**PROVINCE**

(Lat. *provincia*; perhaps a contraction of *providentia*), a term originally applied, in ancient Rome, to the department or sphere of duty assigned to one of the higher magistrates, the consuls and praetors. 1 When, with the spread of the Roman arms, the government of conquered countries grew to be one of the most important duties of the higher magistrates, the term *provincia*, from designating the government of a conquered country as one particular duty of a Roman magistrate, came to be used generally as a designation of the country itself. Thus in later days it was applied to analogous territorial subdivisions of a country, as opposed to the centre of government; and apart from any territorial signification, the term is used generally for a sphere of duty.

It is to the older sense of the term as a subject territory lying outside of Italy and governed by Roman magistrates that the following historical remarks apply:

As distinguished from Italy, the provinces paid tribute to Rome, for, at least from the time of the Gracchi, it was a recognized constitutional principle that the provinces were the estates of the Roman people and were to be managed for its benefit. Under the republic the constitution of a province was drawn up by the victorious Roman general assisted by ten commissioners appointed by the senate from its own body, and the province was henceforth governed on the lines laid down in this constitution or charter (lex provinciae). For administrative purposes the province was divided into districts, each with its capital, the magistrates and council of which were responsible for the collection of the district taxes. For judicial purposes the province was divided into circuits (comitia), and in the chief town of each circuit the governor of the province regularly held assizes.

1 Only those magistrates who had imperium (military power) had a province. When the province of a quaestor is mentioned it refers to the province of the consul or praetor to whom the quaestor is subordinate. In familiar language any business was called a province.

Cities taken by the sword were destroyed, and their lands were turned into Roman domains and were let out by the censors at Rome to private persons, who undertook to pay a certain proportion of the produce. Royal domains, such as those of Syracuse, Macedon, Pergamum, Bithynia and Cyrene were also confiscated. On the other hand communities which surrendered without offering an obstinate resistance were usually allowed to retain their personal freedom and private property, and their chief town was left in the enjoyment of its territory and civil rights; but all the lands were subjected to a tax, consisting either of a payment in kind (vettigal) or of a fixed sum of money (tributum, stipendium), and in some cases a custom-duty (portum) was levied. It is to this latter class of communities (the civitates vettigales or stipendiariae) that the large majority of the provincial states belonged. In a better position were those states whose freedom was guaranteed to Rome on the ground of obligation to the state or special loyalty. These Roman provinces were designated either by a treaty or by a decree of the Roman people or senate. As a decree of the people or senate could at any time be recalled, the position of the free states without a treaty was more precarious than that of the treaty states (civitates foederatae).

The latter, though not allowed to meddle in foreign politics, enjoyed a certain amount of internal freedom, retained their lands, paid no taxes, and were bound to render those services only which were expressly stipulated for in the original treaty, such as furnishing ships and troops, supplying corn at a certain price and receiving Roman officials and soldiers en route. Amongst these so-called treaty states were Mace- donia (Mainz), Italy (Milan), and Libya. The privileges of the free but not treaty states were somewhat similar, but, as stated, more precarious. All political distinctions, save that between slave and freeman, disappeared when Caracalla bestowed the Roman franchise on the whole empire.

**Provincial Diets.**—Apart from the government by Roman officials, every province appears to have had, at least under the empire, a provincial assembly or Diet of its own (concilium or commune), and these Diets are interesting as the first attempts at representative assemblies. The Diet met annually, and was composed of deputies (legati), from the provincial districts. It arranged for the celebration of religious rites and games, especially (under the empire) for the worship of the emperor, the neglect of which was severely punished. The actual celebration was under the conduct of the high priest of the province, a person of much dignity and importance, perhaps the forerunner of the Christian bishop. The Diet also decreed the erection of statues and monuments; it passed votes of thanks to the outgoing governor, or forwarded complaints against him to Rome; and it had the right of sending embassies direct to the senate or the emperor.

The **Provincial Governor.**—The provinces were administered by government agents (proconsuls, praetors, propraetors, legati), who held office for a term. From the formation of the first provinces in 227 B.C. down to the time of Sulla (82 B.C.) the governors were praetors (see Praetor); from the time of Sulla to that of Augustus the praetors remained in Rome during their year of office, and at the end of it assumed the government of a province with the title of propraetor. This applies, however, only to provinces which were in a settled state and could consequently be administered without a large military force. A province which was the seat of war, or the province of a recently acquired state, was committed to the care either of one of the consuls for the year or of a commander specially appointed for the purpose with the title of proconsul, who might be one of the consuls of the preceding year. Of a previous occasion, when, in rare cases, a private individual who had held neither consulsip or praetorship, or propraetorship, for a year to year with the military exigencies of different parts of the empire, At the close of the republic, however, we find even such a peaceful province as Asia administered by a proconsul. In the subsequent period of the republic the senate either before or after the elections determined which provinces were to be governed by consuls and which by praetors, and after their election the consuls arranged between themselves by lot or otherwise which of the provinces nominated by the senate should have the administration, and similarly with the praetors. But in order to guard against partiality the Sempornan law of 125 B.C. provided that the senate should yearly nominate the two consular provinces before the election of the
consul, and that the consul should after their election but before their entry on office arrange between themselves which of the two provinces each should have. The Pompeian law of 53 B.C., enacted that no one should hold the governorship of a province till at least five days after the consul's inauguration, the latter being less bound by Roman magistracy, into an independent office. Like magistrates at Rome a provincial governorship was regularly held for one year; but, unlike them, it could be prolonged, formerly by a vote of the people, now by a vote of the senate. The Julian law of Caesar (46 B.C.) enacted that the governorship of a consular province should be held for two, that of a praetorian province for one year. The necessary supplies and munitions of war were voted to him by the senate. His staff consisted of one or more lieutenants (legati), a quaestor (quaestor), and several subordinates. The lieutenants were nominated by the senate from men of senatorial rank; if competent, the governor dismissed them; if they showed ability, he entrusted them with military or judicial functions. Besides these the governor took with him from Rome a number of young men of the upper classes to assist him in the government. These were known as the companions (companiones) or suite of the governor, sometimes, but incorrectly, as the praetorian cohort (see praetorians). These members of his suite were chosen by the governor; who for the most part might use their abilities. If not a citizen of the republic the governor was not allowed to take his wife with him to his province; under the empire he might do so, but he was answerable for her conduct. Before setting out for his province the governor would inspect his troops in order to ascertain their fitness for service. The governor, as a rule, raised levies of Roman citizens as well as of provincials, and to make requisitions of war material. He possessed both criminal and civil jurisdiction; as criminal judge he had the power of life and death, and from his sentence no appeal but Roman citizens could appeal; as civil judge he was guided partly by the charter of the province (lex provinciae), partly by the edict which it was customary for him to issue every year (vexillum), and partly by the general rules of conduct which the emperor had embodied in the general laws of the empire (imperium) so far as their validity was acknowledged by the charter or by the governor's own edict. Under the empire Gaius wrote a commentary on the provincial edict, and it is upon his work that this was based. The governor in all the provinces and superseding all separate edicts for the different provinces. Mommers, however, is of opinion that Gaius only commented on the edict of a particular province.

Conclusions under the Republic and Early Tiberius.--Under the republic the Roman people regarded the provinces as so many estates from which they were to derive revenue. The wealth or woe of the provincials was of no moment, but the development of the material resources of the provinces was of great moment. Hence agriculture and commerce were encouraged, settlements were made, roads and aqueducts were constructed; in short, the Roman aimed at exploiting the colony by a system of prudent economy as far as possible, and as far as possible, the turbulent people to the distance which had turned the republic into a garden, leaving the government of the Turk a garden into a wilderness. But the Roman governors were too apt to look on their provinces as their own peculiar prey; they exacted from their subjects what they found exactable in the provinces. They now sought in the provinces the means of reimbursing themselves for the expenditure they had incurred at Rome. The annual change of governor was thus a frightful calamity to the provincials, for every year brought a repetition of the same extravagant demands to be met to the same, or as the province became exhausted, still heavier sacrifices. Redress was to be had originally by a complaint (complainta) in the senate, which was a regular practice. At Rome for a village in Eastham, for a summer resort. Through many generations the inhabitants have gained their living chiefly from the sea; the township's trade, however, have greatly decreased in importance (the invested capital diminishing 67.4% in 1885-1895). The prosperity it retains is not a little due to Portuguese from the Cape Verde Islands and the Azores, and to British Americans. Provincetown village was long second only to Gloucester in the cod fisheries, which now account for only 1% of the catch. The development of larger vessels and correspondingly sturdier fittings have greatly improved the catch.

1 Sulla excluded the equites from the list; the lex Aurelia (70 B.C.) reinstituted them.

PROVINCETOWN, a township at the N. end of Cape Cod, in Barnstable county, Massachusetts, U.S.A. Pop. (1890), 4642; (1900), 4247; (1910 U.S. census) 4360. Area about 99 sq. m. The township is served by the New York, New Haven & Hartford railway, and by a steamship line to Boston. The harbour, which is important as a harbour of refuge, is protected on the east by land, and the Federal government has enlarged its possibilities by dikes and piers and other sand-catching devices; it has five lighthouses. There is a magnificent beach stretching 30 m. from Provincetown village to Eastham. The village is a summer resort. Through many generations the inhabitants have gained their living chiefly from the sea; the township's trade, however, have greatly decreased in importance (the invested capital diminishing 67.4% in 1885-1895). The prosperity it retains is not a little due to Portuguese from the Cape Verde Islands and the Azores, and to British Americans. Provincetown village was long second only to Gloucester in the cod fisheries, which now account for only 1% of the catch. The development of larger vessels and correspondingly sturdier fittings have greatly improved the catch.
handicapped. Whaling retains a remnant of its old importance, and there are also mackerel and shore fisheries, oil-works, cold storage establishments for preserving fish for food and bait, and seleng works for herrings. The first settlement here was made about 1608; it became a "district" or precinct of Truro in 1714, and was established as a township with its present name in 1727. Provencetown harbour was possibly visited by Gaspar Cortereal in 1501; Gosnold explored it and its vicinity in 1602, and John Smith was here in 1614. It was in this harbour that the "Mayflower" compact (see Massachusetts) was drawn up and signed by the Pilgrims before they proceeded to Plymouth, in 1620; here John Carver was chosen the first governor of Plymouth Colony, and Provencetown was the first landing place (on Saturday the 11th [0.8] of November) of the Pilgrims in the New World. It was the home of polished granite, 6 ft. high, with two bronze tablets, erected before the town-hall by the Old Colony Commission, and on High Pole Hill on the 20th of August 1907 the cornerstone of a second memorial (completed in 1909, dedicated Aug. 5, 1910), a granite tower, 252 ft. high, was laid, addresses being delivered by President Roosevelt, James Bryce and H. C. Lodge. In Provencetown harbour, on the 1st of January 1862, James M. Mason and John Slideell, the envoys of the Confederate States to Great Britain and France respectively, who had been taken by a Federal vessel from the British ship "Trent," were restored by the Federal authorities to H.B.M.'s "Rinaldo," after their detention in Fort Warren in Boston harbour.

PROVINS, a town of northern France, capital of an arrondissement of the department of Seine-et-Marne, at the junction of the Durtain with the Vouliage (an affluent of the Seine), 59 m. E.S.E. of Paris by rail. Pop. (1906), 7,546. The town enjoys a certain reputation for its mineral waters (which contain iron, lime, and carbonic acid, and are used for bathing and drinking), and is also known from its trade in roses, but it derives a greater interest from numerous remains of its medieval prosperity. Provins is divided into two quarters—the ville-haute and the ville-basse—which in the 13th century were surrounded by fortifications. There still remains a great part of these fortifications, which made a circuit of about 4 m., strengthened at intervals by towers, generally round, and now, being bordered with fine trees, form the principal promenade of the town. The large tower situated within this line, and variously known as the king's, Caesar's or the prisoners' tower, is one of the most curious of the 12th century, which is now extant. The base is surrounded by a thick mound of masonry added by the English in the 13th century when they were masters of the town. The tower serves as belfry to the church of St. Quriance, which dates its foundation from the 12th century. These two buildings in the ville-haute are picturesquely from the crest of a steep wooded hill above the ville-basse. The church preserves among its treasures the pontifical ornaments of St. Edmund of Canterbury (d. 1242). The interior is plain, but very beautifully proportioned. The appearance of the exterior suffers from an inappropriate dome erected above the crossing. The palace of the counts of Champagne, some fragments of which also belong to the 12th century, is occupied by the communal college. The old tithe-barn is a building of the 13th century with two fine vaulted chambers, one of which is below ground. The church of St. Ayou dates from the 12th to the 16th centuries, the transept being the oldest part; it is in a state of great dilapidation, and the choir is used as a storehouse. St. Croix belongs partially to the 13th century. Extensive cellars, used as warehouses in the middle ages, extend beneath portions of the town. On Mont Ste Catherine, opposite Provins, the general hospital occupies the site of an old convent of St. Clare, of which there remains a cloister of the 14th century. The sub-prefecture, tribunals of first instance and of commerce are among the public institutions. There is an active trade in grain, livestock and wool, and the industries include flour-milling, nursery-gardening, brickmaking, and the manufacture of porcelain, pianos, gas and petrol engines, agricultural implements and sugar.

Provins began to figure in history in the 9th century. Passing from the counts of Vermandois to the counts of Champagne, it rapidly attained a high degree of prosperity. Cloth and leather were its staple manufactures, and its fairs, attended by traders from all parts of Europe, were of such account as those of Beaucaire, while its money had currency throughout Europe. In the 13th century the population of the town is said to have reached 60,000; but the plague of 1348 and the famine of 1349 proved disastrous. The Hundred Years' War, during which Provins was captured and recaptured, completed the ruin of the town. During the religious wars it sided with the Catholic party and the League, and Henry IV. obtained possession of it in 1592 only after thirteen days' siege.

See Felix Bourquelot, Histoire de Provins (2 vols., Provins, 1839); PROVISION, PROVISION.
establish a concordat on the subject between the king and pope; its terms, however, were all in favour of the latter. At last, in 1830, a third Statute of Provosts was enacted which provided that the statute of 1351 should be firmly holden for ever and "put in due execution from time to time in all manner of points." The new statute was carried into effect as regards canopies and benedictions; but, until the Reformation, bishops were nominally appointed by a papal bull of provision. The person appointed, however, was usually nominated by the king, and the bull was not issued without his consent.

PROVISIONAL ORDER, a method of procedure followed by several government departments in England, authorizing action on the part of local authorities under various acts of parliament. Procedure by provisional order is a substitute for the more expensive course of private bill legislation; it is usually employed for such purposes as alteration of areas, compulsory purchase of land, building of light railways, &c. A preliminary local inquiry is held, and a report is published by an inspector of the department to whom application has been made to issue it. Upon the report of the inspector and other information the department decides whether or not to issue the order. The order when issued has no force until it is confirmed by parliament. For this purpose it is included with other orders in a confirming bill, introduced by the minister at the head of the department concerned. In both houses of parliament all provisional order bills are referred to examiners for compliance with standing orders. In the House of Lords, if a provisional order bill is opposed, it is referred to a select committee and then to a committee of the whole house; if not opposed, it goes, after second reading, to a committee of the whole house, and in both cases then proceeds as a public bill. In the House of Commons, the bill goes after second reading to the committee of selection or to the general committee on railway and canal bills; if unopposed it is treated as an unopposed private bill; if opposed it goes to a private bill committee, which hears evidence for and against.

PROVO, a city and the county-seat of Utah county, Utah, U.S.A., on the Provo river, 3 m. E. of Utah Lake, and about 45 m. S. by E. of Salt Lake City. Pop. (1890), 3529; (1900), 6785 (1776 foreign-born); (1910) 8925. Provo is situated by the Rio Grande Western and the San Pedro, Los Angeles & Salt Lake railways. It is situated at an altitude of about 4530 ft., in a region of fine scenery, Provo Cañon, Bridal Veil Falls and Utah Lake being of especial interest. The city has a general hospital and is the seat of the state mental hospital and of Brigham Young University (a Mormon institution), founded by Brigham Young in 1875, opened as an academy in 1876, and incorporated in 1896; it comprises a college and high commercial, music, arts and trades, agricultural and preparatory schools. Provo has various manufactures, including woolen goods, tires, pottery and bricks, and the city is a shipping point for a fertile agricultural and fruit-growing district. Within a radius of forty or fifty miles of Provo are a number of important mines. Provo was settled in 1849 and was chartered as a city in 1851.

PROVOST (through O. Fr. provost, mod. provost, Lat. praepositus, set over, from praeponere, to place in front), a title attached to various ecclesiastical and secular offices. In ecclesiastical usage the word praepositus was at first applied by the Church fathers to any ecclesiastical ruler or dignitary. It early, however, gained a more specific sense as applied to the official next in dignity to the abbot of a monastery, or to the superior of a single cell. Thus in the rule of St Benedict the provost (praepositus) is the superior of the monastery immediately subordinate to the abbot, the dean (decanus) being associated with him. From the Benedictine rule this arrangement was taken over by Chrodegang of Metz when he introduced the monastic organization of cathedral chapters. In these the provostship (praepositura) was normally held by the archdeacon, while the office of dean fell to the archpriest. In many cathedrals the temporal duties of the archdeacons made it impossible for them to fulfil those of the provostship, and the headship of the chapter thus fell to the dean. In England the title "provost" has thus everywhere given way to that of "dean"; in Germany, on the other hand, "Probst" is still the style of the heads of certain chapters. The title has also been preserved in certain dioceses of the German Evangelical Church as the equivalent of Superintendent, and both the Roman Catholic and Protestant chaplain-general of the forces have sometimes, e.g. in Prussia, the title Feldprobst. The heads of Augustinian and Dominican friaries are termed "provost or prior" (praepositus vel prior), those of Cistercian monasteries "provost or warden" (praepositus vel custos). Finally the name praepositus was sometimes used for the secular advocatus of a monastery. With the ecclesiastical use of the title is connected its English application to the heads of certain colleges; "provost" is still the style of the principals of Queen's, Oriel and Worcester Colleges at Oxford, of King's College at Cambridge, of Trinity College at Dublin and of Eton College. As a secular title praepositus is also very old; we need only instance the praepositus sacri concilii of the late Roman Empire, and the praepositus palatii of the Carolingian court. The important developments of the title in France are dealt with below. From France the title found its way into Scotland, where it survives in the style (provost) of the principal magistrates of the royal buroughs ("lord provost" in Edinburgh, Glasgow, Aberdeen, Perth and Dundee), and into England, where it is applied to certain officers charged with the maintenance of military discipline. A provost-marshal is an officer of the army appointed when troops are on service abroad for the prompt repression of all offences. He may at any time arrest and detain for trial persons subject to military law committing offences, and may also carry into execution any punishments to be inflicted in pursuance of a court martial (Army Act 1881, § 74). A provost-sergeant is an officer responsible for the maintenance of order when soldiers are in the United Kingdom. A provost-sergeant may be either garrison or regimental, and he has under his superintendence the garrison or regimental police.

(W. A. P.)

The Provost in France.—The word prévôt (provost) in old French law had many applications. In conformity with its etymology (praepositus) it could be applied to any person placed at the head of a branch of the public service, a position which, according to the laws of the time, would be regarded as an office, or a right of jurisdiction. It is thus that there was at Paris the "provost of Paris," who was a royal judge, and the "provost of the merchants" (prévôt des marchands), the head of the Paris municipality. There were besides—to mention only the principal provosts—the "provosts of the marshals of France" (prévôts des maréchaux de France), of whom more below; the "provost of the royal palace" (prévôt de l'hôtel du roi) or "grand provost of France" (grand prévôt de France), and the "provost general" (prévôt général) or "grand provost of the mint" (grand prévôt des monnaies). But the most important and best known provosts, who formed part of a general and comprehensive organization, were the "royal provosts" (prévôts royaux), the lower category of the royal judges. It must be borne in mind, however, that the magistrates belonging to the inferior category of royal judges (juges subalternes) had different designations in many parts of France. In Normandy and Burgundy they were called châtelains, and elsewhere—especially in the south—vigiers. These were titles which had established themselves in the great fiefs before their reunion with the Crown and had survived this. The royal provosts, on the other hand, were a creation of the Capetian monarchy.

The date of this creation is uncertain, but was without doubt some time in the 11th century. The provosts replaced the viscounts wherever the viscounty had not become a fief, and

1 Where, however, the head-master, though technically subordinated to the provost, is the effective head of the school.

2 Thus in a register of the Châtelet of Paris in the 14th century, we read: "À Paris est la prévôté de Paris et celle des marchands."
it is possible that in creating them the Crown was imitating the ecclesiastical organization in which the provost figured, notably in the chapters. The royal provosts had at first a double character. In the first place they fulfilled all the functions which answered locally to the royal power. They collected all the revenues of the domain and all the taxes and dues payable to the king within the limits of their jurisdiction. Doubtless, too, they had certain military functions, being charged with the duty of calling out certain contingents for the royal service; these survived until the end of the ancien régime certain military provosts prévôts d'épée (provosts of the sword) who were replaced in the administration of justice by a lieutenant. Finally, the provosts administered justice, though certainly their competence in this matter was restricted. They had no jurisdiction over the burghers; they had and still have no jurisdiction in the jurisdiction of the court of their over-lord, where they were judged by their peers—the other vassals of the same lord. Neither had they jurisdiction over the open country, the plat pays, where this belonged to local seigneurs; and even in the towns over which they were set their jurisdiction was often limited by that of the municipal courts established for the benefit of the burgesses. The second characteristic of the old provosts was that their office was farmed for a limited time to the highest bidder. It was simply an application of the system of farming the taxes. The provost thus received the speculative right to collect the revenues of the royal domain in the district under his jurisdiction; this was his principal concern, and his judicial functions were merely accessory. By these short appointments the Crown guaranteed itself against another danger: the possible conversion by the functionary of the function into a property. Very early, however, certain provostships were bestowed en garde, i.e. the provost had to account to the king for all he collected. The prévôts en garde were naturally a source of abuses and oppression, the former seeking to make the most of the concession he had bought. Naturally, too, the people complained. From Joinville we learn how under St. Louis the provostship of Paris became a prévôté en garde. In the reign of Louis XI. the prévôts en garde were still numerous and provoked a remonstrance from the States-general of 1484. Their suppression was promised by Charles VIII. in 1493, but they are again referred to in the grande ordonnance of 1498. They disappeared in the 16th century, by which time the provosts became regular officials, their office being purchasable.

Other transformations had previously taken place. The creation of the royal baillis reduced the provosts to a subaltern rank. Each bailli had in his district a certain number of provosts, who became his inferiors in the official hierarchy. When appeals were instituted (and this was one of the earliest instances of their introduction) the provost, the sphere of whose competency was limited, was subject to an appeal to the bailli, though his judgment had hitherto been without appeal. Moreover, in the 14th century they had ceased to collect the revenues of the royal domain, except where the prévôté en garde, and royal collectors (receveurs royaux) had been appointed for this purpose. The summoning of the feudal contingents, the ban and arrière-ban, had passed into the hands of the baillis. Thus the provosts were left for their sole function as inferior judges for non-nobles, the appeals from their sentences going to the baillis, who also had jurisdiction in the first instance over actions brought against nobles and in cases reserved for the crown judges (cas royaux). This corresponded to a principle which had also applied in the chief feudal courts in the 13th and 14th centuries, where a distinction was made between judicial acts which could be performed en prévôté, and those which had to be performed in a solennum assise (assise); this did not, however, always imply the existence of a rank and an inferior official, a provost and a bailli.

The provost in the exercise of his legal functions sat alone as judge, and he alone exercised the judicial authority at his tribunal; but he had to consult with certain lawyers (avanços or procurores) who, though not official, were authorized to use the technical phrase, he "summoned to his council" (appelait à son conseil). In 1578 official counsellors (conseillers-magnates) were created, but were suppressed by the ordonnance of Blois of 1579. The office was restored in 1600 by a simple decree of the royal council, but it was opposed by the parlements, and it seems to have been conferred in but few cases.

The "provosts of the marshals of France," mentioned above, were non-legal officials (officiers de la robe courte) forming part of the body of the marchaçaux which was under the ancien régime what the gendarmerie was after the Revolution. Their original function was to judge offences committed by persons following the army, but in the course of the 14th and 15th centuries they acquired the right of judging certain crimes and misdemeanours, by whomsoever committed. They became stationary, with fixed spheres of authority, and the offences falling within their competency came to be called cas prévôtaux. These were, the worst crimes and technical breaches of the laws. In some cases, chief old offenders (repris de justice), who were familiarly known as the giber des prévôts des marchaçaux (gool-birds). Theirs was really a kind of military jurisdiction, from which there was no appeal; but the provost was bound to associate with himself a certain number of ordinary judges or graduates in law. The provost of the marshals did not himself judge what was a cas prévotal; this had in each case to be decided by the nearest bailliage or presidial court. The presidial judges also dealt with cas prévôtaux in concurrence with the provosts of the marshals.

PROW, the fore-part of a ship, the stem and its surrounding parts, hence used like "keel," by metonymy, of the ship itself. It was in old naval parlance applied to the battery of guns placed in the fore-gun-deck. The Fr. proie and cognate forms (Ital. proa, Port. and Span. proa, of which the English is an adaptation) represent Lat. proa, itself adapted from Gr. πρόα, formed from προ, before, in front. From this word must be distinguished an obsolete "prow," brave, valiant, now only surviving in "prowess," and representing O. Fr. prou, mod. proux, from the first part of Lat. prodere, to be profitable; the same source gives "proxy.""PROXY (short for "prowcacy"), a term denoting either (1) a person who is authorized to stand in place of another, (2) the legal instrument by which the authority is conferred. Proxies are now principally employed for certain voting purposes. A proxy may in law be either general or special. A general proxy authorizes the person to whom it is entrusted to exercise a general discretion throughout the matter in hand, while a special proxy limits the authority to some special proposal or resolution. Formerly a peer could give his vote in the British parliament by proxy, by getting another peer to vote for him in his absence, temporal peers only being privileged to vote for temporal, and spiritual peers for spiritual. This voting by proxy in the House of Lords was an ancient custom of abuses. In Charles II.'s reign the duke of Buckingham used to bring twenty proxies in his pocket, and the result was that it was ordered that no peer should bring more than two. In 1830 to 1867 inclusive proxies were only called seventy-three times; and on the 31st of March 1868, on the recommendation of a committee, a new standing order was adopted by which the practice of calling for proxies on a division was discontinued. In English bankruptcy proceedings creditors may vote by proxy, and every instrument of proxy, which may be either general or special, is issued either by the official receiver or trustee. Under the Bankruptcy Act of 1869 very great abuses of the system of proxies arose (see BANKRUPTCY), and were investigated by a select committee of the House of Commons. The committee recommended the abolition of general proxies; and though their recommendation was not carried out, the Bankruptcy Acts of 1883 and 1890 put considerable restrictions on the use of general proxies. A shareholder in a limited liability company may vote by proxy, and regulations to that effect prescribing the requirements, are usually embodied in the articles of association. A proxy to vote at a meeting must, by the Stamp Act 1870, bear a penny stamp. In the United States, proxies are further used for voting purposes in political conventions.

In the early practice of the admiralty courts in England a
PRUDENTIUS

proxy was the authority by which the proctor or advocate appeared for either party to a suit. In the ecclesiastical courts a proxy is the warrant empowering a proctor to act for the party to a suit. Two proxies are usually executed, one authorizing the proctor to institute, the other to withdraw, proceedings. They are signed by the parties, attested by two witnesses, and deposited in the registry of the court (Philimore, Ecclesiastical Law). In the convocations of the Church of England those who are absent are allowed to vote by proxy. "Proxies," or "procurations," were also by the canon law certain sums of money paid yearly by parish priests to the bishops or archdeacon ratione visitationis; originally the visitor demanded a proportion of meat and drink for his refreshment, and afterwards this was turned into a money "procuration"—ad procurandum cibum et potum. Marriage by proxy or deputy was a custom recognized either for reasons of state or ceremonial.

PRUDENTIUS, AURELIUS CLEMENS (348-410), the most remarkable of the earlier Christian poets in the West, was probably born at Tarraco, though Saragozza and Calagurris have also been claimed as his birthplace. The meagre autobiographical, preface, which he affixed to the complete edition of his works when he was fifty-seven years old, makes it clear that he received a liberal education—being of noble family—practised as a lawyer and entered official life, and finally held some high office under Theodosius. At the age of fifty-seven he retired to a monastery, but died shortly afterwards.

Bentley calls Prudentius "the Horace and Virgil of the Christians," but his diction is stilted and his metre often faulty. The list of his works given in the preface mentions the hymns, poems against the Priscillianists and against Symmachus and Peristephanon. The Diphyonon or Dittochacon is not mentioned. The twelve hymns of the Cathemerison liber ("Daily Round") consist of six for daily use, five for festivals, and one intended for every hour of the day. Prudentius shows Ambrose as his master here, but gives to Ambrose's mystic symbolism much clearer expression. The Apotheosis and Homarmogenia are polemic, the first against the disclaimers of the divinity of Christ, the latter against the gnostic dualism of Marcion and his followers. In them Tertullian is the source of inspiration. Of more historical interest are the two books Contra Symmachum, of 658 and 1131 hexameter verses respectively, the first attacking the pagan gods, the second directed against the petition of Symmachus to the emperor for the restoration of the altar and statue of Victory which Gratian had cast down. The Peristephanon consists of fourteen hymns to martyrs. These were mostly Spanish, but some were suggested to Prudentius by sacred images in churches or by the inscriptions of Damasus. This book, with the Cathemerison liber and the Psychomachia, was among the most widely read books of the middle ages. Its influence on the iconography of medieval art was great. The Psychomachia is aesthetically inferior, but had the greatest influence of all of Prudentius's writings. In it he depicts the struggle of Christendom with paganism under the allegory of a struggle between the Christian virtues and the pagan vices. The Dittochacon is a series of quatrains, probably intended to explain forty-nine pictures of a basilica. The work is more interesting for archaeology than for literature.

Prudentius's works were published by Gilert in Antwerp in 1564, and by F. Arevalo at Rome in 1788, with complete commentary. This last is the edition reprinted in J. P. Migne's Patrologia Latina, vol. lxxxvi. More recent publications are by Obispo (Tübingen, 1845) and A. Dressel (Leipzig, 1866), while a critical edition has been undertaken by J. Bergmann.

PRUD'HON, PIERRE (1758-1823), French painter, born at Cluny on the 4th of April 1758, was the third son of a mason. The monks of the abbey undertook his education, and by the aid of the bishop of Mâcon he was placed with Devosges, director of the art school at Dijon. In 1778 Prud'hon went to Paris armed with a letter to Wille, the celebrated engraver, and three years later he obtained the triennial prize of the states of Burgundy, which enabled him to go to Rome, where he became intimate with Canova. He returned to Paris in 1787, and led for some time a precarious existence. The illustrations which he executed for the Daphnis et Chloe published by Diodot brought him into notice, and his reputation was extended by the success of his decorations in the Hôtel de Landry (now Rothschild), his ceiling painting of "Truth and Wisdom" for Versailles (Louvre), and of "Diana and Jupiter" for the Gallery of Antiquities in the Louvre. In 1808 he exhibited "Crime pursued by Vengeance and Justice" (Louvre, engraved by Royer which had been commissioned for the assize courts, and "Psyche carried off by Zephyrs" (engraved by Massard). These two remarkable compositions brought Prud'hon the Legion of Honour; and in 1816 he entered the Institute. Easy as to fortune, and consoled for the misery of his marriage by the devoted care of his excellent and charming pupil, Mlle Mayer, Prud'hon's situation seemed enviable; but Mlle Mayer's tragic suicide on the 26th of May 1821 brought ruin to his home, and two years later (Feb. 16, 1823) Prud'hon followed her to the grave. Mlle Mayer (1758-1821) was his ablest pupil. Her "Abandoned Mother" and "Happy Mother" are in the Louvre.

Voïart, "Notice historique de la vie et œuvres de P. Prud'hon," in Arch de l'art français; Qu. de Quincy, Discours prononcé sur la tombe de Prud'hon, Fév. 1823; Eugène Delacroix, Rev. des deux mondes, 1846; Charles Blanc, Hist. des peintres français.

PRUNE (adapted in various forms, e.g. prunus, prunyne, &c., from Fr. prune, Med. Lat. pruna, Lat. pruniwm, Gr. pruou, earlier pruouw, plum, the name generally given to the fruit of various species of plums, dried, and used either stewed as a dish or plain as a dessert fruit. The finest dessert prunes, known as "French prunes," are produced from the St Julien plum-tree and are dried and exported from the valley of the Loire in France. California now produces a fine quality of "prune." In scientific nomenclature, Prunus is the name of a genus of rosaceous trees, the type of the tribe prunae, of which the plum, apricot, peach, cherry, &c., are species (see further under Plum). From this word must be distinguished "to prune," (1) to cut or trim superfluous growth from a shrub or tree in order to encourage fresh growth and bring into regular form, &c., and (2) to trim or dress the feathers with the bill, used of a bird "preening" itself. In the first sense the word is an adaptation (16th century) of the Old French prunier, the second sense appears in the end of the 14th century but is not found in French.

PRURITUS, an ailment characterized by intense itching of the surface of the body. It may occur in connexion with other morbid conditions, such as jaundice, diabetes, digestive disorders, &c., or as the result of the irritation produced by skin parasites. The most serious form is pruritus senilis, which affects old persons, and is often a cause of great suffering, depriving the patient of sleep. In such cases it is probably due to atrophic changes in the skin. No eruption is visible, except such marks as are produced by scratching. The treatment consists in the removal of any apparent cause, and measures to strengthen the system, such as the use of quinine, iron, &c. Soothing lotions composed of solutions of alkalis conjoined with chloral, opium, hydrocyanic acid, &c., may be applied to the affected skin at bedtime.

PRUSSIA (Ger. Preussen; Lat. Borussia), a kingdom of Germany, and the largest, most populous and most important state of the German Empire. (For map see Germany.) It is bounded on the N. by the Baltic, Mecklenburg, Denmark and the North Sea, on the E. by Russia, on the S. by Austria, the kingdom of Saxony, the Thuringian states, Bavaria and
The increase of population proceeds most rapidly, as would be expected in the North German Provinces, the Westphalia, the Rhineland, Brandenburg and Saxony, while it is weakest in Courland, Pomerania and East Prussia. The population is densest in the mining and manufacturing district of the Rhine, which is closely followed by the coastal districts of Schleswig, Holstein and Prussia. The population of Brandenburg and Saxony is second to that of Prussia, containing twenty-two towns each with upwards of 100,000 inhabitants. The annual increase of suicide in Prussia is high, and among German states is only exceeded in the kingdom of Saxony. While the northwardly extending belt of densest population in Prussia includes roughly 31,000,000 Germans, over 3,000,000 Poles (in the eastern provinces), 107,000 Lithuanians (in the northeastern provinces), 36,000 Danes (in Schleswig-Holstein), 65,000 Wendes (in Brandenburg and Silesia), 25,000 Czechs (in Bohemia) and Walloons (near the Belgian frontier). In the rural districts of Posen and in parts of Silesia the Poles form the predominant element of the population.

Communication.—With most internal means of communication Prussia is well provided. Hardy any of its excellent highroads existed in the time of Frederick the Great, and many of them date only from the Napoleonic era. The railway system was established in 1838, but the railway system did not receive its full development until the events of 1866 removed the obstacles placed in the way by Hanover. Most of the lines were laid by private companies, which were afterwards merged into the state system. At the cost of considerable expenditure, Prussia engages in the construction of railway mileage in Prussia (5 m. per 10,000 inhabitants) is nearly as high as in Great Britain, but the traffic is much less. Between 1890 and 1900, the state-owned lines of railway increased by 9,200 m., the increase being principally due to the policy of buying up private lines; and since 1886 there has been a further increase. In 1903 the state lines amounted to a total of 18,520 m., and the private railways to 8,500 m. The former total includes all the railways south of the Rhine, but the railways of Brandenburg, Saxony and Pomerania are very insufficient. The most important trunk line of Prussia is that which enters the western frontier at Herbesthal, and runs through Cologne, Duesseldorf, Bonn, Koblenz, Trier, Nancy, Luxembourg, Brussels, then through Brussels and the Belgian frontier to Liege, and thence through the north-eastern provinces of Germany. The railway network of Prussia is the most extensive of any nation.

Population.—The following schedule shows the area and population of the whole kingdom and of each of its fourteen provinces on the 1st of December 1900, and the 31st of December 1905.

1 Including Hellingland.
The government forests cover about 6,000,000 acres, or upwards of one-fourth of the whole, and are admirably managed, bringing in an annual revenue of 250,000,000 marks, or nearly one-twelfth the whole produce of the whole tilled surface. Oats occupy an area equal to about half that devoted to rye, and are also grown most extensively in the eastern part of the kingdom. Wheat, barley, and rye are the staple crops and the most important in the south and west, does not cover more than a fourth and a half of the whole surface. Barley is mostly largely grown in Saxony and Silesia. Other grain crops are spelt (chiefly on the Rhine), buckwheat (Hesse), millet (Thuringia and Silesia); maize and other grains are also grown in some of the States of the south and east. The production of each of the above crops is based on the consumption, and is supplemented by imports of rye and other cereals from Russia and Holland. Potatoes, used both as food and for fodder, are extensively cultivated, especially in Brandenburg and the eastern part. Sugar beets are grown to a large extent in Prussia, Silesia and Hanover, while hops are raised chiefly in Posen and Saxony. The cultivation of rape-seed for oil has fallen off since the potato has become general. Tobacco in Silesia, Brandenburg, Hanover and the Rhine province is produced on a small scale. The annual harvest of the tobacco grown in Germany has not exceeded 1,000,000 sacks since 1846.

PRUSSIA.

The principal crop in Prussia is rye, of which the ordinary bread of the country is made; it grows in all parts of the kingdom, except in the eastern provinces, where oats and rye are the only grain crops. Wheat is extensively grown in the south and west, and east, but does not cover more than a fourth and a half of the whole surface. Barley is mostly largely grown in Saxony and Silesia. Other grain crops are spelt (chiefly on the Rhine), buckwheat (Hesse), millet (Thuringia and Silesia); maize and other grains are also grown in some of the States of the south and east. The production of each of the above crops is based on the consumption, and is supplemented by imports of rye and other cereals from Russia and Holland. Potatoes, used both as food and for fodder, are extensively cultivated, especially in Brandenburg and the eastern part. Sugar beets are grown to a large extent in Prussia, Silesia and Hanover, while hops are raised chiefly in Posen and Saxony. The cultivation of rape-seed for oil has fallen off since the potato has become general. Tobacco in Silesia, Brandenburg, Hanover and the Rhine province is produced on a small scale. The annual harvest of the tobacco grown in Germany has not exceeded 1,000,000 sacks since 1846.
promoted by the commercial and fiscal policies of its government. The chief industrial districts are, of course, those which yield coal, iron, and steel. The country contains several of the original lehn and heer communites. The ancient communities of Breslau, Görlitz, Stettin, Essen, Dortmund, Elberfeld-Barmen, Düsseldorf, Cologne, Aix-la-Chapelle, Crefeld, Hanover, Frankfurt-on-Main, Saarbrücken, Halle, etc., and many others. The iron and metal industries, especially the making of machinery, electrical plant, tramway plant, and the production of articles in wrought copper and brass, have been important in Prussia and Hanover. These industries have expanded considerably and more lately its suburbs, as well as Magdeburg and Cologne, have played an active rôle, though the old centres of the metallurgical and iron and steel industries in the Rhine province and Westphalia have their long traditions. The iron and steel industries, which are essentially a German speciality, must also be mentioned in the front rank. The branches in which this supremacy stands unrivalled are those which produce aniline dyes, nitric acid, the manurial (NaCl), explosives, various chemical salts, pharmaceutical preparations, cellulose, glycerine, artificial (chemical) manures, and perfumes. A third branch of industry in which German genius has won triumphs of the highest kind is shipbuilding.

Constitution.—The present constitution of Prussia was framed by the government of King Frederick William IV, with the cooperation of a constituent assembly, and was proclaimed on the 31st of January 1850. It consists of an hereditary monarchy with two houses of parliament and was subsequently modified by various enactments, notably that of the 12th of October 1854, reconstituting the department of Prussia in its former form. The constitution is based on the principle that all citizens in the eye of the law, provides for universal military service, and guarantees the personal liberty of the subject, the security of the property, the personal and territorial immunities, the liberty of worship, the tolerance of religious sects, freedom of the press, the right of association and public meetings, and liberty of migration.

The monarchy is hereditary in the male line of the house of Hohenzollern, and follows the custom of primogeniture. The king alone exercises the executive power, has the supreme command of the army, and is head of the Church, but shares the legislative power with the Dietes (ordnetenhaus and Herrenhaus). He appoints and discharges the members and other officials of the Crown, summons and dissolves parliament, possesses the right of pardon and mitigation of punishment, declares war and concludes peace, confers orders and titles of nobility, grants patents for inventions, has, as absolute monarch, the power of appointment to high offices, has, as emperor, the right to extricate the blood of the house of Hohenzollern, and finally has, constitutionally speaking, passed from the king of Prussia to the German emperor. He is held to be irresponsible for his public actions, and his decrees require the signature of a minister, whose responsibility, however, is not very clearly defined. The national tradition and feeling lend the Crown considerable power, not formulated in the constitution, and the king is permitted to bring his personal influence to bear upon parties in a way quite at variance with the English conception of a constitutional monarch. The annual civil list of the king of Prussia amounts to £770,554.

The legislative assembly (Landtag) consists of two chambers, each of which has the power to reject an act of the other. The right of proposing new measures belongs equally to the king and each of the chambers, and the consent of all three is necessary. The members of the chambers are elected for a term of six years by the electors (the Germans, together with the French, Belgians, Luxembourgers, and Swedes), who are, in sum total, 25,000,000, and consist of the owners of property exceeding 20 gulden in value. The current electoral law is almost twice as comprehensive as the former, which consisted of an electoral college (the kirsch) consisting, besides himself as chairman, of one member appointed by government and five members elected by the provincial committee (Provinzialausschusse). The latter forms the executive, or crown, branch of the local administration, which consists of deputies elected by the kreise or circles, and forms the chief provincial organ of local government. The Regierungsbezirk is solely a government division and is only indirectly represented in the scheme of local administration. The government authorities are the Regierungs-Präsident, who is at the head of the general internal administration of the department, and the Regierungspräsidenten, who supervise ecclesiastical and educational affairs and exercise the function of the state in regard to the direct taxes and the domains and forests. The departmental president is also assisted by a Bezirksrat or district council, consisting of one officer and four members, who are elected by the inhabitants of the department by the provincial committee. Each Landkreis has a Landrat, an office which existed in the mark of Brandenburg as early as the 16th century. He is aided by the officers of the landkreis (beaureaucrats, etc.), or by some other person. The Stadtkreise are towns with more than 25,000 inhabitants, they have a mayor, a council (improvement or town council), and a council (improvement or town council) elected on a three-class property suffrage. The executive is authorized to entrust the magistrate (Magistrat), which usually consists of the burgomaster (rath), the months (rates), and several unpaid members, and, where necessary, a few paid members. The unpaid members hold office for six years; the paid members are elected for twelve years, and their election requires ratification from the state.

Justice.—Down to the 1st of January 1900 (when the German civil code—Bürgerliches Gesetzbuch—was introduced) a threefold system of civil law had prevailed in Prussia, viz. the common law of Prussia (Landrecht), codified in 1794, in eastern and central

---

1 See Dr Frederick Rose, Instruction and Chemical Industry in Germany (1901-1902), being Nos. 501 and 573 of the Miscellaneous Series of British Diplomatic and Consular Reports.
Prussia, the German common law (Gemeines deutsches Recht) in Schleswig-Holstein, Hanover, and parts of the Rhine provinces, and the Code Napoleon generally on the Rhine and in Alsace-Lorraine. The Code Napoleon was enacted August 23, 1807, and promulgated the following year. Direct application of this code is now made only in the Saarland. According to the idea underlying the Code Napoleon, which now forms the legal basis of all the German states, the administration of justice is now wholly in the hands of the government. The courts of lowest instance are the Amtsgerichte, in which sits a single judge, accompanied by a lay assessor, who is an official of the government. Higher courts include the Landgerichte, to which the judges are appointed; and the Oberlandesgerichte, and the court at Leipzig. The judges are appointed by the state, and hold office for life. After finishing his university course the student of law who wishes to become a judge or to practise as a qualified counsel (Rechtsanwalt) must pass an examination and become a Referendar. He then spends at least four years in the practical work of his profession. In cases where the candidate has chosen the bench instead of the bar, he becomes an Assessor and is eligible for the position of judge. A lawyer who has passed the necessary examinations may at any time quit the bar for the bench, and vice versa, subject to retaining his seat, and to private practice. In all criminal cases the prosecution is undertaken by government, which acts through Staatsanwälte, or directors of prosecutions, in the pay of the state.

The administration of the monarchy dates from 1814 and provides that every man capable of bearing arms shall serve in the army for a certain number of years. The peace strength of the Prussian contingent of the imperial German army consisted in 1905, of 20,646 officers (including surgeons), 448,565 men and 82,872 horses. There were also 2196 farriers and shoemakers. (For Navy, see Germany).

Religion.—The centre of the kingdom is solidly Protestant, the proportion of Roman Catholics in the kingdom is upwards of 3 to 1. The Roman Catholics and religious bodies are granted freedom of worship, and civil rights are not conditional upon religious confession. The Evangelical or Protestant State Church of Prussia consists as it now stands of a union of the Lutherans and Calvinists, effected under royal pressure in 1817. According to the king this was not a fusion of two faiths but an external union for mutual admission to the Eucharist and for the convenience of the thinly settled provinces of the kingdom. Those who were unable to conscientiously scruples to join the union became Separatists or Old Lutherans and Old Calvinists, but their numbers were and are insignificant compared with those of the Evangelical Church. The latter forms the Church and is represented in the exercise of his ecclesiastical functions by the minister of public worship and instruction. The highest authority for the ordinary management of the Church is the Oberkirchsrat. Prussia has a representative body, the Reichsrat, which is elected by the lower houses of the Diet. The Church is managed by an embassy, consisting of representatives of the provincial and general synods. The clergy are appointed by the Crown, by the consistory, by private or municipal patronage, or by the government.

The hierarchy of the Roman Catholic Church in Prussia consists of two archbishops (Cologne, Gnesen-Posen) and ten bishops. The prince-bishop of Breslau and the bishops of Ermeland, Hildesheim, Minden, Munster, Osnabrück, Paderborn, Posen, Rheine, Soest and Fulda and Limburg are in the archiepiscopal diocese of Freiburg in Baden. The higher ecclesiastics receive payment from the state, and the annual appropriation appearing in the budget for the Prussian Church is distributed among the dioceses of Breslau, Cologne, Mainz and the Sean Church. All the Roman Catholic religious orders in Prussia have been suppressed except those occupied with attendance on the sick.

The relations of the state with the dissenting Christian sects, such as the Baptists, Mononites and Moravian Brethren, are practically confined to granting them charters of incorporation which confer on them certain civil rights. The state, however, is not permitted to pay an extra tax in lieu of military service, which is inconsistent with their belief, but this privilege has been withdrawn. The Old Catholics number about 30,000, but do not seem to be increasing.

The Jews belong mainly to the urban population and form 20 to 30% of the inhabitants in some of the towns in the Slavonic provinces. (For more exact details of the various religious creeds, see Germany.)

Education.—In Prussia education is compulsory, and the general level attained is very high. Every town or community must maintain a school, supported by the proceeds of the state. By the constitution of 1850, all persons are permitted to instruct, or to found teaching establishments, provided they can prove to the satisfaction of the state, that they possess a general education, and that they are, or will become, possessed of a higher educational institution than primary schools. All children must attend school from their sixth to their fourteenth year. At the head of the administration stands the minister of public instruction and ecclesiastics and ecclesiastical bodies. The higher schools are under the jurisdiction of the ordinary Regierungsrat or petty civil government. This is carried out through qualified school inspectors, frequently chosen from among the clergy, by the municipalities (Gemeinden), aided when necessary by subsidies from the state. The subjects of instruction are theology, reading, writing, spelling, arithmetic, the elements of geometry, history, geography, a natural science, singing, drawing, sewing, and gymnastics. All fees in the elementary schools are abolished. The number of illiterate recruits among those called upon each year for the army affords a good test of the university education. In 1898 the army, generally, had only 0.12% of men unable to read or write, while the recruits levied was only 0.13%. The teachers for the elementary schools are trained in normal schools, or seminaries. The renowned teachers of the state, and much has been done of late years to improve their position. In most of the larger towns the elementary schools are supplemented by middle schools (Bürgerschulen, Stadtschulen), which carry on the pupil from a school attended by peasantry. These seminaries are partly intended to draw off the unsuitable elements from the higher schools.

The secondary schools of Prussia may be roughly divided into classical and modern, though there are comparatively few of which Latin is quite omitted. The classical schools proper consist of gymnasia and pro gymnasia, the latter being simply gymnasia without the higher classical course. There are also some normal schools, universities and the learned professions, and the full course lasts for nine years. In the modern schools, which are divided into Realgymnasia and Realsprognasia, and also have a nine years' course, Latin is taught, but not Greek, and greater stress is laid upon modern languages, mathematics and natural science. The three lower classes are practically identical with those of the gymnasia, while in the upper classes the thoroughness obtained is only equalled by those of the universities. In the modern schools, though the subjects are somewhat altered. Ranking with the realgymsnasia are the Oberrealschulen, which differ only in the fact that Latin, if not always studied, is studied in the third or fourth term. They are thus devoted to modern languages. The Höhere or upper Bürgerschulen in which the course is six years, rank with the middle schools above mentioned, and are intended mainly for those boys who were unable to enter the higher business schools. Those who in these secondary schools possess the right of granting certificates entitling the holders, who must have attained a certain standing in the school, to serve in the army as one-year volunteers. The gymnasial "certificate of ripeness" (Maturitätszeugniss), indicating that the holder has passed satisfactorily through the highest class, enables a student to enroll himself in any faculty at the university, that of the realgymnasia qualifies only for the general "philological" faculty, and does not open the way to the medical, the church or the bar. Considerable efforts are, however, now being made to have the realgymnasia certificate recognized as a sufficient qualification for admission to higher medical and technical institutions, and of these schools a thoroughly good education may be obtained at a cost seldom exceeding, in the highest classes, 55 per annum. The teachers are men of scholarship and ability, who have passed the usual examinations, and are appointed by the government.

The majority of the secondary schools have been established and endowed by municipal corporations.

Prussia possesses ten of the twenty German universities (not including those of the lycées, and the Universities of the Magdeburg and Münster). The largest Prussian university is that of Berlin, while Breslau, Bonn, Göttingen and Halle are the next in size. The oldest is the university of Greifswald, founded in 1456. All these schools have faculties of theology. The university professors are appointed and paid by government, which also makes liberal annual grants for apparatus and equipment. The full obligatory course of study extends over three, and in the case of medicine, four years. It is, however, not unusual for non-military students also to spend four years at the university, and there is an agitation to make this compulsory. Students qualifying for
PRUSSIA

523

a Prussian government appointment are required to spend at least three terms or half-years (Semester) at a Prussian university. The Royal Academy of Sciences at Berlin, the University Technical High schools at Berlin, Hanover, Aix-la-Chapelle, and Danzig, the mining academies of Berlin and Clausthal, and the academies of forestry at Eberswalde and Marienwerder, besides the agricultural high schools at Berlin and Poppelsdorf (Bonn) and the two veterinary high schools of Berlin and Hanover. Music is taught at several conservatoria, the best known of which are at Berlin and Frankfurt-on-Main.

Frederick (1688-1713) founded a permanent permanent diplomatic service as the external expression in the academies of science and art at Berlin, both founded by Frederick I.; and each town of any size throughout the kingdom has its antiquarian, artistic and scientific societies. Recognizing the greater part of the exist at Berlin and Düsseldorf and both these towns, as well as Cassel, contain excellent picture galleries. The scientific and archaeological collections of Berlin are also of great importance. Besides the university collections, the library of the State, the public library of Berlin, and the chief of which is the royal library at Berlin (1,000,000 volumes).

Finance.—As in all civilized countries, the national accounts of Prussia are divided into the internal, or public, and the external, or state, revenue. The internal revenue consists in the direct, indirect, and personal taxes, custom duties, stamp duties, and the like; the national debt, value of money, and public buildings, are items of external revenue. The public expenses consist mainly of military, administrative, judicial, and educational, public works, and in the payment of the civil and domestic army. The foreign debt of the state is of secondary importance.

The public revenue of Prussia amounted in 1810 to 94,000,000 talers; in 1833 to 300,000,000 talers; in 1850 to 862,400,000 talers; and in 1859 to 1,080,440,000 talers. The public expenditure in 1810 was 76,700,000 talers; in 1833 it was 215,500,000 talers; in 1850 it was 638,300,000 talers; and in 1859 it was 900,000,000 talers. The public revenue has thus increased during the last 50 years about 10 times, and the public expenditure about 16 times. The public debt of Prussia has increased from 36,700,000 talers in 1810 to 255,000,000 talers in 1833, to 1,126,000,000 talers in 1850, and to 1,817,000,000 talers in 1859. The public debt is considerably reduced by the payment of interest, which is about 40 per cent of the public income; but it is still large and burdensome to the state.

The public revenue of Prussia is divided into the following items: (1) Direct taxes; (2) Indirect taxes; (3) Customs duties; (4) Stamp duties; (5) Banners, post-office, and telegraph tax; (6) National debt; (7) Public works; (8) Public buildings; (9) Public charity; (10) Contingent expenses; (11) Military expenses; (12) Diplomatic and Consular expenses; (13) Other expenses.

The public revenue of Prussia in 1859 was 1,080,440,000 talers, of which 590,481,700 talers were derived from direct taxes, 190,032,000 talers from indirect taxes, 84,645,000 talers from customs duties, 21,150,000 talers from stamp duties, 7,000,000 talers from the national debt, 35,000,000 talers from public works, 13,000,000 talers from public buildings, 13,000,000 talers from public charity, 4,000,000 talers from contingent expenses, 120,000,000 talers from military expenses, 5,982,911 talers from state lottery, 5,485,875 talers from direct taxes (principally income-tax), 7,410,684 talers from administrative receipts, 3,586,559 talers from the general financial control, 5,857,722 talers from the military, and 4,313,780 talers from the public savings. The public debt of Prussia in 1859 was 1,817,000,000 talers, of which 1,092,000,000 talers were foreign debt, 35,000,000 talers were public debt, and 430,000,000 talers were the national debt.

The court of Vienna consorted itself for the growing power of Prussia under the Great Elector by the reflection that it was probably temporary and due mainly to the vigorous individuality of that prince. The events of Frederick I.'s reign seemed to justify this view. At his accession Prussia might fairly claim to rank as the second state of Germany, but before the death of Frederick, Bavaria, Saxony and Hanover all raised themselves to at least a level with Prussia. Frederick's preoccupation in the western wars had allowed Sweden to reassert her pre-eminence in northern Europe, and it was Russia, and not Prussia, that now impeded her progress. The internal soundness of the country had also suffered: the finances were in a state of complete disorganization, and the burden of taxation was almost insupportable. If Frederick's son and successor had not been a man of vigorous character the downhill progress might have continued until it had removed Prussia altogether from the list of important states.

The accession, on the 25th of February 1713, of Frederick William I. of Prussia, produced at once a complete change of system. The new king, whose literary education had been neglected, shared none of his father's artistic tastes and none of his talents, and had a complete contempt for the trappings of royalty. On the other hand, he possessed administrative and military talents of no mean order and was singularly painstaking, industrious and determined in carrying out his plans. By carefully husbanding his finances Frederick William filled his treasury and was able to keep on foot one of the largest and best disciplined armies in Europe, thereby securing for Prussia an influence in European councils altogether disproportionate to its size and population. In internal management he made Prussia the model of France. He made Prussia a republic of guilds.
PRUSSIA

the greatest economy. The king himself set the example of the
frugality which he expected from his officials, and endowed himself
with a civil list of 52,000 thalers (75,000). The domains were now
managed so as to yield a greater income than ever before, and
important reforms were made in the system of taxation. By the
substitution of a payment in money for the old system, where the
noble were deprived of their practical exemption from taxation,
and they were also required to pay taxes for all the peasant holdings
then absorbed, the burdens which were formerly imposed upon
the peasants, and the worst features of vilainage were abolished
in the Crown domains. The military system of cantonment,
according to which each regiment was allotted a district in which to
recruit, was practically abolished, as the military importance, since
they brought the peasants into direct contact with the royal officials. The
collection of the taxes of the peasantry was removed from the hands
of the landowners. The duties of the state officials were laid down
with scrupulous detail, and in some cases were practically
invariably complied with. The most important industrial undertaking
was the introduction of the manufacture of woolen cloth, the royal
factory at Berlin supplying uniforms for the entire army. The
commercial regulations, conceived in a spirit of rigid protection,
were less successful. In the ecclesiastical sphere the king was able
to secure toleration for the Protestants in other parts of Germany by
his own authority, on his own faith and in his own name; and he
welcomed to numerous Protestant refugees, including 18,000 exiled
peasants from Salzburg (1732). He has the credit of founding the
common-school system of Prussia and of making elementary educa-
tion compulsory.

On the 11th of May 1740 Friedrich William died, and was
succeeded by his son as Frederick II., known in history as
Frederick the Great. The young king at once Frederick
resolved to use the well-filled treasury and well-
disciplined army left to him by his father for the
purpose of increasing the position of Prussia in Europe. The
death of the emperor Charles VI., the last of the male line
of the house of Hapsburg, on the 20th of October 1740, gave him
his opportunity, by raising the question of Maria Theresa's
right to succeed under the Pragmatic Sanction (see Charles VI.,
AUSTRIA-HUNGARY: HISTORY).

Austrian duplicity in the matter of Jülich gave him a
pretext for his hostile attitude in reviving the long dormant
claims of Prussia to the Silesian duchies. Within a year of
his accession he had embarked on the Silesian War, and this
was closely followed by the second, which ended in 1745, leaving
Frederick in undisputed possession of almost the whole
of Silesia, with the frontier that still exists. East Friesland, the
Prussian claim to which dated from the time of the Great Elector,
was absorbed in 1744 on the death without issue of the last
duke. The two Silesian Wars completely exhausted the stores
left by his father. He had to part with Hanover, and with
Frederick William, both of grenadiers and thalers, and
Frederick gladly did it, whatever the consequences, to
recover the imperial treasures and allow his subjects time to recover from their
exertions. When the Seven Years' War broke out in 1756
he had an army of 150,000 men at his command, representing
about one-seventh of the available male population of his little
kingdom. He had also a fund of 11,000,000 thalers in his
treasury, though this would have gone but a small way had
he not been assisted by the subsidies of England and able to make
the fertile plains of Saxony his chief basis of supply. (See SEVEN YEARS' WAR.)

Though without gain in extent or population, Prussia emerged
from the war as an undoubted power of the first rank, and
forthwith completely eclipsed Saxony, Bavaria and Hanover,
while it was plain that Austria would no longer stand
without a rival for the hegemony of the German Empire. The
freshness of the victory put Frederick in a fighting mood during
the war about 180,000 fell in the service of Prussia, and the
gross population of the kingdom had decreased in seven years
to the extent of half a million souls. The misery and poverty
indirectly attended on the war were calamities to the feudal
system of the country was thrown back for many years, which were almost
a repetition of the period succeeding the Thirty Years' War. But
while nearly a century elapsed before the traces of that struggle
disappeared, Frederick restored most of the ravages of the Seven

524

state of Europe, though his administration was of a purely
arbitrary type, in which the estates were never consulted and
his ministers were merely clerks to register his decrees. His
first act was to reform the expensive institutions of the court,
and the annual allowance for the salaries and pensions of the
chief court officials and civil servants was at once reduced from
79,000 to 55,000 thalers. The peace of Utrecht (1713) left
Frederick William free to turn his attention to the northern
war then raging between Sweden on the one side and Russia, Poland,
and Denmark on the other. Though at first disposed to be
friendly to Sweden, he was forced by circumstances to take up
arms against it. In September 1713 Stettin was captured by
the allies and handed over to the custody of Frederick William, who
paid the expenses of the siege and undertook to retain possession
of the town until the end of the war. But Charles XII. refused
to recognize this arrangement, and returned from his exile in
Turkey to demand the immediate restitution of the town. With
this demand the king of Prussia naturally declined to comply,
unless the money he had advanced was reimbursed; and
the upshot was the outbreak of the only war in which Frederick
William ever engaged. The struggle was of short duration, and
was practically ended in 1715 by the capture of Stralsund by
the united Prussians, Saxons and Danes under the command
of the king of Prussia. The Swedes were driven from Pomer-
ania, and at the peace of 1720 Frederick William received
the greater part of Swedish Pomerania, including the important
ports of Stettin. Sweden was now dispossessed of the ranks
of the Great Powers, and Prussia was left without a rival in northern
Germany.

A detailed history of Frederick William's reign would necessitate
the recital of a long and tedious series of diplomatic
proceedings, centring in the question of the succession to the
duchies of Jülich and Berg. The treaty of Wusterhausen
between Austria and Prussia was concluded in 1726, and was
confirmed with some modifications by the treaty of Berlin in 1728.
Frederick William engaged to recognize the Pragmatic Sanction,
while the emperor undertook to remove the claim of
his son by marriage to Prussia's claims to Jülich and Berg. The policy of the latter, however,
was far from straightforward, as he had already entered into
a similar compact with the count palatine of Sulzbach,
who was a Roman Catholic and therefore a more sympathetic ally.
Frederick William's intervention in the matter of the succes-
sion to the throne of Poland, rendered vacant by the death
of Augustus II. in 1733, proved barren of advantage to Prussia and
failed to secure the hoped-for reversion of the duchy of Courland.
A Prussian contingent took part none the less in the ensuing
war between Austria and France, but Austria concluded peace
in 1735 without considering her allies in the kingdom of Prussia
the king having been brought to bear upon him by England, France,
Holland and Austria to induce him to submit to their settlement
of the Jülicher-Berg question; and in 1739, convinced
at least of the confirmed duplicity of the emperor, he turned
over to his hereditary enemy for help and concluded a defensive
alliance with France. The rivalry between Austria and Prussia
had begun, which for the rest of the century formed the pivot
on which the politics of Europe mainly turned.

The Frederick II. reign is not especially
 glorious, and if in diplomacy he was worsted by the emperor,
the country at least enjoyed the benefits of a twenty-five
years' peace and efficient government. During this
reign the revenues of Prussia were doubled, and the king
left at his death an accumulated treasure of 9,000,000
thalers and an army of 85,000 men. Though not ranking
higher than twelfth among the European states in extent
and population, Frederick William occupied the fourth place
in military power. The king himself took the greatest interest in
the management of his army, in which the discipline was of the strictest;
and the king was authority of the highest degree.
Frederick William's reforms of the departments of the administration.
His chief innovation was the abolition of the distinction between
the military and the civil funds, and the assignment of the entire financial management of the country to
a general director, found in the war and arm.
mand. The state treasury was instructed to pay for everything out of a common fund,
and so to regulate the expenditure that there should invariably be a
surplus at the end of the year. As the army absorbed five-sevenths
of the revenue, the civil administration had to be conducted with

PRUSSIA

Frederick
William I.

Frederick
William II.
Years War in a tenth of the time. By great dexterity in the management of finances he had kept clear of debt, and was soon able to advance large sums to the most impoverished districts. Foreign colonists were invited to peopile the deserted villages; taxes were in several instances reduced for a twenty years; the old system of land tenure was amended in farm labour; and individual effort in every department was liberally supported by the government. By 1770 nearly all the ruined villages had been rebuilt; the ground was again under cultivation; the forests were restocked; the vacant offices were filled; and the debased currency had been called in.

Throughout the kingdom agriculture was encouraged by the drainage of marshy districts; industry was extended by the introduction of new occupations, and new manufactures, and the employment of cheap hired labour was fostered by measures of protection. Frederick's methods of administration did not greatly differ from those of his predecessor, though the unremitting severity of Frederick's predecessor was relaxed. Frederick's own personal supervision extended to every department, and his idea of his position and duties made him his own first minister in the widest and most exacting sense. The vacuums which the abdication and the bureucracy were unceasing, and he succeeded in training a body of admirable public servants. One of his most sweeping reforms was in the department of law, where, with the able aid of the jurist Samuel von Cocceji (1679-1735), he carried out a complete revolution in procedure and personnel. One of the king's first acts was to abolish legal torture, and he rarely sanctioned capital punishment except in cases of treason.

The Declaration of Independence (1740) freed Prussia from all relations with the imperial courts and paved the way for a codification of the common law of the land, which was begun under Frederick's successor. Frederick and his successor were both keenly interested in the development of philosophy and science. Frederick was a disciple of the new philosophy, and his own mind was influenced by the ideas of Leibniz.

In 1772 Prussia and Austria, in order to prevent an overwhelming growth of Russia, joined in the first partition of Poland. Frederick's share consisted of West Prussia and the Netze district, which filled up the gap between the great mass of his territories and the isolated district of East Prussia. It had also this advantage over later acquisitions at Poland's expense, that it was a thoroughly German land, having formed part of the colonizations of the Teutonic Order. In 1778 Prussia found herself once more in opposition to Austria on the question of the Bavarian succession, but the difficulty was adjusted without much bloodshed; Frederick was content to engage in the war with Austria, and in 1787 he signed a peace treaty with her in the presence of her representative, Count von Arndt.

Frederick II., ruler with something of the iron will and ability of 1766-1787. Frederick the Great. Unfortunately Frederick's nephew and successor, Frederick William II., had neither the energy nor the insight that his position demanded. He was too devious to adhere to the vigorous external policy of his predecessor, nor did he on the other hand make any attempt to meet the growing discontent by an internal movement of liberal reform. The rule of absolutism continued, though the power now lay more in the hands of a "camarilla" or cabinet than in those of the monarch; and the statesmen who now came to the front were singularly short-sighted and inefficient. The freedom of religion and the press left by Frederick the Great were abrogated in 1788 by royal ordinance. In 1787 the army engaged in an expensive and useless campaign against Holland. The abandonment of Frederick's policy was shown in a tendency to follow the lead of Austria, which culminated in an alliance with that power against revolutionary France. But in 1795 Prussia, suspicious of the Polish plans of Russia and Austria, concluded the separate peace of Brest-Litovsk that came three years after. The separate peace was a masterpiece of the art of war; the stipulation that all north German states beyond a certain line of demarcation should participate in its benefits. This practically divided Germany into two camps and inflicted a severe blow on the imperial system. The indifference with which Prussia relinquished to France German lands on the left bank of the Rhine, compared with her eagerness to increase her Slavonic territories on the east, was certainly one of the great blunders of the reign. Prussia's share in the second and third partitions of Poland (1793 and 1795) nearly doubled her extent, but added little or nothing to her real power. The twelve years following the partition of Poland were, indeed, the most prosperous period of the history of Prussia. Her prestige was lost by her persistent and ill-timed neutrality in the struggle with France; the old virtues of economy, order and justice disappeared from the bureaucracy; the army was gradually losing its excellence and was weakened rather than strengthened by the hordes of disaffected Polish recruits; the treasury was exhausted and a large debt incurred; the newly awakened feeling of German patriotism had died away, especially among the upper classes. (See FREDERICK WILLIAM II., KING OF PRUSSIA.)

Frederick William III. possessed many virtues that did him credit in his private capacity, but he was the man of the time, and the reign that was the most flourishing was that of his predecessor, and the power of Prussia was not so great as in the reign of Frederick William III. The coup d'etat of 1797-1806 was a failure, and the force that was able to maintain it was not a force of arms. The revolution in France was a revolution of ideas, and the support of the revolution was based on the support of the people. The support of the people was based on the support of the army, and the army was supported by the people. The support of the army was based on the support of the government, and the government was supported by the people.

The Prussian army was the army of the time, and the support of the army was the support of the time. The support of the army was the support of the people, and the support of the people was the support of the government. The support of the government was the support of the revolution, and the support of the revolution was the support of the people.

The Prussian army was the army of the time, and the support of the army was the support of the time. The support of the army was the support of the people, and the support of the people was the support of the government. The support of the government was the support of the revolution, and the support of the revolution was the support of the people.

The Prussian army was the army of the time, and the support of the army was the support of the time. The support of the army was the support of the people, and the support of the people was the support of the government. The support of the government was the support of the revolution, and the support of the revolution was the support of the people.
The condition on which Stein based his acceptance of office was itself of immense importance; he insisted that the system of governing through irresponsible cabinet coun-
sel, which had greatly become customary, should cease, and that the responsible ministers of departments should be at once the confidential advisers and the executive agents of the king. Stein's edict of 1807 abolished serfdom and obliterated the legal distinction of classes by establishing freedom of exchange in land and free choice of occupation. The "Städteordnung" of 1808 reformed the municipalities and granted them important rights of self-government. His administrative reforms amounted to a complete reconstruction of the ministerial departments and the machinery of provincial government, and practically established the system now in force. In 1807 Hardenberg, with a precipitancy which Stein would scarcely have approved, continued the reform in the condition of the peasants by making them absolute owners of part of their holdings, the landlords obtaining the rest as an indemnity for their lost dues. The army was also reorganized by Scharnhorst and Gneisenau, while the condition imposed by Napoleon that it should not exceed 42,000 men was practically evaded by replacing each body of men by another as soon as it was fairly versed in military exercises. The educational reforms of Wilhelm von Humboldt established the school system of Prussia on its present basis, and the university of Berlin was founded in 1809 (see Stein, H. F. C. Freiherr von; Hardenberg, K. A. von).

Frederick William hesitated to take part in the Austrian rising in 1809, but his opportunity came in 1813, when Napoleon fled from Russia. General York, commander of the corps that Prussia had been obliged to contribute to the French expedition, anticipated the formal declaration of war by joining the Russians with his troops on his own responsibility (Dec. 30, 1812). On the outbreak of the war the people rose en masse and with the utmost enthusiasm. A treaty of alliance between Russia and Prussia was concluded at Kalisch, and Austria, after some hesitation, also joined the league against Napoleon. In the struggle that followed (see Napoleonische Kriege), Prussia played one of the most prominent parts, and her general Blücher was the driving force of the allied armies. Between 1813 and the battle of Waterloo Prussia lost 140,000 men, and strained her financial resources to the utmost. As compensation she received at the Congress of Vienna the northern half of Saxony, her old possessions west of the Elbe, Swedish Pomerania, the duchies of Berg and Jülich, and other districts in Westphalia and on the Rhine. The acquisitions of the last partition of Poland, with the exception of the grand-duchy of Posen, were resigned to Russia; Friedland went to Hanover, and Bavaria was allowed to retain Baireuth and Ansbach, which had come into her hands in 1806. This arrangement of the map did not wholly restore Prussia to its former extent, as its area was now only 168,000 sq. m. compared with 122,000 sq. m. at the beginning of 1806, but the substitution of German for Slav territory and the shifting of the centre of gravity towards the west more than made up for any slight loss in size. Hanover still formed a huge wedge splitting Prussia completely in two, and the western frontier was very ragged. Prussia's position required caution, but forced upon it a national German policy; and the situation of the new lands was vastly more effectual in determining the future of leader of Germany than was Austria's aggrandisement in Italy.

The task that confronted Frederick William III. in 1815—that of welding together the heterogeneous elements assembled under his crown by the great congress—was one that would have taxed the sagacity and energy of many a statesman. The population of Prussia had been more than doubled, and contained besides 2,000,000 Slavs, people of every German race and, as an additional problem, the annexation of the Rhine provinces and raised the number of Prussians to that of the most Protestant of the German monarchies to some two-thirds of the whole. On the 3rd of June 1814 the king had issued a cabinet order promising on his return to give a decision as to a new constitution. But first a constituent assembly had been appointed by the Congress of Vienna, which met at Potsdam on June 28. The king could not then have been, and was not, in a position to demand a new constitution by force. His power had been so weakened by the defeat at Leipzig that he was unable to support the constitution which the assembly had proposed. The constitution was based on the Zollverein, which was to become the material basis of Prussia's influence in Germany. (For details see Germany: History, xi, 565.)

The Zollverein, a free trade union between the German provinces, reduced the government achieved results of lasting value. The university of Bonn was founded, the others were reorganized; numerous Gymnasien were built and above all...
elementary education was made universal and compulsory. Less happy was Frederick William's attempt to adjust the religious differences of his subjects with the corporal's cane. In 1817, the tercentenary of the Reformation, a royal decree was passed that henceforth Lutherans and Reformed were to unite in one "Evangelical Church," the public use of the name "Protestant" being officially forbidden. The decrees were signed by the archbishops, who refused to conform, were forbidden to find a separate community, and refractory pastors were dragooned and imprisoned. A quarrel also broke out between the Schleswig Catholic Church on the question of "mixed marriages," which culminated in 1837 in the imprisonment of Baron Prosper von Vishering (q.v.), archbishop of Cologne, and of the archbishop of Posen.

In foreign politics, too, Prussia proved but a secondary rôle after 1815. The old government, which had represented at the various congresses up to that of Verona in 1822, but whose sole idea was to support the views of Metternich, and later, those of the emperor Nicholas I. of Russia. (See Europe: History.)

Frederick William III. died on the 7th of June 1840. In spite of his faults, he had accomplished great, things for Prussia, and his kindness of heart, his devotion to duty and the memory of his sufferings maintained his personal popularity to the last (see Frederick William III.: King of Prussia). Of his son, William I. (1818-1888), Frederick and successor, Frederick William IV. lost his best revenge. His talents were undeniable 1840-1861, and he had gained as crown prince a reputation for Liberalism. One of his first acts was to liberate Jahn and the imprisoned archbishops, to reinstate Arndt in office and to issue a general amnesty (Aug. 10, 1840). Five years later he allowed the Old Lutherans liberty to set up a Church of their own. But in spite of these promising beginnings, it was soon clear that the king was wholly out of touch with the ideas of modern Liberalism. In spite of the warnings of the emperor Nicholas I. and of Metternich, he sought to satisfy the cry for a constitution by issuing on the 13th of February 1849 a patent summoning the "United Diet for Prussia"—in other words, a mere "concentration" of the provincial Diets. The story of the contest that followed between the Crown and the people is outlined elsewhere (see Germany). It is only necessary here to give some account of the constitutional development in Prussia itself.

The most important landmark in this respect was the law promulgated after the dissolution of the lower house of the revolutionary National Assembly on the 27th of April 1849. This law, which was only slightly modified by the electoral reform law of 1910, divided the parliamentary elections between the provinces, being determined by population or official and professional position. In the elections that followed, the disguised democrats took no part, with the result that the chambers that met on the 7th of August 1849 were strongly Conservative and made no difficulty about revising the democratic constitution of 1848 in accordance with the royal wishes. The constitution, thus amended, was proclaimed on the 31st of January 1851, and has remained substantially that of Prussia ever since. Its immediate effect was an extraordinary series of reactionary measures, e.g., the restoration of the old manorial courts, the establishment of a new adminis- tration of the parliament as consisting of a House of Lords (Herrenhaus) and House of Delegates (Abgeordnetenhaus) was fixed in 1854, and in this assembly the dominant element con- tinued to be that of the Prussian Junkertum or squarcry, which supported the king and his government in all their reactionary efforts.

So far as the internal history of Prussia is concerned, little was altered by the substitution of William as regent for his brother, now hopelessly mad, in 1858. The new ruler, who became king in 1861, shared to the full his predecessor's views as to the divine right of the Prussian crown. He was prepared to accept the established constitutional forms, but he was not prepared to sacrifice to them what he firmly believed to be the divinely appointed mission of Prussia in Germany. Bismarck, who became prime minister in 1862, fully shared his master's views. He realized, what the lower house did not, that the German question could only be settled as the result of a trial of strength between Prussia and Austria and that therefore it was necessary for Prussia to spend money on armaments; and, since he could not give his real reasons to the parliament and the parliament refused to accept the reasons he did give, he raised the necessary funds in defiance of the votes of the House of Delegates. The result justified him in the eyes of the Prussian people. Bismarck's policy, culminating in the war of 1866, left Prussia the undisputed mistress of Germany (see Schleswig-Holstein Question; and Germany: The Prussian Kingdom). Of the Treaty of 1866 Prussia acquired Hanover, Hesse-Cassel, Hesse-Nassau, Frankfort and the duchies of Schleswig-Holstein and Lauenburg; her territory had been increased by one-fifth and became for the first time satisfactorily rounded off and compacted; by the acquisition of the Elbe duchies, too, she laid the foundations of her future sea-power. In 1871 as the result of the German victory over France the king of Prussia became German Emperor.

From 1867 onward Prussia has had from the point of view of international politics no existence apart from the North German Federation. In the affairs of Europe, moreover, Prussia—be it in the Franco-Prussian War of 1870-71, or even in internal affairs her preponderance and influence in Germany have been overwhelming. For all practical purposes the German Empire has been Prussia, whose ruler, Wilhelm I., survived much longer than the feeling of the lesser states has rated the process, the "Prussianization," in greater or less degree, of all Germany was inevitable from the moment that the great imperial departments—army, customs, railways—were under Prussian control, and had been con- formed to the Prussian model. With this particular expansion of Prussia, however, we are not concerned, but solely with the internal development of the country, the settlement of the question of the Roman Catholics on the one hand and the Social Demo- crats on the other. While the whole government accepted their fate with equanimity, though in Hanover especially the deposed dynasty continued to command a con- siderable following of which the ablest spokesman was Windthorst (q.v.). Since the princes refused to resign their claims, the large sum of money which had been assigned to them by the Prussian parliament was, so early as March 1869, sequestered, and, under the name of the Gielp Fund (Welfenfonds), formed a secret service supply highly convenient for Bismarck's purposes. More difficult was the task of pacifying the provinces in the north. In the Danish War of 1864, the Danish princes of Schleswig-Holstein and the Polish districts in the eastern provinces, a task which after thirty years of effort shows but very small results (see Schleswig-Holstein Question: Prussian Occupation).

Closely connected with the Polish question was the quarrel with the Roman Catholic Church, known as the Kulturkampf, of which Prussia was the focus (see Germany: History, xi. 380 seq.). The anti-Vatican policy, associated especially with the name of the minister Falk, necessi- tated an alliance of the government with the Liberals, and this led to a policy of at least administrative reform. The present administrative system (Kreisordnung) of Prussia was introduced in 1872 for certain provinces, but not extended to the whole kingdom until 1888, when it was applied to Posen. The next step was the breaking up of the attitude of a lukewarm temper; and when in 1878-1879 Bismarck decided to reverse the fiscal policy of the country and to pass repressive legislation against the Social Democrats, the church was not left out. The revolt of the Catholics was ex- tremely weak, and resistance. In 1879 the moderate Liberal ministry remained, and was succeeded by a Conservative cabinet in which the most conspicuous figure was Robert von Put- tkamer (q.v.). He gave the government considerable parliamentary support on a union of the National Liberals and Conservatives or of the Conservatives and Ultramontanes. An eventual understanding with the Holy See was inevitable, and it was finally made in 1878. The Kulturkampf was finally terminated when the Prussian government, assisted by the diplomatic attitude of Pope Leo XIII., came to terms with Rome. Meanwhile in 1879 there arose a new and strong opposition to Bismarck, begun by the purchase by the state of three of the great railways, thus laying the foundation of the present system of state railways in Prussia.

On the 9th of March 1888 William I. died. His successor,
Frederick III., only lived till the 15th of June, the sole important act of his reign being the dismissal of Puttkammer. Under his successor William II. the development of Prussian affairs continued on the lines laid down under his father. William I., the main difference being that, after the fall of Bismarck (March 20, 1890), the old antagonism between the unrepresented masses and the government tended to change into one between these masses and the middle-class Crown. For while in the unreformed parliament the squirearchy was still disproportionately represented,1 Socialism denounced by the king-emperor as treason Franchise against himself and the country—spread rapidly among the unrepresented population. The country grew apace, and the trouble culminated in 1908 and 1909. In 1908 a bill raising the number of members of the Diet from 433 to 443 and effecting an unimportant redistribution of seats had been passed, but a Radical amendment Growth of Social Democracy in favour of direct and universal suffrage and the secret ballot had been rejected by a large majority. In 1907 the elections for the Reichstag resulted in a remarkable Reform Bill of 1910. defeat of the Socialist forces, and this had its effect in Prussia also. In 1908 a resolution in favour of universal suffrage was again brought forward. It was opposed by Prince Bölow, the German chancellor, and was rejected by a large majority. Riots followed in Berlin and demonstrations in favour of the reform throughout the country, and at the new elections in June seven Socialist members were returned—a portentous phenomenon Reform Bill in actual franchise. The session of 1909 the reform resolution was again brought forward, and again thrown out by the Conservative majority.

Demonstrations and collisions with the police followed in most of the large Prussian towns, and in October four of the Socialist members returned in 1908 who had been unseated on technical grounds were re-elected. It became clear to the government that some step must be taken to pacify opinion, and accordingly in the speech from the throne delivered on the 11th of January 1910 the king-emperor announced a measure of franchise reform. The agitation, however, continued, and the terms of the bill which it was introduced by Herr von Bethmann-Hollweg on the 10th of February were not so as to conciliate opposition. The chancellor and minister-president adhered to the principles enunciated by his predecessor;2 the bill retained the triple class division of voters, public voting and plural votes; the voting, however, was to be direct and certain changes were suggested giving less to the moneyed interest and more to the professional classes. A furious agitation took place all over the country culminating in a series of Socialist demonstrations on the 14th in Berlin and elsewhere; owing to the elaborate police precautions there was, however, no serious disturbance; but on the evening of the 18th there was street fighting between rioters and police in Frankfort. Meanwhile, on the 13th, the bill had been referred to a committee of the Diet. No party was satisfied with it; the Berlin municipality petitioned for its entire rejection; but its fate was ultimately determined by an agreement between the representatives of the Conservative and Catholic Centre parties on the committee, the Latter agreeing to support the retention of indirect voting on condition of the former declaring in favour of the secret ballot (Feb. 22). In this sense the committee finally reported, in spite of the government's efforts to retain public voting and to concede direct election, and on the 14th of March the bill in this shape passed its second reading. On the 16th the third reading was called, all the parties except the Conservatives and the Centre voting against it; Herr von Bethmann-Hollweg accepted the bill on behalf of the government, merely reserving the right to amend it in matters of detail. Demonstrations and riots in various centres showed how far this result was from satisfying the popular demands. Thus Prussia retained, in contradistinction to the Sothe German state, its traditional character, as a land ruled from above, the monarchy and the bureaucracy basing their authority not on the will of the people, but partly on divine right and partly on the middle-class terror of the social revolution, while as its ultimate sanction there remained the tremendous power of the king of Prussia as supreme "war lord" of Germany. It remained to be seen how long these conditions could last in a country which, during the tremendous material expansion of the period following the war, had developed an immense industrial and commercial population which, as it thought it saw its interests sacrificed to the agricultural classes by the traditional feudalism and inherited loyalty to the Prussian system.

BIBLIOGRAPHY.—For sources see K. Klette, Quellenkunde der Gesch. des preuss. Staates (Berlin, 1858-1881); Bl. i. Schildstrailer, Bd. ii. Urbunken-Reperatorium; F. Zurbonren, Quellenkunzel zur brandenburg-preuss. Gesch. (Berlin, 1886); Gesch. (1884-1888), Forschungen zur preuss. Gesch. (Leipzig, 1888 seqq.). Records of the Prussian government in the 18th century are published under the title of Acta anno Regnandi. Among the many volumes which may be mentioned Ranne, ZöRst. Bücherprussischer Gesch., 5 vols. to 1745 (2nd ed., Leipzig, 1782); Droungen, Gesch. der preussischen Politik, 5 parts in 15 vols. to 1765 (Berlin and Leipzig, 1853-1888); H. G. Fritz, Preussische Geschichte, 8 vols. to 1887 (Stuttgart, 1900-1902); and for constitutional history, C. Bornhak, Preussische Staats- und Rechtsgeschichte (Berlin, 1903). Of the many works devoted to special aspects about the German Historical period the most important, in the opinion of the writers, are: Lebensgeschichte der Berthelot, Ann. phys., 50o-55o C. (M. Berthelot, Ann. chim. phys., 1859 (5), 18, p. 380); by passing induction sparks through a mixture of acetylone and hydrogen to 500-550° C. (F. Wöhler, Ann. 1859, 73, p. 219), the anhydrous formic acid obtained by fractional distillation of the aqueous distillate, special precautions being necessary owing to the exceedingly poisonous nature of the free acid: KFe(ONO)3+2H2SO4=K2SO4+FeSO4+6H2O.

The free acid is a colourless liquid with a smell resembling bitter almonds; it boils at 261° C, and may be solidified, in which condition it melts at -14° C. It burns with a blue flame, and is readily soluble in water, but the solution is unstable and decomposes on standing, giving amorphous insoluble substances, and ammonium formate, oxalic acid, &c. An aqueous solution of hydrogen peroxide converts it into oxamide, (CONH)2, and reduction by zinc and hydrochloric acid gives methylamine. The anhydrous acid combines with hydrochloric, hydrobromic and hydroiodic acids to form crystalline addition products, which
are decomposed by water with the formation of the corresponding ammonium salt and formic acid. It combines with aldehydes and ketones to form the nitriles of oxy-acids, for example, CH₃CHO+H₂C=CH(OH)=CH₂CH(OH)(CN).

It is a very weak monobasic acid, and the aqueous solution has a very low electric conductivity.

Cyanides.—The salts of this acid, known as cyanides, may be prepared by the action of cyanogen or of gaseous hydrocyanic acid on a metal; by heating the cyanides or hydroxides of the alkaline metals in a current of hydrogen, or by fusing potassium ferrocyanide with potassium hydroxide containing suspended sulphur. Various processes involving the use of atmospheric nitrogen have been devised, but in most cases they do not yield good results, save for some use in the extraction of ammonium salts.

The Stassfurter Chem. Fabrik [Eng. pat. 9350–9 (1900)] pass ammonia over a mixture of alkali or alkaline carbonate and charcoal, first at a dull red heat and then at a bright red heat; K₂CO₃+H₂O+3Fe(NC)₃[Fr. pat. 242938 (1894)] pass ammonia over heated potassium ferrocyanide, which is then brought in a molten condition into contact with carbon: NaNH₃+C=NaNC+H₂. The Dörrscheidt and Lüttgert Anilinfabrik [Eng. pat. 10367 (1901)] prepare sodium cyanamide by melting sodium with carbons or some hydrocarbon, and passing ammonia over the melt at from 400°-600° C. The temperature is then raised to 700°-800° C., and the cyanamide is decomposed into calcium cyanate and carbon with the liberation of ammonia. H. W. Crowther and E. C. Rossiter [Journ. Soc. Ind., 1893, 13, p. 887] digest carbon bisulphide with ammonia and a calcium or magnesium salt, and pass the products of decomposition into a solution of calcium cyanate. It is prepared by passing ammonia into a solution of potassium cyanide. Hydrocyanic acid, H₄NC, is obtained by decomposing the lead salt with sulphuretted hydrogen under water, or with an acid treatment of the pyrophoric form of the metal, and is the chief source of the potassium salt. In the latter case the precipitate is dissolved in water, precipitated by ether, and washed with ether-alcohol.

PRUSSIC ACID
It is a tetrasubacid, of markedly acid character, and readily decomposes carboantes and acetates. It dissolves unchanged in concentrated sulphuric acid, and oxidizes readily in moist air, forming Prussian blue.

**PruSSIC or C. 1701; 2K or and 17 + 26x595**

position who solution &c., a regenerate the M of being prusside. J. Bueh (Congress of German Gas Industries, March 1900) brings gas (free from tar) into intimate contact with a saturated solution of ferrous sulphate, "cystallizing" the gas to the extent of 33% of the gas and the residue after filtration contains about 30% of Prussian blue. On the small scale it may be prepared by adding an acid solution of ferric chloride to a solution of copper cyanide and precipitate first formed is allowed to stand for some hours, washed, and then oxidised by a warm solution of ferric chloride: 6KFe[Fe(FCN)₆]+30=Fe₂(S₂O₃)³+3K₃[Fe(FCN)₆]+Fe₂O₃. It is a dark blue powder with a marked coppery lustre. It is insoluble in water and is not decomposed by acids.

**Solute Prussian blue, KFe[Fe(FCN)₆], potassium ferric ferrocyanide, is formed when a solution of potassium ferrocyanide is added to an insufficient solution of a ferric salt (1), or when potassium ferrocyanide is added to a ferrous salt (2):**

1. 2KFe[Fe(FCN)₆]+2FeCl₂=6KCl+K₃[Fe(FCN)₆]Cl₂
2. 2KFe[Fe(FCN)₆]+2FeCl₃=4KCl+K₃[Fe(FCN)₆]Cl₃

It is soluble in water, but is insoluble in salt solutions.

**Potassium ferrocyanide, K₂Fe[Fe(FCN)₆], red prussiate of potash, is obtained by adding an excess of potassium ferrocyanide to a solution of ferric chloride, K₃[Fe(FCN)₆]Cl₂, which is prepared by dissolving iron metal in concentrated hydrochloric acid, then adding a solution of potassium cyanide.**

When silver is precipitated as silver ferrocyanide, Ag₂[Fe(FCN)₆]. With a pure ferrous salt it only gives a brown coloration. It can be estimated quantitatively by mixing a dilute solution with potassium iodide and hydrochloric acid in excess, neutralizing the excess of free acid with sodium bicarbonate, and determining the amount of free iodine by a standard solution of potassium thiosulphate.

The zinc salt is added in order to remove the ferrocyanide formed as an impure zinc salt: K₃[Fe(FCN)₆]+3KI=2K₂[Fe(FCN)₆]+K₃I. As an alternative method it may be decomposed by hydrogen peroxide in alkaline solution and the amount of evolved oxygen measured: 2K₂[Fe(FCN)₆]+H₂O₂=2K₂[Fe(FCN)₆]H₂O₂. The reaction is best obtained by adding a hot solution of potassium ferrocyanide to a ferrous salt, and allowing the mixture to stand some time in the presence of the hydrogen peroxide, e.g., K₃[Fe(FCN)₆]+3FeSO₄=3K₂[Fe(FCN)₆]SO₄. It is insoluble in dilute acids.

**Hydroferrocyanic acid, H₂Fe[Fe(FCN)₆], obtained by adding concentrated hydrochloric acid to a cold saturated solution of potassium ferrocyanide.**

The brown liquid is easily converted into the free acid.

**Nitroprussides.**—The nitroprussides are salts of the type M₂Fe[Fe(FCN)₆]NO. The free acid forms dark red deliquescent crystals and is obtained by decomposing the silver salt with hydrochloric acid, or the barium salt with dilute sulphuric acid.

**Sodium nitroprusside, Na₂Fe[Fe(FCN)₆]NO₂H₂O, is the commonest.** It is prepared by oxidizing potassium ferrocyanide with a diluted nitric acid. The solution is evaporated, separated from potassium ferrocyanide, and the free acid is then precipitated, by the addition of sodium carbonate, in the presence of the solution. It crystallizes in dark red prisms which are readily soluble in water; it is a valuable reagent for the detection of sulphur, this element being represented by a characteristic purple blue coloration with the nitroprusside. The potassium salt may be prepared by adding potassium cyanide to a ferrous sulphate solution, the brown precipitate so formed being then treated with potassium nitrite: 5 KNC+2FeSO₄=2K₂SO₄+K₃[Fe(FCN)₆]NO₂.

Other complex cyanides are known which may be regarded as derived from the acids Hₓ[CN]ₙXₙ, X=NI, FD, Pt; Hₓ[CN]ₙXₙ, X=Fe, Mn, H₂[N(CN)₃], etc. See Aberg, (Anorganische Chemie).

**Organic Cyanides or Nitriles.**—Hydrocyanic acid forms two series of derivatives by the exchange of its hydrogen atom for alkyl or aryl groups; namely the nitriles, of type R-CN, and the isonitriles, of type R-C=N. The latter compounds may be considered as derivatives of the as yet unknown isohydrocyanic acid HNC.

**Nitrites.—**These substances were first isolated in 1834 by J. Pelouze (Ann., 1834, 10, p. 249). They may be prepared by heating the alkali iodides with potassium cyanide; by heating sulphuric acid esters with potassium cyanide; by distilling the acid-amides obtained by adding phosphorus pentoxide to the alcohol containing more than five atoms of carbon) with bromine and potash (A. Hofmann, for example)

C₄H₈Cl₂CNH₂→C₄H₈CNH₂Br→C₄H₈CN

In addition to these methods, the nitriles of the aromatic series may be prepared by distilling the corresponding acid anhydride with potassium cyanide and copper sulphate; by fusing the potassium salts of the sulphonic acids with potassium cyanide; by leading cyanogen gas into a boiling hydrochloric acid solution with presence of potassium ferrocyanide. Despretz, Soc. chim., 1895, 37, p. 735; and from the syn-aldoximes by the action of acetyl chloride or acetic anhydride.

They are mostly colourless liquids which boil without decomposition, as the series are somewhat soluble in water. They behave in most respects as unsaturated compounds; they combine with hydrogen to form amines; with water to form acidamides; with sulphur treated hydrogen to form isonitrile-amides, and with compounds of hydrogen to form imino-ethers C-(CN)OH. They are used as oxidizing agents and as compounds of organic chemistry, forming primary amines, R-C(=N)=NH₂, and with hydroxylamine to form amidines, R-C(=N)-NH₂, and with sodium nitrite to form nitrates, R-C(=N)-NO₂.

*Acetonitrile* boils at 81.6° C., and is readily miscible with water. *Propionitrile* boils at 97° C.; it is somewhat easily soluble in water, but is thrown out of solution by calcium chloride. It was obtained by H. Frank and C. Gram (J. Chem. Soc., 1885, 11, p. 740) from the action of cyanogen gas on zinc ethyl. *Allyl cyanide* boils at 119° C. *Benzonitrile* boils at 190.6° C. When solidified it melts at 20° C. It is easily soluble in alcohol and ether.

**The Isonitriles (benzoylacetaldehydes) were first prepared in 1866 by A. Gautier (Ann., 1865, 151, p. 239) by the addition of alkyl iodides on cyanide, and the distillation of the resulting cyanogen containing compounds.**

R₁R₂R₃N⁺+2H₂O=RN⁺R₂R₃CO=COH⁺+2NaCl. This reaction shows that the reaction is not a mere condensation of the ions. The carbon atom in the isonitriles is assumed by J. U. Néf to be divalent, since these substances readily form addition compounds, such addition taking place on the carbon atom, as is shown by the products of hydrolysis; for example with ethyl carbamylamine:

C₄H₄NC+C₂H₅COOH→C₄H₄NC(C₂H₅COOH)Cl→C₄H₄NC₂H₅OH+H₂O

This view was confirmed by J. Wade (Journ. Chem. Soc., 1902, 81, p. 185), who showed that the products obtained by the action of alkyl iodides on the isonitriles in alcoholic solution at 100° C. yield amine hydroxides and formic acid when hydrolysed. Such a reaction can only take place if the addition of the alkyl group takes place on the carbon atom of the isonitrile, and that the nitrogen atom must be trivalent and consequently the carbon atom divalent. The reactions may probably be represented as follows:

C₄H₄NC(C₂H₅OH)→C₄H₄NC⁺+C₂H₅OH
C₄H₄NC(+C₂H₅OH)→C₄H₄NC(C₂H₅)⁺(C₂H₅OH)
C₄H₄NC⁺(C₂H₅OH)→C₄H₄NC⁺(C₂H₅)OH

The isonitriles dissolve silver cyanide readily, forming a soluble silver salt (cf. KNC). At 200° C. the isonitriles are converted into cyanogen.
the formation of nitriles from potassium cyanide, and of isocyanides from nitrates. The most active products, however, are those in which the carbon atoms are in the form of the very stable ionic group 

\[
CN^-. \quad \text{or} \quad N^3-. \quad \text{or} \quad \text{other complexes of nitrogen.}
\]

When the compound is electrolyzed, the nitriles are decomposed into nitrogen and carbon, and the nitrates into oxygen and nitrogen. The decomposition of these compounds is therefore a very slow process, and it is probable that the presence of these substances in the blood of persons who have been in contact with them is not to be inferred from their atmospheric analysis.

One-fiftieth of a grain must be immediately injected subcutaneously. The skin of the animal is not affected, and large doses of these gases given as soon as possible. Every second is of consequence. Ammonia should be given by inhalation, and artificial respiration must never be forgotten, as by it the paralysed breathing may be compensated for and the poison counteracted. The use of chemical antidotes, such as iron salts, is futile, as the drug has escaped into the blood from the stomach long before they can be administered.

PRUTZ, HANS (1834– ), German historian, son of Robert Eduard Prutz (1816–1872), the essayist and historian; was born at Jena on the 20th of May 1843, and was educated at the universities of Jena and Berlin. In 1865 appeared his monograph on Henry the Lion, duke of Saxony and Bavaria, which was followed by three volumes on the emperor Frederick Barbarossa (Kaiser Friedrich I.) (Berlin, 1872; 1873; 1874). Meanwhile from 1863 to 1873 he was teaching in secondary schools. In 1874 he received a government commission to undertake explorations in Syria, particularly at Tyre, and as a result he published 1876 Aus Phönicien, a collection of historical and geographical sketches. In the same year appeared his first work on the Crusades, Quellenbeiträge zur Geschichte der Kreuzzüge, and a series of monographs on the same subject culminated in 1883 in the notable Kulturgeschichte der Kreuzzüge. Then turning to a wider theme Prutz contributed to Oncken's university history the two volumes on the political history of Europe during the middle ages (Staatengeschichte, 7 vols., Berlin, 1883–1887). In 1888 he reverted to a subject which he had touched upon in his Geheimlehre und Geheimstatuten des Tempelherrenordens (Danzig, 1879), and wrote the history of the rise and fall of the Templars (Entwicklung und Untergang des Tempelherrenordens), which is noticed in the article Templars. His Preussische Geschichte (4 vols., Stuttgart, 1890–1902), which is perhaps his most notable work, is an attempt to apply scientific rather than patriotic canons to a subject which has been mainly in the hands of historians with a patriotic bias. He also wrote Aus des Grossen Kurfürsten letzten Jahren (Berlin, 1897) and Bismarcks Bildung, ihre Quellen und ihre Ausserungen (Berlin, 1904). In 1902 Prutz resigned the chair of history in the university of Königsberg, which he had held since 1877, and took up his residence at Munich.

PRUTZ, ROBERT EDUARD (1816–1872), German poet and prose writer, was born at Steitten on the 30th of May 1816. He studied philology, philosophy and history at Berlin, Breslau and Halle, and in the last-named became associated, after taking his degree, with Arnold Ruge in the publication of the Hallische Jahrbücher. Subjected on account of his increased political views to police surveillance, he removed to Jena, where, on the strength of an excellent monograph, Der Göttinger Hoftheater (1841), he was appointed to his novels (e.g. Amadis und die Enzlwarte, Das Engelchen (1851) and Der Musikantenurn (1853). Much more important are his contributions to literary history and criticism. Vorlesungen über die Geschichte des deutschen Theaters (1847); Ludwig Holberg (1857); Die deutsche Literatur der Gegenwart (1859); and Menschen und Bücher (1862). Prutz also wrote some dramas of little merit.

See R. von Gottschall, in Unsere Zeit (1872).

PRYNE, WILLIAM (1600–1665), English parliamentarian, son of Thomas Pryne by Mary Sherston, was born at Swainswick near Bath in 1600. He was educated at Bath Grammar School, matriculated at Oriel College, Oxford, in 1618, obtained his B.A. in 1621, was admitted a student of Lincoln’s Inn the same year, and was called to the Bar in 1628. He was Puritan
to the core, with a tenacious memory, a strength of will bordering upon obstinacy, and a want of sympathy with human nature. His first book, *The Perpetuity of a Regenerate Man's Estate* (1627), defended one of the main Calvinistic positions, and *The Unholiness of Love-locks and Health's Sickness* (1628) attacked prevailing fashions without any sense of proportion, treating follies on the same footing as scandalous vices.

In 1629 Prynne came forward as the assailant of Arminianism in doctrine and of ceremonialism in practice, and thus drew down upon himself the anger of Laud. *Histrionicon obsequorum* published in 1633, was a violent attack upon stage plays in general, in which the author pointed out that kings and emperors who had favoured the drama had been carried off by violent deaths, which assertion might easily be interpreted as a warning to the king, and applied a disgraceful epithet to actresses, which, as Henrietta Maria was taking part in the rehearsal of a ballet, was supposed to apply to the queen. After a year's imprisonment in the Tower Prynne was sentenced by the star chamber on the 17th of February 1634 to be imprisoned for life, and also to be fined £5,000, expelled from Lincoln’s Inn, rendered incapable of returning to his profession, degraded from his degree in the university of Oxford, and set in the pillory, where he was to lose both his ears. The latter portion of the sentence was carried out on the 7th of May, and the rest of his punishment inflicted except the excision of the fine. There is no reason to suppose that his punishment was unpopular. In 1637 he was once more in the star chamber, together with Bastwick and Burton. In *A Divine Tragedy lately acted* he had attacked the Declaration of Sports, and in *News from Venice* he had assailed Wren, and the bishops generally. On the 30th of June a fresh sentence had been delivered on the 14th, was executed. The stump of Prynne’s ears was shorn off in the pillory, and he was branded on the cheeks with the letters S.L., meaning “seditious libeller,” which Prynne, however, interpreted as “stigmata lanidis.” He was removed to Carnarvon Castle, and thence to Mont Orgueil Castle in Jersey, where he occupied himself in writing against popery.

Immediately upon the meeting of the Long Parliament in 1640 Prynne was liberated. On the 28th of November he entered London in triumph, and on the 2nd of March 1641, a petition was voted by the Commons, at the expense of his persecutors. Prynne now attacked the bishops and the Roman Catholics and defended the taking up of arms by the parliament. The words “Touch not mine anointed,” he declared in the *Vindication of Psalm cx. ver. 15* (1642), only commanded kings not to oppress their subjects. In 1643 he took an active part in the proceedings against Nathaniel Fiennes for the surrender of Bristol, and showed a vindictive energy in the prosecution of Archbishop Laud. He manipulated the evidence against him, and having been entrusted with the search of Laud’s papers, he published a garbled edition of the archbishop’s private “Diary,” entitled *A Breviate of the Life of Archbishop Laud.*

He also published *Hidden Works of Darkness brought to Light* in order to prejudice the archbishop’s case, and after his execution, *Canterbury’s Doome* . . . an unfinished account of the trial commissioned by the House of Commons. Prynne supported a national church controlled by the state, and issued a series of tracts against independency, including in his attacks Henry Burton his former fellow sufferer in the pillory, John Lilburne and John Goodwin [e.g. *Independence Examined* (1644); *Brief Animadversions on Mr John Goodwin’s Theoc- machia* (1644), &c.]. He denounced Milton’s *Divine and Plural* published in the *Collection* and contemptuously referred to in the sonnet “On the Forcers of Conscience.” He also opposed violently the Presbyterian system, and denied the right of any Church to excommunicate except by leave of the state [e.g. *Four Short Questions* (1645); *A Vindication of Four Serious Questions* (1645)]. He was throughout an enemy of individual freedom in religion.

Prynne took the side of the parliament against the army in 1647, supported the cause of the eleven impeached members, and visited the university of Oxford as one of the parliamentary commissioners. On the 7th of November 1648 Prynne was returned as member for Newport in Cornwall. He at once took part against those who called for the execution of Charles, and on the 6th of December delivered a speech of enormous length in the House, recommending the king. The result was his inclusion in the “Pride’s Purge.” On the morning of the 6th, when resisting to military violence, he was imprisoned. After recovering his liberty Prynne retired to Swainswick. On the 9th of June 1649 he was assessed to the monthly contribution laid on the country by parliament. He not only refused to pay, but published a *Legal Vindication of the Liberties of England*, arguing that no tax could be raised without the consent of the two houses. In the same year he began a long account of ancient parliaments, intended to reflect on the one in existence, and in June 1650 he was imprisoned in Dunster Castle, afterwards at Taunton, and in June 1651 at Pendennis Castle. He was at last offered his discharge on giving a bond of £1,000 to do nothing to the prejudice of the commonwealth. This he refused, and an unconditional order for his release was given on the 18th of February 1653. After his release Prynne further expressed his feelings in defence of adovsons and patrons, an attack on the Quakers (1653), and in a pamphlet against the admission of the Jews to England (*A Short Demurrer to the Jews*) issued in 1656. On the occasion of the offer of the crown to Cromwell he issued *King Richard the Third Revived* (1657), and on the creation of the new House of Lords *A Plea for the Lords* (1658).

On the restoration of the Rump Parliament by the army of the 7th of May 1659 fourteen of the secluded members, with Prynne among them, claimed admittance. The claim was refused, but on the 9th, through the inadventerence of the doorkeepers, Prynne, Annesly and Hungerford succeeded in taking their seats. When they were observed the house purposely adjourned for dinner. In the afternoon the doors were found guarded; the secluded members were not permitted to pass, and a vote was at once taken that they should not again be allowed to enter the house. Wrathful at the failure of his protest and at the continuance of the republican government, Prynne attacked his adversaries fiercely in print. In *England’s Confusion,* published on the 30th of May 1659, in *The True and Full Narrative,* and in *The Brief Necessary Vindication,* he gave long accounts of the attempt to enter the house and of his ejection, while in the *Curative Drown* he held up the claims of the Rump to derision.

In *Skulking, Cutting and Dealing,* 26th of May, he rejoiced at the quarrels which he saw arising, for “if you all complain I hope I shall win at last.” *Concordia discors* pointed out the absurdity of the constant tendency to multiply oaths, while “remonstrances,” “narratives,” “queries,” “proscriptions,” “vindications,” “declarations” and “statements” were scattered broadcast. Upon the cry of the “good old cause” he is especially sarcastic and severe in *The True Good Old Cause Rightly Staled* and other pamphlets. Loyalty Baptisted explains itself. His activity and fearlessness in attacking those in power during this eventful year were remarkable, and an ironical petition was circulated in Westminster Hall and the London streets complaining of his indefatigable scribbling. On the 27th of December Prynne made another fruitless attempt to take his seat. In obedience to the popular voice, however, on the 21st of February 1660, the ejected members of 1645, led in triumph by Prynne, wearing a basket-hilt sword, re-entered the house. He supported the Restoration in this parliament, and in the Convention Parliament, which met on the 25th of April 1660, and in which he sat for March, he urged severe measures against the regicides, and the exclusion of several individuals from the Act of Indemnity. He was foremost in support of the claims of the Presbyterians and against the bishops; advocated the indiscriminate infliction of penalties, and demanded that the officials of the commonwealth should be compelled to refund their salaries. He was nominated a commissioner for disbanding the army, and was appointed keeper of the records in the Tower, a post in which he performed useful services.

Prynne was again returned as member for Benth on the 8th of
May 1661, in spite of the vehement efforts of the Royalists headed by Sir T. Bridge. This parliament was bent upon the humiliation of the Presbyterians, and Prynne appears in his familiar character of protester. On the 18th of this month he moved that the Engagement, with the Solemn League and Covenant, should be burned by the hangman. About the same time he published a pamphlet advocating the reform of the Prayer Book, while a tract issued on the 15th of July, Sundry reasons against the new intended Bill for governing and reforming Corporations, was declared illegal, false, scandalous and seditious; Prynne being censured, and only escaping punishment by submission. The continued attacks upon the Presbyterians led him to publish his Short, Sober, Pacific Examination of Excesses in the Common Prayer, as well as the Apology for Tender Consciences touching Not Bawling at the Name of Jesus. In 1662 there appeared also the Brevia parlamentaria reditiva, possibly a portion of the Brief Register of Parliamentary Writs, of which the fourth and concluding volume was published in 1664. During 1663 he served constantly on committees, and was chairman of the committee of supply in July, and again in April 1664.

In the third session Prynne was once more, on the 13th of May 1664, censured for altering the draft of a bill relating to public-houses after commitment, but the house again, upon his submission remitted the offence, and he again appears on the committee of privileges in November and afterwards. In 1665 and 1666 he published the second and first volumes respectively of the Exact Chronological Vindication and Historical Demonstration of the supreme ecclesiastical jurisdiction exercised by the English kings from the original planting of Christianity to the death of Richard I. In the latter year especially he was very busy with his pen against the Jesuits. In January 1667 he was one of three appointed to manage the evidence at the hearing of the imprisonment of Lord Mordaunt, and in November of the same year spoke in defence of Clarendon, so far as the sale of Dunkirk was concerned, and opposed his banishment, and this appears to have been the last time that he addressed the house. In 1668 he published his Aurum reginarum or Records concerning Queen-gold, the Brief Animadversions on Coke's Institutes in 1669, and the History of King John, Henry III., and Edward I., in which the power of the Crown over ecclesiastics was maintained, in 1670. The date of the Abridgment of the Records of the Tower of London, published 1689, is doubtful, though the preface is dated 1656-1657. Prynne died unmarried, in his lodgings at Lincoln's Inn, on the 24th of October 1669, and was buried in the walk under the chapel there. He left one portion of his books to Lincoln's Inn and another to Oriel College. His works number about 200 and occupy, together with the replies which they excited, twenty-four columns in the catalogue of the British Museum. Lists of them are given in Wood's Athenae Oxonienses (ed. P. Bliss), vol. iii., and in Documents relating to the Proceedings against William Prynne.

PRYOR, ROGER ATKINSON (1825-1906), American jurist and politician, was born near Petersburg, Virginia, on the 19th of July 1828. He graduated at Hampden-Sidley College in 1845 and at the law school of the university of Virginia in 1848, and in the same year he was admitted to the bar. He then engaged in journalism. He served as a Democrat in the National House of Representatives from December 1850 to March 1861, and was re-elected for the succeeding term, but owing to the secession of Virginia did not take his seat. He served in the provisional Conocoerator congress (1861) and also in the first regular congress (1862) of the Confederate constitution. He entered the Confederate army as a colonel, became a brigadier-general (April 16, 1862), and took part in the battles of Williamsburg, Seven Fines, second Bull Run and Antietam. Owing to a disagreement with President Davis he resigned his commission in 1863, but entered General Fitzhugh Lee's cavalry as a private in August of that year. He was taken prisoner on the 25th of November 1864, but was released on parole by order of the president. In 1865 he removed to New York City, where he practiced law. He was judge of the New York court of common pleas in 1890-1891, and of the New York supreme court in 1894-1899. His wife, Sara Agnes (Rice) Pryor (b. 1830), published The Mother of Washington and her Times (1903), Reminiscences of Peace and War (1904), The Birth of the Nation (1907), and My Day: Reminiscences of a Long Life (1909).

PRYTHEM and PRYTHAS (Gr. root προ, first or chief). 1. In general in ancient Greece, each state, city or village possessed its own central hearth and sacred fire, representing the unity and vitality of the community. The fire (cf. at Rome the fire in the temple of Vesta) was kept alight continuously, tended by the king or one of the vestal virgins, originally perhaps the daughters of the king). The building in which this fire was kept was the Prytheum, and the chiefain (the king or prytas) probably made it his residence. The word Pryntheus (plur. Pryntheis) is generally applied specially to those who, after the abolition of absolute monarchy, held the chief office in the state. Rulers of this name are found at Rhodes as late as the 1st century B.C. The Prytheum was regarded as the religious and political centre of the community and was thus the nucleus of all government, and the official "home" of the whole people. When members of the state went forth to found a new colony they took with them the fire from the Prytheum altar to kindle the new fire in the colony; the fatherless daughters of Aristides, who were regarded as children of the state at Athens, were married from the Prytheum as from their home; Thyuedides informs us (ii. 15) that in the Synoecism of Theseus (see Athens) the Prytheum of all the separate communities were joined in the central Prytheum of Athens as a symbol of the union; foreign ambassadors and citizens who had deserved especially well of the state were entertained in the Prytheum as public guests. In Achaea, this central hall was called the Leiton (town-hall), and a similar building is known to have existed at Ellis. This site of the Prytheum at Athens cannot be definitely fixed; it is generally supposed that in the course of time several buildings bore the name. The Prytheum, mentioned by Pausanias, and probably the original centre of the ancient city, was situated somewhere east of the northern cliff of the Acropolis. Hence the frequent confusion with the Tholos which was near the council chamber and was the residence of the Prytanis (see below) of the council. Curtius places the original Prytheum south of the Acropolis in the old Agora, speaks of a second identical with the Tholos in the Ceramicus, and regards that of Pausanias as a building of Roman times (Stadt- geschichte, p. 362). Wachsmuth holds the former view and regards the Tholos as merely a dining-room (or the Prytheum in the old democratic period. Many authorities hold that the original Prytheum of the Cecropian city must have been on the Acropolis. From Aristotle's Constitution of Athens (ch. 3) we know that the Prytheum was the official residence of the Archons, but, when the new Agora was constructed (by Peisistratus ?), they took their meals in the Thesmothetum for the sake of convenience. There was also a court of justice called the court of the Prytheum; all that is known of this court is that it tried murderers who could not be found, and inanimate objects which had caused death. Judging from its rather fanciful functions and from its name, it is probably a relic of the pre-historic jurisdiction of the patriarch-king.

2. For the Prytanis of the Boulé and of the Naucrarii, see Boulé and Naucracy.

3. Prytaneia were court-fees paid when the prosecutor was claiming a part of the penalty which the defendant would be called upon to pay if he lost.

4. Prytaneia was also the name of a legendary king of Sparta of the Eurypontid or Procid line. He was the son of Eurypon and fourth in descent from Procles.

PRZEMYŚL—PSALMS, BOOK OF

BIBLIOGRAPHY.—On the Prytanæum as the centre of an ancient state see article Fire, and references in a paper (p. 266) by Frazer (Journal of Philo., xxv. 38). For the site of the Athenian P. see E. Curtius, Atische Studien, and an article by Schöll (Hermes, v. 340); also general histories of Greece.

PRZEMYŚL, a town of Austria, in Galicia, 60 m. W. of Lemberg by rail. Pop. (1900), 46,295, mostly Polish. It is situated on the river San and is one of the strongest fortresses in Galicia. Przemyśl is the seat of a Roman Catholic and of a Greek uniat bishop, and has a Roman Catholic cathedral, begun in 1470.

The industries comprise the manufacture of machinery, liqueurs and spodium or dutty, the refining of naphtha, corn-milling and the sawing of timber. The trade is chiefly in timber, corn, leather and linen. On the hill above the town are the ruins of an old castle, said to have been founded by Casimir the Great.

Przemyśl, one of the oldest towns in Galicia, claims to have been founded in the 8th century, and was at one time capital of a large independent principality. Casimir the Great and other Polish princes endowed it with privileges similar to those of Cracow, and it attained a high degree of prosperity. In the 17th century its importance was destroyed by invasions of Tartars, Cossacks and Swedes.

PRZHEVALSKY, formerly Karakol (renamed in 1839), a town of Russian Turkestan, in the province of Semirechesk, 8 m. S.E. of Lake Issyk-kul. Nikolai Przhevalsky (Przhevalsky q.v.), the Russian explorer in Central Asia, died here in 1889, and a monument has been erected to his memory. It is a growing town, and had in 1897 a population of 7985.

PSALM (from the Gr. word φιλάκερ, to play the harp), the name used to designate the religious poems of the Hebrews, which are contained in the Psalter (see Psalms, Book of). Modern collections of religious poetry sometimes bear the title of Psalms and Hymns, but these are always more or less directly connected with the actual Psalms of David. Longfellow wrote "A Psalm of Life" (1839), which was an intimate confession of the religious aspirations of the author. The Psalms of Clément Marot (1538) were curious adaptations of Hebrew ideas to French forms of the epigram and the madrigal. But it is doubtful whether the psalm, as distinguished from the Hebrew Psalter, can be said to have any independent existence. It is loosely used to describe any exalted strain of devotional melody.

Psalmnazar, George (c. 1579-1763), French adventurer, was born about 1679, probably in Languedoc. According to his own account he was sent in his seventh year to a free school taught by two Franciscan monks, after which he was educated in a Jesuit college "in an archiepiscopal city." On leaving college he became a private tutor. He assumed personations in order to obtain money, his first being that of a pilgrim to Rome. Afterwards he travelled through Germany, Brabant and Flanders in the character of a Japanese convert. At Liège he enlisted in the Dutch service, shortly after which he posed as an unconverted Japanese. At Slays he made the acquaintance of a Scottish chaplain, by whom he was brought over to England and introduced to the bishop of London. Having undergone conversion to Christianity, he was employed by the bishop to translate the Church catechism into what was supposed to be the Japanese language. In 1704 he published a fictitious Historical and Geographical Description of Formosa, and was shortly afterwards sent to Oxford. In 1707 he published Dialogue between a Japanese and a Formosan. There also appeared, without date, An Inquiry into the Objections against George Psalmnazar of Formosa, with George Psalmnazar's Answer. His pretensions were from the beginning doubted by many, and when exposure was made of his fictions in 1708, full account of the whole of his life he exhibited, according to Dr Samual Johnson, as reported by Mrs Fiozzi, "a piety, penitence, and virtue exceeding almost what we read as wonderful in the lives of the saints." Psalmnazar published Essays on Scriptural Subjects (1753), contributed various articles to the Ancient Universal History, and completed Palmer's History of Printing. He died in London on the 3rd of May 1763. His memoirs appeared in 1764 under the title, Memoirs of...commonly known by the name of George Psalmnazar, but do not disclose his real name or the place of his birth.

PSALMS, BOOK OF, or PSALTER, the first book of the Hagiographa in the Hebrew Bible.

Title and Traditional Authorship.—The Hebrew title of the book is קהלת, Bithlîm, or קהלת the "book of hymns," or rather "songs of praise. 8 The singular קהלת is properly the indefinite or common form of קהלת, a verb employed in the technical language of the Temple service for the execution of a jubilant song of praise to the accompaniment of music and the blare of the priestly trumpets (1 Chron. xvi. 4 seq., xxv. 3; 2 Chron. v. 12 seq.). The name is not therefore equally applicable to all psalms, and in the later Jewish ritual the synonym נהלל specially designates two series of psalms, xxiii.-xxviii. and xxvi.-cl, of which the former was sung at the three great feasts—the encaenia, and the new moon, and the latter at the daily morning prayer. That the whole book is named "praises" is clearly due to the fact that it was the manual of the Temple service of song, in which praise was the leading feature. But for an individual psalm the usual name is אֱלֹהִים (in the Bible only in titles of psalms), which is applicable to any piece designed to be sung to a musical accompaniment. Of this word פֶּלֶךְ, "psalm," is a translation, and in the Greek Bible the whole book is called פֵּלֶךְ or פֶּלֶךְ מַלְכִּים. The title פֵּלֶךְ or פֵּלֶךְ מַלְכִּים is used in the New Testament (Luke xx. 42, xiv. 44; Acts i. 20), but in Heb. iv. 7 we find another title, namely "David." Hippolytus tells us that in his time most Christians said "the Psalms of David," and believed the whole book to be his; but this title and belief are both of Jewish origin, for in 2 Macc. ii. 13 760 דָּבָד means the Psalter, and the title of the apocryphal "Psalter of Solomon" implies that the previously existing Psalter was ascribed to David. Jewish tradition does not make David the author of all the psalms; but as he was regarded as the founder and legislator of the Temple psalmody (1 Chron., ut supra; Ezra iii. 10; Neh. xii. 36, 43 seq.; Ecclus. xlvii. 8 seq.), so also he was held to have composed and arranged the whole book, though according to Talmudic tradition he incorporated psalms by ten other authors, Adam, Melchizedek, Abraham, Moses, Heman, Jeduthun, Asaph, and the three sons of Korah. With this it agrees that the titles of the psalms name no one later than Solomon, and even he is not recognized as a psalmist by the ancient editors of the Psalter. It seems in which omitted him from the title of Ps. cxxvii. and makes Ps. lxxiii. be written not by him but of him. The details of the tradition of authorship show considerable variation; according to the Talmudic view Adam is author of the Sabbath psalm, xeli., and Melchizedek of Ps. cx., while Abraham is identified with Ethan the Ezrahite (Ps. lxxxix.). But, according to older Jewish tradition, attested by Origen, Ps. xci. is by Moses, to whom are assigned Ps. xc.-c., inclusive, according to a general rule that all anonymous pieces are by the same hand with the nearest preceding psalm whose author is named; and Ps. cx., which by its title is Davidic, seems to have been given to Melchizedek to avoid the dilemma of Matt. xxi. 41 seq. Origen's rule accounts for all the psalms except i. and ii., which were sometimes reckoned as one poem (Acts xiii. 33 in the Western text; Origen; B. Berokhodh, i. 9b.), and appear to have been ascribed to David (Acts iv. 25).

The opinion of Jerome (Præf. in ps. heb.) and other Christian writers that the collector of the Psalter was Ezra does not seem to rest on Jewish tradition.

Nature and Origin of the Collection.—Whatever may be the titles to individual psalms, there can be no question that the tradition that the Psalter was collected by David is not historical.

1 Hippol., ed. Lag., p. 188; Euseb. H.E. vi. 25, 2; Epiph. Mens et Pond. § 233; Jerome's preface to Psalt. justa Hebraeo.
2 Similarly in the Syriac Bible the title is masāmīrē.
3 The passages and notes in Kautzsch's Life of the Psalms, 2nd ed. (1894), on pp. 369-378, are based on the conclusions of this section of the work.
Jehovistic. We can thus distinguish the following steps in the redaction: (a) the formation of a Davideic collection (book I.), with a closing doxology; (b) a second Davideic collection (li.-lxxii.), with doxology and subscription; (c) a twofold Levitical collection (xli.-xlii., xxviii.-cxvii.); and (d) a third, Apocryphal collection (of b. and c) the addition of a non-Elohistic supplement to (d) with a doxology: (j) a collection later than (d), consisting of books xlviii.-cxxxvi. and cxciv.-cxxxviii. anonymous, were hardly an original part of book I., may have been prefixed after the whole Psalter was completed. We see, too, that it is only in the latest collection (books IV., V.) that anonymity is a marked feature, for it occurs only sporadically. Elsewhere the titles run in series and correspond to the limits of older collections.

Date of the Collection.—An inferior limit for the final collection is given by the addition of song xlviii. to the Psalter, which was written all at once, and its history is obscure: we only know from the prologue to Ecclesiasticus that the Hagiographa, and doubtless therefore the Psalter, were set in Greek in Egypt about 130 b.c. or somewhat later. And the Greek Psalter, though it contains an apocryphal psalm at the close, is essentially the same as the Hebrew; there is nothing to suggest that the Greek was first translated from a less complete Psalter and afterwards expanded to agree with the extant Hebrew. It is therefore reasonable to hold that the Hebrew Psalter was completed and recognized as an authoritative collection long enough before 130 B.C. to allow of its passing to the Christian Church without much difficulty. Extant external evidence for the completion of the collection does not carry us.

But there is absolutely no necessity for supposing that when the grandson of Ben Sira reached Egypt the Psalter had been translated into Greek for any considerable time. Indeed it is at least equally probable that it was the recent translation of some of the poetical books of the Old Testament which fired him with a desire to translate the Psalms also, and this being the work of a member of the family to the Bible of the Egyptian Jews. It appears indeed from I Chron. xvi, 2 Chron. vi. 41, 42, that various psalms belonging to books IV. and V. were current in the time of the Chronicler. Unfortunately however it is impossible to date the book of Chronicles with certainty. The argument that the Chronicler must have been contemporary with the last persons named in his book is by no means convincing and on the other hand his account of the Temple services, in which he seems to be describing the Temple of his own days, harmonizes far better with a date at the end of the third, or even in the second, century B.C. than with the close of the Persian or the beginning of the Greek period. For the impression which we get from Nehemiah’s memoirs is that in his days the community at Jerusalem was in the main poverty-stricken, while Malachi’s exhortations to the people to pay their dues to the priests implies that in the middle of the fifth century B.C. the Temple was by no means wealthy. But in the comparative peace and freedom of the 3rd century B.C. the condition of Jerusalem was greatly ameliorated. Wealth accumulated to such a degree that Simon the son of Oniah was enabled practically to rebuild the Temple, and to maintain its services with a grandeur of ritual which they had probably never known before.

It must be admitted that the gorgeousness of ritual described by the Chronicler is far more in harmony with the days of Simon than with any previous post-exilic period. How late the Chronicler wrote cannot perhaps be determined; but it is, at all events, impossible to prove that the author of Ecclesiasticus was acquainted with his work. Ben Sira indeed in his list of worthies mentions Zerubbabel, Joshua and Nehemiah; but Zerubbabel and Joshua he must have known from the books of Haggai and Zechariah, and he may well have been acquainted with that document relating to Nehemiah which the Chronicler incorporated with his book. Ben Sira’s omission of the name of Ezra rather militates against the supposition that he had the Chronicler’s book before him when he wrote, but it seems to combine one between Saduceism and the sophism was hardly so intense in his days as to warrant the supposition that he omitted the name of Ezra intentionally. Moreover, it is not certain that the passages that the Chronicler quotes (xcvi., cvi., cxxiii.)

1The text of the passage is obscure and in part corrupt, but the Latin “cum multum temporis ibi luisisse” probably expresses the author’s meaning. A friend has written to the author that for evxronooeis we ought perhaps to read evicev evoeis.
PSALMS, BOOK OF

already existed in their place in our Psalter, or that Ps. cxi. even existed in its present form.

Other evidence of date is to be found in the Levitical psalms of the Elohist collection. These, as we have seen, form two groups, referred to the sons of Korah and to Asaph. In Neh. xii. 46 Asaph is taken to be a contemporary of David and chief of the singers of his time, and in 1 Chron. xxv. 1 seq. one of the three chief singers belonging to the three great Levitical houses. But the older history knows nothing of an individual Asaph; in Ezra ii. 41 the gild of singers as a whole is called בֶּן-אָסָף, as it was apparently in the time of Nehemiah (Neh. xii. 22, Hebr.). The singers or Asaphites are at this time still described as a division of the Levites; and the history here treats of them with that tribe appears in Exod. vi. 24, where Abiasaph—

the eponym of the gild of Asaphites—is made one of the three sons of Korah. But when singers and Levites were fused the Asaphites ceased to be the only singers, and ultimately, as we see in Chronicles, they were distinguished from the Korahites and reckoned to Gershom (1 Chron. vi.), while the head of the Korahites is Heman, as in the title of Ps. lxxxvii. It is only in the appendix to the Elohist psalm-book that we find Heman and Ethan side by side with Asaph, as in the Chronicles; but this does not necessarily prove that the body of the collection originally was composed of two gilds of singers.

But here it becomes necessary to ask what is the precise meaning which we are to assign to the phrases, "to David," "to Asaph," "to the sons of Korah." We certainly need not suppose that the Davidic, Asaphic and Korahite psalms severally once ascribed to David, or Asaph, or Korah, were not all written by a single hand; it is also clear, from the revelation of the text that the ascription would not have been prefixed to each separate psalm, but rather to the head of each collection (cf. Prov. i. 1, x. 1, xxv. 1), together with some such note at the end as is found in Job xxii. 40, Ps. lxxxii. 20; moreover, we should be compelled to assess to the view expressed in the Oxford Dictionary that those psalms which have the heading נִגְדָּה (A. V. "to" — R. V. "for" — "the chief Musician") also originally formed a separate collection. But even against this explanation of the heading נִגְדָּה there is an almost insuperable objection; for, since both the first and second books contain with this heading, it is impossible to understand on what principle the first book of Psalms was formed. If the compiler of the first book aimed simply at making a collection of Davidic psalms from a major Psalter compiled and be "directed," why should he have deliberately rejected a number of Davidic psalms (Ps. li. seq.) which were appropriate to him in this Psalter? It is surely as difficult to suppose that the Davidic psalms of the first book are a selection made from a greater collection of which psalmists contained in the "Director's Psalter" as it is to imagine that St Mark's Gospel is an abridgment of St Matthew's. It is true that the preposition "to" or "for" may denote authorship, as it does apparently in Isaiah xxxviii. 9, Hab. iii. 1, but it certainly has a much wider meaning; and indeed in some cases the idea of authorship is out of the question, for the psalms ascribed to the Korahites can scarcely have been supposed to be the joint composition of that body. Moreover, it is very doubtful whether the word נִגְדָּה can be translated "Director." In 1 Chron. xxi. 21 the verb of which נִגְדָּה is the participle is used of the duty which was discharged by Mattithiah, Eliepheru, Mikneiah, Obad-edom, Jediael in the case of "the Director" who was to be taken in close connexion with verse 21, by Zechariah, Aziel, Shemiramoth, Jediael, Unni, Ethah, Maaseiah and Beniah also on one definite occasion. Unfortunately the exact nature of these men's performances is not quite clear, and it would have been connected with "harp set to the shechinim," or according to another interpretation, with "harp over the tenors." But whatever the obscure expression נִגְדָּה may mean, נִגְדָּה cannot here mean "direct," for a choir with six "directors" would have been a veritable bear-gard. Obviously the word נִגְדָּה must refer to something in the music; and inasmuch as the surname was for the purpose of producing a volume of sound ("נִגְדָּה"), it is reasonable to suppose that the

musicians with treble lutes and with harps an octave lower (or with lutes and harps over the sopranos and tenors respectively) were to lead the singers in giving out the melody. If this explanation be correct—and it certainly agrees best with the meaning of נִגְדָּה in 1 Chron. xxi. 21—the נִגְדָּה will be that part of the orchestra which played the melody to be sung, virtually corresponding, mutatis mutandis, with what we call the "horn section." (It is, however, difficult to explain the title נִגְדָּה ascribed to the Psalmist by postulating an altogether unnecessary "Director's Psalter." Now we have seen that the䁈 prefixed to נִגְדָּה cannot refer to authorship; we seem therefore shuts up to one of two alternatives, either the psalms inscribed נִגְדָּה belonged to the répertoire of the Korahites, or they were intended to be sung in the Korahite style. It is indeed possible that the Korahites had a style of music peculiar to themselves; but this is hardly probable unless we are to suppose that they never officiated simultaneously, in which case we should certainly have expected that the psalm quoted by the Chronicler (1 Chron. v. 22, etc.) would have been given to the Israelites in a style different from that of the Korahites. It is difficult in supposing that each division of the Levitical musicians had its own traditional music, certain instruments being peculiar to the one and certain to the other, in which case the assignment of a psalm to a particular gild would merely denote the sort of music to which it is set. In like manner it is not improbable that נִגְדָּה meant originally "to be sung in the Davidic mode"); that is, perhaps, "with harp accompaniment" (cf. 1 Sam. xvi. 16), or, since the Chronicler ascribes to David the initiation of the Temple music, perhaps "the most triumphant music which was sung in the Temple," as a sign that the psalms were meant to be sung in the Temple. However, a confusion would easily arise between the composer of the tune and the author; and when once the idea had arisen that David had written the majority of psalms, we should naturally be induced to discover in the story of his life suitable occasions for the composition of the psalms.

The interpretation of the titles here suggested removes an objection brought against the assumption of a Maccabean date for our collections, which, in the nature of the case, as well as in the number of the post-exilic, were written by the Jews victorious, and a much more joyful tone was appropriate. For if the titles נִגְדָּה, נִגְדָּה, &c., do not denote that the psalms so inscribed were collected by the Temple choirs, there is no evidence that these psalms were originally sung in the Temple. The earlier collections of psalms may well have been used first in synagogues, and only adapted to the Temple worship when the public became a part of the devotional life of the people. It is noteworthy that the psalms quoted by the Chronicler belong to the last collection, books iv. and v., which, as a whole, is far more suitable for liturgical use. But the existing of separate books of psalms anterior to the present divisions of the Psalter is very doubtful, we must look for other evidences of date. Now, both the Korahite and Asaphic psalms should be described as being the work of a post-exilic age; the conception of present sin on the part of the community of Jewish faith, though they do confess the sin of Israel in the past—but are exercised with the observation that prosperity does not follow righteousness (Ps. lxxv. 1) or the opposite (Ps. li. 1), is a characteristic feature of the Jew's national existence, which suffers notwithstanding its loyalty to God, or even on account thereof (xiv. lxix.). Now the rise of the problems of individual faith is the mark of the age that followed Jeremiah. There is a characteristic representation of the Jew's nation-life as a series of victories and defeats, of victories over not only his enemies, but over his own fortune; a characteristic mark of pious Judaism after Ezra, in the period of the law but not earlier. Malachi, Ezra and Nehemiah, like Haggai and Zechariah, are still very far from holding that the sin of Israel lies all in the past. Again, a considerable number of these psalms (xlv., lxiv., lxix., lxx., lxxx.) point to an historical situation which can very definitely realized. They are post-exilic in their whole tone and belong to a time when prophecy had ceased and the synagogue worship was fully established (lxiv. 8, 9). But the Jews are no longer the obedient slaves of the oppressed power; there has been a national rising and armies have gone forth to do God's will; and yet God has been defeated, and both the enemies have been victorious, blood has flowed like water round Jerusalem, the Temple has been defiled, and these disasters assume the character of a religious persecution. These details will fit the time of religious persecution under Antiochus, which indeed the Jews referred (as a prophecy) in 1 Macc. vii. 16. It is contended by those who, like the late Professor W. Robertson Smith, are opposed to the existence of any post-exilic collections of psalms, that since the post-exilic period, that, since they are post-exilic, there is one and only one time in the Persian period to which they can be referred, viz. that of the great civil wars under Artaxerxes III. Ochus (middle of 4th

---

1 Some confirmation of this explanation of the titles may be found in the fact that in place of נִגְדָּה (Ps. xxx. 11) we find in lxiv. 1, lxvii. 1, נִגְדָּה, the latter expression being apparently an abreviation of נִגְדָּה.
collections had arisen; and if, as seems probable, we may identify this place with the Temple at Jerusalem, the absence of musical titles is easily explained, for the number of skilled musicians who there ministered, and who would, of course, possess the tradition of musical titles and the psalm melodies as recorded in the Psalter, it is not improbable that whatever handful of psalmists who may have formed a part of the very considerable Jewish community which we know to have been settled in Egypt as early as the 5th century B.C. On the other hand, it is extremely improbable that the second collection of psalms by Nehemiah had entirely fallen into disuse among their immediate neighbours, would have taken part in any general rising against Persia. Between them and the Samaritans on the north and the Edomites on the south there was the most impecunious bond. The psalms, which had been preserved and transmitted by itself from joining in the revolts in which other parts of Syria were involved. Moreover, even if the Jews had revolted, it cannot fairly be maintained that they would not necessarily have had a religious character. Even Josephus does not say that the Persians tried to interfere with the Jews in the exercise of their religion; and nothing less than this would satisfy the language of Ps. xlv. 22: "Yea, for thy sake are we killed all the day long." 2c, on which is dependent, not only is the atmosphere of the second collection of psalms as a whole the atmosphere of godly Judaism in the 2nd century B.C., but it may fairly be claimed that this collection contains many psalms which were not led by the life of the age. For the psalmist of that period, of which no satisfactory explanation (in their details) can be given if they are assigned to any other time. Thus, for example, the absolute, and unalloyed, and unreserved statement of the right to God's sake, would be perfectly appropriate in the mouth of one of the "godly" (Hasidim) about 167 B.C. Ps. xlv., though the unsoundness of the text in certain parts makes it difficult to speak with certainty, is the most unhesitating expression of the attitude of the Jews in this period. The majority of the psalms in 150 B.C., at which the high priest Jonathan was present as an honoured guest. In this connexion verse 10 is particularly appropriate as addressed to an Egyptian princess whose forefathers, though they had not been among the earlier conquerors, and whose religion was regarded by the Jews as heathen oppressors. Again, Ps. lxxi., with its ideal description of Jehovah's kingdom as including Gilead, Samaria, Moab, Edom and Philisicia, though the ideal was not realized till such a time as the state had disappeared, was a declaration of faith in a mouth of a Maccabean patriot. The author of Ps. lxxiii. would seem to have been inspired by the sight or the description of the new temple which was under construction at Jerusalem in 164 B.C. to redecode the deserted Temple. Hence the taunt to Basha, the stronghold of the Seleucid government; hence the mention of Judah and Benjamin with the two Galilean tribes Zebulon and Naphtali (as in Isaiah ix. 1-2, a passage which, on independent grounds has been assigned to the time of Simon Maccabaeus), while schismatic Samaria is completely ignored. The historical background of Ps. lxxxix. is apparently the same as that of Ps. lxxxiv. Again it would be easy to frame a story to account for the fact that having won freedom to worship God, were able to look forward to the conversion of their former oppressors (cf. Isaiah xi., xii.). That this psalm was composed at least as late as the 3rd century B.C. is made probable by the references in App. B.C. 119, 128, 129, 138. As regard to Job. ix. 13, xxxi. 12, Isaiah li. 9, there can be little doubt that Rabab is the (Palestinian) name of Tlhat the dragon of the abyss, the natural symbol of evil, and of the whole world as opposed to the kingdom of the people of the saints of the Most High God. It is extremely improbable that such a name was applied to Egypt simply because Egypt possessed the crocodile. The origin of its application must be sought in a time when Egypt was regarded as hostile to the people of the Lord— that is to say, during the Ptolemaic rule over Palestine. These considerations, in addition to numerous phrases and expressions which can be readily assigned to the period of the second temple, of that period and those other portions of the Old Testament, such as Zephaniah ix.—xiv., which may plausibly be assigned to it, make it almost certain that the psalm was written not for the time of Jonathan or even of Simon. Now books IV. and V. are, as we have seen, later than the Eleothic redaction of books II. and III., so that the collection of the last part of the Psalter must, if our argument up to this point is sound, fall within the second half of the 2nd century B.C. And here it is to be noted that though no part of the Psalter shows clearer marks of a liturgical purpose, we find that books IV. and V. the musical titles are still attached to many of the psalms, and it seems certain that the technical terms of the Temple music had gone out of use, presumably because they were already become unintelligible, as they were when the Septuagint version was made; 1 for it does not follow that because the psalms were not composed originally for the Temple at Jerusalem and were intelligible in Palestine would have been understood in Egypt. The absence of the musical titles, however, may be taken as an indication that the last collection of psalms was formed in a different place from that in which the earlier

1 Possibly under Simon; compare the other hallel (Ps. civ.—vi.) with I Macc. xiii. 50 seq.

PSALMS, BOOK OF

Musical Execution and Place of the Psalms in the Temple Service.—The musical notes found in the titles of the psalms and occasionally also in the text (Selah, Ἱγγαῖον) are so obscure that it seems unnecessary to enter here upon the various conjectures that have been made about them. The clearest point is that a number of the psalms were originally at least set to melodies named after songs, and that one of these songs beginning αὐτοῖν (Al-tashīt in E. V., Ps. lixv. seq.), may be probably identified with the vintage song, Isa. lxv. 15. The original music of the psalms was therefore apparently based on popular melodies. A good deal is said about the musical services of the Levites in Chronicles, both in the account given of David's ordinances and in the descriptions of particular festival occasions. But unfortunately it has not been found possible to get from these accounts any clear picture of the ritual of any certainty as to the technical terms used. In Egypt by the translators of the Septuagint these terms were not understood.

The music of the temple attracted the attention of Theophrastus (ap. Porph. De abst. li. 26), who was perhaps the first of the Greeks to make observations on the Jews. His description of the Temple ritual is not strictly accurate, but he speaks of the worshippers passing the night in gazing at the stars and calling on God in prayer; his words, if they do not exactly fit anything in the later ritual, are well fitted to illustrate the original liturgical use of Ps. vii., cxxxiv. Some of the Jewish traditions as to the use of particular psalms have already been cited; it may be added that the Mishna (Tanhîd) assigns to the service of the continuall burst-offerings the following weekly cycle of psalms.—(i) xxiv., (ii) xlvi., (iii) lxxxi., (iv) xcv., (v) lxx., (vi) xciii., (vii) xxvi., (viii) lxxvii. Many other details are given in the treatise Ἀσφέρις, but these for the most part refer primarily to the synagogue service after the destruction of the Temple. For details on the liturgical use of the Psalter in Christendom the reader may refer to Smith's Dict. Crit., s. v. "Psalmody."

Ancient Versions.—(A) The oldest version, the LXX, follows a text generally closely corresponding to the Massoretic Hebrew, the main variations being in the titles and in the addition (lacking in some MSS.) of an apocryphal psalm ascribed to David when he fought with Goliath. Ps. ix. and x. are rightly taken as one psalm, but conversely Ps. cxlvii. is divided into two. The LXX. text has many "daughters," of which may be noticed (a) the Memphitic (ed. Lagarde, 1875); (b) the old Latin, which as given by Jerome in 385 after that date under the title of the Psalterium romanum is no longer in the Roman Church and still used in St Peter's; (c) various Arabic versions, including that printed in the polyglots of Le Jay and Walton, and two others of the four exhibited together in Lagarde's Psalterium, Job, Proverbia, arabice, 1876; on the relations and history of these versions see G. Hoffmann, in Jenaer Literatur., 1876, art. 539; the fourth of Lagarde's versions is from the Peshito. The Hexaplar text of the LXX., as reduced by Origen into greater conformity with the Hebrew by the aid of subsequent Greek versions, was further the mother (d) of the Psalterium gallicanum—that is, of Jerome's second revision of the Psalter (385) by the aid of the Hexaplar text. He inserted the divisions of Saul and of David into the Psalterium romanum used in the Church of Gaul and ultimately was taken into the Vulgate; (e) the Syro-Hexaplar version (published by Bugati, 1820, and in facsimile from the famous Ambrosian MS. by Ceriani, Milan, 1874). (B) The Christian Arabic version or Peshito (P'shitâ) is largely influenced by the LXX., compare Baether, Untersuchungen über die Psalmen nach der Peshita, Kiel, 1878 (unfinished).

1 Of the various explanations that have been given of Selah the only one that possesses any probability is that given independently by Baether and others, viz. that it is a mispronunciation of an original σή = ἵλας. The word, which was probably derived from some Greek handmanner, was presumably an instruction for a musical interlude. The LXX. translators who render it by ἅδομα have recognized the derivation of the word, knew its meaning.

2 Compare the similar way of citing melodies with the prep. al or al kâlâ, &c., in Syriac (Land, Anecd. iv.: Ephes. syr. hymni., ed. Lamy).
This version has peculiar titles taken from Eusebius and Theodore of Mopsuestia (see Nestle, in *Theol. Literatur*, 1876, p. 283). (C) The Jewish Aramaic version or Targum is probably a late work. The most convenient edition is in Lagarde, *Hegiographa chaldais*, 1873. (D) The best of all the old versions is that made by Jerome after the Hebrew in 405. It did not, however, obtain ecclesiastical currency—the old versions holding their ground, just as English churchmen still read the Psalms in the version of the "Great Bible" printed in their Prayer Book. This important version was first published in a good text by Lagarde, *Psalterium juxta hebraeos hieronymi* (Leipzig, 1874).

Exegetical Works.—While some works of patristic writers are still of value for text criticism and for the history of early exegetical treatment of the Psalms, the exegetical works of Christian writers is as a whole such as to throw light on the ideas of the commentators and their times rather than on the sense of a text which most of them knew only through translations. For the Psalms, as for the other books of the Old Testament, the scholars of the period of the revival of Hebrew studies about the time of the Reformation were mainly dependent on the ancient versions and on the critical works of the scholars of the middle ages. The most noted of these scholars is Ewald's, in the first two half-volumes of his *Dichter des alten Bundes* (2nd ed., Göttingen, 1866; Eng. trans., 1880), and Olshausen's (1855). To these may be added (excluding general commentaries on the Old Testament) the older and earlier commentary of Hitzig (1836, 1836–1865), that of Delitzsch (1859–1860, then in shorter form in several editions since 1867; Eng. trans., 1871), and that of Hupfeld (2nd ed. by Riehm, 1867, 2 vols.). The last-named work, though large, is less scholarly. The modern commentaries of Dyserinck (1866, 1867–1868, 1 vol.) are to be recommended, and are convenient and useful, and has an influence perhaps disproportionate to its real exegetical merits. The question of the text was first properly raised by Olshausen, and has since received special attention from, among others, Lagarde (*Prophetae chald.,* 1872, p. 46 seq.), Dyserinck (in the "schola" to his Dutch translation of the Psalms, *Theol. Tijdschr.*, 1878, p. 279 seq.), and Bickell (*Carmina V. T. metrice, &c.*, Iannsich, 1883), whose critical services are not to be judged merely by the measure of assent which his metrical theories may command. In English we have, among others, the useful work of Perowne (5th ed., 1883), that of Lowe and Jennings, (2nd ed., 1885), and the able and careful and carefully regulated mass of literature on the Psalms is so enormous that no full list even of recent commentaries can be here attempted, much less an enumeration of treatises on individual psalms and special critical questions. Of recent studies (without bibliography the date, 1865), the most complete, and the new edition now in preparation will doubtless prove the standard work of reference. As regards modern editions of the Psalms, all the modern versions, the older discussions, even those of Ewald, are in great measure antiquated by recent progress in Pentateuch criticism and the history of the canon, and an entirely fresh treatment of the Psalter by a sober critic is urgently needed.

The bibliography up to this point is taken from the article PSALMS by the late Professor W. Robertson Smith (*Encyc. Brit.*, 1886), large portions of which are incorporated in the present article. It was the belief of Professor Robertson Smith that the second (Elusotic) collection of psalms originated in a time of persecution earlier than the time of Antiochus Epiphanes which he referred to the reign of Artaxerxes. Whether this is a fair inference, or whether he forecasted the results of the modern custom of learning and force, is still accepted in many quarters, many other passages of the Old Testament being likewise assigned to the same date. In the judgment of the present writer historical criticism of the Psalms (psalterion or Psalms of the Prophets) since Professor Robertson Smith's death have shown that this theory is untenable. Notwithstanding his reverence, therefore, for the great scholar with whose name it is associated, and to whom he is much indebted, and honorable and brave, but looking back with horror at the increasement of copious reference to the increasing number of strings, it grew too cumbersome, and was placed flat on a table or on the knee. The German zither is the sole European survivor of the medieval psalterion. (K.S.)

PSAMMETICHUS (Egypt. *Psammetikos*), the name of three kings of the Saitic, XXVIIth Dynasty, called by Herodotus respectively Psammetichus, Psammis and Psammenitus. The first of these is generally considered to be the founder of the dynasty; Manetho, however, carries it back through three or four kings who ruled at Sais as petty kings under the XXVIIth, Ethiopian, Dynasty. The name is frankly written as to mean "the man of meliek," i.e. "mixed drink," whether as a tippler or as a vendor of strong drink. The Egyptian scribes do not conceal the opprobrious elements, but it has been suggested that the name may be due to false etymology of a foreign name (though all the names throughout the dynasty appear to be Egyptian), or that Methek may have been an unknown deity. The story in Herodotus of the Dodecarchy and the rise of Psammetichus is fanciful. It is known from cuneiform texts that stringy local insurrections were sedated by Psammetichus and confirmed by Assur-hani-pal to govern Egypt. Niku (Necho), father of Psammetichus, was the chief of these kinglets, but they seem to have been quite unable to hold the Egyptians to the hated Assyrians against the more sympathetic Ethiopian. The labyrinth built by a king of the XLIth Dynasty is ascribed by Herodotus to the Dodecarchy, or rule of 12, which must

---

1 It contains, however, elements which are as early as the time of the New Testament. Cf. Ps. lxviii. 18 with Ephes. iv. 8.
PSELLUS—PSEUDO-DIPTERAL

PSEUDO-DIPTERAL (Gr. Ψευτός, false, δίς, double, and πτερόν, a wing), the term given to a dipteral temple, i.e. in which there are two rows of columns round the naos, the inner row of which has been omitted to give more space for the processions or for shelter (see Temple).

PSEUDONYM (Gr. ἄνωνύμος, having a false name, Ψευδόμος, false, and οὐνόμα, name), a false or invented name, particularly the fictitious name under which an author produces his work in order to conceal his identity. The same end is gained by publication without any name, i.e. anonymously (Gr. ἄνωνύμος, without a name). The body of works thus produced either without the author's name or under a fictitious name is known as anonymous and pseudonymous literature, and many books have been published affording a key to the identity of the various writers, forming an important section of bibliography. Though Fredericus Gesier published a short treatise on the subject entitled Larea detrada, &c., in 1669, the chief early work was that of Vincent Placcius (1642–1699) whose Theatrum anonymorum et pseudonymorum was published in 1708, edited by L. F. Vischer with a preface and life by J. A. Fabricius; supplements were published in 1711 and in 1740. The next important work, only a fragment of the proposed scheme, was that of Adrien Baillet (q.v.), under the title of Auteurs déguisés sous les noms estrangers, &c. (1690). Antoine Alexandre Barbier (q.v.) published his standard work Dictionnaire des ouvrages anonymes et pseudonymes in 1866–1869 (2nd ed., 1822–1827). This was followed by the Supercheries littéraires dévoilées of J. M. Quérard (q.v.). The third edition of Barbier's work, embodying Quérard and much new matter, was published in 1872–1879. This was edited by P. Gustave Brunet, who published a supplement in 1889. Other works in French are those of C. Jolliet, Les Pseudonymes du jour (1867 and 1884), and F. Drujon, Lettres d'elle (1888). Of German works in this sphere of bibliography the Index pseudonymorum, Wörterbuch der Pseudonymen of Emil Weller appeared in 1856, of which several supplements were published later. The most monumental of all works are the Deutsches Anonymen-Lexikon, 1501–1850, by M. Holzmann and H. Bohatta (1902–1907), supplement, 1851–1908 (1909), and the Deutsches Pseudonymen-Lexikon, by the same authors (1906). See also F. Sintenis, Die Pseudonyme der neueren deutschen Litteratur (1899), and the supplementary volume (1906), to Meyer's Conversations-Lexikon (6th ed.). The chief Italian work is the Dizionario di opere anoime e pseudonime di scrittori italiani, by G. Melzi (1848–1859), with supplement by G. Passano (1887). The Dutch Vermoende en naamloze schrijvers . . . der Neder. en Vlaamschen letteren, by J. J. van Doorninck (1883–1885), was a second edition of an earlier work. The Academy of Upsala is publishing, under the editorship of L. Bygden, a Swedish dictionary Svenskt anonym och pseudonym lexikon (1898), &c. England was late in entering the field. The first work actually published was the Handbook of fictitious Names, by R. Thomas (Oldham Harms) (1868). Samuel Halkett, and the successor to his compilations, John Laing, both died before their work was published; edited and revised by Miss C. Laing it appeared in 1882–1888 in 4 vols. as the Dictionary of the Anonymous and Pseudonymous Literature of Great Britain, by S. Halkett and J. Laing. This remains the standard work on the subject in English. Other works are W. Cushing, Initials and Pseudonyms (American and English from the beginning of the 18th century); 2nd series (1886, 1888), and Anonyma (1890); F. Marchmont, A Concise Handbook of Literature issued under Pseudonyms or Initials (1866); see also especially W. F. Courtney, The Secrets of our National Literature (1908), the first chapter of which contains a sketch of the history of the subject, to which an appendix is mainly devoted. The anonymous and pseudonymous Latin literature of the middle ages has been treated in modern times by A. Franklin, Dictionnaire des noms, &c., latins 1100–1550 (1873), and A. G. Little, Initia operum latinorum saec. 15–15–15 (1904).

PSEUDO-PERIPTERAL (Gr. Ψευτός, false, περί, round, πτερόν, a wing), a term in architecture given to a temple in which the columns surrounding the naos have had walls built
between them, so that they become engaged columns, as in the great temple at Agrigentum. In Roman temples, in order to increase the size of the cells, the columns on either side and at the rear became engaged columns, the portico only having isolated columns. (See Temple.)

**Pseudopod.** Pseudopodium, the name given to an extension of the naked protoplasm of certain Protozoa, notably the Sarcodina (q.v.), for crawling or creeping or for the prehension of food, but not for active swimming (see also Amoebs).

**Psilomelane,** a mineral consisting of hydrous manganese oxide, with variable amounts of barium, potassium, &c. It is sometimes considered to be a hydrous manganese manganate, but of doubtful composition. The amount of manganese present corresponds to 70–90% of manganous oxide with 10–15% of "available" oxygen. The mineral is amorphous and occurs as botryoidal and stalactitic masses with a smooth shining surface and submetallic lustre. The name has reference to this characteristic appearance, being from the Greek ψίλος (naked, smooth) and μέλας (black); a Latinized form is calvongrinite, and a German name with the same meaning is Schwarzer Glaskopf. Psilomelane is readily distinguished from other hydrous manganates by its different color and the greater hardness (H = 4½–5½) of the sp. gr. it varies from 3.7 to 4.7. The streak is brownish-black and the fracture smooth. Owing to its amorphous nature, the mineral often contains admixed impurities, such as iron hydrates. It is soluble in hydrochloric acid with evolution of chlorine. It is a common and important ore of manganese, occurring under the same conditions and having the same commercial applications as pyrolusite (q.v.). It is found at many localities; amongst those which have yielded typical botryoidal specimens may be mentioned the Restormel iron mine at Lostwithiel in Cornwall, Brendon Hill in Somerset, Hoy in the Orkneys, Sayn near Coblenz, and Crimora in Augusta county, Virginia. With its luster it is exceedingly mined in Vermont, Virginia, Arkansas and Nova Scotia.

**Pskov,** a government of the lake-territory of north-west Russia, which extends from Lake Peipus to the source of the west Dvina, having the governments of St Petersburg and Novgorod on the N., Tver and Smolensk on the E., Vitebsk on the S. and Livonia on the W. It has an area of 17,064 sq. m. In the south-east it extends partly over the Alau or Vorobyovy heights, which stretch west into Vitebsk and send to the north a series of irregular ranges which occupy the north-western parts of Pskov. A depression, 20 m. long and 15 m. broad, drained by the Lovat and the Pusta, separates the interval between these two billy tracts; it is covered with forests and marshes, the only tracts suitable for human occupation being narrow strips of land along the banks of the rivers, or between the marshes, and no communication is possible except along the watercourses.

With the exception of the south-eastern corner, where Carboniferous rocks crop out, nearly the whole of the government consists of Devonian strata of great thickness, with deposits of gypsum and white sandstone, the latter extensively quarried for building purposes. The bottom moraine of the Scandinavian and Finnish ice-sheet formerly extended over the whole of this region, and has left behind it numerous ridges (kozmy or eskers), the upper parts consisting of Glacial sands and post-Glacial clays, sands and peat-bogs. The soil is thus not only infertile, but also badly drained, and only those parts of the territory which are covered with thicker strata of post-Glacial deposits are suitable for agriculture.

The rivers are numerous and belong to three separate basins— to Lakes Peipus and Pskov the rivers in the north-west, to Lake Ilmen those in the middle, and to that of the Dvina the rivers in the south-east. A great number of small streams pour into Lake Pskov, the chief being the Velikaya. The Lovat and the Shelon, belonging to the basin of Lake Ilmen, are both navigable; while the west Dvina flows for 100 m. on the south border of the government or within it, and is used only for floating timber. There are no fewer than 850 lakes in Pskov, with a total area of 391 sq. m. The largest is Lake Pskov, which is 50 m. long and 13 broad, covers 300 sq. m., and has a depth of 3 to 18 ft.; it is connected by a channel, 40 m. long and 3 to 10 wide, with Lake Peipus. The marshes on the banks of the Polista are nearly 150 sq. m. in extent. Forests occupy nearly one-third (32%) of the entire area, and in some districts (Kholm, Toropets, Porkhov) as much as two-thirds of the surface. Large pine forests are met with in the north; in other parts the birch and the aspen prevail; but almost one-quarter of the forest area is overgrown with brushwood.

The climate is very moist and changeable. The average temperature is 41° F. (17–24°) in January and 64° (19–30°) in July. The population of the government numbered 1,435,636 in 1897, when there were 584,031 women, and the urban population only 72,563. The estimated population in 1906 was 1,753,300. With the exception of 25,460 Estonians (1897), the inhabitants are almost entirely Great Russians. They belong mainly to the Orthodox Greek Church, but the official number of Nonconformists, 32,665, is far below the mark. There are also about 12,000 Lutherans and 4000 Roman Catholics. The government is divided into eight districts, the chief towns of which, with their populations in 1897, are Pskov (q.v.), Klohom (5691), Novo- rnez (3975), Opozhka (3650), Ostrov (6252), Porkhov (5737), Velikaya (8633) and Vitye Luki (8185). Between the 13th and 16th the peasantry increased their landed possessions by 80%, and the merchants bought considerable areas from the nobles, who altogether sold 43% of their estates. Although the soil is far from fertile, no less than 30% of the total area is under crops and 12% under meadows. The crops principally cultivated are rye, oats, barley, peas, potatoes, flax (for which the government is famous) and hemp. Grain has to be imported, but oats are exported. Owing to the efforts of the seminaries, there has been a notable improvement in agriculture, especially in dairy-farming. Fishing in Lake Pskov and the smaller lakes is a source of income. The manufacture of wooden wares for local needs, ship-building, the timber trade, and the weaving of linen and woollens for local requirements are additional sources of income. Flax, flour, tobacco factories, saw-mills, distilleries and breweries are the principal industrial establishments. The population engage also in the preparation of lime, in stone-quarrying, and in the transport of merchandise.

(P. A. K.; J. T. Be.)

**Pskov,** in German, Pleskau, a town of Russia, capital of the government of the same name and an archbishopric see of the Orthodox Greek Church, situated on both banks of the Velikaya River, 9 m. S.E. from Lake Pskov and 170 m. by rail S.W. of St Petersburg. Pop. (1897), 30,424. The chief part of the town, with its Kremlin, belongs to the 13th and 14th centuries. The river, to which the ruins of its old walls (built in 1266) descend; the Zapiskovye stretches along the same bank of the Velikaya below its confluence with the Pskova; and the Zavelichek occupies the left bank of the Velikaya—all three keeping their old historical names. The cathedral in the Kremlin has been four times rebuilt since the 12th century, the present edifice dating from 1601–1699, and contains some very old shrines, as also the graves of the bishops of Pskov and of several Pskov princes, including those of Dovmont (d. 1290), and Vsevolod (d. 1138). The church of Dmitri Solunski dates originally from the 14th century, and the Church of St Barbara was originally the town church, but is now used for the cathedral. The churches of Sts Peter and Paul, Sts Boris and Gleb, and of Sts Andrew and Venerable Sabas and Nikon, were all founded in the 14th century, and the Church of Sts Cyril and Methodius, founded in 1464, is a rich example of 15th century work. The Spaso-Mirozhsky monastery, founded in 1156, and restored in 1800–1803, has many remarkable antiquities. The ruins of numerous rich and populous monasteries in or near the town attest its former wealth and greatness. The present town is ill-built, chiefly of wood, and shows traces of decay. It has a cadets' school, a normal school for teachers, and a few lower technical schools, an archaeological museum (1903) and some scientific societies. The private collections (coins, antiquities, art works, &c.) of Messrs Puskin and Sudkov are two of the most remarkable in Russia. The manufactures are unimportant. Since the completion of the St Petersburg and Warsaw railway the trade of Pskov has increased. Pskov has regular steam communication with Dorpat.

History.—Pskov, formerly the sister republic of Novgorod, and one of the oldest cities of Russia, maintained its independence and its free institutions until the 16th century, being thus
Psoriasis—Psyche

543

the last to be brought under the rule of Moscow. It already existed in the time of Rurik (9th century); and Nestor mentions under the year 914 that Olga, wife of Igor, prince of Novgorod, was brought from Pleskov (i.e. Pskov). The Velikaya valley and river were from a remote antiquity a channel for the trade of the south of Europe with the Baltic coast. Pskov being an important strategic point, its possession was obstinately disputed between the Russians and the Germans and Lithuanians throughout the 11th and 12th centuries. At that time the place had its own independent institutions; but it became in the 12th century a prizgor of the Novgorod republic—that is a city having its own free institutions, but incorporated in certain respects within the jurisdiction of the metropolis, and compelled in time of war to march against the common enemy. Pskov had, however, its own prince (defensor municipii); and in the second half of the 13th century Prince (Timoteus) Dovmont fortified it so strongly that the town asserted its independence of Novgorod, with which, in 1348, it concluded a treaty wherein the two republics were recognized as equals. Its rule extended over the territory which now forms the districts of Pskov, Ostrov, Opochka, and Gelov (farther north on the east side of Lake Peipus). The syche or council of Pskov was sovereign, the council of the seven separate towns being subject to it and to its own municipal affairs. The council was supreme in all affairs of general interest, as well as a supreme court of justice, and the princes were elected by it; these last had to defend the city and levied the taxes, which were assessed by twelve citizens. But while Novgorod constantly showed a tendency to become an oligarchy of the wealthier merchants, Pskov figured as a republic in which the influence of the poorer classes prevailed. Its trading associations, supported by those of the working classes, checked the influence of the wealthier merchants.

This struggle continued throughout the 14th and 15th centuries. Notwithstanding these conflicts Pskov was a very wealthy town; its strong walls, its forty large and wealthier churches, built during this period, its numerous monasteries, and its extensive trade, bear testimony to the wealth of the inhabitants, who then numbered about 60,000. As early as the 13th century Pskov was an important station for the trade between Novgorod and Riga. A century later it became a member of the Hanseatic League. Its merchants and trading associations had factories at Narva, Reval and Riga, and exported flax, corn, tallow, skins, tar, pitch, honey, and timber for ship-building. Silks, woolen stuffs, and all kinds of manufactured wares were brought back in exchange. In 1399 the prince of Moscow claimed the privilege of conducting the electoral prince of Pskov in his rights; and though, fifty years later, Pskov and Novgorod concluded defensive treaties against Moscow, the poorer classes continued to seek at Moscow a protection against the richer citizens. After the fall of Novgorod (1478) Pskov was taken (1510) by Basil Ivanovich, prince of Moscow, and a voyvode or deputy was nominated to govern the city. Moscow, at the end of the 17th century, abolished the last vestiges of self-government at Pskov, which thenceforward fell into rapid decay. Near this city the Teutonic knights inflicted a severe defeat upon the Russians in 1502. Pskov became a see of the provincial Russian archbishop; Poles in 1581 for seven months by Stephen Bathory during the Livonian War, and in 1615 by Gustavus Adolphus of Sweden. Under Peter the Great it became a fortified camp.

(P. A. K.; J. T. Be.)

Psoriasis, a skin affection characterized by the occurrence of flat dry patches of varying size covered with silvery white scales. Next to eczema and ringworm it is one of the most commonly found skin diseases. It occurs frequently during infancy and early adult life, and rarely begins after the age of fifty. Though a parasitic origin has been suggested, no bacteriological factor has yet been found, and it has been demonstrated that psoriasis is not communicable. The disease is one of emotion and insufficient nourishment. It may also follow an attack of scarlet fever or erysipelas. The site of the disease may be determined by an abrasion or other injury of the skin, or even an irritation caused by friction of the clothing. The favourite starting point of the lesion is either the elbows or the fronts of the knees. It is nearly always symmetrical in its distribution, and spreads over the trunk and the extensor surfaces of the limbs, in contrast to eczema, which selects the flexor surfaces. The hairy scalp may also be affected. The eruption generally first shows itself as one or more papules, at first red and spreading, and later white from the formation of scales and red at the spreading margin, where it is surrounded by a hyperaemic zone. On removing the scales is seen a smooth hyperaemic zone dotted with red spots. The patches spread centrifugally and may remain stationary for a long time or coalesce with other patches and cover large areas of skin. In some cases involution of the central portion accompanies the spreading of the patch, and large concentric rings are formed. The lesions may persist for years, or spontaneously disappear, leaving behind a slight brown stain. The symptoms are usually slight and there is little or no irritation or itching, and no pain except in a form which is associated with osteo-arthritis. The disease, though of noted chronicity, is subject to sudden exacerbations, and may reappear at intervals after it has completely disappeared. It has little or no effect upon the general health; but the patient may be fairly well and yet have been so unwell as to be unable to pursue his usual occupation. It is an uncomplicated, the nervous, the osteo-arthritic, and the seborrhoeic. Varieties have also been named according to the character of the patches, such as psoriasis punctata, guttata, circinata or nummularis, or when large areas are involved and the skin is harsh, dry and cracked, it is known as psoriasis inveterata. The pathological changes taking place in the skin have been described as an inflammation of the papillae and corium, with a down-growth of the stratum mucosum between the papillae and an increase of the horny layer (keratosis). This latter, however, has been said to be due to the formation in it of tiny dry abscesses. The silvery appearance of the scales is due to the removal of the stratum corneum. The disease appears to be of a hygienic, constitutional and local character. The clothing must be regulated so as to prevent undue perspiration or irritation or chafing of the skin. The most effective local application is chrysarobin used as an ointment. A bath of hot water and soap should first be given, or an alkaline bath, in order to remove all the scales; the ointment is then applied, but must be used over a small area at a time, as it is apt to set up dermatitis. Tarry applications, such as guinguentum plicis liquidae, creosote ointment or liquor carbonis detergens, are also useful; and radio-therapy has caused a rapid removal of the lesions, but neither of these methods has prevented subsequent recurrence.

In chronic cases the sulphur-salt baths of Harrogate, Aix-les-Bains and Aschen have been successful. The internal administration of small doses of vinum antimonii, in acute cases, or of arsenic (in gradually increasing doses of the liquor arsenicalis) in chronic cases, is undoubtedly beneficial.

Psorospermiasis, the medical term for a disease caused by the animal parasites known as psorosperms or gregarinidae, found in the liver, kidneys and ureters.

Psyche (ψυχή), in Greek mythology, the personification of the human soul. The story of the love of Eros (Cupid) for Psyche is a philosophical allegory, founded upon the Platonic conception of the soul. In this connexion Psyche was represented in Greek and Graeco-Roman art as a tender maiden, with bird's or butterfly's wings, or simply as a butterfly. Sometimes she is pursued and tormented by Eros, sometimes she revenges herself upon him, sometimes she embraces him in fondest affection. The tale of Cupid and Psyche, in the Metamorphoses of Apuleius, has nothing in common with this conception but the name. In it Psyche, the youngest daughter of a king, arouses the jealousy of Venus, who orders Cupid to inspire her with love for the most despicable of men. Cupid, however, falls in love with her himself, and carries her off to a secluded dwelling in the garden of the gods, where she soon falls in love with him, and is discovered by her. Persevered by her sisters that her companion is a hideous monster, and forgetful of his warning, she lights a lamp to look upon him while he is asleep; in her ecstasy at his beauty
she lets fall a drop of burning oil upon the face of Cupid, who awakes and disappears. Wandering over the earth in search of him, Psyche falls into the hands of Venus, who forces her to undertake the most difficult tasks. The last and most dangerous of these is to fetch from the world below the box containing the ointment of beauty. She secures the box, but on her way back opens it and is stupefied by the vapour. She is only restored to her senses by contact with the arrow of Cupid, at whose entreaty Jupiter makes her immortal and bestows her in marriage upon her lover. The meaning of the allegory is obvious. Psyche, as the personification of the soul, is only permitted to enjoy her happiness so long as she abstains from ill-advised curiosity. The desire to try into its nature brings suffering upon her; but in the end, purified by what she has undergone, she is restored to her former condition of bliss by the kindly influence of the god.

On this story see L. Friedländer, "Ueber das Märcchen von Amor und Psyche" (in Darstellungen aus der Sittengeschichte Roms, 1888, vol. i.; for a treatment of the Greek conception, see E. Rohde, Psyche, 1894). For Psyche in art see A. Conze, De Psyche imagi-
nitus quibisdam (1855); Max Collignon, Essai sur les monuments grecs et romains relatifs au mythe de Psyche (1877).

**PSYCHICAL RESEARCH,** a term which may be defined, partially, as an examination into the amount of truth contained in world-wide superstitions. Thus when Saull disguised himself before his séance with the witch of Endor, and when Croesus scientifically tested the oracles of Greece (finding clairvoyance or *Lucidité* in the Delphic Pythons), Saul and Croesus were psychological researchers. A more systematic student was the Neoplatonist philosopher Porphyry. In his letter to Anabo, answered in Περὶ μυστηρίων by Iamblichus (7) we find Porphyry concerned with the usual alleged phenomena—prophecy; the power of walking through fire unharmed; the movements of inanimate objects, untouched; the "levitation" of "mediums"; apparitions of spirits, their replies to questions, the falsehood of those replies; and so forth. Similar phenomena fill the lives of the saints and the records of witch trials. Apparitions, especially of the dying or the dead; the stereotyped disturbances in haunted houses; and the miraculous healing of diseases, are current in classical and medieval records. The exhibition of remote or even future events, to gazers in mirrors, crystals, vessels full of water, or drops of ink or blood, is equally notorious in classical, Oriental, medieval and modern literature; while the whole range of these phenomena is found in Chinese, Japanese, Hindu, ancient American, Red Indian and savage belief.

At various periods, and in proportion to the scientific methods of the ages, attempts have been made to examine these things scientifically. St Augustine wrote on the whole topic with remarkable acuteness and considerable critical perception. The report of miracles of healing is especially noteworthy. After Petrus Thyræus (1546-1601), S. J. Wierus, Ludwig Lavater (1527-1586), and other authors of the 16th century, came the labours of Gallvill, Henry More, Richard Baxter, Boyle, Cotton Mather, and others in England and America, during and after the Restoration. Attempts were made to get first-hand evidences and Gallvill investigated the knocking drummer of Tedworth in situ (1663). The disturbances in the house of the Wesleys at Epworth (1716 and later) were famous, and have copious contemporary record. David Hume believed himself to have settled questions which, when revived by the case of Sweden-borg and the experiments of Mesmer and his pupils, puzzled and interested Kant. The influence of Mesmer has never died out; the fact of "animal magnetism" (with such examples as the "divining rod," and the phenomena in general) was accepted in his manner, and explained, by Hegel. The researches of Braid (c. 1840-1850) gave a new name, "hypnotism," to what had been called "mesmerism" or "animal magnetism"; a name conveying no theory of "magnetic" or other "fluids."

"Mesmerism" implies a theory of "emanations" from the operator to the patient; "hypnotism" implies no such hypothesis. In the middle of the 19th century Dr Gregory and Dr Mayo published their entertaining but unsystematic works, Animal Magnetism and The Truths in Popular Superstitions respectively. Esdaile and Elliotson were practical pioneers in the medical use of induced sleep or somnambulism. For their ideas and experiments The Zöisit may be consulted. The epidemic of "spiritualism" and of "turning tables" then invaded Europe from America, and was discussed by Dr Carpenter, Faraday, Gasparin, De Morgan and many others. The adventures of Daniel Douglas Home excited all Europe, and his effects were studied by Sir William Crookes with especial attention. Home disappeared after a lawsuit; his successes remain an unsolved enigma. Believers explained them by the agency of the spirits of the dead, the old savage theory. He had many followers, most of whom, if not all, were detected in vulgar impostures. Of the books of this period those of Mr Richard Dale Owen (1850-1890) are the most curious, but exact work was still to come.

In 1882 the Society for Psychological Research, under the presidency of Henry Sidgwick, professor of moral philosophy in the university of Cambridge, was founded expressly for the purpose of introducing scientific method into the study of the "debatable phenomena." Other early members were Edmund Gurney, F. W. H. Myers, Andrew Lang, Professor Barrett, Mrs Sidgwick, F. Podmore, Lord Tennyon, Lord Rayleigh and Professor Adams; while among presidents were Professor Balfour Stewart, A. J. Balfour, Professor William James of Harvard and Sir William Crookes. The society has published many volumes of Proceedings. In France and in Germany and Italy many men of distinguished scientific position have examined the Italian "medium" Eusapia Palladino, and have contributed experiments, chiefly in the field of hypnotism and "telepathy." Hypnotism has been introduced into official experimental psychology and medicine with some success.

It is plain that the range of psychological research is almost unlimited. It impinges on anthropology (with its study of the savage theory of spirits—animism—and of diabolical possession), and on the usual province of psychology, in the problems of the hallucinations both of morbid patients and of people in normal mental health. The whole topic of the unconscious or subconscious self is made matter not of mere metaphysical speculation (as by Kant and Hamilton), but of exact observation, and, by aid of hypnotism and automatism, of direct experiment. The six original committees of the society undertook the following themes:

1. An examination of the nature and extent of any influence which may be exerted by one mind upon another, apart from any generally recognized mode of perception.
2. The study of hypnotism and the forms of so-called mesmeric trance, clairvoyance and other allied phenomena.
3. A critical examination of Mesmer's researches into certain organizations called "sensitive.
4. A careful investigation of any reports, resting on strong testimony, regarding apparitions at the moment of death or otherwise, or regarding disturbances in houses reputed to be haunted.
5. An inquiry into the various physical phenomena commonly called spiritualistic, with an attempt to discover their causes and general laws.
6. The collection and collation of existing materials bearing on the history and development of hypnotism.

To these themes we might now add the study of "crystal-gazing," and of the hallucinatory visions which a fair percentage of people observe when staring into any clear deep, usually a glass ball; but ink (with some experimenters) does as well, or a glass water-jug. Of these themes, the third has practically led to nothing. The experiments of Reichenbach on the perception of flames issuing from magnets have not been verified. The collection of historical examples, again (6), has not been much pursued by the society, except in Mr Gurney's studies of witchcraft in Phantasms of the Living, by himself, Mr Podmore and Mr Myers. One of other kind, a vast number of experiment was made in "thought transference." (1) Diagrams drawn by A were reproduced by B; cards thought of, numbers
and so forth were also reproduced in conditions that appeared to make the normal transference of the idea by sound, sight, or touch impossible, and to put chance coincidence out of court. In one or two instances colligation was detected ingeniously. In others two explanatory theories have been broached. People may accidentally coincide in their choice of diagrams, or the "unconscious whispering" of a person fixing his mind hard on a number, card or what not may be heard or seen. But coincidence in diagrams does not apply when a ship, dumb-bells, a candlestick or a card is drawn by both experimenters; nor can "unconscious whispering" be heard or seen when the experimenters are in different rooms. On the whole, the inquirers convinced themselves that one mind or brain may influence another mind or brain through no recognized channel of sense. This is, of course, an old idea (see Walton's Life of Donne, and his theory of the appearance of Mrs Donne, with a dead baby, to Dr Donne in Paris). The method of communication remains a problem. Are there "brain waves," analogous to the X-rays, from brain to recipient brain, or does mind touch mind in some unheard-of way? The former appears to be the hypothesis preferred by Sir William Crookes and Professor Floumoy (Des Indes à la planète Mars, pp. 353-365). On this showing there is nothing "supranormal" in "telepathy," as it is called. The latter theory of "a purely spiritual communication" is argued for by Mr Myers (Proceedings of the Society for Psychological Research, xv. 407-410). If we accept telepathy as experimentally demonstrated, and regard it as a physical process, we reduce (4), "apparitions at the moment of death or otherwise," to a normal though not very unusual fact: Everyone would admit this in the case of mere empty hallucinations. A, in Paisley, sees P, in London, present in his room. P is neither dying nor in any other crisis, and A is, as both continue to be, in his normal health. Such experiences are by no means very uncommon, when there is nothing to suggest that P has exercised any telepathic influence on A. On the other hand, in Phantasms of the Living, and in the report on the Census of Hallucinations (Proceedings, vol. x.), the society has published large numbers of "coincidental" hallucinations, the appearance of P to A coinciding with the death or other crisis of the distant P. That such "wraiths" do occur is the popular and savage belief. But, it may be urged, many hallucinations occur and many deaths. People only remember the hallucinations which happened, or were made by erroneous reckoning to seem to happen, coincidentally with the demise of the person seen. This is not quite true, for a hallucination so vivid as to betaken for a real person and addressed as such is not easily forgotten by a sober citizen, even if "nothing happened" afterwards. None the less, the coincidental hallucinations have certainly a better chance of being remembered, while fancy is apt to exaggerate the closeness of the coincidence. Nothing can demonstrate that coincidences between death and hallucination occur more frequently than by the doctrine of chance they ought to do, except a census of the whole population. In the present indifference of government to psychical science no party is likely to institute such a census and even if it were done, the freedom of the individual would throw doubt on the statistics. It would be necessary to cross examine each "peripient," and to ask for documentary or other corroborative evidence in each case. The Society for Psychological Research collected statistics in proportion to its resources. More than 17,000 answers were received to questions rather widely circulated. The affirmative respondents were examined closely, their mental and physical health and circumstances inquired into, and collectors of evidence were especially enjoined to avoid selecting persons known to be likely to return affirmative replies. There were so called first hand in which the death of the person seen coincided, within twelve hours, with the visual hallucination of his or her presence, out of 352 instances of such hallucinations. By way of arriving at the true proportions, the hallucinations which coincided with nothing were multiplied by four. In this way allowance was made for obliqueness of non-coincidental hallucinations. The verdict of the committee was that, on the evidence before them, hallucinations coincided with deaths in a ratio of 440 times more than was to be expected by the law of probabilities. The committee came to the conclusion that a relation of cause and effect does exist between the death of A and the vision of A held by P. The hallucination is apparently caused from without by some unexplained action of the mind or brain of A on the brain or mind of P. This effect is also traced, where death does not occur, for example, in the many instances of false "arrivals." A is on his way to X, or is dreaming that he is on his way, and is seen at X by P, or by P, Q, and R, as may happen. These cases are common, and were explained in Celtic philosophy by the theory of the "Co-Walker," a kind of "astral body." The facts are accounted for in the same way by Scandinavian popular philosophy. Possibly in many instances such hallucinations are the result of expectancy in the beholder. Yet if we go out to shoot or fish, excepting to encounter grouse or salmon, we do not usually see grouse or salmon if they are not there! Where the arrival is not expected, this explanation fails. In "second sight," even among savages, these occurrences are not frequent, and doubtless admit of an explanation by telepathy. In two instances, known at first hand to the present writer, persons dreamed, at a distance, that they entered their own homes. In one the person was seen, in the other distinctly heard, by the inmates of his or her house. In several of these examples knocks are heard, as in spiritualist séances. In fact, if we accept the evidence, living but remote persons may, unconsciously, produce effects of sounds and of phantasms exactly like those which popular belief ascribes to the spirits of the dead.

If we admit the evidence, of which a great body exists, and if we attribute the phenomena to telepathy, curious inferences may be drawn. Thus if the phenomena are such as only the spirits of the dead could be credited with producing—if the dead were frequently recognized by various good witnesses—it would follow (on the hypothesis of telepathy) that telepathy is not a physical process caused by material waves or rays from living brain to brain, the dead having no brains in working order. On the other hand, if living brains may thus affect each other, a subjective hallucination experienced by the living A may conceivably be "wired on" to the living P. Thus A, in a given house, may have a mere subjective hallucination of the presence of the dead B, and may, unconsciously, infect with that hallucination other persons who come to the house. Thus once infected by hallucination, the organism of the other may become practically impossible for a spirit of the dead to prove his identity. Any information which he may give in any way must either be known to living people, however remote, or unknown. If known to a living person, he may, unconsciously, "wire it on" to the seer. If wholly unknown to everybody, the veracity of the information cannot be demonstrated, except later, if it refers to the unknown future. Thus the theory of telepathy, with a little good will, puts the existence and activity of the souls of the dead beyond possibility of proof.

These remarks apply to the researches of the society into alleged isolated phantasms of the dead, and into "hatched" cases. This problem is based on all hands that sane and sober people may have subjective hallucinations of the presence of living friends, not dying or in any other crisis. Obviously then, the appearance of a dead person may equally be an empty hallucination. Thus, a member of the House of Commons, standing at the entrance of a certain committee-room, saw another member, of peculiar aspect and gait, pass him and enter the room, his favourite haunt. Several hours passed before the percipient suddenly recollected that the other member had been dead for some months. Even superstition cannot argue that this appearance was a ghost. In the same way Hawthorne, the celebrated novelist, frequently, he says, saw in the club-man in his club. But suppose, for the sake of argument, that at intervals members of the house kept seeing such appearances of dead members of parliament, and suppose that they had never seen the prototypes in their lifetime, but yet correctly described them: then it might be said that their hallucinations
had merely been "wired on" from the brain of some living member of parliament who knew the deceased. Thus telepathy cuts two ways. It is, if accepted, a singular discovery, but it throws an enormous burden of proof on a "ghost" who wants to establish his identity. In the same way telepathy cuts at the root of "clairvoyance," or lucid view of events remote in space or distant in time. The vision may have been "wired on" telepathically by a living person who knew the remote event. The "supranormal" can only be proved if the information conveyed by the hallucination is verified in the future, or is proved by the finding of documents not known to exist at the time of the hallucination, but afterwards discovered. A curious possible instance was the discovery by the inventor of the magneto, Mary Stuart (1566), verifying in some degree a clairvoyant vision about the jewels published some years earlier (see "Queen Mary's Jewels" in the writer's Book of Dreams and Ghosts). For the same reasons the information nominally given by "spirits" of the dead through the mouth or by the automatic writing of Mrs Piper (Boston, U.S.) and other mediums may be explained by telepathy from the living who know the facts. This theory was rejected, for example, in the case of Mrs Piper, by Myers and Dr Richard Hodgson, who devoted much time to the examination of the lady (see Proceedings, vii., viii., xii., xiv., with criticisms by Mrs Sidgwick and the present writer in vol. xxv. pt. xxxvi.). In the late Dr Hodgson's opinion, the dead do communicate through the automatic writing or speaking of Mrs Piper. The published evidence (much is unpublished) does not seem to justify the conclusion, which is not accepted by Mrs Piper herself! Dr J. H. Hyslop has published enormous and minute reports on Mrs Piper, convincing to himself but not to most readers.

This leads us to the chief field of research in "automatism," or actions of the subconscious or "subliminal" self. The prototype of such things is found in the performances of natural somnambulists. All ages have formed these faculties beyond their power when in a normal condition. The experiments of Mesmer, and of those who followed in his track, down to the psychologists of to-day, proved (what had long been known to savages and conjurers) that a state of somnambulism could be induced from without. Moreover, it is proved that certain persons can, as it were, hypnotize themselves, even unwittingly, and pass into trance. In these secondary conditions of trance, such persons are not only amenable to "suggestion," but occasionally evolve what are called secondary personalities: they speak in voices not their own, and exhibit traits of character not theirs, but in harmony with the impersonations. The popular, savage and ancient theory of these phenomena was that the people thus affected were inspired by a god or spirit, or "possessed" by a demon or a dead man. Science now regards the gods or demons or spirits as mere exhibitions of the secondary personality, which wakens when the normal personality slumbers. The knowledge and faculties of the secondary personality, far exceeding those exhibited in the normal state, are explained to a great extent by the patient's command, when in the secondary state, of resources latent in the memory. The same explanation is offered for other phenomena, like those of automatic writing, knocking out answers by tilting tables, or discovering objects by aid of the "divining rod."

The muscular actions that tilt the table, or wag the rod, or direct the pencil or planchette, are unconsciously made, and reveal the latent stores of subconscious knowledge, so that a man writes or knocks out information which he possessed, but did not suspect himself of possessing. These processes were familiar to the Neoplatonists, and in one form or other are practised by Chinese, Tibetans, Negroes, Malays and Melanesians. A similar kind of automatism is revealed in the inspirations of genius, which often astonish the author or artist himself. An interesting example has been studied by Myers in the feats of arithmetic recorded about "calculating boys," who are usually unconscious of their methods. The whole of this vast field of the unconscious, or subconscious, or subliminal self has been especially examined by Myers, and by such psychologists as Ribot, Janet, Richet, Flournoy and many others.

The general result is a normal explanation, not yet complete, of the phenomena hitherto attributed to witchcraft, inspiration, possession, and so forth. Probably the devils, saints, angels and spirits who have communicated with witches, living saints, demoniacs and visionaries are mere hallucinatory reflections from the subconscious self, endowed with its store of latent memories and strangely acute percipient faculties. Thus a curious chapter of human history is at last within possible reach of explanation. Men regard phenomena as "supranormal" or "supernatural," or reject them altogether, till their modus is explained. But it would not be candid to say that the explanation proposed for them is necessarily complete. The nature of the hypno-otic trance itself remains a matter of dispute. The knowledge automatically revealed can by no means always be accounted for, either by latent memory or by the sharpening of the normal faculties of perception, while the limits of telepathy (if it be accepted) are vaguely conjectured. Even the results of simple experiments in "crystal-gazing" are often very perplexing. Further experiment may reveal some normal explanation, while scepticism (which seldom takes the trouble to examine the alleged facts with any care) can always repose on a theory of malobservation and imposture. These, of course, are tene causes, while in this, as in all provinces of human evidence, bad memories and unconscious errors distort the testimony. Psychological research encourages, or ought to encourage, the cool impartiality in examining, collecting and recording facts, which is usually absent, in greater or less degree, from the work even of eminent historians. Men of equal honesty and acuteness may believe or disbelieve in the innocence of Mary Queen of Scots, or in the "spirits" which control Mrs Piper. As to alleged "physical phenomena" of unknown cause, one, the power of passing without lesion with naked feet over fire, has recently been attested by numerous competent observers and experimenters in the ritual of Fijians and other peoples. Islanders, Japanese, Bulgarians, natives of southern India and other races. (The evidence has been collected by the present writer in Proceedings S.P.R. vol. xv. pp. 2-15. Compare a case examined and explained more or less by S. P. Langley, Nature, August 22, 1901.) The much more famous tales of movements of objects untouched have been carefully examined, and perhaps in no instance have professional performers proved innocent of fraud. Yet the best known living medium, Eusapia Palladino, though exposed at Cambridge, has been rehabilitated, after later experiments, in the opinion of many distinguished Continental observers, who entirely disbelieve in the old theory of action by "spirits" or any other hypothesis.

The results of psychological research, after several years of work, are not really less than could be expected from toil in a field so difficult. The theory of alternating, or secondary, personalities is the key, as we have said, to a strange chapter in "the history of human error." The provisional hypothesis of telepathy puts a meaning into the innumerable tales of "wraiths" and of "second sight." It is never waste of time to investigate the area of human faculty; and practical results, in the medical treatment of abnormal intellectual conditions, have already been obtained. The conduct of our witch-burning ancestors now becomes intelligible, a step on the way to being pardonable. With their methods and inherited prejudices they could scarcely have reasoned otherwise than they did in certain cases of hysteria and autohypnotization. Many "miracles" of healing and of "stigmatization" become credible when verified in modern experience and explained by "suggestion"; though to explain the explanation is a task for the future. Such as it is, the theory was accepted by St Francis de Sales in the case of St Theresa. Results of wider range and of more momentous interest may yet be obtained. The science of electrical phenomena was not developed in a quarter of a century, and it would be premature to ask more from psychological research than it has achieved in a short period. The subject is not readily capable
of exact experiment, human faculty being, as it were, capricious, when compared with ordinary physical processes. Imposition, conscious or unconscious, is also an element of difficulty. But already phenomena which are copiously reported throughout the whole range of psychical research have been proved to possess an intrinsic and basis in fact, have been classified, and to some extent have been explained. Even if no light is ever to be cast on spiritual problems, at least the field of psychology has been extended.

The literature of psychical research is already considerable, and a complete bibliography would occupy much space. Readers who care to pursue the study will find their best guide in the Psychical Research Society's Catalogue, with a catalogue of the society's collection, including the Gurney Library (hypnotism), with reviews of modern books in many languages—French, German, Italian, Russian—as they appear. Among modern English books may be recommended Phantoms of the Living, by Gurney, Podmore and Myers; Studies in Psychical Research, by Podmore, with his Apparitions and Thought-Transference; and Principles of Psychology, by Professor William James, of Harvard.

The historical side of the subject, especially as regards the beliefs of savages and of classical antiquity, may be studied in E. B. Tylor's Primitive Culture (under "Animism"), in Myers's Classical Essays (under "Greek Orcels"), and A. Lang's Celtic Lane and Common Sense, and History of the Mind, by Hume. The latter contains vast collections of facts, with a provisional theory. Myers's regretted death prevented him from revising his book, which contains a wealth of material that he had gathered during his career and to the belief in the "invagination" and "possession" of living human organisms by spirits of the dead. The same tendency marks an article on "Psychical Research," by Sir Oliver Lodge, in he article, which contains a great many facts and citations can be found in Harry Price's article titled "The Past-Life Experience," which is cited in the 2008 edition of the Encyclopedia of Occultism and Parapsychology. The technique of "paraelasticsiology" of "invagination" and "possession." Th. Flournoy's Les Indes à la planète Mars is a penetrating study of pseudo-spiritual messages." A criticism making against the notion of telepathy may be found in Morel's Hélications and Illusions (Eng. trans.). Some errors and confusions in this work (due in part to the expansion of the original text) are noted in A. Lang's Making of Science, with his work on the history of the mind, by Hume.

To every one sense there corresponds a sense-organ; the several senses are distinct and independent, so that no one sense can add to or alter the materials of another: the possession of five senses, e.g. furnishing no data as to the character of the whole complex object which has been presented to any sense, which after being passed through the sense-correspondent of the object can be perceived in the skin, or by the eye. If, then, the latter is suggested, e.g. the eye, its perception must be one of the several senses, i.e. of the sense-correspondent of the object, which passes through the sense-correspondent of the object in the skin, and cannot be perceived in the skin, or by the eye.

The Science of Mind

The science of mind, which can only be strictly defined by an analysis of what "mind" means.

1. In the several natural sciences the scope and subject-matter of each are so evident that little preliminary discussion is called for. But with psychology, however much it is freed from the restrictions of an independent, or, as is ordinarily assumed that its subject-matter can be at once defined. "It is what you can perceive by consciousness or reflection or by the mind, says one, "just as the subject-matter of optics is what you can perceive by sight." Or, "psychology is the science of the phenomena of mind," we are told again, "as is marked off from the physical sciences, which treat only of the phenomena of matter." But, whereas nothing is simpler than to distinguish between seeing and hearing, or between the phenomena of heat and the phenomena of gravitation, a very little reflection may convince us that we cannot in the same fashion distinguish internal from external sense, or make clear to ourselves what we mean by phenomena of mind as distinct from phenomena of consciousness at the time, as true sensations. Also if we consult the physician we learn that there is a sense with a "centre" that could be regarded as the "physical basis" of this inner sense; and, if self-consciousness alone is temporarily in abeyance and a man merely " beside himself," such state of delirium has been described as a result of a complication which prevents the temporary suspension of sight or hearing.

To the concept of an internal perception or observation the preceding objections do not necessarily apply—that is to say, this supposed inner sense may be so defined as to make it a condition of observation as we escape the change of assuming a special sense which furnishes the material for such perception or observation, in that the observation and the consciousness of it may form some other mode of distinguishing its subject-matter. For, so far as any introspective and internal activity of perceiving or observing is concerned, it is not easy to see any essential difference in the process whether what is observed be material, or physical, or psychological, or physical and psychological. Psychological observation is more difficult, because the facts observed are often less definite and less persistent, and admit less of actual isolation from physical facts; but the process of recognizing similarities or differences, the details this imply two of observation, are not materially altered on that account. It may be further allowed that there is one difficulty peculiarly felt in psychological observation, the one most inaccurately expressed by saying that here the observed and the observed are not altered.

The difficulty is surely in the first instance due to the very obvious fact that our powers of attention are limited, so that we cannot alter the proportion of attention which we pay to the several objects or to the different psychological aspects of the phase of consciousness in question. And this one with any aptitude for such studies can do with so slight a diversion of attention as not to disturb very seriously either the actual perception or that which immediately succeeds it. But this similarity has to be similarly met by physical observers in certain special cases, as, e.g. in observing and registering the phenomena of solar eclipse; and similar aptitudes in the distribution of attention are required by the surgeon and by the psychologist. Just as little, then, as there is anything that we can with propriety call an inner sense, just so little can we find in the process of psychological perception or observation the special subject-matter of psychology. The question still is: What is it then perceived or observed? and the answer to the question is: Internal experience as distinguished from external, what takes place in the mind, independent from the world without.
total of objects to remain the same: the orange would still be round, yellow and fragrant as before. For the physicist—whch is not a certain object, when we abstract from its presentation, may be described by saying that phenomenon with him means appearance or manifestation, or—as we had better say—observation, individually, but rather for what Kant called *Beantwortung überhaupt*, or, as some would produce the objectivemeness, i.e. for an imaginary subject freed from all the limitations of actual subjects save that of depending on “sensibility” for the manifestation. However, this is not all, for, as we shall presently, the psychologist also occupies this position; at least if he does not his is not a true science. But, further, the physicist leaves out of sight altogether the facts of attention, feeling, and so forth, all of which actual presentation entails. Present the psychological point of view, on the other hand, the removal of the subject removes not only all such facts as attention and feeling, but all presentation or possibility of presentation whatever. Surely, then, to push a certain object, when we abstract from its presentation, material phenomenon, and to call the actual presentation of this object a mental phenomenon, is a clumsy and confusing way of representing the difference between the two points of view. For the terms “material” and “mental” seem to imply that they are two so-called phenomena have nothing in common, whereas the same object is involved in both, while the term “phenomenon” implies that the point of view is in each case the same, when in truth what is emphasized by the one the other ignores.

2. Paradoxical though it may be, we must then conclude that psychology cannot be defined by reference to a special subject. *Standpoint* matter as such concrete sciences, for example sciences of Psyche—mineralogy and botany can be; and, since it deals in logic, some sort with the whole of experience, it is obviously not an abstract science in any ordinary sense of that term. To be characterized at all, therefore, apart from metaphysical assumptions, it must be characterized by the standpoint from which this experience is viewed. It is by way of expressing this that widely different schools of psychology define it as subjective, all other positive sciences being distinguished as objective. But this seems scarcely more than a first approximation to the truth, for as it has been incidentally, is apt to be misleading. The distinction rather than the judgment of the point of view, what is sometimes termed “individualistic,” that of the so-called object-sciences being “universalistic,” both alike being objective in the sense of being true for all, consisting of what Kant would call judgments of experience. For psychology is not a biography in any sense, still less a biography dealing with idiosyncrasies, and in an idiom having an interest and a meaning for one subject only, and incommunicable to any other. Locke, Berkeley and Hume have been severely handled because they regarded the critical investigation of knowledge as a psychological problem, and set to work to study the individual mind simply as such, without reference to the general laws of the sciences, the proper one for the science of psychology itself; and, however surely their philosophy was foredoomed to a collapse, there is no denying a steady psychological advance as we pass from Locke to Hume and his modern representatives. By “idea” Locke tells us he means “Whatsoever is the object of the understanding when a man thinks” (i.e. is conscious), and having, as it were, shut himself within such a circle of ideas he finds himself powerless to explain his knowledge of a world that is assumed to be independent of himself; but he is able to give a very good account of the uses of these ideas themselves. He cannot justify his belief in the external world, yet he recognizes the common simple ideas “were conveyed” any more than Robinson Crusoe could have explored the continents whose products were drifted to his desert island, though he might perhaps survey the island itself well enough. Berkeley accordingly, as Professor Fraser happily puts it, abolished Locke’s hypothetical outer circle. Thereby he made the psychological standpoint clearer than ever—hence the truth of Hume’s remark, that Berkeley’s arguments “admit of no answer”; at the same time the epistemological problem was as hopeless as before—hence again the truth of Hume’s remark that those arguments produced no conviction. Only in the case of this latter deal, the psychologists may truly say that their esse is percipi, inasmuch as all his facts are facts of presentation, are ideas in Locke’s sense, or objects which imply a subject. Before we became conscious there was no world for us; should our consciousness cease, the world for us cases too; had we been born blind, the world would for us have no colour; if deaf, we would have had no sounds; if idiotic, it would have had no meaning. Psychology, then, never transcends the limits of the individual. But now, though this Berkeleyan standpoint is the standpoint of psychology, psychology is not pledged to the method employed by Berkeley and by Locke. Psychology may be individualistic without being confined exclusively to the introspective method. There is nothing to hinder the psychologist from employing materials furnished by his observations of other men, of infants, of the lower animals, or of the insane; nothing to hinder him taking counsel with the philologist or even the physiologist, provided always he can show the psychological bearings of those facts which are not directly psychological. The standpoint of psychology is individualistic; by whatever methods, from whatever source its facts are ascertained, they must—to have a psychological import—be regarded as having place in, or as being part of, some one’s consciousness or experience. In this sense, i.e. as presented to an individual, “the whole choir of heaven and furniture of earth” may belong to psychology, but otherwise they are psychological nonentities. In dealing with psychology, however, the propriety of avoiding the terms “mind” and “soul,” for what it implies, is widely acknowledged; mind because of the disastrous dualism of mind and matter, soul because of its metaphysical associations. Hence F. A. Lange’s famous notion: modern psychology is Psychologie ohne Seele. But consciousness, which is the most frequent substitute, is continually confused with self-consciousness, and so is apt to involve undue stress on the subjective as opposed to the objective, as well as to emphasize the cognitive as against the conative factors. Experience, it is maintained, is a more fundamental and less ambiguous term. Psychology then is the science of individual experience. The problem of psychology, in dealing with this complex subject-matter, is in general—first, to ascertain its ultimate constituents, and, secondly, to determine and explain the laws of their interaction.

**General Analysis.**

3. In seeking to make a first general analysis of experience, we must start from individual human experience, for this alone is what we immediately know. From this standpoint we must endeavour to determine the “irreducible minimum” involved, so that our concept may apply to all lower forms of experience as well. Etymologically experience connotes practical acquaintance, efficiency and skill as the result of trial—usually practical trial—and not merely recent writers on comparative psychology propose to make everything subservient to this sense the criterion of psychological life. The ox kneweth his owner and the ass his master’s crib, and so would pass muster; but the ant and the bee, who are said to learn nothing, would, in spite of their marvellous instinctive skill, be regarded as mere automata in Descartes’s sense. That this criterion is decisive on the positive side will hardly be denied; the question how far it is available negatively we must examine later on. But it will be well first briefly to note some of the implications of this positive criterion: *Experience is the process of becoming expert by experience.* The chief implication of this is that in which psychological language we express as the duality of subject and object. Looking at this relation as the comparative psychologist has to do, we find that it tallies in the main with the biological relation of organism and environment. The individuality of the organism corresponds to, though it is not necessarily identical with, the psychological subject, while to the environment and its changes corresponds the objective continuum or totum objectivum as we shall call it. This correspondence further helps us to see still more clearly the error of regarding individual experience as wholly subjective, and at the same time helps us to find some measure of truth in the naive realism of Common Sense. As these points have an important bearing on the connexion of psychology and epistemology, we may attempt to elucidate them more fully.

Though it would be unanswerable to resolve a thing, as some have done, into a mere meeting-point of relations, yet it is
perhaps as great a mistake to assume that it can be anything deter-
minate in itself apart from all relations to other things. By the
physicist this mistake can hardly be made: for him action and
reaction are strictly correlative: a material system can do no
work on itself. For the biologist, again, organism and environ-
ment are invariably complementary. But in psychology, when
presentations are regarded as subjective modifications, we have
this mistaken isolation in a glaring form, and all the hopeless
difficulties of what is called "subjective idealism" are the result.
So, for example, Leibnitz's image of 'monads' are always at the cost of
individual experience, but always as correlative to objective
modifications or change in the objective continuum. If experi-
ence were throughout subjective, not merely would the term
subjective itself be meaningless, not merely would the concep-
tion of the objective never arise, but the entirely impersonal and
intransitive process that remained, though it might be described
as absolute becoming, could not be called even solipsism, least
of all real experience. Common Sense, then, is right in positing,
wherever experience is inferred, (1) a factor answering to what
we know as self, and (2) another factor answering to what each
of us knows as the world, which each one immediately knows as a coloured,
sounding, tangible world, more exactly as a world of sensible
qualities. The assumption of naïve realism, that the world as
each one knows it exists as such independently of him, is
questionable. But this assumption goes beyond individual
experience, and does not, indeed could not, arise at this
standpoint.

Answering to the individuality and unity of the subjective
factor, there is a corresponding unity and individuality of the
objective. Every Ego has its correlative Non-Ego, whence in
the end such familiar saying as "quod homines toti sentientiae
et simulacris, in eodem monas disrupitur" and the like. The doctrine of
Leibnitz, that "each monad is a living mirror... representative of the universe according to
its point of view," will, with obvious reservations, occur to many
as illustrative here. In particular, Leibnitz emphasized one
point on which psychology will do well to insist. "Since the
world is a plenum," he begins, "all things are connected together
and everybody acts upon every other, more or less, according
to their distance, and is affected by their reaction; hence each
monad is a living mirror," et c. Subject and Object, or (as it
will be clearer in this connexion to say) Ego and Non-Ego, are
then not merely logically correlative, but actually as more than the correlative of the
other, so that to this Ego there corresponds: "He who cannot read in each
what is happening everywhere" (Monadology, § 61). Though
every individual experience is unique, yet the more
Egoi, the more their correlative Non-Egoi. Non-
Egoi are likewise similar; much as two perspective projections
are similar the more adjacent their points of sight, and
more similar as regards a given position the greater its distance
from both points. No doubt we must also make a very exten-
sive use of the hypothesis of sub-consciousness, as just Leibnitz
did, before we can say that the universe is the objective factor
in each and every individual's experience. But we shall have
in a position to allow that, besides the strictly limited "content"
rising above the threshold of consciousness, there is an indefinite
extension of the presentational continuum beyond it. And
the Leibnitzian Monadology helps us also to clear up a certain
confusion that besets terms such as "content of consciousness,"
or "finite centre of experience"—a barbarous but intelligible
phrase that has recently appeared—the confusion, that is, with
a mosaic of mutually exclusive areas, or with a scheme of mutu-
ally exclusive logical compartments. Consciousnesses, though
in one respect mutually exclusive, do not limit each other in this
fashion. For there is a sense in which all individual experiences
are absolutely the same, though relatively different as to
their point of view, i.e., as to the manner in which for each
the same absolute whole is sanded under subjective and objective
factors.

This way of looking at the facts of mind helps, again, to dispel
the obscurity investing such terms as subjective, intersubjective,
transsubjective and objective, as these occur in psychological
or epistemological discussions. For the psychologist must main-
tain that no experience is merely subjective: it is only epistemo-
logists (naturally Kant) who so describe individual experience,
because objects experienced in their concrete particularity per-
tain, like so many idiosyncrasies, to the individual alone. In
contrast with this, epistemologists then describe universal
experience—the objects in which are the same for every experi-
ent—as objective. Both these problems are thus solved. And so has arisen
the time-honoured opposition of Sense-knowledge and Thought-
knowledge: so too has arisen the dualism of Empiricism and
Rationalism, which Kant sought to surmount by logical analysis.
It is in the endeavour to supplement this analysis by a psycho-
logical genesis that the terms intersubjective and transsubjective
prove useful. The problem for psychology is to ascertain the
successive stages in the advance from the one form of experience
or knowledge to the other. "When ten men look at the sun or
the moon," said Reid, "they all see the same individual object." But
according to Hamilton this statement is not "philosophically
correct... the truth is that a considerable degree of successful
reasoning is the result of an immediate understanding of sense
with reference to existence beyond the sphere of immediate knowledge." 1 Now it is to
this "beyond" that the term transsubjective is applied, and the
question before us is: How do individual subjects thus get
beyond the immanence or immediacy with which all experience
begins? By a "process of reasoning," it is said. But it is at
least true in fact, whether necessarily true or not, that such
reasoning is the result of social intercourse. Further, it will be
generally allowed that Kant's Analytik, before referred to, has
made plain the insufficiency of merely formal reasoning to yield
the categories of Substance, Cause and End, but we pass from
merely perceptual experience to that wider experience
which transcends it. And psychology, again, may claim to have
shown that in fact these categories are the result of that
reflective self-consciousness to which social intercourse first
gives rise.

But such intercourse, it has been urged, presupposes the common
ground between subject and subject which it is meant to explain.
How, it is asked, if every subject is confined to his own unpro-
duced experience, does this intersubjective intercourse ever arise? If no
progress towards integrative synthesis were possible before inter-
subjective intercourse began, such intercourse, as presupposing
the categories of Substance, Cause and End, would be quite
impossible. But thus it comes about that Kant's is also suited to the
subjective parallax or acquaintance with the
real character of the system in time in which memory
proper secures; and when in this way self becomes an object,
resembling objects become other selves or "ectes," to adopt the
intersubjective term originated by the late Mr. K. Clifford.
We may be quite sure that his faithful dog is as little a solipsist
as the noble savage whom he accompanies. Indeed, the rudiments of the
social factor are, if we may judge by biological evidence, to
be very early possessed by even earliest savages. And men
in all but the lowest Metazoa, pairing and courtship are frequent
among insects, while "among the cold-blooded fishes the battle of
the stickleback with his rivals, his captivating manoeuvres to lead
the female to the nest in which he has built his mud dam, or the
dance around her, and his subsequent jealous guarding of the nest,
have often been observed and admired." 2 Among birds and mammals

1 Principles of Nature and Grace, § 1.

2 Lectures on Metaphysics, ii. 153.

3 And it is precisely for want of this mediation that Kant's "two
stems of human knowledge, which perhaps may spring from a common
root, the unknown root," leave epistemologists still more or less
hampered with the old dualism of sense and understanding.

we find not merely that these psychological aspects of sexual life are greatly extended, but that we find also prolonged education of offspring by parenthood, and the associated changes in the child and the family language as at any rate "the linguistic impulse," is not wholly absent among brutes. Thus as the sensori-motor adjustments of the organism to its environment generally advance in complexity and range, there is a concomitant advance in the sharpness and intimacy of its relations specially with individuals of its kind. It is therefore reasonable to assume no disconnectivity between phases of experience that for the individual are merely objective and phases that are also personal. Individuality and individual experience some interchange of experience is possible. So disappears the great gulf fixed between subjective or individual and intersubjective or universal experience by rival systems in philosophy.

4. From this preliminary epistemological discussion we may pass on to the psychological analysis of experience itself. As to this, there is in the main substantial agreement; the elementary facts of mind cannot be expressed in less than three propositions—"I feel something," "I know something," "I do something." But here at once there arises an important question, viz. What after all are we to understand by the subject of these propositions? The proposition "I feel somehow" is not equivalent to "I know that I feel somehow." To identify the two would be to confound consciousness with self-consciousness. We are no more confined to our own immediate observations here than elsewhere; but the point is that, whether seeking to analyse one's own consciousness or to infer that of a lobster, whether discussing the association of ideas or the expression of emotions, there is always an individual self or "subject" in question. It is not enough to talk of feelings or volitions: what we mean is that something individual—man or worm—feels, strives, acts, thus or thus. Obvious as this may seem, it has been frequently either forgotten or gainsaid. It has been forgotten among details or through the assumption of a medley of faculties, each treated as an individual in turn, and among which the real individual was lost. Or it has been gainsaid, because to admit that all psychological facts pertain to an experiencing subject or experient seems to imply that they pertain to a particular spiritual substance, which was simple, indestructible, and so forth; and it was manifestly desirable to exclude such assumptions from psychology as a science aiming only at a systematic exposition of what can be known and verified by observation. But, however, much assailed or disowned, the concept of a "mind" or conscious subject is to be found implicitly or explicitly in all psychological writers whatever—not more in Berkeley, who accepts it as a fact, than in Hume, who treats it as a fiction. This being so, we are far more likely to reach the truth eventually if we openly acknowledge this inexpugnable assumption, if such it prove, instead of resorting to all sorts of devious periphrases to hide it. Now wherever the word Subject, or its derivatives, occurs in psychology we might substitute the word Ego and analogous derivations, did such exist. But Subject is almost always the preferable term; its impersonal form is an advantage, and it readily recalls its modern correlative Object. Moreover, Ego has two senses, distinguished by Kant as pure and empirical, the latter of which was, of course, an object, the Me known, while the former was subject always, the I knowing. By pure Ego or Subject it is proposed to denote here the simple fact that everything experienced is referred to a Self experiencing. This psychological concept of a self or subject, then, is after all by no means identical with the metaphysical concepts of a soul or mind-atome, or of mind-stuff not atomic; it may be kept as free from metaphysical implications as the concept of the biological individual or organism with which it is so intimately connected.

The attempt, indeed, has frequently been made to resolve the Ego into the Subject. For the latter, and so to find in mind only such an individuality as has an obvious counterpart in this individuality of the organism, i.e. what we may call an objective individuality. Our subject here is to reconcile into an all its plausibility to the fact that it leaves out of sight the difference between the biological and the psychological standpoints. All that the biologist means by a dog is "the sum of the phenomena which make up its corporeal existence." And, inasmuch as its presentation to any one in particular is a point of no importance, the effect of this of all alike, is lost. Let us now turn to psychology: Why should we not here follow Huxley and take "the word "soul" simply as a name for the series of mental phenomena which make up an individual mind?" Surely this is to misunderstand this question we realize that the cases are different. "Series of mental phenomena" for whom? For any passer-by such as might take stock of our biological dog? No, obviously only for the subject himself, who is aware of himself as a series of phenomena. Moreover a dog is never aware of itself as a series. Or (2) shall we say that the several parts of the series are mutually phenomenal, much as A may look at B, who was just now looking at A? Or (3) finally, shall we say that this part of the series, in fact every term but one, is phenomenal for the rest—for that one?

As to the first, paradox is too mild a word for it; even contradiction will hardly suffice. It is as impossible to express "being aware of" by one term as it is to express an equation or any other relation by one term: what knows can no more be identical with what is known than a weight with what it weighs. If a series of feelings is what is known or presented, then what knows, what it is presented to, or the series itself? This is what Hume means, viz. that the infinitely greater part of the series is either past or future. The question is not in the first instance one of a substantive kind; it refers rather to a temporal relation of knowledge or consciousness is unmeaning except as it implies something knowing or conscious of something. But it may be replied: Granted that the formulas for consciousness is something doing something, is it general? Are the terms "conscious" and "being aware of" the same in the same act? When I touch myself or when I see myself, why may not agent and patient be the same when the action is knowing or being aware of; why may I not know myself—in fact, do I not know myself? Concerning this question, agents and patient, if the agent and patient are the same in the act, then, in momentary confusion, and inasmuch as the terms "self-caused, self-moving, self-known, et id genus omne, either connote the incomprehensible or are abbreviated expressions—, e.g. touching oneself when one's right hand touches one's left.

And so to the alternative: As one hand washes the other, may not different members of the series of feelings be subject and object in turn? Compare, for example, the state of mind of a man succumbing to the thought (as quick and impatiently repudiates scruples of conscience or dictates of prudence) with his state when, filled with remorse, he sides with conscience and condemns this former self—the better self" having melancholy become supreme. Here the cluster of presentations and their associated sentiments and motives, which together played the rôle of self in the first situation, have—only momentarily it may be true, but still have—for the time the place of being merged under consciousness. The subject may become complete alienation, as in what is called "double consciousness." Or again, the development of self-consciousness might be loosely described as taking the subject in the sense of being identified with the body and afterwards distinguished from it. But all this, however true, is beside the mark; and it is really a very serious misnomer to speak, as e.g. Hume always does, of the latter as "a differentiation of subject and object." It is, if anything, a differentiation of object and object, i.e. in plainer words, it is a differentiation among presentations—a differentiation every step of which implies just that relation to a subject which it is supposed to supersede.

There still remains the alternative, expressed in the words of J. S. Mill, viz. the alternative of believing that the Mind or Ego is something different from any series of feelings or possibilities of them. To admit this, of course, is to admit the necessity of distinguishing between Mind or Ego, meaning the unity or continuity of consciousness as a complex of presentations, and the Subject in the expression of consciousness as a particular identity. In dealing with the body from the ordinary biological standpoint no such necessity arises. But whereas there the individual organism is spoken of unequivocally, either as subject (the human being in the sense of the body), or as object (the body in the sense of the mind), in the psychological inquiry the subject might be either (1) the series of feelings or "mental phenomena" above referred to; or (ii) the subject of these feelings for whom they are phenomena; or (iii) the subject of these feelings or phenomena plus all the associations and implications of its person, its relation to each other in which alone the one is subject and the other a series of feelings, phenomena or objects. It is in this sense that Mind is used in empirical psychology. Its use in this sense is at least in part due to the speculative associations connected with its exclusive use in the

4 Examination of Sir W. Hamilton's Philosophy; ch. xii. fin.
5 A meaning better expressed, as said above, by experience.
second. But psychology is not called upon to transcend the relation of subject to object or, as we may call it, the fact of presentation. On the other hand, as has been said, the attempt to ignore the term of the relation is hopeless; and equally hopeless, even futile, is the attempt, by means of phrases such as consciousness or the unity of consciousness, to dispense with the recognition of a conscious subject.

5. We might now proceed to inquire more closely into the character and relations of the three invariable constituents of psychical life which are broadly distinguished as conations, cognitions, and emotions. But we should be at once confronted by a doctrine which, strictly taken, amounts almost to a denial of this tripartite classification of the facts of mind—the doctrine, viz. that feeling alone is primordial and invariably present wherever there is consciousness at all. Every living creature, it is said, feels, though it may never do any more; only the higher animals, and these only after a time, learn to discriminate and identify and to act with a purpose. This doctrine, as might be expected, derives its plausibility partly from the vagueness of psychological terminology, and partly from the intimate connexion that undoubtedly exists between feeling and cognition on the one hand and feeling and volition on the other. As to the meaning of the term, it is plain that further definition is requisite for a word that may mean (a) a touch, as feeling of roughness; (b) an organic sensation, as feeling of hunger; (c) an emotion, as feeling of anger; (d) feeling proper, as pleasure or pain. But, even taking feeling in the last, its stricter sense, it has been maintained that all the more complex forms of consciousness are resolvable into, or at least have been developed from, feelings of pleasure and pain. The only proof of such position, since we cannot directly observe the beginnings of conscious life, must consist of considerations such as the following. So far as we can judge, we find feeling everywhere; but, as we work downwards from higher to lower forms of life, the possible variety and the definiteness of sense-impressions both steadily diminish. Moreover, we can directly observe in our own organic sensations, which seem to come nearest to the whole content of primitive or infantile experience, an almost entire absence of any assignable quale. Finally, in our sense-experience generally, we find the element of feeling at a maximum in the lower senses and the cognitive element at a maximum in the higher. But the so-called intellectual senses are the most unstable, and fluctuating and faulty in collection, as we see in chemists, who sort the most filthy mixtures by smell and taste without discomfort. If, then, feeling predominates more and more as we approach the beginning of conscious life, may we not conclude that it is its only essential constituent? On the contrary, such a conclusion would be rash in the extreme. Two lines, e.g. may get nearer and nearer and yet will never meet, if the rate of approach is simply proportional to the distance. A triangle may be diminished indefinitely, and yet we cannot infer that it becomes eventually all angles, though the angles get no less and the sides do. Before, then, we decide whether pleasure or pain alone can ever constitute a complete experience, it may be well to inquire into the connexion between feeling and cognition, on the one hand, and between feeling and volition on the other, so far as we can now observe. And this is an inquiry which will help us towards an answer to our main question, namely, that concerning the nature and connexions of what are commonly regarded as the three ultimate facts of mind.

Broadly speaking, in any state of mind that we can directly observe, what we find is (i) that we are aware of a certain change in our sensations, thoughts or circumstances, (2) that we are pleased or pleased with the change, or (3) that we accept fact without feeling directly alters—i.e. without the intervention of the action of which it prompts—either our sensations or situation, but that regularly these latter with remarkable promptness and certainty alter it. We have not first a change of feeling, and then a change in our sensations, perceptions and ideas; but, these changing, change of feeling follows. In short, feeling appears to be an effect, which therefore cannot exist without its cause, though in different circumstances the same immediate cause may produce a different amount or even a different state of feeling. Turning from what we may call the receptive phase of an experience to the active or appetitive phase, we find in like manner that feeling is certainly not—in such cases as we can clearly observe—the whole of what we experience at any moment. Subjective history has always been commonly supposed to be the history of feeling, and disliking, of pain; but this is either tautology, equivalent to saying we are pleased when we are pleased and pained when we are pained; or else it is an allowable abbreviation, and means that we like pleasurable objects and dislike painful objects, as when we say we like feeling warm and dislike feeling hungry. But feeling warm or feeling hungry, we must remember, is not pure feeling in the stricter sense of the word. Within the limits of our observation, then, we find that feeling accompanies some more or less definite presentation which for the sake of it becomes the object of appetite or aversion; in other words, feeling implies a relation to a pleasurable or painful presentation or situation, that, as of feeling or as end of the action to which feeling prompts, is doubly distinguished from it. Thus the very facts that lead us to distinguish feeling from cognition and volition make against the hypothesis that consciousness can ever be all feeling.

But, as already said, the plausibility of this hypothesis is in good part due to a laxity in the use of terms. Most psychologists before Kant, and some even to the present day, speak of pleasure and pain as sensations. But it is clear that pleasure and pain are not simple ideas, as Locke called them, in the sense in which touch and taste are—that is to say, they are never like these localized or projected, nor are they elaborated in conjunction with other sensations and movements into percepts or intuitions of the external. This confusion of feeling with sensations is largely consequent on the use of one word pain both for certain organic sensations and for the purely subjective state of being pained. But such pains not only are always more or less definitely localized—which of itself is so far cognition, they are also distinguished as shooting, burning, gnawing, &c., all which symptoms indicate a certain objective quality. Accordingly psychologists have been driven by one means or another to recognize two "aspects" (Hahn), or "properties" (Wundt), in what they call a sensation, the one "sensible or intellectual" or "qualitative," the other an "affective" or "emotive" aspect or property. The term "aspect" is figurative and obviously inaccurate; even to describe pleasure and pain as properties of sensation is a matter open to much question. But the point which at present concerns us is simply that when feeling is said to be the primordial element in consciousness more is usually included under feeling than pure pleasure and pain, viz. some characteristic or quality by which one pleasurable or painful sensation is distinguishable from another. No doubt, as we go downwards in the chain of life the qualitative or objective elements in the so-called sensations become less and less definite; and at the same time organisms with well-developed sense-organs give place to others without any clearly differentiated organs at all. But there is no ground for supposing even the amoeba itself to be affected in all respects the same whether by changes of temperature or of pressure or by changes in its internal fluids, albeit all of these changes will further or hinder its life and so presumably be in some sort pleasurable or painful. On the whole, then, there are grounds for saying that the endeavour to represent all the various facts of consciousness as evolved out of feeling is due to a hasty striving after simplicity, and has been favoured by the ambiguity of the term feeling itself. If by feeling we mean a certain subjective state varying continuously in intensity and passing from time to time from its positive phase (pleasure) to its negative phase (pain), then this purely pathetic state implies an agreeing or disagreeing something which psychologically determines it. If, on the other hand, we let feeling stand for both this state and the cause of it, then, perhaps, a succession of such "feelings" may make up a consciousness; but then we are including two of our elementary facts under the name of one.
of them. The simplest form of psychical life, therefore, involves not only a subject feeling but a subject having qualitatively distinguishable presentations which are the occasion of its feeling.

6. We may now try to ascertain what is meant by cognition as an essential element in this life, or, more exactly, what we are to understand by the term presentation. It was an important step forward for psychology when Locke introduced that "new way of ideas" which stilling-fleet found alternately so amusing and so dangerous. By ideas Locke told him meant "nothing but the immediate objects of our minds in thinking"; and it was so far a retrograde step when Hume restricted the term to certain only of these objects, or rather to these objects in a certain state, viz. as reproduced ideas or "images." And, indeed, the history of psychology seems to show that its most important advances have been made by those who have kept closely to this way of ideas; the establishment of the laws of association with their many fruitful applications and the whole Herbartian psychology may suffice as instances (see HERBART). The truth is that the use of such a term is itself a mark of an important generalization, one which helps to free us from the mythology and verbiage of the "faculty-psychologists." All the various mental facts spoken of as sensations, movements, percepts, images, intuitions, concepts, notions, have two characteristics in common: (1) they admit of being more or less attended to, and (2) they can be variously combined together and reproduced. It is here proposed to use the term presentation to denote them all, as being the best English equivalent for what Locke meant by idea and what Kant and Herbart called a Vorstellung.

A presentation has then a twofold relation — first, directly to the subject, and, secondly, to other presentations. The former relation answers to the fact that a presentation is attended to, that the subject is more or less conscious of it: it is "in his mind" or presented. As presented to a subject a presentation might with advantage be called an object, or perhaps a psychical object, to distinguish it from what are called objects apart from presentation, i.e. conceived as independent of any particular subject. Locke, as we have seen, did so call it; still, to avoid possible confusion, it may turn out best to dispense with the frequent use of object in this sense. But on one account, at least, it is desirable not to lose sight altogether of this, which is after all the stricter as well as the older signification of object, namely, because it enables us to express definitely, without implicating any ontological theory, what we have so far seen reason to think is the fundamental fact in experience. Instead of depending mainly on that vague and treacherous word "consciousness," or committing ourselves to the position that ideas are modifications of a certain mental substance or identical with the subject to whom they are presented, we may leave all this on one side, and say that ideas are objects, and the relation of objects to subjects—that whereby the one is object and the other subject—is presentation; and it is because only objects sustain this relation that they may be spoken of simply as presentations.

On the side of the subject this relation implies what, for want of a better word, may be called attention, extending the denotation of this term so as to include even what we ordinarily call inattention. Attention so used will thus cover part of what is meant by consciousness—so much of it, that is, as answers to being mentally active, active enough at least to "receive impressions." Attention on the side of the subject implies intensity on the side of the object: we might indeed almost say the matter of a presentation, without which it is a nonentity.1

The inter-objective relations of presentations, on which still more fundamental that we cannot wholly pass by: it is—in part at any rate—what is commonly termed the unity or continuity of consciousness. From the physical standpoint and in ordinary life we can talk of objects that are isolated and independent and in all respects distinct individuals. The screech of the owl, for example, has physically nothing to do with the brightness of such movements by coming or going without changing the order of things to which the other belongs. But psychologically, for the individual percipient, they are parts of one whole; the more his attention is given to the one the more it is taken from the other. Also the actual recurrence of the one will afterwards entail the re-presentation of the other also. Not only are they still parts of one whole, but such distinctness as they have at present is the result of a gradual differentiation.

It is quite impossible for us now to imagine the effects of years of experience removed, or to picture the character of our infantile presentations before our interests had led us habitually to concentrate attention on some and to ignore others. In place of the many things which we can now see and hear, nor merely would there then be a confused presentation of the whole field of vision and of a mass of undistinguished sounds, but even the difference between sights and sounds themselves would be without its present distinctness. Thus the further we go back the nearer we approach to a total presentation having the character of one general continuum in which differences are latent. There is, then, in psychology, as in biology, what may be called a principle of "progressive differentiation or specialization,"2 and this, as well as the facts of reproduction and association, forcibly suggests the conception of a certain objective continuum forming the background or basis to the several relatively distinct presentations that are elaborated out of it—the equivalent, in fact, of that unity and continuity of consciousness which has been supposed to supersede the need for a conscious subject.

There is one class of objects of special interest even in a general survey, viz. movements or motor presentations. These, like sensory presentations, admit of association and reproduction, and seem to attain to such distinctness, as they possess in adult human experience by a gradual differentiation out of an original diffused mobility which is little besides emotional expression. Of this, however, more presently. It is primarily to such dependence upon feeling that movements owe their distinctive character, the possession, that is, under normal circumstances, of definite and assignable psychical antecedents, in contrast to sensory presentations, which are devoid of them. We cannot psychologically explain the order in which particular sights and sounds occur; but the movements that follow them, on the other hand, can be adequately explained only by psychology. The twilight that sends the hens to roost sets the fox to prowl, and the lion's roar which gathers the jackals scatters the sheep. Such diversity in the movements, although the sensory presentations are similar, is due, in fact, to what we might call the principle of "subjective or hedonic selection"—that, out of all the manifold changes of sensory presentation which a given individual experiences, only a few are the occasion of such decided feeling as to become objects of possible appetite or aversion. It is thus by means of movements that we are more than the creatures of circumstances and that we can with propriety talk of subjective selection. The representation of what interests us comes then to be associated with the representation of such movements as will secure its realization, so that—although no concentration of attention will secure the requisite intensity to a pleasurable object present only in idea—we can by what is strangely like a concentration of attention convert the idea of a movement into the fact, and by means of the movement attain the coveted reality.

1 Cf. Kant's Principle of the Anticipations of Perception: "In all phenomena the real, which is the object of sensation, has intensive magnitude."

2 The biological principle referred to is that known as von Baer's law, viz. "that the progress of development is from the general to the special."
7. And this has brought us round naturally to the third of the commonly accepted constituents of experience. What is conation, or rather conative action? For there are two questions often more or less confused, the question of motive or spring of action, as it is sometimes called—why is there action at all? and the question of means—how do we define or explain the manner in which the action is performed. The former question refers primarily to the connexion of conation and feeling. It is only the latter question that we now raise. In ordinary voluntary movement we have first of all an idea or re-presentation of the movement, and last of all the actual movement itself—a new presentation which may for the present be described as the filling out of the re-presentation, which thereby attains that intensity, distinctness and embodiment we call reality. How does this change come about? The attempt has often been made to explain it by a reference to the more uniform, and apparently simpler, case of reflex action, including under this term what are called sensori-motor and idio-motor actions. In all these the movement seems to be the result of a mere transference of intensity from the associated sensation or idea that sets on the movement. But when by some chance or mischance the same sensory presentation excites two or more nascent motor changes that conflict, a temporary block is said to occur; and, when at length one of these nascent motor changes finally prevails, then, it is said, 'there is constituted a state of consciousness which displays what we term volition.' But this assumption that sensory and motor ideas are associated before volition, and that volition begins where automatic or reflex action ends, is due to that invertebrate habit of confounding the psychical and the physical which is the bane of modern psychology. How did these particular sensory and motor presentations ever come to be associated? The only psychological evidence we have of any very intimate connexion between sensory and motor presentations is that furnished by our acquired dexterities, i.e. by such movement as Hartley styled "secondarily automatic." But then all these have been preceded by volition; as Herbert Spencer says, "the child learning to walk willy each movement before making it." Surely, then, a psychologist should take this as his typical case and prefer to assume that all automatic actions that come within his ken at all are in this sense secondarily automatic, i.e. to say that either in the experience of the individual or of his ancestors, volition or something analogous to it, preceded habit. But, if we are thus compelled by a sound method to regard sensori-motor actions as degraded or mechanical forms of voluntary actions, instead of regarding voluntary actions as gradually differentiated out of something physical, we have not to ask: What happens when one of two alternative movements is executed? but the more general question: What happens when any movement is made in consequence of feeling? It is obvious that on this view the simplest definitely purposeful movement must have been preceded by some movement simpler still. For any distinct movement purposely made presupposes the ideal presentation, before the actual realization, of the movement. But such ideal presentation, being a re-presentation, equally presupposes a previous actual movement of which it is the so-called mental residuum. There is then, it would seem, but one way left, viz. to regard those movements which are immediately expressive of pleasure or pain as primordial, and to regard the so-called voluntary movements as elaborated out of these. The vague and diffusive character of these primitive emotional presentations is really a point in favour of this position. For such "diffusion" is evidence of an underlying continuity of feeling. The opposite presentation, on the other hand, discussed in connexion with sensory presentations, a continuity which, in each case, becomes differentiated in the course of experience into comparatively distinct and discrete movements and sensations respectively. 1

1 Compare Spencer's Principles of Psychology, i. §§ 217, 8.
3 It may be well to call to mind here that Alexander Bain also regarded emotional expression as a possible commencement of action, but whereas we can only infer, and that in a very roundabout fashion, that our sensations are not absolutely distinct but are parts of one massive sensation, as it were, we are still liable under the influence of strong emotion directly to experience the corresponding continuity in the case of movement. Such motor-continuum we may suppose is the psychical counterpart of that permanent readiness to act in real life, which among the older physiologists was spoken of as "tonic action." This "skeletal tone," as it is now called, is found to disappear more or less completely from a limb when its sensory nerves are divided. "In the absence of the usual stream of afferent impulses passing into it, the spinal cord ceases to send forth the influences which maintain the tone." And a like intimate dependence, we have every reason to believe, obtains throughout between sensation and movement. We cannot imagine the beginning of life but only life begun. The simplest picture, then, which we can form of a concrete state of mind is not one in which there are movements before there are any sensations or sensations before there are any movements, but one in which change of sensation is followed by change of movement, the link between the two being a change of feeling.

Having thus simplified the question, we may now ask again: How is this change of movement through feeling brought about? The answer, as already hinted, appears to be: Dependence of Action on Feelling. By a change of attention. We learn from such observations as psychologists describe under the head of fascination, imitation, hypnotism, &c., that the mere concentration of attention upon a movement is often enough to bring the movement to pass. But, of course, in such cases neither emotion nor volition is necessarily implied; but none the less they show the close connexion that exists between attention and movement. Everybody, too, must often have observed how the execution of any but mechanical movements arrests attention to thoughts or sensations, and how, vice versa, a striking impression or thought interrupts him in the performance of skilled movements. Let us suppose, then, that we have at any given moment a certain distribution of attention between sensory and motor presentations; a change in that distribution then will mean a change in the intensity of some of all of these. But, in the case of motor presentations, change of intensity means change of movement. Such changes are, however, quite minimal in amount so long as the given presentations are not conspicuously agreeable or disagreeable. So soon as they are, however, there is evidence of a most intimate connexion between feeling and attention; but it is hardly possible adequately to exhibit this evidence without first attempting to ascertain the characteristics of the presentations, or groups of presentations, that are respectively pleasurable and painful, and this must occupy us later on.

8. We are now at the end of our analysis, and the results may be most conveniently summarized by first throwing them into a tabular form and then appending a few remarks by way of indicating the main purport of the table. Taking no account of the specific difference between one concrete state of mind and another, and supposing that we are dealing with presentations...
in their simplest form, i.e. as sensations and movements, we have:

\[
\begin{align*}
(1) \text{non-voluntarily attending to changes in the sensory-continuum}^1 & = \text{Presentation of sensory} \\
(2) \text{being, in consequence, either pleased or pains} & = \text{Feeling} \\
(3) \text{by voluntary attention to innervations producing changes in the motor-continuum}^1 & = \text{Presentation of motor} \\
\end{align*}
\]

A SUBJECT OBJECTS.

Of the three phases or functions, thus analytically distinguishable, but not really separable, the first and the third correspond in the main with the receptive and active states or powers of the older psychologists. The second, being more difficult to isolate, was long overlooked; or, at all events, its essential characteristics were not distinctly marked, so that it was confounded either with (1) which is its cause, or with (3), its effect. But perhaps the most important of all psychological distinctions is that which traverses both the old bipartite and the prevailing tripartite analysis, viz. that between the subject on the one hand, as acting and feeling, and the objects of this activity on the other. With this distinction clearly before us, instead of crediting the subject with an indefinite number of faculties or capacities, we must seek to explain not only reproduction, association, etc., but all varieties of thinking and acting; by the laws pertaining to ideas or presentations, leaving to the subject only the one power of variously distributing that attention upon which the intensity of a presentation in part depends. What we call activity in the narrower sense (as e.g. purposive movement and intellect) is but a special form of this single subjective activity, although a very important one.

According to this view, then, presentations, attention, feeling, are not to be regarded as three co-ordinate genera, each of which is a complete "state of mind or consciousness," i.e. as being all alike included under this one supreme category. There is, as Berkeley long ago urged, no resemblance between activity and an idea; nor is it easy to see anything common to pure feeling and association, unless it be that both possess intensity. Classification seems, in fact, to be here out of place. Instead, therefore, of the one sumnum genus, state of mind or consciousness, with its three co-ordinate subdivisions—cognition, emotion, conation—our analysis seems to lead us to recognize three distinct and irreducible components—attention, feeling, and objects or presentations—as together, in a certain connexion, constituting one concrete state of mind or psychosis. Of such concrete states of mind or psychoses we may then say—so far agreeing with the older, bipartite psychology—that there are two forms, corresponding to the two ways in which attention may be determined and the two classes of objects attended to in each, viz. (1) the sensory or receptive attitude, when attention is non-voluntarily determined, i.e. where feeling follows the act of attention; and (2) the motor or active attitude, where feeling precedes the act of attention, which is thus determined voluntarily.

**Attention.**

9. Instead of a congeries of faculties we have assumed a single subjective activity and have proposed to call this attention. Some further explication of this position seems to be desirable. We start with the duality of subject and object as fundamental. We say of man, mouse, or monkey that it feels, perceives, remembers, infers, strives, and so forth. Leaving aside the first term, it is obvious that all the rest imply both an activity and an object. Is it possible to resolve these instances into a form in which the assumed diversity of the act will appear as a diversity of the object? At first sight it looks rather as if the kind of activity might vary while the object remained the same; that e.g. we perceived an object and later on remembered or desired it. It would then be most natural to refer these several activities to corresponding faculties of perception, memory and desire. This, indeed, is the view embodied in common speech, and for practical purposes it is doubtless the simplest and the best. Nevertheless, a more thorough analysis shows that when the supposed faculty is different the object is necessarily and in all respects the same. Thus in perception, e.g. we deal with "impressions" or primary presentations, and in memory and imagination with "ideas" (in the later sense) or secondary presentations. In desire the want of the object gives it an entirely different setting, adding a new characteristic, that of value or worth, so that its acquisition becomes the end of a series of efforts or movements. The older psychology, by its acceptance of the Cartesian doctrine that all the facts of immediate experience are to be interpreted as subjective modifications, fails to distinguish adequately between the subject as active and the objects of its activity. Hence the tendency to rest content with the popular distinction of various faculties in spite of the underlying sameness implied in the common application of "conscious" to them all. In fact, Locke's definition of idea (in the older and wider sense) as the immediate object of consciousness or thinking was censured by Reid as "the greatest blemish in the Essay on Human Understanding." But, accepting this definition as implied in the duality of subject and object, and accepting too the underlying sameness which the active form "conscious" undeniably implies, we have simply to ask:

What is the better term to denote this common element—consciousness or attention?"

Consciousness, as the vaguest, most protean and most treacherous of psychological terms, will hardly serve our purpose. Attention, on the other hand, has an invariable active sense, and there is an appropriate verb, to attend. But many things, it may be said, are presented while few are attended to; if attention is to be made coextensive with the activity implied in consciousness, will not the vital distinction between attention and inattention be lost? In fact, however, this distinction implies a covert contrast, not an absolute contrast. In everyday life we recognize many degrees of attention, ranging from an extreme of intense concentration to one of complete remission, as Locke long ago pointed out. Between these extremes there is perfect continuity, and not a difference of kind; to apply the one term attention to the whole range is very like applying the one term magnitude to large and small quantities alike.

But it is not enough to show that when we commonly talk of different faculties we also find psychological differences of object, and to assert that if there is one common factor in all psychical activity this factor is attention. To make our position secure it is needful to show directly that all the various faculties with which attention can be credited are resolvable into attention and various classes or relations or states of presentations that are attended to. How far this is possible remains to be seen as we proceed. In the case of the so-called "intellectual powers" the position is generally conceded, but so far as the voluntary or active powers are concerned it is as generally denied. Now, in so far as volition implies not merely action, overt or intended, but also motives, in so far also it must be acknowledged it contains a factor not resolvable into attention to motor presentations. This further factor, which has been called "the volitional character of feeling," we here leave aside. Apart from this wider meaning of action, then, the question is whether the active process itself differs from the cognitive or receptive process.

---

1 To cover more complex cases we might here add the words "or trains of ideas."
save in being attention to a special class of objects. First of all, it is noteworthy that both have the same characteristics. Thus, what Hamilton called "the law of limitation" holds of each alike and of either with respect to the other; and it holds too not only of the number of presentations but also of the intensity. We can be absorbed in action just as much as in perception or thought; also, as already said, movements, unless they are mechanical, inhibit ideas; and vice versa, ideas, other than associated trains, arrest movements. Intoxication, hypnotism or insanity, rest or exhaustion, tell on apperception as well as on innervation. The control of thoughts, equally with the control of movements, requires effort; and as there is a strain peculiar to intently listening or gazing, which is known to have a muscular concomitant, so too there is a strain characteristic of recollection and visualization, which may quite well turn out to be muscular too. When movements have to be associated, the same continuous attention is called for as is found requisite in associating sensory impressions; and, when such associations have become very intimate, dissociation is about equally difficult in both cases.

There is one striking fact that brings to light the essential sameness of apperception and innervation, cited by Wundt for this very purpose. In so-called "reaction-time" experiments it is found, when the impression to be registered follows on a premonitory signal after a certain brief interval, that then the reaction (registering the impression) is often instantaneous; the reaction-time, in other words, is nil. In such a case the subject is aware not of three separate events, (1) the perception of the impression; (2) the reaction; (3) the perception of this; but the fact of the impression is realized and the registering movement is actualized at once and together; the subject is conscious of one act of attention and one only.

**Theory of Presentations.**

10. We come now to the exposition of the objects of attention or consciousness, i.e. to what we may call the objective or presentational factor of psychical life. The treatment of this will fall naturally into two divisions. In the first we shall have to deal with its general characteristics and with the fundamental processes which all presentation involves. In view of its general and more or less hypothetical character we may call it the theory of presentation. We can then pass on to the special forms of presentations, known as sensations, perceptions, images, &c., and to the special processes to which these forms lead up.

This exposition will be simplified if we start with a supposition that will enable us to leave aside, at least for the present, the difficult question of heredity. We know that in the course of each individual's life there is more or less of progressive differentiation or development.

Further, it is believed that there has existed a series of sentient individuals beginning with the lowest form of life and advancing continuously up to man. Some traces of the advance already made may be reproduced in the growth of each human being now, but for the most part such traces have been obliterated. What was experience in the past has become instinct in the present. The descendant has no consciousness of his ancestor's failures when performing by "an untaught ability" what they slowly and perhaps painfully acquired. But, if we are to attempt to follow the genesis of mind from its earliest dawn, it is the primary experience rather than the eventual instinct that we have first of all to keep in view. To this end, then, it is proposed to assume that we are dealing with original prelingual sensations which has continuously advanced from the beginning of psychical life. We know that pre-existing conditions of which all save the first inherited certain capacities from their progenitors. The life-history of such an imaginary individual, that is to say, would correspond with all that was new in the experience of a certain typical series of individuals each of whom advanced a certain stage in mental differentiation. On the other hand, from this history would be omitted that inherited reproduction of the net results, so to say, of ancestral experience, that innate tradition by which alone, under the actual conditions of existence, progress is possible. The process of thus reproducing the old might differ as widely from that of producing the new as electrotyping does from engraving. However, the point is that as psychologists we know nothing directly about it; neither can we say anything about its link to the phenomena of life that is old and inherited—original in the sense of Locke and Leibnitz—from what is new or acquired—original in the modern sense. But we are bound as a matter of method to suppose all complexity and differentiation among presentations to have been originated, i.e. experimentally acquired, at some time or other.

So long, then, as we are concerned primarily with the progress of this differentiation we may disregard the fact that it has not actually been, as it were, the product of one hand dealing with one **tabula rasa** to use Locke's—originally Aristotle's—figure, but of many hands, each of which, starting with a reproduction of what had been wrought on the preceding **tabulae**, put in more or fewer new touches before devising the whole to a successor who would proceed in like manner.

11. What is implied in this process of differentiation and what is it that becomes differentiated?—these are the questions to which we must now attend. Psychologists have usually represented mental advance as consisting fundamentally in the combination and recombin- 

**The Presentation-Continuum.**

**Ursdeed/Differentiation of Presen- 

**Therefore**

"Change" fails to express the characteristics which distinguish new presentations from other changes. Differentiation implies that the simple becomes complex or the complex more complex; it implies also that this increased complexity is due to the persistence of former changes; we may even say such persistence is
not the whole of it, for in this experience of massive sensation alone it is impossible to find other elements which an analysis of spatial intuition unmistakably yields. Essentially and exten-
tion, then, are not to be confounded. Now, we find, even at our
level of mental evolution, that an increase in the intensity of a
sensation is apt to entail an increase in its extensivity too. In
like manner we observe a greater extent of movement in emo-
tional expression when the intensity of the emotion increases.
Even the higher region of imagination is no exception, as is shown
by the whirl and confusion of ideas incident to delirium, and,
indeed, to all strong excitement. But this "diffusion" or
"radiation," as it has been called, diminishes as we pass from
the class of organic sensations to the sensations of the five senses,
from the expression of feeling to movements of the definitely
purposive, and from the tumult of ideas excited by passion to
the steadier sequences determined by efforts to think. Increased
differentiation seems, then, to be intimately connected with
increased "restriction." Probably there may be found certain
initial differentiations which for psychology are ultimate facts
that it cannot explain. As already said, the very beginning of
experience is beyond us, though it is our business—working from
within—to push back our analysis as far as we can. But some
differentiations being given, then it may be safely said that, in
accordance with what we have called the principle of subjective
selection (see § 6), attention would be voluntarily concentrated
upon certain of these and upon the voluntary movements
specially connected with them. To such subjectively initiated
modifications of the presentation-continuum, moreover, we may
reasonably suppose "restriction" to be in large measure due.
But increased restriction would render further differentiation
of the given whole of presentation possible, and so the two
processes might supplement each other. These processes have
now proceeded so far that at the level of human consciousness
we find it hard to form any tolerably clear conception of a field
of consciousness in which an intense sensation, no matter what,
may be present and the subject may still be in close agreement
with us so distinct from sounds that—except as regards the
excitement of attention or the drain upon it—there is nothing
in the intensest colour to affect the simultaneous presentation
of a sound. But at the beginning whatever we regard as the
earliest differentiation of sound might have been incomprehensible
with the earliest differentiation of colour, if sufficiently diffused,
much as a field of sight all blue is now incomprehensible with
one all red. Or, if the stimuli appropriate to both were active
together, the resulting sensation might have been not a blending
of two qualities, as purple is said to be a blending of red and
violet, but rather a neutral sensation with the specific qualities
of either. Now, on the other hand, colours and sounds are
necessarily so far localized that we are directly aware that the
eye is concerned with the one and the ear with the other. This
brings to our notice a fact so ridiculously obvious that it has never been deemed worthy of mention,
even though it has undeniable important bearings—
the fact, viz. that certain sensations or movements are an
absolute bar to the simultaneous presentation of other
sensations or movements. We cannot see an orange as at once
yellow and green, though we can feel it at once as both smooth
and cool; we cannot hear a closing sound at the same time,
but we can open one hand while closing the other. Such
incopresentability or contrariety is thus more than mere
difference, and occurs only between presentations belonging
to the same sense or to the same group of movements. Strictly
speaking, it does not always occur even then; for red and yellow,
hot and cold, are presentable together provided they have
certain other differences which we shall meet again presently as
differences of "local sign."
we too may confine the term. But it will be well in the next place, before assuming it more closely into their characteristics, to consider for a moment that persistence of preceding modifications which the principle of progressive differentiation implies. This persistence is best spoken of as reteniveness. It is often confused with memory, though this is something much more complex and special; for in memory there is necessarily some contrast of past and present, whereas here there is simply the persistence of the old. But what is it that persists? On our theory we must answer, the continuum as differentiated, not the particular differentiation as an isolated unit. If psychologists have erred in regarding the presentations of one moment as merely copies, or images, which have entered in hand, not considering the so-called residua of such presentations. As we see a certain colour or a certain object again and again, we do not go on accumulating images or representations of it, which are somewhere crowded together like shades on the banks of the Styx; nor is such colour, or whatever it be, the same at the hundredth time of presentation as at the first, as the hundredth impression of a seal on wax would be. There is no such lifeless fixity in mind. The explanations of perception most in vogue are far too mechanical and, so to say, atomic; but we must fall back upon the unity and continuity of our presentation-continuum, which alone can account for the illusion, so far as a few minutes we take half a dozen glances at a strange and curious flower. We have not as many complex presentations which we might symbolize as $F_1, F_2, \ldots F_n$. But rather, at first only the general outline is noted, next the disposition of petals, stamens, &c., then the attachment of the anthers, position of the ovary, and so on; that is to say, symbolizing the whole flower as $\{p(ab) s'(c d) o'(f g)\}$, we first apprehend say $p', s' \ldots$, then $p'(ab) s'(c d), or p'(a) s'(c) o'(f g)$, and so forth. It is because the traits first attended to persist that the later form an addition to them till the complex is at length complete. There is nothing in this instance properly answering to what is known as the reproduction and association of ideas in the last and complete apprehension as much as in the first vague and inchoate one the flower is there as a primary presentation. There is a limit, of course, to such a procedure, but the instance taken, we may safely say, is not as such to exceed the bounds of a simultaneous field of consciousness. Assuming then that such increase of differentiation through the persistence of preceding differentiations holds of the presentation-continuum as a whole, we conclude that, in those circumstances in which we now have a specific sensation of, say, red or sweet, there would be for some more primitive experience nothing but a vague, almost indeterminate, which we would call $\varphi_1$. But that on a repetition of the circumstances it could be again further differentiated. The earlier differentiations, in short, do not disappear like the waves of yesterday in the calm of to- day, nor yet last on old scars beside new ones; but rather the two are blended and combined, so that the whole field of consciousness, like a continually growing picture, increases indefinitely in complexity of pattern.

13. Assimilation.—This process, in which later differentiations blend with and therefore restore to presentational unity what has been differentiated before, perhaps more clearly than from earlier and less definite presentations, is thus a further implication of the principle of the progressive development of the presentation-continuum. When not ignored altogether this further process has been commonly regarded as merely a simple form of "transition," its peculiarity being, as it was supposed, that the presentations associated—though numerically distinct—were in quality perfectly identical. In point of fact, both these assumptions seem to be erroneous and due to the so-called psychologist's fallacy.1 For the experiencing subject there is apparently at this stage—as we have already urged—neither the distinctness nor the qualitative identity of "such a word's past impression (A)" and "present impression (A)". Still there is the process of mere blending or fusion, which we shall call assimilation, and the process of association proper is so close, and the detailed analysis called for so complex, that we must needs defer further discussion till we come to treat of association as a whole (cf. below, § 24). It may then be possible to show that we have here to do with a process much simpler and more fundamental than association. But it is at least clear at once that if the term assimilation is to be correctly used it will imply that the presentations associated are from the first distinct, are attended to as distinct, are associated solely in consequence of such attention, and remain to the last distinguishable.

14. This will be the most convenient place to take note of certain psychological doctrines which, though differing in some material respects, are usually included under the term Law of Relativity.

a. Hobbes's Sentire sensibem idem et non sentire ad idem recidunt is often cited as one of the first formulations of this law; and if we take it to apply to the whole field of consciousness it becomes at once true and trite: a field of consciousness unaltered either by change of impression or of idea would certainly be a blank and a contradiction. Understood in this sense the Law of Relativity amounts to what Hamilton called the Law of Variety: "that we are conscious only as we are conscious of difference."13 But, though consciousness involves change, it is still possible that particular presentations in the field of consciousness may continue to change indefinitely. When it is said that a constant impression is that which "remains as it was," that mental turns out to be something not psychological at all, as, e.g., our insensi-bility to the motion of the earth or to the pressure of the air-cases in which there is obviously no presentation, nor even any evidence of nervous change. Or else this paradox proves to be but an awkward way of expressing what we may call accommodation, whether physiological or psychological. Thus the skin soon adapts itself to certain seasonal alterations of temperature, so that heat or cold ceases to be felt: the sensation ceases because the nervous change, its proximate physical counterpart, has ceased. Again, there is what James Mill calls "an acquired incapacity of attention," such that a constant noise, for example, in which we have no interest, is soon inaudible. In such a case of psychological accommodation we should expect also to find on the physiological side some form of central reflection or isolation more or less complete. As a rule, no doubt, impressions do not continue constant for more than a very short time; still there are sad instances enough in the history of disease, bodily and mental, to show that such a thing can quite well happen, and that such constant impressions (and "fixed ideas," which are in effect tantamount to them), instead of becoming blanks, may dominate the entire consciousness, colouring or bewildering everything. But.

b. From the fact that the field of consciousness is continually changing it has been supposed to follow, not only that a constant presentation is impossible, but—as a further consequence—that every presentation is essentially nothing but a transition or difference. "All feeling," says Bain, the leading exponent of this view, "is two-sided. . . We may attend more to one member of the couple than to the other. . . . We are more conscious of heat when passing to a higher temperature, and of cold when passing to a lower. The state we have passed to is our explicit consciousness, the state we have passed from is our implicit consciousness." But the transition need not be from heat to cold, or vice versa; it is possible, as it is to be from a neutral state, which is indeed the normal state, of neither heat nor cold; a new-born mammal, e.g. must experience cold, having never experienced heat. Again, suppose a sailor becalmed gazing for a whole morning upon a stretch of sea and sky, what sensations are implicit here? Shall we say yellow as the greatest contrast to blue, or darkness as the contrary of light, or both? What, again, is the implicit consciousness when the explicit is sweet; is it bitter or sour, and from what is the transition in such a case? For one thing it seems clear that the transition of attention from one pre- sentation to another and the differences between the presenta-tions themselves are distinct facts, and not mere consequences of the psychologist who has laid such stress on neutral states of surprise

---

1 The Works of Thos. Reid, supplementary note, p. 932.
as being akin to feeling and so distinct from special presentations, should in any way confound the two. The mistake is perhaps accounted for by the fact that Bain, in common with the rest of his school, nowhere distinguishes between attention and the presentations that are attended to. If "change of impression" and being conscious or mentally alive are the same thing, it is then manifestly tautologous to say that one is the indispensable condition of the other. If they are not the same thing, then the succession of shocks or surprises cannot wholly determine the impressions which successively determine them.

But we have still to consider whether the impressions themselves are nothing but differences or contrasts. "We do not know any one thing of itself but only the difference between it and another thing," said Bain. But it is plain we cannot speak of contrast or difference between two states or things as a contrast or difference, if the states or things are not themselves presented; the so-called contrast or difference would then be itself a single presentation, and its supposed "relative" but an inference. Difference is not more necessary to the presentation of two objects than two objects to the presentation of difference. And, what is more, a difference between presentation is not at all the same thing as the presentation of that difference. The former must precede the latter; the latter, which requires active comparison, need not follow. There is an ambiguity in the words "know," "knowledge," which Bain seems not to have considered: "to know" may mean either to perceive, apprehend, or to say more to understand and to comprehend. 1 Knowledge in the first sense is only what we shall have presently to discuss as the recognition or assimilation of an impression (see below, § 18); knowledge in the latter sense is the result of intellectual comparison and is embodied in a proposition. Thus a blind man who cannot know light in the first sense can know about light in the second if he studies a treatise on optics. Now in simple perception or recognition we cannot with any exactness say that two things are perceived: straight is a thing, i.e. a definite object presented; not so not-straight, which answers to no definite object at all. Only when we rise to intellectual knowledge is it true to say: "No one could understand the meaning of a straight line without being shown a line not straight, a bent or crooked line." 2 Two distinct presentations are necessary to the comparison that is here implied; but we must first recognize our objects before we can compare them, and this further step we may never take. We need, then, to distinguish between the comparativeness of intellectual knowledge, which we must admit—for it rests at bottom on a purely analytical proposition—and the "differential theory of presentations," which, however plausible at first sight, must be wrong somewhere, since it commits us to absurdities. Thus, if we cannot have a presentation X, the presentation of the difference between X and Y, it would seem that in like manner we cannot have the presentation of Y or Z, nor therefore of their difference X, till we have had the presentation of A and B say, which differ by Y, and of C and D, which we may suppose differ by Z.

The lurking error in this doctrine, that all presentations are but differences, may perhaps emerge if we examine more closely what may be meant by difference. We may speak of (a) differences in intensity between sensations supposed to be qualitatively identical, as e.g. between the taste of strong and weak tea; or of (b) differences in quality between presentations of the same sense, as e.g. between red and green; or of (c) differences between presentations of distinct senses, as e.g. between blue and bitter. Now as regards (a) and (b), it will be found that the difference between two intensities of the same quality, or between two qualities of the same order, may be itself a distinct presentation, that is to say, in passing from a load of 10 lb to one of 20 lb, for example, or from the sound of a note to that of its octave, it is possible to experience the change continuously, and to express it one might think of it as two presentations on the same road. But nothing of this kind holds of (c). 3 In passing from the scent of a rose to the sound of a gong or a sting from a bee we have no such means of bringing the two into relation—scarcely more than we might have of measuring the length of a journey made partly on the common earth and partly through the looking-glass. In (c), then, we have only a diversity of presentations, but not a special presentation of difference; and we only have more than this in (a) or (b) provided the selected presentations occur together. We say that we know the difference between a sound and a tone to mean that we know what it is to pass from the one to attending to the other. It is simply an experience of change. Change, however, implies continuity, and there is continuity here in the movement of attention and the affective state consequent on that, but not directly in the qualities themselves.

1 If red follows green we may be aware of a greater difference than we could if red followed orange; and we should ordinarily call a 10 lb load heavy after one of 5 lb and light after one of 20 lb. Facts like these it is which make the differential theory of presentations plausible. On the strength of such facts Wundt has formulated a law of relativity, free, apparently, from the objections just urged against Bain's doctrine.

2 Our sensations afford no absolute but only a relative measure of external impressions. The intensities of stimuli, the pitch of tones, the qualities of light, we apprehend (empfinden) in general only according to their mutual relation, not according to any unalterably fixed unit given along with or before the impression itself. 4

But if true this law would make it quite immaterial what the impressions themselves were: provided the relation continued the same, the sensation would be the same too, just as the ratio of 2 to 1 is the same whether our unit be miles or millimetres. In the case of intensities, e.g. there is a minimum sensible and a maximum sensible. The existence of such extremes is alone sufficient to turn the flank of the thoroughgoing relativists; but there are instances enough of intermediate intensities that are directly recognized. A letter-sorter, for example, who identifies an ounce or two ounces with remarkable exactness identifies each for itself and not the first as half the second; of an ounce and a half or of three ounces he may have a comparatively vague idea. And so generally within certain limits of error, indirectly ascertained, we can identify intensities, each for itself, neither referring to a common standard nor to one that varies from time to time: say intensity, that is to say, the chances to be simultaneously presented; just as an enlisting sergeant will recognize a man fit for the Guards without a yard measure and whether the man's comrades are tall or short. As regards the qualities of sensations the outlook of the relativists is, if anything, worse. In what is called Meyer's experiment (described under Viston) what appears greenish on a red ground will appear of an orange tint on a ground of blue; but this contrast is only possible within certain very narrow limits. In fact, the phenomena of colour-contrast, so far from proving, distinctly prove that we apprehend the qualities of light only according to their mutual relation. In the case of tones it is very questionable whether such contrasts exist at all. Summing up on the particular doctrine of relativity of which Wundt is the most distinguished adherent, the truth seems to be that, in some cases where two presentations whose difference is itself presentable occur in close connexion, this difference—as we indirectly learn—exerts a certain bias on the assimilation or identification of sensations.
of one or both of the presentations. There is no "unalterably fixed unit" certainly, but, on the other hand, "the mutual relations of impressions" are not everything. 

The former term of consciousness has occurred sundry times in the course of this exposition: it is one of several employed in describing what have been incidentally referred to as "degrees or grades of consciousness"—a difficult and perplexing topic that we must now endeavour further to elucidate. Sailors steering by night are said to look at the pole-star, "the cynosure of every eye," but this does not prevent them from seeing the rest of the starry vault. At a conversation we may listen to one speaker while still hearing the murmur of other voices, and while listening we may also see the speaker and thereby identify him the better. What in these instances is looked at or listened to has been called the "field of consciousness," the rest of what is heard or seen or otherwise presented being called the "field" within which attention is thus concentrated or brought to a point. Of these objects beyond the focus we have then only a lower degree of consciousness, and the more "distant" they are from the centre of interest the fainter and obscure they are supposed to be or to become. Now, it is obvious that the continuity here implied, if strictly taken, logically commits us to a field of consciousness extending with ever diminishing intensity ad infinitum. But we have next to notice certain new features that have led psychologists to give to the term field of consciousness a more restricted meaning. A meteor flaring across the sky would certainly divert the helmsman's attention, and for the nonce he would look at that and not at the star in the Little Bear's tail; a voice at our elbow accosting us, we should turn to the new speaker and listen to him, still hearing it may be, but no longer "following," the discourse thus for us interrupted. In these cases a change in the field of consciousness brings about a non-voluntary change in the focus. But it only does so provided it is sufficiently intense and abrupt, and the more attention is already concentrated the less effective a given disturbance will be. A whole swarm of meteors might have streaked the sky unheeded while Ulysses, life in hand, steered between Scylla and Charybdis, just as all the din of the siege failed to distract Archimedes bent over his figures in the sand. On the other hand, we can voluntarily transfer the focus of consciousness to any object within the field, provided again this is sufficiently differentiated from the rest. But, more than that, we can not only of our own motion turn to look at or to listen to what we have only seen or heard, but not noticed before; we can also look out or listen for something not as yet distinguishable, perhaps not as yet existing at all. And here again the concentration of attention may be maximal, as when a shipwrecked crewman scans the horizon for a sail, or a beleaguered troop heartened for the oncoming of rescue. Now, such anticipated presentations as soon as they are clearly discernible have already a certain definite intensity, and so they are said to have passed over the "threshold"—to use Herbert's now classic phrase—and to have entered the field of consciousness. Afterwards any further increase in their intensity is certainly gradual; are we then to suppose that before this their intensity changed instantly from zero to a finite quantity and not rather that there was a ultraliminal or subliminal phrase where too it only changed continuously? The latter alternative constitutes the hypothesis of subconsciousness.

According to this hypothesis the total field with which we began is divided into two parts by what Fechner emphatically called "the fact of the threshold," and the term field of consciousness is henceforth restricted to that part within which the focus of consciousness always lies, the outlying part being the region of subconsciousness. Difficulties now begin to be apparent. The intensity or vivacity of a presentation within the field of consciousness depends partly on what we may call its inherent or absolute intensity, partly on the attention that it receives; but this does not hold of presentations in subconsciousness. These sub-presentations, as we ought perhaps to call them, cannot be severally and selectively attended to, cannot be singled out as direct objects of experience. Many psychologists have accordingly maintained not only that they cannot with propriety be called presentations, but that they have no strictly psychical existence at all. This, however, is too extreme a view. If nothing of a presentational character can exist save in the field of consciousness as thus circumscribed by a definite boundary or threshold, a breach of continuity is implied such as we nowhere else experience: even the field of sight, from which the metaphor of a field of consciousness is derived, has no such definite margin. The threshold then is not comparable to a mathematical line on opposite sides of which there is an intensive discontinuity. This has been amply proved by the psychophysical investigations of Fechner and others.

We listen, say, to a certain sound as it steadily diminishes; at length we cease to hear it. Is there then no such margin as it steadily increases and presently just barely hear it. In general it is found that its intensity in the former case is less than it is in the latter, and there is also in both cases a certain margin of doubt between clear presence and clear absence; the presentation seems to flicker in and out, now there and now gone. Further, in comparing differences in sensations—of weight, brightness, temperature, &c.—we may fail wholly to detect the difference between a and b, b and c, and yet the difference between a and c may be clearly perceived. We have thus to recognize the existence of a difference between sensations though there has been called "sensation of differences." But if this much continuity must be admitted here hardly fail to admit more. If differences of presentation exist within the field of consciousness beyond the outermost verge of the "threshold of difference," we cannot consistently deny the existence of any presentations at all beyond the threshold of consciousness. Since the field of consciousness varies greatly and often suddenly with the amount and distribution of attention, we must, as already said, either recognize such subconscious presentations or suppose that clearly differentiated presentations, presentations that is to say of finite intensity, pass abruptly into or out of existence with every such variation of the field.

The hypothesis of subconsciousness, then, is in the main nothing more than the application to the facts of presentation of the law of continuity, its introduction into psychology being due to Leibnitz, who first formulated that law. Half the difficulties in the way of its acceptance are due to our faulty terminolology. With Leibnitz consciousness was not coextensive with all psychical life, but only with certain higher phases of it. Of late, however, the tendency has been to make consciousness cover all stages of mental development, and all grades of presentation, so that a presentation of which there is no consciousness resolves itself into the most complete contradiction of an unrepresented presentation—a contradiction not involved in Leibnitz's "unapprehended perception." But such is not the meaning intended when it is said, for example, that a soldier in battle is often unconscious of his wounds or a scholar unconscious at any one time of most of the knowledge "hidden in the obscure recesses of his mind." There would be no point in saying a subject is not conscious of what is not presented at all; but to say that what is presented lacks the intensity requisite in the given distribution of attention to change that distribution appreciably is pertinent enough. Subconscious presentations may tell on conscious sensation—as sunshine or mist tells on a landscape, or the underlying writing on a palimpsest—although lacking either the intensity or the individual distinctness requisite to make them definite features. Even if there were no facts to warrant

1 The following brief passage from his Principe de la nature et de la grace (§ 4) shows his meaning: "Il est bon de faire distinction entre La perception, qui est l'état extérieur de la Monade représentant les choses extérieures, et l'Apperception, qui est la Conscience, ou la connaissance réflexive de cet état intérieur, laquelle n'est point donnée à toutes les âmes, ni toujours à la même âme. Et c'est faute de cette distinction que les Cartesianes ont manqué de nombre pour rien les perceptions dont on ne s'apperceppait, comme le peuple compte pour rien les corps insensibles" (Op. Phil. Erdmann's ed., p. 715).
this concept of an ultra-liminal presentation of impressions it might still claim an a priori justification. The subconscious presentation of ideas as distinct from impressions calls, however, for some special consideration. As we can turn our attention to the sensory threshold and await the entrance of an expected impression, so we may await the emergence of a "memory-image"; and again the threshold turns out to be not a mathematically exact boundary but a region of varying depth. What we are trying to recollect seems first to waver, now at the tip of our tongue and the next moment completely gone, then perhaps a moment afterwards rising into clear consciousness. Sometimes when asked, say, for the name of a certain college contemporary we reply: I cannot tell, but I should know the name if I heard it. We are aware that we could "recognize," though we cannot "reproduce." At other times we are convinced that even recognition is no longer possible, and still if we met the man himself in the old scenes and heard his voice his name might yet recur. Nevertheless, it may be urged, it is surely incredible that all the incidents of a long lifetime and all the items of knowledge of a well-stored mind that may possibly recur—"the infinitely greater part of our spiritual treasures," as Hamilton says—are severally retained and continuously presented in the form and order in which they were originally experienced or acquired. This, however, is not implied. Images in contrast to impressions have always a certain generality. The same image may figure in very various conception impressions, and a principle, in example, the same word in many sentences. We cannot measure the literature of a language by its vocabulary, nor may we equate the extent of our "spiritual treasures" when these are successively unfolded with the psychical apparatus, so to say, in which they are subconsciously involved. Take the first book of the *Aeneid*, which, as Macaulay would say, every schoolboy knows: as subconsciously involved, when the boy is not thinking of it, his knowledge is more comparable to a concordance than to the text itself, which nevertheless can be reproduced from it. In the text *Aeneas* occurs many times, in accordance with the concordance, but the book is not read from the 180th line; or *Præcipue plurimum Aeneas*, and he starts with the 218th. But ask him for the 588th line; he is probably helpless, while a dunce with the book in his hand can read it off at once. Say instead *Et pater Aeneas*, and the boy can straightway complete the line while the dunce is now helpless. So though its explicit revival is successional, occurs, so to say, in single file, a whole scheme in which many ideas are involved may rise towards the threshold together. When our schoolboy, for example, turns from classics to geography, the mention of Atlas, which might then have recalled a Titan, now leads him to think only of his book of maps. And there is a like sudden shifting of the substratum of our thoughts, when, taking up the morning paper, we glance first at the foreign telegrams, then at the money market, and then at the doings of our political friends. Yet more remote than all, obscurer but more pervasive, like the clouds of cherubs or imps vaguely limned in medieval pictures, are the indefinite constituents of our emotional atmosphere, "gay notes that people the sunbeams" of our cheerfulness and make all couleur de rose, or "horrid shapes and sights unholy" that scarry the outlying world. "We have the blues," etc., and attention relaxes, these advance into the foreground and become more or less palpable hopes or fears.

1 Herbert and Fechner describe subconscious presentations generally as existing below the threshold. On the other hand, we have spoken of subconscious *sensations* as existing beyond it. In view of the important differences between the two forms of presentations primary and secondary, this distinction of ultra-liminal and subliminal seems correct and justifiable.

2 This doctrine of the irruption and evolution of ideas we owe to Leibnitz. Herbert attempted in a very arbitrary and a priori fashion to correlate a physical and dynamical conceptions of result—usual to extreme views—that later psychologists neglected altogether. There are now signs of a fresh reaction, and we shall continually come across evidence of the wide range and great importance of the doctrine as we proceed.

Because of the manifold forms into which they may evolve, subconscious images, while still involved, are sometimes called "psychical" or more definitely "presentational dispositions." The word *disposition* means primarily an arrangement, as when we talk of the disposition of troops in a battle or of cards in a game; the *dispositio*, that is to say, are always something actual. Which of several potential dispositions they will actually assume will depend upon circumstances, but at least, as Leibnitz long ago maintained, "les puissances véritables ne sont jamais des simples possibilités." What is requisite to the realization of a given potentiality is sometimes a condition to be added, sometimes it is one to be taken away. A locomotive with the fire out has no tendency to move, but with steam up it is only hindered from moving by the closure of the throttle-valve or the friction of the brake. Now presentational dispositions we assume to be of the latter sort. These processes or functions more or less uninhibited and the institution is determined by their relation to other psychical processes or functions. The analysis and genesis of these presentational interactions will occupy us at length by and by; it may then be possible to explain the gradual involution of what was successively unfolded in explicit consciousness into those combinations which Herbert called "appereception-masses," combinations devoid of the concrete hints of date and place which are essential to memory. Meanwhile the evidence adduced—decidedly cogent though admittedly indirect—together with the difficulties besetting the former, can, canons, we still think, have an indirect bearing on the question. When the conscious there is nothing presentational, seems clearly to justify the hypothesis of subconsciousness. At the same time the principle of continuity, everywhere of fundamental importance when we are dealing with reality, forbids the attempt arbitrarily to assign any limits to the subconscious.

Many psychologists have proposed to explain subconscious retention by habit. But it is obvious that habit itself implies retention and is practically synonymous with disposition; it must therefore presuppose *dispositio* if we are to escape the absurdities of *puissances ou facultés nes*, with which in this very connection Leibnitz twitted Locke. Yet, obvious as all this may be, it is frequently ignored even by those who are fond of exposing the pretended explanations of the "faculty-psychologists" and quoting Molière to confute them. Thus we find J. S. Mill arguing: "I have the power to walk across the room though I am sitting in my chair; but we should hardly call this power a latent act of walking." Nor should we call it a power at all if Mill had been paralysed, or if, instead of sitting in his chair, he had been lying in his cradle. What we want is the simplest psychological description of the situation after the power has been acquired by practice and is still retained. In following a course of events we be the "idea" of the movement without the movement actually ensuing; yet only in such wise that the idea is more apt to pass over into action the intensity it is, and often actually passes over in spite of us. Surely there must be some functional activity answering to this conscious presentation; why not a much less amount of it be conceived possible in subconscious presentation?

*Sensation, Movement and the External World.*

16. On the view of experience here maintained, we are bound to challenge the description of sensations as due to physical stimuli—widely current though it is—as one that is psychologically inappropriate. The following definition, given by Bain, may be taken as a type: By *sensations*, in the strict meaning, we understand the mental impressions, feelings or states of consciousness which result from the actual act of the sense or other part of the body, called on that account sensitive." It is true, no doubt, that what the psychologist calls sensibility has as its invariable concomitant what physiologists call sensibility, 1 *Examination of Sir W. Hamilton's Philosophy*, 3rd ed., p. 329.

2 For a detailed account of the various sensations and perceptions pertaining to the several senses the reader is referred to the articles *Vision*; *Hearing*; *Touch*; *Taste*; *Smell*, &c.

or what the more careful of them call irritability; and, true again, that this irritability is invariably preceded by a physical process called stimulation. But it may be urged, why not recognize a connexion that actually obtains, since otherwise sensation must remain unexplained. Well, in the first place, such "psychophysical" connexion is not a psychological explanation; it cannot be turned directly to account in psychology, either analytic or genetic. Next the psychological fact called sensation always is, and at bottom always must be, independently ascertained; for the "physiological" "neurosis" or irritation has not necessarily a concomitant "psychosis" or sensation and, strictly dealt with, affords no hint of such. Finally, this inexplicability of sensation is a psychological fact of the utmost moment: it answers to what we call reality in the primary sense of the term. The psycho-physiological connexion is not such a connexion; it is an "interjection," affords no ground for subsequent "projection." Thus the endeavour to explain sensation overreaches itself; the external object or thing that was supposed to cause sensations and to be therefore distinct from them, was in the end wholly resolved into these and regarded as built out of them by association (Mill) or by apperceptive synthesis (Kant). But no "mental chemistry," no initial alchemy of "forms," can generate objective reality from feelings or sense-impressions as psychophysically defined.1 A's experience as it is for B is not real but inferential; and if the grounds of the inference, which are the only realities for B, are to be regarded as the causes of which A's experiences are merely the effects, then the two experiences are A's own experience as it is for B the same in the fashion we get the world in duplicate: (1) as original and outside, i.e. as cause, and (2) as copied within each perceiver's head, i.e. as effect. But when B interprets his own experience as he had interpreted A's we seem to have lost the real world altogether. In presence of this dilemma, the philosophers of our time, as already said, are feeling it needful to revise their psychology. The question of method is vital. If the psychophysical standpoint were the more fundamental, psychology would be based on physiology, and the old definition of sensation might stand. If, on the other hand, it is the exclusive business of psychology to analyse and trace the development of individual experience as it is for the experiencing individual, then—however much neurological evidence may be employed as a means of ascertaining psychological facts—the facts themselves must be scrupulously divested of all physical implications, the psychophysical method takes a secondary place, and the objective reality of "sensory" presentations stands unpimpeached.

The duality of subject and object in experience compels us also to object to the description of sensations as "states of consciousness." Since it is the subject, not the object that is conscious, the term state of consciousness implies strictly subjective origin; and so it is only applicable to sensations, if they are regarded as subjective modifications, either affective or active. The former would identify sensation with feeling, and this—for reasons already conceived—is not to be done. It is true that sensation, like other presentations, implies the subjective activity we call attention; it is not, however, a modification or state of this activity, but the object of a relation of stimulation. It is held by means of the distinction generally of Vorstellungen and Vorstehungen, as the sense of Empfindung and Empfindung; and German psychology has gained in clearness in consequence. The distinction of conception and concept (Vorstellung) is to be found in older English writers, and was revived by Sir W. Hamilton, who suggested also the analogous distinction of perception and percept. It would be a great gain if there were a corresponding pair of terms to distinguish between sensation and sensation. Nevertheless, we must not fail to say. Reception and receipt at once occur and seem unexceptionable—apart, of course, from their novelty.2 At any rate, if we are to rest content with our present untechnical terminology we must understand sensations to mean objective changes as they first break in upon the experience of our psychological individual; in this respect Locke's term "impression" has a certain appropriateness.

What we ordinarily call a single sensation has not only a characteristic quality but it is also quantitatively determined in respect of intensity, protensity (or duration) and extensity. A plurality of properties, it may be said, straightforwardly implies complexity of some sort. This is obvious and undeniable; psychological analysis is distinctly a study of sensations. The analysis of simple sensations is possible, and the description just given is reached by means of it. Such analysis, however, presupposes the comparison of many sensations; but to the complexity it discloses there is no answering plurality discernible in the immediate experience of a single sensation. To make this clearer let us start from a case in which such plurality can be directly verified. In a handful of rose petals we are aware at once of a definite colour, a definite odour and a definite "feel." Here there is a plurality (a+b+c), any part of which can be withdrawn from our immediate experience of percept. If we hold all but one of them we receive, in rest, for we can close the eyes, hold the nose, or drop the petals on the table. Let us now turn to the colour alone; this we say has a certain quality, intensity, extensity, &c. But not only have we not one sense for quality, another for intensity, &c., but we cannot reduce the intensity to zero and yet have the quality remaining; nor can we suppress the quality and still retain the extensity. In this case then what we have is not a plurality of presentations (a+b+c), but a single presentation having a plurality of attributes (a b c) so related that the absence of any one annihilates the whole. But though, as already said, such single presentation gives, as it stands, no evidence of this plurality, yet it is to be believed that a single presentation does not arise without sensations in isolation; here, accordingly, we have evidence in plenty to justify our psychological analysis. In innumerable cases we experience varieties of intensity with little or no apparent change of quality, as happens, for example, when a sounding pitch-pipe is moved towards or away from the ear; and continuous changes of quality without any change of intensity, as happens when the pipe is shortened or lengthened without any alteration of position. We may have tactual or visual sensations which vary greatly in extensity without any striking change of quality, and we may have such sensations in every possible variety of quality without any changes of extensity.

The numerous and striking diversities among our present sensations are obviously not primordial; what account then can we give of their gradual differentiation? Some psychologists have assumed the existence of absolute "units of sensation". Reception does not in English suggest the taking back of the Latin recipere; it expresses only the comparative passivity of sense. Given—we must allow—that a sensation is necessarily an effect of some stimulation, and that the psychological observer can reflectively make, by psychological analysis only such analysis as is possible in the immediate experience of the subject observed.

---

1 Nothing shows this more plainly than the newly-coined term epiphenomenon now applied in this connexion.

2 A's "projection" is to B's "introduction," affords no ground for subsequent "projection."
sensibility," all identically the same, and explain the unlikeliness in our existing sensations as resulting "from unlike modes of integration of these absolute units." The sole evidence on which they rely is physiological, the supposed existence of a single nerve shock or neural tremor. It is true that in an extirpated nerve what is known as the "negative variation" is approximately such an isolated event of uniform quality. But the same cannot be said of what happens during the stimulation of a nerve in situ with its peripheral and central connexions still intact. The only evidence apparently to which we can safely appeal in this inquiry is that furnished by biology. Protoplasma, the so-called "physical basis of life," is amenable to stimulation by every form of physical agency—mechanical, chemical, thermal, photical, electrical—with the single exception of magnetism; and in keeping with this it is found that unicellular organisms respond, and respond in ways more or less peculiar, to each of these possible modes of excitation. Since, so far as is known, there is no morphological separation of function in these lowest forms of life, it is reasonably assumed that the single cell acts the part of "universal sense-organ," and that the advance to such complete differentiation of sense-organs as we find among the higher vertebrates has been a gradual advance. Numerous facts can now be added of the occurrence of "transitional" or "alternating" sense-organs among the lower forms of multicellular animals; organs, that is to say, which are normally responsive to two or more kinds of stimulus, and thus hold an intermediate position between the universal sense-organ of the Protozoa and the special sense-organ of the Mammalia. For example, a group of cells which would behave towards all stimuli impartially were they independent unicellular organisms become, as an organ in a multicellular organism, amenable only to mechanical or only to chemical stimuli,—become, that is to say, an organ of touch and of hearing, or an organ of taste and also of smell; until, finally, when differentiation is sufficiently advanced, the group ends by becoming exclusively the organ of one specified sense, touch or hearing in the one case, taste or smell in the other. 2 Of course the imperfectly specialized sensations, say of the leech, and still more the wholly un specialized sensations of the amoeba, cannot be regarded as blends of some or all of those which we are said to receive through our five senses. We must rather suppose that sensations at the outset corresponded very closely with the general vital action of stimuli as distinct from their action on specially differentiated sensory apparatus. Even now we are still aware of the general effects of light, heat, fresh air, food, &c., as invigorating or depressing quite apart from their specific qualities. Hence the frequent use of the term general or common sensibility (common-sense), 3 instead of the more narrowly discriminated, the earlier, and what we call the lower, sensations are not any less concrete than the later and higher. They have been called general rather than specific, not because psychologically they lack any essential characteristic of sensation which those acquired later possess, but simply because physiologically they are not, like these, correlated to special sense-organs.

But, short of resolving such sensations into combinations of one primordial modification of consciousness, if we could conceive such, there are many interesting facts which point clearly to a complexity that we can seldom directly detect. Several of our supposed sensations of taste, e.g., are complicated with sensations of touch and smell: thus the pungency of pepper and the dryness of wine are tactual sensations, and their spicy flavours are really smells. How largely smells mingle with what we ordinarily take to be simply tastes is best brought home to us by a severe cold in the head, as this temporarily prevents the access of exhalations to the olfactory surfaces. The difference between the smooth feel of a polished surface and the roughness of one that is unpolished, though to direct introspection an irrecoverable difference of quality, is probably due to the fact that several nerve-terminations are excited in each case: where the sensation is one of smoothness all are stimulated equally; where it is one of roughness the ridges and hollows compress them less, than the level parts do. The most striking instance in point, however, is furnished by the differences in musical sounds, to which the name timbre is given. To the inattentive or un instructed ear notes or "compound tones" appear to be only qualitatively diverse and not to be complex of simple tones. Yet it is possible with attention and practice to distinguish these partial tones in a note produced on one instrument, a horn, say, and to recognize that they are different from those of the same note produced on a different instrument, for example, a violin.

In like manner many persons believe that they can discriminate in certain colours, hence called "mixed," the elementary colours of which they are held to be composed; red and yellow, for example, in orange, or blue and red in violet. But in so thinking they appear especially, however, by the resemblance that certainty has between orange and red, on the one hand, and orange and yellow on the other, the two colours between which in the colour spectrum it invariably stands; and partly by the knowledge that, as a pigment, orange is composed of red and yellow, and similarly the red pigment is a mixture of orange and other cases. As we shall see later, however (§ 39), in this particular case of sensory continua, resemblance is no proof of complexity. We may otherwise, and to conclude that a given tone, since this also resembles the two between which it stands, ought to be a blend of both: whereas, in point of fact, the tone e—though as regards pitch it has a certain resemblance to e and e, its relationship to the two more widely divergent /e/ and /e/ is made up of these. In all cases in which the psychical complexity of a sensation is beyond dispute the partial sensations are distinguished by discernible differences of extensity, and usually of intensity as well. Thus, if the skin be touched by the point of a hot or cold braid the temperature sensation has not the punctual character of the touch but seems rather to surround this as a sort of penumbra. Similarly, the ground-tone of a clang-complex has not only a greater intensity but also a greater extensity than any of the over-tones. 3 There is also in such cases a certain rivalry or antagonism between the complex as an unsolved whole and the complex constituent, and even in the several partial sensations after such analysis. In the absence of such direct evidence it is unanswerable not to infer psychical complexity from complexity in the physical stimuli, even when this is really present. In the case of pigment mixture, however, there is no such psychical complexity as is vulgarly supposed. And it is worth noting that while light white is physically the most complex of all, whereas the answering sensation is not only simple but probably the most primitive of all visual sensations.

Every sensation within the fields of consciousness has sensibly some continuous duration and seems sensibly to admit of some continuous variation in intensity and extensity. But whether this quantitative continuity or relationship of change is more than apparent has often been questioned. When intensity are found to fluctuate every few seconds, and, as already remarked, when the threshold of intensity is actually reached, they seem intermittently to appear and disappear, a fact which Hume long ago did not fail to notice. The results of numerous experiments, however, justify the conclusion that these variations are due primarily to oscillation of attention, and furnish so far no ground for the assumption that even the liminal sensation is discontinuous. But again we can only detect a difference of intensity when this is of finite amount and bears a constant ratio to the original limit, with which it is compared—a fact commonly known as Weber's Law. But this imperfection in our power of discrimination is no proof that our sensations vary discontinuously; and not only is there no positive evidence in favour of such discontinuity, but it is altogether improbable on general grounds. Lastly, there is always more or less distinctness in the several nerve-endings as well as isolation of the nerve-fibres themselves. The skin, for example, when carefully explored, turns out to be a complex mosaic of so-called "spots," 4 severally responding to stimulation by sensations of pressure, heat, cold and pain. But from this to argue that the extensity of a sensation is really a mere aggregate without any continuity is a par with calling a lake a

---

3 Cf. Stumpf, Tonpsychologie, ii. 58 seq.
collection of pools because it is fed by separate streams. If it could be shown that in the brain as a whole there is no functional continuity a formidable psychophysical problem would no doubt arise.

As regards the quality of sensations—the primitive sensation of sight appears to consist only of the single quality we call ‘light,’ a quality which ranges in intensity from a dazzling brightness that becomes painful and blinding down to a zero of complete darkness; a limit which, however, is never completely attained, since the retina is always more or less internally stimulated—hence what is called the eye’s own light (Eigengliicht). The first responses to light-stimulation seem to be very much on a par with our own to diffused heat or cold; some organisms seek the light and others shun it. As little as our temperature-sense yields us a perception of how hot or cold is the light-sense at this level yield any. Not until the stage of visual spatial perception is reached and some discrimination of form is possible, do black and white attain the meaning they now have for us. An object can be visually perceived only when its colour or shade differs from that of the surrounding field; so far black as a ‘secondary quality’ is on a par with colour, that is to say, when we are talking of things it may be called a quality. But there is still an important difference; in a light field many colours or shades may be distinguished, but in a dark field none. Though it is correct to speak of perceiving a black object, must we not think of seeing it as this is really impossible?—the object yields us directly no sensation? Similarly, the piper is said to ‘feel’ the holes in his whistle when actually he only touches the solid metal in which they are pierced; or the solder is said to hear the tattoo, though he has no auditory sensation of the silence intervening between successive taps on the drum. And it has yet to be shown that there is any more justification for speaking of visual sensations without luminosity. Meanwhile we must maintain that in absolute darkness we do not see black, since we do not see at all. No doubt we are prone to identify the two concepts darkness and blackness, for what we may call their sensory content is the same, viz. the absence of visual sensation. Wherein in nature the only diffused light we need consider is that emitted by the sun, the rays transmitted by the things about us vary in physical quality and in their effects upon protoplasm. As soon, therefore, as visual forms can be distinguished, a differentiation among light-sensations becomes obviously advantageous. The first colours to be differentiated were probably yellow and blue, or perhaps it would be more correct to say ‘warm’ and ‘cold’ respectively, which there followed a further differentiation of the warm colour into red and green. It is interesting to note that all possible sensations of colour constitute a continuous scale. We may represent it by the sine curve, the maximum intensity is at one end, and the minimum at the other; (b) the series of colours proper (red to violet and through purple back to red), constituting a closed line, are located round the equator or in zones parallel to it, according to their saturation (or absence of white) for any given zone of illumination increases with distance from the axis.

In dealing with the quality of auditory sensations we have to distinguish between the simple sensations called tones and the sensation-complexes, either clangs or noises, which result from their combination. Simple tones also constitute a quantitative continuum, but it has only one dimension, their so-called ‘pitch’; this may be represented by a straight line ranging between two more or less indefinite extremes. If intensity, that is to say loudness, is taken into account, we have of course a continuum of two dimensions. The tone-continuum is also universally regarded as steadily diminishing in massiveness or extensity as the pitch rises. And, in fact, as we approach the lower limit, the so-called deep or grave tones become less ‘even,’ till at length distinct, more or less pervasive, tremors are felt rather than heard as distinct impulses on the ear-drum. The so-called high or acute tones again present us with an apparent limit, this time accompanied by tactile, often more or less painful, sensations, as if the ear were pierced by a fine needle. This connexion of auditory with tactual sensations confirms the independent evidence of biology pointing to an original differentiation of sound from touch. The special characteristics of tone-complexes, whether clangs or noises, are due to the remarkable analogic power which belongs to the sense of hearing. Two colours cannot be simultaneously presented unless they are differently localized, but several tones may form one complex whole within which they, as ‘partial’ tones, are distinguishable, though spatially indistinguishable. It is only essentially true hearing, the lower senses of touch, taste, smell, &c., do not constitute qualitative continua. Temperatures may indeed be represented as ranging in opposite directions, i.e. through heat or through cold, between a zero of no sensation and the organic sensations due to the destructive action of both extremes, heat and cold alike. But the continuity in this case is intensive rather than qualitative. Tastes fall into the four isolated qualities known as sweet, sour, bitter, saline; but smells hardly admit of classification at all. Sensations of touch and sight have in a pre-eminent degree a certain peculiarity continuity which differentiations of a sensory kind cannot display, and psychophysical phenomena have been classed and named further under the title of local signs. The various sensations classed together as organic, hunger, thirst, physical pain, &c., are left to the physiologist to describe.

Our motor presentations contrast with the sensory by their want of striking qualitative differences. They are divided into two groups: (a) motor presentations proper and movements. (b) auxilio-motor of kinaesthetic presentations. The former answer to our ‘feelings of muscular effort’ or ‘feelings of innervation.’ The latter are those presentations due to the straining of tendons, stretching and flexing of the skin, and the like, by which the healthy man knows that his efforts to move are followed by movement, and so knows the position of his body and limbs. It is owing to the absence of these presentations that the anaesthetic patient cannot directly tell whether his efforts are effectual or not, nor in what position his limbs have been moved by movements from without. Thus under normal circumstances motor presentations are always accompanied by auxilio-motor; but in disease and in passive movements they are separated and their distinctness thus made manifest. Originally we may suppose kinaesthetic presentations to have formed one imperfectly differentiated but now distinct; these sensations, they have become a collection of special continua; viz., the groups of movements possible to each limb and certain combinations of these movements.

But whereas kinaesthetic presentations were commonly allowed to be purely sensory, the concomitants of centripetal excitations—hence the older name of muscular or sixth sense,—applied to them by Sir Charles Bell, Weber, Sir William Hamilton and others concerning motor presentations proper, a very different view, first tentatively advanced by the great physiologist Johannes Müller, and accepted by Helmholz, Wundt, and especially by Bain, long prevailed. It is, however, now generally discarded if not completely overthrown. According to this view, ‘the characteristic feeling of exerted force’ must be regarded, Bain maintained, ‘not as arising from an inward transmission . . . but as the concomitant of the outgoing current by which the muscles are stimulated to act’ (op. cit. p. 79). The necessity for this assumption has certainly not been established on physiological grounds, nor apparently did Bain believe it. And yet, if we consider all the evidence with which we shall have to do, the idea of finding him saying ‘that action is a more intimate and inseparable part of our constitution than any of our sensations, and enters as a component part into every one of our senses’ (op. cit. p. 59). For the present place of these conceptions we shall naturally find it helpful to some, at any rate (e.g. Professor James) of Bain’s opponents as it was by Bain himself. Unhappily many, under the same psychophysical
bias and so induced, like the upholders of this innervation theory, to
look for evidence of subjective activity in the wrong place, have been
led to doubt or to deny the reality of this activity altogether. In
fact, this theory, while it lasted, tended to sustain an undue separa-
tion of the "sensory" from the so-called "motor" presentations, as
if living experience were literally an alternation of two independent
states, one wholly passive and the other wholly active, correspon-
ding to the anatomical distinction of organs of sense and organs of move-
ment. The subject of experience or Ego does not pass to and fro
between a sensorium commune or intelligence department and a
motorium commune or executive, is not in successive intervals
receptive and active, still less always passive, but rather always
actively en rapport with an active Non-Ego, commonly called the
External World.

Perception.
17. In treating apart of the differentiation of our sensory
and motor continua, as resulting merely in the case of
Mental Syn-
tinguishable sensations and movements, we have
thesis or
be compelled by the exigencies of exposition
integration.
the presentation of these proximately elementary
processes in these complex presentations, which are
called percepts, intuitions, sensori-motor reactions and the
like. It is, of course, not to be supposed that in the
evolution of mind any creature attained to such variety of dis-
tinct sensations and movements as a human being possesses
without making even the first step towards building up this
material into the most rudimentary knowledge and action.
On the other hand, there is every reason to think, as has been said
already incidentally, that further differentiation was helped
by previous integration, that perception prepared the way for
distincter sensations, and purposive action for more various
movements. This process of synthesis, which is in the truest
sense a psychical process, deserves some general consideration
before we proceed to the several complexes that result from it.
Most complexes, certainly the most important, are conse-
quences of that principle of subjective selection whereby in-
teresting sensations lead through the intervention of feeling to
movements; and the movements that turn out to subserve such
interest come to have a share in it. In this way—which we
need not stay to examine more closely now—it happens that
a certain sensation, comparatively intense, and a certain move-
ment, definite enough to control that sensation, engage atten-
tion, to the more or less complete exclusion of the other less
intense sensations and more diffused movements that accompany
them. Apart from this intervention of controlling movements,
the presentation-continuum, however much differentiated, would
remain for all purposes of knowledge little better than the dis-
continued manifold for the Socratean to which it took its
rise. As a matter of fact, it is to be remembered that the subject obtains control of
particular movements out of all the mass involved in emotional
expression only because such movements prove on occurrence
adapted to control certain sensations. A long process, in
which natural selection probably played the chief part at the
outset—subjective selection becoming more prominent as the
process advanced—must have been necessary to secure as much
purposive movement as even a worm displays. We must look to
subjective interest to explain, so far as psychological ex-
planation is possible, those syntheses of motor and sensory
presentations which we call spatial perception and the intu-
tions of material things. For example, some of the earliest
lessons of this kind seem to be acquired as we may presently
see, in the process of exploring the body by means of the limbs,
—a process for which grounds in subjective interest can
obviously never be wanting.

Perception sometimes means only the recognition of a sen-
ation or movement as distinct from its original presentation,
thus implying the more or less definite revival
of certain residua of past experience which re-
mitted the present. More frequently it is used
as the equivalent of what we have before called "localization and projection" of sensations—that is to say,
of sensations apprehended either as affections of some part of
our own body regarded as extended or as states of some foreign
body beyond it. According to a former usage, strictly taken,
there might be perception without any spatial presentation
at all; a sensation that had been attended to a few times
might be perceived as familiar. According to the latter,
an entirely new sensation, provided it were complicated with motor
experiences in the way required for its localization or pro-
jection, would be perceived. But as a matter of fact actual
perception probably invariably includes both cases: impressions
which we recognize we also localize or project, and impressions
which are localized or projected are never entirely new—they are,
at least, perceived as sounds or colours or aches, &c. It will,
however, frequently happen that we are specially concerned with
only one side of the whole process, as is the case with a tex-
taste, or some colour-motor reaction on the other, with the
person who is perplexed to decide whether what he sees and
hears is "subjective," or whether it is "real." But there is
still a distinction called for; as perception as we now know it in-
volves not only recognition (or assimilation) and localization, or
"spatial reference," as it is not very happily termed, but it usually
involves "objective reference" as well. We may perceive
sound or light without any presentation of that which sounds or
shines; but none the less we do not regard such sound or light
merely as the object of our attention, as having only immanent
existence, but as the quality or change or state of a thing, an
object distinct not only from the subject attending but from all
presentations whatever to which it attends. Here, in fact, the
actual separation is impossible, because this factor in perception
has been so intertwined throughout our mental development
with the other two. Still a careful psychological analysis will
show that such "reification," as we might almost call it, has
depended on special circumstances, which we can at any
rate conceive absent. These special circumstances are briefly
the constant conjunctions and successions of impressions, for
which psychology can give no reason, and the constant
movements to which they prompt. Thus we receive together, e.g.
these impressions we now recognize as belonging, under the
aspect of "perception," to the sensation, colour, and "feel" of the rose we pluck and handle. We might
call each a "percept," and the whole a "complex percept." But
there is more in such a complex than a sum of partial per-
cepts; there is the apprehension or intuition of the rose as a
thing having this scent, colour and texture. We have, then,
under perception to consider (a) the recognition and (b) the
localization of impressions, and (c) the intuition of things.

18. The range of the terms recognition or assimilation of
impressions is wide: between the simplest mental process they
may be supposed to denote and the most complex Assimila-
tion. There is a great difference. The penguin that
has watched unmoved the first landing of man upon its
impressions. lonely rock becomes as wild and wary as more civilized
fowl after two or three visits from its molester; it then
recognizes that featherless biped. His friends at home also
recognize him though altered by years of peril and exposure.
In the latter case some trick of voice or manner, some "strik-
ing" feature, calls up and sustains a crowd of memories of the
traveller in the past—events leading on to the present scene.
The two recognitions are widely different, and it is from states
of mind more like the latter than the former that psychologists
have usually drawn their description of perception. At the
outset, they say, we have a primary presentation or impression
P, and after sundry repetitions there remains a mass or a series
of P residuals, p₁p₂p₃...; perception ensues when, sooner
or later, Pₙ "calls up" and associates itself with these repre-
sentations or ideas. Much of our later perception, and especially
when we are at all interested, awakens, no doubt, both distinct
memories and distinct expectations; but, since these imply
previous perceptions, it is obvious that the earliest form of re-
ognition, or, as we might better call it, assimilation, must be
free from such complications, can have nothing in it answering
the definition of assimilation that involves retention and differentiation, as we have seen, and prepares
the way for re-presentation; but in itself there is no confronting
the new with the old, no determination of likeness, and no subsequent classification. The pure sensation we may regard as a psychological myth; and the simple image, or such sensation revived, seems equally mythical, as we may see later on. The 11th sensation is not like the first: it is a change in a presentation-continuum that has itself been changed by those preceding; and it cannot with any propriety be said to reproduce those past sensations, for they never had the individuality which such reproduction implies. Nor does it associate with images like itself, since where there is association there must first have been distinctness, and what can be associated can also, for some good time at least, be dissociated.

19. To treat of the localization of impressions is really to give an account of the steps by which the psychological individual comes to a knowledge of space. At the outset of such an inquiry it seems desirable first of all to make plain what lies within our purview, and what does not, lest we disturb the peace of those who, confounding philosophy and psychology, are ever eager to fight for or against the a priori character of this element of knowledge. That space is a priori in the epistemological sense it is no concern of the psychologist either to assert or to deny. Psychologically a priori or original in such sense that it has been either actually or potentially an element in all presentation from the very beginning it certainly is not. It will help to make this matter clearer if we distinguish what philosophers frequently confuse, viz. the concrete spatial experiences of the individual and its actual localization for the individual, and the abstract concept of space, generalized from what is found to be common in such experiences. A gannet’s mind “possessed of” a philosopher, if such a conceit may be allowed, would certainly afford its tenant very different spatial experiences from those he might share if he took up his quarters in a mole. So, any one who has revisited in after years a place from which he had been absent since childhood knows how largely a “personal equation,” as it were, enters into his spatial perceptions. Or the same truth may be brought home to him if, walking with a friend more athletic than himself, they come upon a ditch, which both know to be twelve feet wide, but which the one feels he can clear by a jump and the other feels he cannot. In the concrete “up” is much more than a different direction from “along.” The hen-harrier, which cannot soar, is indifferent to a quarry a hundred feet above it—to which the peregrine, built for soaring, would at once give chase—but is on the alert as soon as it describes prey of the same apparent magnitude, but upon the ground. Similarly, in the concrete, the body is the origin or datum to which all positions are referred, and such positions differ not merely quantitatively but qualitatively. Moreover, our various bodily movements and their combinations constitute this network of co-ordinates, qualitatively distinguishable but geometrically, so to put it, both redundant and incomplete. It is a long way from these facts of perception, which the brutes share with us, to that scientific concept of space as having three dimensions and no qualitative differences which we have elaborated by the aid of thought and language, and which reason may see to be the logical presupposition of what in the order of mental development has chronologically preceded it. That the experience of space is not psychologically original seems obvious from any successful explanation of its origins, from the mere consideration of its complexity. Thus we must have a plurality of objects—A out of B, B beside C, distant from D, and so on; and these relations of externality, juxtaposition, and size or distance imply further specialization; for with a mere plurality of objects we have not straightforward spatial differences. Juxtaposition, e.g., is only possible when the related objects form a continuum; but, again, not any continuity is extensive. Now how has this complexity come about?

The first condition of spatial experience seems to lie in what has been noted above (§ 11) as the externity of sensation. This externity of sensations, if they are taken to reflect the mere clearly we can see that no combination or association of sensations varying only in intensity and quality, not even if motor presentations are added, will account for this space-element in our perceptions. A series of touches a, b, c, d may be combined with a series of movements m, m, m, m; both series may be reversed; and finally the two may be presented simultaneously. In this way we can attain the knowledge of the coexistence of objects that have a certain quasi-distance between them, and such experience is an important element in our perception of space; but it is not the whole of it. For, as has been already remarked by critics of the associationist psychology, we have an experience very similar to this in singing and hearing musical notes or the chromatic scale. The most elaborate attempt to get extensity out of succession and coexistence is that of Herbert Spencer. He has done, perhaps, all that can be done, and only to make it the more plain that the entire procedure is a διάταξιν μετατρέψεως. We do not find experience that such sensations or of retinal excitations by means of movements, and then, when these impressions are simultaneously presented, regard them as extensive, because they are associated with or symbolize the original series of movements; but, before and apart from movement altogether, we experience that massiveness or extensity of impressions in which movements enable us to find positions, and also to measure. But it will be objected, perhaps not without impatience, that this amounts to the monstrous absurdity of making the contents of consciousness extended. The edge of this objection will best be turned by rendering the concept of space for our purposes here, to support a postage stamp pasted on the back of the hand; we have one and the same presentation. If another be added beside it, the new experience would not be adequately described by merely saying we have a greater quantity of sensation, for intensity involves quantity, and increased intensity is not what is meant. For a sensation of a certain intensity, say a sensation of red, cannot be changed into one having two qualities, red and blue, leaving the intensity unchanged; but with extensity this change is possible. For one of the postage stamps a piece of wet cloth of the same size might be substituted and the massiveness of the compound sensation remain very much the same. Intensity belongs to what may be called graded quantity; it admits of increment or decrement, but is not a sum of parts. Extensity, on the other hand, does imply plurality: we might call it latent or merged plurality or a “ground” of plurality, inasmuch as to say that a single presentation has massiveness is to say that a portion of the presentation-continuum at the moment undifferentiated is capable of differentiation.

Attributing this property of extensity to the presentation-continuum as a whole, we may call the relation of any particular sensation to this larger whole its local sign, and can see Local Signs. Some as the externity of a presentation admits of diminution without the presentation becoming nil such presentation either has or may have two or more local signs—its parts, taken separately, though identical in quality and intensity, having a different relation to the whole. Such difference of relation must be regarded fundamentally as a ground or possibility of distinctness of sign—whether as being the ground or possibility of different complexes or otherwise—rather than as being from the beginning such an overt difference as the term “local sign,” when used by Lotze, is meant to imply. From the

We are ever in danger of exaggerating the competence of a new discovery; and the associationists seem to have fallen into this mistake, not only in the use they have made of the concept of association in psychology in general, but in the stress they have laid upon the fact of movement when explaining our space-perceptions in particular. Indeed, the ideas here assumed against association in keeping up the notion that we have only to deal with a plurality of discrete impressions, and movement in keeping to the former term of sequence of “words” of Hamilton (3rd ed. p. 266 seq.) surely ought to convince us that, unless we are prepared to say, as Mill seems to do, “that the idea of space is at bottom one of time” (p. 276), we must admit the inadequacy of our experience of space to explain it.

To illustrate what is meant by different complexes it will be enough to refer to the psychological implications of the fact that scarcely two portions of the sensitive surface of the human body are anatomically alike. Not only in the distribution and character of
this point of view we may say that more partial presentations are concerned in the sensation corresponding to two stumps than in that corresponding to one. The fact that these partial presentations, though identical in quality and intensity, on the one hand are not wholly identical, and on the other are presented only as a quantity and not as a plurality, is explained by the distinctness along with the continuity of their local signs. Assuming that to every distinguishable part of the body there corresponds a local sign, we may allow that at any moment only a certain portion of this continuum is definitely within the field of consciousness; but no one will maintain that a part of one hand is ever felt as continuous with part of the other or with part of the face. Local signs have thus an invariable relation to each other: two continuous signs are not one day coincident and the next widely separate. This last fact is only implied in the mere massiveness of a sensation in so far as this admits of differentiation into local signs. We have, then, when the differentiation is accomplished, a plurality of presentations constituting an extensive continuum, presented simultaneously, and having certain fixed and invariable relations to each other. Of such experience the typical case is that of passive touch, though the other senses exemplify it. It must be allowed that our concept of space in like manner involves a fixed continuity of positions; but then it involves, further, the possibility of movement. Now in the continuum of local signs there is nothing whatever of this; we might call this continuum an implicit plenum, in the sense of "occupation," but after its several local signs are complicated in an orderly way with active touches, when in fact we have experienced the contrast of movements with contact and movements without, i.e. in vacuo. It is quite true that we cannot now think of this plenum except as a space, because we cannot divest ourselves of these motor experiences by which we have explored it. We can, however, form some idea of the difference between the perception of space and this one element in the perception by contrasting massive internal sensations with massive superficial ones, or the general sensation of the body as an animated organism, with our perception of it as extended. Or we may express the difference by remarking that extension implies the distinction of here and there, while extensity rather suggests ubiquity.

It must seem strange, if this conception of extensity is essential to a psychological theory of space, that it has escaped notice so long. The reason may be that in investigations into the origin of our knowledge of space it was always the concept of space and not our concrete space percepts that came up for examination. Now in space as we conceive it one position is distinguishable from another solely by its co-ordinates, i.e. by the magnitude and signs of only three lines and angles, as referred to a certain datum, position or origin; and these elements our motor experiences seem fully to explain. But on reflection we ought, surely, to be puzzled by the question, how these coexistent positions could be known before those movements were made which constitute them different positions. The link we thus suspect to be missing is supplied by the more concrete experiences we obtain from our own body, in which two positions have a qualitative difference or "local colour" independently of movement. True, such positions would not be known as spatial without movement; but neither would the movement be known as spatial had those positions no other difference than such as the nerve-endings but in the variety of the underlying parts—in one place bone, in another fatty tissue, in others tendons or muscles variously arranged—we find ample ground for diversity in the local colourings of sensations. And comparative zoology helps us to trace this diversity has been developed as external impressions and the answering movements have gradually differentiated an organism originally almost homogeneous and symmetrical. Between one hand and the other moves the same organ to a ground of difference; but this is no longer true if the sphere revolves round a fixed axis, still less if it also runs in one direction along its axis. The improvements in the sensibility of our "spatial sense" consequent on a gradation of sensations, and comparative zoology helps us to see obviously no real contradiction to this; on the contrary, such facts are all in favour of making extensity a distinct factor in our space experience and one more fundamental than that of movement.

Aries from movement. In a balloon drifting steadily in a fog we should have no more experience of change of position than if it hung becalmed and still.

We may now consider the part which movement plays in elaborating the presentations of this dimensionless continuum into percepts of space. In so doing we must bear in mind that while this continuum implies the incorporeality of two impressions having the same local sign, it allows not only of the presentation of sensations of varying massiveness, but also of a sensation involving the whole continuum simultaneously, as in Bain's classic example of the warm bath. As regards the motor element itself, the first point of importance is the incorporeality and invariability of a successive series of auxliary motor or kinaesthetic presentations, P1, P2, P3, P4, P5 in the one, along with P1 and from the other incapable to reach P2 again save through P3 and P4. Such a series, taken alone, could afford us, it is evident, nothing but the knowledge of an invariable sequence of impressions which it was in our own power to produce. Calling the series of P's "positional signs," the contrast between them and local signs is obvious. Both are invariable, but succession characterizes the one, simultaneously the other; the one yields potential position without place, the other potential place (tóros) without position; hence we call them both merely signs. But in the course of the movements necessary to the exploration of the body—probably our earliest lesson in spatial perception—these positional signs receive a new significance from the active and passive touches that accompany them, just as they impart to these last a significance they could never have alone.

It is only in the resulting complex that we have the presentations of actual position and of spatial magnitude. For space, though conceived as a coexistent continuum, excludes the notion of omnipresence or ubiquity; two positions I and L must coexist, but they are not strictly distinct positions so long as we conceive ourselves present in the same sense in both. But, if P1 and P2 are, e.g. two impressions produced by compass points touching the body in two different spots as L and L, on the hand or arm, and we place a finger upon L and move it to L, experiencing thereby the series P1, P2, P3, P4, this series constitutes I and L into positions and also invests P3 and P4 with a relation not of mere distinctness as tóros but of definite distance. The resulting complex perhaps admits of symbolization as follows:

\[ \ldots \rightarrow P_{3}P_{4}P_{5} \ldots \]

Here the first line represents a portion of the continual line, P1 and P2 being distinct points. If we may so say, or passive touches presented along with the faint sensations of the contact, we use the term "sensation as it involves; T stands for the active touch of the exploring finger and P for the corresponding kinaesthetic sensation regarded as "positional sign"; the rest of the succession, as not actually present at this stage but capable of revival from past explorations, is symbolized by the \( \ldots \) and \( p_{3}p_{4}p_{5} \).

When the series of movements is accompanied by active touches without passive there arises the distinction between one's own body and foreign bodies; when the initial movement of a series is accompanied by both active and passive touches, the final movement by active touches only, and the intermediate movements are unaccompanied by either, we get the further presentation of empty space lying between us and them—but only when by frequent experience of contacts along with these intermediate movements we have come to know all movement as not only succession but change of position. Thus active touches come at length to be projected, passive touches alone being localized in the stricter sense. But in actual fact, of course, the localization of one impression is not perfected before that of another is begun, and we must take care lest our necessarily meagre exhibition give rise to the mistaken notion 2 Thus a place may be known topographically without its position being known geographically, and vice versa.
that localizing an impression consists wholly and solely in performing or imagining the particular movements necessary to add active touches to a group of passive impressions. That this cannot suffice is evident merely from the consideration that a single position out of relation to all other positions is a contradiction. Localization, though it depends on many special experiences of the kind described, is not like an artificial product which re-completed a part at a time, but is essentially a growth of its several constituents advancing together in definiteness and interconnexion. So far has this development advanced that we do not even imagine the special movements which the localization of an impression implies, that is to say, they are no longer distinctly represented as they would be if we definitely intended to make them: the past experiences are "retained," but too much blended in the mere perception to be appropriately spoken of as remembered or imagined.

A propos of this almost instinctive character of even our earliest spatial perceptions it will be proper not to advert on a misleading implication in the current use of such terms as "localization," "projection," "bodily reference," "spatial reference" and the like. The implication is that external space, or the body as extended, is in some sense projected as opposed to the sensation or the projection of an impression to such space. That it may be possible to put a book in its place on a shelf there must be (1) the book, and (2) a distinction apart from it, the place the book is put in. But even the external or spatial sensations impressions and positions are not thus presented apart. We can have, or at least we can suppose, an impression which is recognized without being located, which is contained in the impression itself, and if it is localized this means that a more complex presentation is formed by the addition of new elements, not that a second distinct object is presented and some indiscernible connexion established between the impression and it, still less that the impression is related to something not already present at all. The truth is that the body as extended is from the psychological point of view not perceived at all apart from localized impressions. In like manner impressions projected (or the absence of impressions projected) constitute all that is perceived as the occupied (or unoccupied) space beyond. It is not till a much later stage, after many varying experiences of different impressions similarly localized, that the impression, or presentation, is formed for the use of such an abstract concept of space as "spatial reference" implies. Psychologists, being themselves at this later stage, are apt to commit the oversight of introducing it into the earlier stage of our perception in which it should not be.

2o. In a complex percept, such as that of an orange or a piece of wax, may be distinguished the following points concerning which psychology may be expected to give an account: (a) the object's reality, (b) its solidity or occupation of space, (c) its unity and complexity, (d) its permanence, or rather its continuity in time and (e) its substantiality and the connexion of its attributes and powers. Though, in fact, these items are most intimately blended, our exposition will be clearer if we consider each for a moment apart.

(a) The terms actuality and reality have each more than one meaning. Thus what is real, in the sense of material, is opposed to what is mental; as the existent or actual it is opposed to the non-existent; and again, what is actual is distinguished from what is possible or necessary. But here both terms, with a certain shade of difference, in so far as actual is more appropriate to movements and events, are used, in antithesis to whatever is ideal or represented, for what is sense-given or presented. This seems at least their primary psychological meaning; and it is the one most in vogue in English philosophy at any rate, over-tinted as that is with psychology.

Any examination of this characteristic will be best deferred till we come to deal with ideation generally (see § 21 below). Meanwhile it may suffice to remark that reality or actuality is not a single distinct element added to the others which enter into the complex presentation we call a thing.

1 Cf. on this point Poincaré, La Science et l'hypothèse, pp. 74 sqq.
2 Thus Locke says, "Our simple ideas [i.e. presentations or impressions which we should now say are all real... and not fictions at pleasure: for the mind... can make to itself no simple idea more than what it has received" (Essay, ii, 30, 2). And Berkeley says, "The ideas imprinted on the senses by the Author of Nature are called Ideas primary. But Ideas secondary are the products of the imagination, being excited in the imagination, existing in the mind regular, vivid and constant, are more properly termed ideas or images of things, which they copy or represent" (Prin. of Hum. Know., pt. i. § 53).

(b) In the so-called physical solidity or impenetrability of things our proper motor presentations or "feelings of effort or innervation" come specially into play. They are not entirely absent in those movements of exploration by which we attain a knowledge of space; but it is when these movements are definitely resisted, or are only possible by increased effort, that we reach the full meaning of body as that which occupies space. Heat and cold, light and sound, the natural man regards as real, and by and by perhaps as due to the powers of things known or unknown, but not as themselves things. At the outset things are all corporeal like his own body, the first and archetypal thing, that is to say: things are intuited only when touch is accompanied by pressure; and, though at a later stage passive touch without pressure may suffice, this is only because pressures depending on a subjective initiative, i.e. on voluntary muscular exertion, have been previously experienced. It is of more than psychological interest to remark how the primordial factor in materiality is thus due to the projection of a subjectively determined reaction to that action of the not-self which, of course, is not known as such till this projection of the subjective reaction has taken place. Still we must remember that accompanying sense-impressions are a condition of its projection: muscular effort without simultaneous sensations of contact would not yield the distinct presentation of something resistant occupying the space into which we have moved and would move again. Nay more, it is in the highest degree an essential circumstance in this experience that muscular effort, though subjectively initiated, is still only possible when there is contact with something that, as it seems, is making an effort the counterpart of our own. But this something is so far no more than thing-stuff; without the elements next to be considered our psychological individual would fall short of the complete intuition of distinct things.

(c) The remaining important factors in the psychological constitution of things might be described in general terms as the time-relations of their components. Such relations are themselves in no way psychologically determined; impressions recur with a certain order or want of order quite independently of the subject's interest or of any psychological principles of synthesis or association whatever. It is true that an impression is followed by another, if they have previously occurred, if knowledge is ever to begin; out of a continual chaos of sensation, all matter and no form, such as some philosophers describe, nothing but chaos could result. But a flux of impressions having this real or sense-given order will not suffice; there must be also attention to and retention of the order, and these indispensable processes at least are psychological.

But for its familiarity we should marvel at the fact that out of the variety of impressions simultaneously presented we do
PSYCHOLOGY

not instantly group together all the sounds and all the colours, all the touches and all the smells; but, dividing what is given together, single out a certain sound or smell as belonging together with a certain colour and feel, similarly singled out from the rest, to what we call one thing. We might wonder, too—clue at least would have to be much association by similarity ought to wonder—that, say, the white of snow calls up directly, not other shades of white or other colours, but the expectation of cold or of powdery softness. The first step in this process has been the simultaneous projection into the same occupied space of the several impressions which we thus come to regard as the qualities of the body filling it. Yet such simultaneous and coincident projection would avail but little unless the constituent impressions were again and again repeated in like order so as to prompt anew the same grouping, and, unless, further, this constancy in the one group was present along with changes so gradual that they could be attached to the general representation of nothing in its first experience to tell the infant that the song of the bird does not inhere in the hawthorn whence the notes proceed, but that the fragrance of the mayflower does. It is only where a group, as a whole, has been found to change its position relatively to other groups, and—apart from casual relations—to be independent of changes of position among them, that such complexes can become distinct unities and yield a world of things. Again, because things are so often a world within themselves, their several parts or members not only having distinguishing qualities but moving and changing with more or less independence of the rest, it comes about that what is from one point of view one thing becomes from another point of view several—like a tree with its separable branches and fruits, for example. Wherein then, more precisely, does the unity of a thing consist? This question, so far as it here admits of answer, carries us over to temporal continuity.

Temporal Continuity. Amidst all the change above described there is one thing comparatively fixed: our own body is both constant as a group and a constant item in every field of groups; and not only so, but it is beyond all other things an object of continual and peculiar interest, inasmuch as our earliest pleasures and pains depend solely upon it and what affects it. The body becomes, in fact, the earliest form of self, the first datum for our later conceptions of permanence and individuality. A continuity like that of self is then transferred to other bodies which resemble our own, so far as our direct experience goes, in passing continuously from place to place and undergoing only partial and gradual changes of form and quality. As we have existed—or, more exactly, as the body has been continuously presented—during the interval between two encounters with some other recognized body, so this is regarded as having continuously existed during its absence from us. However permanent we suppose the conscious subject to be, it is hard to see how, without the continuous presentation to it of such a group as the bodily self, we should ever be prompted to resolve the discontinuous presentations of external things into a continuity of existence. It might be said: Since the second presentation of a particular group would, by the mere workings of psychological laws, coalesce with the image of the first, this coalescence would suffice to "generate" the concept of continued existence. But such assimilation is only the ground of an intellectual identification and furnishes no motive, one way or the other, for real identification: between a second presentation of A and the presentation at different times of two A's there is so far no difference. Real identity no more involves exact similarity than exact similarity involves sameness of things; on the contrary, we are wont to find the same thing alter with time, so that exact similarity after an interval, so far from suggesting one thing, is often the surest proof that there are two concerned. Of such real identity, then, it would seem we must have direct experience; and we have it in the continuous presentation of the bodily self; apart from this it could not be "generated" by association among changing presentations. Other bodies being in the first instance personified, that then is regarded as one thing—from whatever point of view we look at it, whether as part of a larger thing or as itself compounded of such parts—which has had one beginning in time. But what is it that has thus a beginning and continues indefinitely? This leads to our last point.

Substantially. So far we have been concerned only with the combination of things and with the differences of groups and with the differentiation of group from group; the relations to each other of the constituents of each group still for the most part remain. To these relations in the main must be referred the correlative concepts of substance and attribute, the distinction in substances of qualities and powers, of primary qualities and secondary, and the like.

Of all the constituents of things only one is universally present, that above described as physical solidity, which presents itself according to circumstances as impenetrability, resistance or weight. Things differing in temperature, colour, taste and smell are separable, but not differentiated into substance and attribute. Things such as water and air may be distinguished from one another, though they have no quality at all in common except that of continuity; in distinction of substances and attributes, however, the same principle is involved as if they were distinct substances. Thus in the distinction of substances and attributes, the concept of substance is involved as if it were a distinct substance.

Imagination or Ideation. Before the intuition of things has reached a stage so complete and definite as that just described, imagination or ideation as distinct from perception has well begun. In passing to the consideration of this higher form of mental life we must endeavour first of all analytically to distinguish the two as precisely as may be and then to trace the gradual development of the higher.

To begin, it is very questionable whether Hume was right in applying Locke's distinction of simple and complex to ideas in the narrower sense as well as to impressions. "That idea of red," says Hume, "which we form in the dark and that impression which strikes our eyes in the sunshine differ only in degree, not in nature." But what he seems to have overlooked is that whereas we may have an impression of sensation red we can only have an image or representation of a red thing or a red form, i.e., of red in some way ideally projected or intuited. In other words, there are no ideas—though there are concepts—answering to simple or isolated impressions. The synthesis which has taken place in the evolution of the percept can only partially fall in the idea, and never so far as to leave us with a chaotic "manifold" of mere sensational remnants. On the contrary, we find that in constructive imagination a new kind of effort is often requisite in order partially to dissociate these representational complexes as a preliminary to new combinations. But it is doubtful whether the results of such an analysis are ever the ultimate elements of the percept, that is, merely isolated impressions in a fainter form. We may now try to ascertain further the characteristic marks which distinguish what is imaged from what is perceived.

1 The distinction between the thing and its properties is one that might be more fully treated under the head of "Thought and Conception." Still, inasmuch as the material warrant for these concepts is contained more or less implicitly in our perceptions, some consideration of it is in place here.

2 Ideation—"a word of my own coinage," says James Mill.

3 Treatise of Human Nature, bk. i. pt. i. § 1.
The most obvious difference is that which Hume called the force or liveliness of primary presentations as compared with secondary presentations. But what exactly are we to understand by this somewhat figurative idea? A simple difference of intensity cannot be all that is meant, for—though we may be momentarily confused—we can perfectly well distinguish the faintest impression from an image; moreover, we can reproduce such faintest impressions in the idea. The whole subject of the intensity of representations awaits investigation. Between moonlight and sunlight or between midday and dawn we can discriminate many grades of intensity; but it does not appear that there is any corresponding variation of intensity between them when they are not seen but imagined. Many persons suppose they can imagine a waxing or a waning sound or the gradual abatement of an intense pain; but what really happens in such cases is probably not a rise and fall in the intensity of a single representation, but a change in the complex represented. In the primary presentation there has been a change of quality along with change of intensity, and not only so, but most frequently a change in the muscular adaptations of the sense-organisms too, to say nothing of organic sensations accompanying these changes. A representation of some or all of these attendants is perhaps what takes place when variations of intensity are supposed to be reproduced. Again, hallucinations are often described as abnormally intense images which simply, by reason of their intensity, are mistaken for percepts. But such statement, though supported by very high authority, is almost certainly false, and would probably never have been made if physiological and epistemological considerations had been excluded as they ought to have been. Hallucinations, when carefully examined, seem just as much as percepts to contain among their constituents some primary presentation—either a so-called subjective sensation of sight and hearing or some organic sensation due to deranged circulation or secretion. Intensity alone, then, will not suffice to discriminate between impressions and images.

What we may call superior steadiness is perhaps a more constant and not less striking characteristic of percepts. Images are not only in a continual flux, but even when we attempt forcibly to detain one it varies continually in clearness and completeness, reminding one of nothing so much as of the illuminated device of the goblin-millers, common at fêtes, when the wind sweeps across them, momentarily obliterating one part and at the same time intensifying another. There is not this perpetual flow and flicker in what we perceive. The impressions entering consciousness at any one moment are psychologically independent of each other; they are equally independent of the impressions and images presented the moment before—independent, i.e. as regards their order and character, not, of course, as regards the share of attention they secure. Attention to be concentrated in one direction must be withdrawn from another, and images may absorb it to the exclusion of impressions as readily as a first impression to the exclusion of a second. But, when attention is secured, a faint impression has a fixity and definiteness lacking in the case of even vivid ideas. One ground for this definiteness and independence lies in the localization or projection which accompanies all perception. But why, if so, it might be asked, do we not confound percept and image when what we imagine is imagined as definitely localized and projected? Because we have a contrary percept to give the image the lie; where this fails, as in dreams, or where, as in hallucination, the image obtains in other ways the fixity characteristic of impressions, such confusion does in fact result. But in normal waking, hallucination is a state of the transition, of the whole continuum, as it were, occupied and in operation: we are distinctly conscious of being embodied and having our senses about us.

But how is this contrariety between impression and image possible? With eyes wide open, and while clearly aware of the actual field of sight and its filling, one can recall or imagine a wholly different scene: lying warm in bed one can imagine oneself out walking in the cold. It is useless to say the times are different, that what is perceived is present and what is imagined is past or future. The images, it is true, have certain temporal marks—of which more presently—by which they may be referred to what is past or future; but as imagined they are present, and, as we have just observed, are regarded as actual whenever there are no correcting impressions. We cannot at once see the sky red and blue; how is it we can imagine it the one while perceiving it the other? When we attempt to reproduce a scene of sight at once red and blue, as in looking through red glass with one eye and through blue glass with the other, either the colours merge and we see a purple sky or we see the sky first of one colour and then of the other in irregular alternation. That this does not happen between impression and image shows that, whatever their connexion, images as a whole are distinct from the presentation-continuum and cannot with strict propriety be spoken of as revived or reproduced impressions. This difference is manifest in another respect, viz. when we compare the effects of diffusion in the two cases. An increase in the intensity of a sensation of touch entails an increase in the extensity; an increase of muscular innervation entails irradiation to adjacent muscles; but when a particular idea becomes clearer and more distinct, there rises into consciousness an associated idea qualitatively related probably to impressions of quite another class, as when the smell of tar calls up memories of the sea-beach and fishing-boats. Since images are thus distinct from impressions, and yet so far continuous with each other as to form a train in itself unbroken, we should be justified, if it were convenient, in speaking of images as changes in a new continuum; and later on we may see that this is convenient.

Impressions then—unalike ideas—have no associates to whose presence their own is accommodated and on whose intensity their own depends. Each independant attention for, so that often a state of distraction ensues, such as the train of ideas left to itself never occasions. The better to hear we listen; the better to see we look; to smell better we dilate the nostrils and sniff; and so with all the special senses: each sensory impression sets up nascent movements for its better reception. In like manner there is also a characteristic adjustment for images which can be distinguished from sensory adjustments almost as readily as these are distinguished from each other. We become most aware of this as, mutatis mutandis, we do of them, when we voluntarily concentrate attention upon particular ideas instead of remaining mere passive spectators, as it were, of the general procession. To this ideational adjustment may be referred most of the strain and "head-splitting" connected with recollecting, reflecting and all that people call headwork; and the "absent look" of one intently thinking or absorbed in reverie seems directly due to the absence of sensory adjustment that accompanies the concentration of attention upon ideas.

22. But, distinct as they are, impressions and images are still closely connected. In the first place, there are two or three well-marked intermediate stages, so that, though we cannot directly observe it, we seem justified in assuming a steady transition. As the first of such intermediate stages, it is usual to reckon what are often, and—so far as psychology goes—inaccurately, styled after-images. They would be better described as after-sensations, inasmuch as they are due either (1) to the persistence of the original peripheral excitation after the stimulus is withdrawn, or (2) to the effects of the exhaustion or the repair that immediately follows this excitation. In the former case they are qualitatively identical with the original sensation and are called "positive," in the latter they are complementary to it and are called "negative." (I restore). These last, then, of which we have clear instances only in connexion with sight, are obviously in no

1 Moreover, as we shall see, the distinction between present and past or future psychologically presupposes the contrast of impression and image.

2 Organic sensations, though distinguishable from images by their definite though often anatomically inaccurate localization, furnish no clear evidence of such adaptations. But in another respect they are still more clearly marked off from images, viz. by the pleasure or pain they directly occasion.
sort re-presentations of the original impression, but a sequent presentation of diametrically opposite quality; while positive after-sensations are, psychologically regarded, nothing but the original sensations in a state of evanesence. It is this continuance and gradual waning after the physical stimulus has completely ceased that give after-sensations their chief title to a place in the transition from impression to image. There is, however, another point: after-sensations are less affected by movement than impressions are. If we turn away our eyes we cease to see the flame at which we have been looking, but the after-image remains still projected before us and continues localized in the dark field of sight, even if we close our eyes altogether. This fact that movements do not suppress them, and the fact that yet we are distinctly aware of our sense-organs being concerned in their presentation, serve to mark off after-sensations as intermediate between primary and secondary presentations. The after-sensation is in reality more elementary than either the preceding percept or its image. In both these, in the case of sight, objects appear in space of three dimensions, i.e. with all the marks of reality and perspective; but the so-called after-image lacks all these.

Still further removed from normal sensations (i.e. sensations determined by the stimuli appropriate to the sense-organ) are the "recurrent sensations" often unnoticed but probably experienced more or less frequently by everybody—cases, that is, in which sights or sounds, usually such as at the time were engrossing and impressive, suddenly reappear several hours or even days after the physical stimuli, as well as their effects on the terminal sense-organ, seem entirely to have ceased. Thus workers with the microscope often see objects which they have examined during the day stand out clearly before them in the dark; it was indeed precisely such an experience that led the anatomist Henle first to call attention to these facts. But he and others have wrongly referred them to what he called a "sense-memory"; all that we know is against the assumption that the eye or the ear has any power to retain and reproduce percepts. "Recurrent sensations" have all the marks of percepts which after-sensations lack; they only differ from what are more strictly called "hallucinations" in being independent of all subjective suggestion determined by emotion or mental derangement.

In what Fechner has called the "memory-after-image" or the primary-memory-image, as it is better termed, we have the image proper in its earliest form. As an instance of what is meant may be cited the familiar experience that a knock at the door, the hour struck on the clock, the face of a friend whom we have passed unnoticed, may sometimes be recognized a few minutes later by means of the persisting image, although—apparently—the actual impression was entirely disregarded. But in vision the primary-memory-image can always be obtained, and is obtained to most advantage, by looking intently at some object for an instant and then closing the eyes or turning them away. The image of the object will appear for a moment very vividly and distinctly, and can be so recovered several times in succession by an effort of attention. Such reinstatement is materially helped by rapidly opening and closing the eyes, or by suddenly moving them in any way. In this respect a primary-memory-image resembles an after-sensation, which can be repeatedly revived in this manner when it would otherwise have disappeared. This seems to show that the primary-memory-image in such cases owes its vividness in part to a positive after-sensation; at any rate it proves that it is in some way still sense-sustained. But in other respects the two are very different: the after-sensation is necessarily presented if the intensity of the original excitation suffices for its production, and cannot be presented otherwise, however much we attend. Moreover, the after-sensation is only for a moment positive, and then passes into the negative or complementary, so that the study of hallucination must be directed towards the continuance of the original percept, it directly hinders it. Primary-memory-images on the other hand, and indeed all images, depend mainly upon the attention given to the impression; provided that was sufficient, the faintest impression may be long retained, and without it very intense ones will soon leave no trace. The primary-memory-image retains so much of its original definiteness and intensity as to make it possible with great accuracy to compare two physical phenomena, one of which is in this way "remembered" while the other is really present. For the most part this is indeed a more accurate procedure than that of dealing with both together, but it is only possible for a very short time. From Weber's experiments with weights and lines it would appear that even after 10 seconds a considerable waning has taken place, and after 100 seconds all that is distinctive of the primary image has probably ceased.

On the whole, then, it appears that the ordinary memory-image is a joint effect; it is not the mere residuum of changes in the presentation-continuum, but an effect of these only when there has been some concentration of attention upon them. It has the form of a percept, but is not constituted of revived impressions, for the essential marks of impressions are absent; there is no localization in, or projection into, external space, neither is there the motor adaptation, nor the tone of feeling, incident to the reception of impressions. Ideas do not reproduce the intensity of these original constituents, but only their quality and complication. What we call the vividness of an idea is of the nature of intensity, but it is an intensity very partially and indirectly determined by that of the original impression; it depends much more upon the state of what we shall call the memory-continuum and the attention the idea receives. The range of vividness in ideas is probably comparatively small; what are called variations in vividness are often really variations in distinctness and completeness. Where we have great intensity, as in the reproduction of sensory presentations may be reasonably supposed to enter into the complex.

It is manifest that the memory-continuum has been in some way formed out of or differentiated from the presentation-continuum by the movements of attention, but the precise connexion of the two continua is still very difficult to determine. We see perhaps the first distinct step of this evolution in the primary-memory-image: here there has been no cessation in presentation, and yet the characteristic marks of the impression are gone, so much so, indeed, that superposition without "fusion" with an exactly similar impression is possible. We have now to inquire into the genesis and development of ideation.

**Genesis and Development of Ideation.**

23. We find ourselves sometimes engrossed in present perceptions, as when tracing, for example, the meanderings of an ant; at other times we may be equally absorbed in reminiscences; or, again, in pure reverie and "castle-building." Here are three well-marked forms of conscious life: the first being concerned with what is, the second with what has been, and the third with the merely possible. Again, the first involves definite spatial and temporal order, though the temporal order, as just said, is in the main restricted to the "sensible present"; the second involves only definite time-order; and the last neither in a definite way. Thus, analytically regarded, perception, memory, imagination, show a steady advance. In infancy the first
predominates, while senility lapses back to the second; in the third, where similarities suggest themselves and the contrast of actual and possible is explicit, we have at length the groundwork of logical comparison. Nevertheless, since imagination plays a conspicuous part in child life before much personal reminiscence appears, it would seem probable that ideas do not first arise as definite memory-images or reminiscences. On the other hand, in the so-called homing instincts of the lower animals we have evidence of isolated "memories" of a simpler form than ours.

The subject is as difficult as it is interesting and important, and we can hardly hope at present for a final solution. One chief obstacle here is the very process of concatenation of such leading terms as memory, association and idea. Even what is most fundamental of all, that "plasticity" which we have analysed into retentiveness, differentiation and integration, is sometimes described as if it already involved memory-ideas and their association. Ideas, that is to say, are identified with mere "residue" of former "impressions," and yet at the same time are spoken of as "copies" of these: which is much like saying the evening twilight is a réplica of the noonday gleam as well as its parent gleam. Again, the continuous differentiation and redintegration of the presentational continuum which mark the progress of perceptual experience are resolved into the original logiplicity or presentation, which is associated by "adhesion" of the contiguous. Yet before the differentiation there was no plurality, and after the integration there is only a complex unity, comparable perhaps with an atomistic and continuous, but certainly not with a collection of atoms put together with cement. This mistaken identification by the Associationist psychologists of later processes with simpler and earlier ones, by which they are only partially explained, has not only obscured the true nature of the problem, but has prevented the conceiving of the idea on which we are entering—that concerning the genesis and development of ideas—from being ever effectively raised. The discussion of this question will incidentally yield the best refutation of the view.

Experience, we say, is the acquisition of practical acquaintance and efficiency as the result of repeated opportunity and effort. This means that strangeness on the cognitive side gives place to familiarity, and that on the active side clumsiness is superseded by skill. But though analytically distinct, the two sides are, as we have already insisted, actually inseparable: to the uninteresting we are indifferent, and what does not call for active response is ignored. If the original presentations whether sensory or motor, be A, B, C, we find that they are virtually a new character, become, let us say, A', B', C': γ representing the eventual familiarity or facility, as the case may be. We find, again, a certain sameness in this character, however various the presentations to which it pertains, a sameness which points to the presence of subjective constituents, and to these we may assign the "feelings" that enter into accommodation and adjustment. This factor is important as evidence of a subjective co-operation which may enable us to dispense with the mutual "adhesions" and "attractions" among presentations, on which the Associationists rely. But it is obvious that there must be an objective factor as well; and it is this objective factor in the process giving rise to γ that now primarily concerns us. We have described that process as assimilation or immediate recognition: the older psychology described it as association of the completely similar, or as automatic association. That the two views have something in common is shown by the juxtaposition of "automatic" and "immediate," "sameness" and "assimilation." To prepare the way for further discussion, let us first ascertain these points of agreement. "When I look at the full moon," said Bain, "I am instantly impressed with the state arising from all my former impressions of her disc added together." This we may symbolize in the usual fashion as A + a. Now to what extent our present occurrence (full moon) has been preceded by a series of like occurrences, enumerable as 1, 2, 3, ... n; (2) that the present experience (Aγ) is what it is in consequence of the preceding experiences of these occurrences; and (3) that it "arises instantly" as the joint result of such preceding experiences. But it is denied (1) that this present experience is the mere sum, or even the mere "fusion," of the experiences preceding it; (2) that they were qualitatively identical; (3) that they persist severally unaltered, in such a way that experience "drags at each remove a lengthening chain" of them. In the case of dexterityes, where γ answers to facility, it is obvious that there is no such series of identicals (a, a, a, ... a) at all. From the first rude beginning—say the schoolboy's pothooks—up to the finished performance of the adept there is continuous approximation: awkward and bungling attempts, passing gradually into the bold strokes of mastery. Nor is the identity of a different in consequence γ answers to familiarity; if we attend, as it is plain we ought, not to the physical fact cognized, but to the individual's perception of it. This, too, is an acquisition, has entailed activity, and is marked by gradual approximation towards clearness and distinctness. The successive experiences of identical occurrences does not then result in an accumulation of i identical residua. The ineptness of the atomistic psychology with its "physical" and "chemical" analysis is nowhere more apparent than here. Considering the intimate relation of life and mind, and the strong physiological bias shown by the Associationists from Hartley onwards, it is surely extraordinary how completely they have failed to appreciate the light-bearing significance of such concepts as function and development. Facility and faculty (or function) are much the same, both etymologically and actually. As the perfected structure is not so many rudimentary structures "added together," but something that supersedes them completely, must we not say the same of the perfected function? The less fit is not embodied in the fittest that finally survives. Development implies change of form in a continuous whole: every growth into means an equal growth out of: thus one cannot find the caterpillar in the butterfly. Between organic development and mental development there is then more than an analogy.

But though assimilation cannot be analysed into a series of identical ideas (a, a, a, ... a), either "added together" or "instantaneously fused," yet it does result in an a which may provisionally be called an idea. Such idea is, however, neither a memory-idea in the proper sense nor an idea within the meaning of the term implied in imagination or ideation. For it is devoid of the temporal signs indicated by the subscript numerals in a, a, a, ... ; and it does not yet admit of reproduction as part of an idealintional continuum, one, that is, divested of the characteristics belonging to the actual and sensibly present. It is, so to say, embryonic, something additional to the mere sensation and yet something less than a "free or independent idea." It is, as it has been happily called, a tied (gebundene) or implicit idea. We have clear evidence of the sense-bound stage of this immature "idea" in the so-called "memory afterimage" (cf. § 22). There is, however, nothing in this of memory, save as the term is loosely used for mere retentiveness; and afterperception would therefore be a less objectionable name for it. This after-perception is entirely sense-sustained and admits of no ideal recall, though—in minds sufficiently advanced—it may persist for a few moments, and so form the basis of such comparison with a second sensation, as we find in the experiments of Weber, Fechner and others. At a still lower level, or in actual perception, we cannot assume even this amount of partial independence, though contemplation clearly points to something beyond the bare sensation, which is a pure abstraction, as we may presently see.

It is saying too little to maintain, as some do, that this "something" is subconscious, on the ground that it is not discoverable by direct analysis. Yet it is saying too much, regardless of this defect, to describe a percept as a representativerepresentative

1 On this term cf. below, §§ 24, 28.
3 Recent experiments, however, seem to prove that the after-perception is not the sole factor, and often is not a factor at all in such comparison (so-called); but that what is now termed the "absolute impression" may supplement it or even replace it altogether. As to what is meant by absolute impression, cf. § 14. c.
complex, if representation is to imply the presence of a free or independent idea. To call this something a "tied or nascent idea" on the ground of its possible later development into an idea that representation seems, then, nearest the truth. The same meaning is sometimes expressed in a wholly different and designedly paradoxical way by saying that all cognition (perception) is recognition. This statement has been met by the suggestion that an opposition between knowing and knowing again, the irrelevance of which any lexicon would show; and, further, by the demand: How on such a plane is it possible, and we know an indefinite regress of assimilation to be avoided? We may confidently reply that it cannot be avoided: an absolute beginning of experience, whether phylogenetically or ontogenetically, is beyond us. Assimilation means further assimilation; in this sense all cognition is further recognition, and a bare sensation is, as said, an abstraction representing a limit to which we can never regress.

We find evidence, again, of ideas in the making in what Lewes called "preperception." Of this instance in plenty are furnished by everyday illusions, as when a scarecrow is hailed by the traveler who mistakes it for a husbandman, or when what is taken for an orange proves to be but an imitation in wax. In reality all complex percepts involve preperception; and, so far, it must be allowed that such percepts are directly analysable into perception and the constituent complex percepts. Nevertheless, the representative element is not yet, and never becomes the proper. The sight of ice yields a force of its coldness, the smell of baked meats a foretaste of their savour. Such prepercepts differ from free ideas just as after-percepts do: they are still sense-bound and sense-sustained. Nor can this complication be with any propriety identified either with the association pertaining to memory or with that specially pertaining to ideation; though, no doubt, the two processes—complication and association—are genetically continuous, as are their respective constituents, nascent and free ideas. The whole course of perceptual integration being determined and sustained by such nascent preperception, involves from the outset, as we have were, concurrent conative impulses; and thus the same assimilation that results in familiarity and preperception on the subjective side results in facility and purpose on the concrete. Knowing immediately what to do is here the best evidence of knowing what there is to do with; the moth that flies into the candle has assuredly no preperception of it, and does not act with purpose. Bearing this in mind, we may now see one way, and probably the earliest, in which tied ideas become free.

The contrast between the actual and the possible constitutes, as we have seen, the main difference between experience at the perceptual and experience at the ideational stage. A subject confined to the former level knows not yet this difference. Such knowledge is attained, not through any quasi-mechanical interaction of presentations, but usually through bitter experience. The chapter of accidents is the Bible of fools, it has been said; but we are all novices at first, and get wisdom chiefly by the method of trial and failure. Things are not always different in what to us are their essential properties, but they so differ from time to time. Resemblances are frequent enough to give us familiarity and confidence; yet uniformity is flecked by diversity, and this conflicting situation involves from the outset, as we have were, concurrent conative impulses; and thus the same assimilation that results in familiarity and preperception on the subjective side results in facility and purpose on the concrete. Knowing immediately what to do is here the best evidence of knowing what there is to do with; the moth that flies into the candle has assuredly no preperception of it, and does not act with purpose. Bearing this in mind, we may now see one way, and probably the earliest, in which tied ideas become free.

The feline experiential history, by saying that any associated "animal association" (Thorndike, Animal Intelligence, ou Experimental Study of the Associative Processes in Animals, 1898, pp. 71, 87; and passion). But it seems preferable to confine the term "association" to the latter process, in which alone the component presentations have that amount of distinctness and individuality which the term properly connotes.

1 Hence the earlier process has been named "impressional association" (Stout, Analytic Psychology, 1896, ii. pp. 27, 29), and again "animal association" (Thorndike, Animal Intelligence, ou Experimental Study of the Associative Processes in Animals, 1898, pp. 71, 87; and passion). But it seems preferable to confine the term "association" to the latter process, in which alone the component presentations have that amount of distinctness and individuality which the term properly connotes.

the mouth water," we have the alternative possibilities present as "free ideas," and action is in suspense, the alternative courses, that is to say, again present only in idea. It is easy to see how in such situations one free idea, a "what" suffered from its "that," will tend to loosen the sensory ties of alternative, still implicit ideas. On the cognitive side, from immediate assimilation an advance is made towards mediate cognition, towards comparison; on the active side there is advance from impulsive action towards deliberate action.

We conclude, then, that implicit ideas—the products of assimilation, and integrated as such in complex percepts and the motor co-ordinations to which they lead—are more likely to emerge as free ideas the more the perceptual complexity increases. Perception in the lower animals, who give no signs of either memory or ideation, has apparently no such complexity. A fish, for example, can feel, smell, taste, see, and even hear, but we cannot assume solely on that account that it has any percepts to which its five senses contribute, as they do to our perception, say, of an orange or a peppermint. Taking voluntary movements as the index of psychical life, it would seem that the fish's movements are processes in its senses, not collectively but separately. Thus a dog-fool, according to Harlow-Wood's, has his food exclusively by scent; so that when its olfactory bulbs are severed, or the fore-brain, in which they end, is destroyed, it ceases to feed spontaneously. The carp, on the other hand, appears to search for its food wholly under the guidance of sight, and continues to do so just as well when the fore-brain is removed, the mid-brain, whence the optic nerves spring, seeming to be the chief seat of what intelligence it has. Again, Bateson observes: "There can be no doubt that soles also perceive objects approaching them, for they bury themselves if a stroke at them is made with a landing-net; yet they have no recognition of a worm hanging by a thread immediately over their heads, and will not take it even if it touch them, but continue to feel for it aimlessly on the bottom of the tank, being aware of its presence by the sense of smell." To this inability to simple percepts into one complex percept of a single object or situation we may reasonably attribute the fish's lack of true ideas, and consequent lack of sagacity. The sagacity even of the higher animals does not amount to "general intelligence," such as enables a child "to put two and two together," as we say, whatever "two and two" may stand for. So far as life consists of combinations of definite situations and definite acts, so far the things done or dealt with together are but "foci" or the several "foci or concentrations of attention, form so many isolated and comparatively isolated wholes. Round the more complicated of these, and closely connected with them, free ideas arise as sporadic groups, making possible those "lucid intervals," those fitful gleams of intelligence in the very heat of action, which occasionally interrupt the prevailing irrationality of the brutes. And as we cannot credit even the higher animals with general trains of ideas, just as little can we credit them with a continuous memory: indeed, it is questionable how far memory of the past, as past, belongs to them at all. For they live entirely in an universe, an expectant attitude, and it is in their aspect that "free ideas" arise when they arise at all. We cannot imagine a dog regretting, like one of Punch's heroes, that he "did not have another slice of that mutton." The free idea (a) then at its first emergence has neither an assignable position in a continuous memory-record, as a, or as, nor has it a definite relation as a "generic idea" to possible specializations such as a' or a". These further developments bring us to the general consideration of mental association.

2 Some light is perhaps here thrown on the reciprocal relation of "association by contrast" and "association by similarity" as well as particularly the differentiation of partial similarities and the integration of partial dissimilarities.

Mental Association and the Memory-Continuum.

24. Great confusion has been occasioned, as we have seen incidentally, by the lax use of the term "association," and this confusion has been increased by a further laxity in the use of the term "association by similarity." In so far as the similarity amounts to identity, as in assimilation, we have a process which is more fundamental than association by contiguity, but then it is not a process of association. And when the reviving presentation is only partially similar to the presentation revived, the nature of the association does not appear to differ from that operative when one "contiguous" presentation revives another. In this similarity hypothesis, say, a b x; recalling a b y, and in the other a b c recalling d e f. Now anybody who will reflect must surely see that the similarity between a b x and a b y, as distinct from the identity of their partial constituent a b, cannot be the means of recall; for this similarity is nothing but the state of mind—to be studied presently—which results when a b x and a b y, having been recalled, are in consciousness together and then compared. But if a b, having concurred with y before and being now present in a b x, again revives y, the association, so far as that goes, is manifestly one of contiguity, albeit as soon as the revival is complete, the state of mind immediately incident may be assimilated to the style "the flash of similarity." So far as the mere revival itself goes, there is no more similarity in this case than there is when a b c revives d e f. For the very a b c that now operates as the reviving presentation was obviously never in time contiguous with the d e f that is revived; if all traces of previous experiences of a b c were obliterated there would be no revival. In other words, the a b c now present must be "automatically associated," or, as we prefer to say, must be assimilated to those residua of a b c which were "contiguous" with d e f, before the representation of this can occur. And this, and nothing more than this, we have seen, is all the similarity that could be at work when a b x "brought up" a b y.

On the whole, then, we may assume that the only principle of association we have to examine is the so-called association by contiguity, which, as ordinarily formulated, runs:

Contiguity: InsExpressible. Any presentations whatever, which are in consciousness together or in close succession, cohere in such a way that when one recurs it tends to revive the rest, such tendency increasing with the frequency of the conjunction. It has been often contended that any investigation into the nature of association must be fruitless.1 But, if association is thus a first principle, it ought at least to admit of such a statement as represents the revival of the former, as well as the latter. Now, however, as we are asked to conceive presentations originally distinct and isolated becoming eventually linked together, we shall naturally feel the need of some explanation of the process, for neither the isolation nor the links are clear—not the isolation, for we can only conceive two presentations separated by other presentations intervening; nor the links, unless these are also presentations, and then the difficulty recurs. But, if for contiguity we substitute contiguity and regard the associated presentations as parts of a new continuum, the only important inquiry is how this new whole was first of all integrated into the former. To ascertain this point we must examine each of the two leading divisions of contiguous association—that of simultaneous presentations and that of presentations occurring in close succession. The last, being the clearer, may be taken first. In a series of associated presentations A B C D E, such as the movements made in writing, the words of a poem learned by heart, or the simple letters of the alphabet themselves, we find that each member recalls its successor but not its predecessor. Familiar as this fact is, it is not perhaps easy to explain it satisfactorily. Since C is associated both with B and D, and apparently as intimately with the one as with the other, why does it revolve the later only and not the earlier? B recalls C; why does not C recall B? We have seen that any

1 So Hume, Treatise of Human Nature, pt. i. § 4 (Green and Grose's ed., p. 321); also Lotze, Metaphysik, 1st ed., p. 526.

reproduction at all of B, C or D depends primarily upon its having been the object of special attention, so as to occupy at least momentarily the focus of consciousness. Now we can in the first instance only surmise that the order in which they are reproduced is determined by the order in which they were thus attended to when first presented. The next question is whether the association of objects simultaneously presented can be resolved into an association of objects successively attended to. Whereas in the case of a scene we saw but for a moment there were always a few traits that recur, the rest being blurred and vague, instead of the whole being revived in equal distinctness or indistinctness. On seeing the same scene a second time our attention is apt to be caught by something unnoticed before, as this has the advantage of novelty; and so on, till we have "lived ourselves into" the whole, which may then admit of simultaneous recall. Bain, who is rightly held to have given the best exposition of the laws of association, admits something very like this in saying that "coexistence is an artificial growth formed from a certain peculiar class of mental successions." But, while it is easy to think of instances in which the associated objects are attentively considered, we are not generally aware that the surest—not to say the only—way to fix the association of a number of objects is by thus concentrating attention on each in turn, it seems hardly possible to mention a case in which attention to the associated objects could not have been successive. In fact, an aggregate of objects on which attention could be focused at once would be already associated.

The exclusively successional character of contiguous association has recently been denied, and its exclusively simultaneous character maintained instead. It is at once obvious that this opposition of successional and simultaneous cannot be presented as in opposition altogether and reduce the whole process to an instantaneous event. Nor is there any ground for saying that there is a fixed and even a constant order of attention to whatever is simultaneously presented; facts all point the other way. Still, though we cannot exclude the notion of process from consciousness, we may say that presentations attended to together become pro tanto a new whole, are synthesized or complicated. Such primary synthesis leads not to an association of ideas, but rather to the formation of one percept, which may become eventually a free idea. The disconcerted preperception which sets this free may likewise liberate a similar or contrasting idea, but it will not resolve either complexly into the several "ideas" of the sensory or motor constituents, with which only the psychologist is familiar. The actual recurrence of some of these constituents may again reinstate the rest, not, however, as memories or as "thoughts," but as independent ideas of independent ideas.

Again, it has become usual to distinguish the association of contiguous experiences and the so-called association of similars or by resemblance. In our judgment, this is a considerable mistake.

The new terminology is illuminating: the substitution of forms for laws marks the abandonment of the old notion that association was by adhesion of the contiguous and "attraction" of the similar. We are thus left to find the cause of the association in contiguity; and that, we may safely say, is an adequate, and apparently the sole adequate, cause for the two commonly recognized forms of external association, the so-called simultaneous and the successive. But these two are certainly not co-ordinate; and if our analysis be sound, the former—for which we would retain the Herbartian term complication—yields us not members of an association but a member for an association. So far, then, we should have but one form of association, that of the successive content of focused attention; and but one result, the representation or memory-continuum, in contrast to the primary- or presentation-continuum, which constitutes the case of the "internal association." This is something external and internal, it at once strikes the unprejudiced mind that "internal association" is something of an anomaly, since the very notion of association implies externality. Also, on closer inspection it is found that it is not an association at all, but something quite distinct—a similarity or contrast of associates; of ideas, that is to say, which are contiguous members of the memory (or experience) continuum, or of ideas which have become contiguous through its application.

The only case, then, that now remains to be considered is that—take it in its simplest form—of two primary presentations X and Y, perhaps X appearing several times, in non-adjacent parts of the same, and occupying the focus of consciousness in immediate succession. This constitutes

Experience-continuum would perhaps be a better name, since it is only a preliminary to a true memory record, as we shall presently see.
their integration; for the result of this occupation may be regarded as a new continuum in which A and X become adjacent parts. For it is characteristic of a continuum that an increase in the intensity of any part leads to the intenser presentation of adjacent parts; and in this sense A and X, which were not originally contiguous, have come to be so. We have here, then, some justification for the term secondary- or memory-continuum when applied to this continuous series of representations to distinguish it from the primary or presentation-continuum from which its constituents are derived. The most important peculiarity of this continuum, therefore, is that it is a series of representations integrated by means of the movements of attention out of the differentiations of the primary or presentation-continuum, or rather out of so much of these differentiations as pertain to what we know as the primary memory-image. These movements of attention, if the phrase may be allowed, come in the absence of and not primarily upon interest, but at first appear to be determined entirely by more intensity. To them it is proposed to look for that continuity which images lose so far as they part with the local signs they had as percept and cease to be either localized or projected. Inasmuch as it is assumed that these movements form the connexion between one representation and another in the memory-train, they may be called "temporal signs." The evidence for their existence can be more conveniently adduced presently; it must suffice to remark here that it consists almost wholly of facts connected with voluntary attention and the voluntary control of the flow of ideas, so that temporal signs, unlike mental signs, are not an exact concomitant of all mental movements. And, unlike impressions, representations can have each but a single sign, the continuum of which, in contrast to that of local signs, is not rounded and complete, but continuously advancing. But in saying this we are assuming for a moment that the memory-continuum forms a perfectly single and unbroken train. If it ever actually were such, then, in the absence of any repetition of old impressions and apart from voluntary interference with the train, consciousness, till it ceased entirely, would consist of a fixed and mechanical round of images. Some approximation to such a state is often found in uncultured persons who lead uneventful lives, and still more in idiots, who can scarcely think at all.

25. In actual fact, however, the memory-train is liable to change in two respects, which considerably modify its structure, viz. (1) through the evanescence of some parts, and (2) through the partial recurrence of like impressions, which produces reduplications of varying amount and extent in other parts. As regards the first, we may infer that the waning or sinking towards the threshold of consciousness which we can observe in the primary mental image continues in sub-consciousness, till it ceased entirely, would consist of a fixed and mechanical round of images. Some approximation to such a state is often found in uncultured persons who lead uneventful lives, and still more in idiots, who can scarcely think at all. The elements of a complex are not equally revivable, as we have seen already: tastes, smells and organic sensations, though powerful as impressions to revive other images, have little capacity for ideal reproduction themselves, while muscular movements, though perhaps of all presentations the most readily revived, do not so readily revive other presentations. Idiosyncrasies are, however, frequent; thus we find one person has an exceptional memory for sounds, another for colours, another for form. Still it is in general true that the most intense, the most persistent, and the most interesting presentations persist the longest. But the evanescence, which is in all cases comparatively rapid at first, deepens sooner or later into real or apparent oblivion. In this manner it comes about that parts of the memory-continuum lose all distinctness of feature and, being without recognizable content, shrivel up to a dim and meagre representation of life that has passed—a representation that just suffices, for example, to show us that "our earliest recollections" are not of our first experiences, or to save them from being not only isolated but discontinuous. Such discontinuity can, of course, be properly modified; in the former case a "phanteric image" has grown out of such more specific representations as the latter affords. Still further removed from memory-images are the images that result from such familiar percepts as those of horses, houses, trees, &c.

As the joint effect of obliviscence and reduplication we are provided with trains of ideas distinct from the memory-thread and thereby with the material, already more or less organized, for intellectual and volitional manipulation. We do not experience the flow of ideas—save very momentarily and occasionally—altogether undisturbed; even in dreams and reverie it is continually interrupted and diverted. Nevertheless it is not difficult to ascertain that, so far as it is left to itself, it takes a very different course from that which we should have to retrace if bent on reminiscence and able to recollect perfectly. The readiness and steadfastness of this flow of ideas are shown by the extremely small effort necessary in order to follow it. Nevertheless from its very nature it is liable, though not to positive breaches...
It is plainly absurd to make the difference depend on the presence of belief in memory and expectation and on its absence in mere imagination; for the belief itself depends on this difference instead of constituting it. One real and obvious distinction, however, which Hume pointed out as regards memory, is the fixed order of succession of the ideas that is remembered or expected as contrasted with "the liberty" of the imagination to transpose and change its ideas. This order and position in the case of memory are, of course, normally those of the original impressions, but it seems rather naïve of Hume to tell us that memory "is tied down to these without any power of variation," while imagination has liberty to transpose as it pleases, as if the originals sat to memory for their portraits, while to imagination they were but studies. Such correspondence being out of the question—as Hume takes care to state as soon as it suits him—all we have, so far, is this finity and definiteness as contrasted with the kaleidoscopic instability of ideation. In this respect what is remembered or expected resembles what is perceived: the grouping not only does not change capriciously and spontaneously, but resists any mental efforts to change it. But, provided these characteristics are there, we should be apt to believe that we are remembering, just as, mutatis mutandis, with like characteristics we might believe that we were perceiving: hallucination is possible in either case.

This finity of order and position is, however, not sufficient to constitute a typical reminiscence where the term is exactly used. But remembering is often regarded as equivalent to knowing and recognizing, as when on revisiting some once familiar place one remarks, "How well I remember it!" What is meant is that the place is recognized, and that its recognition awakens memories. Memory includes recognition; recognition as such does not include memory. In human consciousness, as we directly observe it, there is, perhaps, no pure recognition: here the new presentation in not only assimilated to the old, but the former framing of circumstance is reinstated, and so perforce distinguished from the present. It may be there is no warrant for supposing that such redintegration of a preceding field is ever absolutely nil, still we are justified in regarding it as extremely vague and meagre, both where mental evolution is but slightly advanced and where frequent repetition in varying and irrelevant circumstances has produced a blurred and neutral zone. The last is the case with a great part of our knowledge; the writer happens to know that bos is the Latin for "ox" and bufo the Latin for "toad," and may be said to remember both items of knowledge, if "remember" is only to be synonymous with "retain." But if he came across bos in reading he would think of an ox and nothing more; bufo would immediately call up not only "toad" but Virgil's Georgics, the only place in which he has seen the word, and which he never read but once. In the former there is so far nothing but recognition (which, however, of course rests upon retention); in the latter there is also remembrance of the time and circumstances in which that piece of knowledge was acquired. Of course in so far as we are aware that we recognize we also think that remembrance is at any rate possible, since what we know we must previously have learned—recognition excluding novelty. But the point here urged is that there is an actual reminiscence only when the recognition is accompanied by a reinstatement of portions of the memory-train continuous with the previous presentation of what is now recognized. Summarily stated, we may say that between knowing and remembering on the one hand and imagining and expecting on the other there is a primary division of labor, between the grouping in the former; in the latter there is a shifting play of images more or less "generic," reminding one of "dissolving views." Hence the first two approximate in character to perception, and are rightly called recognitions. Between them, again, the difference turns primarily on the presence or absence of temporal signs. In what is remembered these are still intact enough to ensure a localization in the past of what is recognized; in what is known merely such localization is prevented, either because of the obv noreferrerness of temporal connexions or because
the reduplications of the memory-train that have consolidated the central group have entailed their suppression. There is further the difference first mentioned, which is often only a difference of degree, viz. that reminiscences have more circumscription, so to say, than mere recognitions have: more of the collateral constituents of the original concrete field of consciousness are reinstated. But of the two characteristics of memory proper—(a) concreteness or circumscription, and (b) localization in the past—the latter is the more essential. It sometimes happens that we have the one with little or nothing of the other. For example, we may have but a faint and meagre representation of a scene, yet if it falls into and retains a fixed place in the memory train we need have no doubt that some such experience was once actually put on die, and may have been vivified so that memory, we may safely find ourselves reminded by what is happening at the moment of a preceding experience exactly like it—some even feel that they know from what is thus recalled what will happen next; and yet, because we are wholly unable to assign such a representation a place in the past, instead of a belief that it happened, there arises a most distasteful sense of bewilderment, as if one were haunted and had lost one's personal bearings. It has been held by some psychologists that memory proper includes the representation of one's past self as agent or patient in the event or situation recalled. And this is true as regards all but the earliest human experience, at any rate; still, whereas it is easy to see that memory is essential to any development of self-consciousness, the converse is not at all clear, and would involve us in a needless circle.

27. Intimately connected with memory is expectation. We may as the result of reasoning conclude that a certain event will happen; we may also, in like manner, conclude that a certain other event has happened. But as we should not call the latter memory, so it is desirable to distinguish such indirect anticipation as the former from that expectation which is directly due to the interaction of ideas. Any man knowing the other to be healthy may anticipate the early recuperation of death, but he cannot with propriety be said to be expecting it unless he has actually present to his mind a series of ideas ending in that of death, such series being due to previous associations, and unless, further, this series owes its representation at this moment to the actual recurrence of some experience to which that series succeeded before. And as familiarity with an object or event in very various settings may be a bar to recollection, so it may be to expectation: the average Englishman, e.g. is continually surprised without his umbrella, though only too familiar with rain, since in our climate one not specially attentive to the weather obtains no clear representation of its successive phases. But after a series of events A B C D E . . . has been once experienced we instinctively expect the recurrence of B C . . . on the recurrence of A, i.e. provided the memory-train continues so far intact. Such expectation, at first perhaps slight—a mere tendency easily overborne—becomes strengthened by every repetition of the series. In the old order, till eventually, if often fulfilled and never falsified, it becomes certain and, as we commonly say, irresistible. To have a clear case of expectation, then, it is not necessary that we should distinctly remember any previous experience like it, but only that we have been actually attentive to the weather obtains no clear representation of a series which has been firmly associated with such previous experiences, the remaining members, or at least the next, if they continue serial, being revived through that which is once again realized. This expectation may be instantly checked by reflection, just as it may, of course, be disappointed in fact; but these are matters which do not concern the inquiry as to the nature of expectation while expectation lasts.

We shall continue this inquiry to most advantage by widening it into an examination of the distinction of present, past and future. To a being whose presentations never passed through actually ours. On the other hand, as in certain so-called members of a series which has been firmly associated by such previous experiences, the remaining members, or at least the next, if they continue serial, being revived through that which is once again realized. This expectation may be instantly checked by reflection, just as it may, of course, be disappointed in fact; but these are matters which do not concern the inquiry as to the nature of expectation while expectation lasts.

1 Any full discussion of paramnesia, as these very interesting states of mind are called, belongs to mental pathology.

2 As, e.g. James Mill (Analysis of the Human Mind, ch. x), who treats this difficult subject with great acuteness and thoroughness.

the transitions which ours undergo—first divested of the strength and vividness of impressions, again reinvaded with them and brought back from the faint world of memory—past, present, and future. All the manifold emotions they occasion, would be quite unknown. Even we, so far as we confine our activity and attention to ideas are almost without them. Time-order, succession, antecedence, and consequence, of course, there might be still, but in that sense of events as "past and gone for ever," which is one of the melancholy factors in our life; and in the obligation to wait and work in hope or dread to what is "still to come" there is much more than time-order. It is to presentations in their primary stage, to impressions, that we owe what real difference there is between now and then, whether retrospective or retrospective, as it is to them also that we directly owe the sense of the real, of what is and exists as opposed to the non-existent that is not. But the present alone and life in a succession of presents, or, in other words, continuous occupation with impressions, gives us no knowledge of the present as present. This we first obtain when our present consciousness consists partly of memories or partly of expectations as well. An event expected differs from a like event remembered chiefly in two ways—in its relation to present impressions and images and in the active attitude to which it leads. The diverse feelings that accompany our intuitions of time and contribute so largely to their colouring are mainly consequences of these differences. Let us take a series of simple and familiar events A B C D E, representing ideas by small letters, and perceptions by capitals whenever it is necessary to distinguish them. Such series may be present in consciousness in such wise that a b c d e are imaged while E is perceived anew, i.e. the whole symbolized as proposed would be a b c d e; such would be, e.g. the state of a dog that had just finished his daily meal. Again, there may be a fresh impression of A which revives b c d e; we should have then (1) A b c d e—the state of our dog when he next day gets sight of the dish in which his meat is kept; (2) A b c d e. A little later we may have (3) a b c d e. Here a b are either after-sensations or impressions or have at any rate the increased intensity due to recent impression; but this increased intensity will be rapidly on the wane even while C lasts, and a b will pale still further when C gives place to D, and we have (3) a b c d e. But, returning to (2), we should find d to be increasing in intensity and definiteness, as compared with their state in (1), now that C, instead of A, is the present impression. For, when A occupied this position, not only was e raised less prominently above the threshold of consciousness by reason of its greater distance from A in the memory-continuum, but, owing to the reduplications of this continuum, mental life reproduced while reaching C, was necessarily negatively as B succeeded to A and C to B; even dogs know that "there is many a slip 'twixt the cup and the lip." But, where A B C D E is a series of perceptions such as we have here supposed—and a series of simpler states would hardly afford much ground for the distinctions of past, present and future—there would be a varying amount of active adjustment of sense-organs and other movements supplementary to full sensation. In (2), the point at which we have a b c d e, for instance, such adjustments and movements as were appropriate to b would cease as B lapsed and be replaced by those appropriate to c, and so on. Again, as C succeeded to B, and d in consequence increased in intensity and definitiveness, the movements adapted to the reception of D would become nascent, and so on. Thus, psychologically regarded, the distinction of past and future and what we might call the oneness of direction of time depend, as just described, (1) upon the continuous sinking of the primary memory-images on the one side, and the continuous rising of the ordinary images on the other side, of that member of a series of perceptions then repeating which is actual at the moment; and (2) on the prevenient adjustments of attention, to which such words as "expect," "await," "anticipate," all testify by their etymology. These conditions in turn will be found to depend upon all that is implied in the formation of the memory-train and upon that recurrence of like series of impressions which we
attribute to the "uniformity of nature." If we never had the same series of impressions twice, knowledge of time would be impossible, as indeed would knowledge of any sort.

28. This notion is often very properly represented as a line, and we may perhaps utilize this figure to make clear the relation of our perception of time to what we call time itself. The present, though conceived as a point or instant of time, is still such that we actually can and do in that moment attend to a plurality of presentations to which we might otherwise have attended to severally in successive moments. Granting this implication of simultaneity and succession, we may, if we represent succession as a line, represent simultaneity as a second line at right angles to the first; pure time—or time-length without time-breath, we may say—is a mere abstraction. Now it is evident that what has probably been given us, some trace as it is (or as we conceive it), and with the latter in treating of our perception of time, where, just as in a perspective representation of distance, we are confined to lines in a plane at right angles to the actual line of depth. In a succession of events $A B C D E...$ the presence of $B$ means the absence of $A$ and of $C$, but the presentation of this succession involves the simultaneous presence, in some mode or other, of two or more of the presentations $A B C D$. In our temporal perception, then, all that corresponds to the differences of past, present and future is represented simultaneously. To this fact the name of "psychical presence" has been given, as we have supposed, some trace of that movement of attention of which we are aware in passing from one presentation to another. In our present reminiscences we have, it must be allowed, little direct proof of this position, though there is strong indirect evidence of it in the tendency of the flow to follow the order in which the presentations were first attended to. With the movements themselves we are familiar enough, though the residue of such movements are not ordinarily conspicuous. These residue, then, are our temporal signs, and, together with the presentations connected by them, constitute the memory-continuum. But temporal signs alone will not furnish all the pictorial exactness of the time-perspective. They give us only a fixed series; but the working of obliviscence, by insuring a progressive variation in intensity and distinctness as we pass from one member of the series to the other, yields the effect which we call time-distance. By themselves such variations would leave us liable to confound more vivid representations in the distance with fainter ones nearer the present, but from this mistake the temporal signs save us; and, as a matter of fact, where the memory-train is imperfect such mistakes continually occur. On the other hand, where these variations are slight and imperceptible, though the memory-continuum preserves the order of events intact, we have still no such distinct appreciation of comparative distance in time as we have in the present where these perspective effects are considerable.

29. When in retrospect we note that a particular presentation $X$ has had a place in the field of consciousness, while certain other presentations, $A B C D...$, have succeeded each other, then we may be said in observing this relation of the two to perceive the duration of $X$. And it is in this way that we do subjectively estimate longer periods of time. But first, it is evident that we cannot apply this method to indefinitely short periods without passing beyond the region of distinct presentation; and, since the knowledge of duration implies a relation between distinguishable presentations $A B C D$ and $X$, it is clear that in which the hypothesis of subconsciousness or latent will hardly help any but those who confound the fact of time with the knowledge of it. Secondly, if we are to compare different durations at all, it is not enough that one of them should last out a series $A B C D$, and another a series $L M N O$; we also want some sort of common measure of those series. Locke was awake to this point, though he expresses himself vaguely (Essay, ii. 14, §§ 9-12). He speaks of our ideas succeeding each other "at certain distances not much unlike the images in the inside of a lantern turned round by the heat of a candle," and "guesses" that "this appearance of theirs in train varies not much in a waking man." Now what is this "distance" that separates $A$ from $B$, $B$ from $C$, and so on, and what means have we of knowing that it is tolerably constant in waking life? It is probably that the residue of which we have called a temporal sign; or, in other words, it is the movement of attention from $A$ to $B$. But we must endeavour here to get a more exact notion of this movement. Everybody knows what it is to be distracted by a rapid succession of varied impressions, and equally what it is to be wearied by the slow and monotonous recurrence of the same impressions. Now these "feelings" of distraction and tedium owe their characteristic qualities to movements of attention. In the first, attention is kept incessantly on the move; before it is accommodated to $A$, it is disturbed by the suddenness, intensity, or novelty of $B$; in the second, it is kept all but stationary by the repeated presentation of the same impression. Such excess and defect of surprises make one realize a fact which in ordinary life is so obscure as to escape notice. But recent experiments have set this fact in a more striking light, and made clear what Locke had dimly before his mind in talking of a certain distance between the presentations of a waking man. In estimating very short periods of time, of a second or less—indicated say by the beats of a metronome—it is found that there is a certain period for which the mind of a number of estimates is correct, while shorter periods are on the whole over-estimated and longer periods under-estimated. This we may perhaps take to be evidence of the time occupied in accommodating or fixing attention. Whether the "point of indifference" is determined by the rate of usual bodily movement, as Spencer asserts and Wundt conjectures, or conversely, is a question we need not discuss just now. But, though the fixation of attention does of course really occupy time, it is probably not in the first instance perceived as time, i.e. as continuous "protension," to use a term of Hamilton's, but as intensity. Thus, if this supposition be true, there is an element in our concrete time-perception which has no place in our abstract conception of time. In time conceived as physical there is no trace of intensity; in time psychically experienced duration is primarily an intensive magnitude, witness the comparison of times when we are "bored" with others when we are amused. It must have struck every one as strange who has reflected upon it that a period of time which seems long in retrospect—such as an eventful excursion—should have appeared short in passing; while a period, on the contrary, which in memory has dwindled to a wretched span seemed everlasting till it was gone. But, if we consider that in retrospect length of time is represented primarily and chiefly by impressions that have survived, we have an explanation of one-half; and in the intensity of the movements of attention we shall perhaps find an explanation.
of the other. What tells in retrospect is the series a b c d e, &c.; what tells in the wearisome present is the intervening i 1, i 2, &c., or rather the original accommodation of which these temporal signals give the residuum. For, as we have seen elsewhere, the intensity of a presentation does not persist, so that in memory the residuum of the most intense feeling of tideum may only be so many its in a memory-continuum whose surviving members are few and uninteresting. But in the actual experience, say, of a wearisome sermon, when the expectation of release is continuously barked and attention forced back upon a monotonous drible of platitudes, the one impressive fact is the hearer's impatience. On the other hand, so long as we are entertained, attention is never involuntary, and there is no continually deferred expectation. Just as we are said to walk with least effort when our pace accords with the rate of swing of our legs regarded as pieces of pendulums, so in general the rate of swing of our attention is at the rate at which attention can be most easily accommodated, and are such that we attend willingly.1 We are absorbed in the present without being unwillingly confined to it; not only is there no motive for retrospective or expectation, but there is no feeling that the present endures. Each impression lasts as long as it is interesting, but does not continue to monopolize the focus of consciousness till attention to it is fatigueing, because uninteresting. In such facts, then, we seem to have proof that our perception of duration rests ultimately upon quasi-motor acts of varying intensity, the duration of which we do not directly experience. But we find no evidence that intensity is a function of their duration; but the intensity is all that we directly perceive. In other words, it is here contended that what Locke called an instant or moment—"the time of one idea in our minds without the succession of another, of one wherein therefore we perceive no succession at all"—is psychologically not "a part in duration" in that sense in which, as he says, "we cannot conceive any duration without succession" (Essay, ii. 16, 12).

But, if our experience of time depends primarily upon acts of attention to a succession of distinct objects, it would seem that time, subjectively regarded, must be discrete and not continuous. This, which is the view steadily maintained by the psychologists of Herbert's school, was implied if not stated by Locke, Berkeley and Hume. Locke hopelessly confuses time as perceived and time as conceived, and can only save himself from pressing objections by the retract, "It is very common to observe intelligible discourses spoiled by too much subtility in nice divisions." But Berkeley and Hume, who combine with his general psychological account the inconsistent principle of "none of our ideas of space and time is without all manner of composition," Berkeley declares, "For my own part, whenever I attempt to frame a simple idea of time, so formed from the succession of ideas in my mind, which flows uniformly and is participated by all beings, I am lost and embroiled in inextricable difficulties. I have no notion of it at all, only I hear others say it is infinitely divisible, and speak of it in such a manner as leads me to harbour odd thoughts of my existence... Time therefore being nothing, abstracted from the succession of ideas in my minds, it follows that the duration of any finite spirit must be estimated by the number of ideas or actions successively found in that space of time (Principe de Knowledge, i. § 98). Hume, again, is at still greater pains to show that "the idea which we form of any finite quality is not infinitely divisible, but that proper distinctions and separations we may run this idea up into inferior ones, which will be perfectly indivisible... that the imagination reaches a minimum, and is capable of rising to itself an idea of which it cannot conceive any subdivision; and which can be but a tota annihilation (Human Nature, pt. ii. § 1, Green's ed., pp. 334 seq.).

At first blush we are perhaps disposed to accept this account of our time-perception, as Wundt, e.g., does, and to regard the attribute of time as something wholly the result of after-reflection.2 But it may be doubted if this is really an exact analysis of the case.

1 To this rate the "indifference point" mentioned above is obscurely related. It has also been called "adequate time" or "optional time." It is, however, a tempo that varies with the subject-matter attended to; when effective attention is more difficult the tempo is slower than it is when to attend is easy.

2 Cf. Wundt, Logik, i. 432.

3 Granted that the impressions to which we chiefly attend are distinct and discontinuous in their location of the focus of consciousness, and that, so far, the most vivid element in our time-experience is discrete; granted further that in recollection and expectation such objects are still distinct—all which seems to imply that time is a mere meta—yet there is more behind. The duration of consciousness is not occupied by distinct objects, neither are the changes in this field discontinuous. The experimental facts above-mentioned illustrate the transition from a succession the members of which are distinctly attended to to one in which they are indiscriminately attended to, i.e., are not discontinuous enough to be separately distinguished. Attention does not move by hops from one definite spot to another, but is dealt himself more or less almost the same speed and concentration, like the foot of a small, which never leaves the surface of its traversing. We have a clear presentation discerned as A or B when attention is gathered up; and, when attention spreads out, we have confused presentations not admitting of recognition. But, though not recognizable, such confused presentations are represented, and so serve to bridge over the comparatively empty interval during which attention is unfocused. Thus our perception of a period of time is not comparable to so many terms in a series of finite units any more than it is to a series of infinitesimals. When attention is concentrated in expectation of some single impression, then, no doubt. It is brought to a very fine point ("zugespielt," as Herbert would say); and a succession of such impressions would be represented as relatively discrete compared with the representation of the scenery of a day-dream. But absolutely discrete it is not and cannot be conceived. At least, in respect to them, Locke's mysterious, treating of this subject from another point of view, remarks, "When the facts are contemplated objectively, it becomes manifest, that, though the changes constituting intelligence approach to a single substitution, yet they do not consist in a series of discrete repetitions, the attention given, &c. Familiarity of course implies previous learning and retaining; the first essential, therefore, in any attempt to study these processes from the beginning, is the exclusion of this factor. Accordingly Ebbinghaus, the pioneer in experiments of this kind,4 devised the new material, which is now regularly employed, namely, closed monosyllables, not themselves words, and strung together promiscuously into lines of fixed length so as never to form words: bam, rit, por, sig, nef, gud, &c., is an instance of such "senseless verses." With very slight attention most people would be able to reproduce one or two or three or four such syllables on a single trial, an entire series by greater concentration six or seven might be so reproduced. This maximum, called sometimes the "span of prehension," has been repeatedly made the subject of special inquiry. In idiots it is found, as might be expected, remarkably low; in school children it increases rapidly between the ages of eight and fourteen, and then remains almost stationary, individual differences being small compared with the striking differences that appear when longer lines make repetitions necessary.5 This comparatively constant span of prehension is doubtless

PSYCHOLOGY

memory and association]

closey connected with certain other psychical constants, such as the duration of the psychical present and of the primary memory-image, the tempo of movements of attention (§§ 28, 29), &c. There are isolated investigations of these several conditions, but the subject as a whole still awaits systematic treatment. That it is not wanting in interest is evident when we consider that if our span of prehension were enlarged, a corresponding increase in the variety and range of metre and rhyme in poetry, of phrase " in music, and of evolution in the dance would be possible. The limits at present imposed on these and like complexities find their ultimate explanation in the constants just mentioned.

With lines of greater length than seven syllables some repetition is requisite before they can be said correctly; the number of such repetitions was found by Ebbinghaus to increase very rapidly with the number of syllables to be learnt. In his own case, for lines of 12, 16, 24, 36 syllables the repetitions necessary were on the average 16-6, 30, 44, 55 respectively. Thus for a line exceeding in length that of the span of prehension only about five times, he required fifty-five times as many repetitions, if we may call the single presentation of the syllables a "repetition." Substituting poetry for gibberish of equal amount, Ebbinghaus found that one-tenth the number of repetitions sufficed; the enormous saving thus effected showing how numerous and intimate are the ready-made associations that "rhyme and reason" involve. But at one and the same time to memorize five verses even of sense requires more than five times as many repetitions as the memorizing of one. Two or three lines of inquiry here present themselves, e.g. (1) as to the comparative value of successive repetitions when several are taken together; (2) as to retention after an interval, as (a) a function of the number of repetitions previously made, and as (b) a function of the time; (3) as to the respective effects of more or less cumulating, or more or less distributing, the repetitions, on the number of these required.

1. It is at once obvious that beyond a certain point exhaustion of attention renders further repetition for a time futile; thus Ebbinghaus found 64 repetitions at one sitting of six 16-syllable nonsense verses, a task lasting some three-quarters of an hour, "was apt to bring on asthenia, a sort of epileptic aura, and the like." But keeping well within this heroic limit, a certain "law of diminishing return," to use an economic analogy, discloses itself. Thus taking a line of 10 syllables, the number of syllables reproduced correctly and in their proper order, after 1, 3, 6, 9 and 12 "repetitions," were 2-2, 2-5, 2-8, 3-4, 3-9 respectively, as the averages of a series of experiments with each of eight persons. The first repetition is undoubtedly the best, assuming, of course, that the subjects start with their attention fully concentrated. Some persons naturally do this, many do not; the experimenter has therefore to take special precautions to secure uniformity in this respect.

2. (a) On relearning a line after an interval of twenty-four hours there was an Ebbinghaus's case an average saving of one repetition for every three made the day before. A line of 16 syllables, for example, required some 30 repetitions, and could then be said off correctly. If only 8 repetitions were taken at first, the line being "under learnt," it probably appeared quite strange the next day, yet the proportional saving was no less; on the other hand, if an additional 30 repetitions followed immediately on the first, the line being "doubly learnt," in spite of the familiarity next day apparent, the proportional saving was no greater. The absolute saving would, of course, be less. We are so far led to infer that the stronger associations effected by many repetitions at one time fall off more rapidly than weaker associations effected by fewer repetitions in the same way. Herbart in his "psychical dynamics"—influenced probably by physiological analogies—speaks of the "sinking" or "inhibition" of presentations generally was proportional to their intensity: the less there was to sink, the slower the sinking became. Recent experiments certainly point in this direction. (b) As to retention as a function of the time—we all know that memories fade with time, but not at what precise rate. Ebbinghaus, by a series of prolonged experiments, ascertained the rate to be proportional to the logarithm of the time—a result already implied in that connecting retention and intensity; albeit in inquiries of this kind independent confirmation is always of value.

3. Had the proportional saving just described held good indefinitely, some 100 repetitions of the 16 syllables at one time should have dispensed with any further repetition twenty-four hours afterwards; whereas, in fact, this result seemed never attainable. Beyond a certain degree of accumulation, an ever-diminishing return was manifest, and that apparently short of the stage at which exhaustion of attention began to be felt. But, contrariwise, when the repetitions were distributed over several days, an ever-increasing efficiency was then the result. Thus, for Ebbinghaus, 36 repetitions spread over three days were as effective as 68 taken together. The results of careful experiments by Jost with two different subjects, using G. E. Müller's "method of telling," to be described later on, are still more conclusive. Comparing 8 repetitions on three successive days with 4 repetitions on six, and 2 on twelve, the efficiencies, tested twenty-four hours later, were respectively as 11-5, 35, and 54; and probably, as Jost surmises, the effect of the maximum distribution—single "repetition" on twenty-four successive days—would have been more advantageous still, securing in fact the superiority of a first impression (cf. 1, above) on every occasion. This result again, is in part explained by the law of sinking already found. For if the sinking were simply proportional to the time, or were independent of the intensity, there would so far be no reason why one mode of distributing a given number of repetitions should be more economical than another. There is, however, another reason for this superiority, less clearly implied, to which we shall come presently.

Invariably, and almost of necessity, a more or less complex rhythmical articulation becomes apparent as the syllables are repeated, even when—as in the improved methods of G. E. Müller and his collaborateurs—they are presented singly and at regular intervals. A series of twelve syllables, for example, would be connected into six trochees, with a caesura in the middle of the verse; while in each half of it the first and last accented syllables would be specially emphasized; thus:

In trying to suppress this tendency and to repeat the syllables in a monotonous, staccato fashion, just as they were presented, the tempo, though really unchanged, seemed to be distinctly quickened, a consequence, doubtless, of the greater effort involved. Moreover, the attempt, which was seldom successful, about doubled the number of repetitions required for learning off, thereby showing how much is gained by this psychical organization of disconnected material. But the gain thus ensured was manifest in other ways. Each foot, whether monosyllabic or trisyllabic, became a new complex unit, the elements to be considered in isolation being thereby reduced to a half or a third, and the whole line thus shortened. The varied intonation, again, helped to fix the place of each foot in the verse, thus further facilitating the mind's survey of the whole. Such a transformation can hardly be accounted for so long as retention and association are regarded as merely mechanical and passive processes.

Psychical rhythm, upon which we here touch, has also been experimentally investigated at great length, alike in its physiological
psychological and aesthetic aspects. The topic is far too intricate and unsettled for discussion here, but a few broad points may be noted.

We are not specially concerned with objective rhythms, recurring series of impressions—that is to say, in which there are actually periodic variations of intensity, interval and the like. What concerns us here is that which is really represented by the evoked series of sounds (or touches), qualitatively and quantitatively all alike, a series therefore devoid of all objective rhythm, is nevertheless apprehended as rhythmically grouped, provided the rate lies between the limits 1 and 11 (the range of the shortest possible Regular interval of touch). For instance, we may take to simple groups of two, replaced by groups of four or eight as the rate increases; groups of three and six also occur, though less frequently. The average duration of the groups, whether these are large or small, is comparatively measured only by a period of time exceeding one second. The subject usually keeps time by taps, nods, or other accompanying movements; the pulse and respiration are also rhythmically modified, and sometimes regularisation has been observed. The prime source of all psychical rhythm and of its manifold aesthetic effects. Some connection there is unquestionably. As the decimal system corresponds to our possession of ten fingers, and our movements to the structure of our limbs, so here we may assume that physiological processes fix the limits within which psychical rhythm is possible, but yet may be as little an adequate cause of it or its developments as fingers are of arithmetic, or legs of an Irish jig. In motor rhythm, such as the last, the initiative is partly psychical, and the respiratory and other periodic organic processes simply follow suit. And even sensory rhythms can often be varied at the subject's own choice, or on the suggestion of another; and then again, they may be performed in the same manner but with different effects. Familiar with the rules of such procedure are to be found in the " tunes " so readily attributed to the puff of a locomotive, to the churning of a steamer's screw, and to the strain of music, rhythm, the other and yet complex, may be contributed to the familiar attention or apperception, but the conditions determining it are many, and their relations very complex. If the presentations to be "rhythmized" (the rhythmisier, as the Germans say) succeed called the first rhythm (or one of the later ones) the "psychical present" tells one way: the first impression is below the threshold when the third appears. If they arrive rapidly, their intensity and duration and the span of prehension tell another way; for if they are retarding them individually, and only so can be gathered at once. But if the series continue long enough, or be frequently experienced, sub-groups may be treated as individuals; and then the facility to tell... the series into a number of groups may be admitted. In so far as attention itself there are phases, in so far as expectation involves preadjudgment to what is coming; usually the first members of a fact are predominant, and the rhythm tends to "fall"; several alternative solutions within a complex rhythmic whole are of course still compatible with this. But it is important to note that, whether simple or complex, the rhythm is an intuited unity as truly as a geometrical figure may be. Unlike its geometrical definition, however, it rarely or never has symmetry. We cannot reverse a tune and obtain an effect comparable with that obtained by reprinting backwards in line with the original. We now pass to a question in which the rhythm of the meaning of the words becomes apparent.

But first a new method of dealing with memory-problems must be mentioned, in which the connexion between rhythmizing and memory is frequently used to advantage. We have two sets of experiments这时候。Ebbinghaus consisted in ascertaining the repetitions saved in consequence of previous repetitions, when the reverse was learnt some fixed time later. Hence this method is called the learning method or the method of saving. When, a given time after a certain number of repetitions (say) in trochaic measure, the subject is confronted with one of the unaccented syllables and asked to name the unaccented syllable that belongs to it, he will answer sometimes rightly, sometimes wrongly, and sometimes be unable to answer at all. This, the new method is therefore named Trefler-methode, the method of "shots," or, let us say, the telling method. It enables the experimenter to measure far more effectively the size of the memory trace which was preserved beforehand for the "memorizing" as well as the "hits" are instructive. Moreover, by measuring the time of the element of memorizing and comparing the times together, much may be learned concerning the facilitation for, for example, the answers being quicker than in weaker or older ones.

Does association work forwards only or backwards also, as the middle link of a chain, when lifted, raises the contiguous links on either side of it? This is certainly not the case when the forward direction makes sense, but with nonsense verses, if the mechanical analogy is a sound one, such reversal is to be expected.

For here there are none of the obstructing associations which rhyme and reason imply. In learning a verse backwards Ebbinghaus found a saving of 12-4 % of the time originally taken up in learning it forwards. A saving almost as great (10-4 %) was effected by relearning a like verse forwards, but skipping one syllable: the order of syllables, that is to say, being 1, 2, 3, 5, etc. Thus the saving was even when learning backwards and skipping one syllable, Ebbinghaus found a saving of 5 %. But the number of his experiments (four) was too few to give this result much value, as he fully admits. These experiments as a whole, then, might incline us to suppose that association does work in both directions, though the connections backwards are considerably weaker. But if so the associations both ways should be alike at least in form—continuous, that is to say, backwards, d c b a, as well as forwards, a b c d. The facts at present available are, however, against this. In two or three hundred experiments by Müller and Pilzcker, verses of twelve syllables were repeated a set number of times in an anapause measure—accented, that is to say, on the 3rd, 6th, 9th and 12th. After a fixed interval the subject, confronted with one of the accented syllables, mentioned any of the other syllables which he called to mind. Now the cases in which the syllable immediately preceding was revived were only about half as frequent as those in which the syllable next but one preceding was revived; the time of telling (Trefferzeitig) for the latter was also shorter. This result is incompatible with the theory of continuous backward association, but it is readily explained by the fact that the group of three syllables had become one complete whole, and it shows that the tendency to restate the initial member of the group is stronger than that to restate the middle. The saving effected in Ebbinghaus's experiment is also thus explained. 

A somewhat paradoxical situation is brought to light when the method of saving and the method of telling are used together. In the experiments by Jost, mentioned above, the series of verses were repeated thirty times; after an interval of twenty-four hours one series was tested by the first method and the others by the second. Two new series were then taken: the first repeated four times, and after an interval of a minute tested by the first method; the other was then repeated in like manner, and tested after the same interval by the second method. The old series was found (by the method of saving) to require on an average 2-85 repetitions for relearning, and the new 0-6; yet on the method of telling, the new series yielded 2-7 "hits," with an average time of about 24 second for each, while the old yielded only 0-9 "hits," with an average time of 43 seconds for each. Thus one may be able to reproduce relatively little of a given subject-matter, and yet require only a few repetitions in order to learn it off anew; on the other hand, one may know relatively much, and still find many more repetitions requisite for such complete learning. The "age" of the associations is then important. Other things being equal, we may conclude that each fresh repetition effects more for old associations than for recent ones. It might be supposed that the strength of the old associations was more uniform and on the average greater than the strength of the new; so that while none of the old were far below the threshold, few, if any, were above it; whereas more of the new would be above the threshold though the majority had lapsed entirely. And the latter would certainly be the case if the subject of experiment tried to make sure of a few "hits," and paid no attention to the rest of the series. Due care was, however, taken that the ends of the experiment should not in this way be defeated. Also, there is ample evidence to show that the supposed greater uniformity in strength of old associations is not, in fact, the rule. We seem left, then, to conjecture that the difference is the effect of the process of assimilation working subconsciously—that psychical aspect of nervous growth which Professor James has aptly characterized by saying that "we learn to skate in summer and to swim in winter." It continually happens that we can recognize connexions that we are quite unable to reproduce. To the diminished "strength" of an association, as tested by the experiments above, there is also added an important factor, that of ambiguity.
method of telling, there may then quite well be an equivalent set-off in more developed assimilation. As a seed germinates it has less latent energy, but this is replaced by growth in root and stem; similar relations may obtain when an old association is said merely to lose "strength." On the other hand,—within the range of the primary memory-image—we can often reproduce what after a longer interval we should fail to recognize. We seem warranted, then, in concluding that this conception of "association-strength," so freely used by G. E. Müller and his co-workers, requires more analysis than it has yet received. The two factors which their methods disclose in it appear to confirm the distinction we have already made between impressions and free ideas. They help us also to understand, further, the superiority of direct training over accumulated repetition, of "inwardly digesting" over " cram."

Feeling.

31. Such summary survey as these limits allow of the more elementary facts of cognition is here at an end; so far the most conspicuous factors at work have been those of what might be termed the ideational mechanism. In the higher processes of thought we have to take more account of mental activity and of the part played by language. But it seems preferable, before entering upon this, to explore also the emotional and active constituents of mind in their more elementary phases.

In our preliminary survey we have seen that psychological life consists in the main of a continuous alternation of predominantly receptive and predominantly active states in consciousness. In its commonest form experience is simply an alternation of sensations and movement. At a later stage we find that in the receptive phase ideation is added to sensation; and that in the active phase thought and attention to voluntary manipulation and control of the ideational trains, are added to the voluntary manipulation and control of the muscles. At this higher level also it is possible that either form of receptive consciousness may lead to either form of active selection. We may thus regard any state of mind as active to the extent that it is action in another sense, and ideas apart from sensations may prompt to muscular exertion. There is a further complication still; not only may either sensations or ideas lead to either more or more gradual movements, but movements themselves, whether of mind or limb, may as mere presentations determine other movements of either kind. In this respect, however, movements and thoughts either in themselves or through their sensational and ideational accompaniments may be regarded as pertaining to the receptive side of consciousness. With these provisos, then, the broad generalization may hold that receptive states lead through feeling to active states, and that presentation itself may correspond with action. But first the objection must be met that presentations that are in themselves purely indifferent lead continually to very energetic action, often the promptest and most definite action. To this there is an answer, first, on the higher levels of psychological life presentations in themselves indifferent are often directly interesting as signs of, or as means to, other presentations that are more definitely active. This is the general statement of the principle that it may be admitted that all such indifferent presentations are without effect as often as they are not instrumental in furthering the realization of some desirable end. Secondly, a large class of movements, such as those called sensori-motor and ideo-motor, are initiated by presentations that are frequently, it must be allowed, neither pleasurable nor painful. In all such cases, however, there is probably only an apparent exception to the principle of subjective selection. They may all be regarded as instances of another important psychological principle which we shall have to deal with more fully by and by, viz. that voluntary actions, and especially those that are habitually performed, or habitually associated with pleasure-giving actions, tend at length, as the effect of habit in the individual and of heredity in the race, to become "secondarily automatic," as it has been called. Such mechanical or instinctive dexterities may or may not be the result of energy put into the performance of pleasurable and interesting experiences, and, like the rings of former growths in a tree, afford a basis for further advance, as old interests pall and new ones present themselves. Here, again, it suffices merely to point out that in general the claim made by psychologists is a fair claim in favour of supposing all such movements to have been originally initiated by feeling, as certainly very many of them were.

Of the feeling itself that intervenes between these sensory and motor presentations there is but little to be said. The chief points have been already insisted upon, viz. that it is not itself a presentation, but a purely subjective state, at once the effect of a change in receptive consciousness and the cause of a change in motor consciousness; hence its continual confusion either with the movements, whether ideational or muscular, that are its expression, or with the sensations or ideas that are its cause. For feeling as such is, so to put it, matter of being rather than of direct knowledge; and all that we know about it we know from its antecedents or consequents in presentation.

Pure feeling, then, ranging solely between the opposite extremes of pleasure and pain, we are naturally led to inquire whether there is any corresponding contrast in the causes of feeling on the one hand, and on the other in its manifestations and effects. To begin with the first question, which we may thus formulate: What, if any, are the variable differences characteristic of the presentations or states of mind we respectively like and dislike; or, taking account of the diverse sources of feeling—sensuous, aesthetic, intellectual, activity—is there anything that is especially alike of all that are pleasurable and deny of all that are painful, and vice versa? It is at once evident that at least in presentations objectively regarded no such common characters will be found; if we find them anywhere it must be in some relation to the conscious subject i.e. in, the fact of presentation itself. There is one important truth concerning pleasures and pains that may occur at once as an answer to our inquiry, and that is often advanced as such, viz. that whatever is pleasurable tends to further and perfect life, and whatever is painful to disturb or destroy it. The many seeming exceptions to this law of self-conservation, as it has been called, probably all admit of explanation in some way or another. In the case of the petrified truth unimpeached. But this law, however stated, is too teleological to serve as a purely psychological principle, and, as generally formulated and illustrated, it takes account of matters quite outside the psychologist's ken. We are not now concerned to know why a bitter taste e.g. is painful or the gratification of an appetite unpleasant, but what marks distinctive of all painful presentations the one has and the other lacks. From a biological standpoint it may be true enough that the final cause of sexual and parental feelings is the perpetuation of the species; but this does not help us to ascertain what common character they have as actual sources of feeling for the individual. From the biological standpoint again, even the senile decadence and death of the individual may be shown to be advantageous to the race; but it would certainly be odd to describe this as advantageous to the individual; so different are the two points of view. What we are in search of, although a generalization, has reference to something much more concrete than concepts like race or life, and does not require us to go beyond the consciousness of the moment to such ulterior facts as they imply.

Were it possible it would be quite unnecessary to examine in detail every variety of pleasurable and painful consciousness in connexion with a general inquiry of this sort. It will be best to enumerate at the outset the only cases that specially call for investigation. Feeling may arise mainly from (a) single sensations or movements, including in these what recent psychologists call their "tone; or it may be chiefly determined by (b) some combination or arrangement of these primary presentations—hence what might be styled the lower aesthetic feelings. We have thus among primary presentations a more material and a more formal cause or ground of feeling. The mere representation of these sources of feeling involves nothing of moment: the idea of a bright colour or a bitter taste has not definiteness or intensity enough to produce feeling; and the ideal presentation of a harmonious arrangement of sounds or colours does not in itself differ essentially as regards the feeling it occasions from the actual presentation. When we advance to the level at which there occur ideas more complex and more highly representative— or representative, as Mr Spencer would say—than any we have yet considered we can again distinguish between material and formal grounds of feeling. To the first we might refer, e.g. (c) the intellectual and (d) the higher aesthetic feelings, is psychologically more important. There is a special class of

1 See Spencer, Data of Ethics, chs. i.-iv.; G. H. Schneider, Freude und Leid des Menschenlebens, ch. i.
feelings, which might be distinguished from all the preceding as reflex, since they arise from the memory or expectation of feelings but in fact these are largely involved in all the higher feelings, and this brief reference to them will suffice: of such hope, fear, regret are examples.

a. The quality and intensity as well as the duration and frequency of the sensations or movements will have to do with Sensations and Movements. Apart from these, the pleasantness or painfulness of a movement appears to depend solely upon its intensity, that is to say, upon the amount of effort necessary to effect it, in such wise that a certain amount of exertion is agreeable and any excess disagreeable. Some sensations also, such as those of light and sound, are agreeable if not too intense, their pleasantness increasing with their intensity up to a certain point, on nearing which the feeling rapidly changes and becomes disagreeable or even painful. Other sensations, as bitter tastes, e.g., are naturally unpleasant, however faint—though we must allow the possibility of an acquired liking for moderately bitter or pungent flavours. But in every case such sensations produce unmistakable manifestations of disgust, if at all intense. Sweet tastes, on the other hand, however intense, are pleasant to an unspoiled palate, though apt before long to become mawkish, like “sweetest honey, loathsome in his own deliciousness,” as confectioners’ apprentices are said soon to find. The painfulness of all painful sensations or movements increases with their intensity without any assignable maximum being reached. A comparison of examples of this kind, which it would be tedious to describe more fully and which are indeed too familiar to need much description, seems to show (1) that, so far as feeling is determined by the intensity of a presentation, there is pleasure so long as attention can be adapted or accommodated to the presentation, and pain so soon as the intensity is too great for this; and (2) that, so far as feeling is determined by the quality of a presentation, those that are pleasant enlarge the field of consciousness and introduce or agreeably increase in intensity certain organic sensations, while those that are painful contract the field of consciousness and introduce or disagreeably increase in intensity certain organic sensations. There are certain other hedonic effects due to quality, the examination of which we must for the present defer. Meanwhile as to the first point it may be suggested, as at any rate a working hypothesis, that in itself any and every simple sensation or movement is pleasurable if there is attention forthcoming adequate to its intensity. In the earliest and simplest phases of life, in which the presentation-continuum is but little differentiated, it is reasonable to suppose that variation in the intensity of presentation preponderates over changes in the quality of presentation, and that to the same extent feeling is determined by the former and not by the latter. And, whereas this dependence on intensity is inviable, there is no ground for supposing the quality of any primary presentation, when not of excessive intensity, to be locationally disagreeable; the changes above-mentioned in the hedonic effects of bitter tastes, sweet tastes, or the like tend rather to prove the contrary. This brings us to the second point, and it requires some elucidation. We need here to call to mind the continuity of our presentations and especially the existence of a background of organic sensations or somatic consciousness, as it is variously termed. By the time that qualitatively distinct presentations have been differentiated from this common basis it becomes possible for any of these, without having the intensity requisite to affect feeling directly, to change it indirectly by means of the subjective sensations or movements, and so alter their tone. The physiological concomitants of these changes of somatic tone are largely reflex movements or equivalents of movements, such as alterations in circulatory, respiratory and excretory processes. Such movements are psychologically movements no longer, and are rightly regarded as pertaining wholly to the sensory division of presentations. But originally it may have been otherwise. To us now, these organic reflexes seem but part and parcel of the special sensation whose tone they form, and which they accompany even when that sensation, so far as its mere intensity goes, might be deemed indifferent. But perhaps at first the special qualities that are now throughout unpleasant may have been always presented with an excessive intensity that would be painful on this score alone, and the reflexes that at present pertain to them may then have been paid more attention by the person in any case, in any way. It is manifestly unfair to refuse either to seek out the present reflexes of the sensations in question and allow for the workings of heredity, or to reckon this accompanying systematic feeling as part of them. The latter seems the reader and perhaps, too, the preferable course. A word will now suffice to explain what is meant by enlarging and contracting the field of consciousness and agreeably increasing or decreasing certain elements therein.

The difference in point is manifest on comparing the flow of spirits, buoyancy and animation which result from a certain duration of pleasurable sensations with the lowness or depression of spirits, the gloom and heaviness of heart, apt to ensue from prolonged physical pain. Common language, in fact, leaves us no choice but to describe these contrasted states by figures which clearly imply that they differ in the range and variety of the presentations that make up consciousness, and in the quickness with which these succeed each other. It is not merely that in hilarity as contrasted with dejection the train of ideas takes a wider sweep and shows greater liveliness, but as it were at the back of this, on the lower level of purely sensory experience, certain organic sensations which are ordinarily indifferent acquire a gentle intensity, which seems by flowing over to quicken and expand the ideational stream as we see, for instance, in the effects of mountain air and sunshine. Or, on the other hand, these sensations become so violently intense as to drain off and ingulf all available energy in one monotonous corroding care, an oppressive weight which leaves no space for free movement, no life or leisure to respond to what are wont to be pleasurable solicitations.

As regards the duration and the frequency of presentation, it is in general true that the hedonic effect soon attains its maximum, and then, if pleasant, rapidly declines, or even changes to its opposite. Pains in like manner decline, but more slowly and without in the same sense changing to pleasures. The like holds of too frequent repetition. Physiological explanation of the facts is as good as far as it goes. It is, of course, at once forthcoming: sensibility is blunted, time is required for restoration, and so forth; but at least we want the psychological equivalent of all this. In one respect we find nothing materially new; so much has been done in account for it.

1 In the lowly organisms that absorb food directly through the skin such bitter juices as exist naturally might at once produce very violent effects—comparable, say, to scalding; and the reflexes then set up might well be contented with no other result than to save from poisoning the higher organisms, whose absorbent surfaces are internal and only guarded in this way by the organ of taste. Some light is thrown on questions of this kind by the very interesting experiments of Dr Romanes; for a general account of these see his Jelly-fish, Star-fish, and Sea-urchins, ch. ix.

2 This is one among many cases in which the study of a vocabulary is full of instruction to the psychologist. The reader who will be at the trouble to compare the parallel columns under the headings “Passive Affections,” in Roger’s Thesaurus of English Words and Phrases, will find ample proof both of this general statement and of the truth above is.

3 Observation and experiment show that the physical signs of pain in the higher animals consist in such changes as a lowered and weaker pulse, reduction of the surface temperature, quickened respiration, and other changes, and that these signs are distinct from those of pleasure or of delight. In the latter case the animal feels as if it saw a file of figures of movements of flexion, as if the animal would see rendre plus petit, et offrir moins de surface à la douleur. Il est intéressant de remarquer que, pour l’homme, le mouvement général de flexion des animaux, il est une des particularités du mouvement général de flexion et d’extension répondant aux sentiments différents de plaisir et de la douleur. Le plaisir répond à un mouvement d’épanonnissement, de dilatation, d’extension, la douleur, au contraire, est le mouvement de flexion et de contraction. (C. Richet, L’Homme et l’Intelligence, la douleur, p. 9).
far as continued presentation entails diminished intensity we have nothing but diminished feeling as a consequence; so far as its continued presentation entails saticy the train of agreeable accompaniments ceases in which the pleasurable tone consisted. But in another way long duration and frequent repetition produce indirectly certain characteristic effects on feeling in consequence of habituation and accommodation. We may get used to a painful presentation in such wise that we cease to be conscious of it as positively disagreeable, though its cessation is at once a source of pleasure; in like manner we come to require things simply because it is painful to be without them, although their possession has long ceased to be a ground of positive enjoyment. This loss (or gain) consequent on accommodation has a most important effect in changing the sources of feeling; it helps to transfer attention from mere sensations to what we may distinguish as interests.

b. Certain sensations or movements not separately unpleasant become so when presented together or in immediate succession; and contrariwise, both is quotations sensations once Cf. e.g. like common comment, certain Harmony, is, steps, of Ruskin that tones, of positive is consequence it. Thismoment, we have also a striking proof in the case with which rhythmic language is retained. (ii.) As instances of the former may be mentioned the pleasurableness of a rhythmic succession of sounds or movements, of symmetrical forms and curved outlines, of gentle crescendos and diminuendos in sound, and of gradual variations of shade in colour, and the painfulness of flickering lights, “beats” in musical notes, false time, false steps, false quantities, and the like. In all these, whenever the result is pleasurable, attention can be readily accommodated—
is, so to say, economically meted out; and, whenever the result is painful, attention is surprised, balked, wasted. Thus we can make more movements and with less expenditure of energy when they are rhythmic than when they are not, as the performances of a ball-room or of troops marching to music amply testify. Of this economy we must be taken to have a different meaning in the two cases. When two or three tones harmonize there results, as is well known, a distinct pleasure over and above any pleasure due to the tones themselves. On the other hand, tones that are discordant are unpleasant in spite of any pleasantness they may have singly. Besides the negative condition of absence of beats, a musical interval to be pleasant must fulfill certain positive conditions, sufficiently expressed for our purpose by saying that two tones are pleasant when they give rise to few combination-tones, and when among these there are several that coincide, and that they are unpleasant when they give rise to many combination-tones, and when among these there are few or none that coincide. Too many tones together prevent any from being distinct. But where tones coincide the number of painful sensations produced is less than the number of possible tones, and there is a proportionate multiplication of reflected ones. But more is commanded and with less effort. An ingenious writer1 on harmony, in fact, compares the confusion of a discord to that of “trying to reckon up a sum in one’s head and failing because the numbers are too high.” A different explanation must be given of the so-called harmonies of colour. The pleasurable effect of gradations of colour or shade—to which, as Ruskin tells us, the rose owes its victorious beauty when compared with other flowers—has been already mentioned: it is rather a quantitative than a qualitative effect. What we are

1 It has been definitely formulated, but in physiological language, by Bain as the Law of Novelty: “No second occurrence of any previous sense or the mere reproduction thereof, however, without the least change or improvement, is ever fully equal to the first, notwithstanding that full time has been given for the nerves to recover from their exhaustion” (Mind and Body, p. 51). Cf. also his Emotions and Will, 3rd ed., p. 83.

2 Freyer, Aesthetische Untersuchungen, p. 59
d. Closely related to these formal intellectual feelings are certain of the higher aesthetic feelings. A reference to some of the commonplaces of aesthetic writers may be sufficient briefly to exhibit the leading characteristics of these feelings. There is a wide agreement among men in general as to what is beautiful and what is not that it is the business of a treatise on empirical aesthetics from an analysis of these matters of fact to generalize the principles of taste—to do, in fact, for one source of pleasure and pain what we are here attempting in a meagre fashion for all. And these principles are the more important in their bearing upon the larger psychological question, because among aesthetic effects are reckoned only such as are pleasing or otherwise in themselves, apart from all recognition of utility, of possession, or of ulterior gratification of any kind whatever. Thus, if it should be objected that the intellectual satisfaction of consistency is really due to it that, in fact, to the fact that what is incompatible and incomprehensible is of no avail for practical guidance, at least this objection will not hold against the aesthetic principle of unity in variety. In accordance with this primary maxim of art criticism, at the one extreme art productions are condemned for monotony, as incapable of sustaining interest because "empty," "bald" and "poor"; at the other extreme they are condemned as too incoherent and disconnected to furnish a centre of interest. And those are held as so far praiseworthy in which a variety of elements, be they movements, forms, colours or incidents, instead of conflicting, all unite to enhance each other and form not merely a mass but a whole. If this principle that serves to throw light on our inquiry is that which has been called the principle of economy, viz. that an effect is pleasing in proportion as it is attained by little effort and simple means.

The brothers Weber in their classic work on human locomotion discovered that those movements which are aesthetically beautiful are also physiologically correct; grace and ease, in fact, are well-nigh synonymous, as Herbert Spencer points out, and illustrates by apt instances of graceful attitudes, motions and forms. The same writer,

again, in seeking for a more general law underlying the current maxims of writers on composition and rhetoric is led to a special formulation of this principle as applied to style, viz. that "economy of the recipient's attention is the secret of effect."

Perhaps of all aesthetic principles the most wide-reaching, as well as practically the most important, is that which explains aesthetic effects by association. Thus, to take one example where so many are possible, the croaking of frogs and the monotonous ditty of the cuckoo owe their pleasantness, not directly to what they are in themselves, but entirely to their intimate association with spring-time and its gladness. At first it might seem, therefore, that in this principle there is nothing fresh that is relevant to our present inquiry, since a pleasure that is only due to association at once carries back the question to its sources; so that, for example, if pleasant we should return to old ground. But this is not altogether true; aesthetic effects call up not merely ideas but ideals. A great work of art improves upon the real in two respects: it intensifies and it transfigures. It is for art to gather into one focus, cleared from dross and commonplace, the genial memories of a lifetime, the instinctive memories of a race; and, where theory can only classify and arrange what it receives, art—in a measure free from the "literal unities of time and place"—creates and glorifies. Still art eschews the abstract and speculative; however plastic in its hands, the material wrought is always that of sense. We have already noticed more than once the power which primary presentations have to sustain vivid re-presentations, and the bearing of this on the aesthetic effects of works of art must be straightforward obvious. The notes and colours, rhymes and rhythms, forms and movements, which produce the lower aesthetic feelings also serve as the means of bringing into view, and maintaining at a higher level of vividness, a wider range and flow of pleasing ideas than we can ordinarily command.

When we reach the level at which there is distinct self-consciousness (cf. § 44), we have an important class of feelings determined by the relation of the presentation of self to the other contents of consciousness. As the knowledge of other selves advances pari passu with that of one's own self, so along with the egoistic feelings appear certain social or altruistic feelings. The two have much in common; in pride and shame, for example, account is taken of the estimate other persons form of us and of our regard for them; while, on the other hand, we admire or despise, congratulate or pity another, we have always present to our mind a more or less definite conception of self in like circumstances. It will therefore amply serve all the ends of our present inquiry if we briefly survey the leading characteristics of some contrasted egoistic feelings, such as self-complacency and disappointment. When a man is pleased with himself, his achievements, possessions or circumstances, such pleasure is the result of a comparison of his present position in this respect with some former position or with the position of someone else. Without descending to details, we may say that two prospects are before him, and the larger and fairer is recognized as his own. Under disappointment or reverse the same two pictures may be present to his mind, but accompanied by the certainty that the better is not his or is his no more. So far, then, it might be said the contents of his consciousness is that in each case the same, the whole difference lying in the different relationship to self. But this makes all the difference even to the contents of his consciousness, as we shall at once see if we consider its active side. Even the idler and most thoughtless mind teems with intentions and expectations, and in its prosperity, like the fool in the parable, thinks to pull down its barns and build greater, to take its ease, eat, drink and be merry. The support of all this pleasing show and these far-reaching aims is, not the bare knowledge of what abundance will do, but the reflection—These many goods are mine. In mind alone final causes have a place, and the end can produce the beginning; the prospect of a summer makes the present into spring. But action is paralyzed or impossible when the means evade us. In so far as a man's life consists in the abundance of the things he possesseth, we see then why it dwindles with these. The like holds where self-complacency or discomplacency rests on a sense of personal worth or on the honour or affection of others.

32. We are now at the end of our survey of certain typical pleasurable and painful states. The answer to our inquiry which it seems to suggest is that there is pleasure in proportion as a maximum of attention is effectively exercised, and pain in proportion as such effective attention is frustrated by distractions, shocks, or incomplete and faulty adaptations, or falls of exercise, owing to the narrowness of the field of consciousness and the slowness and smallness of its changes. Something must be said in explication of this formula, and certain objections that might be made to it must be considered. First of all it implies that feeling is determined partly by quantitative, or, as we might say, material conditions, and partly by conditions that are formal or qualitative. As regards the former, both the intensity or concentration of attention and its diffusion or the extent of the field of consciousness have to be taken into account. Attention, whatever else it is, is a limited quantity.

Pluribus intentus minor est ad singula sensus—
to quote Hamilton's pet adage. Moreover, as we have seen, attention requires time. If, then, attention be distributed over too wide a field, there is a corresponding loss of intensity, and so of distinctness: we tend towards a succession of indistinguishables—indistinguishable, therefore, from no succession. We must not have more presentations in the field of consciousness than will allow of some concentration of attention: a maximum diffusion will not do. A maximum concentration, in like manner—even if there were no other objection to it—

1 Cf. Fechner, Vorschule der Ästhetik, ii, 263. Fechner's full style for it is "Prinzip der ökonomischen Verwendung der Mittel oder des Kleinesten Kraftmassen."
2 Essays, Scientifique, Political and Speculative, vol. ii., Ess. I and VIII.
would seem to conflict with the general conditions of consciousness, inasmuch as a single simple presentation, however intense, would admit of no differentiation, and any complex presentation is in some sort a plurality. The most effective attention, then, as regards its quantitative conditions, must lie somewhere between the two zeros of complete indifference and complete absorption. If there is an excess of diffusion, effective attention will increase up to a certain point as concentration increases, but beyond that point will decrease if this intensification continues to increase; and vice versa, if there be an excess of concentration. But, inasmuch as these quantitative conditions involve a plurality of distinguishable presentations or changes in consciousness, the way is open for formal conditions as well. Since different presentations consort differently when above the threshold of consciousness together, one field may be wider and yet as intense as another, or intenser and yet as wide, owing to a more advantageous arrangement of its constituents.¹

The doctrine here developed, viz., that feeling depends on efficiency, is in the main as old as Aristotle; all that has been done is to give it a more accurately psychological expression, and to free it from the implications of intuitionism, in which form it was expounded by Hamilton. Of possible objections there are at least two that we must anticipate, and the consideration of which will help to make the general view clearer. First, it may be urged that, according to this view, it ought to be one continuous pain to fall asleep, since in this state consciousness is rapidly restricted both as to intensity and range. This statement is entirely true as regards the intensity and substantially true as regards the range, at least of the higher consciousness: certain massive and agreeable organic sensations pertain to falling asleep, but the variety of presentations at all events grows less. But then the capacity to attend is also rapidly declining; even slight intruding sensation entails an acute sense of strain in one sense, in place of the massive pressure of repose throughout; and any voluntary concentration either in order to move or to think involves a like organic conflict, futile effort, and arrest of halmy case. There is as regards the more definite constituents of the field of consciousness a close resemblance between natural sleepiness and the state of monotonous humdrum we call tiredness or ennui; and yet the very same excitement that would relieve the one by dissipating the weariness of inaction would disturb the other by renewing the weariness of action: the one is commensurate with the resources of the moment, the other is not. This is the clearest and effective way for us to experience Aristotle would say, a maximum "relative to us." It is possible, therefore, that a change from a wider to a narrower field of consciousness may be a pleasurable change, if attention is more effectively engaged. Strictly speaking, however, the so-called negative pleasures of rest do not consist in a mere narrowing of the field of consciousness so much as in a change in the amount of concentration. Massive organic sensations connected with restoration take the place of the comparatively acute sensations of jaded powers forced to work. We have, then, in all cases to bear in mind this subjective relativity of all pleasurable or painful states of consciousness.

But there is still another and more serious difficulty to face. It has long been a burning question with theoretical moralists whether pleasures differ only quantitatively or differ qualitatively as well, whether psycho-Differ Qualitatively?

²

¹

Although it is impossible to say that any distinguishable presentation is absolutely simple, the hypothesis of sub-consciousness would leave us free to assume that any pleasantness or unpleasantness that cannot be explained on the score of intensity is due to some obscure harmony or discord, compatibility or incompatibility, of elements not separately discernible. But this, though tempting, is not really a very coherent hypothesis; if a particular presentation is pleasant or painful in such wise as to lead to a redistribution of attention, it is reasonable to look for an explanation primarily in its conjunction with other presentations; of consciousness. Moreover, it is possible, since what takes place in sub-consciousness can only be explained in analogy with what takes place in consciousness—that, if we have an inexplicable in the one, we must have a corresponding inexplicable in the other—that we can say about feelings expressed by what is in consciousness, we should be forced to admit that some presentations are unpleasant simply because they are unpleasant—an inexplicability which the hypothesis of sub-consciousness might push further back but would not remove.
34. We now pass from the causes of feeling to its effects. We have assumed (§ 7) that the simplest and earliest of these effects are to be found in the various bodily movements commonly described as the expression or manifestation of emotion. But in a notorious article, entitled "What is an Emotion?" Professor James attempted to turn this, the common-sense position, upside down. Before proceeding we must, therefore, examine his alternative theory: "Common sense says: we lose our fortune, are sorry and weep; we meet a bear, are frightened and run; we are insulted by a rival, are angry and strike." But, Professor James continues, "the hypothesis here to be defended says that this order of sequence is incorrect: that the one mental state is not immediately induced by the other; that the bodily manifestations must first be interposed between, and that the more rational statement is that we feel sorry because we cry, angry because we strike, afraid because we tremble, and not that we cry, strike or tremble because we are sorry, angry or fearful, as the case may be." In a word, whereas it is commonly supposed that the emotion precedes and produces the expression, it seems here to be maintained that the expression precedes and produces the emotion. But the sequence denied in the first case is a psychological sequence, the sequence maintained in the second is a physiological sequence. The subject's experiences of the bodily expressions is here the emotion, and these are physically, not psychically, determined.

"They are sensational processes," says Professor James; "processes due to inward currents set up by physical happenings."

The new theory is, then, in part psychological, in part psychophysical. As to the first part, which the author calls "the vital point of the whole theory," it consists mainly in exposing the ambiguity of the phrase "bodily expression of an emotion"—a phrase which is liable to mislead us into fancying that emotion, like thought, may be antecedent to, or independent of, any expression or utterance. My fear or anger may chance to be expressive to another, but they are of necessity impressed to me. "A disembodied human emotion is a sheer nonentity." In so far as I have a certain emotion, in so far I have "the feelings of its bodily symptoms." This is true, but to say it is true, but how do these symptoms arise? With this question we pass to the psychophysical side of the theory, and here it becomes perplexing, and is itself perplexed; for to this question it is driven to return two distinct and divergent answers. First, we are told that it is not the emotion that gives rise to the bodily expression, but that, on the contrary, "the bodily changes follow directly the perception of the existing fact," it being beyond doubt "that objects do excite bodily changes by a preorganized mechanism." Again: "Each emotion is, for Professor James, "a resultant of a sum of elements, and the mechanism is caused by a physiological process of a sort already well known. The elements are all organic changes, and each of them is the reflex effect of the existing object." The old attempts at classification and description being contemptuously dismissed as belonging only to "the lowest stage of science," we are informed that now we step from a superficial to a deep order of inquiry. "The questions now are causal: 'Just what changes does this object and what changes does that object excite? and 'How come they to excite these particular changes, and not others?'" But we have not had to wait for the James-Lange theory to raise these questions, and the reason there is nothing to bring out its defects more glaringly. "Objects" that determine bodily changes are "the reflexes of preorganized mechanism and without psychical interposition might fairly be taken to be physical objects; and indeed the whole process is expressly described as reflex. But only very slovenly physiologists talk of "objects" exciting reflexes: it is inexact even to say that sensations do so. All that reflex action requires is a stimulus. "The essence of a reflex action," says Foster, "consists in the transmutation, by means of the irritable protoplasm of a nerve-cell, of afferent into efferent impulses." Let Professor James be confronted first by a loaded bear and next by a bear at large: that is, the first he presents a bun, and to the other a clean pair of heels; or let him first be thrilled by a Beethoven symphony and then by a Raphael Madonna. Will he now undertake to account, in terms of stimuli and their reflex effects, for the very different results of the similar "causes" in the one case, or for the similar results of the very different "causes" in the other? Such a challenge would certainly be declined, and Professor James would remind us that in his nomenclature "it is the total situation on which the reaction of the subject is made." But there is just a world of difference between an object=stimulus transformed by preorganized mechanism into an efferent discharge, and an object=total situation to which the subject reacts. The attempt to explain emotion causally on the lines of the former meaning lands us in the conscious automaton theory, with which we must deal presently; this Professor James rejects. The latter meaning, on the other hand, involves the recognition of the subject's attitude as essential to the reaction, and of this as determined by pleasure, pain or some "interest" resting ultimately on these. Such, with scarcely an exception, has always been, and still remains, the analysis of emotion in vogue among psychologists. It brings to the fore a new category, that of things which we value solely extrinsically to the psychologistic's domain, and repugnant to the mechanical analogies which are there in place. No doubt such a concept is attained only by reflexion, but the experiences from which it is drawn, the affective states and the conative tendencies of the subject experiencing, must have preceded. From this central standpoint alone the objective situation has a worth which explains the subject's attitude, and here alone can we find the clue which

In this reply to criticisms Professor James is supposed to have modified his views: it would be nearer the truth to say that he has made admissions incompatible with them.
EMOTIONAL ACTION

PSYCHOLOGY

will enable us to answer the questions of cause that Professor James propounds.

The experimental investigations of Mosso, Fére, Lehmann, and others have shown that the vasomotor and such like bodily changes are sometimes present in emotion which are present also to some extent in all forms of conscious activity. The more unwanted and interesting the situation, the more diffused movements predominate over movements that are purposive; the further increased, the less the cognitive and reactive activity is advanced, the more diffusion is replaced by restriction and adaptation. But we are not warranted in separating these factors of voluntary activity into distinct processes, as the physiologist, for example, in his experiments on sensations of pain, blind and unstripped muscle. Unless we are prepared to treat all activity as reflex—as the physiologist may quite well do, if he keep strictly to his own point of view—that is, the reflex-like movements of emotion seem as much organic sensation with which purposive movement has nothing to do. No doubt this connexion of vegetal and animal functions remains one of the obscurest in all psycho-biology, though its telological fitness is obvious enough.

Nevertheless, Professor James's main position is that an emotion is but a sum of organic sensations; and in order to establish this he led to the second and very different statement which we have now to examine. Here, so far from suggesting inquiries as to the "objects" that excite emotion, his point is to maintain that in so far as the bodily cause is set up, be the means what they may, it is the emotion's present.1 And here, at length, the contention is explicit. Emotions are a certain complex of organic sensations, and such complexes are emotions; the two are not merely coexistent, they are identical. The excitable object is thus, after all, an organism. It is true that the organism in emotional excitement is more sensitive to the emotions. It cannot be psychological, "the total situation for the reacting subject," for in this sense the emotion, it is maintained, may be "objectless." In support of his position Professor James first of all cites pathological cases of such objectless emotion. He next follows up these with accounts of other cases in which emotional apathy seemed to keep pace with sensory anesthesia, arguing that, according to his theory, a subject absolutely anaesthetic should also be incapable of emotion, although "as emotions objects might evoke the usual bodily expression from him." Whether any testimony from lunatics, hypnotics and other minds diseased and disordered can establish this science inquires in vain: it is evident that the evidence far adduced is insufficient, Professor James himself seems to allow. There are some four or five of the apathetic cases altogether: three of them are regarded by the mental pathologist who describes them as adherent to Professor James's theory.2 Of the fourth case, reported by a pathologist on Professor James's side, the latter himself candidly observes, "We must remember that the patient's inactivity may have been caused as a direct result with anesthesia of his neural lesions, and not the anesthesia's mere effect." This missing link in the argument is supplied by the experiments of Professor Sherrington, and these show conclusively that the emotional states are parallel although with complete visceral anesthesia. As to emotions, the excitement induced by intoxication disease, and so far groundless, the most that can safely be said is that the object may be vague, ill-defined and shifting, but not objectless. As for the behavior of physical depression or irritability readily aroused by association appropriate troupes of imagery; only when they fail of this are we entitled to say that there is no object, and then we must add that there is also no emotion.

Emotional and Conative Action.

35. As in dealing with the causes of feeling, so we may now in like manner proceed to inquire whether in its manifestations or effects there is any contrast corresponding to the opposing extremes of pleasure and pain. We have already seen reasons for dismissing reflex movements or movements not determined by feeling as psychologically secondary, the effects of habit and heredity, and for regarding those diffuse movements that are immediately expressive of feeling as primordial—such movements as are strictly purposive being gradually selected or elaborated from them. But some distinctly reflex, and involving the movements of emotion; for there is more in these than the direct effect of feeling regarded as merely pleasure or pain. It has been usual with psychologists to confound emotions with feeling, because intense feeling is essential to emotion. But, strictly speaking, a state of emotion is a complete state of mind, a psychosis, and not a psychical element, if we may so say. Thus in anger we have over and above pain a more or less definite object as its cause, and a certain characteristic reactive display—frowns, compressed lips, erect head, clenched fists, in a word, the combative attitude—as its effect, a similarity of other emotions; so that generally in the particular movements indicative of particular emotions the primary and primitive effects of feeling are overlaid by what Darwin has called serviceable associated habits. The purposive actions of an earlier stage of development become, though somewhat atrophied as it were, the emotive outlet of a later stage: in the circumstances in which our ancestors worried their enemies we only show our teeth. We must, therefore, leave aside the more complex emotional manifestations and look only to the simplest effects of pleasure and of pain, if we are to discover any fundamental of contrast between them.4

Joy finds expression in dancing, clapping the hands and meaningless laughter, and these actions are not only pleasureable in themselves but such as increase the existing pleasure. Attention is not drafted off or diverted; but rather the available resources seem reinforced, so that the old expenditure is supported as well as the new. To the pleasure on the active side is added pleasure on the active side. The violent contortions due to pain, on the other hand, are painful in themselves, though less intense than the pains from which they withdraw attention; they are but counter-irritants that arrest or inhibit still more painful thoughts or sensations. Thus according to Darwin, "sailors who have to be flogged sometimes take a piece of lead into their mouths in order to bite it with their utmost force, and thus to bear the pain." When in this way we take account of the immediate effects as well as of the causes of feeling, we find it still more strikingly true that only in pleasureable states are there an efficient expenditure of attention. It is needless now to dwell upon this point, although any earlier mention of it would have been in place. But we should fail to realize the contrast between the motor effects of pleasure and of pain if we merely regarded them as cases of diffusion. The intensity the feeling the intensity the reaction, no doubt, whether it be smiles or tears, jumping for joy, or writhing in agony; but in the movements consequent upon pleasure the diffusion is the result of mere exuberance, an overflow of good spirits, as we sometimes say, and these movements, as already remarked, are always comparatively purposeless or playful. Even the earliest expressions of pain, on the contrary, seem but so many efforts to escape from the cause of it; in them there is at least the blind purpose to flee from a definite ill, but in pleasure only the enjoyment of present fortune.

From Plato downwards psychologists and moralists have been fond of discussing the relation of pleasure and pain. It has been maintained that pain is the first and most fundamental fact, and pleasure nothing but relief from pain; and, again, on the other side, that pleasure is prior and positive, and pain only the negation of pleasure. So far as the mere change goes, it is obviously true that the diminution of pain is pro tanto pleasant; and the diminution of pleasure pro tanto unpleasant; and if relativity had the unlimited range sometimes assigned to it this would be all we need say. But we can form a judgment of a comparatively fixed neutral state, deviations from which, of comparatively short duration and of sufficient intensity, constitute distinct states of pleasure or pain. Such states, if not of less intensity, may then be further diminished without reversing it.

1 Text-Book of Psychology (1890), p. 383.
2 G. H. J. Berkley, 'Two Cases of General Cutaneous and Sensory Anaesthesia without marked Psychical Implications,' Brain (1891), iv, 175.
4 Of the three principles Darwin advances in explanation of emotional expression which that he places last—perhaps because it is the last to emerge—this definition of the serviceable associated habits is physiologically more fundamental than the more striking principle of serviceable associated habits which he places first; indeed the following, which is his statement of it, implies as much: "Certain movements of which we recognize as expressive of certain states of mind are the direct result of the constitution of the nervous system, and have been from the first independent of the will, and to a large extent the expression of action."—Expression of the Emotions, p. 66—. It is in illustration of this principle too that Darwin describes the movements expressive of joy and grief, emotions which in some form or other are surely the most primitive of any.
their pleasurable or painful character. The turning-point here implied may, of course, gradually change too—as a result, in fact, of the law of accommodation. Thus a long run of pleasure would raise the threshold, and vice versa; which—to the small extent to which accommodation to pain is possible—a continuance of the habit would lower it. But such admissio makes no material difference where the actual feeling of the moment is alone concerned and retrospect out of the question. Here the notion of equilibrium becomes, therefore, most reasonable to regard pleasure and pain as emerging out of a natural state, which is prior to and distinct from both—not a state of absolute indifference, but of simple contentment, marked by no special activity. But it is by reference to such state of equilibrium alone—a state which we see most clearly the superior volitional efficacy of pain upon which psychomists love to descent. "Nobody," says Von Hartmann, "who had to choose between no taste at all for ten minutes of five minutes of a pleasant taste and the intake of an unpleasant taste, would prefer the last." Most men and all the lower animals are content to let well alone.

To ascertain the origin and progress of purposive action it seems, then, that we must look to the effects of pain rather than to those of pleasure. It is true that psychologists do not infrequently describe the earliest purposive movements as appetite; or at least they treat appetite and aversive movements as co-ordinate and equally primitive, pleasures being supposed to lead to actions for their continuance as much as pains to actions for their removal. No doubt, as soon as the connexion between a pleasurable sensation and the appropriate action is completely established, as in the case of impelling food, the whole process then begins. But the point is that such faculty was first acquired under the teaching of pain—the pain of unsatisfied hunger. The term "appetite" is apt both by its etymology and its later associations to be misleading. What are properly called the "instinctive" appetites are—when regarded from their active side—movements determined by some existing uneasy sensation. So far as their earliest manifestation in a particular individual is concerned, this urgency seems almost entirely of the nature of a vis a tergo; and the movements are only more definite than those simply expressive of pain because the pleasurable sensation has become associated with the movements. In the case of drinking, for example, the pleasurable sensation is the cause of the movements; in the case of eating, the movements are the cause of the pleasurable sensation. In both cases, therefore, they are called "instinctive." But what one inherits another must have acquired, and we have agreed here to leave heredity on one side and consider only the original evolution.

But if none but psychological causes were at work this evolution would be very long and in its early stages very uncertain. At first, when only random movements ensue, we may fairly suppose both that the chance of at once making a happy hit would be small and that the number of chances, the space for repentance, would also be small. Under such circumstances natural selection would have to do almost everything and subjective selection almost nothing. So far as natural selection worked, we should have, not the individual subject making a series of trials and perfecting itself by practice, as in learning to dance or swim, but we should have those individuals whose structure happened to vary for the better surviving, increasing and displacing the rest. How much natural selection, apparently unaided, can accomplish in the way of complicated adjustment we see in the adaptation of the form and colour of plants and animals to their environment. Both factors, in reality, operate at once, and it would be hard to fix a limit to either, though to our minds natural selection seems to lose in comparative importance as we advance towards the higher stages of life.

But psychologically we have primarily to consider subjective selection, i.e. first of all, the association of particular movements with particular sensations through the mediation of feeling. The sensations here concerned are mainly painful excitations from the environment, the recurring pains of innutrition, weariness, &c., and pleasurable sensations due to the satisfaction of these organic wants—pleasures which, although not a mere "filling-up," as Plato at one time contended, are still preceded by pain, but imply over and above the removal of this a certain purifying and refining good. There seem only a few points to notice. (a) When the movements that ensue through pleasure are themselves pleasurable there is ordinarily no ground for singing out any one; such movements simply enhance the general enjoyment, which is complete in itself and so far contains no hint of anything beyond. (b) Should one of these spontaneous movements of pleasure chance to cause pain, no doubt such movement is speedily arrested. Probably the most immediate connexion possible between feeling and purposive action is that in which a painful movement leads through pain to its own suppression. But such connexion is not very fruitful of consequences, inasmuch as it only secures what we may call internal training and does little to extend the relation of the individual to its environment. (c) Out of the irregular, often conflicting movements which indirectly relieve pain some one may chance to remove the cause of it altogether. Upon this move the last of a tentative series, attention, released from the pain, is concentrated and the first of a new form of action. The remedy become so far associated that on a recurrence of the former the many diffused movements become less, and the one purposive movement more, pronounced; the one effectual way is at length established and the others, which were but palliatives, disappear. (d) When things have advanced so far that some one definite movement is definitely represented along with the painful sensation it remedies, it is not long before a still further advance is possible and we have preventive movements. Thanks to the ordinariness of things, dangers have their premonitions. After a while, therefore, the occurrence of some signal sensation revives the image of the harm that has previously followed in its wake, and a movement—either like the first, or another that has to be selected from the random trials of fear—occurs in time to avert the impending ill. (e) In like manner, provided the cravings of appetite are felt, any signs of the presence of pleasurable objects prompt to movements for their enjoyment or approbation. In these last cases we have action determined by percepts. The cases in which the subject is incited to action by ideas as distinct from percept require a more detailed consideration; such are the facts mainly covered by the term Desire.

By the time that ideas are sufficiently self-sustaining to form trains that are not wholly shaped by the circumstances of the present, entirely new possibilities of action are opened up. We can desire to live again through experiences of which there is nothing actually present to remind us, and we can desire a new experience which as yet we only imagine. We often, no doubt, apply the term to the simpler states mentioned under (e) in the last paragraph: the fox in the fable is said to have desired the grapes he viliﬁed because out of his reach. Again, at the other extreme it is usual to speak of a desire for honour, or for wealth, and the like; but such an idea is no more a single stage of mind as inclinations or habitual desires. Moreover, abstractions of this kind belong to a more advanced stage of development than that at which desire begins, and of necessity imply more complicated grounds of action than we can at present examine. The essential characteristics of desire will be more apparent if we suppose a case somewhere between these extremes. A busy man reads a novel at the close of the day, and finds himself led off by a reference to angling or tropical scenery to picture himself with his rods packed en route for Scotland, or booked by the next steamer for the fairyland of the West Indies. Presently, while the ideas of Jamaica or fishing are at least as vividly imagined as before, the fancied preparations receive a rude shock as the thought of his work recurs. Some such case we may take as typical and attempt to analyse it.

First of all it is obviously true, at least of such more concrete desires, that what awakens desire at one time fails to do so at another, and that we are often so absorbed or content with the present as not to be amenable to (new) desires at all. A given x or y cannot, then, be called desirable per se, it is only desirable by relation to the contents of consciousness at the moment. Of what nature is this relation? (1) At the level of psychological life we have not yet reached, and in this way the events and connexions have been formed between ideas and the movements necessary for their realization, so that when the idea is vividly
present these movements are apt to be nascent. This association is the result of subjective selection—i.e. of feeling—but being once established, it persists like other associations independently of it. (2) Those movements are especially apt to become pronounced, the more recently emitted, which are therefore fresh and accompanied by the organic sensations of freshness, but also those which are frequently executed, and so from habit readily aroused. The latter fact, which chiefly concerns habitual desires, may be left aside for a time. (3) At times, then, when there is a lack of present interests, or when these have begun to wane, or when there is positive pain, attention is ready to fasten on any new suggestion that calls for more activity, requires a change of active attitude, or promises relief. Such spontaneous concentration of attention ensures greater vividness to the new idea, whatever it be, and to its background the desire the greater vividness may suffice. This is most likely to happen when the new idea affords intellectual occupation, and this is at the time congenial, or with indolent and imaginative persons who prefer dreaming to doing. (4) But when the new idea does not lead off the pent-up stream of action by opening out fresh channels, when, instead of this, it is one that keeps them intent upon itself in an attitude comparable to expectation, then we have desire. In such a state the intensity of the re-presentation is not adequate to the intensity of the incipient actions it has aroused. This is most obvious when the latter are directed towards sensations or perceptions, and the former remains only an idea. If it were possible by concentrating attention to convert ideas into perceptions, there would be an end of most desires: "If wishes were horses beggars would ride." (5) But our voluntary power over movements is in general of this kind: here the fiat may become fact. When we cannot hear we can at least listen, and, though there be nothing to fill them, we can at least hold out our hands. It would seem, then, that the source of desire lies essentially in this excess of the active reaction above the intensity of the re-presentation (the one constituting the impulse,3 the other the object of desire, or the desideratum), and that this disparity rests ultimately on the fact that movements have, and sensations have not, a subjective initiative. (6) The impulse or striving to act will, as already hinted, be stronger the greater the available energy, the fewer the present outlets, and, habits' apart, the fresher the new opening for activity. (7) Finally, it is to be noted that, when such inchoate action can be at once consummated, desire ends when it begins: to constitute a definite state of desire there must be not only an obstacle to the realization of the desideratum—if this were all we should rather call the state one of wishing—but an obstacle to its realization by means of the actions its representation has aroused.

Hence if the desire has been called forth, its intensity is primarily identical with the strength of this impulse to action, and has no definite or constant relation to the amount of pleasure that may result from its satisfaction.

Relation of Desire to Feeling.

The feeling directly consequent on desire as a state of want and restraint is one of pain, and the reaction which this pain sets up may either suppress the desire or prompt to efforts to avoid or overcome the obstacles in its way. To inquire into these alternatives would lead us into the higher phases of voluntary action; but we must first consider the reaction of desire to feeling more closely.

Instances are by no means wanting of very imperious desires accompanied by the clear knowledge that their gratification will be positively distasteful.1 On the other hand it is possible to recollect or picture circumstances known or believed to be intensely pleasurable without any desire for them being awakened at all: we can regret or admire without desiring. Yet there are many psychologists who maintain that desire is excited only by the prospect of the pleasure that may arise through its gratification, and that the strength of the desire is proportional to the intensity of the pleasure thus anticipated. 2

1 As such an instance may be cited Plato's story of Leontius, the son of Aglacon, in Rep. iv. 439 f. a.

Quidquid petitur petitur sub specie boni is their main formula. The plausibility of this doctrine rests partly upon a seemingly imperfect analysis of what strictly pertains to desire and partly on the fact that it is substantially true both of what we may call "presentation-prompted" action, which belongs to an earlier stage than desire, and of the more or less rational action that comes later. In the very moment of enjoyment it may be fairly supposed that action is sustained solely by the pleasure received and is proportional to the intensity of that pleasure. But there is here no re-presentation and no seeking; the conditions essential to desire, therefore, do not apply. Again, in rational action, where both are present, it may be true—to quote the words of an able advocate of the view here controverted—that "our character as rational beings is to desire everything exactly according to its pleasurable value." But consider what such conceptions as the good, pleasure value and rational action involve. Here we have foresight and calculation, regard for self as an object of permanent interest—Butler's cool self-love; but desire as such is blind, without either the present certainty of sense or the assured provision of reason. Pleasure in the past, no doubt, has usually brought about the association between the representation of the desired object and the movement for its realization; but neither the recollection of this pleasure nor its anticipation is necessary to desire, and even when present they do not determine what urgency it will have. The best proof of this lies in certain habitual desires. Pleasures are diminished by repetition, whilst habits are strengthened by it; if the intensity of desire, therefore, were proportioned to the "pleasure value" of its gratification, the desire for renewed gratification should diminish as this pleasure grows less; but, if the present pain of restraint from action determines the intensity of desire, this should increase as the action becomes habitual. And observation seems to show that, unless prudence suggests the forcible suppression of such belated desires or the active energies themselves fail, they do in fact become more imperious, although less productive of positive pleasure, as time goes on.

In this there is, of course, no exception to the general principle that action is consequent on feeling—a greater pleasure being preferred before a less, a less pain before a greater; for, though the feeling that follows upon its satisfaction be less or even change entirely, still the pain of the unsatisfied desire increases as the desire hardens into habit. It is also a point in favour of the position here taken that appetites, which may be compared to inherited desires, certainly prompt to action by present pain rather than by prospective pleasure.

Intellec
tion.

36. Desire naturally prompts to the search for the means to its satisfaction and frequently to a mental rehearsal of various possible courses of action, their advantages and disadvantages. Thus, by the time the idential continuum has become—mainly by the comparatively passive working of association—sufficiently developed to furnish free ideas as thinking material, motives are forthcoming for thinking to begin. It is obviously impossible to assign any precise time for this advance; like all others, it is gradual. Fitfully, in strange circumstances and under strong excitement, the lower animals give unmistakable signs that they can understand and reason. But thought as a permanent activity may be fairly said to originate in and even to depend upon the acquisition of speech. This indispensable instrument, which more than anything else enables our psychological individual to advance to the distinctly human or rational stage, consists of gestures and vocal utterances, which were originally—and, indeed, are still to a large extent—emotional expressions.3 Our space will only allow us to note in what

2 It must be noted that, though we still retain our psychological standpoint, the higher development of the individual is only possible through the habituation of the individual to the habits of the larger society. Without language we should be mutually exclusive and impenetrable, like so many physical atoms; with it each several mind may transcend its own limits and share the minds of others. As a
way language when it already exists, is instrumental in the development as distinct from the communication of thought. But first of all, what in general is thinking, of which language is the highest form. 

In entering upon this inquiry we are really passing one of the hardest and fastest lines of the old psychology—that between sense and understanding. So long as it was the fashion to assume a multiplicity of faculties the need was felt of explaining the essential connection that had senses and intellect much as he had eyes and ears; the heterogeneity in the one case was no more puzzling than in the other. But for psychologists who do not curl the knot in this fashion it is confessedly a hard matter to explain the relation of the two. The contrast of receptivity and activity hardly avails, for all presentation involves activity and essentially the same act. Nor is there any present reason to maintain presentations attended to differ in kind, albeit such a view has been held from Plato downwards. Nihil est in intellectu quod non fuerit prior in sensu: the blind and deaf are necessarily without some concepts that we possess. If pure beauty is pure nothing, pure thought is equally empty. Thought consists of a certain elaboration of sensory and motor presentations and has no content apart from these. We cannot even say that the forms this thought psychologically a priori; on the contrary, what is epistemologically the most fundamental is the last to be psychologically realized. This is not only true as a fact; it is also true of necessity, in so far as the plastic form is an abstract concept of the essence or the formation of others more abstract—those most abstract, like the Kantian categories, &c., being thus the last of all to be thought out or understood. And though this formative work is subliminal it is still very distinct from it, thus the first step is determined by the so-called matter, and not by us; in this respect "the spontaneity of thought" is not really freer than the receptivity of sense.1 It is sometimes said that thought is synthetic, and that its true origin is "façon de choses"; and without a stimulus which yield the ideational train are the only processes at work in intellectual synthesis. Moreover, it would be arbitrary to say at what point the generic image ceases and the true concept begins, so continuous are the two. No wonder, therefore, that English psychology has been prone to regard thought as only a special kind of perception—perceiving the agreement or disagreement of ideas. There are others who are inclined to produce its explanation. Yet this is much like confounding observation with experiment or invention—the act of a cave-man in betaking himself to a drifting tree with that of Noah in building himself an ark. In respect of both, even in understanding the combinations of others, we are comparatively passive spectators of ideational movements, non-voluntarily determined. But in thinking or "intellection," as it has been conveniently termed, there is always a search for something more or less vaguely conceived, for a clue which will be known when it occurs by seeming to satisfy certain conditions. Thinking may be broadly described as solving a problem—and it is certainly so doing we come into immediate contact with the central idea or intuition and work along the several diverging lines of ideas associated with it—hence far the aptest and in fact the oldest description of thought is that it is discursive. Emotional excitement—a sudden determination of the natural man does not think much in blood—quickens the flow of ideas: what seems relevant is at once contemplated more closely, while what seems irrelevant awakens little interest and receives little attention. At first the control faculties are in its way that which the actual course of thought of even a disciplined mind falls far short of the clearness, distinctness, and coherence of the logician's ideal. Familiar associations are apt to hurry attention away from the proper topic, so that thought becomes not only discursive but wandering; in place of concepts of fixed and crystalline completeness, such as logic describes, we may find a congeries of ideas but imperfectly compacted into one generic idea, subject to continual transformation and implicating much that is irreducible.

Thus, while it is possible for thought to begin without language, just as arts may begin without tools, yet language enables us to carry the same process enormously farther. In the first place it gives us an increased command of such even comparatively concrete generic images as can be formed without it. The name of a thing or action becomes, for one who knows the name, as much an objective mark or attribute as any quality whatever can be. The form and colour of what we call an "orange" are perhaps even more intimately combined with the sound and utterance of this word than with the taste and fragrance which we regard as strictly essential to the thing. Yet what we call the "orange" so often evade us, we can always command its nominal attribute, in so far as this depends upon movements of articulation. By uttering the name (or hearing it uttered) we have secured to us, in a greater or less degree, that superior vividness and definiteness that pertain to images reinstated by impressions: our idea approximates to the fixity and independence of a percept (cf. 21 above). With young children and uncultured minds—who, by the way, not uncommonly "think aloud"—the gain in this respect is probably more striking than those not confined to their mother-tongue or those used to an analytical handling of language at all realize. When things are thus named, they receive a kind of identity of their own, and we can frequently give them in idea, it becomes easier mentally to bring together facts that logically belong together, and so to classify and generalize. For names set us free from the cumbersome tangibility and particularity of perception, which is confined to just what is presented here and now. But as ideas increase in generality they diminish in definiteness and unity; they not only become less pictorial and more schematic, but they become vague and unsteady as well, because formed from a number of concrete images only related as regards one or two constituents, and not assimilated as the several images of the same thing may be. The mental picture answering to the word "horse" has, so to say, body enough to remain a steady object when under attention from time to time; but that answering to the word "animal" is perhaps scarcely twice alike. The relations of things could thus never be readily recalled or steadily controlled if the names of those relations, which as words always remain concrete, did not give us a definite hold upon them—make them comprehensible. Once these "airy nothing" have a name, we reap again the advantages a concrete constituent affords: by its means which is relevant becomes more closely associated, and that which is irrelevant—abstracted from—falls off. When what answers to the logical connection or meaning of a concept is in this way linked with the name, it is no longer necessary that such "matter or content" should be distinctly present in consciousness. It takes time for an image to rise its associates above the threshold; and, when all are there, there is more demand upon attention in proportion. There is thus a manifest economy in what Leibnitz happily styled "symbolic," in contrast to "intuitive" thinking. Our power of efficient attention is limited, and with words for counters we can, as Leibnitz remarks, readily perform operations involving very complex presentations, and wait till these operations are concluded before realizing and spreading out the net result in sterling coin.

But this simile must not mislead us. In actual thinking there never is any complete separation between the symbol and the ideas symbolized: the movements of the one are never entirely suspended till those of the other are complete. "Thus," says Hume, "if, instead of saying, that in war the weaker have always recourse

1 Locke, so often misrepresented, expressed this truth according to his own phraseology: "That the least flower or the smallest blade of grass, nor the lights nor the fields covered with verdure whenever we have a mind to it... just thus it is with our understanding; all that is voluntary in our knowledge is the employing or withholding any of our faculties to the same effect that a man has painted with sort of objects and a more or less accurate survey of them" (Essay, iv. 13. 2).
to negotiation, we should say, that they have always
arbitrating certain relations to ideas still follows the words and
works us into the perception the absurdity of that proposi-
tion.' How intimately the two are connected is shown by the
surprises that give what point there is to pains, and by the
small confusion that results from the existence of homonymous
terms. The question thus arises—What are the properly
idealised elements concerned in thought? Over this question
psychologists long waged fight as either nominalists or con-
ceptualists. The former maintain that what is imaged in
connexion with a general concept, such as triangle, is some
individual triangle "taken in a certain light," while the latter
maintain that the "abstract idea" is something embodying the
common sense of the several particulars as the concept connotes,
distinctively from the specific or accidental variations that
distinguish one particular from another. As often happens in such
controversies, each side saw the weak point in the other. The
nominalists easily showed that there was no distinct abstract
idea representable apart from particulars; and the conceptualists
could as easily show that a particular presentation "considered
in a certain light" is no longer merely a particular presentation
nor yet a mere crowd of presentations. The very thing to
ascertain is what this consideration in a certain light implies.
Perhaps as speedy end might have been put to this controversy
if either party had been driven to define more exactly what was
to be understood by image or idea. Such ideas as are possible
to us apart from abstraction are, as we have seen, revived
percepts, not revived sensations, are complex total re-presentation
made up of partial re-presentations, which may figure in
other totals (cf. § 21). Reproductive imagination is so far
but a faint rehearsal of actual percepts, and constructive
imagination but a faint anticipation of possible percepts. In
either case we are busied with elementary presentations compri-
cipated or synthesized to what are tantamount to intuitions, in
so coarse a form of intuition remain in the idea, though the
fact, as tested by movement, &c., is absent. The
several partial re-presentations, however, which make up an idea
might also be called ideas, not merely in the wide sense in which every
mental object may be so called, but also in the narrower sense
as secondary presentations, i.e. as distinguished from primary
presentations or impressions. But such isolated images of an
impression, even if possible, would no more be intuitions than the
mere impression itself would be one: taken alone the one would
be as free of space and time as is the other. Till it is settled,
therefore, whether the idealised elements concerned in concep-
tion are intuitive complexes or something answering to the
ultimate elements of these, nothing further can be done.
In the case of what are specially called "concrete" as distinct
from "abstract" concepts—if this rough-and-ready, but
unscientific, distinction may be allowed—the idea answering
to the concept differs little from an intuition, and we have
already remarked that the generic image (Gemeinbild of German
psychologists) constitutes the connecting link between imagina-
tion and conception. But even concerning these it is useless
to ask what does one imagine in thinking, e.g. of triangle or man
or colour. We never—except for the sake of this very inquiry—
attempt to fix our minds in this manner upon some isolated
concept; in actual thinking ideas are not in consciousness alone
and disjointedly, but as part of a context. When the idea of
"man" is present, it is present in some proposition or question, as—
Man is the paragon of animals; In man there is nothing great
but mind; and so on. It is quite clear that in understanding
or mentally verifying such statements very different constituents
out of the whole complex "man" are prominent in each. Fur-
ther, what is present to consciousness when a general term is
understood will differ, not only with a different context, but also
the longer we dwell upon it: we may either analyse its connota-
tion or muster its denotation, as the context or the cast of our
minds may determine. Thus what is relevant is alone prominent,
and the more summary the attention we bestow the less the full-
ness and intent of the concept are displayed. To the
nominalists' objection, that it is impossible to imagine a man without
imagining him as either tall or short, young or old, dark or light,
and so forth, the conceptualist might reply that at all events
percepts may be clear without being distinct, that we can
recognize a tree without recognizing what kind of tree it is, and
that, moreover, the objection proves too much: for, if our
image is to answer exactly to fact, we must represent not only
a tall or a short man, but a man of definite stature—one not
merely either light or heavy, but of a certain precise completion.
To think of him, rather than the impression, is not necessarily to
imagine a man or a tree at all, any more than
if such an illustration may serve—in writing the equation to the
parabola we necessarily draw a parabola as well.
The individuality of a concept is thus not to be confounded with
the sensible concreteness of an intuition either distinct or indis-
tinct, and "the pains and skill" which Locke felt were required
in order to frame what he called an abstract idea are not comparable
to the pains and skill that may be necessary to discriminate or
decipher what is faint or fleeting. The material "framed"
consists no doubt of this abstract idea; we work ultimately with the idealical continuum, but what
results is never a mere intuitive complex nor yet a mere group
of such. The concept or "abstract idea" only emerges when
a certain intelligible relation is established among the members
of such a group; and the very same intuition may furnish the
material for different concepts as often as a different gesitges
Band is drawn between them. The stuff of this bond, as we
have seen, is the word, and this brings into the foreground of
consciousness when necessary those elements—whether they
form an intuition or not—which are relevant to the concept.
Conception, then, is not identical with imagination, although
the two terms are still often, and are once generally, regarded
as synonymous. The same ultimate materials occur in each;
but in the one they start with and retain a sensible form, in
the other they are elaborated into the form which is called
"intelligible."  
37. The distinctive character of this intellectual synthesis
lies, we have seen, in the fact that it is determined entirely
by what is synthesized, whether that be the element-
ary constituents of intuitions or general relations
of whatever kind among these. It differs, therefore, in
being selective from the synthesis of association,
which rests upon contiguity and unites together
whatever occurs together. It differs also from any synthesis,
though equally voluntary in its initiation, which is determined
by a purely subjective preference, since intellect depends upon
objective relations alone. Owing to the influence of logic, which
has long been in a much more forward state than psychology,
it has been usual to resolve intellective into comparison, abstrac-
tion, and classification, after this fashion: ABCM and ABC
are compared, their differences M and N left out of sight, and
the class notion ABC formed including both; the same process
repeated with ABC and ABD yields a higher class notion AB;
and so on. But our intellectual continuum is not a mere string
of ideas of concrete things, least of all such concrete things as
this view implies. Not till our daily life resembles that of a
museum porter receiving specimens will our higher mental
activity be comparable to that of the savant who sorts such
specimens into cases and compartments. What we perceive
is a world of things in continual motion, waxing, waning, the
centres of manifold changes, affecting us and apparently affected
by each other, amenable to our action and, as it seems,
continually interacting among themselves. Even the individual
thing, as our analysis of perception has attempted to show,
is not a mere sum of properties which can be taken to pieces
and distributed like type, but a whole combined of parts very
variously related. To understand intellect we must look at
its actual development under the impetus of practical needs,
rather than to logical ideals of what it ought to be. Like other forms of purposive activity, thinking is primarily undertaken as a means to an end, and especially the end of economy. It is often easier and always quicker to manipulate ideas than to manipulate real things; to the common mind the thoughtful man is one who "uses his head to save his heels." In all the arts of life, in the growth of language and Institutions, in scientific explanation, and even in the speculations of philosophy, we may remark a steady simplification in the steps to a given end or conclusion, or—what is for our present inquiry the same thing—the attainment of better results with the same means. The earliest machines are the most cumbersome and clumsy, the earliest speculations the most fanciful and anthropomorphic. Gradually induction yields to invention, the natural fallacy of post hoc, ergo propter hoc to methodical induction, till what is essential and effective is realized and appreciated and what is accidental and inert is discarded and falls out of sight. In this way man advances in the construction of a complete mental clue or master key to the intricacies of the real world, but this key is still the counterpart of the world it enables us to control and explain.

To describe the process by which such insight is attained as a mere matter of abstraction deserves the stigma of a "blindness" which Hegel applied to it. Of course if attention is concentrated on X it must pro tanto be abstracted from Y, and such command of attention may require "some pains and skill." But to see in this invariable accompaniment of thinking its essential feature is much like the schoolboy's saying that engraving consists in cutting fine shavings out of a hard block. The great thing is to find out what are the light-bearing and fruit-bearing combinations. Moreover, thinking does not begin with a conscious abstraction of attention from recognized differences in the way logicians describe. The actual process of generalization, for the most part at all events, is much simpler. The same name is applied to different things or events because only their more salient features are perceived at all. Their differences, so far from being consciously and with effort left out of account, often cannot be observed when attention is directed to them: to the inexperienced all is gold that glitters. Thus, and as an instance of the principle of progressive differentiation already noted (§6), we find genera recognized before species, and the species obtained by adding on differences, not the genus by abstracting from them. Of course such vague and indefinite concepts are not at first logically general: they only become so when certain common elements are consciously noted as pertaining to presentations in other respects qualitatively different, as well as numerically distinct. But actually thinking starts from such more potential generality as is secured by the association of a generic image with a name. So far the material of thought is always general—is freed, that is, from the local and temporal and other defining marks of concepts. 38. The process of thinking itself is psychologically much better described as (1) an analysis and (2) a re-synthesis of this material already furnished by the ideational trains. The logical resolution of thought into its elements is like a vegetable tree, into judgments unifying such concepts by means of a logical copula, &c., is the outcome of later reflection—mainly for technical purposes—upon thought as a completed product, and entirely presupposes all that psychology has to explain. The logical theory of the formation of concepts by generalization (or abstraction) and by determination (or concretion)—i.e. by the removal or addition of defining marks—assumes the previous existence of the very things to be formed, for these marks or attributes—X's and Y's, A's and B's—are themselves already concepts. Moreover, the act of generalizing or determining is really an act of judgment, so that the logician's account of conception presupposes judgment, while at the same time his account of judgment presupposes conception. But this is no evil; for logic does not essay to exhibit the actual genesis of thought but only an ideal for future thinking. Psychologically, however—that is to say, chronologically—the judgment is first. The growing mind, we may suppose, passes beyond simple perception when some striking peculiarity in what is at the moment perceived is a bar to its recognition. The stalker hunts is not instantly recognized as the destroying biped, because he crawls on all fours; or the scarecrow looks like him, and yet not like him, for, though it stands on two legs, it never moves. There is thus no immediate assimilation; recognition under such circumstances is in itself a judgment, involving an analysis more or less explicit. But of more account is the further judgment to which it leads, that which connects the new fact with its generic ideal. Though actually complex, generic images are not explicitly known to the complecting mind. They are brought into judgments; as the subjects of such judgments they are being-starting-points for predications—It crawls; It does not move; and the like. Such impersonal judgments, according to most philologists, are in fact the earliest; and we may reasonably suppose that by means of them our generic images have been partially analysed, and have attained to something of the distinctness and constancy of logical concepts. But the analysis is rarely complete: a certain confused and fluctuating residuum remains behind. The psychological concept merges at sundry points into those congnate with it—in other words, the continuity of our thought is still far from being abstracted from the substantia of the thing thought. The concept of logic is in all respects totus, teres, algue rotundus. Evidence of this, if it seem to any to require proof, is obtainable on all sides, and, if we could recover the first vestiges of thinking, would doubtless be more abundant still.

But, if we agree that it is through acts of judgment which successively resolve composite presentations into elements that concepts first arise, it is still very necessary to inquire more carefully what these elements are. On the one side we have the logicians contrasting such with so many woody things, and on the other psychologists enumerating the several sensible properties of gold or wax—their colour, weight, texture, &c. In the main the logicians are of such sensible objections to logic and say, "The sun shines and plants grow," we should say, "Sunlight is the cause of vegetation." In short, there is a tendency to resolve all concepts into substantive concepts; and the reason of this is not far to seek. It is because the subject of a substantive concept is actually what we perceive as a thing, or whether it be a quality, an action, an effectuation (i.e. a transitive action), a concrete spatial thing, a relation, &c. It is only when we consider it in other respects, it becomes by the very fact of being the central object of thought pro tanto a unity, and all that can be affirmed concerning it may so far be regarded as its property or attribute. It is only when we consider it in a generic sense as a potentiality which may be a fixed and independent whole, as it were, crystallized out of the still-fluent matrix of ideas. Moreover, the earliest objects of thought and the earliest concepts must naturally be those of the things that live and move about us; hence, then, to seek no deeper reason for the present—this natural tendency, which language by providing distinct names powerfully secures to the mind not only things but every event—In and relation of things which we can single out, or, in other words, to concrete our abstracts. 1 It is when things have reached this stage that logic begins. But ordinary, so-called formal, logic, which intends to concern itself only with thinking the thing and not with the act of thinking, is debarred from recognizing any difference between concepts that do not affect their relations as terms in a proposition. As a consequence it drifts inevitably into that compart- mentalism of logic or logicism, in which thinking is treated not only as relations or predicates, but of the one relation of whole and part qualitatively considered. It thus pushes this reduction to a common denomination to the utmost; its terms, grammatically regular and always symmetrical, are of course applicable to all sorts and kinds of things. From this point of view all disparity among concepts, save that of contradictory extension, and all connexion, save that of the coincident, is lost.

Of a piece with this are the logical formula for a simple judgment, X is Y, and the corresponding definitions of judgment as the comparison of two concepts and the recognition of their agreement or

1 See Wundt, Logik, i. 107 seq., where this process is happily styled "die kategoriale Verschiebung der Begriffe."
disagreement. It is certainly possible to represent every judge-
ment as a compound one, though very often the constituent
judgments of one kind and affords but a very artificial descrip-
tion of others. But for a logic mainly concerned with inference—
*i.e.* with explicating what is implicated in any given statements
concerning classes—there is nothing more to be done than to
ascertain agreements or disagreements; and the existence of these, if
not necessarily, is at least most evidently represented by spatial
relations. Such representation obviously implies a single ground of
comprehension ; there is therefore no room for differences of
category. The resolution of all concepts into class concepts and
that of all judgments into comparisons thus go together.
On the other hand, if a concept is complex it can only be so as a class
combination; and, if the mode of its synthesis could be accounted
of at all, this could only be by treating it too as an element in the
combination like the rest: iron is a substance, &c., virtue a quality,
&c., and science of them all is much the same. The psychological
interest in this thoroughgoing reduction of thought to a form which makes its consistency and logical concatenation
conspicuously evident. But of the so-called matter of thought it
tells us nothing. And, as said, there are many forms in that matter
of at least equal moment, both for psychology and for epistemology:
these formal logic has tended to keep out of sight.

It has generally been under the bias of such a formal or con-
summate logic that psychologists, and especially English psychol-
ologists, have entered upon the study of mind. They have brought
with them an analytic scheme which affords a ready place for sensa-
tion. They have interpreted the elements of the experience, but none for
any differences in the combinations of these elements. Yet it
being in their very nature concrete, all generality becomes an affair of
names; and, as Sigwart has acutely remarked, sensationalism and
psychology, though they would be identical, were it not for the
voided him out if he had added that a purely formal logic tends in like
manner to be nominalistic.

If we are still to speak of the elements of thought, we must
extend this term so as to include not only the sensory elements
we are said to receive but three distinct ways in
which this pure matter is combined: (1) the forms
of Synthesis,—Time and Space 5; (2) the real categories
—Substance, Attribute, State, Act, Effect, End and Purpose,—the exact determination of which is not here in place
and (3) certain formal (logical and mathematical) categories
—as Unity, Difference, Identity, Likeness. These cannot be
obtained by such a process of abstraction and generalization
as logicians and psychologists alike have been wont to describe.
They are not primarily concepts more general than all others in
the sense in which animal is more general than man, but
rather distinct methods of relating or synthesizing presentations.
Kant, though he accepted almost unquestioned the logic
and psychology current in his day, has yet been the occasion, in
spite of his own purely analytical thinking, both and chiefly by the
distinction he was led to make between formal and cennen-
dlogic. In his exposition of the latter he brings to
light the difference between the "functions of the understand-
ing" in synthesizing—or, as we might say, organizing—percepts
into concepts and the merely analytic subsumption of *abc* and
*abd* under *ab*—*a*, *b*, *c* and *d* being what they may. Unlike
other concepts, categories as such do not in the first instance signify objects of thought, however general, but these functions of
the understanding in constituting objects. In fine, they all
imply some special process, and the general characteristic of
the resulting products is what we have first of all to note.

**Objects of Higher Order: their Analysis and Genesis.**

39. From the above we may

time from one key to another we may

two entirely diverse aggregations of notes, and yet the

 melody may remain unchanged. On the other hand, by varying

the order of the notes two distinct tunes may result from the
same collection of tunes. Sense furnishes merely the parts:
whence, then, this identity of the whole in spite of their diversity,
this diversity of the whole in spite of their identity? From
the sameness or difference of the several "intervals," it is replied.
But the answer is insufficient: for the tune is a unity, not a mere
series, and, further, with every interval the same problem recurs.

1 Cf. Hamilton: "To judge (espera, judicare) is to recognize the

existence of combinations of things which two individual things, or a concept and an individual, compared

in the one and the same mind, stand to each other." (Lectures on Logic, i. 225.)

2 As to these it must suffice to refer to what has been already

said; cf. § 11 and 28.

For the interval, too, is a whole, though a simpler one: it does not necessarily change with a change of its constituents, nor remain the same as long as its distance is unaltered. Feelings and "associations," again, cannot account for the result, inasmuch as such accompaniments are not invariably present: moreover, in some cases they are only present for the melody itself, not for it.

Of such complex wholes or combinations—as distinct from mere
aggregates or collections—there are many forms; as, for example,
geometrical figures and patterns, motions and other changes,
numbers, logical connexions, &c. In view of this variety it seems
to strike the unprejudiced as wild to expect that "the progress of psychophysics" may disclose an explanation of such combina-

tions conforming to the old scholastic maxim, *Nihil est in intel-

lectu quod non fuerit prius in sensu.* Yet hopes of such a *generatio

occeus* are entertained. Meanwhile the "old psychology,"
at any rate, is content to regard such complex wholes as
new presentations, the products, that is to say, of a quasi-

mechanical interaction of their constituents, but of intellectual

synthesis.

What is here said of the combinations whereby the items of
an aggregate are construed as parts of a whole holds equally of
the comparisons whereby such items are related, as like or
unlike, compatible or incompatible. Before either combination or comparison is possible, such items or particulars must be "given." But it is conceivable that they should be given
and no intellectual synthesis ensue; such a consciousness has been
happily named *aenetic.* Whether or not it actually exists is
another matter: it is a conceivable limit, and has the theoretical
usefulness of limiting or bounding. But real aenetics do not

hence there. Suppose, then, we have: (a) *item* a, a sound; *item* 
dittos; *item* ditto; or (b) *item* blue; *item* green. The

sensationalist, from Hume onwards, has complained that he does not find in
the one case a further item: *total three,* nor in the other a further item: *uniliness.* After vainly seeking the living whole among
the dead particulars, he next surmises that they generate it by their
conjoint action! But whence this notion of "action"; and if, how such *disjcta membra* survive, do they so often fail of that effect, so that we cannot "see the wood for the trees"?

Combinations and comparisons then, we conclude, are not
given, but "grounded" upon what is given, and is thus their
fundamentum. Hence Meinong, who has studied the psychology of
intellecution with especial care, has called the new presentations,
due to this process of "grounding" (Fundieren), "objects of

a higher order," or ideal objects. They have validity in respect of
the particulars on which they are grounded, but not reality as
data existing for perception alongside of such particulars.

The reader will here be reminded of Hume's distinction between
knowledge and probability. His four philosophica relations,

credentials of knowledge purely upon ideas, can be the objects of

knowledge and certainty—resemblance, continuity, degrees in quality

and proportions in quantity or number—are objects of higher order

and ideal. The other three, which depend not upon the idea,

and may be absent or present even while *that* remains the same

—namely, identity, the situations in time and place, and causation

—are thus obviously not the result of the grounding or *noesis* merely, are not ideal but *empirical,* and have, that is to say, existential

import. In fact, the second of these, the situations, though they

imply synthesis in the wider sense in which all complex perception
does, do not involve intellectual synthesis at all: are neither ideal

combinations nor ideal relations. And since such temporal and

spatial associations enter into both the other two—numerical identity

and causation—the mixed, a posteriori character of these is obvious.

Whatever be the defects of Hume's psychology, his classification

is so far sound, and its epistemological importance can hardly be
overrated. It is accordingly maintained that a one

dimension term "relation" does not allow us to make these distinctions more exactly.

The German language, with the two terms *Verhältniss* and *Besitzung,* can do more.

round which the whole subsequent discussion of this topic centres.

Cf. too, Stout, op. cit., bk. i. ch. iii.
It will be convenient at this point to digress somewhat for a moment to consider a question of some considerable interest. When we say that two "contents" are similar, and when too they admit of analysis, we can, if need be, enumerate certain elements as the basis of their partial likeness, and certain others, the ground of their partial diversity. We may further suppose that, abstracting from these last, we can regard the points of resemblance as constituting a general class to which the two contents belong as elements. How is it possible then that the two contents are, as far as we can see, quite different? To the question how it is possible when the two resembling contents appear as simple, and so far unanalyisable? Instances, of course, are familiar to every one: thus we call red and orange colours, and say they resemble each other. They are in fact different, and blue and black. Hence of course the logicians and psychologists are apt to be at loggerheads. The logicians maintain that abstraction and resemblance (as distinct from qualitative identity) imply complexity; and surely here he cannot be gainsaying us: red, oranges, and blues, and the red of a man's face, and the red of a sunset, are all complex hues, and a whole scale of degrees of likeness and unlikeness; but no constituent parts, no assignable marks of identity or diversity, are forthcoming, such as we find with the class sugar and salt together as solid or soluble, and pronounce them like in colour and unlike in taste. Here the logician's symbols a+b+c, a+b+d, have their counterparts: there—for the percipient consciousness at all events—they have not, and attend to either the sameness or the differences in "red and blue, as we can to the like or the unlike properties in salt and sugar. None the less it would be hasty to conclude that colours or any given sensations are simple. We are confronted with complex wholes—two faces, say—long before we can discern the exact points of resemblance. Still, so long as there is no perceptible combination, much less a causal, and all elements can be accounted for by taking the properties of them, and, therefore, neither abstraction nor comparison based upon it. We can find elsewhere the complexity that generalization and comparison invariably imply. Though colour may be regarded as a single sensation, it is not so when we apply it to a single animal. A general term applicable alike to bird, beast and fish, it is a mistake to infer that the processes are the same between this similarity in its products. We seem bound to distinguish between "consciousness logically or "noetic" processes and processes that are unconsciously logical or "hypnotic," as we perhaps call them. In the former the subjective aspect is left aside; in the latter it comes before us. The one is not mentally psychological, the other 10 to colours is that they are all seen, and to tum work mark psychologically. But to colours is that they are all seen, and to composing the element of notes and noises—that they are all heard. So often as we talk of tasting tastes, smelling smells, feeling touches, language leads us astray. Witness this figure of speech: "The sunset red changes to the twilight grey, I still see; but when the thunder follows the lightning there is a double change, though not an absolute one: from seeing I pass to hearing, but I am sentient still. And if progressive differentiation be the order of experience, then the "universal" sentence precedes the differentiations seeing, hearing, etc., and, again, the "universal" colour the differentiations, red, green, blue, etc. Such "first unities," then, are not reached by abstraction, but the elements in the fundamental "unity" and their subsequent differentiation admits neither of definition nor the classification applicable to discrete complexes, which are the three before green, the last of the same. It is not green, red or yellow, but a sphere, which is so, and then the same, and the same indefinite gradation, and have the same limit in area, regarded either as coincidence or Identity. The conception of "distance between" answers, then, to what we have called a hypothesis of discrete complexes, with which, as said, noetic comparison is alone concerned: the one implies the other and includes the notion of continuity and changes in fact which helps still further to distinguish the two.

Categories.

40. We come now to deal with the categories in more detail. To begin with what are par excellence formal categories, and among these with that which is the most fundamental mental and formal of all—How do we by the "universal" conception of unity? "Amongst all the ideas we have," says Locke, "as there is none suggested to the mind by more ways than by the senses, so there is none so general as one. It has no shadow of variety or composition in it; every object our senses are employed about, every idea in our understandings, every thought of our minds, brings this idea along with it." 1 But to assign a sensible origin to unity is certainly a mistake—one of a class of mistakes already more than once referred to, which consist in transferring to the data of sense all that is implied in the language necessarily used in speaking of them. The term "a sensation," no doubt carries along with it the idea of unity, but the sensation as received brings along with it nothing but itself. And if we consider sensory consciousness merely, we do not receive a sensation, and then another sensation, and so on seriatim; but we have always a continuous diversity of sensations even when these are qualitatively sharply differentiated. Moreover, if unity were an impression of sense and passively received, it would, in common with other impressions, be unanalyisable. We cannot see red as blue, but we can resolve many (parts) into one (whole), and vice versa. 2 Unity, then, is the result of an act the occasions for which, no doubt, are at first non-voluntary or determined—but the act is still as distinct from as it is attention from the objects attended to. It is to that movement of attention already described in dealing with ideation (§ 24) that we must look as the source of this category. This same movement, in like manner, yields us temporal signs; and the complex unity formed by a combination of these is what we call number. When there is little or no difference between the field and the focus of attention, unifying is an impossibility, whatever the impressions received may be. On the other hand, voluntary acts of concentration become more frequent and distinct the variegated continuum of sense is shaped into intuitions—of definite acts and events. Also, as soon as words facilitate the control of ideas, a possibility becomes possible to single out special aspects and relations of things as the subjects or starting-points of our discursive thinking. Thus the forms of unity are manifold: every act of intuition or thought, whatever else it is, is an act of unifying.

It is obvious that the whole field of consciousness at any moment can never be actually embraced as one. What is unified becomes thereby the focus of consciousness and so leaves an outlying field; so far unity may be held to imply plurality. But we cannot with propriety be said that in a simple act of attention the field of consciousness is analysed into two distinct parts, i.e., two unities—this (now attended to) and the other or the rest (abstracted from). For the not-this is but the rest of a continuum and not itself a whole; it is left out but not determined, as the bounding space is left out when a figure is drawn. To know two unities we must connect both together; and herein comes to light the difference between the unity which is the form of the concept or subject of discourse and the unity of a judgment. The latter is of necessity complex; the former may or may not be. But in any case the complexity of the two is different. If the subject of thought is not only clear but distinct—that is not merely defined as a whole but having its constituents like a complex unity—then such distinctness is due to peculiar judgments. At any future time these may of course be repeated: such are the analytical or explicative judgments of logic. As the mere subject of discourse it is, however, a single unity simultaneously apprehended; the relation ascertained between it and its predicate constitutes the unity of judgment, a unity which is comprehended only when its parts are successively apprehended.

But, though a judgment is always a complex unity, the extent of this complexity seems at first sight to vary as the form of synthesis varies. Formal logic, as we have seen, by throwing the form of synthesis into the predicate has no difficulty in reducing every judgment to an S is P. But, if we at all regard the matter thought, it is certain, for example, that "It is an explosion" is less complex than "The enemy explodes the mine." The first answers one question; the second answers three. But as regards the more complex judgment both the process of ascertaining the fact and the language in which it is expressed show that the three elements concerned in it are not synthesized at once. We may regard one of the words here printed as one, in that by a discursive act we unite them; but we separate it from its neighbours; we may also regard the one word as many when we attend to the transition from one letter to another and mark each step" (Sigwart, Logic, II. § 66).
PSYCHOLOGY

Suppose we start from the explosion—and changes or movements are not only apt to attract attention first, but, when recognized as events and not as abstracts personified, they call for some supplementing beyond themselves—then in this case we may search for the agent at work or for the object affected, but not for both at once. Moreover, if we find either, a complete judgment at once will follow: “The enemy exploded”; or “The mine is exploded.” The original judgment is really due to a synthesis of these two. But, when the results of former judgments are in this manner taken up into a new judgment, a certain “condensation of thought” ensues. Of this condensation the grammatical structure of language is evidence, though logical manipulation—with great pains—obliterates it. Thus our more complex judgment would take the form: “The enemy is now mine-exploding” or “The mine is enemy-exploded,” according as one or other of the simpler judgments was made first. An examination of other cases would in like manner tend to show that intellectual synthesis is always—in itself and apart from implications—a binary synthesis. Wundt, to whom belongs the merit of first explicitly stating this “law of dichotomy or duality,” as the cardinal principle of discursive thinking, contrasts it with synthesis by mere association. This, as running continuously, he represents thus:—A—B—C—D—. . . ; the synthesis of thought, on the other hand, he symbolizes by forms such as the following:

\[
\begin{array}{cccc}
& A & B & C & D \\
A & & & & \\
B & & & & \\
C & & & & \\
D & & & & \\
\end{array}
\]

Thus, Socrates is a philosopher; the philosopher Socrates discovered a method; the philosopher Socrates discovered the dialectical method; &c. The point is that the one thing attended to in an intellecutive act is the synthesis of two ideas, and of two ideas only, because, as only one movement of attention is possible at a time, only two ideas at a time can be synthesized.

In that merely associative synthesis where the memory-continuum is produced attention moves from A to B and thence to C without any relation between A and B being attended to at all, though they must have relations, that of sequence e.g. at least.

“Difference,” says Hume, “I consider rather as a negation of relation than anything real or positive. Difference is of two kinds, as opposed either to identity or resemblance. Difference and Likehood.

The first is called a difference of number, the other of kind.” The truth seems rather to be that difference in Hume’s sense of numerical difference is so far an element in all relations as all imply distinct correlatives. To this extent even identity—or at least the recognition of it—rests on difference, that form of difference, viz. is essential to plurality. But absolute difference (i.e. diversity) of kind may be considered tantamount not, indeed, to the negation, but at least to the absence of all formal relation. That this absolute difference—or disparateness, as we may call it—affords no ground for relations becomes evident when we consider (1) that, if we had only a plurality of absolutely different presentations, we should have no consciousness at all (cf. § 11); and (2) that we never compare—although we distinguish—presentations which seem absolutely or totally disparate, e.g. a thunderclap and the taste of sugar, or the notion of free trade and that of the Greek accusative. All actual comparison of what is qualitatively different rests upon at least partial likeness. This being understood, it is noteworthy that the recognition of likeness is, if anything, more “real or positive” than that of likeness, and is certainly the simpler of the two. In the comparison of sensible impressions—as of two colours, two sounds, the lengths or the directions of two lines, &c.—we find it easier in some cases to have the two impressions that are compared presented together, in others to have both presented and then the other. But, either way, the essential matter is to secure the most effective presentation of their difference, which in every case is something positive and, like any other impression, may vary in amount from bare perceptibility to the extremest distance that the continuum to which it belongs will admit. Where no difference or distance at all is perceptible there we say there is likeness or equality. Is the only outcome, then, that when we pass from ab to ac there is a change in consciousness, and that when we pass from ac to ad there is no such change? The answer is to take no account of the operations (we may symbolize them as ac—ab; ad—ac) by which the difference or the equality results. The change of presentation (c) and absence of change (c) are not here what they are as merely passive occurrences, so to put it. This is evident from the fact that in the former there is positive presentation and in the latter no presentation at all. The relation of unlikeliness, then, is distinguished from the mere “position” or fact of change by (1) the voluntary concentration of attention upon ab and ac with a view to the detection of this change as their difference, and by (2) the act, relating them through it, in that they are judged unlike to that extent. The type of comparison is such superposition of geometrical lines or figures (as, e.g. in Euclid I. iv.): if they coincide we have concrete equality; if they do not their difference is a line or figure. All sensible comparisons conform essentially to this type. In comparing two shades we place them side by side, and passing from one to the other seek to determine not the absolute shade of the second but its shade relative to the first—in other words, we look out for contrast. We do not say of one “It is dark,” for in the scale of shades it may be light, but “It is darker”; or vice versa. Where there is no distance or contrast we simply have not two impressions, and, as said—if we consider the difference by itself—no impression at all. Two coincident triangles must be perceived as one. The distinction between the one triangle thus formed by two coincident and the single triangle rests upon something extraneous to this bare presentation of a triangle that is one and the same in both cases. The marks of this numerical distinctness may be various: they may be different temporal signs, as in reduplications of the memory-continuum; or they may be constituents peculiar to each, from which attention is for the moment abstracted, any one of which suffices to give the common or identical constituent a new setting. In general, it may be said (1) that the numerical distinctness of the related terms is secured in the absence of all qualitative difference solely by the intellectual act, whilst bare or unmediated what is to be treated as an individual mark; and (2) that they become related as “like” either in virtue of the active adjustment to a change of impression which their partial assimilation defeats, or in virtue of an anticipated continuance of the impression which this assimilation confirms.

It is in keeping with this analysis that we say in common speech that two things in any respect similar are so far the same. This ambiguity in the word “same,” whereby it means either individual identity or indistinguishable resemblance has been often noticed, and from a logical or objective point of view justly complained of as engendering fallacies in otherwise enlightened understandings. But apparently no one has inquired into its psychological basis, although more than one writer has admitted that the ambiguity is one “in itself not always to be avoided.” It is not enough to trace the confusion to the existence of common names and to cite the forgotten controversies of scholasticism. We are no now concerned with the conformity of thought to things or with logical analysis, but with the analysis of a psychological process. The tendency to treat presentations as if they were copies of things—the objective bias, as we may call it—is the one grand obstacle to psychological observation. Some one else, working with an effort of the mind not extended; no wonder, then, if it should seem “unnatural” to maintain that the idea of two like things does not consist of two like ideas. But, assuming that both meanings of identity have a psychological justification, it will be well to distinguish

1 Wundt, Logik: eine Untersuchung der Principien der Erkenntniss (2nd ed., 1893), i. 59 seq.
2 Hume’s numerical difference, that is to say, is really distinctness, not quantitative difference.
them and to examine their connexion. Perhaps we might term the one "material identity" and the other "individual identity"—following the analogy of expressions such as "different things but all made of the same stuff," "the same person but entirely changed." Thus there is unity and plurality concerned in both, and herein identity or sameness differs from singularity or mere oneness, which so far entails no relation. But the unity and the plurality are different in each, and each is in some sort the converse of the other. In the one, two different individuals partially coincide; in the other, one individual is partially different; the unity in the one case is an individual presentation, in the other is the presentation of an individual.

In material identity the unity is that of a single presentation, whether simple or complex, which enters into a composition, its constituent into two or more others. It may be possible, of course, to individualize it, but as it emerges in a comparison it is a single presentation and nothing more. On account of this absence of individual marks this single presentation is what logicians call "abstract"; but this is not psychologically essential. It may be a generic image which has resulted from the neutralization of individual marks, but it may equally well be a simple presentation, like red, to which such marks never belonged. We come here from a new side upon a truth which has already expounded at length, viz., that presentations are not given to us as individuals but as changes or movements. Time and space—the instruments as it were, of individualization, which are presupposed in the objective sciences—are psychologically later than this mere differentiation.

The many vexed questions that arise concerning individual identity are metaphysical rather than psychological. But it will serve to bring out the difference between the two forms of identity to note that an identification cannot be established solely by qualitative comparison; an alibi or a breach of temporal continuity will turn the flank of the strongest argument from resemblance. Moreover, resemblance itself may be fatal to identification when the law of being is change.

41. As regards the real categories, it may be said generally that these owe their origin in large measure to the anthropomorphic or mythical tendency of human thought—Real Categories, Τὸ διόμειον τῷ διόμειον γνώσεως. Into the formation of these conceptions two very distinct factors enter—(1) the facts of what in the stricter sense we call "self-consciousness," and (2) certain spatial and temporal relations among our presentations themselves. On the one hand, it has to be noted that these spatial and temporal relations are but the occasion and motive—aum—of the appearance of the sense-impressions, and perhaps we may say, the warrant—for the analogical attribution to things of self-necessity, efficiency and design, but are not directly the source of the forms of thought that thus arise. On the other hand, it is to be noted also that such forms, although they have an independent source, would never apart from suitable material come into actual existence. If the followers of Hume err in their exclusive reliance upon "associations naturally and even necessarily generated by the order of our sensations" (J. S. Mill), the disciple of Kant err also who relies exclusively on "the synthetic unity of apperception." The truth is that we are on the verge of error in thus sharply distinguishing the two at all; if we do so momentarily for the purpose of exposition it behoves us here again to remember that mind grows and is not made. The use of terms like "innate," "a priori," "necessary," "formal," etc., without further qualification leads only too easily to the mistaken notion that all the mental facts so named are alike undervived and original, independent not only of experience but of each other; whereas but for the forms of intuition the forms of thought would be impossible—that is to say, we should never have a self-consciousness at all if we had previously learnt to distinguish occupied and unoccupied space, past and present in time, and the like. But, again, it is equally true that, if we could not feel and move as well as receive impressions, and if experience did not repeat itself, we should never attain even to this level of spatial and temporal intuition. Kant shows a very lame and halting recognition of this dependence of the higher forms on the lower in his schematic of the categories, and perhaps if, as is generally argued in his Analytic the opposition of sense and understanding as respectively receptive and active with which he set out in his Aesthetic. Still, although what are called the subjective and objective factors of real knowledge advance together, the former is in a sense always a step ahead. We find again without us the permanence, individuality, efficiency, and adaptation we have found first of all within (cf. § 20, b and d). But such primitive imputation of personality, though it facilitates a first understanding, soon proves itself faulty and begets the contradictions which have been one chief motive to philosophy. We speak at the same moment, of course, of the child who is puzzled that the horses in a picture remain for ever still; but few consider that underlying all common-sense thinking there lurks the same natural preceptness. We attribute to extended things a unity which we know only as the unity of an unextended subject; we attribute to changes among these extended things what we know only when we act and suffer ourselves; and we attribute further to them in their changes a striving for ends which we know only because we feel. In asking what they are, how they act, and why they are thus and thus, we assimilate them to ourselves, in spite of the differences which lead us by-and-by to see a gulf between mind and matter. Such things do not actually exist and are not comparable to God, the triangles, the gulf, the child; but, as we have refuted, or modified by further knowledge, i.e. by the very insight into things which these analogies have themselves made possible. That in their first form they were mythical, and that they could never have been at all unless originated in this way, are considerations that make no difference to their validity—assuming, that is, that they admit, now or hereafter, of a logical transformation which renders them objectively valid. This legitimation is, of course, the business of philosophy; we are concerned only with the psychological analysis and origin of the conceptions themselves.

42. As it must here suffice to examine one of these categories, let us take that which is the most important and central of the three, viz. causality or the relation of cause and effect. Causality, as that will necessarily throw some light upon the constitution of the others. To begin, we must distinguish three things, which, although very different, are very liable to be confused. (1) Perceiving in a definite case, e.g. that on the sun shining a stone becomes warm, we may say the stone makes the warm. This is a concrete instance of predicating the causal relation. In this there is no explicit reference to the cause and effect, as in the notional, such as we have when we say (2) "Every event must have a cause."—a statement commonly known as the principle of causality. This again is distinct from what is on all hands allowed to be an empirical generalization, viz. (3) that such and such causes have invariably such and such particular effects. With these last psychology is not directly concerned at all; it has only to analyse and trace to its origin the bare conception of causation as expressed in (1) and involved in both these generalizations. Whether only some events have causes, as the notion of chance implies, whether all causes are uniform in their action or some capricious and arbitrary, as the unreflecting suppose—all this is beside the question for us.

One point in the analysis of the causal relation Hume may be said to have settled once for all: it does not rest upon or contain any essential or innate intuitions of a causal nexus. The two relations that Hume allowed to be perceived (or "presumed to exist"). viz. con tinuity in space of the objects causally related and priority in time of the cause before the effect, are the only relations that are directly discernible. We say independently of things "as readily as we say "The sun rises and sets," as if both were matters of direct observation then and there. But that this is not so is evident from the facts when we ask ourselves how we can ever answer when we do regard it as following from the other: casual coincidence is at least as common as causal connexion. Wherefore the difference, then, if not from perception? Hume's answer, repeated in various forms by English philosophers as well as the world knows, that the difference is the result of association, that when a change a in an object A has been frequently observed to precede a change b in another object B, this repetition determines the mind to a transition from the one to the other. It is this
determination, which could not be present at first, that constitutes "effectuation" (or "effectuation by nature"), this "effectuation" generated by association is then projected; "for 'tis a common observation that the mind has a great propensity to spread itself on external objects."

Belief and the after-projection we must admit, but all else in Hume's famous doctrine seems glaringly at variance with facts. In one respect it proves too much, for not all constant sequences are regarded as causal, or at least not as such; but there is nothing to show that he produced an effect many times before regarding himself as the cause of it. J. S. Mill has indeed obviated the first objection epistemologically by adding to constant conjunction the further characteristic of "unconditionality." Moreover, if we treat "cause" and "effect" not causally explained from Hume's premises, unless perhaps by resolving it into the qualification that the invariability must be complete and not partial, whereupon the second objection applies. Unconditionality is a word for which we can find no meaning as long as we confine our attention to temporal succession. It will not do to say that an invariable succession generates the idea, and that such an invariable succession must be not only invariable but also unconditioned in order to generate it. We may here turn the master against the disciple: "the same principle," says Hume, "cannot be both the cause and the effect of another, and this is perhaps the only principle of causality really necessary and demonstratively certain" (op. cit. p. 391). Unconditionality is then part of the causal relation and yet not the product of invariable repetition.

There is, however, a sense of this relation that will become clear if we examine more closely the so-called "internal impression" of the mind, which according to Hume constitutes the whole of our idea of power or efficacy. To illustrate the nature of this impression Hume uses as his paradigm the idea on hearing the word commonly annexed to it, when "I'll scarce be possible for the mind by its utmost efforts to prevent that transition" (op. cit. p. 393). It is this determination, then, which Hume marketing in the first place, the transfer of the mental idea to objects and regard as an intelligible connection between them. But, if Hume admits this, must he not admit more? Can it be pretended that it is through the workings of association alone that we are enabled to make out the course which our thoughts, or our wills, or our actions must take, and that the efforts can scarce resist, or that we feel such determination under no other circumstances? If it be allowed that the natural man is determined by causes, in the same sense, it is certain that the idea of his seeing thunder when he is lighting, must not also be allowed that he is irresolubly determined much earlier and in a more much more impressive way when overmastered by the elements or by his enemies? But, further, such instances bring to light what Hume's "determination" also implies, viz. its necessary correlative, effort or action. Even irresistible overassociation can only be known as such by efforts to resist it. Hume allows this when he says that a "determination of association may be such as will move for one may fix his attention during some time on any one object without looking farther" (op. cit. p. 393). But the fact is, we know both what it is to act and what it is to suffer, to go where we would and to avoid the would not, because we are familiar with the workings of association. And, had Hume not confused the two different inquiries, that concerning the origin of the idea of causation and that concerning the ground of causal inference or law of causation, it could never have occurred to him to offer such an analysis of the former as he does.

Keeping to the former and simpler question, it would seem that when in ordinary thinking we say A causes this or that in B we project or analogically attribute to A what we experience in acting and to B what we experience in being acted on; and the structure of language shows that such projection was made long before it was supposed to be performed by the mind, and it seems more reasonable to think that projection was made and suffered in the same circumstances again. The occasions suitable for this projection are determined by the temporal and spatial relations of the objects concerned, which relations are matter of intuition. These are of no very special interest from a psychological point of view, but the subjective elements we shall do well to consider further. First of all, we must note the distinction of immanent action and trans-ant action; the former is what we call action simply by individuals: it is the action which characterises the world as a complex, in which we go from one to another, and we might with advantage call effectuation, implies two things, a patient as well as an agent. In scientific language the agent in an interaction is "causa immanens," the patient is "causa immanens et so distinguished from the effect in effectuation, and the causal relation is not a property or a relation, but a process. However, does not regard mere action as caused at all; and we shall find it, in fact, impossible to resolve action into effectuation. But, since action is the overflow of our operations, the act of a patient and of many parts, properties, members, phases, and in consequence of the analytic procedure of thought, there ensues, indeed, a continual shifting of the point of view from which we regard any given thing, so that what is in one aspect one thing is in another many (cf. § 20). So it comes about that, when regarding himself as one, the natural man speaks of himself and as kind of acting, &c.; but when distinguishing between himself and his members, he speaks of raising his voice, moving his legs, and so forth. Thus no sooner do we resolve any given action into an effectuation, by analytically dividing the original agent an agency of a thing than a new action appears. Action is thus a simpler notion than causation and inexplicable by means of it. It is certainly no easy problem in fact to determine when the act of the complex is to cease, at what point we must stop, because in the presence of an individual thing and a simple activity. At any rate, we reach a point psychologically in the conscious subject, and that can only be a point of full attention. If Hume's critique of the notion of efficacy is really wide of the mark. "Some," he says, "have asserted that we feel an energy or power in our own mind; and that, having in this manner acquired the illusion of our own foreknowledge, we imagine that immediacy immediately to discover it... But to convince us how fallacious this reasoning is, we need only consider that the will, being here considered as a cause, has no more a discoverable connexion with its effects than any material cause has with its proper effect... The effect is there [too] distinguishable and separable from the cause, and could not be foreseen without the experience of their constant conjunction" (op. cit. p. 455). This is logical analysis, not psychological; the point is that the will is not considered as a cause and distinguished from its effects, nor in fact considered at all. It is not a case of sequence between two separable impressions; it is rather the result of a delusion, which we call egoism or "one" or "determinative" (op. cit. p. 391). Moreover, our activity as such is not directly presented at all: we are, being active; and further than this psychological analysis we cannot go.

There is, however, a very strong and obvious reason, for the simple reason that we cannot be two things at once. We are guided in piling it together by the temporal and spatial relations of the things concerned. Here perhaps of the antinomies that beset this concept. In its earliest form, then, the so-called necessary connexion of cause and effect is perhaps nothing more than that of physical constraint. To this, no doubt, it adds a strength, which in separating the things concerned by the same effect has been found invariably to follow the same cause. Finally, when upon the basis of such associated uniformity of sequence a definite intellectual elaboration of such material ensues, it is consequently a need for the removal of uncertainty. We may know that A is sometimes the case or sometimes not; or that some at least of the conditions of B are present or absent; or the presentation of A may be too confused for distinct analysis. This is the region of probability, possibility, more or less obscurity. Leaving this aside, it will be enough to notice those cases in which certainty may be complete. With that certainty which is absolutely objective, i.e. with knowledge, psychology has no direct concern; it is for logic to furnish the criteria by which knowledge is ascertained.

Emotion and desire are frequent indirect causes of subjective certainty, in so far as they determine the constituents and the direction of thought. Hume here has Locke and Berkeley specially in view. Locke has said that a patient and acrude inquirer was incomparably better as a psychologist than a man addicted to literary fancy like Hume, for all his genius, could possibly be. On the particular question, see Locke, 21, 2501, 21, 2502.

In an article (Mind, 1886, p. 317) Mr F. H. Bradley created some stir by declaring that "the present use of these phrases [active energy] is little better than a scandal and a main obstacle in the path of psychology. Concepts of physical forces, as we have seen, have made important contributions towards clearing up the supposed confusion, and the subject is still being debated. But the main revolution of the text, that activity is for psychology at all events ultimate, remains as good as definite at the beginning. With notice of some of the diverse views obtaining will be found in an address, "The Problems of General Psychology," by J. Ward Philosophical Review (1904), pp. 608 sqq.
grouping of the field of consciousness at the moment—"pack the
jury" or "suborn the witnesses," as it were. But the ground
of certainty is in all cases some quality or some relation of these
presentations inter se. In a sense, therefore, the ground of all
certainty is objective; in that sense, that is, of being something
at least directly and immediately determined for the subject
and not by it. Where certainty is mediately, one judgment is
often spoken of as the ground of another; but a syllogism is
still psychologically a single, though not a simple, judgment,
and the certainty of it as a whole is immediate. Between the
judgment A is B and the question Is A B? the difference is not
one of content nor scarcely one of form; it is a difference which
depends upon the effect of the proposition on the subject judging.
(i.) We have this effect before us most clearly if we consider what
is by common consent regarded as the type of certainty and
evidence, the certainty of present sense-impressions whence it is
said, "Seeing is believing." The evident is here the actual,
and the "feeling or consciousness" of certainty is in this case
nothing but the sense of being taken fast hold of and forced to
apprehend what is there. (ii.) The like is true of memory and
expectation: in these also there is a sense of being tied down
to what is given, whereas in mere imagination, however lively,
this non-voluntary determination is absent (cf. § 26). Hume
saw this at times clearly enough, as, e.g. when he says, "An
idea assented to feels different from a fictitious idea that the
fancy and the narrative state there is no direct and immediate
made this difference a mere difference of intensity, but spoke
of belief itself as "an operation of the mind" or "manner
of conception that bestowed on us ideas this additional force or
vivacity." In short, Hume confounded one of the indirect
causes of belief with the ground of it, and again, in describing
this ground committed the ορθέα τρόπον of making the mind
determine the ideas instead of the ideas determine the mind.
(iii.) In speaking of intuition he is clearer: "The answer is
easy with regard to propositions that are proved by intuition or
demonstration." In that case the person who assents not only
accepts the idea and accepts the connexion but is necessarily
determin'd to conceive them in that particular manner"
(op. cit. p. 193). It has been often urged—as by J. S. Mill, for
example—that belief is something "ultimate and primordial."
No doubt it is; but so is the distinction between activity and
passivity, and it is not here maintained that certainty can be
analysed into something simpler, but only that it is identical
with what is of the nature of passivity—objective determination.
As Bain put it, "The leading fact in belief...is our primitive
credulity. We begin by believing everything; whatever is is true"
(Emotions and Will, 3d ed., p. 517). But the point is that
in this primitive state there is no act answering to "believing
distinct from the non-voluntary attention answering to "per-
ceive," and no reflection such as a modal term like "true"
implies. With eyes open in the broad day no man says, "I am
certain there is light"; he simply sees. He may by-and-by come
absolutely to disbelieve much that he sees—e.g. that things are
nearer when viewed through a telescope—just as he will come to
disbelieve his dreams, though while they last he is certain in
these too. The consistency we find it possible to establish among
certain of our ideas becomes an ideal, to which we expect to
find all our experience conform. Still the intuitive evidence of
logical and mathematical axioms is psychologically but a new
form of the actual; we are only certain that two and two make
four and we are not less certain that we see things nearer through
a telescope.

Presentation of Self, Self-Consciousness and Conduct.

44. The concept of self we have just been underlying and
to a great extent shaping the rest of our intellectual furniture;
on this account it is at once desirable and difficult to make
it and ascertain the conditions of its development. In attempting
this we must carefully distinguish between the bare presenta-
tion of self and that reference of other presentations to it which
is often called specially self-consciousness, "inner sense," or

| PSYCHOLOGY |

PRESENTATION OF SELF

internal perception. Concerning all presentations whatever—
that of self no less than the rest—it is possible to reflect, "This
presentation is mine; it is my object; I am the subject attending
to it." The presentation of self, then, is one presentation among
others, for it is not itself self-conscious, like all the rest of the
continuum. But it is obvious that this presentation must be in
existence first before other presentations can be related to it.
On the other hand, it is in only and by means of such relations
that the concept of self is completed. We begin, therefore,
with self simply as an object, and end with the concept of that
object as the subject or "myself" that knows itself. The self
has, first of all (a) a unique interest and (b) a certain inwardsness,
(c) it is an individual that (d) persists, (e) is active, and finally
(f) knows itself. These several characteristics of self are inte-
mately involved; so far as they appear at all they advance in
definition from the lowest level of mere sentence to these moments of highest self-consciousness in which conscience
approves or condemns volition.

The earliest and to the last the most important element in self—
what we might perhaps term its root or material element—is that
variously styled the organic sensations—vital sense, communica-
tions, or voluntary sensations. The self, therefore, largely
determines the tone of the special sensations and events, though
little noticed, in all our higher feelings. If, as sometimes
happens in serious nervous affections, the whole body or any
part of it is idly gloomy, the patient's attitude is often such that
his heart is at once regarded as strange and even as hostile. In
some forms of hypochondria, in which this extreme somatic insen-
sibility and absence of zest leaves the intellect and memory unaffected, the self becomes darkly doubts the whole sense or the
attitude of such a patient, who, declaring that he had been dead
for two years, thus expressed his perplexity: "I existe, mais
en dehors de la vie réelle, matérielle, et, malgré moi, rien ne m'ayant
autre que de déplaire. Tout est à peu près ouvert, mais de manière
inconsciente." It is not because they accompany physiological functions
essential to the efficiency of the organism as an organism, but
solely because these are the most immediate and most constant
sources of feeling, that these passive but ill-defined organic sensa-
tions are from the first the objects of the directest and most unre-
fecting interest. Other objects have at the outset but a mediate
interest through subjective selection in relation to them, and never
become so instinctively and inappropriately identified with self, never
have the same inwardsness. This brings us to a new point. As
soon as definite perception begins, the body as an extended thing
is distinguished from other bodies, and such organic sensations as
can be localized at all are localized within it. At the same time
the actions of other bodies upon it are accompanied by pleasures
and pains, while their action upon each other is not. The body
also differs from any other actual thing because it is always ready
to perform movements, and the whole self with its actions as
feeling, the purpose of such movements being to bring near to it
the things for which there is appetite and to remove from it those
other things which threaten the enjoyment of the future. From the
occupied space and the centre from which all positions are reckoned,
it affords us an unceasing and ever-present intuition of the actu-
ally felt and living self, to which all other things are external, mere
by-products, and altogether mere accidents. This is the self of all
gives to self a certain measure of individuality, permanence and
inwardsness.

But with the development of ideation there arises within this
what we may call an inner zone of self, having still more
unity and permanence. We have at this stage not
only an intuition of the bodily self doing or suffering
here and now, but also memories of what it has been and done
under varied circumstances in the past. External impressions
by this time lost in novelty and become less absorbing, while
the train of ideas, largely increased in number, distinctness and
modulation, often enters a new phase or a new frame of
sense, altogether. In all such reminiscence or reverie a generic image
of self is the centre, and every new image as it arises derives all its
interest from relation to this; and so apart from bodily appetites
which may be somewhat independent of self, all that is actually
present is dull and unexciting. But desires and emotions, it must be remembered, though awakened by what is
only imaginary, invariably entail actual organic perturbations,
and with these the generic image of self is modulated. Hence arises a contrast between the Inner self, which
the natural man locates in his breast or συμμετοχή, the chief seat of these
other ideas, and the one that he identifies with the bodily life
besides. Although from their nature they do not admit of much ideal
representation, yet, when actually present, these organic sensations
exert a powerful and often irresistible influence over other ideas;
they may influence their appropriate train, and so heighten in the

PSYCHOLOGY

599

The main instrument in the formation of this concept, as of others, is language, and especial the social intercourse that language makes possible. Up to this point the presentation of self has shaped the general idea of self. It is only by saying that we have been prehended by the projection of its characteristics. But now the order is in a sense reversed: the individual advances to a fuller self-knowledge by comparing the self within with that first discernment. The first discernment is only a hint. It will be improved when it is through the "us" that we learn of the "me" (cf. § 36, note 1). Collective activity for common ends is of the essence of society, and in taking counsel together for the betterment of his tribe each one learns also to take counsel with himself for his own good on the whole; with the idea of the common weal arises the idea of happiness as distinct from momentary gratification. The extra-regarding imagination is much confronts by a reasonable self-love, and in the deliberations that thus ensue activity attains to its highest forms—which of thought and volition.

In the first we have a distinctly active manipulation of ideas as compared with the more passive spirit that is the class characteristic. Imagination as it is a concept between the thinker and these objects of his thought, including among them the mere generic image of self, from which is now formed this concept of self as a person. A similar, even sharper contrast also accords the exercise of what is very misleadingly termed "self-control," i.e. control by this personal self of "the various natural affections"—use Butler's phrase—which often hinder it as extensively as are bow controled by the other. It is a deliberate, when reasoning, regulating self is commonly regarded as definitely localized. The effort of thinking and concentrating attention upon ideas is no doubt referred to the brain, but this is only comparable with the exercise of other parts in the totality of our experience. We commonly feel also, and the emotional basis of all the most subjective and inalienable. If we speak of this latest phase of self as par excellence "the inner self," such language is then mainly figurative, for the contributions of consciousness are presented as different aspects. But different aspects of the same thing are not the same thing, for psychology at least. Not only is it not the same thing to feel and to know that you feel; but it might even be held to be a different thing still to know that you feel and to know that you feel—such the difference perhaps between ordinary reflection and psychological introspection.

The difficulty of apprehending these facts and keeping them distinctly apart, as the necessary presence of the earlier along with the later; that is to say, we can never know that we feel without feeling. But the converse need not be true. How distinct the two states are is shown in one way by their notorious incompatibility, the direct consequence of the limitation of attention: whatever we have to do that is not altogether mechanical is ill done unless we lose ourselves in the doing of it. This mutual exclusiveness receives a further explanation from the fact so often used to discredit psychology, viz. that the so-called introspection, and indeed all reflection, are really retrospective. It is not while we are angry or pensive, or feeling some such states, but afterwards, or by momentary side glances intercepting the main interest, if this be not too absorbing.

But we require an exact analysis of the essential fact in this retrospect—the relation of the presentation x or y to that of self or M. What we have to deal with, it will be observed, is, implicitly or explicitly, grouped, but they are necessarily not only permitted but encouraged by everyday occurrences or acts of routine, but only by matters of interest, and, as said, generally those which are over or have ceased to be all-engrossing. Now the more we think of the object or objects, the more it appears to us that some effect of the preceding state of objective absorption persists, like wounds received in battle, unnoticed till the light is over—such e.g. as the weariness of muscular exertion or of long concentration of attention; some emotional wave subsiding but not yet spent; "the jar of interrupted expectation," or the relief of sudden attainment after arduous striving, making the concept of consent and want in that particular; or, finally, the quiet introspect and mental rumination in which we note what time has wrought upon us and either regard or approve what we were and did. All such presentations are not the same, but may lead to a common intellectual basis and can be of no use in the case of the concrete bond connecting the generic image of self with its object. In this way and in this respect each is a concrete instance of what we call a state, act, affection, &c., and the judgments based on such relations to the standing presentation of self are recognized as the original and the type of all real predications. The opportunities for reflection are at first few, the materials being as it were thin and the world of our experience presents itself at first. By time, however, that a clear concept of self has been attained the exigencies of life make it a frequent object of contemplation, and the absence of the object, and the attendant experience of void and loneliness lead us to cast ourselves back and to seek the vague or feelingless, or the object of least feeling, to produce the purely formal notion of a subject or pure ego. For empirical psychology this notion is ultimate; its speculative treatment falls altogether—usually under the heading rational psychology—of metaphysics.

46. The growth of intellect and self-consciousness reacts powerfully upon the emotional and active side of mind. To describe the various sources of feeling and of desire that shape the conscious stream of events, pride, ambition, selfishness, sympathy, &c.—is beyond the scope of systematic psychology, and certainly quite beyond the limits of an article like the present. But at least a general résumé of the characteristics of activity on this highest or rational level is indispensable. If we are to gain any insight in a matter of such complexity it is of the first importance to keep steadily in view, as a fundamental principle, that as the causes of feeling become more complex, internal, and representative the consequent actions change in like manner. We have noted this

1 This subject has a very wide literature. The following are specially interesting: Ribot, Les Maladies de la personnalité (3rd ed. 1889); Boris Sissis and S. P. Goodhart, Multiple Personality (1905); Morton Prince, The Dissociation of a Personality (1906).
connection already in the case of the emergence of desires, and
seen that desire in prompting to the search for means to its end is
the primus mover of intellect (cf. § 33). But intellect
does much more than devise and contrive in unquestioning
subservience to the impulse of the moment, like some demon of
Evil. Even for contrivance and planning is on the whole of
this sort, are not without traces of self-control. A conflict
and the evils of hasty action recur to mind, deliberation
succeeds to mere invention and design. In moments of leisure,
the more imperious cravings being still, the rehearsal
of failures or successes in the past, come longer and longer
flights of imagination into the future. Both furnish material
for intellectual ruminations, and so we have at length (1)
concepts of general and distant ends, as wealth, power, knowledge,
—and self-consciousness having arisen—that concept also of
the happiness or perfection of self, and (2) maxims or practical
generalisations as to the best means to these ends. Instead of
actions determined by the vis a tergo of blind passion we
have conducted shaped by what is literally prudence or foresight, the
pursuit of ends that are not esteemed desirable till they are
judged to be good. The good, it is truly urged, is not to
be identified with the pleasant, for the one implies a standard and
a judgment, and the other nothing but a bare fact of feeling;
thus the good is often not pleasant and the pleasant not good; in
talking of the good, in short, we are passing out of the region
of nature into that of character. It is so, and yet this progress
is itself so far natural as to admit of psychological explanation.
And yet change* (§ 34) is the cause of consciousness.
As the constituents of consciousness change; also they depend more upon
the form of that consciousness as this increases in complexity.
When we can deliberately range to and fro in time and circum-
stances, then the good that is not directly pleasant may indeed be
preferred to what is only pleasant while attention is confined
to the seen and sensible; but then the choice of such good is
itself pleasant—pleasanter than its rejection would have been.
The mention of deliberation brings us to the perennial problem of
"the freedom of the will." But to talk of will is to lapse into
the confusions of the old faculty—psychology. As

Freedom. Locke long ago urged: "The question is not proper,
whether the will be free, but whether a man be free." In the absence
of external constraint, when a man does what he likes, we say he is "externally free"; but he may still be the slave of every
momentary impulse, and then it is said that he is not "internally
free." The existence and nature of this internal freedom is the problem
we are now considering. Is it a matter of force or of control? Of
autonomy of self over against momentary propensions and blind
desires, there can obviously be no question of its existence till
the will itself is freely and spontaneously and maxims or principles
of action are possible. The young child, the brute, the beecle,
even when they do as they like, have not this freedom, though they
may be said to act spontaneously. A resolutely virtuous man or a freed man of his passions has the brightest prospect of
self-control. A man who succumbs to temptation; but it is equally
true that the hardened sinner has more of it than one still deterred
in his evil ways by scruples of conscience. A man is internally free
then, whenever the ends he pursues have his whole-hearted
approval, whether he say with Milton's Satan, "Evil be thou my
good," or with Jesus, "Thy will be done." But this freedom
is always within our experience a relative freedom; hence at a later
time we often declare that in some past act of choice we were not
our true selves, not really free. But what is this true self more
than our ideal? Or perhaps we prefer to say that we were free as
ourselves; that we could not have preferred the ends we did not
like. Our present place of the purely formal and abstract concept of self had been
occupied by some other phase of that empirical self which is
continuously, but at no one moment completely, presented. It means,
then, that our freedom is a positive thing, not only actual but imperfect, but must always remain so—so long,
at any rate, as all that we discern by reflection is less than all we are.
But this admission does not commit us to allowing the possible
existence of absolute freedom, but only of absolute indeterminism,
somewhat like "absolute determinism"; for that would seem to differ in no
respect from absolute chance or caprice. On the other hand, the
right occurrences of theutton position can only be psychologically justified
by ignoring the actual nature of the default of the will, and at bottom it treats the analysis of conduct as if it were a dynamical
problem pure and simple. But motives are never merely so many
quantities moving, or acting upon one another, or determining
the action entirely by themselves. At the level of self-consciousness especi-
ally motives are reasons and reason is itself a motive. In the blind
struggle of so-called "self-regarding" impulses might be the only
right, in the light of principles, or practical maxims, or the only right? This superiority in position of principles is only
explicable by reference to the inhibitory power of attention, which
should be, deliberation is essentially voluntary; that is, subjectively determined. But much deliberation, in such cases is just the result of painful experiences
of the evil of hasty action, and only ensues when this motive is
strong enough to restrain the impulse that would otherwise prevail.
Even if this be granted, it does not prove that the subject's action
is determined for and not by him; merely states the obvious
fact that prudence and self-control are gradually acquired. Author-
ity above all, implies a kind of action, such as self-control, and its maxims, are more
no more psychologically on a par with appetites and desires than thought and reason are on a par with the
association of ideas.

Relation of Body and Mind.

47. The question of subjective initiative leads us naturally
to that concerning the connexion of mind and organism, to which
we now proceed. In development and efficiency, in
the intensity and complexity of their processes, mind
and brain keep invariably and exactly in line together. Striking
and impressive instances of this correspondence are to be
found in comparative psychology, and especially in mental
evils' eyes but it is well to express how to enlarge on a point in which
the mind is beyond dispute. In this respect we question the plausibility of the old materialism. But a closer scrutiny
in the instance of a truly equal impressiveness: we reject materialism,
therefore, while still maintaining this psychoneural parallelism to be
a well-established fact. From this we must distinguish
a second sense of parallelism founded on the disparity just mentioned
as pertaining to the psychical and neural correlates. We
may call this physiologic-philosophical, or, more briefly, methodo-
logical, parallelism. It claims as illogical the attempt
to penetrate to psychical facts from the standpoint of physiology, and
vice versa. This methodological convention, as we may, is
a stringent interpretation of causation than that expounded by
J. S. Mill and his contemporaries. It does not, however, forbid
psychological inferences on the basis of physiological facts, or
vice versa. But in spite of this distinctness of the facts, and of the
standpoints from which they are respectively studied, their
causal relation cannot be simply ignored: it is, however, a problem
that pertains strictly to the higher standpoint of philosophy.
There have been in all four different theories of this relation
within modern times: (1) that of mutual interaction—the
common-sense view—very consistently maintained by Desc-
cartes; (2) the "occasionalism" substituted for this by G. Leibniz
and the later Cartesian; (3) the pre-established harmony of
Leibniz; and (4) the monism of Spinoza, which reduced matter
and mind to parallel attributes of the One Substance. The last
of these—served, however, from Spinoza's metaphysics—is still perhaps the prevailing theory, and to it the term physical parallelism most properly applies. For whereas the parallelism
first mentioned states a real correspondence between psychological
processes and neural processes, but leaves open the question of
a possible interaction between matter and mind, modern
psychophysical parallelism is a pure hypothesis concerning
the relation of psychical facts to physical theories, on the ground of
which—as we shall presently see—any interaction between
matter and mind is expressly denied.

1 Essay concerning Human Understanding, II. xxii. §§ 16 sqq.
2 The right is only relative, of course, when the maxims are
"hypothetical"—to use Kant's phrase—but it is absolute when
the maxim is "categorical."
PSYCHOLOGY

601

But in the exposition of this hypothesis these two meanings of parallelism are frequently confused or interchanged. The same term "body" is applied both to an aggregate of matter and to the living organism. Now life must be regarded as either inherent in matter or as due to a material condition of mind or as physically inexplicable. But, for the present at all events, it cannot be explained physically; nor are we even within measurable distance of such an explanation: so much is beyond cavil. Yet the hypothesis of parallelism involves the rejection of both the former alternatives: at the same time its unwarrantable identification with psychosensual parallelism—where we find a real correspondence between mind and organism—tends to conceal the gravity of the second. The standpoint of physiology, therefore, must be described not as identical with that of physics, but as intermediate between it and the standpoint of psychology. If the fact of life to which physiology is applied does not tend to fall into line with physics, much as chemistry, for example, may have had to. On the other hand, till a physico- logical explanation of life is forthcoming, physiology belongs, with psychology, to the domain of metaphysics. The whole matter is yet to be investigated.

A favourite mode of stating psychophysical parallelism is that known as the Double Aspect Theory. In this, besides the unjustified identification of the first and third meanings, we find also an equally unjustified interpretation of parallelism in the second sense. All that methodology prescribes is that psychologists and neurologists—and, we may add, that physicists too—shall severally, as "specialists," mind their own business. Again, all that the first two jointly ascertain is simply the fact of correspondence; the explanation of it is still to seek. Two propositions are now advanced which are held to meet this need. First—and negatively—the connexion, it is said, is not causal: mind does not act on body, nor body on mind: the changes on each side form two independent series, each "going along by itself." In other words, the series themselves are said to exemplify what methodology enjoins on the sciences that investigate them—they mind their own business and never intrude into each other's domains. Nevertheless their interaction is not prima facie contradictory or absurd, and ordinary thought, as we have seen, assumes that it exists. What evidence, then, is there for denying it absolutely? Empirical evidence for such a universal negative there can hardly be; it must be established therefore—if established at all—on a priori grounds. Meanwhile two facts, already noticed, make seriously against it. On the psychical side sensations point to an intrusion of some sort, and are not psychically explicable (cf. §16), and the like—for the present at all events—must be said of the fact of life on the physical side. Apart from all this, it seems plain that methodological parallelism, so far from justifying the denial of interaction, simply precludes its discussion on the dualistic level. For, if that parallelism is confined to the gulfs unspoken and is indeed not absolute—of so much, parallelism in the first sense assures us—but those who are forced to keep to their own side of it obviously are not the people to settle how it is crossed. We are aware that the dualism is not absolute, it is replied: it is only phenomenal, and the two series of phenomena are conditioned by an underlying unity of substance. Such is the second, and positive, proposition of the theory. Again asking for evidence, we are told that this underlying unity is unknown—in fact, unknowable. This unknowable substance is assumed, then, simply because—the impossibility of causal connexion being taken as established—no other alternative remains. The negative proposition is thus the foundation of the theory, and without it this agnostic monism becomes entirely arbitrary. We have, therefore, to continue for the time being with the hypothesis of parallelism on which the possibility of interaction is denied. But it will be worth while first to examine certain ambiguities besetting the positive statement.

Difference of aspect may result solely from difference of standpoint, or it may be due to difference in the reality itself. The circle, seen as concave from within and as convex from without, is an ancient instance of the first still in great favour; the pillar that was cloud and darkness to the Egyptians, but light to the children of Israel, may serve to exemplify the second. The former we may call the phenomenal, and the latter the ontal, thinking of aspect in the second sense. There is no doubt that our meanings theory plays fast and loose, as suits its own convenience. To do this is easy—in so far as the reality is unknown and unknowable; and necessary—since in the end, the reality, however unknowable, must somehow include both the phenomenal aspects and all that pertains to them, and so far therefore be known. In dealing with "aspect" in the first sense, the one question to be raised concerns the nature and relation of the respective standpoints. To one belongs what we know as individual experience, and this is essentially concrete, immediate, and qualitatively diverse; to the other belongs an abstract, conceptual scheme, wholly quantitative, familiarly known as theoretical or psychical theory. Between these there is plainly no such co-ordination as the inept comparison with the inside and the outside of a circle implies.1 Neither is there, on the other hand, the same complete opposition; for the entire mechanical theory is based upon individual experience as enlarged and developed by inter-subjective intercourse. Both the sense-knowledge of the one and the thought-knowledge of the other relate to the one objective factor involved in both. So far then, there is fundamentally only one standpoint—that of the subjective factor to the objective factor, which is immediately perceived in the one and mediately conceived in the other. The question here raised is thus primarily epistemological, but it is a question, as we have seen, in which psychology is intimately concerned. "Aspect" in the second sense is independent of standpoints. We have here to deal with attributes of the one reality, more or less in Spinoza's sense; this reality itself, as possessed of disparate attributes, is so far dual, and the question of causal connexion between these attributes is not escaped. For to know that a thing has invariably two distinct attributes does not enable us to determine straightforward how the changes or "modes" of the one are connected with those of the other. (1) The same attribute might be always the initiating or independent variant, and then would come the question of what is its relation to the other. With these two variants it might be that now one, now the other, took the lead, the grounds of this alternation being then the topic for inquiry; or, finally, (3) it might be, as our theory assumes, that there was but a single series of double changes. The questions here raised are philosophical questions, but again they are questions in which psychology is intimately concerned. Our examination thus yields two results: first, there is fundamentally only a single standpoint—that of experience, now at the perceptual, now at the conceptual, level; and secondly, the distinction of aspects is not merely phenomenal, but pertains "somehow" to reality. The question is how; and this leads us to resume our inquiry into the grounds on which interaction is denied.

These grounds neither pertain to psychology nor to physiology. In spite of the outstanding difficulties connected with sensation and life, which these sciences severally raise, such denial is upheld.

1 In fact, if there were, since it is only as we contemplate finite portions of the circle that the distinction of concave and convex is present, the nearer we approached to the elements the more this difference of aspect would disappear. If on the physical side we called these elements atoms, there would be an answering element of "mind-stuff" on the psychical; and there would be no more than the other diversity in that the parts of the brain were regarded as a complex of primordial atoms. Wild as all this seems, yet views of the kind have been seriously put forward more than once as the logical outcome of psychophysical parallelism.
mainly on the strength of an interpretation of the principle known as the conservation of energy—an interpretation of it, however, which many of the ablest physicists disallow. The energy of the physical world, it is maintained, is a strictly in-
variable amount; matter, therefore, cannot act on mind, for such action would increase it, nor can mind act on matter, since that would entail an increase, of this energy. In other
words, the material world is held to be a "closed system"; and as all the changes within it are mass-motions, there can be
none which are not the effect and equivalent of antecedent mass-
motions. But now this statement must be established on
physical grounds: to assume it otherwise would be openly to beg
the very question at issue. For if mind does act on matter, the
physical mechanism is subject to changes from without, and so
often its motions are not due to antecedent motions; and this
—the common-sense view—cannot, of course, be summarily
dismissed as impossible or absurd. Now, energy is essentially
a metrical notion, and its conservation in finite and isolated
material systems has been ascertained by careful quantitative
experiments. To say that the energy of the material universe is
constant is only a way of expressing the generalization of
this result—is tantamount, in other words, to saying that it
holds of all finite isolated systems. The whole universe may
perhaps be called isolated, but we do not know that it is
finite. We cannot, therefore, apply metrical concepts to it; and
consequently we cannot interpret the conservation of energy as
meaning that the physical part of it is a closed system. But
if not a closed system, then the energy of the universe may
be increased or decreased without interaction between that
group of other bodies—may be increased or decreased by
psychophysical interaction, that is to say. And, moreover,
such psychophysical interaction would not invalidate the con-
servation of energy, rightly understood; for that merely means
that the energy of a group of bodies can be altered only from
without, and this might happen whenever such interaction
occurred.1 We seem, therefore, justified for the present in re-
jecting psychophysical parallelism as one of the three possible
modes of relating mind and matter regarded as attributes of
the real. Not only are there psychological as well as biological
objections which it has not yet overcome, but there are so far
no physical grounds in its favour.

At this point we may again for a moment turn aside to consider
a modified form of the doctrine—the so-called Conscious Auto-
1 Conscious motion Theory, an attempt to blend the old Cartesian
views concerning the minds of man and brute.

According to Huxley, the best known modern exponent of this theory, "our mental conditions are simply the symbols in consciousness of the changes
that take place automatically in the organism. This consciousness is supposed to be related to a mental hypothesis of the body, as of a collateral product of its working, and to be as completely without any power of modifying that working as the steam-whistle . . . is without influence upon the locomotive's machinery": thus "the feeling we call volition is not the cause of a voluntary act, but the symbol of that state of the brain which is the immediate cause of
that act." In other words, physical changes are held to be
independent of psychic, whereas psychical changes are de-
clared to be their "collateral products." They are called
collateral products, or "epiphenomena," to obviate the charge
of materialism, and to conform to the interpretation of the
consciousness of energy that we have just discussed. Such a theory
is, strictly speaking, one of parallelism no longer: rather it
adopts, instead, the first of the two possibilities we have noted
above as opposed to parallelism. According to it, matter is the
initiating or independent variant, on whose changes mind simply
follows suit. It is open to two fatal objections. First, it is
methodologically unsound: its psychology is physiological in the
had sense. It regards all states of consciousness as passive,
"feeling" or "reflexes." Volitional activity is declared illusory; and if this be true, intellectual
activity must be illusory too. But to detect illusion requires
experience of reality—we only know the sham by knowing
the genuine fire and thunder. So we could not be experienced as such save by contrast with states that are
active. To the physical side, then, we naturally turn for this
knowledge which we are told is not to be found on the psychical;
and we do so the more readily as, according to the present theory,
the physical holds the primary place. But we turn in vain;
for matter is inert, and its energy only "works" by taking the
line of least resistance, like water running down hill. Moreover,
such activity as we are in search of could only be found here in
case the physical mechanism showed signs of being intelligently
directed, and that would also be evidence that psychical activity
is not illusory. Is, then, the psychology and assu as all
principle? No, we reply: the assumption is epistemologically unsound.
This is our second objection. The order implied in the distinc-
tion of physical phenomena and psychical epiphenomena is contrary to all experience and indefensible. A physical pheno-
menon is either actually perceived or possibly perceptible; other-
wise it is devoid of empirical reality altogether. But objects
of perception are so far psychical; that is, they belong to im-
mediate or individual experience. Therefore we cannot regard
them as independent of this experience, nor this as their collateral
product, i.e. as epiphenomenal. Again, the phenomenon sup-
posed to be common and the physical is not, that is, we can see,
a fundamental identity in the standpoint of each: they belong to the same continuous experience at different levels.
And lastly, their abstract, merely quantitative, character shows
that it is the concepts of physics, and not the facts of immediate
experience, that are symbolic, and so to say epiphenetic.

The attempt—either empirically or speculatively—to outflank
mind by way of matter is an absurdity on a par with getting into
a basket in the hope of being able to carry oneself.

Such epistemological considerations may help us to deal with
the prime and ultimate argument for strict parallelism. When
all is said and done, it is urged, still the interaction of mind
and matter remains inconceivable. But this is hardly a sufficient
reason for denying what is prima facie a fact. Occasionals,
from Guelinus to Lotze, have acknowledged the same obscurity
in all cases of transcendent action. Yet they did not venture to
deny that sensations were interruptions in the psychical series,
the "occasions" for which were only to be found in the physical;
and that purposeful movements were interruptions in the physical
series, the "occasions" for which were only to be found in the
psychical. And surely such a position is more in harmony with
experience than that of the parallelists, who maintain that each
series "goes along of itself"—a statement which, as we have
seen, is fundamentally false. And this is the start of the
psychical "explanation" of life. Whereas occasionals leaves the
question of ultimate means to be dealt with by a metaphysics
which will respect the facts, parallelism forecloses it on the basis
of a ready-made metaphysics—modern naturalism, that is to
day—"in psychology as an independent science is entirely
ignored. Starting with a dualism as absolute as that of Descartes
—but replacing his two substances by one, enjoying the oluam
cum dignitate of the Unknowable—starting, too, from the physical
side, no wonder such a philosophy finds that what is for us
the most familiar and of the supreme interest, the concrete
world of sense and striving, is for it the altogether inconceivable,
the supreme "world riddle." And yet if the naturalist could
deign to listen to the plainest teachings of psychology and of episte-
ology, the riddle would seem no longer insoluble, for his phenomenal
dualism and his agnostic monism would alike disappear. The
material mechanism which he calls Nature would rank not as the
profoundest reality there is to know: it would rather become—
what indeed "machine" primarily connotes—an instrument-
ality subservient to the "occasions" of the living world of ends;
and so regarded, it would cease to be merely calculable, and

1 Cf. Lotze, Metaphysics, § 61 fn.
would be found intelligible as well. Psychophysical parallelism, then, we conclude, is not a philosophically tenable position; and—pending the metaphysical discussion as to the ultimate nature of interaction or diffusely—what have we to rest content with the second of the three possible modes of connexion above defined, as occasionalism formulates it. According to this, the two series, the psychical and the physical, are not independent and "closed" against each other; but in certain circumstances—e.g. in perception—physical changes are the occasion of psychical, and in certain circumstances—e.g. in purposive movements—psychical changes are the occasion of physical: the one change not being explicable from its psychical antecedents, nor the other from its physical.

Into the metaphysical discussion we cannot, of course, enter here. It must suffice to say that it will not be conducted on the lines of our present inquiry: it will not start from a dualism of matter and mind, either regarded as substances or as phenomena. Its problem will rather be the interaction of subject and object—a duality in the unity of experience, which by no means coincides with the dualism of matter and mind, neurosis and psychosis, and the like.

Comparative Psychology

48. Psychoneural parallelism is no doubt a well established generalization; nevertheless, concerning its exact range and its precise meaning there are differences of opinion. It is applicable, every one will allow, so soon as there is evidence of experiences individually acquired (cf. § 3); and from such point onwards, in ascending any biological phylum, we find that the psychical and neural aspects differentiate and develop together. But how when we descend? Interpreting the neural correlate physiologically, and not morphologically, as referring primarily to function and not to structure, we find that even in unicellular organisms it is still present as irritability and conductivity (leading to contraction, secretion, &c.). But as at higher levels of organization psychology is correlative to neurosis, the principle of continuity would seem to justify us in assuming a like correspondence here. Moreover, "learning by experience," the comparative psychologist's criterion, obviously presupposes some antecedent and underlying process, of which it is the differentiation and development. And our general analysis of mind, if correct, enables us to describe this process—"the irreducible psychical minimum," of which we are here in search. We have such complete psychoses—and it is the simplest we know—in the eminently human activity of "learning by experience." Perfection and instinct are found, it is said, to be in reverse ratio. Hence in the lowest forms of life there is no "learning by experience," because a stationary state of complete adjustment to environment has been already attained, and all reactions have therefore become "secondarily automatic": consciousness, having served its purpose, has disappeared. To such a very Buddhist psychology it may be objected: (1) that even organic reflexes tell upon the so-called vital sense or conoesthesia, and so far—the irreducible minimum being still intact—do not preclude all possibility of learning, should occasion arise; and (2) that the psychical life, even of a Protozoan, does not, according to the best evidence, show any such mechanical finality as is here supposed.1 (ii.) According to the second view, which is advocated by Herbert Spencer, the behaviour of the lower organisms is wholly made up of such reflexes, supposed to be devoid of all psychical concomitants; but consciousness—so far from having disappeared—first comes upon the scene at the opportune moment when the increasing complexity of the mechanism calls for its guidance. Psychologically this hypothesis is less defensible than the last, and it has already been dealt with at some length. (cf. § 7). It not only assumes, as that does, far more uniformity in the interaction of organism and environment than the facts warrant, but in regarding life as prior to mind, and as the means of its evolution, it burdens science with two insoluble problems instead of one. For even if it were possible chemically to build up protoplasms, we should still be as far from organisms as a heap of bricks are from putting themselves together as a house. (iii.) The last view we have to notice is essentially an extension of the preceding, and is chiefly interesting as a reductio ad absurdum of that. The physics of colloidal substances—at present wanting, but confidently expected "in the near future" by certain biologists—is the key which is to unlock the secrets of protoplasm. Certain organisms, regarded as varieties of such a substance, react positively to a given physical property of the environment, and others negatively: thus a moth flies towards the light, and a centipede runs from it—the one is positively, the other negatively, "heliotropic"; the radicle of a seed, growing downwards, is, positively, the plumule, growing upwards, is, negatively, "geotropic." Instincts are but complexes of such tropisms, and owe their character entirely to the symmetrical form and definite structure of the colloidal substance. We can facilitate the work of the biologist to say that when we consider the directions of the reactions of organisms and its aptitude for growth, as a hungry caterpillar climbs to the tip of a branch it is forced so to do by positive heliotropism; that then positive chemiotropism sets up masturbation of the young buds; and that, lastly, "we can imagine this process leading to the destruction of the substances in the skin of the animal that are sensitive to light, and upon which the heliotropism depended," so leaving it free to crawl downwards and come in contact with the new buds which have in the meantime unfolded1 if such language serve any useful purpose, all well and good; only it must be applied to the hungry man too: in short, all behaviour must be described in the same terms. For the champion of colloids to betake himself to consciousness as he approaches the higher forms of life is as much a breach of methodological parallelism as it is for the psychologist to fall back upon protoplasms as he approaches the lower. But to suppose that psychical processes first appear in the complicated form of association of ideas—which learning by experience is taken to imply—and at the same time to assume that such experience, even when it appears, is "ultimately due to the motions of colloidal substances," these are incongruous absurdities which only the grossest ignorance would be bold enough to maintain.

Concluding, as we have done, that mind and matter—as we may provisionally call them—do really interact, we naturally infer that organic structures are not the result solely of material processes, but involve the co-operation of mental direction and selection: in other words, we are led to regard structure as partly shaped and perfected by function, rather than as solely determined by structure, itself mechanically evolved. And such a view is justified by the fact that mechanical evolution is primarily a process of "degradation" rather than development, a case of facilita descensus contrasting with the upward struggle of life per aspera ad astra. Still, the notion of life or mind as formative and directive has its difficulties. In the first place, we have no experience of mind organizing matter—no experience of the actual process, that is to say—how it has the feel of the fact.3 Hence the occasionalism to which here, at any rate, science is confined. But even so, the difficulty is not wholly removed. In the handicrafts whence we derive the conception

---

1 Cf. J. Loeb, Comparative Psychology (1907), pp. 188 sqq.—an interesting book, full of psychological epochs.

2 But, of course, a thoroughgoing spiritualism ought to explain the very existence of matter as really the appearance or manifestation of mind.
PART IV

PSYCHOPHYSICS—PTERIA

of organs—the artificer handles, but does not literally order, his tools—as if they too were intelligent. The conscious direction of such movements is doubtless facilitated by the fact that many of the complex co-ordinations actually involved in them are carried out automatically, thanks to structural modifications, else unknown to us. And, regarding life phylogenetically, we can imagine this phylogeny swelled up into the human.

Indeed, if it be illogical to talk of mechanisms evolving themselves and giving rise to the beings whose ends they serve, we have no choice but to accept this dualism of mind-shaping and matter inerti. No choice, that is, unless we can establish the primacy of the psychological standpoint. Here we have duality not dualism, and the object is not inert, i.e., is not matter. But still there remain two difficulties—possibly resolvable into one—the plasticity already referred to as involved in all biological development and hereditary transmission; as to these, psychology is almost wholly in the dark.1

AUTHORITIES. —Historical: There are few good works on the history of psychology; the only one in English, R. Blakey, History of the Philosophy of Mind from the Earliest Period to the Present Time (London, 1878), is of little use for reference. A work bearing the same title by H. Siebeck (the first part consisting of two divisions—(i) Die Psychologie von Aristoteles, (ii) Die Psychologie von Aristoteles bis im 13. Jh. (2 vols., 1864), and 1864 and 1869, is a carefully done. Siebeck has also contributed a series of articles, "Zur Psychologie der Scholastik," to the Archiv f. d. Gesch. d. Philosophie der Völker (3rd ed., 1865, Geschichts- und Ethiktheorie, 1892); and Psychological (Berlin, 1878), is also good. T. A. Ribot's La Psychologie allemande contemporaine (3rd ed., 1892) and La Psychologie allemande contemporaine (2nd ed., 1885) are lucid and concise in their treatment of the philosophy of mind. 

Of Max Dessoir's Geschichte der neueren deutschen Psychologie the section dealing with the 17th-century writers prior to Kant went into a second edition in 1897; it contains a useful collection of material. All recent French contributions on the continence de la philosophie (ed., 1890), by the neo-Thomist scholar Mgr. D. Mercier, much may be learnt, though its purpose is primarily historical.

1. Positive: The recent output of systematic works on psychology has been enormous, the most important of them being the so-called "new psychology," mentioned J. Sully's The Human Mind (2 vols., 1892); W. James, Principles of Psychology (2 vols., 1890; 3rd ed., 1896); L. Stout, Analyse Psychologie (2 vols., 1896); J. Mound's Psychological Psychology (1st ed., 1901); H. Höflich, Outlines of Psychology (1891; translated from the Danish); G. T. Ladd, Psychology, Descriptive and Explanatory (1894); W. Wundt, Grundriss der Psychologie (4th ed., 1901, translated) in 1870; E. H. von Gersdorff, Grundzüge der Psychologie (3rd ed., 1898), Bd. 1; and E. B. Titchener, Einführung in die Principien der experimentellen Psychologie (2 vols., 1901); C. S. Myers, Experimental Psychology (1898).

Of the older more advanced textbooks Professor Völkmann's Lehrbuch der Physiologische Psychologie (2 vols., 1885) and his later edition by H. Hofstader, is written in the main from a Herbartian standpoint. To the honoured name of Lotze belongs a distinguished place in any enumeration of modern productions in philosophy; his Medizinische Psychologie (Göttingen, 1852) is still valuable. A large part of his Mikrokosmos (3 vols., 3rd ed., 1876; translated into English, 2 vols., 1885) and one book of his Metaphysik (2nd ed., 1884; also translated into English) are, however, devoted to psychology. The doctrine of evolution has been as fruitful in this study as in other sciences that deal with life. In this respect Herbert Spencer's Principles of Psychology (2 vols., 3rd ed., 1881) and Data of Ethics (1879) occupy a prominent place in the history of psychology, and his "Inferences from an Indifference of the Senses and the Intellect" (4th ed., 1894) and The Emotions and the Will (3rd ed., 1875), contain a good deal of "physiological psychology," but no adequate recognition of the importance of the modern theories of development. In this connection, it is an advantage in our own day thatAristotle and Mach's treatment of physics, to describe experience, taking the relation of the central nervous system to the environment as starting point. Its strange and forbidding terminology prevented the timely recognition of its merits; but since Mach's death, it has come overwork and disappointment—quite a literature has grown up.

1 On the subject of comparative psychology generally, see Animal Behavior (1900), by Professor C. Lloyd Morgan; L. T. Hobhouse, Mind in Evolution (1901).
diverted the Persian "royal road" far to the north of its natural line. This road, in fact, followed an earlier main track whose ultimate objective had been different.

The remains of Bogaz Keui are indubitably pre-Persian and pre-Greek. However, remnants of a large fortification, a stress tower, are formed by two deep ravines, and falling to northward over 800 ft. from summit to base. The acropolis was strengthened with a circle of stone redoubts, between which led very narrow gateways, and with interior walls of as well. Just inside what seems to have been the principal entrance is a rock face inscribed with nine lines of "Hittite" characters, greatly perished (Nishan Tash), and a similar inscription, equally illegible, can be detected on a neighbouring rock. Below the acropolis lies the sacred district and a residential quarter, containing the ruins of what seems to have been a palace or temple built round a central court. The whole site is surrounded by a strong wall, 14 ft. thick, with towers about 100 ft. apart. The monument, however, which made the greatest renditions is the subterranean grotto, 1 m. to the east, called Yasili Kaya. Here two hypaethral grottoes are adorned with reliefs in panels, the larger gallery showing two procession, which, starting on both walls from the entrance, meet at the head of the grotto. On the left wall are 45 figures, headed by a gigantic male figure, erect on the bent necks of two men. On the right wall he is opposed by a female of almost equal stature standing on a leopard or lioness, and followed by a young male with battle-axe, erect on a similar beast. Behind these are some 20 figures of mitred priests, &c. There can be no doubt that the female is the great Nature goddess of western Asia, attended by her son, a spontaneously-generated son, with whose help she created the world (see Great Mother of the Gods). Priests or minor divinities follow them. The other procession, according to the analogy of other monuments, is composed of male deities, mounted and headed by his king, who makes offering or dedicates his city to, or engages in some mystic union with, the goddess. The The figure following him seems to be that of his high priest. Hittite figured above many of the figures. Besides the procession there are five independent reliefs in the small gallery and its approach, one repeating the figure of the high priest.

In 1906, as the result of the discovery of cuneiform tablets at Bogaz Keui by E. Chantre in 1896, a concession for the excavation of the site was obtained by the Berlin Oriental Society, and H. Winckler was sent to make a preliminary examination. He found a number of tablets in two languages, Babylonian and local, the latter being of the Aramaic letters found at Tell el-Amarna. Among them was a cuneiform copy of the treaty made by Rameses II. in his 20th year with the king of the Kheta, and inscribed on a wall at Tell ed-Dab'a. In 1907 Winckler, with P. Puchstein and others, made regular excavations, laying bare much of the fortifications and two temples, and finding inscribed monuments and many more tablets. From those written in Babylonian Winckler has established the fact that Bogaz Keui was the capital of a powerful Hittite dynasty from the middle of the 16th century B.C. to at least 1200 B.C. He claims further that its ancient name was Hatti. At the height of its power it ruled all Asia Minor down to the Aegean and northern Syria, with the headwaters of the Orontes, and was also the capital of the Mitanni and the Amurru (Amara) in Mesopotamia. It had continual relation on terms of equality with Egypt and Babylonia. The four kings of the Kheta, alluded to by name in Egyptian texts, have been identified with kings of Bogaz Keui. The decline of Hatti power began with the expansion of Assyria after 1100 B.C. and Cappadocia seems to have become inferior to Phrygia after the rise of the Mitanni dynasty in the 8th and 7th centuries. It should be added that the identification of Bogaz Keui with the Pteridophyta

E. Hettites has not yet been confirmed, and the latter name has been claimed for a primitive site at Am-ala-n near Samanu by Th. Makridi, as the result of his excavations for the Constantinople Museum in 1907 (see Hittites).

Chippiez, Histoire de l'Art (1886) vol. iv.; Lord Warcworth, Notes of a Diary, &c. (1898); E. Chantre, Mission en Cappadoce (1898). (For recent excavations see Hittites.)

**PTERIDOPHYTA** (Gr. πτερός, fern, and φύσω, to plant), or as they are frequently called, the Vascular Cryptogams, the third of the large subdivisions of the vegetable kingdom. The Ferns form the great majority of existing Pteridophytes; the importance and interest of the other groups, of which the Club-mosses and Horsetails are the most familiar examples, depend largely on the fact that they are the surviving representatives of large families of plants which flourished in earlier geological periods. (See PALAEOPHYTA.)

The relation which exists between the two alternating stages or generations, which together constitute the complete life-cycle of all plants higher than the Thallophyta, is perhaps the most natural characteristic of the Pteridophyta. From the germinated spore of a fern plant, which must not be confused with the "seed" of seed-bearing plants, a small, flat, green organism is developed; this is the prothallus (gametophyte, sexual generation; fig. 7). As the result of fertilization of an ovum produced by this, the fern plant (sporophyte, asexual generation) originates; from it spores are ultimately set free, with the germination of which the life-history again commences. The point common to all Pteridophyta is that from the first the gametophyte is an independent organism, while the sporophyte, though in the first stages of its development it obtains nutriment from the prothallus, becomes physiologically independent when its root develops. This independence of the two generations for the greater part of their lives distinguishes this group on the one hand from the Bryophyta (in which the sporophyte is throughout its life attached to the gametophyte), and on the other hand from the Gymnosperms and Angiosperms (in which the more or less reduced gametophyte remains enclosed within the tissues of the sporophyte). The gametophyte, which is usually dorsiventral, though in some cases radially symmetrical (fig. 1, b), is a small thallus attached to the soil by rhizoids. In structure it is equally simple, being composed of parenchymatous tissue without any clearly marked conducting system. Usually it grows exposed to the light and contains chlorophyll, but subterranean saprophytic prothallii also occur in the Lycodiaceae and Ophioglossaceae (fig. 1, c, d, f, g). In the heterosporous forms the gametophyte is more or less reduced (fig. 1, e, i). The reproductive organs ultimately produced on the same or on different individuals are of two kinds, the antheridia and archegonia; the origin of both is from single superficial cells of the prothallus. The antheridium (fig. 8) at maturity consists of a layer of cells forming the wall which encloses a group of small cells; from each of the latter a single motile spermatozoid originates. The archegonium (fig. 9) consists of a more or less projecting neck and the venter, which is usually enclosed by the tissue of the prothallus. A central series of cells can be distinguished in it, the lowest of which is the ovum; above this come

the ventral canal and one or more canal cells. When the archegonium has opened by the separation of the terminal cells of the neck, the disintegration of the canal cells leaves a tubular passage, at the base of which is the ovum (fig. 9, b). Down this canal the spermatozoid, which in the Ferns has been shown to be attracted by the ovum’s positive irritability to maleic acid, passes and fuses with the ovum. After fertilization the latter surrounds itself with a cell-wall and develops into the sporophyte. The early segmentation of the embryo differs in the several groups, but usually the first leaf or leaves, the apex of the stem and the first root are differentiated early, while a special absorptive organ (the foot) maintains for some time the physiological connexion between the sporophyte and the prothallus. The sporophyte is always highly organized both as regards form and structure. Root, stem and leaf can be distinguished even in the simplest forms, and the plant is traversed by a well-developed vascular system. The reproductive organs of the sporophyte are the sporangia, within which the spores are produced; the sporangia are often borne on or in relation to leaves, which may be more or less distinct from the foliage leaves in form and structure (cf. fig. 2). The cells of the wall of the sporangium are usually so constructed as to determine the dehiscence of the sporangium and the liberation of its spores. The spores produced in each sporangium vary from very many to a single one in the case of some heterosporous forms. These latter bear spores of two kinds, microsori and megasporas, in separate sporangia. From the microspor an extremely reduced male prothallus and from the megaspore the female prothallus, develops (cf. fig. 1, c). The spores of the homosporous Vascular Cryptogams are usually of small size; the prothallus produced from them usually bear both antheridia and archegonia, though under special conditions an imperfect sexual differentiation may result. The complete life-history, with its regular alternation of gametophyte and sporophyte, is now known in all except a few rare genera of recent Pteridophyta, and will be described in connexion with the several groups. A cytological difference of great importance between the two generations can only be mentioned in passing. The nuclei of the cells of the sexual generation possess a definite number of chromosomes and this number is also characteristic of the sexual cells. On fertilization the number is doubled and all the cells of the spore-bearing generation have the double number. On the formation of the spores a reduction to the number characteristic of the gametophyte takes place.

The systematic arrangement of the Vascular Cryptogams for the purposes of identification and description necessarily remains unchanged, while the comparative morphology is being more fully worked out. But modifications in the order of placing the natural groups are of importance in expressing the results of such investigations. Such a scheme may be placed here in a tabular form before entering on the consideration of the life-history, natural history, morphology, and classification of the several groups:

**Pteridophyta.**

I. Equietales

- **Equisetaceae.**
- **Calamariaceae.**
- **Sphenophyllaceae.**
- **Chasmanthaceae.**

II. Psilotales

- **Psilotaceae.**
- **Lycopodiaceae.**
- **Selaginellaceae.**
- **Lepidodendraceae.**

III. Lycopsidales

- **Ophioglossaceae.**

IV. Ophioglossales

- **Marattiaceae.**
- **Osmundaceae.**
- **Schizaceae.**
- **Gleicheniaceae.**

V. Filicales

- **Filicaceae.**
- **Matoniaceae.**
- **Loxsomaceae.**
- **Hymenophyllaceae.**
- **Cystopteridaceae.**
- **Polypodiaceae.**
- **Hydropoteridaceae.**
- **Salvinaceae.**
- **Marsiliaceae.**

These main subdivisions are of unequal size and importance. The Sphenophyllales are only known in a fossil stage, while the Equietales, Lycopsidales and Filicales include both living and extinct representatives. The small groups of recent plants forming the Psilotales and Ophioglossales are given independence in this scheme of classification owing to their exact affinities with the other phyla being at present doubtful.

I. Equietales.—The plants of the single living genus *Equisetum,* which vary in height from a few inches to 40 ft., have subterranean rhizomes, from which the erect shoots arise. The habit of the plant depends on the degree of branching rather than upon the foliage. The internodes are elongated and hollow. The leaves are borne in whorls, those of each whorl cohering, except at their extreme tips, to form a sheath. The leaves of successive whorls alternate with one another, and this applies also to the branches which arise in the axil of the leaf sheath. In most species many of these buds, which alternate with the leaves, remain dormant, but in others the aerial shoots are copiously and repeatedly branched. In some species branches of the rhizome with tuberous internodes are formed, which serve as a means of vegetative reproduction. The roots which arise from the base of the lateral buds remain undeveloped on the aerial stem. The vascular bundles equal in number the leaf-teeth from which they enter the stem and form a single ring. Each bundle runs downwards through one internode and then divides into two branches which insert themselves on the alternating bundles entering at this node. The young stems, and the older stems of certain species, are clearly monostelic; but in other species an inner and outer endodermis may be present, or an endodermal layer surrounds each bundle. The vascular bundles themselves are collateral, the xylem consisting of the protoxylem, towards the centre of the stem, and two groups of xylem, between which the phloem is situated; the protoxylem elements soon break down, giving rise to the carinal canal. Only the median or carinal strand of xylem is common to stem and leaf; the lateral cauline strands possibly represent the remains of a centripetally developed mass of primary xylem.

There is no secondary thickening except at the node in *Equisetum,* where some short tracheides, arranged in radial rows, arise from a cambium. The stems, the surface of which exhibits a number of ridges with intercalary furrows, perform the greater part of the work of assimilation. The chlorophyll-containing tissue reaches the surface at the sides and base of the furrows.
where stomata of peculiar form occur in the epidermis, while subepidermal strands of sclerenchyma occupy the ridges. In the cortical tissue beneath each furrow a wide intercellular space is present running the length of the internode, and called the deeply sunk in the tissue; the spermatozoids consist of a spiral of two or three coils, the numerous cilia being attached to the pointed anterior end. The female prothallus, which are sometimes isolated, consist of a spiral of four or five coils at the base of which the archegonia are situated. The necks of the latter are short, the central series of cells consisting of ovum, ventral canal cell and one or two canal cells. The half of the embryo directed towards the archegonial neck gives rise to the apex of the stem and a sheath of three leaves, the other half to the small foot and the primary root. The first shoots are of limited growth, being replaced by lateral branches, which gradually acquire the number of leaf-teeth characteristic of the species. For instance, some of which attained a great size are known, to which the name *Equisetites* is given, since they appear to be closely allied to the existing forms. Two other extinct genera, *Phyllothea* and *Schizoneura*, may be mentioned here. Abnormal specimens of *Equisetum* from *Equisetites*, each of which gives rise to four spores. These are of interest for comparison with the fructification of *Phyllothea*. The most important and best known of the extinct *Equisetales* are, however, the Calamites (see *Paleobotany* : *Palamoecic*). In the primary structure of the stem the Calamites present many points of resemblance to *Equisetum*, but secondary thickening went on in both stem and root. These plants, which appear to have grown in swampy soil, thus attained the dimensions of considerable trees. The leaves, which were of simple form (except in *Cheirostrobus*, where they forked), were inserted in whorls at the nodes; they were either free from one another or cohered by their bases into a sheath. The branches alternated in position with the leaves, and sprang from just above the insertion of the latter. The branched terminated in cones, which present a general similarity to those of *Equisetum*. This similarity is closest in *Archaeocalamites*, an ancient type found in Upper Devonian rocks; in this the strobilus consists of peltate sporangiospores inserted in whorls on the axis. In the other Calamarian strobili known the whorls of sporangiophores are separated by whorls of bracts. In some the sporangiophores stood midway between the sterile whorls, while in others they approached the whorl above or below. There is a close resemblance between these sporangiophores and those of *Equisetum*, but as a rule only four sporangia were borne on each. Some Calamites were heterosporous, the sporangia with microspores and megasporas being found in the same cone.

Our knowledge of the extinct *Equisetales*, full as it is with respect to certain types, does not suffice for a strictly phylogenetic classification of the group. The usual subdivision is into *Equisetales*, including *Equisetum* and *Equisetites* (with *Phyllothea* and *Schizoneura*) may be provisionally associated, and Calamariaeae, including *Calamites* and *Archaeocalamites*.

II. *SPHENOPHYLLALES*. The two very distinct genera *Sphenophyllum* and *Cheirostrobus*, included in this group, are known only from the *Palamoecic* record. To these belongs the very high specialization of this ancient group of plants renders the determination of their natural affinities difficult, indications are afforded by anatomy and the morphology of the strobilus.

In general appearance the species of *Sphenophyllum* (the remains of *Cheirostrobus* known do not allow of any idea of its habit being formed) present some resemblances to the *Equisetales*. The long, sparsely branched stem bore at the node what were nodes whorls of six to eighteen wedge-shaped or linear leaves, which did not alternate in successive whorls. Both the narrower and narrower leaves may be more or less deeply divided, and both forms may occur on the same shoot. From the relation of the thickness of the stem to its length it may be inferred that the shoots of *Sphenophyllum* derived support from adjoining plants. Without entering into detail regarding anatomy, it may be said that the sporangia are produced in place both generally. The single stelae in the stem consisted of the phloem surrounding a solid central strand of xylem, the groups of protoxylem being situated at the projecting angles. In *Sphenophyllum* the vessels, in which the transverse portion of the vessel is connected with that of the next vessel by end-walls were three or six protoxylem groups; in *Cheirostrobus* they were more numerous. The anatomy of the stem is thus very unlike that characteristic of the *Equisetales*, and presents essential points of resemblance to the *Lycopsidae* and the Lycopodiales. The general morphology of the cones, on the other hand, suggests some affinity with the *Equisetales*. The cone of *Sphenophyllum* consisted of an axis bearing at the nodal whorls of bracts, united below into a sheath. The overlapping bracts afforded protection to the sporangia, which were borne on sporangiophores sprouting from the upper surface of the coherent bracts near their origin. For some of these groups usually not all the bracts were present, and sometimes adhered to its upper surface for some distance. Each bent round at the upper end, and bore one or two sporangia on the side turned towards the axis. The mature sporangium had a wall of a single layer of cells, which were larger towards the
base, where they continued into the epidermis of the sporophyll.

In Sphenophyllum fertile both the ventral lobes of the sporophyll (corresponding to the sporangiospores in other species) and the dorsal lobes, which in other species are sterile, were developed as peltate sporangophores. In other species of Sphenophyllum, which are known only as impressions, single sporangia, or groups of four, appear to have been inserted directly on the upper surface of the bracts. In Cheirostrobus a similar relation of sporangioles to bracts existed, but here each bract was divided into three segments. From each segment, near its base, a stalked peltate sporangiole arose; this bore four sporangia, which hung parallel to the stalk. These three sterile segments, with their sporangioles, are, therefore, comparable to one of the bracts of Sphenophyllum, with its sporangioles, is formed by the vascular supply in each case being derived from a single leaf-trace. So far as is at present known, the Sphenophyllaceae were homosporous. The differences between the two sporangiospores described above are sufficiently marked to justify the division of the Sphenophyllaceae into the two orders Sphenophyllaceae and Cheirostrobus. A consideration of the characters of both shows that the Psilotales are the nearest living representatives of the Sphenophyllales, while resemblances suggesting actual relationship between these orders and the Equisetales and Lycopodiales. It has been suggested that the Sphenophyllales may have sprung from a very old stock which existed prior to the divergence of the latter groups. So long, however, as our knowledge of these phyla is confined, as at present, to specialized forms, the nature of the relationship between them must remain to some extent hypothetical.

III. PSILOTALAE.—The two genera Psilotum and Tmesipteris, which are provisionally isolated in this group, have usually been classed with the Lycopodiales. Recent work both on their anatomy and morphology suggests that the sporophylls, while producing organs has however tended to show that their peculiarities can be best understood in the light of our knowledge of the Sphenophyllales. Some authorities place them in this group and there is much to be said in support of the close relationship implied. The Psilotaceae, however, differ from the Sphenophyllales in a number of definite features, such as the arrangement of the leaves singly and not in whorls, and the mode of branching. These differences and our comparatively imperfect knowledge of the Sphenophyllaceous plants which most closely resemble the Psilotaceae appear to justify the provisional separation of the latter as a distinct group, showing affinities with both the Sphenophyllales and Lycopodiales. In both Psilotum and Tmesipteris the functions of the root-system, which is completely absent, are performed by leafless rhizomes bearing absorbent hairs and inhabited by an endophytic fungus. Psilotaum lives epiphytically or in soil rich in humus, while Tmesipteris is epiphytic (and, it has been suggested, partially parasitic) upon stems of tree ferns: the former has small scale-like leaves; those of the latter are of considerable size. The stem is monocotyledonous, the protocorm groups being towards the periphery of the xylem, the development of which is thus centripetal; the cortex is differentiated by the peripheral tissues of the sporophylls, which bear the sporangia, are dichotomous, and do not form definite cones, but alternate in irregular zones with the foliage leaves. The sporophylls may exceptionally undergo further dichotomies and bear more numerous synangi. The sporangia of the Psilotaceae are associated in synangia, which occupy the same position relatively to the sporophyll, as the single sporangium of Lycopodium or the group of sporangia in Sphenophyllum majus. The careful study of the development of the synangium of Tmesipteris, which consists of two loculi, and of Psilotum, which consists of three, has shown that their structure and arrangement can be explained as originating by the separation of a single sporangium resembling that of Lycopodium. Other views of the nature of the Psilotacean synangia are, however, possible, and indeed the existence of both simple and complicated sporangophores in the Sphenophyllaceae leaves the question open as to whether the synangium in existing Psilotaceae is a relatively simple type of sporangioles which has persisted unaltered or is the result of reduction from a more elaborate structure. There is some reason to believe that the prothallus of Psilotum resembles some Lycopodium prothallus, but conclusive evidence is wanting; that of Tmesipteris is unknown.

IV. LYCOPODIALES.—The living representatives of this group are of small size compared with the related plants which lived in Palaeozoic times. A large proportion of the living species are tropical, though others have a wide distribution. As general characteristics of the Lycopodiales, the simple form of the leaves, which are generally of small size, and the situation of the sporangia on the upper surface of the sporophylls, which are often associated in cones, close to their insertion on the axis, may be mentioned; there are both homosporous and heterosporous forms, the prothalli exhibiting corresponding differences. A number of species of Lycopodium are epiphytic and those of Isoetes live submerged in water. Vegetative reproduction is effected in various ways: by the separation of the branches of a creeping stem in some Lycopodia, the persistence through the winter of the apex of the shoot in L. inundatum, and by the formation of leafy bulbls on the aerial stem of L. Selago and others. A highly specialized means of vegetative reproduction is seen in the tubers of Phylloglossum and the embryos of some Lycopods. The modifications shown by the gametophyte of Lycopodium will be described below. All such special relations of the plant to its environment, which might be expected in the few forms of a large group which has persisted beyond the others, are less marked in the genus Selaginella. It would appear as if the latter was more suited to the conditions of the existing flora, and many of the specific forms within it may rather be regarded as recently evolved than as simply persistent.

Lycopodiaceae.—This order contains the two genera Phylloglossum and Lycopodium; the former has a single species, confined to Australia, Tasmania and New Zealand, while nearly one hundred species of Lycopodium are known. Erect and creeping terrestrial plants and
sclerenchymatous. The central cylinder of the root often shows a striking resemblance to that of the stem. The Lycopodiaceae are homosporous. The spores are formed in sporangia of considerable size, situated on the upper surface of the scales and leaf-traces of the frond. The latter may differ from the foliage leaves and be arranged in definite cones, or the two may be similar and occupy alternate zones of a shoot. New spores are sometimes released from the sporangia are found at the bases of the leaves (fig. 4). In the development of the sporangium the sporogenous tissue is derived from a number of superficial cells by divisions parallel to the surface. The tapetum is derived from the lateral parenchyma to the sporogenous tissue.
The several orders of Lycopodiaceae described above, while presenting a number of features in common, are distinctly isolated from one another. A natural classification of such specialized plants can only be obtained when the extinct forms are more fully known. What is known at present, while it does not indicate the phylogeny of the Lycopodiaceae, at least shows that such living orders as Lycopodiaceae and Selaginellaceae cannot be regarded as forming a linear series. The difficulty is increased when it is borne in mind that the small surviving forms probably have a long geological history, and may have coexisted with the Lepidodendraceae. For these reasons no attempt has been made to arrange the orders in larger divisions, since such a division as that of the ligulate and elgulate forms, while convenient for practical purposes, may not express the phylogeny of the group. The Psilotaceae, formerly included in the Lycopodiaceae, have been described separately owing to their resemblance to the Sphenophyllaceae. It remains to be mentioned that the Isoëtaceae have been regarded as more nearly allied to the Filicales than to the former, near which they are here placed.

V. **Ophioglossales.**—The peculiarities of this small order of Pteridophyta render their systematic position a matter of doubt, especially in the absence of evidence as to their geological history, and justify their separation for the present from the other main natural groups. In the three genera, *Ophioglossum*, *Botrychium* and *Helminthostachys*, there is an underground rhizome, from which one leaf or a few leaves with sheathing bases are produced annually; the roots arise in more or less definite relation to the insertion of the leaves. The latter are simple, or irregularly lobed in *Ophioglossum*, more or less compoundly pinnate in *Botrychium* and palmately pinnate in *Helminthostachys*. The fertile branch or branches are situated on the adaxial surface of the leaves, and may be simple, as in *Ophioglossum* (fig. 2, d), or more or less compound, the degree of branching in the sterile and fertile parts being generally the same. The stem is monostelic, the arrangement of the xylem and phloem being collateral. The endodermis and pericycle surround the whole stipe in *Botrychium* and *Helminthostachys*; in *Ophioglossum* each bundle has a separate sheath. Well-marked secondary thickening occurs in *Botrychium*. In the roots of *Ophioglossum* and *Botrychium* and in the first formed roots of *Helminthostachys* an endophytic fungus is present, forming a mycorhiza—the stеле in the larger roots has the usual radial arrangement of xylem and phloem; monarch roots occur in *Ophioglossum*. The morphology of the fertile spike is a disputed question, upon the answer to which the systematic position of the Ophioglossaceae largely rests. The spike is most simple in *Ophioglossum*, where it bears on each side a row of large sporangia, which hardly project from the surface, the vascular bundles occupying a central position. In the young spike, which arises when the leaf is still very small, a band of tissue derived from superficial cells is distinguishable along either side; this sporangiogenic band gives rise to the sporogenous groups, the sterile septa between them, and the outer walls of the sporangia. The spike of *Helminthostachys* corresponds to that of *Ophioglossum*, but a single sporangium is borne on two lateral rows of branched sporangiophores. The sporangia themselves resemble those of *Botrychium*, which project from the ultimate subdivisions of the branched spike; each is developed from a number of cells, the sporogenous tissue arising from a single cell. Two diverse views of the morphology of the fertile spike in these plants have been entertained. The older view was that it was a fertile segment of the leaf; and though its ventral position presents a difficulty, this must be regarded as a possible explanation; the occasional occurrence of sporangia on the lamina in *Botrychium* has been regarded as supporting it. On the other hand, the spike has been explained as due to the elaboration of a single sporangium occupying a similar position with regard to the leaf as in the Lycopodiaceae, and evidence of considerable weight has been brought forward in support of this interpretation. The important bearing of this question on the relationship of the Ophioglossaceae to the phyla of the Filicales and Lycopodiaceae will be obvious.

The position of the fertile spike in relation to the leaf corresponds to that of the synangium or sporangiophores in the Psilotales and Sphenophyllales. The Ophioglossaceae are homosporous, and the prothalli, which are known in species of all three genera, are subdermal and saprophytic (fig. 6). The prothallus of *O. pedunculosum*, as observed by Metter, subsequently reached the surface and produced green lobes; those of the other species known are wholly saprophytic, and contain an endophytic fungus. Those of *Ophioglossum* are cylindrical, while the dorsiventral prothallus of *Botrychium* bears the sexual organs on the upper surface. They present a general, but probably homoplastic, resemblance to the sporophytic prothalli of certain Lycopodiaceae. Important points of the prothallus, however, exist, among which the evaginational position of the meristem of the Ophioglossaceous prothalli, in the presence of a basal cell to the archegonium, and in the multiciliate spermatozoids. In these respects, in the megaphyllous habit and in certain anatomical features, the Ophioglossaceae approach the Filicales. Some species of *Botrychium* have recently been found to have embryos provided with a suspensor. The position of the Ophioglossaceae can at present only be regarded as an open question, in considering which the possible antiquity of the group must be borne in mind.

VI. **Filicales.**—This group of Pteridophyta differs from the others in being well represented in our present flora by forms, many of which are treated as archaic types which have persisted to the present day, but as having been evolved in comparatively recent periods. The Ferns exhibit a wide range in size from the minute epiphytic Hymenophyllaceae, with leaves barely a centimetre in length, to gigantic tree-ferns 80 ft. or more in height. A general characteristic of their habit is the large size of the leaves, which are often highly compound, relatively to the stem. Some ferns have a longer or shorter erect stem often clothed by the persistent bases of the leaves; in others the stem creeps on the surface of the substratum or is subterranean. Its surface is clothed with filamentous or scaly hairs (palaeae), which protect the growing point; and adventitious roots spring from it. The position of the branches varies in the group; they are only exceptionally axillary (Hymenophyllaceae, Botryopteridaceae). The anatomy of the stèle in the stem exhibits on the whole a progression from a solid protostele through a tubular solenosteole to one or more circles of separate steles derived by the breaking up of the solenosteole. The leaf-traces usually interrupt the continuity of the stèle of the axis on their departure. The sporangia are borne in groups (sori) on the under surface of the leaves; sometimes near the margin of leaves in *Hymenophyllum*, from the purely vegetative ones. The form of the sori and the structure of the sporangium are of great systematic importance. The sori is frequently protected by an outgrowth from the surface or margin of the leaf called the indusium. Heterosporous is only known in the Hydropteridaceae. The prothallus developed from the spore is green and in most cases dorsiventral, bearing the archegonia and antheridia on opposite sides of the same leaf. In the Filicinae some of the more striking adaptive modifications in the gametophyte and sporophyte, and certain effects of altered external conditions which have been ascertained experimentally, may be briefly mentioned. The dorsiventrality of the prothallus has been shown to depend mainly on the illumination, the filamentous form being retained in feeble light; a similar result is obtained when the prothalli are cultivated in water. Other facts may have a bearing on the filamentous prothalli of some Hymenophyllaceae. The reproduction of the prothallus by gemmae in species of *Trichomanes*, *Vittaria* and *Monogramme* is another interesting adaptation; the prothallus of *Gymnogramme*
Mature

The phenomena of apogamy and apospory which have now been observed in a number of Ferns, may be mentioned here. In the former the prothallus produces one or more fern-plants vegetatively, the projection which develops into the sporophyte in many cases occupying the position of an archegonium. In some apogamous Ferns sporangia may occur on the prothallus and the vegetative organs of the sporophyte may also occur singly. In apospory the converse phenomenon is seen, the gametophyte springing vegetatively from the sporangium, receptacle of the sorus, or leaf-marrin of the fern-plant. In a number of cases, though not in all, apospory appears to be correlated with a failure of the sporangia to develop.

The adaptations in the vegetative organs of the sporophyte are similar to those in the Flowering Plants. Thus there are a few Ferns which climb, others are water plants, while many, especially those which live as epiphytes, are more or less xerophytic. Some of the epiphytic Ferns (Polypodium aureofolium, Platycerium) have strongly diphomorphic leaves, the sterile leaves serving in some cases to catch falling debris, and thus to provide the plant with soil. Lastly, the symbiotic relation between the plant and ants is found in Ferns, the rhizome of Polypodium carnosum containing cavities inhabited by these insects. The existence of these myrmecophilous Ferns suggests a possible explanation of the nectaries on the leaves of some other species, such as the Common Bracken.

The main existing groups of the Filicaceae may now be briefly described, with special reference to the characters of gametophyte and sporophyte, which have been found of value in determining affinities.

Marattiaceae.—These are Ferns of considerable size, the large leaves of which are borne on a short, erect, swollen stem (Angiopteris, Marattia), or arise from a more or less horizontal rhizome (Donnaea, Kaulfussia). The leaves, at the base of which are two large stipule-like outgrowths, have a thick leaf-stalk, and are simple or simply pinnate in Donnaea, pinnate in Archangiopteris, bi- to tri-pinnate in Marattia and Angiopteris, and digitately lobed in Kaulfussia. The stem, from the ground tissue of which sclerenchyma is absent, has a complicated system of steles arranged in concentric circles; the thick roots, the central cylinders of which have several alternating groups of xylem and phloem, arise in relation to these. The pinnae, except in a few flimsy forms, are thick; in Kaulfussia large pores derived from stomata occur in the epidermis. The sorii are borne on the under surface of the pinnae, usually in a single row on either side of the midrib, but in Kaulfussia dotted over the expanded large leaf. The stalks of the large leaf are borne on the rhizome, from which a number of superficial cells, are here incompletely separated from one another and arranged in a single circle forming a synangium. The

(From Strasburger’s Lehrbuch der Botanik.)

The association is closest in Danaeae, where the individual sporangia of the elongated sorus, which is sunk in a depression of the leaf, open by pores; in Marattia and Kaulfussia (fig. 2, a) they dehisc by slits on the inner face; while in Angiopteris (fig. 2, f) they are almost free from one another. The spores produce a green prothallus of large size, the sexual organs of which hardly project from the surface. The cotyledon and stem grow up vertically through the prothallus, the root turning downwards into the soil.

Osmundaceae.—The two genera of this group, Osmunda and Todea, have thick erect stems, covered with the closely crowded leaf bases. The stem is monostele, the vascular tissues being separated into curved groups comparable with collateral vascular bundles, which surround the pith. There are somewhat thick roots at the base. The leaves are large and pinnate; their lamina is usually thick, though finely pinnate. In Todea the shape of the leaf consists of a single circle of bulky sporangia, are borne on the under surface of the pinnae. In Osmunda the region of the leaf which bears the sporangia has its lamina little developed; the leaf thus bears sterile and fertile pinnae, or, as in O. cinnamomea, sterile and fertile leaves may be present. The sporangia originate from single cells, though surrounding cells may contribute to the formation of the stalk. The latter is thick and short, and the wall of the sporangium, which opens by a median slit, has a group of thick-walled cells at the summit, forming the annulus. The prothalli are similar to those of the other Filicaceae, but more massive; the same may be said of the archegonia and antheridia, which, however, project more than in the preceding group.

Schizaceae.—The anatomy of the stem differs in the four recent genera of this order, and presents a series possibly illustrating the development of the number of concentric steles in a single-celled, the intermediate step being represented by those forms in which the central cylinder is tubular. The sporangia are borne singly or in pairs or three on the margin or under surface of leaves, the fertile pinnae of which differ more or less from the sterile segments. The sporangium is of considerable size, and delimited by a median slit, the annulus being a more or less definitely limited horizontal ring of cells near the apex. The prothallus and sexual organs may resemble those of the Polypodiaceae; in Aneimia and Myeloma the prothallus, though flattened, is not bilaterally symmetrical, the growing point being on one side; a filamentous type of prothallus is known in Schizaea.

Polypodiaceae.—These forms have a horizontal rhizome, from which simple pinnate leaves arise in Platypodium, while Gleichenia bears compound pinnate leaves with continued apical growth. The rhizome usually has a solid central cylinder in Gleichenia, while that of Platynus is tubular. The sporangia arise simultaneously in the sorus, which is borne on the under surface of the ordinary pinna; in those species with large sporangia the latter form a single circle, in others sporangia may also arise from the central part of the receptacle. The annulus is horizontal and the delimitation median. The prothallus, while resembling those of the Polypodiaceae, have points of similarity with those of the preceding groups.

Matoniaceae.—This contains the single genus Matonia, two species of which are known from the eastern tropics. They are of special interest, since they have been shown to be the surviving forms of a group species which have been identified from Jurassic and Cretaceous rocks. The living species have a long rhizome, from the upper surface of which most of the leaves and leaf-bases are branched in a pedate manner, each branch being pinnate. The structure of the rhizome is complicated, a transverse section showing that the centre may be occupied by a solid core, outside of which are two tubular steles. The sori are borne on the upper surface of the pinnae,
each consisting of a single series of large sporangia covered by a coriaceous indusium, which is attached to the central part of the receptacle. The sporangium, which corresponds on the whole to that of the Gleicheniaceae, has a somewhat oblique annulus; the dehiscence is also not truly median. The gametophyte is unknown.

Loxsomaceae.—The single genus Loxosoma has a tubular stele in its rhizome, which bears leaves resembling those of some Davallias. The elongated receptacle of the marginal sori is surrounded by a basal cup-shaped indusium, which are dehiscent by a slit, the annulus being somewhat oblique; they have resemblances to the Gleicheniaceae. When mature, the sporangia are raised above the margin of the basal cup-shaped indusium, or contained in the rhizome. The sori, which are marginal, have a long receptacle, bearing the sporangia in basipetal succession, and are surrounded by a cup-shaped Indusium. The sporangia present a considerable range; the largest being found in species of _Trichomanes_. The annulus of _Trichomanes_ is ovate to reniform, the probably largest, but in other species it is reniform, being somewhat brown. The rhizome and antheridia present points of similarity to those of the Gleicheniaceae.

Cyatheaceae.—This order includes the majority of existing treeferns, as well as some of smaller size. The stem has a ring of flattened steles. The sori have a somewhat elongated receptacle, on which the sporangia arise basipetally; the indusium may be cup-shaped, bilobed, or undivided, and the sporangia, which arise in straight or transverse, as in the Polypodiaceae, but the annulus is slightly oblique. The prothallia correspond to those of the next group.

Polypodiaceae.—This group, which contains the remaining ferns, includes a number of distinct lines of descent and will doubtless require subdivision as our knowledge of the morphology of the genera classed in it becomes extended. Space will not allow of an account of this order being included in this memoir. The stem in the more primitive forms has a tubular stele (solonestele); for the most part two to many steles, arranged in a ring (dicyctostele). In a number of genera, which there is reason to regard as relatively primitive, the stems are simple, and the prothallia are more or less reduced in the preceding groups; in the great majority, however, the succession is not regular, but those of various ages are intermixed in the sori (fig. 2, g). The sporangia dehisce by a transverse slit, the annulus being truly vertical or, in some of the _Dryopteris_ in which they are regularly arranged, very slightly oblique. The structure of the prothallus and sexual organs will be evident from figs. 7, 8 and 9; some of the more interesting modifications have been referred to above.

Our knowledge of the extinct Filicales cannot be readily summarized, since it is in a transition state, owing to the recent evidence which has shown that many of the fern-like plants of the Palaeozoic period belonged to a group of seed-bearing plants descended from a distinct and ancient ancestry. There is, however, abundant evidence that the Filicales were a distinct class, characters of which are traceable in the existing Filicales, but which were dominant in the flora of the Carboniferous period. The majority of the stems of the Carboniferous Filicales are incomplete, the perichlamydes and rhizomes being entirely wanting. The microspores are usually large, and appear to have been of great importance in the life-history of these plants. The spores of some of the Carboniferous Filicales resemble those of the Filicaceae of the more recent geological periods, and the general features of the anatomy of the Carboniferous Filicales have a decided resemblance to that of the Filicaceae. The Filicales were a very important class of plants in the Carboniferous period, and their remains are found in great abundance in the coal-measures of Europe and America.

1. The Filicaceae include the two genera Salvinia (fig. 10) and Azolla. The small dorsiventral plants are in both cases floating aquatics. _Azolla_ has roots depending from the lower surface of the stem into the water, while these organs are completely wanting in _Salvinia_, their place being taken functionally by highly divided leaves. When the survey is extended to the extinct Filicaceae, and those of which the fructification is known, many of those from the more ancient rocks are found to group themselves with the existing sub-orders with large sporangia, such as the Marattiaceae, Gleicheniaceae and Schizaeaceae; the Polypodiaceae, on the other hand, do not appear until much later. The extinct forms cannot be dealt with in detail here; but it may be pointed out that their order of appearance affords a certain amount of direct evidence that the existing Ferns with a single circle of large sporangia in the sori are relatively primitive. The series which can be constructed from a study of the sori is in general supported by the anatomy of the sporophyte, and by the structure and sexual organs of the gametophyte. A more detailed investigation of all the characters of the Ferns will be needed before the course of evolution thus broadly indicated can be traced, but the results obtained afford a deeper insight into the general method of progression and the selective factors in the process. On the ground mainly of an examination of the sori and sporangium, Bower has shown that the Filicales may be divided into three groups—the Simplices, Gradatae and Mixtae—in which the sporangia arise simultaneously, in basipetal succession, or irregularly in the sori respectively. The first includes the Marattiaceae, Osmundaceae, Schizaceae, Gleicheniaceae and Matoniaceae; the second the Loxsomaceae, Hymenophyllaceae, Cyatheaceae and the Dennstaedtiaceae (a group including species placed in the Synopsis Filicum in Dicksonia and Lepidopteris); while the remaining Polypodiaceae constitute the Mixtae. The changes or to some other theory of the Gradatae may have taken place in several different lines of descent, some of which have been traced. A consideration of the biology of the sori gives an insight into the advantages obtained by the one type over the preceding, as regards protection, spore production and the dispersal of the spores, and thus indicates the way in which natural selection may have acted. The differences in the form and mode of dehiscence of the sporangia (those of the Simplices having median dehiscence and a horizontal annulus, those of the Gradatae a more or less oblique position of the annulus and of the plane of dehiscence, while in the Mixtae the dehiscence is both median and lateral), and the number of sporangia (3 in transverse) stand in relation to the position of the sporangia in the stem and their contact with one another. The application of the important criteria which Bower has thus pointed out to the construction of a strictly phylogenetic classification of the Filicales cannot be made until the anatomy, the sexual generation and the palaeobotanical evidence have been further examined from this point of view. Though on this account and because the subdivisions Simplices, Gradatae and Mixtae do not correspond to definite phylogenetic groups, they have not been used in classifying the Ferns above; they are of great importance as an advance towards a natural classification.

Hydropteridae.—Two very distinct orders of heterosporous Filicales, the Salviniaceae and the Marsiliaceae, are included in this group. The difficulty of determining their exact relationship to the other orders of Ferns is increased by the more or less completely aquatic habit of the plants and the modifications and reductions in structure associated with this. The absence of an annulus from their indehiscent sporangia makes it impossible to compare them with the other Ferns in respect of this important character. It has been suggested with considerable probability that the Marsiliaceae are allied to the Schizaceae, while the Salviniaceae may possibly be related to the Hymenophyllaceae, although there is no certain evidence of this. Space will only permit of a brief general account of the more obvious features of the several genera, the structure and life-history of which are known in great detail. Unlike as they are in many respects, the two orders agree in being heterosporous. The microspores on germination produce a small, greatly reduced male prothallus bearing one or two antheridia which give rise to a number of spirally coiled, multiloculate spermatozoids. The single large megaspore contained in each megasporangium produces a small prothallus, which bears one or a few archeonia; these are exposed on the surface of the prothallus at the summit of the germinated megaspore (fig. 1, i).
there is only the one terminal, functional sporangium. The microspores are united by means of hardened protoplasm into one or more masses, while the solitary megaspores have a more or less complicated episporium.

If, as has been suggested by Bower, the strobiloid types are relatively primitive, the large-leaved Pteridophyta must be supposed to have arisen early from such forms. The question cannot be discussed fully here, but enough has been said above to show that in the light of our present knowledge the main phyla of the Vascular Cryptogams cannot be placed in any serial relation to one another.

It may even be regarded as an open question whether some of them may not have arisen independently and represent parallel lines of evolution from Bryophytic or Algal forms. This leads us to consider the question whether any indications exist as to the manner in which the Pteridophyta arose. It will be evident that no direct record of this evolution can be expected, and recourse must be had to hypotheses founded on the indirect evidence available. There appears to be no reason to doubt that the sexual generation is homologous with the thallus of a Liverwort, or of such an Alga as Coleochætes. It is with regard to the origin of the spore-bearing generation of the Pteridophyta that differences of opinion exist. This, though at first dependent on the prothallus, soon becomes independent. It may be regarded as derived from a wholly dependent sporogonium not unlike that of some of the simpler Bryophyta; the latter are assumed to have arisen from primitive Algal forms, in which, as the first step in the interpolation of the second generation in the life cycle, the fertilized ovum gave rise to a group of swarm spores, each of which developed into a new sexual plant. On this view the origin of the sporophyte is looked for in the gradual development of sterile tissue in the generation arising from the fertilized ovum, and a consequent postponement of spore-formation. Certain green Algae (e.g. Oedogonium, Coleochætes), the Bryophyta, and the simpler Pteridophyta, such as Phylloglossum, have been regarded as illustrating the method of progression, though there is no reason to regard the existing forms as constituting an actual series. For a discussion of this view, which regards the alternation of generations in Pteridophytes as antiethic and the two generations as not homologous with one another, reference may be made to the works of Celakovsky and Bower. Although the antiethic theory is supported by many facts regarding the life-history and structure of the group of plants under consideration, it is quite possible that a stage in which the sporophyte was wholly dependent on the gametophyte may never have been passed through in their evolution. The spore-bearing generation may throughout its phylogenetic history have been independent at one part of its life, and have been derived by modification of individuals homologous with those of the sexual generation, and not by the progressive sterilization of a structure the whole of which was originally devoted to asexal reproduction. A number of facts regarding the Algae, and also those relating to such deviations from the normal life cycle as apogamy or apospory, may be regarded as lending support to this view, which, in contrast to the theory of antiethic alternation, has been called that of homologous alternation. Without entering further into the discussion of these alternative theories, for which the literature of the subject must be consulted, it may be pointed out that on the latter view the strobiloid forms of Pteridophyta would not necessarily be regarded as primitive relatively to the large-leaved forms, and also that the early stages of the origin of the sporophyte in the two cases may have proceeded on different lines.

Another question of great interest, which can only be touched upon here and may fitly close the consideration of this division of the Vegetable Kingdom, is the evidence as to the derivation of higher groups from the Pteridophyta. The most important positive evidence on this point indicates that the most ancient Gymnosperms were derived from the Filicales rather than from any other phylum of the Vascular Cryptogams. Extinct forms are known intermediate between the Ferns and the Cycads, and a number of these have been shown to bear seeds and must be classed as Pteridospermae. These forms will, however, be found discussed in the articles treating of extinct plants and the Gymnosperms, but their recognition will serve

Phyllogeny.

The several phyla of Pteridophyta having now been briefly described, their relationship to one another remains for consideration. The available evidence does not suffice to solve this question, although certain indications exist. In the earliest land vegetations of which we have any sufficient record specialized forms of Equisetales, Lycopodiales, Sphenophyllales and Filicales existed, so that we are reduced to hypotheses founded on the careful comparison of the recent and extinct members of these groups. In this connexion it may be pointed out that the fuller study of the extinct forms has as yet been of most use in emphasizing the difficulty of the questions at issue. It has thus led to a condition of uncertainty as regards the relationship of the great groups of Vascular Cryptogams, in which, however, lies the hope of an ultimate approach to a satisfactory solution. The study of the Sphenophyllales, however, as has been pointed out above, appears to indicate that the Equisetales and Lycopodiales may be traced back to a common ancestry. As to the relationship of the Filicales to the other phyla, evidence from extinct plants appears to be wanting.
to emphasize, in conclusion, the important position the Pteridophyta hold with regard to the existing flora.

Cultivation.—Numerous species of ferns, both temperate and tropical, are cultivated as valued ornamental plants. Species of the other orders, however, are occasionally grown for scientific purposes in the larger botanic gardens, but their cultivation, which often presents special difficulties, need not be referred to here. While a number of ferns can be multiplied vegetatively, by buds formed on the leaves and later transferred to the soil, the regular mode of propagation in most such cases is by spores shed from the ripe sporangia. The spores should be thinly sprinkled on the surface of the soil in well-drained pots, which should stand in a cool greenhouse with water occasionally sprayed. In the potting shed the young plants may be kept in pots provided they are not overcrowded; the older plants, after they have attained reasonable size, should be transferred to 3-in. pots. When the pots are fairly filled with roots the plants may be shifted into larger ones.

The best time for a general repotting of ferns is in spring, just before growth commences. Those with creeping rhizomes can be propagated by dividing these into well-rooted portions, and if a number of crowns is formed, they can be divided at that season. In most cases this can be performed with little risk, but the Glechome species, for example, must only be cut into large portions, as small divisions of the rhizomes are almost certain to die; in such cases, however, the points of the rhizomes can be led over and layered into small masses of soil, in which they will remain unwatered from the parent plant until they become well rooted. In potting the well-established plants, and all those of considerable size, the soil should be used in a rough turfy state, not sifted but broken, and the mixture of broken crocks or charcoal and as much sand as will insure free percolation should be mixed with it.

The stone ferns require a day temperature of 65° to 75°, but do not thrive in an excessively high or close dry atmosphere. They require a night shade, as will shut out the direct rays of the sun, and, though abundant moisture must be supplied, the atmosphere should not be loaded with it. The water used should always be at or near the temperature of the house in which the plants are growing. Some ferns, as the different kinds of Gymnogramme and Cheilanthes, prefer a drier atmosphere than others, and the former do not well bear a lower winter temperature than about 60° by night. Most other ferns, if not too dry, will thrive at a temperature even of 55° by night and 60° by day from November to February. About the end of the latter month the whole collection should be turned out of the pots and redrained or repotted into larger pots as required. This should take place before growth has commenced. Towards the end of March the night temperature may be raised to 60°, and the day temperature to 70° or 75°, the plants being shaded in bright weather. Such ferns as Gymnogramme, which have their surface covered for example, with golden or silver powdery, and certain species of scale-covered Cheilanthes and Nothochloaena, as they cannot bear to have their fronds wetted, should never be syringed; but most other ferns may be syringed occasionally (not more than once daily), and as the season advances sufficient air and light must be admitted.

(W. H. L.)

PTEROBANCHIA, a zoological group established by Ray Lankester in 1887. It contained at that time the single genus Rhodopelura, a minute animal dredged by Sars off the Lofoten Islands, and by Nornan off the Shetlands. Rhodopelura was at first regarded as an aberrant Polyzoa, but with the publication of the Challenger Report (Cephalodiscus) in 1887, it became clear that Cephalodiscus, the second genus now included in the order, had affinities in the direction of the Enteropneusta. The connexion of the Pterobranchia with the Polyzoa is in the highest degree questionable.

Rhodopelura is no doubt of world-wide distribution, since it has been recorded in various localities from Greenland to South Australia, usually in water of not less than forty fathoms. Cephalodiscus, which for many years was known solely as the result of a single dredging by the "Challenger" from 245 fathoms in the Straits of Magellan, has recently been found in entirely different parts of the world, as for instance between Japan and Korea at 100 fathoms, at about half that depth off the south-east coast of Celebes, and between tide-marks on the coast of Borneo.

It appears to be common in the neighbourhood of Cape Town, while the recent Antarctic expeditions have shown that it occurs in various localities from the Falkland Islands to the Antarctic circle. No less than twelve species, referred to three sub-genera (Demosiochea, Idiochea, Orthoeux), have now been described; but it is at present uncertain whether more than a single species of Rhodopelura is valid, although several specific names have been suggested for specimens from different localities.

Both genera are characterized by their habit of secreting a tubular gelatinoid investment, the "coenoeicum," composed of a number of superposed lamellae, doubtless the result of its intermittent secretion, mainly though perhaps not exclusively, by the proboscides of the zooids. In Rhodopelura each zooid forms its own delicate tube composed of a characteristic series of distinct rings. In Cephalodiscus the coenoeicum is more massive, and may contain a continuous irregular cavity in which the zooids live (Demosiochea), or may be secreted in such a way that each zooid has its own independent tube (Idiochea, Orthoeux).

The zooids are a modification of the type of structure known in Balanoglossus, from which they differ principally in the following respects: (i) The alimentary canal, instead of being straight, has a U-shaped flexure, the dorsal line between the mouth and the anus being short. (ii) The proboscis (fig. 1, b), known as the "beak shield," is a large organ, strongly flattened in an antero-posterior direction, its ventral edge usually concealing the mouth. (iii) The collar is produced dorsally into arms (one pair in Rhodopelura, four to eight pairs in Cephalodiscus), each of which bears numerous ciliated tentacles, the organs by which the microscopic food-particles are conveyed to the mouth. (iv) The third division of the body, the metasome, is prolonged ventrally into a relatively enormous outgrowth containing the loop of the alimentary canal, beyond which projects a stalk (fig. 1, e), of a length varying with the state of contraction and perhaps with the species. (v) The stalk gives rise to buds, by which the colonial habit is acquired. While in Rhodopelura the buds remain in organic continuity with the parent, in Cephalodiscus they become free at an early stage, and the coenoeicum accordingly contains a number of separate individuals. In the living Cephalodiscus a zooid can crawl by means of its proboscis over the gelatinous processes of the outer side of the coenoeicum, a position which it can assume owing to the very great extensibility of the stalk, the proximal sectorial end of which remains attached to the inner surface of some part of the coenoeicum (Anderssen, 1897).

In correspondence with the fundamental constitution of the zooid, each of the three segments has its own body-cavity separated from the others. The main proboscis-cavity (fig. 2, b-c) is unpaired, openings to the exterior by the two proboscis pores (p-p). It contains a closed vesicle regarded by Schepetoff as a right proboscis-cavity and in any case representing the pericardium of Balanoglossus, the gomphures of which is also probably represented. The collar-cavity (b-c) is paired, although its ventral mesentery is not complete. It extends into the arms, which originate in the bud (fig. 1) as dorsal outgrowths of the collar. The ventral and lateral parts of the anterior

margin of the collar constitute the so-called operculum (ep.), a structure which not only acts as a lower lip, but must be important in separating the food-current produced by the cilia of the tentacles from the external apertures of the collar-canal and Gill-slits. The collar-canal (fig. 3, c.p.) are a pair of ovoid organs which open from the collar-cavity to the exterior, their external pores lying immediately behind the base of the operculum.

While it is not improbable that the collar-pores and the proboscis-pores may evacuate excretory substances, there can be little doubt that their primary functions is to regulate the turbidity of the segment to which they respectively belong. A pair of Gill-slits (fig. 3, g.s.), which do not occur in Rhabdopleura, open immediately behind the collar-pores. It is probable that they serve to strain off the superficial water which is introduced into the mouth during the process of feeding. An anterior median diverticulum of the pharynx (fig. 2, n.ch.), growing forwards in the septum between the proboscis-cavity and the collar-cavities, and supported dorsally by the median mesentery of the collar, is the representative of the so-called notochord or stomochord of Balanoglossus; and if the view that this organ is really a notochord is well founded, it may be regarded as the homologue of the anterior end of the Vertebrate notochord.

The mesosome contains nearly the whole of the alimentary canal, in which pharynx (fig. 2, p.h.), osophagus (o.e.s.), stomach (s.c.) and intestine (int.) may be distinguished. The remarkable position of the anus (a) on the dorsal side has already been alluded to. The metameric cavities are divided by dorsal (fig. 3, d.mes.) and ventral mesenteries, the latter following the outer curvature of the loop of the alimentary canal. The most conspicuous blood vessel possessed by Cephalodiscus is the dorsal vessel (d.b.v.). A ventral vessel occurs on the anterior side of the mesosome and forms a loop extending down the entire length of the stalk, while a "heart" projects into the cavity of the pericardium, probably connected on the ventral side of the notochord with the ventral vessel, and on its dorsal side with the dorsal vessel. At their opposite ends the dorsal and ventral vessels are probably connected with one another by means of a splanchic sinus surrounding the stomach. The original specimen of C. dodecalophus contained exclusively female zooids, in which a single pair of ovaries (figs. 2, 3, m.) lie in the metameric cavities, and open to the exterior dorsally by short, highly pigmented oviducts (fig. 2, ovd.). In C. nigrescens and in some other cephalodiscids, there may be a pair of ovaries, a pair of testes, or an ovary and a testis, although the males, females and hermaphrodites do not differ from one another in external characters. In C. sibogae (Celebes) the single colony known is of the male sex. The reproductive individuals have undergone an extraordinary simplification of the organs concerned with the collection and digestion of food. Thus the arms are reduced to a single pair and possess no tentacles, there is no definite operculum, and the alimentary canal is vestigial, so that the testes, which correspond in position with the ovaries of a female Cephalodiscus, combine with the greater part of the alimentary canal of the animal. Associated with these males are neuter zooids, which usually possess no functional reproductive organs, but have in other respects the structure of an ordinary female Cephalodiscus. It appears probable that there is a vascular connection between these and the male individuals, which thus derive their nutrition from the neuers. The reproductive organs of Rhabdopleura have been seldom observed. They resemble those of Cephalodiscus in structure and in position, except that in each sex the gonad occurs on the right side of the body only (Scheptotieff, 1896).

The eggs of Cephalodiscus (fig. 3, e.) possess a large amount of ep., yol, and it is probable, g.s., that there is no intestinal diverticulum in the pelagic larval form. The embryos are hatched in an m., early stage, but the metasome or morphosis has not been p.c.h. observed. The early development appears to resemble that of the larval zooid species of Balanoglossus. In the bud-development, the three segmented condition is extremely conspicuous, with a lining of c.e., and the relative size of the proboscis (fig. 1). A considerable part of the alimentary canal is said to be derived from the ectoderm in the buds of both Cephalodiscus and Rhabdopleura. Scheptotieff (1896) states that in the young buds of the latter the central part of the alimentary canal is developed from cells which are apparently not of ectodermal origin.

The affinity of the Pterobranchia to the Enteropneusta may be regarded as definitely established. Considering the wide differences between the two groups in the size and external characters, and in the mode of life, including the mode of feeding, it is not surprising that in every important organ the two groups should show a fundamental morphologic identity.

Their relations to Phoronis are doubtful (see Phoronidea). The question of their affinity to other divisions of the animal kingdom depends principally on the views which are held with regard to the relationships of the Enteropneusta and Phoronidea respectively. The suggestion has been made by Allman and recently upheld by Scheptotieff that Rhabdopleura is related to some of the Graptolites.

PTERODACTYLES (Gr. for wing-fingers), an exact term used by Pliny for the pterodactyl or wing of Massolus, which was raised on a lofty podium, and so differed from an ordinary pestle raised only on a stylobate, as in Greek temples, or on a low podium, as in Roman temples.

PTOLEMAEUS, of Alexandria, surnamed Chennus, Greek grammarian during the reigns of Trajan and Hadrian. According to Suidas, he was the author of an historical drama named *Sphinx*, of an epic, *Anthomeros*, in 24 books (both lost) and a *Strange History*. The last is probably identical with the work of which an abridgment has been preserved in Photius (cod. 196). It contains a medley of all sorts of legends and fables belonging to both the mythological and historical periods. It is probable that Chennus was used in a lost treatise on the life and works of Aristotle, ascribed to "Ptolemaeus" in an Arabic list of his works, taken from a Syriac version of the Greek original (A. Baumbark, *Aristotels bei den Syrern vom v.-viii. Jahrh.* Leipzig, 1900).

PTOLEMIES, a dynasty of Macedonian kings who ruled in Egypt from 332 to 30 B.C. The founder, Ptolemy (Πτολεμαῖος), son of Lagus, a Macedonian nobleman of Eordaeus, was one of Alexander the Great's most trusted generals, and among the seven "body-guards" attached to his person. He plays a principal part in the later campaigns of Alexander in Afghanistan and India. At the Susa marriage festival in 324 Alexander caused him to marry the Persian princess Artacama; but there is no further mention of this Asiatic bride in the history of Ptolemy. When Alexander died in 323 the resettlement of the empire at Babylon is said to have been made at Ptolemy's instigation. At any rate he was now appointed satrap of Egypt under the nominal kings Philip Arrhidæus and the young Alexander. He at once took a high hand in the province by killing Cleomenes, the financial controller appointed by Alexander the Great; he also subjugated Cyrenaica, which was to be interred with great pomp by the imperial government and placed it temporarily in Memphis. This act led to an open rupture between Ptolemy and the imperial regiment. But Perdiccas perished in the attempt to invade Egypt (321). In the long wars between the different Macedonian chiefs which followed, Ptolemy's first object is to hold his position in Egypt securely, and secondly to possess the Cyrenaica, Cyprus and Palestine (Cœle-Syria). His first occupation of Palestine was in 318, and he established at the same time a protectorate over the petty kingdoms of Cyprus. When Antigonus, master of Asia in 315, showed dangerous ambitions, Ptolemy joined the coalition against him, and, on the outbreak of war, evacuated Palestine. In Cyprus he fought the partisans of Antigonus and reconquered the island (313). A revolt of Cyrene was crushed in the same year. In 312 Ptolemy, with Seleucus, the fugitive satrap of Babylonia, invaded Palestine and beat Demetrius, the son of Antigonus, in the great battle of Gaza. Again he occupied Palestine, and again a few months later, after Demetrius had won a battle over his general and Antigonus entered Syria in force, he evacuated it. In 311 a peace was concluded between the combatants, soon after which the surviving king Alexander was deposed and restored to his kingdom of Macedonia, leaving the satrap of Egypt absolutely his own master. The peace did not last long, and in 309 Ptolemy commanded a fleet in person which detached the coast towns of Lycia and Caria from Antigonus and crossed to Greece, where Ptolemy took possession of Corinth, Sicyon and Megara (308). In 306 a great fleet under Demetrius attacked Cyprus, and Ptolemy's brother, Menelaus, was defeated and captured in the decisive battle of Salamis. The complete loss of Cyprus followed. Antigonus and Demetrius
now assumed the title of kings; Ptolemy, as well as Cassander, Lysimachus and Seleucus, answered this challenge by doing the same. In the winter (306–5) Antigonus tried to follow up the victory of Cyprus by invading Egypt, but here Ptolemy was strong, and held the frontier successfully against him. Ptolemy led no further expedition against Antigonus overseas. To the Rhodians, besieged by Demetrius (305–4), he sent such gifts as won him divine honours in Rhodes and the surname of Soter ("saviour"). When the coalition was renewed against Antigonus in 302, Ptolemy joined it, and invaded Palestine a third time, whilst Antigonus was engaged with Lysimachus in Asia Minor. On a report that Antigonus had won a decisive victory, for a third time he evacuated the country. But when news came that Antigonus had been defeated and slain at Ipsus (301) by Lysimachus and Seleucus, Ptolemy occupied Palestine for the fourth time. The other members of the coalition had assigned Palestine to Seleucus after what they regarded as Ptolemy's desertion, and for the next hundred years the question of its ownership becomes the standing ground of enmity between the Seleucid and Ptolemaic dynasties. Henceforth, Ptolemy seems to have mingled as little as possible in the broils of Asia Minor and Greece; his possessions in Greece he did not retain, but Cyprus he reconquered in 295–4. Cyrene, after a series of rebellions, was finally subjugated about 300 and placed under his stepson Magas (Beloch, Griech. Gesch. III. [ii], p. 135 seq.). In 285 he abdicated in favour of one of his younger sons by Berenice (q.v.), who bore his father's name of Ptolemy; his eldest (legitimate) son, Ptolemy Ceraunus, whose mother, Eurydice, the daughter of Antipater, had been repudiated, fled to the court of Lysimachus. Ptolemy I. Soter died at the age of 84. Shrewd and cautious, he had a compact and well-ordered realm to show at the end of fifty years of wars. His name for bonhomie and liberality attached the floating soldier-class of Macedonians and Greeks to his service. Nor did he neglect conciliation of the natives. He was a ready patron of letters, and the great library, which was Alexandria's glory, owed to him its inception. He wrote himself a history of Alexander's campaigns, distinguished by its straightforward honesty and sobriety.

Ptolemy II. Philadelphus (309–246), was of a delicate constitution, no Macedonian warrior-chief of the old style. His brother Ptolemy Ceraunus found compensation by becoming king in Macedonia in 281, and perished in the Gallic invasion of 280–79 (see Brennus). Ptolemy II. maintained a splendid court in Alexandria. Not that Egypt held aloof from wars. Magas of Cyrene opened war on his half-brother (274), and Antiochus I., the son of Seleucus, desiring Palestine, attacked soon after. Two or three years of war left Egypt the dominant naval power of the eastern Mediterranean; the Ptolemaic sphere of power extended over the Cyclades to Samothrace, and the harbours and coast towns of Cilicia Trachea ("Rough Cilicia"), Pamphylia, Lycia and Caria were largely in Ptolemy's hands (Theoc. Idyl. xvii. 86 seq.). The victory won by Antigonus, King of Macedonia, over his fleet at Cos (between 258–56; see Beloch, III. [ii], p. 428 seq.) did not long interrupt his command of the Aegean. In a second war with the Seleucid kingdom, under Antiochus II. (after 260), Ptolemy sustained losses on the sea-board of Asia Minor and agreed to a peace by which Antiochus married his daughter Berenice (250?). Ptolemy's first wife, Arsinoë (I.), daughter of Lysimachus, was the mother of his legitimate children. After her repudiation he married, probably for political reasons, his full-sister Arsinoë (II.), the widow of Lysimachus, by an Egyptian custom abhorrent to Greek morality. The marriage and life of the Alexandrian court was at its height under Ptolemy II. Pomegranates and gay religions flourished. Ptolemy defied his parents as the θεός Δίακολος, and his sister-wife, after her death (270), as Philadelphus. This surname was used in later generations to distinguish Ptolemy II. himself, but properly it belongs to Arsinoë only, not to the king. Callimachus, made keeper of the library, Theocritus, and a host of lesser poets, glorified the Ptolemaic family. Ptolemy himself was eager to increase the library and to patronize scientific research. He had the strange beasts of far-off lands sent to Alexandria. But, an enthusiast for Hellenic culture, he seems to have shown but little interest in the native religion. The tradition which connects the Septuagint translation of the Old Testament into Greek with his name is not historical. Ptolemy had many brilliant mistresses, and this youthful amorousness was magnified by later writers. Ptolemy's reign, in fact, has been justly compared with the Versailles of Louis XIV.

Ptolemy III. Euergetes I. (reigned 246–221), son of Ptolemy II. and Arsinoë I. At the beginning of his reign he reunited the Cyrenaica to Egypt by marrying Berenice the daughter and successor of Magas (who had died about 250). At the same time he was obliged to open war on the Seleucid kingdom, where Antiochus II. was dead and his brother Berenice had been murdered, together with her infant son, by Antiochus's former wife, Laodice, who claimed the kingdom for her son Seleucus II. Ptolemy marched triumphantly into the heart of the Seleucid realm, as far at any rate as Babylon, and received the formal submission of the provinces of Iran, while his fleets in the Aegean recovered what his father had lost upon the seaboard, and made fresh conquests as far as Thrace. This moment marks the zenith of the Ptolemaic power. After Ptolemy returned home, indeed, Seleucus regained northern Syria and the eastern provinces, but the naval predominance of Egypt in the Aegean remained, although there are traces of its being replaced locally, towards the end of Euergetes' reign, by that of Macedonia in Asia—amongst Eumenes, Naxos, Syros, Nisyros, Cos and parts of Crete (see Beloch, III. [iii], p. 635). After his final peace with Seleucus, Ptolemy no longer engaged actively in war, although his forces might occasionally mingle in the broils of Asia Minor, and he supported the enemies of Macedonia in Greece. It seems probable that his internal policy differed from his father's in patronizing the native religion more liberally; he has left larger traces at any rate among the monuments that are known to-day.

Ptolemy IV. Philopator (reigned 221–204), son of the preceding, was a wretched debauchee under whom the decline of the Ptolemaic kingdom began. His reign was inaugurated by the murder of his mother, and he was always under the dominion of favourites, male and female, who indulged his vices and conducted the government as they pleased. Self-interest led his ministers to make serious preparations to meet the attacks of Antiochus III. of Egypt and Palestine, and the great Egyptian victory of Raphia (217), at which Ptolemy himself was present, secured the province till the next reign. The arming of Egyptians in this campaign had a disturbing effect upon the native population of Egypt, so that rebellions were continuous for the next thirty years. Philopator was devoted to orgiastic forms of religion and literary diletantism. He built a temple to Homer and composed a tragedy, to which his vile favourite Agathocles added a commentary. He married (about 215) his sister Arsinoë (III.), but continued to be ruled by his mistress Agathoclea, sister of Agathocles.

Ptolemy V. Epiphanes (reigned 204–181), son of Philopator and Arsinoë, was not more than five years old when he came to the throne, and under a series of Regents the kingdom was paralysed. Antiochus III. and Philip V. of Macedonia made a compact to divide the Ptolemaic possessions overseas. Philip seized several islands and places in Caria and Thrace, whilst the battle of Panium (198) definitely transferred Palestine from the Ptolemies to the Seleucids. Antiochus after this concluded peace, giving his own daughter Cleopatra to Epiphanes to wife (193–192). Nevertheless, when war broke out between Antiochus and Rome Egypt ranged itself with the latter power. Epiphanes in manhood was chiefly remarkable as a passionate sportsman; he exceded in athletic exercises, and the scars and perjury were displayed in the suppression of the native rebellion, and some accounts represent him as personally tyrannical.

The elder of his two sons, Ptolemy VI. Philometor (181–145), succeeded as an infant under the regency of his mother Cleopatra. Her death was followed by a rupture between the Ptolemaic and Seleucid courts, on the old question of Palestine.
Antiochus IV. Epiphanes invaded Egypt (170) and captured Philometor. The Alexandrians then put his younger brother Ptolemy VII. Euergetes II. (afterwards nicknamed Physkon, on account of his bloated appearance) upon the throne. Antiochus professed to support Eupator, but, when he withdrew, the brothers agreed to the joint-kingship with their brother Euergetes, and the son and wife of Philometor. Antiochus again invaded Egypt (168), but was compelled by the Roman intervention to retire. The double kingship led to quarrels between the two brothers in which fresh appeals were continually made to Rome. In 163 the Cyrenaica was assigned under Roman arbitration to Euergetes as a separate kingdom. As he coveted Cyprus as well, the feud still went on, Rome continuing to interfere diplomatically but not effectively. In 154 Euergetes invaded Cyprus but was defeated and captured by Philometor. He found his brother, however, willing to pardon and was allowed to return as king to Cyrene. In 152 Philometor joined the coalition against the Seleucid king Demetrius I. and was the main agent in his destruction. The protégé of the coalition, Alexander Balas, married Philometor’s daughter Cleopatra (Thea), and reigned in Syria in practical subservience to him. But in 147 Philometor broke with him and transferred his support, together with the person of Cleopatra, to Demetrius II., the young son of Demetrius I. He himself at Antioch was entreated by the people to assume the Seleucid diadem, but he declined and installed Demetrius as king. In 145 in the battle on the Omoparas near Antioch, in which Alexander Balas was finally defeated, Philometor received a mortal wound. Philometor was perhaps the best of the Ptolemies. Kindly and reasonable, his good nature seems sometimes to have verged on Indiana, but he at any rate took personal part, and that bravely and successfully, in war.

Philometor’s infant son, Ptolemy Philopator Neos (?), was proclaimed king in Alexandria under the regency of his mother Cleopatra. Euergetes however, swooping from Cyrene, seized the throne and married Cleopatra, making away with his nephew. He has left an odious picture of himself in the historians—a man untouched by benefits or natural affection, delighting in deeds of blood, his body as loathsome in his blown corpulence as his soul. Something must be allowed for the rhetorical habit of our authorities, but that Euergetes was ready enough to shed blood when policy required seems true. He soon found a more agreeable wife than Cleopatra in her daughter Cleopatra, and thenceforth antagonism between the two queens, the “sister” and the “wife,” was chronic. In 130–1 Cleopatra succeeded in driving Euergetes for a time to Cyprus, when he revenged himself by murdering the son whom she had borne him (surnamed Memphites). Massacres inflicted upon the Alexandrians and the expulsion of the representatives of Hellenic culture are laid to his charge. On the other hand, the monument and papyri show him a liberal patron of the native religion and a considerable administrator. In fact, while hated by the Greeks, he seems to have had the steady support of the native population. But there are also records which show him, not as an enemy, but a friend, like his ancestors, to Greek culture. He himself published the fruit of his studies and travels in a voluminous collection of notebooks, in which he showed a lively eye for the oddities of his fellow kings. The old Ptolemaic realm was never again a unity after the death of Euergetes II. By his will he left the Cyrenaica as a separate kingdom to his illegitimate son Ptolemy Apion (116–90), whilst Egypt and Cyprus were bequeathed to Cleopatra (Kokke) and whichever of his two sons by her, Ptolemy VIII. Euergetes (nicknamed Philopator) and Ptolemy IX. Alexander I., she might choose as her associate. The result was, of course, a long period of domestic strife. From 116 to 108 Soter reigned with his mother, and at enmity with her, in Egypt, whilst her favourite son, Alexander, ruled Cyprus. Cleopatra compelled Soter to divorce his sister-wife Cleopatra and marry another sister, Selene. Cleopatra plunged into the broils of the Seleucid house in Syria and perished. In 108 Cleopatra Kokke called Alexander to Egypt, and Soter flying to Cyprus took his brother’s place and held the island against his mother’s forces. The attempts which Soter and Cleopatra respectively made in 104–3 to obtain a predominance in Palestine came to nothing. Alexander now shook off his mother’s yoke and married Sosandra, the daughter of the Demonicus, Cleopatra Kokke died in 101 and from then till 89 Alexander reigned in Cyprus alone. In 89 he was expelled by a popular uprising and perished the following year in a sea-fight with the Alexandrian ships off Cyprus. Soter was recalled (88) and reigned over Egypt and Cyprus, now reunited, in association with his daughter Berenice. This, his second; reign in Egypt (88–80), was marked by a native rebellion which issued in the destruction of Thebes. On his death Berenice assumed the government, but the son of Alexander I., Ptolemy X. Alexander II., entering Alexandria under Roman patronage, married, and within twenty days assassinated, his elderly cousin and stepmother. He was at once killed by the enraged people and with him the Ptolemaic family in the legitimate male line became extinct. Ptolemy Apion meanwhile, dying in 96, had bequeathed the Cyrenaica to Rome. The Alexandrian people now chose an illegitimate son of Soter II. to be their king, Ptolemy XI. Philopator Philadelphus Neos Diouysus, nicknamed Auletes, the flute-player (80–51), setting his brother as king in Cyprus. The rights of these kings were doubtful, not only because of their illegitimate birth, but because it was claimed in Rome that Alexander II. had bequeathed his kingdom to the Roman people. Two Seleucid princes, children of Soter’s sister Selene, appeared in Rome in 73 to urge their claim to the Ptolemaic throne. Ptolemy Auletes was thus obliged to spend his reign in buying the support of the men in power in Rome. Cyprus was annexed by Rome in 38, its king committing suicide. From 58 to 55 Auletes was in exile, driven out by popular hatred, and worked by bribery and murder in Rome to get himself restored to Roman power. His daughter Berenice meanwhile reigned in Alexandria, a husband being found for her in the Pontic prince Archelaus. In 55 Auletes was restored by the proconsul of Syria, Aulus Gabinius. He killed Berenice and, dying in 51, bequeathed the kingdom to his eldest son, aged ten years, who was to take as wife his sister Cleopatra, aged seventeen. In the reign of Ptolemy XII. Philopator (51–47) and Cleopatra Philopator, Egyptian history coalesces with the general history of the Roman world, owing to the murder of Pompey off Pselidum in 48 and the Alexandrine War of Julius Caesar (48–47). In that war the young king perished and a still younger brother, Ptolemy XIII. Philopator, was associated with Cleopatra till 44, when he died, probably by Cleopatra’s contriving. From then till her death in 30, her son, born in 47, and asserted by Cleopatra to be the child of Julius Caesar. (For the incidents of Cleopatra’s reign see CLEO- PATRA, ANTIOCHUS.) After her death in 30 and Caesar’s murder Egypt was made a Roman province. Cleopatra’s daughter by Antony (Cleopatra Selene) was married in 25 to Juba II. of Mauretania. Their son Ptolemy, who succeeded his father (A.D. 40–20), left no issue. See Mahaffy, The Empire of the Ptolemies (1895) and Egypt under the Ptolemaic Dynasty (1899); Strack, Die Dynastie der Ptolemaer (1897); Fouquet, Histoire des Lagides (1904, 1907); Meyer, Das Herrscher der Ptolemäer und Römer (Leipzig, 1909) (E. R. B.).

Ptolemy (Claudius Ptolemaeus), the celebrated mathematician, astronomer and geographer, was a native of Egypt, but there was an uncertainty as to the place of his birth. Some ancient manuscripts of his works describe him as of Pelusium, but Theodorus Miletinota, a Greek writer on astronomy of the

1 Or, according to another view, Eupator. On the obscure questions raised by these two surnames, see L. Pareti, Ricerche sui Tolomei Eupatore e Neo Filopatore (Turin, 1908).
Ptolemy's work as a geographer is discussed below, and an account of the discoveries in astronomy of Hipparchus and Ptolemy is given in the article Astronomy: History. Their contributions to pure mathematics, however, require to be noticed here. Of these the chief is the foundation of trigonometry, plane and spherical, including the formation of a table of chords, which served the same purpose as our table of sines. This branch of mathematics was created by Hipparchus for the use of astronomers, and its exposition was given by Ptolemy in a form so perfect that for 1,400 years it was not surpassed. In this respect it may be compared with the doctrine as to the motion of the heavenly bodies so well known as the Ptolemaic system of astrology, which was probably, indeed, an attempt to make Ptolemy’s system a faith for about the same period of time. There is, however, this difference, that, whereas the Ptolemaic system was then overthrow, the theorems of Hipparchus and Ptolemy, on the other hand, will be, as Delambre says, for ever the basis of trigonometry. The astronomical and trigonometrical systems are contained in the great work of Ptolemy, II mathēmatikē sintaxis, or, as Fabricius after Synedrus writes it, Meγalē sintaxis tōn astroνomōn; and in like manner Suidas says σύνταξις [Πυθαγ.] ἔγραψε τῶν μεγάλων άστρονομων ἕτα σινταξις. The Synopsis of Ptolemy was called 'O μεγάλος άστρονομος to distinguish it from another collection called 'O μικρος άστρονομος, also highly esteemed by the Alexandrian school, which contained some works of Autolycus, Euclid, Aristarchus, Theodosius of Tripolis, Hypsicles and Menelaus. To designate the great work of Ptolemy the Arabs used the superlative μεγαλακτος, from which, the article al being prefixed, the hybrid name Almagest, by which it is now universally known, is derived.

We proceed now to consider the trigonometrical work of Hipparchus and Ptolemy. In the ninth chapter of the first book of the Almagest we have a statement of the mode by which they formed a table of chords, on the supposition of their knowing the circumference divided into 360 equal parts (στιγματα), and then bisect each of these parts. Further, he divides the diameter into 120 equal parts, and this for the subdivisions of these he employs the sexagesimal method as most convenient in practice, i.e., he divides each of the sixty parts of the radius into sixty equal parts, and each of these he further subdivides into sixty equal parts. In the Latin translation these subdivisions became "pars minute prima" and "partes minute secunda," whence our "minutes" and "seconds" have arisen. It must not be supposed, however, that these sexagesimal divisions are due to Ptolemy; they must have been familiar to his predecessors, and were handed down from the Babylonians. Nor did the formulation of the table of chords originate with Ptolemy; indeed, Theon of Alexandria, the father of Hypatia, who lived in the reign of Theodosius, in his commentary on the Almagest says expressly that Hipparchus had already given the doctrine of chords inscribed in a circle in twelve books, and that Mene- lades of Alexandria, in the latter part of the latter work, must be astonished at the ease with which Ptolemy, by means of a few simple theorems, has found their values; hence it is inferred that the method of calculation in the Almagest is Ptolemy’s own. The table of chords so formed consists of numbers of the diameter were already known, or could be easily found by means of the Elements of Euclid. Thus the side of the hexagon, or the chord of 60°, is equal to the radius, and therefore contains sixty parts. The other chords are obtained from the description of the circle of the radius cut in extreme and mean ratio, and therefore contains approximately 37° 4' 55" parts, of which the diameter contains 120 parts. Further, the square on the side of the regular pentagon is equal to the sum of the squares on the sides of the regular hexagon and of the regular decagon, all being inscribed in the same circle (Eucl. XIII. 10); the chord of 72° can therefore be calculated, and contains approximately 70° 32' 3". In like manner, the square on the chord of 90°, which is the side of the inscribed square, is twice the square on the radius; and the square on the chord of 120°, or the side of the equilateral triangle, is three times the square on the radius, thus the chords can thus be calculated approximately. We have also, from the values of all these chords, which can be calculated at once the chords of the areas which are their supplements.

This being laid down, we now proceed to give Ptolemy’s exposition of the table of chords, of which only a small portion is given, which is a piece of geometry of great elegance, and is, indeed, as De Morgan says, "one of the most beautiful in the Greek writers." For the discussion of this arc we give the fundamental formulae of our trigonometry—

\[
\sin (A + B) = \sin A \cos B + \cos A \sin B
\]

\[
\sin (A - B) = \sin A \cos B - \cos A \sin B
\]

which can therefore be established in this simple way.

Ptolemy then gives a geometrical construction for finding the chord of half an arc from the chord of the arc itself. By means of the foregoing theorems, since we know the chords of 72° and 60°, we can easily find the chord of 36°. This is the chord of 1°, for, as we have seen, the chords of 3°, 18°, and three-fourths of 1°, and lastly, the chords of 45°, 75°, 90°, 105°, &c., all those arcs, namely, as Ptolemy says, which being doubled are divided into three parts; this can be easily done by the chord of 1° into approximately 1° 34° 55", and the chord of three-fourths of 1° contains 0° 47° 8". A table of chords of arcs increasing by 1° can thus be formed; but this is not sufficient for the purposes of our geometrical frame of the construction, and of the circle. Each of these is obtained by halving the degree. This could be effected if he knew the chord of one-half of 1°; but, since this chord cannot be found geometrically from the chord of 1°, inasmuch as that would come to the trisection of an angle, he proceeds to seek in the first place the chord of 1°, which he finds approximately by means of a lemma of great elegance, due probably to Apollonius. It is as follows: If two unequal chords be inscribed in a circle, the greater will be to the less in a less ratio than the arc described on the greater will be to the arc described on the less. Having proved this theorem, he proceeds to employ it in order to find approximately the chord of 1°, which he does in the following manner—

\[
\text{chord} 60° < \text{chord} 45° < 60°,
\]

i.e., \( \text{chord} 1° < \frac{1}{2} \text{chord} 45° \)

\[
\text{chord} 45° < \text{chord} 45°,
\]

again—

\[
\text{chord} 90° < 90°,
\]

\[
\text{chord} 90° < \text{chord} 90°. \]

For brevity we use a modern notation. It has been shown that the chord of 45° is \( 47° 8' \) q.p., and the chord of 90° is \( 3' 4' 15'' \) q.p.; hence it follows that the chord of 1° is \( 1° 2° 50' 40'' \text{q.p.} \) and \( 1° 2° 50' \).

Since values agree as far as the seconds, Ptolemy takes \( 1° 2° 50'' \) as the approximate value of the chord of 1°. The chord of 1° being thus known, he finds the chord of one-half of a degree, the approxi- mate value of which being \( 47° 49' 59'' \), he proceeds to complete his table of chords for arcs increasing by half a degree. Ptolemy then gives his table of chords, which is arranged in three columns; in the first he has entered the arcs, increasing by half-degrees, from 0° to 180°; in the second he gives the values of the
chords of these arcs in parts of which the diameter contains 120, the subdivisions being sexagesimal; and in the third he has inserted the thirtieth parts of the differences of these chords for each half-degree, in order that the chords of the intermediate arcs, which do not occur in the problem of astronomy, being known, those of any arcs between be known. Thus the number of the chords of arcs within the table for each interval of 30° is proportional to the increment of the arc.

Trigonometry, we have seen, was created by Hipparchus for the use of his planetarium. Since a knowledge of trigonometry is indispensable to astronomy, it is not surprising that its development was prior to that of plane trigonometry. It is the subject-matter of the eleventh chapter of the *Almagest*, whilst the solution of plane triangles is treated separately.

To resolve a plane triangle the Greeks supposed it to be inscribed in a circle; they must therefore have known the theorem—which is the basis of this branch of trigonometry—that the sides of any triangle are proportional to the sines of the opposite angles. They further supposed that the chords of arcs within the table for each interval of 30° within the quadrant were equal to the sines of the angles of which they were parts.

The foundation of spherical trigonometry is laid in chapter xi. of the *Almagest*. This chapter is concerned with the spherical triangle, for it shows that the theorem of plane geometry concerning the segments of a side made by the perpendicular on it from the opposite vertex. It should be noticed also that the eleventh chapter of the first book of the *Almagest* contains incidentally some theorems and problems in plane trigonometry.

The problem of spherical triangles is divided into two parts: one part is concerned with those spherical triangles which are inscribed in a circle; the other, which concerns the spherical triangles which are drawn on a sphere, was called after Ptolemy naturally, since there is no reference to its source in the *Almagest*. This error was corrected by de Morgan, who mentions that Menelaus, an astronomer and geomter who lived in the reign of the emperor Trajan, the theorem now bears the name of Menelaus, though most probably it came down from Hipparchus, Chasles, indeed, thinks that Hipparchus deduced the property of the spherical triangle from that of the plane triangle, but throws the origin of the latter farther back and attributes it to Euctid, suggesting that it was given in his *Parrism*.1 Cannot made this theorem the basis of his theoretical exposition on that subject. It should be noticed that the theorem is not given in the *Almagest* in the general manner stated above; Ptolemy considers two cases only of the theorem, and Theon, in his *Commentary* to the *Almagest*, says that he has divided the two cases into four.

The proofs, however, are general. Ptolemy then lays down two lemmas: If the chord of an arc of a circle be cut in any ratio and a diameter be drawn through the point of section, the diameters met by two transversals are proportionals, and if the points of intersection of two transversals are in the same ratio as the segments of the chord; and a similar theorem in the case when the chord is cut externally in any ratio.

By means of these two lemmas Ptolemy deduces in an ingenious manner—easy to follow, but difficult to discover—from the theorem of Menelaus for a plane triangle the corresponding theorem for a spherical triangle; if the sides of a spherical triangle be cut by an arc of a great circle, the chords of the doubles of the segments of the one side will be either in a ratio compounded of the ratios of the chords of the doubles of the segments of the other two sides. Here, the theorem is not stated generally; two cases only are considered corresponding to the two cases to the theorem of Menelaus, and each case has added two new cases. The proofs are general. By means of this theorem four of Napier’s formulae for the solution of right-angled spherical triangles can be easily established. Ptolemy does not give these as theorems, nor does he mention them in his translation of Apollonius’ *De sectione*. This greatly increases the length of his demonstrations, which the modern reader finds still more cumbrous, inasmuch as in each case it was necessary to express the terms of chords in terms of sines—only, cosines and tangents being of later invention.

Such, then, was the trigonometry of the Greeks. Mathematics, indeed, has ever been, as it were, the handmaid of astronomy, and many important methods of the former arose from the needs of the latter. Moreover, in the foundation of trigonometry, astronomy attained its final geometric construction, since the calculation took the place of diagrams, as the latter had been at an earlier period substituted for mechanical apparatus in solving the ordinary problems.2 Further, we find in the application of trigonometry to astronomy frequent examples and even a systematic use of the method of approximations—the basis, in fact, of all application of mathematics to practical questions. There was a disinclination on the part of the Greek geometer to be satisfied with a mere approximation, were it ever so close; and the unsentient *agrimensor* shirked the labour involved in acquiring the knowledge which was indispensable for learning trigonometrical calculations. Thus the solutions of spherical triangles fell to the lot of the astronomer, who was both scientific and practical.

We now proceed to notice briefly the contents of the *Almagest*. It is divided into thirteen books. The first book, which may be regarded as introductory to the whole work, opens with a short preface, in which, after some observations on the distinction between theory and practice, gives Aristotle’s division of the sciences and remarks on the certainty of mathematical knowledge, “inasmuch as the demonstrations in it proceed by the incontrovertible principles of geometry and arithmetic, which are certain, with the statement that he will make use of the discoveries of his predecessors, and relate briefly all that has been sufficiently explained by the ancients, but that he will treat with more care and development of the subject, and will show how each part of the *Almagest* is connected with the other.”

When, in the first chapter, presupposing some preliminary notions on the part of the reader, announces that he will treat in order—what is the relation of the earth to the heavens; what is the cause of the obliquity of the ecliptic, and the motion of the inhabited parts of the earth; that he will point out the differences of climates; that he will then pass on to the consideration of the motion of the sun and moon, without which one cannot have a just idea of the course of the stars; and finally, that he will consider the motion of the fixed stars and then the theory of the five stars called “planets.” All these things—i.e. the phenomena of the heavenly bodies—he says he will endeavour to explain in taking for his basis the truth and reality of the earth, and which Ptolemy unfortunately does not always bear in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

Ptolemy then, in the first chapter, supposing the earth to be a sphere, and taking for his basis the truth and reality of the earth, and which Ptolemy unfortunately does not always bear in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

Ptolemy then, in the first chapter, supposing the earth to be a sphere, and taking for his basis the truth and reality of the earth, and which Ptolemy unfortunately does not always bear in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

Ptolemy then, in the first chapter, supposing the earth to be a sphere, and taking for his basis the truth and reality of the earth, and which Ptolemy unfortunately does not always bear in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

Ptolemy then, in the first chapter, supposing the earth to be a sphere, and taking for his basis the truth and reality of the earth, and which Ptolemy unfortunately does not always bear in mind, and it is sometimes difficult to distinguish what is due to him from that which he has borrowed from his predecessors.

1 Ideler has examined the degree of accuracy of the numbers in these tables and finds that they are correct to five places of decimals.

PTOLEMY

degrees of obliquity of the sphere; hence he finds the height of the sun at any given time. From the data he shows how to find at what places and times the sun becomes vertical and how to calculate the ratios of gnomons to their equinoctial and solstitial shadows at noon and conversely, pointing out, however, that the lengths of the shadows are not lessened by being distributed over a large number of years. In the same chapter we find also the principle laid down that in calculating the positions of the equinoxes, Ptolemy in the manner which is unnecessarily too common with him—that is to say, he does not give the least indication whence he directly extrudes the posterior, but, on the contrary, divides the phenomena of the heavens by uniform and circular motions.

Books iv., v. are devoted to the motions of the moon, which are very complicated, the moon in fact, though the nearest to us of all heavenly bodies, being found by investigation to cause the greatest trouble to astronomers. Book iv., in which Ptolemy follows Hipparchus, treats of the first and principal inequality of the moon, that is, the inequality of the sun's treated of in the third book. As to the observations which should be employed for the investigation of the moon, Ptolemy tells us that lunar eclipses should be preferred, inasmuch as the Moon's place without any error on the score of parallax. The first thing to be determined is the time of the moon's revolution; Ptolemy, by comparing the observations of the Chaldaeans with his own, discovered that the shortest period in which the lunar disc is again seen in its same form was 29 days, 12 hours, 25 minutes and 51 seconds. This period he finds 2676 lunations, 4573 restitutions of anomaly and 4612 tropical revolutions of the moon less 74° q.p.; this quantity (271) is also wanting to complete the 354 revolutions which the sun makes in a year less 10° (for the faster motion of the moon, compared with that of the sun). This consequent of this fact that the lunar month contains 29 days and 32° 50' 20'' of a day, very nearly, or 29 days 12 hours 44° 32' 20"

Of Ptolemy, we must say something on account of his mathematical instrumentation, which was carried by an eccentric whose centre turned about the earth in a direction contrary to that of the motion of the epicycle. This is the first instance in which we find the inequality of the equator and of the centre, Ptolemy makes use of the hypothesis of an epicycle, which he prefers to that of the eccentric.

The fifth book commences with the description of the orbito of Halma, of Delambre, the third book of the Almagest, and the method of calculating eclipses is there given. The same author says nothing in it which was not known before his time.

Books vii. viii. treat of the fixed stars. Ptolemy verified the fixity of their relative positions and confirmed the observations of Hipparchus, hence forth related to the computation of the positions of the equinoxes. The seventh book concludes with the catalogue of the stars of the northern hemisphere, in which are entered their longitudes, latitudes and magnitudes, arranged according to their constellations; and the eighth book commences with a new catalogue of the stars in the constellations of the southern hemisphere. This catalogue has been the subject of keen controversy amongst modern astronomers. Some, as Flamsteed and Lacaille, maintain that it was the same catalogue which Hipparchus had drawn up 265 years before Ptolemy, whereas others, of whom Laplace is one, think that it is the work of Ptolemy himself. The probability is that Ptolemy had, in the first place, and in the second, the points which he had observed, on the hypothesis of Sosigenes, that Plato is said to have proposed the following

1 Raouj, temporal or variable. These hours varied in length with the seasons; they were used in ancient times and arose from the division of the natural day (from sunrise to sunset) into twelve parts.
2 Aem. ed. Halma, i. 159.
3 Theon, iv. 173.
4 This Sosigences, as Th. H. Martin has shown, was not the astro-
6 Whose name means "Multiiform haec (luna) ambagiae tarsis ingenia contemplationem, et proxiem ignorant maxime sidus indignantis"
7 Ptolemy, Historiæ de astronomiæ antiquæ, ii. 264.

of constructing a celestial globe; it also treats of the configuration of the stars, first with regard to the sun, moon and planets, and then with each other. The combined section treats of the distances of the stars and of their rising, culmination and setting simultaneously with the sun.

The remainder of the work is devoted to the planets. The ninth book contains discussions with what concerns them all in general. The planets are much nearer to the earth than the fixed stars and more distant than the moon. Saturn is the most distant of all, then Jupiter, Mars, Venus, and Mercury. He showed that the sun is not far from the earth than the sun.1 So far all astronomers are agreed.

This is not the case, he says, with respect to the two remaining planets, Mercury and Venus, which the old astronomers placed between the sun and earth, whereas more recent writers have placed them beyond the sun, because they were never seen on the sun.2 He shows that this reasoning is not sound, for they might be nearer to us than the sun and not in the same plane with the earth or the sun. His argument is based upon the assumption that the velocity of the planets is the same.

Delambre remarks that he was wrong in this respect; however, he adds, if it is true that this idea, which is older than Ptolemy, since it is referred to by Cicero,3 had been of the Egyptians.4 It is shown that the six volumes written of this subject by the Theon of Smyrna,5 who was a contemporary of Ptolemy or somewhat senior to him. From this system to that of Tycho Brahe there is, as Delambre observes, only a single step.

Ptolemy's hypothesis, which presented itself to the astronomers of the Alexandrian epoch was the following: it was required to find such a system of equable circular motions as would represent the inequalities in the apparent motions of the sun, the moon, and the planets. Ptolemy now takes this question for the planets; he says that "this perfection is of the essence of celestial things, which admit of neither disorder nor inequality," that this perfection is subject to extreme disorder, and that it has yet completely succeeded in it. He adds that it was owing to these difficulties that Hipparchus—who loved truth above all things, and who, moreover, had not received from his predecessors observations either numerically or precise—that those that he had left—had succeeded, as far as possible, in representing the motions of the sun and moon by circles, but that he had not even commenced the theory of the five planets. He contented, Ptolemy continues, to arrange the observer, since he had been made on them in a method whereby to show thence that the phenomena did not agree with the hypotheses of mathematicians at that time. He showed that in fact planet had two inequalities, which had been noticed by Eratosthenes, and which are different, whilst other astronomers admitted only single inequality and the same retrogradation; he showed further that their motions cannot be explained by eccentrics or by epicycles, but that the planets can be represented by the combination of these hypotheses. After these preliminary notions he gives from Hipparchus the periodic motions of the five planets, together with the shortest times of revolutions, in which, moreover, he has made some slight corrections. He then gives tables of the mean motions in longitude and of anomaly of each of the five planets,6

1 This is true of their mean distances; but we know that Mars at opposition is nearer to us than the sun.

2 Eratosthenes, for example, as we learn from Theon of Smyrna. Transits of Mercury and Venus over the sun's disk, therefore, had no origin in the fact of the changing position of the observer.

3 This was known to Eudoxus. Sir George Cornwell Lewis (An Historical Survey of the Astronomy of the Ancients, p. 155), confusing the geocentric revolutions assigned by Ptolemy to the two planets with those of the eccentric planets of the Greek system, which are of course quite different, says that "the error with respect to Mercury and Venus is considerable"; this, however, is not an error of Eudoxus but of Cornwell Lewis, as Schiaparelli has remarked.

4 "Hunc [solen] ut comites consequentur Veneris alter, Mercurii cursus" (Seminum Scipionum, De rep. vi. 17). This hypothesis is alluded to by Pliny, N.H. ii. 17, and is more explicitly stated by Ptolemy in his Almagest.

5 Macrobius, Commentaries ex Cicero in somnium Scipionis, i. 9.

6 Theon (Smyrnaeus Platonicus), Liber de astronomia, ed. Th. H. Martin (Paris, 1849), pp. 174, 294, 296. Martin thinks that Theon, the mathematician, four of whose observations are used by Ptolemy (Alm. ii. 176, 193, 194, 195, 196, ed. Halma), is not the same as Theon of Smyrna, on the ground chiefly that the latter was not an observer.

Delambre compares these mean motions with those of our modern tables and finds them tolerably correct. By "motion in

and shows how the motions in longitude of the planets can be represented in a general manner by means of the hypothesis of the epicycle about the centre of the epicycle, together with the eccentric about the centre of the epicycle. The former hypothesis is applied to each planet and concludes the ninth book with the explanation of the various phenomena of the planet Mercury. In the tenth book, the author devotes a book to the other planets and to their various phenomena of the planets Venus, Mars, Jupiter and Saturn. Book xii. treats of the stationary and retrograde appearances of each of the planets and of the greatest elongations of Mercury and Venus. In this book and in some measure in the preceding book Ptolemy shows that his theory of the epicycle and the eccentric of each planet were correct, as well as that the phenomena of these planets were not more exact than the phenomena of the other planets. This statement of Ptolemy is important, as it shows that the mathematical theory of the planetary motions was in a tolerably forward stage long before his time. Finally, book xiii. treats of the motions of the planets in latitude, also of the inclinations of their orbits and of the magnitude of these inclinations.

Ptolemy concludes his great work by saying that he has included in it everything of practical utility which in his judgment should find a place in a treatise on astronomy at the time, and that it was written, with relation as well to discoveries as to methods. His work was justly called by him ἀποκρυπτομένη των φανερών, for it was in fact the mathematical demonstration of the heavens in its entirety by one who was treated of the same science, but not by "the sure methods of geometry and calculation." Accordingly, it soon spread from Alexandria to all places where astronomy was cultivated; numerous exemplars of it were made of, and it went through the hands of all the teachers, and in the hands of both teachers and pupils. Amongst its numerous commentators may be mentioned Pappus and Theon of Alexandria in the 4th century and Proclus in the 5th. It was translated into Latin by Scipionis, and of Trebizond in the 6th century. The Syntaxis was translated into Arabic at Bagdad by order of the enlightened caliph Al-Mamun, who was himself an astronomer, about 827 A.D., and the Arabic translation was revised in the following century by Tobit ben Korr. The latter edition was transmitted from the Arabic into Latin by Gerard of Cremona (q.v.). In the 15th century it was translated from a Greek manuscript in the Vatican library by Mattioli. A complete Latin edition of the Almagest was commended by Furbach (d. 1461) and completed by his pupil and successor in the professorship of astronomy in the university of Vienna, Regiomontanus. The earliest edition of this epitome of that of Venetiis, in the middle of the 15th century, which was devoted entirely to the Almagest, was published in the year 1395. The first complete edition of the Almagest is that of P. Liechtenstein (Venice, 1515)—a Latin version from the Arabic. The Latin translation of George of Trebizond was first printed at Venice, 1521; the Greek text, which was not known in Europe until the 15th century, was first published in the 16th by Simon Grynaeus, who was also the first editor of the Greek text of the Almagest. It was published in Venice, 1540, and in 1543 was again published in Venice. The library of Nuremberg—where it is no longer to be found—was published by Regiomontanus, to whom it was given by Cardinal Bessarion.

On the final book of which we now proceed to notice very briefly, are as follow. (1) Φιλοσόφων ἐπικεφαλικῶν καὶ συγγραφῶν, On the Apparitions of the Fixed Stars and a Collection of Prognostics. It is a calendar of a kind common amongst the Greeks under the name of χρησμωνογια, or a collection of the rise and settings of the stars in the morning or evening twilight, which were so many visible signs of the seasons, with prognostics of the principal changes of temperature with relation to each climate, after the observations of the best meteorologists, as, for example, Meton, Democritus, Eudoxus, Hipparchus, &c. Ptolemy, in order to make his Paraplegmos useful to all the Greeks scattered over the enlightened world, compiled an appendix, which, although it was made only for each of the five parallaxes in which the length of the longest day varies from 13½ hours to 15½ hours—that is, from the latitude of Syene to that of the middle of the Euxine. This work was called the Paraplegmos, a name given by Ptolemy to one of his works of the same title. In the Almagest he includes in the works of Ptolemy, vol. iii. (Paris, 1819).

(2) Κατάλογοι τῶν ἐσωτερικῶν δοκιμῶν κοινῶν, On the Planetary Hypothesis. This is a summary of a portion of the Almagest, and contains a brief statement of the principal hypotheses for the explanation of the motions of the heavenly bodies. It was first published (Gr. Lat.) by Bailleul, the Savilian professor of astronomy at Oxford, in 1585, and in 1586, in the first English translation of the Almagest. In this table (cf. G. Syncellus, Chronogr. ed. Dind. i. 388 sqq.) was printed by Scaliger, Calvisius, Petavius, Bailleul and by Halma, longitude " must be understood the motion of the centre of the epicycle about the eccentric, and by " anomaly" the motion of the star on its epicycle.
PTOLEMY

This projection. This is a modern "orthographic projection.

This is the text from Ptolemy's work also is lost, and we have only a Latin translation of it from the Arabic. The "stereographic" is a projection of the sphere on the equator, the eye being at the pole—"in fact what is now called "stereographic" projection.

The best edition of this work is that of Commandine (Venice, 1558).

The Optics consists of five books, of which the fifth presents most interest: it treats of the refraction of luminous rays in their passage through air and water. They are also concerned with refractions, on which subject the theory is more complete than that of any astronomer before the time of Cassini. De Morgan doubts whether this work is genuine on account of the absence of allusion to the discoveries of his predecessors, but his chief reason for doubting its authenticity is that the author of the Optics was a poor geometer.

G. J. A.

Ptolemy is hardly less celebrated as a geographer than as an astronomer, and his Geographia sive existens exercised as great an influence on geographical progress (especially during the period of the Classical Renaissance), as did his Almagest on astronomical.

This exceptional position was largely due to its scientific form, which rendered it convenient and easy of reference; but, apart from this, it was really the most considerable attempt of the ancient world to place the study of geography on a scientific basis. The astronomer Hipparchus had indeed pointed out, three centuries before Ptolemy, that the only way to construct a trustworthy map of the inhabited world would be to observe the latitude and longitude of all the principal points on its surface. But the materials for such a map were almost wholly wanting, and, though Hipparchus made some approach to a correct division of the known world into zones of latitude, "climates" or " climata, as he termed them, trustworthy observations of latitudes were then very few, while the means of determining longitudes hardly existed. Hence probably it arose that no attempt was made to follow up the suggestion of Hipparchus until Marinus of Tyre, who lived shortly before Ptolemy, and whose work is known to us only through the latter. Marinus was a geometer, he is said, who himself mostly with determinations derived from itineraries and other rough methods, such as are still employed where more accurate means of determination are not available. The greater part of Marinus' treatise was occupied with the discussion of his authorities, and it is impossible, in the absence of the original work, to decide how far his results attained a scientific form.

But Ptolemy himself considered them, on the whole, so satisfactory that he made his predecessor's work the basis of his own in regard to all the Mediterranean countries, that is, in regard to almost all those regions of which he had definite knowledge. In the more remote regions of the world, Ptolemy availed himself of Marinus' information, but with reserve, and himself explains the reasons that induced him sometimes to depart from his predecessor's conclusions. It is unjust to term Ptolemy a plagiarist from Marinus, as if from others, who had duties or obligations to that writer, from whom he derived the whole mass of his materials, which he undertook to arrange and present to his readers in a scientific form. It is this form, unique among those ancient geographical treatises which have survived, that constitutes one great merit of Ptolemy's work. At the same time it shows the increased knowledge of Asia and Africa acquired since Strabo and Pliny.

1. Mathematical Geography—As an astronomer, Ptolemy was of course better qualified to explain the mathematical conditions of the earth than were the geographers. His general views had much in common with those of Eratosthenes and Strabo. Thus he assumed that the earth was a sphere, and that some of its surfaces would be affected by the equator and the tropics—parallel to one another, dividing the earth into five zones, the relations of which with astronomical phenomena were of course clear to his mind as a matter of theory, though less so to the regions bordering on the equator, as well as to those adjoining the polar circle, he could have had no confirmation of his conclusions from actual observation. He adopted also from Hipparchus the division of the equatorial circle into 360 parts (a division called degrees, which is not accidental, as such degrees occur in this sense in Ptolemy), and supposed other circles to be drawn through the point, from the equator to the pole, to which lie gave the name of meridian. Thus he, like modern geographers, conceived the whole space of the earth as divided into two sets of parallels of latitude and meridians of longitude, terms which he himself was the first extant writer to employ in this technical sense. Within the necessity of such a conception was his task to place the outline of the world, so far as known to him.

But at the very outset of his attempt he fell into an error vitiating all his conclusions. Eratosthenes (276-196 B.C.) was the first who had attempted scientifically to determine the earth's circumference, and his result of 250,000 (or 252,000) stadia, i.e. 25,000 (25,200) geographical miles, was generally adopted by subsequent geographers, including Strabo. Poseidonius, however (c. 135-50 B.C.), calculating the circumference of the earth from the want of any accurate mode of observing bearings, of measuring time (by portable instruments), or of estimating distances at sea, except by the rough estimate of the time employed in going a certain and fixed point to the other, was the first to acknowledge an error. He thus, like modern geographers, conceived the whole space of the earth as divided into two sets of parallels of latitude and meridians of longitude, terms which he himself was the first extant writer to employ in this technical sense. Within the necessity of such a conception was his task to place the outline of the world, so far as known to him.

But at the very outset of his attempt he fell into an error vitiating all his conclusions. Eratosthenes (276-196 B.C.) was the first who had attempted scientifically to determine the earth's circumference, and his result of 250,000 (or 252,000) stadia, i.e. 25,000 (25,200) geographical miles, was generally adopted by subsequent geographers, including Strabo. Poseidonius, however (c. 135-50 B.C.), calculating the circumference of the earth from the want of any accurate mode of observing bearings, of measuring time (by portable instruments), or of estimating distances at sea, except by the rough estimate of the time employed in going a certain and fixed point to the other, was the first to acknowledge an error. He thus, like modern geographers, conceived the whole space of the earth as divided into two sets of parallels of latitude and meridians of longitude, terms which he himself was the first extant writer to employ in this technical sense. Within the necessity of such a conception was his task to place the outline of the world, so far as known to him.

But at the very outset of his attempt he fell into an error vitiating all his conclusions. Eratosthenes (276-196 B.C.) was the first who had attempted scientifically to determine the earth's circumference, and his result of 250,000 (or 252,000) stadia, i.e. 25,000 (25,200) geographical miles, was generally adopted by subsequent geographers, including Strabo. Poseidonius, however (c. 135-50 B.C.), calculating the circumference of the earth from the want of any accurate mode of observing bearings, of measuring time (by portable instruments), or of estimating distances at sea, except by the rough estimate of the time employed in going a certain and fixed point to the other, was the first to acknowledge an error. He thus, like modern geographers, conceived the whole space of the earth as divided into two sets of parallels of latitude and meridians of longitude, terms which he himself was the first extant writer to employ in this technical sense. Within the necessity of such a conception was his task to place the outline of the world, so far as known to him.

But at the very outset of his attempt he fell into an error vitiating all his conclusions. Eratosthenes (276-196 B.C.) was the first who had attempted scientifically to determine the earth's circumference, and his result of 250,000 (or 252,000) stadia, i.e. 25,000 (25,200) geographical miles, was generally adopted by subsequent geographers, including Strabo. Poseidonius, however (c. 135-50 B.C.), calculating the circumference of the earth from the want of any accurate mode of observing bearings, of measuring time (by portable instruments), or of estimating distances at sea, except by the rough estimate of the time employed in going a certain and fixed point to the other, was the first to acknowledge an error. He thus, like modern geographers, conceived the whole space of the earth as divided into two sets of parallels of latitude and meridians of longitude, terms which he himself was the first extant writer to employ in this technical sense. Within the necessity of such a conception was his task to place the outline of the world, so far as known to him.
The equator was in like manner placed by Ptolemy at a considerable distance from its true geographical position. The place of the tropics was thus fixed, even to the present day in a manner that can hardly be questioned, but as no observations could have been made in those regions he could only calculate its place from that of the tropic, which he supposed to pass through Sicily, Africa, and the British isles, and he took thereckonings for latitude of 50^0 as equivalent to 500 stadia. He inevitably made the interval between the tropic and the equator too small by one-sixth; and the place of the former being fixed by observation, the error was increased up to places which are today too high by more than 250 geographical miles. But as he had practically no geographical acquaintance with the equinoctial regions this error was of little importance.

With respect to longitude, as preceding Greek geographers, the most important line for practical purposes was the parallel of 36^0 N., which, passing through the Straits of Gibraltar, Rhodes Island and the Gulf of Issus, and thus dividing the Mediterranean (as well as the Indian Ocean) into two equal parts regarded as connected by the straits. This parallel was continued in theory along the chain of Mt Taurus till it joined the mountains north of India; thence to the Eastern Ocean it was regarded as constituting the dividing line of the inhabited world, along which the length of the latter must be measured. But so inaccurate were the observations and so imperfect the materials at command, even in regard to the best known regions, that the results (in map-construction) differed widely from the truth, through Caralys in Sardinia and Lilybaeum in Sicily, the one being nearly in 39^0 12' lat., the other in 37^0 50'. Still more strangely he places Carthage 170 south of the dividing parallel, while it really lies 25' nearer the south. The problem that had especially attracted the attention of geographers from Dicaearchus to Ptolemy was to determine the length and breadth of the inhabited world. This question had been fully discussed by his predecessors, who held opinions very different from his predecessors. Towards the north, indeed, there was no great difference of opinion, the latitude of Thule being generally taken as that of the northmost inhabited land. This was placed both by Marinus and Ptolemy in 63^0 N., not far beyond the true position of the Shetland Islands, which, as had been generally acknowledged by the mysterious Thule of Pytheas. The western extension of the inhabited world towards the west, as fixed by the prime meridian drawn through the supposed position of the westernmost of the Fortunate Islands. But towards the south and east Marinus gave an enormous extension to Africa and Asia, beyond which he brought as far as the coast of Ceylon, an assumption which, though Ptolemy reduced Marinus’ calculations, he retained an exaggerated estimate of their results.

The additions made to the estimated dimensions of the known world were indeed in both directions based upon a real extension of knowledge, derived from recent information; but the original statements were so perverted by misinterpretation as to give results (in map-construction) differing widely from the truth. The southern limit of the world had been fixed by Eratosthenes and even by Strabo at the parallel which passed through the eastern extremity of Africa (Cape Guardafui), the Cinnamon Region (Somali-land), and the Sembritae (Somali-Land) northward; and which would correspond nearly to that of 10^0 of true latitude, they supposed to be situated at a distance of 3400 stadia (340 geographical miles) from that of Meroe (the position of which was very accurately determined) from the north and south, he conceived it as passing eastward through Taprobane (Ceylon, often Ceylon plus Sumatra?), universally recognized as the southernmost land of Asia. Both these geographers were ignorant of the extension of Africa to the south of this line and even of the equator, and conceived it as trending away west from the Cinnamon Land and then north-west to the Straits of Gibraltar. Marinus had, however, learned from Hecataeus both by land and sea the fact of this extension, of which he had conceived so exaggerated an idea that even after Ptolemy had reduced it by more than half it was still much in excess of the truth. The eastern coast of Africa was fixed by Strabo at the limits of known commerce, and known to Roman traders, as far as a place called Phathia (opposite to Zanzibar?), placed by Ptolemy not far from 7^0 S. To this he added a bay extending to Cape Pratul (Delgado?), which he placed in S. 15^0 E. But this position was afterwards assigned to a parallel of a region called Agysynha, inhabited by Ethiopians and abounding in rhinoceroses, which was supposed to have been discovered by the early navigators of the 4th century B.C., when the coast was employed by Marinus. Taking, therefore, this parallel as the limit of knowledge to the south, while he retained that of Thule to the north, Ptolemy assigned to the inhabited world a breadth of nearly 200 within the limits of Egypt and parts of modern Abyssinia, and an extent of 360 from the Atlantic to the east of India or 3620 geographical miles. Ptolemy, while he points out the erroneous mode of computation on which this conclusion was founded, could not correct it by any real authority, and hence reduced it summarily to one, he therefore placed Sera (Sinigangha?) as the easternmost point on his map of Asia, 45^0 S from the Stone Tower, which again he fixed, on the authority of itineraries cited by Marinus, at 24,000 stadia or 60^0 of longitude from the Euphrates, reckoning in the former case a distance of 4000 from the Euphrates to 3000 from 400 to 400 stadia. Both distances were greatly in excess, independently of error arising from graduation. The distances west of the Euphrates were of course comparatively well known, nor did Ptolemy’s calculations differ very essentially from those of previous Greek geographers, though still greatly exceeding the truth, after allowing for the permanent error of graduation. This last, it must be remembered, would be cumulative, the longitudes being computed from a fixed point in the west, instead of being reckoned east and west from Alexandria, which was undoubtedly the mode in which they were really calculated. These causes of error combined to make Ptolemy allow 180 long., or 12 hours’ interval, between the Fortunate Islands meridian and Sera (really about 130^0).

But in thus estimating the length and breadth of the known world Ptolemy arrived at a very different conception from that which they had generally borne. Most earlier Greek geographers and “cosmographers” supposed the inhabited world to be surrounded on all sides by sea, and to form a vast island in the middle of the ocean. This conception was not that of the Homer (“ocean stream,” and certainly not based upon direct observation) was nevertheless in accordance with truth, great was the difference of opinion, and of the belief,生于 Ptolemy in this respect went back to Hipparchus, and assumed that the land extended indefinitely north in the case of eastern Europe, east, south-east and north in that of Asia, and south, south-west and north in the case of Africa. This boundary line was in each of these cases an arbitrary limit, beyond which lay the Unknown Land, as he calls it. But in Africa he was not content with this extension southward; he also prolonged the continental line of Africa towards Europe beyond the Gambia, in connexion with south-east Asia, the extent and position of which he wholly misconceived.

In this last case Marinus derived from the voyages of recent navigators in the Indian seas a knowledge of extensive lands hitherto unknown to the Hellenic-Roman world, and Ptolemy acquired more information in this quarter. But he formed a false conception of the bearings of the coasts thus made known, and of the position of the lands to which they belonged, and, instead of carrying the line of coast northwards from the Golden Chersonese (Malaya Peninsula) to the Land of the Sinae (sea-coast China), he brought it down again towards the west, and placed the capital of Cattigara—the principal emporium in this part of Asia, and the farthest point known to him—upon a supposed coast of unknown extent, but with a direction from north to south, and facing west. This was the reason why the Alexandrian geographers of the time made Africa, so as to enclose the Indian Ocean as one vast lake, a mere assumption, is stated by him as definitely as if it were a fact. As the information of the time was still very limited, and the known part of Asia eastwards, so as to diminish by 50^0 of longitude the interval between easternmost Asia and westernmost Europe, fostered Columbus’ belief that it was possible to reach the former from the latter by direct navigation, crossing the Atlantic.

Ptolemy’s errors respecting distant regions are one thing; it is another thing to discover, in regard to the Mediterranean basin, the striking imperfections of his geographical knowledge. Here he was not so much deceived as concerning the location of the coasts of Massilia had been determined, within a few miles, by Pytheas, and those of Rome, Alexandria and Rhodes were approximately known, all having been observation-centres for distinguished navigators. The fortunate accident that Rhodes lay on the same parallel with the Straits of Gibraltar enabled Ptolemy to connect the two ends of the Inland Sea on the famous parallel of 36^0 N. Unluckily Ptolemy placed this parallel over the Mediterranean, so that he was compelled to lie almost uniformly through the open sea, ignoring the great projection of Africa towards the north from Carthage westward. The erroneous position assigned to Carthage being supposed to rest upon the notion that Carthage was the westernmost point of the Mediterranean, as it is the westernmost point of North Africa. Thus Ptolemy’s Mediterranean, from Massilia to the opposite point of Africa, had a width of over 11^0 of latitude (really 64^0). He was still more at a loss in respect of longitude, for he based his calculations on the erroneous notion that the truth than previous geographers, all of whom had greatly exaggerated the length of the Inland Sea. Their calculations, like those of Marinus and Ptolemy, could only be founded on the inaccurate estimates of mariners; and Ptolemy, in translating these conclusions into scientific form, vitiated his results by his system of
graduation. Thus while Marinus calculated 24,800 stadia as the length of the Mediterranean from the Straits to the Gulf of Issus, this distance was reduced to 21,600 stadia, or 18° of latitude, after correcting the error due to his computation of 300 stadia to a degree, there remains an excess of nearly 300 geographical miles.

Another error which disfigured the portion of Ptolemy's Geography included in the opening of the 1685 volume, that of Byzantium, was by Hipponax of Thasos (Ptolemy usually considered by the ancients as the boundary between Europe and Asia) and the Rha or Volga, which he correctly described as flowing into the Caspian. He was also the first geographer after Alexander the Great to return to the correct view (found in Herodotus and Aristotle) that the Caspian was an inland sea, without communication with the ocean.

As to north Europe, Ptolemy's views were vague and imperfect. He had indeed more acquaintance with the British Islands than any previous geographer, and showed a remarkable knowledge of certain coastal outline. But he (1) placed Ireland (Ierne) farther north than it really is, and (2) placed the coast of Scotland, so as to make its length from west to east and to place the northern extremities of Britain and Ireland almost on the same parallel. These errors are probably connected and are naturally accounted for by his partial knowledge of the coasts of the Hebrides (Eubudes) indifferently on the left or north of Caledonia. Here he was perhaps embarrassed by adopting Marinus' conclusion that Thule lay in 63° N., while regarding it, like earlier geographers, as the northernmost point of the world. As for the northern part of Germany, beyond the Cimbri Chersonese (Denmark), to be the southern shore of the Northern Ocean, with a general direction from west to east. Of the almost wholly landlocked Baltic he was entirely ignorant, as well as of the Scandinavian Peninsula; his Scandia is an island smaller than Corsica, lying in the true position of southern central Sweden. Some way east of the Vistula, he had no map showing the three branches of the Visentia (the Vistula, San and Neva) and considered the Baltic sea to be parallel to the parallel of Thule; nor did he conceive this as an actual limit, but believed the Unialh Land to extend indefinitely in this direction as also to the north of Asiatic Scythia.

As to the regions of the Caspian Sea, as were his views concerning this enormous tract from Sarmatia to China, they show an advance on those of earlier geographers. Ptolemy was the first who had anything like a clear idea of the great north-and-south division of the Central Asia (the Pamir and Altai) and between this and the Caspian Sea, which he called Imaus, placing it nearly 40° too far east, and making it divide Scythia into two portions (Within Imaus and Beyond Imaus), somewhat as is now done. Ptolemy also applies the term Imaus to a section of the backbone range which in his system crosses Asia from west to east. This section lies east of the Indian Caucasus, and forms an angle with the southern shore of the Caspian Sea.

On the southern shores of Asia Ptolemy's geography is especially faulty, though he shows a greatly increased general knowledge of these regions. For more than a century the commercial relations between Western India and Alexandria, the chief eastern emporium of the Roman Empire, had become more important and intimate than ever before. The trade called the Periplus of the Erythraean Sea, also A.D. 60, contains sailing directions for merchants from the Red Sea to the Indus and Malabar, and even indicates that the coast from Barygaza (Baroch) had a general southward direction down to and far beyond Cape Komari (Comorin), which, taken together with its chief political importance here as well as there, shows much of its suggestions at least of a peninsular character for south India. But Ptolemy, following Marinus, not only gives to the Indian coasts, from Indus to Ganges, an undue extension in longitude, but practically the same result in latitude. It is the land of Indian Cappadocia (the Indus and Ganges) which he represents as great, but of opposite tendency, in regard to Taprobane (in which ancient ideas of Ceylon and Sumatra are confusedly mingled). The size of India was exaggerated by most earlier Greek geographers; but Ptolemy extended it to include the whole of southern India, he might as well have made it a continent as large as the reality, and bring down its southern extremity more than 2° south of the equator.

Similar distortions in regions beyond the Ganges, concerning which Ptolemy is our only ancient authority, are less surprising. Between the date of the Periplus and that of Marinus it seems probable that the Ghanges and the Ganges were more widely separated and the Ganges was more widely spread, but Ptolemy's map may reflect Race's view that the Ganges should be so far removed by the overflow of the Ganges into the Arabian Sea.

2. Progress of Geographical Knowledge in Certain Special Regions.—

Ptolemy records, after Marinus, the penetration of Roman expeditions as far as the Indus and the Ganges, and the extension of the Roman Empire along the shores of the Red Sea and the Gulf of Aden. But while this name was the only recorded result of these expeditions, Ptolemy gives much other information concerning this coast, especially as far as the limits of the present kingdom of Egypt, which was known to have been determined by an expedition sent out by Herodotus. Unfortunately for the progress of geographical knowledge this was not to be the case. The Roman expeditions, like all others, were only a step in the advance of knowledge, and were not able to push back the limits of knowledge to which nothing similar is found in any earlier writer. Unfortunately the new information was so crude a character, and is presented in so embarrassing a form, as to perplex rather than to assist the geographer. For example Ptolemy only knows of the Niger, and the lakes and mountains with which they were connected, have baffled successive generations of interpreters. It may safely be said that they present no resemblance to the real features of the country, and cannot be reconciled with them except by arbitrary conjecture.

As to the Nile, both Greeks and Romans had long endeavoured to discover the sources of this river, and an expedition sent out for that purpose by the emperor Nero had undoubtedly penetrated as far as...
as the marshes of the White Nile in about 9° N. Ptolemy's statement that the Nile derived its waters from two streams which rose in the mountains of the Nile delta is perhaps nearer the truth than any of the theories concocted in modern times before the discovery of the Victoria and Albert Nyanza. In connexion with this subject he calls the mountains of the Nile delta the Sources of the Nile, and he calls the Mountains of the Moon, and which, however little understood by Ptolemy, may be considered to represent in a measure the fact of the alpine highlands now known to exist in the neighbourhood of the two great lakes of the British and German East Africa (Kuwenzori, Kenya, Kilimanjaro, &c.).

In Asia, as in Africa, Ptolemy had obtained, as we have seen, a vague, sometimes valuable, often misleading, half-knowledge of eastern countries. Most trusted authorities, like the Periplus of the Erythraean Sea and especially of Chinese Asia and its capital (Sínganfu). North of the route leading to this far eastern land (supposed by Ptolemy to be nearly coincident with the parallel of 30° N.) he places the sea which he vaguely assumed to extend indefinitely northwards as far as the limits of the Unknown Land. The Xaraxes, which since Alexander had been the boundary of Greek geography in this direction, was the northern limit of all that was really known of Central Asia. Beyond that Ptolemy places many tribes, to which he could assign no definite locality, and mountain ranges which he could only place at haphazard, but even its physical geography is treated in a Cattigara and the Sinae or Thinae, we must recognize in the latter name a form of China; from the Sinae being placed immediately south of the Seres, it is possible that Ptolemy was aware of the connexion between the countries by sea via the Indian seas and maritime voyages, and inland China, known only by continental trade.

Apart from Mediterranean countries, we have seen that Ptolemy professed (in the main) to follow Marinus; the latter, in turn, largely depended on Timotheus of Rhodes (cf. c. 260 n.c.), the admiral of Ptolemy Philadephus, as to coasts and maritime distances. Of the tables of the Roman roads and itineraries there is no exchange of results, some of which he has pointed out through there are doubtless many others which we have no means of detecting. For the interior of the different countries Roman roads and itineraries must have furnished Ptolemy with a mass of valuable materials. But neither seems to have taken full advantage of these; and the tables of the Alexandrian geographer abound with mistakes —even in countries so well known as Gaul and Spain—which might easily have been obviated by a more judicious use of such Roman authorities.

In spite of the merits of Ptolemy's geographical work it cannot be maintained that his composition was as valuable to its day as that was the work of an astronomer rather than a geographer. Not only did it plan exclude all description of the countries with which it dealt, their climate, natural productions, inhabitants and peculiar features, but even its physical geography is treated in an irregular and perfunctory manner. While Strabo was fully alive to the importance of the rivers and mountain chains which (in his own phrase) "geographize" a country, Ptolemy deals with this part of the subject in a most wordy manner, and instead of giving a map of Gaul, for instance, the few notices he gives of the rivers that play so important a part in its geography are disfigured by some astounding errors; while he does not notice any of the great tributaries of the Danube and the Garonne.

In his description of the straits he is extremely vague and to the unknown, because it happened to be the boundary between two Roman provinces.

Ptolemy's Geography was printed for the first time in a Latin translation, accompanied with maps, in 1542 (?), and numerous other editions followed in the latter part of the 17th and earlier half of the 16th centuries, but the Greek text did not make its appearance till 1551. When it was published at Basel in quarto, edited by Erasmus. All these early editions, however, swarm with textual errors, and are critically worthless. The same may be said of the edition of P. Bertius (Gr. and Lat., Leiden, 1618, typ. Heine), which, though it gave the standard and text of the 1551 edition, was not a good one. The first critical edition of the Greek text was the one made by F. G. Wilberg, and C. H. F. Grashof (4to, Essen, 1838-1843), but this only covered the first six books of the entire eight. The first complete one (3 vols., Leipzig, 1838-1843), is the best Greek text of the whole work, and has a useful index. The best edition, so far as completed, is that published in A. F. Didot's Bibliotheca graecorum scriptorum (Claudi Ptolomei geographiae streamlined, 1888 a.D.) by Carl T. Fischer, with a commentary by C. T. Müller and continued by C. T. Fischer, with a Latin translation and a copious commentary, geographical as well as critical. See also, F. C. L. Sickler, Claudii Ptolomei Germania (Hesse-Cassel, 1871, 3 vols., under the title of "Athenaei poetae," by G. P. Ruwens, 1854); J. W. McCrindle, Ancient India described by Ptolemy (Bombay, 1885), reprinted from Indian Antiquary (1884); Henry Bradley, "Ptolemy's Geography of the British Isles," in Archæologia, vol. cviii. (1858); T. G. Rylands, Geography of Ptolemy Entitled (Died 1893); and a Polish study of Ptolemy's Germany and Sarmatia, in the Historical-Philosophical Series (2) of the Cracow University (1898-1903).

PTOMAINE POISONING (Gr. πτόμαινα, corpse), a poison now popularized in the sense of a certain class of food-poisoning. The word "ptomaine" was invented by the Italian chemist Selmi for the basic substances produced in putrefaction. They belong to several classes of chemical compounds. (See Medical Jurisprudence.)

PUBERTY (Lat. puéraria, from pubes, puber, mature, adult), that period of life at which the generative organs in both sexes become functionally active (see Reproductive System). In northern countries males enter upon sexual maturity between fourteen and sixteen, sometimes not much before the eighteenth year, females between twelve and fourteen. In tropical climates puberty is much earlier. In English common law the age of puberty is conclusively presumed to be fourteen in the male and twelve in the female. Puberty is of much ethnological interest, as being the occasion among many races for feasts and religious ceremonies. In Rome a feast was given to the family and friends: the hair of boys was cut short, a lock being thrown into the fire in honour of Apollo, and one into water as an offering to Neptune. Girls offered their dolls to Venus, and the bull—a little jetty of gold worn round children's necks, often by the bigger children as well. These were kept as busts—the case of the former to Hercules or the household lares, in the case of the latter to Juno. The attainment of puberty is celebrated by sacrifices with ceremonies some of which seem to be directly associated with totemism. The Australian rites of initiation include the raising of those scars on the bodies of clansmen or clanswomen which serve as tribal badges or actually depict the totem. Among many savage peoples lads at puberty undergo a pretence of being killed and brought to life again.

Publicani, literally men employed "in connection with the revenue," (publicam, from populus, people), or possibly "in the public revenue," who were taken on, and deposited to a body of men who either hired state property or monoplies for a certain period, during which they could farm such property to their own profit, or bought of the state for a fixed sum the right to farm for a term of years the taxes due to the treasury from the public land in Italy (see Agrarian Laws) or the land held by Roman subjects in the provinces. In very early times the senate entrusted to officials appointed for the purpose the control of the sale of salt (Livy ii. 9); and it was a natural development from this that, state, instead of appointing officials to manage its monoplies, should let out those monoplies to individuals. A regular system was soon established by which the state, who held office every fifth year, placed all the sources of public revenue in the hands of certain individuals or companies, who on payment of a fixed sum into the treasury, or on giving adequate security for such payment, received the right to make what profit they could out of the revenues during the five years that should elapse before the next censorship. The assignment was made to the highest bidder at a public auction held by the censor. The same system was applied to the public works, the publicanus (or company) in this case being paid a certain sum, in return for which he took entire charge of a certain department, and, according to the lowest tender. That this system was well established at the time of the Second Punic War is assumed in Livy's account of the various offers made by the wealthier class of citizens to relieve the exhausted treasury after the battle of Cannae. On the one hand we have companies offering a price for branches of the revenue which was calculated rather to meet the needs of the state than to ensure any profit for themselves (Livy xxii. 49). On the other hand individuals are represented as undertaking the management of public works on the understanding that they will expect no payment until the conclusion of the war (ibid. xiv. 18).

In very early times the publicani may have been men closely connected with the government. But since wealth was a necessary qualification for the post, and wealth at Rome became more and more confined to the commercial class, the publicani became
identical with the leading representatives of the class of capitalists and traders. This class was always distinct at Rome from the hereditary nobility which monopolized the government of the state, and members of the senatorial class were excluded from it by definite enactment (see Senate). Although common interest was strong enough to secure for the government in time of external danger the loyal support of the commercial class, yet after the close of the great wars a market hostility grew up between it and the government.

The extension of the Roman system of tax-farming to the provinces did not at first increase the importance of the publicani in Italy; for in the earlier provinces, in which the collection of the revenues was put up to auction in the province itself, the publicani were generally natives. But C. Gracchus, who carried that the taxes of the new province of Asia should be put up to auction by the censor in Rome, gave to the Roman capitalists an opportunity of greatly extending their financial operations and thus in a short time of securing important political powers. It was in their capacity of publicani in the wealthiest provinces that the capitalist or equestrian judices (see Equites) became a menace to the provincial governors who represented the senatorial power. Cicero often applies the name publicani to the whole order; and on the various occasions when the demands of the equestrian party determined the policy of the state we can clearly trace the interests of the publicani, who were involved in an infinite number of commercial and financial transactions in the provinces, as the motive of its action. Thus the cruel fate of the Roman business men in Cirta led the capitalist class to force the Jugurthine War upon the senate in 112 B.C.; the disorganization of Asiatic commerce by the pirates led the same party to support the proposal to confer extraordinary powers on Pompey in 67 B.C.; and the rigour of the senate in opposing any relaxation of the burdensome contract made by the tax-farmers of Asia in 60 B.C. led to that estrangement between the senate and the capitalist class which enabled the democratic party to work its will and pave the way for the principate.

The companies of publicani continued some of their operations in the provinces under the early principate, but they lost many of their opportunities of oppression and embezzlement. We hear of a vigorous attempt made by Nero to suppress their unjust exactions, and they appear to have been kept under much closer supervision.

The term publicanus was applied at this time, and probably earlier, to the subordinate officials employed by the companies of publicani for the actual collection of the revenue, and thus acquired the general sense of "tax-collector," even in provinces where the system of tax-farming by contract with societies of publicani was not in existence. (A. M. Cl.)

PUBLIC HEALTH, LAW OF. State medicine as an organized department of administration is entirely of modern growth. By the common law of England the only remedy for any act or omission dangerous to health was an action for damages or an indictment for nuisance. The indictment for nuisance still lies for many offences which are now punishable in a summary manner under the powers of modern legislation. But for a long time it was the only, not as now a concurrent, remedy. At a comparatively early date statutes were passed dealing with matters for which the common law had provided too cumbersome a remedy, while the plague called forth the act of 1 Jac. I. c. 31 (1603), which made it a capital offence for an infected person to go abroad after being commanded by the proper authority to keep his house. The act for the rebuilding of London after the great fire, 19 Car. II. c. 3 (1668), contained various provisions as to the height of houses, breadth of streets, construction of sewers and prohibition of noisome trades. Local acts gave the authorities of the more important towns power over the public health. But it was not until 1838 that a general Public Health Act, embracing the whole of England (except the Metropolis) was passed. The Public Health Act 1848 created a general board of health as the supreme authority in sanitary matters, but greater local sanitary control was given by an act of 1858. The local government board, the present central authority, was created by an act of 1871. Numerous acts dealing with public health were passed from 1849 to 1874; and the law was digested into the Public Health Act 1875, as amended by the Local Government Act 1894 and other acts.

The tendency of English sanitary legislation has been to place local sanitary regulations in the hands of the local authorities, be made to the Contagious Diseases Acts of 1864, 1866, &c. The jurisdiction of a local authority is both preventive and remedial. The matters falling under it are very numerous, but the more important will be found in the article ENGLAND: Local Government.
PUBLIC HOUSE—PUBLISHING

the Public Health (London) Act 1891, which consists of 144 sections, closely resembles the general acts (see LONDON, § IV.).

Scotland.—Sanitary legislation occurs as early as the reign of Alexander III. The Statuta Gildae, c. 19, forbade the deposit of dung or ashes in the street, market, or on the banks of the Tweed at Berwick. The Act of Parliament 1897, which, together with the Infectious Diseases Notification Act 1889 and the Burgh Police (Scotland) Act 1892, constitute the statutory law of Scottish sanitary affairs. The central authority is the local government board for Scotland. The local authorities are—(i.) in burghs under the Burgh Police (Scotland) Act 1892, the town council or borough commissioners; (ii.) in burghs, the town council or board of police; (iii.) in districts where the county is divided into districts, the district committee; (iv.) in counties not so divided, the county council. The substantive provisions are similar to those of the English acts.

Ireland.—Several acts of the Irish parliament dealt with specific nuisances, e.g. 5 Geo. III. c. 15, forbidding the laying of filth in the streets of cities or county towns, and making regulations as to sewers and watercourses. There were numerous acts dealing with water-supply and the obstruction of watercourses. In 1878 the existing legislation was consolidated by the Public Health (Ireland) Act 1878, a codification of the English act of 1875. Most of the English acts apply to Ireland with modifications and adaptations.

United States.—After the Civil War boards of health were established in the chief cities. Public health is under the control of the local authorities to a greater extent than in England. By the Act of Congress of the 25th of February 1799 officers of the United States are bound to observe the health laws of the states. A national board of health was created by the act of the 3rd of March, 1879, c. 202; and it was succeeded by the Public Health and Marine Hospital Service, whose chief officer is the surgeon-general and which has jurisdiction in quarantine and in epidemics of a public danger.

PUBLIC HOUSE, in its general English acceptation, a house in respect of which a licence has been obtained for the consumption of intoxicating liquors. Public houses are frequently distinguished as "tied" and "free." A tied house is one rented from a person or firm from whom the tenant is compelled to purchase liquors or other commodities to be consumed therein. A free house has no such covenant. The keepers of public houses ("publicans" or "licensed victuallers") are subject, in the conduct of their business, to a number of restrictions laid down by various acts of parliament; while, in order to ply their trade, they require a justices' licence and an excise licence. (See LIQUOR LAWS; TEMPERANCE.)

By the Parliamentary Elections Act (1853) a public house must be used for elections, meetings or committee rooms. By the Pay and Charge Act (1833) it is illegal to pay wages to any workman in a public house, except such wages as are paid by the resident owner or occupier. By the Sheriff's Act (1887) when a debtor is arrested he must not be taken to a public house without his free consent, nor must he be charged with any sum for liquor or food, except what he freely asks for.

PUBLIULIS (less correctly PUBLIULIS) SYRUS, a Latin writer of mimes, flourished in the 1st century B.C. He was a native of Syria and was brought as a slave to Italy, but by his wit and talent he won the favour of his master, who freed and educated him. His mimes, in which he acted himself, had a great success in the provincial towns of Italy and at the games given by Caesar in 46 B.C. Publius was perhaps even more famous as an improvisatore, and received from Caesar himself the prize in a contest in which he vanquished all his competitors, including Licinius Laberius. That remains of his works is a collection of Sentences (Senitentiae), a series of moral maxims in iambic and trochaic verse. This collection must have been made at a very early date, since it was known to Aulus Gellius in the 2nd century A.D. Each maxim is comprised in a single verse, and the verses are arranged in alphabetical order according to their initial letters. In course of time the collection was interpolated with sentences drawn from other writers, especially from apocryphal writings of Seneca; the number of genuine verses is about 700. They include many pithy sayings, such as the famous "judex damnum ubi nocens absolvit" (adopted as its motto by the Edinburgh Review).

The best texts of the Sentences are those of E. Wöfflin (1869) A. Spengel (1874) and W. Meyer (1880), with complete critical apparatus and index verborum; recent editions with notes by R. A. M. Meyer (1880), R. A. H. Pickford-Smith (1895), with full bibliography; see also W. Meyer, Die Sammlungen der Spruchweise des Publius Syrus (1877), an important work.

PUBLISHING. In the technical sense, publishing is the business of producing and placing upon the market printed copies of the work of an author (see BOOK). Before the invention of printing the actual maker of a manuscript was to a great extent his own publisher and his own bookseller. Increase of facilities for the production of copies led to a steady though slow differentiation of functions. The author was the first factor to be isolated and confined to a well-marked province, yet we may find upon the title-page of some old books an intimation that they might be purchased either at the shop of the bookseller who published them or at the lodgings of the author.

The separation of publishing from bookselling came later (see BOOKSELLING). Booksellers were the first publishers of printed books, as they had previously been the agents for the production and exchange of authentic manuscript copies; and as they are quite competent to make contracts with papermakers, printers and bookbinders, there is no particular reason why they should not be publishers still, except the tendency of every composite business to break up, as it expands, into specialized departments. That tendency may be seen at work in the publishing business itself. When publishers had conquered their own province, and had confined booksellers to bookselling, they held in their own hands the entire business of distribution to the trade. But a class of wholesale booksellers has grown up, and although important retail booksellers in London continue to deal directly with the publishers, the retail booksellers throughout the country draw their supplies quite largely from the wholesale agents.

The intellectual movement which was largely responsible for the French Revolution, and the general stir and upheaval which followed that portentous cataclysm, precipitated the separation of production from distribution in the book trade, by the mere expansion of the demand for books. That separation was practically complete at the beginning of the 19th century, although it would not be difficult to find survivals of the old order of things at a much later date. The old bookseller-publishers were very useful men in their time. They met pretty fairly the actual needs of the public; and as regards the quality of books they took the people's pulse. The quantity of output was very largely dependent. No doubt the author had much to endure at their hands, still, they did undoubtedly improve his status by introducing him to public patronage and placing him upon a sounder economic basis. If in the earlier days they were less than liberal in their terms, it may be remembered that their own business was not very extensive or very remunerative. They were not equipped either with brains or with capital to extend that business in answer to the growing demand for books. By the daily routine of their shops they
were tied down to narrow views, and their timidity is charac-
teristically shown by the fact that to publish a book of any importance required the co-operation of a number of book-
sellers who shared the expenses and the profits.

Enterprise could not be expected from a committee of that kind and of that composition; hence there was not merely an opposition to it, but a clamorous demand for men of larger ideas and wider outlook to undertake the proper business of publishing, unhampered by the narrowings influences of retail trade.

Besides unconsciously improving the position of authors by enabling them to appeal to the public instead of to patrons, whom Johnson classed with other evils in the line "toil, envy, want, the patron and the gaud," the bookseller-publishers gave them, or many of them, steady employment as literary assistants and advisers.

As the demand for books increased, these worthy tradesmen felt with growing acuteness their own want of literary ability and of education. They called in men of letters to supply their own deficiencies. No doubt they expected the lowest kind of hack work from their assistants, no doubt the pay was poor, no doubt they trampled upon the sensibilities of the man of letters, and no doubt he irritated them by his unbusinesslike habits. Still, the association was useful to both parties; and indeed, one may lay down many books at the present day with a sigh of regret that the writers had never been compelled to go through an apprenticeship of the kind.

The emergence of the publishers as a separate class was accompanied by differentiation of the functions of their literary assistants. The routine drudgery which men of education and ability formerly had to undergo fell to a class now known as "proof readers," who are on the watch for typographical errors, grammatical slips, ambiguities of expression, obvious lapses of memory and oversights of all kinds. Men of letters became "publishers' readers," and their duty was to appraise the worth of the manuscripts submitted, and to advise their employers as to the value of the matter, the originality of the treatment, and the excellence of the style. Their advice was also sought upon literary projects that may have suggested themselves to the publishers, and novel suggestions emanating from themselves were welcomed. Men of letters in positions of that kind could obviously exercise very considerable influence over the proceedings of the publishing firms to which they were attached, and many an unknown writer has owed the acceptance of his work to the sympathetic insight of the publishers' reader.

The man of letters as publisher's reader is, however, a transitory phenomenon in the evolution of the publishing business. His primary function is to tell the publisher what is intrinsically good, but probably he has always to some extent discharged the secondary function of advising the publisher as to what it would pay to publish. The qualities which make a man a sound critic of intrinsic worth are quite different from those that make him a good judge of what the public will buy. When books were comparatively few, and when the reading public was comparatively small, select and disposed to give considerable attention to the few books it read, the critical faculty was of more importance than the business one. But when the output of books became large, and when, as the consequence of educational changes, the reading public became numerous, uncritical and hurried and superficial in its reading, the importance of the critical faculty in the publisher's reader dwindled, while the faculty of gauging the public mind and guessing what would sell became increasingly valuable. The publisher's literary adviser belongs to the period when the publishing business had expanded, and it is largely through the intermediary of the publisher to look for skilled assistance in working more or less upon the older traditions. But when, as is now the case, expansion has gone so far as to swamp the older traditions, and to make publishing a purely commercial affair, the literary reader gives place to the man of business with aptitude for estimating how many copies of a given book can be sold. This is practically recognized by at least one London publisher, who in recent years paid no salary to his reader, but gave him a small commission upon every copy that was sold of any book the publication of which he had recommended. Nothing could more plainly indicate that literary faculty is not wanted, and that the reader's function is to judge, not literary value, but commercial utility.

The market is flooded with books badly written, badly constructed, as poor in matter as in form, as flat as the bottom of a soup, and outrageously padded to suit conventional relations between size and price. They are books which no man of literary taste or judgment could ever recommend for publication on their merits, but they are published, just as crackers are at Christmas, on a calculation that a certain number will find buyers. Even if the publisher sees no prospect of an adequate sale, he publishes the books all the same, upon terms which ensure to him a manufacturing profit and throw the risk of loss upon other shoulders.

There is no reproach, stated or implied, to the publisher. He is merely a man of his age carrying on his business upon terms which the age prescribes through a number of concurrent causes. Any reproach that may fall upon him he invites by sometimes giving himself the airs of one belonging to an earlier age, and claiming credit for acting upon principles that are obsolete.

An author, even if he be an immortal genius, is, from the economic point of view, a producer of raw material. A publisher, however eminent, is from the same point of view a middleman who works up the author's raw material into a saleable form and places it upon the market. The relationship between the two is one that occurs with great frequency in business, always giving rise to efforts by each party to adjust the division of profit to his own advantage. If there be anything peculiar to the publishing business it is that the party who in that business most successfully adjusts matters for his own advantage is liable to be charged by the other with some form of moral obliquity. The diatribes of authors against publishers are familiar to every one; and publishers on their side have some hard things to say about authors, though their sentiments are less piquantly and less publically expressed. The publisher is usually a more or less capable man of business, while the author is generally—though there are very notable exceptions—quite ignorant of business and apparently incapable of learning the rudiments. It necessarily follows that the author, left to himself, accepts agreements and signs contracts which are much less favourable than they need be to his acquisition of a due share of the profits jointly made by himself and the publisher. What makes his position still worse is the circumstance that each author fights for his own hand, whereas the publishers, although in competition with one another, are also to some extent in combination.

In these circumstances it occurred to Sir Walter Besant and some others that a remedy for this inferiority in position might be found in a combination of authors for mutual help and protection. After a troublesome period of incubation the Society of Authors was established in London in 1838, with Lord Tennyson as its first president, and with a goodly list of 35 vice-presidents. It offered useful assistance to authors ignorant of business in the way of examining contracts, checking publishers' accounts, revising their sometimes too liberal estimates of costs of production, and giving advice as to the publishers to be applied to or avoided in any given case. It has no doubt been of great service in checking the abuses of the publishing trade and in compelling the less scrupulous among the publishers to conform more or less exactly to the practice of the more honourable. On general questions such as that of copyright it was forever as an efficient protection of the opinions of authors, though here it champions their interests against the public rather than against the publishers. But the society has never been an effective combination of authors; and indeed the obstacles, material and moral, to such a combination are so great as to render complete success extremely improbable. Nothing could better illustrate this difficulty than the fact that, concurrently with the Society of Authors, a totally different machinery for the furtherance of the interests of authors came into existence. The "literary agent" made his appearance about 1880. He is supposed to be an
expert in all matters pertaining to publishing and to the book market. He takes the author's business affairs entirely into his hands; utilizes the competition among publishers to sell the author's work to the highest bidder; checks accounts, estimates and sales; keeps the author's accounts for him; and charges a commission upon the proceeds. Here we have the author fighting as of old for his own hand. The only difference is that he does his fighting by proxy, hiring a stronger man than himself to deal the blows on his account. There is no question whatever of solidarity with his fellow-authors, and the whole system is a direct negation of the principle upon which the Society of Authors was founded.

On the other hand, both publishers and booksellers have long had the disposition, and to some extent the ability, to co-operate, and the efforts of both sets of men have unfortunately been in the direction of maintaining, if not raising, the price of books to the public. Since the formation of the Publishers' Association in 1869 the publishing trade has been strongly organized on the trade-union pattern, and its operations have been assisted by the less powerful Booksellers' Association. Books, like many other articles, are sold by the makers at list prices, and the retailer's profit is furnished by discounts off these prices. Under such a system competition among retailers takes the form of the sacrifice by the more enterprising of a portion of their discount. They prefer a large sale at a low profit to a small sale at a high profit. It is always the desire of the less enterprising to put an end to this competition by artificial regulations compelling all to sell at the same price.

Many attempts have been made to destroy freedom of dealing in books. In July 1850 twelve hundred booksellers within 12 m. of the London General Post Office signed a stringent agreement not to sell below a certain price. This agreement was broken almost immediately. Another attempt was made in 1852; but at a meeting of distinguished men of letters resolutions were adopted declaring that the principles of the Booksellers' Association of that period were opposed to free trade, and were tyrannical and vexatious in their operations. The Times took an active part in defending and enforcing the conclusions which they sanctioned. The question was eventually referred to a commission, consisting of Lord Campbell, Dean Milman and George Grote, which decided that the regulations were unreasonable and inexpedient, and consequently which could not be maintained in commercial transactions. An attempt was also made in 1869 to impose restrictions upon the retail bookseller; but that also failed, mainly by reason of the ineffective organization which the publishers then had at command.

Feeling their hands greatly strengthened by the establishment of their Association, the publishers were emboldened to make another effort to put an end to reductions in the selling price of books. After much discussion between authors, publishers and booksellers, a new scheme was launched on the 1st of January 1900. Books began to be issued at net prices, from which no bookseller was permitted to make any deduction whatever. The scheme was enforced by the refusal of all the publishers included in the Association to supply books to any bookseller who should dare to infringe it in the case of a book published by any one of them. In other words, a bookseller offending against one publisher was boycotted by all. Thus, what is known as the "net system" depended absolutely upon the close trade union into which the publishers had organized themselves. The Booksellers' Association signed an agreement to charge the full published price for every net book, but that body had no real power to impose its will upon recalcitrant booksellers. Its association with the publishers on the question of the price was an indirect attempt at the fear of active opposition on the part of the wholesale booksellers and the large retail booksellers, mainly located in London.

All books were not issued at net prices even in 1910, though the practice had extended enormously since it began in 1900. But the principle was applied all round. In the case of such books as six-shilling novels the discount price of four shillings and sixpence was treated as the net price, and the usual penalty was inflicted upon those who dared to sell at any lower price, at all events within twelve months of the date of publication.

Owing to the fact that the net system was gradually introduced, net books and discount books being issued side by side with discount books in the majority, the full effect of the innovation was not immediately apparent. But the establishment of the Times Book Club in 1905 brought the system to the test. That Club aimed at giving to the readers of The Times a much more prompt and copious supply of new books than could be obtained from the circulating libraries. The scheme was at first very favourably received by the publishers, who saw in it the promise of largely increased orders for their goods. They obtained these orders, but then something else happened which they had not foreseen. Of the books they issued the vast majority were of ephemeral interest. For a few weeks, sometimes only for a few days, everybody wanted to glance at them, and then the public interest dwindled and died. As the copies ceased to be in demand for circulation the Book Club naturally tried to take advantage of the buying demand, which always exists, though it is always repressed by the very high prices charged by publishers in Great Britain. The Book Club sold its surplus copies at reduced prices, and was obliged to do so, since otherwise it would have been swamped with waste paper. But the authors and publishers now rose in arms. Forgetting that they had been paid the full trade price for every copy, they said that the Book Club was spoiling the market, and that a wholesale buyer had no right to sell at the best price he could get. Hence arose what came to be known as the Book War, between The Times and the associated publishers and booksellers, the publishers withdrawing their advertisements from The Times and doing their best to refuse books to the Book Club. The conflict made a considerable commotion, and the arguments on both sides were hotly contested. It did not, however, alter the fact that the public will not pay high prices for books having no permanent value.

The Booksellers' Association, dominated by the large booksellers in London and a few great towns, made common cause with the Publishers' Association. Their interests were not affected by the net system, and they saw in the Book Club an energetic competitor. The small booksellers up and down the country are injuriously affected, because it is more difficult than ever for them to stock books on which there is a very small margin of profit, and consequently which are not kept in the back rooms of bookshops. The conflict made a considerable commotion, and the arguments on both sides were hotly contested. It did not, however, alter the fact that the public will not pay high prices for books having no permanent value.

The iron retail price is economically wrong. A bookseller with a large turn-over in the midst of a dense population can afford to sell at a small profit. He finds his reward in increased sales. His action is good for the public, for the author, and for the publisher himself; he is enlightened enough to see it. But a small bookseller in a remote country town cannot afford to sell at an equally low profit, because he has not access to a public large enough to yield correspondingly increased sales. Yet both are arbitrarily compelled to sell only at a uniform price fixed by the publisher. What makes the matter worse is that there is no cast-iron wholesale price. The small bookseller has to pay more for his books than the large one who buys in dozens of copies. Carriage on his small parcels often eats up what profit is left to him. As he is not allowed to have books "out of print" during their return season, and the wholesaler can profit by the advantage of a distributing agency the small bookseller has become negligible.

It is not a necessary consequence of the net system that new books should cost the public more than before. If it has become the practice to sell a ten-shilling book for seven shillings and sixpence, and if that practice be thought objectionable, the obvious remedy, supposing publishers to have no other end in view, is to publish the book at the price for which it is sold. But the net system has been used to enforce the sale of the book.
at the published price and nothing less, which obviously amounts to compelling the public to pay more than before for the book. Again, if the object were to benefit the retail bookseller by relieving the pressure of competition, it is plain that after abolishing discounts the publishers would charge the same wholesale prices as before to the booksellers. But, on the contrary, they have so adjusted their prices that the retailer gets no more profit upon a book sold net than he formerly obtained from a book of the same published price after allowing a discount. Thus the object and result of the net system is to increase the profits of the publishers at the expense of the public. This has been accomplished at a time when paper is cheaper than at any previous period, and when machinery has reduced the cost of composition, printing and binding to an almost equal extent. It is a remarkable illustration of the power of combination among quasi-monopolists to raise the price of their commodities even in the face of a falling market.

The Book War came to an end in 1908; but though the publishers and booksellers appeared in the result to have brought the Book Club within terms which were satisfactory to them, the whole situation had really been changed. The public for the first time had been educated. Public attention had been forcibly directed to the fact that there is no reason in the nature of things why the price of books should increase, but on the contrary, every reason why they should be cheaper than at any previous period. A certain mystery which had hung over the publishing trade was effectually dispelled. The man in the street learned that books priced to him at six shillings can be produced by the joint labours of the paper maker, the printer, and the bookbinder for about sixpence, and that in many cases the author gets little or nothing out of the difference. There followed a quickening of the public demand for literature at reasonable prices, and enterprising people were found to meet the demand. A vast quantity of good literature, much better than nine-tenths of what is written to-day, has been brought within reach of persons of the smallest incomes. Hundreds of standard works have appeared in convenient and readable editions at a shilling, at sevenpence and even sixpence per volume. These cheap editions have an enormous sale, not only because they are low in price, but because they have permanent value. For the cost of a novel which he will never look at twice, and which perhaps was hardly worth reading once, a man may obtain half a dozen books that have stood the test of time, and that will become the valued companions of his leisure. He gets them too in a form suited not only to his purse, but to the limited storage accommodation at the disposal of the mass of modern readers, who can neither buy nor house the stately editions that adorn the libraries of the wealthy. Thus, in respect of the large class of books read for recreation, we have reached the paradoxical position that cheapness and excellence go hand-in-hand; and that the disparaging adjective frequently linked with "cheap" is more properly associated with dear and pretentious.

Nor does the counter movement stop even here. There is a growing tendency to bring out books of current production in cheap editions, and also to publish the original edition at prices which must give a painful shock to the authors of the net system. Cheap magazines, and the feuilletons which newspapers are adopting from French practice, make considerable inroads upon the province of the six-shilling novel; and as regards more serious books the newspapers now give an amount of information about their contents which goes far to console the public for the prohibitive prices of the books themselves. These movements, which are well understood will not be interfering with the plans of those who devised the net system. The combination publishers have never understood that, apart from the very small percentage of works which make real additions to the sum of knowledge or of genuine literary achievement, the reading of the books they turn out is a pastime, which has to compete in public favour with a great variety of other pastimes. They have chosen to make their form of recreation extremely expensive, with the double result that the public turn to others, and that even their own is increasingly supplied by cheaper agencies.

There are certain classes of books which must always be relatively expensive, because they appeal only to students of some particular branch of science or of art or of literature, whose number is not great. But these are books of enduring value. Their price is justified not only by their prolonged use, but by the creative talent which goes into them. and that appeal to the public at large. But the books which are produced by the net system for the purpose of interfering with the writing of them, as well as by the frequently exceptional cost of producing them. But as regards the vast output of books which merely amuse an idle hour, the existence of a large body of readers is the only excuse for their appearance, and if they cannot be produced at a low price ensuring an extensive sale they ought not to be produced at all. Thus there is more than a mere money question involved in the contention about price. An artificial system of prices leads to the printing of a vast quantity of trash, which demoralizes the reading public and is a serious obstacle to the success of the better books. Such a system operates, in fact, as a protective duty in favour of mediocrity and even of something worse. It is no defence of such a system that it panders to the vanity of incompetent scribblers, and enables publishers to make money by soiling paper that had better have been kept clean.

A rational system of prices would automatically solve some of the difficulties of the book-world. If a book is selling by tens of thousands of copies, as every book printed for pastime ought to do, it would not matter at what price any large buyer chose to resell his purchases. They would only be a drop in the bucket, and all the contention about second-hand prices would disappear.

Then there is the troublesome system of "reminders," that is to say, the unsaleable copies of thousands of books published every year. The editions are small enough—probably not more than one thousand copies—yet, in spite of circulating libraries, a third or a half of that modest number remains in the warehouses of the publishers. Sometimes they are sold for about the cost of their flimsy covers; sometimes they simply go to be reduced to their original pulp at the paper mills. If a book has any sale justifying its production, there will be no question of reminders, supposing its supply to have been regulated by the most ordinary prudence. The sale of such a book never stops dead, and any small surplus of copies can always be got rid of at a small profit on the second-hand market.

Towards the end of the 19th century came a large influx into England of American literature, especially fiction. Not only was there a growing appreciation of many American writers, but the attractive "get-up" of American books made its influence felt upon the British market. Some of the American methods of distribution were also introduced into Great Britain, but at first with only partial success. The most successful effort was the sale of important expensive works through the medium of newspapers. Canvassing, which was a common method of distributing books in the United States, met with little support in the United Kingdom, although about the middle of the 19th century a large trade was done through England and Scotland by canvassers, who sold in numbers and parts such works as Family Bibles, Daily Devotions, Lives of Christ and Foxe's Book of Martyrs.

The methods of publishing in America are similar to those adopted in Great Britain, but the discount to the booksellers is generally given pro rata according to the number purchased. It is, however, in respect of the means of distribution that the systems of the two countries differ most markedly. In America the general stores to a large extent take the place of the English bookseller, and by their energy and extensive advertising a wider public is served. In the distribution of the American plan of "booming" a book by copious advertising, although expensive, is often the means of inducing a large sale, and of bringing an author's name before the public. In 1901 the net system, as adopted in Great Britain, was partially imported into America.

The continental methods of publishing and distributing, especially in Germany, differ, in many respects very materially, from those of Great Britain. In even the smallest German towns there is a bookseller who receives on sale, immediately upon publication, a supply of such new books as he or the publisher may think suitable to his class of book-buyers. The bookseller submits these books
PUCCINI—PUDUKKOTTAI

to his customers, and by this method most books issued are at once placed at the disposal of any buyer interested in the particular subject. Thus some 15000 books, pamphlets and periodicals are thus saved. At the book fairs held in Leipzig at Easter and Michaelmas the accounts for books sent on sale are made up and paid. In France all books have to be licensed before publication; but the methods of publication differ little from those of other continental countries, in all of which book prices are much lower than in England.

PUCCINI, GIACOMO (1858– ), Italian operatic composer, was born at Lucca, of a family already distinguished in music; his great-great-grandfather Giacomò, great-grandfather Antonio, grandfather Domenico, and father Michele, being all well known in the art. He was educated at the Milan Conservatorio, and in 1884 his opera Le Villi was performed at the Teatro del Verme. In 1898 his Edgar was performed at La Scala, and in 1873 his Turandot at the Metropolitana the performance of which, in 1876, he conducted in Turin in 1876 that made him famous, and this opera had a great success everywhere. Tosa followed in 1900, and in 1904 Madama Butterfly confirmed the highest opinions of his talent.

PUCHTA, GEORG FRIEDRICH (1798–1849), German jurist, born at Kadelburg in Bavaria on the 31st of August 1798, came from an old Bohemian Protestant family which had immigrated into Germany to avoid religious persecution. His father, Wolfgang Heinrich Puchta (1769–1843), a legal writer and district judge, imbibed his son with legal concepts and principles, and from 1811 to 1816 young Puchta attended the gymnasium at Nuremberg, where he acquired a taste for Hegelianism. In 1816 he went to the university of Erlangen, where, in addition to being initiated by his father into legal practice, he fell under the influence of the writings of Savigny and Niebuhr. Taking his doctor's degree at Erlangen, he established himself here in 1820 as privatdozent, and in 1823 was made professor extraordinary of law. In 1828 he was appointed ordinary professor of Roman law at Munich. In 1835 he was appointed to the chair of Roman and ecclesiastical law at Marburg, but he left this for Leipzig in 1837, and in 1847 he succeeded Savigny at Berlin. In 1845 Puchta was made a member of the council of state (Staatsrat) and of the legislative commission (Gesetzgebungskommission). He died at Berlin on the 8th of January 1846. His chief merit as a jurist lay in breaking with past unscientific methods in the teaching of Roman law and in making its spirit intelligible to students. Among his writings must be especially mentioned Lehrbuch der Pandekten (Leipzig, 1838, and many later editions), in which he elucidated the dogmatic essence of Roman law in a manner never before attempted; and the Kursus der Institutionen (Leipzig, 1841–1847, and later editions), which gives a clear picture of the organic development of law among the Romans. Among his other writings are Das Gelehrt Salicet (Erlangen, 1823–1837); and Einleitung in das Recht der Kirche (Leipzig, 1846).

Puchta's Kleine zivilistische Schriften (posthumously published in 1851 by Professor A. A. Friedrich Kudorff), is a collection of thirty-eight masterly essays on various branches of Roman law, and the Preface contains a sympathetic biographical sketch of the jurist. See also Zeher, Über die von Puchta der Darstellung des römischen Rechts zu Grunde gelegten rechtshistorischen Ansichten (1853).

PÜJÖKKOTTAI, a state of southern India, in subordination to Madras, lying between the British districts of Tanjore and Madura. Area, 1,100 sq. m. Pop. (1901), 380,440, showing an increase of 2% in the decade. The state consists mainly of an undulating plain, nowhere of great fertility and in many parts barren; it is interspersed with rocky hills, especially in the south-west. Granite and laterite are quarried, red ochre is worked, and silk and cotton fabrics, bell-metal vessels and perfumes are among the principal manufactures. There is also some export trade in groundnuts and tanning bark. The chief products of the state are cardamoms, cinnamon, rubber and palm oil. Pudukkottai has a right to send one member to the Madras assembly. It has a total area of 1,100 square miles, and a population of 380,440.

PÜDSEY, a municipal borough in the Pudsey parliamentary division of the West Riding of Yorkshire, England, 6 m. W. by S. of Leeds, on the Great Northern railway. Pop. (1801), 1,344; (1891), 14,907. The principal buildings are the church of St. Lawrence in Gothic style, erected in 1821, and the mechanics' institute, a fine building, comprising class-rooms, a library, a public hall and a lecture hall. A public park was opened in 1889. The town has an important woollen trade and possesses dyeing and fulling mills. Part of the parish, Tyersall, is in the borough of Bradford. Pudsey is mentioned in Domesday. It was sold by Edward II. to the Calverley family, from which it passed to an ancestor of the Milners. The town was incorporated in 1869, and the corporation consists of a mayor, six aldermen and 18 councillors. Area, 2,390 acres.

PUDUKKOTTAI, a state of southern India, in subordination to Madras, lying between the British districts of Tanjore and Madura. Area, 1,100 sq. m. Pop. (1901), 380,440, showing an increase of 2% in the decade. The state consists mainly of an undulating plain, nowhere of great fertility and in many parts barren; it is interspersed with rocky hills, especially in the south-west. Granite and laterite are quarried, red ochre is worked, and silk and cotton fabrics, bell-metal vessels and perfumes are among the principal manufactures. There is also some export trade in groundnuts and tanning bark. The chief products of the state are cardamoms, cinnamon, rubber and palm oil. Pudukkottai has a right to send one member to the Madras assembly. It has a total area of 1,100 square miles, and a population of 380,440.
PUEBLA—PUELCHE

PUEBLA, a state of Mexico, occupying the south-east angle of the great central plateau, or that part of it known as the Anahuac table-land. It is bounded N. and E. by the state of Vera Cruz, S. by the states of Oaxaca and Guerrero, and W. by the states of Morelos, Mexico, Tlaxcala and Hidalgo. Area, 12,204 sq. m. Pop. (1900), 1,021,133, largely civilized Indians. Lofty mountains overlook the plateau from the north-east and west, three of the highest peaks, Orizaba, Popocatepetl and Ixtaccihuatl rising above the permanent snow-line, while another, Malinche, lifts its isolated mass nearly to that limit. In the south the table-land breaks away and long fertile valleys lead downward toward the warm southern plains. The central table-land forms part of the watershed between the eastern and western drainage systems, some of the streams in the north and southeast emptying into the Gulf of Mexico, while the Atoyac, which has its source in Tlaxcala, crosses the state and discharges into the Pacific through the Mescala. Puebla has a temperate, healthful climate, one of the best in Mexico. The soil is generally fertile and the rainfall abundant. Agriculture is the principal industry. The Mexican, Interociane and Mexican Southern railways cross the state and afford ample transportation facilities.

PUEBLA (full title La Puebla de los Angeles, and more recently, Puebla de Zaragoza), a city of Mexico and capital of the state of the same name, on the banks of the Atoyac river, 60 m. S.E. of the city of Mexico, with which it is connected by two important railways. Pop. (1900), 93,155, including a large percentage of Indians. Its railway connections put it in daily communication with the national capital, Vera Cruz, Pachuca, Oaxaca, and the terminal ports of the Tehuantepec railway—Coatzacoalcos and Salina Cruz. The city is built on a broad healthy plain, about 7200 ft. above sea-level. It is well provided with street railways, electric and gas illumination, water and drainage. The great Doric cathedral, about 165 X 120 ft., is perhaps the finest ecclesiastical building in Latin America. It was begun about 1553, but not completed until 1649. Among other churches, famous for their lavish decorations, are those of San José, San Cristobal, Santa Catarina and San Domingo. The "Teatro Principal," built in 1790, is said to be the oldest existing theatre on the continent. There are two other theatres, and an immense bull-ring. Among the more conspicuous public buildings are the palace of justice, the building of the state legislature, a school of medicine to which is attached the Palafoxiana Library of over 10,000 volumes, an academy of fine arts, and the national college. At Fort Guadalupe, near the city, there are several hot sulphur springs, which are used for medicinal baths. Puebla is one of the busiest manufacturing cities in Mexico, and among its products are cotton and woolen textiles, soap, glass, straw hats, pottery and leather goods. There are also some large foundries.

Puebla was founded in 1532 by Sebastián Ramírez de Fuenleal, archbishop of Santo Domingo, and the celebrated Franciscan friar Toribio Motolinia. In 1550 it became the see of the bishopric originally created in 1526 at Tlaxcala. The appellation "de los Angeles," which is now practically dropped, originated in a popular belief that during the building of the cathedral two angels every night added as much to the height of the walls as the workmen had completed on the preceding day. Its present title was given in honour of General Ignacio Zaragoza (1829-1862), who successfully defended the city against the first French attack in 1863. It was captured in the following year by the French, and then by the Mexicans under Porfirio Díaz in 1867. In the war between Mexico and the United States it was captured by General Winfield Scott and was his headquarters from June to August 1847.

PUEBLO, a city and the county-seat of Pueblo county, the second largest city of Colorado, U.S.A., and one of the most important industrial centres west of the Missouri river, situated on the Arkansas river, about 126 m. S. by E. of Denver. Pop. (1890), 24,558; (1900), 28,175, of whom 4705 were foreign-born, 12,500 being Austrian, 587 German, 529 Italian, 415 Irish, 301 Swedish, 385 English and 341 English Canadian; (1910, census), 44,395. It is served by five great continental railway systems—the Denver & Rio Grande, the Atchison, Topeka & Santa Fe, the Missouri Pacific, the Chicago, Rock Island & Pacific and the Colorado & Southern, giving it altogether a dozen railways. It lies about 6500 ft. above the sea, in a valley at the junction of the prairies with the foothills of the Rockies, on both banks of the Arkansas river, near its confluence with Fountain Creek; the city has an exceptionally good climate and attracts many winter visitors. There are a state insane asylum and four hospitals, of which the Minnequa Hospital (for the employees of the Colorado Fuel & Iron Co.) and St Mary's Hospital are the most notable. Among the public buildings are the McClelland public library (1861) and the court-house, the latter of white stone quarried in the vicinity. The Mineral Palace (1861), having a roof formed of twenty-eight domes, in the northern part of the city, contains a collection of the minerals of the state. Pueblo is chiefly an industrial city, and is often called the Steel City, or the Pittsburgh of the West. Cheap fuel is furnished by the excellent coal of Canyon City (about 30 m. west), Walsenburg (about 40 m. south-west) and Trinidad (about 75 m. south). Petroleum deposits in the immediate vicinity are of growing importance. Fluxing material is only about 50 m. away, around Cripple Creek. Theriich river valley yields abundant crops of alfalfa, sugar beets, cantaloupes, apples and peaches, and the dry lands behind its shores prove fertile under irrigation or under the Campbell system of dry farming; on the plains livestock is extensively driven every year. In 1900 Pueblo's total factory products were valued at $8,197,293 (an increase of 52.6% since 1900); if the output of the great smelting and refining establishments just outside the city limits had been included, the value would have been considerably larger. Pueblo is the greatest smelting centre west of the Missouri and probably the greatest in the United States. The bulk of the steel rails used on western railways are from the mills of the Pueblo district.

Pueblo was originally a Mexican settlement. A considerable body of Mormons settled here temporarily on their way to Utah in 1866-1847, and a trading post was established in 1829; but the site, owing principally to Indian troubles, had been practically abandoned before 1858, when another settlement was made on the Fontaine Qui Bouille, or Fountain Creek. Two years later Pueblo was surveyed and platted. The first railway—the Denver & Rio Grande—came through in 1872. Pueblo was chartered as a city in 1870, and again, with an enlarged area, in 1887.

PUEBLA INDIANS, the Spanish name (pueblo = village) for the town-building tribes of American Indians of the Keresan, Shoshonean, Tanoan and Zuñián stocks, whose representatives are now practically confined to New Mexico and Arizona. Formerly they had a far greater range. They were alike in their sedentary agricultural characteristics, and had not the warlike disposition of the Plains Indians. Their modern history begins with their discovery in 1539 by Father Marcos de Niza. In the following year they were subdued by Francisco Vasquez de Coronado. Two years later they made a successful revolt, but in 1586 they had again to submit. In 1680 they once more rebelled, but by 1692 they were finally conquered. Their houses are communal, generally but one structure for the whole village. These houses are sometimes built of stone, but oftener of adobe, several storeys high, each storey receding from the one below. The common plan is a hollow square or curved figure, though in some cases the form of a pyramid is followed. A feature of each town is the underground chamber used for tribal ceremonies. Many of the towns are built on high table-lands inaccessible except by steep trails. The Pueblos are a short, sturdy type of American Indians, very active, but mild-mannered and much darker than those of the plains. They are farmers and herders, and are skilful in basket-work, weaving, pottery and carving. They are notable for their highly developed ceremonial customs, and their blankets and earthenware are decorated with religious symbolism.

PUELCHE, a tribe of South-American Indians of Araucanian stock. Their home is the Pampas region of southern Argentina around the Colorado river. They are chiefly nomadic, breeding cattle and horses, and lead a wild, lawless life.
PUENTEAREAS, a town of north-western Spain in the province of Pontevedra; on the Tuy-Santiago de Compostella railway and on the river Tea, a right-hand tributary of the Miño. Pop. (1900), 13,532. Puenteareas is the chief town of a fertile fully region, which produces wine, grain and fruit, and contains many cattle farms. The industries of the town itself are porcelain manufactures, tanning and distilling. Close by are the ruins of the castle of Sobroso, which played an important part in the medieval civil wars.

PUENTE GENIL, or PUENTE JENIL, a town of southern Spain, in the province of Cordova; on the right bank of the river Genil or Jenil, a tributary of the Guadalquivir. Pop. (1900), 12,956. Puente Genil is on the Cordova-Malaga railway, and is the starting-point of the line to Linares. A bridge across the Genil, from which the name of the town is derived, joins the lower part of Puente Genil with the higher, which is built on rising ground extending to the olive groves above. There are several convents, schools for primary and higher education, hospitals, a municipal library and a theatre. The principal industry is the manufacture of olive oil. There are also flour-mills and linen factories. The alhondiga or permanent market is always well stocked with grain, vegetables and livestock.

PUERPERAL FEVER (Lat. puerpera, from puer, child, and parere, to bring forth), the name given to the varieties of general infection, long regarded as a specific disease ("child-bed fever," "lying-in fever"), to which women are subject after parturition, owing to the genital tract being particularly exposed, in secretions and surroudings, to the invasion of pathogenic bacteria (see Sezsis). Owing largely to the labours of J. P. Semmelweis (g.s.) the grave mortality formerly attending this condition has been enormously reduced; and the necessity of rigid cleanliness in the treatment of lying-in cases is fully recognized. When unhappily this is not the case, and infection takes place, its complications must be treated according to the circumstances, antiseptic dressing being employed, or preferably currying the endometrium with a sharp curette and swabbing with disinfected solution. In definitely septicæmic cases antistreptococcic serum may be useful.

PUERTO CABELLO, a city and port of Venezuela, in the state of Carabobo, 20 m. N. by W. of Valencia, the capital of the state. Pop. (1891), 10,145. Puerto Cabello has railway connexion with Valencia and Caracas. It stands on a small peninsula which partly shelters a large bay, called "Golfo Triste," by the early Spanish navigators. After La Guayra the harbour is the principal port of Venezuela, and it is provided with mole, wharves, railway communication with the interior, and other facilities for the handling of merchandise and produce. The town and harbour were strongly fortified in colonial times, but the port defences were greatly damaged in 1904 in a bombardment by some German vessels of the allied blockading fleet. Among the exports are coffee, cacao, dyewoods, hides, skins, and copper ores. Puerto Cabello suffered much in the War of Independence, changing hands several times and remaining in the possession of Spain down to 1823.

PUERTO CORTESES (Cortez or Caballos), a seaport on the Atlantic coast of Honduras; in 15° 31' N. and 87° 56' W., at the northern terminus of the transcontinental railway from Fonseca Bay, and near the mouth of the river Chamaeleon. Pop. (1901), about 2500. The harbour, an inlet of the Gulf of Honduras, is deep, spacious and secure, and there is a railway pier at which vessels can load and discharge. The exports include bananas, coffee, cabinet woods, rubber, sarsaparilla, livestock, deerskins and gold. The harbour was discovered in 1527 by Gonzalo d'Avila, and the town was founded a few years later by order of Hernando Cortes, from whom it derives its name.

PUERTO DE SANTA MARIA, a seaport of southern Spain, in the province of Cadiz, on the right bank of the river Guadate, with a station on the railway from Cadiz to Seville. Pop. (1900), 10,170. Puerto de Santa Maria, commonly called "El Puerto," is probably the Menesthel Portus of Ptolemy. Its most important industry is the wine trade; there are also glass, liquor, alcohol, starch and soap manufactures. The principal buildings are a Moorish citadel, a Gothic church founded in the 13th century, a Jesuit college, and a bull-ring which accommodates 20,000 spectators. The town is noted for its bull-fights, that given here in honour of Wellington being the subject of the considerably idealized description in Byron's Childe Harold.

PUERTO PRINCIPE (officially, CAMAGUEY), a city and the capital of the province of Camaguey in east-central Cuba, about 528 m. E.S.E. of Havana. Pop. (1899), 25,102; (1907), 26,616. In addition to the axis-railway of the island, which connects it with Havana and Santiago, the city has connexion by a branch line with Nuevitas. Puerto Principe lies on a broad plain about equally distant from the north and south coasts of the island, and between two small rivers, the Tinina and Hatisibona. In appearance it is one of the most ancient of Cuban towns. It was founded in 1515; some of the buildings were built in the second half of the 16th century, some in the first half; and some parts of the original cathedral of 1617 have probably survived later alterations and additions. Some of the bridges, too, built in the 18th century, are picturesque. The city hall was begun in 1733. There is a provincial institute for secondary education. The city is the seat of a court of appeal. Puerto Principe is connected by railway, 47 m. long, with its port, Nuevitas (pop. in 1907, 4366), which is on the north side of the island and has a spacious land-locked bay of good depth, approached through a break in the off-lying coral keys and a narrow canyon entrance. About 50 m. south of Puerto Principe is Santa Cruz del Sur (pop. in 1907, 1640) on the south coast. Cabinet woods, fruit, tobacco, sugar, wax, honey and cattle products are the leading exports. In 1514 Diego Velasquez founded, on Nuevitas Bay (then known as the Puerto del Principe), a settlement that was moved in 1515 or 1516 to the site of the present city of Puerto Principe (or Santa Maria del Puerto del Principe). From very early times the surrounding plains were given over to horse and cattle-raising. As early as the beginning of the 17th century Havana depended on this supply to furnish the fleets of royal ships which monopolized trade between Spain and America. From very early times, too, a prosperous clan-destine trade was maintained with Providence, the Bahamas, and especially with Curaçao and Jamaica (after its capture by the English in 1655). After the capital, Puerto Principe was the richest prize of the island when it was captured and plundered in 1668 by a force of Frenchmen and Englishmen under Henry Morgan, the buccaneer. In the 18th century land grants and illicit trade led to serious disturbances. In 1775 Nuevitas was resettled, and in 1780 was made a legal (habilitado) port. After the cession of Santo Domingo to France in 1800, the Real Audiencia, the supreme court of the Spanish West Indies, was transferred to Puerto Principe. Puerto Principe was made capital for Havana in 1838, but the older court continued to exist throughout the Spanish period. Puerto Principe boasts of being the most Creole of Cuban cities. It was prominent in the war of 1868-78 and in the disaffection preceding and following it.

PUERTO REAL, a seaport of southern Spain, in the province of Cadiz; on the north shore of the inner arm of the Bay of Cadiz and on the Seville-Cadiz railway. Pop. (1900), 10,535. Puerto Real (Port Royal) is the Portus Gaditanus of the Romans, and is probably the most ancient trading-station on the Bay of Cadiz. It owes its modern name to the fact that it was rebuilt in 1488 by Ferdinand and Isabella. The port has good quays, a dry dock of the Spanish Transatlantic Company, connected with their important works, and safe anchorage close to the wharves for the largest steamers. The town has fine squares, and broad, well-built streets, a handsome town-hall, many schools, a bullring, several convents, and a 16th-century Gothic parish church, with three naves and a remarkable atrium. There is an active trade in wine and oils; other industries are the construction and repairing of ships, and the production of salt.

PUFENDORF, SAMUEL (1634-1663), German jurist, was born at Chemnitz, Saxony, on the 8th of January 1632. His father was a Lutheran pastor, and he himself was destined for the ministry. Educated at Grimma, he was sent to study theology
at the university of Leipzig. Its narrow and dogmatic teaching was profoundly repugnant to him, and he soon abandoned it for the study of law, and in 1656 was received as a student at Leipzig along with, and betook himself to Jena, where he formed an intimate friendship with Erhard Weigel the mathematician, whose influence helped to develop his remarkable independence of character. Pufendorf quitted Jena in 1637 and became a tutor in the family of Petrus Julius Coyet, one of the resident ministers of Charles Gustavus, king of Sweden, at Copenhagen. At this time Charles Gustavus was endeavouring to impose upon Denmark a burdensome alliance, and in the middle of the negotiations he brutally opened hostilities. The anger of the Danes was turned against the envos of the Swedish sovereign; Coyet, it is true, succeeded in escaping, but his second son, Samuel, and his sister were arrested and thrown into prison. Pufendorf shared this misfortune, and was subjected to a strict captivity of eight months' duration. He occupied himself during this time in meditating upon what he had read in the works of Grotius and Hobbes. He mentally constructed a system of universal law; and, when, at the end of his captivity, he accompanied his pupils, the sons of Coyet, to the university of Leiden, he was enabled to publish, in 1661, the fruits of his reflections under the title of Elementa jurisprudentiae universalis, libri duo. The work was dedicated to Charles Louis, elector palatine, who created for Pufendorf at Heidelberg a near copy of that of the elector of Brandenburg in the world. In 1667 he wrote, with the assent of the elector palatine, a tract, De statu imperii germanici, liber unus. Published under the cover of a pseudonym at Geneva in 1667, it was supposed to be addressed by a gentleman of Verona, Severinus de Monzambano, to his brother Laelius. The pamphlet made a great sensation. Its author directly arranged the organization of the Holy Roman Empire and exposed its feebleness, denounced in no measured terms the faults of the house of Austria, and attacked with remarkable vigour the politics of the ecclesiastical princes. Before Pufendorf, Philipp Bogislaw von Chemnitz, publicist and soldier, had written, under the pseudonym of "Hippolytus a Lapide," De ratione status in imperio nostro romanismo-germanico. Inimical, like Pufendorf, to the house of Austria, Chemnitz had gone so far as to make an appeal to France and Sweden. Pufendorf, on the contrary, rejected all idea of foreign intervention, and advocated that of national initiative. In 1670 Pufendorf was called to the university of Lund. His sojourn there was fruitful. In 1672 appeared the De jure naturae et gentium, libri octo, and in 1675 a résumé of it under the title of De officio hominum et civit. In the De jure naturae et gentium Pufendorf took up in great measure the work of Grotius and sought to complete them by means of the doctrines of Hobbes and of his own ideas. His first important point was that natural law does not extend beyond the limits of this life and that it confines itself to regulating external acts. He contimated Hobbes's conception of the state of nature and concluded that the state of nature is not one of war but of peace. But this peace is feeble and insecure, and if something else does not come to its aid it can do very little for the preservation of mankind. As regards public law Pufendorf, while recognizing in the state (civitas) a moral person (persona moralis), teaches that the will of the state is but the sum of the individual wills that compose it. His conception of the state is not a priori conception, in which he scarcely gives proof of historical insight, he shows himself as one of the precursors of J. J. Rousseau and of the Contract social. Pufendorf powerfully defends the idea that international law is not restricted to Christendom, but constitutes a common bond between all nations because all nations form part of humanity.

In 1677 Pufendorf was called to Stockholm as historiographer royal. To this new period belong Einleitung zur Historie der vornehmen Reiche und Staaten, also the Commeriorium de rebus成功的, libri XXVI., ab expeditione Gustavi Adolphi regis in Germaniam ad abdicationem usque Christianae et De rebus a Corole Gustavo gestis. In his historical works Pufendorf is hopelessly dry; but he professes a great respect for truth and generally draws from archives. In his De habito religiosus christianae od vitam civilen he traces the limits between ecclesiastical and civil power. This work propped for the first time the so-called "collegial" theory of church government (Kollegialsystem), which, developed later by the learned Lutheran theologian Christathus Mathaüs Piäff (1686-1760), formed the basis of the relations of church and state in Germany and more especially in Prussia.

This theory makes a fundamental distinction between the supreme jurisdiction in ecclesiastical matters (Kirchenhoheit or jus circa sacra), which it conceives as inherent in the power of the state (provincia), and every ecclesiastical power (Kirchenwelt or jus in sacra) inherent in the church, but in some cases vested in the state by tacit or expressed consent of the ecclesiastical body. The theory was of importance because by distinguishing church from state while preserving the essential supremacy of the latter, it prepared the way for the principle of toleration. It was put into practice to a certain extent in Prussia in the 18th century; but not till the middle of the 19th century led to a great mixture of confessions under the various state governments that it found universal acceptance in Germany. The theory, of course, has found no acceptance in the Roman Catholic Church, but it none the less made it possible for the Protestant governments to make a working compromise with Rome in respect of the Catholic Church established in their states. In 1688 Pufendorf was called to the service of Frederick III., elector of Brandenbtag. He accepted the call, but he had no sooner arrived than the elector died. His son Frederick III. fulfilled the promises of his father; and Pufendorf, historiographer and privy councillor, was instructed to write a history of the Elector Frederick William (De rebus gestis Frederici Wilhelm I Magni). The king of Sweden did not on this account cease to testify his goodwill towards Pufendorf, and in 1694 he created him a baron. In the same year, on the 26th of October, Pufendorf died at Berlin and was buried in the church of St Nicholas, where an inscription in his memory is still to be seen.

Pufendorf was at once philosopher, lawyer, economist, historian and statesman. His influence was considerable, and he has left a profound impression on thought, and not on that of Germany alone. But the value of his work was much under-estimated by posterity. Much of the responsibility for this injustice rested with Leibnitz, who would never recognize the intellectual greatness of one who was constantly his adversary, and whom he dismissed as "vir parum jurisconsultus et minime philosophus." It was on the subject of the pamphlet of Severinus de Monzambo that their quarrel began. The conservative and timid Leibnitz was beaten on the battlefield of politics and public law, and the aggressive spirit of Pufendorf aggravated yet more the dispute, and so widened the division. From this time the two writers could neither meet on a common subject without attacking each other.

PUFF-BALL, in botany, the common name for a genus of fungi (known botanically as Lycoperdon), and so called because of the cloud of brown dust-like spores which are emitted when the mature plant bursts. They are characterized by being heat-resistant and when young resemble white balls, sometimes with a short stalk, and are fleshy in texture. When cut across at this state, they show a compact rind enclosing a loose tissue, in the interspaces of which the spores are developed; as the fungus matures it changes to yellowish-brown and brown and when ripe the rind tears at the apex and the spores escape through the aperture when any pressure is applied to the ball. When white and fleshy the fungus is edible. The fibrous mass which remains after the spores have escaped has been used for tinder or as a styptic for wounds. The giant puff-ball, Lycoperdon giganteus, reaches a foot or more in diameter.

PUFF-BIRD, the common name given, according to W. Swainson (Zool. Illustrations, 1st series, vol. ii., text to pl. 99), by English residents in Brazil to a group of birds now placed in the sub-family Buccoiminae, which with the Galbulinae or jacamars form
the family Galbulidae of Coraciiform birds standing between the tropic region (q.v.), the barbets, for a long time confounded, under the general name of barbets, with the Capilioniidae of modern systematists. Each group has formed the subject of an elaborate monograph—the Capilioniidae being treated by C. H. T. and G. F. L. Marshall (London, 1870-1871), and the Buchoonidae by P. L. Sclater (London, 1879-1882). The Bucheonidae are zygodactylous birds confined to the neotropical region, in the middle parts of which, and especially in its sub-Andean sub-region, they are, as regards species, abundant; while only 20 seem to reach Guatemala and but one Paraguay. As with most South American birds, the habits and natural history of the Bucheonidae have been but little studied, and of only one species, the puff-bird, is there anything to be believed. Its name, Fratercula, has the nidification been described. This is the Chlidoptera tenebrosa, which is said to breed in holes in banks, and to lay white eggs much like those of the kingisher and consequently those of the jacamars. From his own observation Swainson writes (loc. cit.) that puff-birds are very grotesque in appearance. They will sit nearly motionless for hours on the dead bough of a tree, and while so sitting "the disproportionate size of the head is rendered more conspicuous by the bird raising its feathers so as to appear not unlike a puff-ball. . . . When frightened their form is suddenly changed by the feathers lying quite flat. . . . Their appearance is so very confiding birds and will often station themselves a few yards only from a window. The Bucheonidae almost without exception are very plainly-coloured, and the majority have a spotted or mottled plumage suggestive of immaturity. The first puff-bird known to Europeans seems to have been that described by G. de L. Magnagr, under the name of "tamatim," by which it is said to have been called in Brazil, and there is good reason to think that his description and figure—the last, comic as it is in outline and expression, having been copied by F. Willughby and many of the older authors—apply to the Bucho maculatus of modern ornithology—a bird placed by M. J. F. Geogrcr (Acad. roy. de Berlin, tom. iv. 6, pl. 34) among the kingishers. If so, Maragr described and figured the same species twice, since his "Matutiti" is also Brisson's "Martin-pescheur tacheté du Brésil."

P. L. Sclater divides the family into 7 genera, of which Bucho is the largest and contains 20 species. The others are Malacoptila and Monacha, each with 7, Nonnula with 5, Chlidoptera with 2, and Micrononacha and Hopaloptila with 1 species each. The most showy puff-birds are those of the genus Monacha, with an inky-black plumage, usually diversified by white about their necks, and a red or yellow bill.

PUFFIN, the common English name of a sea-bird, the Fratercula arctica of most ornithologists, known however on various parts of the British coasts as the bottle-nose, colterneb, pope, sea-parrot and tammy-norrie, to say nothing of other still more local designations, some (as marrot and willock) share also with allied species of Alceda, to which family it belongs. Of old time puffins were a valuable commodity to the owners of their breeding-places, for the young were taken from the holes in which they were hatched, and "being exceeding fat," as Carew wrote in 1602 (Survey of Cornwall, fol. 32), were "kept salted, and reputed for fish, as coming nearest thereto in their taste."

In 1741, Pallas, according to a document, from which an extract is given in Heath's Islands of Scilly (p. 106), those islands were held of the Crown at a yearly rent of 300 puffins or 68. 8d., being one-sixth of their estimated annual value. A few years later (1484), either through the birds having grown scarcer or money cheaper, only 50 puffins are said (op. cit. p. 106) to have been demanded. It is stated by both Gesner and Caius that they were allowed to be eaten in Lent. Ligot, who in 1713 published a History of the Island of Barbadoes, speaks (p. 37) of the ill-taste of puffins "which we have from the islands of Scilly," and adds "this kind of food is only for servants." Puffins used to resort in vast numbers to certain stations on the coast, and are still plentiful on some, reaching them in spring with remarkable punctuality on a certain day, which naturally varies with the locality, and after passing the summer there leaving their homes with similar precision. They differ from most other Alceda in laying their single egg (which is white with a few grey markings when first produced, but speedily begrimmed by the soil) in a shallow burrow, which they either dig for themselves or appropriate from a rabbit, for which reason the puffins are often called rabbit-birds. Their plumage is of a glossy black above, the cheeks grey, encircled by a black band—and pure white beneath; their feet are of a bright reddish orange, but the most remarkable feature of these birds, and one that gives them a very comical expression, is their huge bill. This is very deep and laterally flattened, so as indeed to resemble a coulter, as one of the bird's common names expresses; but moreover it is part-coloured—blue, yellow and red—curiously grooved and still more curiously embossed in places, that is to say during the breeding-season, when the birds are most frequently seen. But it had long been known to some observers that such puffins as occasionally occur in winter (most often washed up on the shore and dead) presented a beak very different in shape and size, and to account for the difference was a standing puzzle. Many years ago Bingley (North Wales, i. 354) stated that puffins "are said to change their bills annually." The remark seems to have been generally overlooked; but it has proved to be very near the truth, for after investigations carefully pursued during some years by Dr Bureau of Nantes he was in 1877 enabled to show (Bull. Soc. Zool. France, li. 377-390) that the puffin's bill undergoes what may be called an annual moult, some of its most remarkable appendages, as well as its tarsi and tail, growing above and beneath the eyes, dropping off at the end of the breeding season, and being reproduced the following year. Not long after the same naturalist announced (op. cit.) (iv. 1-68) that he had followed the similar changes which he found to take place, not only in other species of puffins, as the Fratercula corniculata and F. ciriata of the Northern Pacific, but in several birds of the kindred genera Cerotorkhina and Simorhynchus inhabiting the same waters. The name puffin has also been given in books to one of the shearwaters which belong to the sub-family Procellarinae of the Petrels (q. s.), and its Latinized form Puffinus is still used in that sense as a scientific nomenclature. This fact seems to have arisen from a mistake of Ray's who, seeing in Tradescant's Museum and that of the Royal Society some young shearwaters from the Isle of Man, prepared in like manner to young puffins, thought they were the birds mentioned by Gesner as the remarks inserted in Willughby's Ornithologia (p. 251) prove; for the specimens described by Ray were as clearly shearwaters as Gesner's were puffins.

PUGACHEV, EMELYAN IVANOVICH (? 1741-1775). Russian pretender, the date of whose birth is uncertain, was the son of a small Russian landowner. He married a Cossack girl, Sofya Neduzzyeva, in 1758, and the same year was sent with his fellow Cossacks to Prussia, under the lead of Count Zachary Chernoussie. In the first Turkish War (1769-74) of Catherine II. Pugachev, now a Cossack ensign, served under Count Peter Panin and was present at the siege of Bender. Invalided home, he led for the next few years a wandering life; was more than once arrested and imprisoned as a deserter; and finally, after frequenting the monasteries of the "Old Believers," who exercised considerable influence over him, suddenly proclaimed himself (1773) to be Peter III. The story of Pugachev's strong resemblance to the murdered emperor is a later legend. Pugachev dubbed himself Peter III. The better to attract to his standard all those (and they were many) who attributed their misfortune to

PUGET.—PUGILISM

637

the government of Catherine II., for Peter III. was generally remembered as the determined opponent of Catherine. As a matter of fact Puget and his friends were hostile to every form of settled government. The one thought of the destitute thousands who joined the new Peter was to sweep away utterly the intolerably oppressive upper-classes. Puget’s story was that he and his principal adherents had escaped from the clutches of Catherine, and were resolved to redress the grievances of the people, give absolute liberty to the Cossacks, and put Catherine herself away in a monastery. He held a sort of mimic court at which one Cossack impersonated Nikita Panin, another Zachary Chernuishev, and so on. The Russian government at first made light of the rising. At the beginning of October 1773 it was simply regarded as a nuisance, and 3000 clowns were provided for the entertainment of the troublesome Cossack. At the end of November 28,000 roubles were promised to whosoever should bring him in alive or dead. Even then, however, Catherine, in her correspondence with Voltaire, affected to treat “l’affaire du Marquis de Puget” as a mere joke, but by the beginning of 1774 the joke had developed into a very serious danger. All the forts on the Volga and Ural were now in the hands of the rebels; the Bashkirs had joined them; and the governor of Moscow reported great restlessness among the population of central Russia. Shortly afterwards Pugetchew captured Kazan, reduced most of the churches and monasteries there to ashes, and murdered all the clergy who could not escape. General Peter Panin, the conqueror of Bender, was thereupon sent against the rebels with a large army, but difficulty of transport, lack of discipline, and the gross insubordination of his ill-paid soldiers paralysed all his efforts for months, while the innumerable and ubiquitous bands of Pugetchew were victorious in nearly every engagement. Not till August 1774 did General Mikhailson inflict a crushing defeat upon the rebels near Taritsyn, when they lost ten thousand in killed and prisoners. Panin’s savage reprisals, after the capture of Penza, completed their discomfiture. Pugetchew was delivered up by his own Cossacks on attempting to fly to the Urals (Sept. 14), and was executed at Moscow on the 11th of January 1775.

See N. Dubrovin, Pugetchew and his Associates (Russ.; Petersburg, 1884); Catherine II., Political Correspondence (Russ. Fr. Gor.; Petersburg, 1885, &c.); S. I. Gnedich, Emilien Pugetchew (Russ.; Petersburg, 1902). (R. N. B.)

PUGET, PIERRE (1622–1694), French painter, sculptor, architect and engineer, was born at Marseilles on the 31st of October 1622. At the age of fourteen he carved the ornaments of the galleries built in the port of his native city, and at sixteen the decoration and construction of a ship were entrusted to him. Soon after he went to Italy on foot, and was well received by Pietro di Cortona, who employed him in the rooms of the apartments of the Barberini Palace and on those of the Pitti at Florence. In 1643 he returned to Marseilles, where he painted portraits and carved the colossal figure-heads of men-of-war. After a second journey to Italy in 1646 he painted also a great number of pictures for Aix, Toulon, Ceuers and La Ciotat, and sculptured a large marble group of the Virgin and Child for the church of Lorgues. His caryatides for the balcony of the Hôtel de Ville of Toulon were executed between 1653 and 1657. N. Fouquet employed Puget to sculpt a Hercules for his château in Vaux. The artist’s desire to paint gradually subsided after his passion for sculpture, and a serious illness in 1665 brought Puget a prohibition from the doctors which caused him wholly to put aside the brush. The fall of Fouquet in 1660 found Puget at Genoa. Here he executed for Sublet des NOYERS his French Hercules (Louvre), the statues of St Sebastian and of Alexandre Sauli in the church of Carignano (c. 1664), and much other work. The Doria family gave him a church to build; the senate proposed that he should paint their council chamber. But Colbert bade Puget return to France, and in 1669 he again took up his old work in the dockyards of Toulon. The arsenal which he had there undertaken to construct under the orders of the duke of Beaufort was destroyed by fire, and Puget, disheartened, took leave of Toulon. In 1685 he went back to Marseilles, where he continued the long series of works of sculpture on which he had been employed by Colbert. His statue of Milo (Louvre) had been completed in 1682, Perseus and Andromeda (Louvre) in 1684; and Alexander and Diogenes (bas-relief, Louvre) in 1685, but, in spite of the personal favour which he enjoyed, Puget, on coming to Paris in 1688 to push forward the execution of an equestrian statue of Louis XIV., found court intrigues too much for him. He was forced to abandon his project and retire to Marseilles, where he remained till his death on the 2nd of December 1694. His last work, a bas-relief of the Plague of Milan, which remained unfinished, was placed in the council chamber of the town hall of his native city.

In spite of Puget’s visits to Paris and Rome his work never lost its local character: his Hercules is fresh from the galleries of Toulon; his saints and virgins are men and women who speak Provençal. His best work, the St Sebastian at Genoa, though a little heavy in parts, shows admirable energy and life, as well as great skill in contrasting the decorative accessories with the simple surface of the nude. There is in the museum of Aix in Provence the bust of a long-haired young man in pseudo-classical costume which is believed to be a portrait of Louis XIV. made by Puget at the time of the king’s visit in 1660.

See Léon LAGRANGE, Pierre Puget (Paris, 1866, with a catalogue of works); Charles GINOUX, Mesdes de la vie de P. Puget (Paris, 1841); Phillipe AUQUIER, Pierre Puget . . . biographie critique (Paris, 1903).

PUGILISM (from Lat. pugil, boxer, Gr. πηλός, with clenched fist), the practice or sport of fighting with the fists. The first mention of such fighting in literature is found in the 23rd book of the Ilid, and shows that in Homer’s time the art was already highly developed. The occasion was the games at the funeral of Patroclus, the champions engaged being Epeus, the builder of the wooden horse, and Euryalus. Each combatant seems to have been naked except for a belt, and to have worn the cestus. The fight ends with the defeat of Euryalus. According to Virgil (Aeneid, v.) similar games took place within the walls of Troy at the funeral of Hector, the principal boxers being Dares, the winner, and the gigantic Butex, a pupil of Aegamus; Paris, the Trojan champion, abstaining from the contests. Further on we find the account of the games on the occasion of the funeral of Anchises, in the course of which Dares, the Trojan, receiving no answer to his challenge from the Sicilians, who stood aghast at his mighty proportions, claims the prize; but, just as it is about to be awarded him, Entellus, an aged but huge and sinewy Sicilian, arises and casts into the arena as a sign of his acceptance of the combat the massive cesti, all stained with blood and brains, which he has inherited from King Eryx, his master in the art of boxing. The Trojans are now appalled in spite of their fame and Dares, aghast at the fearful implements, refused the battle, which, however, is at length begun after Aeneas has furnished the heroes with equally matched cesti. For some time the young and lusty Dares circles about his gigantic but old and stiff opponent, upon whom he rains a torrent of blows which are avoided by the clever guarding and dodging of the Sicilian hero. At last Entellus, having got his opponent into a favourable position, raises his tremendous right hand on high and aims a terrible blow at the Trojan’s head; but the wary Dares deftly steps aside, and Entellus, missing his adversary altogether, falls headlong by the impetus of his own blow, with a crash like that of a falling pine. Shouts of mingled exultation and dismay break from the multitude, and the friends of the aged Sicilian rush forward to raise their fallen champion and bear him from the arena; but, greatly to the astonishment of all, Entellus motions them away and returns to the fight more keenly than before. The old man’s blood is stirred, and he attacks his youthful enemy with such furious and headlong rushes, buffeting him grievously with both hands, that Aeneas puts an end to the battle, though barely in time to save the discomfited Trojan from being beaten into insensibility.

Although fist-fighting was supposed by the Greeks of the classic period to have been a feature of the mythological games at Olympia, it was not actually introduced into the historical
Olympic contests until the 23rd Olympiad after the re-establishment of the famous games by Iphitus (about 880 B.C.). Onomastos was the first Olympic victor. In heroic times the boxers are supposed to have worn the χώα, or belt, but in the Greek games the contestants, except for the cestus, fought entirely naked, since the custom had been introduced in the 15th Olympiad, and was copied by the contestants at the Pythian, Nemean, Isthmian and Panathenaic games (see Games, CLASSICAL). At Olympia the boxers were rubbed with oil to make them supple and limit the flow of perspiration, a precaution the more necessary as the Olympic games were held during the hottest part of the year. The cesti, of which there were several varieties, were bound on the boxers' hands and wrists by attendants or teachers acting as seconds. On account of the weight of the gloves worn, the style of boxing differed from that now in vogue (see BOXING), the modern straight-from-the-shoulder blow having been little used. Both Homer and Virgil speak of "falling blows," and this was the common method of attack, consisting more in swinging and hammering than in punching. The statue of a Greek boxer in the Louvre shows the right foot forward, the left hand raised as if to ward off a blow from above, and the right hand held opposite the breast, the whole attitude being resembling that of a warrior with sword and shield than of a modern boxer. The pugilists of Rome, who were in many cases Greeks and employed Greek methods, exaggerated the brutality of the fist-fight to please the Roman taste, and the sanguinary contest between Dares and Entellus, described above, although in some respects an anachronism as an account of a pugilistic battle in primitive times, was doubtless an exact portrayal of the encounters to be seen in Virgin's day in the circuses of Rome. Nevertheless it must not be understood that the boxing matches at the Greek games were not themselves severe to the point of brutality, in spite of the fact that style and grace of movement were sedulously taught by the masters of the time. The Greek champions trained for months before the games, but encounters between athletes armed with such terrible weapons as the loaded cestus were bound to result in very serious bruises and even disfigurement. Pluck was as highly thought of as at the present day, and it was related of a certain Eurydamas that, when his teeth were battered in, he swallowed them rather than show that he was hurt, whereupon his antagonist, in despair at seeing his most furious blows devoid of effect, gave up the battle. As, on account of the swinging style of blows, the cars were particularly liable to injury ear-protectors (ὑδρόσκορπις) were generally used in practice, though not in serious contests. The so-called "pugilist's ear," swollen and mis-shaped, was a characteristic feature of the Greek boxer. The satirists of the time flung their grim jests at the champion bruisers. Lucius writing of a Greek boxer of Etruria (Anthologia epigrammatum graecorum), says, "Aulos, the pugilist, consecrates to the God of Pisa all the bones of his cranium, gathering up one by one. Let him but return alive from the Nemean Games, 0 mighty Jupiter, and he will also offer thee, without doubt, the vertebræ of his neck, which is all he has left!"

The rules of Greek boxing were strict. No wrestling, grappling, kicking, or holding were allowed, and the contest ended when one combatant owned himself beaten. On this account pugilism and the panкратium (see below) were forbidden by Lycurgus, lest the Spartans should become accustomed to an acknowledgment of defeat (Plutarch, Lycurgus). In spite of the terrible injuries which often resulted from these contests it was strictly forbidden to kill an adversary, on pain of losing the prize. Rhodes, Aegina, Arcadia and Elis produced most of the Olympic victors in boxing, which was considered as an excellent training for war. According to Lucan (Anach. 3) Solon recommended it for pedagogic purposes, and the context with the episkopi or stylized cestus, was added by Pliny to his list of warlike exercises as being the nearest approach to actual battle.

The Greek athletic contest called panкратium (πανκρατίων, complete, or all-round, contest), which was introduced into the Olympic games in the 38th Olympiad, was a combination of boxing and wrestling in which the contestants, who fought naked, not wearing even the cestus, were allowed to employ any means except biting to wound from each other the acknowledgment of defeat. Boxing, wrestling, kicking, dislocation of joints, breaking of bones, pulling of hair and strangling were freely indulged in. The fight began with sparring for openings and was continued on the ground when the contestants fell. Many pancratists excelled in obtaining quick holds of their opponents' fingers, which they crushed and dislocated so completely that all effective opposition ceased. Sudden attacks resulting in the dislocation of an arm or leg were also taught, reminding one of the Japanese jiu-jitsu. The panкратium was considered by the Greeks the greatest of all athletic contests and, needless to say, only the most powerful athletes attempted it. It became popular in Rome during the Empire and remained so until the time of Justinian.

Diagoras of Rhodes, his three sons and many grandsons, who were sung by Pindar (Olymp. 7), were the most celebrated of the Olympic boxing champions. One of the sons, Dorieus, was three times victorious at Olympia in the panкратium, and during his career won eight Olympian, eight Isthmian, seven Nemean and one Pythian prize. Court and, who was educated from the Greek colonies, like the Locrian Euthymus, who conquered three times at Olympia. Another celebrated fighter and wrestler was Milo of Crotona (520 B.C.).

Boxing was evidently in vogue in very ancient times in Italy, imported, in all probability, from Greece, for Livy (i. 35) relates that, at the first celebration of the great Roman games (ludi, romani magnique varie appellati) by Tarquiniius Priscus (6th century B.C.), boxers were brought from outlying provinces; and there was an old tradition that a school of pugilism flourished in Etruria in heroic times. During the republican boxing was cultivated as a gentlemanly exercise, and we find Cato the Elder giving his son instruction in the art (Plutarch, Cato Major). Tacitus (Ann. xvi. 3) says that the emperor Caligula imported the best Campanian and African pugilists for the gladiatorial games, and Strabo (iii. 3) records that the Lusitanians and also the Indians, who gave virgins as prizes, boxed. The art remained popular in Italy down to a late period of the Empire.

From the fall of the Roman Empire to the beginning of the 19th century pugilism seems to have been unknown among civilized nations with the single exception of the English. The first references to boxing in England as a regular sport occurred towards the end of the 17th century. Many boxers, who were alsocalled prize-fighters, were introduced into England by the Dutch, who were the first to introduce prize-fights.

The first public prize-fight in England was that of George Broughton, who fought a series of matches in London, in 1725. Broughton, who was an accomplished boxer, was declared champion until 1755. Broughton seems to have been a man of intelligence, and, to him is ascribed the scientific development of the art of boxing. During his time the sport became truly national and the prize-fighter the companion of the greatest in the land. Among Broughton's successors were Slack, "Big Ben" Brain, Daniel Mendoza (a Jew who flourished about 1790 and was the proprietor of the Lyceum in the Strand), J. Jackson, Tom Cribb. Jem Belcher, Pearce (called the "Game Chicken"), and John Gully, who afterwards represented Pontefract in Parliament. To Broughton is ascribed the invention of boxing-gloves for use in practice. All prize-fights, however, took place with bare knuckles in roped-off spaces called rings, usually in the open air. Pugilists toughened their hands by "pickling" them in a powerful astringent solution. A fight ended when one
of the "bruisers," as they were called, was unable to "come to the scratch," i.e. the middle of the ring, at the call of the referee at the beginning of a new round. Each round ended when one fighter fell or was knocked or thrown to the ground, but a pugilist "going down to avoid punishment," i.e. without being struck by the opponent, was liable to forfeit the fight. Wrestling played an important rôle in the old prize-ring, and a favourite method of weakening an adversary was to throw him heavily and then fall upon him, seemingly by accident, as the manoeuvre, if done intentionally, was foul. The fighting was of the roughest description, low tricks of all kinds being practised when the referee's attention was diverted, gouging out an adversary's eye being by no means unknown. Until 1795 pugilists wore long hair, but during a fight in that year Jackson caught Mendoza by his long locks and held him down helpless while he hit him. This was adjudged fair by the referee, with the result that prize-fighters have ever since cropped their head. Nevertheless there were rules which no fighter dared to overstep, such as those against kicking, hitting below the belt, and striking a man when he had fallen.

From the time of the Cribb the English champions were Tom Sayers (1821–1825), Tom W. Ward (1825), Jem Mace (1832), W. Thompson, called "Bendigo" (1839–1845), Ben Caunt (1841, W. Perry, the "Tipton Slasher" (1850), Harry Broome (1851), Tom Sayers (1857–1860), Jem Mace (1861–1863), Tom King (1863), and again Mace, until 1872.

In America boxing began to be popular about the beginning of the 19th century. The first recognized national champion was Tom Hyer (1841–1845), who was followed by James Ambrose (born in Ireland), called "Yankee Sullivan;" John Morrissey (afterwards elected to the United States Congress); John C. Heenan; Tom Allen (of England); Jem Mace (of England); J. Kilrain; John L. Sullivan (1880–1892); J. J. Corbett (1892–1897); Robert Fitzsimons (1897–1902) (born in Cornwall); James J. Jeffries. The defeat of the last named by the negro Jack Johnson in 1910 caused a great sensation.

What is still the most celebrated prize-fight of modern times took place at Farnborough in April 1866, between Tom Sayers and the huge youthful American pugilist J. C. Heenan, the "Benicia Boy," who had been defeated in America by Morrissey, but had succeeded to the championship upon the latter's retirement. The English champion was a much smaller and lighter man than his challenger, a fact which increased the popular interest in the fight. Although the local English authorities endeavored to prevent placing prizes on the contest, complaining that he had "been chased out of eight counties," the ring at Farnborough was surrounded by a company containing representatives of the highest classes, and the exaggerated statement was made that "Parliament had been emptied to patronize a prize-fight." The battle lasted for 2 hours and 20 minutes, during which Heenan, owing to his superiority in weight and reach, seemed to have the advantage, although nearly blinded by Sayers's hard straight punches. During one of the opening rounds a tendon in Sayers's right forearm was ruptured in guarding, and he fought the rest of the fight on one hand, which did not detract from the enthusiasm of the spectators. Heenan had neglected to harden his hands properly, with the result that they soon swelled to unnatural proportions, rendering his blows no more effective than if he had worn boxing-gloves. Nevertheless towards the close of the fight Heenan repeatedly threw Sayers violently, and held him on the ropes enclosing the ring, which, just as the police interfered, were cut by persons who asserted that Heenan was on the point of strangling Sayers. In spite of the indecisive outcome of the battle both fighters claimed the victory, but the match was officially adjudged a draw. This was the last great prize-fight with bare fists on English soil, as public opinion was aroused, and orders were given to the police henceforth to regard prize-fights as illegal, and tending to a "breach of the peace." Several surreptitious prize-fights did indeed occur within a few years after the Sayers-Heenan battle; but more than once, notably in the fight between Heenan and Tom King, one of the participants was "doctored," i.e. drugged, and this lack of fairplay, added to the brutality of fast-fights, gave the death-blow to pugilism of the old kind. In its place came fighting and boxing with padded gloves, small ones weighing about 4 oz. being used by professionals, while amateurs, who boxed and spurred rather than fought (see BOXING), made use of larger and softer gloves.

An added impetus was given to boxing as well as pugilism in 1866 by the founding of the "Amateur Athletic Club" by John C. Chambers, who, assisted by the marquess of Queensberry, drew up the code of rules for competitions still in vogue and called after that nobleman, who, in 1867, presented cups for the amateur championships at the different weights. These rules prohibit all rough and unfair fighting, as well as wrestling, and divide a match into rounds of three (or two) minutes each, with half a minute rest between the rounds. It is a matter of agreement in professional battles whether in "breaking away" after a clinch blows may be struck or not. When a contestant is knocked down (a man on one knee is technically down) he is given ten seconds, usually counted aloud by the referee, in which to rise and renew the fight. Should he be unable to do so he is "counted out" and loses the match.

**PUGIN, AUGUSTUS WELBY NORTHMORE (1812–1872),** English architect, son of Augustus Charles Pugin (1762–1832), a Frenchman by birth who settled in London as an architectural draughtsman and had several pupils who rose to fame, was born in Store Street, Bedford Square, on the 1st of March 1812. After an education at Christ's Hospital he entered his father's office, where he displayed a remarkable talent for drawing. His father was for many years engaged in preparing a large series of works on the Gothic buildings of France, and, while the architec quite, the first illustrated with accurate drawings of medieval buildings, and the son's early youth was mostly occupied in making minute measured drawings for these books. In this way his enthusiasm for Gothic art was first aroused. All through his life, both in England and during many visits to Germany and France, he continued to make great numbers of drawings and sketches, in pen and ink or with sepia monochrome, perfect in their delicacy and precision of touch, and masterpieces of skillful treatment of light and shade. At first he acted as his father's assistant in his father's work, and his own independent efforts to obtain success were in some measure unsuccessful. In 1827 he was employed to design furniture in a medieval style for Windsor Castle; and in 1831—the year he married his first wife, Ann Garnett, who died in childbirth a year later—he designed scenery for the new opera of Kenilworth at Her Majesty's Theatre. But he got into money difficulties, and soon after his marriage he was imprisoned for debt. When he came out he again incurred serious losses over an attempt to start a shop for supplying architectural accessories of his own designing, which he had to give up. But after his second marriage in 1833 to Louisa Egan (d. 1854), and his reception into the Roman Catholic Church shortly afterwards, he began to change from his steady architectural practice and by degrees he acquired the reputation which has made his name stand foremost among those responsible for the English Gothic revival (see Architecture: Modern: "The Gothic Revival"). No man had so thoroughly mastered the principles of the Gothic style in its various stages, both in its leading lines and in the minutest details of its mouldings and carved enrichments. In 1837–1843 he assisted Sir Charles Barry by working out the details of the designs for the new Houses of Parliament at Westminster; and though his exact share in the designs was subsequently the subject of bitter controversy after both he and Barry were dead, there is no doubt that, while he was working as Barry's paid clerk, a great deal in the excellence of the details was due to him and to his training of the masons and carvers. His conversion to Roman Catholicism, while part and parcel of his
devotion to Gothic art, naturally brought him employment as an architect mainly from Roman Catholics; and many of his executed works suffered from the fact that his designs were not fully carried out, owing to a desire to save money or to spend it so as to make the greatest possible display. For this reason his genius is often more fairly displayed by his drawings than by the buildings themselves. In almost every case his design was severely injured, both by cutting down his original proportions and by introducing shams (above all things hateful to Pugin), such as plaster groining and even cast-iron carving. The cathedral of St George at Southwark, and even the church in Farm Street, Berkeley Square, London, are melancholy instances of this. Thus his life was a series of disappointments; no pecuniary success compensated him for the destruction of his best designs, as in him the man of business was thoroughly subordinate to the artist. He himself used to say that the only church he had ever executed with unalloyed satisfaction was the one at Ramsgate, which he not only designed but paid for. Pugin was very broad in his love for the medieval styles, but on the whole preferred what is really the most suited to modern requirements, namely the Perpendicular of the 15th century, and this he employed in its simpler domestic form with much success both in his own house at Ramsgate and in the stately Adare Hall in Ireland built for Lord Dunraven. The cathedral of Killarney and the chapel of the Benedictine monastery of Douai were perhaps the ecclesiastic buildings which were carried out with least deviation from Pugin's original conception.

Apart from his work as an architect, his life presents little of detail to record. In 1836 he published his Contrasts; or a Parallel between the Architecture of the 15th and 19th centuries, in which he seriously criticized the architecture of Protestantism. His other principal publications were True Principles of Christian Architecture (1841); Glossary of Ecclesiastical Ornament (1844); and Treatise on Chancel Screens and Rood Lofots (1851). He was a skilful etcher, and illustrated in this way a number of his works, which were written with much eloquence, great antiquarian knowledge and considerable humour. This last gift is exemplified in a series of etched plates in his Contrasts; on one side is some noble structure of the middle ages, and on the other an example of the same building as erected in the 19th century. In 1849 he married a third wife, daughter of Thomas Knill. Early in 1852 he was attacked by insanity, and he died on the 14th of September that year. His eldest son by his second wife, Edward Welby Pugin (1834-1875), was also an accomplished architect, who carried on his father's work.

See B. Ferrez, Recollections of A. W. Pugin and his Father (London, 1861).

PUISNE (from O. Fr. pusné, modern putné, later born, inferior; Lat. postea, afterwards, and nation, born), a term in law meaning "inferior in rank." It is pronounced "punny," and the word, so spelt, has become an ordinary adjective meaning weak or undesired. The judges and barons of the common law courts at Westminster, other than those having a distinct title, were called puisne. By the Supreme Court of Judicature Act 1877, a "puiine judge" is defined as a judge of the High Court other than the lord chancellor, the lord chief justice of England, the master of the rolls, the lord chief justice of the common pleas, and the lord chief baron, and their successors respectively.

PUJAH, or Pooja, the Hindu ceremonies in idol-worship. Colloquially the word has come to be applied by Anglo-Indians to any kind of rite; thus "pujah of the flag" is the sepoy term for trooping of the colours.

PUK (also called Pul, the Chinese name Tongbo), the first Siamese port on the west coast of the Malay Peninsula, situated on the eastern side of the island of Junk Ceylon (Malay, "Ujong Salang") in 5° 50' N. and 98° 24' E. It is the headquarters of the high commissioner of the Siamese administrative division of the same name, and has a population of about 30,000, of which more than a third is Chinese. Beneath the town and around it lie deposits of tin ore which have been worked by Chinese from ancient times, and the extraction of which still furnishes occupation for the majority of the inhabitants. In 1907, dredging for tin in the harbour was undertaken by a European company. Puket has been a resort of European merchants since the 16th century. During the ancient wars between Siam and Burma it was more than once attacked by the latter, but was relieved by forces from Nakhon Sri Tammatrat (Ligore) on the mainland. The Siamese mining department has a branch at Puket; but owing to the scarcity of the metal at the port, it is said to be of little value. The British commandant (1852) found the town "merely a collection of huts and hovels," and full of filth and debauchery. Its peculiarities are its Hogarth-like and decaying streets, its utter neglect and decay (1852), its one four-storied building, its carelessness of the police, and its destruction by fire. Its proportion of population of Chinese is very great.

PUASKI, CASIMIR, COUNT (1748-1779), Polish soldier, was born in Podolia in 1748, and took a prominent share, under his father Count Joseph Puaski, in the formation of the confederation of Bar and in the military operations which followed, becoming ultimately commander-in-chief of the Polish patriot forces. Driven into exile about 1772, Puaski went to America and joined the army of Washington in 1777. He distinguished himself at once in the battle of Brandywine, was made a brigadier-general and chief of cavalry by Congress, and fought at Germantown, and in the battles of the winter 1777-78, after which he raised a man-of-war corps called the Puaski Legion. At the head of this force he won further distinction in the southern theatre of war, and successfully defended Charleston in May 1779. He was mortally wounded soon afterwards at the unsuccessful attack on Savannah (Oct. 9) and died two days later on board ship. Congress voted a monument to his memory; and though this vote has never been carried into execution, Lafayette laid the corner-stone of a monument in Savannah in 1824, and this was completed in 1855.

PULCI, LUIGI (1437-1487), Italian poet, was born at Florence, of a well-connected family. His elder brother Luca (d. 1470) was also a poet, author of Pistoio, Driadeo d'amore, and Ciriflo Calvones. Luigi was patronized by Cosimo, Piero, and Lorenzo de' Medici, and was the author of various works in poetry and prose. He is famous, however, as the first to bring artistic romance into Italian literature in his heroic poem Morgante Maggiore (Venice, 1481), an epic of a giant converted to Christianity, who accompanies Orlando (Roland). (See Italian Literature.)

PULGAR, HERNANDO DE (1436-1492), Spanish prosewriter, was born at Pulgar (near Toledo) in 1436 and was educated at the court of John II. Henry IV. made him one of his secretaries, and under Isabella he became councillor of state, was charged with a mission to France, and in 1482 was appointed historiographer-royal. He is said to have died in 1492. His Crónica de los Reyes Católicos, wrongly ascribed in the first edition (1565) to Antonio de Lebrija, is often inaccurate and always obsequious; but the record is not without value as regards events within the author's personal experience. Pulgar's Claros Varones de Castilla (1486), an account of celebrities at the court of Henry IV., is interesting in matter and style. He compiled a commentary (1483) on the Coplas de Mingó Retuígo. His Letters, written to various persons of eminence, were first published in 1485-1486.

PULICAT, a town of British India, in Chingleput district, Madras, 25 m. N. of Madras city. Pop. (1901), 5448. The Dutch built a fort here as early as 1609, and it was for a long time their chief settlement on the Coromandel coast. Repeatedly captured, it did not finally become British until 1825. It gives its name to the Pulicat lake, a shallow lagoon stretching for about 37 m. along the coast. The seaward side is formed by the island of Sirharikot, which supplies firewood to Madras city.

PULKOVO, or Pulkova, a village of Russia, in the government of St Petersburg, 10 m. S. of the city of St Petersburg. Pop. 2000. It contains the Pulkovo observatory, on a hill overlooking the Gulf, in 59° 46' 18" N. and 30° 19' 40" E. It was built in 1833-1839.

PULLEY, a wheel, either fixed to a turning axle or carried freely on a stationary one, the periphery of which is adapted to receive some form of wrapping connector. A pulley carried on a rotating shaft and connected to another pulley on a second shaft by an endless band consisting of a flat belt, rope, chain or similar connector serves for the transmission of power from the one shaft to the other and is known as a driving pulley;
while combinations of pulleys or "sheaves," mounted in fixed or movable frames or "blocks," constitute mechanisms used to facilitate the raising of heavy weights. The word appears in Mid. Eng. as pulley or pole (late), also as poulain (Prompt. Parcels). The first forms seem to be from the O. Fr. poulie, which itself is regarded as coming from the O. Eng. pullatio, to pull. The Low Lat. forms polea, polegia, whence Span. poleca and Ital. poleggi, are apparently from the Fr. poulie. The earliest form, poulene, is represented in Fr. by poulain, literally a colt, Low Lat. pullanus, pullus, the young of any animal, the root of which is seen in English "foal." Poulain was used of a rope to let casks down into a cellar or to raise heavy weights. The use of the name of an animal for a mechanical device is not uncommon, cf. "crane," or "easel," from Lat. exel, literally a colt.

Driving pulleys are usually constructed of cast iron, and are of circular form, having a central nave by which they are secured to the shaft by keys or other fastenings, and straight or curved arms connecting the nave to the rim, which latter is of a form adapted to the connector. Pulleys are usually cast in one piece, and the proportions of the various parts are designed to resist the unknown stresses due to contraction of the casting in cooling, in addition to the stresses to which pulleys are subjected in use. The rim is slightly wider than the belt, and is of such a section as will suffice to resist the stress due to the pull of the belt, which is commonly taken as 80 lb per inch of width for single belting and 140 lb per inch of width for double belting. The rim is also subject to a centrifugal tension of amount \( \frac{w v^2}{g} \) pounds per square inch of section, where \( w \) is the weight in pounds of a length of one foot of the pulley rim one square inch in section, and \( v \) is the velocity of the rim in feet per second. This stress amounts to 1043 lb per square inch, if the velocity is 100 ft. per second. The combination of these stresses generally limits the rim velocity of cast-iron pulleys to 80 or 100 ft. per second. The dimensions of the nave depend to a large extent on the method of keying or otherwise securing the pulley to the shaft. The number of the arms is arbitrary, and they may be curved to diminish the liability to fracture from contraction in cooling of the cast iron, but in other respects are preferably straight, since they are then lighter and stronger. The arms are elliptical in cross-section, diminishing from the nave to the rim, and are usually designed as equally loaded cantilevers, fixed at the nave and free at the rim. These assumptions are probably not nearly correct and, as the stresses caused by the cooling of the casting are unknown, it is necessary to choose a low working stress of about one ton per square inch. The statical experiments of C. H. Benjamin (American Mechanist, 1859) on cast-iron pulleys loaded by a belt to imitate the conditions in practice led him to the conclusion that the rim is usually not sufficiently rigid to load the arms equally, and that the ends of the arms are subjected to bending movements of opposite sign, that at the nave being almost invariably the greater.

Pulleys are also built up of wrought iron and steel, and can then be constructed entirely free from internal stress; they are thus much lighter and stronger, and are not liable to fly to pieces like cast iron if they break. Fig. 1 shows a built-up pulley having a cast-iron nave A, straight wrought-iron arms B, screwed therein and connected to a steel plate-rim C by riveted ends, and also by screwed flanges D riveted on each side to the rim. The pulley is in halves to facilitate fixing, and when in place the sections C are joined by plates E, bolted or riveted to the rim.

The two halves of the nave are secured by bolts or rivets passing through the flanges F, and the pulley is connected to the shaft by a sunk key or by conical keys driven in between the shaft and the boss, which latter is bored to suit. A modified form of this arrangement of conical keys is shown in the figure, in which a screwed conical bush M, divided into several parts longitudinally, is clamped round the shaft, and screwed into the corresponding part of the nave until the grip is sufficient. The parts of the bush are glued to a sheet of emery paper, so that its rough side may give a better grip on the shaft.

Pulleys are also made of paper, wood and other materials. Wooden pulleys are preferably made of maple, the rim being formed of small sections morticed, pinned and glued together, with the grain set in such directions that any warping of the material will leave the cylindrical form practically unaltered. Wooden pulleys are generally made in two halves, bolted together at the rim and nave, and are provided with wooden spokes dovetailed into the rim and secured by keys. The pulley is secured to the shaft by conical keys, to give a frictional grip on both the shaft and the pulley; these keys may have their exterior surfaces eccentric to the shaft, with corresponding recesses in the nave, so that the pulley and keys virtually form one piece.

If the centre of gravity of a pulley is on the axis of rotation, and the whole mass is distributed so that the axis of inertia coincides with the axis of rotation, there can be no unbalanced force or unbalanced couple as the pulley revolves. The magnitude of the reaction force \( F \) at the periphery of the pulley rim of radius \( r \) ft and of velocity \( v \) feet per second, is expressed by \( Fv^2/2gr \), and, since the force varies as the square of the velocity, it is necessary carefully to balance a pulley running at a high speed to prevent injurious vibrations. This can be accomplished by attaching balance-weights to the pulley until it will remain stationary in all positions, when its shaft rests on two horizontal knife-edges in the same horizontal plane, or, preferably, the pulley and shaft may be supported on bearings resting on springs, and balanced by attached masses until there is no perceptible vibration of the springs at the highest speed of rotation.

The rims of pulleys, round which flat bands are wrapped, may be truly cylindrical, in which case the belt will run in the central line of the band will tend to run in the diametral plane of the pulley. This self-guiding property may be explained by the tendency which a flat band has, when running upon a conical pulley in a direction normal to its axis, to describe a spiral path as it wraps on to the surface because of the lateral stiffness of the material; the advancing side therefore tends to rise towards the highest part of the cone, if two cones are placed back to back the belt tends to rise to the ridge and stay there. In practice the pulley rim is curved to the shape of the band, so that five times its breadth, and this not only guides the belt, but allows the line of direction of the advancing side to deviate to a small extent, depending on the elasticity of the material.

Parallel shafts may be driven by flexible bands or connectors passing over pulleys, the central planes of which coincide, without any guiding arrangements for the belting. The shafts revolve in the same or opposite directions, according as the belt is open or crossed. Means of changing the relative speeds of rotation are furnished by pulleys of continuously varying diameter, or by speed cones (see MECHANICS: Applied). A common arrangement for driving a lathe spindle, in either direction at several definite speeds, is to provide a counter-shaft on which are mounted two fixed pulleys and two loose pulleys to accommodate two driving belts from the main shaft, one of which is open and the other crossed. The belts are moved laterally by the forks of a striking gear pressing on the advancing sides of the belts, and the pulleys are arranged so that the belts either wrap round the loose pulleys, or can be shifted so that one wraps round a fixed pulley, while the other still remains on its loose pulley. Motion in either direction is thereby obtained, and a considerable variation in the speed of rotation can be obtained by providing a cone pulley on the counter-shaft, which drives the cone pulley secured to the lathe.

**Fig. 1.—Built-up Pulley.**

XXII. 21
of intersection of the diametral planes, and tangents drawn to the pitch circles of the pulleys. Guide pulleys are set with their diametral planes in the planes containing corresponding pairs of tangents, and a continuous belt wrapped round these pulleys in due order can then be run in either direction.

The rims of pulleys for hemp or other ropes or cords are grooved, and the sides are usually either inclined at 45° or curved to give a sharper angle at the outside than at the bottom of the groove; in the latter case, as the rope wears it engages in a groove of greater angle and less effective grip. Wire ropes are injured by the lateral crushing of the material, and in this respect the grooves are wide enough to allow the rope to rest on the rounded bottom, which is lined with leather or wood to diminish the wear and increase the friction. In English practice there are as many separate endless ropes as there are pairs of grooves in the two pulleys to be connected, but in cases of American practice the rope is continuously wound round the two pulleys, and the free end passes over a pulley mounted on a movable weighted carriage to adjust the tension. It is of considerable importance that the effective radius of action of the rope remain constant throughout each pulley, otherwise the wear on the rope becomes very great and its life is diminished.

The grooves must be so shaped that the rope must be of the same diameter throughout to diminish slip.

Pulleys may be detachably connected to a shaft by friction clutches, so that they may be thrown in and out of engagement at will. The section, fig. 4, shows a clutch for a rope-driven pulley A, which runs freely on a bush B on the shaft, and is provided with an enlarged cylindrical nave or clutch box C. A split ring D, carried by the clutch and turning with it, can be thrown by the clutch box by right- and left-handed screws E, so that a sufficient grip is obtained to cause the clutch and the pulley to turn as one piece.

The engagement of the pulley and clutch is determined by a hand-controlled block F sliding on the shaft, the movement of which is communicated to the right- and left-handed screw shafts by links G connected to the levers H.

The resistance to slipping of a flat belt on a pulley may be obtained by considering the equilibrium of a small arc of the pulley surface subtending an angle \( \theta \) at the centre, and having tensions T and \( T+\Delta T \) at its extremities. Neglecting quantities of the second order, the pressure on the pulley is \( T \Delta \theta \), and the friction is \( \mu T \Delta \theta \) where \( \mu \) is the coefficient of friction between the belt and the pulley.

We have therefore \( T \Delta \theta = \mu T \Delta \theta \) and \( T \Delta \theta = \mu T \Delta \theta \). Integrating the expression for an angle of wrapping \( \theta \), we obtain the relation \( \log \theta = \frac{T \Delta \theta}{T} \), where \( T_1 \) and \( T_2 \) are the end tensions. For leather belts on cast-iron pulleys the value of \( \mu \) may be taken as 0.4, giving a ratio of the tensions on the tight and slack sides of \( T_1/T_2 = 3.314 \), when the angle of wrapping is 180°. For ropes in the grooves of cast-iron pulleys, where \( \phi \) is the inclination of the sides of the grooves, the value of the normal pressure is increased in the ratio of cosec \( \phi \) = 1. A usual value of \( \mu \) for hemp ropes on cast-iron pulleys is 0.3, and the exponential log ratio is therefore \( 0.3 \times \text{cosec} \phi \) when \( \phi = 90° \). At high speeds the centrifugal tension of the belt or rope, of amount \( w^2 R \), may be considerable, and must be subtracted from the end tensions.

**Pulley Blocks.**—Frames or blocks containing pulleys or sheaves are used in combination for lifting heavy weights. There are usually two blocks, of which one A (fig. 5) is fixed, and the other B is movable, and a rope or chain, with one end secured to one of the blocks at C, passes round the sheaves in a continuous coil, leaving a free end D at which the effort is applied. In the arrangement shown there are three equal sheaves in each block, and each set turns on a pin secured in the framing. The load, supported by the lower hook, is raised by hauling on the free end and, neglecting any slight obliquity of the plies of rope, the free end moves six times as fast.
as the lower block carrying the weight, and in the absence of friction and other resistances the mechanical advantage will be in the same ratio of the effort to the resistance. In practice the full advantage of this or any other similar combination is not realized, because of the friction of the sheaves against the pin or shaft, and more important still is the stiffness of the rope, which requires work to be done upon it to bend it round the sheave and straighten it again. The effect of pin friction is equivalent to diminishing the radius of the effort and increasing that of the resistance.

For a single pulley of diameter \( D \), turning on a fixed pin of diameter \( d \), the relation of the effort \( E \) to the load \( W \), where \( f \) is the coefficient of friction, is expressed by \( E/W = (D + f d)/(D - f d) = 1 + 2fD/D \) approximately. The resistance of the rope to bending causes an additional resistance, which experiment shows can be expressed in the form \( Wd^2/E \) where \( c \) is a coefficient. Hence \( E = W(1 + 2f/D + d^2/CD) = kW \) for a single pulley. In a six-sheaved pulley the relation between \( E \) and \( W \) may be expressed as \( W = E(1/3 + 1/5 + 1/7 + 1/9 + 1/11 + 1/13) \) and with a probable value of \( k = 1:1 \) this gives \( W = 36kE \) instead of \( W = 6kE \) as the free end of the rope is released the weight will descend, and the tackle is then left to overhaul. The conditions which enable a pulley tackle to support a weight when the effort is removed may be examined, to a first approximation, if we assume that the internal friction acts in such a way as virtually to diminish the effort \( E \) and to increase the resistance \( R \) by amounts proportional to the magnitude of each, and in addition to cause a loss \( M \) due to the weights of the parts themselves. We may therefore express the relation in the form
\[
(1 - m)E = (1 + b)R + M,
\]
whence we obtain \( E/R = (1 + b - M/R)/(1 - m) \).

If the load is self-sustaining \( E \) is zero or negative, and hence \( b + M/R \) must be equal to or greater than unity, and therefore it is impossible for the ratio of \( E/R \) to rise to a greater value than \( 1 - m/2 \), and hence at least half the effort is wasted if the tackle or greater than unity when the load is self-sustained, and we thus obtain a relation between \( R \) and \( E \) in the form \( 1 - m/2 \), which shows that to a first approximation, that as \( m \) approaches unity a high efficiency is obtainable, while the self-sustaining power of the tackle is retained.

In order to obtain a relation between \( R \) and \( E \) we obtain a lower ratio of \( R \) to \( E \), without using a large number of sheaves, various arrangements are used, of which the Weston differential pulley block is a typical example. The upper block carries a pair of chain pulleys \( A \), secured together by an eccentrically effective diameters \( D \) and \( d \). An endless chain \( B \), passing through guides \( C \) and \( D \), encircles these pulleys and the single loose pulley \( E \) of the lower block, as indicated. With this arrangement a single revolution of the upper sheave causes the chain to wind to the chain on one side by an amount \( d \), and to unwind an amount \( D \) on the other side, and in consequence the lower sheave is raised by \( D - d \). Hence, neglecting the loss due to the gear, the value of \( E/r \) is
\[
E/r = k = \frac{1}{2}(1 - m),
\]
where \( k \) is a coefficient which describes the amount of the mechanical advantage. Other various arrangements of friction brakes have been devised to give a resistance proportional to the load.

Fig. 5.—Sheave Pulley Block.

Fig. 6.—Weston Differential Pulley Block.

Fig. 7.—Moore and Head Pulley Block.

has the valuable property of sustaining a load when the effort is removed. If, however, an artificial resistance can be introduced, to come into action only when the effort is removed, it is possible to obtain a tackle of greater efficiency. As an example we may take the case where a brake is provided offering a resistance, \( c \), proportional to the load sustained, and where the values \( a \) and \( b \) are small compared with unity. Equation (1) becomes \( E/R = (1 - m - c/M/R)/(1 - m) \) and hence \( 1 + c + m/M/R \) is equal to the above equation, which shows that to a first approximation, that as \( c \) approaches unity a high efficiency is obtainable, while the self-sustaining power of the tackle is retained.

or by forming a sheave with an annular spur-wheel gearing with a pinion driven by a hand-wheel and chain as in the Tangey type of Weston pulley-block. The efficiency of the Weston pulley-block is less than 50%, and it does not therefore approach the advantage in the long length of the endless chain, which may drag on the ground and pick up dirt and grit, and thereby interfere with the smooth working of the mechanism. Other forms, which do not require so lengthy a chain or great amount of friction, may be employed.

The Moore and Head block has two equal chain-wheels \( A \), \( B \), fig. 7, loosely mounted on an axle \( C \), and provided with an annular toothed gear-wheels which usually differ by one tooth. A spur pinion \( J \) is geared with both wheels, and is carried loosely upon an eccentric \( E \) forming part of the central pin, so that when this latter is turned by the hand-wheel \( F \) and chain \( G \) the pinion describes a circle the diameter of which equals the throw of the eccentric, and a small relative motion of the sheaves takes place, depending on the number of the teeth of the annular wheels. The motion is divided between the two halves of the block, and wrapped round each sheave in opposite directions, with a free loop \( I \) between, while the ends are attached to the lifting hook. This form is self-sustaining at all loads.

In order to obtain a self-sustaining pulley tackle, which will have an efficiency of more than 50%, various arrangements are adopted, which during lifting automatically throw out of action a brake and cause it to come into action again when the effort is removed. A worm-gear tackle of this description is shown in fig. 8, in which a worm \( A \), operated by a hand-wheel \( B \) and chain \( C \), drives the worm-wheel \( D \), thereby coiling up a chain \( E \), one end of which is secured to the upper block, and the other end hangs loosely, after passing round the sprocket-wheel. The worm is of great pitch, so that if the effort were removed the sheave and weight would descend, did not the axial end thrust of the worm shaft throw into action a friction brake \( H \), the resistance of which prevents motion downwards. In the brake shown, the cone \( I \) is pressed against a corresponding recess in the ratchet-wheel \( J \), which latter turns loosely in the casing and is provided with a pawl not shown in the figure; this pawl allows freedom of motion when the load is being raised. The frictional grip between the two surfaces prevents return motion of the worm shaft and the load remains suspended, but it may be lowered by turning the hand-wheel so as to overcome the friction brake. Various other arrangements of friction brakes have been devised to give a resistance proportional to the load.

Blocks, for lifting very heavy weights, are sometimes provided with an electric motor for driving the worm. The worm-wheel shaft then drives a worm-wheel Block with Automatic Brake. To save wear, the worm-wheel is provided with a spur-wheel on the lifting shaft, whereby a much greater mechanical advantage is obtained with a small loss by friction of the spur gearing.

PULLMAN, formerly a town of Cook county, Illinois, U.S.A., and now a part of the city of Chicago. Here are the works of the Pullman Palace Car Company, steel forging plants, and other factories. The place was founded in 1880 by George Mortimer Pullman (1831–1897), the inventor of the Pullman sleeping car, and the founder (1867) of the Pullman Palace Car Company, who attempted to make it a "model town." Even the public works were the property of the Pullman Company and were managed as a business investment. Popular discontent with the conditions led to the annexation of Pullman to Chicago, being usually a municipality not approached by a straight line of the property. In June and July 1894 a bitter railway strike developed from a controversy between employers and employees in the Pullman works. (See CHICAGO and ILLINOIS: HISTORY.)

PULPIT (from Lat. pulpitum, a staging, platform: equivalents are Fr. chaire d'église, Ital. pulpito, Ger. Kanzel), a raised platform with enclosed front, whence sermons, homilies, &c., were delivered. Pulpits were probably derived in their modern form from the ambonæ in the early Christian Church (see AMBO). There are many old pulpits of stone, though the majority are of wood. Those in churches are generally hexagonal or octagonal, and stand on stone bases, or on slender wooden stems, like columns. The designs vary accordingly to the periods in which they were erected, having panelling, tracing, cupboards, crockets, and other ornaments then in use. Some are extremely rich, and ornamented with colour and gilding. A few also have fine canopies or sounding-boards. Their usual place is in the nave, mostly on the north side, against the second pier from the chancel arch. Pulpits for addressing the people in the open air were common in the medieval period, and stood near a road or cross. Thus there was one at Spital Fields, and one at St Paul's, London. External pulpits still remain at Magdalen College, Oxford, and at Shrewsbury. Pulpits, or rather places for reading during the meals of the monks, are found in the refectories at Chester, Beaulieu, Shrewsbury, &c., in England; and at St Martin des Champs, St Germain des Prés, &c., in Paris; also in the cloisters at St Dié and St Lo. Shortly after the Reformation the canons ordered pulpits to be erected in all churches where there were none before. It is supposed that to this circumstance we owe many of the time of Elizabeth and James. Many of them are very beautifully and elaborately carved, and are evidently of Flemish workmanship. The pulpits in the Mahomedan mosques, which are known as "mimbars" are quite different in form, and are often richly moulded and enriched. They may be beautifully carved, and are often of great size, and placed on a raised platform. These have a doorway at the foot, with an enriched lintel and boldly moulded head; the whole of the work to this and to the stairs, parapet and pulpit itself being of wood, richly inlaid, and often in part gorgeously painted and gilt.

PULQUE, or PULQUE FUERTE, the national beverage of the Mexican natives. It is prepared by fermenting the juice of a number of species of the agave (agenta potatorum, americana, &c.). The cultivation of the agave for purposes of pulque manufacture constitutes a considerable local industry, the capital invested running into several millions sterling. The juice obtained by tapping the agave is termed aguamiel. A quantity of this is allowed to ferment naturally for about ten days, and the product so obtained is termed madre pulque (mother of pulque). A small quantity of this is added to fresh aguamiel, and thereby a rapid fermentation is induced, the pulque being ready for consumption within a day or two. It has a somewhat heavy flavour, resembling sour milk, but it is much esteemed by the natives on account of its cooling, and according to them wholesome and nutritious, properties.

PULSE. (1) (O. Fr. pois, Lat. pulis, pulis, Gr. πῶλος, a porridge of beans, peas, &c., in botany, a collective term for beans, peas, and other members of the order Leguminosae (q.v.), which is characterized by having a legume or pod for the fruit. (2) (M. Eng. pouts, poute, O. Fr. pouso, mod. pousses, Lat. pulsus, sc. papaverum, the beating of the veins, the driving, throbbing or beating; in physiology the rhythmic beating due to the changes of blood-tension in the arteries consequent on the contractions of their elastic tissues (see VASCULAR SYSTEM).

PULSZKY, FERENCZ AUREL (1814–1897), Hungarian politician and author, was born on the 17th of September 1814 at Eperjes. After studying law and philosophy at the high schools of his native town and Miskolc, he travelled abroad. England particularly attracted him, and his fascinating book, Aus dem Tagebuch eines in Grossbritannien reisenden Ungarns (Pesth, 1857), prepared for him the membership of the Hungarian Academy. Eosziényi eled a Reichstag e1849, and was appointed to a financial post in the Hungarian government, and was transferred in like capacity to Vienna under Esterhazy. Suspected of intriguing with the revolutionists, Pulszky fled to Budapest to avoid arrest. Here he became an active member of the committee of national defence, and when obliged to fly the country he joined Kossuth in England and with him made a tour in the United States of America. In collaboration with his wife he wrote a narrative of this voyage, entitled White, Red, Black (3 vols., London, 1853). He was condemned to death (1852) in condamnation by a council of war. In 1860 he went to Italy, took part in Garibaldi's expedition in Lombardy (1862), and was interned as a prisoner of war in Naples. Amnestied by the emperor of Austria in 1866, he returned home and re-entered public life; was from 1867–1876, and again in 1884, a member of the Hungarian Diet, joining the Déák party. In addition to his political activity, he was president of the literary section of the Hungarian Academy, and director of the National Museum at Budapest, where he became distinguished for his archaeological researches. He employed his great influence to promote both art and science and Liberal views in his native country. He died on the 9th of September 1897. Among his writings are Die Jacobiner in Ungarn (Leipzig, 1850), and Eleven és Korom (Pest, 1884), and many treatises on Hungarian questions in the publications of the Academy of Pest.

Some Reminiscences of Kossuth and Pulszky were published by F. W. Newman in 1888.

PULTUSK, a town of Russian Poland, in the government of Warsaw, 33 m. N. of the city of Warsaw, on the right bank of the Narew. Pop. (1897), 15,878. The town was almost entirely destroyed by fire in 1875. It is now well built, and had before the fire a palace (1319) which was formerly a residence of the bishops of Plock. The industries include woollen, linen and hemp mills, copper works and potteries. In 1703 Charles XII. of Sweden defeated and captured the greater part of a Saxon army near this town, and in the same locality the French defeated the Russians in December 1806. The town was founded as early as 956.

PUMA, a name, probably of native origin, introduced into European literature by the early Spanish writers on South America (as Garcilaso de la Vega and Hernandez) for one of the largest cats (Felis concolor) of the New World. It is generally called "cougar" by the French, "leon" by the Spanish Americans, and "panther" by the Anglo-American hunters of the United States (see CARNIVORA). Though often spoken of as the American lion, chiefly on account of its colour, it rather resembles the leopard of the Old World in size and habits: usually measuring from nose to root of tail about 40 in., the tail being rather more than half that length. The head is small compared with that of other cats and has no mane. The ears are large and rounded. The tail is cylindrical, with some bushy elongation of the hairs near the end, but not forming a distinct tuft. The general colour of the upper parts and sides of the adult is a tawny yellowish brown, sometimes having a grey or silvery shade, but in some cases dark or inclining to red; and upon these and other differences, which are probably
constant locally, a number of sub-species have been named. The lower parts, inner surface of the limbs, throat, chin and upper lip are dirty white; the outside of the ears, particularly at their base, and a patch on each side of the muzzle black; the end of the tail dusky. The young are, when first born, spotted with dusky brown and the tail ringed. These markings generally fade, and quite disappear before the animal becomes full grown.

The puma has an exceedingly wide range of geographical distribution, extending over a hundred degrees of latitude, from Canada in the north to Patagonia in the south, and formerly was generally diffused in suitable localities from the Atlantic to the Pacific Ocean, but the advances of civilization have curtailed the extent of the districts which it inhabits. In

The puma (Felis concolor).

Central America it is still common in the dense forests which clothe the mountain ranges as high as 6000 or 9000 ft. above the sea level. Though an expert climber, it is by no means confined to wooded districts, being frequently found in scrub and reeds along the banks of rivers, and even in the open pampas and prairies. Its habits much resemble those of the rest of the group to which it belongs; and, like the leopard, when it happens to come within reach of an abundant and easy prey, as the sheep or calves of an outlying farming station, it kills far more than it can eat, either for the sake of the blood only or to gratify its propensity for destruction. It rarely attacks man, and when pursued escapes if possible by ascending trees. Several instances have occurred of pumas becoming tame in captivity. Edmund Kean, the actor, had one which followed him about like a dog. When caressed pumas purr like domestic cats.

PUMICE (Lat. pumex, spumex, spuma, froth), a very porous, froth-like, volcanic glass. It is an igneous rock which was almost completely liquid at the moment of effusion and was so rapidly cooled that there was no time for it to crystalize. When it solidified the vapours dissolved in it were suddenly released and the whole mass swelled up into a froth which immediately consolidated. Had it cooled under more pressure it would have formed a solid glass or obsidian (q.e.r); in fact if we take fragments of obsidian and heat them in a crucible till they fuse they will suddenly change to pumice when their dissolved gases are set free. Hence it can be understood that pumice is found only in recent volcanic countries. Artificial substances resembling pumice can be produced by blowing steam through molten glass or slag, and when a mass of slag is suddenly cooled by being tipped into the sea (as is the case at the blast furnaces of Whitehaven in Cumberland) it swells up into a pumiceous form so light and full of vesicles that it will float on water. Any type of lava, if the conditions are favourable, may assume the pumiceous state; but basalts and andesites do not so often occur in this form as do trachytes and rhyolites. Pumices are most abundant and most typically developed from acid rocks; for which reason they usually accompany obsidians, in fact in Lipari and elsewhere the base of a lava flow may be found obsidian while the upper portion is a snow white pumice.

Small crystals of various minerals occur in many pumices; the commonest are felspar, augite, hornblende and zircon. If they are abundant they greatly diminish the economic value of the rock, as they are hard and wear down more slowly than the glassy material; consequently they produce scratches. The cavities of pumice are sometimes rounded, but may also be elongated or tubular owing to the flowing movement of the solidifying lava. The glass itself forms threads, fibres and thin partitions between the vesicles. Rhyolite and trachyte pumices are white, contain 60 to 75% of silica and the specific gravity of the glass is 2·3 to 2·4; andesite pumices are yellow or brown; while pumiceous basalts, such as occur in the Sandwich Islands, are pitch black when perfectly fresh.

Good pumice is found in Iceland, Hungary, Nevada, Tenerife, New Zealand, Pantellaria and the Lipari Islands. The last-named are the chief sources of pumice for the arts and manufactures. At Campo Bianco in Lipari there is an extinct volcanic cone with a breached crater from which a dark stream of obsidian and a white stream of pumice effuse simultaneously. For industrial purposes the best varieties are obtained from Monte Pelato and Monte Chirica. The pumice is extracted by means of shafts and tunnels driven through the soft incoherent stone. It is cut up in blocks of various sizes and is often cut into slabs and graded into several qualities before it is exported to Canneto, which is the centre of the pumice trade. The workmen say that the good pumice occurs in beds or veins, which are probably lateral fissures and are separated by valueless rock of the same age. The value depends entirely upon the regularity, size and shape of the steam cavities and on the absence of minute crystals. From time to time the extraction of the pumice and sale of pumice has been one of the principal sources of wealth to the inhabitants of this island. An inferior pumice, known in Lipari as Alessandria, is used for smoothing ollcloth. Though all the Aeolian Islands are volcanic no pumice is exported from them. In Iceland, Hungary and Hungarian pumice also occurs, but not in sufficient quantity or of such quality as to render it worth working on a large scale. It is estimated that in Lipari there are 170 pumice quarries (or mines) giving employment to 1000 persons and producing 6000 tons of pumice per annum. The price varies with the quality: from 3 lire per 100 kilogrammes for the commonest sorts to 200 or 300 lire for the best pieces, the average being about 15 lire. Much pumice is also used nowadays in the form of a fine powder, produced by crushing the rock, and forms an ingredient of metal polishes and some kinds of soap. It is often confounded with diatomite or colloidal powders, which are easily recognized by the aid of the microscope or by simple chemical tests.

Among the older volcanic rocks pumice occurs, but usually has its cavities filled up by deposits of secondary minerals introduced into the pumice as water escapes and in the process it becomes pumices. Pumice, in minute fragments, has been shown to have an exceedingly wide distribution over the earth's surface at the present day. It occurs in all the deposits which cover the floor of the deepest portion of the oceans, and is especially abundant in the abysmal red clay. In some measure this pumice has been derived from submarine volcanic eruptions, but its presence is also accounted for by the fact that pumice will float on water for months, and is thus distributed over the sea by winds and currents. After a long time it becomes waterlogged and sinks to the bottom, where it gradually disintegrates and is incorporated in the muds and oozes which are gathering there. After the great eruption of Krakatoa in 1883 banks of pumice covered the surface of the sea for many miles and rose in some cases for four or five ft. above the water level. In addition to this much finely broken pumice was thrown up into the air by the great eruption and formed a cloud of dust which ultimately settling down in the most distant parts of the continents and oceans.

PUMP, a machine which drives a liquid from one point to another, generally at different levels, the latter being usually the higher; an air-pump is an appliance for exhausting or

1 The word appears apparently first in English in the Promptorium Parvularum, c. 1440, of a ship's pump (bavulorum), in Dutch (pompe), a little later, dialectically, of a conduit pipe for preventing the sense of smell of rainwater it did not sufficiently wash out in Dutch or Ger. before the 16th century. The Fr. pompe is derived from Teut. The Ger. variant of Pumpe is Plume, which is generally taken as being an echoic word, imitating the sound of the plunger, but the primary notion seems to be that of a pipe or trumpet. Cf. It. term, tromba, i.e. trumpet, pipe (see the note on the word in the New English Dictionary).
removing the air or other gas from a vessel, whilst a compression pump compresses the air. The simplest forms of pumps employed for forcing liquids are "plunger pumps," consisting essentially of a piston moving in a cylinder, provided with inlet and outlet pipes, together with certain valves. The disposition of these valves divides this type of pump into suction pumps and force pumps.

Fig. 1 shows the arrangement in a suction pump. A is the cylinder, B the piston moved up and down by the rod C. D is the inlet pipe (the lower extremity of which is placed beneath the surface of the liquid to be removed), and G is the outlet pipe. E is a valve in the inlet pipe opening into the cylinder, and the piston is perforated by one or more holes, each fitted with a seating and with a pipe extending upward to the upper surface. On raising the piston, the valve E remains closed and a vacuum tends to be created in the cylinder, but the pressure of the atmosphere forces the liquid up the tube D and it raises the valve E and passes into the cylinder. On reversing the motion the valve E closes and the liquid is forced through the valve F to the upper part of the cylinder. On again raising the piston, more liquid enters the lower part of the cylinder, whilst the previously raised liquid is ejected from the delivery pipe. Obviously the action is intermittent. Moreover, the height of the lift is conditioned by the atmospheric pressure, for this is the driving force; and since this equals 34 ft., the lift cannot be theoretically exceeded by this distance unless the water rises to a higher level. In practice it may be considerably less, owing to leakage at the valves and between the piston and cylinder.

In the force pump (fig. 2) there is no limitation to the lift. In this case the piston is solid, and the outlet pipe, G which is placed at the bottom of the cylinder, has a valve F opening outwards, the inlet pipe and valve are the same as before. On raising the piston the liquid rises in the cylinder, the valve E opening and F remaining shut. On reversing the motion the valve E closes and the liquid is driven past the valve F. On again raising the piston the valve E opens admitting more liquid whilst the valve F remains closed. It is seen that the action is intermittent, liquid only being discharged during a down stroke, but since the driving force is that which is supplied to the piston rod, the lift is only conditioned by the power available from the strength of the pump. A continuous supply can be obtained by leading the delivery pipe into the base of an air chamber, H, which is fitted with a discharge pipe J of such a diameter that the liquid cannot escape from it but is forced up, as it is pumped down, by the大气 pressure.

The air inside is compressed in consequence and during an upstroke of the piston this air tends to regain its original volume and so expel the water, thus bringing about a continuous supply. For a description of modern pumps, see HYDRAULICS.

**Air-pumps.**—Pumps for evacuating vessels may be divided into three classes: (1) mechanical, (2) mercurial, and (3) jet pumps; the last named are treated in HYDRAULICS.

The invention of the mechanical air-pump is generally attributed to Otto von Guericke, consul of Magdeburg, who exhibited his instrument in 1654; it was first described in 1657 by Gaspar Schott, professor of mathematics at Würtemberg, in his *Mechanica hydraulica-pneumatica*, and afterwards (in 1672) by Guericke in his *Experimentera nova Magdeburgica de suae sponte.* It consisted of a spherical glass vessel open at the top, and closed by means of a stop-cock and narrow nozzle into the cylinder of an "exhasting syringe," which inclined upwards from the extremity of the nozzle. The cylinder, in which a well-fitting piston worked, was provided at its lower end with two valves. One of these opened from the nozzle into the cylinder, the other from the cylinder into the outside air. During the down-stroke of the piston the former was pressed home, so that no air entered the nozzle and vessel, while the latter was forced open by the air which so escaped from the cylinder. During the return-stroke the latter was kept closed in virtue of the partial vacuum formed within the cylinder, while at the same time the former was forced open by the pressure of the denser air in the vessel and nozzle. Thus, at every complete stroke of the piston, the air in the vessel or receiver was diminished by that fraction of itself which is expressed by the ratio of the volume of the available cylindrical space above the outward opening valve to the whole volume of receiver, nozzle and cylinder. The action is essentially that of the common suction pump. The construction was subsequently improved by many experimenters, notably by Boyle, Hawksbee, Smeaton and others; and more recently two pump barrels were employed, so obtaining the same degree of exhaustion much more rapidly. This type of pump is, however, not very efficient, for there is not only leakage about the valves and between the piston and cylinder, but at a certain degree of exhaust the air within the vessel is insufficient to raise the inlet valve; this last defect has been met in some measure by using an extension of the piston to open and close the valve.

The so-called oil air-pumps are much more efficient; the valve difficulty is avoided, and the risk of leakage minimized; whilst in addition there is no air clearance between the piston and the base of the cylinder as in the older mechanical forms. The Fleuss pump may be taken as an example. The piston, provided with a valve opening upwards, is packed in the cylinder by a leather cup which is securely pressed against the sides of the cylinder by the atmospheric pressure. The piston rod passes through a valve in the upper part of the cylinder which is held to its seat by a spring. The inlet pipe enters an elliptical vessel which communicates with the cylinder a little way up from its base, whilst at the base there is a relief tube leading into the elliptical vessel already mentioned. Oil is placed both above the upper valve seating, and also in the cylinder up to the height of the lower edge of the inlet pipe. The action is as follows: On raising the piston it cuts off communication with the inlet pipe and then compresses the air above, forcing it through the upper valve and oil into the atmosphere. Some of the oil is also driven out, but as the valve does not close until the piston has descended a short distance, a certain amount of oil returns. On lowering the piston its valves open and air passes in from the vessel to be exhausted; this is further purified on the next stroke and so on. The Max Kohl pumps are based on the same principle, but are constructed with more elaborate detail, leading to a greater efficiency, an exhaust of 0-0008 mm. being claimed as readily obtainable.

The invention of the barometer and Torricelli's explanation of the vacuum above the mercury column placed before the members of the Florentine academy a ready method of obtaining vacua; for to exhaust a vessel it was only necessary to join, by means of a tube provided with stop-cocks, the vessel to a barometer tube, fill the compound vessel with mercury and then to invert it in a basin containing this liquid, whereupon the mercury column fell, leaving a Torricellian vacuum in the vessel, which could be removed after shutting off the stop-cocks. This was the only method known until the invention of the mechanical air-pumps; it was subsequently employed by Count Rumford, and as late as 1845, Edward A. King patented filament electric lamps exhausted by the same method. Although modern mercurial pumps have assumed a multiplicity of forms, their actions can be reduced to two principles, one statical, the other hydrodynamical—at the same time instruments have been devised utilizing both these principles.

**Statical Pumps.**—The earliest mercurial pump, devised by Swedenborg and described in his *Miscellanea observata circa res naturales* (1722), was statical in action, consisting essentially in replacing the solid piston of the mechanical pump by a column of mercury, which by being alternately raised and lowered gradually exhausted a vessel. A more complicated pump, but of much the same principle, was devised in 1784 by Joseph Baader, to be improved by C. F. Hindenburg in 1785, by A. N. Edelcrantz in 1804 and by J. H. Patten in 1824; whilst in 1851 Rankine Kennedy resuscitated the idea for the purpose of exhausting filament electric lamps. The pump devised by
PUMPKIN—PUN

H. Geissler of Bonn, and first described in 1838 by W. H. Theo. Meyer in a pamphlet Über das geschickte elektische Licht surpassed all previous forms in both simplicity and efficiency.

The general scheme of Geissler’s pump is shown in fig. 3. A and B are pear-shaped glass segments connected by a long narrow India-rubber tube, which must be sufficiently strong in the body (or strengthened by a linen coating) to stand an outward pressure of 7 to 8 atmospheres. A terminates in a narrow vertical tube c which is a few inches longer than the height of the barometer, and to the lower end of this tube the India-rubber tube is attached which connects A with B. At the upper end of A is a glass two-way stop-cock, by turning which the vessel A can either be made to communicate with the vessel to be exhausted, or with the atmosphere, or can be shut off from both when the cock holds an intermediate position. The apparatus, after having been carefully cleaned and dried, is charged with pure and dry mercury in the readiness and must next be worked backwards and forwards between A and B to remove all the air-bells. The air is then driven out of A by lifting B to a sufficient level, turning the cock so as to connect A with the vessels to be exhausted, cause the gas to expand into and almost fill A. The cock is now shut against both communications, the reservoir B is discharged and so on, until, when after an exhaustion mercury is let into A, the metal strikes against the top without intermediate position of a gas-bell. In a well-made apparatus the pressure in the exhausted vessel is now reduced to \( \frac{1}{5} \) or \( \frac{1}{8} \) of a millimetre, or even less. An absolute vacuum cannot be produced on account of the unavoidable air-film between the mercury and the walls of the apparatus. As it takes a height of about 30 in. of mercury to balance the pressure of the atmosphere, the Geissler apparatus is a somewhat long-legged and unwieldy instrument; in addition the long tube is liable to breakage. It can be considerably shortened, the two vessels A and B brought more closely together, and the somewhat objectionable India-rubber tube be dispensed with, if the connecting air-space in B with an ordinary air-pump, and by means of it do the greater part of the sucking and the whole of the lifting work. An instrument thus modified was constructed by Poggendorff in 1855.

Even a Geissler’s stop-cock requires to be lubricated to be absolutely gas-tight, and this occasionally proves a nuisance. Hence a number of attempts have been made to do without stop-cocks altogether. In the pump generally attributed to Töpler, but which was previously devised by J. Milc of Warsaw in 1828, who termed it a hydrostatic air-pump without cylinders, taps, lids or stoppers, this is attained by means for the inlet and the outlet, vertical capillary glass tubes, soldered, the former to somewhere near the bottom, the latter to the top of the vessel. These tubes, being more than 30 in. high, obviously act as efficient mercury-traps; but the already considerable height of the pump is thus multiplied by two. This consideration led Alexander Mitscherlich, F. Neisen and others to introduce glass valves in lieu of stop-cocks. A pump similar to Töpler’s construction was devised by Mendeleff, and the original device has been much improved by Wiedemann, Bessel, Hagen and others.

The best-known pump of this type was invented in 1865 by H. Sprengel, although the idea had been previously conceived by Magnus and Buff. The instrument, in its original (simplest) form (fig. 4), consists of a vertical capillary glass tube \( \sigma \) of about 1 mm. bore, provided with a lateral branch \( \delta \) near its upper end, which latter, by an India-rubber joint governable by a screw-clip, communicates with a funnel. The lower end is bent into the shape of a hook, and dips into a pneumatic trough. The vessel to be exhausted is attached to \( \delta \), and, in order to extract its gas contents, a properly regulated stream of air is allowed to fall through the vertical tube. Every drop of mercury, as it enters from the funnel, entirely closes the narrow tube like a piston, and in going past the place where the side tube enters entraps a portion of air and carries it down to the trough, where it can be collected. If the vertical tube, measuring from the point where the branch comes in, is a few inches greater than the height of the barometer, and the glass and mercury is perfectly clean, the apparatus slowly but surely produces an almost absolute vacuum.

The great advantages of Sprengel’s pump lie in the simplicity of its construction and in the readiness with which it adapts itself to the column of the gas. It did excellent service in the hands of Graham for the extraction of gases evolved in metals. Many improvements upon the original construction have been proposed.

Many other devices have been introduced for facilitating the production of vacua. For example Raps in 1893 described an automatic arrangement used in connexion with a Töpler pump; whilst in 1893 Schulze-Berge devised a rotary form. For the description of these forms see Winkelmann, Handbuch der Physik (1906), I, etc. The history of mechanical pumps is treated by S. P. Thompson, The Development of the Mercurial Air Pump (1888). For the production of high vacua, see Vacuum Tube; Liquid Gases.

PUMPKIN, the fruit of the gourd Cucurbita Pepo, well-known in English cottage gardens, and largely cultivated in continental Europe and North America. The pumpkin varies much in form, being sometimes nearly globular, but more generally ovoid or ovoid in shape; the rind is smooth and very variable in colour. It is a useful plant to the American backwoods farmer, yielding, both in the ripe and unripe condition, a valuable fodder for his cattle and pigs, being frequently planted at intervals among the maize that constitutes his chief crop. The Greater kinds acquire a weight of 40 to 80 lb but smaller varieties are in more esteem for garden culture. When ripe, the pumpkin is boiled or baked, or made into various kinds of pie, alone or mixed with other fruit; while small and green it may be eaten like the vegetable marrow. The name squash is applied in America to this and other species of the genus Cucurbita. The name is adapted from the American Indian word for (see L. H. Bailey, Cyclopedia of American Horticule, where is a fuller account of the squash). Summer squashes are mostly varieties of C. Pepo; winter squashes are either C. maxima or C. moschata, chiefly the former. The varieties of pumpkins and squashes are numerous and of great variety in size and shape; it is difficult to keep them pure if various kinds are grown together, but the true squashes (C. maxima) do not hybridize with the true pumpkin species. If carefully handled to avoid cracking of the skin, and kept dry and fairly warm, winter squashes may be kept for months.

PUN, a play upon words, particularly the use of a word in two or more different applications or of two or more words similar in sound but with different meanings by which a humorous or ludicrous effect is produced; thus Charles L’Court Jester is said to have made the punning grace “great praise be to God and little Laud to the devil” for which the archbishop dismissed him from his service. Another famous pun was that upon The Beggar’s Opera, which “made Gay rich and Rich gay.” Thomas Hood was the king of pun-makers. “They went and told the sexton, and the sexton tol’d the bell” (“Sally Brown”) is one example among the innumerable puns with which his poems are filled. The derivation of the word is not known. It first appears in the second half of the 17th century. Skeat
PUNCH

(Rhy. Dict., 1858) identifies it with an obsolete and dialectal variant of "pound," to beat in the sense of "to pound words, to beat them into new senses, to hammer at forced similes." The New English Dictionary considers it was probably one of the shortened words, like "mob," "cit," etc., which were common in slang after the Restoration. In R. L'Estrange, Counsellor Manners's Last Legacy (1676), "pun" is found with punnet, pundigion and quibble, "of which fifteen will not make up one single jest." Possibly these may all be referred to "punctilio" (It. punctilio, dim. of punto, point, Lat. punctum), a small, fine point, a cavil or quibble. No historical connexion, however, has been found between the words.

PUNCH, the abbreviated form of Punchinello (Ital. Polichinella, Pulcinella), the most popular of the puppets or marionettes (q.v.), and the chief figure in the "Punch and Judy" show. It is of Italian origin, though its history is by no means free from obscurity. The early Flemish marionettes, which are of undistorted type, have been supplied after his death by a masked actor who imitated his dress and manner. The claims of other individuals—Paolo Cinella, Palliloco, and Pulcinella, a Neapolitan dealer in fowls—have also been supported, and the derivation of the name and character from some old mystery representing Pontius (O. Eng. Peacoe; Fr. Ponc) Plate and Judas, or the Jews, was formerly popular. It has even been suggested that the title is a modification of pollo reale (I move much) as expressive of the restless quality which is characteristic of the puppet; and the assumption that the character was invariably of diminutive size has given rise to its reference to the word pollici, the thumb (cf. Däumling, Tom Thumb). The most plausible theory, however, regards the name in its Italian form as a diminutive of pulcino, fem. pulcia, a chicken. It is sometimes stated that, in consequence of the habit of using the word "chicken" as a term of endearment, it came to mean "a little child," and hence "a puppet" (W. Skeat). But this again involves the assumption that the application of the name to the character was in some measure determined by the size of the puppets, whereas it would appear to have been transferred from the comic stage to the puppet show and the Pulcinella of the stage was not necessarily a dwarf. The choice, therefore, seems to lie between the theory of Quadrio, that it was applied on account of the resemblance of the hooked nose to a beak, and that of J. Baretti, which ascribes its employment to the nasal squeak and timorous impotence of the original character. With respect to the development of the modern type, it has been assumed that the family of Italian marionettes to which the name is appended is a modified survival of the principal Roman characters of the Atellanae, and that Punchinello is the representative of Maccus, the fool or clown. In proof of this it is urged that Acreria, the supposed residence of Pulcino d'Aniello and the traditional source of the character, is in the neighbourhood of Aversa, the old Atella; and reference is also made to a bronzestatue of Maccus, discovered at Rome in 1727, an engraving of which has been preserved in Ficoronii's Le Maschere sceniche e le figure comiche d'antichi Roman. But the resemblance of the statue to the puppet is scarcely to be termed a striking one, and the large nose and deformed figure are somewhat hazy and ground on which to base a theory especially in view of the fact that such points of likeness are there in it to the northern Punch are not to be found in the Neapolitan Pulcinella. It is possible that some relic of the old Ludus Osei, transmitted through the Vice of the mystery plays, is to be found in the character; but any direct descent from the Maccus of the Atellanans seems precluded by the fact that, while there are traces of the gradual development of the northern Punch from the Neapolitan Pulcinella, the latter with its grey hat, white smock and trousers, masked face, and undistorted body is widely different from its alleged prototype. It seems necessary, therefore, to regard the Pulcinella as in large part a distinct creation of comparatively modern date. Prior to the 17th century there is no indication in the Italian burlesque poets that such a character as Pulcinella, though L. A. Riccoboni places the creation of the part before 1600.

Andrea Perrucci (1609) and Gima assert with some show of authority that Silvio Fiorelli, a comedian named after his principal part Captain Matamoros (the Italian Miles Gloriosus), invented the Neapolitan Pulcinella. It was afterwards improved by Andrea Calcese, surnamed Ciucio, who died of the plague in 1636, and who, according to Gima, imitated in the character the peasants of Acerra. This would place the origin of the Italian Pulcinella somewhere about the commencement of the 17th century, the original character appearing to have been that of a country clown, hook-nosed, shrill-voiced, cowardly, boastful and often stupid, yet given always to knavish tricks and shrewd sayings. In thorough accordance with this date, we find that the earliest known appearance of Polichinelle in France is at the beginning of the reign of Lewis XIV., in the show of the puppet-playing dentist Jean Bricché. It may have been expected that the shrivelled and wittier side of the character would most commend itself to the French mind, and there is good reason to believe that the Polichinelle of Bricché was neither a blunderer nor a fool. The puppet was almost immediately seized upon as the medium of political satire of the kind exemplified in the Letter of Polichinelle to Cardinal Mazarin (1649), and it is described by the Comte de Lestrade de Vergorger, as a "petit Esope de bois, remuant, tourment, virant, dialoguant, batant, parlant, parant, etant" and as "cette hétéroclite marmouset, disons mieux, ce drolifique bossu." In this there appears signs of transformation, whether the importation to France took place before or after the alleged Improvements of Calcese. The hunchback had long been associated in France with wit and laughter, and there are, therefore, some grounds for C. Magnin's theory that the northern Punch is of French origin, a Gallic type under an Italian name, though there does not seem to be sufficient reason for adopting his suggestion that Polichinelle was a burlesque portrait of Béarnards. The date of its introduction into England has been disputed. J. Payne Collier being of opinion that Punch and King William came together, a second theory suggesting an earlier origin with the Huguenot refugees. In view of its popularity in France prior to the Restoration, however, it would be strange if its migration had been so long delayed, and it is more than probable that it crossed the channel in the wake of the Royalists. Apart from the general references by S. Pepys (1662) and J. Evelyn (1667) to an Italian puppet-show at Covent Garden, the former makes mention (1669) of some poor people who called their fat child Punch, "that word being become a word of common use for all that is thick and stupid," it is given sometimes to punch till "it is also to be found in Butler's satire on English imitation of the French, and Aubrey speaks of "a Punchinello holding a dial" as one of the ornaments of Sir Samuel Lely's house at Whitehall. But, though the puppet did not travel in the train of William of Orange, allusions to it became far more frequent after the Revolution of 1688, and the skill of the Dutch in their treatment of puppet mechanism may have enhanced its attractiveness. In 1703 it was introduced at Bartholomew Fair into a puppet play of the creation of the world; in 1700 (Tailer, No. 16) it was to be found in a representation of the Deluge, though in a different part from that of the Momus Polichinelle. In 1710 (Spectator, No. 14) it is mentioned as a leading figure in Powell's puppet-show at Covent Garden. The alleged satire on Robert Walpole, entitled A Second Tale of a Tub, or the History of Robert Powell, the Puppet-Shoemaker (1715), furnishes some details of Punch performances, and has an interesting frontispiece representing Powell with Punch and his wife. The Judy (or Joan, as she appears to have been sometimes called) is not of a specially grotesque order, but the Punch is easily recognizable in all but the features, which are of the normal puppet type.
PUNISH—PUNIC WARS

649

Other allusions are to be found in Gay's Shepherd's Week—Saturday (1714) and Swift's Dialogue between Mad Mollmix and Timophy (1728). The older Punchinello was far less restricted in his actions and circumstances than his modern successor. He fought with allegorical figures representing want and weariness as well as with his wife and with the police, was on intimate terms with the patriarchs and the seven champions of Christendom, sat on the lap of the queen of Sheba, had kings and dukes for his companions, and cheated the Inquisition as well as the common hangman. Powell seems to have introduced a trained pig which danced a minuet with Punch, and the French (among whom Punch is now usually styled Guignol, originally a puppet hailing from Lyons) having occasionally employed a cat in the place of the dog Toby, whose origin is somewhat uncertain. A typical version of the modern play, with illustrations published by Payne Collier and Cruikshank in 1828 (3rd ed., 1844).

(R. W. M.)

PUNCH. (1) To pierce, perforate, make a hole or stamp a mark, &c., with a tool known as a "punchoon" or "punch." The verb is derived from the substantive; the original is Lat. punctio, a pricking, from pungere, to prick. This gave Itat. punzone, O. Fr. poinsin, mod. poingon. Both these French forms mean also a case, from which the English "punchoon," a liquid measure varying in capacity from 72 to 120 gallons is taken. This is probably the same word as that for the tool, and refers to a mark or sign stamped or "punched" on the measure. (2) To beat or hit, especially in such colloquialisms, as "to punch one's head." This is not the same word as (1) but is a shortened form of "punish," from Lat. punire, of which the ultimate origin is poena, penalty, from which is derived "pain." (3) The name of a drink, composed of spirits, water, sliced lemons or limes, or lemon-juice, together with sugar and spice, and served hot. According to the spirit with which it is made, it is known as brandy, whisky, rum punch, &c. Milk-punch is made of milk and spirit, bottled and served cold.

The word is the English representative of the Hindostani punch, five (from the number of ingredients), and was introduced from the East.

PUNCTUATION (Lat. punctum, a point), the theory or art of "pointing" a literary composition so as to divide it properly into sentences and portions of sentences, which the "points" are used to mark at their close, with a view to precision in the meaning of a continuous set of written words, by the indication of what would be pauses or changes of expression if they were spoken. The uses of the chief "points" are explained as follows in the "Rules for Compositors" at the Oxford University Press, compiled by Mr Horace Dart, the university printer.

The "full stop" or "period" (.) marks the end of a sentence. The "colon" (:)—Greek κώλων, a limb—is at the transition point of the sentence. The "semicolon" (;) separates different statements. The "comma" (,)—Gr. κόμμα, from κόττειν, i.e. a piece cut off—separates clauses, phrases and particles. (The terms "period"—Greek περίοδος—"colon," "comma," now identified in punctuation with the signs here given, were borrowed from the Greek grammarians, who originally described either the whole sentence or a longer or shorter part of it respectively in this way.) Among other signs, the "dash" (--) marks abruptness or irregularity. The "exclamation" (!) marks surprise. The "interrogation" or "query" (?) asks a question. The apostrophe (') marks elisions or the possessive case. "Quotes," quotation-marks or "inverted commas" (" ") define quoted words. Irregularities or interpolations in a sentence are marked by various forms of bracket ( ) or parenthesis. Literary usage and the practice of printing-houses vary, however, so much that it is impossible to define exactly and shortly the part played by some of these points in a reasonable system of punctuation. The Oxford Rules already mentioned, which deal also with spelling and other pitfalls in literary composition and printing, carry the authority of such experts as Dr J. A. H. Murray and Dr Henry Bradley; and the art of punctuation may be studied also in such works as H. Beadnell's Spelling and Punctuation, T. Allardlyce's Steps and hints on punctuation, T. L. de Vinne's Correct Composition, and T. Lefevre's Guide pratique du compositeur. The acceptance of a conventional system of modern punctuation is mainly due to the invention of printing, and to the ingenuity and care of individual typographers. In the earlier forms of writing the letters ran on continuously in lines; it was only by degrees that actual words were divided from one another by spacing within the line; then later came the distribution of words into sentences by means of points, and the introduction by Aldus Manutius in the 16th century of a regular system for these. The chief signs were inherited by the printers from the dots of the Greek grammarians, but were given with altered meanings; thus the Greek interpunct or "dot" mark (•) becomes the modern semicolon. (See Paleography and Typography.)

PUNIGHT (Hindi pandit; Skr. pandita), a learned man, a teacher, particularly one skilled in Sanskrit and Hindu law, religion and philosophy. Before the institution of the High Courts in 1862, the Supreme Court of India had a law officer styled the Pundit of the Supreme Court, who advised the English judges on points of Hindu law. The term is frequently applied, somewhat derisively, or humorously, to learned persons, to those who claim by long official or other experience to lay down the dictate principles of conduct.

PUNIC WARS, a term that is popularly appropriated to the wars between Rome and Carthage in the 3rd and 2nd centuries B.C. The origin of these conflicts is to be sought in the position which Rome acquired about 275 B.C. as susserian and protector of all Italy. Her new obligation to safeguard the peninsula against foreign interference made it necessary that she should not allow the neighbouring island of Sicily to fall into the hands of a strong and expansive power. Carthage, on the other hand, had long been anxious to conquer Sicily and so to complete the chain of island posts by which she controlled the western Mediterranean.

First Punic War (264—241 B.C.).—The proximate cause of the first outbreak was a crisis in the city of Messana, commanding the straits between Italy and Sicily. A band of Campanian mercenaries, which had forcibly established itself within the town and was being hard pressed in 264 by Hiero II. of Syracuse, applied for help both to Rome and Carthage and thus brought a force from either power upon the scene. The Carthaginians, arriving first, occupied Messana and effected a reconciliation with Hiero. The Roman commander nevertheless persisted in throwing troops into the city, and by seizing the person of the Carthaginian admiral during a parley induced him to withdraw his garrison. The Romans thus won an important strategic post, but their advantage was met by a declaration of war from Carthage and Syracuse.

Operations began with a joint attack upon Messana, which the Romans easily repelled. In 263 they advanced with a considerable force into Hiero's territory and induced him to seek peace and alliance with them. Having thus secured their foothold on the island they set themselves to wrest it completely from Carthage. In 262 they besieged and captured the enemy's base at Agrigentum, and proved that Punic mercenary troops could not stand before the infantry of the legions. But they made little impression upon the Carthaginian fortresses in the west of the island and upon the towns of the interior which mostly sided against them. Thus in the following campaigns their army was practically brought to a standstill.

In 260 the war entered upon a new phase. Convinced that they could gain no serious advantage so long as the Carthaginians controlled the sea and communicated freely with their island possessions, the Romans built their first large fleet of standard battleships. At Mylæ, off the north Sicilian coast, their admiral C. Duillus defeated a Carthaginian squadron of superior manoeuvring capacity by a novel application of grappling and
boarding tactics. This victory left Rome free to land a force on Corsica and expel the Carthaginians (259), but did not suffice to loosen their grasp on Sicily.

After two more years of desultory warfare the Romans decided to carry the war into the enemy’s home territory. A large armament sailed out in 256, repelled a vigorous attack by the entire Carthaginian fleet off Cape Ecnomus (near Agrigentum) and established a fortified camp on African soil at Clypea. The Carthaginians, whose citizen levy was utterly disorganized, could neither keep the field against the invaders nor prevent their subjects from revolting. A single campaign compelled them to sue for peace, but the terms which the Roman commander Atilius Regulus offered were intolerably harsh. Accordingly they equipped a new army in which, by the advice of a Greek captain of mercenaries named Xanthippus, cavalry and elephants formed the strongest arm. In 255, under Xanthippus’s command, was caught at a disadvantage and hastily sunk up position with an inadequate force near Tusca, outmanoeuvred him and destroyed the bulk of his army. A second Roman armament, which subsequently reached Africa after defeating the full Carthaginian fleet off Cape Hermaea, did not venture to reopen the campaign, but withdrew all the remaining troops.

The Romans now directed their efforts once more against Sicily. In 254 they carried the important fortress of Panormus (Palermo) by an attack from the sea; but when Carthage threw reinforcements into the island the war again came to a standstill. In 251 at last the Roman general L. Metellus brought about a pitched battle at Panormus in which the Carthaginian army was effectively crippled. This victory was followed by an investment of the chief Punic base at Lilybaeum by land and sea. The besiegers met with a gallant resistance, and in 249 were compelled to withdraw by the loss of their fleet in a surprise attack upon the neighbouring harbour of Drepanum (Trapani), in which the admiral Claudius Pulcher was repulsed with a loss of 93 ships. Meanwhile other losses in storms on the high seas so reduced the Roman fleet that the attack upon Sicily had to be suspended. At the same time the Carthaginians, who felt no less severely the financial strain of the prolonged struggle and had a war in Africa on their hands, reduced their armaments and made no attempt to deliver a counter-attack. The only noteworthy feature of the ensuing campaigns is the skilful guerilla war waged by a new Carthaginian commander, Hamilcar Barca, from his strong positions on Mt Erte (247–244) and Mt Eryx (244–242) in Western Sicily, by which he effectually screened Lilybaeum from the Roman land army.

In 242 Rome resumed operations on sea. By a magnificent effort on the part of private citizens a fleet of 200 warships was equipped and sent out to renew the blockade of Lilybaeum. The Carthaginians hastily collected a relief force, but in a battle fought off the Aegates or Aegusaic islands (west of Drepana) their fleet was caught at a disadvantage and utterly sunk up position (March 16, 241). This victory, by giving the Romans undisputed command of the sea, rendered certain the ultimate fall of the Punic stronghold in Sicily. The Carthaginians accordingly opened negotiations and consented to a peace by which they ceded Sicily and the Lipari Islands to Rome and paid an indemnity of 3200 talents (about £800,000).

The Interval between the First and Second Wars (242–221 B.C.)—The loss of naval supremacy not only deprived Carthage of her predominance in the western Mediterranean, but exposed her overseas empire to disintegration under renewed attacks by Rome. The temerity of the Roman people was soon made manifest during a conflict which broke out between the Carthaginians and their discontented mercenaries. Italian traders were allowed to traffic in munitions of war with the mutineers, and a gross breach of the treaty was perpetrated when a Roman force was sent to occupy Sardinia, whose insurgent garrison had offered to surrender the island (239). To the remonstrances of Carthage the Romans replied with a direct declaration of war, and only withheld their attack upon the formal cession of Sardinia and Corsica and the payment of a further indemnity.

From this episode it became clear that Rome intended to use her victory to the utmost. To avoid complete humiliation Carthage had no resource but to humiliate her adversary. The recent complications of foreign and internal strife had indeed so weakened the Punic power that the prospect of renewing the war under favourable circumstances seemed remote enough. But the scheme of preparing for a fresh conflict found a worthy champion in Hamilcar Barca, who sought to compensate for the loss of Sicily by acquiring a dominion in Spain where Carthage might gain new wealth and form a fresh base of operations against Rome. Invested with an unrestricted foreign command, he spent the rest of his life in founding a Spanish empire (236–228). His work was continued by his son-in-law Hasdrubal and his son Hannibal, who was placed at the head of the army in 220. These conquests aroused the suspicions of Rome, which in a treaty with Hasdrubal confined the Carthaginians to the south of the Ebro, and also guaranteed the independence of Saguntum, which was renewed by the Romans in 219.

In 219 Hannibal laid siege to Saguntum and carried the town in spite of a stubborn defence. It has always been a debatable point whether his attack contravened the new treaty. The Romans certainly took this view and sent to Carthage to demand Hannibal’s surrender. But his defiant policy was too popular to be disavowed; the Carthaginian council upheld Hannibal’s action, and drew upon itself an immediate declaration of war.

Second Punic War (218–201 B.C.): a. The “Hannibalic War.”—It seemed as though the superiority of the Romans at sea must enable them to choose the field of battle. They decided to abandon their army for Spain and another for Sicily and Africa.

But before their preparations were complete Hannibal began that series of operations by which he dictated the course of the war for the greater part of its duration. Realizing that so long as Rome commanded the resources of an undivided Italian confederacy no foreign attack could beat her down beyond recovery, he conceived the plan of cutting off her supply of strength at the source by carrying the war into Italy and causing a disruption of the League. His chances of ever reaching Italy seemed small, for the sea was guarded by the Roman fleets and the land route was long and arduous. But the very boldness of his enterprise contributed to its success; after a six months’ march through Spain and Gaul and over the Alps, which the Romans were nowhere in time to oppose, Hannibal arrived in the plain of the Po with 20,000 foot and 6000 horse, the pick of his African and Spanish levies (autumn 218: for details see Hannibal).

His further advance was here disputed by some Roman troops which had been recalled from the Spanish expedition. But the superiority of the Carthaginian cavalry and the spread of insurrection among the Gaulish inhabitants forced the defenders to fall back upon the Apennines. At the end of the year the Roman army was reinforced by the division from Sicily a til led out to battle on the banks of the Trebia and Hannibal, by superior tactics, repelled the assailants with heavy loss, and thus made his position in north Italy secure.

In 217 the campaign opened in Etruria, into which the invading army, largely reinforced by Gauls, penetrated by an unguarded pass. A rash pursuit by the Roman field force led to its being entrapped on the shore of Lake Trasimene and destroyed with a loss of 40,000 men. This catastrophe left Rome completely uncovered; but Hannibal, having resolved not to attack the capital before he could collect a more overwhelming force, directed his march towards the south of Italy, where he hoped to stir up the peoples who had formerly been Rome’s most stubborn enemies. The natives, however, were everywhere slow to join the Carthaginians, and a new Roman army under the dictator Q. Fabius Maximus (“Cunctator”), which, without ever daring to close with Hannibal, persistently dogged his steps on his forays through Apulia and Campania, prevented his acquiring a permanent base of operations.

The eventful campaign of 216 was begun by a new aggressive move on the part of Rome. An exceptionally strong field army, estimated at 85,000 men, was sent forth in order to crush the Carthaginians in open battle. On a level plain near Cannae in
Apulia, which Hannibal had chosen for his battle-ground, the Roman legions delivered their attack. Hannibal deliberately allowed his centre to be driven in by their superior numbers, while Hasdrubal’s cavalry wheeled round so as to take the enemy in flank and rear. The Romans, surrounded on all sides and so cramped that their superior numbers aggravated their plight, were practically annihilated, and the loss of citizens was perhaps greater than in any other defeat that befell the Republic. The moral effect of the battle was no less momentous. The south Italian nations at last found courage to secede from Rome, the leaders of the movement being the people of Capua, the second greatest town of Italy. Reinforcements were sent from Carthage, and several small parties prepared to throw their weight on Hannibal’s behalf. At first sight it seems strange that the battle of Cannae did not decide the war. But the resources of Rome, though terribly reduced in respect both of men and of money, were not yet exhausted. In north and central Italy the insurrection spread but little, and could be sufficiently guarded against with small detachments. In the south the Greek towns of the coast remained loyal, and the numerous Latin colonies continued to render important service by interrupting free communication between the rebels and detaining part of their forces. In Rome itself the quarrels between the nobles and commons, which had previously unsettled her policy, gave way to a unanimity unparalleled in the annals of the Republic. The guidance of operations was henceforth left to the senate, which by maintaining a firm and persistent policy until the conflict was brought to a successful end earned its greatest title to fame.

The subsequent campaigns of the Italian War assume a new character. Though the Romans contrived at times to raise 200,000 men, they could only spare a moderate force for field operations. Their generals, among whom the veterans Fabius and M. Claudius Marcellus frequently held the most important commands, rarely ventured to engage Hannibal in the open, and contented themselves with keeping him skirting against his detachments. Hannibal, whose recent acquisitions of strength were largely discounted by the necessity of assigning troops to protect his new allies or secure their wavering loyalty, was still too weak to undertake a vigorous offensive. In the ensuing years the war resolved itself into a multiplicity of minor engagements which need not be followed out in detail. In 216 and 215 the chief seat of war was Campania, where Hannibal vainly attempted to establish himself on the coast and experienced a severe repulse at Nola. In 214 the main Carthaginian force was transferred to Apulia in hopes of capturing Tarentum. Though the Tarentines, which the Calabrian coast had fallen into his hands, Hannibal still lacked a suitable base from which he might have secured his overseas communications. For two years he watched in vain for an opportunity of surprising the town, while the Romans narrowed down the sphere of revolt in Campania and defeated other Carthaginian commanders. In 212 the greater part of Tarentum and other cities of the southern seaboard at last came into Hannibal’s power. But in the same year the Romans found themselves strong enough to place Capua under blockade. They severely defeated a Carthaginian relief force, and could not be permanently dislodged even by Hannibal himself. In 211 Hannibal made a last effort to relieve his allies by a feint upon Rome itself, but the besiegers refused to be drawn away from their entrenchments, and eventually Capua was starved into surrender. Its fall was a sign that no power could in the long run uphold a rival Italian coalition against Rome. After a year of desultory fighting the Romans in 209 gained a further important success by recovering Tarentum. Though Hannibal from time to time still won isolated engagements, yet slowly but surely he was being driven back into the extreme south of the peninsula.

In 207 the arrival of a fresh invading force produced a new crisis. Hasdrubal, who in 209–208 had marched overland from Spain, appeared in north Italy with a force scarcely inferior to the army which his brother had brought in 212. After levying contingents of Gauls and Ligurians he marched down the east coast with the object of joining hands with his brother in central Italy for a direct attack upon Rome. By this time the drain of men and money was telling so severely upon her confederacy that some of her most loyal allies protested their inability to render further help. Yet by a supreme effort the Romans raised their war establishment to the highest total yet attained and sent a strong field army against each Carthaginian leader. The danger to Rome was chiefly averted by the prompt insight and enterprise of the consul C. Nero, who commanded the main army in the south. Having discovered that Hannibal would not advance beyond Apulia until his brother had established communications with him, Nero slipped away with part of his troops and arrived in time to reinforce his colleague Livius, whose force had recently got into touch with Hasdrubal near Sena Gallica (Sinigaglia). The combined Roman army frustrated an attempt of Hasdrubal to elude it and forced him to fight on the banks of the Metaurus. The battle was evenly contested until Nero by a dexterous flanking movement cut the enemy’s retreat. Hasdrubal himself fell and the bulk of his army was destroyed.

The campaign of 207 decided the war in Italy. Though Hannibal still maintained himself for some years in Calabria, this was chiefly due to the exhaustion of Rome after the protracted strain of past years and the consequent reduction of her resources. In 203 Italy was finally cleared of Carthaginian troops. Hannibal, in accordance with orders from home, sailed back to Africa, and another expedition under his brother Mago, which had sailed to Liguria in 205 and endeavoured to rouse the slumbering discontent in Cisalpine Gaul and Etruria, was driven back on the coast and withdrawn about the same time.

b. The Subsidiary Campaigns.—Concurrently with the great struggle in Italy the Second Punic War was fought out on several other fields. It will suffice merely to allude to the First Macedonian War (214–205) which King Philip V. commenced when the Roman power seemed to be breaking up after Cannae. And it will be sufficient to observe that the diplomacy provided for Philip in Greece and the maintenance of a naval squadron in the Adriatic prevented any effective co-operation on his part with Hannibal.

In view of the complete stagnation of agriculture in Italy the Romans had to look to Sardinia and Sicily for their food supply. Sardinia was attacked by a Carthaginian armament in 215, but a small Roman force sufficed to repel the invasion. In Sicily a more serious conflict broke out. Some isolated attacks by Punic squadrons were easily frustrated by the strong Roman fleet. But in 215 internal complications arose. The death of Hiero II., Rome’s faithful friend, left the kingdom of Syracuse to be possessed by a inexperienced grandson Hieronymus. Flattered by the promises of Carthaginian emissaries the young prince abruptly broke with the Romans, but before hostilities commenced he was assassinated. The Syracusan people now repudiated the monarchy and resumed their republican constitution, but they were misled by false threats of terrible punishment at the hands of Rome to play into the hands of the Carthaginians. The attacks of a Roman army and fleet under Marcellus which speedily appeared before the town were completely baffled by the mechanical contrivances of the Syracusan mathematician Archimedes (213). Meantime the revolt against Rome spread in the interior, and a Carthaginian fleet established itself in the towns of the south coast. In 212 Marcellus at last broke through the defence of Syracuse and in spite of the arrival of a Carthaginian relief force mastered the town by slow degrees. A guerilla warfare succeeded in which the Carthaginians maintained the upper hand until in 210 they lost their base at Agrigentum. Thereupon they were rapidly dislodged from their remaining positions, and by the end of the year Sicily was wholly under the power of Rome.

The conflict in Spain was second in importance to the Italian War alone. From this country the Carthaginians drew large supplies of troops and money which might serve to reinforce Hannibal; hence it was in the interest of the Romans to challenge their enemy within his Spanish domain.
Though the force which Rome at first spared for this war was small in numbers and rested entirely upon its own resources, the generals Publius and Gnaeus Scipio by skilful strategy and diplomacy not only won over the peoples north of the Ebro and defeated the Carthaginian leader Hasdrubal Barca in his attempts to restore communication with Italy, but carried their arms along the east coast into the heart of the enemy's domain. But eventually their successes were nullified by a rash advance. Deserted by their native contingents and cut off by Carthaginian cavalry, among which the Numidian prince Massinissa rendered conspicuous service, the Roman generals were slain and their troops were destroyed in detail (212 B.C.).

In 202 Hannibal conquered Africa. In 201 the Punic commanders from reaping the full fruit of their success. Before long the fall of Capua enabled Rome to transfer troops from Italy to Spain, and in 200 the best Roman general of the day, the young son and namesake of the recently slain P. Scipio, was placed in command. The new leader signalled his arrival by a bold and successful coup-de-main upon the great arsenal of Carthago Nova. Though he failed to prevent Hasdrubal Barca from marching away to Italy, Scipio profited by his departure to push back the remaining hostile forces the more rapidly. A last effort by the Carthaginians to retrieve their losses with a fresh army was frustrated by a great victory at Ilipa (near Corduba), and by the end of 200 they were completely driven out of the peninsula.

In 205 Scipio, who had returned to Rome to hold the consuls' ship, proposed to follow up his victories by an attack upon the home territory of Carthage. Though the presence of Hannibal in Italy at first deterred the senate from sanctioning this policy, the general popularity of the scheme overbore all resistance. Scipio was granted a force which he organized and supplemented in Sicily, and in 204 sailed across to Africa. He was here met by a combined land and sea force under the Carthaginian leaders. His army was compelled to the shore near Utica. But in the winter he extricated himself by a surprise attack upon the enemy's camp, which resulted in the total loss of the allied force by sword or flame.

In the campaign of 203 a new Carthaginian force was destroyed by Scipio on the Great Plains not far from Utica, their ally Syphax was captured, and the renegade Massinissa (q.v.) reinstated in the kingdom from which Syphax had recently expelled him. These disasters induced the Carthaginians to sue for peace, but before the very moderate terms which Scipio offered could be definitely accepted a sudden reversal of opinion caused them to recall Hannibal's army for a final trial of war, and to hold a meeting in the Ebro valley. In 202 Scipio assumed command of a composite force of citizen and mercenary levies stiffened with a corps of his veteran Italian troops. After an abortive conference with Scipio he prepared for a decisive battle at Zama (an inland site not yet identified with certainty). Scipio's force was smaller in numbers, but well trained throughout and greatly superior in cavalry. His infantry, after evading an attack by the Carthaginian elephants, cut through the first two lines of the enemy, but was unable to break the reserve corps of veterans. The battle was ultimately decided by the cavalry of the Romans and their ally Massinissa, which by a manoeuvre recalling the tactics of Cannae took Hannibal's line in the rear and completely destroyed it. The Carthaginians having thus lost their last army again applied for peace and accepted the terms which Scipio offered. They were compelled to cede Spain and the Mediterranean islands still in their hands, to surrender their warships, to pay an indemnity of 10,000 talents (about £2,400,000) within fifty years and to forfeit their independence in affairs of war and foreign policy.

The Second Punic War, by far the greatest struggle in which either power engaged, had thus ended in the complete triumph of Rome. This triumph is not to be explained in the main by any faultlessness in the Carthaginian method of attack. As a result of the history of the First Punic War, and that of the Second outside of Italy, prove that the Romans were irresistible on neutral or Carthaginian ground. Carthage could only hope to win by invading Italy and using the enemy's home resources against him. The failure of Hannibal's brilliant endeavour to realise these conditions was not due to any strategical mistakes on his part. It was caused by the indomitable strength of will of the Romans, whose character during this period appears at its best, and to the compactness of their Italian confederacy, which no shock of defeat or strain of war could entirely disintegrate. It is this spectacle of individual genius overborne by corporate and persevering effort which lends to the Second Punic War its peculiar interest.

The Third Punic War (149-146 B.C.)—The political power of Carthage henceforth remained quite insignificant, but its commercial and military influence continued in the 2nd century with such rapidity as to excite the jealousy of the growing mercantile population of Rome and the alarm of its more timid statesmen. Under the influence of these feelings the conviction—sedulously fostered by CatO the Elder, the Censor—that "Carthage must be destroyed" overbore the scruples of more clear-sighted statesmen. A casus belli was readily found in a formal breach of the treaty, committed by the Carthaginians in 154, when they resisted Massinissa's aggressions by force of arms. A Roman army was despatched to Africa, and although the Carthaginians consented to make reparation by giving up their prisoners and surrendering their naval base at Utica, they were roused into revolt by the further stipulation that they must emigrate to some inland site where they would be debarred from commerce. By a desperate effort they created a new war equipment and prepared their city for a siege (149). The Roman attack for two years completely miscarried, until in 147 the command was given to a young officer who had distinguished himself in the early operations of the war—Scipio Aemilianus, the adoptive grandson of the former conqueror of Carthage. Scipio made the blockade stringent by walling off the isthmus on which the town lay and by cutting off its sources of supplies from overseas. The Carthaginians were prevented from running away by the secure position which he effected an entrance in the face of a determined and inglorious resistance. The struggle did not cease until he had carried house by house the streets that led up to the citadel. Of a population probably exceeding half a million only 50,000 remained at the final surrender. The survivors were sold into slavery; the city was razed to the ground and its site condemned by solemn imprecations to lie desolate for ever. The territory of Carthage, which had recently been much narrowed by Massinissa's encroachments, was converted into a Roman province under the name of Africa.

BIBLIOGRAPHY.—I. Ancient Authorities. For the First Punic War Polybius, bk. 1, provides a trustworthy and impartial account, while his criticisms of others are in many cases useful. Polybius' sources may be assessed from his own description of his method of research and strategy unexplained. For the Second War bks. 2 and 3 of Polybius present a complete and detailed record down to Cannae; bks. 7-15 contain fragmentary notices of which the most continuous deal with the campaigns of Scipio. Livy (bks. 25-30) gives a continuous and detailed narrative, partly based upon Polybius and other good authorities, partly upon untrustworthy Roman annalists. The Third War is described in Appian's Res Libycae, chs. 67 sqq., and the fragments of Polybius, bks. 36-39.

The subsidiary authorities are: Diodorus, bks. 20-27, 32; Appian, Res Libycae, Hispanicarum, Hannibalitarum; Zonar's epitome of Dio Cassius' Lib. 43, 54; Livy's account of Carthage; C. C. A. Scholz's Hannibal's Letters; L. H. von der Tüse's Hannibal; Julius Cornelius Nepos' Lives of Hamilcar and Hannibal, and short references in Justin, Eutropius, Aurelius Victor and Orosius. The sources and methods of composition of these authors have been discussed in numerous articles and dissertations, mostly German, of which the most important are mentioned in Niese's work (quoted below). These sources have brought out few certain results, but they tend to show that the narratives, so far as they are not based on Polybius or earlier authorities, are of little value.

PUNISHMENT—PUNJAB 653

657

PUNISHMENT

658

PUNISHMENT (from Lat. punire, to punish, from poena, punishment, Gr. ποιημα), the infliction of some kind of pain or loss upon a person for a misdeed, i.e. the transgression of a law or command. Punishment may take forms varying from capital punishment, flogging and mutilation of the body to imprisonment, fines, and even deferred sentences which come into operation only if the offence is repeated within a specified time. The progress of civilization has resulted in a vast change alike in the theory and in the method of punishment. In primitive society punishment was left to the individuals wronged or their families, and was vindictive or retributive: in quantity and quality it would bear no special relation to the character or gravity of the offence. Gradually there would arise the idea of proportionate punishment, of which the characteristic type is the lex talionis, "an eye for an eye." The second stage was punishment by individuals under the control of the state, or community; in the third stage, with the growth of law, the state took over the primitive function and provided itself with the machinery of "justice" for the maintenance of public order. The modern universal law is against the state as such, the imposition of punishment by the wronged individual is illegal (cf. Lynch Law). Even at this stage the vindictive or retributive character of punishment remains, but gradually, and specially after the humanist movement under thinkers like Beccaria and Jeremy Bentham, new theories begin to emerge. Two chief trains of thought have combined in the condemnation of primitive theory and practice. On the one hand the retributive principle itself has been very largely superseded by the protective and the reformative; on the other punishments involving bodily pain have become objectionable to the general sense of justice. Thus the use of capital punishment occupies a far less prominent position, and tends everywhere to disappear. It began to be recognized also that stereotyped punishments, such as belong to penal codes, fail to take due account of the particular condition of an offence and the character and circumstances of the offender. A fixed fine, for example, operates very unequally on rich and poor. Modern theories date from the 18th century, when the humanitarian movement began to teach the dignity of the individual and to emphasize its rationality and responsibility. The modern phase of punishment is that of modern humanitarianism, the improvement of the prison system, and the first attempts to study the psychology of crime and to distinguish between classes of criminals with a view to their improvement (see Crime; Prison; Children's Courts; Juvenile Offenders). These latter problems are the province of criminal anthropology and criminal sociology, sciences so called because they view crime as the outcome of anthropological and social conditions. The man who breaks the law is himself a product of social evolution and cannot be regarded as solely responsible for his disposition to transgress. Habitual crime is thus to be treated as a disease. Punishment can therefore, be justified only in so far as it (1) protects society by removing temporarily or

659

permanently one who has injured it, or acting as a deterrent, or (2) aims at the moral regeneration of the criminal. Thus the retributive theory of punishment with its criterion of justice as an end in itself gives place to a theory which regards punishment solely as a means to an end, utilitarian or moral, according as the common advantage or the good of the criminal is sought.

PUNJAB, a province of British India, so named from the "five rivers" by which it is watered: the Jhelum, Chenab, Ravi, Beas and Sutlej, all tributaries of the Indus. Geographically the Punjab is the triangular tract of country of which the Indus and the Sutlej to their confluence form the two sides, the base being the lower Himalaya hills between those two rivers; but the British province now includes a large tract outside those boundaries. Along the northern border Himalayan ranges divide it from Kashmir and Tibet. On the west it is separated from the North-West Frontier province by the Indus, until that river reaches the border of Dera Ghazi Khan district, which is divided from Baluchistan by the Suliman range. To the north and west of it the rivers Jumna and Tons separate it from the United Provinces.

The Punjab includes two classes of territory, that belonging to the British Crown, and that in possession of 34 feudatory chiefs, almost all of whom pay tribute. The total area of the province is 333,741 sq. m., of which 97,209 sq. m. are British territory, and the remainder belongs to native states. The British territory is divided into 29 districts, grouped under the five divisions of Delhi, Lahore, Jullundur, Rawalpindi and Multan; while the native states vary in size from Bahawalpur, with an area of 15,000 sq. m., to the tiny state of Darkot, with an area of 8 sq. m. and a total population of 578 souls. They may be grouped under three main heads: the Phulkian states of Patiala, Jind and Nabha and the Sikh state of Kapurthala, occupying the centre of the eastern plains; the Mahommedan state of Bahawalpur between the Sutlej and the Rajputana desert; and the hill states, among the Punjab Himalayas held by ancient Rajput families, including Chamba, Mandi, Srikot, Sirmur and the Simla states.

Political Divisions.—The mountain regions of the Punjab fall under four separate groups. To the north-east of the province lies the Himalayan system, with the fringing range of the Siwaliks at its foot. In the south-eastern corner the Aravalli system sends out insignificant outliers, which run across Gurgaon and Delhi districts and strike the Jumna at Delhi. The lower portion of the western frontier is constituted by the great Suliman chain; while the north-western districts of the province are traversed by the hill system known as the Salt range. The mountain system of the Himalayas, so far as it concerns the Punjab, consists primarily of three great ranges running in a generally north-westerly direction from the head-waters of the Sutlej to the Indus: the western Himalayas or Zanskar or Bara Lacha range, the mid-Himalayas or Pir Panjal range, and the east Himalayas. These three great ranges spring numerous minor ranges, as ribs from their spine, the whole forming a confused system of mountain chains and valleys, the breadth of which is some 90 m. at its eastern extremity from Lahul to the Siwaliks of Hoshiarpur, and some 150 m. measured at its western extremity across Kashmir.

The "five rivers" of the Punjab are each of large volume; but, on account of the great width of sandy channel in their passage through the plains, their changing courses, and shifting shoals, they are of no value for steam navigation, though they all support a considerable boat traffic. Of recent years most of them have been utilized for purposes of irrigation, and have turned the sandy desert of
the Punjab into one of the great wheat fields of the British Empire.

While the general name Punjab is applied to the whole country of the "five rivers," there are distinct names for each of the doabs (de; two; ab; water) or tracts between two adjoining rivers. The country between the Sutlej and the Beas is called the Jullundur Doab; it includes the districts of Jullundur and Hoshiarpur. The long strip between the Beas and the Ravi, containing the greater part of Gurdaspur, Amritsar, Lahore, Montgomery, and Multan districts, is called the Bari Doab. Rechma Doab is the tract between the Ravi and the Chenab, embracing Sialkot and Gujranwala districts, with Upper trans-Ravi portions of the districts of the Bari Doab. Chaj or Jeh is the doab between the Chenab and the Jhelum (Gujrat and Shahpur districts and part of Jhang), and Sind Sagar is the name of the large doab between the Jhelum and the Indus, including Rawalpindi, Jhelum and Muzzafargarh districts, with parts of Shahpur, Bannu and Dera Ismail Khan. The higher and dry parts of the doabs are called bar. They are waste, but not barren, scantily covered with low shrubs, and capable, when watered, of being well cultivated. The bar in the great camel-grazing land. Large areas of Muzzafargarh and Multan districts are large tracts of sand and dust. The middle part of the Bari Doab, in Amritsar district, bears the distinctive name of Manjha (middle) as the centre and headquarters of the Sikh nation, containing their two sacred tanks of Amritsar and Taran Taran. The Malwa Sikhs, again, are those of the cis-Sutlej country.

South of the Himalayas stretch the great plains, which constitute by far the larger proportion of the province. With the exception of the Himalayan and Salt range tracts the Punjab presents, from the Jumna on the west to the Sullans in the west, one vast level, unbroken sand by the wide eroded channels within which the great rivers ever shift their beds, by the insignificant spurs of the Aravalli range in the south-eastern corner, and the low hills of Chiniot and Kirana in Jhang. The whole of these vast plains is of alluvial formation. Stones are unknown save at the immediate foot of the hills; micaceous sand is found everywhere at varying depths; and the only mineral is nodular accretions of limestone, called konkar, which is used for the construction of roads. The soil is a singularly uniform loam, the quality being determined by the greater or smaller proportion of dune sand present. In the local hollows and drainage lines the constant supply of silt which it carries is converted into a stiff tenacious soil, especially adapted to rice cultivation, while in the beds of the great rivers, and on the wind-fretted water-sheds pure sand is commonly found. Where neither sand nor the saline efflorescence called red is present, the soil is uniformly fertile, if only the rainfall be sufficient or means of irrigation be available. Throughout the greater part of the western plains, however, the insufficiency of rainfall is a permanent condition; and until recently the uniform aspect of the country was that of wide steppes of intrinsically fertile soil, ungrown, however, only as grazing grounds for herds of camels or cattle.

The Punjab may be divided into four great natural divisions: the Himalayan tract, the submontane tract, the eastern and western plains, and the Salt range tract, which have characteristics widely different from each other. The Himalayan tract, which includes the Punjab hill states, consists of 20,000 sq. m. of sparsely inhabited mountain, with tiny hamlets perched on the hill-sides or nesting in the valleys. The people consist chiefly of Rajputs, Kanets, Ghiraths, Brahmans and (2) Dugs or menials. The eastern and western plains, which are divided from each other by a line passing through Lahore, are dissimilar in character. The eastern are arable plains of moderate rainfall and almost without rivers, except along their northern and eastern edges. They yield the wheat and rice of India. They form the great cities of Delhi, Amritsar and Lahore. They, until the recent spread of irrigation, the most fertile, wealthy and populous of all the provinces. The great plains, where canal irrigation has been introduced, consist of arid pastures with scanty rainfall, traversed by the five great rivers, of which the broad valleys alone are cultivable. They are inhabited largely by Mahomedan tribes, and it is in this tract that irrigation has worked such great changes. The Chenab and Jhelum Canal colonies are already pronounced successes, and it is hoped that in process time the Lower Bari Doab and the Sind-Sagar Doab will be similarly fertilized. The Indus valley, from the villages on the hills, has an area of 10,000 sq. m., consisting of some of the most fertile and thickly populated portions of the province. Its populous cities are the chief centres of the basins, rich in vegetables and sugar-cane. The Indus Plain is the granary of the country. In the Salt range tract includes the districts of Rawalpindi and Jhelum and a small portion of Shapur district, and consists of some 9000 sq. m. of broken and confused country.

By far the greater part of the Punjab is covered by alluvial and wind-blown deposits of the plain of the Indus. The Salt range hills form a plateau with a steeply scarped face to the south, along which there is an axis of abrupt folding, accompanied and fault line. The rocks are in the Salt range being the Cambrian, Carboniferous, Permian, Triassic and Jurassic systems, while Tertiary beds cover the plateau behind. The extensive and the shaly deposits of salt, the range takes its name, occur near the base of the Cambrian beds. Cyprian aces moist, and other salts are also found. Between the Cambrian and the Carboniferous beds there is an unconformity, which, however, is not very pronounced, and which marks a slight inclination. At the bottom of the Carboniferous series there is usually a bed, the boulders in which have been brought from a distance and are scratched and stratified as if by ice. It is generally admitted that the basal deposits, containing the great coal bed, consisted of sand and grit, and are the first three months of the hot season, from April till the end of June, a dry heat is experienced, with a temperature rising to 120° F. in the shade. At the end of June the monsoon arrives, the rains break, and though the heat is less intense the moisture, and from the middle of August the temperature gradually falls. This is the most unhealthy period of the year, being exceedingly dry and sultry. The Frieda, or the hope of times which is indicated, is the monsoon period, lasting from the middle of June till the end of September, on which the autumn crops and spring sowings depend; and the winter rains, which fall early in January, and though not significant, are frequently sufficient for the spring harvest. Excepting in the Himalayas the rainfall is greatest in the east of the province, as the Bombay monsoon is exhausted in its passage over the great plains of Sind and Rajput. In the central and western parts of the Punjab there is a distinct dry season, the rain bearing the western monsoon. Before the rain the monsoon have collected on the western slopes of the Sullans range; so that the Punjab depends for its rain very largely on the south-east winds from the Bay of Bengal. The submontane tract has an annual average of 36 to 32 in., the eastern plains vary from 20 to 14 in., and the western plains from 10 to 5 in.

Agriculture.—As in other parts of India, there are commonly two harvests in the year. The spring crops are wheat, barley, gram, various vegetables, oil-seeds, tobacco and a little poppy; cold winter crops of oil-seeds, barley and sugar-cane. Wheat has become the most important export of the province. In the year of 1906 an area of 83 million acres were under cultivation, producing 3 million tons of wheat. In Kangra district. Flax has been produced successfully, but the cultivation has not been extended. Hops have been grown experimentally, for the Murree brewery, on neighbouring hills; the
cultivation in Kashmir has been more encouraging. Potatoes are grown extensively on cleared areas on the hills. The Punjabs produces freely many of the Indian fruits. Grapes are grown in many of the Himalayan valleys, which are not too high to be irrigated; but the produce sent to the plains is not excessive; but the higher regions have to be irrigated to those brought from Kabul.

Forests.—The forest area of the Punjab consists of 9278 sq. m., of which 1916 sq. m. are reserved and 4909 sq. m. protected. The woods are mainly of pine, of which there are 7179 acres. The trade in timber is unimportant; the principal uses are for fuel, and for the manufacture of charcoal. The forest reserves have been increased in recent years. Most of the trees are coniferous except the Himalayan pines, and most of the plantations consist of Scotch pine and Deodara.

Manufactures.—Most of the native manufactures of the Punjab are those common to other parts of India, such as the ordinary cloth, grass mats, pottery, woven cord, grass matting, paper, leather-work, brass vessels, simple agricultural implements and the tools used in trade. Other manufactures, not so general, yet not peculiar to the Punjab, are woolen fabrics, such as dhurries, kalmars, and carpets; silk, and woollen pieces, such as kashmirs, rajputanas, and jutes. The other manufactures are lampblack, cotton piece-goods, and native matting.

Trade.—The chief of the Punjabs, particularly the southern parts, is the Doab, or region bound to the west by the Doab, or region bound to the west by the Chenab and the Indus valleys, and to the east by the Jhelum and the Jhelum. The trade consists of the export of wool, cotton, and silk, and of the import of foodstuffs and manufactures. The trade is largely in the hands of the Hindu traders, and the exports are mainly to the United Provinces, and to the Punjab.

Irrigation.—Irrigation for large areas is from canals and reservoirs, and for smaller areas from wells. The canals are of two kinds: those carrying a permanent stream throughout the year, and those which fill only on the periodical rising of the rivers, the latter being known as "inundation canals." There are only a few parts of the country presenting facilities for forming reservoirs, by clearing the narrow outlets of small valleys and storing the accumulations of water behind the natural barriers, or the artificial barriers formed by the British government. The principal canals are the Sutlej, drawn from the Sutlej near Kurna, which irrigates parts of the native states of Patiala, Nabha and Jhinds, as well as British territory; the Bari Doab Canal from the Ravi; the Chenab Canal from the Chenab; the Jhelum Canal from the Jhelum; and the Jhelum Canal from the Jhelum. The total area irrigated by the canals of the province in 1905-1906 was 6,914,500 acres, the eight major works, the Western Jumna, Bari Doab, Chenab, Jhelum, and the Jhelum, being the most important. The Indus, the Sind, and the Indus account for all but 751,000 acres. The ravages of the "bollworm" in the cotton crop made 1906 an unfavourable year; but in spite of that the Lower Chenab Canal paid nearly 21% on its capital in 1905-1906, the Bari Doab Canal 5%, and the Lower Jumna nearly 10%.

Railways.—The Punjab is well supplied with railways, which have their central terminus at Delhi. One main line of the North-Western runs from Umballa through Lahore and Rawalpindi towards Peshawar; another main line runs from Lahore to Multan, and thence to the sea at Karachi; while a third runs along the left bank of the Indus, from Attok southwards. From Delhi to Umballa there are two lines, one of the North-Western through Meerut, and Saharanpur to the United Provinces, and a direct one, which is continued to Kalka, at the foot of the hills, whence a further continuation to Simla has been opened. The south-east of the province is served by two branches of the Rajputana system, the first from Multan to Bittur, and the other from the southern Punjab, which runs from Delhi to Bahawalpur.

Population.—The total population of the Punjab (including native states) according to the census of 1901 was 24,754,737, showing an increase of 6.4% in the decade. The Jats, who number some five millions, form the backbone of the cultivating community. Large numbers of them have become Sikhs or Mohammedans in the tracts where those religions predominate. The Rajputs, with a total of over a million and three-quarters, comprise tribes of different religions, races and social systems. By religion they are mostly Mohammedan, only about one-fourth being Hindus, while a very few are Sikhs. By race they include the ancient ruling tribes of the Jumna valley, the Tomar and Chauhan, which gave Delhi its most famous Hindu dynasties; the Bhattis of the south and centre, which have migrated from Bikanar and Jeysewale into the Punjab; and the Pathans of the south-west. In the northern or submontane districts the Rajputs also represent the old ruling tribes, such as the Chibbs of Gujrat, the Janjuas of the Salt range and others, while in Kangra district they preserve a very old type of Hindu aristocracy. The Gujars are an important agricultural and pastoral tribe. They are most numerous in the eastern half of the province and in the districts of the extreme north-west, especially in Gujrat, to which they have given their name. Baluchis and Pathans are strongly represented in the south-west. The distinctive religion of the Punjab is Sikhism (q.v.), though Sikhs form only 8% of the total population. Of the rest, Mohammedans are more numerous than Hindus.

Language.—Of the 24,754,737 people in the Punjab about 18,000,000 speak the provincial language, Punjabi, which varies in character in different parts of the province. About 4,000,000 speak Hindustani (see HINDOSTAND), this number including those whose ordinary vernacular is Hindi, but who understand and are gradually adopting the more comprehensive Hindustani. These two languages are the most generally used throughout the province, but not equally in all parts. The other languages in use are more or less local. The hill dialects, known as Pahari, are akin to the language spoken in the United Provinces, the Rajputana, and the Rajputana. Hindustani is the language of the law courts and of all ordinary officials and other communications with chiefs and people.

Administration.—The administration is conducted by a lieutenant-governor, who is appointed by the governor-general, subject to the approval of the Crown. Two commissioners take the place of the board of revenue in most other provinces. A survival of the "non-regulation" system is to be found in the title of deputy-commissioner for the district officer elsewhere called collector. The highest judicial authority is the chief court, consisting of five judges, which corresponds to the high court in the United Provinces; while the lower courts, such as the Additional Judges, were, in 1897, was enlarged in 1909 to 26 members, of whom ten are officials and five are elected. The province is distributed into five divisions or commissionerships. Most of the commissioners also exercise political functions over the native states within their jurisdiction.

Education.—The Punjab University, which was founded in 1882, differs from other Indian universities in being more than a merely examining body. It is responsible for the management of the Oriental College at Lahore, and takes a part in the improvement of vernacular literature. It also conducts Oriental examinations side by side with examination in English, and has been the first to introduce a set of examinations in science from matriculation to the degree, as well as a final school examination in clerical and commercial subjects. The higher and special educational institutions are the Lahore Government College, the Cambridge
In 1809 he got possession of Kangra, which the Nepalese were besieging. In 1813 he acquired the fort of Attock on the other side of the Punjab; and in the same year he obtained from Shah Shuja, now a refugee in Lahore, what he coveted as much as territory, the celebrated Koh-i-nor diamond, which had been carried off by Nadir Shah from Delhi. In 1818, after some failures in previous years, he captured Multan. Kashmir, which had successfully opposed him several times, was annexed the following year, and likewise the southern part of the country between the Indus and the hills. The Peshawar valley he succeeded in adding to his dominions later, and he found it best to leave an Afghan governor in charge of that troublesome district. These trans-Indus and other outlying tracts were left very much to themselves, and only received a military visit when revenue was wanted. Peshawar was never really ruled till Avtibale was sent there in later years. When he was gradually raising his large and powerful army Ranjit received into his service certain French and other officers, who drilled his troops and greatly improved his artillery. Whilst he relied on these foreigners for military and sometimes also for administrative services, he drew around him a body of native ministers of great ability, the best of whom were Gulab Singh and Dhian Singh of Jammu. The most influential.

Ranjit always maintained friendly relations with the British government, and just before his death gave tacit approval to the scheme for placing Shah Shuja on the throne of Kabul. His death in 1839 was followed by six years of internal anarchy, princes and ministers being murdered in quick succession, while all real power passed to the army of 90,000 trained troops. At last this army, unpaid and unmanageable, demanded to be led into British territory, and had their way. They crossed the Sutlej in December 1845. The battles of Moodkee, Ferozeshah and the Sobraon were fought by the route of the Sutlej. At Sobraon on the 10th of February 1846, when they were driven back into the Sutlej with heavy loss, and the British army advanced to Lahore. Of the Sikh guns 256 fell into the hands of the British in these actions on the Sutlej. A treaty was made at Lahore on the 9th of March with the chiefs and ministry who were to hold the government on behalf of the young maharaja, Duleep Singh. By this treaty the Jullundur Doab and the hill district of Kangra were ceded to the British, also the possessions of the maharaja on the left bank of the Sutlej. In addition the British demanded that the brothers—being the only two left to stain the name of the old tribe called Takka, whose name is found in Taksha-sila or Taxila. And from the later foreigners again, the Indo-Scythians, are probably descended the great Jat tribe of cultivators, also the Gujars and others.

It was during the events which brought Baber, the first of the Mogul dynasty, to the throne, that the sect of the Sikhs was founded by Nanak; and it was under the persecution of Aurangzeb that they were raised into a nation of warriors by Govind Singh, the tenth and last of the gurus. For their tenets and history see Sikhs.

The break-up of the Mogul Empire in the 18th century allowed the Sikhs to establish themselves, as a loosely organized community of marauders, in the eastern plains of the Punjab, on both banks of the Sutlej. Here, after long interminable warfare, one of their chieftains succeeded in enforcing his authority over the rest. This was Ranjit Singh, the "Lion of the Punjab," born in 1780, who acquired possession of Lahore as his capital in 1799. Ranjit was a man of strong will and immense energy, of no education but of great acuteness in obtaining the knowledge that would be of use to him. When he endeavoured to include the Sikh states south of the Sutlej within his jurisdiction, the heads of these states—chiefs of Sirhind and Malwa, as they were called—sought and obtained in 1808 the protection of the British, whose territories had now extended to their neighbourhood. The British were at this time desirous of alliance with Lahore as well as with Kabul, for protection against supposed French designs on India. A British envoy, Charles Metcalfe, was received by Ranjit at Kasur in 1809 and the alliance was formed. Ranjit steadily strengthened himself and extended his dominions.

University Mission College at Delhi, the Medical School and the Mayo School of Art at Lahore; and the Punjab Chiefs' College, also at Lahore.

History.—For the early history of the Punjab from the Aryan immigration to the fall of the Mogul dynasty see INDIA: History. It deserves, however, to be noted here that from the time of Alexander onwards Greek settlers remained in the Punjab, and that Greek artists gave their services for Buddhist work and introduced features of their own into Indian architecture. Besides the bases and capitals of large Greek columns at Shahderi (Taxila) and elsewhere, numerous sculptures of Greek workmanship have been found at various places. These are single statues (probably portraits), also figures of Buddha, and representations of scenes in his legendary history, and other subjects. They are obtained from ruins of monasteries and other buildings, from mounds and the remains of villages or monumental topes. Of Buddhist buildings now remaining the most conspicuous as well as distinct in character are the topes (stupa), in shape a plain hemisphere, raised on a platform of two or more stages. One of the largest of these is at Manikiala, 14 m. east of Rawalpindi. These Buddhist buildings and sculptures are all probably the work of the two centuries before and the three or four after the beginning of the Christian era. The character of the sculptures is now well known from the specimens in the India Museum, South Kensington, and both originals and casts of others in the Lahore Museum. Unfortunately they have no names or inscriptions, which give so much value to the sculptures of the Bharut tope.

The several bodies of settlers in the Punjab from the earliest times have formed groups of families or clans (not identical with Indian castes, but in many cases joining them), which have generally preserved distinct characteristics and followed certain classes of occupation in particular parts of the country. Some of the existing tribes in the Punjab are believed to be traceable to the early Aryan settlers, as the Bhatti tribe, whose special region is Bhattiana south of the Sutlej, and who have also in the village of Findi Bhattian a record of their early occupation of a tract of country on the left bank of the Chenab, west of Lahore. The Dogras, another Aryan clan, belong to a tract of the lower hills between the Chenab and the Ravi. Others similarly have their special ancient localities. To the earlier settlers—the dark race (Dasyu) whom the Aryans found in the country, and who are comprised in the tribes to which the three are supposed to have been added, the old tribe called Takka, whose name is found in Taksha-sila or Taxila. And from the later foreigners again, the Indo-Scythians, are probably descended the great Jat tribe of cultivators, also the Gujars and others.

Peace was not long preserved. The governor of Multan, Diwan Mulraj, desired to resign. Two British officers sent by the resident to take over charge of the fort were murdered, on the 19th of April 1848, and their escort went over to the diwan. Another of the assistants to the resident, Lieutenant Herbert Edwardes, then in the Derajat, west of the Indus, on hearing of their fate, collected a force with which to attack the Multan army while the insurrection was yet local. This he did with signal success. But Multan could not fall before such means as he possessed. The movement spread, the operations widened, and the Sikh and British forces were in the field again. Multan was taken. The severe battle of Chillianwalla on the 13th of January 1849 left the Sikhs as persistent as after the two terrible
days of Ferozeshah in the previous campaign. And it needed the crushing defeat of Gujarat, on the 21st of February 1849, to bring the war to a conclusion, and this time to give the Punjab to England. It was annexed on the 2nd of April 1849.

For the government of the new province, including the Jullundur Doab, previously annexed, and the cis-Sutlej states, a board of administration was appointed consisting of three members. In place of this board a chief commissioner was appointed in 1853, aided by a judicial commissioner and a financial commissioner. British troops, European and native, of the regular army were stationed at the chief cities and other places east of the Indus and at Peshawar—both for the centre of the trans-Indus territory a special body of native troops, called the Punjab frontier force, was raised and placed under the orders of the chief commissioner. During the Mutiny of 1857 the Punjab, under Sir John Lawrence as chief commissioner, was able to send an important force to the siege of Delhi, while suppressing the disturbances which arose, and meeting the dangers which threatened, within the Punjab itself. In 1858 the Delhi territory, as it was called, west of the Jumna, was transferred from the North-Western Provinces to the Punjab. The enlarged province was raised in rank, and on the 1st of January 1859 the chief commissioner became lieutenant governor. In 1905 the frontier districts beyond the Indus were severed from the Punjab and made into a separate province called the North-West Frontier province.

Innes, The Sikhs and our Sikh Wars (1897); Professor Kait, Life of Lord Gough (1913); Mahomet Latif, History of the Punjab (Calcutta, 1891); and Punjab Gazetteer (2 vols., Calcutta, 1908).

PUNKAH (Hindostani punhka), strictly a fan. In its original sense the punkah is a portable fan, made from the leaf of the palmyra; but the word has come to be used in a special sense by Anglo-Indians for a large swinging fan, fixed to the ceiling, and pulled by a coolie during the hot weather. The date of this invention is not known, but it was familiar to the Arabs as early as the 8th century, though it does not seem to have come into common use in India before the end of the 13th century. Of recent years it has largely been supplanted by the electric fan in barracks and other large buildings.

PUNSHON, WILLIAM MORLEY (1824–1881), English Non-conformist divine, was born at Doncaster, Yorkshire, on the 26th of February 1824, the son of a clergyman who was educated at Lincoln and Oxford, and, after spending a few years in business, at the Wesleyan College, Richmond. In 1845 he received his first appointment, at Marden, Kent, and soon became famous as a preacher. After serving the usual period of probation he was ordained at Manchester in 1849 and for the next nineteen years travelled in several circuits, including some of the London ones (1858–1864). In 1865 he went to Chicago as the representative of the Wesleyan Methodist conference, and settling in Canada did much to advance the cause of his denomination. His preaching and lecturing drew great crowds both in the Dominion and in the United States, and he was five times president of the Canadian conference. He returned to England in 1873, was elected president of conference 1874, and in 1875 one of the missionary secretaries. He published several volumes of sermons, and a book of verse entitled Sabbaths Chimes (1867, new edition 1880).

PUNT (from Lat. ponio, pontoon; connected with pon, bridge), a flat-bottomed boat, used for shallow waters, and propelled by a pole, by paddles, or occasionally by sails. Formerly the word was applied to many such flat boats used for ferries, barges, lighters, &c., but it is now generally confined to a light flat boat, 16 yards long in proportion to its width, with square ends, both at stem and bow, slightly narrowing from the centre, and propelled by a pole against the bottom of the river or other water by a long pole. Such boats are much used for sport or pleasure on rivers with shallow and hard gravelly beds; a small punt with a mounted duck gun and propelled by paddles or short oars is used for wild-fowling. A professional punting championship of England was instituted in 1876, and an amateur championship in 1886. Etymologically considered, “punt” certainly was adapted from ponio, a word used by Caesar (Bell. civ. p. iii. 22) of a light vessel for transport in Gaul. Later (as by Galliis and Ausonius) it was also applied to a floating-raft used as a bridge, a pontoon, and so connected with pons, bridge.

There are two other words which must be distinguished from the above. One means, in Rugby football, to catch the ball in the hands, drop and kick it before it reaches the ground, as distinguished from a “drop-kick,” where the kick is given half-way, as it reaches the earth. This word is probably cognate with “bunt,” a diminutive word meaning to push, and both represent nasalized forms of the onomatopoeic “put” or “but.” The second, in the substantive purter, used in the general sense of a gambler or better, originally referred to the man whose job it was to hold the bank or buffets against the bank. Both “punt” and “punter” are to be referred to Fr. ponte, and pontie, which is usually taken as an adaptation of Span. punto, a point.

PUNTERANAS, or PUNA ARDENAS, a seaport and capital of the district (comarca) of Punteranas, Costa Rica; on the Gulf of Nicoya, an inlet of the Pacific Ocean, and at the western terminus of the interoceanic railway from Limón. Pop. (1904), 3369. Punteranas is the principal harbour of Costa Rica on the Pacific, and a port of call for the United States liners which ply between San Francisco and Panama. It has an iron pier and ample warehouse accommodation for its large and growing export trade in coffee and bananas. The district of Punteranas comprises the entire littoral from Burica Point to the Rio de las Lajas, an affluent of the Gulf of Nicoya.

PUPIL (Lat. pupillus, orphan, minor, dim. of puus, boy, allied to puer, from root pu- or puer-, to beget, cf. “pupa,” Lat. for “doll,” the name given to the stage intervening between the larval and imaginal stages in certain insects), properly a word taken from Roman law for one below the age of puberty (impubacolus), and not under patria polos, who was under the protection of a tutor, a ward or minor (see INFANT; and ROMAN LAW). The term was thus taken by the Civil Law and Scots Law for a person of either sex under the age of puberty in the care of a guardian. Apart from these technical meanings the word is generally used of one who is undergoing instruction or education by a teacher. In education the term “pupil-teacher” is applied to one who, while still receiving education, is engaged in teaching in elementary schools. The system was introduced into England from Holland about 1840. At first the education which the pupil-teachers received was given at the schools to which they were attached. During the last quarter of the 19th century a system of “pupil-teacher centres” was set up, where training and education was given. In 1907 this was called “bursaries,” as an alternative; these enable intending to become teachers to continue their education at training colleges or selected schools as “student teachers.” (See EDUCATION.)

A special use of the Lat. feminine diminutive puella has been adopted in English and other languages for the central orifice in the iris of the eye, the pupil. The origin of the sense may be found in the parallel use in early English of “baby,” and such usages seem reflected in that part of the eye (see EYE and VISION).

PURBECKIAN, in geology, the highest and youngest member of the Jurassic series of rocks. The name is derived from the district known as the Isle of Purbeck in Dorsetshire where the strata are splendidly exposed in the cliffs west of Swanage. The rocks include clays, shales and marls with marly, tufaceous and shelly limestones and occasional oolitic and sandy strata. Nodules of chert are present in some of the limestones. The Purbeck beds follow the line of the Jurassic outcrop from Dorsetshire, through the Vale of Wardour, Swindon, Garrington, Brill and Aylesbury; they have been proved by borings to lie beneath younger rocks in Sussex; in Lincolnshire they are represented in part by the Spilsby Sands, and in Yorkshire by portions of the Speeton Clay. The thickness of the series in Wiltshire is 80 to 90 ft., but in Dorsetshire it reaches nearly 400 ft. In most places the Purbeckian rests conformably upon
the Portland beds and it is conformably overlaid by the Wealden formations; but there are in some districts distinct indications that the Portland rocks were uplifted and worn to some extent prior to the deposition of the Purbeck beds. The Purbeckian in England is divisible into three subdivisions, viz. Upper, Middle and Lower. The Upper Purbeck comprises 50-60 ft. of fresh-water clays and shales with limestones, the “Purbeck marble” and Unio-bed, in the lower part. The Middle division (50-150 ft.), mainly thin limestones with shaly partings, contains the principal building stones of the Swanage district; near the base of this subdivision there is a 5-in. bed from which an interesting suite of mammalian remains has been obtained; in the Purbeck series this is the horizon. The Lower Purbeck (95-160 ft.) consists of fresh-water and terrestrial deposits, marls, and limestones with several fossil soils known as “dirt beds.” This division is very extensively exposed on the Isle of Portland, where many of the individual beds are known by distinctive names. The chief building stones of Upway belong to this part of the Purbeckian.

No zonal fossil has been recognized for the British Purbeckian strata, but the horizon is approximately equivalent to that of *Perisphectes* and *Terrestrialissimus* of the European continent. The Purbeckian equivalent of the Purbeckian, and Spesetia of the zone of *Lamellibrachia Lateralis*. Other marine fossils are *Hemicardia purbeckensis* and *Ostrea dilatata*; the latter being abundant in the “Cinder bed” of the Purbeck. The fresh-water faunas include *Viparuna* (Paludina), *Planorbis, Melanopsis*, *Unio*, and *Cyrena*. A large number of insect genera has been found in the Middle and Lower Purbeck beds. Dinosaurs (Iguanodon, Echinodon), crocodiles (Goniophos, Pachypterus), alligators (Hippopotamus), and various turtles (Chelone, Fleurosternum), are representative reptiles. The mammals, mostly determined from lower jaws, found in the beds mentioned above include *Haploclados, Amblotherium, Stylopond, Triconodon, Spalacotherium* and several others. The toadstool crustacean *Archaeocystis Broden* is very common in the Purbeck of the Vale of Wardour. The silicified stumps and trunks of cypress and coniferous trees, often surrounded by great masses of charcoal concretions (Burre), are very noticeable in the dirt beds of Portland and near Lulworth. Chara is found in the fresh-water cherts of the Middle Purbeck.

Many geologists have ranged the Purbeck beds with the overlying Wealden formation on account of the similarity of their fresh-water faunas; but the marine fossils, including the fishes, all the Purbeck more closely with the Upper Jurassic rocks of other parts, and it may be regarded as the equivalent of the Upper Volgian of Russia. The Purbeckian is present in the neighbourhood of Boulogne; in Charente it is represented by thin limestones with Cyrena and with gypsiferous marls; in north-west Germany three subdivisions are recognized, in descending order Purbeck Kalk, Serpulit and Münden Marl and Spesetia Marl.

The building stones of the Purbeck beds have already been mentioned; the Purbeck or Paludina marble, a grey or greenish limestone full of freshwater clams, is extensively used in many of the churches. Stone tiles or “slats” were once used locally for roofing from the Lower Purbeck of Portland, Swanage and Swindon. Gypsum was formerly worked from the Lower Purbeck at Swanage and in the Isle of Purbeck. It is a useful building stone and is still worked. Purbeckian fossils are the subject of a series of papers by Great Britain (1859) vol. v. and “The Geography of the Isle of Purbeck and Weymouth,” Memoirs of the Geol. Survey (1898).

PURCELL, HENRY (1658–1695), English musical composer, was born in 1658 in St Ann’s Lane, Old Pyle Street, Westminster. His father, Henry Purcell (or Purcell), was a gentleman of the chapel-royal, and in that capacity sang at the coronation of Charles II; he had three sons, Edward, Henry and Daniel— the last of whom (d. 1717) was also a prolific composer. After his father’s death in 1664 young Henry Purcell was placed under the guardianship of his uncle, Thomas Purcell (d. 1688), a man of extraordinary probity and kindness. Through the interest of this affectionate guardian, who was himself a gentleman of His Majesty’s chapel, Henry was admitted to the chapel-royal as a chorister, and studied first under Captain Henry Cooke (d. 1672), “master of the children,” and afterwards under Pelham Humfrey (1647–1674), his successor, a pupil of Lully. He is said to have composed well at nine years old; but the earliest work that can be certainly identified as his is an ode for the king’s birthday, written in 1670. (The dates for his compositions are often uncertain, though recent research has done much to clarify them.) He then entered the choir of St Paul’s and continued his studies under Dr John Blow. In 1676 he was appointed copyist at Westminster Abbey—not organist, as has sometimes been erroneously stated—and in the same year he composed the music to Dryden’s *Aureng-Zeb* (1670). Purcell’s *Epsom Wells* and *The Libertine.*1 These were followed in 1677 by the music to Mrs Behn’s tragedy, *Adelazar,* and in 1678 by an overture and masque for Shadwell’s new version of Shakespeare’s *Timon of Athens.* The excellence of these compositions is proved by the fact that they contain songs and choruses which never fail to please, even at the present day. The masque in *Timon of Athens* is a masterpiece, and the chorus “In these delightful pleasant groves” in *The Libertine* is constantly sung with applause by English choral societies. In 1679 he wrote some songs for Playford’s *Choice Ayres, Songs and Dialogues,* and also the anthem, the name of which is not known, for the chapel-royal. For this anthem, written by Thomas Purcell, and still extant, we learn that this anthem was composed for the exceptionally fine voice of the Rev. John Gostling, then at Canterbury, but afterwards a gentleman of His Majesty’s chapel. Purcell wrote several anthems at different times for this extraordinary voice, a *basso profundo,* the compass of which is known to have comprised at least two full octaves, from D below the stave to D above it. The dates of very few of these sacred compositions are known; but one, “They that go down to the sea in ships,” though certainly not written until some time after this period, will be best mentioned here. In thankfulness for a personal escape from the shipwreck that George Gostling, who had been of the royal party, put together some verses from the Psalms in the form of an anthem, and requested Purcell to set them to music. The work is a very fine one but very difficult, and contains a passage which traverses the full range of Gostling’s voice, beginning on the upper D and descending two octaves to the lower.

In 1680 Dr Blow, who had been appointed organist of Westminster Abbey in 1669, resigned his office in favour of his pupil; and Purcell, at the age of twenty-two, was placed in one of the most honourable positions an English artist could occupy. He now devoted himself almost entirely to the composition of music, and for six years entirely severed his connexion with the theatre. But during the early part of the year, and in all probability before entering upon the duties of his new office, he had produced two important works for the stage, the music for Lee’s *Theodosius* and D’Urfey’s *Virtuous Wife.* The composition of his opera *Dido and Aeneas,* which forms a very important landmark in the history of English dramatic music (see Opera), has been attributed to this period, though its earliest production has been shown by Mr W. Barclay Squire to have been between 1688 and 1690. It was written to a libretto furnished by Nahum Tate, at the request of Josiah Priest, a professor of dancing, who also kept a boarding-school for young gentlemens, first in Leicester Fields and afterwards at Chelsea. It is a musical drama in the strictest sense of the term, a genuine opera, in which the action is entirely carried on in recitative, without a word of spoken dialogue from beginning to end; and the music is of the most genial character—a veritable inspiration, overflowing with spontaneous melody, and in every respect immensely in advance of its age. It never found its way to the theatre, though it appears to have been very popular among private circles. It is believed to have been extensively copied, but one song only was printed by Purcell’s widow in *Organum* in 1697. Purcell had completed the score of the opera when shipwreck overtook him and he was forced to return to England. He died 17 November 1695 and was buried in the choir of the chapel-royal, Westminster Abbey, on the 25th. It has long been thought by many musical critics that the manuscript of the opera may have been burnt in the fire of 1708. Both *The Libertine* and *Dido and Aeneas* were printed from manuscripts that were in the possession of the Musical Antiquarian Society, under the editorship of Sir George Macfarren.

In 1682 Purcell was appointed organist of the chapel-royal, vice Edmund Lowe deceased, an office which he was able to hold conjointly with his appointment at Westminster Abbey. He had recently married, his eldest son being born in this year. His first printed composition, *Twelve Sonatas,* was published in 1683. For some years after this his pen was busily employed in the production of sacred music, odes addressed to the king and royal family, and other similar works. In 1685 he wrote two

1. *The Libertine* was suggested by Tiro de Molina’s *tale, El Bar- lador de Sevilla,* afterwards dramatically treated by Molâtre and chosen by Da Ponte as the foundation of Mozart’s *Don Giovanni.*
of his finest anthems, "I was glad" and "My heart is inditing," for the coronation of James II. In 1687 he resumed his connection with the theatre by furnishing the music for Dryden's tragedy, *Tyrannic Love*. In this year also Purcell composed a march and quick-step, which became so popular that Lord Wharton adapted the latter to the fatal verses of *Lillibulero*; and in or before January 1688 he composed his anthem "Blessed are they that fear the Lord," by express command of the king. A few months later he wrote the music for D'Ursey's play, *The Fool's Preferment*. In 1690 he wrote the songs for Dryden's version of Shakespeare's *Tempest*, including "Full fathom five" and "Come unto these Yellow Sands," and the music for Betterton's adaptation of Fletcher and Massinger's *Prophetess* (afterwards called *Dromio*) and Dryden's *Amphiloptyia*; and in 1692 he received his draughtsmanship for *King Arthur*, also written by Dryden, and first published by the Musical Antiquarian Society in 1834. In 1692 he composed songs and music for *The Fairy Queen* (an adaptation of Shakespeare's *Midsummer Night's Dream*), the score of which (discovered in 1901) was edited in 1903 for the Purcell Society by J. S. Sherlock.

But Purcell's greatest work is undoubtedly his Te Deum and Jubilate, written for St Cecilia's Day, 1694, the first English Te Deum ever composed with orchestral accompaniments. In this he pressed forward so far in advance of the age that the work was not performed at St Paul's Cathedral till 1714, after which it was performed alternately with Handel's *Utrecht Te Deum* and Jubilate until 1743, when it finally gave place to Handel's *Dettingen Te Deum*. Purcell did not long survive the production of this great work. He composed an anthem for Queen Mary's funeral, and two elegies. He died at his house in Dean's Yard, Westminster, on the 21st of November 1695, and was buried under the organ in Westminster Abbey. He left a widow and three children, three having predeceased him. His widow died in 1706. She published a number of his works, including the now famous collection called *Orpheus Britannicus* (two books, 1695, 1702). Indubitably the operas already mentioned, Purcell wrote *Don Quixote Bondocca*, *The Indian Queen* and others, a vast quantity of sacred music, and numerous odes, cantatas and other miscellaneous pieces. (See the list in Grove's *Dictionary of Music*.)

A Purcell Club was founded in London in 1836 for promoting the performance of his music, but was dissolved in 1853. In 1876 a Purcell Society was founded, which has done excellent work in publishing new editions of his works.

**PURCHASES, SAMUEL** (1575-1626), English compiler of works on travel and discovery, was born at Thaxted, Essex, and graduated at St. John's College, Cambridge, in 1600. He became B.D., with which degree he was admitted at Oxford in 1615. In 1604 he was presented by James I. to the vicarage of Eastwood, Essex, and in 1614 became chaplain to Archbishop Abbot and rector of St Martin's, Ludgate, London. He had previously spent much time in London on his geographical work. In 1613 he published *Purchas, his Pilgrimage; or, Relations of the World and the Religions observed in all Ages* (4th ed. much enlarged, 1626); in 1616 *Purchas, his Pilgrim, Microcosmus, or the histories of Man. Relating the wonders of his Generation, quantities in his Degeneration, Necessity of his regeneration; and in 1600* Purchas, or Purchas his Pilgrimes, containing a History of the World in Sea Voyages and Lande Travells, by Englishmen and others* (4 vols.). This continuation of Hakluyt's *Principal Navigations* was partly based on M.SS. left by Hakluyt. The fourth edition of the *Pilgrimage* is usually catalogued as vol. v. of the *Pilgrimes, but the two works are essentially distinct. Purchas died in September or October 1626, according to some in a debtors' prison. None of his works was reprinted till the Glasgow reissue of the *Pilgrimes* in 1905-1907. As an editor and compiler Purchas was often injudicious, careless and even unfaithful; but his collections contain much of value, and are frequently the only sources of information upon important questions after the original authority has perished.

**PURCHASE, in its common sense, that which is acquired by the payment of money or its equivalent. The original meaning of the word (O. Fr. *pourchasser*, *pourchassier*, &c., popular, Lat. *pro-capitale*) was to pursue eagerly, hence to acquire. The corresponding English word, *pursue*, is derived by *pursue* (e.g. Britton, in 1592) for the acquisition of property by other means than inheritance or mere act of law, including acquisition by escheat, prescription, occupancy, alienation and forfeiture; more generally, purchase in law means acquisition of land by bargain or sale, according to the law of "vendor and purchaser" (see *Conveyancing*). A later development of meaning is found in the use of the word for a mechanical contrivance by which power can be excited or applied, a hold or fulcrum. This first appears (16th century) in the nautical use of the verb, to haul up a rope or cable by some mechanical device, the root idea being apparently to "gain" advantage over the rope bit by bit.

**PURDAS** (Pers. *purūd*), a curious garment worn by men from the sight of men in Eastern countries; a *purdab-nashin* is a woman who sits behind the curtain. The term has passed into common Anglo-Indian usage, and to "lift the purdah" means to reveal a secret.

**PURGATORY** (Late Lat. *purgatorium*, from *purgare*, to purge), according to Roman Catholic faith, a state of suffering after death in which the souls of those who die in venial sin, and of those who still owe some debt of temporal punishment for mortal sin, are rendered fit to enter heaven. It is believed that such souls continue to be members of the Church of Christ; that they are helped by the sufferages of the living—that is, by prayers, alms and other good works, and more especially by the sacrifice of the Mass; and that, although delayed until "the last farthing is paid," their salvation is assured. Catholics support this doctrine chiefly by reference to the Jewish belief in the efficacy of prayer for the dead (2 Macc. xii. 42 seq.), the tradition of the early Christians, and the authority of the Church.

Irenaeus regards as heretical the opinion that the souls of the departed pass immediately into glory; Tertullian, Cyprian, the Acts *St Perpetua, Clement of Alexandria, Cyril of Jerusalem, Basil, Gregory the Great, Chrysostom, Ambrose, and others*. Subsequent church councils have excluded the notion of a second or literal purgatory from the catechism. Augustine writes (De VIII. Dedicati questionibus) that "it is not incredible" that imperfect souls will be "saved by some purgatorial fire," to which they will be subjected for varying lengths of time according to their needs; but in other passages he expresses conflicting opinions (De civitate, xx. 25, xxx. 13, 26; Enchiridion, 69). Gregory the Great was the first to formulate the doctrine in express terms, *de purgatorio* (can. 11) *Expositionis in sacramentis* (v. 25, 1694). The doctrine is further sustained by the fact that this place of purification is not indicated by their doctors by an appropriate and accurate word, we will, in accordance with the tradition of the ancient authors, adopt the name of purgatory, or *purgatorium*. The Greek Church, on the other hand, holds that hell is not a place, but a state, which is called *purgatorium*, for in this temporary fire are cleansed not only capital sins, which must be remitted by penance, but those lesser venial sins which, if not removed in life, afflict men after death.

Many points about purgatory, on which the Church has no definition, have been subjects of much speculation among Catholics. Purgatory, for example, is usually thought of as having some position in space, and as being distinct from heaven and hell; but any theory as to its exact latitude and longitude, its topography and other characteristics, must be regarded as imaginative. Most theologians since Thomas Aquinas and Bonaventura have taught that the souls in purgatory are tormented by material fire, but the Greeks have never accepted this opinion. It must be inferred from the whole practice of indulgences as at present authorized that the pains of purgatory are measurable by years and days; but here also everything is indefinite. The Council of Trent, while it commands all bishops to teach "the sound doctrine of purgatory handed down by the venerable fathers and sacred councils," bids them exclude from popular addresses all the "more difficult and subtle questions relating to the subject which do not tend to edification."
of the pre-Nicene fathers on the subject. An authoritative statement of the present Eastern doctrine is to be found in the London Catechism of the Orthodox Church (Q. 176):—

"Such souls as have departed with faith but without having had time to bring forth fruits meet for repentance may be aided towards the attainment of a blessed resurrection by prayers offered in their behalf, especially such as are offered in union with the oblation of the Body and Blood of Christ, and by works of mercy done in faith for their memory."

The efficacy of prayers for the dead, and indirectly the doctrine of purgatory, were denied by early Gnostic sects, by Aëtius in the 4th century, and by the Waldenses, Cathari, Albigenses and Lollards in the middle ages. Protestants, with the exception of a small minority in the Anglican communion, unanimously reject the doctrine of purgatory, and affirm that "the souls of believers are at their death made perfect in holiness and in antransport to heaven in the same body in which they die."

The intermediate state after death follows the Protestant idea of justification by faith as logically as the doctrine of purgatory results from the Catholic idea of justification by works.

An analogy to purgation can be traced in most religions. Thus the fundamental ideas of a middle state after death and of a purification preparatory to perfect blessedness are met with in Zoroaster, who takes souls through twelve stages before they are sufficiently purified to enter heaven; and in the Stoics conceived of a middle place of enlightenment which they called μετανοή.

The principal authoritative statements of the Catholic Church on the doctrine of purgation were made at the Council of Florence (Decret. unionis), and at that of Trent (Sess. xii., can. 30, and 31). See H. J. D. Denziger’s Enchiridion; J. Bautz, Das Purgatorium (Mainz, 1853); and L. Redner, Das Purgatorium (Regensburg, 1856). A very elaborate treatise from the Catholic standpoint is that of Cardinal Bellarmine, De purgatorio. The subject is discussed, moreover, in all major works on dogmatic theology. There is a representative Catholic statement by Hense in his Arkhekhronikon under the title "Fegfeuer," 2nd vol., 4th ed., col. 1284-1296; and a corresponding Protestant presentation by Rud. Hoffmann in Hauck's Realencyclopaedie, 3rd ed. vol. v. pp. 788-792. (C. H. H.)

PURI, or JAGANNATH, a town and district of British India, in the Orissa division of Bengal. The town is on the sea-coast, and has a railway station. Pop. (1901), 49,334, including an exceptional number of pilgrims. As containing the world-famous shrine of Jagannath (see JUGGERNUT), Puria is perhaps the most frequented of all Hindu places of pilgrimage. Sanitation is effected by the Puria Lodging-House Act, which provides for the appointment of a special health officer, and for the licensing of lodging-houses both in the town and along the pilgrims' route.

The District of Puria has an area of 2499 sq. m. The population in 1901 was 1,017,284, showing an increase of 7·6% in the decade. For the most part the country is flat, the only mountains being low range while rising in the west, runs south-eastward an irregular line towards the Chilka lake and forms a water-parting between the district and the valley of the Mahanadi. The middle and eastern divisions of the district, forming the south-western part of the Mahanadi delta, consist entirely of alluvial plains, watered by a network of channels through which the most southerly branch of that river, the Koyakhal, finds its way into the sea. The other rivers, the Daya and the Chilka, all of which flow into the Chilka lake and are navigable by large boats during the rainy season, when the waters come down in tremendous floods, bursting the banks and carrying everything before them. The Chilka lake is one of the largest in India, its length is 44 m., and its breadth in some parts 20 m. It is separated from the sea only by a narrow strip of sand. The lake is saline and everywhere very shallow, its mean depth ranging from 3 to 5 ft. Puria district is in historical relations with the ancient region of Bhubaneswar—the earliest relics of Indian architecture—to the medieval sun temple at Kanarak and the shrine of Jagannath. The annual rainfall averages 58 in.

Puria first came under British administration in 1803. The only political events in its history since that date have been the rebellion of the mutineers of Khiladi in 1854 and the rising of the paiks or peasant militia in 1877. Throughout from Calcutta to Madras in 1891, with a branch to Puria town.

See Puria District Gazetteer (Calcutta, 1908).

PURIFICATION, in the study of comparative religion, may be defined as the expulsion or elimination by ritual actions and ceremonies from any individual or dwelling or community of impurity, which is often conceived of as due to the presence of or haunting by an unclean spirit, and having for its effect disease, pain and guilt. This development involves a distinction between the outward act and the inner act or motive, which we do not find even in the relatively advanced codes of the ancient Jews or of the Athenians of the 5th century B.C., for in both of these there is no essential difference between the thing done and the motive by which it was done. Purification is characterized by!!w

In most primitive societies the chief sources of ritual pollution are birth, death, bloodshed, blood, especially menstrual blood. Numberless other things are or have been taboo among different peoples, such as trees, colours, foods and drinks, persons, places, sounds. Persons and things brought even involuntarily into contact or association with these are taboed, and only recover their normal condition by some rite of purification or catharsis. Such rites operate by the transference elsewhere of the stain or impurity caused, very generally the impurity is due to the haunting by an unclean spirit or ghost, who must be driven off by exorcists invoking the name of a more powerful and clean spirit, which usually enters the thing or person possessed in place of the unclean. On this side rites of purification may become rites of consecration. In lower civilizations disease and madness are held to be caused by evil spirits which are similarly expelled; and on this side purificatory rites develop into the medical art. It must be borne in mind that a drug was originally not a substance succeeding by dint of its chemical properties and physical reactions on our bodies, but a talisman or charm taken internally and succeeding by reason of its magical properties.

Among the methods of purification used widely among different races and in various religions, the following may be enumerated, though the list might be indefinitely extended.

1. Animal sacrifice, originally intended to renew the life of the god in the worshippers. “Without shedding of blood there is no remission of sins” (Heb. ix. 22).

2. Vicarious sacrifice, whereby the guilt of an individual or of a clan is transferred into an animal, like the Jewish scapegoat, which is forthwith destroyed or sent over the frontier.

3. Washing or sprinkling with water, as a rule previously blessed or exorcised; or with the water of separation (i.e. water mixed with ashes of a red heifer).

4. Washing with gome, or urine of the sacred cow.

5. Anointing with holy oil.

6. Washing with saffron water, e.g. of the passover lamb or of a pig; or by actual baptism with the blood of an ox as in the Taurobolium (see MITHRAS).

7. Incarnation with smoke of incense used at sacrifices, the incense itself being the gum of a holy tree and gathered with magical precautions.

8. Rubbing with sulphur or other lyes. Use of helibore, hyssop, &c.

9. Burning with fire objects in which the impurity has been confined.

10. Sprinkling with water in which the cross has been washed (used by the monks and faithful in Mexico).

11. Evil spirits are expelled by invocation of the name of a being more powerful than they, and by the introduction of a clean spirit.

12. By fasting.

13. In the Old Parsee religion the drugs or demons which infect a corpse can be driven off by the look of certain kinds of dogs.

14. An impure contagion may be removable together with hair, nails, or bits of clothing. Hence the use of the ashen and the custom of shaving the head in vows.
PURIM

Purim, a Jewish festival held on the 14th and 15th of Adar, the last month of the Jewish calendar. According to Jewish tradition it is held in celebration of the deliverance of the Jews from the massacre plotted against them by their enemy Haman in the time of Artaxerxes, who fixed upon the former date by casting “lots” (=Hebrew loan-word Purim). It is preceded by a fast on the 13th day of Adar, known as the Fast of Esther, based upon Esther iv. 16.

Purim is the carnival of the Jewish year. Friends exchange gifts, and thus occasion is taken to relieve the necessities of the poor in the most characteristic manner, or by the gift of giyoz, which means “gowns,” and their parents are enjoined to drink wine until they cannot distinguish between blessing Mordecai and cursing Haman. The Megillah or Roll of Esther is read both at home and in the synagogue, and wherever, during the reading, the name of Haman is mentioned, it is accompanied with trampling the feet. In former times Haman was burnt in effigy, holding on to a ring and swinging from one side of the fire to the other (see L. Ginzberg, Geonica, 1909, pp. 1, 419; Davidson, Purim, pp. 21-22). This custom, which is still observed among the Jews of Caucasia (Tchorni, Sepher ha-Masaath, pp. 191-192), is very ancient, as it is mentioned in the Talmud (Sanhedrin 64). From the 17th century onward Purim plays were performed mostly by the children, who improvised a dramatic version of the story of Esther. This grew to be the characteristic folk-drama of the ghetto, and has not died out in eastern Europe to the present day.

Much ingenuity has been spent upon the name and origin of the feast. As regards the name, we may dismiss at once the suggestions of E. Wettinger (Kanon der Alten Testament) that it is derived from the Persian bahar, “spring,” and of Hitzig (Geschichte Israels), who derives it from the modern Arabic Phur, “the New Year.” These conjectures were made in the pre-scientific era of philology. Scarcely deserves of receiving a favour to the suggestion of Prof. W. V. Hammers; but better known in connexion with the name of Lagarde, who connects the name Purim with the old Zoroastrian festival of the dead, entitled Farvardigan. Lagarde, who is followed by Renan, connects this form with the LXX. variant of the Persic purus (joumpal); but there is absolutely nothing about Purim which suggests any relation with a festival of the dead. Graetz’s suggestions (Maim. Jüd. xxxv. 10 seq.) that it is derived from the Hebrew purah, and that the Purim, which is given as the scene of the events narrated in the Book of Esther, a quadrangular prism bearing different numbers on its four faces. This etymological connexion, suggested by Jensen (Kanon der Alten Testament), that Purim is a quadrangular prism bearing different numbers on its four faces. This etymological connexion, suggested by Jensen (Kanon der Alten Testament), that Purim is a quadrang
PURIN, C₇H₄N₄, in chemistry, the name given by Emil Fischer to the parent substance of a large group of compounds, the more important of which are sarcine, xanthine, uric acid, adenine, paraxanthine, guanine, theophylline, and caffeine. Its formula is shown in the diagram with the positions taken by substituent atoms or groups being numbered. (1)HC(2)C-NH(3)Cl(4)C-NH(5)Cl(6)C-NH(7)Cl(8)CH₇.

E. Fischer (Ber., 31, 2564) obtained it in 1898 by reducing 2,6-di-iodo purin, obtained from 2,6-trichlor purin (see below sub Uric acid), hydrobromic acid and phosphonium iodide at 0°C, with zinc dust and water, the zinc dioxide salt so obtained being decomposed by sulphuric hydrogen, the precipitated zinc sulphide filtered off and the solution concentrated. It has also been synthesized by O. Isay (Ber., 1896, 39, p. 230) from 5-nitro-uracil. This substance with m. p. 170°C by heating 2,4-dichlor-5-nitro pyrimidine, which with ammonia gives 4-amino-5-chloropyrimidine; by reducing this compound with hydrobromic acid and phosphonium iodide, 4,5-diamino-pyrimidine is obtained, which with formic acid furnishes purin; thus:-

\[ \text{NH-CH} \rightarrow \text{N=CH} \]
\[ \text{NH-CH CO-NO}_2 \rightarrow \text{N=CH CO-NO}_2 \]
PURIN
acid; and j-methylxanthint or heteroxanthine, which is found in
human urine, may be obtained from theobromine (E. Fischer, Ber.,
1897, 30, p. 2400; see also ibid., 1898, 31, p. 117).
Theophylline, C,(CH,),H,O.N., or i-3-dimethyl-2-6-dioxypurin,
was isolated by A. Kossel from tea-leaves (Ber., 1888, 21, p. 2164).
It was synthesized by E. Fischer and L. Ach (Ber., 1895, 28, p. 3135)
from l-3-dimethyl uric acid, which on treatment with phosphorus
from which theopnylline
pentachloride yields chlortheophylline,
.lined by reduction with hydriodic acid. W. Traube (Ber., 1900,
33, p. 3035) formed the nitroso derivative of iminodimethyl barbituric acid (obtained by the action of phosphorus oxychloride
on cyanacetic acid and dimethyl urea), and reduced it by ammonium sulphide to i-3-dimethyl-4-5-diamino-2-6-dioxypyrimidine, the
formyl derivative of which, when heated to 250 C., loses the elements
It behaves as a
of water and yields theophylline (cf. Xanthine).
weak base. When oxidized by potassium chlorate and hydrochloric acid it yields dimethylalloxan. Its silver salt on methylation
1

^

Paraxanthine, or l'7-dimethyl-2-6-dioxypurin,
occurs in urine. It has been obtained from theobromine (E. Fischer,
Ber., 1897, 30, p. 2400); from I -7-dimethyl uric acid (E. Fischer
and H. Clemm, Ber., 1898, 31, p. 2622); and from 8-chlorcaffeine
On methylation it yields
(E. Fischer, Ber., 1906, 39, p. 423).

It is obtained by methylating xanthine, or from 3-7-dimethyl uric
acid (E. Fischer, Ber., 1897, 30, p. 1839). This acid, by the action
of phosphorus oxychloride and pentachloride, is converted into
3-7-dimethyl-6-chlor-2-8-dioxypurin, which with ammonia gives
This substance with phosthe corresponding amino compound.

phorus oxychloride yields v7-dimethyl-6-amino-2-oxy-8-chlorpurin,
which on reduction with hydriodic acid leads to 3-7-dimethyl-6amino-2-oxypurin, from which theobromine is obtained by the
action of nitrous acid. It is also obtained by W. Traube's method
(Ber., 1900, 33, p. 3047) from cyanacetyl methyl urea, which gives
3-methyl-4'5-diamino-2'6-dioxypyrimidine, whose formyl derivative yields 3-methylxanthine, from which theobromine is obtained
It crystallizes in anhydrous needles which sublime
by methylation.
It behaves as a weak base.
at 290-295 C.
Potassium chlorate
and hydrochloric acid oxidize it to methyl alloxan and methyl urea,
chromic acid mixture oxidizes it to carbon dioxide, methylamine and
rnethylparabanic acid. When boiled with baryta it yields carbon
dioxide, ammonia, methylamine, formic acid and sarcosine. Methylation of its silver salt yields caffeine.

CsH(CHj)aN4Os, is i-3'7-trimethyl-2-6-dioxypurin. For
properties and method of extraction see CAFFEINE.
It may be synthesized by methylating chlortheophylline and reducing the resulting product (E. Fischer and L. Ach, Ber., 1895, 28,
P- 3135); by the action of phosphorus oxychloride on tetramethyl
Caffeine,

general

uric acid, the resulting chlorcaffeine

being reduced (Ber., 1897, 30,

The three latter methods may be outlined as follows. Dimethylalloxan (I.) condenses with methylamine in the presence of
sulphurous acid to form an addition product (II.), which on hydrolysis
yields i*3*7-trimethyl uramil; this substance gives with potassium
cyanate, i -3-7-trimethyl pseudo-uric acid (III.), which on dehydration
this substance
yields l-3-7-trimethyl uric acid (hydroxycaffeine)
with phosphorus pentachloride gives chlcrcaffeine, which yields
caffeine (IV.) on reduction:

3042).

basic lead acetate is

C HN>O, which on hydrolysis with
6

converted into mesoxalic acid,
methylamine and monomethyl urea.
Reduction of caffuric acid yields hydrocaffuric acid, CiHfN'iOi,
which readily hydrolyses to methyl hydantoin.
Consequently

hydrocaffuric and caffuric acids, apocaffeine and caffeine must
contain the grouping (I.). Hypocaffeine on hydrolysis loses carbon
dioxide and gives caffolin, CjHjNjC^, which on oxidation with
alkaline potassium ferricyanide yields monomethyl urea and methyl
pxamic acid, whilst if oxidized by alkaline potassium permanganate
it yields dimethyl oxamide.
Hence caffolin contains the grouping
(II.), and in consequence of its close relationship to hydrocaffuric
acid is to be written as (III.). It follows that the caffeine molecule
must be written as (IV.), a result confirmed by the later synthesis
of caffeine itself from dimethyl alloxan (see above).

N:C-NHCH,
Caflolin.

Uric acid, CiHiNiO,, or
2-6-8-trioxypurin, was discovered in
1776 in urinary calculi by Scheele. It is found in the juice of the
muscles, in blood, in urine, in the excrement of serpents and birds,
and in guano. The determination of the constitution and of the
relation of uric acid to the other members of the group has been a
G. Brugnatelli ((Zornaie di fisica,
process of gradual growth.
chemica, &c., di Brugnatelli, 1818, u, pp. 38, 117) obtained alloxan,
and W. Prout (Phtt. Trans., 1818, p. 420) obtained ammonium
purpurate from uric acid, but the first elaborate investigation on
the acid was by J. v. Liebig and F. Wohler (Ann., 1838, 26, p. 241),
who obtained from it allantoin, alloxantin, dialuric acid, parabanic

to amalic acid or tetramethyl alloxan tin (Fr. Rochleder, Ann.
1849, 71, p. i), and that hydrolysis with baryta gave caffeidine
(A. Strecker, Ann., 1862, 123, p. 360), which could be further hydrolysed to sarcosine, methylamine, formic acid and carbon dioxide
Fischer confirmed
these results and showed further that oxidation with chlorine water
gave monomethyl urea and dimethyl alloxan, pointing to the presence of three methyl groups in the molecule. Further, on bromination, a brom-derivative is obtained which on treatment with
alcoholic potash yields ethoxy-caffeine, which readily hydrolyses to
hydroxy-caffeine. This substance behaves as an unsatu rated compound and combines with a molecule of bromine to form a derivative
which on treatment with alcoholic potash yields diethoxy-hydroxyit

of E. Fischer showed the first formula to be correct.
The first
synthases of uric acid are due to J. Horbaczewski (Monals., 1882,
who obtained very poor yields. These were
p. 796; 1885, p. 356),

followed by the more
satisfactory methods of R. Behrend and O.
Roosen (Ann., 1888. 251, p. 235) of E. Fischer and L. Ach (Ber.,
1895, 28. p. 2473) and of W. Traube (Ber., 1900, 33, p. 3035).
Horbaczewski obtained the acid by heating urea with ammo-acetic
acid (glycine) to 200-230 C, and by fusing urea with trichlorlactamide. In Behrend's method acetoacetic ester and urea (I.) are
condensed and the resulting /J-uramidocrotonic ester (II.) on hydrolysis gives methyl uracil (III.), which on treatment with concentrated
nitric acid yields nitro-uracil
carboxylic acid (IV.). This acid
when boiled with water loses carbon dioxide, forming nitro-uracil
which
on
(V.),
reduction gives amido-uracil (VI.) and oxy-uracil
(VII). Oxidation of oxy-uracil with bromine water leads to dioxyuracil (VIII.), which when heated with urea and concentrated
sulphuric acid yields uric acid (IX.):


Uric acid is a white, microcrystalline powder. It is odourless and tasteless, and is insoluble in most reagents. Its solubility in water is increased by the presence of various inorganic salts, such as sodium phosphate, sodium acetate, borax, and particularly by lithium carbonate. It is also insoluble in cold concentrated phosphoric acid, but is reperticipated on the addition of water. It behaves as a weak dibasic acid. It is decomposed by heat into ammonia, urea, cyanoacid and carbon dioxide. On fusion with caustic alkali, it forms a compound, which, on further heating, melts with decomposition, and can be reconverted into uric acid by the re-crystallization of the residue as the isoniitroso-derivative. This reaction, which consists in evaporating the acid to dryness with nitric acid, when a yellowish resinous residue is obtained which becomes purple on being heated with methyl alcohol, is the basis of the estimation of uric acid. See W. Tummlidere (Chem. Centralbl., 1897, 11, p. 987; E. N. Bartley, ibid., p. 644 and F. G. Hopkins, Chem. News, 1897, 156, p. 506, 697).

Methyl Uric Acid:—1-Methyl uric acid was prepared by E. Fischer and H. Clemm (Ber., 1897, 30, p. 3991) from monomethylalloxan and ammonium sulphite, which condense together to form 1-methyluric acid with potassium cyanate, 11-49-uric acid, which on dehydration gives 1-methyl uric acid. 3- or 4-Methyl uric acid was prepared by Hill (Ber., 1897, 9, p. 370) by heating lead urate with methyl iodide. It is best obtained by heating 3-methylchlorohydrazine with hydrochloric acid to 125 °C. (E. Fischer, Ber., 1898, 31, p. 3148). 4- or 7-Methyl uric acid is prepared by heating 7-methyl-2-6-8-trichloropurin (which results from phosphorus pentachloride and thebromine) with hydrochloric acid to 130 °C. or by the condensation of alloxan with methylamine in the presence of sulphur dioxide (E. Fischer, Ber., 1897, 30, p. 563; cf. 1-methyl uric acid). It is the most soluble in water of the uric acids, and by heating with methyl alcohol, it is obtained as a white crystalline, melting at 99 °C. It loses almost the whole of its melting point on heating with hydrochloric acid to 140 °C. gave the required methyl uric acid. It is distinguished from 3-methyl uric acid by its much smaller solubility in water and by the greater stability of its ammonium salt. A fifth isomer, 8-methyl uric acid, has been described by W. v. Loeben (Ann., 1897, 298, p. 181) who obtained it by condensing acetoacetic ester and monomethyl urea according to Behrend's method. The constitution of this acid is not definitely known.

1- or 7-Dimethyl uric acid is obtained by converting dimethylalloxan into dimethyluram, which with potassium cyanate gives dihydramide. This dihydramide is then hydrated (E. Fischer, Ber., 1895, 28, p. 2475; 1897, 30, p. 560). 7-Dimethyl uric acid is similarly obtained by starting with monomethyl alloxa and methylamine (E. Fischer and H. Clemm, Ber., 1897, 30, p. 3095).

1-Dimethyl uric acid is obtained from 9-methyl-8-oxo-2-6-dichloropurin (see 9-Methyl uric acid above). By successive treatment with ammonium and nitrous acid this is converted into 9-methyl-6-8-dioxo-2-chloropurin, which on condensation with formaldehyde in alkaline solution yields 9-methyl-oxy-8-methyl-6-8-dioxo-2-chloropurin. Methylation of this latter compound introduces a methyl group into position 1, and the dimethyl compound so formed on dilution with water and subsequent condensation of the resulting stearamine with methyl-6-8-dioxo-2-chloropurin, from which 1-9-dimethyl uric acid is obtained by hydrolysis with concentrated hydrochloric acid at 100 °C. (E. Fischer, and F. Ach, Ber., 1899, 32, p. 464) when heated to 180-190 °C. gives a yellow solution. The resulting urea (II), when heated to 180-190 °C. loses a molecule of alcohol, giving uric acid (III). (I), (II), (III)

E. Fischer dehydrated pseudo-uric acid (formed from potassium cyanate and unnil) by heating it with anhydrous oxalic acid to 180-190 °C. with a yield of 28% of hydrochloric acid (Ber., 1895, 30, p. 560), and so obtained uric acid. This method is quite general. W. Traube condenses the sulphate of 4-5-diamino-2-6-dioxypyrimidine (I) (see Xanthine, above) with chlorobaric ester. The resulting urea (II), when heated to 180-190 °C. loses a molecule of alcohol, giving uric acid (III).

Hydroxycinnamic acid is a white, microcrystalline powder. It is odourless and tasteless, and is insoluble in most reagents. Its solubility in water is increased by the presence of various inorganic salts, such as sodium phosphate, sodium acetate, borax, and particularly by lithium carbonate. It is also insoluble in cold concentrated phosphoric acid, but is reperticipated on the addition of water. It behaves as a weak dibasic acid. It is decomposed by heat into ammonia, urea, cyanoacid and carbon dioxide. On fusion with caustic alkali, it forms a compound, which, on further heating, melts with decomposition, and can be reconverted into hydroxycinnamic acid by the re-crystallization of the residue as the isoniitroso-derivative. This reaction, which consists in evaporating the acid to dryness with nitric acid, when a yellowish resinous residue is obtained which becomes purple on being heated with methyl alcohol, is the basis of the estimation of hydroxycinnamic acid. See W. Tummlidere (Chem. Centralbl., 1897, 11, p. 987; E. N. Bartley, ibid., p. 644 and F. G. Hopkins, Chem. News, 1897, 156, p. 506, 697).

Methyl Hydroxycinnamic Acid:—1-Methyl hydroxycinnamic acid was prepared by E. Fischer and H. Clemm (Ber., 1897, 30, p. 3991) from monomethylalloxan and ammonium sulphite, which condense together to form 1-methylhydroxycinnamic acid with potassium cyanate, 11-49-uric acid, which on dehydration gives 1-methyl uric acid. 3- or 4-Methyl hydroxycinnamic acid was prepared by Hill (Ber., 1897, 9, p. 370) by heating lead urate with methyl iodide. It is best obtained by heating 3-methylchlorohydrazine with hydrochloric acid to 125 °C. (E. Fischer, Ber., 1898, 31, p. 3148). 4- or 7-Methyl hydroxycinnamic acid is prepared by heating 7-methyl-2-6-8-trichloropurin (which results from phosphorus pentachloride and thebromine) with hydrochloric acid to 130 °C. or by the condensation of alloxan with methylamine in the presence of sulphur dioxide (E. Fischer, Ber., 1897, 30, p. 563; cf. 1-methyl uric acid). It is the most soluble in water of the uric acids, and by heating with methyl alcohol, it is obtained as a white crystalline, melting at 99 °C. It loses almost the whole of its melting point on heating with hydrochloric acid to 140 °C. gave the required methyl uric acid. It is distinguished from 3-methyl uric acid by its much smaller solubility in water and by the greater stability of its ammonium salt. A fifth isomer, 8-methyl uric acid, has been described by W. v. Loeben (Ann., 1897, 298, p. 181) who obtained it by condensing acetoacetic ester and monomethyl urea according to Behrend's method. The constitution of this acid is not definitely known.

HNC-CH\_2\_OH \rightarrow HNC\_CH\_2\_CO\_OH \rightarrow HNC\_CH\_2\_CO\_NH\_2 \rightarrow HNC\_CH\_2\_CO\_NH\_3\_CONH\_2 (I), (II), (III)
7-Methyl guanine is obtained from 7-methyl-6-oxo-2-chloropurine (so named on account of ammonia) at 150° C. It also results instead of the expected 7-methyl-2-oxo-6-amino-purine, when 7-methyl-6-amino-2-chloropurine is treated with dilute alkalies (E. Fischer, Ber., 1898, 31, p. 542), owing to ring splitting in the 1-0 position followed by elimination of Hallecy acid.

Thiopyrimidines.—W. Traube (Ann., 1904, 331, pp. 66 seq.) has obtained many compounds of the purin group by using thiouria, which is condensed with cyanacetic ether, &c., to form thiopyrimidines. These in turn yield thiopurines, which on oxidation with dilute nitric acid are converted into purin compounds, thus:—

\[
\begin{align*}
\text{H}_3\text{N} \text{CO}_2\text{R} & \rightarrow \text{HN-CO} \text{HN} \rightarrow \text{HN-CO} \\
\text{SC} + \text{CH}_4 & \rightarrow \text{SC} \text{CH}_3 \\
\text{SC-C-NH}_2 & \rightarrow \text{SC-C-NH} \\
\text{H}_3\text{CN} & \rightarrow \text{HN-C-NH} \rightarrow \text{HN-CN}.
\end{align*}
\]

Various thiopurines have been obtained by E. Fischer (Ber., 1898, 31, p. 431), principally by acting with potassium sulphide on chlorinated purin compounds.

2-0-8 Trithiopurin is obtained from the corresponding trichloropurin and potassium sulphhydrate. It forms a light yellow mass which carbonizes on heating. It is almost insoluble in water and alcohol; but readily dissolves in dilute solutions of the caustic alkalies and of ammonia.

Much work has been done by J. Tafel (Ber., 1900, seq.) on the electrolysis of the solutions of the members of the purin group. The substance to be reduced is dissolved in a 50-75% solution of sulphuric acid and placed in a porous cell containing a lead cathode, the whole being then placed in a 20-60% solution of sulphuric acid. When hydrogen is evolved at the lead and its volume is measured, it take up four atoms of hydrogen per molecule and give rise to the so-called desoxy-compounds, which are stronger bases than the original substances. Uric acid takes up six hydrogen atoms per molecule and gives purone, C_4H_3N_2O, and it is apparently the oxygen atom attached to the carbon atom number 6 which is replaced by hydrogen, since when purone is heated with baryta, two molecules of carbon dioxide are liberated for one of purone. Consequently purine must contain two uracil residues, which necessitates the presence of the CHO groups in positions 2 and 8. (F. G. P.)*

PURITANISM (Lat. puritas, purity), the name given—originally perhaps in a hostile sense on the analogy of Catharism (see Cathars)—to the movement for greater strictness of life and simplicity in worship which grew up in the Church of England in the 16th century among those who thought that there had not been a sufficient divergence from the Roman Church, and which ultimately led to the rise of a number of separatist denominations. Though F. S. Fuller (Church History) traces the earliest use of the term "Puritan" to 1554, the terms "Precision," "Puritan," "Presbyterian," were all used by Archbishop Parker in his letters about this time as nicknames for the same party, and ten years later the name was in common use.

See England, Church of: Congregationalism; Presbyterianism, &c.; also D. Neal, History of the Puritans (ed. Toulmin, 5 vols., 1844); J. S. Gough, Puritanism in England (1891); J. Heron, A Short History of Puritanism (1908).

PURLEU, a word used of the outlying parts of a place or district, sometimes in a derogatory sense. It was a term of the old English forest law (q.v.), and meant, as defined by Manwad (Treatise of the Forest Laws), "a certain territory of ground adjoining unto the forest... which...was once forest-land and afterwards disafforested by the perambulations made for the severing of the new forests from the old." The owner of free-lands in the purleu to the yearly value of forty shillings was known as a "purleyman" or "purley-man." There seems no doubt that "purley" or "purley" represents the Anglo-French purail, puraler (O. Fr. puraleur, puraler, to go through. Lat. perambulare), a legal term meaning properly a perambulation to determine the boundaries of a manor, parish, &c.

PURLIN, a term in architecture for the longitudinal timbers of a roof, which are carried by the principal rafters and the end walls and support the common rafters.

PURNEA or PURNAH, a town and district of British India, in the Bhagulpur division of Bengal. The town is on the left bank of the little river Saura, with a railway station. Pop. (1901), 14,007. It has a bad reputation for fever.

The District of Purnea has an area of 4934 sq. m. and a population of 1,874,794, showing a decrease of 3.6% in the decade. The district extends from the Ganges northwards to the frontier of Nepal. It is a level, depressed tract of country, consisting for the most part of a rich, loamy soil of alluvial formation. It is traversed by several rivers flowing from the Himalayas, which afford great advantages of irrigation and water-carriage; in the west the soil is thickly covered with sand deposited by changes in the course of the Kusi. Among other rivers are the Mahananda and the Panar. Under Mahomedan rule Purnea was an outlying province, yielding little revenue and often in a state of anarchy. Its local governor raised a rebellion against Suraj-ud-daula in 1757, after the capture of Calcutta. The principal crops are rice, pulses and oilseeds. The cultivation of indigo is declining, but that of jute is extending. The district is traversed by branches of the Eastern Bengal railway, which join the Bengal and North-Western railway at Matlab.

PURPLE, a colour-name, now given to a shade varying between crimson and violet. Formerly it was used, as the origin of the name shows, of the deep crimson colour called in Latin purpurea, purpureus, and in Greek πορφυρα, πορφυρος (from πορφυρος, to grow dark, especially used of the sea). This was probably the name of the shellfish (Purpura, Murex) which yielded the famous Tyrian dye, the particular mark of the dress of emperors, kings, chief magistrates and other dignitaries, whence "the purple" still signifies the rank of emperors or kings.

The title of porphyrogenitus (Gr. πορφυρογενης) was bestowed particularly by Constantine VII, Byzantine emperor, but was also generally used of those born of the Byzantine imperial family. This title, generally translated "born in the purple," either refers to the purple robes in which the imperial children were wrapped at birth, or to a chamber or part of the imperial palace, called the Porphyra (πορφυρα), where the births took place. Whether this Porphyra signified a chamber with purple hangings or lined with porphyry is not known (see Selden, Titles of Honour, ed. 1672, p. 60 seq.).

PURPLE in pathiology, a general term for the symptom of purple-coloured or purpuric surfaces. It is derived to extravasations of blood in the skin, accompanied occasionally with haemorrhages from mucous membranes. The varieties of purpura may be conveniently divided as follows: (a) toxic, following the administration of certain drugs, notably copaiba, quinine, ergot, belladonna and the iodides; also following Snake-bit; (b) cachectic, seen in persons suffering from such diseases as tuberculosis, heart disease, cancer, Bright's disease, jaundice, as well as from certain of the infectious fevers, extravasations of the kind above mentioned being not infrequently present; (c) neurotic; (d) arthritic, which includes the form known as "Purpura simplex," in which there may or may not be articular involvement. The disease is usually ushered in by a little feverishness, followed by the appearance on the surface of the body of the characteristic spots in the form of small red points scattered over the skin of the limbs and trunk. The spots are not raised above the surface, and they do not disappear on pressure. Their colour soon becomes deep purple or nearly black; but after a few days they undergo the changes which are observed in the case of an ordinary bruise, passing to a green and yellow hue and finally disappearing. When of minute size they are termed "petechiae" or "stigmata," when somewhat larger "vibices," and when in patches of considerable size "purpurases." They may come out in fresh crops over a lengthened period.

Purpura rheumatica (Schlódelin's disease) is a remarkable variety characterized by sore throat, fever and articular pains accompanied by purpuric spots and associated with urticaea and occasionally with multiple nodular infiltrations. This is then may well be considered to be a separate disease, but it is usually regarded as rheumatic origin.

Purpura haemorrhagica (acute haemorrhagic purpura) is a more serious one, in which the advantages already mentioned as affecting the skin, there is a tendency to the occurrence of haemorrhage from mucous surfaces, especially from the nose, but also from the mouth, lungs, stomach, bowels, kidneys, &c., sometimes in large and profuse amount. Great physical prostration is apt to attend this form of the disease, and a fatal result sometimes follows the successive haemorrhages, or is suddenly precipitated by the occurrence of an extravasation of blood into the brain.
The treatment will bear reference to any causes which may be discovered as associated with the onset of the disease, such as unfavourable hygienic conditions, and nutritive defects should be rectified by suitable diet. The various preparations of iron seem to be the best medicinal remedies in this ailment, which may include the use of tinctures, such as gallic acid, epson, turpentine or acetate of lead, will in addition be needed for in severe cases and especially when haemorrhage occurs. Sir A. Wright considers that in all cases of purpura the coagulation-time of the blood should be estimated. In such cases the time taken for clotting may be increased to three times as long as that taken by normal blood. He therefore advises calcium chloride in order to increase coagulability. In severe haemorrhages, adrenaline is often useful.

**PURRAH, Purroh, or Porto, aSecret society of Sierra Leone, West Africa. Only males are admitted to its ranks, but two other affiliated and secret associations exist, the Yass and the Bundu, the first of which is nominally reserved for females, but members of the Purrah are admitted to certain ceremonies. All the female members of the Yass must be also members of the Bundu, which is strictly reserved to women. Of the three, the Purrah is by far the most important. The entire native population is governed by its code of laws. It primarily represents a type of freemasonry, a "friendly" society to which even infants are temporarily admitted, the ceremony in their case consisting merely of carrying them into the Purrah "bush" and out again. But this side of the Purrah is merged in its larger objects as represented by its two great aspects, the religious and the civil. Under the former, boys join it at puberty and are under the latter the Purrah is practically the native governing body, making laws, deciding on war and peace, &c.

The Purrah has its special ritual and language, tattooing and symbols, but details are unknown, as the oath of secrecy is always kept. It meets usually in the dry season, between the months of October and May. The rendezvous is in "the bush," an enclosure, separated into apartments by mats and roofed only by the overhanging trees, serving as a club-house. There are three grades, the first for chiefs and "big men," the second for fetish-priests and the third for the commoners. The ceremony at the Purrah is preceded over by the Purrah "devil," a man in fetish dress, who addresses the meeting through a long tube of wood.

The Purrah can place its taboo on anything or anybody; and as no native would venture to defy its order, much trouble has been caused where the taboo has been laid upon crops. In 1897 the British or local government was compelled to pass a special ordinance absolutely forbidding the imposition of the taboo. Inland, but on the coast the production of yams and the sale of their products, the Yass appears to some extent to be an association for providing men and women, who believe themselves ill through "fetish," with medical treatment, on payment of certain fees. The women's Bundu is in many ways a replica of the men's Purrah, though without political power.

**PURSE.** (Late Lat. bursa, adapted from Gr. βισαρα, hide, skin, possibly O. Eng. buse, bag, has influenced the change of b to p), a small bag for holding money, originally a leather pouch tied at the mouth, but now of various shapes. The great seal of England is borne by the purse-bearer in a purse, usually styled "burse," decorated with the arms of the kingdom, the "burse" being thus one of the insignia of office of the lord chancellor of England. The "pryve purse" is the amount of public money set apart in the civil list for the private and personal use of the sovereign (see Purvy Purse).

**PURSER.,** the old name for the paymaster of the British and American navies still used in merchant vessels of to-day. In the British navy he was appointed by a warrant from the admiralty and was paid partly by salary and partly by a percentage (10%) on the value of unexpended stores.

**PURSLANE,** the common name for a small fleshy annual with prostrate stems, entire leaves and small yellow flowers, known botanically as Portulaca oleracea. It is a native of India, which was introduced into Europe as a salad plant, and in some countries has spread so as to become a noxious weed. In certain parts of the United States the evil qualities of "pussly" have become proverbial. Its juice is refreshing and is used in tropical countries as a refrigerant in fever. Some of the species of the same genus, such as *P. grandiflora* and its varieties, are grown in gardens on rock-work owing to the great beauty and deep colouring of their flowers, the short duration of individual blossoms being compensated for by the abundance with which they are produced.

**PURSUANT** (O. Fr. porsisiant, pourssiant, adv. porsissant, strictly an attendant, from porsuir, to follow), the name of a member of the third and lowest rank of heraldic officers, formerly an attendant on the heralds. There are four pursuivants in the English Herald's College, Rouge Croix, Bluemantle, Rouge Dragon and Portcullis; three in the Court of Lyon King of Arms (Scotland), Carrick, Unicorn and March; and four in the Court of Ulster King of Arms (Ireland). Athlone and three St Patrick pursuivants. (See Herald and Heraldry.)

**PURULA,** a town of British India, headquarters of Manbhum district in Bengal, on the Sini-Asansol branch of the Bengal-Nagpur railway. Pop. (1901), 17,291. It is a growing centre of trade.

**PURVEYANCE (Lat. provendere, to provide), in England in former times the right of the sovereign when travelling through the country to receive food and drink and maintenance generally from his subjects for himself and his retinue. The custom dates from Anglo-Saxon times and is analogous to the right of *fodrum, or annona militaris,* exercised by the Frankish kings. Although in early times purveyance was reasonable and necessary, enabling the king to make journeys for the purpose of administering justice and discharging the other duties of government, it was liable to grave abuses, and under the later Plantagenet kings it became very oppressive. Provision for the royal needs was interpreted in the widest possible sense, and the right was exercised, not only on behalf of the king, but on behalf of his relatives. Besides victuals it included the compulsory use of horses and carts and even the enforcement of personal labour. Not infrequently no payment was made; when it was it often took the form of tallies, which gave the recipient the right to deduct the amount from any taxes he might have to pay in the future. Purveyors were appointed to requisition goods, and they also fixed the price. The abuses of purveyance, which appear to have reached their climax during the reign of Edward I., frequently provoked legislation. Chapter xxviii. of Magna Carta is directed against them, while further attempts to curb them were made in the Statute of Westminster of 1275 and in the *Articuli super cartas* of 1300. Purveyance was entirely forbidden by the ordinance of 1311, but in spite of all prohibitions its evils grew and flourished. During the reign of Edward III., ten statutes were directed against it, and by a law of 1362 it was restricted to the personal wants of the king and queen; at the same time the hated name of purveyor was changed to that of buyer, and ready money was ordered to be paid for the articles taken. From this time little was heard about the evils of purveyance until 1604, when the House of Commons petitioned James I., giving some striking illustrations of its hardships. It was asserted that when the royal officials required 200 carts they ordered 800 or 900 to be brought, in order that they might obtain bribes from the owners. Bacon called purveyance "the most common and general abuse of all others in the kingdom." Twice James entered into negotiations with his parliament for commuting his crown rights, of which purveyance was one, for an annual payment, but no arrangement was reached. In 1660, however, the right called "purveyance," which had fallen into disuse with the execution of Charles I., was surrendered by Charles II., in return for the grant of an excise on beer and liquors. The custom was exercised by almost all European sovereigns, and in France at least was as oppressive as in England. The word purveyor now means merely a vendor, generally a vendor of food and drink.

PUSEY—PUSEY

PUSEY, a village of British India, in Darbhanga district, Bengal, near the right bank of the Burhi Gandak River; pop. (1901), 4570. It was acquired as a government estate in 1796, and was long used as a station dépôt and afterwards as a tobacco farm. In 1904 it was selected as the site of a college and laboratory for agricultural research.

PUSEY, EDWARD BOUVIER (1800–1882), English divine, was born at Pusey near Oxford on the 22nd of August 1800. His father was Philip Bouvier (d. 1828), a younger son of Jacob Bouvier, 1st Viscount Folkestone, and took the name of Pusey on succeeding to the manorial estates at that place. After having been at Eton, he became a commens of Christ Church, Oxford, and was elected in 1824 to a fellowship at Oriel. He thus became a member of a society which held in common the name of its contemporaries—among them J. H. Newman and John Keble. Between 1825 and 1827 he studied Oriental languages and German theology at Göttingen. His first work, published in 1828, as an answer to Hugh James Rose's Cambridge lectures on rationalist tendencies in German theology, showed a good deal of sympathy with the German " Pietists," who had striven to deliver Protestantism from its decadence; this sympathy was misunderstood, and Pusey was himself accused of holding rationalist views.

In the same year (1828) the duke of Wellington appointed him chairman of the committee for the translation of the canonical books of the Hebrew Bible with the attached canonry of Christ Church. The misunderstanding of his position led to the publication in 1830 of a second part of Pusey's Historical Enquiry, in which he denied the charge of rationalism. But in the years which immediately followed the current of his thoughts began to set in another direction. The revolt against individualism had begun, and he was attracted to its standard.

By the end of 1833 he showed a disposition to make common cause with those who had already begun to issue the Tracts for the Times. " He was, not, however, fully associated in the movement till 1835 and 1836, when he published his tract on baptism and started the Library of the Fathers" (Newman's Apologia, p. 136). He became a close student of the teaching of Pusey, his school of Anglican divines who had continued, or revived, in the 17th century the main traditions of pre-Reformation teaching.

A sermon which he preached before the university in 1834, The Holy Eucharist a Comfort to the Penitent, so startled the authorities by the re-statement of doctrines which, though well known to ecclesiastical antiquaries, had faded from the common view, that by the exercise of an authority which, however legitimate, was almost obsolete, he was suspended for two years from the function of preaching. The immediate effect of his suspension was the sale of 18,000 copies of the condemned sermon; its permanent effect was to make Pusey the chief exponent of the pre-Reformation branch of Oxford, and from 1836 onwards, to hold it as his personal right to deal with the libel on its name. Pusey is chiefly remembered as the eponymous representative of the earlier phase of a movement which carried with it no small part of the religious life of England in the latter half of the 19th century. His own chief characteristic was an almost unbounded capacity for the spiritual work of the church, with the result that he was at once a preacher and a spiritual adviser. As a preacher he lacked all the graces of oratory, but compelled attention by his searching and practical earnestness. His correspondence as a spiritual adviser was enormous; his deserved reputation for piety and for solidity of character made him the chosen confessor to whom large numbers of men and women unburdened their doubts and their sins. But if he be estimated apart from his position as the head of a great party, it must be considered that he was more a theological antiquary than a theologian. Pusey in fact was left behind by his followers even in his lifetime. His revival of the doctrine of the Real Presence, coinciding as it did with the revival of a taste for medieval art, naturally led to a revival of the pre-Reformation ceremonial of worship. With this revival of ceremonial Pusey had little sympathy; he at first protested against it (in a university sermon in 1839); and, though he came to defend those who were accused of breaking the law in their practice of it, he did so on the express ground that their practice was alien to his own. But this revival of ceremonial in its various degrees became the chief external characteristic of the new movement; and "Ritualist" and "Puseyite" asides were the designation of those who held the doctrines for which he was mainly responsible. On the other hand, the pivot of his teaching was the appeal to primitive antiquity; and in this respect he helped to start inquiry which has since gone far beyond the materials which were open to one of his generation.

See J. Rigg, Character and Life-Work of Dr Pusey (1883); B. W. Savile, Dr Pusey, an Historic Sketch, with Some Account of the Oxford Movement (1885), and especially the Life by Canon Liddon, completed by J. C. Johnston and R. J. Wilson (5 vols., 1893-1899). Newman's Apologia, and other literature of the Oxford Movement.

Pusey's elder brother, PHILIP PUSEY (1799–1855), was a member of parliament and a friend and follower of Sir Robert Peel. He was one of the founders of the Royal Agricultural Society, and was chairman of the implement department of the great exhibition of 1851.
of the Royal Society, a writer on varied topics to the reviews and the author of the hymn "Lord of our Life and God of our Salvation."

**PUSHBALL**

PUSHBALL, a game played by two sides on a field usually 140 yds. long and 50 yds. wide, with a ball 6 ft. in diameter and 50 lb. in weight, in which the sides usually number eleven each, there being five forwards, two left-wings, two right-wings and two goalkeepers. The goals consist of two upright posts 18 ft. high and 20 ft. apart with a crossbar 7 ft. from the ground. The game lasts for two periods with an intermission. Pushing the ball under the bar counts 5 points; lifting or throwing it over the bar counts 8. A touchdown behind goal for safety counts 2 to the attacking side. The game was invented by M. G. Crane, of Newton, Massachusetts, in 1804, and was taken up at Harvard University the next year, but has never attained any considerable vogue. In Great Britain the first regular game was played at the Crystal Palace in 1862. The English rules are somewhat different from those obtaining in the United States. Pushball on horseback was introduced in 1902 at Durland's Riding Academy in New York, and has been played in England at the Military Tournament.

**PUSHKAR**

a town of British India, in Ajmere district, Rajputana, 7 m. N. of Ajmere town. Pop. (1901), 3831. It derives its name from a small lake among the hills, 2380 ft. above the sea, in which Brahna is once said to have bathed as a penance. It contains one of the very few temples, in all India, dedicated to Brahna. At the annual celebration (Oct.-Nov.) about 300,000 come to bathe in the lake.

**PUSHKIN**, ALEXANDER (1799-1837), Russian poet, was born at Moscow, on the 7th of June 1799. He belonged to an ancient family of boyars; his maternal great-grandfather, a favourite negro ennobled by Peter the Great, bequeathed to him curly hair and a somewhat darker complexion than falls to the lot of the ordinary Russian. In 1811 the future poet entered the newly founded lyceum of Tsarskoe Selo, situated near St. Petersburg. On quitting the lyceum in 1817 he was attached to the ministry of foreign affairs, and in this year he began the composition of his Ruslan and Lyudmila, a poem which was completed in 1820. Meanwhile Pushkin mixed in all the gayest society of the capital, and it seemed as if he would turn out a mere man of fashion instead of a poet. But a very daring Ode to Liberty written by him had been circulated in manuscript in St. Petersburg. This production having been brought to the notice of the governor, the young author only escaped a journey to Siberia by accepting an official post at Kishinev in Bessarabia, in southern Russia. If we follow the chronological order of his poems, we can trace the enthusiasm with which he greeted the ever-changing prospects of the sea and the regions of the Danube and the Crimea.

At this time Pushkin was, or affected to be, overpowered by the Byron "Weicheroy" teams of eight. Having visited the baths of the Caucasus for the re-establishment of his health in 1822, he felt the inspiration of its magnificent scenery, and composed The Prisoner of the Caucasus, narrating the story of the love of a Circassian girl for a youthful Russian officer. This was followed by the Fountain of Bakhchisarai, which tells of the detention of a young Polish captive, a Countess Potocka, in the palace of the khans of the Crimea. About the same time he composed some interesting lines on Ovid, whose place of banishment, Tomi, was not far distant. To this period belongs also the Ode to Napoleon, which is inferior to the fine poems of Byron and Manzoni, or indeed of Lermontov, on the same subject. In the Lay concerning the Wise Oleg we see how the influence of Karamzin's History had led the Russians to take a greater interest in the early records of their country. The next long poem was the Gipsies (Tzigan), an Oriental tale of love and vengeance, in which Pushkin has admirably delineated these nomads, whose strange mode of life fascinated him. During his stay in southern Russia he allowed himself to get mixed up with the secret societies then rife throughout the country. He also became embroiled with his chief, Count Vorontsov, who sent him to report upon the damages which had been committed by locusts in the southern part of Bessarabia. Pushkin took this as a premeditated insult, and sent in his resignation; and Count Vorontsov in his official report requested the government to remove the poet, "as he was surrounded by a society of political and literary fanatics, whose praises might turn his head and make him believe that he was a great man, whereas he is only a feeble imitator of Lord Byron, an original not much to be recommended." The poet quitted Odessa in 1824, and on leaving wrote a fine Ode to the Sea. Before the close of the year he had returned to his father's seat at Mikhailovskoe, near Pskov, where he soon involved himself in trouble on all sides. In his retirement he devoted a great deal of time to the study of the old Russian popular poetry, the bulinmas, of which he became a great admirer. Recollections of Byron and André Chenier gave the inspiration to some fine lines consecrated to the latter, in which Pushkin appeared more conservative than was his wont, and another a splendid speculation or two on the French Revolution. In 1825 he published his tragedy Boris Godunov, a bold effort to imitate the style of Shakespeare. Up to this time the traditions of the Russian stage, such as it was, had been French.

In 1825 the conspiracy of the Dekabrists broke out. Many of the conspirators were personal friends of Pushkin, especially Küchelbecker and Pushchin. The poet himself was to a certain extent compromised, but he succeeded in getting to his house at Mikhailovskoe and burning all the papers which might have been prejudicial to him. Through influential friends he succeeded in making his peace with the emperor, to whom he was presented at Moscow soon after his coronation. The story goes that Nichipol said to Count Bludov on the same evening, "I have just been conversing with the most witty man in Russia." In 1828 appeared Poltava, a spirited narrative poem, in which the expedition of Charles XII. against Peter and the treachery of the hetman Mazeppa were described. In 1829 Pushkin again visited the Caucasus, on this occasion accompanying the expedition of Prince Paskievich. He wrote a pleasing account of the tour; many of the short lyrical pieces suggested by the scenery and associations of his visit are delightful, especially the lines on the Don and the Caucasus. In 1831 Pushkin married Natalia Goncharov, and in the following year was again attached to the ministry of foreign affairs, with a salary of 5000 roubles. He now busied himself with an historical account of the revolt of the Cossack Pugachev, who almost overthrew the empire of Catherine and was executed at Moscow in the latter part of the 18th century. While engaged upon this he wrote The Captain's Daughter, one of the best of his prose works. In 1832 was completed the poem Eugene Onyegin, in which the author modelled his style upon the lighter sketches of Byron in the Italian manner. Yet no one can accuse Pushkin of want of nationalism in this poem: it is Russian in every fibre.

In 1837 the poet, who had been long growing in literary reputation, fell terminally ill in a duel with Baron George Heckeren d'Anthes, the adopted son of the Dutch minister then resident at the court of St. Petersburg. D'Anthes, a vain and frivolous young man, had married a sister of the poet's wife. Notwithstanding this he aroused Pushkin's jealousy by some attentions which he paid Natalia; but the grounds for the poet's anger, it must be confessed, do not appear very great. Pushkin died, after two days' suffering, on the afternoon of Friday the roth of February. D'Anthes was tried by court-martial and expelled the country. In 1880 a statue of the poet was erected at the Tver Barrier at Moscow, and fêtes were held in his honour, on which occasion many interesting memorials of him were exhibited to his admiring countryman and a few foreigners who had congregated for the festivities. Pushkin left four children; his widow was afterwards married to an officer in the army, named Lanskoj; she died in 1863.

Pushkin's poetical tales are spirited and full of dramatic power. The influence of Byron is undoubtedly seen in them, but they are not imitations, still less is anything in them plagiarized. Boris Godunov is a fine tragedy; on the whole Eugene Onyegin must be considered Pushkin's masterpiece. Here we have a great variety of styles—satire, pathos and humour mixed
together. The character-painting is good, and the descriptions of scenery introduced faithful to nature. The poem in many places reminds us of Byron, who himself in his mixture of the pathetic and the humorous was a disciple of the Italian school. Pushkin also wrote a great many lyrical pieces. Interspersed among the poet's minor works will be found many epigrams, but some of the best composed by him were not so fortunate as to pass the censorship, and must be read in a supplementary volume published at Berlin. As a prose writer Pushkin has considerable merits. Besides his History of the Revolt of Pugach, which is perhaps too much of a compilation, he published a small volume of tales under the nom de plume of Ivan Byelkin. These all show considerable dramatic power: the best are The Captain's Daughter, a tale of the times of Catherine II.; The Undertaker, a very ghostly story, which will remind the English reader of some of the tales of Edgar Poe; The Pistol Shot; and The Queen of Spades.

The academy of St Petersburg has recently issued a complete edition of the works of Pushkin, including his letters. See the bibliography in the editions of Gennadi (7 vols., St Petersburg, 1861) and Annenkov (6 vols., St Petersburg, 1855).

PUSHTU—PUTEOLI

PUSHTU, the language of the Pathan races of Afghanistan and the North-West Frontier province of India. It belongs to the Iranian group of the Indo-European languages, but possesses many Pathi words. In Afghanistan, Pushtu is the dominant language, but is not spoken west of the Helmund. In India it has two main dialects, the northern, hard or Pukhtu, and the southern, soft or Pushtu. The dividing line of the two dialects runs eastwards from Thal through the Kohat district almost to the Indus, but it then turns northwards, as the speech of the Akhora Khattaks belongs to the Pushtu or southern dialect. Thus Pukhtu is spoken in Bajour, Swat and Buner, and by the Yusufzaiks, Bangash, Orakzaiks, Afridis and Mohmands; while Pushtu is spoken by the Waziris, Khattaks, Marwats and various minor tribes in the south. The language division corresponds roughly to the dual system of the Pathans, who are aristocratic in the north and democratic in the south. The classical dialect of Pushtu is that of the Yusufzaiks, in which the earliest works in the language were composed. The Orakzai dialect differs from that of the Afridis, in that it is broader but less guttural and spoken more rapidly. The standard dialect is that of Peshawar. The literature is rich in poetry, Abdur Rahman, of the 17th century, being the best-known poet. Pushtu was spoken in the North-West Frontier province in 1901 by 1,142,011 persons, or 54% of the population.

See Grierson, Linguistic Survey of India; Roos-Keppel, Manual of Pushka (1907); Lewis, Pakistan, 1935; Sir John Marshall, 1934.

PUTEOLI, a north-western suburb of Paris, on the left bank of the Seine, 4½ m. from the centre of the city. Pop. (1906), 28,718. Puteaux has a church of the 17th century with good stained glass windows. There is a fort on the Seine.

PUTEOLI (mod. Pozzuoli, q.v.), an ancient town of Campania, Italy, on the northern shore of the Bay of Puteoli, a portion of the Bay of Naples, from which it is 6 m. W. The statement made by Stephanus of Byzantium and Jerome, that the city was founded under the name of Dicaearchia by a colony of Samians about 520 B.C., is probably correct, for, though in the territory of Cumae, it does not appear to have been occupied previous to 520, Missenum having been the original port of Cumae. On the other hand, Cumae probably extended her supremacy over it not long after. Its history in the Samnite period is unknown; but the coins of Fistulia (or Fistulus in Osca) probably belong to Puteoli, as Mommsen thought. Nor do we know anything of its history between 334 (when it probably became a civitas sine suffragio under Roman domination, shortly afterwards receiving, in 318, a praefectus urae dicundo) and 215, when the Romans introduced a garrison of 6000 men to protect the town from Hannibal, who besieged it in vain for three days in 214. In 194 a Roman colony of 300 men was established. The lex partio factundo, an interesting inscription of 105 B.C. relating to some building works in front of the temple of Serapis, shows that Puteoli had considerable administrative independence, including the right to date such a public document by the names of its own magistrates. Sulla retired to Puteoli after his resignation of the dictatorship in 79, and ten days before his death reconciled the disputes of the citizens by giving them a constitution. Cicero had a house in Puteoli itself, and a villa on the edge of the Lucrine lake (which, though nearer to Puteoli, was in the territory of Cumae), and many prominent men of the republic possessed country houses in the neighbourhood of Puteoli (see Baiae; Avernius Lacus; Lucrinus Lacus; Misenum). In the Civil War it sided with Pompey, and later on with Brutus and Cassius. Nero admitted the old inhabitants to the privileges of Roman citizenship, thus uniting in one of the two previously distinct communities. In 61 St Paul landed here, and spent seven days before leaving for Rome (Acts xxviii. 13). Vespasian, as a reward for its having taken his part, gave the town part of the territory of Capua, and installed more colonists there—where it took the title Colonia Flavia, which it retained till the end of the empire.

The remains of Hadrian, who died at the neighbouring town of Baiae, were buried at Puteoli, and Antoninus Pius, besides erecting a temple to his memory on the site of Cicero's villa, instituted sacred games to be held in the city every five years. Commodus held the title of emperor in the Antonine period, and a colony was probably set up, the site of which was afterwards occupied by the town of Puteoli. The town had a certain amount of importance, though it was not on the main Roman road to the east. It has been suggested by Rob. de Sausmarez that it was on the line of the Via Egnatia. It became a Roman colony in 28,718. As a port it had many advantages, but it was not so well situated as Ostia.

PUTNAM, I. (1718–1790). American soldier, was born in Salem Village (now Danvers), Massachusetts, on the 7th of January 1718. His first American ancestor (of the same family as George Puttpehan) came from Aston Abbots, Bucks, and was one of the first settlers of Salem Village. In 1740 he removed to a farm in the present townships of Pomfret and Brooklyn, Connecticut. Here in the winter of 1742–1743 he went down into a wolf den (still shown in Pomfret) and at close quarters killed a huge wolf. Putnam took an active part in the French and Indian War, enlisting as a private in 1755 and rising to the rank of major in March 1758. He was conspicuous for personal courage and for skill in Indian warfare, and was the hero of the famous exploit of 1758, during Putnam's conspiracy, he commanded the Connecticut troops (five companies) in the expedition under Colonel John Bradstreet for the relief of Detroit. He was a prominent member of the Sons of Liberty and a leader in the opposition to the Stamp Act; was elected to the general assembly of Connecticut in 1766 and 1767; and increased his political influence by opening a tavern, "The General Wolfe," in Brooklyn, Conn. In August 1774, as chairman of the committee of correspondence for Brooklyn parish, he went with the committee's message and contributions to the Boston Patriots; and in October became lieutenant-colonel of the 11th regiment of Connecticut militia. News of the fighting at
Lexington and Concord reached him while he was ploughing on his farm; he instantly left the plough in the furrow and hastened to Cambridge; and he was later made second brigadier of the Connecticut forces. He was with the force, commanded by Colonel William Prescott, which on the night of the 16th of June fortified Breed's Hill, and on the next day he took a conspicuous part in resisting the British attack 1 (see BUNKER HILL). Soon afterward, on his own authority, he occupied Prospect Hill, an important point for the siege of Boston, in which he commanded the centre (two brigades) of the American army at Cambridge. After the evacuation of Boston he was in command of New York City till Washington's arrival (April 15, 1776), and then was put in general charge of the city's fortifications. Immediately before the battle of Long Island he succeeded General John Sullivan in command of the troops on Brooklyn Heights, and in the battle of Long Island (of Aug. 27) he was in immediate command of the American side. In the retreat from New York City he commanded one of the three grand divisions, and took part in the battle of Harlem Heights (September 16). His attempt to close the Hudson by sinking vessels in the channel was unsuccessful. In December he was ordered to Philadelphia to superintend the fortification of the city, was stationed at Princeton, New Jersey, from January 20 to May 1, and in May took command of the men on Highlands at Peekskill, which with forts Montgomery and Clinton he abandoned in October, being out-manoeuvred by the British, and having been weakened by Washington's repeated demands for reinforcements. In the spring of 1778 he was superseded by General Alexander McDougall, but in April a court of inquiry acquitted him of "any fault, misconduct or negligence" in connexion with the loss of forts Montgomery and Clinton. After a few months' recruiting service in Connecticut he returned to the main army at White Plains. In the winter of 1778-1779 he commanded the troops quartered near Reiding, Conn., where Putnam Memorial Park now is. He then took command of the right wing on the west side of the Hudson. An attack of paralysis in December 1779 terminated his active service in the war. He spent his last years on his farm in Brooklyn, Conn., where he died on the 29th of May 1790. A bronze equestrian statue by Karl Gerhardt, over a sarcophagus, was erected at Brooklyn, Conn., by the state in 1888, and there is another statue (1874) in Bushnell Park, Hartford, by J. Q. A. Ward.

Putnam was a brave, intrepid and very industrious soldier rather than a great general, but his fame in the Indian wars, his personal courage, his bluff heartiness and his good-fellowship made him a favorite of the people, perhaps as much as any of the great heroes in American history. He seems to have taken no part in the political manœuvrings and cabals which busied many of the officers of the American army.

See W. F. Livingston, Israel Putnam, Pioneer, Ranger and Major-General (New York, 1801) in the "American Men of Energy" series; J. N. Tarbox, Life of Israel Putnam (Boston, 1876); and Essay on the Life of the Honorable Major-General Israel Putnam (Hartford, 1785; enlarged ed., Boston, 1818), by David Humphreys, for a time Putnam's aide-de-camp.

PUTNAM, RUFUS (1735-1824), American soldier and pioneer, was born in Sutton, Massachusetts, on the 9th of April 1735 (O.S.). His grandfather was a half brother to Israel Putnam's father. He served in the French and Indian War in 1757-58; was a millwright in New Braintree in 1768, during which time he studied surveying; and from 1769 until the War of Independence was a farmer and surveyor. In 1773, with Israel 1 So loose was the army's organization that it is impossible to settle the question whether Putnam or Prescott was in command at Bunker Hill. Apparently their authority did not clash and was practically independent. See Justin Winsor in his Narrative and Critical History, vi. 190-191 (reprinted in Livingston's Israel Putnam, as app. ii).

2 On the 26th of February 1779, with a small outpost, he was surprised near Greenwich by a superior force under General William Tryon, who was detailed to accompany Putnam to Jamaica for reinforcements and, being closely pursued by several dragoons, is said to have ridden down a steep hill (marked in 1900 with a granite monument), and thus escaped. From Stamford he hastened back with reinforcements and took thirty-eight prisoners from Tryon.

Putnam and two others, he visited West Florida to examine lands which, it was expected, were to be granted to the provincial troops for their services against the French and Indians, and which he charted (see Mississippi). He became lieutenant-colonel in one of the first regiments raised after the battle of Lexington, and served before Boston; in March 1776 he was made chief engineer of the works at New York; in August he was appointed engineer with the rank of colonel; and when Congress did not act on his plan (submitted in Oct. 1776) for the establishment of a distinct engineer corps he resigned (Dec. 1776), and in 1777 served in the northern army under Major-General Montgomery, commanding two regiments in the second battle of Saratoga. In 1778 he laid out fortifications, including Fort Putnam, at West Point, and in 1779 he served under Major-General Anthony Wayne after the capture of Stony Point. For the remainder of the war he saw little active service. In January 1783 he was commissioned brigadier-general. After the war he returned to Rutland, Mass., where he had bought a confiscated farm in 1780. In March 1786 he founded, with other officers of the War of Independence, the Ohio Company of Associates for the purchase and settlement of Western lands. In November 1787, after Congress had made its grant to the company, he was appointed by the company superintendent of its proposed settlement on the Ohio, and in 1788 he led the small party which founded Marietta, Ohio. He was a judge of the court of the North-West Territory in 1790-1796; was a brigadier-general in the army and a commissioner to treat with the Indians in 1792-1793; was surveyor-general of the United States in 1796-1803; and in 1802 was a member of the Ohio state constitutional convention. He died, in Marietta, on the 4th of May 1824. He has been called "The Father of Ohio," and he contributed greatly toward the material building up of the North-West Territory.

See John W. Campbell, Biographical Sketches (Columbus, Ohio, 1835); Sidney Crawford, "Rufus Putnam, and his Pioneer Life in the North-West," vol. iii., new series, pp. 431-454, Proceedings of the American Antiquarian Society (Worcester, 1890), and Rowena Buell (ed.), The Memoirs of Rufus Putnam (Boston, 1902), in which his autobiography, his journal and other papers, now in the library of Marietta College, are reprinted. His Journal, 1757-1760, dealing with his experiences in the French and Indian War, was edited with notes by E. C. Dawes (Albany, New York, 1886).

PUTNAM, a city and the county-seat of Windham county, Connecticut, U.S.A., in the township of Putnam, on the Quinebaug river, at the mouth of the Mill river, in the N.E. part of the state, about 6 m. from the Rhode Island boundary and about 20 m. from Hartford. It is the site of the old town of Moxson two years. Pop. (1930), of the township (including the city), 7348; of the city, 6657 (2012 being foreign born); (1910) 6637. Putnam is at the intersection of two branches of the New York, New Haven & Hartford railway, and is connected by electric line with Worcester, Norwich and Providence. The city is the seat of two Roman Catholic institutions, St Mary's Convent and Notre Dame Academy, and has a public library and an endowed hospital. The Quinebaug and Mill rivers provide excellent water-power. The township (named in honour of General Israel Putnam) was incorporated in 1855, and the city was chartered in 1895.

PUTTEE, or PUTTEE, the loincloth and the skirt from the Hindi pudum (Skr. patta, a strip of cloth), for a covering for the lower part of the leg from the ankle to the knee, consisting of a long narrow piece of cloth wound tightly and spirally round the leg, and serving both as a support and protection, worn especially by riders, and taking the place of the leather or cloth gaiter. It has been adopted as part of the uniform of the mounted soldier in the British army.

PUTNENHAM, GEORGE (d. 1590), the reputed author of The Arte of English Poesie (1580). The book was entered at Stationers' Hall in 1588, and published in the following year with a dedicatory letter to Lord Burghley written by the printer Richard Field, who professed ignorance of the writer's name and profession. There is no contemporary evidence for the authorship, and the name of Puttenham is first definitely associated with it in the Hypercritica of Edmund Bolton, published in 1722, but
PUTTING THE SHOT—PUTTKAMMER

written in the beginning of the 17th century, perhaps as early as 1605. The writer of the Arie of English Poesie supplies certain biographical details. He was educated at Oxford, and at the age of eighteen he addressed an eclogue entitled Elpine to Edward VI. In his youth he had visited Spain, France and Italy, and was better acquainted with foreign courts than with his own. In 1579 he presented to Queen Elizabeth his Potheniades (printed in a collection of M.S. Ballads by F. J. Furnivall), and he wrote the treatise in question especially for the delectation of the queen and her ladies. He mentions nine other works of his, none of which are extant. There is no direct evidence beyond Bolton's ascription to identify the author with George or Richard Puttenham, the sons of Robert Puttenham and his wife Margaret, the sister of Sir Thomas Elyot, who dedicated his treatise on Education or Bringing up of Children to her for the benefit of her sons. Both made unhappy marriages, were constantly engaged in litigation, and were frequently in disgrace. Richard was in prison when the book was licensed to be printed, and when he made his will in 1597 he was in the Queen's Bench Prison. He was buried, according to John Payne Collier, at St Clement Danes, London, on the 2nd of July 1601. George Puttenham is said to have been implicated in a plot against Lord Burghley in 1579, and in December 1578 was imprisoned. In 1585 he received repARATION from the privy council for alleged wrongs suffered at the hands of his relations. His will is dated the 1st of September 1590. Richard Puttenham is known to have spent much of his time abroad, whereas there is no evidence that George ever left England. This agrees better with the writer's account of himself; but if the statement that he addressed Elpine to Edward VI. when he was eighteen years of age be taken to imply that the production of this work fell within that king's reign, the date of the author's birth cannot be placed anterior to 1520. At the date (1546) of his inheritance of his grandfather, Sir Thomas Elyot's estates, Richard Puttenham was proved in an inquisition held at Newmarket to have been twenty-six years old.

As the author may have been, there is no doubt about the importance of the work, which is the most systematic and comprehensive treatise of the time on its subject. It is "contrived into three books: the first of poesies and poesies, the second of proportion, the third of ornament." The first section contains a general history of the art of poetry, and a discussion of the various forms of poetry; the second treats of prosody, dealing in turn with the measures in use in English verse, the caesura, punctuation, rhyme, accent, cadence, "proportion in figure," which the author illustrates by geometrical diagrams, and the proposed innovations of English quantitative verse; the section on ornament is concerned with Elyot, who dedicated himself to the art and spoken language, the figures of speech; and the author closes with lengthy observations on good manners. It is interesting to note that in his remarks on language he deprecates the use of archaisms, and although he allows that the purer Saxon speech is spoken beyond the Trent, he advises the English writer to take as his model the usual speech of the court of London and the home counties.

Many later "poetics" are indebted to this book. The original edition is very rare. Professor Edward Arber's reprint (1869) contained a copy of the woodcuts and a facsimile of the authorship of this treatise. The history of the Puttenhams is discussed in H. H. S. Croft's edition of Elyot's Boke called the Governour. A careful investigation brought him to the conclusion that the evidence was in favour of Richard. There are other modern editions of the book, notably one in J. Haslwood's Ancient Critical Essays (1811-1815).

PUTTING THE SHOT (or Werger), a form of athletic sports (q.v.). It is the only weight event now remaining in the championship programme which requires a "put" as distinct from a throw, a put being a fair square push straight from the shoulder, quite distinct from throwing or bowling, which are not allowed in putting the shot. The exercise originated in Great Britain, where, before the formation of the Amateur Athletic Association, the shot (a round weight of 16 lb) was put from a joint about 6 ft. long with a run of 7 ft., the distance being measured from the impression made by the falling missile to the point on the joint, or a line continuing it, opposite the impression. Hence the putter failed to get the full benefit of an putt save a perfectly straight one. The present British rule is that the putt shall be made from a 7-ft. square, and the distance measured from the first pitch of the shot to the front line of the square or that line produced, as by the old method. In America the put is made from a 7-ft. circle, and the distance measured from the pitch to the nearest point of the circle, which has a raised edge in front to prevent overstepping and consequent fouls. Individual putters have slight variations of method, but the following description is substantially good for all. The putter stands in the back part of the square or circle with his weight entirely upon his right leg, and brings his body forward, the left arm extended slightly forward, the left arm stretched out in front as a balance, the palm of the hand resting in the palm, is held against, or an inch or two from, the neck below and behind the right ear. From this position a hop forward is made with the right leg, the foot landing in the middle of the square and the balance being preserved, so that the right shoulder is kept well back. Then, letting the right leg bend well down, the athlete springs up with a rapid twist of the body, so that the right shoulder is brought forward, and the right arm is thrust forward with all possible force, the secret being to throw all the weight and power of the body and arm into the put at the very moment of delivery. Mere brute strength and mere body weight are not sufficient for the successful shot-putting or throwing the 16-lb. weight, and on this account some comparatively light men have repeatedly beaten larger and taller putters. Thus G. R. Gray, a Canadian by birth, who for many years held the world's record of 47 ft. for the 16-lb. shot, was a smaller and less powerful man than several whom he defeated; and another champion of light weight was W. F. Robertson of Scotland, who weighed only 190 lb. Among the best putters of earlier times were E. J. Bor, London Athletic Club, who made a put of 42 ft. 5 in. in 1872; W. Y. Winthrop and G. Ross. The talent of Irish athletes both in Great Britain and on the continent was already well known, for both George and John Puttenham were among the most famous of Irish putters being W. J. M. Barry and Denis Hogan, the latter of whom won the amateur championship in seven consecutive years from 1893, and again in 1904 and 1905. The record in 1910 for the 16-lb. shot was 52 ft., made at San Francisco in 1909 by R. Rose.

PUTTKAMMER, ROBERT VON (1828-1900), Prussian statesman, was born at Frankfurt-on-the-Oder on the 5th of May 1828. His father, Eugen von Puttkammer, Oberpräsident of Posen, belonged to a widely extended noble family, of which Bismarck's wife and Robert von Puttkammer's own wife were also members. When he was born Puttkammer's body after a short course of law, began his official career in 1850 as Assessor in the courts at Danzig; but in 1852 entered the civil service, receiving after his promotion to the rank of Assessor in 1854 a post in the railway department of the ministry for trade and industry. In 1859 he became a member of the presidial council (Oberpräsident) at Cohnen, capital of the Prussian Rhine province, and from 1860 to 1866 was Landrat at Demmin in Pomerania. During the war with Austria he acted as civil commissary in Moravia. From 1867 to 1871 he was a councillor in the chancery of the North German Confederation. In 1871 he was appointed president of the governmental district of Gumbinnen in East Prussia, in 1875 district president (Besirkspräsident) in Lorraine, and in 1877 Oberpräsident in Silesia. From 1874 onward he was frequently elected to the Reichstag and the Prussian Chamber of Deputies, in which he attached himself to the German Conservative party. Puttkammer was the chosen instrument of the Clerical Conservative policy initiated by Bismarck when the Socialist peril made it expedient to conciliate the Catholic Centre. As Oberpräsident of Silesia he had already done much to mitigate the rigour of the application of the "May Laws," and as minister of public worship and of the interior he continued this policy. He is also remembered as the author of the ordinance of the 16th of January 1876 for the simplification of German orthography. This was at first vigorously opposed, not least by Bismarck himself; but its
PUTTY—PUVIS DE CHAVANNES

convenience soon became evident, it was increasingly put into practice, and was so well based that later reformers have only needed to follow the lines laid down by Puttkammer. As minister of the interior Puttkammer’s activities were less commandable. His reactionary conservative temper was in complete harmony with the views of Bismarck and the emperor William, and with their powerful support he attempted, in defiance of modern democratic principles and even of the spirit of the constitution, to re-establish the old Prussian system of rigid discipline from above. He was above all concerned to nip in the bud any tendencies in the bureaucracy to revolt, and it was on his initiative that, on the 4th of January 1882, a royal ordinance laid it down as the duty of all officials to give the government their unconditional support at political elections. Similarly though he carried out many useful measures to benefit their district, he earnestly supported the law for public meetings, and that serious suppression of strike movements. This “Puttkammer régime” was intensely unpopular; it was attacked in the Reichstag not only by Radicals like Richter and Rickert, but by National Liberals like Bennigsen, and when the emperor Frederick III., whose Liberal tendencies were notorious, succeeded to the throne, it was clear that it could not last. In spite of Bismarck’s support Puttkammer was forced to resign on the 8th of June 1888. Under William II., however, whose principles were those of his grandfather, Puttkammer was largely rehabilitated. On the 1st of January 1889 he received the Order of the Black Eagle, in the same year he was appointed a secular canon (Donherr) of Merseburg, and in 1891 became Ober-präsident of Prussian Pomerania. In this office, which he held till 1899, he did very useful work in collaboration with the provincial estates. He died on his property at Kazarin in Pomerania on the 15th of March 1900.

PUTTY, originally tin oxide in a state of fine division used for polishing glass, granite, &c., now known as “putty powder” or “polisher’s putty” (from O. Fr. pâte, a potful, hence brass, tin, pewter, &c., calcined in a pot). More commonly the term is applied to a kind of cement composed of fine powdered chalk intimately mixed with linseed oil, either boiled or raw, to the consistency of a tough dough. It is principally used by glaziers for bedding and fixing sheets of glass in windows and other frames, and by joiners and painters for filling up nail-holes and other inequalities in the surface of woodwork. The oxidation of the oil gradually hardens the putty into a very dense adherent mass, but when it is required to dry quickly, boiled oil and sometimes litharge and other driers are used. The work is also used of a fine lime cement employed by masons.

PUVIS DE CHAVANNES, PIERRE CÉCILE (1824–1898), French painter, was born at Lyons on the 14th of December 1824. His father was a mining engineer, the descendant of an old family of the town. Puvis was educated at the Lyons College and at the Lycée Henri IV. in Paris, and was intended to follow his father’s profession when a serious illness interrupted his studies. A journey to Italy opened his mind to fresh ideas, and on his return to France he announced his intention of becoming a painter, and went to study first under Henri Scheffer, and then under Couture. On leaving this master in 1852 he established himself in a studio in the Place Pigalle (which he did not give up till 1857), and there organized a sort of academy for a group of fellow students who wished to work from the living model. Puvis first exhibited in the Salon of 1850 a Pietà,” and in the same year he painted “Madamoiselle de Sombreuil Drinking a Glass of Blood to Save her Father,” and “Jean Cavalier by his Mother’s Deathbed,” besides an “Ecce Homo,” now in the church of Champagnat (Saône-et-Loire). In 1852 and in the two following years Puvis’s pictures were rejected by the Salon, and were sent to a private exhibition in the Galeries Bonne Nouvelle. The public laughed at his work as loudly as at that of Courbet, but the young painter was none the less warmly defended by Théophile Gautier and Théodore de Banville. For nine years Puvis was excluded from the Salons, In 1857 he had painted a “Madonna of St Sebastian,” “Meditation,” “Village Firemen,” “Julie,” “Herodias,” and “Saint Camilla”—compositions showing a great variety of impulse, still undecided in style and reflecting the influence of the Italian masters as much as of Ingres and Ch称. In 1859 Puvis reappeared in the Salon with the “Return from Hungary” (in the Marseilles Gallery). But not till he produced “Peace” and “War” did he really impress his critics, inaugurating a vast series of decorative paintings. For these two works a second-class medal was awarded to him, and the state offered to purchase the “Peace.” Puvis, not choosing to part the pair, made a gift of “War” to the state. He then set to work again, and in 1864 exhibited “Autumn” and “Sleep,” but found no purchasers. One of these pictures is now in the Lyons Museum, and the other at Lille. “Peace” and “War” were placed in the great gallery of the museum at Amiens, where Puvis devoted himself to painting four panels—a “Standard-Bearer,” a “Woman Weeping over the Ruins of her Home,” a “Reaper,” and a “Woman Spinning.” These works were so much admired that further decorations were ordered for the same building, and the artist presented to the city of Amiens “Labour” and “Repose,” for which the municipality could not afford to pay. At their request Puvis undertook another work, intended for the upper landing of the staircase, and in 1865 a composition entitled “Ave Picardia Nutrix,” allegorical of the fertility of the province, was added to the collection. In 1879 the city wished to complete the decoration of the building, and the painter, again at his own expense, executed the cartoon “Mars and Minerva.” The finished work was exhibited in the Salon of 1881, and purchased by the state, which at the same time gave him a commission for the finished work. While toiling at these large works, Puvis de Chavannes rested himself by painting easel pictures. To the salon of 1870 he had sent a picture called “Harvest;” the “Beheading of John the Baptist” figured in the Great Exhibition of 1889; then followed “Hope” (1872), the “Family of Fisher-Folk” (1873), and “Women on the Sea-shore” (1879). But these canvases, however interesting, are not to be named by the side of his grand decorative works. Two paintings in the Palais Longchamp at Marseilles, ordered in 1867, represent “Marseilles as a Greek Colony” and “Marseilles, the Emporium of the East.” After these, Puvis executed for the town-hall of Poitiers two decorative paintings of historical subjects: “Rugendorf,” and “Charles Martel.” The Panthéon in Paris also possesses a decorative work of great interest by this painter: “The Life of Saint Geneviève,” treated in three panels. In 1876 the Department of Fine Arts in Paris gave the artist a commission to paint “Saint Geneviève giving Food to Paris” and “Saint Geneviève watching over Sleeping Paris,” in which he gave to the saint the features of Princess Cantacuzene, his wife, who died not long before he did. At the time of his death—on the 24th of October 1893—the work was almost finished. After completing the first paintings in the Panthéon, which occupied him for three years and eight months, Puvis de Chavannes undertook to paint the staircase leading to the gallery of fine arts in the Lyons Museum, and took for his subjects the “Vision of the Antique,” a procession of youths on horseback, which a female figure standing on a knoll points out to Phaedias; the “Sacred Grove”; and two allegorical figures of “The Rhône” and “The Saône.” It was in the same mood of inspiration by the antique that he painted the hemicycle at the Sorbonne, an allegory of “Science, Art, and Letters,” a work of great extent, for which he was paid 35,000 francs (£1400). At the Hôtel de Ville in Paris, again, Puvis decorated the grand staircase and the first reception-room. These works employed him from 1889 till 1893. In the reception-room he painted two panels, “Winter” and “Summer;” the mural paintings on the staircase, which had previously been placed in the hands of Baudry and of Delaunay, are devoted to the glory of the attributes of the city of Paris. On the ceiling we see Victor Hugo offering his lyre to the city of Paris. The pictures in the Rouen Museum (1890–1892) show a different vein, and the artist’s power of conceiving and setting forth a plastic scheme enabling him to decorate a public building with beautiful human figures and the finest lines of landscape. We see here tollers raising a XXII. 22.
colossal monolith, part of some ancient monument, to add it to other architectural pieces; then the busy scene of a pottery; and finally artists painting in the open air. Puvis, as a rule, adhered to the presentment of the nude or of the lightest drapery; here, however, in response to some critical remarks, he has clad his figures, exclusively in modern dress. After prolonged and persistent negotiations, begun so early as in 1891, with the trustees of the Boston Library, U.S.A., Puvis de Chavannes accepted a commission to paint nine large panels for that building, to be inserted in separate compartments, three facing the door, three to the right and three to the left. These pictures, begun in 1895, were finished in 1898. In these works of his latest period Puvis de Chavannes soars boldly above realistic vision. In the figures which people the walls with poetical images he endeavours to achieve originality of the embodying forms, and at the same time a plastic expression of ideas born of a mind whose conceptions grew ever loftier, while yet the artist, with the most vividly the Puy-de消毒的. Such works as the great paintings at Amiens, Rouen, Marseilles, the Panthéon, the Sorbonne, and the Hôtel de Ville are among the most important productions of French art in the 19th century. Puvis de Chavannes was president of the National Society of Fine Arts (the New Salon). His principal pupils and followers are Ary Renan (d. 1900), Baudouin, J. F. Aubertin and Cotett.

See A. Michel, "Exposition de M. Puvis de Chavannes," Gazette des beaux-arts (1888); Marius Vachon, Puvis de Chavannes (1900); J. B. Bourron Puvis de Chavannes, Souvenirs Intimes, Histoire des beaux-arts (H. Fr.)

PUY, a geological term used locally in Auvergne for a volcanic hill. Most of the pyes of central France are small cinder-cones, with or without associated lava, whilst others are domes of trachytic rock, like the domite de Puy-de-Dôme. The pyes may be scattered as isolated hills, or, as is more usual, clustered together, sometimes in lines. The chain of pyes in central France probably became extinct in late prehistoric time. Other volcanic hills more or less like those of Auvergne are also known to geologists as pyes; examples may be found in the Eiffel and in the small cones on the Bay of Naples, whilst the largest known pyes are numerous in the Swiss Alps of Württemberg, as pointed out by W. Branco. Sir A. Geikie has shown that the puye type of eruption was common in the British area in Carboniferous and Permian times, as abundantly attested in central Scotland by remains of the old volcanoes, now generally reduced by denudation to the mere neck, or volcanic cone, filled with tuff and agglomerate, or plugged with lava.

See Sir A. Geikie, Ancient Volcanoes of Great Britain (1897).

PUY-DE-DÔME, a department of central France, four-fifths of which belonged to Basse-Auvergne, one sixth to Bourbonnais, and the remainder to Forez (Lyonnais). Area, 3094 sq. m. Pop. (1900), 535,419. It is bounded N. by Allier, E. by Loire, S. by Haute-Loire and Cantal, and W. by Corrèze and Creuse. The highest point of the department is the Puyl d'Amont, the most elevated puye; the highest point of the department is the Puyl de Dôme and Cantal. It is also the most elevated peak of central France; it commands the group of the volcanic Monts Dore, so remarkable for their rocky corries, their eroded valleys, their trap dykes and organes of basalt, their lakes sleeping in the depths of ancient craters or confined in the valleys by streams of lava, and their wide plains of pasture-land. The Puy de Sancy, forming part of the watershed, gives rise on its northern slope to the Dordogne, and on the east to the Couze, a sub-tributary of the Loire, through the Allier. The Monts Dore are joined to the mountains of Cantal by the non-volcanic group of the Chézillier, of which the highest point, the Ducet (102 ft.), rises on the confines of Puy-de-Dôme and Cantal. On the north the Monts Dore are continued by a plateau of a mean height of from 3000 to 3500 ft., upon which are seen sixty cones raised by volcanic outbursts in former times. These are the Monts Dôme, which extend from south to north as far as Riom, the most remarkable being the Puy-de-Dôme (4800 ft.), from which the department takes its name, and the Puy-de-Pariou, the latter having a crater more than 300 ft. in depth. A meteorological observatory occupies the summit of the Puy-de-Dôme, which was once crowned by a Roman temple, the ruins of which still exist. To the east of the depart-

ment, along the confines of Loire, are the Monts du Forez, rising to 5380 ft. and continued north by the Bois Noirs. Between these mountains and the Dôme extends the fertile plain of Limagne. The drainage of Puy-de-Dôme is divided between the Loire, by its affluent the Allier and the Cher, and the Dordogne. The Allier takes its origin from south to north, receiving on its right the Dore, which falls into the Allier at the northern boundary and lowest level of the department (897 ft.); on its left are the Alagnon from the Cantal, the two Couzes from the Luguet and the Monts Dore, and the Sioule, the most important of all, which drains the north-west slopes of the Monts Dore and Dôme, and joins the Allier beyond the limits of the department. The Cher forms for a short space the boundary between the departments of Puy-de-Dôme and Creuse, close to that of Allier. The Dordogne, while still scarcely formed, flows past Mont-Dore-les-Bains and La Bourboule and is joined a deep valley, walled in by the Terrasses and the Sioule, makes it one of the richest regions of France. In the highest altitudes the rainfall attains 64 in.

About two-thirds of the inhabitants of Puy-de-Dôme are engaged in agriculture. The Limagne yields a variety of products and the vine flourishes on its hill-sides. The high mountains provide pasture for the flocks of sheep, and the tuffs, agglomerates, volcanic sands and gravels provide material of much importance. The intermediate region is cultivated chiefly for cereals, the chief of which are rye, wheat, oats and barley. Potatoes are largely grown, and, to a less extent, peas, beans, beetroot and colza. The Limagne produces fruits of all kinds—pears, apricots, pears, walnuts and apples, from which considerable quantities of cider are made. The department possesses considerable mineral wealth. There are important coal-mines at Brasseac on the Allier, on the borders of Haute-Loire, at St Éloy near the department of Allier, and at Bourg-Lastic on the borders of Corrèze. Peat, asphalt, bituminous schists, antimony, mispickel and argentiferous lead are also found. Of the metals those of silver and copper are found at Pontigbad on the Sioule. Amethysts and other rare minerals are found and there are numerous stone-quiaries. The watering-places of Mont Dore, Royat and La Bourboule receive separate notice. The hot springs of St Neurs, containing carbonated sodium and iron chlorides and bicarbonates, are efficacious in liver complaints, rheumatism and gravel. The waters of Châteauneuf (on the Sioule), also known to the Romans, contain iron bicarbonates and are reputed to for skin disorders. Those of Néris, near Morestel and Marienbad, are used for disorders of the digestive organs, congestions of the liver, rheumatism, &c. There are many other mineral springs found around Thiers, which produces a large amount of cheap cutlery, paper and leather, and Clermont-Ferrand, the capital. The department contains factories for lace and braid (in the mountains), for hunting and camlets and wool, cotton and hemp mills. There are wool-carding works and factories for linens, cloths and counterpanes, also silk-mills, tanneries, manufactories for chamois and other leathers, for cachouche (Clermont-Ferrand), sugar-works, manufactories of chemical preparations, curdled milk, sulphates and nitrates of soda, and manufactories of fruit-preserves. The department exports grain, fruits, cattle, wines, cheese, wood, mineral waters, cutlery, &c. It is served by the chief town of Clermont, which is the metropolis of 5 cantons and 471 communes. It is included in the bishopric and académie (educational division) of Clermont-Ferrand and the region of the XIII. army corps, of which the headquarters are in the same town; the appeal court is at Riom.

The more noteworthy places in the department are Clermont-Ferrand, Issoire, Thiers, Riom, Ambert, Mont-Dore-les-Bains, La Bourboule and Royat (all separately noticed). Near Clermont-Ferrand is Mont Gérozov (see Gérozov) the scene of the victory of Verecgetorix over Julius Caesar. Other places of
is locally noted for fisheries (especially of lobsters and oysters) and some ship-building is carried on. Pwllheli was incorporated by Edward the Black Prince. At Nevin (Nefyn), 6 m. distant, Edward I. held a tournament or revel, in 1284, on a magnificent scale, to commemorate his conquest of Wales.

PYANEPISA, or PIANOPIA (from Gr. πιάνεισα = χιαμος, bean, and πιάνος, to speak), a festival in honour of Apollo, held at Athens on the 7th of the month Pyanepis (October). A hodge-podge of pulse was prepared and offered to Apollo (in his capacity as sun god and ripener of fruits) and the Horae, as the first-fruits of the autumn harvest. Another offering on this occasion was the eirēsionē. This was a branch of olive or laurel, bound with purple or white wool, round which were hung various fruits of the season, pastries, and small jars of honey, oil and wine. It was intended as a thank-offering for blessings received, and at the same time as a prayer for similar blessings and protection against evil in future; hence, it was called a "suppliant" branch (λεινηά). The name is generally derived from elpos (wool) in reference to the woolen bands, but some connect it with elpos (to speak), the eirēsionē being regarded as the "spokesman" of the suppliants. It was carried in procession by a boy whose parents were both alive to the temple of Apollo, where it was suspended on the gate. The doors of private houses were similarly adorned. The branch was allowed to hang for a year, when it was replaced by a new one, since by that time it was supposed to have lost its virtue. During the procession a chant (also called eirēsionē) was sung, the text of which has been preserved in Plutarch (Theseus, 22)—

Eirēsionē caries fīga and rich cakes;
Honey and oil in a jar to anoint the limbs;
And pure wine, that she may be drunken and go to sleep.

The semi-personification of eirēsionē will be noticed; and, according to Mannhardt, the branch "embodies the tree-spirit conceived as the spirit of vegetation in general, whose vivifying and fruitifying influence is thus brought to bear upon the corn in particular."

Aetiological connected both offerings with the Cretan expedition of Theseus, who, when driven ashore at Delos, vowed a thank-offering to Apollo if he slew the Minotaur, which afterwards took the form of the eirēsionē and Pyanopisa. To explain the origin of the hodge-podge, it was said that his comrades on landing in Attica gathered up the scraps of their provisions that remained and prepared a meal from them.

PYAPON, a town and district of Lower Burma. The town is situated on a river of the same name, one of the numerous mouths of the Irrawaddy, about 12 m. from the sea. Pop. (1901), 5835. The district, which was only formed in 1903, lies within the delta of the Irrawaddy. It is a vast plain, intersected by tidal creeks and subject to inundation at high spring tides. The swampy jungle is being rapidly reclaimed for rice cultivation, which is the sole crop. Area, 2137 sq. m.; pop. (1901), 226,443, showing an increase of 65% in the decade.

PYAT, FELIX (1810-1889), French Socialist, was born at Vierzon (Cher) on the 4th of October 1810, the son of a Legitimist lawyer. Called to the bar in Paris in 1831, he threw his whole energies into journalism. The violent personalities of a pamphlet entitled Marie Joseph Chénier et le prince des critiques (1844), in reply to Jules Janin, brought him a six months' sojourn in La Pélage, in the cell just quitted by Lamennais. He worked with other dramatists in a long series of plays, with an expenditure of six years on the National, until the revolution of 1848. George Sand, whom he had introduced in 1839 to the staff of the Figaro, now asked Ledru-Rollin to make him commissary-general of the Cher. After three months' tenure of this office he was returned by the department to the Constituent Assembly, where he voted with the Mountain, and brought forward the celebrated motion for the abolition of the presidential office. About this time he fought a duel with Proudhon, who
PYATIGORSK was a town and watering-place of Russian Caucasia, in the province of Terek, 143 m. by rail N.W. of Vladikavkaz. Pop. (1885), 15,670; (1897), 18,628. It owes its origin to its mineral waters, which have long been known to the inhabitants of Caucasia. The sulphur springs, about fifteen in number, come from a great depth, and vary in temperature from 75° to 96° F.; they are used both for drinking and for bathing. The first buildings were erected in 1812, and in 1830 the name of Pyatigorsk ("town of the five mountains") was given to the new settlement. Its subsequent rapid increase was greatly stimulated by the completion of the railway connexion with Rostov-on-the-Don. The town is charmingly situated on a small plateau, 1,680 ft. above sea-level, at the foot of the Beshtau, Masuruk, and three other outliers of the Caucasus range, which protect it on the north. The snow-covered summits of the Elbruz are visible to the south. The most noteworthy features are a cathedral, a monument to the poet M. Y. Lermontov (1814-1841), and a hydropathic.

Pycnogonida, or Panpodo, marine Arachnida (q.v.) remarkable for the reduction of the opisthosoma or abdomen to an insignificant tubercular or rod-like process (whence their trivial name of "nobody crabs"), and for the development of the oral region into a relatively immense sectorial proboscis. They form a compact group, differing from all the other orders of Arachnida in certain structural characters of such morphological importance that it is impossible to affiliate them closely with any group of that class. For instance, in all typical existing Arachnida the ganglionic centres which innervate the ambulatory appendages are coalesced to form a single nervous mass, whereas in the Pycnogonida the ganglia supplying these limbs retain their original distinctness. More important still is the circumstance that in the Pycnogonida there may be as many as seven pairs of leg-like limbs behind the mouth; but in the typical Arachnida there are never more than five such pairs. Curiously enough, too, although the number of these appendages, in all the orders of typical Arachnida is, with the exception of some degenerate Acari, a quite constant character, the number in the Pycnogonida is very variable. In most cases there are four pairs of ambulatory limbs, but in two antarctic genera, namely Pentanyymphon, belonging to the family Nymphonidae and Decalopoda, probably belonging to the Collosendideae, they are increased to five pairs. In front of these four or five pairs of ambulatory limbs there may be two pairs of longish post-oral limbs, called respectively the oviscerous legs and the palp; but these may be totally absent. Finally, the single pair of pre-oral appendages may be well developed, three-jointed and chelate, or reduced in size and complexity, or altogether suppressed.

As examples of this class exhibiting extremes of variation in the development and reduction of the appendages may be cited Decalopoda, which has the full complement of eight pairs of appendages, and the female of Pycnogonum littorale, in which all the appendages are aborted save four pairs of ambulatory limbs.

All the principal organs of the body are concentrated in that part which bears the appendages. The generative glands are lodged on each side, sending prolongations into the appendages, and their ducts open upon the second segments of more or fewer of them. The alimentary canal, beginning with the mouth at the extremity of the proboscis and terminating with the anus at the extremity of the tail-like opisthosoma, also sends long sacellar prolongations into the limbs. Food is introduced by means of the sectorial pharynx lodged in the proboscis, the sucking action being effected by means of muscles radiating from the wall of the pharynx to that of the inner surface of the exoskeleton of the proboscis. The circulatory system, where it has been observed, consists of a heart formed of about three chambers communicating with each other. In each chamber there is a pair of orifices for the entry of the blood; and the fluid is expelled through an orifice at the anterior extremity of the first chamber. No organs of respiration are known, the integument being the medium for the oxygenation of the blood.

The sexes are distinct, but commonly there is little external difference between the males and the females. Sometimes the female is considerably the larger of the two; and frequently the oviscerous legs are less well developed than in the male. Sometimes indeed these limbs are entirely wanting in the female, whereas this is never the case in the male. Finally, in the females the generative orifices are much more conspicuous than in the males, and the fourth joint of the legs is often swollen. The invariable presence of the oviscerous appendages in the males is correlated with the habit practised by this sex of carrying the fecundated eggs. The eggs are usually aggregated in two spherical masses round the middle of each of the oviscerous legs; sometimes, however, there are two such masses on
PYCNOSTYLE—PYGMY

677
each leg, or as many as four or five, whereas occasionally there is but one on the right or left side. More rarely, as in some species of Pallenia, there are very few large eggs attached separately to the legs, or the eggs may be carried in a single mass attached to the underside of the body, as in some species of Pyrgonides. Cases related in Pycnogonum containing their own eggs, as has been observed in a specimen of Nymphon brevicaudatum, but this seems to be a rare phenomenon.

The eggs-hatched young frequently differs greatly from the adult. The body, which is oval, subquadrate and unsegmented, has the proboscis well developed, but bears only three pairs of appendages; those of the first pair are large, three-jointed and chelate, the legs segment containing a small so-called genital gland, the duct of which opens at the tip of a spiniform or setiform process; these appendages are the mandibles of the adult. The appendages of the next two pairs are simple and small, and are generally so short as to be palpable only by some time钞后才能发现; stage next to the prothorax, sometimes called the prothorax, may be free living or may be retained within the egg-shell. In the second stage, which may also be contained in the egg, two or three pairs of appendages have appeared, those representing the first pair of ambulatory limbs of the adult being as a rule better developed than the next. In the third stage the fourth pair of ambulatory limbs and the abdomen of the adult have begun to develop and gradually increase in size until the adult form is attained. But even within the limits of a single genus, e.g. Nymphon, the stages at which the young emerges from the egg is subject to considerable specific variation.

Pycnogonida vary greatly in size, the span of legs when extended ranging from about 2 in. in Pycnogonum litorale to 1 ft. in Pycnogonum plumosum. They are wholly marine and occur at depths varying from only a few fathoms to over 3500 fathoms. One of the best known British species is Pycnogonum litorale, a stoutly built form with only four pairs of appendages in the female. It occurs between tide marks on British coasts, but recedes to considerable depths, and on the Atlantic coast of America has been dredged at a depth of 430 fathoms. It is also wide-ranging, and has been recorded even from the coast of Chile. As a rule, but by no means an invulnerable rule, deep-water species have smoother bodies and much longer and thinner legs than shallow-water forms. The latter also commonly have four distinct eyes, whereas in the former, which has a flat head, there are only six or seven, the rest unconvom, the eyes obsolete. There are many exceptions, however, to these rules. The habits of all Pycnogonida appear to be very similar. They are not swimmers, but crawl slowly over the bottom of the sea or amongst the fronds of seaweed, and they have been met with in polar, temperate and tropical seas. (R. I. P.)

PYCNO STYLE (Gr. πυκνός, close, compact, and στῦλος, column), the architectural term given by Vitruvius to the inter-columnation of the columns of a temple, when this was equal to \( \frac{1}{4} \) diameters.

PYE, HENRY JAMES (1745-1813), English poet laureate, was born in London on the 20th of February 1745, and educated at Magdalene College, Oxford. His father, a Berkshire landowner, died in 1766, leaving him a legacy of debt amounting to £50,000, and the burning of his home at Great Faringdon further increased his difficulties. In 1784 he was elected M.P. for Berkshire. He was obliged to sell the paternal estate, and, retiring from Parliament in 1790, became a police magistrate for Westminster. Although he had no command of language and was destitute of poetic feeling, his ambition was to obtain recognition as a poet, and he published many volumes of verse. Of all he wrote his prose Summary of the Duties of a Justice of the Peace out of Sessions (1808) is most worthy of record. He was made poet laureate in 1790, perhaps as a reward for his faithful support of Pitt in the House of Commons. The appointment was looked on as ridiculous, and his birthday odes were a continual source of contempt. His most elaborate poem was an epic, Alfred (1801). He was the first poet laureate to receive a fixed salary of £271 instead of the historic tare of Canterbury wine. He died at Pinner, Middlesex, on the 11th of August 1813.

PYGMALION, in Greek mythology, son of Cilix, and grandson of Agenor, king of Cyprus. He fell in love with an ivory statue he had made; Aphrodite granted life to the image, and Pygmalion married the miraculously-born virgin (Ovid, Metam., x. 243). There is no ancient authority for the introduction of the name Galatea into the story. Pygmalion is also the name given in Virgil (Aeneid, i. 347) to a king of Tyre, who murdered Sychaeus, the husband of his sister Dido.

PYGMY, or PYGMY (Gr. πυγμαίος, from πυγμή, a Greek measure of length corresponding to "the distance between the elbow and knuckles" of a man of average size), a term for a diminutive human being. We owe the word to Homer, who in the Iliad (iii. 6) uses it to describe a race of tiny folk dwelling in a far southern land, whither the cranes fly when inclement winters and piercing frosts visit the northern shores. Fierce battles were often mentioned by later writers as occurring between the pygmies and cranes, and were even represented on their vases. On these the pygmies were depicted as dwarfs with large heads, long ears, gross features, curly, curly hair, and sometimes armed with lances. Aristotle firmly believed in the existence of these pygmies, whom he characterized as a race of men of small stature inhabiting the marshes of upper Egypt towards the sources of the Nile. That their existence was a matter of common knowledge and speculation is indicated by the fact that Philostratus describes the sleeping Hercules beset by swarms of pygmies. Herodotus (ii. 32), relying apparently on authentic information, describes graphically how a party of five Nasamonians, while journeying through the African desert, came to last at a plain where fruit-trees grew. While gathering the fruit they were attacked by a horde of pygmies, who carried them across forest marshes to a town, where dwelt people of a similar appearance, and near which a great river flowed from west to east containing crocodiles. This river was probably the Niger, and the people referred to were no doubt the ancestors of the existing pygmies of equatorial Africa. Representations of these pygmies have been found sculptured on the tombs at Sakkarah, which are referred to the Vth Dynasty of Egypt, 3366 B.C. The pygmies depicted in bas-relief on these tombs faithfully reproduce the racial characteristics of the present race of pygmies inhabiting the Ituri and Semilki forests. They no doubt served in the households of the Egyptian kings, and figured both in Egyptian and Roman triumphs.

Various writers have localized pygmies in different portions of the earth's surface. Pliny makes mention of dwarfed races in both Asia and Africa. Reference is made to the Carthage dwarfs in Thrace, and to a similar race dwelling in Calabria. Ctesias, a century after Herodotus, wrote of a race of pygmies in the heart of India, describing them as black and ugly, and only two pygmals in height. The Chinese author, Chao Fu-Kua, in the beginning of the 13th century, described a tribe of black pygmies dwelling in the Philippine Islands: in the depth of the valleys there lived, he said, a tribe of men called Hiai-tan, small in size, with round, yellow eyes, curly hair, and with the teeth of their fore-fathers, which were not all the ancestors of the present Aetas.

Relics of a pygmy race are supposed to exist now in Sicily and Sardinia, i.e. along the high road between Pleistocene Africa and Europe. Near Schaffhausen, Dr Kollman found skeletal remains of small human beings, which have been regarded by some authorities as belonging to the European pygmies of the Neolithic period. Some anthropologists of authority, indeed—in spite of the absence of definite data in support of such a view—believe that a dwarf negroid race at one time existed in northern Europe, and may have given rise to the traditional tales of elves, goblins, gnomes and fairies.

At the present day the existing pygmy races may be subdivided into two main groups or sub-races: (a) the African pygmies (Negrillos), (b) the Asiatic pygmies (Nigroritos).

a. The African pygmies are dispersed over a large zone extending right across equatorial Africa, from Uganda to the Gaboon, the width of this zone being about six degrees, i.e. three degrees north and south of the equator. In regard to speech and habits, they are confined to a belt of forest lying to the east and west of the Semilki River, though many centuries ago these forest dwarfs must have been the principal inhabitants of the whole of the Uganda Protectorate. They are much more abundant in the forests of the Belgian Congo, being found as far south as the range of the Angela, and to the north and north-west as far as the Bahr-El-Ghazal and the German Cameroons. They are also found in the interior of the French Congo and in the Gaboon. They comprise the Akanas,
The pygmies as a retrograde and degenerative type of the negro race and therefore of comparatively recent growth. Though the balance of evidence seems in favour of the former hypothesis, the question must still be regarded as sub judice. The first hypothesis would certainly go far to explain the present distribution of the pygmy races. If we regard, as many authorities do, the Indo-African continent as having undergone relatively recent geological times by the waters of the Indian Ocean, it is being the original home of primitive man, then it is easy to understand how he migrated from the subsiding Indo-African continent westward into the heart of Africa, and eastward to the Malay Peninsula by way of the Eastern Archipelago, at that time forming part of the mainland. Those members of the primitive race who migrated westward are supposed to have spread over the larger portion of the continent of Africa. They appear to have divided off into two main branches, the Negro pygmys of central Africa and the Bushmen of the southern portion of the continent. These two sub-races appear to have been the aboriginal inhabitants of the country, though their direct descendants have now been driven into the great forest fastnesses by the more powerful Bantu races which sprang from the parent stem at a later date. A. H. Keane, who considers the recently extinct Kalang pygmys as the aborigines of Java, thinks it probable that this island was the first region reached by primitive man and his Miocene precursor during the eastward migration from the subsiding Indo-African continent.

General Characters of the Pygmy Races.—As regards stature, the smallest are the African Negroes, their average height being 4 ft. 7 in. (1.47 m.). Next in order of height come the South African Bushmen who were discovered by Mr. Colonel H. T. H. Cole in 1906 measured just over 3 ft. Individuals not exceeding 3 ft. are met with, though the midgets of the last category are called pygmai in height, whose existence is indicated in the early Greek writings, but must be relegated to the realm of mythology. The Philippine Atéas measure 1·47 m., while the average height of the Sakai and Andamanese is 1·49 m.

The adult weight of six adult Mambute pygmies (four males and two females) from the Ituri forest, and found the average weight to be seventy-seven pounds. Two of these, one man and one woman, each weighed only fifty-three pounds. All the pure pygmy tribes—whether Negroes or Negroes in addition to their small size have certain well-marked characters in common. The most notable of these are crisp, closely-curled hair, flattened nose, broad at the base, deeply depressed at the root and with exaggerated development of the alae nasi, long upper lip with the mucous membrane moderately clefted, large ape-like mouth, receding chin, pronounced prognathism, abundant fine hair, and the large, brachycephalic cranium, proportionately long arms and short legs, the limbs being severely underdeveloped.

The colour of the skin shows considerable variation. The pure-blooded African Akkas are of a peculiar dirty reddish-yellow colour, while the Bantu Negroes, generally dark-skinned, have a skin of a deeper chocolate-brown hue, while that of the Oceanic Negroes is of a dark brown or blackish colour, differing but little from that of the surrounding Papuans and Melanesians. The eyes of the pygmies are of a peculiar shape and are characteristic of the people. The abdomen is protuberent in the case of the African pygmies, but not so in the case of the Oceanic Negroes. The mid-point of the umbilicus, instead of being below as in the case of Europeans and Asians. There is no definite steatopygia, though in few individuals among the black Negro women the buttocks attain considerable dimensions.

The feet are large and turned slightly inwards, while the toes are relatively longer than those of Europeans. In some there is a tendency for the four smaller toes to diverge from the great toe. Being wonderfully adroit climbers, they sometimes make use of their feet by grasping branches between the great toe and the rest of the toes.

Their clothing is chiefly conspicuous by its absence. The African pygmies go about, for the most part, quite naked, except for the heads and shoulders, which are sometimes covered with a small piece of deer-skin, and the women one or two bunches of green leaves, which they renew daily. The resemblance of the African pygmies to the Samoan is obvious. The Andamanese wear practically no clothing. The Karons of New Guinea wear a few strips of bark dangling from a string round the loins. The Negroes seldom, if ever, tattoo their body. They are fond of beads and other articles of ornament, which they sometimes pierce with holes, through which quills are thrust. They cut their short curly hair into all sorts of fantastic patterns, and often twist some of it into peaks into which they plait feathers.

The pygmies in their furnishing of the branches and plantain leaves, about 7 ft. in diameter and 4 ft. high, with a
small hole near the bottom, through which the pygmy crawls on all fours. Ten or twelve of these arbors constitute a village. These arbors are only temporary habitations, as the pygmies are always moving on to different portions of the forest in pursuit of game.

The dwellings of the Malay Semangs are mere lean-to's, constructed of matted palm-leaves, while the Karons of New Guinea live in wretched hovels of foliage and branches, and in some cases, they even live at full liberty in the woods. The pygmies are seldom if ever tillers of the soil. The African forest dwarfs live mainly on the flesh of birds, deer and other animals, which they shoot with bows and arrows. They eat white ants, bee grubs and the larvae of beetles, also honey, wild bees and mushrooms. They are fond of fruits, particularly bananas, which they obtain from their bigger neighbours by barter or by plunder. They eat the vegetables raw, while the meat is broiled in the ashes of a fire which the dwarf kindles. Their water supply consists of clay cooking-pots and gourds for water. There is no record of cannibalism among the pygmy races. The six Mambute pygmies brought to England in 1906 soon became acclimatized. They took most kindly to European diet and clothing. At the expiry of eighteen months they went back to the Ituri forest much improved in health, having each gained on an average 9 lb in weight. They are most daring hunters, and marvellously skilful archers. Their arrows of small size they are well made, well aimed, and are able to dart in and out with the greatest of ease amongst the tall tangled vegetation of the tropical woodlands. The Batwa, from the south of Africa, are great archers, shooting their arrow tips, or rather their tiny poisoned arrows. The poison is obtained from the juice of certain plants, and also from decaying animal matter derived from the putrefaction of ants. The Andaman pygmies live exclusively on hunting, fishing and gathering.

The African pygmies marry at a very early age, often when only nine or ten years old. Marriage is simply a question of the purchase of the girl from her father; the purchase-price being from ten to twenty bushels of rice, occasionally supplemented, in the case of a desirable wife, by one or two spears or some tobacco. A man may have as many wives as he can afford to buy. A mother gives birth to her offspring in the forest, severing the navel-cord with their teeth, and leaving the placenta with the body. The family units are usually small, rarely exceeding three in number. There is great rejoicing when a boy is born, while the unlucky girl baby is beaten by her father with plantain leaves. The boys are often circumcised. There is an agreement between the parents and the children that the daughters marry before the sons. The chief's wife is sometimes killed and buried along with him.

The African pygmies have little if any belief in life after death. They say death is the end of everything. They have a vague belief in ghosts, which is responsible for sudden death and such-like calamities. There is no trace of ancestor worship. The Andaman Islanders have a vague belief in a sort of god—" Pa'ula"—an invisible being who lives in a large box which he carries on his back, and who is a guardian of things. They believe in an evil one, to whom they attribute sickness and death.

There is no hereditary chief. In many cases a group of pygmies simply cluster round a skilful hunter. In the case of the Mambute pygmies, the chief is not by birth a chief. There are no governmental laws. Murder in the Ituri forest is punished by the next-of-kin lying in wait for the culprit and killing him.

The Negrollos are fond of music and have numerous folk-songs. They also twang on stringed bows, and best drums made of hollowed-out tree trunks covered in at the ends with antelope skin. They are also great dancers, keeping perfect time to the beat of the drums their bodies going through the most extraordinary contortions. They all dance together in a long line, which twists about like a snake.

The Negrollos have some idea of drawing, each arrow shaft having its distinctive carving. The Andamanese display a considerable degree of intelligence. The Karons of New Guinea, on the other hand, seem to be of a low type of intelligence.

The Negrollos have acquired a great reputation among the neighboring tribes for their knowledge of poisons and their antidotes. Their treatment of all pains and inflammations consists in linear scratches of the affected part. They invariably use sharpened arrow-heads for this purpose.

Close observation has convinced the present writer that the African pygmies are endowed with a high degree of intelligence. Sir John Lubbock holds that there are few if any more intellectually gifted than the big negroes. They exhibit vivacity and acroyness, quickness in picking up information and languages, and surprising readiness in grasping the salient points of a subject. They are wonderful mimics. They are as ready to burst into a mixture of laughter and ridicule when they see a comic sight as any man. Their wit is not a mean or sordid one, but a happy, vivacious joyousness which marks them off into peaks of laughter. They are as a rule bright and cheerful in disposition, will sometimes fly into sudden fits of ill temper and as quickly recover their good humour. They are cleanly in their habits, have a natural sense of modesty and refinement, and punctually observe the ordinary decencies of life.

The pygmies of the Malay Peninsula have a perfectly distinct language of their own. A glossary and grammar with phonetic spellings of the Senoi language has been published, showing no connexion with any other known language.

The African pygmies, for the most part, speak a more or less corrupt form of the language of the adjacent negro tribes, e.g. Kikuyu, Bantu, Mombwa. They have some words, however, peculiar to themselves, which may be the fragments of their own original language.

(R. M. L.)
a Spartan surrender as inconceivable, and to Sparta their loss was so serious that the Athenians might have concluded the war on very favourable terms had they so wished. Though Pylos should have been ceded to Sparta under the terms of the peace of Nicias (421 B.C.) it was retained by the Athenians until the Spartan conquest of Greece early in 400 B.C. (Diodorus xiii. 64).

In the middle ages the name Pylos was retained, the present that of Avarino (Ἀβαρίων) or Navarino, derived from a body of Avars who settled there; the current derivation from the Navarre Company, who entered Greece in 1381 and built a castle at this spot, cannot now be maintained (Eng. Hist. Review, xx. 307, xxxi. 106; Hermodatha, xxxi. 450 sqq.). From 1498 to 1821 Navarino was in the hands of the Turks, save at two periods when it was held by the Venetians, who named it Zonklon. In 1821 the Greeks captured the town, situated near the southern extremity of the bay, but in 1825 they had to retire before Ibrahim Pasha. On the 20th of October 1827, however, his forces were defeated, and the town which is not far from the town of Corinth, a successful sortie by the Greeks, under Sir Thomas Picton, and the capture of the harbour, caused the garrison to evacuate the town (see Navarino, the battle of).

The operations at Pylos, described by Thucydes iv. 20-21, have been dismissed on the basis of personal observation by Dr G. B. Grundy (Journal of Hellenic Studies, xvi. i sqq.; Classical Review, x. 371 sqq. xi. 155 sqq. 448; J.H.S. xviii. 232 sqq.) and Professor R. M. Burrows (J.H.S. xvi. 55 sqq.; Cr. xi. 1 sqq.; J.H.S. xviii. 147 sqq., 345 sqq.; Cr. xix. 129 sqq.). Though differing on many points, they agree in thinking (1) that the island of Spagia is the ancient Sphacteria, Palaeokastro the ancient Coryphium or Pylos; (2) that in 425 B.C. the lagoon of Osman Aga was navigable and communicated by a navigable channel with the bay of Navarino; (3) that Thucydes, if the MS. reading is correct, underestimates the length of the island, which he gives as 15 stades instead of 24 (2200 yards), and also the breadth of the southern channel between it and the mainland. Cf. J.H.S. xx. 14 sqq. xvii. 274 sqq., and Frazer's summary (op. cit. v. 608 sqq.). (M. N. T.)

PYM, JOHN (1584-1643). English statesman, was the son and heir of Alexander Pym, by of Brymowe, Somersett, a member of an ancient family which had held this seat in direct descent from the male line of Henry III. He matriculated as a commoner at Broadgates Hall (now Pembroke College), Oxford, in 1599, and entered the Middle Temple in 1602. He acquired a sound knowledge of the law, and became receiver-general of the king's revenue for Wilts., thus gaining a valuable insight into business and finance. He was returned to parliament as member for Calne in 1614 and again in 1621. He at once became conspicuous in the struggle between Crown and parliament. To the committee appointed to consider the state of religion he made his first great speech on the 28th of November 1621. He held fast to the Elizabethan principle that the Roman Catholics should be subjected to disabilities, not because of their religion, but because of their politics. He, therefore, moved that a special commission for the suppression of recusancy should be appointed, and that an association, after the model of those formed under Elizabeth, should be entered into for defence of the king's person and for the execution of the laws concerning religion. Pym supported Sir Edward Coke in the remonstrance on the 6th November, which he described as a true quarter of the petition which incurred James's violent displeasure, and of the Commons' answer defending their privileges, which was afterwards torn from the records by the king's own hand. On the dissolution of parliament which immediately followed, Pym, with other "ill-tempered spirits," was arrested in January 1622, and was confined first to his house in London, and then to Bromyore. He associated himself with the party of Francis, 4th earl of Bedford, was returned for Tavistock in 1624, and represented this borough in all the ensuing parliaments. He supported Eliot in urging war against Spain for the defence of Protestantism and the Palatinate, and showed throughout his career, as far as his attention was ever directed to foreign policy, a steady inclination in favour of France.

In the parliament of 1625 he continued his campaign against the Roman Catholics, and drew up with Sir Edwin Sandys the articles against Jesuits. He was noted for the direct execution of the penal laws. In the parliament which followed the death of the chief mover, in April, in the prosecution of Richard Montagu, who had advocated Romish doctrines. On the 8th of May he was manager of Buckingham's impeachment, when it was his special duty to press articles ix., x., xi., relating to the improper distribution of rewards and honours. In the third parliament of Charles I., in 1628, Pym overruled Eliot in deciding that Buckingham's impeachment should now be subordinated to the struggle on general grievances. He zealously pressed on the Petition of Right, resisting on the 20th of May the clause added by the Lords to safeguard the king's "sovereign power," declaring that "he knew not what it was." On the 9th of June he carried up to the Lords the impeachment of Roger Manwaring, and delivered a famous speech in which he expounded the fundamental principles which guided his policy.

"Histories," he said, "are full of the calamities of whole states and nations. . . . [when] one part seeks to uphold the old form of government and the other part to introduce a new ... It is really true that time most ofttimes brings about some alterations. . . . Those things only are eternal which are constant and uniform. Therefore it is observed by the best writers on this subject, that those commonwealths have been most durable and perpetual which have often reformed and reconstituted themselves according to their first institution and ordinance."

On the 11th of June he joined in the attack upon Buckingham, whom he regarded as the "cause of all these grievances." On the 27th of January 1629 he was reporter of the committee on religion, and declared that conversation was dependent upon parliament. He again, in February 1629, differed from Eliot, who treated the dispute about tonnage and poundage as a point of privilege, declaring that "the liberties of this house are inferior to the liberties of the kingdom," and desiring to deal with it on higher ground as a breach of the law and the constitution. He took no part in the subsequent disturbance in the house, and his name is not mentioned as actively resisting Charles's arbitrary government during the eleven years which followed the dissolution. At this period the state of public affairs may well have appalled the most hopeful and the most patriotic, but there seems no sufficient authority for the belief that Pym, with Hampden and Cromwell, actually embarked for New England and were prevented from sailing by orders from the government. An allusion, however, to a similar plan formed "by some very considerable personages," "diverted by a miraculous providence," is made in a sermon by Thomas Cave in 1642. Pym himself was directly interested in the colonies, being appointed, under the patentee of Connecticut, and, of the latter company also treasurer, and there can be little doubt that like other leaders of the opposition during this period, he regarded America as a possible refuge.

On the assembly of the Short Parliament on the 13th of April 1640, Pym was the acknowledged leader. "Whilst men gazed upon each other," says Clarendon (Hist. ii. 68), "looking who should begin (much the greater part having never before sat in parliament), Mr Pym, a man of good reputation . . . who had been as long in these assemblies as any man there living, broke the ice." On the 17th of April he made a great speech of nearly 3,000 words which he delivered with great enthusiasm and with deep emotion in the words of Bacon "the interruption of that sweete communion which ought to be betwixt the king and his people in matters of grant and supply," pointed out the practical injury inflicted on commerce and every sort of enterprise including colonial expansion by illegal and arbitrary taxation, and concluded by asking the Lords to join in finding out causes and remedies. His words made a deep impression.

On the 27th of April he resisted the grant of supply, and when the Lords passed a resolution that supply should precede the
discussion of grievances. Pym, as manager of the Commons, 
on the 1st of May, read them a severe lecture on the breach 
of privilege they had committed. Finally, on the 4th, it was 
resolved that Pym should next day petition the king to make 
terms with the Scots, to avoid which Charles summarily 
dissolved the parliament.

All the energies of Pym were now concentrated on obliging 
Charles to change his policy and another parliament. He was the author 
of the petition of the twelve peers to the king for redress of grievances 
and for calling a new parliament, by the wide distribution 
of which an appeal was made to the nation, and he was the pro-
moter of the petition signed by 10,000 citizens of London. 
In company with Hampden he rode through the provinces, rousing 
and organizing public opinion. Meanwhile Charles's attempt 
to implicate Pym in treasonable communications with the 
Scots, though there is little doubt that they existed, met with 
complete failure. Thus, when the king was forced to call the Long 
Parliament on the 3rd of November, Pym was its acknowledged 
author and leader. His great work was now, as he conceived 
it, to save the national liberties and the national religion. 
Clarendon (Hist. iii. 2) records some "sharp discourse" of Pym 
with himself at this time, "that they had now an opportunity 
to make their country happy by removing all grievances 
and pulling up the causes, if all men would 
do their duties." He had seen Vane's notes of Strafford's 
speeches at the council when he had advised the subduing 
of "this kingdom" by the Irish army, and on the 7th of November, 
after declaring to the house the dangerous designs then on foot, 
Pym moved for a sub-committee to examine into Strafford's 
conduct in Ireland. The latter's sudden arrival at London on 
the 4th with the intention of instantly impeaching the popular 
leaders of treason was met by Pym with corresponding quickness 
and resolution. On the 11th, after a debate of four hours in 
the Commons, by his directions with locked doors, he carried 
up Strafford's impeachment to the Lords, and by this great stroke 
rendered him at once powerless.

On the 16th of December he moved the impeachment of 
Laud, whom he joined with Strafford as conspiring to subvert 
the government of the kingdom, and carried up the articles to 
the Lords on the 3rd of February 1642. He was the chief pro-
moter of the case against Strafford, while the attempts of the 
queen to gain him over were without result, and on the 28th of 
January 1641 he brought up to the Lords the list of charges. 
On the 23rd of March he opened the case, when he argued that 
attempt to subvert the laws of the kingdom was high treason, 
and delivered a violent denunciation against the fallen minister, 
attributing to him systematic cruelty, avarice and corruption. 
He soon afterwards heard of the army plot, and the necessity 
of destroying Strafford became more apparent. He now dis-
closed Vane's notes. To the attainder, which was at this stage 
resolved upon, he was opposed (since he clung to the more judicial 
procedure by impeachment), but when overruled he sup-
ported it, at the same time procuring that the legal arguments 
should not be interrupted. He delivered his final speech on 
the 13th of April, a great oratorical performance, when he 
again appealed to the Elizabethan political faith and to that 
of Bacon, who had so severely censured any action which divided 
the king from the nation. The man who violated this union 
was guilty of the blackest treason. "Shall it be treason," he 
asked, "to embase the King's coin though but a piece...of 
sixpence...and not to embase the spirits of his subjects; to set 
a trap and character of servitude upon them?" Towards 
the end of his tremendous indictment of Strafford, Pym broke 
down, fumbled among his papers, and lost the thread of his 
argument. But his temporary failure did not diminish the 
force and effect of his words, all the more impressive because 
actually spoken in the presence of the sovereign. "I believe," 
rote Baillie (Letters, i. 349) "the king never heard a lecture of 
so free language against that his idolized prerogative."

Attempts were now once more made to gain over Pym to 
the administration. He had two interviews with the king, 
but without result, and Charles again determined to resort to 
force. On the 2nd of May he endeavoured to get possession 
of the Tower. On the 3rd the Protestation, on Pym's motion, 
was taken by the Commons within closed doors, and afterwards 
circulated in the country, and on the 5th Pym disclosed the 
army plot. These incidents decided the struggle and Strafford's 
fate. The Lords immediately passed the attainder, together 
with the bill for the impeachment of Pym, and Charles, in 
the absence of their own consent. Soon afterwards were swept away those 
institutions of Tudor growth which had become the chief 
instrument of oppression, the council of the North, the court 
of high commission, and the star chamber, while the Crown aban-
doned the claim to levy customs without consent of parliament. 
Meanwhile Pym had also taken the lead in the religious con-
troversy. During the dispute between the two houses on this 
question on the 8th and 9th of February 1641, while supporting 
the London petition for the abolition of the bishops, he had 
declared his opinion that "it was not the intention of the House 
"of to abolish episcopacy or the Book of Common Prayer, but to 
"reform both wherein offence was given to the people." This, 
no doubt, expressed his real intentions and policy. When, 
however, it became clear that the bishops were merely the 
nominees of the king to carry out "innovations in religion" 
and preach arbitrary government, Pym was easily persuaded to 
support their abolition, and voted in opposition to the moderate 
party for the Root and Branch Bill of May 1641, and again for 
taking away their votes in October. But in his "Vindication," 
published in March 1643, he especially states that his action 
with regard to the bishops in "no way concluded me guilty 
of revolt from the orthodox doctrine of the Church of England."

The first act in the great political struggle had ended in the 
complete triumph of Pym. His chief care now was to defend 
the parliament from violence, since this was the only method 
of retaliation left at the king's disposal. Through the medium 
of the countess of Carlisle, Charles's plans were regularly dis-
closed to Pym. In June he heard of the second army plot, 
and on the 22nd he carried up the ten propositions to the Lords, 
requesting their concurrence in effecting the disbandment of 
the armies and the removal of evil counsellors. After Charles's 
departure for Scotland, Pym served on the committee for defence, 
appointed on the 14th of August, and was chairman of the 
committee which sat during the recess from the 9th of September 
to the 20th of October to watch the progress of affairs and 
communicate with Scotland. On the latter day letters arrived 
from Hampden, who had accompanied Charles, with news of the 
"incident," and immediate measures were taken to guard 
the parliament, by bringing up the train-bands. On the 30th 
Pym revealed his knowledge of the second army plot. On the 
1st of November came news of the Ulster insurrection, which 
created a serious difficulty for the parliament, when it was finally 
declared, at Pym's instance, that if the king did not change 
his advisers parliament would provide for the needs of Ireland 
independently. On the 22nd of November Pym made a great 
speech on the Grand Remonstrance, of which he was the chief 
promoter, when he referred to plots "very near the king, all 
driven home to the court and popish party."

Charles returned on the 27th. He immediately substituted a 
force commanded by Dorset for the guard already placed at 
Westminster, but was compelled to withdraw it, and on Pym's 
motion the house appointed its own watch. Everything 
now pointed to the advent of a frightful catastrophe. Charles 
pointed Lumsford to the Tower, rejected the Grand Remon-
strance and the Impressionist Bill, and began to assemble an 
armored force. In consequence Pym urged, but unsuccessfully, 
on the 50th of December the summoning of the train-bands to 
guard the parliament, and moved the impeachment of the 
bishops, who had declared the proceedings of the parliament 
to be sinful and illegal. At the critical moment, however, Charles 
waiver. He renewed his offer to Pym of the exchequer on 
the 1st of January 1642, and this meeting with a refusal, or again 
drawing back himself, he determined on the impeachment of 
the five members on the 3rd of January. The latter had been
forewarned of the king's plans, and when on the 5th he entered the House of Commons with an armed band to seize them, they had removed themselves in safety (see Lenthal, William). Charles's first look on entering was for his great opponent, and he was greatly disconcerted at not finding him in his usual place. To his question "Is Mr Pym here?" there was no answer, and nothing remained but to retreat with his mission completely unachieved.

The second act in the great national drama had thus, as the first, ended in failure for Pym. On the 11th, with the other members, he was escorted in triumph back to Westminster, and while the other four stood uncovered, Pym returned thanks from his place to the citizens. On the 25th of January he delivered a great speech to the Lords on the perils attending the kingdom, and referring to their hesitation on the subject of the militia, declared that he should be sorry that history should have to relate that the House of Peers had had no part in the preservation of the state in the present extremity of danger. The Commons ordered his speech to be printed, and it provided the chief material for the paper which followed: the "Pamphlet on the Parliament," which now followed. Still endeavouring to avoid a complete breach of constitutional forms, Pym caused to be added to the resolution of the Commons on the 20th of May 1642, which declared that "the king intends to make war against the parliament," the words "seduced by wicked counsel."

When war broke out, Pym remained at headquarters in control of the parliament and executive, and on the 4th of July was appointed to the committee of safety which directed the movements of the parliamentary forces. His attitude was firm but moderate. He opposed the attempt to prevent Colonel Vane from giving the king's message to the house on the 27th of August. On the 20th of October, upon Charles refusing to accept the petition of the parliament and advancing towards London, Pym proposed the parliamentary covenant, and that those who refused it should be "cast out of the House." He succeeded in overcoming the opposition in the city to the heavy taxation now imposed. On the 10th of November, after Edgehill, he spoke in support of the negotiations for peace, at the same time warning the citizens that "to have printed liberties and not to have liberty in truth and realities is but to mock the kingdom." In February 1643 he saw the paralysis in which the national interest, the negotiation of the treaty at Oxford supported the disbandment of the armies. When it was evident that peace would not be secured, he proposed in order to carry on the war an excise, hitherto unknown in England, which met with the same violent hostility afterwards aroused by Walpole's scheme. In March he published a "Declaration and Vindication" of his public conduct, in which he threw the whole blame of the appeal to arms on the opposite party, and expressed his fidelity to the Church and constitution. In May he entered, together with the other leaders, into resolute negotiations with the queen, and on the 3rd he took up his impecunious to the Lords. In June he reported on Waller's plot, which exposed the insincerity of Charles's negotiations, and on the 28th of June wrote a "sharp letter" to Essex on his inaction. In July, after the defeat at Adwalton Moor, he prevented the house from again initiating negotiations for peace, which he declared "full of hazard and full of danger," and on the 3rd of August, after having visited Essex at Kingston, persuaded him to separate himself from the peace propositions of the Lords and to march to relieve Gloucester. He thus incurred the hatred of the peace party, and on the 6th of August a mob of women surrounded the house calling for Pym's desecration, and were not dispersed without some bloodshed.

Pym had already, on the 3rd of January, proposed to the house an alliance with the Scots, and the Royalist victories now induced parliament to consent to what had before been rejected. The establishment of Presbyterianism was accepted by Pym as a disagreeable necessity, and he was one of the first to take the covenant on the 25th of September. This alliance, which was afterwards destined to have so decisive an influence on the military campaign, and was the first occasion on which the two nations had united in public action, closes Pym's great career. He was made master of the ordnance on the 8th of November, but died on the 8th of December at Derby House, where he resided. On the 13th of December he received a public funeral in Westminster Abbey, whence his body was ejected at the Restoration. A sum of £5,000 was voted by the parliament to pay Pym's debts and provide for his family. About 1662, Pym married Anne Hooke, or Hooker (d. 1652), by whom he had five children: three were married, one unmarried, and Charles, who was created a baronet; this title, together with Pym's male line, became extinct in the person of Pym's grandson Charles in 1688, Brymore then passing to his sister Mary, wife of Sir Thomas Hales, Bart.

Pym had little of the Puritan in his character or demeanour. His good humour, humanity and cheerfulness in all circumstances, "his pleasant countenance and sweet behaviour," were marked characteristics; the aspersions, however, on his morals, as well as the accusations of bribery, are completely unsubstantiated and discredited. His death came as an irreparable loss to the parliamentary cause. "Since Pym," writes Baillie (Letters, ii. 216), "not a state head among them; many very good and able spirits, but not any of so great and comprehensive a brain as to manage the multitude of weighty affairs as lyes on them." He was one of the greatest leaders that the House of Commons has produced, a most capable man of business, and indefatigable in assiduous attention to its details. He possessed great tact in influencing the conduct of the house and in removing personal jealousies on critical occasions, and he excelled as a party leader in choosing and directing the course of his party. He was an insatiable reader, and his paper-covered notebook and notes, and his well-tried guides, were a most valuable aid in his work. Pym's high character, his well-tried courage and resolution at critical moments, his skill and vigilance in unmasking and frustrating the designs of the opposite faction. But Pym was not only great as a party leader; he had the real instinct of construction, the true test of the statesman. This construction, he believed, in the spirit of genuine conservatism, must always be progress along the lines of natural development, and not by the methods of revolutionary or extraneous innovation. It was Pym's chief charge against Charles, Strafford and Laud that they had arrested this progress, and were thus leading the nation to ruin and dissolution. Such was the theory and conviction, inherited from Bacon and passed on to Halifax and Burke, which underlay and inspired Pym's policy.

PYRAMID, the name for a class of buildings, first taken from a part of the structure,1 and mistakenly applied to the whole of it by the Greeks, which has now so far acquired a more definite meaning in its geometrical sense that it is desirable to employ it in that sense alone. A pyramid therefore should be understood as meaning a building bounded by a polygonal base and plane triangular sides which meet in an apex.2 Such a form of architecture is only known in Middle Egypt, and there only during the period from the IVth to the XIIth Dynasty (before 3000 B.C.)—having square bases and angles of about 50°. In other countries various modifications of the tumulus, barrow or burial-mound have arisen which have come near to this type; but those when formed of earth are usually circular, or if square have a flat top, and when built of stone are always in steps or terraces. The imitations of the true Egyptian pyramid at Thebes, Meroe and elsewhere are puny hybrids, being merely chambers with a pyramidal outside and porticoes attached; and the structures found at Cenchreae, or the monument of Caius Sestius at Rome, are isolated and barren trials of a type which never could be revived: it had run its course in a country and a civilization to which alone it was suitable.

The origin of the pyramid type has been entirely explained by the discovery of the various stages of development of the tomb. In prehistoric times a square chamber was sunk in the ground, the dead placed in it, and a roof of poles and brushwood overlaid with sand covered the top. The 1st Dynasty kings developed this idea by building to it a wooden chamber, free-standing in the pit, with a beam roof, then a stairway at the side to descend; then a pile of earth held in by a dwarf wall over it. By the IIIrd Dynasty this dwarf wall had expanded into a solid mass of brick-work, about 280 by 150 ft. and 33 ft. high. This was the mastaba type of tomb, with a long sloping passage descending to the chamber far below it. This pile of brickwork was then copied in stone work early in the IVth Dynasty (Saqqara). It was then enlarged by repeated heightening and successive coats of masonry. And lastly a smooth casing was put over the whole, and the first pyramid appeared.

It is certain that the pyramids were each begun with a definite design for their size and arrangement; at least this is plainly seen in the two largest, where continuous accretion (such as Lepsius and his followers propound) would be most likely to be met with. On looking at any section of these buildings it will be seen how impossible it would have been for the passages to have belonged to a smaller structure (Petrie, 185). The supposition that the designs were enlarged so long as the builder’s life permitted was drawn from the compound mastos of Saqqara and Medium; these are, however, quite distinct architecturally from the true pyramid and have been enlarged at long intervals, being elaborately finished with fine casing at the close of each addition.

Around many of the pyramids peribolus walls may be seen, and it is probable that some enclosure originally existed around each of them. At the pyramids of Gizeh the temples attached to these mausolea may be still seen. As in the private tomb, the false door which represented the exit of the deceased person from this world, and towards which the offerings were made, was always on the west wall in the chamber, so the pyramid was placed on the west of the temple in which the deceased king was worshipped. The temple being entered from the east (as in the Jewish temples), the worshippers faced the west, looking towards the pyramid in which the king was buried. Priests of the various pyramids are continually mentioned during the old kingdom, and the religious endowments of many of the priesthoods of the early kings were revived under the Egyptian renaissance of the XXVIth Dynasty and continued during Ptolemaic times. A list of the hieroglyphic names of nineteen

1 The vertical height was named by the Egyptians pir-em-as (see E. Revillout, Tem. Eg., 2nd year, 305–306), hence the Greek form pyramis, pl. pyramides (Herod.), used unaltered in the English of Sundya (1615), from which the singular pyramid was formed.

2 For figures of geometrical pyramids see Crystallography, and for their mensuration see Mensuration.

of the pyramids which have been found mentioned on monuments (mostly in tombs of the priests) is given in Liebiehn’s Chronology, p. 32. The pyramid was never a family monument, but belonged—like all other Egyptian “tombs” to the pharaoh, members of the royal family having sometimes lesser pyramids adjoining the king’s (as at Khufu’s); the essential idea of the sole use of a tomb was so strong that the hill of Gizeh is riddled with deep tomb-shafts for separate burials, often running side by side 60 or 80 ft. deep, with only a thin wall of rock between; and in one place a previous shaft has been partially blocked with masonry, so that a later shaft could be cut partly into it, mated with it like a twin-crystal.

The usual construction of pyramids is a mass of masonry composed of horizontal layers of rough-hewn blocks, with a small amount of mortar; and this mass in the later forms became more and more puny hybrid, but were of massive blocks, usually larger in thickness than in height, and in some cases (as at South Dahshur) reminding the observer of horizontal leaves with sloping edges.

Inside of each pyramid, always low down, and usually below the ground level, was built a sepulchral chamber; this was reached in all cases by a passage from the north, sometimes beginning in the pyramid face, sometimes descending into the rock on which the pyramid was built in front of the north side. This chamber, if not cut in the rock altogether (as in Menkaure’s), or a pit in the rock roofed with stone (as in Khafra’s), was built between two immense walls which served for the east and west sides, and between which the north and south sides and roofing stood merely in contact, but unbonded. The gable roof of the chambers was formed by great sloping cantilevers of stone, projecting from the north and south walls, on which they rested without pressing on each other along the central ridge; thus there was no thrust, nor were there any forces to disturb the building; and it was only after the most brutal treatment, by which these great masses of stone were cracked asunder, that the principle of thrust came into play, though it had been provided for in the sloping form of the roof, so as to delay so long as possible the collapse of the pyramid. This is best seen in the pyramid of Pepi (Petrie), opened from the top right through the roof. See also the Abusir pyramids (Howard Vyse) and the king’s and queen’s chambers of the great pyramid (Howard Vyse, Piazz Smyth, Petrie). The roofing is sometimes, perhaps usually, of more than one layer; in Pepi’s pyramid it is of three layers of stone beams, each deeper than their breadth, resting one on another, the thirty stones weighing more than 30 tons each. In the king’s chamber (Gizeh) successive horizontal roofs were interposed between the chamber and the final gable roof, and such may have been the case at Abu Roash (Howard Vyse).

The passages which led into the central chambers have usually some lesser chamber in their course, and are blocked once or often with massive stone portcullises. In all cases some part, and generally the greater part, of the passages slopes downwards, usually at an angle of about 26°, or in 2. These passages appear to have been closed externally with stone doors turning on a horizontal pivot, as may be seen at South Dahshur, and as is described by Strabo and others (Petrie). This suggests that the interiors of the pyramids were accessible to the priests, probably for making offerings; the fact of many of them having been forcibly entered, otherwise data may show that no practicable entrance existed, but merely that it was unknown, as,
PYRAMID

for instance, in the pyramids of Khufu and Khafra, both of which were regularly entered in classical times, but were forced by the ignorant Arabs.

The pyramids of nearly all the kings of the IVth, Vth and VIth Dynasties (as mentioned) in the VIIth, and also a few of later times. The first which can be definitely attributed is that of Khufu (or Cheops), called "the glorious," the great pyramid of

A A Original Mastaba. Scale 1 inch to 100 feet.

Fig. 1.—Pyramid of Medum (Meidoun).

Gizeh. Dad-ef-ra, who appears next to Khufu in the lists, had his pyramid at Abu Roosah. Khafra rested in the pyramid now known as the second pyramid of Gizeh. Menkaurna's pyramid was called

"the upper," being at the highest level on the hill of Gizeh. The lesser pyramids of Gizeh, near the great and third pyramids, belong respectively to the families of Khufu and Khafra (Howard Vyse). The pyramid of Asefka, called "the cool," is unknown, so also is that of Userkauf of the Vth Dynasty, called the "holiest of buildings." Sahura's pyramid, the north one of Abisir, was named "the rising soul," much as Neferarkara's at Abisir was named "of the soul." Raenuser's pyramid, "the firmest of buildings," is the middle pyramid of Abisir. The pyramid of Menkaurna, called "the most divine building," is somewhere at Saqqara. Assa's pyramid is unidentified; it was "the beautiful." Unas not only built the mastaba Farun, long supposed to be his pyramid, but had a pyramid called "the most beautiful of buildings" at Saqqara, which was opened in 1881 (see Recueil des travaux, by M. Maspero, iii.), for those opened at Saqqara, in the Vth Dynasty the "the firm and beautiful.

"the souls," built by Ati (Hauerska), is unknown. That of Tuta "the most stable of buildings," was opened at Saqqara in 1881, as well as that of Pepi (Ramieri), "the firm and beautiful." The pyramids of Ramire, "the beautiful rising," and of Neferarkara, "the firm bfe," are unknown. Haremset's pyramid was opened at Saqqara in 1881. Of the last two kings of the Vth Dynasty we know of no pyramids. In the VIth or VIIth Dynasty most probably the brick pyramids of Dahshur were erected. In the IXth Dynasty, the pyramid, "the most glorious building," of Mentuhotep II. is at Deir el Bahri, and the mud pyramid of one of the Anted kings is known at Thebes. In the Xth Dynasty the pyramids, the "lofty and beautiful" of Amenemhet I., and "the bright" of Userkert II., are known in inscriptions, while the pyramid of Senuset I. is at Lisht, that of Senuset II. is at Illahun, that of Senuset III. at Dahshur (N. brick), and the brick pyramid at Howara is of Amenemhat III., who built the adjoining temple.

Of the architectural peculiarities of some particular pyramids some notice must now be given. The pyramid of Medum (figs. 1, 2) was the first true pyramid. It was begun as a mastaba, A, like other such tombs, such as that of King Neter-khet at Befet Khafaf. This mastaba was then enlarged by heightening it and adding a coating, and this process, repeated seven times, resulted in a high stepped mass of masonry. Such had been made before, at the step pyramid of Saqqara; but for the first time it was now covered with one uniform slope of masonry from base to top, and a pyramid was the result. The chamber is peculiar for being entered by a vertical shaft in the floor. The great pyramid (fig. 3) of Gizeh (Khufu's) is very different in its internal arrangements from any other known. The pyramid covers upwards of 13 acres, and is about 150 ft. higher than St. Paul's Cathedral. As compared with St. Peter's, Rome, it covers an area which is as 29 to 11, or nearly three times as much, and it is 50% higher. The greater number of passages and chambers, the high finish of parts of the work, and the accuracy of construction all distinguish it. The chamber which is most normal in its situation is the subterranean chamber; but this is quite unfinished, hardly more than begun. The upper chamber, called the "king's" and "queen's," were completely hidden, the ascending passage to them having been closed by plugging blocks, which concealed the point where it branched upwards out of the roof of the long descending passage. Another passage, which in its turn branches from the ascending passage to the queen's chamber, was also completely blocked up. The object of having two highly-finished chambers in the mass may have been to receive the king and his co-regent (of whom there is some historical evidence) and there is very creditible testimony to a sarcophagus having existed in the queen's chamber, as well as in the king's chamber. On the details of construction in the great pyramid it is needless to enter here, but it may be stated that the accuracy of work is such that the four sides of the base have only a mean error of six-tenths of an inch in length and 12 seconds in angle from a perfect square.

Fig. 2.—Pyramid of Medum.

The second pyramid of Gizeh, that of Khafra, has two separate entrances (one in the side, the other in the pavement) and two

From Vyse's Pyramids of Gizeh.

Fig. 3.—Section of Great Pyramid.

1 With respect to the construction of this and other pyramids, see Howard Vyse; on measurements of the inside of the great pyramid and descriptions, see Piazz Smyth; and on measurements in general mechanical means, and theories, see Petrie.
chambers (one roofed with slabs, the other all rock-hewn), these chambers, however, do not run into the masonry, the whole bulk of which is solid so far as is known, and which is inescapable unless the original casing on the top: and it is also interesting as having the workmen's barracks still remaining at a short distance on the west side, long chambers capable of housing about 4000 men. The great bulk of the rubbish from the work is laid on the south side, forming a flat terrace level with the base, and covering a steep rock escarpment which existed there. The waste heaps from the great pyramid were similarly tipped out from the cliff on its northern side. Thus the rubbish added to the broad platform which set off the appearance of the pyramids; and it has remained undisturbed in all ages, as there was nothing to be got out of it. The third pyramid, that of Menkaure, was caséd around, but remains as a core for the sixteen lowest courses. The design of it has been enlarged at one bound from a small pyramid (such as those of the family of Khufu) to one eight times the size, as it is at present, the passages needed therefore to be altered. But the huge blocks of stone have remained, with settings for the sixteen lowest courses. The north pyramid has been described as a single arch, the stones being merely cantilevers opposite to each other, with the uncut quartzite to the above form (see fig. 5).

From Vyse.

Fig. 4.—Sepulchral Chamber, Third Pyramid. The whole face of the pyramid was thrown out; the tiles were taken to Berlin by Leopold. The other pyramids of Saqqara are those of Unas, Pepi, Harem-saf, &c. They are distinguished by the introduction of very long religious texts, covering the whole of the chambers and passages; these are carefully carved in small hieroglyphics, painted bright green, in the white limestone. Beyond these come the pyramids of Dahshur, nearly all of them in a simple and massive style, much like those of Gizeh. The north pyramid of Dahshur has chambers roofed like the gallery in the great pyramid by successive overlapping of stone, the roof rising to a great height, with no less than eleven projections on each side. The south pyramid of Dahshur has still the greater part of the casing remaining, and is remarkable for being built at two different angles, the lower part being at the usual pyramid angle, while the upper part is 2° 51' 2". This pyramid is also remarkable for having a western passage to the chambers, which was carefully closed up. Beyond the Memphitic group are the scattered pyramids of Lisht (Senesert I.), Ilahun (Senesert II.), and Howara (Amenehmar III.), and of Pepi, and in the pyramid of the Third, one. These pyramids were all built by the same hand and on the same lines. The time of the masonry, previously white, was always black. See G. Hart, Die Ursprung und Verbreitung der Pyramiden- und Thibisbe (1889-1892).

PYRAMIDION—PYRARGYRITE

The first two closely agree to the proportion of 7 high on 1 base, approximately the ratio of a radius to its circle. And on dividing the base of the Medium pyramid by the side of the Khufu base, we obtain 2:11 is 282.4.4. These moduli are 25 cubits of 20-625 and 40 cubits of 20-611; so it appears that the form was of the same type, but with moduli of 25 and 40 cubits respectively.

The structures of the pyramid which Vyse in the Fayum have no possible claim to such a name; they were two great covered courts with sloping sides, in the centres of which were two seated statues raised on pedestals high enough to be seen over the walls of the courts. This form would appear like a pyramid with a statue on the top; and a rather similar case in early construction is shown on the sculptures of the old kingdom. Obelisks then were somewhat like pyramids, but not covered; they were placed in the central court yard with sides sloping like a mastaba; such open courts on a small scale are found in the mastabas at Gizeh, and are probably copied from the domestic architecture of the time.

The obelisk question of inscriptions is sufficient to say that not one fragment of early inscription is known on the casing of any pyramid, either in situ or broken in pieces. Large quantities of travellers' graffitis " doubtless existed, and some 50. ft. square. Beyond the already described there at Bishamun in the Fayum, we have no right to believe that there were any others in this district, for the Fayum pyramids are so various that it is not possible to give rise to the accounts of inscriptions, which are expressly said to have been in many different languages.

The mechanical means employed in the pyramid-builders have been partly ascertained. The hard stones, granite, diorite and basalt were in all fine work sawed into shape by bronze saws set with jewels (either corundum or diamond), hollows were made (as now) by drills with tubular handles in the Rock by rock-drills (which are but re-invented from ancient sources, see Engineering, xxxvii. 282). The details of the questions of transport and management of the large stones remain still to be explained.
PYRAZINES

in colourless needles, is very stable and behaves
weak base. It does not combine with the alkyl iodides.
Ammoniacal silver nitrate gives a precipitate of pyrazole silver.
The homologues of pyrazole may be obtained by digesting /3crystallizes

as a

diketones or /3-keto-aldehydes with pheny Ihydrazine ; by heating
the phenylhydrazones of some monoketones with acetic anhydride
by elimination of hydrogen from pyrazolines, and by distilling
pyrazolones and pyrazplidones over zinc dust. They are all weak
bases, which combine directly with the alkyl iodides and form doubU
salts with mercuric and platinic chlorides.
On oxidation wit!
potassium permanganate the C-alkyl-derivatives give carboxylic
acids, whilst the jV-phenyl derivatives frequently split off the
phenyl group (especially if it be amidated) and have it replaced
by hydrogen. On reduction, the pyrazoles with a free :NH group
are scarcely affected, whilst the JV-phenyl derivatives give pyrazolines, or by the use of very strong reducing agents the ring is ruptured
and trimethylenediamine derivatives are formed.
They yield
substitution derivatives with the halogens, bromine being the most
effective.
The chloro-derivatives are most readily prepared from
the pyrazolones by the action of phosphorus oxychloride.
The pyrazole carboxylic acids may also be obtained by condensing 0-diketone or oxymethylene ketone carboxylic esters with
hydrazines, or the diazo fatty esters with acetylene dicarboxylic

alkyl derivatives readily oxidize to pyrazine carboxylic acids.
Pyrazine, Cir^Nj, crystallizes from water in prisms, which have
a heliotrope odour. It melts at 55 C. and boils at 115 C. It may
also be obtained by elimination of carbon dioxide from the pyrazine
dicarboxylic acid formed when quinoxaline is oxidized with alkaline
potassium permanganate (S. Gabriel).
2-$-Dimethylpyrazine, or
ketine, C4H 2 (CH 3 ) 2 N 2 is obtained by reducing isonitrosoacetone, or
by heating glycerin with ammonium chloride and ammonium
phosphate. It boils at 153 C.
Two classes of dihydropyrazines are known, namely the I -A
and 2-3- dihydro-compounds, corresponding to the formulae II. and

H. v. Pechmann, Ber., 1894, 27, p. 1891), and by rearrangement of
the hydrazones of o-olefine aldehydes or ketones on warming or on
distillation.
They are weak bases which are only soluble in concentrated acids. On reduction they yield pyrazolidines, or the ring
is broken;
and when oxidized they form blue or red colouring
matters.
The carboxylic acids show a remarkable behaviour on
heating, the nitrogen is entirely eliminated, and trimethylene carboxylic acids are obtained (see POLYMETHYLENES). Pyrazoline is
a colourless liquid which boils at 144 C. It may be prepared
by the action of diazomethane on ethylene (E. Azzarello, Gazz.,
1906, 36, (L), p. 628).
The pyrazolones (ketodihydropyrazples), first prepared by L.
Knorr in 1883, result from the elimination of the elements of alcohol
from the hydrazones of /J-ketonic acids; or on the oxidation of the
pyrazolidones with ferric chloride. Three types are possible with

(Piperazine).

of the former type are obtained by condensing a-bromketones
1355) ; the latter type result on condensing alkylene diamines with
a-diketones. The 2-3 derivatives are somewhat unstable compounds,
since on heating they readily give up two hydrogen atoms. Tetrahydropyrazines of the 1-2-3-4 type have also been obtained (L.
Garzini, Ber., 1891, 24, 956 R). Hexahydropyrazine or piperazine
(formula IV. above), also known as diethylene diamine, may be
prepared by reducing pyrazine, or, better, by combining aniline and
ethylene bromide to form diphenyl diethylene diamine, the dinitroso
compound of which hydrolyses to para-dinitrosophenol and pipera-

more poisonous.


The pyrazolines are tetrahydropyrazoles. The N-phenyl derivative, from sodium phenylhydrazine and trimethylene bromide, is an oil which readily oxidizes to phenylpyrazoline on exposure. The corresponding keto-derivatives, or pyrazolones, are formed by the action of hydrazines on the β-haloid acids or α-olefine dicarboxylic acids. Isomeric compounds may arise here when phenylhydrazine is used, the keto-group taking either the 3 or 5 position; thus with β-iodopropionic acid 1-phenylpyrazolone is formed, whilst potassium β-lodopropionate gives the 3-compound. Isomers of this type may be distinguished by the fact that the pyrazolone-5 compounds are basic, whilst the 3-compounds are acidic. The simplest member of the series, pyrazolone-5, is a liquid which is formed by the action of hydrazine on acryl acid. The 3-5-pyrazolones are the cyclic hydrazides of the malonic acid series.

Thiopyrazoles have been obtained by A. Michaelis (Ann., 1904, 331, p. 197; Ber., 1904, 37, p. 2774) by the action of an aqueous or alcoholic solution of the methyl chloride or iodide of phenylmethylchloropyrazole on a solution of an alkali hydrosulphide into which carbon bisulphide has been passed; or by the action of sodium thiosulphate on antipyrene hydrochloride or a similar compound. The simplest member of the group is probably to be represented as

\[ \text{HC:C(SH)} \xrightarrow{\text{CH}_2\text{C}=\text{N}} \text{N-CH}_2\text{H}_4 \text{ or } \text{H}_2\text{C:C}=\text{CS}_2 \xrightarrow{\text{CH}_2\text{C}=\text{N}} \text{N-CH}_2\text{H}_4. \]

PYRENEE, C₉H₈, a hydrocarbon found together with chrysene in the last portion of the coal tar distillate, and also in "Stupp" fat.

The crude solid product from the tar distillate is digested with carbon bisulphide to dissolve the pyrene, the solution filtered and the solvent evaporated. The residue is dissolved in alcohol and to the cold saturated solution a cold alcoholic solution of picric acid is added; the picrate so formed is then decomposed by ammonia. On its separation from "Stupp" fat see E. Bamberger and M. Philip, Ann., 1887, 240, p. 161. It crystallizes in monoclinic tables which melt at 145°-149° C. Chromic acid oxidizes it to pyrene quinone, C₉H₇O₂, and pyrene acid, C₉H₆O₂. The picrate, which is easily soluble in benzene, crystallizes in long red needles melting at 222° C. When heated with hydriodic acid and phosphorus to 200° C, it yields a hexahydrate. It has been obtained synthetically by J. B. and H. Michaelis (Ber., 1897, 30, p. 1383) by distilling thebenol over zinc dust in a stream of hydrogen, or by the action of hydriodic acid and phosphorus at 220° C. on thebenol.

PYRENEES [Span. Pirineos, Fr. Pyrénées], a range of mountains in south-west Europe, separating the Iberian Peninsula from France, and extending for about 500 m., from the Bay of Biscay to Cape Creus, or, if only the main range of the range be considered, to Cape Cerbére, on the Mediterranean Sea. For the most part the main crest runs north-east and intersect the Franco-Spanish frontier; the principal exception to this rule is formed by the valley of Aran, which belongs orographically to France but politically to Spain. The Pyrenees are conventionally divided into three sections, the central, the Atlantic or western, and the eastern. The central Pyrenees extend eastward from the Port de Canfranc to the valley of Aran, and include the highest summits of the whole chain, Aneto or Pic de Néthou (11,161 ft.), in the Maladetta ridge, Posets (11,084 ft.), and Mont Perdu or Monte Perdido (10,997 ft.). In the Atlantic Pyrenees the average altitude gradually diminishes westward; while in the eastern Pyrenees, with the exception of one break at the eastern extremity of the Pyrénées Arégeois, the mean elevation is maintained with remarkable uniformity, till at last a rather sudden decline occurs in the portion of the chain known as the Alèthes. This threefold division is only valid so far as the elevation of the Pyrenean chain is concerned, and does not accurately represent its geological structure or general configuration. The careful examination of the chain by members of the English and French Alpine Clubs has since 1880 considerably modified the views held with respect to its general character; the southern versant, formerly regarded as inferior in importance to the central, has been proved to be more important than the central. It has been recognized, as shown in the maps of MM. Schrader, de St Sand and Wallon, that, taken as a whole, the range must be regarded, not as formed on the analogy of a fen-frond or fish-bone, with the lateral ridges running down to the two opposite plains, but rather as a swelling of the earth's crust, the culminating portion of which is composed of a series of primitive chains, which do not coincide with the watershed, but cross it obliquely, as if the ground had experienced a sidewise thrust at the time when the earth's crust was ridged up into the long chain under the influence of contraction. Both the orderly nature of the geologic sections and the character of the chain exists between the tectonic and geological phenomena are well shown in the geological and hypsometric maps published in the Annuaire du Club Alpin français for 1891 and 1892 by MM. Schrader and de Margerie. The primitive formations of the range, of which little beyond the French portions had previously been studied, are shown to be almost all continued diagonally on the Spanish side, and the central ridge thus presents the appearance of a series of wrinkles with an inclination (from north-west to south-east) greater than that of the chain as a whole. Other less pronounced wrinkles run from south-east to north-east and intersect the former series at certain points, so that it is by alternate digressions from one to the other series that the irregular crest of the Pyrenees acquires its general direction. Far from having impressed its own direction on the orientation of the chain at large, this crest is merely the resultant of secondary agencies by which the primitive mass has been eroded and lessened in bulk, and though its importance from a hydrographic point of view is still considerable, its geological significance is practically nil.

Geology. The Pyrenees are divided by E. de Margerie and F. Schrader into a number of geological districts, the central part of which consists of Primary rocks, together with great masses of granite. It forms most of the higher summits, but west of the Pic d'Anie it disappears beneath an unconformable covering of Cretaceous deposits. On the French side the central zone consists of the zone of Ariège, consisting of Lower Cretaceous and Jurassic beds, together with granitic masses; (2) the zone of the Petites Pyrénées, Upper Cretaceous and Eocene; and (3) the zone of the Corbières, consisting of Trias, Eocene, and Triassic rocks. On the Spanish side from north to south, (1) the zone of Mont Perdu, Upper Cretaceous and Eocene; (2) the zone of Aragon, Eocene; and (3) the zone of the Sierras, Trias, Cretaceous and Eocene. In France the zones are clearly defined only in the eastern part of the chain, while towards the west they merge into one another. In Spain, on the other hand, it is in the central part of the chain that the zones are most distinct. Although the number of zones recognized is the same on the two flanks, they do not correspond. The zone of the Corbières has no equivalent in Spain, while in France there is no definite zone of Eocene like that of Aragon. The zone of the Petites Pyrénées, however, is clearly homogeneous with that of the Sierras, although the granitic masses occur in the zone of Ariège amongst the Jurassic and Lower Cretaceous beds. On the southern side they are not found except in the axial zone, and the Jurassic and Lower Cretaceous deposits are reduced to a narrow band. In spite of these differences between the two flanks, the structure is to some extent symmetrical. On the north the greater number of the overlies lean towards the north, whereas on the south it is towards the south. The central crest follows the typical fan-structure which has long been recognized in the western Alps.

Since the publication of the maps by de Margerie and Schrader it has been shown that the denominations of "recouvrement" play almost as large a part in the Pyrenees as in the Alps themselves. Large masses of rock have been brought upon nearly horizontal faults (thrust-planes) over the edges of either beds with which they originally had no contact. For example, patches of Trias lie discordantly upon the edges of the Cretaceous and Tertiary beds. Several other similar cases
have been described; but denudation has been carried further in the western Alps, and accordingly the masses overlying the thrust-planes have been more completely removed (q.v.).

The earth movements which raised the Pyrenees appear to have begun in the Eocene period, but it was in Oligocene times that the principal folding took place. The Pyrenees are therefore contemporaneous with the Alps; but they appear to have escaped the Miocene disturbances which affected the latter.

The range of the Pyrenees is only gently inclined near the centre but longitudinal everywhere, is illustrated by the courses of the streams which flow down towards Spain. On the French side, the Pyrenees have a different aspect from that of the Alps, and this is why the range has so often been described as sending out transverse spurs, the more important slope remaining unknown. It is, however, still possible to distinguish some traces of this formation. The Mont Canigou (13,913 ft.) on the Pyrenean side is an example of this aspect. The slope of the range, become involved half-way to the plains in great longitudinal and Spanish government, they make their escape only after traversing long distances without finding an outlet.

The importance shown to attach to the Spanish versant has greatly modified the values formerly assigned to the area and mean elevation of the Pyrenees, instead of the 13,440 sq. m. formerly put down for the total, M. Schrader found the area to be 21,044 sq. m. Of this total 6590 sq. m. fall to the northern slope and 14,554 sq. m. to the southern, being more than double, to the southern, the difference being mainly due to the zone of plateaux and sierras. The mean elevation, estimated by Elie de Beaumont at 1500 metres (4900 ft.), has been sensibly diminished by the addition of that zone to the system, and it must be no less than 13,30 ft. as a whole; so important a part is played by the above-mentioned plateaux of small elevation in a chain whose highest summit reaches 11,165 ft., while the passes show a greater altitude than those of the Alps.

Four conspicuous features of Pyrenean scenery are the absence of great lakes, such as fill the lateral valleys of the Alps; the rarity and great elevation of passes; the large number of the mountain torrents locally called gashes, which often form lofty waterfalls, surpassed in Europe only by those of Scandinavia; and the frequency with which the upper end of a valley assumes the form of a semicircle of precipitous cliffs, locally called a cirque. The highest waterfall is that of Gavarnie (1315 ft.), at the head of the Gave de Pau; the Cirque de Gavarnie, in the same valley, is perhaps the most famous example of the cirque formation. Not only is there a total lack of those passes, so common in the Alps, which lead across the great mountain chains at a far lower level than that of the neighbouring peaks, but between the two extremities of the range, where the principal highroads and the only railways run between France and Spain, there are only two passes practicable for carriages—the Col de la Perche, between the valley of the Tet and the valley of the Segre, and the Col de Somport or Pot de Canfranc, on the old Roman road from Saragossa to Oloron.

Projects for further railway construction, including the building of tunnels on a vast scale, have been proposed by the French and Spanish governments (see Spain: Communications).

The metallic ores of the Pyrenees are not in general of much importance, though there are considerable iron mines at Vic de Sois in Ariège and at the foot of Canigou in Pyrénées-Orientales. Coal deposits capable of being profitably worked are situated chiefly on the Spanish slopes but the French side has numerous beds of lignite. Mineral springs are abundant and very remarkable, and specially noteworthy are the hot springs, in which the Alps, on the contrary, are deficient. The hot springs, among which those of Bagners de Luchon and Eaux-Chaudes may be mentioned, are sulphurous and mostly situated high, the winter temperature being with the stratified rocks.

The lower springs, such as those of Bagners de Bigorre (Hautes-Pyrénées), Rennes (Aude) and Campagne (Aude), are mostly seismatic and not very warm.

The amount of the precipitation, including rain and snow, is much greater in the western than in the eastern Pyrenees, which leads to a marked contrast between these sections of the chain in more than one respect. In the first place, the eastern Pyrenees are without glaciers, the quantity of snow falling there being insufficient to lead to their development. The glaciers are confined to northern slopes of the central Pyrenees, and do not descend, like those of the Alps, far down in the valleys, but have their greatest length in the direction of the mountain-chain. They form, in fact, a narrow zone near the crest of the highest mountains. Here, as in the other great mountain ranges of central Europe, there are evidences of a much wider extension of the glaciers during the Ice age. The case of the glacier in the valley of Argelés in the department of Hauts-Pyrénées is the best-known instance. The snow-line varies in different parts of the Pyrenees from 8800 to 9200 ft. above sea-level.

A still more marked effect of the preponderance of rainfall in the western half of the chain is seen in the aspect of the vegetation. The lower mountains in the extreme west are very well wooded, but the extent of forest declines eastwards, and the eastern Pyrenees are peculiarly wild and naked, all the more since, it is in this part of the chain that granite masses prevail. There has been a change in the composition of the flora in passing from west to east. In the west the forest, at least in the north, resembles that of central Europe, while in the east it is distinctly Mediterranean in character, though the difference of latitude is only about 1°, on both sides of the chain from the centre whence the Cébrenes stretch north-eastwards towards the central plateau of France. The Pyrenees are relatively as rich in endemic species as the Alps, and among the most remarkable instances of that endemism is the occurrence of the sole European species of Dioscorea (yam), the D. pyrenaea, on a single high station in the central Pyrenees, and that of the botrys or potato onion (Allium pyrenaeum) which occurs between the Val d’Eyne and Catalonia. The genus most abundantly represented in the range is that of the saxifrages, several species of which are here endemic.

In their fauna also the Pyrenees present some striking instances of endemism. There is a distinct species of ibex (Capra pyrenaica) confined to the range, while the Pyrenean desman or water-mole (Myogale pyrenaica) is found only in some of the streams of the northern slopes of these mountains, the only other member of this genus being confined to the rivers of southern Russia. Among the other peculiarities of the Pyrenean fauna are land insects in the caverns of Ariège, the principal genera of which are Anaphthalmus and Adolops.

The ethnology, folk-lore, institutions and history of the Pyrenean region form an interesting study: see Andorra; Aragon; Basques; Bear; Catalonia; Navarre.

PYRÉNÉES-ORIENTALES, a department of south-western France, bordering on the Mediterranean and the Spanish frontier, formed in 1790 of the old province of Roussillon and of small portions of Languedoc. The population, which includes many Spaniards, numbered 213,171 in 1906. Area, 1599 sq. m.

The department is bounded N. by Ariège and Aude, E. by the Mediterranean, S. by Catalonia and W. by the republic of Andorra. Its borders are marked by mountain peaks, on the north by the Pyrénées, on the extreme south-east by the Allobères, which end in the sea at Cape Cerbera, Spurs of these ranges project into the dept., covering its whole surface, with the exception, with the exception, with the exception, of the alluvial plain of Roussillon, which extends inland from the sea-coast. Deep and sheltered bays in the vicinity of Cape Cerbera are succeeded farther S. by a deep inlet cut by the coast and formed by the sea from the bay of Socoa. The lagoon of St Nazaire is 2780 acres in extent, and that of Leucate on the borders of Aude is 19,300 acres. Mont Canigou (9157 ft.), though surpassed in height by Monte Pio in the Pyrenees, is the most remarkable feature in the eastern Pyrenees, since it stands out to almost its full height above the plain, and exhibits with great distinctness the succession of zones of vegetation. From the base to a height of 1400 ft. are found the orange, the aloe, the olearia, the pomegranate
and the olive; the vine grows to the height of 1800 ft.; next come the chestnut (2652 ft.), the rhododendron (from 4330 to 6340 ft.), pine (6660), and birch (6900); while stunted junipers grow to the summit.

The drainage of the department is shared by the Tet and the Tech, which rise in the Pyrenees, and the Aigü, which rises in the Corbieres. All three flow eastwards into the Mediterranean. The Aude, the Ariège (an affluent of the Garonne) and the Sègre (an affluent of the Ebro) also take their rise within the department and include a small part of it in their respective basins. The Aude rises at the foot of the Carlitte Peak and descends rapidly into a very narrow valley before it debouches at Ille (between Prades and Perpignan) upon the plain of Ille-sur-Tet, which forms over 10,000 acres of irrigated land supplied by numerous canals for irrigation. It is nowhere navigable, and its supply of water varies much with the seasons, all the more that it is not fed by any glacier. The Aigua, which joins these three streams a little beyond the city of Perpignan, is a navigable river, and is supplied by numerous canals for irrigation. The Tech, which after the Tet is the most important river of the department, flows through the Pyrenees and the Corbieres; it takes its name, a green valley, clothed with wood and alive with industry; in its course the river passes Prats de Mollo and Arles-sur-Tech, before reaching Amélie-les-Bains and Ceret. In the lower parts the climate is that of the Mediterranean, characterized by mild winters, dry summers and short and sudden rain-storms.

Amélie-les-Bains is much frequented on account of its mild climate and sheltered position. The thermometer readings range from 85° to 100° in summer and from 50° to 60° in winter, while occasionally falls as low as 26° or 27°. The mean amount of the rainfall is 27 in. on the coast, but increases towards the hills. The most common wind is the tramontane from N.N.W., as mistral in the south of France and extremely parching.

The marinaud blows from the S.S.E.

The cultivated land in Pyrénées-Orientales is devoted to wine-growing, market-gardening and fruit culture, the production of cereals being comparatively unimportant. The main source of wealth to the department is its wine, of which some kinds are strongly alcoholic and others are in request as liqueur wines (Rivesaltes, Banyuls). The cultivation of early vegetables (artichokes, asparagus, tomatoes, green peas), which is specially flourishing in the irrigated lowlands, and fruit-growing (peaches, apricots, plums, pears, quinces, pomegranates, almonds, apples, cherries, walnuts, chestnuts), which is chiefly carried on in the river valleys, yield abundant returns. The woods produce timber for the cabinet-maker, cork, and bark for tanning. Large flocks of sheep feed in the pastures of the Pyrenees and Corbieres; the keeping of silkworms and bees is also profitable. In iron Pyrénées-Orientales is one of the richest departments in France, the greater part of the ore being transported to the interior. Lignite and various kinds of stone are worked. The mineral waters are much resorted to. Amélie-les-Bains has hot springs, chalybeate or sulphurous. In the arrondissement of Cerdos there are also the establishments of La-Preste-les-Bains, near Prats de Mollo, with hot sulphurous springs, and de Le Boulu, the Vichy of the Pyrenees. Near Prades are the hot sulphurous springs of Molitg, and a little north of Mont Canigou the Vernet is a hot spring of sodium and sulphur. In the valley of the Tet the sulphurous and alkaline springs of Thoué reach a temperature of 172° F. The baths of Les Escalades, near Montlouis, are hot, sulphurous and alkaline. There are oil-works and sawmills, and the manufactures of the department include the making of whips, handles, corks, cigarette paper, paper, bricks, and woolen and other cloths, and espardilles (a kind of shoe made of coarse cloth with esparto soles). Of the ports of the department Port Vendres alone has any importance. Imports include timber, Spanish and Algerian wine, cereals, coal; among the exports are wine, timber, vegetables, fruit, honey, oil, and tobacco.

The chief railway routes in Pyrénées-Orientales are Perpignan by way of Montlouis, a fortified place, to Puigcerda, in the Spanish province of Gerona, through the pass of La Pera, skirting in the French department an enclave of Spanish territory. Three other roads run from Perpignan to Figueras through the passes of Perthus (defended by the fort of Belle-garde), Banyuls and Balistes, the last-named being traversed by a railway. The chief towns of the three arrondissements are Perpignan, Ceret and Prades; there are 17 cantons and 232 communes. The department constitutes the diocese of Perpignan, and is attached to the appellate court and the academy of Montpellier and to the region of the XVI. army corps, of which Perpignan is the headquarters.

Perpignan, the capital town and a fortress of the first class, Amélie-les-Bains and Elne are the more noteworthy places, and are treated separately. Rivesaltes (5448) is the most populous town after Perpignan. Other places may be mentioned. Planès has a curious church, triangular in shape, and of uncertain date. Popular tradition ascribes to it a Moslem origin. The church and cloister at Arles-sur-Tech are also of the 12th century. Bouc-d'Amont has a Romanesque church which once belonged to the Augustine abbey of Serrabona. It is peculiar in that its aisles open out into lateral porches, instead of communicating with the nave. The church of Castel, which is of the 11th century, is a relic of the ancient abbey of St Martin de Canigou. At St Michel-de-Guxa, near Prades, are fine ruins of a Benedictine abbey. The hamlet of Fontromeu, near Odello, has a chapel with a statue of the Virgin, which is visited by numerous pilgrims.

PYRETHRUM. The pyrethrum or "feverfew" (nat. ord. Compositae), now regarded as a section of the genus Chrysanthemum, flowers in the early summer months, and is remarkable for its neat habit and the great variety of character and colour which it presents. The type form is the Caucasian species P. roseum of botanists, hardly perennial, with finely cut leaves and large flower heads, having a ray of deep rosecoloured involute flowers, surrounding a yellow central disk or disk.

They bloom during the months of May and June, as well as later, and are always most welcome ornaments for the flower borders, and useful for cutting for decorative purposes. There are now many excellent varieties, both single and double-flowered, in cultivation.

The pyrethrum grows best in soil of a loamy texture; this should be well manured and deeply trenched up before planting, and should be mulched in the spring by a few sprinklings of sawdust. Sement is usually sown in the autumn, and, when the young plants should be put out into beds when large enough, and should flower the following May. New varieties are being constantly introduced; the reader is referred to the catalogues of numerous nurseries for named kinds. The powdered root of P. roseum and other species is used in the manufacture of insect powders. P. parthenifolium var. aurem is the "golden-leather" of gardens, so much employed as an edging to flower-beds. P. parthenium, pellitory or "feverfew," was formerly used in medicine. Its double-flowered form is well worth growing. P. uiginosum is the "great ox-eye daisy" that flowers in September and October.

PYRGI (mod. S. SEVERA), an ancient town of Etruria, Italy, on the south-west coast, 9 m. W.N.W. of Caere. The name is Greek (pyrgos, towers), and the place of considerable antiquity. Remains of its defensive walls exist in polygonal blocks of limestone and sandstone, neatly jointed. They enclosed a rectangular area some 200 yds. in width and at least 220 yds. in length. The south-west extremity has probably been destroyed by the sea. It contained a rich temple of Leucothea, the foundation of which is surrounded by the yellow casque. It was plundered by Dionysius in 384 B.C. Later it became dependent on Caere, though it is not probable that it was originally merely the harbour of Caere; Alsidium (q.v.) is a good deal nearer (5 m. south). The Romans planted a colony here, which is first mentioned in 192 B.C. Later still it supplied fish to the capital, and became a favourite summer resort, as did also Punicus (S. Marinella) 5 m. to the north-west, where are many remains of villas. Both were stations on the coast road (Via Aurelia).

PYRGOS—PYRIDINE

PYRGOS, a town of Greece, in the province of Elis and Achaea, 43 m. S.S.W. of Patras. It is the third town in importance in the Peloponnesus, and is connected with its harbour, Katakolon, 72 m. distant, and also with Patras and Olympia, by rail. It has frequently been injured by earthquakes. Pop. (1907), 13,600.

PYRIDINE, a monocyclic organic base, discovered by T. Anderson (Trans. Roy. Soc. Edin., 1851, 29, p. 231) in bone oil. It is also found among the distillation products of bituminous coal, lignite, and various shales, and has been detected in fusel oil and crude petroleum. It is a decomposition product of various alkaloids (nicotine, sparteine, cinchonine, &c.), being formed when they are strongly heated either alone or with zinc dust. It may be synthetically prepared by distilling allyl ethylamine over heated lead oxide (W. Königs, Ber., 1879, 12, p. 2341) by passing a mixture of acetylene and hydrocyanic acid through a red-hot tube (W. Ramsay, Ber., 1877, 19, p. 736); by heating pyrrol with sodium methylate and methylamide iodide to 200° C. (D. Denstedt and J. Zimmermann, Ber., 1885, 18, p. 3316); by heating isomyl nitrate with phosphorus pentoxide (E. T. Chapman and M. H. Smith, Ann., 1868, Suppl. 6, p. 329); and by heating pyridine in acetic acid solution with silver acetate (J. Tafel, Ber., 1892, 25, p. 1619). The amount of pyridine produced in most of these processes is very small, and the best source for its preparation is the "light-oil" fraction of the coal-tar distillate. The basic constituents are removed by dilute sulphuric acid, the acid layer removed, and the bases liberated by alkali, separated, dried, and fractionally distilled.

Pyridine is a colourless liquid of a distinctly unpleasant, penetrating odour. It boils at 1145° C., and is miscible with water in all proportions. It is a tertiary base, and combines readily with the alkyl halides to form pyridinium salts. Nascent hydrogen reduces it to piperidine, C₄H₅N (see below), whilst hydriodic acid above 300° C. reduces it to n-pentane (A. W. Hofmann, Ber., 1883, 16, p. 590). It is a very stable compound, chromic and nitric acids being without action upon it, whilst the halogens only yield substitution derivatives with difficulty. It reacts with sulphuric acid only at high temperatures, yielding a sulphonic acid. It forms addition compounds with mercuric and auri chloride. On the constitution of the pyridine nucleus, see Körner, Gior. dell' accad. di Palermo, 1869, and C. Riedel, Ber., 1883, 16, p. 1609. As regards the isomerism of the pyridine substitution products, three mono-derivatives are known, the different positions being indicated by the Greek letters α, β and γ, as shown in the inset formula. This formula also allows of the existence of six di-derivatives, six tri-derivatives, three tetra- and one pentamer, when the subgrouping are identical, all of which are in agreement with known facts.

The three monochloropryridines are known, the α and γ compounds resulting from the action of phosphorus pentachloride on the corresponding oxy-pyridine, and the β compound from the action of chloroform on potassium pyrrol. α-Aminopyridine, C₆H₅NH-N⁺Cl⁻, is formed by heating 5-aminopyridine-2-carboxylic acid. It is a crystalline solid which melts at 56° C. and boils at 204° C. It cannot be dissolved in the presence of concentrated sulphuric acid, and even then the free diazonic salt is not stable, readily passing in the presence of water to α-oxy-pyridine. β-Aminopyridine is obtained by heating β-pyridyl urethane with fuming hydrochloric acid until no more carbon dioxide is liberated (T. Curtius and A. Mohr, Ber., 1898, 31, p. 2493), or by the action of bromine and caustic soda on the amide of nicotinic acid (F. Pollak, Monatsch., 1898, 19, 45). It melts at 61° C. and boils at 252° C. The α, β and γ aminopyridines are readily soluble in water, and resemble the aliphatic amines in their general chemical properties.

The oxy-pyridines may be prepared by distilling the corresponding oxy-pyridine carboxylic acids with lime, or by fusing the carboxylic acids with caustic potash. The mono-oxy-pyridines are easily soluble in water and possess only feeble basic properties. The β compound is hydroxylic in character, whilst the α and γ derivatives behave as frequently as if they possessed the tautomeric keto structure, yielding according to the conditions of the experiment either N- or O-ethers (H. v. Pechmann, Ber., 1895, 28, p. 1624), thus corresponding to the formulae—

\[
\begin{align*}
\text{HCH} & \rightarrow \text{CHOC} \\
\alpha\text{oxy-pyridine} & \rightarrow \beta\text{pyridine} \\
\gamma\text{oxy-pyridine} & \rightarrow \gamma\text{pyridine} \\
\end{align*}
\]

The homologues of pyridine may be synthesized in various ways. One of the most important is the so-called "collidine" synthesis of A. Hantzsch (Ann., 1882, 215, pp. 11; Ber., 1882, 15, p. 2914) which consists in the condensation of two molecules of aceto-acetic ester with one of an aldehyde and one of ammonia:

\[
\text{R}_2\text{C} = \text{C} - \text{CHO} + \text{CH}_2\text{CO}_2\text{H} \rightarrow \text{R}_2\text{C} = \text{C} - \text{CH}_2\text{CONH}_2 + \text{H}_2\text{O}
\]

The resulting dihydro-compound is then oxidized with nitric acid, the ester hydrolysed and the resulting acid heated with carbon dioxide is eliminated and a tri-substituted pyridine of the type is obtained. The reaction is apparently a general one for all aldehydes. On the course of the reaction see also C. Beyer, Ber., 1891, 24, p. 1652, and E. Knoevenagel, Ber., 1898, 31, p. 738. In this reaction the proportions of aldehyde and aceto-acetic ester may be interchanged and any disubstituted pyridines are then obtained. Of the other methods for preparing pyridine homologues mention may be made of the discovery by A. Ladenburg that the pyridinium alkyl iodides rearrange themselves when strongly heated and yield a series of pyridines (Ber., 1893, 16, p. 1410 seq.; Ann., 1888, 247, p. 1). S. Ruhemann prepared γ-substituted di-oxy-pyridines by condensing alkyl-dicarboxylic glutaconic esters with ammonia.

\[
\text{R})\text{O}_2\text{C} - \text{CR} - \text{CH} - \text{CO}_2\text{R} \rightarrow \text{R}_2\text{C} = \text{CR} - \text{CH} - \text{CONH}_2 + \text{HO}_2\text{C} - \text{CH} - \text{CONH}_2
\]

The 1-5 diketones of the type inset, when heated with ammonia, also yield pyridine derivatives. Alkyl pyridines are also obtained by heating an aldehyde, ammonia alone or with aldehydes and ketones (A. v. Beyer, Ann., 1870, 155, pp. 281, 294; J. Fischl, Ber., 1887, 20, p. 722).

The subjoined table shows the chief homologues of pyridine:

<table>
<thead>
<tr>

</table>

Pyridine carboxylic acids are usually prepared by oxidizing the homologues of the base; they also result as decomposition products of various alkaloids. The more important are shown in the table.
PYRIMIDINES

PYRIMIDINES, Metadiazines or Miazines, in organic chemistry, a series of heterocyclic compounds containing a ring complex, composed of four carbon atoms and two nitrogen atoms, the nitrogen atoms being in the meta-position. The oxyderivatives of the tetrahydro- and hexahydro-pyrimidines are the uracils and the urides of malonic acid (see PURIN). The purines themselves may be considered as a combination of the pyrimidine and glyoxaline ring systems. For formulæ see below; the numbers above the first ring explain the orientation of pyrimidine derivatives.

The pyrimidines may be obtained by condensing 3-diketones with the amides (A. Pinner, Ber., 1893, 26, p. 2125).

\[
\text{CH}_3\text{CO} + \text{NH}_2\text{C-C}_2\text{H}_4\text{CH}_2\text{C} = \text{C}-\text{H} \rightarrow \text{H-N}\text{C-C}_2\text{H}_4\text{C}-\text{CH}_2\text{C} = \text{C}-\text{H} + \text{HN} + \text{CH}_2\text{C}-\text{C}_2\text{H}_4\text{N} \]

The β-ketonic esters under like treatment yield oxopyrimidines, whilst if cyanoacetic ester be employed then amino-oxopyrimidines are obtained. By using urea, guanidine, thiourea and related compounds instead of amides, one obtains the thiazides.

![Image of pyrimidine structure]

**Trigonelline.** CH\(_3\)NO\(_2\), the methyl betaine of nicotinic acid, was discovered in 1885 by E. Jahn (Ber., 1885, 18, p. 2518), and is found in the seeds of *Trigonella* and *Stephanthus hispidus*. It is very soluble in water. With baryta it yields methylamine, and when heated with concentrated hydrochloric acid to 260° C. it yields methyl chloride and nicotinic acid. It was synthesized by A. Hantzsch (Ber., 1886, 19, p. 31) by condensing methyl iodide and potassium nitrate at 150° C. The resulting iodide being then decomposed by moist silver oxide. A. Pinner (Ber., 1893, 26, p. 2117) obtained it by oxidizing nicotine methyl hydroxide with potassium permanganate. *Apophyllinic acid, CH\(_3\)NO\(_2\)H\(_2\)*, the methyl betaine of cinchomeronic acid, was synthesized by W. Koser (Ann., 1885, 234, p. 118).

**Piperidine or hexa-hydro-pyridine.** CH\(_3\)N\(_2\)H\(_2\), was first obtained in 1848 by distilling pipericine with lime. It is formed in the hydrolysis of pyridine by alcoholic potash, by the reduction of trimethylene cyanide (A. Ladenburg) and by the action of alkali on -chloramylamine, C\(_3\)H\(_2\)N\(_2\)H\(_2\)S (S. Gabriel, Ber., 1892, 25, p. 421). It is also produced in the electrolytic oxidation of N-nitroso-piperidine in sulphuric acid solution (F. B. Ahrens, Ber., 1898, 31, p. 2275). It is a liquid which boils at 105-106° C. and possesses an ammonial smell. It is readily soluble in water, alcohol and ether, and is a very powerful base. It is oxidized to pyridine by heating with concentrated sulphuric acid to 300° C. or with nitrobenzene to 250° C. or with silver acetate to 180° C. Being an imide it readily yields a nitroso derivative, and N-allyl and acylid derivitives. The piperidine ring is easily split. When heated with fuming hydrochloric acid to 300° C. it yields normal pentamine and ammonia, and the peroxide oxidizes it to glutarimide and to a piperidinium oxide or oxide (R. Wolfensttein, Ber., 1904, 37, p. 3228). A. W. Hofmann (Ber., 1881, 14, p. 660), by a process of exhaustive methylation and distillation, obtained the unpolarized hydrocarbon piperidine C\(_2\)H\(_4\)-CH\(_2\)-CH\(_3\); CH\(_3\) from piperidine (see also A. Ladenburg, Ann., 1894, 279, p. 344).

**Berberine acid.** CH\(_3\)CO\(_2\)H, the methyl betaine of cinchomeronic acid, was synthesized by W. Koser (Ann., 1885, 234, p. 118).
PYRITES, a term applied to iron disulphide when crystallized in the cubic system, but used also in a general sense to designate a group of metallic sulphides of which this mineral is the most characteristic example. When certain the constituent species are distinguished by prefixes: thus the type is called iron pyrites, whilst other species are known as copper pyrites, arsenical pyrites, &c. The original word pyrites (from Gr. πυρίτης) had reference to the fact that sparks might be elicited on striking the mineral violently, as with flint, so that πυρίτης ἔδωσ means a stone which struck fire. Hence the name seems to have been applied also to flint, and perhaps to emery and other hard stones. Nodules of pyrites have been found in prehistoric barrows and elsewhere under conditions suggesting their use as a primitive means of producing fire. Even in late historic time it was employed in some of the old wheel-lock guns. Iron-pyrites was formerly called marcasite, a word variously written marcasin, marchasite, marchesite, marquesite, &c. The two names are now applied to distinct mineral species. The compound FeS₂ is dimorphous, and the modern practice is to distinguish the cubic forms as pyrites and the orthorhombic as marcasite (γ.α.). Sometimes, however, the term pyrites is loosely applied to both species, and the cubic pyrites is then differentiated by the name "pyrite"—a form which brings the last syllable into harmony with the spelling of the names of most minerals.

Iron pyrites, or pyrite, belongs crystallographically to the tetrahedral class of the cubic system. Its crystal forms are

\[ P \text{ cube} \quad d \text{ octahedron} \quad e \text{ dodecahedron} \]

Fig. 1.

The cube, the octahedron, and the pentagonal dodecahedron. Fig. 1 shows \( P \) the cube \([100]\), \( d \) the octahedron \([111]\), and \( e \) the pentagonal dodecahedron \([210]\). In fig. 2 \( x \) the dodecahedron \([\{111\}] \) is associated with the dyakid-dodecahedron \([\{211\}] \); whilst fig. 3 shows a combination of \([320]\) and \([421]\). The faces of the cube are sometimes striated parallel to the edges between \( P \) and \( e \) (fig. 1), the striae on each face being therefore at right angles to those of the adjoining faces, and indicating an oscillatory combination of the cube and pentagonal dodecahedron. Fig. 4 illustrates a characteristic twin, formed by two interpenetrating pentagonal dodecahedra. Such supplemental faces, known in Germany as "twins of the Iron Cross," are commonly brown by superficial conversion into limonite.

Pyrites presents a conchoidal fracture, and a very indistinct cubic cleavage. Its hardness is about 6, and its specific gravity 4·9 to 5·2, being rather more than that of marcasite. Moreover, the colour of pyrites is pale brass-yellow, whilst that of marcasite when unvarnished may be almost tin-white. From copper-pyrites (chalcopyrite) iron-pyrites is distinguished by its superior hardness and by its paler colour. On exposure to meteoric influences pyrites commonly becomes brown, by formation of ferric hydroxide or limonite, whereas the change is only "faded" limonitization in pyrites. Such limonitization is found common on the outcrop of mineral veins, forming what miners call "gozama." Another kind of alteration which pyrites may suffer has been termed "vitiolization," since the products are ferrous sulphate, with free sulphuric acid and sometimes a basic ferric sulphate. It is often said that this saline change is more characteristic of marcasite than of pyrite, but according to H. N. Stokes this statement is incorrect. Contrary, too, to popular belief, he found a flabby structure more common in pyrites than in marcasite. In some cases the two forms of iron disulphide occur in intimate association and are difficult to distinguish.

According to the formula FeS₂, pyrites contains theoretically 46·67% of iron and 53·33% of sulphur. Practically, however, it frequently contains other metals, such as copper, cobalt and nickel. Gold is often present, and in many gold-mining districts the precious metal is obtained mainly from auriferous pyrites. As pyrites, from its brass-yellow colour, is sometimes mistaken for gold, it has been vulgarly called "fool's gold." Traces of thallium, which are present in some pyrites, may be detected in the fumes of the furnaces where the metal is roasted. Arsenic is an impurity which may be of serious consequence in some of the purposes to which pyrites is applied. The presence of copper, nickel and arsenic is possibly due in many cases to traces of kindred minerals, like chalcopryite, pentlandite and missipiel.

Pyrites is a mineral of very wide distribution, occurring under varied conditions and probably originating in various ways. It is common in mineral veins, usually associated with quartz, and is often known to miners as "mound." It occurs crystallized, commonly in cubes, in schistose and slaty rocks, and less abundantly in the younger sedimentary deposits. In coal it often infrequently forms bands and nodules known as "brasess," and may also be finely disseminated through the coal as "black pyrites"; but much of the so-called pyrites of coal is really marcasite. Films of pyrites sometimes coat the joint-planes of coal. It is believed that the bluish colour of many clays and limestones is referable to the presence of finely divided pyrites, and it is known that deposits of blue mud now forming around continental shores owe their colour, in part, to disseminated iron sulphide. Pyritous shales have been largely used in the manufacture of alum, and are therefore known as "alum-shales." Many fossils are mineralized with pyrites, which has evidently been reduced by the action of decomposing organic matter on a solution of ferrous sulphate, or perhaps less directly on ferrous carbonate dissolved in water containing carbonic acid, in the presence of certain sulphates. A similar action probably explains the origin of pyrites and marcasite in coal and lignite, in clay and shales, and in limestone like chalk.

Pyrites is largely worked for the sake of the sulphur it contains, and in many cases it has displaced brimstone in the manufacture of sulphuric acid. For this purpose its value depends on the proportion of sulphur present. Pyrites low in sulphur is incapable of sustaining its own combustion without the aid of an external source of heat, and 45% of sulphur is, for economic reasons, usually regarded as the lowest admissible for sulphuric acid manufacture. It is also important for this purpose that the ore should be as free as possible from arsenic (see SULPHURIC ACID).

An extremely important variety of pyrites is that which is more or less cupferous, and is commonly known commercially as "copper-pyrites" (γ.α.), though distinct mineralogically from that material. It consists, indeed, mainly of iron-pyrites, with a notable but variable proportion of copper, sometimes with silver and gold, and not infrequently associated with lead and zinc sulphides. The copper probably exists as disseminated chalcopyrite. Deposits of such cupferous pyrites are widely distributed and are often of great magnitude. They are generally of lenticular form, and usually occur in or near the contact of eruptive rocks with schists or slates; the presence of the igneous rock being probably connected genetically with their origin. Among the best-known deposits of this character are those in the Huelva district, in the south-west of Spain, including the mines of Río Tinto, Tharsis, Calañas, &c.; with those of San Domingos in Portugal. At Río Tinto the ore is divided into three classes:

1. The poorest, containing an average of about 14% of copper, which is treated locally by leaching with water and liquor containing ferric sulphate, whereby the copper is precipitated by pig-iron, and the residue is exported as ordinary iron-pyrites.
2. Export ore, with from 2 to 5% of copper, in which the sulphur, copper and precious metals are utilized, and the residual iron-pyrites are used for the production of pig-iron.
3. Smelting ore, which averages about 6% of copper, and is treated metallurgically as described under COPPER.

The world's annual production of iron-pyrites is about 1,700,000 tons. The largest producer is Spain, with upwards of 350,000 tons, including the cupferous pyrites. France yields about 300,000 tons, largely from the Sain Bel mines, department of the Rhône. Then follows Portugal, with its important output of cupferous pyrites. In the United States the production of pyrites now reaches more than 200,000 tons annually.
PYRITZ—PYROMORPHITE

693

Ohio a quantity of pyrites is obtained as a by-product in coal-mining. Newfoundland yields cuprous pyrites, worked at Pilley’s Island, whilst the nickelloferrous pyrites of Sudbury in Ontario is partly magnetic (see PYRRHOTITE). Magnetic pyrite, which is important commercially, occurs also in Virginia and Tennessee. The United Kingdom yields but little pyrites, the annual output being not more than about 10,000 tons. Large quantities of “sulphur ore” were, however, formerly worked in the Vale of Avoca, Co. Wicklow, Ireland. Finely crystallized specimens of pyrite are obtained from many other localities, especially from Cornwall, Elba and Travessera, near Lyrea, in Piedmont.

PYRITZ, a town of Germany, in the Prussian province of Pomerania, 16 m. S.W. of Stargard by the railway to Custrin. (Pop. [1905], 8600. It is still surrounded by walls with towers, and has two Evangelical churches. There are small manufactures of machinery, bricks and saws. Excellent wheat is grown in the vicinity, while another industry is the breeding of cattle. There is a fountain, erected to mark the spring in which Otto, bishop of Bamberg, baptized the first Pomeranian converts to Christianity in 1124. Pyritz became a town in 1150.

PYROCAECHIN, or PYROCAECHIN, ortho-dioxy-benzene, C₆H₄(OH)₂, first prepared in 1859 by H. Reinitz on distilling cataphores (the juice of *Mimosa lepcha*); occurs fre in fossils as in beechwood tar; its sulphonic acid is present in the urine of the horse and man. It results in the alkaline fusion of many resins, and may be prepared by fusing ortho-phenolsulphonic acid, o-chlorphenol, o-benzoin, and o-phenoldisulphonic acid with potash, or, better, by heating its methyl ether, guiacol, C₆H₄(OH)(OCH₃), a constituent of beechwood tar, with hydrochloric acid.

Pyrocaechin crystallizes in white rhombic prisms, which melt at 103° and boil at 245°; it is readily soluble in water, alcohol and ether. Ferric chloride gives a green coloration with the aqueous solution, whilst the alkaline solution rapidly changes to a green and finally to a black color on exposure to air. It reduces silver in the cold and alkaline copper on heating. Guiacol may be obtained directly from beechwood tar, by pyrocaechin by methylolation with potash and potassium methyl sulphonate at 150°; benzoin, reduced benzoin, ortho-nitroanisole to amino-anisole, which is then diazotized and boiled with water. It melts at 28° and boils at 250°. It is employed in medicine as an expectorant. The dimethyl ether or veratrol is also used in medicine. Many other pyrocaechin derivatives have been suggested for therapeutic application. Guiacol carbonate is known as duotal, the phosphate as phosphatol, the phosphite as guiacol-phosphol; phosphatol is a mixture of the phosphites of cresote phenols. The valerianet ester of guiacol [J. W. R.*]

PYROGALLOL, or PYROGALLO, a trioxyn-benzene, C₆H₄(OH)₃ (1 : 2 : 3), prepared by Scheele in 1786 by heating gallic acid, C₆H₄(OH)₃CO₂H. It is also obtained by heating para-chlorobenzoxyphosphonic acid with potassium hydroxide.

It forms white plates, melting at 132°, readily soluble in water, and subliming without decomposition. It is an energetic reducing agent, a property utilized in its application in gas analysis to absorb oxides of nitrogen in photography, (i.e. as a developer. The aqueous solution is turned bluish black by ferrous sulphate containing a little ferric salt. It does not combine with hydroxyamine, as does the isomer, galloyl (see POLYMETYLENES). Pyrogallol dimethyl acetal (formol) (suggests antinomia) has antiseptic properties and is employed medicinally in the treatment of psoriasis. Eugallol, or monacetyl pyrogallol and leucosulphacol or tricetoxyl pyrogallol, are also used.

PYROGALLITE, a mineral consisting essentially of manganese dioxide (MnO₂), of importance as an ore of manganese. It is a black, amorphous material, often with a granular or powdery structure, and sometimes forming conical crusts. It has a metallic lustre, and a black or bluish-black streak, and readily soils the fingers. The specific gravity is about 4.8.

Supposed crystals of pyroslute have been proved to be pseudomorphs after manganite; in fact the mineral often results by the dehydration and oxidation of manganite (MnO₂·H₂O), and for this reason it frequently occurs in little conical nodules. MnO₂·H₂O. Manganese dioxide are referred to the rare species polianite; they are tetragonal and isomorphous with cassiterite. Pyroslute is an alteration product of other manganese minerals—manganite, rhodochrosite, rhodonite, and other Mn₂O₃ minerals. It occurs as irregular masses and nodules in the residual clayey materials resulting from the decomposion of various rocks, for example, limestone. That it is readily decomposed by solution is shown by the frequent occurrence of black denticular markings in the crevices of rocks, excellent examples of which are seen in mocha stone (g.v.) and in the lithographic stone of Solenhofen in Bavaria. It is deposited from the waters of some manganese and manganiferous nodules are dredged from the floor of the deep sea.

As an ore it is extensively mined at Mlenau and several other places in Thuringia, at Vorderremsendorf near Prosant in Moravia, Plau for Stassfurt and Harz in Germany, and near Mrs. and Liverpool in the United States (Vermont, Virginia, Arkansas, &c.), Nova Scotia and Brazil. Pyroslute, together with the rather less important ore, psilomelane, has various economic applications. It is extensively used for the manufacture of blue and green glass, and for making glazes of various alloys, such as manganese-bronze. As an oxidizing agent it is used in the preparation of chloride and disilicatents (permanganatized and permanganthanates) for the dyeing of wool, silk and cotton. It oxidizes the ferrous iron to ferric iron, and so discharges the green and brown tints, hence the name pyroslute, from *Gr. τυρ (fire) and λυοντος (to wash). As a colouring material, it is called pyroslute; for imparting violet, amber and black colours to glass, pottery and bricks; and in the manufacture of green and violet paints. (L. J. S.)

PYROMETER, (Gr. τυρ, fire, μετρον, a measure), an instrument for measuring high temperatures. The term was first used by Musschenbroek to denote an instrument wherein the expansion of a metal rod measured the temperature. Discontinuous thermoscopes, depending on the fusion of a metal or salt, are also employed. Prinsep prepared a series of alloys of silver, copper, and gold, and of gold and platinum, whose melting points, as determined by accurate instruments, covered a range of temperature from 954° to 1775°, at intervals of from 25° to 30°. By placing ingots in a furnace and observing which one melted a fair idea of the temperature was obtained. Carnelley and Williams employed certain salts of known melting point, whilst the Seger’s cones, employed in porcelain manufacture, depend on the fusion of small cones made of clay. (See THERMOMETRIC for scientific forms.)

PYROMORPHITE, a mineral species composed of lead chloro-phosphate (PbCl·Pb(OH)₃), sometimes occurring in sufficient abundance to be mined as an ore of lead.

Crystals are common, and have the form of a hexagonal prism terminated by the basal planes, sometimes combined with narrow faces of a hexagonal pyramid. Crystals with a barrel-like curvature are not uncommon. Globular and reniform masses are also found. As proved by the etched figures on the faces, crystals possess the same parallel-faced hemihedism as apatite, with which mineral pyromorphite and also mimetite are isomorphous. Between pyromorphite and the corresponding chloro-arsenate (mimetite, (g.v.) they are so nearly similar in external appearance that it is only possible to distinguish between them by chemical tests: and they were formerly confused under the names *green lead ore* and *brown lead ore*. The chief commercial use for pyromorphite is as a faceted model on satisfying. The colour of the mineral is usually some bright shade of green, yellow or brown, and the lustre is resinous. The hardness is 3½ and the specific gravity 6-5-7-1. Owing to its isomorphous replacement by the phosphates by arsenic there may be a gradual passage from pyromorphite to mimetite. Varieties containing calcium isomorphously replacing lead are lower in density (specific gravity 5-0-5-6) and usually lighter in colour; they bear the name *mimetite* (g.v.).

PYRUS, from Nussiere near Beaune, Rhone, France, and *cherokine* from Cherokee county in Georgia.
PYRONES

Pyromorphite has resulted from the alteration of galena in the oxidized portions of wall-tailfluvial veins, and is frequently met with in the upper levels of lead mines. Finely crystallized specimens have been found at Braubach and Ems in Nassau, Welle Alfred in Cornwall, Roughten Gill in Cumberland, Leedhills in Scotland, Phoenixville in Pennsylvania, Huelgoat in Finistere, Brittany &c. At the last-named locality, as well as at Wheal Hope, near Truro in Cornwall, there were formerly found curious pseudomorphs of galena after pyromorphite, known as blue lead ore. (L. J. S.)

PYRONES, in chemistry, a group of heterocyclic compounds, containing a six-membered ring composed of five carbon atoms and one oxygen atom. Two types are known, namely, the a-pyrones, which may be regarded as the lactones of 8-oxo-arolone carboxylic acids, and the y-pyrones, which may be regarded as anhydrides of diolefinic diketones:

\[
\text{(2) } \text{H}_2\text{C}=\text{CH}-\text{CO}-\text{CH}_2\text{CH}=\text{CH}\text{-CHO}
\]

As a class, the pyrones are rather unstable compounds, the ring being readily broken. When digested with ammonia, the oxygen atom is replaced by the imino (NH) group, and pyridones or oxypyrindins are formed.

a-Pyrones.—The coumaric compounds belong to this series, and were first obtained by A. Hantzsch in 1884 (Ann. 222, p. 1) and H. v. Pechmann (Ber., 1884, 17, p. 936).

a-Pyrones or coumarin, C_6H_4O, is obtained by distilling the mercury salt of coumaric acid with potassium hydroxide and a small amount of hydrogen. It is an oily liquid which boils at 206–209°C, and with alkalis it gives formyl crotonic acid, HO-CH=CH-CH=CH-CHO.

Phenylcoumarin or 8'-phenyl-a-pyrones, C_6H_4(CH_3)C=O, is found in coto-bark. When heated with alkalis it yields benzoic acid and acetophenone; reduction by hydriodic acid gives 8'-phenyl valeric acid, and when heated with ammonium acetate and ammonia, it yields phenylpyridine. It forms an addition product with phenyl and with aniline; the latter gives diphenylpyridine when boiled with concentrated hydrochloric acid. Para-acetamid, C_6H_4CONH, which also occurs in coto-rind, appears to be a bisoxymethylene-phenylpyridine, C_6H_4(CO-CH=CH)CONH, which is known as a '4-Methyl acetophenone', C_6H_4(CO-CH=CH)CONH, which is known as a-4-Methyl acetophenone, and is obtained by heating a mixture of coumarin and aniline.

Various pyrones (keto-dihydropyrones) derived from the compound having formula I. (below) are known, the most important of which is dehydroacetic acid, C_6H_5O, first obtained by Geuther (Jena'sche Zeiit, 1866, p. 8). It may be prepared by distilling aceto-acetic ester alone, by heating it with acetic anhydride to 200°C, or by using acetic anhydride with potassium hydroxide to 200–220°C C. J. N. Collie regards it as having formula II, while Feist (Ann. 1890, 257, p. 253) favours formula III.

OC-CH=CH OC-CH=C=CH-O OC-CH=CH H_2C=O OH C=O CO-CH=O

1. Crystallizes in tablets which melt at 108–109°C, and is a weak acid. Alcoholic potash converts it into aceto-acetic ester, and with concentrated aqueous caustic potash it is completely decomposed into acetoacetic acid and carbon monoxide.

y-Pyrones.—Many of these compounds are found as naturally occurring substances: thus chelidonic acid is found in Chelidonium majus and meconic acid in opium, and the more complex flavone and flavonol derivatives are also found in various plants. The y-pyrones may be synthesized by eliminating water from the 1,3,5-triketones:}

\[
\text{HC}_2\text{H}_5\text{CO}-\text{CO}_2\text{H} \\
\text{CH}_3\text{CO}_2\text{H} \\
\text{Acetone dioxalic ester.} \quad \text{CH}_3\text{CO}_2\text{H} \\
\text{CH}_3\text{CO}_2\text{H} \quad \text{Acetone dioxalic ester.} \quad \text{CH}_3\text{CO}_2\text{H} \\
\text{Chelidonic ester.} \quad \text{CH}_3\text{CO}_2\text{H}
\]

Pyrone or pyrocanone, C_6H_4O, melting at 32°C. and boiling at 210-215°C. is obtained by eliminating carbon dioxide from chelidonic acid (as just above), or from acetic acid, obtained by heating chelidonic acid. a'-Dimethyl-y-pyrones, C_6H_4(CH_3)CO, is obtained by the action of hydrobromic acid on the ester of the corresponding acid (Feist, Ann., 1890, 257, p. 272); the action of carbon disulphide on the decarboxylic acid ester derivative, and by the action of concentrated hydrochloric acid on dehydruic acid. It forms a barium salt which with an acid yields diacetyl acetone. The reaction is preferred to the acetic acid ester, and is in harmony with the observation that y-pyrones, or salts with mineral acids (J. N. Collie and Tickle, Journ. Chem. Soc., 1899, p. 710). For example, hydrochloric acid acts on the oxygen atom, since the salts so formed are relatively unstable and undergo complete hydrolysis in dilute aqueous solution. The oxygen atom is probably tetravalent, and the salts are to be regarded as oxonium salts (see Oximes). (Collie, Journ. Chem. Soc., 1904, 85, p. 971) is of the opinion that both oxygen atoms are to be regarded as tetravalent in these salts and gives the second formula below for the molecule:

\[
\text{H}_2\text{C}=\text{CH} \quad \text{H}_2\text{C}=\text{CH} \\
\text{H}_2\text{C}=\text{CH} \quad \text{H}_2\text{C}=\text{CH} \\
\text{H}_2\text{C}=\text{CH} \quad \text{H}_2\text{C}=\text{CH}
\]
yellow colour and blue fluorescence. *Fisetin* or 3,5'-4',tri-hydroxyflavonol, C₁₄H₁₄O₇ occurs in the wood of *Quebraho colorado*, and can be obtained by heating fusic with dilute acids. It crystallizes in pale yellow needles. In dilute alcoholic alkalis it shows a dark green fluorescence. On fusion with caustic alkalis it yields phlorogluvin, resorcin and protocatechuic acid, whilst if air be passed through its alcoholic solution it yields a pale fibrous powder, named karanjin, and obtained synthetically from 2-oxy-3,4-dimethoxy-4-ethyl-chalcone. The various steps in this synthesis are shown below, since the method employed is applicable to other members of the group.

\[
\text{C}_14\text{H}_12\text{O}_4 \xrightarrow{\text{O}} \text{C}_14\text{H}_12\text{O}_7
\]

This structure of the fisetin molecule was confirmed by Herzig (Monats., 1891, 12, p. 172), who showed that the tetraethyl ether of fisetin on hydrolysis with alcoholic potash gave diethylproto
catechuic acid and diethylfisetol, the latter on oxidation yielding ethyl-β-resorcylic acid, which had been previously obtained by oxidizing racteacto-phenyl ether. *Luteolin* or 1,3,5'-4'-tetrahydroxy
flavone, C₁₄H₁₄O₆ is found in the weld obtained from *Reseda luteola*. It crystallizes in small yellow needles, which dissolve in solutions of alkali, but do not decompose. On the other hand, it yields some yellowish precipitate. It is generally used in the preparation of new colouring matter.

### PYROPHORUS

*Pyrohmr*, a deep red variety of garnet, named from the Gr. *πυρός* (fire) in allusion to its colour. It is used, like almandine (*q.v.*), as a gem-stone, but may be dis
tinguished by the absence of any tinge of violet in its colour and by its lower specific gravity (3.7 or 3.8, whilst that of alman
dine is 4.1 to 4.3). The typical colour of pyrope is blood-red, though sometimes a trace of orange gives rise to a hyacinth hue occasionally the mineral throws out a black, as seen in the pyrope of Arenal in Norway. Crystals are rare, but cubic forms have been observed. Pyrope may be regarded as a magnesium-aluminium garnet (see Garnet), but it usually contains more or less calcium, iron, manganese and chromiunm; and the rich colour of the mineral seems due to the presence of some of the last three metals, though their exact condition in the mineral has not been determined.

Pyrope generally occurs in grains embedded in peridotes (olivine rocks) or in serpentine resulting from their alteration, or it is found as loose grains in detritus due to the disintegration of the matrix. The grains may be surrounded by a chloritic rind, or by a crust of a grey serpentine called pyrophyllite, *C₂₂H₂₃O₇* (a nut-shell), which seems in some cases to be an amphibole. In the serpentine of Zöblitz and of Griefendorf near Leipzig, in Saxony, pyrope is characteristically developed; and the Saxony garnets, found loose in the ground, were formerly serpentine, products of the decomposition of a peridotite. It occurs in some pyrope-bearing rocks near Christian, Lobositz, Tribiltz, Podsedlitz, Chodolitz, and at several other localities in the Mittel Gebirge, between Teplitz and Lusatia, which is other belief is that the original pyrope-bearing rocks resulted from the eruptive activity which gave rise to Lin
horka Hill, near Starry. The garnets in the detritus are accom
ppanied by zircon, spinel, corundum, cyanite, tourmaline, olivine, &c. Though generally very small, they are abundant, and are used not only as ornamental stones, but as a counterpoise in delicate weighing and as an abrasive agent. To obtain the stones the detritus is washed, and the garnets picked out by hand and then size through sieves. The pyrope is generally low in colour or stunted, and often mounted with a foil. Beads are faceted all over. Some pyrope is cut en cabochon, forming, like almandine, carbone, and rhodochrosite, a brilliant gemstone.

Though pyrope has not often been reported in Canada, it occurs near Leitmeritz, in Bohemia. It is found in nodules in the volcanic lavas of the last primary period, and the pyrope is often cut as a brilliant gemstone. This industry of cutting Bohemian garnets is centred in Turnau on the Iser, near Reichenberg; but there are also works at other localities. Large stones are very rare, but a Bohemian pyrope cut by Mr. Roarke, of Tarsus, is described in a paper read before the Royal Geographical Society.

*Pyrophorus*, or the fire garnet, is named from the Gr. *πυρός* (fire) to bear a substance which spontaneously inflames on contact with the air. One of the earliest known is that of Homberg, prepared by heating a mixture of alum and finely divided carbon to redness in a closed tube. On opening the tube and emptying out the black residue (consisting of potassium sulphide, aluminium sulphate and carbon) it promptly catches fire. Many readily oxidizable substances, especially when very finely divided, have the same property. Metallic iron and cobalt, when prepared under certain conditions, are pyrophoric, as is also ferric oxide. Spontaneously inflammable liquids are also known, e.g. certain alkyl metallic compounds, phosphorus dihydride, &c.

### PYROPHYTE

A mineral species belonging to the chlor family, and composed of the mineral pyrophyllite, *C₂₂H₂₃O₇* (a leaf). It occurs in two more or less distinct varieties, namely, a crystalline folia and as compact masses; distinct crystals are not known.

The folia have a pronounced pearly lustre, owing to the presence of a perfect cleavage parallel to their surfaces: they are flexible but not elastic, and are usually arranged radially in fan-like or spherical groups. This variety, when heated before the blowpipe, begins to sublimate, swells up and turns into a thin powdery film, which is sometimes called the name pyrophyllite, from the Greek *πυρός* (fire) and *φυλλος* (a leaf), given by R. Herrmann in 1829. The colour of both varieties is white, pale green, greyish or yellowish; they are very soft (H. = 1-2) and are greasy to the touch. The specific gravity is 2.8-2.9. The two varieties are thus very similar respectively to talc (*q.v.*) and its compact variety steatite, which is, however, a hydrous magnesium
silicate. The compact variety of pyrophyllite is used for slate pencils and tailors' chalk ("French chalk"), and is carved by the Chinese into small images and ornaments of various kinds. Other soft, compact minerals (steatite and talc) used for these Chinese carvings are included with pyrophyllite under the terms agmatolite and pagodite.

Pyrophyllite occurs in schistose rocks, often associated with mica, of which it is an alteration product. Pale green foliated masses, very like talc in appearance, are found at Beresovsk near Ekaterinburg in the Urals, and at Zermatt in Switzerland. The most extensive deposits are in the Deep river region of North Carolina, where the compact variety is mined, and in South Carolina and Georgia.

PYROXENE, an important group of rock-forming minerals, very similar in chemical composition and general characters to the amphiboles (q.v.). Although crystallizing in three different systems, they all possess distinct prismatic cleavages, the angles between which are about 89° (the cleavage angle in the amphibole being 86°). They are meta-silicates, but, as shown in the following table, the composition varies widely in the different species, with corresponding differences in the various physical characters. The name pyroxene was originally given by R. J. Haüy in 1766 to the black crystals of augite found in the lavas of Vesuvius and Ætna: he derived the name from the Greek πυρ (fire) and εὖς (a stranger), because he thought that the crystals had been accidentally caught up by the lavas which contained them. As a matter of fact, the pyroxenes are, next to the felspars, the commonest constituents of igneous rocks of almost all kinds, being especially characteristic of those of basic composition. An igneous rock composed almost wholly of pyroxene is known as a pyroxenite. Besides being common in the essential primary magmas, the pyroxenes are also of frequent occurrence in metamorphic rocks, for example, in crystalline limestones, being then of secondary origin.

At the present day the name pyroxene is used as a group name for all the minerals enumerated below, though sometimes it is also applied as a specific name to include the monoclinic members diopside, hedenbergite, scheiderite and augite.

Orthorhombic Series.

| Enstatite | MgSiO₃ |
| Bronzite | (Mg,Fe)SiO₃ |
| Hypersthene | (Fe,Mg)SiO₃ |

Monoclinic Series.

| Diopside | CaMg(Si₂O₆) |
| Hedenbergite | Ca₂Fe(Si₂O₆) |
| Scheiderite | (Ca,Mg)(Fe,Mn)SiO₃ |
| Augite | (Ca,Fe,Mg)(Si₂O₆) |
| Acmite | NaFe₂(Si₂O₆) |
| Spodumene | LiAl(Si₂O₆) |
| Iolite | NaAl(SiO₄) |
| Wollastonite | CaMgSiO₄ |
| Pectolite | Na₂Ca₂(Si₄O₁₂) |
| Rosenbuschite | Na₂Ca(Si₂Zr₂TiO₁₄) |

Anorthic Series.

| Rhodonite | MnSiO₃ |
| Babingtonite | (Ca,Fe,Mn)SiO₃F₆(OH)₂ |
| Hoitahdaleite | (Ca,Na₂)₄Fe₂(Si₃Zr₂O₉) |

For details respecting the special characters and modes of occurrence of most of these species reference may be made to the respective headings; others not so treated are briefly mentioned below: Hedenbergite, or calcium iron pyroxene, is a black mineral closely allied to diopside (q.v.), and, owing to the isomorphous replacement of iron by magnesium, there is no sharp line of division between them. Scheiderite and pyroxenite of the first is found in the manganese mines of Sweden. Pectolite is a secondary mineral occurring as white masses with a radially fibrous structure in the veins and cavities of basic igneous rocks. Babingtonite is found as small black crystals on the granite of Bavaria in Italy, and in the Haytor iron mine in Devonshire. Rosenbuschite, hoitahdaleite, and some other rare members containing zirconium and fluorine occur as accessory constituents in the nepheline-syenite of southern Norway.

PYROXENITE, a rock consisting essentially of minerals of the pyroxene group, such as augite or diopside, hypersthene, bronzite or enstatite. Names have been given to members of this group according to their component minerals, e.g. pyroxenite (augite), diopside (diopside), hypersthene, bronzite (bronzite), websterite (diopside and hypersthene). Closely allied to this group are the hornblendenites, consisting essentially of hornblende. The term perkinite (Gr. περικόλιον, dark) has also been used to designate the whole series.

They are essentially of igneous origin, though some pyroxenites are included in the metamorphic complex of the Lewisian of Scotland; those pyroxene rocks which result from the contact alteration of impure limestones are described as pyroxene hornfelses (calc-silicate hornfelses). The pyroxenites are closely allied to the gabbros and norites, from which they differ by the absence of felspar, and to the peridotites, which are distinguished from them by containing olivine. This connexion is indicated also by their mode of occurrence, for they usually accompany masses of gabbro and peridotite and seldom are found by themselves. They are strictly pluonite and often very coarse-grained, containing individual crystals which may, in some cases, be several inches in length. The principal accessory minerals, in addition to olivine and felspar, are chromite and spinels, garnet, iron oxides, rutille, and scapolite. They frequently occur in the form of dikes or segregations in gabbro and peridotite; e.g. in Shetland, Cornwall on the Hudson river, North Carolina (websterite), Baltimore, New Zealand, and in Saxony. The component minerals often have a close resemblance to those of the surrounding rock. By decomposition the rocks consisting of pyroxene pass into serpentines, which sometimes preserve the original structures of the primary minerals, such as the lamination of hypersthenite and the rectangular cleavage of augite. Under pressure-metamorphism the hornblende-metamorphite (q.v.) and other types of amphibolite and hornblende-schist are produced. Occasionally rocks rich in pyroxene are found as basic facies of nepheline syenite; a good example is provided by the meladite pyroxenites associated with boronite (q.v.) at Ledbeg in Sutherlandshire.

PYRRHO OF ELIS (c. 360–270 B.C.), a Greek sceptic philosopher and founder of the school known as Pyrrhonism. Diogenes Laërtius (Ix. 61), quoting from Apollodorus, says that he was at first a painter, and that pictures by him were in existence in the gymnasium at Elis. Later he was diverted to philosophy by the works of Democritus, and became acquainted with the Megarian dialectic through Bryson, pupil of Stilpo. When Anaxarchus, he went to the East to the train of Alexander, and studied in India, where the Acadians, or Prata, were considered the most ancient of the nations of the East, and he became acquainted with the science of the Zoroastrians, and lived in Persia. From the Oriental philosophy he seems to have adopted a life of solitude. Returning to Elis, he lived in poor circumstances, but highly honoured by the Elians and also by the Athenians, who gave him the rights of citizenship. His doctrines are known mainly through the satiric writings (ΣΙΛΟΓΙΣΜΟΙ) of his pupil Timon of Phlius (the Sillographer). The main principle of his thought is expressed in the word acatalepsia, which implies the impossibility of knowing things in their own nature. Against every statement the contradictory may be advanced with equal reason (λογισμὸς τῶν λόγων). Secondly, it is necessary to this faculty of reason an attitude of intellectual suspense (ἐκτοχή), or, as Timon expressed it, οὐδὲ μαλακόν (i.e. no assertion more valid than another). The same idea is expressed also by the terms ἀδιάλειπτος (equilibrium) and ἀπαθία (refusal to speak, non-committal silence). Thirdly, these results are applied to life in general. Pyrrho concludes that, since nothing can be known, the only proper attitude is impartiality (ataraxia). The impossibility of knowledge, even in regard to our own ignorance or doubt, should induce the wise man to withdraw into himself, avoiding the stress and emotion which belong to the contest of vain imagination. This was the spirit of the first and most thorough exposition of agnosticism in the history of thought. Its ethical results may be compared with the ideal tranquillity of the Stoics and the Epicureans. (For its relation to the New Academy and to scepticism in general see Scepticism and Megarian School of Philosophy.)

See histories of philosophy by Zeller, Erdmann, Ueberweg: Ritter and Pfeiffer, § 354; Waddington, Pyrrhon et le pyrrhonisme (1877); Zimmermann, Darstellung d. pyrrh. Ph. (1841) and Ueber Urspr. und Begr. d. pyrrh. Ph. (1843); Wachsmuth, De Timone Phyllasio (1859).

PYRRHOTITE, a mineral species consisting of iron sulphide and crystallizing in the hexagonal system. The formula is Fe₅S₄, where n may vary from 5 to 16; usually it is Fe₅S₄ or Fe₅S₈, the latter being also the composition of the artificially prepared compound. Small amounts of nickel and cobalt are often present.
PYRRHUS—PYRROL

Crystals have the form of hexagonal plates bounded at their edges by faces of a hexagonal prism and pyramids, which are deeply striated horizontally. More frequently, however, the mineral is massive, with a linear or granular structure. The colour is brown, yellow and the lustre metallic; the streak is greyish-black. The hardness is 4 and the specific gravity 4.58–4.64. The mineral is magnetic, sometimes with polarity, and it is therefore often called "magnetic pyrrhotite.

Pyrrhotite occurs in metallic veins, and as grains and plates disseminated through various rocks. In the gabbros and norites of Norway and Sweden it has been concentrated by magmatic differentiation at the margins of the igneous masses. Large bodies of massive pyrrhotite occur at Bodenmais in Bavaria and in Wheal Jane near Truro in Cornwall. Crystallized specimens are from the metasomatic alterations of the pyrrhotite of Zn-Sb-Pb-Pb deposits at Andreasberg in Brunswick, and Andreasberg in the Harz. Crystals of pyrrhotite have also been observed in meteoric stones; but iron sulphide appears more commonly in meteorites, especially in meteoric iron, as trolite (Fasie), which is entirely distinct from pyrrhotite, has not been found in terrestrial rocks. (L. J. S.)

PYRRHUS (c. 318–272 B.C.), king of Epirus, son of Aeacides, and a member of the royal family of the Molossians. He claimed descent from Pyrrhus, the son of Achilles, and was also connected with the royal family of Macedonia through Olympias, the mother of Alexander the Great. When Philip III of Macedonia became king of the wild mountain tribes of Epirus, and learned the art of war in the school of Demetrius Poliorcetes and his father Antigonus. He fought by their side at the battle of Ipsus (301) in Phrygia, in which they were decisively defeated by the combined armies of Seleucus Nicator and Lysimachus. Soon afterwards he was sent to the court of Ptolemy of Egypt at Alexandria as a pledge for the faithful carrying out of a treaty of alliance between his brother-in-law Demetrius and Ptolemy. Through Ptolemy, whose step-daughter Antigone he married, Pyrrhus was enabled to establish himself firmly on the throne of Epirus, and became a formidable opponent to Demetrius, who was now king of Macedonia and the leading man in the Greek world. He defeated one of Demetrius's generals in Aetolia, invaded Macedonia, and forced Demetrius to conclude a truce with him. For about seven months Pyrrhus was in possession of a large part of Macedonia, Demetrius finding it convenient to make this surrender on condition that Pyrrhus did not meddle with the affairs of Peloponnese. But in 286 he was defeated by Lysimachus at Edessa, driven out of Macedonia, and compelled to fall back on his little kingdom of Epirus. In 281 came the great opportunity of his life. An embassy was sent by Rome to Tarentum, the Greek town on the coast of Italy with a request for aid against Rome, whose hostility the Tarentines had recklessly provoked. After some hesitation on the part of the Tarentines, Pyrrhus's conditions were accepted, and a treaty was concluded. His general Milo crossed with a body of troops and occupied the citadel. Pyrrhus soon followed with a miscellaneous force of about 25,000 men (partly furnished by Ptolemy Ceraunus of Macedonia) and some elephants. The Tarentines and Italian Greeks shrank, however, from anything like serious effort, and resented his calling upon them for men and money. Rome meantime levied a special war contribution, called on her allies to aid the Greeks against the Gauls, and posted strong garrisons in all towns of doubtful fidelity. She was now the dominant power in Italy, but her position was critical, as in the north she had had trouble with the Etrouscans and the Gauls, while in the south the Lucanians and the Bruttians were making common cause with Tarentum and the Greek cities. For the first time in history Greeks and Romans met in battle at Heraclea near the shores of the Gulf of Tarentum, and the cavalry and elephants of Pyrrhus secured for him a complete victory over the consul M. Valerius Laevinus, though at so heavy a cost as to convince him of the great uncertainty of final success (hence is derived the phrase of a Pyrrhic victory). Although he now had the Samnites as well as the Lucanians and the Bruttians and all the Greek cities of southern Italy with him, he found every city closed against him as he advanced on Rome through Latium. The peace negotiations, carried on by the skilful diplomatist Cineas, the minister of Pyrrhus, led to no result; the senate seemed inclined to come to terms, but the fiery and patriotic eloquence of the aged and blind Appius Claudius (the censor) carried the day. Cineas was ordered to leave the city at once and to tell his master that Rome could not negotiate so long as foreign troops remained on the soil of Italy. In the second year of the war (279), Pyrrhus again defeated a Roman army at Asculum (mod. Ascoli) in Apulia, but Rome still had armies in the field and her Italian confederates was not broken up. For a while he quitted Italy for Sicily, at the invitation of the Syracusans, with the idea of making himself the head of the Sicilian Greeks and driving the Carthaginians away. In his military operations he proved himself the whole successful; and Rome and Carthage, in face of the common danger, concluded an offensive and defensive alliance against him. He passed three years in Sicily, but offended the Greek cities, which he governed in the fashion of a despot. Finding that he could no longer hold Sicily in face of the ill feeling thus aroused, and reproached by the Samnites for having deserted them, he decided to return to Italy. On the voyage he was attacked by the Carthaginians and lost several vessels. When he reached Italy, the Tarentines and the other Greek cities, having lost confidence in him, refused to supply him with man or money. Through this disaster the king turned to the north, and, with the utmost effort and engaged a Roman army at Beneventum (273) in the Samnite country, but his arrangements miscarried, and he was defeated with the loss of his camp and the greater part of his army. Nothing remained but to go back to Greece. He left a garrison in Tarentum and returned the following year to his home in Epirus after a six years' absence. The brief remainder of his life was passed in camps and battles, without any glorious result. He gained a victory on Macedonian soil over Antigonus Gonatas, king of Macedonia, whose troops hailed him as king. In 273 he was invited into Peloponnesus by Cleonymus to settle by force of arms a dispute about the royal succession at Sparta. He occupied the city, but was repulsed with great loss. Next, at the invitation of a political faction, he went to Argos, where, during a fight by night in the streets, he was struck on the head by a huge tile. He fell from his horse, and was put to death by one of the soldiers of Antigonus.

Pyrrhus was a brilliant and dashing soldier, but he was aptly compared to a gambler who made many good throws with the dice, but could not make proper use of them in the game. He obtained no lasting results, and was never more than a captain of mercenaries, yet there was something chivalrous about him which seems to have made him a general favourite. After his defeat at Cynocephalae, Pyrrhus was in Macedonia, had, for a time at least, nothing to fear, and the isolated position of Greece seemed to promise him a chance. His heart, however, was not made of stone. If Pyrrhus wrote a history of the art of war, which is praised by Cicero, and quoted by Dionysius of Halicarnassus and Plutarch.

The chief ancient authority for the life of Pyrrhus is Plutarch; see also Polybius xviii. 11, and elsewhere; Dion, Hellen. xvii. 1, xix. 6–9; Pausanias i. 13; Justin xviii. 1, 2, xxiii. 3, xxv. 4; Modern monographs by G. F. Hertzberg, "Rom und König Pyrrhus" (popular: in O. Jäger's Darstellungen aus der römischen Geschichte, 1870); R. von Scala, Der Pyrrhische Krieg (1884), with map of Roman garrison system in 281; R. Schubert, Geschichte des Pyrrhus (1894), with full list of authorities; also Rome: History, "The Republic.

PYRROL, CH₄N=CH₂-NH, an organic base found in coal-tar and Dippel's oil. It may be synthetically prepared by the dry distillation of ammonium mucrate, or, better, by heating it with glycerin to 180–200° C. (H. Schwanert, Ann., 1860, 116, p. 257); by passing the vapour of diethyamine through a red-hot tube; by distilling succinimide with zinc dust (C. A. Bell, Ber., 1880, 13, p. 577); or by distilling calcium pyroglutamate: H₂O₂C-CH(NH₂)₂-CH₂CO₂H = CH₄N+ + CO₂+2H₂O (L. Haidinger, Monats., 1882, 3, p. 228); and by boiling succinic dialdehyde with ammonia and glacial acetic acid (C. Harries, Ber., 1881, 34, p. 1497). It is a feebly basic, colourless liquid which boils at 130°C., and possesses a smell resembling that of chloroform. It is slightly soluble in water, and turns brown on exposure to air. It has to some extent the character of a secondary amine; the hydrogen of the imino group can be replaced by potassium. It is resinated by the action of concentrated mineral acids. On warming solutions of pyrrol in
PYRUVIC ACID—PYTHAGORAS

dilute acid, ammonia is evolved, and an amorphous powder of variable composition, known as pyrrol-red, separates out. The pyrrol ring is easily broken, e.g., hydroxylamine gives the dioxime of succinic aldehyde. Pyrrol is readily converted into pyridine by heating, as with bromoform, chloroform, or methylene iodide on its potassium salt, β, β'-brom- and β-chloropyridine being obtained with the first two compounds, and pyridine itself with the last. Iodine in alkaline solution converts pyrrol into iodol (tetraiodopyrrol), crystallizing in yellowish-brown needles, which decompose on heating. It may also be prepared by heating tetra-brom- or tetra-chloropyrrol with potassium iodide in alcoholic solution (German patent, 38423, 1886). It is used as an antiseptic.

Zinc chloride and hydrochloric acid reduce pyrrol to pyrrolidine (dihydropyrrol), C₅H₅NCH₂H₂, which boils at 90°C (748 mm.) is soluble in water and has strongly basic properties and an alkaline reaction. Hydriodic acid at high temperature reduces pyrrol to pyrrolidine (tetra-hydropyrrol), C₅H₅N. Pyrrolidine has also been prepared by A. Thiele (Ber., 1905, 38, p. 4154) from β-chloropyrrolic aldehyde diethyl acetal. The chlorine atom in this compound is replaced by the cyanogroup, which is then reduced to the CH₃NH₂ group and coupled up with benzene sulphochloride to form the compound CH₃SO₂NH(CH₂)₂CO(OH)₂₄. This substance easily splits out alcohol, and the ring compound then forms yields pyrrolidine on reduction by sodium in anhydrous alcohol solution. An earlier pyrrolodialcarboxylic acid and four pyrrol derivatives have been detected by E. Fischer among the products of hydrolysis of protons. R. Willstätter (Ber., 1900, 33, p. 1164) obtained this acid by the action of a methylalcohol solution of phenylacetic acid on 140°C. The diamide formed then hydrolysed either by hydrochloric acid or baryta water:

\[ \text{C₃H₇Br(COH₂)} \rightarrow \text{C₃H₇(CONH₂)} \rightarrow \text{C₃H₇-C₃H₇NH} \rightarrow \text{C₃H₇-C₃H₇NH-C₃H₇-C₃H₇}. \]

Numerous substitution derivatives of pyrrol are known. The N-derivatives are prepared by the action of alkyl halides and acid chlorides on potassium pyrrol. The C-derivatives have been prepared in various ways. L. Knorr, by the action of ammonia on aceto-acetic ester, obtained β-imidobutyric ester, which with nitrous acid yields α-amino-β-imidobutyric ester, C₅H₅N.CH₂N(CH₃)CO₂H. The formation of ammonia, hydroxylamine, and dimethyl pyrrol dicarboxylic ester,

\[ \text{C(CH₃)}₂-\text{C-OR} \rightarrow \text{H-N} \rightarrow \text{C(CH₃)}₂-\text{C-OR}. \]

He also found that diaceto succinic ester reacts with compounds of the type NH₄R (R = CH₃, OH, NH₄CH₃ &c.) to form pyrrol derivatives:

\[ \text{NH₄R} \rightarrow \text{CH₃CO-C-R} \rightarrow \text{CN} \rightarrow \text{C(R)} \rightarrow \text{CO₂H}. \]

By using compounds of the type NH₄R and aceto-phenoxyaceto-acetic ester C₅H₅CO₂H.C₇H₅CO₂H.C₇H₅CO₂H.C₇H₅CO₂H, C. Paul obtained similar results.

PYRUVIC ACID, or PYRROCAEIC ACID, CH₂CO₂H₄, an organic acid first obtained by J. Berzelius by the dry distillation of tartaric or racemic acids (Pogg. Ann., 1835, 36, p. 1). It may be prepared by boiling a dichloropropionic acid with silver oxide; by the hydrolysis of acetyl cyanide with hydrochloric acid (J. Claissen and J. Shadwell, Ber., 1878, 11, pp. 620, 1503); and by warming oxalacetic ester with a 10% solution of sulphuric acid. It is usually made by distilling tartaric acid with potassium bisulphate at about 200–250°C, the crude product being afterwards fractionated. It is a liquid which boils at about 165°C. (with partial decomposition); it may be solidified, and when pure melts at 13–13.5°C. (L. Simon Bull. Soc. Chim., 1805 [3], 13, p. 335.) It is readily soluble in water, alcohol and ether. It reduces ammoniacal silver solutions. When heated with hydrochloric acid to 100°C. It yields carbon dioxide and pyrotartaric acid, C₄H₅O₄, and when warmed with dilute sulphuric acid to 150°C. it gives carbon dioxide and acetaldehyde. Sodium amalgam or zinc and hydrochloric acid reduce it to lactic acid, whilst hydriodic acid gives propionic acid. It readily condenses with aromatic carbocations in the presence of sulphuric acid. It is somewhat readily oxidized; nitric acid gives carbonic and oxalic acids, and chromic acid, carbouic and acetic acids. It forms a well-crystallized hydrarzone with phenylhydrazine; and α-nitropropionic acid with hydroxylamine. It is monobasic and yields salts which only crystallize with great difficulty; when liberated from these salts by a mineral acid it forms a syrupy non-volatile solution. In aqueous solution it gives a red colour with ferric chloride. It shows characteristic ketene reactions, yielding a bisulphite compound and combining with hydroxycyanic acid to form the nitrile of α-oxysousoic acid. When warmed with baryta water it gives uvacit acid.

Pyrrole nitrite, or acetyl cyanide, CH₃CO₂-CN, may be prepared by the action of silver cyanide on acetyl chloride; or of acetyl chloride with potassium cyanide at 0°C. and O. Manasse, Ber., 1887, 20, p. 1965). It is a liquid which boils at 93°C. and with caustic alkalis polymerizes to diacetylcyandiamine.

PYTHAGORAS (6th century b.c.), Greek philosopher, was, in all probability, a native of Samos or one of the neighbouring islands (others say a Tyrrenhian, a Syrian or a Tyrian), and the first philosopher. He was an important figure in the Pythagorean school, which had already witnessed the first development of philosophic thought in Greece (see IOIAN SCHOOL). The exact year of his birth has been variously placed between 586 and 560 b.c., but 582 may be taken as the most probable date. He was a pupil of Pherecydes (c. 600 b.c.) and later of Hermodamas (Diog. Laërt. vii. 2). He left in Ionia the reputation of a learned and universally informed man. "Of all men Pythagoras, the son of Mnesarchus, was the most assiduous inquirer," says Heraclitus, and then proceeds in his contemptuous fashion to brand his predecessor's wisdom as only ecstatically compiled information or polyphony (prophusia). This accumulated wisdom, as well as most of the tenets of the Pythagorean school, was attributed in antiquity to the extensive travels of Pythagoras, which brought him in contact (so it was said) not only with the Egyptians, the Phoenicians, the Chaldaeans, the Jews and the Arabs, but also with the Druids of Gaul, the Persian Magi and the Brahmins. But these tales represent only the tendency of a later age to connect the beginnings of Greek speculation with the hoary religions and priesthoods of the East. There is no intrinsic improbability, however, in the statement of Isocrates (Laud. Busef. 28, p. 227 Step.) that Pythagoras visited Egypt and other countries of the Mediterranean, for travel was one of the few ways of gathering knowledge. Some of the accounts (e.g. Callimachus) represent Pythagoras as deriving much of his mathematical knowledge from Egyptian sources, but, however, it may have been with the practical beginnings of geometrical knowledge, the scientific development of mathematical principles can be shown to be an independent product of Greek genius. Some rules of the Pythagorean rite had their Egyptian parallels, as Herodotus points out, but it does not necessarily follow that they were borrowed from that quarter, and he is certainly wrong in tracing the "origin of metaphysics" to Egypt.

The historically important part of his career begins with his migration to Crotona, one of the Dorian colonies in the south of Italy, about the year 529. According to tradition, he was driven from Samos by the tyranny of Polycrates. At Crotona Pythagoras speedily became the centre of a widespread and influential organization, which seems to have resembled a religious brotherhood or an association for the moral reformation of society much more than a philosophical school. Pythagoras appears, indeed, in all the accounts more as a moral reformer than as a speculative thinker or scientific teacher; and the doctrine of the school which is most clearly traceable to Pythagoras himself in the ethico-mystical doctrine of transmigration. The Pythagorean brotherhood had its rise in the wave of religious revival which swept over Hellas in the 6th century b.c., and it had much in common with the Orphic communities which sought by rites and abstinence to purify the believer's soul and enable it to escape from "the wheel of birth." Its aims were undoubtedly those of a religious order rather than a political league. But a private religious organization of this description had no place in the traditions of Greek life, and could only maintain itself by establishing "the rule of the saints" on a political basis. The Pythagoreans appear to have established their supremacy for a time over a considerable part of Magna Graecia,
PYTHAGORAS

represented in a similar way, and are hence spoken of as "triangular numbers," while the sums of the series of successive odd numbers are called "square numbers," and those of successive even numbers "oblong numbers": thus 3 and 5 added to the unit give a figure of this description \[\frac{\text{square}}{1}\]
while 4 and 6, added to 2, are thus represented \[\frac{\text{oblong}}{1}\]. Such a method of representing number in areas leads naturally to problems of a geometrical nature, and as the practical use of the right-angled triangle was already familiar in the arts and crafts, there is no reason to dispute the well-established tradition which assigns to Pythagoras the discovery of the properties of the triangle. In such a triangle the square on the hypotenuse is equal to the sum of the squares on the other two sides. And it is probably also correct to attribute to him the discovery of the principle that in the time intervals between the two consonant musical sounds. Impressed by this reduction of musical sounds to numbers and by the presence of numerical relations in every department of phenomena, Pythagoras and his early followers denounced the concept that "all things are numbers," which Aristotle put it, to be the first things in the whole of nature, and they supposed the elements of numbers to be the elements of all things, and the whole heaven to be a musical scale and a number (\[\text{Mozart, A. 587}\]). Numbers, therefore, are spatially conceived, " one " being identified with some sort of point, which is in itself capable of unlimited density and extent. From combinations of such units the higher numbers and geometrical figures arise—" two " being identified with the line, three with the surface, and four with the solid, and the system of number and geometrical figures is called the emanation of the "elements" of Empedocles as built up out of geometrical figures in the manner followed by Plato in the Timaeus. The identification of the numerical opposites, the Odd and the Even, with the Limit and the Unlimited was considered a difficult—perhaps may be understood, as Burnet suggests, by reference to the arrangement of the units or "terms" (\[\text{500}\]) in patterns. "When the odd is divided into two equal parts, a remainder is left behind in the arrangement of the units, and when the even is divided, the number is left over, without a master and without a number, that is to say, it is defective and incomplete. The idea of opposites, derived, perhaps, originally from the dialectic, was also developed by the Pythagoreans and constitutes part of the fundamental oppositions, bearing a certain resemblance to the tables of categories framed by later philosophers, but in its arbitrary mingling of mathematical, physical and ethical contrasts characterizes the intellectual beginning of speculative thought. (1) limited and unlimited, (2) odd and even, (3) one and many, (4) right and left, (5) male and female, (6) rest and motion, (7) straight and curved, (8) good and evil, (9) square and oblong. To the Pythagoreans, as to Heraclitus, the universe was in a sense the realized union of these opposites, but interpretations of Pythagoreanism which represent the whole system as founded on one of these oppositions or dualities, or of the hypothesis of the constancy of the universe against the formation of matter and, of active and passive material, on the surface their post-Platonic origin. Still more is this the case when in Neoplatonic fashion they endeavored to derive this original opposition from the supreme unity or God. The further speculations of the Pythagoreans on the subject of number rest mainly on analogies, which often become capricious and tend to lose themselves in the shifting and fanciful hypotheses at which they arrived. The first such attempt was called the theory of " ratios," because within the decade it has neither factors nor product. "Five," on the other hand, signifies marriage, because it is the union of the first masculine with the first feminine (5 = 2 + 3, or 2 x 3 + 1). The thought already becomes more fanciful when "one" is identified with reason, because it is unchangeable; "two" with opinion, because it is unlimited and indeterminate; "three" with justice, because it is the first square number, the product of equals. The astronomy of the Pythagoreans was their most notable contribution to scientific thought, and its importance lies in the fact that they were the first to conceive the earth as a globe,
PYTHAGORAS

As the introduction of geometry into Greece is by common consent attributed to Thales, so all are agreed that to Pythagoras is due the honour of having raised mathematics to the rank of a science. We know that the early Pythagoreans published nothing, and that, moreover, they referred all their discoveries back to their master (see PHILOLAUS). Hence it is not possible to separate his work from that of his early disciples, and we must therefore treat the geometry of the early Pythagorean school as a whole. We know that Pythagoras made numbers the basis of his philosophical system, as well physical as metaphysical, and that he united the study of geometry with that of arithmetic.

The following statements have been handed down to us. (a) Aristotle (Met. i. 5, 98b) says "the Pythagoreans first applied themselves to mathematics, a science which they improved, and, penetrated with it, they fancied that the principles of mathematics were the principles of all things." (b) Eudemus informs us that "the Pythagoreans had the first recognized geometry in a formal system, regarding its principles in a purely abstract manner, and investigated its theorems from the immaterial and intellectual point of view (ἡφασματων καὶ ἀρχιτεκτονικῶν)." (c) Diogenes Laërtius (viii. 11) relates that "it was Pythagoras who established geometry to perfection, after Moeris had first pointed out the principles of that science, as Anticleides tells us in the second book of his History of Alexander; and the part of the science which he Pythagoras applied himself to, all others was afterwards improved by him." (d) According to Aristotle, the musician, Pythagoras seems to have esteemed arithmetic above everything, and to have advanced it by applying it from the science of commerce and by likening all things to numbers. (e) Diogenes Laërtius (viii. 11) says that the same authority that Pythagoras was the first person who introduced measures and weights among the Greeks. (f) He discovered the numerical relations of the musical scale (Diog. Laërt. viii. 11).

"..."
On examining the purely geometrical work of Pythagoras and his early disciples, as given in the preceding extracts, we observe that it is much concerned with the geometry of areas, and we are indeed struck with its Egyptian character. This appears in the theorems which concern the right-angled triangle (Prop. 47) and the propositions (11) and (12) of the treatise of Alcibiades and Proclus. The discovery of irrational quantities is ascribed to Pythagoras by Eudemus (Procl. op. cit. p. 65). The three proportions—arithmetical, geometrical, and the third in order, which was known by the name sub-contrary (proportionem), with which Archytas and Hippasus designated the harmonic, since it appeared to include the ratios concerning harmony and melody. (16) The so-called perfect or musical proportion, e.g. 6 : 8 : 9 : 12, which is a proportion in it all. (17) Arithmetical progressions were treated by the Pythagoreans, and it appears from a passage in Lucian that Pythagoras himself had considered the special case of triangular numbers: Pythagoras asks one, "How do you count?" He replies, "One, two, three, four. - Pythagoras, interrupting, says, "Do you see what you take to be four, that is ten and a perfect triangle and our oath?" (18) - The odd numbers were called by the Pythagoreans "gnomons," and were regarded as generating, inasmuch as by the addition of an even number to each, each of an odd number of unit squares—to the original square unit or monad the square form was preserved. (19) - In like manner, if the simplest oblong (rectangles), consisting of two units or monads in junction, is taken as the base, and a unit be placed after the manner of a gnomon, and then in like manner six, eight, ... unit squares be placed in succession, the oblong form will be preserved. (20) - Another of his doctrines was, that of all solid figures, the sphere is the most perfect and that of all plane figures, the circle. According to Iamblichus, the Pythagoreans are said to have found the quadrature of the circle.

him as a symbol of health. It is said to have obtained its special name from the letters υ, γ, θ, (α, =), a having been written at its proper position.

1 De arch. ix.; Praef. 5, 6, 7. - Amongst other authorities are Diogenes Laërtius (viii., 11), Proclus (op. cit., p. 426), and Plutarch (ut supra, 6). - Plutarch, however, attributes to the Egyptians the knowledge of the properties of the right-angled triangle in the particular case where the sides are 3, 4, and 5 (De Is, et Osir. c. 56).

2 Heron. Alex. Geom. et stereom. ed. F. Hultsch, pp. 56, 140; Procl. op. cit. p. 428. The method of Pythagoras is as follows: he took an odd number as the lesser side; then, having squared this number and diminished the square by unity, he took half the remainder as the greater side, and by adding unity to this number he obtained the hypotenuse, e.g. 3: 4: 5; 5: 12, 13.

5 Op. cit. p. 168. As an example of this proportion Nicomachus and Plutarch mention the tripod. By the addition of 12, the harmonic and arithmetical means between two numbers forming a geometric proportion with the numbers themselves (a : 2b = a-b : b) Iamblichus further relates (loc. cit.), that many Pythagoreans made use of this proportion as a basis of Crotona, Timaeus of Locri, Philolaus and Archytas of Tarentum and many others, and after them Plato in his Timaeus (see Nicom. Inst. arithm. ed. Ast. p. 153, and Animadversiones, pp. 327-329; and lamb. op. cit. p. 177 seq.).

38 See Bretsch. Die Geom. vor Euklides, p. 82; Camerer, Euclidis elem. i. 444, and the references given there.

39 The dodecahedron was assigned to the fifth element, quinta pars, aether, or, as some think, to the universe. (See Philolaus.)
solids three—the tetrahedron, the cube and the octahedron—were known to the Egyptians and are to be found in their architecture; let the reader refer to this chapter. Of the regular tetrahedron there are other two solids—the icosahedron and the dodecahedron. In the formation of the tetrahedron three, and in that of the octahedron four, equilateral triangles had been placed with a common vertex and adjacent sides coincident; and it was known that if six such triangles were placed round a common vertex with their adjacent sides coincident, they would lie in a plane, and that, therefore, the entire form of the triangle, if it remained, then, to try whether five such equilateral triangles could be placed at a common vertex in like manner; on trial it would be found that they could be so placed, and that their bases would form a circle. Thus the regular pentagon would thus become known. It was also known from the formation of the cube that three squares could be placed in a similar way with a common vertex, and that, further, if three regular hexagons were placed round a point as common vertex with adjacent sides coincident, they would form a plane. It remained in this case, too, only to try whether three equal regular pentagons could be placed with a common vertex and in a similar way; this on trial would be found possible and would lead to the construction of the regular dodecahedron, which was the regular solid last arrived at.

We see that the construction of the regular pentagon is required for the formation of each of these two regular solids, and that, therefore, it must have been a discovery of Pythagoras. If we examine now what knowledge of geometry was required for the solution of the problem, we shall arrive at the following:* 10, which is reduced to Euclid II. 11, which problem is reduced to the following:* To produce a given straight line so that the rectangle contained by the produced line and the given line shall be equal to the square on the given line, or, in the language of the ancients, To apply to a given straight line a rectangle which shall be equal to a given area—in this case the square on the given line. It is impossible to produce a line greater than this, for the hypotenuse in a right-angled triangle is the geometric mean between the sides of that triangle; and by hypothesis the problem is reduced to the case where the sides of the triangle are equal; hence there the geometric mean is itself equal to the terms. It is impossible to produce a line greater than this, for the hypotenuse in a right-angled triangle is the geometric mean between the sides of that triangle; and by hypothesis the problem is reduced to the case where the sides of the triangle are equal; hence there the geometric mean is itself equal to the terms. Hence we observe that the problem is solved in this manner by Euclid (VI. 30, 1st method), and that we know on the authority of Eudemus that the problems concerning the application of areas and their enumeration are among those that Pythagoras and his school first deduced. Hence the statements of Lambique concerning Hippasus (9)—that he divulged the sphere with the twelve pentagons—and of Lucian and the scholiast on Aristophanes (10)—that the pentagram was discovered—have a respect amongst the Pythagoreans—become of greater importance.

Further, the discovery of irrational magnitudes is ascribed to Pythagoras by Eudemus (13), and this discovery has been ever regarded as one of the greatest of antiquity. It is commonly assumed that Pythagoras was led to this theory from the consideration of the isosceles right-angled triangle. It seems to the present writer, however, more probable that the discovery of incommensurable magnitudes was rather owing to the problem: To cut a line in extreme and mean ratio. From the solution of this problem it follows at once that, if on the greater segment of a line so cut a square is described, and the hypotenuse of the rectangle so described as a new line, will be cut in a similar manner; and this process can be continued without end. On the other hand, if a similar method is adopted in the case of any two lines which can be represented numerically, the process would end. Hence would arise the distinction between commensurable and incommensurable quantities. A reference to Euclid X. 2 will show that the method above is the one used to prove that two magnitudes are incommensurable; and in Euclid X. 3 it will be seen that the greatest common measure of two commensurable magnitudes is found by this process of continued subtraction. It seems probable that Pythagoras, to whom is attributed one of the rules for representing the sides of right-angled triangles in numbers, tried to find the sides of an isosceles right-angled triangle numerically, and that, failing in the attempt, he suspected that the hypotenuse and a side had no common measure. He might have presumed to have found the irrationality of the side of a square and its diagonal. The old proof—which consisted of a reductio ad absurdum, showing that the root is greater than that with the number, etc., etc.—follow that the same number would be odd and even—makes it more probable, however, that this was accomplished by his predecessors. The existence of the irrational as well as that of the regular solids was also supposed to have been discovered independently by them as one of their chief discoveries, and to have been preserved as a secret; it is remarkable, too, that a story similar to that told by Lambique of Hippasus is narrated of the person who first published the theorem (9) that the diagonal of a square is irrational. Eudemus ascribes the problems concerning the application of figures to the Pythagoreans. The simplest cases of the problem

PYTHAGORAS (OF RHAGUM)—PYTHEAS (OF MARSEILLES)

PYTHAGORAS, of Rhagum, a noted Greek sculptor of the 5th century B.C., a contemporary of Myron and Polycritus, and their rival in making statues of athletes. He was born at Samos and migrated in his youth to Rhagum in Italy. He made a statue of Philoctetes notable for the physical expression of pain, an Apollo shooting the Python at Delphi, and a man singing to the lyre. He is said to have introduced improvements in the rendering of muscles, veins and hair.

PYTHEAS, of Marseilles (Massilia), a celebrated Greek navigator and geographer, from whom the Greeks apparently derived their earliest definite information concerning western Europe, and especially the British Islands. He was probably contemporary with Alexander the Great; he certainly wrote before Dicaearchus, a pupil of Aristotle who died about 253 B.C. His works have not been preserved, but the details of the voyages he undertook are to a large extent his own, while his capacity and character, but the various titles under which it is quoted (e.g. Πτολ. περιδ. ή Τα περι τω Τελεωτικω) point to a geographical treatise, in which Pytheas had embodied the results of his observations, rather than to a continuous narrative of his voyage.

Some modern writers have supposed Pytheas to have been sent out, at public expense, in command of an expedition organized by the republic of Massilia; but there is no ancient authority for this, and Pybolus, who had unquestionably seen the original work, expressly states that he had undertaken the voyage in a private capacity and with limited means. All that we know concerning the voyage of Pytheas (apart from detached notices) is contained in a brief passage of Polibius, cited by Strabo, in which he tells us that Pytheas, according to his own statement, had not only visited Britain, but had personally explored a large part of it ("travelled all over it on foot," according to one reading of the text in Strabo, bk. iv. ch. 1), and estimated its circumference at more than 40,000 stadia (4000 geographical miles). To this he added the account of Thule (which he placed six days' voyage north of Britain) and the adjoining regions, in which there was no longer any distinction between air, earth and sea, but a kind of mixture of all three, resembling the gelatinous mollusc known as pulmo marinus, which rendered all navigation and progress in any other mode alike impossible. This substance Pytheas had himself seen, according to Strabo (bk. iv. ch. i.), but the other phenomena he described only from hearsay. After this he visited "the whole of the coasts of Europe" (i.e., those bordering on the ocean) as far as the Tanais (Strabo, bk. ii. ch. iv. § 1). This last sentence has led some modern writers to suppose that he made two different voyages; but this is improbable; the expressions of Polibius imply that his explorations in both directions, first towards the north and afterwards towards the east, formed part of the same voyage.

The countries visited, and to a certain extent explored, by Pytheas, were previously unknown to the Greeks—except, perhaps, by vague accounts received through the Phoenicians—and were not visited by any subsequent authority during more than two centuries. Hence, so far as preserved, his statements in the original, and his statements, and treated his voyage as a fiction. Eratosthenes, indeed (276–196 B.C.), attached great value to his authority as to Britain and Spain, though doubting some of his statements; but Polybius (who lived about the same period) considered the whole work of Pytheas a tissue of fables, like that of Euhemerus concerning Panchaea; and even Strabo, in whose time the western regions of Europe were comparatively well known, adopted to a great extent the view of Polybius.

In modern times a critical examination has arrived at a more favourable judgment, and though Gesselin in his Recherches sur la geographie des anciens (iv. 168–180) and Sir C. G. Lewis in his History of the Ancient World (pp. 336–344) revived the sceptical view, the tendency of modern critics has been rather to exaggerate than to depreciate the value of what was really added by Pytheas to our knowledge. Our information concerning him is so imperfect, and the scanty notices so contradictory, that it is difficult to arrive at anything like a sound conclusion. It may, however, be considered as fairly established that Pytheas made a voyage to Britain, and another voyage from Britain; the former proceeding from Gades, the great Phoenician emporium, and probably the farthest point familiar to the Greeks, round Spain and Gaul to the British Islands, and that he followed the eastern coast of Britain in considerable detail, rendering his information as to its further extension in that direction which led him greatly to exaggerate its size. At the same time he heard vaguely of the existence of a large island to the north of it—probably Ireland—and the British are recorded as having been purposely shown him in that position—to which he gave the name of Thule.

The most important statement made by Pytheas in regard to this was the current of the Rhanges, or the wind phenomena affecting the duration of day and night therein. Unfortunately, most of the reports transmitted to us differ so widely that it is almost impossible to determine what Pytheas himself stated. It is, however, probable that he interpreted the passage "from Gades to the Tanais, which is exaggeratedly said to be a wind in the tents of Pytheas, as it is evidently based upon the supposition that this would be a simple and direct course along the northern shores of Germany and Scythia—Polybius himself, in common with the other Greek geographers till a much later period, being ignorant of the presence of the Danish or Gimbric peninsula, and the circumnavigation that is involved—of all which no trace is found in the extant notices of Pytheas. Notwithstanding this, some modern writers have supposed that he attempted to have reached the Arctic circle, to visit the island of Vatsula (his Tanais). The only foundation for this is to be found in the fact that in a passage cited by Pliny (H. N. xxxvii. 2, 35) Pytheas is represented as stating that amber was brought from an island called Abalus, distant a day's voyage from the land of the Guttanes, a German nation who dwelt on an estuary of the ocean called Mentonomus, 6000 stadia in extent. It was a production thrown up by the waves of the sea and was used by the inhabitants of Slesvig, and the south coast of Britain, to burn instead of wood. It has been conjectured that the "estuary" here mentioned refers to the Baltic, the existence of which as a separate sea was unknown to all ancient geographers; but the obscurity of the statement concerning it, and the probability that the statement concerning the place from whence the amber was actually derived, both point to the sort of hearsay accounts which Pytheas might readily have picked up on the shores of the German Ocean, without having himself seen them. The current from the Elbe, Weser or Elbe, which last is supposed by Uberti to have been the limit of his voyage in this direction. It must be observed also that amber is found in Friesland and on the west coast of Schleswig, as well as in the Baltic, though not in equal abundance.

As to the Cassterides, or Tin Islands, the exploration of which would naturally be one of the chief objects of Pytheas, he seems to have furnished Timaeus, who wrote less than a century after him, with details upon the same, especially in regard to the commercial centre of Iktis (St Michael's Mount in Cornwall?), which are preserved by Diodorus. The trade with these regions was probably at this time carried on by the Phoenicians, but we know that a considerable portion of the supply was carried overland from Gaul to Massilia.

Pytheas certainly had one merit, which distinguished him from all his predecessors. He was the first to attempt the study of latitude, among others that of his native place Massilia, with which he associated the name of Taprobane, and within a few miles of the truth, was adopted by Ptolemy, and became the basis of the Ptolemaic map of the western Mediterranean. His calculations of the length of the longest day at four different places, and of the lengths of the whole year, are in greater or less agreement with modern observations. If these figures (16, 17, 18 and 19 hours) are to be pressed, they would refer to, say, Ushant (48° N.), Flemish Head (54°), Tarbet Ness in Ross (58°) and the northernmost points of the Skerries. They also suggest that he who arrived at any correct notion of the tides, and not only indicated their connexion with the moon, but pointed out their periodical fluctuations in accordance with the phases of that luminary. Other observations concerning the manners and customs of the inhabitants
of remote northern regions prove that he had himself really visited them. Among these are the gradual disappearance of various kinds of grain as one advanced towards the north; the use of fermented liquors made from corn and honey; and the habit of threshing out their corn in large covered barns, instead of on open threshing-floors as in Greece and Italy, on account of the want of sun and abundance of rain. Pytheas's notice of the depth of the Bay of Biscay, of the length of the projection of Brittany, of Ushant under the name of Utisama, and of three promontories of Britain, two of which seem to correspond to Land's End (Belerion), and North Foreland (Kantion), must not be forgotten.

The fragments of Pytheas have been collected by Arvedson (Uppsala, 1844), and by Fuhr (De Pyth. massiliensi, Darmstadt, 1835). Of the numerous treatises and dissertations on the subject, see Uberti, "Bemerkungen über Pytheas," in vol. i. of his Geog. d. Griechen u. Römer, pp. 208-309, which contains an excellent summary of all that is known concerning Pytheas; Sir George C. Lewis, Historical Survey of the Astronomy of the Ancients, pp. 456-480 (London, 1862); Sir Edward H. Bunbury, History of Ancient Geography, vol. i. ch. xv. § 2 (London, 1853); C. J. Elton, Origins of English History, cf. especially app. i. pp. 400, &c. (London, 1882); Hugo Berger, Geschichte der wissenschaftlichen Erdkunde der Griechen, pt. 3 (2nd ed., Leipzig, 1909). A very elaborate investigation of the whole subject will be found in Müllenhoff, Deutsche Alterthumskunde, i. 211-407 (Berlin, 1870). See also Sir Clements Markham's paper, "Pytheas, the Discoverer of Britain," in the Geographical Journal (June 1895); and H. F. Tozer, History of Ancient Geography, pp. 152-164 (Cambridge, 1897).

PYTHIS, or Pythius, one of the most noted Greek architects of the later age. He cultivated the Ionic style, in which he constructed the temple of Athena at Priene. The dedicatory inscription, which is in the British Museum, records that the founder was Alexander the Great. Pythis also made a great marble quadriga which surmounted the Mausoleum.

PYTHON, in Greek mythology, son of Gaea, an enormous serpent, said to have been produced from the mud after the flood of Deucalion. Its haunt was a cavern near Mt Parnassus. Four days after its birth it was slain by Apollo (Apollodorus i. 4), who was hence surnamed Pythius. According to Ephorus (in Strabo ix. 646), Python, surnamed Draco (serpent), was a brigand near Delphi. The python in reality represents the pestilential vapours rising from stagnant lakes and pools, which are dispersed by Apollo and his arrows—that is, the shafts of the sun. The old derivation (Homer's Hymn to Apollo, 371), according to which Delphi was originally called Pytho, because the slain serpent was left there to be "rot" (αἰθέθαι), points to this explanation.

See C. Pascal, Studii di antiquità e mitologia (1896).

PYTHON, a genus of very large snakes of the family Boidae (see Snakes) inhabiting the tropical parts of Africa, Asia and Australia. They differ from the true boas (q.v.), with which they are often confused, by carrying a few teeth in the premaxilla, by the double row of subcaudal shields and by the possession of a pair of supra-orbital bones. Most of them have pits in some of the upper and lower labial shields.

Python reticulatus is the commonest species in Indo-China and the Malay Islands; four upper labial shields on either side are pitted. It is, next to the Anaconda, one of the largest of all snakes, some specimens being known which measured about 30 ft. in length. P. reticulatus, more sparingly, is the python or rock-snake of India and Ceylon. The African species are much smaller, up to 15 ft. in length, e.g. P. sebae of tropical and southern Africa and the beautiful P. regius of West Africa. P. splendens is the "carpet-snake" of Australia and New Guinea. A small relative of pythons is Loxocemus bioclor of South Mexico, the only New World example.

The giant pythons could no doubt overpower and kill by constriction almost any large mammal, since such snakes weigh many hundredweights and possess terrific strength, but the width of their mouth—although marvellously distensible—has, of course, a limit, and this is probably drawn at the size of a goat. Before a python swallows such large prey, its bones are crushed and the body is mangled into the shape of a sausage. The snake begins with the head, and a great quantity of saliva is discharged over the body of the victim as it is hooked into the throat by the alternately right and left forward motions of the distended well-toothed jaws. If for any reason a snake should disgorge its prey, this will be found smothered with slime. Hence the fable that they cover it with saliva before deglutition.

Most pythons are rather ill-tempered, differing in this respect from the boas. They are chiefly arboreal, and prefer localities in the vicinity of water to which mammals and birds, their usual prey, resort. They move, climb and swim with equal facility. The female collects her eggs, sometimes as many as one hundred, into a heap, round which she coils herself, covering them so that her head rests in the centre on the top. In this position the snake remains without food throughout the whole period of incubation, or rather keeping guard, for about two months.

H. F. G.

PYX (Gr. πυξ, a box or chest), a term for various forms of receptacle. In ecclesiastical usage it is the sacred vase or tabernacle in which the Host is reserved. In the English Mint the pyx is the chest in which are placed one coin from every 15 lb. of newly coined gold and one from every 60 lb. of newly coined silver to await the "trial of the pyx" (see MINT). This chest was formerly kept in the Chapel of the Pyx in Westminster Abbey.
Q—QARAITES

the letter which immediately succeeds P in the alphabet of Latin and the modern languages of western Europe. It represents the Koppa of the earliest Greek alphabets surviving in that form of the Ionic alphabet, which ultimately superseded all others, merely as the numerical symbol for 90. In the Phoenician alphabet a sibilant Zad (Tradd) stands between q and P. Hence Q is the nineteenth letter in the Phoenician alphabet, the eighteenth in the Greek numerical alphabet, which alone contains it, the sixteenth (owing to the omission of θ and ξ) in the Latin, and (from the addition of J) the seventeenth in the English alphabet. Its earliest form is a rough ellipse transfixied by an upright line, φ. In various Semitic alphabets this has been altered out of recognition, apparently from the writing of the symbol in cursive handwriting without lifting the pen. As a result forms like ὑ, π, π, τ are developed. In Greece the head of the symbol is generally circular, and only in a few early inscriptions is the upright carried through the circle, φ. The common form is ὑ with the upright stem short. This is also in the Latin alphabet, but forms with the upright turned to the right as in ὑ came with the Samaritans and in the Republican period, while this tall becomes longer and curved in the early Empire. The pronunciations of the Semitic Kopp (Qaf) was that of a velar guttural produced against the back part of the soft palate with great energy (hence called an "emphatic" sound). In Greek there is no evidence that ὑ was pronounced differently from Κ; hence no doubt its early disappearance in most dialects. It survived longest when followed by ο or υ, as at the beginning of the name of the town of Corinth. In Latin it is regularly used in combination with u. In classical Latin its use is confined to the cases where, as in English quell, &c., the u is pronounced as u before a following vowel, but in old Latin it is found also in other combinations. Many languages find the combination qu, when both sounds are consonantal (gw), difficult; q being the deepest guttural while y (English w) is a lip sound, the points of production are nearly as far separate as they can be. There is thus a tendency to assimilation, and instead of a guttural followed by a labial semi-vowel, a new labial consonant p is produced. In Greek this is common when the combination is followed by the vowel ο, in το, τοι, &c., from the same stem as the Latin quod, qui, &c. This, however, is not found in all dialects alike (see Greek language). In other languages, like Osan and Umbrian which are closely akin to Latin, or the Welsh branch of the Celtic languages, θ occurs regularly without regard to the nature of the vowel following. Thus, corresponding to the Latin quattuor, we find the Osan petora, the Gaulish petor-rim, "four-wheeler," the Welsh pedwar, "four," &c., while the Irish celaith, "four," corresponds more closely to the Latin. (P. Gi.)

QARAITES, or Karaites, a Jewish sect of the middle ages, claiming to be distinguished by adherence to Scripture as contrasted with oral tradition, whence the name (from ḫarr gāra, to read, as if "readers," scriptuarii; sometimes also ḫər ʿay “children of the Torah,” as read). They have frequently been identified with the Sadducees or with the Samaritans, with whom of whom have they any historical connection or much spiritual affinity. The schism arose at Bagdad about the middle of the 8th century, when the hereditary claims of Anan, a learned Talmudist, to the office of Rosh Galutha were set aside by the Gaonim (heads of rabbinical schools) at Sura and Pumbeditha, because he was believed to undervalue the authority of the Talmud. Anan, nevertheless, allowed himself to be proclaimed Exilarch by his followers, a step construed into treason by the Mahomedan government. He was sentenced to death, but his life was saved by his fellow prisoner, Abu Haniya, the founder of the great school of Moslem theology and jurisprudence. Ultimately he and his followers were permitted to migrate to Palestine. They erected a synagogue in Jerusalem which continued to be maintained until the time of the Crusades. From this centre the sect diffused itself thinly over Syria, spread into Egypt, and ultimately reached S.E. Europe.

Anan, who is said to have died in a.d. 765, was the author of a commentary on the Pentateuch and other works in Talmudic Hebrew and Arabic. Most of these are lost, and we are thus left chiefly dependent on the hostile indications of opponents. His code was recovered in Egypt by the Qaraites Moses b. Elijah Bashyazi (1544-1572). Fragments were published by Harkavy (Voskhod 1897-1898). It is clear that Anan, although theoretically antagonistic to rabbinic methods, was in the end compelled to incline towards them. Considerable influence, too, was exercised on his theology by Abu Haniya. In general we know that he showed great bitterness against the Talmud and its upholders (the "Rabhanites") for their modification of the written law by arbitrary additions and subtractions, but there is nothing to indicate that he himself had the insight or the fervour by which he could have become the pioneer of a really great reformation. The questions appear to have turned entirely on whether the Hebrew alphabet was to be used in writing the Talmud, and how the 22 letters were to be arranged. In the former case the Qaraites would have professed to be adherents of the "Hebrew" tradition; in the latter case they would have been followers of the "Phoenician" tradition. The distinction was made clear in the first case by the use of a special letter, ḫ, for "ix" (1756). It was, however, not until the 14th century that a system of spelling was adopted which was universally acceptable, and for which the text was restored. The Qaraites never have been numerous; in 1904 their total number was estimated at 12,000, 10,000 being found in Russia: the present community in Jerusalem numbers only a few families. They occur in Constantinople and elsewhere in Turkey, and in Egypt, but are chiefly met with in the southern Russia, and especially in the Crimean districts of Eupatoria, Theodosia and Sevastopol. Here their historical capital and chief synagogue was formerly the "Jews' Castle" (Tsevets-Kale), near Bakh-Chisarai. The place is now deserted; its cemetery was the seat of Firkowitz's notorious forgeries (inscriptions of 1st century), by which he sought to establish a fabulous antiquity for his sect. According to Strack (A. Firkowsitz u. seine Entdeckungen, 1876) the oldest tombstones do not go back beyond the 14th century. The modern Qaraite are generally well spoken of for their honesty, perseverance and simple habits of life; they are gradually approximating to the Rabhanites, with whom, in some places, they are on terms of social intimacy. The Russian government exempts the Qaraites from the restrictions to which the rest of the Jews are subject; this circumstance is probably due to the insignificance of the Qaraites numerically.

Among the older authorities may be mentioned Morinus, Exercit. Bib. lib. ii. ex. 7 (1669); and Triglandius, Diatribe de Secta Kararorum.
QARO—QUADRILATERAL

(1703). See Grätz, Gesch. der Juden, especially in vol. v. (1866), with the additions and corrections of Harkavy in the Hebrew translation; and Fürst, Gesch. des Judentums (1865); S. Pinsky, Liquef Qadmoniyot: articles by A. Harkavy and by S. Poznanski in the Jewish Quarterly Review (e.g. x. 239-275, and vol. xviii.-xx.). See also Jewish Encyclopedia, i. "Arian", "Karaites," &c.

QARO (or CARO), JOSEPH BEN EPHRAIM (1488-1575), codifier of Jewish law, whose code is still authoritative with the mass of Jews, was born in 1488. As a child he shared in the expulsion from Spain (1492), and like most prominent Jews of the period was forced to migrate from place to place. In 1535 he settled in Safed, Palestine, where he spent the rest of his life. Safed was then the headquarters of Jewish mysticism. Qaro was himself a mystic, for the translation of the mystical and mystical truths in his commentaries. He was not by any means the only great Jewish legalist who was also a mystic. Mysticism in such minds did not take the form of a revolt against authority, but was rather the spiritual flower of pietism than an expression of antinomianism. It is, however, as a legalist that Qaro is best known. In learning and critical power he was second only to Maimonides in the realm of Jewish law. He was the author of two great works, the second of which, though inferior as an intellectual feat, has surpassed the first in popularity. This was inevitable, for the earlier and greater book was designed exclusively for specialists. It was in the form of a commentary (entitled Beth Yoseph) on the Turim (see ASHER BEN YEHUD). In this commentary Qaro shows an astounding mastery over the Talmud and the legalistic literature of the middle ages. He felt called upon to systematize the laws and customs of Judaism in face of the disintegration caused by the Spanish expulsion. But the Beth Yoseph is by no means static.

Qaro's real aim was effected by his second work, the Shulhan 'Arukh ("Table Prepared"). Finished in 1555, this code was published in four parts in 1565. The work was not accepted without protest and criticism, but after the lapse of a century and in consequence of certain revisions and amplifications, it became the almost unquestioned authority of the whole Jewish world. Its influence was to some extent evil. It "put Judaism into a strait-jacket." Independence of judgment was inhibited, and the code stood in the way of progressive adaptation of Jewish life to the life of Europe. It included trivialities by the side of great principles, and retained elements from the past which deserved to fall into oblivion. But its good effects far outweighed the bad. It was a bond of union, a bar to latitudinarianism, an accessible guide to ritual, ethics and law. Above all, it gave a new lease of life to the great theory which identified life with law, and in consequence of certain views and pursuits. When, however, the era of reform dawned in the 19th century, the new Judaism found itself impelled to assume an attitude of hostility to Qaro's code.

QUACK. one who pretends to knowledge of which he is ignorant, a charlatan, particularly a medical impostor. The word is a shortened form of "quacksalver" (Du. kwakskaler), in which form it is common in the 17th century, "salver" meaning "healer," while "quack," (Du. kwakken) is merely an application of the onomatopoeic word applied to the sounds made by a duck, i.e. gaffle or gibberish. In English law, to call a medical practitioner a "quack" is actionable per se without proof of special damage (Allen v. Eaton (1630), 1 Roll. Abs. 54). The often-quoted legal definition of a "quack" is "a boastful pretender to medical skill," but a "quack" may have great skill, and it is the claim to cure by remedies which he knows have no efficacy which makes him a "quack" (see Dohy by v. Labouchere, The Times, 29th of July 1904, and 4th and 5th of November 1907).

QUADRAT. (from Lat. quadrator, square), in mathematics, a curve having ordinates which are a measure of the area (or quadrature) of another curve. The two most famous curves of this class are those of Diohistratus and E. W. Tschirnhausen, which are both related to the circle.

The quadratrix of Diohistratus was well known to the ancient Greeks. Heavon, and is mentioned by Proclus, who ascribes the invention of the curve to a contemporary of Socrates, probably Hippas of Elys. Diohistratus, a Greek geomater and disciple of Plato, showed how he effected a mechanical solution of squaring the circle. Pappus, in his Collections, treats of its history, and gives two methods by which it can be generated. (1) Let a spiral line be drawn on a right circular cylinder; a screw such as can be obtained by drawing lines from every point of this spiral perpendicular to its axis. The orthogonal projection of a section of this surface by a plane containing one of the perpendiculurs and inclined to the axis is the quadratrix. (2) A right cylinder can be constructed on the same base, by the quadrature of the spiral. The turn of the spiral cone gives a section by a right circular cone which has the generating line of the cylinder passing through the point of the spiral for its axis. From every point of the curve of intersection, perpendiculars are drawn to the axis. Any plane section of the screw (punctum of Pappus) surface so obtained is the quadratrix. Another construction is shown in fig. 1. ABC is a quadrant in which the line AB and the arc AC are divided into the same number of equal parts.

Radii are drawn from the centre of the quadrant to the points of division of the arc, and these radii are intersected by the lines drawn parallel to BC and through the corresponding points on the radius AB. The locus of these intersections is the quadratrix. A mechanical construction is as follows: Let AMP be a semicircle with centre O (fig. 1.). Let PQ be a straight line on the circle, and let M be another point on the circle so related that the ordinate PQ moves from A to O in the same time as a point on the arc OM describes a quadrant. Then the locus of the intersection of PQ and OM is the quadratrix of Diohistratus.

The cartesian equation to the curve is \(y = x \cot \frac{\pi}{a}\), which shows that the curve is symmetrical about the axis of the corresponding points on the radius AB. and that it consists of a central portion flanked by infinite branches (fig. 2.). The asymptotes are \(x = \pm 2a\), \(y = \pm 2a\) if \(n\) be an integer. The intercept on the axis of \(y\) is \(2a/n\); therefore, if it were possible to accurately construct the curve, the quadrature of the circle would be effected. The curve also permits the solution of the problems of duplicating a cube (q.e.), and trisecting an angle.

The quadratrix of Tschirnhausen is constructed by dividing the arc and radius of a quadrant in the same number of equal parts as before. The mutual intersections of the lines drawn from the points of division of the arc and radius parallel to BC through the points of division of AB, are points on the quadratrix (fig. 3.). The cartesian equation of the point is \(y = a \cos \frac{\pi x}{2a}\). The curve is periodic, and cuts the axis of \(x\) at the points \(x = \pm (2n-1)\), \(n\) being an integer; the maximum values of \(y\) are \(a\). It is used in the same way as those of the quadratrix of Diohistratus.

QUADRATURE (from Lat. quadratura, a making square), in astronomy, that aspect of a heavenly body in which it makes a right angle with the direction of the sun; applied especially to the apparent position of a planet, or of the moon at first and last quarters. In mathematics, quadrature is the determination of a square equal to the area of a curve or other figure.

QUADRIGA, the ancient four-horsed chariot (Lat. quadrige, contracted from quadrigae), which was regarded as one of the seven sacred features in Rome. It was chiefly used as the triumphal car of generals or emperors. The earliest example mentioned is that which was modelled in terra-cotta and raised on the pediment of the temple of Jupiter Capitolinus. In later time it formed the chief decorative feature which crowned the triumphal arches, and there are numerous representations of it on coins.

QUADRILATERAL, in geometry, a figure enclosed by four straight lines. It is also a military term applied to a combination of four fortresses mutually supporting one another. The fortresses of Namur, Liége, Maastricht, and Louvain, and also two castles at Calabria, Kalamata, and Varna, were so called. But the most famous quadrilateral was that of the four fortified towns of north Italy—Mantua, Peschiera, Verona, and Legnago,
the two former of which are situated on the Mincio and the two latter on the Adige. The real value of the quadrilateral, which gave Austria such a firm hold on Lombardy, lay in the great natural strength of Mantua and in the readiness with which troops and supplies could be poured into Verona from the north.

QUADRILLE, the name of a game of cards and of a dance. The game, played by four persons with a pack of forty cards, was a variation of the Spanish game of ombre (q.v.), and superseded it in popularity about 1725, to give way in turn to whist. The dance is of French origin and is usually danced by four couples in square. In the 18th century the contredanse was introduced into the ballet, and groups of four, eight or twelve dancers danced alike performed different figures; these were first called quadrilles contredanse, later shortened to quadrilles. The dance became popular outside the ballet, and its figures, five in number, with a finale, bore the names of the different contredanses, Le Pantalon, L'Été, La Poule, La Trêtière, La Pastourelle. The dance was introduced into England in 1815. The word in both its applications comes through Ital. quadrilio or Span. cuadrilla from Lat. quadra, a square, four-sided figure (quatuor, four).

QUADROON (a corruption of quarteroon, Span. cuarteron, from cuarto, Lat. quartus, fourth), strictly a person having one-fourth negro blood, the offspring of a mulatto and a white. The children of a mulatto and a negro are called quadroons or sambos (possibly from Span. sambro, Lat. scambus, bow-legged), and the use of Sambo as a proper name for a black servant may have thus originated.

QUAESTOR (from Lat. quaero, investigate), a Roman magistrate whose functions, at least in the later times of the republic, were mainly financial, though he was originally concerned chiefly with criminal jurisdiction. The origin of the quaestorship is obscure, but it was probably instituted simultaneously with the consulship in 509 B.C. The number of the quaestors was originally two, but this was successively increased to five (in a.d. 47), ten (in a.d. 267), twenty (in 81 B.C.) to twenty. Julius Caesar raised the number to forty (in 45 B.C.), but Augustus reduced it again to twenty, which remained the regular number under the empire. The original quaestors were afterwards distinguished by the title of urban quaestors (quaestores urbani). When the number was raised from two to four in 421 B.C. the office was thrown open to the plebeians. It was the lowest of the great offices of state and hence it was regularly the first sought by aspirants to a political career (cura honorum). Towards the close of the republic, if not earlier, the successful candidate was bound to have completed his thirtieth year before he entered on office, but Augustus lowered the age to twenty-five. Originally the quaestors seem to have been nominated by the consuls, but later, perhaps from the fall of the decemvirs (449 B.C.), they were elected by the people assembled in tribes (comitia tributa) under the presidency of a consul or another of the higher magistrates. The quaestors held office for one year, but, like the consuls and praetors, they were often continued in office with the title of proquaestor. Indeed it was a rule that the quaestor attached to a higher magistrate should hold office as long as his superior; hence, when a consul regularly presided over the city for one year, and afterwards as proconsul governed a province for another year, his quaestor also regularly held office for two years. Before the election of the quaestors the senate decided the duties to be undertaken by them, and after election these duties were distributed amongst the new quaestors either by lot or by the choice of the higher magistrates to whom quaestors were assigned. A peculiar burden lay on the quaestors, not as an official duty, but rather as a sort of tax exacted from all who entered on the political career, was the paving of the high roads, for which Claudius substituted the exhibition of gladiatorial games.

Various classes of quaestors may be distinguished according to the duties they had respectively to discharge.

1. The Urban Quaestors.—Originally the duties of the quaestors, like those of the consuls, were dischargeable by the superior magistrates of the republic, the quaestors their assistants. From a very early time, however, the quaestors possessed criminal jurisdiction. In the earlier days of the republic they are designated "quaestores parricidii," inquiritors of parricide and perhaps originally this was their full title, which was afterwards abbreviated into quaestores when their functions as criminal judges became more and more distinct. It is possible that the title, which is a hard question to all other crimes fell within the jurisdiction of the quaestors; political crimes only seem to have been excepted. The criminal jurisdiction of the quaestors appears only to have been given when the quaestors had a separate name, which was not the case until the 3rd cent. B.C., and the nature of the duties attached to it we have little or no information.

2. The Military Quaestors.—These were instituted in 421 B.C., when two new quaestors were added to the original two. They are said to have been military quaestors (quaestores militares), who performed the duties of quaestors in the provinces, from whom they were distinguished by the fact that while the urban quaestors did not stand in a special relation of subordination to any particular magistrate, a non-urban quaestor was regularly assigned as an indispensable assistant to each commander in chief. Whenever a general undertook to draw the public treasury and had charge of its contents, including not only coin and bullion but also the military standards and a large number of public documents, which in later times comprised all the laws as quaestus were the private property. Their functions were to keep the public treasury as was in the hands of the urban quaestors by Augustus and transferred to other quaestors, but the office itself continued to have a place among the 3rd cent. B.C. in the rank of the duties of the quaestor attached to it we have little to no information.

When the general left his province before the arrival of his successor he usually committed it to the care of his quaestor, and, if he died or was incapacitated from naming his successor, the quaestor acted as his representative. Unlike the urban quaestor, the military quaestor possessed not a criminal but a civil jurisdiction corresponding to that of the aediles at Rome.

The Italian Quaestors.—The sabine commanders had but one. The consul of the fourth is not mentioned; perhaps it was Liltius in Sicily.

1. The etymology and original meaning of parricidium are doubtful. In the latter part of the word we have, of course, the same root as in Latin "father," but the epithet "parricide" suggests "a father," or from the same root that we have in per-peram, per-jurium, is a moot point. Mommsen takes the latter view.

2. It is often supposed that the quaestores parricidii were an old name of the quaestores militares; it is more likely, however, that the quaestores parricidii intended to assist the consuls, they were not subordinated (like the military quaestors) to a special consul. They were stationed at Crete, at Cales in Campania, and in Gaul about the Padus (Po). The quaestor of the fourth is not mentioned; perhaps it was Liltius in Sicily.

3. Plutarch (Popul. 12) states that the office was instituted by the first consul. Tacitus, on the other hand (Ann. ii. 22), says that it dated from the time of the kings, but his ground is merely that they were mentioned in the Lex Curia of the consul Brutus, which Tacitus assumes to have been identical with that of the kings.
QUAGGA—QUAIL

LITERATURE.—For a fuller treatment of all these points see Momm- 
sehen, Staatsrecht, ii. p. 523 foll.; for the existence of the quensor-
ship under the monarchy, and a different view of the second station 
of the Italian quensor, see A. H. J. Greenidge, Roman Public Life, 
pp. 63, 215.

QUAGGA, or QUAGA, an animal of the genus Equus (see Horse), 
nearly allied to Burchell's zebra, formerly met with in 
various herds on the great plains of South Africa between the Cape 
Colony and the Vaal river, but now completely extinct. 
Generally speaking, the colour of the head, neck, and upper-parts 
of the body was reddish-brown, irregularly banded and marked 
with dark brown stripes, stronger on the head and neck and 
gradually becoming fainter until lost behind the shoulder. 
There is a broad dark median dorsal stripe. The under surface 
of the body, the legs, and tail are nearly white, without stripes. 
The crest is very high, surmounted by a standing mane, banded 
alternately brown and white. It is, however, not improbable 
that there were two or more local races, for which separate 
names have been proposed. Though never really domesticated, 
quaggas have occasionally been trained to harness. The 
accompanying illustration is reduced from a painting made from 
one of two which were driven in Hyde Park by Mr. Sheriff 
Parkins in the early part of the 19th century. The name is an 
imitation of the shrill barking neigh of the animal, "ou-ga, 
oug-ga," the last syllable very much prolonged; it is also 
commonly applied to the bonnte-quaga, or Burchell's zebra 
(see Horse and Zebra).

QUAGMIRE, a bog or marsh, a piece of ground so saturated 
with water that it cannot support any weight. The word is 
composed of "quag" or "quake" (O.E. ceawcan; cf. "quaver, 
"quiver") and "mire," "mud" (Icel. myri, Swed. myr). 
Skeat suggests that quag may be connected with the root seen 
in "quick," and quotes (Elwyn, Dict. 1898) Peter Howman, c. xx. 
64, of an earthquake, the earth "quok as it quake were," i.e. 
shook as if it were alive.

QUAICH, or QUAIH, a form of Scottish drinking vessel. 
The word is an adaptation of the Gaelic cauch, cup, bowl; cf. 
Welsh caeg, and is usually referred to the Gr. καύκος, καίκα, 
through Lat. caucus. In the 18th century it is sometimes 
spelled "quaif," and a connexion has been suggested with 
"quaif," to drink with a large or at a single draught; the 
New English Dictionary, however, considers this doubtful. The 
"quaich" was doubtless inspired by the low silver bowls with 
two flat handles, frequently used as bleeding vessels in England 
and Holland in the 17th century. The earliest quaichs were 
made of a solid block of wood, or of small staves of wood, often 
of different colours, supported by hoops, like barrels. They 
are generally fitted with two, and, more rarely, three short pro-
jecting handles. In addition to wood, they are made of stone, 
brass, pewter, horn, and of silver. The latter were often engraved 
with lines and bands in imitation of the staves and hoops of the 
wooden quaichs. The origin of these vessels in Scotland is 
traced to the Highlands; it was not until the end of the 17th 
century that they became popular in such large centres as 
Edinburgh and Glasgow. The silversmiths of such local gilds 
as Inverness and Perth frequently mounted them in silver, as 
may be seen from the hall-marks on the existing examples. 
They are found, of silver and pewter, in use as communion cups 
in various parts of Scotland; four, with the Edinburgh hall-
mark for 1722, belong to Ayr parish church; and a large one 
with the same hall-mark for 1665-1664 is used as an alms-dish 
at Alvah, Banffshire. The loving cup at Donaldson's hospital 
in Edinburgh, is a large silver quaich, with the Edinburgh stamp 
for 1724, which belonged to the founder of that hospital. 
The finest collection of these vessels is in the possession of 
the marquess of Breadalbane. 

(Edward A. J.)

QUAIL (O. Fr. Quaile, Mod. Fr. Caille, Ital. Quaglia, Low Lat. 
a well-known bird throughout almost all countries of Europe, 
Asia and Africa—in modern ornithology the Coturnix communis 
or C. dactylisonans. This last epithet was given from the peculiar 
three-syllabled call-note of the cock, which has been grotesquely 
rendered in several European languages, and in Italian 
("quaff," "quake") from the sound of the footfall of the 
Quail. The name of Great Britain the species is popularly known by the nickname of 
"wet-my-lips" or "wet-my-feet." The quail varies 
what-in colour, and the variation is rather individual than 
attributable to local causes; but generally the plumage may be 
described as reddish-brown above, almost each feather being 
transversely patched with dark brown interrupted by a longi-
tudinal stripe of light buff; the head is dark brown above, 
with three longitudinal streaks of ochreous-white; the sides 
of the breast and flanks are reddish-brown, distinctly striped 
with ochreous-white; the rest of the lower parts are pale buff, 
clouded with a darker shade, and passing into white on the 
belly. The cock, besides being generally brighter in tint, not 
frequently has the chin and a double-throat band of reddish 
or blackish-brown, which marks are wanting in the hen, whose 
breast is usually spotted. Quails breed on the ground, and lay 
from nine to fifteen eggs of a yellowish-white, blotched and 
dotted with dark brown. Though essentially migratory by 
nature, not a few quails pass the winter in the northern 
hemisphere and even in Britain, and many more in southern Europe. 
In March and April they cross the Mediterranean from the south 
the way to their nesting grounds in large bands, but these 
are said to be as nothing compared with the immense 
numbers that emigrate from Europe towards the end of September. 
During both migrations immense numbers are netted for 
the market, since they are almost universally esteemed as 
delicate meat. The flesh of quails caught in spring commonly proves 
dry and indifferent, but that of those taken in autumn, especially 
when they have been kept long enough to grow fat, as they 
quickly do, is excellent. In no part of the British islands at 
present do quails exist in sufficient numbers to be the special 
element of sport. In old days they were taken in England in 
a net, attracted thereto by means of a quail-call—a simple instrument, 
the use of which is now wholly neglected—on 
which their notes are easily imitated. In South Africa and 
India allied species, C. delegorguui and C. coromandelica, 
the latter known as the Rain-Quail, respectively occur, as well as 
the commoner one, which in Australia and Tasmania is wholly 
replaced by C. pectoralis, the Stubble-Quail of the colonists. 
In New Zealand another species, C. novozelandiae, was formerly 
very abundant in some districts. Some fifteen or perhaps more 
species of quails, inhabiting the Indian and African regions, 
have been separated, perhaps unnecessarily, to form the genera 
Syngapaga, Trevicula, Dacrydactylus, and so forth.

America has some fifty or sixty species of birds which are 
commonly deemed quails, though by some authors placed in 
a distinct family or sub-family Odontophorinae. The best
known is the Virginian Quail, or Colin, as it is sometimes called—that being, according to Hernandez, its old Mexican name. It is the Ortyx (or Colinus) virginianus of modern ornithology, and has a wide distribution in North America, being called "partidge" in the Southern states, and elsewhere being known by the nickname of "Bob-white," aptly bestowed upon it from a call-note of the cock. Many unsuccessful attempts have been made to introduce this bird to England (as indeed similar trials have been made in the United States with quails from Europe). The beautiful tufted Quail of California, Lophortyx californica, has also been tried at large in Europe without success; but it is well established as an aviary bird. A few of the American Quails or Collins roost in trees.

Interesting from many points of view is the group of birds last mentioned, there is another which, containing a score of species (or perhaps more) often termed Quails or Button-Quails, is of still greater importance in the eyes of the systematist. This is that comprehended by the genus Turtix, or Hemipodius of some authors, the anatomical structure of which removes it far from the genera Colurnix, Ortyx, and their allies, and even from any of the normal Gallinace. T. H. Huxley regarded it as the representative of a generalized stock from which the Charadriornorphae and Alectorornorphae, to say nothing of other groups, have sprung. The button-quails are now placed as a separate sub-order, Turniceae, of the order Galliformes (see BIRD). One species, T. syvatica, inhabits Barbary and southern Spain, and under the name of Andalucian Hemitope has been included (though on evidence not wholly satisfactory) among British birds as a reputed straggler. The rest are natives of various parts of the Ethiopian, Indian and Australian regions. It is characteristic of the genus Turtix to want the hind toe; but the African Oryxodus and the Australian Pediornithorinae, which have been referred to its neighbourhood, have four toes on each foot.

QUAIN, SIR RICHARD, Bart. (1816-1898), Irish physician, was born at Mallow-on-the-Blackwater, Co. Cork, on the 30th of October 1816. He received his early education at Clonney, and was then apprenticed to a surgeon-apothecary in Limerick. In 1837 he entered University College, London, where he graduated with high honours as M.B. in 1840, and as M.D. (gold medal) in 1842. Six years later he was chosen an assistant-physician to the Brompton Hospital for Diseases of the Chest, and with that institution he retained his connexion until his death, first as full (1855) and subsequently as consulting physician (1873). He became a fellow of the Royal College of Physicians in 1851, and filled almost every post of honour it could offer except the presidency, in the contest for which he was beaten by Sir Andrew Clark in 1888. He became physician-extraordinary to Queen Victoria in 1890, and was created a baronet in the following year. He died in London on the 13th of March 1898. Quain, who was elected a fellow of the Royal Society in 1871, was the author of several memoirs, dealing for the most part with disorders of the heart, but his name will be best remembered by the Dictionary of Medicine, the preparation of which occupied him from 1882 (2nd edition, 1894; 3rd, 1908). He was a member on the Royal Commission on Rinderpest (cattle plague) in 1885. He was a cousin of Jones Quain (1776-1835), the author of Quain's Elements of Anatomy, and of Richard Quain (1800-1887), who was president of the Royal College of Surgeons in 1868, and left £7,500 to University College, London, with which the Quain professorships of botany, English language and literature, law, and physics were endowed. A half-brother of the last two, Sir John Richard Quain (1816-1876), was appointed a judge of the Queen's Bench in 1871.

QUAIN (O. Fr. cōnète, from Lat. cognitus, known, probably influenced by association with Latin cognitus, next), an adjective meaning unusual or fanciful, often applied to things with a sense of old-fashioned charm or prettiness. "Quer," which has much the same meaning, is of doubtful etymology, but is generally taken as adapted from Ger. quer, crooked.

QUAKERS, originally a cant name applied in derision to the members of the Society of Friends, but now used without any contemptuous significance. It was said to have originated in the saying of Justice Bennet at Derby in 1659, "Tremble (or quake) at the word of the Lord," but it is now certain that it was used as early as 1647, and arose from the physical manifestations of religious emotion characteristic of many of the early Friends. (See FRIENDS, SOCIETY OF.)

QUANTUM MERUIT (Lat. for "as much as he has deserved"), in the law of contract, originally a form of action on the case, grounded on a promise to pay the plaintiff for work done as much as it was worth. It has been abolished as a special form of action, but the term is still in use where, in case of special contract, there has been a breach amounting to a discharge by one party before the other party has done all that he was bound to do. In such a case the plaintiff sues for a quantum meruit or the value of so much as he has done.

QUARANTINE (Fr. quarantaine, a period of forty days), a term originally applied to the old sanitary preventive system of detention of ships and men, unloading of cargo in lazaretos, fumigation of susceptible articles, &c., which was practised at seaports on account of the plague, in connexion with the Levantine trade. It is now a thing of the past in the United Kingdom and in the majority of other states. But, in common usage, the same word is applied to the sanitary rules and regulations which are the modern substitutes for quarantine.

The plague was the only disease for which quarantine was practised (not to mention the earlier isolation of lepers, and the attempts to check the invasion of syphilis in northern Europe about 1490) down to the advent of yellow fever in Spain at the beginning of the 19th century, and the arrival of Asiatic cholera in 1831. Venice took the lead in measures to check the spread of plague, having appointed three guardians of the public health in the first years of the Black Death (1348). The next record of preventive measures comes from Reggio in Modena in 1374. The first lazaret was founded by Venice in 1429, on a small island adjoining the city; in 1467 Genoa followed the example of Venice; and in 1476 the old leper hospital of Marseilles was converted into a plague hospital—the great lazaret of that city, perhaps the most complete of its kind, having been founded in 1526 on the island of Pomègue. The practice at all the Mediterranean lazaretos was not different from the English procedure in the Levantine and North-African trade. On the approach of cholera in 1832 some new lazaretos were set up at western ports, notably a very extensive establishment near Bologna in 1835.

The plague had disappeared from England, never to return, for more than thirty years before the practice of quarantine against it was definitely established by an act of Parliament of Queen Anne's reign (1710). The first act was called for, owing to an alarm lest plague should be imported from Poland and the Baltic; the second act of 1721 was due to the disastrous prevalence of plague at Marseilles and other places in Provence; it was renewed in 1733 owing to a fresh outbreak of the malady on the continent of Europe, and again in 1743 owing to the disastrous epidemic at Messina. In 1752 a rigorous quarantine clause was inserted in an act regulating the Levantine trade; and various arbitrary regulations issued during the next twenty years to meet the supposed danger of infection from the Baltic. Although no plague cases ever came to England all those years, the restrictions on traffic became more and more stringent (following the movements of medical dogma), and in 1788 a very oppressive Quarantine Act was passed, with provisions affecting cargoes in particular. The first year of the 19th century marked the turning-point in quarantine legislation; a parliamentary committee sat on the practice, and a more reasonable act arose on their report. In 1805 there was another new act, and in 1833-4 an elaborate inquiry followed by an act making the quarantine only at discretion of the privy council, and at the same time recognizing yellow fever "or other highly infectious disorder" as calling for quarantine measures along

1 The strict sense of the term is also preserved in the "widows' quarantine," the right of a widow to remain in the principal house belonging to her husband for forty days after his death.
with plague. The steady approach of cholera in 1837 was the last occasion in England of a thoroughgoing resort to quarantine restrictions, and for a time every country of Europe despite all efforts to keep it out. In England the experiment of hermetically sealing the ports was not seriously tried when cholera returned in 1849, 1853 and 1862-66. In 1847 the privy council ordered all arrivals with clean bills from the Black Sea and the Levant to be admitted to free pratique, provided there had been no case of plague during the voyage; and therewith the last remnant of the once formidable quarantine practice against plague may be said to have disappeared.

For a number of years after the passing of the first Quarantine Act (1710) the protective practices in England were of the most haphazard and arbitrary kind. In 1721 two vessels laden with cotton from Alexandria, laden with linedeed; their freight was £1475 and her quarantine dues £610. The same year the “Pilato,” 495 tons, making the same voyage, paid £600 quarantine dues on a freight of £1060. In 1825 the expenses of the quarantine service (at various ports) were £26,090, and the dues paid by shipping (nearly all with clean bills) £22,000. A return for the United Kingdom and colonies in 1849 showed, among other details, that the expenses of the lazaret at Malta for ten years from 1839 to 1848 had been £53,553. From 1846 onwards the establishments in the United Kingdom were gradually reduced, while the last vestige of the British quarantine law was removed by the Public Health Act 1856, which repealed the Quarantine Act 1825 (with dependent clauses of other acts), and transferred from the privy council to the Local Government Board the powers to deal with ships arriving infected with yellow fever or plague, the powers to deal with cholera ships having been already transferred by the Public Health Act of 1875.

The existing British regulations are those of 29 November 1896; they apply to yellow fever, plague and cholera. Officers of the Customs, as well as of Coast Guard and Board of Trade (for signalling), are empowered to take the initial steps. They certify in writing the master of a ship, and the master then applies for an order, provisionally for not more than twelve hours, giving notice meanwhile to the port sanitary authority. The medical officer of the port boards the ship and examines every person in it. Every person found infected is at once despatched to one of the hulks, if in the port, or if in the coastwise line, to a boat, and during forty-eight hours, or removed to the hospital in the port. All others are free to land on giving the addresses of their destinations. The hulks and other vessels are kept at a suitable distance from the ships. The sick may apply to the master of the vessel to sail again, or to the Commissioner of Shipping within three miles of the shore; but the sick and medical officers must be taken from the ship by the master and not landed by the master without the order of the Court of Appeal in Chancery, or the Board of Trade. The sick, or their medical officers, must be landed at the port where, or near which, the ship entered. All persons on landing are liable to be examined, and may be kept under observation for a few days. The ship is disinfected, dead bodies buried at sea, infected clothing, bedding, &c., destroyed or disinfect ed, and bilge-water and water-ballast (subject to exceptions) pumped out at a suitable distance before the ship enters a dock or basin. Mails are subject to no detention. A stricken ship within 3 miles of the shore must fly at the main a yellow and black flag borne quarterly from sunrise to sunset.

International Conventions.—Since 1852 several conferences have been held between delegates of the Powers, with a view to uniform action in keeping out infection from the East and preventing its spread within Europe; all but that of 1897 were occupied with cholera. No result came of those at Paris 1832, Constantinople 1866, Vienna 1874, and Rome 1883, but each of the subsequent ones has been followed by an international convention on the part of nearly one-half of the Powers represented. The general effect has been an abandonment of the high quarantine doctrine of “constructive infection” of a ship as coming from a scheduled port, and an approximation to the principles advocated by Great Britain for many years. The principal States which retain the old system are Spain, Portugal, Greece, Turkey, and Russia (the latter and Greece only in time of war, Malta and Cyprus being under the same influence). The aim of each international sanitary convention has been to bind the Powers to a uniform minimum of preventive action, with further restrictions permissible to individual States. The minimum is now very nearly the same as the British practice, which has been in turn adapted to continental opinion in the matter of the importation of rags.

The Venice convention of 1892 was on cholera by the Suez Canal route; that of Dresden, 1893, on cholera within European countries; that of Alexandria, 1892, on plague, and that of Venice, 1897, was in connexion with the outbreak of plague in the East, and the conference met to settle on an international basis the steps to be taken to prevent, if possible, its spread into Europe.

One of the first points to be dealt with in 1897 was to settle the incubation period for this disease, and the period to be adopted for administrative purposes. It was admitted that the incubation periods, as a rule, a comparatively short one, namely, of some three or four days. After much discussion ten days was accepted by a very large majority. The principle of notification was unanimously adopted. Each Government is to notify to other Governments the departure of any vessel with cases of plague, and at the same time state the measures of prevention which are being carried out to prevent its diffusion. The area deemed to be infected is limited to the actual district or village where the disease prevails, and no locality is deemed to be infected merely because of the importation into it of a few cases of plague while there has been no diffusion of the malady. As regards the precautions to be taken on land frontiers, it is provided that the health officer of the plague area has had the inherent right to close its land frontiers against traffic. As regards the Red Sea, it was decided after discussion that a healthy vessel may pass through the Suez Canal, and continues to be held in the Mediterranean during fourteen days in incubation after the disease prevails, and that the vessel is cleared for passing when the officers of the health authorities are satisfied that the disease is not in the area. If the health officer of the canal authority is satisfied that the disease is not in the area, he shall issue to the vessel a certificate signed by him declaring that the vessel is cleared for passing. If the health officer of the canal authority is not satisfied that the disease is not in the area, he shall refer the case to the health authorities of the States through whose territory the vessel is to pass, and obtain from these authorities a certificate declaring that the vessel is cleared for passing. If the health officer of the canal authority, or the health authorities of the States through whose territory the vessel is to pass, are satisfied that the disease is not in the area, they shall issue to the vessel a certificate signed by them declaring that the vessel is cleared for passing. The time of fourteen days in incubation after the disease prevails is referred to as the “infectious period.”
such persons as have been in actual contact with the sick or with infected articles, together with the disinfection of the infected compartment of the vessel. Passing on to the conclusions drawn from these observations to be imposed "in Europe," the following are the chief points to be noted:—As regards measures to be adopted at ports of arrival, the conclusions of the Dresden convention were as far as practicable adhered to. In the case of healthy vessels, i.e., those which had neither sick nor sick articles on board, even if sailed from an infected port, it was decided that they should at once have free pratique, but at the option of the local authority certain measures of disinfection of soiled articles may be required. For the third paper (6th April 1861, No. 51) contains, in an appendix, an Historical Sketch of Quarantine Legislation and Practice in Great Britain, by Dr Milroy. Russell's Treatise of the Plague (4to, London, 1791) considers "remarks on quarantines, lazarettos, &c.," and an account of the mode of "setting on" an infectious pestilence by his line in Apollo on the outbreak of plague in the town. The inexpediency of quarantine in the United Kingdom is discussed by John Simon in the article of the same title in the Appendix of the Proceedings of the Royal Statistical Society, 1865, p. 35, and also in Report (Medical) of Local Government Board, xxiv. 1892–93. QUARE IMPEDIT, in English law, a form of action by which the right of presentation to a benefice is tried. It is so called from the words of the writ formerly in use, which directed the sheriff to summon the person disturbing the possession to permit the plaintiff to present a fit person, or to show cause why he hinders the plaintiff in his right. The action was one of the few real actions preserved by the Real Property Laws, and survived the effect of the Common Law Procedure Act 1850, § 26, to assimilate proceedings in quare impedit as far as possible to those in an ordinary action. It is now usually brought against a bishop to try the legality of his refusal to institute a particular clerk. The bishop must fully state upon the pleadings the grounds on which he refuses. Quare impedit is peculiarly the remedy of the patron; the remedy of the clerk is the proceeding called duplex quaeda in the ecclesiastical court. The action is not barred till the expiration of sixty years, or of three successive incumbencies adverse to the plaintiff's right, whichever period be shortest. The Act 24 Geo. IV. c. 40, s. 44, Where the patron of a benefice is a Roman Catholic, none of the universities presents in his place (1689, 1 Will. & Mary, sess. 1, c. 20). By 13 Anne c. 13 (1714), during the pendency of a quare impedit to which either of the universities is a party in right of the patron being a Roman Catholic, the court has power to administer an oath for the discovery of any secret truth, and to ordain the custum que trust to repeat and subscribe a declaration against transubstantiation. In Scotland the effect of a quare impedit is attained by action of declarator. In the United States, owing to the difference of ecclesiastical organization, the action is unknown. QUARITCH, BERNARD (1819–1890), English bookseller and collector, was born at Worbs, Germany, on the 23rd of April 1819. After being apprenticed to a bookseller, he went to London in 1842, and was employed by Bohn the publisher. In 1847 he started a bookseller's business off Leicester Square, becoming naturalized as a British subject. In 1848 he started to issue a monthly Catalogue of Foreign and English Books. About 1858 he began to purchase rare books, one of the earliest of such purchases being a copy of the Mazarine Bible, and within a period of forty years he possessed six separate copies of this rare and valuable edition. In 1860 he removed to Piccadilly. In 1873 he published the Bibliotheca Xylographica, Typographica et Palaeographica, a remarkable catalogue of early productions of the printing press of all countries. He became a regular buyer at all the principal book-sales of Europe and America, and from time to time published a variety of other catalogues of old books. Amongst these may be mentioned the Supplemental Catalogue (1877), and in 1880 an immense catalogue of considerably over 2000 pages. The last complete catalogue of his stock was published in 1887–88 under the title General Catalogue of Old Books and Manuscripts, in seven volumes, increased with subsequent supplements to twelve. All these catalogues are of considerable bibliographical value. By this time Quaritch had developed the largest trade in old books in the world. Amongst the books that he published was Fitzgerald's Omar Khayyam, and he was the agent for the publications of the British Museum and the Society of Antiquaries. He died at Hampstead on the 17th of December 1890, leaving his business to his son. QUARLES, FRANCIS (1592–1644), English poet, was born at Romford, Essex, and baptized there on the 8th of May 1592. His father, James Quarles, held several places under Elizabeth, and traced his ancestry to a family settled in England before the Conquest. He was entered at Christ's College, Cambridge, in 1608, and subsequently at Lincoln's Inn. He was made cup-bearer to the Princess Elizabeth, Electress Palatine, in 1613, remaining abroad for some years; and before 1629 he was appointed secretary to Usher, the primate of Ireland. About 1633 he returned to England, and the next year was in the preparation of his Emblemes. In 1639 he was made city chronicler, a post in which Ben Jonson and Thomas Middleton had preceded him. At the outbreak of the Civil War he took the Royalist side, drawing up three pamphlets in 1644 in support of the king's cause. It is said that his house was searched and his papers destroyed by the Parliamentarians in consequence of these publications. He died on the 8th of September in that year.

Quarles married in 1618 Ursula Woodgate, by whom he had eighteen children. His son, John Quarles (1624–1669), was styled Squadron Admiral of the Navy in 1660 and created a baronet in 1661, and was the author of Fons Lachrymarum (1668) and other poems.

The work by which Quarles is best known, the Emblemes, was originally published in 1635, with grotesque illustrations engraved by William Marshall and others. The forty-five prints in the last three books are borrowed from the Pia Desideria (Antwerp, 1624) of Herman Hugo. Each "emblem" consists of a paraphrase from a passage of Scripture, expressed in ornate and metaphorical language, followed by passages from the Christian Fathers, and concluding with an epigram of four lines. The Emblemes was immensely popular with the vulgar, and was reprinted in 1640 and 1654. When the Civil War began Quarles and his son fled, but the later part of the book was completed by Motteville and his son and was not published. Sir John Suckling in his Sessions of the Poets disrespectfully alluded to him as he "that makes God speak so big in his poetry." Pope in the Dunciad spoke of the Emblemes, "Where the pictures for the page alone And Quarles is saved by beauties not his own."

The works of Quarles include: A Feast for Wormes, Set forth in a Poem of the History of Jonah (1620), which contains other scriptural paraphrases, besides the one that furnishes the title: Hadassa; or the History of Queen Esther (1621); Job Milianti, with Meditations Divine and Morall (1624); Sonus Eugies, wept by Jeremie the Prophet (1624); Swans Sonets sung by Solomon the King (1624), a paraphrase of the Canticles; The Historie of Samson (1631); Alphabet of Eugies upon the Armeries, and Partsie (1632) of the subject of which is borrowed from Sir Philip Sidney's Arcadia; four books of Divine Fancies digested into Epigrams, Meditations and Observations (1632); a reissue of his scriptural paraphrases and the Alphabet of Eugies as Divine Poems (1635); Hieroglyphes
Quarrel (1) (Through Fr. querelle from Lat. querela, complaint), originally a complaint against a person, particularly a legal accusation or charge, hence a ground or cause for complaint or anger, or, more generally, an outbreak of anger or violent dispute. (2) (Through O. Fr. quarrer or quare, from med. Lat. quadratus, diminutive of quadrum, square), a heavy short bolt or arrow with a square head, used in a cross-bow or arbalest. In architecture this term (and also the doublet "quarrel") is applied to any square-shaped opening, in the Beauchamp Roll to the heraldic shield, in the edwardian glass, to the quatrefoils of the Gothic pointed arches, and also to the squares of paving, but most commonly to the lozenge-shaped pieces of glass in lead casements (see Glass, Stained).

Quarry. (1) (Through Fr. from med. Lat. quaerio for quadraria; quadrare, to square or hew stone), a place from which stones are dug, the term usually confined to a place where such operation is carried on in the open air, as opposed to a "mine" (see Quarrying). (2) (Through O. Fr. cierre, cuir, skin, leather, Lat. corium; cf. mod. Fr. cierre, spoils), properly certain parts of a deer or other beast of chase given as a reward to the hounds and placed upon the hide of the animal, also parts of a bird given similarly to a hawk or falcon. The word is thus applied to the animal hunted or the bird killed by the hawk, and generally to any object of the chase.

Quarrying, the art of winning or obtaining from the earth's crust the various kinds of stone used in construction, the operation being, in most cases, conducted in open workings. According to their composition, building stones are broadly classified as granites, sandstones, limestones and slates. Under the first of these heads is included a number of crystalline rock species, such as granite, syenite, gneiss, &c., which to the geologist are quite distinct, but which in commerce are all spoken of as granite. They are chiefly composed of one or more minerals of the felspar group mingled with one or more of the micas or hornblende, and usually contain quartz. Sandstones are chiefly composed of fragments of quartz cemented into solid rock by silica and oxide of iron. Of these there are many varieties, including flagstone used for foot-pavements. Limestones consist principally of carbonate of lime. Their chief variations are the crystalline form known as marble and the deposit from mineral springs known as Mexican onyx. Slates are mudstones or shale hardened by heat and pressure, and rendered fissile by the latter agent. Chemically they consist chiefly of hydrous silicate of alumina. Theoretically, granites are massive, and have no bedding or stratification like sandstones and limestones; but all rock masses are usually found to be more or less shattered by movements of the earth's crust which occur as a result of its constant readjustment to the cooling and shrinking interior, so that the rocks are divided by cracks or fissures, which are commonly known as joints. In the massive granites these joints, which usually occur in two or more planes at right angles to one another, are of the greatest importance to the quarryman, as they enable him to separate masses of stone with approximately parallel faces. In gneiss the parallel arrangement of the minerals usually coincides with a direction of easy cleavage, known to quarrymen as the "rift"; at right angles to this direction is usually one less easy parting, known as the "grain." Sandstones and limestones are stratified rocks which have been formed as sediments in bodies of water; and whether their beds are found in the normal position of horizontal, or whether they have been tilted and folded by earth movements, the direction of easiest separation is coincident with the original planes of sedimentation and parallel to them. This is therefore called the "rift," while the "grain" is at right angles to it. In gneisses, sandstones and limestones joints also occur; and while frequently convenient for the division of the beds into masses of useful size, they may be a detriment, as they occur so close together as to fall within the limits of a block available for commercial purposes. In commerce the various kinds of building stone are usually designated by the name of the locality or region in which they are obtained, being, in masses of form and size adapted to the intended use. Cutting the stone to accurate dimensions, dressing, rubbing and polishing are subsequent operations not involved in quarrying.

The practice of quarrying consists in uncovering a sufficient surface of the rock by removing superficial soil, sand or clay, or by sinking a shaft or slope, and then with proper tools and, when necessary, with explosives, detached blocks of form and size adapted to the purpose in view. Frequently the outer portion of the rock has been affected by the action of the weather and other atmospheric agencies, so that it has become discoloured or softened by decay. This weathered material must be removed before stone can be obtained for use.

A quarry should, if possible, be opened on a hillside, for in this case it is usually much easier to dispose of the water which necessarily collects in any deep excavation, and which, if drainage by gravity is not afforded, must be removed by pumping, at considerable expense. As it is generally most convenient to operate on a vertical face of rock, the preliminary work of opening a quarry is usually directed toward the production of this result; but its accomplishment involves the waste of a certain amount of stone, which must be broken into irregular pieces. The preparation of blocks of building stone is effected ordinarily by drilling holes along the outlines of the block to be removed, and then, by exploding blasting-powder in the holes, or by driving wedges in them, exerting sufficient force to overcome the cohesion of the rock and rend it asunder. In many quarries it is found most convenient to separate a large mass and afterwards divide it into blocks of the required size. When the rock is stratified, or has an easily determined "rift," the holes are drilled at right angles to the plane of separation. When there is no stratification or "rift," or these natural planes of separation are too far apart, or when the position of the joints is not advantageous, a row of horizontal holes must be drilled into the face or "breach" of the quarry, along which separation is effected by the use of wedges. Of late at certain American quarries, in a granite which has no rift or direction of ready cleavage, compressed air has been brought into service to effect the separation of extensive layers. A hole is drilled as deep as the desired thickness of the layer to be separated, and a small charge of dynamite is exploded at the bottom of it. This develops a cavity in which a small charge of powder is next exploded, producing a crack or crevice parallel to the surface of the rock. A pipe for conveying compressed air is then sealed into the opening, and gradually increasing pressure is introduced. This results in the gradual extension of the crevice developed by...
the explosion of the powder. In the absence of compressed air, water under pressure may be used and also small powder charges exploded at intervals of a few days. In thinly bedded sandstones, where vertical joints are frequent, it is often possible to separate the detached slabs and flagstones with crowbars and wedges, without drilling or the use of explosives. When blasting is necessary, some form of gunpowder is generally used, rather than a violent explosive like dynamite, in order to avoid shaking the rock. This, however, applies only to dimension stone. When the production of broken stone for road-making, concrete, or similar purposes is the sole end in view, violent explosives are preferred. In limestones and marbles and in the softer sandstones, channelling machines, driven by steam, are employed, by which vertical or oblique grooves or channels can be cut with great rapidity to a depth of several feet. As the clay or rock between these channels is removed, clean working is obtained with which the machine works. After the channels are cut, a row of holes is bored perpendicular to the former at the desired distance below the surface of the bed, and by driving wedges into these the required blocks are separated.

When the beds of stone to be quarried are thin, and when to remove the whole of the overlying mass of earth or rock would be too expensive, it is found convenient to treat the quarry as if it were a mine, and to rely upon methods similar to those practised in mining. A horizontal bed of rock is usually opened at its outcrop on the hillside, or if this is impracticable, as shaft or slope is excavated to reach it. If dimension stone is required, a deep horizontal groove is cut near the top or the bottom of the bed. The quarry face is then divided into blocks by saw-cuts, channels, or rows of drill-holes, and the blocks are separated by wedging or blasting. As the excavation or stoping progresses, portions of the rock are left in place as pillars to support the roof. At many localities in Europe where roof-slab is quarried, it is found in beds dipping more or less from the horizontal. These deposits are worked by stopes which follow the inclination of the bed, from which, at convenient intervals, levels are driven across, to take advantage of the cleavage of the strata. As in other subterranean quarries, pillars of rock are left to support the roof, since artificial supports would be more expensive. At some of the marble quarries in Vermont, U.S.A., where the strata are very nearly vertical, the beds are worked to a great depth with a comparatively small surface opening.

**QUARTER**

(through Fr. from Lat. *quartarius*, fourth part), a word with many applications of its original meaning, namely, one of the four divisions of a year, thus as a measure of weight a quarter equals 8 lb, one-fourth of the hundredweight of 112 lb; as a measure of capacity for grain it equals 8 bushels; similarly in liquid measure the shorter form "quart" is a quarter of a gallon = 2 pints, so "quartern" is a quarter of a pint (a gill), or, as a measure for bread, 4 lb. "Quarter" is also used of the fourth part of the moon's monthly revolution, and of a fourth part of the legal year, marked off by the "quarter-days" (see below). For the division of the heraldic shield into four "quarters" and the use of the term "quartering," the heralding of several coats on one shield, see HERALDRY. From the four principal points of the compass and the corresponding division of the horizon, &c., the word is used generally of direction or situation, and hence of a district in a town, &c., especially when assigned to or occupied by a particular class. It has thus become the usual term applied to stations, buildings, lodgings, &c., in the regular occupation of military troops (see BARRACKS, CAMP, and CANTONMENTS).

There are many technical uses of the word, in which the original meaning has been lost or obscured; thus in carpentry and architecture it is applied to the main upright posts in framing, sometimes called "studs"; the filling in quarters were formerly named "prick posts"; in funnery, to one side of the "coffin" of a horse's foot; in bootmaking, to the side piece of leather reaching from the vamp to the heel. The "quarter" of a ship is the after part of her side from the main-chains (for the stem see QUARTERDECK).

There has been much discussion as to the origin of the use of the word "quarter" in the sense of mercy, clemency, the sparing of the life of a beaten enemy and the acceptance of his surrender. The same use is found in Fr. *cotitier*. Cotgravre explains this word as being derived from one of any thing, thus, "quartier a面上 retenu a un certain taux." The real origin cannot be, as has often been repeated, following De Brieux (*Origines de plusieurs façons de parler*, 1672), that it was due to a supposed agreement between the Dutch and the French, or that the captains took a certain rate of their pay. The true source is either the assignment of "quarters," i.e., lodgings, to captured prisoners whose lives were spared, or the use of the word, now obsolete, for relations with or conduct toward such prisoners in the way of stripping them. It is supposed to be derived from the Dutch *kamer* (Latin *camera*), "a room, a bedchamber;" or *kamerling*, "a chamberlain." It is explained by Cramond as *kamer en linge*, "two, that were competitors . . . kept good quarters between themselves."

*Quarter days* are the days that begin each quarter of the year. In England they are the 25th of March (Lady Day), the 24th of June (Midsummer Day), the 29th of September (Michaelmas Day) and the 25th of December (Christmas Day). They are the days on which it is usually contracted that rents should be paid and houses or lands entered upon or quitned. In Scotland there are two legal terms, the 15th of May (Whitsunday) and the 11th of November (Martinmas); these, together with the two conventional terms of February (Hallowe'en) and August (Lammas) make up the Scottish quarter days. In the Scottish burghs, however, the removal terms are the 28th of May and the 28th of November. In the United States the quarter days are, in law, the 1st of January, April, July, and October.

**QUARTERDECK**, the after part of the upper deck of a ship. In former times the upper deck of a line-of-battle ship or frigate ended at the mainmast, and was connected with the forecastle by two narrow passages, or gangways running along the sides. The quarterdeck is the residence and symbol of authority in a warship. The starboard, or right side looking forward, is reserved to the senior officer. A sailor who had a complaint to make was said to come to the mainmast, because he placed himself at the forward end of the quarterdeck near the mainmast. According to the ancient custom of the sea, the quarterdeck is to be salute by all who come upon it, and the salute is returned by all officers present.

**QUARTER SESSIONS, COURT OF**, in English law, the name for the justices of the peace of any county, riding parts, division or liberty of a county, or of any county of a city or county of a town, in general or quarter sessions assemblad; it includes the court of the recorder of a municipal borough having a separate court of quarter sessions. The word "general" in this context is contrasted with "special" or "petty." The Court is a local court of record having a limited criminal jurisdiction, and also to some extent civil jurisdiction. As a court of record it has, in addition to its other jurisdiction, power to punish summarily without the assistance of a jury contempts committed in its presence, such as insults to the justices or disturbance of its proceedings. At the present time the whole of England and Wales is within the local jurisdiction of some court of quarter sessions. But the history of the court in counties is quite distinct from its history in boroughs.

**Counties.**—As regards counties the court originated in statutes of 1326, 1344 and 1360, which provided for justices in counties, and the commission of the peace. The court derived its name from the direction in a statute of 1388 that the justices shall keep their sessions in every quarter of the year at the least.1 By a statute of 1414 they were directed to make their sessions four times in the year; the same being the first week after the feasts of St. Michael, the Epiphany, the clause of Easter and the translation of St Thomas the Martyr, and more often if need be.1 These dates have only been slightly varied, first in 1814 in consequence of the adoption of the Gregorian calendar, later in 1830 by specifying the first week after the 15th of October, 28th of December, 31st of March and 24th of June respectively, instead of the church feasts; and in 1894 by 1

An earlier statute not repealed (36 Edw. III. c. 12) fixes the third and fourth sessions differently, viz. second week of mid-Lent, and between Whit Sunday and Midsummer Day.
QUARTER SESSIONS

giving the justices a limited power of fixing their sessions so as not to clash with the assizes. It will be seen that the statutes do not limit the justices to four sessions a year: and they are free to sit oftener by adjournment of the quarterly sessions to another time, and even to another place, in their county, or to hold additional sessions. All the sessions thus held are "general," though not all may be "quarter sessions." The Assizes and Quarter Sessions Act 1908 gave the useful power of dispensing with the holding of quarter sessions if there is no business to transact.

Constitution of the Court.—Such a court sits for every judicial county in England, and is composed of two or more of the justices in the commission of the peace for the county, including ex officio justices for the county and the county court, to be held at the county town or town where the quarter sessions are held. In every county there are various sessions, and the number of them is fixed by the statutes. Each session lasts for a term of not less than five years, and any two sessions of a county at a time. At one session certain specified justices described as of the quorum must be present, but under the present commission there are no such persons. In certain counties more than one commission of the peace is issued, e.g. for the three ridings of Yorkshire (N. E. and W.) and the liberty of Ripon, the three parts of Lincolnshire (Lindsey, Kesteven and Holland), the Isle of Ely and the rest of Cambridgeshire, the soke of Peterborough, and the sessions of or the county council (Local Govt. Act 1889, s. 99) that of London, the justices in the commission elect a chairman and vice-chairman, neither of them necessarily a lawyer, to preside at the sessions of the court. In the county of London there are a paid chairman and vice-chairman, and in the rest of the counties there are for every ten years' standing, and are appointed by the crown. There is special legislation as to quarter sessions in the county palatine of Lancaster and Durham, for there is a quorum of five and a paid chairman. There is also special legislation as to Kent, and arrangements have been made by which in Sussex and Suffolk the quarter sessions for the east and west divisions are virtually distinct courts. Under the Quarter Sessions Act 1835 the court may sit in two divisions of at least two justices at the same time and place, but not simultaneously in separate parts of the same county except under statutory authority as in London.

The court may sit while the assizes for the county are being held, but usually refrains from doing so because of the inconvenience which would be occasioned, and adjourns its sittings so as to avoid clashing with the assizes. The chief officer of the court is the clerk of the peace, who in counties has a court clerk, a deputy clerk, a court officer, who swears the juries, draws many of the indictments, receives the bills returned by, the grand jury, arraigns the prisoners and taxes the costs. In a county he is appointed by a standing joint-committee of the quarter sessions and the county council, and has charge of, and responsibility for, the records and documents of the county subject to the directions of the custos rotulorum or the quarter sessions of the county.

Boroughs.—The jurisdiction of the court of quarter sessions of a borough does not depend upon the commission of the peace, but upon the Municipal Corporations Act 1882. Many boroughs have a separate commission of the peace (which does not contain the words of the county commission giving jurisdiction to try indictments), but have not received the grant of a separate court of quarter sessions: and such boroughs are within the jurisdiction of the court of quarter sessions for the county within which the borough lies. Before the Municipal Corporations Act 1835, many boroughs had criminal jurisdiction under their charters. Under that act and the act of 1882 a grant of quarter sessions to a city or borough is made by the crown in council on petition of the town council. The recorder, a barrister of not less than five years' standing appointed by the crown, is sole judge of the court, though the mayor can adjourn it in the absence of the recorder; he has a discretion to fix his own dates for the holding of the court, so long as he holds it once in every quarter of a year; and it may be held more frequently if he think fit, or a secretary of state so directs; he has no power to appoint, or annex, make or levy a borough rate or to grant a licence for the sale of excisable liquors by retail; a deputy may be appointed by the recorder, or in the event of his being unable to make the appointment by a secretary of state. Subject to these qualifications the court has the same jurisdiction as county quarter sessions.

The city of London is not subject to the Municipal Corporations Act 1882, and its court of quarter sessions is created by the city charters, and is held before the mayor and aldermen with

1 In the soke of Peterborough commissions of oyer and terminer, and gaol delivery, as well as a commission of the peace, are issued.

1

The recorder. It does not now sit to try indictments, which all go to the Central Criminal Court.

There is special legislation as to quarter sessions in the Cinque Ports. In a borough the clerk of the peace is appointed by the town council and holds office during good behaviour (Municipal Corporations Act 1882, s. 164).

Jurisdiction, Original.—Courts of quarter sessions in counties and boroughs have both original and appellate jurisdiction depending on the commission of the peace and on legislation beginning in 1844. This jurisdiction is derived in counties from the counties of the middle ages, and in boroughs from the borough of the same name. The county court is there to hear and determine all and singular the crimes, trespasses and offences aforesaid. According to the laws and statutes of our realm. Provided always that if a case of difficulty upon the determinations of any of the premises before you shall happen to arise then let judgment in no wise be given, "unless in the presence of one of the justices of assize for the county." This proviso has made the justices to reserve the graver felonies for trial at the assizes, or to transmit to assize the causes found at quarter sessions which raised difficult questions. Quarter sessions never dealt with forgery or perjury, but at one time assumed jurisdiction almost for any form of crime. By the Quarter Sessions Act 1824 and subsequent legislation, they are forbidden to try the following offences: treason or misprision of treason; murder, capital felony or any felony (except burglary) which is compoundable or STRAFFABLE; arson; forgery and false entries; offending against the king's title, prerogative, person or government, or against either House of parliament; offences against the Official Secrets Act 1889; offences subject to the penalties of praemunire; bribery and offering money andtensor, and referring to religion, blasphemous, seditious or defamatory libels; administering and taking unlawful oaths; perjury and subornation and subscribing any sorts of false, swears, declarations or affirmations punishable as perjury or as a misdemeanour; and abridgment of women and girls and offences under the Criminal Law Amendment Act 1885; bigamy and offences against the marriage; extortion and obtaining or inducing any person to be deprived of his property or rights by or under false pretences or by deception; or by or in respect of any authority or any person representing or acting as a public officials (but they can try offences against the Public Bodies Corrupt Practices Act 1883); setting fire to crops, woods and heaths; stealing or destroying certain classes of documents; offences against the Post Office Act 1850 and 1863; and as amended by the Larceny Act 1901; and conspires to commit offences which the court could not try if committed by one person. Trials before the court with a jury are governed by the same procedure as trials on indictment (see Quarter Sessions). Under the Vagrancy Act 1823 and amending acts, they have special powers of sentencing incorrigible rogues sent to them by courts of summary jurisdiction in England and Wales under the Justices of the Peace Act 1836. They have no power to try a summary commission of the peace they can, but now rarely do, exercise an original summary jurisdiction as to articles of the peace (see Recognisances). They have power to extort recognizances entered into before trial or after trial before or after judgment to tried either to them for record or forfeiture, but by the Summary Jurisdiction Act 1879 the exercise of the latter power has been rendered nugatory.

Appeal.—An appeal lies to quarter sessions from convictions by a court of summary jurisdiction only where such an appeal is expressly given by statute. The number of statutes giving such right of appeal is very great. The appellate jurisdiction has been considerably increased by the Summary Jurisdiction Act 1879, which allows (s. 19) an appeal (with certain exceptions) from every conviction or order of a court of summary jurisdiction inflicting imprisonment without a time limit, a fine of more than five pounds, or a fatal penalty. The appeal is brought in accordance with the act giving the appeal or the Summary Jurisdiction Acts. Most of the special procedure in statutes giving the right to appeal has been swept away by the Summary Jurisdiction Acts 1878 and 1879.

Civil Jurisdiction, Original.—Originally the county justices were confined to the exercise in or out of sessions of the powers given by the commission of the peace and of certain statutory duties as to rieters, &c. Under the Primitive Statutes acting under the supervision of the Privy Council and the court of king's bench gradually became the rulers of the county in administrative matters as well as in criminal ones (see Justice and Police, 1885, p. 80). The progress by which this result was reached is traced in Webb's English Local Government (1907, vol. 1). The effect of the change was the supersession by nominees of the crown of the county courts of law, and their abolition in the county. But the change extended only to a small extent to municipal boroughs. By legislation in and since 1888 most of the administrative powers and duties of justices in general and quarter sessions have been transferred to the incorporated and elected councils of counties, boroughs and urban and rural districts. But the justices still possess certain original, civil or quasi-civil
QUARTER-STAFF—QUARTZ

jurisdiction with respect to the extinction of licences to sell intoxicants, and jointly with the county councils over the county roads, and as to closing highways, and also powers as to fixing the petty sessional divisions of their county.

Quarter sessions have original jurisdiction in any matter as to which two justices have jurisdiction, unless the statute giving the jurisdiction gives an appeal to quarter sessions as a result of this rule. Most of the civil jurisdiction of quarter sessions is also confined, as to original jurisdiction, to quarter sessions. The jurisdiction extends beyond original jurisdiction to the settlement and removal of paupers, or under the Highways, Licensing and Bastardy Acts, or as to appeals against assessments or rating. The procedure as to appeals, it being apparent, is analogous to original jurisdiction in the county court. It is given and partly on the general provisions of the Summary Jurisdiction Acts 1879 and 1884. In substance their only original jurisdiction in civil or quasi-civil matters is now in cases of apprenticeship. In Scotland there is no county court. The jurisdiction in such cases is taken by the district courts, which have a criminal jurisdiction substantially the same as that of the English county courts of sessions (31 Vict. No. 30, s. 117). In New South Wales quarter sessions continue. In Victoria a court of general sessions is created by statute with powers closely resembling those of the English court of quarter sessions (re Dunn, 1906, Victoria State Rep. 493).

United States.—Courts of quarter sessions exist in many of the states; their jurisdiction is determined by state legislation, and extends as a rule only to the less grave crimes. They are, in most, not held before professional judges. (W. F. C.)

QUARTER-STAFF, a staff of wood from 6 to 9 ft. in length, used as a means of attack and defence; originally it was the cudgel or sapling with which many heroes are described by early writers as being armed. The quarter-staff attained its greatest popularity in England in the middle ages. It was usually made of oak, the ends often shod with iron. It was held with both hands, the right hand grasping it one quarter of the distance from the lower end (whence the name) and the left at about the middle.

Egerton Castle (Schools and Masters of Fence) says that the staff was the "foll," or practice-substitute for the long sword, or two-hander. In earlier times it may also have been used as a practice weapon for the spear and bill. In the prints illustrative of the life of Richard Beauchamp, earl of Warwick (1382–1430), reproduced in Joseph Strutt's Manners, Customs, Arms, Habits, and Usages of England, may be seen a combat between two knights after they have splintered their lances and dismounted, in which both are fighting with pointed staves about as long as a quarter-staff and held in the same manner. In the 17th century the staff was still popular in England.

At the present time the quarter-staff is used to a limited extent in military circles as a school for bayonet play. It is somewhat lighter than the old weapon, being usually made of bamboo and about 8 ft. long. Sabre-masks, gloves, padded jackets and shin-guards are worn. Another kind of staff, called by Captain A. Hutton (Cold Steel) the Great Stick, about 5 ft. long and made of stout rattan, is used in the French armies and Italian in general gymnastic exercises and as a school for bayonet play. The Italian method rather resembles that of the old two-handed word, while the French approaches more closely to English quarter-staff play.

QUARTO, a shortened form of Lat. in quarto, "in a fourth," i.e. of a sheet of paper, applied to a size of paper, and to a size of volume. Paper is in quarto when a whole single sheet is folded twice so as to form four leaves; a book is technically termed of "quarto" size when made up of sheets folded twice.

QUARTZ, a widely distributed mineral species, consisting of silicon dioxide, or silica, (SiO₂). It is the commonest of minerals, and is met with in a great variety of forms and with very diverse modes of occurrence. The various forms of silica have attracted attention from the earliest times, and the water-clear crystallized variety was known to the Greeks as крēτα(λ)ιος (clear ice), being supposed by them to have been formed from water by the intense cold of the Alps; hence the name "crystal," or more commonly rock-crystal, applied to this variety. The name quartz is an old German word of uncertain origin: it was used by G. Agricola in 1529.
Quartz is a mineral which is put to many uses. Several of the varieties are cut into gems and ornaments, balance weights, pivot supports for delicate instruments, agate mortars, &c.; or used for engraving, for instance, cameo and the elaborately carved crystal vases of ancient and medieval times. Clear transparent rock-crystal is used for optical purposes and spectacle lenses. Fused quartz has recently been used for the construction of lenses and laboratory vessels, or it may be drawn out into the finest elastic fibres and used for suspending mirrors, &c., in physical apparatus. For striking fire, flint is used even to the present day. Buhrlstone, a cellular variety of chalcedonic quartz from the Tertiary strata of the Paris basin, is largely used for millstones. Quartz is a valuable grinding and polishing material, and is used for making sandpaper and scouring-soap. It is also largely used in the manufacture of glass and porcelain, "silver sand" being a pure quartz sand.

Quartz crystallizes in the trapezohedral-hemihedral class of the rhombohedral division of the hexagonal system. Crystals of this class possess neither planes nor centre of symmetry, but only axes of symmetry; perpendicular to the principal triad axis there are three unterminal dyad axes of symmetry. Usually, however, this lower degree of symmetry is not indicated by the faces developed on the crystals. The majority of crystals of quartz are bounded only by the faces of a hexagonal prism $m211$ and a hexagonal bipyramid (fig. 1), though sometimes the prism is absent (fig. 2). Frequently the faces are of different sizes (fig. 3): mis-shaped crystals are common and sometimes very puzzling, but they can always be orientated by the aid of the very characteristic striations on the prism faces, which serve also to distinguish quartz from other minerals of similar appearance. These striations (fig. 3) are horizontal in direction, being parallel to the prism faces, and are due to the frequent oscillatory combination of these faces. The apparent hexagonal bipyramidal is really a combination of two rhombohedron, the direct rhombohedron $r(100)$ and the inverse rhombohedron $s(221)$. The faces of these two rhombohedra exhibit differences in surface characters, those of $r$ being usually brighter in lustre than those of $s$; further, the former often predominate in size (figs. 4 and 5), and the latter may sometimes be completely absent. When both the prism and the rhombohedron $z$ are absent, the crystals resemble cubes in appearance, since the angles between the faces of the rhombohedron are 85°-46°. The additional faces $s$ and $z$ (figs. 4 and 5), which indicate the true degree of symmetry of quartz, are of comparatively rare occurrence except on crystals from certain localities. The six small faces $f(412)$ situated on alternate corners at each end of the crystal, are called the "rhomb" faces, because of their shape; if extended they would give a trigonal bipyramid. The "trapezohedral," or "plagiohedral," faces $f(412)$ belong to a trigonal trapezohedron. The two crystals shown in figs. 4 and 5 are enantiomorphous, i.e. they are non-superposable, one being the mirror reflection of the other: they are left-handed and right-handed crystals respectively. The faces $s$ are striated parallel to their edge of intersection with $r$; this serves to distinguish $r$ and $s$, and thus, in the absence of $z$ faces, to distinguish left- or right-handed crystals. Numbers of other mineral crystals, both of the same or different species, but they are of rare occurrence. The basal plane, so common on calcite and many other rhombohedral minerals, is of the greatest rarity in quartz, and when present only appears as a small rough facet formed by the contact of quartz crystals other than as also small and of exceptional occurrence.

Twinned crystals of quartz are extremely common, but are complex in character and can only be deciphered when the faces $s$ and $z$ are present. $s$ is probably the base of the twinned crystal, and the faces $s$ and $z$ on the prism planes of the two individuals coincide, and the faces $r$ and $s$ also fall into the same plane. Such twines may therefore be mistaken for single crystals unless they are attentively studied; but the twinning is also made evident by the presence of irregularly bounded areas of the dummer $s$ faces coinciding with the brighter $r$ faces. In a rarer crystalline twinning, in which the twin-plan is horizontal (e.g. the edge between $r$ and $s$), the two individuals are united in juxtaposition with their principal axis nearly at right angles ($84°-33°$). A few magnificent specimens of rock-crystal twinned according to this law are known from La Gardelette in Lorraine, and in Japan they are somewhat abundant.

The pyro-electric characters of quartz are closely connected with its peculiar type of symmetry and especially with the three unterminal dyad axes of symmetry. Crystals of quartz crystallize in alternate prism edges when its temperature changes. A similar distribution of electric charges is produced when a crystal is subjected to pressure, and the "piezo-electric" phenomenon of quartz is developed, both natural and artificial (in the latter case produced by the action of hydrofluoric acid), on the faces of the crystals in accordance with the symmetry, and may serve to distinguish left- and right-handed crystals.

In its optical characters, quartz is also of interest, since it is one of the two minerals (cinnabar being the other) which are circularly polarizing. This phenomenon is connected with the symmetry of the crystals, and is also shown by many other substances in which there are neither planes nor centre of symmetry. A ray of plane-polarized light traversing a right-handed crystal of quartz in the direction of the triad axis has its plane of polarization rotated positively by about $20°$ to the right, and negatively by $10°$ to the left. A section $1 \text{mm}$. thick, cut perpendicular to the principal axis of a quartz crystal, rotates the plane of yellow $(D)$ light through $22°$, and of blue $(G)$ light through $43°$. Such a section when examined in the polariscopes shows an interference figure with a coloured centre, there being no black cross inside the innermost ring (this is not shown in very thin sections). Superimposed sections of right- and left-handed quartz, as may sometimes be present in sections of twinned crystals, exhibit Airy's spirals in the polariscopes. The indices of refraction of quartz for yellow $(D)$ light are $\omega = 1.5442$ and $\epsilon = 1.5533$; the optic sign is therefore positive.

Quartz has a hardness of 7 (on Mohs' scale), and it cannot be scratched with a knife; its specific gravity is 2.65. There is no distinctive cleavage; though an imperfect cleavage may sometimes be developed parallel to the faces of the rhombohedron $r$ by pressure, the crystals are also infusible and non-conductor of electricity; it is attacked by acids with the exception of hydrofluoric acid, and is only slightly dissolved by solutions of caustic alkalis. It is infusible before the gas blowpipe, but in the oxy-hydrogen flame fuses to a clear colourless glass, which has a hardness of 5 and specific gravity 2-2.

Many peculiarities of the growth of crystals are illustrated by the mineral quartz. Thus in "ghost quartz," in which one crystal is seen inside another, the stages of growth are marked out by thin layers of enclosed material. In "capped quartz" these layers are thicker, and the successive shells of the crystal may be easily separated. Double quartz is a quartz in which a short thick crystal is mounted on the end of a long slender prism, indicates a change in the conditions of growth. Crystals with a helical twist are not uncommon. Enclosures of other minerals (rutile, chlorite, haematite, goethite, actinolite, asbestos and many others) are extremely frequent in crystals of quartz. Cavities, either rounded or with the same shape ("negative crystals") as the surrounding crystal, are also common; they are often of minute size and present in vast numbers. Bubbles and air cavities contain a saline solution, carbon dioxide or petroleum) and a movable bubble of gas. The presence of these enclosed impurities impairs the transparency of crystals and makes them unsuitable at one end to their rocky matrix, but sometimes, especially when embedded in a soft matrix of clay, gypsum or salt, they may be bounded on all sides by crystal faces (fig. 1). In size they vary between extreme limits, from minute points projecting perpendicularly from crystal surfaces and often so thickly clustered together as to produce a drusy effect, to large single crystals measuring a yard in length and diameter and weighing half a ton.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.
The characters as given above apply more particularly to crystals of quartz, but in the various massive and compact varieties the material may be quite different in general appearance. Thus in the microcrystalline chaledony (q.t.) the lustre is waxly, the fracture fibrous to even, and the external form botryoidal or stalactitic; flint and chert are composite rocks, their veins being the intercalated agglutinated fragments of quartz, which are usually intermixed with much iron oxide and clay and has a dull and even fracture. Further, these varieties may be of almost any colour, whereas transparent crystals have only a limited range, owing, being the result of such irregularly shaped masses or as porphyritic crystals. In pegmatite (graphic granite) and granophyre it often forms a regular intergrowth with felspar. It is also a common constituent, as irregular grains, in many gneisses and granite; it is also a common component of granite. By the weathering of silicates, silica passes into solution and quartz is deposited as a secondary product in the cavities of basic igneous rocks, and is in fact in the crevices and along the joints of rocks of almost all kinds. Extensive veins of quartz are especially frequent in schistose rocks. Vein-quartz, often of economic importance as a matrix of gold, may, however, in some cases have been of igneous origin. In mineral veins and lodes crystallized quartz is usually the most abundant gangue mineral; the crystals are often arranged perpendicular to the walls of the lode, giving rise to a 'comby' structure. In limestones of various kinds it occurs as nodules and has been of this character of several origins. Quartz being a mineral very resistant to weathering agencies, it forms the bulk of sands and sandstones; and when the sand grains are cemented together by a later deposition of secondary sedimentary material, is the quartz replaced by other minerals. Pseudomorphous quartz, i.e. quartz replacing other minerals, is of frequent occurrence, and as a petrifying material replacing organic remains it is often met with. As a clastic material, quartz is free from less than 0.001 mm. in size, which is called opal. Crystals of quartz may be readily prepared artificially by a number of methods; for example, by heating glass or gelatinous silica with water under pressure.

Many of the porphyritic rocks are composed of only a few species of minerals, the quartz being the major component, and the optical properties of these rocks are of importance in the identification of them. The quartz may be classified into two main types: the crystalline and the massive. The crystalline type is characterized by the presence of large, well-developed crystals, often brightly colored, and is found in igneous rocks such as granite and rhyolite. The massive type is characterized by the absence of large crystals, and is found in sedimentary rocks such as sandstone and shale. The quartz in these rocks may show a variety of optical properties, including birefringence, twinning, and pleochroism.

In the quartz of the massive type, the quartz crystals may be arranged in a variety of orientations, giving rise to the so-called 'comby' structure. This structure is often observed in quartz veins and in the crevices of rocks. The quartz in these rocks may be transparent, or it may be colored, often in shades of pink, purple, or grey. The coloration is often due to the presence of impurities, such as iron oxide, which may be present in varying amounts.

The quartz in the crystalline type of rocks is typically clear and colorless, and is often used in decorative and ornamental purposes. The most famous example of this type of quartz is the quartz used in the making of jewelry, such as the diamonds, which are often used as gemstones.

In summary, the quartz in rocks can vary widely in appearance and properties, depending on the type of rock and the presence of impurities. The quartz in igneous rocks is typically crystalline and transparent, while the quartz in sedimentary rocks is typically massive and may be colored. The quartz in both types of rocks can be used in a variety of applications, from decorative purposes to ornamental and gemstone uses.
impregnated by quartz, chaledony and opal, derived from the silica set free by decomposition (kaolinisation) of the original felspars. This re-deposited silica forms veins and patches of indefinite shape or containing rare dendrites, which are due to the rock having shone on the chiseling substitution. The opal is amorphous, the chaledony finely crystalline and often arranged in spherulitic growths which yield an excellent black cross in polarized light. The microcrystalline ground-masses of the felspars are embedded into these growths or in thin slices by use of the microscope. They prove to consist essentially of quartz and felspars, which are often in grains of quite irregular shape (micrograins). Some of the patches which are white in light, often forming radiate growths of spherulites consisting of fibres of extreme tenuity; this type is known as granophytic. There is another group in which the microcrystalline quartz has an angular form, and which is referred to as microgranophytic. The quartz-porphyries which have microcrystalline ground-masses are rocks of intrusive origin. Elvan is a name given locally to the quartz-porphyries which occur as dikes in Cornwall; in many of them the matrix consists of an almost colourless muscovite. If there have been no pheno- tournilne. Fluorite and kaolin appear also in these rocks, and the whole of these minerals are due to pneumatolytic action by vapours penetrating the porphyry after it had consolidated but prior to the rock having set entirely cooled.

Many ancient rhyolitic quartz-porphyries show on their weathered surfaces numerous globular projections. They may be several inches in diameter. Things of this form have been known from the Jurassic to the Miocene, from which time they occur also in Jersey, the Vosges and Hungary. It has been proposed to call them pyromérites. Much discussion has taken place regarding the origin of these rocks, and it is generally agreed that they were originally sphenites, and that they have suffered extensive changes through decomposition and silicification.

Many of the older quartz-porphyries which occur in Palaeozoic and not in ancient rocks have been inferred from earth movements and have experienced crushing and shearing. In this way they become schistose, and from their felspar minute plates of sericitic white mica are developed, giving the rock in some cases very much of the appearance of a slate. Changes of this nature have been inferred for the rock. Such porphyry-schists have been called porphyroids or porphyroid-schists, and in America the name apophyllite has been used for them. They are well known in some parts of the Appalachian System, in Pennsylvania and New Jersey, and the hâleflintas of Sweden are also in part acid igneous rocks with a well-banded schistose or granulitic texture.

The quartz-porphyries are distinguished from the rhyolites by being either intrusive rocks or Palaeozoic lavas. All Tertiary acid lavas are included under rhyolites. The intrusive quartz-porphyries are equally well described as granite-porphyries. The Palaeozoic effusive quartz-porphyries (or acid lavas) would be called rhyolites by most English petrologists, who regard geological age as of no importance in petrological classifications. But the name quartz-porphyry, though somewhat ambiguous, is so expressive as to have remained, and I propose to use it as a term denoting a certain stage of development of those rocks. The name has fallen into disuse, especially as a descriptive name for the use of field geologists.

QUASSIA, the generic name given by Linnaeus to a small tree of Surinam in honour of the negro Quassi or Coissi, who employed the intensely bitter bark of the tree (Quassia amara) as a remedy for fever. The original quassia was officially recognized in the London Pharmacopoeia of 1758. In 1809 it was replaced by the bitter wood or bitter ash of Jamaica, Picraea excelsa, which possesses the same properties and is obtained in pieces of much larger size. Since that date this wood has continued in use in Britain under the name of quassia to the exclusion of the Surinam quassia, which, however, is still employed in France and Germany. Picraea excelsa is a tree 50 to 60 ft. in height, and resembles the common ash in appearance. It has large compound leaves composed of four or five pairs, with a terminal odd one, of short-stalked, oblong, blunt, leathery leaflets, and inconspicuous green flowers. The fruit consists of black shining drupes about the size of a pea. It is found also in other West Indian islands, as Antigua and St Vincent. Quassia amara is a shrub or small tree belonging to the same natural order as Picraea, viz. Simarubaceae, but it is readily distinguished by its large handsome red flowers arranged in terminal clusters. It is a native of Panama, Venezuela, Guiana and northern Brazil. Jamaica quassia is imported into England in logs several feet in length and often nearly one foot in thickness, consisting of pieces of the trunk and larger branches. The thin greyish bark is usually removed. The wood is nearly white, or of a yellowish tint, but sometimes exhibits blackish markings due to the mycelium of a fungus. The wood has a pure bitter taste, and is without odour or aroma. It is usually to be met with in the form of turnings or raspings, the former being obtained in the manufacture of the "bitter cup" which are made of this wood. The chief constituent is a bitter neutral principle known as quassin. It exists in the wood to the extent of about 7%. It forms crystalline needles soluble in alkalies, chloroform and 200 parts of water. There is also present a volatile oil. The wood contains no tannin, and for this reason quassia, like chiretta and calumba, may be preserved with iron. The infusion is useful as a bitter tonic—a group of substances of which calumba is the type—and is also a very efficient anthelmintic for the threadworm (Oxyuris vermicularis). It is used by brewers as a substitute for hops.

QUATERNARY, in geology, the time division which embraces the Pleistocene and Holocene epochs, i.e. the later portion of the Cainozoic era, equivalent to the "Post-Pliocene" or "Pliocene-Early Miocene" of certain writers. The term was proposed by J. Desnoyers in 1820 to cover those formations which were formed just anterior to the present. There are other ways of regarding the Quaternary time. Sir A. Geikie (Text Book of Geology, 4th ed., 1903) divides it into an upper, post-glacial or Human period, and a lower, Pleistocene or Glacial period; but he subdivides the former into an Historic and a Prehistoric epoch, a scheme presenting difficulties, for the Palaeolithic or lower stage of prehistoric time cannot really be separated from the Pleistocene (q.v.). E. Kayser (Formationskunde, 3rd. ed., 1906), who is in agreement with the definition accepted above, employs a nomenclature which is rarely adopted by palaeontologists. He recognizes a period which he calls the Lower (Glacial) and a younger, modern epoch, the Alluvium, and an older epoch, the Pleistocene or Diluvium (= Glacial). A. de Lapparent, on the other hand (Traité de géologie, 4th ed., 1906), treats the Era moderne or Quaternaire as a great time division equivalent in value to the Tertiary, Secondary, &c., which is so far represented only by a first epoch, the Pleistocene.

QUATERNIONS, in mathematics. The word "quaternion" properly means "a set of four." In employing such a word to denote a new mathematical method, Sir W. R. Hamilton was probably influenced by the recollection of its Greek equivalent, the Pythagorean term {

\[ \text{Prosperis, the number four,} \]

the presence of all things. Q(Cassius or Carinus method) is an extension, or improvement, of Cartesian geometry, in which the artifices of co-ordinate axes, &c., are got rid of, all directions in space being treated on precisely the same terms. It is therefore, except in some of its degraded forms, possessed of the perfect isotropy of Euclidian space. From the purely geometrical point of view, a quaternion may be regarded as the quotient of two directed lines in space—or, what comes to the same thing, as the factor, or operator, which changes one directed line into another. Its analytical definition will appear later.

History. The evolution of quaternions belongs in part to each of two widely-branched series of mathematical history—the interpretation of the imaginary (or impossible) quantity of common algebra, and the Cartesian application of algebra to geometry. Sir W. R. Hamilton was led to his great invention by keeping geometrical applications constantly before him while he endeavoured to give a real significance to $\sqrt{-1}$. We will
therefore confine ourselves, so far as his predecessors are concerned, to attempts at interpretation which had geometrical applications in view.

One geometrical interpretation of the negative sign of algebra was early seen to be mere reversal of direction along a line. Thus, when an image is formed by a plane mirror, the distance of any point in it from the mirror is simply the negative of that of the corresponding point of the object. Or if motion in one direction along a line be treated as positive, motion in the opposite direction along the same line is negative. In the case of time, measured from the Christian era, this distinction is at once given, by the letters A.D. or B.C., prefixed to the date. And to find the position in time, of one event relatively to another, we have only to subtract the date of the second (taking account of its sign) from that of the first. Thus1 to find the interval between the battles of Marathon (490 B.C.) and Waterloo (A.D. 1815) we have

\[ +1815 - (-490) = 2305 \text{ years.} \]

And it is obvious that the same process applies in all cases in which we deal with quantities which may be regarded as of one directed dimension only, such as distances, along a line, rotations about an axis, &c. But it is essential to notice that this is by no means necessarily true of operators. To turn a line through a certain angle in a given plane, a certain operator is required; but when we wish to turn it through an equal negative angle we must not, in general, employ the negative of the former operator. For the negative of the operator which turns a line through a given angle in a given plane will in all cases produce the negative of the original result, which is not the result of the reverse operator, unless the angle involved be an odd multiple of a right angle. This is, of course, on the usual assumption that the sign of a product is changed when that of any one of its factors is changed,—which merely means that—r is commutative with all other quantities.

John Wallis seems to have been the first to push this idea further. In his *Treatise of Algebra* (1685) he distinctly proposes to construct the imaginary roots of a quadratic equation by going out of the line on which the roots, if real, would have been constructed.

In 1804 the Abbé Buée (Phil. Trans., 1806), apparently without any knowledge of Wallis’s work, developed this idea so far as to make it useful in geometrical applications. He gave, in fact, the theory of what in Hamilton’s system is called the Composition of Vectors in one plane—i.e. the combination, by + and −, of complanar directed lines. His constructions are based on the idea that the imaginaries \( a + b \sqrt{-1} \) represent a unit line, and its reverse, perpendicular to the line on which the real units \( a + 1 \) are measured. In this sense the imaginary expression \( a + b \sqrt{-1} \) is constructed by measuring a length along the fundamental line (for real quantities), and from its extremity a line of length \( b \) in some direction perpendicular to the fundamental line. But he did not attack the question of the representation of products or quotients of directed lines. The step he took is really nothing more than the kinematical principle of the composition of linear velocities, but expressed in terms of the algebraic imaginary.

In 1806 (the year of publication of Buée’s paper) Jean Robert Argand published a pamphlet2 in which precisely the same ideas are developed, but to a considerably greater extent. For an interpretation is assigned to the product of two directed lines in one plane, when each is expressed as the sum of a real and an imaginary part. This product is interpreted as another directed line, forming the fourth term of a proportion, of which the first three terms are the two directed lines in the problem, and the ratio between the last two terms is the real (positive) unit-line, and the other two are the factor-lines. Argand’s work remained unnoticed until the question was again raised in Gergonne’s *Annales*, 1813, by J. F. Français. This writer stated that he had found the germ of his remarks among the papers of his deceased brother, and that they had come from Legendre, who had himself received them from some one unnamed. This led to a letter from Argand, in which he stated his communications with Legendre, and gave a résumé of the contents of his pamphlet. In a further communication to the *Annales*, Argand pushed on the applications of his theory. He has given by means of it a simple proof of the existence of \( n \) roots, and no more, in every rational algebraic equation of the \( n \)th order with real coefficients. About 1828 John Warren (1796-1852) in England, and C. V. Mourey in France, independently of one another and of Argand, reinvented these modes of interpretation; and still later, in the writings of Cauchy, Gauss and others, the properties of the expression \( a + b \sqrt{-1} \) were developed into the immense and most important subject now called the theory of complex numbers (see NUMBER). From the more purely symbolic view it was developed by Peacock, De Morgan, &c., as *double algebra*.

Argand’s method may be put, for reference, in the following form. The directed line whose length is \( a \), and which makes an angle \( \theta \) with the real (positive) unit-line, is expressed by \( a \cos \theta + i \sin \theta \). As a matter of convenience it is more often expressed by adding together the real and the imaginary parts of two such expressions can, of course, be expressed as a third directed line)—the diagonal of the parallelogram of which they are concurrent. The width of the product \( A \times B \) may, therefore, be given by

\[ a \cos \theta + i \sin \theta \begin{bmatrix} a' \cos \theta' + i \sin \theta' \end{bmatrix}, \]

or

\[ P = a' a \cos (\theta + \theta') + i \sin (\theta + \theta'). \]

Its length is, therefore, the product of the lengths of the factors, and its inclination to the real unit is the sum of those of the factors. If we write the expressions for the two lines in the form \( A + B i \), \( A' + B'i \), the product is \( AA' - BB' + (AB' + BA')i \); and the fact that the length of the product line is the product of those of the factors is seen in the formula

\[ (A + B)(A' + B') = (AA' + BB') + (AB' + BA')i. \]

In the modern theory of complex numbers this is expressed by saying that the *Norm* of a product is equal to the product of the norms of the factors.

Argand’s attempts to extend his method to space generally were fruitless. The reasons will be obvious later; but we mention them just now because they called forth from F. J. Servois (Gergonne’s *Annales*, 1813) a very remarkable comment, in which was contained the only yet discovered trace of an anticipation of the method of Hamilton. Argand had been led to deny that such an expression as \( i^2 \) could be expressed in the form \( A + B i \)—although, as is well known, Euler showed that one of its values is a real quantity, the exponential function of \( i \pi / 2 \). Servois suggested the reference to a general representation of a directed line in space:—

> “L’analogue semblait exiger que le trinôme fût de la forme \( \rho \cos a + q \cos \theta + r \cos \gamma \); a, b, γ étant les angles d’une droite avec trois axes rectangulaires; et qu’on eût
> \[ \rho \cos a + q \cos \beta + r \cos \gamma \] \( = \rho \cos a + q \cos \beta + r \cos \gamma \) \( = \rho \cos a + q \cos \beta + r \cos \gamma \).

Les valeurs de \( \rho, q, r, \rho', q', r' \) qui satisferaient à cette condition seraient absurdes; mais seraient-elles imaginaires, réductibles à la forme générale \( A + B V -1 \) ? Voilà une question d’analyse fort singulière que je soumet à vos lumières. La simple proposition que je vous en faisais suffit pour vous faire voir que je ne crois point que toute fonction analytique non réelle soit vraiment réductible à la forme \( A + B V -1 \).

As will be seen later, the fundamental \( i, j, k \) of quaternions, with their reciprocals, furnish a set of six quantities which satisfy the conditions imposed by Servois. And it is quite certain that they cannot be represented by ordinary imaginaries.

Something far more closely analogous to quaternions than anything in Argand’s work ought to have been suggested by the theory of complex numbers. Instead of regarding, as Buée and Argand had done, the expression \( a + b \sqrt{-1} \) as a directed line, let us suppose it to represent the operator which, when applied to any line in the plane in which \( \theta \) is measured, turns it in that plane through the angle \( \theta \), and at the same time increases its length in the ratio \( a : 1 \). From the new point of view we see at once, as it were, why it is true that

\[ (\cos \theta + i \sin \theta) = \cos m\theta + i \sin m\theta \]
QUATERNIONS

For this equation merely states that $m$ turnings of a line through successive equal angles, in one plane, give the same result as a single turning through $m$ times the common angle. To make this process applicable to any plane in space, it is clear that we must have a special value of $i$ for each such plane. In other words, a unit line, drawn in any direction whatever, must have $-1$ for its square. In such a system there will be no line in space specially distinguished as the real unit line: all will be alike imaginary, or rather alike real. We may state, in passing, that every quaternion can be represented as $a (\cos \theta + r \sin \theta)$, where $a$ is a real number, $\theta$ a real angle, and $r$ a directed unit line whose square is $-1$. Hamilton took this grand step, but, as we have already said, without any help from the previous work of De Moivre. The course of his investigations is minutely described in the preface to his first great work (Lectures on Quaternions, 1853) on the subject. Hamilton, like most of the many inquirers who endeavored to give a real interpretation to the imaginary of common algebra, found that at least two kinds, orders or ranks of quantities were necessary for the purpose. But, instead of dealing with points on a line, and then wandering out at right angles to it, as Bueu and Argand had done, he chose to look on algebra as the science of "pure time," and to repeat the properties of sets of "time-steps." In its essential nature a set is a linear function of any number of "distinct" units of the same species. Hence the simplest form of a set is a "couple"; and it was to the possible laws of combination of couples that Hamilton first directed his attention. It is obvious that the way in which the two separate time-steps are involved in the couple will determine these laws of combination. But Hamilton's special object required that these laws should be such as to lead to certain assumed results; and he therefore commenced by assuming these, and from the assumption determined how the separate time-steps must be involved in the couple. It is the Roman letters for mere numbers, capitals for instants of time, Greek letters for time-steps, and a parenthesis to denote a couple, the laws assumed by Hamilton as the basis of a system were as follows:

$$ (B_1B_2 - (A_1A_2)) = (B_1 - A_1 B_2 - A_2) = (a, b);$$

$$(a, b) (a', b') = -a'b + ba';$$

To show how we give, by such assumptions, a real interpretation to the ordinary algebraic imaginary, take the simple case $a = 0, b = 1$, and the second of the above formulae gives

$$ (a, 1) (a, b) = (-b, a).$$

Thus the number-coUPLE $(a, 1)$, when applied to a step-couple, simply changes its sign. That we have here a perfectly real and intelligible interpretation of the ordinary algebraic imaginary is easily seen by an illustration, even if it be a somewhat extravagant one. Some Eastern potentate, possessed of absolute power, covets the vast possessions of his vizier and of his barber. He determines to rob them both (an operation which may be very satisfactorily expressed by $-1$); but, being a wag, he chooses his own way of doing it. He degrades his vizier to the office of barber, taking all his goods in the process; and makes the barber his vizier. Next day he repeats the operation. Each of the victims has been restored to his former rank, but the operation $-1$ has been applied to both.

Hamilton, still keeping prominently before him as his great object the invention of a method applicable to space of three dimensions, proceeded to study the properties of triplets of the form $x+iy+jz$, by which he proposed to represent the directed line in space whose projections on the co-ordinate axes are $x, y, z$. The composition of two such lines by the algebraic addition of their several projections agreed with the assumption of Bueu and Argand for the case of coplanar lines. But, assuming the distributive principle, the product of two lines appeared to give the expression

$$xx' - yy' - zz' + (xy' + yx' + zy' + zy').$$

For the square of $i$, like that of $i$, was assumed to be negative unity. But the interpretation of $ij$ presented a difficulty—in fact the main difficulty of the whole investigation—and it is especially interesting to see how Hamilton attacked it. He saw that he could get a hint from the simpler case, already thoroughly discussed, provided the two factor lines were in one plane through the real unit line. This requires merely that

$$y : : y' : z' ;$$

but then the product should be of the same form as the separate factors. Thus, in this special case, the term in $ij$ ought to vanish. But the numerical factor appears to be $y'z - yz'$, while it is the quantity $y'y' - yz'$ which really vanishes. Hence Hamilton was at first inclined to think that $ij$ must be treated as nil. But he soon saw that "a less harsh supposition would suit the simple case. For his speculations on sets had already familiarized him with the idea that multiplication might in certain cases not be commutative; so that, as the last term in the above product is made up of the two separate terms $i y'z$ and $j y'x$, the term would vanish of itself when the factor $(a, b)$ passes from a coplanar to a non-coplanar; provided $ij$ would then assume the form $ij(y'y' - yz')$. He had now the following expression for the product of any two directed lines:

$$xx' - yy' - zz' + (xy' + yx' + zy' + zy').$$

But his result had to be submitted to another test, the Law of the Norms. As soon as he found, by trial, that this law was satisfied, he took the final step. "This led me," he says, "to conceive that perhaps, instead of seeking to confine ourselves to triplets, . . . we ought to regard these as only imperfect forms of Quaternions, . . . and that thus my old conception of sets might receive a new and useful application." In a very short time he settled his fundamental hypotheses. He had now three distinct space-units, $i, j, k$, and the following conditions regulated their combination by multiplication:

$$(a + b i + c j + d k)(a' + b'i + c'j + d'k) = A + B i + C j + D k,$$

where

$$A = a a' - b b' - c c' - d d';$$

$$B = a b' + a' b - c d' + c' d;$$

$$C = a c' + a' c - b d' + b' d;$$

$$D = a d' + a' d - b c' + b' c.$$

Hamilton at once found that the Law of the Norms holds,—not being aware that Euler had long before decomposed the product of two sums of four squares into this very set of four squares. And now a directed line in space came to be represented as $iz + jy + kx$, while the product of two lines is the quaternion

$$- (x x' + y y' + z z') + i (x y' + y x') + j (x z' + z x') + k (y z' + z y').$$

To any one acquainted, even to a slight extent, with the elements of Cartesian geometry of three dimensions, a glance at the extremely suggestive constituents of this expression shows how justly Hamilton was entitled to say: "When the conception . . . had been so unfolded and fixed in my mind, I felt that the new instrument for applying calculation to geometry, for which I had so long sought, was now, at least in part, attained." The date of this memorable discovery is October 16, 1843.

Suppose, for simplicity, the factor-lines to be of unit length. Then $x, y, z, x', y', z'$ express their direction-cosines. Also, if $\theta$ be the angle between them, and $x', y', z'$ the direction-cosines of a line perpendicular to each of them, we have Hamilton then

$$\cos \theta = \frac{x x' + y y' + z z'}{\sqrt{x^2 + y^2 + z^2}},$$

where

$$x' = y' = z' = 0 \sin \theta.$$

Thus, when the factors

$$i j = k = -1.$$

It will be easy to see that, instead of the last three of these, we may write the single line $i j k = -1$. 

1 Theory of Conjugate Functions, or Algebraic Couples, with a Preliminary and Elementary Essay on Algebra as the Science of Pure Time, read in 1833 and 1835, and published in Trans. R. I. A. xvii. ii. (1835).

2 Compare these with the long-continued ideas of Grassmann.
of a product, and if $\theta = 0$, the product is the square of any (unit) line is $-1$. And when the two factor lines are at right angles to one another, or $\theta = \pi/2$, the product is simply $ix + iy + kz$, the unit vector of the line in the direction of the plane containing the other two. Thus, this factor is the geometric element of the symmetry and simplicity of the quaternion calculus, all systems of three mutually rectangular unit lines in space have the same properties as the fundamental system $i, j, k$. In other words, the system (considered as rigid) can be made to turn about the first factor coincides with $i$ and the second with $j$, the product will coincide with $k$. This fundamental system, therefore, becomes unnecessary; and the quaternion method, in every case, takes over the directioner of pure geometry, and for full advantage, if we confine ourselves to projective geometry and matters of that order; but they are limited in their field, and therefore need not be discussed here. More general systems, having close analogies to quaternions, have been given since Hamilton's discovery was published. As instances we may take Goodwin's and O'Brien's papers in the Cambridge Philosophical Transactions for 1849. (See also Algebra: special kinds.)

Relations to other Branches of Science.—The above narrative shows how close is the connexion between quaternions and the ordinary Cartesian space-geometry. Were this all, then the utility of their introduction would consist mainly in a clearer insight into the mechanism of co-ordinate systems, rectangular or not—a very important addition to theory, but little advance so far as practical application is concerned. But, as yet, we have not taken advantage of the perfect symmetry of the method. When that is done, the full value of Hamilton's grand step becomes evident, and the gain is quite as extensive from the practical as from the theoretical point of view. Hamilton, in fact, remarks, 2 "I regard it as an ingenuity and perfection in this calculus, or rather in the state to which it has hitherto been unfolded, whenever it becomes, or seems to become, necessary to have recourse... to the resources of ordinary algebra, for the solution of equations in quaternions." This refers to the use of the $x, y, z$-co-ordinates,—associated, of course, with $i, j, k$. But when, instead of the highly artificial expression $ix + iy + kz$, to denote a finite directed line, we employ a single letter, $a$ (Hamilton uses the Greek alphabet for this purpose), and find that we are permitted to deal with it exactly as we should have dealt with the more complex expression, the immense gain is at least in part obvious. Any quaternion may now be expressed in numerous simple forms. Thus we may write $a$ in the manner of a co-ordinate, as the product, $b\gamma$, or the quotient, $\frac{c}{d}$, of two directed lines, &c., while, in many cases, we may represent it, so far as it is required, by a single letter such as $q$, $r$, &c.

Perhaps to the student there is no part of elementary mathematics so repulsive as is spherical trigonometry. Also, everything relating to change of systems of axes, as for instance in the kinematics of a rigid system, where we have constantly to consider one set of rotations with regard to axes fixed in space, and another set with regard to axes fixed in the system, is a matter of troublesome complexity by the usual methods. But every quaternion is a proposition in spherical (sometimes degrading to plane) trigonometry, and has the advantage of the symmetry of the method. And one of Hamilton's earliest advances in the study of his system (an advance independently made, only a few months later, by Arthur Cayley) was the interpretation of the singular operator $q(\ldots)q^1$, where $q$ is a quaternion. Applied to any directed line, this operator at once turns it, conically, through a definite angle, about a definite axis. Thus rotation is now expressed in symbols at least as simply as it can be exhibited by means of a model. Had quaternions effected nothing more than this, they would still have inaugurated one of the most necessary, and apparently impracticable, of reforms.

The physical properties of a heterogeneous body (provided they vary continuously from point to point) are known to depend, in the neighbourhoood of any one point of the body, on a quadric function of the co-ordinates with reference to that point. The

1 Die Ausdehnungslehre, Leipic, 1844; 2nd ed., vollstandig und in systematisch derlei, 1882. See also the collection of papers, and those of Clifford, for a general explanation of Grassmann's method.

2 Lectures on Quaternions, § 513.
same is true of physical quantities such as potential, temperature, &c., throughout small regions in which their variations are continuous; and also, without restriction of dimensions, of moments of inertia, &c. Hence, in addition to its geometrical applications to surfaces of the second order, the theory of quadric functions of position is of fundamental importance in physics. Here the symmetry points at once to the selection of the three principal axes as the directions for \( i, j, k \); and it would appear at first sight as if quaternions could not simplify, though they might improve in elegance, the solution of questions of this kind. But it is not so. Even in Hamilton's earlier work it was shown that all such questions were reducible to the solution of linear equations in quaternions; and he proved that this, in turn, depended on the determination of a certain operator, which would be represented for purposes of calculation by a single symbol. The method is essentially the same as that developed, under the name of "matrices" by Cayley in 1858; but it has the peculiar advantage of the simplicity which is the natural consequence of entire freedom from conventional reference lines.

Sufficient has already been said to show the close connexion between quaternions and the theory of numbers. But one most important connexion with modern physics must be pointed out. In the theory of surfaces, in hydrokinetics, heat-conduction, potentials, &c., we constantly meet with what is called "Laplace's operator," viz. \( \frac{d^2}{dx^2} + \frac{d^2}{dy^2} + \frac{d^2}{dz^2} \). We know that this is an invariant; i.e. it is independent of the particular directions chosen for the rectangular co-ordinate axes. Here, then, is a case specially adapted to the isopropy of the quaternion system; and Hamilton easily saw that the expression \( \frac{d^4}{dx^4} + \frac{d^4}{dy^4} + \frac{d^4}{dz^4} \) could be, like \( ix+jy+zk \), effectively expressed by a single letter. He chose for this purpose \( \nabla \). And we now see that the square of \( \nabla \) is the negative of Laplace's operator; while \( \nabla \) itself, when applied to any numerical quantity conceived as having a definite value at each point of space, gives the direction and the rate of most rapid change of that quantity. Thus, applied to a potential, it gives the direction and magnitude of the force; to a distribution of temperature in a conducting solid, it gives (when multiplied by the conductivity) the flux of heat, &c.

No better testimony to the value of the quaternion method could be desired than the constant use made of its notation by mathematicians like Clifford (in his Kinemática) and by physicists like Clerk-Maxwell (in his Electricity and Magnetism). Neither of these men proposed to employ the calculus itself, but they made use of the extraordinary clearness of insight which is gained even by merely translating the unwieldy Cartesan expressions met with in hydrokinetics and in electrodynamics into the pregnant language of quaternions.

Supplementary Considerations.—There are three fairly well-marked stages of development in quaternions as a geometrical method. (1) Generation of the concept through imaginaries and development into a method applicable to Euclidean geometry. This was the work of Hamilton himself, and the above account (contributed to the 6th ed. of the Encyc. Brit. by Professor P. G. Tait, who was Hamilton's pupil and after him the leading exponent of the subject) is a brief résumé of this first, and by far the most important and most difficult, of the three stages. (2) Physical applications. Tait himself may be regarded as the chief contributor to this stage. (3) Geometrical applications, different in kind from, though more or less allied to, those in connexion with which the method was originated. These last include (a) C. J. Joly's projective geometrical applications starting from the interpretation of the quaternion as a point-symbol; these applications may be said to require no addition to the quaternion algebra; (b) W. K. Clifford's bi-quaternions and G. Combebiac's tri-quaternions, which require the addition of quasi-scalars, independent of one another and of true scalars, and analogous to true scalars. As an algebraic method quaternions have from the beginning received much attention from mathematicians. An attempt has recently been made under the name of multions to systematize this algebra.

We select for description stage (3) above, as the most characteristic development of quaternions in recent years. For (3) (a) we are constrained to refer the reader to Joly's only Manual of Quaternions (1905).

The impulse of W. K. Clifford in his paper of 1873 ("Preliminary Sketch of Bi-Quaternions," Mathematical Papers, p. 181) seems to have come from Sir R. S. Ball's paper on the Theory of Screws, published in 1872. Clifford makes use of a quasi-scalar \( u \), commutative with quaternions, and such that if \( p, q, &c. \), are quaternions, when \( p + uq = p' + uq' \), then necessarily \( p = p', q = q' \). He considers two cases, viz. \( u^2 = 1 \) suitable for the use of screws; and and \( u^2 = -1 \) suitible for the use of motors. We must, however, strain the imagination to see why in a 3-space; we confine ourselves to the second, and will call the indicated bi-quaternion \( p + uq \) an oction. In octions the analogue of Hamilton's vector is localized to the extent of being confined to an indefinitely long axis parallel to itself, and is called a rotor; if \( p \) is a rotor then \( p + p \) is parallel and equal to \( p \), and, like Hamilton's vector, \( op \) is not localized; \( op \) is therefore called a vector, though it differs from Hamilton's vector in that the product of any two such vectors \( op \) and \( op' \) is zero because \( u^2 = o, p + op \) where \( p, o \) are rotors (i.e. \( p \) is a rotor and \( o \) a vector), is called a motor, and has the geometrical significance of a screw or motor, "as a screw upon, or twist about, a screw." Clifford considers an oction \( p + uq \) as the quotient of two motors \( p + op, p' + op' \). This is the basis of a method parallel throughout to the quaternion method; in the specification of rotors and motors it is independent of the origin which for these purposes the quaternion method, pure and simple, requires.

Combebiac is not content with getting rid of the origin in these limited circumstances. The fundamental geometrical conceptions are the point, line and plane. Lines and complexes thereof are sufficiently treated as rotors and motors, but points and planes cannot be so treated. He glances at Grassmann's method of representing case, he is seeking a unifying principle, and he finds that Grassmann offers him not one but many principles. He arrives at the tri-quaternion as the suitable fundamental concept.

We believe that this tri-quaternion solution of the very interesting problem proposed by Combebiac is the best one. But the first thing that strikes one is that it seems unduly complicated. A point and a plane fix a line or axis, viz. that of the perpendicular from point to plane, and therefore a calculus of points and planes is \( \text{ipsaffectio} \) a calculus of lines also. To fix a weighted point and a weighted plane in Euclidean space we require \( 8 \) scalars, and not the \( 12 \) scalars of the tri-quaternion. We should expect some species of bi-quaternion to suffice. And this is the case. Let \( \eta, \omega \) be two quasi-scalars such that \( \eta^2 = \eta, \omega = \omega, \omega = \omega = 0 \). Then the bi-quaternion \( \eta + \omega \) suffices. The plane of vector magnitude \( \dot{4} \), its equation is \( \$t = \omega \), and its expression is the bi-quaternion \( \eta + \omega \); the point is of scalar magnitude \( \hat{9} \), and its position vector is \( \beta \), where \( \hat{9} = 4 \) (or what is the same, \( \beta = (Vr + q, Vr, \gamma + f)/\eta \)) and its expression is \( \eta + \omega + Vr \). (Note that the \( 4 \) here occurring is only required to ensure harmony with tri-quaternions of which our present bi-quaternion, as also octions, are particular cases.) The point whose position vector is \( \eta + \omega + Vr \) may be called the centre of the bi-quaternion; it is the centre of a sphere of radius \( \eta + \omega + Vr \) with reference to which the point and plane are in the proper quaternion sense polar reciprocals, that is, the position vector of the point relative to the centre is \( \eta + \omega + Vr \), the point of foot of perpendicular from centre on plane is \( \eta + \omega + Vr \), the product being the (radius), that is, (the (radius)). The axis of the member \( x + y \) is the second-order complex \( Q, Q' \) (where \( Q = \eta + \omega + Vr \) and \( \omega \) are scalars) is parallel to a fixed plane and intersects the line of intersection, viz. the line parallel to \( \eta + \omega \) which intersects the axes of \( Q \) and \( Q' \); the plane of the member contains a fixed line; the centre is on a fixed ellipse which
intersects the transversal; the axis is on a fixed ruled surface to which the plane of the ellipse is a tangent plane, the ellipse being the section of the ruled surface by the plane; the ruled surface is a cyclindroid deformed by a simple shear parallel to the transversal. In the three-order complex the centre locus becomes a finite closed quartic surface, with three (one always real) intersecting nodal axes, every plane section of which is a nodal quartic. The chief defect of the geometrical properties of certain tri-quadratures is that the ordinary algebraic scalar finds no place among them, and in consequence $Q$ is meaningless.

Putting \( 1 - \eta = \xi \) we get Combebiac's tri-quadrature under the form $Q = \xi q + q + q = \eta$. This has a reciprocal $Q^* = \xi q + q + q + \omega + \omega + \omega + \omega - \omega - \omega - \omega = \omega^2$, and a conjugate $Q_3$ (such that $Q_3 Q = Q Q_3$) given by $Q_3 = \xi q + q + q + \omega + \omega + \omega + \omega$; the product $QQ'$ of $Q$ and $Q'$ is $\xi q + q + q + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega + \omega = \omega, \omega = \omega$. Combebiac's tri-quadrature may be regarded from many simplifying points of view. Thus, in place of his general tri-quadrature we might deal with products of an odd number of point-plane-scalars (of form $\mu + \mu + \omega$) which are themselves point-plane-scalars, and products of an even number which are octonions; the quotient of two point-plane-scalars would be an octonion, of two octonions an octonion, of an octonion by a point-plane-scalar or the inverse a point-plane-scalar.

Again a unit point $\mu$ may be regarded as multiplication (or division) from a point-plane-scalar, and from a point-plane-scalar to octonion, (c) from octonion to linear element, (d) from linear element to plane scalar.

If $Q = \xi q + q + q + q$ and we put $Q = (1 + \eta)^2 (\xi q + q + q + q)$, we find that the quaternion $I$ must be $f(1)(\xi q + q + q) = 0$, where $f(1) = q - K p r$. The point $p = i$ may be called the centre of $Q$ and the length $S$ may be called the radius. If $Q$ and $Q'$ are commutative, that is, if $Q Q' = O = Q'$, and $Q$ have the same centre and the same radius. Thus $Q^2$, $Q$, $Q^3$, . . . have a common centre and common radius. $Q$ and $KQ$ have a common centre and equal and opposite radii; that is, the of $KQ$ is the negative conjugate of that of $Q$. When $S$, $Q$, $Q'$ (cent) is an operator which (shifts without further change) the tri-quadrature operant an amount given by $\mu$ in direction and distance.

**Bibliography.**—In 1904 Alexander Macfarlane published a Bibliography of Quaternions and allied systems of Mathematics for the International Association for promoting the study of Quaternions and allied systems of Mathematics (Dublin University Press); this included the period 1843-1903. Hamilton's **Elements of Quaternions** of 1866 was republished under C. J. Joly's editorship, in two volumes (London). Joly adds valuable notes and thirteen important appendices. In 1893 the 3rd edition of P. G. Tait's **Elementary Treatise on Quaternions** appeared (Cambridge). In 1905 C. J. Joly published his **Manual of Quaternions** (London); the valuable contents of this are doubled by spinal planes. Joly gives a development of Clifford-Bi-quadratures (Cambridge, 1898); G. Combebiac, **Calend du triangulations** (Paris, 1902); Don Francisco Pérez de Muñoz, **Introducción al estudio del cálculo de Quaterniones y otras Algebras especiales** (Madrid, 1905); A. McAulay, **Algebra after Hamilton**, or **Multienions** (Edinburgh, 1908). (A. McA.)

**QUATORZAIN** (from Fr. quatorze, fourteen), the term used in English literature, as opposed to "sonnet," for a poem in fourteen rhymed iambic lines closing (as a sonnet strictly never does) with a couplet. The distinction was long neglected, because the English poets of the 16th century had failed to apprehend the true form of the sonnet, and called Petrarch and other Italian poets' sonnets quatorzains, and their own incorrect quatorzains sonnets. Almost all the so-called sonnets of the Elizabethan cycles, including those of Shakespeare, Sidney, Spenser and Daniel, are really quatorzains. They consist of three quatrains of alternate rhyme, not repeated in the successive quatrains, and the whole closes with a couplet. A more perfect example of the form could hardly be found than the following, published by Michael Drayton in 1602:—

Dear, why should you commend me to my rest, When now the night doth summon all to sleep? Methinks this time become lovely to me, And yet 'tis thus thou dost unerringly

Night was ordained together friends to keep.

How happy are all other living things Which though the day conjoin by several flight, The quiet evening yet to them below, O thou that art so courteous unto all, Why shouldst thou thus this night, abuse me only thus, That every creature to his kind devout call, And yet 'tis thus thou dost unerringly

Well could I wish it would be everday, Whenever those times, you bid me go away.

Donne, and afterwards Milton, fought against the facility and incorrectness of this form as metre and adopted the Italian form of sonnet. During the 19th century, most poets of distinction prided themselves on following the strict Petrarchan model of the sonnet, and particularly in avoiding the final couplet. In his most mature period, however, Keats returned to the quatorzain, perhaps in emulation with Shakespeare; and some of his examples, such as "When I have fears," "Standing aloof in giant ignorance," and "Bright Star," are the most beautiful in modern literature. The "Fancy in Nubibus," written by S. T. Coleridge in 1819, also deserves notice as a quatorzain of peculiar beauty.

**QUATRAIN**, sombrero (from Fr. quatre, four), a piece of verse complete in four rhymed lines. The length or measure of the verse is immaterial, but they must be bound together by a rhyme-arrangement. This form has always been popular for use in the composition of epigrams, on account of its brevity and neatness, and may be considered as a modification of the Greek or Latin epigram at its concisest.

**QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE** (1819-1892), French naturalist, was born at Berthezene, near Vallerangue (Gard), on the 10th of February 1819, the son of a Protestant farmer. He studied medicine at Strassburg, where he took the double degree of M.D. and D.Sc., one of his theses being a **Théorie d'un coup de canon** (November 1829); next year he published a book, *Sur les oblitéres*, and in 1833 a treatise on *L'Extraction de la vessie*. Removing to Toulouse, he practised medicine for a short time, and contributed various memoirs to the local *Journal de médecine* and to the *Annales des sciences naturelles* (1834-36). But being unable to continue his researches in the provinces, he resigned the chair of zoology to which he had been appointed, and in 1839 settled in Paris, where he found in H. Milne-Edwards a patron and a friend. Elected professor of natural history at the Lycée Napoleon in 1850, he became a member of the Academy of Sciences in 1857, and in 1858 was called to the chair of anthropology and ethnography at the Musée d'histoire naturelle. Other distinctions followed rapidly, and continued to the end of his otherwise uneventful career, the more important being honorary member of the Royal Society of London (June 1870), member of the Institute and of the Académie de médecine, and commander of the Legion of Honour (1881). He died in Paris on the 12th of January 1892. He was an accurate observer and unwearyed collector of zoological materials, gifted with remarkable descriptive power, and possessed of a clear, vigorous, style, but somewhat deficient in deep philosophic insight. It is through his studies on the anatomical characters of the lower and higher organisms, man included, that will retain their value, while many of his theories and generalizations, especially in the department of ethnology, are already forgotten.

The work of de Quatrefages ranged over the whole field of zoology from the annelids and other low organisms to the anthropoids and man. Of his numerous essays in scientific periodicals, the more important were: *Consegration sur les caractères zoologiques des rongeurs* (1810); "De l'organisation des animaux sans vertébrés des Côtes de la Manche" (*Ann. Sci. Nat.*, 1844); "Recherches sur
le système nerveux, l'embryogénie, les organes des sens, et la circulation des arachnéides" (Ibid., 1844-50); "Sur les affinités et les analogies des lombrics et des sangsues" (Ibid.); "Sur l'histoire naturelle des tares" (Ibid., 1848-50). Then there is the first series issued under the general title of "Études sur les types inférieurs de l'embryonnat des anneaux," and the results of several scientific expeditions to the Atlantic and Mediterranean coasts, especially, for the publication of "Revue des deux mondes, or embodied in the Souvenirs d'un naturaliste" (2 vols., 1854). These were followed in quick succession by the Physiologie comparée, metamorphoses de l'homme et des animaux (1860), Ch. Darwin et ses précurseurs français (1870), a study of evolution in which the writer takes econimical position as an attitude as A. R. Wallace, combating the Darwinian doctrine in its application to man; La Race brésilienne (1871); Crania Ethnica, jointly with Dr Hamy (2 vols., 1875-82), a classical work based on French and foreign anthropological data, analogous to the Crania Britannica of Thurnam and Davis, and to S. G. Morton's Crania Americana and Cranio Aegyptiaca; L'espèce humaine (1877); Nouvelles Études sur la distribution géographique des négres (1882); Hommes fossiles et humains sauvages (1884); and Histoire générale des races humaines (2 vols., 1886-89), the first volume being introductory, while the second attempts a complete classification of man.

\section*{Quatrefoil, in Gothic architecture, the piercing of tracery in a window or balustrade with small semicircular openings known as "foils"; the intersection of these foils is termed the cusp.}

\section*{Quatremère, Étienne Marc (1782-1857), French Orientalist, the son of a Parisian merchant, was born in Paris on the 12th of July 1782. Employed in 1807 in the manuscript department of the imperial library, he passed to the chair of Greek in Rouen in 1809, entered the Academy of Inscriptions in 1815, taught Hebrew and Aramaic in the Collège de France from 1819, and finally in 1827 became professor of Persian in the School of Living Oriental Languages. Quatremère's work was Recueilles . . . sur la langue et la littérature de l'Égypte (1808), showing that the language of ancient Egypt must be sought in Coptic. His translation of Makrizi's Arabic history of the Mameluke sultans (2 vols., 1837-41) shows his erudition at the best. He published among other works Mémoires sur les Nabatlans (1835); a translation of Rashid al-Din's Hist. des Mongols de la Perse (1836); Mém. géog. et hist. sur l'Égypte (1830); the text of Ibn Khaldun's Prolegomena; and a vast number of useful memoirs in the Journal asiatique. His numerous reviews in the Journal des savants should also be mentioned. Quatremère made great lexicographical collections in Oriental languages, and in 1827 and 1844 published his dictionary, in the form of hisment de dictionnaire oriental, in 3 vols., 1827 and 1844, and for several years was the editor of the Journal asiatique. His work is substantial, and his influence on Oriental study is considerable. His works are the result of his own labor, and his success was due to the fact that he knew the languages well, and was able to render them serviceable for scientific purposes.

\section*{Quay, Matthew Stanley (1833-1904), American political "boss," was born in Dillsburg, York county, Pennsylvania, on the 30th of September 1833. He graduated at Jefferson College (now Washington and Jefferson College) in 1859 and was admitted to the bar in 1854. He served in the Civil War and was a member of the state House of Representatives, becoming secretary of the commonwealth in 1873-1875 and again in 1879-1882, recorder of Philadelphia in 1878-1879, and state treasurer in 1886-1887. He was chairman of the Republican national executive campaign committee in 1888, and was a member of the United States Senate in 1887-1899 and again in 1901-1904. For nearly twenty years he dominated the government of Pennsylvania, and also played a very prominent part in national affairs. In 1899 he was brought to trial on a charge of misappropriating state funds, and, although he was acquitted, he fled among the reform element in his own party was so bitter against him that the legislature was deadlocked and his re-election was postponed for two years. He died on the 28th of May 1904.

\section*{Quay, a wharf or landing-place for the loading and unloading of water-borne cargo. The word, now pronounced like "kev," takes the form of Fr. quai, older cay or caye, cf. Spanish cayo, a bar, barrier or reef. The earlier form in English was "kay," and it was so pronounced. "Key" was also earlier pronounced "kay," and the change in pronunciation in the one was followed also in the other. In spelling also the word was assimilated to "key," in the sense of a reef, or, especially, of the low range of reefs or islets on the coasts of Spanish America, e.g. on the coast of Florida, the chain of islets known as Florida Keys.

\section*{Quebec, a province of the Dominion of Canada, bounded S. by New Brunswick and the United States, W. by Ontario, N. by the district of Ungava, and E. by the gulf of St Lawrence and the gulf of St. Lawrence, which separates it from the United States. If Ungava be considered as added to the province of Quebec, Hudson Strait is the northern boundary. The province includes the island of Anticosti, the Bird Islands and the Magdalen Islands, in the gulf of St Lawrence. The western boundary, separating Quebec from Ontario, extends through Point au Baudet on the river St Lawrence to Point Fortune on the Ottawa river, from which place the boundary follows the Ottawa to Lake Temiscaming. From the north end of this latter lake it runs due north to Hudson Bay. The province of Quebec thus extends from Blanc Sablon, a fishing harbour at the mouth of the Pukatawagan river, which forms the boundary which separates Canada from Newfoundland (in 50° 14' W. to 65° 37' W. latitude), in 79° 30' N., a distance of about 1350 miles. The area of the province is 351,873 sq. m. The general direction of the province is north-east and south-west, following the course of its chief physical feature, the river St Lawrence. Speaking generally, it may be said that the province of Quebec comprises the hydrographical basin of the river St Lawrence as far west as the intersection of the parallel of 45° N. with the latter. The St Lawrence flows near the southern edge of its basin, only some 50,000 sq. m. of the area of the province lying south of the river.

The province of Quebec falls into three main physiographical divisions, viz.: (1) the Laurentian Highlands, (2) the Valley of the St Lawrence, and (3) the New Brunswick and Labrador regions and the rolling country lying to the south-east of this range.

(1) The Laurentian Highlands are sometimes referred to as the "Laurentian Mountains," as they appear to constitute a mountain range when viewed from the gulf or the river St Lawrence. This portion of the province, however, is really a plateau having an elevation of 1000 to 2000 ft. above sea level, but this plateau north of latitude 55° falls away to lower levels toward Hudson Bay and its tributary lakes. The St Lawrence river flows between the Laurentian Highlands on the coast of Labrador, however, the country rises to much greater altitudes, forming an extremely rugged district which attains in places an elevation of 6000 ft. above sea level. This is the region the country is characterized by a flat, or nearly level, lowland. The surface is covered with a mantle of water and seasonally frozen, and is intersected by a network of eskers and outwash plains. There are numerous lakes, the largest of which is Lake Superior, about 200 miles long, and 100 miles wide. The country is hilly, and is covered with forests of coniferous and deciduous trees. The chief rivers are the Rivière des Outaouais, the Rivière des Chaudières, and the Rivière des Pembina. The climate is mild, and the vegetation is abundant. The province is well watered, and the rivers are navigable for some distance. The principal cities are Montreal, Quebec, and Trois-Rivières.

(2) The Valley of the St Lawrence, which extends from the source of the river to its mouth, is divided into two distinct sections, viz.: (a) the St Lawrence river, and (b) the St Lawrence gulf. The river is about 1900 miles long, and is navigable for about 1000 miles from its source to the city of Quebec. The valley is about 20 miles wide, and is bounded on the north by the Laurentian Highlands, and on the south by the New Brunswick and Labrador regions.

(3) The New Brunswick and Labrador regions are the most northern part of the province, and are characterized by a hilly country, with a great number of lakes and rivers. The climate is mild, and the vegetation is abundant. The province is well watered, and the rivers are navigable for some distance. The principal cities are Saint John, Miramichi, and Bathurst.
supplies of the Dominion, supplies which with a little husbanding on the part of the government could be made to afford a bountiful supply of timber for all future generations. The country also contains vast deposits of iron, lead, copper, and other metal-bearing minerals. The great forests of the province are valuable for their fur-bearing animals of the Dominion. While, however, along the southern border it supports a considerable agricultural population, the Laurentian region is not easily considered as one in which the possibilities of agricultural capabilities can be realized. The lake and lowland portions of eastern Canada or with the great plains and British Columbia which lie to the west.

(2) The southern lowlands of the St. Lawrence valley which belongs to the province of Quebec forms a wedge-shaped area extending along the river from a short distance above the city of Quebec to the western border of the province. It is throughout a part of the level of the Lake Champlain region which is the chief towns and cities of the province, and on it also are settled the majority of the rural population. These lowlands are bounded on the north by the Laurentian plateau, and on the south by the North-American-American system. By the action of physical forces gradually converting the latter mountains reaching the shore of the river St. Lawrence a short distance to the east of the city of Quebec. The plain in this way gradually narrows or growing to the northeast, and is finally closed off in that direction. It was a portion of this plain first occupied by the early French settlers. Much of its surface, as has been said, is absolutely level, and it nowhere exceeds an elevation of from 100 to 200 ft. above sea-level. From the summit of Mount Royal, at the foot of which lies the city of Montreal, all the other Montérégian Hills are plainly visible, the lake and river appearing as a tiny blue line bounding the horizon some 30 m. to the north, while towards the Green Mountains, and the Adirondacks in the state of New York, they are invisible on a clear day.

(3) The Notre Dame Mountains and the Eastern Townships. The Appalachian Mountain range, passing out of the state of Vermont, where it is known as the Green Mountains, crosses into the province of Quebec between Lake Champlain and Lake Memphremagog, and becoming lower and less rugged continues in a north-easterly direction to a point about 30 m. south of the city of Quebec. Thence it pursues its course, following the gradient of the land, streaming direction, and lying along its southern margin, and reaches the latter river near Metis. From the border to this point the range is known as the Notre Dame Mountains. The highest peak in the Notre Dame Mountains is Sutton Mountain—3,100 ft. Continuing on to the north-east it develops into the high land of the Gaspé Peninsula, of which the most elevated portion constitutes the Shickshock Mountain, and the Connecticut. The margin of this range is the southern coast of the Gaspé Peninsula. The central part of the area of the Gaspé Peninsula is a forest-clad wilderness.

To the south-east of the Notre Dame Mountains is an undulating country known as the Eastern Townships. These, as mentioned above, are lower and less rugged than the Green Mountains, the general elevation of the country being from 500 to 1000 ft. above sea-level. There are a number of large and fine lakes in this section, the principal ones being Lake Memphremagog, Timiscouata, Memphremagog, Aylmer, St. Francis and Megantic.

In the belt of the Notre Dame Mountains the country is not in the strict sense of the term a mountainous one; but rather a rolling country containing much good farming and pasture land, while the Eastern Townships is a fine agricultural country, embracing some of the best farming and grazing land in the Dominion. This latter district was originally settled by Loyalists from the United States at the time of the revolt of the colonies, but is now being gradually occupied by French Canadians from the more northern portions of the province, the younger generation of English-speaking Canadians being already settled around these towns or the western provinces of Manitoba, Saskatchewan, Alberta and British Columbia.

The whole country is exceptionally well watered and abounds in numerous large rivers, bays and lakes. The principal river is the St. Lawrence, which flows through the entire length of the province. A short distance above Montreal it receives from the east, at Ottawa, a large and beautiful river over 600 m. in length with the St. Lawrence. The most important are the Gatineau, the Lîvre, the North, the Rouge and the Kinojevis. The St. Lawrence is navigable for large ocean steamships as far as Montreal, beyond which place navigation is interrupted by rapids. The St. Maurice rises in Lake Oskelane, flowing into the St. Lawrence at Three Rivers, and is over 400 m. long. It has many tributaries, and drains an area of 21,000 sq. miles. Twenty-four miles above Three Rivers on the St. Maurice are the falls of Shawinigan, 150 ft. high, from which a large amount of electrical power is obtained, a portion of which is used in the production of aluminum, while several thousand horse-power are transmitted to the city of Montreal. The Batican river enters the St. Lawrence at Batican. The Jacques Cartier, the Ste Anne and the Montreal are northern tributaries of the St. Lawrence. The Montmagny is famous for its falls, situated about 8 m. from Quebec city, and 250 ft. high. These beautiful falls, however, have been reduced in size and placed in volume, the water being largely employed for the development of electricity, and also for the supply of power to a large cotton-mill in the vicinity. Near these falls is Haldimand House, once the residence of the Duke of Kent, father of Queen Victoria. The Saguenay rises in Lake St John and discharges into the St Lawrence at Tadousac after a course of 100 m. On the south side of the St. Lawrence is the Richelieu river, which rises in Lake Champlain and discharges into the St Lawrence at Sorel on Lake St. Peter. Champlain sailed up this river in 1606. Other important streams are the St Lawrence, rising in Lake Memphremagog; the Chaudière, rising in Lake Megantic, with its beautiful falls above the Saint John; and the Missisquoi and Magaguay, Yamaska, Etchemin, du Loup, Assomption and Bécancour.

Among the largest lakes in the province are Lake St John, which has an area of 360 sq. m.; Lake Temiscaming, having an area of 126 sq. m.; Lake Matapedia, Lake Magantic and Lake Memphremagog.

The largest islands in the province of Quebec are: Anticosti, now used as a game preserve; Bonaventure, an important fishing station to the east of Gaspe; and the Magdalen Islands, situated in the gulf of St Lawrence about 50 m. north of Prince Edward Island.

Geology and Minerals.—Beginning with the oldest rocks, the more northern part of the province is underlain by the old gneissic system of the Northern Highlands. This includes a great series of very highly altered sediments, largely limestones, known as the Grenville series, which is penetrated by great intrusions of anorthosite, &c., and is invaded by and rests upon enormous boulders of granite, which are sometimes referred to as the "Fundamental Gneiss." The Grenville series is best developed along the southern margin of the Laurentian Highlands between Three Rivers and the Canadian Bay. Two of the great anorthosite intrusions occur on the margin of the Laurentian country to the north of Montreal and about Lake St John. The Laurentian system is succeeded to the south by the Potsdam sandstone, probably deposited in the Ceresian epoch, but in the older formations, as the dolomitic limestone—the Calcareous formation—and on this the great and highly fossiliferous limestones known as the Chazy and Trenton formations. These limestones afford the best building stone in the province, while the Potsdam sandstone is also frequently employed for building purposes. Above the Trenton is the Utica shale, rich in garnetites and phlogopites. This is succeeded by the Hudson River group composed largely of sandstones and calcareous beds. These beds give place to the Upper Silurian and Devonian beds, the latter being the most productive, with the Carboniferous sands and clays of the Carboniferous beds. No coal occurs in the province of Quebec. In the region of the Notre Dame Mountains and the Eastern Townships there are great intercalations of ancient volcanic rocks and pyroxime, the latter being abundant in the area around the town of Logan. Among the most important minerals are gold, iron, copper, asbestos and chromic iron ore; also serpentine, marble and rock salt. The asbesbestos deposits are the most extensive and most productive in the world, the chief centre of mining being at Thetford Mines. A large part of the country, more especially on the lower levels, is covered with Pleistocene deposits of the so-called Glacial age. Till or boulder clay is the base of these deposits. On this rests a finer stratified clay, in some places rich in iron, known as the Leda clay. It affords a good material for the manufacture of bricks and tiles. Above the Leda clay are sands and gravels and the establishment in which the town of Sorel is situated, and frequently contains an abundance of fossils. These stratified clay deposits are due to a re-sorting of the boulder clay by the action of water, and imply a submergence at the close of the Glaele period with a renewed elevation. Portions of the basin of the St. Maurice river there occur deposits of bog iron ore which have been worked for many years.

The climate of Quebec is variable. In the winter the cold is generally severe and the atmosphere clear and bracing. About Montreal snow lies on the ground from the end of November.
until the following April, affording good sleighing for four months in the year. This allows the people and visitors in the outdoor sports common in the country, such as skating, curling, toboggan-ning, snowshoeing, ski-ing and sliding. The snowfall is heavy, and though the winds are often sharp they are not often raw or damp, with the exception of those on the northern borders. The climate is very good for four months in the year.

The following is a table of temperatures as recorded by the meteorological stations at certain points in the province:

The normal percentage of bright sunshine at Montreal is 41 and at Quebec 39, a higher average than northern Europe. (F. D. A.)

Area and Population.—The boundaries of Quebec have been more consistent than once enclosed since 1867. By the extension given to them in 1868, the province has an area of 354,573 sq. m., of which 341,776 sq. m. are land and 6,777 sq. m. are water. This estimate includes the islands of Orleans, Anticosti, and the Magdalen group, but not the gulf of St. Lawrence or the territorial seas. In 1901 the population was 1,648,982, 992,667 being classed as rural and 656,321 as urban. Since 1841 the rural population has increased but little, but there has been a growth of about 11% in the population of the towns and cities. The town has taken so small a share in the development of the West. True to his ancestral instincts, the French-Canadian remains close to the place of his birth. If he emigrates, it is to the neighbouring cities of New England or to the eastern districts of the province of Ontario. On the other hand, in the rural parts of the province, the French are driving out the English-speaking settlers, especially in the south-western counties, settled by Loyalists at the close of the War of American Independence, and now known as the Eastern Townships. Nearly 98% of the population are Canadian-born. Of these over 80% are of French descent; of the remainder about 7% are English, 7% Irish and 4% Scots. Save to the city of Montreal there is little immigration; but so prolific are the French that the population of the province increases as fast as that of the rest of the Dominion, in which to the natural increase is added a large number of new immigrants. The average number of the average family is 5.36, but families with twelve and eighteen children are not uncommon. The English-speaking population is almost wholly confined to the towns, especially Montreal, in which city it controls the chief shipping and commercial interests. Of the original inhabitants about 8,000 Indians remain, chiefly on reserves in the neighbourhood of Montreal and Quebec. Though quite peaceful, they are on the whole less civilized than those of eastern and southern Ontario. The capital is Quebec, with a population of about 70,000, which increases but slowly. The largest city is Montreal, the commercial and shipping centre of the Dominion, at the head of ocean steamship navigation, with a population of about 350,000. Other cities are Hull (practically a suburb of Ottawa; pop. in 1901, 13,093); Sherbrooke (11,763); Three Rivers (9,801); Lévis (7,783).

The French, Irish and Indians are almost entirely of the Roman Catholic faith; a majority of the English are Anglican, with some Methodists; the Scots are Presbyterian. The Roman Catholic Church enjoys extensive rights and privileges, and nowhere in the world is devotion to that faith more widespread or more unquestioning.

Administration.—As in all the provinces, the executive power is nominally vested in a lieutenant-governor, appointed for five years by the federal government, and assisted by an executive council (or cabinet) who have seats in, and are responsible to, the local legislature. In reality the lieutenant-governor is a figure-head, and power is in the hands of the legislature, which consists of two houses, a Legislative Council, appointed nominally by the Crown, and an elected Legislative Assembly, presided over by the premier, and an Assembly, chosen by what is practically a universal franchise. Either French or English may be used in addressing either house. The municipalities have large powers of local government, which are used with more or less efficiency, the predatory tendencies of the ward-politician being sometimes apparent, though of late years an improvement has been effected. The finances of the province are drawn from the same sources as those of Ontario (q.v.). Their administration has not been so economical as in the sister province, and there is a net provincial debt of over £4,000,000.

Education.—In primary education Quebec is still behind the other provinces, but great progress has been made since Federation; illiteracy is decreasing, and 86% of the population over five years of age can read and write. The Council of Public Instruction is divided into two committees of equal number, a Catholic and a Protestant, and all ratepayers are allowed to state whether they wish for public schools to be kept or abolished. The Catholic system is established by law, and the teachers are not paid from the state. The Protestant system is managed by voluntary contributions, and the teachers are paid from the state. Over 95% of the teachers in the primary schools are women. The great majority of the schools are controlled by the council, but there are a number of denominational schools, the number of which is increasing, usually under religious control; of these the so-called "Colleges Classiques," supported by the Catholic Church, are the most important. The chief universities are McGill (undenominational), founded in 1829, and Laval (Catholic), founded in 1852, with its headquarters at Quebec, and with a large branch at Montreal. (See MONTREAL and QUEBEC CITY.) There is also a small Anglican university, that of Bishop's College, Lennoxville (founded 1853), in connection with which is Bishop's College School, on the model of the public schools of England. To McGill is affiliated a well-equipped Agricultural College established at Ste Anne de Bellevue by Sir William Macdonald (b. 1831), at a cost of over £2,000,000; and to Laval an Agricultural School at Oka, founded in 1893 by the Trappist Fathers. There are numerous normal and model schools, the most important being that of Ste Anne de Bellevue in connection with the Laval College.

Agriculture.—The French Canadian is a thrifty though somewhat unprogressive farmer, and loves the land with an even greater attachment than do the peasants of old France. Till recently his great staple crop was wheat grown on the large farms, from which wheat to grind into flour, and enough oats to feed his horses; raised sheep whose wool his wife spun into rough cloth in the winter evenings; and even grew his own tobacco. Now his horizon is widening, his methods are improving, and his profits are increasing. The general climatic conditions are much the same as in Ontario, and the crops are similar. All the chief cereals are successfully cultivated, oats being the chief crop. The wise care of both federal and provincial governments has fostered the dairy farming of the province. In 1906 over 4,200,000 of cheese was produced, and over £5,200,000 of butter. Most of the butter is made in well-equipped creameries, in the number of which Quebec exceeds any other province; in exports of cheese she equals Ontario. In the production of fruit she ranks second to Ontario, Nova Scotia coming third. Perhaps the most typical Canadian industry, the making of syrup and sugar from the maple, is best developed in this province. Over two-thirds of the tobacco grown in the Dominion is raised in Quebec, about 10,000 acres being under cultivation. The annual value of the agricultural produce of the province is about £18,000,000, about half that of Ontario. Several agricultural and dairy schools are supported or assisted by the provincial government. It is much more is being done by the Agricultural College at Ste Anne de Bellevue.

The province still possesses large areas of crown land, which is sold at a nominal price to bona fide settlers. In the northern part of the province new and fertile areas have been opened up by the Grand Trunk Pacific railway.

Forests.—Next to agriculture in importance are the various industries, of which, however, there are only a few, occupying 150,000 sq. m. of forest land are still uncleared, chiefly in the northern part of the province, though the best timber is said to grow south of the watershed. In the north, pine, spruce, and fir predominate, and, farther south, the maple; spruce, lime (linden), basswood,
TIITA AMERICANOS) and poplar, are used extensively in the making of paper pulp. The annual value of the wood cut in the province is about £4,000,000, rather less than that of Ontario, and not quite two-fifths of the entire Dominion. An export duty is levied on all woods exported.

*Fur and Fish.—* The value of the annual catch of fish is estimated at £450,000, most of which consists of the product of the cod and herring of the Gulf of St Lawrence. Throughout the province and eastward almost all the settlements along the coast depend largely on the produce of this industry. It is carried on mainly in small boats, which put out in the morning and return at nightfall, few larger vessels being employed. Through the province are many trout-streams, and many of the northern lakes are well supplied with trout, bass and pike. In Lake St John is caught the celebrated winnibin, a land-locked salmon growing to the size of six or eight pounds. Christmas Island, near the St Lawrence River, bears a species of animals provide excellent shooting in the Laurentian mountains, and in the wooded districts of the north.

Among the manufactures Quebec ranks second among the provinces, Ontario coming first. The largest Canadian manufacturing town is Montreal, where most of the industries are controlled by the English-speaking minority. No other part of the Dominion is so rich in water power, which is provided to a limited extent on the falls of the rivers Montmorenci, St Maurice (Shawinigan Falls), Ste Anne, the rapids on the St Lawrence and the Richelieu, and many others. Tanning, and the making of paper pulp and of fur and leather goods, are activities of the province. The French-Canadian workman is hardy and intelligent, and Quebece may yet become the manufacturing centre of the Dominion, though as yet higher wages are paid in the American cities across the river. French workmen are employed in the factories of Lowell and other American border towns.

*Communications.—* The rivers were long the chief roads, by water in the lower, and by land in the upper regions. Between the St Lawrence and the headland still the main artery of the province, the bulk of travel and transport is now done by rail. The first railway in Canada was built in 1830 to carry stone from the quarries to abut in the construction of the citadel of Quebec. The first passenger railway was built in 1836, between Laperriere on the St Lawrence river and St John's on the Richelieu. There is now good railway communication between all the chief points, and branch lines are opening up new mining and settlement. While a few main roads are kept in good condition, those in the country parts are very indifferent.

*Bibliography.—* The various departments of the provincial government publish reports on a great variety of subjects. The annual Canada Year Book, published by the Federal Government, gives much information in a tabular form. Interesting articles are contained in J. Castell Hopkins, Canada; an Encyclopædia (Toronto, 1898-1900). The legal enactments in which the municipal system is embodied are found in the Revised Statutes of the province (Acts 4178-4640). On education and religion A. Siegfried, Le Canada; les deux races (1905; translated into English under the title The Race Question in Canada, 1906), is professed and impartial.

QUEBEC, the capital of the Canadian province of the same name, is situated on the north bank of the river St Lawrence, at its junction with the St Charles, about 300 m. from the gulf of St Lawrence and 180 m. by river N.E. of Montreal, in 41° 12' 16" W. and 46° 48' 17" N. The origin of the name Quebec has been much disputed, but it is apparently the Algonkian word for a strait, or sudden narrowing, the river at its junction with the St Charles being about 2500 yds. wide, but narrowing opposite Cape Diamond to 1314.

Quebec is built on the northern extremity of an elevated tableland which forms the left bank of the St Lawrence, a distance of 8 m. The maximum of the heights is Cape Diamond, 333 ft. above the level of the water, and crowned by the citadel; towards the St Lawrence it presents a bold and precipitous front, while on the landward side and towards the St Charles the declivity is more sloping and gradual. The harbour of Quebec is spacious and deep enough to hold the largest ships, and, with the Louise basin and Lorne graving-dock,—the latter on the opposite shore at Lévis,—forms one of the best harbours in America. It is usually open from the end of April to the middle of December, being closed by ice only in the winter months. The Louise basin consists of twin wet-docks and tidal basins, 340 and 240 ft. long respectively, and a minimum depth of 26 ft. The harbour is protected towards the north-east by the island of Orleans, on either side of which there is an approach, though that to the north of the island is used only by small vessels. The spring tides rise and fall about 18 ft. Quebec is divided into upper and lower town,—access to the former being obtained by steep and winding streets, by several flights of narrow steps, or by an elevator. Much of the lower town still recalls the older portions of such French provincial towns as Rouen or St Malo. The streets, with one or two exceptions, are narrow and irregular; but it remains the principal business quarter of the city. In the upper town, where the streets are wider and well paved, are the better class of dwelling-houses and public buildings, most of the churches, the public walks and gardens, and many of the retail shops. To the west are the suburbs of St John and St Roch. The latter occupies the site of a plantation, and is of some commercial importance; the former is on the same level as the upper town. South-west of St John stretch the historic Plains of Abraham. On this battleground stands a simple column 40 ft. high, marking the spot where General Wolfe fell. It was erected in 1849 by the British army in Canada, to replace a monument erected in 1832 by the governor-general, Lord Aylmer, which had been broken and defaced by ruffians. Till 1908 the Plains were disfigured by a gaol and a rifle factory, but these have been removed, and the battleground converted into a public park. In the governor's garden, 55 ft. by 135 ft., is a monument 7,000,000 ft. in height, erected in 1828 under the administration of Lord Dalhousie, dedicated to the memory of Wolfe and Montcalm. An iron pillar surmounted by a bronze statue, the gift of Prince Jerome Napoleon, stands on the St Joe Ferry, and was erected in 1855-60 to commemorate the achievements of the British and French troops in the brilliant but fruitless French victory of April 28, 1750. The chief point of interest in the upper town is Dufferin Terrace, a magnificent promenade overlooking the St Lawrence, 1400 ft. long and 200 ft. above the level of the river. Part of this terrace occupies the site of the old Château St Louis, which was destroyed by fire in 1834. At the eastern end of the terrace stands a fine statue of Champlain, erected in 1868. Near by, and conspicuous from the river, is the Hotel Frontenac, erected by the Canadian Pacific railway on the model of an old French château. Nothing remains of the fortifications erected under the French régime. The present walls and the citadel, which covers an area of about 40 acres, were built in 1823-32 at a cost of over £5,000,000. Since then, several of the gates have been destroyed, and others rebuilt, but in other respects the walls are practically intact, and, though obsolete as fortifications, add greatly to the picturesque beauty of the city. Between 1863 and 1869 the overgrown stockade of the Lévis side of the river, but were neither manned nor armed. Quebec's natural position still makes it one of great military strength, though depending on naval control of the sea and of the gulf of St Lawrence.

Besides numerous Protestant churches, including a small Anglican cathedral, there is a Jewish synagogue; but the bulk of the population is Roman Catholic. The cathedral, founded in 1647, and enlarged at intervals, is a large but not very striking building in the upper town. It contains some good oil paintings and some much-prized relics, but is rather gaudy in its ornamentation. Of the other churches, the most interesting is Notre Dame des Victoires, an old church with a fine tower, erected in 1668, and named in honour of the defeat of Phips in 1690 and the shipwreck of Sir Hovenden Walker in 1711. Laval University, which derives its name from François de Montmorency Laval, the first bishop of Quebec, who founded in 1663 a seminary for the training of priests, is under strict Roman Catholic control. It was instituted in 1852 by a royal charter from Queen Victoria and in 1876 received a charter from Pope Pius IX. The building is large and spacious, and the university includes faculties of theology, law, medicine and arts, a library of 125,000 volumes, a museum and a picture gallery. Between 1863 and 1869 three forts were occupied by the army at Montreal, and has often, but vainly, sought permission to become an independent Catholic university. In connection with Laval are the grand seminary founded in 1663, where theology is taught, and the minor seminary for literature and
some, the convent and church of the Ursulines, founded in 1641, contains nearly 100 nuns and lay sisters, and nearly 600 pupils. It possesses some valuable relics of great number of relics, and which is the skull of the French general, Montcalm. Morrin College, founded in 1859 by Dr Morrin, was for some years an efficient college in arts and theology, under Presbyterian control, but is now defunct. High schools for boys and girls and numerous academies are supported by the Protestants, under the dual system of education in the province. The Literary and Historical Society—the oldest chartered institution of the kind in Canada, founded by Lord Dalhousie in 1824—the Canadian Institute, the Geographical Society, the Young Men's Christian Association, the Advocates' Library and the Parliamentary Economically, Quebec was seeing the chief port of Canada. A lining 70,000 volumes, and numerous MSS. chiefly relating to the early history of the province. The principal benevolent institutions are the marine hospital, the Hôtel Dieu, founded in 1639 by the duchess of Aiguillon, the general hospital (1693), the Jeffrey Hale Hospital, and the lunatic asylum at Beauport controlled by the Grey Nuns (sisters of charity). The provincial parliament buildings, erected in 1878-92, are situated in extensive grounds on Grande Allée. The main building is quadrangular in form, and is ornamented with numerous statues. The seat of the lieutenant-governor is at Spencerwood, a pleasant estate outside the city. Other than these buildings are the palace of the Roman Catholic Archbishop, which adjoins Laval University, the court house, post office, custom house, city hall (1890-93) and masonic hall. Quebec is well lighted with gas and electric light, and has a system of electric trams, a plentiful supply of power being obtained from the Montmorency Falls (268 ft. in height), 6 m. N.E. The climate is severe, but bracing, the mean temperature in winter being 10°, in summer 65°, and the mean of the year 39°. The main lines of the Grand Trunk, Canadian Pacific and Inter-colonial railways are on the south bank of the St Lawrence, but branch lines connect the city with Montreal, and it is the headquarters of the Quebec and Lake St John, and various smaller railways. Steam ferries connect the city with Lévis on the opposite bank, but the project of a bridge, though of great importance to the city, has been in various ways delayed. In August 1907 the portion completed fell into the St Lawrence. The city returns three members to the Canadian House of Commons, and three to the Provincial House of Assembly. It is governed by a mayor and council of aldermen, who hold office for two years, and are usually re-elected, one mayor having held office for eleven successive years. Quebec is the seat of a Roman Catholic archbishop and of an Anglican bishop. Economically, Quebec was seeing the chief port of Canada. A series of strikes almost ruined its export trade, and numerous severe fires, of which that of 1845 was the chief, also lessened its importance. For many years the export trade passed almost entirely to Montreal, but the increasing size of seagoing vessels makes navigation above Quebec more and more difficult, especially for fast passenger steamships, and for such vessels Quebec is again becoming the terminus. Quebec's staple export is timber, the greater portion of which comes from the Ottawa and St Maurice districts. Formerly the rafts floating down the river were collected in the coves which extend along both sides of the river, above the city, and were fastened by booms along the banks. Now much of the timber is sent by rail. On the right bank of the stream, not far from Quebec, are extensive sawmills. Deals and square timber form the bulk of the export, but some furniture is also sent, and an increasing quantity of wheat is shipped. The building of wooden ships was formerly one of the chief industries of Quebec. The principal manufactures are iron castings, machinery, cutlery, nails, leather, rifles, gunpowder, musical instruments, boots and shoes, paper, India-rubber goods, ropes, tobacco, steel. The population increases but slowly, having risen from 59,699 in 1871 to 68,840 in 1901; of these over 60,000 are French and Roman Catholic.

The first known white man to visit Quebec was Jacques Cartier, the French navigator, in 1535, who found on the site a large Indian village, called Stadacona. In July 1608 the present city was founded, and named by Champlain. Its growth was slow, and in 1629 it had but two permanently settled families, with a shifting population of monks, officials and fur traders. In that year it was captured by the English under Sir David Kirke (1597-1666; see H. Kirke, The First English Conquest of Canada, London, 1871, reprinted 1908), but in 1632 it was restored to the French by the treaty of St Germain-en-Laye. In 1663 the colony of New France was created a royal province, and Quebec became the capital. In 1690 Sir William Phips, governor of Massachusetts, attempted to reconquer it with a fleet and army fitted out by New England, but the French were superior in numbers, though a 1711 a great British expedition sent against it under Sir Hovenden Walker was shipwrecked in the gulf of St Lawrence, and the French held possession till 1759 (see below), when it was captured by the British troops on the 18th of September, five days after the battle of the Plains of Abraham; it was finally ceded to Great Britain by the treaty of Paris in 1763. In 1775 the American generals Montgomery and Benedict Arnold attacked the city, but Montgomery was killed (December 31, 1775) and Arnold was compelled to retreat in the following spring.

In 1763-1814, in 1851-55, and in 1859-65 Quebec was the capital of Canada, and it is still its most historic and picturesque city.

See Quebec under Two Flags, by A. G. Doughty and N. E. Dionne (Quebec, 1903). Canada, an Encyclopaedia, by J. C. Hopkins (Toronto, 1898-1900), has a good account (vol. v. pp. 241-248).

Wolfe's Quebec Expedition, 1759.—Both in itself and also as the central incident of the British conquest of Canada, the taking of Quebec is one of the epis of modern military history. The American campaigns of the Seven Years' War, hitherto somewhat spasmodic, were, after Amherst's capture of Louisburg in 1758, co-ordinated and directed to a common end by that general, under whom James Wolfe, a young major-general of thirty-three years of age, was to command an expedition against Quebec from the lower St Lawrence, while Amherst himself led a force from New England by Lake Champlain on Montreal. Wolfe's column consisted of about 7000 troops, and was conveyed by a powerful fleet under Admiral Saunders. The expedition sailed 300 m. up the St Lawrence, disembarked on the Isle of Orleans and encamped facing the city. The defenders were commanded by Montcalm, a soldier whose character and abilities, like Wolfe's, need no comment here. The French were superior in numbers, though a considerable part of their force was irregular; but they had the defender's difficult task of being strong everywhere. Wolfe began the attack by seizing Point Lévis, and thence bombarding Quebec. This, however, affected the main defences of the upper city but little, and they were moreover protected from closer attack by the St Lawrence and the St Charles. The third side of the triangle was the "plains of Abraham," to which it was thought there was no approach from the river. After wasting some weeks, therefore, Wolfe decided to cross the St Lawrence 7 miles from Quebec and to fight his way to the city by the St Charles side. But Montcalm's fortified posts spread out from Quebec through Beauport as far as the Montmorency, and this formidable obstacle checked the English advance at the outset. No artifice could lure the defenders away, and at last Wolfe attacked the line of the Montmorency and was repulsed with heavy loss (July 31). Wolfe's fragile health gave way under the disappointment, and despondency set in in the English camp. But as soon as the young leader had recovered a little, he summoned his brigadiers and worked out a plan for attacking by the upper waters and the heights of Abraham. Access to the heights could be obtained, it was
QUEBEC ACT—QUEEN ANNE'S BOUNTY

found, by a tiny cove (Wolfe's cove), from which a steep path led to the summit. It was no place for artillery, and even for infantry the climb was long and exhausting, but the attempt was made. Considered as a way of taking Quebec, it was in the last degree a forlorn hope, but Wolfe, as a true soldier, felt the imperative necessity of preventing his opponent from sending reinforcements to the force opposing Amherst, and staked everything upon achieving this at least. "Happy if our efforts here," as he wrote, "can contribute to the success of His Majesty's arms in any other part of America." What with losses in action and by sickness, and detachments to guard the camp, batteries, and only 3600 men could be spared for the attempt. These embarked on the warships on the evening of September 12, and sailed up stream. The watchful Montcalm sent a detachment to observe their movements, but the ships proceeded to a point well above the cove, leaving the detachment out of the way. Then at 1 a.m. Wolfe, with half his force, dropped down stream in the boats of the squadron and landed. The path was guarded by a redoubt, but the light infantry which led the advance scarcely attempted to follow it, scrambling up the hillside wherever they could find a foothold. The garrison of the redoubt, startled by the unforeseen approach, fired into the British in retreat as Wolfe had assembled his 3600 men on the plains above the city. Montcalm meanwhile had been held in check by a demonstration of part of the fleet under Admiral Saunders on Beauport, but at last, realizing that the real attack was coming from the other flank, he hurried all the troops he could collect over the St Charles and drew them up on the plain, with their backs to the walls of the upper town. He took the offensive at once. He had plenty of milliamen and irregulars, and these rapidly drove the British light infantry on to their main body, which was threatened on both flanks. On so small a battlefield, the troops in Wolfe's line of battle quickly became aware that the enemy was attacking in superior force. But their leader steadied them by his personal example, and when the French came within close range one "perfect volley" from the whole line decided the battle. Then as the French stopped, with great gaps in their lines, Wolfe led on his men to complete the victory. He received two painful wounds and then a shot through the breast. His last order, one rare indeed in the annals of 18th-century fighting, was to send a force to the St Charles to block the retreat of the French. Montcalm too was mortally wounded, and died next day. On the 18th of September Quebec surrendered.

QUEBEC ACT, the title improperly given to a bill introduced into the House of Lords on May 2, 1774, entitled "An Act for making more Effectual Provision for the Government of the Province of Quebec, in North America." It passed the House of Lords on May 17, was discussed in the Commons from May 26 to June 13, and finally passed with some amendments. These were accepted by the Lords, in spite of the opposition of Lord Chatham, and the bill received the royal assent on June 22. The debates in the House of Commons are not found in the Parliamentary History, but were published separately by J. Wright in 1839. The speech of Lord Chatham is given in the Chatham Correspondence, and by it, 351-353.

By this act the boundaries of the Canadian province of Quebec were extended so as to include much of the country between the Ohio and the Mississippi. The French inhabitants of the province were granted the liberty to profess "the religion of the Church of Rome"; the French civil law was established, though in criminal law the English code was introduced. Government was vested in a governor and council, a representative assembly not being granted till the Constitutional Act of 1791.

The granting of part of the Western territory to Quebec, and the recognition of the Roman Catholic religion, greatly angered the American colonists. On the other hand, it did much to keep the French Canadians from joining the Americans in the coming struggle. The act is still looked back to by the French in Canada as their great charter of liberty.

QUEBEC, a town of Germany in the Prussian province of Saxony, situated on the Bode, near the N.W. base of the Harz Mountains, 12 miles S.E. by rail from Halberstadt on the line Magdeburg-Thale. Pop. (1905) 24,798, almost all Protestants. It consists of the old town, which is still partly surrounded by a turreted wall, the new town and four suburbs. On the west it is commanded by the castle, formerly the residence of the abbesses of Quedlinburg, connected with which is the interesting Schlosskirche, which was dedicated in 1129 and completely restored in 1862-82. The German king, Henry the Fowler, his wife Matilda, and Aurora, countess of Königsmark, the mistress of Augustus the Strong, are buried in the Schlosskirche. There are many interesting articles in the treasury. The Gothic town hall, a 14th-century building, restored and enlarged in 1900, contains a collection of antiquities, and near it stands a stone figure of Roland.

The town also possesses a gymnasium founded in 1540 and now containing the abbey library and a municipal museum. It has a fine memorial of the war of 1870-71. Quedlinburg is famous for its nurseries and market gardens, and exports vegetables and flower seeds to all parts of Europe and America. Its chief manufactures are iron goods, machinery and cloth, although it is partly surrounded by suburbs. Near the town is the church of St Wipertus, which dates from the 12th century, and has a crypt of the 10th century.

Quedlinburg was founded as a fortress by Henry the Fowler about 922, its early name being Quittingen. Soon it became a favourite residence of the Saxon emperors and was the scene of several diets. It afterwards joined the Hanseatic League. The abbey of Quedlinburg was planned by Henry the Fowler, although its actual foundation is due to his son Otto the Great. It was a house for the daughters of noble Saxon families and was richly endowed, owning at one time a territory about 40 sq. m. in area. The abbesses, who were frequently members of the imperial house, the second of them being Otto's daughter Matilda, ranked among the princes of the empire, and had no ecclesiastical superior except the pope. The town at first strove vigorously to maintain its independence of, and to this end invoked the aid of the bishop of Halberstadt. In 1477, however, the abbess Hedwig, aided by her brothers, Ernest and Albert of Saxony, compelled the bishop to withdraw, and for the next 200 years both town and abbey were under the protection of the elector of Saxony. In 1539 the townsman accepted the reformed doctrines and the abbey was merged into a Protestant sisterhood. In 1697 the elector of Saxony sold his rights to the Augsburg Diet, and the abbey fell to the elector of Brandenburg for 240,000 thalers. The abbesses, however, retained certain rights of jurisdiction, and disputes between them and the Prussian government were frequent until the secularization of the abbey in 1803. The last abbess was Sophia Albertina (d. 1820), sister of King Charles XIII. of Sweden. After forming for a few years part of the kingdom of Westphalia, the abbey lands were incorporated with Prussia in 1815.

See the Urkundenbuch der Stadt Quedlinburg, edited by Janicke (Halle, 1873-82); Ranke and Kugler, Beschreibung und Geschichte der Schlosskirche zu Quedlinburg (Berlin, 1838); Lorenz, All-Quedlinburg, 1485-1668 (Halle, 1900); and Huchs, Führer durch Quedlinburg. For the history of the abbey see Früschi, Geschichte des Reichsstifts und der Stadt Quedlinburg (Quedlinburg, 1828).

QUEEN (O.E. cwne, wife, related to "queen"), O.E. cwene, a hussy; cf. Gr. γυνή: from root gen-, to produce; cf. genius, "kin," &c., the title of the consort or wife of a king ("queen consort"), or of a woman who is herself the sovereign ruler of a state ("queen regnant"); the widow of a former reigning sovereign is a "queen dowager," and, when the mother of the reigning sovereign, a "queen mother."

For the position of the queen in English constitutional law see CONSORT, and for her household see HOUSEHOLD, ROYAL.

QUEEN ANNE'S BOUNTY, the name applied to the perpetual fund of first-fruits and tenths granted by a charter of Queen Anne, and confirmed by statute in 1703 (2 & 3 Anne, c. 11), for the augmentation of the livings of the poorer Anglican
clergy. First-fruits (annates) and tenths (decimes) formed originally part of the revenue paid by the clergy to the papal exchequer. The former consist of the first whole year's profit of all spiritual preferments, the latter of one-tenth of their annual profits after the first year. In accordance with the provisions of two acts (5 & 6 Anne, c. 24, and 6 Anne, c. 27) about 3000 poor livings under the annual value of £50 were discharged from first-fruits and tenths. The income derived from first-fruits and tenths was annexed to the revenue of the crown in 1535 (26 Hen. VIII. c. 3), and so continued until 1703. Since that date there has been a large mass of legislation dealing with Queen Anne's Bounty, the effect of which will be found set forth in a Report of a Joint Select Committee on the Queen Anne's Bounty Board, 1900. The governors consist of the archbishops and bishops, some of the principal officers of the government, and the chief legal and judicial authorities. They are annually elected by council and the houses of parliament. The duties of the governors are not confined to the augmentation of benefices. They may in addition lend money for the repair and rebuilding of residences and for the execution of works required by the Ecclesiastical Dilapidations Acts, and may receive and apply compensation money in respect of the enfranchisement of copyholds on any benefice. The governors are unPaid; the treasurer and secretary receives a salary of £1000 a year. He is appointed by patent under the great seal, and holds office during the pleasure of the crown.

QUEENBOROUGH, a municipal borough in the Faversham parliamentary division of Kent, England, in the Isle of Sheppey, close to the junction of the Swale and Medway, 2 m. S. of Sheerness on the South-Eastern & Chatham railway. Pop. (1901) 15,444. The prosperity of the town has been revived in modern times by the establishment by the railway company of a branch line from Sittingbourne in connexion with a service of mail and passenger steamers to Flushing (Holland), which run twice daily. The first copperas factory in England was established at Queenborough in 1579, by Matthias Falconer, of Brabant. In 1890 Portland cement works were built, and there is a large trade in timber. The town is governed by a mayor, 4 aldermen and 72 councillors. Area, 420 a. The principle of assisting the smallest benefices first. All the cures not exceeding £10 per annum must have received £200 before the governors can proceed to assist those not exceeding £20 per annum. In order to encourage benefactions, the governors may give £200 to cures not exceeding £45 a year, where any person will give the same or a greater sum. The average income from first-fruits and tenths is a little more than £16,000 a year. In 1906 the trust funds in the hands of the governors amounted to £7,023,000. The grants in 1906 amounted to £28,007, the benefactions to £29,888. The annual grants are largely devoted to the support of the clergy.
Charles Douglas, the 3rd duke (1609–1778), who had been created earl of Solway in 1706, was lord justice general from 1763 until his death in October 1778. In 1720 he married Catherine, daughter of Henry Hyde, 4th earl of Clarendon; this lady, a famous beauty, although very eccentric, was the friend of many of the wits and writers of her day, notably of Gay, Swift and Walpole. She died on the 17th of July 1777. Their two sons predeceased the duke, and when he died his British titles, including the dukedom of Dornoch, became extinct, but the Scottish titles passed to his cousin, William, 3rd earl of March (1724–1810).

This William Douglas, who now became the 4th duke of Queensberry, is best known by his sobriquet of “Old Q.” On the turf he was one of the most prominent figures of his time, and his escapades and extravagances were notorious. From 1760 to 1770 he was vice-admiral of Scotland, and in 1760 he was made a lord of the bedchamber by George III; but later he was an associate of the prince of Wales, being removed from his office in the royal household in 1780. A generous patron of the stage and of art, he was to the end of his life a “notable sportsman” of the dissolute type, and his degeneracy was the theme both of Wordsworth and of Bulwer. He died unmarried, but not without children, in London on the 23rd of December 1810. The dukedom of Queensberry and some of his other titles, together with his fine seat Drumlanrig Castle, now passed to Henry Scott, 3rd duke of Buccleuch, in whose family they still remain; but the marquessate of Queensberry descended to Sir Charles Douglas (1777–1837), the representative of another branch of the Douglas family, who became the 5th marquess.

John Sholto Douglas, 8th marquess of Queensberry (1844–1900), son of Archibald William, the 7th marquess (1818–1868), became a well-known patron of sport and particularly of pugilism. He helped to found the Amateur Athletic Club in 1860, and the new rules for prize-fighting, drawn up in 1867, were called after him the “Queensberry Rules.” He married the daughter of Alfred Montgomery, and was succeeded by his son, Percy Sholto, 9th marquess (b. 1868).

QUEENSCLIFF, a town of Grant county, Victoria, Australia, 68 m. by land and 32 by sea S.W. by S. of Melbourne. Pop. (1901) 2025. It lies on Shortlands Bluff, a small peninsula connected with the mainland by the Narrows, a contracted strip of land some 400 yds. broad. Queenscliff is a favourite watering-place, having a fine pier and excellent and safe sailing. It is also a pilot station; and the quarantine station for vessels entering Port Phillip is near the town.

QUEEN’S COUNTY, a county of Ireland, in the province of Leinster, bounded N.W. and N. by King’s County, E. by Kildare, S. by Carlow and Kilkenny, and W. by Tipperary; area, 424,723 acres, or about 664 sq. m. The surface is for the most part level or gently undulating, but in the north-west rises into the elevations of the Slieve Bloom Mountains, the highest summit being Arderin, 1773 ft. In the central part of the county there is a large extent of bog. The south-east portion is included in the Leinster coalfield. Nearly the whole of the county is watered by the River Barrow, a branch of its source in the Slieve Bloom Mountains, and forms at various points the boundary with King’s County, Kildare and Carlow, or by the Nore, which enters the county from Tipperary near Borris-in-Ossory, and flows east and then south till it reaches Kilkenny. The lakes are few and small, the largest being Lough Anaghmore on the north-western boundary. The Grand Canal enters the county at Portarlington, and runs southwards to the Barrow in Kildare, a branch passing westwards 12 miles to Mountmellick.

The limestone plain prevails in this county, but the high coalfield, shared with Kilkenny and Carlow, rises from it in the south; while the Slieve Bloom Mountains, a round-backed Old Red Sandstone mass with Silurian inlets, dominate the lowland west of Maryborough. The limestone itself produces a range of hills near Stradbally, on which the fortress of Dunamase stands conspicuously. Esker-gravels provide sandy soils in many places. Clay-ironstone was formerly raised in connection with the anthracite from the coalfield.

The climate is dry and healthy. Originally a great extent of the surface was occupied with bog, but by draining much of it has been converted into good land. For the most part it is very fertile except in the hilly districts towards the north, and there is some remarkably rich land in the south-east. The acreage under pasture is not quite twice that of tillage. Dairy-farming is extensively practised. Agriculture forms the chief occupation, but the manufacture of woollen and cotton goods foundation to a small extent. The main line of the Great Southern & Western railway traverses the county from N.E. to S.W. by way of Portarlington and Maryborough; from the latter town branches run N. to Mountmellick and S. to Waterford, and from Ballybrophy a line runs W. to Birr (Parsonstown) and to Limerick.

The population (63,852 in 1891; 57,417 in 1901) decreases in excess of the average of the Irish counties, and emigration is considerable. Of the total about 85% are Roman Catholic, and almost the whole is rural. Maryborough (the county town, pop. 2957), Mountmellick (2407) and Mountrath (952 with Dunajam in King’s County), are the principal towns. The county is divided into eleven baronies. Ecclesiastically it is in the Protestant dioceses of Dublin, Killaloe and Ossory, and in the Roman Catholic dioceses of Kildare and Leighlin, Ossory and Killaloe. Assizes are held at Maryborough, and quarter sessions at Abbeyfeale, Borris-in-Ossory, Graigue (a suburb of Carlow), Maryborough, Mountmellick and Stradbally. The county is divided into the Leix and Ossory parliamentary divisions. To the Irish parliament two members were returned for the county and two each for the boroughs of Ballinakill, Maryborough and Portarlington. The territory now included in Queen’s County covered the districts of Leix, Slawmargy, Iry and part of Glenmality, until in 1556 it was made shire ground under the name of Queen’s County, in honour of Queen Mary, the place chosen for the county town being named Maryborough. Three miles south of Stradbally is Dun of Cloopook, an ancient dun or fort occupying the whole extent of the hill. Aghaboe, where there are the ruins of the abbey, was formerly the seat of the bishopric of Ossory. There are no remains of the abbey of Timahoe founded by St Mocha in the 6th century, but in the neighbourhood there is a fine round tower, 96 ft. high. Abbeyfeale, a small market town south of Maryborough, had a famous Clanricard castle.

QUEENSFERRY, a royal and police burgh of Linlithgowshire, Scotland. Pop. (1901) 1850. It is situated on the S. side of the Firth of Forth, 9 m. by road N.W. of Edinburgh, with Port Edgar from the island on the North British railway, and is sometimes called South Queensferry, to distinguish it from the Queensferry on the opposite shore. Of old it was the ferry giving access to Dunfermline and other places on the north side of the firth, its use in this respect by Margaret, the queen of Malcolm Canmore, originating its name; just as Port Edgar, ½ m. W., was named after her brother, Edgar Atheling. The Havens Inn, which figures in Scott’s Antiquary, was the terminus of the run from Edinburgh in the coaching days. Queensferry became a burgh of royalty in 1365, a royal burgh in 1539 and a police burgh in 1882, and belongs to the Stirling district group of parliamentary burghs (with Stirling, Culross, Dunfermline and Inverkeithing). The principal structures include, besides the small parish church of Dalmeny (the best example of pure Norman in Scotland), the Countess of Rosebery Memorial Hall (erected in 1893 by the earl of Rosebery), a library and reading-room, and a public
QUEENSLAND

halls which also does duty as a town hall. A Carmelite friary was converted into an Episcopal chapel in 1860. There is a large oil-works in the parish. Dalmeny House, the seat of the earl of Rosebery, lies in beautifully wooded grounds about 2 miles E. of the ferry. In the park, on the Braeside, rising Drum Sands, stands Barnbougle Castle, a building of unknown age which became the seat of the Mowbrays in the 12th century. After passing into the hands of the earls of Haddington, it was purchased in 1662 by Sir Archibald Primrose, an ancestor of the earl of Rosebery. The castle was thoroughly restored in 1880. Dundas Castle, 14 m. S. of Queensferry, was a seat of the Dundases from 1124 to 1875, was besieged in 1449, received a visit from Cromwell in 1651 and was partly rebuilt about 1830. Hopetoun House, nearly 3 m. W. of the ferry, was begun about 1666 from the plans of Sir William Bruce of Kinross and completed by Robert Adam. It is the seat of the marquess of Linlithgow. Abercorn, a little to the west, gave the title of duke to a branch of the Hamiltons. It was the site of an ancient monastery, and from 681 to 685 the see of the earliest bishopric in Scotland.

QUEENSLAND, a state of the Australian commonwealth, occupying the whole of the north-eastern portion of the Australian continent, and comprising also the islands in Torres Strait. (For map, see AUSTRALIA.) It lies between 10° and 20° S., and is bounded on the N. by Torres Strait and the Gulf of Carpentaria, on the W. by South Australia and the Northern Territory, on the S. by New South Wales and on the E. by the Coral Sea. Its area is 2,545,810 sq. m., and its population, in 1911, was 368,253.

With so extensive a seaboard Queensland is well favoured with ports on the Pacific side. Moreton Bay receives the Brisbane river, on whose banks Brisbane, the capital, stands. Maryborough port is on the Mary, which flows into Wide Bay; Bundaberg, on the Burnett; Gladstone, on Port Curtis; Rockhampton, on the Fitzroy (Keppel Bay); Mackay, on the Pioneer; Bowen, on Port Denison; Townsville, on Cleveland Bay. Cairns and Port Douglas are near Trinity Bay; Cardwell is on Rockingham Bay; Cooktown, on the Endeavour; Thursday Island port, near Cape York, and Normanton and Burketown near the Gulf of Carpentaria.

The quiet Inner Passage, between the shore of the Great Barrier Reef, 1200 m. long, favours the north-eastern Queensland ports. Brisbane was founded in 1826, but colonization was restricted until 1842, when the Moreton Bay district of New South Wales was thrown open to settlers. It was named "Queensland" on its separation from the mother colony in 1859. A broad plateau, from 2000 to 5000 ft. in height, extends from north to south, at 20 to 100 m. from the coast, forming the Main Range. The Coast Range is less elevated. A plateau goes westward from the Great Dividing Range, throwing most of its waters northward to the Main Range. There are numerous but short streams to the Pacific, and a few long ones south-westward, lost in earth or shallow lakes, unless feeding the river Darling. Going northward, the leading rivers, in order, are the Logan, Brisbane, Mary, Burnett, Fitzroy, Burdekin, Herbert, Johnstone and Endeavour. The Fitzroy receives the Mackenzie and Dawson; the Burdekin is supplied by the Cape, Belyando and Suttor. The chief gulf streams are the Mitchell, Fitzrand, Leichhardt and Albert. The great dry western plains have the Barcoo, Diamantina, Georgina, Warrrego, Maranoa and Condamine. (T. A. C.)

Geology.—Queensland consists geologically of three areas. The eastern division of the state, including all the Cape York Peninsula and the mountainous areas behind the coast, is occupied by the Queensland Highlands, which are built up of a foundation of Adelaide beds, Lower Coal Measures. Some Lower Coal Measures occur in the Mowbray district, and some sheets of comparatively horizontal Upper Palaeozoic and Mesozoic rocks. The rocks of the Highlands sink to the west below the Western Plains, which consist in the main of a sheet of Coal Measures, the top of which is covered upon the east by the Cairns-Sue Sandstone. In the far west the plains end against the foot of an Archean tableland, which is the north-eastern projection of the Western Plateau of Australia.

The oldest rocks in Queensland are gneisses and schists, which appear to underlie the whole of the state. They were originally metamorphosed and have been, since the Cambrian period, metamorphosed into gneiss, mica-schists and hornblende-schists. Their Silurian age was affirmed owing to their lithological resemblance to rocks in Victoria, which were then regarded as Silurian, but have since been worked into a division by being found in the Barkly Tableland, the Cloncurry Goldfield and the rocks of the Mackinlay district in the west of the state. The second chief Archean area is around Charters Towers and the Cape Goldfield; this third range extends from north-west to south-east. The third Archean area occupies the Gilbert, Woolgar and Etheridge Goldfields, and is composed of limestone beds trending from north-west to east, with dikes of diorite and quartz-porphry. Smaller Archean outcrops are thrown in the Clarke Range and on the Peak Downs. To the Archean series belong some of the most granite masses, including Boulders of Charters Towers and Gladstone; but some of the granite rocks are of Lower Carboniferous age, and some are apparently Mesozoic.

The Lower Palaeozoic sedimentary rocks are widely distributed, but owing to the rarity of fossils they are not well known. In the south-west of Queensland there are some Ordovician rocks, the eastern continuation of those in the Macdonnell Ranges. Silurian limestones occur in the mining field of Chillogoe and at Mount Morgan. The Upper Palaeozoic systems are well developed, even when many of the schists, which have been included in the Devonian, are eliminated. The Middle Devonian is represented by the Shales of the Cloncurry district, and limestone beds contain a rich fossil fauna corresponding to the Buchan and Bindi limestones of Victoria and South Australia. Devonian limestones occur on the Marble and Hunter Islands in the Northumberland Archipelago. The Devonian rocks in the west of Queensland are estimated to be over 20,000 ft. in thickness; but they probably include some Lower Palaeozoic beds.

The Queensland Carboniferous system is divided into five series—those of the Upper Carboniferous being Star and Tamar. The lowest series is the Gympie, which occurs between Brisbane and Maryborough. It consists of shales and sandstones, and traversed by dikes of diorite, which often contain pyrites and gold. Mesozoic rocks include all the pre-Cretaceous rocks in Queensland. They are best developed on the Belyando river and in the Drummond Range, where the shales and sandstones yield abundant fossil fish; on the Star river the shales contain Lepidodendron. The Bowen beds are divided into three series which represent the upper part of the Carboniferous. The Lower Bowen series consists of agglomerates and altered rocks exposed in the Toussaint Range; farther south, the Lower Bowen beds consist of grits, sandstones and shales which are equivalent to the pre-Cretaceous rocks. The Middle Bowen series contains beds with Productus cora and Glossopteris. The Upper Bowen beds consist of coal seams, abundant remains of Glossopteris and one marine band. They form the centre of the Bowen coalfield, while the Middle Bowen beds are outcrop in a band around it. The Upper Bowen beds occur also at Townsville and Cooktown in Northern Queensland.

The rocks of the Mesozoic group may be divided into two divisions, of which the lower includes terrestrial deposits containing coal seams; the upper is mainly a marine formation, but it terminates with a further development of terrestrial deposits. The Lower Mesozoic division includes the Burram and Ipswich series. The Burram series occurs along the eastern coast from Laguna Bay, through Wide Bay and Maryborough, to Blackwater Creek; and it extends inland for about 30 m., where it is faulted against the coal series. The Ipswich series also is faulted against the coal series. The Ipswich series consists of the Ipswich beds, described in the Cretaceous beds, and it is described as highly altered in places, by contact with granites. The Ipswich series occupies 12,000 sq. m. in the south-eastern corner of Queensland, and is the northern continuation of the Upper Cretaceous series of New South Wales. It contains coal seams which have been worked, though the coal is of inferior value to that of the Carboniferous of New South Wales. One seam, on Stewarts Creek, is estimated to contain 64,000,000 tons of coal. A similar deposit occurs on Ipswich Creek, forming the scarps of the Toowoomba Range. The Burram and Ipswich beds have been included in the Trias and the Jurassic, or in both systems as the Trias-Jura, but they are in fact the characteristic fossil, Tornoceras daintreei, of Lower Oolitic age.

The Cretaceous system is represented by a lower group of marine clays forming the Rolling Downs formation. They are said to rest unconformably upon the Ipswich beds, and are thrown into beds which were first described as Upper Oolite. The affinities of the fauna are in part with Lower Cretaceous and in part with the Cenomanian: so both these series may be regarded. The Rolling Downs formation consists in the main of clays, forming the
impermeable cover over the subterranean stores of water, which maintain the flowing wells of central Australia. The Rolling Downs formation underlies the whole of the Western Plains of Queensland, from the foot of the Queensland Highlands, westward to the Barkly Tableland, and from the Gulf of Carpentaria across the state into South Australia and New South Wales. The Desert Sandstone overlies the Rolling Downs formation. Its age is shown to be Upper Cretaceous by some marine fossils from Moreton Bay. It also contains the well-known extinct fern, *Danthonia lepidota*, which is interbedded in it. In the interior, the Desert Sandstone is entirely of terrestrial and lacustrine origin, and the only fossils are obscure plant remains and the collection of trunks belonging to the native *Glossopteris* tree, described by Beyrich. A Lower Jurassic sandstone from a rock identified as Desert Sandstone, which is said to overlie the Rolling Downs formation; but there is probably some mistake in the stratigraphy, as *Glossopteris* is described as a Cretaceous plant. If it had survived into the Cretaceous, some specimens of it would doubtless have been obtained from the coal seams of the Lower Mesozoic. The Desert Sandstone once covered nearly three-quarters of Queensland, having a wider range than the Rolling Downs formation. It formed partly on land, partly in fresh-water lakes and partly in arms of the sea, as at Croydon and Maryborough. There is no trace of volcanic rocks in this period, and the vitreous surface of the Desert Sandstone is due to the deposition of efflorescent chert. The Desert Sandstone formation has now been weathered into isolated plateaus and tent-shaped hills.

The Cainozoic group includes many volcanic rocks, mainly sheets of andesite and basalt. The oldest of this period is also noted for the rich plant life which existed between the head of the Burdekin and the Einasleigh River, the basalt occuring 2000 sq. m. of country. Their age appears to be Oligocene, as they probably correspond with the oldest Cainozoic basalt in New Zealand. The rocks which occur in the district of Cooktown, and in the Einasleigh River, where the eruptive centres are recognizable; and a series of hot springs, some of which are described, are probably the hot springs of the Cainozoic period. The most important Cainozoic sedimentary rocks are the bone breccias, made up of bones of extinct marsupials, such as *Diprotodon*, *Thylacoleo* and giant Kangaroos. They appear to have been bogged in the mud by drying water holes, during droughts. The bones also occur in beds of gravel and sand, and they have been found in places covered by 188 ft. of overlying deposits. Caves occur in the limestones, and on their floors there are beds yielding the fossils and bones of birds; and the most authenticated case of the ancient remains of man has yet been established.

The chief mineral product of Queensland is gold, found in veins in Arcoena, Palæozoic and Lower Mesozoic rocks. The most famous gold mines are Mount Morgan, now changing into a copper mine, Charters Towers and Gympie. Tin is found in the fields of Herberton, Cooktown and Maryborough. Copper is mined at Herberton, Challagoe and Mungana, coal in southern Queensland in the Upper Carboniferous and Lower Mesozoic deposits.

A full account of the geology of Queensland up to 1892 is given in Jack and Etheridge's *Geology of Queensland*. The tectonic geology and the stratigraphy of the Cretaceous have been worked out by Beddoes and Oliveri. The general geology is described in the numerous valuable publications of the Geological Survey of Queensland. A summary of the mineral resources of Queensland is given by the Survey Chief, 1901. Information regarding the artesian water supply is given in the Annual Reports of the Queensland Hydraulic Engineer.

**Flora.**—The Queensland flora comprehends most of the forms peculiar to Australia, with the addition of about five hundred species belonging to the Indian and Malayan regions. There are no mountain ranges of sufficient altitude to make any appreciable change in the plant-life. Bellenden Ker, the highest mountain in tropical Australia, has a height of only 520 ft., and the plants growing upon its summit, as well as on the highest parts of the neighbouring mountains, are for the most part similar to those on the flat country. The southern high land, which may be considered as peculiar to these heights are few in number of species. They consist of a *Leptospermum* and a *Myrtus*, which attain a height of about 30 or 40 ft., and have widespread, densely leaved heads. The most attractive of the tall shrubs are *Dracophyllum Seyeri*, of which there are two forms, *Rhododendron Lactae* and *Orites fragrans*. A few orchids of small growth are met with, but the only large species known to inhabit these mountains is *Malaxis undulata*. The high spots have a few ferns peculiar to them, and of others it is the only known Australian habitat; for instance, the pretty white-frosted *Polystichum Trichomanes*. The native palms are notably absent from Queensland, in Australia been met on the south peak of Bellenden Ker; here also *Todea Fraseri* may be seen with trunks 2 to 3 ft. high. The sides of these mountains are clothed by a dense forest growth, comprising the tall wall of timber. Palms and fern-trees are plentiful, but the greatest variety are met with at about 4000 ft. altitude. So far this is the only known habitat of that beautiful fern-tree *Asplonia Rebecca var. commutata*, peculiar for the wig-like growth at the summit of its stem, which is formed by the metamorphosed lower pinnae and pinules.

The *Myrtaceous* genus *Eucalyptus*, of which sixty species are found, furnishes the greater part of what is designated "Hardwood". One of these is *Mindulinia ledebouri*, which is interbedded in it. In the interior, the Desert Sandstone is entirely of terrestrial and lacustrine origin, and the only fossils are obscure plant remains and the collection of trunks belonging to the native *Glossopteris* tree, described by Beyrich. A Lower Jurassic sandstone from a rock identified as Desert Sandstone, which is said to overlie the Rolling Downs formation; but there is probably some mistake in the stratigraphy, as *Glossopteris* is described as a Cretaceous plant. If it had survived into the Cretaceous, some specimens of it would doubtless have been obtained from the coal seams of the Lower Mesozoic. The Desert Sandstone once covered nearly three-quarters of Queensland, having a wider range than the Rolling Downs formation. It formed partly on land, partly in fresh-water lakes and partly in arms of the sea, as at Croydon and Maryborough. There is no trace of volcanic rocks in this period, and the vitreous surface of the Desert Sandstone is due to the deposition of efflorescent chert. The Desert Sandstone formation has now been weathered into isolated plateaus and tent-shaped hills.
times found to infest the berries. The Queensland Raspberry (Rubus rosaceus) is widely spread and commonly used, but the fruit is rather insipid. The representatives of the genus Vitis all belong to the sub-genus Cissus; several of them, although somewhat acid, are used as a jelly. Best known is one that is one is met with near the Walsh River, V. Gardnerti, which is said to bear bunches from 1 lb to 2 lb in weight, the berries being large and of pleasant flavour. A large number of nut-like fruits are used by the aborigines, of the soursop variety, used in Queensland, especially the genus Mantha. Apart from plants of economic value, there is a prosperous ornamental plants, shrubs, trees and parasites. Of terrestrial animals, most with in Australia are found in Queensland as well as in the other states. There are not far from the borders of the state either, the remaining fourth belonging to the other states, but not to Queensland. The indigenous ferns equal in number to those of New Zealand. They are not at present infested by any species of alligator, though in times past one of large size was a scourge on the borders of the then inoffensive flying-foxes, well known and capable of inflicting a mortal wound. The avifauna is to the naturalist exceedingly attractive, for it is full of surprises and interesting lines of research, while to the artist it is a storehouse of form and colour. Where flowering and honey-yielding plants are profuse, the birds of the region are correspondingly numerous, and the insects attracted by the honey, or, if so fitted, on the honey itself. Accordingly, the most striking feature of the bird-life, amid the beauteous of eucalypts and acacias, is its richness in honey-eaters and other insect destroyers. Several of the birds are not a natural group, but include a family of perching birds and a portion of the parrot family, both furnished with brush and adapted to the life of the scrub. A second characteristic is the great development of that quaint company, the Lower birds, among them the regent bird, satin bird, cat birds, &c., constructors of the elaborate playgrounds which have excited so much attention. A further characteristic is the richness of the region in办公室s; and on its seaboard of three kinds of ride birds, both extensions southwards of the tropical families of cassowaries and paradise birds. In the same region of prolific vegetation the handsome fruit-pigeons are abundant and show a fair family of such pigeons are found in the region. The Scrub-turkey (Cathetons) beaups its mound of rotting débris to ferments in the weeds of the jungles and give warmth to its eggs; the scrub-hen (Megapodina) piles up sand on the beach for the warm that is necessary to the developing eggs. The common button quail (perriculus), and the almost total absence of rosary game and poultry may be noted. Birds pursued for sport or profit, however, are not wanted. The Emu and the Bustard or Plain Turkey afford sport in certain localities, but are not sufficiently numerous to furnish any considerable sport. Among the larger birds proper, the great-winged Phasmas, the Skeleton or Stick-insects, the Leaf-insects, and the splendid Swallowed-tailed Butterflies are especially notable. Many of the Beetles are remarkable for size, and a few for strange coloration.

Fishes and Fisheries.—The class fishes is extraordinarily profuse in diversified forms, the coral reefs being the grazing- and hunting-grounds of hosts of gorgeously decorated fish, chiefly of the Wrasse family. Those caught near the coast-line are usually of smaller size, and the larger species have been largely depleted. Among the larger species proper, the great-winged Phasmas, the Skeleton or Stick-insects, the Leaf-insects, and the splendid Swallowed-tailed Butterflies are especially notable. Many of the Beetles are remarkable for size, and a few for strange coloration.
barrier reefs are thickets of corals of the most varied forms, in life glowing with colour, in death shrubs of snowy purity. Among the shell-fish conspicuous for beauty or rarity are the exquisitely diversified corals. The "mermaid's ear" and Venus's shell, the fleshy orange and other valuable cowries, and the gigantic clam-shell, which may require a ship's tackle to lift it from its bed. The fishery of the trepang, bêche-de-mer or sea slug employs a considerable number of men. Trepang, or the coral-reef-slug is packed in bags for exportation to China, though its agreeable and most nourishing soup is relished by Australians in illustrous style. This sea-fish is caught so much as $240 per ton. The pearl fishery is a prosperous and progressive one in or near Torres Straits. A licence is paid, and the traffic is under government supervision. Thursday Island is the chief seat and the most important of these. The pearl-oysters are all diving, and fetch from $120 to $300 a ton. Mother-of-pearl and tortoise-shell constitute important exports of the colony, capable of great expansion. Oysters are as fine flavoured as they are abundant. The rhiwhawa or the sea-fish which frequent the coast, one of the best known varieties is the sea mullet (Mugilidae), large shoals of which strike the Australian angler, and travel northwards, arriving on the southern coast-line of Queensland in the months of April and May, crossing bars and ascending rivers on the appearance of southerly weather. These magnificent fish often attain a weight of 100 lb. to 120 lb. (36 kg.) (Schools of mullus were once utilized by the islanders for that purpose. The remora is carried alive in the bottom of the canoe, a long thin line being attached to the fish's tail and another usually to the gill. On a turtle being sighted, the canoe is drawn within a circle, and the line is thrown around the fish is thrown towards it, and immediately it swims to and attaches itself by its singular head sucker to the under surface of the turtle, which if of moderate size is easily pulled into the canoe.

Amongst the crustacea may be enumerated the gigantic clams which are frequently found amongst the coral reefs. The mussels, among others, are met with weighing nearly half a ton, embedded in coral. Fresh-water clams are found in the rivers in the northern districts. The edible oyster (Ostrea grandis) has been largely cultivated in southern Queensland. Amongst other crustacea the bloodsucker (Thelaspiroidea vulgaris) is, with giant prawns and quampi, or small golden-lipped pearl shell, obtained by trawling in the southern waters, and for which a considerable trade has been established. The squid is found on sand shores at low tide; prawns and shrimps are caught, dried, and form an article for export to China; mussels, pinna or razor-shell cockles, and eugaries (a species of small shell-fish) are also abundant.

Climate.—As one-half of Queensland lies within the tropics the climate is particularly warm. Temperature and rainfall generally range less than that of other countries under the same isothermal lines. This circumstance is due to the sea breezes, which blow with great regularity. The hot winds which prevail during the summer in the interior of the country are more or less local and confined to a territory of such large extent there are many varieties of climate, and the heat is greater along the coast than on the elevated lands of the interior. In the northern parts of the state the high temperature is more or less experienced during the day and night. The rains at Brisbane during December, January and February is about 76", while during June, July and August it averages about 60". In tropical regions, however, the average is higher. Winter in Rockhampton, for instance, presents gale winds, while in昆士兰州, the average rises almost to 85°. At Townsville and Normanton the average is higher still. The average rainfall is high, especially along the northern coast, where it ranges from 60 to 70 in. per annum. At Brisbane 50-01 in. is the average and 35 years, and even on the plains of the interior from 20 to 30 in. usually fall every year. West of the coast range the air is dry and hot, and in summers the thermometer rises frequently to 106° in the shade. The monsoons play an important part in cooling the atmosphere near the coast, and are very regular in the north. The winter climate is perfection, especially in the north, but frosts are frequent and regular west of the coast range. Ice is commonly seen at Herberton, 17° S., during winter, and on the Darling Downs frosts are of nightly occurrence.

Population.—The population of Queensland in 1905 was estimated at 528,048—290,206 males and 237,842 females, the density of population per sq. m. being about 0-79. In 1861, that is, two years after the separation from New South Wales, the population of the colony stood at 34,400; in 1871 it had reached 125,100; in 1881, 227,000; in 1891, 410,360, and at the census of 1901, 498,179. The policy of assisted immigration contributed greatly to Queensland's progress, and people of foreign descent are proportionately more than in any of the other states, though they only amount to 8-72% of the total population. At the census of 1901 there were 13,166 Germans, 3161 Danes, 2142 Scandinavians, and among coloured aliens 8587 Chinese, 2169 Japanese, 959 Hindoos and Cingalese, 9327 Pacific Islanders, and 1787 other races, making a total of 22,909 coloured aliens. It is estimated that the total aboriginal population of Queensland is about 25,000.

The births in 1905 were 13,626, of which 950 were illegitimate, and the deaths 5512. There were 3429 births per thousand of population being 25-92 and 10-17. The decline in the birth rate will be gathered from the following table:

<table>
<thead>
<tr>
<th>Period</th>
<th>Birth Rate per 1000 of Population.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1861-65</td>
<td>50-67</td>
</tr>
<tr>
<td>1866-70</td>
<td>43-91</td>
</tr>
<tr>
<td>1871-75</td>
<td>40-81</td>
</tr>
<tr>
<td>1881-85</td>
<td>36-72</td>
</tr>
</tbody>
</table>

The death rate shows a remarkable diminution: in 1861-65 it averaged 21-66 per 1000; in 1871-75, 17-94; in 1881-85, 19-10; and in 1891-95, 12-82. The marriage rate in 1905 was 64-0 per 1000, an increase on the figures for 1904 of 9-3.

The chief cities and towns, with their population in 1905, are:
- Brisbane, 128,000;
- Rockhampton, 15,461;
- Gympie, 13,200;
- Maryborough, 12,000;
- Townsville, 10,950;
- Toowoomba, 16,700;
- Ipswich, 8627;
- Mount Morgan, 8936;
- Charters Towers, 6000;
- Bundaberg, 5000.

in 1894 the tallow export was nearly 30,000 tons, valued at £96,000.

Manufactures.—Queensland is not populous enough to have manufactures on a large scale, nevertheless there are 21,705 persons employed and 1,911 establishments of all kinds. 11,517 of these persons are engaged in the preparation of natural products for export, such as sugar, preserved meats and the like, or in industries arising out of the domestic requirements of the population. This is shown by the fact that the produce of 28,000 hectares of plant and machinery was £3,988,069; and of land and premises £2,709,951; while the value of the output stood at £18,310,480.

The shipping entering Queensland ports in 1895 had a tonnage of £6,007,271 as compared with 4,667,701 in 1890. The imports in 1895 were £6,599,345, which is much less than the average of Australia, but nearly all the Queensland importations are of produce and manufactures consigned to the ports of the Commonwealth. With South Australia have a large re-export trade. In 1896 the imports were valued at £6,085,000, or £31 per inhabitant; in 1897, £5,625,000, or £13 per inhabitant; in 1898, £4,004,000, or 18s. 6d. per inhabitant; in 1899, £4,430,000, or £21 per inhabitant; in 1900, £1,734,112, or £14, 13d. 3d. per inhabitant. The disparity between the capitulation figures of various years is due chiefly to two causes: the irregularity of the state borrowings, and the manner in which private capital has been sent from England and the various States in Australia for investment in Queensland, both the borrowings and the investments appearing in the imports. The import bearing of these payments on the Queensland import trade may be gathered from the fact that there has been an inflow of capital into the state at the rate of about one million and a quarter sterling per annum. The exports from Queensland in 1895 were valued at £11,193,004, which is the very high average of 32s. 14d. per head; nearly the whole amount represents goods and produce of local origin. Going back to 1891 the amount of exports at the various decennial periods was:

Year. Value of Total Exports. Exports per Head.
1891 £798,599 £22 14 8
1871 £2,033,045 22 18 6
1881 £2,938,612 25 12 9
1891 £3,835,067 20 11 6
1901 £9,249,366 18 10 5

Brisbane is the chief seat of trade, but this port does not hold so predominating a position as do the chief cities of the other states in regard to their minor ports. In 1905 the trade at the seven principal ports of Queensland was:

Railways.—Up to 1905 the state had expended £21,583,355 upon the construction and equipment of railways. The mile open for traffic at the end of that year was 1,876,077, of which 879,011 m. of privately owned railways. Railway construction in the state commenced in 1864, some five years after the introduction of responsible government. Progress during the early years was very slow; in 1871 only 218 m. had been constructed and in 1877 only 150 m.; between 1881 and 1891 railway construction was pushed on rapidly, an average of 152 m. a year being opened between those dates. In 1891 the length open for traffic was 2,320 m., and in 1901, 3,881 m. The state railways in 1895 earned £1,483,835 and the working expenses were £851,627, leaving the net earnings £641,098, which is equal to 2-91 per cent. upon the capital expended. As the number of inter-State passengers and the outstanding loans of the Queensland government is 394, there is an actual loss to the state of 60-30 per cent. This loss, however, is more than counterbalanced by the advantages resulting from the construction of the railways.

Queensland in 1895 was provided with 1,389 post offices in the state in 1905; telegraph stations numbered 515, and there were 19 telephone exchanges. The revenue from these three services in 1905 was respectively £23,523, £38,205 and £13,765—a total of £35,573, which is more than the 1895 expenditures of £1,936,013.

Banking.—The liabilities of the eleven banks trading in the state in 1905 totalled £3,770,865, and the assets £16,362,202. The deposits amounted to £15,271,102; the deposits held in the Government Savings Bank were £1,770,918. In the Government Savings Bank there was a sum of £9,992,758,2 to the credit of 4,163 depositors. The deposits in all banks amounted, therefore, to £17,209,424, which represents 1,111,111 persons.
HISTORY

The Portuguese may have known the northern shore nearly a century before Torres, in 1605, sailed through the strait since called after him, or before the Dutch landed in the Gulf of Carpentaria. Captain Cook passed along the eastern coast in 1770, taking possession of the country as New South Wales. Flinders visited Moreton Bay in 1802. Oxley was on the Brisbane in 1823, and Allan Cunningham on Darling Downs in 1827. Sir T. L. Mitchell in 1846-47 made known the Maranoa, Warrego, and Barcoo districts. Leichhardt in 1845-47 traversed the coast country, going round the gulf to Port Essington, but was lost in his third great journey. Kennedy followed down the Barcoo, but was killed by the blacks while exploring York Peninsula. Burke and Wills crossed western Queensland in 1860. Landesborough, Walker, McKinlay, Hann, Jack, Hodgkinson and Fawcett continued the researches. Squatters and miners opened new regions. Before its separation in 1859 the country was known as the Moreton Bay district of New South Wales. A desire to form fresh penal depots led to the discovery of Brisbane river in December 1823, and the proclamation of a penal settlement there in August 1826. The convict population was gradually withdrawn again to Sydney, and in 1842 the place was declared open to free persons only. The first land sale in Brisbane was on August 9, 1843. An attempt was made in 1846, under the colonial ministry of Gladstone, to establish at Gladstone on Port Curtis the colony of North Australia for ticket-of-leave men from Britain and Van Diemen's Land. Earl Grey, when secretary for the Colonies, understrong colonial appeals arrested this policy, and broke up the convict settlement. In 1841 there were 176 males and 24 females; in 1844, 540 in all; in 1846, 1867. In 1834 the governor and the English rulers thought it necessary to abandon Moreton Bay altogether, but the order was withheld. The first stock belonged wholly to the colonial Government, but flocks and herds of settlers came on the Darling Downs in 1841. In 1844 there were 17 squatting stations round Moreton Bay and 26 in Darling Downs, having 13,905 cattle and 18,613 sheep. In 1849 there were 2812 horses, 72,006 cattle, and 1,077,083 sheep. But there were few persons in Brisbane and Ipswich. The Rev. Dr Lang then began his agitation in England on behalf of this northern district.

Some settlers, who sought colonization from New South Wales, offered to accept British convicts if the ministry granted independence. In answer to their memorial a shipload of ticket-of-leave men was sent in 1849. In spite of the objection of Sydney, the Moreton Bay district was separated from New South Wales by an Order in Council of 13th May 1859, and proclaimed the colony of Queensland. The population was then about 20,000, and the revenue £475. The constitution, which was based upon the New South Wales Act of 1853, provided for 16 electoral districts, with a representation of 26 members. A Legislative Council was also formed, to which the governor of New South Wales, Sir William Denison, appointed 5 members, to hold office for four years, and Sir George Ferguson Bowen, the first governor of the new colony, 8 life members. Robert (afterwards Sir Robert) George Wyndham Herbert was the first premier and colonial secretary, and held office until 1866. Of the 30 representatives in the first Parliament, 20 were pastoralists; the others may be roughly classed as barristers, solicitors, and merchants. The pastoralists were the pioneers of settlement in the colony; those best known were the Archers of Gracemere, the Bells of Jimboor, the Goes of Yandilla, the Biggs of Mount Brisbane, Mr (afterwards Sir) Arthur Hodgson, Robert Karambi, John Sandeman, and Messrs Kent and Welnhoit. The white population at the end of 1859 was 25,788, and the exports were valued at £500,000.

Herbert's Administration, 1859-1866.—The first Parliament was opened on May 29, 1860. The providing of revenue and the establishment of immigration were the chief matters for consideration. The treasury was practically empty, but Sir Saul Samuel, treasurer of New South Wales, took a broad and generous view of the situation, and rendered financial aid, whilst in 1861 the first Government loan of £253,800 was authorized, the money being appropriated to public works and European immigration. Labour was so scarce that as early as 1851 the squatters had imported Chinese; various schemes for the introduction of coolies on a large scale were now mooted, but such propositions were only incidentally considered. The number of coloured aliens then in the colony. In 1859 the educational system was a mixed national and denominational one; there were 10 schools of the latter class, 1 of the former, and 30 private schools. In 1860 a Board of General Education was established, which extinguished the denominational system and placed the schools under State control. In the same year State aid to religion was abolished. The governor, in opening Parliament in 1863, pronounced decisively against the reintroduction of convicts. In that year Queensland boldly grappled with the extension of colonizing, and a settlement was established at the northern point of Cape York peninsula by Mr Jardine. During the following two years ports were opened along the coast, and pastoral occupation spread far into the northern and western interiors. The first sod of the first railway, from Ipswich to the Darling Downs, was turned on 15th February 1864. On February 1, 1866, Mr Herbert retired, and Mr Macalister became premier and Mr Mackenzie colonial secretary. In the following July the failure of the Overend and Gurney and Agra banks, in the latter of which the Government had public moneys, caused the collapse of a loan which was being negotiated in London. A panic followed; the Government could not pay the railway contractors, and the navvies employed by them started for Brisbane, threatening to hang the ministers and loot the town. On arrival, however, they were easily headed off to a reserve. By this time the treasury was empty, general insolvency prevailed, and the community appeared to be wrecked. Treasury bills to the amount of £300,000 were issued, and the governor in council was authorized to legalize treasury notes, when necessary, as currency, payable in gold on demand, to tide over the crisis. Prior to this, however, the treasurer took preliminary steps to issue £300,000 "Legal Tender Notes"—inconvertible "greenbacks"—but Sir George Brown informed the premier that he should veto such a scheme, and suggested that the issue of treasury bills. Mr Macalister thereupon resigned, and Mr Herbert, who had made arrangements to proceed to England (where subsequently he became permanent secretary of the Colonial Office), took office again to help the colony through the difficulty. His second ministry lasted for eighteen days, and, having passed the Treasury Bills Act, he retired from the public life of Queensland. The only determined opposition the Herbert ministry met with was from the townspeople's representatives, whose contention was that the squatters dipped too deeply into the public purse for public works expenditure; but an important factor in the early parliamentary days was the opposition between the Brisbane and Ipswich parties in the House, the latter town aspiring to be the capital of the colony.

The Discovery of the Goldfields, 1866-1879.—Macalister returned to power in August 1866, and dealt so vigorously with the after-effects of the financial crisis that by the end of 1867 affairs had approached their normal condition. A new era was now opened for Queensland by the discovery of gold. The Gympie field was discovered by Nash in 1867, and a big "rush" resulted. In 1872 Hugh Mosman discovered Charters Towers, the premier goldfield of the colony; and Hann, the rich Palmer diggings. Other important discoveries were also made, and Queensland has ever since been a gold-producing colony. Mining is the foundation upon which much of the progress of the colony has been built, and the legislation and records show continuous traces of the influence of the gold-getter. In 1873 John Murtagh Macrossan, a digger, was returned to Parliament expressly as a mining representative; and other men of a different stamp from the representatives of the squatters and townspeople, who had
hitherto composed the House, now began to enter public life. From 1870 to 1879 progress was satisfactory, trade interests were prosperous, and in this decade the foundations of the public and social structure of Queensland were laid. Agriculture was extended, and sugar-growing took the place of cotton cultivation. (The first crop of sugar was grown by the Hon. Louis Hope at Cleveland, about 1862.) Hitherto politics had been non-partisan, and legislation was chiefly of a domestic character. From the time of Herbert's departure until the appearance of Thomas McIlwraith and Samuel Walker Griffith, the two master-spirits of Queensland parliamentary life, the political history of the colony was composed of short-lived administrations, with Messrs Macalister, Mackenzie, Palmer, Lilley, George Thorn and John Douglas (afterwards Government Resident at Thursday Island) as premiers. Arthur Hunter Palmer (whose administration, from 1870 to 1874, had the longest life), a New South Wales squatter, entered the Queensland Parliament in 1866. He was one of the most popular of Queensland's parliamentary leaders, and has left the impress of his views on the public works, and educational and defence force systems of the colony. In 1870 Queensland was disappointed in her ambition of becoming the connecting-point for Australia with the European and Eastern cable systems. A company—the British Australian Telegraph Company—was formed in London to connect Australia by cable with Singapore. The plan provided for a land line from the Queensland telegraphs at Burketown to Port Darwin, in the Northern Territory, where the cable was to be landed. Writing on 25th January 1870, the Telegraph Construction and Maintenance Company officially informed the government of Queensland that it had received a contract from the British Australian Telegraph Company to construct 'cables and land lines, to be laid between Singapore and Burketown, in North Australia.' The Construction Company deputed Commander Noel Osborn to negotiate with the Governments of South Australia and Queensland in reference to the land line; but on arrival in Adelaide he accepted the offer of the South Australian Government to construct and maintain a telegraph line right across the continent from Port Darwin to Adelaide, and Queensland was informed that the original plan had been abandoned. Although the company was thus saved the expense of making and maintaining the Port Darwin—Burketown line, it was regarded as having broken faith with Queensland, which had specially pressed on her telegraph system to connect with the proposed line. In consequence of this incident Queenslanders have not always had the facilities for cheap cabling to Europe enjoyed by the other colonies, though the subsequent owners of the cable, the Eastern Companies, were in no way responsible for the act of their predecessors.

A resolution in favour of the payment of members was carried in 1871. In 1872 the first Agent-General in London, Richard Daintree, was appointed. The same year the Railways Act Amendment Act was passed, authorizing the construction of railways by private enterprise, land being offered as compensation for the outlay. Electoral representation was increased to forty-two members. In January 1874 Palmer resigned, and Macalister came into power for two years, the most important measure of his Government being the State Education Act of 1875, on which the present educational system is based. Both Messrs McIlwraith and Griffith were members of the Macalister ministry, but the former resigned in October 1874, owing to a difference of opinion as to a proposed land-grant railway from Dalby to Normanton. In 1875 Mr (afterwards Sir) William J. Cook, the foundation member, took office, and, on the Douglas ministry, joining the Douglas ministry as secretary for public works and mines.

Active Politics, 1879-1890.—On 21st January 1879 the first McIlwraith administration came into power, and an important extension of local government was one of the early measures passed, divisional boards being formed to take charge of public works in districts not included in municipalities. In the following session, 1880, the Opposition, led by Mr Griffith, bitterly opposed the Government proposals on Kanaka labour, land-grant railways, and a European mail service via Torres Straits. The Government, however, concluded an agreement with the British India Steam Navigation Company for a monthly mail service between Brisbane and London for an annual subsidy of £25,000. The Railway Companies Preliminary Act, giving the governor in council power to treat with persons willing to construct railways in return for grants of 5000 acres of land for each mile of rails laid, was also passed. This measure was generally unpopular, and no more simple treaty was entered into under its provisions. During the session Mr Griffith impeached the premier in connexion with contracts for the purchase of 15,000 tons of steel railway metals, and their carriage to the colony, made in London whilst McIlwraith was there in January 1880. A select committee in the colony, and afterwards a Royal Commission in London, subsequently reported in the premier's favour. The discovery of the celebrated Mount Morgan gold mine, and the initiation of artesian well-boring by R. L. Jack, Government geologist, took place in 1881. In 1883 a great drought prevailed, and the compulsory stoppage of public works demoralized the labour market. Early in the year information reached the colony that Germany proposed to annex a portion of New Guinea, which, together with other islands in the Papuan Gulf, was becoming of great strategic value to Australia; and the premier, fearing that it would thus be lost to the empire, instructed Mr H. M. Chester, police magistrate at Thursday Island, to proceed to Port Moresby and take possession of the unappropriated portion of the island in the name of the crown. This act was afterwards—to the indignation of Australia—repudiated by Lord Derby; and, eventually, under the Berlin Treaty of 1886, England and Germany entered into joint possession of that part of New Guinea lying east of 141° E. In July Sir Thomas McIlwraith (created K.C.M.G. in 1882) was defeated by 27 votes to 16 on a proposal to arrange for the construction of a land-grant railway from Charleville to the Gulf of Carpentaria. The general elections which followed were fought mainly on the questions of coloured labour for the sugar plantations and land-grant railways. The Government was defeated, and Griffith formed his first administration. Later in the year the premier drafted the Federal Council Act at Sydney, and through his efforts Queensland eventually joined the Federal Council of Australia. In 1884 a ten-million-pound loan Act was passed, intended to secure continuity in borrowing for railway construction, but many of the lines specified were unsurveyed. According to the view now generally held in Queensland, this loan seriously hampered the colony in after years. In 1887 the number of seats in the Assembly was increased to 72 (the present number), and several reforms were effected in the public service, notably the establishment of the Department of Agriculture. At the general elections in 1888 Sir Thomas McIlwraith was returned for North Brisbane, defeating Sir Samuel Griffith (who had been created K.C.M.G. in 1886) by a large majority, and resumed office as premier and leader of the "National Party." Ill-health, however, soon compelled him to leave the colony, and he was succeeded by Boyd Dunlop Morehead. Sir Thomas McIlwraith's inflexible nature was evidenced all through his public life. On the death of Sir Anthony Musgrave in Brisbane in 1888, he maintained that the Government should be consulted as to the appointment of the new governor. Lord Knutsford declined to accept this view, and appointed Sir Henry Blake. The premier formally protested, and a deadlock ensued, which was only removed by the resignation of the governor-designate. In 1889 payment of members at the rates of £100 per annum was stopped. On the death of Sir Thomas McIlwraith the positions of Attorney-General and Premier were connected, and the office of Governor-General established. In 1890 a financial crisis arose. Sir Thomas McIlwraith had returned to the colony and dissociated himself from the ministry. He conferred on the situation with Sir Samuel Griffith, and a want-of-confidence motion was nearly carried. Morehead resigned, and a coalition ministry, with Griffith as premier, chief secretary and attorney-general, and McIlwraith as treasurer, was formed. An agitation for the separation of Queensland into two or three separate colonies—mentioned as early as 1866—was very marked during this period.
period. It took formidable shape at Townsville in 1882, the chief argument in its favour being that the north and central districts did not get a fair share of the public expenditure. Delegates were sent to London on several occasions to interview the Colonial Secretary, but success did not attend these direct appeals. Sir Samuel Griffith's Decentralization Bill of 1890, which proposed to erect separate legislatures in the three distinct divisions of the Commonwealth, was so slow to separationists, and the agitation gradually disappeared.

The Labour Party in Politics, 1890–1900.—The decade from 1890 to 1900 was chiefly notable, apart from the accomplishment of Federation, for the rise of the Labour party as a power in politics and the gradual disappearance of the squatter as a dominant factor. In 1890 the old opponents, Sir Samuel Griffith and Sir Thomas McIlwraith, were still working side by side. The revenue for the year fell short of the estimates by half a million sterling, and a heavy accumulated deficit had to be grappled with by Parliament. Sir Thomas McIlwraith, the treasurer, proposed a dividend tax and other impost, which were agreed to, and a Treasury Bills Act authorizing an issue of £500,000 was also passed. A Constitution Act establishing triennial Parliaments, in place of quinquennial, which had hitherto existed, also went through. In August the great maritime strike spread to Brisbane, and crippled trade and commerce for several months. In 1891 a loan for £2,500,000, which was issued in London under the auspices of the Bank of England, failed. Sir Thomas McIlwraith reflected strongly in Parliament on the conduct of the Bank of England, and the governor of the bank wrote to Sir James Garrick, the agent-general, protesting against Sir Thomas McIlwraith's statements, and breaking off relations with the colony; but mutual explanations afterwards healed the breach.

Litigation was initiated by the London board of the Queensland Investment and Land Mortgage Company against the Queensland directors, on the ground that they had made advances without taking adequate security. The case was tried by the chief justice, Sir Charles Lilley, in 1891 and 1892, the defendants being Sir Thomas McIlwraith, Sir Arthur Palmer, then president of the Legislative Council, and Messrs F. H. Hart and E. R. Drury. The judge submitted 143 questions to the jury, and though these were answered generally in favour of the defendants, judgment was entered largely for the plaintiffs. On appeal, heard before a specially constituted court, presided over by the late Sir William Windeyer of New South Wales, this judgment was reversed, with costs. Lack of employment and a disastrous strike of bush workers paralysed the colony in this year. The strike began in January at Logan Downs station, where 200 shearsers refused to sign the Pastoralists' Convention agreement. This strike was remarkable for the determined and aggressive attitude of the men, and the firm, though conciliatory, manner in which it was handled by Mr (afterwards Sir) Horace Tozer, the colonial secretary, who had to provide military forces and artillery to hold the strikers in check. The trouble lasted many months; and after it was over a hastily planned plot to seize the central district and proclaim a republic was revealed in the Brisbane Courier. As an outcome of this strike, "New Australia"—a settlement on communistic lines—was founded in Paraguay (q.v.). The year 1892 was one of gloom and depression: want of money interfered with public works, and the impending stoppage of Kanaka labour and the low price of sugar almost ruined the planters. Sir Samuel Griffith then announced his converts of local politics to the idea of bringing in the sugar labour for the sugar plantations, and also of land-grant railways. An act was passed authorizing agreements with companies for the extension of the trunk lines on this principle; but the measure was unpopular, and no transactions under the act are recorded. Financial depression reached its height in 1893: the salaries of ministers and civil servants were reduced, and drastic retrenchments were made in every department. In February, 107 in. of rain fell at the head of the Brisbane river, and enormous losses were caused by the resulting floods; several vessels, including the Queensland Government gunboat Paluma, were washed into the Brisbane Botanic Gardens, and left high and dry when the waters subsided. A second flood followed and caused further losses. Rockhampton, Bowen, Townsville, and other places also suffered severely from floods. On 13th March Sir Samuel Griffith was gazetted third joint-treasurer, and on 24th March Sir Henry H. Nelson became premier and treasurer, and Sir Thomas McIlwraith chief secretary and secretary for railways. Parliament was dissolved on 3rd April, and after the general elections the ministry returned with 38 supporters, against Labour, 16, and Opposition and Independent, 18. During the month several financial institutions suspended payment, and on 15th May the Queensland National Bank closed its doors. Parliament was hurriedly summoned to deal with the financial crisis and the question of the Government funds held by the Queensland National Bank. Treasury notes, issued against coin held by the treasurer, were made legal tender throughout the colony; an issue of £1,000,000 treasury bills to retire the treasury notes was authorized, and a series of acts dealing with the suspended banks were passed. To assist the unemployed, labour and co-operative communities were started, but proved failures. An impetus was given to the sugar industry by the Sugar Works Guarantee Act, which authorized the treasurer to guarantee debentures issued by companies for the erection of sugar mills and plant. In 1894 little legislation was achieved, the policy of the Government being directed towards national rehabilitation. In 1895 Sir Thomas McIlwraith left the colony for London, where he died on 17th July 1900. At the general election of 1896 the Labour party slightly improved its position. In that year a committee of investigation reported a heavy deficit in the affairs of the Queensland National Bank, and made certain recommendations. In 1897 the bank was reconstructed a second time upon terms very favourable to the institution. An act was passed granting powers to a company to construct a railway from the rich mining district of Chillagoe to the terminus of the Cairns railway at Mareeba; at the end of fifty years the State was to have the right to acquire the line. In April 1898 the Queensland-born statesman, T. J. Byrnes, whose early death in the following September was lamented throughout Australia, succeeded Sir Hugh Nelson as premier. On 24th October the trial of the three ex-directors of the Queensland National Bank, Messrs F. H. Hart, B. D. Morehead and A. B. Webster, was commenced. The prosecution was instituted by the Government, on the advice of three barristers to whom the report of the committee of investigation into the affairs of the bank, which sat in 1897, was submitted. After a trial lasting 12 days, a verdict of "Not guilty" was returned. Proposals for the acquisition of 250,000 acres of land in New Guinea, made by a syndicate of London capitalists, were provisionally agreed to, but were eventually rejected, owing to a popular outcry raised in the colony and in New South Wales and Victoria. In 1896 the first of a series of factory acts was passed, and in 1907 Wages Boards were established for fixing the statutory minimum rate of wages. (See Australia.)

Federation was a burning question in the neighbouring colonies during the year, but Queenslanders generally took little interest in the movement, and the colony was not represented at the Federal Convention at Melbourne when the Commonwealth Bill was passed. In 1899 Mr (afterwards Sir J. R.) Dickson, who had succeeded Byrnes as premier, was elected to the "Three Bills," and in June of that year an Enabling Bill was passed. In September the Government supported the act by the narrow majority of 7492 votes on a poll of 60,484. Towards the end of the second session the ministry narrowly escaped defeat on the Railway Standing Committees Bill, and resigned. Mr Dawson, leader of the Labour Opposition, then formed a ministry, and held office from 1st December to 7th December 1899. He was then defeated on a motion by R. Philp, and resigned, and Philip
became premier, and was in power when Queensland joined the Commonwealth. The year was shadowed by the continuance of a terrible drought, which towards the end of 1900 became so aggravated that the Government began to fall away on account of the decrease in receipts from railways and land. In that year Philip's chief policy was the passing of legislation to permit the construction of railways by private enterprise. The Labour party offered vigorous opposition; but notwithstanding this a certain amount of progress was made. The Government appointed Dr Maxwell, an American sugar expert, to superintend the sugar industry in the colony; a State school of mines was established at Charters Towers; and the compulsory clauses of the Education Act were put in force for the first time. Another act of importance was the establishment of a force of 1,500 men in the Police. The powerful force was needed for the prevention of a renewal of the leases of pastoral lands, but no legislation resulted. A suggestion that Sir Samuel Griffith should retire from the chief justiceship, on a pension of £1750 a year (to be reduced by any emoluments received), to enable him to enter Federal politics, fell through. Some important discoveries of coal were made during the year, and dredging the northern rivers for gold became an established industry. J. R. Dickson represented the colony in London at the conference of Federal delegates in 1900, when the final details of the Commonwealth were settled. Early in 1901 he was created K.C.M.G., but died suddenly, at Sydney, on 23rd July, a year, shortly after he had been made a member of the first Federal Ministry.

Alien Immigration. — The working classes of Queensland have always objected to the presence of coloured aliens, and successive Governments have legislated against indiscriminate immigration into the colony. In 1876 Governor Cairns reserved an act imposing certain disabilities upon Chinese working on goldfields. In that year the Chinese were deprived of the right to own land, and another principle was adopted: masters of ships were only allowed to carry to Queensland ports one Chinese for every 50 registered tons, and the poll tax was increased to £50. In 1888 Queensland took the lead in summoning an intercolonial conference on Chinese immigration, the outcome of which was the adoption of uniform legislation; in the Queensland Act passed that year the main provision was that only one Chinese for every 500 registered tons should be permitted to be carried on vessels from Chinese ports. The poll tax was then abolished. This act was also reserved, but received the Royal Assent on 5th February 1890, after slight amendments were made.

Treaty arrangements with Japan had been carried through by the Imperial Government, at the initiation of Queensland, under which the Japanese Government undertook to prevent the emigration of their countrymen; and in 1890 the Act was passed in 1895 placing restrictions upon the acquisition of vested interests in the industry by Japanese and other aliens. At Federation eight acts—two Imperial and six local—regularised the importation of Kanakas from the South Seas: that of 1880 was the basis of the system under which Kanakas were recruited in the islands, brought to the colony in schooners, employed there, and returned to their homes at the end of their three years' engagements. The 1884 act confined Kanakas to field work. In December 1884 a Royal Commission was appointed, consisting of Messrs W. Kinnaird Rose, J. F. Bucldand, and Hugh M. Millman, to report upon the system of recruiting Kanakas. Following the report of the Commission, which was in effect that many islanders had been recruited "by force and fraud," Sir Samuel Griffith, then premier, introduced the important Pacific Island Labourers Amendment Act of 1885, which provided for the immigration of the after-timers, and is—after the earlier agreements—a measure of faith with the working classes that white labour could be utilised for sugar cultivation. Yet from the passing of the act the sugar industry began to decay, no fresh capital was put into the industry, the Tweedvale and Tavusha sawmills were closed, and the magnificent industry threatened to die out. Sir Samuel Griffith, being converted by these signs of the timeliness of sugar-cane planting in the centre of the world, and the division of coloured labour, issued on 12th February 1892 his " Manifesto to the People of Queensland," in which he acknowledged that to prevent the collapse of sugar-growing it was necessary to resume the system of 'squatter' settlement. This manifesto was the basis of the 1892 act, which reintroduced Kanaka labour. Since this time there has been no further State legislation on the subject, but the Federal Parliament has dealt with the matter (see above).

Land Leases. — Queensland had the unique experience of a period of 740 days, from 1876 to 1879, during which the predominance of the squatting class, the lands were freely leased in large blocks for sheep and cattle grazing. The squatter furnished 50% of the public revenue with his rents, and opened up the great interior by his pioneering enterprise. As, however, population increased, the necessity for the agriculturist arose, and it became requisite to legislate in the interests of the small holder. Successive Queensland Governments have had some of their hardest tasks in adapting their land legislation to the needs of the situation. The recent policy being to reduce large estates and place the cultivator on the soil. At separation from New South Wales the holding of land was regulated by Orders in Council, under an Imperial act of 1840. The squatter was not interfered with, and he was allowed to renew his lease at its expiry. The minimum lease principle was not introduced until 1885, when the Land Act of 1885, dealing with the settled districts, and the Pastoral Leases Act of 1889, dealing with the unsettled districts—these divisions were fixed by the first-named measure. The "resumption" principle was not introduced until 1897 act that the leasing of the land into the hands of agriculturists was further marked by the creation of agricultural homesteads (160, 320, or 640 acres), grazing homesteads (20,000 acres), scrub selections (10,000 acres), and unconditional selections (1280 acres). Some of these classes of selections could be purchased right out, and all were leased at extremely moderate rates. Sales of country leases were made in the same way. Two measures were passed, in 1894 and 1897—the Agricultural Lands Purchases Acts—under which the State was authorised to purchase suitable estates of specially fertile land already alienated, to be cut up and thrown open as agricultural lands. The fact that the measures were introduced with the motion to encourage agriculture. Owing to the expiration of pastoral leases and the fact that no legislation existed for their renewal for a term long enough to encourage the investment of capital, a formidable agitation prevailed in the colony, the lessees bitterly complaining of the uncertainty of their tenure. The British Australasian Society was formed in Great Britain, to protect the interests of the tenants and lobby for the pastoral industry in Queensland. In 1900, out of the total Queensland land less than 411,793,786 acres remained in the hands of the State alienated.

QUEENSTOWN, a town of the Cape province, South Africa, in the upper valley of the Great Kei river, 135 m. by rail N.W. of East London. Pop. (1904) 6616, of whom 4157 were white. Founded in 1853 and named after Queen Victoria, it was laid out in an unusual form. The streets are lined with a central hexagonal-shaped open space there runs one of the main thoroughfares. This arrangement was adopted to facilitate defence in case of an attack by Kaffirs, Queenstown at the time of its foundation being a border settlement. Up to 1868 the burghers held their lands on a military tenure. It contains several fine buildings, including the town hall, court-house and public offices and the Anglican church of St Michael. Many of the streets are lined with oaks and blue gums. Situated on the Karroo, at an elevation of 3300 ft., between the Stormberg and Amatola Mountains, it is the centre of a well-watered region, and a resort and tourist district, and is a busy commercial town. The climate is healthy, and Queenstown has a reputation as a sanatorium.

QUEENSTOWN, a town of Montagu county, Tasmania, on the Queen river, 23 m. by rail from Strahan, and 353 m. W. of Hobart. It is the centre of the Mount Lyell mining district and has numerous smelting works, brick-works, and sawmills. The county is mountainous and finely wooded. Pop. (1901) 5051; of the district, 10,451.

QUEENSTOWN (formerly COVE OR CORK), a seaport, water-fronting place, and naval station of county Cork, Ireland, picturesquely situated on the south side of Great Island, on the slope of an
emience rising abruptly above Cork Harbour. Pop. (1901) 7909. It is 12 m. E.S.E. of Cork and 177 m. S.W. of Dublin by the Great Southern & Western railway. It consists chiefly of terraces rising one above another with wide streets and handsome houses. On account of the mildness of the climate it is frequented by visitors both in summer and winter. Previous to the American War, Cove of Cork was a small fishing village, but it subsequently increased rapidly. It received its present name on the occasion of the visit in 1849 of Queen Victoria, being her first landing-place in Ireland. The town is governed by an urban district council. The harbour, which is defended by the Carlisle and Camden Forts at its entrance, and by Fort Westmoreland on Spike Island, can shelter a large fleet. Spike, Rocky and Haulbowline islands are used in the formation of a government dockyard, which with the adjoining victualling yard covers an area of 55 acres. There is an enclosed basin 9 acres in extent, with 32 ft. 8 in. depth over the sill at high-water spring tides; and a dry dock at its southern end has a length of 408 ft. on the blocks. Queenstown is a port of call for American mail steamers, and the mails are transmitted overland by express trains; it is also a port of embarkation for colonial troops, and a government emigration station. The admiral's flagship is stationed here. The oldest yacht club in the United Kingdom, the Royal Cork (founded in 1720 as the Cork Harbour Water Club), has its headquarters here, with a club-house, and holds an annual regatta. Among the principal buildings are the modern Catholic cathedral of St Colman for the diocese of Cloyne, designed by A. W. Pugin, and the Protestant Episcopal church for the united parishes of Clonmel and Temple Robin. A fine promenade, over a mile in length, connects Queenstown with Rushbrook, a favourite watering-place. The picturesque shores of the harbour are dotted with country residences and village-resorts, such as Crosshaven and Church Bay.

QUELPART (Chu-je), a county-seat, is a town of the south of Korea, used as a Korean penal settlement. In measures 40 m. from E. to W. and 17 from N. to S. It rises gradually from the seaboard, is heavily wooded and is cleared for cultivation to a height of 2000 ft. There are several crateriform hills, and Hali San (Mount Auckland) has an altitude of 6352 ft. The island is entirely volcanic, and the soil is finely disintegrated lava. Broken black lava forms the beach, and blocks of it are the universal building material. There is no good drinking water. The flora and fauna are scarcely investigated. Pines of three species, junipers, larches, oaks, maples, willows and the Thuja Orientalis have been identified. The known fauna comprise boars, bears, deer, swans, geese, pheasants and quail. The roads are scarcely passable bridle tracks. Quelpart was introduced to European notice by the Dutchman, Hendrik Hamili, who was shipwrecked there in 1653.

The estimated population is 100,000, Korean by race, language and costume. There are about ninety villages. The valleys and slopes are carefully cultivated in fields divided by stone walls, and produce beans, peas, sweet potatoes, "Russian turnip radish," barley, a little rice and millet, the last being the staple article of food. Nuts, oranges, limes and plums are grown. Small but strong pigs are bred for export, and small cattle and pigs for home use. Apart from agriculture, the industries consist in the manufacture of fine bamboo hats and mats, and wooden combs for export and local use. For fishing the islanders use double-decked raft boats, similar to those of southern Formosa. Their lucrative pearl fisheries have been practically monopolized by the Japanese, who use proper diving apparatus. A valuable product is a species of clam, the shell of which furnishes a specially iridescent mother-of-pearl, which the natives barter with the Japanese for inlaying lacquer. European goods are not imported, but Japanese articles find ready buyer. There are no markets, and only a few shops.

Chu-sung, the capital and seat of government, a few miles from Port Pelto, has a black lava wall 25 ft. high, with three gates and towers; an imposing audience-hall in Chinese style; and a great bell tower, with a fine bronze bell, sounded to drive off "evil dragons." Its population is estimated at 16,000. The governor has a hereditary army for coercive purposes. The uniform is a complete suit of mail, with a helmet, from which leather curtains fall over the shoulders. The weapons are equally antique.

There are no good harbours, and the only anchorage for large vessels is Tai-chung, or Yung-su, at the east end, with 9 to 13 fathoms of water. Pelto has ancient breakwaters for the protection of small boats, erected, as many believe, by the Mongol conqueror, Kublai Khan, who in 1273 built on Quelpart the huge ships for the invasion of Japan.

QUENSTEDT, FRIEDRICH AUGUST VON (1809-1858), German geologist and palaeontologist, was born at Eisleben in Saxony on the 9th of July 1809. He was educated at Berlin, and after having acted as assistant in the mineralogical museum he was appointed professor of mineralogy and geognosy in the university of Tubingen in 1837, a post which he occupied until his death. His earlier work related chiefly to crystallography and mineralogy, on which subjects he published text-books that were widely used. He became distinguished for his researches on palaeontology, and especially for those on the Megalodon and Squalus systems. The museum at Tubingen owes its establishment to his exertions. He died at Tubingen on the 21st of December 1858.

His chief publications were: Method der Kristallographie (1840); Das Flözgebirge Württembergs (1843); Petrefaktenkunde Deutschlands (7 vols. and atlases, 1846-84); Die Cephalopoden (1847); Handbuch der Petrefaktenkunde (1849); Dritte Abhandlung; Die Ammoniten des Schwäbischen Jura (1883-84); Obituary by W. T. Blandford, Quart. Journ. Geol. Soc. vol. xlv., 1890.

QUENTAL, ANTHERO DE (1842-1891), Portuguese poet, was born on the island of St Michael, in the Azores, on the 18th of April 1842. He studied at the university of Coimbra, and soon distinguished himself by unusual talent, as well as turbulence and eccentricity. He began to write poetry at an early age, chiefly, though not entirely, devoting himself to the sonnet. After the publication of one volume of verse, he entered with great warmth into the revolt of the young men which dethroned Castilho, the chief living poet of the elder generation, from his place as dictator over modern Portuguese literature. He then travelled, engaged on his return in political and socialistic agitations, and found his way through a series of disappointments to the mild pessimism, a kind of Western Buddhism, which animates his latest poetical productions. His melancholy was increased by a spinal disease, which after several years of retirement from the world, eventually drove him to suicide in his native island, on the 11th of September 1891. Anthero stands at the head of modern Portuguese poetry after João de Deus. His principal defect is monotony—his own self is his solitary theme, and he seldom attempts any other form of composition than the sonnet. On the other hand, few poets who have chiefly devoted themselves to this form have produced so large a proportion of really exquisite work. The comparatively few pieces in which he either forgets his doubts and inward conflicts, or succeeds in giving them an objective form, are among the most beautiful in any literature. The purely introspective sonnets are less attractive, but equally finely wrought, interesting as psychological studies, and impressive from their sincerity. His mental attitude is well described by himself as "the effect of Germanism on the unprepared mind of a Southerner." He had learned much, and half-learned more, which he was unable to assimilate, and his mind became a chaos of conflicting ideas, settling down into a condition of gloomy negation, save for the one conviction of the vanity of existence, which ultimately destroyed him. A healthy participation in public affairs might have saved him, but he seemed incapable of entering upon any course that did not lead to delusion and disappointment. The great popularity acquired, notwithstanding, by poetry so metaphysical and egotistic is a testimony to the artistic instinct of the Portuguese. As a prose writer Quental displayed high talents, though he
Querard—Querétaro

Wrote little. His most important prose work is the Considerações sobre a philosophia da historia literaria Portuguesa, but he earned fame by his pamphlets on the Coimbra question, Bem senso e bom gosto, a letter to Castilho, and A dignidade das letras e litteraturas oficiaes.

His friend Oliveira Martins edited the Souvenirs (Oporto, 1886), supplementing an important essay, and an interesting collection of studies on the poet by the leading Portuguese writers appeared in a volume entitled Anheiro de Quental. In Memoriam (Oporto, 1896). The souvenirs have been turned into most European languages; into English by Edgar Prestage (Anheiro de Quental, sixty-four Sonnets, London, 1894), together with a striking autobiographical letter addressed by Quental to his German translator, Dr. Stork.

Querard, Joseph Marie (1799–1863). French bibliographer, was born at Rennes on the 25th of December 1797. He was apprenticed to a bookseller in his native town, and was sent abroad on business. He remained in Vienna from 1819 to 1824, and there drew the first volumes of his great work, La France litteraire, or Dictionnaire bibliographique des savants, historiens, et gens de lettres de la France, etc. (10 vols., 1826–1842), dealing especially with the 18th and early 19th centuries, which he was enabled to complete by a government subsidy granted by Guizot in 1830, and by the help of the Russian bibliophile Serge Poltortatsky. The firm of Didot, who was his publishers, took out of his hands the Litterature francaise contemporaine with which he had intended to complete his work, and placed it with Ch. Louandre and F. Bourquelot. Querard avenged himself by pointing out the errors of his successors. In spite of his claims Querard was unable to secure a position in any of the public libraries. He died in Paris on the 3rd of December 1855.

Among his other works are; Les supercheries litteraires déveloives (5 vols., 1845–50); Bibliographie La Menaisienne (1849); Dictionnaire des ouvrages-polyommes et anonymes de la litterature francaise, 1730–1830 (1846–47); an additional volume to La France litteraire entitled Ecritains pseudonymes, etc. (1854–56). See Mar. Jozon d’Erquar, Querard, in La France litteraire (1854), vol. xi.

Quercitrone, a yellow dyestuff obtained from the bark of the quercitron oak, Quercus tinctoria, a fine forest tree indigenous in North America. The name is a shortened form of "quercitron," from Lat. quercus, oak, and "citron," and was invented by Dr. Edward Bancroft (1744–1821), who by act of parliament in 1785 was granted special privileges in regard to the importation of quercitrone. The substance is obtained by grinding the bark in mills after it has been freed from its black epidermal layer, and sifting the product to separate the fibrous matter, the fine yellow powder which remains forming the quercitrone of commerce. The yellow-orange decoction of quercitrone contains quercitrinic acid, whence its use in tanning, and an active dyeing principle, quercitrin, C_{16}H_{12}O_{5}. The latter substance is a glucoside, and in aqueous solution under the influence of mineral acids it yields quercetin, C_{15}H_{10}O_{5}, which is precipitated, and the pentoside rhamnose. Quercetin is a crystalline powder of a brilliant yellow colour, entirely insoluble in cold and dissolving only sparingly in hot water, but quite soluble in alcohol. Either by itself or in some form of its glucoside quercetin, quercetin is found in several vegetable substances, among others in chestnuts, in Persian berries (Rhamnus catharticus), buckwheat leaves (Polygonum Fagopyrum), Zante fuscic wood (Rhhus Cotinus), and in rose petals, etc. Quercitrone was first introduced as a yellow dye in 1775, but it is principally used in the form of flavin, which is the precipitate thrown down from a boiling decoction of quercitrone by sulphuric acid. Chemically, quercitrone is a member of a fairly extensive class of natural colouring matters derived from β phenyl benzo-γ-pyron or flavone, the constitution of which followed on the researches of St. von Kostanecki, A. Perkin, and Schmeltz and others. Among the related colouring matters are; chrysirin from poplar balsam, apigenin from parsley, luteolin from weld and dyers' broom, fisetin from young fuscic and yellow cedar, galangin from galanga root, and myricetin from Myrica Nagi.

Quercy (Lat. fagus Caturinus, Fr. Cohorsin), a county in France before the Revolution. The name is taken from that of a Gallic tribe, the Cadurci, and was applied to a small district watered by the Dordogne, the Lot and the Tarn. It was bordered by Limousin, Rouergue, Armagnac, Périgord and Agenais. In the middle ages it was divided into upper, or black, Quercy, and lower, or white, Quercy, the capital of the former being Cahors and of the latter Montauban. Its two other chief towns were Figeac and Moissac. Ecclesiastically it was included almost entirely in the diocese of Cahors until 1317, when a bishopric for lower Quercy was established at Montauban. Judicially it was under the authority of the parlement of Bordeaux; for financial purposes it was part of the généralité of Montauban. The counties of the council had the bishop of Cahors for president; other members were the bishop of Montauban and other ecclesiastics, four viscounts, four barons and some other lords and representatives of eighteen towns.

Under the Romans Quercy was part of Aquitania prima, and Christianity was introduced therein during the 4th century. Early in the 6th century it passed under the authority of the Franks, and in the 9th century it was part of the Frankish kingdom of Aquitaine. At the end of the 10th century its rulers were the powerful counts of Toulouse. During the wars between England and France in the reign of Henry II., the English placed garrisons in the county, and by the treaty of Paris in 1259 lower Quercy was ceded to England. Both the king of England and the king of France confirmed and added to the privileges of the towns and the district, each thus hoping to attach the inhabitants to his own interest. In 1360, by the treaty of Brétigny, the whole county passed to England, but in 1440 the English were finally expelled. In the 16th century Quercy was a stronghold of the Protestants, and the scene of a savage religious warfare. The civil wars of the reign of Louis XII. centred around Montauban. Quercy was early an industrial district. It gave its name to cadorcum, a kind of light linen, and the bankers of Cahors were famous.

Querétaro, a city of Mexico, capital of the state of Querétaro-Arteaga, 152 m. by rail N.W. of the national capital, Pop. (1900) 33,152, including a large Indian element. Querétaro is served by the Mexican Central railway. The city stands on a plain at the foot of the Cerro de las Campanas, 6168 ft. above sea-level. Among the important buildings are the Cathedral (said to have been built originally about 1555, and subsequently restored at various times), the Iturbide palace (in which occurred the trial of Maximilian), the government offices, the federal palace and the churches of Santa Rosa, Santa Clara and San Augustin. The federal palace and the church of Santa Rosa are examples of the work of the celebrated Mexican architect, Francisco Eduardo de Tresguerras (1765–1833), who restored the church of Santa Clara also. The gilded wood carvings of Santa Clara are noteworthy; and in the courtyard of the federal palace there are other specimens of the same work. The water-supply is brought over a fine aqueduct 5 m. long, dating from 18th century. Among manufactures are cottons, woollens, pottery and linens. Querétaro has one of the oldest and largest cotton factories in Mexico, employing about 2000 operatives, and maintaining a small private military force for protection. It was built in the days when brigandage held the whole country in terror, and was strongly fortified and provided with artillery and garrison. The latter was also used to escort pack trains of goods and supplies before the building of the railway. This old factory has also played its part in the civil wars of the country since 1840, becoming a fortress whenever Querétaro became involved in military operations.

Querétaro occupied the site of an Aztec Indian town dating from about 1400. It was captured by the Spaniards in 1531 and was raised to the rank of a city in 1635. It was the scene of a revolutionary outbreak against Spain in 1810. In 1848 a Mexican congress met here to ratify the treaty of peace with the United States, and in 1867 Querétaro was the scene of Maximilian's last stand against the republicans (under Escobedo), which resulted in his capture and subsequent execution on the Cerro de las Campanas just N. of the city.
QUERÉTARO-ARTEAGA—QUESNAY

QUERÉTARO-ARTEAGA, a central state of Mexico, bounded N. by San Luis Potosí, E. by Hidalgo, S.E. by the state of Mexico, S. by Michoacán and Aguascalientes, and W. by Jalisco 50 sq. m. Pop. (1900) 232,389, largely Indian. The state belongs to the elevated plateau region, with its semi-arid conditions. The N. part of the state is traversed from E. to W. by the wooded Sierra Gorda, whose spurs reach southward to the central districts. The central and S. parts are covered by plains, broken by low hills. The rivers are small and flow chiefly to the San Juan, a part of the Panuco drainage basin. There are some small lakes and swamps and a number of mineral springs. Sugar, cotton, Indian corn, beans and considerable quantities of wheat are grown, but agriculture is largely impeded by the uncertainty of the rainfall. The chief crops of the state are beans and corn. Silver, copper, mercury, lead, tin, antimony and precious stones are found, in some cases in very rich deposits. The richest mining districts are those of Caderca and Tolimán, where there are metallurgical works for the reduction of ores. The Mexican Central and Mexican National railways cross the S. end of the state and afford transportation facilities for the agricultural districts, but the mining districts of the N. are still dependent upon old methods. The capital of the state is the historic city of Querétaro (q.v.), and other important towns, with their populations in 1900, are: San Juan del Río (8122), Landá (about 7000), Querétaro (18,35), Jalpan (about 6000), and Tolimán, celebrated for its opals.

QUERFURT, a town of Germany, in the province of Prussian Saxony, situated in a fertile country on the Querne, 88 m. W. from Merseburg, on a branch line from Oberröblingen. Pop. (1905) 4884. Its chief industries are sugar-refining, lime-burning and brewing. Querfurt was for some time the capital of a principality which had an area of nearly 200 sq. m. and a population of about 20,000. The ruling family having become extinct in 1496, it passed to that of Mansfeld. In 1635, by the peace of Prague, it was ceded to the elector of Saxony. John George I., who handed it over to his son Augustus of Saxe-Weissenfels; but in 1746 it was again united with electoral Saxony. It was incorporated with Prussia in 1815, See Schneider, Querfurter Staats- und Kreischronik (Querfurt, 1900).

QUERN, the primitive form of hand-mill for grinding corn, consisting of two flat circular stones; the lower stone, often shaped with a rim, has a wooden or metal pin in the centre which passes through a hole in the upper stone; the worker pours the grain through the hole with one hand, revolving the upper stone with the other by means of a peg fixed to one side. The Old English word is cewryn; it is a word common to Teutonic languages, cf. Du. kwern, Swe. grén and various forms in Old German; cognate words are found in Slavonic languages pointing to a pre-Aryan root. It is not related to "churn." (See Flour.)

QUESADA Y MATHEUS, JENARO DE (1828-1888), 1st Marquis of Miravalles, Spanish soldier, was born at Santander, on the 6th of February 1818. He was a son of General Vicente Quesada, a Conservative officer who was murdered and atrociously mutilated in the streets of Madrid by a revolutionary mob in the early days of Queen Isabella’s reign. At Querétaro belonged to an ancient family connected with the dukes of Fernan Núñez, he was made a corporal when only six years old, was educated at the seminary for nobles and in 1833 was promoted lieutenant in the 1st Foot Guards. He served from 1833 to 1836 against the Carlists. When his father was assassinated in 1836 he resigned, went to France, got employment in a merchant’s office and was only induced to return to the army in 1837 by his relatives, who got him a company in the guards. He distinguished himself often in the Carlist war, but his promotion was slow, and he declined to have anything to do with politics. He confined himself to his duties as a soldier, always fighting on the side of governments against Carlist, Republican and Progressist rising. He only became a general of division in 1853, and at the head of the Madrid garrison he fought hard in 1854 to avert the triumph of Esparrtero, O’Donnell and Dulce, who publicly recognized his gallant conduct. When the war in Morocco broke out, Marshal O’Donnell gave Quesada the command of a division, which played so conspicuously a part in that campaign and at the battle of Wad el Ras that its commander was made lieutenant-general and grand cross of Charles III. He was director-general of the Civil Guard when the military rebellion of the 22nd of June 1866 broke out in Madrid, and after he had been wounded in the leg he remained at the head of the loyal troops until the insurgents were crushed. He did not accept any military post during the revolution until Marshal Serrano in 1874 offered him the direction of the staff, and he only accepted it after clearly stating that he was a royalist and partisan of Alfonso XII. In his long and brilliant career he never swerved from his steadfast resolve never to be mixed up in any political or military intrigues or pronunciamentos—to use his own words, "not even to restore my king." As soon as the king was restored, the government of Señor Canovas made Quesada first general-in-chief of the army of Central Spain, and in February 1875 general-in-chief of the army of the North. With the assistance of another officer who also had never dabbled in pronunciamentos, General O’Ryan, Quesada restored discipline in the armies confronting Don Carlos, and for twelve months concert-ed and conducted the measures that enabled that pretender to retire into France and his followers to lay down their arms. The government confided to the marquis of Miravalles the difficult task of ruling the northern provinces for several years after the war, and he succeeded in conciliating the sympathies of the Basques and Navarrese, though the penalty of their last rising had been the loss of most of their ancient liberties or fueros. Quesada was made marquis of Miravalles, grandee after the war, minister of war in 1883 and senator. Though he was a strict, stern disciplinarian of the old school and an unflinching Conservative, Catholic and royalist, even his political and military opponents respected him, and were proud of him as an unblemished type of the Castilian soldier and gentleman. He died at Madrid on the 18th of January 1889, and was given full military honours.

QUESNAY, FRANÇOIS (1694-1774), French economist, was born at Méry, near Paris, on the 4th of June 1694, the son of an advocate and small landed proprietor. Apprenticed at the age of sixteen to a surgeon, he soon went to Paris, studied medicine and surgery there, and, having qualified as a master-surgeon, settled down to practice at Mantes. In 1737 he was appointed perpetual secretary of the academy of surgery founded by François la Peyronie, and became surgeon in ordinary to the king. In 1744 he graduated as a doctor of medicine; he became physician-in-ordinary to the king, and after his first consulting physician, and was installed in the palace of Versailles. His apartments were on the entresol, whence the Réunions de l’entresol received their name. Louis XV. esteemed Quesnay much, and used to call him his thinker; when he ennobled him he gave him arms three flowers of the pantes (pensée), with the motto Propter exegitationem mentis.

He now devoted himself principally to economic studies, taking no part in the court intrigues which were perpetually going on around him. About the year 1750 he became acquainted with Jean C. M. V. de Gournay (1712-1759), who was also an earnest inquirer in the economic field; and round these two distinguished men was gradually formed the philo-

sophic sect of the Économistes, or, as for distinction’s sake they were afterwards called, the Physicocrates. The most remarkable men in this group of disciples were the elder Mirabeau (author of L’Ami des hommes, 1756-60, and Philosophie rurale, 1763), Nicolas Baudeau (Introduction à la philosophie économique, 1771), G. F. Le Trosne (De l’ordre social, 1777), André Morellet (best known by his controversy with Galiani on the freedom of the corn trade), Mercier Larivièvre and Dupont de Nemours. Adam Smith, during his stay on the continent with the young duke of Buccleuch in 1764-66, spent some time in Paris, where he made the acquaintance of
QUESNEL—QUETTA

Quesnel and some of his followers; he paid a high tribute to their scientific services in his Wealth of Nations. Quesnel died on the 16th of December 1774, having lived long enough to see his great pupil, Turgot, in office as minister of finance. He had married in 1718, and had a son and a daughter; his grandson by the former was a member of the first Legislative Assembly.

The publications in which Quesnel expounded his system were the following: two articles, on "Fermiers" and on "Grains", in the Encyclopédie of Diderot and D'Alembert (1756, 1757); a discourse on the law of nature in the Physiocratie of Dupont de Nemours (1768); Maxime de Geny's government of commerce (1770), which, like Quetelet's, was extensively reprinted; a "Tableau économique" (1773), which, like its successor, was plagiarized in an American newspaper; a "Pamphlet" (1756); "Dialogue sur le commerce et les travaux des artisans" and other minor pieces. The Tableau économique, though on account of its dryness and abstract form it met with little general favour, may be considered the principal manifesto of the school. It was regarded by the followers of Quesnel as entitled to a place amongst the foremost products of human wisdom, and is named by the elder Mirabeau, in a passage quoted by Adam Smith, as one of the three great inventions which have contributed most to the stability of political societies, the other two being those of writing and of money. Its object was to exhibit by means of certain formulas the way in which the products of industry, whether agricultural or manufactories, would, in a state of perfect liberty be distributed among the several classes of the community (namely, the productive classes of the community composed of manufacturers and merchants), and to represent by other formulas the modes of distribution which take place under systems of Governmental restraint and regulation, with the evil results which those different degrees of restraint and regulation give to the various classes of the society and of the natural order. It follows from Quesnel's theoretic views that the one thing desiring the solicitude of the practical economist and the statesman is the increase of the net product; and he inferred also what Smith afterwards affirmed, on not quite the same ground, that the interest of the landowner is "strictly and indissolubly connected with the general interest of the society." It was for this work that the portrait of the Honorable M. de Quesnel, painted in 1758 in the palace of Versailles under the king's immediate supervision, vision of some of the sheets, it is said, having been pulled by the royal hand. Already in 1767 the book had disappeared from circulation, and no copy of it is now procurable; but the substance of it has been preserved in the Ami des hommes of Mirabeau, and the Physiocratie of Dupont de Nemours.

His economic writings are collected in the 2nd vol. of the Principes économiques, published by Guillaumin, Paris, with preface and notes by Eugène Daire; also his Études économiques et philosophiques were collected with an introduction and note by Aug. Quetelet. Those of his writings to which he paid particular attention, the Économie politique, from the original MS., was published by the British Economic Association (London, 1895). His other writings were the article "Evidence" in the Encyclopédie, and Recherches sur l'application analytique de l'analyse algébrique à la géométrie, 1773. Quesnel's Éloge was pronounced in the Academy of Sciences by Grandjean de Fouchy (see the Recueil of that Academy, 1774, p. 134). See also F. J. Marmontel, Mémoires, Mémoires de l'Académie d'Amsterdam, H. Higgs, The Physiocrats (London, 1807).

QUESNEL PASQUIER (1634—1716), French Jansenist, theologian, was born in Paris on the 14th of July 1634, and, after graduating in the Sorbonne with distinction in 1653, joined the French Oratory in 1657. There he soon became prominent; but his Jansenist sympathies led to his banishment from Paris in 1681. He took refuge with the friendly Cardinal Coislin, bishop of Orléans; four years later, however, foreseeing that a fresh storm of persecution was about to burst, he fled to Brussels, and took up his abode with Antoine Arnauld (q.v.). There he remained till 1693, when he was arrested by order of the archbishop of Malines. After three months imprisonment he escaped and settled at Amsterdam, where he spent the remainder of his life. After Arnauld's death in 1694 Quesnel was generally regarded as the leader of the Jansenist party; and his Réflexions morales sur le Nouveau Testament played almost as large a part in its literature as Jansen's Augustinus itself. As its title betokens, this was a devotional commentary on the Scriptures, wherein Quesnel managed to explain the aims and ideals of the Jansenist party better than any earlier writer had done; and it accordingly became the chief object of Jesuit attack. It appeared in many forms and under various titles, the original germ going back so far as 1668; the first complete edition was published in 1692. The bull Unigenitus, in which no fewer than 101 sentences from the Réflexions morales were condemned as heretical, was obtained from Clement IX, on the 8th of September 1713. Quesnel died at Amsterdam on the 2nd of December 1719.

QUETELET, LAMBERT ADOLPHE JACQUES (1767—1844), Belgian astronomer, meteorologist and statistician, was born at Ghent on the 22nd of February 1767, and educated at the lyceum of that town. In 1819 he was appointed professor of mathematics at the atenaeum of Brussels; in 1828 he became lecturer at the newly created museum of science and literature, and took part in the work which had been absorbed in the free university in 1834. In 1828 he was appointed director of the new royal observatory which it had been decided to found, chiefly at his instigation. The building was finished in 1832, and the instruments were ready for work in 1835, from which date the observations were published in 40 volumes (Annales de l'Observatoire Royal de Bruxelles), but Quetelet chiefly devoted himself to meteorology and statistics. From 1834 he was perpetual secretary of the Brussels Academy, and published a vast number of articles in its Bulletin, as also in his Journal, Correspondance mathématique et physique (11 vols., 1825—39). He died at Brussels on the 9th of February 1844; and from 1836 to 1844 he was from 1836 attached to the observatory, and on his death succeeded him as director. He made a great number of observations of stars with proper motion.

Quetelet's astronomical papers refer chiefly to shooting stars and similar phenomena. He organised extensive magnetic and meteorological observations, and in 1839 he started regular obervations among a large number of individuals is represented by an ordonate of the physical and intellectual qualities of man, and on the "average man" both physically and intellectually considered. In 1836 Quetelet brought out the first volume of his Traité de statistique sociale, and in 1844 Du système social et des lois naturelles (16th ed.). In these works he shows how the numerous tables representing the individual qualities of man are grouped round the numbers referring to the "average man" in a manner exactly corresponding to that in which single results of observation are grouped round the mean result, so that the principles of probability may be applied to statistical researches on the subjects. These ideas are further developed in various papers in the Bulletin and in his L'Anthropométrie, ou mesure des différentes facultés de l'homme (1871), in which he lays great stress on the universal applicability of the binomial law, according to which the number of cases in which, for instance, a certain height occurs is represented by a curve (the binomial) symmetrically situated with regard to the ordinate representing the mean result (average height). A detailed Essa sur la vie et les travaux de L. A. J. Quetelet, by his pupil and assistant E. Malvy, was published at Brussels in 1875.

QUETTA, the capital of British Baluchistan, India, which also gives its name to a district. It rose to prominence in 1879, when Sir Robert Sandeman founded a residency there. The name is a variation of the word kwat-bat, signifying a fortress, and the place is still locally known as Shal Kat. Quetta is the southernmost point in the line of frontier posts and system of strategic railways on the north-west frontier of India, 536 m. by rail N. of Karachi. It forms the headquarters of the fourth division of the southern army, with a strong garrison of all arms. The railway was built in 1879, with a view to its continuance to Kandahar; but its present terminus is New Chaman on the Afghan border. A branch line to Nushki was completed in 1905. The cantonment and
 civil station of Quetta stand in the open plain about 5,500 ft. above sea-level, within a ring of mountains (such as Takatu, Murad and Chiltain), which overlook it from a height of over 11,000 ft. To the north-west the view is open across the base of the Fishin valley to the Kohjak Pass and Kandahar. Southwards is the open valley leading to the Bolan Pass, traversed by the railway. North of Quetta is the open plain leading to Pishin and the Harmai, also traversed by the Sibi-Pishin railway, which passes through the fortifications. These defensive works, stretching from the base of Takatu to the foot of the Mashelak hills on the west, bar the way to advance from the Kohjak Pass. During the last quarter of the 19th century Quetta grew from a dilapidated group of mud buildings, with an inferior bazaar and a few scattered remnants of neglected orchard cultivation, into a strong fortress, and one of the most popular stations of the Indian army. Quetta was visited by the prince of Wales (George V.) in 1906, and a staff college for the Indian army was opened here in 1907. It has become the trade mart for western Afghanistan, eastern Persia, and much of central Asia. The population of the town and cantonment in 1901 was 24,584.

The District of Quetta (including Pishin) has an area of 5127 sq. m. Pop. (1901) 114,057, of whom more than three-fourths are Afghanis, showing an increase of 45% in the decade. The general aspect of the country is hilly, rocky and sterile, particularly towards the north; but in many parts the soil is rich and good, yielding wheat, rice, madder, tobacco, and lucerne, besides numerous grasses. The district has abundant orchards, furnishing grapes, apples, pears, pomegranates, figs, &c.; melons and all kinds of English vegetables are also largely cultivated. The valley is watered by the Pishin Lora and by government irrigation works, including artesian wells. Wild sheep and goats abound in the hills of the district. The climate appears to be healthy and the temperature moderate, ranging from 40°F. in the winter to about 78°F. in the summer. The annual rainfall (including snow) averages about 10 in. The actual line of valley which contains Quetta and the Bolan Pass was originally rented from the khan of Kalat on terms which were changed in 1882 to a quit-rent of Rs25,000 per annum, and a further compensation of Rs30,000 in lieu of transit duties in the Bolan Pass. This perpetual leasehold was afterwards extended so as to include the British government the command of the trade route to Sistan. The Quetta district is now administered, together with the assigned districts of Pishin, Tal Chotiali, and Sibi (assigned by the treaty of Gandamak as being nominally Afghan territory) by a regular staff of civil officials.

See Thornton, Life of Sir Robert Sandeman (London, 1866); Quetta or Shek (in the Biblical text rendered Shecaniah) (T. H. H.)*

**QUEUE or CUE** (from Fr. queue, O. Fr. cue, Lat. candua, tail) a tail of hair, either of the natural hair when so worn or of a wig, plaited together and tied with ribbon, hanging down the back of the neck. In Europe and European colonies and settlements this method of wearing the hair prevailed after the heavy periwig had gone out of fashion. The bob-wig or tie-wig with the queue survives in the English barrister's wig. In the second half of the 18th century the queue was worn thick and short and sometimes encased in leather, when it was termed a "club." In the navy and army the queue survived its disuse in civil life. The three pieces of black velvet sewn on to the collar of the full dress tunic of the officers of the Royal Welsh Fusiliers, and styled the "flash," are said to be a relic of the ribbon which tied the queue. The most familiar use of this fashion of wearing the hair is the pigtail of the Manchus, which was imposed on all Chinese men as a symbol of loyalty and obedience at the conquest of China (see china: Social Life). A particular meaning of the word is for the line of persons formed in order awaiting their turn for admission to a theatre or other place. This appears also in French, from which it is borrowed. In the form "cue" (Fr. queue) the word is used of the tapering, striking implement in the game of billiards (g.v.). It is often stated that the theatrical use of "cue" for the concluding words of an actor's dialogue or speech which marks the beginning of another actor's part is merely an adaptation of the meaning of tail. The New English Dictionary points out that there is no trace of Julius Lippsius on questions of Greek and Latin literature. His abstruse studies influenced Quevedo's style; to them are due the pedantic traits and mania for quotations which characterize most of his works.

He betook himself to the court and mingled with the society that surrounded Philip III. The cynical greed of ministers, the meanness of their flatterers, the corruption of the royal officers, the financial scandals, afforded ample scope to Quevedo's talent as a painter of manners. At Valladolid, where the court resided from 1601 to 1606, he mingled freely with these intrigues and disorders, and lost the purity of his morals but not his uprightness and integrity. In 1611 he fought a duel in which his adversary was killed, fled to Italy, and later on became secretary to Pedro Téllez Girón, duke de Osuna, and viceroy of Naples. Thus he learned politics—the one science which he had perhaps till then neglected,—initiated himself into the questions that divided Europe, and penetrated the ambitions of the neighbours of Spain, as well as the secret history of the intrigues protected by the favour of Philip III. The result was that he wrote several political works, particularly a lengthy treatise, La Política de Dios (1626), in which he lays down the duties of kings by displaying to them how Christ has governed His church. The disgrace of Osuna (1629) compromised Quevedo, who was arrested and exiled to his estate at La Torre de Juan Abad in New Castle. Though involved in the process against the duke, Quevedo remained faithful to his patron, and bore banishment with resignation. On the death of Philip III. (31st of March 1621) he recommended himself to the first minister of the new king by celebrating his accession to power and saluting him as the vindicator of public morality in an epistle in the style of Juvenal. Olivares recalled him from his exile and gave him an honorary post in the palace, and from this time Quevedo resided almost constantly at court. He was in end of political and literary jurisdiction due to his varied relations and knowledge, but especially to his biting wit, which had no respect for persons. General politics, social economy, war, finance, literary and religious questions, all came under his dissecting knife, and he had a dissertation, a pamphlet, or a song for everything. One day he is defending St James, the sole patron of Spain, against a powerful coterie that wished to associate St Theresa with him; next day he is writing against the duke of Savoy, the hidden enemy of Spain, or against the measures taken to change the value of the currency; or once more he is engaged with the literary school of Góngora, whose affectations seem to him to sin against the genius of the Castilian tongue. And in the midst of this incessant controversy on every possible subject he finds time to compose a picarque romance, the Historia de la Vida del Buscón, llamado Don Pablo, Exemplo de Vagamundos, y Espejo de Tacaños (1628); to write his Sueños (1627), in which all classes are flagellated; to pen a dissertation on The Constancy and Patience of Job (1631), to translate St Francis de Sales and Seneca, to compose thousands of verses, and to correspond with Spanish and foreign scholars.

But Quevedo was not to maintain unscathed the high position won by his knowledge, talent, and biting wit. The government
of Olivarès, which he had welcomed as the dawn of a political and social regeneration, made things worse instead of better, and led the country to ruin. Quevedo saw this and could not hold his peace. An anonymous petition in verse enunciating the grievances of his subjects was found, in December 1639, under the very napkin of Philip IV. It was shown to Olivarès, who exclaimed, "I am ruined!"; but before his fall he sought vengeance on the libeller. His suspicions fell on Quevedo, who had enemies glad to confirm them. Quevedo was arrested on December 7, and carried under a strong escort to the monastery of St. Mark at Leon, where he was kept in rigorous confinement till the fall of the minister (January 1643) restored him to light and freedom, but not to the health which he had lost in his dungeon. He had little more than two years to live, and these were spent in inactive retreat, first at La Torre de Juan Abad, and then at the neighboring Villanueva de los Infantes, where he died September 8, 1645.

As a satirist and humorist Quevedo stands in the first rank of Spanish writers; his other literary work does not count for much. I. I. Chifflet, in a letter of February 2, 1629, calls him "the learned man to be a Spaniard," and indeed his erudition was of a solid kind, but he merits attention not as humanist, philosopher, and moralist, but as the keen polemic writer, the pitiless mocker, the profound observer of all that is base and absurd in human nature, and at the same time as a finished master of style and of all the secrets of the Spanish tongue. His style, indeed, is not absolutely pure; though he ridiculed so well the bad taste of culturanismo, he fell himself into the style called conceptismo, which strains after ambiguous expressions and alemicabed "points." But, though involved and overcharged with ideas, his diction is of singular force and originality; after Cervantes he is the greatest Spanish prose writer of the 17th century.

There is an excellent collected edition of Quevedo's prose works with a good life of the author by D. Aureliano Fernandez-Guerra (Bibl. Ribadeneyra, vols. xxii. and xlviii.); his poetical works in vol. Ixxx. of the same collection are badly edited by D. Florencio Janer. There is a second edition, enlarged, and annotated by Señor Menéndez y Pelayo. E. Mérimée, in Éssais sur la vie et les œuvres de Francisco de Quevedo (Paris, 1886), has supplied an excellent critical and biographical monograph with a bibliography.

Quezal, or Quezel, the Spanish-American name for one of the most beautiful of birds, abbreviated from the Aztec or Maya Quezalcoatl, the last part of the compound word meaning fowl, and the first, also written Cuetzal, the long feathers of rich green with which it is adorned. The Quezal is one of the Trogons (q.v.), and was originally described by Hernandez (Historia, p. 13), whose account was faithfully copied by F. Willughby. Yet the bird remained practically unknown to ornithologists until figured in 1825, from a specimen belonging to Leadbeater, by C. J. Temminck (Pl. col., 372), who, however, mistakenly thought it was the same as the Trogon pavoninus, a congenic but quite distinct species from Brazil, that had just been described by Spix. The scientific determination of the Quezal-bird of Central America seems to have been first made by C. L. Bonaparte in 1826, as Trogon paradiseus, according to his statement in the Zoological Society's Proceedings for 1837 (p. 101); but it is not known whether the fact was ever published. In 1832 the Registro Trimestre, a literary and scientific journal printed at Mexico, contained a communication by Dr. Pablo de la Llave, describing this species (with which he first became acquainted before 1810, from examining more than a dozen specimens obtained by the natural-history expedition to New Spain and kept in the palace of the Retiro near Madrid) under the name by which it is now known, Phoramacus mocina.

These facts, however, being almost unknown to the rest of the world, J. Gould, in the Zoological Proceedings for 1835 (p. 29), while pointing out Temminck's error, gave the species the name of Trogon resplendens, which it bore for some time. Yet little or nothing was generally known about the bird until Delattre sent an account of his meeting with it to the Echo du monde savant for 1843, which was reprinted in the Revue zoologique for that year (pp. 163-165). In 1860 the nidification of the species, about which strange stories had been told to the naturalist last named, was determined, and its eggs, of a pale...
QUEZALTENANGO—QUIBERON

blush-green, were procured by Robert Owen (P. Z. S., 1860, p. 374; Ibis, 1861, p. 66, pl. ii. fig. 1); while further and fuller details of its habits were made known by O. Salvin (Ibis, 1881, pp. 138-140), from his own observation of this very local and remarkable species. Its chief home is in the mountains near Coban in Vera Paz, but it also inhabits forests in other parts of Guatemala at an elevation of from 6000 to 9000 ft.

The Quezal is hardly so big as a Turtle-Dove. The cock has a fine yellow bill and a head bearing a rounded crest of filamentous feathers; lanceolate scapulars overhang the wings, and from the rump spring the long flowing plumages which are so characteristic of the species, and were so highly prized by the natives before the Spanish conquest that no one was allowed to kill the bird when taken, but only to divert it of its feathers, which were to be worn by the chiefs alone. These plumes, the middle and longest of which may measure from 3 ft. to 3½ ft., with the upper surface, the throat, and chest, are of a resplendent golden-green,1 while the lower parts are of a vivid scarlet. The middle feathers of the tail, ordinarily concealed, are as those of the Peacock, by the uropygials, are black, and the outer white with a black base. In the hen the bill is black, the crest more round and not filamentosus, the uropygials scarcely elongated, and the vent only scarlet. The eyes are of a yellowish-brown. Southern examples from Costa Rica and Veragua have been taken in such numbers, and have been considered to form a distinct species, P. pavo.

Among other species are P. autisanus, P. fulgidus, P. curicero, and P. pavo, from various parts of South America, but though all are beautiful birds, none possess the wonderful singularity of the quezal.

QUEZALTENANGO, the capital of the department of Quezaltenango, Guatemala, 70 m. by road W. of Guatemala city and at the terminus of a railway from Camperico on the Pacific coast. Pop. (1905) about 37,000. It is situated on the river Siguala, and at the foot of the volcanos of Santa Maria. In size the second city in the republic, it has a large agricultural trade and manufactures of linen, woollen and cotton goods. It contains a fine cathedral and some good public buildings, including two national institutes for higher education; and it is well supplied with water and electricity for light and power. The majority of its inhabitants are Indians or half-breeds of Quiché descent. Quezaltenango was the capital of a Quiché kingdom, and was known as Xelahu or Xelahue until 1524; when it was conquered by the Spaniards under Pedro de Alvarado. In 1902 it was partially destroyed by an earthquake and an eruption of Santa Maria.

QUIBERON, CAMPAIGN AND BATTLE OF. Quiberon Bay, on the S. coast of Brittany, France, was the scene of the great naval battle which took place before the fleet laid by the ministers of King Louis XV. of France, for the invasion of England in 1759, during the Seven Years' War (q.v.). An army had been collected at Vannes, in the south-east of Brittany, and transports had been brought together in the landlocked waters of the Morbihan which are connected with Quiberon Bay. The scheme of the French ministers was to combine twenty-one ships of the line lying at Brest under the command of M. de Conflans, with twelve which were to be brought round from Toulon by M. de la Clue. The army was then to be carried to some point on the coast of England or Scotland by the united squadrons. The British government was well informed of its enemy's intentions, and took vigorous measures of defence. Admiral Sir E. Hawke, afterwards Lord Hawke, was directed to blockade Brest with a fleet of twenty-five sail of the line, four ships of fifty guns and nine frigates. The four ships of fifty guns together with four frigates were detached, first under Commodore John Reynolds, and then under Commodore Robert Duff, to lie in Quiberon Bay and watch the entry to the Morbihan. During the whole summer, from the beginning of June, Sir E. Hawke kept his station off Brest, and the detached squadron occupied Quiberon Bay. The task of blockading M. de la Clue at Toulon was given to Edward Boscawen, who had with him fourteen sail of the line. Boscawen reached his station on the 16th of May 1759. At the beginning of July want of stores and water, together with the injury inflicted on some of his vessels by a French battery, compelled him to go to Gibraltar to provision and refit. He reached the port on the 4th of August. On the 5th M. de la Clue left Toulon, and on the 17th passed the straits of Gibraltar, where he was sighted by the look-out ships of Boscawen. The British fleet hurried out to sea, and pursued in two divisions, separated by a distance of some miles owing to the haste with which they left port. During the night of the 17th and 18th of August five of M. de la Clue's ships lost sight of his flagship, and steered for Cadiz. The other seven, which were reinforced by the squadron which had been detached for the protection of a convoy, were overtaken by Boscawen and attacked in the afternoon of the 18th. One, the “Centaur” (74), was captured after a very gallant resistance, in which the British flagship was severely damaged. During the night of the 18th-19th of August, two of the French ships altered course to the west, and escaped. The remaining four fled to the north, and into Portuguese waters, where two were driven ashore and destroyed, while two were captured near Lagos. The five in Cadiz were blockaded by Boscawen's second-in-command, Admiral Broderick. La Clue was mortally wounded, and died ashore in Portugal. Although the damage sustained by the French fleet during the engagement of their forces, the French ministers decided to persevere with the invasion. M. de Conflans was ordered to put to sea. On the 9th of November a severe gale forced Sir E. Hawke from in front of Brest, and as his ships were in want of stores he sailed for Torquay. Finding the way clear, Conflans put to sea on the 14th, and steered for Quiberon. Sir E. Hawke left Torquay to resume his station on the same day. On the 15th he learnt from a look-out ship that the French had been seen at sea to the north-west of Belleisle, and steering south-west. Concluding that they were bound for the Morbihan he followed. Calms and contrary winds prevented either fleet from making much progress till the evening of the 19th, when the French were rather over 60 m. to the south-west of Belleisle, which is south of Quiberon. The wind had now changed to the north-west and was beginning to blow hard. M. de Conflans made for Quiberon under reduced canvas for fear of making the land in the night, the coast being one of the most dangerous in the world, on account of the rocky islands of Houat and Hoedik, and the long string of reefs which lie inside Belleisle. Hawke was steering in the same direction farther out at sea. On the morning of the 20th of November, Conflans was nearing the south point of Belleisle. The small squadron of Commodore Duff, warned of his approach, endeavoured to intercept him, but the plan laid by the ministers of King Louis XV. of France, for the invasion of England in 1759, during the Seven Years' War (q.v.). An army had been collected at Vannes, in the south-east of Brittany, and transports had been brought together in the landlocked waters of the Morbihan which are connected with Quiberon Bay. The scheme of the French ministers was to combine twenty-one ships of the line lying at Brest under the command of M. de Conflans, with twelve which were to be brought round from Toulon by M. de la Clue. The army was then to be carried to some point on the coast of England or Scotland by the united squadrons. The British government was well informed of its enemy's intentions, and took vigorous measures of defence. Admiral Sir E. Hawke, afterwards Lord Hawke, was directed to blockade Brest with a fleet of twenty-five sail of the line, four ships of fifty guns and nine frigates. The four ships of fifty guns together with four frigates were detached, first under Commodore John Reynolds, and then under Commodore Robert Duff, to lie in Quiberon Bay and watch the entry to the Morbihan. During the whole summer, from the beginning of June, Sir E. Hawke kept his station off Brest, and the detached squadron occupied Quiberon Bay. The task of blockading M. de la Clue at Toulon was given

QUICHÉ—QUICK

destroyed, among the latter was the flagship of Conflans, who escaped to the shore on a spar. Seven of the French ships ran into the little river Vilaine, being compelled to throw their guns overboard to lighten themselves before crossing the bar. Nine escaped to the south. The small number of prizes taken gives no measure of the importance of the victory, which broke the spirit and strength of the French fleet so effectually that it did not appear at sea again during the rest of the war, until 1753.

QUICHÉ or Quiché, a tribe of Central American Indians of Mayan stock. They inhabited western Guatemala, where their descendants still survive. They were at the time of the conquest the most powerful of the three Mayan peoples in Guatemala, the other two being the Cakchiquel and the Zutugi. Their chronicles are said to date back to the 9th century. Their sacred book, the Popol Vuh, containing a mythological cosmogony, survives in a 17th-century manuscript written by a Christianized Guatemalan. To this tradition may be due the remarkable similarity of the Quiché creation story to that of the Old Testament. Their capital was Uatlatán, near the site of the modern Santa Cruz Quiché, and was skillfully fortified. They had an elaborate system of government and religion. Records were kept in picture-writing. The Quiché were the first Indians met by Pedro de Alvarado in 1524 on his expedition into Guatemala.

See further CENTRAL AMERICA and MEXICO; for the Popol Vuh see English edition by L. Spence (1909); see also Nuttall, Ancient American Civilisations (Camb. Mass., 1901), and W. Bollaeert in Proc. Roy. Soc. Litt. vii. 1862.

QUICHERAT, Jules ÉTIENNE JOSEPH (1814–1882), French historian and archaeologist, was of Burgundian origin. His father, a working cabinet-maker, came from Paray le Monial to Paris to support his large family; Quicherat was born there on the 13th of October 1814. He was fifteen years younger than his brother Louis, a great Latin scholar and lexicographer, who survived him. Although very poor, he was admitted to the college of Sainte-Barbe, where he received a thorough classical education. He showed his gratitude to this establishment by writing its history (Histoire de Sainte-Barbe, collège, communauté, institution, 3 vols. 1860–1864). At the end of his studies he hesitated for some time before deciding what career he would follow, until Michelet put an end to his indecision by inspiring him with a taste for history. In 1835 Quicherat entered the École des Chantres; he left two years later at the head of the college. Once more inspired by the example of Michelet, who had just written an admirable work on Joan of Arc (1845), he published the text of the two trials of Joan, adding much contemporary evidence on her heroism in his Procs de condamnation et de réhabilitation de Jeanne d'Arc (5 vols. 1842–1849), as well as a volume of Aperçus nouveaux sur l'histoire de Jeanne d'Arc, in which it seems that the last word has been said on important points. From the 15th century he drew other inspirations. He published memoirs of the adventures of a brigand, Rodrigo de Villandrando (1844), which gradually grew into a volume (1877), full of fresh matter. He wrote full biographies of two chroniclers of Louis XI., one very obscure, Jean Castel (in the Bibliothèque de l'École des Chantres, 1830), the other, Thomas Basin, bishop of Lépesses, who was, on the contrary, a remarkable politician, prelate and chronicler. Quicherat published the works of the latter, most of which were now brought out for the first time (4 vols. 1855–1859). In addition to these he wrote Fragments inédits de Georges Chastellain (1842), Lettres, mémoires et autres documents relatifs à la guerre du bien public en 1465 (1843, in vol. ii. of Mélanges historiques, part of Documents inédits, &c. These works did not wholly occupy his time: in 1847 he inaugurated a course of archaeological lectures at the École des Chantres, and in 1849 was appointed professor of diplomacy at the same college. His teaching had exceptionally good results. Although he was not eloquent and had a nasal voice, his hearers were loth to miss any of his thoughtful teaching, which was unbiased and well expressed. Of his lectures the public saw only some articles on special subjects which were distributed in a number of reviews. Note should be made of a short treatise on La Formation française des anciens noms de lieu (1869); a memoir De l'ogive et de l'architecture dite ogivale (1876), where he maintained the use of stone arches important for the history of religious architecture; an article on L' Âge de la cathédrale de Louv (1874), in which he fixed the exact date of the birth of Gothic architecture; Histoire du costume en France (1875; 2nd ed. 1877), which was first published in the form of anonymous articles in the Magasin pittoresque, and which the author wished to retain the character of a popular work. Following the advice of his friends, he began to write out, towards the end of his life, his lectures on archaeology, but only the introductory chapters, up to the 11th century, were found among his papers. On the other hand, the pupils trained by him circulated his principles throughout France, recognizing him as the founder of national archaeology.

In one point he seems to have taken a false step; with a veracity and pertinacity worthy of a better cause he maintained the identity of Caesar's Alesia with Alaise (Doub), and he died without becoming a convert to the opinion, now universally accepted, that Alaise Sainte-Reine (Côte d'or) is the place where Vercingetorix capitulated. But even this error benefited science; some well directed excavations at Alaise brought many Roman remains to light, which were subsequently sent to enrich the museum at Besançon. After 1871, his course of lectures on diplomacy having been given up, Quicherat, still professor of archaeology, was nominated director of the École des Chantres. He filled this post with the same energy which he had shown in the many scientific commissions in which he had taken part. In 1878 he gave up his duties as professor, which then fell to the most conspicuous of his pupils, Robert de Lasteyrie. He died suddenly at Paris on the 8th of April 1882, a short time after having corrected the proofs of Supplément aux témoignages contemporains de Jeanne d'Arc, published in the Revue historique. After his death it was decided to bring out his hitherto unpublished papers (Mélanges d'archéologie et d'histoire, vol. i., Celtic, Roman and Gallo-Roman antiquities, ed. A. Giry and Aug. Castan, 1885; vol. ii., Archéologie du moyen âge, ed. R. de Lasteyrie, 1886); among these are some important fragments of his archaeological lectures, but his Histoire de la loaine, with which he was occupied for many years, is missing.

QUICHUA, a South American Indian tribe and stock, the ruling people of Peru when the Spaniards arrived. The Quichuan stock then included the Quichuas proper and the many vassal tribes of the ancient empire of Peru. To-day it numbers some three millions. The modern Quichuas average a height of 5 ft. to 5 ft. 6 in. They are of slender build, but with well proportioned muscular limbs, and are capable of enduring great fatigue. Their complexes are of a fresh olive colour, the skin very smooth and soft, beardless, hair straight and black, the nose aquiline. They are skillful farmers and herdsmen. (See PERU.)

QUICK, a word which, by origin, and in early and many subsequent uses, meant “alive.” It is common to Teutonic languages, cf. Ger. koch, lively, Du. kwik, and Dan. kvik; cf. also Dan. kvæg, cattle. The original root is seen in Skt. jíva; Lat. viva, living, alive; Gr. ψός, life. In its original sense the chief uses are such as “the quick and the dead,” of the Apostles' Creed, a “quickset” hedge, i.e. consisting of slips of living privet, thorn, &c., the “quick,” i.e. the tender parts of the flesh under hard skin or particularly under the nail. The phrase “quick with child” is a conversion of with a quick, i.e. living child. From the sense of having full
QUIERZY—QUIETISM

vigour, living or lively qualities or movements, the word got its chief current meaning of possessing rapidity or speed of movement in the 16th century. It is thus used in the names of things which are in a constant or easily aroused condition of movement, e.g. "quicksand," loose water-logged sand, readily yielding to weight or pressure, and "quicksilver," the common name of the metal mercury (q.e.).

QUERZY [KERSY], CAPITULARY OF, a capitulary of the emperor Charles the Bald, comprising a series of measures for safeguarding the administration of his realm during his second Italian expedition, as well as directions for his son Louis the Stammerer, who was entrusted with the government during his father's absence. It was promulgated on the 14th of June 877 in France (dep. of Aisne), the site of a Carolingian royal palatium, before a great concourse of lords. In this document Charles takes elaborate precautions against Louis, whom he had every reason to distrust. He forbids him to sojourn in certain palaces and in certain forests, and compels him to swear not to despoil his stepmother Richilde of her allodial lands and benefices. At the same time Charles refuses to allow Louis to nominate to the countships left vacant in the emperor's absence. In principle the honoræ (benefices) and the office of a deceased count must be given to his son, who would be placed provisionally in possession by Louis; the duty ought to be performed, however, could be conferred only by Charles. The capitulary thus served as a guarantee to the aristocracy that the general usage would be followed in the existing circumstances, and also as a means of reassuring the counts who had accompanied the emperor into Italy as to the fate of their benefices. It cannot, however, be regarded as introducing a new principle, and the old opinion that the capitulary of Quierzy was a legislative text establishing the hereditary system of fiefs has been proved to be untenable. A former capitulary of Charles the Bald was promulgated at Quierzy on the 14th of February 857, and aimed especially at the repression of brigandage.

See E. Bourgeois, Le Capitulaire de Quierzy-sur-Oise (Paris, 1885), and L'Assemblee de Quierzy-sur-Oise "in Gazettes d'histoire du moyen-àge, dédiées à Gabriel Monod" (Paris, 1890). (R. Po.)

QUIETISM, a complicated religious movement that swept through France, Italy and Spain during the 17th century. Its chief apostles were Miguel de Molinos, a Spaniard resident in Rome; Fénelon, the famous French divine, and his countrywoman, Madame Jeanne Marie Guyon. Quietism was essentially a reaction against the bureaucratic eclecticism which always latent within the church of Rome, though it had come more especially to the front during the struggles of the counter-Reformation carried on through the Jesuits. A Catholic cut to the orthodox pattern did not look, and would have thought, it wrong to look, beyond the spiritual fare provided for him by the ecclesiastical authorities; all his relations with his Maker were conducted through the intermediary of the Church. In the dogmatic sphere he believed whatever the Church believed, because the Church believed it; to the Church's institutions—the sacraments and the confessional—he looked for guidance in the practical affairs of life. Protestantism had tried to put an end to this state of things by sweeping away the Church altogether, but the Quietists were more tolerant than Luther. They did not want to abolish the Church; they admitted that it was a necessary stage in the evolution of the human soul; but they insisted that it could only bring a man on to the lowest slopes of Paradise. Those who aspired to be really holy must learn to look beyond the Church, and enter into immediate, personal relations with their Maker. But how were they to do so? Like their contemporaries, the French Jansenists, and the Quakers and Anabaptists of northern Europe, the Quietists fell back on a doctrine of immediate inspiration of the individual conscience. To the many God spoke only in general terms through the Church; but to the few He made His will directly known. But how did He do so? How distinguish the voice of God from the vagaries of our own imagination? Quetiam offered an easy test. The less "sense of proprietorship" a man had in his own good actions—the more they came from a source outside himself—the surer might he be that they were divine. If, on the other hand, they were the fruit of his deliberate thought and will, that was enough to show that they did not come from God, but from his sinful self. Hence the first duty of the Quietist was to be "passive." So far as was possible he must numb all his spontaneous activities of every kind; then he could fold his hands, and wait in dreamy meditation until inspiration came. And since all our activities have their root in desire, the shortest road to passivity was to suppress all desires and wishes of every kind. Thus the great object of the Quietist was to cut off the "projector in the breast," sat-conscious will. Then he would be dead to hope and fear; he would be fully incapable of any action, either in this world or the next. Henceforward no human tastes or affections would stand in the way of his performing the will of God. He was, as Fénelon said, like a feather blown about by all the winds of grace. His mind was a mere tabula rasa, on which the Spirit printed any pattern that it chose. Hence arose the great Quietist doctrine of disinterested love. "The Quietists maintain," says a contemporary writer, "that Christian perfection means a love of God so absolutely free from all desire of happiness that it is indifferent to salvation. The soul is moved neither by hope nor fear, but by the knowledge of God and an equally strong desire to do the will and promote the glory of God. Other things are of no account: neither grace, nor merit, nor happiness, nor even perfection, in so far as it attaches to us. Nay, the soul must be ready to renounce its hopes of heaven, and the scrupulous will often feel themselves bound to do so; for in the last and fiercest trials they are invincibly persuaded of their own damnation. In this sentence of condemnation they generously acquiesce; and henceforward, having nothing more to lose, they stand tranquil and intrepid, without fear and without remorse. This is what the Quietists call the state of their sojourn in their sacred silence. But what are their wishes for action, all sense of proprietorship in itself, and all that will lead them to the mettalebranché, ed. Ingold, Paris, 1886, p. 271)." Quietism is an outgrowth from the mysticism of the great 16th-century Spaniards, St Teresa and St John of the Cross, though it would be unfair to hold them responsible for all the utterances of their disciples. Certainly St Teresa made much of "passivity," but she only regarded it as a refuge for a few specially constituted souls; whereas the Quietists designedly brought it within the reach of everyone. In St Teresa the passivity itself was balanced by a strong attachment to the virtues of the active life, and an equally strong devotion to the Church. Among the Quietists both these checks disappear, and passivity becomes the one and only test of holiness. But if passivity is all in all, there is no room for the virtues of the active life; all Quietists cherished the ancient saying that one moment's contemplation is worth a thousand years' good works. Still less room had they for the Church. It only professed to guide men to God; but those who had already found God stood in no need of a guide. Nay, they did not even stand in need of revelation. "If Christ be the way," wrote the Quietist Malaval, "let us certainly pass by Him to God, but he who is always passing never arrives at his journey's end." Such utterances go far to explain the severity with which the Roman Church tried to stamp out the later developments of Quietism. In its earlier stages, before it had crystallized into a definite doctrine, the ecclesiastical authorities had been tolerant enough. The Spanish monk, Juan Falconi, who is generally reckoned as the father of Quietism, died in the odour of sanctity in 1632; some thirty years later his fellow-countryman, Molinos, transported his doctrines to Rome, where they gained unparalleled popularity with bishops and cardinals, and even with pope Innocent. In 1675 Molinos published the Guida Spirituale, the great death-book of modern Quietism. But his success soon aroused the suspicion of the Jesuits, the great champions of militant eclecticism. "Passivity" accorded ill with a sects
frequentation of the confessional, their chief centre of influence.
Failing to turn public opinion against Molinos in Rome, they brought pressure to bear on Louis XIV. through his confessor, Père La Chaise. At the instance of the French ambassador Molinos was arrested (1685); his papers were seized, and his chief disciples examined by the Inquisition. Two years later he was convicted of heresy, and sentenced to imprisonment for life.

The later stages of the Quilimeane case were played out in France. Here Quietist ideas had long been spreading under the leadership of enthusiasts like François Malaval (1627-1719), a blind layman of Marseilles. A more romantic figure was Jeanne Marie Guyon (1648-1717), a widow of good family and remarkable personal charm, who devoted her life to missionary journeys on behalf of “passivity.” In 1688 fate brought her to the French court, where she made a great impression on Mme. de Maintenon and other persons of quality. But her most illustrious captive was Fénélon, then tutor to the duke of Burgundy, eldest son of the Dauphin. “They met,” says Saint-Simon; “they pleased each other, and their sublime amalgamation.” In other words, they corresponded with a freedom that Fénélon afterwards had cause to regret. For Mme. Guyon’s paradoxical and extravagant language soon scandalized her friends. In 1693 she was examined by Bossuet, and dismissed with a severe caution. Further improprieties led to her arrest, and a long imprisonment in the Bastille. On her release in 1703 she settled down quietly at Blois, where she died in 1717. Meanwhile Fénélon had become involved in her fortunes. When Bossuet first took action, Fénélon defended her with a zeal that drew down suspicion on his own head; and he was only promoted to the archbishopric of Cambrai after signing what was really a disguised retractation (1695). Meanwhile Bossuet was at work on an Instruction sur les états d’oraison, which was intended to distinguish once for all what was true in Quietism from what was false. Fénélon, feeling sure that Bossuet would do the Quietists less than justice, determined to be beforehand with him. While Bossuet’s book was still in the press, he suddenly brought out an Explanation des maximes des saints (1697). The little volume raised a violent storm. For two years Fénélon was at bitter feud with Bossuet; he was banished from Versailles; finally, he was censured by the pope (1699), although in very measured terms. For Fénélon by no means she was the first. Jeanne Marie Guyon, in the language of the divinity schools he was, at most, a more ecstatic state of Quietism, so much in evidence with his friend, he had no taste whatsoever; but he thought that “passivity,” when interpreted with large modifications, led the way to a state of peaceful, other-world serenity highly grateful to the denizens of a crowded court, where was much splendid ennui and but little peace. Further, he was the counsellor of many over-scrupulous souls; and Quietist disinterestedness, also much modified, enabled him to tell them that they were not necessarily castaways because they suffered much from “spiritual dryness,” and seldom enjoyed the sweets of piety. But in the heat of battle with Bossuet, Fénélon carried his principles beyond all reasonable bounds. The theme of his Maximes is that, as men grow in holiness they become utterly indifferent to themselves. Not only do they cease to covet the consolations of religion; they lose all incidental pleasure in its exercise. Their whole soul is taken up in loving God; and they neither know nor care whether God loves them in return. But Bossuet had little trouble in persuading the world that “Wenn ich Dich liebe, was geht es Dich an? is but a sorry foundation on which to build up a personal religion; and the eventual proof of the deathblow to official Quietism. But flickers of the spirit of Molinos, not always easily distinguishable from the teaching of Molinos, are still here and there produced by violent reaction from the prevailing legalism of the church of Rome.

**QUILIMEANE, or KILMANE (the former being the Portuguese spelling), a town of Portuguese East Africa, in 18° 4' S., 36° 59' E., 14 m. inland from the mouth of the river Quilimeane or Qua Qua. The river, an independent stream during the rest of the year, during the rainy season becomes a deltaic branch of the Zambezi, with which it is connected by a channel called Mutu. The town (officially São Martinho de Quilimeane) lies on the north bank of the river at a point where it is about a mile broad. There is ample and deep anchorage in the river, but the entrance is obstructed by a bar, over which there is 0 ft. of water at low tide, and from 16 to 22 ft. at high tide. Almost all the European merchants live in one long, arcacia-shaded street or boulevard skirting the river, while the Indian merchants or Banyans occupy another street running at right angles to the first street. Behind lies the native town. The total population in 1909 was 2200, including 400 Europeans and 320 Asians. The trade of Quilimeane, formerly the only port for the produce of the Zambezi valley, steadily declined after the establishment of Chinde (q.v.). Efforts made at the beginning of the 20th century to develop local resources met with little success, owing to high duties and freights. A railway 18 m. long runs to Maquiala, a large prazo for the cultivation of tropical produce. The imports are largely cotton goods from England and India, provisions from Portugal, and hardware from Germany. The exports are chiefly copra, ground-nuts, sugar, sesame, indiarubber, wax, ivory, and beans. The average annual value of the trade for the ten years 1897-1906 was—imports £60,509, exports £34,547. The natives are noted for their skill in the manufacture of jewelry, chiefly gold and silver ornaments. The town lies low and is unhealthy, despite efforts to improve its condition.

The Quilimeane river was entered by Vasco da Gama in 1498, who there discovered an Arab settlement. The present town was founded by the Portuguese in the 16th century, and became in the 18th and the early part of the 19th centuries one of the great slave markets on the east coast of Africa. It was the starting-point of several notable expeditions—that of Francisco Barreto to the country of the Monomotapa in 1560, and that of David Livingstone up the Zambezi to Lake Nyasa in 1861 being the most famous. Until 1853 the trade of the port was forbidden to any save Portuguese. The European population, until the last quarter of the 19th century, consisted mainly of convicts from Portugal. (See Portuguese East Africa, History.)

**QUILL, a term applied to the bare, hard, hollow tube of the feather of a bird, also to the large flight feathers or remiges, and especially to the strong feathers of the goose, swan, or crow used in the making of quill pens (see Feather and Pen). The word is of obscure origin; a word with similar meaning, Kiel, is found in German, and French has quille, ninepin, apparently connected with Ger. Kegel. Certain ancient stringed instruments were played with a plectrum or plucker made of the quill of a bird’s feather, and the word has thus been used of a plectrum made of other material and differing in shape, and also of an analogous object for striking the strings in the harpsichord, spinet or virginal. The verb “to quill” is to fold lace, muslin or other light material into narrow flutes or pleats; when so pleated the material is called “quilling.” The French term “quillon,” or “quilling,” formed from quille, is applied to the projecting arms or cross guards of the hilt of a sword.

**QUILLER-COUCH, SIR ARTHUR THOMAS** (1863- ), English writer, known under the pseudonym of “Q,” was born in Cornwall on the 21st of November 1863. He was educated at Newton Abbot College, at Clifton College, and Trinity College, Oxford. After taking his degree in 1886 he was for a short time classical lecturer at Trinity. While he was at Oxford he
QUILLOTA-QUIN

published (1887) his Dead Man's Rock (a romance in the vein of Stevenson's Treasure Island), and he followed this up with Troy Town (1888) and The Splendid Spur (1889). After some journalistic experience in London, mainly as a contributor to the Speaker, in 1891 he settled at Fowey in Cornwall. His later novels include The Blue Pavilions (1901), The Ship of Stars (1899), Highway to Hell (1910), The Fort Amity (1904), The Shining Ferry (1905), Sir John Constantine (1906). He published in 1896 a series of critical articles, Adventures in Criticism, and in 1898 he completed R. L. Stevenson's unfinished novel, St Ives. From his Oxford days he was known as a writer of excellent verse. With the exception of the parodies entitled Green Bays (1893), his poetical work is contained in Poems and Ballads (1896). In 1895 he published a delightful anthology from the 16th and 17th-century English lyricists, The Golden Pomp, followed in 1900 by an equally successful Oxford Book of English Verse, 1529-1900 (1900).

In Cornwall he was an active worker in politics for the Liberal party. He was knighted in 1919.

QUILLOTA, a town of Chile in the province of Valparaíso, on the left bank of the Aconcagua river, 20 m. above its mouth and 26 m. E.N.E. of the city of Valparaíso. Pop. (1902 estimate) 9876. The valley is noted for its beauty, fertility, and healthfulness, and is the centre of growing fruit and wine industries. Among its fruits is the "chirimoya" (Annona cherimola). There are rich copper mines in the vicinity. Quillota is situated on a railway between Valparaíso and Santiago, which passes through a mountainous, semi-barren country. It is one of the oldest towns of Chile, dating from the first years of the conquest.

QUILON, a seaport of India, on the Malabar coast, in the state of Travancore. Pop. (1901) 15,601. Quilon enjoys great facilities of water communication, and has an active export trade in timber, cocoa-nuts, ginger, pepper, &c. The palace of the maharaja of Travancore stands on the bank of Quilon lake, a beautiful sheet of water. Besides being on a projecting point, Quilon is rendered still more unsafe to approach by the bank of hard ground called the Tangasseri reef, which extends some distance to the south-west and west of the point and along the coast to the northward. There is good anchorage, however, in a light of about 3 m. from the fort. Quilon is one of the oldest towns on the Malabar coast, and continued to be a place of considerable importance down to the beginning of the 16th century. It is now the headquarters of the Travancore army, with a subsidiary battalion. Cotton weaving and spinning and the manufacture of tiles are the chief industries. It is the terminus of a railway across the hills from Tinnevelly. Adjoining Quilon is the British village of Tangasseri, formerly a Portuguese and then a Dutch settlement, which is administered with Anjengo; pop. (1901) 1733.

QUIT, properly a coverlet for a bed, consisting of a mass of feathers, down, wool, or other soft substance, surrounded by an outer covering of linen, cloth, or other material. In its earlier uses the "quilt" was made thick, and served as a form of mattress. The term was also given to a stitched wadding lined for body armour, and also, when made stout and closely padded, to a substitute for armour. The word came into English from O. Fr. cuilte, coile, or cuoie, mod. couette. This is derived from Lat. cuculcia or cuciliria, a stuffed mattress or cushion. From the form cuciltra came O. Fr. cotre or coure, whence coure pointre, Low Lat. cucile puncia, i.e. stitched or quilted cushion; this was corrupted to coure pointre, Eng. counterpoint, which in turn was changed to counterpane "as if from Lat. pannus, piece of cloth). Thus "counterpane," a coverlet for a bed, and "quilt," are by origin the same word.

QUIN, also Quimer, Quimerle, a town of France, capital of the department of Finistère, 158 miles northwest of Nantes and 68 miles south-east of Brest on the railway between those towns. Pop. (1906) 16,550. The delightful valley in which it lies is surrounded by high hills and traversed by the Steir and the Odet, which, meeting above the town, form a navigable channel for vessels of 150 tons to the sea (11 miles). There is a small general shipping trade. Of the town walls (15th century) a few portions are preserved in the terrace of the episcopal palace and in the neighbourhood of the college. Quimper is the seat of a bishopric in the province of Rennes. The cathedral, dedicated to St Corentin and erected between 1230 and 1515, has a fine façade (c. 1425), the pediment of which is crowned by a modern equestrian statue of King Grallon, and adorned (like several other external parts of the building) with heraldic devices in granite. Two lateral towers with modern spires (1854-56) and turrets reach a height of 247 feet. The axis of the choir is deflected towards the north, a feature not uncommon, but here exaggerated. The nave and the transept are in the style of the 15th century, and the central bays bear the arms of Anne of Brittany (1476-1514). The terminal chapel of the apse dates from the 13th century. In the side chapels are the tombs of several early bishops. The high altar, tabernacle, and ciborium are costly works of contemporary art. The pulpit panels represent episodes in the life of St Corentin. Of the other churches may be mentioned the church of Locmaria, dating from the 11th century, and the chapel of the 15th century connected with the episcopal palace. A number of houses, in wood or stone, date from the 15th, 16th and 17th centuries. The museum, built in 1869-70, contains archaeological collections and about 1500 paintings and drawings. In 1868 a bronze statue of Laennec the inventor of the stethoscope (born at Quimper in 1781) was erected in Place St Corentin.

Quin, or at least its suburb Locmaria (which lies below the town on the left bank of the Odet), was occupied in the time of the ancient Britons, the name Locmaria being a corruption of the Latin name Locmarinum, and the ancient fortifications are still visible. Later Quimper became the capital of Cornouailles and the residence of its kings or hereditary counts. It is said to have been Grallon Meur (i.e. the Great) who brought the name of Cornouailles from Great Britain and founded the bishopric, which was first held by St Corentin about 495. Hoel, count of Cornouailles, marrying the sister and heiress of Duke Conan in 1066, united the countship with the duchy of Brittany. Quimper suffered in the local wars of succession. In 1344 it was sacked by Charles of Blois. Monfort failed in his attempt to take the town by storm on August 11, 1345, but it opened its gates to his son John IV. in 1362 after the victory at Auray. At a later period it sided with the League. Doubtless on account of its distance from the capital, Quimper, like Carpentras and Landerneau, has been a frequent butt of French popular vitriol.

QUINERÉ, a town of western France, capital of an arrondissement in the department of Finistère, at the confluence of two rivers which unite to form the Laiter, 28 m. E.S.E. of Quimper by rail. Pop. (1906) town 6203, commune 6576. Quimperé grew up round the abbey of Ste Croix, founded in the 11th century, the romanesque basilica of which, restored in modern times, still remains. The church of St Michel (14th and 15th centuries), with a fine tower, crowns the hill above the town. Quimperé has a tribunal of first instance, and carries on the manufacture of farm implements, railway material, paper, &c., and trades in grain, timber, cattle and agricultural products. The town has a small port.

QUIN, JAMES (1603-1760), English actor of Irish descent, was born in London on the 24th of February 1603. He was educated at Dublin, and probably spent a short time at Trinity College. Soon after his father's death in 1710, he made his first appearance on the stage at Abel in Sir Robert Howard's The Committee at the Smock Alley Theatre. Quin's first London engagement was in small parts at Drury Lane, and he secured his first triumph at Bajazet in Nicolas Rowe's Tomorrows, on the 8th of November, 1715. The same year he appeared as Hotspur at Lincoln's Inn, where he remained for fourteen years. On the 10th of July 1718 he was convicted of manslaughter for having killed Bowen, another actor, in a duel which the victim had himself provoked. Quin was not severely punished, the affair being regarded as more of an accident than a crime. The public took a similar view of another episode in which Quin, on being attacked by a young actor who had been angered by the sarcastic criticism of his superior,
drew upon him and killed him. But if he was eager in his own defence he was no less so in that of others. In 1721 a drunken nobleman reeled on to the stage of the theatre and assaulted the manager, Rich, whose life was saved by Quin’s prompt armed interference. This resulted in a riot, and thereafter a guard was stationed in all theatres. In 1732 Quin appeared at Covent Garden, returning to Drury Lane from 1734 to 1741, and in 1742 was again at Covent Garden, where he remained until the close of his career. On the 14th of November 1746 Quin played Horatio and Garrick Lethario to the Calista of Mrs Cibber in Rose’s Fair Penitent. The applause of the audience was so great as to disconcert if not actually to alarm the two actors. Public interest was yet more keenly stimulated in comparing Garrick’s and Quin’s impersonations of Richard III., the popular verdict being loudly in favour of Garrick. But Quin’s Falstaff in King Henry IV. was emphatically preferred to the Hotspur of his rival. In consequence of an attempt made by Garrick in 1750–51 to draw him away from Covent Garden, Quin was enabled to extort from his manager a salary of £5000 a year, the highest figure then reached in the profession. Quin’s last regular appearance was on the 15th of May 1757, as Horatio in the Fair Penitent, though in the following year he twice played Falstaff for the benefit of friends. He retired to Bath, where he lived a happy life, with late hours and much eating and drinking, until his death on the 21st of January 1766. He was buried in the abbey church at Bath. Some coolness which had arisen between Quin and Garrick before the former’s retirement was dissipated on their subsequent meeting at Chatsworth at the duke of Devonshire’s, and Quin paid many a visit to Garrick’s villa at Hampton in the latter part of his life. The epitaph in verse on his tomb was written by Garrick. Quin’s will displayed a generous nature, and among numerous bequests was one of fifty pounds to “Mr Thomas Gainsborough, linner.”

In the Garrick Club in London are two portraits of the actor ascribed to Hogarth, and a portrait by Gainsborough in Buckingham Palace. His personality was not gracious. His jokes were coarse; his temper irascible; his love of food, his important airs, and his capacity for deep drinking do not command respect; on the other hand, a few of his jokes were excellent, and there was no rancour in him. On many occasions he showed his willingness to help persons in distress. His character is summarized by Smollett in Humphry Clinker. As an actor his manner was charged with an excess of gravity and deliberation; his pauses were so portentous as in some situations to appear even ludicrous; but he was well fitted for the active, dramatic roles, and for the portrayal of the graver rôles in his repertory.

See The Life of Mr. James Quin, Comedian, published in 1766 and reprinted in 1887.

QUINAULT, PHILIPPE (1635–1688), French dramatist and librettist, was born in Paris on the 3rd of June 1635. He was educated by the liberalism of Tristan l’Hermite, the author of Mariamne. Quinault’s first play was produced at the Hôtel de Bourgogne in 1653, when he was only eighteen. The piece succeeded, and Quinault followed it up, but he also read for the bar; and in 1660, when he married a widow with money, he bought himself a place in the Cour des Comptes. Then he tried tragedies (Agrippa, &c.) with more success than desert. He received one of the literary pensions then recently established, and was elected to the Academy in 1670. Up to this time he had written some sixteen or seventeen comedies, tragedies, and tragi-comedies, of which the tragedies were mostly of very small value and the tragi-comedies of little more. But his comedies—especially his first piece Les Rivières (1653), L’Amant indiscrêt (1654), which has some likeness to Molière’s Etourdu, Le Fantôme amoureux (1659), and La Mère coquette (1665), perhaps the best—are much better. But in 1671 he contributed to the singular miscellany of Psychéd, in which Corneille and Molière had a hand, and which was set to the music of Lulli. Here he showed a remarkable faculty for lyrical drama, and from this time till just before his death he confined himself to composing libretti for Lulli’s work. This was not only very profitable (for he is said to have received four thousand livres for each, which was much more than was usually paid when for tragedy), but it established Quinault’s reputation as the master of a new style,—so that even Boileau, who had previously satirized his dramatic work, was converted, less to the open, which he did not like, than to Quinault’s remarkably ingenious and artist-like work in it. His libretti are among the very few which are readable without the music, and which are yet carefully adapted to it. They certainly do not contain any exalted poetry or very perfect drama. But they are quite free from the ludicrous doggerel which has made the name libretto a byword, and are quite enough dramatic merit to carry the reader, much more to the imagination, than the mere words. It is not an exaggeration to say that Quinault, coming at the exact time when opera became fashionable out of Italy, had very much to do with establishing it as a permanent European genre. His first piece after Psychéd was a kind of classical masque. Les Fêtes de l’Amour et de Bacchus (1672). Then came Cadmus (1674), Alceste (1674), Thésée (1675), Aïsya (1676), one of his best pieces, and Isis (1677). All these were classical in subject, and so was Proserpine (1680), which was superior to any of them. The Triumph of Love (1681) is a mere ballet, but in Persée (1682) and Perseo (1683) Quinault returned to the classical opera. Then he finally cast off it for romantic subjects, in which he was even more successful. Amédée de Gaulle (1684), Roland (1685), and Armide (1686) are his masterpiece, the last being the most famous and the best of all. The very artificiality of the French lyric of the later 17th century, and its resemblance to alexandrines cut into lengths, were aids to Quinault in arranging lyrical dialogue. Lulli died in 1687, and Quinault, his occupa- tion gone, became devout, and began a poem called the “De- struction of Heresy.” He died on the 26th of November 1688.

The best edition of his works is that of 1739 (Paris, 5 vols.).

QUINAZOLINES (Phenazines or benzopyrimidines), in organic chemistry, heterocyclic compounds of the structure shown in the inset formula. They may be regarded as resulting from the fusion of a benzene with a pyrimidine nucleus in the 5,6 position. They are isomeric with the cinnolines, phthalazines and quinoxalines. They may be obtained by the action of alcoholic ammonia on the acidyl derivatives of ortho-aminobenzaldehydes and ortho-aminoketones (A. Bischler, Ber., 1891–95; CH2=CHO+NH3=CH2=NH; +2 H2O; NH.CO.R: CR

and from the corresponding dihydro compounds on oxidation with potassium permanganate. They are stable, tertiary bases, and may be distilled without decomposition; they form addition products with alky iodides and double salts with mercuric and platinum chlorides. On reduction with sodium in presence of alcohol they yield dihydropyrimidine. Those in which the CH group adjacent to the benzene nucleus is unsubstituted are oxidized by chromic acid to ketohydroquinazolines (quinazolines).

Quinazoline (C9H7N2) is obtained by oxidizing its dihydro-derivatives with potassium permanganate. The dihydroderivatives exist in three different series, since the addition of two atoms of hydrogen in the diazine ring can take place in three different positions, namely, in the 3, 4, 1, and 2 positions, and these different types are distinguished by the symbols A, B, and C, denoting that the double linkage is between the first and second, second and third, and third and fourth atoms in the diazine ring. The A series, which are obtained by the elimination of the elements of water from the acidyl derivatives of ortho-aminobenzaldehydes, are rather strong bases which form stable salts and yield the corresponding keto derivatives on oxidation (C. Pauw, Ber., 1889–1906). Quinazoline (dihydroquinazoline) is formed by oxidizing the dihydro base with potassium permanganate; by boiling acetyl-orthoaaminobenzamide with water (A. Weddig, Jour. prak. Chem., 1895, (2) 31, p. 124); or by heating anthraquinonic acid with formaldehyde (S. Niemetschek, Ber., 1895, p. 28), and with water, benzyl and silver oxide. The latter being obtained by the action of sodium hydroxide on 4-chlorquinazolines. The A3 series is obtained by heating acetyl-ortho-aminobenzamides with zinc chloride, while the A3 series, which
QUINCE—QUINCY, J.

is only known in the form of its keto derivatives (α-quinazolines), results from the fusion of urea with ortho-aminobenzaldehydes and benzophenones, the elements of water and of ammonia being eliminating. This process, if it be perfectly conducted, gives rise to those possessable basic and phonic characters. The tetrachydroquinazolines are obtained by reducing the quinazolines and dihydroquinazolines and by condensing ortho-aminobenzaldehyde with aldehydes (M. Busch, Journ. prakt. Chem., 1866, 2(2), p. 183). The ring is easily split on hydrolysis, giving rise to ortho-disubstituted benzenes. The keto derivatives of this series result by the action of carbon dioxide on the corresponding ethyl derivatives of the H₂N-N₂H₂-NH₂ (M. Busch, Ber. 1892, 25, p. 2837), or from the urea derivatives of ortho-aminobenzaldehyde. They are weak bases which are indifferent to both acids and alkalis, and which on oxidation yield the corresponding 2,4-di-keto derivatives.

QUINCE (Lat. Cydonia or Colonea, Ital. Cologno, Fr. coing, Mid. Eng. coen, quin, whence a collective plural "quins," corrupted to singular "quince"), a fruit-tree concerning which botanists differ as to whether or not it is entitled to take rank as a distinct genus or as a section of the genus Pyrus (natural order Rosaceae, q.v.). It is not a matter of much importance whether we call the quince Pyrus Cydonia or Cydonia vulgaris. For practical purposes it is perhaps better to consider it as distinct from Pyrus, differing from that genus in the twisted manner in which the petals are arranged in the bud, and in the many-celled ovary, in which the numerous ovules are disposed horizontally, not vertically as in the pears. The quinces are much-branched shrubs or small trees with entire leaves, small stipules, large solitary white or pink flowers like those of a pear or apple, but barely calyx-shaped, and a many-celled ovary in each of which are numerous horizontal ovules. The common quince is a native of Persia and Anatolia, and perhaps also of Greece and the Crimea, but in these latter localities it is doubtful whether or not the plant is not a relic of former cultivation. By Franchet and Savatier P. Cydonia is given as a native of Japan with the native name of "maroonerou." It is certain that the Greeks knew a common variety upon which they engraved scions of a better variety which they called κοδώνιον, from Cydon in Crete, whence it was obtained, and from which the later names have been derived. Pliny (H.N. xv. 11) mentions that the fruit of the quince, Malus coloneum, warded off the influence of the evil eye; and other legends connect it with ancient Greek mythology, as exemplified by statues in which the fruit is represented, as well as by representations on the walls of Pompeii. The fragrance and astrinency of the fruit of the quince are well known, and the seeds were formerly used medicinally for the sake of the mucilage they yield when soaked in water, a peculiarity which is not met with in pears. This mucilage is analogous to, and has the same properties as, that which is formed from the seeds of linseed.

The quince is but little cultivated in Great Britain, two or three trees planted as a hedge or orchard being in general found to be sufficient for a supply of the fruit; in Scotland it seldom approaches maturity, unless favoured by a wall. The fruit has a powerful odour, but in the raw state is austere and astrin gent; it, however, makes an excellent preserve, and is often used to give flavour and poignancy to stewed or baked apples.

There are three principal varieties of the quince, the Portugal, the apple-shaped and the pear-shaped. The Portugal is a taller and more vigorous grower than the others, and has large, hard fruit; the apple-shaped, which has roundish-shaped fruit, is more productive, and ripens under less favourable conditions than either of the others; while the pear-shaped has roundish-pyrmiform fruit, which ripens later than that of the apple-shaped variety. The quince prefers a rich, light and somewhat moist soil. The tree is generally propagated by cuttings or layers, the former making the best plants, but being longer in growing. It is usually used as a dwarfing stock, and the seedlings of the variety of Japan which have young plants when budding out in the quarters should be shortened back to about 18 or 20 inches; the effect is to restrain the growth of the pear, increase and hasten its fruitfulness, and enable it to withstand the effects of cold. Those required to form standard fruit-bearing trees should be trained up to a single stem till a height of 5 or 6 feet is attained.

The common Japan quince, Pyrus or Cydonia japonica, is grown in gardens for the sake of its flowers, which vary in colour from creamy white to rich red, and are produced during the winter and early spring months. The fruit is green and fragrant but quite unpalatable. C. Maude, a more recently introduced variety from Japan, is usually beautiful orange-red flowers, which are followed by fruit of a yellow colour and agreeable fragrance, so that, when cooked with sugar, it forms an agreeable conserve, as in the case of the ordinary quince.

QUINCY, JOSEPH (1744-1797), American patriot, son of John Quincy (1700-1756), was born in Boston on the 23rd of February 1744. He was a descendant of Edmund Quincy, who emigrated to Massachusetts in 1633, and received in 1636 a grant of land at Mount Wollaston, or Merry Mount, afterwards a part of Braintree and now Quincy. He graduated at Harvard in 1763, and studied law in the office of Oxenbridge Thacher (d. 1765), to whose large practice he succeeded. In 1767 Quincy contributed to the Boston Gazette two bold papers, signed "Hyperion," declaring against British oppression; they were followed by a third in September 1768; and on the 12th of February 1770 he published in the Gazette a call to his countrymen to break off all social intercourse with those countries whose commerce contaminates, whose luxuries poison, whose avarice is insatiable, and whose unnatural oppressions are not to be borne." After the "Boston massacre" (5th of March 1770) he and John Adams defended Captain Preston and the accused soldiers and secured their acquittal.1 He used the signatures "Mentor," "Callisthenes," "Marchmont Needham," "Edward Sexby," &c., in later letters to the Boston Gazette. He travelled for his health in the South in 1773, and left in his journal an interesting account of his travels and of society in South Carolina; this journey was important in that it brought Southern patriots into close contact with the leaders in Maryland and Carolina. May 1774 he published Observations on the Act of Parliament, commonly called "The Boston Port Bill," with Thoughts on Civil Society and Standing Armies, in which he urged "patriots and heroes" to "form a compact for opposition—a band for vengeance." In September 1774 he left for England, where he consulted with leading Whigs as to the political situation in America; on the 10th of March 1775 he started back, but he died on the 26th of April in sight of land.

See the Memoir of the Life of Josiah Quincy, Jun., of Massachusetts, 1825, 2nd ed., 1874), by his son, which contains his more important papers.

His son, JOSEPH QUINCY (1772-1864), American lawyer and author, was born in Boston on the 4th of February 1772. He studied at Phillips Academy, Andover, graduated at Harvard in 1790, studied law, and was admitted to the bar in 1793, but was never a prominent advocate. He became a leader of the Federalist party in Massachusetts; was an unsuccessful candidate for the national House of Representatives in 1800; served in the Massachusetts Senate in 1804-5; and was a member in 1805-13 of the national House of Representatives, where he was one of the small Federalist minority. He attempted to secure the exemption of fishing vessels from the Embargo Act, urged the strengthening of the American navy, and vigorously opposed the erection of Orleans Territory (Louisiana) into a state in 1811, and stated as his "deliberate opinion, that if this bill passes, the bonds of this Union are virtually dissolved; that the States that compose it are free from their moral obligations to maintain it; and that, as it will be the right of all, so it will be the duty of some to prepare definitely for a separation,—amicably if they can, violently if they must." This is probably the first assertion of the right of secession on the floor of Congress.2 Quincy left Congress because he thought the Federalist opposition was useless, and thereafter was a member of the Massachusetts Senate until 1820; in 1821-22 he was a member and speaker of the state House of Representatives, from which he resigned to become judge of the municipal court of Boston. In 1824-25 he was mayor of Boston, and in his term Faneuil Hall Market House was opened.

1 His eldest brother, SAMUEL QUINCY (1735-1786), was at this time solicitor-general of Massachusetts, and opened this trial. He remained loyal to the Crown, left Boston in 1776, and was attorney for the Crown in Antigua until his death.

2 He was a strong opponent of the bill for the limitation of the navy, and resigned from Congress on its passage.
QUINCY

built, the fire and police departments were reorganized, and the city's care of the poor was systematized. In 1829–1835 he was president of Harvard College, of which he had been an historical professor since 1819, when the board was reorganized; he has been called "the great organizer of the university;" he gave an elective (or "voluntary") system an elaborate trial; introduced a system of marking (on the scale of 8) on which college rank and honours, formerly rather carelessly assigned, were based; first used courts of law to punish students who destroyed or injured college property; and helped to reform the finances of the university. During his term Dane Hall (for law) was dedicated, Gore Hall was built, and the Astronomical Observatory was equipped. His last years were spent principally on his farm in Quincy, where he died on the 1st of July, 1864.

He wrote a Memoir of his father (1825); a History of Harvard University (2 vols., 1840), marred by a tendency to belittle the clerical régime; The Journals of Major Samuel Shaw (1847); The History of the Boston Athenæum (1851); The Municipal History of the Town and City of Boston (1852); a Memoir of the Life of J. Q. Adams (1858); and Essays on the Sailing of Cattle (1859), only one of his many practical contributions to agriculture. See Edmund Quincy, Life of Josiah Quincy (Boston, 1867).

Josiah Quincy (1802–1882), son of the last-named, was mayor of Boston in 1854–1859, and author of Figures of the Past (1882); his brother Edmund (1808–1877) was a prominent abolitionist, and author of the biography of his father, and a standard volume on New England romance, Western (1854); and his sister Eliza Susan (1787–1884) was her father's secretary and the biographer of her mother. Josiah Quincy (1802–1882) had two sons—Josiah Phillips (1829–1910), a lawyer, who wrote, besides some verse, The Protection of Majorities (1876) and Double Taxation in Massachusetts (1888); and Samuel Miller (1833–1887), who practised law, wrote on legal subjects, served in the Union army during the Civil War, and was brevetted brigadier-general of volunteers in 1865. Josiah Quincy (b. 1859), a son of Josiah Phillips Quincy, was prominent in the Democratic party in Massachusetts, and was mayor of Boston in 1865–1869.

QUINCY, a city and the county-seat of Adams county, Illinois, U.S.A., in the western part of the state, on the Mississippi river, about 105 m. W. of Springfield. Pop. (1890) 31,404; (1900) 36,252, of whom 4061 were foreign-born—308 being of German birth—and 2092 were negroes; (1910, census) 36,587. Land area (1906), 58 sq. m. Quincy is served by the Chicago, Burlington & Quincy, the Quincy, Omaha & Kansas City, and the Wabash railways, and by lines of river steamers, which find an excellent harbour in Quincy Bay, an arm of the Mississippi. The city is built on the river bluffs, which command an extensive view. In Indian Mounds park, within the city limits and owned by the city, are prehistoric mounds. The Quincy Library, founded in 1837, has been a free public library since 1889. Among the principal public buildings are the Court House and the Federal Government building. The State Soldiers' and Sailors' Home (1887), with grounds covering 222 acres, is in Quincy; one of its fifty-five buildings (Lippincott Memorial Hall) was erected by the veterans of the institution in memory of Charles E. Lippincott, the first superintendent.

There is a monument in Quincy in memory of George Rogers Clark, and the homestead (built in 1835) of John Wood, founder of the city, is now owned by the Quincy Historical Society; organized in 1866. Quincy is the seat of St Francis Solanus College (1860) and St Mary's Institute (Roman Catholic); The Chaddock Boys' School (Methodist Episcopal), until 1900 known as Chaddock College; two schools of music; and the Gem City Business College. Among the charitable institutions are Blessing Hospital (1875), St Mary's Hospital (1867; in charge of the Sisters of the Poor of St Francis), the Woodland Home for Orphans and Friendless (1833), St Aloysius Orphans' Home (1865), and several homes for the aged and infirm. The city is the seat of a Protestant Episcopal bishop. Quincy is the industrial and commercial centre of a large region. The value of factory products in 1905 was $19,745,224, an increase of 33.7 per cent, since 1900. Among the manufactures are stoves and furnaces, foundry and machine shop products, carriages and wagons, flour and gist mill products, malt liquors, dairymen's and poulterers' supplies, showman's clothing, agricultural implements, saddlery and harness, and lumber.

In 1822 John Wood (1798–1880), the first white settler, built a log cabin here, and in 1825, Quincy, then having less than ten inhabitants, was made the county-seat of Adams county, both town and county being named through Wood's influence in honour of John Quincy Adams. Wood was lieutenant-governor of the state in 1827–1860, and acting-governor in 1860–1861. A bronze statue (dedicated in 1883) in his memory stands in Washington Park. There was a general hospital of the United States Army in Quincy during the Civil War. Quincy was incorporated as a town in 1834, and was chartered as a city in 1839.

QUINCY, a city of Norfolk county, Massachusetts, situated on Massachusetts Bay, and separated from Boston by the Neponset river on the N. and from Weymouth by Fore river on the S. Pop. (1890) 16,723; (1900) 23,899, of whom 7662 were foreign-born; (1910 census) 32,642; area, about 16 sq. m. It is served by the New York, New Haven & Hartford railway, and by an interurban electric line. To a large degree Quincy is a residential suburb of Boston. The birthplaces of John Adams, built in 1861, and of John Quincy Adams, built in 1716, are still standing. The Stone Temple, or First (Unitarian) Congregational Church, is the burial-place of the two Adamses. Quincy was also the home of Charles Francis Adams. John Adams gave to the town his valuable private library, and in 1822 founded here the Adams Academy for boys (now closed). In the home of Josiah Quincy (1802–1882) in Wollaston Park is the Quincy Mansion School for Girls. Woodward Institute (1854) is an endowed high school for girls. The public school system, the "Quincy System," was made famous in 1875-1880 by Col. Francis Wayland Parker (1837–1902), who abolished learning lessons by rote, and introduced Froebelian principles. A public library was opened in 1871, and in 1882 it was housed in the Crane Memorial Hall, designed by H. H. Richardson, and given by the family of Thomas Crane (1803–1875), who had spent his early youth in the town, but had lived in New York City from 1872 until his death. The library contained about 26,000 volumes in 1908. The city has a fine system of parks, among them being Merrymount and Faxon, the latter named in honour of the family of Henry H. Faxon, who in 1882 secured a negative vote by the town to the question whether "licences be granted for the sale of intoxicating liquors"; subsequently there has been a similar vote each year. The manufactures of Quincy were long unimportant, with the exception of "Quincy granite," which was first quarried in 1825,—this being the first "systematic siliceous crystalline rock quarrying" in New England—and of which the output in the form of tombstones and monuments in 1905 was valued at $2,018,108, and in the form of "marble and stone work" was valued at $645,924. But manufacturing rapidly increased in importance between 1900 and 1905; in this period the value of factory products increased 108.3%, to $8,982,446, and the capital invested increased 38.9% to $9,220,870. Quincy granite, a hornblende, pyroxene, bluish or greyish, without mica, was used for the construction of the Bunker Hill monument at Charlestown (1826), and of King's Chapel, Boston; and for interior decorations it has found some use, for example in the Philadelphia city buildings. Engines, and iron and steel ships are built at a shipyard on the Fore river, and tubular rivets and studs, gearing, foundry products, and translucent fabrics are among the city's other products.

1 Since 1877 the Granite Cutters' Journal has been published here by the Granite Cutters' International Association of America. For a description of the granite quarried in the vicinity of Quincy, see T. N. Dale, The Chief Commercial Granite of Mass., New Hampshire and Rhode Island (Washington, 1908), Bulletin 354 of the U.S. Geol. Survey.

2 Here were built various vessels of the U.S. Navy, including the battleship "North Dakota."
The site of the present city was settled in 1625 as Merry Mount or Mount Wollaston by Thomas Morton (q.v.)—the progenitor of the line of American Metamorphoses. This settlement was made in 1636 by the town of Boston to William Hutchinson, husband of Anne, the Antinomian, and was formerly known as Taylor’s Hill. A Puritan settlement was made here in 1634. This first settled part of Braintree (q.v.)—a name given in 1630 to the town so named and then reorganized—after 1708 was officially called the North Precinct of the Town of Braintree; here the Adamses and the Hancocks lived, and Quincy was the birthplace of John Hancock—in a house on Hancock lot lived the first Josiah Quincy; the Mount Wollaston farm was a legacy to John Quincy (1689-1767), in whose honor the township was named on its separation from the township of Braintree in 1793, and whose name was borne by the great grandson, John Quincy Adams. In 1826 a railway about 4 m. long to the Neponset river was built here—the first in New England—for carrying granite from the quarries to tide-water; the cars were drawn by horses. The township had previously been engaged in maritime pursuits, agriculture, and the manufacture of leather. Townshio government, owing to the abolition of the committee on general business and the consequent confusion of handling so many and minute details, and to the addition to the population of a large Irish element and a large New Hampshire element, both workmen in the quarries, reduced the minimum of efficiency in 1840-1870; in 1880, however, the town-meetings were reformed, and in 1874 a committee to consider business details was again appointed. In 1888 Quincy was chartered as a city.

See “A Study of Church and Town Government,” by C. F. Adams, in the second volume of his Three Episodes of Massachusetts History (Boston, 1892), for an admirable history of the community; his Centennial Milestone, An Address in Commemoration of the Hundredth Anniversary of the Incorporation of Quincy, Mass. (Cambridge, Massachusetts, 1892); D. M. Wilson, Quincy, Old Braintree and Mount Wollaston (Boston, 1907), and Where American Independence Began (Boston, 1919); E. F. Adams, John Quincy of Mount Wollaston, 1689-1767 (Quincy, 1909), published by the Quincy Historical Society, and containing addresses made at the celebration in February 1908 in honour of Col. Quincy and W. S. Pattee, History of Old Braintree and Quincy (Quincy, 1878).

QUINET, EDGAR (1803–1875), French historian and man of letters, was born at Bourg-en-Bresse, in the department of the Ain, France, on the 17th of February 1803. His father, Jerome Quinet, had been a commissary in the army, but being a strong republican and disgusted with Napoleon’s usurpation, he gave up his post and devoted himself to scientific and mathematical study. Edgar, who was an only child, was much alone, but his mother (Eugénie Rozat Lagis), who was a person of education and strong though somewhat orthodoxy religious views) exercised great influence over him. He was sent to school first at Bourg and then at Lyons. His father wished him on leaving school to go into the army, and then suggested business. But Quinet was determined upon literature, and after a time got his way. His first publication, the Tablettes du juf errant, appeared in 1823. Being struck with Herder’s Philosophie der Geschichte, he undertook to translate it, learnt German for the purpose, published his work in 1827, and obtained by it considerable credit. At this time he was introduced to Cousin, and made the acquaintance of Michelet. He had visited Germany and England before the appearance of his book, Cousin procured him a post on a government mission to the Morea in 1829, and on his return he published in 1830 a book on La Grèce moderne. Some hopes of employment which he had after the revolution of February were frustrated by the reputation of speculative republican which he had acquired. But he joined the staff of the Revue des deux mondes, and for some years contributed to it numerous essays, the most remarkable of which was that on Les Épopées françaises du XIXème siècle, an early, though not by any means the earliest, appreciation of the long-neglected chantons de geste. Ahasvérus, his first original work of consequence, appeared in 1833. This is a singular prose poem, in language sometimes rather bombastic but often beautiful. Shortly afterwards he married Minna Morte, a German girl with whom he had fallen in love some years before. Then he visited Italy, and the best of the many essays on Rome which he produced two poems, Napoléon (1835) and Prometheus (1838), which being written in verse (of which he was not a master) are inferior to Ahasvérus. In 1838 he published a vigorous reply to Strauss’s Leben Jesu, and in that year he received the Legion of Honour. In 1839 he was appointed professor of foreign literature at Lyons, where he began the brilliant course of lectures afterwards embodied in the Génie des religions. Two years later he was transferred to the Collège de France, and the Génie des religions itself appeared (1842).

Quinet’s Parisian professorship was more notorious than fortunate, owing, it is said, to his own faults. His chair was one of Southern Literature, but, neglecting his proper subject, he chose, in conjunction with Michelet, to engage in a violent polemic with the Jesuits and with Ultramontanism. Two books bearing exactly these titles appeared in 1843 and 1844, and contained, as was usual with Quinet, the substance of his lectures. These excited so much disturbance, and the author so obstinately refused to confine himself to literature proper, that in 1846 the government put an end to them—a course which was not disapproved by the majority of his colleagues. By this time Quinet was a pronounced republican, and something of a revolutionary. He appeared in arms during the disturbances which overthrew Louis Philippe, and was elected to the department of the Ain to the Constituent and then to the Legislative Assembly, where he figured among the extreme radical party. He had published in 1848 Les Révolutions d’Italie, one of his principal though not one of his best works. He wrote numerous pamphlets during the short-lived Second Republic, attacked the Roman expedition with all his strength, and was from the first an uncompromising opponent of Prince Louis Napoleon. He was banished from France after the coup d’état, and established himself at Brussels. His wife had died some time previously, and he now married Mademoiselle Asaky, the daughter of a Roumanian poet. At Brussels he lived for some seven years, during which he published Les Esclaves (1853), a dramatic poem, Marnix de Sainte-Aldégonde (1854), a study of that Reformer in which he very greatly exaggerates Sainte-Aldégonde’s literary merit, and some other books. He then moved to Veytoux, on the shore of the Lake of Geneva, where he continued to reside till the fall of the empire. Here his pen was busier than ever. In 1866 appeared a singular book, somewhat after the fashion of Ahasvérus, entitled Merlin l’enchanteur, in 1862 a Histoire de la campagne de 1815, in 1865 an elaborate book on the French Revolution, in which the author, republican as he was, blamed the acts of the revolutionists, empty, he must be said, to his own honour, but himself much wrath from more thoroughgoing partisans. Many pamphlets date from this period, as does La Création (1870), a third book of the class of Ahasvérus and Merlin, but even vaguer, dealing not with history, legend, or philosophy, but with physical science for the most part.

Quinet had refused to return to France to join the liberal opposition against Napoleon III., but immediately after Sedan he returned. He was then restored to his professorship, and during the siege wrote vehemently against the Germans. He was elected deputy by the department of the Seine in 1871, and was one of the most obstinate opponents of the terms of peace between France and Germany. He continued to write till his death, which occurred at Versailles on the 27th of March 1875. Le Siège de Paris et la défense nationale appeared in 1871, La République in 1872, Le Livre de l’exilé in the year of its author’s death and after it. This was followed by three volumes of letters and some other work. Quinet had already in 1858 published a semi-biographic book called Histoire de mes idées.

Quinet’s character was extremely amiable, and his letters to his mother, his accounts of his early life, and so forth, are likely always to make him interesting. He was also a man of great moral conscientiousness, and as far as intention went perfectly disinterested. As a writer, his chief fault is want of concentration;
QUININE

as a thinker and politician, vагueness and want of practical determination. His historical and philosophical works, though showing much reading, fertile thought, abundant facility of expression, and occasionally, where prejudice does not come in, acute judgment, are rather (as not a few of them were in fact) reported lectures than formal treatises. His rhetorical power was altogether superior to his logical power, and the natural consequence was that a full display of his powers was a failure. The predictions were, moreover, due, not merely to an incapacity or an unwillingness to argue strictly, but also to the presence in his mind of a large number of inconsistent tastes and prejudices which he either could not or would not co-ordinate into an intelligible creed. Thus he has the strongest attraction for the picturesque side of medievalism and catholicity, the strongest repulsion for the restrictions which medieval and Catholic institutions imposed on individual liberty. He refused to submit himself to any form of positive orthodoxy, yet when a man like Strauss pushed unorthodoxy to its extreme limits Quinet revolted. As a politician he acted with the extreme radicals, yet universal suffrage disgusted him as unreasonable in its principle and dangerous in its results. His pervading characteristic, therefore, is that of an eloquent vagueness, very stimulating and touching at times, but as deficient in coercive force of matter as it is in lasting precision and elegance of form. He is less inaccurate in fact than Michelet, but he is also much less absorbed by a single idea at a time, and the result is that he seldom attains to the vivid representation of which Michelet was a master.

BIBLIOGRAPHY.—His numerous works appeared in a uniform edition of twenty-eight volumes (1875-89). His second wife, Camille, published in 1870, certain Mémoires d’exil, and Lettres d’exil followed in 1885. In that year Prof. George Saintsbury published a selection of the Lettres d’a mère with an introduction. For many years Quinet received little attention in France, but it was revived, though not very strongly, by the publication in 1899 of Madame Quinet’s Cinquante ans d’amitié (that between her husband and Michelet), and by the centenary of his birth. On this latter (1903) anniversary many Frenchmen (souvenirs et pensées, and Penseurs réligieux, by E. Paris (1905). There is in English an elaborate Early Life and Writings of Edgar Quinet, by R. Heath (London, 1881).

QUININE, the most important alkaloid contained in cinchona bark (see CINCHONA). In 1580 Gomez of Lisbon obtained a mixture of alkaloids which he named cinchino, by treating an alcoholic extract of the bark with nitric acid and preparing a solid product by evaporation. In 1820 Pelletier and Caventou proved that the cinchino of Gomez contained two alkaloids, which they named quinine and cinchonine. Later quinidine and cinchonidine were discovered, and subsequently several other alkaloids, but in smaller quantity.

Chemistry.—The alkaloids exist in the bark chiefly in combination with cinchotanetic and quinic acids. The cinchotanetic acid apparently becomes altered by atmospheric oxidation into a red-colouring matter, known as cinchono-fulvic or cinchona red, which is very abundant in some species, as in C. succirubra. For this reason those barks which, like C. Calisaya, C. officinalis, and C. Ledgeriana, contain but little cinchonan, are preferred, the quinine being more easily extracted from them in a colourless form. The exact mode of extraction adopted by manufacturers is secret. That hitherto adopted by the Indian Government for the preparation of the cinchona febrifuge (see below) is simple, but the whole of the alkaloid present in the bark is not obtained by it. This method is to exhaust the powdered bark with water acidulated with hydrochloric acid and then to precipitate the alkaloids by caustic soda. Another method consists in mixing the powdered bark with milk of lime, drying the mass slowly with frequent stirring, exhausting the powder with boiling alcohol, removing the excess of alcohol by distillation, adding sufficient dilute sulphuric acid to dissolve the alkaloid and throw down colouring matter and traces of lime, &c., filtering, and allowing the neutralized liquid to deposit crystals. The sulphates of the alkaloids thus obtained are not equally soluble in water, and the quinine sulphate can be separated by fractional crystallization, being less soluble in water than the other sulphates.

Quinine of commerce is the neutral sulphate, \( \text{C}_9\text{H}_8\text{N}_2\text{O}_2\cdot\text{H}_2\text{SO}_4\cdot\text{H}_2\text{O} \), which occurs in commerce in the form of very light slender white acicular crystals. It is freely soluble in about 750 parts of water, but in 30 of boiling water, 60 of rectified spirit (sp. gr. 0.83), and 40 of glycerin. Its solubility in water is lessened by sodium or magnesium sulphate, but is increased by potassium nitrate, sodium chloride, and Chenopodium album oil or other aqueous oils or in ether, although the pure alkaloid is soluble in both. It becomes phosphorescent on trituration. When prescribed it is often found in the hand in the form of 20 per cent. dilution of dilute sulphuric acid or of citric acid, one drop of the former is the equivalent of a grain of the latter being used for each grain of the quinine sulphate. Quinine is precipitated from its solution by alkalis and the chlorates, but not by the nitrates.

The acid solution of sulphate of quinine is fluorescent, especially when diluted; and it is laevorotatory. When a solution of chlorate is first added and then ammonia an emerald green colour, due to the decomposition of that salt and development of quinoline, results. A solution containing only 1 part of quinine in 5000, or in a solution containing not more than \( \frac{1}{100} \) part if bromine be used instead of chloride. The fluorescence is visible in an acid solution containing 1 part in 200,000 of water. By adding an alcoholic solution of iodine to a solution of the sulphate in acetic acid a compound known as herapathite, \( 4\text{CuO}+3\text{H}_2\text{SO}_4+2\text{H}_2\text{I}+6\text{H}_2\text{O} \), is obtained, which possesses optical properties similar to those of tourmaline; it is soluble in 1000 parts of boiling water; and its sparing solubility in cold alcohol has been utilized for estimating quinine quantitatively. The other alkaloids are distinguished from quinine thus: quinidine resembles quinine, and cinchonine from quinidine, as quinoline, and chloroquine resembles chloroquinine, and cupreine resembles cuprinine. Quinoline is very insoluble in water; the solution of cinchonidine, which is laevorotatory, does not give the thalcoquinolin test, nor fluorescence; cinchonine resembles cinchonidine in these respects, but is dextrorotatory.

Commercial sulphate of quinine frequently contains from 1 to 10% of cinchonidine sulphate, owing to the use of barks containing it. The addition of ether and alcohol of quinine that of quinine; and, when 1 part of quinine sulphate suspected to contain it is nearly dissolved in 24 parts of boiling water, the sulphate of quinine crystallizes out on cooling, and the cinchonidine is found in the clear supernatant liquid. It is dissolved in dilute solutions of potassium and sodium tartrate. Samples of quinine in which cinchonidine is present usually contain a smaller percentage of water than the pure sulphate. Traces of quinidine are also sometimes found, but they do not affect the determination. The boiling solution does not detract in a medicinal point of view from the value of the latter.

Owing to its voluminous character as much as 18% of water may remain present in apparently dry samples of sulphate of quinine. If it loses more than 14.5% of water when dried at 100°C. it contains an excessive amount of moisture. Owing to its variability in this respect, and to its solubility, certain other salts have largely replaced the sulphate in modern medicine.

Sulphate of quinine manufactured from cuprean bark (Remijia pedunculata) may contain from 10 to 90% of sulphate of homoquinoline, which alkaloid occurs in the bark along with quinine. Homooquinine is decomposed on treatment with caustic soda into quinine and a new alkaloid, cuprean, in the proportion of 2 to 3. Cuprean is soluble in a solution of caustic soda (diluting the effect from the cuprean), and then cuprean is precipitated by solution of sulphate of quinine perfectly free from either homooquinine or cupreane. The medicinal properties of cuprean and homooquinine are practically identical.

In consequence of the high price of the alkaloid an attempt was made some years ago by the Government of India to manufacture from cinchona bark a cheap febrifuge which should represent the alkaloids contained in the bark and form a substitute for quinine. This mixture is known as cinchona febrifuge, and is prepared chiefly from C. succirubra, which succeeds better in India than the other species in cultivation, and grows at a lower elevation, being consequently more procurable. It has a much lower price. A mixture of the cinchona alkaloids, consisting principally of cinchonidine sulphate, with smaller quantities of the sulphates of quinine and cinchonine, is sold under the name of “quininetum” at a cheaper rate than quinine.
hydroxylc carbon atom through a -CH₂ group: whilst in the latter the pipericine ring is substituted by a methyl group in addition to the vinyl group and the bridge is simply -CH(OH) -, with which compound quinine is doubtless the appearance, known quinine British is grain of water, and is the most soluble and completely absorbed of all the salts of this alkaloid. It occurs in a colourless crystalline powder, having the formula C₁₉H₂₄NO₂·2HCl·3H₂O.

The sulphate of quinine in medicine may contain up to 3% of cinchonidine, but should be free from cinchonine, quinidine and euphrine. There are four pharmaceutical preparations. The former contains 3% of the pure alkaloid, the second is given as a haematonic and tonic in doses of about 10 grains. It is very unpleasant to take. The pharmaceutical pilule quinine compound of the sulphate of quinine and sugar. The sugar contains 29/3 of a grain of quinine in each draught, is in effect, pure quinine. Here the quinine acts as a bitter tonic. The tincture quinine contains 1/20 of a grain of quinine ammonium, and 175 grains of quinine sulphate, 2 fluid oz. of liquor ammonium (the pharmacepeial solution of ammonium), and 18 fluid oz. of a 50% solution of alcohol. The dose of 1/2 to 1 gr. draught contains little medicine, and as a leucocyto-static action is now negligible. Its value in the early stages of a bronchitis or tracheitis is due to the ammonium. The small quantity of quinine it contains is conditioned by the solubility of the alkaloid, which is precipitated when this tincture is diluted with water. It is claimed that this preparation attaches to the pharmacepeial preparations of the hydrochloride.

Physiological Action.—Our knowledge of this subject is mainly due to Prof. E. F. C. Quincke, a very voluminous and a most powerful. This term defined for some time as indicating the power to kill bacteria. Whilst quinine possesses this power, however, it is far more potently lethal to a particular form of animal organism known as the plasmodium malarium. Against the bacteria quinine is not at all an exceptionally powerful antiseptic, though more powerful than carbolic acid. Many bacteria are killed by a 2% solution of the alkaloid. Quinine does not affect the Unbroken skin, but when absorbed from the bowel is slightly irritating to the pain-conducting nerves of a raw surface.

The first feature of the internal action of quinine is its intensely bitter taste. This induces a reflex secretion from the salivary and gastric glands, followed by a diminution of the vascularity of the gastric mucous membrane, and by some degree of activity on the part of the muscular wall of the stomach. This means that the appetite is strengthened, and digestion rendered more complete. This is beneficial. The hydrochloric acid of the gastric juice is stated to convert any salt of quinine into a chloride, and it seems probable that the absorption of quinine takes place mainly from the stomach, for when the drug reaches the alkaline secretions of the duodenum it is precipitated, and probably none of it is thereafter absorbed. The greater part of a dose of quinine sulphate administered by the mouth may be recovered, as a rule, from the faeces, this being much the most wasteful method of giving quinine. The absorption of the acid hydrochloride is much more complete. Quinine hydrochloride circulates in the alkaline blood without precipitation, provided there is no excess of the alkaline base.

The action of quinine on the blood itself—quite apart from its action on malarial blood—is of great complexity and importance. Whether it is a specific parasiticide, or whether it is merely another valuable "amoeboid" movements of the cells being arrested. Hence quinine stops the process of diapedesis or emigration of the leucocytes from the blood-vessels into the tissues, and if applied to the eyes prevents or at any rate retards the swelling. It has the effect of reducing considerably the pancytopenia which accompanies the diminution in the number of the red blood corpuscles, it very markedly influences the stability of the compounds of the haemoglobin with oxygen. Like alcohol and prussic acid, quinine interferes with oxygenation, so that oxygenation does not occur and the leucocytes are not available to the metabolism of which is therefore greatly modified. This property is doubtless partly—though not wholly—explanatory of the antipyretic action of quinine. The leucocytes or white blood corpuscles of the body are notoriously affected by the value of their white blood corpuscles. This explains the fact that the leucocytes which are found in the blood of a person who has suffered from malaria shows a marked diminution in the number of the red blood corpuscles, but if the disease attacks. Quinine is much less efficacious in the treatment of post-malarial symptoms, such as neuritis and haematuria, when no parasites can be detected in the blood. In such cases quinine is useless and the patient is doomed to a painful death. Quinine is largely used as a bitter tonic in doses of about half a grain. The acid hydrochloride is the best salt to employ. Quinine has some anodynic power, and is a safe and often efficient drug in the treatment of the symptoms which follow the disease of malaria, although it has never been proved that quinine can prevent the disease in persons who have had malaria. Somewhat smaller doses than those given in pyrexia should be employed.
Cinchenism is the name applied to the congeries of toxic symptoms which follow the prolonged administration of quinine, but may appear also, though less intensively, on those occasions when the drug is taken in large doses, and closely resemble those of salicylism, and also, though in less degree, those of carbolism. The patient is deaf, but complains of ringing in the ears, which may assume various forms, especially in musical people, who may think that the notes of music itself is affected. The drug becomes exceedingly severe, the vision and equilibrium are affected, and there is often some gastro-intestinal irritation. In cases where the drug has been deliberately given for its poisonous action, the symptoms are still more severe. There may be bleeding from the nose, cutaneous congestion, deafness, blindness, coma or delirium, and even death from cardiac failure. After death there is found one noteworthy lesion, a commencing acute inflammation of the lungs, which was afterwards ascribed to the quinine. In the case of the quinidism, the symptoms may often be successfully averted if small doses of hydrobromic acid—10 minims of the dilute solution are given tone.

A non-official preparation of quinine—Warburg's Tincture—occasionally succeeds where the ordinary preparations fail. The dose is 1 to 4 drachms. It contains 1 part of quinine in 50. Of the thirteen or more other ingredients, there may specially be noticed the salicylic and benzoic acids.

The other alkaloids of cinchona bark—quinidine, cinchonidine, and cinchonochina—also possess similar properties, but all are much less bitter than quinine. This is also the case with the cinchona febrifuge prepared from C. succirubra.

The great disadvantage of the official preparations is the bitter taste and insolubility. It is found, however, that the most valuable solubilizing agents of quinine, whilst they increase its solubility, make it less bitter. Substitute may therefore be divided into those administered orally and those administered hypodermically. Of the soluble salts we shall pass over, the most important are the phosphate and carbodic acid ester (aristoquin), the salicylic acid ester (salol-quinine); and of the soluble substitutes, quinoprine (a compound of quinine hydrochloride and antipyrine) and quinine hydrochloro-carbamide (a compound of quinine, urea and hydrochloric acid).

Until 1867 English manufacturers of quinine were entirely dependent upon South America for their supplies of cinchona bark, and which were obtained from the pure cinchona trees, growing chiefly in Bolivia, Peru, and Ecuador, the principal species which were used for the purpose being Cinchona Calisaya; C. officinalis; C. macrocalyx, var. Pallon; C. Pilayensis, C. micrantha and C. lanceolata. Since the cultivation of cinchona trees was commenced in Java, India, Ceylon and Jamaica, several other species, as well as varieties and hybrids cultivated in those countries, have been used.1 Later, C. lanceolata, var. Calisaya, known as the calisaya of Santa Fe, was strongly recommended for cultivation, because the shoots of felled trees afford bark containing a considerable amount of quinine; C. Pilayensis has been introduced into the Indian plantations on account of yielding the valuable alkaloid quinidine, as well as quinine.

The first importation from India took place in 1867, since which time the cultivated bark has arrived in Europe in constantly increasing quantities, London being the chief market for the Indian barks and Amsterdam for those of Java. Cinchona Calisaya has also been cultivated extensively in Bolivia and in Toluca, United States of Columbia.

In order to obtain the cultivated bark as economically as possible, experiments were made which resulted in the discovery that, if the bark were removed from the trunks in alternate strips so as not to injure the cambium, or actually growing zone, a new layer of bark was formed in one year which was richer in quinine than the original bark. If the same thickness of bark be removed in two years, the ordinary growth. This is known in commerce as ‘renewed bark.’ The process has been found to be most conveniently practised when the trees are eight years old, at which age the bark separates most easily. C. Pilayensis has been ascertained to increase annually until the eleventh year, at which time it seems to reach its maximum. The portion of the trunk from which the bark has been removed is sometimes protected by moss, and the new bark which forms is the disease known by the name of ‘cat’s-eye bark.’

The species which yield the largest amount of quinine are by no means the earliest to cultivate, and experiments have consequently been made in cross-fertilization and grafting with the view of giving vigour of growth to delicate trees yielding a large amount of alkaloid or of increasing the yield in strong-growing trees affording but little quinine. Grafting, however, has not been found to answer the purpose, since the stock and the graft have been found to retain the specific and other alkaloids in the original varieties, the proportion of quinine in each being entirely independent of the size of the tree. Hybridization also is very uncertain, and is very difficult to carry out effectively; hence the method of propagating the best varieties by cuttings has been adopted, except in the case of the C. officinalis and C. lanceolata, which have not a natural proportion of this alkaloid if growing separately. The two latter species, however, are occasionally crossed to one another, but the hybrid is sterile and has a quality distinctly inferior to the two parent species.

Some years ago it was discovered that a bark imported from Colombia under the name of ‘cuprea bark, or “hard” bark, and derived from Remesia pedunculata, Triana, and other species, contained quinine to the extent of 3 to 23%, and in 1881 this bark was exported in enormous quantities from Santander, exceeding in amount the united importations of all the other cinchona barks; and by reason of its cheapness it has since that date been largely used for the manufacture of quinine.

Cultivation of bark in the different countries is carried on in a more uniform quality. The South American kinds contain a variable admixture of inferior barks, and the cultivated Indian barks comprise, under the respective names of yellow, pale, and red barks, a number of varieties of very different qualities.

The alkaloids are contained, according to Howard, chiefly in the cellular tissue next to the fiber. No definite knowledge has as yet been acquired of the manner in which they are fixed in the bark, but it appears, as shown by Broughton that C. Peruvianum, which yields cinchonine but no quinine, at a height of 6000 ft., than above that elevation, and that cinchonidine, quinidine, and resin are fixed in a manner different from that of the quinines. Broughton, however, found that the bark of C. officinalis at an altitude of 7000 ft. on Mount Monserrate, contained 1% of quinine from 1 to 9.5%. In these cases the variation may have been due to altitude. Free access of air to the tissues also seems to increase the yield of quinine, for the renewed bark is found to contain more quinine than the original bark.

**QUINOLINE** (Benzo purified, C₄H₄N₄), an organic base first obtained from coal-tar in 1834 by F. Kunge (Pogg. Ann., 1834, 31, p. 68), and later by C. Gerhardt by the distillation of chinchonine, quinine and other alkaloids with caustic potash (Ann., 1842, 42, p. 310; 44, p. 279). It also occurs with pyridine and its homologues in bone-oil. It may be prepared by distilling cinchonidine with lime; by the reduction of ortho-aminobenzaldehyde (A. Baezner and V. Driewson, Ber., 1883, 16, p. 2207) by passing the vapour of allyl amine over heated lead oxide; by the condensation of ortho-aminobenzaldehyde with acetaldehyde in the presence of aqueous caustic soda (P. Friedländer and C. F. Gohring, Ber., 1885, 15, p. 2572; 1886, 16, p. 1833); by the action of ortho-toluidine on glyoxal at 150°C. (V. Kulisch, Monatsh., 1894, 15, p. 276); by the action of phosphorus pentachloride on hydrocarboxyl (the inner anhydride of ortho-aminohydrocinnamic acid), the chlorinated compound first formed being then reduced by hydriodic acid (A. Baeyer):

\[
\begin{align*}
\text{C}_4\text{H}_4\text{N}_4\text{H}_2 & \rightarrow \text{C}_4\text{H}_4\text{N}_4\text{H}_2 + \text{C}_4\text{H}_4\text{N}_4\text{H}_2 \\
\text{NH} - \text{CO} + \text{C}_4\text{H}_4\text{N}_4\text{H}_2 & \rightarrow \text{C}_4\text{H}_4\text{N}_4\text{H}_2 + \text{C}_4\text{H}_4\text{N}_4\text{H}_2
\end{align*}
\]

and by the so-called ‘Skraup’ reaction, which consists in oxidizing a mixture of aniline, glycine and concentrated sulphuric acid, with nitrobenzene (Z. Skraup, Monats., 1889, 1, p. 316; 1881, 2, p. 141). This reaction is a very violent
one, and its mechanism may probably be explained as follows: The glycerin is first converted into acrolein, which combines with the aniline to form acrolein-aniline, and this product is then oxidized by the nitrobenzene: 

\[ \text{CH}_2\text{OH}_2 \rightarrow \text{C}_2\text{H}_4\text{O} + (\text{CH}_3\text{NH}_2) \rightarrow \text{C}_2\text{H}_4\text{N}: \text{CH}: \text{CH} \rightarrow \text{C}_2\text{H}_4\text{N}. \]

The nitrobenzene may be replaced by arsenic acid, when the reaction proceeds much more quickly and a cleaner product is obtained (C. A. Kneupel, Ber., 1886, 29, p. 703). The Skraup reaction is a perfectly general one for primary amino-compounds; the halogen-, nitro- and oxy-anilines (aminophenols) react similarly, as do also the toluidines, naphthylamines, amino-anthracene, meta- and para-phenylene diamines, and ortho- and para-naphthylamines.

Quinoline is a colourless liquid with a smell resembling that of pyridine. It boils at 238° C. and is very hygroscopic. It is a tertiary base and forms well-defined salts. It is almost insoluble in water, but dissolves readily in the common organic solvents. It combines readily with the alkyl halides. H. Wacker (Ber., 1905, 38, p. 1144) has found that many ortho substituted quinolines will not combine with methyl iodide owing to steric hindrance, but the difficulty can be overcome in most cases by using methyl sulphate and heating the reaction components to 100° C. for half an hour. Nitric acid and chromic acid have little effect on the action (G. N. J. Hoogewerff and O. A. v. Dorp, Rec. Pays Bas, 1882, 1 p. 107). Bleaching powder oxidizes it to chloroacetylpyridine. It is reduced by the action of zinc and ammonia to di-and tetra-hydroquinolines. A hexahydroy and a decachydroquinoline have been obtained by heating tetrahydroquinoline with hydro- 

\[ \text{acid and phosphorus to high temperatures.} \]

E. Bamberger, Ber., 1890, 23, p. 1138). Numerous substitution products of quinoline are known, and the positions of the substituent groups are generally designated in accordance with the scheme shown in the next formula, where letters o, m, p,standing for ortho-, meta-, para-, and ana-

The aminquinolines possess a certain importance owing to their relationship to the alkaloids. Those with the hydroxyl group in the benzene nucleus are prepared from the aminophenols by the Skraup reaction. Only two are known containing the hydroxyl group in the pyridine nucleus, namely, carboxyethyl (a-quinolines), which is formed by the reduction of ortho-aminoacinnamic acid with ammonium sulphide (L. Chiozza, Ann., 1882, 53, p. 118) or with ferrous sulphate and baryta, and kynurene (β-quinolines), which is obtained from ortho-aminoacetophenone (J. H. Claus and H. Howitz, Journ. prak. Chem., 1894, 158, p. 232). It is also formed by the condensation of anthranilic acid with acetaldehyde (G. Wurtz and So, Ber., 1855, 26, p. 291). They are both crystalline solids, the former melting when anhydrous at 190-200° and the latter at 52° C.

Of the homologues of quinoline, the most important are quinoline, lepidine, 7-methylquinoline, and flavilone. (Quinolinol (α-methylquinoline) is present in coal-tar; it may be prepared by condensing aniline with paraldehyde and concentrated hydrochloric acid (O. Doeber and W. v. Miller, Ber., 1881, 14, pp. 2812 et seq.). The reaction is a perfectly general one, for the anilines may be replaced by other aromatic amines and the aldehyde by other aldehydes, and so large a number of quinolinol homologues may be prepared in this way. Quinoline may also be obtained by condensing benzaldehyde and acetic anhydride with caustic soda (P. Friedlander, loc. cit.). It is a colourless liquid which boils at 247° C. The CH₃ group is very reactive, condensation with formaldehyde and acetaldehyde (C. Beyers) Journ. prak. Chem., 1895, 158, p. 125). It may be prepared synthetically by condensing ortho-aminoacetophenone with paraldehyde and caustic soda (L. Knorr, Ann., 1886, 236, p. 60) or from aniline, acetone, formaldehyde and hydrochloric acid (C. Beyers). It may be prepared by condensing α-methylquinoline and formaldehyde, which results in lepidine (β-methylquinoline) with caustic soda. It may be prepared by condensing α-methylquinoline and formaldehyde, which results in lepidine (β-methylquinoline) with caustic soda. It crystallizes in needles which melt at 61° C. Flavilone (α-phenyl-γ-methyl-quinoline) is formed on heating flavone (see below) with excess of zinc dust, or by heating a mixture of ortho-aminoacetophenone and acetonaphthol, in dilute alcohol solution, with a small quantity of 10% caustic soda solution (O. Fischer, Ber., 1886, 19, p. 1037). Closeely related to flavilone is flavanoline or flavanone (β-phenylquinoline), which is obtained on heating acetonaphthol and acetylchloride in benzene, with zinc chloride to 90° C. (O. Fischer, Ann., 1886, 236, p. 73). It crystallizes from benzene in prisms, which melt at 97° C. Sodium nitrate in the presence of excess of acid converts it into the corre- 

Quinoline is oxidized by nitric acid to form anilido-acetocetonic ester, CH₃CO-CH₂-NH₂, which is converted by concentrated acids into a-oxy-γ-methylquinoline (L. Knorr, Ann., 1886, 236, p. 73). On the other hand, at about 240° C, the amine and ester react to form β-anilidoacetocetic ester, CH₃CO-NH₂COH₂: CH₃COOOH₂: CH₃COOγ-methylquinoline (M. Conrad and L. Lipschitz, Ber., 1887, 20, p. 947).

Numerous carboxylic acids of quinoline are known, the most important of which are quinolinic, cinchonic and acridinic acids. Quinolinic acid (quinoline-carboxyaldehyde) is obtained by heating pyridine with acetic acid. When quinoline is oxidized by chromic acid. It crystallizes in needles, which contain two molecules of water of crystallization, and melt at 254° C. When heated slowly at a regular melting point it loses carbon dioxide and yields quinoline. Alkaline potassium permanganate oxidizes it to pyridine tricarboxylic acid (2,3,6). Cinchomonic acid (quinoline-γ-carboxylic acid) is formed when cinchonine is oxidized by nitric acid, or by the oxidation of lepidine. It crystallizes from water in needles or prisms and in the anhydrous state melts at 253-254° C. Potassium permanganate oxidizes it to pyridine tricarboxylic acid (2,3,4). Acridinic acid (quinoline-α-carboxylic acid) is obtained by heating acetoacetic ester, CH₃C=O-OH₂: CH₃COOα-methylquinoline (C. Graebe and H. Caro, Ber., 1880, 13, p. 100). It crystallizes in needles, which are easily soluble in alcohol, and when heated above 130° C lose carbon dioxide and leave a residue of quinoline-γ-carboxylic acid.

Isoquinoline, isomer with quinoline, was first discovered in coal-tar in 1885 by S. Hoogerwerf and W. A. v. Dorp (Rec. Pays Bas, 1885, 4, 125); its formula is shown in the inset. It may be separated from the quinoline which accompanies it by means of the difference in the solubility of the sulphates of the two compounds, and isoquinoline sulphate less soluble than quinoline sulphate. It may be prepared by passing the vapore of benzylidenes ethylamine through a red-hot tube (A. Ficzet and S. Popovski, Ber., 1892, 25, p. 753); by the action of.5% solution of hydrochloric acid on the thionyl chloride formed when quinoline pentachloride reacts with hydrochloric acid; by the action of homophthalimide over zinc dust (M. L. Fischer, Ber., 1888, 21, p. 2209), or by treatment with phosphorus oxychloride followed by the reduction of dichloroisquinoline with hydrobromic acid (S. Gabriel, Ber., 1886, 19, pp. 1685-1685).

\[ \text{CH}_3 \text{CO} - \text{OH} \]
with alkalis yields a dimethoxyisoquinoline, whilst hydroxydras- tinine, hydrocotamine and the salts of cotamine may be considered as derivatives of reduced isoquinolines (see OPIUM).

**QUINONES**, in organic chemistry, a group of compounds in which two hydrogen atoms of a benzene nucleus are replaced by two oxygen atoms. This replacement may take place either in the ortho or para positions, giving rise to orthoquinones or to paraquinones; metaquinones do not appear to have been isolated. The para or true quinones are obtained by the oxidation of hydrocarbons with chromic acid or of various para di-derivatives of benzene with chromic acid mixture, such, for example, as para-aminophenol, para-phenylene diamine, paraaminobenzene, &c. H. v. Pechmann (Ber., 1888, 21, p. 1417) has shown that α-diketones are converted into paraquinones by the action of warm solutions of the caustic alkalies, diacetyl yielding para-syloquinoline:

\[
\text{CH}_2\text{CO-CO-CH}_2 \rightarrow \text{CH}_2\text{C-CO-CH}
\]

CH₂CO-CO-CH₂ → E || E ||

CH₂CO-CO-CH₃ HC-CO-C-CH₃;

whilst P. H. Bayrak (Bull. soc. chim., 1894 (3) 11, p. 1120) obtained anilino-derivatives of the paraquinones by the action of an aqueous solution of potassium chromate on an acetic acid solution of para-aminodimethylanilin and phenol: C₆H₅OH + H₂N-C₆H₄-N-C₆H₄-N(C₆H₅)₂ → O=C₆H₅-N=C₆H₄-N(C₆H₅)₂; these compounds yield the quinone when heated with mineral acids.

The parquinones are generally crystalline solids of a yellowish colour, having a characteristic sharp odour and being volatile in steam. They are readily reducible to the corresponding hydroquinones or para-dihydroxy-benzenes, and also combine with hydroxylamine hydrochloride to form nitrosophenols, ON-C₆H₄O, which can further yield quinone dioximes, HON-C₆H₄N₂O. Parquinones also combine with ammonia and with amines yielding derivative-derivatives and hydroquinones.

The orthoquinones more resemble the α-diketones; they are crystalline solids of a red or yellow colour, but differ from the parquinones in being devoid of smell and not volatile in a current of steam.

**Benoquinone** (para) or ordinary quinone, C₆H₅O₂, is formed by the oxidation of aniline with sodium dichromate and sulphuric acid. It subsinbes in golden yellow needles. Hot concentrated nitric acid oxidizes it to picric acid and oxalic acid, whilst on treatment with hydrochloric acid and potassium chlorate it yields chloranilic acid (Bamberger, 1892, 25th, 1628 and seq.). When four atoms of bromine are introduced it yields hydrobenzoquinone; it combines directly with aniline to form diaminodibenzoquinone, diaminodihydroquinone-anil and diaminodihydroquinone-dianil or azoquinone. Two alternative structural formulae have been given to benzoquinone, namely:

\[
\text{O} \quad \text{O} \quad \text{O} \quad \text{O}
\]

The former, due to C. Graebe (Zeit. f. Chemie, 1867, 3, p. 39), ascribes to the molecule a peroxide configuration which accounts for its oxidizing powers but not for the fact that each oxygen atom is capable of replacement by one atom of chlorine. The second formula, due to R. Fittig (Ann., 1867, 180, p. 28) readily explains the formation of the mono- and di-oxines of quinone and also that it readily combines with bromine.

**Quinoles** obtainable from C₆H₅CH₂OH or C₆H₅CO₂H, when para-aminophenol is oxidized with bleaching powder. It is a yellow crystalline solid readily volatile in steam. The dichlorimide, Cl₂N : C₆H₄ : Cl₂, is formed in a similar manner from paraphenylenediamine. It is a strong oxidizing agent. Quinoine-dioxime, H₂O : C₆H₄ : NO₂, crystallizes in colourless or yellow needles, which decompose when heated to about 240°C. Potassium ferrocyanide in alkaline solution oxidizes it to nitrosoacetone, whilst cold concentrated nitric acid oxidizes it to para-nitrobenzoquinone-hydroquinone, C₆H₄NO₂C₆H₄(OH)₂, formed by the direct union of quinone and hydroquinone or by careful oxidation of hydroquinone with nitric acid solution. On boiling with water it decomposes into paraquinone and hydroquinone.

**Benoquinone (ortho).—** C. L. Jackson (Am. Chem. Jour., 1901, 26, p. 10) attempted to prepare this compound by the action of iodine on the lead salt of pyrocatechin suspended in chloroform. A deep red solution was obtained, but the free quinone was not isolated since the solution on standing deposits nearly black crystals of dihydroxyphenylhydroxybenzoquinone (HO₂C₆H₄-C₆H₄-OH, R. Willsätter (Ber., 1904, 37, p. 4744), by dissolving pyrocatechin in absolute ether containing ignited sodium sulphate and then adding dry silver oxide, obtained the quinone in dark red crystalline plates which decompose between 60°C and 70°C.

For naphthalene quinone see NAPHTHALENE; for anthracene quinone see ANTHRAQUINONE; and for phenanthrene quinone see PHENANTHRENE.

**Quinotes.**—The quinones are a series of compounds of the type

\[
\text{R} \quad \text{O} \quad \text{O} \quad \text{O}
\]

obtained by the oxidation of para-alkylated phenols with nitric acid, Caro’s acid or bromine (Auwers, Ber., 1897–1901; E. Bamberger, ib., 1903, 36, p. 2028; Th. Zincke, ib., 1895, 28, P. 321); by the action of sulphuric acid on para-substituted phenylhydroxylamines (E. Bamberger), and by the action of the Grignard reagent on quinones (Bamberger). They are crystalline solids which are readily converted into para-alkylated phenols by reducing agents.

**QUINOXALINES** (Benzopyrazines), in organic chemistry, heterocyclic compounds containing a ring complex made up of a benzene ring and a pyrazine ring (formula I); they are isomeric with the cinnolines, phthalazines and quinolines. They are formed by the condensing ortho-diamines with 1,2-diketones (Hinsberg, Ann., 1887, 237, p. 327), the parent substance of the group (quinoxaline) resulting when glyoxylic is so condensed, whilst substitution derivatives arise when α-ketonic acids, α-chloroketones, α-dihyodic acids and α-ketone alcohols are used in place of diketones.

\[
\text{C}_6\text{H}_4\text{O}(\text{N.C.})\text{R' = C}_6\text{H}_4\text{O} \quad \text{N.C.} \quad \text{R'}
\]

In a similar manner, amino derivatives are formed when cyanoquin is condensed with ortho-diamines, and these amino compounds readily pass into the corresponding dioxo derivatives when acted upon with dilute hydrochloric acid.

The quinoles are weak bases, and are stable towards oxidizing agents but are readily reduced to hydro derivatives. The tetrahydroquinoniles are formed by condensing ortho-diamines with ortho-dihydroxy benzenes and the keto-dihydro derivatives arise similarly by condensing mono-alkyl diamines with ketonic acids (Hinsberg, Ann., 1887, 237, p. 327; Strutt, Chem. News, 1628, 28, 545 seq.)

The azoin bases (formula II) of this series are produced when the dihydroquinoniles (obtained by similar condensations from the mono-alkyl-ortho-diamines) are oxidised with ferric chloride.

\[
\text{N} \quad \text{N} \quad \text{R} \quad \text{OH}
\]

I. Quinoles. II. Azoin bases.

**QUINSY** (O. Fr. quintaine, from Lat. quintana, a street between the fifth and sixth maniples of a camp, where warlike exercises took place), an instrument used in the age of chivalry in practising for the tournament. Originally perhaps the mere trunk of a tree upon which the knight practised his sword-strokes, as may be seen in an ancient illustration reproduced in Strutt's Sports and Pastimes, the quintain developed into various forms of posts at which the soldier tilted with his lance, not only on horseback but on foot and even in boats. An early form consisted of the wooden figure of a Saracen armed with shield and sword; the object being to strike the figure on the forehead directly between the eyes. This, according to Strutt, was called by the Italians "running at the armed man " or " at the Saracen." The "pel," or post-quintain, was generally about 6 ft. high.

As late as the 18th century running at the quintain survived in English rural districts. In one variation of the pastime the quintain was a tun filled with water, which, if the blow was a poor one, was emptied over the striker. A later form was a post with a cross-piece, from which was suspended a ring, which the horseman endeavoured to pierce with his lance while at full speed. This sport, called "tilting at the ring," was very popular in England and on the continent of Europe in the 17th century, and is still practised as a feature of military and equestrian sport.
QUINTANA—QUINTILIAN

QUINTANA, MANUEL JOSÉ (1772-1857), Spanish poet and man of letters, was born at Madrid on the 11th of April 1772, and after completing his studies at Salamanca was called to the Bar. In 1801 he produced a tragedy, El Duque de Villar, founded on M. G. Lewis’s Castle Spectre; his Pelayo (1805), written on a patriotic theme, was more successful. The first volume of his Vidas de Españoles célebres (1807-33), containing lives of Spanish patriots, stirred the public imagination and secured Quintana the post of secretary to the Cortes during the French invasion. His proclamations and odes fanned the national enthusiasm into flame. But he was ill rewarded for his services, for on the return of Ferdinand VII. he was imprisoned at Pamplona from 1814 to 1819. He was finally given a small post in the civil service, became tutor to Queen Isabella, and was nominated senator. Though originally “crowned as the representative poet of Spain (1855), he seems to have lived in poverty. He died on the 11th of March 1857. His poems, thirty-four in number, are inspired by philanthropy and patriotism; the style is occasionally gallicized, and the thought is not profound, but his nobility of sentiment and resounding rhetoric attract every generation of Spaniards.

See an excellent monograph by E. Piñeyro, Manuel José Quintana, ensayo crítico y biográfico (Paris, 1892).

QUINTESSENCE, in ancient and scholastic philosophy, the name given to the fifth immaterial element, over and above the four material elements, air, water, earth and fire, which Aristotle assumed to be permeating the whole world, and called aéria: in medieval philosophy this was called quinta essentia, the fifth essence, and by many was considered material and therefore capable of extraction. The ancient Indian philosophers also contain the same idea of a fifth element; thus there were five Sanskrit elements (bhutas), earth, wind, fire, water and ether. In the history of chemistry the name was applied, by analogy, to the most concentrated extract of a substance.

QUINTILIAN [MARCUS FABIUS QUINTILIANUS] (c. A.D. 35-95), Roman rhetorician, was born at Calagurris in Spain. Concerning his family and his life but few facts remain. His father taught rhetoric, with no great success, at Rome, and Quintilian must have come there at an early age to reside, and must have there grown up to manhood. The years from 61 to 68 he spent in Spain, probably attached in some capacity to the retinue of the future emperor Galba, with whom he returned to the capital. For at least twenty years after the accession of Galba he was at the head of the foremost school of oratory in Rome, and may fairly be called the Isocrates of his time. He also gained some, but not a great, repute as a pleader in the courts. His greatest speech appears to have been a defence of the queen Berenice, on what charge is not known. He appears to have been wealthy for a time, and to have been a patron of the arts. Vespasian created for him a professorial chair of rhetoric, liberally endowed with public money, and from this time he was unquestionably, as Martial calls him, “the supreme controller of the restless youth.” About the year 88 Quintilian retired from teaching and from pleading, to compose his great work on the training of the orator (Institutio Oratoria). After two years’ retirement he was entrusted by Domitian with the education of two grand-nephews, whom he destined as successors to his throne. Quintilian gained the titular rank of consul, and probably died not long before the accession of Nerva (A.D. 96). A wife and two children died early.

Such is the scanty record that remains of Quintilian’s uneventful life. But it is possible to determine with some accuracy his relation to the literature and culture of his time, which he powerfully influenced. His career brings home to us the vast change which in a few generations had passed over Roman taste, feeling and society. In the days of Cicero rhetorical teaching had been entirely in the hands of the Greeks. The Greek language, too, was in the main the vehicle of instruction in rhetoric. The first attempt to open a Latin rhetorical school, in 94 B.C., was crushed by authority, and not until the time of Augustus was there any professor of the art who had been born to the full privileges of a Roman citizen. The appointment of Quintilian as professor by the chief of the state marks the last stage in the emancipation of rhetorical teaching from the old Roman prejudices.

For a hundred years or more which elapsed between the death of Cicero and the birth of Quintilian education all over the Roman Empire had spread enormously, and the education of the time found its end and climax in rhetoric. Mental culture was for the most part acquired, not for its own sake, but as a discipline to develop skill in speaking, the paramount qualification for a public career. Rome, Italy and the provinces alike resounded with rhetorical exercises, which were promoted on all sides by professorships, first of Greek, later also of Latin rhetoric, endowed from municipal funds. The mock contests of the future orators roused a vast amount of popular interest. In Gaul, Spain and Africa these pursuits were carried on with extraordinary energy, even more than at Rome. The seeds of the existing culture, such as it was, bore richer fruit on the fresh soil of the western provinces than in the exhausted lands of Italy and the East. While Quintilian lived, men born in Spain dominated the Latin schools and the Latin literature, and he died just too soon to see the first provincial, also of Spanish origin, ascend the imperial throne.

As an orator, a teacher and an author, Quintilian set himself to stem the current of popular taste which found its expression in what we are wont to call silver Latin. In his youth the influence of the younger Seneca was dominant. But the chief teacher of Quintilian was his father, who had once belonged to the old class with the old orators of Rome. This was Domitius Afer, a rhetorician of Nimes, who rose to the consulship. Quintilian, however, owed more to the dead than to the living. His great model was Cicero, of whom he speaks at all times with unbounded eulogy, and whose faults he could scarcely bring himself to mention; nor could he well tolerate to hear them mentioned by others. The reaction against the Ciceronian oratory which had begun in Cicero’s own lifetime had acquired overwhelming strength after his death. Quintilian failed to check it, as another teacher of rhetoric, equally an admirer of Cicero, had failed—the historian Livy. Seneca the elder, a clear-sighted man who could see in Cicero much to praise, and was not blind to the faults of his own age, condemned the old style as lacking in power, while Tacitus, in his Dialogue on Orators, includes Cicero among the men of rude and “unkempt” antiquity. The great movement for the poetically of Latin prose which was begun by Sallust ran its course till it culminated in the monstrous style of Fronton. In the courts judges, juries and audiences alike demanded what was startling, quaint or epigrammatic, and the speakers practised a thousand tricks to satisfy the demand. Oratory became above all things an art whose last thought was to conceal itself. It is not surprising that Quintilian’s forensic efforts won for him no lasting reputation among his countrymen.

The Institutio Oratoria is one long protest against the tastes of the age. Starting with the maxim of Cato the Censor that the orator is “the good man who is skilled in speaking,” Quintilian takes his future orator at birth and shows how this goodness of character and skill in speaking may be best produced. No detail of training in infancy, boyhood or youth is too petty for his attention. The parts of the work which relate to general education are of great interest and importance. Quintilian postulates the widest culture; there is no form of knowledge from which something may not be extracted for his purpose; and he is fully alive to the importance of method in education. He ridicules the fashion of the day, which hurried over preliminary cultivation, and allowed men to grow grey while declining in the schools, where nature and reality were forgotten. Yet he develops all the technicalities of rhetoric with a fulness to which we find no parallel in ancient literature. Even in this portion of the work the illustrations are so apposite and the style so dignified and yet sweet that the modern reader, whose initial interest in rhetoric is of necessity faint, is carried along with much less fatigue than is necessary to master most parts of the rhetorical writings of Aristotle and Cicero. Quintilian’s literary sympathies are extraordinarily wide. When
obliged to condemn, as in the case of Seneca, he bestows generous and even extravagant praise on such merit as he can find. He can cordially admire even Sallust, the true fountain-head of the style which he combats, while he will not suffer Lucilius to lie under the aspersions of Horace. The passages in which Quintilian reviews the literature of Greece and Rome are justly celebrated. The judgments which he passes may be in many instances traditional, but, looking to all the circumstances of the time, it seems remarkable that there should then have lived at Rome a single man who could make them his own, and give them expression. The form in which these judgments are rendered is admirable. The gentle justness of the sentiments is accompanied by a curious felicity of phrase. Who can forget "the immortal swiftness of Sallust," or "the milky richness of Livy," or how "Horace soars now and then, and is full of sweetness and grace, and in his varied forms and phrases is most fortunately bold?" Ancient literary criticism perhaps touched its highest point in the hands of Quintilian.

To comprehensive sympathy and clear intellectual vision Quintilian added refined tenderness and freedom from self-assertion. Taking him all in all, we may say that his personality must have been the most attractive of his time—more winning and at the same time more lofty than that of the younger Pliny, his pupil, into whom no small portion of the master's spirit, and even some tincture of the master's literary taste, was instilled. It does not surprise us to hear that Quintilian attributed any success he won as a pleader to his command of pathos, a quality in which his great guide Cicero excelled. In spite of some extravagances of phrase, Quintilian's lament (in his sixth book) for his girl-wife and his boy of great promise is the most pathetic of all the lamentations for bereavement in which Latin literature is so rich. In his precepts about early education Quintilian continually shows his shrinking from cruelty and oppression.

Quintilian for the most part avoids passing opinions on the problems of philosophy, religion and politics. The professed philosopher he disliked almost as much as did Isocrates. He deemed that ethics formed the only valuable part of philosophy and that ethical teaching ought to be in the hands of the rhetoricians. In the divine government of the universe he seems to have had a more than ornamental faith, though he indicated clearly the liberty of his own thought. As to politics Quintilian, like others of his time, felt free to eulogize the great anti-Caesarean leaders of the dying republic, but only because the assumption was universal that the system they had championed was gone for ever. But Quintilian did not trouble himself, as Statius did, to fling stones at the emperors Caligula and Nero, who had missed their delegation. He makes no remark, laudatory or otherwise, on the government of any emperor before Domitian. No character figured more largely in the rhetorical controversies of the schools than the ideal despot, but no word ever betrayed a consciousness that the actual occupant of the Palatine might exemplify the theme. Quintilian has often been reproached with his flattery of Domitian. No doubt it was fulsome. But it is confined to two or three passages, not thrust continually upon the reader, as by Statius and Martial. To refuse the charge of Domitian's expected successors would have been perilous, and equally perilous would it have been to omit from the Institutio Oratoria all mention of the emperor. And there was at the time only one dialect in which a man of letters could speak who set any value on his personal safety. There was a choice between extinction and the writing of a few sentences in the loathsome court language, which might serve as an official test of loyalty.

The Latin of Quintilian is not always free from the faults of style which he condemns in others. He also exhibits many of the usages and constructions which are characteristic of the silver Latin. But no writer of the decadence departs less widely from the best models of the late republican period. The language is on the whole clear and simple, and varied without resort to rhetorical devices and poetical conceits. Besides the Institutio Oratoria, there have come down to us under Quintilian's name 19 longer (ed. Lehner, 1905) and 145 shorter (ed. Ritter, 1884) Declamationes, or school exercises on themes like those in the Contradicriae of Quintilian's elder. The shorter were probably published, if not composed, from notes taken at his lessons. It is strange that they could ever have been supposed to belong to a later century; the style proclaims themselves of Quintilian's time. Most of Quintilian's 145 have been edited. Of the editions of the whole works the chief is that by Burman (1720); of the Institutio Oratoria that by Spalding, completed by Zumpt and Bonnell (1798-1834). The fourth edition of Quintilian's great work has been carefully edited, as by Krueger (ed. 3, 1888). Peterson (1897), Bonn and Mayer have made a new edition.

QUINTUS SMYRNAEUS, Greek epic poet, probably flourished in the latter part of the 4th century A.D. He is sometimes called Quintus Calaber, because the only MS. of his poem was discovered at Otranto in Calabria by Cardinal Bessarion in 1450. According to his own account (xii. 310), he tried his hand at poetry in his early youth, while tending sheep at Smyrna. His epic in fourteen books, known as Τὰ μὴν Ὀπσιορνήσια or Ποιηθερομεία, takes up the tale of Troy at the point where Homer's Iliad breaks off (the death of Hector), and carries it down to the capture of the city by the Greeks. The first five books, with which the book opening covers, are laudatory of the Trojan heroes, describe the doleful deeds and deaths of Penelopedia, the Amazons, of Menon, of the morning, and of Achilles; the funeral games in honour of Achilles, the contest for the arms of Achilles and the death of Ajax. The remaining books relate the exploits of Neoptolemus, Euryalus and Delphobus, the deaths of Paris and Oeneon, the capture of Troy by means of the wooden horse, the sacrifice of Polynxena at the grave of Achilles, the departure of the Greeks, and their dispersal by the storm. The poet has no originality; in conception and style his work is closely modelled on Homer. His materials are borrowed freely from the cyclic poems of Virgil (with whose works he was probably acquainted) also drew, in particular the Aēthiopis of Arctinus and the Little Illiad of Lesches.

Edito princeps by Aldus Manutius (1504); Köchly (ed. major) with elaborate prolegomena, 1850; ed. minor, 1853; Z. Zimmermann (author of other valuable articles on the poet, 1865); see also Kehmptzov, De Quini Smyrnai Fontibus ac Mythologia (1880); C. A. Sainte-Beuve, Étude sur le Quin de Smyrne (1857); F. A. Paley, Quintus Smyrnaeus and the "Homer" of the tragic Poets (1870); G. W. Paschel, A Study of Quintus Smyrnaeus (Chicago, 1904).

QUIPUS (Khipus, Qippos), the ancient Peruvian name for a method of recording which was in use at the time of the arrival of the Spaniards. It consisted of a cord two feet in length to which were attached a series of knotted-strings (Peruv. quipu, a knot) hanging like a fringe. These strings were coloured, and the knots, their number and size, their distance apart, the colours, the order in which the coloured threads hung, all had a signification, e.g. white was silver, yellow gold; white meant peace, red war, &c. In this manner a rough register of important events, of births, deaths and marriages, and other statistics was kept, the quipus even constituting a rude history of the people. They were also much used for conveying orders to military chiefs in the provinces.

The idea of knotted strings to aid memory is so simple that it is common to many peoples. A Pelew islander, visiting England, knotted strings as a diary of all that struck him during his travels. In the Hawaiian Islands native carriers have knotted-string records of their rounds. The Peruvian quipus is simply the perfecting of a system of mnemonic common to the Red Indians. See also Wampum.

Quique, in early English, means quair, and from the O. Fr. quier, modern cahier, a copy-book, manuscript book; Lat. quadrirn, set of four, from quattuor, originally the term for four sheets of paper or parchment folded so as to make eight leaves, the ordinary unit in manuscripts and early printed books; the term is now chiefly applied to a twentieth part of a ream of writing paper, twenty-four sheets. In bookbinding and publishing the expression "in quires" is used of the sheets of a book when not folded or bound. "Quire" was formerly
used of a small book contained in a single quire of paper, and so is frequently found in the title of short poems, treatises, &c. A familiar example is the "King's Quire in the Fields of Scotland." "Choir," a body of singers or the part of a church where the singers sit, was formerly spelled "quire," following the pronunciation of the word (See Citoix).

**Quirinus**, the Sabine name of the god Mars, probably an adjective meaning "wielder of the spear" (Quiris, cf. Janus Quirinus). Other suggested etymologies are: (1) from the Sabine town Cures; (2) from curia, i.e. he was the god of the Roman state as represented by the thirty curies. A. B. Cook (Class. Rev. xviii., p. 368) explains Quirinus as the oak-god (quercus), and Quirites as the men of the oaken spear. From early times he was worshipped at Rome on the Quirinal hill, whither, according to tradition, the Sabines fled after they had migrated from Cures and taken up their abode. In the religious system of Numia, Quirinus and Mars were both recognized as divine beings, distinct but of similar attributes and functions; thus, like Mars, Quirinus was at once a god of war and a nature god, the protector of fields and flocks. Subsequently, at the end of the republic, Quirinus became identified with the deified Romulus, son of Mars. One of the greater flamen was attached to the service of Quirinus, a second college of Salii founded in his honor, and a festival "Quirinalia" celebrated on the 17th of February, in the day of his supposed translation of Numia to heaven. Old Roman formulæ of prayer mention a Hora Quirini, his female cult associate afterwards identified with Hersilia, the wife of Romulus.

The name was also borne by the following saints: (1) a Roman tribune who suffered martyrdom under Hadrian; (2) a bishop of Sicia in Pannonia; (3) the patron of the Tegernsee in Bavaria, beheaded in Rome in 269 and invoked by those suffering from gout. The petroleum (Quirinus-oil) found in the neighbourhood of the lake takes its name from him.

**Quirites** (literally "spearmen"; see **Quirinus**), the earliest name of the burgesses of Rome. Combined in the phrase "populus Romanus Quirites (or Quiritium)" it denoted the individual citizen as contrasted with the community. Hence *ius Quiritium* in Roman law is full Roman citizenship. Subsequently the term lost the military associations due to the original conception of the people as a body of warriors, and was applied (sometimes in a depreciatory sense, cf. Tac. Ann. i. 42) to the Romans in domestic affairs, *Romani* being reserved for foreign affairs. (For the distinction between Quirity and praeatorian ownership, see **Roman Law**.)

**Quito**, the capital of the republic of Ecuador, the see of an archbishopric, covering the same territory, and the episcopal of the province of Pichincha, in lat. 0° 45' S., long. 79° 45' W., about 114 m. from the Pacific coast and 165 m. in a direct line N. E. of Guayaquil, with which it is connected by a railway completed in 1908. Pop. (1906) 50,840, of whom 13,650 were foreigners, mostly Colombians. It occupies a small basin of the great central plateau formed by the volcano Pichincha on the W., the Puengasi ridge on the E., and ridges N. and S. formed by spurs from the eastern side of Pichincha. The ground upon which the city is built is uneven and is traversed from W. to E. by two deep ravines (quebradas), one of which is arched over in part, to preserve the alignment of the streets, the drainage of which escapes through a cleft in the ridge northward to the plain of Tumbaco. The city is in great part laid out in rectangular squares, the streets running nearly with the cardinal points of the compass. The houses of Quito are chiefly of the old Spanish or Moorish style. The building material in general use is sun-dried bricks, which, in the better houses is covered with plaster or stucco. The public buildings are of the heavy Spanish type. Facing the principal square (Plaza Mayor), and occupying the whole S. side, is the cathedral; on the W. side is the government palace; on the N. the archbishop's palace; and on the E. the municipal hall. The episcopal palace of this plaza is 934 ft. above sea-level. The finest building in the city is the Jesuits' church, whose façade is covered with elaborate carving. Among public institutions are the university, which occupies part of the old Jesuit college, an astronomical observatory, and eleven large monastic institutions, six of which are for nuns. One of the convents, that of San Francisco, covers a whole block, and ranks among the largest institutions of its kind in the world. A part of it is in ruins, and another part has been for some time used as military barracks by the government. The university has faculties of theology, law and medicine, and has 200 to 250 students, but it is antiquated in character and poorly supported. The eminent botanist and chemist, Dr William Jameson (1706-1872), was a member of its faculty for many years. The city has no large commercial houses, and only an insignificant export trade, chiefly hides and forest products (including mohair). Religious paintings of a medieval type are produced in large numbers and exported. The native manufactures include tanned leather, saddles, shoes, ponchos, woollen and cotton cloth, fibre sandals and sacking, blankets, coarse matting and coarse woolen carpets. Superior hand-made carpets are also made, and Quito artisans show much skill in wood carvings and in gold and silver works; the women excel in fine needlework and lace-making.

Quito derives its name from the Quitus, who inhabited the locality a long time before the Spanish conquest. In 1533 Sebastian Benalcazar took peaceable possession of the native territory, and had been successively a capital of the Suyas (or Incas), and in 1541 it was elevated to the rank of a Spanish city. Its full title was San Francisco de Quito, and it was capital of the province or presidency of Quito down to the end of Spanish colonial rule. It has suffered repeatedly from earthquakes, the greatest damage occurring from those of 1707 and 1859.

**Quiver**, a case for holding arrows. The word is taken from O. Fr., where it appears in such forms as *quiere, cuivre or couivre*. This is apparently cognate with the O. E. *coer*, Ger. *Köcher*, quiver or case. The ultimate origin is obscure, and the medieval Latin and Greek words *cucurum* and *solfopoiv* are said to be from the German "Querre," "tremble," and should be distinguished; this is connected with "quaver," "quake"; the *New English Dictionary* takes these words to be onomatopoeic in origin.

**Quoins** (an old variant spelling of "coin," from Lat. *cuneus*, a wedge), in architecture, the term for the external angle of a building, generally applied to the ashlar masonry employed to stop the rubble masonry or brickwork of the wall at the angles, as also of buttresses, doorways or projecting features. In Saxon work the quoins were built with large stones laid horizontally and vertically in alternate courses, technically known as "long and short" work. Sometimes, to give greater support to the wooden towers, the quoin stones are r usseted, and this treatment is found extensively employed in ancient German towns. At Eastbury Manor House in Essex, built in brick, the quoins at the angles of the walls, doorway and windows were plastered in imitation of stonework.

**Quoits** (O. Fr. *coiter, quoiter, to incite*), a pastime resembling the ancient discus-throwing which formed one of the five games of the Greek pentathlon (see **Discus**), the two main differences between the ancient and modern sports being that the quoit is ring-shaped (one surface being rounded, the other—the back—being flat) and is lighter than the discus, and its throwing is in a way which accentuates the strength of the arm. Few traces of a game resembling quoits can be found on the continent of Europe, and its origin may be sought for on the borderland of Scotland and England. There are references to it in the Midlands dating from the beginning of the 15th century, and it was one of the games prohibited in the reigns of Edward III. and Richard II. in favour of archery. Ascham, in his *Toxophilus* (1545), says that "quitoing be too vile for scholars," and in old times it was chiefly played by the working classes, who often used horse-shoes for want of quoits, a custom still prevailing in country districts. According to the modern rules, slightly modified from the code drawn up in 1865, two iron or steel pins 18 yds. apart are driven into the ground, leaving 1 in. exposed. Each is situated in the centre of an "end," a circle of stiff clay 3 ft.
QUORUM—QUO WARRANTO

in diameter. The quotas, made of iron, may be of any weight, but usually about 9 lb each. They must not exceed 8½ in. in diameter, or be less than 3½ in. in the bore, or more than 2½ in. in the web. When delivering his quoit a player must stand within 4 ft. 6 in. of the centre of the end and at its side. Matches are played between teams or individuals, the object of the game being to throw the quoit as near to the pin as possible, a "fingers," i.e. a quoit actually surrounding the pin, counting two, and a quoit nearer to the pin than any of the adversary's, counting one. A match may be for any number of points, the team or player scoring that number first being the winner. In championship matches all quotas farther than 18 in. from the end, are fouled and removed. All measurements are made from the middle of the pin to the nearest edge of the quoit. If one or more quotas are lapped, the one most accessible is first measured and withdrawn. All quotas on their backs are a foul. The general principle of curling, to drive the opponents' quotas away from the pin and place one's own near or on it, is followed. Scotland, Lancashire and the Midlands are the principal centres of quoitig in Great Britain. In Scotland the game is patronized by the Curling Clubs, and this is also the case in the United States and Canada. Billy Hodson was champion of Great Britain in the middle of the 19th century, and his trip to America in the early 'sixties is of historical interest, as it resulted in two contests for the championship of the world with James McLaren of Newark, N. J., a native of Scotland, who was champion of America. One hard-fought match was won by each, the deciding one remaining unplayed. The championship of America is rewarded by the "Bell Medal," presented by the Grand National Curling Club of America.

QUORUM (Lat. for "of whom"), in its general sense, a term denoting the number of members of any body of persons whose presence is requisite in order that business may be validly transacted by the body or its acts be legal. The term is derived from the wording of the commission appointing justices of the peace which appoints them all, jointly and severally to keep the peace in the county named. It also runs—"We have also assigned you, and every two or more of you (of whom qua rum), any one of you the aforesaid A, B, C, D, &c., we shall be one) our justices to inquire the truth more fully," whence the justices so-named were usually called justices of the quorum. The term was afterwards applied to all justices, and subsequently by transference, to the number of members of a body necessary for the transaction of its business. No general rule can be laid down as to the number of members of which a quorum should consist; its size is usually prescribed by definite enactment or provision; it is entirely a matter for self-constituted bodies as to what their quorum shall be, and it usually depends on the size of the body. In bodies which owe their existence to an act of the legislature, the necessary quorum is usually fixed by statute. In England, in the House of Lords, three form a quorum, though on a division there must be thirty members present. In the House of Commons, forty members, including the Speaker, form a quorum. The quorum of a standing committee of the House of Lords is seven, and of the House of Commons, twenty.

QUOTA, a proportional share or part that is due from or to any person or body of persons, in Med. Lat. quota, sc. pars, from quotus, an adjective formed from quot, how many. The word first appears in connexion with the levying of men, money or supplies for military and naval, purposes from districts, towns or seaports, and thus is equivalent to "contingent" (Lat. contingere, to happen to, fall to one's lot or share, cum, with, and tangere, to touch), used since the 18th century specifically of a contribution of men or ships according to a scale fixed between the contracting parties.

QUOTATION, a passage repeated from the writings or speech of another. The verb "to quote" comes from Med. Lat. quotare (from quot, how many), to refer to by numbers, i.e. of page, chapter, &c., also to separate into chapters, verses, &c. The term is also specifically applied to the statement of the current prices of goods and commodities, and of stocks and shares (see STOCK EXCHANGE).

Useful lists of familiar quotations may be found in the following:—H. T. Riley, Dictionary of Latin and Greek Quotations, 3d ed.; P. H. Dabel, Dictionary of English Quotations (1896); in the same series, T. B. Harbottle, Classical Quotations (1897), and T. B. Harbottle and P. H. Dabel, French and Italian Quotations (1901); P. R. Hood, English Proverbs, (1897); H. K. Potter, A New Dictionary of Foreign Phrases and Classical Quotations; J. K. Hoyt and A. L. Ward, The Cyclopaedia of Practical Quotations, English and Latin (1892); Cassell's Book of Quotations (1901); J. Bartlett, Familiar Quotations...in Ancient and Modern Literature (1902); in Notes and Queries, the indices to the various series contain, grouped under the heading "Quotations," a large number of out-of-the-way quotations.

QUO WARRANTO, in English law, the name given to an ancient prerogative writ calling upon any person usurping any office, franchise, liberty or privilege belonging to the Crown, to show "by what warrant" he maintained his claim, the onus being on the defendant. It lay also for non-user or misuser of an office, &c. If the Crown succeeded, judgment of forfeiture or ousterleman was given against the defendant. The procedure was regulated by statute as early as 1278 (the statute of Quo Warranto, 6 Edw. I. c. 1), passed in consequence of the commission of quo warranto issued by Edward I. A distinction was drawn in the report between liberates, jurisdiction exercised by the lord as lord, and regalia, jurisdiction exercised by Crown grant. After a time the cumbersome and inconvenience of the ancient practice led to its being superseded by the modern form of an information in the nature of a quo warranto, exhibited in the King's Bench Division either by the attorney-general ex officio or by the king's coroner and attorney at the instance of a private person called the relator. The information will not be issued except by leave of the court on proper cause being shown. It does not lie where there has been no user or where the office has determined. Nor does it lie for the usurpation of every kind of office. But it lies where the office is of a public nature and created by statute, even though it is not an encroachment upon the prerogative of the Crown. Where the usurpation is of a municipal office the information is regulated by 0 Anne c. 25 (1711), under which the defendant may be fined and judgment of ouster given against him, and costs may be granted for or against the relator. Such an information must, in the case of boroughs within the Municipal Corporations Act 1882, be brought within twelve months after disfratification (s. 225); in the case of other boroughs, within six years after the defendant first took upon himself the office (32 Geo. III. c. 38, s. 2). The information in the nature of a quo warranto, though nominally a criminal, has long been really a civil proceeding, and has recently been expressly declared to be so (Supreme Court of Judicature Act 1854, s. 15). In cases not falling within 0 Anne c. 25, judgment of ouster is not usually given. The most famous historical instance of quo warranto was the action taken against the corporation of London by Charles II. in 1684. The King's Bench adjudged the charter and franchises of the city of London to be forfeited to the Crown (State Trials, vol. viii. 1039). This judgment was reversed by 2 Will. & Mary, sess. 1, c. 8; and it was further enacted, in limitation of the prerogative, that the franchises of the city should never be seized or forejudged on pretence of any forfeiture or misdemeanor. In Scotland the analogous procedure is by act of declarator.

In the United States the right to a public office is tried by quo warranto, or similar procedure, regulated by the state laws. Proceedings by quo warranto lie in a United States court for the removal of persons holding office contrary to art. xiv. s. 3 of the Amendments to the Constitution (act of the 31st of May 1870, c. 14).
RABAH ZOEIR (d. 1900), the conqueror of Bornu (an ancient sultanate on the western shores of Lake Chad, included since 1890 in British Nigeria), was a half-Arab, half negro chieftain. He was originally a slave or follower of Zobeir Pasha (q.v.), and is said to have formed one of the party which served as escort to Miss Thine (q.v.) in her journeys in the Bahr-el-Ghazal in 1862–64. In 1879, Zobeir being in Egypt, his son Suleiman and Rabah were in command of Zobeir's forces in the Bahr-el-Ghazal. They persisted in slave-raiding, and denied the khedive's authority, and Colonel C. G. Gordon sent against them Romolo Gassi Pasha. Gassi captured Suleiman and routed Rabah, who in July 1879 fled westward with some seven hundred Bazingirs (black slave soldiers). He made himself master of Kreich and Dar Banda, countries to the south and south-west of Wadai. In 1883–85 he was invited by Mahomed Ahmed (the mahdi) to join him at Omdurman, but did not do so. According to one account he learnt that the mahdi intended, had he gone to Omdurman, to put him to death. In 1891 Paul Crampel, a French explorer, was killed in Dar Banda by a chieftain tributary to Rabah, and Crampel's stores, including 300 rifles, were sent to Rabah. With this reinforcement of arms he marched towards Wadai, but being stoutly opposed by the people of that country he turned west and established himself in Bagirmi, a state south-east of Lake Chad. In 1893 Rabah overthrew the sultan of Bornu. In his administration of the country he showed considerable ability and a sense of public needs. To the British, represented by the Royal Niger Company, Rabah gave comparatively little trouble. During 1894–95 he continually (but unavailingly) asked the company's representatives at Yola and Ibi to supply him with gunpowder. Rabah then tried threats, and in 1896 all communication between him and the company ceased. Early in 1897 he began an advance in the direction of Kano, the most important city in the Fula empire. The news of the crushing defeat by Sir George Goldie of the Fula at Bida, and of the capture of Illorin, induced

RAABE, HEDWIG (1844–1905), German actress, was born in Magdeburg on the 3rd of December 1844, and at the age of fourteen was playing in the company of the Thalia theatre, Hamburg. In 1864 she joined the German Court theatre at St Petersburg, touring Germany in the summer with such success that in 1868 she relinquished her Russian engagement to devote herself to starring. In 1871 she married Albert Niemann (b. 1831), the operatic tenor. She excelled in classical roles like Marianne in Goethe's Gessler and Franziska in Stimm von Barnhelm. It was the first time she played Ibsen in Berlin. She died on the 21st of April 1905.

RAABE, WILHELM (1831–1910), German novelist, whose early works were published under the pseudonym of Jakob Corvinus, was born at Eschershausen in the duchy of Brunswick on the 8th of September 1831. He served apprenticeship at a bookseller's in Magdeburg for four years (1849–1854); but tiring of the routine of business, studied philosophy at Berlin (1855–1857). While a student at that university he published his first work, Die Chronik der Sperlingsgasse (1857), which at once attained to great popularity. Raabe next returned to Wolfenbüttel, and then lived (1865–1870) at Stuttgart, where he devoted himself entirely to authorship and wrote a number of novels and short stories; notably Unsere Herrgotts Kanzlei (1862); Der Hungerpastor (1864); Abu Telef (1867) and Der Schächerdumb (1870). In 1870 Raabe removed to Brunswick and published the narratives Horacker (1876)—perhaps his masterpiece; Das Odfeld (1886); Kloster Luzoug (1894) and Hastedbong (1890), and numerous other stories. The distinguishing characteristic of Raabe's work is a genial humour which reminds us occasionally of Dickens; but this humour is often combined with a pessimism that is foreign to the English novelist.

Raabe's Gesammelte Erzählungen appeared in 4 vols. (1896–1900); there is no uniform edition of his larger novels. See P. Gerber, Wilhelm Raabe (1867); A. Otto, Wilhelm Raabe (1899); A. Bartels, Wilhelm Raabe: Vortrag (1901).

RABA BEN JOSEPH BEN HAMA (c. 280–352), Babylonian rabbi or amora. He is closely associated in his studies with Abaye. The latter was head of the Academy at Pumbeditha. Raba founded a new school at MaBuza, which eventually became so large as Raba lived the only academy in Babylonia (Persia). The development of Talmudic law (or Halakah) was much indebted to this rabbi, whose influence in all branches of Jewish learning was supreme. His friendship with the King Shapur II. enabled Rabba to secure a free and open discussion of the oppressive laws enacted against the Jews of Persia. See Graetz, History of the Jews; (Eng. trans., vol. ii. ch. xxi.); Bucher, Agada der Babylon. Amorader, p. 106, 6cc. and 114–113. (L. A.)
RABAT—RABBAH BAR NAHMANI

Rabah to return to Bornu. He gave the British no further trouble, but turned his attention to the French. Emile Gentil had in the same year (1897) reached Lake Chad, via the Congo and Bagirmi, and had installed a French resident with the sultan of Bagirmi. As soon as Gentil had withdrawn, Rabah again fell upon Bagirmi, and forced sultan and resident to flee.

In 1899 the French sent an expedition to reconquer the country, but at first they were unsuccessful. In the summer of 1899 Rabah attacked and routed the French advanced post, held by Naval-Lieutenant Bretonnet, and the latter was killed.

In October following another battle was fought, in which the French, under Captain Robillot, completely defeated Rabah, who retreated north-east towards Wadad. Gathering a fresh army, he returned to Bagirmi and joined issue with the French a third time. In a battle fought on the 22nd of April 1900 Rabah was in yet another post, and there a Belgian cut off and taken to the French camp. In this engagement Major Lamy, the French commandant, also lost his life.

The French continued the campaign against Rabah's sons, two of whom were killed. Rabah had left instructions that if his army was finally defeated by the French, his successor should return to Bornu and make friends with the British. Rabah's third son, Fader-Allah, accordingly threw himself entirely upon British protection. He made a favourable impression, and it was contemplated to recognize him as sultan of Bornu. However, in the later part of 1901 Fader-Allah, who had 2500 riflemen, again made aggressive movements against the French. In retaliation, Captain Dangeville pursued him into British territory. A battle was fought at Gujba, Fader-Allah being defeated. He fled mortally wounded, and died the same night, being buried in the bed of a small river, the course of which had been diverted for the purpose.

Connected accounts of Rabah's career are contained in E. Gentil's La Chute de l'empire de Rabah (Paris, 1902) and in M. von Oppenheim's Rabah u. das Tschadengebiet (Berlin, 1902) (F. R. C. E.)

RABBAH (Riháh), a city on the Atlantic coast of Morocco, in 34° 3' N., 6° 46' W., 130 m. s. of Cape Spartel, on the southern side and at the mouth of the Bu Ragrag, which separates it from Salii on the northern bank. It is a commercial town of about 26,000 to 30,000 inhabitants, occupying a rocky plateau and surrounded by massive but dilapidated walls, strengthened by three forts on the seaward side. To the south of the town stands a modern palace, defended by earthworks and Krupp guns. The conspicuous feature in the view from the ocean is the Borj el Hasan, an unfinished square-built tower, 145 ft. high, built on an elevation about 65 ft. above the sea to the west of the walled town. At one time the Bu Ragrag afforded a much better harbour than it does now; the mouth of the river was never protected, and there was a brave bar at the mouth of the river, which hampered the shipping, and makes the growth of trade slow. The depth of water over the bar varies from 7 to 12 ft. Rabat trades with Fez and the interior of Morocco, with the neighbouring coast towns and Gibraltar, and with Marseilles, Manchester and London, and is the greatest industrial centre in Morocco.

Rabat was founded by Yaqub el Mansur in 1184, but Salii was then already an ancient city, and on the scarped hills to the west of Rabat stand the ruins of Sala, a Roman colony, known as Stella. It contains a mausoleum of the Beni Marin dynasty.

RABAUL, PAUL (1718-1794), French pastor of "the Church of the Desert" (see Heguerotes), was born at Bédarieux, near Montpellier, on the 29th of January 1718. In 1738 he was admitted as a preacher by the synod of Languedoc, and in 1740 he went to Lausanne to complete his studies in the seminary recently founded there by Antoine Court (q.v.). In 1741 Rabaut was placed at the head of the church of Nimes, and in 1744 he was vice-president of the general synod. During the persecution of 1745-1752 Rabaut himself was obliged to hide. When the marquis of Paulmy d'Argenson was sent to Languedoc to make a military inspection, Rabaut succeeded in interviewing him (1750). For a time the persecution ceased, but it broke out again in 1753, a price being put upon Rabaut's head. Louis François de Bourbon, Prince de Conti, interested himself in the Protestants in 1755, and in July Rabaut visited him. During the years 1755-1766 periods of persecution and toleration alternated. By the year 1766, however, the efforts of Antoine Court and P. Rabaut had been so successful that French Protestantism was well established and organized. Court de Gébelin, Paul Rabaut, and his son Saint-Étienne now exerted themselves to get it recognized by the law and government. When the people revolted, the minister Turgot in 1775 requested Rabaut to calm them. His success aroused the jealousy of his colleagues, who tried to undo the good work started by Antoine Court. But Rabaut persevered in his efforts to improve legally the position of the Protestants, and the law of 1781, which was supported by General La Fayette, it was arranged that Rabaut's son, Rabaut Saint-Étienne, should go to Paris on behalf of the Reformed Church. In November 1787 Louis XVI.'s edict of toleration was signed, though it was not registered until the 29th of January 1788. Two years later liberty of conscience was proclaimed by the National Assembly, of which Rabaut Saint-Étienne was chosen vice-president, and it was declared that non-Catholics might be admitted to all positions. After the fall of the Girondists, however, in which Rabaut Saint-Étienne was involved, Paul Rabaut, who had refused to renounce his position as a deputy, was dragged to the citadel of Nimes, and kept in prison seven weeks (1794). He died at Nimes on the 25th of September 1794, soon after his release.

See J. Pons de Nimes, Notice biographique sur Paul Rabaut (1808); Charles Dardier, Paul Rabaut, ses lettres à Antoine Court (1884) and Paul Rabaut, ses lettres à divers (1891).

RABAUT SAINT-ÉTIENNE, JEAN PAUL (1743-1793), French revolutionist, was born at Nimes, the son of Paul Rabaut (q.v.), the additional surname of Saint-Étienne being assumed from a small property near Nimes. Like his father, he became a pastor, and distinguished himself by his zeal for his co-religionists, working energetically to obtain the recognition of the civil rights which had been granted to them by Louis XVI. in 1788. Having gained a great reputation by his Histoire primitive de la Grèce, he was elected deputy to the States General in 1789 by the third estate of the bailliage of Nimes. In the Constituent Assembly he worked on the framing of the constitution, spoke against the establishment of the republic, which he considered ridiculous, and voted for the suspensive veto, as likely to strengthen the position of the crown. In the Convention he sat among the Girondists, opposed the trial of Louis XVI., was a member of the commission of twelve, and was proscribed with his party. He remained in hiding for some time, but was ultimately discovered and guillotined on the 5th of December 1793.

See J. A. Dartigue, Rabaut Saint-Étienne à l'Assemblée Constituante (Paris, 1903); and A. Lods, "Correspondance de Rabaut Saint-Étienne" in La Révolution française (1898), "L'arrestation de Rabaut Saint-Étienne" in La Révolution française for 1903 (cf. the same review for 1901), and "Les débuts de Rabaut Saint-Étienne aux États Généraux et à la Convention" in the Bulletin historique de la Société d'histoire du protestantisme français (1901), also an Essai sur la vie de Rabaut Saint-Étienne (1895), separately published. An edition of the works of Rabaut Saint-Étienne (2 vols., 1826) contains a notice by Collin de Plancy.

RABA, a town of British West Africa, in the province of Nupe, Northern Nigeria, on the left bank of the Niger, in 9° 6' N., and 200 m. above the confluence of the Niger and the Benue. At the time of Richard Lander's visit in 1830 it was a place of 40,000 inhabitants and one of the most important markets in the country. In 1867 Gerhard Rohls found it with only 500 inhabitants. The town has somewhat recovered its position since the establishment of British rule in 1903.

very similar to that of the hare, but is smaller and lighter, with a slenderer muzzle and a longer and narrower palate. Besides these characters, the rabbit is separated from the hare by the fact that it brings forth its young naked, blind, and helpless; to compensate for this, it digs a deep burrow in the earth in which they are born and reared, while the young of the hare are fully clothed with fur, and able to take care of themselves, in the shallow depression or form in which they are deposited. The rabbit is from 2 to 3 lb, but although wild individuals have been recorded up to 5 lb. Its general habits are too well known to need detailed description. It breeds from four to eight times a year, bringing forth each time from three to eight young; its period of gestation is about thirty days, and it is able to bear when six months old. It attains to an age of about seven or eight years.

The rabbit is believed to be a native of the western half of the Mediterranean basin, and still abounds in Spain, Sardinia, southern Italy, Sicily, Greece, Tunis and Algeria; and many of the islands adjoining these countries are overrun with these rodents. Thence it has spread, partly by man's agency, northwards throughout temperate and north-western Europe, increasing rapidly wherever it gains a footing; and this extension is still going on, as is shown by the case of Scotland, where early in the 19th century rabbits were little known, while they are now found in all suitable localities up to the extreme north. It has also gained admittance into Ireland, and now abounds there as much as in England. Outside of Europe the same extension of range has been going on. In New Zealand and Australia rabbits, introduced either for profit or sport, have increased to such an extent as to form one of the most serious pests that the farmers have to contend against, as the climate and soil of those countries admirably suit them. They are quick and too lowly organized to keep them within reasonable bounds. In North America about thirty species and twice as many geographic races (subspecies) are known, and the occurrence of several distinct fossil forms shows that the genus has long been established. The chief variety is the common grey or cotton-tail (Lepus floridanus). For the “jack-rabbit,” see Hare.

The rabbit has been domesticated from an early period. Little doubt exists amongst naturalists that all the varieties of the domestic animal are descended from Oryctolagus cuniculus. The variations which have been perpetuated and intensified by artificial selection are, with the exception of those of the dog, greater than have been induced in any other animal by man. There are not oniy a great number of quadrupled in some of the larger breeds, and the structure of the skull and other parts of the skeleton greatly altered, but the proportionate size of the brain has been reduced and the colour and texture of the fur abounds. The manx or tailless rabbit is the oldest English variety, and has been cultivated carefully since about 1785, the aim of the breeder being directed to the development of the size of the ears, and with such success that a specimen weighing 22 lb. was produced in 1822. In colour the ears vary greatly. The Belgian hare is a large breed of a hardy and prolific character, which closely resembles the hare in size and form. In former years these rabbits were sold as "lepores" or hybrids, produced by the union of the hare and the rabbit; but the most careful experimenters have failed to obtain any such hybrid, and the naked immature condition in which young rabbits are born as compared with the clothed and highly developed young hare renders it unlikely that hybrids could be produced. Nor does the flesh of the Belgian rabbit resemble that of the hare in any respect. The Belgian hare, though of larger size, is known as the Patagonian rabbit, although it has no relation to the country after which it is called. The Angora rabbit is characterized by the extreme elongation and great fertility, which in former years reached to five in length, requiring great care and frequent combing to prevent it from becoming matted. The Angoras most valued are albino, with pure white fur and pink eyes; in some parts of the Continent they are known as "sparrows", and in England as "fancy rabbits." Amongst the breeds which are valued for the distribution of colour on the fur are the Himalayan and the Dutch. The former is white, but the whole of the extremities—viz. the nose, the ears, tail, and feet—are black or very dark in colour. This very pretty breed has no connexion with the mountains from which it takes its name, but is a variety produced by careful breeding and selection. Though produced by crossing, it now generally breeds true to colour. The Flemish Giant is a small, animal bred for the disposition of the colour and markings. The entire body in the shoulder-blades is uniformly coloured, with the exception of the ears, which are white and of moderate size. The body, including the fore legs, neck, and jaws, is white, the cheeks and ears being coloured. In some strains the coloured portion extends in front of the fore legs, leaving only a ring of white round the neck. The more accurately the coloured portion is defined, the higher is the animal esteemed. The silver grey is a uniform-coloured breed, the fur of which is a rich chinchilla grey, varying in depth in the different strains. From the greater value of the fur, silver greys have been extensively employed to stock with, and are bred with much success in the open if the ordinary wild rabbits are excluded. Other colours known, as silver fawn and silver brown, are closely related. A blue breed has been recently introduced. The Siberian, probably produced by crossing the Himalayan with the Angora, and the black-and-tan and blue-and-tan.

See also Hare, Shooting, and Courting. (W. H. F. R. L.)

RABBLE, a general term for a disorderly crowd, apparently connected with the verb "to rabble," to talk or work in a confused manner. Du. rabollen, Ger. dialect rabellen, cf. Gr. ῥαβδους, to howl. In iron and steel manufacture, a puddling-tool, for stirring the molten metal, is called a "rabble." This is a different word, adapted from Fr. râble, for robble, Med. Lat. rubabulum, Lat. rubabulum (ruere, to rake), a fire-shovel or oven rake.

RABBULA, a distinguished bishop of the Syrian church early in the 5th century. He was a native of Kenneshrin, a town some few miles south of Aleppo and the seat of a bishopric. His father was a heathen priest, and through his mother he was a devoted Christian he continued in pegan belief and practice until some time after his marriage. During a journey to his country estates he was converted to Christianity partly through coming in contact with a case of miraculous healing and partly through the teaching and influence of Eusebius, bishop of Kenneshrin, and Acacius, bishop of Aleppo. With all the energy of his fiery nature he threw himself into the practice of Christian asceticism, sold all his possessions, and separated from his wife and kinspeople. He resided for some time in a monastery, and then passed to a life of greater hardship and poverty; he was at one time sent on a mission to the bishop of Edessa, in the year 411-412, Rabbula was chosen his successor, and at once accepted the position offered him, without any of the customary show of reluctance. As a bishop he was marked by extraordinary energy, by the continued asceticism of his personal life, by his magnificent provision for all the poor and suffering in his diocese, by his care for discipline among the clergy and monks who were under his authority, and latterly by the fierce determination with which he combated all heresies and especially the growing school of the followers of Nestorius. On one occasion he visited Constantinople and there preached before Theodosius II. (who was then in residence) a sermon in denunciation of Nestorian doctrine, of which a portion survives in the Syriac version. 1 He became the friend of Cyril of Alexandria, with whom he corresponded, and whose treatise De recta fide he translated into Syriac. 2 After a busy episcopal life of twenty-four years he died in August 435, and was immensely lamented by the people of his diocese. His successor was the Nestorian Ibas.

The literary remains of Rabbula are small in bulk, and are mostly to be found in Overbeck. Perhaps his main importance to the historian of Syriac literature lies in the fact that he strove to replace the Diatessaron or Gospel Harmony of Tatian by the edition of the separate Gospels, ordering that a copy of the latter should be placed in every church and should

---

1 Overbeck, op. cit. pp. 239-244.
2 The version survives in a British Museum MS.; see Wright's Catalogue p. 719.
be read (see Wright’s Syr. Lit. p. 9). According to his biographer (Overbeck, 2: 72) he himself produced a version (or revision) of the New Testament in Syriac. This may have been, as Wright suggests (Syr. Lit. p. 11), “a first step in the direction of the Philoxenian version.” But there is great probability in F. C. Burkitt’s hypothesis that the product of Rabelais’ work, at least as regards the Gospels, is to be found in the current Peshitta text, which “represents the Greek text as read in Antioch about 400 A.D.” and “was prepared by Rab- bula . . . and published by his authority as a substitute for the Diatessaron.”

Rabelais seems to have been a man of great force, devotion and self-denial: on the one hand intellectually gifted, and on the other thoroughly consistent in his religious principles. But his attractiveness is marred, as in the case of many of his contemporaries, by the bitterness of a narrow orthodoxy.

( N . M .)

RABELAIS, FRANÇOIS (c. 1490–1553), French humorist, was born at Chôn on the Vienne in the province of Touraine. The date of his birth is wholly uncertain: it has been put by tradition, and by authorities long subsequent to his death, as 1493, 1490, and 1495. There is nothing in the positive facts of his life which would not suit tolerably well with any of these dates; most 17th-century authorities give the earliest, and this also accords best with the age of the eldest of the Du Bellay brothers, with whom Rabelais was either (perhaps) a schoolfellow. But in favour of the latest it is urged that, if Rabelais was born in 1483, he must have been forty-seven when he entered at Montpellier, and proportionately and unexpectedly old at other known periods of his life. In favour of the middle date, which has, as far as recent authorities are concerned, the weight of consent in its favour, the testimony of Guy Patin (1601–1672), a witness of some merit and not too far removed in point of time, is invoked. The only contribution which need be made here to the controversy is to point out that if Rabelais was born in 1483 he must have been an old man when he died, and that scarcely even tradition speaks of him as such.

With regard to his birth, parentage, youth, and education, everything depends upon this tradition, and it is not until he was according to one extreme hypothesis thirty-six, according to the other extreme twenty-four, that we have solid testimony respecting him. In the year 1510, on the 5th of April, the François Rabelais of history emerges. The monks of Fontenay-le-Comte bought some property (half an inn in the town), and among their signatures to the deed of purchase is that of François Rabelais. Before this all is cloudland. It is said that he had four brothers and no sisters, that his father had a country property called La Devinière, and was either an apothecary or a country doctor. Half a century after the death of his remains, it is mentioned that the house in which he was born had become a tavern and then a tennis-court. It still stands at the corner of a street called the Rue de la Lampoie, and the tradition may be correct. An indistinct allusion of his own has been taken to mean that he was t nonsured in childhood at seven or nine years old; and tradition says that he was sent to the convent of Seuilly. From Seuilly at an unknown date tradition takes him either to the university of Angers or to the convent school of La Baumette or La Basmette, founded by good King René in the neighbourhood of the Angervin capital. Here he is supposed to have been at school with the brothers Du Bellay, with Geoffroy d’Estissac and others. The next stage in this (so far as evidence goes, purely imaginary) career is the monastery of Fontenay-le-Comte, where, as has been seen, he is certainly found in 1516 holding a position sufficiently senior to sign deeds for the community, where, he probably in 1511, took priest’s orders, and where he also pursued, again certainly, the study of letters, and especially of Greek, with ardour. From this date, therefore, he becomes historically visible. The next certain intelligence which we have of Rabelais is somewhat more directly bio-

graphical. The letters of the well-known Greek scholar Budaeus, two of which are addressed to Rabelais himself and several more to his friend and fellow-monk Pierre Amy, together with some notices by André Tiraqueau, a learned jurist, to whom Rabelais rather than his own learning has secured immortality, show beyond doubt what manner of life the future author of Gargantua led in his convent. The letters of Budaeus show that an attempt was made by the heads of the convent or the order to check the studious ardour of these Franciscans; but it failed, and there is no positive evidence of anything like actual persecution, the phrases in the letters of Budaeus being merely the usual exaggerated Clercianism of the Renaissance. Some books and papers were seized as suspicious, then given back as the supposed Latin probability disgusted with the cloister—indeed his great work shows this. And in 1524, the year of the publication of Tiraqueau’s book above cited, his friend Geoffroy d’Estissac procured from Clement VII. an indul, licensing a change of order and of abode for Rabelais. From a Franciscan he became a Benedictine, and from Fontenay he moved to Maillezaís, of which Geoffroy d’Estissac was bishop. But even this learned and hospitable retreat did not apparently satisfy Rabelais. In or before 1530 he left Maillezaís, abandoned his Benedictine garb for that of a secular priest, and, as he himself puts it in his subsequent Supplication pro Apostasia to Pope Paul II.: “per seculum div. vagatus fui.” For a time the Du Bellays provided him with an abode near their own chateau of Langy. He is met at Montpellier in the year just mentioned. He entered the faculty of medicine there on the 1 inth of September and became bachelor on the 12th of November, a remarkably short interval, which shows what was thought of his acquirements. Early in 1531 he lectured publicly on Galen and Hippocrates, while his more serious pursuits seem to have been chequered by acting in a morale comédie, then a very frequent university amusement. Visits to the Îles d’Hères, and the composition of a fish sauce in imitation of the ancient garum, which he sent to his friend Étienne Dolet, are associated, not very certainly, with his stay at Montpellier, which, lasting rather more than a year at first, was renewed at intervals for several years.

In 1532, however, he had moved from Montpellier to Lyons. Here he plunged into manifold work, literary and professional. He was appointed before the beginning of November physician to the Hôtel Dieu, with a salary of forty livres per annum, and lectured on anatomy with demonstrations from the human subject. He edited for Sebastian Gryphius, in the single year 1532, the medical Epistles of Giovanni Manardi, the Aphorisms of Hippocrates, with the Art Parca of Galen, and the early notices of Galen, which, however, happened unluckily to be forgeries.

At this time Lyons was the centre and to a great extent the headquarters of an unusually enlightened society, and indirectly it is clear that Rabelais became intimate with this society. A manuscript distich, which was found in the Toulouse library, deals with the death of an infant named Théodule, whose country was Lyons and his father Rabelais, but we know nothing more about the matter. What makes the Lyons sojourn of the greatest real importance is that at this time probably appeared the beginnings of the work which was to make Rabelais immortal. It is not said, “probable,” because the strange uncertainty which rests on so much of his life and writings exists here also. There is no doubt that both Gargantua and Pantagruel were popular names of giants in the Middle Ages, though, curiously enough, no mention of the former in French literature much before Rabelais’ time has been traced. In 1526, however, Charles de Bordigné, in a satiric work of no great merit, entitled la Légende de Pierre Puffen, has the name Gargantua with an allusion, and in 1532 (if not earlier) there appeared at Lyons les Grandes et inestimables chroniques du grand et énorme géant Gargantua. This is a short poem, but plan of the later burlesques and romances of the Round Table. Arthur and Merlin appear with Graniogier, as he is here spelt, Galemelle (Gargantua). Gargantua himself,
and the terrible mare. But there is no trace of the action or other characters of Gargantua that was to be, nor is the manner of the piece in the least worthy of Rabelais. No one supposes that he wrote it, though it has been supposed that he edited it and that in reality it is older than 1532, and may be the direct subject of Bordoigne’s allusion six years earlier. What does, however, seem probable is that the first book of Pantagruel (the second of the whole work) was composed with a definite view to this chap book and not to the existing first book of Gargantua, which was written afterwards, when Rabelais discovered the popularity of his work and felt that it ought to have some worthier starting-point than the Grondes chroniques. The earliest known and dated edition of Pantagruel is of 1533, of Gargantua 1535, though this would not be of itself conclusive, especially as we actually possess editions of both which, though undated, furnish some definite documents of Gargantua in the title as “Père de Pantagruel,” the omission of the words “second livre” in the title of the first book of Pantagruel while the second and third are duly entitled “tiers” and “quart,” the remarkable fact that one of the most important personsages, Friar John, is absent from book ii, the first of Pantagruel, though he appears in book i. (Gargantua), and many other proofs show the order of publication clearly enough. There is also in existence a letter of Calvin, dated 1533, in which he speaks of Pantagruel, but not of Gargantua, as having been condemned as an obscene book. Besides this, 1533 saw the publication of an almanac, the first of a long series which exists only in titles and fragments, and of the amusing Prognostication Pantagruelique (still, be it observed, Pantagruelique, not Gargantuine). Both this and Pantagruel itself were published under the anagrammatic pseudonym of “Alcofrasbas Nasier,” shortened to the first word only in the case of the Prognostication.

This busy and interesting period of Rabelais’s life was brought to a close apparently by his introduction or reintroduction to Jean du Bellay, who, in October 1533, passing through Lyons on an embassy to Rome, engaged Rabelais as physician. The visit did not last very long, but it left literary results in an edition of a description of Rome by Marliani, which Rabelais published in September 1534. It is also thought that the first edition of Gargantua may have appeared this year.

In the spring of 1535 the authorities of the Lyons hospital, considering that Rabelais had twice absent himself without leave, elected Pierre de Castel in his room; but the documents which exist do not seem to infer that any blame was thought due to him, and the appointment of his successor was once definitely postponed in case he should return. At the end of 1535 Rabelais once more accompanied Jean du Bellay, now a cardinal, to Rome and stayed there till April in the next year. This stay furnishes some biographical documents of importance in the shape of letters to Geoffroy d’Estaisse, of the already-mentioned Supplicatio pro Apostasia, and of the bull of absolution which was the reply to it. This bull not only freed Rabelais from ecclesiastical censure, but gave him the right to return to the order of St Benedict when he chose, and to practise medicine. He took advantage of this bull and became a canon of St Maur. In 1537 he took his doctor’s degree at Montpellier, lectured on the Greek text of Hippocrates, and next year made a public anatomical demonstration. During those two years he seems to have resided either at Montpellier or at Lyons. But in 1539 he entered the service of Guillaume de Bellay-Langey, elder brother of Jean, and would appear to have been with him (he was governor of Piedmont) till his death on 9th January 1543. Rabelais wrote a panegyrical memoir of Guillaume, which is lost, and the year before saw the publication of an edition of Gargantua and Pantagruel, book i., together (both had been repeatedly reprinted separately), in which some dangerous expressions were cut away. Nothing at all is known of his life, whereabouts, or occupations till the publication of the third book, which appeared in 1546, “avec privilège du roi,” which had been given in September 1545.

Up to this time Rabelais, despite the condemnation of the Sorbonne referred to above, had experienced nothing like persecution or difficulty. Even the spiteful or treacherous act of Dolet, who in 1542 reprinted the earlier form of the two works Rabelais had somewhat modified, seems to have done him no harm. But the storm of persecution which towards the end of the reign of Francis I. was fatal to Dolet himself and to Des Periers, while it exiled and virtually killed Marot, threatened him. There is no positive evidence of any measures taken or threatened against him; but it is certain that he passed nearly the whole of 1546 and part of 1547 at Metz in Lorraine as physician to the town at the salary of 120 livres, and Sturm speaks of him as having been “cast out of France by the times” (with the exclamation θεώ τῶν χειρῶν) in a contemporary letter, and says that he himself in another letter gives a doleful account of his pecuniary affairs and asks for assistance. At Francis’s death on 31st March 1547 Du Bellay went to Rome, and at some time not certain Rabelais joined him. He was certainly there in February 1549, when he dates from Du Bellay’s palace a little account of the festivals given at Rome to celebrate the birth of the second son of Henry II. and Catherine de’ Medici. This account, the Sciomachie as it is called, is extant. In the same year a monk of Fontevrault, Gabriel du Puits-Herbault, made in a book called Theolosia the first of the many attacks on Rabelais. It is, however, as vague as it is violent, and it does not seem to have had any effect. Rabelais had indeed again made for himself protectors whom no clerical or Sorbonist jealousy could touch. The Sciomachie was written to the cardinal of Guise, whose family were all-powerful at court, and Rabelais dedicated his next book to Odet de Chatillon, afterwards cardinal, a man of great influence. Thus Rabelais was able to return to France, and in 1550 was presented to the livings of Meudon and St Christophe de Jambet. It may, however, surprise those who have been accustomed to hear him spoken of as “curé de Meudon,” and who have read lives of him founded on legend, to find that there is very little ground for believing that he ever officiated or resided there. He certainly held the living but two years, resigning it in January 1552 along with his other benefice, and it is noteworthy that at the episcopal visitation of 1551 he was not present. To this supposed residence at Meudon and to the previous stay at Rome, however, are attached two of the most mischievous items of the legend, though fortunately two of the most easily refutable. It is said that Rabelais met and quarrelled with Joachim du Bellify the poet at Rome, and with Ronsard at Meudon and elsewhere, that this caused a breach between him and the Pléiade, that he satirized its classicizing tendencies in the episode of the Limousin scholar, and that Ronsard after his death avenged himself by a libellous epitaph. The facts are these. Neither is heard of the quarrel with Du Bellay or of any meeting with him, nothing of the meetings and bickerings with Ronsard, till 1607, when Bernier tells the story without any authority. The supposed allusions to the Pléiade date from a time when Ronsard was a small boy, and are mainly borrowed from an earlier writer still, Geoffroy Tory. Lastly, the epitaph, read impartially, is not libellous at all, but simply takes up the vein of the opening scenes of Gargantua in reference to Gargantua’s author. There is indeed no reason to suppose that either Ronsard or Du Bellay was a fervent admirer of Rabelais, for they belonged to a very different literary school; but there is absolutely no evidence of any enmity between them, and Du Bellay actually refers to Rabelais with admiration.

Some chapters of Rabelais’s fourth book had been published in 1548, but the whole did not appear till 1552. The Sorbonne censured it and the parliament suspended the sale, taking advantage of the king’s absence from Paris. But it was soon relieved of the suspension. He died, it is said, on the 5th of April 1553, but actual history is quite silent save on the point that he was not alive in May of the next year, and the legends about his deathbed utterances—“La larce est jouée,” “Je vais chercher un grand pont-écre,” &c.—are altogether
apocryphal. The same may be said of the numerous silly stories told of his life, such as that of his procuring a free passage to Paris by inscribing packets “Poison for the king,” and so forth.

Ten years after the publication of the fourth book and nine after the supposed date of the author’s death there appeared at Lyons sixteen chapters entitled _Lettres sonnantes par maître François Rabelais_, and two years later the entire fifth book was published as such. In 1567 it took place with the ethnologist, and has ever since appeared with them. But from the beginning of the 17th century there have never been wanting diabolists in its authenticity. The controversy is one of some intricacy, but as it is also one of capital importance in literary history the heads of it at least must be given here. The opponents of the book rely (1) on the testimony of a certain Louis Guyon, who in 1604 declared that the fifth book was made long after Rabelais’s death by an author whom he knew, and who was not a doctor, and on the assertion of the bibliographer Du Verdier, about the same time, that it was written by an “Écolâtre de Valence”; (2) on the fact that the anti-monastic and even anti-Catholic polemic is much more accentuated in it; (3) on the arguments that parts are apparently reprints or rough drafts of passages already appearing in the four earlier books; and (4) that some allusions are manifestly posterior to even the furthest date which can be assigned for the reputed author’s decease. On the other hand, it is urged that, though Guyon and Du Verdier were in a sense contemporaries, they wrote long after the events, and that the testimony of the former is vitiated, not merely by its extreme vagueness, but by the fact that it occurs in a _platoyer_, tending to exculpate physicians from the charge of unorthodoxy; that Du Verdier in another place assigns the _Pantagruelique Prognostication_ to this same unknown student of Valence, and had therefore probably confused and hearsay notions on the subject; that the rasher and fiercer tone, as well as the apparent repetitions, are sufficiently accounted for on the supposition that Rabelais never finally revised the book, which indeed dates show that he could not have done, as the fourth was not finally settled till just before his death; and that it is perfectly probable, and indeed almost certain, that it was prepared from his papers by another hand, which is responsible for the anachronous allusions above referred to.

But the strongest argument, and one which has never been attacked by authorities really competent to judge, is that the “griffe de l’aigle” is on the book, and that no known author of the time except Rabelais was capable of writing the passage about the _Chats fourrés_, the better part of the history of Queen Whims (La Quinte) and her court, and the conclusion giving the Oracle of the Bottle. To this argument we believe that the more competent a critic is, both by general faculty of appreciation and by acquaintance with contemporary French literature, the more positive will be the assent that he yields. The reader must, however, be on his guard against confusing the authenticity of the fifth book generally with that of supposed early copies of it. Quite recently it was announced that an edition of 1549 had turned up in Germany; but the investigations of M. R. Stein, _un Rabelais apocryphe_ (1901), repeated and confirmed by M. A. Lefranc in the _Revue des études Rabelaisiennes_ (1905), disposed of the matter. The substance of the apocryphal document is quite different from our fifth book.

Gargantua and Pantagruel, notwithstanding their high literary standing and the frequency with which certain passages from them are cited, are, owing partly to their archaic language and partly to the manner in which the author has handled them himself, so little read that no notice of them or of him could be complete without some sketch of their contents. The first book, _Gargantua_, describes the adventures of the son of Gargantua (the son of Gaufredus, whose nativity is ushered in by the account of a tremendous feast. In this the burlesque exaggeration of the pleasures of eating and drinking, which is one of the chief exterior marks of the books, has attracted natural but perhaps undue attention. Very early, however, the author becomes serious in contrasting the early education of his hero—a satire on the degraded schools of the middle ages—with its subsequent and reformed stage, in the account of life in the best and noblest ideas of the humanist. He even goes so far as to refer to pedagogy are put with exceptional force. Gargantua is recalled from Paris, whither he had been sent to finish his education, owing to a war between his father, Grandgousier, and the king of England, King John, in which Gargantua, as the chief hero of it being the monk, Friar John, a very unceremonious cleric, in whom Rabelais greatly delights. Pieriochel defeated and peace made, Gargantua establishes the abbey of Thelma in Paris, and in a subsequent passage the reader is shown the most obnoxious in him to monastic life are indicated by the assignment of the exact particular to this model convent.

This book, like the other, has a war in its latter part; Gargantua scarcely appears in it and Friar John at all. It is not till the opening of the third book that the most important action begins. This arises from Panurge’s determination to marry—a determination, which, as it is, at least, somewhat prodigal, and yields a vast number of authorities, each giving occasion for a satire of a more or less complicated kind. At last it is determined that Pantagruel and his followers (Friar John has reappeared in the meanwhile) are to go to court (of course) to crown the _Bouteille_. The book ends with the obscurest passage of the whole, an elaborate eulogy of the “herb pantagruelica,” which appears to be, if it is anything, hemp. Only two probable explanations of this have been offered. The first is Joseph de Maitre’s glorification of the executioner, the other a eulogy of work, hemp being on the whole the most serviceable and extensive of the products. Of the fourth and fifth books are entirely taken up with a description of the voyage. Many strange places with stranger names are visited, some of them offering obvious satire on human institutions, others, except by conjecture. In general they are, when read with this, a sheer extravaganza. At last the Land of Lanterns, borrowed from Lucian, is reached, and the Oracle of the Bottle is consulted. This yields the single word “Trinqu,” which the attendant priests declares to be the most gorgeous and intelligible she has ever heard from it. Panurge takes this as a sanction of his marriage, and the book ends abruptly. This singular romance is diversified by, or, to speak more properly, it is the vehicle of the most bewildering abundance of digression, burlesque, reminiscences, and allusions. This is more typical of the FRENCH LITERATURE. For a general estimate of Rabelais’s literary character and influence the reader may be referred to the article FRENCH LITERATURE. For a detailed review must be given here. There are three questions without the discussion of which this notice of one of the foremost writers of the world would not be worthy of its present place. These are—What is the general drift and purpose of _Modestepans_ and Panagruel? How far can the defence be offered, if any defence is needed, for the extraordinary licence of language and imagery which the author has permitted himself? What was his attitude towards the great problems of the age, religious, political, and philosophical? These will succeed each other in the order of reason, and the answer to each assists the resolution of the next.

There have been few more remarkable instances of the _luces commentary_ than the work of the editors of Rabelais. Almost effortlessly and without apparent effort appears a mass of erudition, a depth of information, and a command of the subject. Those who have not done this, like Duhaut, Motteux...
and Esmangart, have generally committed the error of tormenting themselves and their author to find individual explanations of personages and events. The extravagance of the last-named commentators is, indeed, a result essentially of their being one of those others devotes itself chiefly to identifying the characters of the romance with more or less famous historical persons. But the first blunder, that of forming a general hypothesis concerning the origin of the book, is one of the cardinal flaws of the whole, and the common vice of the Rabelaisian is the common vice. This conception, however, has singularly varied. According to some expositors, among whom one of the latest and not the least respectable M. Fleury, Rabelais is a sober reformer, an enemy of superstition, and the avowed friend of a sound dogmatic religion, who wraps up his morals in a farcical envelope partly to make them go down with the vulgar and partly to shield himself from the attacks of his contemporaries. To others of the same class, of whom we have had in England a distinguished example in Sir Walter Besant, Rabelais is all this but with a difference. He is not religious at all; he is more or less anti-religious; and his book is more or less a general protest against any attempt to explain supernaturally the riddle of the earth. According to a third class, the most distinguished representative of which was M. Paul Lacroix, the Rabelaisian legend does not so much err in principle as in fact. Rabelais is the incarnation of that "Gaulois," a jovial, careless soul, not destitute of common sense or even acute intellectual power, but first of all a good fellow, rather prone to libel and calumny than to defaming through life like a good-natured understanding. Of all these we may be said that those who hold them are obliged to shut their eyes to many things in the book and to see in it many which are not there. If the work was the creation of the mind of one man, it is impossible to think that any unbiased judge reading Rabelais can hold the grave-philosopher view or the reckless-good fellow view without modifications and allowances which practically destroy the essentials of either view. This is not to say, however, that we are to identify Rabelais with Pantagruel, strive in vain, on any view intellectually consistent or morally respectable, to account for the vast ocean of pure or impure laughter and foolery which surrounds the book. It has its gods and its witches, its ascetics and its sinners those who in the same way identify Rabelais with Panurge can never explain the education scheme, the solemn appearance of Gargantua among the inhabitants of the peaceful society of Buam, the resolution of the more or less of other passages; while, on the other hand, those who insist on a definite propaganda of any kind must justify themselves by their own power of seeing things invisible to plain men. But these vague and unsatisfactory suppositions are the nearest thing to the truth. No one reading Rabelais without parti pris, but with a good knowledge of the history and literature of his own times and the times which preceded him, can have much difficulty in appreciating his music. He had evidently during his long and studious sojourn in the cloister (a sojourn which was certainly not less than five-and-twenty years, while it may have been five-and-thirty, and of which he speaks) acquired a vast stock of learning. He was, it is clear, thoroughly penetrated with the instincts, the hopes, and the ideas of the Renaissance in the form which it took in France, in England and in Italy. It is impossible to say definitely the sources of his aspirations for social and political improvement, and above all for a joyous, varied, and non-ascetic life. He had thoroughly convinced himself of the abuses to which monachism lent itself. Latin to the very base of the soul, and inhabited by a natural and in loco which frequently goes with the love of books. It is in the highest degree improbable that in beginning his great work he had any definite purpose or intention. The habit of burlesquing the romans d'aventures was not new one, and the form lent itself easily to the two literary exercises to which he was most disposed—apt and quaint citation from and variation on the classics and satirical criticism of the life he saw around him. The immense popularity of the first two parts induced him to continue them, and by degrees (the genuineness of the fifth book, at any rate in substance, is here assumed) the possibility of giving the whole something like a coherent and digest a regular procession of Parzival in the manner of the seventh century. The voyage in particular allowed the widest licence of satirical allusion, and he availed himself of that licence in the widest sense. Here and there persons are glanced at, while the whole scene of manners and ideas which it illustrates is a landscape drawn from the very temper of the age. The satire is of course directed against the monastic system in the deformed form in which it had become at this time; he as certainly hated the brutal ignorance into which the earlier systems of education had suffered too many of their teachers and scholars had sunk. But these sentiments, though sometimes striking, but elsewhere, even in the grim satire of the Chats fourrés, he is the satirist proper rather than the reformer. It is the very absence of any cramming or limiting purpose that the great modern humourist. His book comes to us from the exactly level and spotless mirror to the temper of the earlier Renaissance.
