the river Sarnus, nearly 2 m. from the shore of the city of
Naples, almost at the foot of Mt Vesuvius. Of its history before
79 B.C. comparatively little is recorded; but it appears that it
had a population of a very mixed character, and passed successively
into the hands of several different peoples, each of which
contributed an element to its composition. Its foundation was
ascribed by Greek tradition to Heracles, in common with the
neighbouring city of Herculaneum, but it is certain that it was
not a Greek colony, in the proper sense of the term, as we know
to have been the case with the more important cities of Cuma and
Paestum, which was of the Doric in v. 4, 8, in whose time it was a populous
and flourishing place, tells us that it was first occupied by the Oscans 2 (to whom we must attribute the Doric temple in the
Forum Triangolare), afterwards by the Tyrrhenians (i.e. Etruscans)
and Pelasgians, and lastly, by the Samnites. The conquest of
Campania by the last-mentioned people is an undoubted historical
fact, and there can be no doubt that Pompeii shared the fate of the
neighbouring cities on this occasion, and afterwards passed in common with them under the yoke of Rome. But its name
is only once mentioned during the wars of the Romans with the
Samnites and Campanians in this region of Italy, and then only incidentally (I. iv. 38), when a Roman fleet landed near
Pompeii in 302 B.C. and made an unsuccessful marauding expedition up the river Avventino to Nocera. 

In the Roman period, however, it took a prominent part in the outbreak of the
nations of central Italy, known as the Social War (91-89 B.C.),
when it withstood a long siege by Sulla, and was one of the last
cities of Campania that were reduced by the Roman arms. The
inhabitants were admitted to the Roman franchise, but a military
colony was settled in their territory in 80 B.C. by Sulla (Colonia
Corinna Veneria Pompeianorum), and the whole population
was rapidly Romanized. The municipal administration here, as elsewhere in Italy, was in the hands of two duoviri iure dicundo
and two aediles, the supreme body being the city council (decursiones).

Before the close of the republic it became a resort of the Tyro
nobles, many of whom acquired villas in the neighbourhood.
Among them was Cicero, whose letters abound with allusions
to his Pompeian villa. The same fashion continued under the
empire, and there can be no doubt that, during the first century
of the Christian era, Pompeii had become a flourishing place

1 The etymology of the name is uncertain; the ancients derived
it from the Latin pompy (Gr. pympois), in allusion to the journey of
Heracles with the exom of Geryon, but modern authorities refer
it to the Oscan pompa (five).

2 For the Oscan inscriptions found in Pompeii see below ad f.

and the port of Grado (Venetia), as an admiral for the Nucerine League.

See Conway, Italic Dialects, p. 51; J. Beloch, Companian, 2nd ed.,
p. 239.

with a considerable population. Two events only are recorded
of its history during this period. In A.D. 59 a tumult took place
in the amphitheatre between the Sicilians and visitors from
the neighbouring colony of Nuceria. Many were killed and
people were wounded on both sides. The Pompeians were punished for this violent
outbreak by the prohibition of all theatrical exhibitions for ten
years (Tacitus, Ann. xiv. 17). A characteristic, though
rude, painting, found on the walls of one of the houses gives a
representation of this event.

Four years afterwards (A.D. 63) an earthquake, which affected all
the neighbouring towns, went its force especially upon
Pompeii, a large part of which, including most of the public buildings,
was either destroyed or so seriously damaged as to
require to be rebuilt (Tac. Ann. xiv. 29; Seneca, Cat. ii. 1).
From the existing remains it is clear that the Pompeians
were still actively engaged in repairing and restoring the ruined edifices
when the whole city was overwhelmed by the great eruption
of A.D. 79. Vesuvius (p.e.), the volcanic forces of which had been
slumbering for unknown ages, suddenly burst into violent
eruption, which, while it carried devastation all around the
beautiful gulf, buried the two cities of Herculaneum and Pompeii
under dense beds of cinders and ashes. It is singular that, while
Pompeii was but briefly mentioned in the poems of the ancient authors,
the name is frequently used by them in their detailed description of this famous eruption in two
letters of the young Lucretius (Epist. vi. 16, 20), he does not even
notice the destruction of Pompeii or Herculaneum, though his
uncle perished in the immediate neighbourhood of the former
city. But their fate is noticed by Dio Cassius, and its
circumstances may be gathered with certainty from the condition in
which the city has been found. These were such as to conduce to
its preservation and interest as a relic of antiquity. Pompeii was
merely covered with a bed of lighter substances, cinders, small
stones and ashes, which fell in a dry state, while at Herculaneum
the same substances, being drenched with water, hardened into
a sort of tufa, which in places is 65 ft. deep. The whole of this
superincumbent mass, attaining to an average thickness of
18 to 20 ft., was the product of one eruption, though the materials
may be divided generally into two distinct strata, the one
consisting principally of cinders and small volcanic stones
(called in Italian lapilli), and the other and uppermost layer
of fine white ash, often consolidated by the action of water from
above so as to take the moulds of objects contained in it (such
as dead bodies, woodwork, &c.), like clay or plaster of Paris.
It was found impossible to rebuild the town, and its territory
was joined to that of Nola. But the survivors returned to the
spot, and by digging down and tunnelling were able to remove
many objects of value, even the marble facing slabs of the large
buildings.

In the middle ages, however, the very site was forgotten.
Two inscriptions were found in making an underground aqueduct
across the site in 1594-1600, but it was not until 1748 that a more
careful inspection of this channel revealed the fact that beneath
the vineyards and mulberry groves which covered the site
there lay entombed ruins far more accessible, if not more inter-
esting, than those of Herculaneum. It was not till 1763 that
systematic excavations were begun; and, though they were
carried on during the rest of the 18th century, it was only in
the beginning of the 19th that they assumed a regular character;
the work, which had received a vigorous stimulus during the
period of the French government (1806-1814), was prosecuted,
though in a less methodical manner, under the rule of the Boursen
kings (1815-1861). Since 1861 it has been carried on under
the Italian government in a more scientific manner, on a system
designed by G. Fiorelli (d. 1886), according to which the town is
for convenience divided into nine regions—though this rests
on a misconception, for there is really no street between the
Capua and the Nuceria gates—and the results have been of the
highest interest, though the rate of progress has been very
slow.

The town was situated on rising ground less than a mile from
the foot of Vesuvius. This eminent site is due to an outflow
of lava from that mountain, during some previous eruption in
prehistoric times, for we know from Strabo that Vesuvius had
POMPEII

been quiescent ever since the first records of the Greek settlements in this part of Italy. Pompeii in ancient times was a prosperously seaport town situated close to the seashore, from which it is now nearly 2 m. distant, and adjoining the mouth of the river Sarus or Sarno, which now enters the sea nearly 2 m. from its site. The present course of this stream is due in part to modern alteration of its channel, as well as to the effects of the great eruption. The prosperity of Pompeii was due partly to its commerce, as the port of the neighboring towns, partly to the fertility of its territory, which produced strong wine, olive oil (a comparatively small quantity), and vegetables; fish sauces were made here. Millstones and pumice were also exported, but for the former the more gritty lava of Rocca Monfina was later on preferred.

The area occupied by the ancient city was of an irregular oval shape, more than 2 m. in circumference. It was surrounded by a wall, which is still preserved for more than two-thirds of its extent, but no traces of this are found on the side towards the sea, and there is no doubt that on this side it had been already demolished in ancient times, so as to give room for the free extension of houses and other buildings in that direction. These walls are strengthened at intervals by numerous towers, occupying the full width of the wall, which occur in some parts at a distance of only about 100 yds., but in general much less frequently. They are, however, of a different style of construction from the walls, and appear to have been added at a later period, probably that of the Social War. Similar evidences of the addition of subsequent defences are to be traced also in the case of the gates, of which no less than eight are found in the existing circuit of the walls. Some of these present a very elaborate system of defence, but it is evident from the decayed condition of others, as well as of parts of the walls and towers, that they had ceased to be maintained for the purposes of fortification long before the destruction of the city. The names by which the gates and streets are known are entirely of modern origin.

The general plan of the town is very regular, the streets being generally straight, and crossing one another at right angles or nearly so. But exceptions are found on the west in the street leading from the Porta Ercole (gate of Herculanum) to the forum, which, though it must have been one of the principal thoroughfares in the city, was crooked and irregular, as well as very narrow, in some parts not exceeding 12 to 14 ft. in width, including the raised footpaths on each side, which occupy a considerable part of the space, so that the carriage-way could only have admitted of the passage of one vehicle at a time. The explanation is that it follows the line of the demolished city wall. Another exception is to be found in the Strada Stabiana (Stabian Street) or Cardo, which, owing to the existence of a natural inclined plane which affects also the line of the street just east of it, is not parallel to the other north and south streets. The other main streets are in some cases broader, but rarely exceed 20 ft. in width, and the broadest yet found is about 32, while the back streets running parallel to the main lines are only about 14 ft. (It is to be remembered, however, that the standard width of a Roman highroad in the neighbourhood of Rome itself is about 14 ft.) They are uniformly paved with large polygonal blocks of hard basaltic lava, fitted very closely together, though now in many cases marked with deep ruts from the passage of vehicles in ancient times. They are also in all cases bordered by raised footways on both sides, paved in a similar manner; and for the convenience of foot-passengers, which was evidently a more important consideration than the obstacle which the arrangement presented to the passage of vehicles, which indeed were probably only allowed for goods traffic, these are connected from place to place by stepping-stones raised above the level of the carriage-way. In other respects they must have resembled those of Oriental cities—the living apartments all opening towards the interior, and showing only blank walls towards the street; while the windows were generally to be found only in the upper storey, and were in all cases small and insignificant, without any attempt at architectural effect. In some instances the monstony of their external appearance was broken by small shops, occupying the front of the principal houses, and let off separately; these in some cases numerous enough to form a continuous fauce to the street. This is seen especially in the case of the street from the Porta Ercole to the forum and the Strada Stabiana (or Cardo), both of which were among the most frequented thoroughfares. The streets were also diversified by fountains, small water-towers and reservoirs (of which an especially interesting example was found in 1902 close to the Porta del Vesuvio) and street shrines. The source of the water-supply is unknown.

The two principal streets was crossed, a little before it reached the forum, by the street which led directly to the gate of Nola (Strada delle Terme, della Fortuna, and di Nola). Parallel to this last to the south is a street which runs from the Porta Marina through the forum, and then, with a slight turn, to the Sarno gate, thus traversing the whole area of the city from east to west (Via Marina, Strada dell' Abbondanza, Strada dei Diadumeni). These two east and west streets are the two decumani.

The population of Pompeii at the time of its destruction cannot be fixed with certainty, but it may very likely have exceeded 20,000. It was of a mixed character; both Greek and Oriental inscriptions are still found up to the last, and, though there is no trace whatever of Christianity, evidences of the presence of Jews are not lacking—such are wall-painting, probably representing the Judgment of Solomon, and a scratched inscription on a wall, "Sodoma, Gomorra." It has been estimated, from the number of skeletons discovered, that about 2000 persons perished in the city itself in the eruption of A.D. 79.

Almost the whole portion of the city which lies to the west of the Strada Stabiana, towards the forum and the sea, has been more or less completely excavated. It is over one-half of the whole extent, and that the most important portion, inasmuch as it includes the forum, with the temples and public buildings adjacent to it, the thermae, theatres, amphi-theatre, &c. The greater part of that on the other side of the Strada Stabiana remains still unexplored, with the exception of the amphitheatre, and a small space in its immediate neighbourhood.

The forum at Pompeii was, as at Rome itself and in all other Italian cities, the focus and centre of all the life and movement of the city. Hence it was surrounded on all sides by public buildings or edifices of a commanding character. It was not, however, of large size, as compared to the open spaces in modern towns, being only 467 ft. in length by 126 ft. in breadth (excluding the colonnades). Nor was it accessible to any description of wheel carriages, and the nature of its pavement, composed of broad flags of travertine, shows that it was only intended for foot-passengers. It was adorned with numerous statues, some of the imperial family, others of distinguished citizens. Some of the inscribed pedestals of the latter have been found. It was surrounded on three sides by a series of porticos supported on columns; and these porticos were originally surrounded by a gallery or upper storey, traces of the staircases leading to which still remain, though the gallery itself has altogether disappeared. It is, however, certain that from the existing remains that both this portico and the adjacent buildings had suffered severely from the earthquake of 63, and that they were undergoing a process of restoration, involving material changes in the original arrangements, which was still incomplete at the time of their final destruction. The north end of the forum, where alone the portico is wanting, is occupied in great part by the imposing temple of Jupiter, Juno and Minerva being also worshipped here. It was raised on a podium 10 ft. high, and had a portico with six Corinthian columns in front. This magnificent edifice had, however, been evidently overthrown by the earthquake of 63, and is in its present condition a mere ruin, the rebuilding of which had not been begun at the time of the eruption, so that the cult of
the three Capitoline divinities was then carried on in the so-called temple of Zeus Milichius. On each side of it were two arches, affording an entrance into the forum, but capable of being closed by gates. On the east side of the forum were four edifices; all of them are of a public character, but their names and attribution have been the subject of much controversy. The first (proceeding from the north), once known as the Pantheon, is generally regarded as a macellum or meat-market, consisting of a rectangular court surrounded by a colonnade, with a twelve-sided roofed building (tholus) in the centre. On the south side and Q. Catulus (78 B.C.), and therefore belongs to the Oscan period of the city, before the introduction of the Roman colony. It was an oblong edifice divided by columns into a central hall and a corridor running round all the four sides with a tribunal opposite the main entrance; and, unlike the usual basilicae, it had, instead of a clerestory, openings in the walls of the corridor through which light was admitted, it being almost as lofty as the nave. The temple was an extensive edifice, having a comparatively small cela, raised upon a podium, and standing in the midst of a wide space surrounded by a portico of columns.

were shops, and in the centre of the east side a chapel for the worship of the imperial house. Next to this comes the sanctuary of the Lares of the city, a square room with a large apse; and beyond this, as Mau proves, the small temple of Vespasian. Beyond this again, bounded on the south by the street known as the Strada dell' Abbondanza, is a large and spacious edifice, which, as we learn from an extant inscription, was erected by a priestess named Eumachia. Its purpose is uncertain—possibly a cloth-exchange, as the fullers set up a shop here. It is an open court, oblong, surrounded on all four sides by a colonnade; in front is a portico facing the forum, and on the other three sides there is a corridor behind the colonnade with windows opening on it. On the south side of the Strada dell' Abbondanza was a building which Maur conjectures to have been the Comitium. At the south end of the forum are three halls side by side, similar in plan with a common façade—the central one, the curia or council chamber, the others the offices respectively of the duumvir and aediles, the principal officials of the city; while the greater part of the west side is occupied by two large buildings—a basilica, which is the largest edifice in Pompeii, and the temple of Apollo, which presents its side to the forum, and hence fills up a large portion of the surrounding space. The former, as we learn from an inscription scratched on its walls, was anterior in date to the consulship of M. Lepidus outside which again is a wall, bounding the sacred enclosure. Between this temple and the basilica the Via Marina leads off direct to the Porta Marina.

Besides the temples which surrounded the forum, the remains of five others have been discovered, three of which are situated in the immediate neighbourhood of the theatres. Of these by far the most interesting, though the least perfect, is one which is commonly known as the temple of Hercules (an appellation wholly without foundation), and which is not only by far the most ancient edifice in Pompeii, but presents us with all the characters of a true Greek temple, resembling in its proportions that of the earliest temple of Selinus, and probably of remote antiquity (6th century B.C.). Unfortunately only the foundation and a few Doric capitals and other architectural fragments remain; they were coated with stucco which was brightly painted. In front of the temple is a monument which seems to have been the tomb of the founder or founders of the city; so that for a time this must have been the most important temple. The period of its destruction is unknown, for it appears certain that it cannot be ascribed wholly to the earthquake of 62. On the other hand the reverence attached to it in the later periods of the city is evidenced by its being left standing in the midst of a triangular space adjoining the great theatre, which is surrounded by a portico, so as to constitute a kind of forum (the so-called Foro...
smaller theatre is computed to have been capable of containing fifteen hundred spectators, while the larger could accommodate five thousand.

Adjoining the theatres is a large rectangular enclosure, surrounded by a portico, at first the colonnade connected with the theatres, and converted, about the time of Nero, into the barracks of the gladiators, who were permanently maintained in the city with a view to the shows in the amphitheatre. This explains why it is so far from that building, which is situated at the south-eastern angle of the town, about 500 yds. from the theatres. Remains of gladiators' armour and weapons were found in some of the rooms, and in one, traces of the stocks used to confine insubordinate gladiators. The amphitheatre was erected by the same two magistrates who built the smaller theatre, C. Quinctius Valgus and M. Porcius (the former the father-in-law of that P. Servilius Rullus, in opposition to whose hill relating to the distribution of the public lands Cicero made his speech, De lege agraria), at a period when no permanent edifice of a similar kind had yet been erected in Rome itself, and is indeed the oldest structure of the kind known to us. But apart from its early date it has no special interest, and is wholly wanting in external architectural decoration. It has the same general character as similar edifices in other instances. Being in great part excavated in the surface of the hill, instead of the seats being raised on arches, it is wanting also in the picturesque arched corridors which contribute so much to the effect of those other ruins. Nor are its dimensions (460 by 345 ft.) such as to place it in the first rank of structures of this class, nor are there any underground chambers below the arena, with devices for raising wild beasts, &c.

Adjoining the amphitheatre was found a large open space, nearly square in form, which has been supposed to be a forum boarium or cattle-market, but, no buildings of interest being discovered around it, the excavation was filled up again, and this part of the city has not been since examined. Between the entrance to the triangular forum (so-called) and the temple of Isis is the Palaestra, an area surrounded by a colonnade; it is a structure of the pre-Roman period, intended for boys, not men.

Among the more important public buildings of Pompeii were the public baths (thermae). The different establishments of this character have been discovered, of which the first, excavated in 1824, the baths near the forum, built about 80 B.C., was for a long time the only one known. Though the smallest of the three, it is in some respects the most complete and interesting; and it was until of late years the principal source from which we derived our knowledge of this important branch of the economy of Roman life. At Pompeii the baths are so well preserved as to show at a glance the purpose of all the different parts—while they are among the most richly decorated of all the buildings in the city. We trace without difficulty all the separate apartments that are described to us by Roman authors—the apodyterium, tepidarium, caldarium, &c., together with the apparatus for supplying both water and heat, the places for depositing the bather's clothes, and other minor details (see BATHS).

The greater thermes (the so-called "Stabian" baths), which were originally built in the 2nd century b.c., and repaired about 80 b.c., are on a much more extensive scale than the others, and combine with the special purposes of the building a palaestra in the centre and other apartments for exercise or recreation. The arrangements of the baths themselves are, however, almost similar to those of the lesser thermes. In this case an inscription records the repair and restoration of the edifice after the earthquake of 62.

The interest taken by the Pompeians in the sports of the amphitheatre is shown from the fragments of the paintings and scratched inscriptions relating to them which have been found in Pompeii—notice of combats, laudatory inscriptions, including even references to the admiration which gladiators won from the fair sex, &c.
POMPEII

earthquake of 62. It appears, however, that these two establishments were found inadequate to supply the wants of the inhabitants, and a third edifice of the same character, the so-called central baths, at the corner of the Strada Stabiana and the Strada di Nola, but on a still more extensive scale, intended for men only, while the other two had separate accommodation for both sexes, was in course of construction when the town was overwhelmed.

Great as is the interest attached to the various public buildings of Pompeii, and valuable as is the light that they have in some instances thrown upon similar edifices in other ruined cities, far more curious and interesting is the insight afforded us by the numerous private houses and shops into the ordinary life and habits of the population of an ancient town. The houses at Pompeii are generally low, rarely exceeding two storeys in height, and it appears certain that the upper storey was generally of a slight construction, and occupied by small rooms, serving as garrets, or sleeping places for slaves, and perhaps for the females of the family. From the mode of destruction of the city these upper floors were in most cases crushed in and destroyed, and hence it was long believed that the houses for the most part existed as one storey; but recent researches have shown many cases brought to light incontestable evidence of the existence of an upper floor, and the frequent occurrence of a small staircase is in itself sufficient proof of the fact. The windows, as already mentioned, were generally small and insignificant, and contributed nothing to the external decoration or effect of the houses, which took both light and air from the inside, not from the outside. In some cases they were undoubtedly closed with glass, but its use appears to have been by no means general.

The principal living rooms, as well as those intended for the reception of guests or clients, were all on the ground floor, the centre being formed by the atrium, or hall, which was always open above to the air, and in the larger houses was generally surrounded with columns. Into this opened other rooms, the entrances to which seem to have been rarely protected by doors, and could only have been closed by curtains. At the back was a garden. Later, under Greek influences, a peristylium with rooms round it was added in place of the garden. We notice that, as in modern Italy until quite recent years, elaborate precautions were taken against heat, but none against cold, which was patiently endured. Hypocausts are only found in connexion with bathrooms.

All the apartments and arrangements described by Vitruvius and other ancient writers may be readily traced in the houses of Pompeii, and in many instances these have for the first time enabled us to understand the technical terms and details transmitted to us by Latin authors. We must not, however, hastily assume that the examples thus preserved to us by a singular accident are to be taken as representing the style of building in all the Roman and Italian towns. We know from Cicero that Capua was remarkable for its broad streets and widespread buildings, and it is probable that the Campanian towns in general partook of the same character. At Pompeii indeed the street was not wide, but they were straight and regular, and the houses of the better class occupied considerable spaces, presenting in this respect no doubt a striking contrast, not only with those of Rome itself, but with those of many other Italian towns, where the buildings would necessarily be huddled together from the circumstances of their position. Even at Pompeii itself, on the west side of the city, where the ground slopes somewhat steeply towards the sea, houses are found which consisted of three storeys or more.

The excavations have provided examples of houses of every description, from the humble dwelling-place of the artisan or proletarian, with only three or four small rooms, to the stately mansions of Sallust, of the Faun, of the Golden Cupids, of the Silver Wedding, of the Vetti, of Pansa, &c.—the last of which is among the most regular in plan, and may be taken as an almost perfect model of a complete Roman house of a superior class. But the general similarity in their plan and arrangement is very striking, and in all those that rise above a very humble class the leading divisions of the interior, the atrium, tablinum, peristylium, &c., may be traced with unfailing regularity. Another peculiarity that is found in all the more considerable houses in Pompeii is that of the front, where it faces one of the principal streets, being occupied with shops, usually of small size, and without any communication with the interior of the mansion. In a few instances indeed such a communication is found, but in these cases it is probable that the shop was used for the sale of articles grown upon the estate of the proprietor, such as wine, fruit, oil, &c., a practice that is still common in Italy. In general the shop had a very small apartment behind it, and probably in most cases a sleeping chamber above it, though of this the only remaining evidence is usually a portion of the staircase that led to this upper room. The front of the shop was open to the street, but was capable of being closed with wooden shutters, the remains of which have in a few instances been preserved.

Not only have the shops of silversmiths been recognized by the precious objects of that metal found in them, but large quantities of other wares have been preserved, in many instances even the original moulds. Pottery, sestertii, sestertii, wax-letters, inscriptions of corn and pulse, leaves of bread, moulds for pastry, fishing-nets and many other objects too numerous to mention, have been found in such a condition as to be identified without difficulty. Inns and wine-shops appear to have been numerous; one of the latter we can see to have been a thermeopolium, where hot drinks were sold. Bakers' shops are also frequent, though arrangements for grinding and baking appear to have formed part of every large family establishment. In other cases, however, these were on a larger scale, provided with numerous querns or hand-mills of the well-known form, evidently intended for public supply. Another establishment on a large scale was a fullonica (fuller's shop), where all the details of the business were illustrated by paintings still visible on the walls. Dyers' shops, a tannery and a shop where colours were ground and manufactured—an important business where almost all the rooms of every house were painted—are of special interest, as is also the house of a surgeon, where numerous surgical instruments were found, some of them of a very ingenious and elaborate description, but all made of bronze. Another curious discovery was that of the abode of a sculptor, containing his tools, as well as blocks of marble and half-finished statues. The number of utensils of various kinds found in the houses of Pompeii is almost endless, and, as these are in most cases of bronze, they are generally in perfect preservation.

Of the numerous works of art discovered in the course of the excavations the statues and large works of sculpture, whether in marble or bronze, are inferior to those found at Herculaneum, but some of the bronze statuettes are of exquisite workmanship, while the profusion of ornamental works and objects in bronze and the elegance of their design, as well as the finished beauty of their execution, are such as to excite the utmost admiration—more especially when it is considered that these are the casual results of the examination of a second-rate provincial town, which had, further, been ransacked for valuables (as Herculaneum had not) after the eruption of 79. The same impression is produced in a still higher degree by the paintings with which the walls of the private houses, as well as those of the temples and other public buildings, are adorned, and which are not merely of a decorative character, but in many instances present us with elaborate compositions of figures, historical and mythological scenes, as well as representations of the ordinary life and manners of the people, which are full of interest to us, though often of inferior artistic execution. It has until lately been the practice to remove these to the museum at Naples; but the present tendency is to leave them (and even the movable objects found in the houses) in situ with all due precautions as to their preservation (as in the house of the Vetti, of the Silver Wedding, of the Golden Cupids, &c.), which adds immensely to the interest of the houses; indeed, with the help of judicious restoration, their original condition is in large
measure reproduced. In some cases it has even been possible to recover the original arrangement of the garden beds, and to replant them accordingly, thus giving an appropriate framework to the statues, &c. with which the gardens were decorated, and which have been found in situ. The same character of elaborate decoration, guided almost uniformly by good taste and artistic feeling, is displayed in the mosaic pavements, which in all but the humbler class of houses frequently form the ornament of their floors. One of these, in the House of the Faun, well known as the battle of Alexander, presents us with the most striking specimen of artistic composition that has been preserved to us from antiquity.

The architecture of Pompeii must be regarded as presenting in general a transitional character from the pure Greek style to that of the Roman Empire. The temples (as already observed) have always the Roman peculiarity of being raised on a podium of considerable elevation; and the same characteristic is found in most of the other public buildings. All the three orders of Greek architecture—the Doric, Ionic and Corinthian—are found freely employed in the various edifices of the city, but rarely in strict accordance with the rules of art in their proportions and details; while the private houses naturally exhibit still more the extravagance of the Roman taste. We find varieties in the ornamentation, and even in such leading features as the capitals of the columns, which remind one rather of the vagaries of medieval architecture than of the strict rules of Vitruvius or the regularity of Greek edifices. One practice which is especially prevalent, so as to strike every casual visitor, and dates from the early years of the Empire, is that of filling up the flutings of the columns for about one-third of their height with a thick coat of stucco, so as to give them the appearance of being smooth columns without flutings below, and only fluted above. The unpleasing effect of this anomalous arrangement is greatly aggravated by the lower part of each column being almost always of red with yellow ochre, so as to render the contrast between the two portions still stronger.

The architecture of Pompeii suffers also from the inferior quality of the materials generally employed. No good building stone was at hand; and the public as well as private edifices were constructed either of tufa, or lava, or Sarno limestone, or brick (the latter only used for the corners of walls). In the private houses even the columns are mostly of brick, covered merely with a coat of stucco. In a few instances only do we find them making use of a whitish limestone wrongly called travertine, which, though inferior to the similar material so largely employed at Rome, was better adapted than the ordinary tufa for purposes where great solidity was required. The portion of the portico surrounding the forum which was in the process of rebuilding at the time when the city was destroyed was constructed of this material, while the earlier portions, as well as the principal temples that adjoined it, were composed in the ordinary manner of volcanic tufa. Marble appears to have been scarce, and was sparingly employed. In some instances where it had been freely introduced, as in the great theatre, it would seem that the slabs must have been removed at a period subsequent to the entombment of the city.

These materials are used in several different styles of construction belonging to the six different periods which Mau traces in the architectural history of Pompeii. 1.

1. That of the Doric temple in the Foro Triangolare (6th century B.C.) and an old column built into a house in Region vii, Insula 5; also of the older parts of the city walls—date uncertain (Sarno limestone and grey tufa).

2. Numerous atriums (outer walls of the houses of ashlar-work of Sarno limestone, inner walls with framework of limestone blocks, filled in with small pieces of limestone). Date, between the first and second centuries B.C.

3. Grey tufa period; ashlar masonry of tufa, coated with fine white stucco; rubble work of lava. The artistic character is still Greek, and the period coincides with the first (incrustation) style of mural decoration, which (probably originating in Alexandria) aimed at

1. The paintings of the house of the Vetti are perhaps the best-preserved in Pompeii, and extremely fine in conception and execution, especially the scenes in which Cupids take part.

The imitation in stucco of the appearance of a wall veneered with coloured marbles. No wall paintings exist, but there are often fine floor mosaics. To this belong a number of private houses in the case of the temples, and the basilica, the temples of Apollo and Jupiter, the large theatre with the colonnades of the Foro Triangolare, and the barracks of the gladiators, the Stabian baths, the Palaestra, the exterior of the Commodian amphitheatre, and the Temple of Venus and Roma. The public buildings indeed (except the Doric temple mentioned under 1) which do not belong to the time of the Roman colony.

Date, 28 B.C. and 27 B.C.

4. The "quasi-reticulate" period—walling faced with mosaic not yet quite so regular as opus reticulatum, and with brick quoin, coinciding with the second period of decoration (the architectural, and the period between being more difficult to determine (by colour only, and partly making use of architectural designs). It is represented by the small theatre and the amphitheatre, the baths near the forum, the temple of Zeus Milichius, the Comitium (temporal temple only), and the Arch of Germanicus. The ornamentation is much less rich and beautiful than that of the preceding period. Date, from 80 B.C. until nearly the end of the Republican period.

5. The period from the last decades of the Republic to the earthquake of A.D. 63. No homogeneous series of buildings—we find various styles of construction (quasi-reticulate, opus reticulatum of tufa with stone quoins, of the time of Augustus, opus reticulatum with brick quoin or with milled stone and brick quoin, at a later time); and three styles of wall decoration fall within its limits. The second, already mentioned, the third or ornate, with its free treatment of ornament and its arrangement of decorative panels, has an Egyptian origin (originating in the time of Augustus), and the fourth or intricate, dating from about A.D. 50. Marble first appears as a building material in the temple of Fortuna Augusta (c. 3 B.C.). The walls from the point of destruction of the city, the buildings of which can easily be recognized. The only wholly new edifice of any importance is the central baths. Outside the Porta Ercolanese, or gate leading to Herculaneum, is found a house of a different character from all the others, which from its extent and arrangement was undoubtedly a suburban villa, belonging to a person of considerable fortune. It is called—as usual without any authority—the villa of Arius Diomedes; it is very celebrated for the interior decoration, and is remarkable with the numerous ruins of similar buildings which occur elsewhere—often of greater extent, but in a much less perfect state of preservation. But—belonging to the description of ancient authors, such as Vitruvius and Pliny, and the numerous appurtenances frequently annexed to houses of this description.

In the cella of this villa were discovered no less than twenty skeletons of the unfortunate inhabitants, who had evidently fled thither for protection, and fourteen in other parts of the house. Almost all the skeletons and remains of bodies found in the city were discovered in similar situations, in cellars or underground passages, whose roof had caved in; having apparently for the most part escaped from destruction, or having been covered under circumstances where their bodies were easily recovered by the survivors. According to Cassius Dio, a large number of the inhabitants, whose houses were at the time of the eruption either burnt or destroyed, but no bodies have been found there, and they were probably sought for and removed shortly afterwards. Of late years it has been found possible in many cases to take casts of the bodies found—a method which could not have been formed by them by the fine white ashes, partially consolidated by water.

An interesting farm-house (few examples have been so far discovered in Italy) is that at Boscoreale excavated in 1893-1894, which contained the treasure of one hundred and three silver vases now at the Louvre. The villa of P. Fannius Svinthor, not far off, was excavated in 1900; it contained fine wall paintings, which, despite their importance, were allowed to be exported, and sold by auction at the Paris Salons of 1901. (See also P. Fannius Svinthor, La Villa pompeiana di P. Fannius Svinthor; Rome, 1901.)

The road leading from the Porta Ercolanese towards Herculaneum is bordered on both sides for a considerable extent by rows of tombs, as was the case with all the great roads leading into and out of all large Roman towns. These tombs are in many instances monuments of considerable pretension, and of a highly ornamental character, and naturally present in the highest degree the peculiar advantages of Roman sepulchral arrangement and preservation. Hardly any scene even in this extraordinary city is more striking than the coup d'ail of this long street of tombs, on the Braconcello, in the district of Minucial. The constructions are eighteen centuries ago. Unfortunately the names are all otherwise unknown; but we learn from the inscriptions that they are for the most part those of local magistrates and municipal dignitaries of Pompeii. Most of them belong to the first or second century B.C.

There appears to have been in the same quarter a considerable suburb, outside the gate, extending on each side of the road towards Herculaneum, apparently much resembling those which are now found throughout almost the whole distance from the Porta Ercolanese to Naples. It was known by the name of Pagus Augustus Felix
POMPEY

he took the side of Sulla against Marius and Cinna, but for a time, in consequence of the success of the Marians, he kept in the background.

On the return of Sulla from the Mithradatic War Pompey joined him with an army of three legions, which he had raised in Picenum.

Thus early in life he connected himself with the cause of the aristocracy, and a decisive victory which he won in 83 over the Marian armies gained for him from Sulla the title of Imperator.

He followed up his successes in Italy by defeating the Marians in Sicily and Africa, and on his return to Rome in 81, though he was still merely an aequus and not legally qualified to celebrate a triumph, he was allowed by Sulla's consent to enjoy this distinction, while Sulla bestowed upon him with the surname of Magnus, a title he always retained and handed down to his sons.

Latterly, his relations with Sulla were somewhat strained, but after his death he resisted the attempt of the consul M. Aemilius Lepidus to repeat the constitution.

In conjunction with A. Lutatius Catulus, the other consul, he defeated Lepidus when he tried to march upon Rome, and drove him out of Italy (77).

With some fears and misgivings the senate permitted him to retain the command of his victorious army, and decided on sending him to Spain, where the Marian party under Sertorius was still formidable.

Pompey was fighting in Spain from 76 to 71, and after his first serious reverses he was ultimately successful.

After Sertorius had fallen a victim to assassination, Pompey easily defeated his successor Perperna and put an end to the war.

In 71 he won fresh glory by finally crushing the slave insurrection of Spartacus.

That same year, amid great popular enthusiasm, but without the hearty concurrence of the senate, whom he had alarmed by talking of restoring the dreaded power of the tribunes, he was elected with M. Licinius Crassus to the consulship, and entered Rome in triumph (December 31) for his Spanish victories.

He was legally ineligible for the consulship, having held none of the lower offices of State and being under age.

The following year saw the work of Sulla undone; the tribunate was restored, and the administration of justice was no longer left exclusively to the senate, but was to be shared by it with the wealthier portion of the middle class, the equites (q.v.), and the tribuni acerarii.

The change was really necessary, as the provincials could never get justice from a court composed of senators, and it was carried into effect by Pompey with Caesar's aid.

Pompey rose still higher in popularity, and on the motion of the tribune Aulus Gabinius in 67 he entered Rome with an extraordinary command over the greater part of the empire, specially for the extermination of piracy in the Mediterranean, by which the corn supplies of Rome were seriously endangered, while the high prices of provisions caused great distress.

He was completely successful; the price of corn fell immediately on his appointment, and in forty days the Mediterranean was cleared of the pirates.

Next year, on the proposal of the tribune Manilius, his powers were still further extended, the care of all the provinces in the East being put under his control for three years together with the conduct of the war against Mithradates VI., who had recovered from the defeats he had sustained from Lucullus and repaid his dominions.

Both Caesar and Cicero supported the tribe's proposal, which was easily carried in spite of the interested opposition of the senate and the aristocracy, several of whom held provinces which would now be practically under Pompey's command.

The result of Pompey's operations was eminently satisfactory.

The wild tribes of the Caucasus were cowed by the Roman arms, and Mithradates himself fled across the Black Sea to Ponticcaepaeum (modern Kerch). In the years 64 and 63 Syria and Palestine were annexed to Rome's empire.

After the capture of Jerusalem Pompey is said to have entered the Temple, and even the Holy of Holies. Asia and the East generally were left under the subjection of petty kings who were mere vassals of Rome.

Several cities had been founded which became centres of Greek life and civilization.

Pompey, now in his forty-fifth year, returned to Italy in 61 to take the title of P. Pompey the Great.
celebrate the most magnificent triumph which Rome had ever witnessed, as the conqueror of Spain, Africa, and Asia (see A. Holm, *Hist. of Greece*, Eng. trans., vol. iv.). This triumph marked the turning-point of his career. As a soldier everything had gone well with him, as a politician he was a failure. He found a great change in public opinion, and the people indifferent to his achievements abroad. The optimates resented the extraordinary powers that had been conferred upon him; Lucullus and Crassus considered that they had been robbed of him by the honour of concluding the war against Mithradates. The senate refused to ratify the arrangements he made in Asia or to provide money and lands for distribution amongst his veterans. In these circumstances he drew closer to Caesar on his return from Spain, and became reconciled to Crassus. The result was the so-called first triumvirate (see *Rome: History*). But the remainder of the year was spent in the interference of Pompey, who was gradually losing the confidence of all political parties in Rome. The senate and the aristocracy disliked and distrusted him, but they felt that, should things come to the worst, they might still find in him a champion of their cause. Hence the joint rule of Pompey and Caesar was not unwillingly accepted, and anything like a rupture between the two was greatly dreaded as the sure beginning of anarchy throughout the Roman world. With the deaths of Pompey's wife Julia (54) and of Crassus (53) the relations between him and Caesar became strained, and soon afterwards he drew closer to what we may call the old conservative party in the senate and aristocracy. The end was now near, and Pompey blundered into a false political position and an open quarrel with Caesar. In 50 the senate by a very large majority revoked the extraordinary powers conceded to Pompey and Caesar in Spain and Gaul respectively, and called upon them to disband their armies. Pompey's refusal to submit gave Caesar a good pretext for declaring war and marching at the head of his army into Italy. At the beginning of the contest the advantages were decidedly on the side of Pompey, but the superior political tact of his rival, combined with extraordinary promptitude and decision in pressing up his blows, soon turned the scale against him. Pompey's cause, with that of the senate and aristocracy, was finally ruined by his defeat in 48 in the neighbourhood of the Thessalian city Pharsalus. That same year he fled with the hope of finding a safe refuge in Egypt, but was treacherously murdered by one of his old centurions as he was landing. He was five times married, and three of his children survived him—Gnaeus, Sextus, and a daughter Pompea.

Pompey, though he had some great and good qualities, hardly deserved his surname of "the Great." He was certainly a very good soldier, and is said to have excelled in all athletic exercises, but he fell short of being a first-rate general. He won great successes in Spain and more especially in the East, but for these he was no doubt partly indebted to what others had already done. Of the gifts which make a good statesman he had really none. As plainly appeared in the last years of his life, he was too weak and irresolute to choose a side and stand by it. But to his credit be it said that in a corrupt time he never used his opportunities for plunder and extortion, and his domestic life was pure and simple.

**Authorities.**

*Antiquitates* of Plutarch; *Pompey* of Dio Cassius; Appian; *Velleius Paterculus*; *De bello civili*; *Strabo* xlii. 555-560; Cicero, *passim*; Lucan, *Pharsalia*.

*Modern.* *Histories* of Rome in general (see *Rome: Ancient History, ad fin.*); works quoted under *Caesar* and *Cicero*. Also G. Boissier, *Cicero and His Friends* (Eng. trans. A. D. Jones, 1897); J. C. de Suidan-Debosis, *Cicero* (1804); Cicero (1892); C. W. Oman, *Seven Roman Statesmen of the Later Republic* (1902); notes in Tyrrell and Purseil's *Correspondence of Cicero* (see index in vii. 80).

2. **Gnaeus Pompeius,** surnamed *Strabo* (squat-eyed), Roman statesman, father of the triumvir. He was successively *quaestor* in Sardinia (103 B.C.), *praetor* (94), *propraetor* in Sicily (93) and consul (89). He fought with success in the Social War, and was awarded a triumph for his services. Probably towards the end of the same year he brought forward the law ("lex Pompeia de Gallia Transpadana"), which conferred upon the inhabitants of that region the privileges granted to the Latin colonies. During the civil war between Marius and Sulla he seems to have shown no desire to attach himself definitely to either side. He certainly set out for Rome from the south of Italy (where he remained as proconsul) at the bidding of the aristocratic party, when the city was threatened by Marius and Cinna, but he displayed little energy, and the engagement which he fought before the Colline gate, although hotly contested, was indecisive. Soon afterwards he was killed by lightning (87). Although he possessed great military talents, Pompeius was the best-hated general of his time—owing to his cruelty, avarice and perfidy. His body was dragged from the bier, while being conveyed to the funeral pile, and treated with the greatest indignity.

See Plutarch, *Pompey*, i; Appian, *Bell. civ.*, i. 50, 52, 66-68, 80; Vell. Pat. ii. 21; Livy, *Epl.* 74-79; Florus iii. 18.

3. **Gnaeus Pompeius Magnus** (c. 75-45 B.C.), the elder son of the triumvir. In 48 B.C. during the civil war he commanded his father's fleet in the Adriatic. After the battle of Pharsalus he set out for Africa with the remainder of the Pompeian party, but, meeting with little success, crossed over to Spain. Having joined his brother Sextus, he collected a considerable army, the numbers of which were increased by many Punicians who fled from Africa after the battle of Thapsus (46). Caesar, who regarded him as a formidable opponent, set out against him in person. A battle took place at Munda on the 17th of March 45, in which the brothers were defeated. Gnaeus managed to make his escape after the engagement, but was soon (April 12) captured and put to death. He was generally unpopular owing to his cruelty and violent temper.

4. **Sextus Pompeius Magnus** (75-35 B.C.), the younger son of the triumvir. After his father's death he continued the struggle against the new rulers of the Roman Empire. From Cyprus, where he had taken refuge, he made his way to Africa, and after the defeat of the Pompeians at Thapsus (46) crossed over to Spain. After Caesar's victory at the battle of Munda (45), in which he took no actual part, he abandoned Corduba (Cordova), though for a time he held his ground in the south, and defeated Asinius Pollio, the governor of the province. In 43, the year of the triumvirate of Octavius, Antony, and Lepidus, he was proscribed along with the murderers of Caesar, and, not daring to show himself in Italy, he put himself at the head of a fleet manned chiefly by slaves or proscribed persons, with which he made himself master of Sicily, and from thence ravaged the coasts of Italy. Rome was threatened with a famine, as the corn supplies from Egypt and Africa were cut off by his ships, and it was thought prudent to negotiate a peace (in 40, at Misenum, 90), which was to leave him in possession of Sicily, Sardinia and Achaea, provided he would allow Italy to be freely supplied with corn. But the arrangement could not be carried into effect, as Sextus renewed the war and gained some considerable successes at sea. However, in 36 his fleet was defeated and destroyed by Agrippa at Nauculloss off the north coast of Sicily. After his defeat he fled to Mytilene, and from there to Asia Minor. In the attempt to make his way to Armenia he was taken prisoner by Antony's troops, and put to death at Miletus. Like his father, he was a brave soldier, but a man of little culture.
POMPIGNAN—POMPITE MARSHES

See Diod. Cassius, xvi-xlix.; Appian, Bell. civ. iv. 83-117, v. 2-143; Vell. Pat. ii. 73-87; Plutarch, Antony; Livy, Epit. 123, 128, 129, 131; Cicero, Philippica, xiii., and many references in Letters to Atticus.

POMPIGNAN, JEAN JACQUES LEFRANC, MARQUIS DE (1700-1784), French poet, was born on the 17th of August 1700, at Montauban, where his father was president of the cour des aides, and the son, who also followed the profession of the law, succeeded in 1745 to the same charge. The same year he was also appointed conseiller d'honneur of the parlement of Toulouse, but his courageous opposition to the abuses of the royal power, especially in the matter of taxation, brought down upon him so much vexation that he resigned his positions almost immediately, his marriage with a rich woman enabling him to devote himself to literature. His first play, Didon (1734), which owed much to Metastasio's opera on the same subject, gained a great success, and gave rise to expectations not fulfilled by the Adieux de Mars (1735) and some light operas that followed. His reputation was made by Poésies sacrées et philosophiques (1734), much mocked by Voltaire who penned on the title: "Sacrèst ils sont, car personne n'y touche." Lefranc's odes on profane subjects hardly reached the same level, with the exception of the ode on the death of J. B. Rousseau, which secured him entrance to the Academy (1760). On his reception he made an ill-considered oration violently attacking the Encyclopaedists, many of whom were in his audience and had given him their votes. Lefranc soon had reason to repent of his rashness, for the epigrams and stories circulated by those whom he had attacked made it impossible for him to remain in Paris, and he took refuge in his native town, where he spent the rest of his life occupied in making numerous translations from the classics, none of great merit.

La Harpe, who is severe enough on Lefranc in his correspondance, does his abilities full justice in his Cours littéraire, and ranks him next to J. B. Rousseau among French lyric poets. With those of other 18th-century poets his works may be studied in the Petits poètes françois, ed. by M. Prosper Poitevin. His Œuvres complètes (4 vols.) were published in 1791, selections (2 vols.) in 1800, 1813, 1822.

His brother, JEAN GEORGES LEFRANC DE POMPIGNAN (1715-1750), was the archbishop of Vienne against whose defence of the faith Voltaire launched the good-natured mockery of Les Lettres d'un Quaker. Elected to the Estates General, he passed over to the latter and led the 149 members of the clergy who united with the third estate and the National Assembly. He was one of its first presidents, and was minister of public worship when the civil constitution was forced upon the clergy.

POMPONAZZI, PIETRO (PETRUS POMPOZATIUS) (1462-1525), Italian philosopher, was born at Mantua on the 26th of September 1462, and died at Bologna on the 18th of May 1525. His education, begun at Mantua, was completed at Padua, where he became doctor of medicine in 1487. In 1488 he was elected extraordinary professor of philosophy at Padua, where he was a colleague of Achillini, the Averroist. From 1495 to 1509 he occupied the chair of natural philosophy until the closing of the schools of Padua, when he took a professorship at Ferrara where he lectured on the De anima. In 1512 he was invited to Bologna where he remained till his death and where he produced all his important works. The predominance of medical science at Padua had cramped his energies, but at Ferrara, and even more at Bologna, the study of psychology and theological speculation were more important. In 1516 he produced his great work De immortalitate animi, which gave rise to a storm of controversy between the orthodox Thomists of the Catholic Church, the Averroists headed by Agostino Nifo, and the so-called Alexandrist School. The treatise was burned at Venice, and Pomponazzi himself ran serious risk of death at the hands of the Catholics. Two pamphlets followed, the Apologia and the Defensorium, wherein he explained his paradoxes, which were, Catholic and philosophical materialist. His last two treatises, the De incubationibus and the De fate, were posthumously published in an edition of his works printed at Basel.

Pomponazzi is profoundly interesting as the herald of the Renaissance. He was born in the period of transition when scholastic formalism was losing its hold over men both in the Church and outside. Hitherto the dogma of the Church had been based on Aristotle as interpreted by Thomas Aquinas. Somewhere was this identification that any attack on Aristotle, or even the attempt to reopen the old discussions on the Aristotelian problems, was regarded as a dangerous heresy. Pomponazzi claimed the right to study Aristotle for himself, and devoted himself to the De anima with the view of showing that Thomas Aquinas had entirely misconceived the Aristotelian theory of the active and the passive intellect. The Averroists had to some extent anticipated this attitude by their contention that immortality does not imply the eternal separate existence of the individual soul, that the active principle which is common to all men alone survives. Pomponazzi's revolt went further than this. He held, with Alexander of Aprodisias, that, as the soul is the form of the body (as Aquinas also asserted), it must, by hypothesis, perish with the body; form apart from matter is unthinkable. The ethical consequence of such a view is important, and in radical contrast to the practice of the period. Virtue can no longer be viewed solely in relation to reward and punishment in another existence. A new sanction is required. Pomponazzi found this criterion in τοῦ καλοῦ ένεκα—virtue for its own sake. "Praemium essentiale virtutis est ipsam virtut quae hominem felicem facit," he says in the De immortalitate. Consequently, whether or not the soul be immortal, the ethical criterion remains the same: "Neque aliquo pacto declinandum est una virtut quicquid accidat post mortem." In spite of this philosophical materialism, Pomponazzi declared his adherence to the Catholic faith, and thus established the principle that religion and philosophy, faith and knowledge, may be diametrically opposed and yet coexist for the same thinker. This curious paradox he exemplifies in the De incanta- tione, where in one breath he sums up against the existence of demons and spirits on the basis of the Aristotelian theory of the cosmos, and, as a believing Christian, asserts his faith in their existence. In this work he insists emphatically upon the orderly sequence of nature, cause and effect. Men grow to maturity and then decay; so religions have their day and succumb. Even Christianity, he added (with the usual proviso that he is speaking as a philosopher) was showing indications of decline.

POMPONIUS, LUCIUS, called Bononiensis from his birthplace Bononia, Latin comic poet, flourished about 30 B.C. (or earlier). He was the first to give an artistic form to the Atellane Fabulae by arranging beforehand the details of the plot which had hitherto been left to improvisation, and providing a written text. The fragments show fondness for alliteration and playing upon words, skill in the use of rustic and farcical language, and a considerable amount of obscenity.

Fragments in O. Ribbe, Scectae romanorum poesis fragmenta (1897-1898); see Mommsen, Hist. of Rome (Eng. tr.), bk. iv. ch. 13; Teuffel-Schwabe, Hist. of Roman Literature (Eng. tr.), § 131.

POMPOSA, an abbey of Emilia, Italy, in the province of Ferrara, 2 m. from Codigoro, which is 50 m. E. of Ferrara in the delta of the Po. The fine church, a work of the 10th (?) century, with interesting sculptures on the façade and a splendid Romanesque campanile, contains a good mosaic pavement, and interest- ing frescoes of the 14th century. The "Last Judgment" of the school of Giotto and others; and there are also paintings in the refectory. It was abandoned in 1550 on account of malaria.

See G. Agnelli, Ferrara e Pompasa (Bergamo, 1902). (T. As.)

POMPITINE MARSHES, a low tract of land in the province of Rome, Italy, varying in breadth between the Volscian mountains and the sea from 10 to 15 m., and extending N.W. to S.E. from
Vellutini to Terracina (40 m.). In ancient days this low tract was fertile and well-cultivated, and contained several prosperous cities (Suessa Pomatia, Liburiae—perhaps the mod. Cisterna &c.), but, owing to the dying out of the small proprietors, it had already become unhealthy at the end of the Republican period. Attempts to drain the marshes and make them productive by Claudius I. (312 B.C.) when he constructed the Via Appia through them (the road having previously followed a devious course at the foot of the Volscian mountains), and at various times during the Roman period. A canal ran through them parallel to the road, and for some reason that is not altogether clear it was used in preference to the road during the Augustan period. Trajan repaired the road, and Theodoric did the same some four hundred years later. But in the middle ages it had fallen into disrepair. Popes Boniface VIII, Martin V., Sixtus V., and Pius VI. all attempted to solve the problem, the last-named reconstructing the road admirably. The difficulty arises from the lack of fall in the soil, some parts no less than 10 m. from the coast being barely above sea-level, while they are separated from the sea by a series of sand-hills now covered with forest, which rise at some points over 100 ft. above sea-level. Springs also rise in the district, and the problem is further complicated by the flood-water and solid matter brought down by the mountain torrents, which choke up the channels made. By a law passed in 1899, the proprietors are bound to arrange for the sale out of the water from the mountains, keep the existing canals open, and reclaim the district exposed to inundation, within a period of twenty-four years. The sum of £280,000 has been granted towards the expense by the government.

See T. Beri, Paludi panimine (Rome, 1884); R. de la Blanchère, Un Chapitre d'histoire panimine (Paris, 1889).

PONANI, a seaport on the west coast of India, in Malabar district, Madras, at a mouth of a river of the same name. Pop. (1901), 10,562. It is the headquarters of the Moplah or Mappilla community of Mahomedans, with a religious college and many mosques, one of which is said to date from 1510. There is a large export of coco-nut products.

PONCA, a tribe of North-American Indians of Siouan stock. They were originally part of the Omaha tribe, whom they lived near the Red River of the North. They were driven westward by the Dakotas, and halted on the Ponce river, Dakota. After a succession of treaties and removals they were placed on a reservation at the mouth of the Niobrara, where they were prospering, when their lands were forcibly taken from them, and they were removed to Indian Territory (Oklahoma). During the march thither and in their new quarters, the tribe's health suffered, so that in 1878 they revolted and made their way back to the Omahas. They were recaptured, but public attention having been drawn to their hard case they were liberalized in 1886, after a long trial, which resulted in their being declared United States citizens. They number some 700, mostly in Oklahoma.

PONE, a seaport and the second largest city of Porto Rico, the seat of government of the Department of Ponce, on the south coast, about 50 m. (34 m. by the military road) S.W. of San Juan. Pop. (1890), 27,052, of whom 2554 were negroes and 9042 of mixed races; (1910), 25,027. It is served by the American Railroad of Porto Rico, by a railway to Guayama (1910), and by steamboats from numerous ports; an old military road connects it with San Juan. Ponce consists of two parts: Ponce, or the city proper, and Ponce Playa, or the seaport; they are separated by the Portuguese River and are connected by an electric street railway. Ponce Playa is on a spacious bay and is accessible to vessels drawing 25 ft. of water; Ponce is 3 m. inland at the interior margin of a beautiful plain, with hills in the rear rising to a height of 1000 to 2000 ft. The city is supplied with water by an aqueduct about 2 m. long. There are two attractive public squares in the heart of the city: Plaza Principal and Plaza de las Delicias. Among prominent public buildings are the city hall, the custom-house, the Pearl theatre; several churches—Roman Catholic (including a finely decorated cathedral) and Protestant; St. Luke's hospital and insane asylum, an asylum for the blind, a ladies' asylum, a home for the indigent and aged, and a military barracks. At the Quintana Baths near the city are thermal springs with medicinal properties. The surrounding country is devoted chiefly to the cultivation of sugar cane, tobacco, oranges and cane, and to the grazing of cattle. Among the manufactures are sugar, molasses, rum, and ice, and prepared coffee for the market. Ponce, named in honour of Ponce de Leon, was founded in 1752 upon the site of a settlement which had been established in the preceding century, was incorporated as a town in 1848, and was made a city in 1878.

PONELET, JEAN VICTOR (1788-1867), French mathematician and engineer, was born at Metz on the 1st of July 1788. From 1808 to 1810 he attended the École polytechnique, and afterwards, till 1812, the École d'application at Metz. He then became lieutenant of engineers, and took part in the battle of the Moselle, during which he was taken prisoner and was confined at Saratov on the Volga. It was during his imprisonment here that, "privé de toute espèce de livres et de secours, surtout distrair par les malheurs de ma patrie et les miens propres," as he himself puts it, he began his researches on projective geometry which led to his great treatise on that subject. This work, the Traité des propriétés projectives des figures, which was published in 1822 (2d ed., 2 vols. 1865-1866), is occupied with the investigation of the projective properties of figures (see GEOMETRY). This work entitles Poncelet to rank as one of the greatest of those who took part in the development of the subject. Among the most remarkable of his works is the Ménage de la géométrie. From 1815 to 1825 he was occupied with military engineering at Metz; and from 1825 to 1835 he was professor of mechanics at the École d'application there. In 1826, in his Mémoire sur les roues hydrauliques à aubes courbes, he brought forward improvements in the construction of water-wheels, which more than doubled their efficiency. In 1834 he became a member of the Académie; from 1838 to 1848 he was professor to the faculty of sciences at Paris, and from 1848 to 1850 commandant of the École polytechnique. At the London International Exhibition of 1851 he had charge of the department of machinery, and wrote a report on the machinery and tools on view at that exhibition. He died at Paris on the 23rd of December 1867.

See J. Bertrand, Éloge historique de Poncelet (Paris, 1875).

PONCHER, ÉTIENNE DE (1446-1524), French prelate and diplomatist. After studying law he was early provided with a prebend, and became councillor at the parlement of Paris in 1485 and president of the Chambre des Enquêtes in 1488. Elected bishop of Paris in 1503 at the instance of Louis XII., he was entrusted by the king with diplomatic missions in Germany and Italy. After being appointed chancellor of the duchy of Milan, during which he was taken prisoner and held at Milan in 1512, and retained that post until the accession of Francis I., he employed him on various diplomatic missions. Poncher became archbishop of Sens in 1519. His valuable Constitutions synodales was published in 1514.

PONCHIELLI, AMICARE (1834-1886), Italian musical composer, was born near Cremona on the 1st of September 1834. He studied at the Milan Conservatoire. His first dramatic work, written in collaboration with two other composers, was Il Sindaco Babbeo (1831). After completing his studies at Milan he returned to Cremona, where his opera I Promessi sposi was produced in 1836. This was followed by La Saragossa (1861, produced in a revised version as Lina in 1877), Roderigo, rò dei Gati (1864), and La Stella del mondo (1867). A revised version of I Promessi sposi, which was produced at Milan in 1872, was his first genuine success. After this came a ballet, Le Due Gemelle (1873), and an opera, I Lituanu (1874, produced in a revised version as Aliduna in 1884). Ponchielli reached the zenith of his fame with La Gioconda (1876), written to a libretto founded by Artigo Boito upon Victor Hugo's tragedy, Angelo, Tyron de Padoue. La Gioconda was followed by Il Figliuol prodigo (1880) and Marion Delorme (1885). Among his less
important works are Il Parlato clelerno, a musical farce (1875), and a ballet, Clarina (1875). In 1881 Ponchielli was made maestro di cappella of Piacenza Cathedral. His music shows the influence of Verdi, but at its best it has a distinct value of its own, and an inexhaustible flow of typically Italian melody. His fondness for fanciful figures in his accompaniments has been slavishly imitated by Mascagni, Leoncavallo, and many of their contemporaries. Ponchielli died at Milan on the 17th of January 1886.

**PONCHO** (a South American Spanish word, adopted from the Araucanian poncho or poncho in the 17th century), a form of cloak worn originally by the South American Indians, and afterwards adopted by the Spaniards living in South America. It is merely a long strip of cloth, doubled, with a hole for the head.

**POND, JOHN** (c. 1767-1836), English astronomer-royal, was born about 1767 in London, where his father made a fortune in trade. He entered Trinity College, Cambridge, at the age of sixteen, but took no degree, his course being interrupted by severe pulmonary attacks which compelled a long residence abroad. In 1800 he settled at Westminster near Bristol, and began to determine star-places with a fine altitude and azimuth circle of 2½ ft. diameter by E. Troughton. His demonstration in 1806 (Phil. Trans. xcvii. 420) of a change of form in the Greenwich mural quadrant led to the introduction of astronomical circles at the Royal Observatory, and to his own appointment as its head. He was elected a fellow of the Royal Society on the 26th of February 1807; he married and went to live in London in the same year, and in 1811 succeeded Maskelyne as astronomer-royal.

During an administration of nearly twenty-five years Pond effected a reform of practical astronomy in England comparable to that effected by Bessel in Germany. In 1821 he began to employ the method of observation by reflection; and in 1825 he devised means (see Mem. Roy. Astron. Soc. ii. 490) of combining two mural circles in the determination of the place of a single object, the one serving for direct and the other for reflected vision. Under his auspices the instrumental equipment at Greenwich was completely changed, and the number of assistants increased from one to six. The superior accuracy of his determinations was attested by S. C. Chandler's discussion of them in 1828, in the course of his researches into the variations of latitude (Astron. Journ. Nos. 313, 315). He persistently contorted (1810-1824) the reality of J. Brinkley's imaginary star-parallaxes (Phil. Trans. cviii. 477, cxvi. 53). Delicacy of health compelled his retirement in the autumn of 1835. He died at Blackheath on the 7th of September 1836, and was buried beside Halley in the churchyard of Lee. The Copley medal was conferred upon him in 1823, and the Lapland prize in 1817 by the Paris Academy, of which he was a corresponding member. He published eight folio volumes of Greenwich Observations, translated Laplace's Système du monde (in 2 vols. 8vo., 1800), and contributed thirty-one papers to scientific collections. His catalogue of 1172 stars (1833) was of great value.

**POND, a small pool or body of standing water, a word often applied to one for which the bed has been artificially constructed. This may be a variant of "pond" (q.v.), an enclosure.

**PONDCHERRY**, the capital of the French possessions in India, situated on the Coromandel or western coast, 122 m. by rail S. of Madras. The territory, which is entirely surrounded by the British district of South Arcot, has an area of 115 sq. m. with a population (1901) of 174,456. The chief crops are dry grains, rice, earth-nuts and a little indigo. The territory is traversed by a branch of the South Indian railway from Villapiram. The town has a population of 27,448. It is well laid out with fine public buildings; the water-supply is derived from artesian wells. It has an open roadstead, with a small iron pier. The port is visited yearly by 500 vessels, and has trade of the value of about $s,300,000. The principal imports are areca-nuts, wines and liquours, and the chief exports ground-nuts, oil, cotton fabrics and rice. Of the export trade more than one-half is with France, but of the import trade only one-fourth. The weaving of various fabrics forms the principal industry.

Pondicherry was founded in 1693 by François Martin, on the site of a village given him by the governor of Gingee. In 1693 the Dutch took Pondicherry, but restored it, with the fortifications greatly improved, in 1697, at the peace of Ryswick. In 1748 Admiral Boscawen laid siege to it without success, but in 1761 it was taken by Colonel Coote from Lally. In 1763 it was restored to the French. In 1778 it was again taken by Sir Hector Munro, and its fortifications destroyed. In 1783 it was retransferred to the French, and in 1793 recaptured by the English. The treaty of Amiens in 1802 restored it to the French, but it was retaken in 1806. In 1816 it was finally restored to the French.

**PONDO, a Kaffir people who have given their name to Pondo- land, the country comprising much of the seaboard of Kaffraria, Cape province, immediately to the south-west of Natal. The Pondo, who number about 200,000, are divided into several tribal groups, but the native government, since the annexation of the country to Cape Colony in 1824, has been subject to the control of the colonial authorities. (See KAFFERS.)**

**PONDOEWEED, a popular name for Potamogeton natans, a cosmopolitan aquatic plant found in ponds, lakes and ditches, with broad, more or less oblong-ovate, olive-green, floating leaves. The name is also applied to other species of Potamogeton, one of the characteristic genera of lakes, ponds and streams all over the world, but more abundant in temperate regions. It is the principal genus of the natural order of Monocotyledonous Potamogetonaceae, and contains plants with slender branched stems, and submerged and translucent, or floating and opaque, alternate or opposite leaves, often with membranous united stipules. The small flowers are borne above the water in axillary or terminal spikes; they have four stamens, which bear in the back four small herbaceous petal-like structures, and four free carpels, which ripen to form four small green fleshy fruits, each containing one seed within a hard inner coat; the seed contains a large hooked embryo. An allied genus Zannichellia (named after Zanichelli, a Venetian botanist), occurring in fresh and brackish ditches and pools in Britain, and also widely distributed in temperate and tropical regions, is known as horned pondweed, from the curved fruit.

**PONIARD, a dagger, particularly one of small size, used for stabbing at close quarters. The French word poignard, from
which the English is a 16th-century adaptation, is formed from *poing*, fist, the clenched hand in which the weapon is grasped. (See DAGGER.)

**PONIATOWSKI**, the name of a Polish princely family of Italian origin, tracing descent from Giuseppe Torelli, who married about 1630 an heiress of the Lithuanian family of Poniat, whose name he assumed.

The first of the Poniatiowskis to distinguish himself was Stanislaus Poniatiowski (1673-1762), who only belonged to the family by adoption, being the reputed son of Prince Sapieha and a Jewess. He was born at Dercyzyn in Lithuania, and was adopted by Sapieha's intendant, Poniatiowski. With his father he attached himself to the party of Stanislaus Leszczyński, and became major-general in the army of Charles XII of Sweden. After the defeat of Pultowa he conveyed Charles XII across the Dnieper, and remained with him at Bender. From there he was sent to Constantinople, where he extracted from the sultan Achmet III. a promise to march to Moscow. When the grand vizier, Battiagi Meherett, permitted the tsar Peter I. to retreat unharmed from the banks of the Pruth, Poniatiowski exposed his treason. He rejoined Leszczyński in the duchy of Zellebrücken, Bavaria, of which he became governor. After the death of Charles XII. in 1718 he visited Sweden; and was subsequently reconciled with Leszczyński's rival on the throne of Poland, Augustus II., who made him grand treasurer of Lithuania in 1724. On the death of Augustus II. he tried to secure the reinstatement of Leszczyński, who then resumed his claims to the Polish crown. He was taken prisoner at Danzig by the Russians, and presently gave his allegiance to Augustus III., by whom he was made governor of Cracow.

He died at Ryki on the 3rd of August 1762. His second son Stanislaus Augustus became king of Poland (see Stanislaus II.). Of the other sons, Casimir (1721-1789) was his brother's chancellor; Andrew (1735-1775) entered the Austrian service, rising to the rank of feldzeugmeister; and Michael (1736-1794) became archbishop of Gnesen and primate of Poland. Joseph Anthony Poniatiowski (q.v.), son of Andrew, became one of Napoleon's marshals.

Stanislaus Poniatiowski (1727-1830), son of Casimir, shared in the aggrandisement of the family during the reign of Stanislaus II., becoming grand treasurer of Lithuania, starost of Podolia and lieutenant-general of the royal army. In 1793 he settled in Vienna, and subsequently in Rome, where he made a magnificent collection of antique gems in his house on the Via Flaminia. This collection was sold at Christie's in London in May 1839. He died in Florence on the 13th of February 1833, and with him the Polish and Austrian honours became extinct.

His natural, but recognized, son, Joseph Michael Xavier Francis John Poniatiowski (1816-1873), was born at Rome and in 1847 was naturalized as a Tuscan subject. He received the title of prince in Tuscany (1847) and in Austria (1850). He received music under Czecchini at Florence, and wrote numerous operas, in the first of which, *Giovanni di Procida*, he sang the title rôle himself at Lucca in 1838. He represented the court of Tuscany in Paris from 1848, and he was made a senator by Napoleon III., whom he followed to England in 1871. His last opera, *Gelmania*, was produced at Covent Garden in 1872. He died on the 3rd of July 1873, and was buried at Chislehurst. His son, Prince Stanislaus Augustus, married and settled in Paris. He was equerry to Napoleon III., and died in January 1908.

**PONIATOWSKI, JOSEPH ANTHONY** (1763-1813), Polish prince and marshal of France, son of Andrew Poniatiowski and the countess Lesia Kinsky, was born at Warsaw in 1763. Adopting a military career, he joined the Imperial army when Austria declared war against the Turks in 1788, and distinguished himself at the storming of Sabac on the 25th of April, where he was seriously wounded. Recalled by his uncle King Stanislaus when the Polish army was reorganized, he received the rank of major-general, and subsequently that of lieutenant-general, and devoted himself zealously to the improvement of the national forces. In 1789, when Poland was threatened by the armed intervention of Russia, he was appointed commander of the Ukraine division at Bracław on Bug. After the proclamation of the constitution of the 3rd of May 1791 he was appointed commander-in-chief, with instructions to guard the banks of the Dnieper and Dniéper. On the outbreak of the war with Russia, Prince Joseph, aided Kosciusko, displayed great ability. Obliged constantly to retreat, but disposing every point of vantage, he turned on the pursuer whenever he pressed too closely, and won several notable victories. At Polonna the Russians were repulsed with the loss of 3000 men; at Dubienka the line of the Bug was defended for five days against fourfold odds; at Zielence the Poles won a still more signal victory. Finally the Polish arms converged upon Warsaw, and were preparing for a general engagement when a courier from the capital informed the generals that the king had acceded to the confederation of Targowica (see Poland: History) and had at the same time guaranteed the adherence of the army. All hostilities were therefore to be suspended. After an indignant but fruitless protest, Poniatiowski and most of the other generals threw up their commissions and emigrated. During the Kosciusko rising he again fought gallantly for his country under his former subordinate, and after the fall of the republic resided as a private citizen at Warsaw for the next ten years. After Jena and the evacuation of the Polish provinces by Prussia, Poniatiowski was offered the command of the National Guard; he set about reorganizing the Polish army, and on the creation of the grand duchy of Warsaw was nominated war minister. During the war of 1809, when an Austrian army corps under the archduke Ferdinand invaded the grand duchy, Poniatiowski encountered them at the bloody battle of Radzyń, and though compelled to abandon Warsaw ultimately forced the enemy to evacuate the grand duchy, and captured Cracow. In Napoleon's campaign against Russia in 1812 Poniatiowski commanded the fifth army corps; and after the disastrous retreat of the grand army, when many of the Poles began to waver in their allegiance to Napoleon, Poniatiowski remained faithful and formed a new Polish army of 13,000 men with which he joined the emperor at Lützen. In the campaign of 1813 he guarded the passes of the Bohemian mountains and defended the left bank of the Elbe. As a reward for his brilliant services at the three battles of Leipzig he was made a marshal of France and entrusted with the honourable but dangerous duty of covering the retreat of the army. Poniatiowski heroically defended Leipzig, losing half his corps in the attempt, finally falling back slowly upon the bridge over the Elster which the French in the general confusion blew up before he reached it. Contesting every step with the overwhelming forces of the pursuers, he refused to surrender, and covered with wounds plunged into the river, where he died fighting to the last. His relics were conveyed to Poland and buried in Cracow Cathedral, where he lies by the side of Tadeusz Kosciusko and Jan Sobieski. Poniatiowski's *Mes souvenirs sur la campagne de 1792* (Lemberg, 1863) is a valuable historical document.

**PONS, JEAN LOUIS** (1761-1831), French astronomer, was born at Peyres (Hautes Alpes) on the 24th of December 1761. He entered the Marseilles observatory in 1789, and in 1819 became the director of the new observatory at Marlia near Lucca, which he left in 1825 for the observatory of the museum at Florence. Here he died on the 14th of October 1831. Between 1801 and 1827 Pons discovered thirty-seven comets, one of which (observed on the 26th of November 1818) was named after J. F. Encke, who determined its remarkably short period.

PONSARD, FRANÇOIS (1845-1867), French dramatist, was born at Vienne, department of Isère, on the 1st of June 1845. He was bred a lawyer, and his first performance in literature was a translation of Manfred (1857). His play L'Horloge was represented at the Théâtre Français on the 1st of April 1845. This date is a kind of epoch in literature and dramatic history, because it marked a reaction against the romantic style of Dumas and Hugo. He received in 1845 the prize awarded by the Academy for a tragedy "to oppose a dike to the waves of romanticism." Ponsard adopted the liberty of the romantics with regard to the unities of time and place, but he reverted to the more sober style of earlier French drama. The tastes and capacities of the greatest tragic actress of the day, Rachel, suited his methods, and this contributed greatly to his own popularity. He followed up L'Horloge with Agios de Méronie (1846), Charlotte Corday (1850), and others. Ponsard accept imputation to them was no very great enthusiasm, and received the post of librarian to the senate, which, however, he soon resigned, fighting a bloodless duel with a journalist on the subject. L'Henner et l'argent, one of his most successful plays, was acted in 1833, and he became an Academician in 1835. For some years he did little, but in 1866 he obtained great success with Le Lion amoureux, another play dealing with the revolutionary epoch. His Galatée, which excited great opposition in the clerical camp, was produced early in 1867. He died in Paris on the 7th of July of the same year, soon after his nomination to the commandery of the Legion of Honour. Most of Ponsard's plays hold a certain steady level of literary and dramatic ability, but his popularity is in the main due to the fact that his appearance coincided with a certain public weariness of the extravagant and unequal style of 1830.

His Œuvres complètes were published in Paris (3 vols., 1865-1876). See La Fin du théâtre romantique et François Ponsard d'après des documents inédits (1899), by C. Latreille.

PONSONBY, JOHN (1713-1780), Irish politician, second son of Brabazon Ponsonby, 1st earl of Bessborough, was born on the 29th of March 1713. In 1730 he entered the Irish parliament and in 1744 he became first commissioner of the revenue; in 1746 he was appointed a privy councillor, and in 1756 Speaker of the Irish House of Commons. Belonging to one of the great families which at this time monopolized the government of Ireland, Ponsonby was one of the principal "undertakers," men who controlled the whole of the king's business in Ireland, and he retained the chief authority until the marquess Townshend became lord-lieutenant in 1767. Then followed a struggle for supremacy between the Ponsonby faction and the party dependent on Townshend, one result of this being that Ponsonby resigned the speakership in 1771. He died on the 10th of December 1780. His wife was Elizabeth, daughter of William Cavendish, 3rd duke of Devonshire, a connexion which was of great advantage to his son.

Ponsonby's third son, George Ponsonby (1755-1817), lord chancellor of Ireland, was born on the 4th of March 1755 and was educated at Trinity College, Cambridge. A barrister, he became a member of the Irish parliament in 1776 and was chancellor of the Irish exchequer in 1782, afterwards taking a prominent part in the debates on the question of Roman Catholic relief, and leading the opposition to the union of the parliaments. After 1800 Ponsonby represented Wicklow and then Tavistock in the united parliament; in 1806 he was lord chancellor of Ireland, and from 1808 to 1817 he was the official leader of the opposition in the House of Commons. He left an only daughter, whom he died in London on the 8th of July 1817. George Ponsonby's elder brother, William Brabazon Ponsonby, 1st Baron Ponsonby (1744-1856), was also a leading Whig politician, being a member of the Irish, and after 1800, of the British parliament. In 1806 shortly before his death he was created Baron Ponsonby of Imokilly. Three of his sons were men of note. The eldest was John (c. 1770-1855), who succeeded to the barony and was created a viscount in 1839; he was ambassador at Constantinople from 1832 to 1837 and at Vienna from 1846 to 1850. The second son was Major-General Sir William Ponsonby (1772-1815), who, after serving in the Peninsula War, was killed at the battle of Waterloo whilst leading a brigade of heavy cavalry. Another son was Richard Ponsonby (1772-1853), bishop of Derry. Sir William Ponsonby's posthumous son William (1816-1861) became 3rd Baron Ponsonby on the death of his uncle John, Viscount Ponsonby; he died childless and was succeeded by his cousin William Brabazon Ponsonby (1817-1886), only son of the bishop of Derry, on whose death the barony of Ponsonby became extinct.

Among other members of this family may be mentioned Major-General Sir Frederick Cavendish Ponsonby (1783-1837), son of the 3rd earl of Bessborough, a soldier who distinguished himself at the battles of Trafalgar, Salamanca and Vittoria, in the Peninsula War, and was wounded at Waterloo; he was governor of Malta from 1826 to 1835. His eldest son, Sir Henry Frederick Ponsonby (1825-1865), a soldier who served in the Crimea, is its natural inner harbours only admiralty vessels of light draught, while larger ships were compelled to anchor in an open roadstead, which was inaccessible during the prevalence of southerly gales. But great improvements were effected after 1868 by the construction of a breakwater 2800 ft. long.

PONT-À-MOISSON, a town of northern France in the department of Meurthe-et-Moselle, 17 m. N.W. of Nancy by rail. Pop. (1900), 17,620. Ponta Delgada is built on the south coast of St Michael's, in 37° 46' N. and 25° 36' W. Its mild climate, and the fine scenery of its mountain background, render it very attractive to visitors; it is the commercial centre, and the most populous city of the archipelago. Besides the cathedral, it contains several interesting churches and monasteries, and an observatory. Formerly it was a point of the outer defences, now of little account, of the island.

PONTA DELGADA, the capital of an administrative district, comprising the islands of St Michael's and St Mary in the Portuguese archipelago of the Azores. Pop. (1900), 17,620. Ponta Delgada is built on the south coast of St Michael's, in 37° 46' N. and 25° 36' W. Its mild climate, and the fine scenery of its mountain background, render it very attractive to visitors; it is the commercial centre, and the most populous city of the archipelago. Besides the cathedral, it contains several interesting churches and monasteries, and an observatory. Formerly it was a point of the outer defences, now of little account, of the island.
Pontini— Pontécoulant

where his father was murdered in one of the frequent civil brawls which then disturbed the peace of Italian towns. His mother escaped with the boy to Perugia, and it was here that Pontano received his first instruction in languages and literature. Failing to recover his patrimony, he abandoned Umbria, and at the age of twenty-two established himself at Naples, which continued to be his chief place of residence during a long and prosperous career. He first began a close friendship with the distinguished scholar, Antonio Becadelli, through whose influence he gained admission to the royal chancery of Alphonso the Magnanimous. Alphonso discerned the singular gifts of the young scholar, and made him tutor to his sons. Pontano’s connexion with the Aragonese dynasty as political adviser, military secretary and chancellor was henceforth a close one; and the most doubtful passage in his diplomatic career is when he welcomed Charles VIII. of France upon the entry of that king into Naples in 1495, thus showing that he was too ready to abandon the princes upon whose generosity his fortunes had been raised. Pontano illustrates in a marked manner the position of power to which men of letters and learning had arrived in Italy. He entered Naples as a penniless scholar. He was almost immediately made the companion and trusted friend of its sovereign, loaded with honours, lodged in a fine house, enrolled among the nobles of the realm, enriched, and placed at the very height of social importance. Following the example of Pomponio Leto in Rome and of Cosimo de’ Medici at Florence, Pontano founded an academy for the meetings of learned and distinguished men. This became the centre of fashion as well as of erudition in the southern capital, and subsisted long after its founder’s death. In 1461 he married his first wife, Adriana Sassone, who bore him one son and three daughters before her death in 1491. Nothing distinguished Pontano more than the strength of his domestic feeling. He was passionately attached to his wife and children; and, while his friend Becadelli signed the licentious verses of Hermaphroditus, his own Muse celebrated in liberal but loyal strains the pleasures of conjugal affection, the charm of infancy and the sorrows of a husband and a father in the loss of those he loved. Nor long after the death of his first wife Pontano took in second marriage a beautiful girl of Ferrara, who is only known to us under the name of Stella. Although he was at least sixty-five years of age at this period, his poetic faculty displayed itself with more than usual warmth and lustre in the elegiac pieces styled Erudens, which he poured forth to commemorate the rapture of this union. Stella’s one child, Lucilio, survived his birth but fifty days; nor did his mother long remain to comfort the scholar’s old age. Pontano had already lost his only son by the first marriage; therefore his declining years were solitary. He died in 1503 at Naples, where a remarkable group of terra-cotta figures, life-sized and painted, still adorns his tomb in the church of Monte Oliveto. He is there represented together with his patron Alphonso and his friend Sanazzaro in adoration before the dead Christ.

As an artist and statesman Pontano played a part of some importance in the affairs of southern Italy and in the Barons’ War, the wars with Rome, and the expulsion and restoration of the Aragonese dynasty. But his chief claim upon the attentions of posterity is as a scholar. His writings divide themselves into dissertations upon such topics as the “Liberality of Princes” or “Ferocity,” composed in the rhetorical style of the day, and poems. He was distinguished for energy of Latin style, for vigorous intellectual powers, and for the faculty, rare among his contemporaries, of expressing the facts of modern life, the actualities of personal emotion, in language sufficiently classical yet always characteristic of the man. His prose treatises are more useful to students of manners than the succeeding lucubrations of Poggio. Yet it was principally as a Latin poet that he exhibited his full strength. An ambitious didactic composition in hexameters, entitled Urania, embodying the astronomical science of the age, and adorning this high theme with brilliant mythological episodes, won the admiration of Italy. It still remains a monument of fertile invention, exuberant facility and energetic handling of material. Not less excellent is the didactic poem on orange trees, De hortis Hesperidum. His most original compositions in verse, however, are elegiac and hendecasyllabic pieces on personal topics—the De conjugal amore, Erudens, Tumuli, Naonice, Baiar, &c.—in which he uttered his vehemently passionate emotions with a wealth of southern colouring, a profusion of metaphor, a truth of painting from reality which excise their erotic freedom.

Pontano’s prose and poems were printed by the Aldi at Venice. For his life see Arditto, Giovanni Pontano e i suoi tempi (Naples, 1871); for his place in the history of literature, Symonds, Renaissance in Italy. (J. A. S.)

Pontarlier, a frontier town of eastern France, capital of an arrondissement in the department of Doubs, 36 m. S.E. of Besançon by road. Pop. (1906), 7896. It is situated 1750 ft. above sea-level on the Doubs, about four miles from the Swiss frontier, and forms an important strategic point at the mouth of the defile of La Cluse, one of the principal passes across the Jura. The pass is defended by the modern fort of Larmont, and by the Fort de Joux, which was originally built in the 10th century by the family of Joux and played a conspicuous part in the history of Franche-Comté. Pontarlier is the junction of the railway lines to Neuchâtel, Lausanne, Lons-le-Saunier, Dôle and Besançon. A triumphal arch of the 18th century commemorates the reconstruction of the town after the destructive fire of 1736. It was at Pontarlier that the French army of the East made its last stand against the Prussians in 1871 before crossing the Swiss frontier. The distillation of herbs, extensively cultivated for the manufacture of absinthe, kirsch and other liqueurs, is the chief industry. The town is the seat of a sub-prefect and has a tribunal of first instance and a communal college.

Pont Audemer, a town of north-western France, capital of an arrondissement in the department of Eure, 30 m. N.W. of Evreux, on the Les, a left-bank affluent of the Seine, and on the railway from Evreux to Honfleur. Pop. (1906), 5700. The church of St Ouen, which has fine stained glass of the 16th century, combines the late Gothic and Renaissance styles; its choir is Romanesque. Local institutions are the sub-prefecture, a tribunal of first instance, a board of trade- arbitration, a chamber and tribunal of commerce. Manufacturing industry includes the making of malleable metal, a spur factory, the manufacture of glue and paper, cotton-spinning and various branches of leather manufacture. There is trade in flax, wool, grain, cattle, cider, paper, iron, wood and coal. The port has a length of over half a mile on the Lesse, which is navigable for small vessels from this point to its mouth (10 m.). The town owes its name to Audomar, a Frank lord, who in the 7th or 8th century built a bridge over the Lesse at this point. It was the scene of several provincial ecclesiastical councils in the 12th and 13th centuries and of meetings of the estates of Normandy in the 13th century.

Ponte (Ital. for “bridge”), a rough game peculiar to the city of Pisa, in which the players, divided into two sides and provided with padded costumes, contended for the possession of one of the bridges over the Arno. The weapon used, both for offence and defence, was a kind of shield which served as a club as well.

A history and description of the game may be found in William Heywood’s Patio and Ponte (London, 1904).

Pontecorvo, a city of Campania, Italy, in the province of Caserta, on the Garigliano, about 48 m. from Caserta and 3 m. from Aquino, on the railway from Rome to Naples. Pop. (1901), 10,318 (town); 12,492 (commune). The town is approached by a triumphal arch adorned with a statue of Pius IX. The principality of Pontecorvo (about 40 sq. m. in extent), once an independent state, belonged alternately to the Tomacelli and the abbots of Monte Cassino. Napoleon bestowed it on Bernadotte in 1806, and in 1810 it was incorporated with the French Empire.

Pontécoulant, Louis Gustave Le Doulcet, Comte de (1764–1853), French politician, was born at Caen on the 17th of November 1764. He began a career in the army in 1778.
PONTEFRACT

A moderate supporter of the revolution, he returned to the Convention for the department of Calvados in 1792, and became commissary with the army of the North. He voted for the imprisonment of Louis XVI. during the war, and his banishment after the peace. He then attached himself to the party of the Girondists, and in May, 1793, he was outlawed. He had to defend his compatriot Charlotte Corday, who wrote him a letter of reproach for her way to the scaffold. He returned to the Convention on the 8th of March 1795, and showed an unusual spirit of moderation by defending Frieur de la Marne and Robert Lindet. President of the Convention in July 1795, he was for some months a member of the council of public safety. He was subsequently elected to the council of five hundred, but was suspected of royalist leanings, and had to spend some time in retirement before the establishment of the consulate. Becoming senator in 1805, and count of the empire in 1808, he organized the national guard in Franche Comté in 1811, and the defence of the north-eastern frontier in 1813. At the first restoration Louis XVIII, made him a peer of France, and although he received a similar honour from Napoleon during the Hundred Days, he sat in the upper house under the Second Restoration. He died in Paris on the 3rd of April 1833, leaving memoirs and correspondence from which were extracted four volumes (1861–1865) of Souvenirs historiques et parlementaires 1764-1838.

His son Louis Adolphe Le Doucet, comte de Pontécoulant (1794–1882), served under Napoleon in 1812 and 1814, and then emigrated to Brazil, where he took part in the abortive insurrection at Pernambuco in 1817. He also organized a French volunteer contingent in the Belgian revolution of 1830, and was wounded at Louvain. The rest of his life was spent in Paris in the study of ancient music and acoustics. Among his works was one on the Musée instrumental du conservatoire de musique (1864). A younger brother, Philippe Gustave Le Doucet, comte de Pontécoulant (1795–1874), served in the army until 1849, when he retired to devote himself to mathematics and astronomy. His works include Théorie analytique du système du monde (Paris, 1829-1840) and Traité élémentaire de physique céleste (2 vols., Paris, 1840).

PONTEFRACT (pronounced and sometimes written “Pomfret”), a market town and municipal and parliamentary borough in the West Riding of Yorkshire, England, 21 m. S.S.W. from York, served by the Midland, North-Eastern and Lancashire & Yorkshire railways. Pep. (1891), 9702; (1901), 13,427. It is well situated, mainly on an eminence, near the junction of the Aire and the Calder. The most important of the antiquarian remains are the ruins of the famous castle situated on a rocky height, originally covering with its precincts an area of over 8 acres, and containing in all eight round towers. The remains are principally of Norman date, and an unusual feature of the stronghold is the existence of various subterranean chambers in the rock. Below the castle is All Saints church, which suffered severely during the siege of the castle, but still retains some work of the 12th century. In 1387 the tower and transepts were fitted for divine service. The church of St Giles, formerly a chapel of ease to All Saints, but made parochial in the 18th century, is of Norman date, but most of the present structure is modern. The 17th-century spire was removed in 1707, and replaced by a square tower, which was rebuilt in 1797; the chancel was rebuilt in 1869. In Southgate is an ancient hermitage and oratory cut out of the solid rock, which dates from 1356. On St Thomas’s Hill, where Thubutus, Earl of Lancaster, was beheaded in 1332, a chantry was erected in 1373, the site of which is now occupied by a windmill built of its stones. At Monkhill there are the remains of a Tudor building called the Old Hall, probably constructed out of the old priory of St John’s. A grammar school of ancient foundation, renewed by Elizabeth and George III., occupies modern buildings. The town-hall was built at the close of the 18th century on the site of one erected in 1656, which succeeded the old moot-hall dating from Saxon times. Among other buildings are the court house, the market hall, the assembly rooms (a handsome building adjoining the town-hall), and large barracks. The foundation of the principal almshouse, that of St Nicholas, dates from before the Conquest. Trinity Hospital was founded by Sir Robert Knolles (d. 1407), an eminent military commander in the French wars of Edward III. At Ackworth, in the neighbourhood, there is a large school of the Society of Friends or Quakers (1778), in the formation of which Dr John Pott (1712-1758) was a prime mover. There are extensive gardens and nurseries in the neighbourhood of Pontefract, and liquorice is largely grown for the manufacture of the celebrated Pomfret cakes. The town possesses ironfoundries, satch and matting manufactories, taneries, breweries, corn mills and brick and terra-cotta works. The parliamentary borough, falling within the Osbild-Brook division of the county, returns one member (before 1885 the number was two). The town is governed by a mayor, six aldermen and 18 councillors. Area, 4078 acres.

The remains of a Roman camp have been discovered near Pontefract, but there is no trace of settlement in the town itself until after the Conquest. At the time of the Domesday Survey Tateshall (now Tanshelf, a suburb of the town) was the chief manor and contained 60 burgesses, while Kirkby, which afterwards became the borough of Pontefract, was one of its members. The change was probably owing to the fact that Ilbert de Lacy, to whom the Conqueror had granted the whole of the honour of Pontefract, founded a castle at Kirkby, on a site said to have been occupied by a fortification raised by Alric, a Saxon thane. Several reasons are given for the change of name but none is at all satisfactory. One account says that it was caused by a battle fought in 1193 between Henry the Second and the French at the north, but this is known to have been at Ferrybridge, three miles away; a second says that the new name was derived from a Norman town called Pontfrete, which, however, never existed; and a third that it was caused by the breaking of a bridge in 1153 on the arrival of the archbishop of York, St William, when several people were miraculously preserved from drowning, although the town was already known as Pontefract in 1140 when Archbishop Thurstan died there. The manor remained in the Lacy family until it passed by marriage to Thomas, duke of Lancaster, who was beheaded on a hill outside the town after the battle of Boroughbridge. His estates were restored to his brother Henry, earl of Lancaster, on the accession of Edward III., and the manor has since then formed part of the duchy of Lancaster. The town took part in most of the rebellions in the north of England, and in 1390 Richard II. was imprisoned and secretly murdered in the castle. During the Wars of the Roses the town was loyal to Henry VI., and several of the Yorkist leaders were executed here after the battle of Wakefield. It was taken by Robert Aske, leader of the Pilgrimage of Grace, in 1536. In 1642 the castle was garrisoned for Charles I. and sustained four sieges, the second, in 1644, being successful, but two years later it was retaken by the royalists, who held it until after the execution of the king, when they surrendered to General Lambert and the castle was destroyed.

Roger de Lacy in 1194 granted a charter to the burgesses confirming their liberties and right to be a free borough at a fee-farm of 12d. yearly for every toft, granting them the same privileges as the burgesses of Grimsby, and that their revenue should be chosen annually by the lord of the manor at his court leet, preference being given to the burgesses if they would pay as much as others for the office. Henry de Lacy confirmed this charter in 1278 and in 1484 Richard III. incorporated the town under the title of mayor and burgesses and granted a gold merchant with a hase. His charter was withdrawn on the accession of Henry VII. and a similar one was granted, while in 1480 the king gave the burgesses licence to continue choosing a mayor as they had done in the time of Richard III. In 1606-1607 James I. confirmed the charter of Henry VII. and regulated the choice of the mayor by providing that he should be elected from among the chief burgesses by the burgesses themselves. The privilege of returning two members to parliament which had belonged to Pontefract at the end of the 13th century was revived in 1620-1621 on the grounds that the charter of 1606-1607 had restored all their privileges to the burgesses. Since the
PONTEVEDRA—PONTIAC

Redistribution of Seats Act of 1835 one member only has been returned. Liquorice was largely grown as early as 1700-1701, when the corporation prohibited the sale of buds or sets of the plant. Richard III. by his incorporation charter granted the market rights in the borough to the burgesses, who still hold them under his charter.

See Victoria County History: Yorkshire; Eighth Report of the Royal Commission on Historical Manuscripts (1870—1897); Book of Entries of the Pontefract Corporation, 1653-1726 (ed. by Richard Holmes, 1884); Letters of the Right Honorable Baronet Henry Willoughby of Pontefract (1807); George Fox, The History of Pontefract (1827).

PONTEVEDRA, a maritime province of north-western Spain, formed in 1833 of districts taken from Galicia, and bounded on the N. by Corunna, E. by Lugo and Orense, S. by Portugal and W. by the Atlantic. Pop. (1900), 457,623; area, 1605 sq. m. Pontevedra is the smallest of the provinces of Spain except the three Basque Provinces; its density of population, 269.8 inhabitants per square mile, is exceeded in the provinces of Barcelona and Biscay (Vizcaya). Both of these are mining and manufacturing districts, while Pontevedra is dependent on agriculture and fisheries. The surface is everywhere mountainous, and consists almost entirely of arable land, pasture or forest. The coast-line is deeply indented; navigation is rendered difficult by the prevalence of fogs in summer and storms in winter. The river Miño (Portugués Minho) forms the southern frontier, and is navigable by small ships as far as Salvaterra; and the province is watered by many smaller streams, all flowing, like the Miño, into the Atlantic. The largest of these are the Ulla, which separates Pontevedra from Corunna, the Lima and the Lerez. Pontevedra has a mild climate, a fertile soil and a very heavy rainfall. Large agricultural fairs are held in the chief towns, and there is a considerable export trade in cattle to Great Britain and Portugal, hams, salt meat and fish, eggs, breadstuffs, leather and wine. Vigo is the headquarters of shipping, and one of the chief ports of northern Spain. There are also good harbours at Bayona, Carril, Marin, Villagarcia and elsewhere among the deep estuaries of the coast. At Tuy the Spanish and Portuguese railways meet, and from this town one line goes up the Miño valley to Orense, and another northward along the coast to Santiago de Compostela.

PONTEVEDRA, the capital of the Spanish province of Pontevedra; on the Tuy-Corunna railway, and on the river Lerez, which here enters the Ria de Pontevedra, an inlet of the Atlantic. Pop. (1900), 22,330. The name of the town is derived from the ancient Roman bridge (pontis vetus) of twelve arches, which spans the Lerez near its mouth. Pontevedra is a picturesque town, mainly built of granite, and still partly enclosed by medieval fortifications. It contains handsome provincial and municipal halls erected in the 19th century, and many convents, some of which have been converted into hospitals or schools. Marin and Sangenjo are ports on the Ria de Pontevedra, which is the seat of a rich and flourishing diocese. In this town is the ancient Spanish university of the University of San Carlos, and the University of the Holy Cross.

PONTIAC (c. 1720-1760), Indian chief of the Ottawa and leader in the "Conspiracy of Pontiac" in 1763-64, was born between 1712 and 1720 probably on the Maumee river, near the mouth of the Auglaize. His father was an Ottawa, and his mother an Ojibwa. By 1755 he had become a chief of the Ottawa and a leader of the loose confederacy of the Ottawa, Potawatomi and Ojibwa. He was an ally of France and possibly commanded the Ottawa in the defeat (July 9, 1755) of General Edward Braddock. In November 1762 he met Major Robert Rogers, then on his way to occupy Michilimackinac and other forts surrendered by the French, and agreed to let the English troops pass unmolested on condition that he should be treated with respect by the British. Like other Indians he soon realized the difference between French and English rule—that the Indians were no longer welcomed at the forts and that they would ultimately be deprived of their hunting grounds by encroaching English settlements. French hunters and traders encouraged Indian disaffection with vague promises of help from France; in 1762 an Indian "prophet" among the Delawares on the Muskingum preached a union of the Indians to expel the English; and in that year (as in 1761) there were abortive conspiracies to massacre the English garrisons of Detroit, Fort Niagara and Fort Pitt (now Pittsburgh). Pontiac seems to have been chief of a magic association (the Metat), and he took advantage of the religious frenzy and the general unrest among the Indians to organize in the winter of 1762-63 a simultaneous attack on the English forts to be made in May 1763 at a certain phase of the moon. On the 27th of April 1763, before a meeting near Detroit of delegates from most of the Algonquian tribes, he outlined his plans. On the 7th of May, with 60 warriors, he attempted unsuccessfully to gain admission to Detroit, which then had a garrison of about 160 under Major Henry Gladwin (1730-1701); and then besieged the fort from the 9th of May to the end of October. On the 28th of May reinforcements from Fort Niagara were ambuscaded near the mouth of the Detroit. In June the Wyandot and Potawatomi withdrew from the siege, and on the 29th of July they attacked reinforcements (280 men, including 20 of Rogers' rangers) from Fort Niagara under Captain James Dalzell (or Dalzell), who, however, gained the fort, and in spite of Gladwin's opposition on the 31st of July attacked Pontiac's camp, but was ambuscaded on Bloody Run and was killed, nearly 60 others being killed or wounded. On the 12th of October the Potawatomi, Ojibwa and Wyandot made peace with the English; with the Ottawa Pontiac continued the siege until the 30th of October, when he learned from Neyon de la Vallière, commandant of Fort Chartres (among the Illinois) that he would not be aided by the French. Pontiac then withdrew.

Fort Pitt with a garrison of 330 men under Captain Simeon Ecuyer was attacked on the 22nd of June and was besieged from the 27th of July to the 1st of August, when the Indians withdrew to meet a relief expedition of 500 men, mostly Highlanders, under Colonel Henry Bouquet (1719-1766), who had set out from Carlisle, Pennsylvania, on the 18th of July, and relieved Fort Ligonier (on the site of the borough of Ligonier, Westmoreland county, Penn.) on the 2nd of August, but was surprised on the 5th, and fought (5th and 6th) the battle of Bushy Run (25 m. S.E. of Fort Pitt), finally flanking and routing the Indians after tricking them by a feinted retreat of a part of his force. Bouquet reached Fort Pitt on the 27th of August. At Michilimackinac (Mackinac), Michigan, on the 4th of June, the Indians gained admission to the fort by a trick, killed nearly a score of the garrison and captured the remaining, including Captain George Etherington, the commander, besides several English traders, including Alexander Henry (1739-1824). Some of the captives were seized by the Ottawa, who had taken no part in the attack; a part of these were released, and reached Montreal on the 13th of August. Seven of the prisoners kept by the Ojibwa were killed in cold blood by one of their chiefs. Fort Sandusky (on the site of Sandusky, Ohio) was taken on the 5th of July by Wyandot; and Fort St. Joseph (on the site of the present Niles, Mich.) was captured on the 27th of May and 11 men (out of its garrison of 14) were massacred, the others with the commandant, Ensign Schlosser, being taken to Detroit and exchanged for Indian prisoners. On the 27th of May Fort Miami (on the site of Fort Wayne, Indiana) surrendered to the Indians after its commander, Ensign Holmes, had been treacherously killed. Fort Ouiatanon (about 5 m. south-west of the present Lafayette, Indiana) and Fort Presque Isle (on the site of Erie, Penn.) were taken by the Indians on the 1st and 10th of June respectively, and Fort Le Bouef (on the site of Waterford, N.J., not a native of New Brunswick, N.J., had become a fur-trader, and vice-flourishing at Michilimackinac in 1761. He was rescued by Wawatam, an Ottawa, and afterwards by his brother. In 1764 he took part in Colonel John Bradstreet's expedition; in 1770, with Sir William Johnson, the duke of Gloucester and others, formed a company to mine copper on Lake Superior, and was afterwards a fur-trader again until 1796; and then became a merchant in Montreal. His Travels and Adventures in Canada and the Indian Territories between the Years 1760 and 1770 (1809; reprinted 1901) is a valuable account of his fur trade and of his adventures at Michilimackinac. He is not to be confused with his nephew of the same name, also a fur-trader, whose journal was published in 1897 in 3 vols., as New Light on the Early History of the Greater Northwest.
PONTIAC—PONTIVY

Penn.) was surprised on the 18th, but its garrison escaped, and seven (out of 13) got safely to Fort Pitt. Fort Venango (near the site of the present Venango, Penn.) was taken and burnt about the same time by some Senecas (the only Iroquois in the conspiracy), who massacred the garrison and later burned the commander, Lieut. Gordon. About 500 Senecas on the 14th of September surprised a wagon train, escorted by 24 soldiers, from Fort Schlosser (2 m. above Niagara Falls), drove most of them over the brink of the Devil's Hole (below the cataract), and then nearly annihilated a party from Fort Niagara sent to the rescue.

In 1763, although the main attacks on Detroit and Fort Pitt had failed, nearly every minor fort attacked was captured, about 200 settlers and traders were killed, and in property destroyed or plundered the English lost about $1,000,000, the greatest loss in men and property being in western Pennsylvania. In June 1764 Colonel John Bradstreet (1711–1774) led about 1200 men from Albany to Fort Niagara, where at a great gathering of the Indians several treaties were made in July; in August he made at Presque Isle a treaty (afterwards annulled by General Thomas Gage) with some Delaware and Shawnee chiefs; and in September made treaties (both unsatisfactory) with the Wyandot, Ottawa and Miami at Sandusky, and with various chiefs at Detroit. He sent Captain Howard to occupy the forts at Michilimackinac, Green Bay and Sault Ste Marie, and Captain Morris up the Maumee river, where he conferred with Pontiac, and then to Fort Miami, where he narrowly escaped death at the hands of the Miami; and with his men Bradstreet returned to Oswego in November, having accomplished little of value. An expedition of 1500 men under Colonel Bouquet left Carlisle, Pennsylvania, in August, and near the site of the present Tuscarawas, Ohio, induced the Indians to release their prisoners and to stop fighting—the practical end of the conspiracy. Pontiac himself made submission to Sir William Johnson on the 25th of July 1766 at Oswego, New York. In April 1769 he was murdered, when drunk, at Cahokia (nearly opposite St Louis) by a Kaskaskia Indian bribed by an English trader; and he was buried near the St Louis Fort. His death occasioned a bitter war in which a remnant of the Illinois was practically annihilated in 1770 at Starved Rock (between the present Ottawa and La Salle), Illinois, by the Potawatomi, who had been followers of Pontiac. Pontiac was one of the most remarkable men of the Indian race in American history, and was notable in particular for his power (rare among the Indians) of organization.

PONTIAC, a city and the county-seat of Oakland county, Michigan, U.S.A., on the Clinton river, about 26 m. N.W. of Detroit. Pop. (1890), 6200; (1900) 9760, of whom 2020 were foreign-born; (1910 U.S. census) 14,532. It is served by the Grand Trunk and the Pontiac, Oxford & Northern railways (being the southern terminus of the latter), and by the Detroit & Pontiac and the North-Western electric inter-urban lines. In the surrounding country there are many small, picturesque lakes (the largest being Orchard, about 6 m. south-east of Pontiac, Cass and Elizabeth lakes), and there is good hunting and fishing in the vicinity. In Pontiac is the Eastern Michigan Asylum for the Insane (1858), with grounds covering more than 500 acres. The city has various manufactures, and the value of the factory products increased from $2,470,887 in 1900 to $3,247,492 in 1904, or 23.3%. Agricultural products, fruit and wool from the surrounding country are shipped in considerable quantities. The municipality owns and operates its waterworks. Pontiac, named in honour of the famous Indian chief of that name, was laid out as a town in 1818, became the county-seat in 1820, was incorporated as a village in 1837, and was chartered in 1861.

PONTIANUS, pope from 230 to 235. He was exiled by the emperor Maximinus to Sardinia, and in consequence of this sentence resigned (Sept. 28, 235). He was succeeded by Anterus.

PONTIFEX. The collegium of the Pontifices was the most important priesthood of ancient Rome, being specially charged with the administration of the jus divinum, i.e. that part of the civil law which regulated the relations of the community with the deities recognized by the state officially, together with a general superintendence of the worship of gods and family. The name is clearly derived from pons and facere, but whether this signified that the pontifices were responsible for any special connexion with the sacred bridge over the Ticino (Pons Sublimius), or what the original meaning may have been, cannot now be determined. The college existed under the monarchy, when its members were probably three in number; they may safely be considered as legal advisers of the rex in all matters of religion. Under the republic they emerge into prominence under a pontifex maximus, who took over the king's duties as chief administrator of religious law, just as his chief sacrificial duties were taken by the rex sacrorum; his dwelling was the regio, "the house of the king." During the republican period the number of pontifices increased, probably by multiples of three, until after Sulla (82 b.c.) we find them fifteen; for the year 7 b.c. we have a complete list of them in Cicero (Harp. resp. 6, 12). Included in the collegium were also the rex sacrorum, the flamines, three assistant pontifices (minores), and the vestal virgins, who were all chosen by the pontifex maximus. Vacancies in the body of pontifices were originally filled by co-optation; but from the second Punic War onwards the pontifex maximus was chosen by a peculiar form of popular election, and in the last age of the republic this held good for all the members. They all held office for life.

The immense authority of the college centred in the pontifex maximus, the other pontifices forming his consilium or advising body. His functions were partly consultative or ritualistic, but these were the least important; the real power lay in the administration of the jus divinum, the chief departments of which may briefly be described as follows: (1) the regulation of all expiatory ceremonies needed as the result of pestilence, lightning, &c.; (2) the consecration of all temples and other sacred places and objects dedicated to the gods by the state through its magistrates; (3) the regulation of the calendar both astronomically and in detailed application to the public life of the state; (4) the administration of the law relating to burials and burying-places, and the worship of the Manes, or dead ancestors; (5) the superintendence of all marriages by confratres, i.e. originally all legal patrician marriages; (6) the administration of the law of adoption and of testamentary succession. They had also the care of the state archives, of the lists of magistrates, and kept records of their own decisions (commentarii) and of the chief events of each year (annales).

It is obvious that a priesthood having such functions as these, and holding office for life, must have been a great power in the state, and for the first three centuries of the republic it is probable that the pontifex maximus was in fact its most powerful member. The office might be combined with a magistracy, and, though its powers were declaratory rather than executive, it may fairly be described as quasi-magisterial. Under the later republic it was coveted chiefly for the great dignity of the position; Julius Caesar held it for the last twenty years of his life, and Augustus took it after the death of Lepidus in 12 B.C., after which it became inseparable from the office of the reigning emperor. With the decay of the empire the title very naturally fell to the popes, whose functions as administrators of religious law closely resembled those of the ancient Roman priesthood, hence the modern use of "pontiff" and "pontifical."

For further details consult Marquardt, Staatsverwaltung, iii. 235 seq.; Wisowa, Religion et Cultus der Vened, 130 seq.; Bouché-Leclercq, Les Pontifes, passim.

PONTIVY, a town of western France, chief town of an arrondissement in the department of Morbihan, 46 m. N.W. of Vannes by rail. Pop. (1906), 6312 (town); 9506 (commune). The town, situated on the Blavet, at its confluence with the Nantes-Brest canal, comprises two distinct parts—the old town and that to the south known as Napoléoneville. The latter, built by order of Napoleon I., who desired to make it the military headquarters for Brittany, and consisting chiefly of barracks, subsequently gave its name to the whole town, but in 1871 the old name was resumed. The ancient castle (1485) of the dukes
of Rohan, whose capital the town was, is occupied by the Musée le Brigitant de l'art et d'archéologie. A monument to commemorate the Breton-Angevin Union, the deputies of which met at Pontivy in 1790, was erected in 1804, and there are statues of Dr Guépin, a democrat, and General de Lormel (d. 1854). The town has a sub-prefecture, a tribunal of first instance, and a lycée for boys. Pontivy had its origin in a monastery founded in the 7th century by St Ivy, a monk of Lindisfarne.

PONT-L'ABBÉ, a town of western France in the department of Finistère, 13 m. S.W. of Quimper by rail. Pop. (1906), of the town 4485, of the commune 6432. The town is situated on the right bank of the estuary or river of Pont-l'Abbé, 2 m. from the sea. Its port carries on fishing, imports timber, coal, etc., and exports wine-props and the cereals and vegetables of the neighborhood. Of the old buildings of the town, the chief is a church of the 14th, 15th and 16th centuries, once attached to a Carmelite convent; an old castle is occupied by the hôtel de ville. The local costumes, trimmed with the bright-coloured embroideries for which the town is noted, are among the most striking in Brittany; the bigouden or head-dress of the women has given its name to the inhabitants. Pont-l'Abbé carries on flour-milling and the extraction of chemicals from seaweed.

PONTMARTIN, ARMAND AUGUSTIN JOSEPH MARIE FERRARD, Comte de (1811-1890), French critic and man of letters, was born at Avignon (Vaucluse) on the 16th of July 1811. Imbued by family tradition with legitimist sympathies, he began by attacking the followers of the empire and their successors. In the Assemblée nationale he published his Causeries littéraires, a series of attacks on prominent Liberals, which created some sensation. Pontmartin was a indefatigable journalist, and most of his papers were eventually published in volume form: Contes et rivières d'un planteur de choux (1834); Causeries du samedi (1857-1860); Nouveaux samedis (1865-1881), etc. But the most famous of all his books is Les Jeudis de Mme. Charbonneau (1862), which under the form of a novel offered a series of malicious and witty portraits of contemporary writers. Pontmartin died at Avignon on the 29th of March 1890.

See Hatzfeld and Mounier, Les Critiques littéraires du XIXe siècle (1894).

PONTOISE, a town of northern France, capital of an arrondissement of the department of Seine-et-Oise, 18 m. N.W. of Paris on the railway to Dieppe. Pop. (1906), 7063. Pontoise is picturesquely situated on the right bank of the Oise where it is joined by the Viosne. The traffic on the main river is large, and the tributary drives numerous mills. Of the many churches that used to exist in the town two only remain: St Maclou, a church of the 12th century, altered and restored in the 15th and 16th centuries by Pierre Lemercier, the famous architect of St Etienne at Paris, and containing a fine holy sepulchre of the 15th century; and Notre-Dame, of the close of the 16th century, which contains the tomb of St Gaultier, abbot of Moulan in the 12th century. At the top of the flight of steps by which St Maclou is approached is the statue of General Leclerc, a native of the town and husband of Pauline Bonaparte. Grain and flour are the principal staples of the trade; a well-known fair is held in November. The town has a sub-prefecture, tribunals of first instance and of commerce and a communal college. At Méril, near Pontoise, there are interesting remains of the Cistercian abbey of Le Val. Pontoise existed in the time of the Gauls as Brinvo Isarae (Bridge of the Oise). It was destroyed by the Normans in the 9th century, united with Normandy in 1052, and acquired by Philip I. in 1064. Capital of the French Vexin, it possessed an important stronghold and played a conspicuous part in the wars between the French and the dukes of Normandy and in the Hundred Years' War. The English took it in 1410, and again in 1437. In 1441 Charles VII. took it by storm after a three months' siege. After belonging to the count of Charolais down to the treaty of Conflans, it was given as a dowry to Jeanne of France when she was divorced by Louis XII. The parlement of Paris several times met in the town; and in 1561 the states-general convoked at Orleans removed thither after the death of Francis II. During the Fronde it offered a refuge to Louis XIV. and Mazarin. Henry III. made it anapanage for his brother the duke of Anjou. At a later period it passed to the duke of Conti. Down to the Revolution it was a monastic town.

PONTOON (Fr. ponton, from Lat. pons, a bridge), a flat-bottomed boat, used as a ferry boat or lighter; especially a boat of particular design intended to form part of a military bridge. In modern hydraulic engineering the words ponton and pontoon are used to designate hollow water-tight structures which are secured to sunken wrecks and bring them up to the surface, and also the hollow chambers which serve as gates for docks and sluices, and are lowered and raised by the admission and pumping out of water.

Military Pontoon Bridges.—From time immemorial floating bridges of vessels bearing or supporting a row of beams and planks have been employed to facilitate the passage of rivers and arms of the sea. Xerxes crossed the Hellespont on a double bridge, one line supported on three hundred and sixty, the other on three hundred and fourteen vessels, anchored head and stern with their keels in the direction of the current. Darius threw similar bridges across the Bosporus and the Danube in his war against the Scythians, and the Ten Thousand employed a bridge of boats to cross the river Tigris in their retreat from Persia. Floating bridges have been repeatedly constructed over rivers in Europe and Asia, not merely temporarily for the passage of an army, but permanently for the requirements of the country; and to this day many of the great rivers in India are crossed, on the lines of the principal roads, by floating bridges, which are for the most part supported on boats such as are employed for ordinary traffic on the river.

But light vessels which can be taken out of the water and lifted on to carriages are required for transport with an army in the field. Alexander the Great occasionally carried with his army vessels divided into portions, which were put together on reaching the banks of a river, as in crossing the Hydaspe; he is even said to have carried his army over the Oxus by means of rafts made of the hide tents of the soldiers stuffed with straw, when he found that all the river boats had been burnt. Cyrus crossed the Euphrates on stuffed skins. The practice of carrying about skins to be inflated when troops had to cross a river, which was adopted by both Greeks and Romans, still exists in the East. In the 4th century the emperor Julian crossed the Tigris, Euphrates and other rivers by bridges of boats made of skins stretched over osier frames. In the wars of the 17th century pontoons are found as regular components of the trains of armies, the Germans using a leather, the Dutch a tin and the French a copper "skin" over stout timber frames.

Modern military pontoons have been made of two forms, open as an undecked boat, or closed as a decked canoe or cylinder. During the Peninsular War the English employed open bateaux; but the experience gained in that war induced them to introduce the closed form. General Collot devised a buoyant pontoon, cylindrical with conical ends and made of wooden staves like a cask. Then General Sir Charles Pasley introduced demi-pontoons, like decked canoes with pointed bows and square sterns, a pair, attached sternwise, forming a single "pier" of support for the roadway; they were constructed of light timber frames covered with sheet copper and were decked with wood; each demi-pontoon was divided internally into separate compartments by partitions which were made as water-tight as possible, and also supplied with the means of pumping out water; when transported overland with an army a pair of demi-pontoons and the superstructure of one bay formed the load for a single carriage weighing 27-75 cwt. when loaded. The Pasley pontoon united the advantages of the Blanshard pontoon, a tin coated cylinder with hemispherial ends, for which great mobility was claimed, two pontoons and two bays superstructure being carried on one waggon, giving a weight of about 45 cwt., which was intended to be drawn by four horses. The Blanshard pontoon was long used in the British army, but was ultimately discarded; and British engineers came to the conclusion that it was desirable to return to the form of the open bateau to which the engineers of all the
Continental armies had meanwhile constantly adhered. Captain Fowke, R.E., invented a folding open bateau, made of waterproof canvas attached to sliding ribs, so that for transport it could be collapsed like the bellows of an accordion and for use could be extended by a pair of stretchers. This was followed by the pontoon designed by Colonel Blood, R.E., an open bateau with decked ends and sides partly decked where the ball blocks were fixed. It consisted of six sets of framed ribs connected by a deep kelson, two side steaks, and three bottom steaks. The sides and bottom were of thin yellow pine with canvas secured to both surfaces by india-rubber solution, and coated outside with marine glue. The central interval between the pontoons in forming a bridge was invariably maintained at 15 ft.; for the support of the roadway five baulks were ordinarily employed, but nine for the passage of siege artillery and the heaviest loads; they fitted on to saddles resting on central saddle beams. The pontoons were not immersed to within 1 ft. of the tops of their "coamings" when carrying ordinary loads, as of infantry in marching order "in fours" crowded at a check, or the 16-pounder R.M.L. gun of position weighing 43 cwt.; nor were they immersed to within 6 in. in carrying extraordinary loads, such as disorganized infantry, or the 64-pounder R.M.L. gun weighing 98 cwt. In designing this pontoon the chief points attended to were—(1) improvement in power of support, (2) simplification in bridge construction, (3) reduction of weight in transport, and (4) adaptation for use singly as boats for ferrying purposes. One pontoon with the superstructure for a single wagon constituted a load for one waggion, with a total weight behind horses of about 40 cwt.

The following table (from Ency. Brit. 9th ed.) shows the powers of various pontoons in use by different nations in this list. Modern improvements are comparatively few. The "working power of support" has been calculated in most instances by deducting from the "available buoyancy" one-fourth for open and one-tenth for closed vessels.—

| Pontoon          | Length | Displacement of Pontoon, Cb. Fl. | Actual buoyancy, Dr. | Weight of Blocks in a Single Bay of Support, cwt. | Width of Pontoon, ft. | Amidships Buoyancy, cwt. | Central distance in front of block, ft. | Without Railwaylocks, cwt. | Capacity of Pontoon, Dr. | Length, Dr. | Gnome

equipment are (1) the buoyancy of the pier can be proportioned to the weight of traffic and to the roughness of the water; (2) owing to the wood and raft material, fatal to a false or sudden rise in the water, while the pontoons in bridge oppose little resistance to the current, and so require less anchor power; (3) transport rafts, pier- heads and flying bridges can be constructed with great ease, owing to the flush board and swivel sections which are necessary. Pontoons in bridge are convenient to handle, easy to ship or to transport by rail, and can readily be replaced singly if damaged in bridge. A canoe pontoon and superstructure adapted for transport by rail or ship, invented by Colonel Wood, C.B., R.E. The pontoon consists of four sections laced together, each section being a framework of wood covered with washable and resistant planking, and consisting of a "unit," from which can be constructed 48 ft. of infantry in file, 84 ft. for infantry in single file, or a raft to carry 15 men or an empty wagon.

In Germany, however, as mentioned below, lightweight bridge material has been placed in the hands of the cavalry. This tendency, in accordance with the needs of modern armies, will probably become more pronounced in the future. It began with the provision of demolition equipment for the cavalry pioneers.

The organization of bridging personnel in different armies shows as much divergence of opinion as the design of pontoon equipment. In Great Britain, specialist engineers are employed in army trains, and not in the army. In Germany, the army trains have been assigned to the "army troops," which include two "bridging trains," totalling 14 officers and 454 men with 92 vehicles, most of them six-horsed. Each train carries 32 pontoons and 32 bays of superstructure, as well as 16attles and 8 bays of the appropriate superstructure, and can construct 200 yds. of medium bridge in all. Besides these trains the divisional engineer units (a company of division) bear with them in all 4 pontoons and 4 trestles, with the Exception that the British can build their total bridge capacity being about 40 yds. of medium bridge. In France each army corps has a bridging train which admits of the construction of bridges to the extent of about 120 yds. of medium and 140 yds. of light bridging and bears besides 2 "advanced guard" trains which can provide 33 yds. of medium bridging each. Besides the corps trains there are also army trains, five in all, which can furnish 280 yds. of medium and 400 yds. of light bridging apiece. These would be allotted in accordance with the requirements of particular campaigns. In Germany the increasing importance attached to infantry and cavalry in the great war of 1914 has led to the use of a folding-boat wagon with the cavalry regiment. The regimental equipment provides for a ferry, capable of taking 25 to 30 infantrymen, one artillery vehicle or four horses at one journey, a foot-bridge 32 ft. 6 in. in length, or a light bridge of 8 to 13 yds. By assembling the material of a whole cavalry division of 6 regiments a foot-bridge of 110 to 210 yds. or a light bridge of 57 to 70 yds. can be constructing. The corps bridging train of a German army corps can construct 140 yds. of medium or 170 yds. of light bridging, and each of the two divisional trains 40 yds. of medium and 48 yds. of light bridging.

PONTOPPIDAN, ERIK (1668-1764), Danish author, was born at Aarhus on the 24th of August 1668. He studied divinity at the university of Copenhagen, and for some time acted as a travelling tutor. In 1735 he became one of the chaplains of the king. In 1738 he was made professor extraordinaire of theology at the university of Copenhagen, and in 1738 bishop of Bergen, Norway, which he filled until the 20th of December 1764.

His principal works are: Theatre Danieæ veteris et modernæ (4 vol., 1730), a description of the geography, natural history, antiquities, &c., of Denmark; Gestæ vestigia danorum extra Daniam (3 vols. 1730), a laborious but uncritical work; Annaleæ danielenses ab anno 1494 usque ad annum 1747 (3 vols., 1747); Glossarium norvegiaæ (1749); Det første forloig Norges naturlige historie (4 vol., 1752-1754); Eng. trans., A History of Norway (2 vols. 1753), containing curious accounts, often referenty to the life; Origenes hofierenæ (1760); Mœnæs (3 vols., 1742-1743), a religious novel. His Danske Atlas (7 vols. 410), an historical and theological account of Denmark, is most posthumous. See an article by S. M. Gjellerup in Danish Biografisk Lexikon (vol. xiii., 1889).

PONTOPPIDAN, HENRIK (1857— ), Danish author, son of a pastor, was born at Fredericia on the 24th of July 1857. He studied physics and mathematics at the university of Copenhagen, and when he was eighteen he travelled on foot through Germany and Switzerland. His novels show an intimate acquaintance with peasant life and character, the earlier ones being usually a telling evidence of the influence of Kjelindan. An excellent example of his work is his novel Verden og de store, dealing with the history of Emanuel Hanssted, a theorizing radical parson who marries a peasant wife. These three stories, Muld ("Soil," 1891), Det Forloigede Land ("The Promised Land," 1892), and Dommens Dag (1895) are marked by fine discrimination and great narrative power. Among his other works are Fra Hyttenen (1887), Folkelivsældringer (2 parts, 1888-1890), and Skyer (1890). He began in 1898 a new series in Lykke Per, the story of a typical Jutlander. See an article of Niels Möller in Danish Biografisk Lexikon (vol. xiii., 1889).
journeyman to Andrea del Sarto, and was remarked as a young man of exceptional accomplishment and promise. Later on, but still in early youth, he executed, in continuation of Andrea's labours, the "Visitatiun," in the cloister of the Servi in Florence—one of the principal surviving evidences of his powers. The most extensive means of works which he ever undertook was a set of frescoes in the church of S. Lorenzio, Florence, from the "Creation of Man to the Deluge," closing with the "Last Judgment." By this time, towards 1546, he had fallen under the dangerous spell of Michelangelo's colossal genius and superhuman style; and Pontormo, after working on at the frescoes for eleven years, left them incomplete, and the object of general disappointment and disparagement. They were finished by Angelo Bronzino, but have long since vanished under whitewash. Among the best works of Pontormo are his portraits, which include the likenesses of various members of the Medici family; these are vigorously animated and highly finished. He was fond of new and odd experiments both in style of art and in method of painting. From Da Vinci he caught one of the marked physiognomical traits of his visages, smiles and dimples. At one time he took to direct imitation or reproduction of Albert Dürer, and executed a series of paintings founded on the Passion subjects of the German master, not only in composition, but even in such peculiarities as the treatment of draperies, &c. Pontormo died of dropsy on the 2nd of January 1557, mortified at the ill success of his frescoes in S. Lorenzo; he was buried below his work in the Servi.

**PONTREMOLI,** a town and bishop's see of the province of Massa and Carrara, Tuscany, Italy, in the upper valley of the Magra, 25 m. N. by E. of Spezia by rail and 49 m. S.S.W. of Parma, 843 ft. above sea-level. Pop. (1901), 4107 (town); 14,570 (commune). It has a 17th-century cathedral. The church of the Annunziata with its Augustinian monastery is interesting. There are also mineral springs. The town, which is well situated among the mountains, was an independent republic in the 12th and 13th centuries, and in 1495 was sacked by the troops of Charles VIII. of France. It was much damaged by an earthquake in 1834.

**PONTUS,** a name applied in ancient times to extensive tracts of country in the north-east of Asia Minor bordering on the Euxine (Black Sea), which was often called simply Pontos (the Main), by the Greeks. The exact signification of this purely territorial name varied greatly at different times. The Greeks used it loosely of various parts of the shores of the Euxine, and the term did not get a definite connotation till after the establishment of the kingdom founded beyond the Halys during the troubled period following the death of Alexander the Great, about 301 B.C., by Mithradates I., Kings, son of a Persian satrap in the service of Antigonus, one of Alexander's successors, and ruled by a succession of kings, mostly bearing the same name, till 64 B.C. As the greater part of this kingdom lay within the immense region of Cappadocia, which in early ages extended from the borders of Cilicia to the Euxine, the kingdom as a whole was at first called "Cappadocia towards the Pontus" (πόδος τῆς Πόντου), but afterwards simply "Pontus," the name Cappadocia being henceforth restricted to the southern half of the region previously included under that title. Under the last King, Mithradates Eupator, commonly called the Great, the realm of Pontus included not only Pontic Cappadocia but also the seaboard from the Bithynian frontier to Colchis, part of inland Paphlagonia, and Lesser Armenia (see under Mithra- dates). With the destruction of this kingdom by Pompey in 64 B.C., the meaning of the name Pontus underwent a change. Part of the kingdom was now annexed to the Roman Empire, being united with Bithynia in a double province called "Pontus and Bithynia"; this part included (possibly from the first, but certainly from about 40 B.C. onwards) only the seaboard between Heraclea (Eregli) and Amisus (Samsun), the ora Pontica. Hereafter the simple name Pontus without qualification was regularly employed to denote the half of this dual province, especially by Romans and people speaking from the Roman point of view; it is so used almost always in the New Testament.

But it was also frequently used to denote (in whole or part) that portion of the old Mithradatic kingdom which lay between the Halys (roughly) and the borders of Colchis, Lesser Armenia, Cappadocia and Galatia—the region properly designated by the title "Cappadocia towards the Pontus," which was always the name of the Pontic king.

This region is regarded by the geographer Strabo (A.D. 19-21), himself a native of the country, as Pontus in the strict sense of the term (Geogr. p. 698). Its native population was of the same stock as that of Cappadocia, of which it had formed a part, an Oriental race often called by the Greeks Leucosyri or White Syrians, as distinguished from the southern Syrians, who were of a darker complexion, but whose precise ethnological relations are uncertain. Geographically it is a table-land, forming the north-east corner of the great plateau of Asia Minor, edged on the north by a lofty mountain rim, along the foot of which runs a fringe of coast-land. The table-land consists of a series of fertile plains, of varying size and elevation separated from each other by upland tracts or mountains, and it is drained almost entirely by the river Iris (Yeshilk Irnak) and its numerous tributaries, the largest of which are the Scylax (Teherek Irnak) with many affluent streams and the Lycus (Kalkid Irnak), all three rising in the highlands near, or on, the frontier of Armenia Minor and flowing first in a westerly and then in a north-westerly direction to merge their waters in a joint stream, which (under the name of the Iris) pierces the mountain-wall and emerges on the east of Amisusa (Samsun). Between the Halys and the Iris the mountain rim is comparatively low and broken, but east of the Iris it is a continuous lofty ridge (called by the ancients Eregli-ades and Scydises), whose rugged northern slopes are furrowed by torrent beds, down which a host of small streams (among them the Thermodon, famed in Amazon story) tumble to the sea. These inaccessible slopes were inhabited even in Strabo's time by wild, half-barbarous tribes, of whose ethnical relations we are ignorant—the Chalybes (identified by the Greeks with Homer's Chalybes), Tibareni, Mosynocci and Macrones, on whose manners and condition some light is thrown by Xenophon (Anab. V). But the fringe of coast-land from Trebizond westward is one of the most beautiful parts of Asia Minor and is justly extolled by Strabo for its wonderful productiveness.

The sea-coast, like the rest of the south shore of the Euxine, was studded with Greek colonies founded from the 6th century onwards: Amisusa, a colony of Miletus, which in the 5th century received a body of Athenian settlers, now the port of Samsun; Cotyora, now Ordus; Cerasus, the later Pharmacis, now Kerasun; and Tracpezus (Trebizon), a famous city from Xenophon's time till the end of the middle ages. The last three were colonies of Sinope, itself a Milesian colony. The chief towns in the interior were Amasia, on the Iris, the birthplace of Strabo, the capital of Mithradates the Great, and the burial-place of the earlier kings, whose tombs still exist; Comana, higher up the river, a famous centre of the worship of the goddess Ma (or Cybele); Zeda, another great religious centre, refounded by Pompey, now Zelle; Eupatoria, refounded by Pompey as Magnopolis at the junction of the Lycus and Iris; Cabira, Pompey's Diospolis, afterwards Neocesaerea, now Nikes; Sebastopolis on the Scylax, now Sul'un Serai; Sebastina, now Shus; and Megalopolis, a foundation of Pompey, somewhere in the same district.

The history of this region is the history of the advance of the Roman Empire towards the Euphrates. Its political position between 64 and 41 B.C., when Mark Antony became master of the East, is not quite certain. Part of it was handed over by Pompey to client princes; the coast-land east of the Halys (except the territory of Amisusa) and the hill-tribes of Paryadres were given, with Lesser Armenia, to the Galatian chief Deiotarus, with the title of king; Comana was left under the rule of its high-priest. The rest of the interior was partitioned by Pompey amongst the inland cities, almost all of which were founded by him, and, according to one view, was included together with the seaboard west of Amisusa and the coast of north-east Paphlagonia possessed by Mithradates in his new province.
Pontus-Bithynia. Others maintain that only the seaboard was included in the province, the inland cities being constituted self-governing, "protected" communities. The latter view is more in conformity with Roman policy in the East, which did not usually annex countries till they reached (under the rule of client princes) a certain level of civilization and order; but it is difficult to reconcile with Strabo's statements (p. 342 sqq.). In any case, during the years following 40 B.C. all inland Pontus was handed over, like north-east Paphlagonia, to native dynasts. The Pontic possessions of Deiotarus (d. 45 B.C.) were given with additions (e.g. Cabira) in 39 B.C. to Darius, son of Pher克斯, and in 36 B.C. to Polemon, son of a rhetorician of Galatia. The Galatian towns of Sardis and Amasia were given an extension of territory and the royal title. These cities, Zela and Megalopolis were divided between Lycomedes, the high-priest of Zela and Ateporix, who ruled the principality of Carana (later Sebastopolis). Amasia and Amisus were also given to native princes.

After the battle of Actium (31 B.C.) Amisus was given to the province of Bithynia-Pontus, but made no other serious change. Polemon retained his kingdom till his death in 8 B.C., when it passed to his widow Pythodorus. But presently the process of annexation began and the Pontic districts were gradually incorporated in the empire, each being attached to the province of Galatia, then the centre of Roman forward policy. (1) The western district was annexed in two sections, Sebastopolis and Amasia in 3-2 B.C., and Comana in A.D. 34-35. To distinguish this district from the province Pontus and Polemon's Pontus, it was henceforth called Pontus galaticus (as being the first part attached to Galatia), (2) Polemon's kingdom, ruled since A.D. 38 by Polemon II., grandson of the former king, was annexed by Nero in A.D. 64-65, and distinguished by the title of Pontus polemoniacus, which survived for centuries. [But the simple name Pontus, hitherto commonly used to designate Polemon's kingdom, is still commonly used by the Greeks, not only in Pontus itself, but throughout Thrace and Bithynia, where the context makes the meaning clear (e.g. in inscriptions and on coins).] Polemoniacus included the sea-coast from the Thermodoc to Cotyora and the inland cities Zela, Magnopolis, Megalopolis, Neocaesarea and Sebastaea (according to Ptolemy, but apparently annexed since 2 B.C., according to its coins). (3) Finally, at the same time (A.D. 64) was annexed the remaining eastern part of Pontus, which formed part of Polemon's realm but was attached to the province Cappadocia and distinguished by the epithet cappadocianus. These three districts formed distinct administrative divisions within the province to which they were attached, with separate capitals, Amasea, Lycomedes, and Trapezus; but the first two were afterwards merged in one, sometimes called Pontus mediterraneus, with Neocaesarea as capital, probably when they were definitively transferred (about A.D. 114) to Cappadocia, then the great frontier military province.

With the reorganization of the provincial system under Diocletian (about A.D. 293), the Pontic districts were divided up between four provinces of the dioecesis pontica: (1) Paphlagonia, to which was attached most of the old province Pontus; (2) Diaspontus, re-named Helenopontus by Constantine, containing the rest of the province Pontus and the adjoining district, eight cities in all (including Sinope, Amisus and Zela) with Amasia as capital; (3) Pontus Polemoniacus, containing Comana, Polemonium, Cerasus and Trapezus with Neocaesarea as capital; and (4) Armenia Minor, five cities, with Sebastaea, as capital. This rearrangement gave place in turn to the Byzantine system of military districts ( THEMES).

Christianity was introduced into the province Pontus (the Ora pontica) by way of the sea in the 1st century after Christ and was deeply rooted when Pliny governed the province (A.D. 111-113). But the Christianization of the inland Pontic districts began only about the middle of the 3rd century and was largely due to the missionary zeal of Gregory Thaumaturgus, bishop of Neocaesarea. See Ramsay, Illust. Geogr. of Asia Minor (1890); Anderson and Cumont, Studia pontica (1903 et seq.); Babelon and Reinach, Recueil des monnaies d'Asie min., t. 1 (1906); H. Grégoire, "Voyage dans le Pont" &c. in Bull. des correus. hist. (1909). (J. G. C. A.)

PONTUS DE TYARD—PONTYPRIDD

PONTUS DE TYARD (c. 1521-1603), French poet and member of the Pléiade (see DAURAT), was seigneur of Bissy in Burgundy, where he was born in or about 1521. He was a friend of Antoine Héroet and Maurice Scève, and to a certain extent anticipated Ronsard and Joachim Du Bellay. His Erreurs amoureuses, originally published in 1549, was augmented with other poems in successive editions till 1573. On the whole his poetry is inferior to that of his companions, but he was one of the first to write sonnets in French (the actual priority belongs to Melchior de St. Gelas). It is also said that he introduced the sestine into France, or rather reintroduced it, for it was originally a Provençal invention. He became bishop of Châlons-sur-Saône in 1578, and in 1587 appeared his Discours philosophiques. He was a zealous defender of the cause of Henry III. against the pretensions of the Guises. This attitude brought down on him the vengeance of the league; he was driven from Châlons and his château at Bissy was plundered. He survived all the members of the Pléiade and lived to see the sonnets made of his doctrine by Ballatiére. Pontus resigned his bishopric in 1611 and retired to the château de Bragny, where he died on the 23rd of September 1605.

His Oeuvres politiques may be found in the Pléiade française (1875) of M. Ch. Marty-Laveaux.

PONTYPOOL, a market town in the northern parliamentary division of Monmouthshire, England, 8 m. N. of Newport, served by the Great Western, London & North-Western, and Rhymney railways. Pop. of urban district (1901), 6126. It is beautifully situated on an acclivity above the Afon Lwyd, a tributary of the Usk. Its prosperity is due to its situation on the edge of the great coal and iron-field of Monmouthshire and Glamorganshire. The earlier record of trade in iron is in 1588, but it was developed chiefly in the beginning of the 18th century by the family of Hanbury, the proprietors of Pontypool Park. Pontypool was formerly famed for its japanned goods, invented by Thomas Allwood, a native of Newport, who settled in the town in the reign of Charles II., but the manufacture has long been transferred elsewhere. The town and neighbourhood contain large forges and iron mills for the manufacture of iron-work and tin-plate. Water communication is afforded by Newport with the Monmouthshire Canal. On the south-east of Pontypool is the urban district of Panteg, including Griffithstown, with a population (1901) of 7484.

PONTYPRIDD, a market town, and urban district, in the eastern parliamentary division of Glamorganshire, Wales, situated on the Taft at its junction with the Rhondda, on the Taff Vale railway, and on the Glamorganshire Canal, 12 m. N.N.W. from Cardiff, 12 S. from Merthyr-Tydfil, and 169 by rail from London. It is also connected with Newport by a Great Western line 181 m. long. Pop. (1901), 32,316. It receives its name from a remarkable bridge of one arch spanning the Taft, erected in 1755 by William Edwards, a self-taught mason. The bridge is a perfect segment of a circle, the chord being about 140 ft., and the height at low water 36 ft. A three-arched bridge was erected close to it in 1857. The town is built at the junction of the three parishes of Llanwmon, Llantwit Fardre and Eglwysian, out of portions of which Glyntaff was formed into an ecclesiastical parish in 1848, and from this Pontypridd was carved in 1884. The urban district was constituted into a civil parish in 1894. The church of St Catherine, built in 1868, enlarged in 1885, is in early Decorated style; other places of worship are the Baptist, Calvinistic Methodist, Congregational, and Wesleyan chapels. The principal secular buildings are a masonic hall, town-hall built above the market, free library (1890), county intermediate school (1895) and court-house. Near the town is a far-famed rock-working 93 tons in weight, known as the Maen Chwyf, round which a circle of small stones was set up in the middle of the 19th century under the direction
of Myvyr Morganw, who used to style himself archdruid of Wales. The place became, for a time, famous as a meeting place for neo-Drauidic gatherings. Pontypridd was an insignificant village till the opening of the Taff Vale railway into the town in 1840, and it owed its progress chiefly to the development of the coal areas of the Rhondda Valley, for which district it serves as the market town and chief business centre. It also possesses an inn, a canal, and cable works, chemical works, and iron and brass foundries. Pontypridd has, jointly with Rhondda, a stipendiary magistrate since 1872.

**PONY** (from the Lowland Scots *poumey*, probably from O. Fr. *poulerie*, diminutive of *poulin*, a colt or foal; Late Lat. *pulminus*, Late English, a young horse; a horse of the family “poulin,” a small breed, sometimes confused to such as do not exceed 13 hands in height, but generally applied to any horse under 14 hands (see Hosse). The word is of frequent use as a slang term—e.g., for a sum of 2½s; for a liquor measure or glass containing less than half a pint; and in America for a literal translation of a foreign or classical author, a “crib.”

**PONZA** (anc. *Pontiae*), the principal of a small group of islands belonging to Italy. Pop. (1907), 4621. The group is of volcanic origin, and includes Palmarola (anc. Palmaria), Zannone (Sinia), Ventotene (Pandateria, pop. in 1901, 1986) and San Stefano, the latter about a mile from Monte Circeo and 70 m. W. of Naples, and belongs partly to the province of Caserta and partly to that of Naples (Ventotene). There is regular communication with Naples by steamer, and in summer with Anzio. The islands rise to a height of about 70 ft. above sea-level. They are now penal settlements, and their isolated character led to their being similarly used in ancient times.

A colony with Latin rights was founded on Pontiae in 313 B.C. Nero, Germanicus’s eldest son, and the sisters of Caligula, were confined upon it; while Pandateria was the place of banishment of Julia, daughter of Augustus, of her daughter Agrippina the elder, and of Octavia, the divorced wife of Nero.

The Roman weights, equivalent to about 40 lb Russian and about 36 lbavoirdupois. A little more than 62 pounds go to the ton. The word is an adaptation of the Low German or Norse *pund*, pound.

**POOL** (1) A pond, or a small body of still water; also a place in a river or stream where the water is deep and still, and so applied in the Thames to that part of the river known as The Pool, which reaches from below London Bridge to Limehouse. The word in Old English was *pæl*, which may be related to *paul* or *pyll*, and the similar Celtic words, e.g. Cornish *pol*, a creek, common on the Bristol Channel and estuary of the Severn, on the English side in the form “paul.” A further breed-composition has been suggested with Late Lat. *pulminus*, marsh; Gr. *πηλίς*, mud. (2) A name for the stakes, penalties, &c., in various card and other games when collected together to be paid out to the winners; also the name of a variety of games of billiards (q.v.). This word has a curious history. It is certainly adapted from Fr. *poule*, hen, chicken, apparently a slang term for the stakes in a game, possibly, as the *New English Dictionary* suggests, used as a synonym for plunder, booty. “Chicken-hazard” must be cited as a parallel, though that has been taken to be a corruption of *chequeen*, a form of the Turkish coin, a sequin. When the word came into use in English at the end of the 17th century, it seems to have been at once identified with “pool,” pond, as Fr. *fiche* (ficher, to fix), a counter, was with “fish,” counters in card games often taking the form of “fish” made of mother-of-pearl, &c. “Pool,” in the sense of a common fund, has been adopted as a commercial term for a combination for the purpose of speculating in stocks and shares, the several owners of securities “pooling” them and placing them under a single control, and sharing all losses and profits. Similarly the name is given to a form of trade combination, especially in railway or shipping companies, by which the receipts or profits are divided on a certain agreed basis, for the purpose of avoiding competition (see **TRUST**).

**POOLE, REINALD STUART** (1832–1895). English archaeologist and orientalist, was born in London on the 27th of January 1832. His father was the Rev. Edward Poole, a well-known bibliophile. His mother, Sophia, authoress of *The Englishwoman in Egypt* (1844), was the sister of E. W. Lane, the Arabic scholar, with whom R. S. Poole lived in Cairo from 1842 to 1849, thus imbibing an early taste for Egyptian antiquities. In 1852 he became an assistant in the British Museum, and was assigned to the department of coins and medals, of which in 1870 he became keeper. In that capacity he did work of the highest value, alike as a writer, teacher and administrator. In 1882 he was largely responsible for founding the Egypt Exploration Fund, and in 1884 for starting the Society of Egypt Medallists. He died in 1893, and died on the 8th of February 1895. Some of Poole’s best work was done in his articles for the *Ency. Brit.* (9th ed.) on Egypt, Hieroglyphics.
and Numismatics, and considerable portions have been retained in the present edition, even though later research has been active in his sphere of work; he also wrote for Smith’s Dictionary of the Bible, and published several volumes dealing with his special subjects. He was for some time professor of archaeology at University College, London, and also lecturer at the Royal Academy.

His elder brother, Edward Stanley Poole (1830–1867), who was chief clerk in the science and art department at South Kensington, was an Arabic scholar, whose early death cut short a promising career. His two sons, Stanley Lane-Poole (b. 1854), professor of Arabic in Trinity College, Dublin, and Reginald Lane-Poole (b. 1857), keeper of the archives at Oxford, lecturer in diplomatic, and author of various historical works, carried on the family tradition of scholarship.

POOLE, a municipal borough, county in itself, market town and seaport in the eastern parliamentary division of Dorsetshire, England, 1135 m. S.W. by W. from London by the London & South-Western railway. Pop. (1901), 19,485. It is picturesquely situated on a peninsula between Holes Bay and the shallow irregular inlet of Poole Harbour. There are several modern churches, a guildhall, public library and school of art. Poole Harbour, extending inland 6 m., with a general breadth of 4 m., has a very narrow entrance, and is studded with low islands, on the largest of which, Brownsea or Branksea, is a castle, transformed into a residence, erected as a defence of the harbour in Tudor times, and strengthened by Charles I. Potters’ clay is worked here. At low water the harbour is entirely emptied except a narrow channel, when there is a depth of 8 ft. There are some valuable oyster beds. There is a considerable general coasting trade, and clay is exported to the Staffordshire potteries. Some shipbuilding is carried on, and there are manufacturers of cordage, netting and sailcloth. The town also possesses potteries, decorative tileworks, ironfoundries, agricultural implement works and flour-mills. Poole Park, containing 40 acres of land and 62 acres of water, was acquired in 1887 and 1889, and Branksome Park, of 40 acres, in 1895. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 5333 acres.

Although the neighbourhood abounds in British earthworks and barrows, and there are traces of a Roman road leading from Poole to Wimborne, Poole (La Pole) is not mentioned by the early chroniclers or in Domesday Book. The manor, part of that of Canford, belonged in 1086 to Edward of Salisbury, and passed by marriage to William Longespee, earl of Salisbury, thence to Edmund de Lacy, earl of Lincoln, and with his heiress to Thomas, earl of Lancaster, and so to the Crown. Poole is first mentioned in a writ of 1224, addressed to the bailiffs and good men of La Pole, ordering them to retain all ships within their port. Entries in the Patent Rolls show that Poole had considerable trade before William de Longespee, earl of Salisbury, granted the burgesses a charter about 1248 assuring to them all liberties and free customs within his borough. The bailiff was to be chosen by the lord from six men elected by the burgesses, and was to hold pleas for breach of measures and assizes. It is uncertain when the burgesses obtained their town at the fee-farm rent of £8, 13s. 4d. mentioned in 1312. The mayor, bailiffs and good men are first mentioned in 1311 and were required to provide two ships for service against Robert de Brus. In 1372 the burgesses obtained assize of bread and ale, and right to hold the courts of the lord of the manor, the prepositus being styled his mayor. The burgesses were licensed in 1453 to fortify the town; this was renewed in 1493. The mayor was given cognisance of the staple. Elizabeth incorporated Poole in 1560 and made it a separate county; Charles II. gave a charter in 1667. The corporation was suspended after a writ of quo warranto in 1668, the town being governed by the commission of the peace until the charters were renewed in 1688. Poole returned two members to parliament in 1362 and 1368, and regularly from 1452 to 1867, when the representation was reduced, ceasing in 1888. It is uncertain when the Thursday market was granted, but the present fairs on the Feasts of SS Philip and James and All Saints were granted in 1453. Poole, as the headquarters of the Parliamentary forces in Dorset during the Civil War, escaped the siege that crippled so many of its neighbours. When Charles II. visited the town in 1665 a large trade was carried on in stockings, though the prosperity of Poole still depended on its usefulness as a port.

POONA, or PUNA, a city and district of British India, in the Central division of Bombay. The city is at the confluence of the Mutha and Mula rivers, 1850 ft. above sea-level and 119 m. S.E. from Bombay on the Great Indian Peninsula railway. Municipal area, about 4 sq. m.; pop. (1901), 133,320. It is pleasantly situated amid extensive gardens, with a large number of modern public buildings, and also many temples and palaces dating from the 10th to the 19th century. The palace of the peshwas is a ruin, having been destroyed by fire in 1827. From its healthy situation Poona has been chosen not only as the headquarters of the 6th division of the Southern army, but also as the residence of the governor of Bombay during the rainy season, from June to September. The native town, along the river bank, is somewhat poorly built. The European quarter, including the cantonment, extends north-west towards Kirkee. The waterworks were constructed mainly by the munificence of Sir Jamsetjee Jeejeebhoy. Poona was never a great centre of trade or manufacture though still noted for brass-work, jewelry and other articles of luxury. Cotton-mills, paper-mills, a brewery (at Dapuri), flour-mills, factories of ice and mineral waters, and dairy farms furnish the chief industries. Educational institutions are numerous. They include the government Deccan College, with a law class; the aided Ferguson college; the government colleges of science and agriculture; high schools; training schools for masters and mistresses; medical school; and municipal technical school. The recent history of Poona has been painfully associated with the plague. During 1897, when the city was first attacked, the death-rate rose to 93 per 1000 in Poona city, 71 per 1000 in the cantonment, and 93 per 1000 in Kirkee.

The District of Poona has an area of 5349 sq. m. Population (1901), 995,330, showing an increase of 18% after the disastrous famine of 1876–1877, but a decrease of 7% in the last decade. Towards the west the country is undulating, and here the Poona spurs from the Western Ghats enter the district; to the east it opens out into plains. It is watered by many streams which, rising in the ghats, flow eastwards until they join the Bhima, a river which intersects the district from north to south. The principal crops are millets, pulses, oilseeds, wheat, rice, sugar-cane, vegetables and fruit (including grapes). The two most important irrigation works in the Deccan are the Mutha canal, with which the Poona waterworks are connected, and the Nira canal. These are manufactures of cotton, silk and blankets. The district is traversed by the Great Indian Peninsula railway, and also by the Southern Mahartta line, which starts from Poona city towards Satara. It is liable to drought, from which it suffered severely in 1866–1867, 1876–1877, and again in 1896–1897.

In the 17th century the district formed part of the Mahomedan kingdom of Ahmadnagar. Sivaji was born within its boundaries at Junnar in 1627, and he was brought up at Poona town as the headquarters of the hereditary fie of his father. The district thus was the early centre of the Marhatta power; and when Satara became first the capital and later the prison of the descendants of Sivaji, Poona continued to be the seat of government under their hereditary ministers, with the title of peshwa. Many stirring scenes in Maratha history were enacted here. Holkar defeated the last peshwa under its walls, and his flight to Benares led to the treaty by which he put himself under British protection. He was reinstated in 1802, but, unable to maintain friendly relations, he attacked the British at Kirkee in 1817, and his kingdom passed from him.

POOP (Lat. puppis, stern), the stern or after-part of a ship; in the 16th and 17th centuries a lofty and castellated deck. The verb “to poop” is used of a wave breaking over the stern of a vessel.
POORE—POOR LAW

POORE (or Poor), RICHARD (d. 1237), English bishop, was a son of Richard of Ilchester, bishop of Winchester. About 1197 he was chosen dean of Sarum and, after being an unsuccessful candidate for the bishoprics of Winchester and of Durham, he became bishop of Ilchester in 1214. In 1217 he was translated to Salisbury, where he succeeded his elder brother, Herbert Foster. He died in 1228 in the village of Monkton, Dorset, said by some to be his birthplace, on the 15th of April 1237. Poore took some part in public affairs, under Henry III, but the great work of his life was done at Salisbury. Having in 1219 removed his see from Old to New Sarum, or Salisbury, he began the building of the magnificent cathedral there; he laid the foundation stone in April 1220, and during his episcopate he found money and forwarded the work in other ways. For the city the bishop secured a charter from Henry III, and he was responsible for the plan on which it was built, a plan which to some extent it still retains. He had something to do with drawing up some statutes for his cathedral; he is said to be responsible for the final form of the "use of Sarum," and he was probably the author of the Ancien Règle, a valuable "picture of contemporary life, manners and feeling" written in Middle English. His supposed identity with the jurist, Richardus Anglicus, is more doubtful.

POOR LAW. The phrase "poor law" in English usage denotes the legislation embodying the measures taken by the state for the relief of paupers and its administration. The history of the subject and its problems generally are dealt with in the article CHARITY AND CHARITIES, and other information will be found in UNEMPLOYMENT and Vagrancy. This article will deal only with the practice in the United Kingdom as adopted after the reform of the poor law in 1834 and amended by subsequent acts. This reform was brought about mainly by the rapid increase of the poor rate at the beginning of the 19th century, showing that a change was necessary either in the poor law as it then existed or in the mode of its administration.

A commission was appointed in 1832 "to make diligent and full inquiry into the practical operation of the laws for the relief of the poor in England and Wales, and into the manner in which those laws were administered, and to report their opinion as to what beneficial alterations could be made." The commissioners reported "fully on the great abuse of the legislative provision for the poor as directed to be employed by the statute of Elizabeth," finding "that the great source of abuse was the outdoor relief afforded to the able-bodied on their own account or on that of their families, given either in kind or in money." They also reported that "great maladministration existed in the workhouses." To remedy the evils they proposed considerable alterations in the law, and the principal portion of their suggestions was embodied in the Poor Law Amendment Act 1834. By virtue of this act three commissioners were appointed (originally for five years, but subsequently continued from time to time), styled "the poor law commissioners for England and Wales," sitting as a board, and appointing assistant commissioners and other officers. The administration of relief according to the existing laws was subject to their direction and control, and to their orders and regulations for the government of workhouses and the guidance and control of guardians and vestries and the keeping and allowing of accounts and contracts, without interfering with ordinary relief in individual cases. The whole of England and Wales was divided into twenty-one districts, to each of which an assistant commissioner was appointed. The commissioners under their powers formed poor law boards by uniting parishes for general administration, and building workhouses; guardians elected by the ratepayers (or ex officio) having the general government and administration of relief. The expense was apportioned to each parish on settled principles and rules, with power, however, to treat the united parishes as one for certain purposes. Outdoor relief might be given, on the order of two justices, to poor persons wholly unable to work from old age or infirmity. The obstacles which the act had to contend with in London chiefly arose from the confusion and perplexity of jurisdiction which existed in the one hundred and seventy parishes comprised within the city of London and the metropolitan district, some of these containing governing bodies of their own; in some the parish business was professionally managed by open vestries, in others by select vestries, and in addition to these there were district boards of vestries, while the majority of the large parishes were managed by boards of select vestries and boards of directors, governors and trustees. These governing bodies executed a great variety of functions besides regulating the management of the poor. The power, patronage and the indirect advantages which arose from the administration of the local funds were so great that much opposition took place when it was proposed to interfere by constituting a board to be annually chosen and freely elected by the ratepayers, on which the duty of regulating the expenditure for the relief of the poor was to depend. The general management of the poor was, however, on a somewhat better footing in London than in the country.

The act of 1834 was rather to restore the scope and intention of the statute of Elizabeth by placing its administration in the hands of responsible persons chosen by the ratepayers, and themselves controlled by the orders of a central body, than to create a new system of poor laws. The agents and instruments by which the administration of relief is afforded are the following. The description applies to the year 1910, but, as noticed below, the question of further reform was already to the fore, and the precise direction in which changes should go was a highly controversial matter.

The guardians of the poor regulate the cases and description of relief within the union; a certain number of guardians are elected from time to time by the ratepayers. The number was formerly determined by the central board, by whom full directions as to the mode of election were given. In addition to those elected there were ex officio guardians, principally local magistrates. However, both these and nominated guardians were done away with by the Local Government Act 1894. The plural vote (which gave to the votes of the larger ratepayers a higher value) was also abolished; and in place of the old property qualification for the office of guardian a ratepaying or residential qualification was substituted. In urban districts the act in other respects left the board of guardians untouched, but in rural districts it inaugurated a policy of consolidating local authorities. In the rural districts the district council is practically amalgamated with the guardians, for, though each body retains a separate corporate existence, the district councillors are the guardians, and guardians as such are no longer elected. These electoral changes, extremely democratic in their character, brought about no marked general change in poor law administration. Here and there abrupt changes of policy were made, but the difficulty of bringing general principles to bear on the administration of the law remained much as before.

The guardians hold their meetings frequently, according to the exigencies of the union. Individual cases are brought to their notice—most cases of resident poor by the relieving officer of the union; the case of casual paupers by him or by the workhouse officers by whom they were admitted in the first instance. The resident poor frequently appear in person before the guardians. The mode of voting which the guardians follow in respect to any matter they differ on is minutely regulated, and all their proceedings, as well as those of their officers, are entered in prescribed books and forms. They have a clerk, generally a local solicitor of experience, who has a variety of responsible duties in advising, conducting correspondence and keeping books of

1 After an intermediate transfer in 1847 of the powers of the poor law commissioners, and the constitution of a fresh board styled "commissioners for the laws for relief of the poor in England," it was found expedient to concentrate in one department of the government the supervision of the laws relating to the public health, the relief of the poor and local government; and this concentration was in 1871 carried out by the establishment (by Act of Parliament 34 & 35 Vict. c. 70) of the local government board.
accounts, and carrying out the directions of the guardians, who in their turn are subject to the general or special regulations of the local government board.

It may be mentioned here that the chief difficulty in understanding the English poor law arises from the fact that there are three authorities, each of them able to alter its administration fundamentally. The poor law is not only the creation of statutes passed by parliament; it is also controlled by the subordinate jurisdiction of the local government board, which in virtue of various acts has the power to issue orders. In a single year the local government board may issue nearly two thousand orders, over a thousand of them having special reference to the poor law. It is not possible therefore even to summarize the mass of subordinate legislation. A third source of authority is the local board of guardians, which, within the discretion allowed to it by statutes and orders, can so variously administer the law that it is difficult to understand how procedure so fundamentally different can be based on one and the same law.

This elasticity, admirable or mischievous, as we choose to regard it, is the most characteristic feature of the English poor law system. The various officers of the union, from the medical officers to workhouse porters, including masters and matrons of workhouses, are generally appointed by the guardians, and the areas, duties and salaries of these paid officers may be prescribed by the local government board.

Among a multitude of miscellaneous duties and powers of the guardians, apart from the ordinary duties of ordering or refusing relief in individual cases and superintending the officers of the union, the duties devolve on them of considering the adjustment of contributions to the common fund whether of divided or added parishes, and matters affecting other unions, the building of workhouses and raising of money for that and other purposes, the taking of land on lease, the hiring of buildings, special provisions as to superannuation and allowances to officers, the maintenance and orders as to lunatics apart from individual instances, and the superintendence of questions of separation and removal. A paramount obligation rests on the guardians to attend to the actual visitation of workhouses, schools and other institutions and places in which the poor are interested, and to call attention to and report on any irregularity or neglect of duty.

Guardians may charge the rates with the expenses of attending conferences for the discussion of matters connected with their duties (Poor Law Conferences Act 1883). In relation to expenditure the guardians have very considerable but restricted powers. Their accounts are audited by district auditors appointed by the local government board.

Overseers are still appointed under the statute of Elizabeth, and the guardians cannot interfere with the appointment. As, however, the relief of the poor is administered by boards of guardians, the principal duties of overseers relate to the making and collection of rates and payments. The guardians, by order of the local government board, may appoint assistant overseers and collectors.

The conditions of persons entitled to relief are indicated by the terms of the statute of Elizabeth. If they fall within the definitions there given they have right to relief.

A fundamental principle with respect to legal relief of the poor is that the condition of the pauper ought to be, on the whole, less eligible than that of the independent labourer. The pauper has "no just ground for complaint, if, while his physical wants are adequately provided for, his condition is less eligible than that of the poorest class of those who contribute to his support. If a state of destitution exists, the failure of three persons to perform their duty, as a husband, or relative mentioned in the statute of Elizabeth, neglecting those he is under a legal obligation to support, is no answer to the application. The relief should be afforded, and is often a condition precedent to the right of parish officers to take proceedings against the relatives or to apply to other poor under the duty to give immediate relief. In cases however, vary with the circumstances. The case of wanderers under circumstances not admitting of delay may be different from that of persons resident on the spot where inquiry as to all the circumstances is practicable. The statute of Elizabeth contemplated that the relief was to be afforded to the poor resident in the parish, but it is contrary to the spirit of the law that any person shall be permitted to perish from starvation or want of medical assistance. Whoever is by sudden emergency or urgent distress deprived of the ordinary means of subsistence has a right to apply for immediate relief where he may happen to be. Persons comprehended within this class are called "casual poor," although the term "casuals" is generally used in reference to vagrants who take refuge for a short time in the parish. The term "casuals" is derived from the fact that they are applied to ascertain whether applicants are really destitute. Labour tests are applied to the able-bodied, and workhouse tests are applied to those to whom entering a workhouse is made a condition of relief.

As to the nature and kind of relief given under the poor laws the great distinction restored rather than introduced by the amendment of the poor law system in 1834 was between giving all relief to able-bodied persons of their own proper families in well-regulated workhouses (that is to say, places where they may be set to work according to the spirit and intention of the statute of Elizabeth), and confining outdoor relief to a class of persons who are not able to be admitted to the workhouses, and those of the third class. It was not possible by the terms of the statute of Elizabeth to put a price on admission to the workhouses, where only able-bodied persons were to be admitted, and it was desired to put a stop to the institution of more workhouses which was the object of the statute; and the workhouses of the third class were placed under the control of the overseers of the poor. It was provided that the overseers should be the judges of the admission of persons to the workhouses, and that the law relating to workhouses was to be superseded by a separate act. The law of 1834 was a great reform of the poor law. The workhouse was to be the residence of the able-bodied poor, and was to be kept in as good a state as an inn, and the person paying for the workhouse should have the right of admission to the workhouse at any time. The overseers of the poor in the parishes were appointed to enforce the act of 1834, and to keep the workhouse in proper repair. The workhouse was to be kept in a good state of repair, and the overseers were to have the power to keep the workhouse in proper repair. The workhouse was to be kept in a good state of repair, and the overseers were to have the power to keep the workhouse in proper repair. infirm, sick or disabled by any injury, or above sixty years of age to live together, but every such case must be reported to the local government ad\n
The classification of children apart from adult paupers is per\nemptory. Even in those unions where what is called a workhouse\nschool is maintained the children are kept in detached parts of\nthe building, and do not come together with the adults. Such a separate school is built on a separate and often distant site. Some\ntimes the separate school is one building, sometimes detached\n"blocks," and sometimes a group of cottage homes. There still run regular or irregular plans for the reception and treatment of\nchildren, and this is called the scattered systems has been adopted. This\nconsists in lodgings-homes for the children placed in different parts of\nthe town, under the charge of the local guardians. In the rural districts and in less populous unions the children generally attend the local public elementary schools. To these guardians' report must be added. The above\nnumber of course only to those children who are inmates of the separate\nwas charged to the guardians. Outdoor paupers are responsible for\neducation of their children, but guardians legal and financially\nresponsible if the children are not sent regularly to school.

The tendency too has been to improve administrative methods with reference to children.

Two important orders on the subject of the boarding-out of poor\npoor law were issued in 1889. By the Boarding of Children in\nOrdinance of 1888, it was provided that no child shall be placed with\nsuitable foster-parents in the union by all boards of guardians except those in the metropolis. This can be done either through a local board of guardians or through a responsible person. The order to\nthe orphan and desert children may be boarded by all boards of\nguardians without the limits of their own unions, but in all cases\nthat must be done through the offices of properly constituted local\nboards of guardians. The number of children boarded out is not to exceed 4s. per week for each child. The local committee\nrequire to be approved by the Local Government Board.

The question of the education of poor law children was much\ndiscussed in the 1887 meeting of the Poor Law Association. During\nthe administration of the Poor Law Union there was yet another\nauthority, it was the object of the commissioners to induce boards of\nguardians to unite in districts for educational purposes. This\nwas advocated on grounds of efficiency and economy. It was very\nunpopular with the local boards of guardians, and the union, with the\nresult that boards of guardians have in this respect been very much\nlimited, indeed in London, where this suggestion was adopted\nless desirable than in rural unions, several districts have made a large departure from the recommendation of the\naggregation, and was certainly less desirable than in rural unions, where\ndeserted children are boarded out by all boards of guardians without the limits of their own unions, but in all cases\nthat must be done through the offices of properly constituted local\nboards of guardians. The number of children boarded out is not to exceed 4s. per week for each child. The local committee\nrequire to be approved by the Local Government Board.

Other acts to be noted are the Poor Law Act 1889 and the Custody\nof Children Act 1891, § 3. The evil of allowing children who\nhave committed no offence to come into contact with the criminal\ntinue into habits on return to the custody of unworthy parents\nhas been the subject of frequent remark. By the act of 1889,\nguardians are authorized to detain children who are under their\ncharges and who are not abandoned or deserted after to the ages\n16 if boys and of 18 if girls. By the Poor Law Act 1899, the\nthe principle is extended to orphans and the children of bad parents\nchargeable to the rates. The of 1861 goes further, and enacted\nthat where a parent has (a) abandoned or deserted his child, or\n(b) allowed his child to be brought up by another person at that\nperson's expense, or by the guardians of a poor law union for such a\nlength of time and in such circumstances as to satisfy the court\nthat the upbringing of the child has been more to the advantage of his personal duties, the court shall not make an order for the delivery of the child to the parent unless the court has satisfied the court that, having regard to the welfare of the child, he is a fit person to have the custody of the child.

Casual and poor wayfarers admitted by the master and matron\nare kept in a separate ward and detered and set to work in such manner as may be reasonably expected by residents. Fugitives or\ninfants or mendicants are received into a workhouse they are\nusually (as a precaution necessary for preventing the introduction of\nfectious or contagious diseases) kept entirely separate from the other inmates. This procedure is found to stay children with\nFor the guidance of guardians an important circular was issued\nby the London government board or the 15th of March 1886. It\nsays that the guardians have the right to visit schools, and that the\nguardians possess are sufficiently to enable them to deal\nwith ordinary pauperism, and to meet the demand for relief from\nthe classes who usually seek it, yet "these provisions do not in\nall cases meet even the demand made by the local poor law autho\nand others who have hitherto avoided poor law assistance, and who

are temporarily deprived of employment, is—(1) Work which will not\ninvolve the stigma of pauperism; (2) work which can per\ntentially pay the wages ordinarily paid for such work which does not compete with that of other labourers at present in employment; and lastly, work which is not likely to interfere with the resumption of regular employment in their case when able to return to it."

The circular went on to recommend that guardians should confer with the local authorities, and to arrange with the\nfor the execution of works on which unskilled labour may be\nvented and the work can be done on a per diem rate.

The recommendations that were made were as follows:
(1) the men to be employed must be recommended by the guardians;\n(2) the wages must be less than the wages ordinarily paid for such work.

The circular was widely distributed. Many boards that were\ninclined in that direction regarded it as an encouragement to open\nledger of opening of relief works. Others, again, looked closely at the conditions, and declared roundly that it was totally\nunable to fulfil them. A poor law authority, they said, cannot give\nrelief which will not subject the recipients to the legal (if any) and\nand economic disabilities attaching to the receipt of poor law relief. Work which can only be found in the shape of\nthe task-work under adequate supervision. If the work is of a useful\nand necessary character, it must compete with the labour of others\nbered to the trades affected. If the relief works are opened by\nauthorities, it is either the law government or the guardians who\nthe men were only to be employed when recommended by the\nwardens, and then paid less than the current rate of wages, were\nscribed. The circular seems to have been based on the idea that it was a sort of "pauperism." The ambiguity of the circular indeed\nwas such, that both action and inaction seem equally justified by\nthe administration of medical relief to the sick, the objects kept in mind are: (1) The time is not to exceed 4s. per week for each child. The local committee require to be approved by the Local Government Board.

Medical Relief.

Unions are formed into medical districts limited in area and\npoor-rate payments, to which a local board or commissioners, who\nare furnished with a list of all such aged and infirm persons and persons\npermanently sick or disabled as are actually receiving relief and\nresidential within their districts, are to subscribe. When a person\nthe list receives a ticket, and on exhibiting it to the medical officer is entitled to advice, attendance and medicine as his case may require. Medical outdoor relief in connection with dispen\nsaries and hospitals is regulated in the Metropolitan Poor Act 1867 (30 & 31 Vict. c. 6). In connexion with medical relief must be noted the Medical Relief Disqualification Removal Act 1885. This act relieved voters from disqualifi\ncation for registration who were receiving medical relief, and the\nprovisions which require the removal of the names of paupers from the electoral roll are, it is understood, very widely applied. "Guardian Lying-in Homes" were regulated in the Poor Law Act 1894 authorized guardians, in calculating the proper allowance to be made, to disregard an income derived from a friendly society, and to give relief as if the applicant in receipt of such an allowance was wholly destitute. This act is a curiously illiberalization of the\nEnglish poor law system. In earlier years, notably in what is\nknown as Page's letter (22nd Rep. Poor Law Board, p. 108), the central\nboard, had, in answer to inquiry, pointed out that such preferential treatment given to men receiving benefit, insufficient to maintain them, from a friendly society, could not in equity be witheld from persons in receipt of an adequate benefit, or from other sources. The provision of a saving of a substantial amount in a co-operative society, or of cottage property; and further, that\nthat an engagement on the part of guardians to supplement insufficient allowance from a friendly society was a bounty on inadequacy and was therefore against the principle of the law. It is, however, far\nfar as to say that relief given in such disregard of the pauper's income was illegal. They had, however, issued no peremptory order on the subject, nor had guardians been charged for neglect of duty. The Board, in 1894, made the statement that the practice of a general principle of the law, and a very general practice was to reckon friendly society allowances at half their value. The above act set aside the central board's earlier interpretation of the law. It made, however, no attempt to declare that the practice, but is a general one, and all guardians who\nregard the course thereby authorized as contrary to public policy. A

Lunatics.

Lunatics. Several committees of visitors who, among other duties, fix a weekly sum to be charged for the lodging, maintenance, medicine and clothing of each pauper lunatic confined in such asylum. Several

the Lunacy Act 1891.
An explanatory letter issued by the local government board will be found in the 20th Annual Report, p. 23. The tendency of this and of all recent legislation for an afflicted class has been to increase the care and the safeguards for their property and their personal rights.

An owner may acquire title not only of any one of the modes pointed out by the poor laws to become a recipient of the benefits of those laws in that parish or place where the right has been last acquired.

No relief is given to the ratepayers for the support of the person who resides within the union, except where such person is being casually within a parish becomes destitute by sudden distress, or where such person is entitled to relief under justice's order (applicable to persons under orders of removal and to non-resident lunatics), and except to widows and legitimated children where the widow was resident with her husband at the time of his death for which relief is made and where she was not settled, or where a child under sixteen is maintained in a workhouse or establishment for the education of pauper children not situated in the union, and in some cases, in exceptional cases, where the law has by statute permitted an exception to the rule, so that the occupation is by the subject, so that occupation is rateable. Thus for apartments in a royal palace, gratuitously assigned to a subject, who occupies them by permission of the sovereign for the subject's benefit, the latter is rateable on the other hand, where a lease of private property is taken in the name of a subject, but the occupation is by the sovereign or his subjects on his behalf, no rate can be imposed.

As regards occupiers of land and houses, the correct principles as to persons liable to be rated were, after many erroneous views and decisions, established by the House of Lords in 1865 in the case of the Mersey docks. The only occupier exempt from the operation of the act of Elizabeth is the Crown, on the general principle of the titles of the Crown not being impeached. The subject in other words, whether the occupation is by the Crown itself, by a tenant, or by a servant of the Crown, so that the occupation is by the subject, that occupation is rateable. Thus for apartments in a royal palace, gratuitously assigned to a subject, who occupies them by permission of the sovereign for the subject's benefit, the latter is rateable on the other hand, where a lease of private property is taken in the name of a subject, but the occupation is by the sovereign or his subjects on his behalf, no rate can be imposed.

estimated rental of all property and the names of occupiers and owners, and the rateable value after the deductions specified in the Assessment Acts. The whole is described in a volume which has been bound in boards. This valuation list, made and signed by the overseers, is published, and all persons assessed or liable to be assessed, and other interested persons, have a copy of it. In the valuations of other parishes, inspect and take copies of and extracts from that list, and of provisions in relation to the valuation and supplemental valuation lists. Objectors on the ground of unfairness or incorrectness of the valuations hold meetings to hear and determine such objections. The valuation list, where approved by the committee, is delivered to the overseers, who proceed to make the rate in accordance with the valuation lists and in a proportion of the rate for the corn harvest. The rate officers conduct examination and comparison of the rate book with the assessments, and obtain the consent of justices as required by the statute of 3 & 4 Will. III, c. 45. The allowance of the rate is merely a ministerial act, and if the rate is good on the face of it the justices cannot inquire into its validity.

The rate is then published and open to inspection. Appeals may be made to special or quarter sessions, and orders may be made subject to the restriction that, if the objection were such that it would have been dealt with on the valuation lists, no appeal to sessions is permitted unless the valuation list has been duly objected to and the objector had failed to obtain such relief in the matter as he desired. In the metropolis a common basis of value for the purposes of government and local taxation is provided, including the promotion of uniformity in the assessment of rateable property. Provision is made for the payment of contributions for the maintenance of certain charities or vestries, and for the preparation of valuation lists, and the deposit and distribution of valuation lists, and for the periodical revision of the rates of valuation. Many endeavours have been made to readjust the burden of local expenditure. The system of making grants from the national taxes in aid of local rates has been extended. The principle of the metropolis free fund, whereby metropolitan grants assessed on the whole of London in aid of the revenue of the poor law authorities, has been followed, mutatis mutandis, in the relations between the national and the local exchequers. At the time of the repeal of the corn laws, Robert Peel expressed the opinion that this fiscal change necessitated some readjustment of local rates. In that year, 1840, a beginning of grants from the national exchequer in aid of local expenditure was made. The salary of the sanitary inspector of rat-control, medical officers and auditors were provided from the larger area of taxation, and in 1869 the salaries of public vaccinators were added to the list. In 1874 a grant of 4s. per head per week was made, in respect of each pauper lunatic passed by the guardians to the care of a lunatic asylum. By the Local Government Act 1888, supplemented by the Local Taxation (Customs and Excise) Act 1899, this principle was more widely extended. The various grants in aid were abolished, and just substitution the proceeds of certain specified taxes were provided for local purposes. From this source, the gross amount of which of course varies, there are now distributed to local poor-law authorities, medical officers and auditors, and to the guardians of the poor on their average expenditure in previous years in salaries of officials and other specified charges. In London, in order not to conflict with the operation of the common poor fund, which had already been spread through the city, a grant was made of a sum equivalent to about 4d. per diem for each indoor pauper. The number on which this calculation is based is not, however, to be the actual number, but the average of the last five years previous to the passing of the act. By this legislation something like one-quarter of the total expenditure on poor law relief is obtained from national taxes as opposed to local rates. By the Agricultural Rates Act 1866 the occupier of agricultural land was made to pay one-half of certain rates, including the poor rate. The deficiency is supplied by a contribution from the national exchequer. Meanwhile, the spending authority continue to be elected by the local ratepayers. This connexion between central and local government is not without notice. By the Poor Rate Assessment and Collection Act 1896, owners who compound to pay the rates in respect of tenement property are excused from paying the tax in respect of the unoccupied portion of the rate. Such payments by the owner are not considered as payments by the occupier, who thereby is to be deemed duly rated for any qualification or franchise. Under these arrangements a large number of urban districts have contributed directly towards payment of the rates. A converse process is also going on, whereby the ownership of a house and increasing body of property is practically unrepresented. This is due to the great growth of property in the hands of railway companies. The railroad lands are said to be paid considerably over 15% of the local taxation of the country, and they have no local representation. There is, in fact, in local administration a divorce between representation and taxation. This system of representation is described in the book. The railways alone are said to pay considerably over 15% of the local taxation of the country, and they have no local representation. The commission, for example, the ratepayers in the Cornish mining districts are entirely and generally unrepresented. It is impossible not to connect the fact with the rapid growth of local expenditure and indebtedness. Royal Commission of 1903-1909.—The main points of the system of English poor relief, as still in force in 1910, are as outlined above. That it has been inadequate in dealing with the various problems of unemployment and pauperism, which the constantly changing conditions of the industrial world necessarily evolve had however been long acknowledged. Accordingly, in 1903 a royal commission was appointed to inquire into the working of the law relating to the relief of poor persons, and into the various means adopted outside of the poor laws for the relief of the poor suffering from want of employment, particularly during the periods of industrial depression. The commission took voluminous evidence and its report was issued in the appendix volumes to the Report of the Royal Commission number thirty-four. Its contents are as follows: vol. i. English Official Evidence, minutes of evidence mainly of the officers of the Poor Law in England and Wales; vol. ii. London Evidence, minutes of evidence mainly of London Poor Law Associations and Critics, minutes of evidence mainly of critics of the Poor Law and of witnesses representing Poor Law and Charitable Associations; vol. iii. Urban Centres, minute of evidence containing the oral and written evidence of the British Medical Association and of witnesses from the following provincial urban centres—Liverpool and Manchester districts, West Yorkshire, and the County of Lancashire; vol. iv. Rural Centres, minute of evidence containing the oral and written evidence of witnesses from urban centres in the following districts—South Wales and North Eastern Counties; vol. vi. Minutes of evidence relating to the administration of the Poor Law in Scotland; vol. vii. Minutes of Evidence containing the oral and written evidence of witnesses from rural centres in the Western, Western and Eastern Counties, from the parish of Poplar Borough and from the National Conferences. Further evidence and minutes of evidence relating to persons or organisations in the Isle of Wight and Guernsey; vol. viii. Minutes of Evidence relating to the subject of "unemployment"; vol. ix. Evidence of further witnesses on the subject of unemployment; vol. x. Minutes of Evidence containing the oral and written evidence of witnesses from the Poor Law in the Voluntary Unions in the English Channel Islands and in the Isle of Man; vol. xi. Minutes of Evidence containing the oral and written evidence of witnesses from the Poor Law in the Voluntary Unions in the Channel Islands and the Isle of Man; vol. xii. Reports, Memoranda and Tables prepared by certain of the Commissioners; vol. xiii. Diocesan Reports on the Methods of Providing the Charitable Assistance and the extent and incidence of need of relief in certain unions in England and Wales, by Dr. J. C. McVail; vol. xiv. Reports on the Methods and Results of the present system of administering indoor and outdoor relief in certain unions in England and Wales, by Dr. J. P. C. Poole; vol. xv. Reports on the Relation of Charity and the Poor Law, and the extent and the actual and potential utility of Endowed and Voluntary Charities in England and Scotland, by A. K. and H. V. Report to the Poor Law Commission on the Relation of Industrial and Sanitary Conditions to Pauperism, by Steel Maitland and Miss R. E. Squire; vol. xvi. Reports on the effect of Outdoor Relief on Wages and the Conditions of Employment, by Thomas Jones and Miss Williams; vol. xviii. Report on the Condition of the Children who are in receipt of the various forms of Poor Law Relief in certain Unions in London, by Miss M. B. Roberts; vol. xix. Report on the Condition of the Children who are in receipt of certain forms of Poor Law Relief in certain Unions in London, by Miss M. B. Roberts; vol. xxi. Report on the Condition of the Children who are in receipt of certain forms of Poor Law Relief in certain Unions in London, by Miss M. B. Roberts; vol. xii. Report on the Condition of the Children who are in receipt of certain forms of Poor Law Relief in certain Unions in London, by Miss M. B. Roberts; vol. xx. Report on the Condition of the Children who are in receipt of certain forms of Poor Law Relief in certain Unions in London, by Miss M. B. Roberts; vol. xxiv. Report on the Condition of "Ordnary" Paupers in certain Scottish Poorhouses with that of the Able-bodied Paupers in certain English Workhouses, by A. W. Proctor; vol. xxv. Statistical Memoranda and Tables relating to England and Wales, prepared by the Staff of the Commission and by Government Departments and others; vol. xxvi. Result of Revisit to Certain Institutions in England and Wales to Questions circulated on the subject of the Unemployed Workmen Act 1905; vol. xxvii. Reports of Visits to Poor Law and Charitable Institutions and Reports of the Commission's Inspectors; vol. xxviii. Minutes of Evidence containing the oral and written evidence of witnesses from the Poor Law in the Voluntary Unions in the Channel Islands and the Isle of Man; vol. xxix. Report on the Methods of Administering Charitable Assistance and the extent and intensity of Poverty in Scotland, presented to the Committee, Churches appointed by the General Assembly of the Church of Scotland, relating especially to Scotland; vol. xxx. Statistical Memoranda and Tables relating to Scotland, &c.; vol. xxxi. Report on Visits paid by the Foreign Labour Commission; vol. xxii. Report of the Royal Commission to certain Institutions in Holland, Belgium, Germany, and Switzerland; vol. xxxii. Foreign and Colonial Systems of Poor
1909. It consists of a majority report, signed by the chairman and 13 other members, and a minority report signed by 4 dis- sentient members. To this report and its appendices those who wish to obtain an exhaustive account of the working of the English poor law must necessarily have recourse. The "majority" report opens with a statistical survey of poor law performance, a historical sketch of the poor law system down to 1834, and proceeds to deal in detail with the historical development and present condition of the various branches of the poor law under their appropriate headings: (a) the central authority; (b) the local authority; (c) the officers of the local authority; (d) areas of administration; (e) indoor relief; (f) outdoor relief; (g) the aged; (h) the children; (i) the able-bodied under the poor law and (j) the causes of pauperism. Other portions of the report deal with medical relief, distress due to unemployment, and charities and the relief of distress. In reviewing these various subjects the commission lay bare the main defects of the present system, which they briefly summarize as follows:

i. The inadequacy of existing poor law areas to meet the growing needs of administration.

ii. The excessive size of many boards of guardians.

iii. The absence of any general interest in poor law work and poor law elections, due in great part to the fact that poor law stands in no organic relation to the rest of local government.

iv. The lack of intelligent uniformity in the application of principles and in general administration.

v. The want of proper investigation and discrimination in dealing with applicants.

vi. The tendency in many boards of guardians to give outdoor relief without plan or purpose.

vii. The unsuitability of the general workhouse as a test or deterrent for the able-bodied; the aggregation in it of all classes without sufficient classification; and the absence of any system of friendly and restorative help.

viii. The lack of co-operation between poor law and charity.

ix. The tendency of candidates to make lavish promises of out-relief and of guardians to favour their constituents in its distribution.

x. General failure to attract capable social workers and leading citizens.

xi. The general rise in expenditure, not always accompanied by an increase of efficiency in administration.

xii. The want of sufficient control and continuity of policy on the part of the central authority.

The commission stated that these defects have produced a want of confidence in the local administration of the poor law, and that they have been mainly the cause of the introduction of other forms of relief from public funds which are unaccompanied by such conditions as are imperatively necessary as safeguards.

The commission proceed to formulate a scheme of reform, the main features of which are summarized below:

**Public Assistance.**—The commissioners state that the name "poor law" has gathered about it associations of harshness, and still more of hopelessness, which might seriously obstruct the reforms they recommend, and they suggest that the title "public assistance" should be substituted for the old one outlined in their report. They propose the abolition of the existing boards of guardians, the separation of their duties into two categories, and the calling into existence of two bodies for the discharge of the two sets of functions, viz. a local authority, known as the public assistance authority, with an area conterminous with the area of the county or county borough, for central administration and control; and local co-operation area. for dealing with applications, investigating and supervising cases and undertaking such other duties as may be delegated by the public assistance authority. They recommend that the public assistance authority should be a statutory committee of the County Council, with one-half of its members appointed by the council from persons who are members of the council, and the other half of its members appointed by the council from outside their number, and to consist of persons experienced in the local administration of public assistance or relief, with a memorandum on the Relief of Faminies in India; vol. xxi. Alphabetic Lists of Ormal and Non-orval Witnesses.
Unemployment Insurance.—The establishment and promotion of unemployment insurance, especially amongst unskilled and unorganized labour, is of paramount importance in averting distress arising from unemployment, and is of such national importance as to justify, under specified conditions, contributions from public funds towards its furtherance. The commission further state that this insurance can best be promoted by utilizing the agency of existing trade organizations, or of organizations of a like character, so that they are in a position to gather unemployment insurance, either foreign or British, which has been brought before them, is so free from objections as to justify them in recommending it for general adoption.

Labour Council.—The commission recommend their establishment and use. (For these see VAGRANCY.)

Four out of the seventeen members of the commission, being unable to agree with their colleagues, issued a separate report, which is very nearly as voluminous as that of the majority. Their recommendations were more drastic than those of the majority, and had for their aim not a reform of the poor law as it exists, but its entire break-up. The minority agree with the majority in recommending the abolition of workhouses, but instead of setting up new authorities, they consider that the duties of the guardians should be transferred to the county authorities, with an appropriate distribution among four existing committees of the county council. They recommend that the education committee be relieved of responsibility for the education of children of school15; that the health committee should care for the sick and permanently incapacitated, infants under school age, and the aged requiring institutional care. The asylum committee should have charge of the mentally defective and the pension committee of the aged to whom pensions are awarded.

The minority think there should be some systematic coordination, within each local area, of all forms of public assistance and, if possible, of all assistance dispensed by voluntary agencies, and they recommend the appointment, by the county or county borough council, of one or more responsible officers, called “inspectors of public assistance.” Their duties would be to keep a register of all persons receiving any form of public assistance within their districts; they would assess the charge to be made on individuals liable to pay any part of the cost of the service rendered to them or their dependants, and recover the amount thus due. They would also have to consider the proposals of the various committees of the council for the payment of out-relief, or, as the minority prefer to term it, “home aliment.” Other various duties are allotted to them in the report.

The subject of unemployment was considered by the minority and they made the following recommendations:

(1) The duty of organizing the national labour market should be placed upon a ministry capable to parliament. The ministry of labour should have six distinct and separately organized divisions; viz. the national labour exchange; the trade insurance division; the maintenance and training division; the industrial regulation division; the emigration and immigration division, and the statistical division.

National Labour Exchange.—The function of the national labour exchange should be, not only (a) to ascertain and report the surplus or shortage of labour of particular kinds, at particular places; and (b) to diminish the time and energy now spent in looking for work, and the consequent leaking between jobs; but also (c) so to dovetail casual and permanent engagements as to provide practical continuity of work for those now chronically unemployed.

Absorption of Surplus Labour.—To reduce the surplus of labour the minority recommend (a) that no child should be employed, in any occupation whatsoever, below the age of fifteen; no young person under eighteen for more than thirty hours per week, and all so employed should be required to attend some suitable public instruction; (b) that this thirty hours should be reduced to twenty-one by training and technical education; (c) the hours of labour of railway, omnibus and tramway employees should be reduced to a maximum of sixty, if not of forty-eight in any one week; and (d) wage-earning mothers of young children should be withheld from the industrial world by giving them sufficient public assistance for the support of their families.

Regularization of the National Demand for Labour.—In order to meet the periodically recurrent general depressions of trade the government should take advantage of there being at these periods as much unemployment of capital as there is unemployment of labour; that it should definitely undertake, as far as practicable, the regularization of the national demand for labour; and that it should, for this purpose, and to the extent of at least £4,000,000 a year, arrange a portion of the ordinary work required by each department on a ten years’ programme; £40,000,000 worth of work for the time being for the better construction, improvement and land reclamation; to be carried out by the board of agriculture exclusively in the lean years of the trade cycle; by the building of roads and causeways, the drainage of low lying land at the rates locally current for the work, and paid for out of loans raised as required.

Emigration Insurance.—In view of its probable adverse effect on trade union membership and organization the minority commissioners cannot recommend the establishment of any plan of government or compulsory insurance against unemployment. They recommend, however, that in districts where unemployment is especially prevalent, and if, say, one half of the sum actually paid in the last preceding year as out-of-work benefit should be offered to trade unions or other societies providing such benefit.

Maintenance and Training.—For the ultimate residuum of men in distress from want of employment the minority recommend that maintenance should be freely provided, without disgracefulness, to men in the condition of atonement for breach of the peace, and that the physical and mental training that they may prove to require. Suitable day training depots or residential farm colonies should be established, where the men’s working time would be absorbed in work, before the owing of the benefit, and they would, if capable of it, and if their wives and families being, meanwhile, provided with adequate home aliment.

Authorities.—The Report and Evidence of the Royal Commission 1895–1900 is the only work itself on the subject of unemployment. The contents of the various volumes are given supra. Other important publications are Report and Evidence of Royal Commission on Aged Poor (1895); Report and Evidence of Select Committee of House of Commons on Distress from Want of Employment (1905); Report of Departmental Committee on Vagrancy (1906). POPAYAN, a city of Colombia, capital of the department of Cauca, about 240 m. S.W. of Bogotá, on the old trade route between that city and Quito, in 2° 26‘ N., 76° 49‘ W. Pop. (1870), 8,485; (1906, estimate), 10,000. Popayan is built on a great plain sloping N.W. from the foot of the volcano Purace, near the source of the Cauca and on one of its small tributaries, 5,712 ft. above the sea. Its situation is singularly picturesque, the Purace rising to an elevation of 15,420 ft. about 20 m. southeast of the city, the Cotara volcano to approximately the same height, and the two, being closely behind the city, are called the Azucar, 15,978 ft. high. The ridge forming the water-parting between the basins of the Cauca and Patia rivers crosses between the Central and Western Cordilleras at this point and culminates a few miles to the south. Popayan is the seat of a bishopric dating from 1547, whose cathedral was built by the Jesuits; and in the days of its prosperity possessed a university of considerable reputation. It has several old churches, a college, two seminaries founded about 1870 by the French Lazarists, who have restored and occupy the old Jesuit convent, and a mint established in 1749. For centuries it was one of the principal commercial and mining centres, but much of its importance was lost through the transfer of trade to Cali and Pasto, through the decay of neighbouring mining industries, and through political disturbances. Earthquakes have also caused much damage to Popayan, especially those of 1827 and 1834. The modern city has some small manufacturing industries, including woollen fabrics for clothing, but its trade is much restricted, and its importance is political rather than commercial.

Popayan was founded by Sebastian Benalcazar in 1538 on the site of an Indian settlement, whose chief, Payan, had the unusual honour of having his name given to the usurping town. In 1538 it received a coat of arms and the title of “May not my cell be.” from the king of Spain—a distinction of great
significance in that disturbed period of colonial history. It is noted also as the birthplace of Cólás, the Colombian naturalist, and of Mosquera, the geographer. There are hot sulphurous springs near by on the flanks of the volcano Purae, especially at Coconuco, which are much frequented by Colombians.

POPE (Gr. πάπας, post-classical Lat. papa, father), an ecclesiastical title now used exclusively to designate the head of the Roman Catholic Church. In the 4th and 5th centuries it was frequently used in the West of any bishop (Du Cange, s.e.); but it gradually came to be reserved to the bishop of Rome, becoming his official title. In the East, on the other hand, the title of Alexandria survived, did not use it as a title; but as a popular term it was applied to priests, and at the present day, in the Greek Church and in Russia, all the priests are called pappas, which is also translated “pope.” Even in the case of the sovereign pontiff the word pope is officially only used as a less solemn style: though the ordinary signature and heading of briefs is, e.g. “Pius P. P. X.,” the signature of bulls is “Pius episcopus ecclesiae catholicae,” and the heading, “Pius episcopus, servus servorum Dei,” this latter formula going back to the time of St Gregory the Great. Other styles met with in official documents are Pontifex, Summus pontifex, Romanus pontifex, Sancissimus, Sancissimus pater, Sancissimus et durissimus, pontifex maximus, vester, Sanctitas tua, Beatiissimus pater, Beatissudo tua; while the pope is addressed in speaking as “Sanctitas vestra,” or “Beatissime pater.” In the middle ages is also found “Dominus apostolicus” (cf. still, in the litanies of the saints), or simply “Apostolicus.”

The pope is pre-eminently, as successor of St Peter, bishop of Rome. Writers are fond of viewing him as representing all the degrees of the ecclesiastical hierarchy; they say that he is bishop of Rome, metropolitan of the Roman province, primate of Italy, patriarch of the Western Church, and head of the universal Church. This is strictly correct, but, with the exception of the first and last, these titles are seldom to be found in documents. And if these terms were intended to indicate so many degrees in the exercise of jurisdiction they would not be correct. As a matter of fact, from the earliest centuries (cf. can. 6 of Nicaea, in 325), we see that the popes exercised a special metropolitan jurisdiction not only over the bishops nearest to Rome, the future cardinal bishops, but also over those of central and southern Italy, including Sicily (cf. Duchesne, Origines du culte, ch. 1), all of whom received their ordination at his hands. Northern Italy and the rest of the western Church, still more the eastern Church, did not turn to him for their administration. His influence was exercised, not so much from the centre of dogmatic questions but in matters of discipline, by means of appeals, petitions and consultations, not to mention spontaneous intervention. This state of affairs was defined and developed in the course of centuries, till it produced the present state of centralization, according to a law which can equally be observed in other societies. In practice the different degrees of jurisdiction, as represented in the pope, are of no importance: he is bishop of Rome and governs his diocese by direct episcopal authority; he is also the head of the Church, and in this capacity governs all the dioceses, though the regular authority of each bishop in his own diocese is also ordinary and immediate, i.e. he is not a mere vicar of the pope.

But the mode of exercise of a power and its intensity are subject to variation, while the power remains essentially the same. This is the case with the power of the pope and his primacy, the exercise and manifestation of which have been continually developing. This primacy, a primacy of honour and jurisdiction, involving the plenitude of power over the teaching, the worship, the discipline and administration of the Church, is received by the pope as part of the succession of St Peter, together with the episcopate of Rome. The whole episcopal body, with the pope at its head, should be considered as succeeding to the apostolic college, presided over by St Peter; and the head of it, now as then, as personally invested with all the powers enjoyed by the whole body, including the head. Hence the pope, as supreme in matters of doctrine, possesses the same authority and the same infallibility as the whole Church; as legislator and judge he possesses the same power as the episcopal body gathered around and with him in oecumenical council. Such are the two essential prerogatives of the papal primacy: infallibility in his supreme pronouncements in matters of doctrine (see INFALLIBILITY); and immediate and sovereign jurisdiction, under all its aspects, over all the pastors and the faithful. These two privileges, having been claimed and enjoyed by the popes in the course of centuries, were solemnly defined at the Vatican Council by the dogma of the infallibility of the pope, promulgated Oct. 18, 1870. The two principal passages in it are the following: (1) In the matter of jurisdiction: “If any one say that the Roman Pontiff has an office merely of inspection and direction, and not the full and supreme power of jurisdiction over the whole Church, not only in matters of faith and morals, but also as regards discipline and the government of the Church scattered throughout the whole world; or that he has only the principal portion and not the plenitude of that supreme power; or that his power is not ordinary and immediate, as much over each and every church as over each and every pastor and believer: anathema sit.” (2) In the matter of infallibility: “We decree that when the Roman Pontiff speaks ex cathedra, that is to say, when, in his capacity as Pastor and Doctor of all Christians he defines, in virtue of his supreme apostolic authority, a certain doctrine concerning faith or morals to be held by the whole Church, he enjoys, by the divine assistance promised to him in the Blessed Peter, that infallibility with which the divine Redeemer has thought good to endow His Church in order to define its doctrine in matters of faith and morals; consequently, these definitions of the Roman Pontiff are irrefutable in themselves and not in consequence of the consent of the Church.”

For the history of the papacy, and associated questions, see Papacy, Conclave, Cura Romana, Cardinal, &c.

The ordinary costume of the pope is similar to that of the other clergy and bishops, but white in colour; his shoes alone are different, being low open shoes, red in colour, with a cross embroidered on the front; these are what are called the “mules”; a substitute for the compagi of ancient times, formerly reserved to the pope and his clergy (cf. Duchesne, op. cit. ch. 11, 6). Over this costume the pope wears, on less solemn occasions, the lace rochet and the red mozzarella, bordered with ermine, or the camasoro, similar to the mozzaeta, but with the addition of a hood, and over all the stole embroidered with his arms. The pope's liturgical costume consists, in the first place, of all the elements of the pontifical vestments of bishops: stockings and sandals, amice, alb, cincture, tunicle and dalmatic, stole, ring, gloves, chasuble or cope, the latter, however, with a morse ornamented with precious stones, and for head-dress the mitre (see Vestments). The tiara (q.v.), the pontifical head-dress, is not used strictly speaking in the course of the liturgical functions, but only for processions. To these vestments or insignia the pope adds: the jaffa, a kind of long skirt trailing on the ground all round, which the chaplains hold up while he is walking. Over the chasuble he wears the fonsone (see Amice); and after that the pallium (q.e.). He is preceded by the papal cross, carried with the crucifix turned towards him. When going to solemn ceremonies he is carried on the sedile, a portable chair of red velvet with a high back, and escorted by two flabelli of peacock feathers. The papal mass, now rarely celebrated, has preserved more faithfully the ancient liturgical usages of the 8th and 9th centuries.

POPE, ALEXANDER

POPE, ALEXANDER (1688-1744), English poet, was born in Lombard Street, London, on the 21st of May 1688. His father, Alexander Pope, a Roman Catholic, was a linen-drapier who afterwards retired from business with a small fortune, and fixed his residence about 1700 at Binfield in Windsor Forest. Pope's education was desultory. His father's religion would have excluded him from the public schools, even had there been no other impediment to his being sent to them. Before he was twelve he had obtained a smattering of Latin and Greek from various masters, from a priest in Hampshire, from a schoolmaster at Twyford near Winchester, from Thomas Deane, who kept a school in Marylebone and afterwards at Hyde Park Corner, and finally from another priest at home. Between his twelfth and his seventeenth years extensive application to study undermined his health, and he developed the personal deformity which was in so many ways to distort his view of life. He thought himself dying, but through a friend, Thomas (afterwards the abbé) Southcote, he obtained the advice of the famous physician John Radcliffe, who prescribed diet and exercise. Under this treatment the boy recovered his strength and spirits. "He thought himself the better," Spence says, "in some respects for not having had a regular education. He (as he observed in particular) read originally for the sense, whereas we are taught for so many years to read only for words." He afterwards learnt French and Italian, probably in a similar way. He read translations of the Greek, Latin, French and Italian poets, and by the age of twelve, when he was finally settled at home and left to himself, he was not only a confirmed reader, but an eager aspirant to the highest honours in poetry. There is a story, which chronological considerations make extremely improbable, that in London he had crept into Will's coffee-house to look at Dryden, and a further tale that the old poet had given him a shilling for a translation of the story of Pyramus and Thisbe; he had lampooned his schoolmaster; he had made a play out of John Ogilby's IIiad for his schoolfellows; and before he was fifteen he had written an epic, his hero being Alexander, a prince of Rhodes, or, as he states elsewhere, Deucalion.

There were, among the Roman Catholic families near Binfield, men capable of giving a direction to his eager ambition, men of literary tastes, and connexions with the literary world. These held together as members of persecuted communities always do, and kept in touch with each other by visits of family priests. Pope was thus brought under the notice of Sir William Trumbull, a retired diplomatist living at Easthampstead, within a few miles of Binfield. Thomas Dancastle, lord of the manor of Binfield, took an active interest in his writings, and at Whiteknights, near Reading, lived another Roman Catholic, Anthony Englefield, "a great lover of poets and poetry." Through him Pope made the acquaintance of Wycherley and of Henry Cromwell, who was a distant cousin of the Protector, a gay man about town, and something of a pedant. Wycherley introduced him to William Walsh, then of great renown as a critic. Before the poet was seventeen he was admitted in this way to the society of London "wits" and men of fashion, and was cordially encouraged as a prodigy. Wycherley's correspondence with Pope was skillfully manipulated by the younger man to represent Wycherley as submitting, at first humbly and then with an ill-grace, to Pope's criticisms. The publication (Elwin and Court hope, vol. v.) of the originals of Wycherley's letters from MS. at Longleat showed how seriously the relations between the two friends, which ceased in 1710, had been misrepresented in the version of the correspondence which Pope chose to submit to the public. Walsh's contribution to his development was the advice to his study "correctness." "About fifteen," he says, "I got acquainted with Mr. Walsh. He used to encourage me much, and used to tell me that there was one way left of excelling; for, though we had several great poets, we never had any one great poet that was correct, and he desired me to make that my study and aim" (Spence, p. 280). Trumbull turned Pope's attention to the French critics, out of the study of whom grew the Essay on Criticism; he suggested the subject of Windsor Forest, and he started the idea of translating Homer. It says something for Pope's docility at this stage that he recognized so soon that a long course of preparation was needed for such a magnum opus, and began steadily and patiently to discipline himself. The epic was put aside and afterwards burnt; versification was industriously practised in short "essays"; and an elaborate study was made of accepted critics and models. He learnt most, as he acknowledged, from Dryden, but the harmony of his verse also owed something to an earlier writer, George Sandys, the translator of Ovid. At the beginning of the 18th century Dryden's success had given great vogue to translations and modernizations. The air was full of theories as to the best way of doing such things. What Dryden had touched Pope did not presume to meddle with. Dryden was his hero and master; but there was much more of the same kind to be done. Dryden had rewritten three of the Canterbury tales; Pope tried his hand at the Merchant's Tale, and the Prologue to the Wife of Bath's Tale, and produced also an imitation of the House of Fame. Dryden had translated Virgil; Pope experimented on the Thebais of Staturi, Ovid's Heroïdes and Metamorphoses, and the Odyssey. He knew little Latin and less Greek, but there were older versions in English which helped him to the sense; and, when the correspondents to whom he submitted his versions pointed out mistranslations, he could answer that he had always agreed with them, but that he had deferred to the older translators against his own judgment. It was one of Pope's little vanities to try to give the impression that his metrical skill was more precocious even than it was, and we cannot accept his published versions of Staturi and Chaucer (published in "miscellanies" at intervals between 1709 and 1714) as incontrovertible evidence of his proficiency at the age of sixteen or seventeen, the date, according to his own assertion, of their composition. But it is indisputable that at the age of seventeen his skill in verse astonished a veteran critic like Walsh, and some of his pastoral's were in the hands of Sir George Granville (afterwards Lord Lansdowne) before 1706. His metrical letter to Cromwell, which Elwin describes as "a remarkable instance of the rapid growth of a poet's versification, and has turns of wit in it as easy and spirited as any to be found in his mature satires. Pope was twenty-one when he sent the "Ode on Solitude" to Cromwell, and said it was written before he was twelve years old.

Precocious Pope was, but he was also industrious; and he spent some eight or nine years in arduous and enthusiastic discipline, reading, studying, experimenting, taking the advice of some and laughing in his sleeve at the advice of others, "poetry his only business," he said, "and idleness his only pleasure," before anything of his appeared in print. In these preliminary studies he seems to have guided himself by the maxim formulated in a letter to Walsh (dated July 2, 1766) that "it seems not so much the perfection of sense to say things that had never been said before, as to express those best that have been said oftest." His first publication was his "Pastorals." Jacob Tonson, the bookseller, had seen these pastorals in the hands of Walsh and Congreve, and sent a polite note (April 20, 1706) to Pope asking that he might have them for one of his miscellanies. They appeared accordingly in May 1709 at the end of the sixth volume of Tonson's Poetical Miscellanies, containing contributions from Ambrose Philips, Sheffield, Garth and Sydney with "January and May," Pope's version of Chaucer's "Merchant's Tale."

Pope's next publication was the Essay on Criticism (1711), written two years earlier, and printed without the author's name. "In every work regard the writer's end" (l. 253) is one of its sensible precepts, and one that is often neglected by critics of the essay, who comment upon it as if Pope's end had been to produce an original and profound treatise on first principles.

1 The dates of Pope's correspondence with Wycherley are 1704-1710; with Walsh, 1705-1707, and with Cromwell, 1708-1727; with John Caryll (1666-1736) and his son, also neighbours, 1710-1735.
POPE, ALEXANDER

His aim was simply to condense, methodize, and give as perfect and novel expression as he could to floating opinions about the poet’s aims and methods, and the critic’s duties, to “what oft was thought, but ne’er so well expressed” (I. 298). “The town” was interested in belles lettres, and given to conversing on the subject; Pope’s essay was simply a brilliant contribution to the fashionable conversation. The youthful author said that he did not expect the sale to be quick because “not one gentleman in sixty, even of liberal education, could understand it.” The sales were slow until Pope caused copies to be sent to Lord Lansdowne and others, but its success was none the less brilliant for the delay. The town was fairly dazzled by the young poet’s learning, judgment, and felicity of expression. Many of the admirers of the “Essay” would have thought less of it if they had not believed all the more that it was original. “I admired,” said Lady Mary Wortley Montagu, “Mr. Pope’s Essay on Criticism at first very much, because I had not then read any of the ancient critics, and did not know that it was all stolen.” Pope gained credit for much that might have been found, where he found it, in the Institutes of Quintilian, in the numerous critical writings of René Répin, and in René le Bossu’s treatise on epic poetry. Addison has been made responsible for the exaggerated value once set on the essay, but Addison’s paper (Spectator, No. 253) was not unsound praise. He deprecated the attacks made by Pope on contemporary literary reputations, although he did full justice to the poet’s metrical skill. Addison and Pope became acquainted with one another, and Pope’s sacred eclogue, “Messiah,” was printed as No. 378 of the Spectator. In the Essay on Criticism Pope provoked one bitter personal enemy in John Dennis, the critic, by a description of him as Appius, who “stares, tremendous, with a threat’ning eye.” Dennis retorted in Reflections...upon a late Hymn... (1711), abusing Pope among other things for his personal deformity. Pope never forgot this brutal attack, which he described in a note inserted after Dennis’s death, as late as 1743, as written “in a manner perfectly lunatic.”

The Rape of the Lock in its first form appeared in 1712 in Lintot’s Miscellanies; the “machinery” of sylphs and gnomes was an afterthought, and the poem was republished as we now have it early in 1714. William, 4th Baron Petre, had surreptitiously cut off a lock of Miss Arabella Fermor’s hair, and the liberty had been resisted; Pope heard the story from his friend John Caryll, who suggested that the breach between the families might be healed by making the incident the subject of a mock-heroic poem like Bolleaux’s Lutrin. Pope caught at the hint; the mock-heroic treatment of the pretty frivolities of fashionable life just suited his freakish sprightliness of wit, and his own personal taste at the time put him in excellent vein. The Rape of the Lock is admitted to be a masterpiece of airiness, ingenuity, and exquisite finish. But the poem struck Taine as a piece of harsh, scornful, indecent boorishness, a mere succession of oddities and contrasts, of expressive figures unexpected and grimning, an example of English insensibility to French sweetness and refinement. Sir Leslie Stephen objected on somewhat different grounds to the poet’s tone towards women. His laughter at Pope’s raillery was checked by the fact that women are spoken of in the poem as if they were all like Belinda. The poem shows the hand of the satirist who was later to assert that “every woman is at heart a rake,” in the epistle addressed to Martha Blount.

Windsor Forest, modelled on Sir John Denham’s Cooper’s Hill, had been begun, according to Pope’s account, when he was sixteen or seventeen. It was published in March 1713 with a flattering dedication to the secretary for war, George Granville, Lord Lansdowne, and an opportune allusion to the peace of Utrecht. This was a nearer approach to taking a political side than Pope had yet made. His principle had been to keep clear of politics, and not to attach himself to any of the sets into which literary men were divided by party. Although inclined to the Jacobites by his religion, he never took any part in the plots for the restoration of the Stuarts, and he was on friendly terms with the Whig coterie, being a frequent guest at the coffee-house kept by Daniel Button, where Addison held his “little senate.” Pope contributed to Button’s poem, The Messiah... to the Spectator; he had written an article or two in the Guardian, and he wrote a prologue for Addison’s Cato. Nevertheless he induced Lintot the bookseller to obtain from John Dennis a criticism of Cato. On the publication of Dennis’s remarks, the violence of which had, as Pope hoped, made his author ridiculous, Pope produced an anonymous pamphlet, The Narrative of Dr Robert Norris concerning the... Frenzy of Mr John Dennis (1713), which, though nominally in defence of Addison, had for its main purpose the gratification of Pope’s own hostility to Dennis. Addison disavowed any connivance in this coarse attack in a letter written on his behalf by Steele leading the charge of the attacks. In another, if he noticed Dennis’s attack at all it would be in such a way as to allow him no just cause of complaint. Coziness between Addison and Pope naturally followed this episode. When the Rape of the Lock was published, Addison, who is said to have praised the poem highly to Pope in private, dismissed it in the Spectator with two sentences of patronizing faint praise to the young poet, and, coupling it with Tickell’s “Ode on the Prospect of Peace,” devoted the rest of the article to an elaborate puff of “the pastoralists of Mr Philips.”

When Pope showed a leaning to the Tories in Windsor Forest, the friendship of Addison’s coterie made insidious war on him. Within a few weeks of the publication of the poem, and when it was the talk of the town, there began to appear in the Guardian (Nos. 22, 23, 28, 30, 32) a series of articles on “Pastoral.” Not a word was said about Windsor Forest, but everybody knew to what the general principles referred. Modern pastoral poets were ridiculed for introducing Greek moral deities, Greek flowers and fruits, Greek names of shepherds, Greek sports and customs and religious rites. They ought to make use of English rural mythology—hobthrushes, fairies, goblins and witches; they should give English names to their shepherds; they should mention flowers indigenous to English climate and soil; and they should introduce English proverbial sayings, dress, and customs. All excellent principles, and all neglected by Pope in Windsor Forest. The poem was fairly open to criticism in these points; there are many beautiful passages in it, showing close though somewhat professional observation of nature, but the mixture of heathen deities and conventional archaic fancies with modern realities is incongruous, and the comparison of Queen Anne to Diana was ludicrous. But the sting of the articles did not lie in the truth of the oblique criticisms. The pastoralists of Ambrose Philips, published four years before, were again trotted out. Here was a true pastoral poet, the eldest born of Spenser, the worthy successor of Theocritus and Virgil.

Pope took an amusing revenge, which turned the laugh against his assailants. He sent Steele an anonymous paper in continuation of the articles in the Guardian on pastoral poetry, reviewing the poems of Mr Pope by the light of the principles laid down. Ostensibly Pope was censured for breaking the rules, and Philips praised for conforming to them, quotations being given from both. The quotations were sufficient to dispose of the pretensions of poor Philips, and Pope did not choose his own worst passages, accusing himself of actually deviating sometimes into poetry. Although the Guardian’s principles were also brought into ridicule by burlesque exemplifications of them after the manner of Gay’s Shepherd’s Week, Steele, misled by the opening sentences, was at first unwilling to print what appeared to be a direct attack on Pope, and is said to have asked Pope’s consent to the publication, which was graciously granted.

The links that attached Pope to the Tory party were strengthened by a new friendship. His first letter to Swift, who became warmly attached to him, is dated the 8th of December 1713. Swift had been a leading member of the Brothers’ Club, from which the famous Scriblerus Club seems to have been an offshoot. The leading members of this informal
literary society were Swift, Arbuthnot, Congreve, Bishop Atterbury, Pope, Gay and Thomas Parnell. Their chief object was a general war against the dunces, waged with great spirit by Arbuthnot, Swift and Pope.

The estrangement from Addison was completed in connexion with Pope's translation of Homer. This enterprise was definitely undertaken in 1713. The work was to be published by subscription, as Dryden's Virgil had been. Men of all parties subscribed, their unanimity being a striking proof of the position Pope had attained at the age of twenty-five. It was as if he had received a national commission as by general consent the first poet of his time. But the unanimity was broken by a discordant note. A member of the Addison clique, Tickell, attempted to run a rival version. Pope suspected Addison's instigation; Tickell had at least Addison's encouragement. The character of Addison as "Atticus" in the Epistle to Dr Arbuthnot (ii. 193-215) was, however, inspired by resentment at insults that existed chiefly in his own imagination, though Addison was certainly not among his warmest admirers. Pope afterwards claimed to have been magnanimous, but he spoiled his case by the petty inventions of his account of the quarrel.

The translation of Homer was Pope's chief employment for twelve years. The new pieces in the miscellanies published in 1717, his "Elegy on an Unfortunate Lady," and his "Eloisa to Abelard," were probably written some years before their publication. His "Eloisa to Abelard" was based on an English translation by John Humphreys of a French version of the Letters, which differed very considerably from the original Latin. The Iliad was delivered to the subscribers in instalments in 1715, 1717, 1718 and 1720. Pope's own defective scholarship made help necessary. William Broome and John Jortin supplied the bulk of the notes, and Thomas Parnell the preface. For the translation of the Odyssey he took Elijah Fenton and Broome as coadjutors, who between them translated twelve out of the twenty-four books. It was completed in 1725. The profitableness of the work was Pope's chief temptation to undertake it. His receipts for his earlier poems had totalled about £150, but he cleared more than £8000 by the two translations, after deducting all payments to coadjutors—a much larger sum than had ever been received by an English author before.

The translation of Homer had established Pope's reputation with his contemporaries, and has endangered it ever since it was challenged. Opinions have varied on the purely literary merits of the poem, but with regard to it as a translation few have differed from Bentley's criticism, "A fine poem, Mr Pope, but you must not call it Homer." His collaboration with Broome (q.v.) and Fenton (q.v.) involved him in a series of recriminations. Broome was weak enough to sign a note at the end of the work understating the extent of Fenton's assistance as well as his own, and ascribing the merit of their translation, reduced to less than half its real proportions, to a regular revision and correction—mostly imaginary—at Pope's hands. These falsehoods were deemed necessary by Pope to protect himself against possible protests from the subscribers. In 1722 he edited the poems of Thomas Parnell, and in 1725 made a considerable sum by an unsatisfactory edition of Shakespeare, in which he had the assistance of Fenton and Gay.

Pope, with his economical habits, was rendered independent by the pecuniary success of his Homer, and enabled to live near London. The estate at Binfield was sold, and he removed with his parents to Mason's Buildings, Chiswick, in 1716, and in 1719 to Twickenham, to the house with which his name is associated. Here he practised elaborate landscape gardening on a small scale, and built his famous grotto, which was really a tunnel under the road connecting the garden with the lawn on the Thames. He was constantly visited at Twickenham by his intimates, Dr John Arbuthnot, John Gay, Bollingbrook, and Swift (during his brief visits to England in 1726 and 1727), and by many other friends of the Tory party. With Atterbury, bishop of Rochester, he was on terms of affectionate intimacy, but he blundered in his evidence when he was called as a witness on his behalf in 1723.

In 1717 his father died, and he appears to have turned to the Blounts for sympathy in what was to him a very serious bereavement. He had early made the acquaintance of Martha and Teresa Blount, both of them intimately connected with his domestic history. Their home was at Mapledurham, near Reading, but Pope probably first met them at the house of his neighbour, Mr Englefield of Whitknight, who was their grandfather. He began to correspond with Martha Blount in 1712, and after 1717 the letters are much more serious in tone. He quarrelled with Teresa, who had apparently injured or prevented his suit to her sister; and although, after her father's death in 1718, he paid her an annuity, he seems to have regarded her as one of his most dangerous enemies. His friendship with Martha lasted all his life. So long as his mother lived he was unwearying in his attendance on her, but after her death in 1733 his association with Martha Blount was more constant. In defence of the scandal-mongers, they paid visits together at the houses of common friends, and at Twickenham she spent part of each day with him. His earlier attachment to Lady Mary Wortley Montagu was apparently more or less literary passion, which perished under Lady Mary's rigid rules.

The year 1725 may be taken as the beginning of the third period of Pope's career, when he made his fame as a moralist and a satirist. It may be doubted whether Pope had the staying power necessary for the composition of a great imaginative work, whether his crazy constitution would have held together through the strain. He toyed with the idea of writing a grand epic. He told Spence that he had it all in his head, and gave him a vague (and it must be admitted not very promising) sketch of the subject and plan of it. But he never put any of it on paper. He shrank as with instinctive repulsion from the stress and strain of complicated designs. Even his prolonged task of translating weighed heavily on his spirits, and this was a much less formidable effort than creating an epic. He turned rather to designs that could be accomplished in detail, works of which the parts could be separately laboured at and put together with patient care, into which happy thoughts could be fitted that had been struck out at odd moments and in ordinary levels of feeling.

Edward Young's satire, The Universal Passion, had just appeared, and been received with more enthusiasm than any thing published since Pope's own early success. This alone would have been powerful inducement to Pope's emulous temper. Swift was finishing Gulliver's Travels, and came over to England in 1726. The survivors of the Scriblerus Club—Swift, Pope, Arbuthnot, and Gay—resumed their old amusement of parodying and otherwise ridiculing had writers, especially bad writers in the Whig interest. Two volumes of their Miscellanies in Prose and Verse were published in 1727. A third volume appeared in 1728, and a fourth was added in 1732. According to Pope's own history of the Dunciad, an Heroic Poem in Three Books, which first appeared on the 28th of May 1728, the idea of it grew out of this. Among the Miscellanies was a "Treatise of the Bathos or the Art of Sinking in Poetry," in which poets were classified, with illustrations, according to their eminence in the various arts of debasing instead of elevating their subject. No names were mentioned, but the specimens of bad verse were assigned to various letters of the alphabet, which, the authors boldly asserted, were taken at random. But no sooner was the treatise published than the scribes proceeded to take the letters to themselves, and in revenge to fill the newspapers with the most abusive falsehoods and scurrilities they could devise. This gave Pope the opportunity he had hoped for, and provided him with an excuse for the personalities of the Dunciad, which had been in his mind as early as 1720.

Among the most prominent objects of his satire were Lewis (after his return in 1723), and Swift (during his brief visits to England in 1726 and 1727), and by many other friends of the Tory party. With Atterbury, bishop of Rochester, he was on terms of affectionate intimacy, but he blundered in his evidence when he was called as a witness on his behalf in 1723.
Theobald, Colley Cibber, John Dennis, Richard Bent Ley, Aaron Hill and Bernard Lintot, who, in spite of his former relations with Pope, was now classed with the piratical Edmund Curll. The book was published with the greatest precautions. It was anonymous, and professed to be a reprint of a Dublin edition. When the success of the po em was assured, it was republished in 1720, and a copy was presented to the king by Sir Robert Walpole. Names took the place of initials, and a defence of the satire, written by Pope himself, but signed by his friend William Cleland, was printed as "A letter to the Publisher." Various indexes, notes and particulars of the attacks on Pope made by the different authors satirized were added. Any danger of prosecution, the copyright was assigned to Lord Oxford, Lord Bathurst and Lord Burlington, whose position rendered them practically unassailable. We may admit that personal spite influenced Pope at least as much as disinterested zeal for the honour of literature, but in the dispute as to the comparative strength of these motives, a third is apt to be overlooked that was probably stronger than either. This was an unscrupulous elish love of fun, and delight in the creations of a humorous imagination. Certainly to represent the Dunciad as the outcome of mere personal spite is to give an exaggerated idea of the malignity of his intentions. He was anything but a vindictive creature, but he had a genius for satirizing the character of his satires. He was not, except in rare cases, a morose, savage, indignant satirist, but airy and graceful in his malice, revengeful perhaps and excessively sensitive, but restored to good humour as he thought over his wrongs by the ludicrous conceptions with which he invested his adversaries. The most unprovoked assault was on Richard Bentley, whom he satirized in the reconstruction and enlargement of the Dunciad made in the last years of his life at the instigation, it is said, of William Warburton. In the earlier editions the place of hero had been occupied by Lewis Theobald, who had ventured to criticize Pope's Shakespear attacks. In the edition which appeared in Pope's Works (1742), he was dethroned in favour of Colley Cibber, who had just written his Letter from Mr Cibber to Mr Pope inquiring into the motives that might induce him in his satirical writings to be so frequently fond of Mr Cibber's name (1742). Warburton's name is attached to many new notes, and one of the preliminary dissertations by Ricardus Aristarchus on the hero of the poem seems to be by him.

The four epistles of the Essay on Man (1733) were also intimately connected with passing controversies. They belong to the same intellectual movement with Butler's Analogy—the effort of the 18th century to put religion on a rational basis. But Pope was not, as his biographers have sometimes suggested to him by Henry St John, Lord Bolingbroke, who had returned from exile in 1733, and was a fellow-member of the Scriblerus Club. Bolingbroke is said—and the statement is supported by the contents of his posthumous works—to have furnished most of the arguments. Pope's contribution to the controversy consisted in brilliant epigram and illustration. In this didactic work, as in his Essay on Criticism, he put together on a sufficiently simple plan a series of happy sayings, separately elaborated, picking up the thoughts as he found them in miscellaneous reading and conversation, and trying only to fit them with perfect expression. His readers were too dazzled by the verse to be severely critical of the object. Pope himself had not comprehended the drift of the arguments he had adopted from Bolingbroke, and was alarmed when he found that his poem was generally interpreted as an apology for the free-thinkers. Warburton is said to have qualified its doctrines as "rank atheism," and asserted that it was put together from the "worst passages of the worst authors." The essay was soon translated into the chief European languages, and in 1737 its orthodoxy was assailed by a Swiss professor, Jean Pierre de Crousaz, in an Examen de l'Essay de M. Pope sur l'Homme. Warburton now saw fit to revise his opinion of Pope's abilities and principles—for what masque does not appear. In any case he now became as enthusiastic in his praise of Pope's orthodoxy and his genius as he had before been scornful, and proceeded to employ his unrivalled powers of sophistry in a defence of the orthodoxy of the conflicting and inconsequent positions adopted in the Essay on Man. Pope was wise enough to accept with all gratitude an ally who was so useful a friend and so dangerous an enemy, and from that time onward Warburton was the authorized commentator of his works. The Essay on Man was to have formed part of a series of philosophic poems on a systematic plan. The other pieces were to treat of human reason, of the use of learning, wit, education and riches, of civil and ecclesiastical polity, of the love of women, &c. Of the ten epistles of the Moral Essays, the first four, written between 1731 and 1735, are connected with this scheme, which was never executed. There was much bitter, and sometimes unjust, satire in the Moral Essays and the Imitations of Horace. In these epistles and satires, which appeared at intervals, he was often the mouth-piece of his political friends, who were all of them in opposition to Walpole, then at the height of his power, and Pope chose the object of his attacks from among the minister's adherents. Epistle III., "Of the Use of Riches," addressed to Allen Bathurst, Lord Bathurst, in 1732, is a direct attack on Walpole's most feared adversary, and his final appeal to the Duke of Buckingham, generally taken as a picture of Canons, the seat of John Brydges, duke of Chandos, one of Pope's patrons, and caused a great outcry, though in this case Pope seems to have been innocent of express allusion. Epistle II., addressed to Martha Blount, contained the picture of Atossa, which was taken to be a portrait of Sarah Jennings, duchess of Marlborough. One of the worst imputations on Pope's character was that he left this passage to be published when he had in effect received a bribe of £1000 from the duchess of Marlborough for its suppression through the agency of Nathanael Hooke (d. 1765). As the passage eventually stood, it might be considered a poltroon. Peter the Great, husband of Maria, daughter of James II. Pope may have altered it with the intention of diverting the satire from the original object. He was scrupulously honest in money matters, and always independent in matters of patronage; but there is some evidence for this discreditable story beyond the gossip of Horace Walpole (Works, ed. P. Cunningham, i. cxliv.), though not sufficient to justify the acceptance it received by some of Pope's biographers. To appreciate fully the point of his allusions requires an intimate acquaintance with the political and social gossip of the time. But apart from their value as a brilliant strongly-coloured picture of the time Pope's satires have a permanent value as literature. It is justly remarked by Mark Pattison that: "these Imitations are among the most original of his writings." The vigour and terseness of the diction is still unsurpassed in English verse. Pope had gained complete mastery over his medium, the heroic couplet, before he used it to express his hatred of the political and social evils which he satirized. The elaborate periphrases and superfluous ornaments of his earlier manner, as exemplified in the Pastoral and the Homer, disappeared; he turned to the uses of verse the ordinary language of conversation, differing from everyday speech only in its exceptional brilliance and point. It is in these satires that his best work must be sought, and by them that his position among English poets must be fixed. It was

In his edition of the Satires and Epistles (1866).
POPE, ALEXANDER

the Homer chiefly that Wordsworth and Coleridge had in their eye when they began the polemic against the "poetic diction" of the 18th century, and struck at Pope as the arch-corrupter. They were historically unjust to Pope, who did not originate this diction, but only furnished the most finished examples of it. At the beginning of the 19th century Pope still had an ardent admirer in Byron, whose first satires are written in Pope's couplet. The much abused pseudo-poetic diction in substance consisted in an ambition to "rise above the vulgar style," to draw nature to advantage—a natural ambition when the arbiters of literature were people of fashion. If one compares Pope's "Messiah" or "Eloisa to Abelard," or an impassioned passage from the Iliad, with the originals that he paraphrased, one gets a more vivid idea of the consistency of pseudo-poetic diction than could be furnished by pages of analysis. But Pope merely made masterly use of the established diction of his time, which he eventually forsook for a far more direct and vigorous style. A passage from the Guardian, in which Phillips was commended as against him, runs: "It is a nice piece of art to raise a proverb above the vulgar style and still keep it easy and unaffected. Thus the old wish, 'God rest his soul,' is very finely turned:—

"'Then gentle Sidney liv'd, the shepherd's friend, Eternal blessings on his shade attend!'

Pope would have despised so easy a metamorphosis as this at any period in his career, and the work of his coadjuitors in the Odyssey may be distinguished by this comparative cheapness of material. Broome's description of the clothes-washing by Nausicaa and her maidens in the sixth book may be compared with the original as a luminous specimen.

Pope's wit had won for him the friendship of many distinguished men, and his small fortune enabled him to meet them on a footing of independence. He paid long visits at many great houses, especially at Stanton Harcourt, the home of his friend Lord Chancellor Harcourt; at Oakley, the seat of Lord Bathurst; and at Prior Park, Bath, where his host was Ralph Allen. With the last named he had a temporary disagreement owing to some slight shown to Martha Blount, but he was reconciled to him before his death.

He died on the 30th of May 1744, and he was buried in the parish church of Twickenham. He left the income from his property to Martha Blount till her death, after which it was to go to his half-sister Mary and her children. His unpublished MSS. were left at the discretion of Lord Bolingbroke, and his copyrights to Warburton.

If we are to judge Pope, whether as a man or as a poet, with human fairness, and not merely by comparison with standards of abstract perfection, there are two features of his times that must be kept steadily in view—the character of political strife in those days and the political relations of men of letters. As long as the succession to the Crown was doubtful, and political failure might mean loss of property, banishment or death, politicians, playing for higher stakes, played more fiercely and unscrupulously than in modern days, and there was no controlling force of public opinion to keep them within the bounds of common honesty. Hence the age of Queen Anne is preeminently an age of intrigue. The government was almost as unsettled as in the early days of personal monarchy, and there was this difference—that it was policy rather than force upon which men depended for keeping their position. Secondly, men of letters were admitted to the inner circles of intrigue as they had never been before and as they have never been since. A generation later Walpole defied them, and paid the rougher instruments that he considered sufficient for his purpose in solid coin, the realm; but Queen Anne's statesmen, whether from difference of tastes or difference of policy, paid their principal literary champions with social privileges and honourable public appointments. Hence men of letters were directly infected by the low political morality of the unsettled time. And the character of their poetry also suffered. The most prominent defects of the age—the lack of high and sustained imagination, the genteel liking for "nature to advantage dressed," the incessant striving after wit—were fostered, if not generated, by the social atmosphere.

Pope's own ruling passion was the love of fame, and he had no scruples where this was concerned. His vanity and his childish love of intrigue are seen at their worst in his petty manoeuvres to secure the publication of his letters during his lifetime. These intricate proceedings were unravelled with great patience and ingenuity by Charles Wentworth Dilke, when the false picture of his relations with his contemporaries, which Pope had imposed on the public, had been practically accepted for a century. Elizabeth Thomas, the mistress of Henry Cromwell, had sold Pope's early letters to Henry Cromwell to the bookseller Curll for ten guineas. These were published in Curll's Miscellanies in 1726 (dated 1727), and had considerable success. This surreptitious publication seems to have suggested to Pope the desirability of publishing his own correspondence, which he immediately began to collect from various friends on the plea of preventing a similar clandestine transaction. The publication by Wycherley's executors of a posthumous volume of the dramatist's prose and verse furnished Pope with an excuse for the appearance of his own correspondence with Wycherley, which was accompanied by a series of unnecessary deceptions. After manipulating his correspondence so as to place his own character in the best light, he deposited a copy in the library of Edward, second earl of Oxford, and then he had it printed. The sheets were offered to Curll by a person calling himself P.T., who professed a desire to injure Pope, but was no other than Pope himself. The copy was delivered to Curll in 1733 after long negotiations by an agent who called himself R. Smythe, with a few originals to vouch for their authenticity. P.T. had drawn up an advertisement stating that the book was to contain answers from various peers. Curll was summoned before the House of Lords for breach of privilege, but was acquitted, as the letters from peers were not in fact forthcoming. Difficulties then arose between Curll and P.T., and Pope induced a bookseller named Cooper to publish a Narrative of the Method by which Mr. Pope's Private Letters were procured by Edmund Curll, Bookseller (1735). These preliminaries cleared the way for a show of indignation against piratical publishers and a "genuine" edition of the Letters of Mr. Alexander Pope (1737, fol. and 4to). Unhappily for Pope's reputation, his friend Caryll, who was employed by P.T. to beg the return of the copies of Pope's letters before returning them. This letter-book came to light in the middle of the 19th century, and showed the freedom which Pope permitted himself in editing. The correspondence with Lord Oxford, preserved at Longleat, afforded further evidence of his tortuous dealings. The methods he employed to secure his correspondence with Swift were even more discreditable. The proceedings can only be explained as the measures of a desperate man whose maladies seem to have engendered a passion for trickery. They are related in detail by Elwin in the introduction to vol. i. of Pope's Works. A man who is said to have "played the politician about cabals and turnips," and who "hardly drank tea without a stratagem," was not likely to be straightforward in a matter in which his ruling passion was concerned. Against Pope's petulance and "general love of secrecy and cunning" we have to set, in any fair judgment of his character, his exemplary conduct as a son, the affection with which he was regarded in his own circle of intimates, and many well-authenticated instances of genuine and continued kindness to persons in distress.

BIBLIOGRAPHY.—Various collected editions of Pope's Works appeared during his lifetime, and in 1751 an edition in nine volumes was published by booksellers with the commentaries of Mr Warburton. "Warburton interpreted his editorial rights very liberally. By his notes he willfully misrepresented the meaning of the allusions in the satires, and made them more agreeable to his friends and to the court, while he made opportunities for the gratification of his own spite against various individuals." Joseph Warton's edition in 1791 added to the mass of commentary without giving much new elucidation to the obscurities of the text, which eventuated, with his exceptional facilities, had found obscure. In 1769-1807 an edition was issued which included Owen Ruffhead's Life of Alexander.
POPE, A.—POPE, SIR T.

POPE (1769), inspired by Warburton. The notes of many commentators, with some of his own and W. J. Courthope, were included in the Works of Pope, edited by W. L. Bowles (1806). His Poetical Works were edited by Alexander Dyce (1856); by R. Carruthers (1886) for Bohn’s Library; by A. W. Ward (Globe Edition, 1896). His life and work were edited by John Wilson Croker, and formed the basis of what has become the standard version. The Works of Alexander Pope (10 vols., 1871-1878), including unpublished letters and other new material, with introduction and notes, was edited by G. F. Hill. The life of Pope in vol. i. was contributed by Professor Courthope. The chief original authority besides Pope’s correspondence and Ruffhead’s Life is Joseph Spence’s Anecdotes, published by G. R. W. Singer (1781). A short estimate of Pope in his Lives of the Poets. The best modern lives are by Professor Courthope, already mentioned; and Alexander Pope, by Sir L. Stephens, in the English Bibliographer (1890).

The life and works of the poet were studied, many of his works were published in the 19th century, and many important contributions to various edited works of the biographies of Pope, especially the publication of his letters, were made by C. W. Dike in Notes and Queries and the Athenaeum. These articles were reprinted by his grandson, Sir Charles Dike, in 1875, The Papers of a Critic. (W. M.; M. Br.)

POPE, ALEXANDER (1765-1835), Irish actor and painter, was born in Cork, and was educated to follow his father’s profession of miniature painting. He continued to paint miniatures and exhibit them at the Royal Academy as late as 1821; but at an early date he took the stage, first appearing in London as Oroonoko in 1785 at Covent Garden. He remained at this theatre almost continuously for nearly twenty years, then at the Haymarket until his retirement, playing leading parts, chiefly tragic. He was particularly esteemed as Othello and Henry VIII. He died on the 2nd of March 1835. Pope was thrice married. His first wife, Elizabeth Pope (c. 1744-1799), a favourite English actress of great versatility, was billed before her marriage as Miss Younge. His second wife, Maria Ann Pope (1775-1803), also a popular actress, was a member of an Irish family named Campion. His third wife, Clara Maria Pope (d. 1838), was the widow of the artist Francis Wheatley, and herself a skillful painter of figures and of flowers.

POPE, JANE (1742-1818), English actress, daughter of a London theatrical wig-maker, who began playing in a Lilliputian company for Garrick in 1756. From this she speedily developed into soubrette roles. She was Miss Caroline in The School for Scandal at its first presentation (1777), and thereafter she had many important parts confided to her. She was the life-long friend of Mrs Clive, and erected the monument at Twickenham to the latter’s memory. She was not only an admirable actress, but a woman of blameless life, and was praised by all the literary critics of her day—unusual to such a combination. She died on the 30th of July 1818.

POPE, JOHN (1821-1894), American soldier, was the son of Nathaniel Pope (1784-1850), U.S. judge for the district of Illinois, and was born at Louisville, Kentucky, on the 16th of March 1822. He graduated at the United States Military Academy, was assigned to the engineer corps in the Mexican War, receiving the brevet of 1st lieutenant and captain for his conduct at Monterey and Buena Vista. Subsequently he was engaged in engineering and exploring work, mainly in New Mexico, and in surveying the route for a Pacific railroad. He was commissioned captain in 1856. He was actively opposed to the Buchanan administration, and a speech which he made in connexion with the presidential campaign of 1860 caused him to be summoned before a court-martial. Early in the Civil War he was placed, as a brigadier-general U.S.V., in charge of the district of Missouri, which by vigorous campaigning against guerrilla bands and severe administration of the military population, he quickly reduced to order. In 1862, along with the gunboat flotilla (commanded by Commodore A. H. Foote) on the Mississippi, Pope obtained a great success by the capture of the defenses of New Madrid and Island No. 10, with nearly 7000 prisoners. Pope subsequently joined Halleck, and in command of the Army of the Mississippi took part in the siege of Corinth. He was now a major-general U.S.V. The reputation he had thus gained as an energetic leader quickly placed him in a high command, to which he proved to be quite unequal. The “Army of Virginia,” as his new forces were styled, had but a brief career. At the very outset of his Virginian campaign Pope, by a most ill-advised order, in which he contrasted the performances of the Western troops with the failures of the troops in Virginia, forfeited the confidence of his officers and men. The feeling of the Army of the Potomac (which was ordered to his support) was equally hostile, and the short operations culminated in the disastrous defeat of the second battle of Bull Run. Pope was still sanguine and ready for another trial of strength, but he was soon compelled to realize the impossibility of retrieving his position, and resigned the command. bitter controversy arose over these events. Halleck, the general-in-chief, was by no means free from blame, but the public odium chiefly fell upon generals McClellan and Fitz-John Porter, against whom Pope, while admitting his own mistakes, made grave charges. Pope was not again employed in the Civil War, but in the year of the Death of the General, he served in the Northern U.S. as a volunteer, and with his former skill and vigour in dealing with Indian risings. In 1865 he was made brevet major-general U.S.A. (having become brigadier-general on his appointment to the Army of Virginia), and he subsequently was in charge of various military districts and departments until his retirement in 1886. In 1882 he was promoted to the full rank of major-general U.S.A. General Pope died at Sandusky, Ohio, on the 23rd of September 1892.

He was the author of various works and papers, including railway reports (Pacific Railroad Reports vol. iii) and The Campaign of Vicksburg (Washington, 1863).

POPE, SIR THOMAS (c. 1507-1559), founder of Trinity College, Oxford, was born at Deddington, near Banbury, Oxfordshire, probably in 1507, for he was about sixteen years old when his father, a yeoman farmer, died in 1523. He was educated at Banbury school and Eton College, and entered the court of chancery. He found a friend and patron in the lord-chancellor Thomas Audley. As clerk of briefs in the star chamber, warden of the mint (1534-1536), clerk of the Crown in chancery (1537), and second officer and treasurer of the court for the settlement of the confiscated property of the smaller religious foundations, he obtained wealth and influence. In this last office he was superseded in 1541, but from 1547 to 1553 he was again employed as fourth officer. He himself won by grant or purchase a considerable share in the spoils, for nearly thirty manors, which came sooner or later into his possession, were originally church property. “He could have rode,” said Aubrey, “in his owne lands from Cogges (by Witney) to Banbury, about 18 miles.” In 1537 he was knighted. The religious changes made by Edward VI. were repugnant to him, but at the beginning of Mary’s reign he became a member of the privy council. In 1556 he was sent to reside as guardian in Elizabeth’s house. As early as 1555 he had begun to arrange for the endowment of a college at Oxford, for which he bought the site and buildings of Durham College, the Oxford house of the abbey of Durham, from Dr Goodrich Owen and William Martyon. He received a royal charter for the establishment and endowment of a college of the “Holy and Undivided Trinity” on the 8th of March 1556. The foundation provided for a president, twelve fellows and eight scholars, with a schoolhouse at Hook Norton. The number of scholars, was subsequently increased to twelve, the schoolhouse being given up. On the 28th of March the members of the college were put in possession of the site, and they were formally admitted on the 29th of May 1556. Pope died at Clerkwell on the 20th of January 1559, and was buried at St Stephen’s.
POPE-JOAN, POPE-JOAN (1531–1607), was born in London. He was the son of John Pope of Wroxton, and his descendants, the viscouncts Dillon and the earls of Guilford and barons North.

**POPE-JOAN**, a round game of cards, named after a legendary female Pope of the 10th century. An ordinary pack is used, from which the eight of diamonds has been removed, and a special round board in the form of eight compartments, named respectively Pope-Joan, Matrimony, Intrigue, Ace, King, Queen, Knave and Game (King, Queen and Knave are sometimes omitted). Each player—any number can play—contributes a stake, of which one counter is put into the divisions Ace, King, Queen, Knave and Game, two into Matrimony and Intrigue, and the rest into Pope-Joan. This is called drawing the hand. The cards are dealt with an extra hand for "stops," i.e. cards which stop, by their absence, the completion of a suit; thus the absence of the nine of spades stops the playing of the ten. The last card is turned up for trumps. Cards in excess may be dealt to "stops," or an agreed number may be left for the purpose, so that all players may have an equal number of cards. If an honour or "Pope" (nine of diamonds) is turned up, the dealer takes the counters in the compartment so marked. Sometimes the turning-up of Pope settles the hand, the dealer taking the whole pool. The Ace is the lowest card, the King the highest. The player on the dealer's left plays a card and names it; the player who holds the highest then plays it, till a stop is played, i.e. a card of which no one holds the next highest. All Kings are of course stops, also the seven of diamonds; also the cards next below the dealt stops, and the cards next below the played cards. After a stop the played cards are turned over, and the player of the stop (the card last played) leads again. The player who gets rid of all his cards first takes the counters in "Game," and receives a counter from each player for every card left in his hand, except from the player who may hold Pope but has not played it. The player of Ace, King, Queen or Knave of trumps takes the counters from that compartment. If King and Queen of trumps are in one hand, the holder takes the counters in "Matrimony"; if a Queen and Knave, then in "Intrigue"; if all three, those in the two compartments; if they are in different hands these counters are sometimes divided. Unclaimed stakes are left for the next pool. Pope is sometimes considered a universal "stop."

**POPERINGHE**, an ancient town of West Flanders, 12 m. W. of Ypres. Pop. (1904), 11,680. It contains a fine church of the 11th century, dedicated to St Botinus. In the 14th century it promised to become one of the principal communes in Flanders; but having incurred the resentment of Ypres on a matter of trade rivalry it was attacked and captured by the citizens of that place, who reduced it to a very subordinated position. There are extensive hop gardens, bleaching grounds and tanneries in the neighbourhood of the town.

**POPHAM, SIR HOME RIGGS** (1762–1820), British admiral, was the son of Stephen Popham, consul at Tettuan, and was his mother's twenty-first child. He entered the navy in 1778, and served with the flag of Rodney till the end of the war. In 1783 he was promoted lieutenant, and was for a time engaged on survey service on the coast of Africa. Between 1787 and 1793 he was engaged in a curious series of adventures of a commercial nature in the Eastern Sea—sailing first for the Imperial Ostend Company, and then in a vessel which he purchased and in part loaded himself. During this time he took several surveys and rendered some services to the East India Company, which were officially acknowledged; but in 1793 his ship was seized, partly on the ground that he was carrying contraband and partly because he was infringing the East India Company's monopoly. His loss was put at £70,000, and he was entangled in litigation. In 1805 he obtained compensation to the amount of £25,000. The case was a hard one, for he was undoubtedly sailing with the knowledge of officials in India. While this dispute was going on Popham had resumed his career as a naval officer. He served with the army under the duke of York in Flanders as "superintendent of Inland Navigation" and won his confidence. The protection of the duke was exercised with so much effect that Popham was promoted commander in 1794 and post captain in 1795. He was then engaged for years in co-operating in a naval capacity with the troops of Great Britain and her allies. In the Red Sea he was engaged in transporting the Indian troops employed in the expulsion of the French from Egypt. His bills for the repair of his ship at Calcutta were made the excuse for an attack on him and for charging him with the amount. It was just the time of the general reform of the dockyards, and there was much suspicion in the air. It was also the case that Sir St Vincent did not like Popham, and that Benjamin Tucker (1762–1820), secretary to the admiral, who had been the admiral's secretary, was his creature and scyphonist. Popham was not the man to be snuffed out without an effort. He brought his case before Parliament, and was able to prove that there had been, if not deliberate dishonesty, at least the very grossest carelessness on the part of his assailants. In 1806 he co-operated with Sir David Baird in the occupation of the Cape. He then persuaded the authorities that, as the Spanish Colonies were discontented, it would be easy to promote a rising in Buenos Ayres. The attempt was made with Popham's squadron and 1400 soldiers; but the Spanish colonists, though discontented, were not disposed to accept British help, which would in all probability have been made an excuse for establishing dominion. They rose on the soldiers who landed, and took them prisoners. Popham, with difficulty, escaped with his life and his ship from his station; but the City of London presented him with a sword of honour for his endeavours to "open new markets," and the sentence did him no harm. He held other commands in connexion with the movements of troops, was promoted rear admiral in 1814, and made K.C.B. in 1815. He died at Cheltenham on the 10th of September 1820, leaving a large family. Popham was one of the most scientific seamen of his time. He did much useful survey work, and was the author of the code of signals adopted by the admiralty in 1803 and used for many years.

**POPHAM, SIR JOHN** (c. 1531–1607), English judge, was born at Huntworth, in Somerset, about 1531. He was educated at Balliol College, Oxford, and called to the Bar at the Middle Temple. Concerning his early life little is known, but he was probably a member of the parliament of 1558. He was recorder of Bristol, and represented that city in parliament in 1571 and from 1572 to 1583. He was elected Speaker in 1580, and in 1581 became attorney-general, a post which he occupied until his appointment as lord chief justice in 1592. He presided at the trials of Sir Walter Raleigh and Guy Fawkes. Towards the end of his life Popham took a great interest in colonization, and was instrumental in procuring patents for the London and Plymouth companies for the colonization of Virginia. Popham was an advocate, too, of transportation abroad as a means of punishing rogues and vagabonds. His experiment in that direction, the Popham colony, an expedition under the leadership of his brother George (c. 1550–1608), had, however, but a brief career in its settlement (1607) on the Kennebec river. Popham died on the 10th of June 1607, and was buried at Wellington, Somerset. See Foss, *Lives of the Judges*; J. Winsor, *History of America*, vol. iii.

**POPILLIO (or POPILLIA), VIA**, the name of two ancient roads in Italy. (1) A highroad running from the Via Appia to Capua to Reggio, through a distance of 321 m. from the summit of the peninsula, and the main road through the interior of the country, not along the coast. It was built in 150 B.C. by the censor M. Popillus Laenas or in 132 B.C. by the consul P. Popillius. (2) A
highroad from Ariminum to Aquileia along the Adriatic coast. It no doubt originally came into use when Aquileia was founded as a frontier fortress of Italy in 181 B.C., and Polybius gives the distance correctly as 178 m. In 132 it was reconstructed (munia) by the consul P. Popilius, one of whose milestones has been found near Atria. It ran along the shore strip (Lido) from Ariminum to Ravena (33 m.), where it was usual in imperial times for travellers to take ship and go by canal to Alumnium (q.v.), and there resume their journey by road, though we find the stations right through on the Tabula Peutingeriana, and Narses marched in 552 from Aquileia to Ravena. (T. As.)

**POPINJAY** (O. Fr. popégal, or popingay, onomatopoetic, original), an old name for a parrot. Except in its transferred sense of a drooping, vain or conceited, empty-headed person, the word is now only used historically of a representation or image of a parrot swinging from a high pole and used as a mark for archery or shooting matches. This shooting at the popinjay (see Archery) was formerly a favourite sport. "Popingay" is still the proper heraldic term for a parrot as a bearing or charge.

**POPLAR,** an eastern metropolitan borough of London, England, bounded N. by Hackney, S. by the river Thames, and W. by Stepney and Bethnal Green, and extending E. to the boundary of the county of London. Pop. (1901), 168,622. The river Lea, which is the eastern boundary generally followed, is believed to have been crossed towards the north of the modern borough by a Roman road, the existence of which is recalled by the district-name of Old Ford; while Bow (formerly Stratford-le-Bow or Stratford-atte-Bow) was so named from the "bow" or arched bridge which took the place of the ford in the time of Henry II. South of these districts lies Bromley; in the south-east the borough includes Blackwall; and a deep southward bend of the Thames here embraces the Isle of Dogs. Poplar falls within the great area commonly associated with a poor and densely populated district under the name of the "East End." It is a district of narrow, square and mean houses, and it is said that whenever, the march of modern improvement may be seen in the erection of model dwellings, mission houses and churches, and various public buildings. In the north a part of Victoria Park is included. In Blackwall and the Isle of Dogs streets give place to the extensive East and West India Docks (opened in 1806) and Millwall Dock, with shipbuilding, engineering, chemical and other works along the river. Blackwall has been a shipping centre from early times. From the south of the Isle of Dogs (the portion called Cubitt Town) a tunnel for foot-passengers (1902) connects with Greenwich on the opposite shore of the Thames, and lower down the river is the fine Blackwall tunnel, carrying a wide roadway, completed by the London County Council in 1897 at a cost, inclusive of incidental expenses, of £1,383,929. Among institutions the Poplar Accidents Hospital may be mentioned. Near the East India Docks is the settlement of St. Frideswide, supported by Christ Church, Oxford. In Canning Town, which continues this district of poverty across the Lea, and so outside the county of London, are Mansfield House, founded from Mansfield College, Oxford; and a Women's Settlement, especially notable for its medical work. The metropolitan borough of Poplar includes the Bow and Bromley and the Poplar divisions of the Tower Hamlets parliamentary borough, each returning one member. The borough council consists of a mayor, 7 aldermen and 42 councillors. Area, 2327.7 acres.

**POPLAR** (Lat. *Populus*), the name of a small group of catkin-bearing trees belonging to the order *Salicaeae*. The catkins of the poplars differ from those of the nearly allied willows in the presence of a rudimentary perianth, of obliquely cup-shaped form, within the toothed bracteal scales; the male flowers contain from eight to thirty stamens; the fertile bear one-celled (nearly divided) ovary, surmounted by the deeply cleft stigmas; the two-valved capsule contains several seeds, each furnished with a long tuft of silky or cotton-like hairs. The leaves are broader than in most willows, and are generally either deltoid or ovate in shape, often cordate at the base, and frequently with slender petioles vertically flattened. Many of the species attain a large size, and all are of very rapid growth. The poplars are almost entirely confined to the northern temperate zone, but a few approach or even pass its northern limit, and they are widely distributed within that area; they show, like the willows, a partiality for moist ground and often line the river-sides in otherwise treeless districts. There are about twenty species, but the number cannot be very accurately defined—several, usually regarded as distinct, being probably merely variable forms of the same type, and the ease with which the trees intercross has led to the appearance of many hybrids. All yield a soft, easily-worked timber, which, though very perishable when exposed to weather, possesses sufficient durability when kept dry to give the trees a certain economic value. Many of the species are used for paper-making.

Of the European kinds one of the most important and best marked forms is the white poplar or abele, *P. alba*, a tree of large size, with rounded spreading head and curved branches, which, like the trunk, are covered with a greyish white bark, becoming much furrowed on old stems. The leaves are ovate or nearly round in general outline, but with deeply waved, more or less lobed and indented margins and cordate base; the upper side is of a dark green tint, but the lower surface is clothed with a dense white down, which likewise covers the young shoots—giving, with the bark, a hoary aspect to the whole tree. As in all poplars, the catkins expand in early spring, long before the leaves unfold; the ovaries bear four linear stigma lobes; the capsules ripen in May. A nearly related form, which may be regarded as a sub-species, *conestrinus*, the grey poplar of the nurseryman, is distinguished from the true abele by its smaller, less deep cut leaves, which are grey on the upper side, but not so hoary beneath as those of *P. alba*; the pistil has eight stigma lobes. Both trees occasionally attain a height of 90 ft. or more, but rarely continue to form sound timber beyond the first hundredth of growth, though the trunk will sometimes endure for a hundred and fifty years. The wood is very white, and, from its soft and even grain, is employed by turners and toy-makers, while, being tough and little liable to split, it is also serviceable for the construction of packing cases, the lining of carts and wagons, and many similar purposes; when thoroughly seasoned it makes good flooring planks, but shrinks much in drying, weighing about 38 lb per cubic foot when green, but only 33 lb when dry. The white poplar is an ornamental tree, from its graceful though somewhat irregular growth and its dense hoary foliage; it has, however, the disadvantage of throwing up numerous suckers for some yards around the trunk.

The grey and white poplars are usually multiplied by long cuttings; to weather, is so rapid in a moist loamy soil that, according to Loudon, cuttings 6 ft. in length, planted beside a stream, formed in twelve years trunks 10 in. in diameter. Both these allied forms occur throughout central and southern Europe, but, though now abundant in England, it is doubtful whether they are there indigenous. *P. alba* suffers much from the ravages of wood-eating larvae, and also from fungoid growths, especially where the branches have been removed by pruning or accident.

*P. nigra*, the black poplar, is a tree of large growth, with dark, deeply-furrowed bark on the trunk, and ash-coloured branches; the smooth deltoid leaves, serrated regularly on the margin, are of the deep green tint which has given name to the tree; the petioles, slightly compressed, are only about half the length of the leaves. The black poplar is common in central and southern Europe and in some of the adjacent parts of Asia, but, though abundantly planted in Britain, is not there indigenous. The wood is of a yellowish tint. In former days this was the prevalent poplar in Britain, and the timber was employed for the purposes to which that of other species is applied, but has been superseded by *P. monilifera* and its varieties; it probably furnished the poplar wood of the Romans, which, from its lightness and soft tough grain, was in esteem for shield-making; in continental Europe it is still in some request; the bark, in Russia, is used for tanning leather, while in Kamchatka it is sometimes
ground up and mixed with meal; the gum secreted by the buds was employed by the old herbalists for various medicinal purposes, but is probably nearly inert; the cotton-like down of the seed has been converted into a kind of vegetable felt, and has also been used in paper-making. A closely related form is the well-known Lombardy poplar, *P. fastigata*, remarkable for its tall, cypress-like shape, caused by the nearly vertical growth of the branches. Probably a mere variety of the black poplar, its native land appears to have been Persia or some neighbouring country; it was unknown in Italy in the days of Pliny, while from remote times it has been grown on the plains of Punjab, and Persia, where it is often planted along roadsides for the purpose of shade; it was probably brought from these countries to southern Europe, and its popularity from its abundance along the banks of the Po and other rivers of Lombardy, where it is said now to spring up naturally from seed, like the indigenous black poplar. It was introduced into France in 1740, and appears to have been grown in Germany and Britain soon after the middle of the last century, if not earlier. The Lombardy poplar is valuable chiefly as an ornamental tree, its timber being of very inferior quality; its tall, erect, and luxurious form of growth resembles that of the palm, and it derives its name from the resemblance of the young shoots or young branches more or less angular; the glossy, deltoid leaves are sharply pointed, somewhat cordate at the base, and with flattened petioles; the fertile catkins ripen about the middle of June, when their opening capsules discharge the cottony seeds which have given the tree its common western name; in New England it is sometimes called the "river poplar." The cotton-wood timber, though soft and perishable, is of value in its prairie habitats, where it is frequently the only available wood either for carpentry or fuel; it has been planted to a considerable extent in some parts of Europe, but in England a form of this species known as *P. monilifera* is very common, owing to its large globular growth. This is a well-known variety the young shoots are but slightly angled, and the branches in the second year become round; the deltoid short-pointed leaves are usually straight or even rounded at the base, but the younger branches are usually cordate, the leaves being ovate about the middle of May. This tree is of extremely rapid growth, and has been known to attain a height of 70 ft. in sixteen years; it is very tender, so that it must flourish in nearly any moist but well-drained situation. The timber is much used in rural districts for flooring, and is durable for indoor purposes when protected from dry-rot; it has, like most poplar woods, the property of resisting fire better than other timber. The native country of this form has been much disputed; but, though still known in many British nurseries as the "black Italian poplar," it is now well ascertained to be an indigenous tree in many parts of Canada and the United States. It is called "poplar" or "pencil" with *P. deltoides* or *P. molliarum*; the "white poplar" is now said to be a variety of *P. alba", a species of Canada, and is frequently planted in Britain. Its growth is extremely rapid in moist land; the buds are covered with a balsamic secretion. The true balsam poplar, or tacamahac, *P. balsamifera*, also known as the "true poplar" of the North American north-west, is a tree of rather large growth, often of somewhat fastigate habit, with round shoots and oblong-ovate sharp-pointed leaves, the base never cordate, the petioles round, and the disc deep glossy green above but white beneath. It is the "true poplar" of the American Canadian voyageur, abounds on many of the river sides of the north-western plains; it occurs in the neighbourhood of the Great Slave Lake and along the Mackenzie River, and forms much of the drift-wood of the Arctic coast. In these habitats it may attain a large size; the wood is very soft; the buds yield a gum-like balsam, from which the common name is derived; considered valuable as an antiseptic, this is said also to have diuretic properties; it was formerly imported into Europe in small quantities under the name of "balsam poplar," being the plant and not the timber. This balsam gives the tree a fragrant odour when the leaves are unfolding. The tree grows well in Britain, and acquires occasionally a considerable size. Its fragrant shoots and the fine yellow green long-petioled leaves, when they unfold, are a very noticeable feature. It is said by Aiton to have been introduced into Britain about the end of the 17th century.

Poplins, or Tabinettes, a mixed textile fabric consisting of a silk warp with a weft of worsted yarn. As the weft is in the form of a stout cord the fabric has a ridged structure, like rep, which gives depth and softness to the lustre of the silky surface. Poplins are used for dress purposes, and for rich upholstery work. The manufacture is of French origin; but it was brought to England by Gadow and it is now largely made by the British, and has been specially associated with Ireland. The French manufacture depends on the combination between *populines unies* or plain poplins and *populines à dispositions* or Écossaises, equivalent to Scotch tartans, in both of which a large trade is done with the United States from Lyons.

**POPOPATEPETL, (Aztec *popoca* "to smoke", *tepelt* "mountain"), a dormant volcano in Mexico in lat. 18° 50′ 47″ N., long. 98° 33′ 1″ W., which with the neighbouring Ixtacuahatl (Aztec "white woman") forms the south-eastern limit of the great basin known as the "Valley of Mexico." As it lies in the state of Puebla and is the dominating feature in the views of the city of that name, it is sometimes called the Puebla volcano. It is the second highest summit in Mexico; its shape, snow-covered cone rising to a height of 17,976 ft., or 438 ft. short of that of Orizaba. This elevation was reported by the Mexican geological survey in 1895, and as the Mexican Geographical Society calculated the elevation at 17,888 ft., it may be accepted as nearly correct. The bulk of the mountain consists of andesite, but porphyry, obsidian, trachyte, basalt, and other similar rocks are also represented. It has a stratified cone showing a long period of activity. At the foot of the eastern slope stretches a vast lava field—the "maipays" (malapats) of Atlashayacatl—which, according to Humboldt, was once a wide plain and was covered with a layer of ashes and cinders up to 150 ft. thick. This was brought to England from Canada in 1772. In America it seldom attains the large size it often acquires in England, and it is thinned out less than the prevailing form of the western plains; the name of "cotton-wood" is given to it in England. *P. macrophylla* or *candicans*, commonly known as the Ontario poplar, is remarkable for its very large heart-shaped leaves, sometimes 1 ft. in breadth and 1 ft. 6 in. in length, and is frequent in parts of Canada, and is frequently planted in Britain. Its growth is extremely rapid in moist land; the buds are covered with a balsamic secretion. The true balsam poplar, or tacamahac, *P. balsamifera*, also known as the "true poplar" of the North American north-west, is a tree of rather large growth, often of somewhat fastigate habit, with round shoots and oblong-ovate sharp-pointed leaves, the base never cordate, the petioles round, and the disc deep glossy green above but white beneath. It is the "true poplar" of the American Canadian voyageur, abounds on many of the river sides of the north-western plains; it occurs in the neighbourhood of the Great Slave Lake and along the Mackenzie River, and forms much of the drift-wood of the Arctic coast. In these habitats it may attain a large size; the wood is very soft; the buds yield a gum-like balsam, from which the common name is derived; considered valuable as an antiseptic, this is said also to have diuretic properties; it was formerly imported into Europe in small quantities under the name of **POPLIN, or TABINETT,** a mixed textile fabric consisting of a silk warp with a weft of worsted yarn. a thousand feet lower. A detailed description of the volcano was published by the Mexican geological survey in 1895 according to which the crater is elliptical in form, 2008 by 1312 ft., and has a depth of 1637 ft. below the summit of the highest pinnacle and 677 ft. below the lowest part of the rim, which is very irregular in height. The steep, ragged walls of the crater show a great variety of colours, intensified by the light from the deep blue sky above. Huge patches of sulphur, some still smouldering, are everywhere visible, intermingled with the white streaks of snow and ice that fill the crevices and cover the ledges of the black rocks. The water from the melted snow forms a small lake at the bottom of the crater, from which it filters through fissures to the heated rocks below and thence escapes as steam or through other fissures to the mineral springs at the mountain's base. The Indian sulphur miners go down by means of ladders or are lowered by rope and windlass, and the mineral is sent down the mountain side in a chute 2000 to 3000 ft. Some observers report that steam is to be seen rising from fissures in the bottom of the crater, and all are united in speaking of the fumes of burning sulphur that rise from its depths. That volcanic influences are still present may be inferred from the circumstance that the snow cap on Popocatepetl disappeared just before the remarkable series of earthquakes that shook the whole of central Mexico on the 30th and 31st of July 1900.

It is believed that Diego de Ordaz was the first European to reach the summit of Popocatepetl, though no proof of this remains further than that Cortés sent a party of men in 1519 to ascend a burning mountain. In 1522 Francisco Montaño made the ascent and had himself let down into the crater a depth of 400 or 500 ft. No second ascent is recorded until April and November 1827 (see Brantz Mayer, Mexico, vol. ii.). Other ascents were made in 1834, 1848 and subsequent years, members of the Mexican geological survey spending two days on the summit in 1895.

POPPER, DAVID (1840-), Bohemian violoncellist, was born at Prague, and educated musically at the conservatory there, adopting the 'cello as his professional instrument. He was soon recognized, largely through von Bilow, as one of the finest soloists of the time, and played on tours throughout the European capitals. In 1872 he married the pianist Sophie Menter, from whom he was separated in 1886. In 1896 he became professor at the Royal Conservatoire at Budapest. He published various works, mainly compositions for the 'cello, together with four volumes of studies arranged as a violoncello school.

POPO, ERNST FRIEDRICH (1794-1860), German classical scholar and schoolmaster, was born at Guben in Brandenburg on the 13th of August, 1794. In 1818 he was appointed director of the gymnasium at Frankfurt-on-the-Oder, where he died on the 29th of November 1860, having resigned his post three years before. Poppo was an extremely successful teacher and organizer, and in a few years doubled the number of pupils at the gymnasium. He is chiefly known, however, for his exhaustive and complete edition of Thucydides in four parts (11 vols., 1821-1840), containing (i.) prolegomena on Thucydides as an historian and on his language and style (Eng. trans. by G. Burges, 1837), accompanied by historical and geographical essays; (ii.) text with scholia and critical notes; (iii.) commentary on the text and scholia; (iv.) indices and appendices. For the ordinary student a smaller edition (1843-1851) was prepared, revised after the author's death by J. M. Stahl (1875-1889).

See R. Schwaze in Allgemeine deutsche Biographie and authorities there referred to.

POPPY, in botany, a genus of plants known botanically as *papaver*, the type of the family or natural order Papaveraeae. They are annual and perennial erect herbs containing a milky juice, with lobed or cut leaves and generally long-stalked regular showy flowers, which are nodding in the bud stage. The sepals, very rarely three, which are two in number, fall off as the flower opens, the four (very rarely five or six) petals, which are crumpled in the bud stage, also fall readily. The numerous stamens surround the ovary, which is composed of 4 to 16 carpels and is surmounted by a flat or convex rayed disk bearing the stigmas. The ovary is incompletely divided into many chambers by the ingrowth of the placentas which bear numerous ovules and form in the fruit a many-seeded short capsule opening by small valves below the upper edge. The valves are hydrosopic, responding to increase in the amount of moisture in the atmosphere by closing the apertures. In dry weather the valves open, and the small seeds are ejected through the pores when the capsule is shaken by the wind on its long stiff slender stalk. The flowers contain no honey and are visited by pollen-seeking insects, which alight on the broad stigmatic surface. The genus contains about 40 species, mostly natives of central and south Europe and temperate Asia. Five species are British; *P. Rhoes* is the common scarlet poppy found in cornfields and waste places. Cultivated forms of this, with exquisite shades of colour and without any blotch at the base of the petals, are known as Shirley poppies. *P. somniferum*, the opium poppy, with large white or blue-purple flowers, is widely cultivated (see OPIUM). The Oriental poppy (*P. orientale*) and its several varieties are fine garden plants, having huge bright crimson flowers with black blotches at the base. Many hybrid forms of varying shades of colour have been raised of late years. The Iceland poppy (*P. undicaule*), is one of the showiest species, having grey-green pinnae leaves and flowers varying in colour from pure white to deep orange-yellow, orange-scarlet, &c. Specially fine varieties with stalks 18-24 in. high are cultivated on a large scale by some growers for market. The Welsh poppy belongs to an allied genus, *Meconopsis*, a shrub about 2 ft. high, with a yellow and pale yellow poppy-like flowers. It is native in the south-west and north of England, and in Wales; also in Ireland. The prickly poppy (*Argemone grandiflora*) is a fine Mexican perennial with large white flowers.

To the same family belongs the horned poppy, *Glauceum lutetum*, found in sandy sea-shores and characterized by the waxy bloom of its leaves and large golden-yellow short-stalked flowers. Another member of the family is *Eschscholzia californica*, a native of western North America, and well-known in gardens, with orange-coloured flowers and a long two-valved fruit pod.

The plume poppy (*Bocconia cordate* and *B. microcarpa*) are ornamental foliage plants of great beauty. The cyclamen poppy (*Eomecon chionantha*) is a pretty Chinese perennial, having roundish slightly lobed leaves and pure white flowers about 2 in. across. The tree poppy (*Dendromecon rigidum*) is a Californian shrub about 3 ft. high, having golden-yellow flowers about 2 in. across. The Californian poppy (*Platysemon californicus*) is a pretty annual about a foot high, having yellow flowers with 3 sepals and 6 petals; and the white bush poppy (*Romneya Coulteri*) is a very attractive perennial and semi-shrubby plant 2-6 ft. high, with pinnatifid leaves and large sweet scented white flowers often 6 in. across.

POPPY HEADS, a term, in architecture, given to the finials or other ornaments which terminate the tops of bench ends, either to pews or stalls. They are sometimes small human heads, sometimes richly carved images, knots of foliage or finials, and sometimes *fleurs-de-lis* simply cut out of the thickness of the bench end and chamfered. The term is probably derived from the French *poupee*, doll, puppet, used also in this sense, or from the flower, from a resemblance in shape.

POPPY OIL (Oleum popavera), a vegetable oil obtained by pressure from the minute seeds of the garden or opium poppy, *Papaver somniferum*. The white-seeded and black-seeded varieties are both used for oil-making; but when the production of oil is the principal object of the culture, the black seed is usually preferred. The qualities of the oil yielded by both varieties and the proportion they contain (from 50 to 60%) are the same. By cold pressing seeds of fine quality yield from 30 to 50% of virgin or white oil (*huile blanche*), a transparent limpid fluid with a slight yellowish tinge, bland and pleasant to taste, and with almost no perceptible smell. On second pressure with the aid of heat an additional 20 to 25% of inferior oil (*huile de fabrique ou huile ruse*) is obtained, reddish in colour, possessed
of a biting taste, and a linseed-like smell. The oil belongs to the linoleic or drying series, having as its principal constituent linolein; and it possesses greater drying power than raw linseed oil. Its specific gravity at 15° C. is 0.925. Poppy oil is a valuable and much used medium for artistic painting. The fine qualities are largely used in the north of France (huile d'aïllete) and in Germany as a salad oil, and are less liable than olive oil to rancidity. The absence of taste and characteristic smell in poppy oil also leads to its being much used for adulterating olive oil. The inferior qualities are principally consumed in soap-making and varnish-making, and for burning in lamps. The oil is very extensively used in the valley of the Ganges and other opium regions for food and domestic purposes. The methods in India about 30% of oil is extracted, and the remaining oleaginous cake is used as food by the poor. Ordinary poppy-oil cake is a valuable feeding material, rich in nitrogenous constituents, with an ash showing an unusually large proportion of phosphoric acid. The seed of the yellow horned poppy, Glaucium luteum, yields from 30 to 35% of an oil having the same drying and other properties as poppy oil; and from the Mexican poppy, Argemone mexicana, is obtained a non-drying oil used as a lubricant and for burning.

**POPULATION** (Lat. populus, people; popolare, to populate), a term used in two different significations, (1) for the total number of human beings existing within certain areas at a given time, and (2) for the "peopling" of the area, or the influence of the various forces of which that number is the result. The population of a country, in the former sense of the word, is ascertained by means of a census (q.v.), which periodically records the number of people found in it on a certain date. Where, as is generally the case, detail of sex, age, conjugal condition and birthplace is included in the return, the census results can be co-ordinated with those of the parallel registration of marriages, births, deaths and migration, thus forming the basis of what are summarily termed vital statistics, the source of our information regarding the nature and causes of the process of "peopling," i.e., the movement of the population between one census and another. Neither of these two operations has yet reached perfection, either in scope or accuracy, though the census, being the subject of special and concentrated effort, is generally found the superior in the latter respect, and is in many cases taken in countries where registration has not yet been introduced. The countries where neither is in force are still, unfortunately, very numerous.

—Man is the only animal which has proved able to pass from dependence upon its environment to a greater or less control over it; and, accordingly, homogeneously inhabited over every quarter of the globe. The area and population of the world, as a whole, have been the subject of many estimates in scientific works for the last three centuries and are still to a considerable extent matters of rough approximation. Every decade, however, brings a diminution of the field of conjecture, as some form of civilized administration is extended over the more backward tracts, and is followed, in due course, by a survey and a census. It is not necessary, therefore, to cite the estimates framed before 1881, when a carefully revised summary was published by Boehm and H. Wagner. Since then the laborious investigations of P. F. Levasseur and L. Bodin have been completed in the case of Europe and America, and, for the rest of the world, the figures annually brought up to date in the *Statesman's Year Book* may be taken to be the best available. From these sources the abstract at foot of page has been derived.

The principal tracts still unmeasured and unenumerated (in any strict sense) in the Old World are the Turkish Empire, Persia, Afghanistan, China and the Indo-Chinese peninsula and nearly nine-tenths of Africa. In the same category must be placed a considerable proportion of central, southern and Polar America (see Census). There is little of the world which is entirely uninhabited; still less permanently uninhabitable and unlikely to be required to support a population in the course of the expansion of the race beyond its present abodes. Probably the polar regions alone do not fall within the category of the potentially productive, as even sandy and alkaline desert is rendered habitable where irrigation can be introduced; and vast tracts of fertile soil adapted for immediate exploitation, especially in the temperate zones, both north and south, only remain unpeopled because they are not yet wanted for colonization. The geographical distribution of the population of the world is therefore extremely irregular, and, unless from desertion areas but recently colonized, the density is regulated by the means of subsistence within reach. "La population," says G. de Molinari, "a tendance de se proportionner à son débouché." These, in their turn, depend mainly upon the character of the people who inhabit the country. Even amongst savages there are few communities, and those but sparse, which subsist entirely upon what is directly provided by nature. As human intelligence and industry come into play the means of livelihood are proportionately extended; population multiplies, and with this multiplication production increases. Thus, the higher densities are found in the eastern hemisphere, within the zone in which arose the great civilizations of the world, or, roughly speaking, between north parallels 25 and 40 towards the east, and 25 and 55 in the west. Here large areas with a mean density of over 500 to the sq. m. may be found either supported by the food directly produced by themselves, as in the great agricultural plains of the middle kingdom of China and the Ganges valley and delta; or else, as in western Europe, relying largely upon food from abroad, purchased by the products of manufacturing industry. In the one class the density is mainly rural, in the other it is chiefly due to the concentration of the population into large urban aggregates. It is chiefly from the populations of the south-west of Europe that the New World is being colonized; but the territories over which the settlers and their recruits from abroad are able to scatter are so extensive that even the lower densities of the Old World have not yet been attained, except in a few tracts along the eastern coasts of Australia and North America. Details of area and population are given under the headings of the respective countries, and the only general point in connexion with the relation between these two facts which may be mentioned here is the need to bear in mind that the larger the territory the less likely is its mean density-figure to be typical or really representative. Even in the case of small and comparatively homogeneous countries such as Holland, Belgium or Saxony there is considerable deviation from the mean in the density of the respective component subdivisions, a difference which when extended over more numerous aggregates often renders the general mean misleading or of little value.

**Distribution of Population by Sex.**—After geographical dispersion, the most general feature amongst the human race is its division by sex. The number of speculations as to the nature of this distinction has been great, it is said, well-nigh doubled since Drelincourt, in the 18th century, brought together 262 "groundless hypotheses," and propounded on his own part a theory.

which has since been held to be the 363rd in the series. It is
not proposed to deal here with incidents appertaining to the
"ante-natal gloom," and we are concerned only with the
bemings when once they have been born. In regard to the division
of these into male and female, the first point to be noted is that,
in all communities of western civilization, more boys are born
than girls. The excess ranges from 20 to 60 per thousand.
In Greece and Rumania it is exceptionally high, and in some
Oriental or semi-Oriental countries it is said to place to a
deficit, though in the latter case the returns are probably not
trustworthy. From the more accurate statistics available it
appears that the excess of male births varies amongst different
races and also at different times in the same community. It
is high in new-colonized and amongst the Latin races, with the
exception of the French. These, with the English, show a
much smaller excess of boy-births than the average of western
Europe, and the proportion, moreover, seems to be somewhat
decreasing in both these countries and in Belgium, from causes
which have not yet been ascertained. As the mortality amongst
boys, especially during the first year, is considerably above that
of the other sex, numerical equilibrium between the two is estab-
lished in early youth, and in most cases girls outnumber boys,
except for a few years between twelve and sixteen. Then follows
the chequered period of the prime of life and middle age, during
which the liability of men to industrial accidents, war and other
causes of special mortality, irrespective of their greater incli-
nation to emigrate, is generally sufficient to outweigh the dangers
of childbirth or premature decay among the women, who tend,
accordingly, to predominate in number at this stage. In old
age, again, their vitality rises superior to that of the men, and
they continue to form the majority of the community.
The general results are an excess of females over males throughout
western Europe: but though the relative proportions vary from
time to time, remaining always in favour of what is conventionally
called the weaker sex, it is impossible, owing to disturbing factors
like war and migration, to ascertain whether there is any general
tendency for the proportion of females to increase or not. In
comparatively new settlements, largely fed by immigration,
the number of males is obviously likely to be greater than that of
females, but in the case of countries in Asia and eastern Europe
in which also a considerable deficiency of the latter sex is indi-
cated by the returns, it is probable that the strict seclusion,
imposed by convention on women and the consequent reticence
regarding them on the part of the householders answering
the official inquiry tend towards a short count. On the other
hand, the lower position assigned to women and the very
considerable amount of hard work exacted from them, may
cause them to wear out earlier than under higher conditions,
though not to the extent implied in the statistics. In the
following table the latest available information on this head is
given for representative countries of western and eastern Europe,
the East and the New World.

### Distribution by Age

Few facts are more uncertain about an individual than the number of years he will live. Few, on the contrary, as was pointed out by C. Babbage, are less subject to fluctuation than the duration of life amongst people taken in large aggregates. The age-constitution of a community does indeed vary, and to a considerable extent, in course of time, but the changes are usually gradual, and often spread over a genera-
tion or more. At the same time, it must be admitted which those have recently taken place amongst most of the communities of western Europe are remarkable for both their rapidity and their extent; and are probably attributable, in part at least, to influences which were almost inoperative at the
time when Babbage wrote. The distribution of life amongst
the different periods of life is regulated, in normal circumstances, by the birth-rate, and as the mortality at some of the periods is far greater than at others, the death-rate falls
indirectly under the same influence. The statistics of age, there-
fore, may be said to form a link between those of the population,
considered as a fixed quantity, as at a census, and those which
record its movement from year to year. To the correct interpre-
tation of the latter, indeed, they are essential, as will appear
below. Unfortunately, the return of age is amongst the less
satisfactory results of a general enumeration, though its inaccu-
acy, when spread over millions of persons, is susceptible of
correction mathematically, to an extent to make it serve its
purpose in the directions above indicated. The error in the
original return generally arises from ignorance. An illiterate
population is very prone to state its age in even multiples of five,
and even where education is widely spread this tendency is not
altogether absent, as may be seen from the examples given in

Table III. Deliberate mis-statements, too, are not unknown,
especially amongst women. This has been repeatedly illustrated
in the English census reports. Irrespective of the wish of women
between 25 and 40 to return themselves as under 25, there appears
to be the more practical motive of obtaining better terms in
insurance, which, as an overstatement of age often has, is
said, the object of getting better wages in domestic service or
better dietary in the workhouse! In all countries, moreover,
there seems to be an inclination to exaggerate longevity after
the three score years and ten have been passed. In order to minimize
the results of such inaccuracy, the return of ages is compiled in
aggregates of five or ten years and then redistributed over single
years by the method of differences. The present purpose being
merely to illustrate the variation of distribution amongst a few
representative countries, it is unnecessary to enter into more
detail than such as will serve to distinguish the proportions
of the population in main divisions of life. Thus it may be said
that in the West of Europe, particularly in one-third of the people, roughly
speaking, are under fifteen; about one-half, between the age and fifty,
and the remaining sixth older than fifty. The middle period
may conveniently be extended to sixty and subdivided at forty, as is done in Table IV. The differences between the several countries in their age-constitution can best be appreciated by reference to some recognized general standard. The one here adopted is the result of the co-ordination of a long series of enumerations taken in Sweden during the last century and a half, prepared by Dr G. Sundbärg of Stockholm. It is true that for practical use in connexion with vital statistics for a given period, the aggregate age-distribution of the countries concerned would be a more accurate basis of comparison, but the wide period covered by the Swedish observations has the advantage of eliminating temporary disturbances of the balance of ages, and may thus be held to compensate for the comparatively narrow geographical extent of the field to which it relates.

</table>

As regards correspondence with the standard distribution, it will be noted thatFinland, the next country to Sweden geographically, comes after Japan, far detached from northern Europe by both race and distance, and is followed by Portugal, where the conditions are also very dissimilar. The other Scandinavian countries, Norway and Denmark, appear, like Sweden itself in the present day, to bear in their age-distribution distinct marks of the emigration of adults, or, at least, the temporary absence from home of this class at the time of enumeration. The same can be said of Italy in its later returns and of Germany in those before 1895. On the contrary, the effect of the inflow of adult migrants is very marked, as is to be expected, in the returns for the new countries, such as the United States, Canada and Australasia. In the case of the Old World, the divergence from the standard which most deserves notice is the remarkable preponderance of the young in all the countries of eastern Europe, as well as in India, accompanied by an equally notable deficiency of the older elements in the population. Again, there are in the west two well-known instances of deficient reinforcement of the young: France and Ireland, in which countries the proportion of those under 15 falls respectively 75 and 32 per mille below the standard; throwing those over 65 up to 41 and 26 per mille above it. The table does not include figures for earlier enumerations, but one general characteristic in them should be mentioned, viz. the far higher proportion borne in them of the young, as compared with the more recent returns. In England, for instance, those under 15 amounted to 360 per mille in 1841, against 324 sixty years later. In Ireland the corresponding fall has been still more marked, from 382 to 304. The ratio in France was low throughout the 19th century, and during the last half fell only from 273 to 261, raising the proportion of the old above that resulting in northern Europe and Italy from emigration. It is remarkable that the same tendency for the proportion of the young to fall off is perceptible in new countries as well as in the older civilizations, setting aside the influence of immigration at the prime of life in depressing the proportion of children. The possible causes of this widespread tendency of the mean age of a western community to increase appertain to the subject of the movement of the population, which is dealt with below.

The Movement of Population.—"The true greatness of a State" says Bacon, "consists essentially in population and breed of men"; and an increasing population is one of the most certain signs of the well-being of a community. Successive accretions, however, being spread over so long a term as that of human life, does not fail that the population at any given time is necessarily the result of contemporaneous causes; consequently, the traces left by a casual set-back, such as famine, war, or an epidemic disease, remain long after it has been succeeded by a period of recuperation, and are to be found in the age-constitution and the current vital statistics. Population is continually in a state of motion, and in large aggregates the direction is invariably towards increase. The forces underlying the movement may differ from time to time in their respective intensity, and, in highly exceptional cases, may approach equilibrium, their natural tendencies being interrupted by special causes, but the instances of general decline are confined to wild and comparatively small communities brought into contact with alien and more civilized races. The factors upon which the growth of a population depend are internal, operating within the community, or external, arising out of the relations of the community with other countries. In the latter case, population already in existence is transferred from one territory to another by migration, a subject which will be referred to later. Far more important is the vegetative, or "natural" increase, through the excess of births over deaths. The principal influences upon this, in civilized life, are the number of the married, the age at which they marry or bear children, the fertility of marriages and the duration of life, each of which is evidently related to the extent and intensity of the movement.

Marriage.—In every country a small and generally diminishing proportion of the children is born out of wedlock, but the primary regulator of the native growth of a community is the institution of marriage. Wherever, it has been said, there is room for two to live up to the conventional standard of comfort, a marriage takes place. So close, indeed, up to recent times, was the connexion held to be between the prosperity of the country and the number of marriages, that Dr W. Farr used to call the latter the barometer of the former. The experience of the present generation, however, both in England and other countries, seems to justify some relaxation of that view, as will appear below. The tendency of a community towards matrimony, or its "nuptiality," as it is sometimes termed, is usually indicated by the ratio to the total population of the persons married each year. For the purpose of comparing the circumstances of the same community at successive periods this method is fairly trustworthy, assuming that there has been no material shifting of the age-proportions during the intervals. It is not a safe guide, however, when applied to the comparison of different communities, the age-composition of which is probably by no means identical, but in consideration of its familiarity it has been adopted in the first section of Table V. below, with the periods for each of the countries selected as representative.

One of the features which is prominent throughout the return is that in every country except Belgium the rate per mille attained a maximum in the early seventies, and has since shown
a descending tendency, notwithstanding the fact, noted in the preceding paragraph, that the youthful population, which, of course, weighs down the rate, has also been relatively decreasing. Countries of Oriental and semi-Oriental habits have not been shown, owing to the difference in their marriage system from that of western Europe. It may be mentioned, however, in passing, that their marriage rate is generally considerably higher than that here indicated, as may be seen from the example of Galicia, which is here shown separately from cis-Leithian Austria.

</table>

In the opposite direction will be noted the case of Ireland, where the rate is abnormally low; and returns more recent than those included in the table show that of late the rates in Sweden and Norway have also fallen to but little above 11 per mille. In regard to the necessity of taking into consideration the factor of age in the return of marriage-rates, an example may be here given from the data for England. The rate taken upon the total population was 16.7 per mille in 1870–1872 and 15.3 in 1905; by excluding the population under fifteen the corresponding figures are 57.2 and 46.6 per mille. Thus the decline, which by the first method is only 8¾%, becomes by the second, 19%; and if the age-distribution of 1905 were reduced to that of the earlier period, the difference would increase to 22%, the most accurate figure of the three. For the present purpose it is sufficient to connect the rate of marriage with that of births by using as a basis for the former the number of women of conceptive age, or between 15 and 45 years old. The proportion of these is given in the latter portion of the table. Again taking England as an example, the women of the above ages bore the proportion to the total population of 23% in 1871 and had risen to 25% in 1901; but at the former time, 49.6% were married, whilst thirty years later, only 46.8 were thus situated. The table also shows that the proportion of the women of the ages in question who were married exceeds half only in Italy, France and Germany, not to mention Galicia. In other countries the average proportion is about 45%. In Sweden and Norway it is only 41 and in Ireland less than a third. In Scandinavia, and perhaps in Italy, the rate may be affected by the emigration of adult males, but the later columns of the table indicate that this is not the cause of the low rate in Ireland, which appears to be mainly due to abstinence from marriage at the ages specified.

Next to the proportion of the married to the total marriageable the most important factor connected with the natural increase of the population is the age at which marriage takes place. Where the proportion of the married is high, the average age of the wives is low, and early marriage is conducive to relatively rapid increase. In the first place, the interval between generations is shortened, and the elder is contemporaneous with the younger for a longer period. Then, again, the fecundity of women amongst western peoples is at its maximum between 18 and 25 years of age and decreases rapidly as that period is left behind. A Swedish return of 1896–1900 shows that the annual births per thousand wives of 20–25 are fewer by nearly 17% than those of wives under 20. Between 25 and 30 the number falls off by one-fifth, and after 40 by about 44%. In the countries mentioned in Table V, the average proportion borne by wives under 30 to the total under 45 is just over one-third. That proportion is exceeded in southern Europe, where women develop earlier, and in Galicia. In England and France it stands at 36. In Ireland and Sweden it is only 28, and in Denmark, Holland and Norway, 100, it is below the average. The registrar-general of England has pointed out a marked tendency towards the postponement of marriage in that country. Between 1876 and 1905, for instance, the proportion of minors married receded by 43% in the case of men and 32% amongst women. The mean age of husbands married in 1873 was 23-6 years and of wives 24-2, whereas thirty years later the corresponding ages were 28-6 and 26-4. The general results of the decline of the marriage-rate and the postponement of marriage upon the natural growth of population will be discussed in connection with the birth-rate, though the statistics available do not permit of the accurate measurement of the respective influence of these factors, and there are others, too, which have to be taken into consideration, as will appear below.

**Births.**—Apart from the information which the statistics of birth furnish as to the growth of population, they have, like those of marriage, and perhaps to even a greater extent, a special social interest from their bearings upon the moral conditions of the community to which they relate. It is in their former capacity, however, that they enter into the present subject. A birth-rate, taken as it usually is upon the total population, old and young, is open to the objections made above respecting the marriage-rate, and with even more force, as the basis is itself largely the product of the fact which is being measured by it. The internal variations of the rate in a single community, however, can be fairly indicated in this way, as is done in Table VI., which, it is to be noted, refers to those born alive only and excludes the still-born, statistics regarding whom are incomplete.

The crude birth-rate, it will be noted, is in general harmony with that of marriage. In the countries where the former is high the rate of marriage is also above the average. In eastern Europe, so far as the figures can be trusted, this is markedly the case, and the birth-rates range between 39 per mille in Hungary and 49 in Russia, where the tradition of encouraging fertility amongst the peasantry has not been effaced. Among the lower rates which prevail in western Europe, however, the connexion is not so direct, and a low birth-rate is sometimes found with a relatively higher marriage rate and vice versa, a deviation from the natural course of events which will
be discussed presently. The birth-rate, like the marriage-rate, seems to have reached its acme in the seventies, except in the three southern countries, France, Italy and Spain. The decline since the above period is very marked and exceeds that noted in the case of the rate of marriage. It is worth noting, too, that the fall in the crude birth-rate is not confined to the Old World, but has attracted special attention in Australia and New Zealand, where a rate of 40 per mile in the period 1861-1870 has now given place to one of 26. In Massachusetts and other of the older settlements of the United States, moreover, the same feature has been the subject of investigation.

The birth-rate, like the marriage-rate, seems to have reached its acme in the seventies, except in the three southern countries, France, Italy and Spain. The decline since the above period is very marked and exceeds that noted in the case of the rate of marriage. It is worth noting, too, that the fall in the crude birth-rate is not confined to the Old World, but has attracted special attention in Australia and New Zealand, where a rate of 40 per mile in the period 1861-1870 has now given place to one of 26. In Massachusetts and other of the older settlements of the United States, moreover, the same feature has been the subject of investigation.

The crude rates which have been discussed above afford no explanation of this change, nor do they always illustrate its full extent. It is necessary, therefore, to eliminate the difference in the age-constitution of the countries in question by excluding from the field of observation, as before, all except possible mothers, basing the rate upon the respective numbers of women of the contraceptive age, that is between 15 and 45. The proportion borne by this group to the total population in most cases fairly up to that set forth by Dr Sundbärg in his standard. It is well above it in all three parts of the United Kingdom and falls materially below it only in Scandinavia and Italy. Indeed, during the last generation, this proportion has been in most cases slightly increased, in consequence of the fall of the birth-rate which set in anterior to this period. The stock, then, from which wives are drawn is ample. The question remains, how far advantage is taken of it. According to the Sundbärg standard the percentage married is 48. As has been shown in the preceding paragraph, this is surpassed in Italy, France and Germany, and approached in most of the rest, with the exception of Sweden, Norway and Scotland, which are six or seven points below it, and Ireland, where less than a third are married. The proportion married, moreover, has slightly increased since 1880, except in the United Kingdom. In England the marriage-rate (on the age basis) fell off by 4.6% and in Norway and Scotland by 2%, whilst the decline in the birth-rates amounted to 15 and 11% respectively. In Ireland the case was different, as the marriage-rate declined by 12% and the birth-rate by no more than 5.7%. In New South Wales and New Zealand, too, the marriage-rates fell off in the same period by 11 and 38% respectively, whilst the decline in the birth-rates amounted to 35 and 31%. In the above countries, therefore, abstinence from marriage may be said to have been a factor of some importance in the decline. On the continent of Europe, however, looking at the divergence in direction between the crude marriage-rate and that corrected to an age-basis, it is not improbable that the decline in the former may be attributable to some cause other than abstinence from marriage, at all events at the principal reproductive period; and perhaps to a decrease in marriage or remarriage after middle life, a period of which the weight in the age-distribution has been increasing of late. On the other hand, the postponement of marriage in the case of women of contraceptive ages is a tendency which seems to be growing in other countries as well as in England and undoubtedly has a depressing effect upon the rate of births. It would conduct, therefore, to further accuracy in the comparison of the rates of different countries if the latter were to be correlated with greater subdivision of the ages amongst wives between 15 and 45. The proportion of wives below 30 to the total of that group was

The highest rate recorded, 253 per thousand conceiptive wives, was lower than that of any European country except France and Belgium. The cessation of assisted immigration early in the life of the present generation is alleged to have had considerable influence upon the rate, in Victoria, at least, owing to the curtailing of the supply of adult women of the more conceiptive ages and the age of those who had reached the country at an earlier date. But neither this nor the diminution of the marriage-rate amongst women of those ages suffices to account for more than a fraction of the decline. The same tendency, moreover, is traceable in the New England States of America, so far as statistics are available.

It has been held by some that a phenomenon so widely diffused over the western world must be attributable to physiological causes, such as alcoholism, syphillis, the abuse of narcotics and so on. Herbert Spencer, again, before the decline in question set in, put forward the hypothesis that "the ability to maintain individual life and the ability to multiply vary inversely"; in other words, the strain upon the nervous system involved in the struggle for life under the conditions of modern civilization, by reacting on the reproductive powers, tends towards comparative sterility. These theories, however, being supported, according to the authorities of to-day, by no evidence, statistical or other, need not be here considered.

Nor, again, can the decline in fertility be connected with any diminution of material prosperity. On the contrary, the fertility-rate appears to be best maintained in countries by no means distinguished for their high standard of living, such as Spain, Italy, Ireland, and, perhaps, Austria. In this respect, Holland stands by itself; but in the others mentioned, with the exception of Ireland, both marriage and birth-rates are high and there has been a comparatively insignificant fall in prolificity. The decline has been greatest where the standard of comfort is notoriously high, as in the United States, England and Australasia; also in France, where the general well-being reaches probably a lower depth in the community than in any other part of Europe. The comparison of the rates in France with those of Ireland is an instructive illustration of the point under consideration. In France more than half the women of conceiptive age are married: in Ireland less than a third, and the proportion of youthful wives in the latter is 28% below that in France. In both the crude birth-rate is far below that of any other European country. But the fertility of the Irish wife exceeded that of her French compeer by 44% in 1880 and by no less than 84% twenty years later. So steady, indeed, has been the prolificity of Ireland, that from being ninth on the list at the earlier period mentioned, it is now inferior only to Holland and perhaps Finland in this respect.

It need not be assumed, however, that because these rates cannot be associated with the comparative degree of prosperity attained by the individual community they are altogether independent of the economic factors mainly contributing to that condition, such as trade, employment and prices. It is difficult, indeed, if not impracticable, to disentangle the effects which should be respectively attributed to influences so closely related to each other; but, of the three, prices alone tend to sufficient uniformity in their course in different countries to justify a supposition that they are in some way connected with a phenomenon so widely diffused as that of the decline in marriage and fertility. It is not improbable, therefore, that the fall in wholesale prices which, with temporary interruptions, persisted between 1870 and 1900, in general harmony with the other movement, must have contributed to reluctance on the part of those who have enlarged their notions of the standard of comfort to endanger their prospects of enjoying it by incurring the additional expenses of family life. Matrimony may be postponed, or, when entered upon, may be rendered a lighter burden upon the breadwinner. The economic element in the situation, which is imposed upon the individual by circumstances, is thus modified voluntarily into a moral or prudential consideration. In this case diminished prolificity where unaccompanied by a decrease in the number of marriages at reproductive ages, is attributable to the voluntary restriction of child-bearing on the part of the married. This explanation of the decline is supported by the almost unanimous opinion of the medical profession in the countries in question, and substantial evidence can be found everywhere of the extensive prevalence of the doctrine and incidence of what has been termed, in further derogation of the repute of the "much misrepresented Malthus," Neomalthism. Preventive measures of this kind have long been in use in France, with the result shown in Tables V. and VI., and from that country they have spread, mostly since 1870, nearly all over western Europe, as well as to the Anglo-Saxon world beyond the seas; but are scarcely apparent in countries where the Roman church has a strong hold on the people. It is generally held that the practice of thus limiting families usually prevails, in the first instance, among the better-off classes, and in time filters down, as "the gospel of comfort" is called upon those of lesser resources, until the prolificity of the whole community is more or less affected by it. The registrar general for England, indeed, has stated that whilst no more than about 15% of the decline in the birth-rate can be attributed to abstinence or postponement of marriage, nearly 70% should be ascribed to voluntary restriction.

The question of illegitimate births is the last to be here mentioned. It appears to be connected to a considerable extent with the subject dealt with above. In nearly every country the rate of these births has of late years shown a marked fall, which is by some ascribed to the adoption of the same expedients in respect of co-operation as are employed as conventional among the married. The rates given at the end of Table VI. are calculated upon the number of women most likely to produce them, that is, the spinsters, widows and divorced of conceiptive age. In comparing the different countries, it may be noted that in some parts of Europe the rate is raised by the inclusion of the offspring of marriages not registered as demanded by law, though duly performed in church. Then, again, the possibility of legitimization by subsequent marriage tends to raise the rate. Italy and Scotland may be taken as examples of these two influences, and in Germany, too, the rates in Saxony and Bavaria, which are among the highest in Europe, are in part due to the non-registration of marriages sanctioned by religious ceremony only. The low rates in Ireland, Holland and England are especially noticeable, and in the last named, the decrease between 1870 and 1905 amounted to more than 50%, not, however, entirely due, it is said, to improved morality.

Deaths.—The forces tending towards the natural growth of population, which have been described above, differ from that which acts in the opposite direction in two material features. Marriage and child-bearing, in the first place, are operative amongst a fraction of the population only—those of conceiptive age; whereas to the Urn of Death, as Dr Farr expressed it, all ages are called upon those of lesser resources, until the prolificity of the non-married. Then, again, the former are voluntary acts, entirely under the control of the individual; but mortality, though not beyond human regulation, is far less subject to it, and in order to have substantial results the control must be the outcome of collective rather than individual co-operation. The course of the marriage and birth-rates, set forth above, affords evidence that the control over both has been exercised of recent years to an unprecedented extent, and it will appear from what is stated below, that partly owing to this cause, partly, also, to improved hygienic conditions in western life, there has been an even more pronounced decline in the rate of mortality. The general results of both upon the natural increase of population in the countries selected for illustration of this subject will be found at the end of this paragraph. For the purpose of showing this, the crude death-rate, taken, like that of births, upon the whole population, without distinction of age or sex, will suffice. Where, however, the tendency to mortality, not its results, is in question, both the above factors must be taken into account, as they have been above in distinguishing the rate of fertility from that of births. The process of correcting the mere numbers of annual deaths per thousand of population into a form which renders
the return comparable with those for communities differently constituted is somewhat complicated, but it is amply justified by its necessity in adapting the figures to the important services they perform in actuarial and sanitary science. This subject can only be dealt with here in outline. In the first place, sex must be distinguished, because, from infancy upwards, except between the ages of 10 and 20, the mortality amongst females is considerably less than amongst the other sex, and appears, too, to be declining more rapidly. So far as adult life is concerned this superior vitality is no doubt attributable to comparative immunity from the risks and hardships to which men are exposed, as, also, to the weaker inclination of women towards intemperance of different kinds. Thus, though the generally higher proportion of females in the community may seldom be enough to depress more than slightly the death-rate as a whole, it has a substantial effect upon it at the ages where women are in more marked numerical predominance, as in later life, and in places where the number of domestic servants is unusually great. Age is a factor still more important than sex in a return intended to serve as an index of mortality. The liability to death is extremely high amongst infants, decreasing with every month of life during the first year, but continuing above the mean rate until about the age of five. From the latter period until the fifteenth or sixteenth year mortality is at its best. The death-rate then gradually rises, slowly till 25, more rapidly later, when, from about 45 onward deterioration sets itself more pronouncedly, and by three score years and ten, the rate begins to exceed that of childhood. Thus, all other considerations being set aside, mortality tends to vary inversely with the proportion of the population at the healthy period 5 to 25. As the replenishment of this group depends upon the conditions prevailing at the earlier ages, it is to the mortality in childhood that most weight, from the standpoint of hygiene, must be attached. In most European countries not much less than half the annual deaths take place amongst children below five years of age, upon the total number of whom the incidence falls to the extent of from 40 to 120 per mille. The greater part of this is debitable, as just pointed out, to the first year, in which the mortality, calculated upon the number of births, ranged, in the decennium 1895-1904, between 70 per mille, in the exceptionally favourable circumstances of the Australasian States, to nearly 270 in European Russia. It should be remarked, in passing, that these rates are enormously higher amongst illegitimate children than amongst those born in wedlock, and that the proportion of still-born amongst the former is also in excess of that amongst the latter by some 50%. Infantile mortality is higher, too, in urban tracts, especially those associated with manufacturing industries. In Table VII, below, in which the crude rate alone is dealt with, evidence will be found of the general decline which has taken place in the mortality, thus expressed in different countries.

The difference in the rates for the various countries must not be taken as a measure of difference in mortality, since, as according to the table, much of it is ascribable to difference in age-constitution. At the same time, where the range is very wide, as between the rates in Scandinavia and Australia, and those in southern and eastern Europe, the variation, to a great extent, cannot be accounted for otherwise than by difference in hygienic conditions, more especially in the light thrown by the figures of infantile mortality in the second part of the table. The variations from period to period in the same country are more instructive. They show that in the 35 years covered the death-rate has generally declined by over 30%. The exceptional cases are, first, Ireland and Norway, with their emigrating tendencies; then Spain, where the returns have probably to be discounted for improved registration, and France, where the population is all but stationary. In Finland the death-rate at the earlier period taken for the comparison was abnormally swollen by epidemic disease, and if it be set on one side the decline appears to have been in harmony with that in its Scandinavian neighbours. The decline in mortality has been much greater than that in the crude birth-rate everywhere except in France, Australia, and, of course, Ireland; and it is only in the two former that it has been exceeded by that in the fertility-rate. The standard mortality of each community is derived from a life-table, representing a "generation" of people assumed to be born at the same moment and followed throughout their hypothetical life, in the light of the distribution by age ascertained.

through the census and the number of deaths at each age observed for as many years, generally from 10 to 20, as suffice to furnish a trustworthy average. The population thus dealt with is supposed to be stationary, that is, the loss by death at each age is at once made good by the addition of an equal number of the same age, whilst the survivors pass on to the age above. Of the many calculations set forth in these valuable tables there is only room here to refer to the "afterlifetimes" for such countries as it is available, which is quoted in the last column of Table VII. It shows the average number of years which persons of a given age, or, as here, of all ages, will live, on the assumption that they are subject to the calculated probabilities of survival. It is sometimes known as the "expectation of life," a term, however, which involves a mathematical hypothesis now discarded.

The relation between the birth and the death rates has been the subject of much analysis and controversy. Observation has demonstrated that the two rates are generally found to move along parallel lines. A high birth-rate is accompanied by high mortality; conversely, when one is low, so is the other. A birth-rate continuously in excess of the death-rate tends to lower the latter through the supply it affords of people annually reaching the more healthy ages. If the supply be diminished, the narrower field open to the risks of infancy has the immediate effect of further decreasing the mortality. In course of time, however, under the same influence, those passing from their prime into the second period of danger acquire a numerical preponderance which throws its weight upon the general death-rate and tends to raise it. It is assumed that throughout the above course the hygienic conditions of life remain unchanged. If, however, they undergo marked improvement, the duration of life is extended and both birth and death-rates being spread over a wider field of the living, tend to decrease. On the other hand, an accidental set-back to population, such as that caused by famine or a disastrous war, leaves room which an increasing birth-rate hastens to occupy. A similar result follows in a lesser degree a wave of emigration. Examples of all the above tendencies may be gleaned from the returns of the countries named in the table, though space does not admit of their exhibition. In both France and Germany, for instance, the process of replenishment after a great war can be traced both early and late in the 19th century. In England, the decrease in "natality" is in itself enough to account for the decline in the death-rate, apart from any considerations of improved hygiene. In France, on the contrary, the low natality having been so long continued, has raised the death-rate, by reason of the absence of procreation having been shifted by it from birth and the early stages of life to old age. It may be inferred from the above that a high birth-rate does not imply a high rate of increase of population, any more than does a decreasing mortality, but the two rates must be considered in their relations to each other. The death-rate, however, is often taken by itself as the measure of the relatively favourable conditions or otherwise of the different countries; but it indicates at best the maintaining power of the community, whereas the increasing power, as manifested in the birth-rate, has also to be taken into account. Here, again, it is not sufficient to rely upon the mere rate of natural growth, or the difference between the two rates, since this may be the same in a community where both the rates are very high as in one where they are relatively low, a distinction of considerable importance. It has been suggested by Dr Rubin of Copenhagen, that if the death-rate (d) be squared and divided by the birth-rate (b), due influence is allowed to each rate respectively, as well as to the difference in the height of the rates in different countries (Journ. R. Statist. Soc., London, 1897, p. 154). The quotient thus obtained decreases as the conditions are more favourable, and, on the whole, it seems to form a good index to the merit of the respective countries from the standpoint of vital forces. The first column of Table VIII. shows the order in which the countries mentioned are found to stand according to the above test.

The three Australasian states head the list in virtue of their remarkably low death-rate, which outweighs the relative paucity of their births. The next countries in order all belong to north-western Europe, and their index-quotients are all very close to each other. Sweden falls below its geographical neighbours owing to its low birth-rate, and Finland because of its higher mortality. England and Scotland, in spite of their higher birth-rates, are kept below Scandinavia by the higher death-rate, but their birth-rate places them above Belgium. Ireland and France are pulled down by their low natality. The latter, with the same mortality as Germany, stands far below it for the above reason, as Ireland is raised by its lower death-rate above the prolific countries of eastern Europe. The rate of natural growth is given in the second part of the table. In the case of two of the Australasian states, of Holland, Finland, Spain and Italy, the order is in accord with that given by the test applied above, and the difference between the two in Austria, Ireland and France is not large. The great difference between the serial rank occupied in the respective lists by Russia, Servia and Galicia, with remarkably high rates of natural growth, as well as that found in the case of most of the other countries in question, shows that this factor is by no means a trustworthy guide in the estimate of hygienic balance.

**MIGRATION.**—Passing from the internal factors in the movement of population, the influence has to be taken into account of the interchange of population between different countries. The net results of such exchange can be roughly estimated by comparing the rate of natural growth with that of the total increase of the community between one census and another, as set forth in Table VII of the calculations of which the approximate loss by emigration, as calculated by Dr Sutherland, is given. It will be seen that the only European country which gains by the exchange is France, and that the accretion is almost insignificant. Between many of the countries there is a good deal of migration which is only seasonal or temporary, according to the demand for labour. From Russia, too, there is a stream of colonization across the Urals into western Siberia, and amongst the western Mediterranean populations there is constant.
migration to North Africa. The greatest drain from Europe, however, has been across the sea to the United States, Canada and Australasia, especially to the West-north-west. Dr Sundbarg's returns give, about 28 millions as the number which left Europe by sea during the 19th century, of whom all but 4 millions emigrated during the last half of that period. Between 1821 and 1904, about 22 millions landed from Europe in the United States; about 2½ millions in Canada; 2 millions in Australia, besides a good number in Brazil, the Argentine and South Africa. The return of birthplace which usually forms part of the census inquiry, affords supplementary information on the subject of immigration. In Canada, for instance, those born abroad numbered 17 % of the population in 1871, and about 13% thirty years later. In New South Wales, the corresponding figures were 41 and 28%, and in Victoria 55 and 27%. In New Zealand the consequences of the cessation of special encouragement to emigration were still more marked, the foreign-born declining in proportion from 63 to 33%. On the other hand, in the United States, from 9.7% in 1850 the proportion rose to 13.7 in 1900, and has since reached still higher figures, as has been the case recently in Canada also. Up to the early 'nineties the greater part of the immigrants into America were furnished by Germany, Ireland and Great Britain, but for the next fifteen years the place of those countries was taken by Italy and eastern Europe. The general results of the two movements in Europe have been thus summarised by Dr Sundbarg—

Differences tend to be smoothed out, of course, in dealing with a population so large and varied as that of a continent, but the figures suffice to show the contrast between the early part of the century and the period following the great migratory movements to the new goldfields. In the countries receiving the stream of newcomers, the intercensal rate of increase was obviously very different from those of the older countries, though it seems to have largely spent itself or been counteracted by other influences. The latest rates, for instance, were only 18 per mille per annum in Australia; 11 in Canada and 10 in the United States.

BIBLIOGRAPHY.—A very full bibliography up to 1890 is appended to von Fircke's Bevölkerungserhebungen and Bevölkerungspolitik. Reference may also be made to Matthews Dunn, Fecundity, Fertility and Sterility (ed. 1871); Newsholme, Elements of Vital Statistics (ed. 1890), and his paper on birth-rates, Journ. R. Statist. Soc. (1900); W. Farr, Vital Statistics (1886); Coghlan, Report on Decline in Birth-rate, New South Wales (1903), and report of Royal Commission on that decline (1904); Bonar, Malthus and his Work (1883); Bertillon, Elements de démographie; Carrier, Du Prince de population; de Molinari, Ralentissement du mouvement de la population; Bertheau, Essai sur les lois de la population; Starkenburg, Die Bevölkerungs-Wissenschaft; Stieda, Das sexualen Verhältniss der Geber- und Kubin and Westergaard, Statistik der Ehen. POPULONIUM (Etruscan Populonia), an ancient seaport town of Etruria, Italy, at the north end of the peninsula of Monte Massoncello, at the south end of which is situated the town of Piombino (q.v.). The place, almost the only Etruscan town built directly on the sea, was situated on a lofty hill now crowned by a conspicuous medieval castle and a poor modern village (Poperigio). Considerable remains of its town walls, of large irregular, roughly rectangular blocks (the form is that of the natural splitting of the schistose sandstone), still exist, enclosing a circuit of about 1½ m. The remains existing within them are entirely Roman—a row of vaulted substructions, a water reservoir and a mosaic with representations of fishes. Strabo mentions the existence here of a look-out tower for the shools of tunny-fish. There are some tombs outside the town, some of which, ranging from the Villanova period (6th century B.C.) to the middle of the 3rd century B.C., were explored in 1905. In one, a large circular tomb, were found three sepulchral couches in stone, carved in imitation of wood, and a fine statuette in bronze of Ajax committing suicide. Close by was found a horse collar with 14 bronze bells. The remains of a temple, devastated in ancient times (possibly by Dionysius of Syracuse in 343 B.C.), were also discovered, with fragments of Attic vases of the 4th century B.C., which had served as ex votos in it. Coins of the town have also been found in silver and copper. The iron mines of Elba, and the tin and copper of the mainland, were owned and smelted by the people of Populonia; hot springs too lay some 6 m. to the E. (Aqua Populaniae) on the high road—Via Aurelia—along the coast. At this point a road branched off to Sena (Siena). According to Virgil the town served a contingent to the help of Aeneas, and it furnished Scipio with iron in 205 B.C. It offered considerable resistance to Sulla, who took it by siege; and from this date its decline, which Strabo, who describes it well (v. 2, 6, p. 223), already notes as beginning, while four centuries later Rutulius describes it as in ruins. The harbour, however, continued to be of some importance, and the place was still an episcopal see in the time of Gregory the Great.

See C. Dennis, Cities and Cemeteries of Etruria (London, 1885, ii. 212 sqq.); J. Falchi in Notizie degli Scavi (1903-1904); L. A. Milani, ibid. (1908), 199 sqq.

PORBANDAR, a native state of India, in the Kathiawar political agency, Bombay, extending along the S.W. coast of the peninsula of Kathiawar. Area, 536 sq. m.; pop. (1901), 24,650. A large trade is conducted in native boats as far as the east coast of Africa.

PORCELAIN, the name of that kind of ceramic ware which is characterized by a translucent body, also loosely used for the finer kinds of ware generally, popularly known as "china" (see CERAMICS). The French porcelaine, from which the word comes into English, is an adaptation of the Italian porcellana, a cowrie-shell, the beautifully polished surface of which caused the name to be applied to the ware. The Italian word is generally taken to be from porcella, diminutive of porco, pig, from a supposed resemblance of the shell to a pig's back.

PORCH (through the L. porca, from Lat. porcus; the Ital. equivalent is portico, corresponding to the Gr. ἄναθήματος; Ger. Vorhalle), a covered erection forming a shelter to the entrance door of a large building. The earliest known are the two porches of the Tower of the Winds at Athens; there would seem to have been one in front of the entrance door of the villa of Diomede outside the gate at Pompeii; in Rome they were built 1 It commands a fine view, and Corsica is sometimes visible, though not Sardinia, as Strabo (and following him, Lord Macaulay) erroneously state. 
probably not allowed, but on either side of the entrance door of a mansion, porticoes set back behind the line of frontage were provided, according to F. Mazois, as shelters from sun and rain for those who paid early visits before the doors were opened. In front of the early Christian basilicas was a long arced porch called “narthex,” fitted by later times by covered porches as with two forms—one the projecting erection covering the entrance at the west front of cathedrals, and divided into three or more doorways, &c., and the other a kind of covered chamber open at the ends, and having small windows at the sides as a protection from rain. These generally stand on the north or south sides of churches, though in Kent there are a few instances (as Snodland and Boxley) where they are at the west ends. Those of the Norman period generally have little projection, and are sometimes so flat as to be little more than outer dressings and hood-moulds to the inner door. They are often richly ornamented, and, as at Southwell in England and Kelso in Scotland, have rooms over, which have been erroneously called porciae. Early English porches are much longer, and in larger buildings frequently have rooms above; the gables are generally bold and high pitched. In larger buildings also, as at Wells, St Albans, &c., the interiors are as rich in design as the exteriors. Decorated and Perpendicular porches partake of much the same characteristics, the pitch of roof, mouldings, copings, battlements, &c., being, of course, influenced by the taste of the time. The later porches have rooms over them more frequently than in earlier times; these are often approached from the lower storey by small winding stairs, and sometimes have fire-places, and from the roof it is to have served as vestries; and sometimes there is the remains of a piscina, and relics of altars, as if they had been used as chantry chapels. It is probable there were wooden porches at all periods, particularly in those places where stone was scarce; but, as may be expected from their exposed position, the earliest have decayed. At Cobham, Surrey, there was one that had ranges of semicircular arches in oak at the sides, of strong Norman character. It is said there are several in which portions of Early English work are traceable, as at Chevinington in Suffolk. In the Decorated and later periods, however, wooden porches are common, some plain, others with rich tracerie and large boards; these frequently stand on a sort of half storey of stone work or bahut. The entrance porches at the west end of cathedrals are generally called portals, and where they assume the character of separate buildings, are designated gallerys; e.g. the porticoes on the west side of the south transept of Lincoln Cathedral, and at the west end of the nave of Ely Cathedral, and the chapel at the west end of Durham Cathedral. The finest example in England of an open projected porch is that of Peterborough Cathedral, attached to the Early Norman nave.

The term “porch” is also given to the magnificent portals of the French cathedrals, where the doors are so deeply recessed as to become porches, such as those of Reims, Amiens, Chartres, Troyes, Rouen, Bourges, Paris, and Beauvais cathedrals, St Ouen, Rouen, and earlier Romanesque churches, as in St Trophime, Arles, and St Gilles. Many, however, have detached porches in front of the portals, as in Notre Dame at Avignon, Chartres (north and south), Noyon, Bourges (north and south), St Vincent at Rouen, Notre Dame de Louviers, the cathedrals of Albi and Le Puy, and in Germany those of Spires and Regensburg, and the churches of St Laurence and St Sebald at Nuremberg. (R. P. S.)

PORCUPINE (Fr., porc-épine, “spiny pig”), the name of the largest European representative of the terrestrial rodent mammals—distinguished by the spiny covering from which it takes its name. The European porcupine (Hystric cristata) is the typical representative of a family of Old World rodents, the Hystricidae, all the members of which have the same protective covering. These rodents are characterized by the imperfectly rooted cheek-teeth, imperfect clavicles or collar-bones, cleft upper lip, rudimentary first front-toes, smooth soles, six teats and many cranial characters. They range over the south of Europe, the whole of Africa, India and the Malay Archipelago as far east as Borneo. They are all stout, heavily-built animals, with blunt rounded heads, fleshy mobile snouts, and coats of thick cylindrical or flattened spines, which form the whole covering of their body, and are not intermingled with ordinary hairs. Their habits are strictly terrestrial. Of the three genera Hystric is characterized by the inflated skull, in which the nasal chamber is often considerably larger than the brain-case, and

The Porcupine (Hystric cristata). the short tail, tipped with numerous slender stalked open quills, which make a loud rattling noise whenever the animal moves. The common porcupine (H. cristata), which occurs throughout the south of Europe and North and West Africa, is replaced in South Africa by H. aferinereusalis and in India by the hairy nosed porcupine (H. leucura).

Besides those large crested species, there are several smaller species without crests in north-east India, and the Malay region from Nepal to Borneo. The genus Atherura includes the brush-tailed porcupines which are much smaller animals, with long tails tipped with bundles of flattened spines. Two species are found in the Malay region and one in West Africa. Trichys, the last genus, contains two species, T. fasciculata of Borneo and T. macrus of Sumatra, both externally very like Atherura, but differing from the members of that genus in many cranial characteristics. In the New World the porcupines are represented by the members of the family Erethizonidae, or Coendidae, which have rootless molars, complete collar-bones, entire upper lips, tuberculated soles, no trace of a first front-toe, and four teats. The spines are mixed with long soft hairs. They are less strictly nocturnal in their habits; and with one exception live entirely in trees, having in correspondence with this long and powerful prehensile tails. They include three genera, of which the first is represented by the Canadian porcupine (Erethizon dorsatum), a stout, heavily-built animal, with long hairs almost or quite hiding its spines, four front- and five hind-toes, and a short, stumpy tail. It is a native of the greater part of Canada and the United States, wherever there is any remnant of the original forest left. Synethereus, or Ctenod, contains some eight or ten species, known as tree-porcupines, found throughout tropical South America, with one extending into Mexico. They are of a lighter build than the ground-porcupines, with short, close, many-coloured spines, often mixed with hairs, and prehensile tails. The hind-feet have only four toes, owing to the suppression of the first, in place of which they have a lely pad on the inner side of the foot, between which and the toes boughs and other objects can be firmly grasped as with a hand. Chachalac, distinguished by the shape of its skull and the greater complexity of its teeth, contains C. subspinosus, a native of the hottest parts of Brazil. (W. H. F.; R. L.*)

PORDENONE, IL (1483-1539), an eminent painter of the Venetian school, whose correct name was Giovanni Antonio Licinio, or Licino. He was commonly named II Pordenone from having been born in 1483 at Corticelli, a village near Pordenone (q.v.) in Italy. He ultimately dropped the name of Licinio, having quarrelled with his brothers, one of whom had wounded him in the hand; he then called himself Regillo, or De Regillo. His signature runs “Antonius Portunaeensis,” or “De Portunaonis.” He was created a cavaliere by Charles V.

As a painter Licinio was a scholar of Pellegrino da S. Daniele, but the leading influence which governed his style was that of Giorgione; the popular story that he was a fellow-pupil with Titian under Giovanni Bellini is incorrect. The district
PORISM

PORISIONE - PORISM

about Pordenone had been somewhat fertile in capable painters; but Licinio excelled them all in invention and design, and more especially in the powers of a vigorous chiaroscuroist and flesh painter. Indeed, so far as mere flesh-painting is concerned he was barely inferior to Titian in breadth, pulpiness and tone; and he was for a while the rival of that great painter in public regard. The two were open enemies, and Licinio would sometimes affect to wear arms while he was painting. He excelled Giorgione in light and shade and in the effect of relief, and was distinguished in perspective and in portraits; he was equally at home in fresco and in oil-colour. He worked in Pordenone and elsewhere in Friuli, and in Cremona and Venice; at one time he settled in Piacenza, where is one of his most celebrated church pictures, ‘St Catherine disputing with the Doctors in Alexandria’; the figure of St Paul in connexion with this picture is his own portrait. He was formally invited by Duke Hercules II. of Ferrara to that court; here soon afterwards, in 1539, he died, not without suspicion of poison. His latest works are comparatively careless and superficial; and generally he is better in male figures than in female—the latter being somewhat too sturdy—and the composition of his subject-pictures is scarcer in level with their other merits. Pordenone appears to have been a vehement self-asserting man, to which his style as a painter corresponds, and his morals were not excectiunable. Three of his principal scholars were Bernadino Licinio, named II Sacchiene, his so-in-law Pomponio Amalteo, and Giovanni Maria Calderari.

The following may be named among Pordenone’s works: the picture of “S Luigi Giustiniani and other Saints,” originally in S Maria dell’ Orto, Venice; a “Madonna and Saints” (both of these in the Venice academy); the “Woman taken in Adultery,” in the Berlin museum; the “Annunciation,” at Udine, regarded by Vasari as the artist’s masterpiece, now damaged by restorers. In Hampton Court is a dialogue work, the “Painter and his Family”; and in Burghley House are two fine pictures now assigned to Pordenone—the “Finding of Moses” and the “Adoration of the Kings.” These used to be attributed to Titian and to Bassano respectively.

PORDENONE, a town of the province of Udine, Venetia, Italy, 30 m. W. by S. of Udine on the railway to Treviso. Pop. (1901), 82,425 (town); 12,409 (commune). It was the birthplace of the painter generally known as II Pordenone (q.v.). Paintings from his brush adorn the cathedral (which has a fine brick campanile), and others are preserved in the gallery of the town hall. Cotton industries are active, and silk and pottery are manufactured.

PORI, a small opening or orifice, particularly used of the openings of the ducts of the sweat-glands in the skin or of the stomata in the epidermis of plants or those through which the pollen or seed are discharged from anthers or seed capsules. The word is an adaptation through the French from Lat. poris, Gr. πόρος, passage. In the sense of to look closely at, to read with persistent or close attention, “pore” is of obscure origin. It would seem to be connected with “peer,” to look closely into, and would point to an O. Eng. purian or pyriyen. There is no similar word in the Provençal, and “pore” is preserved in the French.

PORFIUS, PUBILII OPTATUS, Latin poet, possibly a native of Africa, flourished during the 4th century A.D. He has been identified with Publius Optatus, who was praefectus urbi (329 and 333), and is by some authorities included amongst the Christian poets. For some reason he had been banished, but having addressed a panegyric to the Emperor Constantine the Great, he was allowed to return. Twenty-eight poems are extant under his name, of which twenty were included in the panegyric. They have no value except as curiosities and specimens of perverted ingenuity. Some of them are squares (the number of letters in each line being equal); certain letters being repeated so as to form a pattern or figure; and at the same time special verses or maxims; others represent various objects (a syrinx, an organ, an altar); others have special peculiarities in each line (number of words or letters); while the 28th poem (the versus anacrusis) may be read backwards without any effect upon sense or metre. A complimentary letter from the emperor and letter of thanks from the author are also extant. The best edition of the poem is by L. Müller (1877).

See also O. Sceck, “Das Leben des Dichters Porphyrius” in Rheinisches Museum (1908), iiix, 267.

PORISM. The subject of porisms is perplexed by the multitude of different views which have been held by geometers as to what a porism really was and is. The treatise which has given rise to the controversies on this subject is the Porisms of Euclid, the author of the Elements. For as much as we know of this lost treatise we are indebted to the Collection of Pappus of Alexandria, who mentions it along with other geometrical treatises, and gives a number of lemmas necessary for understanding it. Pappus states that the porisms of Euclid are neither theorems nor problems, but are in some sort intermediate, so that they may be presented either as theorems or as problems; and they were regarded accordingly by many geometers, who looked merely at the form of the enunciation, as being actually theorems or problems, though the definitions given by the older writers showed that they better understood the distinction between the three classes of propositions. The older geometers generally held that the apposition of any number of straight lines, or of any number of lines in the same straight line, to a figure or point, is porism; and finally a porism as directed to finding what is proposed (εἰς ὁρομοναὶ τοῦ πορτευκόσων). Pappus goes on to say that this last definition was changed by certain later geometers, who defined a porism on the ground of an accidental characteristic as τὸ λείτου ὑπόθεσις τοιαύτης θεωρήματος, that which falls short of a locus-theorem by a (or in its) hypothesis.

Proclus points out that the word was used in two senses. One sense is that of “corollary,” as a result unsought, as it were, but seen to follow from a theorem. On the “porism” in the other sense he adds nothing to the definition of “the older geometers” except to say (what does not really help) that the finding of the center of a circle and the finding of the greatest common measure are porisms (Proclus, ed. Friedlein, p. 301).

Pappus gives a complete enunciation of a porism derived from Euclid, and an extension of it to a more general case. This porism, expressed in modern language, asserts that—if four straight lines of which three turn about the points in which they meet the fourth, if two of the points of intersection of these lines lie each on a fixed straight line, the remaining point of intersection will also lie on another straight line. The general enunciation is left to any number of straight lines, in a circle, (n + 1), of which n can turn about as many points fixed on the (n + 1)th. These n straight lines cut two and two, in 4n (n−1) points, 4n (n−1) being a triangular number whose side is (n−1). If, then, they are made to turn about the n fixed points so that any (n−1) of their 4n (n−1) points of intersection, chosen subject to a certain limitation, lie on (n−1) given fixed straight lines, then each of the remaining points of intersection, (n−1) (n−2) in number, describes a straight line. Pappus gives also a complete enunciation of one porism of the first book of Euclid’s treatise. This may be expressed thus: If about two fixed points, Q, we make turn two straight lines, so as to form a given straight line L, and, if of them one cut off a segment AM from a given straight line AX, given in position, we can determine another fixed straight line BY, and a point B fixed on it, such that the segment BM made by the second moving line on this second fixed line measured from B has a given ratio to the first segment AM. The rest of the enunciations given by Pappus are incomplete, and he merely says that he gives thirty-eight lemmas for the three books of porisms; and these include 171 theorems.

The lemmas which Pappus gives in connexion with the porisms are interesting historically, because he gives (1) the fundamental theorem that the cross or an harmonic ratio of a penultimate of four straight lines meeting in a point is constant for all transversals; (2) the proof of the harmonic properties of a complete quadrilateral; (3) the theorem that, if the six vertices of a hexagon lie three and three on two straight lines, the three points of concourse of opposite sides lie on a straight line.
During the last three centuries this subject seems to have had great fascination for mathematicians, and many geometers have attempted to restore the lost porisms. Thus Albert Girard says in his Traité de trigonométrie (1652) that he hopes to publish a restoration of all the seven original European porisms. The title Porismatum euclidesorum renovata doctrina et forma isogogae recentioribus geometrici exhibita (see Oeuvres de Fermat, I. Paris, 1891); but (two at least of the five examples of porisms which he places do not exist). Pappus of Alexandria, who was the first to throw real light upon the subject. He first succeeded in explaining the only three propositions which Pappus indicates with any completeness. This explanation was published in the Allien, volume II of his Opera quae supersunt reliqua (Glasgow, 1766). Simson's treatise, De porismatis, begins with definitions of theorem, problem, datum, porism and focus. Respecting the porism Simson says that Pappus's definition is too general, and therefore he will substitute for it the following: "Porism is propositio in qua propositur demonstrare rem aliquid vel pluris datas esse, cui vel quibus, ut et cibi et ex rebus innumeris non quidem datis, sed quae ad ea qua data sunt tandem habent some relation to that which the unknown, or unknowns, which..."

It seems that the author is discussing the concept of porisms and their history, particularly focusing on the works of Pappus and Simson. The text mentions the difficulty and importance of understanding the original porisms and the attempts made to restore them. It also refers to the work of Albert Girard and the challenges in restoring the lost porisms. The text concludes with a mention of the importance of understanding the definitions and implications of porisms in historical and mathematical contexts.
PORPHYRY

'Αφορισις ρούς τά θεωρά (Sententiae ad intelligibilitia ducentias, Aides to the study of the Intelligibles). The Life of Pythagoras, which is incomplete, probably formed part of a larger history of philosophy (ψευδοδιογένη), included in Iambi's works (L优雅) down to Plato. There is a tradition that Aristotle was represented by the Introduction (αποδεικτή) to and Commentary (λέγοντα) in the form of questions and answers on the Categories. The first, translated into Latin by Boëtius, was extensively used in the Middle Ages alongside the De interpretatione of Boéadius; of the second only fragments have been preserved. His Σμάδων, a chronological work, extended from the taking of Troy down to A.D. 275, has also been lost. It is indeed in his list of books under the heading of θέματα τῶν ἱστορικῶν that the treatise φιλολογίας οὐράρων is called an κατάστασι (lecture) by Eusebius, who in his Προειράτου εὐαγγέλιο (x. 3) has preserved a considerable extract from it, treating of plagiarism among philosophers, and lists the works of Αποστολός Ιουδαίων and Προειράτου εὐαγγέλιο (Passages homericae); and De antiro nym- parum, in which the description in the Odyssey (vii. 102-112) is explained as an allegory of the Προειράτου εὐαγγέλιο (De abstinencia), on abstinence from animal food, is especially valuable as having preserved numerous original statements of the old philosophers and the substance of Theophrastus's Προειράτου εὐαγγέλιο (On Piety). It also contains a long fragment from the Παντοκράτορ of Boëtius (ed. with introd. S. Brandt, 1906) fragments of the Chronica in C. W. Müller, Frag. hist. gramm. (1849), iii. 688; Quaesiones homericae, by H. Schrader (1880, 1890); Letter to Anes in E. Whalley’s edition of Iambiichus De mysteriis (1887); De philosophiorum et eorumn mysteriis in the Adversus Christianos by A. Georgides (Leipzig, 1891); English trans. of the De abstinencia, De antiro nymparum and Sententiae, by A. C. Bouillet, Porphyry’s De abstinencia (1889); of the De abstinencia, by S. Hieber (1857); and of the Ad Marcellam by A. Zimmern (1896).

Porphyry (Gr. πορφύριος, Lat. porpūrus, purple), in petrology, a beautiful red volcanic rock which was much used by the Romans for ornamental purposes when cut and polished. The famous red porphyry (porfido rosso antico) came from Egypt, but its beauty and decorative value were first recognized by the Romans in the time of the emperor Claudius. It was obtained on the west coast of the Red Sea, where it forms a dike 80 or 90 ft. thick. For a long time the knowledge of its source was lost, but the original locality, marked by many ancient quarries, has been re-discovered at Jebel Dhokan, and the stone is again an article of commerce. In a dark red ground-mass it contains many small white or rose-red plagioclase feldspars, black shining phyllosilicates, and small inclusions of quartz. The original purple or red colour of the feldspars and of the ground-mass is unusual in rocks of this group, and arises from the partial conversion of the plagioclase felspar into thulite and manganese-epidote. These minerals also occur in thin veins crossing the rock. Many specimens show effects of crushing and in extreme cases this has produced brecciation. Another famous porphyry, hardly less beautiful, is the verde antique, porfido verde antico, or marmo lacedaemonium viride of Pliny, which was obtained between Lebetsava and Melonpous in Peloponnesus. It has the same structure as the red porphyry as it contains large white or green feldsparing in a fine ground-mass. The green colour arises from the abundant formation of chlorite and epidote in the large feldspars and throughout the rock. In ancient times it was much used as an ornamental stone, these two varieties of porphyry making a fine contrast with one another. Green porphyries are not so rare as red. A similar rock is obtained at Lambay Island near Dublin. They are still used extensively, especially for small ornaments. Large pieces are difficult to obtain free from flaws, and marble is preferable for mural work, not only because of the greater variety of patterns but also because it is much softer and more easily cut and polished.

Many igneous rocks possess the structure which characterizes these porphyries (see Petrology, Plate III); the presence of scattered crystals of larger size in a fine-grained ground-mass. Most lavas, and many of the rocks which occur as dikes and sills, are porphyritic; and in this description of porphyry this term has consequently been applied to a great variety of rocks, e.g. diorite-porphyry, granite-porphyry, greenstone-porphyry, augite-porphyry, liebeneister-porphyry, &c. More recently the use of the term has been restricted to a series of rocks which are of intrusive origin and contain much porphyritic felspar (with or without quartz or nepheline). The porphyritic intrusive rocks with large crystals of augite, olivine, biotite, and hornblende are for the most part grouped under the lamprophyres; while the term porphyry is rarely now applied to any of the effusive rocks or lavas. Furthermore, it has become usual to subdivide the intrusive porphyries into two classes; the former the calc-silicates, the latter the nepheline-syenites; which are named after the felspars, or felsic silicates, the other mainly plagioclase felspar. The first series is known as the "porphyries," while the second class is called "porites." There are porphyrtes which correspond chemically and mineralogically to granites, syenites, and nepheline-syenites, while the porphyries form a parallel series to the diorites, norites and gabbros. In each case the porphyritic type occurs generally as dikes and thin sheets which consolidated beneath the surface but probably at no great depth (hypabyssal rocks); while granite, gabbro and the other holocrystalline non-porphyritic rocks belong to the plutonic or abyssal group which cooled very slowly at great depths and under enormous pressure.

The principal subdivisions of the group are the granite-porphyries, the rhyolite-porphyries and the augite-porphyrites. The porphyritic orthoclase or alkali felspar is the characteristic mineral. The granite-porphyries and quartz-porphyrites (q.v.) consist mainly of orthoclase, quartz and ferro-magnesian minerals, usually biotite and hornblende. The quartz-porphyrites consist of typical porphyry.

The syenite-porphyrites, like the syenites, are less common than the granite-porphyrites and granites. They are characterized by an abundance of orthoclase and a scarcity or absence of quartz. The felspar crystals are often larger than those of the granite-porphyrites and contain augite; the ground-mass is principally alkali felspar with sometimes a little quartz. In many specimens the feldspars of the second generation form a mass of ill-shaped grains, in others they are little rectangular crystals which may have a fluxion arrangement (orthophytic type of ground-mass); some of the rocks formerly known as orthoclase-porphyrites belong to this group; others are nepheline-porphyries, and are of the nepheline-syenite type. The syenite-porphyrites is the rhomb-porphyry of south Norway and West Africa. In these the large feldspars have rhomb-shaped sections owing to their peculiar crystalline development. Olivine, augite and biotite occur in these rocks, but there is no quartz or soda-lime felspar. The porphyritic feldspars contain both soda and potash and belong to anorthoclase. Rhomb-porphyrites occur as dikes and lavas, and are found in the massif of the "Roen" (central Norway), and other large ice-borne boulders of these rocks have been found among the drift deposits of the east of England.

Elasticite- and leucite- (syenite) porphyrtes form apophyses and dikes, and are found in igneous rocks of southern Norway (southern Norway), and have a remarkable development in the rhomb-porphyries. The former contain porphyritic nepheline which is often weathered to soft,
Porphyrite — Lithic porphyrite

Porphyrites are defined as being composed of 70% or more of large, well-aligned crystals of plagioclase or hornblende, with the rest being a fine-grained matrix. They are characterized by a distinctive "phenocrystic" texture, where the large crystals stand out against a finer-grained groundmass.

### Description

Porphyrites are commonly found as hypabyssal intrusions, often occurring as stocks or sills. They are characterized by a range of felsic to intermediate compositions, with plagioclase feldspar being the dominant mineral. Hornblende and biotite are also common accessories, along with quartz and felspars.

Fig. 1 — The Common Porpore (Phocaena communis).

English Channel being: length from nose to notch between the flukes of the tail, 62½ in.; from the nose to the front edge of the dorsal fin, 29 in.; height of dorsal fin, 4½ in.; length of base of dorsal fin, 8 in.; length of pectoral fin, 9½ in.; breadth of pectoral fin, 3½ in.; breadth of tail flukes, 13 in. The head is rounded in front, and differs from that of dolphins in not having the snout produced into a distinct "beak" separated from the forehead by a groove. The under jaw projects about half an inch beyond the upper. The mouth is wide, bounded by stiff immobile lips, and curves slightly upwards at the hinder end. The eye is small, and the external ear represented by a minute aperture, scarcely larger than would be made by a pin, about 2 in. behind the eye. The dorsal fin, near the middle of the back, is low and triangular. The flippers are of moderate size, and slightly sickle-shaped. The upper-parts are dark grey or nearly black according to the light in which they are viewed and the state of moisture or otherwise of the skin; the under-parts pure white. The line of demarcation between these colours is not distinct, washes or splashes of grey encroaching upon the white on the sides, and varies somewhat in different individuals. Usually it passes from the throat (the anterior part of which, with the whole of the under jaw, is dark) above the origin of the flipper, along the middle of the flank, and descends again to the middle line before reaching the tail. Both sides of the flippers and flukes are black. The anterior edge of the dorsal fin is furnished with a row of small rounded horny spines or, rather, tubercles, of variable number. One of
the most characteristic anatomical distinctions between the porpoise and other members of the Delphinidae is the form of the teeth (numbering twenty-three to twenty-six on each side of each jaw), which have expanded, flattened, spade-like crowns, with more or less marked vertical grooves, giving a tendency to a bilobed or often trilobed form (fig. 2).

The porpoise, which is sociable and gregarious, is usually seen in small herds, and frequents coasts, bays and estuaries rather than the open ocean. It is the commonest cetacean in the seas round the British Isles, and not infrequently ascends the Thames, having been seen as high as Richmond; it has also been observed in the Seine at Neuilly, near Paris. It frequents the Scandinavian coasts, entering the Baltic in the summer; and is found as far north as Baffin's Bay and as far west as the coasts of the United States. Southward its range is more limited than that of the dolphin, as, though common on the Atlantic coasts of France, it is not known to enter the Mediterranean.

It feeds on mackerel, pilchards and herrings and, following the shoals, is often caught by fishermen in the nets along with its prey. In former times it was a common article of food in England and France, but is now rarely if ever eaten, being valuable only for the oil obtained from its blubber. Its skin is sometimes used for leather and boot-thongs, but the so-called "porpoise-hides" are generally obtained from the beuga. The Black Sea porpoise (P. relicta) is a distinct species. A third species, from the American coast of the North Pacific, has been described under the name of Phocoena tomentosa, and another is Neophocaena phocaenoides, a small species from the Indian Ocean and Japan, with teeth of the same form as those of the porpoise, but fewer in number (eighteen to twenty on each side), of larger size, and more distinctly notched or lobed on the free edge. It is distinguished from the common porpoise externally by its black hue and the absence of a dorsal fin. (See CETACEA.)

PORPORA, NICCOLA [or Niccolò] ANTONIO (1656–1727), Italian operatic composer and teacher of singing, was born in Naples on the 10th of August 1656. He was educated at the Conservatorio di Santa Maria di Loreto. His first opera, Basilio, was produced at Naples; his second, Berenice, at Rome. Both were successful, and he followed them up by innumerable compositions of the same character; but his fame rests chiefly upon his unequalled power of teaching singing. At the Conservatorio di Sant' Onofrio and the Poveri di Gesù Cristo he trained Farinelli, Caffarelli, Mingotti, Salimbeni, and other celebrated vocalists. Still his numerous engagements did not tempt him to forsake composition. In 1725 he visited Vienna, but the Emperor Charles VI. disliked his florid style, especially his constant use of the trillo, and refused to patronize him. After this rebuff he settled in Venice, teaching regularly in the schools of La Pietà and the Incurabili. In 1730 he was invited to London as a rival to Handel; but his visit was unfortunate. Little less disastrous was his second visit to England in 1734, when even the presence of his pupil, the great Farinelli, failed to save the dramatic company of Lincoln's Inn Fields theatre, known as the "Opera of the Nobility," from ruin. The sequence of dates and visits in Porpora's life are variously stated by different biographers. The electoral prince of Saxony and king of Poland had invited him to Dresden to become the singing master of the electoral princess, Maria Antonia, and in 1748 he is supposed to have been made Kapellmeister to the prince. Difficult relations, however, with Hase and his wife resulted in his departure, of which the date is not known. From Dresden he is said to have gone to Vienna, where he gave lessons to Joseph Haydn (q.v.), and then to have returned in 1759 to Naples. From this time Porpora's career was a series of misfortunes. His last opera, Camilla, failed; and he became so poor that the expenses of his funeral were paid by subscription. Yet at the moment of his death in 1727, Prince Tripoli and Caffarelli were living in splendour on fortunes which they were largely indebted to the excellence of the old maestro's teaching. In George Sand's Consuelo much use is made of a romantic version of the life of young Haydn and his relations with the heroine, Porpora's pupil, and with Porpora himself. A good linguist and a man of considerable literary culture, Porpora was also celebrated for his power of repartee. His operas are, on the whole, tedious and conventional; but he produced some good work in the form of instrumental music and chamber-cantatas. A series of six Latin duets on the Passion (accessible in a modern edition published by Breitkopf and Haertel) is remarkable for dignity and beauty.

PORRIDGE (an altered form of "pottage," Fr. potage, soup, that which is cooked in a pot), a food made by stirring meal, especially oatmeal, in boiling water and cooking it slowly until the whole becomes soft. The dish and its name are particularly identified with Scotland; in Ireland it is commonly known as "stir-about." The former application to a broth made of vegetables or of meat and vegetables thickened with barley or other meal is obsolete, and the earlier "pottage" is the usual word employed. The term "porridge" apparently dates from the 16th century. In "porringer," a porridge-bowl, the n. is inserted as in "passenger," "messenger."

PORSENA (or PORSENA), LARS, king of Clusium in Etruria. He is said to have undertaken an expedition against Rome in order to restore the banished Tarquinius Superbus to the throne. He gained possession of the Janiculum, and was prevented from entering Rome only by the bravery of Horatius Cocles (q.v.). Porsea then laid siege to the city, but was so struck by the courage of Mucius Scaevola that he made peace on condition that the Romans restored the land they had taken from Veii and gave him twenty hostages. He subsequently returned both the land and the hostages (Livy, ii. 9–15; Dion. Halic., v. 21–24; Plutarch, Poplicola, p. 16–19). This story is probably an attempt to conceal a great disaster and to soothe the vanity of the Romans by accounts of legendary exploits. According to other authorities, the Romans were obliged to surrender the city, to acknowledge Porsea's supremacy by sending him a sceptre, a royal robe, and an ivory chair, to abandon their territory north of the Tiber, to give up their arms, and in future to use iron for agricultural purposes only. It is curious that, in spite of his military success, Porsea made no attempt to restore the Tarquinian dynasty. Hence it is suggested that the attack on Rome was merely an incident of the march of the Etruscans, driven southward by the invasion of upper Italy by the Celts, through Latium on their way to Campania. This would account for its transitory effects, and the speedy recovery of the Romans from the blow. With the departure of Porsea all traces of Etruscan sovereignty disappear and Rome is soon vigorously engaged in the prosecution of various wars (see Tacitus, Hist. iii. 73; Pliny, Nat. Hist. xxxiv. 39 [14]; Dion. Halic. v. 35, 36, vii. 5). The tomb at Chiusi described by Pliny (Nat. Hist. xxxvi. 19) as that of Porsea cannot have been his burial-place (see CLUSIUM).

For a critical examination of the story, see Schweger, Römische Geschichts, h. 17 (1847); Bornemann, Lexik. Credibilität der antiken Roman History, ch. xii. 5; W. H. Fr. Hist. of Rome, vol. i. 1, E. Pais, Storia di Roma, i. ch. iv. (1868). Macaulay's Lays of Ancient Rome gives a dramatic version of the story.

PORSON, RICHARD (1759–1808), English classical scholar, was born on Christmas Day 1759 at East Runton, near North Walsham, in Norfolk, the eldest son of Huggin Porson, parish clerk. His mother was the daughter of a shoemaker named Palmer, of the neighbouring village of Bacton. He was sent first to the village school at Bacton, kept by John Woodrow, and afterwards to that of Happisburgh kept by Mr Summers.
Here his extraordinary powers of memory and aptitude for arithmetic were soon discovered; his skill in penmanship, which attended him through life, was due to the care of Summers, who became early impressed with his abilities, and long afterwards stated that during fifty years of scholastic life he had never come across boys so clever as Porson and his two brothers. He was well grounded in Latin by Summers, remaining with him for three years. His father also took pains with his education, making him repeat at night the lessons he had learned in the day. He would frequently repeat without making a mistake a lesson which he had learned one or two years before and had never seen in the interval. For books he had only what his father's cottage supplied—a book or two of arithmetic, Greenwood's England, Jewell's Apology, and an odd volume of Chamber's Cyclopaedia picked up from a wrecked coaster, and eight or ten volumes of The University of Oxford.

When Porson was eleven years old the Rev. T. Hewitt, the curate of East Ruston and two neighbouring villages, took charge of his education. Mr Hewitt taught him with his own boys, taking him through the ordinary Latin authors, Caesar, Terence, Ovid and Virgil; before this he had made such progress in mathematics as to be able to solve questions out of the Ladies' Diary. In addition to this Hewitt brought him under the notice of Mr Norris of Witton Park, who sent him to Cambridge and had him examined by Professor Lambert, the two tutors of Trinity, Postlethwaite and Collier, and the well-known mathematician Atwood, then assistant tutor; the result was a favourable report of his knowledge and abilities that Mr Norris determined to provide for his education so as to fit him for the university. This was in 1773. It was found impossible to get him into Charterhouse, and he was entered on the foundation of Eton in August 1774.

Of his Eton life Porson had no very pleasant recollections, but he was popular among his schoolfellows; and two dramas he wrote for performance in the Long Chamber were remembered many years later. His marvellous memory was of course noticed; but at first he seems to have somewhat disappointed the expectations of his friends, as his composition was weak, and his ignorance of quantity kept him behind several of his inferiors. He went to Eton too late to have any chance of succeeding to a scholarship at King's College. In 1777 he suffered a great loss from the death of his patron Mr Norris; but contributions from Etonians to aid in the funds for his maintenance at the university were rapidly supplied, and he found a successor to Norris in Sir George Baker, the physician, at that time president of the college of physicians. Chieflly through his means Porson was entered at Trinity College, Cambridge, as a pensioner on the 28th of March 1778, matriculating in April. It is said that what first biased his mind towards critical researches was the gift of a copy of Toop's Longinus by Dr Davies, the head master of Eton, for a good exercise; but it was Bentley and Richard Dawes to whom he looked as his immediate masters. His critical career was begun systematically while an undergraduate. He became a scholar of Trinity in 1780, won the Craven university scholarship in 1781, and took his degree of B.A. in 1782, as third senior optime, obtaining soon afterwards the first chancellor's medal for classical studies. The same year he was elected Fellow of Trinity, a very unusual thing for a junior bachelor of arts, as the junior bachelors were rarely allowed to be candidates for fellowships, a regulation which lasted from 1667 when Isaac Newton was elected till 1813 when Connon Thrillwall became a fellow. Porson graduated M.A. in 1785.

Having thus early secured his independence, he turned his thoughts to publication. The first occasion of his appearing in print was in a short notice of Schütz's Aeschylus in Mattey's Review, written in 1783. This review contains several other essays by his hand; especially may be mentioned the reviews of R. F. Brunck's Aristophanes (containing an able summary of the poet's chief excellencies and defects), Weston's Hermes- tanax, and Huntingford's Apology for the Monostrophes. But it was to the tragedians, and especially to Aeschylus, that his mind was then chiefly directed. He began a correspondence with David Ruhnken, the veteran scholar of Leiden, requesting to be favoured with any fragments of Aeschylus that Ruhnken had come across in his collection of inedited lections and grammarians, and sending him, as a promise, a new undertaking for which he was unequal, some specimens of his critical powers, and especially of his restoration of a very corrupt passage in the Supplices (673-677) by the help of a nearly equally corrupt passage of Plutarch's Eroticus. As the syndics of the Cambridge press were proposing to re-edit Thomas Stanley's Aeschylus, the editorship was offered to Porson; but he declined to undertake it on the conditions laid down, namely, of reprinting Stanley's corrupt text and incorporating all the various notes, however worthless. He was especially anxious that the Medicæan MS. at Florence should be collated for the new edition, and offered to undertake the collation at an expense not greater than it would have cost if done by a person on the spot, but if the syndics refused the offer, the vice-chancellor (Mr Torkington, master of Clare Hall) observing that Porson might collect his MSS. at home.

In 1786, a new edition of Hutchinson's Anabasis of Xenophon being called for, Porson was requested by the publisher to supply a few notes, which he did in conjunction with the Rev. W. Whiter, editor of the Etymologicon universalis. These give the first specimen of that neat and terse style of Latin notes in which he was afterwards without a rival. They also show his intimate acquaintance with his two favourite authors, Plato and Athenaeus, and a familiarity with Eustathius's commentary on Homerus.

In 1797 the Notae breves ad Toopii emendationes in Suidas were written, though they did not appear till 1790 in the new edition of Toop's book published at Oxford. These first made Porson's name known as a scholar of the first rank, and carried his fame beyond England. The letters he received from Christian G. Heyne and G. Hermann preserved in the library of Trinity College, and written before his Euripides was published, afford proof of this. In his notes he points out the errors of Toop and others; at the same time he speaks of Toop's book as "opus illud aureum," and states that his writing the notes at all is due to the admiration he had for it. They contain some brilliant emendations of various authors; but the necessity of having Toop's own notes with them has prevented their ever being reprinted in a separate form.

During this year, in the Gentleman's Magazine, he wrote the three letters on Hawkins's Life of Johnson which have been reprinted by Mr Kidd in his Tracts and Criticisms of Porson, and in a volume of Porson's Correspondence. They are admirable specimens of the dry humour so characteristic of the writer, and prove his intimate acquaintance with Shakespeare and the other English dramatists and poets. In the same periodical, in the number of 1788 and 1789, appeared the Letters to Archdeacon Travis, on the spurious verse 2 John v. 7 (collected in 1790 into a volume), which must be considered to have settled the question. Gibbon's verdict on the book, that it was "the most acute and accurate piece of criticism since the days of Bentley," may be considered as somewhat partial, as it was in defence of him that Porson had entered the field against Travis. But in the masterly sketch of Gibbon's work and style in the preface Porson does not write in a merely flattering tone. It is to be wished that on such a subject the tone of levity had been modified. But Porson says in his preface that he could treat the subject in no other manner, if he treated it at all: "To peruse such a mass of falsehood and sophistry and to write remarks upon it, without sometimes giving way to laughter and sometimes to indignation, was, to me at least, impossible." Travis has no mercy shown him, but he certainly deserved none. One is equally struck with the thorough grasp Porson displays of his subject, the amount of his miscellaneous learning, and the humour that pervades the whole. But it was then the unpopular side: the publisher is said to have lost money by the book; and one of his early friends, Mrs Turner of Norwich, cut down a legacy she had left Porson to £50 on being told that he had written what was described to her as a book against Christianity.
During the years that followed he continued to contribute to the leading reviews, writing in the *Monthly Review* the articles on Robertson's *Parian Chronicle*, Edwards's *Plutarch*, and R. Payne Knight's *Essay on the Greek Alphabet*. He gave assistance to William Beloe in one or two articles in the *British Critic*, and he had supplied also in the *Analytical Review* and the *Critical Review*.

In 1792 his fellowship was no longer tenable by a layman; and, rather than undertake duties for which he felt himself unfit, and which involved subscription to the Articles (though he had no difficulty as to signing a statement as to his conformity with the liturgy of the Church of England when elected Greek professor), he determined not to take holy orders, which would have enabled him to remain a fellow, and thus deprived himself of his only means of subsistence. He might have been retained in the society by being appointed to a lay fellowship, one of the two permanent lay fellowships which the statutes then permitted falling vacant just in time. It is said that this had been promised him, and it was certainly the custom in the college always to appoint the senior among the existing laymen, who otherwise would vacate his fellowship. But the master (Dr Postlethwaite), who had the nomination, used his privilege to nominate a younger man (John Heys), a nephew of his own, and thus Porson was turned adrift without any means of support. A subscription was, however, got up among his friends to provide an annuity to keep him from actual want; Cracherode, Cleaver Banks, Burney and Parr took the lead, and enough was collected to produce about £100 a year. He accepted it only on the condition that he should receive the interest during his lifetime, and that the principal, placed in the hands of trustees, should be returned to the donors at his death. When this occurred they or their survivors refused to receive the money, and it was with part of this sum that, in 1816, the Porson prize was founded to perpetuate his name at Cambridge. The remainder was devoted to the foundation of the Porson scholarship in the same university. This scholarship was first awarded in 1855.

After the loss of his fellowship he continued chiefly to reside in London, having chambers in Essex Court, Temple—occasionally visiting his friends, such as Dr Goodall at Eton and Dr Samuel Parr at Hatton. It was at Dr Goodall's house that the *Letters to Trissotins* were written, and at one period of his life he spent a great deal of time at Hounslow. While there he would generally spend his mornings in the library, and for the most part in silence; but in the evenings, especially if Parr were away, he would collect the young men of the house about him, and pour forth from memory torrents of every kind of literature. The charms of his society are described as being then irresistible.

In 1792 the Greek professorship at Cambridge became vacant by the resignation of Mr Cooke. To this Porson was elected without opposition, and he continued to hold it till his death. The duties then consisted in taking a part in the examinations for the university scholarships and classical medals. It was said he wished to give lectures; but lecturing was not in fashion in those days, and he did far more to advance the knowledge and study of the Greek language by his publications than he could have done by any amount of lecturing. It must be remembered that the emoluments of the professorship were only £30 a year. The authors on which his time was chiefly spent were the tragedians, Aristophanes, Athiseeus, and the lexicons of Suidas, Hesychius and Photius. This last he twice transcribed (the first transcript having been destroyed by a fire at Perry's house, which deprived the world of much valuable matter that he had written on the margins of his books) from the original among the Gale MSS. in the library of Trinity College. Of the latter he had a collection of his own, and he added to the fragments of the other comic poets, and the lexicographers he had a pleasing proof on one occasion when he found how often in Aristophanes he had been anticipated by Bentley, and on another when Schow's collation of the unique MS. of Hesychius appeared and proved him right in "an incredible number" of instances.

In 1795 there appeared from Foullis's press at Glasgow an edition of *Aeschylus* in folio, printed with the same types as the Glasgow *Homer*, without a word of preface or anything to give a clue to the editor. Many new readings were inserted in the text with an asterisk affixed, while an obelus was used to mark many others as corrupt. It was at once recognized as Porson's publication; and that same year he had supplied a new edition in two vols. 8vo, but this was kept back by the printer and not issued till 1806, still without the editor's name. There are corrections of many more passages in this edition than in the folio; and, though the text cannot be considered as what would have gone forth if with his name and sanction, yet more is done for the text of *Aeschylus* than had been accomplished by any preceding editor. It has formed the substratum for all subsequent editions. It was printed from a copy of Pauw's edition corrected, which is preserved in the library of Trinity College.

Soon after this, in 1797, appeared the first instalment of what was intended to be a complete edition of *Euripides*—an edition of the *Hecuba*.

In the preface he pointed out the correct method of writing several words previously incorrectly written, and gave some specimens of his powers on the subject of Greek metres. The notes are very short, almost entirely critical; but so great a range of learning, combined with such felicity of emendation whenever a corrupt passage was encountered, is displayed that there was never any doubt as to the quarter whence the new edition had proceeded. He avoided the office of interpreter in his notes, which may well be wondered at on recollecting how admirably he did translate when he condescended to that branch of an editor's duties.

His work, however, did not escape attack; Gilbert Wakefield had already published a *Tragediarum Delectus*; and, conceiving himself to be slighted, as there was no mention of his labours in the new *Hecuba*, he wrote a "diatribe extemporalis" against it, a tract which for bad taste, bad Latin and bad criticism it would not be easy to match. Gottfried Hermann of Leipzig, then a very young man, who had also written a work on Greek metres, which Dr Elmsley has styled "a book of which too much ill cannot easily be said," issued an edition of the *Hecuba*, in which Porson's theories were openly attacked. Porson at first took no notice of either, but went on quietly with his Euripides, publishing the *Orestes* in 1798, the *Phoenissae* in 1799 and the *Medea* in 1801, the last printed at the Cambridge press, and with the editor's name on the title-page. But there are many allusions to his antagonists in the notes in such points as the final υ, the use of accents, &c.; and on v. 675 of the *Medea* he holds up Hermann by name to scorn in caustic and taunting language. And it is more than probable that to Hermann's attack we owe the most perfect of his works, the supplement to the preface to the *Hecuba*, prefixed to the second edition published at Cambridge in 1802. The metrical laws promulgated are laid down clearly, illustrated with an ample number of examples, and those that militate against them brought together and corrected, so that what had been beyond the reach of the ablest scholars of preceding times is made clear to the tyro. The laws of the iambic metre are fully explained, and the theory of the pause stated and proved, which had been only alluded to in the first edition. A third edition of the *Hecuba* appeared in 1808, and he left corrected copies of the other plays, of which new editions appeared soon after his death; but these four plays were all that was accomplished of the projected edition of the poet. Porson lived six years after the second edition of the *Hecuba* was published, but his natural indolence and procrastination led him to put off the work. He found time, however, to execute his collation of the Harleian MS. of the *Odyssey*, published in the *Grenville Homer* in 1801, and to present to the Society of Antiquaries his wonderful conjectural restoration of the Rosetta stone.

In 1806, when the London Institution was founded (then in the Old Jewry, since removed to Finsbury Circus), he was appointed principal librarian with a salary of £200 a year and a suite of rooms; and thus his latter years were made easy as far as money was concerned.
Among his most intimate friends was Perry, the editor of the Morning Chronicle; and this friendship was cemented by his marriage with Perry's sister, Mrs. G. B. Perry; in November, 1789. The marriage was a happy one for the short time it lasted, as Porteous became more attentive to times and seasons, and would have been weaned from his habits of drinking; but she sank in a decline a few months after her marriage (April 12, 1797), and he returned to his chambers in the Temple and his old habits. Perry's friendship was of great value to him in many ways; but it induced him to spend too much of his time in writing for the Morning Chronicle; indeed he was even accused of "giving up to Perry what was meant for mankind," and the existence of some of the papers he wrote there could be only deplored.

For some months before his death he had appeared to be failing; his health was extremely bad, and he had some symptoms of intermittent fever; but on the 19th of September 1808 he was seized in the street with a fit of apoplexy, and after partially recovering sank in the 28th of that month at the age of forty-nine. He was buried in Trinity College, close to the statue of Newton, at the opposite end of the chapel to where rest the remains of Bentley.

In learning Porton was superior to Valckenier, in accuracy to Bentley. It must be remembered that in his day the science of comparative philology was in its infancy, and the comparative value of MSS. was scarcely considered in editing an ancient author. With many editors MSS. were treated as of much the same value, whether written by himself or by another, and the greater part of his MSS. was regarded as of no value, or even as worthless. "I am afraid," writes he in a letter of a few lines, "that the editor who calls "scrub manuscripts," or "scoundrel copies," and "by greater investigation into MSS. would have avoided;" thus he notes, on the note in the first edition of the scholiast on Sophocles has led him into an investigation of MSS. MS. of Sophocles, which is a great stride. But his most brilliant emendations, such as those of some of those on Athenaeus, in the Supplices of Aeschylus, or, to take one single instance, the emendations for arma 74; see Malby's Thesaurus, p. 299), are such as convince the reader of their absolute certainty; and this power was possessed by Porton to a degree no one else has ever attained. No doubt his mathematical training had something to do with this; frequently the process may be seen by which the truth has been reached.

A few words are called for on his general character. No one ever more loved truth for its own sake; few have sacrificed more rather than truths. It is no time in which the public interest is the standard in this respect was not common. In spite of his failings, few have had warmer friends; no one more willingly communicated his knowledge and gave help to others; scarcely a look appeared in his eye, his words or actions, which he devoted his life without acknowledging assistance from him. And, if it be remembered that his life was a continued struggle against poverty and slight and ill-health, rather than a complaint that he had little, we should wonder how he accomplished so much.

His library was divided into two parts, one of which was sold by auction; the other, containing the transcript of the Gallic Photius, his books with MS. notes, and some letters from foreign scholars, was bought by Trinity College for 1000 guineas. His notebooks were found to contain, in the words of Bishop Blomfield, "a rich treasure of criticism in every branch of classical literature—everything that he indulged in was written with the most perfect art, and is quite fit to meet the public eye, without any diminution or addition." They have been carefully rearranged, and illustrate among other things his extraordinary penmanship and power of minute and accurate writing. Much remains unpublished. J. H. Monk, his successor as Greek professor, and C. J. Blomfield (both afterwards bishops) edited the Adversaria, consisting of the notes on Athenaeus and the Greek letters, and his prelection on Euripides; P. P. Dobree, afterwards Bishop of Oxford, published Phases of Phoenicians and the Letters of Philo. Besides these, from other sources, Professor T. Gaisford edited his notes on Pausanias and Suidas, and Mr Kidd collected his researches on the coinage of Asia Minor, which were published as an appendix to a critical and philological commentary on the works of Homer. His manuscript notes on other writings of the time (mostly reprinted in Barker's Personiana: London, 1852); Dr Young's memoir in former editions of the Encyc. Brit. (reprinted ibid.); and his works: Weston's (utterly worthless) Short Account of the late Mr Richard Person (London, 1868; reissued with a new preface and title-page in 1814); Dr Clarke's narrative of his last illness and death (London, 1808; reprinted in the Classical Journal); Kidd's "Imperfect Outline of the Life of R. P.," prefixed to his collection of the Tracts and Criticisms: London, Saunders & Otley, 1817; Barker's Personiana, vol. ii. (London, 1829); Malby's "Personiana," published by Dyce in the volume of Recollections of the Table-Talk of Students, Lads, and Ladies (London, 1867); "Life in the Cambridgeshire, 1857 by H. R. Lasard;" and the lengthy life by J. S. Watson (London, 1861). See also R. C. Jebb in Dict. Nat. Bibl., and J. E. Sandys, History of Classical Scholarship, ii. 424-434 (with copy of portrait by Fox, 1808).

The dates of Person's published works are as follows: Notes in Xenophenous anabasis (1786); Appendix to Top (1790); Letters to Travis (1790); Aeschylus (1795, 1806); Euripides (1797-1802); collected in the Haus Harriet of the 2Sth, under the title of "Adversaria," (Monk and Blomfield, 1812); Tracts and Criticisms (Kidd, 1815); Aristophanica (Dobree, 1820); Notes in Pausianias (Gaisford, 1820); Phoession (Dobree, 1822); Notes in Suidas (Gaisford, 1820); Personiana (see above); and his "Inaugurum," published in the Societies, 1867). Dr. Turton's vindication appeared in 1827. (H. R. L.; J. E. S.)

PORT. (1) (From the Lat. portus, harbour), a place to which ships may resort for the unloading or taking in of cargo, or for shelter, a harbour, also a town possessing a harbour, a "seaport," or "seaport town," especially one where custom-house officers are stationed. As the name of a dark red Portobello, L'贵州, in the French island of Guadeloupe, is a large town near the chief centre of the wine-shipping trade of Portugal (see WINE). (2) (Through the Fr. porte, from Lat. porta, gate), an entrance or opening, not often used in the sense of gate, except in such compounds as "sallyport," cf. "portcullis," and in the derivative "porter," a keeper of a door or gate, especially of a public building, hotel, college, etc. The most general use of the word is for an opening for the admission of light and air in a ship's side, and formerly in ships of war for an embrasure for cannon, a "port-hole." For the application of the word to the left side of a ship, taking the place of the earlier "harbord" and its disputed origin, see STARRHARD. (3) (French: Fr. porte, "door," Lat. portare, "to carry, bear," properly outward bearing or deportment, whence "portly," originally of dignified or majestic bearing, now chiefly used in the sense of stout or corpulent. The verb "to port" is only used as a military term "to port arms," i.e. to hold the rifle across and close to the body, the barrel being placed opposite to the left shoulder. Derivatives are "port-fire" (Fr. porfe-feul), a fuse for firing rockets, etc., and formerly for the discharge of artillery, and "porter," i.e. one who carries a burden, particularly a servant of a railway company, hotel, etc., who carries passengers' luggage to and from the trains, &c.; and "porterage," the charge for the carriage of goods for hire.

PORT-ADAYDON, a market town of county Armagh, Ireland, on the river Bann and the Great Northern railway, 25 m. W.S.W. of Belfast. Pop. (1891), 12,002. It is a junction of
lines from Dublin, Clones and Omagh. The Bann, which is connected with the Newry Canal and falls into Lough Neagh 5 m. north of the town, is navigable for vessels of 90 tons burden. It is crossed at Portadown by a stone bridge of seven arches, originally built in 1764, but since then re-erected. The manufacture of linen and cotton is carried on, and there is a considerable trade in pork, grain and farm produce. In the reign of Charles I. the manor was bestowed on John Olynx, who erected a mansion and a few houses, which were the beginning of the town. A grain-market was established in 1780. The town is governed by an urban district council.

PORTAELS, JEAN FRANÇOIS (1818–1893), Belgian painter, was born at Vilvorde (Brabant), in Belgium, on the 30th of April 1818. His father, a rich brewer, sent him to study in the Brussels Academy, and the director, François Navez, ere long received him as a pupil in his own studio. About 1841 Portaels went to Paris, where he was kindly received by Paul Delaroche. Having returned to Belgium, he carried off the Grand Prix de Rome in 1842. He then travelled through Italy, Greece, Morocco, Algeria, Egypt, the Lebanon, Judaea, Spain, Hungary and Norway. On his return to Belgium in 1847 Portaels succeeded H. Vanderhaert as director of the academy at Ghent. In 1849 he married the daughter of his first master, Navez, and in 1850 settled at Brussels; but as he failed in obtaining the post of director of the academy there, and wished, nevertheless, to carry on the educational work begun by his father-in-law, he opened a private studio-school, which became of great importance in the development of Belgian art. He again made several journeys, spending some time in Morocco; he came back to Brussels in 1874, and in 1878 obtained the directorship of the academy which had so long been the object of his ambition. Portaels executed a vast number of works. Decorative paintings in the church of St. Jacques-sur-Caudenberg; biblical scenes, such as “The Daughter of Sion Reviled” (in the Brussels Gallery), “The Death of Judas,” “The Magi travelling to Bethlehem,” “Judith’s Prayer,” and “The Drought in Judaea”; genre pictures, among which are “A Box in the Theatre at Budapest” (Brussels Gallery), portraits of officials and of the fashionable world, Oriental scenes and, above all, pictures of fancy female figures and of exotic life. “His works are in general full of a facile grace, of which he is perhaps too lavish,” wrote Théophile Gautier. Yet his pleasing and abundant productions as a painter do not constitute Portaels’s crowning merit. The high place of his name will fill in the history of contemporary Belgian art is due to his influence as a learned and clear-sighted instructor, who formed, among many others, the painters E. Wauters and E. Agenesens, the sculptor Ch. van der Stappen, and the architect Liot. He died at Brussels on the 8th of February 1895.

See E. L. de Taeye, Peintres belges contemporains; J. du Jardin, L’Art flamand. (F. K.)

PORTAGE, a city and the county-seat of Columbia county, Wisconsin, U.S.A., on the Wisconsin river, about 85 m. N.W. of Milwaukee. Pop. (1890) 5143; (1900) 5459, of whom 1154 were foreign-born (1900 U.S. census) 5490. It is served by the Chicago, Milwaukee & St Paul, and the Minneapolis, St Paul & Sault Ste Marie railways. The city is situated at the west end of the government ship canal connecting the Fox and Wisconsin rivers, and river steamboats ply during the open season between Portage and Green Bay and intermediate points in the Fox River Valley, Portage being the head of navigation on the Fox. Portage is in the midst of a fertile farming region, and has a trade in farm and dairy products and tobacco. Its manufactures include brick, tile, lumber, flour, pickles, knit goods, steel tanks and marine engines and launches, and there are several tobacco warehouses and grain elevators. As the Fox and Wisconsin rivers are here only 2 m. apart, these rivers were the early means of communication between Lake Michigan and the Mississippi river. The first Europeans known to have visited the site of the city were Radisson and Groseilliers, who crossed the portage in 1655. The portage was used by Marquette and Joliet on their way to the Mississippi in 1673, and a red granite monument commemorates their passage. About 1712 the Fox Indians disputed the passage of the portage, precipitating hostilities which continued intermittently until 1743. The first settler was Lawrence Barth, who engaged in the carrying trade here in 1703. Jacques Vieuve established a trading post here in 1797, and in 1820 it was a thriving depot of the fur trade. During the Red Bird uprising (1827) a temporary military post was established by Major William Whistler of the U.S. army. Fort Winnebago was begun in the following year, was remodelled and completed by Lieut. Jefferson Davis in 1832, and was subsequently abandoned. It was from there in the same year that the final and successful campaign against Black Hawk was begun. After several failures the Fox-Wisconsin canal was completed in 1856, and in June of that year the “Aquilla,” a stern-wheeler, passed through the canal on its way from Pittsburgh to Green Bay. The shifting channel of the Wisconsin has retarded navigation, and the canal has never been as important commercially as was expected.

PORTAGE LA PRAIRIE, a port of entry and the chief town of Portage la Prairie county, Manitoba, Canada, situated 333 m. N.W. of Winnipeg, on the Canadian Pacific and Canadian Northern railways, at an altitude of 854 ft. above the sea. Pop. (1901), 3901. It is in the midst of a fine agricultural district, into which several branch railways extend, and carries on a large export trade in grain and other farm produce.

PORTALEGRE, an episcopal city, capital of the district of Portalegre, Portugal; 8 m. N. of Portalegre station, on the Lisbon–Badajoz–Madrid railway. Pop. (1900), 11,820. Portalegre is the Roman Ammae or Ammaia, and numerous Roman and prehistoric remains have been discovered in the neighbourhood. The principal buildings are the cathedral, the ruined Moorish citadel, and two more modern forts. The administrative district of Portalegre, in which the rearing of swine, the production of grain, wine and oil, and the manufacture of woollen and cotton goods and corks are the principal industries, coincides with the northern part of the ancient province of Alentejo (q.v.). Pop. (1900), 124,443; area, 2405 sq. m.

PORTALIS, JEAN ÉTIENNE MARIE (1746–1807), French jurist, came of a bourgeois family, and was born at Bauzais in France on the 1st of April 1746. He was educated by the Oratorians at their schools in Toulon and Marseilles, and then entered the civil service. He practised as a lawyer and published his first two works, Observations sur Émile in 1763 and Des Préjugés in 1764. In 1765 he became an avocat at the parliament of Aix, and soon obtained so great a reputation that he was instructed by the duc de Choiseul in 1770 to draw up the decree authorizing the marriage of Protestants. From 1778 to 1781 he was one of the four assessors or administrators of Provence. In November 1793, after the republic had been proclaimed, he came to Paris and was thrown into prison, being the brother-in-law of Joseph Jérôme Siméon, the leader of the Federalists in Provence. He was soon removed through the influence of B. de Y. Barère to a maison de santé, where he remained till the fall of Robespierre. On being released he practised as a lawyer in Paris; and in 1795 he was elected by the capital to the Conseil des Anciens, becoming a leader of the moderate party opposed to the directory. As a leader of the moderates he was proscribed at the coup d'état of Fructidor, but, unlike General Charles Pichegru and the marquis de Barbé-Marbois, he managed to escape to Switzerland, and did not return till Bonaparte became First Consul. Bonaparte made him a conseiller d'état in 1800, and then charged him, with F. D. Tonnelet, Bigot de Préameneau, and Jacques de Maleville, to draw up the Code civil. Of this conciliatory code he was the most industrious member, and many of the most important titles, notably those on marriage and heirship, are his work. In 1801 he was placed in charge of the department of cultes or public worship, and in that capacity had the chief share in drawing up the provisions of the Concordat. In 1803 he became a member of the Institute, in 1806 minister of public worship, and in 1808 a knight grand cross of the Legion of Honour. He soon after became totally
PORTARLINGTON—PORT AUGUSTA

Island; and after an operation he died at Paris on the 25th of August 1807.

The work of Portalis appears in the *Code Napoléon*, but see also Frederick Portalis's *Documents, rapports, et travaux intérieurs sur le Code Civil* (1844) and *Sur le Concordat* (1845); for his life, see the biography in the edition of his *OEuvres* by F. Portalis (1823) and René Lavallée, *Portalis, sa vie et ses œuvres*, (Paris, 1860).

His son, Joseph Marie Portalis (1778–1858), entered the diplomatic service, and obtaining the favour of Louis XVIII., filled many important offices. He was under-secretary of state for the ministry of justice, first president of the court of cassation, minister for foreign affairs, and in 1851 a member of the senate.

**PORTARLINGTON**, a market town situated partly in King's county but chiefly in Queen's county, Ireland, on both banks of the river Barrow, here the county boundary. Pop. (1901), 3214. The railway station, a mile south of the town, is an important junction, 42 miles west by south from Dublin, of the Great Southern & Western system, where the branch line to Athlone leaves the main line. Monthly fairs are held, and there is considerable local trade. After the revocation of the edict of Nantes a colony of French refugees was established here in 1685, and William III. erected a beautiful church in St. Paul (rebuilt in 1850) devoted to their use, services being conducted in the French language, for which reason the church is still spoken of as the "French Church." The former name of the town was Coolteetodera, but on the property passing into the hands of Lord Arlington in the reign of Charles II. the name was changed. Emo Park, 5 miles south of the town, is the fine demesne of the ears of Portarlington, a title granted to the family of Dawson in 1725. An obelisk on Spire Hill near the town is one of the many famine relief works in Ireland. On the river, close to the town, there are picturesque remains of Lea Castle, originally built c. 1260. Portarlington was incorporated in 1609, and was a Parliamentary borough both before the Union and after, its representation in the imperial parliament (by one member) being merged in that of the county by the Redistribution Act of 1885.

**PORT ARTHUR** (formerly Prince Arthur's Landing), a town and harbour in Thunder Bay District, Ontario, Canada, on Lake Superior, and the Canadian Pacific, Grand Trunk Pacific, and Canadian Northern railways, and the lake terminus of the two latter. Pop. (1901), 110-127. The lake terminus of the Canadian Pacific, originally here, has been moved to Fort William, 4 miles distant. Lumber and minerals are shipped from the surrounding district, and vast quantities of grain from the farther west.

**PORT ARTHUR** (Chinese, Lu-shun-k'ou), a fortress situated at the extreme south of the peninsula of Liao-tung in the Chinese principality of Manchuria. It was formerly a Chinese naval arsenal and fortress, but was captured by the Japanese in 1894, who destroyed most of the defensive works. In 1895 it was leased to Russia with the neighbouring port of Talienwan, and was gradually converted into a Russian stronghold. In 1905 the lease was transferred to Japan. The port or harbour is a natural one, entirely landlocked except to the south. The basin inside is of limited extent. Barren and rocky headlands, from the western edge of the peninsula, stretch out 13 miles from the entrance. A line of sound 20 m. long connects the port with Mukden and the trans-Siberian line; there is also railway connexion with Pekin. The harbour is ice-free all the year round, a feature in which it contrasts favourably with Vladivostok.

The Liao-tung peninsula, separated from Korea by the Bay of Korea, and from the Chinese mainland by the Gulf of Liao-tung, runs in a south-westerly direction from the mainland of Manchuria, and is continued by a group of small islands which reach another peninsula projecting from the mainland of China in a north-easterly direction, and having at its north-eastern extremity the port of Wei-hai-wei. The Liao-tung peninsula is indented by several bays, two of which nearly meet, making an isthmus less than 2 m. wide, beyond which the peninsula slightly widens again, this part of it having the name of Kan-tun (regent's sword). Two wide bays open on the eastern shore of the latter: Lu-shun-k'ou (Port Arthur) and Talienwan. Both were leased to Russia. Lu-shun-k'ou Bay is nearly 4 m. long and 1½ m. wide, the entrance being only 350 yds. wide. The Chinese deepened the bay artificially and erected quays. The roadstead is exposed to southerly winds, and in this respect far exceeds that of Talienwan, a bonified small island, containing a fair anchorage. The climate is very mild, and similar to that of south Crimea, only moister.

While in occupation by the Russians Port Arthur became Europeanized. The military port, Tairen, is a few miles to the north. During the Russo-Japanese war the Japanese assailed Port Arthur both by land and sea, and, after repeated assaults, on the 1st of January 1905, General Stoeessel surrendered the citadel into the hands of the Japanese.

**PORTAS**, or *Portuary*, a brevity (q.v.) of such convenient size that it could be carried on the person, with a Latin *primatium* (portas, portary, port, &c.) The English word was adapted from the Old French *portechar*, and took a large number of forms, *e.g. portors, portures, portes,* &c. In Scots law, the "porteous-roll" was the name given formerly to a list of criminals drawn up by the justice-clerk on information given by the local authorities, together with the names of witnesses, and charges made.

**PORTATIVE ORGAN**, a small medieval organ carried by the performer, who manipulated the bellows with one hand and fingered the keys with the other. This small instrument was necessarily made as simple as possible. On a small rectangular board or reservoir, fed by means of a single bellows placed at the back, in front, or at the right side, were arranged the pipes—-one, two or three to a note—supported by more or less ornamental uprights and an oblique bar. The most primitive style of keyboard consisted merely of sliders pushed in to make the note sound and restored to its normal position by a horn spring; the reverse action was also in use, the keys being furnished with knobs or handles.

Towards the middle of the 13th century the portatives represented a number of miniatures illustrated MSS. first show signs of a real keyboard with balanced keys, as in the 13th-century Spanish MS., *Monsignor de la Cantiguenia,* containing four full pages of miniatures of instrumentalists, fifty-one in number. From the position of the performer's thumb it is evident that the keys are pressed down to make the notes sound. There are nine pipes and the same number of keys, sufficient for the diatonic octave of C major with the B flat added. The pipes put into these small organs were flue pipes, their intonation must have been very unstable owing to the irregularity of the wood supply fed by a single bellows, the wood being at this period in a primitive stage. Increased pressure in pipes with fixed mouthpieces, such as organ pipes, produces a rise in pitch. These medieval portative organs, so extensively used during the 14th and 15th centuries, were revivals of those used by the Romans, of which a specimen excavated at Pompeii in 1876 is preserved in the Museum at Naples. The case measures 14½ in. by 9½ in. and contains nine pipes, of which the longest measures 15½ ft. six of these pipes are muffled. From the top similar to those made in *gamba* pipes of modern organs to give them their ready quality, and also to those cut in the bamboo pipes of the Chinese Cheng, which is a primitive organ furnished with free reeds. From the description of these remains by C. F. Abdy Williams, it would seem that a bronze plate 11½ in. by 2½ in. having 18 rectangular slits arranged in three rows to form vandykes was found inside the case, with three little plates of bronze just wide enough to pass through the slits lying by it; this plate possibly formed part of the mechanism for the sliders of the keys. The small instrument often taken for a syrinx on a cornettine of Sallust in the *Histoire de l'art depuis l'empereur d'oriente* is merely a miniature portative.

**PORT AUGUSTA**, a seaport of Frome county, South Australia, on the east shore of Spencer Gulf, 259 m. by rail N.N.W. of Adelaide. Pop. about 2400. It has a fine natural deep and landlocked harbour, and the government wharves have berthing for large vessels. The chief exports are wool, wheat, flour, copper, hedges and tallow. Port Augusta is the seat of a Roman Catholic bishop and has a cathedral, while its town-hall is the finest in the state, that of Adelaide excepted. It is also the starting point of the Great Northern railway. The largest ostrich farm in Australia lies 8 m. from the town. The neighbourhood is rich in minerals, copper, silver, iron and coal have been found, for a reproduction see J. F. Riaño, *Studies of Early Spanish Music*, pp. 110-127 (London, 1887).
and in 1900 valuable gold quartz reefs were discovered at Tarcoola.

PORT AU PRINCE (originally l'Hôpital, and for brief periods Port Henri and Port Républicain), the capital of the republic of Haiti, West Indies, situated at the apex of the triangular bay which strikes inland for about 100 m. between the two great peninsulas of the west coast, with its upper recesses protected by the beautiful Island of Gonâvès (39 m. long by 2 broad). The city is admirably situated on ground that soon begins to rise rapidly towards the hills. It was originally laid out by the French on a regular plan with streets of good width running north and south and intersected by others at right angles. Everything has been allowed to fall into disorder and disrepair, and to this its public buildings form no exception. Every year, in the long quarters of the town are burned down, but the people go on building the same slight wooden houses, with only here and there a more substantial warehouse in brick. In spite of the old French aqueduct the water-supply is defective, from June to September the heat is excessive, reaching 95° to 99° F. in the shade. The population, mostly negroes and mulattoes, is estimated at 61,000. Port-au-Prince was first laid out by M. de la Cuza in 1749. In 1751, and again in 1770, it was destroyed by earthquakes.

PORT BLAIR, the chief place in the convict settlement of the Andaman Islands in the Indian Ocean, situated on the south-eastern shore of the South Andaman Island, in 11° 42' N. 93° E. It derives its name from Lieut. Blair, R.N., who first occupied it in 1788, as a station for the suppression of piracy and the protection of shipwrecked crews. Abandoned on account of sickness in 1796, it was not again occupied until 1856. It possesses one of the best harbours in Asia, while its central position in the Bay of Bengal gives it immense advantage as a place of naval rendezvous. (See Andaman Islands.)

PORT CHESTER, a village of Westchester county, New York, U.S.A., in the south-east part of the state, on Long Island Sound, and about 10 m. N.E. of New York City (26 m. from the Grand Central Station). Pop. (1900), 7,440, of whom 2110 were foreign-born; (1910 census), 12,820. It is served by the New York, New Haven & Hartford railroad, and by daily steamers to and from New York City. The village has various manufactures, including bolts and nuts, motors for racing boats and automobiles; there are also large planing and wood-milling mills. The earliest mention of Port Chester in any extant record is in the year 1732. Until 1837 it was known as Saw Pit, on account of a portion of the village, it is said, being used as a place for building boats. During the War of Independence the village was frequently occupied by detachments of American troops. Port Chester was incorporated as a village in 1838.

PORTCULLIS (from the Fr. porte-coulisse, porte, a gate, Lat. porta, and coulisse, a groove, used adjectival for 'sliding,' from couler, to slide or glide, Lat. colere; the Fr. equivalents are kerce, a barrow, and coulisse, Ger. Füllege; Ital. saracinesco), a strong-framed grating of oak, the lower points shod with iron, and sometimes entirely made of metal, hung so as to slide up and down in grooves with counterbalances, and intended to protect the gateways of castles, &c. The defenders having opened the gates and lowered the portcullis, could send arrows and darts through the gratings. A portcullis was in existence until modern times in a gateway at York. The Romans used the portcullis in the defence of gateways. It was called cataracta from the Gr. καταρακτής, a waterfall (καταρρύφωθα, to fall down). Vegetius: "De re milit. iv. 4) speaks of it as an old method of defence, and it has been suggested that in Psalm xiv. 7, 9, " Lift up your heads, oh ye gates," &c., there is an allusion to a similar contrivance. Remains of a cataracta are clearly seen in the gateway of Pompeii. The Italian name saracinesca originates from the crusades. (See Gate.)

PORTE, THE SUBLIME (Arab. babi’-zii, the high gate, through the French translation la sublime porte), in Turkey, the official name for the government, derived from the high gate giving access to the building where the offices of the principal state departments are situated.

PORT ELIZABETH, a seaport of the Cape province, South Africa, in Algoa Bay, by which name the port is often designated. It lies in 33° 57' S., 25° 37' E. on the east side of Cape Recife, being by sea 436 m. from Cape Town and 384 m. from Durban. In size and importance it is second only to Cape Town among the towns on the east coast. It has been built partly along the seashore and partly on the slopes and top of the bluffs that rise some 500 ft. above the bay. The Baakens' River, usually a small stream, but subject (as in 1908) to disastrous floods, runs through the town, which consists of four divisions; the harbour and business quarter at the foot of the cliffs, the upper part, a flat table-land known as "The Hill"; "The Valley" formed by the Baakens' River; and "South Hill," east of the river.

The Town.—Jetty Street leads from the north jetty to the market square, or in or around which are grouped the chief public buildings—the town-hall, court-house, post office, market buildings, public library, St Mary's Church, St Augustine's (Roman Catholic). Several of these buildings are of considerable architectural merit and fine elevation. The library, of Elizabethan design, contains some 45,000 volumes. The market buildings, at the southern corner of the town, and partly excavated from the sides of the cliff, contain large halls for the fruit, wool and feather markets and the museum. Feather-Market Hall, where are held the sales of feathers, skins and other products, is flanked by two buildings grouped respectively for ethnographical and zoological collections. Other public buildings include a synagogue and a Hindu temple. Leading west from Market Square is Main Street, in which are the principal business houses. Beyond it, on the right, is Main Street East, and a line of large and architecturally interesting commercial buildings. Behind the lower town streets rise terraces to "The Hill," a residential district. Here is an open plot of ground, Donkin Reserve, containing the lighthouse and a stone pyramid set with an inscription. Here, in 1836, and again in 1855, the earthshock of Cape Town was felt. Located a few feet from the site of the second earthquake, the "House of Wonder" was erected in 1856 to commemorate the event. Rufane Donkin, described as "one of the most perfect of human beings, who has given her name to the town below. A fountain, surrounded by the town, bears his name, and the inscription by public subscription in 1905 commemorates "the service of gallantry and valour which perished in the Anglo-Boer war, 1899-1902." Farther west is a large hospital, one of the finest institutions of its kind in South Africa. At the southern end of The Hill is St George's Park, which has some fine trees, in marked contrast to the general treeless, barren aspect of the town. Port Elizabeth indeed possesses few natural amenities, but its golf links are reputed the finest in South Africa. The town, apart from its transit trade and the industries connected therewith, has some manufactures—jam and confectionery works; oil, candle and explosive works; saw and flour mills; tanneries, &c. It has an excellent water supply, "Blue Bay Water." Port Elizabeth has an excellent holding ground, protected from all winds except the south-east, the prevailing wind being westerly. No harbour or light dues are charged to vessels lying in the bay, or to vessels waiting to discharge goods. The river mouth is 99 ft. wide, with wrought iron, respectively 1162, 1152 and 1462 ft. in length, extending to the four fathoms line. These jetties are provided with hydraulic cranes, &c., and railways connect them with the main lines. The chief good to the town is its climate, which along with the many physical advantages makes it one of the best health resorts of South Africa. In favourable weather vessels drawing up to 21 ft. can discharge cargo alongside the jetties. In unfavourable conditions and for larger steamers: tugs and lighters are employed. Rough weather prevents discharge of cargo by lighters, on an average, seven days in the year. The customs-house and principal railway station are close to the north jetty. The port is state owned, and is under the administration of the harbour and railway board of the Union. Trade.—Port Elizabeth is a large import trade, chiefly in textiles, machinery, hardware, apparel and provisions, supplying to a considerable extent the markets of Kimberley, Rhodesia, the Orange Free State, Natal, and the Transvaal. The chief imports are in the shape of finished goods. The chief exports are, in the shape of raw materials, skins, wool and mohair. Skins, hides and mohair are also exported. In 1853 the value of the imports was £57,660; in 1895 £6,364,000, and in 1900 £7,064,000. The export trade in 1900 amounted to £2,010,000 in 1903. Indicative of the fact that the agricultural community was little affected by the trade depression are the export figures, which were from 1900 to 1906 £2,350,000, £2,350,000 and £2,350,000 respectively. In 1907 goods valued at £3,150,000 were exported.

Population.—The population within the municipal area was at the 1901 census 32,959; that within the district of Port Elizabeth 46,626, of whom 17,928 were of German origin and the Deutsche Liedertafel is one of the most popular clubs in the town.
PORTER, BENJAMIN CURTIS (1843— ), American artist, was born at Melrose, Massachusetts, on the 27th of August 1843. He was a pupil of A. H. Bicknell and of the Paris schools, and was elected an associate of the National Academy of Design, New York, in 1878, and a full academician in 1880. He is best known as a painter of portraits.

PORTER, DAVID (1780-1845), American naval officer, was born in Boston, Massachusetts, on the 1st of February 1780. His father, David, and his uncle, Samuel, commanded American ships in the War of Independence. In 1796 he accompanied his father to the West Indies; on a second and on a third voyage he was impressed on British vessels, from which, however, he escaped. He became a midshipman in the United States Navy in April 1798; served on the "Constellation" (Captain Thomas Truxtun) and was midshipman of the foretop when the "Constellation" defeated the "Insurgent"; was promoted lieutenant in October 1799, and was in four successful actions with French ships in this year. In 1803, during the war with Tripoli, he was first lieutenant of the "Philadelphia" when that vessel grounded, was taken prisoner, and was released in 1806. He was commissioned master and commander in April 1806; in 1807-1810 served about New Orleans, where he captured several French privateers, and in 1812 was promoted captain. He commanded the frigate "Essex" in her famous voyage in 1812-1814. In the Atlantic he captured seven brigs, one ship, on the 13th of August 1812, the sloop "Alert," the first British war vessel taken in the War of 1812. Without orders from his superiors he then (February 1813) rounded Cape Horn, the harbours of the east coast of South America being closed to him. In the South Pacific he captured many British whalers (the British losses were estimated at $500,000), and on his own authority took formal possession (November 1813) of Nuku-hiva, the largest of the Marquesas Islands; the United States, however, never asserted any claim to the island, which in 1842, with the other Marquesas, was annexed by France. During most of February and March 1814 he was blockaded by the British frigates "Cherub" and "Phoebe" in the harbour of Valparaiso, and on the 28th of March was defeated by these vessels, which seem to have violated the neutrality of the port. He was released on parole, and sailed for New York on the "Essex, Jr.," a small vessel which he had captured from the British, and which accompanied the "Essex." At Sandy Hook he was detained by the captain of the British frigate "Leda," (who declared that Porter's parole was no longer effective), but escaped in a small boat. He was a member of the new board of naval commissioners from 1815 until 1823, when he commanded a squadron sent to the West Indies to suppress piracy. One of his officers, who landed at Tafjardo (or Foxardo), Porto Rico, in pursuit of a pirate, was imprisoned by the Spanish authorities on the charge of piracy. Porter, without reporting the incident or awaiting instructions, forced the authorities to apologize. He was recalled (December 1824), was court-martialled, and was suspended for six months. In August 1826 he resigned his commission and returned to the United States, was elected until 1829, a member of the Mexican navy, then fighting Spain; in payment for his services he received government land in Tehuantepec, where he hoped to promote an inter-oceanic canal. President Andrew Jackson appointed him consul-general to Algiers in 1830, and in 1831 created for him the post of chargé d'affaires at Constantinople, where in 1841 he became minister. He died in Peru on the 3rd of March 1843.

PORTER, DAVID DIXON (1813-1891), American naval officer, was the son of Capt. David Porter, was born in Chester, Pennsylvania, on the 7th of June 1813. His first voyage, with his father, was in 1823 as pilot, under the command of his father.

While he was in New Orleans he adopted David Farragut, who later served with him on the "Essex."
in West Indian waters in 1823-1824, was terminated by the Fajardo affair (see Porter, David). In April 1826 he entered the Mexican navy, of which his father was commander-in-chief, and which he left in 1828, after the capture by the Spanish of the "Guerrero," on which he was serving under his cousin, David H. Porter (1804-1828), who was killed before the ship's surrender. He became a midshipman in the United States navy in 1829, and in the coast survey in 1836-1842. In 1839 he married the daughter of Captain Daniel Todd Patterson (1786-1839), then commandant of the Washington navy-yard. Porter became a lieutenant in February 1841; served at the naval observatory in 1845-1846; in 1846 he was sent to the Dominican Republic. During the Mexican War he served, from February to June 1847, as lieutenant and then as commanding officer of the "Spitfire," a paddle vessel built for use on the rivers, and took part in the bombardment of Vera Cruz and in the other naval operations under Commander M. C. Perry. From the close of the Mexican War to the beginning of the Civil War he had little but detail duty; in 1855 and again in 1856 he made trips to the Mediterranean to bring to the United States camels for army use in the south-west. In April 1861 he was assigned to the "Powhatan," and was sent under secret orders from the president for the relief of Fort Pickens, Pensacola. Porter's expedition, which had headquarters in the Pensacola navy-yard, was promptly graduated from a fort to a flotilla, and from the 22nd of April, and on the 25th of May was sent to blockade the South-West Pass of the Mississippi. In August he left the gulf in a fruitless search for the Confederate cruiser "Sumter." Upon his return to New York in November he urged an expedition against New Orleans (q.v.), and recommended the appointment of Commander D. G. Farragut (q.v.), his foster-brother, to the chief command. In the expedition Porter himself commanded the mortar flotilla, which, when Farragut's fleet passed the forts on the early morning of the 24th of April 1862, covered its passage by a terrific bombardment that neutralized the fire of Fort Jackson. At Vicksburg Porter's bombardment assisted Farragut to run past the forts (June 28). On the 9th of July Porter was ordered, with ten mortar boats, to the James river, where McClellan's army was concentrated. On the 15th of October he took command of the gun-vessels which had been built on the upper waters of the Mississippi, and to which he made important additions at an improvised navy-yard at Mound City, Illinois. With this he took part in the capture of Arkansas Post on the 11th of January 1863. In the operations for the capture of Vicksburg in 1863 unsuccessful attempts were made. In February and March by Porter's vessels to penetrate through connecting streams and bayous to the Yazoo river and reach the right rear of the Confederate defences on the bluffs. But in May the fleet ran past the Vicksburg batteries, mastered the Confederate forts at Grand Gulf, and made it possible for Grant's army to undertake the brilliant campaign which led to the fall of the place (see American Civil War and Vicksburg). Porter received the thanks of Congress for "opening the Mississippi River" and was promoted rear-admiral. He co-operated with Major-General N. P. Banks in the Red River expeditions in March-May 1864, in which his gun-boats, held above Alexandria by shallop and sloop, narrowly escaped isolation; he returned only by the help of a dam built by Lieut.-Colonel (Brigadier-General) Joseph Bailey (1827-1867). On the 12th of October 1864 he assumed command of the North Atlantic blockading squadron, then about to engage in a combined military and naval expedition against Fort Fisher, North Carolina. Porter claimed that his guns silenced Fort Fisher, but Major-General B. F. Butler, in command of the land forces, refused to assail, asserting that the fort was practically intact. After Butler's removal, Porter, co-operating with Major-General Alfred H. Terry, and commanding the largest fleet assembled at any one point during the war, took the fort on the 17th of January 1865; for this he again received the thanks of Congress. From 1865 to 1869 he was superintendent of the U.S. Naval Academy at Annapolis, which he greatly improved; his most notable change being the introduction of athletics. On the 25th of July he became vice-admiral. From the 9th of March to the 25th of June 1869, while Adolph E. Borie (1809-1880), of Pennsylvania, was secretary of the navy in President Grant's cabinet, Porter was virtually in charge of the navy department. In 1870 he succeeded Farragut in the grade of admiral, which lapsed after Porter's death until 1899, when it was re-established to reward Rear-Admiral George Dewey for his victory at Manila. Porter urged the reconstruction of the navy, which he saw begun in 1882. He died in Washington, D.C., on the 13th of February 1891.

Porter wrote a Life of Commodore David Porter (1875), gossip Incidents and Anecdotes of the Civil War (1885), a none too accurate History of the Navy during the War of the Rebellion (1887), two novels, Allan Dare and Robert le Diable (1885; dramatized, 1887) and Harry Higginson, with his brother-in-law, Albert J. Laidley, and a novel, Captains, published in The Criterion in 1903. See J. R. Soley, Admiral Porter (New York, 1903) in the "Great Commanders" Series.

Admiral Porter's three brothers were in the service of the United States: William David Porter (1809-1864) entered the navy in 1823, commanded the "Essex" on the Tennessee and the Mississippi in the Civil War, and became commodore in July 1862; Theodoric Henry Porter (1817-1846) was the first officer of the American army killed in the Mexican War; and Henry Osceola Porter (1818-1842) resigned from the United States navy in 1847, after seven years' service, fought under William Walker in Central America, returned to the American navy, was executive officer of the "Hatteras" when she was sunk by the "Alabama," and received wounds in the action from the effects of which he died several years later.

PORTER, ENDYMION (1787-1849), English royalist, descended from Sir William Porter, sergeant-at-arms to Henry VII., and son of Edmund Porter, of Aston-sub-Edge in Gloucestershire, by his cousin Angela, daughter of Giles Porter of Mickleton, in the same county, was brought up in Spain—where he had relatives—as page in the household of Olivares. He afterwards entered successively the service of Edward Villiers and of Buckingham, and through the latter's recommendation became groom of the bedchamber to Charles I. In October 1622 he was sent to negotiate concerning the affairs of the Palatinate and the marriage with the Infanta. He accompanied Charles and Buckingham on their foolhardy expedition in 1623, acted as their interpreter, and was included in the consequent attack made by Lord Bristol on Buckingham in 1626. In 1628 he was employed as envoy to Spain to negotiate for peace, and in 1634 on a mission to the Netherlands to the Infante Ferdinand. During the Civil War Porter remained a constant and faithful servant of the king. He was with him during the two Scottish campaigns, attended him again on the visit to Scotland in August 1641, and followed Charles on his last departure from London in 1642, receiving the nominal command of a regiment, and sitting in the Royalist parliament at Oxford in 1643. He had, however, little faith in the king's measures. "His Majesty's businesses," he writes in 1641, "run in their wonted channel—subtle designs of gaining the popular opinion and weak executions for the upholding of monarchy." His fidelity to Charles was of a personal, not of a political nature. "My duty and loyalty have taught me," he declared, "my king;" he declared his "obedience to the throne." His devotion to the king, the fact that he was the agent and protégé of Buckingham, and that his wife Olivia, daughter of John, Lord Boteler of Bramfield, and niece of Buckingham, was a zealous Roman Catholic, drew upon him the hostility of the opposite faction. As member of the Long Parliament, in which he sat as member for Droitwich, he was one of the minority of 59 who voted against Strafford's attainder, and was in consequence proclaimed a "betray of his country." On the 15th of February 1642 he was voted one of the dangerous counsellors, and specially excepted from pardon on the 4th of October and in the treaties of peace negotiated subsequently, while on the 10th of March 1643 he was excluded from parliament. Porter was also implicated in the army plot; he assisted Glamorgan in illegally putting the great seal to the commission to negotiate with the Irish in 1644; and was charged with having in the same manner affixed the
PORTER, FITZ-JOHN—PORTER, HENRY

great seal of Scotland, then temporarily in his keeping, to that of O'Neill in 1641, and of having incurred some responsibility for the Irish rebellion. Towards the end of 1645, when the king's cause was finally lost, Porter abandoned England, and fled successively in France, Brussels, where he was reduced to great poverty, and the Netherlands. The property which he had accumulated during the tenure of his various appointments, by successful commercial undertakings and by favours of the court, was now for the most part either confiscated or encumbered. He returned to England in 1649, after the king's death, and was allowed to compound for what remained of it. He died shortly afterwards, and was buried on the 20th of August 1649 at St Martin's-in-the-Fields, leaving as a special charge in his will to his sons and descendents to "observe and respect the family of my Lord Duke of Buckingham, deceased, to whom I owe all the favours of my life." He had five sons, who all played conspicuous, if not all creditable, parts in the history of the time. According to Wood, Porter was "beloved by two kings: James I. for his admirable wit and Charles I. for his general bearing, brave style, sweet temper, great experience, travels and modern languages." During the period of his prosperity Porter had gained a great reputation in the world of art and letters. He wrote verses, was a generous patron of Davenant, who especially sings his praises, of Dekker, Warmstrey, May, Herrick and Robert Dover, and was included among the 84 "essentials" in Bolton's "Academy Royal." He was a judicious collector of MSS. and as the friend of Rubens, Van Dyck, Mytens and other painters, and as agent for Charles in his commercial transactions, he had a considerable share in forming the king's magnificent collection. He was also instrumental in procuring the Arundel pictures from Spain. The authorship of Eikon τῆς, 1649, a vindication of the Eikon βασιλέως, has been attributed with some reason to Porter.

Almack, p. 94. There are also various references, Sec., to Endymion Porter in Additional Charters, British Museum, 6223, 1633, 6225; Add. MSS. 15,858; 33, 374; and Egerton 2550, 2533; in the Hist. MSS. Comm. Series; MSS. of Duke of Portland, &c., and in Notes and Queries; also Thomson Tracts, Brit. Mus., E.118 (13).

PORTER, FITZ-JOHN (1822-1901), American soldier, was born at Portsmouth, New Hampshire, on the 31st of August 1822. He was the son of a naval officer, and nephew of Dr. Samuel Porter of Abingdon, "FasEx." He graduated at the United States Military Academy in 1845 and was assigned to the artillery. In the Mexican War he won two brevets for gallantry—that of captain for Molino del Rey and that of major for Chapultepec. He served at West Point as instructor and adjutant (1849-1855), and he took part in the Utah expedition. At the outbreak of the Civil War in 1861 he was employed on staff duties in the eastern states, and rendered great assistance in the organization of Pennsylvania volunteers. In the absence of higher authority Porter sanctioned on his own responsibility the recall of Missouri Unionists for permission to raise troops, a step which had an important influence upon the struggle for the possession of the state. He became colonel of a new regiment, the 14th Missouri Infantry, on the 10th of May, and soon afterwards brigadier-general of volunteers. Under McClellan he commanded a division of infantry in the Peninsular campaign, and directed the Union siege operations against Yorktown, and he was soon afterwards placed in command of the V. army corps. When the Seven Days' battle (June 25) Porter's corps had to sustain the full weight of the Confederate attack, and though defeated in the desperately fought battle of Gaines's Mill (June 27, 1862) the steadiness of his defence was so conspicuous that he was immediately promoted major-general of volunteers and brevet brigadier-general U.S. His corps, moreover, had the greatest share in the successful battles of Glendale and Malvern Hill. Soon afterwards, with other units of the Army of the Potomac, the V. corps was sent to General V Corps, and in action on the first day of the disastrous second battle of Bull Run (p.93) led to the general's subsequent disgrace; but it made a splendid fight on the second day to save the army from complete rout, and subsequently shared in the Antietam campaign. On the same day on which McClellan was relieved from his command, Porter, his warm friend and supporter, was suspended. A few days later he was tried by court-martial on charges brought against him by Pope, and on the 21st of January 1863 was sentenced to be cashiered and for ever disqualified from holding any office of trust under the government of the United States.

After many years Porter's friends succeeded (1878) in procuring a revision of the case by a board of distinguished general officers. This board reported strongly in Porter's favour, but at the time the remission of the disqualification penalty was all that was obtained in the way of redress. General Grant had now taken Porter's part, and wrote an article in vol. 135 of the North American Review entitled "An Undeserved Stigma." Against much opposition, partly political (1879-1886) and a veto on a legal point from President Arthur, a relief bill finally passed Congress, and Porter was on the 5th of August 1886 restored to the United States army as colonel and placed on the retired list, no provision, however, being made for compensation. After the Civil War Porter was engaged in business in New York, and during the next few years held successively many important municipal offices. In 1889 he declined the offer made by the khedive of the chief command of the Egyptian army. He died on the 21st of May 1901, at Morristown, New Jersey.

See, besides General Grant's article, Cox, The Second Battle of Bull Run as connected with the Porter Case (Cincinnati, 1882); Lord, A Summary of the Case of F. J. Porter (1883), and papers in the publications of the Military Historical Society of Massachusetts.

PORTER, HENRY (fl. 1590-1599), English dramatist, author of The Two Angry Women of Abingdon, may probably be identified with the Henry Porter who matriculated at Brasenose College, Oxford, on the 10th of June 1589, and is described as aged sixteen and the son of a gentleman of London. From 1590 to 1599 he was engaged in writing plays for Henslowe for the admiral's men, and his closest associate seems to have been Henry Chettle. The earlier entries in Henslowe's Diary are respectful in tone, and the considerable sums paid to "Mr Porter" prove that his plays were popular. Henslowe secured in February 1599 the sole rights of any play in which Porter had a hand, the consideration being an advance of forty shillings. As time goes on he is familiarly referred to as "Harry Porter"; his borrowings become more frequent, and the sums less, until on the 10th of April 1599 he obtained a loan of twelve pence in exchange for a bond to pay all he owed to Henslowe—twenty-five shillings—on pain of forfeiting ten pounds. Whether he paid or not does not appear, but his last loan is recorded on the 26th of May 1599, after which nothing further is known of him. It seems in the highest degree unlikely that he is the Henry Porter who took his degree as Mus. Bac. at Christ Church in 1600 after twelve years' study, and whose skill in sacred music is celebrated in an epitaph by John Weever. The entries in Henslowe's Diary indicate that he wrote a play called Love Prevented (1593), Hot Anger soon Cold, with Chettle and Ben Jonson (1596), the second part of The Two Angry Women of Abingdon (1598), The Four Merry Women of Abingdon (1598), and The Peacock (1594), with Chettle. None of these are extant, unless, as has been suggested, Love Prevented is another name for The Pleasant History of the two angry women of Abingdon. With the humorous mirth of Dick Costes and Nicholas Proverbs, two serving men (1596), the importance of which is well described by Professor Gayley: "As a comedy of unadulterated native flavour, breathing rural life and manners and the modern spirit, constructed with knowledge of the stage, and without affectation or
PORTER, Horace (1837– ), American diplomatist and soldier, was born in Huntington, Pennsylvania, on the 15th of April 1837; son of David Rittenhouse Porter (1788–1867), governor of Pennsylvania in 1839–1845, and grandson of Andrew Porter (1743–1813), an officer in the Continental Army during the War of Independence, and surveyor-general of Pennsylvania from 1809 until his death. Horace Porter studied for a year (1854) at the Lawrence scientific school of Harvard University, and then entered the United States Military Academy, where he graduated in 1860, third in his class. During the Civil War he was chief of ordnance at the capture of Fort Pulaski; then served in the Army of the Potomac until after Antietam; was transferred to the west, where he took part in the battles of Chickamauga (for gallantry in which he received a congressional medal of honour in June 1902) and Chattanooga; and in April 1864 became aide-de-camp to General Grant, in which position he served until March 1865. He earned the brevet of captain at Fort Pulaski, that of major at the battle of the Wilderness, and that of lieutenant-colonel at New Market Heights, and in March 1865 was made colonel and breveted brigadier-general. From August 1867 to January 1868, while General Grant was secretary of war ad interim, Porter was an assistant secretary, and from March 1869 to January 1873, when Grant was president, Porter was his executive secretary. He resigned from the army in December 1873, when he became vice-president of the Pullman Palace Car Company and held other business positions. From March 1897 to May 1905 he was United States ambassador to France. At his personal expense he conducted (1899–1905) a successful search for the body of John Paul Jones, who had died in Paris in 1792. For this he received (May 9, 1906) a unanimous vote of thanks of both Houses of Congress, and the privileges of the floor for life. In 1907 he was a member of the American delegation to the Hague Peace Conference. General Porter became well-known as a public speaker, and delivered orations at the dedication of General Grant's tomb in New York, at the centennial of the founding of West Point, and at the re-interment of the body of John Paul Jones at Annapolis. His publications include West Point Life (1866) and Campaigning with Grant (1897).

PORTER, Jane (1776–1830), British novelist, daughter of an army surgeon, was born at Durham in 1776. Her life and reputation are closely linked with those of her sister, Anna Maria Porter (1776–1832), novelist, and her brother, Sir Robert Ker Porter (1775–1842), painter and traveller. After their father's death, in 1779, the mother removed from Durham, their birthplace, to Edinburgh, where the children's love of romance was stimulated by their association with Flora Macdonald and the young Walter Scott. Mrs Porter moved to London, so that her son might study art, and the sisters subsequently resided at Thames Ditton and at Esher with their mother until her death in 1831. Anna Maria Porter published Artless Tales in 1793–1795, the first of a long series of works of which the more noteworthy are Walsh Cavile (1797), Octavia (1798), The Lake of Killarney (1804), A Sailor's Friendship and a Soldier's Love (1805), The Hungarian Brothers (1807), Don Sebastien (1809), Ballads, Romances and Other Poems (1811), The Relic of St John (1817), The Knight of St John (1817), The Last of St Magalen (1818), The Village of Mariendorp (1821), Rocke Blanche (1822), Honor O'Hara (1826) and Barony (1830). Jane Porter—whose intellectual power, though slower in development and in expression, was greater than her sister's—had in the meantime gained immediate popularity by her first work, Thaddeus of Warsaw (1803), which was translated into several languages and procured her election as canoness of the Teutonic order of St Joachim. In 1810, four years before the appearance of Waverley, she attempted a similar romance in her Scottish Chiefs. The story of Wallace had been a favourite one in her childhood, and she was probably well acquainted with the poem of Blind Harry (How Wallace the Minstrel). Although the book lacked historical accuracy, and the figure of Wallace is a sentimental conception of the least convincing kind, the picturesque power of narration displayed by Miss Porter has saved the story from the oblivion which has overtaken the works of most of Scott's predecessors in historical fiction. Her later works included The Pastor's Fireside (1813), Duke Christian of Lüneburg (1824), Coming Out (1828) and The Field of Forty Footsteps (1828). In conjunction with her sister she published in 1826 the Tales round a Winter Hearth. She was asserted by Miss Porter to be founded on documents placed in her hands by the author's family, but is generally regarded as pure fiction. The claim of her eldest brother, Dr William Ogilvie Porter, to its authorship rests on a memorial inscription in Bristol Cathedral, written by Jane. On the 21st of September 1832 Anna Maria died, and for the next ten years Jane became "a wanderer" amongst her relations and friends.

Robert Ker Porter had in his own way been scarcely less successful than his sisters. After two years of study at the Royal Academy he had gained reputation as a painter of altar-pieces and war battle-scenes, and was a pupil of Joseph Wright of Derby. He went to Russia as historical painter to the emperor in 1804, travelled in Finland and Sweden, where he received knighthood from Gustavus IV, in 1806, and accompanied Sir John Moore to Spain in 1808. In 1811 he returned to Russia and married a Russian princess. He was knighted by the Prince Regent in 1813. In 1817 he travelled to Persia by way of St Petersburg and the Caucasus, returning through Bagdad and western Asia Minor. He examined the riches of Persepolis, making many valuable drawings and copying cuneiform inscriptions. In 1826 he became British consul in Venezuela. His services there were recognized by a knighthood and commandship of the Order of Hanover. Accounts of his wanderings are to be found in his Travelling Sketches in Russia and Sweden (1826), Letters from Portugal and Spain (1809), Narrative of the late Campaign in Russia (1813), and Travels in Georgia, Persia, Armenia, Ancient Babylonia &c., during the years 1817–1820 (1821–1822). After leaving Venezuela (1841) he again visited St Petersburg, and died there suddenly on the 4th of May 1842. Jane Porter, who had joined him in Russia, then returned to England and took up her residence with her eldest brother at Bristol, where she died on the 24th of May 1850.

PORTER, Mary (d. 1769), English actress, was brought to the attention of Betterton by Mrs Barry, who had seen her play the Fairy Queen at Bartholomew Fair. In her company she made her first appearance in 1699, in tragedy, in which she was at her best, although she also played a long list of comedy parts. When her friends, Mrs Barry, Mrs Bracegirdle and Mrs Oldfield, had retired from the stage, she was left its undisputed queen. She died on the 24th of February 1765.

PORTER, Noah (1811–1892), American educationalist and philosophical writer, was born in Farmington, Connecticut, on the 14th of December 1811. He graduated at Yale College, 1831, and laboured as a Congregational minister in Connecticut and Massachusetts, 1836–1846. He was elected professor of moral philosophy and metaphysics at Yale in 1846, and from 1871 to 1886 he was president of the college. He edited several editions of Noah Webster's English dictionary, and wrote on education, &c. His best-known work is The Human Intellect, with an Introduction upon Psychology and the Human Soul (1868), comprehending a general history of philosophy, and following in part the "common-sense" philosophy of the Scottish school, while accepting the Kantian doctrine of intuition, and declaring the notion of design to be a priori. He died in New Haven on the 4th of March 1892.
PORT HURON, a city and the county-seat of Saint Clair county, Michigan, U.S.A., at the confluence of the St Clair and Black rivers, and at the lower end of Lake Huron, about 60 m. N.N.E. of Detroit. Pop. (1900), 14,158 of whom 7142 were foreign-born; (1910 U.S. census) 18,863. It is served by the Grand Trunk and other railways, and by steamboat lines to Chicago and other ports. A railway tunnel, 6025 ft. long, under the Saint Clair, connects the city with Sarnia, Canada. The tunnel, which has an inside diameter of 20 ft., was constructed by the Grand Trunk railway in 1889-1891 at a cost of about $2,700,000, and was designed by Joseph Hobson (b. 1834). Port Huron is laid out with wide streets, on both sides of the Black river and along the lake Front, which has attractive parks and mineral water springs, and is a summer resort. Among its buildings are the court house, the city hall, and a Modern Maccabee Temple—Port Huron being the headquarters of the Knights of the Modern Maccabees (1881), a fraternal society which, in 1910, had a membership of 107,737. Until 1908 Port Huron was the headquarters of the Knights of the Maccabees of the World (founded in 1885; 283,998 members in 1910). Port Huron has large shipping interests, and since 1866 has been the port of entry of the Huron

PORTHOPE, a town and port of entry of Durham county, Ontario, Canada, on the north shore of Lake Ontario, 63 m. N.E. of Toronto by the Grand Trunk railway, and connected with Charlotte, the port for Rochester, New York, by a daily steamboat service. The population, 5585 in 1881, shrunken in 1901 to 4188, but is increasing owing to the popularity of the town as a summer resort. It is picturesquely situated on the side and at the foot of hills overlooking the lake; and Smith's Creek, by which it is traversed, supplies abundant water-power. Trade is carried on in lumber, grain and flour. Trinity College School, a residential school, under Anglican control, has a long and creditable history.

PORT HUDSON, a village in East Baton Rouge Parish, Louisiana, U.S.A., on the left bank of the Mississippi, about 135 m. above New Orleans. At the sharp turn of the Mississippi here the Confederates in 1862 built on the commanding bluffs powerful batteries covering a stretch of about 3 m., their strongest fortifications along the Mississippi between New Orleans and Vicksburg. On the night of the 14th of March 1863 Admiral Farragut, with seven vessels, attempted to run past the batteries, commanded by Brigadier-General William M. Gardner, but four of his vessels were disabled and forced to turn back, one, the "Mississippi", was destroyed, and only two, the "Hartford" and the "Albatross" got past. General N. P. Banks's land attack, on the 27th of May, was unsuccessful, the Union loss, nearly 2000, being six times that of the Confederates. A second attack on the 14th of June, entailed a further Union loss of about 1800 men. But on the 9th of July, two days after the news of the surrender of Vicksburg, after a siege of 45 days, General Gardner surrendered the position to General Banks with about 6400 men, 50 guns, 5000 small arms and ammunition, and two river steamers. The Union losses during the siege were probably more than 4000; the Confederates losses about 800. The capture of Vicksburg and Port Hudson secured to the Union the control of the Mississippi.

PORT HURON, a city and the county-seat of Saint Clair county, Michigan, U.S.A., at the confluence of the Saint Clair and Black rivers, and at the lower end of Lake Huron, about 60 m. N.N.E. of Detroit. Pop. (1900), 14,158 of whom 7142 were foreign-born; (1910 U.S. census) 18,863. It is served by the Grand Trunk and other railways, and by steamboat lines to Chicago and other ports. A railway tunnel, 6025 ft. long, under the Saint Clair, connects the city with Sarnia, Canada. The tunnel, which has an inside diameter of 20 ft., was constructed by the Grand Trunk railway in 1889-1891 at a cost of about $2,700,000, and was designed by Joseph Hobson (b. 1834). Port Huron is laid out with wide streets, on both sides of the Black river and along the lake Front, which has attractive parks and mineral water springs, and is a summer resort. Among its buildings are the court house, the city hall, and a Modern Maccabee Temple—Port Huron being the headquarters of the Knights of the Modern Maccabees (1881), a fraternal society which, in 1910, had a membership of 107,737. Until 1908 Port Huron was the headquarters of the Knights of the Maccabees of the World (founded in 1885; 283,998 members in 1910). Port Huron has large shipping interests, and since 1866 has been the port of entry of the Huron
PORTICI—PORTLAND, EARL OF

customs district. In 1908 its exports were valued at $16,938,680 and its imports at $4,859,120. The city has shipyards, dry docks, large shops of the Grand Trunk railway, publishing houses, and manufactories of agricultural implements, steelworks, automobile bodies, foundry products, paper and pulp, and toys. In 1904 the city's factory products were valued at $4,789,589.

In 1686 the French established Fort St Joseph, a fortified trading post, which came into the possession of the British in 1761 and was occupied by American troops in 1814. The fort was renamed Fort Gratiot in honour of General Charles Gratiot (1788-1853), who was chief-engineer General H.W. Harrison's army in 1812-1814 and was chief-engineer of the U.S. Army in 1828-1838. The settlement which grew up round the fort, and was organized as a village in 1840, was also known as Fort Gratiot, and was annexed to Port Huron in 1873. The fort was abandoned during 1837-1848, during 1852-1866, and, permanently, in 1879. The earliest permanent settlement, in what later became Port Huron, was made in 1790 by several French families. This settlement, distinct from that at the fort, was first called St Rive De Lude, and, after St Dumont, in 1835, incorporated as a village in 1840 (under its present name), and chartered as a city in 1857.

PORTICI, a town of Campania, Italy, in the province of Naples, 5 m. S.E. of Naples by rail, on the shores of the bay, and at the foot of Vesuvius. Pop. (1901), 14,239. The palace, erected in 1738, is traversed by the high road. It once contained the antiquities from Herculaneum, now removed to Naples, and since 1882 it has been a government school of agriculture. There is a small harbour. Just beyond Portici, on the south east, is Resina (pop. in 1901, 20,182), on the site of the ancient Herculanenum, with a large village of inhabitants, engaged in fishing, silk-growing and silk-weaving. The town was completely destroyed by the eruption of Vesuvius in 1631.

PORTICO (Ital. for "porch", Lat. porticus), a term in architecture for the covered entrance porch to a building, which is carried by columns, and either constitutes the whole front of the building, as in the Greek and Roman temples, or forms an important feature, as the portico of the Pantheon at Rome attached to the rotunda. A circular projecting portico, such as those to the north and south transapes of St Paul's Cathedral, and that which forms the west entrance of St Mary le Strand, is known as cyclostyle. The term porticus is used to distinguish the entrance portico in an amphiprostylar or peripteral temple from that behind which is called the posticum.

PORTIÈRE, a hanging placed over a door, as its French name implies, or over the doorless entrance to a room. From the East, where doors are still rare, it came to Europe at a remote date—it is known to have been in use in the West in the 14th century, and was probably introduced much earlier. Like so many other domestic plain鲱dings, it reached England by way of France, where it appears to have been originally called rideau de porte. It is still extensively used either as an ornament or as a means of mitigating draughts. It is usually of some heavy material, such as velvet, brocade, or plush, and is often fastened upon a brass arm, moving in a socket with the opening and closing of the door.

PORT JACKSON, or SYDNEY HARBOUR, a harbour of New South Wales, Australia. It is one of the safest and most beautiful harbours in the world; its area, including all its bays, is about 15 sq. m., with a shore line of 165 m.; it has deep water in every part, and is landlocked and secure in all weathers. The entrance, two rocky promontories known as North and South Heads, is 2 m. wide between the outer heads, and narrows down to 1 m. 256 yds. The port is flanked on both sides by promontories, so that, in addition to a broad and deep central channel, there is a series of sheltered bays with small anchorages. Sydney lies on the southern shore about 4 m. from the Heads. Port Jackson is the chief naval depot of Australasia, the headquarters of the admiral's station, and is strongly fortified. The harbour has a number of islands, most of which are used for naval or government purposes—Shark Island is the quarantine station, Garden Island has naval foundries, hospital and stores, Goat Island is occupied by a powder magazine, Spectacle Island is used to store explosives, and on Cockatoo Island are important government docks. Port Jackson was discovered by Captain Phillip in 1788, though in 1770 Captain Cook, when coasting north, noticed what looked like an inlet, and named it after Sir George Jackson, one of the secretaries to the Admiralty. Captain Cook passed the harbour without recognizing its capacity; but the cliffs which guard the entrance are 300 ft. high, and no view of the basin can be seen without entering it. The Heads, which is opposite the entrance, closes it in, and it is necessary to enter, turn to the south, and then to the west before the last part of the harbour discloses itself.

PORT JERVIS, a city of Orange county, New York, U.S.A., on the Delaware river, at its junction with the Neversink, 88 m. N.W. of New York city by rail, and at the intersection of the boundary lines of the states of New York, New Jersey and Pennsylvania. Pop. (1900), 9385, of whom 995 were foreign-born; (1910 census), 9564. It is served by the Erie and the New York, Ontario & Western railways. The beauty of the scenery here, the town and its environs, and its position, made it a station in early days. At Port Jervis are situated the extensive shops of the Erie railway. Among the manufactures are wearing apparel, silk, glass, and silver ware. The value of the factory products increased from $7,000,601 in 1900 to $7,609,625 in 1905, or 64%. Port Jervis was laid out in 1826, soon after work began on the Delaware & Hudson Canal; it owes its origin to that waterway (now abandoned), and was named in honour of John Bloomfield Jervis (1770-1832), the engineer who constructed the canal, who, in 1836, was in charge of the construction of the Croton Aqueduct, and wrote Railway Property (1850) and The Construction and Management of Iron Works (1851). Port Jervis was incorporated as a village in 1853, and was chartered as a city in 1907.

PORTLAND, EARL OF, an English title held by the family of Weston from 1633 to 1688, and by the family of Bentinck from 1689 to 1716, when it was merged in that of duke of Portland. Sir Richard Weston (1577-1633), according to Clarendon "a gentleman of very ancient extraction by father and mother," was the son and heir of Sir Jerome Weston (c. 1550-1603) of Skreens, in Roxwell, Essex, his grandfather being Richard Weston (d. 1572) justice of the common pleas. A member of parliament during the reigns of James I. and Charles I., Sir Richard was sent abroad by James on two occasions to negotiate on behalf of the elector palatine Frederick V., after the murder of the duke of Buckingham, he became the principal counsellor of Charles I. In 1628 he was created Baron Weston of Neyland and in 1633 earl of Portland. Having in 1625 and 1626 had experience in the difficult task of obtaining money for the royal needs from the House of Commons, Weston was made lord high treasurer in 1628. His own inclinations and the obstacles in the way of raising money made him an advocate of a policy of peace and neutrality. His conduct was frequently attacked in parliament, but he retained both his office and the confidence of the king until his death on the 13th of March 1635. His son and heir, John (1605-1663), was implicated in plotting in the interests of Charles I. in 1643, and was nominally prisoner of Munster from 1644 to 1660. He sat in the convention parliament of 1660. He was succeeded by his son Charles (1639-1665), who was killed in a sea-fight with the Dutch off the Texel, and then by his brother Thomas (1609-1668), who died in poverty at Louvain, when the title became extinct. In 1689 it was revived by William III., who bestowed it upon his favourite William Bentinck (see below.)

Sir Richard Weston must be distinguished from a contemporary and namesake, Sir Richard Weston (c. 1579-1642), baron of the exchequer. Another Sir Richard Weston (c. 1646-1654) was a courtier and a diplomat under Henry VIII.; his son was Sir Francis Weston (c. 1511-1536), who was beheaded for his alleged adultery with Anne Boleyn. This Sir Richard had a brother, Sir William Weston (d. 1640), who distinguished himself at the defence of Rhodes in 1522, and was afterwards prior of the Knights of St John in England. A third Sir Richard Weston (1591-1652), was mainly reponsible for introducing locks on the Wey and thus making this river navigable.

Another family of Weston produced Robert Weston (c. 1515-1573), lord chancellor of Ireland from 1566 until his death on the
PORTLAND, EARL OF—PORTLAND 119

20th of May 1573. Other famous Westons were Stephen Weston (1665-1742) bishop of Exeter from 1724 until his death, and his son Edward Weston (1703-1770) the writer.

Much of the earl of Portland’s correspondence is in the Public Record Office, London. For his political career see S. R. Gardiner, History of the House of Hanover (1795), and L. von Ranke, Englische Geschichte (Eng. trans., Oxford, 1875).

PORTLAND, WILLIAM BEN TINCK, EARL OF (c. 1645-1700), English statesman, was born, according to the Dutch historian, Groen van Prinsterer, in 1645, although most of the other authorities give the date as 1649. The son of Henry Bentinck of Diepenheim, he was descended from an ancient and noble family of Gelderland. He became page of honour and then gentleman of the bedchamber to William, prince of Orange. When, in 1675, the prince was attacked by small-pox, Bentinck nursed him assiduously, and there formed for the first time the intimate friendship of William; henceforward, by his prudence and ability, he fully justified the confidence placed in him. In 1677 he was sent to England to solicit for the prince of Orange, the hand of Mary, daughter of James duke of York, afterwards James II, and he was again in England in 1683 and in 1685. When, in 1688, William was preparing for his invasion, Bentinck went to some of the German princes to secure their support, or at least their neutrality, and he was also a medium of communication between his master and his English friends. He superintended the arrangements for the expedition and sailed to England with the prince. The revolution accomplished, Bentinck was made grooms of the stole, first gentleman of the bedchamber, and a privy councilor; and in April 1689 he was created Baron Cirencester, Viscount Woodstock and earl of Portland. He commanded some cavalry at the battle of the Boyne in 1690, and was present at the battle of Landen, where he was wounded, and at the siege of Namur. But his main work was of a diplomatic nature. Having thwarted the plot to murder the king in 1696, he helped to arrange the peace of Ryswick in 1697; in 1698 he was ambassador to Paris, where he opened negotiations with Louis XIV. for a partition of the Spanish monarchy, and as William’s representative, he signed the two partition treaties. Portland had, however, become very jealous of the rising influence of Arnold van Keppel, earl of Albemarle, and, in 1699, he resigned all his offices in the royal household. But he did not forfeit the esteem of the king, who continued to trust and employ him. Portland had been loaded with gifts, and this, together with the jealousy felt for him as a foreigner, made him very unpopular in England. He received 135,000 acres of land in Ireland, and only the strong opposition of a united House of Commons prevented him obtaining a large gift of crown lands in North Wales. For his share in drawing up the partition treaties he was impeached in 1701, but the case against him was not proceeded with. He was occasionally employed on public business under Anne until his death at his residence, Bulstrode in Buckinghamshire, on the 23rd of November 1709. Portland’s eldest son Henry (1650-1724) succeeded as 2nd earl. He was created marquess of Titchfield and duke of Portland in 1716.

PORTLAND, WILLIAM HENRY CAVENDISH BEN TINCK, 3rd DUKE OF (1738-1800), prime minister of England, son of William, 2nd duke (1709-1762), and grandson of the 1st duke. His mother, Margaret, granddaughter and heiress of John Hoiles, duke of Newcastle, brought to her husband Welbeck Abbey and other estates in Nottinghamshire. He was born in the 14th of January 1738, and was educated at Oxford, where he graduated M.A. in 1757. In 1761, as marquess of Titchfield, he became M.P. for the borough of Weobly (Hereford), but in May 1762 he was called to the upper house on the death of his father. Under the marquess of Rockingham he was, from July 1765 to December 1766, lord chancellor, and on the return of Rockingham to power in April 1782 he was made lord-lieutenant of Ireland. After the short ministry of Shelburne, succeeding the death of Rockingham, the duke of Portland was selected by Fox and North as a “convenient cipher” to become the head of the coalition ministry, to the formation of which the king was with great reluctance compelled to give his assent. The duke held the premiership from 8th of April to 24th of June 1783, and the government of the just and efficient government of British India’’ caused his dismissal from office on the 17th of December following. Under Pitt he was, from 1794 to 1801, secretary of state for the home department, after which he was, from 1801 to 1805, president of the council. In 1807 he was appointed a second time prime minister and first lord of the treasury. Pitt health caused him to resign in October 1809, and he died on the 30th of that month. He owed his political influence chiefly to his rank, his mild disposition, and his personal integrity, for his talents were in no sense brilliant, and he was deficient in practical energy as well as in intellectual grasp.

He married in 1766 Lady Dorothy Cavendish (1759-1794), daughter of the 4th duke of Devonshire, and was succeeded as 4th duke by his son William Henry (1768-1854), who married a daughter of the famous gambler, General John Scott, and was brother-in-law to Canning. His son, the 5th duke, William John Cavendish Bentinck-Scott (1800-1879) died unmarried. He is notable for having constructed the underground halls at Welbeck Abbey, and for his retiring habits of life, which gave occasion for some singular stories. He was succeeded by his cousin William John Arthur Charles James Cavendish-Bentinck (b. 1857) as 6th duke.

PORTLAND, the largest city of Maine, U.S.A., the county seat of Cumberland county, and a port of entry, on Casco Bay, about 115 m. by rail N.N.E. of Boston. Pop. (1890), 36,425; (1900), 50,145, of whom 34,978 were born in Maine, 3125 in the other New England states, 4476 in Canada, and 3273 in Ireland, and 291 were negroes; (1910 census) 58,571. Portland is served by the Maine Central, the Boston & Maine, and the Grand Trunk railways; by steamboat lines to New York, Boston, Bar Harbor, Saint John, N.B., and other coast ports, and, during the winter season, by the Allan and Dominion transatlantic lines. It is connected by ferry with South Portland.

1 Public interest centred for some years round the allegation that he lived a double life and was identical with Mr T. C. Druce, an upholsterer of Baker Street, London, who, in 1851, married Annie May. The ‘Druce case,’ involving a claim to the title and estates, by a younger brother of Samuel Druce (the 1st Duke by Ann May) on behalf of his son, aroused much attention from 1897 to 1908. The Duke of Portland was undoubtedly buried in Kensal Green cemetery in 1879. ‘Druce,’ on the other hand, was supposed to have died in 1864 and been interred in Highgate cemetery, his will bequeathing over £70,000 in personal estate. Mrs Druce’s claims had two aspects, both as involving the revocation of probate of T. C. Druce’s will, and also as identifying Druce with the Duke of Portland. But her application to have the grave in Highgate opened (with the object of showing that the coffin there was empty), though granted by Dr Tristram, chancellor of the diocese of London, was treated as case being taken up independently by Mr G. H. Druce as the representative of this family, from 1903 onwards. A company to finance his case was formed in 1903, and in the autumn of 1907 he instituted proceedings for perjury against Mr Herbert Druce, T. C. Druce’s younger son and executor, for having sworn that he had seen his father die in 1864. Sensational evidence of a mock burial was given by an American minister accustomed to black mass ceremonies, who it was agreed that the grave at Highgate should be opened. This was done on December the 30th, and the body of Mr T. C. Druce was then found in the coffin. The charge of perjury at once collapsed and was withdrawn by Dr Tristram, the Druce case being definitely putting an end to the story of an identity between the two men.
PORTLAND

The hilly peninsula, to which Portland was confined until the annexation of the town of Deering in 1899, is nearly 3 m. in length by about 1 m. in average width; at its east end is Munjoy Hill, so named by early settlers, and the point of land is slightly higher. Portland's total land area is about 21\(^2\) sq. m. The scenery in and about the city is noted for its picturesqueness, and this, with its delightful summerclimate and historic interest, attracts a large number of visitors during the summer season.

Munjoy Hill commands a fine view of Casco Bay, which is overlooked by other wooded heights. There is excellent yachting in the bay, which contains many beautiful islands, such as Peaks and Cushing's islands. Bramhall Hill commands an extensive view west and north-west of the bay, the mainland, and the White Mountains some 80 m. distant.

The city's park system includes the Western Promenade, on Bramhall Hill; the Eastern Promenade, on Munjoy Hill; Fort Allen Park, at the south extremity of the latter promenade; Fort Sumner, another small park farther west, on the same hill; Lincoln Park, containing 23 acres of beautiful grounds near the centre of the city; Deering's Oaks (made famous by Longfellow), the principal park (90 acres) on the peninsula, with many fine old trees, pleasant drives, and a grove of oaks for the shade of the summer, and Boothby Square. There are many pleasant drives along the shore of the bay or the banks of rivers, and some of these lead to popular resorts, such as Riverton Park, on the Presumpscot; Cape Elizabeth, on the south of the harbour; and Falmouth Foreside, bordering the inner bay.

The streets of Portland are generally well paved, are unusually clean, and, in the newer districts, are fire laid with the finest tar, or the old horse-hair, profusely shaded by elms and other large trees—Portland has been called the "Forest City." Congress Street, the principal thoroughfare, extends along the middle of the peninsula northward from the waterfront to the railroad, passing in the middle of its course through the shopping district.

In Portland's architecture, both public and private, there is much that is excellent; and there are a number of buildings of historic importance, at the State House Exchange and other city streets, is of white Vermont marble and has a Corinthian portico. The granite Customs House, extending from Fore Street to Commercial Street, is large and massive. The Public Library building is Romanesque and elaborately ornamented; the building was presented to the city by James F. Baxter; in the library is the statue, by Benjamin Paul Aker (1825-1861), of the dead pearl-diver, well known from Hawthorne's description in The Marble Faun; the Cumberland County Court House, of white Maine granite, occupies the block bounded by Federal, Pearl, Church and Newbury streets; immediately opposite (to the south-west) is the Federal Court building.

On the 21st of July, 1863, Portland was severely stricken by a destructive fire which, it is estimated, did $15,000,000 worth of damage. There are a few remaining ruins of the Pembroke School, on Munjoy Hill, erected in 1807 to detect approaching vessels, rises 222 ft. above tide-water. In Monument Square, the site of a battery in 1775 is a soldiers' and sailors' monument (1889), a tall granite pedestal surmounted by a French woman carved by Francis J. Bouchard, at the corner of State Street is a statue of Henry W. Longfellow by the same sculptor; and where Congress Street crosses the Eastern Promenade, a monument of George W. Peabody (1818-1891), the philanthropist.

On the Western Promenade there is a monument to Thomas Brackett Reed, who was a native and a resident of Portland. On Congress Street, below the Observatory, is the Eastern Cemetery, the oldest burying ground of the city; in it are the graves of Commodore Edward Preble, and of Captain Samuel Blythe (1784-1813) and Captain William Burroughs (1785-1813), who were killed in the engagement between the British brig Boxer and the American brig Enterprise," their respective ships, off this coast on the 5th of September 1813. The cemetery also contains monuments to Alonzo P. Stinson, the first soldier from Portland killed in the Civil War, to the Portland soldiers in the War of Independence, and to the Portland students of the American Missionary Association.

Among the churches are the Cathedral of the Immaculate Conception (Roman Catholic), with a spire 326 ft. high; and St. Luke's (United Presbyterian) Cathedral fire, in the Clark Church (Congregational), in Thomas Street, the Young People's Society of Christian Endeavor was founded in 1889 by the Rev. Francis E. Clark, then pastor of the church. The finest residence dwelling house in Portland is the Wadsworth-Longfellow House, in 1820 to 1832 and in the latter year was chartered as a city. In 1886 a large central portion of the city, about 200 acres, was destroyed by a fire resulting from a Fourth of July celebration. Portland was the birthplace of Henry Wadsworth Longfellow, Thomas Brackett Reed, Edward Preble and his nephew George Henry Preble, Mrs Porton ("Fanny Fern"); Nathaniel Parker Willis, Seargent Smith Prentiss and Neal Dow, and it was the home of William Pitt Fessenden, Theophilus Parsons and Simon Greenleaf.

The first permanent settlement on the peninsula was established by George Clevee and Richard Tucker at the foot of Munjoy Hill in 1633 immediately after they had been ejected from land which they had claimed at the mouth of the Spurwink. Soon the hill at the east end became the property of George Munjoy and that at the west end the property of George Bramhall. The Indian name of the peninsula was Macoghonne, and the new settlement was during the next few years known by various names, such as Casco, Casco Neck, Clevee's Neck, and Munjoy's Neck. In 1858 Massachusetts extended its jurisdiction over this part of Maine. The peninsula, with considerable neighbouring territory and Cape Elizabeth, was organized as a town in 1718 and was named Falmouth. The town suffered so severely from the Indians in 1679 that it was deserted until 1768. It was attacked in 1689, and in 1690 it was utterly destroyed by the French and Indians, and remained desolate until after the Treaty of Utrecht in 1713. When the inhabitants were allowed to return then in 1774 the bell of the old First Parish Church (Unitarian) of Portland (built 1740; the present building dates from 1825) was muffled and rung from morning till night, and in other ways the town showed its sympathy for the patriot cause. As a punishment, on the 18th of October 1775, the town was bombarded and burned by a British fleet. The peninsula portion of Falmouth was incorporated as a distinct town in 1786 and was named Portland. Portland was the capital of the state from 1820 to 1832 and in the latter year was chartered as a city. In 1886 a large central portion of the city, about 200 acres, was destroyed by a fire resulting from a Fourth of July celebration. Portland was the birthplace of Henry Wadsworth Longfellow, Thomas Brackett Reed, Edward Preble and his nephew George Henry Preble, Mrs Porton ("Fanny Fern"); Nathaniel Parker Willis, Seargent Smith Prentiss and Neal Dow, and it was the home of William Pitt Fessenden, Theophilus Parsons and Simon Greenleaf.

PORTLAND, a city, port of entry and the county-seat of Multnomah county, Oregon, U.S.A., on the Willamette river, near its confluence with the Columbia, about 120 m. by water from the Pacific, 186 m. by rail S.S.W. of Seattle and about
PORTLAND, ISLE OF—PORTLANDIAN

772 m. N. of San Francisco. Pop. (1850), 46,385; (1900), 90,426, of whom 25,876 were foreign-born (6943 Chinese); (1910 census) 207,214. Portland is served by the Northern Pacific, the Southern Pacific, the Canadian Pacific, the Great Northern and other railways, by transpacific vessels to Hong-Kong and Yokohama, by coast-wise vessels to San Francisco, to ports on Puget Sound, in British Columbia, and in Alaska, and by river boats sailing 100 m. farther up the Willamette and up the Columbia and the Clearwater to Lewiston, Idaho. The city is built on both sides of the river (which is crossed by five bridges), and covers about 44 sq. m. On the western side the ground rises gradually for a distance of 2 to 10 m., and then rises abruptly 500-1000 ft. to "Portland Heights" and "Council Crest," beyond the mouth-broken surface of which rises the Coast range; on the eastern side a slightly rolling surface extends to the foot-hills of the Cascade Mountains. From "Portland Heights" there are fine views of the Columbia and Willamette valleys, and, particularly, of the snow-clad summits of Mt Hood, Mt Jefferson, Mt St Helen's, Mt Adams and Mt Rainier (or Tacoma). In the residence districts (King's Hill, Nob Hill, Portland Heights, Willamette Heights, Hawthorne Avenue, &c.) are pleasantly shaded streets, and grounds decorated with shrubs, especially roses, which sometimes bloom as late as January—an annual "Rose Festival" is held here in June. The city has 205 acres in parks and numerous beautiful drives. It has a fine climate, the mean temperature during the winter months from 1874 to 1903 was 41°F.; the mean summer temperature for the same period 69°F. For the year ending the 31st of May 1900 the death-rate was reported to be only 0.9 per 1000, and in 1907 to be only 8-28 per 1000. The city's water is brought through a pipe 90 miles from Bull Run river, which is fed by Bull Run Lake at an elevation of more than 300 ft. in the Cascade Mountains.

Among the prominent buildings are the Court House; the City Hall, containing the rooms of the Oregon Historical Society; the Customs House; the Protestant Episcopal Cathedral; the Public Library (with 75,000 volumes in 1908); several tall office buildings with frames of steel; and the Art Museum (1905). There are large grain elevators and miles of wharfs and docks. Among educational institutions are the law and medical departments of the University of Oregon, (1901) and Columbia University (Roman Catholic, 1901). The Oregonian, which was established here in 1850, is one of the most influential newspapers on the Pacific Slope.

The harbour is accessible for vessels of 26 ft. draught and the city's leading industry is the shipment by water and by rail of fish (especially salmon) and of the products (largely lumber, wheat and flour) of the numerous breakwater and wharf industries of which Portland is the most important jobbing centre. The value of the exports in 1908 amounted to $16,652,850 and the value of the imports to $2,937,515; the foreign trade is chiefly with Great Britain and its possessions, and the principal exports, which are preparing and packing salmon, silk, tea and manila and other fibres. Portland is the principal manufacturing city of the state. The total value of its factory products in 1905 was $28,651,321. The principal manufactures were lumber and timber products ($3,577,465) and flour and gist mill products ($2,712,735); other important manufactures were packed meat, planing-mill products, foundry and machine-shop products, railway cars (repair and manufacture), covered and wine and canned and preserved fish (salmon), oysters and fruits and vegetables.

Portland, named after Portland, Maine, was founded in 1845 by two real-estate men from New England, and was charted as a city in 1851. Its early growth was promoted by the demand for provisions from California soon after the discovery of gold there, and although a considerable portion was swept by fire in 1873 the city had a population of nearly 20,000 before railway communication with the East was established by the Northern Pacific in 1883. East Portland and Albina were annexed to the city in July 1891. The Lewis and Clark Centennial Pacific Exposition and Oriental Fair was held in Portland in 1893. The exhibition buildings, at the suggestion of Meriwether Lewis and William Clark to this region in 1805. The forestry building, 205 ft. long by 108 ft. wide and built of logs of Oregon fir 6 ft. or more in diameter and 54 ft. long, and a building devoted entirely to the subject of irrigation, were of unusual interest. The forestry building is now maintained as a museum chiefly for timber and timber products.

PORTLAND, ISLE OF, properly a peninsula of the coast of Dorsetshire, England, as a prolongation of a narrow ridge of shingle, Chesil Bank (q.v.), connects it with the mainland. Pop. (1901), 15,626. It is 4 m. long and nearly 12 in extreme breadth, with an area of about 45 sq. m. The shores are wild and precipitous, and Portland is inaccessible from the sea except towards the south. The highest point, close upon 500 ft., is the Verne hill in the north. Wave action is seen in the numerous coves, and south-east of Portland Bill, the southern extremity of the isle, is a bank called the Shambles, between which and the land there flows a dangerous current called the Race of Portland. A raised beach is seen at Portland Bill. The substratum of the island is Kimeridge Clay, above which rests beds of sand and strata of Oolitic limestone, widely famed as a building stone. Extensive quarries, which are Crown property, have supplied the materials for St Paul's Cathedral and many other important public buildings. In the "dirt-bed" resting upon the Oolitic strata numerous specimens of petrified wood are found, some of great size. The soil, though shallow, is fertile, and mutton fed on the grass has a peculiar rich flavour. Owing to the frequent heavy gales and stormy weather, the chief occupation is fishing and agriculture. Several curious local customs are retained by the inhabitants. A joint railway of the Great Western and London & South Western companies runs south from Weymouth to Portland (44 m.) and Easton (3½ m.) on the island. The line contains a convict prison with accommodation for about 1500 prisoners. Portland Castle, built by Henry VIII. in 1520, is generally occupied by the commander of the engineers or of the regiment stationed on the island. On a rock on the eastern side are remains of a more ancient fortress, Bow and Arrow Castle, ascribed to William Rufus.

A harbour of refuge, begun in 1857 under the direction of the Admiralty, was completed a few years later. A breakwater stretching in a northerly direction from the north-east corner of the island partially enclosed a large area of water naturally sheltered on the south and west. An inner arm ran nearly east from the island and terminated in a masonry head and fort, and an outer detached arm bent to the north and terminated in a circular fort, a narrow entrance for shipping being left between the two. It was formed of a rubble mound quarried by convict labour at the summit of the island, and was lowered by a wire-cable incline to the sea. The harbour thus made was open on the north to Weymouth and the Channel, but the necessity for greater protection from torpedo boats led to its adviser by the Naval Works Acts of 1895 and subsequent years sanctioned works for closing the gap—about 2 m. long—between the end of the outer breakwater and the Bincleaves rocks near Weymouth, and their popularization of these rocks for coast purposes. The Bincleaves shore is and about 4645 ft. long, while from its extremity the other, about 4405 ft. long, stretches in a south-east direction towards Weymouth, passages for navigation about 480 ft. wide. The breakwater is of stone, the shore and new structures also consist of rubble mounds. The defensive harbour thus completely enclosed has an area of 2200 acres to the one-fathom line, of which 1500 acres have a depth of not less than 30 ft. at low water. There is no dockyard at Portland, but the watering and cooling arrangements for the supply of the fleet are of considerable importance. There is a coaling jetty and wharf for the storage of both sea-borne and land-borne coal, with hydraulic appliances for handling it. The harbour and island are strongly fortified.

The island of Portland is not mentioned in the time of the Romans. In 833 it was the scene of an action against the Danes, and in 1052 it was plundered by Earl Godwine. In 1643 the parliamentary party made themselves masters of the island and castle, but shortly afterwards these were regained by the Royalists through a clever stratagem, and not recovered again by the forces of the parliament till 1646.

PORTLANDIAN, in geology, a subdivision of the Upper Jurassic system that includes the strata lying between the Kimmeridge beds and the Purbeck beds. The rocks of Portland, as exposed on the isle of Portland, Dorsetshire, where they have been quarried for more than 200 years. J. Mitchell appears to have been the first to use the term "Portland lime" in geologic literature (1768); T. Webster spoke of the "Portland Oolite" in 1812. In England the strata are very variable; the upper part consists principally of limestones, shelly, oolitic or
PORTLOCK—PORTMANTEAU

compact, or in places very closely resembling chalk (Upway, Portisham, Brill, Chilmark). Nodules and layers of chert are well developed in some of the limestones of Dorsetshire and elsewhere; and a silicified oolite occurs near St Albans' Head. About Swindon, beds of sand are common in the Upper Portland beds with layers of calcareous sandstone (Swindon stone). Many of these beds occur also in the Cenomani of Corfu and Minorca, and a portion is usually sandy and shows a gradual passage into the underlying Kimmeridge Clay.

W. H. Fitton in 1827 gave the name "Portland Sand" to this division. The Upper Portlandian in Dorsetshire is 130-170 ft. thick; the Lower Portlandian in the same district is 100-120 ft. These rocks crop out from South Dorsetshire into Wiltshire, Oxfordshire and Buckinghamshire, and possibly extend beneath younger rocks into Bedfordshire and Cambridgeshire. They have been proved by borings in Sussex and Kent, and in Yorkshire they are represented by part of the Speeton Clays, and in Lincolnshire by part of the Spilaby Sand. At Swindon and Aylesbury a conglomeratic layer with small pebbles of lydite and phosphatized fossils lies at the base of the Portland Stone.

The Upper Portlandian of England is characterized by the ammonite Periophinctes giganteus, along with Cyttheria (Cyrena) rugosa, Trigonia gibbosa, Periophinctes bolomensis and Trigonia incurva as subzonal forms. Ooloceras gigas is the zonal ammonite in the Lower Portlandian, associated with Trigonia Pellai, Cyprina Bronquii, Exogyra brantrumata and Astoria Saemanni as subzonal indices. Other characteristic fossils are Cerithium portlandicum, the casts of which form the familiar "Portland screw," Iastraec oblonga, the Chelonia Stegoechelys; the cretaceous system of north-west Germany includes the Eimbeckhausen Plattenkalk and the Lower Portland Kalk. Oppel's "Tithonian" (tithonic) division, embracing Upper Kimmeridge beds, Portlandian and Purbeckian beds in the Alpine district, is now recognized as a deeper water deposit of this time with many points of resemblance to the Russian development to which the name "Volgian" has been applied by S. Nikitin. The Portlandian beds of Yorkshire are more nearly related to the Volgian phase than to the beds of the same age in the south of England. The term Bono-

PORTLOCK, JOSEPH ELLISON (1794-1864), British geologist and soldier, the only son of Nathaniel Portlock, captain in the Royal Navy, was born at Gosport on the 30th of September 1794. Educated at the Royal Military Academy he entered the Royal Engineers in 1813. In 1814 he took part in the front operations in Canada. In 1824 he was selected by Colonel (afterwards Major-General) T. F. Colby (1784-1852) to take part in Ordnance Survey of Ireland. He was engaged for several years in the trigonometrical branch, and subsequently compiled information on the physical aspects, geology and economic products of Ireland. In 1837 he formed at Belfast a geological and statistical office, a museum for geological and zoological specimens, and a laboratory for the examination of soils. The work was then carried on by Portlock as the geological branch of the Ordnance Survey of Ireland, and the chief results were embodied in his Report on the Geology of the County of Londonderry and of parts of Tyrone and Fermanagh (1843), an elaborate and well-illustrated volume in which he was assisted by Thomas Oldham. After serving in Corfu and at Portsmouth he was, in 1849, appointed Commanding Royal Engineers to the 1st and 2nd Line of Defences on Corfu by the Inspector of Studies at the Royal Military Academy, Woolwich. For a short time commanding officer at Dover, when the Council of Military Education was formed in 1857 he was selected as a member.

During these years of active service he contributed numerous geological papers to the scientific societies of Dublin and to the British Association. He published in 1848 a useful treatise on geology in Weale's "Rudimentary Series" (3rd. ed., 1853). He was president of the geological section of the British Association at Belfast (1852), and of the Geological Society of London (1856-1858). He wrote a Memoir of the late Major-General Colby, with a Sketch of the Origin and Progress of the Trigonometrical Survey (reprinted in 1866 from Papers on Subjects connected with the Royal Engineers, vols. iii.-v.). He also contributed several articles on military subjects to the 8th edition of the Encyclopaedia Britannica. He was elected a Fellow of the Royal Society in 1837. He died in Dublin on the 14th of February 1864.

PORT MAHON, or MAHON (Spanish Puerto Mahón), the capital and principal seaport of Menorca, in the Spanish province of the Balearic Islands. Pop. (1900), 17,144. Port Mahon is situated on the east coast, at the head of a deep inlet which extends inland for 3½ m. It is an important harbor (see Menorca). The city occupies a picturesque hill, and presents a fine appearance from the sea; it is solidly built of excellent stone. Many of the houses date from the British occupation, which has also left curious traces in the customs and speech of the people. The King's Island (Isla del Rey, so called as the landing-place of Alphonso III. of Aragon in 1287) contains a hospital built by the admiral of the British squadron in 1722; farther south-east on the shore is the village of Villa Carlos or George Town, with ruins of extensive British barracks; and at the mouth of the port, on the same side, are the remains of Porte San Felipe, originally erected by Charles V. and twice the scene of the capitulation of British troops. Opposite San Felipe is the easily defended peninsula of La Mola (256 ft. high), which is occupied by extensive Spanish fortifications. Mahon is one of the principal quarantine stations of Spain; the lazaretto, erected between 1798 and 1803, stands on a long tongue of land, separated from La Mola by the inlet of Cala Taulera. The principal modern buildings are the military and naval hospitals, the theatre, museum, library and schools. There are an arsenal and extensive quays. From its position on the route of vessels plying between Algeria and the south of France, the harbour is much frequented by French cargo-steamers; it is also a Spanish naval station. The principal exports are grain, live stock and fruit; cement, coal, iron, machinery, flour, raw cotton and hides are imported. Ships and cotton and woolen goods are manufactured. About 250 vessels enter the port every year, and the annual value of the foreign trade is, approximately, £200,000 to £250,000.

Mahon is the ancient Portus Magonis, which under the Romans was a municipium (Mun. flavium magonatum), probably including the whole island under its authority. As the name suggests, it had previously been a Carthaginian settlement. The Moors, who occupied Menorca in the 8th century, were expelled by James I. of Aragon in 1232. In 1487 the British, under Admiral Blake, captured the town and castle; and in 1555 it was sacked by a corsair called Piali. The British, who under James Stanhope, afterwards Earl Stanhope, seized the island in 1708, made Mahon a flourishing city, and in 1756 it passed it as a free port. In 1756 it fell into the hands of the French through the failure of Admiral Byng to relieve the garrison of St Philip's (San Felipe). Restored to the British in 1762, it was in 1763 heroically but unsuccessfully defended by General Murray. In 1802 it was finally ceded to Spain by the treaty of Amiens.

PORTMANTEAU, a leather case or trunk for carrying articles of personal use when travelling. The typical portmaneau of
PORTO ALEGRE—PORTO MAURIZIO

123

the present day has two compartments which, fastened at the back by hinges, close together like a book. The original portmanteau (adopted from Fr. portemanteau, porter, to carry, manteau, cloak, mantle) was a flexible round leather case to hold a cloak or other garment and of such a shape as could conveniently be carried on a rider's saddle. In French the word was applied to a robustly built, elaborately carved (and very valuable) chest, as by C. L. Dodgson ("Lewis Carroll") in Through the Looking Glass ("The Song of the Jabberwock") used the expression "portmanteau word" of an invented word composed of two words run together and supposed to convey humorously the combined meaning: thus "slithy" conveys slimy and lithe; "misymy," flimsy and miserable.

PORTO ALEGRE, a city and port of Brazil, capital of the state of Rio Grande do Sul, at the northern extremity of Lagoa dos Patos on the eastern shore of an estuary called Rio Guayuba, about 160 m. from the port of Rio Grande do Sul at the entrance to the lake. The population which contains a large foreign element, chiefly German and Italian, was returned as 73,754 by the census of 1900, including some outlying districts not within urban limits. The município (commune), which has an area of 931 sq. m., had a population of nearly 100,000, including a large number of prosperous colonists. The railway from Porto Alegre to Novo Hamburgo and Taquara (55 m.) affords an outlet for some of the older German colonies. The railway from Porto Alegre to Uruguay is completed from Margem da Taquara to Cacequi, 232 m. Its starting point, Margem da Taquara, is about 50 m. from the city, with which it is connected by river steamers. An extension of the railway is projected from Margem and Taquara Barracks. One of the best-known steamer (1785) was a small vessel of 780 tons, the Mercurio, which is still in service.

The city occupies a tongue of land projecting into the estuary, and extends along its shores and back to a low wooded hill. From the site, as seen from the water, is attractive, though its larger part is an almost level plain. There are pleasant suburbs along the shore and on the banks of the River Guaíba. (M. do Vento, i.e. "Windmills," Navigantes and Partenon). The climate is tropical, cool and bracing in winter but insufferably hot in summer. The mean annual temperature is slightly under 69°F., the average maximum is 84° and the average minimum 55°. The annual rainfall is about 30 in. The city is regularly laid out with broad, straight, well-paved streets, in great part lined with shady trees. The waterfront streets, however, follow the curve of the beach. There are several public squares and gardens, the more important being the Praça Harmonia, the Praça d'Alfandega, Praça da Independencia and the Parque, where an exposition was held in 1901. The public water supply is drawn from a range of hills 6 m. distant and is considered good. Porto Alegre, like many Brazilian cities, is in a transition stage, and handsome new structures of French and Italian styles rise from among the low, hovels of modern daytime. Old stone and broken arches are chiefly used in the walls, which are plastered inside and tinted. Tiles are used for roofing, and on modern edifices stucco ornamentation is lavishly employed. The most noteworthy public buildings are the Cathedral (Porto Alegre being the see of a Roman Catholic bishop), the handsome church of Nossa Senhora das Dores, the municipal palace, school of engineering, government palaces, declarative halls, school of medicine, atheneum, normal school and public school institute. One of the most notable edifices—that of Caridade—is the largest in the state. The city is the chief commercial centre of the state and has shipyards for the construction of vessels. It manufactures cotton cloth, woolen cloth, boots and shoes, iron safes and stoves. Porto Alegre is a large city, with a population of 120,000.

Porto Alegre was founded in 1743 by immigrants from the Azores and was at first known as Porto dos Cazes. Owing to the occupation of the southern part of the capitany by the Spaniards, Governor Jose Marcelino de Figueiredo selected this village in 1770 as his official residence and gave to it the name it now bears. It was made a villa in 1803, and in 1807, when Rio Grande do Sul was made a captaincy-general, the transfer of the capital from Rio Grande to Porto Alegre was officially recognized. In 1822 it was raised to the rank of a city, and in 1841, as a reward for its loyalty in revolutionary wars of that province, it was distinguished by the title of leal e valorosa (faithful and valiant). The German immigrants to settle near Porto Alegre arrived in 1825, and much of its prosperity and commercial standing is due to the German element.

PORTOCARRERO, LUIS MANUEL FERNANDEZ DE (1635-1709), cardinal archbishop of Toledo, was a younger son of the marquis of Almenara and was born on the 8th of January 1635. He became dean of Toledo early, and was made cardinal on the 5th of August 1669. Till 1677 he lived at Rome as cardinal protector of the Spanish nation. In 1677 he was appointed interim vicarry of Sicily, counsellor of state and archbishop of Toledo. He ceased to be viceroy of Sicily in 1678. As archbishop of Toledo he exerted himself to protect the clergy from the obligation to pay the excises or octrois duties known as "the millions" and thereby helped to perpetuate the financial embarrassments of the government. His position rather than any personal qualities enabled him to play an important part in a great crisis of European politics. The decree King Charles II. was childless, and the disposal of his inheritance became a question of great interest to the European powers. Portocarrero was induced to become a supporter of the French party, which desired that the crown should be left to one of the family of Louis XIV., and not to a member of the king's own family, the Habsburs. The great authority of Portocarrero as cardinal and primate of Spain was used to persuade, or rather to terrify the unhappy king into making a will in favour of the duke of Anjou, Philip V. He acted as regent till the new king reached Spain and hoped to be powerful under his rule. But the king's French advisers were aware that Spain required a thorough financial and administrative reform. Portocarrero could not see, and indeed had not either the intelligence or the honesty to see, the necessity. He was incapable, obstinate and perfectly selfish. The new rulers soon found that he must be removed and he was ordered to return to his diocese. When in 1706 the Austrian party appeared likely to gain the upper hand, Portocarrero was led by spite and vexation to go over to the Austrians. Fortune changed, he returned to his allegiance to Philip V., and as the government was about to offend the Church he escaped banishment. In 1709 when Louis XIV. made a pretence of withdrawing from the support of his grandson, the cardinal made a great display of loyalty. He died on the 14th of September and by his orders the words Hic jacet pulvis, civitis, ei nihil were put on his tomb.

See Lord Stanhope, History of the War of Succession in Spain (London, 1832).

PORTO FARINA, a town of Tunisia about 20 m. E. of Bizerta, on the Gharr-el-Mela, a lagoon, also known as the Lake of Porto Farina, at the mouth of the Mejerda (the ancient Bagradas). Porto Farina was the naval arsenal of the piratical bays of Tunis and was bombarded by the English under Admiral Blake in 1655. The lagoon has become very shallow in consequence of the silt brought down by the Mejerda. The town has ceased to be important, and its inhabitants have dwindled to about 1500. The ruins 10 m. to the south-west, near the village of Bu Shater, are identified with the ancient Utica (q.v.).

PORTO MAURIZIO, a city of Liguria, Italy, the capital of the province of Porto Maurizio, on the coast of the Ligurian Sea, 46 m. by rail E. of Nice and 70 m. S.W. of Genoa, 115 ft. above sea-level. Pop. (1901), 7,007. It consists of a picturesque old town on the heights and a modern town of villas on the lower slopes. The principal church is dedicated to Gaetano Cantone, a large structure of 1780 with a dome, rebuilt in 1833. A few remains of the old city walls may be seen. About 2 m. north-east of Porto Maurizio is the town of Oneglia, with a fine church, S. Giovanni Battista, designed by Gaetano Amoretti, a hospital (1785) and a large prison. It suffered considerably from the earthquake of 1887. Maurizio and Oneglia lie on the same bay
and both have small but safe harbours, both are frequented for sea-bathing, and both are embowered amid olive groves; and the district is famous for the quality of its oil. The two towns together form one commune, called imperia, which had a population of 2,011 in 1907.

Porto Maurizio appears as Portus Mauri in the Maritime Itinerary. After being subject to the marquises of Turin (11th century) and of Clavesana, it was sold by Boniface of Clavesana in 1288 to Genoa in return for a yearly payment; in 1334 it became the seat of the Genoese vicar of the western Riviera, and remained in the possession of the republic till it was merged in the kingdom of Sardinia. Oneglia, formerly situated inland at the place called Casalmauro, has occupied its present site since 1395. The bishops of Albenga sold it in 1298 to the Doria of Genoa, who in their turn disposed of it in 1576 to Emanuil Philibert of Savoy. In the wars of the house of Savoy Oneglia often changed hands. In 1614 and 1649 the Spaniards and in 1623 and 1722 the Genoese obtained possession; in 1692 it had to repulse an attack by a French squadron; in 1744-1745 it was again occupied by the Spaniards, and in 1792 bombarded and burned by the French. Pellegro Amoretti, assistant secretary to Charles V., and Andrea Doria, the famous admiral, were natives of Oneglia. See G. Donaia, Storia di Porto Maurizio (1889).

PORTO NOVO, a town of British India, on the Coromandel coast in the South Arcot district of Madras. Pop. (1901), 13,712. The English began trading here in 1683, when they found both the Danes and the Portuguese already established. They fought a gallant battle for the town in July 1781, in which Sir Eyre Coote with 8000 men defeated Hyder Ali with 60,000 and saved the Madras presidency. In 1830 an attempt, finally unsuccessful owing to the lack of fuel, was made to smelt iron from the ores found in the vicinity.

PORTO-RICHE, GEORGES DE (1840- ), French dramatist, was born at Bordeaux. When he was twenty his pieces in verse began to be produced at the Parisian theatres; he also wrote some books of verse which met with a favourable reception, but these early works were not reprinted. In 1898 he published Théâtre d’amour, which contained four of his best pieces, La Chambre d’Infante, L’Histoire, L’Amérique, and the title given to this collection indicates the difference between the plays of Porto-Riche and the political or sociological pieces of many of his contemporaries. In Germaine, the passionate and exciting heroine of Amoureuse, Mme Réjane found one of her best parts. In Les Maléfices (Odéon, 1904), also a drama of passion, the characters are drawn from the working classes.

PORTO RICO, or PUERTO RICO ("Rich Harbour"), an island of the United States of America, the most easterly and the fourth in size of the Greater Antilles, situated between 17° 30' and 18° 30' N., and between 65° 30' and 67° 15' W., about 70 m. E. of Haiti, and 500 m. E. by S. of Cuba. About two-thirds of the island is from 30 to 60 m. wide, near the west end, and somewhat narrower towards the east end, and has an area of 3435 sq. m.

Physical Features.—A range of mountains, varying in height from 2000 ft. to about 3750 ft. on El Yunque Peak in the north-east corner, traverses the island from west to east and descends abruptly to the sea at each end. The south slope rises precipitously from the foothills; the north slope is more gradual, but it is much broken by rugged spurs and deep gorges. On the north there is little coastal plain except at the mouths of rivers, but on the south there is a plain of extensive alluvium, the remains of eroded foothills. The water parting is about twice as far from the north coast as it is from the south coast; the rainfall is greater on the north slope, and the principal rivers—Rio Loro and Rio Hanle in the west, Rio Mame and Rio Arobe in the north side. There are eight other rivers on the same side, seventeen on the south side, six at the east end and four at the west end, besides more than 1200 smaller streams, and the deep valleys cut by the streams add to the broken surface of the country. None of the rivers is navigable for more than a mile or two from the coast. The coast-line has few indentations sufficient to afford safe harbours; the smallest is that of Vieques off the island of Vieques (21 m. long and 6 m. wide), and the smaller and nearer barren island of Scalty, and the island of Mona, covered with deposits of guano, off the west coast, and navigable for small craft only.

Fauna.—The native fauna is scarce. The agouti and the armadillo are practically extinct and the only other mammals are ground squirrels, rats, a few other small rodents, and bats. A huge land-turtle is peculiar to the island. Reptiles are scarce, and venomous reptiles unknown. Noxious insects are less numerous than is usual in tropical countries. There are no large game birds, but song birds and doves are numerous on the mountains, and flamingoes and other water-birds frequent the coast. There are a few species of fresh-water fish, but food-fishes are scarce both in the rivers and along the coast.

Flora.—The flora is beautiful and varied. The more rugged districts and higher elevations are clad with such tropical forest trees as ebony, Spanish cedar, sandalwood, rosewood and mahogany. There are several species of palms, flowering trees, trees with beautifully coloured foliage, tree ferns, resinous trees and trees bearing tropical fruits. There are about thirty species of medicinal plants, twelve used for confinements, and twelve for dyestuffs and tanning. In the semi-arid districts on the south slope of the mountains the flora consists chiefly of dry grasses, acacias, yuccas and cactuses.

Climate.—The climate is somewhat more healthy than that of the other chief East Indian islands. The temperature is moderated by the north-east trade winds, which, somewhat modified by local conditions, blow throughout the year, briskly during the day and more mildly during the night. It rarely reaches 100° F. or falls below 50°, and the mean annual temperature is about 80° (75° in January, 84° in August). The mean daily variation at San Juan is 11°; on the mountains the mean daily variation is 25°. The average annual rainfall on the north-east coast, at the foot of El Yunque Mountain, is 120 in. or more, while other districts are semi-arid or subject to severe droughts. At San Juan the average annual rainfall is about 55 in.; nearly two-thirds of this falls from June to November inclusive. Most of the rain is in showers, frequently heavy; and on the windward slope showers are an almost daily occurrence. The island is visited occasionally by hurricanes.

Soil.—Close to the coast the soil is for the most part a coral sand. Farther inland in the level districts and river bottoms it varies from a sandy to a clay loam containing much alluvium. On the foothills and in the less rugged mountain districts there is a thin but rich clay soil derived from coral limestone.

Industries.—A little more than one-fourth of the land is under cultivation and in 1890 more than three-fourths of the working population were engaged in agriculture. There were over 30,000 farms, nearly all of them small, and the average number of acres cultivated on each was not more than fifteen. Sugar on the lowlands, coffee on the upper, and tobacco on the lower mountain slopes are the principal crops. In 1909 there were 185,927 acres of sugar, yielding 244,257 tons for exportation, and valued at $18,432,416. The coffee plantations were greatly injured by a severe hurricane which visited the island on the 8th of August, 1899, but the yield for export increased from 12,157,420 lb. in 1901 to 28,756,750 lb., valued at $4,693,004, in 1907. The acreage, however, decreased from 178,155 acres in 1906 to 157,778 acres in 1909, and in the latter year the crop fell to 28,480,263 lb. Java coffee has been grown with success in Porto Rico. Tobacco of a superior quality is grown extensively on the lower northern slopes and much tobacco is now grown on large estates. The larger part of the coffee and tobacco grown is exported.

The import trade of Porto Rico in 1908 was valued at $24,871,900, of which the value of the imports of manufactured articles was $17,733,410, while of the imported agricultural products it was $7,138,490. The export trade in 1908 was valued at $26,534,700, of which the value of the exports of manufactured articles was $9,138,490, while of the exported agricultural products it was $17,396,210.
PORTO RICO

125

The mineral resources are very limited. Brick clay and lime- stone are abundant, and there are on the south coast a sand marl rich in phosphates and productive salt deposits. Iron ore, lignite, copper, mercury, molybdenite, nickel, platinum and other minerals have been found, but the quantity of each is too small, or the facilities to exploit them are of little commercial value. There are important mineral and thermal springs in various parts of the island.

The insular sugar industries require a large amount of capital, and the only manufacturing industries of much importance are the preparation of sugar, coffee and tobacco for market, and the manufacture of cigars, cigarettes, straw hats, soap, matches, venemkki, sash, doors, ice, distilled liquors and some machinery.

The railroads are inadequate. The American Railroad of Porto Rico, about 190 m. long, connects the principal cities along the north and west coasts and those as far east as Ponce on the south coast; a railway between Ponce and Guayanilla, farther south, is under construction. The Porto Rico and Atlantic Railroad connects Vega Alta with Dorado on the north coast; but there are no inland railways and much of the produce of the interior is carried to the coast in carts by bullocks or on the backs of males. The mileage of wagon roads was increased from about 170 m. in 1898 to 612 m. in 1909. The principal harbours are San Juan on the north and Ponce on the south coast; the former is accessible to vessels of about 30 ft. draught, and the latter has a natural channel which admits vessels of 25 ft. draught.

Two lines of steamboats afford regular communication between San Juan and New York; one of them runs to Venezuelan ports and one to Philadelphia and New York. The number of passengers carried each year is more than 66,000.

The commerce of Porto Rico is principally with the United States. The value of its exports to the United States increased from $8,851,288 in the fiscal year ending on the 30th of June 1909 to $11,117,069 in the fiscal year ending on the 30th of June 1910, and the proportion of its imports from Great Britain to the United States increased during this period from $7,413,502 to $25,163,678. In the meantime the value of its exports to foreign countries increased from $3,052,679 to $4,365,958, and the value of its imports from foreign countries only from $1,055,728 to $3,054,318.

Population.—The population increased from 283,308 in 1850 to 708,655 in 1885; and to 953,443, or 277.5 per sq. m., in 1890. Of the total population in 1890, 536,426, or 61.8% were whites, 304,322 were of mixed blood, 59,390 were negroes and 75 were Chinese. In 1910 the census returned the population as 1,118,012.

The proportion of whites is greatest at the west end than at the east end, greater on the north side than on the south side, and greater in the interior than along the coast. Only 13,872, or about 1.5% of the total population of 1890, were foreign-born, and of these more than one-half were born in Spain. The married portion of the population was only 16.6% in 1895.

The principal towns, with the population of each in 1910, are: San Juan, 48,716; Ponce, 35,097; Mayaguez, 16,577; Humacao, 12,507; Guanica, 11,165; and Arecibo, 7,330. The Roman Catholic church is the predominating church and the bishopric of Porto Rico (1512) is one of the oldest in the New World.

Government.—The constitution of Porto Rico is contained in an act of the Congress of the United States (the Foraker Act) which came into operation in May 1900. The governor is appointed by the president of the United States with the advice and consent of the Senate for a term of four years, and associated with the governor is an executive council consisting of the secretary, treasurer, auditor, attorney-general, commissioner of the interior, commissioner of education, and five other members, all appointed in the same manner and for the same term as the governor. The constitution requires that not more than five of the eleven members of the Executive Council shall be native inhabitants of Porto Rico; in practice the six members who are also heads of the administrative departments have been Americans while the other five have been Porto Ricans.

The insulin government, however, has created a seventh administrativa department—that of health, charities and corrections—and requires that the head of this shall be chosen by the governor from among the five members of the Executive Council who are not heads of the other departments.

The Executive Council constitutes one branch of the legislative assembly; the House of Delegates the other. The House of Delegates consists of 35 members elected biennially, five from each of seven districts. The right to determine the electoral franchise is vested in the legislature itself and that body has conferred it upon practically all adult males. The governor has the right to veto any bill, and for passing a bill over his veto an affirmative vote of two-thirds of the members of each house is required. All laws enacted by the insular legislature must also be submitted to the Congress of the United States, which reserves the right to annul them. Railway, street railroad, telegraph and telephone franchises can be granted only by the Executive Council with the approval of the governor, and none can be revocative without the concurrence of the President of the United States. The governor and Executive Council have the exclusive right to grant all other franchises of a public or quasi-public character. The Congress reserves the right to annul or modify any such act.

The administration of justice is vested in a United States district court and a supreme court, district courts, municipal courts and justice of the peace courts of Porto Rico. The Supreme Court of the United States district court and the chief justice and associate justices of the supreme court are appointed by the President with the consent of the Senate, and the judges of the district courts by the governor. The executive council administers the courts of the supreme court. The principal local government is that of the municipalities or municipal districts, but for the Spanish municipal government the powers are limited to such as are peculiar to Porto Rico. The governor appoints practically all municipal employés and may veto any ordinance of the council; his veto, however, may be overridden by two-thirds of the council. The police force of each municipality, the collection of taxes, the maintenance of the schools, is managed by the insular government; justice in each municipality is also administered by the insular government; the building, maintenance and repair of public roads are under the management of a board of the governor, and the seven Insular Commissions of Commerce and matters pertaining to education are for the most part under the insular commissioner of education and a school board of three members appointed by the governor. All other local affairs are within the jurisdiction of the mayor and municipal council.

Education.—In 1899 more than three-fourths of the inhabitants ten years of age or over were unable to read or write, and when in the following year the present system of government was established large powers were given to the commissioner of education. He controls the expenditure of public money for school purposes, makes all regulations and enforces the law. The votes on the appropriations by the municipal school boards are referred to the commissioner. The school system comprises preparatory schools, rural schools, high schools, graded schools, three high schools and the university of Porto Rico. The University of Porto Rico is a continuation of the law of May 30, 1905, the act of the insular legislature in 1903, but in 1910 only two departments had been organized—the insular normal school and the agricultural school. Numerous scholarships have been established at government expense in Porto Rican schools and in colleges or universities of the United States.

The average daily attendance in the public schools increased from 47,777 in 1906-7 to 56,972 in 1909-10. Each municipality is required to pay to its school board 25% of its receipts from the general property tax.

Finance.—Trade between Porto Rico and the United States is carried on upon important lines since the passage of the Federal law of March 11, 1903. The American consul in Porto Rico is the agent of the American government and receives the goods and pays the net proceeds to the insular government. Other principal sources of income are excise taxes, a general property tax, an inheritance tax and a tax on insurance premiums. For the fiscal year ending June 1909 the net income of the insular government was $3,180,111.75 and the net bonded indebtedness was $37,759,331.22.

History.—On his second voyage Columbus sighted the island, to which he gave the name San Juan Bautista, and remained in its vicinity from the 17th to the 22nd of November 1493. In 1508 Nicolás de Ovando, governor of Española (Haiti) rewarded the services of Juan Ponce de Leon, one of Columbus's companions in 1493, by permitting him to explore the island, then called by the natives "Borinquen," and search for its reputed deposits of gold. Ponce's hospitable reception by the chief, Aquebana or Guayba, and his fairly profitable search for the precious metal led King Ferdinand in 1509 to give him an appointment as temporary governor of the island, where his companions had already established the settlement of Caparra (Pueblo Viejo, near the present San Juan). In 1510 the king through Ovando's influence made this commission permanent. Meanwhile Ferdinand had also restored to Diego Columbus, son of the discoverer, the privileges of his father, including the control of the islands of Haiti and Porto Rico. The new admiral removed Ponce and appointed Juan Cerón to administer the affairs of Porto Rico. The quarrels between these two leaders disturbed the affairs of the island for the next
In 1595 San Juan was unsuccessfully attacked by an English fleet under Sir Francis Drake; two years later another English force, led by Sir George Cumberland, occupied the city for some weeks. The city was attacked in 1625 by a Dutch fleet, which was finally repulsed. The buccaneers or filibusters, who during the 17th century were drawn to the West Indies by the prospect of plundering the possessions of decadent Spain, often invaded Porto Rico, but that island escaped the conquest which Haiti experienced. The English attacked the island in 1678, 1702, 1703 and 1743; and in 1797 an English force attempted to reduce San Juan, but was repulsed by the strong fortifications vigorously manned by resident volunteers. After this event the city was permitted to add the words "very noble and very loyal" to its coat of arms.

Porto Rico was comparatively unaffected by the great Spanish-American uprising of the early 19th century. During the struggle of Spain against Napoleon, the island, in common with the other American dominions, was represented in the Spanish Cortes and had its first legislative assembly. Trade with the United States was permitted in 1815, although only in Spanish ships. The island suffered from the reactionary policy of Ferdinand VII., but the few sporadic attempts at revolution between 1815 and 1820 were readily suppressed. Columbian insurgents made ineffectual attempts to invade the island during 1819-29. Governor Miguel de la Torre, who ruled the island with vice-regal powers during the second period of Ferdinand's absolutism, sternly repressed all attempts at liberalism, and made the island the resort for loyal refugees from the Spanish mainland. This policy, coupled with certain administrative and revenue reforms, and some private attempts in behalf of public education, made the last seven years of his rule, from 1827 to 1834, the most prosperous in the Spanish régime. The unsettled political condition of Spain during the next forty years was reflected in the disturbed political conditions of Porto Rico and Cuba. The suffrage was restricted, the Press was placed under a strict censorship, and the right of public assemblage was unknown. Economically the island in 1866 was in a worse state of affairs than thirty years before. The Revolution of 1868 in Spain promised such salutary changes for the Antilles as the introduction of political parties, the restoration of representation in the Spanish Cortes, and the enfranchisement of the slaves; but the imprudent "Insurrection of Lares," and other outbreaks of 1867-68, delayed these anticipated reforms. The reactionaries feared separation from the mother country. Under the short-lived republican government in Spain Porto Rico was in 1870-74 a province with a provincial deputation, and in 1873 slavery was abolished. After the restoration of the monarchy under Alphonso XII. there was some improvement in the commerce of the island, but politically it displayed all the evils of an obsolete system of administration disturbed by a premature liberalismo. In 1875 the provincial deputation was re-established, but it was not until 1895 that the home government attempted, far too late, to enact a series of adequate reform measures, and in November 1897 followed this by a grant of autonomy.

When in April 1898 war broke out between Spain and the United States the former strongly garrisoned the island, but the fortifications of the capital were largely of the massive stone construction that had repelled Abercrombie a century before, most of the artillery was of an obsolete pattern and the few cruisers in the harbour were antiquated in type. The American invasion of the island occurred in July. On the 25th of that month, while a few vessels made a demonstration before San Juan, the main American fleet was landing some 3400 troops under General Nelson A. Miles at Guánica, a small town on the southern shore, some 15 m. west of Ponce. Three days later the latter town surrendered, amid demonstrations of joy on the part of the inhabitants. The people seemed to regard the American flag as the harbinger of a new era. General Miles's policy in affording employment for the natives likewise served to make the new American régime acceptable.

Meanwhile the Spanish governor-general, Manuel Macías y
Casado, had ordered the forces under his command in the southern part of the island to fall back towards the ridge of mountains intersecting it from east to west, just north of the town of Coamo. Reinforcements were also brought up from San Juan and preparations made to resist an attack by the Americans, despite the current rumours of approaching peace, and on their part the Americans prepared to move out 10,000 men in advance by separate routes across the island in four head. Guayama, Mayagüez and Coamo were occupied; one portion of the army was within 20 m. of the northern coast and another had advanced along the main military road nearly to Albornito, when the signing of the peace protocol on the 12th of August caused an immediate suspension of hostilities. The advance of the Americans had been rapid and decisive, with a small loss of life—three killed and forty wounded—due to the skill with which the military manoeuvres were planned and executed and the cordial welcome given the invaders by the inhabitants. By November the Spaniards had evacuated the greater part of the island; after Captain General Macias embarked for Spain, General Ricardo Ortega was governor from the 16th to the 18th of October, when the island was turned over to the American forces. In the work of policing the island, in the accompanying tasks of sanitation, construction of highways and other public works, accounting for the expenditure of public funds, and in establishing a system of public education, the military control, which under the successive direction of Generals John R. Brooke, Guy V. Henry and George W. Davis, lasted until the 1st of May 1900, proved most effective in bridging over the period of transition from the repressive government of Spain to the semi-paternal system under the American civil government. But it was hardly adapted to teach a people utterly without political experience the essential elements of self-government. To meet this problem the Congress of the United States passed the “Foraker Act,” under which civil government was instituted, and which, with certain modifications is still in force (see Administration). Under this act the American element has exercised the controlling power, and this has proved distasteful to certain Porto Rican politicians.

On the 8th of August 1899 the island was visited by the most destructive cyclone in its history, causing a loss of about 3,500 lives and a property damage amounting to 30,000,000 pesos, the coffee industry suffering most. This calamity afforded the American people an opportunity to display their generosity toward their new colony. Charles H. Allen became the first civil governor in May 1900; he was succeeded in August 1901 by William H. Hunt, who served until July 1904; Beekman Winthrop was governor in 1904-1907 and Régis H. Post from April 1907 until November 1909, when he was succeeded by George R. Colton. The island now has free trade with the United States, and receives into its general revenue fund all customs duties and internal taxes collected in the island. Its political leaders in the House of Delegates are restive under the control exercised by the Executive Council, but an attempt to hold up necessary appropriations resulted in the passage in July 1909 of an act continuing the appropriations of the previous year, whenever for any cause the lower house fails to pass the necessary financial legislation. In 1910 the coffee industry had not yet recovered from the effect of the cyclone of 1899 and the unfortunate mortgage system that prevailed under the Spanish régime. The fact that its product is shut out of its natural markets, without gaining that of the United States, is also a great handicap. The civic status of the people is still unsettled, but there has been under American rule a notable advance in the well-being of the island.

PORTRAITURE

of Adelaide. It is a prosperous and well-equipped port, from which enormous quantities of wheat are annually shipped. Pop. (1901), 7983.

PORTRAITURE. The earliest attempts at individual portraiture (see also PAINTING) are found in the ciborium and mummy-cases of the ancient Egyptians; but their painting never went beyond conventional representation—mere outlines filled in with a flat tint of colour. In Greece portraiture probably had its origin in skilagraphy or shadow-painting. The story of the Greek maiden tracing the shadow of her departing lover on the wall points to this. The art developed rapidly. In 463 B.C., Polygnotus, one of the first Greek painters of distinction, introduced individual portraiture in the decoration of public buildings, and Apelles nearly a century later showed so much genius in rendering character and expression, that Alexander the Great appointed him to paint his portrait in his own presence. In other words, issued an absolute decree forbidding any one else to produce pictorial representations of his majesty. Similar edicts were issued in favour of the sculptor Lysippus and Pyrgoteles the gem engraver. No works of the Greek painters survive, but the fane of two portraits by Apelles, which were in the possession of the emperor Claudius (A.D. 41-54), is known, the heads having been painted out to make room for the features of the divine Augustus!

After the time of Alexander (300 B.C.) Greek art rapidly deteriorated. There is, perhaps, nothing in the history of human intelligence to compare with the dazzling swiftness of its development or the rapidity of its decline. War was followed by pillage and devastation, and victorious Roman generals, mere depredators and plunderers, crowded Rome with the stolen treasures of Greece, with the result that Greek art and Greek influence soon made themselves felt in the imperial city, and for generations its artists were almost exclusively Greeks, chiefly portrait painters and decorators. The Romans possessed no innate aptitude for art, and rather despised it as a pursuit little becoming the dignity of a citizen. Although lacking in appreciation of the higher conditions of art, they found early how to decorate their atra with effigies—originally wax moulds—of the countenances of their ancestors. These primitive "wax-works" ultimately developed into portrait busts, often vivid and faithful, the only branch of art in which Rome achieved excellence.

With the invasion of the Northern barbarians and the fall of the empire Graeco-Roman art ended. In the following centuries Christianity gradually became the dominant religion, but its ascetic temperament could not find expression in the old artistic forms. Instead of joy in the ideals of bodily perfection, came a loathing of the body and its beauty, and artists were classed among "persons of iniquitous occupations." Before the 4th century these prejudices had relaxed, and images and pictures again came into general favour for religious uses. In the 8th and 9th centuries, the iconoclasts commenced their systematic destruction, and it was not till the Renaissance in the 14th century that art began again to live. The great revival brought with it a closer observation of the facts of nature and a growing sense of beauty, and the works of Cimabue and Giotto prepared the way for those of Benozzo Gozzoli, Ghirlandaio and the long line of masters who raised Italian art to such a height in the 15th and 16th centuries. Although the works of the early painters of the Renaissance were mostly devoted to the expression of the dogmas of the Church, the growing love and study of nature led them, as opportunity afforded, to introduce portraits of living contemporaries into their sacred pictures. Gozzoli (1420-1498) and Ghirlandaio (1449-1494) began the practice, followed by nearly all the old and great painters, of introducing portraiture into their works; Ghirlandaio especially filling some of his great fresco compositions with the forms and features of the living men and women of Florence, members of the Tornabuoni, Medici and other great families. Acuteness of observation was innate in the race. By degrees it manifested itself in a marvellous subtlety in the rendering of individual character, in the portrayal of individual men and women, and a school of portraiture was developed of which Titian became the crowning glory. This great Venetian painter, by universal consent reckoned one of the masters of portraiture, has handed down to us the features of many of the greatest historical and literary personages of his time—emperors, popes, kings, doges—all sat by turn to him and loaded him with honours. The names of Bellini, Raphael, Tintoret, Veronese and Moroni of Bergamo occur among those of the great Italian portrait painters of the 15th and 16th centuries. The last-named, some of whose finest works are now in England, was highly praised by Titian.

A love of ugliness characterizes the artists of the early German and Flemish schools, and most of the portraits produced by them previous to Holbein's time suffer from this cause. Schongauer, Dürrer and Lucas Cranach are never agreeable or pleasant, however interesting in other respects. Dürrer, the typical German artist, despised the portrait of dress. He was, the thinker, the woman, was less fitting by nature for a portrait painter than Holbein, who, with a keen sense of nature's subtle beauty, was a far greater painter although a less powerful personality. He produced many fine works in other branches, but it is as a portrait painter that Holbein is chiefly known, and his highest claims to fame will rest on his marvellous achievements in that branch of art. He first came to England in 1526, bringing with him letters of introduction from Erasmus. Sir Thomas More received him as his guest, and during his stay he painted More's and Archbishop Warham's portraits. In 1532 he was again in London, where till his death in 1543 he spent much of his time. He was largely employed by the German merchants of the Steelyard and many Englishmen of note, and afterwards by Henry VIII., by whom he was taken into permanent service with a pension. As a portrait painter Holbein is remarkable not only for his keen insight into the character of his sitters, but for the beauty and delicacy of his drawing. As colourist he may be judged by an admirable example of his work, "The Ambassadors," in the National Gallery in London. Many of his drawings appear to have been made as preliminary studies for his portraits.

In Flanders Jan van Eyck (1390-1440), his brother Hubert, Quintin Matsys, Memling and other artists of the 15th century occasioned practised portraiture. The picture of Jean Arnolfini and his wife, in the National Gallery, London, is a remarkable sample of the first-named artist, and the small half-length of young Martin van Nieuwenhoven, in the hospital of St John at Bruges, of the last-named. Nearly a century later the names of Antony Mor (or Moro), Rubens and Van Dyck appear. Rubens, although not primarily a painter of portraits, achieved no small distinction in that way, being much employed by royalty (Maria de Medici, Philip IV. and the English Charles I. among the number). His services were also in request as ambassador or diplomatist, and therefore at least, if not the creations of that nature. His personal energy and industry were enormous, but a large proportion of the work attributed to him was painted by pupils, of whom Van Dyck was one of the most celebrated. Van Dyck (1599-1641) early acquired a high reputation as a portrait painter. In 1623 he was invited to England by Charles I., and settled there for the remainder of his life. He was knighted by Charles, and granted a pension of £200 a year, with the title of painter to his majesty. Many of Van Dyck's portraits, especially those of the early and middle periods, are unsuited to their freshness, force and vigour of handling. He is a master among masters. England possesses many of his works, especially of his later period. To Van Dyck we owe much of our knowledge of what Charles I. and those about him were like. A routine practice, luxurious living, failing health, and the employment of assistants told upon his work, which latterly lost much of its early charm.

In Holland in the 17th century portraiture reached a high standard. A reaction had set in against Italian influence, and extreme faithfulness and literal resemblance became the prevailing fashion. The large portrait pictures of the members of guilds and corporations, so frequently met with in Holland, are characteristically Dutch. The earliest works of the kind are
generally rows of portraits ranged in double or single lines, without much attempt at grouping or composition. Later, in the works of painters like Rembrandt, Frans Hals and Van der Helst, these pictures of civic guards, hospital regents and masters of guilds assumed a very different character, and are among the very finest works produced by the Dutch portrait painters of the 17th century. They may be termed "subscription portraits"—each member of the guild who desired a place on the canvas agreeing, before the commission was given, to pay, according to a graduated scale, his share of the cost. Among the most famous examples of this class of portraits are "The Anatomy Lesson," of the March-out of Captain Banning Kock and his Company (erroneously called "The Night Watch"), and "The Five Symbols of the Cloth-Workers Guild," by Rembrandt. The magnificent portrait groups at Haarlem by Hals—the next greatest portrait painter of Holland after Rembrandt—and the "Schuttersmaaltyd" by Van der Helst in the Amsterdam Museum, which Reynolds considered "perhaps the first picture of portraits in the world," must also be mentioned.

Of the pictorial art of Spain previous to the 15th century, little, if any, survives. Flemish example was long paramount and Flemish painters were patronized in high places. In the 16th century the names of native Spanish artists began to appear—Morales, Ribera, Zurbaran, a greater Doliol, with the foremost portrait painter; and in the last year of the century Velasquez was born, the greatest of Spain's artists, and one of the greatest portrait painters of the world. None, perhaps, has ever equalled him in keen insight into character, or in the swift magic of his brush.

Philip IV., Olivarrez and Innocenç X. live for us on his canvases. His constantly varying, though generally extremely simple, methods, explain to some extent the interest and charm his works possess for artists. Depth of feeling and poetic imagination were, however, lacking, as may be seen in his prosaic treatment of such subjects as the "Coronation of the Virgin" and "The Martyrdom of St. Bartholomew" and other kindred works in the Madrid Gallery. Velasquez must necessarily be classed with those whose career has been prematurely cut short. His works often show signs of haste and of the scanty leisure which the duties of his office of "Aposentador Mayor" left him—duties which ended in the fatal journey to the Isle of Rhé.

In France the most distinguished portrait painters of the 16th and 17th centuries were the Clouets, Cousin, Vouet, Philippe de Champaigne, Rigaud and Vanloo. French portraiture, long inflated and artificial, reached the height of pomposity in the reigns of Louis XIV. and XV., the epoch of which the towering wig is the symbol. In the 18th and early part of the 19th centuries occur the names of Boucher, Greuze, David, Gérard and Ingres; but somehow the portraits of the French masters seldom attract and capitivate in the same way as those of the Dutch and Italian painters.

Foreign artists were engaged for almost every important work in painting in England down to the days of Sir Joshua Reynolds and Gainsborough. Henry VIII. employed Holbein; Queen Mary, Sir Antonio Moro; Elizabeth, Zuccaro and Lucas de Heere; James I. van Somer, Cornelius Janssens and Daniel Mytens; Charles I. Rubens, Van Dyck, Mytens, Petitot, Honthorst and others; and Charles II., Lely and Kneller, although they were native artists of Zurbaran, Zurcher, Gainsborough, Watson and Jamesone, a Scottish painter. Puritan England and Presbyterian Scotland did little to encourage the portrait painter. The attitude of the latter towards it may be inferred from an entry in the diary of Sir Thomas Hope, the Scottish Lord Advocate in 1628. "This day, Friday, William Jamesone, painter (at the earnest desyer of my sone Mr Alexander) was sufferit to draw my pictur." He does not even give the painter's name correctly, although Jamesone at the time was a man of some note in Scotland. At the commencement of the reign of George I. art in England had sunk to about the lowest ebb. With the advent of William Hogarth (1697-1764) the English school of painting may be said to have commenced, and in Reynolds and Gainsborough it produced two portrait painters whose works hold their own with those of the masters of the 18th and 19th centuries. Both Sir Joshua and Gainsborough are seen at their best in portraits of women and children.

George Romney (1734-1802) shared with Reynolds and Gainsborough the patronage of the wealthy and fashionable of his day. Many of his female portraits are of great beauty. For some unknown reason he never exhibited his works in the Royal Academy.

Sir Henry Raeburn (1756-1823) was a native of Edinburgh, and spent most of his life there. His portraits are broad and effective in treatment, masterly and swift in execution and often fine in colour. He painted nearly all the distinguished Scotsmen of his time—Walter Scott, Adam Smith, Bruxfield, Robertson of MCU, Ladynox, Dugald Stewart, Boswell, Jeffrey, Professor Wilson and many of the leading noblemen, lairds, clergy and their wives and daughters. For a considerable period his portraits were little known out of Scotland, but they are now much sought after, and fine examples appearing in London sale-rooms bring remarkable prices. Raeburn's immediate successor in Scotland, J. Watson Gordon (1788-1864), also painted many excellent portraits, chiefly of men. A very characteristic example of his art at its best may be seen in his "Provost of Peterhead" in the Scottish National Gallery.

Sir Thomas Lawrence (1769-1830) was the favourite English portrait painter of his time, and had an almost unrivalled career. He had an immense practice, and between the years 1787 and 1830 exhibited upwards of three hundred portraits in the Royal Academy alone. The Waterloo Gallery at Windsor contains some of his best work, chiefly painted in 1818-1819, including his portraits of the emperor Francis, Pope Pius VII. and Cardinal Gonsalvi. He was loaded with honours, and died President of the Royal Academy.

Sir J. E. Millais (1833-1896), although most widely known as a painter of figure subjects, achieved some of his greatest successes in portraiture, and no artist in recent years has approached him as a painter of portraits. His portraits of Gladstone, Sir James Paget, Sir Gilbert Greenall, Simon Fraser, J. G. Hook and Mrs. Bischofshaim, to name only a few, are alone sufficient to give him a high place among British portrait painters.

Frank Holl (1845-1888) first came into note as a portrait painter in 1878, and during the subsequent nine years of his life he painted upwards of one hundred and ninety-eight portraits, an average of over twenty-two a year. The strain, however, proved too great for a naturally delicate constitution, and he died at the age of forty-three—another instance of a brilliant career prematurely cut short. To G. F. Watts (1820-1904) we are indebted for admirable portraits of many of the leading men of Victorian Scott politics, science, literature, theology and art. Among more recent artists, Sir W. Q. Orchardson (1835-1910), like Millais more widely known as a painter of figure subjects, but also admirable as a portrait painter; John Sargent (1836- ), whose brilliant and vigorous characterization of his sitters leaves him without a rival; as well as Ouelles, Shannon, Fildes, Herkomer and others, have worthily carried on the best traditions of the art.

In France contemporary portraiture is ably represented in the works of Carolus-Duran, Bonnat and Benjamin Constant, and in Germany by Lenbach, who has handed down to posterity with uncompromising faithfulness the form and features of Prince Bismarck.

Of portraiture in its other developments little need be said. Miniature painting, which grew out of the work of the illuminators, appears to have been always successfully practised in England. The works of Hilliard, Issac and Peter Oliver, Samuel Cooper, Hoskins, Engleheart, Plimer and Cosway hold their own with the best of the kind; but this beautiful art, like that of the engraver, has been largely superseded by photography and the "processes" now in use.

It is unnecessary to refer to the many uses of portraiture, but one of its chiefest has been to transmit to posterity the form and features of those who have played a part, worthy or otherwise, in the past history of our race. Of its value to the
biographer and historian, Carlyle, in a letter written in 1834, says, "In all my poor historical investigations it is one of the most primary wants to procure a bodily likeness of the personage inquired after; a good portrait, if such exists; failing that, even an indifferent, if sincere one; in short, any representation, made by a faithful human creature, of that face and figure which he saw with his eyes and which I can never see with mine. Often I have found the portrait superior in real instruction to half-a-dozen written biographies, or rather, I have found the portrait was as a small lighted candle, by which the biographies could for the first time be read, and some human interpretation be made of them." (G. RE.)

PORT RICHMOND, a part of the borough of Richmond in the state of New York, U.S.A., on the N. shore of Staten Island and on the Kill van Kull Channel. Before 1825 it was a separate village of Richmond county, New York, containing 6290 inhabitants in 1890. It is served by the Staten Island Rapid Transit railway, and by a ferry to Bergen Point, New Jersey, and has steam and electric railway connections with the municipal ferry at St George, which furnishes easy access to the business districts on Manhattan Island. Among its places of historic interest are the Dutch Reformed Church, which is the direct successor of the church established on Staten Island in 1625 or 1626 by Waldenses and Huguenots; and the Danner Hotel, built in 1681 by Jacobus Danner on the site of a temporary fort that had been erected by British troops, and used as a private dwelling until 1820. In this house Aaron Burr spent the last years of his life, dying there on the 14th of September 1836. During its early years the convent received a number of papal privileges; the most important of these, granted by Honorius III. in 1223, authorized it to offer a retreat to women anxious to withdraw from the world without binding themselves by perpetual vows. Little is known of its history during the three succeeding centuries, except that its discipline became relaxed; reform was only attempted when Angélique Arnauld (q.v.) was appointed coadjutor to the elderly and invalid abbess in 1655, the reformer having met with no success. In 1730, contact was made with Jean Duverger (q.v.) abbot of Saint Cyran, and chief apostle in France of the Jansenist revival, and the later history of her convent is indissolubly connected with this movement.

In 1626 constant visitations ofague drove the nuns to Paris; they settled at Port Royal de Paris, at the end of the Faubourg Saint Jacques. The deserted buildings of Port Royal des Champs were presently occupied by "hermita" laymen, mostly relatives of the abbess, who wished for a semi-monastic existence, though without taking formal vows. In 1645, however, some of the nuns returned to the convent, and the former cloistered buildings at a short distance from the church. Here they set up a "little school" for the sons of Jansenist parents; and here Jean Racine, the future poet, received his education. But in 1653 Innocent X. condemned the doctrines of Jansen. Three years later "the hermitage" and school were broken up, and the nuns were forbidden to receive new members into their community. These nuns, it is said, were accused with the nuns at Port Royal in 1660; between 1664 and 1669 the archbishop of Paris laid under an interdict those of the nuns who refused to subscribe the papal censure on Jansen. In 1669, however, came the so-called "Peace of Clement IX." when the Jansenists generally were admitted to grace, and the interdict was removed from Port Royal, though the authorities broke up the convent into two distinct houses. The community of Nuns was divided, and together at Port Royal de Paris, under an independent abbess; their Jansenist sisters were united at the original building in the country. Thereupon followed ten years of peace, for the nuns had a powerful protector in the king's cousin, Mme de Longueville. But in 1679 she died, and Louis at once ordered the nuns to send away their novices and boarders and to receive no others. Finally, in 1705, he got from Clement XI. a new condemnation of the Jansenists, which the few remaining nuns, all of whom were over sixty, refused to sign, and on the 21st of April 1707 they were forcibly removed from Port Royal by the police, and distributed among various convents in the following spring the buildings were pulled down; even the cemetery was not spared. The land on which the convent had stood was given over to Mme de Maintenon's college of St Cyr; in 1825 it was bought by some descendants of Jansenist families, who have done their best to restore the grounds to their original appearance, and have built a museum rich in Jansenist relics. Port Royal de Paris was secularized at the French Revolution, and is now a maternity hospital. But a classified list of the chief books, ancient and modern, dealing with Port Royal, see the Abridged of the History of Port Royal, by Jean Racine, ed. E. Gazer (Paris, 1808). See also C. A. Sainte-Beuve, Port Royal (6 vols. and Index, Paris, 1882); Charles Beard, Port Royal (2 vols., New York, 1906); T. S. H. B鳴ching, Geschichte Port Royal (2 vols., Hamburg, 1839-1844), and the books recommended under the articles ARNAULD, Jansenism and PASCAL.

PORT ROYAL, an island in Beaufort county, South Carolina, U.S.A., at the head of Port Royal Sound, about 16 m. from the Atlantic coast, and about 50 m. S.W. of Charleston. It is about 13 m. long (north and south) by about 7 m. wide. The surface is generally flat, and there is much marshland in its southern part, and along its north-eastern shore. The principal settlement is Beaufort, a port of entry, and the county-seat of Beaufort county. The island is covered with forests, except for a few groves of oaks, a few groves of yellow cypress, and half-a-dozen cypress. Large quantities of phosphate rock were formerly shipped from here. Among the manufactures are cotton goods, canned oysters, lumber and fertilizers. About 5 m. south of Beaufort is the town of Port Royal (pop. in 1910, 1652), a terminus of the Charleston & Western Carolina railway. On the Beaufort River (eastern shore) of Port Island, about 6 m. north of Beaufort Bay, is a United States naval station, with a dry dock and repair shop.

Jean Ribault (1520-1565), leading an expedition sent out by Admiral Gaspard de Coligny (1517-1572) to found a Huguenot colony in the West Indies. He arrived on New Year's Day, 1562, on which day he landed at Port Royal, on the 27th of May 1562, to plant the exposition of the region in the name of Charles IX., and established the first settlement (Fort Charles), probably on Port Island. In June he sailed for France, leaving 26 volunteers under Captain Albert de la Pierrie. Soon afterward the garrison killed Pierrie (probably because of the severity of his discipline), and put to sea in an insufficiently equipped vessel, from which, after much suffering, they were rescued by an English ship, and taken to England. In 1670, a company under Colonel William Sayle (d. 1671) landed on Port Royal Island, but probably because this site exposed her to Spanish attacks, proceeded along the coast and founded the original Charles Town (see CHARLESTON). In 1673, several families, chiefly Scotch, led by Henry Erskine, third Lord Cardross (1650-1693), established on the island a settlement named Stuart's Town (probably in honour of Cardross's family); but three years later most of the settlers were murdered by Spaniards from Florida and the remainder fled to Charleston. In 1710, after the lords proprietors had issued directions for "the building of a town to be called Beaufort Town," in honour of Henry Somerset, duke of Beaufort (1679-1700), the first permanent settlement was established on the island. The town was incorporated in 1785. In July 1776, 200 British soldiers occupied the island by order of Colonel Augustin Prevost, but they were dislodged (Feb. 3) by about 300
PORTRUSH—PORTSMOUTH, DUCHESS OF

Americans, mostly militiamen, under General William Moultrie. At the beginning of the Civil War the Confederates erected Fort Walker on Hilton Head, and Fort Beauregard on Bay Point. Captain (afterwards Admiral) Samuel F. Du Pont and General Thomas W. Sherman organized an expedition against these fortifications, which were reduced by a naval bombardment and were evacuated by the Confederates under General Thomas F. Drayton (d. 1891) on the 7th of November 1861. During the remainder of the war Port Royal Harbour was used as a coaling, repair and supply station by the Federal blockading squadron. Early in 1862 Port Royal Island and the neighbouring region became the scene of the so-called "Port Royal Experiment"—the successful effort of a group of northern people, chiefly from Boston, New York and Philadelphia, among whom was the Governor of Massachusetts, to take charge of the cotton plantations, deserted upon the occupation of the island by Union troops, and to employ the negroes under a system of paid labour. The volunteers organized as the Educational Commission for Freedmen (afterward the New England Freedmen's Aid Society), and the government granted them transportation, subsistence and quarters, and paid them small salaries.

See Edward McCrady's History of South Carolina (New York, 1887-1901); and, for an account of the Port Royal Experiment, Letters from Port Royal (Boston, 1906), edited by Elizabeth W. Pearson.

PORTRUSH, a seaport and the most popular seaside resort of Co. Antrim, Ireland; the terminus of a branch of the Northern Counties (Midland) railway. Pop. (1901), 1941. It is very picturesquely situated on the basaltic peninsula of Ramore Head, with a deep bay on either side, and a harbour protected by the natural breakwater known as the Skerries. A fine hotel, owned by the railway company, and an excellent golf course are the chief features, together with a town-hall with public reading room, and the place is much frequented for golf and sea-bathing. It is also the centre for visitors to the Giants' Causeway, with which it is connected by an electric railway. Dunluce Castle, between Portrush and Bushmills, stands on a rock separated from the mainland by a chasm which is spanned by a bridge. The ruins, which are extensive, are of unknown date. Portrush has a thriving trade in salmon. It is governed by an urban district council.

PORT SAID, a seaport of Egypt, at the northern entrance of the Suez Canal, in 31° 15′ 35″ N., 33° 19′ 20″ E., and 145 m. by rail N.E. of Cairo. Pop. (1907), 48,884. It lies on the western side of the canal on the low, narrow, treeless and desolate strip of land which separates the Mediterranean from Lake Menzala, the land at this point being raised and its area increased by the draining of part of the lake and by the excavation of the inner harbour. The outer harbour is formed by two breakwaters which protect the entrance to the canal; altogether the harbour covers about 570 acres and accommodates ships drawing 28 ft. Originally besides the central basin of the inner harbour there were three docks; between 1903 and 1909 the harbour accommodation was doubled by the construction of new docks on the eastern side of the canal and by enlarging the western docks. The port possesses a floating dock 295 ft. long, 85 ft. broad and 18 ft. deep, capable of lifting 3500 tons, and a patent slip taking 5000 tons and ships drawing 20 ft. 6 in. On the General breakwater, a colossal statue of Ferdinand de Lesseps by E. Fremiet, unveiled in 1890, and a lighthouse 174 ft. high. Among the few buildings of note in the town are the offices of the Suez Canal Company and the British barracks, the last named having been built by Prince Henry of the Netherlands (d. 1879) as a dépôt for Dutch trade.

Port Said dates from 1859 and its situation was determined by the desire of the engineers of the Suez Canal to start the canal at the point on the Mediterranean coast of the isthmus of Suez nearest to deep water, and off the spot where Port Said now stands there was found a depth of 26 ft. at about 2 m. from the shore. For many years after its foundation it depended entirely upon the traffic of the canal, being the chief coaling station of all ships passing through and becoming the largest coaling station in the world. The population was of a very heterogeneous character, but was greatly inclined to leaven by emigration, and was at one time unhealthy, owing to the damp heat and the dirt and noise of the incessant coaling operations gave the town an unenviable reputation. In 1902, however, a new industry was added in the export of cotton from the eastern Mediterranean (the Delta and the Sinai) to Egypt generally, besides making it a tourist route to the capital from the Sudan. This was attractive to the town a considerable commercial community and to raise its social status. A new suburb was created by reclaiming land from the Delta, or the canal border, and another suburb was created on the eastern side of the canal. The average annual value of the trade of the port for the five years 1902-1906 was £4,410,000. This figure includes the value of the coal used by visiting ships through the new and old Suez Canals.

PORTSMOUTH, EARLS OF. In 1743 John Wallop (1690-1762) of Farley Wallop in Hampshire was created earl of Portsmouth. He belonged to an old Hampshire family and had been a lord of the treasury from 1717 to 1720, when he was created Baron Wallop. The earldom has since been held by his descendants, one of whom, Newton Wallop (b. 1856), became the 6th earl in 1891. This earl was a member of parliament from 1880 to 1891 and was under secretary of state for war from 1905 to 1906.

PORTSMOUTH, LOUISE DE KÉROUAILLE, DUCHESS OF (1659-1734), mistress of the English king Charles II., was the daughter of Guillaume de Kérouaille (d. 1693) of a noble family in Brittany, and Marie de Place de Tureur. The name of Kérouaille was derived from an heiress whom her ancestor François de Penhoët had married in 1530. The family were nobles in Brittany, and their name was so spelt by themselves. But the form Queroulles was commonly used in England, where it was corrupted into Carwell or Carewell, perhaps with an ironic reference to the care which the duchess took to fill her pocket. In France it was variously spelt Queroul, Kéroual and Kérouël. The exact date of her birth is apparently unknown. Louise was placed early in life in the household of Henriette, duchess of Orleans, sister of Charles II. Saint-Simon asserts that her family threw her in the way of Louis XIV. in the hope that she would be promoted to the place of royal mistress. In 1670 she accompanied the duchess of Orleans on a visit to Charles II. at Dover. The sudden death of the duchess, attributed on dubious evidence to poison, left her unprovided for, but the king placed her among the ladies in waiting of his own queen. It was said in after times that she had been selected by the French court to fascinate the king of England, but for this there seems to be no evidence. Yet when there appeared a prospect that the king would show her favour, the intrigue was vigorously pushed by the French ambassador, Charles de Saint-Maur, who sent his secret agent, the secretary of the French embassy to England, to meet her and her husband James, and with both of whom she was not unrewarded.

The support she received from the French envoy was given on the understanding that she should serve the interests of her native country. The largest public debt in France (1669-72) was that of the navigation of the English Channel, and a subsidy was raised to pay it. In 1672 the duchess of Portsmouth was granted the title of Madame by the king, who was also confirmed in her rights to the lands and honours from Louis XIV. and was loyally carried out by the queen, who avowed a lasting hatred for her in England was due as much to her own activity in the interest of France as to her notorious rapacity. The titles of Baronne Pots cand, countess of Farcollon and duchess of Portsmouth were granted her for life on the 19th of August 1673. Her pensions and money allowances of various kinds were enormous. In 1677 alone she received £17,300. The French court was frequent in her house, and in December 1674 she was visited by her cousin, the Dutch princess, by reason of the marriage of her son, the Constable of France, to the dauphine, but the relations were strained upon her the ducal seat of Aubigny at the request of Charles II. Her thorough understanding of the king's character enabled her to retain her hold on him to the end. She contrived to escape unresolved during the rise of the Dutch Plot in 1678. She was strong enough to maintain her position during a long illness in 1677, and a visit to France in 1682. In February 1685 she took care to see that the king, who was then in Germany, and who had been ceded to her as a mark of favour, did not die without confession and absolution. Soon after the king's death she retired to France, where, except for one short visit to England during the reign of James II., she remained. Her pensions and an outrageous grant on the Irish revenue given her by
PORTSMOUTH

Charles II. were lost either in the reign of James II. or at the Revolution of 1688. During her last years she lived at Aubigny, and was harassed by debt. The French king, Louis XIV., and after his death the regent Orleans, gave her a pension, and protected her against her creditors. She died at Paris on the 14th of November 1724.

See H. Forneron, Louise de Keroualle (Paris, 1886); and Mrs Colquhoun Grant, From Brillainy to Whitehall (London, 1909).

PORTSMOUTH, a municipal, county and parliamentary borough, and seaport of Hampshire, England, 74 m. S.W. from London, on the London & South-Western and the London, Brighton & South Coast railways. Pop. (1891), 150,278; (1901), 188,133. This great naval station and arsenal is an aggregate of four towns, Portsmouth, Portsea, Landport and Southsea, and occupies the south-western part of Portsea Island, which lies between Portsmouth Harbour and Langstone Harbour, two inlets of the English Channel. Portsmouth Harbour opens into Spithead, one of the arms of the Channel separating the Isle of Wight from the mainland. The harbour widens inlets in boat form, Portsmouth lying on the east shore of the neck, with Gosport opposite to it on the west side. Portsmouth proper may be distinguished as the Garrison town, Portsea as the naval station with the dockyards; Landport is occupied chiefly by the houses of artisans; and Southsea is a residential quarter and a favourite watering-place. Besides a number of handsome modern churches, among which is a Roman Catholic cathedral, Portsmouth possesses, in the church of St Thomas à Becket, a fine cruciform building dating from the second half of the 12th century, in which the chancel and transepts are original, but the nave and tower date from 1608, and the whole was extensively restored in 1904. The garrison chapel originally belonged to the hospital of St Nicholas, a foundation of the 13th century. Among other buildings worthy of mention (apart from those having naval or military connection) the principal is the town-hall (1890), a fine classic building standing alone in a square, and surmounted by a handsome clock tower. Among educational institutions there are a large grammar school (1879), on a foundation of 1732, Roman Catholic schools adjoining the cathedral, schools for engineering students and dockyard apprentices, and seamen and marines' orphan school. Aria College in Portsea was opened in 1874 for the training of Jewish ministers. Victoria Park, in the heart of the town, contains a monument to Admiral Napier. There are recreation grounds for the naval and military forces in the vicinity. There is a railway station (Portsmouth Harbour) on the Hard, from which passenger steamer serve Ryde in the Isle of Wight. A ferry and a floating bridge connect with Gosport. The port has a considerable trade in coal, timber, fruits and agricultural produce. The parliamentary borough returns two members. The county borough was created in 1888. The municipal borough is under a mayor, 14 aldermen and 42 councillors. Area, 5010 acres.

The dockyard seems to have been regularly established about 1540, but long before that date the town was of importance as a naval station and was used for the accommodation of the king's ships. In 1540 it covered 8 acres of ground, abutting on the harbour near the 'King's Stairs.' Cromwell added 2 acres in 1658, and Charles II. added 8 in 1661 and 10 in 1666. About 15 acres more had been reclaimed or bought, and by the end of the 18th century the total area was 90 acres. In 1848 a steam basin, covering 7 acres, and four new dock basins, were opened. By 1865 large embankments were decided upon, increasing the area to 293 acres. These included a tidal basin and, opening out of it, a deep dock and two locks, in themselves serving as the entrance to the basins and four docks. An entrance was also formed between the new tidal basin and the steam basin of 1848, and large additions were made to the wharfage accommodation as well as to the storehouses and factories. Subsequent improvements included the formation of two new dry docks (1896) with a floor-length of 557 ft. and a depth of 335 ft. over the sill at high water of spring tides; the construction of new jetties at the entrance to the tidal basin and at the north wall; the establishment of a coal wharf with hydraulic appliances; a torpedo range in the harbour; the erection of various buildings such as torpedo and gun-mounting stores, electrical shops and numerous subsidiary works; and extensive dredging of the harbour to increase the berthing accommodation for the fleet. Altogether, from 1825 to 1866, 65 acres of enclosed basins, 18,400 ft. of wharfage and about 10 m. of railway. There is a gunnery establishment in the harbour on Whale Island, the area of which has been increased by nearly 90 acres by the excavation of material excavated from the dockyard extension works, and various barracks including those of the royal marine artillery at Eastney; beyond Southsea.

Portsmouth (Portsmouth, Portsmoth) owes its origin to the retreat of the sea from Poole, and its importance to its favourable position for a naval station. Though probably the site had long been recognized as a convenient landing-place, no town existed there until the 12th century, when the strategical advantage it offered induced Richard I. to build one. He granted a charter in 1194 declaring that he retained the borough in his hand, and granting a yearly fair and weekly market, freedom from certain tolls, from shire and hundred court and sheriffs' aids. In October 1200 King John repeated the grants, and Henry III. in 1229 gave the "men of Portsmouth" the town in fee farm and granted a merchant gild. Confirmations were made by successive kings, and a charter of incorporation was given by Elizabeth in 1599-1600. A new and enlarged charter was granted by Charles I. in 1627, by which the borough is now governed subject to changes by the municipal acts of the 19th century. Portsmouth has returned two members to parliament since 1295. A fair on the 1st of August and fourteen following days was granted by Richard I. The first day was afterwards changed to the 26th of June and later to the 11th of July. It was important as a trading fair for cutlery, earthenware, cloth and Dutch metal, and was abolished in 1846. The market, dating from 1194 and originally held on Thursday only, is now held on Thursday and Saturday in addition. Portsmouth was important in the middle ages not only as a naval station but a trading centre. There was a considerable trade in wool and wine, and the building of the dockyards by Henry VII. further increased its prosperity.

See Victoria County History: Hampshire, iii. 172 seq.; R. East, Extracts from the Portsmouth Records.

PORTSMOUTH, a city, port of entry and one of the county-seats of Rockingham county, New Hampshire, U.S.A., on the Piscataqua river, about 3 m. from the Atlantic Ocean, about 45 m. E.S.E. of Concord, and about 54 m. N.N.E. of Boston. Pop. (1910) 15,950. It is connected by a ferry with Kittery, Maine. It is served by the Boston & Maine railway, by electric lines to neighbouring towns, and in summer by a steamboat daily to the Isles of Shoals. The city is pleasantly situated, mainly on a peninsula, and has three public parks. Portsmouth attracts many visitors during the summer season. In Portsmouth are an Athenaeum (1817), with a valuable library; a public library (1881); a city hall; a county court house; a United States customs-house; a soldiers' and sailors' monument; an equestrian
PORTSMOUTH—PORT SUDAN

monument by James Edward Kelly to General Fitz John Porter; a cottage hospital (1886); a United States naval hospital (1891); a home for aged and indigent women (1897); and the Chase home for children (1877).

A Visited State's navy yard, officially known as the Portsmouth Navy Yard, is on an island of the Piscataqua but within the town of Kittery, Maine. In 1800 Fernald's Island was purchased by the Federal government for a navy yard; it was the scene of considerable activity during the War of 1812, but was of much greater importance during the Civil War, when the famous "Kearsarge" and several other war vessels were built here. In 1866 the yard was enlarged by connecting Seavey's Island with Fernald's; late in the 19th century it was equipped for building and repairing steel vessels. It now has a large dry dock. On Seavey's Island Admiral Cervera and other Spanish officers and sailors captured during the Spanish-American War were held prisoners in July-September 1898. Subsequently a large naval prison was erected. In 1905 the treaty ending the war between Japan and Russia was negotiated in what is known as the Peace Building in this yard.

In 1905 the city's factory products were valued at $2,602,036. During the summer season there is an important trade with the neighbouring watering-places; there is also a large transit trade in imported coal, but the foreign commerce, consisting wholly of imports, is small.

Portsmouth and Dover are the oldest permanent settlements in the state. David Thomson with a small company from Plymouth, England, in the spring or early summer of 1623 built and fortified a house at Little Harbor (now Odiorne's Point in the township of Rye) as a fishing and trading station.

In 1630 there arrived another band of settlers sent over by the Laconia Company. They occupied Thomson's house and Great Island (New Castle) and built the "Great House" on what is now Water Street, Portsmouth, This settlement, with jurisdiction over all the territory now included in Portsmouth, New Castle and Greenland, and most of that in Rye, was known as "Strawberry Banke" until 1653, when it was incorporated (by the government of Massachusetts) under the name of Portsmouth. There was from the first much trouble between its Anglican settlers sent over by Mason and the Puritans from Massachusetts, and in 1641 Massachusetts extended her jurisdiction over this region. In 1675, however, New Hampshire was constituted a separate province, and Portsmouth was the capital until 1775. In 1693 New Castle (pop. 1900, 581), then including the greater part of the present township of Rye, was set apart from Portsmouth, and in 1703 Greenland (pop. 1900, 607) was likewise set apart. One of the first military exploits of the War of Independence occurred at New Castle, where there was then a fort called William and Mary. In December 1774 a copy of the order prohibiting the exportation of military stores to America was brought from Boston to Portsmouth by Paul Revere, whereupon the Portsmouth Committee of Safety organized militia companies, and captured the fort (Dec. 14).

In 1849 Portsmouth was chartered as a city.

Portsmouth was the birthplace of Governor Benning Wentworth (1669-1770) and his nephew Governor John Wentworth (1737-1820); of Governor John Langdon (1739-1819); of Tobias Lear (1751-1829), private secretary of General Washington from 1775 until Washington's death, consul-general at Santo Domingo in 1802-1804, and negotiator of a treaty with Tripoli in 1805; of Benjamin Penhallow Shillaber (1814-1890), humorist, who is best known for his "O Pioneers!" and "Portiment's" by James A. Fields, of James T. Fields, of Thomas Bailey Aldrich and of General Fitz John Porter. From 1807 to 1816 Portsmouth was the home of Daniel Webster.

PORTSMOUTH, a city and the county-seat of Scioto county, Ohio, U.S.A., picturesquely situated at the confluence of the Scioto and Ohio rivers, 95 m. S. of Columbus. Pop. (1910 U.S. census) 23,481. Portsmouth is served by the Baltimore & Ohio South-Western, the Chesapeake & Ohio and the Norfolk & Western railways, also by passenger and freight boats to Pittsburgh, Cincinnati and intermediate ports. The city has a Carnegie library, a municipal hospital, an aged women's home (the First ladies' home) extending along the Ohio for 8 m. and arranged in three groups are works of the "Mound Builders." There are two small city parks, and a privately owned resort, Millbrook Park. The surrounding country is a fine farming region, which also abounds in coal, fire-clay and building stone. Natural gas is used for light, heat and power. In 1905 the city's factory products were valued at $7,070,674, of which $4,288,853 was the value of boots and shoes. The Norfolk & Western has division terminals here.

The first permanent settlement in the immediate vicinity was made in 1796. In 1795 Thomas Parker, of Alexandria, Virginia, laid out a village (which was named Alexandria) below the mouth of the Scioto, but as the ground was frequently flooded the village did not thrive, and about 1810 the inhabitants removed to Portsmouth. Portsmouth was laid out in 1803, incorporated as a town in 1815, and chartered as a city in 1851. The Ohio and Erie canal was opened from Cleveland to Portsmouth in 1832.

PORTSMOUTH, a city of Norfolk county, Virginia, U.S.A., on the Elizabeth river opposite Norfolk. Pop. (1910, census), 33,190. Portsmouth is served by the Atlantic Coast Line, the Seaboard Air Line, the Chesapeake & Ohio and the New York, Philadelphia & Norfolk (Pennsylvania system), the Southern, and the Norfolk & Western railways, by steamboat lines to Washington, Baltimore, New York, Providence and Boston, by ferries to Norfolk, and by electric lines to numerous suburbs. There is a 30-ft. channel to the ocean. Portsmouth is situated on level ground only a few feet above the sea; it has about 24 m. of water-front, and adjoins one of the richest trucking districts in the Southern States. Among the principal buildings are the county court house, city hall, commercial building, United States naval hospital, post office building, high school and the Portsmouth orphan asylum, King's Daughters' hospital and the old Trinity Church (1762). In the southern part of the city is a United States navy yard and station, officially the Norfolk Yard (the second largest in the country), of about 450 acres, with three immense dry docks, machine shops, warehouses, travelling and water cranes, a training station, torpedo-boat headquarters, a powder plant (20 acres), a naval magazine, a naval hospital and the distribution headquarters of the United State Marine Corps. The total value of the city's factory products in 1905 was only $145,430. The city is a centre of the Virginia oyster "fisheries." Portsmouth and Norfolk form a customs district, Norfolk being the port of entry, whose exports in 1908 were valued at $11,326,817, and imports at $1,390,044.

Portsmouth was established by act of the Virginia assembly in 1752, incorporated as a town in 1852, and chartered as a city in 1858. Though situated in Norfolk county, the city has been since its incorporation administratively independent of it. Shortly before the War of Independence the British established a marine yard where the navy yard now is, but during the war it was confiscated by Virginia and in 1801 was sold to the United States. In April 1861 it was burned and abandoned by the Federals, and for a year afterwards was the chief navy yard of the Confederates. Here was constructed the iron-clad "Virginia" (the old " Merrimac"), which on the 9th of March 1862 fought in Hampton Roads (q.v.) the famous engagement with the "Monitor." Two months later, on the 9th of May, the Confederates abandoned the navy yard and evacuated Norfolk and Portsmouth, and the "Virginia" was destroyed by her commander, Josiah Tattnall.

PORT SUDAN, a town and harbour on the west coast of the Red Sea, in 10° 37' N. 35° 12' E., 700 m. by boat S. of Suez and 405 m. by rail N.E. of Khartoum. Pop. (1906), 4289. It is the principal port of the Anglo-Egyptian Sudan and the headquarters of the customs administration. The coral reefs fringing the coast are here broken by a straight channel with deep water giving access to the harbour, which consists of a series of natural
PORT TOWNSEND—PORTUGAL

channels and basins. The largest basin is 900 yds. long by 500 broad and has a minimum depth of 6 fathoms. On the north side of the inlet are quays (completed 1909), fitted with electric cranes, &c. Here are the customs-house, coal sheds and goods station. The town proper lies on the south side of the inlet, connected with the quays by a railway bridge. Besides government offices the public buildings include hospitals, and a branch of the Gordon College of Khartum. Beyond the bridge in the upper waters of the inlet is a dry dock. The climate of Port Sudan is very hot and damp and fever is common. Adjacent to the town is an arid plain without vegetation other than mimosa thorns. Some 10 m. west is a line of hills parallel to the coast.

The port dates from 1905. It owes its existence to the desire of the Sudan administration to find a harbour more suitable than Suakin (q.v.) for the commerce of the country. Such a place was found in Mersa Sheik Bahgut (or Barud), 36 m. north of Suakin, a harbour so named from a saint whose tomb is prominent on the northern point of the entrance. When the building of the railway between the Nile and the Red Sea was begun, it was determined to create a port at this harbour—which was renamed Port Sudan (Bander es-Sudan). Up to the end of 1909 the total expenditure by the government alone on the town and harbour-works was £691,430. The railway (which has terminated both at Port Sudan and Suakin) was opened in January 1906 and the customs-house in the May following. Port Sudan immediately attracted a large trade, the value of goods passing through it in 1906 exceeding £470,000. In 1908 the imports and exports were valued at about £750,000. It is a regular port of call of British, German and Italian steamers. The imports are largely cotton goods, provisions, timber and cement; the exports gum, raw cotton, ivory, sesame, dura, senna, coffee (from Abyssinia), goat skins, &c. Forty miles north of Port Sudan is Mahommad Gul, the port for the mines of Gebet, worked by an English company.

The Foreign Office Report, Trade of Port Sudan for the Year 1906, by H. G. Adams, gives a threefold classification of the trade, in the order of magnitudes, at the beginnings of the port. A chart of the harbour was issued by the British Admiralty in 1908. See also Sudan: § Anglo-Egyptian.

PORT TOWNSEND, a city, port of entry and the county-seat of Jefferson county, Washington, U.S.A., on Quimper Peninsula, at the entrance to Puget Sound, about 40 m. N.N.W. of Seattle. Pop. (1905), 3300; (1910), 4787. The city is served by the Port Townsend Southern railway (controlled by the Northern Pacific, but operated independently) and by steamship lines to Victoria (British Columbia), San Francisco, Alaska and Oriental ports. The harbour is 7½ m. long and 3½ m. wide, and is deep, well sheltered and protected by three forts, of which Fort Worden is an excellently equipped modern fortification ranking with the forts at Portland (Maine), San Francisco, Boston and New York. The United States government has at Port Townsend a customs-house, a revenue cutter service, a marine hospital, a quarantine station and an immigration bureau. Port Townsend is the port of entry for the Puget Sound customs district. In 1908 its exports were valued at $37,547,553, much more than those of any other American port of entry on the Pacific; its imports were valued in 1908 at $21,876,367, being exceeded among the Pacific ports by those of San Francisco only. The city has a considerable trade in grain, lumber, fish, livestock, dairy products and oil; its manufactures include boilers, machinery and canned and pickled fish, especially salmon and herring. Port Townsend was settled in 1854, incorporated as a town in 1860 and chartered as a city in 1890.

PORTUGAL, a republic of western Europe, forming part of the Iberian Peninsula, and bounded on the N. and E. by Spain, and on the S. and W. by the Atlantic Ocean. Pop. (1900), 5,036,267; area, 34,254 sq. m. These totals do not include the inhabitants and area of the Azores and Madeira Islands, which are officially regarded as parts of continental Portugal. In shape the country is protected by three forks, of which Port Wolden is the largest, with its greatest length (362 m.) from N. to S., and its greatest breadth (140 m.) from E. to W. For map, see Spain. The land frontiers are to some extent defined by the course of the four principal rivers, the Minho and Douro in the north, the Tagus and Guadiana in the south; elsewhere, and especially in the north, they are marked by mountain ranges; but in most parts their delineation is originally based on political considerations. In no sense can the boundary-line be called either natural or scientific, apart from the fact that the adjacent districts on either side are poor, sparsely populated, and therefore little liable to become a subject of dispute. The Portuguese seaboard is nearly 500 m. long, and of the six ancient provinces all are maritime except Traz-os-Montes. From the extreme north to Cape Mondego and thence onward to Cape Carvoeiro the outline of the coast is a long and gradual curve; farther south is the prominent mass of rock and mountain, which terminates the Minho and Douro and Espichel; south of this, again, is another wide curve, with the headland of Sines, and extending to Cape St Vincent, the south-eastern extremity of the country. The only other conspicuous promontory is Cape Santa Maria, on the south coast. The only deep indentations of the Portuguese littoral are the lagoon of Aveiro (q.v.) and the estuaries of the Minho, Douro, Mondego, Tagus, Sado and Guadiana, in which are the principal harbours. The only islands off the coast are the dangerous Farilhões and Berlings (Portuguese Berlingas) off Cape Carvoeiro.

Physical Features.—Few small countries contain so great a variety of natural features. It is the meeting-place of the Serra da Estrela and the ranges of the northern frontier are almost alpine in character, although they nowhere reach the limit of perpetual snow. At a lower level there are wide tracts of moorland, covered in many cases with sweet-scented cistus and other wild flowers. The lagoon of Aveiro, the estuary of the Sado and the broad inland lake formed by the Tagus above Lisbon (q.v.), recall the waterways of Holland. The sand-dunes of the western coast and the Pinhal de Leiria (q.v.) resemble the French Landes. The Algarve and parts of Alentejo might belong to North-West Africa rather than to Europe. The Paiz do Vinho, on the Douro, and the Tagus near Abrantes, with their terraced bush-vines grown up the steep banks of the rivers, are often compared with the Rhine and the Elbe. The harbours of Lisbon and Oporto are hardly inferior in beauty to those of Naples and Constantinople. Apart from this variety, and from the historic interest of such places as Braga, Bussaco, Cintra, Colimba, or Torres Vedras, the attractiveness of the country is due to its colouring, and not to grandeur of form. Its landscapes are on a small scale; it has no vast plains, no inland seas, no mountain as high as 7000 ft. But its flora is the richest in Europe, and combines with the brilliant sunshine, the vivid but barren beauty of the country, the confused and discoloured ten- tined houses to compensate for any such deficiency. This wealth of colour gives to the scenery of Portugal a quite distinctiv e character and is the one feature common to all its varieties.

The orography of Portugal cannot be scientifically studied except in relation to that of Spain, for there is no dividing line between the principal Portuguese ranges and the highlands of Galicia, Leon and Spanish Extremadura. Three so-called Portuguese systems are sometimes distinguished: (1) the Transmontane, stretching between the Douro and the Minho; (2) the Beirene, between the Douro and the Tagus; and (3) the Tagus. The following ranges belong to the Transmontane system, which is the southern extension of the mountains of Galicia: Peneda (4728 ft.), forming the watershed between the river Lima and the lower Minho; the Serra de Geres (4817 ft.), which rises like a gigantic wall between the Lima and the Homem, and sends off a spur known as the Amarena, Oural and Nora, south-westward between the Homem and the Cavado; La Raya Seca, the continuation of the Serra de Geres (362 ft.) and contains the sources of the Cavado; Cabreira (4196 ft.), which contains the sources of the river Ave and separates the basins of the river Ave and of the Tagus; and the Serra de Carvão (4642 ft.), Villarelo (3547 ft.) and Padrela (3753 ft.), forming together a large massif between the rivers Tamega, Tua and Douro; and Nógueira (4331 ft.) and Borões (3944 ft.), which divide the valley of the Minho from that of the Douro. There are two quite distinct mountain regions. *North of the Mondego it includes Montemuro (4534 ft.), separating the Douro from the upper waters of its left tributary the Paiva; Gralheira (5681 ft.) between the Paiva and the Vouga; the Serra do Caramullo...
PORTUGAL

(3511 ft.), between the Vouga and the Dão; and the Serra da Lapa (3219 ft.), on the western slope of the Tagus between these ranges, but nominally included in the same system, is the Serra da Estrela, the loftiest range in Portugal (6532 ft.). The Estrela Mountains, which enclose the headwaters of the Tagus, are of volcanic origin, from Eocene to Recent, and are continued in the same direction by the Serra de Lousã (3944 ft.). They form the last link in the chain of mountain ranges, known to Spanish geographers as the Carpetano-Vetonica, which extends from the Pyrenees to the Guadarrama. The highest part of the Serra da Estrela constitutes the watershed between the Mondego and Zêzere. Lesser ranges, which are included in the Beirame system and are both volcanic in origin, extend between the rivers Cão and Zêzere; the Guardaúna and Moradal, separating the Zêzere from the Ponsul and Alva, tributaries of the Tagus; the Serra do Alco, and various ridges of the Estrelas, are noteworthy as the sources of a number of considerable waterways. The Trasantiago Mountains cannot rightly be described as a single system, as they consist for the most part of isolated ranges or massiefs. The Serra da Arrabida (1637 ft.) rises between Cape Espichel and Setúbal; São Mamede (3563 ft.), with the parallel and lower Serra de Portalegre, extends along part of the frontier of northern Alemtejo. Ossa (2129 ft.), Caixeiro (1483 ft.), Monturado (1378 ft.) and Mendro (1334 ft.) form the high ground between the rivers Sado, Sorrin and East of the Guadiana the outliers of the Spanish Sierra Morena enter Portuguese territory. The Serra Grandola and Monte Cereal, twelve miles to the west of the Mondego, are the loftiest range in southern Estremadura. In the extreme south the ranges are more closely massed together. They include Monchique, with the peak of Pico ou Fôra (2163 ft.), and several other lower ranges. The basalts, or black lava rocks, which are so strikingly notable of these being the plains (campos) of the Tagus valley, and of Aviz or Benavilla, Beja and Ourique, in Alemtejo; the high plateaux (cimas) of Mogadouro in Traz-os-Montes and Ourém lessons the Tagus valley. Olympic lowlands (seiges) of Chaves and Valença do Minho in the extreme north; and the marshy flats (baixas) along the coast of Alemtejo and the southern shore of the lower Tagus.

The river Tagus, which passes through Portugal to the sea—the Douro, Tagus and Guadiana—are described in separate articles. The chief Portuguese tributaries of the Douro are the Tagus' main tributary in Portugal, and rises on the north; of the Tagus, the Ocrea, Ponsul and Zêzere on the north, the Niza and Sorraia on the south, while into the Guadiana, its right or Portuguese bank, flow the Cáia, Desegue, Cobres, Ourique and Vouga. These four country districts drain to the Atlantic, to which all the main rivers flow in a westerly direction except the Guadiana, which turns south by east in the lower part of its course. The Minho (Spanish Miño) is the most northerly river of Portugal, and in size and importance is only inferior to the three great waterways already mentioned. It rises in the highlands of Galicia, and, after forming for some distance the boundary between that province and Entre-Minho-e-Douro, falls into the sea below the Douro. The waters are not large, and the river is navigable as far as Paredes. The Minho ascends the river as far as Salvatierra in Galicia (20 m.), but larger vessels are excluded by a sandy bar at the mouth. Between the Minho and Douro there are the Lima (Spanish Lérez or Antela), which also rises in Galicia, and the Vouga, the other Portuguese tributary of the Vouga do Castello; the Cavado, which receives the Homem on the right, and forms the port of Espozende in its estuary; and the Ave, which rises in a small lake near the town of Cavado, and falls into the Vouga near the mouth of the Ave.

Between the Douro and the Tagus the Vouga rises in the Serra da Lapa and reaches the sea through the lagons of Aveiro; the Mondego flows north-east through a long ravine in the Serra da Estrela, and then bends back so as to flow west-south-west. Its estuary contains the important harbour of Figueira da Foz; its chief tributaries are the Dão on the right, and the Alva, Ceira and Arouca on the left; its length is 125 m. of which 32 m. are navigable by river steamers. The Alva is navigable to Vila Nova de Foz, and is at the mouth, as well as those of Caldas de Monchique, Caldas da Rainha and Vidago.

The Mondego, which is formed by the junction of several lesser streams and flows north-west to the port of Setubal; and the Mira, which takes this direction from its headwaters south of Monte Virágia to the port of the same name, is navigable to the mouth of the Sado. The waters of the Odulouca and Silves form the harbour of Villa Nova de Portimão, and the Algoz, Algibe or Quarteira, and the Alcacer flow into the sea farther east. Portugal abounds in hot and medicinal springs, such as those of Caldas de Monchique, Caldas da Rainha and Vidago.

Geology.—By far the greater part of Portugal is occupied by an extensive Neogene and Palaeozoic age, and by extensive masses which probably represent an extension of the Aitarna Beds. The western mountains are formed of these rocks, and it is only near the coast and in the plain of the Tagus that later deposits are found. The Mesozoic beds form an irregular triangle at the port of Lisbon and Torres Novas on the south to Oporto on the north. There are also a narrow strip along the southern shores of the Algarve and a

few smaller patches along the western coast. The Tertiary deposits of the Tagus are found in the western and northern areas near the coast. Of the Lower Palaeozoic rocks the Ordovician appears to be the most widely spread. Large areas have been covered by the Cambrian, but it is only at Villa Bolim, about 6 m. (S. of Elvas), that the Carboniferous beds have been described. The Devonian fossils have been found. The Lower Carboniferous, which belongs to the "Culm" facies so widely spread in southern Portugal, occupies a wide belt in southern Portugal. The Upper Carboniferous is very restricted in extent, and occurs in small basins like those of the Central Plateau of France, resting unconformably upon the rocks below. The deposits in these basins are of varius facies, but are mainly of marine origin, which lie seams of coal. It is possible that some of these deposits may belong to the Permian or at least to the Perma-Carboniferous. Of the Mesozoic systems the Jurassic is the most widely-spread. Supposed Triassic beds are found, but they are confined chiefly to the eastern margins of the Mesozoic area north of Lisbon. The Jurassic deposits are partly marine and partly fresh-water or terrestrial, including beds of lignite. On the whole, excepting in eastern Algarve, the Upper Jurassic beds indicate occurrence of a shore-line. The Cretaceous system is very limited in extent. Its most interesting feature is the occurrence near its summit, of many Miocene beds and deposits have been found in the eastern district. Here both Cretaceous and Tertiary forms are found, and the Mondego beds seem to represent the passage between the two systems. At the close of the Cretaceous period great eruptions of basaltic rock took place all over the country. The volcanic rocks then formed are followed by marine deposits of Oligocene and Miocene age. Towards the north these are associated with fresh-water limestones, indicating the presence of a wide inland depression. The rocks of the Cretaceous and Tertiary periods, especially of the Tagus. The contemporaneous beds inland are of fresh-water origin. Eruptive masses of various age are found in many localities. The Cintra granite sends veins into the base of the Upper Jurassic, and there are very extensive igneous rocks in the Monchique system. The geology of Portugal is petrographically of great interest. It consists chiefly of elaeolite-syenite and other rocks derived from the same igneous mass.

Climate.—The climate of Portugal is equable and temperate. Lisbon, Coimbra, Évora and Oporto have mean temperatures between 60° and 61° F., and the daily variation nowhere exceeds 2°. The rainfall of Algarve is partly caused by the very heavy rainfall precipitated on Portugal as one of the westmost countries of Europe and the one most exposed to the Atlantic. The rainfall has been as heavy as 16 ft. in a year, and sometimes, in the winter of 1909-1910, great damage is wrought by floods. Heavy fogs and also common along the coast, rendering it dangerous to ships. The rainfall is heaviest in the north and on the Serra da Estrela; it is least in Algarve. A fine climate and equability are the distinguishing features of the Algarve, which is mainly in Beira and Estremadura, especially at Cintra and Coimbra, and in the northern provinces. In the deep valleys where the mountains keep off the cold, it is especially warm in summer; the summits of the mountains snow lies for many months. The meteorological station on the Serra da Estrela, with a mean annual temperature of 44° F., is the coldest spot in Portugal and the so-called Portuguese observation (Sputnik Ludicani) from a mean of 46°-3° and Guarda of 50°-3°. Even in Lisbon the yearly variation is not less than 90°. In Alentejo the climate is very unfavourable, and indeed the heat is not so great as in Algarve (where Lagos has a mean of 65°), the country has a more desolate appearance; while in winter when the Tagus overflows, unhealthy swamps are left. Notwithstanding that Algarve is hotter than Alentejo, a profuse vegetation takes away much of the tropical character, and the shocks of earthquake are frequently felt, and recall the great earthquake of Lisbon (g.s.) in 1755.

Flora.—The amount of the fauna of the Iberian Peninsula as a whole is given under SPAIN. Wolves are found in the wilder parts of the Serra da Estrela, and wild boars are preserved in some districts. As far as the constituents of its flora are concerned, the Portuguese flora is peculiar, and its distribution is peculiar. The vegetation of Spain is distributed in clearly marked zones; but over the whole of Portugal, except the hottest parts of Algarve and Alemtejo, the plants of northern Spain are found, with the exception only of the extreme south of the country, where the importation of such plants as the agave, the Mexican opuntia, the American maple, the Australian eucalyptus, the Scotch fir and the so-called Ponic observation (Sputnik Ludicani) from a mean of 46°-3° and Guarda of 50°-3°. There are many fine tracts of forest, among which may be mentioned the famous convent-wood of Bussaco (g.v.; cork
trees are extensively cultivated, Barbary oaks (Quercus ballota, Port. oesteira) furnish edible acorns and excellent timber for charcoal, and the cork oaks (Ceratonia silicica, Port. afiverbida) also produce edible seed-pods somewhat resembling beans. Elens, limes and poplars are common north of the Tagus, ilaxes, araucarias, myrtles, magnolias and a great variety of conifers in all parts. The Serra da Estrela has some fine Roman, and the lagoon of Aveiro contains a great number of aquatic plants.

Inhabitants.—The population of Portugal numbered 4,550,000 in 1878, 5,040,729 in 1890 and 5,423,132 in 1900. These totals include the inhabitants of the Azores and Madeira, which together amounted to 406,865 in 1900. Few immigrants enter the country, but the birth-rate is about 30 per 1000, while the mortality is only about 20 per 1000. Large bodies of emigrants, chiefly recruited from the sober, hardy and industrious peasantry of the northern provinces, annually leave Portugal to seek fortune in America. A few go to the Portuguese colonies, the great majority to Brazil. Many Portuguese now choose the more considerable savings and settle on the land. The mortality is highest among male children, and the normal excess of females is in the proportion of 100 to 100. Six-sevenths of the population of continental Portugal inhabit the provinces north of the Tagus. The density of population is greatest in Madeira (479.5 per sq. m. in 1900), Entre-Minho-e-Douro (419.5) and the Azores (277.9); nowhere else does it reach 200 per sq. m. In Alemtejo the percentage sinks to 45.1, and for the whole country, including the islands, it amounts only to 122.8.

The Portuguese people is composed of many racial elements. Its earliest known ancestors were the Iberians (51.1.), a race of semi-nomadic, especially in the north, are closely akin to the Galician and Asturian Spangiards in character, physique and dialect; and these three ethnical groups—Portuguese of the north, Galicians, Asturians—may perhaps be regarded as the purest representatives of the Spanish stock. The first settlers with whom they intermarried were probably Carthaginians, who were followed in smaller numbers by Greeks; but the attempts which have sometimes been made to ascribe certain attributes of the Portuguese to the influence of these races are altogether fanciful. The Romans, whose supremacy was not seriously threatened for some six centuries after the Punic Wars, gave to Portugal its language and the foundation of its civilization; there is, however, no evidence that they seriously modified the physical type or character of its people. In these respects the Suevic and Visigothic conquests left a more permanent impression, especially in the northern provinces. After 711 came the long period of Moorish (i.e. Arab and Berber) predominance. The influence of the Moors was greatest south of the Tagus. In Alemtejo, and still more in Algarve, Arab and Berber types are common; and the influence of these races can everywhere be discerned in the architecture, handcrafts and speech of the peasantry. So complete was the intellectual triumph of the Moors that an intermediate “Mozarabic” population arose, whose blood, Christian in religion, but Arab in language and manners. Many of the Mozarabs even adopted the characteristic Mahomedan rite of circumcision. Under the tolerant rule of Islam the Portuguese Jews rose to a height of wealth and culture unparalleled in Europe; they intermarried with the Christians both at this period and after their forced conversion by King Emanuel I. (1405-1421). After 1495 yet another ethnical element was introduced into the nation, through the importation of African slaves in vast numbers. Negroid types are common throughout central and southern Portugal. No European race confronted with the problem of an immense coloured population has succeeded more successfully than the Portuguese and their kinmen in Brazil; in both countries intermarriage was freely resorted to, and the offspring of these mixed unions are superior in character and intelligence to most half-breeds.

National Characteristics.—The normal type evolved from this fusion of many races is dark-haired, sallow-skinned, brown-eyed and of low stature. The poorer classes, above all the fishermen and small farmers, are physically much finer than the well-to-do, who are prone to excessive stoutness owing to their more sedentary habits. The staple diet of the labouring classes and small farmers is fish, especially the dried codfish called bacalhau, rice, beans, maize bread and meal, olive oil, fruit and vegetables. Meat is rarely eaten except on festivals. In Alemtejo chestsnuts and figs are important articles of diet. Drunkenness is extremely rare. There is no single national dress, but a great variety of picturesque costumes are worn. The sashes, broad-brimmed hats, popolinier, frilly skirts and blouses of the men, and the brilliant cotton dresses and gold or silver filigree ornaments worn on holidays by the women are common throughout the country; but many classes have their own costumes, varying in detail according to the district or province. These costumes may be seen at their best at bull-fights and at such popular festivals as the romarias or pilgrimages, which combine religion with the attractions of a fair. The national sport of bull-fighting (gav.) is conducted as humanely as possible, for the Portuguese are lovers of animals. The artistic sense of the nation is perhaps greatest among the peasantry, although Portugal has the most illiterate peasantry in western Europe. It is manifested in their poetry and music even more than in their admirable costumes and in the good taste which has preserved the Roman or Moorish forms of their domestic pottery. Even the men and women who till the soil are capable of improvising verse of real merit, and sometimes excel in the ancient and difficult art of composing extempore amoebean rhymes. In this way, although the ancient ballads are not forgotten, new words are also fitted to the plaintive folk-tunes (fados) which every farm-hand knows and sings, accompanied sometimes by a rude clarinet or bag-pipes, but more frequently by the so-called Portuguese guitar—an instrument which resembles a mandolin rather than the guitars of Italy and Spain. The native dances, slow but not ungraceful, and more restrained than those of Andalusia or the south of France, are obviously Moorish in origin, and depend for their main effects on the movement of the arms and body. Many curious superstitions survive in the country districts, including the beliefs in witches (feiticeiras, bruxas) and werewolves (lobis-homens); in sirens (sereias) which haunt the dangerous coast and lure fishermen to destruction; in fairies (fados) and in many kinds of enchantment. It will be observed that the nomenclature of Portuguese folk-lore suggests that the popular superstitions are of the most diverse origin—Latin, Greek, Arabic, native (lobis-homen is the Latin lupus homo, wolf-man, sereia is the Greek euphron, witch), or Aruigian, fiteira and fada Portuguese. Other beliefs can be traced to Jewish and African sources.

Chief Towns.—The chief towns of Portugal are Lisbon (pop. 1900, 356,000), the capital and principal seaport; Oporto (167,955), the capital of the northern provinces and, after Lisbon, the most important centre of trade; the seaports of Setubal (22,074), Ilhavo (12,617), Povoa de Varzim (12,621), Vizan (12,173), Faro (11,789), Ovar (10,462), Olhao (10,000) Vianna do Castello (10,000), Aveiro (9975), Lagos (8291), Leiria (7500) and Figueira da Foz (6221); and the inland cities or towns of Braga (24,202), Lousã (22,478), Coimbra (18,144), Evora (16,050), Covilhã (15,496), Elvas (15,681), Portalegre (11,820), Palmella (11,479), Torres Novas (10,746), Silves (9878), Lamego (9471), Guimaraes (9104), Beja (8855), Santarem (8628), Viseu (8052), Estremoz (7920), Monchique (7345), Castello Branco (7288), Abrantes (7255), Torres Vedras (6900), Thomar (6888), Vila Real (6716), Chaves (6388), Guarda (6124), Cinta (914), Braganza (5553), Mafra (4760), Leiria (4450), Batalha (3858), Almeida (3230), Alcochete (2500), Bussaco (1661). All these are described in separate articles.

Communications.—Up to 1851 there was practically no good carriage road south of Portimao, and not until 1884 did any connection exist between Lisbon and Cintra. In 1853 the work of constructing a proper system of roads was undertaken, and by the end of the century all the larger towns were linked together by the main or royal highways to which the “districts” and “municipalities” are subject. Each class of road was named after the authority responsible for its construction and upkeep. In some of the remoter rural districts there are only bridle-paths, or rough tracks, which are not impassable in wet seasons, and are never suitable for vehicles less solid than the Portuguese ox-carts. The first railway was opened in 1853 to connect Lisbon with Badajoz. In 1910 1758 m. were completed, of which 672 m. were state lines. The Portuguese

TOPIC AGRO-FORESTAL. Here, in a country so richly endued with a combination of resources and opportunities, the farmer follows the rule, "one and one make two," taking advantage of the peculiarities of his country. The intensive exploitation of the land, the use of fertilizers, the irrigation of the Iberian plateau, the cultivation of rice, the rearing of horses, the baking of bread, and the distillation of brandy, all contribute to the development of the country's productive potential.

Portuguese Wine.

Wine is an important product of Portugal, with a long history and a rich tradition. The country is known for its fine wines, which are produced in a variety of regions, each with its own unique characteristics. From the Douro Valley, famous for its port wine, to the Alentejo and Beira Interior, known for their red and white wines, Portugal offers a wide range of options for wine enthusiasts.

Fisheries.

Portugal is a major fishing nation, with a long coastline and abundant marine resources. The country has a rich tradition of seafood production, with a variety of fish and seafood species being caught and consumed. From the iconic sardines of the western coast to the more subtle flavors of the eastern coast, Portugal's seafood is a key part of the country's culinary heritage.

Commerce.

Portugal's commerce is diverse and includes a wide range of goods and services. The country is known for its textiles, ceramics, and wine production, as well as its traditional handicrafts. The port of Lisbon is a major hub for trade, with exports including textiles, ceramics, and wine, as well as imports of various goods.

Manufactures.

The manufacture of textiles, ceramics, and wine is a major industry in Portugal, with a long history and a rich tradition. The country's textile industry is known for its high-quality products, while its ceramics industry is renowned for its intricate designs and patterns.

Currency.

The currency of Portugal is the Euro, which it adopted in 1999 as part of the European Union. The Euro is used throughout the country, and is the primary currency for all transactions.

Money.

Portugal has a stable and dependable currency, with a consistent value. The Euro is widely accepted throughout the country, and is used for all transactions.

In 1910 the principal exports, in order of value, were wine (chiefly port and Madeira), raw and manufactured cotton, cork, leather, preserved fish, fruits and vegetables, cotton and yarn, copper ore, timber, olive oil, skins, grain and flour, tobacco and wool. The imports were raw and manufactured cotton, wool and silk, wheat and flour, coal, iron, and steel. The export trade of the Southwestern provinces, many other fresh-water fish common elsewhere in Europe, including pike, perch, tench and chub, are not found.
treasury was deeply indebted, had a capital of £1,500,000, and a monopoly of note issue in continental Portugal, but the notes of the Ultramarine Bank were legal tender in the colonies. The notes of Ultramarine Bank in circulation amounted in value to about £4,000,000. For an account of the Monte Pio Geral, which is a combined bank, pawnbroking establishment and benefit society, see PawnsBroking; the deposits in the Monte Pio and the State Savings Bank, see in 1910 to some £5,228,000. There are also many private banks, including savings banks. Gold is the standard of value, but the actual currency is chiefly Bank of Portugal notes. The values of coins are represented in figures, and expressed in monetary units which do not actually exist. The milres, 1000 reis of the par value of 4s. 9d. (or 4·5 milres to the pound sterling) and the contos of reis (1000 milres) are used for the calculation of large sums. The chief sources of revenue were customs duties, taxes on land and industries, duties on tobacco and breadstuffs, the Lisbon octroi, receipts from national property, regale, lands, &c. The total revenue of the State (or of £5,000,000) was incurred for the service of the consolidated debt; payments for the civil list, cortes, pensions, &c., amounted to more than £2,000,000, and the cost of public works to nearly as large a sum. The ministries of war and marine together spent about £3,500,000 each year. The practice of meeting deficits by loans, together with the great expenditure, after 1853, on public works, especially roads and railways, explains the rapid growth of the national debt in modern times. In 1853 the total debt was £1,857,430, of which £1,282,680 was internal and £374,740 external. In 1859 the total debt was £1,090,000 and in 1891 the finances of the kingdom reached a crisis, from which there was no escape except by arranging for a reduction in the amount payable as interest (see History, below). By the law of the 26th of February 1892 30% was deducted from the internal debt payable in currency; by the law of the 26th of April 1893 63% was deducted from the interest on the external debt, due in gold. A law of the 9th of August 1902 provided for the conversion of certain gold debts into three series of consolidated debt, at reduced interest. In 1900 the total outstanding debt amounted to £1,584,340, of which £1,073,235 was national, £205,140 was municipal and £106,000 was ecclesiastical. The new legislation follows: new external 3% converted in three series, £342,225-465: 43% tobacco loan £7,267,480; internal 3% (quoted in London) £113,122,927. Internal debt at 3·4 and 4·4% was also outstanding to the amount of £7,213,506.

Constitution.—Up to October 1910 the government was an hereditary and constitutional monarchy, based on the constitutional charter which was granted by King Pedro IV. on the 29th of April 1826, and was afterwards several times modified; the most important changes were those effected by the acts of the 5th of July 1857, the 24th of July 1885, and the 28th of March and 25th of September 1895. The revolution of the 5th of October 1910 brought the monarchy to an end and substituted republican government for it. The monarchical constitution recognized four powers in the state—the executive, moderating, legislative and judicial. The two first of these were vested in the sovereign, who might be a woman, and who shared the legislative power with two chambers, the Camara dos Pais or House of Peers, and the Camara dos Deputados or House of Commons; these were collectively styled the Cortes Gerais, or more briefly the Cortes. The royal veto could not be imposed on legislation passed twice by both houses. The annual session lasted four months, and a general election was necessary at the end of every four years, by adult male population after a description, sentencing both houses adjudicated upon all cases of conflict between Peers and Commons; should it fail to reach a decision, the dispute was referred to the sovereign, whose award was final. Up to 1885 some men sat in the House of Peers by hereditary right, while others were nominated for life. It was then decided that such rights should cease, except in the case of princes of royal blood and members then sitting, and that when all the hereditary peers had lapsed the house should be composed of the princes of the royal blood, the archbishops and bishops of the continental dioceses, a hundred legislative peers appointed by the king for life, and fifty elected every new parliament by the Commons. In 1895 the number of nominated life peers was reduced to ninety and the elective branch was abolished. Subject to certain limitations and to a property qualification, any person over 40 years of age was eligible for a peer. The titles and social position lost by the Portuguese aristocracy were not affected when its political privileges were abolished. In the nomination of life peers, and in certain administrative matters the sovereign was advised by a council of state, whose twelve members were nominated for life and were principally past or present ministers. The sovereign exercised his executive power through a cabinet which was responsible to the Cortes, and consisted of seven members, representing the ministries of (1) the interior, (2) foreign affairs, (3) finance, (4) justice and worship, (5) war, (6) marine and colonies, (7) public works, industry and commerce. The House of Commons was composed of 148 members, representing the 26 electoral divisions of Portugal, the Azores and Madeira, which returned 113 elected members and 35 representatives of minorities, and of 7 members representing the colonies. Peers, naturalized foreigners and certain employees of the state were unable to sit in the House of Commons; members were required to be graduates of one of the highest, secondary or professional schools, or to possess an income of not less than 400 milres (£88). All members might, in connexion with their official duties, travel free on railways and ships owned by the state; but since 1892 none received any salary except the colonial members, who were paid 100 milres (£2) per month during the session, and 50 milres (£1) per month during the remainder of the year. All male citizens 21 years old who could read and write, or who paid taxes amounting to 500 reis yearly, had the parliamentary franchise, except convicts, beggars, undischarged bankrupts, domestic servants, workmen permanently employed by the state and soldiers or sailors below the rank of commissioned officer. (For changes made under republican rule, see History, § 8.) Local Government.—Continental Portugal was formerly divided for administrative purposes into six provinces which corresponded to a great extent with the natural geographical divisions of the country. The provinces into which Portugal is now divided, which are still commonly used, are Entre-Minho-e-Douro (also called Entre-Douro-e-Minho or Minho), Tras-os-Montes, Beira, Estremadura, Estremadura, and Alentejo. Another administrative division of less antiquity, comprised the present districts of Aveiro and Oporto, or part of Beira and Entre-Minho-e-Douro. The six provinces were subdivided on Raynaud's proposals in 1835, and were again divided by the chief town, as follows: Entre-Minho-e-Douro into Vianna do Castello, Braga, Oporto, Traz-os-Montes, into Villa Real, Braganza; Beira, into Aveiro, Vizeu, Coimbra, Guarda, Castello Branco; Estremadura, into Leria, Santarem, Lisbon; Alentejo, into Portalegre, Evora, Beja; Algarve was renamed Faro. In 1910 the Azores comprised three districts and Madeira formed one. Each district was governed by a deputy composed of (1) the civil governor, who was nominated by the central authority and presided over the commission; (2) the administrative auditor; and (3) three members chosen by indirect suffrage. The districts were divided into communes (conelhos), which were administered by a mayor nominated by the central authority. The mayor could not preside over the council, which appointed one of its own members to preside and to give effect to its decisions. The communes were subdivided into parishes (freguesias), which were administered by the elected community (Junta de Parochia) over which the parish priest (presaio) presided, and by the regedor, an official who represented the mayor of the commune and was nominated by the civil governor. The central authority had almost always supervision through its representatives, the civil governor, mayors and regedores.

Justice.—In 1910 Portugal was divided into 193 judicial districts (Department of Justice). In cases of interdict the three courts of appeal (tribunais de relacja) sat at Lisbon, Oporto and Ponta Delgada (Azores), and there was a Supreme Court in Lisbon.

Colonies.—At the beginning of the 19th century Portugal possessed a larger colonial empire than any European power except Great Britain and Spain. At the beginning of the 20th century its transmarine possessions had been greatly reduced in size by the loss of Brazil, but were still only surpassed in extent
by those of three powers—Great Britain, France and Germany. Their total area was about 830,000 sq. m., of which 794,000 sq. m. are in Africa. They comprised, in Africa, the Cape Verde Islands, St Thomas and Prince’s Islands, Portuguese Guinea, Angola and Portuguese East Africa, or Mozambique; in India, Goa, Damaun and Diu; in China, Macao; and in the Malay Archipelago part of Timor. All these are described in separate articles. In all the white population is a minority; in most of the climate is unsuitable for European colonization, nor is the commercial value of the colonies commensurate with their cost. Viewed as a whole, Portuguese administration has been carried on under difficulties which have rendered it costly and inefficient, the home government being compelled to contribute a large annual subsidy towards its maintenance. The amount paid in subsidies from 1870 to 1900 was about £1,500,000.

Religion.—Roman Catholicism was the state religion until 1910, but other creeds were tolerated, and the Church lost its temporal authority in 1834, when the monasteries were suppressed and their property confiscated for the first time. There are three ecclesiastical provinces and Pontes Dilha and Evora, each under an archbishop. The archbishop of Braga, whose see is the most ancient, has the title of Primate; the archbishop of Lisbon has the honorary title of Primate of All Portugal. In 1176, the Order of Christ was established, the Azores and the West African colonies. There are fourteen dioceses, of which Oporto is the most important. The annual revenues of the upper hierarchy of the Church amounted, up to 1910, to about £800,000. A large part of the foreign missions have their own places of worship. (See further under History.) Education.—Primary education is regulated by a law of 1844, under which children between the ages of 7 and 15 are bound to attend school, and where, under certain circumstances, they are liable to the parents of a fine and deprivation of civil rights. This law has not been strictly enforced; primary education was never properly organized; and, according to census returns, the proportion of those attending (including children) was from 7% to 8.4% in 1878, 7% in 1890 and 7% in 1900. There were in 1910 5200 public and 1750 private primary schools. In the chief towns there are also technical training courses and lyceums; and the technical education was reorganized in 1894. In 1905 there were state lyceums in each district capital and in Guimarães, Lamego and Amarante; 5 municipal lyceums, at Celorico de Basto, Chaves, Ponte de Lima, Povoa de Varzim and Setubal; 6 lyceums for girls; 13 technical colleges; a secondary school for girls in Lisbon; numerous private secondary schools and ecclesiastical seminaries; industrial, commercial and technical schools; and pilot schools at Lisbon, Oporto, Faro and Ponta Delgada (Azores). Other important educational institutions are described under Lisbon and Oporto. The national university is at Coimbra (q.v.).

During the monarchy, the army was maintained at its normal strength partly by voluntary enlistment and conscription, the chief law regulating it being that of 1887, as variously modified in subsequent years. The cortes fixed the number of conscripts to be called upon to serve for the navy, 500 for the municipal guards and 400 for the fiscal guards. The organization of the army was based on the acts of the 7th of September 1889 and the 24th of December 1901. With these, the section of the Portuguese year of age were liable for service on the 3 years in the regular army, 5 years in the first reserve and 7 years in the second reserve; but exemption could always be purchased. In time of war, the municipal guards, numbering about 2200, and the fiscal guards, numbering 500, might be incorporated in the army. The total effective force of the active army on a peace footing was 1787 officers, 31,281 men, 6479 horses and mules and 100 guns. The total effective force on a war footing, inclusive of reservists, mounted and footed, was 23,000 men, 19,600 horses and mules and 336 guns. Lisbon, Elvas and Angra in the Azores, were considered first-class fortresses, but only Lisbon and Evora, and the chief ports, were equipped. In 1910 the navy consisted of 1 armored vessel, 5 protected cruisers, 2 third-class cruisers, 19 gunboats, 1 torpedo gunboat, 4 torpedo boats, 16 river gunboats, 4 transports and 3 training ships. Twelve other vessels, including those of the coast and river service, were in commission. The whole fleet was manned by about 5000 men.

Bibliography.—Numerous official reports, chiefly statistical, are published periodically in Lisbon; a few are written in French, the largest part in the official language. In concert with the consular and diplomatic reports, they afford a comprehensive survey of the movement of population, the progress of trade, &c. The following state papers deserve special notice: Comunica de fro (1872, 1873), by J. F. Calvão; Minister of Foreign, Ministry of Marine), Le Portugal vinicole (1900), Le Portugal ... agricole (1900), Notas sobre Portugal (2 vols., 1908). For geology, see the section of the Portuguese years of age were written by Cholet and entitiled "Aperçu de la geologie de Portugal," also the "Work of the Portuguese Geological Survey," by Philip Lake, in Science Progress (1896) v. 439-453; both these summaries refer to the most important original papers. Two illustrated volumes by Oswald Crawford, Portugal Old and New (London, 1880) and Round the Calendar (London, 1892) contain much valuable information on agriculture, viticulture and peasant life in the northern provinces. Through Portugal, by Major Martin Hume (London, 1907) and/ and Cintra by S. A. Inchbold (London, 1908), describe the towns, &c., most interesting, illustrated by plates; by coloured, illustrated in colours. Le Portugal (Paris, 1899), by 18 writers, is a brief but encyclopaedic description of continental Portugal. See also Portugal: its Land and Peoples, by W. H. Koebel (London, 1909), and Portuguese Architecture, by W. C. Watton (London, 1908). The following books deal comprehensively with the Portuguese colonies: As Colonias portuguezas, by E. J. de Vasconcellos (Lisbon, 1909); Les Colonies portugueses, by A. de Almada Negreiros (Paris, 1908). (K. J.)

History.

From the centuries which witnessed the destruction of Carthaginian power by Rome, the establishment and decline of Latin civilization, the invasion by Alani; Suevi and other barbarian races, the resettlement under Visigothic rule and the overthrow of the Visigoths by Arab and Berber tribes from Africa, Portugal remained an undifferentiated part of Hispania, until its independence is a result of national consciousness. The Iberian peninsula was one; and its commerce as well. It is true that some Portuguese writers have sought to identify their race with the ancient Lusitani, and have claimed for it a separate and continuous existence dating from the 2nd century B.C. The revolt of Lusitania against the Romans has been regarded as an early manifestation of Portuguese love of liberty, Vithas as a national hero. But this theory, which originated in the 19th century and was perpetuated in the title of The Lusids, has no historical foundation. In 1905 Portugal was an obscure border fief of the kingdom of Leon. Its territories, far from the centres of European civilization and consisting largely of mountains, were relatively poor; they were inhabited by Moors and were, and remained, a backward country. In 1279-1415 the monarchy was consolidated in spite of resistance from the Church, the nobles and the rival kingdom of Castile. In 1415 began a period of crusades and discoveries, culminating in the discovery of an ocean-route to India (1497-1499). From 1490 to 1580 Portugal acquired an empire stretching from Brazil eastward to the Moluccas, reached the zenith of its prosperity and entered upon a period of swift decline. (5) Spanish kings ruled over Portugal from 1581 to 1640. (6) The chief event of the years 1640 to 1755 was the restoration of the Portuguese monarchy. (7) Between 1755 and 1826 the reforms of Pombal and the Peninsular War prepared the country for a change from absolutism to constitutional monarchy. (8) In 1836 the era of constitutional government began.

1. The Establishment of the Monarchy.—The origin of Portugal, as a separate state, was an incident in the Christian reconquest of Spain. Towards the close of the 11th century crusading knights came from every part of Europe to aid the kings of northern and central Spain in driving out the Moors. Among these adventurers was Count Henry of Burgundy, an ambitious warrior who, in 935, married the daughter of Alfons V, king of Leon. The county of Portugal, which had already been won back from the Moors (1055-1064), was included in Theresa's dowry. Count Henry ruled as a vassal of Alfonso VI., whose Galician marches were thus secured against any sudden Moorish raid. But in
1110 Alphonso VI. died, bequeathing all his territories to his legitimate daughter Urraca, and Count Henry at once invaded León, hoping to add to his own dominions at the expense of his suzerain. After three years of war against Urraca and other rival claimants to the throne of León, Count Henry himself died in 1112. He left Theresa to govern Portugal north of the Mondego during the minority of her infant son Alfonso Henriques (Alphonso I): south of the Mondego the Moors were still supreme. Theresa renewed the struggle against her half-sister and suzerain Urraca in 1116–1117, and again in 1120; in 1121 she was besieged in Lanhoso and captured. But a peace was negotiated by the archbishops Diogo Gelmires of Santiago de Compostela and Burdino of Braga, rival churchmen whose wealth and military resources enabled them to dictate terms. Bitter jealousy existed between the two prelates, each claiming to be primates of "all the Spains," and their antagonism had some historical importance in so far as it fostered the growth of separatist tendencies among the Portuguese. But the quarrel was temporarily suspended because both Gelmires and Burdino had reason to dread the extension of Urraca's authority. It was arranged that Theresa should be liberated and should continue to hold the county of Portugal as a feil (honor) of León. During the next five years she lavished wealth and titles upon her lover Fernando Peres, count of Trava, thus estranging her son, the archbishop of Braga and the nobles, most of whom were foreign crusaders. In 1128, after her power had been crushed in another unsuccessful conflict with Leon and Castile, she was deposed by her own rebellious subjects and exiled in company with Peres. She died in 1130.

Alphonso, who became count of Portugal in 1128, was one of the warrior heroes of medieval romance; his exploits were sung by troubadours throughout south-western Europe, and even in Africa "ibn Errik"—the son of Henry—was known and feared. The annals of his reign have been encumbered 1128–1155. with a mass of legends, among which must be included the account of a cortes held at Lamego in 1143; probably also the description of the Valdevez tournament, in which the Portuguese knights are said to have vanquished the champions of León and Castile. Alphonso was occupied in almost incessant border fighting against his Christian or Moorish neighbours. Twenty years of the reign elapsed without a pause in the war, and the frontier were concluded in 1143 by the peace of Zamora, in which Alphonso was recognized as independent of any Spanish sovereign, although he promised to be a faithful vassal of the pope and to pay him a yearly tribute of four ounces of gold. In 1167, however, the war was renewed. Alphonso succeeded in conquering part of Galicia, but in attempting to capture the frontier fortress of Badajoz he was wounded and forced to surrender to Ferdinand II. of León (1169). Ferdinand was his son-in-law, and was probably disposed to leniency by the imminence of a Moorish invasion in which Portugal could render useful assistance. Alphonso was therefore released under promise to abandon all his conquests in Galicia.

He had already won many victories over the Moors. At the beginning of his reign the religious fervour which had sustained the Almoravide dynasty was rapidly subsiding; in Portugal independent Moorish chiefs ruled over cities and petty states, ignoring the central government; in Africa the Almohades were destroying the remnants of the Almoravide power. Alphonso took advantage of these dissensions to invade Alentejo, reinforced by the Templars and Hospitalers, whose respective headquarters were at Soure and Thomar. On the 25th of July 1138 he defeated the combined forces of the Moors on the plain of Ourique, in Alentejo. Legend has magnified the victory into the rout of 200,000 Moorsmen under five kings; but so far was the battle from being decisive that in 1140 the Moors were able to seize the fortress of Leiria, built by Alphonso in 1135 as an outpost for the defence of Coimbra, his capital. In 1144 they defeated the Templars at Soure. But on the 25th of March 1147 Alphonso stormed the fortress of Santarem, and about the same time a band of crusaders on their way to Palestine landed at Oporto and volunteered for the impending siege of Lisbon. Among them were many Englishmen, Germans and Flemings, who were afterwards induced to settle in Portugal. Aided by these powerful allies, Alphonso captured Lisbon on the 24th of October 1147. This was the greatest military achievement of his reign. The Moorish garrisons of Palmella, Cintra and Almada soon capitulated, and in 1158 Alcacer do Sal, one of the chief centres of Moorish commerce, was taken by storm. At this time, however, the Almohades had triumphed in Africa and invaded the Peninsula, where they were able to check the Portuguese reconquest, although isolated bands of crusading adventurers succeeded in establishing themselves in various cities of Alentejo. The most famous of these free-lances was Giraldo Sempavor ("Gerald the Fearless"), who captured Evora in 1166. In 1171 Alphonso concluded a seven years' truce with the Moors; weakened by his wound and by old age, he could no longer take the field, and when the war broke out again he delegated the chief command to his son Sancho. Between 1179 and 1184 the Moors recovered many of their losses in Alentejo, but were unable to retake Santarem and Lisbon. Alphonso died on the 6th of December 1185. He had secured for Portugal the status though not the name of an independent kingdom, and had extended its frontier southwards from the Mondego to the Tagus. He had laid the foundation of its navy and had strengthened, if he did not inaugurate, that system of co-operation between the Crown and the military orders which afterwards proved of incalculable service in the maritime and colonial development of the nation.

Sancho I. continued the war against the Moors with varying fortune. In 1189 he won Silves, then the capital of Algarve; in 1192 he lost not only Algarve but the greater part of Alentejo, including Alcacer do Sal. A peace was then arranged, and for the next eight years Sancho was engaged in hostilities against Alphonso IX. of León. The motives and course of this indecisive struggle are equally obscure. It ended in 1201, and the last decade of Sancho's reign was a period of peaceful reform which earned for the king his popular name of o Poavador, the "maker of towns." He granted fresh charters to many cities, legalizing the system of self-government which the Romans had bequeathed to the Visigoths and the Moors had retained or improved. Lisbon had already acquired 1084 (1210); these towns and many others were made free. Sancho also endeavoured to foster immigration and agriculture, by granting estates to the military orders and municipalities on condition that the occupiers should cultivate or colonize their lands. Towards the close of his reign he became embroiled in a dispute with Pope Innocent III. He had insisted that priests should accompany their flocks in battle, had made them amenable to secular jurisdiction, had withheld the tribute due to Rome and had even claimed the right of disposing of ecclesiastical domains. Finally he had quarrelled with Martinho Rodrigues, the unpopular bishop of Oporto, who was besieged for five months in his palace and then forced to seek redress in Rome (1200). As Sancho was in weak health and had no means of resisting Papal pressure, he made full submission (1210); and after bestowing large estates on his sons and daughters, he retired into the monastery of Alcobaca (q.v.), where he died in 1211.

The reign of Alphonso II. ("the Fat") is noteworthy for the first meeting of the Portuguese cortes, to which the upper hierarchy of the Church and the nobles (fidalgos and ricos homens) were summoned by royal writ. The king was no warrior, but in 1212 a Portuguese contingent asked the Castilians to attack the Moors at Las Navas de Tolosa. Sancho II. of León and Sancho of Aragon united to make the expedition, and the Moorish bishops and captains of the realm, reinforced by foreign crusaders, detook Alcacer do Sal. Alfonso II. repudiated the will of his father, refused to surrender the estates left to his brothers, who went into exile, and only gave up the property bequeathed to his sisters after a prolonged civil war in which Alphonso IX. of León took part against them. Even then he compelled the heiresses to take the veil. His attempts to strengthen the monarchy and fill the treasury at the expense of the Church resulted in his excommunication by
Pope Honorius III, and Portugal remained under interdict until Alphonso II. died in 1223.

Sancho II. succeeded at the age of thirteen. To secure the removal of the interdict the leading statesmen who were identified with the policy of his father—Gonçalo Mendes the chancellor, Pedro Annes the lord chamberlain (mordomo-mór) and Vicente, dean of Lisbon—resigned their offices. Estevan Soares, archbishop of Braga, placed himself at the head of the nobles and churchmen who threatened to usurp the royal power during Sancho II.'s minority, and negotiated an alliance with Alphonso IX., by which it was arranged that the Portuguese should attack Elvas, the Spaniards Badajoz. Elvas was taken from the Moors in 1226, and in 1227 Sancho assumed control of the kingdom. He reinstated Pedro Annes, made Vicente chancellor, and appointed M. Guzman illegitimate chief standard-bearer (mordomo-mór). He continued the crusade against the Moors, who were driven from their last strongholds in Alentejo, and in 1230-1244, after a dispute with Rome which was once more ended by the imposition of an interdict and the submission of the Portuguese ruler, he won many successes in the Algarve. But his career of conquest was cut short by a revolution (1245), for which his marriage to a Castilian lady, D. Meca Lopez de Haro, furnished a pretext. The legitimacy of the union has been questioned, on grounds which appear insufficient; but of its unpopularity there can be no doubt. The bishops, resenting the favour shown to Sancho by his father's anti-clerical misdeeds, took advantage of this unpopularity to organize the rebellion. They found a leader in Sancho's brother Alphonso, count of Boulogne, who owed his title to a marriage with Matilda, countess of Boulogne. The pope issued a bull of deposition in favour of Alphonso, who reached Lisbon in 1246, and after a civil war lasting two years Sancho II. retired to Toledo, where he died in January 1248.

One of the first acts of the usurper, and one of the most important, was to abandon the semi-ecclesiastical titles of visiñador or defender (curizador) of the realm, and to proclaim himself king (rei). Hitherto the position of the monarch had been precarious; as in Aragon the nobles and the church had exercised a large measure of control over their nominal head, and though it would be pedantry to over-emphasize the importance of the royal title, its assumption by Alphonso III. does mark a definite stage in the evolution of a national monarchy and a centralized government. A second stage was reached shortly afterwards by the conquest of Algarve, the last remaining stronghold of the Moors. This drew down upon Portugal the anger of Alphonso X. of Leon and Castile, surnamed the Wise, who claimed suzerainty over Algarve. The war which followed was ended by Alphonso III. ceding to Dona Beatriz de Guzman, illegitimate daughter of Alphonso X., and to hold Algarve as a fief of Castile. The celebration of this marriage, while Matilda, countess of Boulogne and first wife of Alphonso III., was still alive, entailed the imposition of an interdict upon the kingdom. In 1254 Alphonso III. summoned a cortes at Leiria, in which the chief cities were represented, as well as the nobles and clergy. Fortified by their support the king refused to submit to Rome. At the cortes of Coimbra (1261), he further strengthened his position by conciliating the representatives of the cities, who denounced the issue of a debased coinage, and by recognizing that taxation could not be imposed without consent of the cortes. The clergy suffered more than the laity under a prolonged interdict, and in 1262 Pope Urban VI. legalized the disputed marriage and legitimized Dona Diniz, the king's eldest son. Thus ended the contest for supremacy between Church and Crown. The monarchy owed its triumph to its championship of national interests, to the support of the municipalities and military orders, and to the prestige gained by the royal armies in the Moorish and Castilian wars. In 1263 Alphonso X. renounced his claim to suzerainty over Algarve, and thus the kingdom of Portugal simultaneously reached its present European limits and attained its complete independence. Lisbon was henceforth recognized as the capital. Alphonso III. continued to reign until his death in 1279, but the peace of his later years was broken by the rebellion (1277-1279) of D. Diniz,1 the heir-apparent.

The chief problems now confronting the monarchy were no longer military, but social, economic and constitutional. It is true that the reign of Diniz was not a period of uninterrupted peace. At the outset his legitimacy was disputed by his brother Alphonso, and a brief civil war ensued. Hostilities between Portugal and the reunited kingdoms of Leon and Castile were terminated in 1297 by a treaty of alliance, in accordance with which Ferdinand IV. of Leon and Castile married Constance, daughter of Diniz, while Alphonso, son of Diniz, married Beatrice of Castile, daughter of Ferdinand. A further outbreak of civil war, between the king and the heir-apparent, was averted in 1310 by a marriage which ended the disputes between Diniz and Alphonso. Diniz died in 1281, and was canonized for her many virtues in the 16th century. She rode between the hostile camps, and succeeded in arranging an honourable peace between her husband and her son.

These wars were too brief to interfere seriously with the social reconstruction to which the king devoted himself. At his accession the Portuguese people was far from homogeneous; it would be long before its component races—Moors and Mozarabs of the south, Galicians of the north, Jews and foreign crusaders—could be fused into a national body. There were also urgent economic problems to be solved. The Moors had made Alentejo the granary of Portugal, but war had undone their work, and large tracts of land were now barren and depopulated. Commerce and education had similarly been subordinated to the struggle for national existence. The machinery of administration was out of date and complicated by the authority of feudal and ecclesiastical courts. The supremacy of the Crown, though recognized, was still unstable. It was Diniz who initiated the needful reforms. He earned his title of the rei lavrador or "farmer king" by introducing improved methods of cultivation and founding agricultural schools. He encouraged maritime trade by negotiating a commercial treaty with England (1264) and forming a royal navy (1317) under the command of a Genoese admiral named Emmanuele di Pezagna (Manoel Pessanha). In 1290 he founded the university of Coimbra (q.v.). He was a poet and a patron of literature and music (see Literature, below). His chief administrative reforms were designed to secure centralized government and to limit the jurisdiction of feudal courts. He encouraged and nationalized the military orders. In 1290 the Portuguese knights of Sao Thiago (Santiago) were definitely separated from the parent Spanish order. The orders of Crato and of St Benedict of Aviz had already been established, the traditional dates of their foundation being 1213 and 1216. After the condemnation of the Templars by Pope Clement V. (1312) an ecclesiastical commission investigated the charges against the Portuguese branch of the order, and found in its favour. As the Templars were rich, influential and loyal, Diniz took advantage of the death of Clement V. to maintain the order under a new name; the Order of Christ, as it was henceforth called, received the benediction of the pope in 1319 and subsequently played an important part in the colonial expansion of Portugal.

Alphonso IV. adhered to the matrimonial policy initiated by his brother. He arranged that his daughter Maria should wed Alphonso XI. of Castile (1328), but the marriage precipitated the war it was intended to avert, and peace was only restored (1330) after Queen Isabella had again intervened. Pedro, the crown prince, afterwards married Constance, daughter of the duke of Piafial (near Valladolid), and Alphonso IV. brought a strong Portuguese army to aid the Castilians against the Moors of Granada and their African allies. In the victory won by the Christians on the banks of the river Salado, near Tarifa, he earned his title of Alphonso the Brave (1340). In 1347 he married his daughter Leonora 1Throughout this article the abbreviation D. is used for the Portuguese title Don and for its feminine form Dona (see DOnAUS).
(Lerinos) to Pedro IV. of Aragon. The later years of his reign were darkened by the tragedy of Inez de Castro (q.v.). He died in 1357, and the first act of his successor, Pedro the Sever, was to take vengeance on the murderers of Inez.

Pedro I., 1357-1383. Throughout his reign he strengthened the central government at the expense of the aristocracy and the Church, by a stern enforcement of law and order. In 1361, at the cortes of Elvas, it was enacted that the privileges of the clergy should only be deemed valid in so far as they did not conflict with the royal prerogative. Pedro maintained friendly relations with England, where in 1352 Edward III. issued a proclamation in favour of Portuguese traders, and in 1353 the Portuguese envoy Afonso Martins Alho signed a covenant with the merchants of London, guaranteeing mutual good faith in all commercial dealings.

The foreign policy of Diniz, Alphonso IV. and Pedro I. had been, as a rule, successful in its main object, the preservation of peace with the Christian kingdoms of Spain; in consequence, the Portuguese had advanced in prosperity and culture. They had supported the monarchy because it was a national institution, hostile to the tyranny of nobles and clergy. During the reign of Ferdinand (1367-1383) and under the regency of Leonora the ruling dynasty ceased to represent the national will; the Portuguese people therefore made an end of the dynasty and chose its own ruler. The complex events which brought about the crisis may be briefly summarized.

Ferdinand, a weak but ambitious and unscrupulous king, claimed the thrones of Castile and Leon, left vacant by the death of Pedro I. of Castile (1350); he based his claim on the fact that his grandmother Beatrice (1367-1385) belonged to the legitimate line of Castile. When the majority of the Castilian nobles refused to accept a Portuguese sovereign, and welcomed Henry of Trastamara (see SPAIN: History), as Henry II. of Castile, Ferdinand aligned himself with the Moors and Aragonese; but in 1371 Pope Gregory XI. intervened, and it was decided that Ferdinand should renounce his claim and marry Leonora, the daughter of his successful rival. Ferdinand, however, preferred his Portuguese mistress, Leonora Telles de Menezes, whom he eventually married. To avenge this slight, Henry of Castile invaded Portugal and besieged Lisbon. Ferdinand appealed to John of Gaunt, who also claimed the throne of Castile, on behalf of his wife Constance, daughter of Pedro I. of Castile. An alliance between Portugal and England was concluded; and although Ferdinand made peace with Castile in 1374, he renewed his claim in 1380, after the death of Henry of Castile, and sent Joao Fernandes Andejo, count of Ourem, to secure English aid. In 1381 Richard II. of England despatched a powerful force to Lisbon, and betrothed his cousin Prince Edward to one of the children of Ferdinand, who had been recognized as heiress to the throne by the cortes of Leiria (1376). In 1382, however, Ferdinand made peace with John I. of Castile at Salvaterra, deserting his English allies, who retaliated by ravaging part of his territory. By the treaty of Salvaterra it was agreed that Beatrice should marry John I. Six months later Ferdinand died, and in accordance with the terms of the treaty Leonora became regent until the eldest son of John I. and Beatrice should be of age.

Leonora had long carried on an intrigue with the count of Ourem, whose influence was resented by the leaders of the aristocracy, while her tyrannical rule also aroused bitter opposition. The malcontents chose D. John, grand-master of the knights of Aviz and illegitimate son of Pedro the Sever, as their leader, organized a revolt in Lisbon, and assassinated the count of Ourem within the royal palace (Dec. 6, 1383). Leonora fled to Santarem and summoned aid from Castile, while D. John was proclaimed defender of Portugal. In 1384 a Castilian army invested Lisbon, but encountered a heroic resistance, and after five months an outbreak of plague compelled them to raise the siege. John I. of Castile, discovering or alleging that Leonora had plotted to poison him, imprisoned her in a convent at Tordesillas, where she died in 1386. Before this, Nuno Alvares Pereira, constable of Portugal, had gained his popular title of "The Holy Constable" by twice defeating the invaders, at Atoleiro and Trancoso in the district of Guarda.

On the 16th of April 1385 the cortes assembled at Coimbra declared the crown of Portugal elective, and at the instance of João dos Regras, the chancellor, D. John was chosen king. No event in the early constitutional history of Portugal is more important than this election, which definitely affirmed the national character of the monarchy. The choice of the grand-master of Aviz ratified the old alliance between the Crown and the military orders; his election by the whole cortes not only ratified the alliance between the Crown and the commons, but also included the nobles and the Church. The nation was unanimously united.

Ferdinand had been the last legitimate descendant of Count Henry of Burgundy. With John I. began the rule of a new dynasty, the House of Aviz. The most urgent matter which confronted the king—or the group of statesmen, led by João dos Regras and the "Holy Constable" who inspired his policy—was the menace of Castilian aggression. But on the 14th of August 1383 the Portuguese army, aided by 500 English archers, utterly defeated the Castilians at Aljubarrota. By this victory the Portuguese showed themselves equal in military power to their strongest rivals in the Peninsula. In 1412, the Holy Constable won another victory at Valverde; early in 1386 9000 English soldiers, under John of Gaunt, reinforced the Portuguese; and by the treaty of Windsor (May 9, 1386), the alliance between Portugal and England was confirmed and extended. Against such a combination the Castilians were powerless; a truce was arranged in 1387 and renewed at intervals until 1411, when peace was concluded. D. Diniz, eldest son of Inez de Castro, claimed the throne and invaded Portugal in 1398, but his supporters were easily crushed. The domestic and foreign policy pursued by John I. until his death in 1433 may be briefly described. At home he endeavoured to reform administration, to encourage agriculture and commerce, and to secure the loyalty of the nobles by grants of land and privileges so extensive that, towards the end of his reign, many nobles who exercised their full feudal rights had become almost independent princes. Abroad, he aimed at peace with Castile and close friendship with England. In 1387 he had married Philippa of Lancaster, daughter of John of Gaunt; Richard II. sent troops to aid in the expulsion of D. Diniz; Henry IV., Henry V. and Henry VI. of England successively ratified the treaty of Windsor; Henry IV. made his ally a knight of the Garter in 1400. The convent of Batalha (q.v.), founded by the prior who negotiated the victory of Aljubarrota, is architecturally a monument of the English influence prevalent at this time throughout Portugal.

The cortes of Coimbra, the battle of Aljubarrota and the treaty of Windsor mark the three final stages in the consolidation of the monarchy. A period of expansion overseas began in the same reign, with the capture of Ceuta in Morocco. The three eldest sons of King John and Queen Philippa—Edward, Pedro and Henry, afterwards celebrated as Prince Henry the Navigator—desired to win knighthood by service against the Moors, the historic enemies of their country and creed. In 1415 a Portuguese fleet, commanded by the king and the three princes, set sail for Ceuta. English men-at-arms were sent by Henry V. to take part in the expedition, which proved successful. The town was captured and garrisoned, and thus the first Portuguese outpost was established on the mainland of Africa.

3. The Period of Discoveries: 1415-1499.—Before describing in outline the course of the discoveries which were soon to render Portugal the foremost colonizing power in Europe it is necessary to indicate the main causes which contributed to that result. As the south-westernmost of the free peoples of Europe, the Portuguese were the natural inheritors of that work of exploration which had been carried on during the middle ages.
chiefly by the Arabs. They began where the Arabs left off, by penetrating far into the Atlantic. The long littoral of their country, with its many tributaries, and the rivers that flowed into the ocean, had been the training-ground of a race of adventurous seamen. It was impossible, moreover, to expand or reach new markets except by sea: the interposition of Castile and Aragon, so often hostile, completely prevented any intercourse by land between Portugal and other European countries. Consequently the Portuguese merchants sent their goods by sea to England, Flanders, or the Hanse towns. The whole history of the nation had also inspired a desire for fresh conquests among its leaders. Portugal had won and now held its independence by the sword. The long struggle to expel the Moors, with the influence of foreign Crusaders and the military over the religious and civil wars had given a religious and theocratic idea of the “king” i.e. the Senegal, and, in alliance with that potentate, to crush the Turks and liberate Palestine. The conception of an ocean route to India appears to have originated after his death. On land he again defeated the Moors, who attempted to re-take Ceuta in 1418; but in an expedition to Tangier, undertaken in 1436 by King Edward (1433–1438), the Portuguese army was defeated, and could only escape destruction by surrendering as a hostage Prince Ferdinand, the king’s youngest brother. Ferdinand, known as “the Constant,” from the fortitude with which he endured captivity, died unannounced in 1443. In 1444 at Ceuta, Prince Henry’s captives continued their exploration of Africa and the Atlantic. In 1445 Cape Bojador was doubled; in 1434 the first consignment of slaves was brought to Lisbon; and slave trading soon became one of the most profitable branches of Portuguese commerce. The Senegalese was again in 1445. Cape Verde was passed in the same year, and in 1446 Alvaro Fernandes pushed on almost as far as Sierra Leone. This was probably the farthest point reached before the Navigator died (1460). Meanwhile colonization progressed in the Azores and Madeira, where sugar and wine were produced; above all, the gold brought home from Guinea stimulated the commercial energy of the Portuguese. It had become clear that, apart from their religious aspirations, these voyages of discovery were highly profitable. Under Alphonso V., surnamed the African (1443–1458), the Gulf of Guinea was explored as far as Cape St. Catherine, and three expeditions (1458, 1461, 1471) were sent to Morocco; in 1471 Azrila (Asila) and Tangier were captured from the Moors. Under John II. (1487–1495) the fortress of Sào Jorge da Mina, the modern Elmina (q.v.), was founded for the protection of the Guinea trade in 1481–1482; Diogo Cam (q.v.), or Cão, discovered the Congo in 1482; and Diaz (q.v.) doubled the Cape of Good Hope in 1488, thus proving that the Indian Ocean was accessible by sea. After 1492 the discovery of the West Indies by Columbus rendered desirable a delimitation of the Spanish and Portuguese spheres of exploration. This was accomplished by the treaty of Tordesillas (June 7, 1494) which modified the delimitation authorized by Pope Alexander VI. in two bulls issued on the 4th of May, 1493. The treaty gave to Portugal all lands which might be discovered east of a straight line drawn from the Arctic Pole to the Antarctic, at a distance of 370 leagues west of Cape Verde. Spain received the lands discovered west of this line. As, however, the known means of measuring longitude were so inexact that the line of demarcation could not in practice be determined (see J. de Andrade Corvo in Journal das Sciencias Mathematicas, xxxi. 147–176, Lisbon, 1881), the treaty was subject to very diverse interpretations. On its provisions were based the Portuguese claim to Brazil and the Spanish claim to the Moluccas (see Malay Empire and the Moluccas). The treaty was chiefly valuable to the Portuguese as a recognition of the prestige they had acquired. That prestige was enormously enhanced when, in 1497–1499, Vasco da Gama (q.v.) completed the voyage to India.

While the Crown was thus acquiring new possessions, its authority in Portugal was temporarily overshadowed by the growth of aristocratic privilege. At the court of Evora (1433) King Edward had obtained the enactment of a law declaring that the estates granted by John I. to his adherents could only be confirmed by the direct male descendants of the grantees; and failing such descendants, should revert to the Crown. After the death of Edward further attempts to curb the power of the nobles were made by his brother, D. Pedro, duke of Coimbra, who acted as regent during the minority of Alphonso V. (1438–1447). The head of the aristocratic opposition was the Duke of Braganza, who contrived to secure the sympathy of the king and the dismissal of the regent. The quarrel led to civil war, and in May 1449 D. Pedro was defeated and killed. Henceforward the grants made by John I. were renewed, and extended so lavishly a scale that the Braganza estates alone comprised about a third of the whole kingdom. An unwise foreign policy simultaneously injured the royal prestige. When Alphonso married his own niece, Joanna, daughter of Henry IV. of Castile, and claimed that kingdom in her name. At the battle of Toro, in 1476, he was defeated by Ferdinand and Isabella, and in 1478 he was compelled to sign the treaty of Alcantara, by which Joanna was relegated to a convent. His successor, John II. (1481–1495) reverted to the policy of matrimonial alliances with Castile and friendship with England. Finding, as he said, that the liberality of former kings had left the Crown “no estates except the high roads of Portugal,” he determined to crush the feudal nobility and seize its territories. A cortes held at Evora (1495) empowered judges nominated by the Crown to administer justice in all feudal domains. The nobles resisted this infringement of their rights; but their leader, Ferdinand, duke of Braganza, was beheaded for high treason in 1483; in 1484 the king stabbed to death his own brother-in-law, Ferdinand, duke of Vizeu; and 80 other members of the aristocracy were afterwards executed. Thus John “the Perfect,” as he was called, assured the supremacy of the Crown. He was succeeded in 1495 by Emanuel (Manoel I.), who was named “the Great” or “the Fortunate,” because in his reign the sea route to India was discovered and a Portuguese Empire founded.

4. The Portuguese Empire: 1490–1580.—In 1500 King Emanuel assumed the title “Lord of the conquest, navigation and commerce of India, Ethiopia, Arabia and Persia,” which was confirmed by Pope Alexander VI. in 1502. It was now upon schemes of conquest that the energy of the nation was to be concentrated, although the motives which called forth that energy were unchanged. “We come to seek Christians and spices,” said the first of Vasco da Gama’s sailors who landed in India: and the combination of missionary ardour with commercial enterprise which had led to the exploration of the Atlantic led also to the establishment of a Portuguese Empire. This expansion of national interests proceeded rapidly in almost every quarter of the known world. In the North Atlantic Gaspar and Miguel Corte-Real penetrated as far as Greenland (their ““Labrador”) in 1500–1501; but these voyages were politically and commercially unimportant. Equally barren was the intermittent fighting in Morocco, which was regarded as a crusade against the Moors. In the South Atlantic, however, the African coast was further explored, new settlements were founded, and a remarkable development of Portuguese-African civilization took place in the kingdom of Kongo (see Angola).
Pedro Alvares Cabral, sailing to India, but steering far westward to avoid the winds and currents of the Guinea coast, reached Brazil (1500) and claimed it for his sovereign. João da Nova discovered Ascension (1501) and St Helena (1502); Tristão da Cunha was the first to sight the archipelago still known by his name (1506). In East Africa the small Mahommedan empire of stone—Sofala, Mozambique, Kilwa, Brava, Mombasa, Malindi—either were destroyed or became subjects or allies of Portugal. Pedro de Covilhã had reached Abyssinia (q.v.) as early as 1490; in 1520 a Portuguese embassy arrived at the court of “Prester John,” and in 1541 a military force was sent to aid him in repelling a Mahommedan invasion. In the Indian Ocean and Arabian Sea, one of Cabral’s ships discovered Madagascar (1501), which was partly explored by Tristão da Cunha (1507); Maurits was discovered in 1507, Socotra occupied in 1506, and in the same year D. Lourenço d’Almeida visited Ceylon. In the Red Sea Massawa was the most northerly point frequented by the Portuguese until 1541, when a fleet under Estevão da Gama penetrated as far as Suez. Hormuz, in the Persian Gulf, was seized by Alphonso d’Albuquerque (1515), who also entered into diplomatic relations with Persia. On the Asiatic mainland the first trading-stations were established by Cabral at Cochin and Calicut (1501); more important, however, were the conquest of Goa (1510) and Malacca (1511) by Albuquerque, and the acquisition of Diu (1535) by Martim Afonso de Sousa. East of Malacca, Albuquerque sent Duarte Fernandes as envoy to Siam (1511), and despatched to the Moluccas two expeditions (1512, 1514), which founded the Portuguese dominion in the Malay Archipelago (q.v.). Fernão Pires de Andrade visited Canton in 1517 and opened up trade with China, where in 1557 the Portuguese were permitted to occupy Macao. Japan, accidentally discovered by three Portuguese traders in 1542, soon attracted large numbers of merchants and missionaries (see Japan, § viii.). In 1522 one of the ships of Ferdinand Magellan (q.v.)—a Portuguese sailor, though in the Spanish service—completed the first voyage round the world. Up to 1505 the Portuguese voyages to the East were little more than trading ventures or plundering raids, although a few factories for the exchange of goods were founded in Malabar. In theory, the objects of the enterprise were to secure a territory to avoid risking troops ashore, and to leave the defence of such factories as might be necessary to friendly native powers, which would receive in return the support of the Portuguese fleet. Almeida’s statesmanship was to a great extent sound. The Portuguese could never penetrate far inland; throughout the 16th century their settlements were confined to the coasts of Asia, Africa or America, and the area they were able effectively to occupy was far less than the area of their empire in the 20th century. A Chinese critic, quoted by Faría y Sousa, said of them that they were like fishes, “remove them from the water and they straightway die.” It is true of a Portuguese expedition of India,” in a land campaign they would have been outnumbered and destroyed by the armies of any one of the greater Indian states. But their artillery and superior maritime science made them almost invulnerable at sea, and their principal military achievements consisted in the capture or defence of positions accessible from the sea, e.g. the defence of Cochin by Duarte Pacheco Pereira in 1504, the defence of Diu (q.v.) in 1538 and 1546. Alphonso d’Albuquerque (q.v.), who succeeded Almeida in 1509, found it necessary to modify the policy formulated by his predecessor. Command of the sea could not be maintained—least of all in the monsoon months—while the Portuguese fleets were based on Lisbon, which could only be reached after a six months’ voyage; and experience had proved that almost every Portuguese factory required a fortress—for its defence when the fleets were absent. Portugal, like every great maritime trading community from Carthage to Venice, discovered that the ideal of “sea power and commerce” led directly to empire. In 1510 Albuquerque seized Goa, primarily as a naval base, and in so doing recognized the fact that his country was committed to a policy of territorial aggrandisement. Other seaports and islands were conquered or colonized in rapid succession, and by 1540 Portugal had acquired a line of scattered maritime possessions extending along the coasts of Brazil, East and West Africa, Malabar, Ceylon, Persia, Indo-China and the Malay Archipelago. The most important settlements in the East were Goa, Malacca and Hormuz.

To a superficial observer the prosperity of Portugal might well seem to have culminated during this period of expansion. Vast profits were derived from the import trade in the innumerable products of the tropics, of which Portugal was the sole purveyor in Europe. This influx of wealth furnished the economic basis for a sudden development of literary and artistic activity, inspired by contrast with the new world of the tropics. The 16th century was the golden age of Portuguese literature; humanists, such as Damião de Gois (q.v.), and scientists, such as the astronomer Pedro Nunes (Nonius), played conspicuous parts in the great intellectual movements of the time; a distinctive school of painters arose, chief among them being the so-called “Grão Vasco” (Vasco Fernandes of Vizeu); in architecture the name of King Emanuel was given to a new and composite style (the Manoeline or Manoelian), in which decorative forms from India and Africa were harmonized with Gothic and Renaissance designs; palaces, fortresses, cathedrals, monasteries, were built on a scale never before attempted in Portugal; and even in the minor arts and handicrafts—in goldsmith’s work, for example, or in pottery—the influence of the East made itself felt. Oriental splendour and Renaissance culture combined to render social life in Lisbon hardly less brilliant than in Rome or Venice.

In order to understand the apparently sudden collapse of Portuguese power in 1578-1580 it is necessary to examine certain facts and tendencies which from the first rendered a catastrophe inevitable. Chief among these were the extent of the empire and its organization, the financial and commercial policy of its rulers, the hostility, often wantonly provoked, of the chief Oriental states, the depopulation of Portugal and the slave trade, the expulsion of the Jews, the growth of ecclesiastical influence in secular affairs, and the decadence of the monarchy.

It is necessary to exclude Brazil from any survey of the Portuguese imperial system, because the colonization of Brazil (q.v.) was effected on distinctive lines. Otherwise the imperial whole empire was governed on a more or less uniform system, although it included communities of the most diverse nature—protectorates such as Hormuz and Ternate in the Moluccas, colonies such as Goa and Madeira, capitaneias under military rule such as Malacca, tributary states such as Kilwa, fortified factories as at Colombo and Cochin. West of the Cape the settlements in Africa and the Atlantic were governed, as a rule, by officials directly nominated by the king. East of the Cape the royal power was delegated to a viceroy or governor, the designation for whom was sometimes given. The viceroy’s authority was almost unlimited during his term of office. The vicerealty was created in 1505, and from 1511 the Indian capital was Goa. Between 1505 and 1580 only four holders of the office—Almeida (1505-1509), Albuquerque (1509-1515), D. Vasco da Gama (1524) and D. João de Castro (1545-1548)—were men of marked ability and high character. All officials, including the viceroy and naval and military officers, were usually appointed for no more than three years. Although few large
salaries were paid, the perquisites attached to official positions were enormous; at the beginning of the 17th century, for example, the captain of Malacca received not quite £300 yearly as his pay, but his annual profits from other sources were estimated at £20,000. Even judges were expected to live on their perquisites, in the shape of bribes. The competition for appointments was natural enough; Couto mentions the case of one grantee who received the reversion of a post to which 30 applicants had a prior claim.¹ Such reversions could be sold, bequeathed, or included in the dowries of married women; the right of trading with China might be part of the endowment of a school; a monastery or a hospital might purchase the command of a fortress. In 1538 the viceroy, D. Garcia de Noronha, publicly sold by auction every vacant appointment in Portuguese India—an example followed in 1614 by the king. Hardly less disastrous than the system by which officials were chosen and paid was the influence exercised by the Church. Simão Botelho, an able revenue officer, was denied absolutism in 1545 because he had reorganized the Malacca customs-house without previously consulting the Dominicans in that city. In 1560 a supposed tooth of Buddha was brought to Goa; the raja of Pegu offered £100,000 for the relic, and as Portuguese India was virtually bankrupt the government wished to accept the offer; but the archbishop intervened and the relic was destroyed.

The empire in the East was rarely solvent. Almeida and Albuquerque had hoped to meet the expense of administration mainly out of the fees extorted for safe-conducts at sea and trading-licences, with the tribute wrung from native states and the revenue from Crown lands in India. But the growth of expenditure—chiefly of an unremunerative kind, such as the cost of war and missions—soon rendered these resources inadequate; and after 1515 the empire became ever more dependent on the spoils of hostile states and on subsidies from the royal treasury in Lisbon. Systematic debasement of the coinage was practised both in India, where the monetary system was extremely complex,² and in Portugal; and owing to the bullionist policy adopted by Portuguese financiers little permanent benefit accrued to the mother country from its immense trade. Seeking for commercial profit, not in the exchange of commodities, but solely in the acquisition of actual gold and silver, and realizing that the home market could not absorb a tithe of the empire's produce, the Portuguese were at last willing to sell their ships to discharge in Antwerp (where a Portuguese staple was established in 1593), or in some other port near the central markets of Europe. The raw materials purchased by Flemish, German or English traders were used in the establishment of productive industries, while Portugal received a vast influx of bullion, most of which was squandered on war, luxuries or the Church.

In theory the most lucrative branches of commerce, such as the pepper trade, were monopolies vested in the Crown; the chartered companies and associations of merchant adventurers, which afterwards became the pioneers of British and Dutch colonial development, had no counterpart in Portuguese history, except in the few cases in which trading concessions were granted to military or monastic orders. But the Crown frequently farmed out its monopolies to individual merchants, or granted trading-licences by way of pension or reward. These were often of great value; e.g. in 1612 the right of sending a merchant ship to China was valued at £25,000. Great loss was necessarily inflicted on native traders by the monopolist system, which pressed most hardly on the Mahomedans, who had been the chief carriers in Indian waters. Two great powers, Egypt and Turkey, challenged the naval and commercial supremacy of the Portuguese, but an Egyptian armada was destroyed by Almeida in 1502, and though Portuguese fleets were on several occasions (as in 1517 and 1521) dispatched from Suez or Basra, they failed to achieve any success, and the Portuguese were able to close the two principal trade routes between India and Europe. One of these trade routes passed up the Persian Gulf to Basra, and thence overland to Tripoli, for Mediterranean ports, and to Trebizond, for Constantinople. The other passed up the Red Sea to Suez, and thence to Alexandria, for Venice, Genoa and Ragusa. But by occupying Hormuz the Portuguese gained command of the Gulf route; and when they fell to capture Aden (1517, 1517, 1547), and so entirely to close the Red Sea, they almost destroyed the traffic between India and Suez by occupying Socotra and sending fleets to cruise in the Strait of Bab el-Mandeb. In Malacca they possessed the connecting link between the trade-routes of the Far and Middle East, and thus they controlled the three sea-gates of the Indian Ocean and Arabian Sea—the Straits of Hormuz, Bab el-Mandeb and Malacca—and diverted the maritime trade with Europe to the Cape route.

During the critical period in which their empire was being established (c. 1505–1550) the Portuguese were fortunate in escaping conflict with any Oriental power of the first rank except Egypt and Turkey; for the Bahman of Hormuz, the sultanate of the Deccan had been already disintegrated before 1498, and the Mughals and Mahtrattas were still far off. A coalition of the minor Mahomedan states was prevented by the great Hindu kingdom of Vijayanagar, which comprised the southern half of the Indian Peninsula. Vijayanagar gave the militant Mahomedanism of Northern India no opportunity for a combined attack on the Portuguese settlements. After 1565, when the power of Vijayanagar was broken at the battle of Talikot, a Mussulman coalition was at last formed, and the Portuguese were confronted by a line of hostile states stretching from Gujarat to Achin; but by this time they were strong enough to hold their own. It is characteristic of their native policy that they had not only refrained from aiding Vijayanagar in 1565, but had even been willing to despoil their Hindu allies. In 1543 Martim Afonso de Sousa, governor of India, organized an expedition to sack the Hindu temples at Conjeveram in Vijayanagar itself, and similar incidents are common in Indo-Portuguese history. Albuquerque was almost the only Portuguese statesman who strove to deal justly with both Hindus and Mahomedans, to respect native customs, and to establish friendly relations with the great powers of the East. Apart from the rigorous restrictions imposed by his successors upon trade, the sympathies of the natives were estranged by the文体 and versality of the Portuguese, and the latter had acquired barbarities as the wholesale mutilation of non-combatants in war-time, and by religious persecution. After the arrival of the Franciscan missionaries, in 1537, Goa gradually became the headquarters of an immense proselytizing organization, which by 1561 had extended to East Africa, China, Japan and the Malay Archipelago (see GOA: Ecclesiastical History). Wherever the Portuguese were supreme they endeavoured to obtain converts by force. The widespread resentment thus aroused was a frequent cause of insurrection, and between 1515 and 1580 not a single year passed without war between the Portuguese and at least one African or Asiatic people.

Centuries of fighting against the Moors and Castilians had already left Portugal thinly populated; large tracts of land were uncultivated, especially in Alentejo, and wolves and wild boars were still common throughout the kingdom. It was impossible, from the first, to garrison the empire with trained men. As early as 1505 one of Almeida's ships contained a crew of rustics unable to distinguish between port and starboard; soon afterwards it became necessary to recruit convicts and slaves, and in 1558 a royal pardon was granted to all prisoners who would serve in India, except criminals under sentence for treason and canonical offences. Lischoten estimates that of all those who went to the East not one in ten returned. The heaviest losses were due to war and disease, to tropical diseases, but large numbers of the underpaid or unpaid soldiers deserted to the armies of native states. It is impossible to give more than approximately accurate statistics of the resultant depopulation of Portugal; but it seems probable that the inhabitants of the kingdom decreased from about 1,800,000 or 2,000,000 in 1500 to

¹ Decadas, XII, i. 10.
about 1,080,000 in 1556. The process of decay was hastened by frequent outbreaks of plague, sometimes followed by famine; a contemporary manuscript estimates that not fewer than 500 persons died daily in Lisbon alone during July, August, and September 1559, and in some other years the joint effects of plague and famine were little less disastrous.

While the country was being drained of its best citizens, hordes of slaves were imported to fill the vacancies, especially into the southern provinces.\(^1\) Manual labour was thus discredited; the peasants sold their farms and emigrated or flocked to the towns; and small holdings were merged into vast estates, unscientifically cultivated by slaves and comparable with the latifundia which caused so many agrarian evils during the last two centuries of the Roman republic. The depredations of the Moorish and Venetian pirates and the prevalence of famine at a time when Portuguese maritime commerce was most prosperous. The Portuguese intermarried freely with their slaves, and this infusion of alien blood profoundly modified the character and physique of the nation. It may be said without exaggeration that the Portuguese of the "age of discoveries" and the Portuguese of the 17th and later centuries were two different races. Albuquerque, foreseeing the dangers that would arise from a shortage of population in his colonies, had encouraged his soldiers to marry captive Brahman and Mahomedan women, and to settle in India as farmers, shopkeepers or artisans. Under his successor the experiment was fairly successful, but the married colonists afterwards became a privileged caste, subsisting upon the labour of their slaves, and often disloyal to their rulers. Intermarriage led to the adoption, even by the rich, and especially by women (see Goa), of Asiatic dress, manners and modes of thought. Thus in the East, as in Europe, slavery reacted upon every class of the Portuguese.

The banishment, or forcible conversion, of the Jews deprived Portugal of its middle class and of its most scientific traders and financiers. Though the Jews had always been compelled to reside in separate quarters called Juderias, or Jewries, they had been protected by the earlier Portuguese kings. Before 1223 their courts had received autonomy in civil and criminal jurisdiction; their chief rabbi was appointed by the king and entitled to use the royal arms on his seal. Alphonso V. even permitted his Jewish subjects to live outside the Juderias, relieved them from the obligation to wear a distinctive costume (enforced in 1323), and nominated a Jew, Isaac Abrabanel (q.v.), as his minister of finance. In culture the Portuguese Jews surpassed their rulers. Many of them were well versed in Aristotelian and Arabic philosophy, in astronomy, mathematics, and especially in medicine. Three Hebrew printing-presses were established between 1487 and 1495; both John II. and Dom Manuel I. employed Jewish physicians; it was a Jew—Abraham Zacuto ben Samuel—who supplied Vasco da Gama with nautical instruments; and Jews were employed in the overland journeys by which the Portuguese court first endeavoured to obtain information on Far Eastern affairs. The Jews paid taxes on practically every business transaction, besides a special poll-tax of 30 dinheiros in memory of the 30 pieces of silver paid to Judas Iscariot; and for this reason they were protected by the Crown. For centuries they were also tolerated by the commons; but the other orders—ecclesiastics and nobles—resented their religious exclusiveness or envied their wealth, and gradually fostered the growth of popular prejudice against them. In 1440 the Lisbon Juderias were stormed and sacked, and between 1450 and 1481 the cortes four times petitioned the Crown to enforce the anti-Jewish provisions of the canon law. John II. gave asylum to 90,000 Jewish refugees from Castile, in return for a heavy poll-tax and on condition that they should leave the country within eight months, in ships furnished by himself. These ships were not provided in time, and the Jews who were thus unable to depart were enslaved, while their children were deported to the island of St Thomas, and there left to survive as best they might. In 1496 Emanuel I. order the expulsion of all Jews, and the next year it was found that he was first required to purify his kingdom of the Jews, who were accordingly commanded to leave Portugal before the end of October 1497. But in order to avoid the economic dangers threatened by such an exodus, every Jew and Jewess between the ages of 4 and 24 was seized and forcibly baptized (19th March): "Christians" were not required to emigrate. In October 20,000 adults were treated in the same way. These "New Christians" or "Maranos," as they were called, were forbidden to leave the country between 1498 and 1597. In April 1506 most of those who resided in Lisbon were massacred during a riot, but throughout the rest of Emanuel's reign they were allowed to pursue their trade and were permitted to emigrate—an opportunity of which the majority took advantage. Large numbers settled in Holland, where their commercial talent afterwards greatly assisted the Dutch in their rivalry with the Portuguese.

The Reformation never reached Portugal, but even here the critical tendencies which elsewhere preceded Reform, were already at work. Their origin is to be sought not so much in the Revival of Learning as in the fact that the Portuguese had learned, on their voyages of discovery, to see and think for themselves. The scientific spirit may be traced throughout the Roteiros de D. João de Castro (q.v.) and the Colloquios de Garcia de Orza—men who deserted books for experiment and manifested a new interest in the physical world. But orthodox churchmen feared that even in Portugal this appeal from authority to experience would lead to an attack upon religious doctrines previously regarded as beyond criticism. To check this dangerous movement of ideas, they demanded the introduction of the Inquisition into Portugal. The agents of the "New Christians" in Rome long contrived, by lavish bribery and with the support of many enlightened Portuguese, to delay the preliminary negotiations; but in 1556 the Holy Office was established in Lisbon, where the first auto-da-fé was held in 1540, and in 1560 its operations were extended to India. It seems probable that the influence of the tribunal upon Portuguese life and thought has been exaggerated. Autos-da-fé were rare events; their victims were not as a rule serious thinkers, but persons accused of sorcery or Judaizing, nor were they more numerous than the victims of the English laws relating to witchcraft and heresy. But the worst vices of the Inquisition were the widespread system of delation it encouraged by paying informers out of the property of the condemned, and its action as a trading and landholding association. Quite as serious, in their effects upon national life, were the severe censorship to which all printed matter was liable before publication and the control of education by the Jesuits. Poetical and imaginative literature usually escaped censure; but histories were mutilated and all original scientific and philosophical work was banned. Portuguese education centred in the national university of Coimbra, which had long shown itself ready to assimilate new ideas; between 1537 and 1547 John III. persuaded many eminent foreign teachers—among them the Scottish humanist George Buchanan (q.v.), and the French mathematician Élie Vinet—to lecture in its schools. But the discipline of the university needed reform, and the task was entrusted to the Jesuits. By 1555 they had secured control over Coimbra—a control which lasted for two centuries and extended to the whole educational system of the country. The effects of this change upon the national character were serious and permanent. Portugal sank back into the middle ages. The old initiative and self-reliance of the nation, already shaken by years of disaster, were now completely undermined, and the people submitted without show of resistance to a theocracy disguised as absolute monarchy.

Emanuel I. had been a fearless despot, such as Portugal needed if its scattered dependencies were to remain subject to the central government. During his reign (1495-1521) the Church was never permitted to encroach upon the royal

---

\(^1\) In the north, which had been relatively immune from wars, agriculture was more prosperous and the peasants more tenacious of their land; hence the continuance of peasant proprietorship and the rarity of African types between the Douro and the Minho.
prerogative. He even sent ambassadors to Rome to protest against ecclesiastical corruption, as well as to checkmate the Venetian diplomats who threatened Europe with Ottoman vengeance if the Portuguese commercial monopoly were not relaxed. The Oriental magnificence of these embassies, notably that of 1514, and the fact that a king of Portugal dared openly to criticize the morals of the Vatican, temporarily enhanced the prestige of the monarchy. But Emanuel I. was the last great king of the Aviz dynasty. He had pursued the traditional policy of intermarriage with the royal families of Castile and Aragon, hoping to weld together the Spanish and Portuguese dominions into a single world-wide empire ruled by the house of Aviz. His ambition narrowly missed fulfilment, for Prince Miguel, his eldest son, was recognized (1498) as heir to the Spanish thrones. But Miguel died in infancy, and his inheritance passed to the Habsburgs. Frequent intermarriage, often so far within the prohibited degrees as to require a papal dispensation, may possibly explain the weakened vitality of the Portuguese royal family, which was now subject to epilepsy, insanity and premature decay. The decadence of the monarchy as a national institution was reflected in the decadence of the port; which was rarely summoned between 1521 and 1580. John III. (1521-1557) was a ruler of fair ability, who became in his later years wholly subservient to his ecclesiastical advisers. He was succeeded by his grandson Sebastian (1557-1578), aged three years. Until the king came of age (1568), his grandmother, Queen Catherine, a fanatical daughter of Isabella the Catholic, and his great-uncle, Prince Henry, cardinal and inquisitor-general, governed as joint regents. Both were dominated by their Jesuit confessors, and a Jesuit, D. Luiz Gonalves da Camara, became the tutor and, after 1568, the principal adviser of Sebastian. The king was a strong-willed and weak-minded ascetic, who entrusted his empire to the Jesuits, refused to marry, although the dynasty was threatened with extinction, and spent years in preparing for a crusade against the Moors. The wisest act of John III. had been his withdrawal of all the Portuguese garrisons in Morocco except those at Ceuta, Arzila and Tangier. Sebastian reversed this policy. His first expedition to Africa (1574) was a mere reconnaissance, but four years later a favourable opportunity for invasion arrived. A dethroned sultan of Morocco, named Mulai Ahmad (Mahommed XI.), offered to acknowledge Portuguese suzerainty if he were restored to the throne by Portuguese arms, and Sebastian eagerly accepted these terms. The flower of his army was in Asia and his treasury was empty; but he contrived to extort funds from the "New Christians," and collected a force of some 18,000 men, chiefly untrained lads, worn-out veterans, and foreign free-lances. At Arzila, where he landed, he was joined by Mulai Ahmad, who could only muster 800 soldiers. Thence Sebastian sought to proceed overland to the seaport of El Arish, despite the advice of his ally and of others who knew the country. After a long desert march under an August sun, he took up an indefensible position in a valley near Al Kasr al Kebir (q.v.). On the morrow (Aug. 4, 1578) they were surrounded by the superior forces of Abd el Malek, the reigning sultan, and after a brave resistance Sebastian was killed and his army almost annihilated. So overwhelming was the disaster that the Portuguese people refused to believe the truth. It was rumoured that Sebastian still lived, and would sooner or later return and restore the past greatness of his country. "Sebastianism" became a religion; its votaries were numbered by thousands, and four impostors arose in succession, each claiming to be the rei encuberto, or "hidden king," whose advent was so ardently desired (see Sebastian).

There was no surviving prince of the Aviz dynasty except the aged, feeble and almost insane Cardinal Prince Henry, who, as a younger son of Emanuel I., now became king. He died on the 31st of January 1590, and the throne was thus left vacant. There were five principal claimants—Philip II. of Spain; Philipbert, duke of Savoy; Antonio, prior of Crato; Catherine, duchess of Braganza; and Ranuccio, duke of Parma—whose relationship to Emanuel I. is shown in the following table:

5. The "Sixty Years' Captivity": 1581-1640.—The university of Coimbra declared in favour of Catherine, duchess of Braganza, but the prior of Crato was the only rival who offered any serious resistance to Philip II. D. Antonio proclaimed himself king and occupied Lisbon. The advocates of union with Spain, however, were numerous, influential, and ably led by their spokesmen in the cortes, Christovao de Moura and Antonio Pinheiro, bishop of Lefria. The duke of Braganza was won over to their side, chiefly by the promise that he should be king of Brazil if Philip II. became king of Portugal—a promise never fulfilled. Above all, the Church, including the Society of Jesus, naturally favoured the Habsburg claimant, who represented its two foremost champions, Spain and Austria. In 1581 a Spanish army, led by the duke of Alva, entered Portugal and easily defeated the levies of D. Antonio at Alcantara. The prior escaped to Paris and appealed to France and England for assistance. In 1582 a French fleet attempted to seize the Azores in his interest, but was defeated. In 1589 an English fleet was sent to aid the prior in a projected invasion of Portugal, but owing to a quarrel between its commanders, Sir Francis Drake and Sir John Norris, the expedition was abandoned. D. Antonio returned to Paris, where he died in 1594.

Meanwhile the victory of Alcantara left Philip II. supreme in Portugal, where he was soon afterwards crowned king. His constitutional position was defined at the Cortes of Thomar (1581). Portugal was not to be regarded as a conquered or annexed province, but as a separate kingdom, joined to Spain solely by a personal union similar to the union between Castile and Aragon under Ferdinand and Isabella. At Thomar Philip II. promised to maintain the rights and liberties conceded by his predecessors on the Portuguese throne, to summon the Cortes at frequent intervals, and to create a Portuguese privy council which should accompany the king everywhere and be consulted on all matters affecting Portuguese interests. Brazil and the settlements in Africa and Asia were still to belong to Portugal, not to Spain, and neither in Portugal nor in its colonies was any alien to be given lands, public office, or jurisdiction. On these terms the political union of the Iberian Peninsula was accomplished. It was the final stage in a process of accretion dating back to the beginnings of the Christian reconquest in the 8th century. Asturias had been united with Leon, Leon with Castile, Castile with Aragon. All these precedents seemed to indicate that Spain and Portugal would ultimately form one state; and despite the strong nationalism which their separate language and
history had inspired among the Portuguese, the union of 1581 might have endured if the terms of the Thomar compact had been observed. But few of the promises made in 1581 were kept by the three Spanish kings who ruled over Portugal at that time: Philip II. (1556-1598), Philip III. (1598-1621) and Philip IV. (1621-1665). Thus Portugal was summoned (1610), and the government of Portugal was entrusted by Philip III. chiefly to Francis duke of Lerma, by Philip IV. chiefly to Olivares (q.v.).

The kingdom and its dependencies were also involved in the naval disasters which overtook Spain. Faro in Algarve was sacked in 1595 by the English, who ravaged the Azores in 1596; and, in many parts of the world English, French and Dutch combined to harass Portuguese trade and seize Portuguese possessions. (See especially BRAZIL; INDIA; MALAY ARCHIPELAGO.) Union with Spain had exposed Portugal to the hostility of the strongest naval powers of western Europe, and had deprived it of the power to conclude an independent peace.

Insurrections in Lisbon (1634) and Evora (1637) bore witness to the general discontent, but until 1640 the Spanish ascendancy was never seriously endangered. In 1640 war with France and a revolution in Catalonia had taxed the military resources of Spain to the utmost. The royal authority in Portugal was delegated to Margaret of Savoy, duchess of Mantua, whose train of Spanish and Italian courtiers aroused the jealousy of the Portuguese nobles, while the harsh rule of her secretary of state, Miguel de Vasconcellos de Brito, provoked the resentment of all classes.

Even the Jesuits, whose influence in Portugal had steadily increased since 1555, were now prepared to act in the interests of Cardinal Richelieu, and therefore against Philip IV. A leader was found in John, 9th duke of Braganza, who as a grandson of the duchess Catherine was descended from Emanuel I. The duke, however, was naturally indolent, and it was with difficulty that his ambitious and energetic Castilian wife, D. Luiza de Guzman, obtained his assent to the proposed revolution. He refused to take any active part in it; but D. Luiza and her confidential adviser, Joao Pinto Ribeiro, recruited a powerful band of conspirators among the disaffected nobles.

Their plans were carefully elaborated, and on the 1st of December 1640 various strategic points were seized, the few partisans of Spain who attempted resistance were overpowered, and a provisional government was formed under D. Rodrigo da Cunha, archbishop of Lisbon, who was appointed lieutenant-general of Portugal.

6. THE RESTORATION: 1640-1755.—On the 13th of December 1640 the duke of Braganza was crowned as John IV., and on the 10th of January 1641 the cortes formally accepted him as king. The whole country had already declared in his favour and expelled the Spanish garrisons, an example followed by all the Portuguese dependencies. Thus the " Sixty Years' Captivity" came to an end and the throne passed to the house of Braganza. But the Portuguese were well aware that they could hardly maintain their independence without foreign assistance, and ambassadors were at once sent to Great Britain, the Netherlands and France. The struggle between the Crown and the parliament prevented Charles I. from offering aid, but he immediately recognized John IV. as king. Richelieu and the states-general of the Netherlands despatched fleets to the Tagus; but commercial rivalry in Brazil and the East led soon afterwards to a colonial war with the Dutch, and Portugal was left without any ally except France.

The Portuguese armies were at first successful. D. Matheus d'Albuquerque defeated the Spaniards under the baron of Mollinghen at Montijo (May 26, 1644), and throughout the reign of John IV. (1640-1650) they suffered no serious reverse. But great anxiety was caused by a plot to restore Spanish rule, in which the duke of Caminha and the archbishop of Braga were implicated; and especially by the action of Mazarin, who had assumed control of French foreign policy in 1642. At the congress of Mnofst (1643) he refused to make the independence of Portugal a condition of peace between France and Spain; and in a letter dated the 4th of October 1647 he even offered the Portuguese Crown to the duke of Longueville—an offer which illustrates the weakness of John IV. and the dependence of Portugal upon France.

John IV. was succeeded by his second son, Alphonso VI. (1656-1683), who was then aged thirteen. During the king's minority the queen-mother, D. Luiza, acted as regent. She prosecuted the war with vigour, and on the 14th of January 1659 a Portuguese army commanded by D. Antonio Luiz de Menezes, count of Cantanhede, defeated the Spaniards under D. Luiz de Haro at Elvas. In March 1659, however, the war between France and Spain was ended by the treaty of the Pyrenees; and D. Luiz de Haro, acting as the Spanish plenipotentiary, obtained the inclusion in the treaty of a secret article by which France undertook to give no further aid to Portugal. Neither Louis XIV. nor Mazarin desired the aggrandisement of Spain at the expense of their own ally; they therefore evaded the secret article by sending Marshal Schomberg to reorganize the Portuguese army (1660), and by helping forward a marriage between Charles II. of England and Catherine of Braganza, the sister of Alphonso VI. This project had been already mooted by D. Luiza, who had foreseen the restoration of the Stuart monarchy, and had in 1650 welcomed the exiled princes Rupert and Maurice at the court of John IV. The dowry to be paid by Portugal was fixed at £500,000 and the cession to Great Britain of Bombay and Tangier. In May 1663 the marriage was celebrated, and thus Great Britain took the place of France as the active ally of Portugal.

Meanwhile, on the 20th of June 1662, the regency had been terminated by a palace revolution. Alphonso VI. declared himself of age and seized the royal authority; D. Schomberg, however, was not content. D. Luiza retired to a convent. The king was feeble and vacillating, and there was no opposition to his wishes, which were to send another expedition to Spain; but the French were hardly ready to leave the conduct of affairs to stronger hands. D. Luiz de Sousa e Vasconcellos, count of Castello Melhor, directed the policy of the nation while Schomberg took charge of its defence. The army, reinforced by British troops under the earl of Inchiquin and by French and German volunteers or mercenaries, was led in the field by Portuguese generals, who successfully carried out the plans of Schomberg. On the 8th of June 1663 the count of Villa Flor utterly defeated D. John of Austria, and retook Evora, which had been captured by the invaders; on the 7th of July 1664 Pedro de Magalhães defeated the duke of Osuna at Ciudad Rodrigo; on the 17th of June 1665 the marquess of Marialva destroyed a Spanish army led by the marquess of Carracañca at the battle of Montes Claros, and Christovão de Brito Pereira followed up this victory with another at Villa Viçosa. The Spaniards failed to gain any compensating advantage, and on the 13th of February 1668 peace was concluded at Lisbon, Spain at last consenting to recognize the independence of the Portuguese kingdom.

The signature of the treaty of Lisbon had been preceded by another palace revolution. Castello Melhor, hoping to secure further French support for his country, had arranged a marriage between Alphonso VI. and Marie Françoise Elisabeth, daughter of Charles Amadeus of Nemours, and grand-daughter of Henry IV. of France. The marriage, celebrated in 1666, caused the downfall both of Castello Melhor and of the king. Queen Marie detested Alphonso and fell in love with his brother D. Pedro; and after four months of a hated union she left the palace and applied to the chapter of Lisbon cathedral to annul her marriage on the grounds of non-consummation. D. Pedro imprisoned the king and assumed the regency; on the 1st of January 1668 his authority was recognized by the cortes; on the 24th of March the annulment of the queen's marriage was pronounced and confirmed by the pope; on the 2nd of April she married the regent. Castello Melhor was permitted to escape to France, while Alphonso VI. was banished to Terceira in the Azores. A conspiracy to restore him to the throne was discovered in 1674, and he was removed to Cintra, where he died in 1683.

Pedro II., who had acted as regent for fifteen years, now

---

1 Philip I., II. and III. of Portugal.
became king. His reign (1683–1706) was a period of supreme importance in the economic and constitutional history of Portugal. The goldfields of Minas Geraes in Brazil, discovered about 1693, brought a vast revenue in royalties to the Portuguese Crown, which was thus enabled to govern without summoning the cortes to vote supply. In 1697 the cortes met for the last time before the era of constitutional government. Even more important was the change effected when the Whig ministry of Great Britain sent John Methuen to Lisbon to negotiate a commercial agreement. The Methuen Treaty, signed on the 27th of December 1703, detached Portugal from the French alliance, and made her for more than 150 years a commercial and political satellite of Great Britain. Its most far-reaching provisions were those which admitted Portuguese wines to the British market at a lower rate of duty than was imposed upon French and German wines, in return for the free passage of the British fisheries. The demand for "Pon" and "Madeira" was thus artificially stimulated to such an extent that almost the whole productive energy of Portugal was concentrated upon the wine and cork trades. Other industries, including agriculture, were neglected, and even food-stuffs were imported from Great Britain. The disastrous economic results of the treaty were temporarily concealed by the influx of gold from Brazil, the check upon emigration from the wine-growing northern provinces, and the military advantages of alliance with Great Britain. Nor was the virtual abolition of the cortes seriously felt at first, owing to the excellent internal administration of Pedro II. and his minister the duke of Cadaval.

Pedro II. had at first wished to remain neutral in the impending struggle between Philip V. and the archduke Charles, rival claimants for the throne of Spain. But Queen Marie had died in 1683, and in 1687 Cadaval had induced the king to marry Maria Sophia de Neuburg, daughter of the elector-palatine. Louis XIV. of France, who had hoped through the influence of Queen Marie to secure Portuguese support for his own grandson Philip V., realized that this second marriage might thwart his policy, and strove to redress the balance by creating a strong party at the court of Lisbon. He so far succeeded that in 1700 Pedro II. recognized Philip V. as king of Spain and in 1701 protected a French fleet in the Tagus against the British. It was this incident that caused the despatch of the Methuen mission and the renewal of the Anglo-Portuguese alliance in 1703. On the 7th of March 1704 a British fleet under Sir George Rooke reached Lisbon, conveying the archduke Charles and 10,000 British troops, who were joined by a Portuguese army under D. João de Sousa, marquess das Minas, and at once invaded Spain. (For the campaigns of 1704–15, see SPANISH SUCCESSION, WAR OF THE.) In 1705 Pedro II. was compelled by failing health to appoint a regent, and his successor, Catherine of Braganza, queen-dowager of England. On the death of the king (Dec. 9, 1706) Cadaval arranged a marriage between his successor John V. (1706–1750) and the archduchess Mariana, sister of the archduke Charles, thus binding Portugal more closely to the Anglo-Austrian cause. The strain of the war was altogether felt in Portugal, especially in 1711, when the French admiral Duguay-Trouin sacked Rio de Janeiro and cut off the Brazilian treasure-ships. At last, on the 6th of February 1715, nearly two years after the treaty of Utrecht, peace between Spain and Portugal was concluded at Madrid.

Never was the Portuguese Crown richer than in the years 1715–1755; rarely had the kingdom prospered less. The The Monarchy: Commercial and financial evils rife under the last kings of the Aviz dynasty were now repeated. More gold had been discovered in Matto Grosso, diamonds in Minas Geraes. As in the 16th century immense quantities of bullion were imported by the treasury, and were lavished upon war, luxury and the Church, while agriculture and manufactures continued to decline, and the countryside was depopulated by emigration to Brazil. John V. was a spendthrift and a bigot. He gave and lent enormous sums to successive popes, and at the bidding of Clement XI. he joined a "crusade" against the Turks in which his ships helped to win a naval action off Cape Matapan (1717). For these services he received the title of Fidelissimus, "Most Faithful"; "Majesty" had been substituted for "Your Highness," and the new title of "Highness," and the new style was intended to place the king of Portugal on an equality with his Most Christian Majesty of France and his Most Catholic Majesty of Spain. John V. was also empowered to create a multitude of new ecclesiastical dignities, and the archbishop of Lisbon was granted the rank and style of Patriarch ex officio. To the patriarchate was appended a Sacred College of 24 prelates, who were privileged to officiate in the scarlet robes of cardinals, while the patriarch wore the vestments of a second pope. Though regiments were disbanded, fleets put out of commission and fortresses dismantled to save the cost of their upkeep, the Crown paid nearly £100,000 yearly for the maintenance of this new hierarchy, and squandered untold wealth on the erection of churches and monasteries. In the church of São Roque in Lisbon, the decoration of a single chapel measuring 17 ft. by 12 ft. cost £225,000; the expenditure on the convent-panel of Mafra (q.v.) exceeded £4,000,000.

John V. was succeeded by his son Joseph (1750–1777). Five years afterwards Portugal was overtaken by the tremendous disaster of the Lisbon earthquake (see LISBON), which, as Oliveira Martins justly observes, was " more than a cataclysm of nature; it was a moral revolution." It brought the Restoration period to an end (1755). Throughout that period the monarchy had occupied a middle position, dependent until 1768 for its very existence, and after 1768 for its stability, on foreign support. Its policy had been moulded to suit France or Great Britain, while its internal administration had normally been directed by the Church. The cortes had grown obsolete; the feudal aristocracy were become courtiers. Once more, as in 1580, Portugal was governed by ecclesiastics in the name of an absolute monarch; once more, as in 1580, the chief strength of the ecclesiastical party was the Society of Jesus, which still controlled the conscience and mind of the nation and of its nominal rulers, through the confessional and the schools.

7. The Reform of the Monarchy: 1755–1826.—The unity of Portuguese history is hard to perceive in the years which witnessed the rise and fall of the Pombaline régime, the reign of the mad queen Maria, the Peninsular War and the subsequent chaos of revolutionary intrigue. At first sight it seems absurd to characterize this period of despotism ending in war, ruin and anarchy as a period of reform. Nevertheless, it is possible to trace through the apparent chaos an uninterrupted movement from absolutism to representative institutions. Pombal liberated the monarchy from clerical domination, and thus unwittingly opened the door to those " French principles," or democratic ideas, which spread rapidly after his downfall in 1777. The destruction of an obsolete political system, begun by Pombal, was completed by the Peninsular War; while French invaders and British governors together quickened among the Portuguese a new consciousness of their nationality, and a new desire for political rights, which rendered inevitable the change to constitutional monarchy.

Two days after the accession of King Joseph, Sebastião José de Carvalho e Mello, better known as the marquess of Pombal (q.v.), was appointed secretary of state for foreign affairs and war. In a few months he gained an ascendency over the king's mind which lasted until the end of the reign, and was strengthened by the courage and wisdom shown by Pombal at the time of the great earthquake. His policy was to strengthen the monarchy and to use it for the furtherance of a comprehensive scheme of reform. Beginning with finance and commerce, he reversed the bullionist policy of his predecessors and reorganized the entire system of taxation. He sought to undo the worst consequences of the Methuen treaty by the creation of national industries, establishing a gunpowder factory and a sugar refinery in 1751, a silk industry in 1752, wool, paper and glass factories after 1759. Colonial development was fostered, and the commercial dependence of Portugal upon
Great Britain was reduced, by the formation of charted companies, the first of which (1753) was given control of the Algarve sardine and tuna fisheries. The Oldenburg Company (1754) received a monopoly of trade with the Portuguese colonies in the East; extensive monopolist rights were also conceded to the Pará and Maranhão Company (1755) and the Pernambuco and Parahyba Company (1759). In Lisbon a chamber of commerce (Junta do comércio) was organized in 1756 to replace an older association of merchants, the Mercos de homens de negócios, which had attacked the Pará Company; and in the same year the Alto Douro Company was formed to control the port-wine trade and to break the monopoly enjoyed by a syndicate of British wine merchants. This company met with strong opposition, culminating in a rising at Oporto (February 1757), which was savagely suppressed.

Both his commercial policy and his desire to strengthen the Crown brought Pombal into conflict with the Church and the aristocracy. In 1751 he had made all sentences passed by the Inquisition subject to revision by the Crown. The liberation of all slaves in Pará and Maranhão except negroes (1752), and the creation of the Pará Company, were prejudicial to the interests of the Jesuits. Pombal had sent two prelates and two bishops of Brazil to be curtailed. Various charges were brought against the Society by Pombal, and in September 1750, after five years of heated controversy (see Jesuits), he published a decree of expulsion against all its members in the Portuguese dominions. His power at court had previously been strengthened by the so-called Tavora plot. The marquess and Marchioness of Tavora and their two sons, with the duke of Aveiro, the count of Atouguia and other noblemen, were accused of complicity in an attempt upon the life of King Joseph (September 1758). Pombal appointed a special tribunal to judge the case; many of the accused, including those already mentioned, were found guilty and executed; and an attempt was made to implicate the Jesuits. Pombal's enemies declared that he himself had organized the attack upon the king, in such a manner as to throw suspicion upon his political opponents and to gain credit for himself. This accusation was not proved, but the history of the Tavara plot remains extremely obscure. The expulsion of the Jesuits involved Portugal in a dispute with Pope Clement XIII.; in June 1760 the papal nuncio was ordered to leave Lisbon, and diplomatic relations with the Vatican were only resumed after the condemnation of the Jesuits by Clement XIV., in July 1773.

His victory over the Jesuits left Pombal free to develop his plans for reform. He devoted himself especially to education and defense. A school of commerce was founded in 1756. In 1760 the censorship of books was transferred from an ecclesiastical to a lay tribunal; in 1761 the former Jesuit college in Lisbon was converted into a college for the sons of noblemen; in 1768 a royal printing-press was established; in 1772 Pombal provided for a complete system of primary and secondary education, entailing the foundation of 837 schools. He founded a college of art in Mafra; he became visitor of Coimbra University, recast its statutes and introduced the teaching of natural science. Funds for these reforms were to a great extent provided out of the sequestrated property of the Jesuits; Pombal also effected great economies in internal administration. He abolished the distinction between Old and New Christians, and made all Portuguese subjects eligible to any office in the state. Reaching reforms were at the same time carried out in the army, navy and mercantile marine. In 1760 Admiral Boscawen had violated Portuguese neutrality by burning four French ships off Lagos; Pombal protested and the British government apologized, but not before the military weakness of Portugal had been demonstrated. Two years later, when the Family Compact involved Portugal in a war with Spain, Pombal called in Count William of Lippe-Bückeburg to reorganize the army, which was reinforced by a British contingent under Brigadier-General John Burgoyne, and was increased from 3300 to 52,000 men. The Spaniards were at first successful, and captured Braganza and Almeida; but they were subsequently defeated at Villa Velha and Valencia de Alcantara, and the Portuguese fully held their own up to the signature of peace at Fontainebleau, in February 1763. Towards the close of the reign, a long-standing controversy with Spain as to the frontier between Brazil and the Spanish colonies threatened a renewal of the war; but in this crisis Pombal was deprived of power by the death of King Joseph (Feb. 20, 1777) and the accession of his daughter Maria I.

The queen was married to her uncle, who became king consort as Pedro III. Pombal's dismissal, brought about by the influence of the queen-mother Mariana Victoria, Maria I., did not involve an immediate reversal of his policy. The controversy with Spain was amicably settled by the treaty of San Ildefonso (1777); and further industrial and educational reforms were inaugurated, chief among them being the foundation, in 1780, of the Royal Academy of Sciences. Queen Maria, who had previously shown signs of religious mania, became wholly insane after 1788, owing to the deaths of Pedro III. (May 1786), of the crown prince D. Joseph, and of her confessor, the inquisitor-general D. Ignacio de San Caetano. Her second son, D. John, assumed the conduct of affairs in 1792, although he did not take the title of regent until 1799. Meanwhile a two-fold reaction — on one side clericalist, on the other radical — was set up. Pombal had decided that his son-in-law, D. John, was not fit for the crown and that Maria I. was incapable of being regent. D. John told William Beckford in 1786 that "the kingdom belongs to the monks," and his consort Carlota Joaquina, daughter of Charles IV. of Spain, exercised a powerful influence in favour of the Church. But new ideas had been introduced with the new system of education, and the inevitable revolt against absolutism had resulted in the formation of a Radical party, which sympathized with the Revolution in France and carried on an active propaganda through the numerous monastic lodges which were in fact political clubs. D. John became alarmed, and the intendant of police in Lisbon, D. Diogo Ignacio de Pina Manique, organized an elaborate system of espionage which led to the imprisoning or exile of many harmless enthusiasts.

From similar motives, a treaty of alliance with Spain was signed at Aranjuez in March 1793; 5000 Portuguese troops were sent to assist in a Spanish invasion of France; a Portuguese squadron joined the British Mediterranean fleet. But in July 1793 Spain concluded a peace with the French republic from which Portugal, as the ally of Great Britain, was deliberately excluded. In 1796 Spain declared war upon Great Britain, and in 1797 a secret convention for the partition of Portugal was signed by the French ambassador in Madrid, General Pérignon, and by the Portuguese minister Gondomar. D. John appealed for help to Great Britain, which sent him 60,000 men under Sir Charles Stuart, and a subsidy of £200,000. Though Spain, through the influence of D. John's father-in-law Charles IV., still remained neutral, a state of war between Portugal and France existed until 1799. D. John then reopened negotiations with Napoleon, and Lucien Bonaparte was sent to dictate terms in Madrid. But D. John dared not consent to close the harbours of Portugal against British ships. England was the chief market for Portuguese wine and grain; and the long Portuguese littoral was at the mercy of the British navy. Compelled to choose between fighting on land and fighting at sea, D. John rejected the demands of Lucien Bonaparte, and on the 10th of February 1801 he declared war upon Spain. His territories were at once invaded by a Franco-Spanish army, and on the 6th of June 1801 he was forced to conclude the peace of Badajoz, by which he ceded the frontier fortress of Olivenza to Spain, and undertook to pay 20,000,000 francs to Napoleon and to exclude British ships from Portuguese ports. Napoleon was dissatisfied with these terms, and although he ultimately ratified the treaty, he sent General Lannes to Lisbon as his ambassador, instructing him to humiliate the Portuguese and if possible to goad them into a renewal of the war. The same policy was continued by General Junot, who succeeded Lannes in 1804. Junot required D. John to declare war upon Great Britain, but his demand was not immediately pressed owing to the preoccupation of Napoleon with greater affairs, and in October 1805 Junot left Portugal.

By his Berlin decree of the 21st of November 1806 Napoleon
required all continental states to close their ports to British ships. As Portugal again refused to obey, another secret Franco-

Spanish treaty was signed at Fontainebleau on the 27th of October 1807, providing for the partition of Portugal. Entre-Minho-Douro was given to Louis II. of Etruria in exchange for his Italian kingdom; Algarve and Alemtejo were to form a separate principality for Godoy; the remaining provinces were to be garrisoned by French troops until a general peace should be concluded. To give effect to these terms, General Junot hastened westward across Spain, at the head of 30,000 French soldiers and a large body of Spanish auxiliaries. So rapid were his movements that there was no time to organize effective resistance. On the 29th of November D. John, acting on the advice of Sir Sidney Smith, British naval commander in the Tagus, appointed a council of regency and sailed for Brazil, convoyed by Sir Sidney Smith's squadron. For a detailed account of the subsequent military operations, see Peninsular War.

Junot, who was everywhere well received by the Portuguese democrats, entered Lisbon at the end of November 1807. He assumed command of the Portuguese army, divided the kingdom into military governments, and, on the 1st of February 1808 announced that the Braganza dynasty had forfeited its right to the throne. He himself hoped to succeed D. John, and sought to conciliate the Portuguese by reducing the requisition demanded by Napoleon from 40,000,000 francs to 20,000,000. But the action of the French army was felt at once, and as the consequences of the Spanish occupation were spreading, the citizens of Lisbon took refuge in May 1808 a general rising in that country, which soon spread to Portugal. The Spanish garrison in Oporto expelled the French governor and declared for the Braganzas, compelling Junot to march towards the north. He left Lisbon under the control of a regency, headed by the bishop of Oporto, who applied to Great Britain for help, promoted an insurrection against the French, and organized juntas (committees) of government in the larger towns. On the 1st of August 1808 Sir Arthur Wellesley, with 9000 British troops, landed at Figuerêa da Foz. He defeated a French division at Rolica ("Vimiera") on the 17th, and on the 21st won a victory over Junot at Vimeiro ("Vimiera"). Fearing an attack by Portuguese auxiliaries and the arrival of British reinforcements under Sir John Moore, Junot signed the convention of Cintra by which, on the 30th of August 1808, he agreed to evacuate Portugal (see Wellington). The regency appointed by D. John was now reconstituted and in October Sir John Moore assumed command of all the allied troops in Portugal. From Lisbon Moore marched north-eastward with about 32,000 men to assist the Spanish armies against Napoleon; his subsequent retreat to join Sir David Baird in Galicia, in January 1809, diverted the pursuing army under Napoleon to the north-west, and temporarily saved Portugal from attack.

In February Major-General William Carr Beresford was given command of the Portuguese army. Organized and disciplined by British officers, the native troops played a gallant part in the subsequent campaigns. In March-May 1809 the second invasion of Portugal began; Oporto, while an auxiliary force under General Lapisse advanced from Salamanca. On the 22nd of April, however, Wellesley, who had been recalled after the convention of Cintra, landed in Lisbon. On the 12th of May he forced the passage of the Douro, subsequently retaking Oporto and pursuading Soul into Spain. Valuable assistance had been rendered by the Portuguese generals Antonio da Silveira and Manoel de Brito Mousinho—the first a leader, the second an organizer.

After the battle of Wagram (July 6, 1809) the French armies in the Peninsula received large reinforcements, and Marshal Masséna, with 120,000 men, was ordered to operate against Portugal. He crossed the frontier in June 1810 and besieged Almeida, which capitulated on the 27th of August. Wellesley, who had now become Viscount Wellington, opposed his march southwards, and won a victory at Bussaco on the 27th of September; but Masséna subsequently turned the position of the allied army on the Serra de Bussaco, and caused Wellington to fall back on the Tagus. Wellington himself now divided his army into two. His southern army was under the command of Lieutenant General Sir Joseph, and the northern army of the Duke of Wellington, which had been detached from the Tagus, was under the command of Sir Edward Tovey. Here he stood upon the defensive until the invaders should be defeated by starvation. The Portuguese troops cut Masséna's communications; the peasants, under instructions from Wellington, had already laid waste their own farms, destroyed the roads and bridges by which Masséna might retreat, and burned their boats on the Tagus. On the 5th of March 1811, after a winter of terrible sufferings, Masséna's retreat began; he was harassed by the allied troops all the way to Sabugal, where the last rearguard action in Portugal took place on the 3rd of April. The invaders retired with a loss of nearly 30,000 men; Almeida was retaken on the 6th; and the remainder of the war was fought out on Spanish and Portuguese soil. The Portuguese troops remained under Wellington's command until 1814, and distinguished themselves in many actions, notably at Salamanca and on the Nivelle.

At the congress of Vienna (1814-1815) Portugal was represented by three plenipotentiaries, who were instructed to press for the retrocession of Ovienza and to oppose the restoration of French Guiana, which the Brazilians had conquered in 1809. Neither object was attained; and this failure, which was attributed to the lack of British support, hastened the reaction against British influence which had already begun. Since 1808 Portugal had theoretically been governed by the regency representing D. John. But as the regency was corrupt and unable to co-operate with Wellington and Beresford, the British government had demanded that Sir Charles Stuart (son of the Sir Charles Stuart mentioned above) should be appointed one of its members. The real control of affairs soon afterwards passed into the strong hands of Stuart and Beresford; and while the war lasted the Portuguese acquiesced in what was in fact an autocracy exercised by foreigners. In 1815, however, they desired to resume their independence. A further cause of dissatisfaction was the mutual jealousy of Portugal and Brazil. The colony claimed as high a political status as the mother-country, and by a decree dated the 16th of January 1815 it was raised to the rank of a separate kingdom. Thenceforward, until 1822, the Portuguese sovereignty was styled the United Kingdom of Portugal, Brazil and the Algarves. The importance of this change became apparent when Queen Maria I. died (March 1816) and D. John succeeded to the united thrones as John VI. The king refused to leave Brazil, partly owing to the intrigues of Carlota Joaquina, who hoped to become queen of an independent Brazilian kingdom. Thus Portugal, which had been almost ruined by the war, was now humiliated by the failure of her diplomacy at Vienna and by her continued dependence upon Great Britain and Brazil. The resultant discontent found expression in the cry of "Portugal for the Portuguese" and in the demand for a constitution.

In 1817 a military revolt (pronunciamento) in Lisbon was crushed by Beresford, and the leader, General Gomes Freire de Andrade, was executed; but on the 16th of August 1820, after Beresford had sailed to Brazil to secure the return of John VI, a second rising took place in Oporto. It soon spread southward. A new council of regency was established in Lisbon, the British officers were expelled from the army; Beresford, on his return from Brazil, was not permitted to land; a constituent assembly was summoned. This body suppressed the Inquisition and drew up a highly democratic constitution, by which all citizens were declared equal before the law and eligible to any office; all class privileges were abolished, the liberty of the Press was guaranteed, and the government of the country was vested in a single chamber, subject only to the suspensive veto of the Crown. So extreme a change was disliked by most of the powers and by many Portuguese, especially those of the clerical party. Great Britain insisted on the return of John VI., who entrusted the government of Brazil to his elder son D. Pedro and landed in Portugal on the 3rd of July 1821. In 1822, on the advice of
D. Pedro, he swore to obey the constitution (thenceforward known as the "constitution of 1822"). But his younger son, D. Miguel, and the queen, Carlota Joaquina, refused to take the oath; and in December 1822 sentence of banishment was pronounced against them, though not enforced. They had many supporters at home and abroad. French troops had invaded Spain in the interests of Ferdinand VII. (1823), and the French government was prepared to countenance the absolutist party in Portugal in order to check British influence there. Another military revolt broke out in Tras-os-Montes on the 3rd of February 1823, its leader being the count of Amarante, who was opposed to the constitution. D. Miguel appealed to the army to "restore liberty to their king," and the army, incensed by the loss of Brazil (1822), gave him almost unanimous support. At this juncture John VI., vainly seeking for a compromise, abrogated the constitution of 1822, but appointed as his minister D. Pedro de Sousa Holstein, count (afterwards duke) of Palmella and leader of the "English" or constitutional party. These half-measures did not satisfy D. Miguel, whose soldiers seized the royal palace in Lisbon on the 30th of April 1824. Palmella was arrested, and John VI. forced to take refuge on the British flags. In Tras-os-Montes, but the united action of the foreign ministers restored the king and reinstated Palmella; the insurrection was crushed; D. Miguel submitted and went into exile (June 1824).

In Brazil also a revolution had taken place. The Brazilians demanded complete independence, and D. Pedro sided with them. The Portuguese garrison of Rio de Janeiro was overpowered; on the 7th of September 1822 D. Pedro declared the country independent, and on the 12th of October he was proclaimed constitutional emperor. He took no notice of the constituent assembly in Lisbon, which on the 19th of September had ordered him to return to Portugal on pain of forfeiting his rights and inherit the Portuguese crown. By the end of 1823 all Portuguese resistance to the new régime in Brazil had been overcome.

John VI. died on the 10th of March 1826, leaving (by will) his daughter D. Isabel Maria as regent for Pedro I. of Brazil, who now became D. Pedro IV. of Portugal. A crisis was evidently imminent, for Portugal would not tolerate an absentee sovereign who was far more Brazilian than Portuguese. The unsatisfied ambition of Carlota Joaquina and the hostility between absolutists and constitutionalists might at any moment precipitate a civil war. To conciliate the Portuguese, Pedro IV. drew up a charter (known as the "charter of 1826") which provided for moderate parliamentary government on the British model. To conciliate the Brazilians, he undertook (by decree dated May 2nd 1826) to surrender the Portuguese crown to his daughter D. Maria da Gloria (then aged seven); but this abdication was made contingent upon her marriage with her uncle D. Miguel, who was first required to swear fidelity to the charter. 8. Constitutional Government.—The charter of 1826 forms the basis of the present Portuguese constitution and the starting-point of modern Portuguese history. That history comprises four periods: (a) From 1826 to 1834 the clerical and absolutist party, led by D. Miguel united every reactionary element throughout the kingdom in a last unsuccessful stand against constitutional government; (b) From 1834 to 1853 the main problem for Portuguese statesmen was whether the constitution, now accepted as inevitable, should embody the radical ideas of 1822 or the moderate ideas of 1826; (c) From 1834 to 1889 there was a period of transition marked by the rise of three new parties—Progressive, Regenerator, Republican; (d) From 1889 to 1908 the Progressives and Regenerators monopolized the control of public affairs, but the strength of Republicanism was not to be gauged by its representation in the cortes. At the beginning of the 20th century the question whether the monarchy should be replaced by a republic had become a living political issue, which was decided by the revolution of October 5, 1910.

The charter was brought to Lisbon by Sir Charles Stuart in July 1826. The absolutists had hoped that D. Pedro would abdicate unconditionally in favour of D. Miguel, and the council of regency at first refused to publish the charter. They were forced to do so (July 12) by a pronunciamento issued by D. João Carlos de Saldanha de Oliveira e Duarte, count of Saldanha and commander of the army in Oporto. The Absolutist Reaction.

Saldanha, a prominent constitutionalist, threatened to march on Lisbon if the regency did not swear obedience to the charter by the 31st of July. Amid wild enthusiasm the charter was proclaimed on that day, and on the 3rd of August Saldanha became head of a Liberal ministry. An absolutist counter-revolution at once broke out in the north. It was organized by the marquess of Chaves, and supported openly by the Church and the Miguelite majority of the army; secret assistance was also given by Spain. As civil war appeared imminent, Canning despatched 5000 British troops under Sir William Clinton to restore order, and to disband the troops under Chaves. By March 1827 Clinton and Saldanha had secured the acceptance of the charter throughout Portugal.

In October 1826 D. Miguel also swore to obey the charter and was betrothed to his niece D. Maria da Gloria (Maria II.). Pedro IV. appointed him regent in July 1827 and in February 1828 he landed in Lisbon, where he was received with cries of "Viva D. Miguel!" "Viva a Junta!" and a French legion of parliament which had met in accordance with the charter. In April the Tory ministry under Wellington withdrew Clinton's division, which was the mainstay of the charter. In May D. Miguel summoned a Cortes of the ancient type, which offered him the crown; and on the 7th of July 1828 he took the oath as king. Saldanha, Palmella, the count of Villa Flor (afterwards duke of Terceira), and the other constitutionalist leaders were driven into exile, while scores of their adherents were executed and thousands imprisoned. Austria and Spain supported D. Miguel, who was able to dispose of the vast wealth of Carlota Joaquina; Great Britain and France remained neutral. Only the emperor D. Pedro and a handful of exiles upheld the cause of Maria II., who returned to Brazil in 1829.

The Azores, although the majority of their inhabitants favoured absolutism, now became a centre of resistance to D. Miguel. In 1828 the garrison of Angra declared for Maria II., endured a siege lasting four months, and finally took refuge in the island of Terceira, where it was reinforced by volunteers from Brazil and constitutionalist refugees from England and France. In March 1829 Palmella established a regency on the island, on behalf of Maria II.; and D. Miguel's fleet was defeated in Praia Bay on the 12th of August. Portugal plied into the hands of Carlota Joaquina, Saldanha, Palmella, Villa Flor and their followers in Terceira. In 1830 a Whig ministry came into office in Great Britain; the "July revolution" placed Louis Philippe on the throne of France; Carlota Joaquina, the power behind D. Miguel's throne, died on the 7th of January. The fanaticism of the clerical and absolutist parties in Portugal (collectively termed apostolicos) was enhanced by recrudescence of Sebastianism. Men saw in the brutal boor D. Miguel (q.v.) a personification of the hero-king Sebastian, whose second advent had been expected for two and a half centuries. In the orgy of persecution, outrages were committed which suited British and French public opinion. In 1831 D. Miguel retaliated by seizing D. Miguel's fleet in the Tagus (July 1831). In Brazil, D. Pedro abdicated (April 1831); he determined to return to Europe and conduct in person a campaign for the restoration of Maria II. He was received with enthusiasm by Louis Philippe. In Great Britain Palmella raised a loan of £2,000,000 and purchased a small fleet, of which Captain Sartorius, a retired British naval officer, was appointed admiral. In February 1832 the "Liberators," as they were styled, sailed from Belleisle to the Azores, with D. Pedro aboard the flagship. In July they reached Portugal and occupied Oporto, but the expected constitutionalist rising did not take place. The country was almost unanimous in its loyalty to D. Miguel, who had 80,000 troops against the 6500 (including 5000 French and 300 British) of D. Pedro. But the Miguelites had no navy, and no competent general. They besieged D. Pedro in Oporto from July 1832 to July 1833, when the duke of Terceira and
Captain Charles Napier, who had succeeded Sartorius, effected a daring and successful diversion which resulted in the capture of Lisbon, (July 24, 1833). Maria II. arrived from France in September, before the insurgents could rely to the brilliant generalship of Saldanha and the financial straits to which D. Miguel was reduced. In April 1834 a Quadruple Alliance was concluded between France, Spain, Great Britain and the government of Maria II. The allied army defeated the Miguelites at Asseiceira on the 16th of May, and D. Miguel surrendered at Evora-Monte on the 24th. By the convention of Evora-Monte he was condemned to perpetual banishment from the Peninsula. On the 24th of September D. Pedro died. During the few months in which he acted as regent for his daughter, he had transformed Portugal from a semi-feudal into a modern state. Titles, many hereditary privileges and all monopolies were abolished; every convent was closed and its property nationalized; the Jesuits, who had returned after the death of Pombal, were again expelled; the charter of 1826 was restored. Maria II.153 was fifteen years old at her accession. She was twice married—in December 1834 to Augustus, duke of Leuchtenberg, who died four months afterwards; and in April 1836 to Ferdinand of Saxe-Coburg, who received the title of king consort in September 1837. Both the queen and the king consort were strangers to Portugal, and could exercise little control over the turbulent factions whose intrigues and pronunciamientos made orderly government impossible. There were three political parties: the Miguelites, who were still strong enough to cause trouble; the Chartists, who advocated the principles of 1826; the Septembrists, who advocated those of 1822 and took their name from the successful coup d’état of the 9th-11th of September 1836. By this coup d’état the constitution of 1822 was substituted for the charter of 1826; and a Septembrist ministry under the Viscount Sá da Bandeira replaced the Chartist ministry under Saldanha, Terceira and Palmella. A counter-revolution, planned in the royal palace at Belem and hence known as the Belenada, was frustrated in November 1836; and in 1837 a Chartist insurrection was crushed after severe fighting. This was known as the “War of the Marshals,” from the rank of the two Chartist leaders, Saldanha and Terceira. In 1839 a moderate ministry took office, with Antonio Bermudo da Costa Cabral as its real, though not its ostensible, head. A pronunciamiento by Costa Cabral led to the restoration of the charter on the 10th of February 1842, and a Cabral government was formed under the nominal leadership of Terceira. Costa Cabral, who became count of Thomar in 1845, ruled despotically, despite many insurrections, until May 1846, when a coalition of Miguelites, Septembrists and Chartist malcontents drove him into exile. On this occasion the rebellion—known as the “War of Maria da Fonte”—proved formidable. Oporto was held by a revolutionary junta, and Saldanha, who had become prime minister, persuaded the Quadruple Alliance to intervene. In June 1847 the Oporto junta surrendered, under promise of an amnesty, to a combined British and Spanish force, and the convention of Gramido (July 24, 1847) ended the war. Saldanha was rewarded with a dukedom, and retained office until June 1849. The dictatorial rule of his successor—the returned exile, Thomar—provoked another successful rising on the 7th of April 1851. Thomar again fled from the country; Saldanha again became prime minister, but at the head of a moderate coalition. He remained in power during five years of unbroken peace (1851-1856), and carried many useful reforms. The most important of these was the so-called Additional Act of the 5th of July 1852, which amended the charter of 1826 by providing for the direct election of deputies, the decentralization of the executive, the creation of representative municipal councils, and the abolition of capital punishment for political offences. Maria II. died on the 13th of November 1853, and was succeeded by her eldest son D. Pedro, during whose ministry the king consort D. Ferdinand acted as regent.

Under the brothers Pedro V. (1833-1861) and Luiz (1861-1889) Portugal obtained a respite from civil strife. Both monarchs delegated the conduct of affairs to their ministers, who constructed a new educational system, and gradually improved the economic condition of the kingdom and its colonies. Pedro V. came of age and assumed the government on the 16th of November 1855, in 1857 he married Princess Stephanie of Hohenzollern. The only political disturbance which marred the peace of his reign arose out of the seizure of the “Charles and Georges,” a French slave-trader which was captured off Mozambique. Napoleon III. sent a fleet to the Tagus and demanded an indemnity, which Portugal was compelled to pay. In 1866-1861 cholera ravaged the whole kingdom, and especially the capital. The king died of this disease on the 11th of November 1861, and two of his brothers, D. Ferdinand and D. John, died shortly afterwards. D. Luiz was absent at the time, and his father D. Ferdinand again became regent until his return, soon after which (1864) the new king married Maria Pia, daughter of Victor Emanuel II. of Italy. In 1869 slavery was abolished in every Portuguese colony. In 1870 the duke of Saldanha, the last survivor of the turbulent statesmen of Queen Maria’s reign, threatened an appeal to arms if the king would not dismiss his minister, the duke of Loulé, an advanced Radical and freemason, whose influence, dating from the reign of Pedro V., was viewed with disfavour by Saldanha, as well as by more conservative politicians. The king yielded; and Saldanha himself became prime minister, retaining office until 1874, when, at the age of 80, he was sent as ambassador to London. He had been by far the most influential man in Portugal, and his death in 1876 was followed by a regrouping of political parties.

The party of the Regenerators (Regeneradores), formed in 1852 out of a coalition of Septembrists and Chartists, had already been disintegrated. Its more radical elements, known at first as the Historic Left, were in 1877 reorganized as the Progressives (Progressistas). Its more conservative elements carried on the tradition and retained the name of the original Regenerators. Besides these two monarchist parties—the Regenerators or Conservative right and the Progressives or Constitutional left—a strong Republican party was formed in 1881. There were also the Miguelites, active but impotent intriguers; and the advocates of Iberian union, who became prominent in 1867, 1869, 1874, and especially in July 1872, when many well-known politicians were implicated in a fantastic conspiracy for the establishment of an Iberian republic. Portuguese nationalism was too strong for these advocates of union with Spain, whose propaganda was discredited as soon as any national interest was seriously endangered. This was the case in 1872, when Great Britain claimed the southern part of Delagoa Bay. The claim was submitted to the arbitration of M. Thiers, the French president, whose successor, Marshal Macmahon, delivered an award in favour of Portugal on the 10th of April 1875 (see Delagoa Bay).

King Luiz died on the 10th of October 1889, and was succeeded by his son D. Carlos (q.v.). Colonial affairs had for some time received close attention. In 1885 Portugal recognized the Congo Free State, and admitted its sovereignty over the north bank of the Lower Congo, although, in an unratified treaty of 1884, Great Britain had recognized both banks of the river as Portuguese territory. In 1886 Germany, France and Portugal defined by treaty the limits of their adjacent spheres of influence, and on the 26th of March 1887 Macao, hitherto leased to Portugal, was formally ceded by the Chinese government. In 1889 a resolution unanimously adopted by both chambers invited the ministry, of which José de Castro was president and Barros Gomes foreign minister, to press forward the territorial claims of Portugal in East and Central Africa. Shortly after the accession of King Carlos this active policy led to a dispute with Great Britain (see Africa, § 3). A Portuguese force under Major Serpa Pinto had invaded the
Shiré highlands in order to forestall their annexation by the British, and the British government demanded satisfaction. Public opinion rendered compliance difficult until a British squadron was despatched to the mouth of the Tagus, and the British minister presented an ultimatum (Jan. 21, 1890), requiring the withdrawal of all Portuguese forces from the Shiré. Barros Gomes was then able to yield under protest; but disturbances at once broke out in Lisbon and Oporto, and the ministry resigned. A coalition government took office on the 14th of January, with Serpa Pimentel as prime minister and J. Hintze-Ribeiro as foreign minister. The king, in a letter to Queen Victoria, declined for the time being to receive the Order of the Garter, which had just been offered him, and on the 6th of February the government addressed a circular letter to the powers, proposing to submit the issues in dispute to a European conference. Meanwhile a Republican rising was suppressed in Lisbon, and many suspected officers were degraded. On the 30th of August an Anglo-Portuguese agreement was negotiated in London, but the cessions made to Portugal were regarded in Britain as insufficient, the government assumed the loan immediately raised on the security of the railway stocks, and some foreign officers were detained.

The financial crisis of 1892 was followed by a serious financial crisis, involving three changes of ministry. In May the Portuguese government committed a formal act of bankruptcy by issuing a decree reducing the amount then due to foreign bondholders by two-thirds. The bondholders' committees, supported by some of the powers concerned, protested against this illegal action. A compromise was at last arranged by Hintze-Ribeiro, who assumed office in February 1893 as head of a Progressive government. His cabinet promised only slightly better terms to the foreign bondholders, but it relieved the financial tension in some degree; and by coming to an agreement with Germany in East Africa and with Great Britain in South Africa as to the delimitation of frontiers, he minimized the risks of conflict with other countries.

Portugal observed neutrality on the outbreak of the Anglo-Boer War, but the permission it conceded to the British consul at Lourenço Marques to search for contraband of war among goods imported there, and the free passage accorded to an armed force under General Carrington from Beira through Portuguese territory to Rhodesia, were vehemently attacked in the Press and at public meetings. The award of the Swiss arbitrators in the matter of the Delagoa Bay railway was given in 1900 (see Lourenço Marques). Portugal was condemned to pay 15,314,000 francs compensation; and this sum (less the sum of 3,000,000 francs immediately raised by loan from the Portuguese Tobacco Company).

A law of the 7th of August 1901 regulated the conditions of election to the lower house, thus ending a long series of parliamentary reforms. The most important of these had provided for the gradual extinction of the right of hereditary peers to sit in the upper house (July 24, 1889), had reduced the number of deputies and fixed the qualifications required for the exercise of the franchise (March 28, 1893); and had abolished the elective branch in the upper house (Sept. 25, 1893). These changes left untouched the most serious evil in Portuguese public life. The two great parties, Progressives and Regenerators, were largely composed of professional politicians whose votes were determined by their private interests. Skillful manipulation of the electoral returns enabled these two parties to hold office in fairly regular rotation; hence arose the popular nickname of rotativas, applied to Progressives and Regenerators alike. The same methods enabled them to obstruct the election of Republican and Independent candidates.

Under such a system of government it was natural that economic issues should still dominate Portuguese politics at the beginning of the 20th century. Year by year the budget showed a deficit, and the indebtedness of the state increased. A large proportion of the expenditure was unproductive, corruption was rife in public services, and the poverty of the overtaxed peasant and artisan classes gave rise to sporadic outbreaks of violence. In 1902 the students at Coimbra and Oporto organized an agitation against the proposed conversion of the gold debt; and anti-clerical riots, followed by a strike, rendered necessary the proclamation of martial law in Aveiro. In January 1903 a revolution in Brazil. In these circumstances Republicanism rapidly gained ground. Its real strength was masked by the system which enabled any ministry in power to control the election of candidates to the cortes. In April 1906, for example, only one Republican deputy was returned, although it was notorious that the Republican party could command a majority in many constituencies. Though the army as a whole was monarchist, certain regiments had become imbued with revolutionary ideals, which were fortified by the unwise employment of soldiers and sailors for the suppression of industrial disputes. During the weavers' strike the cruiser "Rainha D. Amelia" was converted into a temporary prison, and at Fundão, Aveiro and elsewhere troops had been ordered to protect the men with whom they sympathized. In May 1902, while King Carlos was in England, a military rising was organized in Oporto, but never took place. On the 23rd of April 1903 a body of cavalry and artillery mutinied in Lisbon and proclaimed a republic; but they were overpowered and ultimately transported to Mozambique. Such incidents, unimportant in themselves, were symptomatic of a dangerous state of public opinion, which was debarked from expression in the cortes.

The constitution empowered the sovereign to veto any bill, to dissolve or prorogue the cortes, and to govern by means of ministerial decrees. The use of these extraordinary powers would be a breach of constitutional practice, but not of law. King Carlos had already been criticized for alleged excessive interferences in politics. An experiment in government by decree had been made in May—October 1894; it was repeated in September 1905, when the king consented to prorogue the cortes until January 1906 in order to postpone discussion of the terms upon which the tobacco monopoly was to be allocated. A general election, in February 1906, was followed by three changes of ministry, the last of which, on the 19th of May, inaugurated the régime known in Portugal as the dictadoria or dictatorship. João Franco, the new minister, was conspicuous among the Portuguese politicians for his integrity, energy and courage; he intended to reform the national finances and administration—by constitutional means, if possible. The cortes, opened on the 6th of June 1906, was dissolved on the 14th; another election took place, preceded by an official announcement that on this occasion all votes would be fairly counted; and the "Franquistas" or "New Regenerators" obtained a majority. When the
cortes met, on the 29th of September, the opposition accused King Carlos of complicity in grave financial scandals. It was admitted that he had borrowed largely from the treasury, on the security of his civil list, and the Republican deputies accused him of endeavouring to assign the tobacco monopoly to one of his own foreign creditors, in settlement of the debt. Franco organized a coalition in defence of the Crown, but in January 1907 business in the cortes was brought to a standstill and many sittings ended in uproar. The attacks on the king were repeated at the trial of the poet Guerra Junqueiro, who was indicted for les-majesté. All parties believed that the ministry would fall, and the rotationes prepared once more to divide the spoils of office, when, on the 2nd of May 1907, João Franco reconstructed his cabinet, secured the dissolution of the cortes and announced that certain bills still under discussion would receive the force of law. His partisans in the press hailed the advent of a second Pombal, and their enthusiasm was shared by many enlightened Portuguese, who had previously held aloof from politics but now rallied to the support of an honest dictator. Backed by these forces, as well as by the king and the army, Franco effected some useful reforms. But his cabinet was not only the creation of the constitution, but the work of the Opposition politicians and those officials who feared inquiry, but also the magistracy, the district and municipal councils, and the large body of citizens who still believed in parliamentary government. The existing debt owed by D. Carlos to the nation was assessed at £154,000. This sum was ostensibly paid by the transference to the treasury of the royal yacht "Amelia" and certain palaces; but the cost and upkeep of the "Amelia" had been paid with public money, while the palaces had long been maintained as state property. These transactions, though perhaps necessary to save the credit of the sovereign at the least possible cost, infuriated the opposition. Newspapers and politicians openly advocated rebellion; Franco had recourse to coercion. Seditious journals were suppressed; gaols and fortresses were crowded with prisoners; the upper house, which was hostile to the dictator, was deprived of its judicial powers and reconstituted on a less democratic basis (as in 1820); the district and municipal councils were dissolved and replaced by administrative commissions nominated by the Crown (Jan. 1, 1908).

The ministerial press from time to time announced the discovery of sensational plots against the king and the dictator. It is, however, uncertain whether the assassination of King Carlos and the crown prince (see CARLOS I.), on the 1st of February 1908, was part of a widely organized conspiracy. The attempt was itself made by a group of fanatics, and a body of fanatics, and a body of fans, unconnected with any political party. The republican press applauded the murder; the professional politicians benefited by it. But the regicide Buia and his associates probably acted on their own initiative. The immediate results were the accession of Prince Manoel or Manuel (Emanuel II.) to the throne and the resignation of Franco, who sailed for Genoa. A coalition ministry, representing all the monarchist parties, was formed under the presidency of Admiral Ferreira do Amaral. The administrative commissions appointed by Franco were dissolved; the civil list was reduced; the upper house was reconstituted. A general election took place; in April the cortes met and the balance of power between Progressives and Regenerators was restored. On the 6th of May 1908 D. Manoel swore to uphold the constitution and was acclaimed king by the cortes. His uncle D. Affonso (b. 1865) took a similar oath as crown prince on the 22nd of March 1910. The failure of the dictatorship and the inability of the monarchists to agree upon any common policy had discredited the existing régime, and at the general election of August 1910 the Republican candidates in Lisbon and Oporto were returned by large majorities. On the 3rd of October the murder of a distinguished Republican physician, who had been organized to take place in Lisbon ten days later. The Republican soldiers in Lisbon, aided by armed civilians and by the warships in the Tagus, attacked the loyal garrison and municipal guards, shelled the Necessidades Palace, and after severe street-fighting (Oct. 4th-6th) became masters of the capital. The king escaped to Éricoire and thence, with the other members of the royal family, to Gibraltar. Soon afterwards they travelled undisturbed to England, where the king was received by the duke of Orleans. Throughout Portugal the proclamation of a republic was either welcomed or accepted without further resistance. A provisional government was formed under the presidency of Dr Theophile Braga (b. 1843), a native of the Azores, who had spent most of his life in France (see LITERATURE, below). The new government undertook to carry out part of the Republican programme before summoning a constituent assembly to remodel the constitution. Among its most important acts were the expulsion of the religious congregations which had returned after 1834, the nationalization of their property, and the abolition, by decree, of the council of state, the upper house and all hereditary titles or privileges. The Republican programme also included the separation of Church and State, and the concession of local autonomy (on federal lines, if possible) to the provinces and colonies of Portugal. There is little doubt that the constitution of 1911 is more liberal than that of 1826; there is little doubt that both are unsatisfactory and do not meet the expectations or the needs of the country.

3. Special Periods.—A. Herculano's classic História de Portugal (4 vols., Lisbon, 1846-1853) covers the period up to 1279. H. da Gama de Almeida, Historia de Portugal publica em dez livros (4 vols., Martinho de Barros, 1877-1883) is a scientific study of the highest value. For the periods 1415-1460 and 1750-1777, the authorities quoted under HENRY THE NAVIGATOR, and POMPEDE are: A. Herculano, in Vasco da Gama, &c. (London, 1910). For later history, see L. A. Rebelo da Silva, Historia de Portugal nas secões XVII. e XVIII. (5 vols., Lisbon, 1860-1870); A. M. Latino Coelho, Historia de Portugal desde os fins do XVIII. século até 1814 (3 vols., Lisbon, 1874-1891); the authorities quoted under PENINSULAR WAR; S. J. da Luz Soriano, Historia da guerra peninsular (5 vols., Lisbon, 1871-1877); L. J. Freire de Carvalho, Memorias ... para ... a usurpacao de D. Miguel (4 vols., Lisbon, 1841-1849); Sir C. Napier, An Account of the ... between D. Pedro and D. Miguel (2 vols., London, 1835); W. Bolinart, The Wars of Succession of Portugal and Spain, from 1821 to 1830 (2 vols., London, 1870). (K. G. J.)

LITERATURE

The Portuguese language can most conveniently be described in relation to the other languages of the Peninsula (see SPANISH: Language). Portuguese literature is distinguished by the wealth and variety of its lyric poetry, by its primacy in bicultural prose and verse, by the number of its great writers, by the preeminence of its Roman-Catholic element, and by the almost complete absence of the memoir. Rich as its romantico is, its volume is far less than the Spanish, but the cancioneiros
remain to prove that the early love songs of the whole Peninsula were written in Portuguese, while the primitive prose redaction of Amadís, the prototype of all romances of chivalry, was almost certainly made in Portugal, and a native of the same country produced in the Diana of Montemor (Montemayor) the masterpiece of the pastoral novel. The Lasioads may be called at once the most successful epic cast in the classical mould, and the most national of poems, and the great historical monuments and books of travel of the 16th and 17th centuries are worthy of a nation of explorers who carried the banner of the Quinas to the ends of the earth. On the other hand Portugal gave birth to no considerable dramatist from the time of Gil Vicente, in the 16th century, until that of Garrett in the 19th, and it has failed to develop a national drama.

Its geographical position and history have rendered Portugal very dependent for intellectual stimulus and literary culture on foreign countries, and writers on Portuguese literature are wont to divide their subjects into periods corresponding to the literary currents from abroad which have modified its evolution. To summarize, the first literary activity of Portugal was derived in part from Provence, and Provençal taste ruled for more than a century; the poets of the 15th century imitated the Castilians, and the 16th saw the triumph of Italian or classical influence. Spain again imposed its literary standards and models in the 17th century, France in the 18th, while the Romantic movement reached Portugal by way of England and France; and those countries, and in less degree Germany, have done much to shape the literature of the 19th century. Yet as regards the Peninsula, the literatures of Portugal and Castile act and react on one another and if the latter gave much, she also received much, for nearly every Portuguese author of renown from 1450 until the 18th century, except Antonio Ferreira, who wrote in Spanish, and some, like Jorge de Montemor and Manoel de Mello, produced masterpieces in that language and are numbered as Spanish classics. Again, in no country was the victory of the Italian Renaissance and the classical revival so complete, so enduring.

But notwithstanding all its dependence on classical and foreign authors, Portuguese literature has a distinct individuality which appears in the romanceiro, in the songs named cantores de amio of the cancioneros, in the Chronicles of Fernão Lopes, in the works of other writers of the period of Gil Vicente, in the burlesque verse and prose of the early 16th century, in the Letters of Marianna Alcoforado and, above all, in The Lasioads.

Early Period.—Though no literary documents belonging to the first century of Portuguese history have survived, there is evidence that an indigenous popular poetry both sacred and profane existed, and while Provençal influences moulded the manifestations of poetical talent for nearly two hundred years, they did not originate them. The close relations that prevailed between the reigning houses of Portugal, Provence and Aragon, cemented by intermarriages, introduced a knowledge of the gay science, but it reached Portugal by many other ways—by the crusaders who came to help in fighting the Moors, by the foreign prelates who occupied Peninsular sees, by the monastic and military orders who founded establishments in Portugal, by the visits of individual singers to court and baronial halls, but chiefly perhaps by the pilgrims who streamed from every country along the Frankish way to the far-famed shrine of Santiago de Compostela. Already by the end of the 11th century the lyric poetry of the troubadours had found cultivators in Portugal, and a few compositions which have come down to us bear a date slightly anterior to the year 1200. Among the earliest singers was D. Gil Sanches, an illegitimate son of Sancho I., and we may note the Galician-Portuguese, the first literary vehicle of the whole Peninsula, which appears to be the work of Sancho himself, and addressed to his concubine, A. Ribelinha. The pre-Alphonso period to which these men belong runs from 1200 to 1245 and produced little of moment, but in 1248 the accession of King Alphonso III., who had lived thirteen years in France, inaugurated a time of active and rich production which is illustrated in the Cancioneiro da Ajuda, the oldest collection of Peninsular verse. The apogee of palace poetry dates from 1275 to 1280, when young King Diniz displayed his exceptional talents in a circle formed by the best troubadours of his father Alphonso III. and the veterans of his grandfather Alphonso II., whose song-book, Cantigas de S. Maria, contains the choicest religious verse of the age. Diniz, who had been educated by Ameryc of Cahors, proved himself the most fecund poet-king of his day, though the pléiade of fidalgos forming his court, and the jorques who flocked there from all parts, were fewer in number, less productive, and lacked the originality, vigour and brilliancy of the singers who versified round Alphonso III.

The principal names of the Dionysian period (1284-1325) which is illustrated in the Cancioneiro da Vaticana are the king himself and his bastard D. Alphonso Sanches and D. Pedro, count of Barcelos. Of the two last, the former sings of love well and sincerely, while the latter is represented by love songs replete with false sentiment and by some rather gross songs of maldizer, a form which, if it rarely contains much poetical feeling or literary value, throws considerable light on the society of the time.

The verses of Diniz, essentially a love poet, are conventional in tone and form, but he can write pretty ballads and pastorals when he allows himself to be natural. The Portuguese troubadours belonged to all social classes, and even included a few priests, and though love was their favourite topic they used every kind of verse, and in satire they hold the palm. In other respects they are inferior to their Provençal masters. Speaking generally, the cancioneros form monotonous reading owing to their poverty of ideas and conventionality of metrical forms and expression, but here and there men of talent who were poets by profession and better acquainted with Provençal literature endeavoured to lend their work variety by the use of difficult processes like the lexaprem and by introducing new forms like the pastorelo and the desert. It is curious to note that no heroic songs are met with in the cancioneros; they are all with one exception purely lyrical in form and tone. The death of King Diniz proved a severe blow to troubadour verse, and the reign of his successor Alphonso IV. witnessed a profound decadence of court poetry, while there is not a single poem by a Portuguese author in the last half of the 14th century, and only the names of a few authors have survived, among them the Galicians Vasco de Gama and Corais Casarões, a poet who lived in the Iberian Peninsula in the reign of King Peter I., and theCastilian lover Macías. The romanceiro, comprising romances of adventures, war and chivalry, together with religious and sea songs, forms a rich collection of ballad poetry which continued in process of elaboration throughout the whole of the middle ages, but unfortunately the oldest specimens have perished and scarcely any of those existing bear a date anterior to the 15th century.

Epic poetry in Portugal developed much later than lyric, but the signal victory of the united Christian hosts over the Moors at the battle of the Salado in 1340 gave occasion to an epic by Alphonso Giraldes of which some fragments remain.

The first frankly literary prose documents appear in the 14th century in the form of chronicles, lives of saints and genealogical treatises. The more important are the Chronica Early Prose. breve do arquivo nacional, the Chronicas de S. Cruz de Coimbra, the Chronica da conquista do Algarve and the Livros dos Linhagens, aristocratic registers, portions of which, like the story of King Arthur, have considerable literary interest. All the above may be found in the Portugaliae monumenta historica, scriptores, while the Life of St Elizabeth of Portugal is included in the Monarchia Lusitana; Romania has printed the following hagiographical texts belonging to the same century the Vida de Eufrozina, the Vida de San Egipto and the Vida de Santo Antonio, and one account of the Vida de Santo Elzo has appeared in the Instituto and the Vida dos Santos Barão e Joséfat has been issued by the Lisbon Academy of Sciences.

Romances of chivalry belonging to the various cycles must have penetrated into Portugal at an early date, and the Nobil-ario of the Conde D. Pedro contains the genealogy of Arthur and the adventures of Lear and Merlin. There exists a mid-14th-century Historia do Santo Graal, and an unprinted José
ab Aramadua, while, though the MS. is lost, we have abundant evidence of the existence of a primitive Portuguese prose redaction of Amadis de Gaula anterior to the present Spanish text. Furthermore, the Livro de Espana published by Dr. Leite de Vasconcellos also belongs to the period, and there are other works in MS.

The 15th Century.—In the reign of John I. the court became an important literary centre, the king himself composed a Livro de Montaria, so far unedited, and his sons are rightly described as Camoens as “incluta geração, altos Infantes.” King Edward (Duarte) collected a precious library composed of the ancient classics, some translated by his order, as well as medieval poems and histories, and he wrote a moral treatise Leal conselleiro, and hints on horsemanship, or Livro do estimação do cavalleiro. King John I., who was as famous a poet as his Portuguese pupil, the Holy Com- stable Nuno Alvares Pereira, told in charming infantile prose, the translated Chronica da fundação do mosteiro de Sam Vicente, and the Vida de D. Tello. Fernão Lopes (q.v.), the father of Portuguese history and author of chronicles of King Pedro, King Ferdinand and King John I., has been called by Southey the best chronicler of any age or nation. Gomes Eannes de Azurara completed Lopes’s chronicle of King John by describing the capture of Ceuta, and wrote a chronicle of D. Pedro de Menezes, governor of the town down to 1437, and a chronicle of D. Duarte de Menezes, captain of Alcacer, but his capital work is the chronicle of the conquest of Guinea (see AZURARA).

Though not a great chronicler or an artist like Lopes, Ruy de Pina (q.v.) is free from the rhetorical defects of Azurara, and his chronicles of King Edward and King Alphonso V. are characterized by unusual frankness, and meritorious both as history and literature. All these three writers combined the posts of keeper of the archives and royal chronicler, and were, in fact, the king’s men, though Lopes at least seems rather the historian of a people than the oracle of a monarch. Garcia de Resende (q.v.) appropriated Pina’s chronicle of King John II., and after adding a wealth of anecdote and gossip and casting the glamour of poetry over a somewhat dry record, he reissued it under his own name. The taste for romances of chivalry continued throughout the 15th century, but of all that were produced the only one that has come down to us is the Estoria do Imperador Vespasiano, an introduction to the Graal Cycle, based on the apocryphal gospel of Nicodemus.

The Constable D. Pedro of Portugal, son of the prince of that name already referred to, has left some verses marked by elevation of thought and deep feeling, the Sotyre de felic e infeliz vida, and the death of his sister inspired his Tragodia de la reina Isabel; but he is best remembered by his Coplas del contemplo del mundo in the Cancioneiro Geral. Though he actually drafted the first in his native tongue, all these poems are in Castilian, and D. Pedro is one of the first representatives of those Spanish influences which set aside the Provencal manner and in its place adopted a taste for allegory and a reverence for classical antiquity, both imported from Italy. It was to the constable that the marquis de Santillana addressed his historic letter dealing with the origins of Peninsular verse. The court, poetry of the kings of King Alphonso V. and King John II., so far as it survives, is contained in the lyrical collection known as the Cancioneiro Geral, compiled by Garcia de Resende and printed in 1516. Nearly three hundred authors are there represented by pieces in Portuguese and Castilian, and they include D. João Manuel, D. João de Menezes, João Rodrigues de Sá e Menezes, Diogo Brandão, Duarte de Brito and Fernão de Silva Lopes. The literary progenitors of the cancionero were the chronicler poets, Juan Marinque, Garcia-Sanches de Badajos and Rodriguez del Padron, and its main subjects are love, satire and epigram. The epic achievements of the Portuguese in that century, the discoveries and the wars in Africa, hardly find an echo, even in the verses of those who had taken part in them. Instead, an atmosphere of artificiality surrounds these productions, and the verses that reveal genuine poetical feeling are very few. They include a lament of Garcia de Resende on the death of Ignacio de Castro which probably inspired the inimitable stanzas dedicated to the same subject in The Lustiads, the Pintimiento de Amanos by Diogo Brandão, the Coplas de la luna already referred to, and a number of minor pieces. However, some names appeared in the Cancioneiro Geral, which were to be among the foremost in Portuguese literature, e.g. Bernardim Ribeiro, Christovam Falcão, Gil Vicente, and Sá de Miranda, who represent the transition between the Spanish school of the 15th and the Italian school of the 16th century, the members of which are called Os Quinhentistas. Ribeiro and Falcão, the introducers of the bucolic style, put new life into the old forms, and by their eclogues in redondilhas, breathing the deepest and most genuine feeling in verses of perfect harmony, they gave models which subsequent writers worked by but could never equal.

The Modern Period.—The history of the modern drama begins with religious plays, followed at a later period by moralities, and thence, by an easy transition, by the farce. This transition from the presentment of traditional types to the modern play can be traced in the works of Gil Vicente, the father of the Portuguese theatre. His first efforts belonged to the religious drama, and some of the more notable had edification for their object, e.g. the Barco do Inferno, but even in this class he soon introduces the comic element by way of relief, and in course of time he arrives at pure comedy and develops the study of character. For a detailed description and criticism of his work, see Vicente. In the various towns where he stayed and produced his plays, writers for the stage sprang up, and these formed the Escola Velha or school of Gil Vicente. To name the best known, Evora, the city of culture, produced Afonso de Almeiriz, author of religious pieces, Antonio Ribeiro, nicknamed “the Chiado,” an unfrocked friar with a strong satirical vein who wrote farces in the Bazochian style, and his brother Jeronimo Ribeiro. In Santarem appeared Antonio Prestes, a magistrate who drew from his judicial experience but evinced more knowledge of folk-lore than dramatic talent, while Camoens himself was so far influenced by Gil Vicente, whose plays he had perhaps seen performed in Lisbon, that in spite of his Coimbra training he never exchanged the old forms for those of the classical comedy. His Amphi-tryons is a free imitation of the Latin, yet thoroughly national in spirit and cast in the popular redondilha; the dialogue is spirited, the situations comic. King Seleucus derives from Plutarch and has a prose prologue of real interest for the history of the stage, while Fiódromo is a clever tragi-comedy in verse with prose dialogues interspersed. Another poet of the same school is Balthazar Dias, the blind poet, whose simple religious autos are still performed in the villages, and are continually reprinted, the best liked being the Auto of St Alexis, and the Auto of St Catherine. He is purely medieval in subject and spirit, his lyrics are perfect in form and expression, his diction thoroughly popular. One of the last dramatists of the 16th century belonging to the old school was Simão Machado, who wrote the Comedy of Dúi and the Enchantments of Alfa, two long plays almost entirely in Spanish, and full of digressions only made tolerable by the beauty of their lyrics.

Except Camoens, all these men, though disciples of Gil Vicente, are decidedly inferior to him in dramatic invention, fecundity and power of expression, and they were generally of humble social position. Moreover the favour of the court was withdrawn on the death of Gil Vicente, and this meant much, for
there existed no educated middle class to support a national theatre. At the same time the old dramatists had to face the opposition of the classical school, which appealed to the cultured, and the hostility of the Inquisition, which early declared war on the popular plays on account of their grossness, and afterwards through the index prohibited altogether even the religious autos, as it had condemned the Italian comedies. The way was thus clear for the Jesuits, who, with their Latin tragi-comedies or dramatized allegories written to commemorate saints or for scholastic festivals, succeeded for a time in supplanting both the popular pieces of the old school and the plays modelled on the masterpieces of Greece and Rome. The old dramatists came to write for the lower classes only, and though the school lingered on, its productions were performed solely by travelling companies at country fairs. Though we know that much has perished, the four Indexes of the 16th century give some idea of the rich repertory of the popular theatre, and of the efforts necessary to destroy it; moreover, the Spanish Index of 1559, by forbidding autors of Gil Vicente and other Portuguese authors, is interesting evidence of the extent to which they were appreciated in the neighbouring country.

The Renaissance.—The movement commonly called the Renaissance reached Portugal both indirectly through Spain and directly from Italy, with which last country it maintained close literary relations throughout the 15th century. King Alphonso V. had been the pupil of Matthew of Pisa and summoned Justus Baldunus to his court to write the national history in Latin, while later King John II. corresponded with Politian, and early in his reign the first printing-press got to work. In the next century many famous humanists took up their abode in Portugal. Nicholas Cleynarts taught the Infant Henry, afterwards cardinal and king, and lectured on the classics at Braga and Evora, Vasaeus directed a school of Latin at Braga, and George Buchanan accompanied other foreign professors to Coimbra when King John III. reformed the university. Many distinguished Portuguese teachers returned from abroad to assist the king at the same time, among them Ayres Barbosa from Salamanca, Andre de Gouveia of the Parisian college of St. Barbe, whom Montaigne dubbed the "greatest principal of France," Achilles Estapo and Diogo de Telhe.

At home Portugal produced Andre de Resende (q.v.), author of the Historia da antiguidade da cidade de Evora and De antiquitatis Lusitanae, and Francisco de Hollandia, painter, architect, and author of, inter alia, the Quatro dialogos da pintura antiga. Moreover, women took a share in the intellectual movement of the time, and the sisters Luisa and Angela Sigéa, Joanna Vaz and Paula Vicente, daughter of Gil Vicente, constituted an informal female academy under the presidency of the Infanta D. Maria, daughter of King Manoel. Luisa Sigéa was both an orientalist and a Latin poetess, while Publia Hortensia de Castro, after a course of humanities, philosophy and theology, defended theses at Evora in her eighteenth year.

The Italian school was founded by Sá de Miranda (q.v.), a man of noble character who, on his return in 1526 from a six years' stay in Italy, where he had gathered with the leading writers of the day, initiated a reform of Portuguese literature which amounted to a revolution. He introduced and practised the forms of the sonnet, canzon, ode, epistle in ovata rima and in tercets, and the epigram, and raised the whole tone of poetry. At the same time he gave fresh life to the national redondilha metre (medida selha) by his Cartas or Satiiras which with his Eclogues, some in Portuguese, some in Latin, are among his most successful compositions. His chief disciple, Antonio Ferreira (q.v.), a convinced classicist, went further, and dropping the use of Castilian, wrote sonnets much superior in form and style, though they lack the rustic atmosphere of those of his master, while his odes and epistles are too obviously reminiscent of Horace. D. Manoel de Portugal, Pero de Andrade Caminha, Diogo Bernardes, Frei Agostinho da Cruz and Andre Falcão de Resende continued the erudite school, which, after considerable opposition, definitely triumphed in the person of Luiz de Camoens. The Lina de Bernardes contains some beautiful elegies as well as cartas in the bucolic style, while the odes, sonnets, and eclogues of Frei Agostinho are full of mystic charm. Camoens (q.v.) is, as Schlegel remarked, an entire literature in himself, and some critics rate him even higher as a lyric than as an epic poet. He unites and fuses the best elements of the Italian and the popular muse, using the forms of the one to express the spirit and traditions of the other, and when he employs the medida selha, it becomes in his hands a vehicle for thought, whereas before it had usually served merely to express emotions.

His Lusidos, cast in the Virgilian mould, celebrates the combination of faith and patriotism which led to the discoveries and conquests of the Portuguese, and through the voyage of Vasco da Gama occasioned its composition and formed the skeleton round which it grew, its true subject is the peito illustrue lusitano. Immediately on its appearance The Lusidos took rank as the national poem par excellence, and its success moved many writers to follow in the same path; of these the most successful was Jeronymo Corte Real (q.v.). All these poems, like the Elegiada of Luis Pereira Brandão on the disaster of Al Ksar, the Primeiro cêrco de Dia of the chronicler Francisco de Andrade, and even the Affonso Africano of Quevedo, for all its futile allegory, contain striking episodes and vigorous and well-coloured descriptive passages, but they cannot compare with The Lusidos in artistic value.

The return of Sá de Miranda from Italy operated to transform the drama as well as lyric poetry. He found the stage occupied mainly by religious plays in which there appeared no trace of the Greek or Roman theatre, and, not admiring what he had seen in Italy, he and his followers protested against the name auto, restored that of comedy, and substituted prose for verse. They generally chose the plays of Terence as models, yet their life is conventional and their types are not Portuguese but Roman-Italian. The revived classical comedy was thus so bound down by respect for authority as to have little chance of development, while its language consisted of a latinized prose from which the emotions were almost absent. Though it secured the favour of the humanists and the nobility, and banished the old popular plays from both court and university soon after Gil Vicente's death, its victory was shortlived. Jorge Ferreira de Vasconcellos, who produced the Eufrosina the first prose play, really belongs to the Spanish school, yet, though he wrote under the influence of the Celestina, which had a great vogue in Portugal, and of Roman models, his types, language and general characteristics are deeply national. However, even if they had stage qualities, the very length of this and his other plays, the Ulisipo and the Aulegraphia, would prevent their performance, but in fact they are novels in dialogue containing a treasury of popular lore and wise and witty sayings with a moral object. So decisive was the success of Jorge Ferreira's new invention, notwithstanding its anonymity, that it decided Sá de Miranda to attempt the prose comedy. He modelled himself on the Roman theatre as reflected by the plays of Ariosto, and avowedly wrote the Estrangeiros to combat the school of Gil Vicente, while in it, as in Os Vikhaipondos, the action takes place in Italy. Antonio Ferreira, the chief dramatist of the classical school, knew both Greek and Latin as well as Miranda, but far surpassed him in style. He attempted both comedy and tragedy, and his success in the latter branch is due to the fact that he was not content to seek inspiration from Seneca, as were most of the tragedians of the 16th century, but went to the Greek and Latin dramatists. His Bristo is but a youthful essay, but his second piece, O Céu, is almost a comedy of character, though both are Italian even in the names of the personages. Ferreira's real claim to distinction, however, rests on Ines de Castro (see Ferreira).

The principal form taken by prose writing in the 16th century was historical, and a plate of distinguished writers arose to narrate the discoveries and conquests in Asia, Africa and the ocean. Many of them saw the achievements they relate and were inspired by patriotism to record them, so that their writings
lack that serene atmosphere of critical appreciation which is looked for if historic literature is to take its place as a science. In the four centuries of his Asia, João de Barros, the Livy of his country, tells in simple vigorous language the "deeds achieved by the Portuguese in the discovery and conquest of the seas and lands of the Orient." His first decade undoubtedly influenced Camoes, and together the two men fixed the Portuguese written tongue, the one by his prose, the other by his verse. The decades, which were continued by Diogo de Couto, a more critical writer and a clear and correct stylist, must be considered the noblest historical monument of the century (see Barros). Couto is also responsible for some acute observations on the causes of Portuguese decadence in the East, entitled Soldado pratique.

The word encyclopaedists like Damiao de Goes, a diplomatist, traveller, humanist and bosom friend of Erasmus. One of the most critical spirits of the age, his chronicle of King Manoel, the Fortunate Monarch, which he introduced by one of Prince John, afterwards King John II., is worthy of the subject and the reign in which Portugal attained the apogee of its greatness.

Goes (q.v.) wrote a number of other historical and descriptive works in Portuguese and Latin, some of which were printed during his residence in the Low Countries and contributed to his deserved fame. After twenty years of investigation, at Goa, Fernao Lopes de Castanheda issued his Historia do descobrimento e conquista da India pelos Portuguezes (Lisbon, 1532-1534 and 1561), a book that ranks besides those of Barros and Couto. Antonio Galvao, who, after governing the Moluccas with rare success and integrity, had been offered the native throne of Ternate, went home in 1540, and died a pauper in a hospital, his famous treatise only appearing posthumously. The Tractado dos diversos . . . caminhos por onde a pimenta e especiaria veio da India . . . e assim de todos os descobrimentos . . . que são feitos em a era de 1500 has been universally recognized as of unique historical value. Like the preceding writers, Gealpao characterized the race, man and mind, and embodied his intimate knowledge of its manners and customs in the picturesque prose of the Lendas da India, which embraces the events of the years 1497 to 1550. Among other historical works dealing with the East are the Commentarios de Afonso d'Albuquerque, an account of the life of the great captain and administrator, by his natural son, and the Tratado das causas da China e de Ormus, by Frei Gaspar da Cruz.

Coming back to strictly Portuguese history, we have the uncritical Chronica de D. Joao III. by Francisco de Andrade, and the Chronica de D. Sebastiao by Frei Bernardo da Cruz, who was with the king at Al Kasr al Kebir in Morocco, and Miguel Leitao de Andrade, who was taken to China by his master that battle, related his experiences and preserved many popular traditions and customs in his Miscellanea. Bishop Osorio (q.v.), a scholar of European reputation, wrote chiefly in Latin, and his capital work, a chronicle of King Manoel, is in that tongue.

The books of travel of this century are unusually important because their authors were often the first Europeans to visit or at least to study the countries they refer to. They include, to quote the more noteworthy, the Descobrimento de Frobida, the Itinerario of Antonio Tenreiro, the Verdaes de morte de Pero Joao, by Francisco Alvarez, and the Ethnographia Oriental by Frei João dos Santos, both dealing with Abyssinia, the Itinerario da terra santa by Frei Pantaleao de Aveiro, and that much-translated classic, the Historia da vida do padre Francisco Xavier by Padre Joao de Lucena. Fernao Cardim in his Narrativa epistolar records a journey through Brazil, and Pedro Teixeira relates his experiences in Persia. But the work that holds the palm in its class is the Peregrinacao which Fernao Mendes Pinto (q.v.), the famous adventurer, composed in his old age for his children's reading. While Mendes Pinto and his book are typically Portuguese of that age, the Historia tragica-moralitima, sometimes designated the prose epic of saudade, is essentially the special characteristic of the race of seamen which produced it. This collection of twelve stories of notable wrecks which befell Portuguese ships between 1532 and 1604 contains that of the galleon "St John" on the Natal coast, an event which inspired Corte-Real's epic poem as well as some poignant stanzas in The Lastus, and the tales form a model of simple spontaneous popular writing.

The romance took many forms, and in two of them at least works appeared which exercised very considerable influence abroad. The Memina e moça of Bernardim Ribeiro, a tender pastoral story inspired by saudade for his lady-love, probably moved Montemor or Montemayor (q.v.) to write his Diana, and may some fifty years later have suggested the Lasstlando transformada to Fernando Alves da Orinete, who, however, like Ribeiro, owes some debt to San- nazzaro's Arcadia. To name the Palmeirim de Inglatera of Moraes (q.v.) is to mention a famous book from which, we are told, Burke quoted in the House of Commons, while Cervantes had long previously declared that it ought to be guarded as carefully as the works of Homer. Like most successful romances of chivalry, it had a numerous progeny, but its sequels, D. Duartos by Diogo Fernandes, and D. Clarisel de Bretanga by Goncalves Lobato, are quite inferior. The historian Barros tried his youthful pen in a romance of chivalry, the Chronicas do Imperador Claramundo, while in another branch, and a popular one in Portugal, the Arthurian cycle, the dramatist Ferreira Vazrolios wrote Sogromor or Memorial das proces da segunda Tavola Redonda. A book of quite a different order is the Contos de proveito e exemplor by Fernandes Trancoso, containing a series of twenty-nine tales derived from tradition or imitated from Boccaccio and others, which enjoyed deserved favour for more than a century.

Samuel Usque, a Lisbon Jew, deserves a place to himself for his Consolacãem as tribulaçõem de Israel, where he exposes the persecutions endured by his countrymen in every age down to his time; the book takes the dialogue form, and its dictio is elegant and pure. The important part taken by Portuguese prelates and theologians at the Council of Trent stimulated rhetorical writing, and though the works of the learned, as the Mémoria of Gomara, the Historia of Fernao Santa Maria, the Compendio of Gaspar da Cruz, and so forth, are very valuable, the most famous work is the History of the Life of the Most Illustrious Our Lady of the Rosary by Dom Antonio Pires da Fonseca, which was printed in 1562, and has at least a certain importance.

The moralist of the time three at least deserve the title of masters of prose style, Heltor Pinto for his Imageis da vida Christã, Bishop Arráz for his Dialogos, and Frei Thomé de Jesus for his noble devotional treatise Trabalhos de Jesus, while the same year saw the publication of the first Portuguese dictionary, by the famous Franciscan writer Jeronymo de Vida, entitled Dicio da Freira, though lacking depth, forms a curious and valuable document. The ranks of scientists include the cosmographer Pedro Nunes (Nonius), a famous mathematician, and the botanist Garcia da Orta, whose Colloquios dos simples e drogas was the first book to be printed in the East (1563), while the form of Aristotelian scholastic philosophy known as Philosophia cominbicrens had a succession of learned exponents. As, however, their vehicle was Latin, a mere mention must suffice, and for the same reason only the title of a notable book by Francisco Sanches can be given, the De nobili et prima universalis scientia quod nihilo transirent, 1568.

In 1562 Fernão de Oliveira published the first Portuguese grammar, and three years later the historian Barros brought out his Cartinha para aprender a ler, and in 1540 his Grammatica. Magalhães Gandavo printed some rules on orthography in 1574. Nunes de Leão also produced a treatise on orthography in 1576 and a work on the origins of the language in 1605, and Jeronymo Cardoso gave his countrymen a Latin and Portuguese dictionary.

The 17th Century.—The gigantic efforts put forth in every department of activity during the 17th century led to the inevitable reaction. Energy was worn out, patriotic ardour declined into blind nationalistic vanity, and the age which flourished from Freire de Andrade to the political point of view the 17th century found Portugal in a lamentable state of decadence which dated from
the preceding age. In 1536 the Inquisition began its work, while between 1552 and 1555 the control of higher education passed into the hands of the Jesuits. Following the Inquisition and the Jesuits came two other obstacles to the cultivation of letters, the censorship of books and the Indexes, and, as if these plagues were not enough, the Spanish domination followed. Next the taste of a monarch appeared, and the pen of Don João III, by an irony of fate, in Spanish, and Mello’s classic account of the Catalonian War is also in that language, while, by a still greater irony, Jacinto Freire de Andrade thought to picture and exalt the Cato-like viceroy of India by his grandiloquent Vida de D. João de Castro.

Other historical books of the period are the valuable Discursos of Severim de Faria, the Portugal restaurado of D. Luís de Menezes, conde de Ericeira, the ecclesiastical histories of Archbishop Rodrigo da Cunha, the Agiographia lusitana of Jorge Carlos and the Cronico da Companhia de Jesus by Padre Balthazar Telles. The last also wrote an Historia da Etiópia, and, though the travel literature of this century compares badly with that of the preceding, mention may be made of the Itinerario da Índia por terra até a ilha de Chipre of Frei Gaspar de S. Bernardino, and the Relação do novo caminho através da África e Sysira of Padre Manoel Godinho.

In the 17th century the religious orders and especially the Jesuits absorbed even more of the activities and counted for more in the public affairs of Portugal than in the preceding age. The pulpit discharged some of the functions of the modern press, and men who combined the gifts of oratory and writing filled it and distinguished themselves, their order and their country. The Jesuit Antonio Vieira (q.v.), missionary, diplomat and voluminous writer, repeated the triumphs he had gained in Bahia and Lisbon in Rome, which proclaimed him the prince of Catholic orators. His sermons are a mine of learning and experience, and they stand out from all others by their imaginative power, originality of view, variety of treatment and audacity of expression. His letters are in a simple conversational style, but they lack the popular localisations, humour and individuality of those of Mello. Vieira was a man of action, while the oratorian Manoel Bernardes lived as a recluse, hence his sermons and devotional works, especially Lua e Calor and the Nova Floresta, breathe a calm and sweetly alien to the other, while they are even richer treasures of pure Portuguese. Perhaps the truest and most feeling human documents of the century are the five epistles written by Marriana Alcoforado (q.v.) known as the Letters of a Portuguese Nun. Padre Ferreira de Almeida’s translation of the Bible has considerable linguistic importance, and philological studies had an able exponent in Amaro de Roboredo.

The popular theatre lived on in the Comedias de Cordel, mostly anonymous and never printed its existence would hardly be known were it not for the pieces which were placed on the Index. The popular autôs that have survived are mainly religious, and show the abuse of metaphor and the conceits which derive from Gongora. All through this century Portuguese dramatists, who aspired to be heard, wrote, like Jacinto Cordeiro and Mattos Fragsoso, in Castilian, though a brilliant exception appeared in the person of Francisco Manoel de Mello (q.v.), whose witty Auto do fidalgo aprendiz in redondilhas is eminently national in language, subject and treatment. Until the Restoration of 1640 the stage remained spellbound by the Spaniards, and when a court once more came to Lisbon it preferred Italian opera, French plays, and zarzuelas to dramatic performances in the vernacular, with the result that both Portuguese authors and actors of repute disappeared.

The 18th Century.—The first part of the 18th century differs little from the preceding age except that both affection and bad taste tended to increase, but gradually signs appeared of a literary revolution, which preceded the political and developed into the Romantic movement. Men of liberal ideas went abroad, chiefly to France, to escape the stupid tyranny that ruled in Church and state, and to their exhortation and example
are largely due the reforms which were by degrees inaugurated in every branch of letters. Their names were among others Alexandre Herculano, Joao Sanches, Corrêa da Serra, Brotero and Nascimento. They had a forerunner in Luiz Antonio Verney, who poured scorn on the prevailing methods of education, and exposed to good effect the extraordinary literary and scientific decadence of Portugal in an epoch-making work, *Verdadeiro método de estudar.* From time to time literary societies, variously called academies or acadãrias, arose to co-operate in the work of reform. In 1720 King John V., an imitator of Louis XIV., established the Academy of History. The fifteen volumes of its *Memorias,* published from 1721 to 1756, show the excellent work done by its members, among whom were Caetano de Sousa, his indefatigable position depopulating da Casa Real portuguesa, Barbosa Machado, compiler of the invaluable *Biblioteca Lusitana,* and Soares da Silva, chronicler of the reign of King John I.

The Royal Academy of Sciences founded in 1780 by the 2nd duke of Laçôs, uncle of Queen Maria I., still exists, though its output and influence are small. Its chief contribu-

**Adrois:**

**Lyric Poetry, &c.** all lacked creative power. The principal Greek and Latin authors were the models they chose, and Garçao, the most prominent Arcadian, composed the *Cantata de Dido,* a gem of ancient art, as well as some charming sonnets to friends and elegant odes and epistles. The bucolic verse of Quito, a hairdresser, has a tenderness and simplicity which challenge comparison with Bernardim Ribeiro, and the *Marília* of Gonzaga contains a celebrated collection of bucolic-erotic verse. Their conventionality sets the lyrics of Cruz e Silva on a lower plane, but in the *Hyssope* he improves on the *Lituria* de Bôileau. After a chequered existence, internal discussions caused the dissolution of the Arcadia in 1774. It had only gained a partial success because the despotic rule of Pombal, like the Inquisition before him, hindered freedom of fancy and discussion, and drove the Arcadians to waste themselves on flattering the powerful. In 1790 a New Arcadia came into being. Its two most distingui-

**Academy of Sciences.** portuguesa, still unfinished, and the *Memorias* (1788-

1795), and it included in its ranks nearly all the learned men of the last part of the 18th century. Among them were the ecclesi-

Stalishasterr, poet, Ribeiro do Cenaculo, bishop of Beja, the polymath Ribeiro dos Santos, Caetano do Amaral, a patient investigator of the origins of Portugal, João Pedro Ribeiro, the founder of modern historical studies, D. Francisco Alexandre Lobo, bishop of Vizeu, whose essays on Camoens and other authors show sound critical sense and a correct style, Cardinal Saraiva, an expert on ancient and modern history and the voyages of his countrymen, and Frei Fortunato de S. Beaumont, a historical and literary critic.

In 1756 Cruz e Silva (q.v.), with the aid of friends, established the *Arcadia Ulyssiponense,* "to form a school of good sayings and good examples in eloquence and poetry." The most considered poet of the day joined the Arcadia and individually wrote much excellent verse, but they merely contained poetical diction and comparisons, and distributed his attacks or begged for favours in sparkling verse. The task of purifying and enriching the language and restoring the cult of the Quinhentistas was perseveringly carried out by Francisco Manoel de Nascimento (q.v.) in numerous compositions in prose and verse, both original and translated. Shortly before his death in Paris he became a convert to the Romantik movement, and he prepared the way for its definite triumph in the person of Almeida Garrett, who belonged to the Filhinistãs, or followers of Nascentimento, in opposition to the Elmanistas, or disciples of Boguet.

**The Drama.** Early in the 18th century the spirit of revolt against despotism led to an attempt at the restoration of the drama by authors sprung from the people, who wrote for spectators, as coarse as they were ignorant of letters. Its centres were the theatres of the Bairro Alto and Mouraria, and the numerous pieces staged there belong to low comedy. The *Operas portuguesas* of Antonio José da Silva (q.v.), produced between 1733 and 1741, owe their name to the fact that *arias,* minuets and modinhas were interspersed with the prose dialogue, and if neither the plots, style, nor language are remarkable, they have a real comic force and a certain originality. Silva is the legitimate representative in the 18th century of the popular theatre inaugurated by Gil Vicente, and though born in Brazil, whence he brought the *modinha,* he is essentially a national writer. Like Silva's operas, the comedies of Nicolau Luiz contain a faithful picture of contemporary society and enjoyed considerable popularity. Luiz divided his attention between heroic comedies and comedies *de capa y espada,* but of the fifty-one ascribed to him, all in verse, only one bears his name, the rest appeared anonymously. His method was to choose some Spanish or Italian play, cut out the parts he disliked, and substitute scenes with dialogues in his own way, but he has neither ideals, taste nor education; and, except in *Os Maridos Perdidos,* his characters are lifeless and their conventional passions are expressed in inflated language. Notwithstanding their merits, however, his comedies held the stage from 1760 until the end of the century.

Meanwhile the Arcadia also took up the task of raising the tone of the stage, but though the ancients and the classic writers of the 16th century were its ideals, it drew immediate inspiration from the contemporary French theatre. All its efforts failed, however, because its members lacked dramatic talents and being out of touch with the people, could not create a national drama.

Sarga (q.v.) led the way with the *Theatro Nero,* a bright little comedy in blank verse, and followed it up with another, *Assembleia ou partida;* but he did not persevere. Figueiredo felt he had a mission to restore the drama, and wrote thirteen volumes of plays in prose and verse, but, though he chose national subjects, and could invent plots and draw characters, he could not make them live. Finally, the bucolic poet Quita produced the tragedies *Segundo Castro, Hermione* and two others, but, to these, the French, for all the taste they showed, were stillborn, and in the absence of court patronage, which was exclusively bestowed on the Lisbon opera, then the best equipped in Europe, Portugal remained without a drama of its own.

Sacred eloquence is represented by Fr. Alexandre Palhares, a student of Vieira, whose outspoken attack on vice in high places in a sermon preached before Queen Maria led to his exile from court. The art of letter-writing had cultivators in Abbade Costa, Ribeiro Sanches, physician of Catherine II. of Russia, Alexandre de Gusmão, and the celebrated Cavalleiro de Oliveira, also author of *Memorias politicas e literarias,* published at the Hague, whither he had fled to escape the Inquisition. Philological studies were pursued with ardour and many valuable publications have to be recorded, among them Bluteau's *Vocabulario Portugues,* the *Reflexes sobre a lingua portuguesa* and *arte poética* by Francisco José Freire, the *Exercicios e exercícios da lingua e eloquencia* of Pereira de Figueiredo, translator of the Vulgate, and Vitorbo's *Elucidario,* a dictionary of old terms and phrases which has not been superseded. Finally the best literary critic and one of the most correct prose writers of the period is Francisco Dãs Gomes.

**The 19th Century and After.**—The 19th century witnessed a general revival of letters, beginning with the Romantic move-

**LITERATURE**
field of poetry. Garrett read the masterpieces of contemporary foreign literature during his exiles in England and France, and, imbued with the national spirit, he produced in 1825 the poem *Camões*, wherein he broke with the established rules of composition in verse and destroyed the authority of the Arcadian rhymers. His poetry, like that of his fellow emigré, the austere Herculano, is eminently sincere and natural, but while his short lyrics are personal in subject and his longer poems historical, the verse of Herculano is generally subjective and the motives religious or patriotic. The movement not only lost much of its virility and genuineness, but became ultra-Romantic with A. F. de Castilho (q.v.), whose most conspicuous followers were João de Lemos and the poets of the collection entitled *O Trouvador*; Soares de Passos, a singer for the sad; the melodious Thomas Ribeiro, who drew his inspiration from Zorilla and voiced the opposition to a political union with Spain in the patriotic poem *D. Jayme*. Mendes Leal, a king in the heroic style, Gomes de Amorim and Bulhão Pato, belong more or less to the same school. On the other hand José Simões Dias broke with the Romantic tradition in which he had been educated, and successfully sought inspiration from popular sources, as his *Peninsulares* proves.

In 1865 there arose a serious and lengthy strife in the Portuguese Parnassus, which came to be known as the Coimbra Question from its origin in the university city. Its immediate cause was the preface which Castilho contributed to the poem *Moçídade* of Pinheiro Chagas, and it proclaimed the alliance of poetry with philosophy. The younger men of letters regarded Castilho as the self-elected pontiff of a mutual-praise school, who, ignorant of the literary movement abroad, claimed to direct them in the old paths, and would not tolerate criticism. The revolt against his primacy took the form of a fierce war of pamphlets, and led ultimately to the dethronement of the blind bard. The leaders in the movement were Anheiro de Quental (q.v.) and Dr Theophilo Braga, the first a student of German philosophy and poetry, the second a disciple of Comte and author of an epic of humanity, *Visão dos tempos*, whose immense work in the spheres of poetry, criticism and literary history, marred by contradictions, but abounding in life, cannot be judged at present. In the issue literature gained considerably, and especially poetry, which emerged on a period of active and rich production, still unevaluated, in the persons of João de Deus (q.v.) and the Coimbrans and their disciples. The *Campo de flores* contains some of the most splendid short poems ever written in Portuguese, and an Italian critic has ventured to call João de Deus, to whom God and women were twin sources of inspiration, the greatest love poet of the 19th century. Simplicity, spontaneity and harmony distinguished his earlier verses, which are also his best, and their author belongs to no school but stands alone. A preponderance of reflection and foreign influences distinguish the poets now to be mentioned. Anheiro de Quental, the chief of the Coimbrans, enshrined his metaphysical neo-Buddhist ideas of transcendence by extreme pessimism, and marked the stages of his mental evolution, in a sequence of finely-wrought sonnets. These place him in the sacred circle near to Heine and Leopardi, and, though strongly individualistic, it is curious to note in them the influence of Germanism on the mind of a southerner and a descendant of the Catholic navigators of the 16th century. *Odes modernas*, written in youth, show "Santo Anheiro," as his friends called him, in revolutionary, free-thinking and combative mood, and are ordinary enough, but the prose of his essays, e.g. *Considerations on the Philosophy of Portuguese Literary History*, has that peculiar refinement, clearness and conciseness which stamped the later work of this sensitive thinker. A subtle irony pervades the *Rimas* of João Penha, who links the Coimbrans with Guerra Junqueiro and the younger poets. Partly philosophical, partly naturalistic, Junqueiro began with the ironical composition, *A Morte de D. João*, in *Patria* he evoked in a series of dramatic scenes and lashed with satire the kings of the Braganza dynasty, and in *Os Simples* he interprets in sonorous stanzas the life of country-folk by the light of his powerful imagination and pathetic tendencies. The *Clari
dades de Sul* of Gomes Leal, a militant anti-Christian, at times recalls Baude laire, and flashes of genius run through *Anti-
Christo*, which is alive with the instinct of revolt. The *Só* of the invalidish Antonio Nobre is intensely Portuguese in subjects, atmosphere and rhythmic sweetness, and had a deep influence. Cesario Verde sought to interpret universal nature and human sorrow, and the Parnassian Gonçalves Crespo may be termed a deeper, richer Coppée. His *Minúciauras* and *Nocturnos* have been re-edited by his widow, D. Maria Amelia Vaz de Carvalho, a highly gifted critic and essayist whose personality and *cerde* call to mind the 18th-century poetess, the Marquessa de Alorna. The French symbolists found an enthusiastic adept in Eugenio de Castro. Antonio Feijo and José de Sousa Monteiro have written verse remarkable by its form, while perhaps the most considered of the later poets are Antonio Corrêa de Oliveira and Lopes Vieira. Many other genuine bards might be mentioned, because the Portuguese race can boast of an unceasing flow of lyric poetry.

Garrett took in hand the reform of the stage, moved by a desire to exile the translations on which the playhouses had long subsisted. He chose his subjects from the national history, and began with the *Auto de Gil Vicente*, in which he resuscitated the founder of the theatre, and followed this up with other prose plays, among which the *Alfagnem de Santarem* takes the palm; finally he crowned his labours by *Frei Luís de Sousa*, a tragedy of fatality and pathos and one of the really notable pieces of the century. The historical bent thus given to the drama was continued by the versatile Mendes Leal, by Gomes da Amorim and by Pinheiro Chagas, who all however succumbed more or less to the atmosphere and machinery of ultra-Romanticism, while the plays of Antonio Ennes deal with questions of the day in a spirit of combative liberalism. In the social drama, Ernesto Biester, and in comedy Fernando Caldeira, also no mean lyric poet, are two of the principal names, and the latter's pieces, *A Manitha da Renda* and *A Madrugada*, have a delicacy and vivacity which justifies their success. The comedies of Gervasio Lobato are marked by an easy dialogue and a sparkling wit, and some of the most popular of them were written in collaboration with D. João de Camara, the leading stylist of the 19th century. The plays of D. João V. have been translated and staged abroad. To Henrique Lopes de Mendonça, scholar, critic and poet, we owe some strong historical plays as well as the piece *Zé Palense*, written with Lobato, which made a big hit. The playwrights also include Julio Dantas, and Dr Marcellino Mesquita, author of *Leonor Telles* and other historical dramas, as well as of a powerful piece, *Dór suprema*.

Herculano led the way in the historical romance by his *Lendas e narrativas* and *O Monastério*, two somewhat laboured productions, whose progenitor was Walter Scott; they are still read with their impecable style. Their most powerful work have been *A Moçídade de D. João V.* and *A última corrida de tourou reais em Salvador* by Rebello da Silva, and *Um Anno na Corte* by the statesman, Andrade Corvo, the first and the last superior books. The novel shares with poetry the predominant place in the modern literature of Portugal, and Camillo Castello Branco (q.v.), Gomes Coelho and Eça de Queiroz are names which would stand very high in any country. The first, a wonderful impressionist though not perhaps a great novelist, describes to perfection the domestic and social life of Portugal in the early part of the 19th century. His remarkable works include *Amor na Aduana*, *Retrato de Ricardo*, and the series entitled *Novellas do Minho*; moreover some of his essays in history and literary criticism, such as *Bohemia do Espírito*, rank only next to his romances. Gomes Coelho, better known as *Julio Dinis*, records his experiences of English society in *Oporto* in *A Família inglesa*, and for his romantic idealism he has been dubbed British; Portuguese critics have accused him of imitating Dickens.
His stories, particularly *As Pupilhas do Sr. Reitor*, depict country life and scenery with loving sympathy, and hold the reader by the charm of the characters, but Diniz is a rather subjective monotonous writer who lacks the power to analyse, and he is psychologically a weak psychologist. Erdogan (1898) found in *Figamere's Naturalist* a story in Portuguese by a twoflow book written in 1871, but only published in 1875, under the title *The Crime of Father Amare*; and two of his great romances, *Cousin Basil* and *Os Malas*, were written during his occupancy of consular posts in England. *The Relic* conveys the impressions of a journey in Palestine and in parts suggests his indebtedness to Flaubert, but its mysticism is entirely new and individual; while the versatility of his talent further appears in *The Correspondence of Pratique Mendes*, where acute observation is combined with brilliant satire or rich humour. The later portion of *The City and the Mountains*, for the truth and beauty of its descriptive passages, is highly praised, and many pages are already quoted as classic examples of Portuguese prose. Among other novelists are Oliveira Marreca, Pinheiro Chagas, Arnaldo Gama, Luís de Magalhães and Teixeira de Queiroz, the last of whom is almost as distinctly national a writer as Castello Branco himself.

Years of persevering toil in archives and editions of old chronicles prepared Herculano for his *magnum opus*, the *Historia de Portugal*. The *Historia do Origem e Estabelecimento da Inquisição em Portugal* followed and confirmed the position of its author as the leading modern historian of the Peninsula, and he further enriched and edited the important series *Portugaliae Monumenta Historica*. The Visconde de Santarem, and Judice Biker in geography and diplomacy, produced standard works; Luz Soriano compiled painstaking histories of the reign of King Joseph and of the Peninsular War; Silvestre Ribeiro printed a learned account of the scientific, literary and artistic establishments of Portugal, and Lieut.-Colonel Christovam Ayres was the author of a history of the Portuguese army. Rebelo da Silva and the voluminous and brilliant publicists, Latino Coelho and Pinheiro Chagas, wrote at second hand and rank higher as stylists than as historians. Gama Barros and Costa Lobo followed closely in the footsteps of Herculano, the first, by a *Historia da Administração pública em Portugal nos Séculos XII, XIII, XIV*, positively packed with learning, the second by a *Historia da Sociedade em Portugal no Século XV*. Though he had no time for original research, Oliveira Martins (qua) possessed psychological imagination, a rare capacity for general ideas and the gift of picturesque narration; and in his philosophic *Historia de Portugal*, his sensational *Portugaliae Contemporaneae*, *Os Filhos de D. João and Vida de Nun Avôres*, he painted an admirable series of portraits and, following his master Michelet, made the past live again. Furthermore the interesting volumes of his *Bibliotheca das Sciencias Sociais* show extensive knowledge, freshness of views and critical independence and they have greatly contributed to the education of his countrymen.

Ramalho Ortigão, the art critic, will be remembered principally for the *Farpas*, a series of satirical and humorous sketches of Portuguese society which he wrote in collaboration with Queiroz. Julio Cesar Machado and Filhalo de Almeida made their mark by many humorous publications, and, in the domain of pure literary criticism, mention must be made of Antonio Pedro Lopes de Mendonça, Rebello da Silva, Dr Joaquim de Vasconcelos, Mme Michaelis de Vasconcelos, Silva Pinto, the favourite disciple of Castello Branco, and of Luciano Cordeiro, founder of the Lisbon Geographical Society, whose able monograph, vindicating the authenticity of the Letters of a Portuguese Nun and showed Marianna Alcoforado to be their authoress. Excellent critical work was also done by Moniz Barreto, whose early death was a serious loss to letters.

In scientific literature hardly a single department lacks a name of repute even outside Portugal. The press has accompanied the general progress, and ever since Herculano founded and wrote in the *Panorama*, the leading writers have almost without exception made both name and livelihood by writing for the papers, but as pure journalists none has excelled Antonio Rodrigues Sampaio, Antonio Augusto Teixeira de Vasconcelos and Emidgio Navarro.

The leading Portuguese orators of the 19th century, with the exception of Malheiro, were not churchmen of the past, but politicians. The early days of parliamentary rule produced Manoel Fernandes Thomás and Manoel Borges Carneiro, but the most brilliant period was that of the first twenty-five years of constitutional government after 1834, and the historic names are those of Garrett, Manoel da Silva Passos, and the great tribune and apostle of liberty, José Estevão Coelho de Magalhães. The ill-fated Vieira de Castro excited the greatest admiration by his impassioned speeches in the Chamber of Deputies during the 'sixties; the nearest modern counterpart to these distinguished men is the orator Antonio Candido Ribeiro da Costa.

*Bibliography*.—The corner-stones are the *Bibliotheca Lusitana* of Barros Machado and the *Dicionario bibliographico portugues*, by Innocencio da Silva, with Brito Araujo's supplement; while the *Bibliotheca Hispana Nova* of Nicolau Antonio (1783-1788) may also be referred to. Subsidiary to these are the *Manual bibliographico* of Dr Pinto, the Dicionario bibliographico de los Autores portuguezes que escribieron en Castellano, compiled by Garcia Perez (1890), and such publications as Figaniere's *Historia do Manuscritos do Museu Britanico* (1853). The only full general history of the literature in the Portuguese pen of Dr Theophilo Braga (second and revised edition in 32 vols.). The volumes positively bulge with information and contain much much monotonous and needlessly long-digests and by the fantastic theorizings of their authors as a militant Positivist. Of one-volume books on the same subject, Dr Braga's * Curso da Historia da Literatura portuguesa* and his *Historia da literatura da lingua portuguesa* (2nd ed. 1891) may be recommended, though the plainest *Historia da Literatura portuguesa*, by Dr Mendes dos Remedios (3rd ed., 1908) has the considerable advantage for foreign students of including a large number of portraits of the authors named. See also the *Christianus matheus archaicus* of J. J. Nunes (1905). Among foreign studies the palm must be given to the "Geschichte der portugiesischen Literatur" by the eminent scholar, Michaelis de Vasconcellos, in the *Grundzuss der rom. Philologie* of Grelier (1893-1904). Among general critical studies are Costa e Silva's *Ensaio bibliografico-critico* and the masterly work of Menendez y Pelayo, *Historia de las ideas esteticas en España*.

Coming to special periods, the student may consult, for the cancioniere, Mme Michaelis de Vasconcelos, *op. cit.*, and her great edition of the *Cancioneiro da Ajuda* (1904); also H. R. Lang, *The race of the 16th, 17th and 18th centuries, The Aryan Vagabonds*, as a treatise of the literature of the 16th and 17th centuries in articles in the *Annaes das ciencias e leissas*; and the *Memorias de literatura portuguesa* printed by the Lisbon Academy of Sciences (1874-1906), the *Revista de Ciencias* (1905-1908), *Memorias do Centro Portuguez* (1907, 1908), *Memorias de literatura portuguesa* (1908), *Bibliotheca Lusitana* (6 vols., 1826) and a *Corpus illustrium poetarum latinorum qui latinus scriptorum* (1745-1746), and though much more complete, much less readable, as a modern authority, the *Historia da literatura portuguesa* (1893) of Manuel Monteiro, the *History of Portuguese Literature* (1893) by the American scholar, Joshua Fish, is perhaps the best book on the 19th century has naturally received most attention. For that period, see Lopes of Mendonça, *Memorias de literatura contem- poranea* (1855); Romero Ortiz, *La Literatura portuguesa en el siglo XIX* (1886), containing much undigested information; and Monteiro, 

*Revista de Portugal* for July 1890. Students of the modern is expected to consult *Le Mouvemen politique contemporain en Portugal*, an able sketch; but the soundest review is due to Moniz Barreto, whose "Literatura portuguesa contemporanea" came out in the *Revista de Portugal* for July 1880.

PORTUGUESE EAST AFRICA, or MOZAMBIQUE. This Portuguese possession, bounded E. by the Indian Ocean, N. by German East Africa, W. by the Nyasaland Protectorate, Rhodesia and the Transvaal, S. by Tongaland (Natal), has an area of 293,500 sq. m. It is divided in two by the river Zambezi. The northern portion, between the ocean and Lake Nyasa and the Shiré river, is a compact block of territory, squarish in

*E. P.
shape, being about 400 m. long by 360 m. broad. South of the Zambezi the province consists of a strip of land along the coast varying from 50 to 200 m. in depth. Along the Zambezi itself Portuguese territory extends west as far as the Loanga confluence, some 600 m. by river.

**Physical Features.**—The coast-line extends from 26° 52' S. to 10° 40' S., and from south to north makes a double curve with a general trend outward, i.e., to the east. It has a length of 1430 m. Some 40 m. north-west of Natal (Tongoland) from here is the disembarkation of Delagoa Bay (q.v.). The land then turns outward to Cape Corrientes, a little north of which is Inhambane Bay. Bending westward again and passing several small islands, of which the chief is Bazaruto, Sobyth Island and the islands of the Cape Cross group, it is then formed by the mouth of the Zambezi, which pours its waters into the ocean. From this point onward the coast is studded with small islands, mainly of coral formation. On one of these islands is Mozambique, and immediately north of that part is Conducia Bay. Somewhat farther north are two large basins, Fernao Veloso and Mamba. There is a great difference in the character of the coast north and south of Mozambique. To the north the coast is much indented, abounds in rocky headlands and rugged cliffs whilst, as already stated, there rises to 860 ft. and 1000 ft. the Molokai and Namuli Islands. South of Mozambique the coast-line is low, sandy and lined with mangrove swamps. Harbours are few and poor. The rise of the coast-line at these places arises apparently in that in the northern half the ocean current which flows south between Madagascar and the mainland is close to the coast, and scours out all the softer material, while at the same time the coral accumulations are raised above the level of the waves. But there is an ocean current which forsakes the coast, allowing the accumulation of sand and alluvial matter. North of Fernao Veloso and Mamba the largest bays are Pemba (where there is commodious anchorage for heavy draught vessels) and Beira (q.v.), the last-named lying between the last-named and the last-named islands, for its northern arm Cape Delgado, the limit of Portuguese territory.

Orographically the backbone of the province is the mountain chain which forms the eastern escarpment of the continental plateau. It does not present a uniformly abrupt descent, but places— as in the lower Zambezi district—slopes gradually to the coast. The Lebombo Mountains, behind Delagoa Bay, nowhere exceed 1500 ft. above the sea, but the Sibi, rising to 1500 ft., and the Matshe, which on the northern bank of the Zambesi rises to 2000 ft., is the highest. The Storngonzo massif with Mt. Miranga (6650 ft.), Enhaitse (6650 ft.), and Gogogo (3500 ft.) lies north-east of the Manica plateau, and is the highest point on the eastern escarpment. The larger formation of the Lebombo Mountains, cut by precipitous outer slopes, has been likened in its aspect to a frowning citadel. The chief mountain range, however, lies north of the Zambezi, and east of Lake Chilwa, namely, the Namuli Mountains, which rise to over 2000 ft., and are cut by many deeply incised gorges. Near the shore of Lake Nyasa, to the south, rises the Malagasy Mountains, which are cut by deep gorges and broken by lagoons. The plateau land west of the escarpment are of moderate elevation—perhaps averaging 2000 to 2500 ft. It is, however, only along the Zambezi and north of that river that Portuguese territory lies to the sea.

Besides the Zambezi (q.v.) the most considerable river in Portuguese East Africa is the Limpopo (q.v.) which enters the Indian Ocean about 100 m. north of Delagoa Bay. The Komi (q.v.), Sibi, Busi and Pungwe south of the Zambezi; the Lukumu, Lurio, Montepuiesi (Mtpwesi) and Musu, with the Rovuma (q.v.) and its affluent the Lujenda, to the north of it, are the other rivers of the province with considerable drainage areas. The Sibi rises in Mashonaland at an altitude of over 3000 ft., and after flowing south for over 200 m. turns east and pierces the mountains some 170 m. from the coast, being joined near the Anglo-Portuguese frontier by the Musu and Pungwe. Of the Limpopo and Musu, it is the latter which is the more important, and the Musu is the more important of the two. Below the Lundi confluence the bed of the Sibi becomes considerably broader, varying from half a mile to two miles. In the rainy season the Sibi is a large stream and even in the "dries" it can make a very considerable appearance. The Musu, on the other hand, is a much smaller stream, but it makes a large appearance in the rainy season and is larger than the Sibi in the "dries". The mouth of the Musu and Pungwe is the port of Beira. Of the north-Zambezi streams the Lukumu, rising in the hills south-east of Lake Chilwa, flows south and enters the ocean not far north of Quelimane. The Lurio, rising in the hills south-east of Lake Chilwa, flows north and enters the ocean on the south side of the coast. The Musu and Pungwe rise in the hills south-east of Lake Chilwa, and enter the ocean not far south of Quelimane.

**Geology.**—The central plateau consists of gneisses, granites and schists of the usual East African type which in part or in whole are to be referred to the Archaean system. The next oldest rocks belong to the Karroo period. The principal occurrence is in the Zambezi basin, where at Tete they contain workable seams of coal, and have yielded plant remains indicating a Lower Karroo or Upper Carboniferous age. Sandstones and shales, possibly of Upper Karroo age, are found in the rain-swollen north-western basin, the belt of sandstones being cut by the Zambezi, and there is evidence that rocks crop out from beneath the superficial deposits along the coast belt between Delagoa Bay and Mozambique. The Cenomanian flora is represented in Conducia by the beds of Poxitoza and Acanthospermae and in South Mozambique by the deposits of the uplands, the Ilagazland by the nummulitic limestones which have been found to extend for a considerable distance inland. Basalts occur at several localities in the Zambezi basin. On the flanks of Mount Milianze there are two volcanic cones which would appear to be of comparatively recent date; but the most interesting igneous rocks are the rhyolitic lavas of the Lobango range.

**Climate.**—The climate is unhealthy on the coast and along the banks of the Zambezi. The main factors are the general care, however, Europeans are able to enjoy tolerably good health. On the uplands and the plateau the climate is temperate and healthful. The mean annual temperature is 77°-9°F., the hottest month being November, and the coldest July, 72°-5°F. At Quelimane, on the coast, the mean temperature is 85°-6°F., maximum 106°-7°F. and minimum 49°-1°F. The rainy season extends from the middle of November to the middle of March, and the dry season from May to the end of September. November is a month of light rains. During the monsoons the districts bordering the Mozambique Channel enjoy a fair rainfall, the mean temperature of 76°-1°F., maximum mean 88°-7°F., and minimum mean 65°-3°F.

**Fauna.**—The fauna is rich, game in immense variety being plentiful in most districts. The carnivora include the lion, both the金钱 and black-maned varieties, leopard, spotted hyena, jackal, serval, civet cat, genet, hunting dog (Lycaon pictus) in the Mozambique district, mongoose and spotted otter, the last-named living along rivers and rivers and rivers and rivers. The antelope are numerous, the red and southern red hare and the hog are common. A species of zebra is plentiful, and herds of buffalo (Bos pauro) are numerous in the plains and in the open woods. Antelopes, the finest are the eland and sable antelope. The game is abundant. The gnu and the giraffe is not found within the province. Of edentata the scaly anteater and porcupine are numerous. Among rodents hares and rabbits are abundant. There are several kinds of monkeys and lemuroids, the greater variety of the former being in the north and the latter in the south. There are also many species of reptiles, birds and land and river tortoises are all very numerous, as are pythons (some 18 ft. long), cobra, puff-adders and vipers. Centipedes and scorpions and insects are innumerable. Among insects mosquitoes, flies and flies, particularly the black fly, are very abundant. Soldier ants and ants and ants and ants and ants and ants and ants are common plagues. As has been indicated, the antelopes forms a dividing line not crossed by certain animals, so that the fauna north of that river presents some marked contrasts with that to the south.

**Bird-life.**—The birds are particularly abundant. Among the larger birds flamingoes are especially common in the Mozambique district. Cranes, herons, egrets, storks, pelicans and ibises are numerous, including the beautiful crested crane and the saddle-billed stork (Mycteria senegalensis), the last-named comparatively rare. The eagle, vulture, kite, buzzard, and crow are all represented, though the crested eagle is the most abundant. Of the vultures the black vulture, the fan-tailed, the quail, wild goose, teal, widgeon, mallard and other kinds of duck are all common. Other birds numerous represented are parrots (chiefly a smallish green bird—the grey parrot is not found), ravens, birds of prey and hawks, a number of small white and yellow parrots, a stork, a mandarin duck, a golden pheasant, and a number of small parrots, a starling with a beautiful burnished bronze-green plumage, sparrow-winged plovers, still birds, ruffs and kingfishers. The most interesting feature of the birds is the custom of the natives to burn the grass during the dry season to gives to areas for nearly half the year a blackened, desolate appearance. Six varieties of palms are found—the coco-nut, raphia, wild date, banyan, areca and sugar palm. The coco-nut is common in the coast regions and often attains 100 ft.; the date palm, found mostly in marshy ground and by the banks of small rivers, is seldom more than 20 ft. in height. Of the many timber trees, hardwoods, such as the teak and the ebony are common, and other trees resemble satin and rosewood. The Khaya senegalensis, a very large tree found in rainforests and by river banks, affords durable and easily-worked timber; there are
several varieties of vitex and of fiscus, notably the sycomore, which bears an edible fruit. Excellent hardwood is obtained from a species of guarea. Other characteristic trees are the mahagrove (along the sea shore), sandal-wood, gum cepal, baobab and bombax palm, in the lower plains, dracaenas (dragon trees), candablasa euphorbia, and many species of creepers and flowering shrubs. The thorny smilax and many other prickly creepers and shrubs are abundant. Acacias are numerous, including the gum-yielding variety, while landolphia rubber vines grow freely in the forests. Among plants of economic value the coffee, cotton, indigo and tobacco plants are found, as well as the castor oil and other oleaginous plants. Bananas, mangoes and pineapples grow in great profusion. Among flowers crimson, lotus, gentians, gladiori, lobelias, violets (scentless), red and yellow immortelles (confined to the higher elevations) and yellow and blue amamomus are common. Of grasses the bamboo is common. Phragmites corniculatus and its walking forms, 14 ft. and is abundant along the river banks and along the edges of the marshes. (For the flora of the Nyasa region see British Central Africa.)

Inhabitants.—Portuguese East Africa is sparsely inhabited, the estimated population (1909) being 3,120,000; 90% of the inhabitants belong to various Bantu tribes, from whose ranks most of the natives employed in the Transvaal gold mines are recruited. The most important in the northern half of the province are the Yoos (g.v.) and the Ma Kua (Makwa). The Makwa, notwithstanding the presence of Arabs, Banyans (Hindus), and the English, have preserved in a remarkable degree their purity of race; their language has undergone considerable change (see Bantu Languages). Most of the country between the Rovuma and the Zambezi is populated by branches of this race, governed by numerous petty chiefs. The Makwa are divided into four families or groups—the Low Makwa, the Lomwe or Upper Makwa, the Maua and the Medo. Yao possess the country between the Msala river and Nyasa. The dominant race between the Zambezi and the Mazoe are the Tavala, other tribes in the same region being the Maravi, Senga, Muzimba and Muzuzzo. They are mainly of Zulu origin. Between the Zambezi and the Pungwe are the Barue, Batoka, &c. In the district south of the Pungwe river, known as Gázaland, the ruling tribes, are of Zulu origin, all other tribes of different stock being known as Tongas. For the most part these Tongas resemble the Basutos. They are of peaceful disposition. They occupy themselves with stock-raising and agriculture. The inhabitants numbered about 9000 in 1909. They are chiefly Portuguese and British and nearly a half live in Lourenco Marques. There are many Portuguese half-castes.

Chief Towns.—The chief towns are Lourenço Marques, Mozambique, Quirimane, Inhambane, Beira, Chiinde and Sofala, all the chief ports and European settlements. The other European settlements are Chingane (see Sofala), and Angoa and Lourenço Marques on the coast, Tete and Zumbo on the Zambezi. Angoza lies midway between Quirimane and Mozambique, dates from the 17th century, and is a small and little frequented port. Ibo, founded by the Portuguese at the beginning of the 17th century, is built on an island, likewise called Ibo, in 12° 20' S., 40° 38' E. off the northern arm of Montepuezil Bay, and 180 m. north of Mozambique. Ibo Island is one of a group known as the Querimarch archipelago. The harbour is sheltered but shallow. The town attained considerable dimensions in the 17th century and was made the headquarters of the Cape Delgado district in the 18th century. The most prominent buildings are two forts, one disused. The other, called San João, is star-shaped and was built, according to an inscription over the gateway, in 1797. The Zambezi towns (Sena, Tete and Zumbo) mark the limits of penetration made by the Portuguese inland. Comparatively important places in the 17th and early part of the 18th centuries, with the decline of Portuguese power they fell into a ruinous condition. The opening up of Rhodesia and British Central Africa in the last quarter of the 19th century gave them renewed life. Sena, some 150 m. by river from Chiinde, is built at the foot of a hill on the southern side of the Zambezi, from which it is now distant 2 m., though in the middle of the 16th century the river flowed by it. Sena possesses an 18th-century fort, a modern government house and a church dedicated to St. Marcel.

Tete was founded about the same time as Sena, is also on the southern bank of the Zambezi. It is about 140 m. by the river above Sena. Since 1894 there has been a regular service of steamers between Tete and Chiinde. Of the ancient town little remains save the strongly-built fort and the church. The new town dates from about 1860, when there was a revival of the trade in gold dust and ivory. This trade, however, became practically extinct by 1903; the gold dust traffic through exhaustion of supplies, and the ivory trade through diversion to other routes. A transit trade to British possessions north and south of Tete has been developed, and in 1906 some gold mines in the neighbourhood began crushing ore. Zumbo is picturesquely situated just below the Lomwe confluence and commands large stretches of navigable water on the Loangwe and middle Zambezi.

The 17th-century town was deserted in consequence of the hostility of the natives. In 1859 David Livingstone found on its site nothing but the ruins of a few houses. Since then a new settlement has been made, and Zumbo has acquired some transit trade with Rhodesia.

On the line of railway from Beira to Rhodesia the most important town is Massi Kessi (Portuguese Maçiqueu) in the centre of the Manica goldfields. It lies 2500 ft. above the sea, 14 m. north-west of Beira by rail, and is close to the British frontier. Along the railway from Lourenço Marques to the Beira frontier, there are numerous positions of small settlements. The last Portuguese station is named Tessão Garcia; the first Transvaal station Komati Poort.

Communications.—The Zambezi is navigable by light draught steamers throughout its course in Portuguese territory with one break at the Kebrassa Rapids—400 m. from its mouth. By means of the Siré affluent of the Zambezi there is direct steamer and railway connection with British Central Africa. The navigability of the other rivers of the province has been indicated. From Lourenço Marques railways run to Swaziland and the Transvaal, and from there to the South African Republic and Natal. Lourenço Marques has been opened up to trade with countries beyond Portuguese territory, link the ports named to the British railway systems in South and Central Africa. The route for a railway to connect Beira with Sena was surveyed in 1906—1907, a route from Quirimane to the Zambezi being also surveyed. A light railway (30 m. long) goes inland from Matamba, on Inhambane Bay, serving northern Gázaland. Native caravan routes traverse every part of the country, but these are mere tracks, and in general communication is difficult and expensive.

Lourenço Marques, Beira, Mozambique and other ports are in telegraphic communication with Europe via South Africa and Mozambique (see Mozambique). The Makassar line of Inland telegraph lines connects the ports with the adjacent British possessions. British, German and Portuguese steamship lines maintain regular communication between Lourenço Marques and Durban, Beira and London. In some 1700 vessels of 3,400,000 tons visited the ports of the province.

Agriculture and Other Industries.—The country from the Rovuma to the Zambezi is of great fertility, the richest portion being that between Anoosa and Quirimane. In the basin of the Zambezi the soil is fertilized by the inundations of the river. The low coast land of the Gaza country is almost equally fruitful. A great part of the country is suitable for the growth of the sugar-cane, rice, ground-nuts, coffee and tobacco. The two last named plants, as also cotton, vanilla, tea and cloves, are not a success in the Quirimane region, where coco-nuts and ground-nuts are the chief crops. Tobacco fields are large and are bartered for the Mzambe. The Portuguese Company has large plantations of coffee and sugar. There are numerous sugar factories and rice plantations in the Zambozé district. The natives devote their attention to the raising of rice and to the get-together of the several native crops. A large number of Portuguese are employed as labourers and are paid in rice. Some 2100 vessels of 3,400,000 tons visited the ports of the province.

Fish are plentiful along the coast, and pearls are obtained off the Barame coastline. Turtles are caught in the Querimarch archipelago. Spirits, sugar, fibres and pottery are practically the only commodities manufactured. The hunting of game for ivory and skins affords employment to large numbers of natives.

Mineral Resources.—There are immense deposits of coal in the neighbourhood of Tete and near Delagoa Bay, and adjoining the coalfields ironstone of the best quality is plentiful. Malachite and copper are found in the interior, north-west of Mozambique. The
whole of the region north of Delagoa Bay to the Zambezi and inland to and beyond the Portuguese frontier is auriferous, and ancient gold workings have been found. Writers have been at some pains to identify deposits with the land of Ophir. In Manica several gold mines are worked. In 1906-1907 a rich formation similar to the American placer deposits was discovered in the Manica goldfields. A Government official has also worked at Misse and Chifumbaze, on the north of Tete. The Missile mines are just south of the central British Frontiers. Petroleum is found near Inhambane, as is also a curious elastico-like mass, though inhambenge, rock salt hitsunapa, which is derived from masses of a gelatious alga (see Kew Bulletin, No. 5, 1907).

Commerce.—The chief exports are rubber, sugar, coal, from the Transvaal), copra, ivory, mangrove barks, ivory (including hippopotamus teeth and rhinoceros horns), skins and hides, ground-nuts, and oilseeds, monkey-nuts, mealies, cattle (to Madagascar), cotton, tobacco, gold and other minerals. The principle imports are cotton in the provinces are cotton goods, hardware and stoffus. The "Kaffir" trade is largely in cheap wines of a highly deleterious character, blankets, hats and shoes, brass wire and Venetian beads. Immense quantities of cheap wine are bought by the natives. There are at Lourenço Marques and at Beira a large transit trade to and from the Transvaal and Rhodesia respectively. The average annual value of the external trade of the province for the five years 1910-1915 was about $5,000,000. In 1909 the total trade of the province— including re-exports and goods in transit—exceeded $10,000,000. Fully 50% of this trade was in transit or to the Transvaal. (See Lourenço Marques and Beira. The trade includes an increasing proportion of imports from Great Britain, India, Germany and Portugal. The retail trade both at the seaports and in the settlements inland is largely in the hands of British Indians—Banyans, Battees and Parsees. There are several native coffee-coffees, between which and Madagascar a large surreptitious trade in slaves was carried on until 1877. With this island, and also with Zanzibar, there is a large general coasting trade.

Administration, Revenue, &c.—Formerly called Mozambique, the province since 1891 bears the official title of State of East Africa. It is under a governor-general, appointed for three years, and for administrative purposes is divided into six districts. There is a government council, instituted in 1907, composed partly of officials and partly of elected representatives of the commercial, industrial and agricultural communities. There is also a provincial council, and a minister of the interior with the vice-presidency as "successor." In each district is a subsidiary council. The governor-general resides at Lourenço Marques and has under his immediate direction the Delagoa Bay district, Gasaland (q.v.) and the district of Inhambane was also governed directly by Portuguese officials. The greater part of the country between the Sabi River and the Zambezi, including the Manica and Sofala regions, is under a charter granting sovereign rights for 50 years from 1891, by the Companhia de Moçambique, which has its headquarters at Beira. The Quelimane, Chinde and Zambezi regions are administered by representatives of the governor-general, with headquarters at Quelimane. The Companhia do Nyassa has trading concessions over this district. North of the Quelimane district the coast region and adjacent islands go under the name of Angoza. The territory between the Lurio and Rovuma rivers and Lake Nyasa was governed by the Companhia do Nyassa under a similar charter. Revenue is obtained largely from customs and a hut tax on natives. The annual revenue of the province is about £1,000,000. A military force, about 4000 strong, is maintained, including 1200 to 1400 Europeans. Education is chiefly in the hands of Roman Catholic missionaries.

History.—It is uncertain at what period the east coast of Africa south of Somaliland was first visited by the maritime races of the east. There is, however, no reason to doubt that by the tenth century A.D. the Arabs had occupied the seashore as far south as Sofala, and that they carried on an active trade between East Africa and Arabia, the Persian Gulf and India.

The Arabs built fine towns and exercised control over the coast peoples, but do not appear to have pushed their conquests far inland. They had extensive commercial dealings, chiefly in gold, cotton, slaves, with the people of the country. There are islands on the middle Zambezi valley and the country now known as Mashonaland. Until the close of the 15th century the Arab supremacy was unchallenged. But in 1408 Vasco da Gama entered the mouth of a river which he called Río dos Bons Sinaes (River of Good Tokens), as he first found himself in contact with the civilization of the East. This stream was the Quelimane River, taken by the Portuguese a little later to be the main mouth of the Zambezi. From this river da Gama continued his voyage, putting in at Mozambique and Mombasa on his way to India. Hostilities between the Arabs and Portugese broke out almost immediately; da Gama, indeed, in his first voyage had some trouble with the sultan of Mozambique. In 1502 da Gama paid a visit to Sofala to make inquiries concerning the trade in gold carried on at that place, and the reports as to its wealth which reached Portugal led to the despatch in 1505 of a fleet of six ships under Pedro da Nyaha with instructions to establish Portuguese influence at Sofala. Da Nyaha was allowed to build a fort close to the Arab town. The fort, built in three months, was shortly afterwards attacked by a band of Bantus, who acted on the instigation of the Arabs. The attackers were driven off and the Arabs forced to acknowledge Portuguese rule. In 1509 a captain of Sofala and a factor, or chief trader, were sent out, and from this time the trade of the port fell to the Portuguese. Sofala, however, was not a suitable harbour for the refitting and provisioning of ships on the way to India, and to obtain such a port Mozambique was seized and fortified in 1507. By 1510 the Portuguese were masters of all the former Arab sultanates on the East African coast.

The northern half of this region, from Kilwa to Muckdishu, has passed out of their possession; here it is only necessary to outline the history of the country still under the Portuguese Crown. For forty years Sofala was their only station south of the Zambezi. Thence they traded with the monomatapa or chief of the "Mocaranga" (i.e. the Makalanga or Karanga) in whose territory were the mines whence the gold exported from Sofala was obtained. At that time this chief was a powerful potentate exercising authority over a wide area (see Monomatapa). The efforts made by the Portuguese from Sofala to reach him were unsuccessful. It was probably the desire to penetrate the "land of gold" by an easier route that led, in 1544, to the establishment of a station on the River of Good Tokens, a station from which grew the town of Quelimane. About the same time the Portuguese penetrated inland along the Zambezi, known then as the River of Sena, and founded the trading ports of Sena and Tete, or, perhaps, annexed already existing Arab towns of those names. It was at this period also that Lourenço Marques and a companion, sent out by the captain of Mozambique, entered Delagoa Bay and opened up trade with the natives. This was the most southerly point occupied by the Portuguese. For three centuries however the fine harbour was little used, and its ultimate development was due to the discovery of another "land of gold"—the Witwatersrand—beyond Portuguese territory. In the 16th century the Portuguese turned their energies towards the Zambezi valley. In 1569 their East African dominions, hitherto dependent on the viceroyalty of India, were made a separate government with headquarters at Mozambique.

Francisco Barreto, a former viceroy of India, appointed governor of the newly formed province, was instructed by King Sebastian to conquer the country of the gold mines. The route via the Zambezi, and not that by Sofala, was chosen by Barreto in opposition to the wishes of his council, but in accord with the advice of a Dominican friar named De Monclares. This advice proved fatal owing to the deadly climate of the Zambezi valley. Barreto's expedition, including over 1000 Europeans, started in November 1569, and from Sena marched south, an arrangement having been come to with the monomatapa by which the Portuguese were granted a right of way to the gold mines on condition of their attacking a rebel vassal of that chieftain. Barreto attacked and defeated this rebel, but received no help from the monomatapa, and his force was so greatly weakened by death and disease that he was obliged to return to Sena, whence he went to Mozambique to put down disorder among the Portuguese there. He returned to Sena in 1570, only to die a few days after his arrival. His successor Vasco Fernandez Homem, got together another expedition and made his way inland from Sofala to a region where he saw the ground being worked for gold. The comparative poorness of the mine filled him, he is stated, with disappointment, and he returned to Sofala. Thus these, the most important efforts made by the Portuguese to obtain possession of the interior, ended in failure.
Towards the end of the 16th century the Portuguese posts on the Zambezi were attacked by hordes of savages known as Muzimba, and Tete and Sena were destroyed. The captain-general of Mozambique—the province had been again attached to the Indian vicereignty—was only able to make peace on promise not to interfere with matters which concerned only the native tribes. Thereafter the Portuguese often had to defend even the coast towns from attacks by the Bantus. Still they held one or two posts in the interior besides those on the Zambezi. Of these the chief appears to have been Masapa, on the river Mansovo, i.e. Mazoe, in what is now Mashonaland, and about 150 m. by road from Tete. Near Masapa dwelt the monomotapa, an insignificant chieftain, the power of the Makalanga having been broken by revolts of once subject tribes and by dissensions among the Makalanga themselves. In 1629 a treaty was concluded with a claimant to the chieftainship who embraced Christianity. This man, known as the Monomotapa Filippo, declared himself a vassal of Portugal, and with the help of Dominican friars and a number of half-breeds established his authority.

The Portuguese, however, failed to make any effective use of their East African possessions. Among the causes of their non-success in the years immediately following the period of conquest must be reckoned the "Sixty Years' Captivity" (1580–1640), when the Spanish and Portuguese crowns were united, and the neglect of Africa for the richer possessions in India and the Far East. A more important and permanent reason for the non-development of Mozambique province was its unhealthy and enervating climate, which prevented European colonization. The few thousands of Portuguese who went out were chiefly officials, and they and the small body of planters led in general a life of indolence and debauchery. Commerce too was hampered and good government rendered impossible through the system of farming out the administration to officials who were in return granted a monopoly of trade, and even when this system was abandoned trade was confined to Portuguese subjects. But for many years the Jesuits and Dominicans were unceasing in their endeavours to win the native races to Christianity, the friars being the most energetic section of the white community. The first Jesuit missionaries began work in the province in the neighbourhood of Inhambane in 1560; in the same year another Jesuit, Gonçalo do SIlva, made a second raid on the zimbabwe (chief kraal) of the monomotapa, by whose orders he and his converts were strangled (March 16, 1561). Mission work was soon afterwards begun by the Dominicans and the two orders between them had agents spread over the greater part of the country from Mozambique southward. They gained thousands of at least nominal converts, notably the heir of one of the monomotapas, who was baptized in 1652 and who, renouncing his heathen, became vicar of the convent of Santa Barbara in Goa. But during the 18th century the zeal of the missionaries declined; in 1759 the Jesuits were expelled, and two years later the Dominicans were sent to Goa. At that time they had been, together with a few white, Goanese and half-caste traders, for fully a century practically the only representatives of Portugal in the interior (the towns on the Zambezi excepted). Portugal's influence was confined to helping one tribe in its quarrel with another, in return for favours received. The Portuguese were quite unable to take advantage of the disunion of the natives to establish their own supremacy. The exhaustion and enfeeblement of Portugal had, in short, its natural effect in Africa. In the early years of the 18th century the Arabs wrested from the Portuguese their African possessions north of Delagoa; the Dutch, French and British had been for some time making inroads on Portuguese trade and possessions in the south. In 1604, 1607 and again in 1652 the Dutch unsuccessfully attacked Mozambique, which was also attacked by the Arabs in 1670. The merchants of Sofala and Mozambique had, since the middle of the 17th century, found a new source of wealth in the export of slaves to Brazil, a trade due directly to the capture of the ports of Angola by the Dutch (1640–1648), but continued until nearly the middle of the 19th century. Other trade declined steadily, the continual state of warfare among the tribes of the inland plateaux greatly reducing the production of gold.

In 1752 the government of the East African possessions was again separated from that of Goa, and twenty years later José Maria de Lacerda and Almada, a man of high attainments, made governor of the province at his own request, endeavoured to reform the administration. Lacerda is chiefly remembered for his journey to the heart of Central Africa, where he died in October 1798. Lacerda had conceived the idea of establishing a chain of Portuguese posts across the continent from Mozambique to Angola, and his statesmanlike prescience was shown by his prediction that the seizure of Cape Town by the British would lead to the extension of British rule over Central Africa, thus isolating the Portuguese provinces on the east and west coasts. After Lacerda's death a state of apathy and decay was again manifest throughout Portuguese East Africa. During the greater part of the 19th century the country south of the Zambezi was devastated by hordes of savages of Zulu origin (see GAZALAND).

The discoveries of David Livingstone in the Zambezi basin in the period 1850–1865 attracted the attention of the British to those regions and led to the establishment of British settlements at the southern end of Lake Nyassa and in the Shire highlands. These events aroused anxiety in Lisbon, which was increased when the British obtained a prepondering influence in Matabele, Mashona and Manica lands—the lands of the earlier monomotapas. With sudden energy the Portuguese engaged in the "scramble for Africa," and though the result was disappointing to the patriotic feelings of the people they secured from their powerful neighbours—Great Britain and Germany—much better terms than might have been anticipated, having regard to the extremely limited area over which they exercised any sort of jurisdiction. The story of the partition is set forth fully in Africa, § 5. Before the "scramble" began, Portugal had been fortunate in securing, in 1875, as the result of arbitration, complete possession of the fine harbour of Delagoa Bay, the southern half of which had been claimed by Great Britain in virtue of acts of annexation in 1823 and later years.

The pressure of political events and the commercial activity of her rivals induced Portugal to take steps to develop the agricultural and mineral resources of the territory secured to her by international agreements. Imitating the policy of Great Britain, charters conveying sovereign powers were granted to the Mozambique Company in 1891, and to the Nyassa Company in 1893. Both these companies, as well as the Zambezi Company (which lacks a charter), undertook to open up the territory committed to their care. In all of them British capital is largely engaged. The total decay of Sofala, the removal of the seat of government from Mozambique to Lourenço Marques, the rise of the last named port and of Beira (both largely dependent on the transit trade with British possessions), all served to mark the changed condition of affairs. An agreement concluded in 1909 between the Transvaal and Portugal gave Delagoa Bay from 50 to 55% of the import trade with the Transvaal, the Portuguese agreeing further to facilitate the recruitment of natives in the province for work on the Rand mines. The development, in the early years of the 20th century, of rubber, rice, sugar and other plantations also gave a new impetus to commerce.

The last named work, though not worthy of the historical sketch, is valuable for its flora and fauna sections. For the regions south of the Zambezi see R. C. F. Maughan, Portuguese East Africa (London, 1906) and Zambezia (London, 1909); O Territorio de Mozambique, de Sofala e de Beira (Lisbon, 1903, 1906) prepared by the Mozambique Company; Commandant Smits, La Compagnie à chaîne de Mozambique "in Le Mouvement géographique de Brussels (1906). For the districts north of the Zambezi

1 Slavery was not abolished until 1878.
PORTUGUESE GUINEA

A Portuguese colony in West Africa, extending along the Guinea coast from Cape Roxo in 12° 10' N. to the Cogon estuary in 20° 50' N. Inland, it extends to 13° 40' W., being enclosed landward by French territory, the Casamance district of Senegal to the N., and French Guinean E. and S. (For map, see French West Africa.) The colony has an area of about 14,000 sq. m., and a population variously estimated at from 200,000 to 800,000. It consists largely of a low-lying deltaic region, together with an adjacent archipelago of small islands called the Bissagos.

The coast-line is deeply indented by estuaries into which flow numerous rivers whose sources are in the elevated region on the eastern part of the country. The largest of these is the river of the same name, the Mancoa, a northern affluent, and the Rio Grande or Combé; the last a large stream rising in the highlands of Futa Jallon. North of the Gambia estuary is the Rio Cacheo, which joins the River Casamance at an estuary called Meján. These rivers and estuaries are connected with one another and with many smaller rivers by a network of lagoons; and the Bissagos Islands, which lie off the Gambia estuary, formed on one time part of the estuary itself. The Casamance, as we have said, breaks up into a number of isolated bays, breakers, consisting of over thirty islands, besides many small reefs. The largest island, Orango, is the most southerly of the group and some 30 m. from the coast. Bulama and Bissago, islands of some importance, lie close to the mainland. The larger rivers can be ascended by vessels of considerable size for distances of 40 to 150 m., but navigation is rendered difficult by strong currents and the shifting nature of the channels as well as by hidden rocks and the great difference between high and low water. The climate is unhealthy, with a mean temperature of about 78° F. The rainfall is heavy, thunderstorms being frequent in the wet season, which lasts from May to October.

Flora and Fauna.—Large forest regions extend behind the man- grove-lined lagoons. Their characteristic trees are the oil and date palms, the baobab, the shea-butter tree, ebony, mahogany and calabash trees, and the acacia. Rubber vines are fairly abundant. Besides the forests, densest along the river valleys, there are extensive tracts of grassland and park-like country. Fruit trees include the large variety of size and type, to which we add the guinean nutmeg, apple, mango, the banana, the orange and the citron. The tobacco, indigo and cotton plants grow wild, and the coffee plant is also found. Ground-nuts and kola nuts are cultivated, and rice and millet are the staple crops. The elephant is found in the district between the Gambia and Grande rivers, and hippopotamuses are numerous. Other animals include the panther, wild boar, various antelopes, baboons, chimpanzees and large snakes. Crocodiles and sharks abound in the rivers. Birds include the pelican, heron, marabout, the trumpet bird and innumerable yellow parrots. Partridges and woodcock are also

The hills of the termite mounds are a notable feature in many parts of the country.

The natives of the country are mainly Mandingo (g.e.) and Fula (g.e.). The coast regions and the islands are inhabited by negro tribes which live side by side without mixing, each preserving their own customs, dress, language and type. They exhibit great individuality in appearance and disposition. Their religion is mostly animistic, and they are noted specially for their respect for family life and ancestral worship. Neither Christianity nor Mahometanism has made much headway among them. Going from south to north the chief tribes are the Nante, the Bulama, the Bissait, the Somba, the Mpongo, and many other tribes are to be found. They have a love of war and are jealous of each other's territory. They are strong and courageous, and are well armed, with clubs, muskets and lances. They cultivate the ground with a hoe, and are skilful in the chase. They are an industrious and warlike people, and are well known for their skill as fishermen.

History.—Bulama Island was discovered by Portuguese navigators in 1444, but was not formally claimed by Portugal until 1752; about which time she founded a station at Bissau, which in 1669 a Portuguese vessel entered. In 1870 a claim was made by Great Britain to Bulama and a part of the mainland was disallowed by the arbitrator appointed (President Grant of the U.S.A.). The island limits of the Portuguese sphere were fixed by a convention concluded with France in 1886, and the frontier was delimited during 1900-1903. Though so long settled in the district—the only part of the Guinea coast west of the Gabun left in her possession—Portugal has done little towards its development. With a fertile and well-watered soil, exceedingly rich in natural products, there is not much commerce, and such trade as exists, chiefly in non-Portuguese hands, is hampered by excessive customs duties and vexatious regulations. In 1925 the external trade of the colony was not more than £160,000 and was less than it had been twenty years previously. Ground-nuts, rubber, wax and ivory are the principal exports. Revenue and expenditure are about £50,000 a year. Portuguese authority does not in fact extend much beyond the few stations maintained, nor has the local government won the confidence of the natives. In 1908 Bissau and some European settlements on the mainland were besieged by the Papel and other tribes and troops had to be sent from Portugal before order could be restored. If however, agreement is continued, the Portuguese are confident of a very prosperous future. They are in this easily accessible little enclave a rich field for investigation, the almost nominal sovereignty of Portugal having left the country, practically uninfluenced by European culture, in much the same condition that it was in the 16th and 17th centuries.

PORTUNUS—POSEIDON 169

Guinea; Land und Leute," in Deutsche Rundschau, (1905), vol. xxvii; E. de Vasconcelles, As Colônias portuguesas (Lisbon, 1896–

PORTUNUS, or PORT UNUM, in Roman mythology, originally the god of gates and doors (Lat. porta), and as such identified with Janus and represented with a key in his hand. Gradually he came to be recognized as a separate deity, who protected the harbours (portus) and ensured a safe return to seafarers.

(Cicero, Nat. deor. ii. 26; Virgil, Aen. v. 241). With the introduction of the Greek gods, he became merged in Palaemon-Melias. He had a special priesthood on the Tiber near the Aemilian bridge and near Ostia, where a festival was celebrated in his honour on the 17th of August.

Mommssen unhesitatingly identifies Portunus with the river-god Tiberinus, from the fact that the festival is also called Tiberinalia in the fasti of Philocles; Marquardt regards him rather as the tutelary deity of warehouses.

See J. Marquardt, Römische Staatsverwaltung (1888), ii. 327, note 10.

PORTUS, an ancient harbour of Latium, Italy, on the right bank of the Tiber, at its mouth. For its origin see Ostia. Claudius, on his return from Parthia, constructed the first harbour here, 2½ m. north of Ostia, enclosing an area of 119 acres, with a 2½ m. long curvilinear mole projecting into the sea, and an artificial island, bearing a lighthouse, in the centre of the space between them; the harbour thus opened directly to the sea on the north-west and communicated with the Tiber by a channel on the south-east. The object was to obtain protection from the prevalent south-west wind, to which the river mouth was exposed. Though Claudius, in the inscription which he caused to be erected in A.D. 46, boasted that he had freed the city of Rome from the danger of inundation, his work was only partially successful. Nero gave the harbour the name of Portus Augusti. It was probably Claudius who constructed the direct road from Rome, the Via Portuensis (15 m.) which ran over the hills as far as the modern Ponte Galera, and then straight across the plain. An older road, the Via Campana, ran along the foot of the hills, following the right bank of the Tiber, and passing the grove of the Arval Brothers at the sixth mile, to the Campus salutarum romanarum, the saltmarsh on the right bank—from which indeed it derived its name (see Notizie degli Scavi, 1888, p. 225).

The site can still be fairly clearly traced in the low ground to the east of Ostia Magna, and the lighthouse is represented in bas-reliefs. The harbour is protected by two mole-like breakwaters, one of which is a mole with a breakwater in front, on which stood the lighthouse, with an entrance on each side of it. Trial soundings made in 1907 showed that the central mole reached a depth of about 6 m., though these two m. channels, which are said to be the Prima and Secondae Portus Augusti, go no deeper. The right-hand mole, which is perhaps more ancient, has a depth of about 3½ m. across the arm of the mole protected by a breakwater (opened for traffic by Gregory XIII., and again by Paul V.), and bearing the name Fossa trajana, though its origin is uncertain. Many of the remains of the buildings still preserved, and it is now a very weedy lagoon. It was surrounded by extensive warehouses, remains of which may still be seen; the fineness of the brickwork of which they are built is remarkable. Further to the east is a circular building in brick with niches; it is called the temple of Portunns. To the east again is the so-called Arco di Nostra Donna, a gateway (possibly originally built by Trajan) in the fortifications which surround the port and are attributed to the time of Constantine. Many of the other remains of buildings still preserved were more easily traceable in the 16th century when Pirro Ligorio and Antonio Labacco made plans of the harbour. Considerable excavations were carried on in 1868, but unfortunately without the idea of recording their results. A plan and a description given by R. Lanciani (Annali del risutito, 1868, 144 sqq.) were made under unfavourable circumstances. By means of these works Portus captured the main share of the harbour traffic of Rome, and though the importance of Ostia did not at once decrease we find Portus already an episcopal see in Constantine's time not very long (if at all) after Ostia, and as the only harbour in the time of the Gothic wars. Its abandonment dates from the partial silt ing up of the right arm of the middle Tiber, which is 2½ m. west of the little traffic was left. To the west of the harbour is the cathedral of S. Rufina (10th century, but modernized except for the campanile) and the episcopal palace, fortified in the middle ages, and containing ancient inscriptions from the 1st century. (Isola Sacra) just opposite is the church of S. Ippolito, built on the site of a Roman building, with a picturesque medieval campanile (13th century); 2 m. to the west is the modern village of Fiumicino at the mouth of the right arm of the Tiber, which is 2½ m. west-south-west by rail from Rome. It is a frazione, or portion of the commune of Rome. Three miles to the north is the pumping station, which is the lighthouse (formerly called Stagno di Macarese, now renamed and traversed by many drainage canals) between both and Macarese is kept drained (Bonifica di Macarese) (see Temes). See H. Dessau in Corp. inscr. latin, xiv. 1 sqq. (Berlin, 1887); J. Carcopino in Notizie degli Scavi (1907), p. 734.

PORT-VENDRES, a seaport of south-western France, in the Department of Pyrénées-Orientales, in an inlet of the Mediterranean Sea, 193 m. S.S.E. of Perpignan by rail. Pop. (1906), 2525. Port-Vendres, the ancient Portus Veneris, is fourth in importance of the French Mediterranean ports, and forms a fine harbour of refuge. Its trade, which is with Spain, Greece, and Algeria, is in cork, carobs, grain and wine, &c.

PORUS (4th century B.C.), an Indian prince, ruler of the country between the rivers Hydaspes and Acesines at the time of the invasion of Alexander the Great. In the battle on the banks of the Hydaspes he offered a desperate resistance, and Alexander, struck by his independent spirit, allowed him to retain his kingdom, which he increased by the addition of territory. From this time Porus was a loyal supporter of Alexander. He still held the position of a Macedonian satrap when assassinated some time between 321 and 315 B.C.

See Arrian v. 16, 17; Plutarch, Alexander, 60; Quintus Curtius viii. 19.

PORZIO, CAMILLO (1526–1580?), Italian historian, belonged to a wealthy and noble Neapolitan family, and was the son of the philosopher, Simone Porzio. He studied law, first at Bologna and later at Pisa, and after graduating in utroque jure, practised as a lawyer in Naples. He died in 1580. His chief literary work is La Congiura dei baroni, a history of the unsuccessful conspiracy of the Neapolitan barons against King Ferdinand I. of Naples in 1455; it is based on the authentic records of the state trials, but is prejudiced in favour of the royal power. It was first published by Manutius in Rome in 1565. Of Porzio's other works are the Sive d'Italia (from 1547 to 1552), of which only the first two books have survived, is the most important. The best edition of these two works is that edited by C. Monzani (Florencce, 1855).

PORZIO, SIMONE (1497–1554), Italian philosopher, was born and died at Naples. Like his greater contemporary, Pomponazzi, he was a lecturer on medicine at Pisa (1546–1552), and in later life gave up purely scientific study for speculation on the nature of man. His philosophic theory was identical with that of Pomponazzi, whose De immortalitate animi he defended and amplified in a treatise De mente humana. There is told of him a story which illustrates the temper of the early 16th century prevailing in Italy. When he was beginning his first lecture at Pisa he exclaimed that, as the poet and treatises of Aristotle. The audience, composed of students and townsfolk, interrupted him with the cry Quid de anima? (We would hear about the soul); and Porzio was constrained to change the subject of his lecture. He professed the most open materialism, denied immortality in all forms and taught that the soul of man is homogeneous with the soul of animals and plants, material in origin and incapable of separate existence.

POSEIDON, in Greek mythology, god of the sea and of water generally, son of Cronus and Rhea, and brother of Zeus and Pluto. The connexion of his name with ρόδος, πόρος, πόρος, is generally a matter of tradition, and whatever the three brothers deposed their father Cronus the kingdom of the sea fell by lot to Poseidon. His home was in a golden palace in the depths of the sea near Aegae in Aetolia. In his hand he bore a trident, whereby he flashed the sea into fury, split the rocks, and caused horses and
fountains to spring from them. But, while he caused storms and shipwrecks, he could also send favouring winds; hence he was known as Ζεύς, “the preserver.” Another of his titles was Γεωχός, “the supporter of earth,” the sea being supposed to support the earth and keep it firmly in its place. He was the god of navigation and his temples stood especially on headlands and isthmuses. Every occupation connected with the sea was under his protection, and seafaring people, especially the Ionians, regarded themselves as his descendants. As god of the sea he disputed with other deities for the possession of the land.

Earthquakes were thought to be produced by Poseidon shaking the earth—hence his epithet of Ἐφανείφων, Earth-shaker—and hence he was worshipped even in inland places which had suffered from earthquakes. The seismic wave was also his work; the destruction of Helice in Achaean by such a wave (372 B.C.) was attributed to his wrath (Strabo viii. 384).

The island of Delos was thought to have been raised by him, and about 198, when a new island appeared between Thera and Therasia, the Rhodians founded a temple of Poseidon on it (Strabo i. 57). Thessaly was said to have been a lake until he opened a way for the waters through the Vale of Tempe (Herodotus vii. 129). Poseidon was also the god of springs, which he produced by striking the rock with his trident, as he did on the acropolis of Athens, when disputing with Athena for the sovereignty of Athens (Herodotus viii. 55; Pseudo-Apollodorus lib. ii. 6.2).

As such he was called Νυμφαγετας, the leader of the nymphs of springs and fountains, a god of fresh water, probably his original character, and in this connexion he was called φυταιμός (phytaiamos), a god of vegetation, frequently associated with Demeter. In regard to the contest with Athena, it is probable that Poseidon is really Erechtheus, a local deity ousted by Athena and transformed into an agricultural hero. Dr Farnell, however, holds that Erechtheus and Poseidon were originally independent figures, and that both Erechtheus and Athena were prior to Poseidon. As he gave, so he could withhold, springs of water; thus the waterless neighbourhood of Argos was closed in by springs which, he angrily said, he had sent to the Argive plain (8.18). Mountain streams, he conceded, were his alone; and the black bulls, symbolical of the stormy sea, were sacrificed to him, and often thrown alive into rivers; in Ionia and Thessaly bull-fights took place in his honour; at a festival of his at Ephesus the cup-bearers were called "bulls," and the god himself was surnamed "Bull Poseidon." The horse was especially associated with his worship; he was said to have produced the first horse by striking the ground in Thessaly with his trident (Virgil, Georgics, i. 12). At the fountain of Δίνη in Argolis horses bitted and bridled were sacrificed to him by being drowned (Pausanias viii. 7, 2), and similarly Sextus Pompeius sought to propitiate him by throwing horses into the sea and hence he was worshipped (8.18), even as the Tyrrhenians worshipped Poseidon as Neptune (Ποσειδών Νεπτύς), and was regarded as the tamer as well as the creator of the steed. In the deme of Κολοσσος he was worshipped with Athena, the reputed inventor of the bridle.

Various explanations of the title Νεπτύς have been given: (1) that the horse represented the corn-spirit; (2) the resemblance of the crested waves to horses; (3) the impression of horses’ hoofs near the god’s sacred springs, and the shaking of the earth by them when galloping (see Farnell, Cults of the Greek States, iv. 20). Poseidon plays a considerable part in Greek legend. In the Trojan War he takes the side of the Greeks, because he had been cheated of his reward by Laomedon, king of Troy, for whom he had built the walls of the city. The binding of his son Πολύφησις by Odysseus brings upon the hero the wrath of Poseidon, from which he is only protected by the united influence of the rest of the gods. He is famous for his numerous amours, especially with the nymphs of springs and fountains; his offspring were mostly wild and cruel, like the sea—the Laestrygones, Polyphemus, Antaeus, Procrustes and the like. He was worshipped as a national god by the Ionians, who took his worship over with them from Peloponnesus to Asia Minor. His chief sanctuary was at Mycale, where the Panionia, the national festival of the Ionians, was held. Other seats of his worship were in Thessaly, Boeotia and Peloponnesus. At Tenedos in Laconia he had a famous cave-like temple, with an asylum, and on the island of Τήνος he was worshipped as the physician, probably in reference to the life-giving properties of the sea air. By far the most famous of his festivals was that celebrated every alternate year on the ismthus of Corinth, at which the "Isthmian games" were held. Here a colossal statue of him was set up in bronze by the Greeks after their victory over the Persians. The horse, the dolphin (the symbol of the calm sea) and the pine-tree, with wreaths of which the Isthmian victors were crowned, were sacred to him. Horses and black bulls, boars and rams were offered to him, sometimes human beings. His attributes are the trident and the dolphin (sometimes the tunny fish).

Represented in art Poseidon resembles Zeus, but possesses less of his majestic calm, his muscles are more emphasized, and his hair is thicker and somewhat dishevelled. He is generally naked; his right leg rests on a rock or the prow of a ship; he carries a trident in his hand, and is gazing in front of him, apparently out to sea; sometimes he is standing on the water, swinging his trident, or riding in his chariot over the waves, accompanied by his wife Amphitrite, the Nereids and other inhabitants of the sea. It is in keeping with his restless character that he is rarely found sitting. He sometimes wears a long robe, sometimes a light scarf. Scopas, in a famous group, represented him surrounded by the deities of the sea, escorting Achilles to the islands of the blessed. In modern Greece St Nicholas has been made the patron of the seamen, and he is represented as a sailor. But the Euboean Zacyphous have a special seagod, half man, half fish, who dwells under the sea, rides on dolphins or in a car drawn by dolphins, and is a trident. By the Romans Poseidon was identified with Neptune (Npntvs).

See E. Gerhard, Uber Ursprung, Wesen und Geltung des Poseidon (1851), with references to authorities in conveniently arranged nomenclature: Richter-Rohde, Griechische Mythologie, Preller-Griechische Mythologie, vol. ii. and especially L. R. Farnell, Cults of the Greek States (1907), iv. where special attention is drawn to the ethnological aspect of the cult of Poseidon.

**POSEN**, an eastern province of the kingdom of Prussia, in the German Empire, bounded N. by the Prussian province of West Prussia, E. by Russian Poland and S. and W. respectively by the Prussian provinces of Silesia and Brandenburg. Its area is 1,850 sq. m. It has 1,347,958 inhabitants, of whom 1,775 inhabitant to the square mile. Posen belongs to the north German plain, and consists of a low plateau intersected by the beds of the Netze, the Warthe and the Odra. These three rivers drain into the Oder, but part of the province falls within the basin of the Vistula, which forms the frontier for a short distance on the north-east. By means of the Bromberger canal the Netze is joined with the Brake and then through this river with the Vistula. The surface is dotted with small lakes and ponds, and there are many broad fens and marshes. The soil is light and sandy, but much of the land reclaimed in the boggy districts is very fertile. Upwards of 67% of the area is arable, of which 23% is on the basin of the Vistula, and the rest is under meadows and pasture, much of which is occupied by cattle. Forests amount to 20% by forests, mostly fir. The principal crops are rye, the chief cereal grown, wheat, oats, barley, potatoes, beets and hops. The vine is cultivated to some extent in the south-west corner, and tobacco is also grown. The marshy tracts often afford excellent pasture and support large numbers of cattle, sheep and goats. The mineral resources of the province are practically restricted to lignite and salt. Besides brewing and distilling, the chief products are machinery, sugar, cloth, tobacco and bricks. Trade in timber and agricultural produce is facilitated by the network of railways, navigable rivers and canals, but both industry and trade are somewhat cramped by the duties imposed at the Russian frontier. The population of the province in 1905 was 1,986,637, including 1,347,958 Roman Catholics, 605,312 Protestants and 30,433 Jews. The Roman Catholics are mainly Poles, of whom there are upwards of 1,000,000 in Posen, while the great bulk of the 900,000 Germans are Protestants. About 57% of the population was returned in 1905 as "rural," in spite of the large number of so-called "towns," only five of which, however, have more than 20,000 inhabitants—Posen, Bromberg, Hohenzollern, Gnesen and Schneidemühl. The province of Posen was long the worst-educated part of the German dominions, but of recent years this blight has been remedied. Thus while in 1885-1888 the ratio of illiterates recruited amounted to 9.75%, in 1901 less than one quarter per cent of
POSEN

The military drafts were without schooling. The province returns 15 members to the Reichstag, 29 to the Prussian Lower House of the Prussian Diet, and is represented in the Upper House by 19 members. It is divided into two districts, those of Bromberg and Posen.

History.—The history of Posen, comprehending some part of the old kingdom of Poland, including its most ancient capital, Gnesen, falls within the scope of the article Poland. Its political connection with Prussia dates from 1742, the year in which the Prussians took Posen from the Elector of Saxony; and in 1772, after the Peace of Teschen, the former part of the duchy of Posen, with the city of Torun, was transferred to Prussia. Posen was incorporated into the Prussian kingdom in 1793, and in 1815 it reverted to Prussia under the style of the grand duchy of Posen. In 1848 the Polish inhabitants of the province revolted and had to be put down by force, and, in spite of the efforts of the Prussian government, they remain in language and culture separated from their German contemporaries.

The tide of German immigration into Posen began at an early period and flowed strongly in the 13th and following centuries. The industrial Germansellers were welcomed by the Polish nobles and were the founders of most of the towns, in which they lived after their own customs and governed by their own laws. They cultivated the waste lands in the vicinity, reclaimed the waste soil, and did much to improve agriculture. In the 16th century Protestantism was widely diffused by their means. A strong reaction set in in the following century, and persecution followed. Count Zinzendorf and the movement of the Moravian Brethren were widely diffused in the empire, hastening the political, intellectual and agricultural decline of the district. By the 18th century the burghers had sunk to the level of "stätische Bauern," or peasants with municipal privileges, and there were wide differences.

In the latter part of the 19th century, however, this state of things began to be greatly modified owing to the strong Polish national movement which Prussia strove to drive back the boundaries of Germanism in the districts that were provinces of Prussia, as they had already been driven back in Bohemia. Hitherto the most important class in Posen had been the Polish nobles, of whom many were very poor; but the economical development of the country and the breaking up of large estates into peasant holdings, which created a comparatively wealthy Polish middle class, threatened German ascendancy more seriously than had the traditional nationalism of the nobles. To combat this the police authorities interfere with the compulsion of the Germanization of the Polish population. In 1872 an administrative ordinance made German the medium of instruction in the schools "wherever possible," and the police commissioners who attended pious meetings were instructed to close any meeting at which speeches were delivered in Polish. In April 1888 the Prussian parliament passed a law establishing a commission for the purpose of bringing about a standardization of the Polish in Posen, and decreeing it obligatory to German colonists. The sum of 100,000,000 marks (5,000,000£) was voted for this work, to which in 1898 a like sum was added. In fifteen years an area of nearly 500,000 m. of land was bought up by the colonizers. One-hundred thousand Polish families were settled. In spite of this policy, however, the Polish element continued to gain, this being partly due to immigration over the eastern border, partly to the repressive policy of the Prussian government, but of course what was done on the one hand organization into one that is popular and radical. In 1902 much scandal was caused by the revelation made in the Prussian parliament of the methods used in the attempt to Germanize the Poles; and Count Bölow had to confess that "corporal punishment was out of place in religious instruction." Polish children have been beaten for refusing to say the Lord's Prayer in German (see Ann. Reg., 1901, p.290). In his speech of the 13th of January 1903, in which he made the above admission, Count Bölow also admitted the fact that the Prussian policy. Fresh legislation was passed in May, devoting another 250,000,000 marks (£12,500,000) to the policy of German colonization. The law also directs the teachers in the Polish schools to teach the children the German language.

The laws forbidding the use of the Polish language in the schools were retained, in spite of an agitation in Germany itself for their repeal. Yet, three years later, Baron von Rheinlatten, the minister of finance, complained that in fifteen years the German population of East Prussia had diminished by 650,000, while Polish immigrants had in five years numbered 300,000; at the same time he confessed that the Poles were vastly increasing their children, although their expenditures were extremely small. As a result of this report a further sum of £100,000 was voted for "provincial colonization" and to prevent German emigration.

In 1907 another reform was made somewhat ridiculous by the strike of some 100,000 Polish schoolmasters. The authorities were being whipped for refusing to answer questions in German. The petition of the archbishop of Posen that the children should be allowed to say their prayers in their own language was rejected by the Prussian minister of education, he issued on the 17th of October a pastoral allowing parents to confine religious instruction to home or priestly teaching. As a result parents were fined or imprisoned for withdrawing their children from religious instruction. The repressive efforts of the government, however, culminated in the introduction of a new law in 1909 requiring all Polish religious teachers to take an oath promising that they would not cause or contribute to the compulsory repatriation of Polish landowners in favour of Germans. This bill, which applied to "the districts in which a majority of the Poles, or at least one-third of the Poles, are assured by legal allotments to German settlers"—i.e. Posen and West Prussia—was passed, in spite of the strenuous opposition of some of the most conspicuous nobles in Prussia, in the session of 1910. An imperial ordinance was issued and only the language of the policy in Posen was, was shown in February 1909, when it was condemned, though without effect, by a resolution of the German imperial parliament. In January 1910 the Prussian policy was again arranged in the German parliament in connexion with the "Kattowitz incident," Herr von Delbrück justifying the refusal of a number of minor officials, for voting for Polish candidates at a municipal election, on the ground that the officials of the empire deserted the ground on which the constitution of the empire rested if they failed to support Prussia in her struggle (The Times, January 13, 1910, 5 D.). Herr von Bethmann Hollweg expressed the same views in the Prussian parliament to the same effect (ibid. January 20 and 22).

See further the official work Zwanzig Jahre deutscher Kulturarbeit 1866-1906 (Berlin, 1907). A good account of the Prussian policy in Posen, from an outside point of view, will be found in the Annual Register, passim.

POSEN (Polish Poznań), a city, archiepiscopal see and fortress of Germany, capital of the province of Posen, situated in a wide and sandy plain at the confluence of the Cybina and the Warthe, 150 m. E. from Berlin and 103 m. from Breslau. Pop. (1885), 65,315; (1895), 73,239; (1905), 136,808, of whom nearly one-half are Germans and about one-tenth Jews. Posen lies at the centre of a network of railways connecting it with Berlin, Breslau, Thorn, Kreuzburg, and Schneidemühl. The inner line of fortifications has been removed and the city has been practically modernized. The principal part of Posen, on the left bank of the Warthe, comprises the old town (Alstadt) and the modern quarter created by the Prussians after 1793. On the right bank lie Wallischéi (a district inhabited by Poles) and some other suburbs. Posen has fifteen Roman Catholic and three Evangelical churches and several synagogues. The cathedral contains many interesting objects of art, but, with the exception of the Gothic Marienkirche of the 15th century, none of the churches is notable. The old town-hall is a quaint Slavonic adaptation of Romanesque forms. The royal castle, begun in 1503 and finished by 1533, was afterwards intended for the Poles and became to Poles. The laws forbidding the use of the Polish language in the schools were retained, in spite of agitation in Germany itself for their repeal. Yet, three years later, Baron von Rheinlatten, the minister of finance, complained that in fifteen years the German population of East Prussia had diminished by 650,000, while Polish immigrants had in five years numbered 300,000; at the same time he confessed that the Poles were vastly increasing their children, although their expenditures were extremely small. As a result of this report a further sum of £100,000 was voted for "provincial colonization" and to prevent German emigration.

An Annual Register (1902), p. 280 seq.

1 Annual Register (1902), p. 280 seq.

Posen, one of the oldest towns in Poland and the residence of some of the early Polish princes, including Boleslaus I,
became the seat of a Christian bishopric about the middle of the 10th century. The original settlement was on the right bank of the Warthe, but the new town, established on the opposite bank by German settlers about 1250, soon became the most important part of the double city. Posen became a great dépot for the trade between Germany and western Europe on the one hand and Poland and Russia on the other. Many foreign merchants made the city their residence, and these included a colony of Scots, who exported produce to Edinburgh. The city attained the climax of its prosperity in the 16th century, when its population, according to one estimate, reached 80,000. The Reformation caused a temporary decline in the trade. During Thirty Years' War, the plague and other causes, soon conspired to change this state of affairs, and in the 18th century the population sank to 13,000. New life was infused into the city, after its annexation by Prussia at the second partition of Poland in 1793, and since this date its growth has been rapid.

POSIDIPPUS (3rd cent. B.C.), Greek dramatist, of Candia in Crete, the last and one of the most distinguished of the writers of the new comedy. He began to write for the stage in 280 B.C., and, according to Suidas, wrote 40 plays, of which 17 titles and some fragments have been preserved. He appears to have gone somewhat out of the choice of his subject, and it is evident that cooks held an important position in his list of characters. His comedies were frequently imitated by the Romans (Aulus Gellius ii. 23), and it is considered very probable that the Menachmi (a comedy of errors) of Plautus is an adaptation either from the Θῦαμος, or from some unknown comedy of Posidippus, called Δίωμος, or perhaps Διαέρους. His statue in the Vatican is considered a masterpiece of ancient art.

Fragments in A. Meineke, Poetorum comicorum graecorum fragmenta (1855).

POSIDIPPUS (3rd cent. B.C.) is also the name of a writer of epigrams (c. 270 B.C.), of which about 30 are preserved in the Greek Anthology.

See W. Christ, Griechische Litteraturgeschichte (1898).

POSITONUS (c. 130-50 B.C.), nicknamed "the Athlete," Stoic philosopher, the most learned man of his time (so Strabo τῶν καθήμενων σπουδαίοντας, Galen ἐπιστημονικῶτας) and perhaps of all the school. A native of Apamea in Syria and a pupil of Panaetius, he spent after his teacher's death many years in travel and scientific researches in Spain (particularly at Gades), Africa, Italy, Gaul, Liguria, Sicily and on the eastern shores of the Adriatic. When he settled as a teacher at Rhodes (hence his surname "the Rhodian") his fame attracted numerous scholars; next to Panaetius did he most, by writings and personal intercourse, to spread Stoicism in the Roman world, and he became well known to many leading men, such as Marcus, Rutilius Rufus, Pompey and Cicero. The last-named studied under him (78-77 B.C.), and speaks as his admirer and friend. He visited Rome, e.g. on an embassy in 86 B.C., but probably did not settle there as a teacher.

His works, now lost, were written in an attractive style and proved a mine of information to later writers. The titles and subjects of more than twenty of them are known. In common with other Stoics of the middle period, he displayed eclectic tendencies, following in this Panaetius, Posidonius, and Plato. The predominance of Plato led him to write a commentary on the Timæus; in another way it is shown by important modifications which he made in psychological doctrine. Unquestionably more of a mathematician than a philosopher, he appears clerical and superficial. But at the time his spirit of inquiry provoked Strabo's criticism as something alien to the school (τὸ αἰσχρόν καὶ τὸ θροαντικὸν, ζωὴ λαθοῦσαν ὧν ἐκ τῶν τῆς ἑαυτοῦ ἐπίλεγμαν, ἐφ' άκιντος ἀμπελὼν), although his range of science, geography, natural history, mathematics and astronomy he took even further. This, combined with the distance and magnitude of the sun, to calculate the diameter of the earth and the influence of the moon on the tide. His history of the period from 146 to 88 B.C., in fifty-two books, must have been a valuable storehouse of facts. Cicero, who submitted to his criticism the memoirs which he had written in Greek of his consulship, made use of writings of Posidonius in De natura deorum, bk. ii., and De divinatione, bk. i., and the author of the pseudo-Aristotelian treatise De mundo also borrowed from him.

See B. Pocock, the works of Caesar, 1770-58 (in Eng. trans., Ecclesiastic, 56-70); C. Müller, Fragmenta historiarum graecarum, iii. 245-296; J. Bake, Posidonios Rhodi reliquiae (Leiden, 1810), a valuable monograph; R. Scheppig, De Posidonio rurum gentium Urbes et Itinerarium explorate (Halle, 1717); P. Comte, Posidonios (Ciceronis philosophi, iii. 191 seq., ii. 257 seq., 325 seq., 477-535, 756-789, iii. 342-378 (Leipzig, 1877); Thiaucourt, Essai sur les sources philosophiques de Cicéron (Paris, 1865); Schmickel, Die Lebens- und Werke von Panaetius und Posidonius (1882); Arnold, Untersuchungen über Theophrasses von Mystilene und Posidonius von Apamea (1882). (See also STOICS.)

POSITIVE (or PORTABLE) ORGAN, a mechanical chamber organ which could be carried from place to place without being taken to pieces, and when played was placed on a table or stool and required a blower for the bellows, as well as a performer. It was larger and more cumbersome than the portable (q.v.), with which it has often been confounded. The positive had usually but one kind of pipe, the open diapason of 2 ft. tone, and in the 16th century the best types had three registers by means of which each note could be sounded with its fifth and octave, or each by itself, or again in combinations of two. The positive differed from the regal in having flue pipes, whereas the latter had beating reeds in tiny pipes, one or two inches long, concealed behind the keyboard. During the early middle ages most of the pneumatic organs belonged to this type.

A well-known instance of an early positive or portable organ of the 12th century occurs on the obelisk erected to the memory of Theodosius the Great, on his death in A.D. 395. Among the illustrated manuscripts of the British Museum miniatures abound representing interesting varieties of the portable organ of the middle ages; such as Add. MS. 29902 (fol. 6) and Add. MS. 27065b (fol. i.) as a picture of MS. Tiberius A VII. fol. 104d., all of the 14th century. Add. MS. 28962, Add. MS. 17286, both of the 15th century. These little organs were to be found at every kind of function, civil and religious; frequently mentioned in the accounts of inns and chapels of the rich; at banquets and court functions; in choirs and music schools; and in the small orchestras of Peri and Monteverdi at the dawn of the musical drama or opera. (K. S.)

POSITIVISM (derived from poner, whence positus, that which is laid down, certain), a philosophical term, applied somewhat loosely to any system which confines itself to the data of experience and declines to recognize a priori or metaphysical concepts. In its broadest and looser sense it is applied to empirical philosophers in general. Thus Hume is a positivist in the sense that he specifically restricts philosophy to the sphere of observation, and regards the causal relation as being nothing more than what we have been accustomed to expect. Similarly Mill, Spencer and physical scientists generally view the universe from the positivist standpoint. In its commonest acceptance, however, positivism is both narrower and wider than this. The term is specifically used of the philosophy of Auguste Comte, who applied the term to his system according to which knowledge is based exclusively on the methods and discoveries of the physical or "positive" sciences. According to Comte human thought passes through three stages—philosophical, metaphysical and positive. The final stage, positivism, is the understanding of the universe not as composed of a multitude of individuals each with volition, but as an ordered organism governed by necessary laws (see further COMTE). The outcome of this positivism is the substitution for revealed religion of a religion of humanity—according to Huxley "Catholicism minus Christianity"—in which God is replaced by Humanity. This religion was to have its special priesthood, ritual and organization.

Positivism has, therefore, two distinct sides, the philosophical and the religious. The philosophical side was first and foremost applied to distinguished representatives in France, Germany and England, and in the wider sense indicated above may be regarded as one of the two or three chief influences on modern philosophical development. Through all the details of his philosophy, structure, e.g. the classification of the sciences, are without important significance, the positivistic tendency is prominent in all systems of thought which deny the supernatural and the metaphysical. Agnosticism, Phenomenalism, Rationalism, Materialism all manifest the positivist spirit, denying what may be succinctly described as the metempirical.
In France the Comtian tradition was maintained with important reservations and the abandonment of the religious aspect by Littré (q.v.), Taine and others. In Germany many of the followers of Kant have in greater or less degree maintained the view that all true knowledge is possible without objectification of the senses. The distinctly religious aspect has been comparatively unimportant, except in so far as modern social evolutionists ethics may be regarded as religious in character. In England, however, a number of prominent Positivists have carried out Comte's original ideal of a Church of Humanity with ritual and organization. The chief building (in Chapel Street, Lamb's Conduit Street, London) is adorned with busts of the saints of humanity, and regular services are held. Poetic hymns are sung and addresses delivered. Among the leaders of this movement have been Frederic Harrison, Richard Congreve, E. S. Beesly and J. H. Bridges (d. 1906). Services are also held weekly in Essex Hall, London, and there are a few other centres in the provinces, including a prosperous church in Liverpool.

**POSE COMITATUS** (Lat., "power of a county"), a summons to every male in the county, between the ages of fifteen and twenty, to be ready and apprised, at the command of the sheriff and the cry of the county, to maintain peace and pursue felons. Ecclesiastical persons, peers and such as laboured under any infirmity were not compulsory to attend. Owing to the establishment of county police, the sheriff does not now pursue felon, but by the Sheriffs Act (1857, sec. 8, sub-sec. 2) the calling out of the posse comitatus is expressly authorized if the sheriff finds it necessary to execute the writ. If the sheriff is unable to raise, if necessary, the posse comitatus it is no answer by him, for non-execution of a writ, to say that he was resisted.

See P. E. Mather, *Sheriff Law.*

**POSESSION** (Lat. *possessio,* *possidere,* to possess), in law, a term derived from Roman law. The Roman conception of possession has been generally adopted, but not the Roman deductions from the conception. The subject of possession has become more difficult owing to the various senses in which the term has been interpreted. Thus it has been said to be either a right or a fact conferring a right, or both together. The latter is the view of Savigny, the leading authority upon the subject (Recht des Besitzes, translated by Sir Erskine Perry, 1848). Further, there is a want of agreement among legal writers as to the amount of right or rights that it confers. All that can be said with safety is that possession stands in a position intermediate between simple detention and absolute ownership, and that it implies two elements, physical detention and mental intention to hold the thing possessed as one's own. These difficulties being borne in mind, the definition of W. A. Hunter may be accepted: "Possession is the occupation of anything with the intention of exercising the rights of ownership in respect of it" (*Roman Law,* p. 203). Possession is inchoate or incomplete ownership; it is on its way to become ownership. In the case of the public domain in Rome (ager publicus) the possession was really the important matter, the *dominium* being practically of no value. Possession in Roman law was either *natural* or *civil.* The former was mere occupation, the latter such occupation as ripened by prescription into ownership. Possession exclusive against the world (including the true owner) was called "adverse possession." A servitude, such as a right of way, could not be held in true possession, but was said to be in "quasi-possession." The quasi-possessor, however, had possession remedies. In Roman law a broad distinction was drawn between possession and ownership (dominium). They were protected by different remedies—possession by interdict, ownership by action. This difference can only be explained by history. Here again, unfortunately, authors differ. According to Savigny, a Roman citizen who had become a tenant of part of the *ager publicus* could not by any length of holding obtain more than a quasi-ownership, but one of which it would have been morally unjust to have deprived him. "The only legal remedies of which the tenants could avail themselves, if ejected or threatened with disturbance, were the possessor interdicts, summary processes of Roman law which were either expressly devised by

the praetor for their protection, or else, according to another theory, had in older times been employed for the provisional maintenance of possessions pending the settlement of questions of legal right" (*Maine, Ancient Law,* ch. viii.). Savigny regards the protection of possession as an extension of the protection of the person. The same view was taken by the English court of exchequer in *Rogers v. Spence,* 13 M. & W. R. p. 581. According to Hunter (*Roman Law,* pp. 206, 221), Savigny overlooked the needs of aliens. It was the needs of aliens, incapable of the full proprietary rights of Roman citizens, that led to the invention by the praetor of a means of giving them equitable rights in the land, and protecting them in the enjoyment of these rights. Savigny attributes only two acts to the possession—acquisition of ownership by possession for a given time (usuque antiquo, longi temporis possession) and protection of possession from disturbance (interdictum). Others have included further rights—*inter alia,* the right to use force in defence of possession, and the right to have the burden of proof, in a contest as to the title, thrown upon the adversary: "In pari causa possessor potior habet debet." The position of the possessor in Roman law was very strong. If a bona fide possessor, he could bring an action for *furturn* even against the owner, if a *mala fide* possessor of land, he was so far protected that he could not be ejected by force. A *mala fide* possessor of more than a sufficient amount of land, however, was an ejector.

It has been already stated that there is both a physical and a mental element in the conception of possession. This does not necessarily mean that corporeal contact is in all cases requisite, or that the intention to hold the thing possessed as one's own may not be abandoned for a time. The control may be potential as well as actual. An estate may be possessed without the possessor going upon the land at all, and the possession of goods may be given by delivering the key of the warehouse in which they are stored. In international law the possession of part as giving a title to the whole has been of great importance (see *International Law*). Where goods are pledged or bailed for a specific purpose the intention of the pledgor or bailor to hold them as his own is suspended during the existence of the limited right of the pledgee or bailee, to whom a fragment of the possession has passed. In Roman law the pledgor had *possessio ad usucapionem,* the pledgee *possessio ad interdicta.* The possession of the pledgee or bailee has been called "derivative possession." Possession may be exercised through another ("animo nostro, corpore alieno"), as through a servant, who has no true possession. Possession so exercised has been called "representative possession." As soon as the representative determines to assume control on his own behalf or rights in possession of another, the possession of the principal is gone. Possession in Roman law, or at least in the law of Rome, as stated by *Maine,* 1833, s. 36. The action for the recovery of land, introduced by the *Judicature Acts,* is the modern representative of the action of ejectment.

1 This does not agree with English law, where in certain cases a thief can give a good title to stolen goods, though he has no title himself.

2 In the law of master and servant is based upon the Roman law of master and slave. The servant, like the slave, has not possession of his master's goods even though they are in his custody, unless, indeed, the circumstances are such that he ceases to be a servant and becomes a bailee.

3 The distinction is very important, as it affects the contract of sale. The contract was not to transfer ownership, as in English law, but only *nunc* possession.
POSSSESSION

The right of a party to recover possession is enforced by a writ of possession.

Possession gives in English law, speaking generally, much the same rights as in Roman law. Thus it serves to found a title (see ESTATE) to land, and a right of property in personal chattels. But such a right of property is subject to certain exceptions or provisos upon the clantant. In an action for the recovery of land the defendant need only allege that he is in possession by himself or his tenant, and (where such an allegation is necessary) that he had no notice to quit. The chief differences between Roman and English law, arising to some extent from the differences in the history of the two systems, are that the former did not give to derivative possessors (except in the case of pledge) the remedies of possessors, as does English law, and that Roman law is stricter than English in requiring that possession to found suasatio should (except in the case of jus possessiunis) be esse justo titulus, or under colour of right (see PRESCRIPTION). There is one case of constructive possession which is peculiar to English law—that is, where possession is said to be given by a deed operating under the Statute of Uses (see " Orme's Case," L. R. 5, C. P. p. 281).

In English law the doctrine of possession becomes practically important in the following cases. (1) Possession serves as a convenient means of division of estates (see REAL PROPERTY). One of the conditions of division is possession or actual or reversionary or remainder. It also serves as a division of personal property (q.v.). A close in action is said to be reduced into possession when the right of recovery by legal proceedings has become a mere possession of the article in question. (2) Possession is sometimes used as a title against the owner. In the case of real property it is regarded as prima facie evidence of seisin.1 In the case of personal property the mere possession of a finder is sufficient to enable him to maintain an action for the goods (q.v.). The possessor is the owner. (3) The leading case of Armyv. Delamirr, 1 Str. 504. (4) What is called " unity of possession " is one of the means whereby an estate is extinguished, but may under certain circumstances be preserved. (5) Possession is very important as an element in determining the title to goods under 13 Eliz. c. 5, the Bills of Sale Act 1878 and the Bankruptcy Acts 1883 to 1890. It may be said that as a general rule retention of possession by the transferee or an absolute assignment or a colourable delivery of possession to the transferee is strong prima facie evidence of fraud. (6) Possession or documents of title to goods is generally sufficient to enable agents and others to give a good title under the Factors Acts (see FACTOR). (6) In criminal law the question of possession is important in founding the distinction between larceny and embezzlement.

In England, as in many other countries, the law of possession is constantly changing and developing. The problem is not only one of justice and order, but also one of convenience and fairness. The law of possession is complex and multifaceted, and its application can vary significantly depending on the circumstances.

14b) has been altered by the rule of descent introduced by the Statute of Frauds 1677, and 1 B. & C. 3 (1701). This Act has operated to the prejudice of persons who, by reason of the sale of personal property to a purchaser. At one time possession suits were occasionally maintained in England, and more frequently in Ireland, for thequieting of possession after proof of three years' possession before the filing of a bill of sale. But such a course of action is no longer adopted, and the purchaser. In the case of personal possession by his tenant, and (where such an allegation is necessary) that he had no notice to quit. The chief differences between Roman and English law, arising to some extent from the differences in the history of the two systems, are that the former did not give to derivative possessors (except in the case of pledge) the remedies of possessors, as does English law, and that Roman law is stricter than English in requiring that possession to found suasatio should (except in the case of jus possessiunis) be esse justo titulus, or under colour of right (see PRESCRIPTION). There is one case of constructive possession which is peculiar to English law—that is, where possession is said to be given by a deed operating under the Statute of Uses (see " Orme's Case," L. R. 5, C. P. p. 281).

In English law the doctrine of possession becomes practically important in the following cases. (1) Possession serves as a convenient means of division of estates (see REAL PROPERTY). One of the conditions of division is possession or actual or reversionary or remainder. It also serves as a division of personal property (q.v.). A close in action is said to be reduced into possession when the right of recovery by legal proceedings has become a mere possession of the article in question. (2) Possession is sometimes used as a title against the owner. In the case of real property it is regarded as prima facie evidence of seisin.1 In the case of personal property the mere possession of a finder is sufficient to enable him to maintain an action for the goods (q.v.). The possessor is the owner. (3) The leading case of Armyv. Delamirr, 1 Str. 504. (4) What is called " unity of possession " is one of the means whereby an estate is extinguished, but may under certain circumstances be preserved. (5) Possession is very important as an element in determining the title to goods under 13 Eliz. c. 5, the Bills of Sale Act 1878 and the Bankruptcy Acts 1883 to 1890. It may be said that as a general rule retention of possession by the transferee or an absolute assignment or a colourable delivery of possession to the transferee is strong prima facie evidence of fraud. (6) Possession or documents of title to goods is generally sufficient to enable agents and others to give a good title under the Factors Acts (see FACTOR). (6) In criminal law the question of possession is important in founding the distinction between larceny and embezzlement.

In England, as in many other countries, the law of possession is constantly changing and developing. The problem is not only one of justice and order, but also one of convenience and fairness. The law of possession is complex and multifaceted, and its application can vary significantly depending on the circumstances.

1 1 Seisin" and " possession " are used sometimes as synonymous, as generally by Bracton; at other times they are distinguished: thus there can be possession of a term of years, but no seisin (Noy, Maxims, p. 2). It seems doubtful, however, how far in English law a tenant for life can be said to have a seisin, for he is in law only a bailiff or agent of the landlord. But he certainly has possessory remedies, like the quasi-possessor in Roman law.

2 Compare the Code Napoleon, art. 2279: " En fait de meubles la possession vaut titre."
were confined to the simple dramatic imitation of the voice of the dead king, whose soul was believed to give counsel in this manner to his successor.

6. Demonic possession is a widely spread explanation of such cases. It is found among all primitive and semi-primitive races, e.g., among the American Indians, and among the ancient Near Eastern peoples, especially among the Ancient Egyptians (Anubis, Taweret), among the Semites, the Jews, and the Phoenicians in the time of the Babylonian captivity. The latter people were guilty of all kinds of delusions and delusions, and of the possibilities of suggestion; they were therefore possessed by the demon, and their statements were considered as evidence.

Demonic possession is a well-known phenomenon in the Old Testament, and is referred to in many passages. The demon is usually described as a powerful being, with great knowledge of psychological and spiritual matters. The cases recorded in the Bible are not necessarily the same as those described in modern times, and it is possible that some of the phenomena described in the Bible are due to the demon's influence.

In the lower stages of culture all diseases are explained as due to the influence of the demon, and possession by this being is considered a normal occurrence. The demon is often described as a powerful and malevolent spirit, which is responsible for all kinds of misfortunes and diseases. The demon is usually depicted as a powerful and malevolent spirit, which is responsible for all kinds of misfortunes and diseases.

From the psychological point of view the classification is again threethread: (a) as noted above, the majority of cases of so-called possession are simply psychopathological; (b) another class, the existence of which has only been recognized within recent times is the cases of secondary or multiple personality; the apparent independence and occasional conflict of primary and secondary selves has been explained by the theory of possession; but it has been possible in one of the most severe cases on record to unify the two personalities and memories after what the patient described as a struggle between them for supremacy, which inevitably have suggested possession, as the explanation, had not the issue of the case been the amalgamation of the two streams of consciousness. (c) The problem of the third class of cases, which may be termed mediumistic, is still unsolved. The medium (q.v.) or sensitive appears to have come into being in the trance state a store of memories connected with the lives of deceased friends of the sitter (i.e. a person present at the séance), such memories being dealt with from the standpoint of the deceased person (who is termed the communicator); sometimes the memories are connected with the friends of a person not actually present or with articles placed in the hands of the medium, the owners being absent or dead. Mediumistic cases have undergone elaborate investigation at the hands of the Society for Psychological Research, and no serious attempt has been made to invaluate the facts set forward by the investigator; but so far no satisfactory explanation has been suggested. On the one hand thought transference or telepathy (q.v.) appears to be insufficient, unless we assume that the powers of a medium far transcend anything demonstrable in ordinary telepathic experiments; for the facts stated by or through the medium about the communicator seem in many cases to be known in their entirety to no single living person. If thought transference is the explanation, we must admit that the medium can (1) warp all living brains for facts, (2) select those which are pertinent (i.e. known to the communicator) and (3) combine them in such a way as to suggest that the source of the information is the dead person. On the other hand, although, as we have seen, the communications show knowledge homologous to that of the deceased, they demonstrably do not include the whole of his knowledge; more than one attempt has been made to obtain from communicators the contents of sealed letters, written during their lifetime and kept from the knowledge of all other human beings till the seal was broken; but such attempts have so far failed, and the failure seems to form conclusive evidence both against possession and against other explanations based on the supposition that the dead are communicating.

PÖSSNECK is a town of Germany, in the duchy of Saxe-Meiningen, 21 m. by rail S. of Jena, on the Kotschau. Pop. (1903), 13,702. It has a Gothic Evangelical church built about 1300, and a Gothic town-hall erected during the preceding century. Its chief industries are the making of flannel, porcelain, furniture, machines, musical instruments and chocolate. The town has also tanneries, breweries, dyeworks and brickworks. Possneck, which is of Slavonic origin, passed about 1300 to the landgrave of Thuringia. Later it belonged to Saxony and later still to the duchy of Saxe-Coburg-Saalfeld, passing to Saxe-Meiningen in 1826.

See E. Koch, Aus Pössneckes Vergangenheit (Pössneck, 1894-1895); the same writer, Beiträge zur urkundlichen Geschichte der Stadt Pössneck (Pössneck, 1896-1900); and die Geschichte der Stadt Pössneck, published by der Pössneck-Zeitung (Pössneck, 1900).

POST. 1. (An adaptation in O. Eng. of the Lat. postis, from ponere, to place), a stock, stake or stump, particularly an upright timber used as a support in building, as part of the framework of a door, as a boundary mark, &c., and formerly as a convenient object to which to attach public notices, &c., whence the verb "to post," to publish a notice, advertisement, &c., by affixing it in a conspicuous position, hence to make a notice public, and thence to fix to something, as a name or "postulating" of a defaulter, or of a ship as overdue or missing at Lloyd's.

2. (An adaptation of the Fr. poste, station, position, Ital. posta or posto, formed from the past participle postitus, of Lat. ponere, to place), position, station, a position occupied by a soldier or body of soldiers, especially one specifically allotted to a soldier, such as the round of a sentry, hence a place of employment, an office. The sense of station has developed into the particular application of the word and its various derivatives, "postal," "postage," &c., to the service connected with the delivery of letters (see Post and Postal Service). From the early use of the word as a name for the "posting" or "post" of messages, \( \text{Post} \), \( \text{Post} \), the speedy despatch of messages, letters, &c., was attained by relays of men and horses stationed at regular intervals. This is paralleled by the \text{dispositio equitum} \text{Rossiita} \text{Romana} \text{times} and by the elaborate system of the Great Khan which Marco Polo describes on the roads of China. The \text{New English Dictionary} \text{finds} \text{the earliest use of the O. Fr. \text{poste} and the Ital. posta for these stations of men and horses in Marco Polo's account.} The Medieval Latin expression for the couriers was \text{caballari postarum, riders of the posts.} From the stations or relays of horses the word was early applied to the riders themselves, and later to the mail carried by means of the "posts," and thence to the whole service. At the first establishment of
regular posts in the 16th century in England, they served two purposes, the carrying of the king's letters and the exclusive supply of horses for his friends and other travelers, the first being called the "posts of the packet," the second the "thorow posts." When, in 1780, the monopoly of supplying post-horses was taken away from the "postmasters," the term was retained for the "posting" establishments for travellers throughout the country, as well as in such words as "post-boy" and "post-chaire." The expression "post-haste," generally used adverbially in the sense of "with the utmost speed," was originally a superscription, "haste, post, haste," on letters that needed the greatest despatch, and was a command addressed to the "post, the bearer of the message. The peculiar use of "postmaster," as the name of the "scholars" of Merton College, Oxford, has not been explained. It occurs in the college records first as the name of a building (Postmasters' Hall) outside the college, in which the scholars (called postionistae or portionistes) lived until about 1575. The suggestion that "postmaster" is a corruption of portionista is far-fetched, and there is nothing to support the theory that the scholars, as servants to the masters, stood behind them at table and were thus called post-magistri.

**POST, and POSTAL SERVICE.** The germ of modern postal systems is to be looked for in the earliest organized establishment of a staff of government couriers. In the postal system of Spain and the German empire there is express record of permission to government couriers to carry letters for individuals in April 1544; and within fifteen or sixteen years that permission had grown into a legalized and regulated monopoly, whence the counts of Taxis drew part of their profits as postmasters-general. In Great Britain existing private letters of the 15th century—some, perhaps, of the 14th—bear endorsements which show that they were conveyed by relays of men and horses maintained under the control of the government, and primarily intended for its special service. In several states on the continent of Europe the universities had inland postal establishments for a rudimentary sort at an early date. The university of Paris organized a postal service almost at the beginning of the 13th century, and it lasted in a measure until 1719. In various parts of Europe mercantile gilds and brotherhoods were licensed to establish posts for commercial purposes. But everywhere—as far as the accessible evidence extends—foreign posts were under state control.

**GREAT BRITAIN**

**Early History. (c. 1533-1536).**

As early as the middle of the 13th century entries occur in the wardrobe accounts of the kings of England of payments to royal messengers for the conveyance of letters. In the supervision of these royal messengers lies the germ of the office of postmaster-general. The first English postmaster of whom a distinct account can be given is Sir Brian Tuke, who is described (1533) in the records as "Magister Nunciorum, Curvorum, sive Postarum," "both in England and in other parts of the king's dominions beyond the seas." But long subsequent to this appointment of a postmaster-general the details of the service were frequently regulated by proclamations and by orders in council. Thus, among the royal proclamations in the library of the Society of Antiquaries of London, there is one of Philip and Mary (undated, but apparently of 1555) which regulates the supply of horses for the conveyance of letters to Dover. Again, in July 1556 the lords of the council ordered "that the postes betweene this and the Northe should eche of them keepe a booke, and make entrye of every lettre that he shall receive, the tyne of the deliverie thereunto unto his hands, with the parties names that shall bring it unto him." Much of the business of the foreign postal service to and from England during the earlier years of Queen Elizabeth was managed by the incorporated "merchant strangers," who appointed a special postmaster. When that office fell vacant in 1568 they quarrelled about a successor; and the quarrel cost them their privilege.

**The De Questers.**

The accession of James I. to the English throne, by necessitating a more frequent communication between London and Scotland, led to improvements in the postal service. Special posts had already been established by the magistrates of certain Scottish towns to convey their despatches to and from the court. Thus in 1599 a messenger was appointed by the magistrates of Aberdeen with the title of "council-post." The new royal orders of 1603 directed (1) that the postmasters at the various stages should enjoy the privilege of letting horses to "those riding in post (that is to say) with horn and guide," by commission or otherwise, and to that end they were charged to keep or have in readiness a sufficient number of post-horses; (2) that the lawful charge for the hire of each post-horse should be, for public messengers, at the rate of 2d. a mile, and "besides the guide thereunto," private travellers being left to make their own agreements. Finally, it was directed that every postmaster should keep at least two horses for the express conveyance of government letters, and should forward such letters within a quarter of an hour of their receipt, and that the posts should travel at the rate of not less than 7 m. an hour in summer and 5 m. in winter.

In 1607 the king granted to John Stanhope, first Baron Stanhope of Harrington, and to his son Charles Stanhope, afterwards Lord Stanhope, jointly and to the survivor of them, the postmastership of England under the title of "Master of the Post," and with the Leases of Sir Walter Wills for the year, together with all "avails and profits" belonging to the office. In 1624 a separate office of "postmaster-general of England for foreign parts" was created in favour of Matthew de Quester and Matthew de Quester the younger. The new office was regarded by the existing postmaster-general, Charles, Lord Stanhope, as an infringement of his own patent. A long dispute ensued in the king's bench and before the lords of the council. In 1626 by an order in council liberty was granted to all companies of merchants, including the merchant adventurers, to send their letters and despatches by messengers of their own choosing. A year afterwards this liberty was revoked, except for the company of Merchant Adventurers. Lord Stanhope, however, continued to carry letters abroad by his agents, and obtained a warrant prohibiting De Quester from interfering. It shows strikingly the confusion of postal affairs at this period to find a statement addressed to the privy council by the postmasters of England to the effect that they had received no payments "ever since the last day of November 1621 till this present time, June 1628"—the arrears amounting to £25,000.

The rights of the postmasters were also infringed by private individuals, as by one Samuel Jude in 1629 in the west of England. In 1633 he founded a post between London and Oxford, through which he conducted his correspondence with De Quester, who had lost his son, to William Frizell and Thomas Witherings. Letters-patent were granted to them to give their voices to Raphael, . . . but inclined to favour Godfrey (Dom. Cor. Eliz. xlviii. § 65, State Paper Dept., Rolls Office). Raphael was a German, Godfrey an Englishman.

3 Q. 7th, De l'Equester," as he is called in Latch's Reports of King's Bench Cases, p. 87.
4 These disputes were much embittered by the growing jealousies of English against foreign merchants. The proofs of this in the state correspondence of Elizabeth's day are abundant, but there were many statesmen who took larger views. See, e.g., John Johnston's "De Quester's" Declaration for the . . . erecting and maintaining of the Post Office," (June 1582), Dom. Corresp. Eliz. civ. No. 30; and compare the same writer's "Discourse for the repairing the decayed State of the Merchants," (Dec. 22, 1577), ibid. civ. No. 39, with Leake's "Discourse," &c., of the same year, and John Hales's "Letter to Sir W. Cecil" (March 20, 1596), ibid., iii., where he describes the merchant strangers as being "spies for foreign princes," and with Cecil's "Reasons to move a Forbearring of the Restitution of the Intercourse to Antwerp" (1597), in Heywood's Works, p. 271.
5 See Analytical Index to the Remembrancia, p. 418, as quoted by H. B. Wheatley in the Academy of the 27th of December 1879, p. 464.
jointly, the 15th of March 1633. Witherings took the labouring oar, and ranks as the first of many conspicuous postal reformers.

**Withering's**

Under him one Richard Poole obtained a special postmastership for the service of the court. Among the earlier examples of bureaucratic procedure, however, was the patent of an acceleration of the continental mail service. For this purpose the patentees made a contract with the count of Thurn and Taxis, hereditary postmaster of the Empire and of Spain. At this time there was still but one mail weekly between London, Antwerp and Brussels, and the transit occupied from four to five days. By a subsequent contract with Count Thurn two mails weekly were secured and the transit made ordinarily in two days. In June 1635 Witherings submitted to the king a proposal "for settling of staffets or packet-post betwixt London and all parts of His Majesty's dominions, for the carrying and re-carrying of his subjects' letters" which contains curious notices of the state of internal communications. The net charge to the Crown of the existing posts is stated to be £3,400 per annum. Letters, it is said, "being now carried by carriers or footposts 16 or 18 m. a day, it is full two months before any answer can be received from Scotland or Ireland to London. If any of His Majesty's subjects shall write to Madrid in Spain, he shall receive answer sooner and surer than he shall out of Scotland or Ireland." By the new plan it was proposed that all letters for the northern road should be put into one "post-ante," and directed to Edinburgh, with separate bags directed to each postmaster as lived upon the road near any great town or city. The journey from London to Edinburgh was to be performed within three days. The scheme was approved on the 31st of July 1635, the proclamation establishing eight main postal lines—namely, the great northern road, to Ireland by Holyhead, to Ireland by Bristol, to the marches of Wales by Shrewsbury, to Plymouth, to Dover, to Harwich and to Yarmouth. The postage of a single letter was fixed at 2d. if under 80 m., 4d. if between 80 and 140 m., 6d. if above 140 m., 8d. if to Scotland. It was provided that no other messengers or footposts should carry letters to any places so provided, except common known carriers, or a particular messenger "sent on purpose with a letter by any man for his own occasions," or a letter by a friend, on pain of exemplary punishment. In February 1638 another royal proclamation ratified an agreement between Witherings and De Noveau, postmaster to the French king, for the conveyance of the mails into France by Calais, Boulogne, Abbeville and Amiens.

But in 1640 the active postmaster was accused of divers abuses and misdemeanours, and his office sequestrated into the hands of Philip Burlamachi of London, merchant, who was to execute the same under the Inspection of the principal secretary of state. Witherings then assigned his patent to Robert Rich, earl of Warwick, and a long contest ensued in both houses of parliament. The sequestration was declared by a vote in parliament in 1642 to be illegal. Nevertheless the dispute gave repeated occupation to both houses during the period from 1641 to 1647, and was diversified by several affrays, in which violent hands were laid upon the mails. In 1643 the post office yielded only £5000 a year. In 1644 the Lords and Commons by a joint ordinance appointed Edmund Prideaux "to be master of the posts, messengers and couriers." In 1645 the opinion of the judges was taken on the validity of Witherings's patent (assigned to Lord Warwick), and they pronounced that "the clauses of restraint in the said patent are void and not good in law; that notwithstanding these clauses be void, the patent is good for the rest." It is evident, therefore, that any

In 1650 an attempt was made by the common council of London to organize a new postal system on great roads, to be under a committee of the city.

**Under Cromwell.**

Thereupon the Protector was advised that the management of the post office should be entrusted to John Thurloe by patent upon the expiration of John Manley's existing contract. Thurloe was to give security for payment of the existing rent of £10,000 a year. Ultimately the posts, both inland and foreign, were farmed to John Manley for £10,000 a year, by an agreement made in 1653. Meanwhile an attorney at York, named Hill, placed relays of post-horses between that city and London, and undertook the conveyance of letters and parcels at half the former rates. He also formed local and limited partnerships in various parts of the kingdom for the extension of his plan, which aroused the jealousy of Thurloe. For England, a twopenny postage for Scotland and a fourpenny postage for Ireland. But the post office was looked upon by the government of the day as, first, a means of revenue, and secondly, a means of political espionage. The new letter-carriers were "tramped down" by Cromwell's soldiery. The inventor had a narrow escape from severe punishment. He lived to publish (1659) the details of his plan, at the eve of the Restoration, in a pamphlet entitled A Penny Post or a Vindication of the Liberty and Birthright of every Englishman in carrying Merchants and other Men's letters, against any Restraint of Farmers, &c. It is probable that this publication helped to prepare the way for those measures of partial but far-reaching reform which were effected during the reign of Charles II. The rates of postage and the rights and duties of postmasters were settled under the Protectorate by an act of parliament of 1657, c. 30. In 1659 the item, "by postage of letters in farm, £14,000," appears in a report on the public revenue.

The government of the Restoration continued to farm the post office upon conditions similar to those imposed by the act of 1657, but for a larger sum. Henry Bishop, the first postmaster-general in the reign of Charles II., under Charles II., contracted to pay a yearly rent of £21,500, these new arrangements being embodied in the Act 12 Charles II. c. 35 (1660), entitled "An Act for Erecting and Establishing a Post Office," a clause proposing to frank all letters addressed to or sent by members of parliament during the session was 591, 658 seq.; Journals of the House of Lords, v. 343, 387, 450, 469-473, 500 seq.; Report from Secret Committee on the Post Office, House of Commons, 1679, pp. 60-69.

Illustrations of this may be seen (in the state-paper department of the general record office) among the correspondence between Sir John Coke and Lord Conway, and also in many other state letters sent after that date by the general postmaster of the time. There is in the Bodleian Library (MS. Rawlinson, A. 477) a minute account of the methods alleged to have been pursued in the systematic and periodical examination of letters entrusted to the post office, by the officers authenticated by any signature and is undated. But it is an original document of the time of Charles II., addressed to Mr. Bridgman, clerk of the council, and drawn up to recommend the adoption of a like practice, but with greater dexterity than that used by Dr. Deloraine and Samuel Morland, who, according to this narrative, formed the Cromwellian board of examiners for post-office letters, and who read all that were addressed to foreign parts.

M.R. There is a copy in the library of the British Museum, from which H. B. Wheatley has given the abstract quoted above.

8 Journals of the House of Commons, vii. 627.
POST, AND POSTAL SERVICE

rejected by the Lords. But the indenture enrolled with the letters-patent contained a proviso for the free carriage of all letters to or from the king, the great officers of state and also the single inland letters only of the members of that present parliament during that session. It also provided that the lessee should permit the secretaries of state, or either of them, to have the survey and inspection of all letters at their discretion. Bishop was succeeded by Daniel O'Neill in 1662, in similar terms. In the consequent proclamation, issued on the 29th of May 1663, it was commanded that "no postmasters or other officers that shall be employed in the conveying of letters, or distributing of the same, or any other person or persons, . . . except by the immediate warrant of our principal secretary of state, shall presume to open any letters or pacquets not directed unto themselves." In 1675 the general post office comprised in the chief office, under Henry Bennet, earl of Arlington, as postmaster-general, seventy-five persons, and its profits were farmed for £13,000 a year. There were then throughout England and Scotland 182 deputy postmasters, and in Ireland 18 officers at the Dublin office and 45 country postmasters. "The number of letters missive," says a writer of the same year, "is now prodigiously great. . . . A letter comprising one whole sheet of paper was sent by the Duke of York in 1663, obtained a pension. Every twenty-four hours the post goes 120 m., and in five days an answer may have had from a place 500 m. distant." By an act of the 15th Charles II. ("An Act for Setting the Profits of the Post Office on the duke of York, and his Heirs-Male"), and by a subsequent proclamation issued in August 1683, it was directed that the postmaster-general should "take effectual care for the conveyance of all by-letter, by establishing correspondences . . . in all considerable market-towns with the next adjacent post-stage," and the rights of the postmasters as to hiring horses were again emphasized.

During the post-office of the post-office profits by the duke of York a London penny post was established by the joint enterprise of William Dockwra, a searcher at the custom-house, and of Robert Murray, a clerk in the excise office. The working-out of the plan fell to the first-named, and in his hands it gave in April 1680—although but for a short time—far more extensive postal facilities to the Londoners than even those afforded 150 years later by the plans of Sir Rowland Hill. Dockwra carried, registered and insured, for a penny, both letters and parcels up to a pound in weight and £10 in value. He took what had been the mansion of Sir Robert Abdy in Lime Street as a chief office, established offices for sorting and district offices, and between 400 and 500 receiving-houses and wall-boxes. He established hourly collections, with a maximum of ten deliveries daily for the central part of the city, and a minimum of six for the suburbs. Outlying villages, such as Hackney and Islington, had four daily deliveries; and his letter-carriers collected for each despatch of the general post office throughout the whole of the city and suburbs. Suits were laid against him in the court of king's bench for infringing on the duke of York's patent, and the jealousies of the farmers eventually prevailed. The penny post was made a branch of the general post. Dockwra, after the Revocation of the Banishment (1688) obtained £5,000 a year (for a limited term) in compensation of his losses. In 1697 he was made comptroller of the London office. Eleven years later his improvements were outvied by Charles Povey, the author of schemes for improving coinage, and also of a curious volume, often wrongly ascribed to Defoe, entitled The Visions of Sir Heister Ryley. Povey took upon himself to set up a foot-post under the name of the "halfpenny carriage," appointed receiving-houses, and employed several persons to collect and deliver letters for hire within the cities of London and Westminster and borough of Southwark, to the great prejudice of the Postmaster, but not always the trusted adviser of the Duke of Ormonde. O'Neill's correspondence exists among the Duke's papers, in part at Kilkenny Castle, in part (extensively) among the Carte MSS. in the Bodleian; and it abounds in incidental illustrations of postal administration in both England and Ireland.

The revenue," as was represented by the postmaster-general to the lords of the treasury. Povey was compelled to desist.

At a period the postal system of Scotland was distinct from that of England. It had been organized in the reign of Charles II., who in September 1662 had appointed Patrick Grahame of Inchbrakie to be postmaster-general of Scotland for life at a salary of £500 Scots. It was to seem to be so ordained that the privy council that the rights and duties of the office were ill defined; for immediately after the appointment of Grahame the council commissioned Robert Mein, merchant and keeper of the letter-office in Edinburgh, to organize and establish in Scotland, ordained that Linlithgow, Kilsyth, Glasgow, Kilmarnock, Dumfog, Ballantrae and Portpatrick should be stages on the route, that Mein, and James Dockwra of London, should each have a packet-boat to carry the mail from Portpatrick to Donaghadee.

Perhaps the earliest official notice of the colonial post is to be seen in the following paragraph from the records of the general court of Massachusetts in 1639. "It is ordered that notice be given that Richard Fairbanks his house in Boston is the place appointed for all letters which are brought from beyond the seas, or are to be sent thither to be left with him; and he is to take care that they are to be delivered or sent according to the directions; and he is allowed for every letter a penny, and must answer all miscarriages through his own neglect in this kind." The court in 1667 was petitioned to make better provision; a committee of the privy council were directed to consider what provision was to be made for the conveyance of the despatches as they arrived to the next plantation, and so on, on pain of forfeiting a hoghead of tobacco in default. The government of New York in 1672 established "a post to goe monthly from New York to Boston," advertising, "that those that be disposed to send letters, to bring them to the secretary's office, where, in a lock box, they shall be preserved till the messenger calls for them, all persons paying the post before the bag be sealed up." Thirty years later this monthly post had become a fortnightly one. The office of postmaster-general for America had been created in 1692.

The act of the 9th of Queen Anne which consolidated the posts of the empire into one establishment, and, as to organization, continued to be the great charter of the post office until the reforms of 1838-1850 mainly introduced by Sir Rowland Hill. The act of Anne largely increased the powers of the postmaster-general. It reorganized the chief letter-offices of Edinburgh, Dublin and New York, and settled new offices in the West Indies and those provinces which at that time had no postal service, viz. English, 3d. if under 80 m. and 4d. if above, and 6d. to Edinburgh or Dublin. It continued to the postmaster-general the sole privilege "to provide horses to persons riding post." And it gave, for the first time, Parliamentary sanction to the power, formerly questionable, of the secretaries of state with respect to the opening of letters, by enacting that "from and after the first day of June 1711 no person or persons shall presume . . . to open, detain or delay . . . any letter or letters . . . after the same is or shall be delivered into the general or other post office . . . and before delivery to the persons to whom they are directed, or for the purpose of being examined at the request of the party to whom any letters or papers are to be delivered, or to have the same served by any person or persons, under the authority of an express warrant . . . or by the officers or people of any of the principal secretaries of state, for every such opening, detaining or delaying."

Nine years after the passing of the act of Anne the cross-posts were farmed to the well-known "humble" Ralph Allen—the lover of peace and of humanity. Allen became the inventor of the cross-roads postal system, and having made an agreement that the new profits so created should be his own during his lifetime, his improvements were so successful that he is said to have netted during forty-two years an average profit of nearly £1,000 a year.

It had been at first proposed to reward Palmer by a grant for life of 2½ per cent on a certain proportion of the increased net revenue, which would eventually have given him some £10,000 a year, but this proposition fell through. Pitt, however, appointed Palmer to be comptroller-general of postal revenues, an office which was soon made too hot for him to hold. He obtained a pension of £3,000 a year, and ultimately, by the act 53 Geo. III. c. 157 (1813), after his case had received the sanction of five successive majorities against government, an additional sum of £50,000. Every sort of obstruction was placed in the way of his reward, although nearly a million had been added to the annual public revenue, and during a quarter of a century the mails had been conveyed over an aggregate of some seventy millions of miles without the occurrence of one serious mail robbery.¹

¹ Debates of both Houses of Parliament in 1808 relative to the Agreement for the Reform and Improvement of the Post Office, passim. See also H. Joyce, The History of the Post Office (1893).

Scotland shared in the advantages of the mail-coach system from the first. Shortly before its introduction the local penny post was set on foot in Edinburgh by Peter Williamson, the keeper of a coffee-room in the hall of Parliament Buildings. He, Scottish and Irish Post Office, 1708—1774, employed four letter-carriers, in uniform, appointed by the government, to deliver mail to all parts of the country. The system was extended to the whole of Scotland by an act of 1734. But in Ireland in 1801 only three public carriages were conveyed mail. These were a new system of post, with a number of stations and post offices, had been established by 1764. The system had been adopted in Ireland by 1765. The Post Office, and its counterpart in the north of Ireland, therefore, had been created by an act of 1764. In Ireland the post revenue was shared by the provincial government and the central government.

In the American colonies postal improvements may be dated from the administration of Franklin, who was virtually the last colonial postmaster-general, as well as the best. In one shape or another he had forty years’ experience of postal work, having been appointed postmaster at Philadelphia in October 1737. When he became postmaster-general in 1753 he visited all the chief post offices throughout Pennsylvania, New Jersey, New York, and New England, looking at everything with his own eyes. His administration was not better in its results than it was in its performance. But it was to be a success. He wrote soon after his dismissal, up to the date of his appointment, he says, that the American postal system could be farmed out and the mails could be carried by the companies of the time. A dead-letter office was established in 1764. But in Ireland in 1801 there were only three public carriages conveyed mail. These were the mail-coaches that were used to convey mail from London to the provincial towns.

Before passing to the reform of 1839 we have to revert to that important fact in postal history—the interference with correspondence for judicial or political purposes. We have already seen (1) that this assumption had no parliamentary sanction until the enactment of the 9th of Queen Anne; (2) that the enactment differed from the royal proclamations in directing a special warrant for each letter, and destroying all correspondence in consequence. It is a significant gloss on the statute to find that for nearly a century (namely, until 1795 inclusive) it was not the practice to record such warrants regularly in any official book. When the use to which the warrant was applied, the state trials afford some remarkable instances. At the trial of Bishop Atterbury, for example, in 1723 certain letters were offered in evidence which a clerk of the post office deposed on oath "to be true copies of the originals, which were forwarded at the post office and copied, and sent forward as directed." Hereupon Atterbury asked his witness "if he had any express warrant under the seal of one of the principal secretaries of state for opening the said letters." But the lords shivered his objection on the grounds of public inexpediency. Twenty-nine peers recorded their protest against this decision. But the practice thus sanctioned appears to have been pushed to such lengths as to elicit in April 1735 a strong protest and culture from the House of Commons. A committee of inquiry was appointed, and after receiving its report the house resolved that it was "an high infringement of the privileges of the Lords Common of Great Britain in Parliament that letters of any member should be opened or delayed without a warrant of a principal secretary of state." 1

Sir Rowland Hill's Reforms (1836–1842).

Rowland Hill's pamphlet (Post Office Reform) of 1837 took for its starting-point the fact that, whereas the postal revenue showed for the past twenty years a positive though slight diminution, it ought to have shown an increase of £507,700 a year in round numbers, with the growth of population, and an increase of nearly four times that amount in order to have kept pace with the growth of the analogous though far less exorbitant duties imposed on stage-coaches. The stage-coach duties had produced, in 1815, £217,671; in 1835 they produced £498,497. In 1837 there did not exist any precise account of the number of letters transmitted through the general post office. Hill, however, was able to prepare a sufficiently approximate estimate from the data of the London district post, and from the sums collected for postage. He thus calculated the number of chargeable letters at about 88,600,000, that of franked letters at 7,400,000, and that of newspapers at 30,000,000, giving a gross toll of about 126,000,000. At this period the total cost of management and distribution was £669,569. In the finance accounts of the year (1837) deductions are made from the gross revenue for letters "refused, missent, redirected," and the like, which amount to about £122,000. An analysis of the component parts of this expenditure assigned £265,517 to cost of primary distribution and £270,052 to cost of secondary distribution and miscellaneous charges. A further analysis of the primary distribution expenditure gave £328,358 as the probable outgoings for receipt and delivery, and £144,209 as the probable outgoings for transit. In other words, the expenditure which hinged upon the distance the letters had to be conveyed was £144,000, and that which had nothing to do with distance was £182,000. Applying to these figures the estimated number of letters and newspapers (126,000,000) passing through the office, there resulted a probable average cost of 565 of a penny for each, of which 565 was cost of transit and 565 of cost of receipt, delivery, &c. Taking into account, however, the greater weight of newspapers and franked letters as compared with chargeable letters, the apparent average cost of transit became, by this estimate, but about 565, or less than 565 of a penny.

A detailed estimate of the cost of conveying a letter from London to Edinburgh, founded upon the average weight of the Edinburgh mail, gave a still lower proportion, since it reduced the apparent cost of transit to the average, to the thirty-sixth part of one penny. Hill inferred that, if the charge for postage were to be made proportionate to the whole expense incurred in the receipt, transit and delivery of the letter, and in consequence of its postage, it must be made uniformly the same from every post-town to every other post-town in the United Kingdom, unless it could be shown how we are to collect so small a sum as the thirty-sixth part of a penny. And, inasmuch as it would take a ninefold weight to make the expense of transit amount to one farthing, he further inferred that, taxation apart, the charge ought to be precisely the same for every packet of moderate weight, without reference to the number of its enclosures.

At this period the rate of postage actually imposed (beyond the limits of the London district office) varied from 4d. to 1s. 8d. for a single letter, which was interpreted to mean a single piece of paper not exceeding an ounce in weight; a second piece of paper or any other enclosure, however small, constituted the packet a double letter. A single sheet of paper, if it at all exceeded an ounce in weight, was charged with fourfold postage. The average charge on inland general post letters was nearly 9d. for each. It was proposed that the charge for primary distribution—that is to say, the postage on all letters received in a post-town, and delivered in the same or in any other post-town in the British Isles—should be at the uniform rate of one penny for each half-ounce—all letters and other papers, whether single or double, quartz, or covered by an outer envelope, being charged half an ounce, being charged one penny, and heavier packets, to any convenient limit, being charged an additional penny for each additional half-ounce. It was further proposed that stamped covers should be sold to the public at such a price as to include the postage, which would thus be collected in advance. 2 By the public generally, and pre-eminently by the trading public, the plan was received with favour. By the functionaries of the post office it was denounced as ruinous and visionary. In 1838 petitions poured into the House of Commons. A select committee was appointed, which reported as follows: 3

"The principal points which appear to your committee to have been established in evidence are the following: (1) the exceedingly slow advance and occasionally retrograde movement of the post office revenue during the ... last twenty years; (2) the fact of the charge of postage exceeding the cost in a manifold proportion; (3) the fact of postage being evaded most extensively by all classes of society, and of correspondence being suppressed, more especially among the middle and working classes of the people, and this in consequence, as all the witnesses, including many of the post office authorities, think, of the excessively high scale of taxation; (4) the fact that very considerable sums result from this state of things to the commerce and industry of the country, and to the social habits and moral condition of the people; (5) the fact, as far as conclusions can be drawn from very imperfect data, that whenever on former occasions large reductions in the rates have been made, these reductions have been followed in short periods of time by an extension of correspondence proportionate to the contraction of the rates; (6) and, as matters of inference from fact and of opinion—that (i) that the only remedies for the evils above stated are a reduction of the rates, and the establishment of additional deliveries, and more frequent despatches of letters; (ii) that owing to the rapid extension of railroads there is an urgent and growing necessity for making such changes; (iii) that any moderate reduction in the rates would..."
POST, AND POSTAL SERVICE

occasion loss to the revenue, without in any material degree diminishing the present amount of letters irregularly conveyed, or giving rise to the growth of new correspondence; (iv.) that the principle of a low uniform rate is just in itself, and, when combined with prepayment and collection by means of a stamp, would be exceedingly convenient and highly satisfactory to the public."

A bill to enable the treasury to establish uniform penny postage was carried in the House of Commons by a majority of 100, and became law on the 17th of August 1839. A temporary office was created to enable Rowland Hill to superintend the working out of his System. The first step taken in this direction, on 15th December 1839, the London district postage to 1d. and the general inland postage to 4d. the half-ounce (existing lower rates being continued). On the 10th of January 1840 the uniform penny rate came into operation throughout the United Kingdom—the scale of weight advancing from 1d. for each of the first two half-ounces, by gradations of 2d. for each additional ounce, or fraction of an ounce, up to 16 oz. 1 The postage was to be prepaid, and if not to be charged at double rates. Parliamentary franking was abolished. Postage stamps were introduced in May following. The facilities of despatch were soon afterwards increased by the establishment of offices of distribution.

But on the important point of simplification in the internal economy of the post office, with the object of reducing its cost without diminishing its working power, little was done. The plan had to work in the face of rooted mistrust on the part of the workers. Its author was (for a term of two years, afterwards prolonged to three) the officer, not of the post office, but of the treasury. He could only recommend measures the most indispensable through the chancellor of the exchequer. It happened, too, that the scheme had to be tried at a period of severe commercial depression. Nevertheless, the results actually attained in the first two years were briefly these: (1) the change from the old system to the new, in the United Kingdom, exclusive of that part of the government correspondence which theretofore passed free, had already increased from the rate of about 75,000,000 a year to that of 106,500,000; (2) the London district post letters had increased from about 13,000,000 to 23,000,000, or nearly in the ratio of the reduction of the rates; (3) the illicit conveyance of letters was substantially suppressed; (4) the gross revenue, exclusive of repayments, yielded about a million and a half per annum, which was about 63% of the amount of the gross revenue in 1839. These results at so early a stage, and in the face of so many obstructions, vindicated the new system.

Seven years later (1849) the 196,500,000 letters delivered throughout the United Kingdom in 1842 had increased to nearly 329,000,000. In addition, the following administrative improvements had been effected: (1) the time for posting letters at the London receiving-houses extended; (2) the limitation of weight abolished; (3) an additional daily despatch to London from the neighbouring (as yet independent) villages; (4) the postal arrangements of 120 of the largest cities and great towns revised; (5) unlimited writing on inland newspapers, and payment on payment of an additional penny; (6) a summary process established for recovery of postage from the senders of unpaid letters when refused; (7) a book-post established; (8) registration reduced from one shilling to sixpence; (9) a third mail daily put on the railway (without additional charge) from the towns of the north-western district to London, and day mails extended within a radius of 20 m. round the metropolitan; (10) a service of parliamentary returns, for private bills, provided for; (11) measures taken, against many obstacles, for the complete consolidation of the two heretofore distinct corps of letter-carriers—an improvement (on the whole) of detail, which led to other improvements thereafter. 1

Later History (1842-1905).

When Sir R. Hill initiated his reform the postmaster-general was the earl of Lichfield, the thirty-first in succession to that office after Sir Brian Tuke. Under him the legislation of 1839 was carried out in 1840 and 1841. In September 1841 he was succeeded by Viscount Lowther.

In the summer of 1844 the statement that the letters of Mazzini, then a political refugee, long resident in England, had been systematically opened, and their contents opened and communicated to foreign governments, by Sir James Graham, secretary of state for the home department, 2 aroused much indignation. The arrest of the brothers Bandiera, 3 largely in consequence of information derived from their correspondence with Mazzini, and their subsequent extradition at Consenza made a thorough investigation into the circumstances a public necessity. The consequent parliamentary inquiry of August 1844, after retracing the earlier events connected with the exercise of the discretionary power of inspection which parliament had vested in the secretaries of state in 1719, elicited the fact that in 1806 Lord Spencer, then secretary for the home department, introduced for the first time the practice of recording in an official book all warrants issued for the detention and opening of letters, and also the additional fact that from 1822 onwards the warrants themselves had been preserved. The whole number of such warrants issued from 1806 to the middle of 1844 inclusive was stated to be 1,283, of which no less than 35 had been issued in the years 1841-1844 inclusive, a number exceeding that of any previous period of like extent.

The committee of 1844 proceeded to report that "the warrants issued during the present century may be divided into two classes—1st those issued in furtherance of criminal justice ... and, those issued for the purpose of discovering the designs of persons known or suspected to be engaged in proceedings dangerous to the State, or (as in Mazzini's case) deeply involving British interests, and carried on in the United Kingdom or in British possessions beyond the seas ... Warrants of the second description originated with the home office. The principal secretary of state, of his own discretion, determines when to issue them, and gives instructions accordingly to the under-secretary, whose office is then purely ministerial. The mode of preparing them, and keeping record of them in a private book, is the same as in the case of criminal warrants. There is no record kept of the grounds on which they are issued, except so far as correspondence preserved at the home office may lead to infer them. ... The letters which have been detained and opened are, unless retained by special order, as sometimes happens in criminal cases, closed and sealed, without affixing any mark to indicate that they have been so detained and opened, and are forwarded by post according to their respective superscriptions.

In thirty years this question was again raised in the House of Commons (March 1882) by some Irish members, in relation to an alleged examination of correspondence at Dublin for political reasons. Sir William Harcourt on that occasion spoke thus: "This power is with the secretary of state in England. ... In Ireland it belongs to the Irish government. ... It is a power which is given for purposes of state, and the very essence of the power is that there is no account [of its exercise] can be rendered. To render an account would be to defeat the very object for which the power was granted. If the minister is not fit to exercise the power so entrusted, upon the responsibility cast upon him, he is not fit to occupy the post of secretary of state." 4 The House of Commons accepted this explanation; and in view of many grave incidents, both in Ireland and in America, it would be hard to justify any other conclusion. The increase in the number of postal deliveries and in that of the receiving-houses and branch-offices, together with the numerous improvements introduced into the working economy of the post office, when Rowland Hill at length obtained the means of fully carrying out his reforms by his appointment as secretary, 5 and the increase in postal business, 1839-1857.

---

1 Hill, History of Penny Postage (1860), appendix A (Life, &c., ii. 438). Part of the strenuousness of the opposition to this measure arose, it must be owned, from the "high-handedness" which in Sir R. Hill's character somewhat marred very noble faculties. The change worked much harm to some humble but hardworking and meritorious functionaries.

3 Ibid., pp. 14-17.

5 Hansard, Debates, vol. cclxxvii. cols. 294-296 (session of 1832).
speedily gave a more vigorous impulse to the progress of the net revenue than had theretofore obtained. During the seven years 1845–1852 inclusive the average was but £810,951. During the six years 1852–1857 inclusive the average was £1,166,448—the average of the gross income during the same septennial period having been £2,685,835.

Within a period of eighteen years under the rate of postage being more than sixfold what it was under the rates of 1838. When the change was first made the increase of letters was in the ratio of 225:25:1 per annum. The second year showed an increase on the first of about 16%. During the next fifteen years the average increase was at the rate of about 6% per annum. Although this enormous increase of business, coupled with the increasing demand of the interests of the telegraphic mail service, (invaluable, but costly), carried up the post office expenditure from £57,500,000 to £2,720,800, yet the net revenue of 1857 was within £550,000 of the net revenue of 1839. During the year 1857, the number of newspapers delivered in the United Kingdom was about 71 millions, and that of book-packets (the cheap carriage of which is one of the most serviceable and most popular benefit of postal improvements) about 6 millions.

Since 1858 the achievements of the period 1853–1857 have been eminently surpassed. This period included the establishment of postal savings banks (1861) and the transfer to the state of the telegraphic service (1870). These improvements are dealt with in separate articles. The British postal business has grown at a more rapid rate than the population of the United Kingdom. Some of the causes of this development must be sought within the post office department, e.g., improved facilities, lower charges and the assumption of new functions; but others are to be found in the higher level of popular education, the increase of wealth, industry and commerce, and the rapid expansion of Greater Britain.

The following table shows the growth of letters delivered:

1 It was discovered in the course of this year that the estimated figures for previous years had been swollen by an imperfect method of reckoning the London letters, &c. In 1863 as many as 2,770,000 valentines were sent through the post. The numbers gradually decreased until in 1890 only 320,000 were observed. Christmas cards have, however, considerably increased.

2 Since the 22nd of June 1897, all packets over 2 oz., formerly counted as book packets, are reckoned as letters.

The rates of inland letter postage have been altered as follows. From the 5th of October 1871 to the 1st of July 1883 the charges were: not exceeding 1 oz. one penny; over 1 oz. and not exceeding 2 oz. three halfpence, and an additional halfpenny for every 2 oz. so that the postage on a letter weighing between 10 and 12 oz. was 4d. On a letter weighing over 12 oz. and not exceeding 13 oz. the postage was 1s. 1d., and increased 1d. for each succeeding ounce. On the 1st of July 1883 the postage on letters over 12 oz. was reduced, and the gradation of charge beyond 2 oz. was made uniform, at the rate of one halfpenny for each additional ounce. Thus a letter weighing over 12 and not exceeding 14 oz. was charged 4 3/4, to 16 oz. 3 1/2, and so on. Notwithstanding this change, it was found as late as 1895 that 92% of the letters sent through the post weighed not more than 1 oz. each.

Among a number of postal and telegraphic concessions made to the public on the 22nd of June 1897, the sixtieth anniversary of Queen Victoria's accession to the throne, were new rates for letters as follows:—

Not exceeding 4 oz.
Over 4 oz. and not exceeding 6 oz.
6 oz. and

with 1/4d. for each succeeding 2 oz.

This change, while it saved both the post office and the public the trouble of testing the weight of a large number of letters, had also the advantage of simplicity of calculation—one halfpenny is charged for each 2 oz., with a minimum charge of 1d.

Arrangements were at the same time made to ensure a delivery of letters by postmen at every house in the United Kingdom. It was estimated that 16 millions of letters, whose owners had previously to fetch them from the post office or from some postman on a postman’s walk, would thus be added to the official delivery. The estimate proved to be much under the mark, some 60 millions being added to the letters brought annually into the official delivery under this arrangement. Financial considerations have now been entirely disregarded for the benefit of these letters, and the cost of their delivery alone greatly exceeds the whole revenue derived from them.

In studying the statistics of letters delivered, it should be remembered that the figures for any particular year are affected by circumstances like a general election or a boom in trade, as well as by changes in the rates or condition of the post office services. The letters from foreign countries have been stimulated by lower charges, and those from the colonies by the imperial penny post, to which reference is made below.
POST, AND POSTAL SERVICE

On the 12th of February 1892 letter cards bearing an imprinted penny stamp, and made to be fastened against inspection, were issued to the public at a charge of 1s. for 10 cards. The charge was reduced almost at once to 9d. for 8 cards. Similar cards have long been in use on the continent of Europe, but they do not enjoy much popularity in Great Britain either with the post office, which finds them inconvenient to handle in sorting and stamping, or with the public. The number issued annually is about 10 millions, not counting those of private manufacturers.

The following table gives the number of post cards:

*Private cards with adhesive stamps first allowed in this year.

Post cards were first introduced in Austria on the 1st of October 1869, and were first issued in Great Britain on the 1st of October 1870. Only one kind of card was employed, and this was sold for one halfpenny; but on the complaints of the stationers, a charge of 1d. per dozen for the material of the card was made in 1872, and permission was given for private persons to have their own cards stamped at Somerset House. In 1875 a stouter card was put on sale, and the charges were raised to 7d. per dozen for thin cards and 8d. per dozen for stout cards. In 1889 the charges were reduced, and they are now sold at 10 for 5d., and 11 for 6d., respectively. On the 1st of September 1894, private post cards with an adhesive halfpenny stamp were allowed to be passed by post, and the result has been greatly to diminish the number of post cards sent by private parties. It is estimated that 232 out of the 400 million cards delivered in 1899-1900 were private cards. The sizes of the official cards were again altered in January 1855 and November 1899. The regulations forbidding anything but the address to be written on the address side of a post card were made less stringent on the 1st of February 1897; and in 1898 unpaid post cards, which were previously charged as unpaid letters, were allowed to be delivered on payment of double the post card rate. These various changes, especially the use of the private card and the popularity of illustrated post cards, have contributed to the rapid increase in the number of post cards sent by post. Reply post cards were first issued on the 1st of October 1863. Their use has been extensive. Only about 14 million are issued yearly.

**Letter and Post Cards.**

The purpose of detecting letters, &c., sent by the halfpenny post. The book post received a great impetus in 1892 (May 28) by the permission to enclose book packets in imprinted envelopes. A complaint is, however, made that such envelopes form a dangerous trap for small letters, which are liable to slip inside the flaps of open envelopes. But as the rate of postage for articles weighing over 2 oz. is now the same for letters and post cards, articles over that weight derive no advantage from being sent in open covers.

**Sample Post.**—The sample or pattern post, which was confined to bonâ-fide trade patterns and samples on the 1st of October 1870, was then assimilated to the book post (1d. for 2 oz.); but the restriction was difficult to enforce and irritating to the public, and the sample post was abolished on the 5th of October 1871, when the rates of letter postage were lowered. It was re-established on the 1st of October 1887 (1d. for 4 oz. or under, and 5d. for each succeeding 2 oz.); but when the Jubilee letter rates were introduced (June 22, 1897) it lost its raison d'être, and ceased to exist for inland purposes.

**Newspapers.**—The table on next page shows the estimated number of newspapers delivered in the United Kingdom, and the increase per cent. per annum.

The carriage of newspapers by post does not show the same elasticity as other post office business. This is due largely to the improved system of distribution adopted by newspaper managers and especially to the extension of the halfpenny press. The practice of posting a newspaper after reading it, under a co-operative arrangement, has practically ceased to exist. The carriage of newspapers by post is conducted by the post office at a loss.

It has been frequently stated on behalf of the post office that the halfpenny post is unremunerative. Representations are, however, made from time to time in favour of lower postage for literature of all kinds. It may therefore be of interest to mention that the postmaster general of the United States has, in successive annual reports, deplored the effect on the post office service of the cheap rates for "second-class matter." The cost of carriage over so large a territory is heavier than in the United Kingdom; but the postmaster-general states that the low rates of postage "involve a sheer wanton waste of $80,000,000 or upwards a year." Facilities like the extension of free delivery are stifled, and the efficiency of the whole service cramped by the loss thus sustained. In the United Kingdom the rules respecting the halfpenny post were greatly simplified and brought into effect on the 1st of October 1906. The halfpenny post can be used only

1 Book packets over 2 oz. transferred to the letter post as a result of the Jubilee changes.
POST, AND POSTAL SERVICE

for packets not exceeding 2 oz. in weight. The length of a packet must not exceed 1 ft., while 1 ft. is the limit in width or depth. Any printed or written matter not in the nature of a letter may be sent by the halfpenny post, but every packet must be posted either without a cover or in an unfastened envelope, or in a cover which can be easily removed. The number of halfpenny packets delivered in 1906-1907 was 933,300,000.

The inland parcel post began on the 1st of August 1833. No parcel might exceed 7 lb. in weight, 3 ft. in length, or 6 ft. in length and girth combined. The rates were: not exceeding 1 lb. 3d.; exceeding 1 lb., but not exceeding 3 lb. 6d.; exceeding 3 lb., but not exceeding 5 lb. 9d.; exceeding 5 lb., but not exceeding 7 lb. 18. The following table shows the number of parcels delivered in the United Kingdom:

</table>

Arrangements were made with the railway companies under which they receive 5½ per cent of the postage on each parcel sent by train. This arrangement, which was found to be good for 21 years, proved, however, an onerous one, and on the 1st of June 1887, the post office started a parcel coach between London and Brighton. The coach, replaced in 1905 by a motor van, travelled by night, and reached Brighton in time for the first delivery. The experiment proving successful, other coach and motor services were started at different dates between London and other places in the provinces, the mail services performed by motor vans amounting in 1906 to nearly forty. Nearly 111 millions of parcels were conveyed by the post office in 1900-1901 without passing over a railway.

The number of letters registered in the United Kingdom in 1884-1885 amounted to 11,365,515. In the next ten years the number oscillated between 10,779,555 (1886-1887) and 12,132,144 (1892-1893); but since 1894-1895, when 11,958,264 letters were registered, the number steadily increased, until it stood at 19,029,114 for 1903-1904. It decreased, however, 2½% in 1904-1905, increased 7½ in the following year, but declined again by 8½% in 1906-1907. It has been surmised1 that the introduction of 1846 a system of insurance for registered letters was adopted. This arose on the day that every letter sent under the Post Office Acts was entitled the owner, in case of loss, to recover compensation from the post office up to a limit of £2. For an additional insurance fee of 1d. the limit was raised to £5, and for 2d. to £10. Various changes have since been made, and the separate insurance system has been abolished. At present a registration fee of 2d. entitles to compensation up to £5, 3d. £20, and each additional penny to a further £20, up to a maximum of £400. The system of registration has also been extended to parcels.

On the 1st of February 1891 the railway letter service came into operation. At passenger stations on the principal railways a letter not exceeding 4 oz. in weight may be handed in at the booking office for conveyance by the next train. A fee of 2d. is payable to the station master, as well as the ordinary postage of 1d.

The letter may be addressed to a railway station to be called for. If it bears any other address it is posted on arrival at its proper station. The number of packets so sent is about 200,000 a year.

The express delivery service dates from the 25th of March 1891. A private company formed for the purpose of supplying the public on demand with an express messenger to execute errands was found to be infringing the postmaster-general's monopoly both as regards the conveyance of letters and the transmission of communications by electricity. The services of the company were, however, much appreciated by the public. The government accordingly authorized the post office to license the existing company to continue its business, on the payment of royalties, till 1903,2 and to start an express service of its own.

Messengers can be summoned from the post office by telephone, and arrangements can be made with the post office for the special delivery of all packets arriving by particular mails in advance of the ordinary postman. The sender of a packet may have it conveyed by express messenger all the way, or may direct that, after conveyance by ordinary post to the terminal post office, it shall then be delivered by special messenger. The fees, in addition to ordinary postage, were originally fixed at 2d. for the first mile, and 1d. an additional when the distance exceeded 2 m. and there was no public conveyance. Under the present regulations the fee is 3d. for each mile covered by special messenger before delivery. No charge is made for postage in respect of the special service, but if the packet is very heavy or the distance considerable, and no public conveyance is available, the sender must pay for a cab or other special conveyance.

Letters and parcels to or from a number of foreign countries and colonies may also be marked for express delivery after transmission by post; and residents in London, not having a delivery of ordinary letters on Sunday, may receive on that day express letters from home or abroad which have come to hand too late for express delivery on Saturday nights. The total number of express services in 1905-1906 was 1,576,976. In many cases one of these services included the delivery of batches of letters, so that in London alone 1,010,815 express services were performed, including 47,601 deliveries in advance of the postmen.

There are various central dépôts for dealing with "dead" or returned letters. The principal office is in London. In the year 1905-1906 10,868,272 letters were received at the various returned letter offices, of which 1,008,017 could neither be delivered to the addresses nor returned to the senders. Such of these as contain nothing of value are at once destroyed, and no record of them is kept. The

1 See note to table of Letters Delivered.
others are recorded, and (if not previously claimed by the owners) their contents are sold by auction at intervals. If the owner apprains, after the sale, the proceeds are handed over to him. In addition to these to millions of letters, there were many others disposed of at head post offices, whence they were returned direct and unopened to the senders, whose names and addresses appeared on the outside of the letters. The total number of post cards received in the various offices as undelivered was 185,000 omitted.

</table>

2,565,770; halfpenny packets, 12,439,372; newspapers, 473,346; and parcels, 248,226; 105,145 of these last were re-issued. Articles sent by the halfpenny post are destroyed at the head offices if they cannot be delivered; but the sender may have such articles returned if he writes a request to that effect on the outside of the packet, together with his name and address, and pays a second postage on the return of the packet. The number of registered letters and letters containing property sent through the post with insufficient addresses was 320,041. These letters contained £16,687 in cash and bank-notes, and £63,843 in bills, cheques, money orders, postal orders and stamps. The coin found loose in the post amounted to £1,380, as well as £12,272 in cheques and other forms of remittances.

The table in opposite columns shows the estimated weight of the mails (excluding parcels) exchanged with the British colonies and foreign countries in 1905-1906. The number of letters and post cards may be roughly taken at 40 to the lb.

During the same year 2,474,003 parcels were despatched out of the United Kingdom, and 1,431,035 were received from the British colonies and other countries. Germany, with 336,425, received the largest number of any one country, and easily headed the list of countries from which parcels were imported into the United Kingdom, with 474,669, France coming next with 254,490.

On the 1st of January 1859 a weekly all-sea service to the Australasian colonies was opened. The rates were 4d. per ½ oz. for letters, and 2d. for post cards, as compared with 6d. and 3d. by the quicker route. In the Budget of 1859 provision was made for a lower and uniform rate of postage from the United Kingdom to India and the British colonies generally. The rates, which had hitherto varied from 2½d. to 4½d., or 6d. per ½ oz., were fixed at 2½d. per ½ oz. The change took effect on the 1st of January 1859, and resulted at the outset in a loss of 100,000 a month. The fourth postal union congress, which met at Vienna in May and June 1861 (third congress at Lisbon, February and March 1883), took a further step in the direction of uniformity, and on the 1st of October 1861 the 2½d. rate was extended to foreign as well as colonial letters from the United Kingdom. The Australasian colonies gave their adhesion to the Union at this congress, and the Cape signified its adhesion at the next congress (Washington, May and June 1897), while British Bechuanaland and Rhodesia entered in 1900, and the whole of the British Empire is now included in the international union. Abyssinia, Afghanistan, Arabia, China, and Morocco are the chief countries which remain outside. The rate was 2½d. the first oz., and 1½d. per oz. afterwards.

Advantage was taken of the presence in England of special representatives of India and the principal British colonies to hold an imperial postal conference in London in June and July 1897, under the presidency of the duke of Norfolk, postmaster-general. Chiefly at the instance of Canada the duke announced that on and from Christmas Day 1898 an imperial penny post would be established with such of the British colonies as were prepared to reciprocate. The new rates (1½d. per lb., which had long been advocated by Mr. Henneker Heatit, were adopted then or shortly afterwards by the countries within the empire, with the exceptions of Egypt and the Cape, where the 2½d. rate remained unaltered. The Cape came afterwards into the scheme, and New Zealand joined in 1902. Australia did not see its way to make the necessary financial arrangements, but in 1905 agreed to receive without surcharge letters from other parts of the empire prepaid at 1½d. per ½ oz. and reduced its outward postage to 2d. per ½ oz., raised to 1 oz. in 1907. In 1911 penny postage was adopted throughout the commonwealth and to the United Kingdom. Owing to the special relations existing between the governments of Egypt and the United Kingdom, penny postage for letters passing between the United Kingdom and Egypt and the Sudan was introduced in December 1905; and
the Egyptian post office subsequently arranged for the adoption of this rate with many of the British colonies. On the 1st of October 1908 penny postage was established between Great Britain and the United States on the same lines as the imperial penny post.

At the 1897 conference it was proposed that the parcel rates with British possessions should be lowered and simplified by the adoption of a triple scale for parcels exchanged by sea, namely, 1s. up to 3 lb., 2s. from 3 lb. to 25 lb., and 3s. from 7 lb. to 11 lb. The scale has been adopted by many of the British colonies. The parcel post has been gradually extended to nearly the whole civilized world, while the rates have in many cases been considerably reduced. The United States remained an exception, and in 1906 an agreement was concluded with the American Express Company for a parcel service. In April 1904 an official service was established with the United States post office, but the semi-official service is still maintained with the American Express Company. By the official service the limit of weight was 4 lb. 6 oz., and the postage was 1s. per parcel; by the semi-official service parcels up to 11 lb. in weight may be sent, the rates ranging from 3s. to 6s.

On the 1st of July 1908 the rates were revised. The limit of weight was increased to 11 lb., the rate for a parcel being 1s. 6d. for a parcel up to 3 lb. in weight, 2s. 6d. up to 7 lb., 3s. 6d. up to 9 lb and 4s. 6d. for 11 lb.

The decrease in the number of inland money orders till 1890–1891 was due to the competition of postal orders, and to the reduction (Jan. 1, 1878) of the charge for registering a letter from 4d. to 2d.

In 1862 the issue of orders for larger sums was allowed: not exceeding £7, 9d.; not exceeding £10, 1s.

On the 1st of May 1871 a scale of charges was fixed as follows: orders not exceeding 10s., 1d.; not exceeding £1, 2d.; not exceeding £2, 3d.; and so on, an additional penny being charged per £. For sums over £1, the rate was 1s. It was found, however, that the low rate of 1d. for small orders post no provision for a profit, and the rates were raised on the 1st of January 1878 to: orders not exceeding 10s., 2d.; not exceeding £2, 3d. On the 1st of September 1886 the rates for orders were introduced as follows: not exceeding £1, 2d.; not exceeding £2, 3d.; not exceeding £4, 4d.; not exceeding £7, 4d.; not exceeding £10, 6d. On the 1st of February 1897 new rates were introduced; orders not exceeding £3, 3d.; over £3 and not exceeding £10, 4d.

The cost of a money order transaction (at least 3d.) is very little affected by the amount of the remittance, and it was thought undesirable to continue the unremunerative business of sending small sums by money order at less than cost price at the expense of the senders of larger orders. The needs of smaller remitters appeared to be sufficiently met by postal orders and the registered letter post. It appeared, however, that the new charges fell with great severity upon mutual benefit societies, like the Hearts of Oak, which sent large numbers of small money orders every week, and on the 1st of May 1897 the ad. rate was restored for orders not exceeding £1. This society and others now use postal orders instead of money orders. In 1905 the limit for money orders was extended to £40, and the rates are: sums over £10 and not exceeding £20, 6d.; sums over £20 and not exceeding £30, 8d.; sums over £30 and not exceeding £50, 10d.

Money orders may be sent to almost any country in the world. The rates are as follows: for sums not exceeding £1, 3d.; £2, 6d.; £4, 9d.; £6, 1s.; £8, 1s. 3d.; £10, 1s. 6d.; and for countries on which orders may be issued for higher amounts (limit £40, 3d. for every additional £2 or fraction of £2). The money order system is largely used by the British government departments for the payment of pensions, separation allowances, remittance of bankruptcy dividends, &c.; and free orders may be obtained by the public, under certain conditions, for the purpose of remitting their taxes. The cost of management of the money order office was reduced by the substitution, since 1898, of a number of women clerks for men and boys.

On the 2nd of September 1889 the issue of telegraphic money orders between London and seventeen large towns was begun as an experiment, and on the 1st of March 1890 the system was extended to all head post offices, and branch offices in the United Kingdom. Two years later it was extended to every office which transacts both money order and telegraph business. The rates, which have been several times revised, are (1) a poundage at the ordinary rate for inland money orders; (2) a charge for the official telegraph of 1s. 3d. for every £5 of payment at the ordinary rate for inland telegrams, the minimum being 6d., and (3) a supplementary fee of 2d. for each order. The sender of a telegraphic money order may give instructions that, instead of being left at the post office to be called for, it should be delivered at the payee’s residence, and that it should be crossed

2 The total sums remitted did not fall off to the same extent, showing that the small orders alone were effected. The average amount for ordinary inland orders is now £2, 19s. 5d.

for payment through a bank. He may also, on paying for the extra words, send a short private message to his correspondent in the telegram of advice.

Telegraph money orders may also be sent to Algeria, Austria, Belgium, Bulgaria, Denmark, Egypt, Faeroe Islands, France, Germany, Holland, Hungary, Iceland, Italy, Luxembourg, Monaco, Norway, Rumania, Sweden and Switzerland. A fee of 2d. is required in addition to the usual money order commission and the cost of the telegram. The system is being rapidly extended to other countries.

The telegraph inland money orders in 1905-1906 amounted to 503,543, and the sums so remitted to £1,646,882, an average of £5, 15s. The number of telegraph money order transactions between the United Kingdom and foreign countries amounted to 18,787, representing £39,402.

Postal orders were first issued on the 1st of January 1881. For some years before that date postmasters-general had considered the possibility of issuing orders for fixed amounts at a small commission to replace money orders for sums under 20s., which had failed to be remunerative. When the plan was submitted to a committee appointed by the treasury, it was objected that postal orders as remitting media would be less secure than money orders. This was met in part by giving a discretionary power to fill in the name of the post office and also of the payee. Another objection which was urged, namely, that they would prove to be an issue of government small notes under another name, was quickly disproved. Parliament sanctioned the scheme in 1880. The first series were:—

In 1884, a new series was issued and a provision made that broken amounts might be made up by affixing postage stamps, to the value of 5d., to the orders. Postal orders have become increasingly popular as a means of remitting small amounts, especially since the introduction in 1903 of new denominations, rendering it possible to obtain a postal order for every complete sixpence from 6d. to 21s. From 6d. to 25. 6d. the poundage is 4d., from 3s. to 15s. 1d., from 15s. 6d. up to 21s., 1½d. Postal orders are also furnished with counterfoils, as a means of keeping a record of the number and amount of each order posted. Orders for amounts of 5s. and upwards are printed in red ink. A system of interchange of postal orders between the United Kingdom and India and the British colonies, and also between one colony and another, has been instituted. British postal orders are obtainable also at post offices in Panama, Constantinople, Salonica and Smyrna, and on H.M. ships. The following table shows the number and value of postal orders issued from the beginning to the 31st of March 1907 (ooo's omitted):

It remains to be added that the various statutes relating to the post office, except those relating to telegraphs and the carriage of mails, were consolidated by the Post Office Act 1908. The act repealed and superseded 26 acts wholly or in part in parts, Sections 1-11 deal with the duties of postage; §§ 12-19 with the conditions of transit of postal packets; §§ 20-27 with newspapers; §§ 27-25 with money orders; §§ 26-32 with ship letters; §§ 33-44 with the postmaster-general and officers; §§ 45-47 with the holding, &c., of land; §§ 48-49 with the extension of postal facilities and accommodation; §§ 50-69 with post office offees; §§ 70-78 with legal proceedings, and §§ 79-94 with regulations, definitions, &c.

The establishment of post office savings banks was practically suggested in the year 1860 by Charles William Sykes of Huddersfield, whose suggestion was cordially received by W. E. Gladstone, then chancellor of the exchequer, to whose conspicuous exertions in parliament the effectual working-out of the measure and also many and great improvements in its details are due. Half a century earlier (1807) it had been proposed to utilize the then existing and rudimentary money order branch of the post office for the collection and transmission of savings from all parts of the country to a central savings bank to be established in London. A bill to that effect was brought into the House of Commons by S. Whitbread, but it failed to receive adequate support, and was withdrawn. When Sykes revived the proposal of 1807 the number of savings banks managed by trustees was 638, but of these about 350 were open only for a few hours on a single day of the week. Only twenty throughout the kingdom were open daily. Twenty-four towns containing upwards of ten thousand inhabitants each were without any savings bank. Fourteen counties were without any. In the existing banks the average amount of a deposit was £4, 6s. 5d.

In 1881, the Post Office Bill, entitled "An Act to grant additional facilities for depositing small savings at interest, to secure the proper collection of the sums remitted by small orders for the purpose of Government by the due repayment thereof," became law on the 17th of May 1881, and was brought into operation on the 16th of September following. The banks first opened were in places theretofore unprovided. In February 1882 the act was brought into operation in Scotland and in Ireland. Within two years nearly all the money order offices of the United Kingdom became savings banks, and the expansion of the business was continual. The growth of business is shown in the following table:

The code of the 1st of November 1888 did not enlarge the limits of deposits or make any great and conspicuous change in the general system, but the postmaster-general obtained power to offer certain facilities for the transfer of money from one account to another, for the easier disposal of the funds of deceased depositors by means of nominations, and in various ways to perfect the convenience of the depositors. Arrangements were made for reducing to 1s. the cost of certificates of births, deaths and marriages required for savings bank purposes. In July 1880 Local Loans 3% Stock was made available for purchase through the post office savings bank.

"In July 1891," says the report of the postmaster-general in 1897, "another Act of Parliament was passed by which the maximum amount which might be deposited was raised from £150 to £200, inclusive of interest. The annual limit remained at £30, but it was provided that, irrespective of that limit, depositors might place in the bank the amount of any one withdrawal in the same year. The object of this provision was to avoid curtailing the saving power of a person who might be driven by emergency to make an inroad upon his store, but who might nevertheless, when the emergency had passed, find himself none the poorer and able to replace the money withdrawn.

The act provided also that where on any account the principal and interest together exceeded £200, interest should cease only on the amount in excess of £200, whereas previously interest ceased altogether when it had brought the balance of an account up to £200.

The next striking development of the Savings Bank arose out of the Free Education Act, passed in September 1891. The

For a succinct account of the history of the post office savings banks, see "So far as deposits and the general public are concerned," see Forty-third Report of Postmaster-General (1897), pp. 32 seq.
government of the day desired that advantage should be taken of the opportunity to inculcate upon parents and children alike a saving habit that they should save for education. It was thought they were no longer bound to pay. The Education Department and the postmaster-general worked in concert to realize this end. Some means were necessary to press the aim upon all concerned, special stamp slips were prepared and issued, money was supplied on credit with stocks of stamps to be sold to the children, and clerks from the nearest post offices attended at schools to open accounts. This may have exceeded the limits of thrift for 1892; about 1400 schools adopted the scheme at once, and three years later this number had risen to 3000. A sum of nearly £4,000 was estimated to have been deposited in schools in 5 months, and about £60,000 in the first year. Competition with the stamp-slip system in the schools, the extension of School Penny Banks, connected intimately with the Savings Bank, was a conspicuous result of the effort to turn into profitable channels the pennies which no longer passed for school fees. "In December 1895 another Act of Parliament extended the annual limits of deposits from £50 to £50. The maximum of £200 remained unchanged, but it was put in as a warning that some accumulations accruing after that amount had been reached should be invested in government stock unless the depositor gave instructions to the contrary." In December 1895 arrangements were made for the use of the telegraph for the withdrawal of money from the savings bank. Postmasters-general had hesitated long before sanctioning this new departure. It was known that the system was in force abroad, and in this country there were many cases in the United Kingdom where the possibility of withdrawing money without delay might be all-important, and might save a depositor. On the other hand, it was strongly held that the cause of thrift would be sometimes served by interposing a delay between a sudden desire to spend and its realization; and it was also held to be essential to maintain a marked distinction between the bank of deposit for savings and a bank for keeping current accounts.

On the whole, the balance of opinion was in favour of the change, and two new methods of withdrawal were provided. A depositor might telegraph for his money and have his warrant sent to him by return of post, or he might telegraph for his money and have it paid to him in an hour or two on the authority of a telegram from the savings bank to the postmaster. The first method cost the depositor about 9d., the second cost him about 1s. 3d. for the transaction. On the 3rd of July 1905 a new system of withdrawal was instituted, under which a depositor, on presentation of his book at any post office open for savings bank business, can withdraw immediately any sum not exceeding £1. Depositors have availed themselves extensively of this system. During 1906, 4,758,440 withdrawals, considerably more than one-half of the total number of withdrawals, were made "on demand," and as a consequence the number of withdrawals made by telegraph fell to 122,802, against 168,360 in the previous year (during only half of which the "on demand" system was in force).

By an act which came into force on the 1st of January 1895, building societies, which, being incorporated, were entitled to deposit at any one time a sum not exceeding £500, and to buy government stock up to £500 through the savings bank.

**Savings Bank Finance.**—The increase in the deposits lodged in the post office savings bank must be ascribed to a variety of causes. Numbers of trustee banks have been closed, and have transferred their accounts to the post office bank; greater facilities have been offered by the bank: the limits of deposit in one year, and of total deposit, have been raised; and, since October 1892, deposits may be made by cheque; while the long-continued rise in the rate of interest made the assured 2½% of the post office savings bank an increasing temptation to a class of investors previously accustomed to look elsewhere. The high price of consols, due in part to the magnitude of purchases on savings bank account, proved a serious embarrassment to the profitable working of the bank, which had shown a balance of earnings on each year's working until 1896, after paying its expenses and 2½% interest to its depositors, had been reduced by a war which affected 1896 and 1897, and the difficulty. The average cost of each transaction, originally nearly 7d., has been brought down to 5d. Down to the year 1896, £1,988,676 was paid into the exchequer under § 14 of the Act of 1892, c. 13, being the excess of interest which was paid above 2½% per year by year. But since 1895 there have been deficits in each year, and in 1905, owing principally to the reduced rate on consols, the expenditure exceeded the income by £88,094.

The central savings bank having outgrown its accommodation in Queen Victoria Street, London, a new site was purchased in 1898 for £45,000 at West Kensington, and the foundation-stone of a new building, costing £300,000, was laid by the prince of Wales on the 24th of June 1899. The entire removal of the business was carried out in 1903.

Under the Workmen's Compensation Act of 1897, sums awarded as compensation might be invested in the post office savings bank. This arrangement proved so convenient that an act of 1901 authorized a similar investment of money paid into an English county court in ordinary actions at common law, and ordered to be invested for the benefit of an infant or lunatic. In 1906 a committee was appointed to go into the question as to whether the post office should provide facilities for the insurance of employers in respect of liabilities under the Workmen's Compensation Acts, but no scheme was recommended involving post office action either as principal or agent.

Post offices, however, exhibit notices drawing attention to the liabilities imposed by the act of 1906, and sub-postmasters are encouraged to accept agencies in their private capacity for insurance companies undertaking this class of insurance.

**Inducements to Thrift.**—By arrangement with the war office in July 1893, the deferred pay of soldiers leaving the army was invested in their behalf in the post office savings bank, but it was found that the scheme was not economical; the scheme was discontinued in 1901. At the request of large employers of labour, an officer of the savings bank attends at industrial establishments on days when wages are paid, and large numbers of men have thus been induced to become depositors. The advantages of the savings bank appear to be now thoroughly appreciated throughout the United Kingdom, as shown by the following table.
Women and children of all ranks are believed to be 60-59 of the total number of depositors.

The accounts open at the end of 1895 showed the following division of deposits:

<table>
<thead>
<tr>
<th>Per cent.</th>
<th>Balances not exceeding £50</th>
<th>Exceeding £50 and not exceeding £100</th>

The division according to number of accounts, in the same groups, was 90-8, 5-3, 2-2, 1-3 and 0-4 respectively.

Investments in Government Stock.—In September 1888 the minimum amount of government stock which might be purchased or sold through the post office savings bank was reduced from £10 to £1, and it was also provided that any person who had purchased stock through the savings bank could, if he so desired, have it transferred to his own name in the books of the Bank of England. The act of 1893 raised the limit of stock to £200 in one year, and £500 in all; but any depositor might purchase stock, to replace stock previously sold, in one entire sum during that year. If a depositor exceeds the authorized limits of deposit in the post office savings bank, the excess is invested in stock by the post office on his behalf. The investments of depositors in government stock, however, have a tendency to decrease, and the sales, on the other hand, to increase, as will be seen from the following table:

Annuites and Life Insurances.—The act of 1882, which came into operation on the 3rd of June 1883, utilized the machinery of the post office savings bank for annuities and life insurances, which had been effected through the post office at selected towns in England and Wales since the 17th of April 1865. Under the act of 1882 all payments were to be made by means of money deposited in the savings bank, and an order could be given by a depositor that any sum—even to 1d. a week—should be devoted to the purchase of an annuity or insurance so long as he retained a balance in the savings bank. In February 1896 new life insurance tables came into operation, with reduced annual rates, and with provision for payment of sums insured at various ages as desired. The following table shows the business done from 1901 to 1905:

The limit of letters in one word of plain language was raised from 10 to 15, and the number of figures from 3 to 5. The International Telegraph Bureau was also ordered to compile an enlarged official vocabulary of code words, which it is proposed to recognize as the sole authority for words which may be used in cypher telegrams sent by the public. (See Appendix to Postmaster-General's Report, 1897.) See further Telegraph.

Ten years of state administration of the telegraphs had not passed before the postmaster-general was threatened with a formidable rival in the form of the telephone, which assumed a practical shape about the year 1878, the first exchange in the United Kingdom being established in 1882.
the City of London in that year. The history of the telephone service and the growth of the industry are set out in the article Telephone.

POST OFFICE STAFF

The staff of the post office on the 31st of March 1906 amounted to 105,432. Of these 41,681 were women, a proportion of over one-fifth of the staff. The postmasters numbered 875 (including 10 employed abroad), and the sub-postmasters 21,027.

The total number of offices (including branch offices) was 22,088. The unestablished staff, not entitled to pension, made up chiefly of telegraph boys, and of persons who were employed only for part of the day on post office business, included 87,753 out of the grand total, and almost the whole of the sub-postmasters. The pay and prospects of almost all classes have been greatly improved since 1884, when the number stood at 91,814.

The principal schemes of general revision of pay have been: 1881, Fawcett’s scheme for sorting-clerks, sorters and telegraphists; 1885, additional cost £110,000 a year; and for postmasters 1888, £170,000; Raikes’s various revisions, 1888, chief clerks and supervising officers, £6210; 1890, sorting-clerks, sorters and telegraphists, £170,600; 1890, supervising force, £65,000; 1890, London sorters, £20,700; 1891, London overseers, £2400; 1891, postmen, £125,650; Arnold Morley, 1884, London overseers, £1400, and rural auxiliaries, £20,000.

A committee was appointed in June 1895 with Lord Tweedmouth as chairman, to consider the pay and position of the post office staff, excluding the clerical force and those employed at head-quarters. The committee reported on the 15th of December 1896 and its recommendations were adopted at an immediate increased expense of £15,000 a year, which has since risen to £50,000. In 1897 additional concessions were made at a cost of £40,000 a year.

In July 1890 a number of postmen in London went out on strike. Only 500 were dismissed in one morning, and the work of the post office was carried on without interruption. The men received no sympathy from the public, and most of them were ultimately successful in their plea to be reinstated. A quasi-political agitation was carried on during the general election of 1892 by some of the London sorters, who, under the plea of civil rights, claimed the right to influence candidates for parliament by exacting pledges for the promise of parliamentary support. The leaders were dismissed, and the post office has upheld the principle that its officers are to hold themselves free to serve either party in the State without putting themselves prominently forward as political partisans of Parliament has been repeatedly asked to sanction a parliamentary inquiry to reopen the settlement of the Tweedmouth Committee, and the telegraphists have been especially active in pressing for a further committee.

The rates of pay at various dates since 1881 are set out with great fullness in the Parliamentary Papers (Postmen, No. 237 of 1897; Sorters, Telegraphists, &c., No. 250 of 1898, and Report of the Select Committee on Post Office Servants, 1907; this latter contains important recommendations for the removal of many grievances which the staff had been long agitating to have removed).

In November 1891 an important change was made in the method of recruiting postmen, with the object of encouraging military service, and providing situations for those who after serving in the army or navy are left without employment at a comparatively early age. In making appointments to the situation of postman, preference was given to army, navy and royal marine pensioners, and men of the army reserve. Due regard was paid to the legitimate claims of telegraph messengers or other persons who had prospects of succeeding to these situations. In August 1897 the government decided to reserve one-half of all suitable vacancies for ex-soldiers and sailors, as postmen, porters and labourers, and preference has been shown to them for employment as lift-attendants, care-takers, &c.

Finance.—The following table shows the financial working of the post office:

The Postage Stamps

For all practical purposes the history of postage stamps begins in the United Kingdom. A post-paid envelope was in common use in Paris in the year 1853. Stamped postal letter-paper (carta postale bollata) was issued to the public by the government of the Sardinian States in November 1818, and stamped postal envelopes were issued by the same government from 1820 until 1836. Stamped wrappers for newspapers were made experimentally in London by Charles Whiting, under the name of "go-frees," in 1830. Four years later (June 1834), and in ignorance of what Whiting had already done, Charles Knight, the well-known publisher, in a letter addressed to Lord Althorp, then chancellor of the exchequer, recommended similar wrappers for newspapers. From this suggestion apparently Rowland Hill, who is justly regarded as the originator of postage stamps, got his idea. Meanwhile, however, the adhesive stamp was made experimentally by James Chalmers in his printing-office at Dundee in August 1834. These experimental stamps were printed from ordinary type, and were made adhesive by a wash of gum. Chalmers had already won local distinction by his successful efforts in 1822, for the acceleration of the Scottish mails from London. Those efforts resulted in a saving of forty-eight hours on the double mail journey, and were highly approved in Scotland and in the provinces.

Rowland Hill brought the adhesive stamp under the notice of the commissioners of post office inquiry on the 13th of February 1837. Chalmers made no public mention of his stamp of 1834 until November 1837.

Rowland Hill’s pamphlet led to the appointment of a committee of the House of Commons on the 22nd of November 1837, "to inquire into the rates and modes of charging postage, with a view to such a reduction thereof as may be made without injury to the revenue." This committee reported in favour of Hill’s proposals; and an act was passed in 1839, authorizing the treasury to fix the rates of postage, and regulate the mode of their collection, whether by postpayment or otherwise. A premium of £200 was offered for the best, and £100 for the next best, proposal for bringing stamps into use, having regard to

---

2 Patrick Chalmers, Sir Rowland Hill and James Chalmers, Inventor of the Adhesive Stamp (London, 1882), passim. See also the same writer’s pamphlet, entitled The Position of Sir Rowland Hill made plain (1883), and his The Adhesive Stamp, a Fresh Chapter in the History of Post-Office Reform (1881). Compare Pearson Hill’s tract, A Paper on Postage Stamps, in reply to Chalmers, reprinted from the Philatelic Record of November 1881. Pearson Hill has therein shown conclusively the priority of publication by Sir Rowland Hill. He has also given proof of James Chalmers’s express acknowledgment of that priority. But he has not weakened the evidence of the priority of invention by Chalmers.
The canton of Zürich was the first foreign state to adopt postage stamps, and the first to introduce the practice of perforating the stamps, being introduced by the government of Brazil. That of the United States did not adopt them until 1847; but a tentative issue was made by the post office of New York in 1845. An adhesive stamp was also issued at St. Louis in the same year, and in Rhode Island in the next. In Europe the Swiss cantons of Geneva (1844) and of Basel (1845) soon followed the example set by Zürich. In the Russian Empire the use of postage stamps became general in 1848 (postage stamps were first used in the Bank of Finland). France issued them in 1849. The same year witnessed their introduction into Tuscany, Belgium and Bavaria, and also into New South Wales. In South America, Brazil, Argentina, Uruguay, Paraguay, and Chile issued stamps in 1850. The use of postage stamps seems to have extended to the Hawaiian Islands (1857) a year before it reached the Dutch Netherlands (1852). Within twenty-five years of the first issue of a postage stamp in London, the known varieties, issued in all parts of the world, amounted to 1391. Of these 841 were of European origin, 333 were American, 59 Asiatic, 55 African. The varieties of stamp issued in the several countries of Oceania were 107, and those of South America, 105. The postage stamps still in circulation in 1865, leaving 580 still in currency.

ENGLISH ISSUES

(I.) Line-engraved Stamps.

Halfpenny Stamp.—First issue, October 1, 1870: size 18 mm. by 14 mm.; lake-red varying to rose-red.

One Penny Stamp.—First issue, 1st (for 6th) May 1840: the head of a young King George III, drawing by Henry Corbould of William Wyon's medal struck to commemorate her majesty's visit to the City of London on the 9th of November 1837: size 22.3 mm. by 18.1 mm.; black, watermarked with a small crown; a few sheets in 1841 struck in red, two essays were made in April and October 1840 in blue and blue-back; imperforate. The second issue, January 20, 1841, differed only from the first issue as to colour—red instead of black; it is stated i that the colour, "though always officially referred to as 'red,' was really of a rose-red, and this may be regarded as the natural colour; but considerable variations in tone and shade (brick-red, orange-red, lake-red) and more or less red-brown have been observed by me, especially of the paper, though primarily due to a want of uniformity in the method employed for preparing the ink." The change of colour from black was made in order to render the obliteration line in black instead of red ink) more distinct; imperforate. The third issue, February 1854: small crown watermark; perforated 16 (i.e. 16 holes to 2 centimetres). The fourth issue, January 1855, differed only from the third issue in being perforated 14. Fifth issue, February 1855: a new head of William IV, with minute variations of engraving. In the second die the eyebrow is more distinctly shaded, the nostril more curved, and the band round the hair has a thicker dark line in the middle forming an edge. Small crown watermark; perforated 16 and 14. Sixth issue, July 1860: large crown watermark; perforated 14; a certain number 16. Seventh issue, January, 1858: carmine rose varying from pale to very deep. Large crown watermark; perforated, chiefly 14. Eighth issue, April 1, 1864: checkletters in all four corners instead of two only; large crown watermark; perforated 14.

In 1880 the line-engraved one penny stamps were superseded by the surface-printed one of similar value in venetian red, designed and engraved by Messrs Archer & Co. i Three-halfpenny Stamp.—October 1, 1870: large crown watermark; lake-red; perforated 14. Superseded in October 1880 by De la Rue's surface-printed stamp.

Two-penny Stamp.—First issue, 1st (for 6th) May 1840: small crown watermark; light blue, dark blue; imperforate. Second issue, March 1841: small crown watermark; white line below "Post Office," and above "Two" dull to dark blue; imperforate. Third issue, February (?), 1857: large crown watermark; blue, dark blue; perforated 16. Fourth issue, March 1855: small crown watermark; blue, dark blue; perforated 14. Fifth issue, 1858: large crown watermark; blue, dark blue; perforated 16; blue, dark blue; perforated 14. Sixth issue, May (?), 1857: large crown watermark; white lines thinner, blue, dark blue; perforated 14; dark blue; perforated 16. Seventh issue, July 1858: large crown watermark; white lines as in fifth issue; deep to very deep blue, violet blue; perforated 14. Superseded in December 1880 by De la Rue's surface-printed stamp.

(ii.) Embossed Stamps.

Produced by Dryden Brothers, of Lambeth, from designs submitted by Mr. Ormond Hill of Somerset House, engraved after Wyon's medal.

First issue, March 1, 1854: violet, reddish lilac, dark violet; imperforate. Superseded in October 1856 by De la Rue's surface-printed stamp.

Tentpence—November 6, 1848: pale to very deep chestnutbrown; imperforate. Superseded in November 1856 by De la Rue's surface-printed stamp.

(iii.) Surface-printed Stamps before 1880.

Twopence.—All perforated 14. First issue, May 1, 1862: heraldic emblems watermark; carmine (pale to deep). Second issue, March 1, 1865: same watermark as above; carmine-pink. Third issue, July 1867: watermarked with a spray of rose; carmine-pink, carmine-rose. Fourth issue, July 1873: watermark as third issue; carmine-rose. Fifth issue, January 1, 1881: watermark large crowned rose; imperforate. Sixth issue, November 1881: large crowned pink, as fifth issue; purple shades overprinted with value in deep pink.

Sixpence.—All perforated 14. First issue, October 21, 1858; no letters in angles; watermark heraldic emblems; dull lilac. Second issue, December 1, 1862: small white letters in angles; otherwise as first issue. Third issue, April 1865: large white letters in angles; otherwise as first issue. Fourth issue, November 1, 1865: large crown watermark spray of rose; otherwise as third issue; some in bright lilac. Fifth issue, March 1860; as fourth issue; lilac, deep lilac, purple-lilac. Sixth issue, January 1, 1863: as fourth issue; bright chestnutbrown. Seventh issue, October 1872: as fourth issue; buff. Eighth issue, April 1873: as fourth issue; greenish grey. Ninth issue, April 1, 1874; watermarked as fourth issue; large coloured letters in angles; greenish grey. Tenth issue, January 1, 1883: as fourth issue; as new watermark; as new as ninth issue. Eleventh issue, January 1, 1883: as tenth issue; purple, overprinted with value in deep pink.

Eightpence.—September 11, 1876: watermark large garter; chrome-yellow, pale yellow; perforated 14.

Ninelpence.—All perforated 14. First issue, January 15, 1862: watermark heraldic emblems; ochre-brown, bright bistre. Second issue, November 1, 1865: watermark same as above; corn, straw. Third issue, October 1873: watermark spray of rose; straw.

Tenpence.—July 1, 1867: watermark spray of rose; red-brown; perforated 14.
POST, AND POSTAL SERVICE

One Shilling.—All perforated 14. First issue, November 1, 1856: watermark heraldic emblems; no letters in angles; dull green, pale to dark green. Second issue, December 1, 1862: as above, but larger letters in angles; pale to dark green. Third issue, February 1865: as above; large white letters in angles; pale to dark green, bluish green. Fourth issue, August 1867: watermark spray of rose; otherwise as third issue; pale to dark green, bluish green. Fifth issue, September 1869: as above; otherwise as fourth issue; light to dark green, bluish green. Sixth issue, October 14, 1880: as fifth issue; pale red-brown. Seventh issue, June 15, 1881: watermark large crown; otherwise as sixth issue; pale red-brown.

Two Shillings.—Watermark spray of rose; perforated 14. First issue, July 1, 1867: pale to full blue, very deep blue. Second issue, February 1868: light brown. Third issue, August 1876: vermilion; replaced the line-engraved stamps of the same value, and a new surface-printed stamp of fivepence was introduced. These stamps are distinguished by the absence of plate-numbers and (except in the case of check-keys in the corners) also by the coarser style of engraving necessary for printing by machines driven by steam-power.

One Halfpenny.—First issue, October 14, 1860: large crown watermark; pale green, bluish green, dark green; perforated 14. Second issue, April 1, 1884: slate-blue. One Penny.—January 1, 1880: large crown watermark; venetian red; perforated 14.

Three-halfpence.—October 14, 1880: large crown watermark; venetian red; perforated 14.

Two pence.—December 8, 1880: large crown watermark; pale to very deep carmine red; perforated 14.

Five pence.—March 15, 1881: large crown watermark; dark dull indigo, indigo-black; perforated 14.

The Customs and Inland Revenue Act which came into force on June 1, 1881, made it unnecessary to provide separate penny stamps for postal and fiscal purposes. By an act of 1882 (45 & 46 Vict. c. 72) it became unnecessary to provide separate stamps for postal and fiscal purposes up to and including stamps of the value of 2s. 6d. A new series was therefore issued:

One Penny.—All perforated 14. First issue, July 12, 1881: large crown watermark; 14 pears in each angle; purple-lilac, purple. Second issue, December 12, 1881: as first issue; 16 pears in each angle; purple.

Three-halfpence.—April 1, 1884: large crown watermark; purple; perforated 14.

Two pence.—Ditto.

Two and a halfpenny.—Ditto.

Three pence.—Ditto.

Four pence.—Ditto.

Five pence.—Ditto.

Six pence.—Ditto.

Ten pence.—Ditto.

Two Shillings and Sixpence.—July 22, 1883: watermark large anchor; purple, dull lilac, dark purple; perforated 14.

Five Shillings.—April 1, 1884: ditto; pale to very deep carmine. Two shillings and sixpence; replaced the two shillings-sixpence; perforated 14.

One Pound.—First issue, April 1, 1884: large crown watermark, 3 appearing in each stamp; brown-violet; perforated 14. Second issue, January 27, 1891: same watermark; bright green; perforated 14.

Five Pounds.—March 21, 1882: large anchor watermark; orange-vermilion, vermilion, bright vermilion; perforated 14.

Following upon the report of a committee of officials of the General Post Office, and in response to the request of various telegraphs, a series of new stamps, commonly known as the “Jubilee” issue, was introduced on January 1, 1887, all of which between one halfpenny and one shilling contained either in two colours or on a coloured paper, so that each stamp was printed in part in one or other of the doubly fugitive inks—green and purple.

One Halfpenny.—January 1, 1887: large crown watermark; orange-vermilion; orange-vermilion; replaced the one penny; perforated 14.

Three-halfpence.—January 1, 1887: yellow paper; watermarked with a large crown; purple; perforated 14.

Four pence.—January 1, 1887: watermark and perforation as in the three pence; green and brown.

Four pence-halfpenny.—September 15, 1892: as the fourpence; green and carmine.

Five pence.—January 1, 1887: as the fourpence; purple and blue.

Sixpence.—January 1, 1887: pale red paper; watermarked with a large crown; purple; perforated 14.

Nineteen pence.—January 1, 1887: large crown watermark; purple and blue; perforated 14.

Ten pence.—February 24, 1890: as the ninetypence; purple and carmine-red.

One Shilling.—January 1, 1887: as the ninetypence; green.

The various fiscal stamps admitted to postage uses, the overprinted official stamps for use by government departments, and the stamps specially surcharged for use in the Ottoman Empire, do not call for detailed notice in this article.

The distinctive telegraph stamps are as follows:

One Halfpenny.—April 1, 1880: shamrock watermark; orange vermilion; perforated 14.

One Penny.—February 1, 1876: as the halfpenny; reddish brown.

Three pence.—Perforated 14. First issue, February 1, 1876: watermark spray of rose; carmine. Second issue, August 1881: watermark large crown; carmine.

Four pence.—March 15, 1877: watermark large garter; pale sage-green; perforated 14.

Five Shillings.—First issue, February 1, 1876: watermark cross path; dark to light rose; perforated 15 by 15.

One Pound.—March 1, 1877: watermark shamrock; brown-purple; perforated 14.

Five Pounds.—March 1, 1877: watermark shamrock; orange-vermilion; perforated 15 by 15.

BRITISH COLONIES AND DEPENDENCIES

Australia Commonwealth.—In 1905 there were 6654 post offices open; 113,405,720 letters and cards, 171,844,868 newspapers, book-packets and circulars, 2,168,810 parcels, and 13,980,239 telegrams were received and despatched; the revenue was £5,738,146 and the expenditure £2,717,035.

New Zealand.—In 1905 there were 1937 post offices open; 74,767,288 letters and cards, 47,334,363 newspapers, book-packets and circulars, 392,017 parcels, and 5,640,219 telegrams were dealt with. The revenue from the post office was £410,658, and from telegraphs £273,011, while the expenditure on the post office was £392,146 and on telegraphs £276,581.

Dominion of Canada.—In 1905 there were 16,879 post offices open; 33,792,500 letters and cards, 60,405,000 newspapers, book-packets and circulars, and 58,338 parcels were received and despatched. The revenue from the post office amounted to £1,053,548, and from telegraphs £28,727, while the expenditure was, on the post office £92,562 and on telegraphs £75,934.

Cape of Good Hope.—The number of post offices open in 1905 was 1043; 7,506,600 letters and cards, 3,706,666 newspapers, book-packets and circulars, 536,800 parcels, and 6,045,228 telegrams were dealt with. The revenue from the post office was £242,056, and from telegraphs £206,842 the expenditure being £45,171 on the post office and £27,863 on telegraphs.

British India.—In 1905 there were 16,923 post offices open; 597,706,867 letters and cards, 76,751,977 newspapers, book-packets and circulars, 4,541,367 parcels, and 9,068,345 telegrams were dealt with. The revenue from the post office was £1,566,704 and from telegraphs £7,433,193, while the expenditure was, on the post office, £1,199,557 and on telegraphs £546,914.
FRANCE

The French postal system was founded by Louis XI. (June 19, 1462), was largely extended by Charles IX. (1565), and received considerable improvements at various periods under the respective governments of Henry IV. and Louis XIII. (1603, 1622, 1627 seq.).

In 1627 France originated a postal money-transmission system, a system of cheap registration for letters. The postmaster who thus anticipated modern improvements was Pierre d’Alméras, a man of high birth, who gave about £20,000 (of modern money) for the privilege of serving the public. The turmoil of the Fronde wrecked much that he had achieved. The first farm of postal income was made in 1672, and by farmers it was administered. The postmastership for a long time was not only sold but made hereditary. Many administrative improvements of detail were introduced, indeed, by Mazarin (1643), by Louvois (c. 1680 seq.), and by Cardinal de Fleury (1728); but many formidable abuses also continued. The revolutionary government transferred rather than removed them. Characteristically, it put a board of postmasters in a room of a farming postmaster-general and a controlling one. Napoleon (during the consulate) abolished the board, recommitted the business to a postmaster-general as it had been under Louis XIII., and greatly improved the details of the service. Napoleon’s organization of 1802 is, in substance, that which now obtains, although, of course, large modifications and developments have been made from time to time.

The university of Paris, as early as the 13th century, possessed a special postal system, for the abolition of which in the 18th it received a large compensation. But it continued to possess certain minor postal privileges until the Revolution.

Mazarin’s edict of the 3rd of December 1643 shows that France at that date had a parcel post as well as a letter post. That edict creates for each head post office throughout the kingdom three several officers styled respectively (1) comptroller, (2) weigher, (3) assessor; and, instead of remunerating them by salary, it directs them, first, to carrying on the existing letter rate and parcel rate, and the division of the surcharge between the three.

Fleury’s edicts of 1728 make sub-postmasters directly responsible for the loss of letters or parcels; they also make it necessary that senders should post their letters at an office, and not give them to the carriers, and regulate the book-post by directing that book parcels (whether MS. or printed) should be open at the ends.

In 1758, almost eighty years after Dockwra’s establishment of a penny post in London, an historian of that city published an account of it, which in Paris came under the eye of Claude Piarron de Chamouset, who obtained letters-potent to carry letters without the setting profit for himself, issued a tract with the title, Mémoire sur l’établissement à Londres, sur la modéle de laquelle on pourrait en établir de semblables dans les plus grandes villes d’Europe. The reform was successfully carried out.

By this time the general post office of France was producing a considerable and growing revenue. In 1676 the farmers had paid to the king £48,000 in the money of that day. A century later they paid a fixed rent of £353,000, and covenanted to pay in addition one-fifth of their net profits. In 1788—the date of the last letting to farm of the postal revenue—the fixed and the variable payments were commuted for one settled sum of £480,000 a year. The result of the devastations of the Revolution and of the wars of the empire together is shown strikingly by the fact that in 1814 the gross income of the post office was but little more than three-fifths of the net income in 1788. Six years of the peaceful government of Louis XVIII. raised the gross annual revenue to £528,000. On the revolution of 1830 it reached £1,348,000. Towards the close of the next reign the post office yielded £2,100,000 (gross). Under the revolutionary government of 1848-1849 it declined again (falling in 1850 to £1,744,000; under that of Napoleon III. it rose steadily and uniformly with every year. In 1858 the gross revenue was £2,296,000, in 1868 £3,596,000.

The ingenuity of the French postal authorities was severely tried by the exigencies of the German War of 1870–71. The first contrivance was to organize a pigeon service (see Pigeon and Balloon Posts). The application of photography was prepared by the aid of photographic appliances. The number of postal pigeons employed was 363, of which number fifty-seven returned with despatches. During the height of the war, the Exchequer of the Empire, by a regulation of the Empire, purchased the government postal service by pigeon post into Paris by way of Tours, subject to the regulations that no information concerning the war was given, that the number of words did not exceed twenty, that they should be sent by weight and that the delivery time was one day. The special transmission fee of 6l. was prepaid as postage. At this rate the postage of the four letters on each folio was 2s., on the eighteen pellicles of sixdes, in each carried by one pigeon for £1,520. Each despatch was repeated until its arrival had been acknowledged by balloon post; consequently many were sent off twenty and even more than thirty times. The second step was to establish a French postal service for the passage of post to the most distant part of the empire and an extension of the telegraph. The third was to establish a French postal service for the passage of post to the most distant part of the empire and an extension of the telegraph. The fourth was to establish a French postal service for the passage of post to the most distant part of the empire and an extension of the telegraph. The fifth was to establish a French postal service for the passage of post to the most distant part of the empire and an extension of the telegraph. The sixth was to establish a French postal service for the passage of post to the most distant part of the empire and an extension of the telegraph.

M. Durnoufobelongs much of the honour of making the balloon service successful. On the basis of experiments carried out by him a decree of the 26th of September 1878 regulated the postal system. Out of the four several ascents, each costing on the average about £200, fifty-seven achieved their purpose, notwithstanding the building by Krupp of twenty guns, supplied with telescopic apparatus, for the destruction of the postal balloons. Only five were captured, and two others were lost at sea. The aggregate weight of the letters and newspapers thus mailed by the French post office amounted to about eight tons and a half, including upwards of 10,000 letters of the airmail service; and upwards of 30,000 letters were also sent by aeronauts in other ways. All the despatches were conveyed. The heroism displayed by the French balloon postmen was equaled by that of many of the ordinary letters sent by the convention post authorized to call on postmen and carriers of the French postal service, who, at the peril of their lives, made frequent journeys to the various places where the Anglo-Indian mails were abandoned. They were sent through Belgium and Germany, by the Brenner Pass to Brindisi, and thence by Italian packets to Alexandria. The French route was resumed in 1872.

1 The despatches carried by the pigeons were in the first instance photographed on a reduced scale on thin sheets of paper, the original was then preserved, and a copy inserted in a pigeon. The pigeon leaving the city an improved system was organized. The communications, whether public despatches, newspapers or private letters, were printed in ordinary type, and micro-photographed on to films of collection. Each pellicle measured less than 2 in. by 1, and the reproduction of sixteen folio pages of type contained above 3000 private letters. These pellicles were so light that 50,000 despatches, weighing less than 1 gramme, were regarded as the weight for one pigeon. In order to ensure their safety during transit the films were rolled up tightly and placed in a small quill which was attached longitudinally to one of the tail feathers of the bird. On their arrival in Paris they were flattened out and the means of addressing the despatch sent to a secreted letter for clerks, and despatched to their destination. This method was afterwards improved upon, sensitive paper being substituted for the films, and an apparatus by which the most delicate despatches were transmitted.  

17 Seventeenth Report of the Postmaster-General, p. 7.  
POST, AND POSTAL SERVICE

The comparative postal statistics for all France during the years 1900 and 1905 stands thus:

The savings banks system of France, so far as it is connected with the postal service, dates only from 1875, and began then (at first) simply by the use of post offices as agencies and feeders for the pre-existing banks. Prior to the postal connection the aggregate of the deposits stood at £22,920,000. In 1877 it reached £32,000,000. Postal savings banks, strictly so called, began only during the year 1881. At the close of 1882 they had 210,712 depositors, with an aggregate deposit of £1,872,938 sterling; in 1905 they had 12,134,524 depositors, with an aggregate deposit of £229,094,145.

The union of the telegraph with the post office dates only from 1878. The following table gives the figures for 1900 and 1905:

AUSTRIA-HUNGARY

The Austrian postal system is among the oldest on record. Vienna possessed a local letter-post and a parcel post, on the plan of prepayment, as early as May 1772, at which date no city in Germany possessed the like. This local post was established by a Frenchman (M. Hardy) and managed by a Dutchman (Schlooten). Thirteen years after its organization it became merged in the imperial post. The separate postal organizations of the empire (Austria) and of the kingdom (Hungary) date from 1857. In Austria the post office and the telegraph office are

1 Loeper, "Organisation des postes de ville," in L’Union postale viii. 1 seq.
2 The International Postal Union was founded at Berne in 1874. All the countries of the world belong to it, with the exception of Afghanistan, Baluchistan, China, Abyssinia and Morocco. Conferences have been held at Paris (1875), Lisbon (1885), Vienna (1891), Washington (1897) and Rome (1906).
The revenue quoted does not include any allowance for the larger quantity of official matter carried for other public departments &c. Indeed, the postmaster-generals postage charges for 1906, estimated that if the due allowance were made it would add approximately $20,000,000 to the revenue. The post-office department is compelled to carry anything sent under a penalty frank, and franks are used by all the departments and their agents for the purpose of carrying everything they choose to send (Report, postmaster-general, 1893). The expenditure does not include the amounts certified to the Treasury for the transportation of mails over aided Pacific railways, or any allowance for the use of such buildings as are provided by the government.

Complaints to expectations repeatedly expressed, each year shows a deficit. This is partly explained by reductions in charges. The rate of postage on first-class matter was reduced from three cents to two cents on the 1st of October 1883, and the unit of weight was increased, from half an ounce to one ounce on the 1st of July 1885. On the latter date, also, the postage on second-class matter was reduced from two cents to one cent per pound. This low rate has led to wholesale violation of the purpose of the law. In his report for 1890 Mr. Ewing Smith, postmaster-general, estimated that "fully one-half of all the matter mailed as second-class, and paid for at the post rate, is not properly second-class within the intent of the law." and that the cost of mere transportation of this class of matter has exceeded the revenue derived from it by more than $12,000,000 for the year.

Until 1863 the rates of postage were based upon the distances over which the mails were conveyed. In 1846 these rates were—no exceeding 300 m., three cents; exceeding 300 m., ten cents. In 1851 the rates were reduced to three cents for distances not exceeding 3000 m. and ten cents for distances exceeding 3000 m. The use of adhesive postage stamps was first authorized by act of Congress, approved on the 3rd of March 1847, and on the 1st of June 1856 prepayment by stamps was made compulsory. In 1853 a uniform rate of postage without regard to distance was fixed at three cents, and on the 1st of July 1869 the rate was further reduced to two cents, the equivalent of the British postage stamp.

All mail matter for distribution within the United States is divided into four classes. First-class matter includes letters, postal cards, post cards and anything sealed or closed against inspection. Second-class matter includes all newspapers and periodicals exclusively in print that have been entered as second-class matter, and regularly issued at stated intervals as frequently as four times a year from a known office of publication and mailed by publishers or newspapers to actual subscribers or to newspapers for sale, and newspapers and periodicals of this class by publishers or publishers instead of than publishers. The rates of postage to publishers are one cent a pound, and to other than publishers, one cent for each four ounces. Third-class matter includes printed books, pamphlets, engravings and circulars in print or bound and purporting to be distributed in the process. The rate for third-class matter is one cent for each two ounces. Fourth-class matter is all mailable matter not included in the three preceding classes which is so prepared for mailing as to be easily withdrawable from the wrapper and examined. The rate is one cent for each ounce.

The franking privilege, which had grown to be an intolerable abuse, was temporarily abolished in 1873, but the post office now carries free under official "penalty," labels or envelopes (i.e. envelopes containing a notice of the legal penalty for their unauthorized use) matter which is of an official character, the privilege being extended to congressmen and government officials (see FRANKING). As late as 1860 the mails conveyed nothing but written and printed matter. They now admit nearly every known substance which does not exceed four pounds in weight (this re-striction does not apply to single books), and which from its nature is not liable to injure the mails or the persons of postal employes.

A delivery system existed in a number of cities of the Union in 1862, the carriers remunerating themselves by the collection of a voluntary fee of from one to two cents on each piece of mail delivered. A uniform free delivery system was first authorized by law on the 3rd of March 1863, and was established on the succeeding 1st of July in forty-nine cities. The number of carriers employed the first year was 685. On the 1st of July 1884 there were 3500 letter-carriers in one hundred and fifty-nine "free delivery cities."

The free delivery service has grown rapidly. On the 1st of July 1901, 866 cities and towns were included in the scheme, and
POSTER, a placard in the form either of letterpress or illustration, for posting up or otherwise exhibiting in public to attract attention to its contents. According to Brewer’s Dictionary of Phrase and Fable, before the Fire of London the rails and posts which protected foot-passengers in the streets were used for affixing theatrical and other announcements, whence the name of posting-bills or posters; and in later times the name has come more generally into use for any fairly large separate sheet, illustrated or not, used to attract publicity, even though not actually posted up. In the article ADVERTISEMENTS the use of posters is discussed, and newspaper posters (or contents bills) under the heading of “Publicity” where the use of a decorative and illustrated poster has come to represent a special form of artistic design.

The earliest examples of pictorial posters were adorned with rough woodcuts. When lithography became a commercial process, wood-blocks ceased to be employed. The modern artistic poster made a definite beginning in France about 1850, when a design by Balantine to advertise a book entitled Comment meurent les femmes. His example was followed by C. Nanteuil, D. A. M. Kaflet, Cavarni, Bertrand, Grandville, Tony Johannot, E. de Beaumont, E. Grasset, T. H. Grau, Marien, Manet and other artists of high repute. Most of these early designs were printed in black on white or tinted paper. Between 1860 and 1866 crude attempts at printing posters in colours were made in both France and England. In 1867 the French Government made a serious effort to establish a system by means of which French firms and individuals could produce posters in all the principal centres of the country. The necessary formalities were accomplished, and the system was virtually carried into effect. In 1868, on the occasion of the World’s Fair at Paris, a number of experienced advertising men, among them Talbert, Raffet, and Veyrier, gave utterance to the belief that the system was well-nigh ideal for the purpose of advertising, but in the event the experiment failed.

In England the artists’ committee of the Post Office, who had been at first opposed to the whole idea of posters, was largely influenced by the example of France, and by the establishment of the Art Fund (1892), which has made a special study of poster design. The Post Office granted a series of special commissions to various artists, among whom Bissell, Mignot, and other Frenchmen of the highest standing, have been employed. It is interesting to observe the progress of this artistic development, and the growth in importance of the special art of poster design, which is now carried on in every country of the world, and has become one of the most important means of advertising in modern times. In France the system of posters is well established, and many important posters have been executed, and the system has been widely adopted in Germany, Italy, and other countries.

In France the system of posters is well established, and many important posters have been executed, and the system has been widely adopted in Germany, Italy, and other countries.

The various postal and telegraph rates and regulations of the United States are given in the U.S. Official Post Guide (price 50 cents). For the United States, see the U.S. Official Postal Guide (T. A. I.).

POST AND PAIR—POSTER, a card game popular in the 16th and 17th centuries. A hand consisted of three cards, a pair royal ranking highest, or failing this, the highest pair. Another name of the game was Pink.
ordinary merit. Curious if not very artistic bills have been produced in Russia; and in Austria good work has been done by Ortik, Schliessmann, Oliva and Hyrnais.

In the United States of America, however, with the exception of work done by Matt Morgan, few points of artistic interest were produced before 1889, in which year Louis J. Rhead commenced a notable series of decorative placards. Will H. Bradley began to produce his curious decorative grotesque posters a little later. If American and English plakat artists designing of large posters they have no rivals in the production of small illustrated placards for publishers of books and magazines. Chief among those who have devoted themselves to this branch of poster design is Edward Penfield. Others who have achieved success in it include Maxfield Parrish, Ethel Reed, Will Carqueville, J. C. Gould, J. C. Leyendecker, Frank Hazenplug, Charles Dana Gibson, Will Demuth, W. H. L. Lundberg and Henry Mayer.

Exhibitions of artistic posters have been held in the chief cities of Europe and America, and the illustrated placard has already a literature of its own. In England a monthly magazine (The Poster) was for a time specially devoted to its interests, and collectors are numerous and enthusiastic.

See Ernest Mairston, Les Affiches illustrées (Paris, 1895); Les Maîtres de l'affiche (Paris); Les Affiches étrangères illustrées (Belgium, Austria, Great Britain, United States, Germany and Japan) (Paris, 1897); Charles Hiatt, Pictures Posters (London, 1895); J. L. Spouse, Das Moderne Plakat (Dresden, 1897); Arsene Alexandre, M. H. Spielmann, H. C. Bunner and A. Jaccacci, The Modern Poster (New York, 1895) (C. H.)

POSTER (from O. Fr. postere, posterle, Late Lat. postulra, small back-door, posterus, behind), a small gateway in the encine of a castle, abbey, &c., from which to issue and enter unobserved. They are often called “sally ports.” (See Gate.)

POSTHUMOUS, that which appears or is produced after the author’s death, is most often applied to a literary work or work of art published or produced after its author’s death, or especially to a child born after the death of its father. The Latin postumus, latest, last, from which the word is derived, is formed from post, after, but it was in Late Latin connected with humare, to place in the ground (huma), to bury.

POSTICHE, a French term for a pretentious imitation, a counterfeit, particularly used of an inartistic addition to an otherwise perfect work of art. The French word was adapted from the Italian posticio, from Latin postius, placed, added.

POSTILL, a posthole, properly a gloss on a scriptural text, particularly on a gospel text, hence any explanatory note on other writings. The word is also applied to a general commentary, and also to a homily or discourse on the gospel or epistle appointed for the day. The word in Medieval Latin was posillia, and this has been taken to represent post illa sc. verba textus, i.e. “after these words of the text” (see Du Cange, Glossarium, s.v. postillae), but the form “apolstil” may point to the Latin apposilium, placed near or next to.

POSTILLION (through the Fr. from the Ital. postigione), a postboy, rider of a post-horse, hence any swift messenger, but more particularly the rider of the near horse of a vehicle drawn by two or more horses where there is no driver. The swift travelling postchaises of the 17th and early 19th centuries were usually driven by postillions.

POSTUMIA, VIA, an ancient highroad of northern Italy, constructed in 148 B.C. by the consul Spurius Postumius Albinus. It ran from the coast at Genua through the mountains to Pertona, Placentia (the termination of the Via Aemilia Lepidi) and Cremona, just east of the point where it crossed the Po. From Cremona the road ran eastward to Bedriacum, where it forked, one branch running to the left to Verona and thence to the Brenner, the other to the right to Mantua, Altinum and Apud There. The military occupation of Liguria depended upon this road, and several of the more important towns owed their origin largely to it. Cremona was its central point, the distances being reckoned from it both eastwards and westwards.

(T. As.)

POSY (a shortened form of posy, Fr. posée, poetry), a verse of poetry or a motto, either with a moral or religious sentiment or message of love, often inscribed in a ring or sent with a present, such as a bouquet of flowers, which may be the origin of the common use of the word for a nosegay or bouquet.

It has been suggested that this use is due to the custom of the symbolic use of flowers. Skeat quotes the title of a tract (Heber’s MSS. No. 1442), “A New yeare’s guite, or a posie made upon yeare’s first day.” &c. Posy rings, plain or engraved gold rings with a “posy” inscribed on the bezel, were very frequently in use as betrothal rings from the 16th to the 18th centuries. Common “posies” were such lines as “In thee my choice I do rejoice,” “As God decreed so we agreed,” and the like. There are several rings of this kind in the British Museum.

POTASHES, the crude potassium carbonate obtained by fritivating wood ashes and evaporating the solution to dryness, an operation at one time carried out in iron pots—hence the name from “pot” and “ashes.” The term potash or caustic potash is frequently used for potassium hydroxide, whilst such a phrase as sulphate of potash is appropriately replaced by potassium sulphate. (See Potassium.)

POTASSIUM [symbol K (from kalium), atomic weight 39.114 0=16], a metallic chemical element, belonging to the group termed the metals of the alkalis. Although never found free in nature, in combination the metal is abundantly and widely distributed. In the oceans alone there are estimated to be 114X105 tons of sulphate, KSO4, but this inexhaustible store is not much drawn upon; and the “salt gardens” on the coast of France lost their industrial importance as potash-producers since the deposits at Stassfurt in Germany have come to be worked. These deposits, in addition to common salt, include the following minerals: syline, KCl; carnallite, KCl-MgCl2·6H2O (transparent, deliquescent crystals, often red with diffused oxides of iron); kainite, K2SO4·2MgSO4·3CaSO4·H2O·anhydrite, CaSO4; salt, NaCl, and some minor components. These potassium minerals are not confined to Stassfurt; larger quantities of syline and kainite are met with in the salt mines of Kalusz in the eastern Carpathian Mountains. The Stassfurt minerals owe their industrial importance to their solubility in water and consequent ready amenability to chemical operations. In point of absolute mass they are insignificant compared with the abundance and variety of potassic silicates, which occur everywhere in the earth’s crust; orthoclase (potash felspar) and potash mica may be quoted as prominent examples. Such potassic silicates are found in almost all rocks, both as normal and as accessory components; and their disintegration furnishes the soluble potassium salts which are found in all fertile soils. These salts are sucked up by the roots of plants, and by taking part in the process of nutrition are partly converted into oxalate, tartrate, and other organic salts, which, when the plants are burned, are converted into the carbonate, K2CO3. It is a remarkable fact that, although in a given soil the soda-content may predominate largely over the potash salts, the plants growing in the soil take up the latter: in the ashes of most land plants the potash (calculated as K2O) forms upwards of 90% of the total alkali. The proposition holds, in its general sense, for sea plants likewise. In ocean water the ratio of soda (Na2O) to potash (K2O) is 100:12:3 (Dittmar); in kelp it is, on the average, 100:5:26 (Richardson). Ashes particularly rich in potash are those of burning nettles, wormwood (Artemisia absinthium), tansy (Tanacetum vulgare), fumitory (Fumaria officinalis), and tobacco. In fact, the ashes of herbs generally are richer in potash than those of the trunks and branches of trees; yet, for obvious reasons, the latter are of greater industrial importance as sources of potassium carbates. According to Liebig, potassium is the essential alkali of the animal body; and it may be noted that sheep excrete more of the potassium which they take from the land as sweat, one-third of the weight of raw merino consisting of potassium compounds.

To Sir Humphry Davy belongs the merit of isolating this element from potash, which itself had previously been considered an element. On placing a piece of potash on a platinum plate, connected to the negative of a powerful electric battery, and
brining a platinum wire, connected to the positive of the battery, to the surface of the potassium a vivid action was observed: gas was evolved at the upper surface of the fused globule of potash, whilst at the lower surface, adjacent to the platinum plate, minute metallic globules were formed, some of which immediately inflamed, whilst others merely tarnished. In 1808 Gay-Lussac and Thénard (Ann. chim. 65, p. 325) obtained the metal by passing melted potash down a clay tube containing iron turnings or wire heated to whiteness, and Caradus (ibid. 66, p. 97) effected the same decomposition with charcoal at a white heat. This last process was much improved by Brunner, Wöhler, and especially by F. M. L. Donny and J. D. B. Mareska (Ann. chim. phys. 1857 (3), 55, p. 147). Brunner’s process consisted in forming an intimate mixture of potassium carbonate and carbon by igniting crude tartar in covered iron crucibles, cooling the mass, and then distilling it at a white heat from iron bottles, the vaporized metal being condensed beneath the surface of paraffin or naphtha contained in a copper vessel. It was found, however, that if the cooling be not sufficiently rapid explosions occurred owing to the combination of the metal with carbon monoxide (produced in the oxidation of the charcoal) to form the potassium salt of hexa-xybenzene. In Mareska and Donny’s process the condensation is effected in a shallow iron box, which has a large exposed surface, capable of being cooled by damped cloths. When the distillation is finished the iron box, after cooling, is unclamped and the product turned out beneath the surface of paraffin. It is purified by redistilling and condensing directly under paraffin. Electrolytic processes have also been devised. Linnemann (Journ. Prakt. Chem., 1853, 72, p. 413) obtained the metal on a small scale by electrolysing potassium cyanide between carbon electrodes; A. Matthiessen (Journ. Chem. Soc., 1856, 30) electrolysed an equimolecular mixture of potassium and calcium chlorides (which melts at a lower temperature than potassium chloride) also between carbon electrodes; whilst Caster’s process, in which caustic potash is electrolysed, is employed commercially. The metal, however, is not in great demand, for it is generally found that sodium (q.v.), which is cheaper, and, weight for weight, more reactive, will fulfil any purpose for which potassium may be desired.

Pure potassium is a silvery white metal tinged with blue; but on exposure to air it at once forms a film of oxide, and on prolonged exposure deliquesces into a solution of hydrate and carbonate. Perfectly dry oxygen, however, has no action upon it. At temperatures below 0° C. it is pretty hard and brittle; at the ordinary temperature it is so soft that it can be kneaded between the fingers and cut with a blunt knife. Its specific gravity is 0.855; hence it is the lightest metal known except lithium and beryllium. It fuses at 66.5° C. (Rupess) and boils at 336° C. (König). The metal emits an intensely green vapour. It may be obtained crystallized in quadratjct octahedra of a greenish-blue colour, by melting in a sealed tube containing an inert gas, and inverting the tube when the metal has partially solidified. When heated in air it fuses and then takes fire, burning into a mixture of oxides. Most remarkable, and characteristic for the group it represents, is its action on water. A pellet of potassium when thrown on water at once bursts out into a violet flame and the burning metal fizzes about on the surface, its extremely high temperature precluding absolute contact with the liquid, except at the very end, when the last remnant, through loss of temperature, is wetted by the water and bursts with explosive violence. The reaction may be written \( K + \frac{1}{2}H_2O = KOH + H_2 \) and the flame is due to the combustion of the hydrogen, the violet colour being occasioned by the potassium vapour. The metal also reacts with alcohol to form potassium ethylate, while hydrogen escapes, this time without inflammation: \( K + \frac{3}{2}H_2O = K_2CO_3 + \frac{3}{2}H_2 \). When heated to redness the amide is decomposed into ammonia and potassium nitride, \( K_3N_2 \), which is an almost black solid. Both it and the amide decompose water readily with formation of ammonia and caustic potash. Potassium at temperatures from 200° to 400° C. occides hydrogen gas, the highest degree of saturation corresponding to a pressure of 1 atmosphere. As it is very soluble in dilute hydrogen the compound from 200° upwards loses hydrogen, until the tension of the free gas has arrived at the maximum value characteristic of that temperature (Troost and Hauteville).

**Compounds.**

Potassium hydroxide or caustic potash, KOH, formerly considered to be an oxide but shown subsequently to be a hydroxide of potassium, may be obtained by dissolving the metal or monoxide in water, but in a form which acquires the characteristic taste and odor of caustic potash on evaporation. KOH is obtained by double distillation of the filtrate of the caustic liquid, and the clear KOH is further purified by filtration. The remaining solid of calcium carbonate and hydrogen is washed by decantation, with small instalments of hot water to recover as much of the alkali diffused throughout it, but this process may not be complete. After passing into solution the liquors after a concentration in iron vessels are now evaporated in a silver dish, until the heavy vapour of the hydroxide is seen to go off. The residual oily liquid is then poured into a porcelain dish containing 2 to 3 parts of water (Bunsen), and its peroxide, the customary form of "sticks," and allowed to cool. The solid must be at once bottled, because it attracts the moisture and carbonic acid of the air with great avidity and deliquesces. Acetic acid, due to Dittmar, is standardized to 18.0, and is found to be better adapted than iron basins for the preliminary concentration of potassium. The latter begin to oxidize before the only has come up to the traditional strength of specific gravity \( \frac{1}{3}\) when cold, while nickel is not attacked so long as the percentage of real \( KHO \) is short of 60. For the fusion of the dry hydroxyd nickel vessels cannot be used; in fact, even silver is perceptibly attacked so soon as it is heated to redness. KOH can be produced only in gold vessels. Glass and (to a less extent) porcelain are attacked by caustic potash slowly, in the cold, more readily on boiling.

Some metallic potassium is an opaque, white, stone-like mass of dense granular fracture; specific gravity 2.1. It fuses considerably below and is perceptibly volatile at a red heat. At a white heat the vapour breaks into potassium, oxygen, and hydrogen and carbon. It is soluble in cold water and, in any proportion of water on boiling. On crystallizing a solution, the hydroxyd \( KOH_2H_2O \) is deposited; \( 2KOH\cdot H_2O \) and \( 2KOH\cdot 4H_2O \) have also been obtained. The solution is intensely "alkaline" to test-papers. It readily dissolves the epidermis of the skin and many other kinds of animal tissue—hence the former application of the "sticks" in surgery. A dilute potash readily emulsifies fats, and on boiling saponifies them with formation of a soap and glycine.

All commercial caustic potash is contaminated with excess of water (over and above that in the KHO) and with potassium carbonate and chloride; sulphate, as a rule, is absent, but is prepared for several purposes in the same way. To digest the hydroxyd best, it is to be dissolved in absolute alcohol, decanting and evaporating the solution to dryness and fusing in silver vessels.

The peroxide, \( KO_2 \), discovered by Gay-Lussac and Thénard, is obtained by heating the metal in an excess of slightly moist air or oxygen. Vernon Harcourt (Journ. Chem. Soc., 1862, p. 267) recommends melting the metal in a flask filled with nitrogen and gradually displacing this gas by oxygen; the first formed grey film on the metal changes to a deep blue, and then the gas is rapidly absorbed, the film becoming white and afterwards yellow. It is a dark yellow powder, which fuses at a high temperature, the liquid losing in boiling decomposes in nitric acid, and itmoxide, and it is not oxidized by pure oxygen, whilst carbon monoxide gives potassium carbonate and oxygen at temperatures below 100°. A violent reaction ensues with phosphorus and sulphur, and many metals are oxidized by it, some with incandescence.
Photography.

Potassium chloride, KCl, also known as muriate of potash, closely resembles ordinary salt. It is produced in immense quantities at the Stassfurt salt mines by precipitation from brine. The crude product of the manufacturer of this salt are assayed into a raw material containing approximately, in 100 parts, 55-65 of carnallite (representing 16 parts of potassium chloride, 2 parts of common salt and other soluble salts, (CaCl₂·MgCl₂·6H₂O), and minor components. This mixture is now worked mainly in two ways. (1) The salt is dissolved in water with the help of steam, so that the solution is cooled slowly, in the presence of a quantity of impure common salt crystallizes out, which is removed. The decanted liquid on standing a 70% potassium chloride, which is purified by washing with cold water. Common salt principally goes into solution, and the percentage mother liquor brought up to from 80 to 95. The mother-liquor from the 70% chloride is evaporated, the common salt which separates out in the heat removed as it appears, and the sufficiently concentrated liquid is allowed to cool. The salt is then crystallized out, which is easily decomposed into its components (see infra). (2) Ziervolge and Tuchen’s method.—The crude salt is ground and then heated in a concentrated solution of magnesium chloride with very gentle agitation, and the solution is allowed to cool until the crystals form out relatively pure on cooling. The mother-liquor is used for a subsequent extraction of fresh raw salt. The carnallite produced is dissolved in water and the filtrate from this deposit a coarse granular potassium chloride containing up to 99% of the pure substance. The undissolved residue produced in either process consists chiefly of kieserite and common salt. It is not a practice by the Arpels Compagny, this sulphate and magnesium chloride. The potassium bromide by-products are utilized for the manufacture of manures.

Chemically pure potassium is most conveniently prepared by dissolving the pure carbonate by boiling it in a plentiful solution of potassium hydroxide, at the lowest temperature and then fusing the residue in a well-covered platinum crucible. The fused product solidifies on cooling into colourless crystals.

When hydrochloric acid gas is passed into the solution the salt is completely precipitated as a fine powder. If the original solution contained the chlorides of magnesium or calcium or sulphate of potassium all impurities remain in the mother-liquor but the sulphurates as KHSO₄, and can be removed by washing the precipitate with strong hydrochloric acid. The salt crystallizes in cubes of specific gravity 1.995; it melts at about 80° and volatilizes at a bright red heat. The solution has an equimolecular composition, and in the same condition, a dark blue mass is obtained of uncertain composition. It is extensively employed for the preparation of other potassium salts, but the largest quantity (especially of the impure variety) is the cheap salt.

Potassium bromide, KBr, may be obtained by dissolving bromine in poteah, whereon bromide and bromate are first formed, evaporating and igniting the product in order to decompose the bromate; KBr + H₂O = KBrO₃ + H₂O (cf. chlorates); but it is manufactured by acting with bromine water on iron filings and deposing the iron bromide thus formed with potassium carbonate. In appearance it closely resembles the chlorides, forming colourless cubes which readily dissolve in water and melt at 727°. It combines with bromine to form an unstable tribromide, KBr₃ (see F. P. Worley, Journ. Chem. Soc., 1905, 57, p. 110).

Potassium iodide, KI, is obtained by dissolving iodine in poteah, the deoxidation of the iodate being facilitated by the addition of charcoal before ignition, proceeding as with the bromide. The combination with potassium carbonate is also easily accomplished by dissolving in the minimum amount of water, and neutralizing with dilute sulphuric acid; alcohol is now added to precipitate the potassium sulphite, the solution filtered and crystallized. It forms colourless cubes which are readily soluble in water, melt at 68°, and yield a vapour of normal density. It is sparingly soluble in absolute alcohol. Both the iodide and bromide are used as rectifying agents in the signalling apparatus of the telephone. Imbibed by water, the aqueous solutions of the salt form a dark brown liquid, which on evaporation over sulphuric acid gives black acicular crystals of the tri-iodide, KI₃. This salt is very deliquescent; it melts at 45°, and at 100° decomposes with evolution of hydrogen, and formation of iodine. carnallite KCl·MgCl₂·6H₂O, a halogen salt see chloride, chlorine, bromine and iodine.

Potassium carbonate, K₂CO₃, popularly known as "potass", was originally obtained in countries where rock salt was cheap by lixiviation of the salt with warm water. It is not prepared, except for dryness in iron pots and calcining the residue; in more recent practice the calculation is carried out in reverberatory furnaces. This product, known as "crude potash", contains, in addition to carbonate, varying amounts of sulphate and chloride and also insoluble matter. Crude potash is used for the manufacture of glass, and, after being causticized, for the making of soft soap. For the preparation of soft soap by treating the crude product with the minimum of cold water required to dissolve the carbonate, removing the undissolved part (which consists chiefly of sulphate), and evaporating the clear liquid, the process is called "oleum". The solution (which still contains most of the chloride of the raw material and other impurities) is known as "pearl ashes." Large quantities of carbonates used to be manufactured from the aqueous residue left in the distillation of the "oleum" and sold as "crude potash". For this purpose the liquors were evaporated to dryness and the residue is obtained to obtain a very impure carbonate, which is purified by methods found on page 597. The different compounds of the several components. Most of the carbonate which is not precipitated as a separate deposit at the chloride of the Stassfurt beds by an adaptation of the "Leblanc process" for the conversion of common salt into soda ash (see ALUMINUM MANUFACTURE).

Chemically pure carbonate of potash is best prepared by igniting pure bicarbonate (see below) in iron or (better) in silver or platinum vessels, or else by calcining pure cream of tartar. The latter operation for present as an impurity, remains mostly in the mother liquor from which the carbonate is extracted by lixiviation with water and filtration. The filtrate is evaporated to dryness in iron or platinum vessels and the residue fully dehydrated by gentle agitation. This operation becomes less convenient when a mixture, at a red heat (838° C., Carnelley) into a colourless liquid, which solidifies into a white opaque mass. The dry salt is very hygroscopic; it deliquesces into an oily solution ("oleum tartari") in oxygen or air. The pure carbonate is completely dissolved in the salt of 100 to 150°. On crystallizing a solution monochloride crystals of 2K₂CO₃·3H₂O are deposited, which by heating to a red heat are completely dehydrated at 130°. The carbonate, being insoluble in strong alcohol (and many other liquid organic compounds), is much used for dehydration of the corresponding aqueous preparations. Pure carbonate is constantly used in the laboratory as a basic substance generally, for the disintegration of silicates, and as a precipitant.

The industrial preparation serves for the making of flint glass, of potash soap (soft soap) and of caustic potash.

Potassium sulphate, K₂SO₄, is completely dehydrated and is used for the manufacture of plasters, making of paper, and in many other purposes. It is a product of commerce.

Potassium sulphide, K₂S, was obtained by Berzelius in pale red crystals by passing hydrogen over potassium sulphate, and by Bertarelli in a flesh-colour after being precipitated by bromine. It appears, however, that these products contain higher sulfides. On saturating a solution of caustic potash with sulphuric hydrogen, and adding a second equivalent of alkali, a solution is obtained which on evaporation in a vacuum deposits crystals of K₂S·5H₂O. The solution is strongly caustic. It turns yellow on exposure to air, absorbing oxygen and carbon dioxide forming thiosulphate and potassium carbonate, and liberating sulphuretted hydrogen, which decomposes into water and sulphur, the latter combining with the monosulphide to form higher sulpha. The solution also decomposes on boiling. The hydroxysulphite, K₂S·H₂O, is obtained by heating the sulphate, then adding saturated hydrogen, and by Berzelius on acting with sulphuretted hydrogen on potassium carbonate at a dull red heat. It forms a yellowish-white, deliquescent mass, which melts on heating, and at a sufficiently high temperature it yields a dark red liquid. It is readily soluble in water, and on evaporation in a vacuum over caustic lime it deposits colourless, rhombohedral crystals of K₂S·5H₂O. The solution is more easily prepared by saturating potash solution with sulphuric hydrogen, and by adding a sufficient quantity of sodium carbonate. This mixture is a mixture of various poly sulphides with the sulphate and thiosulphate, in variable proportions, obtained by gently heating the carbonate with sulphur in covered receivers, and forming a brown mass. In the pharmacopoeia it is designated potassa sulphurata.

Potassium sulphite, K₂SO₃, is prepared by saturating a potash solution with sulphur dioxide, adding a second equivalent of potash,
and crystallizing in a vacuum, when the salt separates as small deliquescent, hexagonal crystals. The salt K$_2$SO$_4$·H$_2$O may be obtained by crystallizing the metabisulphite, K$_2$SO$_3$ (from sulphur dioxide and water) or the sodium salt sulphite, K$_2$SO$_4$·H$_2$O (from sulphur dioxide and a mixture of milk of lime and potassium sulphate) with an equivalent amount of potash. The salt K$_2$SO$_4$·H$_2$O is obtained as oblique rhombohedral crystals by crystallizing the solution with hydrochloric acid. On the isomeric potassium sulphites see SULPHUR.

Potassium sulphate, K$_2$SO$_4$, a salt known early in the 14th century, and studied by Glauber, Boyle and Tachenius, was styled in the 17th century casewurst, one of the chief ingredients of Casewurst, but the process is now given up because the salt can be produced cheaply enough from the chloride by decomposing it with sulphuric acid and calcining the residue. To purify the crude product it is dissolved in water and the solution filtered and allowed to cool when the bulk of the dissolved salt crystallizes out with characteristic promptitude. The very beautiful (anhidrous) crystals have the habit of a double six-sided pyramid, but really belong to the rhombohedral system. They are transparent, very hard and absolutely permanent in the air. They have a bitter, salty taste. The salt is soluble in water, but insoluble in caustic potash of sp. gr. 1.35, and in absolute alcohol. It fuses at 1078°C. The crude salt is used occasionally in the manufacture of glass. The acid sulphate or bisulphate, KHSO$_4$, is readily produced by fusing thirteen parts of the powdered normal salt with eight parts of sulphuric acid. It melts at 170°C, which has been taken as the standard. Of the three parts of water of 0°C the solution behaves pretty much as if it were two congeners, K$_2$SO$_4$ and H$_2$SO$_4$, were present side by side with sodium chloride (KNO$_3$) as an excess of alcohol, in fact, precipitates the normal sulphate (with free acid) remains in solution. Similar is the behaviour of the fused dry salt at a dull red heat; it acts on silicates, tinitates, &c., as if it were sulphuric acid raised beyond its natural boiling point. Hence its frequent application in analyses as a dehydrating agent. For the salts of other sulphur acids, see SULPHUR.

Potassium nitrate, NH$_4$K, discovered by Gay-Lussac and Thénard in 1817, is obtained as an olive green or brown mass by gently heating the metal in ammonia gas, or as a white, water-white, crystalline mass when the metal is heated in a silver boat. It decomposes in moist air, or with water, giving caustic potash and ammonia, in the absence of air, the pentahydrate of potassium nitrate in the manufacture heating Tithesley (Journ. Chem. Soc., 1894, p. 517) found that it decomposed into its elements. For the nitrates see SALTSPETRE and for the cyanide see PRUSSEY ACID.

Medicine.

Pharmacology.—Numerous salts and preparations of potassium are used in medicine; viz. Potassii Carbonis (salt of tartar), dose 5 to 20 grs, from which are made (a) Potassii Bicarbonasc, dose 5 to 30 grs; (b) Potassii Caustica, a powerful caustic not used internally.

From caustic potash are made (1) Potassii Permanganatis, dose 1 to 3 grs, used in preparing Liquor Potassii Permanganatis, a 1% solution, dose 2 to 4 grs. (2) Potassii Iodidum, dose 5 to 20 grs. (3) Potassii Chloridum, dose 5 to 20 grs. (4) Potassii Bromidum, dose 5 to 30 grs. (4) Potassii Alum, a 1% solution, dose 10 to 40 grs. Potassii Acetis, dose 10 to 40 grs. Potassii Chloris, dose 5 to 15 grs, from which is made a lozenge. Trichloris Potassii Chloris, each containing 3 grs. Potassii Tartratis, 1 drachm (cream of tartar), dose 20 to 60 grs, which has a stimulating power Potassii Tartras, dose 30 to 60 grs. Potassii Nitri (saltpetre), dose 5 to 20 grs. Potassii Sulphas, dose 10 to 40 grs. Potassii Bichromasc, dose 5 to 1 gr.

The treatment of poisoning by caustic potash may take place or poisoning by pearl ash containing caustic potash. A caustic taste in the mouth is quickly followed by burning abdominal pain, vomiting and diarrhoea, with a feeble pulse and a cold clammy skin. Potassium chloride is often used for the purpose in doses of 10 to 20 grs of the powder to be given in the form of a saline purgative. The treatment is washing out the stomach or giving emetics followed by vinegar or lemon juice and later oil and of egg.

Teratology.—Externally: Caustic potash is a most powerful irritant and caustic; it is used with lime in making Vienna paste, which is occasionally used to destroy morbid growths. Liquor potassae is also used in certain skin diseases. The pernagumate of potash is an irritant if used pure. Its principal action is as an antiseptic and acting on the skin. They are readily inhaled by the urine, rendering it alkaline and thus more able to hold uric acid in solution. They also hinder the formation of uric acid calculi. The acetate and the citrate are valuable mild diuretics in the treatment of uric aciduria, and, by increasing the amount of urine diminish the pathological fluids in pleuritic effusion, ascites, &c. In tubal nephritis they aid the excretion of fatty casts. The tartrate and acid tartrate are also diuretic in their action and, as well as the carbonate, are valuable hydrgaegue saline purgatives. Potassium nitrate is chiefly used to make nitre paper, which on burning emits fumes useful in the treatment of the asthmatix paroxysm. Lozenges of potassium chlorate are used in stomatitis, tonsillitis and pharyngitis, it can also be used in a gargle, 10 gts. to 1 fl. oz. of water. Its therapeutic action is said to be due to nascent oxygen given off, so it is local in its action. In large doses it is a dangerous poison, converting the oxyhaemoglobin of the blood into methaemoglobin. Internally the permanganate is a valuable antidote in opium poisoning. The action of potassium bromide and potassium sulphonate on the spinal cord is well known. If we consider potassium salts if taken in large doses are cardiae depressants, they also depress the nervous system, especially the brain and spinal cord. Like all alkalis if given in quantities they increase metabolism.
The chief value of the potato as an article of diet consists in the starch it contains, and to a less extent in the potash and other salts. The quantity of nitrogen in its composition is small, and hence it should not be relied on to constitute the staple article of diet. Letheby gives the following as the average composition of the potato:

<table>
<thead>
<tr>
<th>Nutrient</th>
<th>Amount</th>

</tr>
</tbody>
</table>

—a result which approximates closely to the average of nineteen analyses cited in *How Crops Grow* from Grouven. In some analyses, however, the starch is put as low as 13-30, and the nitrogenous matter as 0-92 (Dehérain, *Cours de chimie agricole*, p. 159). Boussingault gives 25-2% of starch and 3% of nitrogenous matter. Warington states that the proportion of nitrogenous matter to the starch in all the temperate parts of potatoes is as 1 to 10-6. The composition of the tubers evidently varies according to season, soils, manuring, the variety grown, &c., but the figures cited will give a sufficiently accurate idea of it. The "ash" contains on the average of thirty-one analyses as much as 59-8% of potash, and 19-1% of phosphoric acid, the other ingredients being in very minute proportion.

Where, as in some parts of northern Germany, the potato is grown for the purpose of manufacturing spirit great attention is necessarily paid to the quantitative analysis of the starchy and saccharine matters, which are found to vary much in particular varieties, irrespective of the conditions under which they are grown.

It is to the Spaniards that we owe this valuable esculent. The Spaniards met with it in the neighbourhood of Quito, where it was cultivated by the natives. In the *Cronica de Peru* of Pedro Cieca (Seville, 1553), as well as in other Spanish books of about the same date, the potato is mentioned under the name "battata" or "papa." Hieronymus Cardan, a monk, is supposed to have been the first to introduce it from Peru into Spain, from which country it passed into Italy and thence into Belgium. Carl Sprengel, cited by Professor Edward Morren in his biographical sketch entitled *Charles de l'Escluse, sa vie et ses oeuvres*, states that the potato was introduced from Santa Fé into England by John Hawkins in 1563 (*Garten Zeitschrift*, 1895, p. 346). If this be so, it is a question whether the English and not the Spaniards are entitled to the credit of the first introduction; but, according to Sir Joseph Banks, the plant brought by Drake and Hawkins was not the common English potato but the sweet potato.

In 1587 or 1588 De l'Escluse (Clusius) received the plant from Philippe de Sivry, lord of Waldheim and governor of Mons, who in his turn received it from some member of the suite of the papal legate. At the discovery of America, we are told by Humboldt to have been cultivated in all the temperate parts of the continent from Chile to Colombia, but not in Mexico. In 1585 or 1586, potato tubers were brought from what is now North Carolina to Ireland on the return of the colonists sent out by Sir Walter Raleigh, and were first cultivated on Sir Walter's estate near Cork. The tubers introduced under the auspices of Raleigh were thus imported a few years later than those mentioned by Clusius in 1588, which must have been in cultivation in Italy and Spain for some years prior to that time. The earliest representation of the plant is to be found in Gerard's *Herbal*, published in 1597. The plant is mentioned under the name *Pepus orbiculatus* in the first edition of the *Catalogus of the same author*, published in 1596, and again in the second edition, which was dedicated to Sir Walter Raleigh (1599). It is, however, in the *Herbal* that we find the first description of the potato, accompanied by a woodcut sufficiently correct to leave no doubt whatever as to the identity of the plant. In this work (p. 787) it is called "Battata virginiana sive Virginianorum, et Pappus, Potatoes of Virginia."

The "common potatoes" of which Gerard speaks are the tubers of *Ipomea Batatas*, the sweet potato, which nowadays would not in Great Britain be spoken of as common. A second edition of the *Herbal* was published in 1636 by Thomas Johnson, with a different illustration from that given in the first edition, and one which in some respects, as in showing the true nature of the tuber, is superior to the first. The phenomenon of growing out or "super-tuberation" is shown in this cut.

Patroux, in his *Histoire des tubers* (1884), in his report on Virginia, describes a plant under the same name "with roots as large as a walnut and others much larger; they grow in damp soil, many hanging together as if fixed on ropes; they are good food either boiled or roasted." The plant (which is not a native of Virginia) was probably introduced there in consequence of the intercourse of the early settlers with the Spaniards. The cultivation of the potato in England made but little progress, even though it was strongly urged by the Royal Society in 1663; and not much more than a century has elapsed since its cultivation on a large scale became general.

Botanists are agreed that the only species in general cultivation in Great Britain is the one which Bauhin, in his *Phytologia*, p. 89 (1596), called *Solanum tuberosum esculentum*, a name adopted by Linnaeus (omitting the last epithet), and employed by all botanical writers. This species is probably native in Chile, but it is very doubtful if it is truly wild further north. Baker (*Journ. Linn. Soc.*, 1884, xx. 496), has reviewed the tuber-bearing species of *Solanum* from a systematic point of view as well as from that of geographical distribution. Out of twenty so-called species he considers six to be really distinct, while the others are merely synonymous or trifling variations. The six admitted tuber-bearing species are *S. tuberosum*, *S. Maglia*, *S. Commersoni*, *S. cardiophyllum*, *S. salicifolia*, and *S. oxycarpum*.

*S. tuberosum* is, according to Mr Baker, a native not only of the Andes of Chile but also of those of Peru, Bolivia, Ecuador and Colombia, also of the mountains of Costa Rica, Mexico and the United States. The potato seems most probable, however, that some at least of the plants mentioned in the northern part of America are the descendents of cultivated forms. *S. Maglia* is a native of the Chilian coast as far south as the Chonos Archipelago, and was cultivated in the garden of the Horticultural Society at Chiswick in 1822, being considered by Sabine, in his paper on the native country of the wild potato, to be the true *S. tuberosum* and the origin of the cultivated forms. This species was also found by Darwin in Chile, and was considered by him, as by Sabine before him, to be the wild potato. Baker refers to the plants figured by Sabine (*Trans. Hort. Soc. Lond.* v. 249) (fig. 1) as being without doubt *S. Maglia*, but *A. de S. Maglia* in *Origenes plantarum cultivatae*, p. 40) is equally emphatic in the opinion that it is *S. tuberosum*. *S. Commersoni* occurs in Uruguay, Buenos Aires and the Argentine Republic, in rocky situations at a low level. Under the name of *S. Ohrens* it has also been introduced into western Europe, where it is not only cultivated but produces a great quantity of tubers, which are edible, but have a slightly acid taste. *S. cardiophyllum*, described by Lindley in the *Journ. Hort. Soc.*, is a native of the mountains of Mexico at elevations of 3000 to 9000 ft. *S. Jamacui* is a well-defined species occurring in the mountains of Colorado, New Mexico and Arizona, and also in Mexico. In a wild state the tubers are not larger than marbles. *S. oxycarpum* is a

**POTATO**

201
little known but very distinct tuberous species from central Mexico.

A review of the localities in which the presence of S. tuberosum and its tuber-bearing allies has been ascertained shows that, broadly, these varieties may be divided into two classes in which they would not be subjected, at least in their growing season, to the same extremes of heat, cold and drought as plants growing on inland plains. Again, those forms growing at a high elevation would probably start into growth later in the season than those near the coast. The significance of these facts from a cultural point of view is twofold: for, while a late variety is desirable for culture in Great Britain, as ensuring more or less immunity from spring frost, it is, on the other hand, undesirable, because late varieties are more liable to be attacked by the potato disease (Phytophthora infestans) which as a rule appears about the time when the earliest varieties are ready for lifting, but before the late varieties are matured.

In cultivation the potato varies very greatly not only as to the season of its growth but also as to productivity, the vigour and luxuriance of its foliage, the presence or relative absence of hairs, the form of the leaves, the size and colour of the flowers, &c. The tubers vary greatly in size, form and colour; gardeners divide them into rounded forms and long forms or "kidneys," and there are of course varieties intermediate in form. The colour of the rind, yellowish, brown or purple, furnishes distinctions, as does the yellow or white colour of the flesh. They have a characteristic smell and their pronounced or moderate vitality are relatively very constant characteristics. These variations have arisen chiefly through cross-breeding, though not entirely so, there being a few cases upon record of the production of "sports" from tubers that have become the parents of new varieties, but authentic cases of the sporting of tubers are few and far between. If, on the other hand, the true seeds of any of our cultivated varieties are sown, the seedlings show very wide variations from one another and from the parent.

In this connection it is very interesting to observe that Messrs Sutton of Reading find that the seedlings of many of the varieties of potato that occur spontaneously in different parts of America come quite true to type from seed.

The potato thrives best in a rather light friable loam; and in thin sandy soils the produce, if not heavy, is generally of very good quality. Soils which are naturally wet and heavy, as well as those which are heavily manured, are not suitable. Indeed it is best, except when Linder gently is ample space, to grow only the earlier kinds in gardens. If the soil is of fairly quality the less manure used upon it the better, unless it be soot or lime. Gypsum, bone-dust, superphosphate of lime and nitrate of soda may also be used, and would be adopted, if the soil contains much vegetable matter; but the best results are usually obtained when farmyard manure is supplemented by artificials, not by using artificials alone.

Diseases are commonly propagated by planting whole tubers or by dividing the tubers, leaving to each segment or "set" one or two eyes or buds. The "sets" are then planted in rows at a distance varying from 15 in. to 3 ft., the distance being regulated by the height of the stems, and that between the sets varying from 6 to 12 in., 8 in. being a good average space for garden crops, with 2 ft. between the rows. The sets may be put in 6 in. deep. The planting of whole tubers instead of the cut sets usually gives a better return.

1 Although these are the only species admitted as such by Baker, it is well to add some of the varieties. The S. tuberosum of Lindley, differing from the common S. tuberosum in not producing tubers, was found in Chile, and is probably not specifically distinct, although exceptional, for it is by no means very unusual to find evergreen plants of S. tuberosum divide into mountainous and, according to Baker, a form of S. tuberosum, but so far its habitat in the mountain woods of Juan Fernandez is climatically different from that in the dry mountains of central Chile, where the true S. tuberosum is found, that the latter have more recently landed on the summit of Quindua in Colombia, at a height of 11,453 ft. It produces tubers of the size of a nut. S. Andrenum, found by André at Cauca (6,234 ft.), was considered by the traveller to be best adapted to the more advanced districts. In the case of the potato, as in the case of the tomato, S. Andrenum and S. vitile, S. Pendenti, a native of the mountains of New Mexico and Arizona, was considered by Asa Gray to be likewise a form of S. tuberosum.

The full-sized tubers are, however, preferable to smaller ones, as their larger buds tend to produce stronger shoots, and where cut sets are the usual return it is essential and impossible, as a protective plant disease called the "curl," which sometimes attacks the young stems, causing them and also the leaves to become curled, and few or no tubers to be produced; in this connection it is worth mentioning that Irish seed potatoes give a larger yield than English, probably on account of their being less matured. It has also been noted that the sprouting of the eyes of the potato may be accelerated if, while still unripe, it is taken up by the finger and rubbed against the surface of the soil. The best sets are obtained from plants grown in elevated and open situations, and it is also beneficial to use sets grown on a different soil.

The best crops should, if possible, be planted in a light soil and in a warm situation, towards the end of February, or as early as possible in March. In some cases the tubers for early crops are sown on a hotbed, the plants being put out as soon as the leaves can bear exposure.

The main crop should be planted by the middle of March, sown being used; late planting is very undesirable. Those intended for storing ought be dug up soon as they are fairly ripe, unless they are attacked by the disease, in which case they must be taken up as soon as the marrain is observed; or if they are only sufficiently developed to be worth preserving, but not fully ripe, they are dug up and stored in shallow slaters or feathers, being lightly passing down them into the tubers; this may be done without disturbing the tubers, which can be dug afterwards.

The earliest seedling of December, and the last varieties in January and February: the varieties specially suited for forcing being chosen. The mode of cultivation adopted by the London market gardeners is thus in substance explained by Baker, who recommends lifting the long loose tubers, or tubers, as he calls them, at any time during the winter when conditions they will sprout in about a month. A bed of the requisite length (sometimes 100 yds.), is then prepared of about 2 ft. thickness of hot dung, soil is put on to the depth of 8 in., and the frames set over all. The potatoes are then carefully taken up from the striking bed, all the shoots being removed except the main one, and they are planted 4 in. deep, radishes being thrown thinly over them and covered lightly in May. When the haulm of the potato has grown to about 6 in. in height the points are nipped off, in order to give the radishes fair play; and, although this may stop growth for a few days, still the potato crop is always excellent. After planting nothing more is required but to keep up the temperature to about 70°, admitting air when practicable, and giving water as required. The crop is not dug up until it has come to maturity.

Potatoes are also grown largely in hooped beds on a warm border. The hooped bed is open at the sides and, after the shoots have been planted, as above, are planted out in January in trenches 2 ft. deep filled with hot dung, the sets being planted 5 in. deep, and over all are radishes sown. The ridges are then hooped over, allowing about 2 ft. of space in the middle between the ridges and the long, and the hoops covered with mats and straw, but as soon as the radishes come up they are uncovered daily, and covered again every night as a protection against possible frosts. This is continued till the potatoes are ready for digging in May.

Potatoes are sometimes grown in pots in heat, sown being planted in 11 in. pots about two-thirds full of soil, and placed near the glass in any of the forcing-houses, where a temperature of 65° to 70° is to be maintained. The plants are duly watered and earthed up as they advance in growth.

Potato Diseases

There are several agricultural subjects of greater importance than the culture of the potato and the losses entailed by potato disease. It is not unusual in bad seasons for a single grower to lose £50 per acre in one season. In extreme cases every tuber is lost, as the produce will not even pay the cost of lifting.

The best-known disease of potatoes is caused by the growth of a fungus named Phytophthora infestans, within the tissues of the host plant, and this fungus has the peculiar property of piercing and breaking up the cellular tissues and setting up putrescence in the course of its growth. The parasite, which has a somewhat restricted range of host plants, chiefly invades the potato, Solanum tuberosum; the bittersweet, S. Dulcamara, and other species of Solanum. It is also very destructive to the tomato, Lycopersicum esculentum, and to all or nearly all

POTATO
the other species of *Lycopersicum*. At times it attacks petunias and even scrophulariaceous plants, as *Antirrhinum* and *Schizanthus*.

As a rule, although there are a few exceptions, the disease occurs wherever the potato is grown. It is known in South America in the home of the potato plant. In England the disease is generally first seen during the last ten days of July; its extension is greatly favoured by warm and showery weather. To the unaided eye the disease is seen as purplish brown or blackish blotches of various sizes, at first on the tips and edges of the leaves, and ultimately on the leaf-stalks and the larger stems. On gathering the foliage for examination, especially in humid weather, these dark blotches are seen to be putrid, and when the disease takes a bad form the dying leaves give out a highly offensive odour. The fungus, which is chiefly within the leaves and stems, seldom emerges through the firm upper surface of the leaf; it commonly appears as a white bloom or mildew on the circumference of the disease patches on the under surface. It grows within the tissues from central spots towards an ever-extending circumference, carrying putrescence in its course. As the patches extend in size by the growth of the fungus they at length become confluent, and so the leaves are destroyed and an end is put to one of the chief vital functions of the host plant. On the destruction of the leaves the fungus either descends the stem by the interior or the spores are washed by the rain to the tubers in the ground. In either case the tubers are reached by the fungus or its spores, and so become diseased. The fungus is very small in size, and under the microscope appears slightly whitish or colourless. The highest powers are required to see all parts of the parasite.

The accompanying illustration shows the habit and structure of the fungus. The letters A B show a vertical section through a fragment of a potato leaf, enlarged 100 diameters; A is the upper surface line, and B the lower; the lower surface of the leaf is shown at the top, extremely attenuated vibrating hairs termed "cilia," as shown at H. These zoospores escape and swim about in any film of moisture, and on going to rest take a spherical form, germinate and produce the mycelium. *Phytophthora parasitica* may germinate directly without undergoing division. The mycelium from the germinating sporangia or zoospores soon finds its way into the tissues of the potato leaf by the organs of transpiration, and the disease extends along the leaf-stalks and even over again till the entire potato leaf, or indeed the whole plant, is reduced to putridity. The germinating spores are not only able to pierce the leaves and stems of the potato plant, and so gain an entry to its interior through the epidermis, but they are also able to pierce the skin of the tuber, especially in young examples. It is therefore obvious that, if the potato is damaged in its early stages by disease, the whole plant may become putrid. The spores or zoospores are carried by the wind, or by the rain, or by the feet of small animals and insects, from the leaves to the tubers, to the leaves of other plants, and to the soil. Their range and activity are undoubtedly extensive in the natural state, but where practised to an immense extent they materially reduces the produce of tubers. The labour entailed in repeated earthing up is also considered a serious objection to its general adoption.

The means of mitigating the damage done by this disease are (1) the selection of varieties found to resist its attacks; (2) the collection and destruction of diseased tubers so that none are left in the soil to become a menace to future crops; (3) care that no tubers showing traces of the disease are planted; (4) spraying with Bordeaux mixture at intervals from midsummer onwards. The last measure prevents the germination of the spores of the fungus on the leaves, and is a most useful mode of checking the spread of the disease; to be successful in its use, however, entails care in the preparation of the spray and thoroughness in its application. In spite of the many efforts in the direction of obtaining a resistant variety no great measure of success has been attained. The earlier varieties of potato appear to escape the disease almost entirely, as they are usually ready to be lifted before it becomes troublesome; while certain of the later varieties are much less prone to it than the majority. They do not appear, however, to maintain the same degree of immunity over a long period of years, but to become more and more open to the attack as the variety becomes older; nor do they always exhibit the same degree of immunity in different localities. Something may be done to mitigate the loss arising from the disease by selecting comparatively immune varieties from time to time.

Many ingenious attempts have been made to obtain a variety perfectly immune to this disease, but without much success, and in every case the disease has been reduced instead of being entirely got rid of by crossing with some of the native species, raised hybrids between it and the two common species of *Solanum* native in this country, *S. Dulcamara* and *S. nigrum*, but the hybrids produced are not distinct and are not therefore a menace to the grower. Attempts have also been made in grafting the potato on these two species and, though he succeeded, there is no record to show whether the product was any harder than the parents. Dean (Gard. Chron., Sept. 1876, p. 304) succeeded in getting the potato on the tomato, but it has not been carried out similar experiments on an extensive scale (Journ. Roy. Hort. Soc. 1899, xxiii. Proc. p. 29), but in no case have the variations produced proved disease-proof. Various experimenters, especially Finn, have asserted that by engraving an eye of one variety into the tuber of another, not only will adhesion take place but the new tubers will present great variety of character; this seems to be the case, but it can hardly be said to have been established. If we can only find the key to the result of any commingling of the essences of the two varieties the wound may simply have set up that variation in the buds the occasional existence of which has been already noted. It is possible that the disease is spread from the potato to with one or other of the wild types of tuberous *Solanums* may give rise to a variety which shall be immune, though unfortunately most are themselves liable to the attacks of the fungus, and one of the few crosses so made between the common potato and *Solanum Magiac* has exhibited the same undesirable trait. The form cultivated in England for some time under the name *Solanum tuberosum* (which, however, forms tubers and is probably not that known under this name by Lindley) is found to be almost free from the attack. In view of the fact that Bishop has proved that immunity from the attacks of a certain fungus in wheat is a transmissible recessive character reappearing in some of the individuals of the second generation, it would appear that this is the natural and secure method of this form. It is possible, too, that continued cultivation in the rich soil of gardens may induce that tendency to vary when seedlings are raised. It is therefore so marked a feature of the potato of commerce, in one or more of the other species of tuberous *Solanums*.  

---

**FIG. 2.**—*Phytophora infestans*. Fungus of Potato Disease.
Another fungus attacking the leaves is *Macrosorium Solani* (fig. 3), but this attack usually comes earlier in the season than the foregoing. It is characterized by the curling of the leaves, which later show black spots due to the production of numerous dark spores in patches on the diseased leaves. The damage is often considerable, as the crop is greatly lessened by the interference with the functions of the leaf. The parasite may be held in check by spraying with Bordeaux mixture early in the season. The fungus passes the winter on pieces of leaf, &c., left on the ground. All such refuse should be cleared up and burned. A third fungus, *Cercospora concors*, also forms spots on the leaves and may be kept in check by the same means.

Wiltting of the foliage followed by the discoloration of the stem and branches is characteristic of a disease of the potato known as "Blackleg." This disease is due to the presence of large numbers of *Bacillus solanacearum* in the tubes through which water is conveyed to the leaves from the roots. Their presence causes the appearance of blackish streaks in the stem and a dark ring some little distance below the surface in the tissues of the tuber. Tubers showing any trace of such a ring should not be used for seed, and rotation of crops should be observed as a means of preventing the infection of the crop with the germ. Biting and sucking insects have been found to carry the bacilli from one plant to another.

The tubers frequently show scurfy or scab-like spots upon their surface, thus greatly depreciating their value for market purposes. The fungus, *Sorosporium scabies*, which is the cause of the scab, does not penetrate into the flesh of the tuber, nor detract from its edible properties. Excess of lime in the soil is said to favour the development of the fungus. Similar spots are produced on potatoes in America by the fungus *Gospora scabies*, and in both cases, if affected "seed" potatoes are sown, a second infection of the soil is likely. The control of the disease involves the whole surface of the field as the fungus has been of recent introduction into Great Britain, but bids fair to become very troublesome. The spores of the fungus pass the winter in the soil and the delicate mycelium attacks the young shoots in the summer. These become brown, finally blackish and greatly contorted until a large scab is formed on the developing tuber, whence the name by which the disease is known—"black scab." Diseased potatoes left in the soil and even slightly diseased "sets" are a source of infection of succeeding crops. Rotation must be observed and no diseased sets planted.

The rotting of tubers after lifting may be due to various causes, but the infection of the tubers by the *Pseudomonas* already mentioned is a frequent source of this trouble, while "Winter Rot" is due to the fungus *Neotria Solani*. This fungus finds conditions suitable for growth when the potatoes are stored in a damp condition; rotting from this cause rarely occurs when they are dried before being placed in heaps. The first signs of this fungus are the appearance of small white tufts of mycelium bursting through the skin of the tuber, the ends of the fungus being visible in tufts of the threads forming these tufts. This form of fruit is succeeded by others which have received different names, and lastly by the mature *Neotria* which forms minute red flake-shaped perithecia on parts of the rotted potatoes that have dried up. The intermediate forms are known as *Monosorium*, *Pusarium* and *Cephalosporium*. The pieces of dried-up potato with the spores of *Neotria* upon them are a source of infection in the succeeding year, and care should be taken that diseased tubers are not planted. Flowers of sulphur plentifully sprinkled over the potatoes before storing has been found to check the spread of the rot in the heap.

**POTATO RACE**, a running contest, where the winner is the first who collects in a basket or other receptacle a number of potatoes, usually eight, placed, as a rule two yards apart, along a straight line, and then crosses a finish line five or ten yards farther on.

**POTATO WAR** (*Kartoffelkrieg*), the name given by the Prussians to the War of the Bavarian Succession in 1778-79. The Prussians and a Saxon contingent, commanded by Frederick the Great and his brother Prince Henry, were opposed to two French armies under Loudon and Lacy. The Prussians consisted almost entirely of manœuvre which had for their object the obtaining or the denial to the enemy of food-supplies. The war thus acquired the name of *Kartoffelkrieg*. Its duration was from the 3rd of July 1778 to the assembly of the congress of Teschen on the 10th of March 1779, and its total cost £4,350,000 and 20,000 men to all parties. The war may be studied from the military point of view as an extreme example of what Clausewitz calls "war with a restricted aim."

**POTAWATOMI** (properly *Potawatomi*), fire-makers, in allusion to their secession from the Ojibway, and their establishment of a separate council-fire, a tribe of North American Indians of Algonquian stock. When first known (about 1670), they lived around Green Bay, Wisconsin. They subsequently moved south and eventually settled in lower Michigan. They were allied with the French in their wars against the Iroquois and took part in the conspiracy of Pontiac (q.v.). In the War of Independence they fought for England, as also in that of 1812. In 1846 most of them were removed to a reservation in Kansas. Of these the majority have abandoned their tribal relations and become citizens. Others are in Wisconsin and the state of Oklahoma. They now number some 2500.

**POTCHEFSTROOM**, a town of the Transvaal, 88 m. S.W. of Johannesburg and 222 m. N.E. of Kimberley by rail. Pop. (1904), 5348, of whom 6014 were whites. The town stands 4100 ft. above the sea on the banks of the Mooi River, 15 m.
above its junction with the Vaal. The streets are lined with fine willow trees, and there are public grounds in which are nurseries and a showyard. Golf links add to the attractions of the place, which is one of the healthiest in the Transvaal. In the neighbourhood are gold-mines; the reef appearing to be a continuation of the Witwatersrand reefs. The Vaal river goldfields, of which Venterskroon is the centre, are 16 to 20 m. south-east of Potchefstroom.

Potchefstroom was founded in November 1838 by Hendrik Potgieter, and is the oldest town in and first capital of the Transvaal. In 1862 it was the scene of civil war between rival Boer factions. In 1880-81 the garrison camped outside the town was besieged by Boers under Commandant P. A. Cronje. The British troops (250 in number) were confined to a fort 25 yds. square and lost over a third of their strength in killed and wounded before they surrendered on the 21st of March, the investment having begun on the 18th of December 1880. Charges of treachery were brought against Cronje for failing to notify the besieged that an armistice had been agreed to by the Boer leaders. Of this armistice Colonel R. C. Winsloe, who was in command of the British, became aware before the surrender took place. On the suggestion of Commandant Cronje, General Barney was detached from the main body, and a cart loaded with brandy was sent to the garrison, after which the British were allowed to abandon the town until the conclusion of peace. In the Anglo-Boer War of 1899-1902 Potchefstroom was occupied by the British without opposition. (See Transvaal: History.)

POTEMKIN, GRIGORY ALEKSANDROVICH, PRINCE (1739-1791), Russian statesman, was born at Chizheva near Smolensk. He was educated at the Moscow University, and in 1755 entered the "Reiter" of the Horse Guards. His participation in the coup d'état of the 8th of July 1762 attracted the attention of the new empress, Catherine II., who made him a Kammerjunker and gave him a small estate. The biographical anecdotes relating to him during the next few years are obscure and mostly apocryphal. In 1768 he quit the Guards and was attached to the court as a Kammerherr, but in 1769 he volunteered for the Turkish War and distinguished himself at Khotin, Foschani and Larga, besides routing the Turks at Olta. It was not till 1771 that he became Catherine's prime favourite. In that year he was made an adjutant-general, lieutenant-colonel of the Preobrazhensky Guards, a member of the council of state, and, in the words of a foreign diplomatist, "the most influential personage in Russia."

Somewhat later he was created a count, and appointed commander-in-chief of all the Russian forces in the New World. When conquered provinces in the Ukraine were then called. In 1776, at Catherine's request, the emperor Joseph II. raised Potemkin to the rank of a prince of the Holy Roman Empire. In 1775 he was superseded in the empress's graces by Zavadovsky; but the relations between Catherine and her former lover continued to be most friendly, and his influence with her was never seriously disturbed by any of her subsequent favourites. A whole mass of facts testify to the enormous and extraordinary influence of Potemkin during the next ten years. His correspondence with the empress was uninterrupted. The most important events of the period passed through his hands. Catherine loaded him with gifts. He was deeply interested in the question of the southern boundaries of Russia and consequently in the fate of the Turkish Empire. It was he who, in 1776, sketched the plan for the conquest of the Crimea which was subsequently realized; and about the same period he was busy with the so-called "Greek project," which aimed at restoring the Byzantine Empire under one of Catherine's grandsons. In many of the Balkan states he had well-informed agents. After he became field marshal, in 1784, he introduced many reforms into the army, and built a fleet in the Black Sea, which, though constructed of very bad materials, did excellent service in Catherine's second Turkish campaign. In 1787-89 he was on the scene of civil war, as well as of the Crimean War, and was exposed to very severe criticism, yet it is impossible not to admire the results of his stupendous activity. The arsenal of Kherson, begun in 1778, the harbour of Sevastopol and the new fleet of fifteen liners and twenty-five smaller vessels, were monuments of his genius. But there was exaggeration in all he attempted. He spared neither men, money, nor himself in attempting to carry out his gigantic scheme for the colonization of the south Russian steppes; but he never calculated the cost, and more than three-quarters of the design had to be abandoned when but half finished. Catherine's famous expedition to the south in 1787 was a veritable triumph for Potemkin; for he contrived to conceal all the weak points of his administration and to present everything in a rose-coloured light. On this occasion he received the title of prince of Tauris. The same year the second Turkish War began, and the founder of New Russia took upon himself the responsibilities of commander-in-chief. But the army was ill-equipped and unprepared; and Potemkin in an hysterical fit of depression gave everything up for lost, and would have resigned but for the steady encouragement of the empress. Only after Suvarov had valiantly defended Kinburn did he take heart again, and besiege and capture Ochakov and Bender. In 1790 he conducted the military operations on the Dniester and held his court at Jassy with more than Aslatic pomp. In 1791 he returned to St Petersburg where, along with his favorite, Catherinian adherent Potemkin, which was overthrown, the new favourite, Zubov, and in four months spent 850,000 roubles in banquets and entertainments, a sum subsequently reimbursed to him from the treasury.

This the empress grew impatient and compelled him (1791) to return to Jassy to conduct the peace negotiations as chief Russian plenipotentiary. On the 5th of October, while on his way to Nikolayev, he died in the open steppe, 40 m. from Jassy, in consequence of eating a whole goose while in a high state of fever. Very various are the estimates of Potemkin. Neither during his life nor after his death did any two people agree about him. The German pamphlet: Ponsam Rhfrst der Finsterniss und seine Celiebche, published in 1794, is a fair specimen of the opinion of those who regarded him as the evil genius of Catherine and of Russia. But there were many, including the empress herself, who looked upon him as a man of manifold and commanding genius. He was indubitably the most extraordinary of all the Catherinian favourites. He was an able administrator, but wanting in self-control. Licentiousness, extravagance and an utter disregard for human life were his weak points, but he was loyal, generous and magnanimous. Nearly all the anecdotes related of him by Helbig, in the biography contributed by him to the Journal Minerva (1791-1800), and freely utilized by later biographers, are absolute fables. (See also W. H. S. Livings: Geschichte Katharinas II. (Berlin, 1891-1893); C. de Larivièrè, Catherine la Grande d'après sa correspondance (Paris, 1895); Anonymous, La Cour de Catherine II. Ses collabora- teurs et ses agents successifs (St Petersburg, 1897); L. Jaspars: Geschichte der Kaiserin Katharina die Große, 1745-1796 (R. N. B.)

POTENTILLA, (nat. order Rosaceae, q.v.), a border and rock-garden plant. Many of the species bear brilliantly coloured flowers and graceful foliage. A soil of a good loamy staple, enriched with rotten dung, will grow the potentilla to perfection. Potentillas may be increased, though not very freely, by parting them into as many pieces as there are crowns, the side growths being those which can usually be thus separated. This may be done in autumn or spring, and the plants will generally bloom the following season. The species and some of the varieties reproduce true from seed, and are readily increased by that means. The following are some of the best kinds: aurea, aetrosanguinea, davurica, formosa, nitida, n. atro-rubra, speciosa, tridentata and villosa.

POTENTIOMETER, an instrument for the measurement of electromotive force and also of difference of electric potential between two points. The term potentiometer is usually applied to an instrument for the measurement of steady or continuous potential difference between two points in terms of the potential of the terminals of a standard voltaic cell of some kind, such as a Clark or Weston cell. The modern potentiometer has been developed out of an arrangement due to J. C. Poggendorff, employed also by J. Latimer Clark, but converted
into its modern direct reading form by J. A. Fleming in 1885 (see *Industries*, 1886, i. 155). In principle the modern potentiometer consists of an arrangement by means of which any potential difference not exceeding a certain assigned value can be compared with that of a standard cell having a known electromotive force. In simplest form it consists of a long, straight, fine, uniform wire stretched over a divided scale. The ends of this wire are connected to one or more secondary cells of constant electromotive force, a variable resistance being interposed so as to regulate the current flowing through the fine wire. To one end of this fine wire is attached one terminal of a sensitive galvanometer. Sliding contacts can be moved along the fine wire into any position. Supposing that the scale under this wire is divided into 2000 parts and that we are in possession of a standard Clark cell, the electromotive force being known at various temperatures, and equal, say, to 1.434 volts at 15°C. The first process is to set the potentiometer. The slider is placed so as to touch the fine wire at division No. 1434 on the fine wire, and the Clark cell is connected in between the sliding contact and one terminal of the galvanometer, so that its negative pole is connected through the galvanometer with that end of the fine wire to which the negative pole of the working battery is attached. The resistance in circuit with the fine wire is then altered until the galvanometer shows no deflexion. We then know that the fall of potential down the 2000 divisions of the fine wire must be exactly 2 volts. If then we substitute for the standard cell any other source of electromotive force, we can move the slider into another position in which the galvanometer will show no deflexion. The scale reading then indicates directly the electromotive force of this second source of potential. Thus, for instance, if an experiment were made with a Leclanché cell, and if the balancing-point were found to be at 1500 divisions on the scale, the electromotive force would be determined as 1.500 volts. Instead of adjusting in this manner the electromotive force of any form of cell, if we pass any constant current through a known resistance and bring wires from the extremities of that resistance into connexion with the slider and the galvanometer terminal, we can in the same way determine the fall of potential down the above resistance in terms of the electromotive force of the standard cell and thus measure the current flowing through the standard resistance.

In the practical form the potentiometer wire is partly replaced by a number of coils of wire, say 4 or 6, and the poten-
tiometer wire itself has a resistance equal to one of these coils. One terminal of the galvanometer can then be shifted to the junction between any pair of consecutive coils and the slider shifted to any point on the potentiometer wire. By such an arrangement the potential difference can be measured of any amount from 0 to 1.5 volts. In some cases the potentiometer wire is wholly replaced by a series of coils divided into small subdivisions. We may employ such a potentiometer to measure large potential difference greater than the electromotive force of the working battery, as follows: The two points between which the potential difference is required are connected by high resistance, say of 100,000 ohms or more, and from the extremities of a known fraction of this resistance, say, 1/100 or 1/1000 or 1/10,000 wires are brought to the potentiometer and connected in between the slider and the corresponding galvanometer terminal. We can thus measure as described the drop in volts down a known fraction of the whole high resistance and therefore calculate the fall in potential down the whole of the high resistance, which is the potential difference required. The potentiometer and the divided resistance constitute a sort of electrical scaleyard by means of which any electromotive force or difference of potential can be compared with the electromotive force of a standard cell. Very convenient and practical forms of potentiometer have been devised by Crompton (fig. 2), Nalder, Elliot Bros., Fleming and others. An essential accompaniment therefore of the potentiometer is a series of standard low resistances, say of 0-1, 0-01, 0-001 and so on, of such a nature as to be able to divide into known fractions. In practical work, the low resistances take the form of certain strips of metal which have on them two pairs of terminals, one termed "current terminals," and the other potential ter-
inals. These resistance strips, as they are called, are carefully adjusted so that the resistance between the potential terminals has a known low value. In order to measure the value of a continuous electric current, and therefore to calibrate any amperemeter which precedes as follows: The amperemeter is placed in series with a suitable low resistance strip, say of 0-01 ohm. From the potential terminals of the strip, wires are brought to the potentiometer so as to determine their potential difference in terms of the electromotive force of the standard Clark cell. An observation is then taken of the reading of the amperemeter and of the fall of potential down the low resistance when a certain steady current is passing through the strip and amperemeter. Supposing that the potential fall down the strip is found to be 0-981 volt, the strip difference having a resistance of 0-01 ohm, it would be seen that the current passing through the strip was 98.1 amperes. If then the amperemeter scale reading was 100 it would show an error of that scale reading of minus 1-9 amperes or nearly 2%. In the same manner the potentiometer may be used to calibrate a volt-meter by the aid of a divided resistance known value.

Standard Cells.—A necessary adjunct to the potentiometer is some standard cell to be used as a standard of electromotive force. In the case of the Clark standard cell above mentioned the elements are mercury and zinc separated by a paste of mercurous and zinc amalgam and connected with a cell case of phosphorite. The German experts seem to favour the latter form; the specifi-
cation issued by the Physikalisch-Technische Reichsanstalt of Berlin may be found in the *Elektrician*, xxxi. 265-266. The electromotive force of the cell diminishes with rise of temperature, the board of trade value being 1.434 volts at 15°C. and 1.434 (1 - 0.000077 (1 - 15) volts at 0°C. A more exact expression is obtained if instead of 0-000077 a value of 0-000077281 is used. The Weston standard cell cadmium and cadmium sulphate are substi-
tuted for zinc and zinc sulphate; it has the advantage of a much smaller coefficient of temperature variation than the Clark cell. It is conventionally made up in a glass vessel of H form, pure mercury and cadmium amalgam being the two elements (fig. 3).

1 According to K. Kahle and W. Wien, the electromotive force of the H form of Clark cell is 1.4322 volts at 15°C.
POTENZA—POTGIETER

and when made as directed below it has at \( r^\circ \) C. an electromotive force \( E \) volts, such that

\[ E = 1.0184 - 0.00000406 (t - 20) - 0.00000005 (t - 20)^2 + 0.000000001 (t - 20)^3. \]

After the platinum wires have been sealed through the glass, a little aqua regia is placed in the cell lengthwise to double the electrolyte from the platinum, when it is thrown out and replaced with a solution of mercuric nitrate. Then, by the use of another piece of platinum as anode, mercury is electrolytically deposited on the platinum, which may also be amalgamated by making it white hot in a Bunsen flame and plunging it in mercury. To prepare the cadmium amalgam, one part of pure cadmium is dissolved in six parts of pure mercury, and the product while warm and fluid is placed in one limb of the cell and warmed, to ensure perfect contact with the platinum wire. The cadmium sulphate solution is prepared by digesting a saturated solution of cadmium sulphate with cadmium hydroxide to remove free acid, care being taken not to raise the temperature above 70° C, and then by digesting it still further with mercuric sulphate until no more precipitation occurs. The cadmium sulphate solution is then made of the salt in it. The mercuric sulphate must be free from acid, and made neutral by titration with finely divided mercury. In making the paste, so much cadmium sulphate must be added that a saturated solution of that salt is formed, and is present in the cell. The cell has the electromotive force above stated if the amalgam of cadmium has from 6 to 13 parts of mercury to 1 of cadmium. The German investigators seem to have a great predilection for the H form of cell, but it is clear that a narrow tubular cell of the British board of trade form not only comes more quickly to the temperature of the water bath in which it is placed, but is more certain to be wholly at that temperature. In a modern form of the H cell made by F. E. Smith, of the National Physical Laboratory (Phil. Trans., A, 207, pp. 393-420), a contraction formed in the side of the vertical tube tends to hold the contents in place. Fig. 4 shows this cell, hermetically sealed, mounted in a brass case.

In cases where great accuracy is not required, a Daniell cell can be used as a standard of electromotive force. The form designed by J. A. Fleming (Phil. Mag., 20, p. 126) consists of a U tube, one leg of which contains a rod of pure amalgamated zinc, and the other a rod of amalgamated copper. The leads are filled with solutions of zinc sulphate and copper sulphate, the zinc rod being in the zinc solution and the copper rod in the copper sulphate. When so made, the cell has an electromotive force of 1.072 volts and no sensible temperature variation. The solutions are made by dissolving the purest recrystallised sulphate of copper and sulphate of zinc in distilled water. For the zinc solution, take 55.5 parts by weight of crystals of zinc sulphate (\( \text{ZnSO}_4 \cdot 7\text{H}_2\text{O} \)) and dissolve in 44.5 parts by weight of distilled water; the resulting solution should have a specific gravity of 1.200 at 20° C. For the solution of copper, take 16.5 parts by weight of pure crystals of copper sulphate (\( \text{CuSO}_4 \cdot 5\text{H}_2\text{O} \)) and dissolve in 83.5 parts by weight of water; the resulting solution should have a specific gravity of 1.200 at 20° C. The solutions should be allowed to stand to these densities and kept in stock bottles, from which the reservoirs of the cell should be filled up as required.

A form of potentiometer employing a vibration galvanometer and suitable for alternating currents measured by tachoelectric methods has been devised by Dr Drysdale (see Proc. Phys. Soc. Lond. 1909, 21, 561.).

POTENZA (anc. Potentia), a town and episcopal see of Basilicata, Italy, capital of the province of Potenza, 103 m. by rail E. by S. of Naples. Pop. (1901), 12,313 (town); 16,163 (comm.). Situated 2700 ft. above sea-level on an isolated hill above the Basento (anc. Casentumus), it is much exposed to winds and has a far more northerly climate than its position (40° 40' N.) implies, and is indeed one of the coldest places in Italy (mean temp. Jan 37° F., July 70-9°, for whole year 58° F.). It has a large market and is a chief centre for the output of the earthquake of 1857; it has a school of the industrial arts and sciences, grows good wine, and makes bricks.

The ancient Potentia lay some 470 ft. lower, by the river. Its name shows that it was of Roman origin, and its importance was no doubt due to its position at the intersection of the road leading west to the Via Popillia and north-east to the Via Appia, with the Via Hercula. No remains are visible, but a considerable number of inscriptions have been found. Potentia must be distinguished from Potentia in Picenum, on the Adriatic coast, near the modern Porto di Recanati, a colony founded in 184 B.C., the same year as Pisaurom, but of which little is known.

The abandonment of the old site and the erection of the new town probably date from the earthquake of 1273. By the Angevines Potenza was made a domain of the San Severino family; in the beginning of the 13th century it was held by Francesco Sforza, and in 1435 it passed to the Guevara family; the Loffredo, who succeeded by marriage, continued in possession till the abolition of the great fiefs. In 1694 there was a severe earthquake; and the more terrible earthquake which on the 16th and the 17th of December 1857 passed through southern Italy, and in Basilicata alone killed 32,475 persons, laid the greater part of Potenza in ruins. In 1860 it was the first town to rise against the Neapolitan government.

POTGIETER, EVERHARDES JOHANNES (1808-1875), Dutch prose writer and poet, was born at Zwolle, in Overysel, on the 17th of June 1808. He started life in a merchant’s office at Antwerp. In 1831 he made a journey to Sweden, described in two volumes, which appeared at Amsterdam in 1836-1840. Soon afterwards he settled in Amsterdam, engaged in commercial pursuits on his own account, but with more and more inclination towards literature. With Heijz, the popular poet of Holland in those days, and Bakhuizen van den Brink, the rising historian (who also Gelegen van Pinxters, Potgieter founded, the *Vesuvius* ("The Muses," 1834-1836), a literary review, which was, however, soon superseded by De Gids ("The Guide"), a monthly, which became the leading magazine of Holland. In it he wrote, mostly under the initials of "W. D—g," a great number of articles and poems. The first collected edition of his poems (1832-1868) appeared in 2 vols. (Haarlem, 1868-1875), preceded by some of his contributions to De Gids, in 2 vols. also (Haarlem, 1864), and followed by 3 vols. of his Studien en Schetsen ("Studies and Sketches," Haarlem, 1879). Soon after his death (Feb. 3, 1875) a more comprehensive edition of Potgieter’s Verspreide en Nagelaten Werken ("Miscellaneous and Posthumous Works") was published in 8 vols. by his friend and literary executor, Johan C. Zimmerman (Haarlem, 1875-1877), who likewise supervised a more complete edition of Potgieter’s writings which appeared at Haarlem in 1885-1890 in 19 vols. Of Potgieter’s *Het Noorden in Omtrekken en Tafreelen* ("The North in Outlines and Pictures") the third edition was issued in 1882, and an édition de luxe of his poems followed at Haarlem in 1893. Under the title of *Personen en Onderwerpen* ("Persons and Subjects") many of Potgieter’s criticisms had collectively appeared in 3 vols. at Haarlem in 1885, with an introduction by Busken-Huet.

Potgieter’s most famous and the private Dutch classics was Hoft, whose peculiarity in style and language he admired and imitated. The same vein of altruistic, if often exaggerated and biased, abhorrence of the wonted conventionalities of literary life runs through all Potgieter’s writings, even that which was written with Huet, parts of which have been published. Potgieter remained to his death the irreconcilable enemy of the Dutch "Jan Saie," as the Dutchman is nicknamed who does not believe in the regeneration of the Dutch people. Potgieter held up the Nederlanders of the golden age of the
16th and 17th centuries as models to be emulated. In these views he essentially differed from Huet. Yet the two friends worked harmoniously together; and when Potgieter reluctantly gave up De Gédé in 1665, it was Huet whom he chose as his successor. Both then proceeded to Italy, and were present at the Dante festivities at Florence, which in Potgieter's case resulted in a poem in twenty stanzas, De Dante Alighieri, the first of his Poésies. Potgieter's influence has been very marked and beneficial; but his own style, that of a purist, was at times somewhat forced, stilted and not always easily understood.

(H. T.)

POTHIER, ROBERT JOSEPH (1669-1772), French jurist, was born at Orleans on the 9th of January 1669. He studied law for the purpose of qualifying for the magistracy, and was appointed in 1720 judge of the presidial court of Orleans, thus following in the footsteps of his father and grandfather.

This post he held for fifty-two years. He paid particular attention to the correction and co-ordination of the text of the Pandects, his Pandectae Justinianiæ in novum ordinem digestæ (Paris and Chartres, 1748-1752) being a classic in the study of Roman law. In 1749 he was made professor of law in the university of Orleans. He wrote many learned monographs on French law, and much of his work was incorporated almost textually in the French Code Civil. He died at Orleans on the 2nd of March 1772. Of his numerous treatises the following may be specially mentioned: Traité des obligations (1761); Du Contrat de vente (1762); Du Contrat de bail (1763); Du Contrat de société (1765); Des Contrats de prêt de consommation (1766); Du Contrat de dépeç et de mandat (1766); Du Contrat de nantissement (1767), &c. His works have several times been published in collected form (edited by Gillfrein, 1820-1824; by Dupin, 1823-1825, and by Bugnet, 2nd ed. 11 vols. 1861-1865).

See Dupin, Dissertation sur la vie et les ouvrages de Pothier (Paris, 1823), and Frémont, Vie de R. J. Potier (Orleans, 1850).

POTHOOK, an S-shaped metal hook for suspending a pot over a fire. While one extremity is hooked to the handle of the pot, the other is caught upon an iron crane moving on a pivot over the fire. Modern cooking-ranges have obviated the necessity for this arrangement, but it is still to be seen in great numbers of country cottages and farmhouses kitchens all over England, and in small artisans' houses in the west midlands and the north. In the elementary teaching of writing the "pot-hook" is a script of similar shape.

POTI, a seaport of Russian Transcaucasia, in the government of Kutais, at the mouth of the Rion on the coast of the Black Sea, 51° 59' 45" N., 37° 35' 13" E., of the town of Poti, in co. of Batum. Pop. (1888), 3113; (1907), 7660. The white walls of the fort contrast with the green turrets which surround them, and the lighthouse, 117 ft. high, is visible 17 m. Situated in a marshy delta not more than 2½ ft. above the level of the river, Poti is extremely unhealthy, fever and ague prevailing in summer and autumn. The Russians have improved the town and port, but the latter is still exposed to west and south-west gales. A new entrance was constructed in 1905, and a new inner harbour was at the same time under construction. The shipping trade amounts to £50,000 to £60,000 a year, almost entirely marquise oil, with some maize.

Poti represents the ancient Phasis, a commercial colony of the Greek city of Miletus. The present fortress was built in 1578 by Sultan Murad III. of Turkey at the time of a war with Persia. In 1640 it was destroyed by the Imeretians (Georgians), but it was restored and enlarged. The town was a great slave market. It was captured by the Russians in 1812 and 1829.

POTLATCH, a term, corrupted from a Nootka Indian word for "gift," for a ceremonial custom among some of the Indian tribes of north-west America, consisting in the distribution by an individual of his property among his friends and neighbours, who make equivalent gifts, with interest, in return.

POTOCKI, IGNATY (1710-1800). In Polish Statesman and writer, son of Eustachy Potocki, general of artillery of the army of Lithuania, was born at Podhajce. He was educated first at Warsaw beneath the eye of the pedagogic reformer Stanislaw Konarski (1700-1773), and subsequently in Italy, where he proposed to take orders. On returning home, however, he abandoned this idea, and as a member of the newly instituted commission of education rendered invaluable services to his country for the next sixteen years. He earnestly desired a reform of the constitution also, and was thus attracted to the party of the Czartorysky. Elected deputy to every diet since 1778, he was a conspicuous member of the patriotic opposition. In matters of importance nothing was done without his advice, and he was esteemed as much for his character as for his talents. His influence was at its height during the Four Years' Diet, 1778-1782. He was appointed a member of the committee for the reform of the constitution, defended eloquently the right of the towns to the franchise, and was an advocate of an alliance with Prussia. Thus he was one of the creators of the constitution of the 3rd of May 1791, although his aristocratic antecedents prevented him from going the lengths of the more radical reformers. On the formation of the confederation of Targowica, Potocki emigrated to Dresden; but on the outbreak of the revolution of 1794 returned to Poland, was appointed a member of the national government, and entrusted with the conduct of foreign affairs. On the fall of Warsaw he surrendered to Suvarov and was sent to Russia, where he remained till 1796. On his return to Poland in 1796 he was made president of the Diet, where for the next thirteen years he devoted himself to literature. At the end of the war of 1809 he was commissioned to go to Vienna to present to Napoleon the petitions of the Galicians for the incorporation of their province with the grand duchy of Warsaw. He died at Vienna the same year. The most notable of Potocki's works is: Vom Entstehen und Untergangen der polnischen Konstitutionen vom 3ien Mai 1792 (Lemberg, 1793).

See August Sokolowski, Illustrated History of Poland (Pol.), vol. iv. (Vienne, 1901).

POTOCKI, STANISLAW FELIX (1752-1809), Polish politician, son of Franciszek Salezy Potocki, palatine of Kiev, of the Tulcyn line of the family, was born in 1752. He entered the public service, and owing to the influence of his relations became grand standard-bearer of the Crown at the age of twenty-two. In 1782 he was made palatine of Russia, in 1784 a lieutenant-general, and in 1786 he purchased the rank of a general of artillery from the Saxon minister, Bruhl, for 20,000 ducats. Elected deputy for Bracław at the famous Four Years' Diet, he began that career of treachery which was to terminate in the ruin of his country. Yet his previous career had awakened many hopes in him. A great provincial ruling patriarchally in his vast estates, liberal, enlightened, a generous master and a devoted patriot, his popularity culminated in 1784 when he presented an infantry regiment of 400 men as a free gift to the republic. But he identified the public welfare with the welfare of the individual magnates. His scheme was the division of Poland into an oligarchy of autonomous grandes exercising the supreme power in rotation (in fact a perpetual interregnum), and in 1788 he won over to his views two other great lords, Xavier Branicki and Severin Razewski. The election of Malachowski (q.v.) and Kazimierz Sapieha as marshals of the diet still further alienated him from the Liberals; and, after strenuously but vainly opposing every project of reform, he retired to Vienna whence he continued to carry on an active propaganda against the new ideas. He protested against the constitution of the 3rd of May 1791, and after attempting fruitlessly to induce the emperor Leopold to take up arms "for the defence of the liberties of the republic," proceeded with his friends in March 1792 to St Petersburg, and subsequently with the connivance of the empress Catherine formed the confederation of Targowica for the maintenance of the ancient institutions of Poland (May 14, 1792), of which he was the marshal, or rather the dictator, directing its operations from his castle at Tulcyn. When the May constitution was overthrown and the Prussians were already in occupation of Great Poland, Potocki (March 1793) went on a diplomatic mission to St Petersburg; but, finding himself duped and set aside, retired to Vienna till 1797, when he settled down at Tulcyn and devoted himself for the remainder of his life to the improvement of his estates. He wrote On the
Polish Succession (Pol.) (Amsterdam, 1780); Protest against the Succession to the Throne (Pol.) (ibid. 1790); and other political works.

See Friedrich Schulz, Poland in the year 1793 (Pol.) (Warsaw, 1899); Josef Zajaczek, History of the Revolution of 1794 (Pol.) (Lemberg, 1881).

POTOMAC, a river in the east central part of the United States, having its source in the Allegheny Mountains and flowing S.E. into Chesapeake Bay. It is formed by the union of its north and south branches, about 15 m. S.E. of Cumberland, Maryland. The main stream has a length of about 450 m. and is navigable for large vessels for 113 m. above its mouth. The north branch, about 110 m. long, rises in the north-eastern part of West Virginia, pursues a north-easterly course, and forms part of the boundary between Maryland and West Virginia. The south branch has its sources in Highland county, Va., and in Pendleton county, W.Va., and flows north-east for about 140 m. until it joins the north branch. From the junction of these two streams until it reaches Harper's Ferry the Potomac river separates Maryland from West Virginia. At Harper's Ferry it receives the waters of the Shenandoah river and cuts through the Blue Ridge Mountains in a gorge noted for its scenic beauty. From this point to its mouth it forms the boundary between Virginia and Maryland. The stream crosses the Blue Ridge Mountains at an elevation of about 245 ft., and at Georgetown (Washington), 62 m. distant, it meets tidewater. Of this descent about 90 ft. occurs about 15 m. above Washing-
ton, at the Great Falls, a series of rapids about a mile long, including a cataract about 35 ft. high. Three and a half miles above Washington are the Little Falls, which mark the head of navigation. Large vessels, however, are prevented by a bridge from proceeding above Georgetown. At Washington there are two channels, with respective depths at mean low water of 18 and 21 ft. Large sums have been spent since 1870 on improving these channels. A few miles below the city the river broadens into a deep tidal estuary from 2½ to 7 m. wide; and channels 24 ft. deep and 200 ft. wide through all the shoals were secured by the project of 1899. The Anacostia river, or "East Branch," which flows into the Potomac just south of Washington, is navigable for large vessels for about 2 m. and for small scows and lighters as far as Bladensburg, Md., 82 m. above its mouth; its natural channel was narrow and tortuous, and about 18 ft. deep; in 1909 improvements (begun in 1902) had procured a channel 20 ft. deep at mean low water and 380 ft. wide. The Chesapeake & Ohio Canal, from Georgetown to Cumberland, Md., follows the Potomac closely on the Maryland side. The shipments over the Potomac above Washington in 1907 were valued at $7,596,494, and those below Washington at $21,093,800, the principal commodities being coal, iron and ores, gas, canned vegetables, and building and paving materials. The shipments on the Anacostia river were of much the same character, and in 1907 were valued at $4,312,687.

POTOROO, or RAT KANGAROO, any member of the diprotodont marsupial sub-family Potoroinae (see Marsupialia). None of them exceed a common rabbit in size. They inhabit Australia and Tasmania, are nocturnal, and feed on the leaves of grasses and other plants, as well as roots and bulbs, which they dig up with their forepaws; in this way some of them do considerable damage to cultivated crops. About ten species are known, presenting a considerable range of diversity in minor characters. The members of the type genus (Potorous) run, rather than leap, and do not use the hind feet for kicking. In the genus Bettongia the tail is prehensile, and with it they collect grass and twigs for making nests in their burrows.

Potosí, a department of Bolivia occupying the south-western angle of that republic, bounded N. by Oruro, Cochabamba and Chuquisaca, E. by the two last departments and Tarija, S. by Argentina and W. by Chile and Oruro. Pop. (1900), 325,615, the larger part Indians; area, 48,501 sq. m. The eastern part of the department is traversed north to south by the eastern branch of the Andes, locally known as the Cordillera de los Frailes and the Sierras de Chichas. Spurs and broken ranges project eastward from these, between which are the headstreams of the Placencia. The Placencia river, formed by the Plcayo and Guapay, the first flowing south-east to the La Plata, and the second north-east to the Madeira, with the Amazon. The Plcayo itself rises in the department of Oruro, but several of its larger tributaries belong to Potosí—the San Juan, Cota-
gata and Tumusla in the south, and Cachimayo in the north. The western part of the department belongs to the great Bolivian altiplanicie, or southern extension of the Titicaca basin. It is a barren, saline waste, almost uninhabitable. In the north, bordering on the transverse ridge of which the Cerro de Tahu-
a (17,454 ft.) forms a part, is the depression known as the Pampa de Empeza, 12,680 ft. above sea-level, which is largely a region of morasses and saline plains. On and near the southern frontier is another transverse ridge, in part formed by the Sierra de La Plata, in the eastward part of the department; the Cerro de Quiriyaco, in the westward part; over which the mountain passes leading to the S.E. plains rise to 10,700 ft.; and in the westward part of the department, in the north, are the Sierra de Lipez, 10,080 ft., and the Cerro de Potosí, 15,458 ft.; it is a waterless desert like the Puna de Atacama.

Potosí is essentially a mining department, though agriculture and grazing occupy some attention in the eastern valleys. The western plateau is rich in minerals, especially silver and copper. The Huanchaca group of mines, situated on the slopes of the eastern mountain range overlooking the Pampa de Empeza, has the largest output of silver in Bolivia. The Pulacayo mine, belonging to this group, 15,153 ft. above sea-level, ranks next to the Broken Hill mine of Australia in production. Between 1873 and 1901 it yielded 4320 tons of silver, or an estimated value of $7,23,000,000. Farther South is the Cerro de Potosí, the richest silver mine in the world, and a low-capping mountain range 15,458 ft. above sea-level, claimed to have the highest mine in the world; Porco, a few miles south-west of Potosí; Guadalupe, Colquechaca and Auлагas. Besides silver, the Chorolique mines also yield tin, copper, bismuth, lead and wolfram. In 1907 the national government undertook railways from Potosí to Oruro, 205 m., and from Potosí to Tupiza, 185 m., to connect with the Central Northern line of Argentina, which was opened to Quiaca on the frontier on the 25th of May 1908. In western Potosí the department is traversed by the Antoñagasta & Oruro railway (0.75 metre gauge). Besides Potosí, the capital of the department, the principal towns are Huanchaca (pop. about 100,000), the headquarters of the famous silver mines, 15,458 ft. elevation, and overlooking the Pampa de Empeza; Uyuni, 9 m. from Huanchaca, 12,100 ft. above sea-level, a small town but an important railway junction and commercial centre on the waterless plain, the shipping point and supply station for an extensive mining region; and Tupiza (pop. about 5000 in 1906), a prettily situated town near the Argentine frontier, on a small branch of the San Juan river, 9800 ft. above sea-level.

POTOSÍ, a city of Bolivia, capital of the department of Potosí, 47 m. (direct) S.W. of Sucre, or 88 m. by the post-road. Pop. (1906, estimate), 23,450. Potosí stands on a barren terrace on the northern slope of the Cerro Gordo de Potosí, 12,992 ft. above sea-level, and is one of the highest towns in the world. The famous cerro from which its name is taken rises above the town, and to part by apparently 1 ft., is baden, white-capped, and honeycombed with mining shafts. The town is regularly laid out with streets crossing each other at right angles. The smoke-begrimed buildings, many of which are unoccupied and in ruins, are commonly of adobe. A large plaza forms the conventional centre, around which are grouped various religious edifices, the government house, town hall, national college, the old "royal mint" dating from 1585, and the treasury. The city has a massive, plain cathedral, which in part dates from early colonial times, and in part from the closing years of Spanish rule. The water supply is derived from a costly system of reservoirs and aqueducts constructed by the Spanish government during the years of its city's greatest prosperity. There are 27 of these artificial lakes, and the aqueducts originally numbered 32, some of which are no longer serviceable. Rough mountain roads and pack animals are the only means of transportation to and from Potosí, but a railway from Oruro to Tupiza via Potosí, forming part of the projected Pan-American route, was contracted for in 1908. In 1861 the population of Potosí was reported to be 160,000, which probably included the whole mining district. A part of the diminution since then is explained by the fact that the great majority of the mines on the cerro have been abandoned.
The foundation of the city dates from 1547, two years after the first discovery of silver on the cerro by an Indian herder named Gualci. Charles V. conferred upon it the title of "villa imperial." From 1545 to 1800 the crown tax of one-fifth upon the mineral product amounted to £32,500,000, showing an acknowledged output of £163,000,000. The actual output, however, must have been much greater, as Spain was flooded with contraband silver, and there was a large trade in it at La Plata ports, whence it was taken to Brazil and Portugal.

The total output to 1864 has been estimated at more than £300,000,000, and the annual output, at the beginning of the 20th century barely exceeded 400,000 ozs. The struggle for independence began in Potosí on the 9th of November 1810, but the Spanish forces succeeded in retaining possession down to 1822.

POTOTAN, a town of the province of Iloilo, island of Panay, Philippine Islands, on the Jalaur river, about 17 m. N. of Iloilo. Pop. (1903), 37,373, including the population of Dingle (12,129) and Mina (2456), annexed after the census was taken. There is a fine church in the old town and a large stone church in Dingle; in the old town are several other buildings of masonry and wood. The industries are the cultivation of sugar-cane, Indian corn, rice, tobacco and hemp, and the raising of cattle, carabao, sheep and horses.

POTS DAM, a town of Germany, the administrative capital of the Prussian province of Brandenburg, and one of the principal residences of the German Emperor, beautifully situated on the river Havel, 16 m. S.W. of Berlin, on the main line of railway to Magdeburg. Pop. (1905), 61,415. It is also connected with the capital by two local lines and by a steamboat service through the chain of lakes formed by the river. The greater part of the town lies on the right bank of the Havel and is connected with the Teltow suburb on the opposite bank by a long bridge (Lange Brücke). At the north end of this bridge rises the royal palace, a large quadrangular building of the 17th century, with a colonnade, chiefly interesting for the numerous relics it contains of Frederick the Great, who made it his favourite residence. At the south-eastern corner of the palace, close to the bridge, is the tree under which petitioners waited for the answer to their grievances, which Frederick the Great gave from an opposite window. It also contains reminiscences of Voltaire, who resided here for several years. The principal churches are the Nikolaikirche, containing the remains of Frederick the Great and his father, Frederick William I.; and the Friedenskirche, or Church of Peace, erected by Frederick William IV. in 1845-1850. To the Friedenskirche is attached a mausoleum built after the model of a chapel at Inchnien in Tirol, in which are buried Emperor Frederick III. and his consort, the Princess Royal of Great Britain, and two of their children who died in infancy. Among other conspicuous buildings are the large barracks and other military establishments; the town hall; and the Brandenburg gate, in the style of a Roman triumphal arch. The town has fine statues of several of the Prussian kings, including Frederick the Great. The Lustgarten, the Wilhelmsplatz and the Plantage are open spaces laid out as pleasure-grounds and adorned with statues and busts. In spite of its somewhat sleepy appearance, Potsdam manufactures of silk goods, chemicals, furniture, chocolate, tobacco and optical instruments. Market-gardening affords occupation to many of the inhabitants, and the cultivation of winter violets is a specialty. The Havel is well stocked with fish. On a wooded eminence to the south of the town lies the observatory with extensive premises.

Potsdam is almost entirely surrounded by a fringe of royal palaces, parks and pleasure-grounds, which fairly substantiate its claim to the title of a "German Versailles." Immediately to the west is the park of Sans Souci, laid out by Frederick the Great, and largely extended by Frederick William IV. It is in the formal French style of the period, and is adorned with fountains, statuary and architectural ruins. Near the palace is the famous winnowing, now royal property, which, according to a tradition now regarded as doubtful, its owner refused to sell to the king, meeting threatened violence by an appeal to the judges of Berlin. A little farther on is the Orangery, an extensive edifice in the Italian style, containing numerous pictures and other works of art. The park also includes the Chinese laurel, a giant laurel tree which was a large plant graduating at the beginning of the 20th century barely exceeded 400,000 ozs. The struggle for independence began in Potosí on the 9th of November 1810, but the Spanish forces succeeded in retaining possession down to 1822.

The palace, containing the Marble Palace. The list of Potsdam palaces may be closed with two situations on the left bank of the Havel—one at Klein-Glienicker, formerly the country-seat of Prince Frederick Charles of Prussia (the "Red Prince"), and the other on the hill of Rabelsberg. The latter, designed as a miniature copy of Windsor Castle, in the midst of a park in the English taste, was formerly the summer residence of the emperor William I.

Potsdam was originally a Slavonic fishing-village named Pozzupini, and is first mentioned in writing by the name "Potostan" in the 14th century, but was unimportant until the great elector built a palace here between 1660 and 1682; and even at the close of his reign it was only occupied by inhabitants of William I. greatly enlarged Potsdam, and his stiff military tastes are reflected in the monotonous uniformity of the streets. Frederick the Great continued his father's work, and is the real creator of the present splendour of the town, to which all his successors have contributed.

See H. C. P. Schmidt, Geschichte und Topographie der Residenzstadt Potsdam (Potsdam, 1825); G. Selig, Potsdam und Sanssouci (Breslau, 1888); Mügge, "Führer durch Potsdam und Umgebung" (Potsdam, 1896); Köppisch, "Die königlichen Schlösser und Gärten zu Potsdam" (Berlin, 1854); and Bethge, Die Hohenzollerndenkmäler (Potsdam, 1890).

POTS DAM, a village of St. Lawrence county, New York, U.S.A., in the township of Potsdam, on the Raquette river, about 68 m. N.E. of Watertown. Pop. of the village (1905) 4162; (1910) 4036; of the township (1905) 8992; (1910) 8725. The village is served by the New York Central & Hudson River railway. It has a public library and is the seat of a state Normal School (1869), an outgrowth of St. Lawrence Academy (founded in 1810 by Benjamin Raymond and maintained by him until 1816, when it was corporated); of the Thomas S. Clarkson Memorial School of Technology (1869), founded by his sisters in honour of Thomas S. Clarkson (1827-1864); and of the Crane Normal Institute of Music. The village has a considerable trade in dairy products. In the neighbourhood are extensive quarries of the well-known "Potsdam sandstone," the uppermost division of the Cambrian system, described as a "fine-grained sandstone cemented with silica," and very durable. The House of Parliament at Quebec, All Saints Cathedral at Albany, New York, and many other public edifices were built of this stone.

The "Ten Towns" of St. Lawrence county, including the township of Potsdam, were sold by the state in 1877. The first settlement was made on the Raquette river, close to the present village, in 1803; the township was incorporated in 1806 and the village in 1831. Potsdam was named after Potsdam in Prussia because of the occurrence in each locality of reddish sandstone.

POTT, AUGUST FRIEDRICH (1802-1887), German philologist, was born at Nettelrede, Hanover, on the 14th of November 1802. He studied in Göttingen, and in 1825 became schoolmaster at Celle, Hanover; but after two years removed to Berlin, where he became privatdozent at the university. He studied comparative philology, and in 1833 was made professor at Halle, where he remained till his death on the 5th of July 1887. His Elymologische Forschungen (1834-1836) entitled him "the great modern disciple in the Indo-Germanic science of language. Pott also devoted much attention to the origins of the gipsies.

POTT, PERGIVAL (1714-1788), English surgeon, was born in London on the 6th of January 1714. He served his apprenticeship with Edward Nourse, assistant surgeon to St Bartholomew's Hospital, and in 1736 was admitted to the Barbers'
POTTER, A.—POTTER, J.

Company and licensed to practise. He became assistant surgeon to St Bartholomew's in 1744 and full surgeon from 1749 till 1757. He died in London on the 22nd of December 1758. The last words of his brain in England, on seeing even his pupil, John Hunter, on the practical side, he introduced various important innovations in procedure, doing much to abolish the extensive use of escharsotics and the actual cautery that was prevalent when he began his career. A particular form of fracture of the ankle which he sustained through a fall from his horse in 1756 is still described as Pott's fracture, and his book, Some Few Remarks upon Fractures and Dislocations, published in 1768 and translated into French and Italian, had a far-reaching influence in Great Britain and France. Pott's disease is a spinal affection of which he gave an excellent clinical description in his Lectures on the Diseases of the Spine, frequently found to accompany a Curvature of the Spine (1779). Among his other writings the most noteworthy are A Treatise on Ruptures (1756), Observations on the Nature and Consequences of those Injuries to which the Head is liable from external violence (1768), and Chirurgical Observations (1775). There are several editions of his collected works; that published by Sir James Earle in 1790 contains a sketch of his life.

POTTER, ALONZO (1800-1865), American bishop of the Protestant Episcopal Church, was born at Beekman (now La Grange), Dutchess county, New York, on the 6th of July 1800. His ancestors, English Friends, settled in Portsmouth, Rhode Island, and his father, a farmer, and a Quaker, and in 1798 and in 1814 was a member of the New York Assembly. The son graduated at Union College in 1818, and in 1821-1826 was professor of mathematics and natural philosophy there. In 1824 he was ordained priest, and married a daughter of Eliphalet Nott of Union College; she died in 1830, and in 1831 he married her cousin. He was rector of St Paul's Boston, from 1826 to 1831, when he became professor of moral and intellectual philosophy and political economy at Union. In 1838 he refused the post of assistant bishop of the eastern diocese (Maine, New Hampshire, Massachusetts and Rhode Island), but in 1838-1843 he was vice-president of Union College in 1838-1843. After the suspension of Henry Ustick Onderdonk (1789-1858) from the bishopric of Pennsylvania Potter was chosen to succeed him, and was consecrated on the 23rd of September 1845. Owing to his failing health he visited England and France in 1858, and in April 1864 sailed from New York for California, but died on board ship in San Francisco harbour on the 4th of July 1865.

In 1846 he established the western and northern convocations of priests in dioceses; from 1850 to 1860, when his corner-stone was laid, he laboured for the "Hospital of the Protestant Episcopal Church in Philadelphia"; and in 1861 he established the Philadelphia Divinity School. In 1842 with George B. Emerson (1797—1871) he published The School and the Schoolmaster, which had a large circulation and great influence. In 1825, 1828, 1849 and 1853 he delivered five courses of lectures on the Lowell Institute foundation. He advocated temperance reform and frequently delivered a lecture on the Drinking Usages of Society (1852); he was an opponent of slavery and published a reply to the pro-slavery arguments of Bishop John Henry Hopkins (1792—1868) of Vermont. He edited many reprints and collections of sermons and lectures, and wrote several treatises, including: Of Science and Art (1840), The Law of Limits which is to the Domestic and Mechanic Arts (1841), Handbook for Readers and Students (1843), and Religious Philosophy (1870).

His brother, HORATIO POTTER (1802—1887), was born in Beekman, New York, on the 4th of February 1802. He graduated at Union College in 1826, was ordained a priest of the Protestant Episcopal Church in 1828, was rector for several months in Saco, Maine, and in 1828-1833 was professor of mathematics and natural philosophy at Washington (now Trinity) College, Hartford, Connecticut. In 1833-1835 he was rector of St Peter's, Albany; in November 1834 he was elected provincial bishop of New York in place of Benjamin Tredwell Onderdonk (1791—1861), who had been suspended, and upon Onderdonk's death he became bishop. In 1868 his diocese was divided, the new dioceses of Albany, Central New York, and Long Island being separated from it. Bishop Potter attended the Lambeth conferences of 1867 and 1868. His failing health put an end to his work. In 1883, with his nephew, H. C. Potter (q.v.), became his assistant. He died in New York City on the 2nd of January 1887.

POTTER, HENRY CODYMAN (1835—1908), American Protestant Episcopal bishop, the son of Bishop Alonzo Potter, was born in Schenectady, New York, on the 25th of May 1835. He was educated in the Philadelphia Academy of the Protestant Episcopal Church and in the Theological Seminary of Virginia, where he graduated in 1857. He was ordained deacon in 1857 and priest in 1858; was rector of Christ Church, Greensburg, Pennsylvania, in 1858-1859, and of St John's Church, Troy, N. Y., in 1859-1861; refused the presidency of Kenyon College in 1860 and the bishopric of Iowa in 1874; was secretary of the House of Bishops in 1866-1883; and was assistant rector of Trinity Church, Boston, in 1866-1868, and rector of Grace Church, New York City, in 1868-1884. In October 1883 he was consecrated assistant to his uncle, Horatio Potter, bishop of New York, and in 1887 succeeded him. The Rev. David Hummell Greer (b. 1844) became his coadjutor in September 1903, and succeeded to the bishopric after the death of Bishop Potter in Cooperstown, N. Y., on the 21st of July 1908. During Bishop Potter's administration the corner-stone of the Cathedral of St John the Divine was laid in (1892).

He was notable for his interest in social reform and in politics; as rector of Grace Church he worked to make it an "institute church" with working-men's clubs, day nurseries, kindergartens, &c., and he took part in the summer work of the missions on the east side in New York City long after he was bishop; in 1894 he was elected a Tammany Hall man and became a Tammany judge; and in 1901 he was appointed a Tammany commissioner to the city government, where he was active in the reform movement which elected Seth Low mayor in the same year; he frequently assisted in settling labour disputes; he was for the reestablishment of the army canteen and attempted to improve the saloon, which he called the "poor man's club"—notably by his taking part in the opening (August, 1904) of the successful Onderdonk's book, Remarks on Morals and Deconstructions at Home and Abroad (1872); The Gates of the East (1876), a book of travels; Sermons of the City (1881); Waymarks (1892); The Scholar and the State (1897); The East of To-day and Tomorrow (1902); The Industrial Situation (1902); Law and Loyalty (1903), and Reminiscences of Bishops and Arch-Bishops (1906).

See Harriett A. Kayser, Bishop Potter, the People's Friend (New York, 1910).

Another brother, CLARKSON NOTT POTTER (1825—1882), was a civil engineer, then (1838—1868) a practising lawyer in New York City, and in 1829—1875 and in 1877—1881 a Democratic member of the National House of Representatives. Another brother, Robert擂ubin POTTER (1825—1887), a soldier, commanded the 51st New York Volunteers at Cedar Mountain, Second Bull Run and Antietam, was wounded at Antietam and at Petersburg, was commissioned major-general of volunteers in September 1865, and was brevetted major-general of volunteers. At the beginning of the war he was assistant professor of law at the Union College, New York. Potter (1836—1901), was rector of the Church of the Nativity, South Bethlehem, Pennsylvania, in 1862-1865, was professor of ethics in Lehigh University in 1866—1871, and was president of Union College in 1871—1884, of Hobart College in 1883—1897, and of Cosomopolitan University, a correspondence school, in 1897—1901.

POTTER, JOHN (c. 1674—1747), archbishop of Canterbury, was the son of a linen-draaper at Wakefield, Yorkshire, and was born about 1674. At the age of fourteen he entered University College, Oxford, and in 1693 he published notes on Plutarch's De audiendi poetis and Basil's Oratio ad fuenes. In 1694 he was elected fellow of Lincoln College, and in 1697 his edition of Lycophron appeared. It was followed by his Archaeologia graeca (2 vols. 8vo, 1697—1708), the popularity of which endured till the advent of Dr William Smith's dictionaries. A reprint of his Lycophron in 1702—1705 dedicated "To the Great Highness of the Antiquities" was afterwards published in Latin in the Thesaurus of Gronovius. Besides holding several livings he became in 1704 chaplain to Archbishop Tenison, and shortly afterwards was made chaplain-in-ordinary to Queen Anne. From 1708 he was regius professor of divinity and canon of Christ Church, Oxford; and from 1715 he was bishop of Oxford. In the latter year appeared his edition of Clement of Alexandria. In 1707 he published a Discourse on Church Government, and he took a prominent part in the controversy with Benjamin Hoadly,
POTTER, P.—POTTO

bishop of Bangor. In January 1737 Potter was unexpectedly appointed to succeed Wake in the see of Canterbury. He died on the 10th of October 1747. His Theological Works, consisting of sermons, charges, divinity lectures and the Discourse on Church Government, were published in 3 vols. 8vo, in 1753.

POTTER, PAUL (1625-1654), Dutch animal painter, was born at Enkhuizen, Holland. He was instructed in art by his father, Peter Potter, a landscape and figure painter of some merit, and by Nicolas Moeyaert, of Amsterdam. Other masters and influences are mentioned by various writers, but more than any other of his contemporaries he learned through his own study and practice. By the time he had settled, at fifteen his productions were already much esteemed. In 1646 he went to Delft, where he became a member of the gild of St Luke. At the age of twenty he settled at the Hague, and there married in 1650. He was patronized by Maurice, prince of Orange, for whom he painted the life-size picture of the "Young Bull," now the finest of the celebrated works in the gallery of the Hague. In 1652 he was induced by Burghmaster Tulp of Amsterdam to remove to that city. His constitution seems to have been feeble, and his health suffered from the unremitting diligence with which he pursued his art. He died on the 15th of January 1654 at the age of twenty-nine.

His paintings are generally small; early in life, however, he attempted, but with ill success, to work on a monumental scale, as in the "Bear Hunt" at the Rijks Museum and the "Boar Hunt" of the Carsten Jan collection, Berlin. Even the famous "Equestrian Portrait of Tulp" in the Six collection, Amsterdam, is awkward and stiff and hard in handling. His animals are designed with careful accuracy, while the landscape backgrounds are introduced with spirit and appropriateness. His colour is clear and transparent, his execution firm and finished without being laboured. His view of nature is purely objective and unemotional; the greatest directness and simplicity the things he saw before him, and his paintings of horses and cattle are so individualized that they become faithful portraits of the animals. The best among his small portraits of horses are in the Louvre and in the Schwerin Gallery; and certain of his studies are the most brilliant of all.

The earliest dated picture of importance is "Abraham Entering into Canaan" (1642), at the Germanic Museum in Nuremberg, in which he makes the Scriptural subject an excuse for painting the patriarch and his wife and son. By 1650 (Rijksmuseum, Amsterdam) he makes similar use of the Greek myth. Among his finest works on a small scale are a cattle piece (1653) in the Duc d'Arenberg's collection, and a similar, though earlier, picture in the British Museum. In spite of his early death Paul Potter produced a great number of works. He worked with feverish application, as though he were aware of the short span of life that was given him and of the necessity of engraving suitable series of animals, which are simple and direct in method and handling. Here, as in painting, his precocity was remarkable; his large plate of the "Herdsmen," produced when he was only eighteen, and that of the "Shepherd," which dates from the following year, show him at his best as an accomplished master of the point.

Potter's works have been engraved by Bartolozzi, Danckerts, Visscher, Le Bas and others. Authentic paintings from his brush command very considerable prices. At the Stove sale in 1890 "The Dairy Farm" realized the record price of £6000. There are two of his paintings at the National Gallery, three in Buckingham Palace and a large group in the Duke of Westminster's collection. On the continent of Europe the most numerous and representative examples are to be found at the Rijks Museum in Amsterdam, the Hermitage in St Petersburg, and the Dresden Gallery.

See Paulus Potter, sa vie et ses œuvres, by T. van Westreenen (the Hague, 1867); Eaux-fortes de Paul Potter, by Georges Gratet Duplessis; and an old but interesting volume, Paul Potter, peintre de l'École hollandaise, by C. L. F. Lecarpentier (Rouen, 1816). (F. G. K.)

POTTER, PHILIP CIPRIANI HAMBLEY (1792-1871), English musician, was born in London, the son of a pianoforte teacher, and godson for the child of G. B. Cipriani, the painter. He was educated for the church and elected a scholar at Westminster school, and afterwards attended Atwood, Callcott, Crotch and Woelfl; later at Vienna, where he received encouragement from Beethoven. In 1816 an audition by him was performed at a Philharmonic concert, and he began a distinguished career as a pianist. In 1822 he became a professor, and in 1832 principal (resigning in 1859) of the Royal Academy of Music; in 1850 an exhibition was founded there in his honour. Cipriani Potter composed many works, now mostly forgotten, though important in their day. He died on the 28th of September 1871.

POTTERIES, THE, a name popularly applied to a district of north Staffordshire, the principal seat of the china and earthenware industry in England. It lies in the valley of the Trent a little south of its source, and extends into tributary valleys and up the hills flanking them. For a distance of 9 m. from south-east to north-west, and about 3 m. from north-east to south-west, the district resembles one great town, but the chief centres are Burslem, Hanley, Longton, Stoke-on-Trent, Fenton and Tunstall. Under the "Potteries federation" scheme (1908) these towns were amalgamated in 1910 as one municipal borough under the name of Stoke-on-Trent. Newcastle-under-Lyme, though not sharing in the staple industry, may also be reckoned in the district. Among the lesser manufacturing centres Etruria, ranking as a suburb of Hanley, is well known for its connexion with Josiah Wedgwood, who founded works here in 1750. The Wedgwoods and the Mintones are the two most famous family names connected with the china industry. The district is rich in timber, and abundant local natural products necessary to the industry; the finer clays and other ingredients are brought from Cornwall and elsewhere. Ironstone is raised in the district. The North Staffordshire and London & North-Western railways and the Grand Trunk canal are the principal means of communication.

POTTAST, AUGUST (1824-1858), German historian, was born at Höxter on the 13th of August 1824, and was educated at Paderborn, Munster and Berlin. He assisted G. H. Pertz, the editor of the Monumenta Germaniae historica, and edited the Regesta pontificum romanorum, 1158-1304 (Berlin, 1871-1878). From 1874 to 1894 he was librarian of the German Reichstag. He is chiefly known through his monumental Bibliotheca historica medii aevi (1862), a guide to the sources of European history in the middle ages. The work, in the form of an index, gives particulars of practically all the historical writers of Europe and their work between 375 and 1500. A new and enlarged edition appeared at Berlin in 1896. Pothast died on the 13th of February 1858.

POTTINGER, ELDRED (1811-1843), Anglo-Indian soldier and diplomatist, entered the Bombay Artillery in 1827, and after a period of regimental duty was appointed to the political department under Colonel (afterwards Sir Henry) Pottinger. In 1837 he made a journey through Afghanistan in disguise. Arriving at Herat, he found it threatened by a Persian army (with which were some Russian officers) and immediately made himself known to the Afghan commander, offering his services. The attack which soon followed was conducted with the greatest vigour, but the defence, inspired by Pottinger, was invariably successful, and after a year the siege was raised. For this great service Pottinger was thanked by the governor-general, the earl of Auckland, made brevet-major, and also received the C.B. He was also appointed political officer at Herat. In 1841 he was political officer in Kohistan when the revolt against Shah Shuja took place. In 1842 he was political officer of Charikar, Major Pottinger stood a siege of fourteen days, and then made an adventurous retreat to Kabul. Less than a fortnight after his arrival Sir William Macnaghten was murdered, and Pottinger succeeded to his position as envoy to the Afghan court. The apathy of the military leaders made resistance hopeless, and it only remained to negotiate for the withdrawal of the British mission. Pottinger himself was one of the hostages handed over to Akbar Khan, and thus escaped the massacre in the Khayer Pass. Released, after many months' captivity, by Sir George Pollock's army, he returned to India, and a year later died while visiting Hong-Kong.

POTTO, the native name of the West African slow-lemurs, popularly called "sloths," and scientifically known as Perodicticus, a name referring to the aborted condition of the index finger, which forms their most distinctive feature. The ordinary potto (P. potto) is about the size of a squirrel, but with
large staring eyes, and a mere stump of a tail; its general colour is rufous brown. Bates's potto (P. bailesi), of the Congo, is nearly allied; but the swantibo (P. Arcyroute calaberenis), of Ostwaldia, differs by the complete loss of the tail (see Primates).

Pottstown, a borough of Montgomery county, Pennsylvania, U.S.A., on the Schuylkill river, 40 m. N.W. of Philadelphia. Pop. (1910 census) 15,590. Pottstown is served by the Pennsylvania and the Philadelphia & Reading railways, and by electric lines to neighbouring towns. In the borough is the Hill School (1851), an excellent secondary school for boys. There is trade with the surrounding country, which is devoted to farming and dairying and abounds in iron ore and tinstones, but the principal industry is the manufacture of iron and steel, the first commercially important iron furnaces in Pennsylvania having been established near the site of Pottstown in 1716-1718. In 1905 the factory products were valued at $8,144,723 (10-7% more than in 1900). Three miles from Pottstown, in an amusement park, are the “ringing rocks,” which cover about an acre, and have varying tones when struck, so that tunes may be played upon them. Pottstown was settled and laid out in 1752 and was named Pottsgrove in honour of its founder, John Pott (1710-1768); in 1815 it was incorporated as a borough and in 1829 the present name was adopted. Pottsville, a borough of Schuylkill county, Pennsylvania, U.S.A., at Schuylkill Gap through Sharp Mountain on the Schuylkill river, about 90 m. N.W. of Philadelphia. Pop. (1910 census) 20,236. It is served by the Pennsylvania, the Lehigh Valley and the Philadelphia & Reading railways, and by the Eastern Pennsylvania railway company to the borough of Minersville (pop., 1910, 7,420), about 42 m. N.N.E., and to the other boroughs in the immediate neighbourhood, for which Pottsville is a business and shipping centre. It is picturesquely situated in the famous Schuylkill coalfield and on the old Schuylkill canal and Tumbling Run, and has a considerable trade. The lumber yards and flour-mills are the principal industries, which are supported by the immense forests of the Pennsylvania and of the Philadelphia & Reading railways at Pottsville. In 1905 the total value of the factory products was $5,805,788.

The first settlers here, a single family, were massacred by the Indians in August 1780; a second settlement was established about 1795, and an iron furnace was erected a few years later. In 1804 this furnace was purchased by John Pott (1759-1827), the founder of the borough; in 1807 coal was discovered; in 1816 the town was laid out; in 1826 it was incorporated as a borough; and in 1831 the borough became the county-seat. In 1834-1837 Pottsville was a centre of the Molly Maguire disturbances, and here a number of the members were hanged, and convicted in 1876-1877. In 1868 the borough of Yorkville (pop., 1900, 1125) was annexed to Pottsville.

Potwalloper, or Potwaller, the name of a class of persons who were entitled in certain English boroughs to the parliamentary franchise. The word is usually taken to mean literally “one who boil a pot,” from “wallop” or “gallop,” which Skeat (Etym. Dict., 1868) connects with the Old Low Ger. wolen, to boil, cf. “well,” i.e. which springs or boils up. The Potwalloper was defined in Curry’s Case, 1838 (Falc and Fiz., p. 331) as “one, whether he be a householder or a lodger, who has the sole dominion over a room with a fireplace in it, and who furnishes and cooks his own diet at his own fireplace.” The Representation of the People Act (1832) reserved these ancient franchise rights to their then holders only. In the Return of Parliamentary Constituencies (Electors, &c., 1868), there was one “potwalloper” on the register.

Pouched Mouse, the colonial name for any member of the polyprotodont marsupial genus Phascologale (see Marsupialia). There are over a dozen species, none larger, the most much smaller than a rat. The food of these animals is almost entirely insects, which some pursue among the branches of trees, while others, with a less mobile and more burrowing nature, are found throughout Australia, wherever the species have uniformly coloured fur, and also in New Guinea and the Aro and some of the adjacent islands, most of the Papuan forms being distinguished by striping on the back. In the view of Oldfield Thomas these marsupials fill the place held in Malaya by the tree-shrews, and in South America by the smaller opossums.

Poughkeepsie, a city and the county-seat of Dutchess county, New York, U.S.A., and on the east bank of the Hudson river, 73 m. N. of New York City. Pop. (1910 census), 27,936. It is served by the New York Central & Hudson River, the New York, New Haven & Hartford, the West Shore, the Central New England, and the Poughkeepsie & Eastern (merged in the Central New England) railways, and by river steamboat lines on the Hudson. A cantilever railway bridge, 2260 ft. long (6876 ft., including land approach) and 80 ft. above the water at the Hudson at this point. The city is built partly on terraces rising 200 ft. above the river and partly on a level plateau above. On the Hudson here is the course for the inter-collegiate boat-races in which the American college crews (save those of Yale and Harvard, which row on the Thames at New London) have rowed annually, beginning in 1895, except in 1896, when the race was rowed at Saratoga. In the north-eastern part of the city is College Hill Park, and in the centre is Eastman Park (11 acres, originally the home of Harvey Grindle Eastman). Vassar College (q.v.), one of the most famous women’s colleges in America, occupies a part of the old town, and the college was named for the city. Other educational institutions are the Lyndon Hall School (1848) for girls, Putnam Hall (for girls), St. Faith’s School (Protestant Episcopal; removed in 1904 from Saratoga Springs, where it was founded in 1890), Riverview Military Academy (1836), and Eastman Business College, one of the largest commercial schools in the country, founded in 1859 by Harvey Grindle Eastman (1832-1878). Immediately north of Poughkeepsie is the Hudson River State Hospital for the Insane (1871); in the city are the Vassar Brothers’ Hospital (1878), with which a nurses’ training school is connected; the Vassar Brothers’ Home (1881) for aged and infirm men; the Vassar Veterinary College (1899), with a zoological park, 30 acres; the Old Ladies’ Home (1879); the Pringle Memorial Home (1899), for aged and indigent men, and the Adirondack Memorial Library (45,000 volumes in 1900). The city is a manufacturing centre of considerable importance; the factory products in 1905 were valued at $7,206,914, an increase of 29-2% over 1900.

Poughkeepsie was settled by the Dutch about 1698, taking its name from an Indian word “apokeepsing,” or “Poughkeepsigh,” which seems to have been the name of a waterfall on the river front. The New York legislature met in Poughkeepsie in 1778, 1780, 1781, 1782, 1789 and 1795, and here in 1788 met the convention which ratified the Federal Constitution (July 28). Poughkeepsie was incorporated as a village in 1799 and was chartered as a city in 1854.

Poulite, a mass of linseed-meal, bread or other substance, sometimes of medicinal herbs, mixed with boiling water and enclosed in muslin or linen and applied to the skin to reduce inflammation, to induce warmth, or when mixed with mustard, &c., as a counter-irritant. The word seems to have been taken from the plural pulter of the Lat. pulter, length, pulse, Gr. ρυθαροσ.

POULTRY AND POULTRY-FARMING. The term “poultry” (from pulter, Fr. poulet, dim. of poule, a fowl) is usually regarded as including the whole of the domesticated birds reared by man for the sake of their flesh and their eggs. The most important is the common fowl, which is remarkable as having no distinctive English name; but the present article also deals with the poultry-farming side of the turkey, the guinea-fowl, the duck and the goose. For purely zoological details the separate articles referred to should be consulted.

Fowls. — The common fowl (see Fowl) belongs to the restricted genus Gallus, of which four wild species are known—the Bankiva jungle fowl (G. ferrugineus), the Sonnerat jungle fowl (G. sonneratii), the Ceylon jungle fowl (G. stanleyi), and the forked-tail jungle fowl (G. succulentus). The origin of the domesticated birds is described by Blyth, and the breeders living in the Bankiva fowl, much stress being laid on the comparative want of fertility in the hybrids produced between this species
or the domesticated breeds and the other three forms of wild Galli, it is probably that this want of fertility was due in great part to the unnatural conditions under which the parent and offspring were placed, as, if bred under more natural conditions, there is no difficulty in rearing these hybrids or in breeding from them with the domesticated varieties.

**Breeds.**—The number of poultry exhibitions has nowadays multiplied to such an extent that as many as twenty shows have been held in the United States in the past season. The demand for fanciers has increased the money value of prize fowls and created a large class—almost a profession—who have considerable pecuniary interests embroiled in breeding and exhibiting such birds. This predilection for English breeds is very remarkable, and has turned naturally given rise to many proceedings of doubtful character, which it has been found needful to keep in check by an organization known as the Poultry Club. An enormous multiplication of new breeds has resulted, and all breeds having had their older subdivisions supplemented by new colours, produced through crossing and skilful selection, amidst which buff or orange, now and then peeping out in new and strange combinations, and the formerly the diminutive bantams were confined to a few well-marked varieties, all the large breeds of poultry have now been dwarfed into bantam size by the skill of breeders. To enter farther into the subject of this article, but it may be interesting to state that at a public auction in 1901 one prize fowl was sold for £150.

**Game Fowls.**—Game fowls differ less from the wild bird than domestic breeds. Here, however, the tail is considerably larger, and carry the tail more erect than the wild birds. Game fowls in England were long cultivated not only as useful poultry, but on account of their combative tendencies for the cock-fighters. The legs are strong and very sharp. There is a tendency towards the assumption of the female plumage by the males, and distinct breeds of "henny" game are known. Game fowls have been reared in the temperate account of the former, the amount of the breast-meat, owing to the size of the pectoral muscles, being very great, from which cause, combined with their hardihood, they are most valuable for crossing with other breeds, as the plumage is distinctive of the fowl, and the comb and wattle are large and conspicuous of colour, retaining in all cases their distinctive peculiarities of form.

Game fowls have been reduced in size by selective breeding, and exceedingly minute game bantams have been produced with the diminution of the size of the legs, the comb, and the wattle. The long-necked "stilly" game fowls, which resulted at one time from breeding for exhibition purposes, have been again superseded in a decided manner by genuine game fowls.

**Cochins.**—This type, which must be regarded as including not only the birds generally so-called but also the Brahmas and Langshans, is of very large size, some of the males reaching the great weight of 4 or 5 lb. They are also distinguished by a profusion of downy plumage, with small wings and tails; they are incapable of long flight, and the pectoral muscles are consequently but feebly developed. The Cochins originally imported from Shanghai were of the same description as the great black fowl which are reared with the grey Chittagong, the Brahmas being the result of the cross, and they became established as a pure breed, faithfully reproducing their own type. The Langshans, a later importation, have fuller bodies, broader and deeper in colour, plumage and shape, and the head-feather has removed all Cochins—it is to be feared permanently—from amongst popular and useful breeds, and in only a degree the Brahma, once the most popular breed of the day. On the other hand, old sub-breeds, based upon a comb from one or the other of the Asiatic races, have been multiplied and largely bred, these being all of smooth-legged type and somewhat less in size. A sub-variety of Cochins, raised in America, by crossing with a cuckoo-coloured breed long known as Dominiques, became fashionable under the name of Plymouth Rocks. They are cuckoo-coloured, viz. each feather is marked with transverse grey stripes on a lighter grey ground. In this way, probably, the cuckoo-coloured form of the same colour as the hens; their legs are not feathered, and the plumage is not so loose as that of the more typical Cochins. To the original cuckoo-coloured Plymouth Rock have been added buff and white varieties; and by crossing Cochins and Brahmas with other fowls, American breeders produced another useful race of compact form with smooth yellow legs, and white feathers faced with black round the tips; these breed White Leghorns; in addition, they have added other colours and patterns of plumage. The feathered Langshan has given rise to the black Orpington with smooth legs; and a local cross of Cochins and Dorking prevalent in Lincolshire, to a bird resembling the Cochins and Dorking, is of a compact form, the legs being rather short, the comb large, and though quite unrelated to the former. All these are useful for table, and good layers.

**Malayan Fowls.**—The Malayan type has been long recognized as being distinct and peculiar. In the wild birds are of large size, clear black plumage, with very long legs and necks. The Gallus giganteus of Temminck, which he regarded erroneously as a distinct species, belongs to this group, as did the Kulm fowl and the grey Chittagong of the United States, and the Malay are of savage disposition. Several smaller breeds of a somewhat similar type are known as Indian Game; some of these, as the Aseels, are of indomitable courage. Until the arrival of the so-called Cochin breeds from the north of China and Corea, they had been regarded as quite wild and were employed to impart size to other varieties by crossing.

**Spanish.**—The Spanish or Mediterranean type is well marked. The birds are of moderate size, with large single erect combs and wattle, and a broad breast. In the male the comb is broad and extends over the face, and its size has been so greatly developed by cultivation that in some specimens it is 6 or 7 in. in length and breadth. Close related to the Spanish, differing only in colour of plumage and extent of white face and ear-lobe, are the white and brown Leghorns, the slaty-blue Andalusians, the black Minoras, &c. All are non-incubators, the desire to sit having vanished long ago. The legs are short, and are usually adorned with free layers of large white eggs; and the yellow-legged Leghorns of similar type, though rather smaller, have spread on all sides with much multiplication of varieties, the latest of which, with mottled cranium, the anterior, is termed the Hamburghs.

**Hamburghs.**—The Hamburghs, erroneously so called from a name given them in the classification adopted at the early Birmingham shows, are all sub-varieties of Cochin, the origin of which is from the pictures by Hondekoeter and other early Dutch artists. In Great Britain they are erroneously termed Polish. The development of the feathered crest is accompanied by a great diminution of the comb and wattle. The head-feathers are long and strong, and wattles are also absent in some breeds, their place being occupied by a large tuft of feathers, forming what is termed the "beard." In all the crested breeds there is a remarkable alteration of the skull forming a prominent hollow tuberosity which contains a very large part of the brain. This portion of the brain-case is rarely entirely ossified. There are, on the other hand, sub-varieties, based upon a comb from one or the other of the Asiatic races, have been multiplied and largely bred, these being all of smooth-legged type and somewhat less in size. A sub-variety of Cochins, raised in America, by crossing with a cuckoo-coloured breed long known as Dominiques, became fashionable under the name of Plymouth Rocks. They are cuckoo-coloured, viz. each feather is marked with transverse grey stripes on a lighter grey ground. In this way, probably, the cuckoo-coloured form of the same colour as the hens; their legs are not feathered, and the plumage is not so loose as that of the more typical Cochins. To the original cuckoo-coloured Plymouth Rock have been added buff and white varieties; and by crossing Cochins and Brahmas with other fowls, American breeders produced another useful race of compact form with smooth yellow legs, and white feathers faced with black round the tips; these breed White Leghorns; in addition, they have added other colours and patterns of plumage. The feathered Langshan has given rise to the black Orpington with smooth legs; and a local cross of Cochins and Dorking prevalent in Lincolshire, to a bird resembling the Cochins and Dorking, is of a compact form, the legs being rather short, the comb large, and though quite unrelated to the former. All these are useful for table, and good layers.
Game, which is of unsurpassed excellence for the table. Mating a Dorking cock with large game hens is found to be the most advantageous.

Silk Fowls.—These constitute a singular variety, in which the barbs of the feathers are not connected by barbules and the entire plumage is composed of loose filaments. Similar variations are found amongst other species of birds, but are soon lost in a wild state. The silk fowl best known is that in which the plumage is perfectly white, whilst the skin, cellular tissue between the muscles, and the periphery of the feathers are a deep blue-black, the comb and wattles being a dark leaden blue. The birds are admirable sitters and mothers, and are much valued for rearing pheasants, being of somewhat small size. Though of remarkable appearance, they are not very profitable. In cross with other breeds the silky character of the plumage is generally lost, but the dark skin and intermuscular cellular tissue remain and greatly lessen the value of the bird in the market.

Frissted Fowls are birds in which each feather curls outwards away from the body. They are common in India, but are not adapted to the climate of Britain, as the plumage offers an imperfect protection against cold.

Rumpless Fowls are those in which the coccygeal vertebrae are absent; there is consequently no tail. By crossing, rumpless breeds of any variety may be produced. They are not desirable to cultivate, as, from the structural peculiarities, the eggs are very apt to escape being fertilized.

Dupples or Creepers are birds in which the bones of the legs and feet are so long that progression is considerably interfered with.

The best known are the Scotch dupples.

Long-tailed Fowls, under the various names of Yokohama or Phoenix fowls, or Shimotawaro fowls, are singular varieties recently introduced from Japan, from which the birds are 6 to 7 ft. long. In Japan they are said to assume a much greater length. One bird in the museum at Tokio is stated to have sickle-feathers 17 ft. long. In other respects the fowls are not peculiar, resembling the birds of the Game type.

Bantam.—This term is applied to fowls of a diminutive size without any reference to the particular breed. By careful selection and crossing with small specimens any variety can be reduced to the desired size. The Chinese had in the Summer Palace at Peking small Cochinews weighing not more than 1 lb each. The Japanese have long possessed a dwarf breed with enormous tail and comb, and with very short legs. One of the most artificial breeds is the Sebright, first raised by Mr. Sebright, named after its originator. This bird has the laced or marginal feather of the Polish combined with the absence of male plumage in the cocks, so that it may be described as a hen-feathered bird with laced plumage. When perfectly marking it is of singular beauty, but is not remarkable for fertility.

Most of the modern changes in breeds, broadly speaking, have been in the direction of replacing poultry with chiefly fancy points by really useful fowls, yet it is noteworthy that they have been carried out by fanciers, or breeders for exhibition, proving that there has not been but that practical antagonism between the aims of these breeders and the production of food which some have alleged. But there has further been, since 1890 especially, a remarkable development of what has been termed "utility" poultry-breeding.

Feeding and Egg-production.—These aspects of poultry-culture are closely connected, and in both such advances have been made as almost amount to a revolution. The breeders of the United States have led the way, and, though it had first been taught in England, were the first to practise generally the systematic breeding, year after year, from the best layers only. It had always been known that some hens would lay from 150 to 200 eggs in a year whilst many did not exceed 100, and some laid much less. This was tested (on a better stock than the average) at the Maine experimental station in 1895-1899, 260 pullets being selected, of which 5 died and 190 were stolten. Of the remainder, 39 laid 166 eggs each or more, and 22 less than 100, the rest coming between these figures; the five best laid 200, 206, 209, 216 and 208 eggs in twelve months, and the three worst only 36, 37 and 38 in the same time. From such figures the money value of selective breeding is apparent. As a proof of what may be done by systematic breeding, one American breeder obtained an average of 196 eggs per annum from as many as 600 white Leghorns, and another 194 eggs from 140 Plymouth Rocks; greater numbers have been obtained from single birds or small pens of fowls, but these are results from considerable flocks. It has been proved, however, that such averages as these cannot be obtained unless they are fed for as well as bred for.

The most successful egg-farmers now feed their poultry on definite "rations," compounded so as to give what is termed a proper "nutritive ratio," or proportion of albuminoids to carbohydrate material. The basis of such feeding is analysis of foodstuffs, in some form which shows simply their percentages of albuminoids, fats or hydrocarbons, carbohydrates (alcohol, sugar, &c.), salts, crude husk or fibre, and water. Fats, being relatively much richer in carbon than the starch compounds, are generally multiplied by 2·25, and this product added instead to the carbohydrates; then the ratio of albuminoids to nitrogenous matter to this total of carbohydrate compounds is the "nutritive ratio." The following is a useful table of analyses made out in this way, taken from The Book of Poultry:

### Analyses of Poultry Foods.

Many writers have introduced unnecessary complication into a very simple matter. Some elaborately compute the amount of "dry matter," which is useless if our analysis show the proportion of water, as above. Others have calculated "digestibility," on the theory that food not rejected as excrement is "retained in the body." This theory has a basis in the case of animals which consume a large amount of hard indigestible fibre, excreted in such a form as horse manure; but fowls macerate all they eat in the crop, and grind it in the gizzard, and in their case the excreta represent very little undigested food, but mainly the final result of the vital processes, the food itself being digested so completely that we may be sure that we more than allow for any factor of indigestibility if we merely leave out any crude husk or fibbre, giving that to the town where it is worth, and calculate our ratio direct from the figures of the table.

Two extremely simple cases will suffice as examples of the modern method. Potatoes are often cheap, but on account of their starchy composition require a "balance," and the same may be said of maize; one method of balancing each will show what is meant and the simplicity of the calculation. We will take potatoes and bran.
### Ratio of Potatoes and Bran.

Adding here the fats x 2 1/2 to the carbohydrates, we get the ratio of the mixtures as 22 : 90, or about 1 : 4 1/2, which is very good. Coming next to the maize, let us suppose that it is desired to feed this as grain in the evening, and to "balance" it by an equal weight of "mash" or soft mixture in the morning. One way would be as follows:

### A Diet containing Maize.

This ration explains how in such a case we must multiply the figures for maize by 3, and those for oats by 2, being the proportions we are taking to one portion of horse-flesh. The ratio of this dietary comes out slightly lower than 1 : 4 1/2.

The proper ratio for feeding fowls has received much discussion. Dietetic authorities mostly agree that about 1 : 5 is the best for maintenance of animal life generally, and more specifically that there should be of albuminoids about 18 parts in 100, of fats 7 and carbohydrates 75. That should suffice for growing chickens; but it is fairly obvious that fowls fattening may require more fat, while the constant production of eggs, whose high ratio is shown in the analyses, must require a larger amount of albuminoids. This fact is indicated by the hen herself, which when laying devours large earthworms, usually rejected with disgust at other times. She shows by this appetite how specially she needs albumen; and fowls on a wide range, though only fed with corn, may thus in summer "balance" a dietary for themselves by the worms and insects which they procure. When they cannot do this, more albumen must be supplied, and the general opinion of practical egg-farmers has tended towards a ratio of 1 : 4 or 1 : 4 1/2 for hens in full lay. One successful American breeder feeds as high as 1 : 3, and states that his results have been best at that figure.

Passing from theory, the greatest practical advance in poultry-feeding has probably been the discovery of the benefit to be derived from the extra supply of albumen between fresh bones cut up small in a mill known among breeder's as "cut bone") and such green food as clover or cabbage. The bones contain a good proportion of fat, and of mineral salts also, which careful experiments have shown to be of great importance both in egg-production and for growing stock. Green food had until recently been looked upon chiefly as a corrective, or necessity for health, though it was known that fowls on a pasture grazed largely. But the nutritive ratio of clover is as high as 1 : 3, and American poultry-farmers now use it largely as really albuminous food, to promote laying. Its use in this way also allows more animal food to be used without ill effect; and to this free use of clover and cut bone in conjunction the improved results upon American egg-farms are largely due. The following is the "mash" ration on a successful American egg-farm, and represents a high forcing diet: middlings or sharps 100 lb, maize-meal 75 lb, gluten-meal (a highly nitrogenous by-product of American flour-milling) 25 lb, clover meal 80 lb, meat-meal 35 lb, all weighed dry, mixed with boiling water in the evening, and kept covered all night.

The majority of poultry-farmers give their stock each day one feed of grain, and one of soft meal-food or "mash," but by no means agree as to the times for these meals. In England, morning mash and evening grain are almost universal, the former giving more support during the long fast at night, and the former more rapid recuperation on cold mornings. But in America and Canada, where the climate compels confinement of the fowls for months together in enclosed sheds, health and eggs can only be secured by constantly "mashing," to promote which the grain is scattered amongst loose litter spread several inches deep. Many, therefore, prefer to scatter the grain in the morning and feed the mash at night, alleging that a good breakfast of mash makes the fowls lazy, with bad results. Others state that this is avoided by a rather scantier morning feed of mash, with a slight sprinkle of grain in the litter afterwards. In 1890 a careful experiment was made by the Massachusetts Agricultural College, two similar lots of pullets being fed upon similar food, on the two plans, for two periods of several months each, in summer and winter seasons, and each lot receiving, besides the morning and evening feeds, a slight sprinkle of millet in the litter. To promote fermentation there was scarcely any difference, what little there was being in favour of the morning mash; and the birds thus fed became also somewhat the heaviest. The most remarkable result was that the weight of manure voided in the night was nearly double in the case of the evening-mash birds, showing the rapid digestion of mash food.

**Artificial Incubation and Rearing.—**In the separate article on **INCUBATOR** details are given concerning the appliances used in artificial hatching and rearing, and the subject may be only briefly alluded here.

Even in England the eggs hatched in incubators now probably equal, or nearly equal, those hatched under hens: in America the wide practice of artificial incubation is difficult to realize. Of small-sized machines one Illinois maker sold 14,800 in 1899; and in regard to large sizes, in 1900 at least seven names and addresses were known of operators who each used from 55 to as many as 85 machines, every machine holding 300 or more eggs: somewhat smaller plants were of course far more numerous. Experience on such a vast scale has led to a practical advance of considerable importance. While in England it is still usual to effect empirical adjustment of ventilation and moisture, the better American incubators are dispensed with direct measurement. It was remembered that the hen hatches without moisture, and equally so the egg-ovens of Egypt; the absence of direct air-current, and consequently of any rapid evaporation, being the obvious explanation. The manufacturers therefore set themselves to slow the movement of the air; and when this object was effectually accomplished, it was found that there was no need for moisture, and that the chicks also hatched out stronger and in higher proportion. The general opinion in the United States, where many farmers tested both hens and machines on a large scale, whilst still undecided between them, is that the proceeds of artificial incubation are superior by about 10% and this is based upon hatches of thousands annually.

Artificial hatching necessitates artificial brooding, and in this also great changes have taken place, any real success in rearing having been for some years far behind that in hatching. The method universally attempted at first might be called the "coverlet" system, nesting material such as strips of flannel or wool, warmed from above, being provided for the chicks to nestle under, as they do under the feathers of the hen. Many were reared in this way, but failures were also terribly general, and these were ultimately traced to confinement and pollution and heating and refreezing of the air, caused by the nesting material. That system is now abandoned, warmed but open chambers being provided, which the chicks use at pleasure, but which have no coverlet to rest upon their bodies. In some, heated pipes traverse the upper part of the chamber, some inches above the chicks; in others a warm iron plate radiates heat in the same way; in others warmed air is brought in by pipes or openings; in some small ones the lamp itself burns in the chamber of the brooder: but the principle is common to all of a warmed shelter, open above, and generally with an outer chamber also, sheltered but not heated, which breaks the transition from the open air. In America a very large proportion of the chickens reared are brought up till hardy in the large "brooder-houses" mentioned below.
Poultry-farming.—Poultry-farming in a practical sense is now carried on somewhat extensively in various ways, understanding that term to include any case where poultry-culture is carried on for substantial profit, or as an important interest of the holding, beyond the mere breeding of prize birds for exhibition. The difficulty never had been, as some have stated, in ground getting tainted or rent costing too much. It is now well understood that in the English climate 100 birds per acre must not be exceeded, though it is far better to confine them to one-half or one-third of the space, while some crop is got off the remainder when they go yearly to absolutely fresh ground. The meat was formerly a large and much for 100 fowls, but the real difficulty was and is that a fowl is such a small unit, entailing constant liability to small losses and wastes, and necessity for labour and oversight out of proportion. Hence at a time when 100 eggs per annum was thought a fair return for each bird, and there was but a poor and uncertain market for them, this difficulty was insuperable. A very different average production would now be worked for; while, on the other hand, the greater crowding into cities, and growing appreciation of eggs as an article of diet, have caused a market for “new-laid” eggs at good prices which previously did not exist. It is these changes which are of material importance in the additional possible yield from the same holding.

The chief development in England at the beginning of the 20th century was a very large increase in the poultry kept upon farms. Formerly very few were kept, looked after casually by the mistress or a boy, and only expected to provide for the household and occasionally a few sellings in cash, while any food expressly fed to them was grudged. It has now been taught all over the country, by lecturers under the county council technical instruction committees, that poultry pay best of any branch upon a farm. It has become generally known that, if provided they can be run over the farm by using detached houses, and not huddled together, a decent hens per acre can be kept up in good holding. In the best cases, with the cow crop stock; indeed, the curious fact is observed that horses and cattle prefer to graze over grass that might be thought soiled by the fowls. Where the statement was once derided, it is now a commonplace of county council lecturers, that the additional manure thus made is really worth to the farm from sixpence per bird annum for small breeds to as much as one shilling for very large ones. Out of a large number of similar instances collected in 1900, one specimen may be given. In Worcester-shire 210 fowls had the run of 100 acres, lots of 20 to 30 being kept in detached houses. From 20,000 to 25,000 eggs per annum were marketed, and 150 to 200 chickens, the food averaging about 4/6d., and the cash return 50/90 to 1/0. The almost universal opinion is that the manure pays for the labour, and that the annual profit averages from 45/ to 50. 6d. per head.

Poultry-farming on a larger scale than this is also carried on in connexion with the Sussex fattening industry, presently described. That was until recently a separate business, chickens being bought from neighbouring small rearers, or imported from Ireland, to go directly into fattening cages; and it has often been stated that rearing and fattening together were incompatible. This was so far true that the manure made by numbers of fattened poultry was very considerable, and had to be used upon a small holding in order to use it; such a holding, therefore, received as much as it could possibly bear, and was thereby “sickened” for live poultry running at large. But with an extra holding or larger holding this is not the case, and increasing competition and the desire for the two profits have led to a large amount of rearing and fattening combined. In 1894 one of the officers of the agricultural commission found 8000 chickens being reared and fattened annually on one farm of 200 acres, and this proved only a pioneer: in 1900 he found (amongst many such instances) 4000 reared upon 80 acres, 1500 upon 22 acres and 5000 upon an extra holding (taken for the purpose), owing to it being a very large farm, and being let rent free, the one-third produced being rented as cattle, the remainder as wheat; and in addition a large area of oats, both for the fowls; and some cows were kept, the skim milk from which was used in the same way; but the poultry was the controlling interest of the whole.

On any such scale as this the manure becomes of great importance. About 1880 Dr Augustus Voelcker, chemist at the Royal Agricultural Society, made the following analysis of two samples, one moist or fresh dropped, the other freed from much moisture by storing under cover for four weeks:

<table>
<thead>
<tr>
<th>Moisture</th>
<th>Partially Dried Manure.</th>
<th>Manure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organic matter and ammonia salts</td>

</tr>
<tr>
<td>Insoluble silicious matter (sand)</td>
<td>12-58</td>
<td>12-49</td>
</tr>
</tbody>
</table>

The values in the usual way, Dr Voelcker found that the moist manure was worth £2 per ton, and the drier stored manure £4 4s. per ton; but though the figures were indispensible, for many years such manure was practically unsaleable. Gradually in Sussex it became saleable at 6d. per bushel, and in 1900 some of the smaller fatters were selling it at prices varying from 4s. to 10s. per load, the larger men either used it themselves or obtained higher prices.

Really large poultry-farms are few in England, and to give quite recent facts would be to run the risk that they might prove ephemeral. It has been supposed that the common experience is failure after two years’ trial, but this is unduly pessimistic. Even in 1901 two farms in Berkshire were selling eggs from over 2000 and 3000 laying hens; and there was one farm in the west of England, occupying 300 acres with the poultry (besides a shorthorn herd and other branches), which had a stock of 5000 pullets for laying, and had been in existence four years, with a capital amounting to thousands of pounds having been sunk in it. The owner explained that two years was the critical period, simply because for about that time there were practically no returns, and that in his case he had only ‘‘turned the corner’’ after three years. Though a practical man already, he had been in a small way with one incubator and training one man; gradually extending, building up his own market, organizing his own selling agency, and building a mill to grind his own grain. Only such gradual extension by practical men can ever lead to success.

Besides the breeding of prize poultry, the changes mentioned in the early portion of this article have led to another class of breeding directed to the supply of pure races from good stock, but bred mainly for purposes of utility. The demand for such stock, at fair prices, though far below those for prize stock, is a good index of the development of the poultry industry. The establishments which supply it furnish eggs for hatching, or stock birds, or newly hatched chickens, which are now hatched in incubators and sold by thousands when only one day old, at which age they travel without needing food. Some of such establishments are quite large. One in Yorkshire occupies 43 acres solely devoted to this business.

Poultry-farming has reached its fullest development in the United States, with no doubt to the apparently inexthaustible market; butcher’s meat being far less eaten than in England, and poultry and eggs to a large extent replacing it as national food. More especially is there an enormous demand for small chickens, known as “broilers,” weighing from 1½ lb to 2 lb only, destined to be split in half and broiled on a gridiron. These birds being unfattened, and ready at ten or twelve weeks, give a quick turnover with less expense and risk than older fattened birds; and this peculiar demand has largely dominated American poultry-farming, a great deal of which runs in the direction of great “broiler-plants” solely devoted to the hatching and rearing of these broilers, while large “brooder-houses,” similar to those used in that business, the prevalent ones in the Mississippi Valley. The broiler business started at Hamptonville in New Jersey about 1880–85, when plant after plant was rapidly erected, some of which have since shut down; but many others
have taken their place, and some of the originals are still running.

The chicks are all hatched in incubators (many plants running from 20 to 40 machines), and then transferred to long "brooder-houses," built with a corridor all along one side, the rest being divided into successive pens for the chickens. These latter are moved along every few days to the next of the pens, which are arranged so as to give rather more space as the birds grow larger. Each pen has next the corridor a "hover" or brooding-shelter. These have no nesting material, but only a roof or cover somewhat to retain the heat, closed by a curtain cut into stripes in front, and are warmed by hot-water pipes running along the building. Generally these pipes run some inches above the chicks reposing on the floor, and are set rather on a slant, so as to be higher for the bigger chicks in the larger pens; but in some cases they run under the floor, and warm the air which enters under the hovers. Every hover, with its inmates, can be reached from the corridor at the back of all. In many cases the chickens are confined in these small pens until large enough, the floors being littered and regularly cleaned; but some raisers have also small outside yards which they use in fine weather. The mortality in nearly all plants is great, as might be supposed. There are said to be 300 chicks at Hatching Station at which 90% of the eggs incubated, yet pay a modest profit at that, which is allowed for. On the one hand, a broiler realizes about four times the cost of its own hatching and food; on the other hand, the labour is very heavy and the loss considerable: these factors obviously give a very wide range of possibilities as regards success or failure.

The most remarkable establishment of this kind, embodying

some novel features, was erected in Ohio at the end of 1896

by J. Loughlin. The plant cost over $60,000, and was designed to market 250 to 300 broilers per day regularly, weighing 1 lb each, which were sold alive to one large dealer at $8 per dozen. Each day an average of 450 eggs were started, the chicks from which went into one pen. For the chicks, while small, there were 30 small pens, each with 5 by 10 ft. of floor space, or at the rate of six chickens per sq. foot; and there were 60 larger pens each 8 by 12 ft. with outer runs to each of 8 by 20 ft. Every day the chickens were marketed from the ninetieth pen, and all the rest moved one pen forward, leaving the first small pen vacant for the day's hatch: thus fully 22,000 birds were in the plant at one time.

In more general American poultry-farms the same system of "brooder-houses" largely prevail, and from many general numbers of broilers are sent to market; but as both heat and

liver are perceptibly affected by such rearing, birds intended

for stock are either taken out of doors early, or reared in detached

brooders, as in England. Some establishments are mainly egg

farms, high averages being obtained by the system before

described. Many breeders have a high reputation for their

stock as layers, and derive large profit from selling stock or eggs

or other farms. There are many immense duck-farms or

"ranches," as mentioned below, which sell nothing except

stock ducks or market ducklings. A great many combine the

breeding and sale of exhibition poultry with some or all of these objects. Favorable points being on the great superior qualities than in England, and the farmer and exhibitor far more

commonly combined.

As a rule, American poultry-farmers employ long ranges of

buildings divided into pens or houses, with enclosed yards in

front; and the most remarkable fact is that interest can be paid

upon the capital sunk in such buildings. The explanation in

some cases is that much is put up by personal labour, while

the cheapness of land and feed are also favourable. But the

climatic conditions also differ. During the winter months the

birds have to be confined in what are called "scratching-sheds,"

and American farmers have successfully reduced to a system

the keeping of them healthy and in profit by scratching amongst

litter in a small space. During this period the outer runs

sweat, and are in open air; smaller runs therefore suffice, and

the stock is kept closer and more compact. Another system is

pursued, more especially about Rhode Island, called the "colony"

plan; detached rough houses, holding forty or fifty hens each,

being scattered over the farm: there may be a hundred houses,

but there is no fencing. This is very economical in buildings,

but expensive in the labour of feeding and collecting eggs, and

the system is only possible near the sea or where there is little

snow. In several cases it has been abandoned for the system

of housing and scratching-sheds.

There are a few very large establishments indeed in the United

States, combining almost every branch. At the Meadow Brook

Farm in Pennsylvania, occupying 80 acres, the buildings total

in area 84,000 sq. ft., and the farm has sent to market in one

year 25,000 chickens and 20,000 ducklings, besides selling

many stock birds, and an enormous number of eggs for hatch-

ing at an average price of $40 per 1000. Businesses like this

are very exceptional; but farms on a more moderate scale are

numerous, and intelligent American farmers reckon to make

a profit of a dollar per annum for each head of their laying or

breeding stock.

Table Poultry.—National taste governs the market for table

poultry to the Surrey district, whose centre is Heathfield: these

are preferred, and at one time black legs or yellow skin were heavily

discounted. More knowledge has largely removed that prejudice,

but white has a market value still. In France exceedingly white

and tender meat is preferred. In America, white skin and legs are

mostly preferred, and in Europe also black legs are common.

In America yellow skin and legs are actually preferred, such fowls

being thought more juicy; but there has been some tendency towards

white meat of late. Belgian feeders think the best result follows

from the white-decked hen; but in the case of French fowls the various

confirmation of this idea that one of the best English table fowls is the produce of a cross between Dorkings and the

yellow-skinned Indian game, while other similar instances might be cited.

For many years past the British and English fowls have been shown by displays of plucked birds in connexion with the Christmas

Smithfield Cattle Show. For many years France had a reputation for white fowls, but was surpassed in the last few years by a few of

American origin, and the majority of the British breeders now business. The chief supply of the best fowls for the London market has long come

from the Surrey district, whose centre is Heathfield: these are termed "Surrey" fowls, though Surrey now sends few in comparison.

This local industry has been founded in a curious way upon the

"ground oats" of the district, the whole grain being ground up, broken and nearly fleshless. This is put upon the floor, with

a few dressing of the stones, which are "stitched" into little pits by a pointed pick, instead of being dressed into narrow grooves, as for

flour-milling; and this meal is found specially suitable for feeding

and fattening poultry. It is sold at 1s. 6d. per lb. The British fowls

are fed with pellets of meal dipped in milk, but this method is now

quite superseded by machine cramping, a rubber tube from the machine being introduced into the crop of each fowl, and a stroke

of the foot on a pedal squeezing out the ration of food, almost creamed

paste, composed of the ground oats, fat and sour skim-milk, a food

which puts on flesh fast and makes it white and delicate. Great

experience is required in this business. When killed and plucked, the fowls are placed in a trough whilst still warm, close side by side,

and their backs and breasts pressed closer together by a board loaded

with heavy weights. This combination of fattening and subsequent

shaping constitutes the Sussex system, which is extending in some

other parts of England; many excellent fowls, well fed, but unfat-

tered, are also supplied from Lincolnshire (known as "Bosports")

and other districts. The largest provincial towns have similar sup-

plies, if less degree.

In America larger fowls are called "roasters," to distinguish them from the broilers above described; and there has grown up in the

country a system of these also in confinement. Hatch-

ing them begins in September, and the birds are at first reared in

brooder-houses; but when large enough are placed about fifty together in small houses, with 6 by 8 ft. of floor, in small yards

of 200 sq. ft. Each cage contains an one pen 10 by 17 ft., in a warmened house, where they remain till

killed at 7 lb or 8 lb weight. One firm had raised in this way, for

seven years in succession, 2000 birds per annum upon half an acre

of land. This system is occasionally applied in the cultivation of

market gardens, and in the production of poultry for market, one

of the best known establishments being owned by John O. Smith, Jr.,

of Mechanicsburg, Pa., and members of his family. As to the prices of

fowls, as a rule only 60% are reared of those hatched, the loss of the rest being averaged and allowed for.

Europe has a general demand for broilers fattened quite young, weighing only 8 oz. to 1 lb each, and known as petit poulets, or "milk chickens." In Belgium somewhat older ones,
weighing up to 16 lb, are sold as *poulets de grains*. The demand for such birds in England is small, and confined to the West End of London, the flesh being too excessively tender for average English palates. Birds of similar sizes have lately been finding a market in the United States, and squash broilers, but are split and broiled, and not fattened, the difference being that a whole bird is served for one portion.

**Turkeys.**—The varieties of the turkey (g.v.) differ chiefly as to colour. The principal English breeds are the bronze or Cambridge, the black or Norfolk, the fawn and the white. Of these the first, especially when crossed with the American, is the largest and most desirable.

Turkey-breeding has been largely dominated by the magnificent American bronze breed derived from America, during the last century. There is some question whether it does not require more open and freer ground than the older English strains, and may not be more delicate on small holdings. French birds come largely to the Christmas market in London, but, as compared with English, are small. The chicks, when hatched after twenty-eight days' incubation, should be left undisturbed for twenty-four or thirty hours, during which time they are digesting the yolk that is absorbed into the intestinal canal at birth. No attempt should be made to cram them; their first food should consist of sweet fresh meal, soft custard made with equal parts of egg and milk set by a gentle heat, and, above all, abundance of some bitter milk which is much better liked by young birds on which they can be reared successfully with very little food of any other description. The young turkeys progress much better if the hen has the range of the farm and the young birds are confined to a flat yard for a month. If they are thus reared they are much harder than when reared and corn-fed, and not so susceptible to injury from slight showers; but a damp locality should be avoided. Turkey-hens are reared the same way in winter in small pens, unless they are of the kind of birds that will become tame enough to be allowed to run over-fatness, over-fatness, and in injury, and in young turkeys it is often a serious objection. The best market turkeys are those that have been reared on coarse grain, and are kept only as long as they are fit for the market; if killed for home use, they are retained by the quills, which they do not shed except when they are very old. The turkey is a very valuable bird for those who have no other poultry. After the early spring markets the old birds must be fed most freely to cause the production of eggs in cold weather, corn being given in vessels of water, and the birds must be shut up at night, or the young birds kept in the house, and turned out in the morning. Turkey-breeding is a very profitable industry, very high prices being paid for ducklings in the early months of the year. The so-called Muscovy duck is a Brazilian species, *Cairina moschata*, which is not reared for the market, although the young birds are edible. The drake of the Muscovy is black and probably sterile. Hybrid ducks are the result.

**Ducks.**—All the varieties of the domesticated duck are descended from the common mallard or wild duck, *Anas boschas*, a species which, though timid in its wild state, is easily domesticated, and suffers changes of form and colour in a few generations. The most important breeds are: the Rouen, which retaining the colour of the original species, grows to a large size; the Aylesbury, a large white breed with an expanded lemon-coloured bill; the Peking, a white breed with a pale yellowish tint to the plumage, and a very bright orange bill; two breeds which are entirely black. The smaller of these, which has been bred down to a very diminutive size, is remarkable for the extreme lustre of its feathers and the fact that its eggs are covered with a dark black pigment, which becomes less in quantity as each successive egg is deposited. It is known by the equally absurd names of East Indian, Labrador or Buenos Aires duck. The larger black variety, the Cayuga duck, has been introduced into England. Decoy or call ducks are small breeds of a very lugubrious character, which were originally bred for the purpose of attracting the wild birds to the decoys. Some are of the natural colour, others are white. Among the less known breeds are the *saddlebacks*.

The duck, formerly called Pheasant duck from its erect attitude, the hook-billed and the tufted ducks, &c. During the last fifteen years of the last century, the first of these became very popular in England as a hardy forager and good layer, many birds laying 150 to 180 eggs in a year. It is small in body but good in flavour, and is a great favourite in many districts.

Formerly the greater number of ducklings came to the London market from the Vale of Aylesbury. This trade still continues, but the adherence of the Aylesbury duckers to old-fashioned methods, including demand, has led to great competition in other districts, such as Norfolk, Buckinghamshire, and Cambridgeshire. The duck-farmers market 10,000 to 15,000 annually, mostly hatched in incubators, and never allowed in the water or out of the small rearing-rooms for the first six weeks of their life. They have found its fullest development, the number who raise 10,000 ducklings a year being considerable, and a few sending to market, as above indicated, very large numbers indeed, requiring to 40 to 80 incubators to keep up the supply. It is remarkable that while in England the Aylesbury is generally preferred, in America the Peking duck is universally used, and has been made by selection both larger and a better layer. Some duck-farmers in England have, however, also adopted the Peking. By good feeding the ducks are caused to lay in the winter months, when the eggs are hatched under hens, the young ducklings being reared in artificially warmed buildings or in the labourers' cottages; they are fed most liberally on soft, soaked grits, and given a liberal allowance of the purest marine products which are fit for the market; if killed for home use, their quills are removed. They do not shed except when they are very old. The turkey is a very valuable bird for those who have no other poultry. After the early spring markets the old birds must be fed most freely to cause the production of eggs in cold weather, corn being given in vessels of water, and the birds must be shut up at night, or the young birds kept in the house, and turned out in the morning. Duck-rearing is a very profitable industry, very high prices being paid for ducklings in the early months of the year. The so-called Muscovy duck is a Brazilian species, *Cairina moschata*, which is not reared for the market, although the young birds are edible. The drake of the Muscovy is black and probably sterile. Hybrid ducks are the result.

**Geese.**—The domestic goose (g.v.) of Europe is undoubtedly the descendant of the migratory Graylag goose, *Anser cinereus*, from which it differs chiefly by its increased size. Although domesticated since the time of the Romans, it has not been subject to much variation. The most important breeds are the large grey variety known as the Toulouse, the white breed known as the Embden, and the common variety frequently marked with dark feathers on the back, and hence termed "saddlebacks."

After the Crimean War a Russian variety was introduced into England in which the feathers are singularly elongated, and even curled and twisted; this breed, termed the Sebastopol, is of small size and more important as a fancies' breed than from a practical point of view. In some countries a second species is domesticated; it is usually termed the Chinese, knob-fronted or swan goose, *Anser cygnoides*. Though perfectly distinct as a species, having a different number of vertebrae in the neck and a loud changing voice, it breeds freely with the common goose, and the hybrids produced are perfectly fertile.

Geese in England are declining in relative popularity. In Germany they are much more extensively reared, to a tremendous extent, and the British consul-general at Berlin reports that even the large domestic supplies have to be supplemented by considerable imports from Russia, a special "goose-train" of fifteen to forty cars arriving daily from Königsberg to Berlin, and thence thence to Paris. A new and increased interest in goose-breeding, and in the Chinese goose especially, which has been largely bred (with some trifling peculiarities) under the name of the African goose, and crossed with the Embden and Toulouse. The produce of this African cross is considered very fertile and profitable to rear. Geese are much more exclusively vegetable feeders than ducks, and must always be kept to profit where they can obtain a large proportion of their food from grass or hay. To feed them in the usual manner is a great misfortune, as they continue fertile to a great age. Geese are readily fattened on oats thrown into water, and the young, when brought rapidly forward, are a much more marketable breed than the adults. The Chinese, if well fed, lay at a much earlier date than the ordinary kind, and if their eggs are hatched under large Cochin hens, giving three or four to each bird, the young are ready for the table at a very early period. The main objection to geese is their knack of walking about the earth and not in boxes, which become too dry and over-heated. In breeding for the market or for the sake of profit, the very large exhibition birds should be avoided, as many are barren from over-fatness, and none are so prolific as birds of fair average size.
POULTRY AND POULTRY-FARMING

National Interests and Commerce.—The foreign importations of eggs into Great Britain increased rapidly during the later years of the 19th century. Taking only alternate years for brevity's sake, the following table shows the amount, value and average price per 120 between 1870 and 1900—

<table>

</table>

From such figures the conclusion might be drawn that foreign eggs were "ousting" British to a formidable extent; but such a conclusion is dispelled when we take into consideration questions of price and quality. It appears that the eggs were delivered at very different prices, France averaging for the year 1900, 78. 7d. per 120, Denmark 7s. 6d., Belgium 8s. 2d., Germany 8s. 6d.; and Russia 8s. 5d., making it appear that the British market, or factory, or farm, or whatever you choose to call it, could compete. A steady decline in imports of the higher priced French eggs, an enormous increase of low-priced eggs, explain the drop in average price from 85. 7d. per 120 in 1874 to 6s. 5d. in 1900; and was this all the effect? It would be difficult to say that the selling price of eggs had fallen. But this is not so. While the higher priced foreign eggs have thus been largely displaced from the market, there has grown up a very large demand for the "new-laid" British eggs, at prices much higher than any of the above. There is a wholesale market for such eggs in London. The lowest price (in May) for 1900 was 5s. 6d. to 6s. 6d., and the highest (in December) 19s. 20s. per 120. The quantity of "new-laid" British eggs now sold is enormous, and has grown up in the face of foreign imports, the native producer selling in spite of them, and at far better prices, many times more than he did, say, in 1875.

The following table shows British imports of poultry and game for the last three years of the 19th century—

The total for 1900 thus amounted to 51,010,360. The imports from France and Belgium are largely for the Christmas market. Those from Russia are chiefly very small fowls wrapped in paper and packed in cases, weighing but a few pounds each, which were sold at 8s. 2d. or 1s. 3d. each. Other sources include America, Canada and Australia, which have been sending smaller but increasing quantities of large birds, packed in smaller numbers, and which realize 2s. 6d. to 3s. 6d. each, a far smaller Virus as much as 34. 6c. each. Such supplies have somewhat affected the Sussex fattening industry, necessitating the production of a lower class of bird at a lower price and narrower margin; but they look rough and inferior in colour, and chiefly supply restaurant and hotel demand. The foreign birds being cold-storage goods, which must be consumed quickly when taken out, a fresh Sussex fowl of the same weight will always sell for considerably more.

There were also some 3,000,000 of British poultry in Ireland; in Ireland they are collected. The year 1891 closed a decade in which the number of holdings under ten acres had decreased enormously, and the number of poultry was doubled to 17,450,000. In 1898 this number had doubled to 14,856,517, and in 1899 there were 18,233,520. The Irish Agricultural Organization Society is doing much to improve breeds and management, and the packing of eggs, of which Ireland is a considerable exporter to Great Britain. There is also now a considerable export of lean chickens for fattening to Sussex and other parts of England, and a smaller number have also been fattened in Ireland.

In Australia most of the federated states have a produce export department, which consists of a dairy section and a poultry section, and ships to London, managing, if desired, the whole business. That of South Australia shipped a good many eggs to England in 1895, but the temperature was found too low for eggs, and this trade has now ceased. The South Australia trade was shipped in a similar way to South Africa, West Australia and Victoria to London. In New South Wales such arrangements have inaugurated a small export business which seems to be the most active of any known at present in the poultry industry in this state than in others. The government statistician estimated the number kept in 1900 at 3,180,000 fowls, 320,000 ducks, 254,000 turkeys and 97,000 geese, the annual consumption being about three-fourths of the number above. In Canada the government makes considerable effort to encourage poultry. It has established several stations where systematic fattening of chickens in the English manner is taught, and official expeditions are also made on the results of varying climate and other matters. From these stations shipments of fattened chickens were first made to Liverpool and London, commencing an export trade which shows signs of growth.

The poultry industry in the United States is the most gigantic in the world. By the census of 1900, which tabulates returns from 5,066,252 out of the 7,537,657 farms in the States, the number of fowls imported and destined for this country increased from 100,000 in 1885 to 1,250,000 in 1890, and is now said to be about 2,000,000. This number represents breeding and laying stock, which thus averages about 49 birds to every holding; it also of necessity omits many of the smaller city-dwelling fowls which are kept in the hundreds. In the year 1900 the wholesale is given as 136,841,877 dollars, and of the year produced (1,293,819,186 dozen) at 144,286,186 dollars; a total year's product of over $56,000,000. Adding only a very moderate amount for the smaller producers not returning the poultry industry in America exceeded in value either the wheat crop, or swine or cotton crop.

The importance of poultry in France has long been recognized, being second only in importance to the moderately small holdings and the national disposition to small rural industries. The eggs exported are collected from the farmers by such a well-organized system that eggs collected on Wednesday are in the London market the following Tuesday; this system represents breeding and laying stock, which thus averages about 49 birds to every holding; it also of necessity omits many of the smaller city-dwelling fowls which are kept in the hundreds. The wholesale is given as 136,841,877 dollars, and of the year produced (1,293,819,186 dozen) at 144,286,186 dollars; a total year's product of over $56,000,000. Adding only a very moderate amount for the smaller producers not returning the poultry industry in America exceeded in value either the wheat crop, or swine or cotton crop.

The conditions in Belgium are somewhat similar to those in France. Some eggs are imported from Italy, and much of the home production is marketed in Italy. The export of eggs to Italy is more important than to Germany, and there are none coming from the latter country. Eggs are exported chiefly to France, Great Britain and Germany. There is a fattening industry somewhat similar to that in Sussex, lean chickens being bought for fattening in certain markets. The chief export of these is to Germany, but there is some to the London market, especially in December.

In the Netherlands the number of poultry increased considerably during the last decade, and the number of eggs has increased which diminished. Taking 1900 as a typical year, there were 4,083,312 fowls, 430,022 ducks, 36,307 geese, and 13,103 turkeys; and there were about 70 special establishments for poultry-rearing, with a live carcase (chickens) geese at £57,500; but this latter article is now exceeded by geese alone sent to Germany, as above noticed.
POUNCE—POUND

221

Her vast southern provinces are, of course, the origin of this produce, which is collected by dealers from the farmers, the price realized by the latter for eggs being in summer sometimes less than a rupee per hundred. The government has shown considerable interest in this growing industry, several shipments of produce being sent out to almost incredibly low rates on the State railways; but the vast distances involved must always convene Russian produce to the supply of the cheaper class. There is a demand in western Europe. (L. W. 13.)

POUNCE. (1) To drop upon, to seize forcibly upon, by a bird of prey seizing its victim in its claws. The substantive "pounce," from which the verb is formed, was the technical name in falconry for the claws on the three front toes of a hawk’s claws, and so the Book of St Albans (1486) “Fryst the grete Clees behynde ... ye shall call hom talons. ... The Clees within the Jote ye shall call of right her Pownces.” (2) To decorate metal by driving or punching a design into it from the under or back part of the surface; also to decorate cloth or other fabric by stamping or “pinking” holes, scalloping the edges, &c. Both these words are from the Late Latin *punere*, *punctum*, to prick, pierce. From them must be distinguished (3) “pounce,” a preparation of powdered cuttle-fish or sandarach, the resin of the sandarach-tree, formerly used for drying ink on the roughened surface of vellum, parchment or paper where an erasure had been made; later, the word was also given to the black sand used generally as a dusting-powder for drying ink before the invention of blotting-paper. The “pounce-box” or “pouncet-box” was a familiar object on all writing-tables till that time. A similar box with pierced lid for holding perfumes, &c., bears the same name. This word is formed from the Lat. *punge*, pounce-box, which was employed for securing a smooth surface on vellum, parchment, &c. The term “pounce” is also applied to a finely powdered gum of the juniper or to pipe-clay darkened with charcoal used in transferring designs to fabrics, wall-surfaces, &c., through holes pricked in the original drawing.

POUND. (1) An enclosure in which cattle or other animals are retained until redeemed by the owners, or when taken in distress until repossessed, such retention being in the nature of a pledge or security to compel satisfaction for debt or damage done. Animals may be seized and impounded when (1) distrained for rent; (2) damage feasant, i.e. doing harm on the land of the person seizing; (3) straying; (4) taken under legal process. A pound belongs to the township or village or manor where it is situated. The pound-keeper is obliged to receive everything offered to his custody and is not answerable if the thing offered be illegally impounded.

By a statute of 1554, no distress of cattle can be driven out of the hundred where taken unless to a pound in the same county, within three miles of the place of seizure. This statute also fixes 4d. as the fee for impounding a distress. Where cattle are impounded the impounder is bound to supply them with sufficient food and water (see the Health of Animals Acts 1849 and 1854); any person, moreover, is authorized to enter a place where animals are impounded without food and water more than 24 hours and supply them; and the cost of such food is to be paid by the owner of the animal before it is removed. A statute of 1690 gives treble damages and costs against persons guilty of pound breach; and by statute of 1843 (Pound Breach) persons releasing or attempting to release cattle impounded or damaging any pound to a fine not exceeding £5, answerable to the person on whose behalf the cattle were distrained, with imprisonment if the damage be so great as to have an effect on the health of the animals and to prevent them from doing any useful work.
POUSSIN—POVOA DE VARZIM

R. Ruding, Annals of the Colnagie (1816) and H. J. Chaney, Our Weights and Measures (1897).

POUSSIN, NICOLAS (1594—1665), French painter, was born at Les Andelys (Eure) in June 1594. Early sketches attracted the notice of Quentin Varin, a local painter, whose pupil Poussin became, till he went to Paris, where he entered the studio of Ferdinand Elle, a Fleming, and then of the Lorrain L’Allemand. He found French art in a stage of transition, and the distinctions of the academical schools destined to supplant it were not yet established; but, having met Courtois the mathematician, Poussin was fired by the study of his collection of engravings after Italian masters. After two abortive attempts to reach Rome, he fell in with the chevalier Marini at Lyons. Marini employed him on illustrations to his poems, took him into his household, and in 1624 enabled Poussin (who had been detained by commissions in Lyons and Paris) to rejoin him at Rome. There, his patron having died, Poussin fell into great distress. Failing ill he was received into the house of his compatriot Dughet and nursed by his daughter Anna Maria, to whom in 1629, Poussin was married. Among his first patrons were Cardinal Barberini, for whom was painted the “Death of Germanicus” (Barberini Palace); Cardinal Omodei, for whom he produced, in 1630, the “Triumphs of Flora” (Louvre); Cardinal de Richelieu, who commissioned a Bacchanaal (Louvre); Vicenzo Giustiniani, for whom was executed the “Massacre of the Innocents,” of which there is a first sketch in the British Museum; Cassiano dal Pozzo, who became the owner of the first series of the “Seven Sacraments” (Belvoir Castle); and Fillac de Chanteloup, with whom in 1640 Poussin, at the call of Sublet de Noyers, returned to France. Louis XIII conferred on him the title of “first painter in ordinary,” and in two years he produced several pictures for the royal chapels (the “Last Supper,” painted for Versailles, now in the Louvre) and eight cartoons for the Gobelins, the series of the “Labours of Hercules” for the Louvre, the “Triumph of Truth” for Cardinal Richelieu (Louvre), and much minor work. In 1643, disgusted by the intrigues of Simon Vouet, Feuquières and the architect Lemercier, Poussin withdrew to Rome. There, in 1648, he finished for De Chanteloup the second series of the “Seven Sacraments” (Bridge Water Gallery) and also his noble landscape with Diogenes throwing away his Scoop (Louvre); in 1649 he painted the “Vision of St Paul” (Louvre) for the comic poet Scarron, and in 1650 the “Triumph of Alexander the Great” (Louvre) for the duke of Crèquy. Year by year he continued to produce an enormous variety of works, many of which are included in the list given by Félibien. He died on the 19th of November 1665 and was buried in the church of St Lawrence in Lucina, his wife having predeceased him.

The finest collection of Poussin’s paintings as well as of his drawings is possessed by the Louvre; but, besides the pictures in the National Gallery, London, and Dulwich, the Duc de Chevreul possesses one of his most considerable works: The “Triumph of Pan” is at Baisliden (Berks.), and his great allegorical painting of the “Arts” at Knowesley. At Rome, in the Colonna and Valmarini Palaces, are notable works by him, and one of the private apartments of Prince Doria is decorated by a great series of landscapes in distemper. Throughout his life he stood aloof from the popular movement of his native school. His influence in France was purely decorative, but, in Rome, we find a survival of the impulses of the Renaissance coupled with conscious reference to classic work as the standard of excellence. In general we see his paintings at a disadvantage, for the colour, even of the best preserved, has changed in part, so that the keeping is disturbed; and the noble construction of his designs can be better seen in engravings than in the original. Amongst the many who have reproduced his works Audran, Claudine Stuins, Plinot, and Petrus are the most successful.

Poussin left no children, but he adopted as his son his gaspar Dughet (Gasparo Duche), his wife’s brother, who took the name of Poussin-Dughet. Dughet possesses one of his best easel-pictures, the “Sacrifice of Abraham,” formerly the property of the Colonna, is now, with other works by the same painter, in the National Gallery, London. The frescoes executed by Gaspar Poussin in S. Martino di Monti are in a bad state. The Duc de Chevreul possesses a single work by his hand. Gaspar died at Rome on the 27th of May 1675.

P. Nation (Lady Dile), Documents inédits, Le Poussin, in L’Art (1882).

POUILLON, EMILE (1840—1906), French novelist, was born at Montauban (Tarn et Garonne). He published in 1878 a collection of stories entitled Nouvelles réalistes. Making himself the chronicler of his native province of Quercy, he painted its scenery and its life with great clearness of outline and without exaggeration. His books include Césette (1881), the story of a peasant girl; L’Innocent (1884); Jean-de-Jeanne (1886); Le Cheval bleu (1888); Le Veu d’tre chaste (1900); Chaste-pluie (1890); Les AmOURS (1892); Petites âmes (1893); Mademoiselle Clémence (1896); Pays et paysages (1895); Petites gens (1903); Bernadette de Lourdes (1894), a mystery; and Le Roi de Rome (1898), a play. He died at Chambéry.

POVINDAH, a class of warrior nomadic traders in Afghanistan, who belong chiefly to the Nasir and Suliman Kuel tribes of Ghilzais. Their name, which designates their occupation, is derived from the same root as the Pushtu word for “to graze.” They are almost wholly engaged in the carrying trade between India and Afghanistan and Central Asia. They assemble every autumn in the plains east of Ghazni, with their families, flocks, herds and long strings of camels and horses, laden with the goods of Bokhara and Kandahar; and forming caravans march through the Kakar and Waziri countries by the Zhob and Gomal passes of the Suliman hills. Entering Dera Ismail Khan district about October they leave their families and flocks, their arms and some two-thirds of their fighting men in the great grazing grounds which lie on either side of the Indus, and while some wander in search of emargened pastures, others travel in the great cities of India, and even by rail as far as Calcutta, Karachi and Bombay. In the spring they again assemble, and return by the same route to their homes in the hills about Ghazni and Kalat-i-Ghilzai. When the hot season begins, the men, leaving their belongings behind them, move off again to Kandahar, Herat and Bokhara, with the Indian and European merchandise which they have brought from Hindustan. For generations the Waziris have carried on war to the knife with these merchant traders. To meet the opposition that awaited them on the road the Povindahs used to move heavily armed, in bodies of from 5000 to 10,000, and regular parades and encampments were observed under an elected khan or leader. But since the Gomal Pass was taken over by the British and opened up in 1889 there has been comparative security on the border. During the Second Afghan War the tribes on the Tank border were stirred up by emissaries from Kabul, and the Suliman Khel joined the Mahsud Waziris in their daring raid on the town of Tank in January 1879. Colonel Boisragon, who commanded at Dera Ismail Khan, moved out against the Povindah settlements in the mouth of the Gomal Pass and severely punished them. The Povindahs paid a fine of nearly Rs. 60,000 (L1500), and agreed that in future their migratory band of marchers and camp followers, were disarmed on their entry into British territory, their weapons to be deposited in a military arsenal, and returned to their owners when they again crossed the border.

POVOA DE VARZIM, a seaport of northern Portugal, in the district of Oporto; on a small and ill-sheltered bay, 18 m. N. of Oporto by the branch railway to Villa Nova de Famalicão. Pop. (1900), 12,623. In summer Povoa de Varzim is the most
The Rocky Mountains and the canyons of the Green and Colorado rivers, during the course of which (1860) he made a daring boat-journey of three months, through the Grand Canyon, the river channel not having previously been explored. In these travels he gathered much valuable information on the geology, and he also made a special study of the Indians and their languages.

His able work led to the establishment under the U.S. government of the geological and geographical survey of the Rocky Mountain region with which he was occupied in 1870-1879. This survey, with those of Ferdinand Hayden (1829-1889) and Captain George M. Wheeler (b. 1842) was incorporated with the United States Geological and Geographical Survey under Clarence King (1842-1901) in 1879, when Powell became director of the Bureau of Ethnology, a department he had assisted in founding.

On King’s resignation in 1881, Powell was appointed director also of the Geological Survey, a post which he occupied until 1894. To him the present thorough organization of the U.S. Geological Survey is largely due.

His principal publications were Exploration of the Colorado River of the West and its Tributaries (1875), Report on the Geology of the Eastern Portion of the Uinta Mountains (1876), Report on the Lands of the Arid Region of the United States (1879), Introduction to the Study of Indian Languages (1880), Canyons of the Colorado (1881), and Old Trails and Errors (1882). Especially important were his observations on what is now termed the “Uinta type” of mountain structure: a broad, flattened anticline, from which the strata descend steeply into bordering low grounds and quickly resume their horizontality—being sometimes faulted, and affording evidence of enormous denudation. He died in Haven, Maine, on the 23rd of September 1902.

POWELL, VYASOR (1671-1760), Welsh Nonconformist, was by birth a Radnorshire man and was educated at Jesus College, Oxford. About 1659 he entered upon the career of an itinerant preacher, and for preaching in various parts of Wales he was twice arrested in 1660; however, he was not punished and during the Civil War he preached in and around London. In 1666, when the victory of the parliamentary cause was assured, Powell returned to Wales, having received a certificate of character from the Westminster Assembly, although he had refused to be ordained by the Presbyterians. With a salary granted to him by parliament he resumed his itinerant preaching in Wales. In 1659 parliament appointed a commission “for the better propagation and preaching of the gospel in Wales,” and Powell acted as one of the principal advisers of this body. For three years he was actively employed in removing from their pulpits those ministers whom he regarded as incompetent. In 1653 he returned to London, and having denounced Cromwell for accepting the office of Lord Protector he was imprisoned. At the Restoration in 1660 he was arrested for preaching, and after a short period of freedom he was again seized, and he remained in prison for seven years. He was set free in 1667, but in the following year he was again a prisoner, and he was in custody when he died on the 27th of October 1670. Powell wrote several treatises and also some hymns, but his chief gifts were those of a preacher.

See The Life and Death of Mr Vavasor Powell (1671), attributed to Edward Bagshaw the younger; Vavasors Examen et Purgament (1654), by E. Allen and others; D. Neal, History of the Puritans (1822); and T. Rees, History of Protestant Nonconformity in Wales (1861).

POWELL, WILLIAM GRATAN (1797-1841), Irish actor, was born near Kilmacthomas on the 2nd of November 1797. At the age of fourteen he joined a company of strolling players, eventually getting small parts in the London theatres.

On the sudden death of Charles Connor he was given his parts and was immediately recognized as the best stage Irishman of his generation, becoming a popular favourite in London, Dublin and America. He was on board the ill-fated “President” when she foundered at sea in March 1841. Powell wrote and

POWDER—POWER

frequented sea-bathing resort in northern Portugal; it is also the headquarters of important sardine, hake, and sea-bream fisheries.

POWDER (through O. Fr. pulde, modern poudre, from Lat. pulvis, pulveris, dust), the small loose particles into which solid matter is disintegrated by such processes as grinding, crushing, pounding, &c., hence any preparation which takes the form of such loose unconnected particles, the most familiar example of such preparation being that of gunpowder (q. v.).

Many powders are found in medical uses, some of which have retained the name of their inventor, such as the compound powder of rhubarb, "Gregory powder," named after a Scottish doctor, James Gregory (1697-1724). Various preparations in form of powder were used for toilet purposes. During the period when a wig or hair was worn "powdered" or whitened, houses had a special room set apart for the process, known as the powdering-room or closet. In some birds, such as the herons, certain down-feathers or plumulce break off into a fine dust as fast as they are formed and form tracts defined in size and situation and known as "powder-down patches."

POWELL, FREDERICK YORK (1850-1904), English historian and scholar, was born in Bloomsbury, London, on the 14th of January 1850. Much of his childhood was spent in France and Spain, so that he early acquired a mastery of the language of both countries, and an insight into the genius of the Spanish. He was educated at Rugby School, and matriculated at Oxford as an unattached student, subsequently joining Christ Church, where he took a first-class in law and modern history in 1872. He was called to the bar at the Middle Temple in 1874, and married in the same year. He became law-lecturer and tutor of Christ Church, fellow of Oriel College, delegate of the Clarendon Press, and in 1894 he was made regius professor of modern history in succession to J. A. Froude. Although he never made any extensive contribution to history, he was a particularly stimulating teacher. He had been attracted in his school days to the study of Scandinavian history and literature, and he was closely allied with Professor Gunder van Eifison (d. 1889), whom he assisted in his Icelandic Prose Reader (1897), Corpus posticum boreale (1887), Origines Islandicae (1902), and in the editing of the Grimm Centenar papers (1886). He took a keen interest in the development of modern French poetry, and Verlaine, Mallarmé and Verhaeren all lectured at Oxford under his auspices. He was also a connoisseur in Japanese art. In politics his sympathies were with the oppressed of all nationalities; he had befriended refugees after the Commune, counting among his friends Jules Vallès; the author of Les Réfractaires; and he was also a friend of Stepniak and his circle. He died at Oxford on the 8th of May 1904.

See the Life, with letters and selections, by Oliver Elton (1906).

POWELL, GEORGE (c. 1638-1714), English actor and playwright, was the son of an actor of the same name (d. c. 1638), with whom, as the king of Bakam, he first appeared in 1687, as Emanuel in The Island Princess, Tate’s version of Fletcher’s play. He wrote or adapted Alphonse, King of Naples (1661), Treacherous Brothers (1670), and Very Good Wife (1603), and acted in them and in a long list of contemporary plays almost until his death. As a tragedian he succeeded to many of Betterton’s parts, but not to his genius.

POWELL, JOHN WESLEY (1834-1902), American geologist and ethnologist, was born at Mount Morris, New York, on the 24th of March 1834. His parents were of English birth, but had moved to America in 1830, and he was educated at Illinois and Oberlin colleges. When the Civil War broke out he entered the Union Army as a private, and at the battle of Shiloh he lost his right arm. He continued, however, on active service and served as division chief of artillery before Vicksburg, reaching the rank of major of volunteers. In 1865 he was appointed professor of geology and curator of the museum in the Illinois Wesleyan University at Bloomington, and afterwards at the Normal University. In 1867 he commenced a series of expeditions to
POWER OF ATTORNEY—POWER TRANSMISSION

POWER OF ATTORNEY, or LETTER OF ATTORNEY, is an authority under hand and seal empowering the person named therein to do some act on behalf of the principal, which otherwise could only be done by the principal himself. It is either general or special. A general power of attorney authorizes the agent to do any act for the principal, however great, in matters of a particular nature only, or in respect of a particular business. A special act of attorney authorizes the agent to represent his principal only in some particular specified act. It expires with death of the principal, and is revocable at his will, even by a verbal notice, unless it has been given for a valuable consideration. Moreover, the terms of the power are construed literally, and give such authority only as they confer expressly or by necessary implication. The Conveyancing Act of 1881 provides for protection for any person making any payment or doing any act in good faith, in pursuance of a power of attorney, if before the time of the payment or act the donor of the power had died or become lunatic, of unsound mind, or bankrupt, or had revoked the power. The law relating to powers of attorney is a branch of the law of agency. (See Agent; Principal and Agent.)

POWERS, HIRAM (1805-1873), American sculptor, the son of a farmer, was born at Woodstock, Vermont, on the 29th of June 1805. In 1819 his father removed to Ohio, about six miles from Cincinnati, where the son attended school for about a year, staying meanwhile with his brother, a lawyer in Cincinnati. After leaving school he found employment in superintending a reading-room in connexion with the chief hotel of the town, but, being, in his own words, "forced at last to leave that place as his clothes and shoes were fast leaving him," he became a clerk in a general store. His second employer in this line of business having invested his capital in a clock and organ factory, Powers set himself to master the construction of the instruments, displaying an aptitude which in a short time enabled him to become the first mechanic in the factory. In 1826 he began to frequent the studio of Mr Eckenstein, and at once conceived a strong passion for the art of sculpture. His proficiency in modelling secured him the situation of general assistant and artist of the Western Museum, kept by a Frenchman named Dorerget, where his ingenious presentation of the infernal regions to illustrate the more striking scenes in the poem of Dante met with extraordinary success. After studying thoroughly the art of modelling and casting, at the end of 1834 he went to Washington, where his remarkable gifts soon awakened general attention. In 1837 he settled in Florence, where he remained till his death. While he found it profitable to devote the greater part of his time to busts, his best efforts were bestowed on ideal work. In 1839 his statue of "Eve" excited the warm admiration of Thorwaldsen, and in 1843 he produced his celebrated "Greek Slave," which at once gave him a place among the leading sculptors of his time. Among the best known of his other ideal statues are the "Fisher Boy," "Il Penseroso," "Proserpine," "California," "America" (modelled for the Crystal Palace, Sydenham), and the "Last of his Tribe." He died on the 27th of June 1873.

See an article by T. A. Trollope in Lippincott's Magazine for February 1875.

POWER TRANSMISSION. The appliances connected with installations for the utilization of natural sources of energy may be classified into three groups—

1. Prime movers, by means of which the natural force of energy is transformed into mechanical energy. To this group belong all such appliances as water turbines, steam turbines, steam engines and boilers, gas producers, gas engines, oil engines, &c.

2. Machinery of any kind which is driven by energy made available by the prime mover. To this group belong all machine tools, textile machinery, pumping machinery, cranes—in fact every kind of machine which requires any considerable quantity of energy to drive it.

3. The appliances by means of which the energy made available by the prime mover is transmitted to the machine designed to utilise it. The term power is used to denote the rate at which energy is transmitted. The unit of power in common use is the horse power, and one horse power means a rate of transmission of 330 foot-pounds per second.

In many cases the prime mover is combined with the machine in such a way that the transmission is not distinctly differentiated from either the prime mover or the machine, as in the case of the locomotive engine. In other cases the energy made available by the prime mover is transmitted to a number of separate machines at a distance from the prime mover, as in the case of an engineer's workshop. In this case the transmitting mechanism by means of which the energy is distributed to the several machines has a distinct individuality. In other cases prime movers are located in places where the natural source of energy is abundant, namely, near waterfalls, or in the neighbourhood of coal-fields, and the energy made available is transmitted in bulk to factories, &c., at relatively great distances. In this case the method and mechanism of distribution become of paramount importance, since the distance between the prime mover and the places where the energy is to be utilized by machines is only limited by the efficiency of the mechanism of distribution.

Prime movers are considered in the articles STEAM ENGINE; GAS ENGINE; OIL ENGINE, and HYDRAULICS, and machines in various special articles. The methods and mechanisms of distribution or transmission alone form the subjects of the present article, and the different methods in general use readily fall into four divisions—

1. Mechanical.
2. Pneumatic.
3. Hydraulic.
4. Electrical.

I.—MECHANICAL

§ 1. Methods.—The mechanical transmission of power is effected in general by means of belts or ropes, by shafts or by wheel gearing and chains. Each individual method may be used separately or in combination. The problems involved in the design and arrangement of the mechanisms for the mechanical distribution of power are conveniently approached by the consideration of the way in which the mechanical energy made available by an engine is distributed to the several machines in the factory. By a belt on the fly-wheel of the prime mover the power is transmitted to the line shaft, and pulleys suitably placed along the line shaft by means of other belts transmit power, first, to small countershafts carrying fast and loose pulleys and striking gear for starting or stopping each engine as will, and then to the driving pulleys of the several machines. (See also Pulleys.)

§ 2. Quantitative Estimation of the Power Transmitted.—In dealing with the matter quantitatively the engine crank-shaft may be taken as the starting point of the transmission, and the first motion-shaft of the machine as the end of the transmission so far as that particular machine is concerned.

Let T be the mean torque or turning effort which the engine exerts continuously on the crank shaft when it is making N revolutions per second. It is more convenient to express the revolutions per second in terms of the angular velocity ω, that is, in radians per second. The relation between these quantities is ω = 2πN. Then the rate at which work is done by the engine crank shaft is Tω foot-pounds per second, equivalent to Tω/500 horse power. This is now distributed to the several machines in varying proportions. Assuming for the sake of simplicity that the whole of the power is absorbed by one machine, let T be the torque on the first motion-shaft of the machine, and let ω1 be its angular velocity, then the rate at which the machine is absorbing energy is Tω1 foot-pounds per second. A certain quantity of energy is absorbed by the transmitting mechanism itself for the purpose of overcoming frictional and other resistances, otherwise the rate of absorption of energy by the machine would exactly equal the rate at which it was produced. Assuming steady ordinary conditions of working. Actually therefore Tω1 would be less than Tω so that

\[ T\omega_1 = T\omega - 7\frac{1}{2}(1) \]
where $\eta$ is called the efficiency of the transmission. Considering now the general problem of a multiple machine transmission, if $T_{101}, T_{102}, T_{103}, \ldots$ are the several torques and angular velocities of the respective first motion shafts of the machines,

$$(T_{101} + T_{102} + T_{103} + \ldots) = \eta T_w$$

expresses the relations which must exist at any instant of steady motion. This is not quite a complete statement of the actual conditions because some of the produced energy is always in course of being stored and unstored from instant to instant as kinetic energy in the moving parts of the mechanism. Here, $\eta$ is the over-all efficiency of the distributing mechanism. We now consider the separate parts of the transmitting mechanism.

§ 3. Belts.—Let a pulley $A$ (fig. 1) drive a pulley $B$ by means of a leather belt, and let the direction of motion be as indicated by the arrows on the pulleys. When the pulleys are revolving uniformly, a transmitting power to $B$, one side of the belt will be tight and the other side will be slack, but both sides will be in a state of tension. Let $t$ and $u$ be the respective tensions on the tight and slack side; then the torque exerted by the belt on the pulley at $r$ is $\frac{1}{2}ru$, where $r$ is the radius of the pulley in feet, and the rate at which the work done on the pulley is $(t-u)ru$ foot-pounds per second.

If the horse-power required to drive the machine be represented by $h.p.$, then

$$(t-u)ru = 550 \text{ h.p.},$$

assuming the efficiency of the transmission to be unity. This equation contains two unknown tensions, and before either can be found another condition is necessary. This is supplied by the relation between the tensions, the arc of contact, the radius of curvature of the belt $r$, and the coefficient of friction $\mu$ between the belt and the pulley, the mass of the belt and the speed of the belt.

Consider an element of the belt (fig. 2) subtending an angle $\delta\theta$ at the centre of the pulley, and let $t$ be the tension on one side of the element and $(t+\delta t)$ the tension on the other side. The tension tending to cause the element to slide bodily round the pulley face is $t \delta \theta$. The normal pressure between the element and the pulley, required to prevent slipping is $W \delta \theta$, where $W$ is the weight of the belt per foot, the constraining force required for this purpose is $W \delta \theta$, where $v$ is the linear velocity of the belt in feet per second. Hence the frictional resistance of the element to sliding is $(t-W)\delta \theta$, and this must be equal to the difference of tensions $\delta t$ when the element is on the point of slipping, so that $(t-W)\delta \theta + W \delta \theta = \delta t$. The solution of this equation is

$t-W = \frac{W}{\mu}$

where $t$ now is the maximum tension and $u$ the minimum tension, and $\mu$ is the base of the Napierian system of logarithms, 2.718.

Equations (3) and (4) supply the condition from which the power transmitted by a given belt at a given speed can be found. For ordinary work the term involving $v$ may be neglected, so that (4) becomes

$$t_{\mu} = \frac{W}{\mu}.$$ 

Equations (3) and (5) are ordinarily used for the preliminary design of a belt to calculate $t$, the maximum tension in the belt necessary to transmit a stated horse-power at a stated speed, and the tension required at the grooves at the ends of the belt and $\delta$. (See W. C. Unwin, *Machine Design*, 12th ed., p. 377.) The ratio should be calculated for the smaller pulley. If the belt is arranged as in fig. 1, that is, with the slack side uppermost, the drop of the belt tends to increase $\theta$ and hence the ratio $t_{\mu}$ for both pulleys.

$\S$ 4. Example of Preliminary Design of a Belt.—The following example illustrates the equations for the design of a belt in the ordinary way. Find the width of a belt to transmit 20 h.p. from the flywheel of an engine to a shaft which runs at 180 revolutions per minute (equal to 18.54 radians per second), the pulley on the engine being 26 in. in diameter, and the pulley at the load 18 in. in diameter.

The diameter of such a belt is 120 in., equal to 2.049 radians, and further assume that the coefficient of friction $\mu = 0.3$. Then from equation (5) $t_{\mu} = \frac{2.049}{0.3} \times \frac{1}{18.54} = 4.282$, from which $t_{\mu} = 1.87$, and $u = 1.87$. Using this in (3) we have $t = 1.87 - 1.87 = 0.583$, and, from which, inserting the value 838 for $t$, $u = 404.5$ lb. Using this value of $u$ in equation (1)

$$H.P. = \frac{(838-404.5) \times 18.4 \times 1.5}{28.2} = 19.15.$$ 

Thus with the comparatively low belt speed of 28 ft. per second the horse power is only diminished by about 5%.

As the velocity increases the transmitted horse power increases, but the loss from friction is also increased. The efficiency of a belt will become very low at the speed of the belt at which the horse power transmitted is a maximum. An increase of speed above this results in a diminution of transmitted horse power.

§ 5. Belt Velocity for Maximum Horse Power.—If the weight of a belt per foot is given, the speed at which the maximum horse power is transmitted for an assigned value of the maximum tension $t$ can be calculated from equations (3) and (4) as follows:

Let $t$ be the given maximum tension with which a belt weighing $W$ lb per foot may be worked. Then solving equation (4) for $u$, substituting $t$ from each side, and changing the signs all through, we have $v = \sqrt{W/gW}$. Utilizing the data of the previous example it is easy to construct this matter, as $t = 838$ lb per square inch, $W = 1.4$ lb per foot, and consequently, from the above expression, $v = 80$ ft. per second approximately. A lower speed than this should be adopted, however, because the above investigation does not include the loss incurred by the continual bending of the belt round the circumference of the pulley. The loss from this cause increases with the velocity of the belt, and operates to make the maximum horse power for a belt considerably lower than that given above.

§ 4. Transmission Power.—When a horse-power is absorbed in its continual bending round the pulleys, the amount depending upon the flexibility of the belt and the speed. If $C$ is the couple required to bend the belt to the radius of the pulley, the rate at which work is done is $C \times 28$ foot-pounds per second. The value of $C$ for a given belt varies approximately inversely as the radius of the pulley, so that the loss of power from this cause will vary inversely as the radius of the pulley and directly as the speed of revolution. Hence the flexible belts are to be prered and stiff ones. Besides the loss of power in transmission due to this cause, the bending causes a stress in the belt which is to be added to the direct stress due to the tensions in the belt in order to find the maximum stress. In ordinary leather belts the bending stress is usually negligible; in ropes, however, especially wire rope, it assumes paramount importance, since it tends to overstrain the outermost strands and if these give way the life of the rope is soon determined.

§ 7. Rope Driving.—About 1856 James Combe, of Belfast, introduced the practice of transmitting power by means of ropes running in grooves turned circumferentially in the rim of

![Diagram of belt](From Abram Combe, Proc. Inst. Mech. Eng.)

the pulley (fig. 3). The ropes may be led off in groups to the different floors of the factory to pulleys keyed to the distributing shafting. A groove was adopted having an angle of about 45°.
and this is the angle now used in the practice of Messrs Combe, Barbour and Combe, of Belfast. A section of the rim of a rope driving wheel showing the shape of the groove for a rope 1\(\frac{1}{2}\) in. diameter is shown in fig. 4, and a rope driving pulley designed for six 1\(\frac{1}{2}\)in. ropes is shown in fig. 5. A rope is less flexible than a belt, and therefore care must be taken not to arrange rope drives with pulleys having too small a diameter relatively to the diameter of the rope. The principles of §§ 3, 4, 5 and 6, apply equally to ropes, but with the practical modification that the working stress in the rope is a much smaller fraction of the ultimate strength than in the case of belting and the ratio of the tensions is much greater. The following table, based upon the experience of Messrs Combe, presents the practical possibilities in a convenient form:

<table>

The speed originally adopted for the rope was 55 ft. per second. This speed has been exceeded, but, as indicated above, for any particular case there is one speed at which the maximum horse power is transmitted, and this speed is chosen with due regard to the effect of centrifugal tension and the loss due to the continual bending of the rope round the pulley. Instead of using one rope for each groove, a single continuous rope may be used, driving from one common pulley several shafts at different speeds. For further information see Abram Combe, Proc. Inst. Mech. Eng. (July 1896). Experiments to compare the efficiencies of rope and belt driving were carried out at Lille in 1894 by the Sociétie Industrielle du Nord de la France, for an account of which see D. S. Capper, Proc. Inst. Mech. Eng. (October 1896). Cotton ropes are used extensively for transmitting power in factories, and though more expensive than Manila ropes, are more durable when worked under suitable conditions.

§ 8. Shafts.—When a shaft transmits power from a prime mover to a machine, every section of it sustains a turning couple or torque \(T\), and if \(w\) is the angular velocity of rotation in radians per second, the rate of transmission is \(T_w\) foot-pounds per second, and the relation between the horse power, torque and angular velocity is

\[
T_w = \frac{550 \cdot \frac{T}{w}}{12} \text{ H.P.}
\]

The problem involved in the design of a shaft is so to proportion the size that the stress produced by the torque shall not exceed a certain limit, or that the relative angular displacement of two sections at right angles to the axis of the shaft at a given distance apart shall not exceed a certain angle, the particular features of the problem determining which condition shall operate in fixing the size. At a section of a solid round shaft, where the diameter is \(D\) inches, the torque \(T\) inch-pounds, and the maximum shearing stress \(f\) pounds per square inch, the relation between the quantities is given by

\[
T = \pi D f
\]

and the relation between the torque \(T\), the diameter \(D\), the relative angular displacement \(\theta\) of two sections \(L\) inches apart by

\[
T = \pi C 2 \pi D^2 f / 32 L
\]

where \(C\) is the modulus of rigidity for the material of the shaft. Observe that \(\theta\) is here measured in radians. The ordinary problems of shaft transmission by solid round shafts subject to a uniform torque only can be solved by means of these equations.

Calculate the horse power which a shaft 4 in. diameter can transmit, revolving 120 times per minute (12\(\frac{1}{2}\) radians per second), when the maximum shearing stress \(f\) is limited to 11,000 lb per square inch. From equation (7) the maximum torque which may be applied to the shaft is \(T = 138,400\) inch-pounds. From equation (6)

\[
T_w = \frac{550 \cdot \frac{T}{w}}{12} = 264. \text{ The example may be continued to find how much the shaft will twist in a length of 10 ft. Substituting the value of the torque in inch-pounds in equation (8), and taking 11,500,000 for the value of \(C\),}
\]

\[
\theta = \frac{138,400 \cdot 120 \cdot 32}{11,500,000 \cdot 3 \cdot 14 \cdot 256} = 0.057 \text{ radians},
\]

and this is equivalent to 3\(\frac{3}{4}\)°.

In the case of hollow round shafts where \(D\) is the external diameter and \(d\) the internal diameter equation (7) becomes

\[
T = \pi f (D^4 - d^4)/16 D \text{ H.P.}
\]

and equation (8) becomes

\[
T = \pi C 2 \pi D^2 f / 32 L \text{ inch-pounds.}
\]

The assumption tacitly made hitherto that the torque \(T\) remains constant is rarely true in practice; it usually varies from instant to instant, often in a periodic manner, and an appropriate value of \(f\) must be taken to suit any particular case. Again it rarely happens that a shaft sustains a torque only. There is usually a bending moment associated with it. For a discussion of the proper values of \(f\), to suit cases where the stress is variable, and the way a bending moment of known amount may be combined with a known torque, see STRENGTH OF MATERIALS. It is sufficient to state here that if \(M\) is the bending moment in inch-pounds, and \(T\) the torque in inch-pounds, the magnitude of the greatest direct stress in the shaft due to the effect of the torque and twisting moment acting together is the same as would be produced by the application of a torque of

\[
M + \pi T (T^4 + M^2)^{\frac{1}{3}} \text{ inch-pounds.}
\]

It will be readily understood that in designing a shaft for the distribution of power to a factory where power is taken off at different places along the shaft, the diameter of the shaft near the engine must be proportioned to transmit the total power transmitted whilst the parts of the shaft more remote from the engine are made smaller, since the power transmitted there is smaller.

§ 9. Gearing Pitch Chains.—Gearing is used to transmit power from one shaft to another. The shafts may be parallel; or inclined to one another, so that if produced they would meet in a point; or inclined to one another so that if produced they would not meet in a point. In the first case the gear wheels are called spur wheels, sometimes cog wheels; in the second case bevel wheels, or, if the angle between the shafts is 90°, miter wheels; and in the third case they are called skew bevels. In all cases the teeth should be so shaped that the velocity ratio between the shafts remains
HYDRAULIC POWER TRANSMISSION

constant, although in very rare cases gearing is designed to work with a variable velocity ratio as part of some special machines. For the principles governing the shape of the teeth to fulfil the condition that the velocity ratio between the wheels shall be constant, see MECHANICS, § Applied. The size of the teeth is determined by the torque the gearing is required to transmit.

Pitch chains are closely allied to gearing; a familiar example is in the driving chain of a bicycle. Pitch chains are used to a limited extent as a substitute for belts, and the teeth of the chains and the teeth of the wheels with which they work are shaped on the same principles as those governing the design of the teeth of wheels.

If a pair of wheels is required to transmit a certain maximum horse power, the angular velocity of the shaft being \( \omega \), the pressure \( P \) which the teeth must be designed to sustain at the pitch circle is 550 H.P./f.t., where \( R \) is the radius of the pitch circle of the wheel, whose angular velocity is \( \omega \).

§ 10. Velocity Ratio.—In the case of transmission either by belts, ropes, shafts or gearing, the operating principle is that the rate of working is constant, assuming that the efficiency of the transmission is unity, and that the product \( Tu \) is therefore constant, whether the shafts are connected by ropes or gearing. Considering therefore two shafts, \( Tu = T_1u_1 = T_2u_2 \); that is \( \omega_1 \phi_1 = \omega_2 \phi_2 \); i.e. the angular velocity ratio is inversely as the torque ratio. Hence the higher the speed at which a shaft runs, the smaller the torque for the transmission of a given horse power, and the smaller the tension on the belts or ropes for the transmission of a given horse power.

§ 11. Long Distance Transmission of Power.—C. F. Hiram originated the transmission of power by means of wire ropes at Colmar in Alsace in 1850. Such a telodynamic transmission consists of a series of wire ropes running on wheels or pulleys supported on piers at spans varying from 300 to 500 ft. between the prime mover and the place where the power is utilized. The slack of the ropes is supported in some cases on guide pulleys distributed between the main piers. In this way 300 h.p. was transmitted over a distance of 6500 ft. at Freiberg by means of a series of wire ropes running at 62 ft. per second on pulleys 11 ft. in diameter. The individual ropes of the series, each transmitting 300 h.p., were each 1-08 in. diameter and contained 10 strands of 8 wires per strand, the wires being each 0-072 in. diameter. Similar installations existed at Schaffhausen, Oberursal, Bellegarde, Tortona and Zürich. For particulars of these transmissions with full details see W. C. Unwin's Howard Lectures on the "Development and Transmission of Power from Central Stations" (Journ. Soc. Arts, 1893, published in book form 1894). The system of telodynamic transmission would not doubt have developed to a much greater extent than it has done but for the advent of electrical transmission, which made practicable the transmission of power to distances utterly beyond the possibilities of any mechanical system.

See W. J. M. Rankine, Treatise on Machinery and Millwork; and W. C. Unwin, Elements of Machine Design; and for telodynamic transmission see F. Reuleaux, Die Konstruktion. (W. E. D.)

II.—HYDRAULIC

The first proposal for a general transmission of hydraulic power was made by Bramah in 1802. In 1846 Lord Armstrong's hydraulic crane was erected at Newcastle, and was worked from the town water mains, but the pressure in such mains was too low and uncertain to secure satisfactory results. The invention of the accumulator in 1850 enabled much higher pressures to be used; since then 700 lb per square inch has been adopted in most private hydraulic power transmission plants. An attempt to give a public supply of hydraulic power was made in 1859, when a company was formed for laying mains in London along the river Thames between the Tower and Blackfriars, the engineer being Sir George Bruce; but though an act of parliament was obtained, the works were not carried out. The first public hydraulic supply station was established at Hull in 1877. In 1883 the General Hydraulic Power Works, Messrs Ellington and Woodall being the engineers, were started in London, and they now form the largest system of hydraulic power transmission in existence. Works of a similar character have since been established in several other towns. The general features of hydraulic power transmissions are: (1) a central station where the hydraulic pressure is created, usually by means of steam pumping engines; (2) a system of distribution mains; (3) machines for utilizing the pressure. In cases of public supplies there is the further important matter of registration.

When dealing with any practical problem of hydraulic power transmission it is of the first importance to determine the maximum demand for power, its duration and frequency. If the duration of the maximum demand is limited and the frequency restricted—for instance, when a swing bridge has to be opened and closed only a few times in the course of a day—a small pumping plant and a large accumulator will be desirable. If the maximum demand is more or less continuous, as when hydraulic pressure is used for working a pump in a mine or a hydraulic engine in a workshop, the central station pumping engine must be capable of supplying the maximum demand without the aid of an accumulator, which may or may not, according to circumstances, be provided to serve as a regulator. A hydraulic accumulator (fig. 1) ordinarily consists of a hydraulic cylinder and ram, the ram being loaded with sufficient weight to give the pressure required in the hydraulic mains. If a pressure of 700 lb per square inch is wanted, the weight of the ram and its load, neglecting friction, must be 700 lb for each square inch of its area, and if the cylinder is full, i.e. the ram elevated to its full extent, the accumulator is a reservoir of power, exactly as if it were a tank at the same cubical extent placed at an elevation of about 1600 ft. above the mains and connected with them. The function of accumulators in hydraulic power distribution is frequently misunderstood, and it has been urged that as in practice the size of the reservoirs of power that can be obtained by their use is small, they are of little value. An accumulator having a ram 20 in. diameter by 20 ft. stroke loaded to 700 lb is
POWER TRANSMISSION
[HYDRAULIC]

Of pressure, and the size of mains required for a given supply of power, and therefore have a most important influence on the economic of distributing power. The mechanical efficiency of hydraulic accumulators is very high, being from 95% to 98%, and they are practically indestructible.

When designing central stations the aim should be to employ pumping engines of such capacity that they can be worked as nearly as possible continuously at about their maximum output; the same consideration should, in the main, determine the size of the pumping units in a station where more than a single unit is employed. With a number of units, each can be worked, when in use, at or near the most economical speed. Moreover, reserve plant is necessary if the supply of power is to be constant, as an answer the units are the many the actual reserve required is less than where that is at a few.

An effect of the multiplication of power units is to increase the capital outlay; indeed, it may be stated quite generally that economy in working and maintenance cannot be obtained without a larger capital outlay than would be required for a simpler and less comprehensive plant. A high degree of economy is maintained, however, on financial data—the ultimate basis on which these practical questions rest—can only be obtained in large establishments where the averaging effect of the combination of a large number of comparatively small intermittent demands for power is greatest. The load-factor, since it was first coined by Colonel R. E. Crompton in 1891, has come into common use as an expression of the relation between the average and the maximum output from any central source of supply. No argument is required to show that a given central station operating working continuously at its maximum speed day and night all the year round, say for 8760 hours in a year, should produce the power more cheaply per unit, not only as to the actual running time, but also as to the capital or interest charges, than the same plant running on the average at the same speed for, say, one-third the time, or 2920 hours. In this case the load-factor 2920/8760 = .333, or 33.37%. The saving in the whole expenditure per unit is in direct proportion to an increase in the load-factor, and its effect on the various items of expenditure is extremely variable. The influence is greatest on the capital charges, and it has no influence at all, or may even have a detrimental effect, on some items; for instance, the cost of repairs per unit of output may be increased by a high load-factor. Its effect on the coal consumption depends very much on the kind and capacity of the boilers in use; on whether the engines are condensing or non-condensing; on the hours of work of the engine staff, &c. The economic value of the load-factor is of great importance in every installation, but its influence on the cost of supply varies at each central station, and must be separately determined. There is a load-factor peculiar to each use for which the power is supplied, and the whole load-factor can only be improved by the combination of different classes of demands, which differ in regard to the time of day or season at which they attain maximum or minimum. It is in this respect that the great economy of a public distribution of power is most apparent, though there is also, of course, a direct economy due simply to the presumably large size of the central stations of a public supply. Demands for power are of necessity have unfortunately a tendency to arise at the same time, so that in the absence of storage of power there seems no prospect of the load-factors for general supply of power in towns ever being the most favourable conditions, 40%. The load-factor of most public hydraulic power supplies is considerably under 30%. It is questionable, however, whether a very high load-factor conduces to economy of working expenses as a whole in any general supply of energy. The more continuous the supply during the twenty-four hours of the day the greater is the difficulty of executing repairs, and the greater the amount of the reserve plant required. In all central station work where fluctuating loads have to be dealt with it is most important that there should be ample boiler power. In a comprehensive system of power supply demand arises in a very sudden and very large way forcing the boilers involves greater waste of coal than keeping steam up in sufficient reserve boilers. For this purpose boilers with large water capacity, such as the Lancashire, are preferable to the tubular type, if sufficient space is available the total steam and also thermal storage are advantageous. Feed water heaters or economizers should always be used, all steam and feed pipes should be carefully protected from radiation, and the pipe lines should be covered; in short, to secure the results in thermal consumption every care must be taken to minimise the stand-by losses which are such serious items in central station economy the load-factor is low. Though high load-factor has the peculiar advantage, as regards coal consumption, that it is the speed of the engines which varies with an intermittent demand, nevertheless at the London stations it has been found that during the busy time, working only 40% of the time, 75% of the runs of the engines can be obtained i.e. at least 25% of the coal is wasted through the stand-by losses and through the pumping engines having to run at less than full power.

maximum demand, even though the maximum may be required only during a few minutes of the day. In the hydraulic system accumulators at the central stations perform the two distinct functions of reducing the maximum load on the pumps which supply the demand, and regulating automatically the speed of the pumps as the demand varies from minute to minute. In any large system where a number of pumping units are required they also allow a sufficient interval of time to start any additional units. Accumulators connected to the mains at a considerable distance from the central station reduce the variations
To determine the scale on which a central station plant should be designed is frequently a difficult matter. The rate of growth of the expected demand for the power is an important factor; but it has been clearly established that the reduction of working expenses resulting from the increase in size of an undertaking proceeds in a diminishing ratio. Increase in output is in fact sometimes accompanied by more than a proportionate increase of expenses. During recent years there have been causes at work which have raised considerably the price of labour, fuel, other items of expense, and the law of the “diminishing ratio” has been masked.

On the diagram (fig. 3) of the costs of the London undertaking and the amount of power supplied, have been plotted points marking the total expenses of each year in relation to the output of power. These points for the years 1884-1899, and for output of from 50 to 700 million gallons followed approximately a straight line. Since 1899, however, though the output has increased from 708 millions to 1400 million gallons, the costs per unit of output have been always considerably above the preceding periods. The details of the London supply given in table 1 partly explain this by the relatively high price of fuel, but an equally important factor has been the rise in the local rates, which in the period 1899-1900 have risen from 2d. up to 3d. per 1000 gallons. If the cost of fuel, rates and wages had remained constant the plotting of expenses in relation to output would have been approximately along the extension of the line AB. This line cuts the vertical axis at A above the origin O, and the line OA indicates the minimum amount of the expenses, and by implication the initial size of the first central station erected in London. The curve in this diagram gives the cost per 1000 gallons. Whether it is more economical to have several smaller stations in any particular system of power transmission, or a single centre of supply, is mainly governed by the cost of the mains and the facilities for laying them in the area served. No general rule can, however, be formulated, for it is a question of balance of advantages and disadvantages.

The load-factors are calculated on the actual recorded maximum output of the connected capacity of engines having been installed. The daily periods of maximum output are shown in fig. 2. The table shows that the load-factors have not been much affected either by the increase of the area of supply or by the increase of the demand. The average maximum load factor of the Durham small. The capital cost of the London undertaking has been about £950,000. In the central station at Wapping, erected in 1891, there are six sets of triple-expansion, surface-condensing fixed and reciprocating engines, providing a working pressure of 150 lb. per square inch, and two accumulators with rams 20 in. diameter by 23 ft. stroke loaded up to 800 lb. per square inch. The engines run at a maximum piston speed of 250 ft. and the output is transmitted to the consumer by means of the pumping engines and the pumping rods. The supply given from this station in 1900 was approximately 6,800,000 gallons per week, and the cost for fuel, wages, superintendence, lighting, repairs and sundry station expenses amounted to £30, per 1000 gallons. In the diagram (fig. 5) the power consumption of this station is shown in 1899-1900, the year of the annual general regulations of the company. The capital cost of the station, including the land, was £70,000. The load-factor at this station for 1900 was 0.4, and the supply 0.4. This can only be explained by conditions which are exceptionally favourable, and the figures represent the best result that has hitherto been obtained in hydraulic power central station work, having regard to the high price of fuel.

The instalation in Hull differs little from the numerous private plants at work on the docks and railways of the United Kingdom. The value of the experiment was chiefly commercial, and the large public hydraulic power works established since to be found in the cities and industrial districts. Two or more engines are employed to drive the pumps. In Liverpool there are two central stations. The working pressure is 850 lb. per square inch. There are 27 m., of mains, and about 1100 machines at work. In Manchester and Glasgow the pressure adopted is 1200 h.p. In Manchester this pressure was selected principally in view of the large number of hydraulic packing presses used in the city, and the result has been altogether satisfactory. The works are evidently small by the comparison of the capital stations being designed for 1200 h.p. Another station has since been built of equal capacity, and nearly 5 million gallons per week are being supplied for work about 2100 machines. Twenty-three miles of mains are laid.

In Antwerp a regular system of high-pressure hydraulic power transmission was established in 1894 specially to provide electric lighting for the city. The engineer in charge was an electrical engineer of Ghent, who came to the conclusion that the most economical way of installing the electric light was to have a central hydraulic station, and from it transmit the power through pipes to various substations in the town, where it could be converted by means of turbines and dynamos into electric energy. The coal cost of the electricity supplied—0.88d. per kw. hour—compares favourably with most central electric supply stations, although the electrical transmission is more economical than steam-power transmission and the cost of the coal used in the turbines for the conversion of the power to electricity might be reduced. Von Rysselberghe argued that hydraulic pumping engines would be more economical than steam-engines and dynamos, and that the loss in the pipes and the payment of power would be less with hydraulic converters than if the current were distributed directly. The loss in conversion, however, proved to be twice as great as had been anticipated, owing largely to defective storage batteries and the neglect of the supply and drainage of the converting stations; and the net result was commercially unsatisfactory.

At Buenos Aires hydraulic mains are laid in the streets solely for drainage purposes. Each of the pumps, which are stationary at intervals, contains two hydraulic pumps which automatically pump the sewage from a small section of the town into an outfall sewer at a higher level. The districts where this system is at work lie below the general drainage level of Buenos Aires. The average efficiency (pump h.p. to i.h.p.), is 41%, which is high, having regard to the low heads against which the pumps work. In this application all the conditions are favourable to hydraulic power transmission. In an industrial district, there is a considerable rise in the general pressure in the pipes, and the load at each stroke of the pumps is constant. The same system has been adopted for the drainage of the docks district, and a somewhat similar installation is in use at Margate.

Hydraulic power is supplied from the hydraulic mains on a sliding scale according to the quantity consumed. The minimum charge in the precincts of the city is 0.1d. per 1000 gallons, the rate per gallon being 0.5d. In 1000 gallons at 750 lb. per square inch there is an energy of 10,000 X 1730 = 8,745 kw. hours; thus 1s. 6d. per 1000 gallons = 2d. 33,000 X 560 = £3 5d. per gallon nearly. This amount is made up approximately of 0.9d. per 1000 gallons for the cost of generation, distribution and general expenses including rates and rate for capital charges. The average charge levied on consumers in 1901 was about 2s. 4d. per 1000 gallons. Establishments not receiving the current may any time communicate with the company for an estimate of the probable cost of hydraulic power at 750 lb. per square inch can be supplied from central stations in towns on a commercial basis over any considerable areas at less than 1s. per 1000 gallons.

</table>
25% as the efficiency of the motor through which the power is utilized, this rate would give 1.83 hp. per brake or effective h.p. hour. This cost seems high, and it is difficult to believe that it is the best hydraulic power transmission can accomplish having regard to the well-established fact that the mechanical efficiency of a steam pumping engine is greater than any other application of a steam-engine, and that the power can be conveyed through mains without any material loss for considerable distances. Still, no other system of power transmission except gas seems to be better off, and there is no method of transmission by which energy could, at the present time, be supplied retail in towns with commercial success at such an average rate when steam is employed as the prime mover. The average rate charged for hydraulic power in London and elsewhere is much the same as the average rate charged for the supply of electrical energy to the ordinary consumer. Gas is undoubtedly cheaper, but in a large number of cases is mechanically inconvenient in its application. Hydraulic pressure, electrical energy and compressed air (with reheating) can all be transmitted throughout towns with approximately the same losses and at the same cost, because the power is obtained in each system from coal, boilers, and steam-engines, and the actual loss in transmission can be kept down to a small percentage. The use of any particular system of power does not, however, primarily depend upon the cost of running the central station and distributing the power, but mainly upon the mechanical convenience of the system for the purpose to which it is applied. One form of energy is, in practice, found most useful for one purpose, another form for another and no one can command the whole field.

When water is employed as the fluid in hydraulic transmission the effects of frost must usually be provided against. In London Precautions against Frost. the mains, passed through the surface condensers of the engines, so as to raise its temperature. The mains are laid 3 ft. below the surface of the ground. Exposed pipes and cylinders are clothed, and means provided for draining them when out of use. When these simple precautions are adopted damage from frost is very rare. In special cases oil having a low freezing point is used; and in small plants good results have been obtained by mixing glycerin and methylated spirit with the water. A few gas jets judiciously distributed are of value where there is a difficulty in properly protecting the machinery by clothing.

From the central station the hydraulic power must be transmitted through a system of mains to the various points at which it is to be used. In laying out a network of mains it is first necessary to determine what velocity of flow can be allowed. Distribu-

Fig. 4.-Half section and elevation at AB. Detail of 10" steel pipe. independent of the actual pressure employed, and at moderate velocities of 3 to 4 ft. per second the loss per 1000 yds. is almost a negligible quantity at a pressure of 700 lb per square inch. For practical purposes Box's formula is sufficiently accurate—

Loss of head = \( \frac{Q^2}{2gD^2} \times \frac{L}{32} \) \text{ (diameter of pipes in inches \( \times \frac{L}{32} \)).} There is a further loss due to obstruction caused by valves and bends, but it has been found in London that a pressure of 750 lb at the central accumulators is sufficient to ensure a pressure of 700 lb throughout the system. The greatest distance the power is conveyed from the central stations in London is about 4 m. The higher the initial velocity the more variable the pressure; and in order to avoid this variation in any large system of mains it is usual to place additional accumulators at a...
distance from the central station. They act in the same way as air-vessels. The mains should be laid in circuit, and valves placed at intervals, so that any section can be isolated for repairs or for making connections without disturbing the supply at other points. The main valves adopted in London are shown in fig. 4. Valves are also used to control all branch pipes while relief valves, water safety and air valves are fixed as required.

The largest pipes used in London are 10 in. in diameter, and the smallest laid in the streets are 2 in. The pipes from 8 in. and below are usually cast in iron, flanged and provided with spigot and sockets. The joints (fig. 5) is made with a gutta-percha ring, though sometimes asbestos and leather packing rings are used. Cast iron pipes for hydraulic purposes have been standardized by the Engineering Standards Committee. Fig. 6 shows the 10 in. steel main as used in London. The main was laid in 1887 by the Rotherhithe Pumping Station of the London Hydraulic Power Company through the labour of the railways, and is used both as a feeder main for supply to the City. It is the first instance of the use of feeder mains in hydraulic transmission. The velocity of flow at the highest pressure of 6 ft. per second and is automatically disconnected from the general system should the pressure in this main fall below that of accumulator pressure, the mains, sterilized and controlled, are now in use. Ellington’s system of hydraulic feeder mains has been developed by the laying of a 6-in. steel main from the Tate’s Building to the Fleet Street in Blackfriars to the Strand, over Waterloo Bridge.

The Falcon Wharf Pumping Station at Blackfriars is the original central station in London, and the accumulators there are loaded to 750 lb per square inch. The other accumulators are situated about 3 m. from Falcon Wharf and about the same distance from each other. The accumulator pressure at the outlet station varies during the winter morning of the day maintained at about 800 lb per square inch. Consequently the smaller variations in demand for power throughout the day, which causes a very intermittent running of the plant at Falcon Wharf, and the load-factor there is very low. The pumping plant has never been heavily utilized, and the accumulator is part of the plant is constructed to pump into the feeder main at pressures of 800, 900, or 1000 lb per square inch according to the demand existing from hour to hour in the Strand district. By this means the output from Falcon Wharf has been doubled with a much improved load-factor. The accumulator in this system is of special construction (fig. 7). The pressure 750 lb per square inch is maintained in the cylinder A, and the pressure of 800 lb per square inch according to the quantity of pressure water required to be transmitted through it. The higher pressure is required when the velocity in this main is 10 ft. per second. There is an automatic control valve at the junction of the feeder main with the service mains in the Strand, adjusted so that the same effect is produced as if a pumping station were in operation at that point of equal capacity to the maximum flow through the main. The length of the feeder main in this case is 2000 yds., and at 10 ft. per second there is a loss of pressure of 240 lb per square inch, but the effect on the coal consumption is almost negligible, as the maximum flow is seldom needed. The engines are specially constructed to take the pressure overload. The feeder main is made of the economic limit of the use of feeder mains, it is reached when the additional running expenses involved equal the annual value of the saving effected in the capital expenditure.

In public supplies the power is used in all cases registered by water-meters, and since 1887 have been in use at the central stations to record the amount supplied at each instant during the day and night. The ratio between the power registered by the machines and the power sent into the mains is the commercial efficiency of the whole system. The loss may be due to leakage from the mains or to defects in the meters; or if, as is often the case, the exhaust from the machines is registered, the meters give the maximum and minimum supplies during 24 hours every day, the maximum record showing the power required for a given number and capacity of machines, and the minimum giving its idle period. It is possible to obtain an efficiency of 95% in most public power transmission plants over a series of years, but great care is required to produce such a good result. In some years 98% has been registered. Until 1888 no meters were used for registration of the machines is a very uncertain quantity; the character of the machines and the nature of the conditions are so variable that a really accurate general statement is impossible. In most cases the losses in the machine are practically the same for each structure, and consequently the efficiency of a given machine may vary within very wide limits according to the work it has to do. For instance, a hydraulic pump of a given capacity, delivering the water to an elevation of 50 ft., and with a discharge of 15 ft., even though the hydraulic-pressure rams may be proportioned to the reduced head, the efficiency falls below 50%. The ultimate efficiency of the system, or of pump h.p. in the one case is 64%, and in the other under 40%. In crane or lift work the efficiency varies with the size of the apparatus, with the load and with the speed. Efficiency in this sense is a most uncertain guide to the most useful and successful applications of hydraulic power—as, for instance, hydraulic capstans for hauling wagons in railway goods yards—have a very low efficiency expressed as the ratio of work done to work expended. Hydraulic cranes for coal or grain hoisting have a high efficiency when well designed, but it is now very usual to employ grabs to save the labour of filling the buckets, and their use lowers the efficiency, expressed as the ratio of work done to work expended, to 50% or 60%. If the cranes are fully loaded, 50% to 60%, of the indicated power of the central station engine is often utilized in useful work done with a radius of 2 or 3 m. from the station. In very favourable circumstances the efficiency may rise to over 70%, and in a great many cases in practice it no doubt falls below 25%. If, however, energy in any form can be obtained ready for use at a moderate rate, the actual efficiency of the machines (i.e. the ratio the useful work done to the energy input) is not of very great importance where the use is intermittent.

Hydraulic pressure is more particularly advantageous in cases where the incompressibility of the fluid employed can be utilized, as in hydraulic lifts, capstans and presses. For these purposes have the peculiar and distinct advantage of direct action of the pressure on the moving rams, resulting in simplicity of construction, slow and steady movement of the working parts, absence of mechanical brakes and greatest safety in action. When the valve regulating the admission of the pressure to the hydraulic cylinder is closed, the water is shut in, and, as it is
incompressible, the machine is locked. Thus all hydraulic machines possess an inherent brake; indeed, many of them are used solely as brakes.

Hydraulic power transmission does not possess the flexibility of electricity, its useful applications being comparatively limited, but the simplicity, efficiency, durability and speed of hydraulic transmission is such that it must continue to occupy an important position in industrial development.

Sometimes a much higher pressure than 700 lb or 1000 lb per square inch is desirable, particularly for heavy presses and for machine tools such as are used for riveting, for punching, shearing, &c. The development of these applications has been largely due to the very complete machinery invented and perfected by W. T. Tweddell. One of the principal installations of this kind was erected in 1876 at Toulon dockyard, where the machines are all connected with a system of mains of 2½-in. bore and about 1700 yds. long, laid throughout the yard at an average pressure of 1000 lb per square inch by engines of 100 h.p. with two large accumulators. Marc Berrier-Fontaine, the superintending engineer of the dockyard, stated that the economy of the system over the separately-driven geared machines formerly used is very great. But while pressures so high as 3 tons per square inch (as in the 12,000-ton Armstrong-Whitworth press) have been used for forging and other presses, it is not desirable, in the

![FIG. 8.](image)

an important application of hydraulic power transmission is for ship work, the system being largely adopted both in H.M. navy and for merchant vessels. Hydraulic coal-discharge machinery was fitted by Armstrong as early as 1854 on board a small steamer, and in 1868 some hopper barges on the Thames were fitted with hydraulic hoisting machinery. A Betts Brown of Edinburgh applied hydraulic power to ship work in 1873, and in the same year the first use of this power forjournaling and shearing of g. M., and perfektion H.M.S. "Thunderer." The pressure usually employed in H.M. navy is 1000 lb per square inch. Accumulators are not used and the engine is to be fully supplied to supply the tension on the whole demand. The distance through which the power has to be transmitted, of course, very short, and the high velocity of 2000 ft. per second is allowed for in the main pipes. The maximum engine-power required under these conditions on the larger ships is very considerable.

A recent development of hydraulic power on board ships is the Stonehamp system of closely bolted heads. In hydraulic transmission of power it is usually the pressure which is employed, but there are one or two important cases in which the velocity of flow due to the pressure is utilized in the machine. Reference has already been made to the use of turbines working at 750 lb per square inch at Antwerp. The Pelton wheel has also been adapted for use with such high pressures. Another useful application of the velocity due to the head in hydraulic transmission is in an adaptation of the well-known jet pump to fire hydrants. The value of the system of hydraulic transmission for the extinction of fire can hardly be overestimated where, as in London and most large towns, the ordinary pressure in the water mains is insufficient for the purpose.

### III. Pneumatic

Every wind that blows is an instance of the pneumatic transmission of power, and every windmill or sail that catches the breeze is a demonstration of it. The modern or technical use of the term, however, is confined to the compression of air at one point and its transmission to another point where it is used in motors to do work. The first recorded instance of this being done was by Denis Papin (b. 1647), who compressed air with power derived from a water-wheel and transmitted it through tubes at a distance. About 1820 George Medhurst (1759–1827) took out patents in England for machinery to compress and transmitted air which worked motors, and he built a pneumatic automobile. William Mann in 1829 took out a patent in England for a compound air compressor. In his application he states: "The condensing pumps used in compressing I make of different capacities, according to the densities of the fluid to be compressed, those used to compress the higher densities being proportionately smaller than those previously used to compress it to the first or lower densities," &c. This is a very exact description of the best methods of compressing air to-day, omitting the very important inter-cooling.

Baron Van Ratham in 1840 made a steam engine driven by a pneumatic jet and to use inter-coolers between each stage, to get 700 lb pressure for use in locomotives. For the next forty years inventors tried without success all manner of devices for cooling air during compression by water, either injected into the cylinder or circulated around it, and finally, with few exceptions, settled down to direct compression with no cooling worthy of mention. Only in the last ten years of the 19th century were the fundamental principles of economical air compression put into general practice, though all of them are contained in the patent of William Mann and the suggestion of Van Ratham.

The successful application of the pneumatic jet to the transmission of power, as we know it, was at the Mont Cenis Tunnel in 1861. The form of compressor used was a system of water rams—several of them in succession—in which water was the piston, compressing the air upwards in the cylinder and forcing it out. Although the air came in contact with the water, it was not cooled, except slightly at the surface of the water and around the walls of the cylinders. The compressors were located near the tunnel, and the compressed air was transmitted through pipes to drilling machines working at the faces in the tunnel. Rotary drills were tried first, but were soon replaced by percussion drills adapted from drawings in the United States Patent Office, copied by a French and Italian commission from the patent of J. W. Fowler of Philadelphia. H. S. Drinker, (Tunneling, Explosive Compounds and Rock Drills, New York, 1893) states positively that the first percussion drill ever made to work successfully was patented by J. J. Couch of Philadelphia in 1849. Shortly afterwards Fowler patented his drills, in which the direct stroke and self-rotating principle was used as we use it now. The first successful drill in the Hoosac Tunnel was patented in 1866 by W. Brooks, S. F. Gates and C. Burleigh, but after a few months was replaced by one made by Burleigh, who had bought Fowler's patent and improved it. Burleigh made a complaint to the General Hydrotechnical Committee of France which in 1877 stated, "Pneumatic transmission of water in the cylinders. The successful work in the Mont Cenis and Hoosac Tunnels with the percussion drilling machines caused the use of compressed air to spread rapidly, and it was soon found there were many other purposes for which it could be employed with advantage.

The larger tunnels and metal mines were naturally the earliest to adopt pneumatic transmission, often using it for pumping and hoisting as well as drilling. In Paris and Nantes, in Bern and in Birmingham (England), street tramways have been operated by pneumatic power, the transmission in these, however, being in tanks rather than pipes. Tanks on the cars are filled at the central loading stations with air at very high pressure, which is used in driving the motors, enough being taken to enable the car to make a trip and return to the loading station. Several attempts in pneumatic street traction were made in America, but failed owing to financial troubles and the successful introduction of electric traction. It is used very successfully, however, both in Europe and in America, in underground mine haulage, being especially adapted to coal mines, where electricity would be dangerous from its sparks. The copper smelting works at Anaconda, Montana, U.S.A., uses twelve large pneumatic
LOCOMOTIVES FOR CHARGING THE FURNACES, REMOVING SLAG, &C. Many stone quarries have a central plant for compressing air, which is transmitted through pipes extending to all working points, and operates hammers, hoists, drills, stone cutters, &c., by means of motors. Every considerable ironworks, railroad shop or foundry has its pneumatic transmission plant. Also in the erection of the larger steel bridges or buildings a pneumatic transmission plant is of great advantage, and many railways have a portable compressing plant on a car ready to be moved to any point as needed.

Dr. Julius G. Pohle, of Arizona, patented in 1886, and introduced extensively, the use of compressed air for lifting water directly, by admitting it into the water column. His plan is largely adopted in artesian wells that do not flow, or do not flow as much as desired, and is so arranged that the air supply has a back pressure of water equal to at least half the lift. If it is desired to lift the water 30 ft. the air is admitted to the water column at least 30 ft. below the standing water surface. The air admitted being so much lighter than the water it displaces, the column 60 ft. high becomes lighter than the column 30 ft. high and is constantly released and flows out at the top. The efficiency of this method is only 20 to 40% depending on the lift, but its adaptation to artesian wells renders it valuable in many localities.

A remarkable pneumatic transmission system was installed in 1890 by Priestly in the Snake River Desert, Idaho, U.S.A., on the north side of the river is a cliff, nearly perpendicular, about 500 ft. high. One hundred and ninety feet above the river, for a considerable distance along the cliff, streams of water gush out from between the bottom of the great lava bed and the hardened clay of the old lake bottom. Priestly, without knowledge of Pohle's system, built a pipe line down the bluff and trained the water into it in such a way that it carried a very considerable quantity of air in the form of bubbles along with it down the pipe, compressing it on the way. The air was collected at the bottom in a covered reservoir, and taken up the cliff again to the lower part of an inverted siphon pipe, one side of which reached down from the water-supply about 60 ft. and the other side reached up and over the bluff. Allowing the water to fill both sides of the pipe to the level of the water-supply, he admitted his compressed air at about 75 lb pressure into the lower part of the pipe near the bottom, and soon had water flowing upwards over the cliff and irrigating a large tract of rich lava land. He had made a power, a transmission and a motor plant without a moving part. A similar compressor was installed near Montreal, Canada, in 1896; another at Ainsworth, British Columbia, in 1898; and another at Norwich, Connecticut, U.S.A., in 1902. These are called hydraulic air compressors and show an efficiency of about 70%. They are particularly adapted to positions where there is a large flow of water with a slight fall or head.

The actual transmission of power by air from the compressor to the motor is simple and effective. The air admits of a velocity of 15 to 20 ft. per second through pipes, with very slight loss by friction, and consequently there is no necessity for an expensive pipe system in proportion to the power transmitted. It is found in practice that, allowing a velocity as given above, there is no noticeable difference in pressure between the compressor and the motor several miles away. Light butt-welded tubing is largely used for piping, and if soundly made in there is very slight loss from leakage, while, moreover, can be easily detected and stopped. In practice, a sponge with soap-suds passed around a joint furnishes a detective agency, the escaping soapy water being visible in the air. In general, the actual loss need not be more than 1% loss through leakage and 1% possibly through friction in the pneumatic transmission of power.

Air develops heat on compression and is cooled by expansion, and the temperature and amount of heat vary with the conditions. For the purpose of illustration suppose a cylinder 10 ft. long containing 10 cubic ft. of air at 60° F., with a frictionless piston at one end. If this piston be moved 2 ft. into the cylinder, so that the air is compressed to one-quarter its original volume, it is developed by the compression of the air could be allowed to escape, the air will be under a pressure of 90 lb per square inch and at a temperature of 460° F. If this air is cooled down to 60° F. the pressure will be reduced to 45 lb per square inch, showing that the heat produced in the air itself during compression gives it an additional expansive force of 45 lb per square inch. The average force or pressure in compressing this air without loss of heat is 21 lb per square inch, whereas if all the heat developed during compression had been removed as rapidly as developed the pressure would have been 45 lb per square inch, or 10 lb per square inch, showing that the heat developed in the air during compression, when not removed as fast as developed, caused in this case an extra force of 10 lb per square inch to be used on the piston. If this heated air could be transmitted without any loss of heat the extra force used in compressing it could be utilized; but in practice this is impossible, as the heat is lost in transmission. If, for instance, holding the 25 cubic ft. of air at 45 lb per square inch and at 60° F., were released the air expanding without receiving any heat would move it back within 34 ft. of the end only, and the temperature of the air would be lowered 170° F., or to 10° F. below its original temperature. If this remaining expansion were 'completely' approached by most air motors. In practice isothermal compression is approached by compressing the air slightly, then cooling it, compressing it slightly again, and again cooling it until the desired compression is completed. Such process is called isothermal compression, in which isothermal expansion is approximately accomplished by allowing the air to do part of its work (as expanding slightly in a cylinder) and then warming it, allowing it to do a little more work and then warming it again, and so continuing until expansion is complete. It will be seen that the air is carefully cooled during compression to prevent the heat it develops from working against the compression cylinder, and in most cases is more carefully handled during expansion to prevent loss from cold developed during expansion. More stages of compression of course give a higher efficiency, but the cost of machinery and friction losses have to be considered. The reheating of air above a certain temperature would be objectionable on two accounts, great objections to having any kind of combustion underground, and where reheating is possible, as W. C. Unwin says, "for the amount of heat supplied the economy realized in the weight of air used is surprising. The reason for this is, the heat supplied to the air is used nearly five times as efficiently as an equal amount of heat employed in generating steam." Practically there is a hot-air engine, using a medium much more effective than common air, in a close circuit of air engine, making the whole plant so efficient that the whole system extremely high.

IV.—ELECTRIC.

Though the older methods of power transmission, such as wire ropes, compressed air and high-pressure water, are still worked on a comparatively small scale, the chief commercial burden has fallen upon the electric generator and motor linked by a transmission line. The efficiency of the conversion from mechanical power to electrical energy and back again is so high, and the facility of power distribution by electric motors is so great, as to leave little room for competition in any but very exceptional cases. The largest single department of electrical power transmission—that is, transmission for traction purposes—is at present almost wholly carried on by continuous currents. The usual voltage is 500 to 600, and the motors are almost universally series-wound constant-potential machines. The total amount of such transmission in daily use reaches probably a million and a half horse power. In long distance power transmission proper continuous currents are not used to any considerable extent, owing mainly to the difficulty of generating continuous currents at sufficient economic cost per mile. In general work, and the difficulty of reducing such pressure, even if it could be conveniently obtained, far enough to render it available for convenient distribution at the receiving end of the line. Single continuous current machines have seldom been built successfully for more than about 2000 to 3000 volts, if at the same time they were required to deliver any considerable amount of current. About 300 to 500 kilowatts per machine at this voltage appears to be the present limit, although it is by no means unlikely that the use of commuting poles and
other improvements may considerably increase these figures. For distances at which more than this very moderate voltage is desirable one must either depend on alternating currents or use several generators in parallel. In ancient practice the former alternative is universally taken. On the continent of Europe a very creditable degree of success has been achieved by adopting the latter, and many plants upon this system are in use, mostly in Switzerland. In these generators are worked at constant current, a sufficient number in series being employed to give the necessary electromotive force.  

Power Transmission at Constant Current.—In this system, which has been developed chiefly by M. Thury, power is transmitted from constant current generators worked in series, and commonly coupled mechanically in pairs or larger groups driven by a single prime mover. The individual generators are wound for moderate currents, generally between 50 and 150 amperes, and deliver this ordinarily at a maximum voltage of 2000 to 3500, the output per armature seldom being above 300 kw. For the high voltages needed for long distance transmission as many generators as may be required are thrown in series. In the Moutiers-Lyons transmission of 170 m., the most considerable yet installed on this system, there are four groups, each consisting of four mechanically-coupled generators. The common current is 75 amp., and the maximum voltage per group is about 15,000 volts, giving nearly 60,000 volts as the transmission voltage at maximum load. In the St. Louis transmission, worked about at 35 m., the constant current is 150 amp., and the voltage per armature is 2500, five pairs being put in series for the maximum load voltage of 25,000.

Regulation in such plants is accomplished either by varying the field strength through an automatic governor or by similarly varying the field produced if the generators are provided with such devices. The former method is generally used where the output is variable. The transmission circuit is of the simplest character, and the power is received by motors, or for local distribution by motor generators, held to speed by centrifugal governors controlling field-voltage. The transmission current is always the same, no stages being introduced for rectification or inversion; and the motors are in groups mechanically coupled and in series. In the Moutiers-Lyons transmission motor-generators are even designed to give a three-phase constant potential distribution, and in reverse to permit interchange of energy between the continuous current and several polyphase transmission systems.

The advantages of the system reside chiefly in easier line insulation than with that of Polyphase. The distribution of the current is due to line inductance and capacity. It is probably as easy to insulate for 100,000 volts continuous current as for 50,000 volts alternating current. Part of the difference is due to the fact that in the latter case the frequency of waves is 75,000 per second, and the addition static effects and minor resonant rise of voltage must be reckoned with. There is some possibility, therefore, of the advantageous use of continuous current in case very great distances, requiring considerable voltages, are to be covered. The great advantages in connection with many small generating plants are obtained.

As in two- and three-phase apparatus the present practice is about equally divided; the transmission lines themselves, however, are, with rare exceptions, worked three-phase, on account of the saving of 25% in copper secured by the use of this system. Inasmuch as transformers can be freely combined vectorially to give resultant electromotive forces having any desired magnitudes and phase relations the passage from two-phase to three-phase, and back again, is made with the utmost ease, and the character of the generating and receiving apparatus thus becomes almost a matter of indifference. As regards such apparatus it is safe to say that honours are about even; sometimes one system proves more convenient, sometimes the other. The difficulty of obtaining proper single-phase motors for the varied purposes of general distribution has so far prevented any material use of single-phase transmission systems.

Generators for Power Transmission.—The generators are usually large two- or three-phase machines, and in the majority of instances are driven by water-wheels. Power transmitters then on the scale from steam plant has, up to the present, made no substantial progress, save as the networks of large electrical supply stations have in some cases grown to cover radii of many miles. The size of these generators varies from 100 or 200 kw. in small plants, up to 10,000 or more in the larger ones. Their efficiency ranges from 92% or thereabouts in the smaller sizes up to 96% or a fraction more in the largest, at full load. The voltage of these generators varies greatly. When raising transformers are used it is usually from 500 to 2500 volts; without them the generators are usually wound for 10,000 to 15,000 volts. Intermediate voltages have sometimes been employed, but are rather passing out of use, as they seem to fulfil no particularly useful purpose. The tendency at the present time, whatever the voltage, is towards the distribution being carried on by stationary armatures with revolving field magnets, or towards a pure inductor type having all its windings stationary. At moderate voltages such an arrangement is merely a matter of convenience, but in high-voltage generators it is practicable and advantageous. In simple machines with polyontal windings, these windings having several separate armature teeth per pole per phase, while the high-voltage machines are generally monontal; in both classes the edges of the pole pieces are usually chamfered away in such form as to produce at least a close approximation to the sinusoidal form for the electromotive force. For this purpose, and to obtain a better inherent regulation under variations of load, the field magnets are, or should be, particularly designed and proportioned. The proper characteristic of electromotive force from no load to full load, non-inductive, is less than 10% at constant field excitation. Closeness of inherent regulation is an important matter in generators for transmission work.
inasmuch as there is as yet no entirely successful method of automatic voltage regulation on very large units; and the less hand regulation the better. The high tension network or transmission line, moreover, tends to secure stability of wave form in the electromotive force, a matter of even greater importance. There has been much discussion as to the best wave form for use on alternating circuits, it having long been maintained that the sine wave or the symmetrical polytide wave does not give the most economical use of iron in the transformers. For transmission work, however, particularly over long distances, the flat top or sub-sine wave often yields a smaller iron content compared with the tendency to a reduction of the iron losses, thus saving cost. If necessary, the sinusoidal wave may be obtained by using a filter. The question of the best wave form is one which depends on the conditions of the individual case.

Mechanically, the aluminium, whilst having possibly the highest coefficient of expansion, exhibits no tendency toward stress relaxation, even when subjected to considerable stress. For example, the tensile strength of an annealed copper is about 50% greater than that of copper, and the elongation at break of the former is also 50% greater. Aluminum, however, is found to be inferior to copper in the ability of the lower limit of conductivity. This is due to the fact that the crystals of aluminium are not as perfect as those of copper. Consequently, in the case of the aluminium, it is possible to impart to it a higher value of tensile strength, as compared with copper, and to develop a considerable amount of conductivity.

The aluminium, however, is found to be inferior to copper in the ability of the lower limit of conductivity. This is due to the fact that the crystals of aluminium are not as perfect as those of copper. Consequently, in the case of the aluminium, it is possible to impart to it a higher value of tensile strength, as compared with copper, and to develop a considerable amount of conductivity.
POWER TRANSMISSION

[electrical portion]

formation, which takes place only within a very limited temperature range, is practically unknown under conditions of maximum wind. The relation of wind velocity to pressure in case of a suspended wire or cable may be approximately expressed by the equation

\[ P = \frac{V^2 A}{2 L} \]

in which \( P \) is the vertical pressure, \( V \) is the wind velocity, \( A \) is the area of cable, and \( L \) is the vertical wind velocity in miles per hour. Except for sleet conditions the wind pressure is, then, a matter of little concern. At times sleet may accumulate on bare wires to a thickness of an inch or more in certain cases, and the lateral stability of the line is a matter of less concern than the added component of stress in the catenary. The third element of line stress, the actual crushing stress of the wire load, is of no concern in the case of long-distance transmission.

In scientific line design the best example has been set by the Italian engineers, who, realizing that the longitudinal strains, which are very severe in case of breakage of spans rigidly supported from pole to pole, while the lateral strain due to wind increase only slightly, have introduced the principle of longitudinal flexibility. The poles or towers of structural steel are so designed as to be fairly stiff against lateral pressure and are given secure foundation against overturning, but are deliberately designed to deflect lengthwise the line in the extreme case of breakage of wires so as at once to relieve the catenary tension without passing their elastic limit. In this way complete security is attained with a minimum of material and expense.

In recent construction both in America and Europe the tendency is to use steel poles or towers of ample height, 40 to 60 ft. and spans ranging from 1000 to 1500 ft. with occasional 2000 ft. spans. The allowed is considerable, often 3% to 4% of the span length. Crossarms and pins, when used, are commonly of iron or steel, and the interiors of the insulators are therefore fairly at earth potential. The actual strain is due to a0,000 to 70,000 it is certain that the insulator of factoring safety would be seriously reduced, and some recent lines have been equipped with suspension insulators. These are in effect porcelain bells from 10 in. diameter up to 15 ft. in the case of the upper parts of the line. The bells are all the same size and are spaced about a foot apart, the suspensions being variously designed. These insulating groups can be as large as 3000 ft. and in some cases the grooves run side by side and are spaced 2 ft. between centres, and for the higher voltages something like 1 ft. for each 10,000 volts.

Voltage — The most important factor in the economy of the conductor is the actual voltage used for the transmission. This varies within very wide limits. For transmissions only a few miles in length the pressures employed may be from 2000 to 5000 volts. For a number of years the experience of the Central Colorado power company has shown that to various alternators and transformers to be employed. The very high voltages now being used are for distances up to 1000 miles between 6000 and 15,000 volts. The highest voltages so far employed is 110,000 volts, which was successfully used in two American plants: that of the Grand Rapids—Muskegon (Michigan) system, and in the transmission works in Southern California. Both employ suspension insulators with five bells in series, and operate with no more trouble than falls to the lot of systems using ordinarily high voltages. The Rio de Janeiro transmission system, operates at 88,000 volts with 9500 ft. for cable insulation, 17-1/2 ft. in height, carried on steel pins; the Kern River (California) plant at 75,000 volts with similar construction; the Missouri River Power Co. (Montana) at 70,000 volts, using glass insulators on wooden pins spaced 8 to 10 ft. apart; and the very large systems at Bakersfield, in building transformers for still higher pressures, the real problem lying in the insulation of the line. Taken as a whole these high voltages have been working very satisfactorily, with the exception of doing apparently as well as those near the lower, owing to more careful precautions in construction. Likewise the distances of transmission have steadily risen. There are, all told, nearly a score of power transmissions over 100,000 ft. In length, the longest distance yet covered being from De Sabla to Sausalito (California), a distance of 232 m. This, like most other long American transmissions, is at voltages of 60,000 volts or higher and the troubles which at certain instances there seems to be very little evidence of trouble due to frequency. In point of fact, those who have had the most experience with long distance transmission are the last to worry about the difficulties of using alternating current. The reason for this is very simple: at high voltages, even the most minute differences in the resistance of the lines in high voltage work, but they are rather interesting than alarming. The lines become self-luminous from the "coronal" discharge at a little above 20,000 volts, and at 40,000 or 50,000 volts the phenomenon, though not without interesting characteristics, is not of sufficient importance to say startling, character. At above 100,000 volts this coronal discharge must be given serious consideration.

Resistance, in substance, is due to synchronous frequencies of alternating force, and is important only in the electrical time-constant of the system. The frequency of the currents actually employed in transmission work is so low that resonance with the fundamental frequency must be extremely rare; resonance with the harmonics is, however, common—much commoner than is generally supposed. In every electromotive force wave the odd harmonics are more or less in evidence, particularly the third, fifth, and possibly seventh. The harmonic conditions are not at all formidable, the general form of a sinusoidal form, traces of harmonics up to at least the 15th may generally be found; the third, seventh and the alternate higher harmonics are manifest in flattening the crest of the wave. Supposing, what is often quoted as a rule, that the harmonics tend to be distributed in phase with the fundamental, all the harmonics tend somewhat to elevate the shoulders of the wave; a wave, therefore, which is exactly sinusoidal at a slight elevation above it is certain to be affected by harmonics, while if it has a high central portion, there is evidence of great predominance of the fifth and higher harmonics. Generally the harmonics are slightly out of phase with the fundamental and the edges of the line, where the harmonics are less. In the amplitude of these harmonics, the third is usually the largest, and may sometimes in commercial machines amount to as much as 20% of the amplitude of the fundamental, and frequently 10%. In machines where sinusoidal waves are used it is of course much less, but it is not difficult to find even the seventh and higher harmonics producing variations as great as 5%. Since, other things being equal, the rise in electromotive force due to resonance is directly proportional to the magnitude of the harmonic, and the change of getting it increases rapidly with the presence of those of the higher orders, the desirability of using the possible approximation to a sinusoidal wave is self-evident. The greater the inductance and capacity of the system and the less its ohmic resistance, the greater the chance of getting serious resonance. As regards the distributed capacity and inductance due to the line alone, the ordinary conditions are very small, for the general form of such distributed capacity and inductance is to produce in the system a series of static waves, their length varying inversely with the frequency. At commercial frequencies the wave length is very long, and the largest effect is very small. The effect of the only small fraction of a single wave length appears; the total length of the line is generally much less than one quarter the commercial wave length, and the only notable effect is a moderate rise of potential due to the inductive effect of the harmonic. A circuit is \( T = \frac{0.00639}{\sqrt{LC}} \), where \( L \) is the absolute self-induction in hens and \( C \) the capacity in microfarads; and if the frequency, the wave length, and the inductive and resistive effects are considered, all of which is necessarily the case, resonance may safely be looked for, and resonance of the harmonics may appear conspicuously in lines of ordinary lengths. The following table gives the values, both \( L \) and \( C \) of three-mile circuit, of the sizes (American wire-gauge) ordinarily employed for transmission circuits, the wires being assumed to be strong 48 in. apart and the height already indicated:

In cases where underground cables form a part of the system, the above values of \( C \) are very largely increased, and the probability of resonance is in proportion enhanced. A still further complication is introduced by the fact that the electrical capacity of the earth and ground upon the system, which may often be far greater than that due to the entire line, even if the latter be of considerable length. In point of magnitude the coupling, particularly near the head-ends, may be a serious factor: the earth capacity and inductance of the overhead line alone is of rare occurrence and generally of trivial amount, while it is equally probable
POWER TRANSMISSION

That resonance, due to localized capacity and inductance rather than that of the complete circuit may produce discharges, causing very serious disturbances upon the system. The subject has not been adequately investigated, but the tendency towards formidable sparking and arcing at various points on long-distance transmission systems is appreciable, for there is not any necessary relation for by-passing the nominal voltages alone. The conditions may be still further complicated by the effect of earths or open circuits, which sometimes may produce, temporarily, appalling resonant phenomena, brought about by an insufficient inductance of the apparatus and introducing surges. In ordinary working the resonance of the harmonics is not very conspicuous, and the fact that it occurs not systemically, but occasionally, may indicate a different cause; this indicates more strongly than anything else that the vital point is not the time-constant of the line alone, but those of the apparatus connected thereto. A definite and persistent tendency towards resonance alone is not easy to be effected, and the question of suitable inductance in the parts of the system most seriously affected, but the best general policy is to avoid as far as possible the presence of the higher harmonics, which are the chief sources of damage.

Closely allied to and connected with resonance is the phenomenon known as "surging," which is due to the discharge of the electromagnetic energy when that circuit is broken. This discharge is an oscillatory tone, going on with decreasing amplitude until it is fretted away by resistance and other sources of loss. Its frequency is that of the system, but the range may be much modified, so that the proper. It is sufficiently serious on its merits, however, since the resulting rise of voltage increases directly with the current and may produce terrific results when the break comes as the result of a short-circuit. In these circumstances there is a very likely violent change in the conditions of the circuit even without an actual break. Such a change produces an impulsive redistribution of energy that may give a sharp rise in voltage. Every apparatus or part of apparatus which contains a large energy of this sort is liable to be affected by minor surges. Such surges are trivial when commonly referred to as "static." Surging, depending as it does on large currents of high frequency, is usually accompanied by formidable effects on circuits of moderate voltage, while on high voltage transmission circuits the usually moderate current and the large margin of safety in the insulation are important ameliorating influences.

Maintenance.—Transmission lines are, when practicable, laid out through open country, and along roads which furnish easy access for inspection and repairs. The chief sources of danger in temperate climates are mechanical injury from the falling of branches of trees across the circuit, sleet and wind storms, and lightning. The first-mentioned difficulty may be avoided by keeping clear, so far as possible, of wooded country; and it should be inculcated that, at the voltages customarily used for transmission, a twigg the size of a lead-pencil falling across the wires may set arcing, and it will end by burning the wires completely off—directly by fusion, but rather indirectly by the arcing. A precaution which is practically safe against all storms, save those of most extraordinary violence, and with care may be made secure even against these. As a matter of practice, interruptions of service upon transmission systems are due to mechanical injuries alone and are but rare, but are far more likely to occur in some part of the distributing system. The most dangerous combination of circumstances is a sleet storm sufficient to coat the wires with ice, followed by heavy winds; if the wind is diagonal to the direction of the wires it can bear this particular danger in mind, there need be very little fear of serious results. Lightning is a much more formidable enemy. The lightning discharges observed upon electric circuits are of two general descriptions: first, a direct discharge of lightning upon the line, more or less severe, and always to be dreaded; and secondly, induced discharges due to lightning flashes which do not hit the line, or to static disturbances which may or may not produce lightning. Discharges of the former class are vastly more severe than those of the latter, and, fortunately, are somewhat rare. They may actually shatter the line, or may distribute themselves along it for a considerable distance. The lightning-arrestors that can be put on the lines are of little or no practical value, as the lightning that comes towards the apparatus, the vast majority of lightning discharges, to whatever cause they may be due, will be deflected harmlessly to earth. Moreover, the apparatus itself has a considerable power of resistance, and most useful results may be very thoroughly protected by such lightning-arrestors, and other points, such as prominent elevations along the line, should receive similar additional protection. In some cases a substantial steel-wire cable stretched along the tops of the poles several feet above the line wires and well grounded at frequent intervals has been found very advantageous. With the best protection at present available, lightning is not a serious menace to continuity of service, and the apparatus of the distributing system is far more difficult to protect than the main line and its apparatus.

Sub-stations.—In most long-distance transmission work the transmission lines are connected directly to the sub-station itself. It is a matter of common knowledge that the general distribution system precisely the same relations which are borne by a central electric supply station to its distributing lines. Such a sub-station should be treated, in fact, as a central station, receiving its electric energy either from local generators driven by prime movers. The design of the sub-station, however, is somewhat different from that of the ordinary central station. The transmission lines terminate generally in a bank of three-phase transformers, and the line voltage is reduced or higher voltage employed upon the line to the 2000 or more generally used in the distribution. These transformers are usually large, and their magnitude should be determined by the same considerations which govern the selection of apparatus employed in a generating station. The general rule to be followed is that the separate units shall be of such size that one of them may be used with a unit of the same class. In connection with synchronous transformers, the unit in two- or three-phase working is the bank of transformers, which must be used together. In Continental practice three-phase reducing transformers are frequently made to include all three phases in one structure; this practice is less frequently followed in American plants, separate transformers being more often used in each phase. In this case, two or three transformers, according as the two- or three-phase system is used, constitute a single transformer unit, and the line voltage is reduced by a step down, made from three-phase line to two-phase distribution, the change is made by the appropriate vector connexion of the transformers. The full-load efficiency of large sub-station transformers is commonly 90 per cent. In actual practice, increasing operating conditions, regulating appliances, to enable the voltage upon the distribution lines to be held constant and uniform. These regulators are, in practice, synchronous regulators, of the core type, and are of two general varieties, one is an alternating current regulator, the other is an inductive regulator. In the former the current is obtained in divers ways—sometimes by changing the inductive relations of the primary, and secondary coils, sometimes by changing the relative number of effective turns in primary and secondary coils. Sets of these are used, and are so proportioned that the working, if anything, shall not be affected. These transformers are to be controlled over a sufficiently wide range to secure uniform potential on the system, and with a degree of delicacy that obviates any undesirable changes in voltage. The regulation is obtained by continuous manual or automatic adjustment, and is entirely satisfactory. In very large systems it is worth noting that the so-called "skin effect" in alternating current conductors may become conspicuous. In the transmission circuits themselves the wires are, in practice, never large enough to produce any sensible difference in conductivity for continuous and for alternating currents. In the heavy omnibus-bars of a large sub-station the skin effect is usually insignificant. The skin effect, however, may become an important item in a given case, especially when the supply is from an alternating current, usually synchronous converters feeding either traction system or electric lighting mains. Beyond these converters the system becomes an ordinary continuous-current system, and is treated as such. In the former the three-phase generators are often preferred to synchronous converters. Series arc lighting from transmission circuits is a much more serious problem. At the present time two methods are in vogue: first, the single-phase, and, secondly, series alternating apparatus for feeding alternating arcs. This apparatus consists either of constant current transformers with automatically moving secondaries, or of inductive regulators, also automatic in their action, supplemented by transformers to supply them with the necessarily rather high constant current. The application of the two systems is at present divided; electrically, the alternating apparatus gives a rather higher real efficiency, but involves the use of alternating arcs, which are somewhat less efficient, while the rectifying apparatus requires a much smaller current, which is somewhat objectionable on the score of low-power factor. Mercury rectifiers are now used rather extensively and give excellent results, although they are as yet of somewhat uncertain life, and, like the synchronous rectifiers, require special transformers when worked at constant current. In Continental practice arc lights are almost universally worked off constant
potential circuits, and hence the difficulties just considered are for the most part peculiar to American systems.

Distances of Transmission.—The ultimate determining factor in the distance to which power can be commercially transmitted is the economic side of the transmission, the maximum distance being the maximum distance at which the transmission will pay. As a mere engineering feat the transmission of power to a distance of many hundred miles is perfectly feasible, and, judging from the data available, the phenomena encountered in increasing the distance of lines have not been of such character as to cause any hesitation in going still farther, provided the increase is commercially feasible. In American practice, it is within the truth to say that nearly all transmission lines of from five hundred to one thousand miles have been built (on a large scale—several thousand kilowatts) the chances for commercial success are still good. The larger the amount of power transmitted, the better on the whole is the commercial situation. The longer, one yet operated has already been noted, and may be regarded as a commercial success. In certain localities where the cost of fuel is extremely high, transmissions of several hundred miles may prove successful from a commercial as well as an engineering standpoint, but the growth of industry, which indicates the necessity for such a transmission, may go on until, through improved facilities of transport, the cost of fuel may be greatly lowered and the economic conditions entirely changed. The economical exploitation of transmissions sometimes takes place much more quickly than would be anticipated at first sight, so that when very long distance transmissions are under consideration, the permanence of the conditions which make them profitable should be a very serious element of consideration.

(L. B.L.)

POWIS, EARLS AND MARQUESSES OF.—Before the Norman Conquest the Welsh principality of Powis, comprising the county of Montgomery and part of the counties of Brecknock, Radnor, Shropshire, Merioneth and Denbigh, was subject to the princes of North Wales. Early in the 12th century it was divided into upper and lower Powis. In 1283 Owen ap Griffin, prince of upper Powis, formally resigned his princely title (nomen et circums principatus) and his lands to the English king Edward I. at Shrewsbury, and received the lands again as an English barony. (See Montgomeryshire Collections, 1868, vol. i.). This barony of Powis passed through female inheritance to the family of Cherleton and in 1421 to that of Grey. It fell into abeyance in 1551.

In 1587 Sir Edward Herbert (d. 1594), a younger son of William Herbert, earl of Pembroke, purchased some of the lands of the barony, including Red castle, afterwards Powis castle, near Welshpool, and in 1629 his son William (c. 1573-1656) was created Baron Powis. William's grandson, William, the 3rd Baron (c. 1639-1699), was created Earl of Powis in 1674 and Viscount Montgomery and marquess of Powis in 1687. The recognized heir to the throne in 1690 was Lord Herbert of Powis, who was suspected of complicity in some of the popish plots and was imprisoned in the Tower of London from 1678 to 1684. He followed James II. into exile and was created duke of Powis by the dethroned king. The English government deprived him of his estates, but these were restored to his son William, the 2nd marquess, in 1722. William, who had a somewhat chequered career as a Jacobite, died in October 1745, and when his son William, the 3rd marquess, died in 1748 the titles became extinct.

In 1718 Henry Arthur Herbert (d. 1772), who had been made Baron Herbert of Chibbury in 1743, was created Baron Powis and earl of Powis. He allied himself with the earlier holders of these titles, with which family he was distantly connected, by marrying Barbara, a niece of the 3rd marquess. The titles became extinct a second time when his son George Edward died in January 1801. George's sister and heiress, Henrietta Antonia (1758-1830), married Edward Clive (1754-1829), son and heir of the great Lord Clive. In 1794 he was made Baron Clive of Walcot, and in 1804, after serving as governor of Madras from 1798 to 1803, he was created Baron Powis and earl of Powis. His son Edward, the 2nd earl (1795-1848), took the name of Herbert in 1829 on the death of that of Clive. He was a member of parliament from 1806 to 1839, and was elected in opposition to the Prince Consort, as chancellor of the university of Cambridge in 1847. His second son was Lieut.-General Sir Percy Egerton Herbert (1829-1876), who distinguished himself in the Crimean War, and Sir Percy's son, George Charles [h. 1862], became the 4th earl in 1891.

POWNALL, THOMAS (1722-1805). British colonial statesman and soldier, was born at Saltfleetby, Lincolnshire, England, in 1722. He was educated at Lincoln and at Trinity College, Cambridge, where he graduated in 1743. He entered the office of the lords commissioners of trade and plantations, of which his brother John was then secretary; and in 1753 he went to America as private secretary to Sir Danvers Osborn, just appointed governor of New York. Osborn committed suicide soon after reaching New York (Oct. 6), but Pownall remained in America, devoting himself to studying the condition of the American plantations, and in 1754, he met Benjamin Franklin, and a life-long friendship between the two resulted. In 1756 he returned to England, and presented to Pitt a plan for a campaign against the French in Canada, to begin with the investment of Quebec. In 1757 Pitt appointed him governor of Massachusetts,1 in which office he heartily supported Pitt's policy during the Seven Years' War, and in 1758 encouraged the equipment of a force of 7000 men, to be recruited and armed in New England; but the French power in America once broken, Pownall came more directly under the influence of the lords of trade, and his unwillingness to carry out the republican policies of the crown caused his transfer to the governorship of South Carolina in February 1760. This office he held nominally for about a year; but he never went to South Carolina, and in June 1760 he returned to England. In 1762-1763 he was commissary-general of the British troops in Germany. As member of parliament for Tregony in 1768-1774 and for Minehead in 1774-1780, he at first sided with the Whigs in opposing all plans to tax the American colonists, but he supported North's administration after the outbreak of the War of Independence. He died at Bath in the 4th of February 1798.

POYET, GUILLAUME (1472-1549), French magistrate, was born at Angers. After practising successfully as a barrister at Angers and Paris, he was instructed by Louise de Savoy, sister of the king, Francis I., to uphold her rights against the constable de Bourbon in 1521. This was the beginning of his fortunes. Through the influence of the queen-mother he obtained the posts of advocate-general (1530) and president of the parliament of Paris (1534), and became chancellor of France in 1538. He was responsible for the legal reform contained in the ordinance of Villers-Cotterets (1539), the object of which was to shorten procedure. This ordered the keeping of registers of baptisms and deaths, and enjoined the exclusive use of the French language in legal procedure. With the constable de Montmorency he organized an intrigue to ruin Admiral Chabot, and procured his condemnation in 1544; but after the admiral was pardoned, Poyet was himself thrown into prison, deprived of his offices, and sentenced to a fine of 100,000 livres. He recovered his liberty in 1545, and died in April 1548.

See C. Porée, Guillaume Poyet (Angers, 1898).

POYNINGS, SIR EDWARD (1459-1521), lord deputy of Ireland, was the only son of Robert Poyning, second son of the 4th Baron Poyning. His mother was a daughter of Sir William Paston, and some of her correspondence is to be found in the

1 In September 1755 Pownall had been made lieutenant-governor of New Jersey, but he had little to do with the affairs of that province and resigned soon after his appointment to Massachusetts.
Passion Letters. Robert Poynings was implicated in Jack Cade's rebellion, and Edward was himself concerned in a Kentish rising against Richard III., which compelled him to escape to the Continent. He attached himself to Henry, earl of Richmond, afterwards King Henry VII., with whom he returned to England in 1485. By Henry VII. Poynings was employed in the wars on the Continent, and in 1493 he was made governor of Calais. In the following year he went to Ireland as lord deputy under the viceroyalty of Prince Henry, afterwards King Henry VIII. Poynings immediately set about Anglicizing the government of Ireland, which he thoroughly accomplished, after inflicting punishment on the Irish. In 1494 he married Margaret de la Pole, the illegitimate daughter of the “holy league” between England, Spain, the emperor, and the pope, in 1513. In 1530 he was present at the Field of the Cloth of Gold, in the arrangement of which he had taken an active part. He died in 1531. By his wife, Elizabeth Scot, Poynings left no surviving issue, and his estates passed through a collateral female line to the earl of Northumberland. He had several illegitimate children, one of whom, Thomas Poynings, was created Baron Poynings in 1545, but died in the same year without heirs.

POYNTER, SIR EDWARD JOHN, BART. (1856— ), English painter, son of Ambrose Poynter, architect, was born in Paris on the 20th of March 1836. He pursued his art studies in England and in Paris (under Gleyre, 1856-1859), and exhibited his first picture at the Royal Academy in 1861. In 1869, after the exhibition of "Israel in Egypt" and "The Catapult," he was elected an Associate of the Royal Academy, and in 1876, the year of "Atalanta's Race," full Academician.

In the decorative arts he practised freely as a designer in fresco, mosaic, stained glass, pottery, tile-work and the like. While still quite a young man, he was encouraged by the architects William Burges, A.R.A., to design panels for his quaint Gothic cabinets; Messrs Powell obtained from him cartoons of designs for stained glass; for the decoration of Waltham Abbey church he was employed on a series of thirty important designs. Attracted by these, Duley Brothers commissioned a number of full-page drawings on wood for the illustration of their celebrated "Bible Gallery." The cartoons for "St George" and "St David," the mosaic panels now standing on the old lobby of the Palace of Westminster (for which produced in 1870, and they were followed by the "Apelles" and "Phidias," in the same method of reproduction, in the Victoria and Albert Museum; by the important series of frescoes in St Stephen's, Dublin castle, which comes from the life of the saint; by the decoration of the grill room at the Museum at South Kensington, with the tiles en cambric—an achievement strikingly successful and pregnant with results. Always a lover of water-colour drawing and of the art of landscape painting, he was elected to the Royal Society of Painters in Water Colours in 1883. In 1874 he designed the Ashtemee medal; and in 1892, for the coinage of that year, the reverse of the shilling and florin, to the obverse of Mr Thomas Brock, R.A.

When the art teaching centre of South Kensington was assuming the importance it has since attained, Mr Poynter was appointed director for art in the Science and Art Department, and became president of the Royal College of Art, and by virtue of his vigorous and successful administration he invested his office with a distinction which, after his resignation in 1885, it soon notoriously lacked.

The directorship of the National Gallery became vacant in 1854, and Poynter, profoundly versed in the works of the Old Masters, especially of the Italian schools, was appointed to the post, which he held for ten years. Under his rule the National Gallery of British Art, at Millbank, presented by the late Sir Henry Tate, became a department of the National Gallery, and thither were removed many pictures formerly in the British rooms at Trafalgar Square, as well as the Chantrey Collection from South Kensington, &c. One of the most important services by the director was the editing of the great Illustrated Catalogue of the National Gallery (1889-1900), in which every picture in the collection is reproduced—an unprecedented achievement in the annals of art-publishing.

On the death of Sir John Millais in 1896, Poynter was elected to the presidency of the Royal Academy, and was knighted. He was made a baronet in 1902.

Paintings.—Among Sir Edward Poynter's most notable pictures have been the following: "Israel in Egypt" (1867); "The Catapult" (1868); "Perseus and Andromeda" (1872); "Atalanta's Race" (1876); "The Fortune-Teller" (1877); "Nausicaa and Her Maidens" (1879); "Visit to Asculapius" (1886), now in the Chantrey Collection in the Tate Gallery; "The Ides of March" (1883); "Diademum" (1885), now destroyed; "On the Terrace" (1886); "The Meeting of Solomon and the Queen of Sheba" (1894); "Horse Showing" and "In the Four Seasons" (1894), and numerous portraits and water-colour drawings.

Lectures.—In his series of Shade Lectures, delivered from 1875 to 1897, collected first published in 1879 (republished, with additions, in 1897), Sir Edward Poynter deals with the whole subject of art education, considering in turn Decorative Art, Old and New Art, Systems of Art Education, Hints on the Formation of a Style, Training of Art Students, The Study of Nature, The Value of Prints, Objects of Study, Professor Ruskin on Michelangelo (hotly controverted in tone), Influence of Art in Social Life, and Ancient Decorative Art.

POZHAREVAT (also written Passarowitz and Pozzarevac), a town in Servia, situated in the Morava valley, 4 m. E. of the Morava river and 8 m. S. of the Danube. The station for steamers, Dubravica, with its custom-house, standing on the banks of the Danube, forms practically the harbour of Pozharevats. The town has no special industry, but is the principal market of a very extensive and fruitful plain between the rivers Morava, Mlava and Danube. It is the capital of a department bearing the same name, and the seat of a prefecture, a tribunal of justice, a college and several national or nominal schools. It has a large modern penitentiary, with a department for political offenders and a prison for women. Two miles to the west, towards Morava, is situated Lubicevo, a model farm and stud belonging to the government. The shady park and flower gardens are a popular resort of the people of Pozharevats. The town is known in the history of international treaties as the place at which the famous peace of Passarowitz between Austria and Turkey was concluded in 1718. Pop. (1900), 12,957.

Lignite is worked at Kostolats, 7 m. N. by E., and the hills between Pozharevats and Kostolats show many traces of Roman mines. A number of coins, sarcophagi and inscriptions found in the neighbourhood confirm the statements of the travellers.

POZOBLANCO, a town of southern Spain in the province of Cordova, near the head-waters of the Guadamatillas and of other small sub-tributaries of the Guadiana. Pop. (1900), 12,792. Pozo Blanco is one of the chief towns in the lowlands of Los Pedroches, which lie between the Sierra de la Alcudia on the north and the Sierra Morena on the south. Although there is no railway in the district, Pozo Blanco has a thriving trade. Its fairs are famed for their exhibits of live stock and agricultural products. There are zinc and argentiferous lead mines in the neighbourhood, and manufactures of cloth and leather in the town.

POZZO DI BORGO, CARLO ANDREA, COUNT (1754-1842), Russian diplomatist, was born at Alata, near Ajaccio, of a noble Corsican family, on the 8th of March 1754, some four years before the cession of the island to France. He was educated
POZZUOLI—PRAED

at Pisa, and in early life was closely associated with Napoleon and Joseph Bonaparte, the two families being at that time closely allied in politics. Pozzo was one of the two delegates sent to the National Assembly in Paris to demand the political incorporation of Corsica in France, and was subsequently one of the Corsican deputies to the Legislative Assembly, where he sat on the benches of the right until the events of August 1792. On his safe return to Corsica he was warmly received by Paoli, but found himself in opposition to the Bonaparte brothers, who were now veering to the Jacobin party. Under the new constitution Pozzo was elected procureur-général-syndic, that is, chief of the civil government, while Paoli commanded the army. With Paoli he refused to obey a summons to the bar of the Convention, and the definite breach with the Bonaparte family, who actively supported the revolutionary authorities, dates from this time. Eventually Paoli and Pozzo accepted foreign help, and from 1794 to 1796, during the English protectorate of Corsica, Pozzo was president of the council of state under Sir Gilbert Elliot. When Napoleon sent troops to occupy the island he was excepted from the general amnesty, and took refuge in Rome, but the French authorities demanded his expulsion, and gave orders for his arrest in northern Italy. After a short stay in London he accompanied in 1802 Sir Gilbert Elliot (now become Lord Minto) on an embassy to Vienna, where he lived for six years and was well received in political circles. Hatred of Napoleon was his dominant passion, and even as an exile of no official standing he was recognized as a dangerous enemy. In 1804 through the influence of Prince Adam Czartoryski he entered the Russian diplomatic service, and was employed in 1805 as Russian commissioner with the Anglo-Neapolitan, and in 1806 with the Prussian army. He was entrusted with an important mission to Constantinople in 1807, but the conclusion of the alliance between Alexander I and Napoleon at Tilsit in July interrupted his career, necessitating a temporary retirement after the completion of his business with the Porte. He returned to Vienna, but on the demand of Napoleon for his extradition Metternich desired him to leave the capital. In London, where he found safety from Napoleon, he renewed many old ties, and remained in England until 1812, when he was recalled by Alexander. He diligently sought to sow dissension in the Bonaparte household, and in a mission to Sweden he secured the co-operation of Bernadotte against Napoleon. On the entry of the allies into Paris he became commissary general to the provisional government. At the Bourbon restoration General Pozzo di Borgo became Russian ambassador at the Tuileries, and sought to secure a marriage between the duke of Berry and the Russian grandduchess Anna, Alexander's sister. He assisted at the Congress of Vienna, and during the Hundred Days he joined Louis XVIII, in Belgium, where he was also instructed to discuss the situation with Wellington. The tsar dreamed of allowing an appeal to the people of France on the subject of the government of France in accordance with his vague liberalizing tendencies, but Pozzo's suggestions in this direction were met by violent opposition, the duke refusing to make any concessions to what he regarded as rebellion; but in the immediate circumstances adduced some reason for neglecting the danger was considered excessive. During the early years of his residence in Paris Pozzo laboured tirelessly to lessen the burdens laid on France by the allies and to shorten the period of foreign occupation. That his French sympathies were recognized in Paris is shown by the strange suggestion that he should enter the French ministry with the portfolio of foreign affairs. He consistently supported the moderate party at court, and stood by the ministry of the duc de Richelieu, thus earning the distrust and dislike of Metternich, who held him responsible for the revival of Liberal agitation in France. His influence at the Tuileries declined with the accession of Charles X., whose reactionary tendencies had always been distasteful to him; but at the revolution of 1830, when the Tsar Nicholas was reluctant to acknowledge Louis Philippe, he did good service in preventing difficulties with Russia. In 1832 he visited Petersburg; the next year he was in London renewing his relations with Wellington, and early in 1835 he was suddenly transferred to the London embassy in succession to Prince Lieven. Although he did not lose in official standing, Pozzo was aware that this change was due to suspicions long harboured in various quarters in St Petersburg that his diplomacy was too favourable to French interests. In London his health suffered, and he retired from the service in 1839 to spend the rest of his days in Paris, where he died on the 15th of February 1842. He had been made a count and peer of France in 1818. See Ouvrard, Sixt et Pozzo (St Petersburg, 1840); Correspondance diplomatique du comte Pozzo di Borgo et du comte de Nesselrode, ed. by Charles Pozzo di Borgo (2 vols., Paris, 1839-1897); Vicomte A. Maggiolo, Corsa. France et Russie. Pozzo di Borgo, 1764-1842 (Paris, 1901); J.H.B.R. Capefigue, Les Diplomates européens (4 vols., 1843-1847).

POZZUOLI (anc. Pozzol, q.v.), a seaport and episcopal see of Campania, Italy, in the province of Naples, 7½ m. W. of it by rail. Pop. (1900), 17,017 (town); 22,838 (commune). It is situated on and at the base of a hill projecting into the bay at Pozzuoli, separated from the main portion of the Gulf of Naples by the promontory of Posillipo. Its mineral baths are frequented in summer; and the volcanic pozolanæa earth (also found near Rome), used now as in Roman times for making cement and concrete, is also quarried at Pozzuoli. In the middle ages Pozzuoli was frequently sacked and also damaged by the natural convulsions of 1198 and 1538. To the north-east of the town is the Solfatura, a half extinct volcano crater, in which sulphurous gases are exhaled.

PRABHU, the writer caste of Western India, corresponding to the Kayastha of Bengal. Though numbering only 21,041 in Bombay in 1901, they occupy a very high position socially and in the professions. The first Indian to be appointed to the executive council at Bombay was a Prabhu, of the well-known Chabba family.

PRADBRIJSMITH JAMES (1792–1862), French sculptor, was born at Geneva. He was a member of the French Academy, and a popular sculptor of the pre-Romantic period, representing in France the drawing-room classicism which Canova illustrated at Rome. His chief works are the Niobe group (1822), "Atalanta" (1828), "Psyche" (1824), "Sappho" (1828) (all in the Louvre), "Prometheus" (Tuileries Gardens), a bas-relief on the triumphal arch of the Carrousel, the figures of "Fame" on the Arc de l'Étoile, and a statue of J. J. Rousseau for Geneva. Besides these mention should be made of his "Three Graces" (1821).

PRAGUE, BOHEMIA (1847– ). Spanish painter, was born at Villanueva da Gallago (Saragossa). Having studied first at the Fernando Academy, and then at the Spanish Academy in Rome, of which he was afterwards director, he became the leading historical painter of modern Spain. In 1896 he was appointed director of the Madrid Museum. Though he is best known for such large historical compositions as "Joan the Mad" (gold medal, Paris, 1878), and "The Surrender of Granada" (gold medal, Munich, 1883), in which he discarded the heavy colouring of Laurens for a lighter and more atmospheric key, he has painted many excellent genre pictures in the manner of Francisco José de Goya, some decorative compositions in which he follows the example of Tiepolo. The best of these are his decorations in the Murgo Palace in Madrid. Among his best known works are "El pemem", "Strand at Vigo", "Procession in Venice," "La Fiorello", "Reading on the Balcony," "Don Alfonso the Warrior," and "Don Alfonso the Scholar." He became member of the Berlin Academy in 1892.

PRAED, WINTHROP MACKWORTH (1822–1839), English poet, born in London on the 26th of July 1802. The old family name was Mackworth, the additional name of Praed being derived from the marriage of the poet's great grandfather with a Cornish heiress. His father, William Mackworth Praed, was a sergeant-at-law. His mother belonged to the English branch of the New England family of Winthrop. In 1814 Praed was sent to Eton College. He there founded a manuscript periodical called Apis matina. This was succeeded in October 1826 by the Etonian, a paper projected and
PRAEFECT

241

edited by Praefect and Walter Blount, which appeared every month until July 1821, when the chief editor, who signed his contributions "Peregrine Courtenay," left Eton, and the paper died. Henry Nelson Coleridge, William Sidney Walker, and John Moultrie were the three best known of his contributors in this periodical, which was published by Charles Knight, and of which many interesting particulars are given in Knight's Autobiography and in Maxwell Lyte's Eton College. Before Praefect left school he succeeded in establishing over a shop at Eton a "boys' library," the books of which are now amalgamated in the School Library. His career at Cambridge, where he matriculated at Trinity College, October 1821, was marked by exceptional brilliancy. He gained the Browne medal for Greek verse four times, and twice the chancellor's medal for English verse. He was bracketed third in the classical tripos in 1824, won a fellowship at his college in 1827, and three years later carried off the Seatonian prize. At the Union his speeches were only rivalled by those of Macaulay and of Charles Austin (1799–1874), who subsequently made a great reputation at the parliamentary bar. The character of Praefect during his university life is described by Bulwer Lytton in the first volume of his Life. He began to study law, and in 1829 was called to the bar at the Middle Temple. He went to the Norfolk circuit, where his prospects of advancement were bright, but the bias of his feelings inclined him towards politics, and after a year or two he devoted himself entirely to political life. Whilst at Cambridge he leaned to Whiggism, and then to the Whigs; his feelings were afterwards the same, but during the agitation for parliamentary reform his opinions changed, and when he was returned to parliament for St Germans (Dec. 17, 1830) his election was due to the Tory party. He sat for that borough until December 1832, and on its extinction contested the borough of St Ives, within the limits of which the Cornish estates of the Praeds were situated. The squibs which he wrote on this occasion were collected in a volume printed at Penzance in 1833 and entitled Trash, dedicated without respect to James Halse, Esq., M.P., his successful competitor. Praefect sat for Grantham from 1835 to 1847, and was secretary to the Board of Control during Sir Robert Peel's short administration. He sat for Aylesbury from 1837 until his death. During the progress of the Reform Bill he advocated the creation of three-cornered constituencies, in which each voter should have the power of giving two votes only, and maintained that freeholds within boroughs should confer votes for the boroughs and not for the county. Neither of these suggestions was then adopted, but the former ultimately formed part of the Reform Bill of 1866. He married in 1835 Helen Bogle. He died of consumption at Chester Square, London, on the 15th of July 1852.

Praefect's lighter poetry was the perfection of ease. Mr Austin Dobson has justly praised his "sparkling wit, the clearness and finish of his style, and the flexibility and unflagging vivacity of his rhythm" (Ward's English Poets). It abounded in happy allusions to the characters and follies of the day. In his humorous effusions he found numerous imitators.

His poems were first edited by R. W. Griswold (New York, 1844); another American edition, by W. A. Whitmore, appeared in 1859; an authorized edition with a memoir by Derwent Coleridge appeared in 1864: The Political and Occasional Poems of Mr. Praefect (London, 1844) was edited with notes by his nephew, Sir George Young, included many pieces collected from various newspapers and periodicals. Sir George Young separated from his work some poems, the work of his friend Edward Marlborough Fitzgerald, generally confused with his. Praefect's essays, contributed to various magazines, were published in Morley's Universal Library in 1887.

PRAEFECT (praefectus), the title of various Roman officials, both civil and military. A praefectus was not one of the magistrates proper; he was, strictly speaking, only the deputy or lieutenant of a superior magistrate or commander. The following were the most important.

1. The city praefectus (praefectus urbis) acted at Rome as the deputy of the chief magistrate or magistrates during his or their absence from the city. Thus he represented in the earliest times the king and in later times the consuls or consuli when he or they were absent on a campaign or on other public duties, such as the celebration of the annual Latin festival on the Alban Mount. The absence of the chief magistrate for more than a single day rendered the appointment of a praefectus obligatory; but the obligation only arose when all the higher magistrates were absent. Hence so long as the consuls were the only higher magistrates their frequent absence often rendered the appointment of a praefectus necessary, but after the institution of the praetorship (367 B.C.) the necessity only arose exceptionally, as it rarely happened that both the consuls and the praetor were absent simultaneously. But a praefectus continued to be regularly appointed, even under the empire, in the enforced absence of all the higher magistrates, and especially at the Latin festival. The right and duty of appointing a praefectus devolved upon a praefectus (king, dictator or consul) whose deputy he was, but it seems to have been withdrawn from the consuls by the Licinian law (367), except that they still nominated praefectus for the time of the festival. No formalities in the appointment and no legal qualifications on the part of the praefect were required. The praefectus had all the powers of the magistrate whose deputy he was, except that he could not nominate a deputy to himself. His office expired on the return of his superior. There could only be one city praefect at a time, though the dictator Caesar broke the rule by appointing six or eight praefectus simultaneously.

Under the empire there was introduced a city prefecture which differed essentially from the above. Augustus occasionally appointed a city praefectus to represent him in his absence from Italy, although the praetors, or even one of the consuls, remained in the capital. In the absence of Tiberius from Rome during the last eleven years of his reign (A.D. 26–37) the city prefecture, hitherto an exceptional and temporary office, became a regular and permanent magistracy; in all subsequent reigns the praefectus held office even during the presence of the emperor in Rome. He was always chosen by the emperor and usually from men who had held the consulship; his office was regarded, like the censorship under the republic, as the crowning honour of a long political career. It was not conferred for any definite length of time, but might be held for years or for life. As under the republic, the praefectus was not allowed to quit the city for more than a day at a time. His duty was the preservation of peace in the capital; he was, in fact, the chief of the police, being charged with the superintendence of the streets, markets and public buildings. He was further entrusted by Augustus with a summary criminal jurisdiction over slaves and rioters, which was, however, gradually extended till in the time of Severus or even earlier it embraced all offences by whomsoever committed. He also had the power of dealing with civil cases where his interference seemed requisite in the interests of the public safety, but such occasions were naturally few. By the beginning of the 3rd century, and perhaps earlier, appeals to the emperor in civil cases were handed over by him to be dealt with by the praefectus. Except where special restrictions interfered, an appeal lay from the praefectus to the emperor. Though not a military officer, the praefectus commanded the city cohorts (cohortes urbane), which formed part of the garrison of Rome and ranked above the line regiments, though below the guards (see Praetorians). The military power thus placed in the hands of the chief of the police was one of the most sorely-felt innovations of the empire. The constitutional changes of Diocletian and Constantine extended still further the power of the praefectus, in whom, after the disbanning of the guards and the removal from Rome of the highest officials, the whole military, administrative and judicial powers were centred.

2. Under the republic judicial praefectus (praefecti jure dicendo) were sent annually from Rome as deputies of the praetors to administer justice in certain towns of the Italian allies. These towns were called prefectures (prefecturae). After the Social War (90–89 B.C.), when all Italy had received the Roman
The different kinds of praefects are fully discussed in Mommsen, Römisches Staatsrecht (1887) vols. ii., iii.; see also T. M. Taylor, Constitutional and Political History of Rome (1899). There is an excellent monograph on the Praefectura urbis by P. E. Vigneaux (1866). Mommsen deals very cursorily with the praefectus castrorum, but there is a special article by G. Wilmanns, in Epigraphis epigraphica (1872), vol. i., "De praefecto castrorum et praefecto legioni." For the French préfet see Praefect.

(3.)

PRAEMUNIRE (Lat. praemunere, to pre-admonish or forewarn), in English law an offence so called from the introductory words of the writ of summons issued to the defendant to answer the charge, "Praemunire facias A.B.," &c., i.e. "cause A.B. to be forewarned." From this the word came to be used to denote the offences of ecclesiastical, ecclesiastical, by means of such writ, and also the penalties they incurred. The name of Richard II., Purchasing bulls from Rome (1392), is usually designated the Statute of Praemunire, but it is only one of numerous stringent measures (some still unrepealed, and, as a body, of the most confused character) passed for the purpose of putting restraint on the papal usurpation of authority in England. From the beginning of the 14th century papal aggression had been particularly active, more especially in two forms. The one, the disposal of ecclesiastical benefices, before the same became vacant, to men of the pope's own choosing; the other, the imposition of the high - prestige of his representative to the courts of the country. The Statute of Provisors 1306, passed in the reign of Edward I., was, according to Coke, the foundation of all subsequent statutes of praemunire. This statute enacted "that no tax imposed by any religious persons should be sent out of the country whether under the name of a rent, tallage, tribute or any kind of imposition." A much greater check on the freedom of action of the popes was imposed by the Statute of Provisors (1350-1357) and the Statute of Praemunire passed in the reign of Edward III. The former of these, after premising "that the Pope of Rome, according to him the sovereigns of possession and benefices of the Holy Church of the realm of England doth give and grant the same benefices to aliens which did never dwell in England, and to cardinals, which might not dwell here, and to others as well aliens as denizens, as if he had been patron or advoue of the said dignities and benefices, as he was not of right by the laws of England . . . .", ordained the free election of all dignities and benefices elective in the manner as they were granted by the king's progenitors. The Statute of Praemunire (the first statute so called) 1353, though expressly levelled at the pretensions of the Roman curia, excludes any direct reference to papal 'prae- for any trouble occasioned by the grievances and clamorous complaints of the great men and commons of the realm of England " enacts "that all the people of the king's ligeance of what condition that they be, which shall draw any out of the realm in plea " or any matter of which the cognizance properly belongs to the king's court shall be allowed two months in which to answer for their contempt of the king's rights in transferring their pleas abroad. The penalties which were attached to the offence under this statute involved the loss of all civil rights, forfeiture of lands, goods and chattels, and imprisonment during the royal pleasure. Many other statutes followed that of 1353, but that passed in the sixteenth year of Richard II.'s reign is, as mentioned before, usually referred to as the Statute of Praemunire. This statute, after first stating "that the right of recovering the presentments to churches, prebends, and other benefices . . . belongeth only to the king's court of the old right of his crown, used and approved in the time of all his progenitors kings of England," proceeds to condemn the practice of papal transmission, and after rehearsing the promise of the three estates of the realm to stand with the King in all cases touching his crown and his regality, enacts "that if any purchase or purchase, or cause to be purchased or pursued in the court of Rome, or elsewhere, any such translations, processes, and sentences of excommunications, bulls, instruments or any other things whatsoever . . . he and his notaries, abbots and counsellors shall be put out of the king's protection, and their lands,
tenements, goods and chattels forfeit to the king, and they shall be attached by their bodies or process made against them by praemunire facias. This statute, says Stubbs, was one of the strongest defensive measures taken during the middle ages against Rome and was called for by the conduct of the pope, who had forbidden the bishops to execute the sentences of the royal courts in suits connected with ecclesiastical patronage. The last ancient statute concerning praemunire, until the Reforma-
tion, was an extension in the reign of Henry IV. (1400) of the Statute of Provisors, by which all persons who accepted any provision from the pope to be exempt from canonical obedience to their proper ordinary were subjected to the penalties prescribed. The range and description of offences subject to the penalties of praemunire were greatly widened after the Reforma-
tion, so that acts of a very miscellaneous character were from time to time brought within the scope of enactments passed for a very different purpose. For instance, the penalties of praemunire were incurred, under an act of Queen Elizabeth (1571), for denying the Queen's title; and under an act of James I. the Statute of Monopolies (1623), for obtaining any stay of a Papal ordainment. There was a similar extension in any suit for a monopoly; under an act of Charles I. (1640) the attempting to restrain the importation or making of gunpowder was a praemunire; in the reign of Charles II. an act of 1661 made the asserting maliciously and advisedly, by speaking or writing, that both or either house of parliament has a legis-
latve authority without the king, a praemunire. In the same reign, the Habacus Corpus Act 1679 made the committing of any man to prison out of the realm a praemunire, unpardonable even by the king. It thus appears that while the Crown by its prerogative might at any time remit the whole or any part of the punishment incurred by a praemunire, an exception was made in transgressions of the Statute of Habacus Corrus.1 An act of William III. (1693) made serjeants, counsellors, proctors, attorneys, and all officers of courts practising without having taken the proper oaths guilty of a praemunire. By the Suc-
cession to the Crown Act 1707, verbally to assert the rights of a person to the Crown contrary to the Acts of Settlement and Union is praemunire (to do so by writing or printing is treason). The Royal Marriages Act 1772 is the last statute which sub-
jects anyone to the penalties of a praemunire. A peer charged with praemunire is not entitled to trial by his peers, but is to be tried by a jury. The most famous historical instance of a prov-
cision of the Statute of Praemunire was that of Cardinal Wolsey in 1529.

PRAENESTE (mod. Palestrina), a very ancient city of Latium, lies 23 m. E. of Rome by the Via Praenestina (see below), on a spur of the Apennines facing the Alban Hills. To the natural strength of the place and its commanding situation Praeneste owed in large measure its historical importance. There are varieties of great extent, and an inscription. Objects in metal and ivory discovered in the earliest graves prove that as early as the 8th or 7th century B.C. Praeneste had reached a considerable degree of civilization and stood in commercial relations not only with Etruria but with the East. At this time the city was probably under the hegemony of Alba Longa, then the head of the Latin League. In 490 B.C., according to Livy, Praeneste withdrew from the Latin League, in the list of whose members given by Dionysius (v. 61) it occurs, and formed an alliance with Rome. After Rome had been weakened by the Gallic invasion (390) Praeneste joined its foes in a long struggle with Rome. The struggle culminated in the great Latin War (340-33), in which the Romans were victorious, and Praeneste was punished for its share in the war by the loss of part of its territory. It was not, however, like most other Latin cities, embodied in the Roman state, but continued in the position of a city in alliance with Rome down to the Social War, when it received the Roman franchise (in 90 B.C., probably as one of those cities which had not rebelled or had laid down their arms at once), which in 215 B.C. some of its citizens—who had bravely held Casilinum against Hannibal, and only surrendered when pressed by hunger—had refused to accept.

As an allied city it furnished contingents to the Roman army and possessed the right of exile (jus exilii), i.e. persons banished from Rome were allowed to reside at Praeneste. To judge from the works of art and inscriptions of this period (338 to 90 B.C.), it must have been for the place a time of prosperity, and even luxury. The nuts of Praeneste were famous and its roses were amongst the finest in Italy. The Latin spoken at Praeneste was somewhat peculiar, and was ridiculed to some extent by the Romans. In the civil wars of Sulla the younger Marius was blockaded in the town by the Sullans (82 B.C.); and on its capture Marius slew himself, the male inhabitants were mas-
sacred in cold blood, and a military colony was settled on part of the city. From this story, though, though as fragments of the new coloni, we find that in 63 B.C. this was already in the possession of large proprietors. It was probably in 82 B.C. that the city was removed from the hill-side to the lower ground at the Madonna dell' AQUILA, and that the temple of Fortune was enlarged so as to include much of the space occupied by the ancient city. From an inscription found in 1907 it appears that Sulla delegated the foundation of the new colony to M. Terentius Varro Lucullus, who was consul in 73 B.C. Under the empire Praeneste, from its elevated situation and cool salubrious air, became a favourite summer resort of the wealthy Romans, whose villas studded the neighbourhood. His place ranked it with Tibur and Baiae, though as a fact it never became so fashionable a residence as Tibur or the Alban Hills. Still, Augustus resorted thither; here Tiberius recovered from a dangerous illness, and here Hadrian probably built himself a villa. Marcus Aurelius also had a villa here. Amongst private persons who owned villas at Praeneste were Pliny the younger and Symmachus. Inscriptions show that the inhabitants of Praeneste were especially fond of gladiatorial shows.

But Praeneste was chiefly famed for its great temple of Fortune and for its oracle, in connexion with the temple, known as the "Praenestine lots" (sortes praenstinae). The oldest portion of the temple was a small, square building, dedicated to the goddess on the lowest terrace but one. Here is a grotto in the natural rock, containing a beautiful coloured mosaic pavement, representing a sea—
temple of Poseidon on the shore, with various fish swimming in the sea. To the east of this is a large space, now open, but once very possibly roofed, and forming a basilica in two storeys, built against the rock on the north side, and there decorated with pilasters also; and to the east again is an apsidal hall, often identified with the temple itself, in which the famous mosaic with the temple itself, in which the famous mosaic of Ivis, when in the Palazzo Barberini on the uppermost terrace, was found. Under this hall is a chamber, which also, with possibly another floor, was covered. It was in the 2nd century B.C. In front of this temple an obelisk was erected in the reign of Claudius, fragments of which still exist. The modern cathedral, just below the level of this temple, occupies the civil basilica of the town, upon the façade of which was a sun-dial, described by Varro (traces of which may still be seen). In the modern piazza the steps leading up to this latter basilica and the base of a large monument were found in 1907; so that only a part of the piazza represents the ancient forum. As extended by Sulla the sanctuary of Fortune occupied a series of five vast terraces, which, resting on gigantic steps, the Praenestines shortened some words: they said cœta for cœtan, Ismod for Ismod, true for true, Tondrus for Tondrus, and inscriptions exhibit the forms Acmenono and Tondrus for Agmeno and Tyndarus. They said nentremes for nentrenses in the sense of testicul and longiceto for noton (Feustes, i. "nentremes" and "tongere"). Cf. Quintilian, Inst. 1. 5. 56.

1 Sir T. E. Tomlin says that there is only one instance of a prose-
cution on a praemunire to be found in the state trials, in which case the penalties were inflicted upon some persons for refusing to take the oath of allegiance to Charles II.
substructions of masonry and connected with each other by grand staircases, rose one above the other on the hill in the form of the side of a pyramid, crowned on the highest terrace by the round temple of Fortune. This immense edifice, probably by far the largest sanctuary in Italy, must have presented a most imposing aspect, visible as it was from a great part of Latium, from Rome, and even from the sea. The ground at the foot of the lowest terrace is 1476 ft. above sea-level; here is a cistern, divided into ten large chambers, in brick-faced concrete. The goddess Fortuna here went by the name of Primigenia (First-Born, but perhaps in an active sense First-Bearer); she was represented sucking two babies, said to be Jupiter and Juno, and she was especially worshiped by matrons. The oracle continued to be consulted down to Christian times, until Constantine, and again later Theodosius, forbade the practice and closed the temple. A bishop of Praeneste is first mentioned as 203, and the parentage of the city, which is now a Roman town, was for a long time uncertain.

On the summit of the hill (2471 ft.), nearly a mile from the town, stood the ancient citadel, the site of which is now occupied by a few poor houses (Castel San Pietro) and a ruined medieval castle of the Popes. The citadel, which may be traced back to pre-Roman times, is a great part of the Alban Hills and the Campagna as far as the sea. Considerable portions of the southern wall of the ancient citadel, built in very massive Cyclopean masonry of blocks of limestone, are still seen. The outer face of the wall is so regularly built that the citadel with the town, can still be traced. The ruins of the villa attributed to Hadrian stand in the plain near the church of S. Maria della Vittoria in the suburb of Subiaco, and from this villa, the city was discovered the Braschi Antinensis, now in the Vatican. The calendar, which, as Suetonius tells us, was set up by the grammarian, M. Verrius Flaccus in the forum of Praeneste (the reference being to the forum of the imperial period, at the Madonna dell' Aquila), was discovered in the ruins of the church of S. Agapitus in 1771, where it has been used as building material (C. Hilsen in Corp. inscr. lat. 2nd ed. i. 230). Excavations made, especially since 1855, in the ancient praetorium, after the layers of earth had been removed, revealed a long history of settlement. The earliest remains, however, found layer by layer under the present ground-level, and at the foot of the hill, and of the town, have yielded important results for the history of the art and manufactures of Praeneste. Of the objects found in the early stratum, about the tenth and seventh centuries B.C., the cups of silver and silver-gilt and most of the gold and amber jewellery are Phoenician (possibly Carthaginian), or at least made on Phoenician models; but the bronzes and some of the other objects appears to be of local manufacture. These objects are discovered belonging to the period intermediate between the 7th and 3rd centuries B.C.; but "from about 250 B.C. onwards we have a series of Praenestine graves surmounted by the characteristic 'pigna-appeal' of local, but not the Colonna family, not only bronze, ivory and gold ornaments before the skeleton. From these come the bronze cistae and specula with partly (but far from wholly) Etruscan inscriptions, for which Praeneste is renowned (Coro, Itali. Dial.). Among these is the famous Ficoroni casket, engraved with pictures of the arrival of the Argonauts in Bithynia and the victory of Polyx in Aegyptus. It was found in 1758.

In this century antiquaries but a large number of minor pieces of similar style have been discovered in Etruria and are published in full by the German Archäologische School at Rome: Etruskische Spiegel, vol. v. sqq. (Berlin, 1884). Hence, although a priori it would be impossible to doubt the Etruscan character of the Praenestine art, it is now known that objects of very similar style have come from Etruria, the evidence, positive and negative, points decisively to an Etruscan factory in or near Praeneste itself (Conway). Most of the objects discovered in the necropolis are praetors. Of course, I mean the praetors of Praeneste, an oddity in itself. That praetors of Praeneste were not the only praetors of Praeneste was discovered in the Praeneste Museum (which possesses the Ficoroni casket) and the Barberini library.

PRAENESTINA, VIA—PRAETOR

PRAENESTINA, VIA, an ancient road of Italy, leading from Rome E. by S. to Praeneste, a distance of 23 m., Gabii being situated almost exactly half-way. At the ninth mile the road crosses a ravine by the waT was preserved and dedicated Ponte di Nona, with seven arches, the finest ancient bridge in the neighbourhood of Rome. The line of the road is, considering the difficulty of the country beyond Gabii, very straight. In the stretch beyond Gabii it is only used as a track, and well preserved. Half-way between Gabii and Praeneste is the well-preserved single-arched bridge, known as Ponte Amato.

See T. Ashby in Papers of the British School at Rome, i. 149 sq. (T. Ashby).

PRAETOR (Lat. praetor, "he who goes before," "a leader") originally a military title, was in classical times the designation of the praetor and praetorius instead of praefectus. The Roman consuls were at first called praetors; in the early code of the Twelve Tables (450 B.C.) they appear to have had no other title. By the Licinian law of 367, which abolished the military tribunes with consular power and enacted that the supreme executive should henceforward be in the hands of the two consuls, a new magistrate was at the same time created who was to be a colleague of the consuls, though with lower rank and lesser powers. This new magistrate was entrusted with the exclusive jurisdiction in civil cases; in other respects his powers resembled those of the consuls. His distinctive title was the city praetor (praestor urbium, y, and praetor urbanius). In the second consulship of the consul, increased, the city praetor always ranked first. To this new magistrate the title of "praetor" was henceforward properly restricted.1 About 242 the increase of a foreign population in Rome necessitated the creation of a second praetor for the decision of suits between foreigners (peregrini) or between citizens and foreigners. This praetor was known at a later time as the "foreign praetor" (praetor peregrinorum).2 About 227 two more praetors were added to administer the recently acquired provinces of Sicily and Achaia. The conquest of Spain occasioned the appointment of two more in 197, of whom one governed Hither and the other Further Spain. The number of praetors, thus augmented to six, remained stationary till Sulla's time (82). But in the interval their duties vastly multiplied. On the one hand, five new provinces were added to the Roman dominions—Macedonia and Asia in 146, Africa in the same year, Asia in 134, Gallia Narbonensis in 118, Cilicia probably in 102. On the other hand, new and permanent jury courts (quaestiones perpetue) were instituted at Rome, over which the praetors were called on to preside. To meet this increase of business the tenure of office of the praetors and also of the consuls was practically prolonged from one to two years, with the distinction that in their second year of office they bore the title of"praetor praetorius and consul instead of praefectus and consul. The prolongation of office, together with the participation of the praetors in duties which properly fell to the praetors, formed the basis of Sulla's arrangements. He increased the number of the praetors from six to eight, and ordained that henceforward all the eight should in their first year administer justice at Rome and in their second should as praefectors undertake the government of provinces. The courts over which the praetors presided, in addition to those of the city praetor and the foreign praetor, dealt with the following offenses: oppression of the provincials by governors (repudium, bribery (ambitus),(C.); treason (malitia), murder (de scorte et veneficiis), and probably forgery (falsi)). A tenth province

1 Some writers, following Livy vi. 42, assert that at first the praetorship was open to patricians only, but Mommsen (Rom. Staatsrecht ii. 195 [204]) shows that this is probably a mistake. The election of a plebeian to the office for the first time in 337 is not necessarily opposed to the notion of the election, but there appears to have been no legal obstacle to it. 2 His official title in republican times was Praetor qui inter peregrinos jus dicit, under the empire Praetor qui inter cives peregrinos jus dicit, until the time of Vespasian, when the abbreviated title praetor peregrinorum came into use.
PRAETORIANS

(Gallia cisalpina) was added to the previous nine, and thus the number of judicial and provincial departments corresponded to the annual number of praetors, propraetors and proconsuls. The proportion, however, was not long maintained: new provinces were added to the empire—Bithynia in 74, Cyrene about the same time, Crete in 67, Syria in 64—and one or more new law courts were instituted. To keep pace with the increase of duties Julius Caesar increased the number of praetors successively to ten, fourteen and sixteen; after his time the number varied from eight to eighteen.

The praetors were elected, like the consuls, by the people assembled in the comitia centuriata and with the same formalities.1 They regularly held office for a year; only in the transition period between the republic and the empire was their tenure of office sometimes limited to a few months.2 The insignia of the praetor were those common to the higher Roman magistrates—the purple-edged robe (toga praetexta) and the ivory chair (sella curulis); in Rome he was attended by two lictors, in the provinces by six. The praetors elect cast lots to determine the department which each of them should administer—perhaps an essential part of his civil jurisdiction, and as such was a signal of that new dignity which the praetor acquired over the transfer of the decisions of small cases to the praetorials in the absence of the consuls. But since in the early years of the consular rule in Rome it is probable that a considerable share of religious business devolved on the city praetor; this was certainly the case with the Festival of the Cross-roads (compitalia), and he directed the games in honour of Apollo from their institution in 212. Augustus in 22 placed the direction of all the popular festivals in the hands of the praetors, and it is not without significance that the praetors continued thus to minister to the pleasures of the Roman mob for centuries after they had ceased almost entirely to transact the business of the state. (For the praetor as provincial governor see PROVINCE.)

A full account of the praetorship will be found in Mommsen, Römisches Staatsrecht (1887), vol. ii. and P. Willems, Le Droit public romain (1883); T. M. Taylor's Constitutional and Political History of Rome (1899) will also be found useful. There is a monograph by L. Labatut, Histoire de la prétére (1868).

PRAETORIANS. In the early Roman republic, praetor (praetor) meant commander of the army; in the later republic praetor and propraetor were the usual titles for the provincial governors with military powers. Accordingly, the general's quarters in a camp came to be called praetorium,4 and one of the gates porta praetoria, and the general's bodyguard cohors praetoria, or, if large enough to include several cohorts, cohors praetoriae. Under the empire the nomenclature continued with some changes. In particular cohors praetoriae now designated the imperial bodyguard. This, as founded by Augustus, consisted of nine cohorts, each 1000 strong, some part of which was always with the emperor, whether in Rome or elsewhere. In A.D. 23 his successor Tiberius concentrated this force on the south edge of Rome in fortified barracks: hence one cohort in turn, clad in civilian garb, was sent to the emperor's house on the Palatine, and large detachments could be despatched to foreign wars. The men were recruited voluntarily, in Italy or in Italianized districts, and enjoyed better pay and shorter service than the regular army: they were under praefecti praetorio (usually two; later, sometimes three, rarely only one), who during most of the empire might not be senators. This force was the only body of troops in Rome (save a few cohortes urbanae, a fire brigade, and some non-Roman personal guards of the emperor), or, indeed, anywhere near the capital. Accordingly it could make no effective use of its powers in crises—at the accession of Claudius in A.D. 41, in 55–60, the second century. But its normal influence was less than is often asserted. Moreover, its prefects, since they were two and liable to be diuanted, and since they could not be senators, neither combined with the

1 [The age for the office was forty under the republic, thirty under the empire.]
2 [They took the place of the quaestors; this arrangement continued till the time of Claudius.]
3 [The fiscal praetor (praetor fiscalis) was appointed by Nero to hear claims preferred against the imperial fiscus.]
4 [Marquardt conjectures with much probability that when Caracalla extended the Roman franchise to the whole empire he at the same time abolished the foreign praetorship.]
5 [In permanent forts and fortresses, praetorium probably denoted strictly a residence: the official headquarters building (though commonly styled praetorium by moderns) was the principia. On the other hand praetorium could denote any lord's residence, even on a civilian's estate.]
PRAETORIUS—PRAGMATISM

senators to restore an oligarchy nor themselves aspired as pretenders to the throne. These prefects were at first soldiers, but later mostly lawyers who relieved the emperors of various civil and criminal jurisdiction. In the second century the praetorian cohorts became ten in number, and at the end of it Septimius Severus reorganized them so that they consisted practically of barbarian soldiers and held constant conflict with the people of Rome. At the end of the third century the praefecti praetorio were reconstituted as four officers, each ruling one quarter of the now divided empire. In 312 the Praetorian Guard was suppressed by Constantine. Their barracks at Rome covering a rectangle of 39 acres (1210 by 1410 ft.), were included by Aurelian in the walls of Rome, and three sides of the enceinte can still be seen near the Porta Pia, with brickwork as old as Tiberius: the interior (now barracks for the Italian army) is archaeologically less interesting.

Both speaking into existence, or even to understand the description left us by other less careful writers.

PRAEUTUTII (also called Praeuterii), a tribe of ancient Italy inhabiting the south of Picenum. Their territory lay between the rivers Vomanum and Tessinnus (Pliny iii. § 110), and therefore included Castrum Novum, Interamnia and the Truentus, as well as probably the original of Hadria. From this name was derived the mediæval form Aprüfum (quoted by Kiepert in his Alte Geographie), and hence the modern Abruzzo (more commonly in the plural gli Abruzzi), denoting the whole central mountain land of Italy. We have no evidence, except their name, and that throws no light on their language for separating them from the other inhabitants of Picenum (q.v.).

(R. S. C.)

PRAGMATIC SANCTION (Lat. pragmatica sanctio, from the Gr. πράγμα, business), originally a term of the later Roman law. It is found in the Theodosian and Justinian codes, together with such variants as a pragmaticum, pragmatica fuiusco, command; annotatio, an imperial rescript; constitutio, a regulation;

and pragmaticum rescriptum. It was a decision of the state dealing with some interest greater than a question in dispute between private persons, and was given for some community (universitas hominum) and for a public cause. In more recent times it was adopted by those countries which followed the Roman law, and in particular by despotically governed countries where the rulers had a natural tendency to approve of the maxims and to adopt the thought of the emperor. A pragmatic sanction, as the term was used by them, was an expression of the will of the sovereign or “the prince,” defining the limits of his own power, or regulating the succession. Justinian regulated the government of Italy after it had been reconquered from the Ostrogoths by pragmatic sanctions. In after ages the king of France, Charles VII., imposed limits on the claims of the popes to exercise jurisdiction in his dominions by the pragmatic sanction of Bourges in 1438. The emperor Charles VI. settled the law of succession for the dominions of the house of Habsburg by pragmatic sanction first published on the 19th of April 1713, and thereby prepared the way for the great war which ensued upon his death. Philip V., the first of the Bourbon kings of Spain, introduced the Salic law by a pragmatic sanction, and his descendant, Ferdinand VII., revoked it by another. The term was not used in England even for such things as the will by which Henry VIII. regulated the succession to the throne, which would have been a pragmatic sanction in a country of the Roman law. The term and the thing signified by it have become obsolete owing to the spread of constitutional government in modern Europe.

PRAGMATISM, in philosophy, etymologically a theory or method of dealing with real things (Gr. πράγματα: cf. πραγματικός, versed in affairs). “Pragmatic,” as here employed is not used in the common colloquial sense of “pragmatical,” i.e. “fussy and positive,” nor in the historical sense, as in “Pragmatic Sanction,” of relating to affairs of state, but in the sense of practical or efficient. Pragmatism, as a general philosophic doctrine or mental attitude, can only be understood as part of a reaction against the intellectualistic speculation which has characterized most of modern metaphysics. It arises from a general awakening to the fact that the growth of our psychological and biological knowledge must profoundly transform the traditional epistemology. It follows that “pragmatic” lines of thought may originate from a multiplicity of considerations and in a variety of contexts. These, however, may be conveniently classified under four main heads—psychological, logical, ethical and religious—and the history of the subject shows that all these have contributed to the development of pragmatism.

1. Psychologically, pragmatism starts from the efficacy and all-pervasiveness of mental activity, and points out that interest, attention, selection, purpose, bias, desire, emotion, satisfaction, &c., colour and control all our cognitive processes. It insists that all thought is personal and purposive and that “pure” thought is a figment. A judgment which is not prompted by motives and inspired by interest, which has not for its aim the satisfaction of a cognitive purpose, is psychologically impossible, and it is, therefore, mistaken to construct a logic which abstracts from all these facts. Nor is the presence of such non-intellectual factors in thinking necessarily deleterious: at any rate they are ineradicable. Truths are always on one side matters of belief, and beliefs are ultimately rules for action. The whole functioning of our mental apparatus is directed upon yielding the right response to the stimuli of the environment, and is valuable if and in so far as it does this. The “psychologism” thus introduced into logic amounts to a systematic protest against the notion of a dehumanized thought and the study of logic in abstraction from actual psychic process.

2. In its logical aspect pragmatism originates in a criticism of fundamental conceptions like “truth,” “error,” “fact”

* The New English Dictionary quotes for nine distinct senses of the word, of which the philosphic is the eighth. The seven earlier ones are all more or less obsolete, and their very number shows that the meaning of the word was very vague.
and "reality," the current accounts of which it finds untenable or meaningless. "Truth," for example, cannot be defined as the agreement or correspondence of thought with "reality," for how can thought determine whether it correctly "copies" what transcends it? Nor can our truth be a copy of a transcendent and absolute truth (Dewey). If it be asked, therefore, what such phrases mean, it is found that their meaning is really defined by their use. The real difference between two conceptions lies in their application, in the different consequences for the purposes of life which their acceptance carries. When no such "practical" difference can be found, conceptions are identical; when they will not "work," i.e. when they thwart the purpose which demanded them, they are false; when they are inapplicable they are meaningless (A. Sidgwick). Hence the "principle of Peirce" may be formulated as being that "every truth has practical consequences, and these are the test of its truth." It is clear that this (i) implicitly considers truth as a value, and so connects it with the conception of good, and (2) openly raises the question—What is truth, and how is it to be distinguished from error? This accordingly becomes the central problem of pragmatism. This same issue also arises independently out of the breakdown or rationalistic theories of knowledge (F. H. Bradley, H. H. Joachim). Logical analysis, after assuming that truth is independent and not of our making, has to confess that all logical operations involve an apparently arbitrary interference with their data (Bradley). Again, it assumes an ideal of truth which turns out to be humanly unattainable and incompatible with the existence of error, and an ideal of science which no human science can be conceived as attaining. The obvious way of avoiding the scepticism into which rationalism is thus driven is to revise the assumptions about the nature and postulates of truth which lead to it.

3. The ethical affinities of pragmatism spring from the perception that all knowing is referred to a purpose. This at once renders it "useful," i.e. a means to an end or "good." Completely "useless" knowledge becomes impossible, though the use of knowledge may still vary greatly in character, in directness, and in the extent and force of their appeal to different minds. This relation to a "good" must not, however, be construed as a doctrine of ethics in the narrower sense; nor is its "utilitarianism," to be confused with the hedonism of the British associationists. "Useful" may mean "practical," or "merely," or "for the sake of," or "for the end," and the "good" which the "true" claims must be understood as cognitive. But cognitive "good" and moral "good" are brought into close connexion, as species of telelogical "good" and contributory to "the Good." Thus only the generic, not the specific, difference between them is abolished. The "true" becomes a sort of "value," like the beautiful and the (moral) good. Moreover, since the "real" is the object of the "true," and can be distinguished from the "unreal" only by developing superior value in the process of cognition which arrives at it, the notions of reality and "fact" also turn out to be disguised forms of value. Thus the dualism between judgments of fact and judgments of value disappears: whatever "facts" we recognize are seen to be relative to the complex of human purposes to which they are revealed. It should further be noted that pragmatism conceives "practice" very widely: it includes everything related to the control of experience. The dualism, therefore, between "practice" and "theory" also vanishes; a "theory" unrelated to practice (however indirectly) is simply an illusion. Lastly it may be pointed out that, as asserting the efficacy of thought and the reality of choice, pragmatism involves a real, though difficult, conception of the course of events.

4. Pragmatism has very distinctly a religious coloration in religion, because it explains, and to some extent justifies, the faith-attitude or will to believe, and those who study the psychology of religion cannot but be impressed with the pragmatic nature of this attitude. If the whole of a man's personality goes to the making of the truth he accepts, it is clear that his beliefs are not matters of "pure reason," and that his passionate and volitional nature must contribute to them and cannot validly be excluded. His religion also is ultimately a vital attitude which rests on his interests and on his choices between alternatives which are real for him. It is not however asserted that his mere willing to believe is a proof of the truth of what he wishes to believe, any more than a will to disbelieve justifies disbelief. His will to believe merely recognizes that choice is necessary and implies risk, and puts him in a position to obtain verification (or disproof). The pragmatic claim for religion, therefore, is that, to those who will take the first step and will to believe an encouraging amount of the appropriate verifications accrues. It is further pointed out that this procedure is quite consonant with the practice of science with regard to its axioms. Originally these are always postulates which have to be assumed before they can be proved, and thus in a way "make" the evidence which confirms them. Scientific and religious verification therefore, though superficially distinct, are alike in kind. The pragmatic doctrine of truth, which it is now possible to outline, results from a convergence of the above lines of argument. Because truth is a value and vitally valuable, and all meaning depends on its context and its relation to us, there cannot be any abstract "absolute" truth disconnected from all human purposes. Because all truth is primarily a claim which may turn out to be false, it has to be tested. To test it is to try to distinguish between truth and falsity, and to answer the question—What renders the claim of a judgment to be true, really true? Now such testing, though it varies greatly in different departments of knowledge, is always effected by the consequences to which the claim leads when acted on. Only if they are "good" is the claim validated and the reasoning judged to be "right": only if they are tested does the theory of truth become intelligible and that of error explicable. If, therefore, a logic fails to employ the pragmatic test, it is doomed to remain purely formal, and the possibility of applying its doctrines to actual knowing, and their real validity, remain in doubt. By applying the pragmatic test on the other hand, it is possible to describe how truths are developed and errors corrected, and how in general old truths are adjusted to new situations. This "making of truth" is conceived as making for greater satisfaction and greater control of experience. It renders the truth of any time relative to the knowledge of the time, and precludes the notion of any rigid, static or incorrigible truth. Thus truth is continually being developed and re-made. If the notion of truth seems to be such that our cognitive purposes would have been false if we believed that they were by the truth we had at the time, it is antedated and said to have been "true all along." If an old truth is improved upon, it is revalued as "false." To this double process there is no actual end, but ideally an "absolute" truth (or system of truths) would be a truth which would be adequate to every purpose.

Extensions of pragmatism in a variety of directions readily suggest themselves, and indeed only the doctrine of truth in the above sketch can be treated as strictly indispensable. If however the logical method of pragmatism is critically applied to all the sciences, many doctrines will be cut out which have little or no "pragmatic value." This all-round application of the pragmatic method has received the name of "humanism." It expressly refers itself to the maxim of Protagoras that "man is the measure of all things," and is best conceived as a protest against the assumption that logic can treat thought in abstraction from its psychological context and the personality of the knower, i.e. that knowledge can be dehumanized. To arbitrary and unverifiable metaphysical speculation, and to forms of "absolutism" which have lost touch with human interests, this humanism is particularly destructive. It emphasizes the personal aspect of all knowing and its contribution to the "making of reality" which necessarily accompanies the making of truth. But it also goes on to raise the question whether the making of reality for our knowledge does not, in view of the essentially practical nature of knowledge, imply also a real making of reality by us, and so throw light upon the whole genesis of reality. In this direction pragmatism may ultimately lead to a number of metaphysics.
each of which will represent a personal guess at a final synthesis of experience, while remaining essentially undogmatic and improbable. The great variety and impermanence of meta-physical systems in the past thus find their explanation in that they were all along what they are now recognized as being, viz., personal efflorescences provoked by a totality of experiences which differed in each case.

As regards the history and bibliography of pragmatism, the term was first invented by C. S. Peirce in discussions with William James at Harvard University, and its meaning was expounded by him in an article on "How to make our Ideas clear" in the Popular Science Monthly (1878), where it was referred to by James in his Will to Believe (1896, p. 124, in a paper first published in 1881). The validity of the argument from common sense was attacked by Schiller in 1903 when he asserted a proposition of A. J. Balfour's Foundations of Belief by A. Seth Pringle-Pattison in his Man's Place in Cosmos (1897, p. 307). But the word "pragmatism" itself first occurs in print in 1898, in James's pamphlet on Theoretical Conceptions and Practical Results, and again in his Varieties of Religious Experience (1902, p. 444). It was rapidly taken up, first by W. Caldwell in Mind (1900, new series, No. 36), and by F. C. S. Schiller in Personal Idealism (1902). James himself at first developed mainly the psychological and ethical aspects of the doctrine in his epoch-making Principles of Psychology (1890) and his Will to Believe. The application to logic, therefore, was mainly made by his followers, John Dewey and his pupils, in the Chicago Logical Essays (1901), especially in his Studies in Logical Theory (1903), where, however, the term is used "instrumentalism," and by F. C. S. Schiller, in "Axioms as Postulates" (in Personal Idealism, 1902), in his "Pragmatism as a Logical Theory of Meaning" (1908) and The Meaning of Truth (1900). H. B. Wadwen's "The Pragmatics of Pragmatism" (1910) is a popular sketch. Alfred Sidgwick's logical writings, especially his Distinction (1892) and The Use of Words in Argument (1901), represent an independent development. For the religious applications see G. Tyrell (Lex orandi, 1903, Lex credendi, 1906). Among critical writers on the pragmatist movement see H. E. Smith, Modern Philosophy (1903), and H. V. Knox (Mind, new series, No. 54). There is already a large controversial literature in the philosophic journals, and two critical works appeared in 1906: J. B. Pratt, What is Pragmatism (1906); and Schiller's Pragmatism (1914), and again in the English-writing world, identical or kindred tendencies are represented in France by Leroy, Poincaré, Bergson, Millhaud, Blondel, Dubem, Wilbois, Pradines; in Germany by Mach, Ostwald, Simmel, Jerusalem, Goldschéidt, Jacoby; in Italy by Facetti, Froszolini, Vallat, Troiano. In addition there are numbers of partial pragmatists, e.g., G. Santayana (The Life of Reason, 1905). Various anticipations of pragmatism in the history of philosophy are noted in Schiller's Plato or Protagoras (1908).

PRAGUE (Ger. Prag; Bohemian Praha), the ancient capital of the Bohemian kingdom, residence of an archbishop and an imperial governor, and the meeting-place of the Bohemian Diet, was the political and religious centre of the country, and it is difficult to say whether it have not yet been incorporated with it, was 460,849 in 1906. Somewhat under a fifth of the population are Germans, the rest belong to the Bohemian (Czech) nationality. Prague is situated on both banks of the river Vitava (Ger. Moldau) in 50° 2' N., 14° 25' E., 150 m. N.W. of Vienna and 75 S.S.E. of Dresden. The city is divided into eight districts, which are numbered thus: I. Staré mesto (the old town), II. Nové mesto (the new town); III. Malá strana (the small side "quarter"); IV. Hradčany; V. Josefské město (Joseph's, formerly the Jewish, town); VI. Vyšehrad; VII. Holešovice-Jirava; VIII. the suburbs Karlin (Ger. Karlovy), Vinohrady and Smíchov are not yet incorporated with the city. Prague was by its geographical situation naturally destined to become the capital of Bohemia, as it lies in the centre of the country. The origin of Prague goes back to a very early date, though, as is the case with most very ancient cities, the tales connected with its origin are not doubt legendary. The earliest inhabited spot within the precincts of the present city was the hill named Vyšehrad (higher castle, acropolis) on the right bank of the Vitava. Here the semi-mythical prince Krok, his daughter Libusa, and her husband the peasant Prýmysl are stated to have resided. To Libusa is attributed also the foundation of a settlement on the opposite bank of the Vitava on the Hradčany hill. The ancient Bohemian chronicler Cosmas of Prague gives a very picturesque account of this semi-mythical occurrence.

It is probable that at an early period buildings sprang up in the environs of the present Staré město and Malá strana that are situated nearest to the banks of the river. These banks were from a very remote period connected by a bridge. This bridge was probably situated very near the spot where Charles IV. afterwards built the famed "bridge of Prague." It is probable that independently of the Hradčany and Vyšehrad settlements a certain number of buildings existed as early as 993 on the site of the present Poříč street (near the station of the state railway). The city continued to increase, and during the reign of King Vratislav (1061-1092) many Germans were attracted to Prague.

In 1235 King Venceslaus I. surrounded the old town—that is to say, the buildings on the right bank of the Vitava—with a wall. The gate was guarded by a bridge. The Vyšehrad, the residence of the Dukes, followed the line of the present Elisabeth Street, the Příkop or Graben—which therefrom derives its name, signifying ditch or "trench"—and then that of the Ovocna and Ferdinanda Streets. The Jewish quarter was included in the fortifications, but it was divided by gates and a wall from the old town. King Ottakar II. also contributed greatly to the enlargement of Prague. The still extant fortified towers of the Hradčany belong to his reign. The sovereign, however, to whom Prague is most indebted is the emperor Charles IV. (Charles VI., as king of Bohemia). He has rightly been called the second founder of Prague. He founded schools, and introduced a feudal system which reached the Continent. It immediately became famous all over Europe and students flocked to it from all countries. The town soon became too small, and it is probably in consequence of this that Charles determined to found the "new town." This, which includes the greater part of the modern city, was surrounded by walls, which starting from the foot of the Vyšehrad included the small already-existing settlement of Poříč and then adjoined the borders of the old town from the beginning of the present Příkop Street up to the river. During the Hussite wars Prague suffered greatly. The two of the greatest battles of the Hussite wars, that of the Zizkov and that of the Vyšehrad (both 1420), were fought on the outskirts of Prague, and after the last-named battle the ancient Vyšehrad castle was entirely destroyed. The Bohemian nobles in alliance with the citizens of the old town attacked and conquered the new town, which for a time lost its privileges and became subject to the old town. Prague gradually recovered during the reign of King George of Poděbrad, and became yet more prosperous during that of King Vladislav.

During the reign of Ferdinand I. of Habsburg (1526-1564) Prague played a considerable part in the opposition to that prince caused by Bohemia by his endeavour to reduce both the political and the religious liberties of the university, one of the oldest on the Continent. It was in Prague that the Thirty Years' War broke out. On the 23rd of May 1618 the Protestant nobles of Bohemia threw from the windows of the council chamber of the Hradčany palace two of the Imperial councillors who were accused of having influenced in a manner unfavourable to the Bohemians the emperor Matthias, who was also king of Bohemia. War broke out and continued until 1620; Matthias was succeeded by Ferdinand. In the same year the Bohemians
In the years of peace that followed, the development of Prague was constant and vast. The removal of the fortifications greatly assisted this development. The communities of Vyšehrad (1863), Holesovic-Bubna (1884) and Liběch (1901) were consecutively included in the city. Occasional riots, such as in 1897, when the Bohemians were exasperated by the action of the government, which restricted the use of the national language in the law courts; and in 1896 when the leaders demanded an extension of the suffrage, have not interfered with the increasing prosperity of the city, and their importance has been greatly exaggerated.

Though numerous ancient monuments at Prague have been destroyed in consequence of intestine strife and foreign warfare, the city still contains many of great value and may be considered one of the most interesting of European cities. The situation of the town has also at all periods been greatly admired. The centre of the old town and indeed of the entire community of Prague is the town hall (staroměstské radnice), which is surrounded by the marketplace, the scene of great patriotic demonstrations in 1862. The buildings of the town hall date from various periods. Its oldest parts are the tower and the chapel of St Lawrence, built in 1381. The adjoining ancient council chamber dates from 1340. The state rooms in the building are now used for the meetings of the town council is decorated by two paintings of the Bohemian artist Wenceslaus Brouk, which were painted before the Peace of St. Germain. The election of George of Poděbrad as king of Bohemia was celebrated by the building of the market-place opposite the town hall is situated the ancient Týn church, memorable as having been the religious centre of the Hussite movement. A well-preserved gate tower, which was protected with the town walls in 1725, has remained as an isolated fragment of the wall. An ancient gate, now held as representing the ladder pointing upward to a representation of the chalice, the emblem of the Hussite Church. Both statue and chalice were removed by the Jesuits in 1623. In the interior of the town hall the great state rooms of the Renaissance period are much admired. The Church of St Martin in the Wall, is said to be the very pulpit from which the Hussite archbishop John of Rokyten preached. In earlier days the Church reformers Míček and Hus also preached here. Close to the town hall is the Joseph-Sadá, the ancient ghetto of Prague. The synagogues, one of the oldest in Europe, and the adjoining cemetery—part of which has unfortunately been destroyed in the course of the modern sanitary improvement of this part of Prague—has great historical interest. The university founded by Charles IV. in 1348 played a great part in the history of Bohemia during the Hussite wars. The lecture-rooms and other institutions connected with the two universitities of Prague and Hradčany are a memorial of the great men who have been connected with either or both universities. The German one continued to exist—are now housed in two vast buildings known as the Carolinum and the Clementinum. The Carolinum, first built about the year 1383 but frequently altered, restored, and burned, now houses the library of the University of Prague, and any other building at Prague. It was the scene of many religious discussions, and it was here also that the Bohemian nobles met before the uprising of 1618. The large part of the lecture-rooms, the library and the hall of the University of Prague is on the island of Hradčany. This building was formerly a college of the Jesuits, who established themselves in Prague in 1556 and erected these extensive buildings at various periods between 1578 and 1715. The Celestial ulice, which leads from the town hall to the limits of the old town contains at its extremity the so-called powder tower (prašná brána). It occupies the spot where one of the old town gates was situated, and was built by King Vladislaw in that elaborate style of architecture which is known as the style of Vladislav. The building was very skilfully restored in 1880-1883. The powder tower stands at the corner of the Hradčany (in Ger. Graben) which with its continuations, the Modern (Nový) and the Ferdinándová, forms the most modern part of modern Prague. At the extreme end of the Ferdinánduvu ulice is the modern Bohemian national theatre.

The "new town" of Prague, though not equal in interest to the "old town," is also well worth notice. At the extremity of the place of Wenceslaus (Václavské Náměstí) is situated the handsome building that contains the collections and library of the Bohemian Museum. The museum was founded by Charles Louis of Austria on the 18th of May 1891. The numerous important churches in the "new town" the Karlov deserves special mention. It was built by Charles IV. in 1350 in the Gothic style, but was restored in the 18th century. The monastery that formerly adjoined this church has been suppressed and its buildings are now used as a hospital. Near the Karlov church is the Karlovo Náměstí (place of Charles), in which is situated the former town hall of the city, now known as the "new town hall" from the fact that it was thrown at the beginning of the Hussite wars. The Vyšehrad, now a part of Prague, adjoins the "new town." It has preserved but slight traces of its ancient splendour. It contains, however, the
PRAIRIE, THE—PRAIRIE DU CHIEN

Romanesque chapel of St Martin, the Church of SS Peter and Paul, and the adjoining cemetery where many of the leaders of the Bohemian national movement are buried.

The districts of Prague situated on the left bank of the Vltava are called the prairie, that is, the watered lands of the city by bridges of which the oldest is the Karlův most (bridge of Charles). The present structure was begun by Charles IV. in 1357, but in consequence of frequent storms and inundations it was only completed in 1393. The present bridge is of a later date.

At the entrance of the bridge in the centre of the Malá strana is the monument to Radetzky, erected in 1858 out of captured Piedmontese cannon. Near here are the palaces of the governors of Bohemia and that in which the last Diet of the Empire was held. At the entrance of the Malá strana is the extensive Strahov monastery, from the terraces of which the finest view of the city can be obtained. Prominent among the notable libraries in Prague, and a small picture gallery. The church of the monastery contains the tomb of the famous General Pappenheim.

In the Malá strana and the adjoining Hradčany are situated the winter residences of the wealthiest Bohemian nobility. Of the many palaces, the Waldstein, Schwarzenberg—formerly Rosenberg—palaces, the two palaces of the counts Thun and that of Prince Lobkowitz are the most interesting. On the summit of the Hradčany is the standard work of the ancient kings of Bohemia, which also contains the hall where the estates of Bohemia formerly met. During the Hussite wars most of the buildings on the Hradčany hill were destroyed, and a large part of the castle still known as the halls of Vídu was burnt in the beginning of 1680; the handsome halls known as the Spanish and German halls were erected by Ferdinand I., and additions were made by other sovereigns also. The grandiose façade and the ruined and partly new buildings of the castle are an imposing work of art, which was begun by the prince of Austria, and it is also occupied by the emperor of Austria during his visits to Prague. Adjoining the Hradčany palace is the famed Cathedral of St Vitus, where the kings of Bohemia were crowned, and where the old court treasury is kept. Not far from Prague, and the present building was begun by Charles IV., and has as yet remained unfinished. The cathedral contains the chapel of St Wenceslaus, where the insignia of the Bohemian kings are preserved, the tomb of St John of Nepomuk, and a monument to the Bohemian sovereigns who are buried here, the work of Colin of Malines. On the slope of the Hradčany hill are the ancient towers named the Mlužka, Daliborka, the white tower and the little black tower, which once protected the fortifications erected by Ottakar II. (1253–1278).

The suburbs of Prague contain few objects of interest, but they are the centres of the rapidly increasing trade and industry of Prague.

See Count Lützow, Prague, in "Mediaeval Towns" (Series, London, 1902); Tomek, Děje Města Prahy (History of the town of Prague), which the author only continued up to the year 1608.

PRAUGERIE, THE, a revolt of the French nobility against King Charles VII. in 1440. It was so named because a similar rising had recently taken place in Prague, Bohemia, at that time closely associated with France through the house of Luxemburg, kings of Bohemia, and it was caused by the reforms of Charles VII. at the close of the Hundred Years' War, by which the king increased the taxes and increased the duties of his officers, and especially the ordinances passed by the estates of Languedoc at Orleans in 1439, which not only gave the king an aid of 100,000 francs (an act which was later used by the king as though it were a perpetual grant and so freed him from that parliamentary control of the purse so important in England), but demanded as well royal nominations to offices in the army, marked a gain in the royal prerogative which the nobility resolved to challenge. The main instigator was Charles L, duke of Bourbon, who three years before had attempted a similar rising, and had been forced to ask pardon of the king. He and his bastard brother, Alexander, were joined by the former favourite, Georges de la Trémoille, John V., duke of Brittany, who allied himself with the English, the duke of Alençon, the count of Vendôme, and captains of mercenaries like Antoine de Chabannes, or Jean de la Roche. The duke of Bourbon gained over to their side the dauphin Louis—afterwards Louis XI.—then sixteen years old, and proposed to set aside the king in his favour, making him regent. Louis was readily induced to rebel; but the country was saved from a serious civil war by the energy of the king's officers and the solid loyalty of his "good cities." The constable de Bourbon defeated the dauphin and Alexander, and the old battleground with Georges de la Trémoille, and in two months he had subdued the country. The royal artillery battered down the feudal strongholds. The dauphin and the duke of Alençon failed to bring about any sympathetic rising in Auvergne, and the Praguerie was over, except for some final pillaging and plundering in Saintonge and Poitou, which the royal army failed to prevent. Charles VII. then attempted to ensure the loyalty of the duke of Bourbon by the gift of a large pension, forgave all the rebellious gentry, and installed his son in Dauphiné (see Louis XI.). The ordinance of Orleans was enforced.

PRAHRAN, a city of Bourke county, Victoria, Australia, 3½ m. by rail S.E. of Melbourne and suburban to it. Pop. (1901), 41,161. It is connected with Melbourne by cable tram over a fine iron girder bridge across the Yarra. Many of its streets are planted with trees and it has numerous handsome shops and houses. Prahran was proclaimed a city in 1879.

PRAIRIE (adopted from Fr. prairie, the prairie. Late Lat. praetoria, Lat. pratum, meadow), a level tract of grassy and treeless country, generally restricted to tracts so characterized in the central parts of North America. In the United States the prairies may be taken to extend from southern Michigan and western Ohio over Illinois (especially designated the Prairie State), Indiana, Missouri, Iowa, Wisconsin and Minnesota, and west of the Missouri to the foothills of the Rocky Mountains (see articles on the several states, and United States). In Canada they extend from the same mountains to a line somewhat to the east of Winnipeg. The word prairie is used in a large number of compounds referring to natural and other features, flora, fauna, &c., characteristic of the prairies. Examples are: prairie-chicken or prairie-hen, a name for the pinnated grouse (Guptidiona or Tympanurus cupido), also applied to Pedioecetes phasianellus, the sharp-tailed grouse; prairie-dog, a rodent of the squirrel family, genus Cynomys, a gregarious burrowing animal, and other names noticed below; prairie-schooner, a name for the covered wagons in which emigrants used to cross the plains; prairie-grass, &c.

PRAIRIE DU CHIEN, a city and the county-seat of Crawford county, Wisconsin, U.S.A., on the east bank of the Mississippi River about 3 m. above the mouth of the Big Black, north of Madison, Wis. (1890) 3,131; (1900) 3,272; (1905) 3,170; (1910) 3,149. It is served by the Chicago, Milwaukee & St Paul, and the Chicago, Burlington & Quincy railways. The city has a fine location, its natural attractiveness and mineral springs in the vicinity combining to make it a summer and health resort. It has an excellent artesian water-supply. Among its buildings are the Crawford county court-house, the city hospital and a sanatorium. It is the seat of St Mary's Academy (1872; R.C.) for young women, and the College of the Sacred Heart (1889; R.C.) for men. Among the manufactures are agricultural implements, flour, cheese, and flour. About 20 m. N. of Madison, W. W. of Madison, Pop. (1890) 3,131; (1900) 3,272; (1905) 3,170; (1910) 3,149. It is served by the Chicago, Milwaukee & St Paul, and the Chicago, Burlington & Quincy railways.
PRAIRIE-MARMOT—PRAKRIT

Territory made Prairie du Chien his temporary headquarters. During the Black Hawk War (1832) Zachary Taylor, then a lieutenant-colonel, was in command of Fort Crawford, and to him Black Hawk was entrusted after his capture. The Chicago, Milwaukee & St Paul railroad was completed to Prairie du Chien in 1857. The city was chartered in 1872.

PRAIRIE-MARMOT, a zoological emendation for the American name “prairie-dog,” applied to a small North American rodent allied to the squirrels and marmots, and technically known as *Cynomys ludovicianus* (see MARMOT). In a great degree prairie-marmots, of which there are several species in North America, ranging as far south as Mexico, are intermediate between marmots and soulikis (see SOULIK), having the cheek-pouches much smaller than in the latter, and the first front-toe, which is rudimentary in marmots and soulikis, well developed. The teeth are more complex than those of marmots, and the two series converge behind. In their slender build and small size, prairie-marmots are much more like soulikis than marmots. In habitats these rodents are very like marmots, the typical species inhabiting the open prairies, while the others are found in mountains. The prairie species (*C. ludovicianus*) makes a raised, funnel-shaped entrance to its burrow. All feed on the roots of grass; and when disturbed, like marmots, utter a whistling cry. Rattlesnakes, owls and weasels are commonly found in the burrows; but their presence makes it appear that the existence of a kind of “happy family” arrangements, the snakes, at any rate, preying on the young marmots. The hibernation of these rodents is only partial, and confined to seasons of intense cold. (See RODENTIA.)

PRAKRIT (*prakrita*, natural), a term applied to the vernacular languages of India as opposed to the literary Sanskrit (*sanskṛta*, purified). The place which the Prakrits occupy in regard to the Indo-European languages (q.v.), ancient and modern, is treated under that head. There were two main groups of ancient Indo-Aryan dialects, or Primary Prakrits, viz., the so-called Vedic or Eastern Prakrits, of which the well-known language is *Ayāvāśa*, and that of what is called the Western Prakrits. The language of the Western Prakrits bears not much resemblance to the language of the Vedas, and was crystallized in the shape of literary Sanskrit about 300 B.C. Beside it all the Primary Prakrits continued to develop under the usual laws of phonetics, and, as vernaculars, reached a secondary stage marked by a tendency to simplify harsh combinations of consonants and the broader diphthongs, the synthetic processes of declension and conjugation remaining as a whole unaltered. The process of development closely resembles that of old Italian from the Italic dialects of Latin times. It should be noted that although the literary dialect of the Midland became fixed, the vernacular of the same tract continued to develop in the Western Prakrits, but owing to the existence of a literary standard by its side its development was to a certain extent retarded, so that it was left somewhat behind by its fellows in the race.

The Secondary Prakrits, in their turn, received literary culture. In their earliest stage one of them became the sacred language of Buddhism, and under the name of Pali (q.v.) has been widely studied. In a still later stage several Secondary Prakrits became generally employed for a new literature, both sacred and profane. Not only were three of them used for the propagation of the Jaina religion (see JAINA), but they were also dealt with as vehicles for independent secular works, besides being largely employed in the Indian drama. In the last-named Brahmins, heroes and people of high rank spoke in Sanskrit, while the other characters expressed themselves in some Secondary Prakrit according to nationality or profession. This later stage of the Secondary Prakrits is known as the Prakrit *par excellence*, and forms the main subject of the present article. A still further stage of development will also be discussed, that of the *Abhābraṁa*, or “corrupt language.” The Prakrit *par excellence*, which will throughout the rest of this article be called simply “Prakrit,” underwent the common fate of all Indian literary languages. In its turn it was fixed by grammarians, and as a literary language ceased to grow, while as a vernacular it went on in its own course. From the point of view of grammarians this further development was looked upon as corruption, and its result hence received the name of *Apaḥbraṁa*. Again in their turn the *Apaḥbraṁas* received literary cultivation and a stereotyped form, while as vernaculars they went on into the stage of the Tertiary Prakrits and become the modern Indo-Aryan languages.

In the Prakrit stage of the Secondary Prakrits we see the same grouping as before—a Midland language, and the dialects of the Outer Band. The Prakrit of the Midland was known as Sauraseni, from Sūrāsena, the name of the country round Mathurā (Muttra). It was the language of the territories having the Gangetic Doab for their centre. To the west it probably extended as far as the modern Lahore and to the east as far as the confluence of the Jumna and the Ganges. Conquests carried the language much further afield, so that it occupied not only Rajputana, but also Gujarāt. As stated above, the development of Sauraseni was retarded by the influence of its great neighbour Sanskrit. Moreover, both being sprung from the same original—the Primary Prakrit of the Midland—its vocabulary, making allowances for phonetic changes, is the same as in that language.

The Prakrits of the Outer Band, all more closely connected with each other than any one of them was to Sauraseni, were Māgadhī, Ardhamāgadhī, Māhārāṣṭrī, and an unknown Prakrit called South-West Māgadhī. Māgadhī was spoken in the eastern part of the Gangetic plain. Its proper home was Māgadhā, the modern South Bihar, but it extended far beyond these limits at very early times. Judging from the modern vernaculars, its western limit must have been about the longitude of the city of Benares. Between it and Sauraseni (i.e. in the modern Oudh and the country to its south) lay Ardhamāgadhī or “half-Māgadhī.” Māhārāṣṭrī was the language of Māhārāṣṭrā, the great kingdom extending southwards from the river Nerbudda to the Kistna and sometimes including the southern part of the modern Bombay Presidency and Hyderabad. Its language therefore lay south of Sauraseni. West of Sauraseni, in the Western Punjab, there must have been another Prakrit of which we have no record, although we know a little about its later *Apaḥbraṁa* form. Here there were also speakers of Paścāti (see INDO-ARYAN LANGUAGES), and the local Prakrit, if we are to judge from the modern Tertiary vernacular, was a mixed form of speech. We have a detailed description of only one *Apaḥbraṁa*—the Nāgara—the *Apaḥbraṁa* of the Sauraseni spoken in the neighbourhood of Gujarāt, and therefore somewhat mixed with Māhārāṣṭrī. We may, however, conclude that there was an *Apaḥbraṁa* corresponding to each Prakrit, so that we have, in addition to Sauraseni, a Māgadhā, an Ardhamāgadhā and Māhārāṣṭrī, which were all to some extent derived from more than one local *Apaḥbraṁa*, of which we may mention Brāhmi, the ancient dialect of Sind. There were numerous Prakrit subdialects to which it is not necessary to refer.

Of all these Prakrits, Māhārāṣṭrī is that which is best known to us. It early obtained literary pre-eminence, and not only was the subject of long treatises by native grammarians, but became the language of lyric poetry and of the formal epic (kavya). Dramatic works have been written in it, and it was also the vehicle of many later scriptures of the Jaina religion. We also know a good deal about Ardhamāgadhī, in which the older Jaina writings were composed. With Māgadhā we have, unfortunately, only a partial acquaintance, derived from brief accounts by native grammarians and from short sentences scattered through the plays. We know something more about Sauraseni, for it is the usual prose dialect of the plays, and is also employed for the sacred writings of one of the Jaina sects.

The materials extant for the study of the Prakrit are either native grammars or else literary works written in accord with the rules laid down therein. Originally real vernaculars with tendencies towards certain phonetic changes, the dialects were taken in hand by grammatical systematizers, who pruned down what they thought was over-luxuriant growth, trained errant shoots in the way they thought
they ought to have gone, and too often generalized tendencies into universal rules. Subsequent writers followed these rules and not the living speech, even though they were writing in what was meant to be a vernacular. Moreover, at an early date, the Prakrits, qua literary languages, began to lose their characteristics as local forms of speech. A writer composed in Māhārāṣṭrī, not because it was his native language, but because it was the particular Prakrit employed for lyrics and in formal epics. In the same way, in dramatic literature, Saurāsēṇī and Māgadhī were put into the mouths of characters in particular walks in life, whatever the nationality of the dramatist might have been. There was thus a tendency for these literary forms of speech to be devitalized and, to some extent, to lose their dialectal character. The Prakrits, which, according to the rules of the grammarian and different forms were used by the writers of the different dialects of the most distant parts of India. On the other hand, although to a certain extent artificial, the literary Prakrits are all based on local vernaculars, a fact entirely borne out by a comparison with the modern Indian languages, which closely agree with them in their mutual points of difference. We now proceed to consider the general points in which the Prakrits differ from Sanskrit and from each other. The reader is thrstuated as familiar with the general outline of the article SANSKRIT.

Vocabulary.—The vocabulary of S. is to all intents and purposes the same as that of Skr. In the languages of the Outer Band there are numerous provincial words (dēṣā or dēṣāya), the originals of which belonged to Primary Prakrits rather than those of the Middle. In the Outer Band there is also a rich variety of grammatical forms, many of which are found in the Veda and not in classical Sanskrit and some (e.g., Pr. ā, Pali ṣā, Greek θ) which cannot be traced to any known Primary Prakrit form, but which must have existed in that stage and beyond it, back into Indo-European times.

The Prakrits have completely preserved their suffixes, which appear as pure vowels, and may each be either long or short. Aṭ and āṭ become either ṇ or ī and īr respectively. The vowel r becomes a, ī, or, under the influence of a neighbouring labial, u. Before two consonants an original long vowel becomes short, and i and u are (according to the grammarians) changed to e and o respectively. The last rule is an instance of grammarians' over-regularization, and is not universally true. Examples, Skr. mṛgā-, Pr. mṛgō-; Skr. sīndrā-, Pr. sīndrō-. Skr. πuṣṭaka-, Pr. poṭhō-. Conversely, a short vowel before two consonants is lengthened on one of them being elided. Thus, Skr. śvarā-, Pr. śvarō- or śvarā-, Skr. jhā-, Pr. jhō-. In Ap. the quantity of vowels is very loosely observed.

In all dialects n becomes p unless it is followed by a dental mute, but in Jaina works mn and initial n remain unchanged. Judging from modern vernaculars, the latter seems to have been the real state at an early date. But in Skr. n, j becomes y and r becomes l. Here also s and b become i, a peculiarity still preserved by the modern Bengali. Elsewhere i and s usually become i, but the change of a sibilant to h is not uncommon in the Outer Prakrits (even in Mg.), though rare in the more archaic S.

Initial 7 becomes j except in Mg., in which, on the contrary, j becomes y. Subject to the foregoing general rules, all other initial consonants usually remain unchanged. As regards medial singular consonants—

1. K, g, j, t, d and y are usually elided. As a hiatus is caused by the elision, a faintly sounded y (or in some cases v) is substituted for the elided consonant, though only written in Jaina MSS. and in some isolated forms, e.g., pāt, pitomā-ī, maya, mṛgō or mṛtō-.

The last example illustrates the extraordinary confusion which results from the strict application of this rule of elision of final consonants. Some examples of combinations, which have failed in the main object of a language—the connotation of distinct ideas by distinct sounds. To the present writer it seems impossible that such a language could ever have existed, and he is persuaded that this anomalous condition is an error of transcription which has been perpetuated by the grammarians of the S. and T. over-generalization. A rule has been made out of a tendency, and this tendency was evidently, first, to soften a hard letter, and then (but not necessarily) to elide it. We see this well illustrated by the elision of ś (see next point) and m in the Aṣāminic forms, but it is usually elided in the singular number in the Outer languages.

2. K, gh, th, dh, ph and bh similarly become k. Also, as above, S. and Mg. change th to dh. Th becomes dh, and ph may become bh. The other aspirates (ch, jh, gh), and also sometimes bh, remain unchanged. In Ap., as before, kk, th and ph are usually preserved in gh, dh and bh respectively.

3. T becomes 8, d becomes j (often written l), when doubled before a nasal, and beforehand or in the end of a word, becomes k. P and b usually become v. The Outer languages often cerebralize dental sounds and change t to l.

4. N, m, l and h remain unchanged. V disappears before a, but begins to be generalized. In Ap. m, n, and l become a nasalized by anusāsika; thus, Skr. bhrahama-; Ap. bhāvra-

Final consonants usually disappear altogether, except nasals, which become anusāsā. Thus, Skr. samantā, phalām, Pr. samantā, phalan.

The following rules will be found to include the great majority of the cases of the Prakrits of the Outer Band, and are a generalization of all changes from Primary to Secondary Prakrit, viz., the substitution, mainly by a process of assimilation, of a slurred for a distinct pronunciation.

In a Prakrit, a conjunct consonant cannot consist of more than two elements, and, except in Mg. and Ap., can only be a double consonant or a consonant preceded by a nasal, a consonant followed by r, or one of the following: gh, nh, mh, lb. The consonants r and h cannot be prolonged.

In Pr. the only conjuncts which can begin a word are gh, nh, mb, and lb. If any other conjunct consonant be initial, the first member of the Pr. form of it is dropped. Thus, in Pr. khaś, Skr. khaśā, Pr. khaśā. If we omit the initial preposition a- (Pr. a-), the kk becomes initial, and we have kama, not *kkama. Similarly, Skr. sthira- becomes Pr. thīra- *sthīra-

1. l, v and el are when they stand first or last in a compound, and the remaining letter is double, if it admits of doubling. Thus, Skr. ukā, Pr. ukā; Skr. pāka, Pr. pāka-. The same rule is followed according to Pr. for kā, which, as a preposition, is sometime, especially in Ap., retained even when initial. Thus, Skr. arka-, Pr. akka; Skr. priya-, Pr. pīā or (Ap.) pīā.

4. M, n and y are elided when standing last in a compound, and the compound letter, magadhi, is doubled. Thus, pramāṇa, Skr. pramāṇa, Pr. pramāṇa.

5. K, g, l, t, d, p, s, s and s are elided when standing first in a compound, and the remaining letter is doubled as before; thus, Skr. bhaktō, Pr. bhātō; Skr. shrāila-, Pr. shrāila- for *śhrāila-(śhrāīla-).

6. The above rules hold in the order given; that is to say, rule 3 holds in preference to rules 4, and 5, and rule 4 in preference to rule 6. Thus, in Skr. the preserved character becomes kk or kk, while in Ap. it becomes kk. Thus, in Skr. bhaktō becomes k; in Ap. bhātō becomes k, but the Pr. form is kk.

Special Rules for Mg.—In this form of Pr. there are several peculiar changes. Dy, ry, ry, all become ṭy; ṭy, ṭy, ṭy become ṭi; medial ṭh becomes ṭi; ṭi, ṭi, ṭi become ṭi; and ṭh, ṭh become ṭi.

Other changes also occur, besides dialectic variations of those given above.

Declension.—Pr. has preserved the three genders of Skr., but has lost the genitive declension. As a rule, the gender of a noun follows that of the Skr. original, though in AMg. there is already a tendency to substitute the masculine for the neuter, and in Ap. these two genders are frequently confused. The declension is also usually increased, and the number of cases is increased from seven to nine. In the formation of cases, the phonetic rules just given are fully applied, but there are also other deviations from the Skr. original. The consonantal stems which form an important part of Skr. declension are usually doubled, and, as a tendency to assimilate their declension to that of a-bases, corresponding to the first and second declensions in Latin. This tendency is strongly helped by the free use of plausitive suffixes ending in ā, which are added to the base without affecting its meaning. Of these the most common are -ka-, -dā-, and -ala-, -illa- or -uilla-. The first of these was also very common in Skr., but its use became much extended in Pr. In accordance with the general rule, the k is allowable to elision; thus, Skr. gṛha-ka, Pr. gṛha-ā-. It may even be doubled, as in Skr. bahū-, much, Pr. bahū-ā, for bahū-kā-kā-deh- (deh- is confined to Ap., and may be used alone or together with the suffix -deh-). These forms are in Skr. kā-ka-deh-. Pr. kāhō-še (kāhō-sē). Ilā- is most common in the Outer languages, and especially so in AMg. and M.; thus, Skr. purā-, M. par-ūlla.

All the Skr. cases are preserved except the dative, which has almost entirely disappeared. There remains, however, the singular number in the Outer languages. Everywhere the genitive can be employed in its place. Most of the case-forms are derived from Sanskrit according to the phonetic rules, but Ap. has a number of peculiar forms which cannot be referred to that language (e.g., the remarks above about -hi=θ). It also rarely distinguishes between the nominative and the accusative. As an example, we may give the commoner forms of the dative case in Ap. kḥhā-ūlla- (deh-). Ilā- is most common in the Outer languages, and especially so in AMg. and M.; thus, Skr. purā-, M. par-ūlla.

The Prakrit cases of the singular number resemble the above, differing only in the nominative and accusative singular and plural. Ap. has almost lost the neuter termination in the singular. Feminine a-stems are declined on the same lines, but the cases have run more into each other, the instrumental, genitive, and locative singular
being identical in form. Very similarly are declined the bases ending in other vowels. The few still ending in consonants and which have not become merged in the a-declension, present numerous apparent irregularities, due to the inevitable phonetic changes, which must be learned from the textbooks.

Singulär: 

Nom. putras
dat. putrā
dat. putrā
abl. putrā
gen. putrā
loc. putrā

Plural: 

Nom. putrā
dat. putrā
dat. putrā
dat. putrā
abl. putrā
gen. putrā
loc. putrā

Thus, M. puṣṭijī is or S. puṣṭijī, he being asked.

The following are therefore the only ten which are fully conjugated in Pr.: the present, the imperative, the future and the optative. Except in Ap, the personal terminations in general correspond to the Skr. ones, but in the other, which probably go back to unrecorded Primary Prakrits and have not as yet been explained. As an example we take the conjugation of the base puṣṭa-ask (Skr. puṣṭahā), in the present tense.

The imperative similarly follows the Skr. imperative. The S. second person singular is generally puṣṭa, while the Outer languages often have a form corresponding to puṣṭa, but the optative is generally formed by adding -ei- in the Outer languages and -eh- in S.; thus, S. puṣṭeṣā, others puṣṭeṣām, etc., may I ask. The Skr. future termination -eṣu- is represented by -ṣā or -ṣi-, but puṣṭeṣām or puṣṭeṣā is rare. 

PraKrit literature.—The great mass of PraKrit literature is devoted to the Jain religion, and so far as it is known, is described under the head of Jainas. Here it is sufficient to state that the oldest Jaina sūtras were in Ardhamāgadhī, while the non-canonical books of the Śvētāmbara sect were in a form of Māhārāṣṭra, and the canon of the Digambaras appears to have been in a form of Śaurasūṃa. Besides these religious works, Prakrit also appears in secular literature. In artificial lyric poetry it is pre-eminent. The Sanskrit work on grammar called Sphātrākṣikā, compiled at some time between the 3rd and 11th centuries A.D. by Hāla. The grace and poetry of this collection, in which art most happily succeeds in concealing art, has rarely been exceeded in literature of its kind. It has had numerous imitators, both in Sanskrit and in the modern vernaculars, the most famous of which is the Satsal of Bihārī Lāl (17th century A.D.). Hāla's work is important, not only on its own account, but also as showing the existence of a large Prakrit literature at the time when it was compiled. Most of this is now lost. There are some scholars (including the present writer) who believe that Sanskrit literature owes more than is generally admitted to works in the vernacular, that even the Māhārāṣṭra first took its form as a folk-e pic in an early Prakrit, and consequently translated into Sanskrit, in which language it was further manipulated, added to, and received its final shape.

In literary Prakrit we have two important specimens of formal
epic poetry—the Rāvaṇavaha or Sītubandha (attributed to Pravarasena, before A.D. 700), dealing with the subject of the Rāma-yāpa, and the Gātikāvya of Vākpati (7th–8th century A.D.), celebrating the conquest of Bengal by Yāsovarman, king of Kanauj. Reference must also be made to the Kumārapālā-carita, the title of the last eight cantos of the huge Devāyana Mahākavya of Hīmācandra (A.D. 1150). The whole work was written in the form of 108 plays of which the first 86 are in Sanskrit and Prakrit grammar, the Siddhā-hēmacandra. The last eight cantos are in Prakrit, and illustrate the rules of the corresponding portion of his work. Its heroine is Kumāra-pāla of Ahihvilāḍa. Dramatic literature has also an admired example in the Karpāramatā (“Camphor-cluster,” the name of the heroine) by Rāja-śekhara (A.D. 900), an amusing comedy of intrigue. An important source of our knowledge of Prakrit, and especially of dialectic Prakrit, is the Sanskrit drama. It has already been pointed out that in works of this class many of the characters speak in Prakrit, different dialects being employed for different purposes. Generally speaking, Sūtrasūri is employed for prose and Māhārāṣṭri (the language of lyric poetry) for the songs, but special characters also speak special dialects according to their supposed nationality or profession. In India there is nothing extraordinary in such a polyglot medley. It is paralleled by the conditions of any large house in Bengal at the present day, in which there are people from every part of India, each of whom speaks his own language and is understood by the others, though none of them attempts to speak what is not his mother tongue. The result is that in the Sanskrit drama we have a valuable reflection of the local dialects. It is somewhat distorted, for the authors wrote according to the rules laid down by technical handbooks, and the dialects which they employed were, in the case of the later writers, as dead as Sanskrit. But nevertheless, if not an absolutely true representation, it is founded on the truth, and it is almost our only source of information as to the condition of the Indian vernaculars in the first five centuries A.D. The drama which gives the best examples of these dialects is the Mrchchhatakā. For further particulars regarding the Sanskrit drama, reference should be made to the article SANSKRIT.

AUTHORITIES.—The father of Prakrit philology was Ch. Lassen, the author of the Institutiones linguae praeicatoriae (Bonn, 1837). This famous work, a wonderful product of the learning of the time, is now out of date, and has been definitely superseded by R. Fischel’s Geschichtliche Lexikon (Stuttgart, 1880). A valuable addition to the study of the language, the best work is H. Jacob’s Ausgewählte Erzählungen in Māhārāṣṭri zur Einführung in das Studium der Prakrit, Grammatik, Text, Wörterbuch (Leipzig, 1871). The most valuable of the native works is Cowell’s of Vararuci’s Prākṛt-prākāśa (London, 1868), R. Fischel’s of Hīmacandra (Halle, 1877, 1880) [see above], and E. Hultsch’s of Sūtrasūri’s Caritā (Berlin, 1875). For a classical Prakrit drama, see Fischel’s The Dirdhātexam of Hīmacandra (Bombay, 1880). For Apajharaṇa, in addition to his edition of Hīmacandra’s grammar, see the same author’s Materialien zur Kenntnis des Apajharaṇa (Berlin, 1902). For the mutual relationship of the various Prakrits, see S. Konow, “Māhārāṣṭri and Mārāṭhī,” in the Indian Antiquity, (1903), xxxii., 186 sqq. For Jaina Prakrit, see under JAINA AND JAINES. As regards the secular texts mentioned above the following are the best editions: A. Weber, Das Sākonatcatasham des Itala (Leipzig, 1883); another edition by Durgāprasad and Kāśīnāth Pāṇḍurang Parab under the title of The Gāthapataśatōtālā Sīvahana (Bombay, 1889) (a facsimile of the original Pāṇḍuranga-Prakrit manuscript in the Hoboken Public Library, New York); Fānag征abo or Sīvahana (Strasbourg, 1880–1883) [text and translation]; Sivadatta and Parab, The Sīvahana of Prasorasa (Bombay, 1895); Shākakār Pāṇḍurang Pāṇḍit, The Gātikāvya, a Historical Poem in Prakrit, by Vākpati (Bombay, 1887); Theme editor, The Karpāramatā (Bombay, 1900); Rājaghrada’s Karpāramatā, edited by S. Konow, translated by C. R. Lanman (Cambridge, Mass., 1901). The literature of the Sanskrit drama is given under SANSKRT. (G. A. GR.)

PRAM (Du. pram), the name of a flat-bottomed boat or barge used as a “lighter” for discharging and loading cargo in the ports of the Baltic and North Sea. The word, which is common in various forms to all the languages bordering on those seas, is originally Slavonic; its ultimate etymology connects it with the words found in all Indo-European languages which are to be traced to the root par-, to go through, travel; cf. “fear,” “ferry,” “far,” Gr. παρος, Lat. portare, carry, etc.

PRANTL, KARL VON (1820–1888), German philosopher, was born at Landsberg on the Lech on the 28th of January 1820, and died on the 14th of September 1888 at Oberstdorf. In 1843 he became doctor of philosophy at Munich Observatory, where he was made professor in 1859. He was also a member of the Academies of Berlin and Munich. Strongly in agreement with the Hegelian tradition, he defended and amplified it in Prinz, Philosophische Aufgabe der Philosophie (1859) and Verstehen und Beweisen (1877). In these works he emphasized the identity of the subjective and the objective for consciousness, and the fact that the perception of this unity is peculiar to man. He is more important, however, as a commentator and scholar, and made valuable contributions to the study of Aristotle. He published Aristoteles über die Farben (1849), Aristoteles’ acht Bücher der Physik (1857), and numerous minor articles on smaller points, such as the authenticity of the thirty-eight books of the Problems. The work by which he is best known is the Geschichte der Logik im Abendland (Leipzig, 1855–1876). Chr. Sigwart, in the preface to the first edition of his Logic, makes “special mention” of the assistance he obtained from this book.

PRATI, GIOVANNI (1815–1884), Italian poet, was born at Dasino and educated in law at Padua. Adopting a literary career, he was inspired by anti-Austrian feeling and devotion to the royal house of Savoy, and in early life his combination of a sympathy for national independence with monarchic sentiments brought him into trouble in both quarters, Guerrazzi expelling him from Tuscany in 1849 for his praise of Carlo Alberto. In 1856 he was elected a deputy to the Italian parliament, and in 1857 a senator. He died at Fontebranda, near Rome, on May 8, 1884. Prati was a prolific poet, his volumes of verse ranging from his romantic narrative Ermenegarda (1841) to the lyrics collected in Psiche (1875) and Iside (1878). His Opere varie were published in five volumes in 1875, and a selection in one volume in 1892.

PRATINAS (the quantity of the second vowel is doubtful), one of the oldest tragic poets of Athens, was a native of Phlius in Peloponnesus. About 500 B.C. he competed with Choricius and Aeschylus, when the latter made his first appearance as a poet for the stage. Pratinas was also the author of satyrical dramas as a species of entertainment distinct from tragedy, in which the rustic merry-making and the extravagant dances of the satyrs were retained. The associations of his home, not far from Corinth, where Arion was said to have established the cyclic choruses of satyrs, may account for his preference for this kind of drama. Pratinas was also a writer of dithyrambs and the choral odes called hyporchemata (a considerable fragment of one of these is preserved in Athenaeus xiv. 617). It is related that, during the performance of one of his plays, the scaffolding of the wooden stage gave way, in consequence of which the Athenians built a theatre of stone; but recent excavations make it doubtful whether a stone theatre existed in Athens at so early a date. A monument was erected by the inhabitants of Phlius in honour of Pratinas’s son Aristias, who, with his father, enjoyed the reputation of excelling all, with the exception of Aeschylus, in the composition of satyrical dramas, one of which was called Cyclops.

See Pausianias ii. 13; Suidas s.v.; fragments in T. Bergk, Poetarum lyricarum graecarum, vol. iii.

PRATINCOLE, a word apparently invented by J. Latham (Synopsis, v. 222), being the English rendering of Pratincola, adopted in 1776 by P. L. Meunier (Elementa, p. 381) to a bird which

Diet hitherto received no definite name, though it had long before been described and even recognizably figured by Aldrovandus (Ornithologia, xvii. 9) under the vague designation of "hirundo marina." It is the Glareola pratina of modern ornithologists, forming the type of a genus Glareola, founded by M. J. Brisson in 1760, belonging to the group Lornicolae, and constituting together with the coursers (Curtorius) a separate family, Glareolidae. The pratincoles, of which some eight or nine species have been described, are all small birds, slenderly built and mostly delicately coloured, with a short stout bill, a wide gape, long pointed wings,
tand a tail more or less forked. In some of their habits they are thoroughly plover-like, running very swiftly and breeding on the ground, but on the wing they have much the appearance of swallows, and, like them, feed, at least partly, while flying. 1

The ordinary pratincole of Europe, G. pratincus, breeds abundantly in many parts of Spain, Barbary and Sicily, along the valley of the Danube, and in southern Russia, while owing to its great powers of flight it frequently wanders far from its home, and more than a score of examples have been recorded as occurring in the British Islands. In the south-east of Europe a second and closely-allied species, G. n bornannus or G. melanoptera, which has black instead of chestnut inner wing-coverts, accompanies or, farther to the eastward, replaces it; and in its turn it is replaced in India, China and Australia by G. orientalis. Australia also possesses another species, G. grallaria, remarkable for the great length of its wings and much longer legs, while its tail is scarcely forked—peculiarities that have led to its being considered the type of a distinct genus or sub-genus Stiltia.

Two species, G. lactea and G. cinerea, from India and Africa respectively, seem by their pale coloration to be desert forms, and they are the smallest of this curious little group. The species whose mode of nidification is known lay either two or three eggs, stone-coloured, blotched, spotted, and streaked with black or brownish-grey. The young when hatched are clothed in down and are able to run at once—just as are young plovers.

(A. N.)

PRATO, a town and episcopal see of Tuscany, Italy, in the province of Florence, 11 m. by rail N.W. of Florence, 207 ft. above sea-level. Pop. (1906), 29,107 (town); 55,208 (commune). It is situated on the Bisenzio, and is dominated by a medieval castle and surrounded by walls of the 11th and 14th centuries. The cathedral of St Stephen was begun in the 12th century in the Tuscan Romanesque style; to this period belongs the narrow nave with its wide arches; the raised transepts and the chapels were added by Giovanni Pisano in 1317–1320; the campanile dates from 1340 (it is a much smaller and less elaborate version of Giotto’s campanile at Florence), while the façade, also of alternate white sandstone and green serpentine, belongs to 1413. It has a fine doorway with a bas-relief by Andrea della Robbia over it; but the most striking external feature is the lovely open-air pulpit at an angle of the building, erected by Michelozzo and Michelangelo for displaying to the people without risk the Virgin’s girdle, brought from the Holy Land by a knight of Prato in 1130. The pulpit itself has beautiful reliefs of dancing children; beneath it is a splendid bronze capital.

The contract was given out in 1428, but the work was seriously begun only in 1434 and finished in 1438. The Chapel of the Girdle has good frescos by Agnolo Gaddi (1363), a statue of the Virgin by Giovanni Pisano, and a handsome bronze open-work screen. The frescos in the choir, with scenes from the life of St John the Baptist and St Stephen, are by Fra Filippo Lippi (1456–1466) and are his best work; the dance of Salome and the lying in state of St Stephen are the finest of the series. Among the other works of art may be mentioned the clay statue of the Madonna dell’ Ulivo by Benedetto da Maiano. The massive old Palazzo Pretorio (15th century) has been somewhat modified in details; the adjacent Palazzo Comunale contains a small picture gallery

1 This combination of characters for many years led systematizers astray, though some of them were from the first correct in their notions as to the Pratincole’s position. Linnaeus, even in his latest published edition, placed it in the genus Hirundo, but the interposed and annotated copies of his Systema naturae in the Linnean society’s library show the species marked for separation and insertion in the Order Gullae—Pratincola trachela being the name by which he had marked it. Shortly afterwards Linnaeus, and some of his successors, in the same edition of Brissolin, as mentioned above, had been disregarded. Different erroneous assignments of the form have been made even by naturalists of note, and sometimes widely different after the Madoncella’s internal structure of the Pratincole. For instance, Sandeval in 1873 (Tenamen, p. 86) placed Glareola among the Caprimulgidae, a position which osteology shows cannot be maintained for a moment.

with works by Filippo and Filippino Lippi. A beautiful Madonna by the latter (1497) is in a small street shrine at the corner of the Via S. Margherita. The Church of S. Domenico is a Gothic edifice of 1281; that of S. Francesco has an almost Renaissance façade, fine cloisters with a good 15th-century tomb, and a chapter-house with Giotottesque frescoes. The Madonna del Buon Consiglio has some good reliefs by Andrea della Robbia, by whom is also the beautiful frieze in the Madonna delle Carceri. This church, by Giuliano da Sangallo (1485–1491), is a Greek cross, with barrel vaults over the arms, and a dome; it is a fine work, and the decoration of the exterior in marble of different colours (unfinished) is of a noble simplicity. Some remains exist of the 13th-century fortress, and the large Piazza Mercatale is picturesque. The works of art visible in Prato are due, as will be seen, entirely to Florentine artists. As a whole the town has a somewhat modern aspect. The industries of Prato embrace the manufacture of woollens (the most important), straw-plaiting, biscuits, hats, macaroni, candles, silk, olive oil, clothing and furniture, also copper and iron works, and printing.

Prato is said to be first mentioned by name in 1107, but the cathedral appears as early as 1048 as the parish church of Borgo Cornio or Santo Stefano. It was subject to the Alberti until 1180, and was then under the Imperial supremacy. It appears to have been burned from this time until 1433. In 1343 the town acknowledged the authority of Robert, king of Naples, and in 1350 Niccola Acciajoli, seneschal of Joanna, sold it to the Florentines for 17,500 florins of gold. In 1512 it was sacked by the Spaniards under General Cardona. It obtained the rank of city.

See E. Corradini, Prato (Bergamo, 1905).

PRATT, ORSON (1811–1881), Mormon apostle, was born of humble parents at Hartford, New York. In 1830 he joined the Mormon Church, becoming a member of its council of twelve in 1834 and one of its twelve apostles in 1835. Pratt was also a mathematician of some note. He was professor of mathematics in the university of Deseret and wrote several books on this subject, these including Cubic and Biquadratic Equations (1866). He was a member, and several times speaker, of the Utah House of Representatives. Among his writings may be mentioned Key to the Universe (1866), and The Bible and Polygamy (1870). PRAWN, the name of an edible large shrimp-like crustacean in Great Britain usually applied to Leander serratus (see Shrimp). The word is in M. Eng. prawn, prauze or prawn, and no cognate forms are found in any other languages. It has been often referred to the Lat. penna, a ham-shaped shellfish, but this is due to Florio, who by a mistake guesses pannocchie, prawn-fishes or shrimps. The O. Ital. penna and pannocchia meant a shellfish which yielded “nacre” or mother-of-pearl.

PRAXIAS and ANDROSTHENES, Greek sculptors, who are said by Pausanias (x. 19, 4) to have executed the pediments of the temple of Apollo at Delphi. Both were Athenians; Praxias a pupil of Calamis. The statement raises historic difficulties, as, according to the leaders of the recent French excavations at Delphi, the temple of Apollo was destroyed about 373 B.C. and rebuilt by 339 B.C., a date which seems too late for the lifetime of a pupil of Calamis. In any case no fragments of the pediments of this later temple have been found, and it has been suggested that they were removed bodily to Rome.

PRAXILLA, of Sicyon, Greek lyric poetess, one of the so-called nine “lyric” Muses, flourished about 450 B.C. According to Athenaeus (xv. 694), she was famous as a composer of sopia (short lyrical poems sung after dinner), which were considered equal to those of Alcaeus and Anacreon. She also wrote dithyrambics and hymns, chiefly on mystic and mythological subjects. In the genealogies of the gods and heroes a dactylic metre was also called her name.

Fragments in T. Bergk, Poetae lyrici Graeci, vol. iii.; see also C. F. Neue, De Praxilla Siicynae reliquis (progr. Dorpat, 1844).

PRAXITELLES, of Athens, the son of Cephissodotus, the greatest of the Attic sculptors of the 4th century B.C., who has left an imperishable mark on the history of art. It has been maintained by some writers that there were two sculptors of the name, one a contemporary of Phidias, the other, more
celebrated, of two generations later. This duplication is de-
ferred in Furtwängler's Masterpieces of Greek Sculpture (pp. 99, 102, seq.) but on insufficient grounds. There is, however, no
reason why the great Praxiteles should not have had a grand-
father of the same name: all that we can say is that at present
we have no certain evidence that this was the case.

Though Praxiteles may be considered as in some ways well
known to us, yet we have no means for fixing his date accurately.
It seems clear that he was no longer working in the time of
Alexander the Great, or that king would have employed
him. Pliny's date, 364 B.C., is probably that of one of his most
noted works.

Our knowledge of Praxiteles has received a great addition,
and has been placed on a satisfactory basis, by the discovery
at Olympia in 1877 of his statue of Hermes bearing the
Dionysus, which is now in the British Museum. This statue,
which was long considered the most perfect in the history of
Greek art, has been famous throughout the world (Greek Art, fig. 43 and Plate VI. fig. 83) Hermes was
represented as in the act of carrying the child Dionysus to the
nymphs who were charged with his rearing. He pauses on the
way, and holds out to the child a bunch of grapes to excite his
desire. The young child can hardly be regarded as a success;
he is not really childlike. But the figure of the Hermes, full
and solid without being fleshy, at once strong and active, is
a masterpiece, and the play of surface is astonishing. In the head
we have a remarkably rounded and intelligent shape, and the
face expresses the perfection of health and enjoyment.

This statue seems to us to be our best evidence for the
style of Praxiteles. It altogether confirms and interprets the
statements as to Praxiteles made by Pliny and other ancient
critics. Gracefulness in repose, and an indefinable charm are
also the attributes of works in our museums which appear to
be copies of statues by Praxiteles. Perhaps the most notable
of these are the Apollo Sauroctonus, or the lizard-slayer, a youth
leaning against a tree and idly striking with an arrow at a lizard,
and the Aphrodite at the bath (Greek Art, Plate V., fig. 71)
of the Vatican, which is a copy of the statue made by Praxiteles
for the people of Cnidos, and by them valued so highly that
they refused to sell it to King Nicomedes, who was willing in
return to discharge the whole debt of the city, which, says Pliny,
was enormous.

The Satyr of the Capitol at Rome has commonly been regarded
as a copy of one of the Satyrs of Praxiteles; but we cannot identify
it in the list of his works. Moreover, the style is hard
and poor; a far superior replica exists in a torso in the
Louvre. The attitude and character of the work are certainly
of Praxitelean school.

Excavations at Mantinea in Arcadia have brought to light
the basis of a group of Leto Apollo and Artemis by Praxiteles.
This basis was doubtless not the work of the great sculptor him-
self, but of one of his assistants. Nevertheless it is pleasing
and historically valuable. Pausanias (viii. 9, 1) describes the
base, "on the base which supports the statues there are
sculptured the Muses and Marsyas playing the flutes." Three
slabs which have survived represent Apollo, Marsyas, a slave,
and six of the Muses, the slab which held the other three having
disappeared.

A head of Aphrodite at Petworth in England, and a head of
Hermes in the British Museum (Aberdeen Hermes), have lately
been claimed by competent authorities as actual works of
Praxiteles. Both are charming works, but rather by the suc-
cessors of Praxiteles than by himself.

Besides these works, connected with Praxiteles on definite
evidence, there are in our museums works without number of
the Roman age, statues of Hermes, of Dionysus, of Aphrodite,
of Satyrs and Nymphs and the like, in which a varied amount of
Praxitelean style may be discerned. Four points of composi-
tion may be mentioned, which appear to be in origin Praxitelean:
(i) a very flexible line divides the figures if drawn down the
midst from top to bottom; they all tend to lounging; (2) they
are adapted to front and back view rather than to being seen
from one side or the other; (3) trees, drapery and the like are
used for supports to the marble figures, and included in the
design, instead of being extraneous to it; (4) the faces are
presented in three-quarter view.

The subjects chosen by Praxiteles were either human beings
or the less elderly and dignified deities. It is Apollo, Hermes
and Aphrodite who attract him rather than Zeus, Poseidon
or Athena. And in his hands the deities sink to the human
level, or, indeed, sometimes almost below it. They have grace
and charm in a supreme degree, but the element of awe and
reverence is wanting.

Praxiteles and his school worked almost entirely in marble.
At the time the marble quarries of Paros were at their best;
but could any marble be finer for the purposes of the sculptor
than that of which the Hermes is made. Some of the statues
of Praxiteles were coloured by the painter Nicias, and in the
opinion of the sculptor they gained greatly by this treatment.

(P. G.)

PRAYER (from Lat. precari, entreat; Ital. pregheria, Fr.
piètre), a term used generally for any humble petition, but more
technically, in religion, for that mode of addressing a divine
or sacred power in which there predominates the mood and
intention of reverent entreaty.

Prayer and its Congeners.—Prayer in the latter sense is
a characteristic feature of the higher religions, and we might even
say that Christianity or Mahommedanism, ritually viewed, is
in its innermost essence a service of prayer. At all stages of
organized religion, and more especially in the case of
the more primitive types of cult, prayer as thus understood
occurs together with, and shades off into, other varieties of
observance that bear obvious marks of belonging to the same
family.

Confining ourselves for the moment to forms of explicit address,
we may group these under three categories according as the
power addressed is conceived by the applicant to be on a higher,
or on much the same, or on a lower plane of dignity and authority
as compared with himself. (1) Only if the deity be regarded
as altogether superior is there room for prayer proper, that is,
reverent entreaty. Of this we may perhaps roughly distinguish
a higher and a lower type, according as there is either complete
confidence in the divine benevolence and justice, or a disposition
to suppose a certain arbitrariness or at any rate condition-
ality to attach to the granting of requests. In the first case
prayer will be accompanied with disinterested homage, praise
and thanksgiving, and will in fact tend to lose its distinctive
character of entreaty or petition, passing into a mystic commu-
ning or converse with God. In the second case it will be supported
by pleading, involving on the one hand self-abasement, with
concession of sins and promises of repentance and reform, or
on the other hand self-justification, in the shape of the expression
of faith and recital of past services, together with reminders
of previous favour shown. (2) If, however, the worshipper place
his god on a level with himself, so far at any rate as to make
him to some extent dependent on the service man contracts
to render him, then genuine prayer tends to be replaced by a
mere bargaining, often conjoined with flattery and with insincere
promises. This spirit of do ut des will be found to go closely
with the gift-theory of sacrifice, and to be especially character-
istic of those religions of middle grade that are given over to
sacrificial worship as conducted in temples and by means of
organized priesthood. But that, when the high gods are kind for a consideration, the lower deities will likewise
