duties at Baltimore, he studied physics under Helmholtz at
ROWLANDSON, R.—ROWLANDSON 787

Berlin, and carried out a well-known research on the effect of an electrically charged body in motion, showing it to give rise to a magnetic field. As soon as he was settled at Baltimore, two important pieces of work engaged his attention. One was a redetermination of the value of this magnetometer, which was substantially different from that ascertained by the committee of the British Association appointed for the purpose, but ultimately he had the satisfaction of seeing his own result accepted as the more correct of the two. The other was a new determination of the mechanical equivalent of heat. In this he used Joule's paddle-wheel method, though with many improvements, the whole apparatus being on a larger scale and the experiments being conducted over a wider range of temperature. He obtained a result distinctly higher than Joule's final figure; and in addition he made many valuable observations on the variation of the specific heat of water, which J. P. Joule had assumed to be the same at all temperatures. In 1832, before the Physical Society of London, he gave a description of the diffraction gratings with which his name is specially associated, and which have been of enormous advantage to astronomical spectroscopy. These gratings consist of pieces of metal or glass ruled by means of a diamond point with a very large number of parallel lines, on the extreme accuracy of which their efficiency depends. For their production, therefore, dividing engines of extraordinary trueness and delicacy must be employed, and in the construction of such machines Rowland's experience and skill brought him conspicuous success. The results of his labours may be found in the elaborate Photographic Map of the Normal Solar Spectrum (1888) and the Table of Solar Wave-Lengths (1858). In the later years of his life he was engaged in developing a system of multiplex telegraphy.

ROWLANDS, RICHARD (fl. 1560–1620), Anglo-Dutch antiquary, whose real name was Verstegen, was the son of a cooper whose father, Theodore Roland Verstegen, a Dutch emigrant, came to England about 1500. Under the name of Rowlands, Richard went to Christ Church, Oxford, in 1565, where he studied early English history and the Anglo-Saxon language. Leaving the university without a degree, he published in 1576 a work of antiquarian research, translated from the German, entitled The Post of the World, describing the great cities of Europe; and soon afterwards he moved to Antwerp, where he resumed the name of Verstegen, and set up in business as a printer and engraver. In 1587 he went to Paris, and in 1593 to Spain, where he studied in the college at Seville, afterwards returning to Antwerp, where he lived so far as is known until his death, the date of which, though certainly later than 1630, is unknown. Rowlands was a zealous Roman Catholic, and in 1587 he published at Antwerp Theatrum Crudelitatum haereticarum, in which he criticized the treatment of the Roman Catholic Church in England under Elizabeth so freely that when a French translation of the book appeared in the following year he was thrown into prison at the instance of the English ambassador in Paris. Many of his writings were published in the name of Verstegen. His works included A Dialogue on Dying Well (1603), a translation from the Italian; Restitution of Decayed Intelligence in Antiquities concerning the English Nation, dedicated to James I. (1603); Neder Deutsche Epigrammen (1617); Sundry Successive Regal Governments in England (1620); Spiegel der Nederlandsche Eldenden (1621). The verses on the defeat of the Irish rebels under Tyrone, entitled England's Joy, by R. R. (1601), is doubtfully attributed to him. Richard Verstegen, author of Nederlantische Antiquiteiten (Brussels, 1646), is probably another person, possibly Rowlands's son.

ROWLANDS, SAMUEL (c. 1573–1630), English author of pamphlets in prose and verse, which reflect the follies and humours of the lower middle-class life of his time, seems to have had no contemporary literary reputation; but his work throws considerable light on the social London of his day. Among his works, which include some poems on sacred subjects, are: The Betraying of Christ (1598); The Letting of Humours Blood in the Head-sweats (epics and satires) and A Merry Meeting, or 'tis Mery when Knaves meete (1600)—the two latter being publicly burnt by order, but republished later under other names—(Humors Ordinaries and The Knave of Clubbes); Greenes Ghost haunting Conie-Catchers (1602), which he pretended to have edited from Greene's papers, but which is largely borrowed from his printed works; Tis Merrie when Gossipes meete (1602), a dialogue between a Widow, a Wife, a Maid and a Vintner; Looko to it; for Ile stabbe ye (1604), in which Death describes the tyrants, careless divines and other evil-doers whom he will destroy; Hils broke loose (1605), an incident and Joudied Loy a time in Paris, and a later verme of Divine recreation (not extant), poems founded on the Old Testament; A Terrible Battell betwene . . . Time and Death (1606); Democritus, or Doctor Merry-man his Medicines against melancholy humors, reprinted, with alterations, as Doctor Merrie-man, and Diogenes Lantheurn (1607), in which 'Athens' is London; The Famous History of Guy, Earl of Warwick (1607), a long romance in Rowland's favourite six-lined stanza, and one of his lastest, least successful efforts; Humors Looking Glsae (1608); and Martin Mark-all, Beadle of Bride-well (1610), a history of roguey containing much information about the roam of highwaymen and the complete vocabulary of thieves' slang up to that time. Of his later works may be mentioned Sir Thomas Overbury; or the Poysdeon Knights Complaint, and The Melancholy Knight (1615), which suggests a hearing of Beaumont and Fletcher's Knight of the Burning Pestle. The last of his humorous stories, Good News and Bad News, appeared in 1622, and in 1628 he published a pious volume of prose and verse, entitled Heavens Glory, Seek ye: Ears vonnie, Flye ye: Hell's Horror, Fere it. After this nothing is known of him. Mr Gosse, in his introduction to Rowland's complete works, edited (1874–80) for the Hunterian Club in Glasgow by Mr S. J. H. Hertrage, sums him up as a "kind of small non-political Defoe, a pamphleteer in verse whose talents were never put into exercise except when his possessor was pressed for means, and a poet of considerable talent without one spark or glimmer of genius." Mr Gosse's notice is reprinted in his Seventeenth Century Studies (1883). A recently discovered poem by Rowlands, The Bride (1617), was reprinted at Boston, U.S.A., in 1905 by Mr A. C. Potter.

ROWLANDSON, THOMAS (1756–1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or city merchant. On leaving school he became a student in the Royal Academy. At the age of sixteen he studied in Italy, and was so successful in the frequent tours on the Continent, enriching his portfolios with numerous jottings of life and character. In 1775 he exhibited at the Royal Academy a drawing of "Delliah visiting Samson in Prison," and in the following years he was represented by various portraits and landscapes. Possessed of much facility of execution and a ready command of the figure, he was spoken of as a promising student; and had he continued his early application he would have made his mark as a painter. But by the death of his aunt, a French lady, he fell heir to a sum of £7000, plunged into the dissipations of the town and was known to sit at the gaming-table for thirty-six hours at a stretch. In time poverty overtook him; and the friendship and example of Gillray and Bunbury seem to have suggested caricature as a means of filling an empty purse. His drawing of Vauxhall, shown in the Royal Academy exhibition of 1784, was bought by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809–11 issued in his Pictorial Magazine "The Schoolmaster's Tour"—a series of plates with illustrative verses by Dr William Coombe. They were the most popular of the artist's works. Again engraved by Rowlandson himself in 1812, and issued under the title of "The Tour of Dr Syntax
in Search of the Picturesque," they have attained a fifth edition by 1813, and were followed in 1820 by "Dr Syntax in Search of Consolation," and in 1821 by the Third Tour of Dr Syntax in Search of a Wife. The Later Collaborations of designs, however, did not appear in the English "Dance of Death," issued in 1814-16, one of the most admirable of Rowlandson's series, and in the "Dance of Life," 1822. Rowlandson also illustrated Smollett, Goldsmith and Sterne, and his designs will be found in The Spirit of the Public Journals (1825), The English Spy (1825), and The Humourist (1831). He died in London, after a prolonged illness, on the 22nd of April 1827.

Rowlandson's designs were usually executed in outline with the reed-pen, and delicately washed with colour. They were often printed in a series with pieces of mottled basaltic aqua-tinta—usually by a professional engraver, the impressions being finally coloured by hand. As a designer he was characterized by the utmost facility and ease of draughtsmanship, and the quality of his art suffered from this haste and over-production. He was true if not a very refined humorist, dealing less frequently than his fierce contemporary Gillray with politics, but commonly touching, in a rather gentle spirit, the various aspects and incidents of social life. His most artistic work is to be found among the more careful drawings of his earlier period; but even among the exaggerated caricature of his later time we find hints that this master of the humorous mind had fitted to the beautiful had he so will.

See J. Grego, Rowlandson the Caricaturist, a Selection from his Works, &c. (2 vols., 1880).

ROWLEY, WILLIAM (c. 1565-1642), English actor and dramatist, collaborator with several of the dramatists of the Elizabethan period, especially with Thomas Middleton. He is not to be identified with "Master Rowley, once a rare scholar of learned Pembroke Hall in Cambridge," whom Francis Meres described in his Palladis Tamia as one of the "best for comedy." The only Rowley at Pembroke Hall at the period was Ralph Rowley, afterwards rector of Chelsford. William Rowley is described as the chief comedian in the Prince of Wales's company, and it was doubtless during the two years' union (1614-16) of these players with the Lady Elizabeth's company that he was brought into contact with Middleton. Rowley joined the King's Servants in 1623, and retired from the stage about four years later. The fact of his marriage is recorded in 1637, and he is supposed to have died about 1642. Four plays attributed to his sole authorship are extant: A new Wonder, A Woman never Veal (printed, 1632); A Match at Midnight (1633); A Tragedie called The Lost (printed, 1633); and a householdman, The Gentleman with the Life and Death of the Cripple that stole the Weathercock at Paules (1638). They are distinguished by effectiveness of situation and ingenuity of plot, so that we may conjecture why he was in such request as an associate in play-making, and he had further an experimental knowledge of the coarse comedy likely to please the pit. It is recorded by Langbaine that he "was beloved of those great men Shakespeare, Fletcher and Jonson." The plays he wrote with Middleton are dealt with under that heading. With George Wilkins and John Day he wrote The Travels of the Three English Brothers (1607); with Thomas Heywood he produced the romantic comedy of Fortune by Land and Sea (printed, 1653); he was associated with Thomas Dekker and John Ford in The Witch of Edmonton (printed, 1661); A Cure for a Cuckold (printed, 1661); and The Thracian Wonder (printed, 1661) are assigned to the joint authorship of Webster and Rowley; while Shakespeare's name was unjustifiably coupled with his on the title-page of The Birth of Merlin: or, The Child hath found his Father (1662). Rowley also wrote an elegy on Hugh Attwell, the actor, and a satirical pamphlet describing contemporary London, entitled A Search for Money (1669).

The dramatist Samuel Rowley, described without apparent reason by J. P. Collier as William Rowley's brother, was employed by Henlsole as a reader of plays. He wrote some scriptural plays now lost, with William Borne (or Bird, or Boyle) and Edward Juby. His only extant pieces are: When you see me, You know me. Or the famous Chronicle Historie of King Henry the eighth, with the birth and prosperous life of Edward Prince of Wales (1616), of interest because of its possible connexion with the Shakespearian play of Henry VIII., and The Noble Souldier, Or, A Contract Broken, justly reteng'd (1634), which was entered, however, in the Stationers' Register in the work of Thomas Dekker, to whom the major share is probably assignable.

ROWLEY REGIS, an urban district in the Kingswinford parliamentary division of Staffordshire, England, on the Stourbridge branch of the Great Western railway, 7 m. W. of Birmingham, Pop. (1901) 34,679. It lies in a hilly district rich in coal and iron, while a hard basaltic intrusion known as Rowley rag is largely quarried. The town is a modern growth out of a village surrounding the church of St Giles, which dates from the 13th century, though rebuilt in 1840. Iron manufactures are extensive; there are also brick and tile works and breweries.

ROWLOCK (pronounced rullock or roollock), a device on the gunwale of a boat in or on which an oar rests, forming a fulcrum for the oar in rowing. The word is a corruption due to "row" of the earlier "oar-lock," O.E. drēc, a lock or enclosed place for an oar. The simplest form of rowlock is a notch, square or rounded, on the gunwale, in which the oar rests; other kinds are formed by two pins or pegs, "thole pins" (thole being ultimately the same word as Norm. tell, a young fir-tree), and by a swivel with two horns of metals, pivoted in the gunwale or on an outrigger (see Oak).

ROWTON, MONTAGUE WILLIAM LOWRY-CORRY, BARON (1838-1903), second son of the Right Hon. Henry Corry by his wife Harriet, daughter of the 6th Earl of Shaftesbury, was born in London on the 8th of October 1838, educated at Harrow and at Trinity College, Cambridge, and called to the bar in 1863. His father, a son of the 2nd earl of Belmore, represented County Tyrone in parliament continuously for forty-seven years (1826-73), and was a member of Lord Derby's cabinet (1866-68) as vice-president of the council and afterwards as first lord of the Admiralty. Montague Corry was thus brought up in close touch with Conservative party politics; but it is said to have been his winning personality and social accomplishments rather than his political connections that recommended him to the favourable notice of Disraeli, who in 1866 made Corry his private secretary. From this time till the statesman's death in 1881 Corry maintained his connexion with Disraeli, the relations between the two men being more intimate and confidential than usually subsist between a private secretary and his political chief. When Disraeli resigned office in 1868 Corry declined various offers of public employment in order to be free to continue his services, now given gratuitously, to the Conservative leader; and when the latter returned to power in 1874, Corry resumed his position as official private secretary to the prime minister. He accompanied Disraeli (then earl of Beaconsfield) to the congress of Berlin in 1878, where he acted as one of the secretaries of the special embassy of Great Britain. On the defeat of the Conservative ministry in 1886 he was made a life peer with the title of Baron Rowton, of Rowton Castle, Shropshire. He had rendered service of an exceptional order to his chief, and after Beaconsfield's removal to the House of Lords his private secretary became invaluable in keeping him in touch with the rank and file of his party. Lord Rowton was in Algiers when Beaconsfield was stricken with his last illness in the spring of 1881; but returning post-haste across Europe, he was present at the death-bed of his old chief. Beaconsfield (q.v.) bequeathed to Rowton all his correspondence and other papers. Lord Rowton will long be remembered as the originator of the scheme known as the Rowton Houses. Consulted by Sir William Borne or Bird engaged to play with the Admiral's Men for three days from 1583, the Mayflower would be borrowed 30s. from Henlsole to pay for a new play, Jugurth, by W. Boyle (probably another name for himself). He helped S. Rowley in Joshua (1601), and in additions (1602) to Marlowe's Dr Faustus. His connexion with the theatre ceased about 1621.
Edward Guinness (afterwards Lord Iveagh) with regard to the latter's projected gift of £200,000 for endowment of a trust for the improvement of the dwellings of the working classes, Rowton made himself personally familiar with the conditions of the work of the inhabitants of London; and he determined to establish "a poor man's hotel," which should offer better accommodation than the common lodging-houses, at similar prices. In the face of much discouragement and difficulty, the first Rowton House was opened at Vauxhall in December 1892, the cost (£30,000) being defrayed by Lord Rowton, though he was by no means a man of great wealth. In 1894 a company, Rowton Houses (Limited), was incorporated to extend the scheme, a main characteristic of which was that the houses should not be charitable institutions but should be on a paying commercial basis. The scheme proved a gratifying success, and was imitated not only in many of the chief towns of Great Britain, but also in different countries of Europe and in America (see HOUSING). Lord Rowton also devoted himself to the business of the Guinness Trust, of which he was a trustee, and was interested in many philanthropic schemes. Lord Rowton was unmarried, and the title consequently became extinct at his death, which occurred in London on the 9th of November 1903.

**ROXANA,** or ROXANE, daughter of the Bactrian king Oxyartes, and wife of Alexander the Great. After the latter's death she gave birth at Babylon to a son (Alexander IV.), who was accepted by the generals as joint-king with Arrhidaeus. Having crossed over to Macedonia, and thrown in her lot with Olympias, mother of Alexander the Great, she was imprisoned by Cassander in the fortress of Amphipolis and put to death (310 or 300 B.C.). The marriage of Alexander and Roxana was the subject of a famous painting by Aytion. See Plutarch, Alexander, 47, 77; Arrian, Anab. iv. 18, viii. 27; Diod. Sic. xviii. 3, 38, xix. 11, 52, 105; Strabo xi. p. 517, xvii. p. 794.

**ROXBURGHE, EARLS AND DUKES OF.** Robert Ker, 1st earl of Roxburghe (c. 1570-1650), was the eldest son of William Ker of Cessford (d. 1606) and the grandson of Sir Walter Ker (d. c. 1584), who fought against Mary queen of Scots both at Carberry Hill and at Langside. He was descended from Sir Andrew Ker of Cessford (d. 1526) who fought at Flodden and was killed near Melrose in January 1526 by the Scotts of Buccleuch. The deed was avenged when the Kers under Sir Walter killed Sir Walter Scott of Buccleuch in Edinburgh in 1552. Robert Ker was also descended, on the maternal side, from Andrew Ker of Ferniehurst (c. 1471-1549), a celebrated border chieftain. Another famous member of the family was Andrew's grandson, Sir Thomas Ker of Ferniehurst (d. 1586), who, Camden says, "of an immovable fidelity to the queen of Scots and the king her son." He was the father of Robert Carr, earl of Somerset, the favourite of James I.

After a turbulent life on the border Robert Ker became a Scottish privy councillor in 1599 and was made Lord Roxburghe about the same time; he accompanied King James to London in 1603, and was created earl of Roxburghe in 1616. He was lord privy seal for Scotland from 1637 to 1649, and in the Scottish parliament he showed his sympathy with Charles I.; but he took no part in the Civil War, although he signed the "engagement" for the king's release in 1648. He died at Floors, his residence near Kelso, on the 18th of January 1650. His son Harry, Lord Ker, had died in January 1643; consequently his titles and estates passed by special arrangement to his grandson, William Drummond (d. 1675), the youngest son of his daughter Jean and his husband John Drummond, 2nd earl of Perth. William took the name of Ker, became 2nd earl of Roxburghe, and married his cousin Lord Ker's daughter Jean.

The second earl's son was Robert, 3rd earl (c. 1658-1683), whose son was John, 1st duke of Roxburghe (c. 1680-1741). John became 5th earl in the death of his brother Robert, the 4th earl, in 1690, and is described by George Lockhart of Carnwath as "perhaps the best accomplished young man of quality in Europe." In 1704 he was made a secretary of state of Scotland, and he helped to bring about the union with England, being created duke of Roxburghe in 1707 for his services in this connexion. This was the last creation in the Scottish peerage. The dukedom was a representative peer for Scotland in four parliaments; George I. made him a privy councillor and keeper of the privy seal of Scotland, and he was loyal to the king during the Jacobite rising in 1715. He was again a secretary of state from 1716 to 1725, but he opposed the malt-tax, and in 1725 Sir Robert Walpole procured his dismissal from office. He died on the 24th of February 1741. His only son, Robert (c. 1709-1755), who had been created Earl Ker of Wakesfield in 1722, became 2nd duke, and was succeeded by his son John, 3rd duke of Roxburghe (1740-1804), the famous bibliophile. John was betrothed to Christiana, daughter of the duke of Mecklenburg-Strelitz; but when the princess's sister Charlotte was affianced to George III., reasons of state led to the rupture of the engagement, and he died unmarried on the 19th of March 1804. The duke's library, including a unique collection of books from Caxton's press, and three rare volumes of broadside ballads, was sold in 1812, when the Roxburghe Club was founded to commemorate the sale of Waldeyer's edition of Boccaccio. Roxburghe's cousin William, 7th Lord Bellenden (c. 1728-1805), who succeeded to the Scottish titles and estates, died childless in October 1805, and for seven years the titles were dormant. Then in 1813 Sir James Innes, bart. (1736-1832), a descendant of the 1st earl, established his claim to them, and taking the name of Innes-Ker, became 5th Duke of Roxburghe. Among the unsuccessful claimants to the Roxburghe dukedom was John Bellenden Ker (c. 1765-1842), famous as a wit and botanist and the author of *Archaeology of Popular Phrases and Nursery Rhymes* (1837), whose son was the legal reformer, Charles Henry Bellenden Ker (c. 1785-1871).

The 5th duke's great-grandson, Henry John Innes-Ker (b. 1876), became 8th Duke in 1892. The Duke of Roxburghe sits in the House of Lords as Earl Innes, a peerage of the United Kingdom, which was conferred in 1837 upon James Henry, the 6th Duke (1816-1879).

**ROXBURGH, a Border county of Scotland, bounded W. by Berwickshire, E. and S.E. by Northumberland, S. by Cumberland, S.W. by Dumfriesshire and N.W. by the shires of Selkirk and Mid Lothian. It has an area of 426,060 acres, or 665-7 sq. m. The only low-lying ground in the shire is found in the N. and in the valleys of the larger rivers, and the whole S. is markedly hilly. Though the Cheviots, forming for a considerable distance the natural boundary with England, mostly belong to Northumberland, Cattleshill Shin (1742 ft.) and Peel Fell (1664) are Scottish peaks. The chief heights of the mountainous mass constituting the watershed between Teviotdale and Liddesdale are Cauldhead Head (1900), Greatmoor (1664), Pennygant (1605), Din Fell (1755), Windburgh (1622) and Arnot Fell (1464). In the W. is Crib Law (1760), and in the N., near Melrose, occur the triple Eildons (highest peak, 1385). The county is abundantly watered. The Tweed flows through the N. of the shire for 26 out of its total run of 67 m., though for about 2 m. (near Abbotsford) it is the boundary stream with Selkirkshire, and for 10 m. lower down with Berwickshire (parishes of Earlston and Merton). On the right its affluents are the Bowden and the Teviot, and on the left the Allan and the Eden. The Teviot is the principal river lying entirely in Roxburgshire. From its source near Causeway Grain Head on the Dumfriesshire border, it follows mainly a N.E. direction for tributaries are on the right, Allan Water, the Slitrig, Dean Burn, the Rule, the Jed, the Oxsam and the Kale, and, on the left, Northwick Water and the Ale, both rising in Selkirkshire. The Liddel is the leading stream in the S. Rising near Peel Fell in the Cheviots it flows S.W. to the Esk after a course of 27 m., receiving on the right Hermitage Water, on the left Kershope Burn. The Kershope and Liddel, during part of their run, serve as boundaries with Cumberland. Excepting the Liddel, which drains to the Esk, much the greater portion of the surface is drained, by the Tweed, to the North Sea. The lakes are few
and small, the largest being Yetholm or Primside Loch and Horslaw, both in the parish of Linton among outlying hills of the Cheviots. Teviotdale, Liddesdale, Tweedside and Jedcote are the principal valleys.

Geology.—This county contains a considerable range of sediments, from those of the Ordovician to the Carboniferous systems, and with these are associated large tracts of volcanic rocks. The Ordovician and Silurian rocks occupy the N.W. and W. part of the county; they have been fairly well known, sharp and well marked on the crests of the anticlines that the strata of the former system appear flanked on either side by those of the latter. The oldest rocks are the mudstones and radiolarian cherts with coal beds. The upper Ordovician rocks of these are followed by shales and graywackes of Llanedeylo age and similar rocks of Caradoc age. Then comes the Silurian with the Birkhill shales and massive gneisses and graywackes of the Gala or Quantock district. The Hawick rocks of these are followed by the deposition of the older tracts and they occupy the greater part of the Silurian area. Wenlock and Ludlow rocks are found S. of Hawick rocks from Wisp Hill N.E. by Stobs Castle; other intrusive masses occur in the Old Red Sandstone and Carboniferous areas, the largest of these being that which appears in a belt some 14 m. in length from near Riccarton in the direction of Hob Kirk. Two divisions of the Old Red Sandstone occur; the lower, which consists of subordinate sandstones and conglomerates in sheets of continuous luvivas with some tuffs, is confined to the Cheviots; the strata are unconformable upon the upturned Silurian beds. The upper division, which is considered unformable unless upon the lower, occupies about one-third of the county. It consists of coarse conglomerates at the base followed by sandstones and marls. It is well developed in the N., where volcanic rocks come in; the Trow Crags of Melrose and the Tweedside range extend to these. The sandstones extend from Newtown and Kelso to Kirkton with extensions in the valleys S.W. Carboniferous rocks are represented by the Caerlaverock and Liddesdale sandstone series; they have been thrown up into numerous uplands of Carter Fell, Larriston Fell, &c., they are sandstones with shales, some calcareous beds and coal and volcanic beds. In the N.E. corner of the county the outer part of the Berwickshire Coast and rocks lies within the boundary. An interesting series of volcanic "rocks" belonging to this period is exemplified in Dunain Law, Black Law Maiden Paps and Ruberslaw and other hills. Glacial deposits are represented by boulder clay and beds of gravel and sand.

Climate and Industries.—The average annual rainfall is about 37 in., higher in the hilly regions and somewhat lower towards the N.E. The mean temperature for the year is 48° F., for January 38° F., and for July 60° F. The soil is chiefly loamy on the lower levels and clayey on the higher. The banks of the larger streams are often very fertile. In other districts a mixture of clay and gravel is mostly found. In parts of Berwickshire, Liddesdale and Jedcote several kinds of fruit are successfully grown. The area under grain about two-thirds is occupied by oats, the remainder being principally devoted to barley. Among green crops turnips and swards are most generally cultivated; potatoes covering a considerable extent of land. In parts of Berwickshire, Liddesdale and Jedcote several kinds of fruit are successfully grown. Both in the pastoral and arable localities agriculture is in an advanced condition. The hill country everywhere covered with a thick growth of heather, is suited for the grazing of sheep which occur in very large numbers. The cattle are chiefly used for mutton and beef. The church of the Cheviots, Gadancia (Bonjedward) near Jedfoot and Eildon Hill (Trimontium). Another so-called Roman road is the Wheel Causeway or Causey, a supposed continuation of the Maiden Way which joins the river Tweed. It is conjectured that the arms of the Britons of Strathclyde who under Ardan, were defeated with great slaughter by Ethelfrith, king of Bernicia, at the battle of Densgastane or Dawstane in 603. There are hill forts in Liddesdale on the Allan, in the parish of Oxnam, and on the most easterly of the three Eildons. This last is said to be the largest example of its kind in Scotland. The fortress was defended by palisades around the three circular terraces which form the hill-top. Within the enclosure there was a town of huts, judging from certain marks that indicate the site of such dwellings, and the relics of early British pottery that have been found, while the fact that springs exist renders it probable that some kind of settlement existed at the time.

The towns of Roxburgh are Yetholm, Jedburgh, Kelso, Melrose and Selkirk. The shires of Roxburgh, Berwick and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county is under school-board jurisdiction, and there are secondary schools at Hawick and Kelso, while the board schools at Jedburgh and Melrose have secondary departments. Most of the "residue" grant is expended in maintaining teachers to attend science and art classes at Edinburgh University and Hawick, and in subsidizing science and art and technical classes at Hawick, Kelso and elsewhere.

ROXBURGHSHIRE

Population and Administration.—The population in 1911 was 48,804, or 73 persons to the sq. m. In 1901 there were 132 persons who spoke Gaelic and English, but none Gaelic only. The principal towns are Hawick (pop. 17,303), Kelso (4008), Jedburgh (3136), Melrose (2195). The county returns a member to parliament, and Hawick belongs to the Border group of parliamentary burgs. Jedburgh, the county town, is a royal burgh, and Hawick, Kelso and Melrose are police

comparatively a state of repose, disturbed to some slight degree during the
Covenanting troubles and, to a much slighter degree, by the
Jacobite rebellions.

ROXBURY, formerly a city of Norfolk county, Massachusetts, U.S.A., situated between Boston and Dorchester, but since 1868 a part of Boston. It is primarily a residential district. Among its institutions are the Roxbury Latin School, established in 1645, the Fellows Athenaeum (a part of the Roxbury branch of the Boston Public Library), with about 26,000 volumes in 1909, and the New England Hospital for Women and Children (1863), the New England Baptist Hospital (1893), the Woman’s Charity Club Hospital (1860), the Roxbury Homoeopathic Dispensary (1851), the Roxbury Home for Children and Aged Women (1839), a Home for Aged Couples (1884) and the Massachusetts Home for Intemperate Women (1879). On Mount Bellevue, in West Roxbury (set apart from Roxbury in 1851 and annexed to Boston in 1873), there is an observatory (erected in 1869 by the city of Boston as a standpipe for the high service water supply). Among the manufacturers of the district are cotton and woolen goods, cordage, carpets, shoes and foundry products. The town of Roxbury (at first usually spelled Rocksbury) was founded in 1630 by some of the Puritan immigrants who came with Governor John Winthrop; the settlers were led by William Pynchon, who settled in 1636 near the party from here and founded Springfield, Mass. At the home of Rev Thomas Welde (d. 1662), the first minister, Anne Hutchinson (q.v.) was held in custody during the winter of 1637–38. Associated as teacher with Welde and his successors, Samuel Danforth and Nehemiah Walter, was John Eliot, the apostle to the Indians, who removed to Roxbury in 1632 and died here in 1690. Roxbury was the home also of Thomas Dudley, of his son Joseph and of his grandson Paul; of Robert Calef (d. 1710), the leader of the opposition to the witchcraft craze; of General Joseph Warren, and of William Eustis (1753–1829), who was U.S. secretary of war (1809–12), minister to the Netherlands (1814–18), and governor of Massachusetts (1832–25); and from 1837 to 1845 Theodor Parker was the pastor of the Unitarian Church of West Roxbury. Of special interest in the old Roxbury burial-ground is the "Ministers’ Tomb," containing the remains of John Eliot, and the tomb of the Dudleys. West Roxbury was the scene of the Brook Farm experiment (see Brooke Farm). Roxbury was chartered as a city in 1846.

ROY, WILLIAM (1726–1790), a famous British surveyor, military draughtsman, antiquary (1886), &c. In 1767, when an assistant in the office of Colonel Watson, deputy-quarter-master-general in North Britain, he began the survey of the mainland of Scotland, the results of which were embodied in what is known as the "duke of Cumberland's map." In 1775 he obtained his commission in the 4th King's Own Foot, and in 1779 gained his lieutenantcy and went to serve in Germany in the Seven Years' War. In 1765 he appears as deputy quarter-master-general to the forces, surveyor-general of coasts and engineer-director of military surveys in Great Britain; in 1767 he became F.R.S., in 1767 major-general, in 1769 director of Royal Engineers. Besides his campaigns and observations in Germany, his visits to Ireland (1766) and to Gibraltar (1765) were important. In 1783–84 he conducted observations for determining the relative positions of the French and English royal observatories. His measurement of a base-line for that purpose on Hounslow Heath in 1784, the germ of all subsequent surveys of the United Kingdom, gained him in 1785 the Copley medal of the Royal Society. Roy's measurements (not fully utilised till 1787, when the Paris and Greenwich observatories were properly connected) form the basis of the topographical survey of Middlesex, Surrey, Kent and Sussex. He also executed an account of this work for the Phil. Trans. when he died on the 1st of July 1790.

ROYAL FERN, in botany, the common name for the fern Osmunda regalis, a native of Britain, where it grows in bogs, marshy woods, &c. It is a handsome plant with bi-pinnate fronds 2 to 6 ft. long and 1 ft. or more broad; the tops of the fronds are fertile, the fertile pinnae being cylindrical and densely covered with the spore-cases, giving the appearance of a dense panicle of flowers, whence the plant is known as the flowering fern. There are various cultivated forms—crisata has the ends of the fronds and the pinnae finely crested, and corymbifera has curiously forked and crested fronds. Several other species, such as O. cinnamomea, O. Claytoniana, are known as handsome greenhouse ferns (see also Ferns).

ROYAL SOCIETY, THE, the oldest scientific society in Great Britain, and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in the year 1660, but a nucleus had in fact existed for several years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the New Philosophy or Experimental Philosophy," and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Boyle speaks in sundry letters written in 1646 and 1647. These weekly meetings, according to Wallis, were first suggested by Theodore Haak, "a German of the Palatinate then resident in London," and they were held sometimes in Dr Goddard's lodgings in Wood Street, sometimes at the Bull-Head Tavern in Cheapside.

Some of these "Philosophers," resident in Oxford about 1648, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of Dr Wilkins, warden of Wadham College. A close intercommunication was maintained between the Oxford and London Philosophers; but ultimately the activity of the society was concentrated in the London meetings, which were held principally at Gresham College.

On November 28, 1660, the first journal book of the society was opened with a "memorandum," from which the following is an extract: "Memorandum that Novemb., 28. 1660. These persons following, according to the usual custom of most of them, met together at Gresham College to hear Mr Wren's lecture, viz. The Lord Brouacker, Mr Boyle, Mr Bruce, Sir Robert Moray, Sir Paul Neile, Dr Wilkins, Dr Goddard, Dr Petty, Mr Ball, Mr Rooke, Mr Wren, Mr Hill. And after the lecture was ended, they did, according to the usual manner, withdraw for mutual assurance. Where amongst other matters that were discoursed of, something was offered about a design of founding a Colledge for the promoting of Physico-Mathematicall Experimentall Learning." It was agreed at this meeting that the company should continue to meet on Wednesdays at three o'clock; an admission fee of ten shillings with a subscription of one shilling a week was instituted; Dr Wilkins was appointed chairman; and a list of forty-one persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray brought word that the king (Charles II.) approved the design of the meetings; a form of obligation was framed, and was signed by all the persons enumerated in the memorandum of the 28th of November and by seventy-three others. On the 12th of December another meeting was held at
which fifty-five was fixed as the number of the society,—per-
sons of the degree of baron, Fellows of the College of Physicians,
and public professors of mathematics, physics and natural
philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular
meeting-place of the society. Sir Robert Moray (or Murray)
was chosen president {March 6, 1661}, and continued from time
to time to occupy the chair until the incorporation of the
society, when Lord Brouncker was appointed the first president
under the charter. In October 1661 the king offered to be
entered one of the society, and next year the society was in-
corporated under its present title. The name "Royal Society "
appears to have been first applied to the Philosophers by John
Evelyn, in the dedication of his translation of a book by Gabriel
Naudé, published in 1661. Evelyn records in that year the
thanks of the "philosophic assembly" for the honourable
mention he had made of them by the name of "The Royal
Society."

The charter of incorporation passed the Great Seal on the
15th of July 1662, to be modified, however, by a second charter
in the following year, repeating the incorporating clauses of the
first charter, but conferring further privileges on the society.
The second charter passed the Great Seal on the 22nd of April
1663, and was followed in 1669 by a third, confirming the powers
granted by the second charter, with some modifications of detail,
and granting certain lands in Chelsea to the society; the council
remained the Royal Society until the first time on the 11th
of May 1663, when resolutions were passed that debate con-
cerning those to be admitted should be secret, and that Fellows
should pay 1s. a week to defray expenses.

At this early stage of its history the "correspondence"
which was actively maintained with continental philosophers
formed an important part of the society's labours, and selections
from this correspondence furnished the beginnings of the
Philosophical Transactions (a publication now of world-wide
celebrity). At first the publication of the Transactions was
entirely in the hands of the respective societies. The first
issue of the Royal Society appeared on Monday, March 6, 1664-65, under the title of Philosophical Transactions: giving some Account of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world, with a dedication to the Royal Society signed by Henry Oldenburg, the first secretary of the society. It was ordered (1st of March 1664-65) "that the tract be licensed by the Council of the Society, being first reviewed by some of the members of the same." In 1730, 406 numbers, or 46 volumes, had been published. After this date the work was under the superintendence of a committee, and the division into numbers disappeared. The society also from its earliest years published, or directed the publication of, separate
treatises and books on matters of philosophy; most notable
among these being the Philosophiae naturalis principia
mathematica Autore Is. Newton. Imprimatur: S. Pepys,

In 1887 the Philosophical Transactions was divided into two
series, labelled A and B respectively, the former containing
papers of a mathematical or physical character, and the latter
papers of a biological character. More than 225 quarto volumes
have been published. In 1832 appeared the first volume of
Abstracts of papers printed in the Philosophical Transactions
from the year 1800. This publication developed in the course of
a few years into the Proceedings of the Royal Society, which
has been continued up to the present time. It is published
now in two series, corresponding to the two series of the Philo-
osophical Transactions, and is issued in 8vo form at the rate of
about three volumes a year.

It is, however, certain that one of the most important functions of the society from the beginning was the performance of ex-
periments before the members. In the royal warrant of 1663 order was given that the society should be described as "The Royal Society for the improving of Natural Knowledge by experiments"; and during its earlier years the
time of the meetings was principally occupied by the perform-
ance and discussion of experiments. The society early exercised
the power granted by charter to appoint two "curators of experi-
ments," the first holder of that office being Robert Hooke, who was afterwards elected a secretary of the society.

Another matter to which the society gave attention was the
formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr Hubbard," which, by a
resolution of council passed on the 21st of February 1666, was purchased for the sum of £100. This museum, at one time the
most famous in London, was presented to the trustees of the
British Museum in 1781, upon the removal of the society to
Somerset House. A certain number, however, of instruments
and models of historical interest have remained in the possession
of the society, and some of them, more particularly associated
with its earlier years, are still preserved at Burlington House.
The remainder have been deposited in the Victoria and Albert
Museum, South Kensington.

After the Great Fire of London in September 1666 the
apartments of the Royal Society in Gresham College were
required for the use of the city authorities, and the society
were therefore invited by Henry Howard of Norfolk to meet
in Arundel House. At the same time they presented the library purchased by his grandfather, Thomas earl of
Arundel, and thus the foundation was laid of the important
collection of books, essays, and pamphlets which the society possesses. Of the Arundel MSS. the bulk was sold to the trustees of the British Museum in 1830 for the
sum of £3,559, the proceeds being devoted to the purchase of
scientific books. These MSS. are still kept in the British
Museum as a separate collection. The society, however, still
possesses a valuable collection of scientific correspondence,
oficial records, and other manuscripts, including the original
manuscript, with Newton's autograph corrections, from which
the first edition of the Principia was printed, and many other
original documents of great interest.

In 1718 the journal-book records that "the lord bishop of Sarum proposed for candidate Mr Isaac Newton, professor of the mathematicks at Cambridge."

Newton was elected a Fellow January 11, 1767-72, and in 1763
he was appointed president, a post which he held till his
death in 1727. During his presidency the society moved to
Crane Court, their first meeting in the new quarters being held
November 8, 1710. In the same year they were appointed
visitors and directors of the Royal Observatory at Greenwich,
a function which they continued to perform until the acces-
sion of William IV., when by the new warrant then issued the
president and six of the Fellows of the Royal Astronomical
Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal
Society removed from Crane Court to the apartments assigned
to them by the government in the new Somerset House, where
they remained until they removed to Burlington House in
1837. The policy of Sir Joseph Banks was to render the Fellow-
ship more difficult of attainment than it had been; and the
measures which he took for this purpose, combined with other
circumstances, led to the rise of a faction headed by Dr
Horsley. Throughout the years 1783 and 1784 feeling ran
exceedingly high, but in the end the president was supported
by the majority of the society. An account of the controversy
will be found in a tract entitled An Authentic Narrative of
the Dissensions and Debates in the Royal Society. An important
step in pursuance of the same policy was taken in the year 1847,
when the number of candidates recommended for election by
the council was limited to fifteen, and the election was made
annual. This limitation has remained in force up to the present
time. Concurrent with the gradual restriction of the Fellowship
was the successive establishment of other scientific bodies. The
founding of the Linnean Society in 1788 under the auspices of
several Fellows of the Royal Society was the first instance of
the establishment of a distinct scientific association under royal
charter; and this has been followed by the formation of the
large number of societies now active in the promotion of special branches of science.

From the time of its royal founder onwards the Royal Society has constantly been appealed to by the government for advice in connexion with undertakings of national importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has successfully urged upon the attention of, the government: the improvement and regulation of the Royal Observatory in Greenwich; the placing of the calendar in 1752; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of longitude from the difference of time of the meridian vibrations; comparison of the British and French standards of length; the Geodetic Survey in 1784, and the General Trigonometrical Survey begun in 1791; the observations of Venetian Transits of Venus from 1769 (commissioned by Captain Cook), 1772 and 1822; the Antarctic expeditions of 1772 (under Captain Cook, whose voyage extended to the circumnavigation of the globe), of 1839 (under Ross), and 1900; oceanographic and meteorological expeditions of 1872 (in search of the North-West Passage), of 1810 (under Parry), of 1827 (Parry and Ross), of 1845 (Franklin), of 1874 (under Nares); numerous expeditions for observing eclipses of the sun and moon, and for measuring tonnage of ships; 1823, copper sheathing by sea-water; Babbage’s calculating machine; lightning-conductors for vessels of war; 1825, supervision of gas-works; 1831, tidal observations and instruments; the Royal Mail service; the North American continent; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the government of the Ganges; 1871, the transatlantic cable; 1872, “Challenger” expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the “Triton” in Faroe Channel; 1883, borings in delta of Nile; 1884, Bureau des Poids et Mesures; international conference 12 a pendulum meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour-blindness; 1895, examination of the structure of a coal reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geophysical Bureau, 1897, determination of the relations between the metric and imperial units of weights and measures; and, more recently, an inquiry into the volcanic eruptions in the West Indies; international seismological international and existing tides; the sun’s atmosphere; measurement of an arc of the meridian across Africa.

In recent years also the society, acting at the request of the government, has taken the leading part in investigating, in co-operation with the military and medical, the tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and similar subjects. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the International Council of Scientific Unions, founded in 1883, which is composed of all the principal scientific academies of the world, meeting regularly to promote international action in questions of scientific interest.

As noted above, the Royal Society has exercised, and still exercises, a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory at Greenwich, which important discoveries have been made, in relation to various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever and similar subjects. The society has standing committees which advise the Indian government on matters connected with scientific inquiry in India and on the observatories of India. The society has taken a leading part in the promotion of the International Council of Scientific Unions, founded in 1883, which is composed of all the principal scientific academies of the world, meeting regularly to promote international action in questions of scientific interest.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of the annual grant of £4000 for the promotion of scientific research. The origin of this grant is as follows: in 1703, John Flamsteed and John Body were chosen by the council of the Royal Society to advise the government as to the nature of a grant of £4000 to be given for the encouragement of science. This grant of £1000 afterwards became annual, and was continued until 1876. In that year an additional sum of £1000 for similar purposes was granted, and the two funds of £1000 and £4000 were administered concurrently until 1881, in which year the two were combined in a single annual grant of £4000 under new regulations. Since 1896 parliament has also voted a grant of £2000 for the publication of scientific papers, not only those issued by itself, but also scientific matter published through other channels. The most important and most used of these publications are the Proceedings of the Royal Society, a catalogue of scientific papers—an index now in twelve quarto volumes, under authors’ names, of all the memoirs of importance in the chief English and foreign scientific serials from the year 1800 to the present time. The work was prepared under the direction of the Royal Society. A continuation carrying the catalogue up to the end of the 19th century, and a subject index to the whole catalogue, have also been compiled. A minute of the funds administered by the Royal Society will be found in the Year Book published annually, and the origin and history of these funds will be found in the Record of the Royal Society (and ed. 1901). The income of the society is derived from the profits of the investment of the capital of the bequest of Lord Godwin, from the interest on the endowment of the society, and from interest on various investments. The balance-sheet and an account of the estates and property are published in the Year Book. For the year 1896, from the Royal, the Davy and the Hughes were awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1700), and is awarded "...the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford medal was established by the will of Mr John Davy, F.R.S., the son of the discoverer of the Davy lamp, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the Year Book.

The society also has the power of conferring three research studentships, one founded in 1890 in memory of J. P. Joule, and the others created out of a bequest to the society by Sir William Macdonald in 1897.

The society has a rule that every candidate for election to the Royal Society must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must sign from personal knowledge. The council annually elects fifteen by ballot, and the names selected are submitted to the society for election by ballot. The names of Fellows elected since that date are given in the Year Book. The society also gives grants to students, by the Royal Society and the Hughes are awarded by the society every year; the Rumford and the Darwin medals biennially, the Sylvester triennially and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1700), and is awarded "...the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. ROYALTY—ROYCE

ROYALTY (O. Fr. reale, reialte, royaute, from Med. Lat. regalis, the substantive of regalis, of or belonging to a king, rey), kingly state or personality, hence a royal person, or number of persons of royal birth collectively, a member of a royal family. More particularly "royalty" is used of the rights and attributes of a sovereign, and especially of dukes paid to the crown, which belong to the sovereign: pure coroneo, such as dukes from gold and silver mines, waifs, estrays, &c. The term is usually applied to the payment made by a publisher to an author on every copy of his book sold; to the payment made to a patentee on each article manufactured under his patent by a licensee (see PATENTS), and to the payment made to the owner of minerals for the right of working, paid on the ton or other weight raised.

ROYAN, a town of W. France, in the department of Charente Inférieure, on the right bank of the Gironde, at its mouth 63 m. below N.N.W. of Bordeaux. Pop. (1906) 7442. Royan is one of the most frequented bathing resorts on the Atlantic seaboard. The coast is divided into a number of small bays or "conches," forming so many distinct beaches: to the E. of the town is the "Grande Conche" with the municipal casino; to the S. the "Conche de Foncillon," separated from the first-named by a quay which forms a fine terraced esplanade; beyond the fort of Royan follow in succession the conches "du Chay" and "de Robinson," and the most fashionable of all, that of Pontaillac. The port carries on sardine-fishing and an active coasting trade, but the harbour at high tide is accessible only to vessels drawing from 8 to 10 ft., and at low water is dry. Eugène Pelletan, the author of a statue in the town, of which he was a benefactor. The lighthouse of Cordouan, 200 ft. in height, rebuilt on the site of an older tower by the architect Louis de Foix in 1584-1610 and added to about the end of the 18th century, stands on a rock 75 m. W.S.W. of Royan.

Royan after passing through many hands came to the family of la Trémoille, in whose favour it was made first a marquisate and then a duchy. During the first half of the 15th century it was held by the English. During the wars of religion it was a centre of Calvinism and had to sustain in 1522 an eight days' siege by the troops of Louis XIII. As late as the end of the 18th century it was but a "bourg" of about one thousand inhabitants, noticeable only for its priory, where Brantôme wrote a portion of his Chronicles. The prosperity of the place dates from the Restoration, when steamboat communication was established with Bordeaux.

ROYAT, a watering-place of central France, in the department of Puy-de-Dôme, situated at a height of 1475 ft. on the Tiretaine, 11 m. S.W. of Clermont-Ferrand. Pop. (1906) 1451. The thermal springs, situated in the part of Royat known as St. Mart, are strongly impregnated with carbonic acid and chloride of sodium and are used in cases of rheumatism, gout, bronchitis, asthma, anaemia, &c. They were known in Roman times, and ruins of ancient baths are still to be seen. The village of Royat proper, a little higher up the valley, has a church of the 11th and 12th centuries fortified with battlements.

ROYER-COLLARD, PIERRE PAUL (1763-1845), French statesman and philosopher, was born on the 21st of June 1763 at Sompuis, near Vitry le Français (Marne), the son of Antoine Royer, a small proprietor. His mother, Angélique Perpétue Collard, was a woman of unusual strength of character and of austere piety. Pierre Paul Royer was sent at twelve to the college of Chaumont of which his uncle, Father Paul Collard, was director. He subsequently followed his uncle to Saint Omer, where he studied mathematics. At the outbreak of the Revolution, which moved him to passionate sympathy, he was practising at the Parisian bar. He was returned by his section, the Island of Saint Louis, to the Commune, of which he was secretary from 1790 to 1792. After the revolution of the 10th of August in that year he was replaced by J. L. Tallien. His sympathies were now with the Gironde, and after the insurrection of the 12th Prairial (31st of May 1793) he was in danger of his life. He returned to Sompuis, and was saved from arrest possibly by the protection of Danton and in some degree by the impression made by his mother's courageous piety on the local commissary of the Convention. In 1797 he was returned by his department (Marne) to the Council of Five Hundred, where he soon fell in with the Jansenists, especially with Camille Jordan. He made one great speech in the council in defence of the principles of religious liberty, but the coup d'état of Fructidor (4th of September 1797) drove him again into private life. It was at this period that he developed his legitimist opinions and entered into communication with the comte de Provence (Louis XVIII.). He was the ruling spirit in the small committee formed in Paris to help forward a Restoration independent of the comte d'Artois and his party; but with the establishment of the Consulate he saw the prospects of the monarchy were temporarily hopeless, and the members of the committee resigned. From that time until the Restoration Royer-Collard devoted himself exclusively to the study of philosophy. He derived his opposition to the philosophy of Condillac chiefly from the study of Descartes and his followers, and from his early veneration for the fathers of Port-Royal. He was occupied with the erection of a system which should provide a moral and political education consonant with his view of the needs of France. From 1812 to 1814 he lectured at the Sorbonne. From this time dates his long association with Guizot. Royer-Collard himself was supervisor of the press under the first restoration. From 1815 onwards he sat as deputy for Marne in the chamber. As president of the commission of public instruction from 1815 to 1820 he checked the pretensions of the clerical party, the immediate cause of his retirement being an attempt to infringe the rights of the university of Paris by giving university diplomas, independent of university examinations, to the teaching fraternity of the Christian Brothers. Royer-Collard's acceptance of the Legitimist principle did not prevent a faithful adherence to the social revolution effected in 1789, and he protested in 1815, in 1820, and again under the monarchy of July against laws of exception. He was the moving spirit of the "Doctrairies," as they were called, who met at the house of the comte de Ste Aulaire and in the salon of Madame de Staël's daughter, the duchesse de Broglie. The leaders of the party, beside Royer-Collard, were Guizot, P. E. H. de Serre, Camille Jordan and Charles de Rémusat. In 1820 he was excluded from the council of state by a decree signed by his former ally Serre. In 1827 he was elected for seven constituencies, but remained faithful to his native department. Next year he became president of the chamber, and fought against the reactionary policy which precipitated the Revolution of July. It was Royer-Collard who in March 1830 presented the address of the 221. From that time he took no active part in politics, although he retained his seat in the chamber until 1839. He died at his estate of Châteauvieux, near Vitry, on the 2nd of September 1845. He had been a member of the Academy since 1827. Royer-Collard married in 1799 Mlle. de Forges de Châteauvieux. The two daughters who survived to womanhood received an education of the utmost austerity.

Royer-Collard left no considerable writings, but fragments of his philosophical work are included in Jouffroy's translation of the works of Thomas Reid. The standard life of Royer-Collard is by his friend Prosper de Saint-Hilaire, Histoire de Pierre Paul Royer-Collard, ses discours et ses écrits (2 vols., 1861). There are also biographies by M. A. Philippe (1857), by L. Vingtain (1858), by E. Spuller (1860), by A. Chatambeau (1861), by M. E. Pague (Politique et morale du xixe siècle (1891); H. Taine, Les Philosophes français du xixe siècle (1857); L. Séché, Les Derniers Jansenistes (1891); and Lady Binnenhassett, "The Doctrairies" in the "Cambridge Modern History," vol. x. chap. 10, 1907. For further references see H. P. Thieme, Guide bibliographique (Paris, 1907).

ROYCE, JOHN FORBES (1799-1858), British botanist and teacher of materia medica, was born in Cawnpore in 1799. Entering the service of the East India Company as assistant surgeon, he devoted himself to studying botany and geology, and made large collections among the Himalaya Mountains. He also investigated the medical properties of the plants of
HOOD—RUBBER

Hindustan and the history of their uses among the native races. The results of these investigations appeared in an essay On the Antiquity of Hindoo Medicine (1837). For nearly ten years he held the post of superintendent of the East India Company’s botanic garden in the Himalayas at Sattaran. In 1837 he was appointed to the professorship of materia medica in King’s College, London, which he held till 1856. From 1838 onwards he conducted a special department of correspondence, relating to vegetable products, at the East India House, and at the time of his death he had just completed there an extensive and valuable museum of technical products from the East Indies. In 1851 he superintended the Indian department of the Great Exhibition. He died at Acton near London on the 2nd of January 1858.

The work on which his reputation chiefly rests is the Illustrations of the Botany and other branches of Natural History of the Himalaya Mountains, and of the Flora of Cashmere, in 2 vols. 4to, begun in 1839. In addition he wrote An Essay on the Productive Resources of India (1840). On the Culture and Commerce of Cotton in India and Elsewhere (1841) and The Fibrous Plants of India fitted for Cordage (1855), together with papers in scientific journals.

ROYSTON, a market town in the Hitchin parliamentary division of Hertfordshire, England, close to the border of Cambridgeshire, 48 m. N. of London by the Cambridge branch of the Great Northern railway. Pop. of urban district (1901) 3517. The church of St John the Baptist is mainly Early English. There are a market house, and institute with library and museum. Beneath a street in the town is a curious example of a hermit’s cave, excavated in the chalk, and containing rude carvings of the crucifixion and other sacred subjects. It was discovered in 1742. The town lies on the Roman Ermine Street, at the point where it strikes from the hills across the plain, and its straight course is deflected slightly W. Roman relics have been found, and several barrows and earth-mounds occur on the neighbouring hills. A monastery of Augustinian canons was founded here towards the close of the 12th century, but there are no remains.

ROYTON, an urban district of Lancashire, England, within the parliamentary borough of Oldham, 2 m. N. of Oldham on the Lancashire & Yorkshire railway. Though of early origin, it is, as a town, of wholly modern growth. The cotton manufacture is its chief industry. Pop. (1901) 14,894.

ROZAS, JUAN MARTINEZ DE (1759-1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago. He held the post of acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1806 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning his position as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national Junta on the 18th of September 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized and a national congress was called together in July 1811. But at the end of that year divisions began to arise between Rozas’ followers from Concepción and the men of Santiago; and a feud broke out between Rozas and José Miguel Carrera (q.v.) who had secured control of Santiago. In 1812 Carrera succeeded in securing the banishment of his rival, who retired to Mendoza, where he died on the 3rd of March 1813.

See P. B. Figueira, Diccionario biográfico de Chile, 1550-1887 (Santiago, 1889), and J. B. Suárez, Rasgos biográficos de hombres notables de Chile (Valparaíso, 1886); both giving biographical sketches of prominent characters in Chilean history.

ROUBON (Rhiwbabon), a town of Denbighshire, N. Wales, in the E. parliamentary division, near the Shropshire border, 5 m. S.W. of Wrexham, on the Great Western railway. Pop. (1901) 3248. It is situated on a small tributary of the Dee. The old Gothic church is thought by some to have been founded by Mabon, a brother of Llewelyn (13th c.), and has monuments to the Wynn family, by Nollekens and Rysbrack, and to Dr D. Powel (d. 1598), translator into English of Caradoc’s (of Llanfairian) History of Wales. In the neighbourhood are collieries, engineering works, an iron foundry and chemical works, besides an extensive industry in glassed and other bricks. Near Roubon is Caerfaddon (Caerfaddon), an ancient village surrounded by circular intrenchments, and Wynnstay, with an avenue of fine trees. Anciently the residence of Madoc ab Gruffyd Maelor (founder of Valle Crucis Abbey), it was called Wasttay, from Watt’s Dyke, an old rampart on the estate. It was named Wynnstay on its coming into possession of the Wynns (17th c.). Offa’s Dyke, near here, is 10 ft. high, and broad enough for two carriages abreast. Not far is Chirk Castle (supposed to have been built in 1013), besieged by Cromwell’s artillery: near it, in the Ceiriog valley, the defeat of Henry II. by Owen Gwynedd took place in 1165.

RUBBER, Indian, or Caoutchouc (a word probably derived from Cahucha or Cauchu the names in Ecuador and Peru respectively for rubber or the tree producing it), the chief constituent of the coagulated milky juice or latex furnished by a number of different trees, shrubs and vines. The latex of the best rubber plants furnishes from 20 to 50% of rubber. The latex is not to be confused with the sap of trees, on the circulation of which their nutrition depends. Though frequently occurring, it is not a universal feature of plant life, and does not appear to be necessary or even directly connected with the nutritive system of plants. Its exact function is not known; though it is largely stored in vessels or small sacs which reside in the cortical tissue between the outer bark and the wood is also found in the leaves and sometimes in the roots or bulbs. The trees and plants whose latices furnish caoutchouc in considerable quantity chiefly belong to the natural orders Euphorbiaceae, Urticaceae, Apocynaceae, Asclepiadaceae. The latex is usually obtained from the bark or stem by making an incision reaching almost to the wood when the milky fluid flows more or less readily from the laticiferous vessels. It, like milk, an emulsion, and when examined with the microscope is seen to consist of numerous globules suspended in a watery fluid. On standing, some latices separate, more or less readily, into an upper layer resembling cream and consisting of the globules, and a lower watery layer. This separation can be readily effected with some latices by the use of a centrifugal machine, but this method has not yet been applied to any extent commercially. The globules which furnish the cream gradually pass on standing into solid caoutchouc, a process which is facilitated by rapid stirring, or by the addition of an acid or other chemical agent. If the latex is warmed or an acid, an alkali or astringent plant juice is added to it, “coagulation” usually takes place more or less readily, the caoutchouc separating in solid flakes or curds. The efficacy of heat or of an acid, an alkali or other agent in promoting coagulation depends on the character of the latex, and varies with that obtained from different plants. The watery fluid in which the globules are suspended holds certain proteins, carbohydrates and a small proportion of salts in solution. The latex exhibits a neutral, acid or alkaline reaction depending upon the plant from which it has been obtained.

When exposed to air the latex gradually undergoes putrefactive changes accompanied by coagulation of the caoutchouc. The addition of a small quantity of ammonia or of formalin to some latices usually has the effect of preserving them for a considerable time. The nature of the coagulation is not yet completely understood. It has been compared with that of milk and of blood, which depend essentially on the coagulation or separation in curds of a proteid or albuminous substance, such as takes place when white of egg is warmed. There is, however, reason to believe that the coagulation of latex into rubber is not mainly of this character. The globules in the latex are liquid, and the phenomenon of coagulation would seem to consist in the passage of this liquid into solid caoutchouc through the kind of change known as polymerization or condensation, in which a liquid passes into solid without alteration.
RUBBER

of composition or by condensation with the elimination of the elements of water. The effect of chemical agents in producing coagulation are in consonance with what is known of other instances of polymeric or condensation changes, whilst the fact that the collection of globules separated by cream after thorough washing, and therefore removal of all proteid, is susceptible of solidification into a solid mass by various mechanical art such as churning, strongly supports the view that the character of the change is distinct from that of any alteration which may occur in the proteid constituents of the latex.

The existence of caoutchouc or rubber was first observed soon after the discovery of America. It was noticed that certain Indian tribes of South America played with a ball composed of a resilient and elastic substance, which afterwards was found to possess the power of removing lead pencil marks from paper and came into commerce as Indian Rubber. It was not until the middle of the 18th century that the trees which yielded caoutchouc were identified, chiefly by French observers. La Condamine ascertained the nature of the tree, now known as Hevea brasiliensis, from which the Para rubber of S. America was obtained, whilst a little later Fresnau and Aublet described the Ephoribaceous trees which furnished the rubber of Guiana.

The methods adopted by the natives in S. America and in Mexico for incising the trees and obtaining the rubber are exceedingly primitive, but survive with little modification at the present day.

Statistics of Rubber Production.—Until recently rubber was obtained almost exclusively from the tropical forests of S. and Central America, E. and W. Africa and Asia, being the produce of naturally occurring trees and vines. The increase in the demand, for which the employment of rubber tires is largely responsible, has given an increased stimulus to the production of “wild” rubber, with the result that trees and vines have been recklessly cut and destroyed, and in some instances vast regions, as in the S. Sudan, have been nearly entirely denuded of rubber vines. This has led to restrictive measures, the vines being tapped under definite regulations as to the manner and time of tapping, and also to requirements as to replanting vines to take the place of those which have been injured or destroyed, certain areas being periodically closed. Such measures, which are now in operation in the French Sudan, the Congo and in German W. and E. Africa, can, however, only be enforced by special administrative machinery and at considerable expense, and this legislative action can only be regarded as temporary and preliminary to the establishment of plantations of rubber trees, which are not only easier to control, but the trees are less liable to injury from careless tapping. In Africa it seems probable that the production of rubber from vines is likely to be entirely superseded in process of time, and replaced by the plantations of trees which are already being established in those districts in which careful experiment has determined the kind of rubber tree best adapted to the locality. The forests of tropical America have suffered similarly, trees having been injured or destroyed and in some cases cut down in order to secure the immediate increase of supply which was called for by a considerable rise in value. The result has been that in the forests of Brazil and Mexico the conservation of rubber trees has received greater attention, whilst new and extensive areas are planted in S. and Central America. The wild rubber of S. and Central America was, until the last, the rubber supply of the world, and is likely to continue to be so for many years to come. Although the cost of transport from the remote forest regions of some districts is a serious consideration, this is not likely to be operative in reducing production until there has been a considerable and permanent fall in price, by which time new areas in those countries in which planting is now taking place will probably have come into bearing.

The enormous increase in the commercial demand for rubber and the probability of the continuance of this increase in view of the great variety of purposes to which the material can be applied, has led to great activity in rubber planting in other parts of the world, especially in Ceylon and the Malay Peninsula and Archipelago, where the Para rubber trees (Hevea brasiliensis) has been successfully introduced, and numerous plantations, many of which have not been in existence for more than ten or fifteen years, are now being grown to meet the world’s supply. This rubber is known as “plantation” rubber in contradistinction to the “wild” rubber.

“Plantation” Para rubber from Ceylon and the Malay States has brought prices equal to and often exceeding those of fine Para rubber from Brazil. This is largely due to the improved methods of preparing the rubber practised by the planters of Ceylon and Malaya, which lead to the exclusion of the impurities usually found in “wild” rubber. Para rubber from Brazil generally contains about 15% of water, whilst “plantation” Para is usually nearly dry and contains 1% of water or less. It would appear, however, that the finest “wild” Para rubber as a rule possesses greater tensile strength than the “plantation” rubber. This has been ascribed by some to the presence in “wild” rubber of certain impurities derived either from the latex or introduced during the preparation of the rubber which are thought to enhance the physical properties of the caoutchouc. It is more probable, however, that the superiority of the “wild” Para is principally due to the greater age of the forest trees from which the rubber is obtained, many of which are from thirty to fifty years old. It is well known that the Hevea tree usually furnishes very inferior rubber if tapped before it is six or seven years old, and there is evidence to show that the quality of the rubber improves with the age of the tree. The oldest of the plantation trees of Ceylon and Malaya are not much more than twelve years old, whilst it is to be feared that immature trees are often tapped and their latex mixed with that of older trees before coagulation, thus forming inferior rubber. It is therefore to be expected that as time goes on the quality of “plantation” rubber will improve, and there would seem to be no reason why it should not eventually be fully equal to that of the “wild” rubber.

In 1909 the total production of rubber is stated to have been about 70,000 tons, of which more than one-half came from tropical America, about one-third from Africa, whilst the remainder was chiefly of Asiatic origin, including “plantation” rubber from Ceylon and Malaya, which amounted to about 3000 tons.

Chieflly owing to the supplies of “wild” rubber which are still available, comparatively little has been done until recently in establishing plantations either in Africa or in tropical America, but in Asia, including Ceylon, India and Malaya, in which there are relatively few important naturally-occurring rubber plants, there has been for some years great activity in forming plantations of rubber trees introduced mainly from tropical America, and there are now many millions of dollars’ worth of capital invested in companies established to form rubber plantations chiefly in Ceylon and Malaya. Each year should therefore show an increase in the production of plantation rubber. No trustworthy estimate of the rate of the increase of production can, however, be formed, as several uncertain economic factors have to be taken into account. Among these are the precise extent of demand, the limit of the inevitable fall in price with largely increased production, the cost of labour as increasing amounts are required, and the effect of changed conditions on the output of “wild” rubber and the coming batch of the new plantations which are being established in tropical America.

There can be little doubt that with a fall in price further uses for rubber would arise, leading to an increased demand, and among them may be mentioned its utilization as a road material. Difficulties in the supply of labour in the East may hinder the further development of the rubber-planting industry, especially at a period when a reduction in the cost of production may be the chief problem. In 1900 the average cost of producing “plantation” rubber in Ceylon and Malaya...

(Spiral and V Systems.)

From Photographs in the Collections of the Imperial Institute.
may be stated approximately to have been from 10d. to 1s. per lb. The cost of collecting "wild" rubber is less easy to state with any approach to accuracy, since the cost varies in different districts of S. and Central America, but the average cost is stated not to be less than 1s. per lb. In Africa the cost of collection is much less, but the rubber is generally of inferior quality.

The market price of commercial rubber is determined by the current price of "fine Para" from S. America. This is subject to considerable fluctuation, and varied in 1900 to 1908 from 2s. 10d. to 5s. 9d. a lb. As much as 6s. 9d. per lb was given for specie in Brazil. In 1904 the latter price of fine Para reached a high level, and has considerably declined, reaching in 1907–8 a lower figure than had been recorded since 1900. At the beginning of 1908 the price gradually rose again to the neighbourhood of 4s. a lb. During 1909, without any serious decline in production, the price rapidly rose, owing to extraordinary causes, to about 10s. a lb, and in the early part of 1910 rose to over 12s. a lb, and subsequently fell to about half this price. Having regard to the present cost of producing "plantation" rubber, and to the probability that, apart from a possible increase in the price of labour, this cost is susceptible of further reduction, it may be concluded that rubber production in the long run will continue to be profitable even should a considerable fall in market value take place.

The Principal Rubber Trees, their Cultivation, and the Preparation of Rubber.—Most commercial rubber is derived from natural supplies, from the wild rubber trees of S. and Central America, India and Africa. Each year, however, the output of "plantation" rubber will show a considerable increase, and it is to be expected that ultimately this will form the chief source of supply, unless unforeseen circumstances should arise to interfere with the development of the plantation industry, which has been vigorously started chiefly with European capital in the tropical possessions of the British Empire, India, China, France and Germany. The best rubber is now obtained from large trees, of which the following are the most important:

1. "Para" rubber, which takes the first position in the market, is derived from species of Hevea, principally Hevea brasilienensis, of which there are enormous forests in the valleys of the Amazon and its tributaries, and also in Peru, Bolivia, Venezuela and Guiana. In Brazil alone it is stated that the rubber area amounts to at least one and a half million acres. The Para trees have been largely planted in S. America, and have met with considerable success especially in Ceylon and Malaya (Plate I. figs. 11 and 12).

2. "Ceara" or Manioba rubber is derived from species of Manihot, mainly Manihot glaziovii of S. America, and is unusually abundant in Brazil, and successfully introduced into other countries (Plate II. fig. 13). The latex of this tree flows less freely than that of Hevea brasilienensis, and the collection of large quantities of the latex is attended with considerable difficulty. The latex is therefore usually allowed to coagulate on the tree, as it slowly exudes from the incision. On this account it is often exported in strings or "scrap" and not usually in biscuits or balls. Party for this reason and partly because pieces of wood and dirt are apt to be included with the scrap, the market value of Ceara rubber is usually less than that of Para. The plantations of Manihot established in E. Africa, Ceylon and S. India have, however, begun to furnish a better quality of Ceara rubber, which is often prepared in biscuit form.

3. The "Ule" rubber of Central America and British Honduras originates from Castilla elastica. In S. America its natural occurrence appears to be limited to west of the Andes, but the tree is abundant in Mexico, Guatemala and Nicaragua. The rubber comes into commerce in thick strips or sheets as "scrap." The rubber is usually dark in colour and is often contaminated with proteid impurities derived from the Ule tree. Ule rubber is generally inferior in strength to Para and commands a lower price. The Castilla tree has been experimentally planted in Ceylon, the West Indies and other countries (Plate II. fig. 14).

4. Rambog or Assam rubber is the produce of Ficus elastica, commonly known as the indorrubber tree and cultivated in Europe as an ornamental plant. This tree, indigenous to Asia, attains large dimensions in India, Ceylon and the Malay Archipelago (Plate II. fig. 15). It furnishes most of the rubber of India, Sumatra and Java. Although intrinsically of excellent quality, Rambog rubber, owing to the careless method of collection practised by the natives who, to the detriment of the plant, try to detach the rubber in clusters by beating, is obtained from incisions in the bark of the tree. The rubber is of good quality, though, owing to the method of preparation adopted, the product is often of inferior quality, and consequently usually brings a lower price than the best rubber of other countries.

5. Lagos rubber is the produce of the African rubber tree Funtumia elastica, which is indigenous to Africa from W. Africa to the Ethiopian coast. It is known as the silk rubber tree, probably on account of the silky nature of the latex attached to the seeds. The latex, which is usually coagulated by standing or by heating, is obtained from incisions in the bark of the tree. The rubber is of good quality, though, owing to the method of preparation adopted, the product is often of inferior quality, and consequently usually brings a lower price than the best rubber of other countries.

6. Besides the trees described above, a number of climbing plants or vines belonging to the Apocynaceae secrete a latex which furnishes rubber of good quality. These trees are less satisfactory than trees as rubber producers, owing to the readiness with which they are injured and destroyed by careless tapping, and to the difficulty of regulating these methods in the case of vines distributed over enormous areas of forest. Of these vines the most important are the species of Landolphia which occur throughout tropical Africa, including the Sudan, Congo, Mozambique and Madagascar, the principal of which are Landolphia aurantiaca and L. Humedotia, commonly found throughout S. Africa and between the Orinoco and the Amazon in W. E. Africa. The rubber is obtained by incising the vines and coagulating the latex by exposure, by admixture with active volatile jucntes or by heating. Landolphia rubber is usually roughly prepared and in consequence contains considerable impurities. The vines of species of Cithandra and Carpodium in W. Africa also furnish good rubber, as do the Porteranum gracilis of British Guiana and Parkinsonia flexuosa of S. America. The vines resembling Landolphia are widely distributed in Asia. Among the species of Willughbiea and Leucoonitis, from which much of the rubber exported from Borneo is derived; Parameria glandulifera, common in Java and Borneo, and Ureca escentunc and Cryptostegia grandiflora, both common in Burma.

Among other sources from which rubber is commercially obtained may be mentioned the Guayule plant (Parthenium argentatum) of Mexico, and the "Eccanda" plant cultivated in Ceylon from the tuberosous roots of which rubber is extracted by the natives. The "Eccanda" plant has been named Rapheinomea utilis. The root rubber prepared by the natives of the Congo and the S. Sudan is extracted partly from the roots of Landolphia or from the rhizomes of Landolphia Thollonii or Carpodium lanceolatum. It is obtained by breaking up the roots or rhizomes in hot water and separating the rubber, and machines have now been devised for this purpose.

Little is at present known of the large rubber tree of Tonkin (Blackrudes rotkinensis), the latex of which is stated to furnish excellent rubber.

Sources of Commercial Rubber

1. Para rubber is so named from the Para province of Brazil, from the principal town of which, also known as Para, most of the rubber is shipped. This rubber is obtained chiefly from Hevea brasiliensis, Müll. Arg., a large eufoliate tree upwards of 60 ft. in height, and having a trunk bearing bark, which is being lanceolate and tapering at both ends (fig. 1). The trunk reaches about 8 ft. in circumference. The flowers are usually pale green. The fruit is a capsule containing three seeds, which are rather larger than cobs, having a brown smooth surface figured with black patches. The seeds readily lose their vitality, and on this account need special care in transport. They should be loosely packed in gunny or charcoal. These seeds have been examined at the Imperial Institute, and the kernels have been found to contain nearly half their weight (48%) of an oil resembling linseed oil and applicable for the same purposes. The residue or cake, after expression, is a good fuel, and may prove to be of value for feeding animals. There is present in the seeds an enzyme which readily decomposes the oil if the seeds are crushed and kept, setting free a fatty acid and glycerin. As the seeds are very abundant, they will probably be utilized commercially as soon as the demand for planting has subsided.

In Brazil the trees are found in different districts, but flourish best on rich alluvial clay slopes by the side of rivers, where there is a constant supply of water. The rubber reaches from 80°9' to 94°4' F. at noon and is never cooler than 73° F. at night, while rain falls during about six months and the soil and atmosphere are moist throughout the year. The trees are generally cultivated in the tree named Pao de Xerriga by the Portuguese, from the use by the Omaqua Indians of squirts or syringes made from a piece of pipe inserted in a hollow flax-shaped ball of rubber. The succulent stalk is four to six years old, as young trees yield inferior rubber. If carefully conducted, tapping does not injure the tree. The latex is collected in the so-called dry season between June and February. The trees are tapped in the early morning when the latex is most readily obtained.
To obtain the latex, deep incisions are made near the base of the tree extending up the trunk. Small shallow cups are placed below the incisions to receive the milk, each cup being attached by sticking a piece of soft clay to the tree and pressing the cup against it. The latex, of which each tree yields only about 6 oz. in three days, has a strong ammoniacal odour, which rapidly disappears, and in consequence of the loss of ammonia the latex will not keep for longer than a day unchanged; hence when it has to be carried to a distance from the place of collection, a 3% of ammonia solution is added. The latex usually furnished about 30% of rubber.

To obtain the rubber, the latex is usually treated in the following manner. A piece of wood about 3 ft. long, with a flattened end, forming a kind of paddle, is dipped in the milk, or this is poured over it as evenly as possible. The milk is then carefully dried by turning the mould round and round in the smoke produced by burning wood mixed with certain oily palm nuts; those of *Attalea excelsa* are considered best, the smoke being confined within certain limits by the narrowness of the neck of the pot in which the nuts are heaped. The creosote and other products from the smoke no doubt act antiseptically and prevent to a large extent the subsequent putrefaction of the proteids retained by the coagulated rubber. Each layer of rubber is allowed to become firm before forming another; a practised hand can make 5 or 6 lb. in an hour. In some districts a stout stick is substituted for the paddle, on which the rubber as it coagulates is wound cylindrically. The rubber thus prepared is the finest that can be obtained. The cakes when completed are, in order to remove them from the mould, slit open with a sharp knife, which is kept wet, and are hung up to dry. The flat rounded cakes of rubber made in this manner are known in the London market as "biscuits." They retain about 15% of moisture.

The scrapings from the tree, which contain fragments of wood, are mixed with the residues of the collecting pots and the refuse of the vessels employed, and are made up into large rounded balls, which form the inferior commercial quality called "negrohead," and often contain 25-35% of impurity. The yield of rubber varies, but it is stated on an average to be 10 lb. of rubber per tree, and if carefully tapped one tree will yield this amount for many years in succession.

**Plantations of Hevea brasiliensis.**—Hevea brasiliensis was introduced to Ceylon and Singapore from seedlings raised at Kew from Brazilian seed, specially collected by Mr. H. A. Wickham in S. America. The seedlings rapidly developed and in most places in which they were planted grew into large trees which furnished satisfactory latex when tapped in their sixth or seventh year. Ever since plantations of Hevea have been made on an increasing scale in the Straits Settlements, the Federated Malay States and in Ceylon, and at the present time rubber plantations form the principal industry in these colonies. Successful plantations of Hevea have also been established in Java, Sumatra and Borneo. Many of these plantations have not yet reached the productive stage—that is, the sixth or seventh year. A large number of plantations in British Malaya and Ceylon are now actively exporting increasing quantities of rubber. Hevea seedlings were also introduced into India, but did not apparently succeed except in Burma and S. India.

It may be estimated that between one and two million acres of land in the different countries referred to have been already appropriated for rubber plantations. Plantations are also being formed in British, French and German possessions in W. Africa and in the Congo, also in the tropical portions of Australia. In certain districts of British W. Africa the Hevea, which has been planted promises well, especially in the Gold Coast, where good yields of latex are stated to have been obtained.

It may be useful to summarize here the experience which has been gained in the formation of plantations of Hevea and in the production of rubber.

*Hevea brasiliensis* as a rule flourishes to the greatest extent at low altitudes on rich soil capable of retaining moisture. The nature of the soil is of secondary importance, provided that it is able to hold moisture and that climatic conditions of high and even temperature with considerable rainfall and absence of wind are satisfied. Although the tree is sensitive to such conditions, it appears to possess a certain capacity of adaptation which should be borne in mind. Generally a low altitude is desirable, but good results have been obtained in Ceylon in sheltered positions at elevations of 3000 ft. and over, although at higher altitudes the growth of these trees appears to be slower. In many plantations besides catch crops (cassava, sesame, ground-nuts, &c.) other crops, such as tea, coffee, cocoa and tobacco, are grown with rubber. It is improbable, except in the early stages of the rubber tree, that this procedure will succeed; the rubber will ultimately dominate the position to the detriment and ultimate extinction of the other crop, whilst the growth of the rubber tree will be retarded. A partial exception may perhaps be made in the case of cocoa, when the two plants are placed not too closely in about equal numbers. In these circumstances it appears that satisfactory results may be obtained from both crops, at any rate for a certain number of years.

The experience of planters in general is in favour of the complete removal of weeds from a rubber plantation. This practice, which involves considerable expenditure, adds considerably to the cost of maintaining plantations, and, although justified so far by results, possesses several other disadvantages. During the tropical rains the soil is liable, to a greater or less extent, to denudation, which becomes very serious when the land slopes; and in any case, the soil is apt to become impoverished by the loss of its soluble constituents. These disadvantages are at their maximum when the rubber trees are quite young. At a later stage the shade of the large trees compensates to a considerable extent for the absence of cover on the ground. Another disadvantage of uncovered soil in a plantation of young rubber trees is that the ground under the heat of a tropical sun becomes quite barren. For this reason proposals have been made to plant in the place of weeds low-growing leguminous plants, the growth of which will not only prevent impoverishment and loss of soil during the rains and conserve moisture in the heat, but will also have the effect of enriching the soil in nitrogenous compounds. Through the power leguminous plants possess of absorbing nitrogen from the air through nodules on their roots. Among the plants which are being tried for this purpose are various species of Crotolaria, leguminosae, and the weedy grass, *Panicum maximum*. The success of the method cannot yet be judged, but the experiment is one which deserves very full trial.

One of the most important subjects in connexion with rubber plantations is the method to be adopted in tapping the trees for latex. The native method, which has long been in vogue in Brazil and Mexico are primitive and often injurious to the tree. At present it cannot be said that fineness has been reached on the subject of the best method, giving a good return of latex with a minimum of damage to the trunk. A method that has been at one time largely adopted was to make a series of V-shaped incisions on four sides of the tree to a height of about 6 ft. from the base, the latex obtained from the upper part of the tree is said to furnish less rubber. A method of tapping the tree is shown in Fig. 2. The latex is collected in cups placed at the apex of each V. Other systems are the herring-bone plan of a vertical channel.
with lateral connecting channels about 1 ft. apart at an angle of about 45°, the latex being collected in cups placed at the base of the vertical channels (fig. 2); the spiral system, in which a series of channels are cut all the way through the trunk, makes it possible virtually the entire area of the trunk is tapped. In some instances a combination of these methods is employed. The V-system is the oldest, but is largely superseded by the herring-bone; the spiral system is the largest but in long narrow trunks it is probably that the manufacturer will be able to dispense with washing. This will operate to the advantage of plantation rubber and against the wild rubber, so long as the latter is not exported in a purer condition.

So far the Hevea belongs to the rubber trees of the tropical belt and the East have not been seriously troubled by insect or fungoid pests, and which have occurred have succumbed to proper treatment. The most destructive is a white thread-like fungus (Fomes semistatus) which attacks the roots of the Hevea tree and eventually kills it. The development of this fungus is greatly promoted by the presence of decaying stumps and logs in the plantation. Therefore, in many plantations to remove all old wood and to extract stumps of old trees, which in the first instance it was considered unnecessary to remove.

3. The source of "Ule" rubber exported from Central America, and of the "Caño" rubber of Peru is Castilla elastica, Cerv., in the family Urticaceae, with a trunk 3 ft. or more in diameter, and large hairy oblong lanceolate leaves often 18 in. long and 7 in. wide (fig. 4). The tree grows most abundantly in a sporadic manner

both the wild rubber containing variable quantities of impurity and the purer plantation rubber, the latter, however, in much smaller amount. The fact that at present washing machinery exists in a European factory that most of the rubber received needs washing, leads to the greater purity of plantation rubber, except for special purposes, being generally discounted by the manufacturer. As soon as the output of plantation rubber of constant composition has been secured from different estates for several years the greater the latitude and larger the dimensions it is probable that the manufacturer will be able to dispense with washing. This will operate to the advantage of plantation rubber and against the wild rubber, so long as the latter is not exported in a purer condition.

For the Manihot Glasiovi belonging to the Euphorbiaceae is the tree of N.E. Brazil which furnishes Ceara or Manioba rubber (fig. 3). It is closely related to the Manioc, cassava, and tapioca plant (Manihot utilissima) which it resembles when young and which also exhibits a tuberous root system. The tree grows well on dry and rocky soil without any fertilizer, and it stands the loss of its lateral branches. The growth is considerable period of the year, and flourishes at high altitudes up to about 1300 ft. for 4000 ft. therefore adapted for conditions which are unsuitable for Hevea. The tree grows about 30 ft. high, with a rounded head of foliage, and grey-green leaves with 7-lobed palmate leaves, somewhat resembling the leaves of the castor-oil plant in shape and size. The seeds (fig. 3), which are abundant and retain their vitality well, have a thin, dark brown coat. The seeds take a year to germinate, unless the edges near the end bearing the caruncular projecting are rasped off. Cuttings, if they have a single bud, root readily. The trees are tapped when they are about five years old. The mode of collecting the rubber is as follows. After brushing away the leaves, the tree is cut off from the root of the tree by means of a hand tool, the hussar knives, the parasol knives, or a small quantity of an anesthetic such as cresote is added during coagulation. The plantations rubber comes into commerce in the form of the crinkled rubber known as crepe, or in sheets or biscuits, and sometimes in large blocks made by compressing the crepe rubber. Block rubber is considered to possess certain advantages in securing a constant product, and is generally employed in being used at the factory. The best condition and form in which to export rubber cannot be regarded as settled. The probabilities are that in the end the production of a rubber as nearly as possible free from water and impurities and of constant quality will be recognized, as well as meeting the requirements of the modern manufacturer. The need for scrupulous cleanliness in the preparation of rubber is now recognized, and the arrangements of a rubber factory in Ceylon or Malaya are comparable with those in the best European factories.

In the present stage of rubber production it is necessary, for the manufacturer in Europe to wash all rubber. He receives...
in the dense moist forests of the basin of the Rio San Juan, where the rain falls for nine months in the year. It prefers rich fertile soil on the banks of watercourses, but does not flourish in swamps. It is found also in Costa Rica, Guatemala, Honduras, Mexico, Cuba and Hayti, and in Panama with another species of Castilla, and on the W. coast of S. America down to the slopes of Chimborazo; the Cordilleras of the Andes separating the Castilleias from the Hevea of Brazil.

In Nicaragua the latex is collected in April, when the old leaves begin to fall and the new ones are appearing, during which time the latex is at its greatest.
The tree is tapped either in the same manner as the Hevea, or by encircling the tree with a simple spiral cut at or near the ground and then tapping the parallel spirals if the tree be large. At the bottom of the spiral an iron spout about 4 ft. long is driven into the tree, and the milk is received in iron pans. A tree 20 to 30 ft. high to its first branches, and about 4 ft. in diameter, is expected to yield annually about 20 gallons of milk, each gallon giving about 2 lb. of rubber. In the evening the milk is strained through a wire sieve and transferred to barrels, to be kept in a cool place until ready for use.

In British Honduras an alkaline decoction prepared from the Moon plant (Calonictyon spectosum) is used for the same purpose. If these plants are not obtainable, water is added to one of the milk, and the mixture allowed to stand for twelve hours. The coagulum is then flatted out by a wooden roller to get rid of the cavities containing watery liquid, and the sheets are then hung up for 45 days or longer, when they weigh about 2 lb., the sheets being usually ½ to 1 in. thick and 20 in. in diameter. When coagulated in water, the mass is placed in vats in the ground and allowed to stand in a forest and in a crock. It is then rolled into balls. That which dries on the incisions in the tree is called "bola" or "burucha," and is said to be highly prized in New York. The loss of Nicaraguan rubber by drainage is estimated at 15%. It is exported at about 15%.

Rubber is chiefly composed of the soft, solid, elastic substance known as caoutchouc. It is usually assumed that this substance is present as such in the latex. The globules in the latex, however, consist more probably of a distinct liquid substance which readily changes into the solid caoutchouc. The coagulation of the latex consists in the formation of a gelatinous mass, due to the presence of the proteins therein, and this alteration in the protein leads to the solidification of the globules into caoutchouc. The latter, however, is probably a distinct effect. Under certain conditions, as when latex is allowed to stand in the open air, it is coagulated, a cream is obtained consisting of the liquid globules, which may be washed free from protoplasm without change, but, either by mechanical agitation or by the addition of acid or other chemical agent, the liquid gradually solidifies to a mass of solid caoutchouc.

The phenomenon therefore resembles the change known to the chemist as polymerization, by which through molecular aggregation a liquid may pass into a solid without change in its empirical composition. The effect may be produced chemically by a number of agents known as condensation, and be accompanied by the elimination of the elements of water. So far the chemical nature of the liquid globules of the latex is unknown, and the exact character of the change which converts this liquid into solid caoutchouc remains to be determined.

The watery liquid known as rubber milk or latex is an emulsion consisting chiefly of a weak watery solution of proteids, carbohydrates and salts holding the liquid globules in suspension. In connexion with the production of the latex, the most important factor is the proportion of caoutchouc it contains. In a good rubber this ranges from 70-90% and over. The proportion and nature of the proteids or the other materials considerably influence the nature of the rubber. The proteids should be as far as possible removed during the preparation of the rubber, as these substances are chiefly responsible for the objectionable smell and colour of "native rubbers", and chemical treatment leads to substantial improvement in the composition of the rubber. All crude rubber contains more or less proteid, and in the opinion of some technical experts its presence even affords strength to the material, but this cannot be accepted as proved. The dissolved salts (potassium, sodium, ammonium, calcium, magnesium, &c.) of the latex are generally entirely absent from the well-prepared rubber. Of considerable importance to the value of the rubber is the absence of the resins and other constituents which are present in greater or smaller proportion in all latices. The presence of more than a small percentage of resin in the latex leads to the production of rubber containing much resin, which seriously depreciates its commercial value for many purposes. The resin in a good rubber should be as small as possible, and should in any case be less than 10%. There is no feasible method at present known of preventing the inclusion of the resin of the latex with the rubber during coagulation, and although the separation of the resin from the solid caoutchouc by means of solvents is possible, it is not practicable or profitable commercially. A complete examination of a series of different latices has shown that, in many cases, e.g. Hevea and Castilla, the resin present in the latex derived from young trees, and diminishes in amount as the tree ages. This is one reason why young trees should not be tapped. The composition of latex and of typical rubbers is given below:

The chemical analysis of crude rubber is an important guide to its value. At present, however, the methods of analysis usually employed are not sufficiently delicate to afford all the necessary information as to the intrinsic value of the higher grades of rubber, although the present methods give much useful information. The tests of the physical properties of rubber usually applied to determine its value in the market are also very rough and cannot be relied upon. The development of the rubber industry has led to the search for new methods of testing. The tests of the chemical properties of rubber are required. At present the caoutchouc which is used for scientific purposes is obtained by a process of extraction in which the chemical properties of the caoutchouc may be determined.

The chemical composition of crude rubber is important for the determination of the nature of the rubber and its commercial value. The principal constituent of all rubbers, is a relatively simple compound of the same substance, from whatever botanical source it may have been derived. This is an elastic solid, almost transparent in thin sheets, composed entirely of carbon and hydrogen. The empirical composition of which is represented by
The formula \( \text{C}_6\text{H}_6 \). It thus possesses the same composition as the hydrocarbon of gutta-percha and as that of oil of turpentine and other terpenes which are the chief components of essential oils. The properties of caoutchouc closely resemble those of these oils, but it is considerably more complex than is represented by the empirical formula, and that it is to be regarded as the polymer of a terpene or similar hydrocarbon and composed of a chain of 

\[ \text{C}_6\text{H}_6 \] units, is not entirely correct, however, that its actual structure is not known.

When solid caoutchouc is strongly heated, it breaks down, without change in its ultimate composition, into a number of simpler liquid hydrocarbons of the terpene class (dipentene, di-isoprene, isoprene, etc.) and one, isoprene (\( \text{C}_6\text{H}_8\)), is of simpler structure. When treated with caustic alkali, it is decomposed into rubber (\( \text{C}_6\text{H}_4\)), from which it can also be obtained by the action of an intense heat.

It was this liquid hydrocarbon (isoprene) which is now allowed to stand for some time in a closed bottle, gradually passes into a solution having the principal properties of natural caoutchouc. The same change of isoprene into caoutchouc may also be induced by the action of certain chemical agents. It may therefore be said of caoutchouc that it has been already artificially or synthetically prepared, and the possibility of producing synthetic rubber cheaply on a commercial scale depends on the only problem. At present the change of isoprene into caoutchouc is mainly of interest in indicating possibilities with regard to the conversion of the liquid globules of the latex rubber to and from the formation of rubber by plants. The exact chemical nature of caoutchouc is, however, not yet determined, and recent researches point to the fact that its molecular structure may even be somewhat different from that of the terpenes.

The exact manner in which isoprene passes into caoutchouc is also not understood. These problems are, however, certain to be solved in the near future, and then probably caoutchouc may be formed in other ways than from isoprene.

The question of whether synthetic rubber will ever be produced cheaply on a commercial scale is therefore the important one for those who are largely interested in the rubber-planting industry. No definite answer can be given to this question at the present time. Its settlement will depend in part on the cost of producing rubber from plants, which from their point of view it is the interests of planters to reduce as far as possible. There are many substances produced which can be broken down into useful technical means, but, as with quinine, the process involved is too costly to enable the synthetic product to compete with the natural product.

The chief properties of caoutchouc and its employment for technical purposes will be described. Caoutchouc is not dissolved by water or alcohol, and is not affected except by the strongest acids. Alkalies have little effect on it under ordinary circumstances, although prolonged contact with ammonia results in a partial change. The best solvents for rubber are carbon bisulphide, benzol and mineral naphtha, carbon tetrachloride and chloroform. These liquids, either alone or mixed, are used in making the various solutions and liquids for technical purposes. Vegetable and other oils rapidly penetrate caoutchouc and lead to deterioration of its properties. Sulphur when warmed with caoutchouc combines with it, and on this fact the vulcanization of rubber is based also the power of sulphur, of the hard black material known as vulcanite or ebonite.

Caoutchouc is a soft elastic resilient solid. In this respect it differs from gutta-percha, which, like caoutchouc, is derived from the plants of the terpene series, but of a chemical value which is chiefly depends on the extent to which it is capable of being stretched without breaking, and the extent to which it at once returns to its original dimensions. Caoutchouc is a bad conductor of heat and electricity, and alone or mixed with other materials is employed as an electrical insulator.

When caoutchouc is heated slightly above the temperature of boiling water it becomes softer and loses much of its elastic strength, which, however, it recovers on cooling. At about 150° to 200° C. caoutchouc melts, forming a viscous liquid which does not solidify on cooling. This viscous liquid is present in small proportion in some of the rubber oils owing to the decarboxylation of terpenes in their chemical structure. Caoutchouc is hard and brittle, being converted by heating gutta-percha which closely resembles caoutchouc in its chemical structure.

It is known that it absorbs oxygen when exposed to air and light, and the absorption of oxygen accompanying a gradual change in the characteristic properties of rubber, and ultimately to the production of a hard, inelastic, brittle substance containing oxygen, is of great importance. Caoutchouc, when passed into a solution of rubber in chloroform the caoutchouc combines with a molecule of ozone forming a compound of the empirical composition \( \text{C}_6\text{H}_6\text{O}_3 \). When this compound is acted on by water, hydrogen peroxide and levulinic aldehyde are formed, the aldehyde being subsequently oxidized by the hydrogen peroxide, forming levulinic acid. The hydrocarbon of gutta-percha yields similar compounds, and is therefore closely related to rubber.

When the action of ozone on caoutchouc has thrown new light on the complex question of the chemical structure of this substance, and discloses relationships with the sugars and other carbohydrates from which levulinic acid is obtained by oxidation.

Caoutchouc, like other "unsaturated" molecules, forms compounds with chlorine, bromine, iodine and sulphur.

**Commercial Treatment of Rubber.**

In the industrial working of indiarubber, the various impurities present in the crude "wild" rubber (bark, dirt, and the principal impurities) are removed by the下列 process: The lumps of crude caoutchouc are first softened by the prolonged action of hot water, and then cut into slices by means of a sharp knife—generally by hand, as thus any loose stones or other foreign substances can be removed. The softened slices are now repeatedly passed between grooved rollers, known as washing rollers (fig. 8), a supply of hot or cold water being made to flow over them. Solid impurities speedily become crushed, and are carried away by the water, while the rubber takes the form of an irregular sheet perforated by numerous small circular holes. This perforated sheet is then washed with warm water, and the washed product contains in its pores a notable proportion of water, which is removed by hanging the rubber for some days in a warm room. It is now ready either for incorporation with sulphur and other materials, or for agglomeration into solid masses by means of a masticating machine—an apparatus which consists of a strong cylindrical cast-iron casing, inside which there revolves a metal cylinder with a fluted or corrugated surface. Some of the rubber having been placed in the annular space between the inner cylinder and the outer casing, the former is made to revolve; and the continued kneading action to which the rubber is subjected works it into a solid mass, something like a gigantic sausage. Before commencing the mastication it is generally necessary to warm the apparatus by means of steam; but as the operation proceeds the heat produced requires to be moderated by streams of cold water flowing through the casing. The inner cylinder is generally placed somewhat eccentrically in the outer casing, in order to render the kneading more perfect than would otherwise be the case.

After masticated rubber into rectangular blocks, it is first softened by heat, and then forced into iron boxes or moulds. The blocks are cut into thin sheets by means of a sharp knife, which is caused to move to and fro about two thousand times per minute, the knife being kept moistened with water, and the block fed up to it by mechanical means. Cut sheets are largely used for the fabrication of certain classes of rubber goods—these being made by cementing the sheets together with a solution of rubber in naphtha or benzol. Most articles made of such rubber would, however, be of very limited utility were they not hardened or vulcanized by the action of sulphur or some compound of that element. After vulcanization, rubber is no longer softened by a moderate heat, a temperature of 160° C, scarcely affecting it, nor is it rendered rigid by cold, and the ordinary solvents fail to dissolve it. It must, however, be distinctly understood that it is not the mere enlargement but the actual condensation of the rubber molecules that causes vulcanization. If an article made of cut sheet be immersed for a few minutes in a bath of melted sulphur, maintained at a temperature of 120° C, the rubber absorbs about one-tenth of its weight of sulphur. This solid intumescent rubber, which is therefore black in colour from the presence of free sulphur, is still unvulcanized, and unaltered as regards general properties. If, however, it be now subjected for an hour or two to a temperature of about 145° C the compact rubber absorbs and vulcanizes caoutchouc in the result. When a manufactured article has been saturated with sulphur in the melted sulphur bath, the heat necessary for vulcanization may be obtained either by high-pressure steam, by the injection of air, or by the placing of the sulphur bath heated to about 140° C. In this last case absorption of the sulphur and its intimate combination with the rubber occur simultaneously. Cut sheets, or articles made from them, may be...
saturated by being laid in powdered sulphur maintained for some hours at about 110° C. Sheets sulphurized in this way can be made up into articles and joined together either by the use of rubber cement, which is water-proof, or by means of indiarubber solution; after which the true vulcanization, or "curing," as it is termed, can be brought about in the usual way.

Another method of vulcanizing articles made from cut sheet rubber consists in exposing them to the action of chloride of sulphur. Either they are placed in a leaden cupboard into which the vapoúr is introduced, or they are dipped for a few seconds in a mixture of one part of chloride of sulphur and forty parts of carbon disulphide or purified light petroleum. Vulcanization takes place in this instance without the action of heat; but it is usual to subject the goods for a short time to a temperature of 40° C. after their removal from the solution, in order to drive off the liquid which has been absorbed, and to ensure a sufficient action of the chloride of sulphur. Treatment with a warm alkaline solution is afterwards advisable, in order to remove traces of hydrochloric acid generated during the process.

Another very excellent method of vulcanizing cut sheet goods consists in placing them in a solution of the polysulphides of calcium at a temperature of 140° C. Rubber employed for the manufacture of cut sheets is often coloured by such pigments as vermilion, oxide of chromium, ultramarine, orpiment, antimony, lamp black, or oxide of zinc, incorporation being effected either by means of the masticator or by a pair of rollers internally by steam, and so geared as to move in contrary directions at unequal speed (fig. 9). Most of the rubber now manufactured is not combined with sulphur when in the form of sheets, but is mechanically incorporated with about one-tenth of its weight of that substance by means of the mixing rollers—any required pigment or other matter, such as whiting or barium sulphate, being added. The mixed rubber thus obtained is readily softened by heat, and can be very easily worked into any desired form or rolled into sheets by an apparatus known as the calendaring machine. Vulcanization is then ensured by exposure for half an hour or more to a temperature of 135°-150° C., usually in closed iron vessels into which high-pressure steam is admitted (fig. 10). Tubes are generally made up around mandrels, and allowed to pass throughout the curing to remain imbedded in pulverized French chalk, which affords a useful support for many articles that tend to lose their shape during the process. Of late years a considerable amount of seamless tubing has been made, much in the same way as lead piping, by forcing the mixed rubber through the calendaring machine and curing as above. The calendared sheets are generally cured under full of their own weight, cloth, the markings of which they retain; and hollow articles, such as playing balls or injection bottles, are vulcanized in iron or brass moulds, tinned inside and very slightly greased. Before it is put in, the article is roughly put together, and the expansion of the included air forces the rubber into contact with the internal surface of the mould, or a little carbonate of ammonia is enclosed. Belting intended for driving machinery is built up of canvas which has been thoroughly fricitioned with the soft mixed rubber, and is cured by placing it in a kind of press kept by means of steam at a heat of about 140° C. Packing for the stuffing boxes of steam engines is similarly prepared from strips of rubber and frictioned canvas, as also are the so-called insertion sheets, in which layers of rubber alternate with canvas or even wire in order to prevent overflow, and now employed, in some cases, as hand stamps, and attempts have been made to introduce them for press and machine printing. A plaster cast of the type is, when dry, placed on the canvas, with shells of cardboard and wood, and vulcanized in the usual way with about 10% of sulphur now softened by heat, forced into the mould, and retained there by pressure during the operation of curing, which is usually effected in an iron box heated over steam to 140° C.

The ordinary macintosh or waterproof cloth is prepared by spreading on the textile fabric layer after layer of indiarubber paste or solution made with benzol or coal-naphtha. If cotton or linen is desired, a mixtue of indiarubber and of indiarubber paste is applied, and this is finished with a vulcanizing method by steam heat; but, when silk or wool is employed, no sulphur is added to the paste, the dried coating of rubber being merely brought into momentary contact with the mixture made of indiarubber, and no effect is produced.

Double texture goods are made by uniting the rubber surfaces of two pieces of the coated material. Air goods, such as cushions, beds, gas bags, and so forth, are made of textile fabric which has been coated with mixed rubber either by the spreading process above described, or by means of heated rollers, the curing being then effected by steam heat. The manufacture of overshoes and fishing boats is an analogous process, only the canvas base is more thickly coated with a highly pigmented rubber of low quality. The articles are first fashioned by joining the soft material; they are then varnished, and afterwards cured in ovens heated to about 135° C.

The fine oil by spreading of indiarubber solution, already charged with the requisite proportion of sulphur, on a textile base previously prepared with a mixture of paste, glue and tallow, is then heated by steam heat, and, the preparation on the cloth being scarcely dry, the sheet is readily removed. The required thickness of the spread sheet is very often secured by the rubber-faced shoe, which two cloths are united by the process described being used in making elastic webbing are usually cut from spread sheets. The manufacture of springs, valves and washers does not require any very special notice, these articles being generally fashioned out of indiarubber in the rubber mill, and vulcanized afterwards by steam heat, for the vulcanizing temperature,—such as carbonate of ammonia, crystalized alun, and liny ground damp sawdust. Uncombined sulphur is generally used, and often leads to the decay of vulcanite. In other cases the injurious effects of free sulphur are obviated by using instead of it a metallic sulphide,—generally the orange sulphide of antimony; but, for the best results, it is necessary that this should contain from 20 to 30% of uncombined sulphur.

It will thus be seen that for nearly all practical purposes, including tires, vulcanized rubber mixed with mineral matter is employed. Such articles contain varying proportions of rubber (12-60%), 75% of combined sulphur and 25-70% of other mineral matter. Vulcanized rubber is also now largely used as an electrical insulator for the construction of cables, &c., instead of gutta-percha.

When the vulcanization of rubber is carried too far, from the presence of a very large proportion of sulphur and an unduly long action of heat, the caoutchouc becomes hard, horn-like, and often black. Rubber hardened by over-vulcanization is largely manufactured under the name of ebonite or vulcanite. It is usually made by incorporating about 40% of sulphur with purified Borneo rubber by means of the usual mixing rollers, shaping the required articles out of the mass thus obtained, and heating for six, eight or ten hours at 140° C. to 150° C. Ebonite is a fine polish, and is especially valuable to the electrician on account of its insulating properties, and to the chemist and photographer because vessels made of it are unaffected by most chemical reagents. A kind of vulcanite which contains a large proportion of vermiculite or other mineral pigment is used, under the name of dental rubber, for making artificial gums and supports for artificial teeth.

RUBBLE—RUBENS

RUBBLE, broken stone, of irregular size and shape. This word is closely connected in derivation with “rubbish,” which was formerly also applied to what we now call “rubble.” The earlier Middle English form was _robus_ or _robes_. It would appear that the original is an O. Fr. _robel_. _Roba_ (older form _robbia_) is found in Italian in the sense of refuse, trash. _Robba_ is explained by Florio as a gown, or mantle, robe, wealth, goods, trash. The original sense was “spoil.” Thus, “robe,” “roh,” “rubbish” and “rubble” are all cognates.

“Rubble-work” is a name applied to several species of masonry (q.v.). One kind, where the stones are loosely thrown together in a wall between boards and grouted with mortar almost like concrete, is called in Italian _muraglia di getto_ and in French _hocage_. Work executed with large stones put together without any attempt at courses is also called rubble.

RUBELLITE, a red variety of tourmaline (q.v.) used as a gem-stone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia-mica (lepidolite). The most valued kinds are deep red; the colour being probably due to the presence of manganese. It is the finest of the feldspates for which it is sometimes called siberite, or passes under the misleading name of “Siberian ruby.” The mills at Ekaterinburg, where it is cut and polished, draw most of their supplies from the Ural Mountains—chiefly from Murksinska, Sarapulskaya and Shaitanka, near Ekaterinburg—but specimens are occasionally found at Nerchinsk in Transbaikalia. Burma is famous for rubellite, but little was known as to the conditions of its occurrence there until after the British annexation, when the old workings were visited and described by C. Barrington Brown and by F. Noetling. The pits which yield rubellite are dug in alluvial deposits in the Mong-long valley, some miles to the S.E. of Mogok, the centre of the ruby country. It was here that the Chinese obtained the rubellite so much valued in China for buttons of the caps of mandarins of certain rank. In the British Museum there is a remarkable specimen of crystallized rubellite of large size and fine form, but of poor colour, which was presented by the king of Ava to Colonel Michael Symes on the occasion of his mission in 1795. Very fine rubellite is found in the United States, notably at Mount Mica, near Paris, Oxford Co., Maine, where the crystals are often red at one end and green at the other. Mount Rubellite, near Hebron, and Mount Apatite at Auburn, are other localities in the same state from which fine specimens are obtained. Chesterfield and Goshen, Mass., also yield red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego Co., California. In Europe rubellite occurs sparingly at a few localities, as at San Piero in Elba and at Penig in Saxony; but the mineral is rarely if ever fit for the lapidary.

RUBENS, PETER PAUL (1577-1640), Flemish painter, was born at Siegen, in Westphalia, on the 29th of June 1577. His father, Johannes Rubens, a druggist, although of humble descent was a man of learning, and councillor and alderman in his native town (1562). A Roman Catholic, he became, a zealous upholder of the Reformation, and we find him spoken of as _le plus docte Calviniste qui jusc et pour lors au Bas Pays_. After the plundering of the Antwerp churches in 1566, the magistrates were called upon for a justification. While openly they declared themselves devoted sons of the church, a list of the followers of the Reformed creed, headed by the name of Anthony Van Stralen, the burgomaster, got into the hands of the duke of Alva. This was a sentence of death for the magistrates, and Johannes Rubens lost no time in quitting Spanish soil, ultimately settling at Cologne (October 1568) with his wife and four children.

In his new residence he became legal adviser to Anne of Saxony, the second wife of the prince of Orange, William the Silent. Before long it was discovered that their relations were not purely of a business kind. Thrown into the dungeons of Dillenburg, Rubens lingered there for many months, his wife, Maria Pypelinck, never relaxing her endeavours to get the undutiful husband restored to freedom. Two years elapsed before the prisoner was released, and then only to be confined to the small town of Siegen. Here he lived with his family from 1573 to 1578, and here Maria Pypelinck gave birth to Philip, afterwards town-clerk of Antwerp, and Peter Paul. A year after (May 1578) the Antwerp lawyer got leave to return to Cologne, where he died on the 18th of March 1579, after having, it is said, returned to Roman Catholicism.

Rubens went to Antwerp with his mother when he was scarcely ten years of age. He was an excellent Latin scholar, and also proficient in French, Italian, Spanish, English, German and Dutch. Part of his boyhood he spent as a page in the household of the countess of Lalain, in Brussels; but tradition adds that his mother allowed him to follow his proper vocation, choosing as his master Tobias Verhaecht. Not the slightest trace of this first master’s influence can be detected in Rubens’s works. Not so with Adam Van Noort, to whom the young man was next apprenticed. Van Noort, whose aspect of energy is well known through Van Dyck’s beautiful etching, was the highly esteemed master of numerous painters—among them Adrian Balem, Sebastian Vranck, and Jordens, later his son-in-law.

Rubens remained with Van Noort for the usual period of four years, thereafter studying under Otto Vaneius or Van Veen, a gentleman by birth, a most distinguished Latin scholar and a painter of very high repute. He was a native of Leiden, and only recently settled in Antwerp. Though Rubens never adopted his style of painting, the tastes of master and pupil had much in common, and some pictures by Otto Vaneius can be pointed out as having inspired Rubens at a more advanced period. For example, the “Magdalene anointing Christ’s Feet,” painted for the cathedral at Malaga, and now at the Hermitage in St Petersburg, closely resembles in composition the very important work of Otto Vaneius in the church at Bergues near Dunkirk.

In 1598, Adam Van Noort acting as dean of the Antwerp guild of painters, Rubens was officially recognized as “master”—that is, was allowed to work independently and receive pupils. His style at this early period may be judged from the by no means satisfactory “Holy Trinity” at Antwerp Museum, which already shows his bold, vigorous handling, and the “Portrait of a Youth” in the Munich Pinakothek.

From 1600 to the latter part of 1608 Rubens belonged to the household of Hieronymus Van Beverest, of Antwerp. The duke, who spent some time at Venice in July 1600, had his attention drawn by one of his courtiers to Rubens’s genius, and immediately induced him to enter his service. The influence of the master’s stay at Mantua was of extreme importance, and cannot be too constantly kept in view in the study of his later works.

Sent to Rome in 1601, to take copies from Raphael for his master, he was also commissioned to paint several pictures for the church of Santa Croce, by the archduke Albrecht of Austria, sovereign of the Spanish Netherlands, and once, when he was a cardinal, the titular of that see. A copy of “Mercury and Psyche” after Raphael is preserved in the museum at Pesti. The religious paintings—“The Invention of the Crown,” “The Crowning with Thorns” and “The Crucifixion”—are to be found in the hospital at Grasse in Provence (Alpes Maritimes).

At the beginning of 1603, “The Fleming,” as he was termed at Mantua, was sent to Spain with a variety of presents for Philip III. and his minister the duke of Lerma, and thus had opportunity to spend a whole year at Madrid and become acquainted with some of Titian’s masterpieces. Of his own works, known to belong to the same period, in the Madrid Gallery, are “Hercules” and “Democritus.” Of Rubens’s abilities so far back as 1604 we get a more complete idea from the initial picture now in the Antwerp Gallery, “The Baptism of Our Lord,” originally painted for the Jesuits at Mantua. Here it may be seen to what degree Italian surroundings had influenced the household painter of Vincenzo Gonzaga. Vigorous to the extreme in design, he reminds us of Michelangelo as much as any of the degenerate masters of the Roman school.
while in decorative skill he seems to be descended from Titian and in colouring from Giulio Romano. Equally with this picture, "The Transfiguration," now in the museum at Nancy, and the portraits of "Vincenzo and his Consort, kneeling before the Trinity," in the library at Mantua, claim a large share of attention.

Two years later we meet a very large altar-piece of "The Circumcision" at St Ambrogio at Genoa, the "Virgin in a Glory of Angels," and two groups of Saints, painted on the wall, at both sides of the high altar in the church of Santa Maria in Valicella in Rome. These works remind us of a saying of Baglione, who was acquainted with Rubens in Italy: Arrere egli buon gusto, e dieue in una maniera buona Italiana.

While employed at Rome in 1608, Rubens received most alarming news as to the state of his mother's health. The duke of Mantua was then absent from Italy, but the dutiful son, without awaiting his return, at once set out for the Netherlands. When he arrived in Antwerp, Maria Pypelinckx was no more. However strong his wish might now be to return to Italy, his purpose was overruled by the express desire of his sovereigns, Albrecht and Isabella, to see him take up a permanent residence in the Belgian provinces. On the 3rd of August 1609 Rubens was named painter in ordinary to their Highnesses, with a salary of 500 livres, and the "rights, honours, privileges, exemptions," &c., belonging to persons of the royal household, not to speak of the gift of a gold chain. Not least in importance for the artist was a complete exemption from all the regulations of the gild of St Luke, enabling him to engage any pupils or fellow-workers without being obliged to have them enrolled—a favour which has been of considerable trouble to the historians of Flemish art.

Although so recently returned to his native land, Rubens seems to have been, with one accord, accepted by his countrymen as the head of their school, and the municipality was foremost in giving him the means of proving his acquirements. The first in date among the numerous repetitions of the "Adoration of the Magi" is a picture in the Madrid Gallery, measuring 12 ft. by 17, and containing no fewer than eight-and-twenty life-size figures, many in gorgeous attire, warriors in steel armour, horsemen, slaves, camels, &c. This picture, painted in Antwerp, at the town's expense, in 1609, had scarcely remained three years in the town hall when it went to Spain as a present to Don Rodrigo Calderon, count of Oliva. The painter has represented himself among the horsemen, bare-headed, and wearing his gold chain. From a letter written in May 1611 we know that more than a hundred young men were desirous to become his pupils, and that many had, "for several years," been waiting with other masters until he could admit them into his school.

Apart from the success of his works, another powerful motive helped to detain the master in Antwerp—his marriage with Isabella Brant (October 1609). Many pictures have made us familiar with the graceful young woman who was for seventeen years to share the master's destinies. We meet her at the Hague, St Petersburg, Berlin, Florence, at Grosvener House, but more especially at Munich, where Rubens and his wife are depicted at full length on the same canvas. "His wife is very handsome," observes Sir Joshua Reynolds, "and has an agreeable countenance," but the picture, he adds, "is rather hard in manner." This, it must be noted, is the case with all those pictures known to have immediately followed Rubens's return, when he was still dependent on the assistance of painters trained by others than himself. Even in the "Raising of the Cross," now in the Antwerp cathedral, and painted for the church of St Walburga in 1610, the dryness in outline is very striking.

According to the taste still at that time prevailing, the picture is tripartite, but the wings only serve to develop the central composition, and add to the general effect. In Witchoek's beautiful engraving the partitions even disappear. Thus, from the first, we see Rubens quite determined upon having his own way, and it is recorded that, when he painted the "Descent from the Cross," "St Christopher," the subject chosen by the Arquebusers, was altered so as to bring the artistic expressions into better accordance with his views. While the subject was frequently repeated by the great painter, this first "Descent from the Cross" has not ceased to be looked upon as his masterpiece. Begun in 1611, the celebrated work was placed in 1614, and certainly no more striking evidence could be given of the rapid growth of the author's abilities. Rubens received 2400 florins for this picture. In many respects, Italian influence remains conspicuous in the "Descent from the Cross." Rubens had seen Ricciarelli's fresco at the Trinita de' Monti, and was also acquainted with the grandiose picture of Barocci in the cathedral of Perugia, and no one conversant with these works can mistake their influence, the tone and spirit in Rubens. Rubens's personality could not be overpowered by his terminations, and only in type, as well as in colouring, the "Descent from the Cross" may be termed thoroughly Flemish and Rubenesque.

If Sir Dudley Carleton could speak of Antwerp in 1616 as Magna civilis, magna solitudo, there was no place nevertheless which could give a wider scope to artistic enterprise. Spain and the United Provinces were for a time at peace; almost all the churches had been stripped of their adornments; monastic orders were powerful and richly endowed, gilds and corporations eager to show the fervour of their Catholic faith, and museum the "monster of heresy" seemed for ever quelled. Gothic churches began to be decorated according to the new fashion adopted in Italy, altars magnified to monuments, sometimes reaching the full height of the vaulted roof, displayed, between their twisted columns, pictures of a size hitherto unknown. No master seemed better fitted to be associated with this kind of painting than Rubens. The temple erected by the revered fathers in Antwerp was almost entirely the painter's work, and if he did not, as we often find asserted, design the front, he certainly was the inspirer of the whole building. Hitherto no Fleming had undertaken to paint ceilings with foreshortened figures, and blend the religious with the decorative art after the style of those buildings which are met with in Italy, and owe their decorations to masters like Titian, Veronese and Tintoretto. No fewer than forty ceiling-panels were composed by Rubens, and painted under his direction in the space of two years. All were destroyed by fire in 1718. Sketches in water-colour were taken some time before the disaster by de Wit, and from these were made the etchings by Du Pont which alone enable us to form a judgment of the grandiose undertaking. In the Madrid Gallery we find a general view of the church in all its splendour. The present church of St Charles in Antwerp is, externally, with some alteration, the building here alluded to.

Rubens delighted in undertakings of the vastest kind. "The large size of a picture," he writes to W. Trumbull in 1621, "gives us painters more courage to represent our ideas with the utmost freedom and semblance of reality... I confess myself to be, by a natural instinct, better fitted to execute works of the largest size." The correctness of this appreciation he was very soon called upon to demonstrate most strikingly by a series of twenty-four pictures, illustrating the life of Marie de Médicis, queen-mother of France. The gallery at the Luxembourg Palace, which these paintings once adorned, has long since disappeared, and the complete work is not exhibited in the Louvre. Drawings, it seems, had been asked from Quentin Varin, the French master who incited Poussin to become a painter, but Rubens was ultimately preferred. This preference may in some degree be ascribed to his former connexion with the court at Mantua, Marie de Médicis and the duchess of Gonzaga being sisters. From the cradle to the day of her reconciliation with Louis XIII., we follow Marie de Médicis after the manner in which it was customary in those days to consider personages of superior rank. The Fates for her have spun the silken and golden thread; Juno watches over her birth and entrusts her to the town of Florence; Minerva, the Graces and Apollo take charge of her education; Love
exhibits her image to the king, and Neptune conveys her across the seas; Justice, Health and Plenty endow her son; Prudence and Generosity are at her sides during the regency; and, when she resigns the helm of the state to the prince, Justice, Strength, Religion and Fidelity hold the oar. The sketches of all these paintings—now in the Munich Gallery—were painted in Antwerp, a numerous staff of distinguished collaborators being entrusted with the final execution. But the master himself spent much time in Paris, retouching the whole work, which was completed within less than four years. On the 13th of May 1625, Rubens writes from Paris to his friend Peiresc that both the queen and her son are highly satisfied with his paintings, and that Louis XIII. came on purpose to the Luxembourg, "where he never has set foot since the palace was begun sixteen or eighteen years ago." We also gather from this letter that the picture representing the "Felicity of the Regency" was painted to replace another, the "Departure of the Queen," which had caused some offence. Richelieu gave himself some trouble to get part of the work, intended to represent the life of Henry IV., bestowed upon Cavalier d'Arpina, but did not succeed in his endeavours. The queen's exile, however, prevented the undertaking from going beyond a few sketches, and two or three panels, one of which, the "Triumph of Henry IV.," now in the Uffizi Gallery, is one of the noblest works of Rubens or of any master.

On the 11th of May 1625, Rubens was present at the nuptials of Henrietta Maria at Notre Dame in Paris, when the scaffolding on which he stood gave way, and he tells us he was just able to catch an adjoining tribune.

No painter in Europe could now pretend to equal Rubens either in talent or in renown. Month after month productions of amazing size left the Antwerp studio; and to those unacquainted with the master's pictures magnificent engravings by Vorstman, Pontius and others had conveyed singularly striking interpretations. "Whatever work of his I may require," writes Moretus, the celebrated Antwerp printer, "I have to ask him six months before, so as that he may think of it at leisure, and do the work on Sundays or holidays; no week days of his could I pretend to get under a hundred florins."

Of the numerous creations of his brush, none, perhaps, will more thoroughly disclose to us Rubens's comprehension of religious decorative art than the "Assumption of the Virgin" at the high altar of Antwerp cathedral, finished in 1625. It is, of twenty repetitions of this subject, the only example still preserved at the place for which it was intended. In spirit we are here reminded of Titian's "Assunta" in the cathedral at Verona, but Rubens's proves perhaps a higher conception of the subject. The work is seen a considerable way off, and every outline is bathed in light, so that the Virgin is elevated to dazzling glory with a power of ascension scarcely, if ever, attained by any master.

Although able to rely so greatly on his power as a colourist, Rubens is not a mere decorator. He penetrates into the spirit of his subjects more deeply than, at first sight, seems consistent with his prodigious facility in execution. The "Massacre of the Innocents," in the Munich Gallery, is a composition that can leave no person unmoved—mothers defending their children with nails and teeth. When St Francis attempts to shelter the universe from the Saviour's wrath (Brussels Gallery), Rubens recalls to our memory that most dramatic passage of the Iliad when Hecuba, from the walls of Troy, entreats her son Hector to spare his life. Rubens was a master artist in these studies of Italian art, he brought him back to the Quattrocentisti nor the Raffaelleschi; their power was at an end. The influence of Michelangelo, Titian, Tintoretto, more especially Barocci, Polidoro, and even Parmigianino, is no less visible with him than with those masters who, like Spranger, C. Schwartz and Goltzius, stood high in public estimation immediately before his advent.

In the midst of the rarest activity as a painter, Rubens was now called upon to give proofs of a very different kind of ability. The truce concluded between Spain and the Netherlands in 1609 ended in 1621; Archduke Albrecht died the same year. His widow sincerely wished to prolong the arrangement, still hoping to see the United Provinces return to the Spanish dominion, and in her eyes Rubens was the fittest person to bring about this conclusion. The painter's comings and goings, however, did not remain unheeded, for the French ambassador writes from Brussels in 1624—"Rubens is here to take the likeness of the prince of Poland, by order of the infanta. I am persuaded he will succeed better in this than in his negotiations for the truce." But, if Rubens was to fail in his efforts to bring about an arrangement with the Netherlands, other events enabled him to render great service to the state.

Rubens and Buckingham met in Paris in 1625; a correspondence of some importance had been going on between the painter and the Brussels court, and before long it was proposed that he should endeavour to bring about a final arrangement between the Crowns of England and Spain. The infanta willingly consented, and King Philip, who much objected to the interference of an artist, gave way on hearing, through his aunt, that the negotiator on the English side, Sir Balthasar Gerbier—a Fleming by birth—was likewise a painter. Rubens and Gerbier very soon met in Holland. Matters went on very well, and Rubens volunteered to go to Spain and lay before the council the result of his negotiations (1628). Nine months were thus spent at Madrid; they rank among the most important in Rubens's career. He had brought with him eight pictures of various sizes and subjects as presents from the infanta, and he was also commissioned to paint several portraits of the king and royal family. An equestrian picture of Philip IV., destroyed by fire in last century, became the subject of a poem by Lope de Vega, and the description enables us to identify the composition with that of a painting now in the Palazzo Pitti, ascribed to Velazquez.

Through a letter to Peiresc we hear of the familiar intercourse kept up between the painter and the king. Philip delighted to see Rubens at work in the studio prepared for him in the palace, where he not only left many original pictures, but copied for his own pleasure and profit the best of Titian's. An artistic event of some importance connected with the sojourn in Spain was the meeting of Rubens and Velazquez, to the delight, and, it may be added, advantage of both.

Great as was the king's admiration of Rubens as a painter, it seems to have been scarcely above the value attached to his political services. He now commissioned the painter to go to London as bearer of his views to Charles I., and Rubens, honoured with the title of secretary of the king's privy council in the Netherlands, started at once on his new mission. Although he stopped but four days in Antwerp, he arrived in London just as peace had been concluded with France. Received by Charles with genuine pleasure, he very soon was able to gratify himself so far as to induce the king to pledge his royal word to take part in no undertakings against Spain so long as the negotiations remained uncompleted, and all the subsequent endeavours of France, Venice and the States found the king immovable in this resolution. The tardiness of the Spanish court in sending a regular ambassador involved the unfortunate painter in distressing anxieties, and the tone of his despatches is very bitter. But he speaks with the greatest admiration of England and the English, regretting that he should only have come to know the country so late. His popularity must have been very great, for on the 23rd of February 1630 the university of Cambridge conferred upon him the honorary degree of Master of Arts, and on the 5th of February 1630 he was knighted, the king presenting him with the sword used at the ceremony, which is still preserved by the descendants of the artist.

Although, it seems, less actively employed as an artist in England than in Spain, Rubens, besides his sketches for the decoration of the Banqueting Hall at Whitehall, painted the admirable picture of "The Blessings of Peace" now in the
National Gallery. There is no reason to doubt, with Smith, that “His Majesty sat to him for his portrait, yet it is not a little remarkable that no notice occurs in any of the royal catalogues, or in the writings of the period, of the existence of such a portrait.” While in England, Rubens very narrowly escaped drowning while going to Greenwich in a boat. The fact is reported by Lord Dorchester in a letter to Sir Isaac Wate (Sainsbury, cvxi.). At the beginning of March the painter’s mission came to a close.

Rubens was now fifty-three years of age; he had been four years a widower, and before the end of the year (December 1630) he entered into a second marriage with a beautiful girl of sixteen, named Helena Fourment. She was an admirable model, and none of her husband’s works may be more justly termed masterpieces than those in which she is represented (Munich, St Petersburg, Blenheim, Liechtenstein, the Louvre, &c.). Although the long months of absence could not be termed blanks in Rubens’s artistic career, his return was followed by an almost incredible activity. Inspired more than ever by the glorious works of Titian, he now produced some of his best paintings. Brightness in colouring, breadth of touch and pictorial conception, are strikingly in those works we know to have been painted in the latter part of his lifetime. Could anything give a higher idea of Rubens’s genius than, for example, the “Feast of Venus,” the portrait of the Archduke Albert, or the large “Ildefonso” (Fig. 2). This last picture—now, as well as the two others just alluded to, in the Vienna Gallery—was painted for the church of the convent of St Jacques, in Brussels. On the wings are represented the archdukes in royal attire, under the protection of their patron saints. The presence of these figures has led to some mistake regarding the date of the production, but it has been proved beyond doubt, through a document published by Mr Crast (1884), that the “Ildefonso” (at Vienna) is none other than the St Petersburg belongs to the series of works executed after the journeys to Spain and England. Archduke Albrecht had been dead ten years. The picture was engraved by Witdoeck in 1638.

Isabella died in 1633, and we know that to the end Rubens remained in high favour with her, alike as an artist and as a political agent. The painter was even one of the gentlemen she deputed to meet Marie de Médicis with her at in 1631, after her escape from France.

Spain and the Netherlands went to war again, the king never ceasing to look upon the Dutch as rebels, and much trouble and suspicion came upon the great artist. As to the real nature of his engagements with Frederick Henry of Orange, whom he is known to have befriended, or the extent to which he may have denounced to Ferdinand of Austria, the cardinal-infant of Spain, was called to the government of the Netherlands on the death of his aunt. He was the king’s younger brother, and arrived at Antwerp in May 1635. The streets had been decorated with triumphal arches and “spectacula,” arranged by Rubens, and certainly never equalled by any other works of the kind.1 Several of the paintings detached from the arches were offered as presents to the new governor-general, a scarcely known fact, which accounts for the presence of many of these works in public galleries (Vienna, Dresden, Brussels, &c.). Rubens was at the time laid up with gout, but Prince Ferdinand was desirous of expressing his satisfaction, and called upon the painter, remaining a long time at his house. Rubens and Ferdinand had met at Madrid, and only a short time elapsed before the painter was confirmed in his official standing—a matter of small importance, if we consider that the last years of his life were almost exclusively employed in working much more for the king than for his brother. About a hundred and twenty

1 Many sketches of the arches are still preserved in the museums in Antwerp, St Petersburg, Cambridge, Windsor, &c. All the communications were collected under the direction of Rubens by his pupil J. Van Thulden and published under the title of Ponta introtitus honori serenissimi Principis Ferdinandi Austriaci S. R. E. card. a. S. P. Q. Antwerp. decreta et ordinata. paintings of considerable size left Antwerp for Madrid in 1637, 1638 and 1639; they were intended to decorate the pavilion erected at the Pardo, and known under the name of Torre de la Parada. Another series had been begun, when Ferdinand died in 1646, and it was ordered by Philip IV that the painter was no more, and Jordaens would finish the work. Rubens breathed his last on the 30th of May 1644.

More fortunate than many artists, Rubens left the world in the midst of his glory. Not the remotest trace of any weakness is visible in the last two years of his life, not the slightest failing of mind or skill, can be detected even in his latest works, such as the “ Martyrdom of St Peter,” at Cologne, and the “Judgment of St Thomas,” at Prague, or the “Judgment of Paris” at Madrid, where his young wife appears for the last time.

Rubens has little of the Italian grace and refinement; he was a Fleming throughout, notwithstanding his frequent recollections of those Italian masters whom he most admired, and who themselves have little, if anything, in common with Raphael. But it must be borne in mind how completely his predecessors were frozen into stiffness through Italianization, and how necessary it was to bring back the Flemish school to life and nature. Critics have spoken Ruben’s historical improprieties. Of course nobody could suppose that his classical learning did not go far enough to know that the heroes of the Old Testament or of Roman history were not dressed in the habits of his time, whether the example of Titian, Paolo Veronese, and many others. In no other school do we find these animated hunts of lions, tigers, and even salamanders and other fantastic animals, which sometimes are amongst the finest specimens of art, and here again are life and nature displayed with the utmost power. “His horses are perfect in their kind,” says Reynolds; “his dogs are of the strong Flemish breed, particularly those of his racing days, which he placed in the midst of which lay his seat of Steen. As a portrait painter, although less refined than Van Dyck, he shows that eminent master the way; and his pure fancy subjects, as the “Garden of Love” (in Dresden) and the “Village Feast” (Louvre), have never been equalled.

For nearly one hundred years the Flemish school may be said to have been a reflection of the Rubenesque principles. Although Jordans and Erasmus Quellus lived till 1678, the school might be termed a body without soul.

Some etchings have been ascribed to Rubens, but except a head of Henry of Orange, the only one which is in existence in the British Museum, and a beautiful figure of St Catherine, we can admit none of the other plates said to proceed from Rubens as authentic. Rubens nevertheless exercised an immense influence both at art of engraving. Under his direct guidance Soutman, Vorstmann, Pontius, Witdoeck, the two Bolswerts, Peter de Jode, N. Lauwers, and many others of less note, left an immense number of beautiful plates, reproducing the most celebrated of his paintings. The influence of what was once called Rubens’s style, by which, pictorially speaking, it might be sufficient to notice the transformation undergone by the Antwerp school of engraving under Rubens; even the modern school of engraving, in more than one respect, is founded on the principles of the style of the “prince de la ligne (ONE ENGRAVING).” His influence is scarcely less apparent in sculpture, and the celebrated Luke Fayd’herbe was his pupil.

The influence of the Flemish art was strong on Rubens. None of his four sons became a painter, nor did any of his three daughters marry an artist. According to Rubens’s will, his drawings were to belong to that one of his sons who might become a painter, or in the event of one of his daughters marrying a celebrated artist, they were to be her portion. The valuable collection was dispersed only in 1659, and of the pictures sold in 1640 thirty-two became the property of the king of Spain. The Madrid Gallery alone possesses over sixty of his works. Four years after her husband’s death, Helena Fourment married J. B. Van Brouckhoven de Bergheyc, knight of St James, member of the privy council, &c. She died in 1673. In 1746 the male line of Rubens’s descendants was completely extinct in the female line in a hundred families of name in Europe trace their descent from him.

The paintings of Rubens are found in all the principal galleries in Europe. In Antwerp and Brussels, Madrid, Paris, Lille, Dresden, Berlin, Munich, Vienna, St Petersburg, London, Florence, Milan, Turin exhibit several hundreds of his works. J. Smith’s Catalogue gives descriptions of more than thirteen hundred compositions.

RUBIACEAE, in botany, a large natural order of seed plants, belonging to the series Rubiales of the subclass Sympetalae (Gamopetalae) of Dicotyledons, and containing about 350 genera with about 4500 species. It is mainly a tropical family of trees, shrubs and herbs, but some of the tribes, especially Galieae, to which the British representatives belong and which contains only herbs, are more strongly developed in temperate regions. Some species of Galium reach the Arctic zone and are found at high elevations on mountains in the tropics.

The most striking characteristic of the family are the opposite-decussate, generally entire, stipulate leaves. The stipules are very varied in form; they generally stand between the petals of a pair or one petal (peripetal). The two stipules of adjacent leaves are usually united, and in the Galieae, as well shown in the British species, are enlarged and leaf-like, forming with the two leaves an apparent whorl; by fusion or branching of the stipules the number of leaves in the whole whorl varies from four to eight or more. The flowers are rarely solitary, terminal or axillary, as in Gardenia; generally they are arranged in cymes or panicles or crowded into heads, and are often in pairs. In British members of the family they are very small, but may be conspicuous from their numbers, as in lady's bedstraw (Galium verum). The flowers are hermaphrodite and regular with parts in fours or fives; the four or five sepals, petals and stamens are arranged in two series above the ovary, which consists of two carpels, contains one to indefinite anatropous ovules in each of the two chambers, and is crowned by a simple style ending in a head or in two lobes. The sepals are often small, sometimes reduced to a narrow ring enclosing the top of the ovary or altogether absent. The united petals form a corolla which varies widely in form in the different genera; it is often funnel- or salver-shaped, the honey, which is secreted at the disc round the base of the style, being at the bottom of a longer or shorter tube, in which case the flowers are adapted for pollination by Lepidoptera or bees, as in Gardenia, Mussaenda, Guettarda, &c.; in other cases it is bell-shaped or, as in Galium, rotate, with a short tube and sharply spreading segments; the honey is in these cases freely exposed or only slightly concealed and the flowers are pollinated by flies. The stamens are attached to the corolla-tube and alternate in position with its segments; they are often dimorphic (or heterostyled) with short-styled and long-styled forms as in ippecacuanha (see fig.).

The fruit also varies widely in form and is dry or fleshy. When dry it forms a capsule with septical or loculicidal dehiscence, or is a drupe or berry. Some members are one-seeded or two-seeded, which, as in the British cleavers (Galium aparine), sometimes bear hooked appendages which aid their dispersal.

Some species are remarkable for their relation with ants. Thus Myrmecocodia, Hymenopetalum are epifytic plants, in which the base of the stem forms a large tuber, which is attached to the support by numerous adventitious roots. The substance of the tuber is pecten-trogae; some species contain canes communicating by galleries, which are inhabited by ants. There is no evidence that the presence of the ants is of any service to the plant.

The order is divided into a large number of tribes based on the number of ovules in each ovary-chamber, the character of the fruit seed and ovule, and the asemination of the corollas. These may be arranged in three families as follows:

Cinchonae, often woody plants with scale-like stipules, and numerous ovules in each ovary-chamber; the fruit is generally a capsule. To this belong Cinchona (g.s.), a genus of large trees with handsome flowers containing about forty species in the Andes of South America; it is well known as the source of Peruvian bark. An allied genus, Bowdaria (g.s.), from tropical America, is cultivated for its flowers. The species of Uncaria climb by means of hooks which are modified florescence-axes.

Mussaendae, Gaudinia (g.s.), and other genera are characterized by having a fleshy fruit.

Coffeeae, often woody or shrubby plants with scale-like stipules; each ovary-chamber contains only one ovule. Coffee (g.s.), a genus of shrubs with about twenty-five species in the Old World tropics, includes the coffee plant (C. arabica and C. liberica); the fruit is a two-seeded drupe, the seed is the "coffee-bean." The thickened roof of the drupe yields ippecacuanha (g.s.).

Stellatæae, herbaceous plants with leaf-like stipules; each ovary-chamber contains one ovule only. Includes the four British genera Rubia, one species of which, R. tinctorum, is madder; Galium, including G. verum (lady's bedstraw), G. aparine (goose-grass or cleavers), and other British species; Asperula, including A. odorata (woodruff) and Sherardia.

The order is closely allied to Caprifoliaceae, the chief distinction being the absence of stipules in the latter.

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum and Caesena, and formed the boundary between Italy and the province of Cisalpine Gaul. Hence Caesar's crossing of it in 49 B.C. was tantamount to a declaration of war against Rome as represented by Pompey and the Senate. The historic importance of this event gave rise to the phrase "crossing the Rubicon" for a step which definitely commits a person to a given course of action. There has been much controversy as to the identification of the stream; it appears that its upper course is represented by that of the Picciatello (called Rubigone in the 11th and 12th century and now Rugone or Urgone), and its lower portion by the Fiumicino, which the Urgone once joined. The point was marked by a station on the Via Aemilia below their confluence, 12 m. N.W. of Ariminum, bearing the name ad Confluentes; and here is still preserved a three-arched bridge, larger than is necessary for the water carried by the present Fiumicino.

RUBIDIUM [symbol Rb, atomic weight 85.45 (O=16)], a metallic element belonging to the group of the alkali metals. It is found in the minerals lepidolite, petalite and in various specimens of mica and of carnallite, and in some mineral waters. It also occurs in tea, cocoa, coffee, tobacco and in the ashes of beetroot. It was discovered by R. Bunsen and Kirchhoff (Ann., 1860, 113, p. 337), in the spectroscopic examination of the residues obtained on evaporation of water from a mineral spring at Dürkheim, being characterized by two distinctive red lines. The best source of rubidium salts is the residue left after extracting lithium salts from lepidolite, the method of separation being based on the different solubilities of the platino-chlorides of potassium, rubidium and caesium.
in water (R. Bunsen, Ann., 1862, 122, p. 351). A somewhat similar process based on the varying solubilities of the corresponding alums has also been devised by Redtenbacher (Jour. prak. Chem., 1865, 95, p. 148). The metal is prepared by distilling the carbonate with carbon (an explosive compound similar to that obtained from potassium and carbon monoxide is liable to be formed simultaneously), by reducing the hydroxide of the alumina: 4RbOH+2Al=Al2O3+4Rb, or by 2Rb+2H2SO4=Rb2SO4+2H2 (N. Bekker, Ann., 1868, 121, p. 124 ref.); by reducing the carbonate (C. Winckler, Ber., 1890, 23, p. 51) or the hydroxide with magnesium (H. Erdmann and P. Köthener, Ann., 1890, 294, p. 55), and by heating the fused chloride with calcium in an exhausted glass tube at 400-500° C. (L. Hackspill, Comptes rendus, 1905, 141, p. 101). The metal was first obtained electrolytically in 1910 by electrolysing the fused hydroxide in a nickel vessel, with an iron wire cathode and iron cylinder anode; the product on cooling being obtained under pyridine cooled by a freezing mixture (G. von Hevesy, Zeit. anorg. Chem., 1910, 67, p. 242). It is a silvery white metal which melts at 35-36° C. and has a specific gravity of 1.52. It oxidizes rapidly on exposure to air, and decomposes cold water very rapidly. It closely resembles caesium and potassium in its general properties. The rubidium salts are generally colourless, mostly soluble in water and isomorphous with the corresponding potassium salts.

Rubidium hydride, RbH, was obtained in the form of colourless needles by H. Moissan (Comptes rendus, 1903, 136, p. 587) from the direct combination of its constituent elements. It rapidly dissociates on hydration. The existence of an oxide RbO appears to be doubtful, the results of Erdmann and Köthener (loc. cit.) pointing to the formation of RbOH by the direct union of the metal with dry oxygen. E. Regnault (Comptes rendus, 1897, 124, p. 159), by partially oxidizing the metal in a current of dry oxygen and removing excess of metal by distillation in vacuo, has obtained oxides of composition RbO (yellowish white), Rb2O (black) and Rb3O (green). Rubidium hydroxide, RbOH, is in a cold hydrated form which is formed by the action of rubidium on water, or by the addition of baryta water to a solution of rubidium sulphide. It is readily soluble in water, the solution being very alkaline and caustic. It melts at 101°. Evaporation of the aqueous solution at 15° C. deposits a crystalline hydrated hydroxide of composition RbOH2.H2O (R. de Forcrand, Comptes rendus, 1900, 139, p. 1341). Rubidium chloride, RbCl, is formed on burning rubidium in chlorine, or on dissolving the hydroxide in hydrochloric acid. RbCl at 18° C. is colorless and melts at 48°. It decomposes above this point. It crystallizes in colourless cubes and volatilizes when heated very strongly. It is soluble in water and combines with many metallic chlorides to form double salts. It combines also with iodine chloride, forming red bromides, and with nitric acid (H. L. Wells and H. L. Wheeler, Amer. Jour. Sci., 1891 (3), 43, p. 475). Rubidium sulphate, Rb2SO4, is obtained by the action of sulphuric acid on the carbonate or hydroxide of the metal, or by the action of milk of lime on rubidium alum, the excess of lime being precipitated by rubidium carbonate and the solution neutralized by sulphuric acid. It forms large colourless hexagonal crystals. Several sulphides of the metal have been described by W. Biltz and E. Wilke-Dörfurt (Zeit. anorg. Chem., 1906, 48, p. 297). The normal sulphide, Rb2S4.H2O, is colourless, and when heated in aqueous solution with the requisite amount of sulphur is transformed into the yellow tetrasulphide, Rb2S4.H2O. A pentasulphide, RbS5, which crystallizes in red prisms melting at 223° C., is also obtained by the direct union of the normal sulphide with sulphur. When Rb2S is heated to red heat the transformation takes place, forming colourless disulphide, whilst if the heating be carried out in a current of nitrogen it yields the trisulphide, Rb3S2.H2O. These sulphides are much less soluble than the corresponding caesium compounds.

Rubidium nitrate, RbNO3, obtained by the action of nitric acid on the carbonate, crystallizes in needles or prisms and when strongly heated is transformed into a mixture of nitrite and nitric acid. Rubidium nitrite, RbNO2, was prepared by H. Moissan (Comptes rendus, 1903, 136, p. 1777) by the action of liquid ammonia on rubidium. The product combines with acetylene to form rubidium acetylide acetylene, Rb2C2.C2H2, which on heating in vacuo decomposes to rubidium and carbon monoxide, Rb2C (ibid. p. 1217). Rubidium carbonate, Rb2CO3, formed by the addition of ammonium carbonate to rubidium hydroxide, is a crystalline mass which melts in its water of crystallization when heated.

The atomic weight of rubidium was determined by R. Bunsen (Pogg. Ann., 1861, 113, p. 339). Pictet (Zeit. anal. Chem., 1862, 1, p. 519) and Godefroy (Ann., 1867, 181, p. 185), the methods being based on the conversion of rubidium halides into the corresponding silver salt, and the values obtained vary from 85.40 to 85.50. The determination of E. H. Archibald (Jour. Chem. Soc., 1904, 85, p. 776) from the analysis of the chloride and bromide gives the mean value as 85.45 (O=16).

**RUBINSTEIN, ANTON GRIGOROVICH** (1829-1894), Russian pianist, born of Jewish parentage on the 28th of November 1829 at Weichwoytynetz, in Podolia, was the son of a pencil manufacturer who migrated to Moscow. The Rubinstein family, at the dictature of Anton's grandfather Roman, Rubinstein, had all been baptized at the time of the ukase against the Jews issued in 1830 by the Tsar Nicholas. Anton was then one year old. Besides his mother he had but one teacher, the piano master Alexander Villoing, of whom he declared at the end of his own career that he had never met a better. In July 1838 Rubinstein appeared in the theatre of the Petrowski Park at Moscow; and in the year following he went to Paris after Villoing, and in 1840 played before Liszt. For some time after this Rubinstein travelled in Holland, Germany and Scandinavia, and reached England in 1843, where on the 20th of May he made his first appearance at a Choral Fund concert. In 1845, after a brief visit to Moscow in 1843, he went with his family (including his brother Nikolaus) to Berlin in order to complete his musical education. Dehn was their master, and Mendelssohn, whom Rubinstein had met previously in London, their best friend. The sudden death of Rubinstein's father necessitated the withdrawal of his mother and Nikolaus to Moscow, while Anton, on Dehn's advice, went to Vienna to seek a livelihood. Hence, after more hard study for nearly two years, he went with the flautist Heindl, and later alone, on a concert tour in Hungary; and the outbreak of the revolution in Vienna preventing his return there, he went via Berlin to St Petersburg, where the Grand Duchess Hélène appointed him Kammervirtuos. About this time an unfortunate error of the police nearly caused his emigration to Siberia, from which he was saved by his patroness.

During the next eight years Rubinstein spent most of his time in St Petersburg studying, playing and composing. His opera Dmitri Donskoi was produced there in 1851, and Tomos der Narr in 1853. Die Sibiriischen Jäger, written about the same time, was not produced. On the advice of his patroness and Count Wilhortske he visited Hamburg and Leipzig, and arrived for the second time in London in 1857, when at a Philharmonic concert he introduced his own composition, in C. In the following year, he was appointed, in the meantime been appointed Concert Director of the Royal Russian Musical Society. In 1862, in collaboration with Carl Schubert, he founded the St Petersburg Conservatorium, of which he was director until 1867. In 1868 he travelled in Germany, France and England, and remained for some time in Vienna, where he introduced a large number of his own compositions. Thence he went to America in 1872 and 1873, when he returned to Russia, and after a short rest set off once more on concert tours. In this manner the rest of his life was spent, until in 1885 he began a series of historical recitals of immense interest, which he gave in most of the chief European capitals. He died on the 20th of November 1894.

In addition to the works already named, Rubinstein left compositions in almost every known form. Among other of his operas are Die Kinder der Häsle, Feramors (Lalla Roukh), Nero, Der Duamon and Die Makababé, this last perhaps more frequently played than all the others, of which the chief defect is their lack of dramatic point. On the subject of oratorio Rubinstein held original views, though his attempt to realize them in Moses and Christus was not completely successful, while his efforts in Berlin and London to found a Sacred Theatre failed entirely. Nevertheless he had himself regarded the Christus as his most accomplished work. The most familiar of his five symphonies are the "Ocean" and the "Dramatic." He wrote scores on scores of pianoforte works, from complex concertos to the most commonplace salonstücks; abundance of concerted chamber-music, and a number of songs and duets, which enjoyed some popularity. He also published several books, including his Reminiscences and Die geistliche Oper.
Rubrubic—Rubruquis

Rubrubic's fame as one of the greatest of piazzas will live in history. His technique bore comparison with that of Liszt; he possessed a power for interpreting the most different kinds of music which has not been surpassed.

His brother Nikolaus (1855-1881) was also a remarkable pianist, and a marvellous teacher of music. He founded the conservatorium of music at Moscow.

See Bernhard Vogel, Anton Rubenstein, Biographischer Abriss (Leipzig, 1888); Alexander MacArthur, Anton Rubinstein, a Biographical Sketch (Edinburgh, 1889); Eugen Zabel, Anton Rubinstein, Ein Künstlerleben (Leipzig, 1890); Anton von Halton, Anton Rubinstein (Utrecht, 1888); Catharina H. Cronk, The Works of Anton Rubinstein (London, 1900).

Rubrubic (Fr. rubrique, Lat. rubrica, ruber, red), in its earliest and original sense, red earth or ochre, reddle, and hence applied to words written or printed in red lettering, in MSS. or printed books, such as chapter headings, paragraphs, initial letters, &c., thus marking in a distinctive manner that to which attention is to be drawn. The term was also applied to the passages so marked, and more especially to the directions or rules as to the conduct of divine service in liturgical books. This is the chief current usage of the term (see Liturgy).

Rubruquis (or Rubrouck), William of (c. 1251-1270; fl. 1253-55) was a Franciscan friar, one of the chief medieval travellers and Franciscan writers. Nothing is known of him save what can be gathered from his own narrative, and from Roger Bacon, his contemporary and brother Franciscan. The name of Rubruquis ("Fra tris Williemi de Rubruquis") is found in the imperfect MS. printed by Hakluyt in his collection, and followed in his English translation, as well as in the completer issue of the English by Purchas. Writers of the 16th, 17th, and 19th centuries have called the traveller Rysbrooke and Rysbrokis (Rysbroek and Rysbroek in the Biographie universelle and Noue. biog. générale)—an error founded on the identification of him with the origin of Rubrouck in Brabant (a few miles south of Brussels) and perhaps promoted by the name of John of Rysbroek or Rysbroek (1294-1382), a Belgian mystic, whose treatises have been reprinted as late as 1848. It is only within the last twenty years that attention has been called to the fact that Rubrouck is the name of a village and commune in old (medieval) French Flanders, belonging to the canton of Cassel in the department du Nord, and lying some 83 m. N.E. of St Omer. In the library of the latter city many medieval documents exist expressing expressly de Rubroucks1 of the 12th and 13th centuries. It may be fairly assumed that Friar William correctly gives this place, 2nd MS. printed by him, now in the British Museum, MSS. Reg. 14 C. xiii. fol. 225 r-36 r. (Itinerarium fratris Williemi de Rubruquis de ordine fratrum Minorum, Galli, Anna gratie 1253, ad portes Orientales).

Friar William went to Tartary under orders from Louis IX. (St Louis). That king, at an earlier date, viz. December 1248, when in Cyprus, had been visited by alleged envoys from Elchigadaj (Ilichkadaal, Ilichkdaal), who commanded the Mongol hosts in Armenia and Persia. The king then despatched a return mission consisting of Friar Andrew of Longjumeau or Lonjumel and other ecclesiastics, who carried presents and letters for both Ilichkadaal and the Great Khan. They reached the court of the latter in the winter of 1249-50, when there was no actual khan on the throne; and they returned, along with Tartar envoys, hearing a letter to Louis from the Mongol regent-mother which was couched in terms so arrogant that the king repented sorely of having sent such a mission: ("li rois se repentit fort quant il y envoya," Johnville, Histoire de Saint Louis, pp. 148-49, in Paris edition of 1858 by F. Michel, Paulin Paris and F. Didot). These returned envoys reached the king when he was at Caesarea, therefore between March 1251 and May 1252. But not long after the king, hearing that the Tatar prince Sartak, son of Batu, was a "baptized Christian," felt moved to open communication with him, and for this purpose deputed Friar William of Rubrouck. The former rebuf had made the king chary of sending formal embassies, and Friar William on every occasion, beginning with a sermon delivered in St Sophia's on Palm Sunday (i.e. April 13th) 1253, disclaimed that character.

Various histories of St Louis, and other documents, give particulars of the despatch of the mission of Friar Andrew from Cyprus, but none mention that of Friar William; and the first dates given by the latter are those of his sermon at Constantinople, and of his entrance into the Black Sea (May 7th, 1253). He must therefore have received his commission at Acre, where the king was residing from May 1252 to the 29th of June 1253; but he had travelled by way of Constantinople, as has just been indicated, and there received letters to some of the Tatar chiefs from the emperor, who was at this time Baldwin de Courtenay, the last of the Latin dynasty.

The narrative of the journey is everywhere full of life and interest. The vast conquests of Jenghiz Khan were still in nominal dependence on his successors, at this time represented by Mangu Khan, reigning on the Mongolian steppes, but practically these conquests were splitting up into several great monarchies. Of these the Ulus of Juji, the eldest son of Jenghiz, formed the most westerly, and his ruler was Batu Khan, established on the Volga. Sartak is known in the history of the Mongols as Batu's eldest son, and was appointed his successor, though he died immediately after his father (1256). The story of Sartak's Christianity seems to have had some foundation; it was currently believed among Asiatique Christians, and it is alleged by Armenian writers that he had been brought up and baptized among the Russians. Pope Innocent IV. (August 29, 1254) refers with enthusiasm to Sartak's baptism, of which he had just heard from a priest whom the khan had sent as envoy to the papal court.

Rubrouck and his party landed at Soldaia, or Sudak, on the Crimean coast, then a centre of intercourse between the Mediterranean world and what is now S. Russia. Equipped with horses and carts for the steppe, they travelled successively to the courts (i.e. the nomad camps) of Scaccatai (Kadan?), Sartak and Batu, thus crossing the Don and arriving at the Volga: of both these rivers Friar William gives vivid and interesting sketches. Batu kept the travellers for some time in suspense, and then referred them to the Great Khan himself, an order involving the enormous journey to Mongolia. The actual travelling of the party from the Crimea to the khan's court near Karakorum cannot have been, on a rough calculation, less than 5000 m., and the return journey to Laziago in Cilicia would be longer by 500 to 700 m. The chief dates to be gathered from the narrative are as follows: the envoys embark on the "Exain," May 7th, 1253; reach Soldaia, June 21st; set out thence, June 1st; reach the camp of Sartak, July 1st; begin the journey from the camp of Batu E. across the steppes, September 16th; turn S.E., November 1st; reach the Talas river, November 8th; leave Callac2 (S. of Lake Balkash), November 30th; reach the camp of the Great Khan, December 27th; leave the camp of the Great Khan on or about July 10th, 1254; reach camp of Batu again, September 16th; leave Batu's camp at Sarai, November 1st; arrive at the Iron Gate (Derbent), November 13th; Christmas spent at Nakhshivan or Nakhchivan (under Ararat); reach Antioch (from Laziago, Layes, or Ayas, of Cilicia, via Cyprus), June 29th, 1255; reach Tripoli, August 15th.

1 A detailed notice of such documents was published by M. E. Coussemaeker of Lille. See remarks by M. d'Avezac in Bull. de la Soc. de Géog., 2nd vol. for 1868, pp. 569-70.

2 The county of Flanders was at this time a fief of the French crown (see Natalis de Wailly, Notes on Joinville, p. 376). William's mother-tongue may have been Flemish. From his representation to Mangu Khan (p. 361) that certain "Teutoonic" had been carried away as slaves by a Tatar chief were "nostre lingue," Dr Franz Max Schmidt inclines to think this certain.
The camp of Batu was first reached near the northernmost point of his summer marches, therefore about Ukek or Uvyek, near Saratov (see Marco Polo, Paris ed. of 1824, p. 3). Before the camp was left they had marched with it five weeks down the Volga. The point of departure would lie on that river somewhere between 48° and 50° N. The route taken lay E. by a line running N. of the Caspian and Aral basins; then from the south of the basin of the Talas river; thence across the passes of the Kirghiz Ala-tau and S. of the Balkash Lake to the Ala-kul and the Baratula Lake (Ebi-nor). From this the travellers struck N. across the Barluk, or the Orkochuk Mountains, and thence, passing S. of the modern Kobdo, to the valley of the Jankan river, whence they emerged on the plain of Mongolia, coming upon the Great Khan’s camp at a spot ten days’ journey from Karakorum and bearing in the main S. from that place, with the Kangul Mountains between.

This route is of course not thus defined in the narrative, but is a deduction from the facts stated therein. The key to the whole is the description given of that central portion intervening between the basin of the Talas and Lake Ala-kul, which enables the topography of that region, including the passage of the Ili, the plain S. of the Balkash, and the Ala-kul itself, to be identified past question.1

The return journey, being made in summer, after retraversing the Jankan valley,2 lay apparently farther to the N., and passed N. of the Balkash, probably with a fairly straight course, to the mouths of the Volga. Thence the party travelled S. by Derbent, and so by Shamakhi to the Araxes, Nakhshavan, Erzingan, Sivas and Iromian, to Laçajo, Layas, or Ayas, where the embarks for Cyprus and Syria. St Louis had returned to France a year before.

We have alluded to Roger Bacon’s mention of Friar William. Indeed, in the geographical section of the Opus Majus (c. 1202) he cites the traveller repeatedly and copiously, describing him as “frater Wilhelmus quem dominus rex Franciae misit ad Tartarum, Armeniam et Persiam perplanum orientalem aquilonem et loca in medio anniis, et scriptis haec praedita illustri regi: librum diligenet vidit et cum ejus auctore contuli” (see Opus Majus, Oxford edition of 1897, i. 353-66). Add to this William’s own incidental particulars as to his being—like his predecessor, Friar John de Plano Carpini—a very heavy man (ponderosus velde), and we know no more of his personality, except the abundant indications of character afforded by the story itself. These paint for us a figure stout-hearted, wise and uncorrupted, observer, keen in the acquisition of knowledge, the author of one of the best narratives of travel in existence. His language indeed is done in the Ciceronian quality; but it is in his style and the smoothness of expression where we find those difficulties of comprehension, and of the badness of his turgenannus or dragoman,3 he gathered a mass of particulars, wonderfully true or of which he was well assured, with that ease and clarity of diction, and manners, but as to religion and language. Of his geography a good example occurs in his account of the Caspian (eagerly caught up by Roger Bacon), which is perfectly accurate, except that he places the hill country occupied by the Mulakhs, or Assassins, on the E. instead of the S. shore. He explicitly corrects the allocation of Isfand that it is a gulf of the ocean: “non est verum quod dicit Yskhorus...musquam enim tantum oceanum, sed unidue circumdatur terra” (265). Of his interest and acumen in matters of language we may cite examples. The language of the Pascitur (or Bashkirs) and of the Hungarians is the same as he had learned from Dominicans who had been among them (274). The language of the Ruthenians, Poles, Bohemians and Slavonians is of the same type as ours (274). In the town of Equius (immediately beyond the Ili, perhaps Asparuh)4 the people were Mahomedians speaking Persian, though so far remote from Persia (281). The Uighurs (or Yugurs) of the country are said to be (see note 1 below) having either part of their own, and in that language and character the Nors- torsians of that tract used to perform their office and write their books (291-92). The Uighurs are those among whom are found Mahomedans and Persians, and have their holy books, and their holy names, in Syriac, but know nothing of the Turkish language, just as some of our monks sing the mass without knowing Latin (293). The Tibet people write as we do, and their letters have a strong resemblance to ours. The Tangut people write from right to left like the Arabs, and their lines advance upwards (329). The current money of Cathay is of cotton paper, a palm in length and breadth, and on this they print lines like those of Mangu Khan’s seal:—imprimis lines siccut est sigillum Mangu "faciunt in una figura plurae lures comprehendentis unam dictioem,"—a still more wonderful utterance!5

Yet this sagacious observer is denounced as an untruthful historian by Isaac de Sancto Domingo in his learning, or, a kind of rare in his day, but narrow, wrong-headed, and to natural acumen and candour far inferior to the 16th century friar) simply because Rubrouck’s evidence as to the Turkish dialect of the Uighurs is not corroborated by the fact of his not having explored the cultivated regions of the empire. Thus he states: “Istam descerni vident hem, viz. that the Uighurs were by race and language Tibetans. Léon Cahun (Introduction à l’histoire de l’Asie, pp. 353-55, 384-86, 392) also shows a strange perversity in depreciating Rubrouck; he fails to distinguish between the Carpano and the Oakerbek, so the fair judgment (Geschichte der Erde, p. 165, &c.). At the same time, Rubrouck may be considered inferior as a politician and as humanist to Carpini; and the latter’s remarkable work has in its turn suffered from the same critical treatment.”

The narrative of Rubrouck, after Roger Bacon’s copious use of it, seems to have dropped out of sight, though five MSS. are still known to exist: the chief of these are (1) Corp. Chr. Coll. Cambidge, No. 66, fol. 67 v.-110 r. of about 1320; (2) No. 181 of the same library, fol. 321-98, of about 1270-90; (3) Leiden Univ. Libr., No. 77 (formerly 104), fol. 160 r.-190 r. of about 1290. It has no place in the famous collections of the 14th century, nor in the earlier introduction to the Itinerarium of Rubrouck; in its place there is an abbrevioted form, called the Oakerbek (40) rubbing in the 13th century. The reason to the Itinerarium of Latin Christendom with Tartary. It first appeared imperfectly in Hildvult (1598 and 1599), as we have mentioned. But it was not till 1839 that any satisfactory edition of the text was made available, and then it was by Jules Delaporte in his Voyages de l’Asie, vol. 11, containing an edition of the Latin text, and a collation of the MSS. put forth by M. J. Schmitz, with a critical, spelling, and distincion, viz. Francisch Michel and Thomas Wright. But there is no commentary on the subject-matter, such as M. d’Avezac attached to his edition of Friar John de Plano Carpini in the same volume. Something has been done to supply this deficiency by the four editions in the Hildvult Society’s publications, (1) William of Rubrouck... John of Plan de Carpine, trans. and edited by William W. Rockhill (London, 1900); (2) Texts and Versions of... Carpine and Rubrouck, edited by C. Raymond Beazley (London, 1903). Richtofen in his China, i. 602-4, has briefly but justly noticed Rubrouck. A French version with some notes, issued at Paris in 1877, in the Bibliothèque orientale Élisabéthanne, contains a monograph, Uber Rubruks Reise (Berlin, 1885), has been separately

---

1 See details in Cathay and the Way Thither, pp. 86-8, and Schuyler’s Turkestan, i. 402-5. Mr. Schuyler points out the true identification of Rubrouck’s river with the Ili, instead of the Chu, which is a much smaller stream; and other amendments have been made by M. Schmitz (Itinéraire de Eubruco, p. 2). This meaning may be put on Rubrouck’s words: “Our going was in winter, our return in summer, and that by a way lying very much farther north, only that for a space of fifteen days’ journey in going and fifteen days returning, covered a certain river between mountains, and on these there was no grass to be found except close to the river.” The position of the Chagan Takoi or upper Jankan seems to suit these facts best; but Mr Schuyler refers to them under the upper Ichik, and the Huang H’o.3

2 Ego enim percepit postea, quando incepit auliquem intelligibile idioma, quod quando dicebam unam ipse totum alium dicebat, secundum quod ei occurrerat. Tun, videns oculicum locumdi en ipsum, eligi magis tacere” (248-50).

3 The page references in the text are to d’Avezac’s edition of the Latin (see below).

---

4 The Bashkirs now speak a Turkish dialect; but they are of Finnish race, and it is quite possible that they then spoke a language akin to Magyar. There is no doubt that the Mussulman historians of that age identified the Hungarians and the Bashkirs (e.g. see extracts from Juvinal and Rashibudin in App. to D’Ohsson’s Hist. Pers., vol. 2, pp. 620-3) and the Bashkirs with the Magyar, as recorded with the Magyar by Abulghazi. See Fr. tr. by Desmazies, pp. 19, 140, 180, 189.

5 *App. Equis.* Asparuh is often mentioned by the historians of that time; but his success is usually attributed to the fact that he began to prey somewhere on the Ili frontier. Dr F. M. Schmidt thinks this identification impossible; but one of his reasons—viz. that Equis was only one day from Caal—appears to be a misapprehension of the text.

6 See Forschungen im Gebiete...der Völker Mittel-Asiens (St. Petersburg, 1824), pp. 90-93.
RUBY (Lat. rubens, red), the most valued of all gem-stones, a red transparent variety of corundum, or crystallized alumina. It is sometimes termed "oriental ruby" to distinguish it from the spinel ruby, which is a stone of inferior hardness, density and value (see Spinel). When the word ruby is used without any qualifying prefix, it is always the true or so-called oriental stone that is meant in modern nomenclature. Ancient writers, relying chiefly on colour, classed together under a common name several brilliant red stones, such as the ruby, spinel and garnet: thus the σπαῖος of Theophrastus and the Carbunculus of Pliny were names which seem to have been applied to several distinct minerals. Although the word ruby is used in the English translation of the Old Testament it is improbable that this stone, associated with granite and graniteose rocks, some of which are highly basic; and it is from the anorthite, or lime-felspar, and the associated minerals in the pyroxene-gneisses, that the corundum, spinel and calcite, may, according to Judd, have been derived. Probably the felspar is first altered to scapolite, and this on decomposition would yield calcium carbonate and hydrous aluminium silicates, from which the anhydrous alumina might ultimately be separated. The limestone contains (in addition to the ruby) spinel, garnet, graphite, wollastonite, scapolite, felspar, mica, pyrrhotite and other minerals. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and it may be that this process is hastened by hydration into gibbsite and diasporo, which by further alteration and union with silica, &c., may yield margarite, vermiculite, chlorite and other hydrous silicates.

The Burmese rubies are not generally worked in the limestone matrix, but are mostly found loose in detrital matter, which is clayey and sandy in character and yellowish-brown in colour, and is known locally as "byon." Some of the deposits occur in limestone caverns, where they may, like cave-earth, represent the insoluble residue of the limestone. Workings in the cave-deposits are called "loodwins" (crooked mines). In the alluvium of the valleys, the ruby-pits are known as "twinline" (round pits), whilst workings in the ruby-earth on the hillsides are termed "hmyautilns" (water mines). The byon contains, with the ruby, other coloured corundum and spodumene. This mineral has been found also in crystalline limestone in the hills near Sagyin, about 20 m. N. of Mandalay, and it is of mineralogical interest to note that the limestone here contains chondrodite.

Rubies are found in Siam, at several localities in the provinces of Chantabur and Krat; and Professor H. Louis has described their occurrence at Moung Klong in this region. The rubies are found with sapphires and spinels, in gravels, resting in some cases on basic igneous rocks. The Siam rubies are generally of dark colour, often inclining to a deep reddish brown. Rubies occur, with sapphires and other minerals, in the gem-gravels of Ceylon, but are not usually of such good colour as the Burmese stones. A cloudy variety, which, when cut with a convex surface, exhibits a luminous star, is known as star-ruby (see Asterias). In peninsular India rubies are rarely found, though they have been reported from the corundum deposits of Madras and Mysore. The ruby is known, however, to occur in a micaceous limestone at Jagdalak, near Kabul in Afghanistan.

Rubies, generally of pale colour, are found with the sapphires of Montana, especially at Yogo Gulch near Utica. In the corundum deposits of N. Carolina ruby is occasionally met with, especially at Cowee Creek, Macon county, where it occurs in crystals of tabular, rhombohedral and prismatic habit. These crystals, sometimes of fine colour, are found in gravels resting on a soft rock called sapphire, which results from the weathering of certain basic igneous rocks; and it is notable that the ruby crystals are associated with the variety of garnet termed rhodolite, as described by Professor Judd and W. E. Hiddlen. Australia has occasionally yielded rubies, but mostly of small size and inferior quality. In New South Wales and in Victoria they have been found in drift gravels, and a magenta-coloured turbid variety from Victoria has been described under the name of barklyite.

Rubies have been produced artificially with much success. At one time it was the practice to fuse together small fragments of the natural stone; and gems cut from such material were known as reconstructed rubies. This process has given way to Professor A. Verneuil's method of forming artificial ruby from purified ammonia-alum with a certain proportion of chrome-alum. The finely powdered material is caused to fall periodically into an oxyhydrogen flame, the heat of which decomposes the alum, and the alumina thus set free forms liquid drops which collect and solidify as a pear-shaped mass. When of the characteristic pigeon's-blood colour, the synthetical ruby contains about 2-5% of chrome oxide. The manufactured ruby possesses the physical character of corundum, but may generally be distinguished by microscopic bubbles and striae. The manufacture is carried out commercially. (For other processes, see Gem, Artifical.)

It should be noted that several minerals known popularly as rubies have no relation to the true red corundum. Thus, "Cape rubies" from the South African diamond mines, "Australian rubies" from South Australia, and "Arizona rubies" are merely fine garnets; Siberian "ruby" is red tourmaline (see Rubellite), and "Balas ruby" is spinel (q.v.). Ruby silver is a name applied to light red silver ore, or pyrossilite; ruby copper is merely cuprite, in brilliant crystals; and ruby-blende is a clear red variety of zinc sulphide.

BIBLIOGRAPHY.—For the Burmese ruby, see "The Rubies of Burma and Associated Minerals; their mode of occurrence, origin and metamorphoses," by C. Barrington Brown and Professor J. W. Judd, Phil. Trans., 1897, 187, p. 151. For the ruby of Siam, see "The Ruby and Sapphir Deposits of Moung Klong, Siam," by H. Louis, Mineralog. Mag., 1894, 10, p. 267. For synthetical ruby,
RUBY MINES—RUDD

RUBY MINES, a district in the Mandalay division of Upper Burma, lying along the Irrawaddy river between the Bhamo district on the N., the Shan States on the E., Mandalay district on the S. and Katha on the W. Including the Shan state of Mongmit, which is temporarily administered as part of the district, the total area is 5476 sq. m.; pop. (1901) 87,694. The district geographically forms part of the Shan plateau, and is to a great extent a mass of hills with a general N. and S. direction. It contains considerable numbers of Kachins (13,390) and Palaungs (16,400). The annual rainfall at Mogok averages 98 in. The administrative headquarters are at Mogok, which is also the centre of the ruby mining industry. It stands in the centre of 900 sq. m. above-sea-level, and is reached by a cart-road from Thabeikkyin, 61 m. distant, on the Irrawaddy. The Ruby Mines Company employs about 44 Europeans and Eurasians in its works, which are situated at the north end of the town. The company has constructed a dam across the Yeni stream and set up an electric installation of about 450 horse-power, which works pumps and the washing machinery. The mines were worked under Burmese rule, but were discontinued on account of the small profit. Now they seem to be established on a sound financial basis. The system adopted is to excavate large open pits, from which the ruby-earth or byon is removed by hand and washed and crushed by machinery. Spinells and sapphires are found with the rubies. In 1904, the produce of rubies alone was 200,000 carats, valued at £80,000, most of which were sent to London for sale. In addition, some mining is carried on by natives, working under a licence which does not permit the use of machinery. The district contains 904 sq. m. of reserved forests.

RUCKERT, JOHANN MICHAEL FRIEDRICH (1788–1860), German poet, was born at Schweinfurt on the 16th of May 1788, the eldest son of a lawyer. He was educated at the gymnasium of Nauels in Anhalt and at the universities of Würzburg and Heidelberg. For some time (1816–17) he worked on the editorial staff of the Morgenblatt at Stuttgart. Nearly the whole of the year 1818 he spent in Rome, and afterwards he lived for several years at Coburg. He was appointed a professor of Oriental languages at the university of Erlangen in 1826, and in 1841 he was called to a similar position in Berlin, where he was also made a privy councillor. In 1849 he resigned his professorship at Berlin, and went to live on his estate Neuses near Coburg. He died on the 31st of January 1866. When Ruckert began his literary career, Germany was engaged in her life-and-death struggle with Napoleon, and in his first volumes of poetry, published in 1814 under the pseudonym "Fricmund Raimar," he gave, particularly in the powerful "Geharnischte Sonette," vigorous expression to the prevailing sentiment of his countrymen. In 1815–18 appeared Napoleon, eine politische Komödie in drei Stücken (only two parts were published), and in 1817 Der Kranz der Zeit. He issued a collection of poems, Östliche Rosen, in 1822; and in 1834–38 his Gesammelte Gedichte were published in six volumes, a selection from which has passed through many editions. Rückert, who was master of thirty languages, made his mark chiefly as a translator of Oriental poetry, and as a writer of poems conceived in the spirit of Oriental masters. Much attention was attracted by a translation of Hariri's Makamen (1826), Nat und Damajanti, an Indian tale (1828), Rosamund und Suhrib, eine Heldengeschichte (1838), and Homasa, oder die ältesten arabischen Volkslieder (1846). Among his original writings dealing with Oriental subjects are Morgenländische Sagen und Geschichten (1837), Erbauliches und Beschauliches aus dem Morgenland (1836–38), and Brahmanische Erzählungen (1839). The most elaborate of his works is Die Weisheit des Brahmenom, published in six volumes in 1836–39. This last and the Liebesfrühling (1844), a cycle of love-songs, is the best known of all Rückert's productions. In 1843–45 he issued the dramaul Soul und David (1843), Herodes der Grosse (1844), Kaiser Heinrich IV. (1843) and Christofforo Columbo (1845), all of which are greatly inferior to the work to which he owes his position as the greatest of German lyricists. At the time of the Danish war in 1864 he wrote Ein Dutzend Kampffieder für Schleswig-Holstein, which, although published anonymously, produced a considerable impression. After his death many poetical translations and original poems were found among his papers, and several collections of them were published. Rückert had a splendour of imagination which made Oriental poetry congenial to him, and he has seldom been surpassed in rhythmical skill and metrical ingenuity. There are hardly any lyrical forms which are not represented among his works, and in all of them he wrote with characteristic ingenuity. His complete edition of Rücker's poetical works appeared in 12 vols. in 1868–69. Subsequent editions have been edited by L. Laistner (1869), C. Beyer (1896), G. Ellinger (1897). See also, worthy of Rückert and seine Werke (1867); C. Beyer, Friedrich Rückert, ein biographisches Denkmal (1868), Neue Mitteilungen über Rückert (1873), and Nachgelassene Gedichte Rücker's and neue Beiträge zu dessen Leben und Schriften (1877); R. Boxberger, Rückert-Studien (1878); P. de Lagarde, Erinnerungen an F. Rückert (1886); F. Muncker, Friedrich Rückert (1890); G. Voigt, Rückert's Gedankenlyrik (1891).

RÚDAGI (d. 954). Farid-éddin Mahommed 'Abdallāh, the first great literary genius of modern Persia, was born in Rūdagī, a village in Transoxiana, about 875–900. Most of his biographers assert that he was totally blind, but the accurate knowledge of colours shown in his poems makes this very doubtful. The Rūdagī story is that he was invited to the court of the Sāmadī Naṣr II. bin Ahmad, the ruler of Khorāsān and Transoxiana (913–42), who invited the poet to his court. Rūdagī became his daily companion, rose to the highest honours and amassed great wealth. In spite of various predecessors, he well deserves the title of "father of Persian literature," the "Adam or Sultan of poets," since he was the first who impressed upon every form of epic, lyric and didactic poetry its peculiar stamp and its individual character. He is also said to have been the founder of the "diwān"—that is, the typical form of the complete collection of a poet's lyrical compositions in a more or less alphabetical order which prevails to the present day among all Mahommadan writers. Of the 1,500,000 verses attributed to him, there remain only 52 kasādas, ghazals and rubā'īs; of his epic masterpieces we have nothing beyond a few stray lines in native dictionaries. But the most serious loss is that of his translation of Ibn Mokaffa's Arabic version of the old Indian fable book Kalīla und Dimnāh, which he put into Persian verse at the request of his royal patron. Numerous fragments, however, are preserved in the Persian lexicon of Asadī of Tus (ed. P. Horn, Göttingen, 1897). In his kasādas, all devoted to the praise of his sovereign and friend, Rūdagī has left us unguelled models of a refined and delicate poetry, which is very different from the often bombastic compositions of later Persian enthusiasts. His didactic odes and epigrams express in well-measured lines a sort of Epicurean philosophy of human life and human happiness; more charming still are the purely lyrical pieces in glorification of love and wine. Rūdagī survived his royal friend, and died poor and forgotten by the world.

There is a complete edition of all the extant poems of Rūdagī, in Persian text and metrical German translation, with a biographical account, based on forty-six Persian MSS. In Dr H. Ethe's "Rüder der Sämmlendichter" (Göttinger Nachrichten, 1873, pp. 663–742); see also his "Neupersische Literatur" in Gelgendorff's Geschichte des persischen und arabischen Buchdruckes in der persischen Literatur (1901), p. 73; E. G. Browne, Literary History of Persia, i. (1902); C. J. Pickering, "A Persian Chaucer" in National Review (May 1890).

RUDD, or RED-EYE (Leuciscus erythropthalmus), a fish of the Cyprinid family, spread over Europe, N. and S. of the Alps, also found in Asia Minor, and common in localities where there are still waters with muddy bottom. The colour of the fish are usually similar, and frequently confused by anglers; the former differs principally in the more posterior dorsal fin, which is situated exactly opposite the space between the ventral and anal fins. It is a fine fish, but little esteemed for food,
RUDDER—RÜDESHEIM

and rarely exceeds 12 in. in length and 2 lb in weight. It feeds on small freshwater animals and soft vegetable matter, and spawns in April or May. It readily crosses with the white bream, and more rarely with the roach and bream.

RUDDER (O.E. Roter, i.e. rorer), that part of the steering apparatus of a ship which is fastened to the stern outside, and on which the water acts directly. The word may be found to be used as if it were synonymous with "helm." But the helm (A.S. Hillf, a handle) is the handle by which the rudder is worked. The tiller, which is perhaps derived from a provincial English name for the handle of a spade, has the same meaning as the helm. In the earliest times a single oar, at the stern, was used to row the vessel round. In later times oars with large blades were fixed on the sides near the stern. In Greek and Roman vessels two sets were sometimes employed, so that if the pitching of a fixed in the head outside the ship in water, the foremost pair could still act. As these ancient ships were, at least in some cases, sharp at both ends and could sail either way, steer (or steering) oars were fixed both fore and aft. The steer oar in this form passed through a ring on the side and was supported on a crutch, and was turned by a helm, or tiller. Norse and medieval vessels had, as far as we can judge, one steer oar only placed on the right side near the stern—the name "starboard," i.e. steerside, for the right side of the ship looking forward. In the case of small vessels the steer oar possesses an advantage over the rudder, for it can bring the stern round quickly. The tiller is still used in some small boats and rowing boats which have to work against wind and tide, and in surf when the rudder will not act. It is not possible to assign any date for the displacement of the side rudder by the stern rudder. They were certainly used together, and the second displaced the first in the course of the 14th century when experience had shown that the rudder was more effective at the stern than at the side. The rudder of a wooden ship when fully developed was composed of four pieces. The first or main piece was hung on to the stern post of the ship. Its upper portion was known as the rudder head, and was at first an oval shaft which passed into the ship through the rudder port, and to which the helm was fixed. A canvas bag called a rudder coat covered the opening to exclude the water. In later days Sir R. Seppings introduced the cylindrical form in order to prevent the water from coming into the round rudder port. Three back pieces were fastened to the main piece longitudinally. The whole were fastened together by iron bands called pintle straps, which had at the forward end a pin or pintle, which fitted into braces, i.e. fixed rings on the stern post, so that the rudder hung on hinges. The lower part of the main piece was bevelled, and so was the stern post, so as to allow for the rise and fall of the ship. A projecting piece called a choke or wood-lock was fixed in the head outside the ship in order to prevent the rudder from being lifted by the water out of its hinges. A small vessel can be steered by the helm or tiller, but in a larger it is necessary to apply a mechanical leverage. This was secured by carrying ropes, or in later times chains, to the sides of the ship, and then through blocks to the upper deck, round a barrel which is worked by the wheel. The principle of the rudder cannot alter, but the means employed to work it have been altered by the introduction of the screw, and by the increased size of ships. A single screw is placed in an open space before the stern post. As the opening thus created prevents the water from flowing directly on to the rudder, a screw steamer is sometimes difficult to steer. In order to make the rudder more manageable, it has been balanced, i.e. pivoted, on a shaft placed at about a third of its length from the foremost edge. In a double screw there is no opening, but the balanced rudder is still used, and the ship can be turned by reversing one of the screws. The need for more power to work the helm has led to the introduction of steam, and hydraulic steering apparatus which can be set in motion by a small wheel.

See Burney’s Falcör’s Dictionary (London, 1830); Torr’s Ancient Ships (Cambridge, 1894); Nares, Seamanship (Portsmouth, 1882).

RUDDIMAN, THOMAS (1674–1757), Scottish classical scholar, was born on October 1674, at Ragall, Banffshire, where his father was a farmer. He was educated at Aberdeen University, and through the influence of Dr Archibald Pitcairne he was made assistant in the Advocates’ Library, Edinburgh. His chief writings at this period were editions of Florence Wilson’s De Animis Tranquillitatis Dialogos (1707), and the Cautio Solomoni Paraphrasis Poetica (1709) of Arthur Johnston (1587–1641), editor of the Delicuis Poetarum Scotiorum. On the death of Dr Pitcairne he edited his friend’s Latin verses, and arranged for the sale of his valuable library to Peter the Great of Russia. In 1714 he published Rudiments of the Latin Tongue, which was long used in Scottish schools. In 1715 he edited, with notes and annotations, the works of George Buchanan in two volumes folio. As Ruddiman was a Jacobite, the liberal views of Buchanan seemed to him to call for frequent censure. A society of scholars was formed in Edinburgh to “vindicate that incomparably learned and pious author from the calumnies of Mr Thomas Ruddiman” but Ruddiman’s remains the standard edition, though George Logan, John Love, John Man and others attacked him with great vehemence. He founded (1715) a successful printing business, and in 1728 was appointed printer to the university. He acquired the Caledonian Mercury in 1729, and in 1736 was appointed keeper of the Advocates’ Library, resigning in 1752. He died in Edinburgh, on the 19th of January 1757. Ruddiman besides the works mentioned, the following writings of Ruddiman deserve notice: An edition of Gavin Douglas’s Aeneid of Virgil (1710); the editing and completion of Anderson’s Selectus Diphraitum et Numismatum Scotiae Thesaurus (1739); Catalogue of the Advocates’ Library (1733–40); and a folio edition of other works (1751). He also helped Joseph Ames with the Typographical Antiquitates. Ruddiman was for many years the representative scholar of Scotland. Writing in 1766, Dr Johnson, after reproving Boswell for some bad Latin, significantly adds—“Ruddiman is dead.” When Boswell proposed to write Ruddiman’s life, “I should take pleasure in helping you to do honour to him,” said Johnson.

See Chalmers’s Life of Rudiment (1794); Scots Magazine, January 1757.

RUDEN, FRANÇOIS (1784–1855). French sculptor, was born at Dijon on the 4th of June 1784. Till the age of sixteen he worked at his father’s trade as a stonemason, but in 1809 he went up to Paris from the Dijon school of art, and became a pupil of Castellier, obtaining the Grand Prix in 1812. After the second restoration of the Bourbons he retired to Brussels, where he got some work under the architect Van der Straeten, who employed him to execute nine bas-reliefs in the palace of Tervueren. At Brussels Rude married Sophie Fremiet, the daughter of a Bonapartist compatriot to whom he had many obligations, but gladly availed himself of an opportunity to nut his sympathy for the cause of liberation of the Virgin for St. Guérais and a “Merry fastening his Sandals” (now in the Louvre) obtained much attention. His great success dates, however, from 1833, when he received the cross of the Legion of Honour for his statue of a “Neapolitan Fisher Boy playing with a Tortoise,” which also procured for him the important commission for all the ornament and one group in the Arc de l’Étoile. This group, the “Départ des volontaires de 1792,” a work full of energy and fire, immortalizes the name of Rude. Amongst other productions we may mention the statue of the mathematician Gaspard Monge (1848), Jeanne d’Arc, in the gardens of the Luxembourg (1852), a Calvary bronze for the high altar of St Vincent de Paul (1855), as well as “Hebe and the Eagle of Jupiter,” “Love Triumphant” and “Christ on the Cross,” all of which appeared at the Salon of 1857 after his death. He died suddenly on the 3rd of November 1855.

RUDEBAL (Lat. radix, rubbish), a botanical term for plants growing on rubbish heaps or in waste places.

RÜDESHEIM, a town of Germany in the Prussian Rhine province on the right bank of the Rhine, 19 m. S.W. of
Wiesbaden by the main line from Frankfurt-on-Main to Cologne. Pop. (1905) 4773. Its situation, at the lower end of the famous vineyard district of the Rheingau, opposite Bingen and just above the romantic gorge of the Rhine, renders it a popular tourist centre. Behind the town rises the majestic Niederwald (935 ft.), on the crest of which stands the national monument, "Germania," commemorating the war of 1870-71. Rüdesheim has some interesting towers. The Brömserburg, or Niederburg, a massive structure built in the 13th century, formerly belonging to the archbishops of Mainz; the Boosenburg, or Oberburg, which was rebuilt in 1868, with the exception of the keep; the Adlerturm, a relic of the fortifications of the town; and the Vorderburg, the remains of an old castle. The Gothic church of St James has some interesting paintings and monuments, and there is also a Protestant church. The town has electrical works, but its industries are mainly concerned with the preparation of wine, the best kinds being Rudesheimer Berg, Hinterhaus and Rotlatt.

See J. P. Schmelzeis, "Rüdesheim im Rheingau" (Rüdesheim, 1891); and Heiderlindens, "Rüdesheim and seine Umgebung" (Rüdesheim, 1888).

**RUDINI, ANTONIO STARABBA, MARQUIS DI** (1839-1906). Italian statesman, was born at Palermo on the 6th of April 1839. In 1859 he joined the revolutionary committee which paved the way for Garibaldi's triumphs in the following year; then after spending a short time at Turin as attaché to the Italian foreign office he was elected mayor of Palermo. In 1866 he displayed considerable personal courage and energy in quelling an insurrection of separatist and reactionary tendencies. The prestige thus acquired led to his appointment as prefect of Palermo, and while occupying that position he put down brigandage throughout the province; in 1868 he was prefect of Naples. In October 1869 he became minister of the interior in the Mennabrea cabinet, but he fell with that cabinet a few months later, and although elected member of parliament for Cacaniti held no important position until, upon the death of Minghetti in 1886, he became leader of the Right. Early in 1891 he succeeded Crispi as premier and minister of foreign affairs by forming a coalition cabinet with a part of the Left under Nicotera; his administration proved vacillating, but it initiated the economies by which Italian finances were put on a sound basis and also renewed the Triple Alliance. He was overthrown in May 1893 after the change of the Chamber of Deputies, but on his return of his rival, Crispi, to power in December 1893, he resumed political activity, allying himself with the Radical leader, Cavallotti. The crisis consequent upon the disaster of Adowa (1st March 1896) enabled Rudini to return to power as premier and minister of the interior in a cabinet formed by the veteran Conservative, General Ricotti. He concluded peace with Abyssinia, but endangered relations with Great Britain by the unauthorized publication of confidential diplomatic correspondence in a Green-book on Abyssinian affairs. To satisfy the anti-colonial party he ceded Kassala to Great Britain, provoking thereby much indignation in Italy. His internal policy was marked by continual yielding to Radical pressure and by persecution of Crispi. By dissolving the Chamber early in 1897 and favouring Radical candidates in the general election, he paved the way for the outbreak of May 1898, the suppression of which entailed considerable bloodshed and necessitated a state of siege at Milan, Naples, Florence and Leghorn. Indignation at the results of his policy led to his overthrow in June 1898. During his second term of office he thrice modified his cabinet (July 1896, December 1897, and May 1898) without strengthening his political position. In many respects Rudini, though leader of the Right and nominally a Conservative politician, proved a dissolving element in the Italian Conserva-
tive party by his alliance with the Liberals under Nicotera in 1891, and by his understanding with the Radicals under Cavallotti in 1894-98; by abandoning his Conservative colleague, General Ricotti, to whom he owed the premiership in 1896; and by his vacillating action after his fall from power, he divided and demoralized a constitutional party which, with greater sincerity and less reliance upon political cleverness, he might have welded into a solid parliamentary organization. At the same time he was a thorough gentleman and grand seigneur.

One of the largest and wealthiest landowners in Sicily, he managed his estates on liberal lines, and was never troubled by agrarian disturbances. The marquis, who had not been in office since 1898, died on the 6th of August 1908, leaving a son, Carlo, who married a daughter of Mr Henry Labouchere.

**RUDOK,** a small town on the Ladakh frontier of Tibet, through which all the trade of Tibet passes to Leh, and at which is maintained the Chinese outpost that for many years persistently interfered with European exploration. Rudok is picturesquely situated on the side of a hill standing isolated in the plain near the E. end of Lake Pangong, across which the official boundary between Tibet and Kashmir runs. The houses are built in tiers, whitewashed and walled in. At the top of the hill are a large palace and several monasteries painted red. About a mile away from the foot of the hill is another monastery. Rudok is about 13,500 ft. above sea-level, and the greatest altitude on the route connecting it with Lhasa is the pass of Mariom la (the water-parting between the Brahmaputra and the Sutlej) is 15,500 ft. The winter climate of Rudok and of all the towns of the Tsangpo basin, owing to the intense dryness of the air and the light fall of snow, seems to be bracing and exhilarating rather than severe. The thermometer never approaches the minimum record of Puerta (in the same latitude and at half the absolute elevation), according to the observations of native surveyors.

**RUDOLF** (otherwise known as BASSO NOROK and GALLOP), a large lake of E. equatorial Africa, forming the centre of an inland drainage system, occupying the S. of the Abyssinian Highlands and a portion of the great equatorial plateau. The lake itself lies towards the N. of the great East African rift valley, between the parallels of 3° 26' and 5° N., while the meridian of 36° E. is slightly W. of the centre of the northern wider part, the narrower southern portion bending to 36° E. The length along the curved axis is 185 m., the maximum width 37, and the area roughly 3500 sq. m. Its altitude is 1250 ft. Towards the S. it seems to be deep, but it is comparatively shallow in the N. Its water is brackish, but drinkable. The country bordering the lake on almost every side is sterile and forbidding. The S. end, for some 50 m. on the W. of the lake, is longer than the E., but is in high ridges —the escarpments of a rugged high plateau, over which, as it is traversed, shows abundant signs of volcanic activity, great changes having been reported since 1889. In particular, the great volcano of Lubururaa (Teleki's volcano) at the S. end of the lake is said to have been destroyed between 1889 and 1897 by a sudden explosion. The highest point of the S.E. side of the lake is Mount Kulal, 7812 ft., while the culminating height within the basin of the lake is Mount Sil, 9280 ft., which lies about 20 m. S. of Lubururua. Further N., on the W. side, sandy plains alternate with lines of low hills, the immediate shores (on which the water appears to have encroached in very modern times) being marked by spits of sand, which in places cut off lagoons from the main body of the lake. These are the haunt of great numbers of water-birds. In 3° 8' N. the dry bed of the Turkwell—in its upper course a large river descending the slopes of Mount Elgon—approaches the lake. Near the N. end mountains again approach the shores, the most prominent being Mount Luburutu (5200 ft.), an extinct volcano with a well-conserved crater. At the extreme N.W. corner a bay some 35 m. long (Sanderson Gulf) is almost separated from the rest of the lake by two long points of land. On the E. side, open arid plains, with few trees, occupy most of the N. country. One hill, in 3° 20' N., has a height of 10,000 ft. The climate round Lake Rudolf, and of the town of Lake Tana, is very hot and damp, and the lowland of Lake Baraa, a hilly country, the highest point between the lakes being 3524 ft. Immediately N. of these hills rises the Hummurr Range, with one peak exceeding 7000 ft. Near the S. end is the volcanic island of Elmoloo, 10 m. long, and there are a few small islets. Just N. of 4° N. is a small volcanic
island with highest point 2100 ft. At the N. end of the lake a level swampy plain is traversed by various arms of the lake and by the Nianam river. This river has been shown to be identical with the Omo, the course of which was long one of the most debated questions of African geography. Its northernmost feeders rise on the high plateau S. of the Blue Nile, in 9° 20' N., and being swollen by other streams from the E. and W., soon form a large river. During its lower course it makes two considerable bends to the W. before finally entering the lake as a deep stream a quarter of a mile wide.

Lake Rudolf (previously known on the east coast by report) was discovered in 1888 by Count Samuel Teleki and Lieutenant Ludwig von Höhnel. It was subsequently visited by Dr. Donaldson Smith, Vittorio Bottego, H. S. Cavendish, H. H. Austin, and others, and by 1905 its shores and the neighbouring country had become fairly well known. In 1907, by an agreement between the powers concerned, the N.E. end of the lake, into which the Omo debouches, was assigned to Abyssinia, the rest of the lake to Great Britain.

Maud, R.E.); Ludwig von Höhnel, Discovery of Lakes Rudolf and Stefanie (London, 1894); A. Donaldson Smith, Through Unknown African Countries (London, 1897); A. H. Neumann, Elephant-Hunting in East Equatorial Africa (London, 1898); L. Vannutelli and C. Citteni, L'Omo (Milan, 1899); M. S. Welby, Twists Sirdar and Menelik (London, 1901); H. H. Austin, Among Swamps and Giants in Equatorial Africa (1902); C. H. Sigmond, To Abyssinia through an Unknown Land (1910).

RUDOLPH I. (1218-1273), German king, son of Albert IV. count of Habsburg, and Hedwig, daughter of Ulrich count of Kyburg, was born at Limburg on the 1st of May 1218. At his father's death in 1239 Rudolph inherited the family estates in Alsace, and in 1245 he married Gertrude, daughter of Burkhard I. count of Hohenstaufen, to whom the aged Frederick II., on the death of his godfather the emperor Frederick II., and his loyalty to Frederick and to his son Conrad IV. was richly rewarded by grants of land, but in 1254 was excommunicated by Pope Innocent IV. The disorder in Germany after the fall of the Hohenstaufen afforded an opportunity for Rudolph to increase his possessions. His wife was an heiress; and on the death of his childless uncle, Hartmann VI. count of Kyburg, in 1264, he seized his valuable estates. Successful feuds with the bishops of Strassburg and Basel further augmented his wealth and his reputation; rights over various tracts of land were purchased from abbots and others; and he was also the possessor of large estates in the regions now known as Switzerland and Alsace.

These various sources of wealth and influence had rendered Rudolph the most powerful prince in S.W. Germany when, in the autumn of 1273, the princes met to elect a king. His election at Frankfurt on the 20th of September 1273 was largely due to the efforts of his brother-in-law, Frederick III. of Hohenzollern, burgrave of Nuremberg. The support of Albert duke of Saxe-Lauenburg, and of Louis II. count palatine of the Rhine and duke of upper Bavaria, had been purchased by the payment of a lump sum to two of Rudolph's daughters; so that Ottakar II. king of Bohemia, a candidate for the throne, was almost alone in his opposition. Rudolph was crowned at Aix-la-Chapelle on the 24th of October 1273, and the feast which followed has been described by Schiller in Der Graf von Habsburg. To win the approbation of the pope Rudolph renounced all imperial rights in Rome, the papal territory and Sicily, and promised to lead a new crusade; and Pope Gregory X., in spite of Ottakar's protests, not only recognized Rudolph himself, but advised Alphonso X. king of Castile, who had been chosen German king in 1257, to do the same. In November 1274 it was decided by the diet at Nuremberg that all crown estates seized since the death of the emperor Frederick II. must be restored, and that Ottakar of Bohemia must answer to the diet for not recognizing the new king. Ottakar refused to appear or to restore the provinces of Austria, Styria, Carinthia and Carniola which he had seized. He was placed under the ban; and in June 1276 war was declared against him. Having detached Henry I. duke of lower Bavaria from his side, Rudolph compelled the Bohemian king to cede the four provinces in November 1276. Ottakar was then invested with Bohemia by Rudolph, and his son Wenceslaus was betrothed to a daughter of the German king, who made a triumphal entry into Vienna. Ottakar, however, raised questions about the execution of the treaty, made an alliance with some Polish chiefs and procured the support of several German princes, including his former ally, Henry of lower Bavaria. To meet this combination Rudolph entered into an alliance with Ladislaus IV. king of Hungary, and gave additional privileges to the citizens of Vienna. On the 26th of August 1278 the rival armies met on the banks of the river March near Dürnkrut, and Ottakar was defeated and killed. Moravia was subdued and its government entrusted to Rudolph's representatives, while Wenceslaus was again betrothed to one of his daughters.

Rudolph's attention was next turned to his new possessions in Austria and the adjacent countries. He spent several years in establishing his authority there, but found some difficulty in making these provinces hereditary in his family. At length his wife, who was over 50 years old, was declared barren, and in December 1282 Rudolph invested his sons Albert and Rudolph with the duchies of Austria and Styria at Augsburg, and so laid the foundations of the greatness of the house of Habsburg.

Turning to the west he compelled Philip I. count of upper Burgundy to cede some districts to him in 1281, forced the citizens of Berne to pay the tribute which they had previously refused, and in 1286 marched against Philip's successor, Otto IV., and compelled him to do homage. In 1281 his first wife died, and on the 5th of February 1284 he married Isabella, daughter of Hugh IV. duke of Burgundy. Rudolph was not very successful in restoring internal peace to Germany. Orders were indeed issued for the establishment of landpeaces in Bavaria, Franconia and Swabia, and afterwards for the whole of Germany; but the king lacked the power, or the determination, to enforce them, although in December 1289 he led an expedition into Thuringia where he destroyed a number of robber-castles. In 1291 he attempted to secure the election of his son Albert as German king; but the princes refused on the pretext of their inability to support two kings, but perhaps because they feared the increasing power of the Habsburgs. Rudolph died at Spittal an der Drau on the 5th of July 1291 and was buried in the cathedral of that city. He had had three sons, Albert, the heir, and two other sons during whose minority his eldest son, Albert, afterwards the German king Albert I., survived him. Rudolph was a tall man with pale face and prominent nose. He possessed many excellent qualities, bravery, piety and generosity; but his reign is memorable rather in the history of the house of Habsburg than in that of the kingdom of Germany.

BIBLIOGRAPHY.—The original authorities relating to the time and life of Rudolph are found in the Monumenta Germaniae Historiae, Scriptores, Band xvii. (Hanover and Berlin, 1826 fol.). The following should also be consulted: Acta imperii sancta, Urkunden und Geschichten der Reichskammergericht, ed. by R. Beck, (Leipzig, 1879); Acta imperii inedita seculi XIII et XIV, Urkunden und Briefe zur Geschichte des Kaiserreichs, ed. by E. Winkelmann (Innsbruck, 1888); Aktenstücke zur Geschichte des deutschen Reiches unter den Kaisern Rudolph I. und Albert I., ed. by F. Kaltenbrunner (Vienna, 1880); M. Gerbert, Codex epistolarius Rudolph I. (Sanblas, 1772); F. J. Bodemann, Codex epistolarius Rudolph I. Kaiserreiches regis (Leipzig, 1857).

The best modern authorities are K. Hagen, Deutsche Geschichte von Rudolf von Habsburg bis auf die neueste Zeit (Frankfurt, 1854-57); O. Lorenz, Geschichte Rudolfs von Habsburg und Adolfs von Nassen (Vienna, 1863-67); Th. Lindner, Deutsche Geschichte unter den Habsburgern und Luxemburgern (Stuttgart, 1888-93); A. Herr, Rudolf von Habsburg (Vienna, 1874); H. von Zeihsberg, Uber das Rechtsverhältnis von Rudolf von Habsburg zu Otto von Böhmen (Vienna, 1882); H. Otto, Die Beziehungen Rudolfs von Habsburg zu Papst Gregor X. (Erlangen, 1893); A. Busson, Der Krieg von 1278 und die Schlacht bei Dürnkrut (Vienna, 1889); and O. Redlich, Rudolf von Habsburg (Innsbruck, 1903).
RUDOLPH II.—RUDOLPH THE BALD

RUDOLPH II. (1552-1612), Roman emperor, son of the emperor Maximilian II. by his wife Maria, daughter of the emperor Charles V., was born in Vienna on the 18th of July 1552. In 1563 he was sent to Spain, where his natural abilities were improved by a good education, but he lacked the frank and tolerant spirit of his father, resembling rather his uncle Philip II. of Spain. In 1572 he was crowned king of Hungary, three years later king of Bohemia; and in October 1575 he was chosen king of the Romans, or German king, at Regensburg, becoming emperor on his father's death in October 1576. The importance of Rudolph's reign is negative rather than positive, consisting more in what he did not do than in what he did; although it is questionable whether any ruler could have prevented the religious struggles of Germany and the Thirty Years' War.

The more active part of the emperor's life was the period from his accession to about 1597. During that time he attended the infrequent imperial diets, and took an interest in the struggle in the Netherlands and the defence of the empire against the Turks. He was at times suspicious of the papal policy, while his relations with Spain were somewhat inharmonious. As a convinced Roman Catholic he forwarded the progress of the counter-reformation, and in general the tolerant policy of Maximilian II. was reversed. Political as well as religious privileges were attacked; the administration was conducted by Germans; and the result was a considerable amount of discontent which became very pronounced about the opening of the 17th century. Concurrently with the growth of this unrest Rudolph had become increasingly subject to attacks of depression and eccentricity, which were so serious as to amount almost to insanity. In 1604, after a war with Turkey that had been in progress since 1593, many of the Hungarians rebelled against Rudolph and chose Stephen Boesoray as their prince. By this time the members of the Habsburg family were thoroughly alarmed at the indifference or incompetence of the emperor; and their anxieties were not diminished by the knowledge that he was in feeble health, was unmarried, and had refused to take any steps towards securing the election of a successor. In April 1606 they declared Rudolph incapable of ruling, and recognized one of his younger brothers, the archduke Matthias, afterwards emperor, as their head; and in the following June Matthias, having already with the emperor's reluctant consent taken the conduct of affairs into his own hands, made peace by granting extensive concessions of the rebellious Hungarians, and by continuing the treaty with the sultan in November of the same year. Then shaking off his lethargy Rudolph prepared to renew the war with the Turks; a move which Matthias met by throwing himself upon the support of the national party in Hungary. Matthias also found adherents in other parts of his brother's dominions, with the result that in June 1608 the emperor was compelled to cede to him the kingdom of Hungary together with the government of Austria and Moravia. Rudolph now sought the aid of the princes of the empire, and even of the Protestants; but he had met with no success in this direction when trouble arose in Bohemia. Having at first rejected the demand of the Bohemians for greater religious liberty, the emperor was soon obliged to yield to superior force, and in 1606 he acceded to the popular wishes by issuing the Letter of Majesty (Majestätsbrief), and then made similar concessions to his subjects in Silesia and elsewhere. A short reconciliation with Matthias was followed by further disorder in Bohemia, which was invaded by Rudolph's cousin, the archduke Leopold (1586-1632). The Bohemians invoked the aid of Matthias, who gathered an army; and in 1611 the emperor, practically a prisoner at Prague, was again forced to cede a kingdom to his brother. Rudolph died at Prague, his usual place of residence, on the 20th of January 1612, and was succeeded as emperor by Matthias.

Rudolph was a clever and cultured man, greatly interested in chemistry, alchemy, astronomy and astrology; he was a patron of Tycho Brahe and Kepler, and was himself something of a scholar and an artist. He was the greatest collector of his age, his agents ransacking Europe to fill his museums with rare works of art. His education at the Spanish court and an hereditary tendency to insanity, however, made him haughty, suspicious and consequently very unpopular, while even in his best days the temper of his mind was that of a recluse rather than of a ruler.

The sources for the life and times of Rudolph II. are somewhat scanty; as many of the official documents of the reign, which were mostly in Latin, and in Vienna and Prague, have been destroyed, probably during the Thirty Years' War. The best authorities, however, are: Rudolph II. epistolae ineditae, edited by B. Comte de Pace (Vienna, 1771); M. Ritter, Quellen-beiträge zur Geschicht des Kaisers Rudolf II. (Munich, 1872); and Deutsche Geschichte im Zeitalter der Gegen-reformation und des dreissigjährigen Krieges (Stuttgart, 1887 fol.); L. von Ranke, Zur deutschen Geschichte: Vom Religionsfrieden bis zum 30-jährigen Kriege (Leipzig, 1868); A. Gindely, Rudolf II. und seine Zeit (Prague, 1862-68); F. Steive, Die Verhandlungen über die Nachfolge Kaiser Rudolfs II. (Munich, 1886); in the Allgemeine Deutsche Biographie, Band xxix. (Leipzig, 1886); and Der Ursprung des dreissigjährigen Krieges (Munich, 1875); P. von Bezdol, Kaiser Rudolf II. und die heilige Liga (Munich, 1886); J. Janssen, Geschichte des Deutschen Volks seit dem Ausgang des Mittelalters (Freiburg, 1878 fol.), of which there is an English translation by M.A. Mitchell and H. Christy (London, 1896 fol.); and H. Moritz, Die Wahl Rudolfs II. (Marburg, 1893).

RUDOLPH, or Raul (d. 936), king of the Franks and duke of Burgundy, was a son of Richard duke of Burgundy, and probably a member of the Carolingian family. He became duke of Burgundy on his father's death in 921, and having married Emma, daughter of Robert duke of the Franks, assisted his father-in-law to drive the Frankish king, Charles III. (the Simple), from his throne. Robert then became king of the Franks, and when he was killed in battle in June 923 he was succeeded by Rudolph, who was crowned king at Sens in the following month. Giving Burgundy to his brother-in-law Giselaert of Vergi (d. 926), the new king was fully occupied in resisting the attacks of the Normans, and in combating the parties of Charles the Simple; but his enterprises were mainly unsuccessful, and his authority was not generally recognized. But when engaged in a struggle with his brother-in-law, Herbert II. count of Vermandois, over the possession of the county of Laon, Rudolph experienced happier fortunes. At Limoges a great victory was gained over the Normans, whose duke, William I., did homage to him in 933; invasions of Aquitaine led to the recognition of the Franks by the counts of the district; and Herbert of Vermandois was defeated and put to flight. In 935 peace was made between these rivals; and on the 14th of January 936 Rudolph died at Auxerre, leaving no sons.

See W. Lippert, König Rudolf von Frankreich (Leipzig, 1886).

RUDOLPH (d. 1080), German king, and duke of Swabia, opponent of the emperor Henry IV., was a son of Kuno count of Rheinfelden, who possessed estates in both Burgundy and Swabia. He received the duchy of Swabia from Agnes, regent and mother of the young king, Henry IV., in 1057, and two years later married the king's sister Matilda (1045-1060), and was made administrator of the kingdom of Burgundy, or Arles. Differences soon arose between the king and his brother-in-law, whose loyalty was suspected during the Thuringian war. When Henry was excommunicated and deposed by pope Gregory VII., the princes met at Forcheim, and elected Rudolph as German king. He renounced the right of investiture, disclaimed any intention of making the crown hereditary in his family, and was crowned at Mainz on the 27th of March 1077. He found no support in Swabia, but, uniting with the Saxons, won two victories over Henry's troops, and, in 1080, was recognized by the pope. On the 15th of October 1080, Rudolph was severely wounded at Hohenmölsen, and died the next day. He was buried at Merseburg, where his beautiful bronze tomb is still to be seen.

See O. Grund, Die Wahl Rudolfs von Rheinfelden zum Gegenkönig (Leipzig, 1880).

RUDOLPH, or Raul, known as RUDOLPH GLABER (Rudolph the Bald) (d. c. 1500), French chronicler, was born in
Burgundy about 853, and was in turn an inmate of the monasteries of St. Lever at Champeaux and St. Bénigne at Dijon, afterwards entering the famous abbey of Cluny, and becoming a monk at St. Germain at Auxerre before 1039. He also appears to have visited Italy. His Historiarum sui temporis libri V., dedicated to St. Odilon, abbot of Cluny, purports to be a universal history from 900 to 1044; but is an irregular narration of events in France and Burgundy. Rudolph was a strong believer in the approaching end of the world.

The Historiarum was first printed in 1596, and published by A. Duchesne in the Historiae Francorum Scritptores, tome iv. (Paris, 1615), and afterwards, in the Monumenta Germaniae Historica, Band vii.; but perhaps the best edition of the work is the one edited by M. Prou in the Collection de textes pour servir à l'étude et l'enseignement de l'histoire (Paris, 1886). Rudolph also wrote a Vita S. Galealmi, abbasit S. Bentigny, published by J. Marinell in the Acta Sacrotorum, tome vi. (Paris, 1668).

See A. Moliner, Les Sources de l'histoire de France, tome ii. (Paris, 1902); and A. Poithas, Bibliotheca historica (Berlin, 1896).

RUDOLSTADT, a town of Germany, capital of the principality of Schwarzburg-Rudolstadt, and the chief residence of the prince, lies on the left bank of the Saale, 18 m. S.W. of Jena, by the cross-roads of the literary and scientific and the most beautiful districts of Thuringia. Pop. (1905) 12,494. The picturesque town is a favourite tourist resort. Besides containing the government buildings of the little principality, Rudolstadt is well provided with schools and other institutions, including a library of 65,000 volumes. The residence of the prince is the Heideckburg, a palace on an eminence 200 ft. above the Saale, which was rebuilt after a fire in 1735, and contains a picture gallery, a magnificent banqueting hall and a library. The Ludwigsburg, another palace in the town, built in 1742, accommodates the natural history collections belonging to the prince. The principal church dates from the end of the 15th century and contains tombs and effigies of many of former princes. In the Anger, a public park between the town and the river, is the Theatre. The Rudolshad—a handsome hydropathic establishment with a richly decorated interior—lying amidst extensive grounds, is also noticeable. Various memorials in and near the town commemorate the visits of Schiller to the neighbourhood in 1787 and 1788. The industries of the place include the manufacture of porcelain, chocolate and dye-stuffs, wool-spinning and bell-foundings.

The name of Rudolstadt occurs in an inventory of the possessions of the abbey of Hersfeld in the year 800. After passing into the possession of the German kings and then of the rulers of Orlamünde and of Weimar, it came into the hands of the counts of Schwarzburg in 1335. Its civic rights were confirmed in 1404, and since 1599 it has been the residence of the ruling house of Schwarzburg-Rudolstadt.

See Renovatio, Chronik von Rudolstadt (Rudolstadt, 1860); Anemüller, Geschichtsbilder aus der Vergangenheit Rudolstädts (Rudolstadt, 1888); and Woerl, Rudolstadt (2nd ed., Leipzig, 1890).

RUDRA (probably from the root rud, "to howl," hence "the howler"), in Hindu Vedic mythology, a storm god, and father of the Maruts (the frequent hurdlers of storms). He shoots tempests at the earth, but is not essentially a malevolent deity, being invoked as a protector of cattle. In the Atharvaveda he is lord of life and death, and in later Hinduism one of the Hindu trinity, the god Siva.

See A. Macdonell, Vedic Mythology (Strassburg, 1887); Sir William Muir, Original Sanscrit Texts, iv. 299-420.

RUE (Fr. ruer, Lat. ruda, from Gr. ῥῦθ, the Peloponnesian word for the plant known as πύραυλος), the name of a woody or bushy herb, belonging to the genus Ruta, especially Ruta graveolens, the "common rue," a plant with bluish green spotted leaves and greenish yellow flowers. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in medieval and later medicine as a stimulative and irritant drug. It was commonly supposed to be much used by witches. From its association with "rue," sorrow, repentance (O. Eng. hrozwun, from hrozwanan, to be sorry for, cf. Ger. reuen), the plant was also known as "herb of grace," and was taken as the symbol of repentance.

RUEDA, LOPE DE (1510?-1567?), Spanish dramatist, was born early in the 16th century at Seville, where, according to Cervantes, he worked as a metal-beater. His name first occurs in 1534 as acting at Benavente, and between 1559 and 1561 he was manager of a strolling company which visited Segovia, Seville, Toledo, Madrid, Valencia and Córdoba. In the last-named city Rueda fell ill, and on the 21st of March 1565 made a will which he was too exhausted to sign; he probably died shortly afterwards, and is said by Cervantes to have been buried in Córdoba cathedral. He was twice married; first to a disreputable actress named Mariana, who became the mistress of the duke de Medinaceli; and second to Rafaela Angela, who bore him a daughter. His works were issued posthumously in 1567 by Timoneda, who toned down certain passages in the texts. Rueda's more ambitious plays are mostly adapted from the Italian; in Eufemia he draws on Bocaccio, in Medora he utilizes Giancarli's Zingara, in Armelina he combines Raineri's Aitilla with Cecchi's Servigiale, and in Los Engañados he uses Gli'Inganni, a comedy produced by the Sansovini, a literary society at Siena. These follow the original so closely that they give no idea of Rueda's talent; but in his pasos or prose interludes he displays an abundance of riotous humour, great knowledge of low life, and a most happy gift of dialogue. His predecessors mostly wrote for courtly audiences or for the study; Rueda with his strollers created a taste for the drama which he was able to gratify, and he is admitted both by Cervantes and Lope de Vega to be the true founder of the national theatre.

His works have been reprinted by the marquis de la Fuenfanda del Valle in the Colección de libros raros y curiosos, vols. xxiii. and xxiv.

RUEIL, a town of N. France, in the department of Seine-et-Oise, at the W. foot of Mt. Valérien, 6 m. W. of Paris by tramway. (Pop. (1906) 10,430). Rueil has a church rebuilt under Napoleon III. in exact imitation of a previous church in the Renaissance style, and containing the tombs of the Empress Josephine and her daughter Hortense de Beauharnais. In the 17th century Richelieu built a château which no longer exists. Rueil has important photographic works and manufactures of lime and cement, &c. Close to the town is the château of Malmaison, a building of the 18th century famous as the residence of the empress Josephine. It was afterwards occupied by Rueda, a literary society at Siena. In 1900 the owner, Daniel Osiris, presented it and the park to the nation; the apartments have been as far as possible restored to the condition in which they were when inhabited by Josephine and Napoleon.

RUFF, a bird so called from the very beautiful and remarkable frill of elongated feathers that, just before the breeding-season, grow thickly round the neck of the male, who is considerably larger than the female, known as the receive. In many respects this species, the Tringa pugnax of Linnaeus and the Machetes pugnax of modern ornithologists, is one of the most characteristic of its family. The best account of it given in 1813 by G. Montagu (Suppl. Orn. Dictionary), who seems to have been struck by the peculiarities of the species, and, to investigate them, visited the fens of Lincolnshire, possibly excited thereto by the example of T. Pennant, whose information, collected there in 1769, was of a kind to provoke further inquiry, while Daniel (Rural Sports, iii. p. 234) had added some other particulars, and subsequently G. Graves in 1876 repeated in the same district the experience of his predecessors. Since that time the great changes produced by the drainage of the fen-country have banished this species from nearly the whole of it, so that R. Luhboch (Obs. Pania of Norfolk, pp. 69-73) and H. Stevens (Birds of Norfolk, ii. pp. 261-271) can alone be cited as modern witnesses of its habits in England, while the trade of netting or snaring ruffs and fattening them for the table has for many years practically ceased.

The cock bird, when, to use the fensman's expression, he has
RUFFIAN—RUFFO

819

not "his show on," and the hen at all seasons, offer no very remarkable deviation from ordinary sandpipers; outwardly there is nothing, except the unequal size of the two sexes, to rouse suspicion of any abnormal peculiarity. But when spring comes all is changed. In a surprisingly short time the feathers clothing the face of the male are shed, and their place is taken by papillae or small caruncles of bright yellow or pale pink. From each side of his head sprouts a tuft of stiff curled feathers, while the feathers of the throat change colour, and beneath and around it sprouts the frill or ruff already mentioned as giving the bird his name. The feathers which form this remarkable adornment are, like those of the "ear-tufts," stiff and incurred at the end, but much longer—measuring more than 2 in. They are closely arrayed, capable of depression or elevation, and form a shield to the front of the breast impenetrable by the bill of a rival. More extraordinary than this, from one point of view, is the great variety of coloration that obtains in these temporary outgrowths. Considering the really few colours that the birds exhibit, the variation is something marvellous, so that fifty examples may be compared without finding a very close resemblance between any two of other species of Limicoline bird has, so far as is known, any tendency to it. Indeed, in many species of Limicola, as the dotterel, the godwits (q.v.), phalaropes and perhaps some others, the female is larger and more brightly coloured than the male, who in such cases seems to take upon himself some at least of the domestic duties. Both Montagu and Graves, to say nothing of other writers, state that the ruffs, in England, were far more numerous than the reeves; and their testimony can hardly be doubted; though in Germany J. F. Naumann (Vög. Deutschland's, vii. p. 544) considers that this is only the case in the earlier part of the season, and that later the females greatly outnumber the males. By no one have the ruff's characteristics been more happily described than by J. Wolley, in a communication to W. C. Hewitson (Eggs of Brit. Birds, 3d ed., p. 346), as follows:

"The ruff, like other fine gentlemen, takes much more trouble with his courtship than with his duties as a husband. Whilst the reeves are sitting on their eggs, scattered about the swamps, he is to be seen far away flitting about in flocks, and on the ground dancing and sparring with his companions. Before they are confined to their nests, it is wonderful with what devotion the females are attended by their gay followers, who seem to be trying to be more attentive than the rest. Nothing can be more expressive of humility and ardent love than some of the actions of the ruff. He throws himself prostrate on the ground, with every feather on his body standing up and quivering; but he seems as if he were afraid of coming too near his mistress. If she flies off, he starts up in a manner to almost approach her at the next place of alighting, and all his actions are full of life and spirit. But none of his spirit is expended in care for his family. He never comes to see after an egg."

The breeding-grounds of the ruff extend from Great Britain across N. Europe and Asia; but the birds become less numerous towards the E. They winter in India, reaching even Ceylon, and Africa as far as the Cape of Good Hope. The ruff also occasionally visits Iceland, and there are several well-authenticated records of its occurrence on the E. coast of the United States, while an example is stated (Ibis, 1875, p. 332) to have been received from the N. of S. America.

RUFFIAN (Fr. rufian, It. ruffiano), a brutal, violent person, a swaggerer, low bully. The etymology is obscure, but the word has been connected with "ruffler," a bully, swaggerer, one who "ruffles" (M. Du. rafeln, to pander). An early derivation, quoted in Du Cange, derives it from Lat. rufus, red, as the hair of the meretricies, with whom the ruffiani were generally associated, was red or gold, as contrasted with the black hair of sober matrons.

RUFFO, FABRIZIO (1744–1827), Neapolitan cardinal and politician, was born at San Lucido in Calabria on the 16th of September 1744. His father, Litterio Ruffo, was duke of Baranzello, and his mother, Giustiniana, was of the family of Colonna. Fabrizio owed his education to his uncle, the cardinal Thomas Ruffo, then dean of the Sacred College. In early life he secured the favour of Giovanni Angelo Bracchi di Cesera, who in 1775 became Pope Pius VI. Ruffo was placed by the pope among the chierici di camera—the clerks who formed the papal civil and financial service. He was later promoted to be treasurer-general, a post which carried with it the ministry of war. Ruffo's conduct in office was diversely judged. Colletta, the historian of Naples, speaks of him as corrupt, and Jomini repeats the charge. Ruffo's biographer, Sachinelli, says that he incurred hostility by restricting the feudal powers and rights of the landowners in the papal states. In 1791 he was removed from the treasurership, but was created cardinal on the 29th of September, though he was not in orders. He never became a priest. Ruffo went to Naples, where he was named administrator of the royal domain of Caserta, and received the abbey of S. Sophia in Benevento in commendam. When in December 1798 the French troops advanced on Naples, Ruffo fled to Palermo with the royal family. He was chosen to head a royalist movement in Calabria, where his family, though impoverished by debt, exercised large feudal powers. He was named vicar-general on the 25th of January 1799. On the 8th of February he landed at
La Cortona with a small following, and began to raise the so-called “army of the faith” in association with Fra Diavolo and other brigand leaders. Rufio had no difficulty in upsetting the republican government established by the French, and by adopting a name associated with the bandits, ‘Rufio’ was born.

The campaign has given rise to much controversy. Rufio appears to have lost favour with the king by showing a tendency to spare the republicans. He resigned his vicar-generalship to the prince of Cassero, and during the second French conquest and the reigns of Joseph Bonaparte and Murat he lived quietly in Naples. Some notice was taken of him by Napoleon, but he never held an important post. After the restoration of the Bourbons he was received into favour. During the revolutionary troubles of 1822 he was consulted by the king, and was even in office for a very short time as a “loyalist” minister. He died on 25th October 1827.

The account of Rufio given in Colletta’s History of Naples (English translation, Edinburgh, 1860) must be taken with caution. Colletta was a violent liberal partisan, who wrote in exile, and largely from memory. He has been corrected by the Duke de Lauria, Iuterno alla storia del Rivista di Napoli e Sicilia (Naples, 1835). Rufio’s own side of the question is stated in Memorie Storiche sulla vita del Cardinale Fabrizio Ruffo, by Domenico Sacchinelli (Naples, 1836). See also Fabrizio Ruffo: Revolution and Gegen-Revolution, translated by A. C. Hallett (Vienna, 1882).

RUFIIJ, a large river of German East Africa, entering the sea by a considerable delta, between 7° 45’ and 8° 13’ S. Its upper basin, which extends from N. to S. through over 300 m., is drained by three main branches, which unite to form the lower Rufiji. Of the three upper branches, the two southern, the Luvegu and the Ulanga, though shorter than the northernmost (the Ruaha), carry a greater volume of water, as they come from a more rainy region, and by their junction in 8° 35’ S., 37° 25’ E., the Rufiji proper may be said to be formed.

The Luvegu rises 10° 50’ S., 35° 50’ E., and flows N.E. in a wooded valley, 30 to 40 m. wide, and bounded on either side by a broken country, in great part uninhabited and covered with thin forest. In its lower course it is a large stream—100 to 150 yds. wide.

The Ulanga is formed by a number of streams descending from the outer escarpment of the high plateau which runs N.E. from the head of Lake Nyasa and in Uhehe becomes broken up in ranges of mountains. The most important head-stream, the Ruhudye, rises in about 9° 30’ S., 34° 40’ E. As a whole, the Ulanga valley is broad, level and swampy, the river running in a very winding course and sending off many diverging arms. It is navigable throughout the greater part of its course, having even in the dry season a passage 3 to 12 ft. deep, with a width of 40 to 120 ft. In April and May nearly all the streams overflow their banks and cover a great part of the plain.

Just below the junction of the Luvegu and Ulanga, the Rufiji flows rapidly for a short distance past the town of La Puente falls, and then N.E. in a fairly straight course to the junction of the Ruaha, in 7° 55’ S., 37° 52’ E. The most remote branch of the Ruaha rise N. of Lake Nyasa in the Livingstone mountains. The united stream makes a wide sweep to the S. of the heights of the mountains, from which it receives various tributaries, finally flowing S.E. and E. to the Rufiji. A little below the junction the Rufiji is broken by the Pangani falls, but is then navigable by small steamers to its delta. In this part of its course the river receives no large tributaries, but sends out divergent channels. The country on either side is a generally level plain, inundated, on the south, in the rains, and the river having a course of 100 to 150 m. in width, with a fall of 3 m. an hour. The main mouth of the river is that known as Simba Uranga, the bar of which can be crossed by ocean vessels at high water, but all the branches are very shallow as the apex of the delta is approached. Much of the delta is suited for rice-culture.

RUFINUS, TYRANNUS, presbyter and theologian, was born at or near Aquileia at the head of the Adriatic, probably between 340 and 345. In early manhood he entered the cloister as a catechumen, receiving baptism about 370. About the same time a visit of Jerome to Aquileia led to a close friendship between the two, and shortly after Jerome’s departure for the East Rufinus also was drawn thither (in 372 or 373) by his interest in its theology and monasticism. He first settled in Egypt, hearing the lectures of Didymus, the Origenistic head of the Monastery at Alexandria, and also cultivating friendly relations with Macarius of the other ascetics in the desert. In Egypt, if not even before leaving Italy, he had become intimately acquainted with Melania, a wealthy and devout Roman widow; and when she removed to Palestine, taking with her a number of clergy and monks on whom the scepticism of the Arians had made a deep impression, Rufinus seems also (375) followed her. While his patrician life was in a convent of her own in Jerusalem, Rufinus, at her expense, gathered together a number of monks in a monastery on the Mount of Olives, devoting himself at the same time to the study of Greek theology. This combination of the contemplative life and the life of learning had already developed in the Egyptian monasteries. When Jerome came to Bethlehem in 386, the friendship formed at Aquileia was renewed. Another of the intimates of Rufinus was John, bishop of Jerusalem, and formerly a Nitrian monk, by whom he was ordained to the priesthood in 390. In 394, in consequence of the attack upon the doctrines of Origen made by Epiphanius of Salamis during a visit to Jerusalem, a fierce quarrel broke out, which found Rufinus and Jerome on different sides; and, though three years afterwards a formal reconciliation was brought about between Jerome and John, the breach between Jerome and Rufinus remained unhealed.

In the autumn of 397 Rufinus embarked for Rome, where, finding that the theological controversies of the East were exciting much interest and curiosity, he published a Latin translation of the Apology of Pamphilus for Origen, and also (398–402) summoned Rufinus from Aquileia to Rome to vindicate his orthodoxy; but he excused himself from a personal attendance in a written Apologia pro fide sua. The pope in his reply expressly condemned Origen, but left the question of Rufinus’s orthodoxy to his own conscience. He was, however, regarded with suspicion in orthodox circles (cf. the Decretum Gelassi, § 20) in spite of his services to Christian literature. In 408 we find Rufinus at the monastery of Pinetum (in the Campagna?)—thence he was driven by the arrival of Alaric to Sicily, being accompanied by Melania in his flight. In Sicily he was engaged in translating the Homilies of Origen when he died in 410.

The original works of Rufinus are—(1) De Adulteratione Librorum Origenis—an appendix to his translation of the Apology of Pamphilus, and intended to show that many of the features in Origen’s teaching which were then held to be objectionable arose from interpolations and falsifications of the genuine text; (2) De Benedictionibus XII Patriarcharum Libri II—an exposition of Gen. xlix.; (3) Apologia s. Inversionum in Hieronymum Libri II; (4) Apologia pro Fide Sac. ad Anastasium Pontificem; (5) Historia Eremitica—consisting of the lives of thirty-three monks of the Nitrian desert; (6) Expositio Symbol, a commentary on the creed of Aquileia comparing it with that of Nicene, which is referred to in this writing in the 4th century. The Historiae Ecclesiasticae Libri XI of Rufinus consist partly of a free translation of Eusebius (10 books in 9) and partly of a continuation (bks. x. and xi.) down to the death of Theodosius the Great. The other translations of Rufinus are—(1) the Institutius Monachorum and some of the Homilies of Basil; (2) the Apology of Pamphilus, referred to above; (3) Origen’s Praelectiones; (4) Origen’s Homiliae (Gen. xiv., also Cant. and Rom.); (5) Opuscula of Gregory of Nazianzus (ed. Sententiae); (6) Sentenziarum Libri; (7) the Sententiae of Evagrius; (8) the Clementine Recognitions (the only form in which this work is now extant); (9) the Canon Paschalis of Anastasius the African; (10) he carelessly overestimated the influence which Rufinus exerted upon Western theologians by thus putting the great Greek fathers into the Latin tongue. D. Vailati’s uncompleted edition of Rufinus (vol. i. fol., Verona, 1745) contains the De Benedictionibus, the Apologies, the

See W. H. Freemantle in Dict. Chr. Biog. iv. 555–60; A. Ebert, Alter Nat. Lab. der Mittelalter im Abendlande, i. 321–27 (Leipzig, 1889); G. Krüger in Hauck-Herzog's Real-encyk. für Prof. Theol., where there is a full bibliography.

RUFUS, GAUSS VALGUIS, Latin poet, friend of Horace and Maecenas, and consul in 12 B.C. He was known as a writer of elegies and epigrams, and his contemporaries believed him capable of great things in epic. The author of the panegyric on Maecenas declares Rosinus to be the only poet capable of imitating the great man's Homer. Rufus did not, however, confine himself to poetry. He discussed grammatical questions by correspondence, translated the rhetorical manual of his teacher Apollodorus of Pergamum, and began a treatise on medicinal plants, dedicated to Augustus. Horace addressed to him the ninth ode of the second book.

Fragments in R. Weichert, Poetarum Latinorum Vitae et Carminum Reliquiae (1850); R. Unger, De C. Valgi Rui Poematis (1838); O. Kibbeck, Geschichte der römischen Dichtung (1889), ii. 1; M. Schanz, Geschichte der römischen Literatur (1899), ii. 1; Teuffel, Hist. of Roman Literature (Eng. trans., 1900), 241.

RUFUS, LUCIUS VARIUS (c. 74–14 B.C.), Roman poet of the Augustan age. He was the friend of Virgil, after whose death he and Plotius Tusca prepared the Aeneid for publication, and of Horace, for whom he and Virgil obtained an introduction to Maecenas. Horace speaks of him as a master of epic, the only poet capable of celebrating the achievements of Vipsanius Agrippa (Odes, i. 6); Virgil (under the name of Lycidas, Ecl. ix. 35) regrets that he had hitherto produced nothing comparable to the work of Varius or Helvius Cinna. From Macrobius (Saturnalia, vi. 1. 39; 2, 19) we learn that Varius composed an epic poem De Morte, some lines of which are quoted as having been imitated or appropriated by Virgil; Horace (Sat. i. 10, 43) probably alludes to another epic, and, according to the scholar on Epistles, i. 16, 27–29, these three lines are taken bodily from a panegyric of Varius on Augustus. But his most famous literary production was the tragedy Thyestes, which Quintilian (Inst. Orat. x. 1, 98) declares fits to rank with any of the Greek tragedies. The didascalia (which is preserved in a Paris MS.) informs us that it was produced at the games celebrated (20 B.C.) by Augustus in honour of the victory at Actium, and that Varius received a present of a many mistresses from the emperor.

Fragments in E. Bührens, Frag. Poetarum Romanarum (1886); monographs by A. Weichert (1836) and R. Unger (1870, 1878, 1898); M. Schanz, Geschichte der römischen Literatur (1899), ii. 1; Teuffel, Hist. of Roman Literature (Eng. trans., 1900), 233.

RUG, a term of Scandinavian origin (cf. Swed. rugg, rough hair; Norw. dial. rugga, rough), and probably connected with "rough" and "rag," originally for a kind of coarse woollen material, like frieze; hence it is used of a piece of thick material used as a wrap or covering for the knees or body in travelling or in bed, and especially for a thick mat or small-sized carpet laid on the floor (see Carpet).

RUGBY, a market town in the Rugby parliamentary division of Warwickshire, England, finely situated on a tableland rising from the S. bank of the Avon, near the Oxford Canal. Pop. of urban district (1901), 16,890. It is an important junction on the London & North-Western railway, by which it is 82½ m. N.W. from London; it is served also by the Great Central railway and by a branch of the Midland railway from Leicester. The boys' school, ranking as one of the most famous public schools in England, was founded and endowed under the will (1567) of Laurence Sheriff, a merchant grocer and servant to Queen Elizabeth, and a native either of Rugby or of the neighbouring village of Brownsover. The endowment consisted of the parishion of Brownsover, Sheriff's mansion house in Rugby, and one-third (5 acres) of his estate in Middlesex, near the Foundling Hospital, London, which, being let on building leases, gradually increased to about £5,000 a year. The full endowment was obtained in 1653. The school originally stood opposite the parish church, and was removed to its present site on the S. side of the town between 1740 and 1750. In 1809 it was rebuilt from designs by Henry Hakewill (1771–1859), the chapel, dedicated to St Lawrence, was added in 1820. At the tercentenary of the school in 1867 subscriptions were set on foot for founding scholarships, building additional schoolrooms, rebuilding or enlarging the chapel and other objects. The chapel was rebuilt and re consecrated in 1872, and further additions were made in 1898. A swimming bath was erected in 1876; the Temple observatory, containing a fine equatorial refractor by Alvan Clark, was built in 1877, and the Temple reading-room with the art museum in 1878. The workshops underneath the gymnasium were opened in 1889, and a new big school and class-rooms were erected in 1885. From about 70 to 175, the numbers attending the school have increased to nearly 600. A great impulse was given to the progress of the school during the headmastership of Thomas Arnold, 1837–42. Among Arnold's successors were Archibald Campbell Tait and Frederick Temple, both afterwards archbishops of Canterbury.

The parish church of St Andrew was rebuilt from designs by W. Butterfield and re consecrated in 1879. A tower and spire were added in 1894. An aisle commemorates John Moultrie (1799–1874), rector, widely known as the "poet-priest." The church of Holy Trinity is by Sir G. G. Scott, that of St. Mary's, by Stanlake. The church of St Mary, rebuilt by A. W. Pugin. Trade is mainly agricultural; there is a large cattle market, and several fairs are held annually.

The early history of Rugby is obscure, but a settlement of the Danes is presumed from the name, and from the neighbouring tract of Dunsmore Heath (Danesmoor). Rugby was originally a hamlet of the adjoining parish of Clifton-on-Dunsmore; and is separately treated of as such in Domesday Book. Ermuldis de Bosco (Ermalid de Bois), lord of the manor of Clifton, seems to have erected the first chapel in Rugby, in the reign of Stephen, about 1140. It was afterwards granted by him, with certain lands, to endow the abbey of St Mary, Leicester, which grant was confirmed by his successors and by royal charter of Henry II. In the second year of King John (1200) a suit took place between Henry de Rokey, lord of the manor of Rugby, and Paul, abbot of St Mary, Leicester, which resulted in the former obtaining possession of the advowson of Rugby, on condition of homage and service to the abbots of Leicester. By virtue of this agreement the chapel was converted into a parish church and the vicarage into a rectory.

RUGE, ARNOLD (1802–1880), German philosopher and political writer, was born at Bergen, in the island of Rügen, on the 13th of September 1802. He studied at Halle, Jena and Heidelberg, and became an adherent of the party which sought to create a free and united Germany. For his zeal he was exiled (1831) for fighting for national freedom. Kolinow, where he studied Plato and the Greek poets. On his release in 1830 he published Schill und die Seinen, a tragedy, and a translation of Oedipus in Colonus. Ruge settled in Halle, where in 1837 with E. T. Echtermeyer he founded the Hallesche Jahrbücher für deutsche Kunst und Wissenschaft. In this periodical he discussed the questions of the time from the point of view of the Hegelian philosophy. The Jahrbücher was detested by the orthodox party in Prussia; and was finally suppressed by the Saxon government in 1845. In Paris Ruge took part with Karl Marx as co-editor of the Deutsch-Französische Jahrbücher, but had little sympathy with St. Matthew's theories, and soon left him. In the revolutionary movement of 1848 he organized the Extreme Left in the Frankfort parliament, and for some time he lived in Berlin as the editor of the Die Reform. The Prussian government intervened and Ruge soon afterwards left for Paris, hoping, through his friend Alexandre Ledru-Rollin, to establish relations between German and French republicans; but in 1849 both Ledru-Rollin and Ruge had to take refuge in London. Here, in company with Giuseppe Mazzini and other advanced politicians, they formed a "European Democratic Committee." From this Ruge soon withdrew, and in 1850 went to Brighton, where he supported himself by teaching and writing. In 1866 and 1870 he vigorously
supported Prussia against Austria, and Germany against France. In his last years he received from the German government a pension of 1000 marks. He died on the 31st of December 1880.

Ruge was a leader in religious and political liberalism, but did not produce any work of enduring importance. In 1846-48 his Gesammelte Schriften were published in ten volumes. After this time he wrote, among other books, Unter System, Revolutions-novellen, Die Loge des Humanismus, and Aus früherer Zeit (his memoirs). He also wrote many poems, and several dramas and romances. He translated into German various English works, including the Letters of Junius and Buckle's History of Civilization. His Letters and Diary (1825-80) were published by Paul Nerring (Berlin, 1885-87). See A. W. Bolin's L. Feuerbach, pp. 127-52 (Stuttgart, 1894).

Rugeley, a market town in the Lichfield parliamentary division of Staffordshire, England, in the Trent valley. Pop. of urban district (1901), 4447. The London & North-Western railway has stations on the main line (Trent Valley, 124 m. N.W. from London), and at the town, on a branch line to Walsall. The Grand Trunk canal here follows the Trent. To the S.W. lie the hills of Cannock Chase. The church of St Augustine is modern; of the parish church of the 14th century only the tower and chancel remain. The municipal offices, market hall and assembly-room are contained in one building (1879). A grammar school was founded in 1611. There are ironfoundries, corn-mills and tanneries; and the parish includes several collieries.

Rügen, an island of Germany, in the Baltic, immediately opposite Stralsund, 13 m. off the north-west coast of Pomerania in Prussia, from which it is separated by the narrow Stralsund, or Boddin. Its shape is exceedingly irregular, and its coastline is broken by numerous bays and peninsulas, sometimes of considerable size. The general name is applied by the natives only to the roughly triangular main trunk of the island, while the larger peninsulas, the woodland extremities of which taper to narrow necks of land, are considered to be as distinct from Rügen as the various adjacent smaller islands which are also included for statistical purposes under the name. The chief peninsulas are those of Jasmund and Wittow on the north, and Mönchgut, at one time the property of the monastery of Eldena, on the south-east; and the chief neighbouring islands are Umannz and Hiddensee, both off the north-west coast. Rügen is the largest island in Germany. Its greatest length from N. to S. is 32 m.; its greatest breadth is 25½ m.; and its area is 377 sq. m. The surface gradually rises towards the west to Rugard (335 ft.)—the "eye of Rügen"—near Bergen, but the highest point is the Hertaburg (505 ft.) in Jasmund. Erratic blocks are scattered throughout the island, and the roads are made with granite. Though much of Rügen is flat and sandy, the fine beech woods which cover a great part of it, and the bold northern coast scenery combine with the convenient sea-bathing offered by the various villages around the coast to attract large numbers of visitors. The most beautiful and attractive part of the island is the peninsula of Jasmund, which terminates to the north in the Stubbenkammer (Slavonic for "rock steps"), a sheer chalk cliff, the summit of which, the Königstuhl, is 420 ft. above the sea. The east of Jasmund is clothed with an extensive beech wood called the Stübbenitz, in which lies the Borg, or Herta Lake. Connected with Jasmund by the narrow isthmus of Schabe to the west is the peninsula of Wittow, the most fertile part of the island. At its north-west extremity rises the height of Arcona, with a lighthouse.

A railway connects the island with Stralsund, and from the landing-stage at Altefähn a railway traverses the island, passing the capital Bergen to Sassnitz, on the north-east coast. Hence a regular steamboat service connects with Trelleborg in Sweden, thus affording direct communication between Berlin and Stockholm. The chief places are Garz, Sagard, Gingst and Putbus, the last being the old capital of a barony of the princes of Putbus. Sassnitz, Göhren, Sellin and Lauterbach-Putbus are among the favourite bathing resorts. Schöritz was the birthplace of the patriot and poet, Ernst Moritz Arndt. Ecclesiastically Rügen is divided into 75 parishes, in which the pastoral succession is said to be almost hereditary. The inhabitants are distinguished from those of the mainland by peculiarities of dialect, costume and habits; and even the various peninsulas differ from each other in these particulars. The peninsula of Mönchgut has preserved its peculiarities; but there, too, primitive simplicity is yielding to the influence of the great North Sea stream of summer visitors. The inhabitants raise some cattle, and Rügen has long been famous for its geese; but the only really considerable industry is fishing,—the herring-fishery being especially important. Rügen, with the neighbouring islands, forms a governmental department, with a population (1905) of 47,023.

The original Germanic inhabitants of Rügen were dispossessed by Slavs; and there are still various relics of the long reign of paganism that ensued. In the Stübbenitz and elsewhere Huns' or giants' graves are common; and near the Hertha Lake are the ruins of an ancient edifice which some have sought to identify with the shrine of the heathen deity Hertha or Nerthus, referred to by Tacitus. On Aroncs in Wittow are the remains of an ancient fortress, enclosing a temple which was destroyed in 1168 by the Danish king Waldemar I., when he made himself master of the island. Rügen was ruled then by a succession of native princes, under Danish supremacy, until 1218. After being for a century and a half in the possession of a branch of the ruling family in Pomerania, it was finally united with that duchy in 1478, and passed with it into the possession of Sweden in 1648. With the remainder of Western Pomerania Rügen has belonged to Prussia since 1815.

See Fock, Rügen-Schlesischer Geschichts- (6 vols., Leipzig, 1861-72); R. Arndt, Fairy Tales from the Island of Rügen (London, 1866).

Ruhla, a town of Germany, partly in the duchy of Saxo-Weimar and partly in that of Saxe-Coburg-Gotha. Pop. (1905) 7017. It stretches along the valley of the Erb in the Thuringian forest 8 m. S. of Eisenach, and attracts a number of visitors owing to its beautiful natural surroundings and its mineral springs. Its staple industry is the making of wooden and meerschaum pipes; it has also electrical works, and some small manufactures. Ruhla, which is known locally as Die Ruh, was famous in the middle ages for its armours and, subsequently for its cutters.

See Ziegler, Das Thüringerschloss Ruhla (Dresden, 1876).

Ruhken, David (1733-1798), one of the most illustrious scholars of the Netherlands, was of German origin, having been born in Pomerania in 1733. His parents had him educated for the church, but after two years at the university of Wittenberg he determined to live the life of a scholar. At Wittenberg Ruhken lived in close intimacy with the two most distinguished professors, Ritter and Berger. To them he owed a thorough grounding in ancient history and Roman antiquities and literature; and from them he learned a pure and vivid Latin style. At Wittenberg, too, Ruhken derived valuable mental training from study in mathematics and Roman law. Probably nothing would have severed him from his surroundings there but a desire which daily grew upon him to explore the inmost recesses of Greek literature. Neither at Wittenberg nor at any other German university was Greek in that age seriously studied. It was taught in the main to students in divinity for the sake of the Greek Testament and the early fathers of the church. F. A. Wolf, by a succession of native professors, had broken through the ancient forms and Porson's gibe that "the Germans in Greek are sadly to seek" was barred with truth. It is significant of the state of Hellenic studies in Germany in 1743 that their leading exponents were Gesner and Ernesti. Ruhken was well advised by his friends at Wittenberg to seek the university of Leiden, where, stimulated by the influence of Bentley, the great scholar Tiberius Hemsterhuis had founded the only real school of Greek learning which had existed on the Continent since the days of Joseph Scaliger and Isaac Casaubon.
Perhaps no two men of letters ever lived in closer friendship than Hemsterhuis and Ruhnken during the twenty-three years which passed after Ruhnken's expulsion from the Netherlands in 1743 to the death of Hemsterhuis in 1766. A few years made it clear that Ruhnken and Valckenerae were the two pupils of the great master on whom his inheritance must devolve. As his reputation spread, many efforts were made to attract Ruhnken back to Germany, but after settling in Leiden, he only left the country once, when he spent a year in Paris, ransacking the public libraries (1755). For work achieved, this year of Ruhnken may compare even with the famous year which Ritschl spent in Italy. In 1757 Ruhnken was appointed lecturer in Greek, to assist Hemsterhuis, and in 1761 he succeeded Ouden- dorp with the title of the 'greatary professor of history and eloquence,' but practically as Latin professor. This promotion drew him on the enmity of some native Dutchers, who deemed themselves (not without some show of reason) to possess stronger claims for a chair of Latin. The only defence made by Ruhnken was to publish works on Latin literature which eclipsed and silenced his rivals. In 1760 Valckenerae succeeded Hem- sterhuis in the Greek chair. The intimacy between the two colleagues was only broken by Valckenerae's death in 1785, and stood without stain the test of common candour for the office (an important one at Leiden) of university librarian, in which Ruhnken was so successful. Ruhnken's later life was clouded by severe domestic misfortune, and by the political commotions which, after the outbreak of the war with Eng- land in 1780, troubled the Netherlands without ceasing, and threatened to extinguish the university of Leiden. He died in 1798.

Personally, Ruhnken was as far as possible removed from being a recluse or a pedant. He had a well-knit and even handsomely framed, attractive manner (though sometimes tinged with irony), and a nature simple and healthy, and open to impressions from all sides. Fond of society, he cared little to what rank his associates belonged, if they could add anything to his knowledge or give him something to learn. His biographer even says of him in his early days that he knew how to sacrifice the Sirens without proving traitor to the Muse. Life in the open air had a great attraction for him; he was fond of sport, and would sometimes devote to it two or three days in the week. In his bearing towards other scholars Ruhnken was generous and dignified, distributing literary aid with a free hand, and meeting insulatings for the most part with a smile. In the records of learning he occupies an important position. He formed a principal link in the chain which connects Bentley with the modern scholarship of the Continent. The spirit and the aims of Hemsterhuis were carried on by his pupils. Ruhnken was committed to his trust, and were faithfully maintained. He greatly widened the circle of those who valued taste and precision in classical scholarship. He powerfully aided the emancipation of Greek studies from theology; nor must it be forgotten that he first in modern times dared to think of rescuing Plato from the hands of the professed philosophers—men presumptuous enough to interpret the ancient sage with little or no knowledge of the language in which he wrote.

Ruhnken's principal works are editions of (1) Timaeus's Lexicon of Platonic Words, (2) Thalaeus and other Greek commentators on Roman law, (3) Rutilius Lupus, and other grammarians, (4) Velleius Paterculus, (5) the works of Muretus. He also occupied himself much with the history of Greek literature, particularly the oratorical literature, with the Homeric hymns, the scholia on Plato and the Greek and Roman grammarians and rhetoricians. A discovery famous in its time was that in the text of the work of Apianus on rhetoric a large piece of a work by Longinus had been embedded. Modern editors date the writings attributed to Longinus here to the interest of this discovery without lessening its merit. The biography of Ruhnken was written by his great pupil, Wytenbach, soon after his death.

RUHR, a river of Germany, an important right-bank tribu- tary of the lower Rhine. "It rises on the north side of the Winterberg in the Sauerland, at a height of about 2000 ft. above the sea. It first takes a northerly and north-westerly course, and in a deep and well-wooded valley winds past the romantically situated town of Arnsberg. Shortly after reaching Neheim it bends to the south-west, courses through the mining district around Hagen, and receives first the left tributaries of the Lenné. Hence in a tortuous course it works its way past Witten, Steele, Kettwig and Mülheim, and, after a course of 144 m., discharges itself into the Rhine at Ruhrort. From this place the Ruhr canal connects it with Duisburg. The river is navigable from Witten downwards (43 m.), by the aid of eleven locks; but navigation is often greatly impeded through death of water.

RUHRT, a town of Germany, in the Prussian Rhine province, situated at the junction of the Ruhr and the Rhine, in the midst of a productive coal district, 15 m. N. of Düsseldorf and 12 E. of Crefeld by rail. Ruhrort has the largest river harbour in Europe, with a basin extending nearly 5 m. along the river, and it is the principal shipping centre for the coal of the Westphalian coalfield, which is despatched in the fleet of steam-tugs and barges belonging to the port. The coal is sent principally to South Germany and the Netherlands. Grain and timber are also exported and iron ore is imported. In 1905 the port was entered and cleared by over 27,000 vessels of 7,418,065 tons. The industries of the town include large iron and steel works, shipbuilding yards and tanneries. Ruhrort has three Evangelical and three Roman Catholic churches, and several schools and public institutions.

RUIZ, JUAN (c. 1283-6. 1350), Spanish poet, was born probably at Alcalá de Henares, and became arch-priest of Hita. Though he draws his physical portrait in the Libro de buen amor, he gives no exact biographical details. It may be inferred from his writings that he was not an exemplary priest, and one of the manuscripts of his poems states that he was imprisoned by order of Gil Albornoz, archbishop of Toledo, but his exact guilt is unknown whether he was sentenced for his irregularities of conduct, or on account of his satirical reflections on his ecclesiastical superiors. Nor is it possible to fix the precise date of his imprisonment. Albornoz nominally occupied the see of Toledo from 1337 to 1368, but he fell into disgrace in 1351 and fled to Avignon. A consideration of these circumstances points to the probable conclusion that Ruiz was in prison from 1337 to 1350, but this is conjecture. What seems established is that he finished the Libro de buen amor in 1343 while in gaol, and that he was no longer arch-priest of Hita in January 1351; it is assumed that he died shortly before the latter date. Ruiz is by far the most eminent poet of medieval Spain. His natural gifts were supplemented by his varied culture; he clearly had a literary knowledge of colloquial (and perhaps of literary) Arabic; his classical reading was apparently not extensive, but he knew by heart the Disticha of Dionysius Cato, and admits his indebtedness to Ovid and to the De Amore ascribed to Pamphilus; his references to Blanchefleur, to Tristan and to Yseult, indicate an acquaintance with French literature, and he utilizes the fabliaux with remarkable deftness; lastly, he adapts fables and apologies from Aesop, from Pedro Alfonso's Disciplina clericalis, and from medieval bestiaries. All these heterogeneous materials are fused in the substance of his versified autobiography, into which he intercalates devout songs, parodies of epic or forensic formulae, and lyrical digressions on every aspect of life. Ruiz, in fact, offers a complete picture of picaresque society in Spain during the first half of the 14th century, and his impartial irony lends a deeper tone to his rich colouring. He knows the weaknesses of both clergy and laity, and he dwells with equal irony on the amorous adventures of great ladies, on the perverse intrigues arranged by demure nuns behind their convent walls, and on the simpler instinctive animalism of country lasses and Moorish dancing-girls. In addition to the faculty of genial observation Ruiz has the gift of creating characters and presenting types of human nature: from his Don Furón is derived
the hungry gentleman in Lazarillo de Tormes, in Don Melón and Doña Endrina he anticipates Calisto and Melibea in the Celestina, and Celestina herself is developed from Ruiz' Trotseventos. Moreover, Ruiz was justly proud of his metrical innovations. The Libro de buen amor is mainly written in the cuaderna vía modeled on the French alexandrine, but he im- parts to the measure a variety and rapidity previously unknown in Spanish, and he experiments by introducing internal rhymes or by shortening the fourth line into an octosyllabic verse; or he boldly recasts the form of the stanza, extending it to six or seven lines with alternate verses of eight and five syllables. But his technical skill never sinks to triviality. All his writing bears the stamp of a unique personality, and, if he never attempts a sublime flight, he conveys with contagious force his enthusiasm for and under any conditions—in town, country, vagabondage or gaol.

His influence is visible in El Corbacho, the work of another jovial goliard, Alphonso Martinez de Toledo, arch-priest of Talavera, who wrote more than half a century before the Libro de buen amor was imitated by the author of the Celestina. Ruiz is mentioned with respect by Santillana, and that his reputation extended beyond Spain is proved by the surviving fragments of a Portuguese version of the Libro de buen amor. By some strange accident he was neglected, and apparently forgotten, till 1790, when an expurgated edition of his poems was published by Novoa. Antonio Sanchez; from that date his study and imitation have steadily increased, and by the unanimous verdict of all competent judges he is now ranked as the greatest Spanish poet of his century. An accurate edition of his works was published by M. Jean Ducamin at Toulouse in 1901, and he is the subject of Sr. D. Julio Puyol y Alonso's critical study, El Arcipreste de Hita (Madrid, 1904).

RUKWA (sometimes also Rikwa and Hikwa), a shallow lake in German East Africa, lying 2650 ft. above the sea in a N.W. continuation of the rift-valley which contains Lake Nyassa. The sides of the valley here run in steep parallel walls 30 to 40 m. apart, from S.E. to N.W., leaving between them a level plain extending from about 73$^{\circ}$ to 81$^{\circ}$ S. i. This whole area was probably once covered by the lake, but this has shrunk so that the permanent water occupies only a space of 30 m. by 12 at the S. immediately under the E. escarpment. In the rains its extends some 30 m. farther N., and the north of the plain is likewise then covered. On the dry season, however, the most it remains is a bare expanse intensely heated by the sun in the dry season, and forming a tract of foul mud near the lake shores. But in 1903-4 the level of the lake rose so that the waters covered the whole depression. The lake has two large feeders, one coming from the W., the other from the S.E. The W. feeder, the Saiši, or Momba, rises in 86$^{\circ}$ 50' S., 37$^{\circ}$ 30' E., and traverses a winding valley cut out of the high plateau between lakes Nyassa and Tanganyika. It enters the lake on its N.W. side. The other chief feeder, the Songwe, rises in 9$^{\circ}$ 8' S., 33$^{\circ}$ 30' E. on the same plateau as the Saiši and flows N.W., entering Rukwa at its S. end. The Songwe is joined about 50 m. about its mouth by the Rupa, whose head-waters are in the high-lying land N.E. of Rukwa. The maximum depth of the lake is about 104 ft. Its water is very brackish and of a milky colour from the mud stirred up by the wind. It contains great quantities of fish. First seen from the north by Joseph Thomson in 1880, it was visited by Dr Kaiser, a German, in 1882, and has since been thoroughly explored by various British and German travellers.

RULHIERE (or RULHIER), CLAUDE CARLOMAN DE (1735-1791), French poet and historian, was born at Bondy, near Paris, on the 12th of June 1735. He became aide-de-camp to Marshal Richelieu, whom he followed through the Hanoverian campaigns of 1735 and to his government at Bordeaux in 1758; and at twenty-five he was sent to St Petersburg as secretary of legation. Here he actually saw the revolution which seated Catherine II. on the throne, and thus obtained the facts of *Anecdotes sur la révolution de Russie* in 1762. Catherine made repeated efforts to secure the destruction of the MS., which remained unpubished until 1807. Rulhier became secretary to the comte de Provence (afterwards Louis XVIII.) in 1773, and he was admitted to the Academy in 1787. The later years of his life were spent chiefly in Paris, where he held an appointment in the Foreign Office and went much into society; but he visited Germany and Poland in 1776. His unfinished *Histoire de L'anarchie de Pologne* (4 vols., 1807) was published posthumously under the editorship of P. C. F. Daunou. The only important historical work which he published during his lifetime was his *Éclaircissements historiques sur les causes de la révoluce de l'Étât de Nantes . . .* (9 vols., 1788), undertaken in view of the restoration to the Protestants of their civil rights. Rulhier died at Bondy on the 30th of January 1791.

His short sketch of the Russian revolution is justly ranked among the masterpieces of the kind in French. Of the larger *Poland* Carlyle, as justly, complains that its allowance of fact is too small in proportion to its bulk. The author was also a fertile writer of vers de société, short satires, epigrams, &c., and he had a considerable reputation among the witty and ill-natured group also containing Nicolas Chamfort, Antoine de Rivarol, Louis René de Champsencetz, &c. On the other hand, he was one of the chief of caring for J. J. Rousseau in his morose old age, until Rousseau was content to quarrel with him.

Rulhier's works were edited, with a notice by P. R. Anguis, in 1819 (Paris, 6 vols. 8vo). The *Russian Revolution* may be found in the *Chefs-d'œuvre historiques of the Collection Didot*, and the title altered to *Rèvolutions de Pologne*, in the same collection. See also a notice by Eugène Asse prefixed to an edition 1890 of Rulhier's *Anecdotes sur le Maréchal de Richelieu; Sainte-Beuve, Contes du lendemain* (vol. iv.).

RULLUS, PUBLIUS SERVILIUS, Roman tribune of the people, in 64 B.C., well known as the proposer of one of the most far-reaching agrarian laws brought forward in Roman history. This law provided for the establishment of a commission of ten, empowered to purchase land in Italy for distribution amongst the poorer citizens and for the foundation of colonies. Its professed object was to clear Rome of the large number of pauper citizens, who formed a standing menace to peace. The members of the commission were to be invested with powers so extensive that Cicero spoke of them as ten "kings." They were to be elected for five years by seventeen of the tribes chosen by lot from the thirty-five; the imperium was to be conferred upon them by the lex curiata, together with judicial powers and the rank of praetor. Only those were eligible who personally gave in their names, a clause intended to exclude Pompey, who was at the time absent in the East. In fact, the commission as a whole was intended to act as a counterpoise to his power. The only land available for the purposes of the bill was the Ager Campanus and the Ager Stellatns, where 5000 citizens were to be settled at once, but as these were utterly insufficient, other lands were to be acquired by purchase. The necessary money was to be found by the sale of all the public property in Italy which had been ordered to be sold by resolutions of the senate (in 81, or subsequently), but which the fear of unpopularity had deterred the consuls from selling; by the sale of lands, &c., in the provinces which had become public property since 88, and even of the domains acquired during the Mithridatic war. A special article, the object of which was to pacify those who had received grants of land from Sulla, declared such possessions to be private property, for which compensation was to be paid in case of surrender. The revenues of the provinces which were now being organized by Pompey, and the booty and money taken or received by generals during war were also to be applied to this purpose. The places to which colonies were to be sent were not specified (with the exception mentioned above), so that the commissioners would be able to sell wherever they pleased, and it was left to them to decide what was public or private property.
Cicero delivered four speeches against the bill, of which three are still extant, although the first is mutilated at the beginning. The second is the most important for the history of the bill; nothing is known of the fourth. Very little enthusiasm was shown in the matter by the people, who preferred the distribution of doles in the city to the prospect of distant allotments. One of the tribunes even threatened to put his veto on the bill, which was withdrawn before the voting took place. The whole affair was obviously a political move, probably engineered by Caesar, his object being to make the democratic leaders the rulers of the state. Although Caesar could hardly have expected the bill to pass, the aristocratic party would be saddled with the odium of rejecting a popular measure, and the people themselves would be more ready to welcome (according to Cicero himself, an allusion fulfilled by the passing of the lex Julia in 50, whereby Caesar at least partly succeeded where Rullus had failed.

See the orations of Cicero De legge agraria, with the introduction in G. Long's edition, and the same author's Decline of the Roman Republic, iii. p. 241; Mommsen, Hist. of Rome, bk. v. ch. 5; art. Agrarian Laws.

RUM, or ROUM (Arab. or-Rüm), a very indefinite term in use among Mahommedans at different dates for Europeans generally and for the Byzantine empire in particular; at one time even for the Seljuk empire in Asia Minor. It is now confined to Greeks in the Ottoman territory. When the Arabs met the Byzantine Greeks, these called themselves 'Payada, or Romans, a reminiscence of the Roman conquest and of the founding of the new Rome at Byzantium. The Arabs, therefore, called them the Rüm as a race-name (already in Kor. xxx. 1), their territory the land of the Rüm, and the Mediterranean the Sea of the Rüm. The original ancient Greeks they called Ŷunân (Ionians), the ancient Romans, Rüm and sometimes Laŷnûyn ( Latins). Later, inasmuch as Muslim contact with the Byzantine Greeks was in Asia Minor, the term Rüm became fixed there geographically and remained even after the conquest by the Seljuk Turks, so that their territory was called the land of the Seljus of Rüm. But as the Mediterranean was the Sea of the Rüm, so all peoples on its coast were called sweepingly, the Rüm. In Spain any Christian slave-girl who had embraced Islam was named Rûmıya, and we find the crew of a Genoese vessel being called Romans by a Muslim traveller. The crusaders introduced the Franks (Ifranjia), and later Arabic writers recognize them and their civilization on the N. shore of the Mediterranean W. from Rome; so Ibn Khaldûn in the latter part of the 14th century. But Rûm is still used in Morocco for a Christian or European in general, instead of the now elsewhere commoner Ifranji (or Franc). (R. M.)

Beet spirit is also occasionally used for blending with genuine rum, particularly with the “flavoured” or “German” rum. The latter name originated in the fact that the rum was exported very largely to Germany for the purpose of blending. The general composition of various kinds of rum is manifest from the annexed table. The consumption of rum in the United Kingdom has fallen off considerably of late years, currently with the general tendency of the public towards lighter and “drier” alcoholic beverages (see Spirits).

Composition of Different Varieties of Rum

RUMANIA, or Rumania [România], a kingdom of southeastern Europe, situated to the north-east of the Balkan Peninsula, and on the Black Sea. Pop. (1910, estimate) 6,850,000; area, about 50,720 sq. m., or about 6500 sq. m. less than the combined areas of England and Wales. Rumania begins on the seaward side with a band of territory called the Dobrudja (q.v.); and broadens westward into the form of a blunt crescent, its northern horn being called Moldavia, its southern Walachia.

Physical Features. — Along the inner edge of this crescent run the Carpathian Mountains, also called, towards their western extremity, the Transylvanian Mountains (q.v.) or Transylvanian Alps; and the frontier which marks off Rumania from Hungary is drawn along their crests. The eastern boundary is formed by the river Pruth (Prut), between Moldavia and Russia; farther south by the Killia mouth of the Danube (Dunarea), between the Dobrudja and Russia, and by the Black Sea. In the extreme south-east, an irregular line, traced from Jalile, 10 m. S. of Mangalia, on the coast, as far as the Danube at Silistria, 85 m. inland, separates the Dobrudja from Bulgaria. Otherwise, the Danube constitutes the whole southern frontier; its right bank being Bulgarian for 290 m., and Servian for 30 m. in the extreme south, for 50 m. in the Danube, and for 80 m. in western Rumania through the Verciorova or Kazan Pass. It here resembles a long lake, overshadowed by precipitous mountains, which vary from 1000 to 2000 ft. The Danube enters Rumania from the east, 116 yds. in width, with a depth of 30 fathoms. At the eastern end of the pass are the celebrated Iron Gates, a rapid so named by the Turks, not from the surrounding heights, which here descend gradually to the river, but from the number of submerged rocks in the waterway. As it flows eastward from the frontier, the Danube gains in breadth and volume. Islands are frequent; the bank recedes and become lower until, after 50 m., they stand almost level with the water. Henceforward, for 290 m., the Rumanian shore is a desolate fen-country, varied only by a few hills, by cities, and by lagoons often 15 m. long. East of Bucharest, a series of lagoons and estuaries drain the coast. There are two large marshy islands, the upper being 57 m. long, the lower 43 m. long. Both have an average breadth of 10 m. Beyond Galatz, the river again turns eastward, branching out, near Tulcea, into three great waterways, which wind through the alluvial delta down to the sea. The southernmost, which is called the Killia Mouth; the central, the Sulina; the southern, the Str. George’s. Between Verciorova and the Sulina Mouth, the Danube traverses 540 m. Its current is rapid, and supplies the motive power for the sawmills, flour-mills, &c., at Bucharest and other towns on the Black Sea, which are worked by water-mills on the Danube. 1

1 In 1904, in a lecture read before the Rumanian Geographical Society, M. A. Sturdza showed that Rumania should not be included in the Balkan Peninsula, where it is placed by many writers and cartographers. This corrected impression of the territory covered by the term of the Rumania was forwarded to all similar associations in Europe. See A. Sturdza, La Rumanie n’appartient pas à la péninsule balkanique (Bucharest, 1904).

2 i.e. Cauldron.
power for thousands of floating watermills, which lie moored in the shallows. It is fed by many tributaries, which rise in the Carpathians as mountain torrents, growing broad and sluggish as they flow south-eastward through the central Rumanian plain. In Walachia it is joined by the Jiu (or Schyl) opposite Rahova; by the Olt (ancient Aluta) at Turnu Magurele; by the united streams of the Dimbovita (Dambovita) and Argesh (Arges) at Oltenița; by the Jalonitza (Jalomja) opposite Hîșova. The Olt pierces the Carpathians, by way of the Rothenhurm Pass, and forms the boundary of Little (i.e. western) Walachia, or Olțland. The Sereth (Siretu or Sereți) flows for about 340 m. from its Transylvanian source through Moldavia, and meets the Danube near Galatz, after receiving the Moldova, Bistritza (Bîtrîța), Trotosht (Trotosht) Milcovă, Putna, Râmațică and Buzău on the west; and the Bârlad (Bârlada) on the east. The Milcovă was the former boundary between Walachia and Moldavia. The Pruth rises on the northern limit of Moldavia, forms the eastern frontier for 330 m., and falls into the Danube near M. E. of Galatz. Its chief Rumanian tributaries are the Basheu (Basăul) and Jijia, rivers of the north. The Dobrogea (g.e.) or Dobrogen covers about 900 sq. m. between the Black Sea and the lower reaches of the Danube. Its high crystalline rocks, covered with sedimentary formations, descend abruptly towards the delta, but more gradually towards the south, where the Bulgarian steppes encroach upon Rumanian soil. The few small rivers which drain the hills generally flow seaward, but those of the delta and steppes belong to the Danubian system. The coast is a low-lying region of sandhills, mires and marshes with one lagoon, 42 m. long, connected by a short stream with the St. George Mouth. Its outlet on the sea is named the Portidj Mouth (Gara portifili) of the Danube. North of this, the lagoon is called Lake Buzău, while its southern half, that off by three long islands, is the Blue Lake (Siuo Ostru, in Bulgarian). Apart from the Dobrogea, the whole of Rumania is included in the northern basin of the lower Danube. It consists of a single inclined plane stretching upwards, with a north-westerly direction, from the left bank of the river to the summits of the Carpathians. It is divided into three zones—steppe, forest and alpine. The first begins beyond the mud-flats and reed-beds which line the water's edge, and is a vast monotonous lowland, sloping so gently as to seem almost level. The surface is a yellow clay, with patches of brown or dark grey, outliers of the Russian "black earth." Cereals, chiefly maize, with green crops and fields of gourds, alternate with fallow land overgrown by coarse grasses, weeds and stunted shrubs. Among the scanty trees, willows and poplars are commonest. The second zone extends over the foothills and lower ridges of the Carpathians. This region, called by Rumanians "the district of vines," is the most fertile portion of the country. In it grow most fruits and flowers which thrive in a temperate climate. Oaks, elms, firs, ashes and beeches are the principal forest trees. The third zone covers the higher mountains on their southern and eastern sides, whose violently contorted strata leave many transverse valleys, though usually inclining laterally towards the south-east. The birch and larch woods of this zone give way to pine forests as the altitude increases; and the pines to mosses, lichens and alpine plants, just below the jagged iron-grey peaks, many of which attain altitudes of 6000 to 8000 ft.

Geology.—The axis of the Transylvanian Alps consists of sericite schists and other similar rocks; and these are followed on the south by Jurassic, Cretaceous and Early Tertiary beds. The Jurassic and Cretaceous beds are ordinary marine sediments, but from the Cenomanian to the Oligocene the deposits are of the peculiar facies known in the Alps and Carpathians as Flysch. Further north, the Flysch forms practically the whole of the Rumanian flank of the Carpathians. Along the foot of the Carpathians lies a broad trough of Miocene salt-bearing beds, and in this trough the strata are sometimes horizontal and sometimes strongly folded. Outside the band of Miocene beds the Sarmatian, Pontian and Levanitine series, often concealed by Quaternary deposits, cover the great part of the Danube plain. Even the Pontian beds are sometimes folded. In the Dobrogea crystalline rocks, presumably of ancient date, rise through the Tertiary and recent deposits and form the hills which lie between the Danube and the Black Sea.1

Climate.—The Rumanian climate alternates between extreme cold in winter, when the thermometer may fall to 20° Fahrenheit and extreme heat in summer, when it may rise to 100° in the shade. Autumn is the mildest season; spring lasts only for a few weeks. Spring at Bucharest has a mean temperature of 56°; summer, 1 See L. Teissere and L. Mariac, *L' accept géologique sur les formations calcaires et les gisements de sel en Roumanie*, *Mém. des intérêts pétroliers roumains* (1902), pp. 3-81; S. Bergeron, *Observations relatives à la structure de la haute vallée de la Jabouilla (Roumanie) et des Carpathes roumaines*, *Bull. Soc. Geol. France*, ser. 4, vol. iv. (1904), pp. 54-77.
RUMANIA

Rumania. - Apart from Bacau, which is situated in the midst of the fertile Danubian plain, and Prahova, with its rich amber and lignite, the majority of the country is mountainous, its climate, besides being cold, is very dry and scorching in the summer, and very moist and rainy in the winter, so that the worst seasons are winter and spring. The rainfall, which is heaviest in summer, averages about 15 to 20 in.

The rivers of the Carpathian region also abound in fish, both fresh and salt water, and a number of species of Claudiota, once regarded as exclusively Transylvanian, are found south of the Carpathians. Moldavia and the Baragan Steppes are the home of various varieties of sheep and the lower kinds of mammals. Over 40 species of freshwater mussels (Unionidae) have been observed in the Rumanian rivers.

The Dniestr and the Pruth, which flow west through the country, are navigable for a considerable distance. The Danube, which flows past their mouths, is the only Rumanian river of great importance, for here it is joined by the Argez, Istria, and other rivers, which are navigable for considerable distances. The Danube has been navigable from Braila to Constanza for many centuries, but is now obstructed by swamps and other drawbacks. The red wines of Moldavia, especially the brand known as Piscic Cerbului, resemble Bordeaux.

The wine-producing countries of Europe, Rumania stood fifth in the wine production of Europe, and were surpassed by France, Germany, Austria, and Switzerland. The whites of this region are very fine, and the reds are very high in alcohol content.

The forests of Rumania are very extensive, and are worked by the government, which is the owner of the woods. The government has authorized the collection of wood for fuel, and the timber is used for building.

extent benefit the peasantry. The limited size of their farms, and the necessity for buying wood and paying for pasturage, both of which were formerly free, prevented them from obtaining complete independence of the large proprietors, on whose estates they still had 12 acres per state in.jpg

The great increase after 1907-8 is due to the inclusion of railway receipts and expenditure, with some other items not previously entered.

In May 1905 the outstanding public debt, which amounted to about 54,000,000,000, mainly placed in Germany and bearing interest at an average rate of 5%, was converted into a uniform 4% stock. This was the result of the successful negotiation over a period of fourteen years in each of the various periods allotted for repayment of the component loans. But a considerable increase in the total debt was involved, because a bonus of 10½% in new 4% stock, based on the old by lines from Jassy and Galatz to Krinl and to cover the bonus, an additional 4½% loan was raised at 90-70, amounting to 14,000,000, redeemable in 1945. At the beginning of the fiscal year 1909-10 (March 31st, O.S.) the total outstanding debt was 58,357,000, and the debt charges for the year were estimated at £5,518,080.

**Banks and Currency.**—Apart from the General Bank of Rumania (capital and reserves 1910, £5,500,000), which is owned by the municipalities mainly of Germany, are the largest credit establishments belonging to the state. They include the National Bank (capital and reserves in 1910, £1,560,000), founded in 1880; the Agricultural Loan Bank, founded in 1894; the Rural Credit Bank. There are credit institutions established by the public, in each of the agricultural districts, and by the state to defray expenses. The price to be paid for the land differed in different districts, and was to be paid to the state in small annual installments. In May 1905 the outstanding public debt, which amounted to about 54,000,000,000, mainly placed in Germany and bearing interest at an average rate of 5%, was converted into a uniform 4% stock. This was the result of the successful negotiation over a period of fourteen years in each of the various periods allotted for repayment of the component loans. But a considerable increase in the total debt was involved, because a bonus of 10½% in new 4% stock, based on the old by lines from Jassy and Galatz to Krinl and to cover the bonus, an additional 4½% loan was raised at 90-70, amounting to 14,000,000, redeemable in 1945. At the beginning of the fiscal year 1909-10 (March 31st, O.S.) the total outstanding debt was 58,357,000, and the debt charges for the year were estimated at £5,518,080.

**Fisheries.**—Among European freshwater fishing-grounds, the Danube is only surpassed by the Volga: the most valuable fish being sturgeon and sterlet, mostly netted in the St. George's mouth; carp, often weighing 50 lb; pike, perch, tench and eels. By an act of 1865, a close period was instituted, the lakes and rivers restocked, and the state fisheries, which are either farmed by private companies or directly administered, were set in a regular position. The cultivation grey Rumanian caviare is forwarded to Berlin, and there blended with Russian caviare. Flounders and mullet are caught in the Black Sea, and there are oyster-beds in the delta and on the Dobrudja line. The salt, which is marketed in Athens, is permitted to be sent to Russia and Austria-Hungary. Fish of inferior quality is imported, chiefly from Russia.

**Manufactures and Commerce.**—The native mines, fields and forests furnish raw material for most of the few factories which exist. These include petroleum refineries, iron foundries, distilleries, flour mills, sugar refineries, sawmills, paper mills, chemical works, glass and porcelain works. In 1905, 62 factories were opened, and 77 were closed. A law passed in 1908 provided that any one undertaking to found an industrial establishment with a capital of at least £2,000, or employing at least 25 workmen (of whom two-thirds should be Rumanians), should be granted 20 years' exemption, and all direct taxes, freedom from customs dues for machinery and raw material imported, exemption from road taxes, reduction in cost of carriage of materials on the state railways, and preferential rights to the supply of manufactured articles to the state.

The following table shows the value of Rumanian imports and exports for five years:

</table>

The principal imports are metals and machinery (£3,510,000 in 1908), textiles, silk, wool, hair and hides. Grain (£1,317,000 in 1908), petroleum (£1,543,000) and timber (£1,069,000) are by far the most important exports, the remainder consisting of live-stock the animal products, fruit, vegetables and mineral waters. In 1908, 1909 and 1910, the exports of Rumanian goods were (in order): Belgium, Great Britain and Italy; the chief exporters to Rumania were Germany, Austria-Hungary, Great Britain and France. The wide fluctuations in Rumanian commerce are largely due to the dependence of the country on the grain trade.

**Finance.**—The state revenue is derived from customs; from public works and public land; from indirect taxes on the stamps and the sale of alcohol and traders' registration fees; from the tobacco, salt, match, playing-card and cigarette-paper monopolies; and from the postal, telegraphic and telephone services. The chief items of expenditure are the national debt, and the cost of defence, public works and education.
RUMANIA

The population number 5,912,520 in 1899, and about 6,850,000 in 1910. Fully 6,000,000 of these were Rumans or Vlachs (g.v.). The population of foreign descent comprises many Jews, Armenians, gipsies, Greeks, Germans, Turks, Tatars and Magyars, Servians and Bulgarians. The Jews increase more rapidly than any of these peoples except the Armenians. They usually congregate in the larger towns, though in northern Moldavia there are a few purely Jewish villages, recalling those of Poland.

The gipsies, who are mostly converts to the Orthodox Church, still, as a rule, cling to their vagabond existence, though their skill at handicrafts finds them ready employment in the towns. During their centuries of slavery, they were organized into castes, as musicians, metal workers, masons, &c.; but after about 1850 the bonds of caste were gradually relaxed and gipsies began to intermarry with Rumans. The Gypsies form a floating population of merchants and small traders, anxious to amass a fortune and return home. German and Austrian business men visit the country in large numbers, and colonies of German farmers flourish among the mountains of Little Walachia. In central Moldavia there is a large population of Magyar descent, and the Servian and Bulgarian elements are strong near the Danube. The interior of the Dobrudja is occupied largely by Turks and Bulgarians, with Tatars, Russians and Armenians, but here the Romanians steadily gain ground at the expense of the alien. At Megidia, a flourishing town of about 10,000 inhabitants, which sprang up after 1860 between Cernavoda and Constantza, the Tatars predominate. Russians of the Lipovan sect live in exile in Bucharest and other cities, earning a livelihood as cab-drivers, and wearing the long coats and round caps of their countrymen.

National Character.—Two dissimilar types are noticeable among the Rumans. One is fair-haired, florid and blue-eyed; the other, more frequent among the Carpathians, is dark, resembling the southern Italians. Both alike are hearty, though rarely tall; both, when of the peasant class, frugal and inured to toil amid the rigours of their native climate. Proud of their race and country, they acquired, with their independence, an ardent sense of nationality; and they look forward to the day which will reunite them to their kinsmen in Transylvania and Bessarabia. They have been taught, originally in the interests of Transylvanian Roman Catholicism, to regard themselves as true descendants of the Romans. The peasants retain their distinctive dress, long discarded, except on festivals and at court, by the wealthier classes. Men wear a long linen tunic, leather belt, white woolen trousers and leather gaiters, above Turkish slippers or sandals. The women's head-dress is generally a high cylindrical cap of rough cloth or felt, while the mountaineers prefer a small round straw hat. Sundays and holidays bring out a sleeveless jacket, embroidered in red and gold; and both sexes wear sheepkins in cold weather. The linen dresses of women are fastened by a long sash or girdle, wound many times round the waist; the holiday attire being a white gown covered with embroideries, one or more brightly coloured aprons and necklaces of beads or coins. The standard of comfort is lowest along the Danube and in parts of the Dobrudja. As the land becomes higher, the dwellings improve; but, despite the presence of a doctor in each commune, disease is everywhere rife. Many villages are wholly built of timber and thatch, especially amongst the Carpathians, the floors being frequently raised on piles, several feet above the ground. The inner walls are often hung with hand-woven tapestries, which harmonize well with the smoke-blackened rafters, the primitive loom and the huge Dutch stove characteristic of a prosperous Rumanian farm. Many pagan beliefs linger on in the country, where vampires, witches and the evil eye are dreaded by all. The peasants reassure themselves by the use of charms and spells, and by a strict observance of the forms which their creed prescribes. A cross is kept very well or burning; every house has its coat of arms and sacred pictures. Church festivals for the most part are kept with equal care. For months together a Ruman will subsist on vegetables and mamaliga, the maize porridge that forms his staple diet. Beef and mutton are rarely touched, and in some districts pork is only eaten on St Hilary's day (the 20th of December, O.S.). Veal is the one kind of meat generally consumed. Wine and plum-spirit, or the more powerful brandy distilled from grain, are drunk in great quantities by the townsfolk, more sparingly by countrymen; Rumans generally being more sober than the western Europeans. The ceremonies which accompany a wedding preserve the tradition of marriage by capture; a peasant bride must enter her new home carrying bread and salt, and in parts of Walachia a flower is painted on the outer wall of cottages in which there is a girl old enough to marry. Young men swear eternal brotherhood; girls, eternal sisterhood; and the Church ratifies their choice in a service at which the feet of the pair are chained together. This relationship is morally and legally regarded as not less binding than kinship by birth. The dead are borne to the grave with uncovered faces, and a Rumanian funeral is a scene of much barbaric display. All classes delight in music and dancing. Women hold spinning-parties at which the leader begins a ballad, and each in turn contributes a verse. A number of satirical folk-tales (largely of Turkish origin) are current at the expense of Jew, gipsy or parish priest. The Rumanian folk-songs, sung and often improvised by the villagers, or by a wandering guitar-player (coboz), are of exceptional interest and beauty (see Literature, below). The national dances and music closely resemble those of the Southern Slavs (see Montenegro and Bulgaria).

Constitution.—In 1866, Prince Charles of Hohenzollern-Sigmaringen was chosen prince of Rumania by a constituent assembly elected under universal suffrage. This assembly at the same time drew up a constitution, which remains in force, though modified in 1879 and 1884. In 1881, Prince Charles was proclaimed king. As he proved childless, the succession was accepted by his brother, Prince Leopold, on behalf of his son William; and in 1888 William renounced his claim in favour of Ferdinand his younger brother. Thus the monarchy became hereditary in the family of Hohenzollern-Sigmaringen. No woman may ascend the throne; and, in default of a male heir, the representatives of the people can choose a king among the royal families of western Europe. Parliament consists of a senate, elected for eight years, and
a chamber of deputies, elected for four years. Senators must be forty years old and possess an income of 4,000 leu (£360). They are chosen by two colleges of electors; one composed of citizens with an income of 800 leu; the other, of citizens with incomes varying from 432 to 860. The heir-apparent, the two archbishops, the six bishops and the rectors of both universities, sit ex officio in the senate. For the chamber of deputies, all citizens over twenty-five who have had some technical difficulties, and requires a separate vote of the legislature in every individual case. Deputies must be not less than twenty-five years of age. Both senates and deputies receive 20 leu for each day of actual attendance, and travel free on the railways. The king may temporarily veto any measure passed by parliament. Executive power is vested in a council under the presidency of a prime minister, and representing the ministers of foreign affairs; justice; the interior; religion and education; war; finance; agriculture, trade, industry and public domains; and public works. Entire liberty of speech, assembly and the press is guaranteed by the constitution, and also the titles and privileges of the boia or nobles were abolished.

For purposes of local government, Rumania is divided into 32 departments, each controlled by a prefect and subdivided into sub-prefectures and communities. The sub-prefectures (p partially correspond with the French arrondissements. Prefects and sub-prefectures are appointed by the state, the departments being elected. Very heavy octroi duties provide the means of municipal administration.

Law and Justice.—Until the 17th century justice was administered according to custom and precedent, or, in ecclesiastical cases, by the rules of an ill-defined canon law. The first change was introduced by Matthias Bassara, prince of Walachia (1633-51), and by Basili the Wolf, prince of Moldavia (1643-53). Basili drew up a criminal code, on the principle of "an eye for an eye." Thus, a man guilty of arson was burned alive. No idea of equality before the law as yet existed; nobles might only be beheaded or banished. Bassara's code, and the civil code of Rumania, based on the criminal code, with a number of civil enactments, based on Roman law, and regulating testaments, guardianship, &c. The next great advance began with the Russian protectorate over Rumania (1828-56), when many changes were introduced. The ancient princely jurisdiction was abolished, and a petty court in each rural commune. But nothing was yet done to modify the relative positions of noble and serf. The growth of the present system dates from the union of Moldavia and Walachia in 1859. The main provisions of Rumanian law are drawn from the codes of western powers, especially the Code Napoleon. Besides the communal courts, there are quarter-sessional or circuit courts, where simple cases are decided. An appeal from these courts is ultimately decided by the departmental courts, which sit in every capital of a department, and in which sessions are held, at stated times, for the trial by jury of serious offences. Any appeal from the departmental courts is brought before the provincial courts or councils of the kingdom of Jassy; and thence, if necessary, to the supreme tribunal, or court of cassation (Curtea de Cassatie), which sits in Bucharest.

Defence.—At the accession of Prince Charles, the Rumanian army consisted of some 16,000 levies, led by adventurers from any country, provided with no uniform, and, in many cases, armed only with pikes or sabres. Under Prince Charles universal and compulsory service was established. The present system, in which his reforms have been culminated, rests upon a law of 1861, and is theoretically based upon service of three years, every citizen between the ages of 21 to 30, in the army of a professional officer, and every citizen over the age of 18, in the army of a volunteer officer. By this law the forces are divided into three sections. The first is composed of men between the ages of 21 and 30, enrolled in the field army, to be paid in cash and armed with a light sword. Every citizen must serve from his 30th to his 35th year in the second section, or territorial militia, which musters in spring for shooting-practice and in the autumn for field manoeuvres. In the militia are included some 250,000 men. Every village of 500 inhabitants is divided into a block, chosen by lot from the yearly contingent of conscripts but not immediately summoned for duty in the field army. Finally, every citizen between the ages of 36 and 46 belongs to the third section, called the Gheata (Landsturm), which can only be called upon for home service in war. In time of peace the field army consists of four complete army corps, with headquarters at Craiova, Bucharest, Kishinev and Jassy; besides a cavalry division with headquarters at Craiova, and a separate cavalry division with headquarters at Bucharest. Its peace strength in 1909-10 was 44,155 officers, 89,227 non-commissioned officers and men, and 108,500 men. It is armed with the Mannlicher magazine rifle (model 1893), the cavalry with the Mannlicher carbine, the horse and field artillery with Krupp quick-firing guns. On a war footing the field army would consist of 115,000 men. In all 4,500,000 men, but up to 1910 this branch of the service was not completely organized. The arrangements for mobilization are otherwise very efficient. The army and the navy are held in a high state of efficiency. The war budget for 1909-10 was £2,721,000.

The fortifications designed in 1852 by the Belgian engineer, General Briandont, and completed at a cost of more than £4,000,000, are one of the best-known of the French military defenses. The Sereth Line, an entrenchment extending over a front of 45 m. from Galatz to Focshani, and intended to cover an army of defence against hostile forces from the North-East, and of the outworks which the Bucharest the largest fortified camp in the world, except Paris. All these fortifications, including the additional works at Galatz and Focshani, are strongly armed with Kruyp and Grasun guns.

The Rumanian navy is divided into two squadrons; one for the Danube, with headquarters at Galatz; one for the Black Sea, with headquarters at Constantinza. In 1909-10 the fleet comprised 16 vessels, five of which are torpedoes and three for the Far Eastern war; a training-ship, a despatch-boat, a ship for the mining service and numerous vessels for naval police. The state possesses a floating dock and a marine arsenal at Constantza. The State Church of Rumania, which is governed by a Holy Synod, professes the Orthodoxy Oriental creed. Its independence was formally recognized by the ecclesiastical patriarchs of Constantinople, in 885. The Rumanian Church had claimed its independence from very ancient times, but under the Turkish suzerainty and Phanariote hospodars Greeks were generally elected as bishops, and the influence of the Greek patriarch at Constantinople came to be more and more felt. In 1832 it was decided to elect to all foreign prelates. In 1872 a law was passed by which the bishops were elected by the senate, the chamber of deputies, and the synod sitting as an assembly (the only other occasion on which provision is made for hierarchy without any apparent heir). It was subsequently decided to consecrate the holy oil in Rumania instead of procuring it from Russia or Constantinople; but the Greek patriarch protested. Secret negotiations were entered into which came to a successful issue. The patriarch feared on the one hand that the growing influence of the Russian Church would give a colour of Slavism to the whole church, and that a Russian might eventually be appointed ecclesiastical patriarch at Constantinople, while the Rumanians hoped by means of the independence of their church to deprive the Russians of all excuse for interfering in their internal affairs under the pretext of protecting what they considered their "national" church. The independence, agreed to recognize the patriarch at Constantinople as the chief dignitary of the Orthodox Church.

The metropolitan archbishop of Bucharest, officiating in a styled manner, is recognized by Rumania and Constantinople, and serves the Holy Synod; the other members being the metropolitan of Jassy (primate of Moldavia), the six bishops of Râmniuș Vâlcea, Roman, Hushî, Buzău, Curtea de Argeș and the Lower Danube (Galatz); together with eight bishops in patria, their coadjutors. Metropolitan and bishops are elected by the senate and deputies, sitting together. In Hungary there are a uniate metropolitan and three bishops belonging to the Rumanian church. These secular clergy marry before ordination; and only regular clergy (calugari) are eligible for high prebend. Although many convents had been closed and utilized for secular purposes, there were in 1910 no less than 168, including 49 in Bucharest alone. Many of these were the result of the brief period in which many monasteries and nunneries were held by alien foundations, such as the convents of Mount Athos and Jerusalem; while the revenues of many more were spent abroad by the patriarch of Constantinople. Religious liberty is fully conceded to all churches, including those of the Protestants, Armenians and Lipovans having their own places of worship.

Education.—Primary education is free and compulsory, where secular clergy marry before ordination; and only regular clergy (calugari) are eligible for high prebend. Although many convents had been closed and utilized for secular purposes, there were in 1910 no less than 168, including 49 in Bucharest alone. Many of these were the result of the brief period in which many monasteries and nunneries were held by alien foundations, such as the convents of Mount Athos and Jerusalem; while the revenues of many more were spent abroad by the patriarch of Constantinople. Religious liberty is fully conceded to all churches, including those of the Protestants, Armenians and Lipovans having their own places of worship.

Although many convents had been closed and utilized for secular purposes, there were in 1910 no less than 168, including 49 in Bucharest alone. Many of these were the result of the brief period in which many monasteries and nunneries were held by alien foundations, such as the convents of Mount Athos and Jerusalem; while the revenues of many more were spent abroad by the patriarch of Constantinople. Religious liberty is fully conceded to all churches, including those of the Protestants, Armenians and Lipovans having their own places of worship.
Secondary and higher education are also free. There are gymnasia, or grammar schools of four classes, roughly corresponding with the first three of eight classes, which answer to the German gymnasia. Up to the fourth class all pupils are taught alike in the lyceums; in the fifth, however, they are divided into a literary or "humanistic" section, and a scientific or "technical" section. The latter is taught in the grammar class. English and Italian being added for the "realists." Greek and Latin for the "humanists." Technical instruction is given in the agricultural schools; in various arts and crafts institutes, such as the Bucharest School of Jassy; in the several colleges of Bucharest; in numerous commercial schools, and in schools of domestic economy for girls. In 1909-10 there were four rech and seven training schools for teachers and training schools.

The cost of education is largely borne by the communes, as well as by the state. At Bucharest and Jassy there are universities with faculties of law, science and medicine.

Antiquities. — The history of primitive civilization in Rumania can be traced back to the Neolithic Age; numerous remains of this period have been found at Voigadra in the Romanat-Dap department. Rumanian rule left a deep imprint on the country. The following Roman towns have been identified: (1) in the Dobrudja, Cius (Hirsova), Troesmis (Igliza), Arrubium (Machin), Vidunun (Isacala), Istru (Karahanian), Theaueum (Adam Klissi), Khallaz (Khalgula), Toni (Constantza); (2) in Moldavia, Doinogia (Tigindia); (3) in Walachia, Drobetae (Turnu Severin), Malva (Cesca), Castra Nova (Craiova), Romula (Resca), Sorium (Rusiori de Vede), Pelenandva (Bric-Fadacs); (4) in Bessarabia, Dragasani (Dargaz); Triaina (Râmnicu Văcărescu), Arutela (Bivolari), Pons Vetus (Caieni), Komidava (Petroasa), Rimdavita (Buzau). A great military road encircled the Dobrudja hills and skirted the Bulgarian shore of the Danube for some distance, until it was cut by a ferry; a little less than two leagues from the coast of the Black Sea and striking northwards into Transylvania, up the Olten valley, the other bending westwards until it reached the Jiu, and there diverging southwards to Turnu Severin, and thence eastwards to the Black Sea. The plains near the Olten and Jiu estuaries are rich in Roman remains, notably in the towns of Caracal, Grojdibod and Iasla. Ruins and inscriptions may be seen at Resca, a town of Slavenni, villas and a stadium of the Roman period (A.D. 161 - 192) at Cesca, and at Petroasa, close by. The celebrated treasure of Petroasa (commonly written Petrosoa), preserved in Bucharest museum, consists of embossed and jewelled gold plate, and probably dates from the middle of the 1st century A.D. See Petroasa.

Bibliography.—A list of the numerous statistical and other official publications issued at Bucharest in Rumanian or French is given yearly in Annual Statistical of Rumania. The final results of the census of 1890 were published by the ministry of agriculture in 1900. See also G. C. Beier, La Roumanie en 1893 (1902); A. de Gebartus, La Roumanie et les Roumains (Florence, 1868); E. de Martonne, La Valachie, essai de monographie géographique (Paris, 1886), with maps; (5) R. Feul. and Prezea (1882); G. Beuger, Rumania in 1900 (trans. from the German by A. H. Keane (London, 1901)); A. Bellessort, La Roumanie contemporaine (Paris, 1900), with maps, that La Roumanie au temps de Sa Majesté le Roi Carol I. (Bucharest, 1907); I. Vulunt, Istoria a Râmnicului (Bucharest, 1908); G. D. History

Introduction. — The earliest record of the lands which constitute the kingdom of Rumania begins with the period immediately preceding their conquest by the Romans.

Dacia. — From the 6th to the 12th century, wave after wave of barbarian conquerors, Goths, Tatars, Slavs and others, passed over the country, and, according to one school of historians, almost obliterated its original Daco-Roman population; the modern Vlachs, on this theory, representing a later body of immigrants from Transdanubian territory. According to others, the ancient inhabitants were, at worst, only submerged for a time, and their direct descendants are the Rumanians today. Each of these conflicting views is supported by strong evidence; and the whole controversy, too large and too obscure for discussion here, is considered under the heading Vlachs.

Towards the close of the 13th century, Walachia and Moldavia were occupied by a mixed population, composed partly of Vlachs, but mainly of Slavs and Tatars; in Great Walachia, also called Muntenia, the Petchenegs and Cumanians predominated. Rumanian historians have striven by piecing together the stray fragments of evidence which survive, to prove that their Vlach ancestors had not, as sometimes alleged, been reduced to a scattered community of nomadic shepherds, dwelling among the Carpathians as the serfs of their more powerful neighbours. The researches of Hascecu, Xenopol and other historians tend to show the existence of a highly organized Vlach society in Transylvania, Oltland and certain districts of Hungary and Moldavia; of a settled commonality, agricultural rather than pastoral; and of a hereditary feudal nobility, bound to pay tribute and render military service to the Hungarian crown, but enjoying many privileges, which were defined by a distinct customary law (jus cosinica). Although the characteristic titles of voivode, knez and ban (all implying military as well as civil authority) are of Slavonic origin, and perhaps derived from the practice of the later Bulgarian (or Bulgaro-Vlachian) empire, the growth of Vlach feudal institutions is attributed to German influences, which permeated through Hungarian channels into the Vlach world, and transformed the primitive tribal chiefs into a feudal aristocracy of boiers or boyards (nobles).

With the 13th century, at latest, begins the authentic political history of the Vlachs in Rumania, but it is not the history of a united people. The two principalities of Walachia and Moldavia developed separately, and each has its own annals. After the 1320's, it becomes possible to trace the progress of these Danubian Principalties in a single narrative, owing to the uniform system of administration adopted by the Turkish authorities, and the rapid contemporary growth of a national consciousness among the Vlachs. At last, in 1859, the two principalities were finally united under the name of Rumania. The subjoined history of the country is arranged under the four headings: Walachia, Moldavia, the Danubian Principalties and Rumania, in order to emphasize this historical development.

Walachia. — Tradition, as embodied in a native chronicle of the 16th century, entitled the History of the Rumanian Land since the Arrival of the Romans (Istoria bitet Romântst de condău au descăltâci Rominul), gives a precise account of the founding of the Walachian state by Radu Negru, or Rudolf the Black (otherwise known as Negru Voda, or the Black Prince), voivode of the Romans of Fugaras in Transylvania, who in 1200 descended with a numerous people into the Transalpine plain and established his capital first at Câmpulung and then at Curtea de Argeș. Radu dies in 1310, and is succeeded by a series of voivodes whose names and dates are duly given; but this early chapter of Walachian history has been regarded by later students as fictitious. A considerable body of Vlachs doubtless emigrated from Hungary at this time, and founded in Walachia a principality dependent 1 I.e. Walachia east of the Olt, not to be confused with the Meveția Bâlăia in southern Macedonia (see Balkan Peninsula).

2 In later Rumanian history there arose a class who obtained their rank by merit or favour, and did not necessarily bequeath it to their heirs. But the hereditary aristocracy also survived, and feudalism remained characteristic of Rumanian society up to 1860.
on the Hungarian crown; but material is lacking for a detailed description of the movement.

In 1330 the voivode John Bassaraba 1 or Bazarra the Great (1310–38) succeeded in inflicting a crushing defeat on his suzerain King Charles I of Hungary, and for fourteen years Walachia enjoyed complete independence. Louis the Great (1342–82) succeeded for a while in restoring the Hungarian supremacy, but in 1367 the voivode Vlad or Vladislav inflicted another severe defeat on the Hungarians, and succeeded for a time in ousting the Magyar governor of Turnu Severin, and thus incorporating Olțand in his own dominions. Subsequently, in order to retain a hold on the loyalty of the Walachian voivode, the king of Hungary invested him with the title of duke of Fojorah and Omalas, Rumanian districts in Transylvania.

Under the voivode Mircea (1386–1418), whose prowess is still celebrated in the national folk-songs, Walachia played for a while a more ambitious part. This prince during the earlier part of his reign sought a counterpoise to Hungarian influence in close alliance with King Ladislaus V. of Poland. He added to his other titles that of "count of Severin, doughter of the sea, and lord of Silistria," which in Vidin and Sistora appear in his possession. A Walachian contingent, apparently Mircea's, aided the Servian taar Lazar in his vain endeavour to resist the Turks at Kossovo (1389); later he allied himself with his former enemy Sigismund of Hungary against the Turkish sultan Bayezid I., who inflicted a crushing defeat on the allied armies at Nikopolis in 1396. Bayezid subsequently invaded and laid waste a large part of Walachia, but the voivode succeeded in inflicting considerable loss on the retiring Turks, and the capture of Bayezid by Timur in 1402 gave the country a reprieve. In the internecine struggle that followed amongst the sons of Bayezid, Mircea espoused the cause of Musa; but, though he thus obtained for a while considerable influence in the Turkish councils, this policy eventually drew on him the vengeance of the sultan Mahomet I., who succeeded in reducing him to a tributary position.

During the succeeding period the Walachian princes appear alternately as the allies of Hungary or the creatures of the Turk. In the later battle of Kossovo of 1448, between the Hungarians, led by Hunyadi János and the sultan Murad II., the Walachian contingent treacherously surrendered to the Turks; but this did not hinder the victorious sultan from massacring the prisoners and adding to the tribute a yearly contribution of 3000 javelins and 4000 shields. In 1453 Constantinople fell; in 1454 Hunyady died; and a year later the sultan invaded Walachia to set up Vlad IV. (1455–62), the son of a former voivode. The father of this Vlad had himself been notorious for his ferocity, but his son, during his Turkish sojourn, had improved on his father's example. He was known in Walachia as Dracul, or the Devil, and has left a name in history as Vlad the Impaler. The stories of his ferocious savagery exceed belief. He is said to have feasted amongst his impaled victims. When the sultan Mahomet invaded the impalement of his avoy, the pasha of Vidin, who had been charged with Vlad's deposition, invaded Walachia in person with an immense host, he is said to have found at one spot a forest of pales on which were the bodies of men, women and children. The voivode Radu (1462–75) was substituted for this monster by Turkish influence, and constrained to pay a tribute of 12,000 ducats; but Vlad returned to the throne in 1476–77.

The shifting policy of the Walachian princes at this time is well described in a letter of the Hungarian king Matthias Corvinus (1458–90) to Casimir of Poland. "The voivodes," he writes, "of Walachia and Moldavia fawn alternately upon the Turks, the Tatars, the Poles and the Hungarians, that among so many masters their perfidy may remain unpunished." The

prevailing laxity of marriage, the frequency of divorce, and the fact that illegitimate children could succeed as well as those born in lawful wedlock, by multiplying the candidates for the voivodeship and preventing any regular system of succession, contributed much to the internal confusion of the country. The elections, though often controlled by the Turkish Divan, were still constitutionally in the hands of the boiers, who were split up into various factions, each with its own pretender to the throne. The princes followed one another in rapid succession, and usually met with violent ends. A large part of the population led a pastoral life, and at the time of Veran TIMUR's visit to Walachia in the early part of the 16th century, the towns and villages were built of wood and wattle and daub. Tirgovisehtca alone, at this time the capital of the country, was a considerable town, with two stone castles.

A temporary improvement took place under Neagoa Bassaraba (1512–21). Neagoa was a great builder of monasteries; he founded the cathedrals of Curtea de Argeș (q.v.) and Tirgoviste, and adorned Mount Athos with his pious works. He transferred the direct allegiance of the Walachian Church from the patriarchate of Ochrida in Macedonia to that of Constantinople. On this occasion, however, the brief period of comparative prosperity which his architectural works attest was tragically interrupted, and it seemed for a time that Walachia was doomed to sink into a Turkish pashalik. The Turkish commander, Mahmud Bey, became treacherously possessed of Neagoa's young son and successor, and, sending him a prisoner to Stambul, proceeded to nominate Turkish governors in the towns and villages of Walachia. The Walachians resisted desperately, elected Radu, a kinsman of Neagoa, voivode, and succeeded with Hungarian help in defeating Mahmud Bey at Grumats in 1522. The conflict was prolonged with varying fortunes until in 1524 the doughty opposition of the Walachians triumphed in the sultan's recognition of Radu.

But the battle of Mohacs in 1526 decided the long preponderance of Turkish control. The unfortunate province served as a transit route for Turkish expeditions against Hungary and Transylvania, and was exhausted by continual requisitions. Turkish settlements were gradually making good their footing on Walachian soil, and mosques were rising in the towns and villages. The voivode Alexander, who succeeded in 1591, and like his predecessors had bought his post of the Divan, carried the oppression still further by introducing a janissary guard and farming out his possessions to his Turkish supporters. Meanwhile the Turkish governor of the Bulgarian bank was not content to ravage the country, and again it seemed as if Walachia must share the fate of the Balkan States and succumb to the direct government of the Ottoman.

In the depth of the national distress the choice of the people fell on Michael, the son of Petrușko, han of Craiova, the first dignitary of the realm, who had fled to Transylvania to escape Alexander's machinations. Supported at Constantinople by two influential personages, Sigismund Báthory, prince of Transylvania (1581–98 and 1601–2), and the English ambassador, Edward Barton, and aided by a loan of 200,000 florins, Michael succeeded in procuring the Divan's recognition of Radu as the Walachian pretender. The genius of Michael "the Brave" (1593–1601) secured Walachia for a time a place in universal history. The moment for action was favourable. The emperor Rudolph II. had gained some successes over the Turks, and Sigismund Báthory had been driven by Turkish extortions to throw off the allegiance to the Sultan. But the first obstacle to be dealt with was the presence of the enemy within the walls. By previous concert with the Moldavian voivode Aaron, on the 13th of November 1594, the Turkish guards and settlers in the two principalities were massacred at a given signal. Michael followed up these "Walachian Vespers" by an actual invasion of Turkish territory, and, aided by Sigismund Báthory, succeeded in carrying by assault Rostock, Silistria and other places on the right bank of the lower Danube. A simultaneous invasion of Walachia by a large Turkish and Tatar host was successfully defeated;

1 A. Sturdza gives a genealogical table, showing that Radu belonged to the great native dynasty of Bassarab (q.v.) or Bassaraba, which continued, though not in unbroken succession, to rule in Walachia until 1658, and in Moldavia until 1669.
the Tatar khan withdrew with the loss of his bravest followers, and, in the great victory of Mantin on the Danube (1595), the Turkish army was annihilated, and its leader, Mustafa, slain. The sultan now sent Sinan Pasha, "the Renegade," to invade Walachia with 100,000 men. Michael withdrew to the mountains before this overwhelming force, but, being joined by Băthory with a Transylvanian contingent, the voivode resumed the offensive, stormed Bucharest, where Sinan had entrenched a Turkish detachment, and, pursuing the main body of his forces to the Danube, overtook the rearguard and cut it to pieces, capturing enormous booty. Sinan Pasha returned to Constantinople to die, it is said, of vexation; and in 1597, the sultan, weary of a disastrous contest, sent Michael a red flag in token of reconciliation, reinvited him for life in an office of which he had been unable to deprive him, and granted the succession to his son.

In 1599, on the abdication of Sigismund Băthory in Transylvania, Michael, in league with the imperialist forces, and in connivance with the Saxon burghers, attacked and defeated his successor Andreas Băthory near Hermannstadt, and, seizing himself the title of voivode, secured his proclamation as prince of Transylvania. The emperor consented to appoint him his viceroy (locum tenens per Transylvania), and the sultan ratified his election. As prince of Transylvania he summoned diets in 1599 and 1600, and, having expelled the voivode of Moldavia, united under his sceptre three principalities. The partiality that he showed for the Ruman and Szekler parts of the population alienated, however, the Transylvanian Saxons, who preferred the direct government of the emperor. The imperial commissioner General Basta lent his support to the disaffected party, and Michael was driven out of Transylvania by a successful revolt, while a Polish army invaded Walachia from the Moldavian side. Michael's coolness and resource, however, never deserted him. He resolved to appeal to the emperor, rode to Prague, won over Rudolph by his singular address, and, richly supplied with funds, reappeared in Transylvania as imperial governor. In conjunction with Basta he defeated the superior Transylvanian forces at Gorosol, expelling Sigismund Băthory, who had again aspired to the crown, and, taking one hundred and fifty flags and forty-five cannon. But at the moment of his returning prosperity Basta, who had quarrelled with him about the supreme command of the imperial forces, deserted him, in January and 19th of August 1601. Not only had Michael succeeded in rolling back for a time the tide of Turkish conquest, but for the first and last time in modern history he united what once had been Trajan's Dacia, in its widest extent, and with it the whole Ruman race north of the Danube, under a single sceptre.

Michael's wife Florika and his son Nicholas were carried off into Tatar captivity, and Şerban or Sherban, of the Bassaraba family, was raised to the voivodeship of Walachia by imperialist influences, while Sigismund resumed the government of Transylvania. On his deposition by the Porte in 1610, there followed a succession of princes who, though still for the most part of Ruman origin, might the name of Băthory at Stamboul. Transylvanian Walachian contingents were continually employed by the Turks in their Polish wars, and the settlement of Greeks in an official or mercantile capacity in the principality provoked grave discontent, which on one occasion took the form of a massacre.

The reign of the voivode Matthias Bassaraba (1635–54) was an interval of comparative prosperity. Matthias repulsed his powerful rival, Basil the Wolf, the voivode of Moldavia and his Tatar and Cossack allies. His last days were embittered, however, by an outbreak of military misfortunes. His illegitimate son and successor, Constantin Şerban (1654–58), was the last of the Bassaraba dynasty to rule over Walachia; and on his death the Turkish yoke again weighed heavier on his country. The old capital, Targoviste, was considered by the Divan to be too near the Transylvanian frontier, and the voivodes were accordingly compelled to transfer their residence to Bucharest, which was finally made the seat of government in 1668.

RUMANIA

The mechanical skill of the Walachians was found useful by the Turks, who employed them as carpenters and pontoniers; and during the siege of Vienna in 1683 the Walachian contingent, which, under the voivode Şerban Cantacuzene, had been forced to co-operate with the Turks, was entrusted with the construction of the two bridges over the Danube above and below Vienna. The Walachian as well as the Moldavian prince, who had been also forced to bring his contingent, maintained a secret system of communication with the besieged, which was continued by Şerban after his return to Walachia. The emperor granted him a diploma creating him count of the empire and recognizing his descent from the imperial house of Cantacuzene, Şerban meanwhile collecting his forces for an open breach with the Porte. His prudence, however, perpetually postponed the occasion, and Walachia enjoyed peace to his death in 1688. This peaceful state of the country gave the voivode leisure to promote its internal culture, and in the year of his death he had the satisfaction of seeing the first part of a Walachian Bible issued from the first printing-press of the country, which he had established at Bucharest. He had caused to be compiled 30 volumes of the language, to which business it was to instruct the sons of the boiers in grammar, rhetoric and philosophy.

Immediately on Şerban's death the boiers, to prevent the Porte from handing over the office to the Greek adventurer who bid the highest, proceeded to elect his sister's son Constantine Brancovan. The Turkish envoy then in Bucharest was persuaded to invest Brancovan with the caftan, or robe of office, in token of Turkish approval, and the patriarch of Constantinople, who was also present, and the archbishop of Walachia, Theodosius, consecrated him together at the high altar of the cathedral, where he took the coronation oath to devote his whole strength to the good of his country and received the boiers' oath of submission. Brancovan, it is true, found it expedient to devote his predecessor's treasure to purchasing the confirmation of his title from the Divan, but the account of his coronation ceremony remains an interesting landmark in the constitutional history of the country. In his relations with the Habsburg power he displayed the same caution as the voivode Şerban. In spite of defeats inflicted on the Turks by the imperial troops at Pozharevats, in 1688, in 1690, it was only by an exercise of force that they secured winter quarters in Walachia; and though after the battle of Pollava in 1709, Brancovan concluded a secret treaty with the tsar Peter the Great, he avoided giving open effect to it. The tranquillity which he thus obtained was employed by Brancovan as by his predecessor in furthering the internal well-being of the country, with which success is best apparent from the description of Walachia left by the Florentine Del Chiaro, who visited the country in 1709 and spent seven years there. He describes the stoneless Walachian plain, with its rich pastures, its crops of maize and millet, and woods so symmetrically planted and carefully kept by Brancovan's orders that hiding in them was out of the question. Butter and honey were supplied to the sultan's kitchen at Stamboul; wax and cattle to Venice; and the red and white wine of Walachia, notably that of Fitseii, to Transylvania. The Walachian horses were in demand among the Turks and Poles. Near Ribnik and elsewhere were salt-mines which supplied all the wants of the Transdanubian provinces of Turkey; there were considerable copper mines at Madian; and iron was worked near Targoviste. The gipsy community was bound to bring fifteen pounds weight of gold from the washings of the Arges. Many of the boiers were wealthy, but the common boiers were ground down with taxation that “of their ancient Roman valor only the name remained.” To avoid the extortion of their rulers numbers had emigrated to Transylvania and even to the Turkish provinces. The principal Walachian city was Bucharest, containing a population of about 50,000; but, except for two large hans or merchants' halls built by Brancovan and his
predecessor, and the recently erected palace, which had a marble staircase and a fine garden, the houses were of wood. The dress of the men was thoroughly Turkish except for their lamb-skin caps, that of the women half Greek, half Turkish. The houses were scrupulously clean and strewn with sweet herbs. Del Chiaro notices the great imitative capacity of the race, both artistic and mechanical. A Walachian in Venice had copied several of the pictures there with great skill; the copper-plates and wood engravings for the new press were executed by native hands. The Walachians imitated every kind of Turkish and European manufacture; and, though the boiers imported finer glass from Venice and Bohemia, a glass manufactory had been established near Tighoviste which produced a better quality than the Polish. From the Bucharest press, besides a variety of ecclesiastical books, there were issued in the Ruman tongue a translation of a French work entitled *The Maximis of the Orientals* and *The Romance of Alexander the Great.* In 1700 Brancovan had a map of the country made and a copperplate engraving of it executed at Padua.

The prosperity of Walachia, however, under its "Golden Bey," as Brancovan was known at Stambul, only increased the Turkish exactions; and, although all demands were punctually met, the sultan finally resolved on the removal of his too prosperous vassal. Brancovan was accused of secret correspondence with the emperor, the tsar, the king of Poland and the Venetian republic, of betraying the Porte's secrets, of preferring Tigr oviste to Bucharest as a residence, of acquiring lands and palaces in Transylvania, of keeping agents at Venice and Vienna, in both of which cities he had invested large sums, and of striking gold coins with his effigy. 1 An envoy arrived at Bucharest on the 4th of April 1714, and proclaimed Brancovan *mazări,* i.e. deposed. He was conducted to Constantinople and beheaded, together with his four sons. A scion of the rival Cantacuzenian family was elected by the pasha's orders, and he, after exhausting the principalities for the benefit of the Divan, was in turn deposed and executed in 1716.

From this period onwards the Porte introduced a new system with regard to its Walachian vassals. The line of national princes ceased. The office of voivode or hospodor was sold to the highest bidder at Stambul, to be farmed out from a purely mercenary point of view. The princes who now succeeded one another in rapid succession were mostly Greeks from the Phanar quarter of Constantinople who had served the palace in the quality of dragoman (interpreter), or held some other court appointment. They were nominated by imperial order, without a shadow of free election, and were deposed and transferred from one principality to another, executed or reappointed, like so many pashas. Like pashas they rarely held their office more than three years, it being the natural policy of the Porte to multiply such lucrative nominations. The same hospodor was often reappointed again and again as he succeeded in raising the sum necessary to buy back his title. Constantine Mavrocordato was in this way hospodar of Walachia at six different times, and paid on one occasion as much as a million lion-dollars (400,000 ducats) for the office. The princes thus imposed on the country were men of intelligence and culture. Nicholas Mavrocordato, the first of the series, was himself the author of a Greek work on duties, and maintained at his court Demeter Prokopios of Moschopolis in Macedonia, who wrote a review of Greek literature during the 17th and the beginning of the 18th centuries. Constantine Mavrocordato was the author of really liberal reforms. He introduced an *urbarium* or land law, limiting to 24 the days of *angaria,* or forced labour, owed yearly by the peasants to their feudal lord. In 1747 he decreed the abolition of serfdom, but this enactment was not carried into effect. But the rule of the Phanariots could not but be productive of grinding oppression, and it was rendered doubly hateful by the swarms of Greek adventurers who accompanied them. Numbers of the peasantry emigrated, and the population rapidly diminished. In 1745 the number of tax-paying families, which a few years before had amounted to 147,000, had sunk to 70,000. Yet the taxes were continually on the increase, and the hospodor Scarlet Ghica (1758-61), though he tried to win some popularity by the removal of Turkish settlers and the abolition of the *vakari* or tax on cattle and horses, which was peculiarly hateful to the peasantry, raised the total amount from 25,000,000 lion-dollars, about £5,000,000. The Turks meantime maintained their grip on the country by holding on the Walachian bank of the Danube the fortresses of Giurgevo, Turnu Severin and Orsova, with the surrounding districts.

But the tide of Ottoman dominion was ebbing fast. Already, by the peace of Passarowitz Pozharevats in 1718, the banat of Craiova had been ceded to the emperor, though by the peace of Belgrade in 1739 it was recovered by the Porte for its Walachian vassal. In 1760 the Russian general Romanzov occupied the principality, the bishops and clergy took an oath of fidelity to the empress Catherine, and a deputation of boiers followed. Though Mavrocordato had recovered his throne in 1762, and in 1772 the negotiations at Fokshani between Russia and the Porte broke down because the empress's representatives insisted on the sultan's recognition of the independence of Walachia and Moldavia under a European guarantee. Turkish rule was, however, definitely restored by the treaty of Kuchuk Kainardji, in 1774; and as from this period onwards Walachian history is closely connected with that of Moldavia, it may be convenient before continuing this review to turn to the earlier history of the sister principality.

(3) Moldavia—According to the native traditional account, which is given by the Moldavian chroniclers of the 16th, 17th and 18th centuries, Dragosh the son of Bogdan, the founder of the Moldavian principality, emigrated with his followers from the Hungarian district of Marmaros in the northern Carpathians. The dates assigned to this event vary from 1290, given by Urechia, to 1342, given by the monastic chronicle of Putna. The story is related with various fabulous accompaniments. From the aurochs (*simbru,* in pursuit of which Dragosh first arrived on the banks of the Moldova, is derived the ox-head of the Moldavian national arms, and from his favourite hound who perished in the waters the name of the river. From the Hungarian and Russian sources, which are somewhat more precise, the date of the arrival of Dragosh, who is confused with the historical Bogdan Voda (1340-1365), appears to have been 1349, and his departure from Marmaros was carried out in defiance of his Hungarian suzerain.

These legendary accounts seem to show that the Moldavian voivodate was founded, like that of Walachia, by Vlah immigrants from Hungary, during the first half of the 14th century. Its original strength lay probably in the compact Ruman settlements among the eastern Carpathians, first mentioned by Nicetas of Chonea, about 1164. The Moldavian lowlands were still held by a variety of Tatar tribes, who were only expelled after 1356, by the united efforts of Andrew Lazkovitch, voivode of Transylvania, and Bogdan Voda, the first independent prince of Moldavia. Coins bearing the name of Bogdan are still extant; and there is an inscription over his tomb at the monastery of Radautzi, in Bukovina, placed there by Stephen the Great of Moldavia (1457-1560).

In the agreement arrived at between Louis of Hungary and the emperor Charles IV. in 1372, the voivodate of Moldavia was recognized as a dependency of the crown of St Stephen. The overlordship over the country was, however, contested by the king of Poland, and their rival claims were a continual source of dispute between the two kingdoms. In 1422 a remarkable agreement was arrived at between Sigismund, in his quality of king of Hungary, and King Ladislaus II. of Poland, by which both parties...
In 1504 Stephen the Great died, and was succeeded by his son, Bogdan III. "The One-eyed." At feud with Poland about Pokuția, despairing of efficacious support from hard-pressed Hungary, the new voivode saw no hope of safety except in a dependent alliance with the advancing Ottoman power, which already hemmed Moldavia in on the Walachian and Crimean sides. In 1513 he agreed to pay an annual tribute to the sultan Selim in return for the sultan's guarantee to preserve the national constitution and religion of Moldavia, to which country the Turks now gave the name of Kara Bogdan, from their first vassal. The terms of Moldavian submission were further regulated by a firman signed by the sultan Suleiman at Budapest in 1520 by which the yearly present or bakshish, as the tribute was euphoniously called, was fixed at 400 ducats, 40 horses and 25 falcons, and the voivode was bound at need to supply the Turkish army with a contingent of 1000 men. The Turks pursued much the same policy as in Walachia. The tribute was gradually increased. A hold was obtained on the country by the occupation of various fortresses on Moldavian soil with the surrounding territory—In 1538 Cetatea Alba, in 1552 Bender, in 1572 Chotim (Khotin). Already by the middle of the 16th century the yoke was so heavy that the voivode Elias (1546–51) became Mahommedan to avoid the sultan's anger.

At this period occurs a curious interlude in Moldavian history. In 1561 the adventurer and impostor Jacob Basilicus succeeded with Hungarian help in turning out the voivode Alexander Lapusbeanu (1552–61 and 1563–68) and seizing on the reins of government. A Greek by birth, adopted son of Jacob Heraklides, despot of Paros, Samos and other Aegean islands, acquainted with Greek and Latin literature, and master of most European languages; appearing alternately as a student of astronomy at Wittenberg, with whom he had been invited by Count Mansfeld, as a correspondent of Melancthon, and as a writer of historical works which he dedicated to Philip II. of Spain, Basilicus, finding that his Aegean sovereignty was of little practical value beyond the crowning of poet laureates, fixed his roving ambition on a more substantial dominion. He published an astounding pedigree, in which, starting from "Hercules Triptolemus," he wound his way through the royal Servian line to the kinship of Moldavian voivodes, and, having won the emperor Ferdinand to his financial and military support, succeeded, though at the head of only 1000 cavalry, in routing by which he disbursed the vast superior forces of the voivode, and even in purchasing the Turkish confirmation of his usurped title. He assumed the style of Basilevs Moldablas, and eluded the Turkish stipulation that he should dismiss his foreign guards. In Moldavia he appeared as a moral reformer, endeavouring to put down the prevalent vices of bigamy and divorce. He erected a school, placed it under a German master, and collected children from every part of the country to be maintained and educated at his expense. He also busied himself with the collection of a library. But his taxes—a ducat for each family—were considered heavy; his orthodoxy was suspected, his foreign counsellors detested. In 1565 the people rose, massacred the Hungarian guards, the foreign settlers, and finally Jacob himself.

The expelled voivode Alexander was now restored by the Porte, the schools were destroyed, and the country relapsed into its normal state of barbarism under Bogdan IV. (1568–73). Bogdan's successor, John the Terrible (1572–74), was provoked by the Porte's demand for 120,000 ducats as tribute instead of 60,000 as heretofore to rise against the oppressor; but after gaining three victories he was finally defeated and slain (1574), and the country was left more than ever at the mercy of the Ottoman. Voivodes were now created and chosen in 3iid succession by the Divan, but the victories of Michael the Brave in Walachia invigorated the national spirit in the Moldavians. The Moldavian dominion was now disputed by the Transylvanians and Poles, but in 1600 Michael succeeded in annexing it to his "Great Dacian" realm. On Michael's murder the Poles under Zamoyski again
asserted their supremacy, but in 1618 the Porte once more recovered its dominion and set up successively two creatures of its own as voivodes—Gratiani, an Italian who had been court jeweller, and a Greek custom-house official, Alexander.

As in Walachia at a somewhat later date, the Phanariote régime seemed now thoroughly established in Moldavia, and it became the rule that every three years the voivode should procure his confirmation by a large baksheesh, and every year by a smaller one. But Prince Basili the Wolf (Vasile Lupul), an Albanian, who succeeded in 1634, showed great ability, and for twenty years maintained his position on the Moldavian throne. He introduced several internal reforms, codified the written and unwritten laws of the country, established a printing press, Greek monastic schools, and also a Latin school. He brought the Moldavian Church into more direct relation with the patriarchate of Constantinople, but also showed considerable favour to the Latins, allowing them to erect churches at Suceava, Jassy and Galatz. The last voivode of the Bassarab family, Eliaș Voda, reigned from 1667 to 1669.

During the wars between Sobieski, king of Poland (1674–96), and the Turks, Moldavia found itself between hammer and anvil, and suffered terribly. Several times the voivode Dukas was forced as his Wallachian contemporary to supply a contingent for the siege of Vienna in 1683. After Sobieski's death in 1696, the hopes of Moldavia turned to the advancing Muscovite power. In 1711 the voivode Demetrius Cantemir, rendered desperate by Turkish exactions, concluded an agreement with the tsar Peter the Great by which Moldavia was to be a protected and vassal state of Russia, with the enjoyment of its traditional liberties, the voivodeship to be hereditary in the family of Cantemir. On the approach of the Russian army the prince issued a proclamation containing the terms of his appeal to the ruler of the Russian empire, offering to pay three thousand zloty in taxes, and to send the small fleet to the port of Odessa. But the long Turkish terror had done its work, and at the approach of a Turkish and Tartar host the greater part of the Moldavians deserted their voivode. The Russian campaign was unsuccessful, and all that Peter could offer Cantemir and the boiars who had stood by him was an asylum on Russian soil.

In his Russian exile Cantemir composed in a fair Latin style his Descriptio Moldaviae, the counterpart, so far as Moldavia is concerned, to Del Chiaro's contemporary description of Walachia. The capital of the country was now Jassy, to which city Stephen the Great had transferred his court after Suceava had been destroyed by the Turks. It was at this time forty churches—one of stone, some of wood. Fifty years before it had contained 12,000 houses, but Tatar devastations had reduced it to a third of its former size. The most important commercial emporium was the Danubian port of Galatz, which was frequented by vessels from the whole of the Levant from Trebizond to Barbary. The cargoes which they here took in consisted of Moldavian timber (oak, deal and cornel), grain, butter, honey and wax, salt and aitre. Kilia, at the mouth of the Danube, was also frequented by trading vessels, including Venetian and Ragusan. Moldavian wine was exported to Poland, Russia, Transylvania, and Hungary; that of Cotnari was in Cantemir's opinion superior to Tokay. The excellence of the Moldavian horses is attested by a Turkish proverb; and annual droves of as many as 40,000 Moldavian oxen were sent across Poland to Danzig. Moldavia proper was divided into the upper country or Terra de sus, and the lower country, or Terra de jos. Bessarabia had been detached from the rest of the principality and placed under the direct control of the military authorities. It was divided into four provinces: that of Budzag, inhabited by the Nogal Tatars; that of Cotnari, taken by the Greek Monkastron, a strongly fortified place; and those of Ismaila and Kilia. The voivodes owed their nomination entirely to the Porte, and the great officers of the realm were appointed at their discretion. These were the

Great Logothete (Marele Logofet) or chancellor; the governor of Lower Moldavia—Vornicul de l'erra de josu; the governor of Upper Moldavia—Vornicul de l'erra de sus; the Haiman or commander-in-chief; the high chamberlain—Marele Postelnicu; the great Spatar, or sword-bearer; the great cup-bearer—Marele Paharnicu; and the treasurer, or Vistiernicu, who together formed the prince's council and were known as Boiari de Statu. Below these were a number of subordinate officers who acted as their assessors and were known as boiars of the Divan (Boiari de Divanu). The high court of justice was formed by the prince, metropolitan and boiars: the Boiari de Statu decided on the verdict; the metropolitan declared the law; and the prince pronounced sentence. The boiars were able to try minor cases in their own residences, but subject to the right of appeal to the prince's tribunal. Of the character of the Moldavian people Cantemir does not give a very favourable account. Their best points were their hospitality and, in Lower Moldavia, their valour. They cared little for letters, and were generally indolent, and their prejudice against mercantile pursuits left the commerce of the country in the hands of Armenians, Jews, Greeks and Turks. The pure-blood Rumanian population, noble and plebeian, inhabited the country; the rest, of mixed blood, consisting mainly of Little Russian and Hungarian race, and were in a servile condition. There was a considerable gipsy population, almost every boiar having several Zingar families in his possession; these were mostly smiths.

From this period onwards the character of the Ottoman domination in Moldavia is in every respect analogous to that of Walachia. The office of voivode or hospodar was farmed out by the Porte to a succession of wealthy Greeks from the Phanar quarter of Constantinople. All formality of election by the boiars was now dispensed with, and the princes received their cation ofoffice from the sultan. The nobility entertained the sultan himself, and were under the prince's protection by the Greek patriarch. The system favoured Turkish extortion in two ways: the presence of the voivode's family connexions at Stambul gave the Porte so many hostages for his obedience; on the other hand the princes themselves could not rely on any support due to family influence in Moldavia itself. They were thus mere puppets of the Divan, and could be deposed and shifted with the same facility as so many pashas—an object of Turkish policy, as each change was a pretext for a new levy of baksheesh. The chief families that shared the office during this period were those of Mavrocordato, Ghica, Callimachi, Ypsilanti and Murusi. Although from the very conditions of their creation they regarded the country as a field for exploitation, they were themselves often men of education and ability, and unquestionably made some praiseworthy attempts to promote the general culture and well-being of their subjects. In this respect, even the Phanariote régime was preferable to mere pasha rule, while it had the further consequence of preserving intact the national form of administration and the historic offices of Moldavia. Gregory Ghica (1744–77), who himself spoke French and Italian, founded a school or "gymnasium" at Jassy, where Greek, Latin and theology were taught in a fashion. He encouraged the settlement of German Protestant colonists in the country, most of whom set up as watchmakers in Jassy, where they were further allowed to build an evangelical church. J. L. Carra, a Swiss who had been tutor to Prince Ghica's children, and who published in 1783 an account of the actual state of the principalities, speaks of some of the boiars as possessing a taste for French literature and even for the works of Voltaire, a tendency actively combated by the patriarch of Constantinople.

The Russo-Turkish War, which ended in the peace of Kuchuk Kainardji (1774); was fatal to the integrity of Moldavian territory. The house of Austria, which had already annexed Galicia in 1772, profited by the situation to arrange with both contending parties for the peaceful cession of Bukovina to the Habsburg monarchy. This richly wooded Moldavian province, containing Suceava
(Suczawa), the earliest seat of the voivodes, and Cernautil or Czernovich, was in 1774 occupied by Habsburg troops with Russian connivance, and in 1777 Baron Thugut procured its formal cession from the sultan.

(a) The Danubian Principalities: 1774-1859.—By the treaty of Kuchuk Kainardji Russia consented to hand back the principalities to the sultan, but by Article xvi. of the treaty, several stipulations were made in favour of the Walachians and Moldavians. The people of the principalities were to enjoy all the privileges that they had possessed under Mahomet IV.; they were to be freed from tribute for two years, as some compensation for the ruinous effects of the last war; they were to pay a moderate tribute; the agents of Walachia and Moldavia at Constantinople were to enjoy the rights of national representatives, and the Russian minister at the Porte should on occasion watch over the interests of the principalities. The stipulations of the treaty, though deficient in precision (the Walachians, for instance, had no authentic record of the privileges enjoyed under Mahomet IV.), formed the basis of future liberties in both principalities; but for the moment all reforms were postponed.

The revolt was concluded when it was arrested by the Porte, which refused to recognize the right of the Walachian boyars to elect their voivode, and nominated Alexander Ypsilanti, a creature of its own. In 1777 Constantine Murusi was made voivode of Moldavia in the same high-handed fashion. The Divan seemed intent on restoring the old system of government in its entirety, but in 1783 the Russian representative extracted from the sultan a decree (hatishifer) defining more precisely the liberties of the principalities and fixing the amount of the annual tribute—for Walachia 619 purses exclusive of various "presents" amounting to 130,000 pisters, and for Moldavia 135 purses and further gifts to the extent of 115,000 pisters. By the peace of Jassy in 1792 the Dniester was recognized as the Russian frontier, and the privileges of the principalities as specified in the hatishifer confirmed.

In defiance of treaties, however, the Porte continued to change the hospodars almost yearly and to exact extraordinary installation presents. The revolt of Pasvan Oglu in Bulgaria was the cause of great injury to Walachia. The rebels ravaged Little Walachia in 1807-2, and their ravages were succeeded by those of the Turkish troops, who now swarmed over the country. Exaction followed exactation, and in 1802 Russia resolved to assert her treaty rights in favour of the oppressed inhabitants of the principalities. The accession of Constantine Ypasilanti (1802-6) in Walachia, and of Alexander Murusi (1802-6) in Moldavia, the Porte was constrained to issue a new hatishifer by which every prince was to hold his office for at least seven years, unless the Porte satisfied the Russian minister that there were good and sufficient grounds for his deposition. This clause of the hatishifer was not enforced. All irregular contributions were to cease, and all citizens, with the exception of the boyars and clergy, were to pay their share of the tribute. The Turkish troops then employed in the principalities were to be paid off, and one year's tribute remitted for the purpose. The boyars were to be responsible for the maintenance of schools, and the hospodars were to hold their princely courts for the benefit of the gentry. The number of Turkish merchants resident in the country was limited. Finally, the hospodars were to be amenable to representations made to them by the Russian envoy at Constantinople, to whom was entrusted the task of watching over the Walachian and Moldavian liberties. This, it will be seen, was a veiled Russian protectorate.

In 1804 the Serbs under Karageorge rose against the Turkish dominion, and were secretly aided by the Walachian voivode Ypasilanti. The Porte, instigated by Napoleon's ambassador Sebastiani, resolved on Ypasilanti's deposition, but the hospodar succeeded in escaping to St Petersburg. In the year that now ensued between the Russian and the Turks, the Russians were for a time successful, and even demanded that the Russian territory should extend to the Danube. They occupied the principalities from 1806 to 1812. In 1808 they formed a governing committee consisting of the metropolitan, another bishop, and four or five boyars under the presidency of General Kusnikov. The seat of the president was at Jassy, and General Engelhart was appointed as vice-president at Bucharest.

By the peace of Bucharest, however, in 1812, the principalities were restored to the sultan under the former conditions, with the exception of Bessarabia, which was ceded to the tsar. The Pruth thus became the Russian boundary.

The growing solidarity between the two Ruman principalities received a striking illustration in 1815, when the Walachian and Moldavian hospodars published together a code applicable to both countries, and which had been elaborated by a joint commission.

The Greek movement was now beginning to assume a practical shape. About 1780 Rigas Feraios, a Hellenized Vlach from Macedonia who is also known by the purely Greek name of Rigas Phereis, had founded in Bucharest a patriotic and revolutionary association known as the Society of Friends (Εταιρεία των Φιλακτών) which gradually attained great influence. In 1810 Ignatius, the metropolitan of Walachia, founded a Greek literary society in Bucharest which soon developed into a political association, and many of the principles of the Greek movement were translated into practice and finally united into one powerful secret society, the Hetaireia. Some of the members even cherished the fantastic hope of restoring the ancient Byzantine empire. In 1821 Alexander Ypasilanti, a son of the voivode, and an aide-de-camp of the tsar Alexander I., entered Moldavia at the head of the Hetaireia, and, representing that he had the support of the tsar, prevailed on the hospodar Michael Suzu to aid him in invading the Ottoman dominions. To secure Walachian help, Ypasilanti advanced on Bucharest, but the prince, Theodore Vladimirescu, who represented the national Ruman reaction against the Phanariotes, repulsed his overtures with the remark "that his business was not to march against the Turks, but to clear the country of Phanariotes." Vladimirescu was slain by a Greek revolutionary agent, but Ypasilanti rashly continuing his enterprise after he had been repudiated by the Russian emperor, his forces were finally crushed by the Turks at Dragashani, in Walachia, and at Skulen, in Moldavia; and the result of his revolt was a Turkish occupation of the principalities. In 1822 the Turkish troops, who had committed great excesses, were withdrawn on the combined representations of Russia, Austria and Great Britain. The country, however, was again ravaged by the retiring troops, quarters of Jassy and Bucharest burned, and the population fled with all its goods. The principalities were to enjoy commercial freedom, and the right of establishing a quarantine cordon along the Danube or elsewhere. The internal constitution of the countries was to be regulated by an "Organic Law," which was drawn up by assemblies of bishops and boyars at Jassy and Bucharest, acting, however, under Russian control. The Organic Law thus elaborated was by no means of a liberal character, and amongst other abuses maintained the feudal privileges of the boyars. It was ratified by the Porte in 1834, and the Russian army of occupation thereupon withdrew. The newly elected hospodars, Alexander Ghica (1834-42) and George Bibescu (1847-69) in Walachia, and Michael Sturdza (1834-69) in Moldavia, were in alliance with the Organic Law. Their reigns were marked by the social, financial and political predominance of Russia, which had steadily increased since 1771. The treaty of 1774 had given Russia a firm foothold in Rumanian politics. This
had been strengthened by the khanisher of 1821; while the treaties of 1832, 1856 and 1859 had respectively yielded up Bessarabia, the Dnioula mouth of the Danube and the St George mouth to the tsar. From 1834 to 1848 the Russian consul at Bucharest was all-powerful.

The revolutionary movement of 1848 extended from the Romans of Hungary and Transylvania to their kinsmen of the Transalpine regions. Here its real object was the overthrow of Russian influence. In Moldavia the agitation was mostly confined to the boiards, and the hospodar Michael Sturdza succeeded in arresting the ringleaders. In Walachia, however, the outbreak took a more violent form. The people assembled at Bucharest, and demanded a repudiation of Prince Brătianu, after setting his signature to the constitution submitted to him, fled to Transylvania, and a provisional government was formed. The Turks, however, urged thereto by Russian diplomacy, crossed the Danube, and a joint Russo-Turkish dictatorship restored the Organic Law. By the Balta-Liman convention of 1849 the two governments agreed to the appointment of Barbã Stîrbeiu (Stîrbe) as prince of Walachia, and Gregory Ghica for Moldavia.

On the entry of the Russian troops into the principalities in 1853, the hospodars fled to Vienna, leaving the government in the hands of their minions; and a campaign that now ensued great suffering was inflicted on the inhabitants, but in 1854 the cabinet of Vienna induced the Russians to withdraw. Austrian troops occupied the principalities, and the hospodars returned to their posts. One important consequence of the revolution had been the banishment of many rising politicians to western Europe, where they were brought into contact with a higher type of civilization. The practice initiated by the more liberal Phanariotes of sending Rumanian students to the French, German and Italian universities tended in the same direction. Statesmen such as I. C. Brătianu, D. A. Sturdza, S. C. Ghica and Lascăr Catargiu (who have in the result drawn the line under separate headings) received their political training abroad, and returned to educate their countrymen. To this fact the surprisingly rapid progress of Rumania, as compared with the Balkan States, may very largely be attributed.

By the treaty of Paris in 1856 the principalities with their existing privileges were placed under the collective guarantee of the contracting Powers, while remaining under the suzerainty of the Porte—the Porte on its part engaging to respect the complete independence of their internal administration. A strip of southern Bessarabia was restored to Moldavia, so as to push back the Russian frontier from the Danube mouth. The existing laws and statutes of both principalities were to be revised by a European Commission, sitting at Bucharest, and their work was to be assisted by a Divan or national council which the Porte was to convene for the purpose in each of the two provinces, and in which all classes of Walachian and Moldavian society were to be represented. The European commission, in arriving at its conclusions, was to take into consideration the opinion expressed by the representative councils; the Powers were to come to terms with the Porte as to the recommissionings of the commission; and the final result was to be embodied in a khanisher of the sultan, which was to lay down the definitive organization of the two principalities. In 1857 the commission arrived, and the representative councils of the two peoples were convoked. On their meeting in September they at once proceeded to vote with unanimity the union of the two principalities into a single state under the name of Rumania (Rumania), to be governed by a foreign prince elected from one of the reigning dynasties of Europe, and having a single representative assembly. The Powers decided to undo the work of national union. By the commission was inscribed by the European congress at Paris in 1858, it was decided that the principalities should continue as heretofore to be governed each by its own prince. Walachia and Moldavia were to have separate assemblies, but a central commission was to be established at Focşani for the preparation of laws of common interest, which were afterwards to be submitted to the respective assemblies. In accordance with this convention the deputies of Moldavia and Walachia met in separate assemblies at Bucharest and Jassy, but the choice of both fell unanimously on Prince Alexander John Cuza (January 1859).

(5) Rumania.—Thus the union of the Rumanian nation was accomplished. A new conference met in Paris to discuss the situation, and in 1856 the election of Prince Cuza was ratified by the Powers and the Porte. The two principalities and the central commission were preserved till 1862, when a single assembly met at Bucharest and a single ministry was formed for the two countries. The central commission was at the same time abolished, and a council of state charged with preparing bills substituted for it. In May 1864, owing to difficulties between the government and the general assembly, the assembly was dissolved, and a statute was submitted to universal suffrage giving greater authority to the prince, and creating two chambers (of senators and of deputies). The franchise was now extended to all citizens, a cumulative voting power being reserved, however, for property, and the peasantry were emancipated from feudal labour. Up to this point the prince had acted freely; he had founded the universities of Bucharest and Jassy; his reforms had swept away the last vestiges of feudalism and created a class of peasant freeholders. But the closing years of his reign were marked by an attempt to concentrate all power in his own hands. He strove to realize his democratic ideals by despotic methods. His very reforms alienated the goodwill of all classes; of the nobles, by the abolition of forced labour; of the clergy, by the confiscation of monastic estates; of the masses, by the introduction of a tobacco monopoly and the inevitable collapse of the inflated hopes to which his agrarian reforms had given rise. His own death left the country a prey to civil and political disorder, and at last the leading statesmen in both provinces, who had long believed that the national welfare demanded the election of a foreign prince, conspired to dethrone him. In February 1866 he was compelled to abdicate; and a council of regency was formed under the presidency of Prince Ion Ghica. The count of Flanders, brother to the king of the Belgians, was proclaimed hospodar of the united provinces, but declined the proffered honour.

Meanwhile a conference of the Powers assembled at Paris and decided by a majority of four to three that the new hospodar should be a native of the country. The principalities, however, determined to elect Prince Charles, the second son of Prince Charles Antony of Hohenzollern-Sigmaringen. On a referendum, 685,699 electors voted in his favour, against 224 dissentients. Prince Charles was an officer in the Prussian army, twenty-seven years of age, and was related to the French imperial family as well as to the royal house of Prussia: his nomination obtained not only the tacit consent and approval of his friend and kinsman King William of Prussia, but also the warm and more open support of Napoleon III. The king of Prussia, however, had agreed that the new hospodar should be a native of the principalities, and would not therefore openly approve of Prince Charles’s election. Acting on the advice of Bismarck, the prince asked for a short leave of absence, resigned his commission in the Prussian army on crossing the frontier, and hastened down the Danube to Rumania, under a feigned name and with a false passport. On the 20th of May he landed at Turnu-Severin, where he was enthusiastically welcomed. He reached Bucharest on the 22nd, and on the same day, in the presence of the provisional government, took the oaths to respect the laws of the country and to maintain its rights and the integrity of its territory. In October Prince Charles proceeded to Constantinople and was cordially received by his suzerain, the sultan, who bestowed on him the firman of investiture, admitted the principle of hereditary succession in his family, and allowed him the right of maintaining an army of 30,000
RUMANIA

839

men. Rumania was to remain part of the Ottoman empire within the limits fixed by the capitulations and the treaty of Paris.

The first Rumanian ministry formed under the new prince was composed of the leading statesmen of all political parties, care being taken that the two provinces should be equally represented. A new constitution was unani-

mously passed by the chamber on the 11th of July. It provided for an Upper and Lower House of Re-

presentatives, and conferred on the prince the right of an absolute and unconditional veto on all legislation. Other reforms were urgently needed. There was an empty treasury, and the floating debt amounted to £7,000,000; maladministra-

tion was rampant in every department of the state; the national guard was mutable, while the small army of regulars was badly organized and inefficient. The existence of famine and cholera added to the difficulties of the government, and in March 1867 the Lower House, by a majority of three, passed the laconic resolution, "The chamber inflicts a vote of blame on the government." As the result of this vote M. Kretzulescu, a Moderate Conservative, was called to the head of affairs, and I. C. Bratianu entered the government as minister of the interior. The new ministry, of which Bratianu was the leading spirit, showed considerable energy: a concession was granted for the construction of the first Rumanian railway, from Bucharest to Giurgove, and the reorganization of the army was undertaken. Among other less judicious measures, a decree was passed ostensibly directed against all vagabond foreigners, but really aimed at the Jews, large numbers of whom, including many respected landowners and men of business, were imprisoned, or expelled, from Jassy, Bacau and other parts of Moldavia. This harsh treatment created intense indignation abroad, especially in France and Great Britain; and the emperor Napoleon wrote personally to Prince Charles pro-
testing against the persecution. The country could not afford to lose the goodwill of the emperor of the French, at that time one of the most powerful factors in Europe—in July 1869 Bratianu, although immensely popular, found it necessary to resign office, and with him fell the rest of the cabinet.

On the 15th of September 1869, Prince Charles married Princess Elizabeth of Wied, afterwards celebrated under her literary name of Carmen Sylva.

1 In the same year the army was reorganized, and a rural police created. Every able-bodied citizen was rendered liable to give three days' work yearly towards the construction of roads, or to pay a small tax as an equivalent. An important railway concession, which subse-

quently caused grave political complications, was granted to the German contractors Straussberg and Offenheim.

Much excitement was aroused in Rumania by the outbreak of the war between Prussia and France. The sympathies of the Rumanians were entirely on the side of the French, whom they regarded as a kindred Latin race, while those of the prince were naturally with his native country. The excitement culminated in a revolutionary outbreak at Ploesti, where a hot-headed deputy, Candianu Popescu, after the mob had stormed the militia barracks, issued a proclamation deposing Prince Charles and appointing General Golescu regent. Owing to the loyalty of the regular army the insurrection was speedily quelled. But the feeling in the country was strong against the German sovereign, who seriously thought of abdicating when a jury acquitted the accused rebels. On the 7th of December he wrote confidentially to the sovereigns whose representatives had signed the treaty of Paris, suggesting that the future of Rumania should be regulated by a European congress.

A few days subsequently the prince learned that the German railway contractor Straussberg was unwilling or unable to pay the coupons of the railway bonds due on the 1st of July 1870, which were mostly held by German people in Germany. This threw the responsibility of payment on Rumania, and was a severe blow to the prince, through whose instrumentality the loan had been placed. Matters were brought to a crisis by the Prussian government threatening to force the Rumanian government to provide for the unpaid coupons. The country was financially in no condition to comply. Bitter indignation prevailed against every German, and culminated in an attack on the German colony in Bucharest on the 22nd of March 1871. On the following morning the prince summoned the members of the council of regency of 1866, and informed them of his inten-
tion to place the government in their hands. Lascar Catargiu and General Golescu, the only two members present, as well as Dimitrie Sturza and other influential persons, declined to accept the responsibility. Catargiu offered to unite the different sections of the Conservative party in order to deal with the crisis. The prince accepted his offer. The elections took place early in May 1871, and the government, to which all the most respectable elements in the country had rallied, obtained a large majority. When parliament met in May the prince had a most enthusiastic reception. The anti-German feeling in the country had greatly subsided, in consequence of the crushing defeat of France; and in January 1872 the new empire of Rumania undertook to pay the railway coupons. The German syndicate was satisfied, and the railway crisis ended.

Catargiu's ministry was the tenth that had held office in the five years since the prince's arrival, but it was the first one that was stable. In March 1875 the budget for 1876, amounting to £6,000,000, nearly double in amount that of the year 1866, was passed without difficulty, and on the 28th of the month the parliamentary session closed. It was the first occasion in Rumania that the same chamber had sat for the whole constitutional period of four years, and also the first time that the same ministry had opened and closed the same parliament.

Only the fall of the Catargiu ministry saved the country from revolution. The leading Liberals had promised a con-
spiracy for the arrest and expulsion of the prince, and the formation of a provisional government under General Dabija. The prospect of a return to power put an end to these machina-
tions. Catargiu's ministry was succeeded by an administration under General Florescu, known as the "cabinet of the generals," and, a month later, by the so-called "ministry of conciliation" under M. Jepureanu. A commission of the chambers drew up an indictment against Catargiu and his late colleagues, accusing them of violating the constitution and the public liberties, squandering the state revenues, and other abuse of power. Unable to stem the tide of popular passion, which was crying for the impeachment of Catargiu, Jepureanu resigned office, and Bratianu formed a new Liberal cabinet, destined to guide the country through many eventful years.

But the re-opening of the Eastern Question was destined to bring to a climax the great struggle of Rumania for existence and independence, and temporarily to throw into the shade all domestic questions. The insurrection in Bulgaria, with its accompanying horrors, followed by the deposition of Sultan Murad and the succession of the sultan Abdul Hamid, contributed to indicate the near approach of a Russo-Turkish war. Russia had shown symptoms of anger against Rumania for not having taken up a decided attitude in the approaching struggle, and the Russian ambassador Ignatiev had some months previously threatened that his government would seize Rumania as a pledge as soon as the Turks occupied Servia and Montenegro. Prince Charles decided to send a mission, composed of Bratianu and Colonel Slaniceneau (the minister of war), to the imperial headquarters at Livadia. They were well received by the emperor (October 1876), but in spite of mixed threats and cajoleries on the part of Gorchakov, Ignatiev and others, Bratianu returned without having definitely committed his country to active measures.

On the 14th of November six Russian army corps were mobilized to form the army of the south under the grand duke

For biographical details, see Charles, king of Rumania; and Elizabeth, queen of Rumania.
Nicholas. A few days later two secret envoys arrived at Bucharest, the one M. de Nelidov, to negotiate on the part of the Russian government for the passage of their army through Rumania, the other Ali Bey, to arrange on behalf of the sultan a combination with Rumania against Russia. Prince Charles cleverly temporized with both powers. Negotiations with Russia were continued, and Bratianu was sent to Constantinople to put pressure upon Turkey to secure certain rights and privileges which would practically have made Rumania independent, except that it would still have paid a fixed tribute; but the conference of the powers assembled at that capital came to a definite end on the 10th of January 1877, when the Turkish government, after every procrastination, agreed to the conference. Mean- while the Porte, in issuing Midhat Pasha's famous scheme of reforms, had greatly irritated Rumanian politicians by including their country in the same category as the other privileged provinces, and designating its inhabitants as Ottoman subjects. A secret convention was signed between Russia and Rumania on the 10th of April, by which Rumania allowed free passage to the Russian armies, the tsar engaging in return to maintain its political rights and to protect its integrity, while all matters of detail connected with the passage of the Russian troops were to be regulated by a special treaty. On the 23rd of April Russia declared war against Turkey, and the grand duke Nicholas issued a proclamation to the Rumanian nation, announcing his intention of entering their territory in the hope of finding the same welcome as in former wars. The Rumanian govern ment made a platonic protest against the crossing of the frontier, and the Rumanian troops fell back as the Russians advanced; provisions and stores of all kinds were supplied to the invading army against cash payments in gold, and the railways and telegraphs were freely placed at its disposal. The Rumanian chambers were assembled on the 26th of April, and the convention with Russia was sanctioned. The Ottoman government immediately broke off diplomatic relations with Rumania, and on the 11th of May the chambers passed a resolution that a state of war existed with Turkey. (For a detailed account of the subsequent campaign, in which Prince Charles and the Rumanian army contributed greatly to the success of the Russian arms, see Russo-Turkish Wars, and Plevna.) The fall of Plevna left the Russian army free to march on Constantinople, and on the 31st of January 1878 the preliminaries of peace were signed at Adrianople. They stipulated that Rumania should be independent and receive an increase of territory.

Peace between Russia and Turkey was signed at San Stefano on the 3rd of March. On the 20th of January the Rumanian agent at St Petersburg was officially informed of the intention of the Russian government to regain possession of the Rumanian portion of Bessarabia, i.e. that portion which was ceded to Moldavia by Russia after the Crimean War. Rumania was to be indemnified at the expense of Turkey by the delta of the Danube and the Dobrudja as far as Constantza. The motive assigned was that this territory had not been ceded to Rumania, but to Moldavia, and had been separated from Russia by the almost obsolete treaty of Paris (1856). But the proposed exchange of territory aroused the most bitter indignation at Bucharest. Bratianu and Coğălniceanu were sent to Berlin to endeavour to prevail on the representatives of the Powers there assembled in June 1878 to veto the cession of Bessarabia to Russia; but the Rumanian delegates were not permitted to attend the sittings of the congress until the Powers had decided in favour of the Russian claim. The treaty of Berlin in dealing with Rumania decided to recognize its independence, subject to two conditions: First (Art. xlv.), that the principality should restore to the emperor of Russia that portion of the Bessarabian territory detached from Russia by the treaty of Paris in 1856, bounded on the west by the mid-channel of the Pruth, and on the south by the mid-channel of the Kilia branch and the Staryi Stambl mouth. Second (Art. xlv.), that absolute freedom of worship should be granted to all persons in Rumania;
Rumania was now comparatively, but not entirely, free from fears of serious foreign complications. Austria and Russia alike resented the decision to fortify Bucharest and the Sireth line, adopted by the Rumanian government in 1882. Relations with Russia had remained strained ever since the war. The delimitation of the Dobrudja frontier was still unsettled, and owing to Russian opposition was not finally disposed of till 1884. Expenses incurred during the war led to much controversy, especially when the Russian government claimed the return of £120,000 advanced to enable the Rumanians to mobilize, and considered by them as a free gift. A compromise was made, both parties withdrawing their claims, in April 1882.

Relations with Austria-Hungary were also on a very unpleasant footing. It was nearly a case of two-pated reforms of a far more discord—the navigation of the Danube (p.720) and the "national question," i.e., the status of the Vlach communities outside Rumania, and especially in Transylvania and Macedonia (see Vlachs and Macedonians). The Danube question became acute in 1881, 1883 and 1899; the national question is a more permanent source of trouble, affecting Austria-Hungary, Greece, Turkey and Bulgaria. King Charles, who naturally favoured the ally of Germany, and Bratianu, who regarded Russian policy with suspicion, endeavoured to promote a better understanding with Austria-Hungary. But there was a strong anti-German party in the country, especially among the old believers and the peasantry. Community of creed, ancient tradition, influence, the entire absence of Russian merchants, and the consequent avoidance of many small commercial rivalries, contributed to bring about a sort of passive preference for Russia, while the bitter disputes that had occurred with Germany on the question of railway finance had left a very hostile feeling.

In March 1883 the government decided to introduce various important changes into the constitution. Three electoral colleges were formed instead of four; a considerable addition was made to the numbers of the senate and chamber; trial by jury was established for press offences, except those committed against the royal family and the sovereigns of foreign states; these were to be tried by the ordinary tribunals without jury. A bill was passed endowing the crown with state lands, giving an annual rent of £24,000 in addition to the civil list fixed in 1866 at £49,000; another measurement granted free passes on the railways and an allowance of £1 daily during the sitting of parliament to all senators and deputies. The revision of the constitution had estranged the two heads of the Liberal party, I. C. Bratianu, who was mainly responsible for the new measures, and C. A. Rosetti, who was consistently opposed to them.

The Conservative-Junimist parliament nevertheless restored tranquillity to the country. On the 22nd of May 1891, the 25th anniversary of the king's accession was celebrated with great enthusiasm. Meanwhile the gold standard had been introduced (1889), and the financial situation was regarded as satisfactory. In December 1891 a stable cabinet was at last formed by Lucar Catargiu. The new ministry during their four years' tenure of office passed several useful measures through parliament. The state credit was improved by the conversion of foreign capital; the sale of the state lands to the peasantry was actively continued; a law was passed making irremovable the judges of the court of appeal and the presidents of tribunals, and other important judicial reforms were carried out; a mining law was passed with the object of introducing foreign capital; and the commercial marine was developed by the formation of a state ocean service of passenger and cargo steamers. Great reforms, which had been unsuccessfully attempted by former governments, were made in the service of public instruction and in the organization of the clergy.

In 1893 and 1894 commercial and extradition treaties and a trade-mark convention were made with Great Britain, Austria-Hungary and Germany. Meanwhile the Liberal opposition was being reorganized. On the death of I. C. Bratianu, in 1891, his brother Dimitrie was proclaimed chief of the united Liberal party, but he also died in June 1892, and the veteran statesman Dimitrie Sturdza was recognized as the head of the Liberals. In 1894 he started a very violent agitation in favour of the Rumanians in Hungary. Another popular opposition cry was "Rumania for the Rumanians." The new mining law, among other concessions, gave foreigners the right to lease lands for long periods for the working of petroleum, and this was denounced by the opposition as being hostile to national interests, and also as being against the spirit of the constitution,
which prohibited foreigners from holding lands. The bill was carried by the government in April 1895, as well as another important measure favouring the construction of local railways by private contractors. The Liberal opposition protested, retired from the chamber, and took no further part in legislative proceedings. The Liberal party had been out of office for eight years, the Conservative-Junimist coalition had practically carried out its complete programme, and legislation was at a deadlock owing to the abstention of the Liberal opposition. As the electorate showed itself in favour of a change of ministry, Catargiu resigned, and a new Liberal government was formed by D. Sturdza.

The advent to power of a statesman who had recently been making such violent attacks on the Hungarian government caused some anxiety in Austria-Hungary. When once office was obtained, it was to the interest of the new government that the agitation should subside. The official opening by the emperor of Austria of the new channel through the Iron Gates of the Danube, on the 27th of September 1896, was the means of bringing about a great improvement in the relations between the two countries. It led to an exchange of visits between the emperor and King Charles, who also visited the tsar Nicholas II, in August 1898. The visit was the symbol of a reconciliation between the Rumanians and the Russians, the relations between whom had been the reverse of cordial since 1878. As regards home politics, the overwhelming majority of the Liberal party at the elections of 1895, instead of being a source of strength, proved the very reverse. It caused the party to split up into factions—Sturdzists, Aurelianists and Flevists, so called after the names of their respective chiefs. Sturdza himself soon had to retire. The head of the Orthodox Church, the metropolitan Gennadius, had for some years past, as head of the philanthropic establishments founded by the princess Brancov, desired to obtain the entire management of these wealthy foundations, and had made violent attacks on the two administrators, Prince George Bibescu and Prince Stiri, both members of the Brancov family. In the quarrel that ensued the prelate was openly accused of simony, of heresy, and other matters more suitable for a criminal court. After a public trial before the Holy Synod, he was found guilty of certain canonical offences, and sentenced to be deposed. The same night, he was seized by the police, and removed by force to a neighbouring monastery. This harsh treatment of the head of the Church led to an attack on Sturdza. On the 3rd of December 1896, the president of the council, M. Aurelian, was called on to reconstitute a Liberal cabinet, with the principal object of calming public opinion by the settlement of this question. Aurelian then appealed to the patriotic sentiments of the Conservative party to help to solve the difficulty, and with the aid of Lascar Catargiu and Tache Ionescu the following decision was reached: the Holy Synod was to review its judgment, and the metropolitan was to be restored to his ecclesiastical rank; but, after holding it for a few days, he was voluntarily to resign and to receive as compensation a handsome pension. Calm was thus restored, but Aurelian and his colleagues were not inclined to hand over their portfolios to Sturdza and his partisans. The struggle terminated in the success of Sturdza, who in April 1897 returned to power and remained president of the council until 1899. Few of the important measures promised in the Liberal programme were passed, one for the reform of public instruction being the most noteworthy. Sturdza, who was a public man and not a scholar, having decided on the national question, was also destined to fall on it. A popular agitation was raised on the subject of certain subsidies made by the Rumanians for the support of the Rumanian schools at Kronstadt in Transylvania, and Sturdza was accused of too great subserviency to the Hungarian government. The agitation culminated in street riots at Bucharest. On the same evening that Sturdza tendered his resignation to the king (April 1899) the veteran Conservative statesman Lascar Catargiu suddenly died. The Conservatives, led by G. G. Cantacuzene, returned to office with an overwhelming majority. They were immediately confronted by an acute economic crisis. The financial position of the country had hitherto on the surface been very satisfactory. The public debt, mostly placed in Germany, amounted to about £57,000,000. It was not alleged that the country was over-burdened with which money had always been borrowed gave rise to great extravagance. Expenses which ought to have been defrayed out of the ordinary budget, such as the erection of magnificent public offices at Bucharest, were frequently defrayed out of the loans; and the custom had arisen when money was scarce of issuing treasury bonds. When the Conservatives came into office they found that the payment of 2½ millions of these bonds would shortly become due, and there were no resources in the treasury to meet them. Owing to the Transvaal War and other causes, the money market was most unfavourable, especially in Germany; and there was an almost entire failure of the harvest. The value of cereals exported in 1898 was about 9 millions sterling, in 1899 only 3½ millions. The government managed to extricate itself from its immediate difficulties in the autumn of 1899, by raising a loan of £7,000,000 in Berlin, but on very stringent terms. Besides paying a much higher rate of interest than heretofore, it bound itself not to contract any further loans until this one was paid. The Conservatives were united in wishing to meet the financial crisis by a moderate reduction of expenditure and a large increase of taxation, while the Liberal opposition advocated the permanent reduction of the annual expenditure of £800,000, which would necessitate the raising of £200,000 only by fresh taxation. The Conservative programme was naturally unpopular; Carp and the Junimists were unwilling to co-operate with the government, and, on the 26th of February 1901, D. Sturdza again became premier.

His administration lasted until the 31st of December 1904, and averted the impending bankruptcy of Rumania by a policy of strict retrenchment. In 1904 Sturdza was able to exceed the proposed limit of annual expenditure, £8,740,000, owing to a great increase in the value of the tobacco monopoly. Even a recurrence of agricultural depression during the same year left the national credit intact. Another financial reform was undertaken by the Conservatives, who returned to power on the 4th of January 1905, with G. G. Cantacuzene as prime minister, and in May floated the conversion loan, already described.

The chief causes of the agrarian insurrection in March 1907 have been outlined above (under Land Tenure). But an additional cause was the harsh treatment of the peasants on the state and communal lands leased to Jewish middlemen. At first an attack on the Jews alone, the rising soon became a jacquerie directed against all the large landowners. Numerous towns and villages were sacked and partly burned, and 140,000 soldiers were employed to suppress the revolt. On the 24th of March the Cantacuzene ministry resigned and was succeeded by a Liberal government under the leadership of D. Sturdza, who completed the restoration of order by strong military measures and afterwards initiated remedial legislation. He abolished the system by which public lands were leased to middlemen, reduced the land tax on small holdings, and granted new facilities for obtaining credit to the peasants. After a general election in June 1907, Sturdza remained in office with an overwhelming majority. To meet the cost of agrarian reform, and of the reorganization of the army (1908), he introduced various fiscal changes, notably an alteration in the budget system, by which the total revenue and expenditure were distributed into large and small amounts (as above).

Rumania was little affected by the political changes in the Balkan Peninsula (1908-10) coincident with the Turkish revolution, the annexation of Bosnia and Herzegovina by the Dual Monarchy, the proclamation of Bulgarian independence and the erection of Montenegro into a kingdom. South of the Danube its chief political interest centred in the Kutzo-Vlach communities in Macedonia, which were the object of a Panhellenic
propaganda most offensive to Rumanian nationalism. An irade of the sultan Abdul Hamid had in 1906 recognized the existence of the Kutzo-Vlachs as a religious body (millet), forming an integral part of the Rumanian Church. This decision was regarded by the Greeks as a blow to their own interests, and Greek revolutionary bands were accused of persecuting the Kutzo-Vlachs. (See also MACEDONIA.) Even before 1906 there was keen rivalry between Greece and Rumania, and the "Macedonian question" was the underlying cause of the disputes which, arising ostensibly from quite trivial causes, led to the formation of the Rumanian Church. When it was established that the dialect of the Rumanians living on the Lower Danube was structurally an integral part of the Rumanian tongue, some of its adherents began to use it in their religious services, with the consent of the Rumanian Church. This is the so-called Daco-Rumanian, spoken by a vast majority of Rumanians over the whole of Rumania, in Transylvania, Bukovina, the Banat, and some other parts of the Servia and Servia and Dobrudja, forming part of the Rumenian Church. The two most important dialects are the Istro-Rumanian, spoken in part of Istria but rapidly becoming extinct, and the Macedo-Rumanian, spoken by the Kutzo-Vlachs (see above). The latter dialect has been preserved almost completely—between the Romance of the Balkans and the Romance of the West. In the Macedo-Rumanian there are no Magyar loan-words, but there is a large Albanian element, and Greek loan-words are more numerous than Slavonic.

BIBLIOGRAPHY.—No scientific history of Rumania was published up to the 20th century, but the task of collecting and editing original documents was partially carried out by the Rumanian Academy and by private students, especially after 1880. The so-called Chronicle of Hurea is a modern forgery, and up to the 14th century the only valid authorities are Slavonic, Hungarian and Byzantine chroniclers. Thenceforward a great mass of material is available. It is partly incorporated in the yearly Annalee of the Rumanian Academy, 2nd series, from 1880, and in the 30 volumes of E. Hürmzuk's Documente privitoare relative la istoria Românilor (Bucharest, 1875, &c.). Other important original documents, or works containing such, are: A. M. Despot, De situ Daciae, Transylvaneae, et Moldavicae, et Transilvaneae, in Kovatch's Scriptores rumeni Hungarorum, volume minor (Bucharest, 1798); G. Urechea's late 16th-century Chronique de Moldavie, ed. J. Picot (Paris, 1878); Rumanian texts in the various Slavonic, Hungarian, and Byzantine translations and adaptations of the Old Testament—of great value; the 17th-century Opere Complete of Miron Costiu, ed. V. A. Urechea (Bucharest, 1886); A. M. del Chiaro, Istoria delle monarchie slaviche (Bologna, 1876-1878); the early 18th-century Opere principale D. Cantemir, issued by the Academy (Bucharest, 1872, &c.); N. Iorga, Acte si fragmente cu privire la istoria Românilor (Bucharest, 1895-97). M. Kogălniceanu, Crâncile Românilor (Bucharest, 1872-74); J. L. Carra, Istoria de Moldavie et de Valachie, avec une dissertation sur l'état actuel de ces deux provinces (Jassy, 1777); A. M. Blanc de Launay, Mémoire sur l'état ancien et actuel de la Moldavie, présenté à l'Académie (Paris, 1787); D. A. Sturdza, Acte et documente relative la istoria romanenilor Românilor (Bucharest, 1900, &c.); ibid., Scirele et citântupi lui I. C. Bratianu (Bucharest, 1903, &c.). On the Phanariote period, the R. D. Costiu, Istoria Romanilor. Les origines. Etude sur l'état de la société române à l'époque des règnes phanariotes (Paris, 1898). For a general history of Rumania, see V. A. Urechea, Istoria Râov inător (Bucharest, 1891, &c., 8 vols.); A. D. Xenopol, Istoria Românilor din Dacia Traiană (Jassy, 1888-93, 6 vols.—abridged French edition entitled Histoire des Roumains, 2 vols., Paris, 1896); and P. Negulesco, Histoire du droit et des institutions de la Roumanie (Paris, 1906). The Istro-Rumanian forms, as it were, are a series of words of Slavonic origin to words of Latin origin is approximately as three to two; large numbers of loan-words have also been added from Turkish, Greek, Magyar and other sources. It is noteworthy, however, that where Latin words have survived they are sometimes purer than in the Romance languages of the West.

RUMANIAN is, geographically, an isolated eastern member of the group of Romance languages (g.v.), being severed from all the rest by countries in which the predominant speech is Slavonic or Magyar. It represents the original rustic Latin of the Roman provinciales in Moesia and Dacia, as modified by centuries of alien rule. Structurally, its Latin characteristics have been well preserved; but its vocabulary has undergone great changes, being modified to suit the needs of the inhabitants and influenced by various foreign elements. It is thus possible to trace the origin of words to Latin origin is approximately as three to two; large numbers of loan-words have also been added from Turkish, Greek, Magyar and other sources. It is noteworthy, however, that where Latin words have survived they are sometimes purer than in the Romance languages of the West.

The Latin alphabet is used, with special signs to represent sounds borrowed from Slavonic, &c. All the vowels except e are pronounced as in Italian; e has the same phonetic value as in Old Slavonic (= French é) and is often similarly prestoset (= ye in yet), notably at the beginning of all words except neologisms. The accented vowels á and ê are pronounced as in French, the nasal nasal is pronounced as in French; r as in Russian; s as Slav. (Slav. III) as th; t as (Slav. III) as ts or tz; w as wanting. The remaining consonants are those of the several languages as in French.

Rumanian orthography remained in a transitional state throughout the 19th century. The Latin alphabet is used, with special signs to represent sounds borrowed from Slavonic, &c. All the vowels except e are pronounced as in Italian; e has the same phonetic value as in Old Slavonic (= French é) and is often similarly prestoset (= ye in yet), notably at the beginning of all words except neologisms. The accented vowels á and ê are pronounced as in French, the nasal is nasal is pronounced as in French; r as in Russian; s as Slav. (Slav. III) as th; t as (Slav. III) as ts or tz; w as wanting. The remaining consonants are those of the several languages as in French.

The accentuation of Rumanian, though complex, is governed by certain broad principles, except in the case of neologisms, many of which have been borrowed from French and Italian, without change of accent. Non-Romanian nouns retain the accent of the nominative singular in all cases and in both numbers (e.g. copilă, girl, vocative plur. copilor), except when a diminutive or augmentative suffix is added; the accent then shifts to the suffix. The language is very rich in diminutives and augmentative forms: e.g. the name Ion or Iohann, has the diminutives: Ionăscu, Ionța, Ionăși, Ionța, Ionțel, &c. In verbs—apart from a few exceptional cases—the accent falls on the first syllable of the inflected form, e.g. eș dorn, I sleep, but eș dormir, I slept. For the sake of euphony, a is frequently attached instead of e to words beginning in a, e.g. words formerly used only in masculine nouns terminating in a consonant, an interpolated preceded by the suffix article (om, man, om-ul, the man).

LANGUAGE.

Rumanian is a Romance language of the Romance stock, corresponding to the Italian and French languages. It is the language of the Rumanians, who are a diverse group of peoples living in the eastern Balkan Peninsula, mainly in the present-day Rumania, but also in parts of Moldova, Ukraine, and other regions in the former Yugoslavia.

The Rumanian language is closely related to other Romance languages, such as Italian and French. It shares many common features with these languages, such as a similar grammar and vocabulary.

However, Rumanian also has distinct features that set it apart from other Romance languages. For example, it retains some archaic elements from the Latin language, such as archaic pronunciation and spelling. Additionally, it has a rich vocabulary due to its long history and cultural development.

Overall, Rumanian is a fascinating language that reflects the unique cultural heritage of the Rumanian people.
RUMANIA

LITERATURE

The intellectual development of Rumania has never until modern times been affected by Latin culture, but it has been profoundly influenced first by Slavonic literature, then by the Greek or Byzantine literature, and last, by the Western, notably French and Italian novels. The history of Rumanian literature can be divided into three distinct periods: the Slavonic, from the beginnings of Rumanian literature in the middle of the 16th century down to 1710; the Greek, from 1710–1830, corresponding with the era of Phanariote rule; and the last period, from 1830 to the present day. Rumanian literature from Slavonic to Rumanian was very gradual. Slavonic had been the language of the Church from the early middle ages, and was therefore hallowed in the eyes of the people and the clergy; through the political connexion with the Slavonic kingdoms of the south, Bulgaria and Servia, it had also been the language of the chancellories and of the court. Even when the Rumanian language at last supplanted the Slavonic, it did not emancipate itself from the original; the new was merely a translation from the old, and at the beginning it was as literal as possible. We have therefore in the first period a mediaeval literature transplanted to Rumania and consisting of translations from the Slavonic. The reason of the change from Slavonic into Rumanian is to be sought in the influence the Reformation had among the Rumanian inhabitants of Transylvania.

The second period is marked by a complete waning of Slavonic influence, through the literary activity of the Greek hospodars. The Slavonic kingdoms of the south had lost their independence; they had ceased to produce anything worth having, whilst the Greeks brought with them the old literature from Byzantium and the Greek printing presses. They introduced into Rumania the first printing presses, treated Rumanian as an unsober and barbarous language, and imposed upon the Church their own Greek language, Greek literature, and Greek culture. This literature may be taken to represent the period of the Renaissance in the West; but when the yoke of the Phanariots was shaken off, the link that connected Rumanian literature with Greek was also broken, and under modern influences began the romantic movement which has dominated Rumanian literature since 1830.

Much of the Rumanian literature of the first two periods has been preserved only in MSS.; few of these have been investigated, and a still smaller number have been compared with their original. The Rumanian Academy keeps jealous watch over the treasures it has accumulated, and few have had access to the riches entombed in its archives; nor has any private or public collection been catalogued. An exhaustive history of Rumanian literature is, for the time being, a pious wish.

First Period: c. 1550–1710.—Rumanian literature begins, like all modern European literature, with translations from the Bible. The oldest of these are direct translations from Slavonic texts, following the original word for word, even in its grammatical construction. The first impetus towards the printing of the Rumanian translations came from the princes and judges in Transylvania. It is under their orders and often at their expense that the first Slavonic printing presses were established in places like Kronstadt (Brashov) Oragia, Sass-Shebesch and Belgrad (Alba Julia, in Transylvania) where Slavonic and Rumanian books appeared. The foremost printer and translator was a certain Dianokus Koresi, of Greek origin, who had emigrated to Walachia and thence to Transylvania. He was assisted in his work by the "popes" (parish priests) of those places where he worked. The very first book published in Rumanian is the Gospels printed in Kronstadt between 1560 and 1561. An absolutely identical Slavonic text of the Gospels appeared in the same year, or one year earlier, which shows the close connexion for the Rumanian translators. Following up the list of publications of the books of the Bible in chronological order, we find Diakonous Koresi immediately afterwards—the date has not yet been definitely ascertained—printing Rumanian translations from Greek. In 1577 he printed at Saz-Shebesch a Psalter in both Slavonic and Rumanian; the Rumanian follows the Slavonic verse for verse. A MS. Psalter more recently discovered shows close affinity to this codex and in spite of its inferior quality it must be considered as a copy of it made about 1585; it even reproduces the printer's errors of Koresi's edition. To the 16th century belong the first attempts to translate the Old Testament which appeared in Orasul in 1582, under the title Pala. The example thus set could not fail to react upon the Rumanians in Walachia, with whom the Transylvanians stood in close commercial and intellectual connexion with Rumania; the supremacy in the Church; yet once the example had been set in Transylvania, and the influence of the Slavonic nations had begun to slacken, it was inevitable that the Rumanian language should sooner or later supplant its own. It was in Transylvania that the complete Rumanian translation of the New Testament appeared (Belgrad, 1648). This translation was based upon the Slavonic original, but the text had been verified and corrected, by comparison with a Greek text and with the original Gallican version. The chief author of this translation, which may be termed classical, seems to have been a certain Hieromonach Sylvestre who lived in Bucharest about 1600 and died in 1650. The latter was the first time the Greek alphabet was used by the Rumanians, and the fourth time in the history of the language. It appears to have been at first used on the historic or Slavonic side, with the Rumanian; and the edition of the Testament (1661–90), a translation of the whole Bible. Upon this version, no doubt, are based the editions of the Bible with a Greek text, and it appears to have been in great use in the British Museum. Sylvestre also prepared a new edition of the Psalter as part of his Bible (Belgrad, 1641), verifying the text by reference to a Rumanian and Greek originals. The first edition of this complete Bible was published (1688) by order of Prince Ioan Sârâna, of Cantacuzene, of Radu Grecau, assisted by his brother Sârâna and by the Metropolitan of Buzau, which may be considered as the beginning of the Rumanian literary movement in the 17th century.

No other Rumanian translation approaches it in style and diction, although the authors, as they own, utilized the older translations, and for the New Testament and the Psalter they utilized Sylvestre's work. At least a hundred years had to pass ere a new edition of the whole Bible was undertaken, nor was the Bible used for private reading, except such passages as were included in the lessons read in church. These were translated independently of the ancient texts, and it was a long time before the language was heard in the church. Upon this translation he based the rhymed Psalter at which he worked from 1660–73, when it appeared in Uniev. This is the first example of rhymed psalms in Rumanian, the author following the model of similar versions used in Hungary. An edition of it was published in Transylvania in 1682, in which the rhymed Psalter into Hungarian (1667) and this served as the basis for a literal translation made by Ioan Visku (1667). About the same time Theodore Koresi attempted to verify the Psalter and dedicated his work to Petru the Great of Russia. A new translation of the Psalter from Slavonic, with a commentary, the first of its kind, was made in 1697 by Alexander Dascalu (Alexander Preceptor Polonius). All these last-mentioned Psalters are in MS.

Turning from the Bible to homilies and the liturgy, we find the ancient collections of homilies in Rumania to be due to the same general movements. A translation of the Catechetical Homilies by Koresi (in the capacity of the magistrate of Kronstadt. Foro Miclaus, c. 1570), seems to have been translated from a Latin version into Rumanian, and published in Bucharest under the title Catedhuluatori (1571). It was printed by a certain Melchisedec and contained thirteen homilies. Very voluminous is the next collection, Evanghelie cathedhuluatorii (Aliexandru Somescu and Ioamie Butavius, Govora, 1636). One year later appeared the first book printed in Moldavia, the collection of homilies Carne românescul de sfântului (Jassy, 1644). It is a volume of 1000 folio pages, of which the first half is absolutely identical with Somescu's collection. A similar unacknowledged loan was made by Melietie the Macedonian, compiler of the homilies which appeared at Deal in 1644. Of special interest
is the next publication of homilies Cheia inteselului, "the Key of understanding," by the Walachian metropolitan Varlaam, translated into Rumanian by Dositheiu (1668). The first book printed in Bucharest, begins the long series of editions which have issued from the press of the "Mitropolie" in Bucharest. From this press originated also the less important presses at Buzau and Bucharest. In the following two centuries all the books for the Church service were printed. Two or three more collections may be mentioned here—one called Storia de aur, "the Golden Law," and translated by Dositheiu (1688), probably from some Hungarian Calvinistic collection of oratory sermons; and the "Pearls," Margaritare, translated by the Greek homilies of St Chrysostom, Epiphanius, Anastasius Sinaiticus, Cyprian, and from the Old Greek, which was then in demand by the Rumanian and Serbian Greceanu. The only collection of original sermons is the Didahii delivered by the metropolitan Anthim the Iberian (q.p.), the scholar, artist, translator, printer and great linguist, who was the second metropolitan of Bucharest. Both these collections and homilies were printed in Bucharest in 1888.

The Rumanian language was not yet introduced into the Church. All the service books were in Slavonic, but during this period most of them were translated, and some of them printed, although not yet officially used. The burial service seems to have been the first to be translated. Two Eucaristia appeared during the second half of the 17th century, one by the bishop Dosi-theiu (Jassy, 1679–80), which remained almost unknown, and the other based upon the Slavonic, by Ioan of Vinți (Belgrad, 1689). This latter book has become an important and standard basis of the modern Rumanian liturgical books.

The Law.

The first book printed in Rumanian was the Liber pater noster, in 1624. A complete code of laws, translated from the Greek and Slavonic and adapted to local needs under the direction of the prince of Walachia, Mihai Sturdza, was published in 1700. The Intronizarea legii, in which Pravilul de Vesale was incorporated without acknowledgment, remained the recognized code almost down to 1866. It embraces the canonical code of the civil law. The chief authors were Uriël Năsturel and Danil M. Miclăuşen. The earliest historical works are short annals, written originally in Slavonic by monks in the monasteries of Moldavia and Walachia. In the reign of Iosif, prince of Moldavia (Sassoferrato), a historian of the world down to 1498. Two other universal histories were translated from Greek and Slavonic chronographs. One by Pavel Danovici contains the history of the world told in the style of the Slavonic and one chronicle from the history of Pope Sylvester and the description of the various church councils; and it concludes at the year 1636. The second is the Itrongraf of Dorotheus of Momembastian, translated by a certain Ion Pop. Both these annals were printed in Bucharest. The Didahii were published at Bucharest in 1888.

The Liturgy.

The Ethical literature.

The First period: 1710–1830.

The Phanariote period has been described as one of total decay; the political degradation of Rumania was thought to be reflected in its spiritual life. But the facts do not warrant this opinion. The few who had taken the trouble to study Rumanian literature paid not the slightest attention to the vast MS. material accumulated during the years of the Phanariote dominion, and out of sheer ignorance and political bias condemned this period as sterile. Another influence was far more potent than the conduct of the Greek princes, though some of them were real benefactors of the people. In Transylvania one section of the Rumanian population had accepted the spiritual rule of the pope; they were in sympathy with the Latin views instead of Greek Orthodox. Rome took good care to educate the priesthood far above the status of the Orthodox priests, and continued an extensive proselytising activity. So long as the Rumanians were spiritually united with the other Orthodox nations, and so long as they used the Slavonic or Cyrillic alphabet, they would practically be cut off from the Latin West. If, however, they could be induced to discard the old Slavonic alphabet and substitute for it the Latin, and could be brought to recognize their national and ethnical unity with ancient Rome, it was hoped that they would be more easily induced to enter into the unity of faith. Thus a great change was wrought towards the end of the 18th and in the
first half of the 19th century in the whole current of Rumanian literature. It suited the promoters of that movement to pretend that they started a new era. But the Latin or Transylvanian movement wrought great havoc in Rumanian literature and caused the greatest confusion in the language. Only now are some authors beginning to free themselves from the evil influence.

By the end of the 17th century Rumanian had become the authorized language of the Church, and the Rumanian translation of the Gospels (printed 1693) had become the authorized version. The translation of church books officially authorized and revised in this period are still used for church services. Such are the Cesalos, revised by Bishop Kliment of Râmnicu Vâlcea (1743), the Eclogosis (1764), the Kritica (1722), the Krestoare (1725), the Mirese, in 12 folio volumes, by Bishops Kesarie and Filaret of Râmnicu Vâlcea (1776-80), is equal in importance to the first translation of the Bible and to the later publication of the Lives of Saints, also in 12 huge folio volumes, published under the direction and the assistance of the metropolitan Veniamin of Moldavia. The latter was translated from the Greek and appeared in Neamt in 1809-12, and was reprinted in Bucharest 1835-36. In beauty, richness and lucidity of language, and in dignity of style, these two books resemble the Bible of 1688.

Slavonic having entirely disappeared from the sources of literature, writers turned to Greek, and for a century they were busy translating into Rumanian the most important works of the older Fathers of the Church. Some of these translations were published much later; but in 1736, the Great (and of Ephesos) translated the middle of the 18th century, was printed at Bucharest in 1827, the Scala Coeli of Joh. Klimakus, the Treasury of St Damasenus (MS. 1747 by a certain Mihalaeca), the Life of St John of Alexandria (1654) and of the Muses were translated into Rumanian and published in 1784. Some of these translations were made among others by the poet Filaret of Moldavia, who was to English the 18th century. He was a man of great talent and was capable of expressing himself in a style that was not only suited for abstract problems and theological dialectics, but was also well suited to express subtle ideas. In Transylvania, with the conversion to Greek-Catholicism of Bishop Athanasius in 1701, the Greek Orthodox had to place themselves down to 1850 under the protection of the Servian metropolitan of Karlovat. No writer of any consequence arose among them. Their authors were of two types: the first was a sort of writer, and the second was a sort of translator. In the latter category, Neamt was sent to Rome and helped from Vienna to obtain a serious education and occasionally also temporal promotion. With a view probably to counteract the literary activity in Rumania, the bishops P. Roscovat, P. Bobb and P. Bobb were sent to Rome to study. The first was ordained to the priesthood in Râmnicu Vâlcea in 1784; a translation of Gregory of Nazianzus appeared at Bucharest in 1727. The great polemical work of Simeon of Thessalonica, the Greek original of which was published by Evgeni (1785-90), was translated into Rumanian before it was printed (Bucharest, 1756). The Lapsi, mentioned above, was printed at Bucharest in 1754. All these translations were made among others by the great Metropolitan Athanasius, who was a man of great talent and was also capable of expressing himself in a style that was not only suited for abstract problems and theological dialectics, but was also well suited to express subtle ideas. Simeon of Thessalonica was the poet of the modern Rumanian Church, and in 1868; it was modernized in its language, and no doubt careful work was done to make it suitable for Rumanian, even if differences would be revealed in those passages in which the religious Church tradition differs from the Eastern Orthodox Church.

Thus the Greek authors and the Rumanian writers of the latter part of the 18th century, the great Metropolitan Athanasius, who was a man of great talent and was also capable of expressing himself in a style that was not only suited for abstract problems and theological dialectics, but was also well suited to express subtle ideas. Simeon of Thessalonica was the poet of the modern Rumanian Church, and in 1868; it was modernized in its language, and no doubt careful work was done to make it suitable for Rumanian, even if differences would be revealed in those passages in which the religious Church tradition differs from the Eastern Orthodox Church.

In Moldavia a similar development took place, translations leading up to the time of Paul Emanuel (1758-1824), the great dean in St. Petersburg. It is that of the scholar and linguist Constantin Konaki (1777-1849), who might be termed the Rumanian Longfellow for the facility and felicity of his translations from Western poetry and for his short poems in the Rumanian idiom. His Psihiațrii și știrii ale timpului al doilea (1854) and Metastasio, a man of immense activity, of great power of initiative and of still greater imagination. He was then ushered in the new epoch, and for close upon forty years he stood at the head of almost every literary undertaking.

There were two periods in his life—the latter the exact opposite and negation of the former. Up to 1848 he was closely connected with the political and administrative life of the country. He translated the works of G. Asaki and Alexander Beldiman in Moldavia developed a similar activity. Beldiman copied a number of ancient chroniclers, wrote a satire on the Greeks, and translated and adapted a number of French poems, and later consisted of mostly history and descriptive poetry. Nowhere has the theatre played a more important rôle in the history of civilization than in Walachia and Moldavia, more in the former than in the latter. It formed the rallying-ground for the lyrical romances of Piran și Tise (1808) and Sofiațian și Ițdălă (1821); and the humorous Leonat și Derofta, a satire on bad women and on drunken husbands, now a chapbook. Barak wrote the patriotic poems of 1802-03, his translation of the Abington, as an example of the new generation which cherished the memory of the tragedy of the Rumanian language.

Among the poets was Vasile Aaron (1770-1822) and Ion Barak (1779-1848). Aaron wrote the patriotic poems, his translation of the Abington, as an example of the new generation which cherished the memory of the tragedy of the Rumanian language.

The love-songs of the time are primitive imitations of the Neo-Greek lyric dithyrambs and rhapsodies, which through the teaching of the princes of Walachia were considered as the fountainhead of poetical inspiration. But a closer acquaintance with the West led to greater independence in poetical composition. In the three generations of the Vaceaescu one can follow this process of rapid evolution. Ianache Vaceaescu, author of the first native Rumanian grammar on independent lines, was also the first who tried his hand at poetry, following Greek examples. He then studied Italian, French and German poetry, and made translations from Voltairi and Rousseau. He died in 1796, but had made some progress. He was overshadowed by the grandee Ioan (b. 1818), who was more learned than any other man both the representative of an epoch fast vanishing and the harbinger of the new spirit that was stirring young Rumania. In the political satire of his Vineașcii sănătății was an important step forward by 1848; but among them were some of the poems of Ianache and Alecu, which were confused with his own work. In this volume, Coliseul din poezie a demului aic marj legel .Vaceaescu, there are other poems, both epic and lyric, which have rare echoes among the best of the language. A contemporary of his earlier period, Paris Mainumule (1794-1837), wrote his Rodul de poeti (1820) under Greek influence, but after- wards, when he was on the threshold of his career and the spell of Mihai Eminescu was strong, he published his Albastru (1824) and Nucu (1847) of Voltaire. Among his contemporaries may be mentioned G. Crețeanu (1829-1889) and A. Stolzenau (1834-1857), who left some weak poems of a sentimental and patriotic character, but also translated works of Voltaire. Two others, Ion Călugărescu (1834) and Iuliu (1848) of Voltaire. Among his contemporaries may be mentioned G. Crețeanu (1829-1889) and A. Stolzenau (1834-1857), who left some weak poems of a sentimental and patriotic character, but also translated works of Voltaire. Two others, Ion Călugărescu (1834) and Iuliu (1848) of Voltaire. Stolzenau (1834-1857), who left some weak poems of a sentimental and patriotic character, but also translated works of Voltaire. Two others, Ion Călugărescu (1834) and Iuliu (1848) of Voltaire.
poetry for inspiration. He collected Rumanian popular songs and ballads (Doino, 1844) (J. Bălcescu, 1853). Leontin Constantinescu (1820-73) introduced admirable pictures of Rumanian life into Rumanian poetry. In Legende (1871) and Ostași noștri (1877) he strikes the patriotic note. His fame rests on his lyrical poems, which he sometimes composed in the charm of popular rhythm. Alecsandri is less successful in his dramas, most of which are adaptations from French originals; the only merit of his novels is that amidst the phrenetic and philological turmoil he kept to the purest language of the Rumanians.

From Alecsandri there is a natural transition to his great rival, who was also his superior in depth of thought and in mastery of form and language, the great poet of popular literature; the popular poet of the Rumanian language. Eminescu, he also be made of Matilde Cugler Poni (b. 1833), who published some admirable short poems in the Rumanian reviews (Pozori, 1888). Veronica Micle (1853-1889) belongs to the same circle of gifted Rumanian women (b. 1853). But these women disappear with the appearance of Eminescu, who, like Bolintineanu, started a new school of poetry and left a deep and growing influence upon the new generation. His best follower, though possessing originality of his own, is A. Vălăcuță (b. 1859). G. Coboș, who has risen more recently to fame, is the poet of the unfortunate Rumanian peasant, emancipated only in name and on paper, and a prey to greedy landowners and to a medieval administration. This school drew their inspiration from popular poetry, and all of them were sons of the lower middle class or of peasants, who by dint of heavy work and real hardship were able to rise above the narrow social conditions in which they were born.

Somewhat different has been the development of the Rumanian prose writers. They suffered in consequence of the philological disputes, and brought about the disintegration of the Rumanian language. But these writers are also a reflection of the Rumanian way of life, and left a deep and growing influence upon the new generation. His best follower, though possessing originality of his own, is A. Deauna Kioan (1860). The first novel describing Rumanian human nature in everyday life is the Clocetii vechi și noi (1863) of Nicolae Filimon (1810-1863). In Moldavia where the knowledge of the old chronicles had not entirely died out and disturbing philological influences were not so acutely felt, we find the vivid writings of Mihail Codălincaen— one of the leading spirits of the 19th century, the greatest mind and the real founder of Rumanian prose. Among his political, public, and dramatic works, we shall mention the two famous Rumanian historical novels, Dacia literară (1849-60) and Arcihiva romanescă (1845-49); he also has the great merit of having published the first edition of the Rumanian chronicles. The more abstract (1878-1871), a second Eliade, helped to inaugurate a literary reform in Moldavia; but the result was disappointing, until the literary society known as the Junimea was started, in the seventies, by Tittu Maniu. R. C. (1815-59), the founder of the Rumanian language movement, put a stop to the prevailing Latinism, and turned the current of Rumanian literature into a more healthy channel, by the publication of his Critici (1874).

Ioan Ghica, a contemporary of the revolutionaries of 1848, gathered his recollections of those agitated times into two volumes, Amintiri (1890) and Scrisori către V. Alecsandri (1897), which besides having value as a model of Rumanian prose. Among writers of fiction three stand out prominently: Ion Slavici (b. 1848) describes the life of the people, notably of the Transylvanian peasants, in short stories, Noul de popor. Barbu Stănescu, des historice (b. 1852) (b. 1853) and Ion Mihailescu,Poșta (b. 1858) (b. 1859) are characterized by a wealth of imagery and richness of language; but the characters are all mostly unreal and exaggerated. The best known collections are Salina (1883) and Trudobrat (1885). Ioan Slavici (b. 1848), the most influential of the three, has worked a revolution of modern times, who has brought on the stage living types of the lower and middle classes, and has skillfully portrayed the effect of modern vogue on old customs, is also the author of the powerful short stories, (b. 1860), which have the title of Studii critic (1890 sqq.) been a ruthless but none the less judicious critic.

Curiously enough, there is not a single novel in the Rumanian literature with a sustained plot; none which presents a study of the development of human character amid the multifarious vicissitudes of life. The reason for this deficiency may be, while Rumanian poetry could well compare with that of any Western nation, in the domain of prose writing, and of novels in particular, one must look to the future to fill up the gap now existing.

There existed in Rumania another set of literary monuments at least as old as any of the books hitherto enumerated, but which appealed to a wider circle. Rumanian folk-literature contains both popular written books and oral songs, ballads, &c. It is advisable to group the material in three sections: (1) the romantic and religious literature—both of these being written—and (3) the modern collections of ballads, songs, tales, &c.

To the first belong the oldest books, such as the History of Alexander the Great, which was known in Rumania in the 17th century. It rests mostly upon a Slavonic-Greek text and is of the utmost interest for the study of this cycle of legends. The first printed copy appeared in 1704, and has been reprinted in innumerable editions. Next comes the legend of Constantine, of his town and his exploits—a remarkable collection of purely Byzantine legends. In addition to these there is the history of St. Sylvester and the history of St. Constantine, &c., all still in MS. The History of Barlaam and Josaphat (see Barlaam and Josaphat) may also be mentioned here, for it appealed to the people not so much for the interest of the legends themselves as the pithy parables and apologicals contained in the legend were incorporated into the Teachings of Prince Neagoe, and were also circulated separately; they are found in many old MSS. Udrice (Urd) Năstulcu, a poet of the 18th century, has collected and arranged these legends into a work of 8 volumes, the farewell song of the prince departing into the forest, has since become one of the most widespread popular songs. Of similar oriental origin is the Dream of Homer, the interpretation of which has been published by a number of Rumanian scholars, and has reached Rumania early in the 18th century, probably in Slavonic. The history of Synthippa and the Seven Masters has also become a popular book. It was translated from the Greek version. To the same cycle of oriental tales belongs the Halina, already described, which G. Gorjeanu printed (3 vols., 1835-37) as his own work. The History of Arbib and Anamod, by printed by Anton Pann from a Slavonic text, is also a good collection of legends. The work of Akryios the Wise, mentioned in Tobit and found in many languages. In Rumania it rests on an older Greek-Slavonic text, and owes its great popularity to the wise and witty proverbs it contains. To the same cycle of popular literature belongs a work of Yanuță, who was also a poet and composed his tunes. In about twenty years he published no less than fifty books, all of them still popular. Besides his edition of the Rumanian Church service-books with musical notation, he published a series of tales, proverbs and songs either from older texts or from oral information, and he made the first collection of popular songs, Spitalul amorului, "The Hospital of Love" (1850-53), with tunes either composed by himself or obtained from the gipsy musicians who alone performed them. The Rumanian proverbs were a matter of great interest to folklore. His Poeecte vorbei (first ed. 1 vol., 1847; 2nd ed. 3 vols., 1851-53) is a large collection of proverbs ingeniously connected with one another, and culminating in a short tale from a popular tale exemplifying the proverb. The Fabule și istorioare (2 vols., 1839-41) is a collection of short popular stories in rhyme; Sesiunarea la târă (1852-53) is a description of the Rumanian peasantry and peasants. These Rumanian writers, houses on a winter’s night, the girls and women spinning and working, the young men telling tales, proverbs, riddles, singing songs, &c. Pann also collected the jokes of the Turkish jester, Nasreddin, which he printed in Eastern and Western Slavonic, also in rhyme. He also published a collection of Christmas carols, set to music by himself; these are still sung by boys on Christmas night.

Far larger than the secular is the religious popular literature; it comprises many apocryphal tales from the Old and the New Testaments, and not a few of the heretical tales circulated by the various sects. (c. 1848) and Mina (1858), which percolated into Rumania through the medium of Slavonic. A recent enumeration of the
chief tales must suffice. Only a few of them have hitherto been published. They exist in numerous MSS. which testify to their great antiquity. Numerous popular sayings may be derived from their influence upon the people's imagination. They include the History of Adam and Eve, the Legend of the Cross, The Apocalypse of Abraham, the History of the Sibyl, the Legends of Solomon; numerous legends were composed to glorify the memory of St. John the Baptist; a very remarkable version of the Gospel of Nicodemus; and the Epistle of Pilate. Printed in tens of thousands they form a particular branch of folklore dealing with etiological and apocryphal problems. The ancient Apocalypse of Peter appears here under the name of Paul, then there is an Apocalypse of the Virgin Mary, who, like Peter, is carried by the Archangel through the gates of Paradise, and through whose intervention sufferers are granted pardon on certain days of the year. Combined with these is the Sunday Epistle, sent from Heaven, enjoining strict observance, not only of Sunday, but also of Holy Friday, and providing for absolution as both Holy Days date in their Rumanian form from the 16th and 17th centuries; the Sunday Epistle is well known in connexion with the Flagellants.

In the same pamphlet to the Sunday Epistle was published the legend of St. Sina and sometimes that of Avestita,—the former saved the children of his sister from the attacks of the devil, who had devoured them and had to restore them alive; the latter is the female child which, heroised by an angel from carrying out her evil design. In both cases the repetition of the legend and the recitation of a string of mystical names serve, like some other tales, apocalyptic and otherwise, as amulets, subjective magic, as it were, to devil. Most of these texts rest many popular charms and incantations. Therein lies the importance of this written literature, for it gives us the clue to much that now lives in the mouths of the people, and is by way of being of immediate antiquity. Incantations and astrological calendars and prognosticos are among the best known and most widely circulated popular books, and the lives of St. Alexius, Xenophon, &c. have been written up in lyric and epic patterns of ancient forms. They are, however, one of the chief sources of tales, which has beenTatareni, and the collection of tales of the Moldavian Ion Creanga (1837-89) appeared in his Opere complete (1908). Excellent collections are those of D. Stancu, Basme (1888-1893), I. G. Biseria, Basme (1886), Frâneșcu și Cătreâne (1888), Kure-Vlach tales, some of which have been found in Transylvania, Die Ernährung, vol. ii. The only review devoted to the study of folklore is the Science, founded in 1892. In recent times a kind of stagnation seems to have overtaken Rumanian folklore and attempts have been made to place the intellectual life of the nation on a sounder basis, the work of transition from the past to the present has hitherto absorbed more energy than appears necessary. Whatever the causes may have been, the fact is that now there is a great interest in tales and stories, a great poverty in outlook.

RUMELIA, or RUMELIA (Turkish Rumelii, "the land of the Romans," i.e. the East Roman or Byzantine empire), a name commonly used, from the 13th century onwards, to denote that part of the Balkan Peninsula which was subject to Turkey. More precisely it was the country bounded N. by Bulgaria, W. by Albania and S. by the Morea, or in other words the ancient provinces, including Constantinople and Salonica, of Thrace and Macedonia. The name was ultimately applied more especially to a province composed of central Albania and western Macedonia, having Monastir for its chief town. Owing to administrative changes effected between 1870 and 1875, the name ceased to correspond with any political division. Eastern Rumelia was constituted an autonomous province of the Turkish empire by the Berlin treaty of 1878; but on the 18th of September 1885, after a bloodless revolution, it was united with Bulgaria (q.v.).

RUMFORD, BENJAMIN THOMPSON, COUNT (1753-1814), British-American man of science, philanthropist and administrator, was born at Woburn, in Massachusetts, on the 26th of March 1753. The Thompson family had been settled in New England since the middle of the previous century, and belonged to the class of moderately wealthy farmers. His father died while he was young, and his mother speedily married a second time. But he seems to have been well cared for, and he was at the age of fourteen sufficiently advanced "in algebra, geometry, astronomy, and even the higher mathematics," to calculate a solar eclipse within four seconds of accuracy. In 1766 he was apprenticed to a storekeeper at Salem, in New England, and while in that employment occupied himself in chemical and mechanical experiments, as well as in engraving, in which he attained to some proficiency. The outbreak of the American War put a stop to the trade of his master, and he thereupon left Salem and went to Boston, where he engaged himself as assistant in another store. He was at that period between seventeen and eighteen years old, and at nineteen, he says, "I married, or rather I was married." His wife was the widow of Colonel Benjamin Rolfe, and the daughter of Timothy Walker, a "highly respectable minister, and one of the first settlers at Rumford," now called Concord, in New Hampshire. His wife was possessed of considerable property, and was his senior by fourteen years.

This marriage was the foundation of his success. Soon after it he became acquainted with Governor Wentworth of New Hampshire, who conferred on him the majority of a local regiment of militia. He speedily became the object of distrust among the friends of the American cause, and it was considered prudent that he should seek an early opportunity of leaving the country. On the evacuation of Boston by the royal troops, therefore, in 1776, he was selected by Governor Wentworth to carry despatches to England. On his arrival in London Lord George Germain, secretary of state, appointed him to a clerkship in his office. Within a few months he was advanced to the post of secretary of the province of Georgia, and in about four years he was made under-secretary of state. His official duties, however, did not interfere with the prosecution of scientific pursuits, and in 1779 he was elected a fellow of the Royal Society. Among the subjects to which he especially directed his attention were the explosive force of gunpowder, the construction of firearms, and a system of signalling at sea. In connexion with the last, he made a cruise in the Channel fleet, on board the "Victory," as a volunteer under the command of Admiral Sir Charles Hardy. On the resignation of Lord North's administration, of which Lord George Germain was one of the least popular members, he left the civil service, and was nominated to a cavalry command in the revolted provinces of America. But the War of Independence was tactically at an end, and in 1783 he finally quitted active service, with the rank and half-pay of a lieutenant-colonel. He now formed the design of joining the Austrian army, for the purpose of campaigning against the Turks, and so crossed over from Dover to Calais with Gibbon, who, writing to his friend Lord Sheffield, calls his fellow-passenger "Mr Secretary-Colonel-Admiral-Philosopher Thompson." At Strassburg he was introduced to Prince Maximilian, afterwards elector of Bavaria, and was by him invited to enter the civil and military service of that state. Having obtained the leave of the British
government to accept the prince's offer, he received the honour of knighthood from George III., and during eleven years he remained at Munich as minister of war, minister of police, and grand chamberlain to the elector. His political and courtly employments, however, did not absorb all his time, and he contributed during his stay in Bavaria a number of papers to the Philosophical Transactions. But that he was sufficiently alert as the principal adviser of the elector the results of his labours in that capacity amply prove. He reorganized the Bavarian army; he immensely improved the condition of the industrial classes throughout the country by providing them with work and instructing them in the practice of domestic economy; and he did much to suppress mendicity. The multitude of beggars in Bavaria had long been a public nuisance and danger. In one day he caused no fewer than 2000 of these outcasts and depredators in Munich and its suburbs alone to be arrested by military patrols, and transferred by them to an industrial establishment which he had prepared for their reception. In this institution they were both housed and fed, and they not only supported themselves by their labours but earned a surplus for the benefit of the electoral revenues. The principle on which the establishment was founded is embodied in the following memorable words: "To make vicious and abandoned people happy," he says, "it has generally been supposed necessary first to make them virtuous. Why not reverse this order? Why not make them first happy, and then virtuous?"

In 1791 he was created a count of the Holy Roman Empire, and chose his title of Rumford from the name as it then was of the American township to which his wife's family belonged. In 1795 he visited England, one incident of his journey being the loss of all his private papers, including the materials for an autobiography, which were contained in a box stolen from off his postchaise in St Paul's Churchyard. During his residence in London he applied himself to the discovery of methods for curing smoky chimneys and the contrivance of improvements in the construction of fireplaces. But he was quickly recalled to Bavaria, Munich being threatened at once by an Austrian and a French army. The elector fled from his capital, and it was entirely owing to Rumford that a hostile occupation of the city was prevented. It was then proposed that he should be accredited as Bavarian ambassador in London; but the circumstance that he was a British subject presented an insurmountable obstacle. He, however, again came to England, and remained there in a private station for several years. In 1798 he presented to the Royal Society his "Enquiry concerning the Source of Heat which is excited by Friction," in which he combatged the current view that heat was a material substance, and regarded it as a mode of motion. In 1799 he, in conjunction with Sir Joseph Banks, proposed the establishment of the Royal Institution. It received its charter of incorporation from George III. in 1800, and Rumford himself selected Sir Humphrey Davy as scientific lecturer there. Until 1804 he lived at the Royal Institution in Albemarle Street, London, or at a house which he rented at Brompton, and when his residence in London was over he again established himself in Paris, remaining there from 1804 till 1806. He died in 1792 as his second wife the wealthy widow of Lavosier, the celebrated chemist. With this lady he led an extremely uncomfortable life, till at last they agreed to separate. He took up his residence at Auteuil, where he died suddenly on the 21st of August 1814, in the sixty-second year of his age.

Rumford was the founder and the first recipient of the Rumford medal of the Royal Society. He was also the founder of the Rumford professorship of the American Academy of Arts and Sciences, and of the Rumford professorship at Harvard University. His complete works with a memoir by G. E. Ellis were published by the American Academy of Arts and Sciences in 1870-75.

RÜMİ. (1207-1273). Mahomed b. Mahomed b. Husain albalikhî, better known as Maulâna Jalâl-uddîn Rûmî (or simply Jalâl-uddîn, or Jalal-eddîn), the greatest Sufî poet of Persia, was born on the 30th of September 1207 (604 A.H. 6th of Rabî' I.) at Balkh, in Khorâsân, where his family had resided from time immemorial. He claimed descent from the caliph Abu Bekr, and from the Khwârizm-Shâh Sultan Alâ-uddîn b. Tukush (1190-1220), whose only daughter, Malik-i-Jâhân, had been married to Jalâl-uddîn's grandfather. Her son, Mohammed, commonly called Bahâ-uddîn Walad, was famous for his learning and piety, but being afraid of the sultan's jealousy, he emigrated to Asia Minor in 1212. After residing for some time at Malatia and afterwards at Erzîngân in Armenia, Bahâ-uddîn was called to Lâranda in Asia Minor, as principal of the local college. Here young Jalâl-uddîn grew up, and in 1226 married Jâhuâr Khânî, the daughter of Lâlî Sharâf-uddîn of Samarkand. Finally, Bahâ-uddîn was invited to Iconium by 'Alâ-uddîn Kaikubâd (1210-1236), the sultan of Asia Minor, or, as it is commonly called in the East, Rûm—whence Jalâl-uddîn's surname (takhallus) Rûmî.

After Bahâ-uddîn's death in 1231, Jalâl-uddîn went to Aleppo and Damascus for a short time to study, but, dissatisfied with the exact sciences, he returned to Iconium, where he became by and by professor of four separate colleges, and devoted himself to the study of mystic theosophy. His first spiritual instructor was Sayyid Burhân-uddîn Husainî of Tirmîzî, one of his father's disciples, and, later on, the wandering Sultan Baha-uddîn, whose writings had the most powerful influence over Jalâl-uddîn. Shams-uddîn's aggressive character roused the people of Iconium against him, and during a riot in which Jalâl-uddîn's eldest son, 'Alâ-uddîn, was killed, he was arrested and probably executed; at least he was no more seen. In remembrance of these victims of popular wrath Jalâl-uddîn founded the order of the Maulawî (in Turkish Mevlîvî) dervishes, famous for their piety as well as for their peculiar garb of mourning, their music and their mystic dance (samâ), which is the outward representation of the circling movement of the spheres, and the inward symbol of the circling movement of the soul caused by the vibrations of a Sufî's fervent love to God. The establishment of this order, which still possesses numerous cloisters throughout the Turkish empire, and the leadership of which has been kept in Jalâl-uddîn's family in Iconium uninterruptedly for the last six hundred years, gave a new stimulus to his zeal and poetical inspiration. Most of his matchless odes were composed in honour of the Maulawî dervishes, and even his opus magnum, the Mathnawi (Mesnevi), or, as it is usually called, The Spiritual Mathnawi (mathnawi-i-mevlavi), in six books or daftars, with 30,000 to 40,000 double-rhymed verses, can be traced to the influence of the dervishes. The idea of this immense collection of ethical and moral precepts, which was suggested by his favourite disciple Hasan, better known as Husâm-uddîn, who in 1258 became Jalâl-uddîn's chief assistant. Jalâl-uddîn dictated to him, with a short interruption, the whole work during the remaining years of his life. Soon after its completion Jalâl-uddîn died, on the 17th of December 1273 (672 A.H. 5th of Jamâdâ II.). His first successor in the rectorship of the Maulawî fraternity was Husâm-uddîn himself, after whose death in 1284 Jalâl-uddîn's younger and only surviving son, Shâhâb-uddîn Ahmad, commonly called Sultan Walad, and favourously known as author of the mystical mathnawi Rababnama, or the Book of the Guitar (died 1312), was duly installed as grand-master of the order.

Jalâl-uddîn's life is fully described in Shams-uddîn Ahmad 'Alâkî's Mandeb-ul-Draftin (written c. 1835), the most important portions of which have been translated by J. W. Redhouse in the preface to his English metrical version of The Mesnevi, Book the First (London, 1851); there is also an abridged translation of the First Book, the work of the Rev. H. H. Whitfield (2nd ed., 1898). Complete editions have been printed in Bombay, Lucknow, Tabriz, Constantinople and in Bulaq (with a translation, 1900 A.H.), and at the end of which a seventh dastar is added, the genuineness of which is refuted by the work of Jalâl-uddîn himself in one of the Bodleian copies of the poem, Ouseley, 294 (f. 3288 seq.). A revised edition was made by 'Abbâd-ul-latif (1872 and 1892 A.D., and the same author's commentary on the Mathnawi, 'Alâf-ul-mevlavi, and his glossary, 'Alâf-ul-adabî), have been lithographed in Cawnpore (1876) and Lucknow (1877) respectively, the latter under the title Farhang-i-mathnawi. For the other numerous commentaries and for further biographical and literary particulars of Jalâl-uddîn, see Râzi's Col. of the Persian MSS.
RUMINANTIA—RUNCBERG

RUMINANTIA, a term employed by Cuvier to include all the existing artiodactyle ruminating ungulate mammals now classed under the groups Pecora, Tylotoda and Tragulina. By Professor Max Weber it is employed as a collective designation for these groups, together with the extinct Anthracotherioidea and Didchoboonidea; but its use seems best restricted to a general term rather than a definite systematic group. (See ARTIODACTYLE, PECORA, TYLOPODA.)

RÜMKE, CARL LUDWIG CHRISTIAN (1788-1863), German astronomer, was born in Mecklenburg on the 28th of May 1788. He served in the British navy from 1807 until 1817, and was director of the school of navigation at Hamburg from 1819 till 1820. In 1821 he went to New South Wales as astronomer at the observatory built at Parramatta by Sir Thomas Brisbane. He returned to Europe in 1830 and took charge of the observatory at Hamburg. His chief work was concerned with the cataloguing of stars: a preliminary catalogue of the stars of the S. hemisphere was published in 1832 at Hamburg, and in 1846-52 he published his great catalogue of 13,000 stars. In 1857 he went to reside at Lisbon, where he died on the 21st of September 1863.

His son, GEORGE FREDERICK WILHELM (1832-1900), born on the 31st of December 1832, at Hamburg, was astronomer at the observatory at Durham, England, from 1853 to 1856. He then became assistant at the Hamburg observatory, and in 1862 was appointed director of the same institution. From 1884 he was the Hamburg delegate for the International Earth Measurement. He died on the 3rd of March 1900.

RUNCIMAN, ALEXANDER (1736-1785), Scottish historical painter, was born in Edinburgh in 1736. He studied at Foulis's Academy, Glasgow, and at the age of thirty proceeded to Rome, where he spent five years. It was at this time that he became acquainted with Fuseli. The painter's earliest efforts had been in landscape; he soon, however, turned to historical and imaginative subjects, exhibiting his "Nausicaa at Play with her Maidens" in 1767 at the Free Society of British Artists, Edinburgh. On his return from Italy, after a brief residence in London, where in 1772 he exhibited in the Royal Academy, he settled in Edinburgh, and was appointed master of the Trustees' Academy. He was patronized by Sir James Clerk, whose hall at Penicuik House he decorated with a series of subjects from Ossian. He also executed various religious paintings and an altar-piece in the Cowgate Episcopal Church, Edinburgh, and easel pictures of "Cymon and Iphigenia", "Sigismunda weeping over the Heart of Tancred", and "Aphigina landing with the Ashes of Germanicus." He died in Edinburgh on the 4th of October 1785. His works, while they show high intention and considerable imagination, are frequently defective in form and extravagant in gesture. His younger brother, JOHN RUNCIMAN (1744-1766), who accompanied him to Rome, and died at Naples in 1766, was an artist of great promise. His "Flight into Egypt," in the National Gallery of Scotland, is remarkable for the precision of its execution and the mellow richness of its colouring.

RUNCORN, a market town and river-port in the Northwich parliamentary division of Cheshire, England, on the S. of the estuary of the Mersey in the Cheshire ward of Southport district (1901) 16,491. It is served by the London & North-Western railway, and has extensive communications by canal. The modern prosperity of the town dates from the completion in 1773 of the Bridgewater Canal, which here descends into the Mersey by a flight of locks. Runcorn is a sub-port of Manchester, with which it is connected by the Manchester Ship Canal, and has extensive wharfs and warehouse accommodation. The chief exports are coal, salt and pitch; but there is also a large traffic in potters' materials. A transporter bridge between Runcorn and Widnes, with a suspended car worked by electricity to convey passengers and vehicles across the Mersey (town of Widnes, Cheshire, England) was constructed in 1902. The town possesses shipbuilding yards, iron foundries, rope works, tanneries, and soap and alkali works.

Owing to the Mersey being here fordable at low water, Runcorn was in early times of considerable military importance. On a rock which formerly jutted into the Mersey Æthelfleda erected a castle in 916, but of the building there are now no remains; while the rock was removed to further the cutting of the ship canal. Æthelfleda is also said to have founded a town, but it is not noticed in Domesday. The ferry is noticed in a charter in the 12th century.

RUNDLE (apparently from "run" and "dale," valley, originally something separated off, cf. "deal"), the name of a form of occupation of land, somewhat resembling the English "common field" system. The land is divided into discontinuous plots, and cultivated and occupied by a number of tenants to whom it is leased jointly. The system was common in Ireland, especially in the western counties. In Scotland, where the system also existed, it was termed "run-rig" (from "run," and "rig" or "ridge").

RUNEBERG, JOHAN LUDVIG (1804-1877), Swedish poet, son of a sea-captain, was born at Jakobstad, in Finland, on the 5th of February 1804. He was brought up by an uncle at Uleåborg, and entered the university of Åbo in the autumn term of 1822. In 1823 he broke off his studies to act as tutor in two quiet Finnish villages, Saarjärvi and Ruovesi, where he gained a thorough knowledge of the popular life and poetry, and on his return to Åbo he began to contribute verses to the local newspapers. In the spring of 1827 he received the degree of doctor of philosophy. The university had been removed after the great fire of 1827 to Helsingfors, where Runeberg became, in 1830, amanuensis to the council of the university. In the same year he published at Helsingfors his first volume of Dikter (Poems), and a collection of Serbiska folkdänger (Servian folk-songs) translated into Swedish. In 1831 his verse romance of Finnish life, Grofsen i Pherho (The Grave in Pherho), received the small gold medal of the Swedish Academy, and the poet married Fredrika Charlotta Tengström, daughter of the archbishop of Finland. In the same year he was appointed university lecturer on Roman literature. In 1832 he published his beautiful little idyll, Elgskyttaarne (The Elk-Hunters); and in 1833 a second collection of lyrical poems. He founded in 1832 the Helsingfors Morgenblad, a paper which dealt chiefly with aesthetic and literary questions, and exercised great influence both in Sweden and Finland. In it appeared many of his own poems and tales. His comedy, Frearen Johan Lunder (The Country Lover, 1834), was not a success, but in 1836 he published Hanna, a charming idyll of Finnish country life, written in hexameters. In 1837 Runeberg accepted the chair of Latin at Borgå College, and resided in that little town for the rest of his life.

He was now recognized in his remote Finland retirement as second only to Tegnér among the poets of Sweden. In 1841 he published Nadescha, a romance of modern Russian life, and Julipullien (Christmas Eve), another idyll of Finnish life. The third volume of his Dikter bears the date 1843, and the noble cycle of unrhymed verse romances called Kung Fjolar, the setting of which is taken from old Scandinavian legend, was published in 1844. Finally, in 1848, he achieved a great popular success by his splendid series of poems on the war of 1848 which was published in 1852. The series bears the name of Fäärsk Sälls Sägner (Ensign Steel's Stories); a second series appeared in 1860. From 1842 to 1850 the poet was rector of Borgå College, a post which he resigned to take the only journey out of Finland which he ever accomplished, a visit to Sweden in 1857. In 1854 he collected his prose essays into a volume entitled Smårra Berättelser. In the same year he was made president of a committee for the preparation of a national Psalter, which
RUNES

issued, in 1837, a psalm-book largely contributed by Runeberg for public use. He once more attempted comedy in his Kon ej (Can't) in 1862, and tragedy, with infinitely more success, in his stately Kungrane på Salamis (The Kings at Salamis) in 1863. Runeberg died at Boià on the 6th of May 1877. His writings were collected by C. R. Nyblom in six volumes in 1870, and his posthumous writings in three volumes (1878-79).

The poems of Runeberg show the influence of the Greeks and of Goethe upon his mind; but he possesses a great originality. It is hardly possible to over-estimate the value of his patriotic poems as a link between the Swedish and Finnish nations. He has remained one of the most popular Swedish poets, although his whole life was spent in Finland.

An account of his life and works by C. R. Nyblom is prefixed to the Samlade Skrifter of 1870. For a minute criticism of Runeberg's principal poems, with translations, see Gosse's Studies in the Literature of Northern Europe (1879). A selection of his lyrical pieces was published in an English translation by Messrs Magnusson & Palmer in 1878. There are also monographs on Runeberg by Dietrichson and Rancken (Stockholm, 1864), by Cygniàus (Helsingfors, 1873), by Ljunggren (Lund, 1862-83), and Pescher (Stutt-
gart, 1878).

RUNES, RUNIC LANGUAGE AND INScriptions.

The art of writing with an alphabet appears to have been introduced into Germanic Europe in the Iron Age. Something hieratic and mysterious was involved in the idea of letters as used to convey thought, and from the earliest recorded times they were called runes, from the Gothic runa (rún, in Icelandic), which originally means a secret thing, a mystery, and was later used to describe a letter of the ancient language (see Alphabet and Scandinavian Languages). The Iron Age is supposed to have existed from circa 200 to circa 650, and it is to the close of this epoch that the beginning of the writing on Scandinavian monuments is attributed. There are runes which have been discovered in England, and some also on the Germanic mainland of Europe, but it is in the Scandinavian peninsula that the vast majority of inscribed monuments have been discovered. The custom of erecting runic monuments, i.e. stones engraved with more or less literary statements, over the bodies of the dead, was practised first, there can be no doubt, in Norway and Sweden, then spread to Denmark and over the whole North of Europe. It is remarkable, however, that two of the three runic alphabets from which our knowledge of the whole range of runic-literature is founded, were discovered outside Scandinavia. These three alphabets exist, the first on a thin gold bracteate found in 1774 at Vadsöna, in Sweden; the second on a bracelet, dug up at Charnoy, in Burgundy; the third on a knife, found in the Thames in 1857, and now in the British Museum. There are two principal runic alphabets, the older consisting of 24 letters, and with f; the latter of 16 letters. During the last century before the introduction of Christianity, the larger alphabet was increased by 3 letters.

The oldest runes which have been examined are those found on the Thorsbjerg Shield-back, which is at present in the Kiel Museum; here the writing, which runs from right to left in straight lines, is of the fourth or fifth century. Other important sources of runic knowledge are the diadem of Straarà, the Vimose comb and the brooch of Hilmimgöje, which was found in the Vier Fen. Still greater importance has the Golden Horn, discovered at Gellehusu, near Tondern, in 1734; this monument was stolen by thieves and melted down, but fortunately not until a careful copy of it had been made, which is now in the Museum at Copenhagen. It is not until the 6th century that the runic stones begin. The most ancient are believed to be those of Einang, of Tune, of Strand, of Varnum, of Tanum and of Verto. Perhaps a little later are the stones at Nykkøbing, Skåningh, Skåning, Tormod, Byg and others, numerous to mention, but all, as seems likely, erected between 550 and 600. On the famous Tune-stone, the name of the author of the inscription is preserved, "I Wiwar made these runes," and this is not an isolated instance. The original direction of the runic writing was from left to right, like Latin, but quite early the reverse method was introduced. A union of these forms produced more complicated systems, in which much was left to the individual taste.

From the earliest times uninscribed memorial stones in Scandinavia, bautsteinar, were raised to preserve the memory of the dead, and these certainly partook of a more or less religious and sacrificial character. It is evident that, during the Iron Age, stones continued to be erected which had no inscriptions, after the runic alphabets had been invented, and that at first the runes were added only in cases of great importance or solemnity. These runic stones were as a rule posed on the top of the grave, or by the side of it, on mounds, of which only one example survives, that of the stone of Einang, in Norway. But runic stones were not infrequently placed in the grave itself. These were smaller than those erected outside the grave, and they did not lend themselves to lengthy or elaborate inscriptions. The majority of graves containing such small runestones, bearing merely the name of the deceased or a magical sentence, have been found in Norway. But the antiquity of most of these is questioned, that of Vatn, which is the oldest, being now placed no earlier than the 8th century. The very important rune-stone of Wåtland, on which is the oldest Norwegian monument employing the shorter alphabet, is attributed by Wimmer to heathen times, indeed, but to a date no earlier than the second half of the 9th century. It is supposed that the most ancient of the runic stones of Sweden, those respectively of Vånga, Skärkind and Kinnevad, must have come from the interior of graves, but there is no certain proof of this.

The latest criticism tends to the belief that when runes were first inscribed on Scandinavian monuments, they were placed both upon and inside graves, but that after the runic letters had been used for about a century, the latter custom tended to exclude the former. About the year 800 both customs began to increase among the Icelandic. The practice of placing the runic-stones inside, however, soon getting the upper hand. It is a curious fact that in Iceland not a single rune-stone which can be referred back to heathen times is known to exist; the Icelandic rune-stones all date from a period well advanced in the middle ages. It was the old theory that the ancient stones had mouldered away under stress of weather, but that is abandoned, and it is now supposed that the aristocratic exiles from Norway, who settled in Iceland, had not yet adopted in their old home the practice of inscribed monuments to their dead. There were bautsteinar in Iceland, as we know, but there is no evidence that these runic inscriptions exist which possess the highest literary interest. These are all attributed to the beginning of the 9th century. The Kallerup Stone was discovered in 1826 at the village of Hjøtetostrup, a Danish mile E. of Roskilde; it has been lifted and placed in its original position. This monument contains a statement in old Danish, to the effect that it marks the grave of Hornbora, son of Swidi. The Stone of Snoldelev was discovered in 1768, not far from the spot where the Kallerup Stone was found; it is now in the Archaeological Museum at Copenhagen; this has a long and involved inscription in a form of old Scandinavian, allied to the classical Icelandic. The Stone of Hilkis was found on the islet of that name in 1860, and is now at Copenhagen. The other most famous runic monuments are those of Fimleðs, Örja, Nörreaða, Glarrendrup, Fryggevaelde and Rönninge, of all of which Wimmer has published full analytical descriptions.

These inscriptions are of remarkable value as historical documents, from a period of which no other definite records remain in existence. From a literary point of view, they represent what Germanic language was up to the point at which Ulthius created a new alphabet for his version of the Bible, by adapting to the runic alphabets a number of Greek letters. It was an error, now exploded, to suppose that the notae impressae, which Tacitus describes in his Germania, were written runes; these were simply signs, or mystic marks, which had no linguistic significance. These are described in the staves of the Edda as having been revealed to mankind by the god Odin,
and they were of a hieratic character. The suggestion is that the written runes were introduced from the south of Europe by a Phoenician agency, and that they were copied from Greek or Roman coins which had found their way to Scandinavia. In several of the sagas it is recorded that runes were inscribed on war horns, called kelfi, and on rudders at sea; it has been suggested that the Eddic poets were familiar in this way, but the only authority for this is that the Snorri sturk is said to have been taken down on a kelfi. In Christian times runes came to be regarded as an archaic curiosity, and were engraved on sticks, chairs and spoons; a loto stick with runes on it is preserved in the Bodleian library. In the Forshög runes are mentioned as carved on the blade of an eel. Even cases occur in which the normal Latin alphabet was called runamöl or a language of Runes. A runic letter was called a runastafir in Iceland.

Taylor, Greeks and Goths: A Study on the Runes (London, 1879); G. Stephens, The Old-Scandinavian Runes and Runic Writings (Oxford, 1882); Oscar Stenzel, Ueber eine andere Runenform (Rödstenen i Östergötland (Stockholm, 1878); Cleafey and Vignussen, Iceland-English Dictionary (Oxford, 1874); Wilhelm Grimm, Uber deutsche Runen (Göttingen, 1821); Olsen, Runerne i de öldislandske Litteratur (Christiansia, 1891).

RUNG, a short round bar or stick used as a cross-bar or rail in a chair, and particularly as one of the steps or rounds of a ladder. In Scottish the word retains the original meaning of a staff or stick, especially a short thick cudgel. The O.E. hreong is used only of a bar or rail in a wagon; the word also occurs in O.Du. ronje, beam of a plough, Ger. Runge, pin, bolt.

RUNNIMEDOE, or Runnymede, a meadow on the S. bank of the river Thames, England, in the county of Surrey and the parish of Egham. It is celebrated in connexion with the signature of Magna Carta (q.v.) by King John on the 15th of June 1215. It has been disputed whether the ceremony took place actually in the meadow or on Magna Carta or Charter Island lying off it. The charter itself indicates Runnime de by name, but this may have included the island, which is the traditional site and was in 1217 the meeting-place of Henry III. and Louis (afterwards Louis VIII.) of France.

RUNNING, the most primitive form of athletic exercise considered as a sport. Athletic apparatus of every kind has been improved in modern times, but the spiked running-shoe may be said to represent the sole advantage enjoyed by the modern runner over his Olympic prototype. As an athletic sport running has been in vogue from the earliest times, and the simple foot-race (δρόμος), run straight away from starting-point to goal, or once over the course of the stadion (a little over 200 yds.), formed an event in the Greek pentathlon, or quintuple games (see GAMES, CLASSICAL). It was diversified with the race once over the course and return, and the δαράξ, a long run many times (often as many as twelve, i.e. about 2½ m.) up and down the stadion. There was also the δρόμοι ὀλιγὰρχος, a short race for warriors, who wore full armour and carried sword and shield, which has been imitated by the modern military race in full marching order. Except in the warriors' race the Greek runners were naked, save occasionally for a pair of light shoes. No records of the times made by the runners in the Greek races have been handed down. It may be inferred that the contests were very severe, since the ancient Olympic chronicles preserve the memory of several runners, of whom Ladas was the most conspicuous, who fell dead at the completion of the long course and were in state with their brows circled by the victor's chaplet. In ancient Italy running was practised in circus exhibitions, as described by Virgil (Aen. v. 286 seq.).

In the middle ages the best runners were oftenest found among the couriers maintained by potentates and municipalities, those of Tartary, England, Scotland, Italy and the Basque country having enjoyed the greatest reputation, while the Peichs, or Persian couriers of the Turkish sultans, often ran from Constantinople to Adrianople and back, a distance of about 220 m., in two days and nights. Many couriers carried silver beads in their mouths to obviate thirst. Couriers (syce) who run before the carriages of their masters are still in use in the East. In the districts of India not traversed by railways, daily messengers are still employed to carry the mails from village to village, many wasting away their blood in the attempt. The runners of the American Indians were famous, and extraordinary tales are told of their swiftness and endurance.

In all parts of Great Britain, running at short distances, as well as steeplechases and cross-country runs, has been popular for many centuries, each district and period having its champions, some of whom achieved national reputation. During the Puritan rule and that of Charles II. athletic sports all but died out in England, only to be revived with renewed vigour in the early part of the 19th century, when the public schools and universities began to pay more attention to them. A significant event in the history of running was the institution of the famous "Crack Run" (cross-country) at Rugby in 1837. The establishment of the Cambridge University sports (1857), the Oxford sports (1860), and the British championship meetings (1866) placed athletics upon a formal and recognized basis. Records made thereafter received the stamp of authenticity, those made in former years being doubtful on account of lax measurements and timing. In the United States and Canada authentic records date from the institution of the American Championships in 1876. The National Association of Amateur Athletes of America was formed in 1880.

Running at the present day is divided into sprinting (distances up to one-quarter of a mile), middle-distance running (from one-quarter of a mile to 1000 yds.) and long-distance running (over 1000 yds.).

Sprinting consists of running over short distances with a full and continuous burst of speed, the chief distances being 200 yds., 220 yds. and quarter-mile. Distances up to and including 220 yds. are in America called dashes. The course for sprinting races, when run in the open air, is marked off in lanes for the individual runners by means of cords stretched upon short iron rods. Starting in sprints has now become very expert. The old method of dropping a handkerchief was the worst possible way to give the starting signal, since the muscles react most slowly to impressions of sight, less so to those of touch, and most quickly to those of sound, a difference of 1/2 of a second in reaction amounting to over one foot in a run of 100 yds. All modern foot-races are therefore started by the pistol; the runners wait for the signal in a crouching attitude, with the fingers of both hands resting on the ground on each side of the body, from which position they spring upwards and forwards at the sound of the pistol. The crouching start was found to be much quicker in getting off the mark than the upright attitude formerly adopted, and by 1892 had been adopted by all first-class sprinters in America, and a year or two later in Great Britain. Another advantage is that the runner is steadier on the mark, and since its adoption the prescribed penalty of being placed one yard behind the mark for starting before the pistol-shot has been very seldom enforced, and the risky experiment of "beating the pistol," i.e. letting the body fall forward in the hope that the shot would come before the feet had to be moved, has practically disappeared.

The improvement in training and the adoption of the crouching start have resulted in the continued reduction of sprinting records. "Even time," or 10 secs., is still considered a fine performance for the hundred yards, but has been repeatedly beaten both in England and America. A. F. Duffield, who, like C. A. Bradley and J. W. Morton, won the English championship in four successive years, shares with D. J. Kelly the record, 9½ secs., for 100 yds.; and J. W. Morton, a Scot, as well as J. H. Hempton and W. T. Macpherson of New Zealand, are credited with 9½ secs. The excellence of American runners in the sprints is probably accounted for partly by temperament influenced by climate; but the American practice of running
short races of from 90 to 75 yds., during the numerous indoor meetings held in winter-time offers excellent training in starting and getting rapidly into full stride. The best time for the eighth mile (220 yds.), a distance often run in America, is 21 1/2 secs., made in 1896 on a straightaway track by B. J. Wefers. The quarter-mile (440 yds.) is almost always run on a curved track, and hence a quick start is important, for should the runner who has the advantage of the inside position allow himself to be outrun in the distance to the first turn, one of his opponents is likely to cut in and deprive him of it, while on the other hand a runner on the outside must actually outrun the inside man in order to be on even terms after the turn. The element of strategy, unknown in straight sprints, thus enters into the quarter. Speed is, of course, the chief requisite for a quarter-miler, but a certain amount of staying power is also necessary. The standard time for the quarter is 50 secs., which means an average speed of 11-3 secs. for each 100 yds. round the course. That of M.W. Long of Columbia University, who made the record, 47 secs., in 1909, was on that occasion 10-68 secs. for each hundred yards.

The system of "relay races" was usually run by four men each going a quarter or a distance, is a popular variety. The favourite distance is a mile, each man running a quarter at top speed. This method of racing was introduced in the United States about the year 1890 on the model of the Massachusetts firemen's "bean-pot" races, and has since become very popular there. The old method was for the men running the second quarter of the course to wait on the mark for the first relay man to arrive, and then, snatching small flags from their hands, to continue the race, handing over the flags to the third relay upon completing their quarter. The flags, being cumbersome, were afterwards abandoned, and the new runners are now required only to touch the persons of the preceding contestants. The 1 m. record, 3 min. 21 1/2 secs., was made in 1898 by B. J. Wefers, M. W. Long, T. E. Burke and H. S. Lyons of the New York Athletic Club.

**Middle-Distance Running.**—The chief middle distances are 600 yds., 660 yds., 880 yds. (half-mile) and 1000 yds., but of these the half-mile is the only one commonly recognized in championship sports. Endurance is more important at these distances, though speed is essential, and the element of strategy increases. An element unknown to sprinting enters into middle- and long-distance runs, namely that of pace-making; even when the race is between two individuals at least one other runner on each side takes part in the contest, in order to "make the pace" for his principal. Emilio Lunghi (U.S.A.) holds the half-mile world's record of 1 min. 52 1/2 secs., made in 1909. J. F. K. Cross of Oxford University ran the half-mile at Oxford in 1888 in 1 min. 54 3/4 secs. The record for 1000 yds., 2 min. 13 secs., was made by L. E. Myers (U.S.A.). The distance of three-quarters of a mile is seldom run now at large meetings.

**Long-Distance Running.**—This includes all flat races of 1 m. or more, as well as steeplechasing, hare-and-hounds, and other forms of cross-country running. Great Britain has always been the home of long-distance running, different forms of cross-country racing having been popular all over the kingdom for centuries. In England at the championship meeting the distance events on the flat are the 1 m., 4 m. and 10 m. races, and in the inter-university sports the 1 m. and 3 m.; in America the distances are 1 m., 2 m. and 5 m.; but any and all of these distances are often included in important British and American programmes. Hard daily training is necessary for a distance runner. Good pace-making and strategy in general are of great importance. The runner must learn to "run to the watch," i.e. to cover the different portions of the distance in a certain time, in order to be placed most advantageously for the finish. The mile race requires speed as well as stamina. Most champion milers are capable of doing the half under 2 min. The record for the mile, made in 1886 at Lillie Bridge by W. G. George, as a professional, is 4 min., 12 1/2 secs.; the amateur record is 4 min. 15 3/4 secs., made by T. P. Connell in America. J. Binks, holding the British amateur record with 4 min. 16 3/4 secs., made at Stamford Bridge in 1902. The longer-distance races require more stamina than speed, and a careful handing of strength. The following table gives the records (up to 1908) for the distance runs on the flat, longer than 1 m.—

In addition to the records for the above-mentioned distances, Shrubb held in 1908 the records for 6, 7, 8, 9 and 11 m., and also for the greatest distance covered in 1 h., namely, 11 m. 1310 yds. He won the 4 m., and the 10 m. British championship 1901-4 inclusive, and the 1 m. championship 1903 and 1904; also the French 1 m. and 3 m. championship 1902-4 inclusive. Shrubb was moreover a first-class cross-country runner also; he won the British 10 m. cross-country championship 1901-4 inclusive, and the international 8 m. cross-country championship 1902-4. In 1863 a full-blooded Suffolk Red Indian, L. Bennet, known as "Deerfoot," ran 12 m. in 1 h. 2 m. 2½ secs. Real **cross-country running** is a fast jog over hill and dale. It may take the form of a race from the gymnasia or club-house across the fields to a given spot and back again, passing over various objects or buildings; of a practice run behind the coach preparatory to a long-distance race on the track; or of a paper-chase, or hare-and-hounds, the "hares," two or three in number, starting a few minutes before the "hounds," and leaving a trail of scraps of paper dropped from bags, which must be followed by the "hounds." In Great Britain the standard distance is 10 m., but in America it is somewhat less, the distance for the intercollegiate championship race being 6 1/2 m.

**Steeplechasing** was originally only a cross-country run over a course plentifully provided with natural obstacles, such as brooks, ditches, fences and hedges; but at the present day the steeplechase takes place in the interior enclosure of an athletic field and the obstacles are artificial. They are constructed either 76 or 80 yds. apart, and consist of hurdles, a stone wall about 3 ft. high and 2 or 3 ft. broad, and a water-jump, a ditch about 6 ft. broad filled with water and guarded by a wall or fence covered with thick furze or other thick shrubbery. Steeplechase courses differ widely, but the usual distance run in Great Britain and America is 2 m. The time necessary to cover this distance varies according to the difficulties of the course, but a few seconds under 11 min. is considered very fast time.

**Race-walking** is the favourite form of distance running, each team consisting of 10 men and the distance usually 4 m., the standard of the modern Olympic Games. Different systems of scoring are in vogue, but the usual one allows the winner ten points, the second to arrive nine, and so on, the tenth arrival receiving one point. The team aggregating the highest number of points wins.

Among modern distance events the **Marathon Run** of about 40 kilometres (24 m. 1500 yds.) is the most important. It was introduced in the first revived Olympic Games at Athens in 1896 (see **Atletic Sports**) in memory of the famous Greek runner who was said to have brought the news of the battle of Marathon in Athens, dropping dead when his task was finished.

**RUODLIB**, a romance in Latin verse by an unknown German poet who flourished about 1095; he was almost certainly a monk of the Bayorian abbey of Tegernsee. The poem is one of the oldest German romances of knightly adventure, and its vivid picture of feudal manners gives it a certain value as an historical document. The poet was probably an eye-witness of the episode (ll. 4231-5221) which represents the meeting of the emperor Henry II. with Robert of France on the banks
of the Maas in 1623. Ruudtief was left unfinished, and furthermore the MS. was cut up and used for binding books, so that the fragments were only gradually discovered (from 1807 onwards) and pieced together. The framework of the story is borrowed from popular märchen of the youth who take service away from home, and is paid in wise saws instead of current coin. He receives at the same time a loaf, with instructions not to cut it until he is once more at home. This contains the coins. The proverbs, usually three in number, were increased in Ruudtief to twelve, each of which was the starting-point of an epoch by which the hero was made to appreciate its value.

For examples of the three-proverb tale see W. Bottrell, Traditions and Heindische Stories (Fellunci, 2nd series, 1873); C. A. Schubert, Bele, The White Wife ... (London, 1868); K. V. Kjellenberg, Erin (Stuttgart and Tübingen, 1849), and others in the French romance of the Saint Graal, in the Gesta Romanorum (the three proverbs bought by Domitian) and the old French Dit des trois pommes. The best edition of Ruudtief is by F. Seiler (Halle, 1885). There is a modern version by M. Heinie (Leipzig, 1897), and a full analysis of the contents is given by R. Koegele, Gesch. d. deutschen Lit. bis zum Ausgang des Mittelalters (Strasbourg, 1894-97; ii, pp. 342-412).

RUPAR, a town of British India, in Umballa district of the Punjab, on the left bank of the river Sutlej, 43 m. N. of Umballa, 1120 ft. above sea-level. Pop. (1901) 8888. It was the scene of Ranjit Singh's visit to Lord William Bentinck when governor-general in 1831. Here are the head works of the Sirhind canal. Rupar has manufactures of cotton twill and hardware. Hindu and Mahomedan fairs are held.

RUPAR (Hindustani रुपया, from Sanskrit रुप्य), the standard coin of the monetary system in India. A silver coin of 175 grains Troy, called solo, approximating to the rupee, was struck by the Mahomedan rulers of Delhi in the 13th century; but the rupee itself, of 799 grains, was introduced by Sher Shah in 1542. The English at first followed various indigenous standards; but since 1835 the rupee has uniformly weighed 180 grains, containing 165 grains of pure silver. The weight of the rupee (one tola) is also the unit upon which the Indian standard of weights is based. Down to about 1873 the gold value of the rupee was 2s., and ten rupees were thus equal to £1; but after 1873, owing to the depreciation of silver, the rupee at one time sank as low as 1s. 7d. It was ordered to India in 1803 to close the mints, and in 1889 he make the rupee legal tender at fifteen to £1. This policy proved successful, and since 1890 the exchange value of the rupee has practically remained at 7s. 4d. Therefore a lakh of rupees, which before 1873 was worth £1,000, is now only worth £666.66, and a crore of rupees, which was formerly a million sterling, now only amounts to £666,666. The rupee is divided into sixteen annas, now worth 1d. each, and the anna is subdivided into 12 pies. (See India, and Money.)

RUPERT (HÜBER), ST., according to the Gesta Sancti Hrodberti, which dates from the 9th century, was a kinsman of the Merovingian house, and bishop of Worms under Childerich III. (695-713). At the invitation of the duke of Bavaria, Theodo II., Rupert went to Regensburg (Ratisbon), where he began his apostolate. He founded the church of St Peter near the Wallersee, and subsequently, at Salzburg, the church of St Peter, together with a monastery and a dwelling for the clerks, as well as a convent for women "in superiori castro iuavensium." He died and was buried at Salzburg. He is regarded as the apostle of the Bavarians, not that the land was up to that time altogether heathen, but because of his services in the promotion and consolidation of its Christianity.

See Bibliotheca kagiographica Latina (Brussels, 1890), n. 7390-7491; W. Fried from "Die älteste Lebensbeschreibung Ruperts von Salzburg" in Neues Archiv für ältere deutsche Geschichtskunde, xxviii. 283 seq.; Hauck, Kirchengeschichte Deutschlands (3rd ed.), i. 372 seq. (H. De.)

RUPERT, PRINCE, Count Palatine of the Rhine and Duke of Bavaria (1619-1682), third son of the elector palatine and "winter king" of Bohemia, Frederick V., and of Elizabeth, daughter of James I. of England, was born at Prague on the 17th of December 1619. A year later his father was defeated at the battle of the Weisser-Berg, near Prague, and driven from Bohemia. After many wanderings the family took refuge in Holland, where Rupert's boyhood was spent. In 1633 the boy was present at the Battle of Lutter and Toenniesfeld, in the service of the Prince of Orange; and in 1635 he served in this prince's bodyguard. In 1636 he paid his first visit to England, where he was admitted to the University of Oxford, and was named as the governor of a proposed English colony in Madagascar. But this scheme did not mature, and Rupert was sent to England in 1640, where he served with the Royalists in the Civil War. In 1648 he was released, and, accompanying his mother to Holland, was summoned to England to assist his uncle, for the Great Rebellion was about to break out.

In July 1642 he landed at Yarmouth. Charles at once made him general of the horse and independent of Lord Lindsey, the nominal commander of the whole army. From this point until the close of the first Civil War in 1646 Prince Rupert is the dominant figure of the war. His battles and campaigns are described in the account Great Rebellion. He was a skilful cavalry leader, and it was not until the battle of Marston Moor in 1644 that the Royalist cavalry was beaten. The prince's strategy was bold as well as skilful, as was shown both in the Royalist movements of 1644 which he proposed, and in the two far-ranging expeditions which he carried out for the relief of Newark and of York. In November 1644, in spite of the defeat at Marston Moor, he was appointed general of the king's army. But this appointment, though welcome to the army, was obnoxious to the king's counsellors, who resented the prince's independence of their control, and to some of the nobility over whose titles to consideration he had ridden roughshod, and to some of the officers whose indiscipline and rapacity were likely to be repressed with a heavy hand. These dissensions culminated, after the prince's surrender of Bristol to Fairfax, in a complete break with Charles, who dismissed him from all his offices and had Rupert's younger brother Maurice seek their fortunes beyond the seas.

Rupert's character had been tempered by these years of responsible command. By 1645, although the parliamentary party accused him not merely of barbarity but of ingratitude for the kindnesses which his family had received from English people in the days of the Palatinate War, Rupert had in fact become a good Englishman. He was convinced, after Marston Moor, that the king's cause was lost, in a military sense, and moreover that the king's cause was bad. When he surrendered Bristol without fighting to the uttermost, it was because Fairfax placed the political issue in the foreground, and after the capitulation the prince rode to Oxford with his enemies frankly discussing the prospect of peace. Already he had deliberately advised Charles to make peace, and had come to be suspected, in consequence, by Charles's optimistic adviser Digby. But to Charles himself the news of the fall of Bristol was a thunderbolt. "It is the greatest trial to my constancy that has yet befallen me," he wrote to the prince, "that one that is so near to me in blood and friendship submits himself to so mean an action." Rupert was deeply wounded by the implied stain on his honour; he forced his way to the king and demanded a court-martial. Thus the whole of this matter had dragged on for a time, but Rupert now the incident was brought to court to be of any assistance, and after further misfortunes the quarrels they separated, Charles to take refuge in the camp of the Scots, Rupert to stay, as a spectator without command, with the Oxford garrison. He received at the capitulation a pass from the parliament to leave England, as did also his faithful comrade Maurice.

For some time after this Rupert commanded the troops
Rupert—Russellae

formed of English exiles in the French army, and received a
wound at the siege of La Bassee in 1647. Charles in misfortune
had understood something of his nephew’s devotion, and wrote
to him in the friendliest terms, and though the prince had by
no means forgiven Digby, Colepeper and others of the council,
he obtained command of a Royalist fleet. The king’s enemies
were now no longer the Presbyterians and the majority of the
English people but the stern Independent community, with
whose aims and aspirations he could not have any sympathy
whatever. A long and unprofitable naval campaign followed,
which extended from Kinsale to Lisbon and from Toulon to
Cape Verde. But the prince again quarrelled with the council,
and spent six years (1654–60) in Germany, during which
period nothing is known of him, except that he vainly attempted
(as also before and afterwards) to obtain the apanage to which
as a younger son he was entitled from his brother the elector
palatine. At the Restoration he settled in England again,
receiving from Charles II. an annuity and becoming a member
of the privy council. He never again fought for land, but,
turning admiral like Blake and Monk, he bore a brilliant part
in the Dutch War. He died at his house in Spring Gardens,
Westminster, on the 20th of November 1682.

Apart from his military renown, Prince Rupert is a dis-
tinguished figure in the history of art as one of the earliest
mezzotinters. It has often been said that he was the inventor
of mezzotint engraving, but this is erroneous, as he obtained
the secret from a German officer, Ludwig von Siegen. One of
the most beautiful and valuable of early mezzotints is his “Head
of St John the Baptist.” He was also interested in science,
experimented with the manufacture of gunpowder, the boring
of guns and the casting of shot, and invented a modified brass
called “prince’s metal.”

Prince Rupert was duke of Cumberland and earl of Holdern-
ness in the English peerage. He was unmarried, but left two
natural children; one a daughter who married General Emmanuel
Scrope Howe and died in 1740, and the other a son, whose
mother (who claimed that she was married to the prince) was
Frances, daughter of Sir Henry Bard, Viscount Bellamont.
The son was killed in 1686 at the siege of Buda.

See E. Warburton’s Life of Pr. Rupert (London, 1849) and ad-
titural authorities quoted in the memoir by C. II. Firth in the Dict.
Nat. Biog.

Rupert (1235–1410), German king, and, as Rupert III.,
elector palatine of the Rhine, was a son of the elector Rupert
II. and Beatrix, daughter of Peter II., king of Sicily. He
was born at Amberg on the 5th of May 1352, and from his early
years took part in the government of the Palatinate to which
he succeeded on his father’s death in 1398. He was one of the
four electors who met at Oberlahnstein in August 1400 and
declared King Wenceslaus deposed. This was followed by the
election of Rupert as German king at Reise on the 21st of that
month, and by his coronation at Cologne on the 6th of the
following January. Winning some recognition in S. Germany,
he made an expedition to Italy, where he hoped to receive the
imperial crown, and to crush Gian Galeazzo Visconti, duke of
Milan. In the autumn of 1401 he crossed the Alps, but his
troops, checked before Brescia, melted away, and in 1402
Rupert, too poor to continue the campaign, returned to Ger-
many. The news of this failure increased the disorder in
Germany, but the king met with some success in his efforts to
restore peace, and in October 1403 he was recognized by Pope
Boniface IX. It was only the indolence of Wenceslaus that
prevented his overthrow, and in 1406 he was compelled to make
certain concessions. The quarrel was complicated by the papal
schism, but the king was just beginning to make some headway
when he died at his castle of Landskron near Oppenheim on the
18th of May 1410 and was buried at Heidelberg. He married
Elizabeth, daughter of Frederick IV. of Hohenzollern, burggrave
of Nuremberg, and left three sons and four daughters. Rupert,
who earned the surname of clemens, was brave and generous,
but his resources were totally inadequate to bear the strain of
the German kingship.

Rupert’s Land, a former district of Canada. The generous
Aristocrat of Charles II. given in 1670 to the Hudson’s Bay Com-
pany gave rights of possession, trade and administration of
justice “of all those seas, straits and bays, rivers, lakes,
creeks and sounds, in whatsoever latitude they shall be, that
lie within the entrance of the straits commonly called Hudson’s
streights, together with all the lands, countries and territories
upon the coasts and confines of the seas, straits, bays, lakes,
rivers, creeks and sounds aforesaid, which are not now actually
possessed by any of our subjects, or by the subjects of any other
Christian prince or state.

The general interpretation given to this was that it included
all the country drained into Hudson Bay. As Prince Rupert
was at the time governor of the Hudson’s Bay Company his name was
given to the concession under the name “Rupert’s Land.” It
will be observed that Athabasca, New Caledonia and British
Columbia were not included in this grant. They were held under
the title Indian Territories by the Hudson’s Bay Company by
licence terminable every twenty-one years, the last term closing
with 1859. Rupert’s Land was transferred to Canada by the
imperial government in 1870, and ceased to exist as a political
name. It is still used as the title of the episcopal diocese, which
is in the main coincident with the province of Manitoba.

Rupilius, PUBLIUS, Roman statesman, consul in 132 B.C.
During the inquiry that followed the death of Tiberius Gracchus,
directed by himself and his colleague Popillius Laenas, he
proceeded with the utmost severity against the supporters of
Gracchus. In the same year he was despatched to Sicily, where
he suppressed the revolt of the slaves under Eunus. During
131 he remained as proconsul of the island, and, with the
assistance of ten commissioners appointed by the senate, drew
up regulations for the organization of Sicily as a province.
These regulations were known by the title of leges Rupiliæ,
though they were not laws in the strict sense. Rupilius was
subsequently brought to trial (123 B.C.) and condemned for
corrupting the state. Eunus, guilty of his condemnation,
added to disappointment at the failure of his brother to obtain the
consulship in spite of the efforts of Scipio, caused his death shortly afterwards.

See Cicero, De Am. 19, Tusc. disp. iv. 17, in Verr. ii. 13, 15;
Diod. Sic. xxxiv. 1, 20; Vell. Pati. ii. 7.

Ruppin, or Neuruppin, a town of Germany, in the Prussian
province of Brandenburg, lies on the W. bank of a small lake,
the Ruppiner See, 37 m. N.W. of Berlin by rail. Pop. (1905)
18,555. The town, which was rebuilt in fine, regular fashion
after a destructive fire in 1787, contains three Protestant
churches, a Roman Catholic church and various educational
and benevolent institutions. Its inhabitants are employed in
the manufacture of cloth, starch and machinery, in iron-
founding and lithography. Important cattle and horse fairs
are held here. Ruppin received municipal rights in 1256.
The small town of Altruppin, lying at the north end of the
lake, has a 15th-century church and some small manufactures.
Pop. (1905) 1813.

See Heydemann, Neuere Geschichte der Stad Neuruppin (Neuruppin,
1863); and G. Bittkau, Allere Geschichte der Stadt Neuruppin
(Neuruppin, 1887).

Russellae, an ancient town of Etruria, Italy, about 10 m.
S.E. of Vetulonia and 5 m. N.E. of Grosseto, situated on a hill
with two summits, the highest 636 ft. above sea-level. It
was one of the twelve cities of the Etruscan confederation, and
was taken in 294 B.C. by the Romans. In 205 B.C. it contributed
grain and timber for the needs of Scipio’s fleet. A colony
was founded here either by the Triumviri or by Augustus.
The place was deserted in 1138, and the episcopal see was transferred
to Grosseto. The ruins are now thickly overgrown with brushwood; but the walls, nearly 2 m. in circumference, are in places well preserved. They consist of large unworked blocks of a travertine which naturally splits into roughly rectangular blocks; these are quite irregular, and often as much as 9 ft. long by 4 ft. wide: in the interstices smaller pieces are inserted. The walls are embanking walls, with a low breastwork in places. Within the circuit which they enclose, now under cultivation, are two summits, one occupied by a Roman amphitheatre while the other by a tower (?) of uncertain date; a Roman cistern also is visible. Some 2 m. S.S.W. are modern baths, fed by hot springs, which were in use in Roman times also, as the discovery of remains of Roman buildings shows.

See G. Dennis, *Cities and Cemeteries of Etruria* (London, 1883), ii. 222. (T. A.)

**RUSH, BENJAMIN** (1745-1813), American physician, was born in Byberry township, near Philadelphia, on a homestead founded by his grandfather, a Quaker gunsmith, who had followed Penn from England in 1683. In 1760 he graduated at Princeton. After serving an apprenticeship of six years with a doctor in Philadelphia, he went for two years to Edinburgh, where he attached himself chiefly to William Cullen. He took his M.D. degree there in 1768, spent a year more in the hospitals of London and Paris, and began practice in Philadelphia at the age of twenty-four, undertaking at the same time the chemistry class at the Philadelphia medical college. He was a friend of Franklin, a member of Congress for the state of Pennsylvania in 1776, and one of those who signed the Declaration of Independence the same year. He had already written on the Test Laws, "Sermons to the Rich," and on negro slavery; and in 1774 he started along with James Pemberton the first anti-slavery society in America, and was its secretary for many years. In 1789 he was a member of the Pennsylvania convention which adopted the Federal constitution, and thereafter he retired from public life, and gave himself up wholly to medical practice. In 1789 he exchanged his chemistry lecture-ship for that of the theory and practice of physic; and when the medical college, which he had helped to found, was absorbed by the university of Pennsylvania in 1791 he became professor of the institutes of medicine and of clinical practice, succeeding in 1796 to the chair of the theory and practice of medicine. He gained great credit when the yellow fever devastated Philadelphia, in 1793, by his assiduity in visiting the sick, and by his bold and successfully successful two-division of the disease by bleeding. He died in Philadelphia on the 19th of April 1813, after a five days' illness from typhus fever. His son Richard is separately noticed. Another son, James (1786-1860), was a physician, and author of various books, such as *Philosophy of the Human Voice* (1827) and *Analysis of the Human Intelect* (1853).

Benjamin Rush's writings covered an immense range of subjects, including language, the study of Latin and Greek, the moral faculty, capital punishment, medicine among the American Indians, maple sugar, the blackness of the negro, the cause of animal life, tobacco smoking, spirit drinking, as well as many more strictly professional topics. His last work was an elaborate treatise on the *Disorders of the Mind* (1812). He is best known by the five volumes of *Medical Inquiries and Observations*, which he brought out at intervals from 1799 to 1795 (two later editions revised by the author).

See *Abbay* by the *African* (Dr David M'Hose; *Ezra*, i., New York, 1824), with biographical details taken from a letter of Rush to President John Adams; also references in the works of Thacker, Gross and Bowditch on the history of medicine in America. His part in the yellow fever controversies is indicated by La Roche (*Yellow Fever in Philadelphia from 1690 to 1854*, 2 vols., Philadelphia, 1855) and by Bancroft (*Essay on the Yellow Fever*, London, 1811). His services as an abolitionist pioneer are recorded in Clarkson's *History of the Abolition State*.

**RUSH, RICHARD** (1780-1859), American statesman and diplomatist, son of Dr Benjamin Rush, was born in Philadelphia, Pennsylvania, on the 29th of August 1780. He graduated at Princeton in 1797, and was admitted to the bar in 1800. He was attorney-general of Pennsylvania in 1811, comptroller of the treasury of the United States in 1811-14, attorney-general in the cabinet of President James Madison in 1814-17, acting secretary of state from March to September 1817, minister to Great Britain in 1817-25, secretary of the treasury in the cabinet of President J. Q. Adams in 1825-29, and candidate for vice-president on the Adams ticket in 1828. In 1818, while minister to Great Britain, he, in association with Albert Gallatin, concluded with British plenipotentiaries the important treaty which determined the boundary line between the United States and Canada from the Lake of the Woods to the Rocky Mountains and provided for the joint occupation of Oregon for ten years. He also conducted the negotiations with Canning in 1823 relating to the S. American fisheries.

He followed the Adams-Clay faction of the Democratic-Republican party in the split of 1825-28, but returned to the Democratic party about 1834 on the bank issue. In 1835 he and Benjamin C. Howard, of Baltimore, Maryland, were sent by President Jackson to prevent an outbreak of hostilities in the Ohio-Michigan boundary dispute. In 1836-38 Rush was commissioner to receive the Smithsonian legacy (see *Smithsonian Institution*), and in 1847-49 he was minister to France. He died at Philadelphia on the 30th of July 1839.

He published *A Narrative of a Residence at the Court of London from 1803 to 1805* (2 vols., 1812), all editions after the first edition of the 1st volume are entitled *Memoranda of a Residence, &c.*; *Washington in Domestic Life* (1857), compiled from letters at home and abroad by an intimate friend of Mr. Rush; and *Occasional Productions*, *Political, Diplomatic and Miscellaneous* (1860); and while attorney-general he suggested the plan for the compilation, *Laws of the Nation* (5 vols., 1815), edited by John B. Calvin.

**RUSH.** Under the name of rush or rushes, the stalks or hollow stem-like leaves of several plants have minor industrial applications. The common rushes (species of Juncus; see *Juncaceae*) are used in many parts of the world for chair-bottoms, mats and basket-work, and the pith serves as wicks in open oil-lamps and for tallow candles—whence rushlight. The fibrous stems and leaves of the bulrush or reed-mace, Typha angustifolia, are used in N. India for ropes, mats and baskets. *Scirpus* and other Cyperaceae are used for chair-bottoms, mats and thatch; the rush mats of Madras are made from a species of Cyperus. The sweet-rush, yielding essential oil, is a grass, *Andropogon Schenckii*, known also as lemon grass. Large quantities of the "horse-tail," *Equisetum hians*, are used under the name of Dutch or scouring rush for scouring metal and other hard surfaces on account of the large proportion of silica their ash contains. *Bulomus umbellatus* (see *Alismaceae*); wood-rush is the common name for *Luzula* (see *Juncaceae*). *Acorus Calamus*, sweet-flag, is also known as sweet-rush.

**RUSHDEN,** an urban district in the E. parliamentary division of Northamptonshire, England, 66 m. N.N.W. from London by the Midland railway. Pop. (1901) 12,453. The church of St Mary is a fine cruciform building with western tower and spire. It is mainly decorated, with perpendicular additions, but retains some Early English details. The growth of Rushden as a town is modern. The industrial population is employed in boot and shoe making, the local staple.

**RUSHWORTH, JOHN** (c. 1641-1706), compiler of the *Historical Collections* commonly described by his name, was the son of Lawrence Rushworth of Acklington Park, Warkworth, Northumberland. When he was given the degree of M.A. at Oxford in 1649, he was said to belong to Queen's College, but there are no traces of his presence at the university. He was bred to the law, and in 1638 was appointed solicitor to the town of Berwick. He was enrolled in Lincoln's Inn in 1641, and was called to the bar in 1647. He made a point of attending on all public occasions of a political and judicial character, such as proceedings before the Star Chamber or the Court of Common Pleas. He was at one time in the House of Commons. He was on duty when King Charles I. came down to arrest the five members on the 4th of January 1642, and made notes of his speech. The king insisted on taking the notes, and ordered them to be published. Rushworth
attended the trial of the earl of Strafford, and took shorthand notes of the proceedings. He was much employed as a messenger between the king and the parliament, and from the 11th of April 1644 till the 9th of March 1647 was licensor of pamphlets. When the new model army was formed he was appointed secretary to the parliamentary general, Sir Thomas Fairfax. He was present at the battle of Naseby, of which he wrote an account. When Fairfax, who was offended by the execution of the king, resigned his command, Rushworth was for a short time secretary to Cromwell. He was afterwards employed by the council of state and during the protectorate, and sat in Cromwell's parliament for Berwick. When Richard Cromwell resigned the protectorate, Rushworth was employed by the Rump after it had been re-established by Monk. He made his peace with the government of Charles II., and though he was threatened with trial as a regicide he was not seriously molested. During the reign of Charles II. he continued to act as agent for the town of Berwick, and he sat for it in parliament. He was also for a time agent for Massachusetts, but the colony complained that it received no advantage from his services. During the last years of his life he fell into poverty, and from 1684 till his death on the 19th of May 1690 he was a resident in the King's Bench prison. At this time he had destroyed his memory by over-indulgence in drink. The collection of papers which he made was published in eight volumes folio between 1659 and 1701. The volumes from the fourth onwards appeared after his death. The first, which appeared with a dedication to Richard Cromwell, was recalled and another impression supposed to be a true one.

RUSKIN, JOHN (1819-1900), English writer and critic, was born in London, at Hunter Street, Brunswick Square, on the 8th of February 1819, being the only child of John James Ruskin and Margaret Cox. They were Scots, first cousins, the grandchildren of a certain John Ruskin of Edinburgh (1732-1780). In Praeterita the author professes small knowledge of his ancestry. But the memoirs published on the authority of the family trace their descent to the Adairs and Agnews of Galloway. In this family tree are men famous in arms and in the public service. Sir Andrew Agnew of Lochnaw, Admiral Sir John Ross, Field-Marshal Sir Hew Dalrymple Ross, Dr John Adair, in whose arms Wolfe died at Quebec, and the Rev. W. Tweddale of Glenluce, to whom the original Covenant, now in the Glasgow Museum, had been confided. The name Ruskin is said to be a variant of Erskine, or Roskell, or Rogerkin, and even Roughskin. It is more probably Rusking, an Anglian family, which passed northwards and became Ruskin, Ruskyn and Rusken.

John Ruskin, the author's grandfather, a handsomely tall of twenty, ran away with Catherine Tweddale, daughter of the Covenanting minister and of Catherine Adair, then a beautiful girl of sixteen. He settled in Edinburgh and engaged in the wine trade, lived liberally in the cultivated society of the city, lost his health and his fortune, and ended his days in debt. His son, John James Ruskin (1785-1864), father of the author, was sent to the High School at Edinburgh under Dr A. Adam, received a sound classical education, and was well advised by his friend Dr Thomas Brown, the eminent metaphysician. When of age, John James was sent to London to enter the wine trade. There, in 1809, he founded the sherry business of Ruskin, Telford & Domecq; Domecq being proprietor of a famous vineyard in Spain, Telford contributing the capital of the firm, and Ruskin having sole control of the business. John James Ruskin, a typical Scot, of remarkable energy, probity and foresight, built up a great business, paid off his father's debts, formed near London a most hospitable and cultured home, where he maintained his taste for literature and art, and lived and died, as his son proudly wrote upon his tomb, "an entirely honest merchant." He was also a man of strong brain, generous nature and fine taste. After a delay of nine years, having at last obtained an adequate income, he married his cousin, Margaret Cox, who had already lived for eighteen years with his mother, the widow of John Ruskin of Edinburgh. When this marriage of the two cousins, who had known each other all their lives, took place in 1818, neither of them was young. John James was thirty-three and Margaret was thirty-seven. In the following year (8th Feb. 1819) their only child, John, was born in Hunter Street, London.

Margaret Ruskin, the author's mother, was a handsome, strong, stern, able, devoted woman of the old Puritan school, Calvinist in religion, unsparing of herself and others, rigid in her ideas of duty, proud, reserved and ungracious. She was the daughter of Captain Cox, of Yarmouth, master mariner in the herring fishery, who died young; whereupon her widow maintained herself as landlady of the King's Head Inn at Croydon. Her younger daughter married Mr Richardson, a baker, of Croydon; the elder, Margaret, married John James by the eye. Sister of John James, married Peter Richardson, a tailor, of Perth, so that the author had cousins of two Richardson families, unconnected with each other. In his own memoirs he speaks much more of these than of any Ruskins, Tweddales, Adairs or Agnews. The child was brought up under a rigid system of nursing, physical, moral and intellectual; kept without toys, not seldom whipped, watched day and night, and trained from infancy in music, drawing, reading aloud and observation of natural objects. When he was four the family removed to a house on Herne Hill, then a country village, with a garden and rural surroundings. The father, who made long tours on business, took his wife, child and nurse one year after year across England as far as Cumberland and Scotland, visiting towns, cathedrals, castles, colleges, parks, mountains and lakes. At five the child was taken to Keswick; at six to Paris, Brussels and Waterloo; at seven to Perthshire. At fourteen he was taken through Flanders, along the Rhine, and through the Black Forest to Switzerland, where he first imbibed his dominant passion for the Alps. His youth was largely passed in systematic travelling in search of everything beautiful in nature or in art. And to one so precocious, stimulated by a parent of much culture, ample means and great ambition, this resulted in an almost unexampled aesthetic education. In childhood also he began a systematic practice of composition, both in prose and verse. His mother trained him in reading the Bible, of which he read through every chapter of every book year by year; and to this study he justly attributes his early command of language and his pure sense of style. His father read to him Shakespeare, Scott, Don Quixote, Pope and Byron, and most of the great English classics; and his attention was especially turned to the formation of sentences and to the rhythm of prose. He began to compose both in prose and verse as soon as he had learned to read and write, both of which arts he taught himself by the eye.

His first letter is dated 1832, when he was only four. In it he corrects his aunt, who had put up the wooden pillars of his Waterloo bridge 'upside down.' At five he was a bookworm. At seven he began a work in four volumes, with 'copper-plates printed and composed by a little boy, and also drawn.' His first poem, correct in rhyme and form, was written before he was seven. At nine he began 'Eudoxia, a poem of the Universe.' From that year until his Newdigate Prize, at the age of twenty, he wrote enormous quantities of verse, and began dramas, romances and imitations of Byron, Pope, Scott and Shelley. What remain of these effusions have no special quality except good sense, refined feeling, accuracy of phrase, and a curious correctness of accent and rhythm. Of true poetry in the higher sense there is hardly a single line.

His schooling was irregular and not successful. At the age of eleven he was taught Latin and Greek by Dr Andrews, a scholar of Glasgow University. About the same time he had lessons in drawing and in oil painting from Runciman. French and Euclid were taught by Rowbotham. At fifteen he was sent for two years to the day-school of the Rev. T. Dale of Peckham, and at seventeen he attended some courses in
literature at King's College, London. In painting he had lessons from Copley Fielding and afterwards from J. D. Harding. But in the incessant travelling, drawing, collecting specimens and composition in prose and verse he had gained but a very moderate classical and mathematical knowledge when he matriculated at Oxford; nor could he ever learn to write tolerable Latin. As a boy he was active, lively and docile; a good walker, but ignorant of all boyish games, as naif and as innocent as a child; and he never could learn to dance or to ride. He was only saved by his intellect and his fine nature from turning out an arrant prig. He was regarded by his parents, and seems to have regarded himself, as a genius. As a child he had been "a savant in petticoats"; as a boy he was a poet in breeches. At the age of seventeen he saw Adèle, the French daughter of Monsieur Domecq, Mr Ruskin's partner, a lovely girl of fifteen. John fell rapturously in love with her; and, it seems, the two fathers seriously contemplated their marriage. The young poet wooed the girl with poems, romances, dramas and mute worship, but received nothing except chiding indifference and lively ridicule. To the gay young beauty, familiar with Parisian society, the raw and serious young man was a possible suitor. She was sent to an English school, and he occasionally saw her. His unspoken passion lasted about three years, when she married the Baron Duquesne. Writing as an old man, long after her death, Ruskin speaks of his early love without any sort of rapture. But it is clear that it deeply coloured his life, and led to the dangerous illness which for some two years interrupted his studies and made him a wanderer over Europe.

As the father was resolved that John should have everything that money and pains could give, and was one day to be a bishop at least, he entered him at Christ Church, Oxford, as a gentleman-commoner—then an order reserved for men of wealth and rank. Ruskin's Oxford career, broken by the two years passed abroad, was not very full of incident or of usefulness. Though he never became either a scholar or a mathematician, he did enough accurate work to be placed in the honorary fourth class both in classics and in mathematics. By the young bloods of the "House" he was treated pleasantly as a raw outsider of genius. By some of the students and tutors, by Liddell, Newton, Acland and others, he was regarded as a youth of rare promise, and he made some lifelong friendships with men of mark and of power. Both he and his college took kindly the amazing proceeding of a young man who was only to reside at Oxford, that she might watch over her son's health. The one success of his Oxford career was the winning the Newdigate Prize by his poem "Salsette and Elephants," which he recited in the Sheldonian Theatre (June 1839). Two years of ill-health and absence from home ensued. And he did not become "a Graduate of Oxford" until 1842, in his twenty-fourth year, five years after his first entrance at the university. In fact, his desultory school and college life had been little more than an interruption and hindrance to his real education—the study of nature, of art and of literature. Long before Ruskin published books he had acquired a name as an artist. In March and April 1838, which make Loundon's Magazine of Natural History published an essay of his on the strata of mountains and an inquiry as to the colour of the Rhine. He then wrote for Loundon's Magazine of Architecture, and verses of his were inserted in Messrs Smith & Elder's Friendship's Offering, by the editor, T. Pringle, who took the lead to see the poet Rogers. At seventeen he wrote for Blackwood a defence of Turner, which the painter, to whom it was first submitted, did not take the trouble to forward to the magazine. At eighteen he wrote a series of papers, signed Kata Phusin, i.e. "after Nature," for Loundon's Magazine, on "The Poetry of Architecture." In 1838 (he was then nineteen) Mr Loundon wrote to him: "You are, I understand, in the order reserved, thus that ever it has been my fortune to become acquainted with."

Having recovered his health and spirits by care and foreign travel, and having taken his degree and left Oxford, Ruskin set to work steadily at Herne Hill on the more elaborate defence of Turner, which was to become his first work. Modern Painters, vol. i., by "a Graduate of Oxford," was published May 1843, when the author was little more than twenty-four. It produced a great and immediate sensation. It was vehemently attacked by the critics, and coolly received by the painters. Even Turner was somewhat discouraged; but the painter was now known to both Ruskins, and they freely bought his pictures. The family then went again to the Alps, that John might study mountain formation and "Truth in Landscape. In 1845 he was again abroad in Italy, working on his Modern Painters, the second volume of which appeared in 1846. He had now plunged into the study of Bellini and the Venetian school, Fra Angelico and the early Tuscans, and he visited Lucca, Pisa, Florence, Padua, Verona and Venice, passionately devoting himself to architecture, sculpture and painting in each city of north Italy. He wrote a few essays for the Quarterly Review and other periodicals, and in 1849 (act. 30) he published The Seven Lamps of Architecture, with his own etchings, which greatly increased the reputation acquired by his Modern Painters.

On the 10th of April 1848, a day famous in the history of Chartism, Ruskin was married at Perth to Euphemia Chalmers Gray, a lady of great beauty, of a family long intimate with the Ruskins. The marriage, we are told, was arranged by the parents of the pair, and was a somewhat hurried act. It was evidently ill-assorted, and brought no happiness to either. They travelled, lived in London, saw society, and attended a "Drawing-room" at Buckingham Palace. But Ruskin, immersed in various studies and projects, was no husband for a brilliant woman devoted to society. No particulars of their life have been made public. In 1854 his wife left him, obtained a nullification of the marriage under Scots law, and ultimately became the wife of John Everett Millais. John Ruskin returned to his parents, with whom he resided till their death; and neither his marriage nor the annulling of it seems to have affected seriously his literary career.

Ruskin's architectural studies, of which The Seven Lamps was the first fruit, turned him from Turner and Modern Painters. He planned a book about Venice in 1845, and The Stones of Venice was announced in 1845 as in preparation. After intense study in Italy and at home, early in 1851 (the year of the Great Exhibition in London) the first volume of The Stones of Venice appeared (act. 32). It was by no means a mere antiquarian and artistic study. It was a concrete expansion of the ideas of Modern Painters, and was a work of great power. It expressed the expression of their religion, their morality, their national aspirations and social habits. It was, as Carlyle wrote to the author, "a sermon in stones," "a singular sign of the times," "a new Renaissance." It appeared in the same year with the Construction of Sheepfolds—a plea for the reunion of Christian churches—in the same year with the essay on Pre-Raphaelitism, the year of Turner's death (9th December). The Stones of Venice was illustrated with engravings by some of the most refined artists of his time. The author spent a world of pains in having these brought up to the highest perfection of the reproductive art, and began the system of exquisite illustration, and the art of finely printed books which make his works rank so high in the catalogues and price-lists of collectors. This delicate art was carried even farther in the later volumes of Modern Painters by the school of engravers whom Ruskin inspired and gathered round him. And these now rare and coveted pieces remain to reprove us for our modern preference for the mechanical and unnatural chiaroscuro of photogravure—the successor and destroyer of the graver's art. Although Ruskin was practised in drawing from the time that he could hold a pencil, and had lessons in painting from some eminent artists, he at no time attempted to paint pictures. He said himself that he was unable to compose a picture, and he was sought to produce anything that he would call a work of original art. His drawings, of which he produced an enormous quantity, were always intended by himself to be studies or memoranda of buildings or natural objects precisely as they appeared to his eye. Clouds, mountains, landscapes, towers,
RUSKIN

The Stones of Venice was completed at Herne Hill, and he began a series of "Letters and Notes" on pictures and architecture. In this year (act. 34) he opened the long series of public lectures wherein he came forward as an oral teacher and preacher, not a little to the alarm of his parents and amidst a storm of controversy. The Edinburgh Lectures (November 1853) treated Architecture, Turner, and Pre-Raphaelitism. The Manchester Lectures (July 1854), treated the moral and social uses of art, now embodied in The Joy for Ever. Some other lectures are reprinted in On the Old Road and The Two Paths (1859). These lectures did not prevent the issue of various Notes on the Royal Academy pictures and the Turner collections; works on the Harbours of England (1856); on the Elements of Drawing (1857); the Elements of Perspective (1859); and at last, after prolonged labour, the fifth and final volume of Modern Painters was published in 1860 (act. 41). This marks an epoch in the career of John Ruskin; and the year 1860 closed the series of his works on art strictly so called; indeed, this was the end of his regular productive form. The last forty years of his life were devoted to expounding his views, or rather his doctrines, on social and industrial problems, on education, morals and religion, wherein art becomes an incidental and instrumental means to a higher and more spiritual life. And his teaching was embodied in an enormous series of Lectures, Letters, Articles, Selections and serial pamphlets. These are now collected in upwards of thirty volumes in the final edition. The entire set of Ruskin's publications amounts to more than fifty works having distinctive titles. For some years before 1860 Ruskin had been deeply stirred by reflecting on the condition and work and influence of our modern art, and he had written a shorter volume than any of the others, and in it he had dealt bitterly with the mode in which buildings, and buildings and other works were produced. In 1854 he joined Mr F. D. Maurice, Mr T. Hughes, and several of the new school of painters, in teaching classes at the Working Men's College. But it was not until 1860 that he definitely began to propound a new social scheme, denouncing the dogmas of political economy. Four lectures on this topic appeared in the Cornhill Magazine until the public disapproval led the editor, then W. M. Thackeray, to close the series. They were published in 1862 as Until this Last. In the same year he wrote two papers in the same sense in Fraser's Magazine, then edited by J. A. Froude; but he in turn was compelled to suspend the moral issue. They were completed and ultimately issued under the title Munera Pulveris. These two small books contain the earliest and most systematic of all Ruskin's efforts to depict a new social Utopia: they contain a vehement repudiation of the orthodox formulas of the economists; and they are for the most part written in a trenchant but simple style, in striking contrast to the florid and discursive form of his works on art.

In 1864 Ruskin's father died, at the age of 79, leaving his son a large fortune and a fine property at Denmark Hill. John still lived there with his mother, aged 83, infirm, and falling in sight, to whom came as a companion his cousin, Joanna Ruskin Agnew, afterwards Mrs Arthur Severn. At the end of the year 1864 Ruskin delivered at Manchester a new series of lectures—not on art, but on reading, education, woman's work and social morals—the expansion of his earlier treatises on economic sophisms. This afterwards was included with a Dublin lecture of 1868 under the fantastic title of Sesame and Lilies (perhaps the most popular of his social essays), of which 44,000 copies were issued down to 1900. He made this, in 1871, the first volume of his collected lectures and essays, the more popular and didactic form of his new Utopia of human life. It contains, with For Ever, a complete survey of the moral and his conception of the place of woman in modern society. In the very characteristic preface to the new edition of 1871 he proposes never to reprint his earlier works on art; disclaims many of the views they contained, and much in their literary form; and specially regrets the narrow Protestantism by which they were pervaded. In the year 1866 he published a little book about girls, and written for girls, a mixture of morals, theology, economics and geology, under the title of Ethics of the Dust; and this was followed by a more important and popular work, The Crown of Wild Olive. This in its ultimate form contained lectures on "Work," "Traffic," "War," and the "Future of England." It was one of his most trenchant utterances, full of fancy, wit, eloquence and elevated thought. But a more serious volume was Time and Tide (1867), a series of twenty-five letters to a workman of Sundaland, upon various points in the Ruskinian Utopia. This little collection of "Thoughts," written with wonderful vivacity, ingenuity and fervour, is the best summary of the author's social and economic programme, and contains some of his wisest and finest thoughts in the purest and most masculine English that he had at his command. In 1859 he issued the Queen of the Air, lectures on Greek myths, a subject he now took up, with some aid from the late Sir C. Newton. It was followed by some other occasional pieces; and in the same year he was elected Slade professor of art in the university of Oxford. He now entered on his professorial career, which continued with some intervals till 1884, and occupied a large part of his energies. His lectures began in February 1870, and were so crowded that they had to be given in the Sheldonian Theatre, and frequently were repeated to a second audience. He was made honorary fellow of Corpus Christi, and occupied rooms in the college.

In 1871 his mother died, at the age of 90, and his cousin, Miss Agnew, married Mr Arthur Severn. In that year he bought from Mr Linton, Brantwood, an old cottage and property on Coniston Lake, a lovely spot facing the mountain named the Old Man. He added greatly to the house and property, and lived in it continuously until his death in 1900. In 1871, one of Ruskin's last works, the small volume entitled Theological Essays, a series of sermons and lectures partly illustrated, which originally filled eight volumes and are now reduced to four.

The early years of his Oxford professorship were occupied by severe labour, sundry travels, attacks of illness and another cruel disappointment in love. In spite of this, he lectured, founded a museum of art, to which he gave pictures and drawings and £5000; he sought to form at Oxford a school of drawing; he started a model shop for the sale of tea, and model lodgings in Marylebone for poor tenants. At Oxford he set his pupils to work on making roads to improve the country. He now founded "St George's Guild," himself contributing £7000, and the object of which was to form a model industrial social movement, to buy lands, mills and factories, and to start a model industry on co-operative or Socialist lines. In connexion with this was a museum for the study of art and science at Sheffield. Ruskin himself endowed the museum with works of art and money; a full account of it has been given in Mr E. T. Cook's Studies in Ruskin (1890), which contains the particulars of his university lectures and of his economic and social experiments. It is unnecessary to follow out the history of these somewhat unpromising attempts. None of them came to much good, except the Sheffield museum, which is a public success, and is now transferred to the town. In Fors, which was continued month by month for seven years, Ruskin poured out his thoughts, proposals and rebukes on
society and persons with inexhaustible fancy, wit, eloquence and freedom, until he was attacked with a violent brain malady in the spring of 1878 (‘et. 59); and, although he recovered in a few months sufficiently to do some occasional work, he resigned his professorship early in 1879. The next three years he spent at Brantwood, mainly in retirement, and unhappy in finding nearly all his labours interrupted by his broken health. In 1880 he was able to travel in northern France, and began the *Bible of Amiens*, finished in 1885; and he issued occasional numbers of *Fors*; the last of which appeared at Christmas 1884. In 1882 he had another serious illness, with inflammation of the brain; but he recovered sufficiently to travel to his old haunts in France and Italy—his last visit. And in the following year he was re-elected professor at Oxford and resumed his lectures; but increasing brain excitement, and indignation at the establishment of a laboratory to which vivisection was admitted, led him to resign his Oxford career, and he retired in 1884 to Brantwood, which he never left. He now suffered from frequent attacks of brain irritation and exhaustion, and had many causes of sorrow and disappointment. His lectures were published at intervals from 1870 to 1885 in *Aitra Penelioi*, *The Eagle’s Nest*, *La Fontaine, Ariadne Florentina*, Val d’Arno, *Prosperina, Deucalion*, the *Laws of Ecosole*, *The Bible of Amiens, The Art of England* and *The Pleasures of England*, together with a series of pamphlets, letters, articles, notes, catalogues and circulars.

In the retirement of Brantwood he began his last work, *Pradera*, a desultory autobiography with personal anecdotage and reminiscences. He was again attacked with the same mental malady in 1885, which henceforth left him fit only for occasional letters and notes. In 1886 it was found that he had exhausted (spent, and given away) the whole of the fortune he had received from his father, amounting, it is said, to some thing like £20,000; and he was dependent on the vast and increasing sale of his works, which produced an average income of £4000 a year, and at times on the sale of his pictures and realizable property. In 1872 a correspondent had remonstrated with him in vain as to taking “usury,” i.e. interest on capital lent to others for use. In 1874 Ruskin himself had begun to doubt its lawfulness. In 1876 he fiercely assailed the practice of receiving interest or rent, and he henceforth lived on his capital, which he gave freely to friends, dependants, public societies, charitable and social objects. The course of his opinions and his practice is fully explained in his *Lupercal* and his *Fors*. In 1878 he was commissioned to write chapters of *Pradera*, which was designed to record memories of his life down to the year 1875 (‘et. 56). It was, in fact, only completed in regular series down to 1878 (‘et. 39), with a separate chapter as to Mrs Arthur Severn, and a fragment called *Dilecta*, containing letters and early recollections of friends, especially of Turner. These two books were published between 1885 and 1889; and except for occasional letters, notes and prefaces, they form the last writings of the author of *Modern Painters*. His literary career thus extends over forty years. But he has left nothing more graceful, naïve and pathetic than his early memories in *Pradera*—a book which many years later, with a few corrections, he republished in 1884.

The last ten years of his life were passed in complete retirement at Brantwood, in the loving care of the Severn family, to whom the estate was transferred, with occasional visits from friends, but with no sustained work beyond correspondence, the revision of his works, and a few notes and prefatory words to the books of others. He wished to withdraw his early art writings from circulation, but the public demand made this practically impossible. And now the whole of his writings are under the control of Mr George Allen, in several forms and prices, including a cheap series at 5s. per volume.

The close of his life was one of entire peace and honour. He was loaded with the degrees of the universities and membership of numerous societies and academies. “Ruskin Societies” were founded in many parts of the kingdom. His works were translated and read abroad, and had an enormous circulation in Great Britain and the United States. Many volumes about his career and opinions were issued in his lifetime both at home and abroad. His 80th birthday, 8th February 1889, was celebrated by a burst of congratulations and addresses, both public and private. His strength failed gradually; his mind remained feeble but unclouded, and his spirit serene. An attack of influenza struck him down, and carried him off suddenly after only two days’ illness, 20th January 1900. He was buried in Coniston churchyard by his own express wish, the opening ceremonies of the new church having been transferred to another day.

Ruskin’s literary life may be arranged in three divisions. From 1837 to 1860 (‘et. 18 to 41) he was occupied mainly with the arts. From 1860 to 1871 (‘et. 41 to 52) he was principally occupied with social problems. From 1871 to 1885 (‘et. 52 to 60) he was again occupied with technical subjects, and, after tentatively experimenting with securing his social Utopia by speech, pen, example and purse. But the essential break in his life was in 1860, which marks the turn to his main works, art and the opening of his attempt to found a new social gospel. With regard to his views of art, he himself modified and revised them from time to time; and it is admitted that some of his judgments are founded on imperfect study and personal bias. But the essence of his teaching has triumphed in effect, and has profoundly modified the views of artists, critics and the public, although it is but rarely accepted as complete or final. The moral of his teaching—that all living things are the expression of a supreme truth, natural to all, inherent in all, is the axiom of all aesthetic work or judgment. John Ruskin founded the Reform in Art.

With regard to his economic and social ideas there is far less general concurrence, though the years that have passed since *Unto this Last* have appeared to have the practical overthrow of the rigid plutonomy which he denounced. So, too, the vague and sentimental socialism which pervades *Museus Pulveris, Time and Tide* and *Fors* is now very rarely regarded as the basis of the social operations of many energetic reformers. But the negative part of Ruskin’s teaching on economics, social and political problems, has been much more effective than the positive part of his teaching. It must be admitted that nearly the whole of his practical experiments to realize his dreams have come to nothing, which is not unnatural, seeing his defiance of the ordinary habits and standards of life. A moral reformer was a rare and striking instance of assailing philosophers, economists and men of science, of whom he knew almost nothing, and whom he perversely misunderstood: men such as Adam Smith, Comte, Mill, Spencer, Darwin and all who followed them. In art, Ruskin had however received a good training, which made him a consummate expert. In philosophy and science he was an amateur, seeking to found a new sociology and a Utopian polity out of his own inner consciousness and study of nature, of poetry and the Bible. It is not wonderful if, in doing this, he poured forth a quantity of crude conceits and some glaring blunders. But in the most Quixotic of his schemes, and in the most short-sighted of his projects, his marvellous insight into the heart of things and men, and his marvellous insight on all that is true, real and noble in life, made his most startling proposals pregnant with meaning, and even his completely full of fascinating materialism and their too frequent extravagance of rhetoric. But his later economic and social pieces, such as *Unto this Last, Time and Tide, Sesame and Lilies*, are composed in the purest and most lucid of English styles. And many of his simply technical and explanatory notes have the same quality. Towards the close of his life, in *Fors* and in *Pradera*, will be found passages of tenderness, charm and sincerity which have never left a glow on our language.

Ruskin’s life and writings have been the subject of many studies and books’ composed by friends, disciples and admirers. The principal is the *Life* by W. G. Collingwood, his friend, neighbour and secretary from 1860, until his pupil, Mr J. A. Hobson, in *John Ruskin, Social Reformer* (2nd ed., 1899), has elaborately discussed his social and economic teaching, and claims him as the first philosopher and social critic of his age. Many of Ruskin’s works have been written by Mrs Meynell (1900). His art theories have been discussed by Professor Charles Waldstein of Cambridge in *The Work of John Ruskin* (1894), by Robert de la Sizeranne in *Ruskin’s Art* (1897), and Professor W. Emmerich de Fribourg in *Ruskin et la Bible* (1901). The monumental “library edition” of Ruskin’s works (begun in 1903), prepared by Mr E. T. Cook, and with Mr A. Wedderburn, is the greatest of all the tributes of literary admiration to him.

**RUSSELL (FAMILY)**

The great English Whig house of the Russells, ears and dukes of Bedford, rose under the favour of Henry VIII. Obsequious genealogists have traced their
lineage from "Hugh de Rozel," alias "Hugh Bertrand, lord of le Rozel," a companion of the Conqueror, padding their fiction with the pedigree of certain Russells who are found holding Kingston Russell in Dorset as early as the reign of King John. But the first undoubted ancestor of the Bedford line is Henry Russell, a Weymouth merchant, returned as a Burgess for that borough in four parliaments between 1425 and 1442. He may well have been the son of Stephen Russell, another Weymouth merchant, whose name is just before his in the list of those men of substance in Dorsetshire who, in 1434, under the act of parliament, were to be sworn not to maintain breakers of the peace. Stephen Russell, having served the office of bailiff of Weymouth, was returned as burgess to the parliament of 1395, and one William Russell was returned for King's Melcombe in 1440. Both Stephen and Henry were in the wine trade with Bordeaux, and in 1427 Henry was deputy to the chief butler of England for the port of Melcombe. In 1442 a pardon under the privy seal significantly describes Henry Russell of Weymouth, merchant, as alias Henry Gascoign, gentleman, and it is therefore probable that the ducal house of Bedford springs from a family of Gascon wine-merchants settled in a port of Dorsetshire, a county remarkable for the number of such French settlers.

Henry Russell of Weymouth made a firm footing upon the land by his marriage with Elizabeth Hering, one of the two daughters and co-heirs of John Hering of Chaldon Herig, a Dorsetshire squire of old family, heir of the Winterbourne of Winterborne Clenston and of the Cernes of Draycot Cerne. John Russell, eldest son of this match, born before 1432, and returned to parliament for Weymouth in 1459, had his seat at Berwick in Swyre, and he and his son and heir, James Russell, being buried in the parish church of Swyre.

Thus John Russell, son and heir of James, was born in a family of squire's rank, whose younger branches went on for many generations as merchants and shipowners at Weymouth. A happy accident is said to have brought him to court. The archduke, whose son he and other descendants were, and whose name in the old family is Maximilian, was driven by heavy weather into Weymouth, whence Sir Thomas Trenchard had him escorted to the king at Windsor. According to tradition, John Russell, Trenchard's young kinsman, was lately home from his travels with a knowledge of foreign tongues, those travels being probably made in the mercantile interests of his family. As travelling companion, or as a spy upon the strange guests, young Russell was sent with the archduke, who is said to have commended him to King Henry. Certain it is that on the accession of Henry VIII. John Russell advanced rapidly, serving the crown as soldier and as diplomatic agent. He fought well at Thérouanne, saw the battle of the Gabbionnière and the French disaster at Pavia, lost an eye by an arrow at Morlaix.

In 1523 he was knight-marshal of the king's household. In 1526 he married a rich widow, Anne, daughter and co-heir of Sir Guy Sapcotes by the co-heir of Sir Guy Wolston, a match which brought to the Russells the Buckinghamshire estate of Chenuis, in whose chapel many generations of them lie buried. His peerage as Lord Russell of Chenuis dated from 1530, and in the same year he had the Garter. Having held many high offices—lord high admiral, lord president of Devon, Cornwall, Dorset and Somerset, and lord privy seal—he was named by Henry VIII. as one of his executors. At the crowning of Edward VI. he was lord high steward, and after his defeat of the western rebels was raised, in 1550, to the earldom of Bedford. Mary Queen, like her brother, made him lord privy seal, although he is said to have favoured the Reformation which enriched him. He died in London in 1555, leaving to his son a vast estate of church lands and lands forfeited by less successful navigators of the troubled sea of Tudor politics. In the west he had the abbey lands of Tavistock, which give a marquess's title to his descendants. In Cambridgeshire he had the abbatiate of Thorny, in Bedfordshire the Cistercian house of Woburn, near which was the seat of the Russell of Lods of Covehove with the "Long Acre." Thus the future wealth of his house was secured by those "immoderate grants" which made a text for Edmund Burke's furious attack upon a duke of Bedford.

He left an only son, Francis, second earl of Bedford, K.G. (1527-1585), who, being concerned in Wyatt's plot, escaped to the Continent and joined those exiles at Geneva whose religious sympathies he shared. He returned in 1557, and was employed by Queen Mary before her death. Under Queen Elizabeth he governed Berwick, and was lord-lieutenant of the northern counties. Three of his four sons died before him, the third, killed in a border fray, being father of Edward, third earl of Bedford, who died without issue in 1627. The fourth son, William, created Lord Russell of Thornhaugh in 1603, was a soldier who fought fiercely before Zutphen beside his friend Sir Philip Sidney, whom he succeeded as governor of the Low Countries and was from 1597 to 1599 lord of Devonshire. He died in 1613, leaving an only son, Francis, who in 1627 succeeded his cousin as fourth earl of Bedford. This early built the square of Covent Garden, and headed the "undertakers" who began the scheme for draining the great Fen Level. He opposed the king in the House of Lords, but might have played a part as mediator between the sovereign and the popular party who accepted his leadership had he not died suddenly of the smallpox in 1641 on the day of the king's assent to the bill for Strafford's attainder. William, the eldest surviving son, succeeded as fifth earl, Edward, the youngest son, being father of Edward Russell (1653-1722), admiral of the fleet, who, having held the chief command in the victory of La Hogue, was created in 1697 earl of Orford. The fifth earl of Bedford, after fighting for the parliament at Edgehill and for the king at Newbury, surrendered to Essex and occupied himself with completing the drainage of the Bedford Level. He carried St Edward's staff at the crowning of Charles II., but quitted political life after the execution of his son, Lord Russell, in 1683. In 1694 he was created duke of Bedford and marquess of Tavistock, titles to which his grandson, Wrothesley Russell, succeeded in 1700. The "patriot" Lord Russell had added to the family estates by his marriage with Rachel, daughter and co-heir of Thomas Wrothesley, the fourth earl of Southampton, from whom she finally inherited the earl's property in Bloomsbury, with Southampton House, afterwards called Bedford House. Her son, the second duke of Bedford, married the daughter of a rich citizen, John Howland of Streatham, a match strangely commemorated by the barony of Howland of Streatham, created for the bridegroom's grandfather, the first duke, in 1695. The third duke, another Wrothesley Russell (1708-1732), died without issue, his brother John (1710-1771) succeeding him. This fourth duke, opposing Sir Robert Walpole, became, by reason of his rank and territorial importance, the leader of the Whig party. In the duke of Devonshire's administration he was lord-lieutenant of Ireland, and he served as lord high constable at the coronation in 1760. His son Francis, styled marquess of Tavistock, was killed in 1767 by a fall in the hunting field, and Lord Tavistock's son Francis (1765-1802) became the fifth duke. This was the peer whom Burke, snarling from a criticism of his own pension, assailed as "the Leviathan of the creatures of the crown," enriched by grants that "outragéd economy and even staggered credibly." He pulled down Bedford House, built by Inigo Jones, Russell Square and Tavistock Square rising on the site of old gardens and courts. Dying unmarried, he was succeeded by his brother John, the sixth duke (1766-1839), whose third son was the statesman created in 1861, Earl Russell of Kingston Russell, better known as Lord John Russell. Lord Odo Russell, a nephew of "Lord John," and ambassador at Berlin from 1871 to his death in 1884, was created Lord Ampthill in 1881. Herbrand Arthur Russell (b. 1838), the eleventh duke and fifteenth earl, succeeded an elder brother in 1893. (O. B.)

RUSSELL, ISRAEL COOK (1832- ), American geologist, was born at Harrattsville, New York, on the 10th of December 1832. He graduated at Cornell University in 1872, and later studied at the School of Mines, Columbia, where he was assistant professor of geology from 1875-77.
RUSSELL, J.—RUSSELL, 1st EARL

Geologist on the United States Geographical and Geological Surveys in 1878, and in 1880 became attached to the Geological Survey of the United States. In 1892 he was appointed professor of geology in the university of Michigan.

His publications include Sketch of the Geological History of Lake Lakonatin (1865); The Newark System (Bulletin No. 85 U.S. Geol. and Geog. Surveys, 1867); Glaciers of North America (1897); Glaciers of Mount Rainier (Ann. Rep. U.S. Geol. Survey, 1898); and North America (1900).

RUSSELL, JOHN (1745–1806), British portrait painter in pastel, was born at Guildford, Surrey. At an early age he entered the studio of Francis Cotes, R.A., from whom he derived his artistic education, and set up his own studio in 1767. Russell was a religious painter and a devout follower of Whitefield. He began an elaborate introspective diary in, Byrom's shorthand in 1766 and continued it to the time of his death. In it he records his own mental condition and religious exercises, entering with a certain morbid ingenuity into long disquisitions, and only occasionally recording information concerning his sitters. His religious life is the key to his complex character, as it actuated his whole career.

He obtained the gold medal at the Royal Academy for figure drawing in 1770 and exhibited from the beginning of the Academy down to 1805. He was the finest painter in crayons England ever produced, and although he painted in oil, in water-colours and in miniature, it was by his works in crayon that his reputation was made. He wrote the Elements of Painting in Crayon, and described in it his method. He made his own crayons, blending them on his pictures by a peculiar method termed "sweetening." This he carried out with his fingers, rubbing in the colours and softening them in outline, uniting colour to colour so accurately that they melt into one another with a characteristic cadence. His pastel work is to oil painting "what the vaudeville is to the tragedy or the sonnet to the epic." His colours were pure and his blending so perfect that no change is to be seen in his works since they were executed. Sir Joseph Banks, writing in 1789 respecting his portraits of the president, of Lady, Mrs and Miss Banks, stated that "the oil pictures of the present time fade quicker than the persons they are intended to present, but the colours made use of by Russell will stand for ever," and in that prophecy is so far justified.

An interesting picture by him hangs in the Louvre ("Child with Cherries"), and two, including "The Old Bathing Man at Brighton," are owned by the crown. At the Royal Academy, of which he was a member, he exhibited three hundred and thirty pictures, and was engraved by Collyer, Turner, Heath, Dean, Bartolozzi, Trotter, and other portrait engravers. Russell received warrants of appointment to the king, queen, prince of Wales and the duke of York. He was interested in astronomy, a friend of Sir W. Herschell, and no mean mathematician. He drew an exceedingly accurate map of the moon, and invented a piece of complicated mechanism for exhibiting its phenomena, publishing a pamphlet, illustrated by his own drawings, describing the apparatus.

Two of his sons inherited their father's talent, and one of them, William (1780–1870), exhibited five fine portraits in the Royal Academy.

See George C. Williamson, John Russell (London, 1894).

RUSSELL, JOHN (d. 1494), English bishop and chancellor, was admitted to Winchester College in 1443, and in 1449 went to Oxford as fellow of New College. He resigned his fellowship in 1465, and appears to have entered the royal service. In April 1467 and January 1468 he was employed on missions to Charles the Bold at Bruges. He was there again in February 1470 as one of the envoys to invest Charles with the Garter: the Latin speech which Russell delivered on this last occasion was one of Caxton's earliest publications, probably printed for him at Bruges by Colard Mansion (see Blades, Life of Caxton, i. p. vii, ii. 29–31). In May 1474 he was promoted to be keeper of the privy seal, and retained his office even after his consecration as bishop of Rochester on the 22nd of September 1476, and translation to Lincoln on the 9th of September 1480. As a trusted minister of Edward IV., he was one of the executors of the king's will; but on the 13th of May 1483 he accepted the office of chancellor in the interest of Richard of Gloucester, apparently with great reluctance. He retained the great seal till the 29th of July 1485. Russell was above all things an official, and was sometimes employed by Henry VII. in public affairs. But his last years were occupied chiefly with the business of his diocese, and of the university of Oxford, of which he had been elected chancellor in 1483. He died at Oxford on the 30th of December 1494, and was buried at Lincoln Cathedral.

Sir Thomas More calls Russell "a wise manne and a good, and of much experience, and one of the best-learned men, undoubtedly, that England had in hys time." Two English speeches composed by Russell, for the intended parliament of Edward V., and the first parliament of Richard III., are printed in Nichols's Grants of Edward V. (Camen Soc.). Some other writings of less interest remain in manuscript.

For contemporary notices see especially More's Life of Richard III., the Continuation of the Cronynal Chronicle, ap. Freeman, Scriptores, and Bentley's Excerpta Historia, pp. 16–17. See also Wood's History and Antiquities of the University of Oxford, and T. Kirby, Winchester Scholars, and Annals of Winchester College. There are modern biographies in Campbell's Lives of the Chancellors, and Foss's Judges of England.

RUSSELL, JOHN RUSSELL, 1st EARL (1792–1878), British statesman, third son of the 6th duke of Bedford, by Georgiana Elizabeth Byng, second daughter of the 4th viscount Torrington, was born in London on the 18th of August 1792. He was sent to a private school at Sunbury in 1800, and from 1803 to 1804 he was at Westminster School, but was then withdrawn on account of his delicate health. From 1805 to 1808 he was with a private tutor at Woodnesborough, near Sandwich. In 1808 he went to Spain, he studied from the autumn of 1809 to 1812 at the university of Edinburgh, and then the academic centre of Liberalism, and dwelt in the house of Professor John Playfair. On leaving the university, he travelled in Portugal and Spain, but on the 4th of May 1813 he was returned for the ducal borough of Tavistock and thereupon came back to England.

In foreign politics Lord John Russell's oratorical talents were especially shown in his struggles to prevent the union of Norway and Sweden. In domestic questions he cast in his lot with those who opposed the repressive measures of 1817, and protested that the phraseology of the discontent at home should be relieved by remedial legislation. When failure attended all his efforts he resigned his seat for Tavistock in March 1817, and meditated permanent withdrawal from public life, but was dissuaded from this step by the arguments of his friends, and especially by a poetic appeal from his friend Tom Moore. In the parliament of 1818–20 he again represented the family borough in Devon, and in May 1819 began his long advocacy of parliamentary reform by moving for an inquiry into the corruption which prevailed in the Cornish constituency of Grampound. During the first parliament (1820–26) of George IV. he sat for the county of Huntingdon, and secured in 1821 the disfranchisement of Grampound, but the seats were not transferred to the constituency which he desired. Lord John Russell paid the penalty for his advocacy of Catholic emancipation with the loss in 1826 of his seat for Huntingdon county, but he found a shelter in the Irish borough of Bandon Bridge. He led the attack against the Test Acts by carrying in February 1828 with a majority of forty-four a motion for a committee to inquire into their operations, and after this decisive victory they were repealed (5th of May 1828). He warmly supported the Wellington ministry when it realized that the king's government could only be carried on by the passing of a Catholic Relief Act (April 1829). For the greater part of the shortlived parliament of 1827–31 he served his old constituency of Tavistock, having been beaten in a contest for Bedford county at the general election by one vote; and when Lord Grey's
Reform ministry was formed, in November 1830, Lord John Russell accepted the office of paymaster-general without a seat in the cabinet. This exclusion was the more remarkable in that he was chosen (1st of March 1831) to explain the provisions of the Reform Bill, to which the cabinet had given its formal assent. The Whig ministry was soon defeated, but an appeal to the country increased the number of their adherents, and Lord John Russell was returned by the freeholders of Devon. After many a period of doubt and defeat, “the bill, the whole bill, and nothing but the bill” passed into law (7th of June 1832), and Lord John stood forth in the mind of the people as its champion. After the passing of the Reform Bill he sat for the S. division of Devon, and continued to retain the place of paymaster-general in the ministries of Lord Grey and Lord Melbourne. The former of these cabinets was broken up by the withdrawal of Mr. Stanley after his defeat at Derby.

Lord John Russell had visited Ireland in the autumn of 1833, and had come back with a keen conviction of the necessity for readjusting the revenues of the Irish church. To these views he gave expression in a debate on the Irish Tithe Bill (May 1834), whereupon Stanley, with the remark that “Johnny has upset the coach,” resigned his place. The latter was abruptly, if not rudely, dismissed by William IV. when the death of Lord Spencer promoted the leader of the House of Commons, Lord Althorp, to the peerage, and Lord John Russell was proposed as the spokesman of the ministry in the Commons (Nov. 1834). At the general election which ensued the Tories received a considerable accession of strength, but not sufficient to ensure their continuance in office, and the adoption by the House of Commons of the proposition, that the surplus funds of the Irish church should be applied to general education, necessitated the resignation of Sir Robert Peel's ministry (April 1835). In Lord Melbourne’s new administration Lord John Russell became home secretary and leader of the House of Commons, but on his seeking a renewal of confidence from the electors of South Devon, he was defeated and driven to Stroud. The Whig ministry succeeded in passing a Municipal Reform Bill (7th of Sept., 1835), and a settlement of the tithe question in England and Ireland (1836). In May 1839, on an adverse motion concerning the administration of Jamaica, the ministry was left with a majority of five only, and promptly resigned. Sir Robert Peel's attempt to form a ministry was, however, frustrated by the refusal of the queen to dismiss the ladies of the bedchamber, and the Whigs resumed their places with Lord John Russell as secretary of state for the colonies. Their prospects brightened when Sir John Yarde-Buller’s motion of “no confidence” at the opening of the session of 1840 was defeated by twenty-one, but a similar vote was some months later carried by a majority of 229, whereupon the Whig leader announced a dissolution of parliament (June 1841). At the polling-booth his friends sustained a crushing defeat; the return of Lord John Russell for the City of London was almost their solitary triumph.

On Sir Robert Peel’s resignation (1846) the task of forming an administration was entrusted to Lord John Russell, and he remained at the head of affairs from July 1846 to Feb. 1852, but his tenure of office was not marked by any great legislative enactments. His celebrated Durham letter (4th of Nov. 1846) on the threatened assumption of ecclesiastical titles by the Roman Catholic bishops, weakened the attachment of the “Pelletiers” and alienated his Irish supporters. The impotence of their opponents, rather than the strength of their friends, kept the Whig ministry in power, and, although beaten by a majority of nearly two to one on Mr Locke King’s County Franchise Bill in February 1851, it could not divest itself of office. Lord Palmerston's unauthorized recognition of the French coup d'état was followed by his dismissal from the post of foreign secretary (Dec. 1851), but he had his revenge in the ejection of his old colleagues in February 1852. During Lord Aberdeen’s administration Lord John Russell led the Lower House, at first as foreign secretary (to the 1st of February 1853), then without portfolio, and lastly as president of the council (June 1854). In 1854 he brought in a Reform Bill, but in consequence of the war with Russia the bill was allowed to drop. His popularity was diminished by this failure, and although he resigned in January 1855 on Mr. Canning’s motion for an inquiry into the conduct of the war in the Crimea, he did not regain his old position in the country. At the Vienna conference (1855) Lord John Russell was England’s representative, and immediately on his return he became secretary of the colonies (May 1855), but the errors in his negotiations at the Austrian capital followed him and forced him to retire in July of the same year.

For some years after this he was the “stormy petrel” of politics. He was the chief instrument in defeating Lord Palmerston in 1857. He led the attack on the Tory Reform Bill of 1859. A reconciliation was then effected between the rival Whig leaders, and Lord John Russell consented to become foreign secretary in Lord Palmerston’s ministry (1860) and to accept an earldom (July 1861). During the American War Earl Russell’s sympathies with the North restrained his country from taking sides in the contest, and he warmly sympathized with the efforts for the unification of Italy, but he was not equally successful in preventing the spoilation of Denmark. On Lord Palmerston’s death (October 1865) Earl Russell was once more summoned to form a cabinet, but the defeat of his ministry in the following June on the Reform Bill which they had introduced was followed by his retirement from public life. His leisure hours were spent in the preparation of numberless letters and speeches, and in the composition of his Recollections and Suggestions (1875), but everything he wrote was marked by the belief that all philosophy, political or social, was summed up in the Whig creed of fifty years previously. Earl Russell died at Pembroke Lodge, Richmond Park, 28th May 1878.

Earl Russell was twice married—first in 1835, to Adelaide, daughter of Mr Thomas Lister, and widow of Thomas, second Lord Ribblesdale, and secondly, in 1841, to Lady Frances Ann Maria, daughter of Gilbert, second earl of Minto. By the former he had two daughters, by the latter three sons and one daughter. His eldest son, Lord Amberley, who married a daughter of the second Baron Stanley of Alderley, predeceased him on the 9th of January 1876, and their eldest son (b. 1865) succeeded as second Earl Russell.

Lord Russell played some part as an author. His tales, tragedies and essays (including The Nun of Arrouca, 1822, and Essays and Sketches by a Gentleman who has left his Lodgings, 1820) are for the most part the fruits of his leisure; his Life of William Lord Russell (1819), Memoirs of the Affairs of Europe (1824–29, 2 vols.), Correspondence of John, 4th Duke of Bedford (1842–46, 3 vols.), Memorials and Correspondence of C. J. Fox (1853–57, 4 vols.) and Life and Correspondence of J. C. Fox (1853–56, 2 vols.) are among the chief authorities on Whig politics. He also edited the Memoirs, Journal and Correspondence of Thomas Moore (1853–56, 8 vols.).

The chief biography is that by Sir Spencer Walpole (1891, 2 vols.). The volume by Stuart J. Reid (1895, "Prime Ministers of Queen Victoria" Series) should also be consulted. (W. P. C.)

RUSSELL, JOHN SCOTT (1808–1882), British engineer, was born in 1808 near Glasgow, a "son of the manse," and was at first destined for the ministry. But this intention on his father's part was changed in consequence of the boy's early leanings towards practical science. He attended in succession the universities of St Andrews, Edinburgh and Glasgow,—obtaining a degree in the last-named at the age of sixteen. After spending a couple of years in workshops, he settled in Edinburgh as a lecturer on science, and soon attracted large classes.

In 1832–33 he was engaged to give the natural philosophy course at the university, the chair having become vacant by the death of Sir John Leslie. In the following year he began his remarkable series of observations on waves. Having been consulted as to the possibility of utilizing steam-navigation on the Edinburgh & Glasgow canal, he replied that the question could not be answered without experiments, which he was willing to undertake if a portion of the canal were placed at his disposal. The results of this inquiry are to be found in the Trans. Roy. Soc. Ed. (vol. xiv.), and in the British
Association Reports (seventh meeting). The existence of the long wave, or wave of translation, with many of its most important features, was here first recognized, and it was clearly pointed out why there is a special rate, depending on the depth of the water, at which a canal-boat can be towed at the least expenditure of effort by the horse. The elementary mathematical theory of the long wave was soon supplied by commentators on Scott Russell's work, and a more complete investigation was subsequently given by Sir G. G. Stokes. Russell indulged in many extraordinary and groundless speculations, some of which were published in a posthumous volume, The Wave of Translation (1885). His observations led him to propose and experiment on a new system of shaping vessels, known as the wave system, which culminated in the building of the “Great Eastern.” His activity and ingenuity were also displayed in many other fields,—steam-coaches for roads, improvements in boilers and in marine engines, the immense iron dome of the Vienna Exhibition, cellular double bottoms for iron ships, &c. With Mr Stafford Northcote (afterwards Lord Iddesleigh), he was joint-secretary of the Great Exhibition of 1851; and he was one of the chief founders of the Institution of Naval Architects. He died at Ventnor on the 8th of June 1882.

RUSSELL, THOMAS (1762-1788), English poet, was born at Beaminster, early in 1762. He was the son of John Russell, an attorney at Bridport, in Dorsetshire, and his mother was Miss Virtue Brickle, of Shaftesbury. He was educated at the grammar school of Bridport, and in 1777 proceeded to Winchester, where he stayed three years, under Dr Joseph War ton, and Thomas Warton, the professor of poetry. In 1780 Russell became a member of New College, Oxford. He graduated B.A. in 1784 and was ordained priest in 1786. During his residence at the university he devoted himself to French, Italian, Spanish, Portuguese, Provencal and even German literature. His health, however, broke down, and he retired to Bristol hot wells to drink the waters; but in vain, for he died there on the 31st of July 1788. He was buried in Power stock churchyard, Dorset. In 1789 was published a thin volume, containing his Sonnets and Miscellaneous Poems, now a very rare book. It contained twenty-three sonnets, of regular form, and a few paraphrases and original lyrics. The sonnets are the best, and it is by right of these that Russell takes his place as one of the most interesting precursors of the romantic school of poetry. In W. B. Yeats' words, “in other words, he rejected entirely the narrow circle of subjects laid down for 18th-century poets. In this he was certainly influenced both by Chatterton and by Collins. But he was still more clearly the disciple of Petrarch, of Boccaccio and of Camoens, each of whom he had carefully and enthusiastically studied. His sonnet, ‘Suppos’d to be written at Lemnos,’ is his masterpiece, and is unquestionably the greatest English sonnet of the 18th century.”

The anonymous editor of Russell's solitary volume is said to have been William Howey (1766-1848), long afterwards archbishop of Canterbury, who was a youthful bachelor of New College when Russell, who had been his tutor, died. His memoir of the poet is very perfunctory, and the fullest account of Russell is that published by H. S. Tristram in his English Seamen, vol. ii. p. 382. Russell, One of the Peers of the Empire, London (1866), is the story of the life of Russell, and the book is written by General H. M. N. de Guise. Russell, One of the Peers of the Empire, London (1866), is the story of the life of Russell, and the book is written by General H. M. N. de Guise. Russell, One of the Peers of the Empire, London (1866), is the story of the life of Russell, and the book is written by General H. M. N. de Guise.

RUSSELL, WILLIAM CLARK (1844—), British author, was born at the Carlton House Hotel, New York, on the 24th of February 1844, the son of Henry Russell, author of "Cheer, Boys, Cheer," and other popular songs. He went to school at Winchester, and then at Boulogne, joining the merchant service at thirteen, and serving for eight years. This apprenticeship to a seafaring life was turned to account in a series of stories which have fascinated two generations of boy readers. John Holdsworth, Chief Mate (1874), immediately made his reputation. Other successful stories were: The Wreck of the Governor (1875), The Romance of a Midshipman (1898), The Ship's Adventure (1890), Overdue (1903), Abandoned (1904), His Island Princess (1905). He joined the staff of the Newcastle Daily Chronicle, and afterwards became a leader writer on the Daily Telegraph, but the double labour of journalism and novel-writing threatened his health, and he resigned in 1887. Many of the papers which he contributed to the Daily Telegraph were collected in volume form in Round the Galley Fire and other volumes. He also wrote a Life of Lord Collingwood (1891), and, with W. H. Jacques, Nelson and the Naval Supremacy of England (New York, 1896).

RUSSELL, SIR WILLIAM HOWARD (1824-1907), English war correspondent, was born at Livelyvale, near Tallagh, in the county of Dublin, on the 28th of March 1821, being one of the Russells of Limerick, whose settlement in Ireland dates from the time of Richard II. He entered Trinity College in 1838. Three years later he was thrown very much on his own resources, but a relative, Mr R. W. Russell, who had been sent to Ireland by The Times, deputed him to report the Irish elections at Longford, and his success definitely turned his attention to journalism. Coming to London in 1842, he went to Cambridge, but left before taking a degree. In the following year he was sent by The Times to Ireland to report the O'Connell meetings. In 1845 he was appointed to superintend the reports on the Irish railways, and was shortly afterwards sent by The Times to inspect the O'Connell property in S.W. Ireland, when his plain speaking drew forth a characteristic tirade from the "Liberator." For a short period in 1847 his services were temporarily transferred to the Morning Chronicle, but with that exception he remained permanently connected with The Times. He was sent as special correspondent to Denmark in the war of 1849-50. He did not, however, at once relinquish a legal career, and was called to the bar at the Middle Temple in 1851. On the outbreak of the Crimean War in 1853 he went out as special correspondent, and, accompanying the light division to Gallipoli, proceeded with the first detachment to Varna. On the embarkation for the Crimea he was attached to the second division, and landed with it on the 14th of September. He was present at the battle of the Alma on the 20th of September, at the investment of Sevastopol, at Balakлавa on the 25th of October and Inkerman on the 5th of November.

Towards the end of May 1855 he accompanied the expedition to Kertch, and did not return to the Crimea until the following December. In September 1855 he was sent to Moscow to the war, 1855-56. Russell's letters to The Times were mainly responsible for the enlightenment of the public at home as to the conduct of affairs at the scene of action, and his exposure of the mismanagement during the winter of 1854 did more than anything else to cause the downfall of Lord Aberdeen's ministry. In 1856 Russell was sent to Moscow to describe the coronation of the tsar, and in the following year was attached to the headquarters of Lord Clyde in India. He was present at the siege and capture of Lucknow in 1858, the operations in Oudh, the battle of Tallah and the battle of Aura in Robilkhand, and he received the Indian war medal with the Lucknow clasp. The events of those stirring times are vividly recorded in My Diary in India in 1858-59. Next year he was sent to Italy, but arrived on the eve of the armistice at Villa franca. On the 7th of January 1860 appeared the first number of the Army and Navy Gazette, which he founded, and of which he was editor and principal proprietor. In 1861 Russell proceeded to Washington, and reached McDowell's headquarters just before the first battle of Bull Run, and his account of the Federal retreat drew much hostile criticism. He published his account of the war, in so far as he had witnessed it, in My Diary, North and South, during the Crimean War (1882). Returning to England in 1863, he remained at home until 1866, when he proceeded to the headquarters of General Benedek and witnessed the battle of Königgrätz, 3rd of July.
During the interval of peace that followed he accompanied the prince of Wales to the Nile, Constantinople, the Crimea and Greece in 1855, and published an account of the tour in the following year, when he also contested the borough of Chelsea unsuccessfully in the Conservative interest. On the outbreak of the Franco-Prussian War in 1870, Russell was with the crown prince from the battle of Wörth, 6th of August, and Sedan, 15th of September, till the capitulation of Paris. His account appeared in 1874 under the title of My Diary during the Last Great War. His description of the burning of Paris by the Communards was not the least of his journalistic triumphs. In 1875-76 he was honorary private secretary to the prince of Wales during his tour through India, of which he published an account in 1877. When Lord Wolseley was sent to quell the Zulu rebellion in 1879, Russell was attached to his staff as correspondent. In 1880-81 he was a member of Sutherland’s party for a tour in the United States and Canada, described in Hesperokten, and in 1882 he was again with Lord Wolseley in the Egyptian campaign. In 1885 he published a personal retrospect entitled The Great War with Russia. Russell was knighted in May 1895, and was the recipient of numerous war medals and various foreign orders. He married twice, first in 1846 Miss Burrowes, who died not long afterwards, and secondly in 1884 the Countess A. Malvezzi. He died on the 11th of February 1907.

RUSSELL, LORD WILLIAM (1639-1683). English politician, was the third son of the 13th duke of Bedford and was born on the 1st of September 1639. About 1654 he was sent to Cambridge with his elder brother Francis (on whose death in 1678 he obtained the courtesy title of Lord Russell). On leaving the university, the two brothers travelled abroad, visiting Lyons and Geneva, and residing for some while at Augsburg. William’s account of his impressions is spirited and interesting. He was at Paris in 1658, but had returned to Woburn in December 1659. At the Restoration he was elected for the family borough of Tavistock. For a long time he appears to have taken no part in public affairs, but rather to have indulged in the follies of court life and intrigue; for both in 1665 and 1664 he was engaged in duels, in the latter of which he was wounded. In 1666 he married Rachel (1639-1723), second daughter of the 4th earl of Southampton, and widow of Lord Vaughan, thus becoming connected with Shaftesbury, who had married Southampton’s niece. With his wife Russell always lived on terms of the greatest affection and confidence. She corresponded with Tillotson and other distinguished men, and a collection of her admirable letters was published in 1773.

It was not until the formation of the “country party,” in opposition to the policy of the Cabal and Charles’s French-Catholic plots, that Russell began to take an active part in affairs. He then joined Cavendish, Brudenel, and Lyttleton and others in vehement antagonism to the court. With a passionate hatred and distrust of the Catholics, and an intense love of political liberty, he united the desire for ease to Protestant Dissenters. His first speech appears to have been on the 22nd of January 1673, in which he inveighed against the stop of the exchequer, the attack on the Smyrna fleet, the corruption of courtiers with French money, and “the ill ministers about the king.” He also supported the proceedings against the duke of Buckingham. In 1675 he moved an address to the king for the removal of Danby (see LEPPS, DUKE OF) from the royal councils, and for his impeachment. On the 1st of February 1677, in the debate on the fifteen months’ prorogation, he moved the dissolution of parliament; and in March 1678 he seconded the address praying the king to declare war against France. The enmity of the country party against Danby and James, and their desire for a dissolution and the disbanding of the army, were greater than their enmity to Louis. The French king therefore found it easy to form a temporary alliance with Russell, Hollis and the opposition leaders, by which they engaged to cripple the king’s power of hurting France and to compel him to sell Louis’s friendship,—that friendship, however, to be given only on the condition that they in their turn should have Louis’s support for their cherished objects. Russell in particular entered into close communication with the marquis of Ruvigny (Lady Russell’s maternal uncle), who came over with money to distribute among parliament. By the testimony of Barillon, however, it is clear that Russell himself utterly refused to take any part in the intended corruption.

By the wild alarms which culminated in the Popish Terror Russell appears to have been affected more completely than his otherwise sober character would have led people to expect. He threw himself into the party which looked to Monmouth as the representative of Protestant interests, a grave political blunder, though he afterwards was in confidential communication with Orange. On the 4th of November 1678 he moved an address to the king to remove the duke of York from his person and councils. At the dissolution of the pensionary parliament, he was, in the new elections, returned for Bed fordshire. Danby was at once overthrown, and in April 1679 Russell was one of the new privy council formed by Charles on the advice of Temple. Only six days after this we find him moving for a committee to draw up a bill to secure religion and property in case of a papish successor. He does not, however, appear to have taken part in the exclusion debates at this time. In June, on the occasion of the Covenanters’ rising in Scotland, he attacked Lauderdale personally in full council.

In January 1680 Russell, along with Cavendish, Capell, Powell, Essex and Lyttleton, tendered his resignation to the king, which was received by Charles “with all my heart.” On the 16th of June he accompanied Shaftesbury when the latter indicted James at Westminster as a papish recusant; and on the 26th of October he took the extreme step of moving “how to suppress popery and prevent a papish successor”; but while on the 2nd of November, now at the height of his influence, he went still further by seconding the motion for exclusion in its most emphatic shape, and on the 19th carried the bill to the House of Lords for their concurrence. The limitation scheme he opposed, on the ground that monarchy under the conditions expressed in it would be an absurdity. The statement, made by Echard alone (Hist. of England, ii.), that he joined in opposing the indulgence shown to Lord Strafford by Charles in dispensing with the more horrible parts of the sentence of death—an indulgence afterwards shown to Russell himself—is entirely unworthy of credence. On December 18 he moved to refuse supplies until the king passed the Exclusion Bill. The prince of Orange having come over at this time, there was a tendency on the part of the opposition leaders to accept his endeavours to secure a compromise on the exclusion question. Russell, however, refused to give way a hair’s-breadth.

On the 26th of March 1681, in the parliament held at Oxford, Russell again seconded the Exclusion Bill. Upon the dissolution he retired into privacy at his country seat of Stratton in Hampshire. It was, however, no doubt at his wish that his chaplain wrote the Life of Julian the Apostle, in reply to Dr Hickey’s sermons, in which the lawfulness of resistance in extreme cases was defended. In the wild schemes of Shaftesbury after the election of Tory sheriffs for London in 1682 he had no share; upon the violation of the charters, however, in 1683, he began seriously to consider as to the best means of resisting the government, and on one occasion attended a meeting at which treason, or what might be construed as treason, was talked. Monmouth, Essex, Hampden, Sidney and Howard of Escrick were the principal of those who met to consult. On the breaking out of the Rye House Plot, of which neither he, Essex, nor Sidney had the slightest knowledge, he was accused by informers of promising his assistance to raise an insurrection and compass the death of the king. Refusing to attempt to escape, he was brought before the council, when his attendance at the meeting referred to was charged against him. He was sent on the 30th of June 1683 to the Tower, and, looking upon himself as a dying man, betook himself wholly to preparation for death. Monmouth offered to appear to take his trial, if thereby he could help Russell, and Essex refused to abscond for fear of injuring his friend’s chance of escape. Before a committee of
the council Russell, on the 28th of June, acknowledged his presence at the meeting, but denied all knowledge of the proposed insurrection. He reserved his defence, however, until his trial. He would probably have saved his life but for the perjury of Lord Howard. The suicide of Essex, the news of which was brought into court during the trial, was quoted as additional evidence against him, as pointing to the certainty of Essex's guilt. On July 19 he was tried at the Old Bailey, his wife assisting him in his defence. Evidence was given by an informer that, while at Shaftesbury's hiding-place in Wapping, Russell had joined in the proposal to seize the king's guard, a charge indignantly denied by him in London and bequeathed with his dying breath that he was one of a committee of six appointed to prepare the scheme for an insurrection. Howard, too, expressly declared that Russell had urged the entering into communications with Argyll in Scotland. Howard's perjury is clear from other witnesses, but the evidence was accepted. Russell spoke with spirit and dignity in his own defence, and, in especial, vehemently denied that he had ever been party to a design so wicked and so foolish as those of the murder of the king and of rebellion. It will be observed that the legality of the trial, in so far as the jurors were not properly qualified and the law of treason was not observed, was denied in the trial of William & Mary which annulled the attainder. Hallam maintains that the only overt act of treason proved against Russell was his concurrence in the project of a rising at Taunton, which he denied, and which, Ramsay being the only witness, was not sufficient to warrant a conviction.

Russell was sentenced to die. Many attempts were made to save his life. The old earl of Bed ford offered £50,000 or £100,000, and Monmouth, Legge, Lady Ranelagh, and Rochester added their intercessions. Russell himself, in petitions to Charles and James, offered to live abroad if his life were spared, and never again to meddle in the affairs of England. He refused, however, to yield to the proposals of the politicians which were designed to make him grant the unlawfulness of resistance, although it is more than probable that compliance in this would have saved his life. He drew up, with Burnet's assistance, a paper containing his apology, and he wrote to the king a letter, to be delivered after his death, in which he asked Charles's pardon for any wrong he had done him. A suggestion of escape from Lord Cavendish he refused. He behaved with his usual quiet cheerfulness during his stay in the Tower, spending his last day on earth as he had intended to spend the following Sunday if he had reached it. He received the sacrament from Tillotson, and Burnet twice preached to him in his farewell paper; and, the parting from whom was his only great trial, he slept peacefully, and spent the last morning in devotion with Burnet. He went to the place of execution in Lincoln's Inn Fields with perfect calmness, which was preserved to the last. He died on the 21st of July 1683, in the forty-fourth year of his age. His attainder was reversed in 1689, and his son Wriothesley (1680-1711) succeeded his grandfather as 2nd duke of Bedford in 1700.

A true and moderatesumming-up of his character will be found in his Life, by Lord John Russell (1820). (O. A.)

RUSSELL OF KILLOWEN, CHARLES RUSSELL, Baron (1834-1916), lord chief justice of England, was born at Newry, county Down, on the 9th of November 1834. He was the eldest son of Arthur Russell, a Roman Catholic gentleman, who was engaged in commerce and brewing in Newry. Educated first at Belfast, afterwards in Newry, and finally at St Vincent's College, Castleknock, Dublin, in 1849, he was articled to a firm of solicitors in Newry. In 1854 he was admitted, and began to practise his profession. Disturbances between Roman Catholics and Orangemen were at that time prevalent in this part of Ireland, and in the legal proceedings which ensued at quarter and petty sessions young Russell distinguished himself as a bold and skilful advocate in the cause of his co-religionists. He was always formed an important element in Russell's character happily harmonizing with these professional duties. After practising, however, for two years, he determined to seek a wider field for his abilities, and to become a barrister in England. It was a wise ambition, early conceived by young Russell, stimulated by his present success, and encouraged by the counsel of at least one competent adviser, Judge Jones, who was much impressed by Russell's ability in the conduct of a case at the Newry quarter sessions. He believed, moreover, that to succeed at the Irish bar he would have (to use his own phrase) to "swallow his convictions." With this end in view Russell, whilst still practising and residing in Belfast, became a student of Trinity College, Dublin. He matriculated there in 1855, and passed examinations from time to time, but did not wait to become a graduate. In 1856 he went to London and became a student of Lincoln's Inn. In 1858 he married, in Belfast, Ellen, the eldest daughter of Dr Mulholland, a physician of distinction in that city. In 1859 he was called to the bar, after gaining by examination a first-class honour certificate, and joined the Northern Circuit. Except some valuable introductions to friends in London and Liverpool, which his uncle, the president of Maynooth, had given to him, Russell brought to the work of his profession no external aids. He had to rely upon himself. But the equipment was sufficient. A well-built frame; a strong, striking face, with broad forehead, keen grey eyes, and a full and sensitive mouth; a well-considered voice, not high-sounding, yet of the true melodious type; he corresponded well to strong emotions, whether of indignation, or scorn, or pity; an amazing power of concentrating thought; an intellectual grasp, promptly seizing the real points of the most entangled case, and rejecting all that was secondary, or petty, or irrelevant; a faculty of lucid and forcible expression, which, without literary ornamentation or grace of style, could on fit occasions rise to impassioned eloquence—all these things Russell had. But beyond and above all these was his immense personality, an embodiment of energetic will which riveted attention, dominated his audience, and bore down opposition. His successful advocacy in the Colin Campbell divorce case in 1863; his famous cross-examination of the Lord Provost; and still more famous speech before the Parnell Commission in 1888, afforded perhaps the best examples of Russell's characteristic powers. He was not a learned lawyer in the sense in which Willes, or Mellish, or Blackburn were learned lawyers; he did not possess the fine legal acumen of his great contemporary, Herschell; but he had a sufficient apprehension of legal principles. He handled a point of law with telling directness and force. His argument as the leading counsel for Great Britain in the Bering Sea Arbitration in 1863, and his address at Saratoga Springs on International Law and International Arbitration in 1896, are expressions of law in his practical application to matters of state which the most learned jurist must admire for their thoroughness and perspicacity.

Russell's success, after he joined the Northern Circuit, did not, of course, come to him at once. For some time his work in court was principally in the Court of Passage at Liverpool, which he regularly attended from London. He wrote a book on its procedure, which was published in 1862. This ancient local court, possessing both common law and Admiralty jurisdiction, had as its presiding judge—then styled "assessor"—an eminent leader of the Northern Circuit, Mr Edward James. Substantial commercial cases were not tried there; Russell soon had a goodly portion. Steadily, and, for a barrister, speedily, Russell's fortune grew. His biographer, Mr Barry O'Brien, has given, in The Life of Lord Russell of Kilkenny (1901), an account of Russell's fees, which shows that they were, in round figures: in 1859, £117; in 1862, £205; in 1866, £236; and in 1870, £5230. At the beginning of this period Russell wrote occasionally for the newspapers, and especially for the Irish press. From early boyhood onwards he maintained a keen interest in politics, and pre-eminently in the public affairs of Ireland. In 1839 he published a pamphlet entitled The Catholic in the Workhouse, and from his pen is to be found, in his Dublin Revisited, with a gr. His legal work was not wholly confined to the north of England. He was employed at the Guildhall and elsewhere by solicitors of position in the City of London. He was one of the counsel engaged in
the Windham lunacy case in 1861, and in the action of Saurin v. Storr in 1860. In 1865 he argued in ex parte Chavasse before Lord Westbury, L.C., and soon afterwards was honoured by him with the offer of a county court judgeship.

In 1872 Russell took "silk," and from that date for some time he divided the best leading work of the circuit with Holker, Herschell and Pope. In 1874 Holker became solicitor-general in the Conservative administration. In 1880 Herschell accepted the same office in a Liberal ministry, and about the same time Pope practically left the circuit, to become in a short time one of the most successful advocates at the parliamentary bar. Russell's success as a Q.C. during this period of his career was prodigious. He excelled in the conduct alike of commercial cases and of those involving, as he used to say, "a human interest," although undoubtedly it was the latter which more attracted him. He was seen to the least advantage in cases which involved technical or scientific detail. If his advocacy suffered a defeat, however, it was never an inglorious defeat. Those who were on the Northern Circuit at the time will not easily forget the case of Dixon v. Plimsoll—a libel action brought by a Liverpool shipowner against Mr S. Plimsoll—tried before Baron Amphlett and a Liverpool special jury, in which Holker won a notable victory for the respondent; or Nuttall v. Wilde, a breach of promise action, in which Pope led brilliantly for the successful plaintiff, and Russell's speech for the defence was one of the finest in point of passion and pathos that was ever heard upon the Northern Circuit. At the same time, with all his fighting power, Russell was eminently a sagacious adviser. No barrister ever knew better how and when to settle a case, where the client's true interest called for a settlement.

In 1880 a new phase of Russell's arduous life began. He was returned to parliament as an independent Liberal member for Dundalk, a constituency which he had twice before unsuccessfully contested. From that time forward until his appointment to a lordship of appeal in succession to Lord Bowen in 1894, he sat in the House of Commons for Dundalk until 1885, and afterwards for South Hackney, where he was returned as the Liberal member on four successive occasions—once in 1889, twice in 1896, and again in 1892. The entrance into parliament laid upon Russell's time and labour a heavy additional tax. His was a nature which could not, in work or even in pleasure, be content to do anything lightly or by halves. He was essentially a man of action; intensity—at times almost fierce intensity—both of purpose and of devotion to its fulfilment characterized everything he did. Upon such a man parliamentary life between 1880 and 1894 necessarily entailed a severe strain. During the whole of this epoch, in home affairs, Irish business almost monopolized the political stage; and Russell was Irish to the core. From 1880 to 1886, as a private member, and as the attorney-general in Mr Gladstone's administrations of 1886 and 1892, he worked in and out of parliament for the Liberal policy in regard to the treatment of Ireland as few men except Russell could or would work. He never spared himself. After a long day in the turmoil of the courts, he cheerfully gave a long evening to a distant and often, from the standpoint of personal notoriety, an obscure, platform. His position throughout was clear and consistent. Before 1886 on several occasions he supported the action of the Irish Nationalist party. He opposed coercion, voted for compensation for disturbance, advocated the release of political prisoners and voted for the Macartney inquiry. He wrote to the Daily Telegraph a series of letters on the Irish land question, which were afterwards published (1889) in a collected form. But he never became a member of the Irish Home Rule or of the Parnellite party; he was elected at Dundalk as an independent Liberal, and such he remained. He was proud of the kingdom in whose might and glory Ireland could claim so large a part; and when, as attorney-general in the Gladstone administration, he warmly advocated the establishment of a subordinate parliament in Ireland, he did so because he sought the amelioration and not the destruction of Ireland's relations with the rest of that kingdom. "I am absolutely opposed," he said (The Life of Lord Russell of Killowen, p. 194) to the South Hackney voters, "to separation; but, reserving imperial control on all imperial questions, I think Irishmen on Irish soil should have the power of dealing in the way which seems best to them with all questions that concern them." It is impossible to say that Russell's success in the House of Commons, considerable as it was, was comparable to his career as an advocate in the courts of justice. He was listened to, always with respect and often with admiration, but he was not made for a debater; and the position of a law officer has generally not proved favourable to the attainment of parliamentary eminence. In great public affairs the law officer advises and supports, but not for him is the glory of initiating public policy.

Russell's parliamentary duties, fully as he discharged them, first as a private member and afterwards as attorney-general, were not allowed by him to obstruct his professional career. He rapidly became in London what he was already in Lancashire, the favourite leader in nisi prius actions. The list of causes célèbres in the period 1880-94 is really a record of Russell's cases, and, for a great part, of Russell's victories. The best known of the exceptions from the latter category was the libel action Belt v. Lawes in 1882, which, after a trial before Baron Huddleston and a special jury lasting more than forty days, resulted in a verdict for the plaintiff, for whom Sir Hardinge Giffard (afterwards Lord Chancellor Halsbury) appeared as leading counsel. The triumph of his client in the Colin Campbell divorce suit in 1886 afforded perhaps the most brilliant instance of Russell's forensic capacity in private litigation. His fees in 1885, the year before he became attorney-general, amounted to nearly £17,000. More important, however, as well as more famous, than any of his successes in the ordinary courts of law during this period were his performances as an advocate in two public transactions of mark in British history. The first of these in point of date was the Parnell Commission of 1888-90, in which Sir Charles Russell appeared as leading counsel for Mr Parnell. The commission held its first sitting on the 22nd of October 1888, and presented its report in February 1890. In April 1889, after 63 sittings of the commission, in the course of which 340 witnesses had been examined, Sir Charles Russell, who had already destroyed the chief personal charge against Mr Parnell by a brilliant cross-examination, in which he proved it to have been based upon a forgery, made his great opening speech for the defence. It lasted several days, and concluded on the 12th of April. This speech, besides its merit as a wonderful piece of advocacy, possesses permanent value as an historical survey of the Irish question during the last century, from the point of view of an Irish Liberal. It was in the same year published after careful revision by its author (1890). The second public transaction was the Bering Sea Arbitration, held in Paris in 1893. Sir Charles Russell, then attorney-general, with Sir Richard Webster (afterwards Lord Alverstone, L.C.J.), was the leading counsel for Great Britain. Russell, in the course of his very powerful argument before the tribunal, maintained the proposition, which he again handled in his Saratoga address to the American Bar Association in 1896, that "international law is neither more nor less than what civilized nations have agreed shall be binding on one another as international law." The award was, substantially, in favour of Great Britain. In recognition of their distinguished services, the queen bestowed upon both the leading representatives of Great Britain the honour of the grand cross of St Michael and St George.

In 1890 Russell accepted his career as an advocate ended. A judgeship, if he had wished it, had been within his reach twelve years before. In 1894, on the death of Lord Bowen, he accepted the position of a lord of appeal. A month later he was appointed lord chief justice of England in succession to Lord Coleridge, to whose memory he devoted in the following September a paper in the North American Review. To the discharge of his functions as a judge Russell brought with him all the qualities of intellect and character which had made him so eminent as an advocate, and their greatness was not less conspicuous in his
new position. Brief as was his tenure of the office, he proved himself well worthy of it. He was dignified without pompous-ness, quick without being irritable, and masterful without tyranny. He was scrupulously punctual. Suitors and hearers could not but be impressed by the manifest determination of the lord chief justice to get to the truth, and to do so without waste of time. If there was a touch of excessive zeal for dispatch, when occasionally, there were flashes of impatience, they were elicited by the exhibition, as he deemed it, of want of preparation, or slovenliness, or ver- bosity on the part of the advocate before him. Even the youngest and most obscure practitioner could always count upon the assiduous attention of the lord chief justice to a pertinent and thoughtful argument. In 1896 Lord Russell (Pollock B. and Hawkins J. being on this occasion his colleagues on the bench) presided at the trial at bar of the leaders of the Jameson Raid. It was a state trial of grave importance. Russell's conduct of it, in the midst of much popular excitement, was by itself sufficient to establish his reputation as a great judge. One other event at least in his career while lord chief justice deserves a record, namely, his share in the Venezuela Arbitration in 1899. Lord Herschell, who had been nominated to act with Lord Justice Collins (afterwards Master of the Rolls), as a British representative on the Commission of Arbitra- tion, of which the distinguished Russian jurist M. Martens was president, died somewhat suddenly in America before the beginning of the proceedings. The lord chief justice accepted the invitation to take the vacant place, and performed his very onerous duty with conspicuous ability.

Nor was it only on the bench or as an international judge that Lord Russell of Killowen sought, during the last years of his busy life, to do service to his country. He signalized his zeal as a law reformer by the public advocacy of radical changes in the system of legal education in the Inns of Court, and by the promotion of measures to put down the vice of secret and illicit commissions in commercial and business life. On the former subject he delivered in 1895 an address in Lincoln's Inn Hall, under the auspices of the Council of Legal Education, which was afterwards printed and published. In 1899, dealing with the latter question, he introduced in the House of Lords a bill, which had its first reading. He again introduced a bill in the session of 1905, which was read a second time, but did not become law. On the 10th of August 1900 the great advocate and great judge passed quietly away at his London residence, after a short illness due to an internal malady.

In private as in public life Russell was always strenuous, and most attracted by things that called for the exercise of activity, whether bodily or intellectual. Inaction he disliked both for himself and in others. Though not an athlete, he took an interest in manly pastimes: he was fond of riding and of breeding horses; he liked being on the racecourse; and he enjoyed games, both of skill and of chance. A student of books, he was not; he could lay no claim to wide learning or elegant scholarship; but he could appreciate a good book; he was versed in Shakespeare; and he knew and loved the poetry and the songs of his native land. When he wrote, his style, inornate, clear and forcible, reflected the character of his thought. He was a staunch and sympathetic friend, ever ready, in an unostentatious way, to help, where help was really needed. While he undoubtedly exhibited at times, chiefly during the earlier part of his career, a certain brusqueness and impetuousness of speech and demeanour, those who came into contact with him recognized in him that "Romulan" (Byzantine Ρως or Ρώσος), a name first given to the Scandinavians who founded a principality on the Dnieper in the 9th century; and afterwards extended to the collection of Russian states of which this principality formed the nucleus. The word Rus, in former times wrongly connected with the tribal name Rhoxolani, is more probably derived from Ruotsi, a Finnish name for the Swedes, which seems to be a corruption of the Swedish rothsmen, "rowers" or "seafarers."
RUSSIA

I. THE RUSSIAN EMPIRE

The Russian empire stretches over a vast territory in E. Europe and N. Asia, with an area exceeding 8,660,000 sq. m., or one-sixth of the land surface of the globe (one-twenty-third of its whole supericies). It is, however, but thinly peopled on the average, including only one-twelfth of the inhabitants of the earth. It is almost entirely confined to the cold and temperate zones. In Novaya Zemlya and the Taimyr peninsula, it projects within the Arctic Circle as far as 77° 6' and 77° 40' N., respectively; while its S. extremities reach 38° 5' in Armenia, 35° on the Afghan frontier, and 42° 30' on the coasts of the Pacific. To the W. it advances as far as 50° E. in Lapland, 54° 5' in Poland, and 49° 45' on the Black Sea; and its E. limit—East Cape on the Bering Strait—is in 191° E.

The White, Barents and Kara Seas of the Arctic bound it on the N., and the northern Pacific—that is, the Seas of Bering, Okhotsk and Japan—bound it on the E. The Baltic, with the Gulfs of Bothnia and Finland, limits it on the N.W.; and two sinuous lines of land frontier separate it respectively from Sweden and Norway on the N.W., and from Prussia, Austria and Rumania on the W. On the S. and E. the frontier has changed frequently according to the expansion and contraction of the empire under the pressure of political expediency and expediency. The Black Sea is the principal demarcating feature on the S. of European Russia. On the W. side of that sea the S. frontier touches the Danube for some 120 m.; on the E. side of the same sea it zigzags from the Black Sea to the Caspian, utilizing the river Aras (Araxes) for part of the distance. As the Caspian is virtually a Russian sea, Persia may be said to form the next link in the S. boundary of the Russian empire, followed by Afghanistan.

On the Pamirs Russia has since 1885 been conterminous with British India (Kashmir); but the boundary then swings away N. toward Chinese Turkestan and the N. side of Mongolia, and, since 1904-5, it has skirted the N. of Manchuria, being separated from it by the river Amur. As thus traced, the boundary in Central Asia includes the two khanates of Bokhara and Khiva, which, though nominally protected states, are to all intents and purposes integral parts of the Russian empire. But it excludes Manchuria, with the Liao-tung peninsula and Port Arthur, upon which Russia only placed her grasp in 1898-99, a grasp which she was compelled by Japan to release after the war of 1904-5.

The total length of the frontier line of the Russian empire by land is 8500 m. in Europe, and nearly 100,000 m. in Asia, and by sea over 11,000 m. in Europe and between 10,000 and 20,000 m. in Asia. Russia has no oceanic possessions; her islands are all appendages of the mainland to which they belong. Such are Karlo, East Kvarken, the Åland archipelago, Dagö, and Ösel or Oesel in the Baltic Sea; Novaya Zemlya, with Kohlguyev and Vaigach, in the Barents Sea; the Solovet'sk Islands in the White Sea; the New Siberian archipelago, Wrangel Land and Bear Islands, off the Siberian coast; the Commander Islands off Kamchatka; the Shantar Islands and the N. of Sakehalin in the Sea of Okhotsk. The Archipelago was sold to the United States in 1867, together with Alaska, and in 1875 the Kurile Islands were ceded to Japan.

If the border regions, that is, two narrow belts, on the N. and S., be left out of account, a striking uniformity of physical feature prevails throughout the whole vast extent of the Russian empire. High plateaus like that of Pamir (the "roof of the World") and Armenia, and lofty mountain chains like the snow-clad Caucasus, the Alai, the Tian-shan, the Sayan Mountains, exist only on the outskirts of the empire.

Viewed broadly, the Russian empire may be said to occupy the territories to the N.W. of the great plateau formation of the old continent—the tableland of Asia—which stretches with decreasing altitude and width from the high tableland of Tibet and Pamir to the lower plateaus of Mongolia, and thence N.E. through the Vitim region to the farthest extremity of Asia. Thus it consists of the immense plains and flat lands which extend between the plateau formation and the Arctic Ocean, including the series of parallel chains and hilly spurts which skirt the former region on the N.W. And it is only to the E. of Lake Baikal that it climbs up on to the plateau, from which it descends again before it reaches the Pacific.

This plateau formation—the oldest, geological continent of Asia—being unfit for agriculture and for the most part unsuited for permanent settlement, while its oceanic slopes have from the dawn of history been occupied by a relatively dense population, has prevented Slav colonization from reaching the Pacific. The Russians chanced to cross it in the 17th century at its narrowest and most N. part, and thus struck the Pacific on the foggy and frozen shores of Lake Baikal. But this mountain barrier, after withstanding the depressions around Lake Baikal, they crossed over the plateau in a more genial zone and descended to the Pacific by the Amur. After that they spread rapidly S., up to the nearly uninhabited valley of the Usuri, to what is now the Gulf of Peter the Great. In the S.W. higher portions of the plateau formation the empire has only comparatively recently planted its foot on the Pamir, and it was only a few years earlier that it established itself firmly on the highlands of Armenia.

A broad belt of hilly tracts—in every respect alpine in character, and displaying the same variety of climate and organic life as alpine tracts usually do—carries the plateau formation throughout its entire length on the N. and W., being interrupted by the immediate region between the plateau and the plains. The Caucasus, the Elburz, the Kopet-dagh and Paropamisus, and the Pamirs, the Tien-shan, and the Ala-tau mountain regions, and farther N.E. the Altai, the still unnamed complex of the Minusinsk Mountains, the intricate mountain-chains of Sivan, with those of the Alai and Vitim Valleys, the former from N.W. to S.E., and the others from S.W. to N.E.—all these belong to the same alpine belt that borders the plateau from end to end of the series.

A great part of the large area which extend from the base of the Alpine foothills to the shores of the Arctic Ocean, assume the character either of dry deserts, as in the Aral-Caspian depression, or of low broad deserts with a meager plant formation throughout. The desert occupies the N.W. western part of Russia and E. Siberia, of lacustrine regions in N.W. Russia and Finland, or of high deserts in W. Siberia, and of "tundras" in the far N. Throughout the whole of this vast area, their monotonous surfaces are divided only by part, low, hilly tracts. Recently emerged from the Post-Pliocene sea, or freed from their mantle of ice, they persistently maintain the self-same features over immense areas; and the few portions that rise above the general level exhibit broad and gentle swellings than of mountain-chains. Of this class are the swampy plateaus of the Kola peninsula, sloping gently S. to the lacustrine region of Finland and N.W. Russia; the Valdai tableland, with its side slopes; the Oblast, and all the other tracts of N.E. Russia; the broad and gently sloping meridional belt of the Ural Mountains; and lastly the Taimyr, Tunguzka and Verkhoyansky ranges in Siberia, which, notwithstanding their sub-Arctic position, do not reach the snow-line. The mountains and plateaus of the Trans-Mongolian region, and the forest-clad Sikhota-ain on the Pacific, and the volcanic chains of Kamchatka belong, however, to quite another orographical construction, being the borders of the territories by which the great plateau formation descends to the depths of the Pacific Ocean.

It is owing to these leading orographical features—divined by Carl Ritter, but only recently ascertained and established as fact by geographical research—that so many of the areas of the rivers of the old continent are comprised within the limits of the Russian empire. Taking their rise on the plateau formation, or in its outskirts, they flow first along lofty longitudinal valleys, then northward with the slope of the plateau, through the rocky barriers, and finally they enter the lowlands, where they become navigable, and, describing wide curves to avoid here and there the minor plateaus and hilly tracts, they bring into water-communication with one another places hitherto isolated and apart. The double river-systems of the Volga and Kama, the Ob and Irtysh, the Angara and Yenisei, the Lena and Vitim on the Arctic slope, and the Amur and the Pacific slope, are instances. These were the obvious channels of Russian expansion.

A broad depression—the Aral-Caspian desert—has arisen where the plateau formation reaches its greatest altitude, and at the same time the suddenly changed direction of the Vitim desert is now filled to only a small extent by the salt waters of the Caspian, Aral and Balkash inland seas; but it bears unmistakable traces of having been during Post-Pliocene times an immense inland basin. The Aral Sea, the Voly, the Zador and the Wendsatai discharge their waters without reaching the ocean, but they bring life to the rapidly desiccating Transcaspian steppes, and link together the most remote parts of Russia.

Botany.—The most striking feature in the geography of Russia is its...
The Cambrian is represented by blue clays, argillaceous sandstones and bituminous slates in Esthonia and St Petersburg. The Older or Silurian, and Silurian, are well developed, and it is most probable that, with the exception of the Archean continuers of Finland, and the sea covered the whole of Russia. Being concealed, however, by more recent deposits, the deposits appear on the surface only in N.W. Russia (Esthonia, Livonia, St Petersburg and on the Volkhov); where all the subdivisions of the system have been found; in the Taimyr ridge; on the Urals; in the Pai-kho ridge; and in the islands of the Arctic Ocean. In Poland the rocks of these periods are met with in the Kielce Mountains, and in Podolia in the deeper ravines. The Devonian granites, limestones, and red sandstones, cover immense tracts and appear on the surface over a much wider area. From Esthonia these rocks extend N.E. to Lake Onega, and S.E. to Mogilev; they form the central plateau, as also the slopes of Finland and the Petsamoo region. In N.W. and Poland they contain a special fauna, and it appears that the Lower Devonian series of W. Europe, represented in Poland and in the Urals, is missing in N.W. and central Russia, where only the Middle and Upper Devonian series occur.

Carboniferous deposits occur over nearly the whole of E. Russia, their boundary being a line drawn from Archangel to the upper Dnieper, thence to the upper Don, and to the mouth of the last-named river, with a long narrow gulf extending W. to encircle the plateau of the Donets. They are visible, however, only on the W. borders of this region, being covered towards the E. by thick Permian and Triassic strata. Russia has three large coal-basins—the Donets basin, the Donets basin in the Urals. In the Volga plateau there are only a few beds of mediocre coal. In the Moscow basin, which was a broad gulf of the Carboniferous sea, coal appears as isolated, interstratified seams, amid such lenticular deposits, the formation of which was favoured by frequent minor subsides of the seacoast. The coal is here confounded with the lower division of the Carboniferous (corresponding with the English Coal-measures) is only 16,000 sq. m., and comprise a valuable stock of excellent anthracite and bituminous coal, and together with iron-ore. In this basin, as in W. Europe generally, the principal coal seams occur in the Upper Carboniferous, while the Lower Carboniferous is mainly composed of marine deposits, with, however, the first bed of coal near its summit. Several northern coalfields in the Russian slope of the Taimyr ridge may be added to the above. The Pollah coalfields belong to another Carboniferous area of deposit, which extended over E. Russia.

The Permian limestones and marls occupy a strip in E. Russia of much less extent than that assigned to them by Murchison. The variegated marls of E. Russia, rich in salt-springs, but very poor in fossils, are now held by most Russian geologists to be Triassic, and the Permian limestones, which contain similar remains of plants similar to those of England and Germany. But in the government of Vologda, on the rivers Sychkana and N. Dvina, the fossiliferous limestones and coal, belonging to the Indian Gondwana beds have been found; and with these there are numerous remains of reptiles similar to those which occur in the Indian deposits. In the Urals the marine facies is more fully developed, and the fauna includes the well-known deposited of the *Proclus* limestone of the Central Asian mountain belt.

During the Jurassic period the sea began again to invade Russia from S.E. and N.W. The limits of the Russian Jurassic system may be represented by a line drawn from the double valley of the Sychkana and Vytchega that of the upper Volga, and thence to Kieff, with a wide gulf penetrating towards the N.W. Within this space three depressions, all running S.W. to N.E., are filled with the Upper Jurassic deposits; the first belonging to the higher part of the region, and appear as isolated islands in central Russia. In the S.E. all the older subdivisions are represented, the deposits having the characters of a deep-sea formation in the region of the Caucasian ridge of the Caucasus. They are rich in grinding stone, and in phosphatic deposits.

The Tertiary formations occupy large areas in S. Russia. The Eocene covers wide tracts from Lithuania to Taurisint, and is represented in the Crimea and Caucasian by thick deposits belonging to the same ocean which left its deposits on the Alps and the Himalayas. Oligocene, quite similar to that of N. Germany, and containing brown coal and amber, has been met with only in Lithuania and the Baltic Provinces. The Miocene, which occupies extensive tracts in S. Russia, S. of a line drawn through Lublin to Ekaterinoslav and Saratov. Not only the higher ranges of Caucasus and Yalta, but also the Donets ridge, rose above the...
RUSSIA

Population.—The population of the empire, which was estimated at 74,000,000 in 1859, was found to be over 129,200,000 at the census of 1897, taken over all the empire except Finland. In 1904 it was estimated to be 145,000,000, and in 1906, according to a detailed estimate of the Central Statistical Committee, it was 149,990,300. Thus from 1860 to 1897 the population increased 74½%, and from 1897 to 1904 26½, an average annual increase of about 3½% as compared with an average annual increase of 2¾% during the period 1860-97. The increase took place chiefly in the large cities, in Siberia, Poland, Lithuania, S. Russia and Caucasus. The official divisions of the empire are given here, and details are given in separate articles.

It has been found, from a comparison of the densities of population of the various provinces in 1859 with the distribution in 1897, that the centre of density has distinctly moved S., towards the shores of the Black Sea, and W., the greatest increase having taken place in the E. Polish and in the Lithuanian provinces, along the S.W. border, in the prairie belt beside the Black Sea, and in Orenburg. N. Caucasus and S.W. Siberia likewise show a considerable increase. For the men of every 100 men in the Russian governments proper was 102-9; in Poland, 98-6; in Finland, 102-2; in Caucasus, 88-9; in Siberia, 93-7; and in Turkestan and Transcaspia, 83-0.

The effects of emigration and immigration cannot be estimated with accuracy, because only those who crossed the frontier with passports are taken account of. The statistics of these show that there was during the thirty-two years, 1856–88, an excess of emigration over immigration of 1,146,682 in the case of Russians, and a surplus of immigration over emigration by 1,056,338.

On the other hand, in the six years, 1892–97, the excess of Russian emigration over immigration was 207,553, as compared with an excess of foreign immigration over emigration in only 1,144,246. The total emigrants from Russia numbered 2,358,339, of whom 1,444,246 were Russians; while the immigrants numbered 2,333,053, of whom 1,432,057 were foreigners. It is also known that the number of Russian immigrants into the United States in 1891–1902 was 742,860, as compared with 314,460 in 1873–90, or a grand total since 1873 of 1,056,338. By far the greater part of these were Jews.

The emigration to Siberia varies much from year to year. It was estimated during the first five years it amounted to an average of 100,000, but in the years 1901–3 to an average of 84,638 per annum. Altogether some 800,000 peasants are estimated to have settled in Siberia during the period 1886–96, but during the years 1893–95 no less than four millions in all. There is also some emigration from central Russia to the Ural’s, as well as to some of the steppe regions.

Within the empire a very great diversity of nationalities is comprised, due to the amalgamation or absorption by the Slav race of a variety of Ural-Altai stocks, of Turko-Tatars, Turkoo-Mongols and various Caucasian races. In some cases their ethnical relations have not yet been completely determined. According to the results obtained by the census committee in 1897, working on a linguistic basis, the distribution of races was as given in the table opposite:

There were in European Russia and Poland only twelve cities with more than 100,000 inhabitants in 1884; and in 1900 there were sixteen, namely, St Petersburg, Moscow, Odessa, Warsaw, Odessa, Lódź, Riga, Kharkov, Kiev, Samara, Kazań, Ekaterinoslav, Rostov-on-the-Don, Astrakhan, Tula and Kishinev. In other parts of the empire there were four cities each having over 100,000 inhabitants in that year, namely: Vinnitsa, Kamenets-Podolsk, Kharkov and Ternopol. All told, 20 towns and 94 villages of these are in middle Russia (Moscow, Tula and Kazań), eight are in S. Russia. There are thirty-four cities in European Russia and Poland, and forty in the entire empire, with from 5,000 to 100,000 inhabitants each. The rural population, as a result of amalgamation of 2,304,7 settlements falling far behind the number of registered villages, not as a rule scattered about the country. In the inclement regions of the N. and in the N. parts of the forest zone the villages are very small. They are larger, but still small, in White Russia, Lithuania and the region of the lakes; but in the steppe governments they are very appreciably bigger, some of the Cossack stanitsas or settlements exceeding 20,000, and many of them numbering more than 10,000 inhabitants each. The houses are generally built of wood and with roofs of thatched straw, and stand with a great distance from one another. The families live in one or more rooms, which are of a great size; the roofs of the villages usually cover a large area of ground, and the houses are scattered and straggling. The mortality in most towns is so great that during the last ten years of the last century, in very great number of cities, the deaths exceeded the births by 1 to 4 in the thousand.

Government and Administration.—Russia was described in the Abmach of Gotha for 1910 as "a constitutional monarchy under an autocratic tsar." This obvious contradiction in terms well illustrates the difficulty of defining in a single formula the system, essentially transitional and meanwhile sui generis, established in the Russian empire since October 1905. Before this date the fundamental laws of Russia described the power of the emperor as "autocratic and despotic," but in the fundamental style is still "Emperor and Autocrat of All the Russias," but in the fundamental laws as remodelled between the imperial manifesto of 1730 October and the opening of the first Duma on the 27th of April 1906, while the name and principle of autocracy was jealously preserved, the word "autocratic" vanished. Not that the regime in Russia had become in any sense "constitutional," that the earlier laws had, but the "limited autocracy" had given place to a "self-limited autocracy," whether permanently so limited, or only at the discretion of the autocrat, remaining a subject of heated controversy between conflicting parties in the state. Provisionally, then, the Russian governmental system may perhaps be best defined—as M. Chasels suggests—as "a limited monarchy under an autocratic emperor."

At the head of the government is the emperor, whose power is limited only by the provisions of the fundamental laws of the empire. Of these some are ancient and undisputed; the empire may not be partitioned, but described as a subject to the tsar, his empire, and the emperor, or to the male heir; the emperor and his consort must belong to the Eastern Orthodox Church; the emperor can wear no crown that entails residence abroad. By the manifesto of the 31st of December 1905 the emperor voluntarily limited his legislative power by decreeing that no measure was to become law without the consent of the Imperial Duma, a freely elected national assembly. By the law of the 20th of February 1906 the Council of the Empire was associated with the Duma as a legislative Upper House; and from this time the legislative power has been exercised normally by the emperor in concert with the two chambers. The Council of the Empire, or Imperial Council (Gosudarstvenny Sabor), as reconstituted for this purpose, consists of 196 members, of whom 98 are nominated by the emperor, while 98 are elective. The ministers, also nominated, are ex officio members. Of the elected members 3 are returned by the "black" clergy (the monks), 3 by the "white" clergy (seculars); 18 by the corporations of nobles, 6 by the academy of sciences and the universities, 6 by the chambers of commerce, 6 by the industrial councils, 34 by the governments having semeistvos, 16 by those having no semeistvos, and 6 by Poland. As a legislative body the powers of the Council are co-ordinate with those of the Duma, in practice, however, it has seldom if ever initiated legislation.

The Duma of the Empire or Imperial Duma (Gosudarstvenny Duma), which forms the Lower House of the Russian parliament, consists (since the ukas of the 2nd of June 1907) of 442 members, elected by an exceedingly complicated process, so manipulated as to secure an overwhelming preponderance for the wealthy, and especially the landed classes, and also for the representatives of the Russians as opposed to the subject peoples. Each province of the empire, except the now disfranchised steppe of Central Asia, returns a certain proportion of members (fixed in each case by law in such a way as to give a preponderance to the Russian element), in addition to those returned by certain of the subjects returned by the imperial election, which is held by the local authorities.

2 M. Stolypin defended the ukas of the 2nd of June 1907, which in flat contradiction of the provisions of the fundamental laws altered the electoral law without the consent of the legislature, on the ground that what the autocrat had granted the autocrat could take away. The members of the Opposition, on the other hand, quoting Art. 84 of the fundamental laws ("The empire is governed on the immutable basis of laws issued according to the will of the emperor."), only act within the limits of the order established by those laws. It is noteworthy that even the third Duma in its address to the throne, if it avoided the tabooed word "constitutions," avoided also all mention of autocracy.

6 Le Parlement russe, p. 151.

8 Imperator is the official style. The Russian translation is Gosudar. Popularity, however, the emperor is known by his old Russian title of tsar (tsar).

9 This is the first time since Peter the Great that the clergy have been given a voice in secular affairs in Russia.

10 The number of the council was not fixed, and there are only between 108 and 115 members, all of whom are appointed. The council met in secret, and selected by the emperor.

11 These returned 23 members in the first and second Dumas.

</table>

1 These totals include in some cases small linguistic groups not mentioned in the table.
2 About 77% Bulgarians, the rest mostly Bohemians (Czechs).
3 Principally Frenchmen, with Englishmen, Italians, Norwegians, Danes, Dutchmen and Spaniards.
4 Ethnologically the Bulgarians ought perhaps to come here; but, as a large admixture of Slav blood flows in their veins and they speak a distinctly Slav language, they have in this table been grouped with the Slavs.
5 Includes Georgians, Mingrelians, Immeretians, Lazes and Svaneetians.
6 For details, see table under the heading CAUCASIA. Of the total given here, 20% are Circassians.

the great cities. The members of the Duma are elected by electoral colleges in each government, and these in their turn are elected, like the semestres (see below), by electoral assemblies chosen by the three classes of landed proprietors, citizens and peasants. In these assemblies the large proprietors sit in person, being thus electors in the second degree; the lesser proprietors are represented by delegates, and therefore elect in the third degree. The urban population, divided into two categories according to their taxable wealth, elects delegates direct to the college of the government (Guberniya), and is thus represented in the second degree; but the system of division into categories, according not to the number of taxpayers but to the amount they pay, gives a great preponderance to the richer classes. The peasants are represented only in the fourth degree, since the delegates to the collegiate college are elected by the volosts (see below). The workmen, finally, are specially treated. Every industrial concern employing fifty hands or over elects one or more delegates to the electoral
Further, the emperor has the power to issue ordinances having the force of law, i.e., under extraordinary circumstances, and, though the Duma is not sitting. These ordinances must, however, be of temporary nature, must not infringe the fundamental laws or statutes passed by the two chambers, or change the electoral system, and must be laid upon the table of the Duma at the first opportunity. Since, however, the emperor has the power of proroguing or dissolving the Duma as often as he pleases, it is clearly that these temporary ordinances might in effect be made permanent. Finally, the emperor has the right to proclaim anywhere and at any time a state of siege.

In this way the fundamental laws were suspended not only in Poland but in St. Petersburg and other parts of the empire during the greater part of the four years succeeding the grant of the constitution.

It should be noted, none the less, that the third Duma succeeded in establishing its position, and that in view of its useful activities even the extreme Right came to realize that there could be no return to the old undisguised absolutist régime (see History, below, ad fin.).

By the law of the 18th of October (November 1) 1905, to assist the emperor in the supreme administration a Council of Ministers (Sovet Ministrov) was created, under a minister president, the first appearance of a prime minister in Russia. This council consists of all the ministers and of the heads of the principal administrations.

The ministries are as follows: (1) of the Imperial Court, to which the administration of the apanages, the chapter of the imperial orders, the imperial palaces and theatres, and the Academy of Fine Arts are subordinated; (2) Foreign Affairs; (3) War and Marine; (4) Finance; (5) Commerce and Industry (created in 1905); (6) Interior (including police, health, censorship and press, posts and telegraphs, foreign religions, statistics); (7) Agriculture; (8) Ways and Communications; (9) Justice; (10) Public Instruction. Dependent on the Council of Ministers are two other councils: the Holy Synod and the Senate.

The Holy Synod (established in 1721) is the supreme organ of government of the Orthodox Church in Russia. It is presided over by a lay procurator, representing the emperor, and consists, for the rest, of the three metropolitanos of Moscow, St. Petersburg, and Kiev, the archbishop of Georgia, and a number of bishops sitting in rotation.

The Senate (Prawitelstvyushchi Senat, i.e. directing or governing senate), originally established by Peter the Great, consists of members nominated by the emperor. Its functions, which are exceedingly various, are carried out by the different departments into which it is divided. It is the supreme court of cassation (see Judicial System, below); an audit office, a high court of justice for all political offences; one of its departments fulfils the functions of a heralds' college. It also has supreme jurisdiction in all disputes arising out of the administration of the empire, notably differences between the representatives of the central power and the elected organs of local self-government. Lastly, it examines into registers and promulgates new laws, a function which, in theory, gives it a power, akin to that of the Supreme Court of the United States, of rejecting measures not in accordance with the fundamental laws.

For purposes of provincial administration Russia is divided into 76 governments (guberniya), 18 provinces (oblast) and 1 district (obrak). Of these 11 governments, 17 provinces and 1 district (Sakhalin) belong to Asiatic Russia. Of the rest 8 governments are in Finland, 10 in Poland. European Russia thus embraces 59 governments and 1 province (that of the Don). The Don province is under the direct jurisdiction of the ministry of war; the rest have each a governor and deputy-governor, the latter presiding over the administrative council. In addition there are governors-general, generally placed over several governments and armed with more extensive powers,
usually including the command of the troops within the limits of their jurisdiction. In 1906 there were governors-general in Finland, Warsaw, Vilna, Kiev, Moscow and Riga. The larger cities (St Petersburg, Moscow, Odessa, Sevastopol, Kerch-Tenikha, Nikolayev, Rostov) have an administrative system of their own, independent of the governments; in these the chief of police acts as governor. As organs of the central government there are further, the ispravniks, chiefs of police in the districts into which the governments are divided. These are nominated by the governors,\(^1\) and have under their orders in the principal localities commissaries (stanovoi pristav). Ispravnik and stanovoi alike are armed with large and ill-defined powers; and, since they are for the most part illiterate and wholly ignorant of the law, they have proved exasperating engines of oppression. Towards the end of the reign of Alexander II., the government, in order to preserve order in the country of districts, also created a special class of mounted rural policemen (seyadniki, from uрядник, order), who, armed with power to arrest all suspects on the spot, rapidly became the terror of the countryside.\(^2\) Finally, in the towns every house is provided with a detective policeman in the person of the porter (dvornik), who is charged with the duty of reporting to the police the presence of any suspicious characters or anything else that may interest them.\(^3\)

In addition to the above there is also a police organization, in direct subordination to the ministry of the interior, of which the principal function is the discovery, prevention and extirpation of political sedition. They are secret police, armed with inquisitorial and arbitrary powers, has always existed in autocratic Russia. Its most famous development was the so-called "Third Section" (of the imperial chancery) instituted by the emperor Nicholas I. in 1826. This was entirely independent of the ordinary police, but was associated with the previously existing corps of gendarmes (Korpus Zhandarmov), whose chief was placed at its head. Its object had originally been to keep the emperor in close touch with all the branches of the administration and to bring to his notice any abuses and irregularities (see Nicholas I.), and for this purpose its chief was in constant personal intercourse with the sovereign. Actually, however, its activity, directed mainly to the discovery of political offences, degenerated into a hideous reign of terror. Its organization was spread all over Russia; its procedure was secret and summary (transportation by administrative order); and, its instruments being for the most part ignorant and largely corrupt, its victims were counted by thousands.

The "Third Section" was suppressed by Alexander II. in 1880, but only in name. In fact it was transformed into a separate department of the ministry of the interior, and, provided with an enormous secret service fund, soon dominated the whole ministry. The corps of gendarmerie was also incor-

1. From Catherine II.'s time to that of Alexander II. they were elected by the nobles. This was changed in consequence of the emancipation of the serfs.

2. They were sometimes known as Karyadniki, chicken-stealers (from kura, hen). See Leroy-Beaulieu, L’Empire des tsars, ii. 134.

3. The dvornik is on duty for sixteen hours at a stretch, during which he is not allowed to sleep or even to shelter in the porch.

4. Until the ukas of October 15, 1906, the peasant class was stereotyped under the electoral law. No peasant, however rich, could qualify for a vote in any but the peasants' electoral colleges. The ukas allowed peasants with the requisite qualifications to vote as landowners. At the same time the Senate interpreted the law to provide for the total exclusion of all but the heads of families actually engaged in farming from the vote for the Duma.

5. None but peasants—not even the noble-landowner—has a voice in the assembly of the provincial assizes or zemstvos.

6. Sixteen provinces have no zemstvos, i.e., the three Baltic provinces, the nine western governments annexed from Poland by Catherine II., and the Cossack provinces of the Don, Astrakhan, Orenburg and Stavropol.

7. By the law of the 24th (25th) of June 1890 the peasant members of the zemstvos were to be nominated by the governor of the government or province from a list elected by the volosts.

8. The method of the "volosts" electoral system which tended to make these assemblies as slavish and reactionary as any government bureau, the zemstvos did good work, notably educational, in those provinces where the proprietors were inspired with a more liberal spirit. Many zemstvos also made extensive and valuable inquiries into the condition of agriculture, industry and the like.
Since 1870 the municipalities in European Russia have had institutions like those of the semstvos. All owners of houses, and tax-paying merchants, artisans and workmen are enrolled on lists in a descending order according to their assessed wealth. The total valuation is then divided into three equal parts, representing three groups of electors very unequal in number, each of which elects an equal number of delegates to the municipal duma. The executive is in the hands of an elective mayor and an aprava, which consists of several members elected by the duma. Under Alexander III., however, by laws promulgated in 1892 and 1894, the municipal dumas were subordinated to the governors in the same way as the semstvos. In 1894 municipal institutions, with still more restricted powers, were granted to several towns in Siberia, and in 1895 to some in Caucasus.

In the Baltic provinces (Courland, Livonia and Estonia) the landowning classes formerly enjoyed considerable powers of self-government and numerous privileges in matters affecting education, police and the administration of local justice. But by laws promulgated in 1888 and 1889 the rights of police and manorial justice were transferred from the landlords to officials of the central government. Since about the same time a process of rigorous Russification has been carried through in the same provinces, in all departments of administration, in the higher schools and in the university of Dorpat, the name of which was altered to Yuriev. In 1893 district committees for the management of the peasants' affairs, similar to those in the purely Russian governments, were introduced into this part of the empire.

Judicial System.—Not the least valuable of the gifts of the "tsar emancipator," Alexander II., to Russia was the judicial system established by the statute (Sudebni Ustav) of the 20th of November 1864. The system which this superseded was not indigenous to Russia, but had been set up by Peter the Great, who had taken as his model the inquisitorial procedure at that time in vogue on the continent of western Europe. Both civil and criminal procedure were secret. All the proceedings were conducted in writing, and the judges were not confronted with either the parties or the witnesses until they emerged to deliver judgment. This secrecy, combined with the fact that the judges were very ill paid, led to universal bribery and corruption. To check this courts were multiplied (there were five, six or more instances), which only multiplied the evil. Documents accumulated from court to court, although they could tell their gist; costs were piled up; and all this, combined with the confusion caused by the chaotic mass of imperial ukazes, ordinances and ancient laws—often inconsistent or flatly contradictory—made the administration of justice, if possible, more dilatory and capricious than in the old, unreformed English court of chancery. Above all, there was no dividing line between the judiciary and the administrative functions. The judges were not so by profession; they were merely members of the official class (chisnovitsa), the prejudices and vices of which they shared.

Of this system—except so far as the confusion of the laws is concerned—there is no place in 1864 made a clean sweep. The new system established—based partly on English, partly on French models—was built up on certain broad principles: the separation of the judicial and administrative functions, the independence of the judges and courts, the publicity of trials and oral procedure, the equality of all classes before the law. Moreover, a democratic element was introduced by the adoption of the jury system and—so far as one order of tribunal was concerned—the election of judges. The establishment of a judicial system on these principles constituted, as M. Leroy-Beaulieu justly observes, a fundamental change in the conception of the Russian state, which, by placing justice outside the sphere of the executive power, ceased to be a despotism. This fact made the new system especially obnoxious to the bureaucracy, and during the latter years of Alexander II. and the reign of Alexander III. there was a piecemeal taking back of what had been given. It was reserved for the third Duma, after the revolution, to begin the reversal of this process.3

The system established by the law of 1864 is remarkable in that it set up two wholly separate orders of tribunals, each having their own courts of appeal and coming in contact only in the senate, as the supreme court of cassation. The first of these, based on the English model, are the courts of the elected justices of the peace, with jurisdiction over petty causes, whether civil or criminal; the second, based on the French model, are the ordinary tribunals of nominated judges, sitting with or without a jury to hear important cases.

The justices of the peace, who must be landowners4 or (in towns) persons of moderate property, are elected by the municipal dumas in the towns, and by the semstvos in the country districts, for a term of three years. They are of two classes: (1) acting justices (uchastokanye miryanye sudy); and (2) honorary justices (pochetnye miryeye sudyi). The acting justice sits normally alone to hear causes in his canton of the peace (uchastok), but, at the request of both parties, he may, in the case of a simple claim, put another justice as assessor or substitute.5 In all civil cases involving less than 30 roubles, and in criminal cases punishable by no more than three days' arrest, his judgment is final. In other cases appeal can be made to the "assize of the peace" (miryeye syed), consisting of three or more justices of the peace meeting monthly (cf. the English quarter sessions), which acts both as a court of appeal and of cassation. From this, again appeal can be made on points of law or disputed procedure to the senate, which may send the case back for retrial by an assize of the peace in another district.

The ordinary tribunals, in their organization, personnel and procedure, are modelled very closely on those of France (see France, Law and Institutions). From the town judge (izpravnik), who, in spite of the principle laid down in 1864, combines judicial and administrative functions, an appeal lies, as in the case of the justices of the peace, to an assembly of such judges; from these again there is an appeal to the district court (okrugniya sud), consisting of three judges;6 from this to the court of appeal (sudebnaya palata); and over this again is the senate, which, as the supreme court of cassation, can send a case for retrial for reason shown. The district court, sitting with a jury, was established for both civil and criminal cases, but only by special leave in each case of the court of appeal. The senate, as supreme court of cassation, has two departments, one for civil and one for criminal cases. As a court of justice its main drawback is that it is wholly unable to cope with the vast mass of documents representing appeals from all parts of the empire.

Two important classes in Russia stood more or less outside the competence of the above systems: the clergy and the peasants. The ecclesiastical courts still retain a jurisdiction over the clergy which they have lost elsewhere in Europe; and in them the old secret written procedure survives. Their interest for the laity lies

An ukaz of 1879 gave the governors the right to report secretly on the qualifications of candidates for the office of justice of the peace. In 1889 Alexander III. abolished the election of justices of the peace, except in certain large towns and some outlying parts of the empire, and greatly restricted the right of trial by jury. The confusion of the judicial and administrative functions was introduced again by the appointment of officials as judges. In 1909 the third Duma restored the election of justices of the peace. A principal reason for this was, that the justices, though noble-landowners, are almost exclusively of very moderate means, and, though elected by the land-owning class, they are—according to M. Leroy-Beaulieu—prejudiced in favour of the poor mujik rather than of the wealthy landlord.

The honorary justices are mainly recruited from the ranks of the higher bureaucracy and the army.

4 This corresponds to the French cour d'arrondissement, but its jurisdiction is, territorially, much wider, often covering several districts or even a whole government.
mainly in the fact that marriage and divorce fall within their competence; and their reform has been postponed largely because the wealthy and corrupt society of the Russian capital preferred a system which makes divorce easily purchasable and avoids at the same time the scandal of publicity. The case of the peasants is more interesting, and deserves a somewhat more detailed notice.

The peasants, as already stated, form a class apart, untouched by the influence of Western civilization, the principles of which they are quite incapable of understanding or appreciating. This fact was recognized by the legislators of 1864, and beneath the statutory tribunals created in that year the special courts of the peasants were suffered to survive. These were indeed but a few years older. Up to 1861, the date of the emancipation, the peasant serfs had been under the patrimonial jurisdiction of their lords. The edict of emancipation abolished this jurisdiction, and set up instead in each volost a court particular to the peasants (volostnye sud), of which the judges and jury, themselves peasants, were elected by the assembly of the volost (volostnye skhod) each year. In these courts the ordinary written law had little to say; the decisions of the volost courts were based on the local customary law, which alone the peasants, and the peasant alone, understand.

The justice administered in them was patriarchal and rough, but not ineffective. All civil cases involving less than 100 roubles value were within their competence, and more important cases by consent of the parties. They acted also as police courts in the case of petty thefts, breaches of the peace and the like. They were also charged with the maintenance of order in the msh and the family, punishing inquilines of the religious law, husbands who beat their wives, and parents who ill-treated their children. The penalty of flogging, preferred by the peasants to fine or imprisonment, was not unknown. The judges were, of course, wholly illiterate, and this tended to throw the ultimate power into the hands of the clerk (pisar) of the court, who was rarely above corruption.

In 1880, according to the observations of M. Leroy-Beaulieu, the fines inflicted by the court were commonly paid in vodka, which was consumed on the premises by the judges and the parties to the suit; there is no reason to suppose that this immorality was abandoned.

The peasants are not compelled to go to the volost court. They can apply to the police missionaries (stanovoi) or to the justices of the peace; but the great distances to be traversed in a country so sparsely populated makes this course highly inconvenient.2 On the other hand, from the volost court there is no appeal, unless it has acted ultra vires or illegally. In the latter case a court of cassation is provided in the district committee for the affairs of the peasants (Uyezdnoe po krestianskim dolam spravstviye), which has superseded the assembly of arbiters of the peace (mirnye porudniki) established in 1866.3

Previous to the revolution of 1905 but little progress had been made in Russia as regards education.4 Distress of the natural sciences, even in their technical applications, and of Western ideas of free government; desire to make university education easy and even secondary education, a privilege of the wealthier classes; neglect of primary education, coupled with suppression by the ministry of public instruction of all initiative, private and public, in the matter of disseminating education among the illiterate classes—these were the distinctive features of the educational policy of the last twenty years of the 19th century.

It was only towards its close that a change took place in the attitude of the government towards technical education, and a few local technical schools were established. It was, however, not till 1870, too, that a reform was started in secondary education, with the object of revising the so-called "classical" system favouring an education since the eighteenth century, which has been demonstrated after nearly thirty years of experiment. Apart from the schools under the ministry of war (Cossack reitseks and schools at the barracks), the great bulk of the primary schools is still in the hands of the Parochial or Diocesan Synod. Those under the latter body are of recent growth, the policy of the last twenty years of the 19th century having been to hand over the budget allowances for primary instruction to the parishes, or to the local boards of public instruction, which had been demonstrated as being insufficient. The consequence is, that the village priests, being too much occupied with their parochial duties, and not at all encouraged by any semblance of official attention to the schools, and the numerous pupils either exist on paper only, or are handed over to half-educated cantors, deacons or hired teachers. One good feature of the Russian primary school system, however, is that in many villages there are school gardens or fields; in nearly 1000 schools, bee-keeping, and in 300 silkworm culture is taught, while in some 900 schools the children receive instruction in various trades; and in 300 schools a system of mixed education is practised. Girls are taught handwork in many schools. Nearly 50% of the teachers are women. The total expenditure on primary schools in 1905 was 55,300,000 (about the average in recent years), of which 20% were paid for by the state, the rest being furnished by the village communities and the municipalities and 11% by private persons. The middle schools are maintained by the state, which contributes 25% of the expenditure of the classical and technical institutes. About 64% of the expenditure, including the zemstvos and municipalities. The total grants from the state exchequer for education of all grades in all parts of the empire amounted in 1906 to 8,107,000. The progress of primary education is illustrated by the fact that, while in 1885 there was one school for every 2665 inhabitants and one pupil for every 48 inhabitants, in 1898 the figures were 1643 and 31 inhabitants respectively. Accordingly, the average number of literates varied from 89.2 to 44.9% of the population in the rural districts, and from 63.6 to 37.2% in the urban.

For higher education there were in 1904 only 9 universities (Yenisey or Irkut, Kazan, Kharkov, Kiev, Moscow, St Petersburg, Warsaw and Tomsk), with 19,400 students, 6 medical academies (one for women), 6 theological academies, 6 military academies, 5 philanthropical institutes, 3 Eastern language institutes, of which 1 is a French institute, 4 veterinary institutes, 2 mining institutes, 4 engineering institutes, 2 universities for women (930 students at St Petersburg), 3 technical pedagogical schools, 2 engineering technical institutes, 1 forestry and 1 topographical school.

The state, however, has also given active encouragement of new educational institutions, notably technical and commercial schools, which are placed under the new minister of commerce and industry. Finland has a university of its own at Helsingfors.

The standard of teaching in the universities is on the whole very high, and may be compared to that of the German universities. The students are hard-working, and generally very intelligent. Mostly sons of poor parents, they live in extreme poverty, supporting themselves chiefly by translating and by tutorial work.

The state of secondary education still leaves much to be desired. The steady tendency of Russian society towards increasing the number of secondary schools, where instruction would be based on the study of the natural sciences, is checked by the government in favour of the classical gymnasia. Sunday schools and public libraries are very much neglected.

A characteristic feature of the intellectual movement in Russia is its tendency to extend to women the means of higher instruction. The gymnasia for girls are both numerous and good. In addition to these, notwithstanding government opposition, series have been given to the effort for improvement, and that the question has been successively raised by the society for the Education and the Duma. What form it would ultimately take depended still on the balance between the forces of conservatism and change, the suspicious temper of the autocracy being revealed during the period of the abortive revolution of 1905, with a withdrawal of privileges, e.g., in the matter of the independence of the universities. Any account of the educational system cannot, therefore, be otherwise than historical and provisional [Ed.].

The educational reform of the time of the Duma provided for a reorganization of secondary education, and an imperial ukaz of 15th of March 1903 laid down the lines on which this was to proceed. The old curriculum of the Real schools is now superseded.

---

1 J. Empire des isars, ii. p. 310.
2 In the case of a parish's weight is given to the "customs" of the peasants, even when these conflict with the written law.
3 The abolition of the special courts of the peasants was announced in the same imperial ukaz (16th of October 1906) which promised the reform of the primary education, the fuller education of the rural communities, and permission for them to migrate elsewhere without losing their communal rights. This was made part of the general reform of Russian local government, which in the autumn of 1910 was still under the consideration of the Duma.
4 Of the effects of the political changes in Russia on the educational system of the country it was, even in the autumn of 1910, too early to say anything save that an undoubted impetus had been given to the effort for improvement, and that the question has been successively raised by the society for the Education and the Duma. What form it would ultimately take depended still on the balance between the forces of conservatism and change, the suspicious temper of the autocracy being revealed during the period of the abortive revolution of 1905, with a withdrawal of privileges, e.g., in the matter of the independence of the universities. Any account of the educational system cannot, therefore, be otherwise than historical and provisional [Ed.].

The educational reform of the time of the Duma provided for a reorganization of secondary education, and an imperial ukaz of 15th of March 1903 laid down the lines on which this was to proceed. The old curriculum of the Real schools is now superseded.
RUSSIA

of higher schools, in which careful instruction is given in natural and social sciences, have been opened in the chief cities under the name of "pedagogical courses." At St. Petersburg a women's medical and surgical examination institute, under the searchers than those of the ordinary academy (especially as regards diseases of women and children), was opened, but after about one hundred women had received the degree of M.D. it was suppressed by order of the czar. The university has established societies for women, supported by subscription, with programmes and examinations equal to those of the universities.

The natural sciences are much cultivated in Russia. Besides the previously mentioned, the Mineralogical Society, the Geographical Society, with its scientific societies. Caucasian and Siberian branches, the archaeological societies and the scientific societies of the Baltic provinces, all of which are recognized as independent institutions, have lately sprung up a series of new societies in connection with each university, and their serials are yearly growing in importance, as, too, is the Geographical Society of Friends of Natural Science, the Chemico-Pharmaceutical Society, the Imperial Natural History and other associations. The work achieved by Russian savants, especially in biology, physiology and chemistry, and in the sciences dealing with them, is most remarkable.

The ordinary revenue of the empire is in excess of the ordinary expenditure, but the extraordinary expenditure not only swallows up this surplus, but necessitates the raising of fresh money each year. On the other hand, the government has to deal for this extraordinary expenditure. A considerable number of new railways, including the Siberian, have been built with money obtained from that source. But since 1894 all extraordinary expenditure, with the exception of the construction of new lines of railway, have been defrayed out of ordinary revenue. The only sources of extraordinary revenue still remaining under that head are the money derived from loans and the sale of mining and in the Russian Black Sea. The extraordinary revenue, obtained principally from the sale of spirits (28%), which is a state monopoly, from state railways (233%) and customs (16%) annually rose from a total of £13,750,000 in 1895 to a total of £21,360,000 in 1905. Other noteworthy sources of revenue are trade licences, direct taxes on lands and forests, stamp duties, posts and telegraphs, indirect taxes on tobacco, sugar and alcohol, the crown lands, and crown Royalties, and lands payable annually by the peasants since 1861. At the same time the total ordinary expenditure has increased at a similarly steady rate, namely, from £117,791,000 in 1895 to £202,544,000 in 1905. In 1904, 81% of this ordinary expenditure was covered by revenues, namely, from taxes, duties, and duties, and from the sale of public goods. The war was incurred in consequence of the war with Japan, and to this must be added in 1905 a further expenditure of £42,085,000. The total debt of Russia, near trebled between 1904 and 1906. (£57,038,600) and 1862 (£145,500,000), and again between 1872 (£42,277,000) and 1892 (£526,109,000) it more than doubled, while by 1906 it amounted altogether to £812,040,000. Of the total debt 17% is held by the public.

The system of obligatory military service for all, introduced in 1874, has been maintained, but the six years' term of service has been reduced to five, while the privileges granted to volunteers who have served in the previous service have been slightly extended. During the reign of Alexander III. efforts were mainly directed towards: (1) reducing the time required for the mobilization of the army; (2) increasing the immediate reserve forces of the army for serving the army; (3) strengthening the W. frontier by fortresses and railways; and (4) increasing the artillery, siege and train reserves. Further, the system of service from was raised from 40 to 43 years and the militia (Landsturm) was reorganized. The measures taken during the reign of Nicholas II. have been chiefly directed towards increasing the fighting capacity and readiness for immediate service of the troops in Asia, and towards the better reorganization of the local irregular militia forces. Broadly speaking, the army is divided into regulars, Cossacks and militia. The permanent army is composed of (4,200,000 men (about 950,000 combattants), while the war strength is approximately 75,000 officers and 4,500,000 men. However, this latter figure is merely nominal, the available artillery and train service being much below the strength which would be required for such an army; estimates which put the military forces of Russia in time of war at 2,750,000—irrespective of the armies which may be levied during the war itself—are considerably higher. These forces could not be sustained. The infantry and rifles are armed with small-bore magazine rifles, and the active artillery have steel breech-loaders with extreme ranges of 411 to 100,000 yards. Before the war Russia maintained four separate squadrons: the Baltic, the Black Sea, the Pacific and the Caspian. But in the operations before Port Arthur and in the disastrous battle of Tsushima the Russian fleets were almost completely annihilated. The battle of the Black Sea fleet and a few other battleships were, however, still left, and since 1904 steps have been taken to build new ships, both battleships and powerful cruisers. Kronstadt is the naval headquarters in the Baltic, Sevastopol in the Black Sea and Vladivostok on the Pacific.

Fortresses.—The chief first-class fortresses of Russia are Warsaw and Novogórgorsky in Poland, and Brust-Litovsk and Kovno in Lithuania. The second-class fortresses are Kronstadt and Sveaborg (Hansöö). The Gulf of Finland, covered by the Black Sea, Kerch on the Black Sea and Vladivostok on the Pacific. In the third class are Viborg in Finland, Ososovets and Ust Dvinsk in the Baltic, and in the fourth, the cities of the Black Sea, and Kara and Batum in Caucasus. There are, moreover, 40 forts and fortresses unclassed, of which 6 are in Poland, 8 in W. and S.W. Russia, and the remainder (more fortiified posts) in the Asiatic dominions.

II. EUROPEAN RUSSIA

Geography.—The administrative boundaries of European Russia, apart from Finland, coincide broadly with the natural limits of the East-European plains. In the N. it is bounded by the Arctic Ocean; the islands of Novaya-Zemlya, Kolguev and Vaigach also belong to it, but the Kara Sea is reckoned to Siberia. To the E. it has the Asiatic dominions of the empire, Siberia and the Kirghiz steppes, from both of which it is separated by the Ural Mountains, the Ural river and the Caspian—the administrative boundary, however, partly extending into Asia on the Siberian slope of the Ural. To the S. it has the Black Sea and Caucasus, being separated from the latter by the Manych depression, which in Post-Pliocene times connected the Sea of Azov with the Caspian. The W. boundary is purely conventional: it crosses the peninsula of Kola from the Varanger Fjord to the Gulf of Bothnia; thence it runs direct to the Kurisches Haff in the southern Baltic, and thence to the mouth of the Danube, taking a great circular sweep to the W. to embrace Poland, and separating Russia from Prussia, Austrian Galicia and Rumania.

It is a special feature of Russia that she has no free outlet to the open sea except on the ice-bound shores of the Arctic Ocean. Even the White Sea is merely a gulf of that ocean. The deep indentations of the gulfs of Bothnia and Finland are surrounded by what is ethnologically Finnish territory, and it is only at the very head of the latter gulf that the Russians have taken firm foothold by erecting their capital at the mouth of the Neva. The Gulf of Riga and the Baltic belong also to territory which is not inhabited by Slavs, but by Finnish races and by Germans. It is only within the last hundred and thirty years that the Russians have definitely taken possession of the N. shores of the Black Sea and the Sea of Azov. The E. coast of the Black Sea belongs properly to Transcaucasia, a great chain of mountains separating it from Russia. But even this sheet of water is an inland sea, the only outlet of which, the Bosphorus, is in foreign hands, while the Caspian, an immense shallow lake, mostly bordered by deserts, possesses more importance as a link between Russia and her Asiatic settlements than as a channel for intercourse with other countries.

The territory occupied by European Russia—1600 m. in length from N. to S., and nearly as much from E. to W.—is on the whole a broad elevated plain, ranging between 500 and 900 ft. above sea-level, deeply cut into by river-valleys, and bounded on all sides by broad swells or low mountain-ranges: the lake plateaus of Finland and the Maanselkä heights in the N.W.; the Baltic coast-ridge and spurs of the Carpathians in the W., with a broad depression between the two, occupied by Poland; the Crimea and Caucasian mountains in the S.; and the broad but moderately high swellings of the Ural Mountains in the E.

From a central plateau, which comprises the governments of Tver, Moscow, Smolensk, Pskov, and Krak, and projects E. towards Samara, attaining an average elevation of 800 to 900 ft. above the sea, the surface slopes gently in all directions to a level of 300 to 500 ft. Then it again rises gradually as it approaches the hilly tracts which enclose the great plateaus. This central swelling may be considered a continuation towards the E.N.E. of the great line of upheavals of N.W. Europe; the elevated grounds of Finland would then represent a continuation of the same surface, and the higher plateaus of the northern mountains of Finland a continuation of Kjölen (the Keel) which separate Sweden from Norway, while the other great line of
RUSSIA

upheaval of the old continent, which runs N.W. to S.E., would be represented in Russia by the Volga in the S. and by the Timan ridge of Pechora in the N.

The hilly aspect of several parts of the central plateau is not due to foldings of the strata, which for the most part appear to be horizontal, but to the fact that the level of the ground is on the average lower than that of the sea. The valleys are deeply eroded in the plateau, especially on its borders. The round flattened summits of the Valdai plateau do not rise above 1100 ft., and they present the appearance of mountains only in the more distant, where the inclination is a little steeper. The altitudes of the Baltic coast-ridge between the governments of Grodno and Minsk. The same elevation is reached by a very few it, which do not serve the depression of Lake Peipus being only 200 to 250 ft. above the sea. The same is true of the plateaus of Livonia, "Wendish Switzerland," and the government of Vitebsk. In the center and south, the level of the ground is raised to a larger elevation. The valleys are excavated to a depth of 800 or 900 ft., giving quite a hilly aspect to the country. It is only in the S.W., where spurs of the Carpathians enter the government of Volhynia, Podolia and Bessarabia, that ridges reaching 1100 ft. are met with, these again intersected by deep ravines.

The depressions which gap the borders of the central plateau thus acquire a greater importance than the small differences in its vertical elevation. So it is the broad depression of the Oka, Volga and Lower Kama, bounded on the N. by the faint swelling of the Uvaly, the watershed between the Arctic Ocean and the Volga basin, and on the S. by the river Ulla, which traverses the central plateau from the N. to S. In the same band, the Volga, and its basin, is divided from the upper Volga, and its basin, is divided from the basin of the Ulla, by the narrow strip of the Livonian plateau, which extends from the N. to the S. The depression which separates the Volga from the Ulla is more than 1000 ft. deep, and the bordering ravines are broader. They are now called the Oka, the Volga and the Ulla, instead of the Riga, Preetz and Pleshevo, which are the names usually given to that portion of the central plateau which is occupied by the Volga and its tributaries. All the rivers which are connected with the Volga by a water communication are broad, and the differences in level which separate the various parts of the central plateau are greater than the differences of the mountains of the west. The Volga, the Ulla and the Kama are the most important of these rivers, and their differences of level are equal to or greater than the difference of level between the highest and lowest points of the central plateau.

Moreover, the rivers of Russia range from the shortest to the longest, and from the shallowest to the deepest. They are navigable throughout by the navigators who may have to pass through or around them. Their differences of level are greater than the differences of the mountains of the west, and they are connected with each other and with the sea by a network of navigable canals.

The Russian rivers are divided into two classes: the short rivers, which flow entirely within the Russian empire, and the long rivers, which flow into the Russian empire and are navigated by foreign countries. The short rivers are those which flow entirely within the Russian empire, and are navigated by Russian boats, and the long rivers are those which flow into the Russian empire and are navigated by foreign boats. The short rivers are those which flow entirely within the Russian empire, and are navigated by Russian boats, and the long rivers are those which flow into the Russian empire and are navigated by foreign boats. The short rivers are those which flow entirely within the Russian empire, and are navigated by Russian boats, and the long rivers are those which flow into the Russian empire and are navigated by foreign boats. The short rivers are those which flow entirely within the Russian empire, and are navigated by Russian boats, and the long rivers are those which flow into the Russian empire and are navigated by foreign boats.

The northernmost of the long rivers is the Volga, which flows into the Gulf of Finland. The Volga is navigable throughout its length, and it is the chief waterway of the Russian empire. The northernmost of the long rivers is the Volga, which flows into the Gulf of Finland. The Volga is navigable throughout its length, and it is the chief waterway of the Russian empire. The northernmost of the long rivers is the Volga, which flows into the Gulf of Finland. The Volga is navigable throughout its length, and it is the chief waterway of the Russian empire. The northernmost of the long rivers is the Volga, which flows into the Gulf of Finland. The Volga is navigable throughout its length, and it is the chief waterway of the Russian empire. The northernmost of the long rivers is the Volga, which flows into the Gulf of Finland. The Volga is navigable throughout its length, and it is the chief waterway of the Russian empire.

The southernmost of the long rivers is the Oka, which flows into the Gulf of Finland. The Oka is navigable throughout its length, and it is the chief waterway of the Russian empire. The southernmost of the long rivers is the Oka, which flows into the Gulf of Finland. The Oka is navigable throughout its length, and it is the chief waterway of the Russian empire. The southernmost of the long rivers is the Oka, which flows into the Gulf of Finland. The Oka is navigable throughout its length, and it is the chief waterway of the Russian empire. The southernmost of the long rivers is the Oka, which flows into the Gulf of Finland. The Oka is navigable throughout its length, and it is the chief waterway of the Russian empire.
part, constitutes the frontier between European Russia and the Kirghiz steppe; it receives the Salmazer on the right and the Ilek on the left. The Kuma, the Terek and the Kura, with the Aras, which drains the Lake Uchchu, belong to Caucasus.

The soil of Russia depends chiefly upon the distribution of the boulder-clay and loess, on the degree to which the rivers have severely excavated their valleys, and on the moistness of the soil. A third and very important element is the percentage of cultivation, 10% of the aggregate surface of European Russia (apart from Poland and Finland) being occupied by lakes, marshes, sand, etc., 30% by forests, 16% by prairies, and only 26% being under crops. The distribution of the forests is far from equal, and the five following subdivisions may be established:

1. The tundras; 2. The forest region; 3. The middle region, comprising the surface available for agriculture and partly covered with forest; 4. The mountain belt, the half humid, half dry climate; and 5. The New Siberian, the least cultivated, and the five following subdivisions may be established:—

1. The tundras; 2. The forest region; 3. The middle region, comprising the surface available for agriculture and partly covered with forest; 4. The mountain belt, the half humid, half dry climate; and 5. The New Siberian, the least cultivated.

Soil.

The surface of Europe is covered with a thin coating of loess, derived from the decomposition of loess and loamy soil, and the addition of manure. The area under cultivation, 10% of the aggregate surface of European Russia (apart from Poland and Finland), being occupied by lakes, marshes, sand, etc., 30% by forests, 16% by prairies, and only 26% being under crops. The distribution of the forests is far from equal, and the five following subdivisions may be established:

1. The tundras; 2. The forest region; 3. The middle region, comprising the surface available for agriculture and partly covered with forest; 4. The mountain belt, the half humid, half dry climate; and 5. The New Siberian, the least cultivated.

Climate.

Russia is divided into three main regions: the north, the south, and the steppes. The northern part of Russia is characterized by the Arctic climate, with cold winters and cool summers. The southern part is characterized by a continental climate, with hot summers and cold winters. The steppes region has a semi-arid climate, with dry summers and mild winters. Russia's climate is influenced by its geographical location, which results in a significant variation in temperature and precipitation across the country.

1. Bibliography of Geography: see Tilto, in "Vestnik of Russian Geogr. Soc. (1883); P. P. Semenov, Geogr. and Statist. Dictionary of the Russian Empire (in Russian, 5 vols., St. Petersburg, 1860-84); the most trustworthy source that we have for the geography of Russia is the official "Sovr. Materielov, with regard to Russian railways (1876); Statistical Sbornik of the Ministry of Communications, vol. (1884); the most trustworthy source for the geography of Russia is the official "Sovr. Materielov, with regard to Russian railways (1876); Statistical Sbornik of the Ministry of Communications, vol. (1884)."
The Arctic Region comprises the tundras of the Arctic littoral beyond the N. of the forest, which closely follows the coast line, with deviations towards the N. in the river valleys (70° N. in Finland and on the Arctic Circle about Archangel, 68° N. on the Urals, 71° in W. Siberia). The shortness of the summer, the deficiency of drainage, and the depth to which the soil freezes in winter, are the circumstances which determine the characteristic features of the vegetation of the tundras. Their flora is far closer akin to the floras of N. Siberia and N. America than to that of central Europe. As the steppe plant grows on the borders of the birch, the dwarf willow and several shrubs; but where the soil is drier, and humus has been able to accumulate, a variety of herbaceous plants and shrubs are found, such as are abundant in the W. Europe, and which make their appearance. Only 275 to 280 phanerogams are found within this region.

The Forest Region of the Russian botanists includes the greater part of the country, from the Arctic tundras to the steppes, and over this immense expanse it maintains a remarkable uniformity of character. Beketov subdivides it into two portions—the forest region proper and the steppe (Ante-Steppe and Pridneprovye). The N. limit of the forest-steppe region is marked by the divide of the Frunze, through Zhittomir, Kursk, Tambov and Stavropol-on-Volga to the sources of the Ural river. But the forest region proper presents a different aspect in the N. from that in the S. and must in turn be subdivided into two parts—the coniferous region and the region proper, the latter being divided into the birch, the dwarf willow and several shrubs; but where the soil is drier, and humus has been able to accumulate, a variety of herbaceous plants and shrubs are found, such as are abundant in the W. Europe, and which make their appearance. Only 275 to 280 phanerogams are found within this region.
strip on the S. coast of the Crimea, where a climate similar to that of the Mediterranean coast has permitted the development of a flora closely resembling that of the valley of the Arno in Italy. Human cultivation has destroyed the abundant forests which sixty years ago covered the region. The olive and the chestnut are rare; but the beech reappears, and the Pinus pinaster recalls the Italian pines. At a few points, such as Nikita and Akkerman, in the South, the supcupita, or coniferous plants have been aclimated by a human agency, the Californian Wellingtonia, the Lebanon cedar, many evergreen trees, the laurel, the cypress, and even the Anatolian palm (Chamaerops excelsa) flourish. The grass vegetation is very rich; the fox, the weasel, the hedgehog, and the porcupine are abundant; the flowering plants are known. But on the whole, the Crimean flora has little in common with that of the Caucasus.

Russia belongs to the same zoogeographical region as central Europe and the Caspian steppe, and shares with the latter the species that give occupation to nearly 100,000 people. The mouths of the Caspian rivers are especially celebrated for their wealth of fish.

**Ethnography.**—Remains of Palaeolithic man, contemporary with the large Quaternary mammals, are few in Russia; they have been discovered only in Poland, Paltava and Voronezh, and perhaps also on the Oka. Those of the later Lacustrine period, on the contrary, are so numerous that there is scarcely one lacustrine basin in the regions of the Oka, the Kama, the Don, or the Volga, not to speak of the lake-region itself, and even the Black Sea coasts, where remains of Neolithic man have not been discovered. The Russian plains have been, however, the scene of so many migrations of successive races, that at many places a series of deposits belonging to widely distant epochs are found one upon another. Settlements belonging to the Stone age, and manufactories of stone implements, burial-grounds of the Bronze epoch, earthen forts and burial-mounds (kurgans)—of this last four different types are known, the earliest belonging to the Bronze period—are superposed, rendering the task of unravelling their several relations one of great difficulty.

Two different races—a brachycephalic and a dolichocephalic—can be distinguished among the remains of the earlier Stone period (Lacustrine period) as having inhabited the plains of E. Europe. But they are separated by so many generations from the earliest historic times that sure conclusions regarding them are impossible; at all events, as yet Russian archaeologists are not agreed as to whether the ancestors of the Slavs were Sarmatians only or Scythians also, whose skulls have nothing in common with those of the Mongol race. The earliest data which may be regarded as established belong to the 1st century, and have been found in the Sepid-Nah and the Mordvinian regions towards the W., and the Sarmatians were compelled to abandon the region of the Don, and cross the Russian steppes from E. to W., under the pressure of the Aorzes (the Mordvinian Erzya) and Siraks, who in their turn were soon followed by the Huns and Uigur-Turkish Avars.

In the 7th century S. Russia was the seat of the empire of the Khazars, who drove the Bulgarians, descendants of the Huns, from the Don, one section of them migrating up the Volga to found there the Bulgarian empire, and the remainder travelling towards the Danube. This migration compelled the N. Finns to advance farther W., and a body of intermingled Tavats and Kazakhs penetrated to the S. of the Gulf of Finland.

**Fauna.**—The fauna is very rich; it includes all the forest and garden birds known in W. Europe, as well as a very great variety of aquatic birds. A list, still incomplete, of the birds of St Petersburg runs to 252 species. Hunting and shooting give occupation to a great number of persons. The reptiles are few. As for fishes, all those of W. Europe, except the carp, are met with in the lakes and rivers in immediate connection with the characteristics feature of the region being its wealth in Coregoni and in Salmonidae generally.

In the ante-steppe the forest species proper, such as Pleromys solans and Tamasius suslicus, disappear, and the echinoderm common across the Urals at Khersones. The hare is increasing rapidly, as well as the fox. The avifauna, of course, becomes poorer; nevertheless, the woods of the steppe, and still more the forests of the ante-steppe, give refuge to many birds, even to hazel-hen (Tetrao bonato), capercaillie (T. tetrix) and woodcock (T. urogallus). The fauna of the scrub in the river valleys is decidedly rich, and includes aquatic birds. The destruction of the forests and the advance of wheat into the prairies are rapidly reducing the species of the lacustrine period. Mammals and birds which are numerous in the plains of Siberia and those of the steppes are rapidly disappearing, together with the colonies of marmots; the insectivores are also becoming scarce in consequence of the destruction of the insects. The wild boar is still found in many places; the marmot (Spermophilus), and the destructive insects which are a scourge to agriculture, become a real plague. The absence of Caregoni is a characteristic feature of the fish-fauna of the steppes; the sturgeon, on the contrary, reappears, and the rivers abound in this sturgeon (Acipenseridae). In the Volga below Nizhny-Novgorod the sturgeon (Acipenser ruthenus), and others of the same family, as well as a very great variety of ganoids and Teleostes, appear in the same abundance as formerly. The rivers of the Black Sea, the Dnieper, and the Don, supply a great deal of fish, mostly sturgeon (Acipenser ponticus) and beluga (Acipenser labiatus), which is still caught by the ancients in the Volga. The black sea sends sturgeon (Acipenser alosaurus) to the coast of the Mediterranean, where it is caught in large quantities. The Belosa is the name of the river where sturgeons are caught. The Belosa is the name of the river where sturgeons are caught.
As early as the 8th century, and probably still earlier, a stream of Slav colonization, advancing E. from the Danube, poured over the plains of S.W. Russia. It is also most probable that another similar stream—the N., coming from the Elbe, through the basin of the Vistula—ought to be distinguished. In the 9th century the Slavs occupied the upper Vistula, the S. of the Russian Incrustine region, and the W. of the central plateau. They had Lithuanians to the W.; various Finnish tribes, intermingled towards the S.E. with Turkish (the present Bashkirs); the Bulgars, whose origin still remains doubtful, on the middle Volga and Kama; and to the S.E. the Turkish-Mongol races of the Pechenegs, Polovtsy, Uzes, &c., while in the S., along the Black Sea, was the empire of the Khazars, who had under their rule several Slav tribes, and perhaps also of some Finnish origin. In the 9th century also the Ugrics are supposed to have left their Ural abodes and to have traversed S.E. and S.W. on their way to the bend of the Danube. If the Slavs be subdivided into three branches—the W. (Poles, Czechs and Wends), the S. (Servians, Bulgarians, Croatians, &c.), and the E. (Great, Little and White Russians), it will be seen that, with the exception of some 3,000,000 Little Russians, now settled in East Galicia and in Poland, and of a few on the southern slope of the Carpathians, the whole of the E. Slavs, occupy, as a compact body, W., central and S. Russia.

Like other races of mankind, the Russian race is not pure. The Russians have absorbed and assimilated in the course of their history a variety of Finnish and Turko-Finnish elements. Still, craniological researches show that notwithstanding this fact, the Slav type has been maintained with remarkable persistency: Slav skulls ten and thirteen centuries old exhibit the same anthropological features as those which characterize the Slavs of our own day. This may be explained by a variety of causes, of which the chief is the maintenance by the Slavs down to a very late period of gentile or tribal organization and gentile marriages, a fact vouched for, not only in the pages of the Russian chronicler Nestor, but still more by visible social evidences, the gens later developing into the village community, and the colonization being carried on by large coordinated bodies of people. The Russians do not emigrate as isolated individuals; they migrate in whole villages. The overwhelming numerical superiority of the Slavs, and the very great differences in ethnic type, belief and mythology between the Indo-European and the Ural-Altaic races, may have contributed to the same end. Moreover, while a Russian man, far away from home among Siberians, readily marries a native, the Russian woman seldom does the like. All these causes, and especially the first-mentioned, have enabled the Slavs to maintain their ethnic purity in a relatively high degree, whereby they have been enabled to assimilate foreign elements and make them intensify or improve the ethnical type, without giving rise to half-breed races. The very same N. Russian type has thus been maintained from Novgorod to the Pacific, with but minor differentiations on the outskirts—and this notwithstanding the great variety of races with which the Russians have come into contact. But a closer observation of what is going on in the recently colonized confines of the empire—where whole villages live without mixing with the natives, but slowly bringing them over to the Russian manner of life, and then slowly taking in a few female elements from them—gives the key to this feature of Russian life.

Not so with the national customs. There are features—the wooden house, the oven, the bath—which the Russian never abandons, even when swapped in an alien population. But when settled among these the Russian—the N. Russian—readily adapts himself to many other differences. He speaks Finnish with Finns, Mongolian with Burists, Ostiak with Ostiaks; he shows remarkable facility in adapting his agricultural practices to new conditions, without, however, abandoning the village community; he becomes hunter, cattle-breeder or fisherman, and carries on these occupations according to local usage; he modifies his dress and adapts his religious beliefs to the locality he inhabits. In consequence of all this, the Russian peasant (not be it noted, the trader) proves himself to be an excellent colonist.

The different branches can be distinguished among the Russians from the dawn of their history:—the Great Russians, the Little Russians (Maloruss as or Ukrainians), and the White Russians (the Byelorussians). These correspond to the two current groups of immigrants, who by their approach with perhaps an intermediate stream, the proper place of the White Russians not having been as yet exactly determined. The primary distinction between these branches has been increased, in the last nine centuries, by contact with different nationalities—the Great Russians absorbing Finnish elements, the Little Russians undergoing an admixture of Turkish races, and the White Russians subjected to Lithuanian influence. Moreover, notwithstanding the unity of language, it is easy to detect among the Great Russians themselves two separate branches, differing from one another by slight divergences of language and culture, and differing considerably from the Mongolian races, the Tatars, and the White Russians, from the element of the Novgorodians and the Novgorodians. The latter extend throughout N. Russia into Siberia. Many minor anthropological differences can be distinguished among both the Great and the Little Russians, depending chiefly on the assimilation of various minor subdivisions of the Ural-Altaian.

The Great Russians occupy in one compact mass the space enclosed by a line drawn from the White Sea to Lake Pskov, the area of the N. Donets, and the Don. The Russian races of Finland, also absorbed into the Ural-Altaic groups of Podolia, Volynia, Poltava, and Kiev. The Zaporozhian Cossacks colonized the steppes farther E., towards the Don, where they met with a large population of Great Russian runaways, constituting the Don Cossacks. The Don Cossacks were further conquered by Catherine II. to colonize the E. coast of the Sea of Azov, constitute the Black Sea and later the Kaffa Cossacks (part of whom, the steppe-Turkic, mongoletic, and Turco-Tatars, occupied large parts of the government of Stavropol and of N. Caucasus).

The Little Russians occupy the steppes of S. Russia, the S.W. slopes of the central plateau and those of the Carpathian and Lublin uplands and the slopes of the Carpathians and the Ural-Altaic groups of Podolia, Volynia, Poltava, and Kiev. The Zaporozhian Cossacks colonized the steppes farther E., towards the Don, where they met with a large population of Great Russian runaways, constituting the Don Cossacks. The Don Cossacks were further conquered by Catherine II. to colonize the E. coast of the Sea of Azov, constitute the Black Sea and later the Kaffa Cossacks (part of whom, the steppe-Turkic, mongoletic, and Turco-Tatars, occupied large parts of the government of Stavropol and of N. Caucasus).

The White Russians, intermingled to some extent with Great and Little Russians, Poles and Lithuanians, occupy the upper parts of the W. slope of the central plateau.

The Finnish races, which in prehistoric times extended from the Ob all over N. Russia, even then were subdivided into Ugrians, Permynaks, Bulgarians and Finns proper, who drove back the prehistoric population of the plains of Siberia. The Permyaks, who in the 7th century penetrated to the S. of the Gulf of Finland, in the region of the Fins and Kurs, where they fused with some extent with the Lithuanians and the Letts. At the present races of Finnish origin are recognized in connection with the Finns proper, the Tavasts, in central Finland; the Kvens, in N.W. Finland; the Karelians, in the E., who also occupy the lake regions of Onolents and Archangel; and have settlements in Novgorod and Tver; the Novgorodians, in the N.E. districts along the Neva; the Ests, in Estonia and the N. of Livonia; the Livs, on the Gulf of Riga; and the Kurs, intermingled with the Letts; (b) the N. Finns, or Lapps, in N. Finland and on the Kola peninsula, the Samoyedes in Archangel and Siberia; (c) the Volga Finns, or rather the old Bulgarian branch, to which belong the Mordvinians, and the Cheremises in Kazan, Kostroma and Vyatka, though they are classified by some authors with the following: (d) the Permyaks, or Cis-Uralian Finns, including the Votiake on the E. of Vyatka, the Permynaks in Perm, the Syryenians or Zyrvogians in Vologda, Archangel, Vyatka and Perm; (e) the Ugrians, or Trans-Uralian Finns, including the Komi, on whom the Ural-Altaic elements, the Tatars in Tobolsk and partly in Tomsk, and the Magyars, or Ugrians.

The following are the chief subdivisions of the Turko-Tatars in Europe and Russia:—(1) The Tatars, of whom three different branches must be distinguished: (a) the Kazak Tatars on both banks of the Volga, below the mouth of the Oka, and on the lower Kama, but penetrating farther S. in Ryaza, Tamsb, Samara, Simbirsk and Perm; (b) the Crimean Tatars, who occupied the Crimea and (c) those of the Crimea, a great many of whom emigrated to Turkey after the Crimean War (1854–56). There are, besides, a certain number of Tatars in the S.E. in Misn, Gredno and Vilna. (2) The Bashkirs, who inhabit the basin of the S. Ural, that is, the steppes of Ufa and Orenburg, extend also into Perm and Samara. (3) The Chuvashs, on the right bank of the Volga, in Kazan and Simbirsk. (4) The Meshcheryaks, a tribe of Finnish origin who formerly inhabited the basin of the Volga, and driven out in the 15th century by the Russian colonists, immigrated into Ufa and Perm, where they now live among the Baskirs, having adopted their religion and customs. (5) The Teptyaks, also of Finnish origin.
settled among the Tatars and Bashkirs in Samara and Vyatka. The Bashkirs, Meshcheryaks and Teptys rendered able service to the Russian government against the Kirghiz, and until 1863 they constituted a kind of Kirghiz for the Russian khans. The Bashkirs of Central Asia, as the abodes were in Asia, in the Ishim and Kirghiz steppes. One section of them crossed the Ural and occupied the steppe between the Urals and the Volga; the remainder belong to Turkestan and Siberia.

The Mongol race is represented in Russia by the Kalmucks, who inhabit the steppes of Astrakhan between the Volga, the Don and the Kama. They are Lamaists by religion and immigrated to the Moscow province (now Dauria) in the 17th century, driving out the Tatars and Nogais, and after many wars with the Don Cossacks, one part of them was taken in by the Don Cossacks, so that even now there are among these Cossacks several Kalmuck names mixed up with the White Russian, Yakut, and Bessarabian. In Russian Poland they constitute 13\% of the total population. In Kovno, Vilna, Mogilev, Grodno, Volynia, Podolia, Minsk, Vitsebsk, Kiev, Belorussia and Kherson, they constitute, on the average, 20\% of the population and in the provinces of these governments they reach 30 to 50\% of the population. Organized as they are into a kind of community for mutual protection, they maintain the trade wherever they penetrate. In the villages they are mainly innkeepers, intermediaries in trade and pawnbrokers. In many towns most of the skilled labourers and a great many of the unskilled (for instance, the Jews) speak the Kalmuck Russian. The Jews of the Karaite sect differ entirely from the orthodox Jews both in worship and in mode of life. They, too, are inclined to trade, but they also carry on agriculture successfully. Those inhabiting the Don Cossack Tatar, and the few who are settled in W. Russia speak Polish. They are on good terms with the Russians.

Of W. Europeans, the Germans only attain considerable numbers in European Russia. In the Baltic provinces they constitute the ennobled landlord class, and are the tradesmen and artisans in the towns. Considerable numbers of Germans, tradesmen and artisans, settled at the invitation of the Russian government to man the larger towns as early as the 16th century, and to a much greater extent in the 18th century. Numbers were invited in 1762 to settle in S. Russia, as separate agricultural colonies, and these have since increased and spread into the Don region extensively. Protected as they were by the right of self-government, exempted from military service, and endowed with considerable allotments of good land, these colonies are much wealthier than the neighbouring Russian peasants. The Germans of W. Russia form the wealthiest and the most industrious of the Russian nation. They are chiefly Lutherans, but many of them belong to other religious sects—Anabaptists, Moravians, mennonites. During the closing years of the 19th century great numbers of Germans entered the industrial governments of Poland, namely, Piotrow, Warsaw and Kalisz.

The Rumanians (Moldavians) inhabit the governments of Bessarabia, Podolia, Kherson and Ekaterinoslav. In Bessarabia they constitute from one-fourth to three-fourths of the population in certain districts, and nearly 50\% of the entire population of the government. On the whole the Novorossian governments (Bessarabia, Kherson, Ekaterinoslav and Taurida) exhibit the greatest variety of population. Little and Great Russians, Ukrainians, Bulgarians, Germans, Greeks, Frenchmen, Poles, Tatars and Jews are mingled together and scattered about in small colonies, especially in the great towns and counties. (6) The Koreans inhabit the three provinces, Kherson, Odessa and Taurida, where they are traders, as also do the Armenians, scattered through the towns of S. Russia, and appearing in larger numbers only in the district of Rostov.

The Lithuanians prevail in Kovno, Vilna and Suwalki; and the Letts, who are, however, more scattered, are chiefly concentrated in Vitsebsk, Courland and Livonia.

In the Baltic provinces (Estonia, Livonia and Courland) the prevailing tribes are the Esthons, Lithuanians and Letts; the Germans being respectively 3\%, 7\% and 8\% of the population. The relations of the Esthons and Letts with their landlords are anything but friendly.

The boundaries of St Petersburg (apart from the capital), Olonets and Archangel contain an admixture of Karelians, Samoyedes and Sviryanians, the remainder being Great Russians. In the north-west, the province of the Finn-Lapp and the Valdai (now-Novgorod, Simbirsk, Samara, Penza and Saratov) the Great Russians prevail, the remainder being chiefly Mordvinians, Tatars, Chuvashes and Bashkirs, Germans in Samara and Saratov, and Little Russians in the last named. In the Ural governments of Perm and Vyatka Great Russians are in the majority, the remainder being a variety of Finno-Tatars. In the S. Ural governments (Uralsk, Orenburg, Ufa) the admixture of Turko-Tatars—of Kirghiz in Uralsk, Bashkirs in Orenburg and Ufa, and less important races—becomes considerable.

The state religion is that of the Orthodox Greek Church (Orthodox Catholic or Orthodox Eastern Church). Its head is the tsar; but although he makes and annuls all appointments, he does not determine questions of dogmatic theology. The principal ecclesiastical authority is the Holy Synod, the head of which, the Procurator, is one of the members of the imperial council, and exercises very wide powers in ecclesiastical matters. In theory all religions may be freely professed, except that certain restrictions, such as domicile, are laid upon the Jews; but in actual fact the dissenting sects are more or less severely treated. According to returns published in 1905 the adherents of the different religious communities in the whole of the Russian empire numbered approximately as follows, though the heading Orthodox Greek includes a very great many Raskolniki or Dissenters.

The ecclesiastical heads of the national Orthodox Greek Church consist of three metropolitans (St Petersburg, Moscow, Kiev), fourteen archbishops and fifty bishops, all drawn from the ranks of the monastic (celibate) clergy. The parochial clergy are celibate in life. One must be married when appointed, but if a widower may not marry again.

All Russians, with the exception of a number of White Russians who belong to the United Greek Church (see ROMAN CATHOLIC CHURCH, § Russia), profess the Russian Orthodox faith, or belong to one of the numberless dissenting sects. The Poles and most of the Lithuanians are Roman Catholics. The Esthons and all other Western Finns, the Germans and the Swedes are Protestant. The Tatars, Bashkirs and Kirghiz are Mahomedans; but the last-named have to a great extent maintained along with Mahomedanism their old Shamanism. The same holds good of the Meshcheryaks, both Moslem and Christian. The Mordvinians are nearly all Orthodox Greek, as also are the Votyaks, Voguls, Cheremisses and Chuvashes, but their religions are, in reality, modifications of Shamanism under the influence of some Christian and Moslem beliefs. The Moguls, though baptized, are in fact believers in fetishism as much as the unconverted Samoyedes. Finally, the Kalmarki are Lamae Buddhists.

In his relations with Moslems, Buddhists and even fetishists the Russian peasant looks rather to conduct than to creed, the latter being in his view simply a matter of nationality. Indeed, towards paganism, at least, he is perhaps even more tolerant, preferring on the whole to keep on good terms with pagan divinities. The numerous outbreaks against the Jews are directed, not against their creed, but against them as keen business men and extortionate money-lenders. Any idea of proselytism is quite foreign to the ordinary Russian mind, and the outbursts of proselytizing zeal occasionally manifested by the clergy are really due to the desire for "Russification," and traceable to the influence of the higher clergy and of the government.

1 The restrictions on domicile were to some extent relaxed in the beginning of 1907.
RUSSIA

It is this political rather than religious spirit which also underlies the repressive attitude of the government, and of the Orthodox Church as the organ of the government, towards the various dissident sects (Raskolnik, from raskol, schism), which for more than two centuries past have played an important part in the popular life of Russia, and, since the political developments of the end of the 18th and early years of the 19th century, have tended to do so more and more. To understand the problem of the Raskolnik it is necessary to bear two things in mind: the fundamental principle of Eastern Orthodoxy as distinct from Western Catholicism, and the practical identification in Russia of the National Church with the National State. The very basis of Orthodoxy is that the Church is by Christ’s ordinance unalterable, that its traditional forms, every one of which is a vehicle of saving grace, were established in the beginning by Christ and his apostles, and that consequently nothing may be added or altered. The trouble began early in the 17th century with the attempt, made in connexion with the printing of the liturgical books, to emend certain ritual details in which there was proved to have been a development of usage; and this came to a head under the patriarch Nikon (q.v.). Under his influence a synod endorsed the changes in 1654; one bishop alone, Paul of Colonna, dissented, and he was deposed, knouted and kept in prison till he died mad. In 1665 the synod anathematized the adherents of the old forms, and the anathema was confirmed by those of 1666 and 1667. To the conservatives, known subsequently as Old Ritualists or Old Believers, this marked the beginning of the reign of Antichrist (was not 666 the number of the Beast?); but they continued the struggle, conservative opposition to the Westernizing policy of the tsars, which was held responsible for the introduction of Polish luxury and Latin heresy, giving it a political as well as a religious character. The rising of the Strelets in 1682 all but gave them the victory; the crushing of the rising relegated them definitely to the status of schismatics. They were placed in still completer antagonism to the established Orthodox Church by the innovations of Peter the Great. The Muscovite tsars had pursued them with fire and sword. The Russian emperors, having established themselves as heads of the Church and the Holy Synod as a state department, were not likely willingly to tolerate their existence.

The Raskol was threatened with extinction by the gradual dying out of its priests, which led to a further schism within itself, into the Popovshchina (with priests) and the Bezpopovshchina (without priests). The Popovtsi, who were served by priests converted from the Orthodox Church, made their headquarters in the island of Werka, in a tributary of the Dnieper, in Poland (1695), and after its destruction by the government in 1735 and again in 1764, at Starodubye in the government of Chernigov, whence their doctrine spread in the country of the Don. In 1771 their headquarters were fixed at Moscow, in the Rogoshkiy cemetery assigned to them during the plague; here they had a monastery, seminary and consistory, until they were ejected by the emperor Nicholas I. In 1832 priests were forbidden to join them, and they had to apply to a deposed Bosnian metropolitan, who became their chief bishop, establishing his see in the monastery of Belokrinitsa in Bukovina. In 1862 the synod of the Popovshchina passed a circular letter making advances to the government with a view to a compromise, which was arranged on the basis of the Old Believers consenting to accept the ministrations of Orthodox priests on condition that they should use the unrevised books. This led to a further schism into three sections: those who recognize the metropolitan and the compromise (Edisonovtsy), those who recognize the metropolitan but oppose the compromise (Biegozovtsy), those who repudiate both (Bieglapoovtsy). There had already been other schisms on such questions as the right way to swing a censor and the legality of self-immolation for the lord’s sake.

The Bezpopovtsi, known also as Pomoranye, because they are mainly found in the sparsely populated country near the White Sea, are in some ways more remarkable. They reject the ministration of priests altogether, since in the time of Antichrist (*i.e.* the heretic tsar) the only sacrament that remains is baptism. They therefore elect elders, who expound the Scriptures, baptize and hear confessions. They are, however, in no sense evangelicals in the Western sense; for they observe rigorous fasts, reverence icons, and believe implicitly in the efficacy of the multiplication of crossings, bowings and prostrations. They have, moreover, thrown off from time to time a number of extravagant offshoots. Such are the Philippovtsi, founded by one Philip (who burned himself alive for Christ’s sake in 1743), who have exalted self-immolation into a principle; the Stranniki (pilgrims) and Byeguni (runners), who interpret Matt. x. 37 fl. literally, and reject legal marriage; the Nyedovtsi (deniers), who deny the necessity for common worship, since there are no priests; the Molchajniki (mutes), whom no torture can persuade to utter a word.

Closely akin to these, though not derived from the Old Believers, are certain mystic sects which deny the efficacy of the sacraments altogether. Of these the most remarkable are the so-called Khlysti (“flagellants,” from klyesy), “to strike, lash,” but possibly a corruption of Khristi, “Christ’s”). They originated in 1645, when, according to their belief, God the Father descended in a chariot of fire on Mount Gorodim, in the province of Vladimir, and took up his abode in a peasant named Daniel Philippov, who chose another peasant, named Ivan Suslov, for his son, the Christ. Suslov selected a “mother of God” and twelve apostles. Though twice crucified and once flayed by order of the tsar, he always rose again, and did not die till 1716. Suslov chose a successor in one Prokopy Lapkin, and since then—in the belief of the sect—every generation, even every community, has had its Christ and its “mother of God,” who are worshipped by reason of the Divine Spirit dwelling in them. It is the duty of all believers to strive to become one or other of these by subduing the flesh, which is the product of Evil, and all motions of the will. Each community is presided over by an “angel,” or prophet, and a prophetess, whose word is law. All alike are subject to the twelve commandments issued by the “Sabaoth,” that is to say Daniel Philippov. These include the prohibition of alcoholic drink, of fleshly sins and of marriage, and the inculcation of faith in the Holy Cross and complete surrender to his influence. At their prayer-meetings the Khlysti dance to the accompaniment of hymns, the dance gradually developing into a wild dervish-like spinning which is kept up till they drop, foaming at the mouth and prophesying. Perhaps the most remarkable fact about this sect is that it is secret, and that its members ostensibly belong to the Orthodox Church.

An offshoot of the Khlysti is the more celebrated secret sect of the Skoptsi (skoptsi, a eunuch), which represents an extreme ascetic reaction from the promiscuous immorality of some (by no means all) of the Khlysti. Their idea of attaining salvation is self-mutilation according to the counsel of perfection implied in Matt. xix. 13 and 1 Pet. iii. 8, 9. The “royal seal” is complete self-castration; partial mutilation is known as the “second purity.” In the case of women the mutilation usually takes the form of amputation of the breasts. This horrible sect, which was founded by one Selivanov in the last quarter of the 18th century, seems to have a morbid attraction for people of all classes in Russia, and all the efforts of the government have not succeeded in stamping it out (see SKOPTSI).

Closely akin to certain Western forms of dissidence from traditional Catholicism, though of native growth, are the Molokan, so popularly because they continue to drink milk (moloko) during fasts. Their origin is unknown, but they are officially mentioned as early as 1765. They style themselves “truly spiritual Christians,” and in their rejection of the sacraments, their indifference to outward forms, and their insistence on the spiritual interpretation of the Bible ("the letter killeth"), they are closely akin to the Quakers, whom they resemble also in their inoffensive mode of life and the practice of mutual help.

---

1 The most important alterations were the repetition twice, instead of three times, of the "Alleluia" at the Eucharist, and making the sign of the cross with two fingers instead of three.
RUSSIA

From the Molokani the Dukhobortsi, in England better known as Doukhobors (q.v.), are distinguished by their subordination of the Scriptures to the authority of the "inner light." They are dualists, like the Bogomils (q.v.), ascribing the body to a fall from a pure condition, and the soul to the principle of conservation.

The Incarnation was no isolated historical occurrence, but it is repeated over and over again in the faithful, each one of whom is in a certain sense God, by virtue of the indwelling Spirit. Both the Molokani and the Dukhobortsi deny the authority of the civil government as such, and object on principle to military service. The former, however, give little trouble; on the other hand, the government has from time to time proceeded with extreme severity against the Dukhobortsi, whose refusal to serve in the army, if allowed to go unpunished, would have set a contagious example.

Dissidence of all kinds has made a considerable advance since the emancipation of the serfs in 1861, the increase—as might be expected—in a wholly illiterate population—being greatest in the more extravagantly sects. On the other hand, Western Protestantism has also made great headway, notably the Stundists, whose rationalistic-

Protestantism has gained a firm foothold especially in Little Russia, where the Raskol never penetrated. The Baptists have also made considerable progress, notably among the Molokani.1

Social Conditions.—The old subdivisions of the population into orders possessed of unequal rights is still maintained. The great mass of the people, 81-6% belong to the peasant order, the others being: nobility, 1.3%; clergy, 0.9; the burghers and merchants, 0.3; and military, 0.1. Thus more than 88 millions of the Russians are peasants. Half of them were serfs in 1861, 16,444,490 males in 1858—the remainder being "state peasants" (9,104,891 males in 1858, exclusive of the Archangel government) and "domain peasants" ($427,740 males the same year).

The serfdom which had sprung up in Russia in the 16th century, and became consecrated by law in 1609, taking, however, nearly one hundred and fifty years to attain its full growth, was abolished in 1861. This act liberated the serfs from a yoke which was really terrible, even under the best landlords, and from this point of view it was obviously an immense benefit.2 But it was far from securing corresponding economic results.

The households servants or dependents attached to the personal estates of their masters were merely set free; and they entirely went to reinforce the town proletariat. The peasants proper received their houses and orchards, and allotments of arable land. These allotments were given over to the rural commune (mir), which was made responsible, as a whole, for the payment of taxes for the allotments. For these allotments the peasants had to pay, as before, either by personal labour or by a fixed rent. The allotments could be redeemed by them with the help of the crown, and then they were freed from all obligations to the landlord. The crown paid the landlord in obligations representing the capitalized rent, and the peasants had to pay the crown, for forty-nine years, 6% interest on this capital. The redemption was not calculated on the value of the allotments of land, but was considered as a compensation for the loss of the compulsory labour of the serfs; so that throughout Russia, with the exception of a few provinces in the S.E., it was—and still remains, notwithstanding a very great increase in the value of land—much higher than the market value of the allotment. Moreover, many proprietors contrived to curtail seriously the allotments which the peasants had possessed under serfdom, and frequently they deprived them of precisely the parts which they were most in need of, namely, land which resembled in produce the normal kind of land around forests. The effect of this, craftily calculated beforehand, was to compel the peasants to rent pasturage lands from the landlord at any price.

The present condition of the peasants—according to official documents—is as follows: the numbers of small and medium-sized farms which are owned by the peasants themselves or in which the peasants are working. In proportion to the total area under cultivation, the average area of the allotment necessary to the subsistence of a family under the three-fields system was estimated at 28 to 42 acres. Land must thus of necessity be rented from the landlords at fabulous prices, and even then the annual income of the allotment itself is frequently below that of the tribute of the old-time landlord. The debt burden is as great as ever. The peasants, however, are, as a rule, better off, but they may have to pay a redemption tax, and many of the proceeds of the redemption go into the pockets of the landlords, instead of benefiting the peasants. The redemption tax is paid by the peasants in lieu of the emancipation payment. The peasants have, on the average, sufficient rye-bread for only 200 days in the year—often for only 150 and 100 days. One quarter of them have received allotments of only 2-9 acres perヘルプレセス, which is not enough to support the households of the peasant masses. The redemption tax average at 21.83 roubles per household of 5 persons. The redemption tax ranges from 1.8 to 55 roubles per household. The redemption tax is levied for the period of 50 years, and in many cases it is not paid in full. The redemption tax is due in one sum, and the proceeds are paid to the landlords, and the peasants are forbidden by law to inflict corporal punishment upon the peasants.

The average allotment in Kherson is only 0.99 acres, and for allotments from 2.9 to 5.8 acres the peasants pay 5 to 10 roubles of redemption tax. The state peasants are better off, but still they may have to pay a redemption tax, and many of the proceeds of the redemption go into the pockets of the landlords, instead of benefiting the peasants. The redemption tax is paid by the peasants in lieu of the emancipation payment. The peasants have, on the average, sufficient rye-bread for only 200 days in the year—often for only 150 and 100 days. One quarter of them have received allotments of only 2-9 acres perヘルプレセス, which is not enough to support the households of the peasant masses. The redemption tax average at 0.21 roubles per household of 5 persons. The redemption tax ranges from 0.18 to 55 roubles per household. The redemption tax is levied for the period of 50 years, and in many cases it is not paid in full. The redemption tax is due in one sum, and the proceeds are paid to the landlords, and the peasants are forbidden by law to inflict corporal punishment upon the peasants.

The situation of the former serf-proprietors is also unsatisfactory. Accustomed to the use of compulsory labour, they have failed to accommodate themselves to the new conditions. The millions of roubles of redemption money received from the crown have been spent without any real or lasting agricultural improvements having been affected. The forests have been sold, and only those landowners who are raking rent, are prospering, and without which the peasants could not live upon their allotments. After the years 1861 to 1892 the land owned by the nobles decreased 50%, or from 210,000,000 to 150,000,000 acres; during the following twenty years it increased again by 1,110,000 acres; and now, therefore, the landlords control less than half the land of the Russian Empire.

The redemption tax is paid by the peasants in lieu of the emancipation payment. The peasants have, on the average, sufficient rye-bread for only 200 days in the year—often for only 150 and 100 days. One quarter of them have received allotments of only 2-9 acres perヘルプレセス, which is not enough to support the households of the peasant masses. The redemption tax average at 0.21 roubles per household of 5 persons. The redemption tax ranges from 0.18 to 55 roubles per household. The redemption tax is levied for the period of 50 years, and in many cases it is not paid in full. The redemption tax is due in one sum, and the proceeds are paid to the landlords, and the peasants are forbidden by law to inflict corporal punishment upon the peasants.

The co-operative spirit of the Great Russians shows itself in another sphere in the artel, which has been a prominent feature of Russian life since the dawn of history. The artel is the co-operative agricultural organization in Europe, with this difference that it makes its appearance without

1 See N. Tugni, Russie sectaire (1888); A. Leory-Beaulieu, L'Empire des Tsars, tome iii. (1896); trans. 1896); C. K. Grass, Russische Sekten (1907 seq.). Further useful references are given in Bonwetsch’s article, "Raskolnikin," in Herzog-Hauck, Realencyclo., (3rd ed., 1905), vol. v, p. 436.

2 It was only as late as 1904, however, that the landed proprietors were forbidden by law to inflict corporal punishment upon the peasants.
RUSSIA

In consequence of these more favourable conditions there is greater variety in the cropping; a good deal of wheat is grown, as well as beetroot for sugar, fibre plants and oleaginous plants, and even (W. of the Dnieper) the vine. Live-stock breeding is likewise in a more prosperous condition. The rest of the black earth zone, which stretches from these governments N.E. to the Volga, is less favoured by nature; the winters are longer and more inclement, and droughts are not uncommon. When this happens there is great suffering from famine, for wheat is the crop upon which the dependents of the small farmers depend. The rye, buckwheat and oats are also cultivated. But a long course of continuous cropping with these grain crops, without affording compensation to the soil in the form of manure or deep cultivation, has so exhausted it that its productiveness has suddenly fallen away. Consequently the peasantry is constantly in a state bordering on destitution, and exposed to the horrors of famine, like those which visited them in 1890 and 1898, and threatened in 1907.

In Bessarabia, the three chief products are maize, wine and hardy fruit, especially plums. Here the climate is temperate and fairly moist, but farther E. it is distinctly more arid. Wheat is the principal crop, with barley second. Water-melons, sun-flowers and flax, both the last two for oil, are usual crops. But the breeding of horses and sheep is of equal importance with agriculture. Here again both capital and labour are absent, and the cultivation of the soil suffers from the fact that, owing to the absence of timber, dry dung is used for fuel instead of being employed as manure. The steppe conditions extend over the greater part of the Crimea and the Volga province. The actual distribution of arable land, forests and meadows, in European Russia and Poland is shown in the following table:-

Down to January 1st 1903, the peasants had actually redeemed out of the land allotted to them in 1861 a total of 280,530,516 acres. In Poland the peasants as a body have, in addition to the land thus assigned to them by the government, bought some 1½ million acres since 1863, and of this quantity they purchased not less than 1,600,000 acres, or 64%.

Taking the whole of European Russia and Poland, almost exactly two-thirds of the total area is sown every year with cereals. But a large part of the total people of these countries is officially enemies of rye, 26% with wheat, 20% with oats and 14% with barley. Beetroot (6-8 million tons annually) for sugar is especially cultivated in Poland, the governments of Kiev, Podolia, Volynia, and some of the other central and southern provinces. About 100,000 tons of tobacco are grown annually in the S. Flax and hemp occupy considerable acreages in central and N.W. Russia. The vine is cultivated as far N. as 49° N. (in Bessarabia, Crimea, Don Cossacks territory) and of this quantity over 25-50 million gallons, three-fifths in Caucasia. Market-gardening and fruit-growing are profitable occupations in certain parts of S. and central Russia, and have led recently to the establishment.
of factories for canning fruit and for making jam and pickles. Transcaucasia supplies, chiefly from the government of Erivan, some 12,000 tons of raw cotton annually. The tea plantations thrive and are planted fairly rapidly on the Black Sea littoral in Transcaucasia.

Live-stock are diminishing in numbers all round: in the case of horses, from 21 per 100 inhabitants in 1882 to 11 per 100 inhabitants in 1900; of cattle, from 31 in 1882 to 23 in 1904; of sheep, from 56 to 46 and 41 in the years named respectively; and pigs, from 13 to 9 and 10 respectively. Recent investigations in the government of Moscow have revealed that 40% of the peasant households have no horses at all and still more have no cows. The result of the inquiries elicited the fact that 28% of the peasant households were without horses, although of the total number of horses in the countryside the non-existence of the great number of them with their owners met with is small and possessed of very little strength; the best are those of Poland, the W. governments and the S. steppe country. Both the horses of the Cossacks and the byling race are particularly admirable.

The peasants, in common with the rest of the Russian nation, are not big, are famous for their endurance. Finland ponies are exported in large numbers. The best bred races of cattle are those of Poland, the W. provinces, Little Russia and the far N. (Kirchmogorze). Of the 55 million steers kept in Russia in about 15 millions belong to the fine merino breed, and these are pastured chiefly on the Black Sea steppes. Modern dairy-farming is only just beginning in Russia, but butter is being exported in increasing quantities.

The industry is the older, and is still conducted on primitive methods, but has been greatly increased by the large amounts of grain being transported by water down the Kama and other rivers. The minerals chiefly produced in the Urals are iron, coal, gold, platinum, and precious metal. The ore mined doubled in the former years to 1,000,000 tons in the latter; but since 1900 the output has declined, the total for 1904 (inclusive of Siberia) being 6,400,000 tons. Thus the mining of the metals, which was at its height before the 19th century, is not quite 20% of the total in all European Russia and Poland. The output of coal in the Urals is, altogether, less than 3% of the total for all the empire and 4% of the output of European Russia (exclusive of the Urals) alone.

before the 19th century, that is, to say, industries carried on with capital and machinery in large factories. Industry of this character was first established in Poland in 1820, and it has grown there rapidly, though never so rapidly as during the last few years of the 19th century. The principal centre is Lodz in the government of Posen, the growth of which is due to the establishment of a good market and the growth of the industry. Good markets have sprung up also in Warsaw and at Somnowice and Bendzin in the extreme S.W. corner of Poland. Besides cottons the products include woollens and cloth, silk, chemicals, machinery, iron, coal, sugar, 2:4: cottons and oilcake, 2:4:; oleaginous seeds, &c., 1:5:; with hemp, spirits, pottery, game, borses, hair, furs, leather, tobacco, etc., and the products of the various factories, the Chinese, 2:2:; fish, 3:2:; with leather and hides, chemicals, silks, wine and spirits, colours, fruits, coffee, tobacco and rice. The countries from which Russia buys most extensively are Germany (34%), the United Kingdom (15%) and the United States (9%). Machinery, coal, iron, &c., are the goods which are bought by the commodities supplied by the United Kingdom.

The total mercantile marine of Russia does not aggregate 700,000 tons; and it is distributed in the following proportions: 35:4: in the Caspian Sea, 4:7: in the Black Sea and the Sea of Azov, 2:4: in the Baltic Sea and 5:2: in the White Sea. And these proportions represent fairly well the relative importance of the different sections of the mercantile marine. But of the vessels that visit the Russian ports in the way of trade every year only 8:3: are Russian, the rest being of foreign build. Russian craft play, however, a much more important role in the internal trade than the foreign vessels. The increase of commerce with foreign countries increases rapidly, e.g. whilst in 1894 it amounted to an aggregate of 23,933,400 tons, in 1904 it reached a total of 38,720,240, or an increase of over 70% in the ten years. During the same period the tonnage of the trade vessels themselves more than doubled, while the

With regard to Russian industry generally, the extravagant prices which have been paid for iron and all iron goods, owing to the prohibitive tariffs, combined with the obstacles put in the way of education, hamper the development of all industries. The cotton factories excel chiefly in the production of red and printed cottons. In the flax-mills the tendency is to produce the finest qualities as well as the coarser. The silk-mills employ silk obtained from the Caucasus, Italy and France. The growth of the sugar-industry is shown by the fact that in 1888-93 the average annual production of sugar was 4,454,000 tons, but in 1894-95 it was 1,180,293 tons. Since 1894 the government has had a monopoly in retailing spirituous liquors, but not wine or beer; but distilling, a very widespread industry, is left in private hands. Beer is chiefly brewed in Poland and Baltic provinces. The breweries exist in nearly every government, but it is especially at Warsaw and St Petersburg, and after these at Moscow, that the largest and best modern breweries and beer and malt factories are established. The government of Russia, as shown by the statistics, is an important producer of flour, and there are several tobacco and hemp factories.

Far from being destroyed by the competition of the modern factories, the home industries maintain their ground, and new branches of petty trade having sprung up in some districts, among them the manufacture of agricultural machinery (threshing machines in Ryazan, Vyatka and Perm; ploughs in Smolensk, &c.) deserves notice.

The wealth of Russia consisting mainly of raw produce, the trade of the country turns chiefly on the purchase of this for export, and on the sale of manufactured and imported goods to the home market. This has been an invariable feature for a number of middlemen,—in the W. Jews, and elsewhere Russians,—to whom the peasants are for the most part in debt, as they purchase in advance on security of subsequent payments. A great deal of the internal trade is carried on by travelling merchants.

The fairs are very numerous. Those of Nizhniy-Novgorod, with a return of 20 million sterling of Israel and Charkov, of Nizhniy-Novgorod, of Narva, of Tver, of Ryazan, and of Tyumen have considerable importance both for trade and for home manufactures. Altogether, no fewer than 16,000 fairs are held in Russia, 85% of them in European Russia. Of these, 30 show returns of goods imported to the value of over £100,000 each, 41 from £50,000 to £100,000, and 437 from £10,000 to £50,000 each.

The external trade of the Russian empire (bullion and the like not included) since the year 1886 is shown in the following table—
independent principalities]

RUSSIA

891

crews increased 10½%, the number of men employed in the latter year being approximately 150,000.

In 1860 Russia possessed less than 1000 m. of railways; by 1885 this had increased to 5,550 m. By 1896, 36,415 m. or 84½% were in European Russia and nearly 6400 m. (15½%) in Asiatic Russia. Between 1893 and 1905 the building of railways proceeded at an average rate of nearly doubling within the ten years, namely, from 22,600 to 40,500 m. The European Russian railways cost on an average £10,465 per mile to construct, and the Asiatic Russian railways £502 per mile.

A railway network of rare importance as well as commercial importance, was built during the last two decades of the 19th century. At the same time the chief lines of railway were built in the Transcaucasian region and in the southern part of Asia. Another line of great importance is the junction line between the Transcaucasian railway—which runs from Batum and Poti to Baku via Tiflis, with a branch line to Kara—and the railway system of Russia proper. This junction has been affected not only by the main Caspian Sea port of Baku, but by the Caspian Sea, and it is also important because Baku is the chief port of Baku and Petrovsk, which are connected with Baku. The Black Sea port of Novorossiysk, which has a long line to the lower Volga, has been connected with the Baku line, has consequently also been brought into touch with the Russian railways. The Volga is reached from central Russia by seven lines of railways, including one to Kazan, and three main lines radiate from Saratov, two of which are to Krasnodar, while the upper Volga (Yaroslavl) is connected with Archangel by a line 52.3 m. long. A zone tariff was introduced on the Russian railways in 1894, and the cost of long journeys was considerably reduced; a journey of 625 m. was reduced from 24 to 17½; a journey of 10,000,000 jars is reduced from 17 to 12½, while for less than twice as much 1900 m. can be covered.

Fish form an important article of national food. The numerous fasts of the national church prescribe a fish diet on many days in the year, and a fish market is a continual feature of daily life. The transportation of fish for great distances. Along the Murman coast of the Arctic Ocean and in the White Sea, where many millions of herrings are caught annually by some 3000 persons, the yearly produce is estimated at the value of £140,000. In the Baltic Sea, as well as in the lakes of its basin (Ladoga, Onega, Ilmen, etc.), there are more than 500,000 fishers and their annual yield is 10,000,000 jars of fish and nearly 1500 m. p. of caviar are prepared annually, while salted fish is, next after bread, the staple food of large masses of the population. The Black Sea fisheries, in which about 4000 men are engaged, yield fish valued at £300,000 per annum. The value of the fish has much increased owing to the introduction of cold storage; as a result of the employment of the methods of packing, fish is now exported in a fresh state from the Black Sea to all parts of S.W. Russia, and even to Europe. The annual yield of the Caspian Sea, inhabited by more than 15,000 men, is valued at £600,000. In the Volga section of the Caspian Sea fish are caught to the value of about £1,000,000 annually; in the Volga section of the Black Sea, where 2000 men are engaged, fish valued at £100,000 are obtained. The total value of the Caspian fisheries is estimated at £3,000,000 per annum. Taking the Lake Aral and Siberian river fisheries into account, it is estimated that altogether the Russian fisheries yield a revenue to the state of about £250,000 annually.1 In addition from 13,000 to 60,000 seals and about 200 whales are killed annually off the Murman coast. Hunting is an occupation of considerable importance in N. and N.E. Russia, and along the shores of the Arctic Ocean.

Authors.—The Russkii Encyclopedia Slovan, edited by Brockhaus and Efron, was begun in 1890, with the idea of giving a Russian version of Brockhaus’ Conversations Lexicon, but from the very first volumes for its separate parts it became a monumental encyclopedia, and is, indeed, an inexhaustible source of information on everything Russian. A general popular description of Russia entitled Russkoe Selo (London, 1891); Le Région et la defends de Russie (Paris, 1893); The Future of Russia (Eng. trans., London, 1906); M. M. Kovalevsky, Russian Political Institutions (Chicago, 1902), Modern Customs and Ancient Laws of Russia (London, 1890); The Republic of Russia (Eng. trans., London, 1907); The settled Kraj Russlands (Paris, 1902); A. B. Meakin, Russia (London, 1906); G. von Schulze-Gävernitz, Volks- wirtschaftliche Studien aus Russland (Leipzig, 1899); J. Machat, Die Ethnographie Russlands (London, 1894); The Eastern Outposts of Russia, by the Department of Trade and Manufactures (English by J. M. Crawford, 5 vols., St Petersburg, 1893); A. F. Rittich, Die Ethnographie Russlands’ in Petermanns Mitteilungen (Berlin, 1902). P. A. K. j. T. Be.

History

The history of Russia may be conveniently divided into four consecutive periods: (1) the period of independent principalities; (2) the Mongol Domination; (3) the Tsardom of Muscovy; and (4) the Modern Empire.

1. A Conglomeration of Independent Principalities.—The first period, like the early history of many other countries, begins with a legend. Nestor, an old monkish chronicle of Kiev, relates that in the middle of the 9th century the Slav and Finnish tribes inhabiting the forest region around Lake Ilmen, between Lake Ladoga and the upper waters of the Dnieper, paid tribute to itinerant adventurers from the land of Rus, which is commonly supposed to have been a part of Sweden. In the year 859 these tribes expelled the Northmen, but finding that they quarrelled among themselves, they invited them, three years later, to return. Our land, said the deputation sent to Rus for this purpose, is great and fertile, but there is no order in it; come and reign and rule over us. Three brothers, princes of Rus, called respectively Rurik, Sineus and Truvor, accepted the invitation and founded a dynasty, from which many of the Russian princes are supposed to have descended.

Who were those warlike men of Rus who are universally recognized as the founders of the Russian Empire? This question has given rise to an enormous amount of discussion among learned men, and some of the disputants have not yet laid down their arms; but for impartial outsiders who have carefully studied the evidence there can be little doubt that

1 See Researches into the State of Fisheries in Russia (9 vols.), edited by Minister of Finance (1896, Russian); Kusnetzow’s Fischerei und Thierbeutung in den Gewassern Russlands (1898).
RUSSIA

During these interminable struggles of rival princes, Kiev, which had been so long the residence of the grand-prince and of the metropolitans, was repeatedly taken by storm and ruthlessly pillaged, and finally the whole valley of the Dnieper fell a prey to the marauding tribes of the steppe. Thereupon Russian secularization and political influence retreated northwards, and from that time the continuous stream of Russian history is to be sought in the land where the Vikings first settled and in the adjoining basin of the upper Volga. Here new principalities were founded and new agglomerations of principalities came into existence, some of them having a grand-prince who no longer professed allegiance to Kiev. Thus appeared the grand-prince of Suzdal or Vladimir, of Tver, of Ryazan and of Moscow—all irreconcilable rivals with little or no feeling of blood-relationship. The more ambitious and powerful among them aspirèd not to succeed but to subdue the others and to take possession of their territory, and the armed retainers, who were wont formerly to wander about as freelances, gave up their roving mode of life, settled down permanently in one principality, became landed proprietors, and sought to share as boyars the princes’ authority.

Among the principalities of that northern region the first place was long held by Novgorod. Since the days when Rurik had first chosen it as his headquarters, the little town on the Volkov had grown into a great commercial city and a member of the Hanseatic league, and it had brought under subjection a vast expanse of territory, stretching from the shores of the Baltic to the Ural Mountains, and containing several subordinate towns, of which the principal were Pskov, Nizhny-Novgorod and Vyatka. Unlike the ordinary Russian principalities, it had a republican rather than a monarchial form of government. Indeed, it was not so much a principality as a municipal republic of the Venetian type. It always had a prince, no doubt, but he was engaged by formal contract without much attention being paid to hereditary rights, and he was merely leader of the troops, while all the political power remained in the hands of the civil officials and the Vechtse, a popular assembly which was called together in the market-place, as occasion required, by the tolling of the great bell. Descendants of Rurik, impregnated with the pride of a dominant military caste, did not much like serving those truculent, wilful burghers, and some of them, after a time, voluntarily laid down their office and retired to more congenial surroundings. Those of them who tried to have their own way and came into conflict with the authorities had always to yield in the long run, and they were liable to be treated very unceremoniously, so that the vulgar adage, “If the prince is bad, into the mud with him!” became a maxim of state policy.

There was here in the Russian land the germ of republicanism or constitutional monarchy, but it was not destined to be developed. The principality which was to become the nucleus of the future Russian empire was not Novgorod with its democratic institutions, but its eastern neighbour Moscow, in which the popular assembly played a very insignificant part, and the supreme law was the will of the prince. The opposition which he encountered came not from the burghers but from the boyars and the nobles.

II. The Mongol or Tatar Domination, 1238-1453.—Between Moscow and Novgorod there was a long and bitter rivalry, breaking out occasionally into armed conflicts, and among the princes of the other principalities the old struggle for precedence and territory went on incessantly until it was suddenly interrupted, in the first years of the fourteenth century, by the unexpected irruption of an irresistible foreign foe coming from the mysterious regions of the Far East. “For our sins,” says the Russian chronicler of the time, “unknown nations arrived. No one knew their origin or whence they came, or what religion they practised. That is known only to God, and perhaps to wise men learned in books.” The Russian princes first heard of them from the wild nomadic Polovtsis, who usually pillaged the Russian settlers on the frontier but who now preferred
friendship and said: "These terrible strangers have taken our country, and to-morrow they will take yours if you do not come and help us." In response to this call some Russian princes formed a league and went out eastward to meet the foe, but they were utterly defeated in a great battle on the banks of the Kalka (1224), which has remained to this day in the memory of the Russian common people. Now the country was at the mercy of the invaders, but, instead of advancing, they suddenly retreated and did not reappear for thirteen years, during which the princes went on quarrelling and fighting as before, till they were startled by a new invasion much more formidable than its predecessor. This time the invaders came to stay, and they built for themselves a capital, called Sarai, on the lower Volga. Here the commander of "the Golden Horde," as the western section of the Mongol empire was called, fixed his headquarters and represented the majesty of his sovereign the grand khan who lived with the Great Horde in the valley of the Amur. About the origin and character of these terrible invaders we are much better informed than the early Russian chroniclers. The nucleus of the invading horde was a small pastoral tribe in Mongolia, the chief of which, known subsequently to Europe as Jenghiz Khan (q.v.), became a mighty conqueror and created a vast empire that stretched from China to the shores of the Baltic and the valley of the Danube—a heterogeneous state containing many nationalities held together by purely administrative ties and by an enormous military force. For forty years after the death of its founder it remained united under the authority of a series of grand khans chosen from among his descendants, and then it began to fall to pieces till the various fractions of it became independent khaganates.

The khagan closely connected with the history of Russia was that of Kipchak or the Golden Horde, the khans of which, as we have seen, on the lower Volga and built for themselves a capital called Sarai. Here they had their headquarters and held their assembly, called the Khurultai, or the meeting of the whole of their dominions. Between the khans and the Tatars, they were generally supposed. In the first place, they never settled in the country, and they had not much direct dealings with the inhabitants. In accordance with the admonitions of Jenghiz to his children and grandchildren, they retained their pastoral mode of life, so that the subject races, agriculturists and dwellers in towns, were not disturbed in their ordinary vocations. In religious matters they were extremely tolerant, and even all the idolaters or Shamans, and as such they had naturally no religious fanaticism; but even when they adopted Islam they remained as tolerant as before, and the khan of the Golden Horde (Berka) who first became a Mussulman allowed the Russians to found a Christian bishopric in his capital. One of his successors, half a century later, married a daughter of the Byzantine emperor, and gave his own daughter in marriage to a Russian prince. These represent the bright side of Tatar rule. It had its dark side also. So long as a great horde of nomads was encamped on the frontier the country was liable to be invaded by an overwhelming force of ruthless marauders. These invasions were fortunately not frequent, but when they occurred they caused an incalculable amount of devastation and suffering. In the intervals the people had to pay a fixed tribute. At first it was collected in a rough-and-ready fashion by a swarm of Tatar tax-gatherers, but about 1259 it was regulated by a census of the population, and, finally, the collection of it was entrusted to the native princes, so that the people were no longer brought into direct contact with the Tatar officials.

By the princes the yoke was felt more keenly, and it was very galling. In order to reply to accusations brought against them, or in order to be confirmed in their functions, they had to travel to the Golden Horde on the Volga or even to the camp of the grand khan in some distant part of Siberia, and the journey was considered so perilous that many of them, before setting out, made their last will and testament and wrote a parental admonition for the guidance of their children. Nor were these precautions by any means superfluous, for not a few princes died on the journey or were condemned to death and executed for real or imaginary offences. Even when the visit to the Horde did not end so tragically, it involved a great deal of anxiety and expense, for the Mongol dignitaries had to be conciliated very liberally, and it was commonly believed that the judges were more influenced by the amount of the bribes than by the force of the arguments. The grand khan was the lord paramount or suzerain of the Russian princes, and he had the force required for making his authority respected. Ambitious members of the Rurik dynasty, instead of seeking to acquire territory by conquest in the field, now sought to attain their ends by intrigue and bribery at the Mongol court.

Of all the princes who sought to advance their fortunes in this way the most dexterous and successful were those of Moscow. They made themselves responsible for the tribute of other principalities as well as of their own, and gradually they became lieutenants-general of their Mongol suzerain. So long as the Mongol empire remained united and strong, they were most submissive and objects of contempt, when, however, the Kipchak Horde went to pieces and began to fall to pieces, they assumed airs of independence, intrigued with the insubordinate Tatar generals, retained for their own use the tribute collected for the grand khan, and finally put themselves at the head of the patriotic movement which aimed at throwing off completely the hated Mongol yoke. For this purpose Dimitri Donskoi formed in 1380 a coalition of Russian princes, and gained a great victory over Khan Mamai of the Golden Horde on the famous battlefield of Kulikovo, the memory of which still lives in the popular legends. For some time longer the Tatars remained troublesome neighbours, capable of invading and devastating large tracts of Russian territory and spreading panic and destruction everywhere. But the Horde was now broken up into independent and mutually hostile khaganates, and the Moscow diplomatists could generally play off one khaganate against the other, so that there was no danger of the old political domination being re-established.

Having thus freed themselves from Tatar control, the Moscow princes continued to carry out energetically their traditional policy of extending and consolidating their dominions at the expense of their less powerful relations. Already Dimitri of the Don was called the grand-prince of all Russia, but the assumption of such an ambivalent title was hardly justified by facts, for there were at this time powerful khaganates and grand-princes who claimed to be independent. The complete subjection of these small moribund states and the creation of the autocratic tsardom of Muscovy were the work of Ivan III., surnamed the Great, his son Basil and his grandson Ivan IV., commonly known as Ivan the Terrible, whose united reigns cover a period of 122 years (1462-1584).

III. The Tsardom of Muscovy.—What may be called the home policy of these three remarkable rulers consisted in absorbing the few principalities which still remained independent, and in creating for themselves an uncontrolled monarchical authority. In the pursuit of both these objects they were completely successful. When Ivan III. came to the throne the remaining independent principalities were Great Novgorod, Pskov, Tver, Ryazan and Novgorod-Seversk. He first directed his attention to Novgorod, and by gradually undermining and then destroying the ancient republic liberties he reduced the haughty city, which had long styled itself Lord Novgorod the Great, to the rank of a provincial town. Then he annexed its colonies and thereby extended his dominions to the Polar Ocean and the Ural Mountains. At the same time he took possession of Tver, on the ground that the prince had allied himself with Lithuania. His successor Basil followed in his footsteps, and dealt with the municipal republic of Pskov as Ivan had dealt with Novgorod. Finding the inhabitants too much attached to
their ancient liberties, he abolished the popular assembly, removed the great bell to Novgorod, induced his own boyars in the administration, transported whole of the leading families to other localities, replaced them by 300 families from Moscow, and left in the town a strong garrison of his own troops. Ryazan shared the same fate. In 1521 the prince, being suspected of forming an alliance with the Crimean Tatars, was summoned to Moscow and arrested. Two years later the prince of Novgorod-Seversk was accused of intriguing with the Poles and imprisoned for the rest of his life. Thus all the principalities were brought under the power of Moscow, and in that respect there remained nothing for Ivan the Terrible to do. He took precautions, however, against any of the dead or moribund principalities being resuscitated, and published with unrelenting severity an attempt to resist him. With the suppression and absorption of the independent principalities the problem was only half solved. The tsars of Muscovy meant to be autocratic rulers alike in their old and in their new territories. Their forefathers had been trained in the Tatar school of politics and administration, and in their ideas of government they had come to resemble Tatar khans much more than the grand-princes of the old patriarchal type. Their autocratic tendencies were fostered also by the Church. As Christianity was brought into Russia from Constantinople it was only natural that the ecclesiastics, many of whom were Greeks, should admire Byzantine ideals and recommend them as models to be imitated. For the ambitious Moscow princes many of the Byzantine ideas were very acceptable. They liked to consider themselves as the Lord's anointed, placed high above all ordinary mortals even of the most exalted rank; and when Constantinople fell into the hands of the infidel they began to imagine that, as the most powerful potenates of the Eastern Orthodox world they were the protectors of the Orthodox faith and the political heirs of the East Roman emperors. With a view to strengthen this claim Ivan III. married a niece of the last Byzantine emperor of that line, who had fallen fighting when his capital was taken by the Turks (1453). From that moment Ivan's subjects noticed a change in his attitude towards them, and attributed it to the evil influence of the Greek princess. In the old times the grand-prince was simply primus inter pares among the minor princes, and these lived with their boyars almost on a footing of equality. Now the tsar of Muscovy and of all Russia adopted the airs and methods of a Tatar khan and surrounded himself with the pomp and splendours of a Byzantine emperor. Ivan III., notwithstanding the influence of his Greek consort, showed some respect for the ancient traditions and the susceptibilities of those around him, but his successor Basil did not follow his father's example. All through his reign he preferred to employ as officials men of humble origin, and habitually treated the boyars and great nobles very unceremoniously. For disobedience to his orders he imprisoned a boyar who was his own brother-in-law, and he caused another to be beheaded for complaining that the boyar-council was not consulted in important affairs of state. A boyar of Nizhny-Novgorod who allowed himself to criticize the new order of things, and attributed the change to the influence of the Greek princess, had his tongue cut out. From the ecclesiastics Basil likewise insisted on unfailing obedience, and he did not hesitate to depose by his own authority a metropolitan who was at that time the highest dignitary of the Russian Church. According to Siegmund von Herbertstein (1486-1566), an Austrian envoy who visited Moscow at that period, no sovereign in Europe was obeyed by the grand-prince of Muscovy, and his court was remarkable for barbaric luxury. In his palace were numerous equerries, chamberlains and other court dignitaries, and when he went out he was attended by a guard of young nobles dressed in gaudy costumes and armed with silver halberds.

Such radical changes naturally produced a great deal of dissatisfaction among men of Slavonic temperament, whose grandfathers had been independent princes, boyars or free lances, and the malcontents could not adopt the old practice of emigrating to some other principality. There was no longer within the Russian land any independent principality in which an asylum could be found, and emigration to a principality beyond the frontier, such as Lithuania, was regarded as treason, for which the property of the fugitive would be confiscated and his family might be punished. In these circumstances the only outlet for discontent was sedition, and the malcontents awaited impatiently a favourable opportunity for an attempt to curb or overthrow the autocratic power. That opportunity occurred when Basil died in 1533, leaving a successor a child only three years old, and the chances seemed all on the side of the nobles; but the result belied the current expectations, for the child to came to be known in history as Ivan the Terrible, and died half a century later in the full enjoyment of unlimited autocratic power. The fierce struggle between autocratic tyranny and oligarchic disorder, which went on in intermittent fashion during the whole of his reign, cannot be here described in detail, but the chief incidents may be mentioned.

During Ivan's minority the country was governed, or rather misgoverned, first by his mother, and then by rival factions led by great nobles such as the princes Shuiski and Khodasevich. Once during the murder of the young tsar no one came forward and assert his authority. Having convoked his boyars he reproached them collectively with robbing the treasury and committing acts of injustice, and he caused one of them, a Prince Shuiski who happened to be in power at the moment, to be seized by his huntsmen and torn in pieces by a pack of hounds, as a warning to others. Thus apparently he asserted his authority, but in reality, being only thirteen years old, he was a mere puppet in the hands of one of the opposition factions, who wished to out their rivals, and for the next four years the government of the country went on as before. It was not till he was about seventeen that he took an active part in the administration, and one of his first acts foreshadowed his future policy: he insisted on the metropolitan crowning him, not as grand-prince of Muscovy, but as tsar of all Russia (1547). From the earliest times the term tsar—a contraction of the word Caesar—had been applied to the kings in Biblical history and the Byzantine emperors, and Ivan III. had already been described in the Church service as "the ruler and autocrat of all Russia, the new Tsar Constantine in the new city of Constantine Moscow," but on no previous occasion had a grand-prince been crowned under that title. A few months later occurred in Moscow a great fire, which destroyed nearly the whole city, and a serious popular tumult, in which the tsar's uncle was murdered by the populace. Ivan regarded these events as a punishment from Heaven for the neglect of his duties, and he began to attend to public affairs under the influence of an enlightened priest called Sylvester and an official of humble origin called Adashev. With the assistance of these two counsellors he held in check the lawless, turbulent nobles, and ruled justly, to the satisfaction of the people, for fourteen years. Then suddenly, for reasons which cannot easily be explained, he inaugurated a reign of terror which lasted for twenty-four years and earned for him the epithet of "the Terrible." Though there had been no open insurrection, he caused many boyars and humble persons to be executed, and when some of the great nobles, fearing a similar fate, fled across the frontier and tendered their allegiance to the prince of Lithuania, his suspicion and indignation increased and he determined to adopt still more drastic measures. For this purpose he organized, outside the regular administration, a large corps of civil officials and armed retainers, whose duty it was to obey him implicitly in all things; and with this force, which rose rapidly from 1000 to 6000 men, he acted like a savage invader in a conquered country. Accompanied by these so-called Oprichniki, who have been compared to the Turkish Janissaries of the worst period, he ruthlessly devastated large districts—with no other object
apparently than that of terrorizing the population and rewarding his myrmidons—and during a residence of six weeks in Novgorod, lest the old turbulent spirit of the municipal republic should revive, he massacred, it is said, no less than 60,000 of the inhabitants, including many women and children. It is quite possible, as some apologists suggest, that the number of his victims may have been exaggerated, but that they are to be counted by thousands there can be no doubt. In the monastery of St Cyril has been preserved a list of those for whom he requested the prayers of the Church, the total being 2470. The only reference to Novgorod in this curious document is: "Remember, O Lord, the souls of thy Novgorodian servants to the number of 1505 persons." According to the Novgorodian annalists as many as 1500 persons were sometimes put to death in a single day. Perhaps the discrepancy is to be explained by supposing that the pious tsar did not consider all his victims as servants of the Lord, whose souls deserved the prayers of the faithful.

While thus uniting under their vigorous autocratic rule the small rival principalities, the Moscow princes had to keep a watchful eye on their eastern neighbours. The Golden Horde, long weakened by internal dissensions, had now fallen into several khanates, the chief of which were Kazan, Astrakhan and the Crimea. As these independent Tatar states were always jealous of each other, and their jealousy often broke out in open hostility, it was easy to prevent any combined action on their part; and as in each khanate there were always several pretenders and contending factions, Muscovite diplomacy had little difficulty in weakening them individually and preparing for their annexation. In the case of Kazan and Astrakhan the annexation was effected without any great effort in 1552-54, and two years later the Bashkirs, who had likewise formed part of the great Mongol empire, consented to pay tribute. On the other hand, the khans of the Crimea were able, partly from their geographical position and partly from having placed themselves under the protection of the sultans of Turkey, to resist annexation for more than two centuries and to give the Muscovites a great deal of trouble, not only by frequent raids and occasional invasions, but also by allying themselves with the Western enemies of the tsars. As late as 1680 Moscow was pillaged by a Tatar horde; but there was no longer any question of permanent political subjection to the Asiaties, and the Russian frontier was being gradually pushed forward at the expense of the Khans. This was owing partly to the advance of the agricultural population in quest of virgin soil. These latter, like the colonists in the American Far West, had to be constantly on the alert against the attacks of their troublesome neighbours, and they accordingly organized themselves in semi-military fashion. Those of them who lived on the outskirts of the pacified territory adopted a mode of life similar to that of their hereditary opponents, and constituted a peculiar class known as Cossacks, living more by flocks and herds and by marauding expeditions than by agriculture. In the basins of the southern rivers they formed semi-independent military communities. Those of the Volga and the Don professed allegiance to the tsar of Moscow, whilst those of the Dnieper recognized at first as their suzerain the king of Poland. In neither case did the allegiance involve strict obedience to orders from the superior, and their loyalty was always in danger of being troubled by their love of independence and equality and their desire for loot. More than once they raided and pillaged in wholesale fashion the territory they were supposed to protect. On the whole, however, at that period as in more recent times, they contributed largely to the process of territorial expansion. (See also POLAND: History.)

The Cossacks.

Before the Eastern menace had been entirely removed the ambitious Moscow princes had begun to look with envious eyes beyond their western frontier. Here lay the principalities of Lithuania and beyond it the kingdom of Poland, two loosely conglomerated states which had been created by the Piast and Gedynian dynasties in pretty much the same way as the tsardom of Muscovy had been created by the descendants of Rurik. When the two became united under one ruler towards the end of the 14th century they formed a broad strip of territory stretching from the Baltic to the Black Sea and separating Russia from central Europe. For Russian ambition the barrier was a formidable one, but it did not entirely preclude possibilities of expansion in a more or less remote future. When examined closely it was found to contain many internal flaws.

In no sense could it be considered a homogeneous political unit, for in Lithuania the majority of the population were Russian in nationality, language and religion, whereas in Poland the great majority of the inhabitants were Polish and Roman Catholic. Gradually, it is true, the Lithuanian nobles, who possessed all the land and held the peasantry in a state of serfage, adopted Polish nationality and culture, but this change did not secure homogeneity, because the masses clung obstinately to their old nationality and religion, and all the efforts of the Church of Rome to bring them under papal authority proved fruitless. A further source of weakness was the political organization. Nominally it was an hereditary monarchy, but the warlike, turbulent nobles systematically encroached on the sovereign power till they reduced it to a mere shadow and made it elective, with the result that the kingdom of Poland, including the principality of Lithuania, was at last, politically speaking, the most anarchical country in Europe.

As the Muscovite and the Lithuano-Polish princes were equally ambitious and equally anxious to widen their borders, they naturally came into conflict. At first the Muscovite was decidedly the aggressor. On the death of Casimir, king of Poland and grand-prince of Lithuania, in 1492, the kingdom and the principality ceased to be united and Ivan III. considered he had a good opportunity for attacking the latter. After a short campaign a peace was concluded and Ivan's daughter was given in marriage to the Lithuanian grand-prince, but the matrimonial alliance did not improve the relations between the two countries. On the contrary it served as a pretext for Ivan to interfere in Lithuanian affairs. He not only insisted that his daughter's religion should be duly respected, but he constituted himself the protector of the Orthodox population and this led to a new war in 1499, which went on till 1503, when it was concluded by the cession to Russia of Chernigov, Starodub and 17 other towns. His successor, Basil, tried to get himself elected grand-prince of Lithuania, but in vain, when 1511 the latter was once more vacant by the death of his brother-in-law in 1506, but the choice fell on the late prince's brother Sigismund, who was likewise elected king of Poland. The two countries were thus once more united and better able to resist aggression, but some of the great nobles were discontented and Basil hoped with their assistance to attain his ends.

He began war therefore in 1514 and at once captured Smolensk, but in the following year he was defeated, and the war dragged on during more than seven years, with varying successes and without any important result. In the negotiations for peace the inordinate pretensions of the Muscovite prince were put forward boldly: he not only refused to restore Smolensk, but asked also for Kiev and a number of other towns on the ground that in the old time of the independent principalities they had belonged to descendants of Rurik.

The policy of expansion westwards, inaugurated by Ivan III., was modified and enlarged by Ivan the Terrible. The former had aimed simply at making annexations in Lithuania; the latter aspired to obtaining a firm footing on the Baltic coast and establishing direct relations, diplomatic and commercial, with the Western Powers.

In this respect he was a precursor of Peter the Great, but he greatly underestimated the difficulties of the task. To reach the Baltic he had to overcome the resistance, not only of the Lithuanians and the Poles, but also of the Teutonic and Livonian military orders, the Swedes and the Danes, who all had possessions in the intervening territory and who all objected to the barbarous Muscovites, already sufficiently formidable, strengthening themselves by direct foreign trade with western Europe and especially by the importation of arms and cunning
foreign artificers. Like the European settlers on the coast of Africa in more recent times, they wished the barbarians of the interior to be restricted to the use of their primitive weapons. One of the Polish kings, for example, threatened with death the English sailors who should attempt to carry on the illicit trade in arms, on the ground that "the Muscovite, who is not only our opponent of to-day but the eternal enemy of all free nations, should not be allowed to supply himself with cannon, bullets and munitions or with artisans who manufacture arms hitherto unknown to those barbarians." This was precisely the reason why Ivan IV, was so anxious to force his way to the coast. His grandfather had obtained from Venice an "artist" who undertook "to build churches and palaces, to cast big bells and cannons, to fire off the same cannon and to make every sort of castings very cunningly"; and with the aid of that clever Venetian he had become the proud possessor of a "cannon-house," subsequently dignified with the name of "arsenal." In imitation of the grandfather the grandson gave a commission to a Saxon, in whom he had confidence, to collect artists and artisans in Germany and bring them to Moscow, but he was prevented from carrying out his scheme by the Livonian Order (1547). A few years later (1553) he found unexpectedly a different route for communication with the West. A ship of an English squadron which was trying to make the most of his reputation, crossed the northern Dvina, and her captain, Richard Chancellor, journeyed to Moscow in quest of opportunities for trade. He met with such a favourable reception from the tsar that on his return to England a special envoy was sent to Moscow by Queen Mary, and he succeeded in obtaining for his countrymen the privilege of trading freely in Russian towns. In return the Russians were allowed to trade freely in England. This afforded great satisfaction to Ivan, but it did not entirely satisfy his requirements, because the new route by the White Sea and North Cape was long and uncertain and for a great part of the time obstructed by ice. But when he continued, therefore, his efforts to reach the Baltic coast, and he soon came into collision with the Swedes. After a dilatory war of three years he concluded a peace on the ground of free commercial relations, and then he attacked the Livonian Order, on the pretext that the Livonian town of Dorpat had not paid tribute according to ancient treaties. Finding himself unable to resist the Muscovites, the grand master of the Order put himself under Polish protection, and this led to a seven years' war (1563-70) with Poland, during which the Swedes and Danes intervened on their own account. Ivan did not display much military talent, but he showed a remarkable amount of tenacity. No sooner had he made peace with the Poles and failed to get himself elected as their king, than he began a war with the Swedes which dragged on for more than a decade (1572-1583), and before it was ended he was again at war with Poland (1579-81). Though severely tried by disappointments and defeats he never lost hope, and when he died in 1584 he was preparing to renew the struggle and endeavouring to form for that purpose an alliance with England; his great idea, however, was not to be realized till more than a century later, and meanwhile the tsardom of Muscovy had to pass through a severe internal crisis in which its existence was seriously endangered.

Ivan the Terrible had succeeded in stamping out ruthlessly all open resistance to his will, and had created an autocratic government of the Oriental type; but the elements of disorder were still lying beneath the surface, and as soon as the cunning, energetic despot died they reappeared. His son and successor, Theodore (Feodor), was a weak man of saintly character, very ill fitted to consolidate his father's work and maintain order among the ambitious, turbulent nobles; but he had the good fortune to have an energetic brother-in-law, with no pretensions to sanctity, called Boris Godunov, who was able, with the tsar's moral support, to keep his fellow-bourgeois in the said cannon did during fourteen years, and his administration was signalized by two important innovations—the attaching of the peasants to the land (adscription gleboe) and the creation of the patriarchate—a bath of which deserve a passing notice.

Boris has often been called the creator of serfage in Russia, but in reality he merely accelerated a process which was the natural result of economic conditions. In a primitive, thinly populated, agricultural country, in which the demand for agricultural labour greatly exceeds the supply, the value of land is in proportion to the number of permanent labourers settled on it, and the landed proprietors naturally try to attract to their estates as many peasants as possible; and in this competition the large proprietors have evidently an advantage over their humbler and weaker rivals. Such had been for a considerable time the condition of Russia, and the small proprietors were now becoming so impoverished that they could no longer fulfil their duties to the state. The remedy they proposed was that the labourers should be prohibited from migrating from one estate to another, and an order to that effect was issued, with the result that the peasants, being no longer able to change their domicile and seek new employers, fell practically under the unlimited power of the proprietors on whose land they resided. This change was, of course, popular among the lower and middle ranks of the landlord class, but was very displeasing to the great nobles.

The second wave of innovation which has been mentioned was popular among all classes. Hitherto the highest authority in the Russian Church was the metropolitan, who was nominally under the jurisdiction of the patriarch of Constantinople, and as soon as Constantinople fell into the hands of the infidel, and the tsars of Muscovy claimed to be the successors of the Byzantine emperors, it seemed right and proper that the Russian Church should become autocephalous and be governed by an independent Russian patriarch. The change was very dexterously effected by Godunov, with the formal assent of the Eastern Orthodox Church as a whole, and one of his adherents was placed on the patriarchal throne. The farm and the city and the landed proprietors and the ecclesiastics, Boris Godunov increased his influence to such an extent that on the death of Tsar Feodor without male issue in 1598 he was elected his successor by a Great National Assembly. His short reign was not so successful as his administration under the weak Feodor. The oligarchical party considered it a disgrace to obey a simple boyar; conspiracies were frequent, the rural districts were desolated by famine and plague, great bands of armed brigands roamed about the country committing all manner of atrocities, the Cossacks on the frontier were restless, and the government showed itself incapable of maintaining order. Under the influence of the great nobles who had unsuccessfully opposed the election of Godunov, the general discontent took the form of hostility to him as a usurper, and rumours were heard that the late tsar's younger brother Dimitri (Demetrius), supposed to be dead, was still alive and in hiding. In 1603 a man calling himself Dimitri, and professing to be the rightful heir to the throne, appeared in Poland, and a few months later he crossed the frontier with a large force of Poles, Russian exiles, German mercenaries and Cossacks from the Dnieper and the Don. In reality the younger son of Ivan the Terrible had been strangled before his brother's death—by orders, it was said, of Godunov—and the mysterious individual who was impersonating him was an impostor; but he was regarded as the rightful heir by a large section of the population, and immediately after Boris's death in 1605 he made his triumphal entry into Moscow. Thus began a period of Russian history commonly called "the Troublesome Times," which lasted until 1613. (See DEMETRIUS, PSEUDO-.)

The reign of Dimitri was short and eventful. Before a year had passed a conspiracy was formed against him by an ambitious noble called Basil (Vassili) Shuisky, and he was assassinated in the Kremlin. The chief conspirator, Shuisky, seized the power and was elected tsar by an Assembly composed of his faction, but neither

RUSSIA

[TSARDOM OF MCSOVKY]
the ambitious boyars, nor the pillaging Cossacks, nor the German mercenary bands were satisfied with the change, and soon a new impostor, likewise calling himself Dmitri, son of Tsar Ivan, came forward as the rightful heir. Like his predecessor, he enjoyed the protection and support of the Polish king, Sigismund III., and was even tempted to compel Shuiski to abdicate; but as soon as the throne was vacant Sigismund put forward as a candidate his own son, Wladislaus. To this latter the people of Moscow swore allegiance on condition of his maintaining Orthodoxy and granting certain rights, and on this understanding the Polish troops were allowed to occupy the city and the Kremlin. Then Sigismund unveiled his real plan, which was to obtain the throne not for his son but for himself. This scheme did not please any of the contending factions and it roused the anti-Catholic fanaticism of the masses, which, under Michael Romanov, the young son of the metropolitan Philarct, who was connected by marriage with the late dynasty.

During the reign of Michael (1613-45) the new dynasty came to be accepted by all classes, and the country recovered to some extent from the disorders and exhaustion from which it had suffered so severely; but it was not strong enough to pursue at once an aggressive foreign policy, and the tsar prudently determined to make peace with Sweden and conclude an armistice of fourteen years with Poland. At the conclusion of the armistice in 1632, during a short truce in Poland, he attempted to avenge past injuries and recover lost territory; but the campaign was not successful, and in 1634 he signed a definitive treaty by no means favourable to Russia. That lesson was laid to heart, and he subsequently maintained a purely defensive attitude. As a precaution against Tatar invasions he founded fortified towns on his southern frontiers—Tambov, Kozlov, Penza and Simbirsk; but when the Don Cossacks offered him Azov, which they had captured from the Turks, and a National Assembly, convoked for the purpose of considering the question, were in favour of accepting it as a means of increasing Russian influence on the Black Sea, he decided that the town should be restored to the sultan, much to the disappointment of its inhabitants.

In the reign of Michael's successor, Alexius (1645-76), the country recovered its strength so rapidly that the tsar was tempted to revive the energetic aggressive policy and put forward claims to Livonia, Lithuania and Little Russia, but he was obliged to moderate his pretensions. Livonia continued to be under Swedish rule, and Lithuania remained united with Poland. Some advantages, however, were obtained. Smolensk and Chernigov were definitely incorporated in the tsardom of Muscovy, and great progress was made towards the absorption of Little Russia.

The tsar and the patriarch. The tsar and the patriarch. The tsar and the patriarch. The tsar and the patriarch.
RUSSIA

While the Muscovites of the upper classes were thus beginning to abandon their old oriental habits, their government was preparing to make a political evolution of a similar kind. Notwithstanding the efforts of the Poles and the Foreign relations. Military Orders to exclude Russia from the shores of the Baltic and keep her in a state of isolation, she was coming slowly into closer relations with central and western Europe. The emperor, the governments of England, Holland, France and Sweden, and even the Grand Turk made advances to the tsar. Some of them wished to gain him as an ally against their rivals, whilst others hoped to obtain from him commercial privileges and permission to trade directly with Persia. The political and the commercial proposals were alike received with coldness, because the native diplomats had aims which could not be reconciled completely with the policy of any other country, and the native merchants were afraid of foreign competition. The negotiations gave, therefore, little tangible result, but they helped to prepare the way for the new order of things which was soon to be introduced by Alexius's son, Peter the Great.

Before reaching the new order of things, the country had to pass through an internal crisis similar to that which followed the death of Ivan the Terrible, but not nearly so severe. Alexius had been twice married and had left several children by each of his wives, and, as generally happened in such cases, a struggle for power ensued between the two rival families. The late tsar's eldest son, Theodore, was weak in health and died without male issue after an uneventful reign of six years (1676–82). As the second son, Ivan, next in the order of succession, was almost an imbecile, the third son, Peter, born of the second marriage, was proclaimed tsar, and his maternal relations became the dominant faction, but their triumph was of very short duration. An ambitious, energetic sister of Ivan, well known in Russian history as Sophia Alexeyevna, instigated the strelcisi (strelits), as the troops of the unreformed standing army were called, to upset the arrangement. After making a tumult in the Kremlin and assassinating several of the men in power, they insisted that Ivan should be proclaimed tsar jointly with Peter, and that Sophia should act as regent during the minority of the two young sovereigns. She accepted unhesitatingly the difficult and dangerous post, and ruled autocratically for seven years (1682–89), but this did not satisfy her ambition. Having discovered that Peter, who had reached the age of seventeen, was thinking of taking the administration into his own hands, she conspired against him with the commander of the strelcisi and some of his maternal relations; but she was circumvented by the rival faction and interned in a convent, and Peter's mother was put in her place. The importance of these incidents, which are very characteristic of political life in the tsardom of Muscovy, will appear in the sequel.

If Peter really thought of taking the administration into his own hands, he very soon abandoned the idea and returned to the irregular suburban life he had led during his half sister's regency—associating with foreigners who could teach him the mechanical arts of the West, drilling troops, building and sailing boats, forming projects for the creation of a great navy, indulging publicly in Bacchanalian revels and boisterous amusements not at all to the taste of his pious countrymen, and appearing in Moscow as Orthodox tsar only on great ceremonial occasions. Already the desire to make his country a great naval power was becoming his ruling passion, and when he found by experience that the White Sea, Russia's sole maritime outlet, had great practical disadvantages as a naval base, he launched upon two projects of getting a firm footing on the shores of the Black Sea and the Baltic. At first he gave the preference to the former, and with the aid of a flotilla of small craft, constructed on a tributary of the Don, he succeeded in capturing Azov from the Turks. Greatly elated by this success, he recommended to the council of boyars the construction of a powerful fleet for carrying on war with the infidel, and he himself went abroad to learn more about shipbuilding and useful foreign inventions, and to prepare
diplomatically the projected crusade. His foreign tour, during which he visited Germany, Holland, England, France and Austria, lasted nearly a year and a half, and was suddenly interrupted, when on his way from Vienna to Venice to study the construction of war-galleys, by the alarming news that the turbulent streltsy of Moscow had mutinied anew with the intention of placing Sophia on the throne. On arriving in Moscow he found that the mutiny had been suppressed and the ringleaders punished, but he considered it necessary to reopen the investigation and act with exemplary severity. Of the surviving mutineers over twelve hundred were executed, some of them by his own hand, and the entire corps was disbanded.

From this moment may be dated the personal reign of Peter, for he now began to direct personally all branches of the administration, and governed with indefatigable vigour for twenty-seven years, during which he greatly increased the area and profoundly modified the internal condition of his country. At first he concentrated his attention on foreign affairs. During his foreign tour he had discovered that the idea of a grand crusade against the infidel was irreconcilable, for France was, according to her traditional policy, the ally of the sultan, Austria wished to avoid trouble on her eastern frontier in order to devote her energies to the question of the Spanish succession, and all the other countries which he wished to draw into the coalition had good reasons of their own for desiring the maintenance of peace in eastern Europe. For his Baltic schemes, on the contrary, he had found the ground well prepared. During a halt of a few days in Poland on his way back from Vienna, King Augustus had explained to him a project for partitioning the trans-Baltic provinces of Sweden, by which Poland should recover Livonia and annex Estonia, Russia should obtain Ingria and Karelia, and Denmark should take possession of Holstein. As Sweden was known to be exhausted by the long wars of Gustavus Adolphus and his successors, and weakened by internal dissensions, the dismemberment seemed an easy matter, and Peter embarked on the scheme with a light heart; but his illusions were quickly dispelled by the eccentric young Swedish king, Charles XII., who arrived suddenly in Estonia and completely routed the Russian army before Narva. Thus began the so-called Northern War, which lasted intermittently for more than twenty years, and was terminated by the treaty of Nystad (Sept. 10, 1721). By that treaty Peter acquired not only Ingria and Karelia, as originally contemplated, but also Livonia, Estonia and part of Finland. The problem of obtaining a firm footing on the Baltic coast, on which Ivan the Terrible had squandered his resources to no purpose, was now solved satisfactorily.

Peter’s other favourite scheme, that of acquiring the command of the Black Sea, was as far from realization as ever. In the midst of the Northern War, shortly after the great Russian victory of Poltava (1709), the sultan, at the instigation of Swedish and French agents, determined to recover Azov, and made great military preparations for that purpose. Having annihilated at Poltava the army of Charles XII., Peter was not at all indisposed to renew the struggle with Turkey, and began the campaign in the confident hope of making extensive conquests; but he had only got as far as the Pruth when he found himself surrounded by a great Turkish army, and, in order to extricate himself from his critical position, he had to sign a humiliating treaty by which Azov and other conquests were restored to the sultan. His dreams of freeing the Christians from the yoke of the infidel had to be abandoned, and the côtés (crusading) fleet for the conquest of the outer shores of the Black Sea was postponed till the reign of Catherine II.

Those tedious and exhausting wars did not prevent Peter from attending to internal affairs, and he displayed as a reformer even more vigour and tenacity than as a general in the field. His first reforms were connected with the army. Several of his immediate predecessors had come to recognize that Russia, with her antiquated military organization, was unable to cope with her Western neighbours, and had begun to organize, with the help of foreigners, a military force more in accordance with modern requirements; but the progress made in that direction had been slow and unsatisfactory. Unlike his predecessors, Peter was in a hurry to realize his plans, and he set to work at once. In less than two years the time of disbanding the streltsy he contrived to create an army of 40,000 men. This army, it is true, was so inefficient that it was completely routed by the Swedish king with a most inferior force, but it was improved gradually until it learned to conquer its Swedish opponents. To accomplish such a feat it was necessary, of course, to expend large sums of money; and as the country could ill bear an increase of taxation, the whole financial system had to be improved and the natural resources of the country had to be developed. At the same time the military and financial requirements dislocated the local and central administration, and consequently a series of radical administrative reforms had to be undertaken. Thus one reform led to another; but Peter was not dismayed by the magnitude of the task, and worked vigorously in all departments with a sublime disregard for the clamour of reactionary opponents and for the feelings and prejudices of his subjects in general. A prudent ruler in his position would have sought to preserve the outward forms while changing the inner substance, but Peter was not at all prudent in that sense. Very often he wantonly provoked opposition, as when he shaved off his beard and compelled his chief officials to do likewise, though he well knew that the operation was regarded by the ignorant masses and the pious of all ranks as a sinful defacing of the image of God. In his eyes the beard was a symbol of the old régime, and as such it must be removed. Reckless of consequences, he swept away the venerated ceremonial formalities which his ancestors had scrupulously observed, openly scoffed at ancient usage, habitually dressed in foreign costume, and generally chose foreign hereticks as his boon companions. In adopting foreign innovations, he showed, like the Japanese of the present day, no sentimental preference for any particular nation, and was ready to borrow from the Germans, Dutch, English, Swedes or French whatever seemed best suited for his purpose. The innovations, it must be admitted, did not prove so efficient as he expected, because human nature and traditional habits cannot be changed as quickly as institutions. When the Boyar Duma became the Senate, and the Prikazi or administrative departments were organized under the name of Colleges, and when every important town was endowed with a Rathhaus, a Polizeimeister, gilds, aldermen, and all the municipal paraphernalia of western Europe, the vices of the old institutions survived in the new. Notwithstanding the changes in organization and terminology, the officials remained ignorant, indolent, careless, indifferent to the public welfare, high-handed and extortionate, and the local self-government which was intended to enlighten and control them proved sadly wanting in vitality and practically worthless. So inefficient, indeed, were the reforms as a whole, and so unsuited to the national character and customs, that the Slavophil critics of a later date could maintain plausibly the paradoxical thesis that in regard to internal administration Peter was anything but a national benefactor. However that may be, it must be confessed even by Slavophils that he dragged his countrymen, more by force than by persuasion, from the paths of traditional routine and pushed them along with all his might on the broad road of progress in the modern sense of the term. Abandoning the ancient Muscovite capital, where many influential innovations had been made, and after the establishment of an army and a few of the supernumerous inhabitants regarded him with horror as Antichrist, he built at the mouth of the Neva a new capital which was to serve as “a window through which his people might look into Europe”; and laying aside the national title of tsar he proclaimed himself (1711) emperor (Imperator) of all Russia—much to the surprise and indignation of foreign diplomatic chancelleries, which resented the audacity of a semi-barbarous potentate in claiming to be
equal in rank with the head of the Holy Roman Empire. Gradually, however, the chancelleries had to withdraw their protests, for it came to be generally recognized that the semi-barbarian, who died at the early age of fifty-three, had transformed the oriental tsardom of Muscovy into a state of the Western type and had made it a powerful member of the European family of nations (see Peter I).

IV. The Modern Empire.—On the death of Peter (1725) the internal tranquillity and progress of the empire were again seriously threatened by the uncertainty of the order of succession, and the autocratic power which he had wielded so vigorously passed into the hands of a series of weak, turbulent sovereigns who were habitually guided by personal caprice and the advice of intriguing favourites rather than by serious political considerations. During this period, which lasted from 1725 to 1762, the male line of the Romanov dynasty became extinct, and the succession passed to various members of the female line, which intermarried with German princes. In this way German influence was enormously increased, and was represented by men of considerable capacity holding the highest official positions, such as Birem, Münnich and Ostermann. The main events of the period may be summarized very briefly. Peter, by his first marriage, had acquired an unhappy offspring (q.v.) who figures more largely in imaginative literature than in history—a narrow-minded, obstinate, pious youth, who had no sympathy with his father's violent innovations, and was completely under the influence of the old Muscovite reactionary faction. Intimidated by the paternal anger and threats he took refuge in Austria, and when he had been induced by illusory promises to return to Russia he was tried for high treason by a special tribunal, and after being subjected to torture died in prison (1728). To avert the danger of a man of this type succeeding to the throne Peter made a law by which the reigning sovereign might choose his successor according to his own judgment. After a few years Peter's own wife, Catherine, the daughter of a Lithuanian peasant, was crowned with all due solemnity, "in recognition of the courageous services rendered by her to the Russian Empire." This gave Catherine a certain right to the throne at her husband's death, and her claims were supported by Peter's most influential coadjutors, especially by Prince Menshikov, an ambitious man of humble origin who had been raised by his patron to the highest offices of state. On the other hand the great nobles of more conservative tendencies wished to get the young son of the cesarevich Alexius made emperor under their own control. The factions fell out, Alexius died, and Catherine reigned for about a year and a half, after which the son of the cesarevich Alexius, Peter II., occupied the throne from 1727 to 1730. At first he was under the tutelage of Menshikov, who wished him to marry his daughter, but he soon contrived, with the aid of the Dolgorukis and other old families, to get his imperious tutor arrested and exiled to Siberia. The Dolgorukis and their friends thus came into power, and on the death of Peter II. in 1730 they offered the throne to Anne, a daughter of Courland, a daughter of Ivan V., elder brother of Peter the Great, on condition of her signing a formal document by which the seat of government should be transferred from St Petersburg to Moscow, and the autocratic power should be limited and controlled by a grand council composed of their own faction. Anne accepted the condition and became empress, but when she discovered that the attempt to limit her powers in favour of a small conservative oligarchy was extremely unpopular among all classes, she submitted the question to an assembly of 800 ecclesiastical and lay dignitaries, and at their request the unlimited autocratic rule was re-established. Her reign (1730-40) was a regime of methodical German despotism on the lines laid down by her husband Peter the Great, and as she was naturally indolent and much addicted to frivolous amusements, the administration was directed by her favourite Biren (q.v.) and other men of German origin. Having no male issue, she chose as her successor the infant son of her niece, Anna Leopoldovna, duchess of Brunswick, and at her death the child was duly proclaimed emperor, under the name of Ivan VI., but in little more than a year he was dethroned by the partisans of the Princess Elizabeth, a daughter of Peter the Great and Catherine I. As a true daughter of the great Russian reformer, Elizabeth (1741-61) relegated the German element to a subordinate position in the administration and gave her confidence to genuine Russians like Bestuzhev, Vorontsov, Razumovski (her morganatic brother) and the Shuvalovs. Her hatred of Germans showed itself likewise in her persistent struggle with Frederick the Great, which cost Russia 300,000 men and 30 millions of roubles—an enormous sum for those days—but in the choice of a successor she could not follow her natural inclinations, for among the few descendants of Michael Romanov there was not even one, in the female line, who could be called a genuine Russian. She proclaimed, therefore, as heir-apparent the son of her deceased elder sister Anna, Charles Peter Ulrich, duke of Holstein-Gottorp, a German in character, habits and religion, and tried to Russianize by making him adopt the Eastern Orthodox faith and live in St Petersburg during the whole of her reign; but her well-meant efforts were singularly unsuccessful. Impervious to Russian influence, she remained true to his original nationality, and by his undisguised aversion to everything in his adopted country and his passionate, childish admiration of Frederick the Great, he made himself so unpopular that within a few months of his accession, in December 1761, he was dethroned and assassinated by the partisans of his ambitious and able consort, the famous Catherine II.

During the long reign of Catherine II. (1762-96) Russia made rapid progress in civilization, and came to be fully recognized as one of the Great Powers. Coming after a series of incompetent rulers, the German princess who had brought herself to the Russian throne by her own merits won the respect of all the world. She made Russia into a great power both in home and in foreign affairs; but she was not a mere imitator. Peter had endeavoured to import from western Europe the essentials of good government and such of the useful arts as were required for the development of the natural resources of the country; Catherine did likewise, but she did not restrict herself to purely utilitarian aims in the narrower sense of the term. She strove to impart also something of the refinement and ornamental attributes of Western civilization, and aspired to raise her adopted shtandel intellectually and artistically to the west-European level. This new departure she lost no time in proclaiming to the world. Within a few months of her accession, having heard that the publication of the famous French Encyclopédie was in danger of being stopped by the French government on account of its irreligious spirit, she proposed to Diderot that he should complete his great work in Russia under her protection. Four years later she endeavoured to embody in a legislative form the principles of enlightenment which she had imbibed from the study of the French philosophers. A Grand Commission, which might be called a consultative parliament, composed of 652 members of all classes—officials, nobles, burghers and peasants—and

1 To assist the reader in threading the genealogical maze briefly described above, the following tabular statement is inserted:—

| (II.) Alexius (1645-50). |
| (III.) Theodore (1650-52). |
| (IV.) Ivan V. (1652-7). |
| (V.) Peter I. (1672-72). |
| (VI.) Anne (1725-40). |
| (VII.) Catherine II. (1741-61). |
| (VIII.) Ivan VI. (1744-46). |
| (IX.) Elisabeth. (1741-61). |
| (X.) Peter I., d. (1762). |
| (XI.) Peter II. (1762-63). |
| (XII.) Peter III., d. (1762). |
| (XIII.) Ivan VI. (1762-63). |
of various nationalities, was called together at Moscow to consider the needs of the empire and the means of satisfying them. The instructions for the guidance of the Assembly were prepared by the empress herself and were, as she frankly admitted, the result of "pillaging the philosophers of the West," especially Montesquieu and Beccaria. As many of the democratic principles frightened her more moderate and experienced advisers, she wisely refrained from immediately putting them into execution. After holding more than two sittings the so-called Commission was dissolved without getting beyond the realm of theory and *pis desideria*. Subsequently very important reforms were introduced, not by the vote of an assembly, but by the fiat of the autocratic power. The large territorial units of administration created by Peter the Great were broken up into so-called "governments" (*gubernii*) and further subdivided into districts (*uieyards*), and each government was confided to the care of a governor and a vice-governor assisted by a council. A certain amount of local self-government was entrusted to the nobles and the burgurers, and the judicial administration was thoroughly reorganized in an enlightened and humane spirit. The great estates of the Church, on which were settled about a million serfs, were secularized and assimilated with the state-domains. At one moment the idea of emancipating all the serfs was entertained, but the project was speedily abandoned, because it would have alienated the nobles—the only class on which Catherine could rely for support. To conciliate them she greatly extended the area of serfdom by making large grants of land and serfs to courtiers and public servants who had specially distinguished themselves. About education a great deal was spoken and written, and a certain amount of progress was effected. Whilst primary education was neglected, secondary schools were created in the principal towns and a Russian Academy was founded in St. Petersburg. In the imperial court, so far as outward decorum and refinement were concerned, there was an immense improvement, and the upper section of the old Russian *Dvorianstvo* became a noblesse with French aristocratic conceptions and ideals. A taste for French literature spread rapidly, and the poets and dramatists of Paris found clever imitators in St. Petersburg.

By such means Catherine made herself very popular in the upper ranks of society, but as a woman and a usurper who did little or nothing to lighten the burdens of the people she failed to gain the loyalty and devotion of the masses. In the first part of her reign popular discontent found expression in various forms, and on one occasion it produced a serious insurrection. In 1773 a Don Cossack called Pugachev, who was so uneducated that he could not even sign the manifestes written for him, declared himself to be Peter III., and announced that he was going to St. Petersburg to punish his faithless wife and place his son Paul on the throne. Many believed, or affected to believe, in the pretender, and in a short time he gathered around him a large force of Cossacks, peasants, Tatars and Tchuvash, swept over the basin of the lower Volga, executed mercilessly the landed proprietors, seized and pillaged the town of Kazan, and kept the whole country in a state of alarm for more than a year. Finally, after a crushing defeat in which 2000 of the insurgents were killed and 6000 taken prisoners, he was betrayed by some of his followers and executed in Moscow. His name and exploits still live in the popular legends, and the insurrection is often referred to in revolutionary pamphlets as a laudable popular protest against tyrannical autocracy.

In foreign affairs Catherine devoted her attention mainly to pushing forward the Russian frontier westwards and southwards, and as France was the traditional ally of Sweden, Poland and Turkey, she adopted at first the so-called *système du Nord*, that is to say, a close alliance with Prussia, England and Denmark against France and Austria, who had buried their traditional enmity in the famous alliance of 1756. The first step westwards was taken in Courland, which lay between Russian territory and the Baltic coast. At the time of her accession the duchy was ruled by a son of the Polish king Augustus III., and he gave a pretext for aggression by refusing to allow Russian troops returning from the Seven Years' War to pass through his territory. For this unfriendly act he was deposed and replaced by Biren, who had previously been duke of Courland (1757-40) and had since been exiled to Siberia and Varoslav. Under Biren (1763-69) and his son and successor (1760-95), as nominees of Catherine, Courland was completely under Russian influence until 1795, when it was formally incorporated with the empire. The next country to feel the expansive tendencies of Russia was Poland, which had now very little power of resistance. Whilst Russia, Austria, Prussia and France were becoming powerful monarchies with centralized administration, Poland had remained a weak feudal republic with an elected king chosen under foreign influence and fettered by constitutional restrictions. All political authority was in the hands of turbulent nobles who quarrelled among themselves, who were always inclined to submit the questions at issue to the arbitration of arms, and who did not scruple to invite foreign powers to intervene on their behalf. The middle classes, which were making other countries rich and powerful, existed only in an embryonic condition. Instead of a well-organized army of the modern type there was merely an undisciplined militia composed almost exclusively of irregular cavalry; and the national defences as a whole were so weak that, in the opinion of such a competent authority as Maurice of Saxony, the country might easily be conquered by a regular army of 48,000 men. Here was a tempting field for the application of Catherine's aggressive policy, and if she had had to deal merely with the Poles she would have had an easy task. Unfortunately for the success of her schemes she had to reckon with stronger states which were anxious to check the Russian advance, and which were determined, in the event of aggression, to have a share of the plunder. Frederick the Great was at that moment impatient to extend and consolidate his kingdom by getting possession of the basin of the lower Vistula, which separated eastern Prussia from the rest of his dominions, while Austria had also claims on Polish territory and would certainly not submit to be excluded by her two rivals. In these circumstances Catherine hesitated to bring matters to a crisis, but her hand was forced by Frederick, and in 1772 the first partition of Poland took place without any very strenuous resistance on the part of the victim. This national disaster opened the eyes of many Polish patriots to the necessity of changing radically the old order of things, and an attempt was made by them to remove some of the more glaring absurdities of the existing constitution: the throne was declared to be hereditary, the *liberum veto* by which any petty noble could annul the most important decision of the national assembly was abolished, the royal authority was greatly strengthened, and the townsmen were empowered to send deputies to the Diet (1771). Such salutary reforms were naturally unwelcome to the aggressive neighbours who wished to preserve the traditional anarchy in order to have new facilities for intervention, and as Russia had signed with the puppet-king in 1768 a treaty by which the constitution could not be modified without her consent, she had a plausible ground for protest. She waited, however, until a deputation of the malcontents, who regretted the loss of *liberum veto* and who were afraid that the party of reform might undertake the emancipation of the serfs, came to St. Petersburg and asked for support in defence of the ancient liberties. Then an imperial manifesto reminding the Diet of its treaty of 1772 and issuing a challenge entered the Ukraine. This led to the second partition (1793), by which Russia obtained the eastern provinces with three millions of inhabitants. Even now the work of spoliation was not complete. When the patriots under Kosciusko made a desperate effort to recover the national independence the struggle produced a third partition (1795), by which the remainder of the kingdom was again divided between Russia, Prussia and Austria. Thus Poland disappeared for a time from the map of Europe.
Paul left no deep, permanent mark on Russian history. In internal affairs he wished to undo what his mother had done, but his impulsive, incoherent efforts in that direction merely dislocated the administrative mechanism without producing any tangible results. In foreign affairs he displayed the same capriciousness and want of perseverance. After proclaiming his intention of conferring on his subjects the blessings of peace, he joined in 1798 an Anglo-Austrian coalition against France; but when Austria paid more attention to her own interests than to the interests of monarchical institutions in general, and when England did not respect the independence she, in which she had taken under his protection, he succumbed to the artful blandishments of Napoleon and formed with him a plan for ruining the British empire by the conquest of India. Having roused, by what ought perhaps to be called his insanity, the enmity, distrust and fear of all around him, including some members of his own family, he was assassinated on the night of the 23rd to 24th of March 1801, and was succeeded by his son Alexander I.

The early part of Alexander's reign (1801-25) was a period of generous ideas and liberal reforms. Under the influence of his Swiss tutor, Frederick César de Laharpe, he had imbibed many of the Democratic ideas of the day, and he hoped to put them in practice, with the assistance at first of three young friends, Novosiltsow, Adam Caartorsky and Strogono, who were his intimate counsellors and were popularly known as the Triumvirate, and later of Mikhail Speranski (q.v.). Some of the more oppressive measures of the previous reign were abolished; the clergy, the nobles and the merchants were exempted from corporal punishment; the central organs of administration were modernized and the Council of the Empire was created; the idea of granting a constitution was academically discussed; great schemes for educating the people were entertained; scientific schools, gymnasia, training colleges and ecclesiastical seminaries were founded; the existing universities of Moscow, Vilna and Dorpat were reorganized and new ones founded in Kazan and Kharkov; the great work of self-emancipation was begun in the Baltic provinces. In all these schemes Alexander took a keen personal interest; but his enthusiasm was soon cooled by practical difficulties, and his attention became more and more engrossed by foreign affairs.

At that time, in respect of foreign affairs, Russia was entering on a new phase of her history. Hitherto she had confined her efforts to territorial expansion in eastern Europe and in Asia, and was content with the dominions, which she obtained from the Treaty of Kuchuk-Kainarji (1774). Russia's advance westward raised indirectly the Eastern Question, because it threatened two of France's traditional allies, Sweden and Poland, and Choiseul counselled that the best means of checking Catherine's aggressive schemes was to incite France's third traditional ally, Turkey, to attack her. This was not a difficult matter, because the Sublime Porte had many things to complain of in the past and had good reason to fear aggression in the near future. War was accordingly declared in 1768, but it proved disastrous for the sultan; and he had to sign in 1774 the treaty of Kuchuk-Kainarji, which gave Russia a firm hold on the Black Sea and the lower Pontic (see Russia: History.). The Tatars of the Bug, of the Crimea and of the Kuban were liberated from the suzerainty of the Porte; Azov, Kinburn and all the fortified places of the Crimea were ceded to Russia; the Bosphorus and Dardanelles were opened to Russian merchant vessels; and Russian ambassadors obtained the right to intervene in favour of the inhabitants of the Danubian principalities. Ten years later the semblance of independence which was left to the khan of the Crimea was destroyed and the peninsula formally annexed to the empire.

The peace concluded at Kuchuk-Kainarji was not of long duration. Catherine had conceived土耳其 an intimate and pressing desire to solve radically the Eastern Question by partitioning Turkey as she and her allies had partitioned Poland, and she had persuaded the emperor Joseph II. to take part in the scheme. It was intended that Russia should take what remained of the northern coast of the Black Sea, Austria should annex the Turkish provinces contiguous to her territory, the Danubian principalities and Bessarabia should be formed into an independent kingdom called Dacia, the Turks should be expelled from Europe, the Byzantine empire should be resuscitated, and the grand-duke Constantine, second son of the Russian heir-apparent, should be placed on the throne of the Porte. Catherine saw in this scheme a means of establishing a new Constantinople, and as Catherine's menacing attitude left little doubt as to her aggressive intentions the Porte presented an ultimatum and finally declared war (1787). Fortune again favoured the Russian arms, but as Austria was less successful and signed a separate peace at Sistova in 1791, Catherine did not obtain much material advantage from the campaign. By the peace of Jassy, signed in January 1792, she retained Ochakov and the coast between the Bug and the Dniester, and she secured certain privileges for the Danubian principalities, but the Turks remained in Constantinople, and the realization of the famous grand project, as it was termed, had to be indefinitely postponed.

During the first years of the French Revolution Catherine's sympathy with philosophic liberalism rapidly evaporated, and she did all in her power to stimulate the hostility of the European sovereigns to the democratic movement; but she carefully abstained from joining the Coalition, and waited patiently for the moment when the complications in western Europe would give her an opportunity of solving independently the Eastern Question in accordance with Russian interests. That moment never came. In November 1796, when the country was not yet prepared to enter on a decisive struggle with Turkey, Catherine died at the age of sixty-six, and was succeeded by her son Paul, whom she had kept during her long reign in a state of semi-captivity.

The short reign of Paul (1796-1801) resembled in many points the still shorter one of his father, Peter III. Both sovereigns were childish wayward and capriciously autocratic; both were recklessly indifferent to the feelings, convictions and wishes of those around them; both took a passionate interest in the minutiae of military affairs; as Peter had conceived a boundless admiration for Frederick the Great, so Paul conceived a similar admiration for Napoleon, and both suddenly reversed the national policy to suit this feeling; both were singularly blind to the consequences of their conduct; and both fell victims to court conspiracies which could be in some measure justified, or at least excused, on patriotic grounds.
the one strove to erect bulwarks against French aggression, the other was preparing the ground for fresh annexations. During 1803–4 the breach between the two rivals widened, because Napoleon became more and more aggressive and unceremonious in Italy and Germany. Before the end of 1803 Alexander had come to perceive the necessity of resisting him energetically in order to save Europe from complete subjection, and in August 1804 he recognized that an armed conflict was inevitable. It broke out in the following year, and after the battles of Austerlitz (December 1805) and Friedland (June 1807), in which the Russians were completely defeated, the two sovereigns had their famous interviews at Tilsit, at which they not only made peace but agreed to divide the world between them, with a sublime indifference to the interests of other states. The grandiose project was at once vaguely outlined in the Grande Armée plan, to the intense satisfaction of both parties, and on both sides there was much rejoicing at the conclusion of such an auspicious alliance; but the diplomatic honeymoon was not of long duration. The mutual assurances of unbounded confidence, admiration and sympathy, if there was any genuine sincerity in them, represented merely a transient state of feeling. Napoleon, who could brook no equal, was nourishing the secret hope that his confederate might be used as a docile subordinate in the realization of his own plans, and the confederate soon came to suspect that he was being duped. His suspicions were intensified by the hostile criticisms of the Tilsit arrangement among his subjects and by the arbitrary conduct of his ally, who continued his aggressions in reckless fashion as if he were sole master of Europe. The sovereigns of Sardinia, Naples, Portugal and Spain were dethroned, the pope was driven from Rome, the Rhine Confederation was extended till France obtained a footing on the Baltic, the grand-duchy of Warsaw was re-organized and strengthened, the promised evacuation of Prussia was indefinitely postponed, an armistice between Russia and Turkey was negotiated by French diplomacy in such a way that the Russian troops should evacuate the Danubian principalities, which Alexander intended to annex to his empire, and the scheme for breaking up the Ottoman empire and ruining England by the conquest of India, which had been one of the most attractive baits in the Tilsit negotiations, but which had not been formulated in the treaty, was no longer spoken of. At the same time Napoleon threatened openly to crush Austria, and in 1809 he carried out his threat by defeating the Austrian armies at Wagram and elsewhere, and dictating the treaty of Schönbrunn (October 14).

Russia now remained the only unconquered power on the continent, and it was evident that the final struggle with her could not be long delayed. It began 18 November 1812 by the invasion of Russia, which began with the scorched earth policy, and ended in 1815 at Waterloo. During those three years Alexander was the chief antagonist of Napoleon, and it was largely due to his skill and persistency that the allies held together and freed Europe permanently from the Napoleonic domination. When peace was finally concluded, he had obtained that predominant position in European politics which had been the object of his ambition since the commencement of his reign, and he now believed firmly that he had been chosen by Providence to secure the happiness of the world in general and of the European nations in particular. In the fulfilment of this supposed mission he was not very successful, because his conception of national happiness and the means of obtaining it differed widely from that of the peoples whom he wished to benefit. They had fought for freedom in order to liberate themselves not only from the yoke of Napoleon but also from the tyranny of their own governments, whereas he expected them to remain subserviently under the patriarchal institutions which their native rulers imposed on them. Thus, in spite of his academic sympathy with liberal ideas, he became, together with Metternich, a champion of political stagnation, and co-operated willingly in the reactionary measures against the revolutionary movements in Germany, Italy and Spain. In the affairs of his own country he refrained from developing and extending the liberal institutions which he had created immediately after his accession, and he finally adopted in all departments of administration a strongly reactionary policy. This naturally caused profound disappointment and dissatisfaction in the liberal section of the educated classes and especially among the young officers of the regiments which had spent some years in western Europe. Some of these officers had been in touch with the revolutionary movements, and had adopted the idea then prevalent in France, Germany and Italy that the best instrument for assuring political progress was to be found in secret societies. In Russia such societies began to be formed about 1816. The tsar, though he came to know of their existence, refrained from taking repressive measures against them, and when he died suddenly at Taganrog in the 1st of August 1825 he was not in a position to realize their political aspirations. The heir to the throne was the late tsar’s eldest brother, Constantine, but he declined, for private reasons, to accept the succession, Nicholas, was proclaimed emperor. Taking advantage of this short interregnum, some members of the secret societies, mostly officers of the Guards, organized a mutiny among the troops quartered at St Petersburg and in Podolia, with a view to effecting a political revolution, but the movement was easily suppressed, and the ringleaders, known subsequently as the Decembrists, were severely punished (see Nicholas I).

Nicholas was a blunt soldier incapable of comprehending his brother’s sentimental sympathy with liberalism. The Decembrists’ abortive attempt at revolution and the Polish insurrection of 1831, which he crushed with great severity, confirmed him in his conviction that Russia must be ruled with a strong hand. That conviction he put into practice with extreme rigour during the thirty years of his reign (1825–55), endeavouring by every means at his disposal to prevent revolutionary ideas from germinating spontaneously among his subjects and from being imported from abroad. For this purpose he created a very severe press censorship and an expensive system of passports, which made it more difficult for Russians to visit foreign countries. It would be unjust, however, to say that he was the determined enemy of all progress. Progress was to be made in certain directions and in a certain way. Not only was the army to be well drilled and the fleet to be carefully equipped, but railways were to be constructed, river-navigation was to be facilitated, manufacturing industry was to be developed, commerce was to be encouraged, the administration was to be improved, the laws were to be codified and the tribunals were to be reorganized. All this was to be done, however, under the strict supervision and guidance of the autocratic power, with as little aid as possible from private initiative and with no control whatever of public opinion, because influential public opinion is apt to produce insubordination. When the results proved unsatisfactory, remedies were sought in increased administrative supervision, draconian legislation and severe punishment, and no attempt was made to get out of the vicious circle. In the last months of his life, under the influence of a great national disaster, the conscientious, persistent autocrat began to suspect that his system was a mistake, but he still clung to it obstinately. “My successor,” he is reported to have said on his death-bed, “may do as he pleases, but I cannot change!”

This steadfast faith in autocratic methods and the exaggerated fear of revolutionary principles were shown in foreign as well as in home affairs. Like Alexander in the last period of his reign, Nicholas considered himself the supreme guardian of European order, and was ever on the watch to oppose revolution in all its forms. Hence he was generally in strained relations with France, especially in the time of Louis Philippe, who became king not by the grace of God but by the will of the people. During the revolutionary ferment of 1848–49 he urged the Prussian king to refuse the imperial crown, co-operated with the Austrian emperor in suppressing the Hungarian insurrection, and compelled the Prussians to withdraw their support from the insurgents
in Schleswig-Holstein. Unfortunately for the peace of the world his habitual policy of maintaining the existing state of things was frequently obscured and disturbed by his desire to maintain and increase his own and his country's prestige, influence and territory. By the Persian War, which broke out in 1826, in consequence of frontier disputes, he annexed the provinces of Erivan and Nakhichevan, and during the whole of his reign the conquest of the Caucasus was systematically carried on. With regard also to the Ottoman empire his policy cannot be said to have been strictly conservative. As protector of the Orthodox Christians he espoused the cause of the rayahs in Greece, Servia and Rumania. Under a threat of war he obtained in 1826 the Convention of Akerman, by which the autonomy of Moldavia, Walachia and Servia was confirmed, free passage of the straits was secured for merchant ships and disputed territory on the Asiatic frontier was annexed, and in July 1827 he signed with England and France the treaty of London for the solution of the Greek question by the mediation of the Powers. As the sultan rejected the mediation, his fleet was destroyed by the combined squadrons of the three Powers at Navarino; and as this "untoward event" did not suffice to overcome his resistance, a Russian army crossed the Danube and after two hard-fought campaigns advanced to Adrianople. Here, on the 14th of September 1828, was signed a treaty by which the Porte ceded to Russia the islands at the mouth of the Danube and several districts on the Asiatic frontier, granted full liberty to Russian navigation and commerce in the Black Sea, and guaranteed the autonomous rights previously accorded to Moldavia, Walachia and Servia. By the 10th article of the treaty, moreover, Turkey acceded to the protocol of the 22nd of March 1829, by which the Powers had agreed to the erection of Greece into a tributary principality. This attempt of Russia to secure the sole prestige of liberating Greece was, however, frustrated by the action of the other Powers in putting forward the principle of the independence of the new state, with a further extension of frontiers.

The result of the war was to make Russia supreme at Constantinople; and before long an opportunity of further increasing her influence was created by Mehemet Ali, the ambitious pasha of Egypt, who in November 1831 began a war with his sovereign in Syria, gained a series of victories over the Turkish forces in Asia Minor and threatened Constantinople. Sultan Mahmud II. was powerless in the field; Wallachia and Moldavia were in confusion; the sultan, who had been defeated by the Tsar at Georgia, died in despair of Russia. Nicholas immediately sent his Black Sea fleet into the Bosphorus, landed on the Asiatic shore a force of 10,000 men, and advanced another large force towards the Turkish frontier in Bessarabia. Under pressure from England and France the Egyptians retreated and the Russian forces were withdrawn, but the tsar had meanwhile (July 8, 1833) concluded with the sultan the treaty of Unkvar-Skelessi, which constituted ostensibly a defensive and offensive alliance between the two Powers and established virtually a Russian protectorate over Turkey. In a secret article of the treaty the sultan undertook in the event of a casus foederis arising, and in consideration of being relieved of his obligations under the articles of the public treaty, to close the Dardanelles to the warships of all nations "au besoin," which meant in effect that in the event of Russia being threatened with an attack from the Mediterranean he would close the Dardanelles against the invader. England and France protested energetically and the treaty remained a dead letter, but the question came up again in 1840, after Mahmud's renewed attempt to crush Mehemet Ali had ended in the utter defeat of the Turks by Ibrahim at Nesib (June 24, 1839). This time Mahmud was supported by the French government, which aimed at establishing predominant influence in Egypt; but he was successfully opposed by a coalition of Great Britain, Russia, Austria and Prussia, which checkmated the aggressive designs of France by the convention of London (July 15, 1840) (see MEHMET ALI AND TURKEY). In this way the development of Russian policy with regard to Turkey was checked for some years, but the project of confirming and extending the Russian protectorate over the Orthodox Christians was revived in 1852, when Napoleon III. obtained for the Roman Catholics certain privileges with regard to the Holy Places in Palestine. At the same time Austria intervened in Montenegro affairs and induced the sultan to withdraw his troops from the principality. In these two incidents the tsar perceived a diminution of Russian prestige and influence in Turkey, and Prince Menshikov was sent on a special mission to Constantinople to obtain reparation in the form of a treaty which should guarantee the rights of the Orthodox Church with regard to the Holy Places and confirm the protectorate of Russia over the Orthodox rayahs, established by the treaties of Kainarj, Bucharest and Adrianople. The resistance of the sultan, supported by Great Britain and France, led to the Crimean War, which was terminated by the taking of Sebastopol (September 1853) and the treaty of Paris (March 30, 1856). By that important document Russia reluctantly consented to a strict limitation of her armaments in the Black Sea, to withdrawal from the mouths of the Danube by the retrocession of Bessarabia which she had annexed in 1812, and finally to a renunciation of all special rights of intervention between the sultan and his Christian subjects. Nicholas did not live to experience this humiliation. He had died at St Petersburg on the 2nd of March 1855 and had been succeeded by his eldest son, Alexander II.

The first decade of Alexander's reign is commonly known in Russia as "the epoch of the great reforms," and may be described as a violent reaction against the political and intellectual stagnation of the preceding period. The repressive system of Nicholas, in which all other public interests were sacrificed to that of making Russia a great military power, the guardian of order in Europe and the predominant factor in the Eastern Question, had been tried and found wanting. Ending in a military disaster and a diplomatic humiliation, it had failed to attain even the narrow object for which it had been created. This was clearly perceived and keenly felt by the educated classes, and as soon as the strong hand of the uncompromising autocrat was withdrawn, they clamoured loudly for radical changes in the aims and methods of their rulers. Russia must adopt, it was said, those enlightened principles and liberal institutions which made the Western nations superior to her not only in the arts of peace but even in the arts of war; for by this means alone could the hope to overtake and surpass them in the race of progress. On that subject there was wonderful unanimity, and the few persons who could not join in the chorus had the prudence to remain silent. For the first time in the history of Russia public opinion in the modern sense became a power in the state and influenced strongly the policy of the government. Though the young emperor was of too phlegmatic a temperament to be carried away by the prevailing excitement and of too practical a turn of mind to adopt wholesale the doctrinaire theories of his self constituted, irresponsible advisers, he recognized that great administrative and economic changes were required, and after a thorough reorganization of his standing armed forces in the Crimean War, the thoroughgoing spirit of the reforms, of which the most important were the emancipation of the serfs, the thorough reorganization of the judicial administration and the development of local self-government. All these undertakings, in which the humane, liberal-minded autocrat received the sympathy, support and co-operation of the more enlightened of his subjects, were successfully accomplished. The serfs were liberated entirely from the arbitrary rule of the landowners and became proprietors of the communal land; the old tribunals which could be justly described as "dens of iniquity and incompetence," were replaced by civil and criminal lawcourts of the French type; in which justice was dispensed by trained jurists according to codified legislation, and from which the traditional bribery and corruption were rigidly excluded; and the administration of local affairs—roads, schools, hospitals, &c.—was entrusted to provincial and district councils freely elected by all classes of the population. In addition to these great and beneficial changes, means were taken for developing more rapidly the
vast natural resources of the country, public instruction received an unprecedented impetus, a considerable amount of liberty was accorded to the press, a strong spirit of liberalism pervaded rapidly all sections of the educated classes, a new imaginative and critical literature dealing with economic, philosophical and political questions sprang into existence, and for a time the young generation fondly imagined that Russia, awakening from her traditional lethargy, was about to overtake, and soon to surpass, on the path of national progress, the older nations of western Europe.

These sanguine expectations were not fully realized. The economic and moral condition of the peasantry was little improved by freedom, and in many districts there were signs of positive impoverishment and demoralization. The local self-government institutions after a short period of feverish and not always well-directed activity, showed symptoms of organic exhaustion. The reformed tribunals, though incomparably better than their predecessors, did not give universal satisfaction. In the imperial administration, the corruption and long-established abuses which had momentarily vanished, began to reappear. Industrial enterprises did not always succeed. Education produced many unforeseen and undesirable practical results. The demand for the press could not be suppressed, the tsar refrained from further initiating new legislation, and the government gave it to be understood that the epoch of the great reforms was closed.

In the younger ranks of the educated classes this state of things produced keen dissatisfaction, which soon found vent in revolutionary agitation. At first the agitation was of an academic character and was dealt with by the press-censure; but it gradually took the form of secret associations, and the police had to interfere. There were no great, well-organized secret societies, but there were many small groups, composed chiefly of male and female students of the universities and technical schools, which worked independently and for a purpose. The pharisaical puritanism of autocracy could not be overturned by blasts of revolutionary trumpets in the periodical press and in clandestinely printed seditious proclamations, the young enthusiasts determined to seek the support of the masses, or, as they termed it, "to go in among the people" (idti v narod). Under the disguise of doctors, midwives, school teachers, governesses, factory hands or common labourers, they sought to make proselytes among the peasantry and the workmen in the industrial centres by revolutionary pamphlets and oral explanations. For a time the propaganda had very little success, because the uneducated and illiterate, which ended in disappointment. Though the propagandists descended to a lower platform and spread rumours that the tsar had given all the land to the peasants, and was prevented by the proprietors and officials from carrying out his benevolent intentions, there was a serious danger of agrarian disorders, and energetic measures were adopted by the authorities. Wholesale arrests were made by the police, and many of the accused were imprisoned or exiled to distant provinces; some by the regular tribunals, and others by so-called "administrative procedure" without a formal trial. The activity of the police and the sufferings of the victims naturally produced intense excitement and bitterness among those who were arrested, and a secret organization calling itself the Executive Committee announced in its clandestinely printed organs that the functionaries who distinguished themselves in the suppression of the propaganda would be "removed." A number of prominent officials were accordingly condemned to death by this secret terrorist tribunal, and in some cases the sentences were carried out. General Mzenzlov, the head of the political police, was assassinated in broad daylight in one of the principal streets of St. Petersburg, and in the provinces a good many officials of various grades shared the same fate. As these acts of terrorism had quite the opposite of the desired effect, repeated attempts were made on the life of the emperor, and at last the carelessly laid plans of the conspirators were successful. On the 17th of March 1881, when returning from a military parade to the Winter Palace, Alexander II. was terribly wounded by the explosion of a bomb, and died shortly afterwards. (For details of this revolutionary movement, see NIHILISM.)

In respect of foreign policy the reign of Alexander II. differed widely from that of Nicholas. The Eastern Colossus no longer inspired respect and fear in Europe. Until the country had completely recovered from the exhaustion of the Crimean War the government remained in the background of European politics. Its attitude was graphically described in the famous declaration of Prince Gorchakov: "La Russie ne bouge pas; elle se repose, elle est à l'abri d'une crise."

The tsar, however, this description was not accurate; Russia sulked so far as Austria was concerned, for she could not forget that the emperor Francis Joseph, by his wavering and unfriendly conduct towards her during the Crimean War, had ill repaid her assistance to the Habsburg Monarchy in 1849, and had fulfilled the cynical prediction of Prince Schwarzenberg that his country would astonish the world by her ingratitude. It was not without secret satisfaction, therefore, that Prince Gorchakov watched the repeated defeats of the Austrian army in the Italian campaign of 1839, and he felt inclined to respond to the advances made to him by Napoleon III.; but the terms of a Russo-French alliance, which had come into existence immediately after the Crimean War, ripened very slowly, and they were completely destroyed in 1863 when the French emperor wounded Russian sensibilities deeply by giving moral and diplomatic support to the Polish insurrection. On that occasion Bismarck helped Gorchakov to ward off the threatened intervention of France and England, and he thereby founded the cordial relations which subsisted between the cabinets of Berlin and St. Petersburg down to 1878, and which contributed powerfully to the creation of the German empire by defending the Prussian cabinet against the jealousies and enmity of Austria and France. It was under these circumstances that the Russo-Turkish War of 1877-78, which ended in disappointment. Though the campaign enabled him to rebuild Sevastopol and construct a Black Sea fleet, his reign might have been a peaceful and prosperous one, but he tried to recover the remainder of what had been lost by the Crimean War, the province of Bessarabia and predominant influence in Turkey. To effect this, he embarked on the Turkish War of 1877-78, which ended in disappointment. Though the campaign enabled him to recover Bessarabia at the expense of his Rumanian ally, it did not increase Russian prestige in the East, because the Russian army was repeatedly repulsed by the Turks, and when at last it reached Constantinople, it was prevented from entering the city by the threatening attitude of England and Austria. In the field of diplomacy there was likewise disappointment. The concessions extorted from the Porte by the preliminaries of San Stefano (March 3, 1878) were revived and considerably modified in favour of Turkey by the congress of Berlin (June 13-July 13, 1878); see EUROPE: history. Much greater success attended the efforts of Russian diplomacy and Russian arms in Asia. The treaty of Almaty (January 30, 1858), and without any military operations, the cession of a great part of the basin of the Amur was obtained from China. Six years later began the rapid expansion of Russia in Central Asia, and at the end
of Alexander II.’s reign her domination had been firmly established throughout nearly the whole of the vast expanse of territory lying between Siberia on the north and Persia and Afghanistan on the south, and stretching without interruption from the eastern coast of the Caspian to the Chinese frontier. The greater part of the territory was formally incorporated into the empire, and the petty potentates, such as the khan of Khiva and the amir of Bokhara, who were allowed to retain a semblance of their former sovereignty, became obsequious vassals of the White Tsar.

The assassination of Alexander II. by the terrorists made a profound impression on his son and successor, and determined the general character of his rule. Alexander III. (1881–94), who had never sympathized with liberalism in any form, entered frankly on a policy of retrogression, which was pursued consistently during the whole of his reign. He could not, of course, undo the great reforms of his predecessor, but he amended them in such a way as to counteract what he considered the exaggerations of liberalism. Local self-government in the village communes, the rural districts and the towns was carefully restricted, and placed to a greater extent under the control of the regular officials. The reformers of the previous reign had endeavoured to make the emancipated peasantry administratively and economically independent of the landed proprietors, while the conservatives attempted to opposite the assumption that the peasants did not know how to make a proper use of the liberty prematurely conferred upon them, endeavoured to re-establish the influence of the landed proprietors by appointing from amongst them “land-chefs,” who were to exercise over the peasants of their district a certain amount of patriarchal jurisdiction. The reformers of the previous reign had sought to make the new local administration (zemstvo) a system of genuine rural self-government and a basis for future parliamentary institutions; these latter conservatives transformed it into a mere branch of the ordinary state administration, and took precautions against its ever assuming any political character. Even municipal institutions, which had never shown much vitality, were subjected to similar restrictions.

In short, the various forms of local self-government, which were intended to raise the nation gradually to the higher political level of western Europe, were condemned as unsuited to the national character and traditions, and as productive of disorder and demoralization. They were accordingly replaced in great measure by the old autocratic methods of administration, and much of the administrative corruption which had been cured, or at least repressed, by the reform enthusiasm again flourished luxuriantly.

In a small but influential section of the educated classes there was a conviction that the revolutionary tendencies, which culminated in nihilism and anarchism, proceeded from the adoption of cosmopolitan rather than national principles in all spheres of educational and administrative activity, and that the best remedy for the evils from which the country was suffering was to be found in a return to the three great principles of nationality, orthodoxy and autocracy. This doctrine, which had been invented by the Slavophiles of a previous generation, was eagerly instilled into the mind of Alexander III. by Pobedonostsev (q.v.), who was one of his teachers, and later his most trusted adviser, and its influence can be traced in all the more important acts of the government during that monarch’s reign. His determination to maintain autocracy was officially proclaimed a few days after his accession. Nationality and Eastern orthodoxy, which are so closely connected as to be almost blended together in the Russian mind, received not less attention. Even in European Russia the regions near the frontier contain a great variety of nationalities, languages and religions. In Finland the population is composed of Finnish-speaking and Swedish-speaking Protestants; the Baltic provinces are inhabited by German-speaking and Dutch-speaking Lutherans; the inhabitants of the south-western provinces are chiefly German-speaking Roman Catholics and Yiddish-speaking Jews; in the Crimea and on the Middle Volga there are a considerable number of Tatar-speaking Mahommedans; and in the Caucasus there is a conglomerate of races and languages as is to be found on no other portion of the earth’s surface. Until recent times these various nationalities were allowed to retain un molested the language, religion and peculiar local administration of their ancestors; but when the new nationality doctrine came into fashion, attempts were made to spread among them the language, religion and administrative institutions of the dominant race. In the reigns of Nicholas I. and Alexander II. these attempts were merely occasional and intermittent; under Alexander III. they were made systematically and with very little consideration for the feelings, wishes and interests of the people. The relations of the villages were assimilated to those of the purely Russian provinces; the use of the Russian language was made obligatory in the administration, in the tribunals and to some extent in the schools; the spread of Eastern orthodoxy was encouraged by the authorities, whilst the other confessions were placed under severe restrictions; foreigners were prohibited from possessing funded property; and in some provinces administrative measures were taken for making the land pass into the hands of orthodox Russians. In this process some of the local officials displayed probably an amount of zeal beyond the intentions of the government, and, as the attempt to oppose the measures was rigorously punished. Of all the various races the Jews were treated most severely. The great majority of them had long been confined to the western and south-western provinces. In the rest of the country they had not been allowed to reside in the villages, because their habits of keeping vodka-shops and lending money at usurious interest were found to demoralize the peasantry, and even in the towns their numbers and occupations had been restricted by the authorities. But, partly from the usual laxity of the administration and partly from the readiness of the Jews to conciliate the needy officials, the rules had already been relaxed. As soon as this fact became known to Alexander III. he ordered the rules to be strictly carried out, without considering what an enormous amount of hardship and suffering such an order entailed. He also caused new rules to be enacted by which his Jewish subjects were heavily handicapped in education and professional advancement. In short, complete Russification of all non-Russian populations and institutions was the chief aim of the government in home affairs.

In the foreign policy of the empire Alexander III. likewise introduced considerable changes. During his father’s reign its main objects were: in the west, the maintenance of the alliance with Germany; in the south-eastern provinces, the recovery of what had been lost by the Crimean War, the gradual weakening of the Sultan’s authority, and the increase of Russian influence among the minor Slav nationalities; in Asia, the gradual but cautious expansion of Russian domination. In the reign of Alexander III. the first of these objects was abandoned. Already, before his accession, the bonds of friendship which united Russia to Germany had been weakened by the action of Bismarck in giving to the cabinet of St Petersburg at the Berlin congress less diplomatic support than was expected, and by the Austro-German treaty of alliance (October 1879), concluded avowedly for the purpose of opposing Russian aggression; but the old relations were partly re-established by secret negotiations in 1880, by a meeting of the young tsar and the old emperor at Danzig in 1881, and by the meeting of the three emperors at Skierkiev in 1884, by which the Three Emperors’ League was reconstituted for a term of three years (see Europe: History). Gradually, however, a great change took place in the tsar’s views with regard to the German alliance. He suspected Bismarck of harbouring hostile designs against Russia, and he came to recognize that the permanent weakening of France was not in accordance with Russian political interests. He determined, therefore, to oppose any further disturbance of the balance of power in favour
of Germany, and when the treaty of Skierneiwex expired in 1887 he declined to renew it. From that time Russia gravitated slowly towards an alliance with France, and sought to create a counterpoise against the Triple Alliance of Germany, Austria and Italy. The tsar was reluctant to bind himself by a formal treaty because the French government did not offer the quasitute guarantees of stability, and because he feared that it might be induced, by the prospect of Russian support, to assume an aggressive attitude towards Germany. He recognized, however, that in the event of a great European war the two nations would in all probability be found fighting on the same side, and that if they made no preparations for concerted military action they would be placed at a grave disadvantage in comparison with their opponents of the Triple Alliance, who were believed to have already worked out an elaborate plan of campaign. In view of this contingency the Russian and French military authorities studied the military question, and the result of their labours was the preparation of a military convention, which was finally ratified in 1894. During this period the relations between the two governments and the two countries became much more cordial. In the summer of 1891 the visit to Kronstadt of a French squadron under Admiral Gervais was made the occasion for an enthusiastic demonstration in favour of a Franco-Russian alliance; and two years later (October 1893) a still more enthusiastic reception was given to the Russian Admiral Avelan and his officers when they visited Toulon and Paris. But it was not till after the death of Alexander III. that the word "alliance" was used publicly by official personages. In 1895 the term was first publicly employed by M. Ribot, then president of the council, in the Chamber of Deputies, but the expressions he used were so vague that they did not entirely remove the prevailing doubts as to the existence of a formal treaty. Two years later (August 1897), during the official visit of M. Félix Faure to St Petersburg, a little more light was thrown on the subject. In the complimentary speeches delivered by the president of the French Republic and the tsar, France and Russia were referred to as allies, and the term "nations allies" was afterwards repeatedly used on occasions of a similar kind.

In south-eastern Europe Alexander III. adopted an attitude of reserve and expectancy. He greatly increased and strengthened his Black Sea fleet, so as to be ready for any emergency that might arise, and in June 1886, contrary to the declaration made in the Treaty of Berlin (Art. 59), he ordered Batum to be transformed into a fortified naval port, but in the Balkan Peninsula he persistently refrained, under a good deal of provocation, from any intervention that might lead to a European war. The Bulgarian government, first under Prince Alexander and afterwards under the direction of M. Stamboloff, pursued systematically an anti-Russian policy, but the cabinet of St Petersburg confined itself officially to breaking off diplomatic relations, and making diplomatic protests, and unofficially to giving tacit encouragement to revolutionary agitation.

In Asia, during the reign of Alexander III. the expansion of Russian domination made considerable progress. A few weeks after his accession he sanctioned the annexation of the territory of the Tekke Turkomans, which had been conquered by General Skobelev, and in 1883 he formally annexed the Merv oasis without military operations. He then allowed the military authorities to push forward in the direction of Afghanistan, until in March 1885 an engagement took place between Russian and Afghan forces at Panjeh. Thereupon the British government, which had been some time carrying on negotiations with the cabinet of St Petersburg for a delimitation of the Russo-Afghan frontier, intervened energetically and prepared for war; but a compromise was effected, and after more than two years of negotiation a delimitation convention was signed at St Petersburg on 20th July 1887. The forward movement of Russia was thus stopped in the direction of Herat, but it continued with great activity farther east in the region of the Pamirs, until another Anglo-Russian convention was signed in 1895. During the whole reign of Alexander III. the increase of territory in Central Asia is calculated by Russian authorities at 420,895 square kilometres.

On 1st November 1894 Alexander III. died, and was succeeded by his son, Nicholas II., who, partly from similarity of character and partly from veneration for his father's memory, continued the existing lines of policy in home and foreign affairs. The expectation entertained in many quarters that great legislative changes would at once be made in a liberal sense was not realized. When an influential deputation from the province of Tver, which had long enjoyed a reputation for liberalism, ventured to hint in a loyal address that the time had come for changes in the existing autocratic régime, they received a reply which showed that the emperor had no intention of making any such changes. Private suggestions in the same sense, offered directly and respectfully, were not better received, and were not only not listened to, but managed to take the hint, and their undue zeal at once disappeared. Nicholas II. showed, however, that his father's policy of Russification was neither to be reversed nor to be abandoned. When an influential deputation was sent from Finland to St Petersburg to represent to him respectfully that the officials were infringing the local rights and privileges solemnly accorded at the time of the annexation, it was refused an audience, and the leaders of the movement were informed indirectly that local interests must be subordinated to the general welfare of the empire. In accordance with this declaration, the policy of Russification in Finland was steadily maintained, and caused much disappointment, not only to the Finlanders, but also to the other nationalities who desired the preservation of their ancient rights.

In foreign affairs Nicholas II. likewise continued the policy of his predecessor, with certain modifications suggested by the change of circumstances. He strengthened the cordial understanding with France by a formal agreement, the terms of which were not divulged, but he never encouraged the French government in any aggressive designs, and he maintained friendly relations with Germany. In the Balkan Peninsula a slight change of attitude took place. Alexander III., indignant at what he considered the ingratitude of the Slav nationalities, remanded collective chancelleries, as far as possible, from all intervention in their affairs. About three months after his death, de Giers, who thoroughly approved of this attitude, died (26th January 1895), and his successor, Prince Lobanov, minister of foreign affairs from 10th March 1895 to 30th August 1896, endeavoured to recover what he considered Russia's legitimate influence in the Slav world. For this purpose Russian diplomacy became more active in south-eastern Europe. The result was perceived first in Montenegro and Servia, and then in Bulgaria. Prince Ferdinand of Bulgaria had long been anxious to legalize his position by a reconciliation, and as soon as he got rid of Stamboloff he made advances to the Russian government. They were well received, and a reconciliation was effected on certain conditions, the first of which was that Prince Ferdinand's eldest son and heir should become a member of the Eastern Orthodox Church. As another means of opposing Western influence in south-eastern Europe, Prince Lobanov inclined to the policy of protecting rather than weakening the Ottoman empire. When the British government seemed disposed to use coercive measures for the protection of the Armenians, he gave it clearly to be understood that any such proceeding would be opposed by Russia. After Prince Lobanov's death and the appointment
RUSSIA

RUSSIA

of Count Muraviev as his successor in January 1897, this tendency of Russian policy became less marked. In April 1897, it is true, when the Greeks provoked a war with Turkey, they received no support from St Petersburg, but at the close of the war the tsar showed himself more friendly to them; and afterwards, when it proved extremely difficult to find a suitable person as governor-general of Crete (see CRETE), he recommended the appointment of his cousin, Prince George of Greece—a selection which was pretty sure to accelerate the union of the island with the Hellenic kingdom. How far the recommendation was due to personal feeling, as opposed to political considerations, it is impossible to say.

In Asia, after the accession of Nicholas II, the expansion of Russia, following the line of least resistance and stimulated by the construction of the Trans-Siberian railway, took the direction of northern China and the effete little kingdom of Korea. A great part of the eastern section of the railway was constructed on Chinese territory, and elaborate preparations were made for bringing Manchuria within the sphere of Russian influence. With this view, the cabinet of St Petersburg, at the close of the Chino-Japanese War in 1895, objected to all annexations by Japan in that quarter, and insisted on having the treaty of Shimoneseki modified accordingly. Subsequently, by tainting from the Tsangli-Yaman a branch line, she tightened her hold on that portion of the Chinese empire and prepared to complete the work of aggression by so-called "spontaneous infiltration." From Manchuria, it was assumed, the political influence and spontaneous infiltration would naturally spread to Korea, and on the deeply indented coast of the Hermit Kingdom might be constructed new ports and arsenals more spacious and strategically more important than Fort Arthur.

This grandiose project was unexpectedly destroyed by the energetic resistance of Japan, who had ear-marked the Hermit Kingdom for herself, and who declared plainly that she would never tolerate the exclusive influence of Russia in Manchuria. In vain the Russian diplomatists sought to overcome her opposition by dilatory negotiations, in the firm conviction that a small island kingdom in the Pacific would never have the audacity to attack a power which had conquered and absorbed the whole of Northern Asia. Their calculations proved erroneous. Convinced that the onward march of the Colossus could not be permanently arrested by mere diplomatic conventions, the cabinet of Tokio suddenly broke off diplomatic relations and commenced hostilities (February 8, 1904). For Russia the war proved a series of uninterrupted reverses both on land and on sea, until it was terminated by the treaty of Portsmouth in October 1905 (see RUSSO-JAPANESE WAR).

What contributed powerfully to the conclusion of peace was the fact that the Russian government was hampered by internal troubles. The old Liberal movement and the terrorist organizations which had been suppressed by Alexander III, were being reuscitated, and the liberal and revolutionary leaders, taking advantage of the unpopularity of the war, were agitating for the convocation of a Constituent Assembly, which should replace the old bureaucratic régime by democratic institutions. With great reluctance the tsar consented to convocate a consultative chamber of deputies as a sop to public opinion, but that concession stimulated rather than calmed public opinion, and shortly after the conclusion of peace the Liberals and the Revolutionaries, combining their forces, brought about a general strike in St Petersburg together with the stoppage of railway communication all over the empire. Panic-stricken for a moment, the government issued a manifesto proclaiming Liberal principles and promising in vague language all manner of political reforms (October 29, 1905), and when the immediate expectations created by this extraordinary document were not at once realized, preparations were made for overthrowing the existing régime by means of an armed insurrection. Many believed that the end of autocracy had come, and an extemporized Council of Labour Deputies, anxious to play the part of a Comité de Salut Public, was ready to take over the supreme power and exercise it in the interests of the proletariat. In reality the revolutionary movement was not so strong and the government not so weak as was generally supposed. Mutinies occurred, it is true, during the next few weeks in Kronstadt and Sevastopol, and in December there was street-fighting for several days in Moscow, but such serious disorders were speedily suppressed, and thereafter the revolutionary manifestations were confined to mass meetings, processions with red flags, attempts on the lives of officials and policemen, robberies under arms and agrarian disturbances.

Notwithstanding the unsatisfactory results of the October manifesto the tsar kept his promise of convoking a legislative assembly, and on the roth of May 1906 the first Duma was opened by his majesty in person; but it was so systematically and violently hostile to the government and so determined to obtain executive, in addition to its legislative, functions, that it was dissolved on the 23rd of July without any legislative work being accomplished. The second Duma, which met on the 5th of March 1907, avoided some of the mistakes of its predecessor, but as a legislative assembly it showed itself equally incompetent, and a large section of its members were implicated in a well-organized attempt to spread sedition in the army by revolutionary propaganda. It was dissolved, therefore, on the 16th of June 1907, and the electoral law which had given such unsatisfactory results was modified by imperial ukase.

The third Duma was subsequently convoked for the 14th of November 1907.

(D. M. W.)

Development of the Russian Constitution.—At the end of 1910 the Russian revolution, which seemed at one time to promise an overturn as complete as that of the ancien régime in France, would seem to have entered on a path of orderly and conservative development, and it is possible, now that the smoke of combat has cleared away, to form some estimate of the forces through the interplay of which this result has been achieved. At the outset the superficial resemblance between the revolutionary movement in Russia and that of 1789 in France was striking: (there was the same breakdown of the traditional machinery of government, the same general outcry for control by a representative national assembly, the same gradual and reluctant concessions wrung from the crown under pressure of disaffection in the army, popular bavmutes, the assassination of unpopular officials, and the burning of homes and houses by organized bands of peasants. Similar, too, was the revolution, with the partialism of spectacles at last allowed, of the unhappy effect of the long divorce of the intellect of the country from any experience of practical politics. But here the analogy breaks down. France in 1789, though its ancient provincial boundaries survived, had long since been welded into a nation conscious of its common interests; Russia remains a vast empire, composed of the most heterogeneous, sometimes even mutually hostile, elements, whose antagonisms were bound to be an element of weakness in any assembly truly representative of all sections of the people. In France the Revolution had the support of the middle classes; in Russia an indigenous middle class has, comparatively speaking, no existence, the peasants forming the overwhelming majority of the population.1

1 In 1897 only 15% of the population were engaged in commerce or industry, including the work-people. Of the middle class, moreover, a large proportion were Jews and Germans. The peasants numbered 75%
were practically powerless, the more so as their political activity consisted mainly in "building theories for an imaginary world." The *boursgeois* revolutionists of France had all been *philosophes*, but their philosophy had at least paid lip-service to "reason"; the Russian revolutionists who formed the majority of the first and second Dumas, as though inspired by the cynical nonsense preached by Tolstoi,1 subordinated reason to sentiment, until—their impracticable temper having been advertised to all the world—it became easy for the government to treat them as a mere excrescence on the national life, a malignant growth to be removed by a necessary operation. In 1909 the number of exiles for political reasons from Russia was reckoned at 180,000; but the third Duma, purged and packed by an ingenious franchise system, was in its third year passing measures of beneficent legislation, in complete harmony with the government. It is proposed to trace briefly the steps by which this result was obtained.

In order to explain the course of the revolution which came to a head in 1905 it is necessary to say a few words about constitutional plans and liberal experiments, initiated from above, which had preceded it. Of the ancient *zemski sobor* (assembly of the country) it is unnecessary here to say much, though Nicholas II. was pressed by the more reactionary elements to model his parliament on this rough equivalent of the Western states-general. The *zemski sobor*, which had played a considerable part in the struggle of the tsars against the great boyars in the 17th century, had met but once since the days of Peter the Great.2 The origin of the present constitution of Russia is commonly traced not in this institution, but in the artificial constitution elaborated by Mikhail Speranski (q.v.) in 1809 at the instance of the emperor Alexander I. Of Speranski's plan only the establishment of the Imperial Council (January 1st, 1810) was realized in his lifetime.3 In 1864, however, the emperor Alexander II. carried the scheme a step further by the creation of elected provincial assemblies (zemstvos), to which in 1870 elected municipal councils (dumas) were added. The opportunity thus given for debate naturally stimulated the movement in favour of constitutional government, which received new impulses from the sympathetic attitude of the emperor Alexander II., his grant in 1876 of a constitution to the liberated principality of Bulgaria, and the multiplication of nihilist outrages which pointed to the necessity of conciliating Liberal opinion in order to present a united front against revolutionary agitation. In January 1881 Count Loris-Melikov, minister of the interior, proposed to convene a "general commission" to examine legislative proposals before these were laid before the Imperial Council; this commission was to consist of members elected by the zemstvos and the larger towns, and others nominated in the provinces having no zemstvos. The plan was approved by Alexander II. on the very morning of his assassination (February 17th, 1881), but it was never promulgated. The new tsar, Alexander III., was an apt pupil of his tutor Pobedonostsev (q.v.), the celebrated procurator of the Holy Synod, for whom the representative system was "a modern lie," and his reign covered a period of frank reaction, during which there was not only no question of granting any fresh liberties but those already conceded (e.g. the principle of the separation of the administrative and judicial functions) were largely curtailed. The result of this policy of repression, associated as it was with gross incompetence and corruption in the organs of the administration, was the rapid spread of the revolutionary movement, which gradually permeated the intelligentsia and ultimately reached a pitch that he paid no attention to them; he only guided himself (he said) by sentiment, which he felt sure told him what was good and right!"—Interview with Metchnikoff in Sir Ray Lankester's *Science and Scandal*, p. 43.

In 1876, when Catherine II.—in a mood of encyclopaedist enlightenment—summoned it. The meeting confined its attention to economic questions, and had no political character whatever.

1 Tolstoi observed that the argument and reasoning that he paid no attention to them; he only guided himself (he said) by sentiment, which he felt sure told him what was good and right!—Interview with Metchnikoff in Sir Ray Lankester's *Science and Scandal*, p. 43.

2 In his speech at the opening of the first Polish parliament at Warsaw in 1818, Alexander I. publicly announced his intention of granting free institutions to Russia.

3 Sazonov's sentence of twenty years' hard labour was commuted by Nicholas II. to fourteen years.

4 Duma = council, assembly (dumat, to think over, reflect upon).

909 RUSSIA

The movement came to a head, as a result of the disasters of the war with Japan, in 1904. The assassination of the minister of the interior Plehve, on the 14th of July, by the revolutionary Sazonov was remarkable as a symptom mainly owing to the widespread sympathy of the European press of all shades of opinion with the motives of the assassin. It was clear that the system with which the murdered minister's name had been associated stood all but universally condemned, and in the appointment of the conciliatory Prince Sviatopolk-Mirski as his successor the tsar himself seemed to concede the necessity for a change of policy.4 In November, with the tacit consent of the police, a private assembly of eminent members of local zemstvos and municipal dumas was held in St Petersburg to discuss the situation. The majority of this decided to approach the crown with a suggestion for a reform of the Russian system on the basis of a national representative assembly, an extension of local self-government, and wider guarantees for individual liberty. The day on which the deputation laid these views before Prince Mirski was hailed by public opinion as recalling the 5th of May 1789, the date of the meeting of the French states-general at Versailles. The emperor, however, whatever his own views, was surrounded by reactionary influences, of which the most powerful were the empress-mother, Pobedonostsev the procurator of the Holy Synod, Count Muraviev and the Grand-Ducal Council. The emperor proposed to consult the members of his cabinet for enunciating reforms affecting the peasants, workmen and local zemstvos failed to satisfy public opinion; for there was no word in it of constitutional government. Petitions continued to flow in to the emperor's cabinet, praying for a national representation, from the zemstvos, from the nobles and from the professional classes, and their moral was enforced by general agitation, by partial strikes, and by outrages which culminated at Moscow in the murder of the Grand-duke Sergius (February 4th, 1905). In the imperial counsels the resisting forces still seemed to have the upper hand. Prince Mirski resigned, his resignation being immediately followed by a reactionary imperial manifesto reaffirming the principle of autocracy (February 18th). Bulgynin, Mirski's successor, had no knowledge of this until after its publication; he hastened to the tsar and obtained the issue on the same day of a rescript which, while reserving the "fundamental laws of the empire" inviolate, stated the emperor's intention of summoning the representatives of the people to aid in "the preparation and examination of legislative proposals." A commission of inquiry, under the emperor's presidency, was now established to elaborate the means for carrying this promise into effect. On the 6th of June, in reply to a deputation of the second congress of zemstvos headed by Prince Trubetskozi, the emperor promised the speedy convocation of a National Assembly. When, however, on the 6th of August, the new law was promulgated, it was found that the "Imperial Duma"4 was to be no more than a consultative body, charged with the examination of legislative proposals before these came before the Imperial Council, the duty and right of passing them into law being still reserved for the autocrat alone. (The members of the Duma, moreover, were placed at the mercy of the government by a clause empowering the Directing Senate to suspend or deprive them.) The promulgation of this truncated constitution was greeted by universal agitation, culminating in September in a general strike, rightly described as the most remarkable political phenomenon of modern times. For days the whole mechanism of civilized existence in Russia was at a standstill, all intercourse...
with the outside world cut off; until at last the government was forced to yield, and on the 17/30th of October 1905 the tsar issued the famous manifesto promising to Russia a constitution based on the main principles of modern Liberalism: national representation, freedom of conscience and opinion, guarantees for individual liberty.

The enormous programme of constitutional reform foreshadowed in the manifesto had to be elaborated in haste by Count Witte, the minister of the Interior, under circumstances by no means promising. The organs of government seemed paralysed by the repudiation of the principle on which their authority was based, and the empire to be in danger of falling into complete anarchy. The revolutionary terrorists; popular agitation was fomented by a multitude of new journals preaching every kind of extraordinary doctrine, now that the censor no longer dared to act; in December the trouble culminated in a formidable rising in Moscow. The revolutionary terrorists were countered by the terrorists of the reaction who, under the name of "the Union of the Russian People," began an organized extermination of the elements supposed to be hostile to the traditional régime. The "black band" (chernaya sotnia), or "black hundreds," as they were branded by public opinion, directed their attacks especially against the Jews, and pogroms, i.e. organized wholesale robbery and murder of Jews, occurred in many places, it was believed with the connivance of the police and veiled approval in exalted quarters.

Meanwhile the political parties which were to divide the new Duma had taken shape. Apart from the extremists on one side or the other, frank reactionaries on the Right and Socialists on the Left, two main divisions of opinion revealed themselves in the congresses of the zemstvos that met at Moscow in September and November. In the former there had been a fusion between the Radicals, supporters of the autonomy of Poland and a federal constitution for the empire, and the Independence party (Osvobozhdeniya) formed by political exiles at Paris in 1903, the fusion taking the name of Constitutional Democrats, known (from a word-play on the initials K.D.) as "Cadets." The more moderate elements found a rallying cry in the manifesto of October, took the name of "the Party of 17 October," and became known as "Octobrists." In the zemstvo congress of November the "Cadets" protested against the "grant" of a constitution already elaborated, and demanded the convocation of a Constituent Assembly. The Octobrists, on the other hand, supported Count Witte's moderate programme, the most important provisions of which were the extension (11 December 1905) of the suffrage under the stillborn constitution of August, and (20 February 1906) the reorganization of the Duma as the Lower House, and of the Imperial Council (half of which was to be elective) as the Upper House in the new parliament.

The elections were held in March 1906, and on the 27th of April the emperor Nicholas II solemnly opened the first Duma of the Empire. The "Cadets" commanded an overwhelming majority in the Lower House, and their intractable temper and ignorance of affairs became at once apparent. The address in reply to the speech from the throne, voted after a debate in which abstract theories had triumphed over common sense, demanded universal suffrage, the establishment of pure parliamentary government, the abolition of capital punishment, the expropriation of the landlords, a political amnesty, and the suppression of the Imperial Council. When the minister of the interior, M. Goremykin, who had succeeded Witte at the head of the government, met these preposterous demands with a flat refusal, the House vetoed, on the motion of M. Kuznin-Karaviev, for an appeal to the people (July 4). Four days later the government dissolved the Duma, M. Goremykin at the same time being replaced by M. Stolypin. The "Cadets" refused to accept this action and, in imitation of the famous meeting in the tennis-court at Versailles, adjourned to Vyborg in Finland, where, under the presidency of M. Muromtsov, they drew up and issued a manifesto calling on the Russian people to refuse taxes and military service. Its sole result, apart from the punishment which afterwards fell on its authors, was to show how little the majority of the dissolved Duma had represented the Russian people. Isolated mutinies in the army followed, and terrorist outrages here and there—notably, in August, the dastardly bomb outrage in the Isle of Apothecaries at St Petersburg, which seriously injured one of M. Stolypin's little daughters; but the mass of the nation and of the army remained wholly unmoved, while the repetition of troubles was made more difficult by the establishment of field courts martial with summary powers.

The second Duma met on the 6th of March 1907. M. Stolypin had not ventured to alter the electoral law without parliamentary consent, but with the aid of a compliant Senate the pro-

RUSSIA

Meanwhile the pan-Russian movement had been gaining space. At first it had seemed that the new birth of Russia would lead to a revival of pan-Slavism, directed not as in the middle of the 19th century, against Austria but against Germany. In May 1908 a deputation of the Slav members of the Austrian Reichsrat paid a ceremonial visit to the Duma at St Petersburg, and in this "neo-Slav" demonstration M. Dmowski, leader of the Polish party in the Duma, took part. In the following year, however, the situation was completely altered, a result due to the growing anti-Polish feeling in the Duma and, more especially, to the support given by the Austrian Slavs to the annexation of Bosnia and Herzegovina. This event caused the utmost excitement in Russia; the crown prince of Servia, who arrived in St Petersburg on the 28th of October to ask for the armed assistance of the tsar between Great Britain and Russialimes of the people; and, though armed intervention was impossible, M. Isvolsky took the lead in the abortive demand for a European conference (see EUROPE: History). Neo-Slav dreams were now replaced by a passionate desire to consolidate the Russian empire on a purely Russian basis. Even the remnant of the "Cadets" had by this time renounced their sympathy with Polish aspirations, and in the matter of Finland the Duma proved itself even more imperial than the emperor himself. The Finnish question is dealt with elsewhere (see FINLAND: History). Here it may suffice to mention, as illustrating the change of mind, the speeches made by the Russian representatives to the Finnish Diet that the Russian majority of the Duma included among the imperial questions in Finland which the Finnish diet ought to refer to the imperial legislature not only all military matters—as the tsar demanded (Rescript of October 14)—but the question of the use of the Russian language in the grand-duchy, the principles of the Finnish administration, police, justice, education, formation of business companies and of associations, public meetings, the press, the customs tariff, the monetary system, means of communication, and the pilot and lighthouse system. The old tendency illustrated by the outcome of the revolutionary movements of 1848 was once more in evidence—the tendency of merely abstract theories of democratic liberty to succumb to the immemorial instinct of race and race ascendency.

As an international force Russia had been, of course, all but completely crippled by the outcome of the Japanese War and the subsequent revolution. Her recovery, however, revealed the immense reserves of her strength. On the 30th of July 1907 she signed a convention with Japan of mutual respect for treaty and territorial rights, and guaranteeing the integrity of China. On the 31st of August of the same year the long period of annual sessions of the Russian national assembly was closed by a convention for an amicable settlement of all questions likely to disturb the relations of the two Powers in Asia generally, including the demarcation of Persia into spheres of influence (see PERSIA: History). This new entente with Great Britain, cemented by a visit paid by King Edward VII. to the tsar at Reval on the 9th June 1908, helped to knit close once more the loosened alliance with France, and so to preserve the threatened balance of Europe. That in the work of restoring its military position the Russian government had the support of the Russian parliament was proved by a subsidy of £1,000,000 voted by the Duma, on the 30th of December 1908, for the special service of the reorganization and redistribution of the army. (W. A. P.)

BIBLIOGRAPHY.—The history of Russia, especially that of the last few years, has formed the subject of a vast number of works, of very varying authority, in many languages. In Russia itself the first great history of the Russian Empire was that of N. M. Karamzin (St Petersburg, 1788-1826), which, though reactionary in tone and largely superseded, remains a classic. The next monumental history of Russia, that of Sergei Mikhailovich Soloviov (9 vols., Moscow, 1863-72), must be reckoned, no less than that of Karamzin, as an epoch-making work in historical method and research. Soloviov's history, from the earliest times to 1774, is based throughout on original investigation of sources, and therefore, though inferior to Karamzin's work as

1 See above, Government and Administration.
2 The law establishing individual peasant-proprietorship was passed on December 21st.
RUSSIAN LANGUAGE

For the characteristics which this special branch of the Slavonic family shares with the rest, for a table showing the Russian alphabet and the transliterations of it used in this and in other (non-linguistic) articles of the Encyclopaedias, and for the points which distinguish Russian alike from the Southern (Balkan) and from the North-Western (Polish, Czech, &c) branches of Slavonic, see Staliv. These latter points, fully treated under corresponding sections of the article Slavs, are here summarized:

I. Proto-Slavonic (Proto-Sl.) half vowels ā and ī have disappeared as such: ā (.), though still written at the ends of words, is mute; it serves but to show that the foregoing consonant is “hard.” See below for “hard” and “soft” (denoted by’) consonants, nor the “hard” = “tenuis, soft” = “sonant, media of Eng. usage. Where a vowel was indispensable to help out a group of consonants, ā has been replaced by ā or ī; and in many of these vowels sometimes appear without such justification (e.g. agent, lat. sign: ā when so needed becomes e, otherwise it disappears or else leaves a trace in the “softness” of the preceding consonant, in which case it is still written: Old Slavonic (O.S.), sânta, “sleep”; dînt, “day”; R. sonâ (ā mute), den(ā’en).

II. Proto-Sl. y survives in R. and Polish. The sound is a “high-mixed-narrow i,” pronounced with the lips for ī and the tongue as for ū, not unlike Eng. y in “rhythm.” After labials there is a distinct w sound before the vowel. After gutturals it has become į.

III. Treatment of Liquids: retention of r instead of the r of N.W. Slav.; retention as in Polish of hard l (between ī and w, not unlike Eng. l in “milk,” “people”); helping out of sonant r and į by a vowel put in before the r or į; especially the so-called full vocalism by which, e.g. Proto-Sl. *gorďa, “town,” became R. gorodă, O.S. gorďa, Polish, gród; Proto-Sl. *mełko, “milk,” R. melko, O.S. melko, Polish, mleko.

IV. Proto-Sl. nasals: ā (Fr. on), became R. u; ė (Fr. in), R. ā, ja: O.S. put, “way”; pešt, “five,” R. putt, p’ait.

V. Softening (Palatalization, &c): Proto-Sl. ĭ, ėj gave R. ĭ, ĭ, Proto-Sl. *svěťa, “candle”; *medja, “boundary”; R. sok, m’da. Proto-Sl. ľj, ľj, ľj, ľj gave R. and S. Slav. pl. bl, bl, e.g. R. svět; Polish, siewa, siew. Before Proto-Sl. soft vowels ā, ė, į, ī, Ĳ consonants were affected, the tongue being raised in anticipation of the narrow vowel, and so not making so clean a contact with the papacy. Then what amounted to a new j developed in R., as Ė became practically Ė and Ė (orig. Ė) came to sound as jē, Ė as Ė, at the beginning of a syllable, and all together with Ė began very much to soften the preceding consonant in literary R.; however, this new j never broke down the consonant into a palatalized shlent or affricate, though it had this effect in White Russian (Wh. R.) and Polish.

However, the result is that almost every consonant in Russian can be pronounced “hard” or “soft,” a distinction which is very difficult for a foreigner to make, as his tendency is to overlook the softness and pronounce as unchangeable consonant instead of the palatal element melting into it. This is encouraged by the alphabetic system by which the letters e (.), ISO, ā, stand for jē, jē, Ė at the beginning of a syllable, but after a consonant merely indicate that the consonant is soft, the vowel being the same as in ē, ā, ā, o, e, e, g, for l-ā. A soft consonant in its turn narrows the vowel before it, e.g. the vowel in ēl, “fir,” is like a in “Yale”; that in jēl, marks a hypothetical form.
RUSSIAN LANGUAGE

"ate," like e in "yell": e and è (ê) are now indistinguishable, except that accented e before a hard consonant has a tendency to be pronounced jo, e.g., t'elù, "of villages," is pronounced d'ol, but the dotted line ê or è of the same word is sometimes denoted by è.

VI. Great Russian has kept as in Old Russian (Lit. R.) and Whh. R., like Czech and High Sorb, now have h.

VII. A specially Russian point is that Proto-Sl. je and ju beginning a word, appear in R. as o and u; O.S. jedinâ, "one," jutro, "morning," R. odiniâ, uro.

VIII. Russian has lost the distinctions of quantity which survive in Czech and S. Slav., but its accent is free as in S. Slav. The accent is extremely capricious, often falling differently in different cases of the same noun, or persons of the same tense, also it is an aspiratory accent, so strong that the unaccented syllables are much slurred over and their vowels dinned. In learned terms concerned with most important and great attention to the accent, and at first to read accented texts.

The above phonetic peculiarities have marked Russian as far back as we can trace it. In the earliest documents it appears with an apparatus of grammatical forms practically identical with that ascribed to primitive Slavonic. The history of the language is not so much that of its phonetic decay as that of its morphological simplification and syntactic development. The tracing of this process is rendered difficult by the fact that O.S. was the ecclesiastical and literary language until the 17th century, and though in the end the O.S. texts suffer modifications, producing the Russian form of Church Slavonic, it is only by accident that the Russian forms appear in them. Russian is better represented in additions made by the scribe, as in the colophon of the Ostromor gospel (A.D. 1056/57), the oldest dated O.S. MS. In a certain number of legal documents dating from the 12th century onwards Russian forms definitely predominate, but the subject-matter is too limited to offer much material.

Borrowings.—The effect of the Church language upon Russian has been very strong, comparable to that of Latin upon French or English: O.S. forms of words and suffixes, betrayed by their phonetic peculiarities though pronounced more or less à la russe, have in some cases ousted the native forms, in other cases the two exist side by side; the Slav. form generally has the more dignified or metaphorical, the Russian the simpler and more direct sense: even some of the grammatical terminations (e.g. pres. part. act.; certain forms of the adj. &c.) are Slavonic; but speakers are quite unconscious of using anything that is not Russian (see S. Bulé, Church Slavonic Elements in Modern Russian, St P., 1893), and not till the 18th century did even grammarians understand the difference. Less important elements have been the Tatar which gave names for many Oriental things such as weapons, jewels, stuffs, garments and household things, and the Polish, which during the 17th century supplied many terms needed to express European things and ideas. In the 18th century such importations were made from Latin and all the Western European languages, in Peter's time mostly from German and Dutch (for nautical terms, English supplied some), in Catherine's rather from French, which had become the language of the aristocracy. During the first quarter of the 19th century modern Russian found itself and discarded superfluous Slavonic and European borrowings alike. Since then fresh loan-words have mostly belonged to the international quasi-Greek terminology, though like German R. sometimes prefers analogous compounds made from its own roots.

Literary Russian as spoken by educated people throughout the empire is the Moscow dialect (see below) modified by these influences. It is still a highly inflected language, comparable in that respect rather to Latin and Greek than to the languages of western Europe, though during historic time it has lost many of the grammatical forms whose full development we can study in O.S., and whose presence we can assert in the scanty remains of Old R. This process has relieved it of the dual number, save for certain survivals; in the nouns, of the vocative case (save for certain ecclesiastical forms), and many of the distinctions between the declensions, especially in the plural, the oblique cases of the simple, and the more cumbrous forms of the compound, adjective; in the verbs, of the supine, the imperfect, the aorist and the conditional (now reduced to a particle); but this simplification leaves it with six cases, Nom., Acc., Gen., Dat., Instrumental and Locative, three genders, three substantial declensions, -a, -o, -i, and traces of -a and consonantal stems, a special pronominal declension with many tricky forms, an adjective which takes its place between them, and a system of numerals in which a compromise between grammar and logic has produced a kind of maz. The forms of the verb are easier, as only the present indic. has three persons, the imperat. has but the 2nd, and the past is a participle, which, having discarded the copula, distinguishes only gender and number. The infinitive and four participles offer no special difficulty, but the gerundives or verbal adverbs, from the old masc. nom. sing., are troublesome. The curious mechanism by which these few verbal forms are by means of the aspects made to express most of our tenses and other shades of meaning of which even English is incapable, is briefly explained under SLAVS. On the whole the syntax is simple, the periods which imitation of Latin and German once brought into fashion having given place to the shorter sentences of French and English models.

Such a language, though less difficult than it is generally supposed, is learned much better if some preliminary study is devoted to the accidence, before the student launches out into conversation, as otherwise the habit may be acquired of disregarding the terminations and speaking very incorrectly.

Dialects.—Russian dialects fall into two main divisions—Great (Velikorusskij), including White (Belorusskij) Russian, and Little Russian (Malorossikij). The latter is spoken in a belt reaching from Galicia and the Northern Carpathians (see RUTHENIANS) through Podolia and Volhynia and the governments of Kiev, Chernigov, Poltava, Kharkov and the southern part of Voronezh to the Don and the Kuban upon which the Donets Cossacks were settled. To the south of this belt in "New Russia" the population is much mixed, but Little Russians on the whole predominate. In all there must be about 30,000,000 Little Russians.

The Great Russian division includes all other Russian speakers—the main body to the N. and E. of the Little Russians, the settlers in Siberia, the Caucasus and along the southern coast, the educated classes, officials and many towns- men throughout the empire, probably not less than 70,000,000 speakers exclusive of White Russians. On the whole it is very conservative, and therefore, in spite of its vast extent, is wonderfully uniform. It falls into two main dialect groups—the northern or o group and the southern or e group. The line between them runs roughly E.S.E. from Pskov to the Oka and then eastwards to the Urals. The northern group is the more conservative and pronounces very nearly according to the spelling, unaccented o remaining o, but o is in general rather like u, while e before hard consonants is apt to be jo and before soft consonants ū. The southern part of this group, comprising most of the governments of Vladimir and Yaroslavl with adjoining parts of Tver and Kostromà, are alone free from a further peculiarity, a tendency to mix up e and ê which can be traced in the ancient documents of Novgorod and has spread with the Novgorod colonists across the whole of N. Russia to the Urals and Siberia. These distant dialects have adopted many words from the Ugro-Finnish natives. The southern or o group of dialects pronounces unaccented a, e and even i as ò or ja; with this goes a tendency to pronounce g as h, and to mix up û and v. The Moscow dialect, which is the foundation of the literary language, and White Russian, are both best classed with the o dialect.

The Moscow dialect really covers a very small area, not even the whole of the government of Moscow, but political causes have made it the language of the governing classes and hence of literature. It is a border dialect, having the southern pronunciation of unaccented ò as a, but in the jo for accented ë.
before a hard consonant it is akin to the North and it has also kept the northern pronunciation of ə instead of the southern h. So too unaccented ə sounds like i or j.

White Russian, in the governments of Vitebsk, Mihalev, and Minsk, and adjoining parts of Pskov, Smolensk, Chernigov and Vlna (some 10,000,000 speakers), appears at first so different from Great Russian that it was long classed as a separate division. It was the official language of the Lithuanian principality afterwards merged in Poland and hence was under strong Polish influence. Little R. was under somewhat similar influence, so that the two dialects have approximated in some respects; the originally White Russian was not much nearer Lit. R. than was any other south-eastern Gt. R. dialect. In its main characteristic Wh. R. approximates to Polish, but this likeness goes deeper than the surface Polonisms above referred to, as it falls into its natural place in the classification of Slavonic languages by the phenomena of “softening.” Accordingly I and ə, when soft or before soft ə, become ò and ò, e.g. R. čelo, “body,” dělo, “deed,” měď, “bear,” Wh. R. čelo, děle, měď, “bear.” Russian čelo, dělo, něďiště. Other special points which distinguish Wh. R. from the other a dialects are a tendency to confuse u and ə and to pronounce either of them as a u. The same sound also taking the place of hard l closing a syllable; r is always hard; f, a sound essentially non-Slavonic, appears as ch or chv, e.g. cronk, R. francus, “a Frenchman,” Chvođar, R. Fodor, “Theodore.”

In accidence we may note the preservation of the vocative; of the sibilants before case terminations where R. has restored gutturals by analogy, e.g. locatives nosâte, rucête, saste, R. noget, rukête, sochte, from nogdt, “foot,” rukát, “hard,” sochte, “plough”; and of the ļrd sing. pres. ind. in ļor ļ, or without any ļ. V’oďet or v’oďe for R. ved’ot, “leads.”

On the boundary between Wh. R. and the Novgorod dialect the former has the latter’s confusion of ļ and ļ.

The best account of Wh. R. is E. Karskij, Sketch of the Sounds and Forms of Wh. R. Speech (Moscow, 1886); there is a dictionary by Nosovič (St P., 1875). Bezsonov, Wh. R. Songs (Moscow, 1874), and P. V. Schein in a whole series of publications give good specimens of the dialect.

The Little Russian dialect claims to be a literary language; it has established this claim in Galicia (see Ruthenians), but its use as such is much restricted in Russia. The Little Russians differ from the Great Russians not only in language but in physical type, customs, domestic architecture and folk-lore; though Russophobes have tried to prove that this is due to the Finnish element in the Great Russians, it cannot be substantiated, and the Little Russians, especially the descendants of the Cossacks, have no small Tatar element in them. For the last three centuries they have been under strong Polish influence, and this has had great effect upon the vocabulary but not much on phonetics or morphology. Little Russian is divided into three main groups of dialects: those of Hungarian, which show an approximation to Slovak; those of Galicia, which rather recall Polish; and those of the Ukraine and other districts in Russia, which gradually shade into South Great Russian and White R., though the love of the sound a is noticeably absent. Little Russian is rather characterized by itacism; for original y and original ļ have coincided in a sound between ə and y not unlike the Eng. short i, and original ľ, also e and even a after having been lengthened in compensation for lost semi-vowels are now represented by i.

Further, Little Russian has reduced the common Russian softening, only keeping it before a and o and for ļ and a, and hardening the consonant before e and original ə. In common with Wh. R. it has h for ɡ, a vocative case, gutturals made sibilant before ļ (for ɫ) in oblique cases, 3rd sing. without the ļ, 1st plur. in -mō and -me instead of mə, ns for nj, ɫ for lj, ɫ for ļ, ɡ for n, ɚ and hard ɫ, but all these occur more or less throughout S. Russian and only tend to a superficial resemblance.

These phonetic peculiarities are not universal, but the presence of the narrowed ĵ, ə and o is sufficient to mark a dialect as Little Russian.

The Russian alphabet is modified for Little Russian use as r = h and hence r = g; ĵ is used for the ɡ which does not soften the preceding vowel, ə for the thick and ļ for the pure ļ.

For oral and written literature, the first of these sections includes the interesting byliny, or “tales of old time,” as the word may be translated, which have come down to us in great numbers, as they have been sung by wandering minstrels all over the country. The scholars who have given their attention to these compositions have made the following division of them into cycles: (1) that of the older heroes; (2) that of Vladimir, prince of Kiev; (3) that of Novgorod; (4) that of Moscow; (5) that of the Cossacks; (6) that of Peter the Great; (7) the modern period. These poems, if they may be so styled, are not in rhyme; the ear is satisfied with a certain cadence which is observed throughout.

For a peasant songs.

Peasant songs.

The style of Russian literature which prevailed from the time of Lomonosov was wholly based upon the French or pseudo-classical school. It was, therefore, hardly likely that these peasant songs would attract attention. But when the gospel of romanticism was preached and the History of Karamzin appeared, a new impulse was given to the collection of all the remains of popular literature. In 1804 appeared a volume based upon those which had been gathered together by Cyril or Kirsha Danilov, a Cossack, at the beginning of the 18th century. They were received with much enthusiasm, and a second edition was published in 1814. In the following year there appeared at Leipzig a translation of many of these pieces into German, in consequence of which they became known much more widely. This little book of 160 pages is important because the originals of some of the byliny translated in it are now lost. Since that time large collections of these poems have been published, edited by Rybnikov, Hilferding, Srezenovsky, Avenarius and others.

These curious publications have all the characteristics of popular poetry in the endless repetitions of certain conventional phrases—"the green wine," "the bright sun" (applied to a princess), "the damp chamber," "the bright home," "the green glade," "the bright path," "the white reason," etc. The heroes of the first cycle are monstrous beings, and seem to be merely impersonifications of the powers of nature; such are Volga Vesselisch, Mikula Seliáninovich and Sviatogor. They are called the bogatyr starksie. Sometimes we have the giants of the mountain, as Sviatogor, and the serpent Gorinich, the root of part of both
names being *gora* (mountain). The serpent Gorinich lives in caves, and has the care of the precious metals. Sometimes animal natures are mixed up with them, as *zmi-bogatyry*, who unites the qualities of the serpent and the giant, and bears the name of Tugairn Zmiyevich. There is the Pagun Idol (*Idolische Pogonske*), a great gluton, and Nightingale the Robber (*Solovey Razboinik*), who terrifies travellers and lives in a nest built upon six oaks.

In the second cycle the legends group themselves round the celebrated Prince Vladimir of Kiev. The chief hero is Ilya Muromets, who performs prodigies of valour, and is of gigantic stature and superhuman strength. The cycle of Novgorod deals with the stories of Vasilii Buslaveich and Sadko, the rich merchant. The fourth cycle deals with the autocracy; already Moscow has become the capital of the future empire. We are told of the taking of Kazan, of the conquest of Siberia by Yermak, of Ivan the Terrible and his confidant Maluta Skuratovitch. It is observable that in the popular tradition Ivan is not spoken of with any hatred. As early as 1619 some of these *byliny* were committed to writing by Richard James, an Oxford graduate who was in Russia as chaplain of the embassy. The most pathetic is that relating to the unfortunate Xenia, the daughter of Boris Godunov. Yermak, the conqueror of Siberia, forms the subject of a very spirited lay, and there is another on the death of Ivan the Terrible. Considering the relations in which she stood to the Russians, we cannot wonder that Marina, the wife of the false Demetrius, appears as a magician. Many spirited poems are consecrated to the achievements of Stenka Razin, the bold robber of the Volga, who was for a long time a popular hero. The cycle of Peter the Great is a very interesting one. We have songs in abundance on the achievements of the tsar, as the taking of Azov in 1696. There is also a poem on the execution of the *streisy*, and another on the death of Peter. In the more modern period there are many songs on Napoleon. The Cossack songs, written in the Little Russian language, dwell upon the glories of the *sich*, the sufferings of the people from the invasions of the Turks and Mongols, the exploits of the Haidamaks and, lastly, the fall of the Cossack republic. Besides these, the Russians can boast of large collections of religious poems, many of them containing very curious legends. In them we have a complete store of the beliefs of the Middle Ages. A rich field may be found here for the study of comparative mythology and folk-lore. Many of them are of considerable antiquity, and some seem to have been derived from the Midrash. Some of the more important of these have been collected by Bessonov. Besides the *byliny* or legendary poems, the Russians have large collections of *skazki* or folk-tales, which have been gathered together by Sakharov, Abramovitch, and other collectors. They also are full of valuable materials for the study of comparative mythology.

Leaving the popular and oral literature, we come to what has been committed to writing. The earliest specimen of the Russian, properly so called, must be considered the Ostromir Codex, written by the diak Gregory at the order of Ostromir, the *posadnik* or governor of Novgorod. This is a Russian recension of the Slavonic Gospels, of the date 1056-57. Of the year 1073 we have the *Izhornik* or *Miscellany* of Sviatoslav. It was written by John the diak or deacon for that prince, and is a kind of Russian encyclopedia, drawn from Greek sources. The date is 1076. The style is praised by Buslavev as clear and simple. The next monument of the language is the *Discourse concerning the Old and New Testament*, by Hilarioun, metropolitan of Kiev. In this work there is a panegyric on Prince Vladimir of Kiev, the hero of so much of the Russian popular poetry. Other writers are Theodosius, a monk of the Pestcherskiy cloister, who wrote on the Latin faith and some *Pouchenia* or "Instructions," and Luke Zhidita, bishop of Novgorod, who has left us a curious *Discourse to the Brethren*. From the writings of Theodosius we see that many pagan habits were still in vogue among the people. He finds fault with them for allowing these to continue, and also for their drunkenness; nor do the monks escape his censure.

Zhidiata writes in a more vernacular style than many of his contemporaries; he eschews the declamatory tone of the Byzantine authors.

With the so-called Chronicle of Nestor (g.v.) begins the long series of the Russian annalists. There is a regular chain of these chronicles, extending with only two breaks to the time of Alexis Mikhailovich, the father of Peter the Great. Besides the work attributed to Nestor, we have chronicles of Novgorod, Kiev, Volhynia and many others. Every town of any importance could boast of its annalists, Pskov and Suzdal among others. In some respects these compilations, the productions of monks in their cloisters, remind us of the Anglo-Saxon *Chronicle*, dry details alternating with here and there a picturesque incident; and many of these annals abound with the quintest stories. There are also works of early travellers, as the igumen Daniel, who visited the Holy Land at the end of the 11th and beginning of the 12th century. A later traveller was Athanasius Nikitin, a merchant of Tver, who visited India in 1470. He has left a record of his adventures, which has been translated into English and published for the Hakluyt Society. Later also is the account written by two merchants, Korebeinikov and Grekov. They were sent with a sum of money to the Holy Sepulchre to entreat the monks to pray without ceasing for the soul of the son of Ivan the Terrible, whom his father had killed. A curious monument of old Slavonic times is the *Pouchenie* ("Instruction"), written by Vladmir Monomakh for the benefit of his sons. This composition is generally found inserted in the *Chronicle* of Nestor; it gives a quaint picture of the daily life of a Slavonic prince.

In the 12th century we have the sermons of Cyril, the bishop of Turov, which are attempts to imitate in Russian the florid Byzantine style. In his sermon on Holy Week, Christianity is represented under the form of spring, Paganism and Judaism under that of winter, and evil thoughts are spoken of as pestiferous winds. And here may be mentioned the many lives of the saints and the Fathers to be found in early Russian literature. Some of these have been edited by Count Bezborodko in his *Memoriali Starihney Russkoy Literature* ("Memorials of Ancient Russian Literature").

We now come to the story of the expedition of Prince Igor, which is a kind of *byлина* in prose, and narrates the expedition of Igor, prince of Novgorod-Siversky, against the Polovtses. The manuscript was at one time preserved in a monastery at Yaroslav, but was burnt in the great fire at Moscow in the year 1812. Luckily the story had been edited (after a fashion) by Count Musin-Pushkin, and a transcript was also found among the papers of the empress Catherine. The original was seen by several men of letters in Russia, Karamzin, Prie, and others. They are a mass of Christological and heathen allusions, but there are parallels to this style of writing in such a piece as the "Discourse of a Lover of Christ and Advocate of the True Faith," from which an extract has been given by Buslavev in his *Chronomathy*. There is a great deal of poetical spirit in the story of Igor, and the metaphors are frequently very vigorous. Mention is made in it of another hard named Boyan, but none of his inspirations have come down to us. A strange legend is that of the tsar Solomon and Kitovras, but the story occurs in the popular literatures of many countries. Some similar productions among the Russians are merely adaptations of old Bulgarian tales, especially the so-called apocryphal writings. The *Zadenitschina* is a sort of prose poem much in the style of the "Story of Igor," and the resemblance of the latter to this piece and to many other of the *sazania* included in or attached to the Russian chronicle, furnishes an additional proof of its genuineness. The account of the battle of the "Field of Woodcocks," which was gained by Dmitri Donskoy over the Mongols in 1380, has come down in three important versions. The first bears the title "Story of the Fight of the Prince Dmitri Ivanovich with Mamai"; it is rather meagre in details but full of expressions showing the patriotism of the writer. The second version is more complete in its historical details, but still is not without
RUSSIAN LITERATURE

anachronisms. The third is altogether poetical. The Prostoy et O Drakule ("Story of Drakula") is a collection of anecdotes relating to a cruel prince of Walachia who lived in the 15th century. (See RUMANIA, History.) Several of the barbarities described in it have also been assigned to Ivan the Terrible.

The early Russian laws present many features of interest, such as the Ruskaya Pravda of Yaroslav, which is preserved in the chronicle of Novgorod; the date is between 1018 and 1054. The laws show Russia at that time to have been in civilization quite on a level with the rest of Europe. But evil influences of the Mongols was soon to make itself felt. The next important code is the Sudebnik of Ivan III., the date of which is 1497; this was followed by that of Ivan IV. of the year 1539, in which we have a republication by the tsar of his grandfather's laws, with additions. In the time of this emperor also was issued the Stogloz (1551), a body of ecclesiastical regulations. Mention must also be made of the Udalenie or "Ordinance" of the tsar Alexis. This abounds with enactments of sanguinary punishment: women are buried alive for murdering their husbands and the torture of confession is recognized as a means of proving evidence; and the knot and mutilation are mentioned on almost every page. Some of the penalties are whimsical: for instance, the man who uses tobacco is to have his nose cut off; this was altered by Peter the Great, who himself practised the habit and encouraged it in others.

In 1553 a printing press was established at Moscow, and in 1564 the first book was printed, an "Apostol," as it is called, i.e. a book containing the Acts of the Apostles and the Epistles. The printers were Ivan Fedorov and Peter Timofeiev; a monument has been erected to the memory of the former. As early as 1568 Ivan had invited printers to Russia, but they were detained on their journey. Fedorov and his companions were soon, however, compelled to leave Russia, and found a protector in Sigismund III. The cause appears to have been the enmity of the copists of books, who succeeded in drawing over to their side the more fanatical priests. The first Slavonic Bible was printed at Ostrog in Volhynia in 1581. Another press, however, was soon established at Moscow; up to 1600 sixteen books had been issued there.

A curious work of the time of Ivan the Terrible is the Domostroy, or "Book of Household Management," which is said to have been written by the monk Sylvester. This priest was at one time very intimate with Ivan, but ultimately was banished to the Solovetsky monastery on the White Sea. The work was originally intended by Sylvester for his son Anthimius and his daughter-in-law Pelagia, but it soon became very popular. We have a faithful picture of the Russia of the time, with all its barbarisms and ignorance. We see the unbounded authority of the husband in his own household: he may inflict personal chastisement upon his wife; and her chief duty lies in ministering to his wants. To the reign of Ivan the Terrible must also be assigned the Chetits-Minei or "Book of Monthly Orders," containing extracts from the Greek fathers, arranged for every day of the week. The work was compiled by the metropolitan Macarius, and was the labour of twelve years. An important writer of the same period was Prince Andrew Kurbskiy, descended from the sovereigns of Yaroslav, who was born about 1528. In his early days Kurbskiy saw a great deal of service, having fought at Kazan and in Livonia. But he quarrelled with Ivan, who had begun to persecute the followers of Sylvester and Adashev, and fled to Lithuania in 1563, where he was well received by Sigismund Augustus. From his retreat he commenced a correspondence with Ivan, in which he reproached him for his many cruelties. Ivan in his answer declared that he was quite justified in taking the lives of his slaves if he thought it right to do so. Kurbskiy died in exile in 1583. He also wrote a life of Ivan, but Bestuzhev Riumin thinks that his hatred of Ivan led him to exaggerate, and he regrets that Karamzin should have followed him so closely. Besides the answers of Ivan to Kurbskiy, there is his letter to Cosmas and the brotherhood of the Cyrillic monastery on the White Lake (Bielo Ozero), in which he reproaches them for the self-indulgent lives they are leading. Other works of the 16th century are the Stepennaya Kniga, or "Book of Degrees" (or "Pedigrees"), in which historical events are grouped under the reigns of the grand-dukes, whose pedigrees are also given; and the Life of the Tsar Feodor Ivanovich (1584-90), written by the patriarch Job. To the beginning of the 17th century belongs the Chronograph of Sergius Kubasov of Tobolsk. His work extends from the creation of the world to the accession of Michael Romanov, and contains interesting accounts of such of the members of the Russian royal family as Kubasov had himself seen. Something of the same kind must have been the journal of Prince Matislavskiy, which he showed the English ambassador Jerome Horsey, but which is now lost.

To the time of the first Romanovs belongs the story of the siege of Azov, a prose poem, which tells us, in an inflated style, how in 1637 a body of Cossacks triumphantly repelled the attacks of the Turks. There is also an account of the siege of the Trenitz, which was not reconquered until 1668. The work was issued by Professor Soloviev of Helsingfors at Upsala and printed in 1860. The picture which Kotoshikin draws of his native country is a sad one, and from his description, and the facts we gather from the Domostroy, we can reconstruct the Old Russia of the time before Peter the Great. Perhaps, as an exile, Kotoshikin allowed himself to write too bitterly. A curious work is the Uralidok Sokolnikhui Puti ("Directions for Falconry"), which was written for the use of the emperor Alexis, who, like many Russians of old time, was much addicted to this pastime. The Serb, Yuri Krzhanich, who wrote in Russian, was the first pan-Slavist, anticipating Kollar by one hundred years, or more, and creating a modern Slavonic grammar (with comparison of the Russian, Polish, Croatian and White Russian), which was edited from the manuscripts by Bodiansky in 1848. For his time he had a very good insight into Slavonic philology. His pan-Slavism, however, sometimes took a form by no means practical. He went so far as to maintain that a common Slavonic language might be made for all the peoples of that race—an impossible project which has been the dream of many enthusiasts. He was banished to Siberia, and finished his grammar at Tobolsk. He also wrote a work on the Russian empire in the middle of the 17th century, compiled by the Poles during the 17th century, which was edited by Besonov in 1860. The picture drawn, as in the corresponding Servian, by Kotoshikin, is a very gloomy one. To this period belongs the life of the patriarch Nikon by Shusserin. The struggles of Nikon with the tsar, and his emendations of the sacred books, which led to a great schism in Russia, are well known. They have been made familiar to Englishmen by the eloquent pages of the late Dean Stanley. From this revision may be dated the rise of the Raskolniks (Dissenters) or Staro-obrashdtsi (those who adhere to the old ritual). With Simeon Polotskiy (Polotskiy) (1628-1680) the old period of Russian literature comes to a close. 1

---

1 Horsey says: "Tread in their cronickells written and kept in secret by a great priem prince of that country named Knez Ivan Fedorovich Matislavskiy, Minister of his grace and confined unto me many secrets observed in the memory and procis of his tyme, which was lowner-score yeares, of the state, natur, and government of that comonwealth."—Band, Russia at the Close of the Sixteenth Century (Hakluyt Society, 1856).

2 Lectures on the Eastern Church.
literture may be closed. He was tutor to the tsar Feodor, son of Alexei, and may be said to have helped to introduce the culture of the West into Russia, as he was educated at Kiev, then a portion of Polish territory. Polotski came to Moscow about 1640. He wrote religious poetry (Prochenski, "The Garland of Faith"), and composed poems and religious dramas (The Prodigal Son, Nubuchadnessar, &c.). He has left us some droll verses on the tsar's new palace of Kolomenskoie, which are very curious doggerel. The artificial litanies that roared, moved their eyes, and walked especially delighted him. There does not seem to be any ground for the assertion (often met with even in Russian writers) that Sophia, the sister of Peter the Great, was acquainted with French, and translated some of the plays of Molière.

And now all things were to be changed. Russia was to adopt the forms of literature in use in the West. One of the chief helpers of Peter the Great in the education of the people was Peofane (Theopanes) Procopovich (1681-1756), author of the Ecclesiastical Regulations and some plays, who advocated the cause of science; passing through the interesting he produced a valuable work on Poverty and Riches. Alexiok Kantemir (1705-1744), son of a former hospodar of Moldavia, wrote some clever satires still read; they are imitated from Boileau. Kantemir, who died at a favorable age, published two satires, he published versions of Fontenelle's Pluralité des Mondes and the histories of Justin and Cornelius Nepos. He was for some time Russian ambassador at the courts of London and Paris. But more celebrated than these men was Michael Lomonosov (q.v.). He was an indefatigable writer of prose and verse, and left many, tragedies, didactic poetry, essays and fragments of epics.

Vassili Tatishchev (1686-1730) was the author of a work which is interesting as the first attempt in that field. He was disgraced for having written a dig and occasional poem. His work was not given to the world till after his death. There had been a slight sketch published before by Khilkov, entitled the Harrow of Russian History. Basili Trediakovski (1703-1799) was born at Astrakhan, and we are told that Peter, passing through that city at the time of his Persian expedition, had Trediakovski pointed out to him as one of the most promising boys of the school there. Whereupon, having questioned him, he said, "a boy of easy instruction. A busy worker, but author of nothing." His Temakhidi, a poem in which he versified the Iliad of Fénéon, drew upon him the derision of the wits of the time. Bickerly, he took his place among the Russian comedians. But the teat of a man at that time in Russia was not altogether a cheerful one. His services, however, to the Russian language were great.

The crown of the reign of Elizabeth Russian literature made great progress, the French furnishing models. Alexander Sumarokov (1718-1777) wrote prose and verse in abundance—comedies, tragedies, idyls, satires and epigrams. He is, perhaps, best entitled to remembrance for his plays, which are rhymed, and in the French style. His Dmitri Samomansets ("Demetrius the Pretender") is certainly not without merit. Some of the pieces of Kniazhnin have greater merit than their time. The Chatterbox, The Originals and especially The Fatal Marriage. He is now almost forgotten. In 1756 the first theatre was opened at St Petersburg, a building, the beautiful at that time in Russia, 1744-1748, when she was to have Homers, Findars, Horaces and Virgils. Michael Kherskov (1733-1807) wrote besides other poems two enormous epics—the Russians in twelve books, and Dismas and Judas, in eleven. Hugh Trepauk the Hippolitus Bogdanovich (1743-1803) wrote a pretty lyric piece, Dushenka, based upon La Fontaine, and telling the story of the loves of Cupid and Psyche. With Ivan Krylov (1769-1844) of whom it has been said that he is the star of fabulists: this half oriental form of literature, so common in countries ruled absolutely, has been very popular in Russia. Krylov's work (1744-1784), which aims to improve the German origin, began by translating the fables of Gellert, but "forward other original specimens. A writer of real national comedy appeared in Denis Voronoff, who probably derived much to St Petersburg at Moscow (1744-1792). His best production is Dedrodel ("The Minor"), in which he satirizes the coarse features of Russian society, the ill-treatment of the serfs, and other matters. He saw France on the eve of the Revolution and has described what he did see. Russian as he was, and accustomed to serfdom, he was yet astonished at the wretched condition of the French peasants. The great poet of the age of Catherine, the laureate of Pushkin, who was Gabriel Derzhavin, essayed many styles of composition, and was a great master of his native language. There is something grand and organ-like in his style, and he unfortunately occasionally degenerates into bombast. His versification is perfect; and he had the courage to write satirically of many persons of high rank. His tide to God is the best known of his poems in Western countries. He died in Paris. Then comes Edward Young, the author of the Night Thoughts. Other celebrated poems of Derzhavin are Felitsa, Odes on the Death of Prince Menshikovsky, The Nobleman, The Taking of Ismail, and The Taking of Warsaw. His Memorie were published in 1827.

An unfortunate author of the days of Catherine was Alexander Radishtchev (1749-1802), who, having, in a small work, A Journey to St Petersburg and Moscow, spoken too severely of the miserable condition of the serfs, was exiled to Siberia, from which he was afterwards allowed to return, but not till his health had been permanently injured by his imprisonment. An equally unfortunate fate befell the historian Nicholas Novikov (1744-1818), who, after having worked hard as a journalist, and done much for education in Russia, fell under the suspicion of the government, and was imprisoned for six years on her desire. On his release it seemed that the short reign of Paul was not favourable to literary production; the censorship of the press was extremely severe, and many foreign books were excluded from Russia. Russia, under Peter the Great, came into the realm of Alexander, one of the greater of whose days was Nicholai Karamzin (q.v.). His chief work is his History of the Russian Empire, but he appeared in the fourfold aspect of historian, novelist, essayist and poet. Nor need we more than mention the celebrated Archbishop Platov (q.v.). Ivan Dmitriev (1760-1837) wrote some pleasing lyrics and epistles, but is best known for the story of the lives of the Danish painters who have been well acquainted with the English poets. Ozerov (1769-1816) wrote a great many tragedies, which are but little read now. They are in rhyming alexandrine couplets, handled native subjects with success, as in his Dmitri Donskoy (1807) and Yaropolk and Olek (1798). In Ivan Kriloff (q.v.) the Russians found their most genial fabulist. As Derzhavin was the poet of the age of Catherine, so Vasili Zhukov is the poet of the age of Nicholas I. He is perhaps the most delightful of living Russian prose writers. He has been said to have been that of the age of Alexander. He is more remarkable, however, as a translator than as an original poet. His translations from the French, the German (Goethe), and the English (Byron, Moore, Southey) One of his original productions, The Poet in the Camp of the Russian Warriors, was on the lips of every one at the time of the War of the Fatherland (1877-1880) in 1812. He produced versions of the epistle of Nala and Damayanti from the Mahabharata, of Rustum and Zohrab from the Shah-nameh, and of a part of the Odyssey. In the case of these three masterpieces, however, he was obliged to turn to literal translations (mostly German), as he was unacquainted with the original languages. The Iliad was translated during this period by Gnedich, who was familiar with Greek. He has produced faithful versions, and has naturalized the hexameter in the Russian language with much skill. Constantine Batishkoff (1787-1835) was the author of many elegant poems, and at the outset of his career was considered a great poet. He managed to live in this condition to an advanced age. Merzlak and Tinglezon deserve a passing notice as the writers of songs of which still keep their popularity. During his short life (1799-1837) Alexander Pushkin (q.v.) was the accepted poet of Russia. His work, which will be found enumerated in the article devoted to him (see Pushkin). In Alexander Griboyedov (1795-1829) (q.v.) the Russians saw the writer of one of their most successful comedies (Griboyedov, in English). He was translated as The Misfortune of Being Too Clever (lit. "Grief out of Wit"). Ivan Koslov (1774-1838) was author of some pretty original lyrics, and was translated as The Czar's Saturday Night. He became a cripple and blind, and his misfortunes elicited some cheering and sympathetic lines from Pushkin, which will always be received with pleasure. Pushkin found a successor in Michael Lermontov (q.v.), who
has left us many exquisite lyrics. A genuine bard of the people, "Lermontov, and one of their most truly national authors, was Alexei Koltsov (1809–1842), the son of a tallow merchant of Riga. A studied and taciturn man, Koltsov has, like many of the best Russians, are to be found in all the collections of Russian poetry. He died of consumption after a protracted illness. Another poet who much resembled Koltsov was Ivan Nikitin (1820–
1855), an abolitionist and a philosopher. He was a Russian and a Madman a Russian in that he seems to have had in his blood the spirit of Nekrasov, who imitation Sir Walter Scott. The most celebrated of the romances of Nekrasov was Yuri Miloslavsky, a tale of the expulsion of the Turks from the Crimea (1872). It is a madman's history, written in a style of feverish urgency: it is a spirited picture of the times; unfortunately, a gloss is put upon the barbary of the manners of the period. Among the better known productions of Lazhrzhnikov are The Hermit and The Palace of Ice. A bad boy now forgotten writer of novels was Thaddeus Bulgarin (1789–1859).

In Russian literature of great and original talent was Nicholai Gogol (1809–1852) (q.v.). In his Dead Souls he satirized all classes of society, some of the portraits being wonderfully vivid. Being the native author of a history of Russia, his works had the scene of its principal events in the history of the people, especially in such stories as the Old-Fashioned Household, or in the more powerful Taras Bulba. This last is a highly wrought story, giving us a picture of the old Russian society and the life of the Cossacks. Gogol was also the author of a good comedy, The Revisor, wherein the petty pillerings of Russian municipal authorities are satirized. In his Memoirs of a Madman and Portraits, he shows a weird and fantastic imagination. He was the first to have proved that the real Russian life was much more fantastic than the imagination of the Russian people. His tales are so much like The Cloak, and the curious tale Viz ("The Demon"), where he gives us a picture of Kiev in the old days. His field of fiction Gogol had various famous successors, concerning whom details will be found in separate articles. It must suffice here to enumerate Alexander Herzen (d. 1870); Fedor Dostoievsky (1821–1881); Alexander Ostrovsky (1828–1886); Ivan Turgenev (1818–1875); Leo Tolstoy (1828–1910), and Count L. Tolstoy (1828–1910), the last of whom ranks as much more than a man of letters.

In Vissarion Belinski the Russians produced their best critic. For thirteen years (1834–47) he was the Aristarchus of Russian literature and exercised a healthy influence. In his later days he addressed a withering epistle to Gogol on the newly adopted teaching of the latter.

Since the time of Karamzin the study of Russian history has made great strides. He was followed by Nicholas Polevoy (1775–1838), who published a History of the Moscow State (1817). Alexander Polevoy (1780–1859), author of The Fisherman and The Emigrants (1822–1900); Volodya Ksichkovsky (1826–1889); Feodor Dostoievsky (1821–1881); Alexander Ostrovsky (1828–1886); Turgenev (1818–1875); Dostoevsky (1826–1889), also famous as a dramatist; and greater than all these Ivan Turgenev (1818–1883), and Count L. Tolstoy (1828–1910), the last of whom ranks as much more than a man of letters.

Lermontov. During the last generation of the 19th century most of these petrified posthumous heroes were left successors of equal merit. Dostoevsky, Pisemsky, Turgenev, Goncharov, Ostrovsky and Saltikov followed each other to the grave in rapid succession. Leo Tolstoy alone remained, a veritable passion, a creator whose fame has given his descendants, even the contributions of his great prose fiction. In 1865 Apukhtin, author of many graceful lyrics, died; in 1870 Apollon Maliov, and soon afterwards Polotsky. These men were well known throughout Russia, and the acts of their lives, their poetry and fiction, have been regarded by most part of the so-called decadents and symbolists. Among them may be mentioned A. Korinfsky; Ivan Banin, who has published an excellent translation of Longfellow's Hiawatha; and Constantine Balchur, who was the principal translator of Greece when he was publisher of the Greek edition of the Iliad, which is legion. In 1897 Professor Bestuzhiev-Riumin, of the university of St Petersburg, died. He had held his chair of history for forty years, and he is now the only surviving scholar of that name. His History of Petrograd is a notable work. The only first volume and the first half of the second were published when he died. Soloviev and Kostomarov are dead. The famous school of Russian historians is thus almost extinct. But some members of the old school and some of the new in Russia have been furnished with the name of professors. One of the most interesting was the history professor of the University of St Petersburg, Pro- fessor Milukov, who has started his Sketches of the History of Russian Culture (Ocherki po istorii russkoi kultury), which has been much read. Professor Bilbskov wrote a History of Catherine II. and N. Shilder a Life of Alexander II, which has been much read. V. G. Rozhkov wrote an important work entitled Village Economy in Muscovy in the Sixteenth Century. This book analyses the conditions under which economic production was developed in Old Russia. In 1848-1857—an epoch of great Russian poetry—the publication of the Pushkin appears here before us in the most minute details of his everyday life. The centenary of his birth (1899) was signalized by the publication of a very large volume of his letters and essays. His career. The details furnished by his nephew L. Pavlovitch, were especially noteworthy. The second volume appeared of the classical History of the Russian Church, by E. Golubinsky. A valuable contribution to early Russian history was furnished by the Legal An- tiquities (Yuridicheskaia Drevnosti) of V. Serejevitch, who quite a new light has been thrown upon the Russian sober. The well- known savant, Maxime Kovalvskiy, published the second volume of his Historical Dictionary of Russian Law. In 1897 A. N. Rozhkov wrote an important work entitled Russian History in the Sixteenth and Seventeenth Centuries. He holds entirely new views on the oprichina, the famous bodyguard of Ivan the Terrible. Professor B. Klitschus of the university of Moscow, published in 1883 a valuable book on the Russian language, as the national language of the emperors was called, and in 1890 he issued his Aids to Lectures on Russian History. Russian writers have not often devoted them- selves to the political and social conditions of other countries, but an exception must be made in the cases of the books by Professor Vinogradov, formerly of Moscow, notably his Investigations into the Social History of England in the Middle Ages (1867). The learned author even went so far as to consult the Oxford professor Gogol, with prudence, also prepared an edition of this work for the English public. In fiction no new writers appeared of equal calibre to Gogol, Turgenev, Dostoevsky and Tolstoy. But A. Chekov showed considerable power in his short stories. Some of the tales of Gogol (g.s.), Ertel and Yasinsky are also of great merit. The brilliant Garnish died insane in 1888.

Another book, based on the literature of the Russian dialects, the Little and White Russian, is rich in skazki (tales and songs). Peculiar to them is the duma, a narrative poem which contains in many particulars with the Romanians. Since the beginning of the 19th century, the Little Russian duma have been repeatedly edited, as by Maksimovich Metlinsky and others, and an elaborate edition was undertaken by Dragomanov and the duma of the Little Russians. The White Russian duma of the Little Russians exhibit of classification, and they have been divided by their latest editors as follows: (1) the songs of the drazhnia, treating of the early princes and their followers; (2) the Cossack period (Kozachestvo), in which the Cossacks are found in continual warfare with the Polish pan in the attempts to establish a union under the Standard of the Roman Catholic religion; (3) the period of the Haidamaks, who formed the nucleus of the national party, and prolonged the struggle. The foundation of the Little Russian literature (written, as opposed to the oral) was attempted by V. A. wine, whose travesty of part of the Aeneid enjoys great popularity among some of his countrymen. Others, however, object to it as tending to bring the language or dialect into ridicule. A truly national Russian literature, however, was not possible in that age, till the Cossacks, in the government of Kiev, in the condition of a serv. The strange adventures of his early life he has told us in his autobiography. He did not get his freedom till some time after he had reached the age of eighteen, when he was released from his master by (1847) and various efforts of the poet Zhukovsky and others. Besides poetry, he occupied himself with painting, with considerable success. He has also published a novel of the first type, which is remarkable for the grace of its style and the beauty of its spirit. But his best work is his political poems, and he has written a fine volume of verse with the title of the poem "Haidamaks," which was published with exile to Siberia from 1847 to 1857. He did not long survive his return, dying in 1861, aged forty-six. No one has described with greater vigour than Shevchenko the old days of the Ukraine. In his youth he listened to the village traditions handed down by the priests, and he has faithfully reproduced them. In the powerful poem entitled Haidamak we have a graphic picture of the horrors enacted by Gonta and his followers at Uman. The funeral of the poet was a vast public procession; a great cairn, surmounted with a cross, was raised over his remains, where he lies buried near Kaniov on the banks of the Dnieper. His grave has been styled the "Mecca of the South Russian Revolutionists." "In the whole city of Odessa," says a verse of his, "terrible news—one contributed by the novelist Turgenev—appeared at Prague in 1876. Besides the national songs, excellent collections of folk songs are also published in Russia, Poland and eastern Galicia. There is a large volume of popular songs, produced by the method of the "Kiev school," which has been written and published in Kiev in 1875 by Lonachevsky. Eugene Zelechovsky compiled a valuable Dictionary of the Russian dialect. There is a good grammar by Oedtta, a pupil of Mikloish. The distribution of these works has not been large, but the author's aim has been to collect and reproduce them, the one of the most neglected of the Russian folk-songs. The White Russian songs have been published by Shein and others.

Bibilography.—A. Pypin, History of Russ. Lit. (in Russian); A. Brückner, Geschichte der russ. Lit. (Leipzig, 1895); Eng. trans. by J. Zima, London; A. V. Nosovitch, History of the Latest Russ. Wiener, Anthology of Russ. Lit. (New York, 1902); Rosa Newmark, Poetry and Progress in Russia (London, 1907). (W. R. M.)

RUSSO-JAPANESE WAR, 1904–5. The seizure by the Russian highway of the Chinese fortress of Port Arthur, which she had a few years previously, in concert with other powers, compelled Japan to relinquish, was from the Russian point of view the logical outcome of her eastward expansion and her need for an ice-free harbour on the Pacific. The extension of the Trans-Siberian railway through Manchuria to Port Arthur and a large measure of influence in Manchuria followed equitably naturally. But the whole course of this expansion had been watched with suspicition by Japan, from the time of the Saghalien incident of 1875, when the island, then barely emerging from the feudal age, had to cede her half of the island to Russia, to the Shimonoseki treaty of 1895, when the powers compelled her to forego the profits of her victory over China. The subsequent occupation of Port Arthur and other Chinese harbours by European powers, and the evident intention of consolidating Russian influence in Manchuria, were again and again the subject of Japanese representations at St Petersburg, and these representations became more vigorous when, in 1903, Russia seemed to be about to extend her Manchurian policy into Korea. No less than ten draft treaties
were discussed in vain between August 1903 and February 1904, and finally negotiations were broken off on February 5th. Japan had already on the 4th decided to use force, and her military and naval preparations, unlike those of Russia, kept pace with her diplomacy.

This was in fact an eventuality which had been foreseen and on which the naval and military policy of Japan had been based for ten years. She too had her projects of expansion and hegemony, and by the Chino-Japanese War she had gained a start over her rival. The reply of the Western powers was first to maintain the territorial integrity of China, and then within two years to establish themselves in Chinese harbours. From that moment Japanese policy was directed towards establishing her own hegemony and meeting the advance of Russia with a fait accompli. But her armaments were not then adequate to give effect to a strong-handed policy, so that for some years thereafter the government had both to impose heavy burdens on the people and to pursue a foreign policy of marking time, and endured the fiercest criticism on both counts, for the idea of war with Russia was as popular as the taxes necessary to the large expenditures were the more abhorrent. The fact that year by year, the tone of Japanese policy became firmer. In 1902 her position was strengthened by the alliance with England; in 1903 her army, though in the event it proved almost too small, was considered by the military authorities as sufficiently numerous and well prepared, and the arguments of the Japanese diplomats stiffened with menace. Russia, on the other hand, was divided in policy and consequently in military intentions and preparations. In some quarters the force of the new Japanese army was well understood, and the estimates of the balance of military power formed by the minister of war, Kuropatkin, coincided so remarkably with the facts that at the end of the summer of 1903 he saw that the moment had come when the preponderance was on the side of the Japanese. He therefore proposed to abandon Russian projects in southern Manchuria and the Port Arthur region and to restore Port Arthur to China in return for considerable concessions on the side of Vladivostok. His plan was accepted, but "a lateral influence suddenly made itself felt, and the completely unexpected result was war." Large commercial interests were in fact involved in the forward policy, "the period of heavy capital expenditure was over, that of profits about to commence," and the power and intentions of Japan were ignored or misunderstood. Further, Dragomirov, a higher military authority even than Kuropatkin, declared that "Far Eastern affairs were decided in Europe." Thus Russia entered upon the war both unprepared in a military sense, and almost entirely indifferent to its causes and its objects. To the guards and patrols of the Manchurian railway and the garrisons of Port Arthur and Vladivostok, 80,000 in all, Japan could, in consequence of her recruiting law of 1895, oppose a first-line army of some 270,000 trained men. Behind these, however, there were scarcely 200,000 trained men of the older classes, and at the other end of the long Trans-Siberian railway Russia had almost limitless resources.

The strategical problem for Japan was, how to strike a blow sufficiently decisive to secure her object, before the at present insignificant forces of the East Siberian army were augmented to the point of being unassailable. It turned, therefore, principally upon the efficiency of the Trans-Siberian railway and in calculating this the Japanese made a serious underestimate. In consequence, far from applying the "universal service" principle to its full extent, they trained only one-fifth of the annual contingent of men found fit for service. The quality of the army, thus composed of picked men (a point which is often forgotten), approximated to that of a professional force; but this policy had the result that, as there was no adequate second-line army, parts of the first-line had to be reserved, instead of being employed at the front. And when for want of these active troops the first great victory proved indecisive, half-trained elements had to be sent to the front in considerable numbers—indeed the ration strength of the army was actually trebled. The aim of the war, "limited" in so far that the Japanese never deluded themselves with dreams of attacking Russia at home, was to win such victories as would establish the integrity of Japan herself and place her hegemony in the Far East beyond challenge. Now the integrity of Japan was worth little if the Russians could hope ultimately to invade her in superior force, and as Port Arthur was the station of the fleet that might convey an invasion, as well as the symbol of the longed-for hegemony, the fortress was necessarily the army's first objective, a convincing Sedan was the next. For the navy, which had materially only a narrow margin of superiority over the Russian Pacific Squadron, the object was to keep the two halves of that squadron, at Port Arthur and Vladivostok respectively, separate and to destroy them in detail. But in February weather these objects could not be pursued simultaneously. Prior to the break-up of the ice, the army could only disembark at Chemulpo, far from the objective, or at Dalny under the very noses of its defenders. The army could therefore, for the moment, only occupy Korea and try to draw upon itself hostile forces that would otherwise be available to assist Port Arthur when the land attack opened. For the navy, instant action was imperative.

On the 8th of February the main battle-fleet, commanded by Vice-Admiral Togo, was on the way to Port Arthur. During the night his torpedo-boats surprised the Russian squadron in harbour and inflicted serious losses, and later in the day the battleships engaged the coast batteries. Repulsed in this attempt, the Japanese established a stringent blockade, which tried the endurance of the ships and the men to the utmost. From time to time the torpedo-craft tried to run in past the batteries, several attempts were made to block the harbour entrance by sinking vessels in the fairway, and free and deadly use was made by both sides of submarine mines. But, though not destroyed, the Port Arthur squadron was paralysed by the instantaneous assertion of naval superiority.

Admiral Alexeiev, the tsar's viceroy in the Far East and the evil genius of the war, was at Port Arthur and forbade the navy to take the risks of proceeding to sea. For a time, when in February Admiral Stroko was accidentally killed (surprise of February), Admiral Makárov, an officer of European reputation, commanded the fleet, this lethargy was shaken off. The new commander took his ships to sea every day. But his energetic leadership was soon ended by a tragedy. A field of electro-mechanical mines was laid by the Japanese in the night of April 12th-13th, and on the following day the Japanese cruisers stood inshore to tempt the enemy on to the mine-field. Makárov, however, crossed it without accident, and pursued the cruisers until Togo's battle-fleet appeared, whereupon he went about and steamed for port. In doing so he recrossed the mine-field, and this time the mines were effective. The flagship "Dvoryanskoe" was struck and went down with the admiral and 600 men, and another battle-ships was seriously injured. Then the advocates of passivity regained the upper hand and kept the squadron in harbour, and henceforward for many months the Japanese navy lay unchallenged off Port Arthur, engaging in minor operations, covering the transport of troops to the mainland, and watching for the moment when the advance of the army should force the Russian fleet to come out. Meantime seven Japanese cruisers under Vice-Admiral Kaínamura went in search of the Russian Vladivostok squadron; this, however, evaded them for some months, and inflicted some damage on the Japanese mercantile marine and transports. The Japanese had not waited to gain command of the sea before beginning the sea transport of that part of their troops allotted to Korea. The roads of that country were so poor that the landing had not

1 Related declarations of war appeared on the 10th.
2 The total Russian army on a peace footing is almost 1,000,000 strong.
3 A vivid picture of the state of affairs in the navy at this period is given in Semenov's Raspěla (Eng. trans.).
to be made, not on the Straits of Tsushima, but as far north as possible. Chemulpo, nearer by 50 m. to Port Arthur than to Japan, was selected. On the first day of hostilities Rear-Admiral Uri disembararked troops at Chemulpo under the eyes of the Russian cruiser "Varang," and next day he attacked and destroyed the "Varang" and some smaller war-vessels in the harbour, and the rest of the 1st Army (General Kuroki) was gradually brought over during February and March, in spite of an unbeat en and, under Makarov's régime, an enterprising hostile navy. But owing to the thaw and the subsequent break-up of the miserable Korean roads, six weeks passed before the columns of the army (Guard, 2nd and 12th divisions), strung out along the "Mandarin road," to a total depth of six days' march, closed upon the head at Wiju, the front of which extended 21,000 yards.

Opposite to them they found a large Russian force of all arms.

The Russian commanders, at this stage at least, had not and could not have any definite objective. Both by sea and by land their policy was to mass their resources, repulsing meantime the attacks of the Japanese with as much damage to the enemy and as little to themselves as possible. Their strategy was to gain time without immobilizing themselves so far that the Japanese could impose a decisive action at the moment that suited them best. Both by sea and by land, such strategy was an exceedingly difficult game to play. But all the same, Makarov survived, it would have been played to his advantage, had Togo's fleet been destroyed when it would have been steadily used up. One day, indeed (May 15th), two of Japan's largest battleships, the "Hatsume" and the "Yashima," came in contact with free mines and were sunk. One of them went to the bottom with five hundred souls.

But the admiral was not on board. The Russian sailors said, when Makarov's fate was made known, "It is not the loss of a battle- ship. The Japanese are welcome to two of them. It is he." Not only the skill, but the force of character required for playing with fire, was wanting to Makarov's successors.

It was much the same on land. Kuropatkin, who had taken command of the army, saw from the first that he would have to gain three months, and disposed his forces as they came on the scene, unit by unit, in perfect accord with the necessities of the case. His expressed intention was to fight no battle until superiority in numbers was on his side. He could have gained his respite by concentrating at Harbin or even at Mukden or at Liao-Yang. But he had to reckon with the fleet at Port Arthur. He knew that the defences of that place were defective, and that if the fleet were destroyed whilst that of Togo kept the sea, there would be no Russian offensive. He therefore chose Liao-Yang as the point of concentration, and having thus to gain time by force instead of by delay, he pushed out a strong covering detachment towards the Yalu.

But little by little he succumbed to his milieu, the atmosphere of false confidence and passivity created around him by Alexeiev. After he had minutely arranged the Eastern Detachment in a series of rearguard positions, so that each fraction of it could contribute a little to the game of delaying the enemy before retiring on the positions next in rear, the commander of the detachment, Zasulich, told him that "it was not the custom of a knight of the order of St George to retreat," and Kuropatkin did not use his authority to recall the general, who, whether competent or not, obviously misunderstood his mission. Thus, whilst the detachment was still disposed as a series of rearguards, the foremost fractions of it stood to fight on the Yalu, against odds of four to one.

The Japanese 1st Army was carefully concealed about Wiju until it was ready to strike. Determined that in this first battle against a white nation they would show their mettle, the Japanese lavished both time and forethought on the minutest preparations. Forethought was still busy when, in accordance with instructions from Tokio, Kuroki on the 30th of April ordered the attack to begin at daybreak on the 1st of May. For several miles above Antung the rivers Yalu and Aiko are parallel and connected by numerous channels. The majority of the islands thus formed were held and had been bridged by the Japanese. The points of passage were commanded by high ground a little farther up where the valleys are deeply deflected, and beyond the flank of the ill-concealed positions of the defence.

The first task of the right division (12th) was to cross the upper Yalu and seize this. To the Guard and 2nd divisions was assigned the frontal attack on the Chihluncheng position, where the Russians had about one-half of their forces under Major-General Kashtalinski. On the 30th of April, Inouye's 12th division accomplished its task of clearing the high ground up to the Aiko. The Russians, though well aware that the force in their front was an army, neither retired nor concentrated. Zasulich's mere show of leadership, however, was sufficient to encourage him to retreat when he had taught the Japanese a lesson, and therefore Kuropatkin's original arrangements were not sensibly modified. So it came about that the combined attack of the 2nd and Guard divisions against the front, and Inouye on the left flank and rear, found Kashtalinski without support. After a rather ineffective artillery bombardment the Japanese advanced in full force, without hesitation or faintheartedness, and plunging into the river, stormed forward under a heavy fire. A few moments afterwards Zasulich ordered the retreat. But the pressure was far too close now. Broken up by superior numbers the Russian line parted into groups, each of which, after resisting bravely for a time, was driven back. Then the frontal attack stopped and both divisions abandoned themselves to the intoxication of victory. Meanwhile, the right attack (14th division) encountering no very serious resistance, crossed the Aiko and began to move on the left rear of the Russians. On the side of the defence, each colonel had been left to retire as best he could, and thus certain fractions of the retreating Russians encountered Inouye's advancing troops and were destroyed after a most gallant resistance. The rearguard itself, at Hamatan, was almost entirely sacrificed, owing to the wrong direction taken in retreating by its left flank. Fresh attempts were made by subordinate units, and then the retreating Russians, under Zasulich's command, again came up. The result was a battle of three days, and between 21,000 and 22,000 killed.

The Yalu, like Valmy, was a moment in the world's history. It mattered little that the Russians had escaped or that they had been in inferior numbers. The serious fact was that they had been beaten.

The general distribution of the Russian forces was now as follows: The main army under Kuropatkin was forming, by successive brigades, in two groups—I Siberian Corps (Stakelberg), Niu-chwang and Kai ping; II. Siberian Corps, Liao-Yang. Zasulich (III. Corps and various other units) had still 21,000. In the Port Arthur fortified town, under Lueut.-General Stoessel (IV. Corps), were 27,000 men, and General Linievich around Vladivostok had 23,000. These are, however, paper strengths only, and the actual number for duty cannot have been higher than 110,000 in all. The Trans-Siberian railway was the only line of communication with Europe and western Siberia, and its calculated output of men was 40,000 a month in the summer. In October 1904, therefore, supposing the Japanese to have used part of their forces against Port Arthur, and setting this off against the absence of Linievich and Stoessel, Kuropatkin could expect to have a sufficient superiority in numbers to take the offensive. His policy was still, "No battle before we are in superior force."

For the moment it was equally Japan's interest to mark time in Manchuria. Still intent upon the Russian Port Arthur squadron, she had embarked her 2nd Army (General Oku, 1st, 3rd, 4th and 5th divisions) during April, and sent it to Chihmampoo whence, as soon as the ice melted and Kuroki's victory cleared the air, it sailed to the selected landing-place near Piazewo. Here, under the protection of a continuous chain of war-vessels between the Elliot
Islands and the mainland, Oku began to disembark on the 5th of May. But the difficulties of the coast were such that it took three weeks to disembark the whole and to extend across the peninsula to Port Adams. Oku then, leaving the 5th division behind, moved down with the rest towards Kinchow, and after storming that place found himself face to face with a position of enormous strength, Nanshan Hill, at the narrowest part of the peninsula, where part of a Russian division (3000 only out of 12,000 were actually engaged) had fortified itself with extreme care. On the 26th of May took place the battle of Nanshan. The Japanese attack was convergent, but there was no room for envelopment; the Russian position moreover was "all-round" and presented no flanks, and except for the enfilade fire of the Japanese and Russian gunboats in the shallow bays on either side the battle was locally at every point a frontal attack and defence. The first rush of the assailants carried them up to the wire and other obstacles, but they were for many hours unable to advance a step farther. But the resolute Oku attacked time after time, and at last the 4th division on his right, assisted by its gunboats, forced its way into the Russian position. The Russians had just begun to retreat, in accordance with orders from higher authorities. But it was a second undeniable victory. It was, moreover, a preface to those furious assaults on Port Arthur which, because they were the expression of a need that every soldier felt, and not merely of a tactical method, transcend all cool-blooded criticism. The Japanese losses were 4500 out of 30,000 engaged or 15%, that of the Russians fully half of the 3000 engaged. The victors captured many guns, but were too exhausted to pursue the Russians, whose retirement was not made in the best order.

The transports were now conveying the 6th and 11th divisions to Pitszewo; these were to form the 3rd Army (Noji) for operations against Port Arthur. Oku exchanged his 1st division for the 6th. The 2nd Army then turned northward (3rd, 4th, 5th and 6th divisions). The 10th division, forming the nucleus of the 4th Army, had begun to land at Takushan on the 19th of May. The 2nd and 4th Armies were the left wing of a widespread converging movement on Liaoyang. Oku had the greatest
distance to march, Kuroki the smallest. The latter therefore had to stand fast in the face of the Russian Eastern Detachment, which was three days' march at most from Feng-hwang-cheng and could be supported in three more days by Kuropatkin's main body, whereas the pressure of Oku's advance would not begin to be felt by the Russian Southern Detachment until the twelfth day at earliest. It was necessary therefore for the first objective to make a slight concession to the second. Oku had to start at the earliest possible moment, even though operations against Port Arthur were thereby delayed for a week or two. In fact, Oku's march began on June 13th; Kuroki's on June 24th; the moves of the intermediate forces at various dates within this interval. Meanwhile, Kuropatkin, assembling the main army week by week, was in a difficult position. His policy of gaining time had received a severe blow in the failure of his executive officer to realize it, and that officer, though with his unpursued troops quickly regained their moral, had himself completely lost confidence. On the news of the battle (coupled with that of a fresh army appearing on the Korean coast), Kuropatkin instantly sent off part of his embryo central mass to bar the mountain passes of Fenshuling and Motienling against the imagined relentless pursuit of the victors, and prepared to shift his centre of concentration back to Mukden. The subsidiary protective forces on either flank of Zasulich had promptly abandoned their look-out positions and fallen back to join him. But the commander-in-chief, soon realizing that the Japanese were not pursuing, reasserted himself, sent the protective troops back to their posts, and cancelled all orders for the evacuation of Liao-Yang. From this time forward, Kuropatkin allowed his subordinates little or no initiative. A few days later, Zasulich's persistent requests to be allowed to retreat and the still uncertain movements of the 2nd Army induced him once more to prepare a concentration on Mukden. But on the 6th of May he learned that the Japanese 1st Army had again halted at Feng-hwang-cheng and that the 2nd Army was divided and dispersed, as at Pitszowo, and he resumed (though less confidently) his original idea. The Eastern protective detachment, now strengthened and placed under the orders of Count Keller, was disposed with a view to countering any advance on Liao-Yang from the east by a combination of manœuvre and fighting. 2 It was at this moment of doubt that Alexeiev, leaving Port Arthur just in time and profoundly impressed with the precarious state of affairs in the fleet and the fortress, gave the order, as commander-in-chief by land and sea, for an “active” policy (19th May). Kuropatkin, thus required to abandon his own plan, had only to choose between attacking the 1st Army, as on June 4th, or permitting Oku. He did not yield at a second letter from the vicerey, the news of Nan Shan, and above all a signed order from the tsar himself. “Inform General Kuropatkin that I impose upon him all the responsibility for the fate of Port Arthur,” were needed to bring him definitely to execute a scheme which in his heart he knew to be perilous. The path of duty for a general saddled with a plan which he disapproves is not easily discoverable. Napoleon in like case refused, at the risk of enforced resignation, but so did Moreau; the generality of lesser men have obeyed, but so did Suvorov. Stakelberg's I. Siberian Corps was therefore reinforced towards the end of May up to a strength of above 35,000. But it remained a detachment only. The Liao-Yang central mass was still held in hand, for the landing of the 4th Army—really only a division at present—at Takushan and the wrong placing of another Japanese division supposed to be with Kuroki (really intended for Nogi) had aroused Kuropatkin's fears for the holding capacity of Keller's detachment. Moreover, disliking the whole enterprise, he was most unwilling to use up his army in it. The Russians, then, at the beginning of June, were divided into three groups, the Southern, or offensive group (35,000), in the triangle Neuchwang-Haiching-Kaiping; the Eastern or defensive group (30,000), the main body of it guarding the passes right and left of the Wiju-Liao-Yang road, the Japanese in the outlying hills of the upper Aho and Yalu valleys, the right (Mishchenko's Cossacks), while they (Kucharski) guarding Fenshuling pass and the road from Takushan; the reserve (42,000) with Kuropatkin at Liao-Yang; the “Usuri Army” about Vladivostok; and Stessell's two divisions in the Kwantung peninsula. On the other side the 1st Army was at Feng-hwang-cheng with one brigade detached on the roads on either hand, the left being therefore in front of the Takushan division and facing the Fenshuling. Oku's 2nd Army (4 divisions or 60,000 combatants) was about Port Adams. This last was the objective of the attack of Stakelberg's 35,000. Kuropatkin's orders to his subordinate were a compromise between his own plan and Alexeiev's. Stakelberg was to crush by a rapid and energetic advance the covering forces of the enemy met with, and his object was “the capture of the Nan Shan position and thereafter an advance on Port Arthur.” Yet another object was given him, to “relieve the pressure on Port Arthur by drawing upon himself the bulk of the enemy's forces,” and he was not to allow himself to be drawn into a decisive action against superior numbers. Lastly, on June 7th, while Stakelberg was proceeding southward on his ill-defined errand, Kuropatkin, imposed upon by the advance of the Tsushan column to Sui-yen, forbade him to concentrate to the front, only removing the veto when he learned that the 4th Army had halted and entrenched at Sui-yen. On the 14th, all his arrangements for supply and transport being at last complete, Oku moved north. Although he was still short of part of the 6th division, he was in superior force. He had, moreover, the perfectly definite purpose of fighting his way north, and at Telissu or Wafangkou on the 14th of June, as he expected, he came upon Stakelberg's detachment in an entrenchment position. On the 14th and 15th, attacking sharply on the Russian front and lopping round both its flanks, Oku won an important and handsome victory, at a cost of 3,000 Japanese and 2,000 Russians, and a loss of at least 25,000 out of about 25,000 engaged, retired in disorder. Thus swiftly and disastrously ended the southern expedition. Meanwhile, except for the movement on Sui-yen already mentioned, and various reconnaissances in force by Keller's main body and by Rennenkampf's Cossacks farther inland, all was quiet along the Motienling front. Kuroki entrenched himself carefully about Feng-hwang-cheng, intending, if attacked by the Russian main army, to defend to the last extremity the ground and the prestige gained on the 1st of May. From this point to the culmination of the advance at Liao-Yang, the situation of the Japanese closely resembles that of the Prussians in 1866. Haicheng represents Münchgrätz, Liao-Yang Gitschin, and the passes east of Liao-Yang Nachod and Trautenau. The concentration of the various Japanese armies on one battlefield was to be made, not along the circumference of the long arc they occupied, but towards the centre. Similarly, Kuropatkin was in the position of Benedek. He possessed the interior lines and the central reserve which enables interior lines to be utilized, and a stroke of good fortune prolonged the period in which he could command the situation, for
on the 23rd of June an unexpected sortie of the Russian Port Arthur squadron paralysed the Japanese land offensive. In the squadron were seen the battleships damaged in the February attacks, and the balance of force was now against Togo, who had lost the "Yashima" and the "Hatsuse." The squadron nevertheless tamely returned to harbour, Togo resumed the blockade and Nogi began his advance from Nanshan, but the 2nd and 4th Armies came to a standstill at once (naval escort for their sea-borne supplies being no longer available), and the 1st Army, whose turn to advance had just arrived, only pushed ahead a few miles to cover a larger supply area. On the 1st of July the Vladivostok squadron appeared in the Tsushima Straits, and then vanished to an unknown destination, and whether this intensified the anxiety of the Japanese or not, it is the fact that the 2nd Army halted for eleven days at Kaiping, bringing the next on its right, 4th Army, to a standstill likewise. Its next advance brought it to the fortified position of Tashichiao, where Kuropatkin had, by drawing heavily upon his central reserve and even on the Eastern Detachment, massed about two army corps.

On the 24th Oku attacked, but the Russian general, Zarubayev, handled his troops very skillfully, and the Japanese were repulsed with a loss of 1200 men. Zarubayev, who had used only about half his forces in the battle, nevertheless retired in the night, fearing to be cut off by a descent of the approaching 4th Army on Haicheng, and well content to have broken the spell of defeat. Oku renewed the attack next day, but found only a rearguard in front of him, and without following up the retiring Russians he again halted for six days before proceeding to Haicheng to effect a junction with the 4th Army (Nooz), which meanwhile had won a number of minor actions and forced the passage of the mountains at Fengning South.†

The 1st Army, after its long halt at Feng-hwang-cheng, which was employed in minutely organizing the supply service—a task of exceptional difficulty in these roadless mountains—reopened the campaign on the 24th of June, but only tentatively on account of the discouraging news from Port Arthur. A tremendous rainstorm imposed further delays, for the coolies and the native transport that had been laboriously collected scattered in all directions. The Motljenning pass, however, had been seized without difficulty, and Keller's power of counter-attack had not been reduced to nothing by the desperate resistance of his forces to the concentration at Tashichiao. But Oku's 2nd Army was now at a standstill at Kaiping, and until he was further advanced the 1st Army could not press forward. The captured passes were therefore fortified (as Feng-hwang-cheng had been) for passive resistance. This, and the movements of the 4th Army, which had set its face towards Haicheng and no longer seemed to be part of a threat on Liao-Yang, led to the idea being entertained at Kuropatkin's headquarters that the centre of gravity was shifting to the south. To clear up the situation Keller's force was augmented and ordered to attack Kuroki. It was repulsed with a loss of nearly 1000 men in the action at the Motljenning (17th July), but it was at least assured that considerable forces were still on the Japanese right, and upon the arrival of a fresh army corps from Europe Kuropatkin announced his intention of attacking Kuroki. And in effect he succeeded in concentrating the equivalent of an army corps, in addition to Keller's force, opposite to Kuroki's right. But having secured this advantage he stood still for five days, and Kuroki had ample time to make his arrangements. The Japanese general occupied some 20 m. of front in two halves, separated by 6 m. of impassable mountain, and knowing well the danger of a "cordon" defensive, he met the crisis in another and a bolder fashion. Calling in the brigade detached to the assistance of Nooz as well as all other available fractions of his scattered army, he himself attacked on the 31st of July, all along the line. It was little more than an assertion of his will to conquer, but it was effectual. On his left wing the attacks of the Guard and 2nd divisions (action of Yang-tzu-ling) on the Russian front and flank failed, the frontal attack because of the resolute defence, the flank attack from sheer fatigue of the troops. Count Keller was killed in the defence. Meantime on the Japanese right the 12th division attacked the large bodies of troops that Kuropatkin had massed (Yu-shu-ling) equally in vain. But one marked success was achieved by the Japanese. The Russian 35th and 36th regiments (10th European Corps) were caught between two advancing columns, and, thanks to the initiative of one of the column leaders, Okasaki, destroyed. At night, discouraged on each wing by the fall of Count Keller and the fate of the 35th and 36th, the whole Russian force retired on Anping, with a loss of 2400, to the Japanese 1000 men.

This was the only manifestation of the offensive spirit on Kuropatkin's part during the six months of marking time. It was for defence, sometimes partial and elastic, sometimes rigid and "at-all-costs," that he had made his dispositions throughout. His policy now was to retire to Liao-Yang as slowly as possible and to defend himself in a series of concentric prepared positions. In his orders for the battle around his stronghold there is no word of counter-attack, and his central mass, the special weapon of the commander-in-chief, he gave over to Bilderling and to Zarubayev to strengthen the defence in their respective sections or posted for the protection of his line of retreat. Nevertheless he had every intention of delivering a heavy and decisive counterstroke when the right moment should come, and meantime his defensive tactics would certainly have full play on this prearranged battlefield with its elaborate redoubts, bombproofs and obstacles, and its garrison of a strength obviously equal (and in reality superior) to that of the assailants.

The Japanese, too, had effected their object, and as they converged on their objective, the inner flanks of the three armies had connected and the supreme commander Marshal Oyama had taken command of the whole. But, as the event was to prove, the military policy of Japan had failed to produce the requisite number of men for the desired Sedan, and so, instead of boldly pushing out the 1st Army to such a distance that it could move on Yoshikawa, and in 1866 and 1870, he attached it to the general line of battle. It was not in two or three powerful groups but in one long chain of several deployed divisions that the advance was made.

On the 25th of August the 2nd and 4th Armies from Haicheng and the 1st Army from the Yin-tsu-ling and Yu-shu-ling began the last stage of their convergent advance. The Russian first position extended in a semicircle from Anshantien (on the Liao-Yang-Hai-cheng railway) into the hills at Anping, and thence to the Taitsei river above Liao-Yang; both sides had mixed detachments farther out on the flanks. The first step in the Japanese plan was the advance of Kuroki's army to Anping. Throughout the 25th, night of 25th-26th, and 26th of August, Kuroki advanced, fighting heavily along the line, until on the night of the 26th the defenders gave up the contested ground at Anping. Hitherto there had only been skirmishing on a large scale on the side of Hai-cheng. Kuropatkin having already drawn in his line of defence on the south side towards Liao-Yang, the 2nd and 4th Japanese Armies delivered what was practically a blow in the air. But on the 27th there was a marked change in the Japanese plan. The right of the 1st Army, when about to continue the advance west on Liao-Yang, was diverted northward by Oyama's orders and ordered to prepare to cross the Tsitszebo. The retirement of the Russian 12th Corps into its entrenchments emboldened the Japanese commander-in-chief to imitate Moltke's method to the full. On the 28th, however, the 1st Army made scarcely any progress. The right (12th) division reached the upper Tsitszebo, but the divisions that were to come up on its left were held fast by their
opponents. The 29th was an uneventful day on which both sides prepared for the next phase.

The Russians' semicircle, now contracted, rested on the Taitszebo above and below the town, and their forces were massed most closely on either side of the 'Mandarin' road that the 1st Army had followed. Opposite this portion of the line was the Guard and the 4th Army. Oku was astride the railway, Kuropatkin extending towards his proposed crossing-points just beyond Kuropatkin's extreme left (the latter was behind the river). On the 30th the attack was renewed. The Guard, the 4th Army and the 2nd Army were completely repulsed.

On the night of the 30th the first Japanese troops crossed the Taitszebo near Lien-Tao-Wun, and during the 31st three brigades were deployed north of Kwan-tun, facing west. The Russian left wing observed the movement all day, and within its limited local resources made dispositions to meet it. Kuropatkin's opportunity was now come. The remainder of the 2nd division was following the 12th, leaving a nine-mile gap between Kuroki and Nozu, as well as the river. It was not into this gap, which had no military significance, but upon the isolated divisions of the 1st Army that the Russian general proposed to launch his counterstroke. Reorganizing his southern defences on a shorter front, so as to regain possession of the reserves that he had so liberally given away to his subordinates, he began to collect large bodies of troops opposite Kuroki, while Stakelberg and Zarubayev, before withdrawing silently into the lines or rather the fortress of Liao-Yang, again repulsed Oku's determined attacks on the south side. But it was not in confidence of victory that Kuropatkin began the execution of the new plan—rather as a desperate expedient to avoid being cut off by the 1st Army, whose strength he greatly overestimated.

On the morning of the 1st of September—the anniversary of Sedan, as the Japanese officers told their men—Oyama, whose intentions the active Kuroki had somewhat outrun, delivered a last attack with the 2nd and 4th Armies, and the Guard on the south front, in the hope of keeping the main body of the Russians occupied and so assisting Kuroki, but the assailants encountered no resistance, Zarubayev having already retired into the fortress. North of the Taitszebo the crisis was approaching. Kuroki's left, near the river, vigorously attacked a hill called Manjuyama which formed part of the line of defence of the XVII Corps from Europe. But the right of the 1st Army (12th division) was threatened by the gathering storm of the counterstroke from the side of Yentai Mines, and had it not been that the resolute Okasaki continued the attack on Manjuyama alone, the Japanese offensive would have come to a standstill. Manjuyama, thanks to the courage of the army commander and of a single brigadier, was at last carried after nightfall, and the dislodged Russians made two counter-attacks in the dark before they would acknowledge themselves beaten. Next morning, when Kuroki, who had conceived the mistaken idea of a general retreat of the Russians on Mukden, was preparing
to pursue, the storm broke. Kuropatkin had drawn together seven divisions on the left rear of the XVII. Corps, the strength of the whole being about 90,000. On the extreme left was Orlov's brigade of all arms at Yentai Mines, then came the I. Siberian Corps (Stabelkberg), then the X. Corps, then the XVII. But Orlov, perplexed by conflicting instructions and caught in an unfavourable situation by a brigade of the 12th division which was executing the proposed "pursuit," gave way—a stroke of his force in actual reality and the cavalry that was with him was driven back by the Kobi (reserve army) brigade of the Guard. The fugitives of Orlov's command disordered the on-coming corps of Stabelkberg, and the outer flank of the great counterstroke that was to have rolled up Kuroki's thin line came to an entire standstill. Meantime the X. Corps furiously attacked Okasaki on the Manjuyama, and though its first assault drove in a portion of Okasaki's line, a second and a third, made in the night, failed to shake the constancy of the 15th brigade. Misunderstandings and movements at cross-purposes multiplied on the Russian side, and at midnight Kuropatkin at last obtained information of events on the side of Yentai Mines. This was the 23rd, and Orlov was routed, Stabelkberg's command much shaken, and at the same time Zarubayev in Liao-Yang, upon whom Oku and Nozu had pressed a last furious attack, reported that he had only a handful of troops still in reserve. Then Kuropatkin's resolution collapsed, although about three divisions were still intact, and he gave the order to retreat on Mukden.

Thus the Japanese had won their great victory with inferior forces, thanks "in the first instance to the defeat of General Orlov. But at least as large a share in the ruin of the Russian operations must be attributed to the steadfast gallantry of the 15th brigade on Manjuyama. The losses of the Japanese were totalled 23,000, those of the Russians 19,000. Coming, as it did, at a moment when the first attacks on Port Arthur had been repulsed with heavy losses, this brilliantly successful climax of the four months' campaign more than restored the balance. But it was not the expected Sedan. Had the two divisions still kept in Japan been present Kuroki would have had the balance of force on his side, the Russian retreat would have been confused, if not actually a rout, and the war would have been ended on Japan's own terms. As it was, after another day's fighting, Kuropatkin ordered a retreat to the position that his forces had seized the previous day in the attempt at pursuit made by part of the 10th division on the 4th of September. The railway still delivered 30,000 men a month to Mukden, and Japan had for a time outrun her resources. At St Petersburg the talk was not of peace but of victory, and after a period of reorganization the Russians advanced afresh to a new trial of strength. But the remainder of the Manchurian campaign, like the second half of the war of 1859, was nothing more than a series of violent and resultless encounters of huge armies-armies far larger than those which had fought out the real struggle for supremacy at Liao-Yang and Magenta.

At this time the siege of Port Arthur had only progressed so far that the besiegers were able to realize the difficulties before them. The Nogi landed on the 1st of June, and his army (1st and 11th divisions) gradually separated itself from Oku's and got into position for the defence of the Haruna, the commercial harbour, which was seized without fighting, and a month later began the 24th to the other side. But so far from retiring within his fort-line Stessel took up a strong position outside. Dislodged from this on the 26th June, the Russians checked Nogi's further advance on July 3-4 by a fierce, though unsuccessful, counterstroke. Having been reinforced by the 9th division and two extra brigades of infantry, Nogi advanced again on the 26th, having burned his own town and set fire to the forests. Nogi had already 5000 men. Nogi advanced again on the 26th, having burned his own town and set fire to the forests. Nogi had already 5000 men. The defenders of Port Arthur, as well as the Russians in 1900, owing to the meagre allotment of funds only partially carried out before the war, had some tincture, but no more, of modern continental ideas. There was a continuous encinte of plain trace round the Old Town, at a distance of 1000 to 2000 yds from it, which not only prevented the Japanese from having any hope of the fire of the forts, but the Lune river the defensive line offered by the hills is less defined, and the line adopted for the permanent works was on the north only 3000 yds. from the harbour and 2000 yds. from the New Town. Russia is 20 miles and so the Chinese were able to build their lines close to the S.W. end of the harbour. The total length of this line from sea to sea is 12 m. Its most obvious weakness is that given on the ill. "20th Metre Hill" overlooks both. Here it had been intended to construct permanent works, but considerations of expenditure had caused this to be deferred.

On this main line of defence some seven or eight permanent forts have been disposed (if it can be said to dispose with some of the concrete works were better than semi-permanent in character). Some of these had been prepared with interior parapets and platforms of concrete for medium guns. Port Erib-Uran was of this character. The general design appears to have been graduated on the French detached forts of the "seventies (see FORTIFICATION), as the front parapet was designed for infantry and the interior, 10 ft. higher, for guns. The ditch, 30 ft. deep, excavated in the rock, was faced by counterscarp galleries. The living casemates were under the gorge parapet. A grave defect in the design was that there was not covered communication between these casemates and the gun platforms. The ditch there was 12 to 15 ft. deep, was defended by counterscarp galleries. The casemates in the gorge, partially cut off from the terreplein by a couple of deep sunk yards or outer parapet could be defended. In the last reserve, in addition to this the terreplein was retrenched. In both of these forts there was an apparently meaningless projection at the gorge. It is possible that these were embrochment batteries to bring flank the intervals. Fort Sung-Shu was of the same type as Chi-Kuan. These three were the only permanent forts seriously attacked.

The permanent works were supplemented before the siege began by a prodigal development of semi-permanent works and trenches. Everywhere on the line there had its attack, and how it is to be defined with these concrete works were better than semi-permanent in character). men had been killed and wounded in three weeks. The Russians strengthened their works around the captured forts in such a way as effectually to prevent farther advance, and the Japanese 3rd Army had now to resign itself to a methodical siege. Small sorties, partial attacks and duels between the Japanese guns and the generally more powerful ordnance of the fortress continued.

**Attacks on the north front.**

The siege approaches were first directed against the Temple-Waterworks group, which was stormed on the 19th and 20th of September. Pan-Lung was connected with the Japanese lines by covered ways, approaches were begun towards several of the eastern forts, and on the 20th of September 180-Metre Hill was stormed, though the crest was untenable under the fire from 203-Metre Hill. The Japanese were now beginning to pay more attention to the western side of the fortress, and from the 19th to the 22nd there was hard fighting around 205-Metre Hill, the attack being eventually repulsed with the loss of 2000 men. Operations in the west were thereafter abandoned for the time being, and the eastern forts remained the principal objective of the attack. Heavier howitzers had been sent from Japan, and on the 1st of October the first batteries of 28 centimetre (11 in.) howitzers came into action. They fired a shell weighing 485 lb., with a bursting charge of 17 lb. On the 12th, the Japanese took the trenches between the Waterworks Redoubt and Erh-Lung, and cut the water-supply. Saps were then pushed on against Erh-Lung, and to help in their progress a Russian advanced work called "G" was captured on the 16th, by a skilfully combined attack of infantry and artillery. From this time forward there was a desperate struggle at the sapphires on the north front.²

On the 26th of October another assault was made on Chi-Kuan Fort and Battery, and was continued at intervals, varied by Russian counter-attacks, till the 2nd of November. By this time the Japanese were becoming disheartened. They had incurred an additional loss of 13,000 men without substantial gain, except a lodgment on the counterscarp of Sung-Shu. This prepared the way for mining, which had already been begun at Erh-Lung. On the 17th of November seven mines were exploded at Sung-Shu, which blew in the back of the counterscarp galleries. At Erh-Lung on the 20th of November three mines were exploded, which half filled the ditch, and the Japanese later on sapped across to the escarp over the debris. At Chi-Kuan, the counterscarp gallery had been breached by an ill-managed Russian mine on the 23rd of October and the Japanese got in through the breach and made a lodgment. They did not, however, get possession of the whole of the counterscarp galleries before about the middle of November. On the 22nd of November the Japanese assaulted the trench round Chi-Kuan battery. It was captured and retaken by counter-attack twice between 6 p.m. and 1 a.m. In this fight each side was using corps as breastworks.

On the 26th of November another assault was made on the same lines as that of the 29th of October. By this time the besiegers were sapping under the escarp of the northern forts, and it would have been better to delay. But the situation was serious in the extreme. In Manchuria Kuropatkin's army had reasserted itself. From Europe Rozhestvensky's squadron was just setting sail for the Far East. Marshal Oyama sent his principal staff officers to stimulate Nogi to fresh efforts, and some exhausted units of the besieging army were replaced by fresh troops from Japan. With 100,000 men and this urgent need of immediate victory, Nogi and the marshal's staff officers felt bound to make a third general assault. The siege works had indeed made considerable progress. The ditches of Sung-Shu and Erh-Lung were partially filled. They held most of the ditch of Chi-Kuan Fort and were cutting down the escarp, and two parallels had been made only 30 yds. from the Chinese Wall at "G" and Pan-Lung. The general assault was made at 1 p.m. At Sung-Shu the stormers got into the fort, but suffered much from the artillery on the western side of the Lun-ho valley, and were beaten out of it again in 20 minutes; 2000 men tried in vain to get up the Lun-ho valley to take Sung-Shu in rear. At Erh-Lung they could not get over the outer parapet at "G" they took a portion of the Chinese Wall and lost...
it again, other trenches with a cross fire being behind. At Pan-Lung the machine guns on the Wall prevented them from leaving the palace. For a time, the whole front of the fort was covered with entanglements defended by machine guns on the gorge parapets, and the Japanese could make no way. Briefly, there was a furious battle all along the line, and nothing gained. On the morning of 11th November, when the 2nd Division, after 2,000 casualties, had been abandoned.

On the front the Japanese returned to mining.

But so urgent was the necessity of speedy victory that the fighting had to continue. And so great was the pressure of every other object, that the Japanese had been able to make no way, the weight of the attack was directed on 203-Metre Hill. A battery of 11-inch howitzers was established only one mile away. On the 28th of November the batteries of the 1st and 2nd Divisions opened in the 9th of November, there was a heavy bombardment by the big howitzers, which obliged the Russians to take shelter in rear of the ruined walls. On the 2nd December the Russians tried a counter-attack. During the next two days the artillery were busy. The engineers sapped up to the ruins of the western work, set the shelters on the reverse slope and directed artillery fire by telephone. Thirty-six guns swept the ground with shrapnel. Finally on the 5th of December the Japanese attacked successfully. Their losses in the last ten days at 203-Metre Hill had been probably over 10,000. Those of the Russians were about 5,000, chiefly from artillery fire. This was the turning-point of the siege. At once the 11-inch howitzers, assisted by telephone from 203-Metre, opened upon the Russian ships; a few days later these were wholly hors de combat, and at the siege. The forces attacked and destroyed were practically the main western defences. Before the 9th of December the Japanese had kept Chi-Kuan was blown up, and at the cost of 800 men, General Saseyeda (11th division), personally leading his stormers, captured the great fort on the 15th of December. The attack was also attempted from the 5th division on the 28th of December, though a mere handful of the defenders prolonged the fighting for eight hours and the assailsant lost 10,000 men. Sung-Shu suffered a worse fate on the 4th, the greater part of the town and the undefended western end, of which General Kondratenko, had been killed on the 15th of December, and though the Japanese seem to have anticipated a further stand, Stessel surrendered on the 2nd of November, with 34,000 men. Vithet was killed. As the Russians became gradually weaker, the Japanese closed in to within 3 m. range, and Prince Uchtomsky (who succeeded to the command on Vithet's fall) gave up the struggle at nightfall. The Russians scattered, some vessels heading southward, the majority with the admiral making for Fort Arthur, whence they did not again emerge. All the rest were either forced into neutral ports (where they were interned) or destroyed, among the latter being the third-class cruiser "Novik," which had already been a brilliant reputation for daring, and now steamed half round Japan before she was brought to action and run ashore. The victors blockaded Fort Arthur, until near the close of the siege, when the big gun was added and examined the remnant of the Russian fleet from 203-Metre Hill, Togo concluded that it would be safe to return to Japan and give his ships a complete refit. Kaimura's squadron (5 ships) was sent to intervals on the night of 18th of August in engaging and defeating the Russian Vladivostock squadron (Admiral Jessen). Thus the Russian flag disappeared from the Pacific, and therefore only the Baltic fleet could hope seriously to challenge the supremacy of the Japanese navy.

The remainder of the war on land, although it included two battles on a large scale and numerous minor operations, was principally a test of endurance. After Liao-Yang there were no extended operations, the area of conflict being confined to the plain of the coast side of the Hun-ho and the fringe of the mountains. Japan had partially accomplished her task, but had employed all her trained men in this partial accomplishment. It was questionable, even in October 1904, whether she could endure the drain of men and money, if it were prolonged much further. On the other hand, the Russians opposed the war which had never been popular, gradually became the central feature of a widespread movement against irresponsible government. Thus while the armies in Manchuria faced one another with every appearance of confidence, behind them the situation was exceedingly grave for both parties. A state of equilibrium was established, only momentarily disturbed by Kuroptatkin's offensive on the Sha-ho in October, and by the Sandup incident in the winter, until at last Oyama fought a battle on a grand scale and won it. Even then, however, the results fell far short of anticipation, and the armies settled down into equilibrium again.

After the battle of Liao-Yang Kuroptatkin reverted for a moment to the plan of a concentration to the rear at Tieling. Politically, however, it was important to hold Mukden, the Manchurian capital, and since the Japanese, as on previous occasions, reorganized instead of pursuing, he decided to stand by ground, a resolve which had an excellent effect on his army. Moreover, growing in strength day by day, and aware that the Japanese had outrun their powers, he resolved, in spite of the despondency of many of his officers, to renew the offensive. On the 10th of December, about 20,000 men, the Japanese had about 170,000. The latter lay entrenched north of Liao-Yang, from a point 9 m. west of the railway, through Yentai Station, a position which had been paid good deal of rain, and the ground was heavy. Kuroptatkin's intention was to work round the Japanese right, on the hills with his eastern wing (Stakelberg), to move his western wing (Bilderling) slowly southwards, and by a flank move, to cut the lines of retreat of the Japanese. The advance of Bildering, however, necessarily methodical and slow in any case, had taken more time than was anticipated. Still, Bildering crossed the Sha-ho and made some progress towards Yentai, and the demonstration was so far effectual that Kuroki's warnings were almost disregarded by the Japanese headquarters. The commander of the 1st Army, however, took his measures well, and Stakelberg found the greatest trouble in deploying his forces for action in this difficult country. Oyama became convinced of the truth on the 9th and 10th, and prepared a great counter-attack. A battle was fought on the 15th of October, and the whole line was held. The 2nd Army, which had been engaged for 15 m. of front, and the entire 2nd and 4th Armies and the general reserves were to be thrown upon Bildering. On the 11th the real battle opened. Kuroki displayed the greatest skill, and was of the back to the same line as the Russians. Still the result of Stakelberg's attack, for which he was unable to deploy his whole force, was disappointing, but the main Japanese attack on Bildering was not much more satisfactory, for the Russians had kept every step of their previous advance, and fought splendidly. The Russian commander-in-chief states in his work on the war that Bildering became engaged a fond instead of gradually withdrawing as Kuroptatkin intended, and at any rate it is unquestioned that, in consequence of the serious position of affairs on the western wing, not only did Stakelberg use his reserves to support Bildering, when the 12th division of Kuroki's army was in action; and was well away, but Bildering himself suspended the general offensive on the 13th of October. In the fighting of the 13th-16th of October the Russians gradually gave back as far as the line of the Sha-ho, the Japanese being able to drive them, after a severe battle, on the 16-17th October, onto the 18th, the Shaho, where some difficulties were experienced by the Russians, and the Japanese made several efforts to take these positions with success. Kuroptatkin wished to continue the offensive, but his corps commander, Nogi, who had so much expense of the Japanese army, gave him the idea. The positions of the rival armies from the 18th of October, the close of the battle of the Sha-ho, to the 26th of January 1905, the opening of the battle of Sandup (Hokkaido)—the most important battle of the whole campaign, and the final blow to the old-fashioned term "winter quarters." The total losses of the Russians are stated as 42,000 men, but this is very considerably exaggerated; the Japanese acknowledged 26,000 casualties. In January 1905, apart from Mishchenko's cavalry raid in rear.
of Oyama's forces (January 8th-16th) the only change in the relative positions of Oyama and Kuropatkin as they stood after the battle of the Sha-ho was that the Japanese had extended somewhat westwards towards the Hun-ho. The Russians, 300,000 strong, were now organized in three armies, commanded by Generals Linievich, Grippenberg and Kaulbars; the total strength of the Japanese 1st, 2nd and 4th Armies and reserve was estimated by the Russians at 220,000.

Towards the end of January, Kuropatkin took the offensive. He wished to inflict a severe blow before the enemy could be reinforced by the late besiegers of Port Arthur, and sent Grippenberg with seven divisions against Oku's two on the Japanese left. The battle of Sandepu (Heikoutai), fought in a terrible snow-storm on the 26th and 27th of January, 1905, came near to being a great Russian victory. But the usual decaucus of Russian operations and their own magnificent resistance saved the Japanese, and after two days' severe fighting, although Grippenberg had not been checked, Kuropatkin, in face of a counter-attack by Oyama, decided to abandon the attempt. The losses were roughly 6000 Japanese to over 10,000 Russians.

Both sides stood fast in the old positions up to the verge of the last and greatest battle. Kuropatkin was reinforced, and appointed Kaulbars to succeed Grippenberg and Biderling to the command of the 3rd Army vacated by Kaulbars. On the other hand, Nogi's 3rd Army, released by the fall of Port Arthur, was brought up on the Japanese left, and a new army under Kawamura (5th), formed of one of the Port Arthur and two reserve divisions, was working from the upper Yalu through the mountains towards the Russian left rear. The Russian line in front of Mukden from the Hun-ho, through the Putilov and Novgorod hills on the Sha-ho, to the mountains, was 47 m. long, the armies from right to left being II. (Kaulbars), III. (Biderling) and I. (Linievich); a general reserve was at Mukden. On the other side from left to right, on a line 40 m. long, were Oku (2nd Army), Noz (4th), Kuroi (1st) and Kawamura (5th), the general reserve in rear of the centre at Yentai and the 3rd Army in rear of Oku. Each side had about 310,000 men present. The entire front of both armies was heavily entrenched.

The Russians had another offensive in contemplation when the Japanese forestalled them by advancing on the 21st of February. The 5th Army gradually drove in Kuropatkin's small detachments in the mountains, and came up in line with Kuroi, threatening to envelop the Russian left. The events on this side and misleading information induced Kuropatkin to pay particular attention to his left. The Japanese 1st and 5th Armies were now engaged (25th February), and elsewhere all was quiet. But on the 27th the fighting spread to the centre, and Nogi (originally behind Oku) was on the march to envelop the Russian right. He was held under observation throughout by Russian cavalry, but it seems that little attention was paid to their reports by Kuropatkin, who was still occupied with Kuroi and Kawamura, and even denied his right of its reserves to reinforce his left. With a battle-front exceeding two days' marches the wrong distribution of reserves by both sides was a grave misfortune. Kuropatkin was at last convinced, on the 28th of February, of the danger from the west, and did all in his power to form a solid line of defence on the west side of Mukden. Nogi's first attack (1st-2nd March) had not much success, and a heavy counterstroke was delivered on the 2nd. Fighting for localities and alterations in the interior distribution of the opposing forces occupied much time, and by the 3rd, though the battle had become severe, Kuropatkin had merely drawn in his right and right centre (now facing W. and S.W. respectively) a little nearer Mukden. His centre on the Sha-ho held firm, Kuroi and Kawamura made but slight progress against his left in the mountains. Nogi and Oyama were equally impressed with the strength of the new (west) Russian front, and like Grant at Petersburg in 1864, extended farther and farther to the outer flank, the Russians following suit. The Japanese marshal now sent up his army reserve, which had been kept far to the rear at Yentai, to help Nogi. It was not before the evening of the 6th of March that it came up with the 3rd Army and was placed in position opposite the centre of the Russian west front.
RUSSO-JAPANESE WAR

After the disasters of Mukden and Tsushima, and being threatened with internal disorder in European Russia, the tsar, early in June, accepted the mediation of the president of the United States, and pourpours were set on foot. The war meanwhile drifted on through May, June and July. Linievich, who succeeded Kuropatkin shortly after the battle of Mukden, retired slowly northward, re-organizing his forces and receiving fresh reinforcements from Europe. A Japanese expedition occupied Sahaglen (July 8–30), and another, General Hasegawa, advanced through Korea towards Vladivostok. But the fighting was desultory. The peace negotiations were opened at Portsmouth, New Hampshire, on the 9th of August, and by the end of the month the belligerents had agreed to the main points at issue, that Russia should cede the half of Sahaglen, annexed in 1875, surrender her lease of the Kwangtung peninsula and Port Arthur, evacuate Manchuria and recognize Japan's sphere of influence in Korea. The treaty of peace was signed on the 23rd of August 1905.

BIBLIOGRAPHY.—The first place in the already numerous works on this subject is by the General Consul of Germany awarded to General Sir I. S. M. Hamilton's A Staff Officer's Scrap Book, and the second to the reports of the British attachés (The Russo-Japanese War: British Officers' Reports, War Office, 1908). Other first-rate reports are the Precious Air of the Japanese Staff (Reports of Military Observers, General Staff, U.S.A.); Major V. Tettau's 18 Monats beim Heere Russlands; von Schwarz, Zehn Monate beim Heere Roslows' and Kuropatkin's work (part of which has been translated into English). Of detailed military histories the principal are the semi-official series of narratives and monographs produced by the Austrian military journal Streiflungen der österreichischen Kriegsmarine. The most important are Cordier's "Les Japonais en Mandchourie" (Revue d'Infanterie, 1910); and Cumlan, Etude sur les caractères généraux de la guerre en extrême-orient (Paris, 1909). One naval narrative of absorbing interest has, however, appeared, Semenov's Rasplata (English trans.).

The rest of the line severe local fighting had continued, but the Russian positions were quite unshaken, and Kuropatkin's reserves—which would have been invaluable in backing up the counter-attack of the 2nd of March—had returned to face Nogi. He had organized another counterstroke for the 6th, to be led by Kaulbars, but this collapsed unexpectedly after a brief but severe fight.

Kuropatkin now decided to draw in his centre and left towards Mukden. On the 7th, the various columns executed their movement to the Hun-ho with complete success, thanks to good staff work. The Japanese followed up only slowly, and Kaulbars stood fast, facing each other over the west front; after the fall of the general reserve, Nogi was able to prolong his line to the north and eventually to bend it towards the Russian line of retreat. Bilderer and Linievich were now close in to Mukden and along the Hun-ho. On the other side Oku had taken over part of Nogi's line, thus freeing the 3rd Army for further extension to the north-west, and the rest of the 2nd Army, the 4th, the 1st and the 5th were approaching the Hun-ho from the south (March 8th). On this day the fighting between Nogi and Kaulbars was very severe, and Kuropatkin now managed his mind. On the 9th, by Oyama's orders, Nogi extended northward instead of further swinging in south-eastward. Oku now occupied all the original line of the 3rd Army, Nozu alone was left on the south front, and Kuroki and Kavamura began to engage Linievich seriously. But Nogi had not yet reached the Mukden-Tieling railway when, on the night of the 9th, every preparation having been made, Kuropatkin's retreat began. On the 10th, covered by Kaulbars, who held off Nogi, and by strong rearguards at east of Mukden, the movement continued, and though it was not executed with entire precision, and the rearguards suffered very heavily, the Russian troops were able to draw off into safety to the northward. On the evening of the 10th, after all their long and hardly contested enveloping marches, Nogi's left and Kavamura's right met north of Mukden. The circle was complete, but there were no Russians in the centre, and a map of the positions of the Japanese on the evening of the 10th shows the seventeen divisions thoroughly mixed up and pointing in every direction but that of the enemy. Thus the further pursuit of the Russians could only be undertaken after an interval of re-organization by the northernmost troops of the 5th and 3rd Armies. But the material loss inflicted on the Russians was far heavier than it had appeared before. It is generally estimated that the Russian losses were no less than 97,000, and the Japanese between 40,000 and 50,000. Japan had had to put forth her supreme effort for the battle, while of Russia's whole strength not one-tenth had been used. But Russia's strength in Europe, with but one line whereby it could be brought to bear in the Far East, was immaterial, and on the theatre of war a quarter of the Russian field forces had been killed, wounded or taken.

It remains to narrate briefly the tragic career of the Russian Baltic fleet. Leaving Libau on the 13th-15th of October 1904, the fleet steamed down the North Sea, expecting every night to receive the news of the torpedo operation off the east of Japan. But the excitement opened the wildest indemnigation, and Russia was for some days on the verge of war with England. A British fleet "shadowed" Rozenhvestenski for some time; but eventually the Russians were allowed to proceed. On reaching Madagascar, Rozenhvestenski heard of the fall of Port Arthur, and the question of return to Russia arose. But Rear Admiral Nebugatov was despatched from the Baltic via Suez early in March 1905, and the armada proceeded by the Straits of Malacca, joining at Johore in January. The fleet arrived. The united fleet was formidable rather in number than in quality; the battleships were of very unequal value, and the armed vessels were tied to the movements of many lame ducks. Rozenhvestenski had, moreover, numerous shipmates in his crew. Nevertheless, the Japanese viewed his approach with considerable anxiety, and braced themselves for a final struggle. Of the various courses open to him, Togo prudently chose that of awaiting Rozenhvestenski in home waters. The Russians left Kamran on the 14th of May, and for a time disappeared into the Pacific. It was assumed that they were making for Vladivostok either via Tsushima strait or by the Pacific; Rozenhvestenski chose the former course, and on the 27th of May the fleets met near Tsushima. About 1.45 p.m., the Russian fleet, who were concealed, who were concealed, and expected to open out for battle as the Japanese approached. The Russian battleships, originally heading N.E.E., swerved to the right, and the Japanese, who had crossed their front. Togo's fire was concentrated first on the Pallas," the leading Russian battleship, and by 2.25 p.m. it was hors de combat. At this time both the battle-fleets were running south; the Russian vessels were aimed at, but the Japanese fire, after seeking by superior speed to head off the Russians, now inclined towards the S.E., and the Russians continued. At 3 o'clock the Russian flagship "Suvorov" had fallen out of the line, though still firing. Rozenhvestenski's fleet had engaged on the horizon on the Nebugatov's starboard wing and Nogi's port. Shortly afterwards the Russians suddenly turned N., and sought to pass, across the wake of Togo's battle-fleet, up the straits. Thereupon the leading Japanese ships promptly turned together, covered by the rear ships, which ran past them on the original course and then came round in succession; this manoeuvre was so well executed that the Japanese again headed off their enemy, who swerved for the second time towards the E. The Japanese thereupon executed the same manoeuvre as before, and steamed S.E. again (about 4.40). They were not unsheathed, but the Russians were suffering far more severely. Meanwhile, the two fleets had been heavily engaged, and the Russian cruisers kept on the right of their battleships, while the Japanese, very superior in speed, ran S., S.E. and E. across the rear of the enemy's main squadron, and about 3 ranged up alongside the three fleet squadrons; the Japanese, however, were enveloped by the crowd of damaged battleships, store-ships and collers; but before they were in the greatest confusion, which was presently increased by the battleship squadron, now turned back and heading W., with the less distinguished ships against it; and, in addition, some of the Japanese squadrons hung on to the remnant of the enemy's battle-fleet, and the others dealt with the numerous Russian vessels that were unable to keep up. Then Togo called off his ships and gave the torpedo craft room and the night to attack. At daylight the lighter ships joined again, and before long the whole Russian fleet, with few exceptions, had been captured or sunk.

The Peace of Portsmouth.
RUSSO-TURKISH WARS (1828-29 and 1877-78). The earlier wars between Russia and Turkey possess little military interest to-day, and are scarcely remembered except as the occasion of Suvarov’s exploits. The first of the three 19th-century (1806-1812) wars, however, though much less vigorously fought than the preceding wars, at any rate introduced the “Eastern question” into European politics as a factor affecting the balance of power, and its cessation at the moment of Napoleon’s advance on Moscow had a great effect on the emperor’s Russian campaign.

The second war is more celebrated. It was a reflex of the Greek War of Independence, and began with the invasion of Rumania by the Russians in May 1828. One corps invested and took Braila, another passed by Bucharest and Rustchuk and Silistria, and a third crossed the Danube below Isacka. The first and the last were united as an army under the tsar and advanced through the Dobrudja on Shumla. But after a considerable amount of fighting it was decided that the Turks here were too strong for the invaders, and the tsar drew off his forces by degrees towards Varna, which was besieged next. But the Shumla troops were thus gradually set free to join the Turkish field army under the grand vizier, which, however, merely menaced, without seriously attacking, the besiegers of Varna. The place surrendered on the 16th of October, and the tsar at once turned upon the grand vizier, attacked him on the river Kamber (15th October) and forced him to retreat to Aldos.

Meantime, however, Silistria offered a gallant resistance. Even when the besiegers were reinforced from the main army they could not master the defence, and when winter came on the siege was abandoned, and the Russians drew off into Rumania into winter quarters. In Asia, meanwhile, a Russian army under Prince Paskievich had advanced from Tiflis, and captured Kars and other places, while the Black Sea fleet secured the surrender of Poti. Paskievich next defeated the Turks at Akhalzik (27th August), captured Ardahan, and advanced on Rustchuk. But before he could get there into conflict with the fierce Kurds, he gave up further enterprises and, leaving garrisons in the strong places, took his army back into the Caucasus for the winter.

In 1829 Diebitsch took over the command of the 70,000 men on the Danube, and resolved to carry the war over the Balkans. As a preliminary the fleet seized Sozopolis (Sisepol). A second and vigorously pressed siege of Silistria ended with the surrender of the place on June 30th, the Turkish operations for the expulsion of the Sozopolis garrison and the relief of Silistria being dilatory as before. The Turkish army was at this time in the process of reorganization on a European model, which added to the difficulties of the Russians. The grand vizier, Reschid Mehmet, in May attempted to combine the Rustchuk and Shumla garrisons for the expulsion of the Russians from Varna, but unsuccessfully, the two columns being beaten in detail. Soon afterwards Diebitsch, with part of the army investing Silistria, marched against him and defeated him at Tcherkovna (11th June). Immediately after this Diebitsch carried out the brilliant passage of the Balkans and advanced to Adrianople, which laid Constantinople at his mercy, and brought about an immediate peace. A month after its signature, a Turkish army from the west, attempting to recapture Adrianople behind Diebitsch, was defeated on the 16th October at Arnaut Kalesii. In Asia, meantime, Paskievich, after relieving Akhalzik, where his garrison had been blockaded, won two victories on two successive days at Kainly and Milli Duzov (1st and 2nd June), and captured a number of fortresses, his victorious advance being arrested only by the terms of peace.

(X.)

The War of 1877-78.—On 24th April 1877, the tsar declared war against Turkey, with the avowed object of righting the wrongs of the Christians in Turkey. The Turco-Servian war was just over. Contrary to expectation the Turks had proved victorious. Hostilities had ceased in October 1876, though it was not till 1st March 1877 that peace had been signed. During 1876 the Turks had also quelled an insurrection of the Christians in Bulgaria, when the treatment they meted out to the Christians and thecry of “Bulgarian atrocities” had aroused the sentimental sympathies of Europe.

The Danube formed the Turkish frontier. Flowing west to east along the southern boundary of Rumania, it turned to the north and then to the east to the Black Sea, enclosing the Dobrudja, an inhospitable and difficult region, of rectangular shape, some 100 m. N. to S. by 30 to 50 m. E. to W., which was the extreme northern part of the Turkish dominions.

The Russians did not anticipate that the opposition to be encountered from the Turkish forces would be of a serious nature. As for natural obstacles, there were the Danube and the Balkans directly across their route, but the passage of these was not likely to cause any serious delay.

The Turkish fortresses of the Quadrilateral—Rustchuk, Silistria, Shumla and Varna—could be avoided, and Nikopol and Vedin were more or less isolated. It would only be necessary to cover the lines of communication from the action of the garrisons of these places. It was known that Osman Pasha was at Vedin with what remained of the Turkish force which had defeated the Servians the previous year, and it would be necessary to detach a force to operate against him. There would be some delay in the forwarding of supplies, due to the fact that the Rumanian railway was of different gauge to the railroads of Russia, but this would not be serious. This line, the only railway through Rumania, ran from Galatz to Bucharest, where one branch ran west by Slatina and the other to Giurgevo on the Danube, where it connected with a line south of the river from Rustchuk to Shumla and Varna through Rasgrad. It was generally imagined that the advance to Constantinople would be of the nature of a triumphal march. By a clause of the Treaty of Paris of 1856 the Russian naval forces in the Black Sea had been destroyed, and though this clause was revoked in 1871, in 1877 the Turks possessed the undoubted command of the sea. Had things been different, an advance through the Dobrudja, with a safe line of supply by water, would have offered many advantages. Under existing circumstances, with Turkish gunboats on the Danube and ironclads on the Black Sea, such a course was out of the question.

The plan of campaign formed by the Russians was as follows: One corps was to enter the Dobrudja to protect the line of communication against any Turkish advance east of the Danube, while the remainder would cross the Danube between Rustchuk and Nikopol, cross the Balkans and advance on Adrianople. Detached forces would meanwhile mask the “Quadrilateral” and the Turkish force at Vedin.

A Convention had been made with Rumania, allowing the passage of the Russians through the country. The Rumanians proclaimed their independence of Turkey, and although the tsar declined their offer of active co-operation for the time being, their troops occupied Calafat, facing Vedin, and early in May their batteries engaged the guns of Vedin across the river. The Russian army with which it was proposed to carry on the war, consisted of six army corps and two cavalry brigades. Each corps was composed of one cavalry and two infantry divisions. Each division had 14 battalions and 6 guns of Cossacks. Each infantry division had 48, and each cavalry division 12 guns. This force had been mobilized in the November of the previous year, and was now distributed as follows:

Commander-in-chief: The grand-duke Nicholas, with head-quarters at Kishinev.

VI. Army Corps Odesa and Tatar Bunar.

VII. Army Corps Tarutinskaja and Kanszany.

VIII. Army Corps Ungueni.

IX. Army Corps Winnica.

X. Army Corps Crimea.

Rifle Brigades Bessaciznak.

The mobilization of the IV., XIII., and XIV. Army Corps had been ordered in December 1876, but they would not be ready to move till the following month—May 1877. In
addition to the above, there were heavy artillery with 400 siege guns, engineers with pontoon trains, naval launches, and the necessary supply trains. The total Russian forces numbered 200,000 combatants of all arms, with 850 field and 400 siege guns.

For some months prior to the tsar's declaration, Turkey had realized that war was inevitable, but such preparations as were made were far from adequate. Abdul Kerim, who had commanded in Servia the previous year, was still acting as commander-in-chief, but the task set him was not an easy one. With the Russians in front, the Servians and Montenegrins, whose action was known to be uncertain, on the flank, and the Christian population of Bulgaria, in sympathy with the Russians, in the midst, it required a younger and more energetic man, with a greater knowledge of the art of war than he possessed, to plan and to carry out a successful defence of the Moslem dominions. The prospect of war had aroused the Turks, and the nation had taken steps to prepare for the conflict, but they lacked trained leaders. The Turkish officers were but ill-instructed. Works on the art of war did not exist in the Turkish language. General conscription existed in Turkey, but there was an entire absence of organization. Theoretically, each of the six districts into which the empire was divided should have produced an army of four corps, but it was only on paper. Practically the troops were not organized in corps. At the outbreak of war, Osman's force, some 30,000 strong, was at Vidin; a few battalions were spread along the Danube from Vidin to Silistria, with a brigade of infantry in Nikopol, another at Sistova, and the best part of two divisions at Rustchuk. Abdul Kerim's head-quarters were at Shumla where there were two more infantry divisions. A cavalry division was in process of organization. Varna was the base of supply and was connected by rail with Shumla and Rustchuk. Sulaiman Pasha, with some 40,000 men, was at Montenegro. The total Turkish forces in Europe at that time were about 120,000 men with 450 guns, but they were diseminated instead of being concentrated, or grouped in view of a rapid concentration. Abdul Kerim's plan, or rather his idea, was, that the Russians would find some difficulty in the first place in forcing the passage of the Danube, and when they had succeeded in this, they would be bound to enter the zone of the Quadrilateral, where he hoped, operating with the fortresses as supports, to deal with them successfully. As regards the Turkish fleet, at the outset, in addition to a fleet of 8 ironclads below Braila, there were 7 monitors and 48 wooden ships of war on the Danube between Hizrosa and Vidin.

In the matter of armament the Turks had the advantage. The artillery were armed with a Krupp breech-loading gun, which was better than the Russian bronze gun, while the Peabody-Martini rifles of the infantry were superior to the Russian Krenk. The firearm of the Turkish cavalry was the Winchester repeating carbine, which was inferior to the short Berden with which the Russian cavalry was armed. But this advantage in armament was discounted by the fact that, from motives of economy, the Turkish soldier had done but little rifle practice.

Hostilities commenced on the 24th of April, when the Russian army advanced in three columns towards Bucharest, the eastern flank covered by the XI. Corps which marched to Galatz. By the end of May the bulk of the Russian forces were assembled at Bucharest practically opposite the intended point of passage, with the advanced guard under General Skobelev at Giurgoevo, and cavalry observing the river line from Turnu Magureli to Kalarash. It was now decided to await the arrival of the IV., XIII., and XIV. Corps and the necessary bridging material for the passage of the Danube.

On June 15th the troops were disposed as follows: 8th Cavalry Division at Turnu Magureli; 12th at Oltenita; 2nd at Kalarash; Advanced Guard at Giurgoevo; XI. Army Corps at Olenitzal and Giurgoevo; VIII., XII., XIII., IX., at Bucharest; IX. at Slatina; IV. at Slobodisia; XIV. at Galatz; VII. at Odessa; X. in the Crimea. Meanwhile steam launches were brought overland, and the Russians, by means of torpedoes, submarine mines and their shore batteries, had succeeded in clearing the Danube of Turkish vessels between Nikopol and Rustchuk. Two of the smaller ironclads had been sunk, the remainder of the flotilla driven under the shelter of the fortresses, while barricades of mines effectually isolated them and prevented them from again entering the zone of operations. Of the large ironclads on the lower Danube, one was sunk near Sulina, and from that time the remainder stayed in Sulina harbour.

On June 22nd the XIV. Army Corps crossed into the Dobrudja at Galatz and advanced south, the Turkish detachment there retiring before them. Pontoons having been brought by rail, the necessary rafts and boats (which had been constructed at Slatina on the Aluta) were floated down to the neighbourhood of Zimnitz, and on June 24th siege batteries opened fire on Nikopol and Rustchuk, while the IX. Army Corps made a feint of crossing just beyond these towns. These were the Turkish commander as to the Russian intentions, and on the night of June 26/27th, 12 companies of rifles, with a squadron and 6 guns, were landed on the south bank opposite Zimnitz, and within twenty-four hours the whole of the VIII. Corps had crossed the river. By July 2nd the Russians had completed a bridge over the river, which is 1000 yds. wide at this point. At Sistova was a Turkish brigade of infantry. The commander, in the early morning of the 27th, received information from his outposts of the crossing, but instead of moving with his whole force, sent two battalions to oppose it. The Russians drove them back, and when reinforced, advanced against the heights in rear of Sistova, which were occupied with a loss of 800 men, the Turkish troops retiring to Tarnova and Nikopol. The Turks had remained ignorant of the Russians' concentration in Rumania and no attempt had been made to discover their plans. Abdul Kerim remained inactive in the fortresses of the Quadrilateral, and even when he heard of the crossing at Sistova, decided that it was but a demonstration. No measures were taken to observe the Russians. They were thus able to complete their crossing practically undisturbed, and this although it was never likely that the Russians would voluntarily select a point of passage leading into the Quadrilateral. Everything pointed to a crossing between Nikopol and Rustchuk. Gurko crossed the Danube from the Russian bridge on July 3rd and occupied Tarnova on July 7th, the Turkish garrison retreating to Osman Bazar. At Tarnova he learned that the Shipka Pass was occupied by 3000 Turks, and that none of the remaining passes were held in any force. He then determined to cross by the Hainkiol Pass and to turn the Shipka. He started from Tarnova on the 12th July, on which day the head of the VIII. Corps reached the town. Hainkiol was occupied on the 14th, a detachment of 300 Turks being driven away. Gurko then sent two squadrons to cut the telegraph at Yeni Zagra, and leaving a garrison to hold the best route for the Turks under existing circumstances would have been to leave garrisons in the fortresses, to observe the river line and to push reconnaissances to the north of the river, and to dispose the field army in a central position, whence it could concentrate on any point as soon as the enemy's intentions were revealed.

On June 30th Lieut.-General Gurko was put in command of a detachment composed of 10 battalions, 31 squadrons and 32 guns, with which he was ordered to advance rapidly to Tarnova to gain possession of a pass over the Balkans, to damage railways and telegraphs, and to endeavour to stir up a Bulgarian revolt. He crossed the Danube by the Russian bridge on July 3rd and occupied Tarnova on July 7th, the Turkish garrison retreating to Osman Bazar. At Tarnova he learned that the Shipka Pass was occupied by 5000 Turks, and that none of the remaining passes were held in any force. He then determined to cross by the Hainkiol Pass and to turn the Shipka. He started from Tarnova on the 12th July, on which day the head of the VIII. Corps reached the town. Hainkiol was occupied on the 14th, a detachment of 300 Turks being driven away. Gurko then sent two squadrons to cut the telegraph at Yeni Zagra, and leaving a garrison to hold the best route for the Turks under existing circumstances would have been to leave garrisons in the fortresses, to observe the river line and to push reconnaissances to the north of the river, and to dispose the field army in a central position, whence it could concentrate on any point as soon as the enemy's intentions were revealed.

2nd Period.—Operations in Bulgaria to the fall of Plevna.
by small bodies of the enemy, and he failed to co-operate, with the result that the attack from the north was repulsed. The Turkish commander, however, evacuated the pass that night (July 18th/19th). It was occupied by the Russians on July 19th, and held till the end of the war. Gurko's detachment was followed across the Danube bridge by the XII. and XIII. Army Corps, which crossed between July 3rd and 5th and moved towards the Jantra river; the IX. Corps was across by July 10th and advanced on Nikopol; the XI. Corps crossed July 10th-15th; and finally the IV. Corps between July 20th and 30th. The VIII. Corps had meanwhile advanced on Tarnova, as we have seen.

On July 3rd Abdul Kerim received orders from Constantino-ple to advance against the Russians, and set out with the force from Shumla for Rustchuk, immediately preceded by the cavalry division. Still no attempt was made to gain contact with the Russians and discover their intentions. From Rustchuk, Abdul Kerim advanced towards the Jantra, and after a skirmish between the Turkish cavalry and a Russian cavalry brigade again retired. Realizing Abdul Kerim's incapacity, and rendered anxious by Gurko's successful advance, the authorities at Constantinople now decided to give the command to Mehmet Ali. He superseded Abdul Kerim on July 19th, and at once ordered the concentration of all available forces at Rasgrad. Meanwhile Osman Pasha, who had till now been condemned to inactivity at Vidin, received permission to march.

Vidin, with its modern fortifications and heavy armourment, and with the Danube on one side and marshy ground towards the interior, was a place of considerable strength. But with the Russians south of the Danube there could no longer be any justification for keeping Osman's 30,000 men isolated. Leaving garrisons in Vidin and the other towns along the Danube from Nikopol to Rakovitza, and to bar the roads from Servia, Osman left Vidin with the remaining 19 battalions, 6 squadrons and 9 batteries on July 13th. His original plan was to join the 10 battalions under Hairi Pasha, then garrisoning Nikopol, and attack the Russian flank between Biela and Tarnova; but on July 15th he received news that the Russians were attacking Nikopol, and he then decided to march straight to Plevna, where there was a garrison of 5000 men under Atouf Pasha. Osman reached Plevna (g.a.) on July 19th, and at once took up a position which had been previously reconnoitred by Atouf Pasha, on the hills to the north-east and east of the town. He had arrived just in time. On July 16th the Russian IX. Corps had taken Nikopol, and on the 18th orders were received to occupy Plevna with one division. At 5 a.m. on July 20th General Schilder-Schildner, with the 5th Division IX. Corps and other forces, attacked Osman's position. No preliminary reconnaissances was made, and the Russians, after an artillery bombardment lasting about an hour, attacked at four points with separate columns. By midday the Russians were in retreat, having lost over 2800 men. There was no pursuit. On July 20th Osman was reinforced by fourteen battalions from Sofia, and the following day sent Rifaat Pasha with six battalions, a battery and some Circassian cavalry to occupy Lovcha in order to secure his communications with Sofia.

Osman's force at Plevna, within three days' march of the one Russian bridge over the Danube and flanking their line of operations, could not be neglected, and General Krüdener, commanding the IX. Corps, received orders to attack again as soon as possible. After the battle of the 20th he had been reinforced by brigades of the IV. and XII. Corps and a cavalry division. With this force, 30,000 in all, he attacked on July 30th. Krüdener advanced in two columns, cavalry covering both flanks. Skobelev, with the cavalry on the southern flank, was subsequently reinforced by infantry, so there were practically three columns of attack. A general reserve of one brigade was kept at Karagatsch (16 m. east of Plevna). After an artillery engagement which lasted from 8.30 a.m. till 2.30 p.m. the infantry advanced. The fighting lasted till sunset, when the Russians withdrew to Karagatsch, having lost 7300 officers and men. The Turkish casualties were 2000. General Krüdener, having reconnoitred the position, had hesitated to attack with the force available, and only acted in obedience to the orders received from headquarters, then 80 m. distant at Tarnova. His defeat was an unpleasant surprise for the Russians. Their plans were rudely upset, and their attention was now directed solely to the taking of Plevna. Headquarters were moved from Tarnova back to Bulgareni, Gurko was called back from south of the Balkans, the Rumanian army was called in to co-operate, orders were issued for the Guards and Grenadier Corps and the 24th and 26th infantry divisions to mobilize, 188,000 of the 1st Ban militia and three divisions of the reserve were called out, and the 2nd and 3rd infantry divisions and the 3rd Rifle Brigade from Moscow district, where they had been mobilized, were at once ordered to the front.

At this time the position of the Russians was as follows: the XIV. and part of the VII. Corps were north of the Danube, covering the communications; the IV. and IX. Corps were opposed to Osman Pasha at Plevna and his garrisons of Lovcha and Orchanie (the advanced depot of the Plevna force); the XI., XII. and XIII. Corps were along the White Lom facing Mehmet Ali, who was on the line Rasgrad-Eski Dzuma with a force of about 80,000 infantry with 6o guns and a few regiments of cavalry, in addition to the garrisons of the fortresses; a small garrison on the Shipka Pass. Gurko was south of the Balkans, where Suleiman Pasha had a force of some 30,000 men. The Russian casualties since the commencement had reached 15,000, and their numbers south of the Danube did not exceed 100,000. Suleiman Pasha could have joined Osman or Mehmet Ali, avoiding the Shipka, and a vigorous offensive against the Russian flank at that time held out every prospect of success. The Shipka Pass would of necessity have been evacuated, but all through we find the Turkish commanders with their eyes fixed on geographical, which were sometimes strategic, points, and losing sight of the fact that the Russian army was their first objective. It is true that the ministers at Constantinople were largely responsible for the faulty strategy, but the generals in the field were also to blame. It was the moment for vigorous action on the part of the Turks. The moral equilibrium of the enemy was upset and the whole army demoralized by this second defeat at Plevna, but not a move was made. Again Osman failed to pursue. He was weak in cavalry, but he had sufficient to keep in touch with the enemy, who were utterly demoralized, and could have followed on with his whole force. He was but 35 m. distant from Sistova, and the result of the demolition of the bridge would have been incalculable. He was subsequently forbidden by Constantinople to assume the offensive, but it was not necessary to consult ministers as to pursue after a successful battle, and they cannot be held responsible for this. The other Turkish commanders received news of the result of the battles of Plevna with incredulity, and likewise failed to turn them to account.

South of the Balkans was Suleiman's army. He was ordered from Montenegro on July 1st, and, leaving garrisons along the Montenegro frontier, embarked at Antivari on July 15th. Disembarking at Dedegatch on the 21st, he moved thence by train to Adrianople. His command, increased by some 15 battalions under Reouf Pasha, raised in the Balkan zone, amounted to approximately 30,000 men, and he was ordered to retake the Shipka Pass and to join Osman Pasha. Suleiman arrived at Karabunar on July 20th and moved to Eski Sraga, where he was joined by Reouf Pasha. Gurko received news about the Shipka Pass, ignorant of the arrival of Suleiman, moved against Reouf Pasha on the 27th of July, and found himself confronted by their combined forces on the 31st. He was attacked by Suleiman that day and was forced to retire. His force consisted of 15,000 men, including six battalions of Bulgarian volunteers which had just been raised. The following day he retreated across the Balkans by Hainkoï, where he left two brigades to hold the Hainkoï and Elena Passes, the
Bulgarian troops joining the garrison on the Shipka. Suleiman remained at Yeni Zagra till the 17th of August, when he set out for the Shipka. On August 21st the heights east of the pass were taken, and during the next few days there was desperate fighting; but the original garrison was gradually reinforced, and the Russians held on. In this fighting the Russian losses amounted to close on 4000, while the Turkish casualties were about treble that number. Suleiman now intranched himself close to the Russian position, and there he remained till Sept. 17th, when after a three days' bombardment he again assaulted the position, but was repulsed with considerable loss. This was the last assault made on the Russian position. Suleiman replaced Mehmet Ali as commander-in-chief on Oct. 1st, and was himself succeeded by Reouf Pasha. Thus, under orders from Constantinople, Suleiman frittered away his opportunity and his army in a fruitless attempt to retake the Shipka Pass.

It was not till the middle of August that Mehmet Ali decided to move against the Russians and ordered an advance. The Cesarevich (afterwards Alexander III.), who was opposing him with the XI., XII. and XIII. Corps, in all about 30,000, was extended on the line of the White Lom from Pirogs to Eskin Djuma. On August 22nd and 23rd there were engagements about Ayaslar, resulting in the retreat of the Russians. On August 30th he moved the 2nd and 3rd batteries to the right of the White Lom. On September 3rd he crossed the White Lom and again defeated them at Katzelevo, the enemy retiring behind the Banitcha Lom. On September 17th Mehmet Ali continued his advance, but halted on the 14th for a week. He then made an attack on Cerkovna on the 21st, but was repulsed with a loss of 1600 men, and two days later retired his army behind the White Lom. He had effected nothing. As will be seen later, the Russian operations against Plevna had not been in any way disturbed.

The containing force under the Cesarevich had retired a certain distance, but it still held the main Turkish army. Mehmet Ali's original plan was to concentrate, by Osman Bazar, effect a junction with Suleiman, and move on Tirova. But Suleiman was averse to his plan and it was negatived at Constantinople, though if this plan had been carried out with vigour, the position of the Russians should have been critical. He then advanced on a front of 50 m. instead of moving concentrated, which is the explanation of his failure. It is true that he was much hampered by the state of his cavalry, which was exhausted, and consequently was without information, while the Russians were well served. Mehmet Ali now concentrated his force, but at this juncture he was superseded by Suleiman Pasha.

To retake the Shipka Pass. At this time the Russians were disposed in a semicircle round Plevna, their right or N. flank resting on Ribina and the S. flank resting on Bogot. On August 30th Osman had moved out with a column of all arms towards Pelishat. The following day he engaged the Russians. The Turks lost 300 killed and 1000 wounded, and the Russian losses were about 1000. It is difficult to say what was the object of this sortie, which was of the nature of a reconnaissance in force. It achieved nothing. The Turks were not defeated, but retired again into Plevna the same evening. By the end of August the whole of the Rumanian army had crossed the Danube, and during the first days of September the first Russian reinforcements, consisting of the 2nd and 3rd infantry divisions and the 3rd Rifle Brigade, had arrived and joined the forces round Plevna. Mehmet Ali's advance and the assaults on the Shipka had been repulsed. The Russians could expect no further reinforcements before October, and it was therefore decided to make a third attempt to take Plevna, but first of all to occupy Lovcha. Skobelev had already made an unsuccessful attempt on August 6th, and General Prince Imeretinski, with a force of two infantry divisions and a brigade of Cossacks, in addition to Skobelev's mixed brigade, was now entrusted with the task. The garrison under Rifait Pasha amounted to 8 battalions, 6 guns and some Circassians. Fighting commenced on Sept. 1st and on the 3rd the Turks were driven out, most of the survivors finding their way to Plevna, and bringing in guns with them. The Russians lost 1500, the Turks 2500. On Sept. 2nd, Osman set out with a strong relieving column from Plevna, but on the 4th, hearing that the Russians had already occupied the town, he turned back and reached Plevna on the 6th. On Sept. 5th, 8 battalions and 2 batteries reached Orkhanie, and Osman's force, including the Lovcha troops, numbered about 30,000 men and 72 guns. The Russian forces, including the Rumanians, numbered about 50,000. Their plan was, after a long artillery bombardment, to attack the eastern front with the Rumanian forces, the south-eastern front with the IV. and IX. Corps and the southern front with Imeretinski's command. The attacks were to be simultaneous. The cavalry divisions were to be kept in rear to close the flank of the attacking infantry. During the night of Sept. 6th/7th the troops were moved into preparatory position, and batteries were constructed at 3000 to 5000 yds. from the outer works. The artillery bombardment was commenced at 6 a.m. on Sept. 7th and continued till midday Sept. 11th. So far the infantry had only been engaged on the south flank, where Skobelev had succeeded Imeretinski in the command. He had succeeded in advancing to within 2000 yds. of the southern Turkish redoubts and had entrenched himself. The orders for Sept. 11th were to summon the Infantry to be delivered at 3 p.m. after a six hours' cannonade. A dense fog interfered with the artillery bombardment. At the end of the day the Rumanians had taken No. 1 Grivitza reduct, the attack on the S.E. front had been repulsed and Skobelev had established himself within 1000 yds. of Plevna, having taken Kavanik and Issa forts. On Sept. 12th the Turks retook these forts and drove Skobelev back. During the next two days the Russians continued to bombard the works, but no further attack was made. The Rumanians remained in possession of the Grivitza reduct, defeating an attempt made by the Turks to retake it on Sept. 14th. The Russians then decided to retire and entrenched themselves on a line with Vertitsa-Radishevco, with their cavalry extending to the Vidi on either flank. There was no question of pursuit; in the first and second battles the numbers had been about equal, but now the Russians were vastly superior and Osman would have been crushed by a powerful counter-attack.

In their third battle the Turks had lost 5000, while the Russian casualties amounted to close on 20,000. The Russian bombardment, lasting four days, had effected nothing. It had not caused 200 casualties. The object of the artillery is to cover the advance of the infantry, and the arms must work in combination. The defender does not expose himself to the artillery fire unless he is strong enough to repel the approaching infantry. The Russians failed to realize this and practically wasted their ammunition. They had again failed to reconnoitre the position and attacked along the whole front instead of pressing home in strength at the decisive points. Their attacks were not even simultaneous, and Osman was able to shift his reserves from point to point. In addition to this, when the Russians retired one-third of their force had not been engaged. The defects in their plan of action are largely attributable to the fact that control was nominally centred in one man, senior officers were present who interfered with his arrangements.

It was now decided to complete the investment of Plevna, and Todleben, the defender of Sevastopol, was entrusted with supreme control of the operations. He arrived on the scene on Sept. 28th, but it was not till Oct. 24th that the investment was completed, and, meanwhile, on Sept. 24th and again on Oct. 8th, strong reinforcements arrived, raising the Turkish force under Osman to 84 battalions, 25 squadrons and 60 guns, with an effective of 48,000 men. Plevna had been re-victualled and the sick and wounded had been sent back to Orhanie. General Krikov, who had been operating west of the Vidi, with 32 squadrons and 30 horse artillery guns, had failed to prevent these movements, and was superseded by General Gurko on Oct. 8th.
Guards Corps had all reached Plevna by Oct. 20th, and two divisions were at once placed under Gurko's orders, raising his command to 35,000 infantry, 10,000 cavalry and 48 guns. His instructions were to capture the Turkish positions along the Sofia road. He compelled the garrison of Dolni-Dubnik to retire into Plevna, and captured Gorni Dubnik and Telis with their garrisons after severe fighting on Oct. 24th and 25th. Osman's force was thereby reduced by 12 battalions. About the middle of November the opposing forces were disposed as follows: 6 divisions along the Lom, under the Cesarievich, facing Suleiman's army; 3 divisions holding the Shipka under Radetzky; 1 division at Lovcha; 23 divisions west of the Vid under Gurko; and 12 divisions east of the Vid, investing Plevna. The XIV. Corps was in the Dobrudja, the VII. Corps about Odessa and the X. Corps in the Crimea.

On the Turkish side Suleiman advanced across the Lom, leaving small garrisons in the fortresses, and attacked at Mechka on Nov. 19th, and at Mechka and Trstenik on Nov. 26th, and again on Dec. 1st, but each time without success, and he retired across the Lom. South of the Balkans Vessil Pasha had succeeded Reauf Pasha on the Shipka. He continued to contain the three Russian divisions there, but made no attempt to dislodge them, beyond small offensive demonstrations made with the object of concealing the departure of large drafts which were sent to Sofia.

At Sofia and Orkanie, the Turks were forming an army of recruits and reservists with the object of advancing to the relief of Osman. Mehemet Ali was entrusted with the command. Osman had already asked the sultan's permission to evacuate Plevna, with a view to co-operating with Mehemet Ali, but permission was refused. It was not till the investment was completed that the sultan changed his mind, too late, and gave his sanction to the move. The Russians received information of Mehemet Ali's intended advance, and as the force round Plevna amounted to 191 battalions, 120 squadrons and 650 guns, it was decided that Gurko should move with his detachment towards Sofia. He concentrated his force at Yablonitsa on Nov. 5th and succeeded in driving the Turkish advanced guard from Orkanie. Mehemet Ali now occupied a strong position covering the Arabki Konak Pass over the Balkans, and, with a force of 43 battalions with cavalry and guns, made no attempt to attack.

Osman Pasha, his supplies having given out, eventually decided on a sortie. His troops had been short of food since the beginning of November, and the number of sick had risen to 10,000. His plan was to break through to the west and make for Sofia via Berkovitz. The Russians observed the preparations made and concentrated sufficient force at the threatened point, with the result that Osman and his army of 40,000 men capitulated. The Turkish losses in the action were about 6000 and the Russians lost about 1500.

The Russians now decided, notwithstanding the difficulties due to the winter season, to push on across the Balkans. The VII. and X. Corps were still left guarding the Russian coasts. The Cesarievich was left north of the Balkans with 71,000 men to guard the communications. Gurko's force was raised to 80,000. Leaving a containing force to oppose the Turks at the Arabki Konak Pass positions, he crossed by the Curia Pass. The Turks retired unobserved, and after a feeble stand at Tashkosen retreated to Kustendil. Gurko occupied Sofia on Jan. 4th. Radetzky's force at the Shipka was raised to 66,000, with which force, having defeated the Turkish forces at the 24th, Pasha now retired into the Greek south of the Balkans. Radetzky commenced operations on Jan. 5th. Keeping one division to hold the works on the Shipka, he moved the remainder of the force in two columns under Skobelev and Prince Mirski, who were to cross one on each side and attack simultaneously from the south. Vessil Pasha held an entrenched camp at Shenovo with some 12,000 men; the remainder of his force was in position on the mountains. Owing to the difficulties of the crossing, Skobelev was delayed. Mirski attacked on Jan. 8th and was repulsed. The following day Skobelev and Mirski attacking together were successful, and Vessil Pasha capitulated with his force; some 36,000, of whom 6000 were sick and wounded. Vessil Pasha had pointed out the danger of his position on Jan. 7th, but, contrary to Suleiman's advice, the war minister, believing an armistice imminent, had ordered him to hold on to the Shipka Pass. Mehemet Ali's force, dangerously delayed owing to interference by the minister of war, was over-lately regarded Tatar-Bazardjik, to which Pasha retired by Suleiman (now commander-in-chief) for the concentration of his forces. Having received news of the capture of the Shipka force he retired on Philippopolis, with Gurko's forces closely pursuing. But Radetzky's forces had already pushed on and practically cut Suleiman off from Adrianople. After some engagements about Philippopolis on Jan. 15th, 16th and 17th, he retreated towards the Aegean Sea through the Rhodope mountains, having lost most of his guns, and reached Enos about Jan. 28th, whence what remained of his force was conveyed by water to Constantinople.

Suleiman had again missed his opportunity. The Russians crossed the Balkans in a wide front of about 180 miles, and there was opportunity for successful action by a capable commander. There were not only the columns commanded by Gurko and Radetzky, but also a third column under General Kartoff, which crossed by the Trojan Pass, after which it joined Gurko's force. There were the troops under Mehemet Ali about Sofia, Vessil Pasha's force about the Shipka, and the main army on the Lom, which had been withdrawn south of the Balkans after the fall of Plevna, so that Suleiman, who had been appointed commander-in-chief, had an available force of 130 battalions, 120 guns and a proportion of cavalry. The fortified town of Adrianople offered a strong central position at which to concentrate his forces, and with this point as support, acting on interior lines, he could have dealt with the invading and widely separated columns in detail. But he missed his opportunity and left his scattered forces to be overwhelmed by superior numbers in each instance. The minister for war was undoubtedly responsible to a great extent for this faulty strategy, but the blame falls on the head of Suleiman as commander-in-chief. There was no object in leaving Pasha on the Shipka. All available forces should have been concentrated in a sound strategic situation.

The Servians had crossed the frontier after the fall of Plevna, and the Montenegrins were also pressing on. On Jan. 16th the Russians occupied Adrianople, and on Jan. 30th they were facing the Buyuk Tchemedjli lines, with their flanks resting on the Black Sea and the Sea of Marmora. Mehemet Ali was in command of what remained of the Turkish armies behind the lines. On Jan. 31st an armistice was arranged, and on March 3rd the treaty of San Stefano was signed, the terms of which were modified later at the Berlin Conference in June and July 1878.

The Russo-Turkish War proved once for all the great value of improvised fortifications, in other words, of spade work in warfare, and the advantages of field works as regards invisibility against artillery fire. It was not only at Plevna that field intrenchments were made use of. Notable instances were the defence of Lovcha by the small Turkish garrison of 8 battalions with one battery, which from their entrenchments kept Skobelev with over 20,000 men and 90 guns at bay for three days, inflicting on him a loss of over 1500 men. Again, at Gorni Dubnik on Oct. 24th, 3500 Turks with 4 guns held out against 32,000 Russians with 120 guns and 60 guns, inflicting a loss on them of over 3300, and eventually were forced to surrender by a surprise attack under cover of darkness, when their ammunition had run short, and their numbers had been reduced by 1500 casualties. In the attack the success of Skobelev stands out, and we find that he had realized the necessity of intrenching the ground he had gained.

The war was brought to a conclusion, but the Turks had not been beaten in battle. With the exception of the fighting round Plevna and the role of Suleiman's army at Philippopolis
there had been no decisive battles. The Turks had been defeated owing to the incapacity of their leaders, none of whom had previously commanded an army organized according to modern ideas. They were ignorant of strategic principles. Then, again, the interference of the generals in the field by the constant interference of the generals in the field. Constantinople had in each case resulted in the disasters which invariably followed the attempt of civilian amateurs to control warlike operations.

On the Russian side, the enemy had been at first despised, and consequently the forces originally employed were inadequate, which meant subsequent delays, losses and expense. The command of the sea had proved of little value to the Turks. Their flotilla rendered them no assistance. In the early stages it could have materially assisted by landing reconnoi'tring parties N. of the Danube, and by interfering with the Russians when crossing the river. The Russian navy was the only effective force in the Black Sea, and the campaigning objective throughout the campaign, but commanders with the requisite dash and initiative were not forthcoming. The defeat of the Turks was due in the first place to the failure of their politicians to ensure the adequate organization and training of the army during peace time, in the second place to the want of a commander who had educated himself to undertake the responsibilities entrusted to him.

A separate campaign had been waged, as before, in Asia Minor. Here the Turks under Mukhtar Pasha had 57,000 men in two corps, the northwest and the Batoum, and the other of Erzerum and Kars. His opponent, Loris Melikov, had at first only some 28,000 infantry, but a disproportionate number of Cossack Sotnias. The Russians advanced in three weak columns. On the 17th of May, 1829, the left column stormed Arslanbad. The right and centre columns then closed inwards upon Kars, which they besieged, but the siege was given up in July, after Mukhtar, advancing to its relief with 35,000 men, had repelled Melikov's attack at Zitz (June 26th). The left column occupied Bayazid without difficulty, but when it had proceeded thence on the Erzerum road the Russian garrison was blockaded by the Turks (July 14th). The garrison of the place, however, was reinforced and held at Igdir in the Araxes valley. Meanwhile the Turks on the coast had advanced, in concert with their fleet, and raised an insurrection amongst the Mahomedans of the littoral. They were eventually defeated, but the insurrection was not completely suppressed until the summer of 1878.

In August, Mukhtar, who had followed up Melikov's retreat from Kars, and won the victory of Kizil-Tepe, led 30,000 men in front of this position, and behind them the Kars garrison of 10,000. Ismail on the Bayazid side had 40,000 Dervish, at Batoum, 17,000. But after an interval of two months Melikov was reinforced, while drafts for the European wars were taken from Mukhtar, and Loris Melikov, or Duke Michael, assuming command of the Russians, defeated his opponent completely in the battle of the Aladja Dagh (Oct. 15th). The remnants of Mukhtar's army retreated on Erzerum, and while part of the garrison was besieged at Arslanbad and part attempted to fall off the retreat of Ismail on the Bayazid road, while the corps from the Araxes valley followed the latter up. Ismail slipped past them, however, and rejoined Mukhtar at Erzerum. But the two together were no longer able to resist the superior numbers of the Russians, who defeated them in a last battle at Deve Boyun (Nov. 4th). Kars was stormed on the night of the 11th of November.

RUST (O.E. rāst, a word which appears in many Teutonic languages, cf. Du. roest, Ger. rost); in origin it is allied with "ruddy" and "red," the reddish-brown powdery substance which forms on the surface of iron or steel exposed to atmospheric corrosion. Formerly the process was regarded as oxidation pure and simple, and, although it was known that iron did not rust in dry air, yet no attempt was made to explain why water was necessary to the action. F. S.ace-Calvert in 1871 showed that the carbon dioxide of the atmosphere was a factor; and in 1888 Crum Brown published the theory—termed the "carbonic acid theory"—that water and carbon dioxide react with iron to form ferrous carbonate and hydrogen, the ferrous carbonate being subsequently oxidized by moist oxygen to ferric hydrate and regenerating carbon dioxide, which again reacts with more iron. This theory was controverted by Wyndham Dunstan, who attempted to prove that carbon dioxide was not necessary to rusting; and in place of the acid theory, he set up a scheme which involved the production of hydrogen peroxide. G. T. Moody has since shown that when all traces of carbon dioxide are removed (which is a matter of great experimental difficulty) iron may be left in contact with oxygen and water for long periods without rust appearing, but on the admission of carbon dioxide specks are rapidly formed. It also appears that rust changes in composition on exposure to the atmosphere, both the ferrous oxide and carbonate being in part oxidized to ferric oxide. Acids, other than carbonic, may promote rusting; this is particularly the case with ironwork exposed to the acids—sulphurous, nitric, &c.—contained in smoke. It is probable that the action depends upon the presence of iron, oxygen and water, and some acid which makes the water an electrolyte.

Steel differs in many ways from iron in respect of atmospheric corrosion; the heterogenous nature of steel gives occasion to a selective rusting; ferrite is much more readily attacked than the cementite and pearlite; moreover, the introduction of other elements may retard rusting; this is particularly the case with the nickel-steels.

Rustchuk (Bulg. Russ), the capital of the department of Rustchuk, Bulgaria, on the right bank of the Danube, where it receives the E. Lom. Pop. (1906) 33,552. Rustchuk is the headquarters of a military division and of a naval flotilla stationed on the Danube. As a river-port and the terminus of railways from Varna and from Sofia via Trnovo, it has much commercial importance; and it possesses tobacco and cigarette factories, soap-works, breweries, aerated water factories, dyeworks, tanneries, sawmills, brick and tile works and a celebrated pottery.

In the time of the Romans Rustchuk was one of the fortified points along the line of the Danube. In the Tabula Peutingeriana it appears as Prisca, in the Antonine Itinerary as Serantapia, in the Notitia as Seragintapista and in Ptolemy as Priste Polis. Destroyed by barbarian invaders in the 7th century the town recovered its importance only in comparatively modern times. In 1810 it was captured by the Russians, who destroyed the fortifications. It played an important part in the Russo-Turkish Wars of 1828-29, 1853-54 and 1877-78. In 1877 it was nearly destroyed by the Russian artillery stationed in the Romanian town of Giurgevo, on the opposite bank of the Danube.

Rustenburg, a district and town of the Transvaal, South Africa. The district originally included all the N.W. part of the country, but is now of much smaller dimensions. Its S. border is marked by the Magaliesberg and other hills forming the N. escarpment of the high veld and the watershed between the Vaal and Limpopo. Several of the headstreams of the Limpopo rise within the district on the N. slopes of the Magaliesberg. The climate of the district is sub-tropical and the principal cultivation is that of tobacco, and fruit trees, notably oranges. The opening of the railway to Pretoria in 1866 led to a marked development of trade. In an amphitheatre formed by the hills and 61 m. by rail W. of Pretoria is the town of Rustenburg with a population (1904) of 1815. The town is one of the oldest in the Transvaal, having been founded in 1850 by the Voortrekkers. It was at Rustenburg that the volksraad met in March 1852 to ratify the Sand River Convention granting independence to the Transvaal Boers. At the time it was feared that there would be civil war between Hendrik Potgieter and Andries Pretorius, but they were reconciled in Potgieter's tent. Later Rustenburg became the home of the Kruger family. It was occupied by the British under R. S. Baden Powell in June 1900.
part being left rough. Similar work exists at Arak-el-Emir in Palestine (151 B.C.). The finest examples are those of the walls of the temple at Jerusalem, and at Hebron, where the stones are of immense size and the rustication projects sometimes over a foot. The Crusaders' castles in Palestine are all boldly rusticated, but the projecting portions have been worked over with a chisel in diagonal lines, and this enables them to be distinguished from the Hittite style. In the five-sided tower at Nurcemberg and the Burg-Capelle at Rothenburg, the rustication has a decorative value, so that in later work it was employed for the quoin-stones of towers. The masonry of the Palazzo Vecchio, and of the Piti, Strozzi and Riccardi palaces, all in Florence, and of other palaces in Siena and Volterra, is rusticated. Rustication was employed in terraces and grottos in Italy, where on account of its extravagances it gave rise to the term "grottesque." In the later Renaissance the edges of the stone were bevelled off, with a sunk joint in addition; and the treatment was known as vermiculated, if in imitation of earth burrowed by worms; marine, if with small shell holes; stalactitic, if carved in imitation of lime deposits, &c. In Italy the projecting portions were sometimes worked into facets. Rustication was introduced into England by Inigo Jones, who, in old Somerset House, York Stairs Watergate, the gateway of the Botanical Garden at Oxford, and elsewhere, used it only in alternate courses, his example being followed by other architects of the Renaissance. The term is now applied to the ashlars blocks of masonry which alternate with the circular drums of columns in many public buildings.

RÜSTOW, FRIEDRICH WILHELM (1821-1875), Swiss soldier and military writer, was a Prussian by birth. He entered the service of his native country, and served for some years, until the publication of Der Deutsche Militärtat von der Revolution (Zürich, 1850) brought him official condemnation. He was sentenced by a court-martial to a long term of fortress imprisonment, but succeeded in escaping to Switzerland. He obtained military employment in the service of the Republic, and in 1857 was major on the engineer staff. Three years later he accompanied Garibaldi in the famous expedition against the two Sicilies as colonel and chief of the staff, and to him must be ascribed the victories of Capua (19th Sept. 1860) and the Volturino (1st Oct. 1860). At the end of the campaign he once more settled down at Zürich. At the outbreak of the war in 1862 he offered his services, but was not accepted. In 1878, on the foundation of a military professorship at Zürich, Rüstow applied for the post, and, on its being given to another officer, lost heart and committed suicide.

Two younger brothers, both Prussian soldiers, were also distinguished men. The elder, Alexander (1824-1866), is remembered for his work Der Kästenkrieg (Berlin, 1848); the younger, Caesar (1826-1856), was one of the foremost experts of his time in the design and construction of military rifles, and the writer of several treatises on that subject, of which we may mention Die Kriegshandfeuerwaffen (Berlin, 1857-63). Both Alexander and Caesar fell on the field of battle in the war of 1866, at Königgrätz and Dębica respectively.

Amongst F. W. Rüstow's works, which covered nearly every branch of the military art, a large number must be mentioned. Historical—Kriegschronik des historischen Kaisers Carl (Gottingen, 1855; 2nd ed., Nordhausen, 1862), Kommentar zu Napoleon III., Geschichte Julius Cäsars (Stuttgart, 1865-67), Geschichte des Griechischen Kriegswesens (in collaboration with Köchly, Aarau, 1852), Militär-Handwörterbuch (Zürich, 1859, 2nd ed., 1860), Geschichte der Infanterie (Gottingen, 1857-58; 3rd ed., 1884), Die Ersten Feldschieß-Epochen 1700-1707 (Zürich, 1867), Der Krieg von Corunna (d. Paris, 1865), Die italienischen Feldzüge 1812-1814 (d. Berlin, 1865), Ungarischen Insurrektionen 1848-49 (Zürich, 1866), reminiscences of 1866 in Italy (Leipzig, 1861) and monographs on the campaigns of 1848-49 in Italy (Zürich, 1849) and the Crimean War (Zürich, 1855-56). Critical and General—Allgemeine Taktik und während 2nd ed., 1860), Kriegspolitik und Kriegsgebräuch (Zürich, 1879), Militär-Handwörterbuch (Zürich, 1859), Die Feldherrkunst des XIX Jahrhunderts (Zürich, 1857; 3rd ed., 1878-79), Der Krieg und seine Mittel (Leipzig, 1856). He also wrote Annalen des Königreichs Italien (Zürich, 1862-63).

RUTEBEUF, or Rutebeuf (fl. 1245-1285), French troubadour, was born in the first half of the 13th century. His name is nowhere mentioned by his contemporaries. He frequently plays in his verse on the word Rutebeuf, which was probably a nom de guerre, and is variously explained by him as derived from rude beau and rude auro. He was evidently of humble birth, and he was a Parisian by education and residence. Paulin Paris thought that he began life in the lowest rank of the minstrel profession as a jongleur. Some of his poems have autobiographical value. In Le Mariage de Rutebeuf he says that on the 2nd of January 1261 he married a woman old and ugly, with neither dowry nor amiability. In the Complainte de Rutebeuf he details a series of misfortunes which have reduced him to abject destitution. In these circumstances he addresses himself to Alphonse, comte de Poitiers, brother of Louis IX., for relief. Other poems in the same vein reveal that his own miserable circumstances were chiefly due to a love of play, particularly a game played with dice, which was known as griesche. It would seem that his distress could not be due to lack of patrons, for his metrical life of Saint Elizabeth of Hungary was written by request of Erard de Valery, who wished to present it to Isabel, queen of Navarre; and he wrote elegies on the deaths of Anseau de l'Isle Adam, the third of the name, who died about 1251, Eude, comte de Nevers (d. 1267), Thibaut V. of Navarre (d. 1270), and Alphonse, comte de Poitiers (d. 1271), which were probably paid for by the families of the personages celebrated. In the Pauvreté de Rutebeuf he addresses Louis IX. himself.

The piece which is most obviously intended for popular recitation is the Dîl de l'Herberie, a dramatic monologue in prose and verse supposed to be delivered by a quack doctor. Rutebeuf was also a master in the verse conte, and the five of his Jribiaux that have come down to us are gay and amusing.

The matter, it may be added, is sufficiently gross. The adventures of Frère Denys le cordelier, and of "la dame qui alla trois fois autour du monstre," find a place in the Cent Nouvelles nouvelles.

Rutebeuf's serious work as a satirist probably dates from about 1260. His chief topics are the iniquities of the friars, and the defence of the secular clergy of the university of Paris against their encroachments; and he delivered a series of eloquent and insistent poems (1262, 1263, 1268, 1274) exhorting princes and people to take part in the crusades. He was a champion of the university of Paris. He was in close contact with the religious orders who were supported by Pope Alexander IV., and he boldly defended Guillaume de Saint-Amour when he was driven into exile. The libels, indecent songs and rhymes condemned by the pope to be burnt together with the Perils des derniers temps attributed to Saint-Amour, were probably the work of Rutebeuf. The satire of Ronart le Boustourd, which borrows from the Reynard cycle little but the names under which the characters are disguised, was directed, according to Paulin Paris, against Philip the Bold. To his later years belong his religious poems, and also the Vœu de l'herberie, a description of a dream, in the manner of the Roman de la Rose.

The best work of Rutebeuf is to be found in his satires and verse contes. A miracle play of his, Le Miracle de Théophile, is one of the earliest dramatic pieces extant in French. The subject of Theophilus, the Cilian monk who made a pact with the devil, which was afterwards returned to him by the intervention of the Virgin, was a familiar one with the story-tellers of the middle ages. Rutebeuf can claim no priority in the choice of the subject, which had been treated dramatically in the Latin piece ascribed to the nun Hroswitha of Gandersheim, but his piece has considerable importance in dramatic history.

The Œuvres of Rutebeuf were edited by Achille Jubinal in 1839 (6th edition, 1874); a more critical edition is by Dr Adolf Kressner.

1 It has been suggested that Brunetto Latini was thinking of Rutebeuf when he wrote in his Livre du Trésor: "Le Rive, le jeu, voila la vie du jongleur, qui se moque de lui-même, de sa femme, de ses enfants, de tout le monde."
RUTH, BOOK OF, in the Old Testament. The story of Ruth (the Moabitess, great-grandmother of David) is one of the Old Testament Hagiographa and is usually reckoned as the second of the five *Megilloth* (Festal Rolls). This position corresponds to the Jewish practice of reading the book at the feast of Pentecost; Spanish MSS., however, place it at the head of the *Megilloth*; and the Talmud (*Baba Bathra*, 148b) gives it the first place among all the Hagiographa. On the other hand, it follows Judges in the Septuagint, the Vulgate and the English version. But although it was very early and that a later arrangement should transfer Ruth from the Hagiographa to the historical books, and place it between Judges and Samuel, no motive can be suggested for the opposite change, and the presumption is that it found a place in the last part of the Jewish canon after the second (with the historical books) had been definitely closed. See Bible: *Old Testament*, section I. “Canon”; *Canticles*; *Lamentations*.

That the book of Ruth did not originally form part of the series of “Former Prophets” (Joshua–Kings) is further probable from the fact that it is quite untouched by the process of ‘prophetic’ or ‘Deuteronomistic’ editing, which helped to give that series its present shape after the fall of the kingdom of Judah. The narrative has no affinity with the point of view which looks on the history of Israel as a series of examples of divine justice and mercy in the successive rebellions and repentances of the people of God. But if the book had been known at the time when the history from Joshua to Kings was edited it could hardly have been excluded from the collection; the ancestry of David (iv. 17, 18–22) was of greater interest than that of Saul, which is given in 1 Sam. ix. 1, whereas the old history names no ancestor of David beyond his father Jesse.

In truth the hearer of Ruth should transfer itself as dealing with times far back (Ruth i. 1), and takes delight in depicting details of antique life and obsolete usages (iv. 7); it views the stormy period before the institution of the kingship through the softening atmosphere of time, which imparts to the scene a gentle sweetness very different from the harsher colours of the old narratives of the book of Judges. It has indeed been argued that, as the author seems to take no offence at the marriage of Israelites with Moabitite women, he must have lived before the time of Ezra and Nehemiah (Ezra ix.; Neh. xii.); but the same argument would prove that the book of Esther was written before written it. The designation of a period of Hebrew history as “the days of the judges” is based on the Deuteronomistic additions to the book of Judges (ii. 16 sqq.) and does not occur till the period of the exile. It is true that the language has some features which appear to link it with the narratives in Samuel and Kings, but it might fairly be assumed either that the book is the work of a late author well acquainted with the earlier literature, or that an old narrative had undergone some rewriting at a later age.

No definite conclusion can be drawn from the fact that the language stands in marked contrast to that of Chronicles, Ezra, Nehemiah, &c., since writings presumably more or less contemporary did not necessarily share the same characteristics (observe, for example, the prose parts of Job).

Like the stories appended to Judges (by a post-Deuteronomistic hand) the book of Ruth connects itself with Bethelhem, the traditional birthplace of David. Some connexion between Bethlehem and Moab has been found in the (now corrupt) text of i Chron. iv. 22 (where the Targum and late rabbinical exegesis discover references to the story of Ruth), and is more explicitly suggested by the isolated 1 Sam. xxii. 3 seq. which evidently knew of some relationship between the Moabites and the inhabitants of the land of Ruth. Next, the writer claims the sympathy of his readers.

The religious pragmatism lacking in the original is in part supplied by the Targum (i. 5, 6).

Ruth, upon whose Moabitite origin he frequently insists, and this feature is noteworthy in view of the fact that which intermarriage was regarded at a certain period (Deut. xxv. 3; Neh. xii.; Ezra ix. seq.). The independent evidence for the present post-exilic form of the book has consequently led many scholars to the conclusion that it was directed against the drastic steps associated with the reforms of Ezra and Nehemiah, which, as is known, were not everywhere acceptable. Thus, not only do we have a beautiful portrait of a woman of Moabitite origin, but she becomes the ancestress of David himself, and in the days of these measures the charming and simple story would inevitably suggest the question, whether the exclusiveness of Judaism could not be carried too far. There is no reason, however, to believe that this was the original object of the story. It contains other features of considerable interest to which more importance seems to be attached, and the writer is evidently an artist who takes manifest delight in the touching and graceful details of his picture, and is not simply guided by a desire to impart historical information or to enforce some particular lesson.

One does not look for absolute consistency in oriental narratives, and even this little book contains several internal intricacies which demand investigation. The genealogy from Ruth 4:19–22, in view of the blue name Salma (Salmon), father of Boaz, is a Calebite clan, name, not associated with its earlier seat S. of Hebron as in Judges i., 1 Sam. xcv., &c., but as “father” of Bethlehem, representing exilic or later conditions (1 Chron. ii. 51; see Caleb). Apart from other signs of a late date in this list of the ancestors and descendants of Boaz, iv. 12 certainly implies that the genealogical lines of Perez and Boaz were not identical, and thus verses 18–22 in the opinion of most scholars are a later addition.

Further, the story involves points of old family usage which are no longer clear. The well-known custom which gives the nearest heir of the dead a right to marry the widow is necessarily distinct from the levirate (q.v.), where it is the brother’s duty to marry his widowed sister-in-law if childless, and where the eldest son succeeds to the name and inheritance of the deceased. In Hebrew usage the refusal to perform the levirate brought ignominy (see Deut. xxv. 5–10), and Gen. xxxviii. refers to the Tamar, when Shelah was not given to her, obtained a child through her father-in-law Judah (see esp. vers. 14, 26). In addition to these customs to prevent the alienation of the estate and to perpetuate the family name, the post-exilic story in Num. xxvii. 1–11, xxxvi. gives daughters the right of succession to the estate. The levirate was also provided they do not marry outside the tribe. Although the levirate still continued (Matt. xxii. 24 sqq.), the late laws in Lev. xviii. 15, xx. 21, as also this story, may be aimed at against it. Finally, the gōlāh (“next kinsman,” lit. “avenger”; see Driver, *Ency. Bib.* col. 1745 seq.) has the first right of purchase to an estate (Jer. xxxii. 6–15), and indeed must redeem the property which he needs relative might be compelled to sell (Lev. xxv., see ver. 25). Now it appears that Boaz combines the essential duty of the gōlāh in purchasing the estate over which Naomi holds rights, and at the same time marries, not Naomi, who is now old, but her daughter-in-law Ruth. In order to perpetuate her husband’s family, Naomi, who had realized the impossibility of the levirate in her case (i. 11 seq.), returned home a disconsolate and childless widow (i. 20 seq.), but the filial Ruth fell in with her plans and put herself entirely into the hands of the kinsman Boaz (iii.). In the happy finale, Naomi is the recipient of congratulations upon the birth of a son to the faithful Ruth (iv. 176, “there is a son born to Naomi”); the name of the dead is thus “raised up” (iv. 5, 10), and the child Obed is clearly recognized.

as of the line of Elimelech and Mahlon (Naomi's husband and son). In point of fact, a nearer kinsman than Boaz had agreed to purchase the estate (as gōdēl), which Naomi evidently had not yet sold (see commentaries on iv. 3); but he was unwilling to marry Ruth (reading in ver. 5, "a" and also Ruth thou must buy "); cf. ver. 10), recognizing that if a son were born the estate would revert to the line of Elimelech, thus leaving him at a disadvantage. He was evidently unprepared for what seems a novel condition (contrast Boaz in ill. 12 seq.), although, from the felicitations in iv. 11-13, the issue of the marriage is actually reckoned to the husband (Boaz). It is improbable that these conflicting features in v. 11-13 and ver. 17a, and all that they involve, co-existed, and it is possible that the former (with the implied reference to the coming David) is not part of the original. However, as in the equally complicated story in Gen. xxxviii, it is difficult to trace the extent or growth of the various motives, e.g., the primary interest in Naomi, the romantic marriage of Ruth, the selling of the land (which comes only in ch. iv.), &c.

RUTHENIANS, a name applied to those of the Little Russians who are Austrian subjects. The name is a form of the word Russian. The Ruthenians were separated from the bulk of the Russians by the accident of the two feudal principalities of the old Red Russia, Halšće and Volhynia, having fallen to Lithuania, which in turn was united with Poland. At the partition of Poland no one troubled about ethnological boundaries. The language is in substance like the Little Russian of the Ukraine, though it has marked differences; the most interesting dialects are those in the extreme W., which approach to Slovak and that of the Huzuli in Bukovina. The Ruthenians number some three million in Galicia, Bukovina, and in the other provinces of the Empire. Along the coasts of Hungary from the Black Sea to the Caspian eastwards. Throughout Galicia the Poles form the aristocracy, though in two-thirds of it Ruthenians form the bulk of the population, while the middle class is Jewish or German. The Ruthenians are therefore under an alien yoke both politically and economically: in religion they mostly belong to the Uniate Church, acknowledging the Pope but retaining their Slavonic liturgy and most of the outward forms of the Greek Church. Their intellectual centre is Lemberg (Liviv or Lvów), where some lectures in the university are given in their language, and they are agitating for it to have equal rights with Polish. Yet here Little Russian is freer than in the Russian empire, and in Lemberg is the very beginning of a literature, the society called by the name of Svečenko, the Little Russian poet. This society publishes voluminous transactions in a special orthography and deals with everything concerning Little Russia, its archaeology, people and language.

See summary of the work of the Svečenko for ten years in Archiv f. slawische Phil. xxxvii. (1905), p. 279.

Ruthenium (Ru), atomic weight 101-7 (O = 16), in chemistry, a metallic element, found associated with platinum, in platinum ore and in osmiridium. The metal may be obtained from the residues obtained in the separation of osmirium from osmiridium. These are washed with ammonium chloride until the filtrate is colourless, ignited, fused with caustic potash and nitre, the melt dissolved in water and nitric acid added to the solution until the colour of potassium ruthenate disappears. A precipitate of ruthenium oxide gradually separates; this is collected and ignited in a graphitic crucible and finally fused in the oxyhydrogen furnace (H. Sainte-Claire Deville and J. H. Debray, Ann. chim. phys., 1859, (3), 56, p. 406). For other methods see C. E. Claus, Pogg. Ann., 1845, 65, p. 200; E. Frémy, Comptes rendus, 1854, 38, p. 1008; T. Wilm, Ber., 1853, 16, p. 1524. A purer ruthenium is obtained by A. Guthier and L. Trenkner (Zeit. anorg. Chem., 1905, 45, p. 166) by heating the crude metal (obtained by other processes) in a mixture of oxygen until all the impurities are oxidized. The residue is then fused with caustic potash and nitre, dissolved in water, saturated with chlorine and distilled on the water-bath in a current of chlorine. Pure ruthenium tetroxide distils over. This is then dissolved in water, reduced by alcohol and ignited in oxygen. Ruthenium in bulk resembles platinum in its general appearance, and has been obtained crystalline by heating an alloy of ruthenium and tin in a current of hydrochloric acid gas. Its specific gravity (after fusion) is 12-063 (A. Joly, Comptes rendus, 1893, 116, p. 430). It fuses easily in the electric arc. It oxidizes superficially when heated, but fairly rapidly when ignited in an oxidizing blowpipe flame, forming a black smoke of the oxide. It also oxidized when fused with caustic potash and nitre, forming a ruthenate. Acids have practically no action on the metal, but it is soluble in solutions of the alkaline hypochlorites. Like most of the other metals of the group, it absorbs gases. A colloidal form has been obtained by A. Guthier and G. Hofmeier (Jouur. prakt. Chem., 1905, (2), 71, p. 452) by reducing ruthenium salts with hydrazine hydrate in the presence of gum-arabic.

Several oxides of ruthenium have been described, the definite existence of some of which appears to be doubtful. The dioxide, RuO₂, is formed by heating sulphate, or by heating the metal in a current of oxygen. In octahedral monoxide, RuO₂ is insoluble in acids and decomposes when heated to a sufficiently high temperature. Fusion with caustic potash or nitric oxide converts the metal to the unstable ruthenium sesquioxide, RuO₃, which is a black, almost insoluble powder. An oxide of composition Ru₂O₅ is obtained as a black powdered hydrate when the peroxide is heated with water for some time. It becomes anhydrous at about 360° C., and is unattacked by acids and alkanis. The peroxide, RuO₄, is formed when a solution of potassium ruthenate is decomposed by chlorine, or by oxidizing ruthenium compounds, with potassium chlorate and hydrochloric acid, or with potassium permanganate and sulphuric acid. It forms a golden yellow crystalline mass, which sublimes slowly in vacuo, and melts at 25-5° C. It blackens on exposure to moisture, and decomposes when exposed to light. It is insoluble in water, but is decomposed by a mixture of oxidised ruthenium sesquioxide, RuO₃, and hydrogen peroxide, Ru₂O₅.H₂O. It is readily reduced. Its vapour possesses a characteristic smell, somewhat resembling that of ozone. Ruthenium tetroxide, Ru₂O₇, is obtained by reducing ruthenium sesquioxide by sulphuric acid or hydrogen. It is stable in the cold. The sesquichloride, RuCl₃, is formed when a mixture of chlorine and carbon monoxide is passed over finely divided ruthenium heated to 150° C. (Joly, loc. cit., p. 291). It is a brown powder which is readily decomposed by boiling water. It absorbs ammonia readily, forming RuCl₃.NH₃. Numerous double chlorides are known, e.g., RuCl₃-4KCI; RuCl₃-3NH₃Cl, &c. The pure tetrachloride, RuCl₄, has not been isolated, but is chiefly known in the form of its double salts, such as potassium ruthenium chloride, K₂RuCl₄, which is obtained when finely divided ruthenium is fused with caustic potash and potassium chlorate and the fused mass is dissolved in water. U. A. E. (Comptes rendus, 1893, 116, p. 82). It is a red-brown crystalline powder, which is soluble in water. A similar ammonium salt is obtained by fusing sulphate with ammonium chloride, when the metal is warmed with pyrites and some borax, and the fused mass treated with hydrochloric acid first in the cold and then hot. The insoluble residue contains a mixture of two sulphides, and their mixture is convertible into chlorides. When the residue is treated with hydrogen cyanide, Ru(OH)₂.C₂H₄.NH₂, is obtained from ammonium and ruthenium sesquichloride at 40° C., the product being purified by crystallization from ammonia. It forms small brown lamellae which disintegrate in the water, with a blue reflex in the blowpipe flame, and a violet reflex. The solution possesses a considerable tinctorial power, dyeing silk in the cold. Ruthenium cyanide, K₂Ru(C₂H₄.NH₂)₂, is obtained with a solution of potassium cyanide, crystallizes in colourless plates which are soluble in water. A ruthenium silicide, RuSi, has been prepared by H. Moissan (Comptes rendus, 1903, 137, p. 292) by the
RUTHERFORD, M.—RUTHERGLEN

direct combination of the two elements in the electric furnace.

In iron, very dark, needle-like crystals, burns in oxygen and is not attacked by acids. Potassium ruthenate, K₂RuO₄·H₂O, obtained by fusion of the metal with caustic potash and nitre, crystallizes in prisms which become covered with a black deposit of ruthenate, when exposed, to moist air. It is soluble in water, giving an orange-red solution which becomes green on standing, and gradually deposits the hydrated pentoxide, RuO₂·H₂O (H. Debray and A. Combettes, Comptes Rendus, 1898, 128, 1233). The 96% ruthenate, K₂RuO₄ formed by the action of chlorine on the ruthenate, or of alkali on the peroxide at 65°C, is a black crystalline solid which is stable in dry air but decomposes when heated strongly. On exposure to moist air, it forms a black deposit. The ruthenate compounds were studied by C. E. Claus, Ann., 1856, 98, p. 317; A. Joly, Comptes Rendus, 1888, 107, p. 694; 1889, 108, pp. 854, 1300; 1890, 111, p. 966; L. Briard, ibid., 1896, 122, p. 730; 1896, 123, p. 265; where the weight of ruthenate was determined by A. Joly (Comptes Rendus, 1889, 188, p. 946), who obtained the values 101.3 and 101.3.

RUTHERFORD, MARK, the pen-name of William Hale White, English author, who was born at Bedford about 1830. His father, William White, a member of the nonconformist community of the Bunyan Meeting, removed to London, where he was well known as a doorkeeper of the House of Commons; he wrote sketches of parliamentary life for the Illustrated Times, papers afterwards collected by his son as The Inner Life of the House of Commons (1879). The son was educated for the Congregational ministry, but the development of his views prevented his taking up that career, and he became a clerk in the admiralty. He had already served an apprenticeship to journalism and at one time was a contributor as a novelist to the three books "edited by Reuben Scapcott," The Autobiography of Mark Rutherford (1881), Mark Rutherford's Deliverance (1882), and The Revolution in Tanner's Lane (1887). Under his own name he translated Sipnoza's Ellic (1883). Later books are Miriam's Schooling, and other Papers (1890), Catherine Purse (2 vols., 1893), Clara Hopgood (1896), Pages from a Journal, with other Papers (1900), and John Bunyan (1905). Though for a long time little appreciated by the public, his novels—particularly the earlier ones—have a power and style which must always give his works a place of their own in the literary history of their time.

RUTHERFORD, WILLIAM GUNION (1853-1907), English scholar, was born in Peeblesshire on the 17th of July 1853. He was educated at St Andrews and Oxford, where he graduated in natural science, with a view to following the medical profession, which he abandoned in favour of a scholastic career. From 1883 to 1901 he was headmaster of Westminster school; and his death, on the 10th of July 1907, deprived classical scholarship in England of one of its most brilliant modern representatives. Rutherford devoted special attention to Attic idioms and the language of Aristophanes. His most important work, the New Phrynichus (1883), dealing with the Atticisms of the grammarian, was supplemented by his Babrius (1883), a specimen of the later Greek, which was the chief subject of C. A. Lobeck's earlier commentary (1830) on Phrynichus. His edition (1896-1905) of the Aristophanic scholar from the Ravenna MS. was less successful. Mention may also be made of his Elementary Greek Accent and Lex Rex, a list of cognate words in Greek, Latin and English.

RUTHERFORD (or RUTHERFORD), SAMUEL (c. 1600-1661), Scottish divine, was born about 1600 at the village of Nisbet, Roxburghshire. He went to college at Edinburgh in 1617, graduating M.A. in 1621, and two years afterwards was elected professor of humanity. On account of an alleged indiscretion before his marriage in 1626 he was dismissed his professorship in that year, but, after studying theology, he was in 1627 appointed minister of Anwoth, Kirkcudbrightshire, and soon took a leading place among the clergy of Galloway. In 1636 his first book, entitled Exercitationes Apologeticæ pro Divina Gratia—an elaborate treatise against Arminianism—appeared at Amsterdam. Its severe Calvinism led to a prosecution by the bishop, Thomas Sydserf, in the High Commission Court, first at Wigtown and afterwards at Edinburgh, with the result that Rutherford was deposed from his pastoral office, and sentenced to confine them in Aberdeen during the king's pleasure. His banishment lasted from September 1636 to February 1638, and the greater number of his published Letters belongs to this period of his life. He was present at the signing of the Covenant in Edinburgh in 1638, and at the Glasgow Assembly of the same year he was restored to his parish. In 1639 he was appointed professor of divinity in St Mary's College, St Andrews. He only accepted the position on the condition that he should be allowed to act as colleague to Robert Blair in the church of St Andrews. He was sent up to London in 1643 as one of the eight commissioners from Scotland to the Westminster Assembly. Remaining at his post over three years, he did great service to the cause of his party. In 1642 he had published his Peaceable and Temperate Plea for Paul's Presbytery in Scotland, and the sequel to it in 1644 on The Due Right of Presbyteries provoked Millon's contemptuous reference to "mere A. S. and Rutherford" in his sonnet On the New Forces of Conscience under the Long Parliament. In 1644 also appeared Rutherford's Lex Rex, a Dispute for the Just Prerogative of King and People, which gives him a recognized place among the early writers on constitutional law; it was followed by The Divine Right of Church Government and Excommunication (1646), and Free Disputation against Pretended Liberty of Conscience (1648), characterized by Bishop Beacher as "perhaps the most elaborate defence of persecution which has ever appeared in a Christian country." The works are a supplement to his Ieroglifici Augusti de Christi Naturam et Vicariato (1645), Christ Dying and Drawing Sinners to Himself (1647), and Survey of the Spiritual Antichrist (1648). In 1647 he returned to St Andrews to become principal of the New College there, and in 1648 and 1651 he declined successive invitations to theological chairs at Harderwijk and Utrecht. After the Restoration in 1660, his Lex Rex was ordered to be burned. He was deprived of all his offices, and on a charge of high treason was cited to appear before the ensuing parliament. His health utterly broke down, and he drew up, on the 26th of February 1661, a Testimony, which was posthumously published. He died on the 23rd of the following March.

The fame of Rutherford now rests principally upon his remarkable Letters, which, to the number of 215, were first published anonymously by M'Ward, an amanuensis, as Joshua Redivivus, or Mr Rutherford's Letters, in 1664. They have been frequently reprinted, the best edition (365 letters) being that by Rev. A. A. Bonar (1846), with a sketch of his life. In addition to the other works already mentioned, Rutherford published in 1651 a treatise, De Divina Prerogativa, against Molinism, Socinianism and Arminianism, in which Rutherford's work is thoroughly justice, remarked that "as the Letters were the best piece so this was the worst he had ever read."

See also a short Life by Rev. Dr Andrew Thomson (1884); Dr A. A. Bonar, Life in Mr M'Ward's MS. (1883); and Whyte, Samuel Rutherford and some of his Correspondents (1894); Rev. R. Gilmour, Samuel Rutherford (1904).

RUTHERGLEN (locally pronounced Räglen), a royal municipal and police burgh of Lanarkshire, Scotland. Pop. of royal burgh (1901) 18,270. It is situated on the left bank of the Clyde, 2½ m. by the Caledonian railway S.E. of Glasgow, with the E. of which it is connected by a bridge. The parish church stands near the spire of the ancient church where, according to tradition, the treaty was made in 1297 with Edward I., by which Sir John Menteith undertook to betray Wallace to the English. The principal public building is the town hall, dating from 1861. The industries include colleries, chemical works, dye-works, cotton and paper-mills, chair-making, tube-making, pottery, rope and twine-works and some shipbuilding. It forms one of the Kilmarnock group of parliamentary burghs, with Dunbarton, Port-Glasgow, Renfrew and Kilmarnock.

Rutherford was erected into a royal burgh by David I. in 1126. It then included a portion of Glasgow, but in 1226 the boundaries were rectified so as to exclude the whole of the city. In early times it had a castle, which was taken by Robert Bruce from the English in 1313. It was kept in good repair till after the battle of Langside (1568), when it was burnt by order of the regent Moray. In 1679 the Covenanters published their Declaration and Testimony at Rutherford prior to the battles of Drumclog and Bothwell Brig (1679).
RUTHIN (Rhudd ddin, "red fortress"), a municipal and contributory parliamentary borough (with Denbigh and Holt) and market town of Denbighshire, N. Wales, situated on a hill rising from the river Clwyd, 21 m. from Chester, and 215 from London by rail. Pop. (1901) 2643. It is on the Great Western railway (Dyserth branch). Apart from the legends of Arthur and his limestone block (shown in the market-place), the first event of note in its history is its connection with the de Grey de Ruthyn family (the first lord died 1353). It was sold by the de Greys to Henry VII., and Elizabeth gave it to the earl of Warwick. In 1646, after two months' siege, it was dismantled by the Parliaments. The new castle occupies the same site, and is built of the same coloured sandstone as the old. New buildings for the Free Grammar School (founded in 1595 by Gabriel Goodman, dean of Westminster, who also in 1590 helped the farmers of Ruthin to found a college) were opened in the town in 1893. The old (conventional) Anglican church of St Peter, once belonging to "Les Bons-hommes," and made collegiate in 1310 by John de Grey, has a Perpendicular north aisle roof, nearly 500 panels of carved oak, and cloisters which have been made into a house for the warden of the hospital. Agriculture is the staple, but there are chemical, aerated waters, bricks, terra-cotta and other manufactures.

RUTHVEN, the name of a noble Scottish family which traces its descent from a certain Thor, who settled in Scotland during the reign of DaviI. I. In 1488 one of its members, Sir John Ruthven (1458), was created Lord Ruthven for his services in the field of battle. His eldest son William was killed at Flodden in 1513, and consequently his grandson William succeeded him in the title, and after holding the offices of extraordinary lord of session and keeper of the privy seal died in December 1552, leaving three sons. The eldest of these, Patrick, 3rd Lord Ruthven (c. 1520-1560), played an important part in the political intrigues of the 16th century as a strong Protestant and a supporter of the lords of the congregation. He favoured the marriage of Mary with Darnley, and was the leader of the band which murdered Rizzio. This event was followed by his flight into England, where he died on the 13th of June 1566. Ruthven wrote for Queen Elizabeth a Relation of the murder, which is preserved in MSS. in the British Museum.

A descendant of the 1st Lord Ruthven in a collateral line, also named Patrick Ruthven (c. 1573-1651), distinguished himself in the service of Sweden, which he entered about 1660. As a negotiator he was very useful to Gustavus Adolphus because of his ability to "drink immeasurably and preserve his understanding to the last," and he also won fame on the field of battle. Having taken part in the Thirty Years' War and been governor of Ulm, he left the Swedish service and returned to Scotland, where he was employed by Charles I. He defended Edinburgh Castle for twelve decayed housekeepers, during the civil war, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. But his faculties had begun to decay, and in 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on the 2nd of February 1651. He left no sons and his titles became extinct.

during the civil war, and when the Civil War broke out he joined Charles at Shrewsbury. He led the left wing at the battle of Edgehill, and after this engagement was appointed general-in-chief of the Royalist army. For his services he was created Lord Ruthven of Ettrick in 1639, earl of Forth in 1642 and earl of Brentford in 1644. The earl compelled Essex to surrender Lostwithiel, and was wounded at both battles of Newbury. But his faculties had begun to decay, and in 1644 he was superseded in his command by Prince Rupert. After visiting Sweden on a mission for Charles II., Brentford died at Dundee on the 2nd of February 1651. He left no sons and his titles became extinct.

Ruthven—Rutile

941

The 2nd Lord Ruthven left a son, Alexander (d. 1599), the founder of the family of Ruthven of Freeland, and the grandfather of Sir Thomas Ruthven (d. 1673), on whom Charles II. bestowed the title of Lord Ruthven of Freeland in 1651. When his son David died unmarried in April 1701 the title of Baroness Ruthven was assumed by the latter's sister, Jean (d. 1725), although according to some authorities the peerage had become extinct. It was, however, assumed in 1722 by Isobel (d. 1732), wife of James Johnson, who took the name of Ruthven on succeeding to the family estates; and their son, James Ruthven (d. 1783), took the title and was allowed to vote at the elections of Scots representative peers. In 1853 the barony again descended to a female, Mary Elizabeth Thornton (c. 1784-1854), the wife of Walter Hore (d. 1878). She and her husband took the name of Hore-Ruthven, and their grandson, Walter James Hore-Ruthven (b. 1838), became the 8th Baron in 1864.

RUTILE, the most abundant of the three native forms of titanium dioxide (TiO2); the other forms being anatase (q.v.) and brookite (q.v.). Like anatase, it crystallizes in the tetragonal system, but with different angles and cleavages, it being crystallographically related to cassiterite, with which it is isomorphous. The crystals resemble cassiterite in their prismatic habit and terminal pyramid planes (fig. 1) and also in the twinning: the prism planes are striated vertically. Geniculated twins, with ε (101) as twin-plane, are of frequent occurrence, and the twinning is usually several times repeated, giving rise to triplets (fig. 2), sextets and octets. Twin-lamellae are often present in the crystals. Acicular crystals are sometimes twinned together to form reticulated skeletal plates to which the name "sagenite," from Gr. σαγήνη (a net), is applied. A rarer type of twinning, on the plane (301), gives rise to heart-shaped or kite-shaped forms. There are distinct differences parallel to the planes of the prism, but they are not too (too). The colour is usually reddish-brown, though yellowish in the very fine needles, and black in the ferruginous varieties ("nigrine" and "ilmenorutile"): the streak is pale brown. The name rutile, given by A. G. Werner in 1803, refers to the colour, being from the Latin rutillus (red). Crystals are transparent to opaque, and have a brilliant metallic-adamantine lustre. The hardness is 6½ and the specific gravity 4.2, ranging, however, up to 5.2 in varieties containing 16% of ferric oxide. The refractive indices and the positive birefringence are high.

Rutile occurs as a primary constituent in eruptive rocks, but more frequently in schistose rocks. As delicate acicular crystals it is often enclosed in mica and quartz: in mica (q.v.) it gives rise to the phenomenon of asterism; and clear transparent quartz (rock-crystal) enclosing rutile is often cut as a gem under the name of "Venus' hair stone" (Veneris crista; Phyll). Larger crystals occur in the cavities of granite and crystalline schists; very large twinned crystals have been found at Graves Mountain in Lincoln county, Georgia, and good specimens have been obtained from several places in Norway and the Swiss and Tirolese Alps. As a secondary mineral, rutile in the form of minute needles is of wide distribution in various sedimentary rocks, especially clays and slates. As rounded grains it is often met with in auriferous sands and gravels. The mineral has little economic value; it has been used for imparting a yellow colour to glass and porcelain, and for this purpose is mined at Risør and other places in Norway.

(L. J. S.)
RUTILIUS CLAUDIUS NAMATIANUS, Roman poet, flourished at the beginning of the 5th century A.D. He was the author of a Latin poem, De Reditu Sapiens, in elegiac couplets, describing a voyage from Rome to Gaul in A.D. 416. The life and excellence of the work, and the flashes of light which it throws across a momentous but dark epoch of history, combine to give it exceptional importance among the relics of late Roman literature. The poem was in two books; the exordium of the first and the greater part of the second have been lost. What remains consists of about seven hundred lines.

The author is a native of S. Gaul (Toulouse or perhaps Poitiers), and belonged, like Sidonius, to one of the great governing families of the Gaulish provinces. His father, whom he calls Lachausi, had held high offices in Italy and at the court of the Western Emperor (Seleucus or Umbrian), then imperial treasurer (comes sacrarum largitionum), imperial recorder (quaestor), and governor of the capital itself (praefectus urbi). Rutilius boasts his career to have been no less distinguished than his father's, and particularly indicates that he had been secretary of state (magister officiorum) and governor of the capital (i. 157, 427, 467, 561). After reaching manhood, he passed through the tempestuous period between the death of Theodosius (395) and the fall of the usurper Attaulus, which occurred near the date when his poem was written. He witnessed the chequered career of Stilicho as actual, though not titular, governor of the West, when the hosts of Radagaisus rolled back from Italy, only to sweep over Gaul and Spain; the defeats and triumphs of Alaric; the three sieges and final sack of Rome, followed by the marvellous recovery of the city; Heraclian's vast armament dissipated; and the fall of seven pretenders to the Western diadem. Undoubtedly the sympathies of Rutilius were with those who during this period dissented from, and when they could, opposed the general tendencies of the imperial policy. We know from himself that he was the intimate of those who belonged to the circle of the great orator Symmachus—who, it is assumed by many, orator, or elegiac, of the imperial household. As Symmachus is known to have been a partisan of the Eastern Church, it is possible that the poet also held the same views; but this assertion is not to be inferred from the poem. In the exordium the poet's attitude towards paganism is marked. The whole poem is made up of a prologue—a penitent address to a deity, feeling that all the world of literature and culture is and must remain pagan; that outside paganism lies a realm of barbarism. The poet wears an air of exalted superiority, as if it were a grand emotion of his to denounce a faith which he considers so inferior that the future of the ancient gods of Rome will not bele their glorious past. Invective and apology he scorns alike, nor troubles himself to show, with Claudian, even a grudging hand, that he could have stood face to face with the Goths, and led the Roman senate to support the pretenders Eugenius and Attaulus in the vain hope of reinstating the gods whom Julian had failed to save.

While making but few direct assertions about historical characters or events, the poet forces us important conclusions concerning the politics and religion of the time. The attitude of the writer towards paganism is remarkable. The whole poem is made up of a prologue—a penitent address to a deity, feeling that all the world of literature and culture is and must remain pagan; that outside paganism lies a realm of barbarism. The poet wears an air of exalted superiority, as if it were a grand emotion of his to denounce a faith which he considers so inferior that the future of the ancient gods of Rome will not bele their glorious past. Invective and apology he scorns alike, nor troubles himself to show, with Claudian, even a grudging hand, that he could have stood face to face with the Goths, and led the Roman senate to support the pretenders Eugenius and Attaulus in the vain hope of reinstating the gods whom Julian had failed to save.

We read in Gibbon that "Honourius excluded all persons who were adverse to the catholic church from holding any office in the state," that he "obstinately rejected the service of all those who dissented from his religion," and that "the law was applied in the utmost latitude and rigorously executed." Far different is the picture of political life impressed upon us by Rutilius. His voice is assuredly not that of a partisan of a discredited and overthrown faction. He sends the boldest of the Latin senators and Christians afterwards, whom a new breeze in politics might easily have wafted back to the old religion. Between these two sections the broad old Roman toleration reigns. Some ecclesiastical hierarchies have gradually imagined that after the sack of Rome they had the new. As a statesman, he is at pains to avoid offending those politic Christian senators over whose pride in their country had at least as great power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only to attack the monks, whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian judge had forced by thousands in the ranks of his army. Judas Rutilius could assault without wounding either pagans or Christians, but he intimates, not obscures, that he hates it chieflly as the evil root whence the rank policy of the Christians arises.

We read in Gibbon that "Honourius excluded all persons who were adverse to the catholic church from holding any office in the state," that he "obstinately rejected the service of all those who dissented from his religion," and that "the law was applied in the utmost latitude and rigorously executed." Far different is the picture of political life impressed upon us by Rutilius. His voice is assuredly not that of a partisan of a discredited and overthrown faction. He sends the boldest of the Latin senators and Christians afterwards, whom a new breeze in politics might easily have wafted back to the old religion. As a statesman, he is at pains to avoid offending those politic Christian senators over whose pride in their country had at least as great power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only to attack the monks, whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian judge had forced by thousands in the ranks of his army. Judas Rutilius could assault without wounding either pagans or Christians, but he intimates, not obscures, that he hates it chieflly as the evil root whence the rank policy of the Christians arises.

The edicto princeps is that by J. B. Pius (Bologna, 1520), and the principal editions since of the work are those by G. celebration, who held the office of the ancient senator at Rome composed of past office-holders, the majority of whom were certainly pagan still. We discern a Christian section whose Christianity was merely religious; he reviews Stilicho's life and career, and Christians afterwards, whom a new breeze in politics might easily have wafted back to the old religion. Between these two sections the broad old Roman toleration reigns. Some ecclesiastical hierarchies have gradually imagined that after the sack of Rome they had the new. As a statesman, he is at pains to avoid offending those politic Christian senators over whose pride in their country had at least as great power as attachment to their new religion. Only once or twice does Rutilius speak directly of Christianity, and then only to attack the monks, whom the temporal authorities had hardly as yet recognized, and whom, indeed, only a short time before, a Christian judge had forced by thousands in the ranks of his army. Judas Rutilius could assault without wounding either pagans or Christians, but he intimates, not obscures, that he hates it chieflly as the evil root whence the rank policy of the Christians arises.
RUTILIUS RUFUS—RUTLAND, 7TH DUKE OF

RUTILIUS Rufus, Publius. Roman statesman, orator and historian, born c. 158 B.C. He was on intimate terms with the Stoic philosopher Seneca, with whom he took part in the War (134), and he also accompanied Q. Metellus Numidicus in the campaign against Jugurtha (109). In 105 he was elected to the consulship, and restored the discipline of the army and introduced an improved system of drill. Subsequently, he went as legate to Q. Mucius Scaevola, governor of Asia. By assisting his superior in his efforts to protect the provincials from the extortion of the publicani, or farmers of taxes, Rufus incurred the hatred of the equestrian order, to which the publicani belonged. In 92 he was charged with the very offence of extortion which he had done his utmost to prevent. The charge was absurd, but as the jurors at that time were chosen from the publicani, the sentence was only to be expected. Rufus accepted the verdict with the resignation befitting a Stoic and pupil of Panaetius. He retired to Mytilene, and afterwards to Smyrna, where he spent the rest of his life, and where Cicero saw him as late as the year 78. Although invited by Sulla to return to Rome, Rufus refused to do so. It was doubtless during his stay at Smyrna that he wrote his autobiography and a history of Rome in Greek, part of which is known to have been devoted to the Numantine War. He possessed a thorough knowledge of law, and wrote treatises on that subject, some fragments of which are quoted in the Digesta. He was also well acquainted with Greek literature.

Sir Cicero, Pro Fonteio, 17, Brutus, 20, 310. Livy, epit. 70; Macrobius, Sat. i. vii. 34; Appian, Hist. 88; Athenaeus iv. p. 168; W. H. Sutherland, De Romanis Antiquitatis (Leiden, 1846); H. Peter, Hist. Rom. Reliquiae, t. cclxi.—cclxxviii. (life), frags. p. 187; A. H. J. Greenidge, Hist. of Rome, i. p. 484.

RUTLAND, EARLS AND DUKES OF. The 1st earl of Rutland was Edward Plantagenet (1373-1415), son of Edmund, Duke of York, and grandson of King Edward III. In 1390 he was created earl of Rutland, but was to hold the title only during the lifetime of his father, on whose death in 1402 the earldom accordingly became extinct, the earl then becoming Duke of York. The title earl of Rutland seems to have been assumed subsequently by different members of the house of York, though it does not appear that any of them had a legal right to it. One of these was the 1st earl's nephew, Richard Plantagenet, Duke of York, father of King Edward IV. Richard's daughter Anne married for her second husband Sir Thomas St Leger, and their daughter Anne married George Manners, 1st Baron Ros, or Roos (d. 1533). Their son, Thomas Manners (d. 1543), was therefore great-grandson of Richard Plantagenet, who had styled himself earl of Rutland among other titles. In 1525 Thomas Manners was created earl of Rutland, and his descendants have held this title ever since. Rutland was a favourite of Henry VIII., who conferred on him many offices and extensive grants of land, including Belvoir Castle, in Leicestershire, which became henceforth the chief residence of his family. He was succeeded in the earldom by his son Henry (c. 1516-1563); and his second son, Sir John Manners, acquired Haddon Hall, Derbyshire, by his marriage with Dorothy, daughter of Sir George Vernon, called "the king of the Peak." Henry, the 2nd earl, was an admiral of the fleet in the reign of Queen Mary, and later enjoyed the favour of Queen Elizabeth. His son Edward, 3rd earl (c. 1545-1587), who was also a favourite with Elizabeth, left no sons, and the barony of Ros, which had hitherto descended with the earldom, passed to his daughter Elizabeth (d. 1591), wife of William Cecil, Earl of Exeter; his successor in the earldom was his brother John (d. 1588), whose son Roger, 5th earl (1576-1612), married a daughter of Sir Philip Sidney. The barony of Ros was restored to the main line of the family in the person of Francis, 6th earl (1578-1624), who inherited it in 1618 as heir general of his cousin William Cecil, Lord Ros (1590-1618); but it was again separated from the earldom of Rutland on the death of Francis without male issue, and the assumption of the courtesy title of Lord Ros by the eldest son of subsequent earls of Rutland appears to have had no legal basis.

The 8th earl, a cousin of his predecessor and also of the 6th earl, was John (1604-1679), eldest son of Sir George Manners the elder, descendent of Sir John Manners, the second son of the 1st earl. His son John, 9th earl (1638-1715), a partisan of the revolution of 1688, received the Princess Anne at Belvoir Castle on her flight from London; after the accession of Anne to the throne she created him marquess of Granby and duke of Rutland in 1703. The 1st duke was three times married; the divorce in 1670, while he was still known as Lord Ros, of his first wife, Anne, daughter of the marquess of Dorchester, was a very celebrated legal case, being the first instance of divorce a vinculo by act of parliament, a divorce a mensa et thoro having previously been granted by the ecclesiastical courts. His grandson John, the 3rd duke (1696-1779), was the father of Abdallah Granby, the soldier, whose son Charles, 4th duke of Rutland (1754-1787), succeeded his grandfather. When marquess of Granby he represented Cambridge University in the House of Commons, and hotly opposed the policy that led to war with the American colonies. He was instrumental in procuring the entrance of the younger Pitt to the House of Commons, and remained through life an intimate friend of that statesman. After succeeding to the dukedom in 1779, he sat in the cabinets of Shelburne and of Pitt, and became lord lieutenant of Ireland in 1784. He was one of the earliest to advocate a legislative union of Ireland and England, and, with Lord Melbourne, was invited by the Prince of Wales to write a letter to Pitt in June 1784. The poet Crabbe was for some time private chaplain to the duke at Belvoir. His wife, Mary Isabella (1756-1831), "the beautiful duchess," whose portrait was four times painted by Sir Joshua Reynolds, was a daughter of the 4th duke of Beaufort. His eldest son, John Henry, 5th duke (1778-1857), was the "duke" in Disraeli's Coningsby; the latter's two sons, the marquess of Granby and Lord John Manners, figuring in the same novel as "the marquis of Beaumanoir" and "Lord Henry Sidney" respectively. Both these sons succeeded in turn to the dukedom, Lord John Manners succeeding his brother Charles Cecil John, the 6th duke (1815-1885), as 7th duke of Rutland (see below) in 1888. In 1891 he was made a knight of the Garter, being the tenth earl and the sixth duke of Rutland of the same creation to wear this illustrious order.

RUTLAND, JOHN JAMES ROBERT MANNERS, 7TH DUKE OF (1818-1906), English statesman, was born at Belvoir Castle on the 13th of December 1818, being the younger son of the 5th duke of Rutland by Lady Elizabeth Howard, daughter of Byron's guardian, the 5th earl of Carlisle. Lord John Manners, as he then was, was educated at Eton and Trinity College, Cambridge. In 1841 he was returned for Newark in the Tory interest, along with W. E. Gladstone, and sat for that borough until 1847. Subsequently he sat for Colchester, 1850-57; for North Leicestershire, 1857-58; and for East Leicestershire from 1885 until in 1888 he took his seat in the House of Lords upon succeeding to the dukedom.

Melbourne's Whig government had been doomed for some time before it went out in June 1841. The Tories came in with a large majority under Peel, and among Manners's friends who were successful in the constituencies, besides Gladstone, were Smythe, afterwards 7th Viscount Strangford, at Canterbury; Baillie-Cochrane, afterwards 1st Lord Lamington, at Bridport; and Disraeli at Shrewsbury. Cherishing many of the ideas of the cavaliers of the 17th century, and full of political and literary ardour, Lord John was soon prominent in the social group which revolved round Lady Blessington. In 1841 he committed some of his loyalist and other fancies to a volume called England's Trust, and other Poems, which he dedicated to his friend Smythe, and in which occurred the familiar line about "laws and learning" and "our old nobility." Before the end of this year Manners had definitely associated himself with the "Young England" party, under the leadership of Disraeli. This party sought to extinguish the predominance of the middle-class bourgeoisie, and to re-create the political prestige of the aristocracy by resolutely proving its capacity to ameliorate the social, intellectual, and material condition of
the peasantry and the labouring classes. At the same time its members looked for a regeneration of the Church, and the rescue of both the Church and Ireland from the trammels inherited from the Whig predominance of the 18th century. Manners made an extensive tour of inspection in the industrial parts of N. England, in the course of which he and his friend Smythe expounded their views with a brilliance which frequently extorted compliments from the leaders of the Manchester school. In 1843 he supported Lord Grey's motion for an inquiry into the condition of England, the serious disaffection of the working classes of the north being a subject to which he was constantly drawing the attention of parliament. Among other measures that he urged were the disestablishment of the Irish Church, the modification of the Mortmain Acts, and the resumption of regular diplomatic relations with the Vatican. In the same year he issued in pamphlet form a strong Plea for National Holydays. In 1844 Lord John vigorously supported the Ten-hours Bill, which, though strongly opposed by Bright, Cobden, and other members of the Manchester school, was ultimately passed in May 1847. In October during that year he took part in, and spoke at, the brilliant festival held at the Equestrian statue of Disraeli. A few days later he and his friends attended a festival at Bingley, in Yorkshire, to celebrate the allotment of land for gardens to working men, a step which, through the agency of his father, he had done a great deal to further. About the same time Smythe dedicated to him his Historic Fancies as to "the Sir Philip Sidney of our generation." Manners figured as Lord Henry Sidney in Disraeli's Coningsby, and not a few of his ideas are represented as those of Egremont in Sybil and Waldersha in Endymion. But the disruption of the Young England party was already impending. Lord John's support to Peel's decision to increase the Maynooth gratuity in 1845 led to a difference with Disraeli. Divergences of opinion with regard to Newman's secession from the English Church produced further deflections in the ranks, and the rupture was completed by Smythe acquiescing in Peel's conversion to Free Trade. Lord John produced another volume of verse, known as English Ballads, chiefly patriotic and historical, in 1850. In the same year he wrote the letterpress for an atlas of coloured views by J. C. Schetky; and he published several pamphlets, one on the Church of England in the Colonies, in 1857. During the three short administrations of Lord Derby (1852, 1858, and 1866) he sat in the Commons as a commissioner of the office of works. On the return of the Conservatives to power in 1874 he became postmaster-general in Disraeli's administration, and was made G.C.B. on his retirement in 1880. He was again postmaster-general in Lord Salisbury's administration, 1885-86, and was head of the department when sixpenny telegrams were introduced. Finally, in the Conservative government of 1886-92 he was chancellor of the duchy of Lancaster. He had succeeded to the dukedom of Rutland in March 1888, upon the death of his elder brother. He died on the 4th of August 1906 at Belvoir Castle.

Rutland was succeeded as 8th duke by his eldest son (b. 1859) who had been Conservative M.P. for the Melton division of Leicestershire from 1888 to 1895; and whose wife, as marchioness of Granby, became well known as a clever artist, a volume of her Portraits of various distinguished men and women being published in 1899.

Rutland, a midland county of England, bounded N. and E. by Lincolnshire, N. and W. by Leicestershire, and S.E. by Northamptonshire. It is the smallest county in England, having an area of 1,525 sq. m. The surface is pleasantly undulating, ridges of high ground running E. and W., separated by rich valleys. The principal of these valleys is the vale of Catmose, in the S.W. district, to the N. of which rises a tableland commanding wide views into Leicestershire. The vale maintains its reputation for richness of soil assigned to it by Drayton in his Poly-Olbion. This, the N.W. part of the county, is also the district of the well-known Cottesmore Hunt. The royal forest of Lyfield, or Leafield, which included the greater part of the hundreds of Oakham and Martinsley, once extended over the county between Oakham and Uppingham, and patches of it still exist. To the S. of Uppingham it was known as Beaumont Chase. The river Welland, flowing N.E., forms the S.E. boundary of Rutland with Northamptonshire. The Gwash, or Wash, which rises in Leicestershire, flows eastward through the centre of the county, and just beyond its borders in Lincolnshire joins the Welland. The Chater, also rising in Leicestershire, flows southward to join the Welland about 2 m. from Stamford. The Eye, forming part of the S.W. boundary, is also tributary to the Welland.

Geology.—The county consists entirely of Jurassic formations, viz. of Liassic and Oolitic strata—the harder beds, chiefly limestone containing iron, forming the hills and escarpments, and the clay-rising in Leicester and Rutland are chiefly of the Middle Lias, and belong to the Lower Lias in the N.W. The bottom of the vale of Catmose is formed of marlstone rock belonging to the Middle Lias, and its sides are composed of long slopes of Upper Lias clay. The Upper Lias covers a large area in the W. of the county, and is worked for bricks at Luffenham and Seaton. The lowest of the Oolitic formations is the Northampton sand, which has yielded iron ore at Marton and Cottesmore. The Lincolnshire Oolite limestone contains a small amount of iron, and is worked at Westwood for building purposes, the quarries at Ketton, Clipsham, and Caserton being famous beyond the boundaries of the county. Rutland and Oolite of the Caen and S.E. Oolite, being chiefly limestone, and S.W. Gravel deposits of boulder clay, sand and gravel, mask the older strata in many places.

Industries.—In the E. and S.E. districts the soil is light and sandy, and is the chief medium for cotton manufactures but fertile loam, and in the vale of Catmose the soil is either clay or loam, or a mixture of the two. The prevailing redness, which colours even the streams, is owing to the ferruginous limestone carried down from the slopes of the hills. The name of the county is by some authorities derived from this characteristic of the soil, but the explanation is doubtful. The E. of the county is chiefly under tillage and the W. in grass. Nearly nine-tenths of the total area (a high proportion) is under cultivation, wheat being by far the most important grain crop. Turnips and swedes occupy the greater part of the area under green crops. The rearing of sheep (Leicesters) and pigs (Dorsets and Long Horns) and cattle (Southdowns) occupies the chief attention of the farmer. Large quantities of cheese are manufactured and sold as Stilton. Agriculture is practically the only industry of importance, but there is some quarrying and boot-making.

The county is, in the diocese the oldest rocks and is one of the southern counties, with 42 ecclesiastical parishes or districts, wholly or in part. It returns one member to parliament.

History.—The district which is now Rutland was probably occupied by a tribe of Middle Angles in the 6th or 7th century, and was subsequently absorbed in the kingdom of Mercia. Although mentioned by name in the will of Edward the Confessor, who bequeathed it to his queen Edith for life with the remainder to his son William, it was not held as a county at the time of the Domesday Survey, in which term Rutland is only applied to that portion assessed under Nottinghamshire, while the S.E. portion of the modern county is surveyed under Northamptonshire, where it appears as the wapentake of Wiceslea. Rutland is first mentioned as a distinct county under the administration of a separate sheriff in the pipe roll of 1239, but as late as the 14th century it is designated "Rutland Soke" in the Vision of Piers Plowman, and the curious connexion with Nottinghamshire, a county which does not adjoin it at any point, was maintained up to the reign of Henry III, when the sheriff of Nottingham was by statute appointed to sit in the central parts of the county. In the north-western counties of Rutland, Alstoe and Martinsley appear in the Domesday Survey of Nottinghamshire as wapentakes, Martinsley at that date including the modern hundred of Oakham Soke; East hundred
and Wranglike hundred are mentioned in the middle of the 12th century, the latter formerly including the additional hundred of Little Casterton. The shire-court for Rutland was held at Oakham.

Rutland was originally included in the diocese of Lincoln, and in 1201 formed a rural deanery within the archdeaconry of Northampton; but on the erection of Peterborough to an episcopal see by Henry VIII. in 1541, the archdeaconry of Northampton, with the deanery of Rutland, was transferred to that diocese. In 1579 the deanery of Rutland was subdivided into three portions, and in 1576 it was placed within the newly-founded archdeaconry of Oakham.

Among the most conspicuous of the Norman lords connected with this county was Walkelin de Ferrers, who founded Oakham Castle about the 12th century. The castle was subsequently bestowed by Richard II., together with the ealdom of Rutland (see above), on Edward, son of Edmund, duke of York. Essenidine (Essenden or Essington) was purchased in 1545 by Richard Cecil of Burleigh, and the title of baron of Esseniden bestowed on his grandson is retained by the earls of Salisbury.

Sir Everard Digby, one of the conspirators in the Gunpowder plot, belonged to the family of Digby, of Stoke Dry. Burley-on-the-hill was held by Henry Despenser, the warlike bishop of Norwich, in the reign of Richard II., and was purchased by George Villiers, duke of Buckingham, who entertained James I. there as his castle.

The battle of Stamford was fought at Horn, near Exton, in March 1470 between Edward IV. and the Lancastrians, when from the precipitate flight of the latter the engagement became known as Losecoat Field. On the outbreak of the Civil War Rutland displayed a strong puritanical and anti-royalist sentiment, and in 1642 the sheriffs and a large number of the gentry and nobility of the county forwarded a petition to the House of Lords begging that the county might be placed in a state of defence, and that the votes of papists and prelates might be disallowed; and again, in 1648, a memorial addressed to Lord Fairfax protested against the design of the parliament to treat with Charles.

Rutland has always been mainly an agricultural county. The Domesday Survey mentions numerous mills in Rutland, and a fishery at Ayston rendered 325 eels. In the 14th century the county exported wool. Stillton cheese has long been made in Leyfield Forest and the vale of Catmose, and limestone is dug in many parts of the county. The development of the economic resources of Rutland was helped in 1703 by the extension of the Melton Mowbray canal to Oakham.

Two members were returned to parliament for the county of Rutland from 1295 until under the Redistribution of Seats Act of 1885 the representation was substantially reduced. The only old castle of which there are important remains is Oakham, dating from the time of Henry II. and remarkable for its Norman Hall. Of Essenden Castle only the moat remains. The Bede-house at Liddington dates from the end of the 14th century. Hambleton Hall, now a farm-house, is a good specimen of Jacobean architecture. Many old houses of the 17th and 18th centuries are to be met with in the villages. An interesting feature of the ecclesiastical architecture of the country is the frequent continuation of the round-headed arch after the Early English style had become fully developed; as, for instance, in the Early English churches at Great Casterton, Stoneby and Empingham, Clipham (Early English and Decorated), and St Peter's, Preston, where the nave arcade is Norman on one side and Early English on the other, but yet retains round-headed arches on both sides. Tickencote church is a remarkable specimen of late Norman work, with one of the finest chancel-arches extant in this style. Ketton church is transitional Norman, Early English, and early Decorated, the broach spire being of later date. St Mary's, Greetham, is a good example of Decorated with fine tower and spire.

See Victoria County History, Rutland: James Wright, History and Antiquities of the County of Rutland (London, 1864); T. Blore, History and Antiquities of the County of Rutland, vol. i., pt. 2 (containing the East hundred and including the hundred of Casterton Parva; Stamford, 1811); C. G. Smith, A Translation of that portion of Domesday Book which relates to Lincolnshire and Rutland (London, 1870).

Rutland, a city and the county seat of Rutland county, Vermont, U.S.A., on Otter creek, about 67 m. S. by E. of Burlington. Pop. (1900) 11,499, of whom 1533 were foreign-born; (1910 census) 13,546. Area, 8½ sq. m. It is served by the Delaware & Hudson (being a terminus of one of its branches) and the Rutland (New York Central) system railways. It is pleasantly situated within sight of the Green Mountains. Among its public buildings and institutions are the United States Government Building, the State House of Correction, the Rutland Free Library (1886, with 17,500 volumes in 1908), the H. H. Baxter Memorial Library, a Memorial Hall, the County Court House, the City Hall, and the City Hospital. The famous Rutland marble is quarried in W. Rutland (pop. in 1910, 3427 and Proctor (pop. in 1910, 2871), which were parts of the township of Rutland until 1886. In 1905 the value of the city's factory products was $2,522,856 (28-5% more than in 1900). Rutland was incorporated as a city by New Hampshire in 1761 to John Murray of Rutland, Massachusetts, and about the same time it was granted (as Fairchild) by New York. No settlement was made until 1770, and in 1772 the place was again granted by New York under the name of Socialborough. From 1784 to 1804 Rutland was one of the capitals of Vermont and the Capitol, built in 1784, is the second oldest building in the state. The Rutland Herald, one of the oldest newspapers in Vermont still published, was established as a Federalist weekly in 1794—a daily edition first appeared in 1861, and is now Republican. In 1847 the village of Rutland was incorporated, and in 1876 a portion of the township including the village was chartered as a city.

Rutledge, John (1739–1800), American jurist and politician, was born in Charleston, South Carolina, in 1739. He studied law in London and began to practise in Charleston in 1761. He was a delegate to the Stamp Act Congress in 1765, and to the Continental Congress in 1774–77 and 1782–83; he was chairman of the committee which framed the state constitution of 1776, and the first "president" (governor) of South Carolina in 1777–78. Disapproving of certain changes in the constitution, he resigned in 1778, but was elected governor in the following year, and served until 1782. From 1782 to 1789 he was a member of the state court of chancery. In the Constitutional Convention of 1787 he urged that the president and the Federal judges should be chosen by the national legislature, and preferably by the Senate alone, and that the president should be chosen for a term of seven years, and should be ineligibale to succeed himself. Rutledge championed the Constitution in the South Carolina convention by which that instrument was adopted on behalf of the state. He was associate justice of the United States Supreme Court in 1789–91, and chief justice of the supreme court of South Carolina in 1791–95. Nominated chief justice of the Supreme Court of the United States in 1795, the president, during the August term, but the Senate refused to confirm his nomination, apparently because of his opposition to the Jay Treaty. His mind failed late in 1795, and he died in Charleston on the 23rd of July 1800.

His brother, Edward Rutledge (1749–1800), a signer of the Declaration of Independence, was born in Charleston on the 23rd of November 1749. He studied law in his brother's office, and in London in 1769–73, and began to practise in Charleston in 1773. He served in the Continental Congress in 1774–77, and was sent with John Adams and Benjamin Franklin to confer on terms of peace with Lord Howe on Staten Island in September 1776. As captain of artillery and later as lieutenant-colonel he served against the British in South Carolina in 1779–80; but he was captured near Charleston in 1780, and was imprisoned at St Augustine, Florida, for a year. He was a member of the state legislature from 1782 to 1798, and in 1791 drafted the act which abolished primogeniture in South Carolina. From 1798 until his death in Charleston, on the 23rd of January 1800, he was governor of South Carolina.

Rutley, Frank (1842–1904), English geologist and petrographer, was born at Dover on the 14th of May 1842. He was educated partly at Bonn, but his interest in geology was kindled at the Royal School of Mines, where he studied from 1863–64; he then joined the army, and served as lieutenant until 1867,
when he became an Assistant Geologist on the Geological Survey. Working then in the Lake district, he began to make a special study of rocks and rock-forming minerals, and soon qualified as acting petrographer on the Geological Survey. For several years he worked in this capacity at the Museum in Jermy Street: he described the volcanic rocks of E. Somerset and the Bristol district in 1876, and wrote special memoirs on The Eruptive Rocks of Brent Tor (1878), and on The Felicitous Laves of England and Wales (1885). He was the author of an exceedingly useful little book on Mineralogy (1874; 12th ed., 1909); also of The Study of Rocks (1879; 2nd ed., 1881), Rock-forming Minerals (1888), and Granites and Greenstones (1894); and of a number of petrographical papers, dealing with perlitic and spherulitic structures, with the rocks of the Malvern Hills, &c. In 1882 he was appointed lecturer on Mineralogy in the Royal College of Science, and held this post until ill-health compelled him to retire in 1898. He died in London on the 16th of May 1904.

Obituary (by H. B. Woodward), with bibliography, in Geol. Mag. (July 1904).

RUTULI, a people of ancient Italy inhabiting Ardea and the district round it on the coast of Latium, at no great distance from Aricia, and just W. of the territory of the Volsci. They are ranked by the form of their name with the Siculi and Appuli (Apuli), probably also with the Itali, whose real Italic name would probably have been Vituli (see Italy). This suggests that they belong to a fairly early stratum of the Indo-European population of Italy. The same is suggested by the tradition adopted or moulded by Virgil, by which the leader of the people of the soil in their resistance to the settlement of the Latin tribes is the Rutulian prince Turnus, a name which, if any conjecture could be founded on it, might be held to point rather to Eturia than to any other Italic source; hence it is generally supposed that the hospes of the exiled Etruscan king Mezentius, and as taking up arms to defend himself against his angry subjects—Pliny (iii. § 6) classifies them, with the Siculi, among the primitive tribes that at one time or another inhabited part of Latium, and it is to be observed that they are not included in the thirty Latin communities who once took part in the Latin Festival on the Alban Mount (see further Siculi).

(R. S. C.)

RUVIGNY, HENRI DE MASSUE, MARQUIS DE, afterwards EARL OF GALWAY (1649-1720), was born at Paris on the 9th of April 1648, and was the son of the 1st Marquis de Ruvigny, a distinguished Huguenot of French extraction; a little later, however, that family was neutralized, and at the battle of Neerwinden, in 1652, his father was killed. He was a distant relative of the Viscounts of Ruvigny, and was the son of Lucienne, the wife of Lord William Russell. He saw service under Turenne, who thought very highly of him. Probably on account of his English connexions he was selected in 1678 by Louis XIV. to carry out the secret negotiations for a compact with Charles II., a difficult mission, which he executed with great skill. Succeeding his father as "general of the Huguenots," he refused Louis's offer, at the revocation of the Edict of Nantes, to retain him in that office, and in 1690, having gone into exile with his fellow Huguenots, he entered the service of William III. of England as a major-general, foreseeing thereby his French estates. In July 1697 he distinguished himself at the battle of Aughrim, and in 1692 he was for a time commander-in-chief in Ireland. In November of that year he was created Viscount Galway and Baron Portarlington, and received a large grant of forfeited estates in Ireland. In 1693 he fought at Neerwinden and was wounded, and in 1694, with the rank of lieutenant-general, he was sent to command a force in English pay which was to assist the duke of Savoy against the French, and at the same time to relieve the distressed Vaudois. But in 1695 the duke changed sides, the Italian peninsula was neutralized, and Galway's force was withdrawn to the Netherlands. From 1697 to 1702, a critical period of Irish history, the Earl of Galway (he was advanced to that rank in 1697) was practically in control of Irish affairs as lord justice of Ireland. After some years spent in retirement, he was ordered in 1704 to command the allied forces in Portugal, a post which he sustained with honour and success until the battle of Almanza in 1707, in which Galway, in spite of care and skill on his own part, was decisively defeated. But he scraped together a fresh army, and, although infirm, was reappointed to his command by the home government. After taking part in one more campaign, and distinguishing himself by his personal bravery in action, he retired from active life. His last service was rendered in 1715, when he was sent as one of the lords justices to Ireland during the Jacobite insurrection. As most of his property in Ireland had been restored to its former owners, and all his French estates had long before been forfeited, parliament voted him pensions amounting to £1,500 a year. He died unmarried on the 3rd of September 1720. The English peerage died with him, but not the French marquisate.

RUVO, a town and episcopal see of Apulia, Italy, in the province of Bari, 21 m. W. of the city of that name by steam tramway, 853 ft. above sea-level. Pop. (1901) 25,245. The cathedral, a basilica with a very lofty nave (so high, indeed, that the gable of the façade is only slightly above the steep sloping roofs of the aisles, and the clerestory is very small), and with two aisles, has three apses, a square campanile and a rich façade with three portals. It belongs probably to the 7th or 8th centuries. The interior has a fine triforium; it contains some interesting frescoes of the 15th century, and is unique in Apulia in having a gallery supported by corbels round the nave (see A. Avena, Monumenti dell' Italia Meridionale, Rome, 1902, 117). S. Giovanni Rotondo is an ancient circular baptistery with two large fonts. In the Palazzo Jatta is a famous and beautiful collection of vases and coins found in the Apulian tombs around the city; part of these, however, are now to be found in the museum at Naples. The Palazzo Spinola has an interesting Renaissance court. Ruvo occupies the site of the ancient Rubi, on the Via Trajana (see APPEL, Via). Coins were issued by the city before it became Roman.

RUVENZORI, more correctly Runzaro, is to be known also as Kokora, a mountain range in Central Africa, lying just north of the equator, and intersected near its eastern edge by 30°E. It has a length of about 65 m., with a maximum breadth of about 30 m., and its highest peaks rise above the limits of perpetual snow. The range as a whole, the major axis of which runs a little east of north, falls steeply on the west to the Central African rift-valley traversed by the Semiliki, the western head-stream of the Nile, while on the east the fall is somewhat more gradual towards the highlands of western Uganda. The upper parts are separated by fairly low passes into six groups of snowy uplands, and separated by parallel ridges rising in each case more than 15,000 ft. above the sea and reaching, in the culminating point of the western group (Mount Stanley), about 16,800 ft. The origin of the range seems connected with that of the rift-valley on the west, both being due to vertical displacements of the earth's crust. Ruwenzori has been formed by an upheaval en masse of a portion of the archean floor of the continent, bounded east and west by lines of fracture, but resulting in a general dip from west to east. A further upheaval seems to have produced an elliptical anticline, causing the strata to dip outwards at a generally high angle. Traces of volcanic action are almost nonexistent. Compositions of gneisses and mica-schists offering no great resistance to denudation, in its centre the range consists of much more refractory rocks (amphibolites, diorites, diabases, &c.), to which fact, coupled with the existence of vertical fractures, the persistence and separation of the higher summits is probably due. The snow-clad area does not now extend more than ten miles in any direction, though there is abundant evidence that the glaciers were formerly far more extensive.

The upper region is almost entirely enveloped by day thick cloud, which descends on the east to about 9000 ft., and on the west is still on the ice. It sometimes lifts towards evening, giving a sight of the snowy peaks, but by 9 a.m. these have always receded.
RUYSBROEK—RUYSDAEL

947

once more been hidden. As a result, the climate is very humid, the rainfall being probably at least 100 in. annually, and the slopes are furrowed by numberless streams, the most important fed by the glaciers of the upper region, and afterwards flowing in deeply cut valleys between the outer spurs. From the innermost recesses between Mounts Stanley, Speke and Baker, the main branches of the Mubinzu ascend to the east, while the four principal streams on the west unite to form the Butaguz drainage on both sides ultimately finding its way to the Semiliki, either directly or through Lake Dweru and the Albert Edward Nyanza.

As in other ranges of Central Africa the vegetation displays well-marked zones, varying with the altitude; but owing to the lower level to which the cloud descends on the west (probably an outcome of the general climatic régime of Central Africa, as the range lies between the east African plateau and the relatively low-lying basin of the Congo), the limits of the several zones reach a lower level on the west than on the east. They have been defined as follows by Mr R. B. Woosnam of the British Museum scientific expedition of 1906-7—

Zones. Upper Limits (East Side).
Grass 6,500 ft.
Forest 8,000 ft.
Bamboos 10,000 ft.
Tree heaths 12,500 ft.
Lobelias and Senecios 14,500 ft.

above which is the summit region of snow and bare rock. The boundaries between the zones are not of course hard and fast lines, but merely indicate the levels between which the respective forms are specially characteristic, though they occur also in higher or lower zones. The forest zone is perhaps the best marked, being visible from a distance as a dark ring. On the west it merges in part with the low-lying forest of the Semiliki valley. Owing to the abundance of moisture, mosses, hepaticae and lichens are prevalent in several of the zones, and bogs, with Vaccinium and other low-growing plants, are common above the forest zone. Helichrysums are abundant in the zone immediately below the snow, where they form large bushes. The larger mammals are found chiefly on the lower slopes, but bushbuck, pigs, leopards, monkeys, a hyrax and a serval cat occur at higher altitudes. The birds include kites, buzzards, ravens, sun-birds, touracos, a large swift, and various warblers and other small kinds. The upper limit of human settlement, with cultivation of colocola and beans, has been placed at 6,700 ft.

Attempts have been made to identify the range with the "Mountains of the Moon" of Ptolemy and other ancient writers, the snows of which were thought to feed the Nile lakes. But in view of the extreme vagueness of the statements and the absence of all detailed knowledge of the geography, it is far more likely that the rumours of snowy mountains really referred to Mounts Kenya and Kilimanjaro, especially as they seem to have been obtained rather from the east coast than from the direction of the Nile. In modern times the existence of a snowy range in this part of Africa was first made known by Sir Henry Stanley during the Emin Pasha relief expedition of 1887-89, though hints of high mountains had been obtained by Stanley himself and by Romolo Gessi in 1876 and by others from the neighbourhood of the Albert Nyanza. Stanley named the main mass Ruwenzori, and outlining eastern peaks he called Mt. Gordon Bennett, Mt. Lawson, Mt. Edwin Arnold, &c.—the last named lying N.E. of Lake Dweru. Subsequently Stanley's own name was given to the chief summit. One of Stanley's followers, Lieut. Stairs, ascended the western slopes to over 10,000 ft. in 1889, and partial ascents were afterwards made by Dr Stuhlmann, Mr Scott Elliot, Mr J. E. Moore, Sir Harry Johnston, Mr Douglas Freshfield, and others. Early in 1906 some of the secondary ridges above the snow-line were scaled by Messrs Grauer, Tegart and Maddox, and by Dr Wollaston and other members of the British Museum expedition, while later in the year the duke of the Abruzzi led a well-equipped expedition, including various scientists, to the upper parts of the range, and with the help of trained Alpine guides ascended not only the culminating twin summits (which he named Margharita and Alexandra after the queens of Italy and England), but all the principal snow-clad peaks. The expedition produced for the first time a detailed map of the upper region, and threw much light on the geology and natural history of the range.

RUYSBROEK (or RUYSBROECK), JAN VAN (1203-1381), Dutch mystic, was born at Ruysbroek, near Brussels, in 1293. In 1317 he was ordained priest and became vicar of St Gudule, Brussels. When sixty years of age he withdrew with a few companions to the monastery of Groenendael, near Waterloo, giving himself to meditation and mystical writing, and to a full share of the practical tasks of the society. He was known as the "Ecstatic Teacher," and formed a link between the Friends of God and the Brothers of the Common Life, sects which helped to bring about the Reformation. Ruysbroek insisted that the soul finds God in its own depths, and noted three stages of progress in what he called "the spiritual ladder" of Christian attainment: (1) the active life, (2) the inward life, (3) the contemplative life. He did not teach the fusion of the self in God, but held that at the summit of the ascent the soul still preserves its identity. His works, of which the most important were De vera contemplatione et De septem gradibus amoris, were published in 1848 at Hanover; also Reflections from the Mirror of a Mystic (1906) and Die Zieere der geistlichen Hochzeit (1901).

See Rufus M. Jones, Studies in Mystical Religion, pp. 308-14 (1909); M. Maeterlinck, Ruysbroek and the Mystics, with selections from The Abridgment of the Spiritual Marriage (tr. by J. T. Stoddart, London, 1894); and art. MYSTICISM.

RUYSDAEL (or RUISDAEL), JACOB VAN (c. 1628-1688), the most celebrated of the Dutch landscapists, was born at Haarlem. He appears to have studied under his father Izask Ruysdael, a landscape painter, though other authorities make him the pupil of Berghem and of Albert van Everdingen. The earliest date that appears on his paintings and etchings is 1645. Three years later he was admitted a member of the guild of St Luke in Haarlem; in 1659 he obtained the freedom of the city of Amsterdam, and in 1668 his name appears there as a witness to the marriage of Hobema. During his lifetime his works were little appreciated, and he seems to have suffered from poverty. In 1681 the sect of the Mennonites, with whom he was connected, petitioned the council of Haarlem for his admission into the almshouse of the town, and there the artist died on the 14th of March 1682.

The works of Ruysdael may be studied in the Louvre and the National Gallery, London, and in the collections at the Hague, Amsterdam, Berlin, and Dresden. His favourite subjects are simple woodland scenes, similar to those of Everdingen and Hobema. He is especially noted as a painter of trees, and his rendering of foliage, particularly of oak leaflage, is characterized by the greatest spirit and precision. His views of distant cities such as those of Haarlem in the possession of the Marquess of Bute, and that of Katwijk in the Glasgow Corporation Galleries, clearly indicate the influence of Rembrandt. He frequently paints coast-scenes and sea-pieces, but it is in his rendering of lonely forest glades that we find him at his best. The subjects of certain of his mountain scenes seem to be taken from Norway, and have led to the supposition that he had travelled in that country. We have, however, no record of such a journey, and the works in question are probably merely adaptations from the landscapes of Van
Everdingen, whose manner he copied at one period. Only a single architectural subject from his brush is known—an admirable interior of the New Church, Amsterdam, in the possession of the marquess of Bute. The prevailing hue of his landscapes is a full rich green, which, however, has darkened with time, while a clear grey tone is characteristic of his seascapes. The art of Ruisdael, while it shows little of the scientific knowledge of later landscapists, is sensitive and poetic in sentiment, and direct and skilful in technique. Figures are sparingly introduced into his compositions, and such as occur are believed to be from the pencils of Adrian van de Velde, Philip Wouwerman, and Jan Lingelbach.

Unlike the other great Dutch landscape painters, Ruisdael did not aim at a pictorial record of particular scenes, but he carefully thought out and arranged his compositions, introducing into them an infinite variety of subtle contrasts in the formation of the clouds, the plants and tree forms, and the play of light. He particularly excels in the painting of cloudy skies which are spanned dome-like over the landscape, and determine the light and shade of the objects.

Characteristic of his early period, from about 1646 to 1653, is the choice of very simple motifs and the careful and labious study of the details of nature. The time between his departure from Haarlem and his settling at Zierikzee was a fruitful period. He may have spent it travelling and helped him to gain a broader view of nature and to widen the horizon of his art. Mr Otto Beit owns a magnificent view of the "Castle of Bentheim," dated 1654, from which it may be concluded that his wanderings extended to Germany. In his last period, from about 1675 onwards, he shows a tendency towards overcrowded compositions, and affects a darker tonality, which may partly be due to the use of thin paint on a dark ground. Towards the end, in his leaning towards the romantic mood, he preferred to draw his inspiration from other masters, instead of going to nature direct, his favourite subject being rushing rivers and waterfalls and ruined castles on mountain crests, which are frequently borrowed from the Swiss views by Roghman.

Ruisdael etched a few plates, which were reproduced by Amand Durand in 1878, with text by Georges Duplessis. The "Cornfield" and the "Travellers" are characterized by M. Duplessis as prints of a high order which may be regarded as the most characteristic expressions of landscape art in the Low Countries.

RYAN, Lacy (1694–1760), English actor, appeared at the Haymarket about 1709. By 1718 he had joined the company at Lincoln's Inn Fields, where he shared the lead with his friend Quin. In 1732 he followed the company to Covent Garden, and there he remained until his death. Iago, Cassius, Edgar (in The Winter's Tale), and Hamlet have long been popular characters. He played a number of comic roles, and in 1751, as the chief trial advocate and assessor in the case of John Ker, he gained a wide repute as a lawyer.

RYAZAN, a government of central Russia, bounded by the governments of Moscow and Tula on the W., by Vladimir on the N., and by Tambov on the E. and S., with an area of 16,250 sq. m. Ryazan is an intermediate link between the central Great Russian governments and the steppe governments of the S.—the wide and deep valley of the Oka being the natural boundary between the two. On the left of the Oka the surface often consists of sand, marshes and forests; while on the right the fertile black-earth prairies begin, occupying especially the districts of Ranenburg, Sapozhok and Dankov. The whole of Ryazan is covered by a great forest, which is drained by the river-valleys and numerous ravines. Iron-ores, limestone, grindstone grits, potters' clays, and thick beds of peat are worked, besides coal. The N. belongs to the forest regions, and, notwithstanding the wholesale destruction of forests, these (chiefly coniferous) in several districts still cover one-third of the surface. In the S., where the proximity of the steppes is felt, they are much less extensive, the prevailing species being oak, birch, and other deciduous trees. Altogether forests cover about one-fifth of the total area. The Oka is the chief river; it is navigable throughout, and receives the navigable rivers Pnya and Pfa, besides a great many smaller streams utilized for floating timber. Steamer ply on the Oka to Kasimov and Nizhni-Novgorod. The Don belongs to Ryazan in its upper course only. On the whole, the S. districts are well watered. Small lakes are numerous in the broad depression of the Oka and elsewhere, while extensive marshes occur in the N.E. districts; a few attempts at draining some of these beside the Oka have resulted in the reclamation of excellent pasture lands. The climate is a little warmer than at Moscow, the average temperature at the city of Ryazan being 40°; February, 3°-2°; July, 67°.

The estimated population in 1906 was 2,100,000, and is nearly Great Russian throughout, containing only a trifling admixture of Tatars, Poles and Jews in towns. Some Tatars immigrated into the Kasimov region in the 15th century, and are noted for their honesty of character as well as for their agricultural prosperity. The people of the Pra river are described as Meshcheryaks, but their manners and customs do not differ from those of the Russians. The chief occupation is agriculture. Out of the total area only 5% is unfit for tillage, and between 50 and 60% is under crops; although the area under cultivation and the crops is extensive, yet the land is only one of the wealthiest governments of Russia, the situation of the peasants is far from satisfactory. Live-stock breeding is rapidly falling off on account of want of pasture lands, but hay, which is abundant, especially on the rich meadow lands of the Oka, is exported. More than half of the land (52%) is owned by the village community, 40% by private owners, 5% by the crown, and 2% by various institutions. During the last thirty years of the 19th century the nobles sold 36% (1,261,000 acres) of their lands, mainly to merchants and peasants; the latter cultivate two-thirds of the total cultivated area.

The principal crops are oats, rye and potatoes, with wheat, barley, buckwheat, flax, hemp, tobacco, hops and fruit. But the most characteristic crop is the production of tobacco, hops, vegetables and fruit, however, are grown for export. Bee-keeping is developing and manufactures increasing, the factories being chiefly cotton and flax mills, flour mills, machine works, soap works, cement, glass and match factories, distilleries, and chemical works.

The government is divided into twelve districts, the chief towns of which are Ryazhsk, Dankov, Prusnol, Ranenburg, Ryazhsk, Sapozhok, Skopin, Spask and Zarinsk. Small industries, such as boat-building, the preparation of pitch and tar, the making of wooden vessels and sledges, matting and boot-making, are carried on in the villages, especially in the N., which belongs, properly speaking, to the Vladimir industrial region. Domestic trades, such as lace-making (supported by two schools) and embroidery on leather, give occupation to 40,000 women. Trade, especially in corn and manufactured goods, is brisk, and has been stimulated by the opening of coal-mines, e.g. in the district of Skopin. Considerable efforts have been made by the local governing bodies to increase the number of schools. Most interesting archaeological remains have been discovered in Ryazan, and have been placed in the new museum at the city of Ryazan.

The Slavs began to colonize the region of Ryazan as early as the 9th century, penetrating thither both from the north (Great Russians) and the south (Cossacks). As early as the 10th century the principality of Murom and Ryazan is mentioned in the chronicles. During the following centuries this principality increased both in territory and wealth, the liberties of the nobles being confirmed by the governments of Kaluga and Moscow. Owing to the fertility of the soil, its Russian population rapidly increased, while the Finnish tribes which formerly inhabited it migrated farther E., or became merged among the Slavs. The Mongol invasion of 1239-42 stopped all development. The principality, however, still continued to exist; its princes strongly opposed the annexation by Moscow, making alliance with the Mongols and with Lithuania, but finally succumbed in an attack in 1382, but continued to be the chief town of the principality only until the 14th century. In the 11th century one of the Kiev princes founded, on the banks
RYAZHK—RYE

of a small lake, a fort which received the name of Pereyaslav-Ryazansky. In 1194 (or in 1335) the bishop of Murom, compelled to leave his own town, settled in Pereyaslav-Ryazansky. The princes of Ryazan followed his example, and by and by completely abandoned the old republican town of Ryazan. In 1314 Vitovt, prince of Lithuania, took it, and in the following year the town was taken by the Moscow prince. It continued, however, to be the residence of the Ryazan princes until 1517. In 1565 and 1577 it was plundered and burned by the Tatars, but in 1600, 1513, 1521 and 1564 it was strong enough to repel them. Earthen walls with towers were erected after 1301; and in the 17th century a kreml or citadel still stood on the high crag above the Trubezh.

RYAZHK, a town of Russia, in the government of Ryazan, 72 m. by rail S. of the city of Ryazan. Pop. (1897) 12,993. It is one of the chief railway junctions of Russia, where meet the lines from Moscow and other Russian points, from Poland to Samara and Siberia. It has become a centre for all the corn-growing regions of Russia, and is a wealthy place.

Rybinsk, or Rubezhsk, a town of Russia, in the government of Yaroslavl, 60 m. by river N.W. of Yaroslavl. It is connected by rail (186 m.) with Bologoye, on the line between St Petersburg and Moscow. It derives its importance from its situation on the Volga, opposite the mouth of the Shesna, which connects the Volga with the regions around Lake Ladoga. Rybinsk has also an active trade in agricultural products from the neighbouring districts. The permanent population, which was 25,223 in 1897, is increased in the summer by nearly 100,000 workers from different parts of Russia.

RYDBERG, ABRAHAM VIKTOR (1828–1893). Swedish author and publicist, was born in Jönköping on 18th December 1828. He was educated at the high school of Växjö, and passed on to the university of Lund in 1851. While at school he was publishing verse and prose in the periodicals; some of these early miscellanies he collected in 1894 in the volumes called Varia. As a student he turned to more precise labours, and devoted himself to science. He had almost determined to adopt the profession of an engineer, when he was offered in 1855 a post on the staff of one of the largest Swedish newspapers. This caused his thoughts to return to imaginative literature, and it was in the feuilleton of this journal (the Göteborgs Handels-och sjöfartstidningen) that Viktor Rydberg's romances successively appeared; he was editorially connected with it until 1876. The Freebooter on the Baltic (1857) and The Last of the Athenians (1859) gave Rydberg a place in the front rank of contemporary novelists. It was a surprise to his admirers to see him presently turn to theology, but with The Bible's Teaching about Christ (1869), in which the aspects of modern Biblical criticism were first placed before Swedish readers, he enjoyed a vast success. He followed this up by a number of volumes. Ro the popular philosophy of religion, all inspired by the same reverent and yet searching spirit of inquiry. The modernity of his views led to his being opposed by the orthodox clergy, but by the wider public he was greatly esteemed. Nevertheless, it is said that it was his religious criticism which so long excluded him from the Swedish Academy, since he was not elected until 1877, when he had long been the first living author of Sweden. Roman Days is a series of archaeological essays on Italy (1876). He collected his poems in 1883; his version of Faust dates from 1876. In 1884 he was appointed professor of ecclesiastical history at Stockholm. He died, after a short illness, on the 22nd of September 1895. In defence of Rydberg Swenson was a writer of the first order, who carried on the tradition of Boström and Geijer in philosophy and history, and possessed in addition a glow of imagination and a marvellous charm of style. He was an idealist of the old romantic type which Sweden had known for three-quarters of a century; he was the last of that race, and perhaps, as a mere writer, the greatest. In personal character Rydberg was extremely like his writings—stately, ardent and ceremonious, with a fund of amiability which made him universally beloved. His premature death was the subject of national mourning, and had even a historical significance, for with him the old romantic influence in Swedish literature ceased to be paramount. (E. G.)

RYDE, a municipal borough and watering-place in the Isle of Wight, England, 5 m. S.S.W. of Portsmouth. Pop. (1911) 4,745. It is beautifully situated on rising ground on the N.E. coast, overlooking Spithead. It occupies the site of a village called La Rye or La Riche, which was destroyed by the French in the reign of Edward II. About the close of the 18th century it was a small fishing hamlet, but it rapidly grew into favour as a watering-place. Ryde is connected by rail with the other towns in the island, and there is also steamboat communication with Portsmouth, Southampton, Southsea, Portsea and Stoke’s Bay. The pier, built originally in 1812, but since then greatly extended, forms a delightful promenade half a mile in length. The railway trains run out to its head, with a round tower on each side, known as the Land Gate, erected for the wife of Sir Gilbert Scott, and other churches, the market house and town hall, the Royal Victoria Yacht club-house, the theatre and the Royal Isle of Wight Infirmary. There are golf-links near the town. The town was incorporated in 1868, and is governed by a mayor, 6 aldermen and 18 councillors. Area, 819 acres.

Rye, a market town and municipal borough in the Rye parliamentary division of Sussex, England, 11 m. N.E. by E. from Hastings, on the South-Eastern & Chatham railway. Pop. (1901) 3900. It rises on a sharp eminence above the S. of Romney Marsh, which within historic times was an inlet of the English Channel. The sea began to recede in the 16th century, and now the river Rother forms a small estuary with its mouth 2 m. from the town; this serves as a small harbour with a depth of 15 ft. at high tide, and there is some trade in coal, grain and timber. Fishing and shipbuilding are carried on, and there is a market for sheep (which are pastured in great numbers on the marshes), wool, grain and hops. The church of St Mary is of mixed architecture, chiefly Transitional, Norman and Early English; it is cruciform, with a low central tower. Of the old fortifications there remain portions of the town wall, a strong quadrangular tower built by William of Ypres, earl of Kent, and lord warden in the time of Stephen, and now forming part of the police station, and a handsome gate with a round tower on each side, known as the Land Gate, at the entrance into Rye from the London road. Picturesque old houses are numerous. In the low land S. of the town stands Camber Castle, one of the coastal defensive works of Henry VIII. In the vicinity are golf-links, to which a steam tram runs from the town. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 983 acres.

In the time of Edward the Confessor, Rye (Ria, Ryeport, La Rie) was a fishing village and, as part of the manor of "Rameslie," was granted by the king to the abbot and convent of Fécamp, by whom it was retained until Henry III. resumed it. By 1286 Rye was probably a port of consequence, and a charter of 1288 confirms the right. Richard I. shows that in the reign of Edward II. it had been added to the Cinque Ports. The fluctuations of the sea and attacks of the French caused its decline in the 13th and 14th centuries, and the walls were therefore built in the reign of Edward III. The decay of Winchelsea contributed to the partial revival of Rye in the 15th and 16th centuries, when it was a chief port of passage. Towards the end of the 16th century the decay of the port began, and notwithstanding frequent attempts to improve the harbour it never recovered its ancient prosperity. Rye was incorporated under a mayor and jurats
by the beginning of the 14th century, but possesses no charter
distinct from the Cinque Ports. As a member of the Cinque
Ports, which were summoned from 1322 onwards, Rye returned
two representatives to parliament from 1366 until 1832; after
that date one only until 1885. In 1290 the barons of the royal
port of Rye were granted a three days' fair in September, altered
in 1505 to March. The mayor and commonality evidently held
weekly markets on Wednesday and Friday before 1405, as in
that year the Friday market was changed to Saturday. Ship-
building has been carried on since the 13th century.

**Rye**. This cereal, known botanically as *Secale cereale*, is
supposed to be the cultivated form of *S. montanum*, a wild
petennial species occurring in the more elevated parts of the
Mediterranean region, and W. to Central Asia. Its cultivation
does not appear to have been practised at a
very early date, relatively speaking. Alphonse de Can-
dolles, who has collected the evidence on this point, draws
attention to the fact that no traces of this cereal have
hitherto been found in Egyptian monu-
ments, or in the earlier Swiss dwell-
ings, though seeds have been found in
association with weapons of the
Bronze period at Olmütz. The
absence of any name for it in the
Semitic, Chinese and Sanskrit languages
is also adduced as an indication of its
comparatively recent culture. On the
other hand, the general occurrence
of the name in the modern lan-
guages of N. Europe, under
various modifications, points to the
cultivation of the plant then, as now, in those regions. The
origin of the Latin name *secale*, which exists in a modified
form among the Basques and Bretons, is not explained.

Rye is a tall-growing annual grass, with fibrous roots, flat,
narrow, ribbon-like bluish-green leaves, and erect or decurved
cylindrical slender spikes like those of barley. The spikelets
contain two or three flowers, of which the uppermost is
usually imperfect. The outer glumes are acute and glabrous,
the flowering glumes lance-shaped, with a comb-like keel
at the back, and the outer or lower one prolonged at the
apex into a very long bristly awn. Within these are three
stamens surrounding a compressed ovary, with two feathery
stigmas. When ripe, the grain is of an elongated oval form,
with a few hairs at the summit. When the ovaries of the plant
become affected with a peculiar fungus (*Claviceps purpurea*)
they become blackened and distorted, constituting ergot (q.v.).

In the S. of Great Britain rye is chiefly or solely cultivated
as a forage-plant for cattle and horses, being usually sown in
autumn for spring use, after the crop of roots, turnips, or
oats; and the harvest of June or early July. When the grain
is ripe, it is cut and threshed. Rye bread or black bread is in
general use in N. Europe. The straw, which is prized on account of its length, is used
for making hats and in the manufacture of paper. Rye flour is used
for cattle-food and poultries, and the grain in the distillery.

**Ryezhitsa**, a town of Russia, in the government of
Vitebsk, 150 m. N.W. from the town of Vitebsk and on the
railway between St Petersburg and Warsaw. Its population
rose from 7306 in 1867 to 10,681 in 1897; but its
importance is mainly historical. The cathedral is a modern
building (1846). Ryezhitsa, or, as it is called in the Livonian
chronicles, Roziten, was founded in 1285 by the Teutonic
Knights to keep in subjection the Lithuanians and Letts.
The castle was continually the object of hostile attacks. In 1561
the Teutonic Knights gave it in pawn to Poland, and, though it
was captured by the Russians in 1567 and 1577, and had its
fortifications dismantled by the Swedes during the war of the
Russian empire.

**Ryland, William Wynne** (1738–1789). English engraver,
was born in London in July 1738, the son of an engraver and
copper-plate printer. He studied under Ravenet, and in
Paris under Boucher and J. P. le Bas. After spending five
years on the Continent he returned to England, and, having
engraved portraits of George III. and Lord Bute after Ramsay,
and a portrait of Queen Charlotte and the Princess Royal after
Francis Cotes, R.A., he was appointed engraver to the king.

In 1766 he became a member of the Incorporated Society of
Artists, and he exhibited with them and in the Royal Academy.
In his later life Ryland abandoned line-engraving, and intro-
duced the so-called "shakier," in which the lines are composed of
spotted dots, and in which he transcribed Mortimer's "King
John Signing Magna Charta," and copied the drawings of the old
masters and the works of Angelica Kauffmann. In consequence of
his extravagant habits his affairs became involved; he was
convicted of forging bills upon the East India Company, and,
after attempting to commit suicide, was executed at Tyburn
on the 29th of August 1783.

**Rylands, John** (1801–1888). English manufacturer and
merchant, was born at St Helens, Lancashire, on the 7th of
February 1801, and was educated at the grammar school in that town.
In 1835 he and his elder brother and his father, a manufacturer of
woollen goods, founded the firm of Rylands, the cotton goods
and linen manufacturers, at Wigan. The business rapidly
increased, dye-work and bleach-works were added, and the
discovery of coal under some of the firm's property added materi-
ally to its wealth. In 1825 the partners became merchants as
well as manufacturers, and subsequently acquired spinning mills
at Bolton and elsewhere. In 1847, his father being dead and
his brothers having retired, John Rylands assumed entire
control of the business, which in 1873 was turned into a limited
liability company. It has mills at Manchester, Bolton, and
Wigan, and is now probably the largest concern of the kind
in Great Britain. John Rylands was a benefactor to various
charities, and was one of the original financiers of the Man-
chester Ship Canal. He died at Stretford on the 11th of
December 1888. A permanent memorial, the John Rylands
Library, was erected by his widow in Manchester in 1890.

**Ryle, John Charles** (1816–1900), English bishop, was born
at Macclesfield on the 10th of May 1816, and was educated at Eton
and at Christ Church, Oxford, where he was Craven Scholar in
1836. After holding a curacy at Exbury in Hampshire, he
became rector of St Thomas's, Winchester (1843), rector of
Helmhingham, Suffolk (1844), vicar of Stratford (1851), honorary
canon of Norwich (1852), and dean of Salisbury (1880); but, before
taking this office was advanced to the new see of Liverpool,
where he remained until his resignation, which took place three
months before his death at Lowestoft on the 10th of June 1900.
Ryle was a strong supporter of the evangelical school. Among his longer works are Christian Leaders of the Eighteenth Century (1869), Expository Thoughts on the Gospels (7 vols., 1856–69), Prefaces to Shakespeare (1847). His second son, Herbert Edward Ryle (b. 1856), a distinguished Old Testament scholar, was made bishop of Exeter in 1901, and in 1903 bishop of Winchester.

Rylsk, a town of Russia, in the government of Kursk, 71 m. by rail W.S.W. of the town of Kursk. It is connected by a branch line with the Kursk-Kiev railway. Pop. (1897) 11,415. It has oil wells, blast furnaces, and manufactories of soap and tallow, and an active trade in corn, hemp, and scythes imported from Austria. It was founded in the 9th cent. and is frequently mentioned in the annals from 1152 onwards. Its cathedral was built in the 15th century.

Rymer (1644–1713), English historiographer royal, was the younger son of Ralph Rymer, lord of the manor of Bralferton in Yorkshire, described by Clarendon as “possessed of a good estate,” and executed for his share in the “Presbyterian rising” of 1663. Thomas was probably born at Yafforth Hall early in 1641, and was educated at a private school kept at Danby-Wiske by Thomas Smelt, a noted Royalist, with whom Rymer was “a great favourite,” and “well known for his great critical skill in human learning, especially in poetry and history.”

He was admitted as pensionarius minor at Sidney Sussex College, Cambridge, on April 29, 1658, but left the university without taking a degree. On May 2, 1666, he became a member of Gray’s Inn, and was called to the bar on June 21, 1672. His first appearance in print was as translator of Cicero’s Prince (1668), from the Latin treatise (1668) drawn up for Prince Henry. He also translated Rapin’s Reflections on Aristotle’s Treatise of Poete (1674), with a preface in defence of the classical rules for unity in the drama, and followed the principles there set forth in a tragedy in verse, licensed September 13, 1677, called Edgar, or the English Monarch, which was a failure. The printed editions of 1678, 1691 and 1693 belong to the same issue, with new title-pages. Rymer’s views on the drama were again given to the world in the shape of a printed letter to Fleetwood Sheppard, the friend of Prior, under the title of The Tragedies of the Last Age Consider’d (1678, 2nd ed. 1692). To Ovid’s Epistolis Translated by Several Hands (1689), with preface by Dryden, “Pendele to Ulysses” was contributed by Rymer, who was also one of the “hands” who “Englished” the Plutarch of 1683–86. The life of Nicius fell to his share. He furnished a preface to Whitelocke’s Memorials of English Affairs (1682), and wrote in 1681 A General Draught and Prospect of the Government of Europe, reprinted in 1689 and 1714 as Of the Antiquity, Power, and Decay of Parliaments, where, ignorant of his future dignity, the critic had the misfortune to observe, “You are not to expect truth from an historiographer royal.” He contributed three pieces to the collection of Poems to the Memory of Edmund Waller (1688), afterwards reprinted in Dryden’s Miscellany Poems, and is said to have written the Latin inscription on Waller’s monument in Beaconsfield churchyard. The preface to the posthumous Historia Ecclesiastica (1688) of Thomas Hobbes is said to have been by Rymer, but the Life of Hobbes (1681) sometimes ascribed to him was written by Richard Blackburne. He produced a congratulatory poem upon the arrival of Queen Mary in 1689. His next piece of authorship was to translate the sixth eley of the third book of Ovid’s Tristia for Dryden’s Miscellany Poems (1692, p. 148). On the death of Thomas Shadwell in 1692 Rymer received the appointment of historiographer royal, at a yearly salary of £200. Immediately afterwards appeared his much discussed Short View of Tragedy (1693), criticizing Shakespeare and Ben Jonson, which produced The Imperial Critick (1693) of Dennis, the epigram of Dryden,2 and the judgment of Macaulay that Rymer was “the most cursed than Beaconsfield’s reference to critics as ‘men who have failed in literature and art’ (Lothair, chap. xxxiv.) or Balzac’s ‘al aly at Mérimée in similar terms. The poet’s remarks on the worst critic that ever lived.” John Dunton (Life and Letters, p. 354), however, considered him “orthodox and modest,” and Pope “one of the best critics we ever had” (Spence’s Anecdotes). Rymer contended that although Shakespeare possessed humour he had no genius for tragedy, Othello being merely “a bloody farce without salt or savour.”

Within eight months of his official appointment Rymer was directed (August 26, 1663) to carry out that great national undertaking with which his name will always be honourably connected, and of which there is reason to believe that Lords Somers and Halifax were the original promoters. The Codex Juris Gentium Diplomaticus (1663) of Leibnitz was taken by the editor as the model of the Foedera. The plan was to publish all records of alliances and other transactions in which England was concerned with foreign powers from 1101 to the time of publication, limiting the collection to original documents in the archives and works then in the hands of the late Dr. James I. This was not uniformly carried out, and the work contains some extracts from printed chronicles. From 1664 he corresponded with Leibnitz, by whom he was greatly influenced with respect to the plan and formation of the Foedera. While collecting materials, Rymer unwisely engraved a spurious charter of King Malcolm, acknowledging that Scotland was held in homage from Edward the Confessor. When this came to be known the Scottish antiquaries were extremely indignant. G. Redpath published a MS. on the independence of the Scottish crown, by Sir T. Craig, entitled Scotland’s Sovereignty Asserted (1695), and the subject of Bishop Nicolson’s Historical Library (1702) this led Rymer to address three Letters to the Bishop of Carlisle (1702–1706) explaining his action, and discussing other antiquarian matters. Sir Robert Sibbald answered the second letter (1704). The first and second letters are usually found together; the third is extremely rare. Rymer had now been for some years working with great industry, but was constantly obliged to petition the crown for money to carry on the undertaking. Up to August 1688 he had expended £1253, and had only received £500 on account.

At last, on November 20, 1704, was issued the first folio volume of the Foedera, Conventiones, Litterae et curucunque generis Acta Publica inter reges Angliæ et aliæ quosvis imperatorum, reges, &c., ab. A.D.1101 ad nostras usque tempora habita aut tractata. The publication proceeded with great rapidity, and fifteen volumes were brought out by Rymer in nine years. Two hundred and fifty copies were printed; but, as nearly all of them were presented to persons of distinction, the work soon became so scarce that it was priced by booksellers at one hundred guineas. A hundred and twenty sheets of the fifteenth volume and the copy for the remainder were burnt at a fire at William Bowyer’s, the printer, on January 30, 1712–13. Rymer died shortly after the appearance of this volume, but he had prepared materials for the sixteenth volume which was issued a year later.

These were placed in the hands of Robert Sanderson, his assistant. For the greater part of his life Rymer derived his chief subsistence from a mortgage assigned to him by his father. His miscellaneous literary work could not have been very profitable. At one time he was reduced to offer his MSS. for a new edition for sale to the earl of Oxford. About 1703 his affairs became more settled, and he afterwards regularly received his salary as historiographer, besides an additional £200 a year as editor of the Foedera. Twenty-five copies of each volume were also allotted to him. He died at Arundel Street, Strand, December 14, 1713, and was buried in the church of St. Clement Dane’s. His will was dated July 10, 1713. Tonson issued an edition of Rochester’s Works (1714), with a short preface by the late historiographer. Another posthumous publication was in a miscellaneous collection called Curious Amusements, by M. B. (1714), which included “some translations from Greek, Latin and Italian poets, by T. Tragedies of the Last Age have been reprinted in his Works (1821), xxv. pp. 383–396, and in Johnson’s Life of Dryden. See also Dryden’s Works, ed. by T. Rymer, vol. xi. p. 251, vol. xii. p. 20. ‘I ver came across a worse critic than Thomas Rymer,’ says Prof. George Saintsbury, who discusses his theories at length in History of Criticism (1902), pp. 391–397. See also A. Holther, T. Rymer’s dramatische Kritik (1908).
RYOT—RZHEV

Rymer. Some of his poetical pieces were also inserted in J. Nichol's \textit{Select Collection} (1780-86, 8 vols.), and two are reproduced in A. H. Bullen's \textit{Musae Proterea} (1895).

Two more volumes of the \textit{Foedera} were issued by Sanderson in 1715 and 1717, and the last three volumes (xviii., xix. and xx.) by the same editor, but upon a slightly different plan, in 1728 and 1730. The last six volumes were published by Tonson, all the former by Churchill. Under Rymer it was carried down to 1866, and continued by Sanderson to 1854. The rarity and importance of the work induced Tonson to prepare a full index (1745), a second much improved upon the first edition, and to embody Holody's collation, commenced at the head of the 6th vol. and finished in 1747. It is in every respect better than the others, and is compressed within ten folio volumes. The arrangement is more convenient; there is some additional matter; the index is better; the type is not so good, but it is to be preferred to either of the previous editions. When the volumes of the \textit{Foedera} first appeared they were analysed by Leclerc and Rapin in the \textit{Bibliothèque choisie} and \textit{Bibliothèque ancienne et moderne}. Rapin's articles were collected in a volume in the \textit{New Edition of Mr Rymer's Foedera}, printed by Tonson in 1730, and on the whole the second is an improvement upon the first edition. A third edition, embodying Holody's collation, was commenced at the head of the 6th vol. and finished in 1747. Rymer was subsequently made keeper of the Tower records, was appointed editor. The new edition appeared between 1727 and 1735. The last three volumes are the same in both issues. There are some corrections and improvements in the first edition, in the \textit{New Edition of Mr Rymer's Foedera}, printed by Tonson in 1730, and on the whole the second is an improvement upon the first edition. A third edition, embodying Holody's collation, was commenced at the head of the 6th vol. and finished in 1747. It is in every respect better than the others, and is compressed within ten folio volumes. The arrangement is more convenient; there is some additional matter; the index is better; the type is not so good, but it is to be preferred to either of the previous editions.

For the first few weeks no result was reached, and in June William III. and Louis XIV., the protagonists in the struggle, each appointed one representative to meet together privately. The two chosen were William Bentinck, earl of Portland, and marshal Boufflers, and they soon drew up the terms of an agreement, to which, however, the emperor Leopold I. and the king of Spain would not assent. But in a short time Spain gave way, and on the 20th of September 1679 a treaty of peace was signed between France and the three powers, England, Spain and Holland, the Empire still holding aloof. William then persuaded Leopold to make peace, and a treaty between France and the Empire was signed on the 30th of October following.

The basis of the peace was that all towns and districts seized since the treaty of Nijmegen in 1679 should be restored. Then France surrendered Freiburg, Breisach and Philippsburg to Germany, although she kept Strassburg. On the other hand, the Spaniards, besides ceding Pondicherry to France, were required to evacuate Catalonie, and the barrier fortresses of Mons, Luxembourg and Courtrai. The duchy of Lorraine, which for many years had been in the possession of France, was restored to Leopold Joseph, a son of duke Charles V., and the Dutch were to be allowed to garrison some of the chief fortresses in the Netherlands, including Namur and Ypres. Louis undertook to recognize William as king of England, and promised to give no further assistance to James II.; he abandoned his interference in the electorate of Cologne and also the claim which he had put forward to some of the lands of the Rhenish Palatinate.

RZHEV, or Rzhev, a town of Russia, in the government of Tver, 76 m. S.W. of the town of Tver, occupying the bluffs on both banks of the Volga (here 350 ft. wide) near the confluence of the Vazuza. Pop. (1900) 31,514. It is the terminus of a branch line (85 m.) from the St Petersburg & Moscow railway, and is the centre of a large transit trade between Orel, Kaluga and Smolensk and the ports of St Petersburg and Riga. In the 12th century Rzhev belonged to the principality of Smolensk. Under the rulers of Novgorod it became from 1225 a subordinate principality, and in the 14th century the two parts of the town were held by two independent princes.
S

the twenty-first letter of the Phoenician alphabet, is one of the four sibilants which that alphabet possesses. In the Phoenician alphabet it takes a form closely resembling the English w, and this when moved through an angle, 90° is the ordinary Greek sigma ʕ. In Phoenician itself and in the other Semitic alphabets the position of the middle leg of the W is altered so that the symbol takes such forms as v or ὶ or ῃ, ultimately ending sometimes in a form like Klaidsiways. In Greek, where ʕ is the twentieth letter of the alphabet, or, if the merely numerical ʕ and ʕ are excluded, the eighteenth, another form ʕ or ʕ according to the direction of the writing is also widespread. This, which is the only form of the earliest period at Cumae, where it is also found more rounded ʕ, is the origin of the Latin s and its descendants. The development from the angular to the curved shape of S may be seen in its occurrences on the early cippus found in the Roman Forum in 1899. Apart from doubtful instances it is here six times clearly engraved; four of the instances are angular, the other two are more or less rounded. The Semitic name of the symbol is skin; the Greek name sigma may mean merely the hissing letter and may be a genuine Greek derivative from the verb δίκω (δίκω), hiss. Some, however, see in it a corruption of the Semitic name samekh, the letter which corresponds in alphabetic position and in shape to the Greek ʕ (σ). The Dorian Greeks, however, as Herodotus tells us (l. 139), called that letter san which the Ionian Greeks called sigma; san seems more likely to be an attempt to reproduce the Semitic name. Herodotus says nothing of a difference in shape, but most authorities regard the form Σ, which with the value of s is practically confined to Doric areas, and as being san. In the compound σαμμάρα, san like kappa (κάππα) was known to the Athenians as a brand for highbred horses (cf. Aristophanes, Clouds, 122, 1298, 23, 438). For the symbol Τ which was used at Ephesus and other places in Asia Minor and elsewhere for the sound represented by -σα in Ionic Greek, by -tτ in Attic, see Alphabet. Further points of difficulty in connexion with the sibilants are discussed under X and ʕ. The pronunciation of s was originally unvoiced: in English it is often used for the voiced sound as well, compare lose with loose, house with houses. At the end of words the voiced sound is often written with -s, the unvoiced with -ss as in his and kiss. In other cases the pronunciation can be ascertained only from the context, as in use, unvoiced for the substantive, voiced for the verb. Sometimes a difference of meaning is indicated by difference of spelling though the sounds in the two words are identical, as in jurs and jurse. The voiced form of s (i.e. z) readily passes into r in many languages: compare the Eng. hare with the Ger. Hase, the Eng. ear and Lat. auris with the Gothic auso and Lithuanian ausis, "ear." Here also should be mentioned the sound sh, which, like th, is not a combination of sounds though written with two symbols. Hence in transcription from foreign languages and in works on phonetics it is represented by s or ś. The difference in formation between ś and s is that the former is dental or alveolar, the latter is produced farther back and has at least two varieties. In the usual Eng. sh the tip of the tongue is bent backwards so that the tongue becomes spoon-shaped. The voiced sound to this is generally written z as in azure, but sometimes s as in pleasure. The sound of sh is also sometimes represented by z, as in sure, sugar. This is occasioned by the y-sound with which u now begins, and is carried further in dialect than in the literary language, sne and suit, for example, being pronounced in Scotland like the Eng. shoe and shoot. The sh sound is sometimes not even written with a sibilant, as in the pronunciation of the ʕi and ʕii of words like rhetorician and month. (P. Gt.)

SAALE, a river of Germany, a tributary of the Elbe, rises between Bayreuth and Hof in the N.E. of Bavaria, springing out of the Fichtelgebirge at an altitude of 2390 ft. It pursues a winding course in a northerly direction, and after passing the manufacturing town of Hof, flows amid well-wooded hills until it reaches the pleasant vale of Saalberg. Here it receives the waters of the Schwarza, in whose romantic valley lies the castle of Schwarzbürg, the ancestral seat of the princes of the ruling house of Schwarzbürg-Rudolstadt. From Saalberg the Saale enters the dreary limestone formation of Thuringia, sweeps beneath the barren, conical hills lying opposite to the university town of Jena, passes the pleasant watering-place of Kösen, washes numerous vine-clad hills and, after receiving at Naumburg the deep and navigable Unstrut, flows past Weissenfels, Merseburg, Halle, Bernburg and Kalbe, and joins the Elbe just above Barby, after traversing a distance of 226 m. It is navigable from Naumburg, 100 m., with the help of sluices, and is connected with the Elster near Leipzig by a canal. The soil of the lower part of its valley is of exceptional fertility, and produces, amongst other crops, large supplies of sugar beetroot. Among its affluents are the Elster, Regnitz and Otla on the right bank, and the Ilm, Unstrut, Salza, Wipper and Bode on the left. Its upper course is rapid. Its valley, down to Merseburg, is picturesque, and even romantic, because of the many castles which crown the enclosing hills. It is sometimes called the Thuringian or Saxon Saale, to distinguish it from another Saale (70 m. long), a right-bank tributary of the Main, in the Bavarian district of Lower Franconia.

See Hertzberg, Die historische Bedeutung des Saalelats (Halle, 1895).

SAALFELD, a town of Germany, in the duchy of Saxe-Meiningen, picturesquely situated on the left bank of the Saale, 24 m. S. of Weimar and 77 S.W. of Leipzig by rail. Pop. (1905) 13,245. One of the most ancient towns in Thuringia, Saalfeld, once the capital of the extinct duchy of Saxe-Saalfeld, is still partly surrounded by old walls and bastions, and contains some interesting medieval buildings, among them being a palace, built in 1679 on the site of the Benedictine abbey of St Peter, which was destroyed during the Peasants' War. Other notable edifices are the Gothic church of St John, dating from the beginning of the 13th century; the Gothic town hall, completed in 1537; and, standing on an eminence above the river, the Kitzerstein, a palace said to have been originally erected by the German king Henry I., although the present building is not older than the 16th century. But perhaps the most interesting relic of the past in Saalfeld is the striking ruin of the Hoher Schwarm, called later the Sorbenburg, said to have been erected in the 7th century. Saalfeld is situated in one of the busiest parts of Meiningen and has a number of prosperous industries, including the manufacture of machinery, bricks, colours, malt, cigars, hosiery and vinegar. Other industries are brewing, printing and iron-found ing, and there are ochre and iron mines in the neighbourhood.

Saalfeld grew up around the abbey founded in 1075 by Anno, archbishop of Cologne, and the palace built by the emperor Frederick I. In 1380 it was purchased by the landgrave of Thuringia, and with this district it formed part of Saxony. In 1680 it became the capital of a separate duchy, but in 1699 it was united with Saxe-Coburg, passing to Saxe-Meiningen in 1826. On the 10th of October 1866 a battle took place near Saalfeld between the French and the Prussians, during which Prince Louis Ferdinand of Prussia was killed.

See Wagner and Grobe, Chronik der Stadt Saalfeld (Saalfeld, 1865-1867), and Thümmel, Kriegstage aus Saalfelds Vergangenheit (Berlin, 1882).

SAAR, a river of Germany, a right-bank tributary of the Mosel. It rises in the Donon, an eminence of the Voges, close to the Franco-German frontier, and flows at first north, then north-west and finally north again to its junction with the Mosel.
at Konz. Its length is 143 m. The middle part of its valley is an important industrial district, with coal-mines and a variety of manufactures; the Saar wines are also well known. The principal towns on the Saar are Saargemünd, Saarbrücken and St Johann (which face each other across the river), Saarlouis and Saarburg. The river is navigable up to Saargemünd, a distance of 75 m. From here there is connexion with the Rhine-Marne canal by way of the Saar canal, built in 1862, and 40 m. in length, following the Saar valley upwards for about half that distance.

**SAARBRÜCKEN**, a town of Germany, in the Prussian Rhine Province, on the left bank of the Saar, a navigable tributary of the Mosel, is situated 40 m. by rail, and at the junction of lines to Trier and Saarbrücken by rail, and at the junction of lines to Trier and Saarbrücken by rail.

Collected editions of his works appeared at Antwerp in 1677-1678, and again at Madrid in 1789-1790; see also vol. xxv. of the Bibli. de aut. esp. (1853).

SAAZ (Czech Žatec), a town of Bohemia, Austria, 64 m. N.W. of Prague by rail. Pop. (1900) 16,168, mostly German. It lies on the Eger, which is spanned here by a suspension bridge, 210 ft. long, which is the oldest of its kind in Bohemia, having been constructed in 1826. It possesses several ancient churches, of which one is said to date from 1206, and a town hall built in 1559. Saaz is the centre of the extensive hop trade of the neighbourhood. In early times it was the seat of a royal count (Zupan or gaussgraf). A coat-of-arms was given to the inhabitants by Ladislaus for their courage during the storming of Milan; and the place is recorded as one of the last places ceded to Ottokar II.

From the outbreak of the Hussite Wars to the Thirty Years' War Saaz was Hussite or Protestant, but after the battle of the White Mountain (1620) the greater part of the Bohemian inhabitants left the town, which became German and Roman Catholic.

SABADELL, a town of north-eastern Spain, in the province of Barcelona; on the river Ripoll and on the Barcelona-Sara-gossa railway. Pop. (1900) 23,294. The town has handsome modern public buildings, including the town hall, schools for primary and higher education, hospitals and theatres. Cloth, linen, paper, flour and brandy are the chief wares exported, and there are iron foundries and saw-mills. About half the inhabitants are employed in the textile factories. Sabadell is said to be the Roman Sebennatum, but in Spanish annals it is not noticed until the 13th century.

SABAENS. The ancient name of the people of Yemen (q.v.) was Saba (Saba' with final maza); and the oldest notices of them are in the Hebrew Scriptures. The list of the sons of Joktan in Gen. x. 26-29 contains in genealogical form a record of peoples of South Arabia which must rest on good information from Yemen itself. Many of these names are found on the inscriptions or in the Arabic geographers—Sheba (Saba'), Hazarmaveth (Hadramut), Abimeel (Ahiime'at'tchar), Jobsh (Yuhaibib, according to Halévy), Jerah (Warath of the geographers), Joktan (Arab Qaṭban; yeqaṭ qabata). On the other hand, the names of some famous nations mentioned on the inscriptions are lacking, from which it may be concluded that they did not rise to prominence till a later date. Saba' (Sheba) itself, which was in later times the chief name, has in Gen. x. 28 a subordinate place; it was perhaps only a collective name for the companies of merchants who conducted the South-Arabian export trade (the root sab' in the inscriptions meaning to make a trading journey), and in that case would be of such late origin as to be held only as a royal town under the local genealogy.

Two other accounts in Genesis, originally independent, give supplementary information drawn from the Sabaean colonies, the stations and factories established to facilitate trade through the desert. The inscriptions of Al'-Ola published by D. H. Müller show that there were Mineaean colonies in North Arabia. Other South Arabs, and especially the Sabaens, doubtless also planted settlers on the northern trade routes, who in process of time united into one community with their North-Arab kinsmen and neighbours. Thus we can understand how in Gen. xxv. 2-3 Sheba and Dedan appear among the North-Arab "sons of Keturah." Again, the Sabaens had colonies in Africa and there mingled with the black Africans; and so in Gen. x. 7 Sheba and Dedan, the sons of Raamah (Rahmah), appear in the genealogy of the Cushites. With the Ethiopians Saba' means "men," a clear indication of their Sabaean descent.

The queen of Saba who visited Solomon may have come with a caravan trading to Gaza, to see the great king whose ships plied on the Red Sea. The other biblical books do not mention the Sabaens except incidentally, in allusion to their trade in incense and perfumes, gold and precious stones, ivory, ebony, and costly garments (Jer. vi. 20; Ezek. xxvii. 15, 20, 22 seq.; Isa. lx. 6; Job vi. 19). These passages attest the wealth and trading importance of Saba from the days of Solomon to those of Cyrus. When the prologue to Job speaks of plundering

Sabaens (and Chaldaean) on the northern skirts of Arabia, these may be either colonists or caravans, which, like the old Phoenician and Greek traders, combined on occasion to trade. The prologue may not be historical; but it is to be presumed that it deals with historical possibilities, and is good evidence thus far.

The biblical picture of the Sabaean kingdom is confirmed and supplemented by the Assyrian inscriptions. Tiglath-Pileser II. (733 B.C.) tells us that Teima, Saba', and Ḥajjāq (=Ephah, Gen. xxv. 4 and Isa. ix. 6) paid him tribute of gold, silver and much incense. Similarly Sargon (715 B.C.) in his Annales mentions the tribute of Shamsi, queen of Arabia, and of Ithamar of the land of Saba'—gold and fragrant spices, horses and camels.

The earliest Greek accounts of the Sabaens and other South-Arabian peoples are of the 3rd century B.C. Eratosthenes (276-194 B.C.) in Strabo (xiv. 4. 2) says that the extreme south of Arabia, over against Ethiopia, is inhabited by four great nations—the Mineans (Mēpāōn, Mēpāio; Ma'ın of the inscriptions) on the Red Sea, whose chief city is Carma; next to them the Sabaens, whose capital is Mariba (Mariab of the inscriptions); then the Catabanes (Qatabān of the inscriptions), near the Straits of Bāb-el-Mandeb, the seat of whose king is Yamaa; fourthly, and farthest east, the people of Ḥaḍramūt (Hudhrāit) (the term hemza); and lastly the people Sabota. The Catabanes produce frankincense and Ḥaḍramūt myrrh, and there is a trade in these and other spices with merchants who make the journey from Aelana (Elath, on the Gulf of 'Akaba) to Minea in seventy days; the Gabaeans (the gaba'n of the inscriptions, Pliny's Gebanitae) take forty days to go to Ḥaḍramūt. This short but important and well-informed notice is followed a little later by that of Agatharchides (120 B.C.), who speaks in glowing terms of the wealth and greatness of the Sabaens, but seems to have less accurate information than Eratosthenes. He knows only the Sabaens and thinks that Saba is the name of their capital. He mentions, however, the "happy islands" beyond the straits, the station of the Indian trade (210 B.C.). Artemidorus (100 B.C.) quoted by Strabo, gives a similar account of the Sabaens and their capital Mariba, of their wealth and trade, adding the characteristic feature that each tribe receives the wares and passes them on to its neighbours as far as Syria and Mesopotamia.

The accounts of the wealth of the Sabaens brought back by traders and travellers excited the curiosity of Rome, and Augustus entrusted Aelius Gallus with an expedition to South Arabia, of which we have an authentic account in Strabo (xvi. 4. 22). He hoped for assistance from the friendly Nabataeans; but, as they owed everything to their position as middlemen for the South-Arabian trade, which a direct communication between Rome and the Sabaens would have ruined, their viceroy Syllaecus, who did not dare openly to refuse help, sought to frustrate the emperor's scheme by craft. Instead of showing the Romans the caravan route, he induced them to sail from Cleopatra to Leucoome, and then led them by a circuitous way through waterless regions, so that they reached South Arabia too much weakened to effect anything. But the expedition brought back a considerable knowledge of the country and its products, and the Roman leader seems to have perceived that the best entrance to South Arabia was from the havens on the "Chatram; at least we may conclude when a hundred years later (A.D. 77, as Dillmann has shown), in the Periplus of an anonymous contemporary of Pliny (§ 23) we read that Charibael of Zafar, "the legitimate sovereign of two nations, the Hormeites and Sabaens," maintained friendly relations with Rome by frequent embassies and gifts. Pliny's account of Yemen, too, must be largely drawn from the expedition of Gallus, though he also used itineraries of travellers to India, like the Periplus Maria Erythraei just quoted.

Nautical improvements, and the discovery that the southwest monsoon (Hippalus) gave sure navigation at certain seasons, increased the connexion of the West with South Arabia, but also wrought such a change in the trade as involved a revolution in the state of that country. The hegemony of the Sabaens
now yields to that of a new people, the Homerites or Hnymar, and the king henceforth bears the title "king of the Himyartes and Sabaeans." Naval expeditions from Berenice and Myos-Hormos to the Arabian ports brought back the information on which Claudius Ptolemy constructed his map, which still surprises us by its wealth of geographical names.

Sabaeans colonies in Africa have been already mentioned. That Abyssinia was peopled from South Arabia is proved by its language and writing; but the difference between the two languages is so great that an originally Sabaean population of the city of Axum, as the middle of the 4th century king Axumit, and of the Ethiopians, Sabaeans, and Sillar. More serious was the conflict under Dhû-Nu‘ad, the Sabaeans, and the Homermes, and of the Ethiopians, and the Axumites, and of the Sabaeans, and the Sillar. With the exception of what the South-Arabian Hamdani relates of his own observation or from authentic tradition, the Mahommaded Arabic accounts of South Arabia and Sabaea are of little worth. The great event they dwell on is the burning of the dam of Mahrab, which led to the emigration northwards of the Yemenite tribes. We may be sure that this event was not the cause but the consequence of the decline of the country. When the inland trade fell away and the traffic of the coast towns took the sea route, the ancient metropolis and the numerous inland emporia came to ruin, while the many colonies in the north were broken up and their population dispersed. To the Sabaean written style, when it speaks (xxxiv. 17) of well-known cities which God appointed as trading stations between the Sabaeans and the cities He had blessed (Egypt and Syria), and which He destroyed because of their sins.

**Inscriptions.**—This abstract of the history of Yemen from ancient sources can now be verified and supplemented from inscriptions. Doubts as to the greatness and importance of the Sabean state, as at Yemen, for the neighbourhood of Yathrib. Following this, Seetzen, in 1816, was able to send to Europe, from porphyry blocks near Yarim, the first copies of Sabaean inscriptions. They could not, however, be read. But the inscriptions found by Welsted in 1854 and 1855 and deciphered by tumult in his turn, and in the east of the city. These, with other inscriptions on stone and bronze plates brought home by Englishmen, found a cautious and sound interpreter in Oslander. The historical and geographical results of all the work of these and of the late Dr. J. E. Glaser have been most for epigraphy, while Mazoni is to be remembered for his excellent geographical work.

The elongation of the Sabaeans in inscriptions is almost closely akin to the Hebrew, but is purely conjectural without the modifications in the consonantal forms which Ethiopic has devised to express vowels. There are twenty-nine letters, one more than in Arabic, Semitic, and Bible. A decided form of an alphabet, which is probably the parent of the South-Indian character, is undeniably derived from the so-called Phoenician alphabet, the connecting link being the forms of the Saba inscription and the Thamudean inscription found by Dr. Lazard. Of the twenty-six letters, a white twenty-seventh probably corresponds to Arabic م (mi), but also probably ٍ (mun), and a black ُ (mut), and probably also ب (hamza) and ث (thawr) have been differentiated in many ways. This seems to imply that the two alphabets had a common history up to a certain point, but parted company before they were well developed. The Thamudic and Sabean inscriptions are locally nearer to Phoenicia, and the letters are more like the Phoenician. This character therefore appears to be the link connecting Phoenician with Sabean writing. It may be compared with the Phoenician letter ص (sin); but the Sabaeo-Himyaritic alphabet is far more likely to have been formed of the Phoenician alphabet, and a few letters added. The Sabean cylinder of about 1000 B.C., and it is remarkable that the Sabaean saphra, "write," seems to be borrowed from Assyrian šafēra. Language of the Sabaeans is South Semitic, forming a link between the North Arabic and the Ethiopic, and is much nearer the former than the latter. Of the two dialects commonly called Sabean and Minecan the latter might be better called Hadrâmitic, as it is the dialect of the inscriptions found in Hadramut, and the Mineans seem undoubtedly to have entered the Jauf from Hadrâmut.

Inscriptions not only give names of nations corresponding to those in the Bible and in classical authors, but throw a good deal of fresh light on the political history of Yemen. The inscriptions and coins give the names of more than forty-five Sabean kings, and many of them are venerated in the Christian faith. All the inscriptions are of two periods, the earlier being dated to the Sabaeo-Himyaritic period, the other to the Sabaeo-Sabaean period. The inscriptions on the Sabaeo-Himyaritic cylinder of about 1000 B.C. have been assigned to a king called "abe, from the city of Bayyin. If this Ishtar is identical with the 'Asal of Strabo, king of Ma'nabah at the time of the Roman invasion, the inscription preserves a trace of the influence of that event on the use of the two Koine forms of the alphabet.

The inscriptions of the latest period present a series of dates—660, 640, 592, 573, 385—of an unknown era. Reinaud thought the chronology to be based on a period of 50 years, and that the fortresses of Mawiyat (now Siyan Ghorib) date the 640. It has been said to have been erected "when the Abyssinians overran the country and destroyed the king of Himyar and his princes. Referring to this death of Dha Nuwas (A.D. 575), Reinaud fixes 115 B.C. as the epoch of the Sabean era. This ingenious combination accords well with the circumstance that the oldest dated inscription, of the year 858 (A.D. 270), mentions abtar, Shams and other heathen deities, while the inscriptions of 852 (A.D. 273) and 573 (A.D. 458), as far as they can be read, contain no name of a heathen god, but do speak of a god Ra–hmân–n—this is the Hebrew Ramân, the compassionate. Sabaeans, in the 4th century, are called "king of the Sabaeans, and the Sabaeo-Himyaritic period seems to begin with, or a little after, the expedition of Aelius Gallus. A fragmentary inscription of Ma'rīb (Br. Mus., 33) was made by Ishtar Yâsibb and Ya'zil Isyan, the two kings of Sabaea and Hadramut, some 140 years before the battle of Badr (A.D. 624). The fragment contains the date 337 B.C. and the name of Ishtar. This Ishtar is identical with the 'Asal of Strabo, king of Ma'nabah at the time of the Roman invasion, the inscription preserves a trace of the influence of that event on the use of the two Koine forms of the alphabet.
The three Minean citadels lie nearly in this position (\ldots), with old Sabean places (Ra'am) all round them, and even with some Minean settlements (e.g. Nask and Kâmân) within the triangle they form. It is thus clear that the Mineans had already dispersed the Sabean (see above). The inscriptions have yielded the names of twenty-seven Minean kings, who were quite independent, and, as it would seem, not always friends of the Sabean, for neither dynasty bears a succession list with all of its kings included. What the Sabaeans and kingdoms are freely mentioned by both, presumably when they stood under the protection of the one or the other, respectively.

The Mineans were the active rivals of the Sabean influence, and a war between the two is implied by the colophon on the obelisk, mentioning that they disputed the hegemony with one another, there being at one time under a Minean, at another under another Sabean. The names there may have been under the Minean influence. The religions also of the two powers present many points of agreement, with some notable differences. Thus, puzzling as the fact appears, it is clear that the Mineans formed a sort of political and linguistic bloc in the Sabean country. The origin of the Mineans from Hadramut is rendered probable by the probable dominance of their dialect in the inscriptions of that country (except that of Hîn Ghorâb), by the rule, already mentioned, of a Minean prince in Hadramut, and by Pliny's statement (H.N. 9.32) that the frankincense was collected at Sabota (the capital of Hadramut; inscr. nzw), but exported only through the Gebanites, whose kings received custom dues on it, compared with xii. 69, where he speaks of Minean myrrh "in qua et Atraitamica et Gebanitica et Ausritis Gebbatitaram regno\ldots", implying that Minean myrrh was really a Hadramite and Gebanite product. All things are in the same position between the Mineans and the Sabaean, and from the Minean inscriptions we know that the Gebanites were at one time a Minean race, and stood in high favour with the queen of Ma'ân. Thus we are led to conclude that the Mineans were a Sonatric people, and often entered in the Minean inscriptions, to secure the northern trade road for their products. We cannot but see that their fortified posts in the north of the Sabean kingdom had strategical importance in the 4th to 5th B.C. Attingham and Minean, pagi alius, per quos evicatur uno triumviro angelo (Pl. xvi.)

Hi primi commercium turis fecere maxime exercet, a quibus et Minean dictum est. Besides this road, they had the coast road, for, according to their policy, they lie the Gebanite held the port of Ocelis. If we can understand how they are not mentioned in Gen. x. In later times, as is proved by the Minean colony in Al Habs, it was a place that reveals to us how they were formed. The Sabaeans in some parts of the north. In the 'Ola inscriptions we read the names of Minean kings and gods. Notable also is the mention in 1 Chron. iv. 41 of the Bedouin encampments (ânâm) and the inhabitants, which may refer to the destruction of a Minean caravan protected by these Bedouins. The LXX. at least renders Mâ'nim by Marâwâ. It seems bold to conjecture that the Mineans were in accord with the Romans under Rome, as is implied in no X. 27, in the case, that is named among the cities which that general destroyed, though ruin fell on Nask and Kâmân, which lie inside the Minean territory. This succession of events before the 4th century B.C. In South Arabia were hereditary, the son generally following the father, though not seldom the brother of the deceased came between, apparently on the principle of seniority, which we find also in North Arabia. The original family, to have their names inscribed, must be born to one of the magnates after a king came to the throne was his designated successor; the wives of the magnates who were at the king's accession were carefully watched, and the first child born was brought up as heir to the kingdom. There seems to be a mistake in the first part of this statement; what Estrathecenes have said is that the oldest prince after the king was the designated successor. This law of succession explains how we repeatedly find two names in the Minean inscriptions, and two among the Mineans; the second king is the heir. The principle of seniority, as we know from North Arabian history, gives rise to this custom of assigning the eldest son to the throne, which was evidently in favour of the direct heir. On the other hand, it readily leads to a limited power of election by the magnates, and in fact good Arabian sources speak of seven electoral princes. Some inscriptions name the king, and have the name of the eldest son behind it, and it has been priestly, his titles being dhu barîf, epomynous and rasnuh, "sacrifice," All royal inscriptions are signed by him at the beginning and the end, and he appears with the king on coins. In the Minean inscriptions, the lists of names, dates, and inscriptions, the religion of the Sabean is obscure. Most of the many names of gods are mere names that appear and vanish again in particular districts and towns and are not native to the Sabean, and many Minean inscriptions show a little more. The worship of the heavenly bodies, for which there is Arabic evidence, had evidently a great place in Yemen. Sun-worship seems to have been peculiar to the Sabaeans and a general objection has been made to the Sabaeans and other South Arabian sun deities being Shams, this must be ascribed to Sabean influence. The Sabaeans Shams was a goddess, while the chief divinity of the Mineans was the god ‘Athtar, a male figure, worshipped under several forms, of which the commonest are the Eastern ‘Athtar and ‘Athtar Dhu Keb’d. Wadd and Nikhr, the gods of love and hate, are possibly only other forms of the two ‘Athtars. The Mineans also recognize ‘Athtar; but with them he is superseded by Almahqah, who, for the same reason (see above), as ‘Athtar was the god of Venus, and therefore is identical with ‘Athtar. The moon-god ‘Sin appears in inscriptions as ‘Sandulabw; but, according to Hamdâni, Haubas, "the drier," was the Sabean moon-god. On the Shabwit inscription ‘Athtar is the chief deity, and in the same manner as nearly related in the Babylonian legend of ‘Ishtar's descent to Hades, where ‘Ishtar is conversely the daughter of the god Sin. The mother of ‘Athtar on another inscription is probably the sun. In the Ta‘if (U.E.I. 9) ‘Athtar is mentioned as a god of the temple. Three gods of the inscriptions are named in the Koran—Wadd, Yaghîth, and Nasr. In the god of that name, and the protection of the vineyard, protection of the vineyard.

Sacrifices and incense were offered to the gods. The names for altars (nâzîm) and sacrifice (dibûk) are common Semitic words, and the altar of incense being mentioned for the first time, in Hebrew. A variety of spices—the wealth of the land—are named on these altars, as rand, laddanam, costas, tarum, &c. Frankincense is also mentioned. The god of sacrifices was revealed the tithe of the produce of trade and of the field, in kind or in ingots and golden statues, and these tributes, with the tribute offerings, erected and maintained the temples. Temples and fortresses were built for the gods, at first in the form of altars, and later in the form of temples. This was the case, and the god’s wife offered four statues for the health of their four children, and a man offers to Dhu Sami statues of a man and two camels, in prayer for his own health and the protection of his camels from disease or robbers.

Their commerce brought the Sabaeans under Christian and Jewish influence; and, though the old gods were too closely connected with the old morality to allow of an easy change, still it is quite probable that the trading policy, already spoken of, seems to have affected religion as well as the state. The inland gods lost importance with the failure of the overland trade, and Judaism and Christianity seem to have had a marked influence on the south Arabian inscriptions. In Jewish influence appears in the name ‘Athtar (see above), while efforts at Christianization seem to have gone forth from several places at various times. According to Philostratus, the Homerists were converted under Constantius I. by the Indian Theophilius, who built churches in Zafar and Aden. Another account places their conversion in the reign of Anastasius (491–518). In Nejran Syrian missionary seems to have introduced Christianity (Nôdeke). But, as the religion of the hostile Ethiopian Christians, that of milita, national obstacles to its adoption in Yemen; and, as heathenism had quite lost its power, it is intelligible that Dhu Nawâs, who was at war with the Roman force, was rendered the head of a Christian kingdom. The Christian influence in the 4th century B.C., with the legend Aôre and the owl standing on an overturned amphora. The reverse has the head of Pallas with a Sabean N. Of younger coins the first series has a king's head and a lion, and there is evidence that the line, which had been formed in reference to the religious,. The series shows Roman influence, and must be later than the expedition of Gallus. As the standard of the coins of Attic type is not Attic in origin, we must conclude, as a whole, that there was an indirect Athenian influence. The type must have been introduced into the Sabaeans by Eudoxus, who founded a school of Phoenicia (Gaza). One remarkable tetradrachm with the Sabean legend Abaya'î is imitated from an Alexander of the 2nd century B.C. The lion is a rare animal, and the inscription on the reverse, which is a sacrifice to the Persian god ‘Athtar, Dhu Keb’d. Wadd, and Nikhr, the gods of love and hate, is possibly only other forms of the two ‘Athtars. The Mineans also recognize ‘Athtar; but with them he is superseded by Almahqah, who, for the same reason (see above), as ‘Athtar was the god of Venus, and therefore is identical with ‘Athtar. The moon-god ‘Sin appears in inscriptions as ‘Sandulabw; but, according to Hamdâni, Haubas, "the drier," was the Sabean moon-god. On the Shabwit inscription ‘Athtar is the chief deity, and in the same manner as nearly related in the Babylonian legend of ‘Ishtar’s descent to Hades, where ‘Ishtar is conversely the daughter of the god Sin. The mother of ‘Athtar on another inscription is probably the sun. In the Ta‘if (U.E.I. 9) ‘Athtar is mentioned as a god of the temple. Three gods of the inscriptions are named in the Koran—Wadd, Yaghîth, and Nasr. In the god of that name, and the protection of the vineyard, protection of the vineyard.

LITERATURE.—Fresnel, Pières Textes, as inscr. Himyarites, récit de M. Arnaud (1845). Inscriptions in the Himyarite Character in the
SABAKI—SABAZIUS

British Museum (London, 1863); Praeceptor, Beitr. zur Erklarung der himyar. Inschr. (3 parts, Halle, 1872-1874); Kremers, Sud- arabische Sagen der Propheten und Propheten. Die Propheten, 1877 (vi., D. H. Müller, Sudarabische Studien (Vienna, 1877); Id., Die Burgen u. Schlosser Sudarabiens (2 parts, Vienna, 1879-1881) (especially for chronology and antiquities); Mordtmann and Müller, Sudarabische Studien (Leiden, 1887); Nielsen, Die Geschichte der Propheten (ed. 2) and Römische Querkärtte, vi.; see also Helyot, Histoire des ordres religieux (1714), i. c. 16, and Maxi Himebcher, Orden u. Kongreßenten (1907), i. "SABATIER, LOUIS AUGUSTE (1830-1901). French Protestant theologian, was born at Vallon ( Ardèche), in the Cévennes on the 22nd of October 1839, and was educated at the Protestant theological faculty of Montauban and the universities of Tübingen and Heidelberg. After holding the pastorate at Aubenas in the Ardèche from 1864 to 1868 he was appointed professor of reformed dogmatics in the theological faculty of Strasbourg. His markedly French sympathies during the war of 1870 led to his expulsion from Strasbourg in 1872. After five years' effort he succeeded in establishing a Protestant theological faculty in Paris, and became professor and then dean. In 1886 he became a teacher in the newly founded religious science department of the Ecole des Hautes Études of the Sorbonne. Among his chief works were The Apostle Paul (3rd ed., 1896); Mémoire sur la notion hebraique de l'Esprit (1879); Les Origines littéraires de l'Apothéose (1888); The Vitality of Christian Dogmas and their Power of Evolution (1890); Religion and Modern Culture (1897); Historical Evolution of the Doctrine of the Atonement (1903); Outlines of a Philosophy of Religion (1897); and his posthumous Religious of Authority and the Religion of the Spirit (1904), to which his colleague Jean Réville prefixed a short memoir. These works show Sabatier as "at once an accomplished dialectician and a mystic in the best sense of that word" (E. Maine, Revue de l'Institution publique de Belgique, viii. 1903).

On his theology see E. Méndez in Expositori Tímate, xv. 30, and G. B. Stevens in Hibbert Journal (April 1903).

His brother, PAUL SABATIER, was born at St Michel de Chabrillanoux in the Cévennes on the 3rd of August 1858, and was educated at the faculty of theology in Paris. In 1885 he became vicar of St Nicolas, Strasbourg, and in 1889, declining an offer of prebendary which was conditional on his becoming a German subject, he was expelled. For four years he was pastor of St Clerge in the Cévennes and then devoted himself entirely to historical research. He had already produced an edition of the Diddach, and in November 1893 published his important Life of St Francis d'Assisi. This book gave a great stimulus to the study of medieval literary and religious documents, especially of such as are connected with the history of the Franciscan Order. In 1908 he delivered the Jowett Lectures on Modernism at the Passmore Edwards Settlement, London.

SABAZIUS, a Phrygian or Thracian deity, frequently identified with Dionysus, sometimes (but less frequently) with Zeus. His worship was closely connected with that of the great mother Cybele and of Attis. His chief attribute as a chthonian god was a snake, the symbol of the yearly renovation of the life of nature. Demosthenes (De corone, p. 132) mentions various ceremonies practised during the celebration of the mysteries of this deity. One of the most important was the passing of a golden snake under the clothes of the initiated across their bosom and its withdrawal from below—an old rite of adoption. From Val. Max. i. 3, 2 it has been concluded that Sabazius was identified in ancient times with the Jewish Sabaoth (Zebaoth).

Plutarch (Smyr. iv. 6) maintains that the Jews worshipped Dionysus, and that the day of Sabath was a festival of Sabazius. Whether he was the same as Sozou, a marine deity of southern Asia Minor, is doubtful. Some explain the name as that of "beer god," from an Illyrian word soba, while others suggest a connexion with ζαρα (god of "health") or oős. His image and name are often found on "votive hands," a kind of talisman adorned with emblems, the nature of which is obscure. His ritual and mysteries (Sacra Savadisa) gained a firm footing in Rome during the 2nd century A.D., although as early as 139 B.C. the first Jews who settled in the capital were expelled by virtue of a law which prescribed the propagation of the cult of Jupiter Sabazius. Sabatier, Louis Auguste. "On the Sabazios of Asia Minor," in Journal of Religion, 1898, p. 434: H. Usener, "Götternamen" in Revue de l'instruction publique en Belgique, 1899; C. S. Blinkenberg, Archäologiske Studier (1904).
SABBATAI SEBI—SABBATH

SABBATAI SEBI (1626–1676), Jewish mystic, whose Messianic claims produced an unparalleled sensation throughout the world, was born in Smyrna. He was of Spanish descent and was gifted with a personality of rare fascination. As a lad he was attracted by the mysticism of Luria (q.v.), which impelled him to adopt the ascetic life. He passed his days and nights in a condition of ecstasy. He began to dream of the fulfillment of Messianic hopes, being supported in his vision by the outbreak of English Millenarianism. Christian visionaries fixed the year 1666 for the millennium, and in his appeal to Cromwell on behalf of the return of the Jews to England Menasseh ben Israel (q.v.) made strong appeal to this belief. Sabbatai's father (Mordecai) was the Smyrna agent for an English house, and often he did not fulfill the expectations of his fellow Jews. Dazzled by this confirmation of his nascent confidence, Sabbatai for a time found himself the object of suspicion and even persecution. This treatment, so far from extinguishing the flame, eventually converted it into a conflagration. It was in 1648 (the year which Kabbalists had calculated as the year of salvation) that Sabbatai proclaimed himself Messiah, and in Constantinople came across an able but somewhat unworshipful man, who pretended that he had been warned by a prophetic voice that Sabbatai was indeed the long-awaited Redeemer. Others believed in him, but at first his adherents were a small circle of devotees who kept their faith a secret. For the rest of his life, by his sermons of Psalms, and children were always fascinated by him. And now the era of his miracles begins. He journeyed to Jerusalem, and there was the instrument for conferring unexpected services on the community. An oppressive exaction was imposed by a local pasha, and in order to win the succour of Raphael Halebi, Sabbatai repaired to Cairo, being on his route at Hebron hailed as Messiah. His mission was completely successful. At Cairo Sabbatai married. As a boy he had been married and divorced twice—but these were merely nominal unions. Now, however, the romantic story of a beautiful girl (Sarah) was on people's lips; she was firm in her faith, and the daughter of the Messiah. Sabbatai had, at the same time, announced that in a dream a spiritual bride had been promised to him. At the house of Halebi bride and bridgroom met. The adhesion of Halebi produced many imitators, and with a retinue of believers, a charming wife and considerable funds, Sabbatai returned in triumph to the Holy Land. Nathan of Gaza assumed the rôle of Elijah, the Messiah's forerunner, proclaimed the coming restoration of Israel and the salvation of the world through the bloodless victory of Sabbatai “riding on a lion with a seven-headed dragon in his jaws” (Graets). Again 1666 was given as the apocalyptic year. Threatened with excommunication by the Patriarch of Jerusalem, Sabbatai returned to Smyrna (autumn of 1665). Here he was received with wild enthusiasm, and the masses were carried beyond all bounds. With delicious joy the Jews of Smyrna—men, women and children—fell down and worshipped. They prepared for the return. Men left their work to make ready for the start. They fasted, they rejoiced; one hour they chilled themselves in the cemeteries, the next they rushed frantically through the streets singing Psalms refrains. Nor did Sabbatai's adherents all belong to the ignorant classes. The Rabbi Hayim Benveniste and other rabbis of Smyrna and Antwerp learning and teaching, shared the general delusion. It is unnecessary to tell the rest of the story in detail. Many letters are extant, written home to English and Dutch business-houses, in which the marvels of Sabbatai are reported, sometimes with apparent belief in them. From the Levant the Sabbataean movement spread to Venice, Amsterdam, Hamburg and London. Sabbatai was no longer able to doubt the reality of his mission. Day by day he was hailed from all the world as king of the Jews. But his character was too weak to sustain the part. Though he was almost deserted by many of his brethren, who at his word agreed to modify their religious observances, yet he was unable to turn the enthusiasm of thousands to any account. Had he boldly led the way to Jerusalem, he would probably have carried everything before him. At the beginning of the fast year 1666 Sabbatai went (or was summoned) to Constantinople. Here he was arrested, but reports of miracles continued, and many of the Turks were inclined to become converts. Soon he was transferred to Abydos, amidst the almost tragic consternation of his deluded followers. In September Sabbatai was brought before the Sultan, and he had not the courage to refuse to accept Islam. And so the Messianic imposture ended in the apostacy of Sabbatai. The reaction among the Jews was terrible, and a sense of shame was joined to feelings of despair. But the sober-minded among the Jews—these had throughout been the vast majority—seized their opportunity to reclaim those who had been victims of a terrible wrong. Yet many continued to believe in him, as he from time to time attempted to resume the leadership of his followers. But he died in Constantinople (1676). One of Sabbataian—Domein of Salonica—survived him, and for many a long year the controversy for and against his claims left an echo in Jewish life.

The literature on the life and career of this remarkable man is very extensive. Sabbatai Sebi figures largely in English books of the period. A valuable account is given in particular by Graets, an end to itself that the rules prescribed for it did not require to be justified by appeal to any larger principle of religion or humanity. The precepts of the law were valuable in the eyes of the Scribers because they were the seal of Jewish particularism, the barrier erected between the world at large and the exclusive community of Yahweh's grace. The ideal of the Sabbath which all these rules aimed at realizing was absolute rest from everything that could be called work; and even the exercise of those offices of humanity which the strictest Christian Sabbatarians regard as a service to God, and therefore as specially appropriate to His day, was looked on as work. To save life was allowed, but only because danger to life "superseded the Sabbath." In like manner the special ritual at the temple prescribed for the Sabbath by the Pentateuchal law was not regarded as any part of the hallowing of the sacred day; on the contrary, the rule was that in this regard, "Sabbath was not kept in the sanctuary." Strictly speaking, therefore, the Sabbath was neither a day of relief to tolling humanity nor a day appointed for public worship; the positive duties of its observance were to wear one's best clothes, eat, drink and be glad (justified from Isa. liii. 13). A more directly religious element, it is true, was introduced by the practice of attending the synagogue service; but it is to be noted that a feminine form, properly shabbath, is used throughout, in transitive forms and applications it means to "sever," to "put an end to," and intransitively, "it means to "complete" an end. The grammatical form of shabbath suggests a transitive sense, "the divider," and apparently indicates the Sabbath as dividing the month. It may mean the day which puts a stop to the week's work. It may mean that this is less likely. It certainly cannot be translated "the day of rest.""

SI 12.3.1

1 From the Thirty-ninth was deduced the familiar "Sabbath day's journey" (Acts 1.2), based primarily, it would seem, upon the command in Ex. xxxi. 12. It was a distance of 2000 cubits.
remembered that this service was primarily regarded not as an act of worship but as a meeting for instruction in the law.

2. **Attitude of Jesus.**—So far, therefore, as the Sabbath existed for any end outside itself it was an institution to help every Jew to learn the law, and from this point of view it is regarded by Philo and Josephus, who are accustomed to seek a philosophical justification for the peculiar institutions of their religion. But this certainly was not the leading point of view with the more orthodox among the Rabbinists; and at any rate it is quite certain that the synagogue is a post-exilic institution, and therefore that the Sabbath in old Israel must have been entirely different from the Sabbath of the Scribes. But that it was destitute of any properly religious observance or meaning is inconceivable, for, though many of the religious ideas of the old Hebrews were crude, their institutions were never arbitrary and meaningless, and when they spoke of consecrating the Sabbath they must have had in view some religious exercise of an intelligible kind by which they paid worship to Yahweh. Indeed, that the old Hebrew Sabbath was quite different from the Rabbinical Sabbath is demonstrated in the trenchant criticism which Jesus directed against the latter (Matt. xii. 1-14; Mark ii. 27). The general position which He takes up, that “the Sabbath was made for man and not man for the Sabbath,” is only a special application of the wider principle that the law is not an end in itself but a help towards the realization in life of the great ideal of love to God and man, which is the sum of all true religion. But Jesus further maintains that this view of the law as a whole, and the interpretation of the Sabbath law which it involves, can be historically justified from the Old Testament. And in this connexion He introduces two of the main methods by which historical criticism of the Old Testament has recurred in modern times: He appeals to the oldest history rather than to the Pentateuchal code as proving that the later conception of the law was unknown in ancient times (Matt. xii. 3 seq.), and to the exceptions to the Sabbath law which the Scribes themselves allowed in the interests of worship (v. 5) or humanity (v. 11), as showing that the Sabbath must originally have been devoted to purposes of worship and humanity, and was not always the purposeless arbitrary thing which the schoolmen made it to be. Modern criticism of the history of Sabbath observance among the Hebrews has done nothing more than follow out these arguments in detail, and show that the result is in accordance with what is known, as to the dates of the several component parts of the Pentateuch.

3. **Old Usage.**—Of the legal passages that speak of the Sabbath all those which show affinity with the doctrine of the Scribes—regarding the Sabbath as an arbitrary sign between Yahweh and Israel, entering into details as to particular acts that are forbidden, and enforcing the observance by severe penalties, so that it no longer has any religious value, but appears as a mere legal constraint—are post-exilic (Exod. xvi. 23-30, xxxi. 12-17, xxxv. 1-3; Num. xv. 32-36); while the older laws only demand such cessation from daily toil, and especially from agricultural labour, as among all ancient peoples naturally accompanied a day set apart as a religious festival, and in particular lay weight on the fact that the Sabbath is a humane institution, a holiday for the labouring classes (Exod. xxviii. 12; Deut. v. 13-15). As it stands in these ancient laws, the Sabbath is not at all the unique thing which it was made to be by the Scribes. “The Greeks and the barbarians,” says Strabo (x. 3, 9), “have this in common, that they accompany their sacred rites by a festal remission of labour.” So it was in old Israel: the Sabbath was one of the stated religious feasts, like the new moon and the three great agricultural sacrificial celebrations (Hosea ii. 11); the new moons and the Sabbath was alike called men to the sanctuary to do sacrifice (Isa. i. 14); the remission of ordinary business belonged to both alike (Amos viii. 5), and for precisely the same reason. Hosea even takes it for granted that in captivity the Sabbath will be suspended, like all the other feasts, because in his day a feast implied a sanctuary. This conception of the Sabbath, however, necessarily underwent an important modification when the local sanctuaries were abolished under the “Deuteronomic” reform, and these sacrificial rites and feasts which in Hosea’s time formed the regular observance of every act of religion were limited to the central altar, which most men could visit only at intervals. From this time forward the new moons, which till then had been at least as important as the Sabbath and were celebrated by sacrificial feasts as occasions of religious gladness, fall into insignificance, except in the conservative temple ritual. The Sabbath did not share the same fate, but with the abolition of local sacrifices it became for most Israelites an institution of humanity divorced from ritual. So it appears in the Deuteronomic decadence, and presumably also in Jer. xxvii. 19 seq. In this form these last day’s rest was one of the few outward ordinances by which the Israelite could still show his fidelity to Yahweh and mark his separation from the heathen. Hence we understand the importance attached to it in the exilic literature (Isa. i. 2 seq., lviii. 13), and the character of a sign between Yahweh and Israel ascribed to it in the post-exilic law. This attachment to the Sabbath, beautiful and touching so long as it was a spontaneous expression of continual devotion to Yahweh, acquired a less pleasing character when, after the exile, it came to be enforced by the civil arm (Neh. xiii.), and when the later law even declared Sabbath-breaking a capital offence. This increasing strictness is exemplified by the attitude of the Book of Jubilees (i. 17-32, l. 6-13). But it is just to remember that without the stern discipline of the law the community of the second temple could hardly have escaped dissolution, and that Judaism alone preserved for Christianity the hard-won achievements of the prophets.

4. **Early Christian Church.**—The Sabbath exercised a twofold influence on the early Christian church. On the one hand, the weekly celebration of the resurrection on the Lord’s day could not have arisen except in a circle that already knew the week as a sacred division of time; and, moreover, the manner in which the Lord’s day was observed was directly influenced by the synagogue service. On the other hand, the Jewish Christians continued to keep the Sabbath, like other points of the old law. Eusebius (H. E. iii. 27) remarks that the Ebionites continued to observe both the Lord’s day and the Sabbath; and this practice obtained to some extent in many quarters. For the **Apostolical Constitutions** recommend that the Sabbath shall be kept as a memorial feast of the creation as well as the Lord’s day as a memorial of the resurrection. The festal character of the Sabbath was long recognized in a modified form in the Eastern church by a prohibition of fasting on that day, which was also a point in the Jewish Sabbath law (comp. Judith viii. 6). On the other hand, Paul had quite distinctly laid down from the first days of Gentile Christianity that the Jewish Sabbath was not binding on Christians (Rom. xiv. 5 seq.; Gal. iv. 10; Col. ii. 16), and controversy with Jews led in consequence to a direct renunciation of the Lord’s day among the Gentiles, and to an erasure of the Jewish day (e.g. Co. of Laodicea, A.D. 351). Nay, in the Roman church a practice of fasting on Saturday as well as on Friday was current before the time of Tertullian. The steps by which the practice of resting from labour on the Lord’s day instead of on the Sabbath was established in Christendom and received civil as well as ecclesiastical sanction are dealt with under Sunday; it is enough to observe here that this practice is naturally and even necessarily connected with the religious observance of the Lord’s day as a day of worship and religious gladness, and is in full accordance with the principles laid down by Jesus in His criticism of the Sabbath of the Scribes. But of course the

1 See the Mishnah, tract. “Shabbath” and the alleviation permitted in the tract. “Erubin”; and compare Schürer, Gesch. d. jud. Volkes (3) pp. 303 seq., where the Rabbinical Sabbath is well explained and illustrated in detail.

3 In actual life the Sabbath was often far from being the burden which the Rabbinical expositions would lead one to expect. It “is celebrated by the very people who did observe it, in hundreds of hymns, which would fill volumes, as a day of rest and joy, of presentment of the pure bliss and happiness which are stored up for the righteous in the world to come” (S. Schechter, Jewish Quart. Review, iii. p. 763; cp. id., Studies in Judaism, pp. 296 seq.).
SABBATH

complete observance of Sunday rest was not generally possible to the early Christians before Christendom obtained civil recognition.

5. Origin.—As the Sabbath was originally a religious feast, the question of the origin of the Sabbath involves itself into an inquiry why and in what circle a festal cycle of seven days was first established. In Gen. ii. 1-3 and in Exod. xx. 11 the Sabbath is declared to be a memorial of the completion of the work of creation in six days. But it appears certain that the Decalogue as it lay before the Deuteronomist did not contain any allusion to the creation (see Decalogue), and it is generally believed that this reference was added by the same post-exilic hand that wrote Gen. i. 1-11. The older account of the creation in Gen. ii. 4b seq. does not recognize the hexameron, and it is even doubtful whether the original sketch of Gen. i. distributed creation given in seven days. The connexion, therefore, between the seven days' week and the work of creation is now generally recognized as secondary. But, if the week as a religious cycle is older than the idea of the week of creation, we cannot hope to find more than probable evidence of the origin of the Sabbath. Unless the Sabbath was already an institution peculiarly Jewish, it could not have served as a mark of distinction from heathenism. This, however, does not necessarily imply that in its origin it was specifically Hebrew, but only that it had acquired distinguishing features of a marked kind. What is certain is that the origin of the Sabbath must be sought within a circle that used the week as a division of time. Here again we must distinguish between the few, such as P, who divided the week into seven days, and those, however, in which the seven days are named each after the planet which is held to preside over its first hour. It is plain, however, that there is a long step between the astrological assignment of each hour of the week to a planet and the recognition of the week as an ordinary division of time by people at large. Astrology is in its nature an occult science, and there is no trace of a day of twenty-four hours among the ancient Hebrews. Moreover, it is doubtful from extant remains of Assyrian calendars whether the astrological week prevailed in civil life even among the Babylonians and Assyrians. They did not dedicate each day in turn to a different planetary god; and it is therefore preiphic to assume that the Sabbath was in its origin what it is in the astrological week, the day sacred to Saturn, and that its observance is to be derived from an ancient Hebrew worship of that planet.

The week, however, is found in various parts of the world in a form that has nothing to do with astrology or the seven planets, and with such a distribution as to make it pretty certain that it had no artificial origin, but suggested itself independently, and for natural reasons, to different races. In fact, four quarters of the moon supply an obvious division of the month; and, wherever new moon and full moon are religious occasions, we get in the most natural way a sacred cycle of fourteen or fifteen days, of which the week of seven or eight days (determined by half moon) is the half. Thus the old Hindus chose the new and the full moon as days of sacrifice; the eve of the sacrifice was called śrāvad, and in Buddhism the same word (upasaṇa) has come to denote a Sabbath observed on the full moon, on the seventh day, or on the two days which are eighth from the full and the new moon respectively. Other religious exercises. From this point of view it is most significant that in the older parts of the Hebrew Scriptures the new moon and the Sabbath are almost invariably mentioned together.

Nor are other traces wanting of the connexion of sacrificial occasions—i.e., religious feasts—with the phases of the moon among the Semites. Thus the Hittites had four feasts in the moon each month, and of these two at least were determined by the conjunction and opposition of the moon. That full moon as well as new moon had a religious significance among the ancient Hebrews seems to follow from the fact that, when the great agricultural feasts were fixed to set days, the full moon was chosen. In older times these feast-days appear to have been Sabbaths (Lev. xxiii. 11; comp. the article Passover). A week determined by the phases of the moon has an average length of 29[1/4]/7, or 4[1/14] times 7, i.e., three weeks out of eight would have eight days. But there seems to be in 1 Sam. xx. 27, compared with verses 18, 24, an indication that in old times the twenty-eighth of the new moon, or the third week of seven working days would occur only in two months. We cannot tell when the Sabbath became dissociated from the month; but the change seems to have been made before the Book of the Covenant, which already makes mention of the Sabbath separately as an act of humanity and ignores the new moon. In both points it is followed by Deuteronomy.

6. The Babylonian and Assyrian Sabbath.—The Babylonian calendar contains an explicit reference for the observance of Sabbath from certain secular acts on certain days which forms a close parallel to the Jewish Sabbatical rules. Thus for the 7th, 14th, 21st, 28th and also the 19th days of the intercalary month Elul it is prescribed (Isa. v. 14) that the whole nation is not to eat meat; nor is any food cooked by fire, he is not to change the clothes on his body nor put on gala dresses, he may not bring sacrifices nor may the king ride in his chariot, he is not to hold court nor may the priest sacrifice for him in the temple. In one of the first days of the month the sick room, the day is not favourable for invoking curses, but at night the king may bring his gift into the presence of Marduk and Ishtar. Then he may offer sacrifice so that his prayers be heard.

Clearly, then, it was a day of suspended activity, but it will be noted that no religious ordinances are prescribed in place of the forbidden secular matters. So far no evidence is forthcoming that the same days of each month were observed as these of this special rarely occurring month. Calendars exist for other months which make no such regulations for any days. These abstinence are prescribed for the king and a few other persons; there is no evidence that they were observed by all the people. The 19th day is supposed to have had its sacred nature as the 49th day from the commencement of the preceding month, assuming that to have had 30 days. The months were divided into three (see the Hebrew names for the months: 1st, 2nd, 3rd) the character sought to be applied to the 20th day of the following month. There is no evidence that these days were called shabbat, a word which is rendered umm nāḥ liḥbī, "day of rest of the heart," and has been thought to be the origin of Sabbath. This name shabattu was certainly applied to the 15th day of the month, and um nāḥ liḥbī could mean "day of rest in the middle," referring to the moon's pause at the full. The frequent Old Testament reference of "new moons and Sabaths" to the original observance of the 1st and 15th days of the month. Many days are indicated in the calendar as nubattu, a term which signifies rest, pause, and especially a god's concomital rest with his consecrated goddess. The same such days are as a bar to attending even the most important diplomatic business or setting out on a journey. Such nubattu days fell on the 3rd, 7th and 10th of the intercalary month Elul, and 5th, 9th and 12th of the 7th month Tishri, and could not be precarious to assume that the same days in each month were nubattu, for the nubattu fell on the 4th of Lyar on one occasion.

1 See further, E. Schürer in Zeit. f. Neu Test. Wissens. (1903), pp. 1-66. For the theological discussions whether and in what sense the fourth commandment is binding on Christians, see Decalogue.

2 The week, ended by the Sabbath, determined the 'days of creation, not the 'days of creation the week" (S. R. Driver, Genesis (1909), p. 35). At the same time, there was a peculiar appropriateness in associating the Sabbath with the doctrine that Yahweh is the Creator of all things; for we see from Isa. xi. 24-25 that this doctrine was a mainstay of Jewish faith in those very days of exile which gave the Sabbath a new importance for the faithful.

3 If the day is divided into twenty-four hours and the planets preside over each hour of the day in the order of their periodic times (Saturn, Jupiter, Mars, Sun, Venus, Mercury, Moon), we get the order of days of the week with which we are familiar. For, if the Sun presides over the first hour of Sunday, and therefore also over the first hours of the following days, we have the twenty-third hour, Mercury the twenty-fourth, and the Moon, as the third in order from the Sun, will preside over the first hour of Monday. Mars, again, as third from the Moon, will preside over Thursday. In this way, the planets became very current in the Roman empire, but was still a novelty in the time of Dio Cassius (xixxi. 18).

4 The evidence of the worship of Saturn among the oldest Hebrews is doubtful. Among v. 26 (where Chiiu is taken to represent Kavan-Saturn) is of uncertain interpretation, see W. R. Harper's discussion, Hosea, pp. 139-141 (International Crit. Comm., 1905).

XXIII. 31
Possibly the intercalary month was abnormal, the incidence of observances depending not on the day of the month in ordinary months but on the day of the week reckoned consecutively through the year. For it is obvious that if each 7th day during the year was observed as such, it would, like our Sunday or a Jewish Sabbath, fall on a different day of the month in different months. It is quite possible that sabbatum and nubatum are from the same root and originally denoted much the same thing—a pause, abstention, from labor or for ceremonial purposes. The 7th day of the month being purely arbitrary may exhibit a normal arrangement, supposing that the month and the week begin together.

There are traces of what may be called the "five-day week," but also some traces of a period of seven days. The former would be an exact submultiple of the 30-day month, but the exact relation of seven days to the month is not very clear. If the 15th always was full moon day, the 7th would coincide with the 21st half moon day, and 35 days would bowle away considerably from the moon's phases. The significance of seven throughout Babylonian literature is very marked, and most of the material has been collected by J. H. Hahn, Sabbatical and Sabbath (1903), 1st ed., 1903, and 2nd ed., 1909. It is quite consistent with the evidence to suppose that a seven-day week was in use in Babylonia, but each item may be explained differently, and a definite proof does not exist. The enormous number of dated documents has induced some scholars to attempt a statistical research into the observance of the 7th, 14th, 19th, 21st, 28th, and 49th days of the months as Sabbaths. This has not been carried out with sufficient caution. If the Sabbath involved abstention from all such business, it could be recorded in dated documents and observed as the 7th, &c., and should show a marked falling off in the number of dated documents. This appears actually to be the case in the period of the First Dynasty of Babylon and also in the 7th century in Egypt, which both show a marked difference in the number of documents. In other cases the inclusion of documents relating to the temple business, payments of tithes and other dues, salaries to temple officials, and such ceremonies as marriages, &c., which may have demanded the presence of the congregation and were at least partly religious in nature, have been allowed to complicate the matter. Such business as did not profane the Sabbath according to Babylonian ideas cannot be quoted against their observance of their Sabbath. Further, since the Sabbath fell on each 7th day through the year, any indication by dated documents of a falling off in the number of transactions on the 7th day of the month must obviously be completely disregarded. As a matter of fact, in most cases the earliest Seleucid documents from temple archives, it may be expected that the Sabbath days would show an increased number of records.

For reasons above indicated the whole subject is in its infancy. But it is possible to show that the pentateuchal Sabbath, which was universally observed in Israel from Mosaic times, it would not preclude a certain indebtedness to Babylonia for at least the germ of the institution. On the other hand, complete indentity of regulations and observance in Babylonia and Israel at the 7th, 14th, 19th, 21st, 28th, and 49th days is to be expected; but more than development on the same lines. The evidence of Babylonian observance has not yet been exhaustively considered. Its most suggestive likenesses are indicated above, but further evidence is needed of the similarity less striking where one finds of it is more fully understood.

(C. H. W. J.)

7. Sabbatical Year.—The Jews under the second temple observed every seventh year as a Sabbath according to (p. 16) Lev. xxvi. 34 seq. (cp. 2 Chron. xxxvi. 21); indeed, so long as the Hebrews were agricultural people, in a land often ravaged by severe famines, the law of the Sabbatical year could not have been observed. Even in later times it was occasionally productive of great distress (1 Mac. vi. 49, 53; Jos. Ant. xiv. 16, 2). In the older legislation, however, we already meet with a seven years’ period in more than one connection. The release of a Hebrew servant after six years’ labour (Exod. xx xi. 2 seq.; Deut. xv. 12 seq.) has only a remote analogy to the Sabbath year. But in Exod. xxiii. 10 seq. it is prescribed that the crop of every seventh year shall be left for the poor, and after them for the beasts. The difference between this and the later law is that the seventh year is not only a Sabbath, and that there is no indication that all land was to lie fallow on the same year. In this form a law prescribing one year’s fallow in seven may have been anciently observed, but it scarcely originated from the analogy of a seventh day of rest. It is extended in v 11 to the vineyard and the olive oil, but here the culture necessary to keep the vines and olive trees in order is not forbidden; the precept is only that the produce is to be left to the poor. In Deuteronomy this law is not repeated, but a fixed seven years’ period is ordained for the benefit of poor debtors, apparently in the sense that in the seventh year no interest is to be exacted by the creditor from a Hebrew, or that no proceedings are to be taken against the debtor in that year (Deut. xv. 1 seq.). See the discussion by Driver, Internal Crit. Comm., ad loc., and the commentaries on Neh. v. ii.

LITERATURE.—In addition to the references already made, see the articles in Encyc. Bib. and Hastings’ Dict. Bible (with references); Fr. Hohn, Studien zum Alten Testament (reguliert). (Gutersloh, 1903: an interesting list of unlucky days from an old Egyptian calendar on p. 57 seq.): and for post-Biblical literature, F. Weber’s Jüdische Theologie (Index), by Franz Delitzsch and Schubert (1859).

SABBATION, or Sambatyon, a river (real or imaginary) in Media—named in some old authorities (Palestinian Talmud, and Midrash Gen. Rabba, lxxxii.)—the site of the exile of the Ten Tribes. But Josephus (War, vii. 1) has this curious passage, from which, no doubt, many of the subsequent legends were derived:

"Now Titus Caesar tarried some time at Berytus (Beirut) and then removed thence and gave magnificent show in all the cities of Syria through which he went, and exhibited the captive Jews as proof of the destruction of that nation. He saw on his march a river (identified by Sir C. W. Wilson with ' the stream running from the intercalary propriety,' in Syria) of seven days in the month, &c.,, such a nature as deserves to be recorded in history. It runs between Araca (Arka), which is part of Agrippa's kingdom, and Rapharea (Rafaniyeh, at north end of the Lebanon), and has something very remarkable and peculiar about it: it is very strong, and has plenty of water; after which its springs fail for six days together, and leave its channel dry, as any one may see. After this it runs on the seventh day as it did before, and as though it had undergone no change at all, and it has been observed to keep this order perpetually and exactly: whence they call it the Sabbatic river, so naming it from the sacred Sabbath of the Jews."

Whiston, in his notes to Josephus, already points out that Pliny describes the same river (Hist. Nat. xxxi. 11), but according to him it ran for four days and rested on the seventh. This is the favourite form of the legend, though though there are intermittent streams in various parts of Asia, none has yet been found to correspond to the fixed regularity posited in the tradition. Various medieval travellers reported such rivers, e.g. Petahiah of Regensburg, who states that such a stream may be found near Jabhaneh, but his assertion is unfounded.

Mahomedans still assert that Josephus's statement is true of the Nahar-al-Atus in the neighbourhood in which he locates his Sabbatic river, but modern travellers report that this stream runs every third day. Such facts would, however, be sufficient to explain the origin of the legend. The accounts of Josephus and Pliny do not assert that the intermittence of the current had any connexion with the early Sabatic law; this is a result of the 2nd century A.D., however, assumes this connexion (Sanhedrin 65 b), and a confusion between the Sambatyon of the Lost Tribes and the Sabbatical river of Syria begins to manifest itself. It is owing to the narrative of Eldad the Danite (q.v.) that the Sambatyon river rose into wide fame in the 9th century. His diary became the Arabian Nights not only of the Jews but also of many medieval Christians and Moslems. Eldad describes the Children of Moses, a powerful and Utopian race, whose territory is surrounded by a wonderful river. He describes it in these terms:

"The river Sambatyon is 200 yds. broad, about as far as a bow-shot. It is full of sand and stones, but without water; the stones make a great noise like the waves of the sea and a stormy wind, 80 to 90 ft. in the night the noise is heard at a distance of half a day's journey, and they sound as if the water were boiling; and when they hail collect themselves in one pool, out of which they water the fields. There are fish in it, and all kinds of clean birds fly round it. And this river of stone and sand and noisy stones continues three days. On the seventh day as soon as the Sabbath begins, fire surrounds the river, and the flames remain until the next evening, when the Sabbath ends."

Nöldeke (Beiträge zur Geschichte des Alexanderrnoms, 48) has shown that the Sambatyon appears in one version of the Alexander Legend. Kaswini, the author of the Arab Cosmography, also refers to the Sambatyon. So does Proser John in his letter addressed to the emperor Frederick; in his account it is the violence of the current of sand and stone that prevents the Lost Tribes from reuniting. It is unnecessary to summarize
SABBIONETA—SABELLIUS

the various embellishments of the legend; in one version the river attains a width of 17 m. and throws stones as high as a house. But there are no stones on Saturday; it then resembles a lake of snow-white sand.

Menasseh ben Israel (q.v.), who gave vogue to this latter story in his *Hope of Israel*, adds the detail that if sand from Sambatyon be kept in a bottle it agitates itself during the week of the fast; it remains still on the Saturday.

The site of the Sambatyon varies considerably in the different narratives. Media, Ethiopia, Persia, India, the Caspian district,—all these are suggested. Reggio identified the river with the Euphrates, Fann with the Zeb in Adiabene. But as Neubauer remarks: "It would be lost time to trouble ourselves about the identification of this stream."

See Neubauer, *Where are the Ten Tribes?* in *Jewish Quarterly Review*, vol. I. passim; M. Seligsohn in *Jewish Encyclopedia*, x. 681. (L.A.)

SABBIONETA, a town of Lombardy, Italy, in the province of Mantua, from which it is 20 m. S.W. by steam tramway, not far from the N. bank of the Po, 59 ft. above sea-level. Pop. (1901) 1835 (town); 7016 (commune). Its period of prosperity was under Vespasian Gonza (d. 1591), who was its duke; by him it was transformed into a small "Residenzstadt." It was well fortified, and from this period dates the ducal palace (now the Municipio), the theatre designed by Pacomozzi, &c. The church and the summer palace contain frescoes by the Campi of Cremona. Here in 1567 a Hebrew printing press was set up.

SABELLIUS, the name originally given by Mommsen in his *Unteritalische Dialetke* to the pre-Roman dialects of Central Italy which was neither Oscan nor Umbrian. The progress of study has, however, grouped them under more specific names, such as the "North Oscan" group (see PAELIGNI) and the "Latinian" group (see LATIN LANGUAGE), and the only content now left for the term Sabellic consists of a group of 8 or 9 inscriptions to which it certainly cannot be applied with truth. They are probably, if not certainly, the most ancient inscriptions in existence on Italian soil. Since they were all found on a strip of the eastern coast running from the mouth of the Aternum on the south to Pesaro on the north, it is probably best to call them simply "East Italic" or "Adriatic."

Not even the transcription of their alphabet has reached the stage of certainty, for even in this small number of inscriptions the alphabet seems to vary. The chief doubt is about the value of V and Μ (or Α and Α) which appear beside the symbol A on the same inscriptions; and of the dots in the middle of the line which are certainly not interpuncts. They may conceivably have some connexion with the dots in Venetic inscriptions, which R. S. Conway has endeavoured to explain (see VENERI). The most striking characteristic of the group of inscriptions is that the direction of the writing in alternate lines is not merely reversed but inverted ("serpentine bonstrophedon" as on the Etruscan stele of Capua of the 5th century B.C.) (see ETURIA: Language). Thus if the first line consisted of the letters ABC, in that order, the next would be D3G, i.e., with each letter turned so as to face the left, and with its head downwards. This arrangement appears in some of the Venetic inscriptions also. The study of the language from Sabellic, now preserved in the Naples Museum. The probability is that both this and all the rest were epigraphs, but a translation is at yet out of the question. The stone from Cestriano gives us certain forms which seem to be recognizable as Indo-European, namely *paterefo, materefo*, though it is far from certain that the symbol Μ, which is here represented by f, really has that value.

Pauli's conjecture that these inscriptions probably represented the language of some settlers from Ilyria has little support except that of some coincidences in tribal and local names on the two sides of the Adriatic (e.g., *Truentum*, quod solum Liburni in Italia relicuium est) (*Piln. Nat. Hist.* iii. 110); *entum* being a frequent Ilyrian ending, and *Liburn* an Ilyrian tribe), though it is a priori likely enough.

For the authorities for the alphabets and the text of the inscriptions as known down to 1897, see R. S. Conway's *Italic Dialects* (Cambridge, 1897), ii. 528; and nothing has yet (1908) been added to what was written about the alphabets by Karl Pauli (Alltsach. Stud. iii., "Die Veneter," Leipzig, 1891, pp. 220 seq. and p. 423). Some memorable but wholly uncertain attempts by W. Deehmke as to the meaning of some of the inscriptions may be sought in the appendix to Zvetkaeff's *Inscr. Italie inferiores dialiectae*; and also in a further inscription of this class has been found at Belmonde Piceno, which is preserved in the museum at Bologna and reported by Brizio in *Notiz. degli scavi*, 1905, p. 104.

It is to be noticed that a much longer and far more legible inscription from Novilara (now in the museum at Pesaro—a cast of it is at Bologna) sometimes spoken of as Sabellic, whose first two words are *mimmis erat*, is perhaps more probably to be regarded as containing some variety of Etruscan, though its character is far from certain. Its alphabet closely resembles Etruscan of the 4th century B.C. It is a very interesting monument both for its own sake, since it is sculptured as well as inscribed (there is one—or more—hunting or pastoral scene on the back), and because the archaeological stratum (late Bronze period) of the cemetery from which it is believed to have come is clearly marked.

With a companion fragment it is fully described by Brizio in *Mitt. de la R. Acc. Bologna*, v. (1895), and it has also been discussed by Ella Lattes in *Hermes* (230), and it has also been discussed by Ella Lattes in *Hermes* (230), and also has been discussed by Ella Lattes in *Hermes* (230), and also has been discussed by Ella Lattes in *Hermes* (230).

SABELLIUS (fl. 320), early Christian presbyter and theologian, was of Libyan origin, and came from the Pentapolis; he became a presbyter some time early in the 3rd century. To understand his position a brief review of the Christian thought of the time is necessary. Even after the elimination of Gnosticism the church remained without any uniform Christology; the Trinitarians and the Unitarians continued to confront each other, the latter at the beginning of the 3rd century still forming the large majority. These in turn split into two principal groups—the Adoptianists and the Modalists—the former holding Christ to be the man chosen of God, the Holy Spirit rested in a quite unique sense, and who after the Holy Spirit descended upon him, to the horse having the God man, became divine, the latter maintaining that Christ to be a manifestation of God Himself. Both groups had their scientific theologians who sought to vindicate their characteristic doctrines, the Adoptianist divines holding by the Aristotelian philosophy, and the Modalists by that of the Stoics; while the Trinitarians (Tertullian, Hippolytus, Origen, Novatian), on the other hand, appealed to Plato.

In Rome Modalism was the doctrine which prevailed from Victor to Caecilius or Callistus (c. 190-220). The bishops just named are reputed to have been elected in the city the schools of Epipnus and Cleomenes, where it was held that the Son was identical with the Father. But the presbyter Hippolytus was successful in convincing the leaders of that church that the Modalistic doctrine taken in its strictness was contrary to Scripture. Callistus saw himself under the necessity of abandoning his friends and setting up a mediating formula designed to harmonize the Trinitarian and the Modalistic positions. But, while excommunicating the strict Unitarians (Monarchs), he also took the same course with Hippolytus and his followers, declaring their teaching to be ditheism. The mediation formula, however, proposed by Caecilius, was accepted by the church in the course of the decades immediately following, the doctrine of the Trinity being brought into the Roman Church. In the year 250, when the Roman presbyter Novatian wrote his book *De Trinitate*, the doctrine of Modalism, once discredited as ditheism, had already become official there. At the same time Rome and most of the other churches of the West still retained a certain leaning towards Modalistic monarchism. This appears, on the one hand, in the use of expressions having a Modalistic ring about them—see especially the poems of Commodian, written about the time of Valerian—and, on the other hand, in the rejection of the doctrine that the Son is subordinate to the Father and is a creature (witness the controversy between Dionysius of Alexandria and Dionysius of Rome), as well as in the readiness of the West to accept the formula of Athanasius, that the Father and the Son are one and the same in substance (μονοθετία). The strict Modalists, whom Calixtus had excommunicated along with their most zealous opponent Hippolytus, were led

1. For the Sabellic tribes, see SABINE.
SABIANS—SABINE

by Sabellius. His party continued to subsist in Rome, for a considerable time afterwards, and withstood Calixtus as an unscrupulous apostate. In the West, however, the influence of Sabellius seems never to have been important; in the East, on the other hand, after the middle of the 3rd century his doctrine found much acceptance, first in the Pentapolis and afterwards in other provinces. It was violently controverted by the bishops, notably by Dionysius of Alexandria, and the development in the East of the philosophical doctrine of the Trinity after Origen (from 260 to 320) was very powerfully influenced by the opposition to Sabellianism. Thus, for example, at the great synod held in Antioch in 268 the word ὑποστάσεως was rejected, as seeming to favour Unitarianism. The Sabellian doctrine itself, however, during the first two centuries underwent many changes in the East and received a philosophical dress. In the 4th century this and the allied doctrine of Marcellus of Ancyra were frequently confounded, so that it is exceedingly difficult to arrive at a clear account of it in its genuine form.

Sabellianism, in fact, became a collective name for all those Unitarian doctrines in which the divine nature of Christ was acknowledged. The teaching of Sabellius himself was very closely allied to the older Modalism ("Patrapiassonianism") of Noetus and Praxedis, but was distinguished from it by its more careful theological elaboration and by the account it took of the Holy Spirit. His central proposition was that the Father, Son, and Holy Spirit are the three persons in the πρόσωπον of the Father as Creator and Lawgiver, then in the πρόσωπον of the Son as Redeemer, and lastly in the πρόσωπον of the Spirit as the Giver of Life. It is by this doctrine of the succession of the πρόσωπα that Sabellius is distinguished from the older Modalists. In particular it is significant, in conjunction with the reference to the Holy Spirit, that Sabellius regards the Father also as merely a form of manifestation of the one God—in other words, has formally put Him in a position of complete equality with the other Persons. This view prepares the way for Augustine's doctrine of the Trinity. Sabellius himself appears to have been influenced by the "formae" (τὸν ἴδιον τῆς κατάστασις) of the Deity, but he chiefly relied upon Scripture, especially such passages as Deut. vi. 4; Exod. xx. 3; Isa. xlv. 6; John x. 38. Of his later history nothing is known; his followers died out in the course of the 4th century.

The sources of our knowledge of Sabellianism are Hippolytus (Philos. bk. ix.), Epiphanius (Haer. xlix.) and Dionys. Alex. (Epp.); also various passages in Athanasius and the other fathers of the 4th century. For modern discussions of the subject see Schlachermacher (Theol. Ztschr. 1822, Ht. 3); Lange (Ztschr. f. hist. Theol. 1832, ii. 2); Dozy (Nouveaux, xxxv. 3); Zahn (Marcell. w. Ancarya, 1867); R. L. Ottley, The Doctrine of the Incarnation (1866); a further historical account of Dogma, and Harnack (s. v. "Monarchianismus," in Herzog-Hauck, Realencycl. f. prot. Theol. und Kirche, xiii. 303). (A. H. A.)

SABIANS. The Sabians (α-Σαβίας) who are first mentioned in the Koran (ii. 59, v. 73, xiiii. 17) were a semi-Christian sect of Babylonia, the Elamites, closely resembling the Mandaeans or so-called "Christians of St John the Baptist," but not acquainted with them. Their name is probably derived from the Aramaic סָבִי, a dialectical form of סֵבִי, and signifies "those who wash themselves"; the term al-muqhtasita, which is sometimes applied to them by Arab writers, has the same meaning, and they were also known as ἡμεσαβιατικαί. How Mahomet understood the

In the 18th century there was discovered in one of the catacombs of Rome an inscription containing the words "qui et Illius diceret et Peter inventis." This can only have come from a Sabellian.

"Sābians" is uncertain, but he mentions them together with the Jews and Christians. The older Mahomedan theologians were agreed that they possessed a written revelation and were entitled accordingly to enjoy a toleration not granted to mere heathen. Curiously enough, the name "Sābian" was used by the Meccan idolaters to denote Mahomet himself and his Moslem converts, apparently on account of the frequent ceremonial ablutions which formed a striking feature of the new religion.

From these true Sābians the pseudo-Sabians of Harrān (Carraχe) in Mesopotamia must be carefully distinguished. In A.D. 830 the Caliph Ma'mūn, while marching against the Byzantines, received a deputation of the inhabitants of Harrān, astonished by the sight of their long hair and extraordinary costume, he inquired what religion they professed. Getting no satisfactory answer threatened to exterminate them, unless by the time of his return from the war they should have embraced either Islam or one of the creeds tolerated in the Koran. Consequently, acting on the advice of a Mahomedan jurist, the Harrānians declared themselves to be "Sābians," a name which shielded them from persecution in virtue of its Koranic authority and was so vague that it enabled them to maintain their ancient beliefs undisturbed. There is no doubt as to the general nature of the religious beliefs and practices which they sought to mask. Since the epoch of Alexander the Great Harrān had been a famous centre of pagan and Hellenistic culture; its people were Syrian heathens, star-worshippers versed in astrology and magic. In their temples the planetary powers were propitiated by blood-offerings, and it is probable that human victims were occasionally sacrificed even as late as the 9th century of our era. The more enlightened Harrānians, however, adopted a religious philosophy strongly tinged with Neoplatonic and Christian elements. They produced a brilliant succession of eminent scholars and scientists who transmitted to the Moslems the results of Babylonian civilization and Greek learning, and their influence at the court of Baghdad secured more or less toleration for Sābianism, although in the reign of Harūn al-Rashid the Harrānians had already found it necessary to establish a fund by means of which the conscientious scruples of Moslem officials might be overcome. Accounts of these false Sābians reached the West through Maimonides, and then through Arabic sources, long before it was understood that the name in this application was only a disguise. Hence the utmost confusion prevailed in all European accounts of them till Chwolson published in 1856 his Sōbbrer und der Sabismus, in which the authorities for the history and belief of the Harrānians in the middle ages are collected and discussed.

See also "Nouveaux documents pour l'étude de la religion des Harrānians," by D. De Sacy, in the Actes of the sixth Oriental congress, ii. 281 f. (Leiden, 1885).

SABICU WOOD is the produce of a large leguminous tree, Lysilema Sabica, a native of Cuba. The wood has a rich mahogany colour; it is exceedingly heavy, hard and durable, and therefore most valuable for shipbuilding. Sabicu, on account of its durability, was selected for the stairs of the Great Exhibition (London) of 1851, and, notwithstanding the enormous traffic which passed over them, the wood at the end was found to be little disfigured by the traffic.

SABINE, SIR EDWARD (1758–1858), English astronomer and geodesist, was born in Dublin on the 14th of October 1758, a scion of a family said to be of Italian origin. He was educated at the Royal Military Academy, Woolwich, and obtained a commission in the royal artillery at the age of fifteen, attaining the rank of major-general in 1839. His only experience of warfare seems to have been at the siege of Fort Erie (Canada) in 1814. In early life he devoted himself to astronomy and physical geography, and in consequence he was appointed astronomer to various expeditions, among others that of Sir J. Ross (1818) in search of the North-West Passage, and that of Sir E. Parry (1820–24). Later, he spent long periods on the inter-tropical coast of Africa and America, and again among the snows of Spitzbergen. He was associated with Henry Williams Chisholm and others as a member of the Royal Commission of
1868-1869 for standardizing weights and measures. Sabine was for ten years (1861-1871) president of the Royal Society, and was made K.C.B. in 1869. He died at East Sheen, Surrey, on the 26th of May 1883.

Of Sabine's scientific work two branches in particular deserve very high credit—his determination of the length of the second's pendulum, and his extensive researches connected with terrestrial magnetism. The establishment of a system of magnetic observatories in various parts of British territory all over the globe was accomplished mainly on his representation; and a great part of his life was devoted to their direction, and to the reduction and discussion of the observations. While the majority of his researches bear on one or other of the subjects just mentioned, others deal with such widely different topics as the birds of Greenland, ocean temperatures, the Gulf Stream, barometric measurement of heights, arcs of meridian, glacier transport of rocks, the volcanoes of the Hawaiian Islands, and various points of meteorology.

SABINI, an ancient tribe of Italy, which was more closely in touch with the Romans from the earliest recorded period than any other Italian people. They dwell in the mountainous country east of the Tiber, and are the district northward of the volcanoes inhabited by the Latins and the Aequians in the heart of the Central Apennines. Their boundary, between the southern portion of the Umbrians on the north-west, and of the Picentines on the north-east, was probably not very closely determined. The traditions connect them with the beginning of Rome, and with a large number of its early institutions, such as the worship of Jupiter, Mars and Quirinus, and the patrician form of marriage (confarreatio).

Of their language as distinct from that of the Latins no articulate memorial has survived, but we have a large number of single words attributed to them by Latin writers, among which such forms as (1) fereus, Lat. hircus; (2) ausmus, Lat. aurum; (3) novensile, Lat. novensides ("gods of the nine seats"); (4) the river name Foraros, beside pure Lat. Fabaros (Servius, ad Aen. vii. 715); and (5) the traditional name of the Sabine king, Numa Pompilius (contrasted with Lat. Quintilius), indicate clearly certain peculiarities in Sabine phonology: namely, (1) the representation of the Indo-European palatal aspirate gh by h instead of Lat. h; (2) the retention of s between vowels; (3) the change of medial and initial d to l; (4) the retention of medial f which became in Latin b or d; and (5) the change of Ind.-Eur. q to f as well as the usual change of q to f as well as the usual change of q to f. It seems very probable that the Sabines were the parent stock of the Samnites, and this is directly confirmed by the name which the Samnites apparently used for themselves, which, with a Latinized ending, would be Safinu (see SAMNITES and the other articles there cited, dealing with the minor Samnite tribes).

It is one of the most important problems in ancient history to determine what was the ethnological relation of these tribes, whom we may call "Sabine," to the people of Rome on the one hand, and the earlier stratum or strata of population in Italy on the other. Much light has been thrown on this group of questions in recent years both from linguistic and from archaeological sources. For the historical and archaological evidence which connects the Sabines with the patriarchs of Rome, see ROME, Ancient History. The linguistic side of the matter may be conveniently dealt with here. From this point of view the question to be asked is what language did the Sabines speak? Was it most nearly akin to Latin or to Oscan or again to Umbrian and Volscian?

A single monument of 5th- or 4th-century Sabine would be of unique value; but in the absence of any such direct evidence we are thrown back on a few cardinal facts: (1) Festus, though he continually cites the Lingua Oscan never spoke of Lingua Sabina, but simply of Sabini, and the same is practically true of the other Latin dialects. The Sabines, however, have the language of the Sabines as a living speech, though he does imply (v. 66 and 74) that the dialect used in the district differed somewhat from urban Latin. The speech therefore of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been.

(2) The language of the Samnites was that which we now call Oscan (see OSCA Lingua). (3) The evidence of the glosses and place-names already referred to confirms tradition by the resemblance which they show to the phonological characteristics of Oscan. On the other hand there are two or three forms called Sabine by Latin writers which do appear to show the sound q unchanged, especially the name of the Sabine god Quirinus, which seems to be at least indirectly connected with the name of the Sabine town Cures. We do not, however, know that the initial sound of this word was originally a Velar q, and Professor Ridge-1

There are only six suffixes so used among the names of ancient Italy.1 These suffixes are: -ulo-, -io-, -o-, -ti- (or -atil-), -ensi,

1. The suffix -ulo- appears only in a few old names, Siculi, Rutuli, Appuli, Paeduli and *Vituli, which would have been the Latin form instead of Itali, which was taken over from the Greekized form italoi.

2. Excluding this small group, the frequency of the occurrence of these suffixes in ancient Italy is shown by the following table:

| Table of Ethnic Suffixes in Ancient Italy. |
|---|---|---|---|---|---|---|
| Dialectic Area. | -IO- | -CO- | -NO- | -TI- | -ENS- | Totals. |
| Messapii | 2 | 16 | 2 | 20 |
| Peucetii | 1 | 15 | 3 | 19 |
| Duni | 1 | 8 | 3 | 14 |
| Bruttii | 2 | 11 | 2 | 19 |
| Lucani | 3 | 2 | 1 | 20 |
| Hipicini | 3 | 3 | 1 | 20 |
| Frentani | 3 | 4 | 2 | 10 |
| Samnitiae | 1 | 5 | 4 | 13 |
| Labini | 3 | 4 | 3 | 13 |
| Aurunci | 2 | 2 | 1 | 5 |
| Volsci | 2 | 1 | 4 | 11 |
| Kernici | 1 | 3 | 2 | 6 |
| Marsi | 1 | 3 | 4 | 9 |
| Aequi | 1 | 3 | 4 | 6 |
| Latini | 4 | 8 | 20 | 27 |
| Early Rome | 2 | 19 | 6 | 27 |
| Sabini | 1 | 19 | 2 | 21 |
| Ituria (including the Falisci) | 5 | 1 | 20 | 70 |
| Marrucini | 1 | 2 | 4 | 7 |
| Paeduli | 6 | 2 | 14 |
| Vestini | 8 | 4 | 2 | 14 |
| Piceni | (1) | 15 | 5 | 14 |
| Umbri | (1) | 23 | 15 | 73 |
| **Totals.** | 27 | 7 | 354 | 107 | 601 |

The figures in brackets refer to the forms in -CINO; see below.

3. The names in -io- seem to have been evenly distributed over the Italian area and not to mark any particular tribe or epoch.

4. The suffix -ensi can be shown to have borne a political significance, the language of the Sabines by Varro's time had become too Latinized to give us more than scanty indications of what it had once been.

---

1 This statement with those which follow is based upon the collections of the place-names of ancient Italy, arranged according to their locality, by R. S. Conway in The Italic Dialects (Cambridge, 1897).
SABINIANUS—SABLE ISLAND

that is to say, it was used by the Romans to form the names of the inhabitants of municipal towns, as for instance *Pore-ivenses*, the inhabitants of Forum Julii. There remain, therefore, the three suffixes *-co-, -no-, and -ti-, and it will be seen from the table that the relative frequency of these suffixes in different dialect-areas varies very greatly. The *-co-*, for example, has almost driven out any other in the district of the Hirpini, and it is greatly preponderant among the Campani, in the district of the Lucani, and among the Latini and Sabini themselves.

6. The other, the *-ti-*, which is nowhere frequent, is practically confined to the central areas.

7. In the article VoLscr it is shown that the addition of the *-no-*, suffix is often a mark of the conquest of an original *-co-*, Sabine tribe. It is also fairly frequently added to names formed with the *-ti-*. Ardea gave first Ardestes and then Artea; the Picentes became Picentini, the Camerites Cameronti; of such forms there are no fewer than 54.

8. The addition of the *-ti-*, suffix to the *-no-*, ethnicon, as in *Iguvinates*, is comparatively rare, and no doubt denotes the opposite process, namely, the absorption of a *-no-*, tribe by a population to whom it was natural to use the suffix *-ti-*. The two opposite processes confirm the inference that both are due to some change of race, not merely to a change of custom in the same population in a later age; for in that case the change would have been in one direction only.

The assumption of the Safine origin of the *-no-*, suffix is further confirmed by the practice of the Romans themselves. The folk of Latium after the Safine conquest were no longer Latiores but Latinii; and over against the old name *Quiriti* was the new *Populus Romanus*. Just the same rough and ready nomenclature was applied to communities conquered on foreign soil; the *Sparriarui* became *Spartani*, the *Syrachoni* *Syracusani*, and the *Amarykoi* *Asiani*, and so on.

The assumption that Latin was properly the language of the Latin plain and of the Plebs at Rome, which the conquering patricians learnt from their Slav, and substituted for the Latinised dialect of the conquered people, is supported by the striking evidence of such continual interchange going on within quite modern periods of time afforded by the epistolae of the Livy and Cicero. With the arrival of the Slav on the plain of Rome, the manufacture of farm-implements and trade in cattle are carried on. A communal college is among the public institutions. From the 11th century Sabine was the seat of a powerful barony, which in 1602 was made a duchy-peerage in favour of Urbain de Laval, marshal of France. The place afterwards came into the possession of Colbert de Torcy, nephew of the great Colbert who built the château. In 1488 a treaty which resulted in the union of France and Brittany was concluded at Sablé, between Charles VIII. and Duke Francis II.

SABLE, a town of western France, in the department of Sarthe, on the river Sarthe, 30 m. S.W. of Le Mans by rail. Pop. (1906) 4952. Sablé has a château of the 18th century, a fortified gateway, relic of a medieval stronghold, and a modern church with fine stained glass of the early 19th century. It is the site of the manufacture of farm-implements and trade in cattle are carried on. A communal college is among the public institutions. From the 11th century Sablé was the seat of a powerful barony, which in 1602 was made a duchy-peerage in favour of Urbain de Laval, marshal of France. The place afterwards came into the possession of Colbert de Torcy, nephew of the great Colbert who built the château. In 1488 a treaty which resulted in the union of France and Brittany was concluded at Sablé, between Charles VIII. and Duke Francis II.

SABLE ANTELOPE, the English name for a large and handsome South African antelope (*Hippotragus niger*), exhibiting the usual feature of *Hippotragus*—dark or black in both sexes. The sable and the roan antelope (*H. equinus*) belong to a genus nearly related to the oxen, with which they form a group or subfamily. In all these antelopes long cylindrical horns are present in both sexes; the muzzle is hairy; there is no gland below the eye; the tail is long and tufted; and in the breadth of their tail crowns the upper molar-teeth resemble those of the oxen. The sable and roan antelopes are distinguished from *Oryx* by the stout and thickly ringed horns rising vertically from a ridge over the eyes at an obtuse angle to the plane of the lower part of the face, and then sweeping backwards in a bold curve. Sable antelopes are among the handsomest of South African antelopes, and are endowed with great speed and staying power. They are commonly met with in herds including from ten to twenty individuals, but on rare occasions as many as fifty have been seen together. Forest-clad highlands are their favourite resorts. The roan antelope is a larger animal, with shorter horns, whose general colour in both sexes is strawberry-rose. It is typically a South African species, but is represented by a local race in the eastern Sudan (*H. equinus bakeri*) distinguished by its redder colour and different face-makings.

SABLE ISLAND, an island of Nova Scotia, Canada, 110 m. S.E. of Cape Bégonia, in 43° 56' N. and 66° W. It is composed of shifting sand, and is about 20 m. in length by 1 m. in breadth, rising in places to a height of 85 ft. In the interior is a lake about 10 m. in length. At either end dangerous sandbars run out
about 17 m. into the ocean. It has long been known as "the graveyard of the Atlantic"; over 200 known wrecks have been catalogued, and those unrecorded are believed greatly to exceed this number. The coast is without a harbour and liable to fogs and ice storms, and regular ocean currents of great strength sweep round it, and its only safe-harbour is indistinguishable until close at hand. Since 1873 an efficient lighthouse system and life-saving station has been maintained by the Canadian government, and the danger has been much lessened. Since 1904 it has been connected with the mainland by wireless telegraphy. The island is constantly changing in shape, owing to the action on the sand of wind and wave, and tends to diminish in size. Since 1763, when taken over by Britain, it has shrunk from 40 m. in length to 20, from 23 in breadth to 1, and from 200 ft. in height to 85; since 1873 the western lighthouse has thriee been removed eastward. As this makes navigation still more dangerous, the Canadian government has planted thousands of trees and quantities of root-binding grass, and the work of destruction has been somewhat stayed. Wild fruits grow plentifully during the summer, and cranberries are exported. Wild ducks, gulls, and other birds nest in large numbers, and a native breed of ponies has long flourished.

Sable Island, estimated as being then over 100 m. in length, was known to the early navigators under the name of Santa Cruz. Early in the 16th century horses were left on its shores by the Portuguese, and the native ponies, supposed to be their descendants, are still exported. In 1598 a band of convicts were turned loose by the Dutch at the Roche, but in 1603 the survivors were restored to France.

See Rev. Geo Patterson in *Transactions of Royal Society of Canada* (1894 and 1897).

**SABRE-FENCING**, the art of attack and defence with the sabre, or broad-sword. Besides the heavy German basket-sabre and the *Schilder* (see below) there are two varieties of sabre used for fencing, the military sword and the so-called light sabre. These are nearly identical in shape, being composed of a slightly curved blade about 34 in. in length and a handle furnished with a guard to protect the hand; but the military sword, or broad-sword proper, the blade of which is about 2 1/2 in. wide near the guard, tapering to 1 in. near the point, is considerably heavier than the light sabre and is generally preferred by military instructors, being almost identical with the regulation army sabre in size and weight. Until 1900 it was the common fencing sabre in Great Britain, the United States, and most European countries, although its use was practically confined to military circles. About 1900 the light Italian sabre was introduced and became the recognized cut-and-thrust weapon among fencers throughout the world. In Austria-Hungary it became popular as early as 1885, while in Italy, the country of its origin, it has been in use since the middle of the 19th century. Its blade is about 2 1/2 in. wide a little below the guard, tapering to 1 1/2 in. just under the point. For practice this is truncated and the edge blunt, but in scoring both edge and point are assumed to be sharp, while in countries on the continent of Europe (though not in Great Britain or the United States) the back-edge (false-edge) is also supposed to be sharpened for some 8 in. from the point. In Italy when used for duelling the point and both edges are actually sharpened.

The modern sabre is a descendant of the curved light cavalry sword of the late 18th century, which was introduced into Europe from the Orient by the Hungarians.

The old-time European swords used for cutting were nearly all straight, like the Ital. *schienone* and *spadone*, the English and German two-handers and the Scotch claymore (see *Sword*). There was indeed a heavy curved fencing weapon called *dussack*, very popular in the German fencing schools of the 16th and 17th centuries, which was of wood, very broad and as long as the fencer's arm, with an elliptical hole for the hand in place of a guard. But the *dussack* was introduced from Bohemia, where, as in Hungary, swords were oriental in shape, and as it completely disappeared in the last half of the 17th century it can hardly be considered in any way as the ancestor of the modern sabre. The old English *back-sword*, the traditional English weapon, though the curved form was not quite unknown, was almost invariably straight. The ancient English sword-and-buckler play (see *Fencing*) was, to the disgust of its devotees, driven out as a method of serious combat by the introduction at the beginning of the Elizabethan era of the Italian thrusting sabres. Nevertheless it survived as a sport up to the first half of the 18th century, being practised, together with the back-sword or broad-sword play, cudgelling or single-stick fencing, foiling and boxing, by the fencing masters of that period, whose exhibitions, given for the most part in the popular bear-gardens, were described by Pepys, Steele and others. The masters who figured in these "stage-fights" were called "prize-fighters"; and at that period they regarded boxing only as an unimportant part of their art. The most famous of them was Figg, the "Atlas of the Sword" (see *Fencing*). The back-sword of Figg's time was essentially the military sword then in use, having a single straight edge. The blows were aimed at the head, body or legs. Towards the close of the 18th century sticks began to be used for back-swording, the play at first aiming at any part of the person; but the head soon came to be the sole object of attack, blows on the body and arms being used only to gain an opening. The usual defence was from a high hanging guard. No lunging was allowed. Fencing with the broad-sword did not, however, at any period entirely disappear in England, and was taught by all the regular masters, especially by the celebrated Angelo. The earlier play, of the time of Figg and later, was simple and safe. The prevailing defensive position was the hanging guard, high or medium, with the arm extended and the point downwards. There were also high inside and outside, tierce, quarte, low prime, seconde, and the head or "St George," parries; the last, a guard with the blade nearly horizontal above the head, being the supposed position of England's patron saint from which he dealt his fatal blow at the dragon. Owing to the great weight of the old back-sword wrist-play was almost impossible, the cuts being delivered with a chopping stroke. Later in the 18th century a nimble style, called the Austrian, came into fashion, owing to the introduction of a lighter, curved sabre, the principal guards being the medium, with extended hand and sword held perpendicularly with the point up; the hanging, with the point aimed both outside and inside; the half-circle; the "St George," and the spadroon, with horizontal arm and sword pointing downwards. The *spadroon* (Ital. *spadrone*), a light, straight, flat-bladed and two-edged sword, was also a popular 18th-century weapon, and was used both for cutting and thrusting. The thrusting attacks and parries were generally similar to those of the small-sword (see *Foil-Fencing*), but few or no circular parries were used. The cuts were like those of the broad-sword. The Germans, like the British, were once masters of the edge in fencing, but the art declined with the introduction of the point, and sabre-playing survived only in the army and in academic circles with the heavy basket-sabre (see below).

The school of sabre still taught in most armies, and up to the end of the 19th century by fencing-masters of all countries except Italy and Austria-Hungary, shows little advance from that in vogue in Angelo's time. Two fundamental guards are usual, one (taught at the French army school at Joinville-le-Pont) corresponding to the guard of tierce in foil-fencing, except that the left forearm rests in the small of the back; and the other a high hanging guard, with crooked arm and the point of the sabre directed slightly forwards. The methods of coming on guard are considerably, but have nothing to do with fencing proper.

In 1860 the Florence (Cavallerie) system of sabre play, which had been introduced into the British army, the cavaliere F. Masiello spending some time at Aldershot for the purpose of training the army swordsmen, but since the year 1900 regular instruction in swordsmanship has practically been abandoned.

Fencing on horseback for cavalry is simple in comparison with light sabre-play. The cavalry sword is of two patterns, one the heavy, straight cuirassier's sword, and the other somewhat lighter with a slightly curved blade. On the attack straight
SABRE-FENCING

point thrusts, and wide sweeping cuts are used. The three principal parries are the “head” (or “high prime”) with horizontally held blade; the “tiere,” on the right, parrying cuts at the left side of the head and body; and the “quarte,” on the opposite side.

The modern style of fencing with the light sabre was perfected in Italy during the last quarter of the 19th century, the most important pioneer in its development having been G. Radaelli, a Milanese master, who became chief instructor of the sabre in the Royal Italian Military Fencing Academy in 1874, when it was transferred to Milan from Parma. Radaelli’s system was described by F. Masio, an army officer whose works are marked by a high military authority on the light sabre. An old-time rivalry between the Neapolitan and the northern Italian fencing methods came to a crisis when M. Parise, an expert of the southern school, secured first place for foil-fencing in a tournament instituted by the military authorities, the result being the transfer of the Military Fencing Academy to Rome under the title of Scuola Magistrale di Roma. There was, however, less difference between the two schools in sabre than in foil play, and the Radaelli system for the former was so generally esteemed that a master of that method was established at the Roman Academy.

The light fencing-sabre is made up of two principal parts, the blade and the handle. The blade, from 32½ to 34½ in. long and slightly and gradually curved from hilt to point (which is truncated), has the tongue, or tang, which runs through the handle; the heel, or thick uppermost part of the blade fitting on to the guard; the edge, running from heel to point; the back-edge or false-edge (sometimes not allowed), running from the point along the back for about 8 in.; and the back, running from point to heel (unless there is a back-edge). The blade is fluted on both sides from the heel where the back-edge begins. The handle consists of the guard, of thin metal, extending from the pommel to the heel of the blade; to protect the hand; the grip, or back; the pommel, or knob; a button which finishes off the handle and holds the tongue in place.

The recognition of the light fencing-sabre as a practice weapon only, related to the heavier military sword as the foil is to the duelling-sword, at once makes apparent the difference between the play of the two cut- and thrust-weapons. As a light cut with the military sabre will be of little advantage in battle, however prettily delivered, it is evident that in order to produce a shock of impact sufficient to put an adversary out of action, a wide sweeping movement with the sword (moulinet; Ital. molinello) is necessary. With the fencing-sabre a bit is hit if properly delivered with the edge or point, however light it may be. For hits of this kind less force is necessary, and wide moulinets are not only useless but dangerous, since in making them the point must for a moment be directed away from the opponent, and momentary openings are thus left of which the opponent may take advantage by attacks on the preparation. For this reason the cuts of the Radaelli school are delivered with moulinets of very narrow radius, made as much as possible by a movement of the elbow only, keeping the point directed menacingly towards the opponent, when the cut is made, the person may be effective and the school of the heavy sabre has to reckon with this fact, in fencing with the light sabre no hit lower than the hips counts, although hits upon any part of the person above the hips are good; in England cuts on the outside of the thigh are allowed. This somewhat narrows the scope of the fencing-sabre, just as the scope of the foil is narrower than that of the duelling-sword.

The military sword is, on account of its weight, usually held firmly in the hand with the thumb overlapping the fingers; but in holding the light sabre the thumb is placed on the flat of the grip, giving a perfect command over the movements of the blade, called by the Italians pasteggo. Both attacks and parries are executed as narrowly as possible, avoiding the wide movements common in heavy sabre-play, and the moulinets (which are ellipses described by the point as it is drawn back for a cut) are made, not by swinging the sword round the head, but by drawing back the hand held in front of the body, and with the point directed forward. The thrusts with the light sabre are made with the thumb to the left; whereas in the French school it is turned down, so that the blade curves upward. The modern school allows no such parries as the “St George,” in executing which the blade is held at right angles to the body, but teaches that the point should always be directed towards the adversary as much as possible. The attacks are either “simple,” “complex” or “secondary,” and bear a general resemblance to those in foil-fencing (q.v.); simple attacks being such as are not preceded by feints; complex attacks those preceded by feints, advances, or some other preliminary manoeuvre; and secondary attacks those carried out while the adversary is himself attacking or preparing to attack. The parries also correspond in nomenclature, and generally in nature, to those used in foil-play, but no circular or counter-parries are taught, though sometimes employed.

Terms used in Sabre-Fencing.—“ Absence of the blade”: a guard so wide as apparently to leave the body uncovered, so as to entice the adversary to attack with either supplementary cut or thrust after the failure of an attack, when the adversary replies simply or with a feint. “Assault” (Ital. assalto), a regular bout. “Back” (Ital. retro), the blade (see “beat,” “feint,” “graze,” and “parry”). “Beat” (Ital. battuta): a hard dry stroke on the adversary’s blade, in order to drive it aside and push home an attack; a “re-beat” is made by beating lightly at the adversary’s blade when the latter is supine, thus driving his blade and beating violently on the other side. “Cavassone” (see below under “disengage”). “Completion” (see below under riposte).

“Controtempo”: to parry an attack in such a manner that the adversary’s advancing hand or blade is hit at the same time, whereas in battle on any part of the adversary attempts an “attack on the blade” to avoid contact by a narrow circular movement of the point and hand; this is generally followed by a straight thrust or cut, as the force of his blow will seek a new opening. “Development” (attacks on the): attacks made while the adversary is making a complex attack, i.e. one consisting of at least two movements—either opening or closing movements (see “pre-liminary” and “disengage”). “Disarmament” (Ital. sforse): striking the adversary’s weapon from his hand by means of a sweeping stroke along his blade from the point downwards. “Disengage” (Ital. cavassone): being on guard (engaged) in one line, to draw one’s point under the adversary’s sword and lunge on the other side: to avoid a cut by retiring the right foot behind the left; a time-cut at the adversary’s arm is usually made at the same time. “Graze” (Ital. grazi), to run one’s blade along the surface of the opponent’s blade and hand,0 as if brushing. “Invitation guard”: a guard in any line with the blade intentionally so wide that the adversary lunges into the apparent opening, only to meet a prepared counter. “Incontro” (Ital. for “double-hit”): an attack that leaves the adversary with neither a defensive cover nor an opening. “Engagement” (the): the four quarters into which the trunk is divided, attacks and parries opposite them being called after them. These are, with the adversary not on guard in “octave” (not used in sabre); lower left “half-circle” (not used in sabre). When the hand is held in “pronation” (thumb down) the lines are: upper right, “tiere”; upper left, “prime”; lower right, “second”; lower left, “low prime” (“second” generally used). “Quinte” and “septime” are also lines of the Italian school. “Lunge”: the advance of the body by stepping forward with the right foot in order to deliver a cut or thrust. “Opposition”: pressing the hand and blade in attack towards the side the adversary’s blade is on; the object being to occupy his blade and cover one’s person from a riposte. “Press”: forcing the adversary’s blade aside in order to deliver an opening attack; either directly or on the same side after he has recovered his blade and parried too wide on his supposed threatened side. “Preparation” (Ital. preparazione): when it is certain that the adversary attempts a beat, graze or press. “Re-beat” (see “beat”). “Remise” (see “appuntata”). “Riposte”: a quick cut or thrust made after parrying an attack, without lunging. When the riposte cuts are carried out suddenly as he other arm as he crosses over it to create an opening. “Stop-thrust”: the instant thrust made after parrying an attack, without lunging. “Timber-cut”: a quick slash or a sudden arm as he crosses over it to create an opening. “Toccatol” (Ital. for “hit”): “Touché” French for “hit.”

Manchette-Fencing (Fr. manchette, a cuff) is a variety of sabre-play popular in Germany, in which the fencers stand at such a
distance from each other that only hand and forearm can be reached with the last few inches of the sword nearest the point, both edges being supposed to be sharp. No thrusts are allowed, and both feet must remain stationary where they are planted when the bout begins. Narrow parries are necessary, though many cuts are avoided by withdrawing the hand. Manchette-fencing is not considered good practice for the light sabre and is therefore losing ground.

The German Basket-Sabre (Krummer Säbel, or Krummsäbel) is a descendant of the heavy cavalry sabre once in use in some branches of the German horse. It is now used almost exclusively by students. It has a strongly curved blade about 32 in. long and 1 in. broad, tapering slightly towards the end, which is truncated, no thrusts being allowed. The hand is protected by a large guard of heavy steel basket-work, and the handle is shaped to fit the hand, the forefinger being run through a leather loop. On account of the great weight of the weapon (about 24 lb, more than half of which is in the guard) blows delivered with a full swing are impracticable, and all cuts are made from the elbow and wrist, the hand being generally kept as high as possible. The *Messer* is the distaff at which the combatants stand from one another. There are three recognized distances, that in general use being the middle, from which two sabres can be crossed at about 1 ft. from the points. Neither combatant may move his left foot (the right in the case of a left-handed fencer) from the position in which it is placed at the beginning of the bout, all advances and retreats being made by the movements of the right foot and the body. The position of the engagement is in high tierce, the arm being held straight outwards to the adversary. The feet are planted about 24 in. apart, the right in advance. The right shoulder is bent forward and the stomach drawn back, imparting a slight stoop to the fencer. There are eight cuts and as many parries. The basket-sabre is used in the more serious students' duels; the neck, wrist, armpits and body below the nipples being heavily bandaged.

Rapier-fencing among the students of the German universities and technical high schools of Germany, Austria, Switzerland and Russia may be considered under the sabre, as the rapier, although originally used for thrusting as well as cutting, is now employed by students only to cut. According to the association of German fencing masters the modern weapon when blunt and used only for practice is called Rapier or Stahlrapier, but when sharpened for duelling the Shahrud-Beiliger (stricker). It is derived from the long straight sword of the German Reiters, or light cavalry, who were famous in the 16th century and later. Its use, however, was only occasional before the middle of the 19th century, when it gradually took the place of the dangerous Pariser, or long French small-sword, for the semi-serious duels (*Messenur*) of the students. There are two varieties of rapier, each having a thin flat blade about 33 in. long and 1 in. wide and truncated at the point, but distinguished by the shape of the handle. The bell-rapier (Glockenrapier), used only at the north German universities of Leipzig, Berlin, Halle, Breslau, Königsberg and Greifswald, is furnished with a guard consisting of a cup or pot, which is about 1 1/2 in. deep, joined to the pommel by a steel shaft protecting the hand. Its total weight is about 1 3/2 lb. The basket-rapier (Korbrapier), used at all universities except those named above, has a handle protected by a sort of basket of heavy steel wire. Its total weight is 2 lb. The balance is just below the guard. The blade of the rapier is divided conventionally into the *forte*, the half next the hilt, and the *foible*. These are again divided into full and half forte and full and half foible, the half foible being the weakest quarter of the blade, nearest the point. Every bout, whether with sharp or blunt weapons, is preceded by the command *Auf die Messer* (on the mark, literally distance). The two fencers take position with feet apart and the tip pointed slightly in advance, just far enough from one another to allow their heads to be reached by the sword without moving the feet, which remain firm during the entire bout. During the first half of the 19th century the objective points of the rapier included the upper arm and breast; but later the head, including the face, became the sole target. In practice a heavy mask of wire with felt top, a glove with padded arm-piece (Stulp) and a padded apron to protect body and legs are worn. There is one defensive position, which is with the arm stretched upward bringing the hand and hilt about 6 in. in front of and above the forehead, and the point of the rapier directed diagonally downward across the body and to the outside of the adversary's knees. The fencers having at the command *Bindet die Klüinge!* (Join blades!) placed their hilt together with the points of the rapiers directed upwards, attack simultaneously at the opponent's (Go!). All blows are delivered from the wrist, slightly helped by the shoulder, the hand being stopped below the level of the eyes. No movement of the head or body is allowed except such as is unavoidably connected with that of the sword-arm.

C. Roux (Paris, 1885), a work of some importance in the German student fencing.

**SABZAWAR,** a town of Afghanistan, situated at an elevation of 3,550 ft. on the left bank of the river Harud, 93 m. S. of Herat. Sabzawar was once a city of considerable size, and still possesses a fortress with sides of about 200 or 250 yds. This fortress has been abandoned, and the town, which is the centre of a group of villages, is now fairly prosperous, with a bazaar of about 800 shops and a busy traffic with Seistan. The plains about Sabzawar are highly cultivated by the Nurzai Duras, and each village boasts its own little mud fort.

**SAZBEVAR,** a district of the province of Khorasan in Persia, formerly called Balak. It is situated between Nishapur on the east and the Turkoman frontier, and has a length of about 50 m. and a breadth of 90; its population is about 60,000, and it pays to the government a yearly revenue of £8000. The district has many flourishing villages and much cultivation; it produces much wool, excellent cotton, some silk, partly exported to Russia, partly manufactured into various stuffs in the district, and fruits, exported dried in large quantities. The export trade is chiefly done by a few Russian Armenians who reside in Sazbevar town.

**SAZBEVAR,** the capital of the district, is situated 150 m. E. of Shahrud and 65 m. W. of Nishapur, in 36° 12' N., 57° 39' E., at an elevation of 3100 ft. The population, which was 30,000 before the famine in 1877, is now about 14,000. There are some good caravanserais, a well-supplied bazaar, three colleges, two large and thirty small mosques, and post and telegraph offices.

**SACCHARIC ACID, C₆H₁₀O₄ or H₂O₅C(CH₂OH)₂CO₂H, in chemistry, a tetraoxydicarboxylic acid which exists in three stereoisomeric forms. The ordinary or dextro (d)-saccharic acid is formed in the oxidation of cane sugar, grape sugar, d-glucionic acid and many other carbohydrates with nitric acid. It forms a deliquescent mass. On standing, the syrupy acid gives the crystalline lactonic acid, C₆H₁₀O₄. Solid amalgam reduces it to gluconic acid, C₆H₁₀O₅ or H₂O₅C(CH₂OH)₂CO₂H, whilst hydriodic acid reduces it to adipinic acid, H₂O₅C(CH₂OH)₂CO₂H. Nitric acid oxidizes it to dextro-tartaric acid and oxalidic acid. Laevol- (l)-saccharic acid is formed by oxidizing l-gluconic acid with nitric acid, whilst the inactive (d-1)-acid is obtained similarly from inactive gluconic acid. These acids closely resemble the d acid except in their action on polarized light. For their relations...
SACCHARIN—SACCHINI
to the glasses see Sugar. Mucic acid (p. 9) is isomer with these acids.

SACCHARIN, the name given to several distinct chemical substances. The saccharin of commerce, so named from its excessively sweet taste, is a coal-tar product, being the imide of ortho-sulphobenzoeic acid, \( \text{C}_6\text{H}_4 \left( \text{SO}_3 \right) \text{NH} \). It may be prepared by the oxidation of ortho-toluenedisulphonamide \( \text{C}_8\text{H}_7\text{N}_2\text{SO}_2\text{NH}_2 \) with potassium permanganate (F. Ehlberg and I. Remsen, Ber., 1879, 12, p. 460); by the electrolytic oxidation of the above sulphonamide (German patent 35211); by the action of concentrated sulphuric acid on ortho-sulphamidobenzoeic acid, \( \text{NH}_2\text{SO}_2\text{C}_6\text{H}_4\text{CO}_2\text{H} \) (German patent 113720); by warming the chloride of ortho-sulphobenzoeic acid phenyl ester (\( \text{SO}_2\text{ClC}_6\text{H}_4\text{CO}_2\text{H} \)) with excess of aqueous ammonia (R. List and M. Stein, Ber., 1898, 31, p. 1662); and from benzaldehyde ortho-sulphonic acid by conversion into its acid chloride, which with ammonia yields the corresponding acid-amide, which gives saccharin on oxidation with atmospheric oxygen (German patent 94248). It is a crystalline powder which melts at 220°C with partial decomposition. It is soluble with difficulty in cold water, but is moderately soluble in hot water and readily soluble in alcohol. By the action of concentrated hydrochloric acid at 150°C, it is decomposed into ammonia and ortho-sulphobenzoeic acid. With phosphorus pentachloride above 200°C, it yields ortho-chlorinobenzene. Sodium saccharin, \( \text{C}_6\text{H}_4\text{CO}_2\text{SO}_3\text{Na} \), and potassium saccharin, \( \text{C}_6\text{H}_4\text{CO}_2\text{SO}_3\text{K} \), are forms of it. \( \text{C}_6\text{H}_4\text{CO}_2\text{SO}_3\text{NH} \), known as saccharic acid, is also known as "saccharin." By boiling dextrin or laevulose with milk of lime the so-called "saccharic acid," \( \text{C}_6\text{H}_4\text{O}_2\text{CH}+\text{C}_6\text{H}_4\text{O}_2\text{OH}+\text{CO}_2 \), a lactone of the formula, is obtained (E. Pégot, Ber., 1880, 13, p. 196; H. Hiliani, Ber., 1882, 15, p. 2954). It crystallizes in large prisms, has a bitter taste, and is easily soluble in hot water. Potassium permanganate oxidizes it to carbonic and acetic acids. Heating with caustic potash to 200°C gives formic and lactic acids, and when reduced by hydriodic acid and sodium hydroxide is formed. 

"Iso-saccharin" and "meta-saccharin" are formed by the action of lime on milk sugar (H. Hiliani, Ber., 1885, 18, p. 631). The former melts at 93°C, and on reduction by hydriodic acid and phosphorus is converted into 4-ethyl-4-hydroxyvalerolactone. Meta-saccharin melts at 141-142°C and is easily soluble in water.

SACCHETTI, Franco (c. 1335-c. 1400). Italian poet and novelist, was the son of Benci di Ugoccione, surnamed "Buono," of the noble and ancient Florentine family of the Sacchetti (comp. Dante, Par. c. xvi.). He was born at Florence about the year 1335. While still a young man he achieved repute as a poet, and he appears to have travelled on affairs of more or less importance as far as to Genoa, Milan and "Ischiavonia." When a sentence of banishment was passed upon the rest of the house of Sacchetti by the Florentine authorities in 1380 it appears that Franco was expressly exempted, "per esser tanto uomo buono," and in 1383 he was one of the "eight," discharging the office of "prior" for the months of March and April. In 1385 he was chosen ambassador to Genoa, but preferred to go as podestà to Bibbiena in Casentino. In 1392 he was podestà of San Miniato, and in 1396 he held a similar office at Faenza. In 1398 he received from his fellow-citizens the post of captain of their then province of Romagna, having his residence at Portico. The date of his death is unknown; most probably it occurred about 1400, though some writers place it as late as 1410.

Sacchetti left a considerable number of sonneti, canzoni, ballate, modrigali, &c., which have never been printed, but which are still extant in at least one MS. in the Laurentian library at Florence. His Novelle were first printed in 1724, from the MS. in the same collection, which, however, is far from complete. They were originally 300 in number, but only 258 in whole or in part now remain. They are written in pure and elegant Tuscan, and, based as they are for the most part on real incidents in the public and domestic life of Florence, they are valuable for the light they throw on the manners of the age, and occasionally also for the biographical facts preserved in them.

SACCHI, ANDREA (c. 1600-1661). Italian painter of the later Roman school, was born at Nettuno near Rome in 1600, or perhaps as early as 1598. His father, Benedetto, a painter of undistinguished position, gave him his earliest instruction in the art; Andrea then passed into the studio of Albani, of whom he was the last and the most eminent pupil, and under Albani he made his reputation early. The painter of Sacchi's pre-}
production of his opera Alessandro nell' Indie he was appointed director of the Conservatorio dell' Ospedalotto, where he trained some admirable female singers and wrote church music. In 1717 he visited London, where notwithstanding a cruel cabal formed against him, he achieved a brilliant success, especially in his four new operas, Tamerlano, Lucio Vero, Nitetti e Persero and Il Gran Cid. Later he met with an equally enthusiastic reception in Paris, where in 1783 his Rinaldo was produced under the immediate patronage of Queen Marie Antoinette, to whom he had been recommended by the emperor Joseph II. But neither in England nor in France did his reputation continue to the end of his visit. It seems everywhere to have been the victim of bitter jealousy. Even Marie Antoinette was not able to support his cause in the face of the general outcry against the favour shown to foreigners; and by her command, given to guard the utmost reluctance to be sure, the most undoubted masterpiece, Édipe à Colone, was set aside in 1786 to make room for Lemoine's Phèdre—a circumstance which so preyed upon his mind that he died of chagrin on the 7th (or 8th) of October 1786.

Sacchini's style was rather graceful than elevated, and he was deficient both in creative power and originality. But the dramatic truth of his operas, more especially the later ones, is above all praise, and he never fails to write with the care and finish of a thorough and accomplished musician. Édipe was extremely successful after his death, and was performed at the Académie nearly six hundred times. Sacerdotism (from Lat. Sacerdos, priest, literally one who presents sacred offerings, sacer, sacred, and dare, to give), a term applied, usually in a hostile sense, to the system, method and spirit of a priestly order or class, under which the functions, dignity and influence of the members of the priesthood are exalted in the ministry of religion, and in the church at the expense of the laity. This exaltation of the priesthood in the Christian church is based on the claim that the priest exercises sacrificial and supernatural powers in the celebration of the Eucharist.

SACHEVERELL, HENRY (1674-1724), English ecclesiastic and politician, was the son of Joshua Sacheverell, rector of St Peter's, Marlborough. He was adopted by his godfather, Edward Hearst, and his wife, and was sent to Magdalen College, Oxford, in 1689, was dey of his college from 1689 to 1701 and fellow from 1701 to 1713. Addison, another Wiltshire lad, entered at the same college two years earlier, but was also elected a dey in 1689; he inscribed to Sacheverell in 1694 his account of the greatest English poets. Sacheverell took his degree of B.A. in 1693, and became M.A. in 1693 and D.D. in 1708. His first preferment was the small vicarage of Cannock in Staffordshire; but he leapt into notice when holding a preachership at St Saviour's, Southwark. His famous sermons on the church in danger from the neglect of the Whig ministry over its interests were preached, on the one hand, and Derby on the 15th of August, the other at St Paul's Cathedral on the 5th of November 1709. They were immediately reprinted, the latter being dedicated to the lord mayor and the former to the author's kinsman, George Sacheverell, high sheriff of Derby for the year; and, as the passions of the whole British population were at this period keenly exercised between the rival factions of Whig and Tory, the vehement invective of this furious divine on behalf of an ecclesiastical institution which supplied the bulk of the adherents of the Tories made him their idol. The Whig ministry, then slowly but surely losing the support of the country, were divided in opinion as to the propriety of prosecuting this zealous parson. Some were against such a measure; but Godolphin, who was believed to be personally alluded to in one of these harangues under the nickname of "Volpone," urged the necessity of a prosecution, and gained the day. The trial lasted from 27th February to 23rd March 1710, and the verdict was that Sacheverell should be suspended for three years and that the two sermons should be burnt at the Royal Exchange. This was the decree of the state, and it had the effect of making him a martyr in the eyes of the populace and of bringing about the downfall of the ministry. Immediately on the expiration of his sentence (13th April 1713) he was instituted to the valuable rectory of St Andrew's, Holborn, by the new Tory ministry, who despised the author of the sermons, although they dreaded his influence over the mob. He died at the Grove, Highgate, on the 5th of June 1734.

See Hearne's Diaries, Bloxam's Register of Magdalen and Hill Burton's Queen Anne, vol. ii. There is an excellent bibliography by Falconer Madan (1887).

SACHEVERELL, WILLIAM (1638-1691), English statesman, son of Henry Sacheverell, a country gentleman, was born in 1638. His family had held a good position in Derbyshire and Nottinghamshire since the 12th century, the name appearing as Sent Cheverell in the roll of Battle Abbey, and William inherited large estates from his father. He was admitted at Gray's Inn in 1667, and in 1670 he was elected member of parliament for Derwentwater. He immediately obtained a prominent position in the party hostile to the Court, and before he had been six months in the House of Commons he proposed a resolution that all "popish recusants" should be removed from military commands; the motion, enlarged so as to include civil employment, was carried without a division on the 28th of February 1677-1673. This resolution was the forerunner of the Test Act, in the preparation of which Sacheverell took an active part, and which caused the break up of the cabal. He now took part in nearly every debate in the House of Commons, being recognized as one of the most able of the leaders of the opposition or country party. He strongly opposed the king's policy of alliance with France, advocating a league with the Dutch instead, and the refusal of supplies until the demands of the Commons should be complied with. Sacheverell took especial interest in the state of the navy and spoke in many debates on this question. In 1677 he carried an address to the king calling upon him to conclude an alliance with the United Provinces against Louis XIV., and when the Speaker adjourned the House by Charles's order Sacheverell made an eloquent protest, asserting the right of the House itself to decide the question of its adjournment. When parliament met early in 1678 assurances were received from Charles II. that he had arranged the treaties demanded by the Commons; but Sacheverell boldly questioned the king's good faith, and warned the Commons that they were being deceived. When the secret treaty with France became known, thus confirming Sacheverell's insight, the latter called for the disbandment of the forces and advocated the refusal of further supplies for military purposes; and in June 1678 he resolutely opposed Lord Danby's proposal to grant £300,000 per annum to Charles II. for life. Barillon mentions Sacheverell among the Whig leaders who accepted bribes from Louis XIV., but the evidence against him is not conclusive.

When Titus Oates began his pretended revelations in 1678 Sacheverell was among those who most firmly believed in the existence of a Popish plot. He was one of the most active investigators of the affair, and one of the managers of the impeachment of the five Catholic peers. He also acted for a time as chairman of the secret committee of the Commons, and drew up the report on the examination of the Jesuit Coleman, secretary to the duchess of York. He was a member of the committee for drafting the articles of impeachment against Danby in 1678, and was appointed one of the managers of the Commons; and in 1679, when the impeachment, interrupted by the dissolution of parliament, was resumed in the new parliament, he spoke strongly against the validity of Danby's plea of pardon by the king. The allegations made in Sacheverell's report on the examination of Coleman prompted the country party to demand the exclusion of James, duke of York, from the succession to the throne, the first suggestion of the famous Exclusion Bill being made by Sacheverell on the 4th of November 1678 in a debate—"the greatest that ever was in Parliament," as it was pronounced by contemporaries—raised by Lord Russell with the object of removing the duke from the King's Council. He vigorously promoted the bill in the House of Commons and opposed granting supplies till it should pass. When Charles offered an alternative scheme (1679) for limiting the powers of a Catholic sovereign, Sacheverell made a great speech in which he pointed out the
In the conflict between the Petitioners and the Abhorrers he supported the former, and on the 27th of October 1680 brought forward a motion asserting the right of petitioning the king to summon parliament, and proposed the impeachment of Chief Justice North as the author of the proclamation against tumultuous petitioning. Sacheverell was one of the managers on behalf of the Commons at the trial of Lord Stafford in Westminster Hall, but took no further part in public affairs till after the election of March 1681, when he was returned unopposed for Derbyshire. He was prosecuted for riot in connexion with the surrender of the charter of Nottingham in 1682, being tried before Chief Justice Jeffreys, who fined him 500 marks.

At the general election following the death of Charles II. in 1685 Sacheverell lost his seat, and for the next four years he lived in retirement on his estates. In the convention parliament summoned by the prince of Orange, in which he sat for Heytesbury, he spoke in favour of a radical resettlement of the constitution, and served on a committee, of which Somers was chairman, for drawing up a new constitution in the form of the Declaration of Rights, which included one of the representatives of the Commons in their conference with the peers on the question of declaring the throne vacant. William III. appointed Sacheverell a lord of the admiralty, but he resigned the office after a few months. He procured the omission of Lord Jeffreys’s name from the Act of Indemnity. In 1690 he moved a famous amendment to the Corporation Bill, proposing the addition of a clause—the purport of which was misrepresented by Macaulay—for disqualifying for office for seven years municipal functionaries who in defiance of the majority of their colleagues had surrendered their charters to the Crown. A celebrated debate on this question took place in the House of Commons in January 1690; but the evident intention of the Whigs to perpetuate their own ascendancy by tampering with the franchise contributed largely to the Tory reaction which resulted in the defeat of the Whigs in the elections of that year. Sacheverell was elected member for Nottinghamshire; but he died on the 9th of October 1691, before taking his seat.

In the judgment of Speaker Onslow, Sacheverell was the "ablest parliament man" of the reign of Charles II. He was one of the earliest of English parliamentary orators; his speeches greatly impressed his contemporaries, and in a later generation, as Macaulay observes, they were "more remarkable for the vigour and beauty of the oratory in which they were drawn" than the works of Walpole and Pulteney. Though his fame has become dimmed in comparison with that of Shaftesbury, Russell and Sidney, he was not less conspicuous in the parliamentary proceedings of Charles II.’s reign, and he left a more permanent mark than any of them on the constitutional changes of the period.

Sacheverell was twice married. His first wife was Mary, daughter of William Staunton of Staunton; and his second was Jane, daughter of Sir John Newton. His eldest son Robert represented the borough of Nottingham in six parliaments and died in 1714. The family became extinct in 1724.

SACHS, H. (1494–1576), German poet and dramatist, was born at Nuremberg on the 5th of November 1494. His father was a tailor, and he himself was trained to the calling of a shoemaker. Before this, however, he received a good education at the Latin school of Nuremberg, which left behind it a lasting interest in the stories of antiquity. In the spring of 1509 he began his apprenticeship, and was at the same time initiated into the art of the Meistersingers by a weaver, Leonhard Nunnenpeck. In 1531 he set out on his Wanderjahre, and worked at his craft in many towns, including Regensburg, Passau, Salzburg, Munich, Osnabrück, Lübeck and Leipzig. In 1516 he returned to Nuremberg, where he remained during the rest of his life, working steadily at his handiwork and devoting his leisure time to literature. In 1517 he became master of his guild and in 1519 married. The great event of his intellectual life was the coming of the Reformation; he became an ardent Lutheran and in 1523 wrote the famous monologue, Der geheime Lutherschlag, and the poem beginning Die willenbergsich Nächtiagil, Die man jetzt höret überall, and four remarkable dialogues in prose, in which his warm sympathy with the reformer is tempered by counsels of moderation. In spite of this, his advocacy of the new faith brought upon him a reproof from the town council of Nuremberg: and he was forbidden to publish any more Bühlein oder Reimen. It was not long, however, before the council itself openly threw in its lot with the Reformation. After the death of Hans Sachs’s first wife in 1560 he married again. His death took place on the 19th of January 1576. Hans Sachs was an extraordinarily fertile poet. By the year 1560 he had composed, according to his own account, 4275 Meisterlieder, 1700 tales and fables in verse, and 208 dramas, which filled no fewer than 34 large manuscript volumes; and this was not all, for he continued writing until 1573. The Meisterlieder were not printed, being intended solely for the use of the Nuremberg Meistersinger school, of which Sachs was the leading spirit. His fame rests mainly on the Spruchgedichte, which include his dramatic writings. His "tragedies" and "comedies" are, however, little more than stories told in dialogue, and divided at convenient pauses into a varying number of acts; of the essentials of dramatic construction or the nature of dramatic action Sachs has little idea. The subjects are drawn from the most varied sources, the Bible, the classics and the Italian novelists being especially laid under contribution. He succeeds best in the short anecdotal Fastnachtslied or Shrovetide play, where characterization and humorous situation are of more importance than dramatic form or construction. Farces like Der fahrende Schüler im Paradies (1550), Das Wildbad (1550), Das heiss Elsen (1551), Der Bauer im Fegefeuer (1552) are inimitable in their way, and have even been played with success on the modern stage.

SACHS, JULIUS VON (1832–1897), German botanist, was born at Breslau on the 2nd of October 1832. At an early age he showed a taste for natural history, and on leaving school he became, in 1851, private assistant to the physiologist J. E. Purkinje at Prague. In 1856 he graduated as doctor of philosophy, and then adopted a botanical career, establishing himself as Privatdozent for plant physiology in the university of Prague. In 1859 he was appointed physiological assistant to the Agricultural Academy of Tharandt in Saxony; and in 1861 he was called to be director of the Polytechnic at Chemnitz, but was almost immediately transferred to the Agricultural Academy at Poppelsdorf, near Bonn, where he remained until 1887, when he was nominated professor of botany in the university of Munich. As professor of botany he was then transferred to the university of Würzburg, which he continued to occupy (in spite of calls to all the important German universities) until his death on the 20th of May 1897.

Sachs achieved distinction as an investigator, a writer and a teacher; his name will ever be especially associated with the great development of plant physiology which marked the latter half of the 19th century, though there is scarcely a branch of
SACHS—SACKBUT

SACKBUT, Shabbusshe, SAGBUT, Draw or Drawing Trumpet (Scotland, draucht trumpet) or FLAT TRUMPET (Fr. saquebute, saqueboute, cabuche, trompette harmonique; Ger. Posaune, Basaun, Pusin, Zug-Trommet; Ital. tromba da tirarsi or tromba spezzata; Span. sacabuche; Dutch basuin Schuif trompette), the earliest form of slide trumpet, which afterwards developed into the trombone. As soon as the effect of the slide in lengthening the main tube and therefore proportionally deepening the pitch of the instrument was understood, and its capabilities had been fully realized, the development of a family of practical tenor and bass instruments followed as a matter of course. It is not known exactly in what country the principle of the slide was first discovered and applied to musical instruments; if it be not an Oriental device, then the credit is probably due to the Netherlands or to South Germany before or during the 13th century.

The early history of the sackbut is among the most interesting of all instruments. Various attempts have been made to fix the etymology of the word as derived from Span. sacabuche through French. The Rev. F. W. Galpin suggests a derivation from sacr, to draw out, and buche, identical with bueha (Lat. buxus), used in the sense of a tube or pipe originally of boxwood. To accept this derivation they would be to lose sight of the fact that all the technical names applied to the sackbut in various languages directly acknowledge its descent from the buccina (q.v.), with the exception of Italian, in which the recognition is indirectly made through the synonym tromba. A clue to the etymology of sacabuche is afforded by the well-known fact that not only did the Arabs after the conquest introduce oriental musical instruments by way of Spain to western Europe, but the Arabic names also clung to the instruments in many cases. The Arabs had a military trumpet they called Buk or Bugu, a word they had borrowed from the Christians, and it is mentioned in a musical treatise of the 14th century (Escorial MS. 69) among the musical instruments then in use in Spain. It has been conceived on philological grounds that England derived her knowledge of the sackbut from France, but the oldest known form of the word in English is shakkushe, which occurs in the accounts of Henry VII.

for the 3rd of May 1495, and is obviously of Spanish origin. Sackbut appears early in the 14th century.

The word sacubbuch was at some time applied in Spain to the ship's pump; and the questions naturally arise, Which came first, and was the musical instrument named after the pump from the great resemblance in their form and as well as in outward form? It is certainly significant that the Ital. tromba, from which sprang "trumpet" and "trombone," means a pump as well as a trumpet and the trunk of an elephant. Even if it could be proved beyond doubt that the slide had been tried on the trumpet before the word tromba was used for it, there would still remain serious difficulties to be disposed of. (1) The word trumba, trumbe, trompe, already general in the Roman of the 14th century, was first applied to the tubas and curved horns, probably from the similar curve of the elephant's trunk. (2) If tromba referred to the pump, it must have been applied to the slide trumpet, and tromba da tromba would be sensible etymology. (3) The etymology given above from buk or buque, trumpet, supported by similarly compounded words in English, Scotch, Dutch, Italian, would have to be regarded as a strange but not unparalleled philological coincidence. The earliest instance yet discovered of the use of sacubbuch as a musical instrument seems to be in the 14th century.

The transformation of the busine (buccina) into the sackbut involved two or three processes, the addition of the slide being accomplished in at least two stages. A long slide first was applied to the straight busine made in three or four sections having rings or knobs at the joints. The sliding portions or joints here doubled served as a rapid wind windings over a long pipe, and was used for changing the key. The long slide, added for the purpose of obtaining a diatonic compass, denoted a further step in the evolution. When applied to the straight busine it differed materially from the slide on the sackbut or trombone, for the whole instrument was with the slide fully drawn out, so that the knobs were equidistant; on the slide being gradually closed the pitch was proportionately raised in order to fill in the gaps of the first fifth by the slide. The slide on the trombone was a tool of harmonic purpose, and the existence of the slide yet found by the writer, and the instrument, although straight, is one of the earliest sackbuts. The manipulation of the slide on the busine must have been exceedingly difficult, requiring not only skill, but a long arm. This led to the next step in evolution, i.e., the bending of the tube in three parallel parts, what is like a flattened S, an example of which, also of the 13th century, is found on some preserved woodwork from the abbey of Cluny.

The folding of the busine marks the advent of the new double slide, like a U, made to draw out and lower the pitch. This radical change did not come all at once, the intermediate step being the folding of the busine, with the old single slide, the whole being drawn up and down, as the slide closed and opened again. This interesting development is shown (fig. 2) in a miniature by Taddeo Crivelli in the Borrò Bible (1455-1471). The two upper joints defined by rings are clearly drawn of larger caliber than the lower folded portion, which has been drawn out to what would approximately correspond to the third position on the trombone lowering the pitch one tone. A single slide would require to be moved about twice the distance of the double or folded tube on the trombone to produce any given effect. This drawing of the sackbut must not be taken as showing the instrument in use in Crivelli's day; it is clearly retrospective, for sackbuts in a more advanced stage are not uncommon in works of art of the same century. In a MS. preserved in the library of the Arsenal in Paris, executed for the dukes of Burgundy in the middle of the 15th century, is seen a trumpet of

---

2 This question has been thoroughly investigated by the late Professor George Case in his work on the trombone.

Fig. 1.

The folding of the busine marks the advent of the new double slide, like a U, made to draw out and lower the pitch. This radical change did not come all at once, the intermediate step being the folding of the busine, with the old single slide, the whole being drawn up and down, as the slide closed and opened again. This interesting development is shown (fig. 2) in a miniature by Taddeo Crivelli in the Borrò Bible (1455-1471). The two upper joints defined by rings are clearly drawn of larger caliber than the lower folded portion, which has been drawn out to what would approximately correspond to the third position on the trombone lowering the pitch one tone. A single slide would require to be moved about twice the distance of the double or folded tube on the trombone to produce any given effect. This drawing of the sackbut must not be taken as showing the instrument in use in Crivelli's day; it is clearly retrospective, for sackbuts in a more advanced stage are not uncommon in works of art of the same century. In a MS. preserved in the library of the Arsenal in Paris, executed for the dukes of Burgundy in the middle of the 15th century, is seen a trumpet of a cavalry type with a single straight slide drawn out so far that the bell rests on the performer's foot (fig. 3).

The last transition immediately preceding the change into the trombone consisted in folding the tube to form two U-shaped bends, one of which pointed downwards and the other upwards, still as in the slide trombone (fig. 4). This branch was bent over between the two other, with a curve of 90° at right angles above them, the bell extending downwards beyond the lower U-bend. Sackbuts of this type are to be seen in Dürer's picture in the Nuremberg town hall, and in other works by artists of the 15th century, as, for instance, in Gentile Bellini's Procession of the Piazza S. Marco among the band to the right of the flag.

The further history and development of the sackbut are given under Trombone. See also Trumpet and Buccina. (K. S.)

Sackett's Harbor, a village in Jefferson county, New York, U.S.A., at the eastern end of Lake Ontario, on the south shore of Black River Bay, about 1 m. from its mouth, and about 10 m. W. by S. of Watertown. Pop. (1890) 787; (1900) 1266; (1910) 805. Sackett's Harbor is served by the New York Central & Hudson River railway. It is built on low land, around a small, nearly enclosed harbour, the northern shore of which is formed by Navy Point, a narrow tongue of land extending about ½ m. nearly due eastward from the mainland. About 1 m. to the W. by S. is Horse Island, approximately ½ m. long (east and west), and nearly as broad, only a few feet above the lake level and separated from the mainland by a narrow strait, always fordable, and sometimes almost dry; at its eastern end is Sackett's Harbor Lighthouse. The harbour is deep enough for the largest lake vessels. The village is a summer resort. At Sackett's Harbor are Madison Barracks, a United States military post, established in 1813 and including a reservation of 99 acres; and a United States naval station. In the post cemetery is the grave of General Zebulon M. Pike, who was killed at York (now Toronto) on the 27th of April 1813.

The first settlement was made in 1801 by Augustus Sackett, and the village was incorporated in 1821. In the War of 1812 Sackett's Harbor was an important strategic point for the Americans, who had here a naval station, Fort Tompkins, at the base of Navy Point, and Fort Volunteer, on the eastern side of the harbour. In July 1813 a British squadron unsuccessfully attempted to capture a brig and schooner in the harbour. From Sackett's Harbor American expeditions against York (now Toronto) and Fort George respectively set out in April and May 1813; though scantily garrisoned it was successfully defended by General Jacob Brown (who had just taken command) against an attack, on the 9th of May, of Sir George Prevost with a squadron under Sir James Lucas Yeo. The British losses were 259; the American 157, including Lieut.-Colonel Electus Backus, commander of the garrison before General Brown's arrival. Almost all the American stores at the naval station were destroyed to save them from the enemy. The blockade of the harbour by Yeo was abandoned in June 1814 after the defeat of a force from the squadron sent out to capture garrison which were being brought from Oswego to Sackett's Harbor to equip the superiour, an American vessel launched on the 1st of May, and a smaller vessel nearly completed. Sackett's Harbor was the starting-point of a force of 700 men under a Pole named von Schultz, who in November 1838, during the uprising in Upper Canada (Ontario) attempted to invade Canada, was taken prisoner near Prescott, was tried at Kingston, being defended by Sir John Macdonald, and with nine of his followers was executed in Kingston in December.
SACKING AND SACK MANUFACTURE—SACKVILLE

SACKING AND SACK MANUFACTURE. Sacking is a heavy closely-woven fabric, originally made of flax, but now almost exclusively made of jute or hemp. The more expensive kinds, such as are used for coal sacks for government and other vessels, are made of hemp, but the jute fibre is extensively used for the same purpose, and almost entirely for coal sacks for local house supplies. The same type of fabric is used for wool sacks, cement bags, ore bags, pea sacks and for any heavy substance; it is also made up into a special form of bag for packing cows and rolls of jute and flax yarns for delivery from spinners to manufacturers. Proper sacking is essentially a twilled fabric, in which the number of warp threads per inch greatly exceeds the number per inch of weft. The illustration shows a typical kind of three-leaf twill, double warp-sacking.

All three-leaf twill sackings are double in the warp, but four-leaf sackings are single. They are usually 27 in. wide, but other widths are made.

The lower part of the illustration shows four repeats of the three-leaf twill, while the lines drawn to the plan of the fabric show that each line of the design is represented in the cloth by two warp threads. The result is single, but each one is usually about four times the weight of the warp for the same length (about 8 lb warp and 32 lb weft). Large quantities of cotton sacks are made for flour, sugar and similar produce; these sacks are usually plain cloth, some woven circular in the loom, others made from the piece.

Large quantities of seamless bags or sacks for light substances are woven in the loom, but these are almost invariably made with what is termed the double plain weave, i.e., the cloth, although circular except at the end, is perfectly plain on both sides. Circular bags have been made both with three-leaf and four-leaf twills, but it is found much more convenient and economical to make the cloth for these kinds, and in most cases for all other types, in the piece, and then to make it up into sacks by one or other of the many types of sewing machines. The pieces are first separated into different lengths by special machinery, which may be perfectly automatic, or semi-automatic—usually the latter, as many thicknesses may be cut at the same time, each of the exact length. The lengths of cloth are then separately doubled up, the sides being sewn together by special sewing machines of the Laing or Union make (of which there are seven or eight different kinds for different types of bags), and the ends hemmed. It will thus be seen that the length required is twice the length of the sack plus the amount for hemming the mouth.

The sack is now ready for delivery, unless the name of the owner, some trade mark, or other particular marks are required to appear on it. These particulars are printed on in one or more colours by the Kinmond and Kidd patent mullicolor sack-printing machine.

The chief centres for these goods are Dundee and Calcutta, all varieties of sacks and bags being made in and around the former city.

SACKVILLE, GEORGE, 1st Viscount (1716-1785), generally remembered as Lord George Sackville or Lord George Germain, third son of Lionel Cranfield Sackville, 1st duke of Dorset, was born on the 26th of January 1716. Educated at Westminster School and Trinity College, Dublin, he was gazetted captain in the 7th Cathcart's Horse (now 6th Dragoon Guards) in 1737, and three years later was transferred to Bragg's regiment of foot (Gloucestershire Regiment) as lieutenant-colonel; immediately afterwards the regiment sailed for active service on the Rhine, and although it was not present at the battle of Dettingen, its lieutenant-colonel was made brevet colonel and aide-de-camp to the king. It was not until two years later that Sackville took part in his first battle, Fontenoy. Wounded in the charge of Cumberland's infantry column, he was taken to the tent of King Louis XV. to have his wound dressed. Released, by what means does not appear, he was sent home to serve against the Pretender in Scotland. He was given the colonelcy of the 20th (Lancashire Fusiliers), but was too late to take part in the battle of Culloden. In 1747-1748 he was again with the duke of Cumberland in the Low Countries, and in 1749 was transferred to the cavalry, receiving the colonelcy of the 7th (3rd) Irish Horse (Carabiniers). With this office he combined those of first secretary to his father, the lord-lieutenant of Ireland, and Irish secretary of war, and a seat in each of the two Houses of Commons at Westminster and Dublin, winning at the same time the repute of being "the gayest man in Ireland except his father." In 1755 he was promoted major-general, took an English commission and obtained his Irish offices. In 1757 he was made lieutenant-general of the ordnance, and transferred to a fourth colonelcy. In 1758, under the duke of Marlborough, he shared in the ineffective raid on Ancanla Bay, and the troops, after a short sojourn in the Isle of Wight, were sent to join the allied army of Duke Ferdinand of Brunswick in Germany. Marlborough died shortly after they landed, and Sackville succeeded him as commander-in-chief of the British contingent. But no sooner had he taken over the command than his haughty and domineering temper estranged him both from his second-in-command, Lord Granby, and the commander-in-chief, Prince Ferdinand. This culminated on the day of Minden (August 1, 1758). The British army, aided by some of the Hanoverians, had won a brilliant success, and every man in the army looked to the British cavalry to charge and to make it a decisive victory. But Sackville, in spite of repeated orders from Prince Ferdinand, sullenly refused to allow Grany's squadrons to advance. The crisis passed, and the victory remained an indecisive success. Popular indignation was unbounded, and Sackville was dismissed from his offices. But his courage, though impugned, was sufficient to make him press for a court-martial, and after a trial lasting five months against him, this pronounced him guilty of disobedience, and adjudged him " unfit to serve his Majesty in any military capacity whatsoever." The sentence was executed with gratuitous harshness. It was read out on parade to every regiment in the service, with a homily attached, and placed on record in every regimental order book. Further, it was announced in the Gazette that his Majesty had expunged Sackville's name from the roll of the Privy Council. This, and Sackville's own dogged perseverance, turned the scale in his favour. No reverses to the British arms occurred to keep alive the memory of his lost opportunity, and in 1763 his name was restored to the list of the Privy Council. Hitherto without party ties in parliament, in 1769 he allied himself with Lord North. To this period belong the famous Junius Letters, with the authorship of which Sackville was erroneously credited. In 1770, under the terms of a bill, he assumed the name of German. In the same year his coolness and courage in a duel with Captain George Johnstone, M.P., assisted to rehabilitate him, and in 1775 having meantime taken an active part in politics, he became secretary of state for the colonies in the North cabinet. Thus, though still standing condemned as unfit for any military employment, he exercised a powerful and unfortunate influence on the military affairs of the nation. As the war department in those days fell to the colonial office, and German was practically the director of the war for the suppression of the revolt in the American colonies. What hopes of success there were in such a struggle Germain and the North cabinet dissipated by their misunderstanding of the situation and their friction with the generals and the army in the theatre of war. But this failure was not on the same footing as that of Minden, and in spite of virulent party attacks, King George III., on the resignation of the North ministry, offered him a peerage. Sackville, in characteristic fashion, stipulated for a viscountcy, as otherwise he would be junior to his secretary, his lawyer and to Amherst, who had been pardoned his father's. There was some opposition to his taking his seat in the House of Lords. But his health was failing and he withdrew from politics, spending his last years as a benevolent and autocratic country magnate. He died at...
SACKVILLE—SACRAMENT

Stoneland Lodge (Buckhurst Park), Sussex, on the 26th of August 1785.

SACKVILLE, MORTIMER SACKVILLE-WEST, 1st BARON SACKVILLE-WEST (1852-1888), was descended from Sir Richard Sackville, a Kentish gentleman, and a cousin of Ann Boleyn. A member of parliament and courtier under Henry VIII., Richard Sackville became chancellor of the court of augmentations in 1548 and was knighted in 1549. He amassed a great deal of wealth, and Sir Robert Naunton said his name should be "sill-sack," rather than "Sackville." He was on friendly terms with Roger Ascham, whom he advised to write his Scholemaster. In 1604, his son Thomas was created earl of Dorset, and from him the earls and dukes of Dorset (q.v.) of the Sackville family were descended.

Mortimer Sackville-West was a younger son of George John Sackville, 4th Earl de la Warr (See de la Warr): his mother, Elizabeth, Baronesse Buckhurst, being a daughter of John Frederick Sackville, 3rd duke of Dorset. When in 1873 his elder brother, Reginald Windsor, became 7th Earl de la Warr, Mortimer succeeded by arrangement to the extensive estates of the Sackvilles, including Knole Park, their beautiful Kentish residence, which had come to his family through his mother. In 1876 he was created Baron Sackville of Knole, and died on the 1st of October 1888.

His brother, LIONEL SACKVILLE-WEST (1827-1908), succeeded as 2nd baron. He had a long career in the diplomatic service. From 1852 to 1853 he was ambassador to the Barbary states. He retired from 1878 to 1881 he represented his country at Madrid, and from 1881 to 1888 at Washington. His retirement was due to an unfortunate interference in American domestic politics, or what was taken as such, which caused some stir. He died in September 1908 and was succeeded by his nephew Lionel Edward (b. 1867) as 3rd baron. By a Spanish dancer, Josefa Duran de Ortega, known also as Pepita de Oliva, Mr Sackville-West, as the 2nd baron then was, had several children, and soon after his death one of these, calling himself Ernest Henri Jean Baptiste Sackville-West, claimed to be a lawful son and his father's heir. He asserted that between 1863 and 1867 Sackville-West had married his mother. The case came before the English courts of law in 1909-1910, and it was decided that the children of this union were all illegitimate, as Pepita's husband, Jean Antonio Gabriel de Oliva, was alive during the whole period of his wife's connexion with Sackville-West.

SACO, a city of York county, Maine, U.S.A., on the Saco river, and the Atlantic Ocean, opposite Biddeford, with which it is connected by bridges, and 14 m. S.W. of Portland. Pop. (1890), 6075; (1900) 6222 (903 foreign-born); (1910) 6583. It is served by the Boston & Maine railway, and is connected with Portland by an electric line. The actual municipal limits include an area of about 40 sq. m., but much of this is sparsely settled, and the centre of settlement, or city proper, is about 5 m. above the mouth of the Saco. The city has a public park (Pepperrell Park) of 30 acres, the Dyer Library (1790), containing in 1908 16,000 volumes, and York Institute (established in 1866 and incorporated in 1867), with a library of 5000 volumes in 1908; and is the seat of Thornton Academy (co-educational), incorporated in 1811, opened in 1813, but closed during 1848-1889 after the burning of the old building. Old Orchard Beach, in the vicinity, extending along the shore front of the township of Old Orchard (pop. in 1900, 964) and part of the shore fronts of Saco and Scarborough, is a popular summer resort; in August 1907 nearly all the hotels were burnt, but others have since been built. At Saco the river falls about 55 ft. and provides excellent water-power. The city's principal manufactures are cotton goods and cotton-mill machinery. Saco was settled as early as 1631, and was the seat of the Gorges government from 1636 to 1653, when it passed under the jurisdiction of Massachusetts. Until 1762 Saco and Biddeford formed one town or plantation until 1718 under the name of Saco, and from 1718 to 1762 under the name of Biddeford. In 1716 Sir William Pepperrell acquired title to the principal part of what is now Saco, in 1752 this was made a separate parish, and ten years later it was incorporated as a separate township under the name of Pepperellboro. In 1779 the Pepperell property was confiscated as that of a loyalist, and in 1869 the name of the township was changed to Saco. In 1818 Saco was chartered as a city.

SACRAMENT, in religion, a property or rite defined in the Anglican catechism as "an outward and visible sign of an inward and spiritual grace;" if the grace be allowed to be inherent in the external symbolic thing or act as well as in the faithful who receive or do it, this definition holds good not only for the Latin Church, but for more primitive religions as well. In the Greek Church the equivalent word is μυστήριον, a mystery, a usage which is explained below.

The Latin word sacramentum originally meant any bodily or sensible thing, or an action, or a form of words solemnly ordained with a meaning and purpose which in itself it has not. Thus the money deposited by each of two litigants in a sacrementum or with a priest, was called a sacrament. The winner of the suit got back his deposit, but the loser forfeited his to the god or to the winning party. In Livy it signifies the oath (q.v.) which soldiers took among themselves not to run away or desert. Pliny uses it similarly of the oath by which the Christians of Bithynia bound themselves at their solemn meetings not to commit any act of wickedness. Tertullian (c. 160-240) uses it in both senses, of an oath, as in the passage of his treatise About Spectacles, where he says that no Christian "passes over to the enemy's camp without throwing away his arms, without abandoning the standards and sacraments of his chief." In the treatise To the Nations, i. 16, he speaks of the sacraments of our religion, intending, it would appear, the love-feast and Eucharist. So in the Apology, ch. vii., he speaks of the sacrament of infanticide and of the eating of a murdered child and of incest: following the banquet, the crimes of which the Christians were commonly accused. In the work Against Marcion, iv. 34, he speaks of the sacrament of baptism and Eucharist. In the work against the Jews, ch. xi., he speaks of the letter ταύ set in ink on the forehead of the men of Jerusalem (Ezek. ix. 4), as the sacrament of the sign, i.e. of the cross; and in chap. xiii. of the same work he dwells on the sacrament of the wood prepared in 2 Kings vi. 6. The stick with which Elissa made the iron to swim in that passage, and the wood which Isaac carried up the mountain for his own pyre were sacraments reserved for fulfilment in the time of Christ. In other words they were types, things which had a prophetic significance. In the same work, chap. x., he speaks of the sacrament of the Passion foreshadowed in prophecies. In his work On the Soul, chap. xviii., the aeons and genealogies of the Gnostics are the sacraments of heretical ideas. In the work About the Crown, chap. iii., he describes how the faithful take the sacrament of the Eucharist also in their meetings held before dawn. Elsewhere he speaks of the sacraments of water, oil, bread. In the work Against Valentianists, chap. xxix., he speaks of the great sacrament of the name, here rendering the Greek word μυστήριον, mystery. In the tract On Monogamy, chap. xi., he speaks of the sacrament of monogamy. Elsewhere he talks of the sacrament of faith, and of the Resurrection, and of human salvation, and of the Pascha, and of union, and of the body of Christ. Later Latin fathers use the word with similar vagueness, e.g. Augustine speaks of the salt administered to catechumens before baptism and of their exorcism as sacraments; and as late as 1129 Godfridus so calls the salt and water, oil and chrism, the ring and pastoral staff used in ordinations. But by this time the tendency was in the West to restrict the sense of the word. Thus Isidore his Hieographiae, c. 630, in his book of Origois, vi. 19, recognized as sacrament's baptism and the chrism, and the Body and Blood, and he writes thus: "Under the screen of corporeal objects a divine virtue of the sacraments in question secretly brings about salvation: wherefore they are called sacraments from their secret or sacred virtues." Bernard (In coen. Dom. § 4, op. ii. 88) calls the rite of washing feet a sacrament, because without it we have no portion with Christ (John xiii. 8), and therefore it is necessary to salvation. Hugo de St Victor, c. 1120, in his work On the
Sacrament

Sacrament, distinguishes six, but of different grades of importance. The two principal ones necessary to salvation are baptism and the Eucharist; then come the water of aspersion and the wearing of cinders, and so forth; these advance man in sanctity. Lastly come those needful to the hallowing and instituting of other sacraments, those which concern the conferring of orders or of monkish habit. In his Summa he declares that there are seven chief sins, either original or of act, so there must be seven sacraments to remedy them; but he only enumerates six, namely baptism and the sacraments of confirmation, of the altar, of penance, last unction and matrimony. Peter Lombard (c. 1150) added as a seventh that of ordination, and to this number the Latin Church adhered at the councils of Florence and Trent. This enumeration was also adopted in 1575 by the Augsburg confession of the year 1540 by Jeremiah Patriarch of Constantinople, and again in a council held in the same city in 1639 to anathematize Cyril Lucar, who with the Anglicans recognized two only, baptism and the Eucharist. It is hardly fair on the strength of these two pronouncements to attribute the doctrine of seven sacraments to the Eastern churches in general; except under a sporadic Latin influence, they have not troubled themselves so to define their number.

In this article it is impossible to attempt a history of the sacraments and of the controversies which in every age have arisen about them. It is enough to formulate a few general considerations of a kind to orientate and guide inquirers. To begin with, it is obvious that the number of sacraments must vary according to the criterions we use of what constitutes a sacrament. The Anglicans recognize baptism and the Eucharist alone, under the impression that Christ ordained these and none other. The Latin doctors by arguments as good as those usually put forth in such controversies have no difficulty in proving that Christ instituted all seven. How, they argue, could Paul (1 Cor. iv. 1) call himself and others "ministers of Christ and stewards of the mysteries of God" unless the mysteries in question had been directly instituted by Christ. They contend even that extreme unction was so instituted, and that St James in his Epistle did but promulgate it. So Christ instituted confirmation non exhibendo sed primitiendo, not by undergoing it and so setting it forth in His own person, but by promising to send the Paraclete. The sacrament of confession and penance He equally instituted when He assigned the power of the keys to the Apostles.

The Latin Church, following Guillelmus Antissiodorensis (c. 1215), distinguishes in each sacrament the matter from the form. The matter is the sensible thing which in accordance with Christ's institution can be raised to a sacramental plane. It flows from e.g. water with immersion and guide in baptism; bread and wine in the Eucharist; anointing and laying on of hands in confirmation; contrition in the sacrament of penance. The form consists of the words used in the rite, e.g. in penance, of the formula "I absolve thee"; in the Eucharist, of the words "This is my body" and "This is the cup of my blood" or "This is my blood"; in confirmation, of the words "I sign thee with the sign of the cross and confirm thee with chrism of salvation in name of Father and Son and Holy Spirit"; in baptism, of the words "I baptize thee in the name of Father, Son and Holy Spirit (or among the Greeks "N. or M. is baptized in the name," &c.). Merely verbal change in these formulæ made without prejudicing the sense does not invalidate the sacrament. On the part of the minister or priest officiating must be present also an inward intention or will to do what the Church does. Thus a drunkard's or a madman's sacraments would only be mockery, even though the recipients received them in good faith and devoutly. On the other hand, sanctity of life on the part of the minister is not necessary in order to the validity of the sacraments which he confers, although this was held to be the case by the Donatists in the 4th century, and following them by the Waldensians and Albigenses in the 12th, and by the followers of Hus and Wycliffe in the 14th. The latter enunciated the following rule: "If a bishop or priest be living in mortal sin, then he neither ordains, nor consecrates, nor baptizes." The Cathars even held it necessary, in case a bishop fell into mortal sin, to repeat his baptisms and ordinations, for they had been vitiated by his sins. On such points the Catholics followed the more sensible course.

Certain of the sacraments can obviously only be once conferred, e.g. baptism, confirmation and orders; but can be conditionally repeated, if there is a doubt of their having been validly conferred. In conditional baptism the Latins, since about the year 1227, use the formula, "If thou art not baptized, then do I baptize thee," &c. The Latins further insist on a strict observance of the traditional matter and form. Thus baptism is not valid if wine or ice be used instead of water, nor the Eucharist if water be consecrated in place of wine, nor confirmation unless the Chrism has been blessed by a bishop; also olive oil must be used. The distinction, be it noted, of form and matters more appropriate to the sacraments of baptism, Eucharist, confirmation and last unction, than to those of orders, penance and matrimony. The recognition by the Church of the last-named as a sacrament was, in spite of the commendation uttered by Jesus (Mark x. 9), slow and arduous, owing to the erudite enthusiasm of the first generations of believers. In many regions baptism involved renunciation of married life, and for at least the first two hundred years marriage was a civil rite preceding baptism, which was deferred until the age of thirty or even later. Liturgical forms for consecrating marriage are of late development, and the Church took the institution under its protection through outside social pressure rather than of its own will and wish.

In any Latin pontifical or Greek euchologion we find numerous prayers for the consecration, not only of men, but of things. Here is an example of such a petition from the 9th century codex of Heribert, archbishop of Milan:1 "Be thou graciously pleased by the infusion of the Holy Spirit to strengthen and enhance the substance, of old approved by thee, of this oil here before thee; to the end that whatsoever in the human kind hath been touched therewith may speedily pass to a higher nature, and that the ancient Enemy may not, after anointing with the same, claim aught for himself, but that he may grieve for that he is exposed to the shafts of this blessed engine of defence, and groan because by the oil of peace the swellings of his antique fury are kept down and repressed: through our Lord Jesus Christ," &c.

Or again the following prayer for baptism over the water from the Ethiopic Statutes of the Apostles as translated by the Rev. G. Horner (London, 1904, p. 165): "God, my Lord almighty, who madest heaven and earth . . . who mingledst and unitedst the immortal with the mortal, who madest living things by combination of the two, and gavest to that which was made bodily a soul also, which thou causest to dwell within: stir this water and fill it up with thy Holy Spirit, that it may become water and Spirit for regeneration to those who are to be baptized: work a holy work and make them to become sons and daughters of thy holy name."

Such petitions as the above are common in the more ancient of the Christian cults, and are all alike inspired by the idea that a spirit or divine virtue can be confined in material objects which are to be brought into contact with or swallowed by men and animals. The same idea pervades old medical treatises; for a drug was not a chemical substance taking effect naturally on the human system, but something into which a supernatural virtue had been magically introduced, in order the more easily and efficaciously to be brought to bear upon the patient. The spirits which take possession of man or animal can equally take possession of a material substance, and even replace the substance, leaving the outward accidents of colour, shape and size unchanged. This primitive belief, termed "animism" by E. B. Tylor, asserts itself everywhere in Christianity; and objects thus invested with spiritual or curative powers are called by the Latin doctors sacramentals. Thus in the Theologia dogmatica

et moralis of P. M. Belmont, bishop of Claremont (8th ed., Paris, 1899, vol. iii. p. 119) the following definition is given of sacramentals: "Sacramentals are certain things or actions instituted or consecrated by the Church for the production of certain spiritual effects, and sometimes for the obtaining of a temporal effect."

Some of the older authorities, like Caietan and Soto, taught that sacramentals as such, defined have power to produce their effects ex opere operato, i.e. by their own inherent virtue; others that they produce them ex opere operatis, i.e. through the merit and disposition of the user. But in the latter case, argues M. Belmont, what is the use of the prayers offered up over the substances; and how account for the differences of effects which by the testimony of the faithful are respectively caused by water duly blessed and by water falsely blessed? If the mere state of mind of the person using the water determines the effect, then in the case of both kinds of benediction, the true and the false alike, it would be one and the same. He therefore inclines to the opinion that there is no inherent virtue in sacramentals, but that God is moved by the prayers uttered in their consecration to produce salutary effects in those who use them. Thus he avoids on the one side the opus operatum view, and on the other a merely receptionist position.

The consecration of material objects and in general their use in religion and cult was consistently avoided by the Manicheans; not because they failed to share the universal belief of earlier ages that spirits can be induced by means of fitting prayers and incantations into inanimate things, but because the external material world was held to be the creation of an evil demiurge and so incapable of harbouring a pure spirit. The sacramentals of the great Church were denounced by them as vehicles of the evil one; and this class of prejudice was carried to such a length that some of them eschewed even baptism with water and the sacrament of bread and wine. That they retained the laying on of hands in their spiritual baptism was an inconsistency which their orthodox opponents did not fail to note; the human hand, argued the latter, is, like the rest of the body, no less the work of the evil creator than water, oil, bread and wine, or than the wood, metal and stone out of which altars, images and churches are made. Relics for the same reason were abhorred by the Manicheans; the Catholics defending them on the ground that the bodies of saints participate in a divine virtue, and that they are consecrated under the form of such working miracles in the same manner as had the cloak of Elijah (2 Kings ii. 14), or the corpse of Elisha (ibid. xii. 21), the hem of Christ's garment (Matt. ix. 20), Peter's shadow (Acts v. 15), the handkerchiefs or aprons off Paul's body (ibid. xix. 12). The Manicheans' answer to such arguments was that miracles worked by Christ and the Apostles in the material world were only aprioritonal and not real, while those of the Old Testament were satanic.

It has been argued that the sacramental rites of the Christians were largely imitated from the pagan mysteries; but for the first two hundred years this is hardly true, except perhaps in the case of certain Gnostic sects whose leaders intentionally amalgamated the new faith with old pagan ideas and rites. It is true that Gentile converts carried over into the new religion many ideas and habits of cult contracted under the old; this was inevitable, for no one lightly changes his religious habits and categories. For long generations the doctors of the Church fought bravely against such an infusion of heathen customs; thus in Latin countries we find the rule to keep New Year's day as a fast, just because the pagans feasted on it, giving one another gifts (strenae, Fr. étrences) and taking omens for the coming year. But in the 4th century this puritanic zeal gave way, and there were an increasing number of ceremonies more and more richly and splendidly arranged by the Church; a century earlier in Asie Minor Gregory the Thaumaturge was actively transforming into shrines and cult of martyrs the temples and idolatrous rites of heroes and demigods. In proportion as such conversion was facile and rapid, it was probably imperfect.

That baptism is called the Seal (σφραγις), and Illumination (φωτισμός) in the 2nd century has been set down to the influence of the pagan mysteries; but as a matter of fact the former term is a metaphor from military discipline, and the idea conveyed in the latter that gnosis or imparting of divine love is an illuminating of the soul is found both in the Old and New Testaments. Nor because the pagans regarded the close meetings of the Christians usually held in private houses as mysteries in which incest and cannibalism were rife, does it follow that the Christians themselves accepted the comparison. On the contrary, as a thousand passages in the earlier apologists attest, they viewed the pagan mysteries with horror and detestation. Nor were they so solicitous, as it is pretended, to conceal from the authorities what they did and said in their liturgical meetings. The Christians of Bithynia were evidently quite frank about them to Pliny (c. 112), and Justin in his Apology reveals everything to a pagan emperor (c. 150). That catechumens could not participate in the ἀγαπή or love-feast (of which in this epoch the Eucharist was merely an episode) does not give to those feasts the character of a Greek mystery. The uncircumcised proselyte was similarly excluded from the Paschal meal on which the Eucharist was largely modelled, even though it may not have been in any way a continuation of the same. Baptism and the ἀγαπή took their rise in Palestine, and in their origin certainly owed little or nothing to outside influences. For both there can be found Jewish models, if necessary. The sacred feasts of the Essenes and Therapeuta in particular, as described by Josephus and Philo, closely resembled the Eucharistic ἀγαπή.

Undeniably Clement of Alexandria and Origen apply the language of the Greek mysteries to Christian gnosis and life. "These are," says Clement, "divine mysteries, hidden from most and revealed to the few who can receive them." And Origen compares them to the sacred vessels, and would have them "guarded secretly behind the veil of the conscience and not lightly produced before the public." He who so produces them "dances out the word of the true philosophy,"—a technical description of the profanation of the mysteries. It is not even safe, according to these two fathers, to commit too much to writing; and Clement undertakes not to reveal in writing many secrets known to the initiated among his readers; otherwise the indiscreet eye of the heathen may rest on them, and he will have cast his pearls before swine. But we may discount most such talk in these writers as bellettristic pedantry, copied as a rule from Philo of Alexandria, whose language is involved, and the latter's description of the Therapeuta (ed. Mangny, ii. 473) we read how each ascetic had "in his house a room in which in solitude they celebrated the mysteries of the holy life, introducing nothing therein, either to drink or to eat, nor anything else necessary for the uses of the flesh." And in scores of other passages Philo dwells on "the ineffable mysteries" of Jewish faith and allegory. He even writes thus: "O ye initiated ones, with purified sense of hearing, shall ye accept in your souls these truly sacred mysteries, nor divulge them to any of the unintiated. . . . I have been initiated by Moses the friend of God in the great mysteries." But because he uses the language of the Greek mysteries, Philo never imitated the thing itself; and he is ever ready to denounce it in the bitterest terms. Clement and Origen really meant no more than he. At a later period, however, the difficulty of screening the rites of baptism and Eucharist from the eyes of catechumens and from their ears the creeds and liturgies—a difficulty which had ever been formidable and which after the overthrow of paganism must have become insurmountable—seems to have provoked not only a great outpouring on the part of the Christian rhetors, like Basil, Chrysostom, the Gregorys and the Cyrilis, of phrases borrowed from the Greek mysteries, but perhaps an actual use of precautions. Thus the bishop of Rome, Julius (c. 340), complained (Athanas. His. c. c. 31. ed., Migne ed., 14. 350d) that a court of law had not been cleared of catechumens, Jews and pagans, in a case where the legal discussion introduced the topic of the table of Christ; and the preachers of the 4th and

1 Perhaps, however, Pliny refers only to the renegades among them.
5th centuries in their discourses often make a point of not citing the creed or describing the Eucharist; they stop short and ejaculate such remarks as θαυμάκω πίστις, νομίζω fideles ("the faithful know it"). Such was the Disciplina arcaei. All will admit who study the Nicean Church, that the Christian sacraments have stolen the clothes of the pagan mysteries, dethroned and forbidden by the Christian emperors. The catechumenate, an old institution, older in most regions than the mysteries themselves, suggested and rendered feasible such wholesale theft, especially in an age in which the sacredotal class wished to be pre-eminent, and left nothing undone to enhance in the eyes of the multitude the importance and solemnity of rites which it was their prerogative to administer. The disappearance, too, of the pagan mysteries must have left a void in many hearts, and the clerics tried to fill it up by themselves masquerading as hierophants. In the age of the Council of Nice the custom arose of baptizing children of three, because at that age they can already talk and utter the baptismal vows and responses. Not a few homilies of that age survive, denouncing the deferring of baptism, and urging on parents the duty of initiating their young children. Thus there is much evidence to show that long before A.D. 500 child baptism was in vogue. But in that case how can the creed and ritual of baptism, the Lord's Prayer and the Eucharistic formulae, have been kept secret? How can they have been the "awful mysteries," the "dread and terrible canons," the "mystic teachings," the "ineffable sentences," the "oracles too sacred to be written," which the homilists of that age pretend to have been? Could our modern freemasons continue to hide their watchwords and ritual, or even make a pretence of doing so, if they were constrained by public opinion to initiate every child three years of age? The thing is absurd. When, therefore, we find such phrases in Greek and Latin homilies of the period of 350 to 550 we must regard them as elaborate make-believe. Because catechumens as well as the faithful were present at the sermons, the preachers thought it becoming to throw them in; but the audience must have been aware that their secrets were open ones.

Literature.—Theologia dogmatica et moralis ad mentem S. Thomae Aquinatis et S. Alphonsi de Ligorio (6 vols., Paris, 1899); Gustav Anrich, Das antike Mysteriensystem (Gottingen, 1894); L. Duchesne, Origines du culte christien (Paris, 1899); Joseph Bingham, Origines ecclesiasticae (London, 1894); Adolf Harms, Doctrinengeschichte (Freiburg, 1897).

Sacramentals (Sacramentals), in the Roman Catholic Church certain acts or ordinances instituted not by Christ, but by the Catholic Church with divine authority. They are believed, in their application to persons and things, to communicate quasi ex opere operato through ordained priests the grace of God, consisting in purification, supernatural revivification and sanctification. The term is thus used to cover the rites of dedication, consecration and benediction, and, closely connected with the last-named, exorcism.

SACRAMENTARIANS, the name given to those who during the Reformations controversy not only denied the Roman Catholic "transubstantiation," but also the Lutheran "consubstantiation." They comprised two parties: (1) the followers of Capito, Carlstadt and Bucer, who at the diet of Augsburg presented the Confessio Tetrapolitana from Strassburg, Constance, Lindau and Memmingen; (2) the followers of the Swiss reformer Zwingli, who to the same diet presented his private confession of faith. The doctrinal standpoint was the same—an admission of a spiritual presence of Christ which the devout soul can receive and enjoy in a total realization of any physical or corporeal presence. After holding their own view for some years the four cities accepted the Confession of Augsburg, and were merged in the general body of Lutherans; but Zwingli's position was incorporated in the Helvetic Confession. It is a curious inversion of terms that in recent years has led to the name Sacramentarians being applied to those who hold a high or extreme view of the efficacy of the sacraments.

Sacramento, the capital of California, U.S.A., and the county-seat of Sacramento county, 91 m. (by rail) N.E. of San Francisco, on the eastern bank of the Sacramento river, about 61 m. above its mouth, at the point where it is joined by the American. Pop. (1850) 6820, (1860) 26,856, (1900) 29,682, of whom 6723 were foreign-born (1371 Germans, 1253 Irish, 94 Chinese, 653 English, 446 Canadians and 337 Japanese), and 492 were negroes (1910, census 44,696. Land area (1906) 4,499 sq. m. Sacramento is on the direct east-west line to Ogden, Utah, of the Southern (once the Central) Pacific railway (which has its main shops here), the starting point of the Southern Pacific line to Portland, Oregon, the terminus of several shorter branches of the Southern Pacific and on the Western Pacific, which has repair shops here, and it is served by interurban electric railways connecting with places in the Sacramento and San Joaquin valleys. The city is about 200 m. below Red Bluff, the head of river navigation for boats drawing 8 or 9 ft. of water, having 85 5 ft. Colusa, 91 m. above Sacramento, is the head of navigation; at low water, vessels drawing 7 ft. of water go up the river to Sacramento. There are two daily steamers to San Francisco, besides freight lines.

The city site is level (formerly in many parts 5 ft. below flood-level of the river) and is about 30 ft. above sea-level, and the street plan is rectangular. The business quarter has been filled in, and levees have been built along the Sacramento and American rivers. The climate is mild: the average annual temperature is 60° F.; average for winter months, 48°; for spring, 50°; for summer, 71°; for autumn, 51°; average temperature, 71°. San Francisco is the centre of a large railway system, and is served by the following railways: the Southern Pacific (1853), the Central Pacific (1863), the Western Pacific (1873), the Eastern Pacific (1874), the California Central (1885). The principal buildings are: a very fine state capitol (cornerstone laid, 1860; completed, 1874) in a wooded park of 35 acres, in which is an Insectary where parasites of injurious insects are propagated; Roman Catholic and Protestant Episcopal cathedrals; the county court-house; the city hall; the public library (in 1908, 41,400 volumes); and the Crocker Art Gallery, which was presented to the city by the widow of Judge E. B. Crocker, one of the founders of the Central Pacific, with an art school and an exhibit of the minerals of the state. There is a state library of 140,000 volumes in the capitol; connected with it are travelling libraries sent out through the rural districts of the state. In Sacramento are the large state printing establishment, in which, in addition to other books and documents, text-books for the entire state school system are printed; the College of the Christian Brothers, Howe's Academy, Atkinson's Business College, St Joseph's Academy, the Stanford-Lathrop Memorial Home for Friendless Girls (1900), under the Sisters of Mercy, two other orphanages, the Southern Pacific Railway Hospital (1868), the Mater Misericordiae Hospital (1895), Sisters of Mercy, Wentworth Hospital, a City Receiving Hospital (1884), the Marguerite Home (for old ladies), the Mary Magdalen Home (1895), the scientific and Peniel Rescue Home (1895). Just outside the city limits is the State Agricultural Pavilion, with race track and live-stock exhibition grounds (where the State Agricultural Society holds its annual "State Exposition" in September).

The city has a large wholesale trade. Its prosperity rests upon that of the splendid Sacramento Valley, a country of grain and fruit farms, along whose eastern side lie the gold-producing counties of the state. It is the centre of the greatest deciduous fruit region of California, and shipped about 11,000 car-loads east of the Rocky Mountains in 1909. Sacramento derives electric power from Folsom, on the American river, 23 m. away, and from Colgate, on the Yuba river, 115 m. distant. The manufacturing interests of the city are large and varied: the city's manufactures include flour (1905, value $1,772,747), lumber, distilled liquors, canned and preserved vegetables and fruits, packed meats, cigars and harness. In 1905 the total value of the factory product was $10,319,416. In 1909 the assessed valuation of the city was about $30,400,000, and the bonded indebtedness about $1,100,000. The city owns its own water system, which has a capacity of 22 million gallons daily, and is a financial success.

In 1850 John Augustus Sutter (1803–1880), a Swiss military
officer, was allowed to erect a fort on the then frontier of California, on the present site of Sacramento. He became a Mexican official (1840), and in 1841 obtained from the Mexican government a grant of 11 square leagues of land. Sutter's fort, or "New Helvetia" (a reproduction of which, with a historical museum, In Fort Sutter Park, is one of the objects of interest in the city), was on the direct line of overland immigration from the East, and its position—purposefully selected by Sutter with a view to freedom of interference from Mexican officials—made Sutter a man of great importance in the last years of the Mexican régime. After the discovery of gold in 1848, made on Sutter's land, near the present Coloma, about 45 m. E.N.E. of Sacramento, several rival towns were started on Sutter's property near the fort. Of these fortune finally favoured Sacramento—a name already frequently applied to the fort, and adopted for the name of the settlement about its embarcadero or river landing in 1848. The first sale of town lots was in January 1849. Here began the determined movement for the organization of a state government. The extraordinary richness of the placer mines of '49 caused the city to grow with wonderful rapidity. In October 1849 its population was probably 2000, in December 4000 and a year later 10,000. Trouble with land "squatters" almost led to local war in 1850. In 1849 the city offered $1,000,000 for the honor of being the state capital, which it finally secured in February 1854 (the legislature having already met here once in 1851). Between November 1849 and January 1853 the city was thrice devastated by fearful floods, and it was two-thirds destroyed by fire in November 1854; but though these misfortunes caused a collapse of inflated realty values, they did not seriously cripple the city in its development. A city government was organized in August 1849, and in February 1850 this government was incorporated, and in 1863 reincorporated; the city and county governments were consolidated from 1858 to 1863; and a new city charter was received in 1893, coming into effect in 1894. The first local steam railway of California was opened from Sacramento in 1855, and here in 1863 was begun the building of the Central Pacific railway across the Sierras, the first train from the Atlantic coast reaching Sacramento in May 1869. In 1869 there was another flood, the most destructive in the history of the city; since then the measures taken for protection have secured safety from the river. The government of the city in the 'fifties was excessively corrupt and expensive. Progress since the end of the flush mining days has been steady and conservative.

SACRARIUM, the term in classic architecture given to the cella of a temple, and to the apartment in a dwelling-house which was sacred to a deity. In medieval architecture the term is applied on the European continent to that portion of a chancel, which, enclosed with a railing or balustrade in front of the altar, is devoted to the celebration of the Holy Eucharist; this in England is generally known as the presbytery.

SACRED HEART. Devotion to the Sacred Heart of Jesus is a cult peculiar to the modern Roman Catholic Church. The principal object of this devotion is the Saviour Himself. The secondary and partial object is that Heart which was the seat or organ of His love, and which forms the natural symbol thereof. Heart and love are viewed, not physiologically, but in their moral connection. The chief liturgical expressions of this cult are the institution of a feast of the Sacred Heart and public representations of it by statues and pictures.

Private worship of Christ's heart in particular is of great antiquity in the Church, and is prominent in St Gertrude and other monastic devotions generally thought of by St Francis of Sales (q.v.) who gave this symbol to his Order (the Visitation) as its badge. The Venerable Fr. Eudes must also be mentioned as a great propagator of the devotion, in the same century, and he was the first to obtain a certain public, though only local, authorization of the new pious practices. Blessed Margaret Mary Alacoque (1647-1690), a Visitation nun of Paray-le-Monial, assisted by her director, the Venerable Claude de la Colombière, S.J. (1614-1682), was the instrument of the introduction of the specific worship of the Sacred Heart into the Church by a decision of the supreme authority, although their work only took effect long after their death. Mary of Modena, the exiled queen of James II, at the instance of the Visitation nuns petitioned in 1669 for a papal Feast of the Sacred Heart. Neither then, however, nor on the presentation of new petitions in 1726, was an affirmative answer obtained. Meanwhile the chief objection, that of "novelty," was gradually removed by the multiplication of local manifestations, the genuineness of which was proved to the satisfaction of the Roman Congregation of Rights, and in 1765 it was allowed for houses of the Visitation and certain countries. It must be added that this devotion was strongly opposed, not only by the Jansenists, but by others within the Church, under the mistaken idea that the Heart of Christ was viewed in it as separate from the rest of His Being. The formulation of this objection by the synod of Pistoia in 1686, however, only underlined the justification of the doctrine, which contributed to confirm the cult. In 1866 Pius IX. introduced the feast into the general calendar of the Roman Catholic Church, fixing the Friday after the octave of Corpus Christi for its celebration. The Beatification of Blessed M.M. Alacoque in 1864 gave a new impetus to the cause of which she had been the apostle.

See Nie. Nilles, S.J., De rationibus festorum SS. Cordis Jesu, &c. (3rd ed., Innsbruck, 1873); E. Letierno, S.J., Eudes sur le Sacrè Coeur de la Visitation (Paris, 1890). These two works contain bibliographical lists. Dalgarnas, The Devotion to the Heart of Jesus (1855); H. E. Manning, The Glories of the Sacred Heart (1876); Jos. Nix, Cultus SS. Cordis Jesu... cum additamentio de cultis purissimi cons. F. Marfisiae (Paris 1894); Burin (q.v.).

SACRIFICE (from Lat. sacrificium; sacer, holy, and facere, to make), the ritual destruction of an object, or, more commonly, the slaughter of a victim by effusion of blood, suffocation, fire or other means. While the Hebrew for sacrifice, na, makes the killing of the victim the central feature of the ceremony, the Latin word brings out the fact that an act of sacralization (see Taboo) is an essential element in many cases. The sacrifice of desacralization is, however, also found; hence MM. Hubert and Mauss describe a sacrifice as "a religious act, which, by the consecration of a victim, modifies the moral state of the sacrificer or of certain material objects which he has in view," i.e. it either confers sanctity or removes it and its analogue, impurity. It is, in fact, "a procedure whereby communication is established between the sacred and profane spheres by a victim, that is to say by an object destroyed in the course of the ceremony." By this definition the term sacrifice is extended to cover the inanimate offering which is consumed by fire, broken or otherwise rendered useless for the purpose of human life.

Theories of Sacrifice.—Explanations of sacrifice, as of other rites, are naturally not wanting among the peoples who have practised or still practise it; but they are often of the nature of aetiological myths and give no clue to the original meaning. Scientific theories date from the second half of the last century, and were originated in the first instance by the English anthropological school.

(o) According to the view put forward by Dr Tylor, the sacrifice is originally a gift, offered to supernatural beings by man for the purpose of securing their favour or minimizing their hostility. By a natural series of transitions the gift theory became transformed, in the minds of the sacrificers, into the homage theory, which again passed by an easy transition into the renunciation theory. These were, in fact, simply the popular theories of sacrifice put on an evidential basis by facts drawn from various stages of culture.

(b) With W. Robertson Smith, on the other hand, a new era was reached, in which the recently recognized existence of potenium (q.v.) was made the basis of an attempt to give a 1 Scipione de Riecchi, bishop of Pistoia from 1786 to 1791, on the ex-Jesuits requesting him to consecrate a bell dedicated to this object, issued a pastoral letter (3rd June 1784) in which he pointed out that the spirit of true religion was "far removed from fetichism," and warned his flock against "cardiokteria." This pastoral was subsequently in 1786 annexed to the resolutions passed by the reforming synod of Pistoia (q.v.), and was condemned with eighty-four other propositions by papal bull in 1794.—Ep.
theory of origins. The first form of his theory distinguishes (i.) honorific, (ii.) piacular and (iii.) mystical or sacramental sacrifices; but the latter type is traced back to the same cycle of ideas as that in which the piacular sacrifice originated. (i.) The essential feature of this type was that the god and his worshippers shared the sacrifice and might thus be regarded as commensals, or table companions. The human commensals were the totem-kin, whom Robertson Smith conceived to have been in the habit of sharing a common meal in daily life, or at least of not mixing with other kins. The object of sharing the meal with the god was to renew the blood bond. The victim was the animal of a hostile totem-kin or an animal commonly offered to the god. The god was originally a stranger, taken into the kin by a rite of blood brotherhood, and this constitutes the dark point of the theory; for Robertson Smith regards the blood bond as relatively late; hence we do not see how the god became associated with the kin. (ii.) The piacular sacrifice arose from the need of atoning for bloodshed within the kinship group; properly speaking, the culprit himself should suffer: should he be unknown or beyond the reach of vengeance, a substitute had to be found. This was naturally found in the non-human member of the totem-kin—the totem animal; in a sense, therefore, the god died for his people. (iii.) In the mystical sacrifice the god is himself slain and eaten by his worshippers. In the Religion of the Semites (2nd ed., 1894) the theory was remodelled so as to overcome the difficulty pointed out above. The god, the victim and the human group are regarded as of the same kin; the animal (totem) is the earlier form of the god; the deity was originally female, for under matrilineal rules the mother alone is of kin to her children, but, with the rise of descent in the male line, the god was transformed into a male. The sacrifice is in its origin a communion; god and worshippers have a bond of kinship between them; but it is liable to be interrupted or its strength diminished. Ceremonies of initiation are the means by which the alliance is established between the deity and the young man, when the latter enters upon the rights of manhood; and the supposed bond of kinship is thus regarded as an artificial union from the outset, so far as the individual is concerned, although Robertson Smith still maintains the theory of the fatherhood of the god, where it is a question of the origin of the totem-kin. From the communion sacrifice sprang the *piaculum*, which here becomes a subsidiary form and finds its full explanation in the ideas connected with the mystic union of god and worshippers. For the object of the *piaculum* is the re-establishment of the broken alliance, which was precisely that of the communion sacrifice. With the decline of totemism arose the need for human sacrifice—the only means of re-establishing the broken tie of kinship when the animal species was no longer available to be eaten.

This theory of Robertson Smith's has been attacked from two sides. In the first place, L. Marillier (Rev. de l'hist. des religions, xxxvi. 243) argues that if there was an original bond of kinship between the god and the kin, there is no need to maintain it by sacrificial rites, and cites against Smith's view the practice of totemic groups. To this it might be replied that the real significance of initiation ceremonies is still obscure; it is a plausible argument that the child does not form part of the kin till after initiation, but this argument seems inconclusive, for in West Australia there is solidarity, according to Grey (Journals, ii. 239), between the whole of the kinship group, whether adult or not; and, moreover, nowhere are rites found which are intended to strengthen the union between a man and his totem by means of the blood bond, unless we include the aberrant totemism of the Arunta (Spencer and Gillen, Native Tribes of Central Australia, 167), who eat their totems in order to gain magical powers of increasing the stock of the totem animal. Marillier further argues that if, on the other hand, there was no bond between god and people but that of the common meal, it does not appear that the god is a totem god; there is no reason why the animal should have been a totem; and in any case this idea of sacrifice can hardly have been anything but a slow growth and consequently not the origin of the practice. In the second place, M.M. Hubert and Mauss point out that Robertson Smith is far from having established either the historical or the logical connexion between the common meal and the other types of sacrifice; the simplest Semitic forms known to us are the most recently known; further their simplicity may mean more than documentary insufficiency, and in any case does not imply any priority; the *piaculum* is found side by side with the communion at all times. Moreover, under *piaculum* are confused purifications, propitiations and expiations; Smith's contention that purifications, whose magical character he recognizes but interprets as late, are not sacrificial, is far from conclusive.

(c) Building in part on the foundation laid by Robertson Smith, Dr J. G. Frazer has put forward the view that while the sacrifice of the god may have been piacular, it was also intended to preserve his divine life against the inroads of old age. This theory he exemplifies by stating (i.) the putting to death of the man-god, who is often also the king, on whose health is held to depend the safety of his people, of the world, or even of the universe; and (ii.) the annual killing of the representative of the spirit of vegetation or of the Corn-spirit (see Demonology).

(d) For L. Marillier sacrifice was, at its origin, essentially a magical rite—the liberation by the effusion of a victim's blood of a magical force which was to bend the gods to the will of man; from this arose, under the influence of cult of the dead, the gift theory of sacrifice. Adopting the theory of W. R. Smith, Marillier also maintained, but without clearly explaining the relation of this part of his theory to the preceding, that a human kinship group conceived the idea of allying itself with one god in particular. This they did by sacrificing a victim and effecting communion with the god by the application of its blood to the altar; or, more directly, by the sacrifice of the animal-god and the contact of the sacrificial with its blood.

(e) The preceding theories are attempts, in the main, to derive from one source all the forms of sacrifice. M.M. Hubert and Mauss, while admitting that in all sacrifices is found some idea of purchase or substitution, decline to admit that all have issued from one primitive form. In their view, based on an analysis of Hebrew and Hindu forms of sacrifice, the unity of sacrifice consists in the immediate aim of the ritual, not in the ultimate end to be attained; for we rarely find a rite other than complex and by the same sacrifice more than one result may be sought or attained. The unity of procedure consists in the fact that sacrifice involvesed the divine in communication with the profane by an intermediary—the victim—which may be piacular or honorific, a messenger or a means of divination, a means of altering the world, or indeed of the life of the species or a source of magical energy which the rites diffuse over objects in its neighbourhood.

(g) Our knowledge of primitive forms of sacrifice is meagre; even were it more extensive, it would probably be impossible to determine the origin or origins of sacrifice; for no ritual has necessarily survived unchanged in form and meaning since its inception, and even permanence of form cannot be taken to imply a corresponding permanence of meaning for the worshippers. If, however, we turn to Australia, where sacrifice is unknown, we find more than one class of rites in which we can trace an idea akin to some forms of sacrifice. Just as the German reaper leaves the last ears of corn as an offering to Wodan, so the Australian black offers a portion of a find of honey; in New South Wales a pebble is said to have been offered or a number of spears, in Queensland the skin removed in forming the body-scar. Thus it appears that the gift theory may after all be primitive; the worship of, or care for, the dead may have supplied in other areas the motive for the near offering to sacrifice; or the evolution may have been due to the spiritualization of the gods. In Australia, among the Hottentots,
in the Malay Peninsula and elsewhere, blood ceremonies are in use which are unconnected with the slaughter of a victim; in this blood ritual we may see another possible source of sacrifice. The Arunta hold that the spirits of kangaroos are expelled by human blood from certain rocks. By parity of reasoning a blood ritual may have been adopted by peoples who practise the expulsion of evils, conceiving them either animistically or as powers; catharsis, in the sense of removal of uncleanness, is not necessarily primitive.

**Principles of Classification.**—It is possible to classify sacrifices according to (a) the occasion of the rite, (b) the end to be achieved, (c) the material object to be affected or (d) the form of the rite. 

(a) The division into periodical and occasional is important in Hindu and other higher religions, and the *suras* constantly draw the distinction; the former class is obligatory, the latter facultative. In less developed creeds the difference tends to remain in the background; whether a caste annual rites, communal, purificatory or expiatory, are celebrated, and these are held to be in like manner obligatory. (b) The end to be achieved is, as has been shown by Hubert and Mauss, sometimes sacralization, sometimes desacralization. In the former case the sacrificer is raised to a higher level; he enters into closer communion with the gods. In the latter either some material object, not necessarily animate, is deprived of a portion of its sanctity and made fit for human use, or the sacrificer himself loses a portion of his sanctity or impurity. In the sacrifice of sacralization the sanctity passes from the victim to the object; in that of desacralization, from the object to the victim. (c) Sacrifices may be classified into (i) subjective or personal, where the sacrificer himself gains or loses sanctity or impurity; (ii) objective, where the current of *mana* (see Tanoo) is directed upon some other person or object, and only a secondary effect is produced on the sacrificer himself. (d) The form of the sacrifice is discussed in the next section.

**Ritual.**—For Hinduism and later Judaism we possess a wealth of material on which to base a comparative study of the forms of sacrifice; a form of this—animal sacrifice in the Vedas—has been analysed by M.M. Hubert and Mauss. For Greece and Rome, where the instructions as to ritual were not embodied in the elaborate codes handed down in Hinduism or Judaism, our material is far less complete. For other areas we have often no description of the procedure at all, but merely the briefest outline of the actual process of slaughter, and we are ignorant whether the form of the rite is in reality simple (either from a loss of primitive elements or from never having advanced beyond the stage at which we find it), or whether the absence of details is due to the inattention or lack of interest of the observer. It must therefore be understood that the following analysis of ritual, based on the most elaborate codes known to us, is by no means conclusive as to the primitive form or forms of sacrifice. The necessary elements of a Hindu sacrifice are found in the sacrificer, who provides the victim, and is affected, directly or indirectly, by the sacrifice; he may or may not be identical with (2) the officiant, who performs the rite; we have further (3) the place, (4) the instruments of sacrifice and (5) the victim; where the sacrificer enjoys only the secondary results, the direct influence of the sacrifice is directed towards (6) the object; finally, we may distinguish (7) three moments of the rite—(a) the entry, (b) the slaughter, (c) the exit.

The sacrifices of sacralization and desacralization mentioned above find their analogues in the Hindu scheme of the rite; sacralization and desacralization, sometimes performed by means of subsidiary sacrifices, are the essential elements of the preparation for sacrifice and the subsequent lustration. In these more developed forms, such as the offering of soma, they assumed a great importance; (1) the sacrificer had to pass from the world of man into a world of the gods; consequently he was separated from the common herd of mankind and purified; he underwent ceremonies emblematic of rebirth and was then subject to numberless taboos imposed for the purpose of maintaining his ceremonial purity. In like manner (2) the officiant prepared himself for his task; but in his case the natural sanctity of the priest relied on the necessity of undergoing all that the common man had to pass through; in fact, this was one of the causes which brought him into existence, the other being the need of a functionary familiar with the ritual, who would avoid disastrous errors of procedure, destructive of the efficacy of the sacrifice. (3) Where there was an appointed place of sacrifice—the Temple at Jerusalem, according to later Jewish prescription—there was no need of preparation of a place of sacrifice; but the Hindu chose, each for himself, the site of his altar. (4) The necessary rites included (a) the establishment of the fires, friction being the only permitted method of kindling it, (b) the tracing on the ground of the *vedi*, or magical circle, to destroy impurities, (c) the digging of the hole which constituted the real altar, (d) the preparation of the post which represented the sacrificer and to which the victim was tied, and other minor details. (5) The victim might be naturally sacred or might have to undergo sanctification. In the former case (a) individual animals might be distinguished by certain marks, or (b) the whole species might be allied to the god; in the latter case the victim had to be without blemish; (c) the age, colour or sex of the victim might differ according to the purpose of the sacrifice. It was first cleansed; then plied with laudatory epithets; and, thirdly, soothed, so that it might be more acceptable to the gods and less likely to do an injury after its death, when its spirit was set free. It had now reached a degree of sanctity and only the priest might touch it; it was sprinkled with water, and anointed with butter; finally, the priest made three turns round it with a lighted torch in his hand, which finally separated it from the world and fitted it for its high purpose. The object of the sacrifice being to bridge the gulf between the sacred and profane worlds, the sacrificer had to remain in contact with the victim, either personally, or, to avoid ritual perils, by the intermediary of the priest. After excuses made to the animal or to the species in general, the victim was placed in position, and silence observed by all who were present. The cord was drawn tight and the victim ceased to breathe; its spirit passed into the world of the gods. But this did not conclude the ceremony, even as far as the victim was concerned; it remained to dispose of the corpse. After a rite intended to secure its perfect ceremonial purity, a part of the victim, the *śadvāpa*, was removed, held over the fire and finally cast into it. The remainder, divided into eighteen portions, was cooked; seven fell to the sacrificer, after an invocation, which made them sacred by calling the deity to descend into the offering and thus sanctify the sacrificer. (6) Then followed the rites of desacralization, including burning of certain of the instruments, lustration of the post, destruction of the butter, &c. Finally the priest, the sacrificer and his wife performed a lustration, found in an exaggerated form in the "bath" which concluded the *soma* sacrifice, and the ceremonies were at an end.

The sacrificial scheme of sacrifice holds good for other areas, and in particular for more primitive peoples, is an open question. Our data are nowhere so full as for India; where they are comparatively abundant they refer either to a civilized or semi-civilized people, or to an area, like West Africa, where the influence of Islam has introduced a disturbing element. Though the moralization of gods has only proceeded pari passu with the moralization of mankind, the deities of the more advanced nations are perhaps felt by them to be more terrible and more difficult of access than the divinities of lower races; herein lies one explanation of the power of the priesthood. Even if the conception of the relative sanctity of gods and men remained unaltered, it by no means follows that in primitive times the sacrificer would necessarily act as he is supposed to do now, as was demanded by the consciousness of later generations. With our present knowledge the problem of the original form of sacrifice, if there be a single primary form, is insoluble.

No general survey of sacrificial ritual is possible here, but a few details as to the mode of slaying the victim and disposing of the body may be given. The head of the animal or man may be cut off (and custom often requires that a single blow shall suffice), its spine broken or its heart torn out; it may be

---

SACRIFICE
stoned, beaten to death or shot, torn in pieces, drowned or buried, burned to death or hung, thrown down a precipice, strangled or squeezed to death. The sacrificer may aim at causing a speedy death or a slow one. The corpse may be burnt, in part or as a whole; portions may be assigned to the priest, the sacrificer and the gods; the skull, bones, &c., may receive special treatment; the fat or blood may be set aside, and they or the ashes may be singled out as the share of the god, to be offered upon the altar; the skin of the victim may be employed as a covering for the idol or material representative of the god, either permanently or till the next annual sacrifice. The blood of the victim may be drunk by the priest as a means of inducing inspiration, its entrails may be employed in divination, its flesh consumed in a common meal, exposed to the birds and beasts of the wild as a sacrifice to the earth.

It is equally impossible to give a general survey of the purposes of sacrifice; not only are they too numerous but it is rare to find any but mixed forms; the scapegoat, for example, is also a messenger to the dead, and its flesh is eaten by the sacrificers. Certain main types may, however, be enumerated.

Cathartic Sacrifice.—In primitive cults the distinction between sacred and unclean is far from complete or well defined (see Tanoo); consequently we find two types of cathartic sacrifice—(i) one to cleanse of impurity and make fit for common use, (ii) the other to rid of sanctity and in like manner render suitable for human or intercourse.

(i) The most conspicuous example of the first class is the scapegoat. Two goats were provided by the ancient Hebrews on the Day of Atonement; the high priest sent one into the desert, after confessing on it the sins of Israel; it was not permitted to run free but was probably cast over a precipice; the other was sacrificed as a sin-offering. In like manner in the purification of lepers two birds were used; the throat of one was cut, the living bird dipped in the blood mingled with water and the leper sprinkled; then the bird was set free to carry away the leprosy. In both these rites we seem to have a duplication of ritual, and the parallelism of sacrifice and the scapegoat clear.

(ii) As an example of the second class may be taken the sacrifice of the bull to Rudra. M.M. Hubert and Mauss interpret this to mean that the sanctity of the remainder of the herd was concentrated on a single animal; the god, incarnate in the herd, was eliminated by the sacrifice, and the cattle saved from the dangers to which their association with the god exposed them. In the Feast of Firstfruits we have another example of the same sort; comparable with this concentration of holiness is the respect or veneration shown to a single animal as representative of its species (see Animal Worship). In both these cases the object of the rite is the elimination of impurity or of a source of danger. But the Nazarite was equally bound to lay aside his holiness before mixing with common folk and returning to ordinary life; this he did by a sacrifice, which, with the offering of his hair upon the altar, freed him from his vow and reduced him to the same level of sanctity as ordinary men.

With regard to the scapegoat, it must be noted that we also meet with a more concrete idea of expulsion of evil (see Demonology, Exorcism), which is present among the most primitive peoples, such as the Australians. This raises the problem of how far the catharsis dealt with above is in its original form an elimination of impurity, and how far something more definite—a spirit or other principle of evil—is held to be expelled by scapegoat and allied ceremonies.

Communal Sacrifice.—In spite of the importance attached to the idea of the common meal by Robertson Smith, it is not a primitive rite of adoption. The custom of eating the body of the victim does not necessarily spring from any idea of communion with the god; it may also arise from a desire to incorporate the sanctity which has been imparted to it—an idea on a level with many other food customs (see Cauvade), and based on the idea that eating anything causes its qualities to pass into the eater. Where the victim is an animal specially associated with a god (the most conspicuous case is perhaps that of the corn spirit), it may be granted that the god is eaten; but precisely in these cases there is no custom of giving a portion of the victim to the god.

Deificatory Sacrifice.—The object of certain sacrifices is to provide a deity with the abode of a house, town or frontier. (a) In Burma, as in many other countries, those who die a violent death are held to haunt the place where they met their fate; consequently when a town is built living men are interred beneath the ramparts and the pillars of the gates. (b) In parts of North America the nagual or manitu animal, of which the Indian dreams during the initiation fast and which is to be his tutelary spirit, is killed with certain rites. (c) Human representatives of the corn or vegetation spirits are killed; in these, as in other cases of the sacrifice of the man-god cited by Dr Frazer, the killing of the old god is at the same time the making of a new god. (d) The scapegoat is treated as a means of raising a human being to the rank of a god. (e) Gods may be paraphrastic (in the anthropomorphic form) to themselves as a means of renewing the life of the god.

(f) The method of creating a fetish (see Fetius) on the Congo resembles deificatory sacrifice; but here there is no actual slaughter of a human being; magical means are alone relied upon.

Honourific Sacrifices.—Whatever their origin, sacrifices tend to be interpreted as gifts to the god. Man seeks to influence his fellow men in various ways, by intimidation, by decease, by bribery; and it is quite natural to find the same ideas in the spirit of a religion. Food is often given to a god because he is believed to take pleasure in eating; the germ of this idea may have been identical with that of some funerary sacrifices—to nourish the divine life. At a later period, pari passu with the spiritualization of the god, comes a refinement of the tastes attributed to him, and the finer parts of the sacrifice, finally it may be only its savour, are alone regarded as acceptable offerings. Just as attendants are provided for the dead, so the god receives sacrifices intended to put slaves at his disposal. This latter idea was the more likely to arise, as the gift theory of sacrifice is closely associated with that of the god as the ruler or king to whom men bring a tribute, just as he had to appear before his earthly king bearing gifts in his hands. The honourific sacrifice is essentially a propitiation; it must be distinguished from the piaculum (see below), to which in some aspects it is allied.

Mortuary Sacrifice.—Sacrifices, especially of human beings, are offered immediately after a death or at a longer interval. Their object may be (a) to provide a guide to the other world; (b) to provide the dead with servants or a retinue suitable to his rank; (c) to send messengers to keep the dead informed of the things of this world; (d) to strengthen the dead by the blood or life of a living being, in the same way that food is offered to them or blood rituals enjoined on mourners.

Piacular Sacrifice.—When the god receives a gift in the honourific sacrifice, he demands a life in the piaculum. This, according to Westermarck, is the central idea of human sacrifice: the victim is substituted for the sacrificer, to deliver him from perils by disease, famine or, more indefinitely, from the wrath of the god in general. The essential feature of the piaculum is that it is an expiation for wrong-doing, and the victim is often human.

Human Sacrifice.—Many theories of the relation of human to animal sacrifice have been put forward, most of them on an insufficient basis of facts. It has been held that animal sacrifice is the primitive form and that the decay of totemism or lack of definition of animals has brought about the substitution of a human victim; but it has also been urged that in many cases animal victims are treated like human beings and must consequently have replaced them, that human beings are smarmed with the blood of sacrifice, and must therefore have themselves been sacrificed before a milder régime allowed an animal to replace them. If tradition is any guide, human sacrifice seems in many important areas to be of secondary character; in spite of the great development of the rite among the Aztecs, tradition says that it was unknown till two hundred years before the conquest; in Polynesia human sacrifices seem to be comparatively modern; and in India they appear to have been rare among the Vedics peoples. On the whole, human sacrifice is far commoner.
SACRIFICE

among the semi-civilized and barbarous races than in still lower stages of culture. In Australia, however, where sacrifice of the ordinary type is unknown, the ritual killing of a child is practised in connexion with the initiation of a magician; it is therefore by no means axiomatic that animals were offered before human beings; the problem of priority is one to be solved for each area separately, but probably no solution is possible; in the absence of Aztec traditions it would hardly have seemed probable that two centuries had seen so great a transformation.

Among the forms of human sacrifice must be reckoned religious suicide. This is perhaps mainly found in India but is not unknown in Africa and other parts of the world. Human sacrifices were known in ancient India and survived till late in the 19th century (see below); both Greeks and Romans practised them, no less than the wilder races of ancient Europe. Semites and Egyptians, Peruvians and Aztecs, slew human victims; Africa, especially the West Coast, till recently saw thousands of human victims perish annually; in Polynesia, Tahitians and Fijis were great centres of the rite—in fact, it is not easy to name an area where it has not been known.

No general survey of sacrifice on geographical lines is possible, but some of the more important features in each area may be noticed.

Sacrifice in Greece and Rome.—Both the mainland of Greece and the Greek colonies practised human sacrifice, usually as a means towards expulsion of evil. Thus, the Athenians maintained a number of outcasts, from whom in times of national calamity two were selected, one for the men, one for the women, and stoned to death outside the city; at the Thargelia two victims were annually put to death in the same way. Many animal sacrifices were known; of especial importance is the annual sacrifice of a goat on the Acropolis, though at other times the animal was not permitted to enter the temple.

Important features of Greek sacrifice, though not necessarily found in every rite, were the putting of wreaths and pieces of wool on the victim, the gilding of its horns, the lustration of the officiant and the sprinkling of those present with holy water. It was held inauspicious if the animal was unwilling; if it nodded all was well. Barley meal 1 was strewn on its neck, and a lock of hair cut from its forehead and burned. The animal was then clubbed, its throat cut and the altar sprinkled with its blood. Finally the body was skinned and cut up and the god's share burned on the altar.

The important Attic sacrifice of the Dipolia, known as Ἀθηναίων ἁγίων, demands some notice. Cakes were laid on the altar of Zeus Polieus and oxen driven round; the one which touched the cakes was the victim. An officiant at once struck it with his axe and another cut its throat; then all save the one who struck the first blow partook of its flesh. Then the hide was stuffed with grass and yoked to a plough; the participants were charged with ox murder and each laid the blame on the other; finally the axe was thrown into the sea. The interpretation of the rite is uncertain; it may perhaps be connected with agrarian rites.

At Rome the scapegoat did not suffer death; but in the Saturnalia a human victim seems to have been slain till the 4th century A.D. Many forms of animal sacrifice were found; the generalized account given above for Greece is true also for the Romans.

Sacrifice in Egypt.—Of Egyptian ritual little is known; our knowledge rests mainly on the evidence of pictures. At Deir el Bahri we see that the animal had its throat cut in Mahommedan fashion; it lay on its side, the legs tied together; the heart was taken out, then the liver; the burnt sacrifice was hardly known. Sacrifice was common; an account of animal sacrifice has been given above. Among human sacrifices may be mentioned the sutee, or custom of immolating a widow on the funeral pyre of the husband, and the Khond sacrifice of the Merish, who was either purchased or the son of a victim father. Some days before the sacrifice, the victim, who was often kept in captivity for long periods, was devoted by the cutting of his hair, previously unshorn, and his sanctity was increased later by various ceremonies of anointing. Finally he was taken in procession, stuperified or otherwise rendered incapable of resistance, and put to death by strangulation or pressure. The remains were dismembered and carried to the fields, excepting the portion offered to the earth goddess, which was buried.

Sacrifice in Africa.—Especially in West Africa many forms of sacrifice are found. In the annual "customs" of Dahomey, now abolished, hundreds of human victims were offered. Three main forms of human sacrifice existed in this area: (1) the scapegoat; (2) the messenger; and (3) the expiation, but combinations were not infrequent. The victim was often kept in captivity and well fed; to transfer their sins people laid their hands upon him as he was led in procession, his head covered with ashes; on the way to the place of sacrifice were three enclosures, the second open to chiefs and priest only, the third to the officiant and his helper alone; the blood of the victim was offered to the gods. At the present day the animal victim may be burned or drowned, buried in the earth or simply exposed. Sometimes the sacrificer's hands are laid on the victim before it is slain, or he may be smeared with its blood; in other cases the blood is smeared on the door posts, or the sacrificer is touched on every part of the body with the victim's body. On the Congo, if a man commits a murder, the community votes whether he shall die or be expelled; if the latter, a victim is killed, of which all must partake; but this is not, as might be imagined, a case of Robertson Smith's piaculum for the re-establishment of the tribal bond; for the criminal is driven out of the community.

Sacrifice in America.—Sacrifice was relatively infrequent and undeveloped among the Red Indians. The Pawnees, however, had an elaborate ritual, in which a human victim was sacrificed to the Morning Star; the blood of the victims was sprinkled on the fields, and the details of the rite are not unlike those of the Khond custom. The Iroquois sacrifice of the white dog bole in later times the character of a scapegoat festival; but it is doubtful how far this was an original feature. The animals were decorated with wampum and strangled, and then the sins of the people were transferred to them; then the remains were burned and the ashes gathered up, taken through the village and sprinkled on the fields. In Mexico and Central America sacrifices were very common; the lowest estimate is 20,000 annually. The victims were often fished for a whole year and treated as divine; the heart was an offering to the god, the body was eaten by the priests and nobles and the head was preserved with those of previous victims.

(N. W. T.)

The Idea of Sacrifice in the Christian Church.

There can be no doubt that the idea of sacrifice occupied an important place in early Christianity. It had been a fundamental element of both Jewish and Gentile religions, and Christianity tended rather to absorb and modify such elements than to abolish them altogether. To explain the growth of the 18th had been modified already. Among the Jews the preaching of the prophets had been a constant protest against the grosser forms of sacrifice, and there are indications that when Christianity arose bloody sacrifices were already beginning to fall into disuse; a saying which was attributed by the Ebionites to Christ repeats this
protest in a strong form, "I have come to abolish the sacrifices; and if ye do not cease from sacrificing the wrath of God will not cease from you" (Epiph. xxx. 10). Among the Greeks the philosophers had come to use both arguments and ridicule against the idea that the offering of material things could be needed by or acceptable to the Maker of them all. Among both Jews and Greeks the earlier forms of the idea had been rationalized into the belief that the most appropriate offering to God is that of a pure and penitent heart, and among them both was the idea that the vocal expression of contrition in prayer or of gratitude in praise is also acceptable. The best instances of these ideas in the Old Testament are in Psalms i. and li., and in Greek literature the striking words which Porphyrus quotes from an earlier writer, "We thought then, having been united and made like to God, to offer our own conduct as a holy sacrifice to Him, the same being also a hymn and our salvation in passionless excellence of soul" (Euseb. Dem. ev. 3). The ideas are also found both in the New Testament and in early Christian literature: "Let us offer up a sacrifice of praise to God continually, that is, the fruit of lips which make confession to His name" (Heb. xii. 13); "That prayers and thanksgivings, made by worthy persons, are the only perfect and acceptable sacrifices I also admit" (Just. Mart. Trypho, c. 117); "We honour God in prayer, and offer this as the best and holiest sacrifice with righteousness to the righteous Word" (Clem. Alex. Strom. vii. 6).

But among the Jews two other forms of the idea expressed themselves in usages which have been perpetuated in Christianity, and one of which has had a singular importance for the Christian world. The one form, which probably arose from the conception of Yahweh as in an especial sense the protector of the poor, was that gifts to God may properly be bestowed on the needy, and that consequently alms have the virtue of a sacrifice. Biblical instances of this idea are:—"He who doeth alms is offering a sacrifice of praise" (Eccles. xxxii. 2); "To do good and to communicate forget not, for with such sacrifices God is well pleased." It was thought later, and made by the Philippians to Paul when a prisoner at Rome are "an odour of a sweet smell, a sacrifice acceptable, well pleasing to God" (Phil. iv. 18). The other form, which was probably a relic of the conception of Yahweh as the author of natural fertility, was that part of the fruits of the earth should be offered to God in acknowledgment of His bounty, and that what was so offered was especially blessed and brought a blessing upon both those who offered it and those who afterwards partook of it. The persistence of this form of the idea of sacrifice constitutes so marked a feature of the history of Christianity as to require a detailed account of it.

In the first instance it is probable that among Christians, as among Jews, every meal, and especially every social meal, was regarded as being in some sense a thank-offering. Thanksgiving, blessing and offering were co-ordinate terms. Hence the Talmudic rule, "A man shall not taste anything before blessing it" (Joseph. Beracoth, c. 4), and hence St Paul's words, "He that eateth, eateth unto the Lord, for he giveth God thanks" (Rom. xiv. 6; cp. 1 Tim. iv. 4). But the most important offering was the solemn oblation in the assembly on the Lord's day. A precedent for making such oblations elsewhere than in the synagogue had been afforded by the Essenes, who had endeavoured in that way to avoid the contact with uncleann things which a resort to the temple might have involved (Jos. Antiq. xviii. 5), and a justification for it was found in the prophecy of Malachi, "In every place incense is offered unto my name and a pure offering; for my name is great among the Gentiles, saith the Lord of hosts" (Mal. i. 11, repeatedly quoted in early Christian writings, e.g. Teaching of the Twelve Apostles, c. 14; Just. Mart. Trypho, c. 28, 41, 116; Irenaeus iv. 17, 5).

The points in relation to this offering which are clearly demonstrable from the Christian writers of the first two centuries, but which subsequent theories have tended to confuse, are these: (1) It was considered as an offering of sacrifice; for in the Teaching of the Twelve Apostles, in Justin Martyr and in Irenaeus it is designated by each of the terms which are used to designate sacrifices in the Old Testament. (2) It was primarily an offering of the fruits of the earth to the Creator; this is clear from both Justin Martyr and Irenaeus, the latter of whom not only explicitly states that such oblations are continued among Christians, but also meets the current objection to them by arguing that they are offered to God not as though He needed anything but to show the gratitude of the offerer (Iren. iv. 17, 18). (3) It was offered as a thanksgiving partly for creation and preservation and partly for redemption: the latter is the special purpose mentioned (e.g.) in the Teaching of the Twelve Apostles; the former is that upon which Irenaeus chiefly dwells; both are mentioned together in Justin Martyr (Trypho, c. 41). (4) Those who offered it were required to be not only baptized Christians but also "in love and charity one with another"; there is an indication of this latter requirement in the Sermon on the Mount (Matt. v. 23, 24, where the word translated "gift" is the usual LXX. word for a sacrificial offering, and is so used elsewhere in the same Gospel, viz. Matt. viii. 4, xxiii. 19), and still more explicitly in the Teaching, c. 14, "Let not any one who has a dispute with his fellow come together with you (i.e. on the Lord's day) until they have been reconciled, that your sacrifice be not defiled." This brotherly unity was symbolized by the kiss of peace. (5) It was offered in the assembly by the hands of the president; this is stated by Justin Martyr (Apol. i. 65, 67), and implied by Clement of Rome (Ep. i. 54).

Combined with this sacrifice of the fruits of the earth to the Creator in memory of creation and redemption, and probably always immediately following it, was the sacred meal at which part of the offerings was eaten. Such a sacred meal had always, or almost always, formed part of the rites of sacrifice. There was the idea that what had been solemnly offered to God was especially hallowed by Him, and that the partaking of it united the partakers in a special bond both to Him and to one another. In the case of the bread and wine of the Christian sacrifice, it was believed that, after having been offered and blessed, they became, in the aggregate, the body and blood of Christ. This "communion of the body and blood of Christ," which in early writings is clearly distinguished from the thank-offering which preceded it, and which furnished the materials for it, gradually came to supersede the thank-offering in importance, and to exercise a reflex influence upon it. In the time of Cyprian, though not before, we begin to find the idea that the body and blood of Christ were not merely partaken of by the worshippers but also offered in sacrifice, and that the Eucharist was not so much a thank-offering for creation and redemption as a repetition or a showing forth anew of the self-sacrifice of Christ. This idea is repeated in Ambrose and Augustine, and has since been a dominant idea of both Eastern and Western Christendom. But, though dominant, it has not been universal; nor did it become dominant until several centuries after its first promulgation. The history of it has yet to be written. For, in spite of the important controversies to which it has given birth, no one has been at the pains to distinguish between (i) the theories which have been from time to time put forth by eminent writers, and which, though they have in some cases ultimately won a general acceptance, have for a long period remained as merely individual opinions, and (ii) the current beliefs of the great body of Christians which are expressed in recognized formulaires. A catena of opinions may be produced in favour of almost any theory; but formulaires express the collective or average belief of any given period, and changes in them are a sure indication that there has been a general change in ideas.

It is clear from the evidence of the early Western liturgies that, for at least six centuries, the primitive conception of the nature of the Christian sacrifice remained. There is a clear distinction between the sacrifice and the communion which followed it, and that which is offered consists of the fruits of the earth and not of the body and blood of Christ. Other ideas no doubt attached themselves to the primitive conception, of which there is no certain evidence in primitive times, e.g. the idea of the propitiatory character of the offering, but these
SACRILEGE

ideals rather confirm than disprove the persistence of those primitive conceptions themselves.

All Eastern liturgies, in their present form, are of later date than the surviving fragments of the earlier Western liturgies, and cannot form the basis of so sure an induction; but they entirely confirm the conclusions to which the Western liturgies lead. The main points in which the pro-medieval formalities of both the Eastern and the Western Churches agree in relation to the Christian sacrifice are the following. (1) It was an offering of the fruits of the earth to the Creator, in the belief that a special blessing would descend upon the offerers, and sometimes also in the belief that God would be propitiated by the offerings. The bread and wine are designated by all the names by which sacrifices are designated (sacrificia, hostiae, libamina, and at least once sacrificium placationis), and the act of offering them by the ordinary term for offering a sacrifice (immmolation). (2) The offering of bread and wine was originally brought to the altar by the person who offered it, and placed by him in the hands of the presiding officer. In course of time there were two important changes in this respect: (a) the offerings of bread and wine were committed for money, with which bread and wine were purchased by the church-officers; (b) the offerings were sometimes handed to the deacons and by them taken to the bishop at the altar, and sometimes, as at Rome, the bishop and deacons went round the church to collect them. (3) In offering the bread and wine the offerer offered, as in the ancient sacrifices, primarily for himself, but inasmuch as the offering was regarded as having a general propitiatory value he mentioned also the names of others in whom he was interested, and especially the departed, that they might rest in peace. Hence, after all the offerings had been collected, and before they were solemnly offered to God, it became a custom to recite the names both of the offerers and of those for whom they offered, the names being arranged in two lists, which were known as dipycys. Almost all the old rituals have prayers to be said "before the names," "after the names." It was a further and perhaps much later development of the same idea that the good works of those who had previously enjoyed the favour of God were invoked to give additional weight to the prayer of the offerer. In the later series of Western rituals, beginning with that which is known as the Leonine Sacramentary, this practice is almost universal. (4) The placing of the bread and wine in the chalice was followed by the kiss of peace. (5) Then followed the actual offering of the gifts to God (immolation missae). It was an act of adoration or thanksgiving, much longer in Eastern than in Western rituals, but in both classes of rituals beginning with the form "Lift up your hearts," and ending with the "Ter Sanctus or Trisagion." The early MSS. of Western rituals indicate the importance which was attached to this part of the liturgy by the fact of its being written in a much more ornate way than the other parts, e.g. in gold uncial letters upon a purple ground, as distinguished from the vermilion cursive letters of the rest of the MS. With this the sacrifice proper was concluded. (6) But, since the divine justification had been "Done this in remembrance of me," the sacrifice was immediately followed by a commemoration of the passion of Christ, and that again by an invocation of the Holy Spirit (epideisis) that He would make the bread and wine to become the body and blood of Christ. Of this invocation, which is constant in all Eastern rituals, there are few, though sufficient, surviving traces in Western rituals. Then after a prayer for sanctification, or for worthy reception, followed the Lord's Prayer, and after the Lord's Prayer the communion.

In the course of the 8th and 9th centuries, by the operation of causes which have not yet been fully investigated, the theory which is first found in Cyprian became the dominant belief of Western Christendom. The central point of the sacrificial idea was shifted from the offering of the fruits of the earth to the offering of the body and blood of Christ. The change is marked in the rituals by the duplication of the liturgical forms. The prayers of intercession which in earlier times are found only in connexion with the former offering, are repeated in the course of the same service in connexion with the latter. The designations and epithets which are in earlier times applied to the fruits of the earth are applied to the body and blood. From that time until the Reformation the Christian sacrifice was all but universally regarded as the offering of the body and blood of Christ. The innumerable theories which were framed as to the precise nature of the offering and as to the precise change in the elements all implied that conception of it. It still remains as the accepted doctrine of the Church of Rome. For, although the council of Trent recognized fully the distinction which has been mentioned above between the Eucharist and the sacrifice of the mass, and treated of them in separate sessions (the former in Session xiii., the latter in Session xxii.), it continued the medieval theory of the nature of the latter. The reaction against the medieval theory at the time of the Reformation took the form of a return to what had no doubt been an early belief,—the idea that the Christian sacrifice consists in the offering of a pure heart and of vocal thanksgiving. Luther at one period (in his treatise De capituliis Babylonica) maintained, though not on historical grounds, that the offering of the oblations of the people was the real origin of the conception of the sacrifice of the mass; but he directed all the force of his vehement polemic against the idea that any other sacrifice could be efficacious besides the sacrifice of Christ. In the majority of Protestant communities the idea of a sacrifice has almost lapsed. That which among Catholics is most commonly regarded in its aspect as an offering and spoken of as the "mass" is usually regarded in its aspect as a participation in the symbols of Christ's death and spoken of as the "communion." But it may be inferred from the considerable progress of the Anglo-Catholic revival in most English-speaking countries that the idea of sacrifice has not yet ceased to be an important element in the general conception of religion.

The practice of the imitation or profanation of sacred things, a crime of varying scope in different religions. It is naturally much more general and accounted more dreadful in those primitive religions in which cultual objects play so great a part, than in more highly spiritualized religions where they tend to disappear. But wherever the idea of sacred exists, sacrilege is possible. The word itself comes from the Lat. sacrilegium, which originally meant merely the theft of sacred things, although already in Cicero's time it had grown to include in popular speech any insult or injury to them.

The history of sacrilege reflects a large phase of the evolution of religion. In primitive religious inclusive of almost every serious offence even in fields now regarded as merely social or political, its scope is gradually lessened to a single part of one section of ecclesiastical criminology, following inversely the development of the idea of holiness from the concrete to the abstract, from fetishism to mysticism. The primitive defence against sacrilege lay directly in the nature of sacred things, those that held a curse for any violation or profanation. This brings us at once into the whole field of taboo (q.v.). From it we pass without a break, merely narrowing the application as the conception of sacredness grew clearer and less associated with magic, into early criminal law with its physical sanctions. The Levitical enactment of the offender reparation for the damage with the addition of one-fifth of the offender's sacrifice and an excommunicatory sacrifice (Lev. v. 15, 16). Even the gold and silver ornaments of the images of false gods were not to be coveted nor appropriated for fear of being contaminated with the curse which they could impart (cf. Deut. vii. 25). The tragic story of the stoning of Achan, who stole some of the spoils of Jericho which Joshua had consecrated to the treasury of Yahweh, is one of the most

No religion was more prodigal in rules to safeguard that which was held more consecrated than the Jewish, especially in its temple laws; violation of them often led to mob violence as well as divine chastisement. The temple rules do not apply to synagogues, however, and unseemly conduct in them is liable only to civil action. The whole wide field of Jewish taboo naturally involves sacrilege as its reverse side. Such violations of holy things as making mock of the Scriptures, or even reciting them as one would ordinary literature, was sacrilege in the eyes of the rabbi. Even imitation of the style of the Talmud has also been accounted sacrilege.

While the Roman cults were amply protected by taboos, there was no comprehensive term in Roman law for religious violations and profanations in general. Sacrilegium was narrowly construed as the theft of sacred things from olives against. Sacred things, according to Gaius, were those things that had been definitely consecrated to the gods—and so had come to partake of their holiness. Sacred places did not include private shrines. According to Ulpian the punishment for sacrilegium varied according to the position and standing of the culprit and the circumstances under which the crime was committed. For the lower classes it was crucifixion, burning or the wild beasts. The latter penalty was also attached to theft of sacred things by night, but stealing by day from a temple object of little value brought only sentence to the mines. People of higher rank were subjected to burning and classical times the law kept to the narrow meaning of sacrilegium, but in popular usage it had grown to mean about the same as the English word. Traces of this usage are frequent in Augustan writers. The early church Fathers use the word most frequently in the restricted sense, although an effort has been made to read the wider meaning in Tertullian. But by the middle of the 4th century the narrower meaning had disappeared. In Ambrose, Augustine and Leo I, sacrilegium means sacrilege. The wider meaning had invaded the law as well. Mommsen was of the opinion that sacrilegium had no settled meaning in the laws of the 4th century. But it was rather that an enlarged application of the idea of sacred made the crime of sacrilege in the sense of violatio sacri a more general one. This was partly due to the influence of Christianity, which sought to include as objects of sacrilege all forms of church property, rather than merely those things consecrated in pagan cults, partly to the efforts of the later emperors to surround themselves and everything emanating from them with highest sanctions. In the Theodosian Code the various crimes which are accounted sacrilege include—apostasy, heresy, schism, Judaism, paganism, attempts against the immunity of churches and clergy or privileges of church courts, the desecration of sacraments, &c. and even Sunday. Along with these crimes against religion went accession to burning and classical times the law kept to the laws, especially counterfeiting, defraudation in taxes, seizure of confiscated property, evil conduct of imperial officers, &c.

There is no formal definition of sacrilege in the code of Justinian but the conception remains as wide. The church had found in the imperial law a strong protector.

The penitentials (q.v.), or early collections of disciplinary canons, gave much attention to sacrilege. In the earliest of them, sacrilege in the narrower sense is not a separate class of crime, but the wider usage goes with variations through the different collections. There is also the greatest difference in the penalties assigned, reaching from little more than restitution of property to penance of one to five or even fifteen years. The Frankish synods emphasize: the crime of seizing church property of every kind, including the vast estates so envied by the lay nobility. In the Pseudo-Isidore the attempt was made to include even property on which the church had merely a legal claim. The murder or injury of the clergy is also sacrilege in both penitentials and capitularies. The practice of magic, superstition, &c., are also frequently referred to as sacrilege, especially during the long struggle with German heathenism. With the definite triumph of the church, the profanation of its sanctuaries became less frequent, and once robbery or seizure of ecclesiastical possessions or violation of its privileges tended to absorb the attention of synods and popes. Gratian's Decretum mirrors two tendencies, the church legislation with its growingly less the most application, and the wider meaning as in Justinian's Code, owing to the revival of Roman law in the 11th century. It thus was once more declared to include all violations of the divine law. A somewhat distorted, but well-substantiated use of the word sacrilegium in medieval Latin was its application to the fine paid by one guilty of sacrilege to the bishop.

The penalties in the canon law included, in addition to restitution, penance, fines and excommunication; and right of asylum was denied to the culprit. The jurisdiction was something jointly shared with the temporal power in case corporal punishment were involved. The numerous enactments of councils to ensure the proper care of church property, prohibiting the use of churches for secular purposes, for the storing of grain or valuables, for dances and merry-making, do not technically come under the head of legislation against sacrilege. The worst sacrilege of all, defiling the Host, is mentioned frequently, and generally brought the death penalty accompanied by the cruellest and most ignominious tortures. The period of the Reformation naturally increased the commonness of the crime. Under the emperor Charles V. the penalty for stealing the Host was the stake; that for other crimes was graded accordingly. In France, in 1561, under Charles IX. it was forbidden under penalty of death to demolish crosses and images and to commit other acts of scandal and impious sedition. In the declaration of 1682, Louis XIV. decreed the same penalty for sacrilege joined to superstition and impiety, and in the somewhat belated religious persecution of the duke of Bourbon in 1724 those convicted of larceny in churches, together with their accomplices, were condemned, the men to the galleys for life or for a term of years, the women to be branded with the letter V and imprisoned for life, or for a term. When one takes into account that the next article of the declaration decreed death for domestic theft, the legislation is not relatively cruel. Yet even in the enlightened 18th century popular fanaticism made of sacrilege the most heinous offence. The trial of La Barre in 1766 at Abbeville (see Voltaire) is the most famous in modern times. Convicted of wearing his hat while a religious procession was passing—as well as of blasphemy—he was accused as well of having mutilated a crucifix standing on the town bridge. Declared guilty, after torture, he was sentenced to have his tongue cut out, to be beheaded and the body to be burned, a sentence which was confirmed by the parlement of Paris and the bigoted king Louis XV. In the midst of the French Revolution respect for civic festivals was sternly enacted, but sacrilege was an almost daily matter of state policy. In the penal code the penalty for interfering with and molesting worshippers is slight, a fine of from 16 to 300 francs and prison from six days to three months, while damage or insult to the objects of worship brought only 16 francs to 500 francs fine, and prison from fifteen days to six months. In 1825 the reactionary parliament once more brought back the middle ages, by decreeing the death penalty for public profanation, the execution to be preceded by the amende honorable before the church doors. "Theft sacrilege" was treated in a separate series of equally savage clauses. This was a crime not recognized in the penal code, which was therefore to be modified by this law. No attenuating circumstances were to be recognized, as in the general scheme of the penal code. This ferocious legislation was expressly and summarily abrogated in 1830.

English Law.—In English law, sacrilege is the breaking into a place of worship and stealing therefrom. At common law benefit of clergy was denied to robbers of churches. A statute of 1553 made the theft of church vestry or household desecration of church, chapel or churchyard punishable with three months' imprisonment on conviction before two justices, the imprisonment to be continued unless the offender entered into surety for good behaviour at quarter sessions. This tendency to lesser penalties and lesser section of the SS. Code. In violation of sacrilege in the same position as if the offence had not been committed in a sacred building But breaking into a place of worship at night, says Coke, is burglary, for the church is the mansion house
Sacristy—Saddlery

of Almighty God. The Larceny Act of 1681 punishes the breaking into, or out of, a place of divine worship in the same way as burglary, and the theft of things sacred in the same way as larceny. Now by the Malicious Damage Act 1861 the unlawful and malicious destroying or damaging any picture, statue, monument or other memorial of the dead, painted glass or other monument or work of art, in any church, chapel, meeting-place or other place of divine worship is a misdemeanour punishable by imprisonment for six months, and in the case of a male under the age of sixteen years with whipping.

Sacristy (through Fr. sacristie, from med. Lat. sacristia or sacristina), the term in ecclesiastical architecture given to the room or hall in a large church wherein are kept the vestments and utensils (sacra) used in the services and celebrations. Like the diaconicon in the Greek Church, it was usually situated on the north side of the chancel, but its position varies according to that of the chapter-house, as it is generally placed between the latter and the church.

Sacro Bosco, Johannes de [John Hollywood] (d. 1244 or 1256), astronomical author, studied at Oxford and was afterwards professor of mathematics at the university of Paris. He wrote a treatise on spherical astronomy, Tractatus de sphera, first printed at Ferrara in 1472. This was the second astronomical work to be printed. Although recording no advance on the Arabian commentaries on Ptolemy, it gained a great reputation; twenty-four editions appeared before 1500, and at least forty between 1500 and 1647, in which year the last edition was published at Leiden. About the year 1522 he wrote De anni ratione or De computo ecclesiastico (printed editions at Paris in 1538 (?), 1550, 1572 and at Antwerp in 1547 and 1560), in which he points out the increasing error of the Julian calendar, and suggests a remedy which is nearly the same as that actually used under Gregory XIII. three hundred and fifty years later.

He also wrote Algorismus or De arte numerandi, printed in 1490 (?), in 1517 (Vienna), 1521 (Cracow), 1523 (Venice): De astrologio and Brevarium juris.

Saddle (a word common to Teutonic languages, cf. Ger. Sattel, Ital. sella, also in Russ. siedlo and Lat. sella, for saddle; it is not derived directly from Lat. saddle, which means a chair, but all the words are to be referred to the root sad-, which gives Lat. sedere, Eng. "sit," "settle," "seat," &c.), a seat, usually of leather, fixed by girdles to the back of a horse for riding; also a padded cushion for the back of a draught horse, fastened by girdles and crupper; to it are attached the supports for the shafts, and rings for the reins (see SADDLERY). The word is also applied to many objects resembling a saddle in shape or function, such as a block to support a spar in a ship, or in machinery to support a rod, or in masonry (q.v.) the top or "apex stone" of the gable of a building, &c.

Saddle bars, in architecture (Fr. traverses), are narrow horizontal iron bars passing from mullion to mullion, and often through the whole window from side to side, to steady the stone work, and to form stays, to which the lead work is secured. When the bays of the windows are wide, the lead lights are further strengthened by upright bars, passing through eyes forged on the saddle bars, and called stanchions. When saddle bars pass right through the mullions in one piece, and are secured to the jambs, they have sometimes been called "stay bars."

Saddlery and harness, two terms which embrace the whole of the art of horse riding with and for riding. "Harness" (O. Fr. harnes, mod. harnais, Ger. Harnisch, of unknown origin) was originally a general term for equipment, e.g. the body armour of a soldier. It is now usually confined to the draught horse's equipment, "saddle and bridle" being used of that of the riding horse.

Saddlery is principally a leather trade, and the craft has been established in England as a separate trade since the 13th century, when the London Saddlers' Company received its charter from Edward I. There is evidence also of its early prosperity at Birmingham; the principal seat of the cheaper saddlery trade is now at Walsall, in which county are numerous the makers of buckles, chains, stirrups, spurs, bits, hames, &c.

The "bridle" (O.E. bridul for bridgel, from bredgan, to pull) is the combination of straps and buckles which fits on the horse's head, the headstall, together with the bit and reins which it keeps in position. The headstall consists of the headpiece passing behind the ears and joining the head-band over the forehead; the check-straps run down to the head to the bit to which they are fastened; in the driving bridle the "blinders," rectangular or round leather flaps which prevent the horse from seeing anything except what lies in front, are attached to the cheek-straps; the nose-bands pass round the head above the nostrils and the throat-latch from the top of the cheek-straps underneath the head. The "martingale" passes between the horse's legs with one end fastened to the bit and the other to the bridle or nose-band. It prevents the horse throwing up his head. The bit is the metal contrivance inserted in the mouth to which the reins are attached. There are innumerable patterns of bits, but they may be divided into the "snaffle" (Du. snuvel, horse's muzzle), the "curb" and combinations of the two. The "snaffle" for the riding horse has a smooth jointed steel mouthpiece, with straight cheek-bars, the rings for the reins and other pieces of the headstall are fixed to the bars at the junction with the mouthpiece. A severer snaffle has the mouthpiece twisted and fluted. The bars prevent the horse pulling the bit through the mouth. The snaffle without bars is generally called the "bridoon." The curb-bit (Fr. courbe, Lat. curvus, bent, crooked) is one to which a curb-chain or strap is attached, fastened to hooks on the upper ends of the cheek-bars of the bit and passing under the horse's lower jaw in the chin groove. The reins are attached to rings at the lower ends of the curb-bars, the leverage thus pressing the curb-chain against the jaw. The mouthpiece of the curb-bit is unjointed and has in the centre a "port," i.e. a raised curve allowing liberty for the tongue and bringing the pressure on the base of the horse's jaw. The curb-bit and the bridoon can be used together with separate headstalls and reins, but there are many combination bits, such as the Pelham. In this mouthpiece, without one end fastened to the girth and the other to the bridle or the rings fixed at the junction of the mouthpiece and cheek-bars; the lower ends have rein rings as in the plain curb-bit.

The riding saddle is composed of the "tree," the framework or skeleton, the parts of which are the pommel or head, the projection which fits over the withers, and the side bars which curve round to the cantle or hind-bow. The tree in the best saddles is made of beechwood split with the grain; thin canvas is glued over the wood to prevent splitting, silk or steel threads are then riveted to the head and on the cantle. Linen webs are fastened lengthwise and across, over which is nailed canvas and serge between which the padding is stuffed. To the tree are fastened the stirrup-bars. The leather covering of the tree when first fully developed had two heads or pommels, between which the right leg was supported, the support for the left being the stirrup. The third pommel or "leaping head," against which the left leg rests, was, it is said, invented as the result of a match between two gentlemen riders to ride a steepleschase on side-saddles; the winner had provided himself this support for his left leg. At first the "leaping head" was only used in the
SADDLEWORTH—SADDUCEES

hunting-field and the double cow-horn was still retained; as its usefulness became apparent the second pommel practically disappeared.

Space forbids the discussion of the varieties of harness for the pair-horse carriage, the four-horse coach, the farm wagon, &c., or the different types of curb and snaffle used for riding horses. The bridle and bit or curb were identical in both. There was, however, a headstall, but it was used only when the snaffle was fastened to it. The leather collar, heavily padded, passes over the head and rests firmly on the shoulders; the hames, linked pieces of metal, fit tightly round it and are fastened at the top by the head-stap; they bear the traces, or straps which pass along the horse’s sides and the shafts are attached by loops slipped over hooks in the body of the carriage. Where the collar is dispensed with, the traces are attached to the head and neck pieces at the front of the horse works. The breast harness is much used for the lightly harnessed American trotting horses, and for military draught horses. The saddle pad is a narrow leather cushion girdled under the belly and held in position by the crupper-dock and the crupper, a loop strap passing under the tail. The saddle supports the shafts by the back-band and its tugs and by the belly-band. The reins pass from the bit through *treeters* or rings on the hames and pad. The harness on the horses’ hindquarters consists of the breeching, passing round behind the horse and helping in backing and stopping the vehicle, the hip-strap fastened to the breeching and passing over the hind-quarters, and the kicking-stripe along the sides and fastened to the shafts. The bearers, the rein, when used merely as a support to the head, or as an aid to the improvement of the paces, consists of a separate bridoon-bit with the reins passing through rings on the throat-band and thence slipped over the bit. One of the bridle-harness, which forms the rein over the head-stall, keeps the horse’s head up in a cramped attitude and the mouth continually working on the bit. A recent modification of the severer form is not attached to the bit.

Historical Sketch.—Questions as to the epoch in the history of mankind when the horse was first trained for draught and riding are for archaeologists and anthropologists to discuss (see Horse, § History). With the domestication of the horse came the development of the harness with which the horse was harnessed. The mouthpiece slipped into the mouth, finally replaced by wood or bone. Stone age objects have been found in lake-dwellings, such as that at Roberthay in the Lake District, which are often jointed metal mouthpieces and a plain curved bar acting as a curb-stap. The cheek-bars of the bit take a variety of forms: straight bars, circles with rays, square or oblong plaques, triangles and the swan-necked or cloven types (or a combination of the first two). The curved and severe bits were used, and heavy bits with cruel mouthpieces and long elaborately curved cheek-bars are still used by Arabs and the riders of Central and South America. The bit of the armed war horse and of the middle Ages is the *enchained mouth* (Latin *lentum*). The English *enchained mouth* is a plain bit with cheek-bars and mouthpiece covered with sharp spikes to prevent the foot-soldier catching hold of the bridle (see R. Tschilke and R. Forrer, *Die Pferde ihrer Geschichte*; for illustrations of bits from prehistoric times to the 16th century).

The saddle was not used in Egypt; the Assyrian monuments (cf. the illustration noticed above) chiefly show decorated saddle-cloths. In medieval times the saddle was much like that of the Oriental saddle of to-day with high peaks before and behind. In the military saddle of the 14th and 15th centuries the high front parts of the saddle were armoured and extended to protect the legs. The saddle (see picture above) at Lonsdale (now at the British Museum) becomes almost a box into which the rider was fixed; the high cantle fitted round the rider’s loins and when charging he lifted himself into practically an upright position (Plate xxvi). The saddle used by men hunting was much like the Arab saddle of to-day, and similar forms are in use in Europe and elsewhere where the British saddle has not been adopted. Women rode astride or on a pillion behind a male rider, or in side-saddle; the latter form (Plate xxvii) was adopted in the 16th century. For the harness of the ancient draught horse see CHARIOT.

SADDLEWORTH, an urban district in the Colne Valley parliamentary division of the West Riding of Yorkshire, England, 14 m. N.E. of Manchester, on the London & North Western railway. Pop. (1901) 12,320. It lies on the western side of the elevation of Stanedge, which here forms the watershed between streams flowing westward to the Irish Sea and eastward to the North Sea. Early earthworks and tumuli are numerous in the locality. The Huddersfield canal follows the valley, and, like the railway, is carried under Stanedge by a long tunnel.

SADDUCEES, a sect or party of the Jews mentioned in the historical books of the New Testament (with the exception of the fourth Gospel), by Josephus, and in the Talmud. According to all the authorities, the essential qualification for the title is the denial of certain beliefs which the Pharisees held to be implicitly contained in Scripture, and therefore necessarily part of Judaism as soon as they were formed. From their first point of view they were orthodox conservatives, so far as they really cared to remain—for whatever reason—with the pale of Jewry and

---

**Fig. 3.**—*a*, Side-saddle; *b*, hunting saddle; *c*, officer’s regulation saddle (British army). (From models made by Messrs Champion and Wilton.)
to justify their presence there. From the standpoint of the Pharisees who championed the hope of everlasting life and believed in the existence of angels, through whom God could communicate with men, they were infidels. As the Pharisees accumulated the oral tradition which was afterwards codified and elaborated or preserved by fragments, which served some useful purpose, in the Talmud and other Rabbinic writings, the Sadducees acquired concrete regulations to oppose so long as they dared. The Pharisees even improved for upon the Temple ritual, and their popularity enabled them to force the Pharisees into adopting the improvements.

But though some of those who bore the title may be reckoned at their best as orthodox conservatives, their position was, as far as our mainly Pharisaic authorities permit us to learn, merely negative; and all the information we possess, whether it rests on facts or on prejudice, points to their close affinity with the Jews who renounced their faith altogether and advertised the fact—say by habitual and unwarranted breach of the Sabbath, for instance. In fact, broadly speaking, the Sadducees for the period during which they are reported to exist, represent and embody the tendency to conformity with neighbouring Gentiles, which is deplored and denounced by Jewish writers from Moses to Philo. And there is this to be said that idolatry may be an outward symbol of a real indebtedness to idolaters which is not necessarily wiped out when the tangible idols are smashed. Idolatry is plainly incompatible with the law of Moses: so were Greek caps; but the Jews who conformed to Hellenism in the time of Antiochus Epiphanes acquired much that was conserved and utilized in that great attempt to convert the Greek world to Judaism, whose best monument is the works of Philo. The process is normal: first, there is an unqualified adoption of a foreign culture by the Sadducees of the time being; then, after unqualified opposition, the Pharisees of the time admit whatever is admissible within the four corners of the Law and are confronted by other Sadducees who have not followed the first into temporary or permanent separation from the existing Jewish way of life and absorption in the immediate foreign environment, and who, therefore, will have none of the current innovations which the Pharisees have in course of time selected as capable of assimilation and reconciliation with the existing body of growing doctrine and practice. The Jews spoiled the Egyptians: some made a golden calf and worshipped it; others destroyed it and turned to the temple as the necessary: thus the man of Soco who prohibited the hope of reward for service done to God. But this explanation of the name is as worthless as the rest of the Talmudic accounts of the Sadducees who were already dead and gone. For the present the explanation put forward by A. E. Cowley (Ency. Bib. 4236) holds the field: a Persian word Zindik meaning Zoroastrian, and therefore infidel in the mouths of those who did not hold with Zoroaster, was applied to them by their opponents and gradually took hold as the name of a sect that was synonymous with the Sadducees, i.e., Zadokite or Righteous. Its acquired significance could be varied by the inflexion of the voice or the suggestion of inverted commas.

Schürer (Geschichte des jüdischen Volkes, ii, 4th ed., pp. 447-456, 475-489) gives the evidence of the ancient authorities and references to modern studies of the subject. See also Jews. (J. H. A. H.)

**SADE, DONATIEN ALPHONSE FRANÇOIS, COUNT** [usually called the MARQUIS DE SADE] (1740-1814), French licentious writer, was born in Paris in the 2nd of June 1740. He entered the light-house at fourteen and saw considerable military service before returning to Paris in 1766. Here his vicious practices became notorious, and in 1772 he was condemned to death at Aix for an unnatural offence, and for poisoning. He fled to Italy, but in 1777 he was arrested in Paris, removed to Aix for trial, and there found guilty. In 1778 he escaped from prison, but was soon re-arrested and finally committed to the Bastille. Here he began to write plays and obscene novels. In 1789 he was removed to the Charenton Lunatic Asylum, but was discharged in 1790, only to be re-committed as incurable in 1803. He died there on the 2nd of December 1814. Among his works, all of the type indicated, were Justine (1791), Juliette (1792), Philosophie dans le boudoir (1793), and Les Crimes de l'amour (1800). The word Sadism, meaning a form of sexual perversion, is derived from his name.

**SÁ DE MIRANDA, FRANCISCO DE** (1485-1538), Portuguese poet, was the son of a canon of Coimbra belonging to the ancient and noble family of Sá, and passed his early years by the banks of the river Mondego, the source of inspiration to poets in every age. He probably made his first studies of Greek, Latin and philosophy in one of the colleges of the Old City, and in 1505 went to Lisbon University, beginning at the same time to frequent
the court. Verse-making and gallantry occupied much of his time there, and by virtue of his talents and name he became one of a group comprising the greatest nobles and most celebrated poets of the age, including Bermartim Ribeiro and Cristóvão Falcão, who surrounded the beautiful and gifted D. Leonor de Mascarenhas. He seems to have resided for the most part in the capital down to 1521, dividing his time between the palace and the university, in the latter of which he had taken the degree of doctor of law by 1516. Honoured by the friendship of Prince John (afterwards John III.), he accompanied the court as it moved from place to place during the reign of King Manoel, and witnessed the triumphs of the Fortunate Monarch; and at a time when the flag of Portugal floated victorious in every sea and her ships encircled the globe, it was not surprising that the youthful and gifted poet aspired to be the Virgil of a new Augustus ruling a universal monarchy. His studious and reflective mind and sound sense did not allow him, however, to nourish these illusions for long, and we find him pointing out in tones of prophetic melancholy the signs of decadence and future disaster. He had come out of the university so good a lawyer that he was able to act as ad interim professor of his faculty, and he was offered a judicial post, but his independent spirit and punctilious conscience led him to refuse it. He had only embarked on a legal career to please his father, and on the latter's death he abandoned law for moral and stoic philosophy and poetry, and resolved to travel. He had observed with regret the modest intellectual position of his country, for all her wealth and epic achievements, the latter of which had found no echo in poetry; and if he were to learn and be able to introduce new forms of art fed by fresh ideals, as he desired, he felt he must go abroad. The Cantoiromeiro de Resende, which represented the poetical efforts of courtiers for almost a century and contained Miranda's early verses, showed the extent of the national poverty by its artificiality, and lack of ideas, of sincerity and of good taste. These defects are not surprising, seeing that during most of that long period the literary movement had been confined to court circles and had remained essentially imitative of Spanish models, with hardly a vestige of national or popular inspiration about it. Portugal had been too busy building up a world-empire to imbibe much of the mental culture of the Renaissance, and even the classics were for the most part only known through Spanish translations. Direct intercourse between Portugal and Italy partook of a commercial rather than a literary or artistic character, and, previously to Miranda's journey, Italian poetry was practically unknown.

In the middle of July 1520 he set out across Spain for Italy, and spent the years 1521 to 1525 abroad, visiting Milan, Venice, Florence, Rome, Naples and Sicily "with leisure and curiosity." He enjoyed intimacy with Giovanni Ruccellai, Lattanzio Tolomei and Sanazarro; he partook of the liberal hospitality of the Vittoria and the Castelvetro, dwelt in the house of Mirandola, and in his house he probably talked with Bembo and Ariosto, and perhaps met Machiavelli and Guicciardini. He assisted at the rebirth of the Italian drama and saw the performance of classical prose comedies, a form of art which he was to transplant to Portugal. Lastly he heard the echoes of the Protestant revolt, and witnessed with horror the dissolution of morals which prepared the way for the Reformation.

Returning home in 1525, he brought with him the sonnet and canzone of Petrarch, the tercet of Dante, the ottava rima of Ariosto, the eclogue in the manner of Sanazarro, and Italian endecasyllabic verse. He did not, however, like his disciple Antonio Ferreira (q.v.), abandon the national rodondilha, but rather continued to employ it and carried it to perfection in his Cartas. Settling down in Coimbra or its environs, he lived there from 1526-1527 until 1532. The visit of King John III., and his court to the city enabled him to resume his old relations with the reigning house and the cultivated members of the nobility, who received him affably and listened with interest to the story of his Italian tour. Gil Vicente, the court dramatist, was then at the height of his fame, but his autos appeared poor things to Sá de Miranda as compared with the comedies he had seen in Italy; and urged by his friends to present an example of the new style, he wrote the Estrangeiros. Produced in 1527-1528, it was the first Portuguese prose comedy, and was composed on the lines of the classical Roman drama as modified by contemporary Italian authors like Ariosto; it had a great and immediate success, notwithstanding the opposition of the partisans of the popular auto, who saw themselves attacked in the prologue. In 1528 Miranda made his first real attempt to introduce the new forms of verse by writing in Spanish a canzon entitled Fabula do Mondego, and in 1530-1532 he followed it up with the eclogue Aleixo, which among its rodondilhas has some endecasyllables—the earliest attempt at ottava rima in Portuguese. Various sonnets dedicated to friends also belong to this period.

The foundations of the Italian school were now laid, and henceforth Miranda's reputation as a poet grew visibly, while he was also one of the most esteemed of courtiers; but the opposition of his literary foes increased with his very success. Moreover, in the sphere of politics pessimism had taken firm hold of him. From being a land of promise, India had become for him, as for Camoens, "the mother of villains, the stepmother of men of honour"; and though the wealth of the East poured into Lisbon, Portugal remained poor because agriculture was neglected and corn had to be imported from abroad. Miranda protested in vigorous terms against the fever of adventure and lust of gold, but few gave ear to his moralizings or had leisure to read poetry, and in 1534 he left the court.

The year 1532 had marked his passage from the active to the contemplative life, and the eclogue Bosto, in the form of a pastoral dialogue written in rodondilhas, opened his new manner. It has a pronounced personal note, and its episodes are described in a genuinely popular tone. The shepherds Gil and Bento represent, the one city sociability, the other rustic aloofness, or the contrast between life at court and in the country, and serve as a vehicle for the poet's ideas. The same epoch saw the composition of his Cartas or sententious letters in quintilhas, which, with Bosto and his satires, make up the most original, if not the most valuable, portion of his legacy, and served as models for two centuries. His allusion in Aleixo to the exile of Bernardim Ribeiro, and his defence of his friend, seem to have offended that powerful grandee, the count of Castanheira, and probably hastened his retirement from court, and the royal gift of a Comenda of the Order of Christ, situate by the river Neiva on the borders of Galicia, came opportunely, because the rents Sá de Miranda drew from it and a small private fortune enabled him to live in modest comfort at the neighbouring Quinta do Tapada. Poetry with him was never a mere pastime, and, after a short period of repose, the gift of a MS. of the verses of Garcilasso and Boscan, founders of the Italian school in Castile, encouraged him to resume the work of reform commenced at Coimbra; between 1533 and 1538 he composed five eclogues in Spanish and five in Portuguese, one of them the first in Portuguese, which show evident traces of their influence.

Before long he heard echoes of his new song, first from the province, then from the court. In 1536 he married D. Brígida de Azevedo, a lady of rare qualities and education, belonging to an illustrious Minho family. He spent the rest of his life in retirement at the Quinta do Tapada, which became a centre from which the reform of Portuguese poetry spread; for he developed great poetical activity in his retreat, and while he read and annotated Homer in the original Greek, he did not disdain domestic pleasures and country sports. His evenings were occupied by music and the performance of comedies and mimas, and by readings of Bembo and Ariosto with cultivated neighbours; and he extended hospitality to savants like Nicholas Cleynarts and Francisco de Hollanda, and launched on the career of letters such men as Diogo Bernardes, the author of the Lima.

In 1538 he wrote his second classical prose comedy, the Vilhampontos, which was played before the Cardinal Infant Henry, afterwards king, at his request, and on the poet's death that prince saw to the printing of this and the earlier comedy. During the years 1543 to 1553, except for a few occasional poems Sá de Miranda kept silence, and the cause is not far to seek; the Inquisition had got to work, and the Jesuits had acquired control of the university and dispersed the humanists.
the king and court lent their presence to autos da fé and organized public penances, initiating a reign of fanaticisms and sadness, there was no place for poetry. Sá de Miranda could only deplorably in private the misfortunes of his country and devote himself to polishing his verses and educating his children. His life’s work was done, for the year 1550 saw Castiliana writing, the admirable sonnets, canzonets and elegies, and the Italian school had definitely triumphed. The last eight years of Sá de Miranda’s life produced a cycle of beautiful poems evoked by the personality of Prince John, the heir-apparent, who loved letters and especially poetry, and whose precocity of talent made him the hope of all patriots. In 1550 and 1551, at the prince’s visit to the university of Coimbra, he honoured the master by asking for a collection of his poems, and on three occasions we find the latter despatching portions of his son-book to Lisbon accompanied by dedicatory sonnets. Moreover, he had the further gratification of receiving verses from Antônio Ferreira, Jorge de Montemayor, Diogo Bernardes, and André Falcão de Resende, which were so many proofs of the vitality of his school. Three misfortunes, however, came on him in quick succession. He lost his eldest son in 1553, Prince John died in 1554, and in 1555 his wife died. His friend King John III. passed away in 1557, and on the 15th of March 1558 Sá de Miranda followed him to the grave.

He was not a great writer and never entered into the hearts of his countrymen, remaining the poet of the cultured, who could understand him and pardon his metrical imperfections. He led the way, however, in a revolution in literature, and especially in poetry, which under his influence became higher in aim, purer in tone and broader in sympathy. He is obviously not at ease in the new forms which he had introduced, and his verse is, as a rule, austere, unharmonious and often difficult of understanding, but these remarks do not, of course, apply to his redondilhas. Some of his sonnets are, however, admirable, and display a grave tenderness of feeling, a refinement of thought, and a simplicity of expression which give them a high value. As examples it is only necessary to mention the one beginning “ O sol e grande...” and the lines he composed on the death of his wife. Sá de Miranda wrote much and successfully in Castilian, several of his best eclogues being in that language. The charm of these compositions lies in their convincing descriptions of natural scenery and country life, which he loved and comprehended to perfection.

Sá de Miranda’s works were first published in 1595, but the admirable critical edition of Madame Michéels de Vasconcellos (Halle, 1865), containing life, notes and glossary, superseded all other attempts which are concerned. His poems cannot be read in the 1784 edition of the collected works. No modern or critical edition is available. See also Oswald Crawford, Portugal Oilet (Liverpool, 1880); Dr. de Silva, Sobreda de Miranda (3 parts, Coimbra, 1889-1890); Decio Carneiro, Sá de Miranda e a sua obra (Lisbon, 1895); and Dr. Theophilo Braga, Sá de Miranda (Oporto, 1895). (E. Fr.)

**SADHU**, a Hindu ascetic, corresponding to the Mahommedan fakir (q.v.). The Sadhus, who are known also as Saagrais, Gosains and Buragis, are of various sects, hold peculiar opinions, indulge in strange practices, and subject themselves in many cases to cruel hardships and fantastic disciplines. They range in moral standing from the peripatetic philosopher to the idle vagabond. Some lead the life of contemplation, which Hindus consider especially holy; others pose as alchemists, physicians, fortune-tellers, palmists or acrobats; while others yet again practise voluntary tortures, such as holding one arm upright until it withers, or lying continually upon a bed of spikes. Some go about almost naked, or smeared all over with ashes; but the usual garment of an ascetic is stained an orange red with ochre. Hindu ascetics, censures the colour and style, and the rationalist. Among Hindus their death are buried instead of being burned, usually in a sitting posture, and often in salt. During the disturbed period of Indian history, before British rule was firmly established, armed bodies of Sanyasis or Gosains attached themselves to the Mahratta armies, and also ravaged Northern Bengal in the time of Warren Hastings.

**SÅ’DÌ** (c. 1184-1292). **Muslih-Uõdn.** Or more correctly **Musharif-Uõdn.** **Muslih-Uõdn.** the greatest didactic poet and the most popular writer of Persia, was born about 1184 (A.H. 580) in Shiraz. After the premature death of his father he was taken under the protection of Sa’d b. Zengi, the atabeg of Fars, who sent him to pursue his studies in the famous madressah of Bagdad, the Nâzâmiyya, where he remained about thirty years (1196-1225). About 1210 (A.H. 605) his literary fame had spread as far as Kashgar in Turkestan, which the young poet (who in honour of his patron had assumed the name of Sa’dî) visited in his twenty-sixth or twenty-seven year. After mastering all the dogmatic disciplines of the Islamic faith he turned his attention first to practical philosophy, and later on to the more ideal tenets of Sufic pantheism, under the spiritual guidance of the famous shiikh Shihâb-Uõdn Umar Suhrawardi (died 1234; A.H. 632). Between 1220 and 1225 he paid a visit to a friend in Isfahan, went from there to Damascus, and returned to Isfahan just at the time of the invasions of the Mongols, when the atabeg Sa’dî had been deposed by the victorious Khwarizm ruler of Ghïyâs-Uõdn (1226). Sadly grieved by the misfortune of his patron and disgusted with the miserable condition of Persia, Sa’dî quitted Shiraz and entered upon the second period of his life—that of his wanderings (1226-1256). He proceeded via Balkh, Ghazni and the Punjab to Gujârât, on the western coast of which he visited the famous shrine of Siva in Somnath. After a prolonged stay in Delhi, where he learnt Hindûstânî, he sailed for Yemen. Overcome with grief at the loss of a beloved child (when he had married is not known), he undertook an expedition into Abyssinia and a pilgrimage to Mecca and Medina. Thence he directed his steps towards Syria and lived as a renowned sheikh for a considerable time in Damascus, which he has once visited. There and in Baalbek he added to his literary renown that of a first-rate pulpit orator. Specimens of his spiritual addresses are preserved in the five homilies (on the fugitive nature of human life, on faith and fear of God, on love towards God, on rest in God and on the search for God). At last, weary of Damascus, he withdrew into the desert near Jerusalem and led a solitary wandering life, till one day he was taken captive by a troop of Frankish soldiers, brought to Tripoli, and condemned to forced labour in the trenches of the fortress. After enduring countless hardships, he was eventually rescued by a rich friend in Aleppo, who paid his ransom, and gave him his daughter in marriage. But Sa’dî, unable to live with his quarrelsome wife, set out on fresh travels, first to North Africa and then through the length and breadth of Asia Minor and the adjoining countries. Not until he had passed his seventieth year did he return to Shiraz (about 1256; A.H. 653). Finding the place of his birth tranquil and prosperous under the wise rule of Abûbakr b. Sa’dî, the son of his old patron (1226-1260; A.H. 633-658), the aged poet took up his permanent abode, interrupted only by repeated pilgrimages to Mecca, and devoted the remainder of his life to Sufic contemplation and poetical composition. He died at Shiraz in 1292 (A.H. 691) according to Hamdallâh Musta’fî (who wrote only forty years later), or in December 1291 (A.H. 690), at the age of 110 lunar years.

The experience of the world gained during his travels, his intimate acquaintance with the various countries he had visited, his insight into human character, together with an inborn loftiness of thought and the purest moral standard, made it easy for Sa’dî to compose in the short space of three years his two masterpieces, which have immortalized his name, the **Bûstân** or “ Fruityarden ” (1237) and the **Gulistan** or “ Rose-garden ” (1258), both dedicated to the reigning atabeg Abû Bekr. The former, also called **Sa’dînma**, is a kind of didactic epopee in ten chapters and dozens of hundred verses, which passes in review the highest philosophical and religious questions, all imbued in the very spirit of Christianity, and abounds with sound ethical maxims and matchless gems of transcendent speculation. The latter is a prose work of a similar tendency in eight chapters, interspersed with numerous verses and illustrated, like the **Bûstân**, by a rich store of clever tales and charming anecdotes; it discusses more or less the same topics as the larger work, but has acquired a much greater popularity in both the East and the West, owing to its easier and more varied style, its attractive
lessons of practical wisdom, and its numerous bonus mottoes. But Sa'di's *Dīwān*, or collection of lyric poetry, far surpasses the Baštan and Gulistan, at any rate in quantity, whether in quality also is a matter of taste. Other minor works are the Arabic *qasidas*, the first of which lamented the destruction of the Arabian caliphate by the Mongols in 1258 (A.H. 636); the Persian *qasidas*, partly panegyric, partly didactic; the *marāthi*, or elegies, beginning with one on the death of Ābū Bekr and ending with one on the defeat and demise of the last caliph, Mosta'ṣim; the *masnūd*, or elegies with allusions to other Arabic men of letters; the *parvōn*, of rather artificial character; the *tarjīʿa*, or refrain-poems; the *ghasals*, or odes; the *sāḥibiyāt* and *mukhātāt*, or moral aphorisms and epigrams; the *rubāʿiyāt*, or quatrains; and the *masnūdī*, or distichs. Sa’dī’s lyric poems possess neither the easy grace and melodious charm of Hāfż’s songs nor the overwhelming grandeur of Jelālud-dīn Rumi’s divine hymns, but they are nevertheless full of deep pathos and show such a fearlessness of truth as is seldom met with in Eastern poetry. Even his panegyrics, although addressed in turn to almost all the rulers who in those days of continually changing dynasties presided over large empires, show no servility so common in the effusions of Oriental encomiasts.

The first who collected and arranged his works was ‘Alî b. Ahmad b. Bisutūn (1326-1334; A.H. 720-734). The most exact information about Sa’dī’s life and works is found in the introduction to Dr W. H. Bacher’s work, Sa’dī’s *Abū’l-ʿAbbās,* 2 vols. (Stuttgart, 1879; a complete metrical translation of the epigrammatic poems), and in the same author’s “Sa’dī Studien,” in Zeitschrift der morgenländischen Gesellschaft, 4, p. 185. But see also W. Geiger’s *Gründzüge der iranischen Philologie*, ii. pp. 292-296, with full bibliography; and E. G. Browne, *Literary History of Persia,* pp. 527-539. Sa’dī’s *Kulliyāt* or complete works have been edited by Harrington (Calcutta, 1791-1795) (with an English translation of some of the prose treatises and of Daulat Shah’s notice on the poet, of which a German version is found in Graf’s *Rosengarten* (Leipzig, 1846, p. 229 sq.); for the numerous lithographed editions, see Rice’s *Pers. Cat.* 257); and by Dr Sadler (Calcutta, 1810 and 1828), as well as in Lahore, Cawnpore, Tabriz, &c.; a critical edition with Persian commentary was published by K. H. Graf at Vienna in 1850 (German metrical translations by the same, Jena, 1850, and by Schlecht-Wiescher, Vienna, 1852; English prose translations by H.W. Clarke (London, 1879); and Ziauddin Gulam Mehdidin (Bombay, 1888); verse by G. S. Davie (1882); French translation by Barbier de Meynard (Paris, 1880). The best editions of the *Gulistan* are by A. Sprunger (Calcutta, 1851) and by Platts (London, 1874); the best translations into English by Eastwick (1852) and by Platts (1873), the first four sāḥīs in prose and verse, and the last two in prose; and by the Rev. during the year 1858); into German by Graf (1846); see also S. Robinson’s *Persian Poetry for English Readers* (1883), pp. 245-366. The *Pandānamah*, a book of wisdom (of doubtful genuineness) has been translated by W. N. Worthington (London, 1871). Persian pastoral or *qūsī* elegies, quatrains and distichs have been edited, with a German metrical translation, by Graf, in the *Z.D.M.G.* kx. p. 92 sq., xii. p. 82 sq., xiii. p. 445 sq., xv. p. 541 sq. and xvi. p. 555 sq. On the life of Sa’dī in contrast to Hāfż and Rumi, comp. Ethé, “Der Sūfismus und seine drei Hauptvertreter,” in *Morgenländische Studien* (Leipzig, 1870), pp. 95-124. (H. E.)

SADIYA, the extreme north-east frontier station of British India, in the Lakhimpur district of Eastern Bengal and Assam. It stands high on a grassy plain, nearly surrounded by forest-clad mountains, on the right bank of what is locally (but erroneously) considered the main stream of the Brahmaputra. On the opposite bank a railway has recently been opened which connects with the Assam-Bengal line. Sadiya is garrisoned by detachments of native infantry and military police, and is the base of a chain of outposts. There is a bazaar, to which the hill-men beyond the frontier—Mishmis, Abors and Khamits—bring down rubber, wax, ivory and musk, to barter for cotton-cloth, salt, metal goods, &c.

SADLER, MICHAEL THOMAS (1750–1835), English social reformer, was the son of John Sadler, was born at Snelston, Derbyshire, on the 3rd of January 1780. Settling down in business in Leeds in 1800, he early took an active part in political life, devoting himself particularly to the administration of the poor law. In 1828 he wrote Ireland: its Evils and their Remedies, in which he advocated a poor-law, and a tax on absenteeism. He also took a share in the Malthusian controversy, writing *The Law of Population: a Treatise in Disproof of the Super-fecundity of Human Beings and developing the Real Principle of their Increase* (1830). He entered parliament in 1829 as member for Newark, and devoted his efforts to questions of social reform. He took a leading part in the agitation for the prevention of child labour in factories—he was chairman of the committee appointed to inquire into the subject. He contested Leeds after the Reform Bill of 1832 (Aldborough, for which he had sat before, being deprived of its member), but was defeated by Macaulay. In 1834 he was unsuccessful at Alnwick, and failing health prevented any further attempts to re-enter parliament. He settled down at Newark, where his firm had business interests, and died at New Lodge on the 29th of July 1835.

SADLER (or SADLER), SIR RALPH (1507–1587), English statesman, the son of Henry Sadler, steward of the manor of Cilney, near Great Hadham, Hertfordshire, was born at Hackney, Middlesex, in 1507. While a child he was placed in the family of Thomas Cromwell, afterwards earl of Essex, whose secretary he eventually became. Between 1525 and 1529 his patron’s letters are full of a name in connexion with Cardinal Wolsey’s suppression of the monasteries; this probably brought him under the king’s notice, for in 1536 he was made gentleman of the privy chamber, and from that time was continually employed by Henry VIII. In 1537 Sadler went first to Scotland to try to reconcile Margaret to her son King James V., and then to France on the same mission to James V. He seems to have been successful, and was again in Scotland in 1540 trying to induces the king to follow his uncle’s ecclesiastical policy.

In or about January 1540, he was made secretary of state along with Sir Thomas Wriothesley, and was knighted, probably about the same time. On James V.’s death Sadler again went to Scotland (March 1543) to negotiate a marriage between Prince Edward and his cousin Mary; he was unsuccessful, but still retained Henry’s confidence. On Henry’s death in 1547, Sadler was by his will made one of the councillors to the sixteen noblemen entrusted with the young king’s guardianship.

In the same year he was appointed treasurer to the army sent to Scotland, and for his services in rallying the repulsed cavalry at the battle of Musselburgh or Pinkie, he was created a knight-baronet. He also received many grants of land, including the manor of Cilney in Hertfordshire, where he built a magnificent house in 1546. When Mary Tudor visited the three days of her residence, living quietly till Elizabeth’s accession. He issued the writs for the privy council meeting at Hatfield on the 20th of November 1558, and during the first year of the queen’s reign he once more became a councillor. He sat in the parliament of January 1558–1559 as member for Hertford, which he had already represented in 1541, 1542 and 1553. Not long afterwards his strong Protestant sympathies and his acquaintance with Scotch affairs induced Elizabeth to send him (1559) to Scotland, ostensibly to settle the border disputes, but in reality to secure a union with the Protestant party there, and he was largely instrumental in bringing about the treaty of Leith, July 6th, 1560. In 1568 Sadler was appointed chancellor of the duchy of Lancaster, and in the same year was one of the English Commissioners employed in treating on the matters arising from the flight of the Queen of Scots. From this time he seems to have been continually engaged as a discreet and trusty servant in connexion with Mary’s captivity, and was frequently sent with messages to her. On the 25th of August 1584, when, owing to the imputations made by his countess, George 6th earl of Shrewsbury was allowed to resign his guardianship of the Queen of Scots then under him. In September Mary was removed from Sheffield to Wingfield and thence early in 1585 to Tutbury. In April, Sadler, after numerous petitions on his part, was permitted to resign his distasteful charge. He is said by some to have been sent to Scotland to announce to James VI. his mother’s death, but this is not corroborated by the state papers. On the 30th of March 1587 Sadler died at Stanlon, and was buried in the church there. He had married about 1534 Elizabeth Mitchell, of the family of the Sadlers.
whose first husband Matthew Barre had deserted her and was believed to be dead. Barre, however, reappeared a few years later, and Sadler then obtained an act of parliament legitimizing his children. Sadler was not a brilliant statesman, but a most faithful and intelligent servant. His letters, particularly those on Scottish affairs, are most interesting.

SADO, an island belonging to Japan, lying 32 m. W. of Niigata, on 38° N., 138° 30’ E. It has a circumference of 130 m., an area of 336 sq. m. and a population of 113,000. The port is Ehina, on the east coast; and at a distance of 161 m., near the west coast, is the town of Aikawa, having in its vicinity gold and silver mines, for which Sado is famous. They have been worked from very early times. Sado consists of two parallel hill ranges separated by a lower isthmus; the loftiest peak is that of Kimpokuzan (3815 ft.), to the north of Aikawa.

SADOLETO, JACOPO (1477–1547). Italian humanist and churchman, was born at Modena in 1477, and, being the son of a noted jurist, was designed for the same profession. He gave himself, therefore, to humanistic studies and acquired reputation as a Latin poet, his best-known piece being one on the group of Laocoön. Passing to Rome, he obtained the patronage of Cardinal Carafa and adopted the ecclesiastical career. Leo X. chose him as his secretary along with Pietro Bembo, and in 1517 made him bishop of Carpentras. Sadoletto had a remarkable talent for affairs and approved himself a faithful servant of the papacy in many difficult negotiations under successive popes, especially as a peacemaker; but he was no bigoted advocate of papal authority, and the great aim of his life was to win back the Protestants by peaceful persuasion—he would never countenance persecution—and by putting Catholic doctrine in a conciliatory form. Indeed his chief work, a *Commentary on Romans*, though meant as a prophylactic against the new doctrines, gave great offence at Rome and Paris. Sadoletto was a diligent and devoted bishop and left his diocese with reluctance even after he was made cardinal (1536). His industry and tolerant spirit, combined with a reputation for scholarship and eloquence and his diplomatic abilities, give him a unique place among the churchmen of his time. He died in 1547.

His collected works appeared at Mainz in 1607, and include, besides his theologically-frenzied pieces, a collection of Epistoles, a treatise on education (first published in 1533), and the *Phaedrus*, a defence of the free press (1538). The collection was that published at Verona (1737–1738); it includes the life by Fioribello. See also Péricau, *Fragmenta biographica* (1589); Joty, *Études sur Sadoletto* (Caen, 1857); Balan, *Monumenta*, vol. i. (Innsbruck, 1885); Kochini’s edition of the letters (Modena, 1872).

SADOLIN, JÖRGEN (c. 1499–1505) Danish reformer, the son of Jens Christensen, a curate and subsequently a canon of Viborg cathedral, and consequently, in all probability, born (c. 1496) out of wedlock, as his Catholic opponents frequently took care to remind him. He himself never used the name Sadolinus, which seems to have been invented subsequently by his son Hans, and points to the fact that the family were originally saddle-makers. We first hear of him on the 1st of December 1525, when Frederick I. permitted him to settle at Viborg to teach young persons of the poorer classes “whatever might be profitable.” On this occasion he is described as “magister” and no doubt got his degree abroad, where he seems to have been won for the Reformation. He sided with Hans Tausen when the latter first began to preach the gospel at Viborg, and Tausen, though himself only in priest’s orders, shortly before he left the place, ordained Sadolin (1520). Amongst “the little people” who attended the church in Copenhagen in 1530 Sadolin occupied a prominent place. Frederick subsequently transferred him to Funen, where he acted, according to his own expression, as “adjuver in verbo” to Knud Gyldenstjerne, bishop of Odense. At the diocesan council held on the 27th of May 1532, during the absence of the bishop, he presented to the assembled priests a translation of Luther’s catechism, with Luther’s name omitted, preceded by an earnest plea in favour of a better system of education and a more practical application of the Christian life, which occupies a conspicuous place in the literature of the Danish Reformation. In the following year Sadolin published the first Danish translation of the Confession of Augsburg. He disappears during the troublesome times of “revens Fejde” (1533–1536), though we get a glimpse of him at the end of 1536 as one of the preachers at Vor Frue Kirke, the principal church of Copenhagen. On the 2nd of September 1537 he was consecrated by the German reformer, Johann Bugenhagen, who himself only had priest’s orders, superintendent, or first evangelical bishop, of Funen. As bishop he was remarkable for the success with which he provided the necessary means for the support of churches, schools and hospitals in his widespread diocese, which had been deprived of its usual sources of income by the wholesale confiscation of church property. Towards the Catholics he adopted a firm, but moderate and reasonable, tone, and his indulgence to the Protestants was influenced mainly by a fierce attack from the Puritan clergyman of Odense, who absurdist accused him of being a crypto-Catholic. He gave the funeral oration over Christian III. in St John’s Church at Odense in February 1559, though now very infirm and blind, and died at the end of the same year.

See Bricka, *Dansk Biografisk Lst. Art. Sadolin* (Copenhagen, 1887). (R. N. B.)

SADOWA (Czech, Sadon), a village of Bohemia, Austria, 4 m. N.W. of Koniggrätz. Pop. (1900) 185, exclusively Czech. Sadowa, with the small adjoining wood, was one of the principal and most hotly contested Prussian positions in the decisive battle now usually called by the name of Koniggrätz (see SEVEN WEEKS’ WAR).

SAEPINUM (mod. Altilla, near Serino), a Samnite town 9 m. S. of the modern Campobasso, on the ancient road from Beneventum to Corfinium. It was captured by the Romans in 293 B.C. The position of the original town is on the mountain far above the Roman town, and remains of its walls in Cyclopean masonry still exist. The city walls (in *opus reticulatum*) of the Roman town were erected by Tiberius before he became emperor, the date (between 2 B.C. and A.D. 1) being given by an inscription. Within them are remains of a theatre and other buildings, including temples of Jupiter and Apollo, and there still exists, get a glimpse leading to Bovianum, an inscription of about A.D. 168, relating to the *Tractus* (see APULLA) in Roman days, forbidding the natives to harm the shepherds who passed along them (*Corp. inscr. Lat. ix. 2438*).

SAETERSDAL, a district in the south of Norway, comprising the valleys of the Otter river and its tributaries. The river rises in the fjords above the Bukken Fjord, and flows south to Christiansund. The natives preserve old customs and an individual costume. A railway follows the valley to Byglands Fjord (48 m.), on the lake of that name, fostering the local agricultural and timber trade, and a driving road continues to Viken i Valle from which bridge-paths lead to Ile Dalen in Tele- marken, and over the Enden and Mann fjords to Lake Suldal on the Bratlandsdal route.

SAFED KOH (“white mountain”), in many respects the most remarkable range of mountains on the north-west frontier of India, extending like a 14,000 ft. wall, straight and rigid, towering above all surrounding hills, from the mass of mountains which overlook Kabul on the south-east to the frontiers of India, and preserving a strike which—being more or less perpendicular to the border line—is in strange contrast to the usual conformation of frontier ridge and valley. The highest peak, Sikaram, is 15,650 ft. above sea-level, and yet it is not a conspicuous point on this unusually straight-backed range. Geographically the Safed Koh is not an isolated range, for there is no break in the continuity of water divide which connects it
SAFES, STRONG-ROOMS AND VAULTS

With the great Shandur offshoot of the Hindu Kush except the narrow trough of the Kabul river, which cuts a deep waterway across where it makes its way from Dakka into the Peshawar plains. Strategically it is an important topographical feature, for it divides the basin of the Kabul river and the Khyber route from the valley of Kurram, leaving no practicable pass across its rugged crest to connect the two. Its western slopes, where it abuts on the mountain masses which dominate the Kabul plain, are forest-covered and picturesque, with deep gullies intersecting them, and bold craggy ridges; the same may be said of the northern spurs which reach downward through the Shinwari country towards Gandamak and Jalalabad. Here the snow lies late and moisture is abundant—but on the southern sun-scorched cliffs but little vegetation is to be seen. Approaching the Peshawar plains the Safeed Koh throws off long spurs eastward, and amongst the foothills of these eastern spurs the Afridi Tirah long remained hidden from European eyes.

The term "safe," whilst really including any receptacle for the secure deposit of valuables provided with a lock or other device intended to prevent any person except the owner or some person authorized by him gaining access thereto, has gradually come to be confined to such receptacles when fitted with a vertical door, as distinguished from a lid, and of such a size that they can be moved into position, by the use of proper appliances, in one piece. Such receptacles, when so large as to require that their parts should be assembled in situ, fall under the term "strong-rooms," or in the case of safe-deposits "vaults," and when constructed with hinged lids, as distinct from doors, under the terms "cash-box," "deed-box" and "coffer." The term "coffer" is probably the most ancient, and in earlier days included, as it still does in France, what are now known as safes.

Although it is practically certain that boxes provided with locks or coffers must have followed closely the development of locks (q.v.) and been in use in ancient Egypt, yet no examples remain to us of earlier date than the middle ages. The earliest examples extant were constructed of hard wood banded with hammered iron, and subsequent development took place rather on artistic than on practical lines up to the time of the introduction of boxes entirely of iron. On the continent of Europe the iron box was developed to a very high standard of artistic beauty and craftsmanship, but with no real increase of security. Several specimens of these coffers supposed to be of 17th-century workmanship are preserved in the museum at Marlborough House. Cast-iron chests seem to have been made in various parts of Great Britain in the early part of the 19th century, but the use of wrought iron was probably confined to London until 1820, or thereabouts, when the trade spread to Wolverhampton.

Up to this time no attempt had been made to make coffers fireproof, for though a patent for fireproofing had been taken out in 1801 by Richard Scott, it does not appear to have been used. In 1834, however, a patent was obtained by William Marr for the application of non-conducting lines, followed about four years later by a similar patent in the name of Charles Chubb. The foundation, however, of the modern safe industry was laid by Thomas Milner, originally a tinsmith of Sheffield, who after a few years' business in Manchester established, in 1839, works at Liverpool for the manufacture of tinplate and sheet iron boxes and who later made plate iron chests or coffers and, probably the earliest, safes about the year 1846. To him is due the modern system of fireproofing, which owes its merit to the use not of non-conductors but of an absorbent material which in the case of fire will be permeated with moisture present in it, either in the form in which burst or discharge their contents when subjected to heat, or mixed with it as water of crystallization in combination with an inorganic salt. The patent he obtained in 1840 contains the following claim: "Constructing, forming, or manufacturing boxes, safes, or other depositories of an outer case of iron or other metal or material, enclosing one, two, or more inner cases, with spaces or chambers between them, containing an absorbent material or composition, such as porous wood, dust of wood, dust of bones, or similar substances, in which are distributed vessels, pipes or tubes filled with an alkaline solution or any other liquid or matter evolving steam or moisture, the tubes or vessels bursting or otherwise discharging themselves on the exposure of the box or other depository to heat or fire, into the surrounding absorbent matter, which thus pervaded with moisture and rendered difficult of destruction, protects the inner cases or boxes and their contents." In 1843, Edward Tann, Edward Tann, Junr., and John Tann took out a patent for securing the presence of moisture by means of a chemical salt. In their patent they give preference to alum in combination with Austin's cement or gypsum, but they also claim "any non-conductors of heat may be used, and for alum may be substituted sulphate of potash, muriate of ammonia, borax, impure potash, nitrate of soda, soda in cake, pearlash, or any of the known alkalies." Milner considered this an infringement of his patent of 1840, and in an action before Lord Campbell and a special jury in the Queen's Bench, on the 3rd of June 1851, a verdict was given upholding his contention.

For some years no marked improvements in safes were made, although the manufacture had been taken up in various places by different firms. Safes had, however, been constructed of thicker materials, and some attention had been paid to the more secure attachment of the various parts; also, with the advent of the wrought-iron safe, as distinct from the cofier, the practice had developed of securing the door by a number of bolts operated by a handle and fastening them in the locked position by the lock proper, in order that a small key might be used (Charles Chubb's patent, 1845).

Concurrently with the increase of strength in safes and probably with the increased value of articles preserved in safes, the skill of the professional thief had also increased, and this went on for some years until the Cornhill burglary of 1865 called general attention to the question. In 1860 a patent was taken out by Samuel Chatwood for a safe constructed of an outer and inner body with the intervening space filled with ferro-manganese or speigeleisen in a molten state, the total thickness being 2 in. (fig. 1). The drilling of conical holes in the inner surface of the outer plate as shown in the figure renders the use of drills of any materials at present known quite inoperative; as the drill, even if it could be made sufficiently hard to pierce the speigeleisen, would on meeting it be bedded in the soft steel and unable to free itself. The construction of such a safe was an expensive matter, and it was not till after the robbery above referred to that he was enabled to sell a single example; it is, however, still in demand for the preservation of diamonds, as probably the only
Safes, Strong-Rooms and Vaults

Absolutely drill-proof receptacle. This patent is noteworthy as being the only one connected with the lock and safe industry which has been extended by the Privy Council.

It is about this period (1860–1870), perhaps the most important in the history of safes, that the opening of safes by wedges seems to have become prominent. The effect of wedges was to bend out the side of the safe sufficiently to allow of the insertion of a crowbar between the body and the edge of the door, and various devices were adopted by different makers with the object of resisting this mode of attack. These devices may be placed in three classes: (1) the fixing to the door of studs or projections which, when the door closed, passed into holes or recesses in the frame of the body; (2) the use of bolts hooking into the side framing or entering the bolt holes at an angle; (3) the strengthening of the side framing and of the attachment of the bolts to the outer door-plate. The third of these methods (fig. 2) was patented by Samuel Chatwood in 1862, and is still very commonly employed. The second method was used by Chubb and Chatwood, but is not to-day in general use. The first method was used by all makers of repute, but has now been abandoned, as the increased structural strength of the better class of safes renders such devices unnecessary.

To prevent safes from being opened by the drilling of one or two small holes in such positions as to destroy the security of the lock itself, advantage was taken of the improvements in the manufacture of high carbon steel, and even in what is to-day called the “fire-proof” safe a plate of steel which offers considerable resistance to drilling is placed between the outer door plate and the lock.

For many years little advance was made except such as consisted in substituting steel for iron and in general gaining increased strength by the utilization of better materials, although many safes are made and sold to-day which offer little if any more resistance to fire and thieves than those of 1860–1870. About 1888 the “solid” safe was introduced. In this the top, bottom and two sides of the safe, together with the flanges at the back only or at both back and front, are bent from a single steel plate (fig. 3). This construction, with solid corners, also illustrated in figs. 1 and 2, only became practicable in consequence of the great improvements which had been made in the quality of steel plates; the credit of its invention formed the subject of litigation, which, however, was not carried to an issue. The abolition of corner joints, which up to 1888 had been made by dovetailing and by the use of angle irons, had been previously attempted by welding, but the process was abandoned as commercially impracticable.

In the early days of the safe industry in America the conditions as far as protection from fire was concerned were entirely different from those obtaining in Great Britain. The timber construction employed in American buildings rendered fires much more fierce, but at the same time of very short duration, not more than an hour or two. To meet this condition of affairs thick sides of non-conducting materials were more efficacious than the chambers of steam-generating materials employed in British construction, but the gradual abandonment of timber and the increasing size of buildings have called for changes in the methods of fire-proofing.

The American “burglar proof” safe (fig. 4) seems to have developed from the fire-proof (fig. 5) simply by the addition of extra thickness of metal, usually alternately hard and soft, without any serious increase of structural strength; this construction, known as the “laminated” or “built up,” offers little resistance to burglars, as the various layers can be separated from one another by the use either of explosives, especially nitroglycerine, or of wedges. In 1890 a commission was appointed by the U.S.A. government to report upon the strong-rooms or vaults of the treasury at Washington; and their report1 was presented in September 1893. This commission based their conclusions on experiments conducted in their presence, as well as on well-authenticated experiments performed by safe-makers on their own and other makers’ productions, and they found that, with the single exception of the Corliss safe, all the safes which came under their notice—and these comprised all the best-known American makes—could be opened by burglars by

drilling, by the use of explosives, and by the use of wedges and similar well-known tools. This Coriass safe consists of a spherical shell of cast iron several inches thick and with its exterior hardened by “chilling.” It is fitted with a ground-in door rotating concentrically with the shell and internally. The spherical form and great thickness render the useful space in the interior very small and of inconvenient shape.

The requirements of a modern safe may be briefly summarized. In fire- and thief-proof safes, the body and door must be constructed of sufficient thickness, and the joints as well as the attachment of the door to the body frame of sufficient strength, to remain uninjured by a fall from the highest position in which the safe may be placed to the basement, or by the impact of any debris, coping stones, girders, &c., falling from the highest part of the building to the basement. The space between the outer body and the inner casing must be properly charged with a steam-generating mixture in sufficient quantity to keep the interior of the safe moist for the whole time during which it may be subjected to heat in the case of a fire. The same requirements must be satisfied in burglar-proof safes. In addition, the body and door must be of such material and of such thickness that it is impossible to cut a sufficiently large hole to extract the contents, and so constructed that they cannot be dismembered; the framing and attachment of the bolts to the door must be able to resist the action of wedges or forcing screws; the vital parts of the lock and bolt-work must be further protected so that it is impossible to attack them by drilling; and this protection must not be liable to be destroyed by the action of heat; the lock itself must not be capable of having its security destroyed by the explosion of the largest quantity of explosive which can be inserted. If these conditions are satisfied there is little fear that the oxy-acetylene blowpipe, the electric arc or the use of the higher explosives can be made effective. The amount of protection required to meet the above conditions must, in each case, depend on what tools it is reasonable to anticipate may be employed by the burglar and the maximum time which he may have at his disposal. The use of high explosives has become a more frequent method of attack by burglars in Great Britain, but where the safes have been of the best quality, of solid construction and good workmanship, this means of attack has been rendered ineffective.

**Strong-rooms and Vaults.—** It is not hard to imagine that the use of strong-rooms was much earlier than that of safes; in fact, there can be no doubt that masonry rooms provided with heavy wooden doors secured by locks were in use in ancient Egypt, and that the development of strong-room doors attached to masonry rooms followed that of the old coffer very closely. No exact date can be obtained as to the introduction of what we may call modern strong-rooms, but it is only reasonable to suppose that, where larger quantities of valuables had to be preserved than a safe would conveniently hold, a safe-door of larger dimensions would be made and attached to a masonry or brick room. The next step would be the discovery that the walls of such a room offered little protection against even unskilled violence, and the lining of the room with metal would immediately follow; the door frame, as a matter of course, being attached to the plating. Strong-rooms of this construction are in common use to-day by banks and other institutions; and, as with safes, so with strong-rooms, development has taken place in the direction of increasing the thickness and the structural strength as well as in the application of superior locking devices (see Locks).

This increase of structural strength has been carried along somewhat different lines by different makers in Great Britain and along still more diverse lines in America. Masonry or brickwork alone is now rarely relied on for the protection of goods of any great value; concrete, however, reinforced by old railway metals imbedded therein and sometimes connected together to form, as it were, a cage, is in use. Railway metals attached to steel plates and also bedded in concrete are very largely employed. Thick plates of steel and latterly of manganese and other special steels are also in common use. Various forms of strong-room walls are illustrated in fig. 6.

Usually a strong-room is provided with an open-work gate or
SAFETY-LAMP

the safety of Davy lamps is endangered by exposure to a current of gas moving at more than 6 ft. a second, as the flame is then liable to be forced through the gauge, and the Clancy and Stephenson lamps are not safe in currents exceeding 8 and 10 ft. respectively. These lamps are, however, improved and modified to meet the requirements of safety in air-currents travelling at a high velocity. In the Hepplewhite-Gray lamp there is a conical glass surrounding the light, with a gauze chimney, protective outside the outer glass. The whole is carried downwards through three tubes forming the standards of the cage. This lamp, in addition to giving a good light overhead owing to the shape of the glass, is peculiarly susceptible to gas, and therefore valuable in testing for fire-damp. Other approximate lamps are the Deflector and those of Marsault and Mueseler when specially bonneted to resist extra high-speed currents. The illuminant now generally obtained for lamp purposes is a mixture of hydrogen and air in the proportion of 1 part of hydrogen to 2 parts of air, for the purpose of providing a lamp which will burn actually in gaseous mixtures. The principle is not new, for it has been long recognized that the presence of the lamp itself is sufficient to prevent the fire from the explosion in coal-mines; but owing to the weight and cost their use is as yet very restricted.

SAFETY-LAMP affords indications of the presence of fire-damp (marsh gas) in the air of a mine. When the amount of the gas reaches 2 or 2½ %, it may be detected by reducing the flame till it is practically non-luminous, when a pale blue flame or luminous cap will appear above the lamp. A blue flame indicates that the percentage of fire-damp, until when there is about 10% of the blue flame fills the whole interior of the gauze cylinder. If the lamp is allowed to remain too long in such a fiery atmosphere, it becomes dangerous, because the blue flame may set fire to the explosion. The lamp is therefore, however, required in filling, so that no free liquid may be left in the holder; the spirit must be entirely absorbed by a filling of sponge, and any superfluous quantity poured off. Portable electric lamps, using electric accumulators or dry batteries, have been produced to be used in coal-mines; but owing to the weight and cost their use is as yet very restricted.

SAFETY-LAMP, a form of lamp, used especially in mines, which is so constructed that it will burn without igniting a gaseous explosive mixture by which it is surrounded. To effect this end, the lamp is encircled with a protecting metal case which is perforated with numerous small holes. Through these air for feeding the flame can enter freely and the products of combustion escape; but the flame or gases cannot pass out at a sufficiently high temperature to cause the ignition of the explosive mixture outside, because on arriving at the perforations they give up much of their heat to the cold air, and are therefore without the energy to cause the flame to burn. By this means the lamp is rendered useless, by which it is conducted away. In 1816 Sir Humphry Davy discovered the safety lamp of gauze as the material of the metal case, when the substance of the wire was rightly proportioned to the size of the aperture. The standard adopted as the limit for safety at that time was a gauze of 28 iron wires to the linear inch, having 784 apertures per square inch, but in some lamps the apertures are occasionally made still smaller.

The common safety or Davy lamp consists of a small cylindrical oil-lamp, a gauze cylinder about 6 ft. long, and 1½ in. in diameter, with a flat gauze top. The upper gauze is doubled to prevent it from being worn into holes by the products of combustion, and the air for feeding the flame enters through the open gauze, so that the gauze surface is encountered, by which it is conducted away. In 1816 Sir Humphry Davy discovered the safety lamp of gauze as the material of the metal case, when the substance of the wire was rightly proportioned to the size of the aperture. The standard adopted as the limit for safety at that time was a gauze of 28 iron wires to the linear inch, having 784 apertures per square inch, but in some lamps the apertures are occasionally made still smaller.

The common safety or Davy lamp consists of a small cylindrical oil-lamp, a gauze cylinder about 6 ft. long, and 1½ in. in diameter, with a flat gauze top. The upper gauze is doubled to prevent it from being worn into holes by the products of combustion, and the air for feeding the flame enters through the open gauze, so that the gauze surface is encountered, by which it is conducted away.

In Stephenson's safety-lamp, generally known as the "Georgie" lamp, from its inventor George Stephenson, the light is covered by a glass chimney, surrounded by an outer casing and top of wire gauze. The feed air is admitted through numerous small holes in a copper ring above the gauze, and the air for feeding the lamp enters through the gauze only. The gauze is made of wires, which are drawn through the necessary number of holes, and are then twisted, and the twisted wire is mounted upon a cage, a gauze top being screwed on. The gauze is then suitably washed and the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a copper ring, which is screwed on, the gauze is then opened, the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a copper ring, which is screwed on, the gauze is then opened, the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a copper ring, which is screwed on, the gauze is then opened, the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a copper ring, which is screwed on, the gauze is then opened, the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a copper ring, which is screwed on, the gauze is then opened, the lamp is ready for use. The gauze is maintained with a copper ring, and at the top is an iron ring, also a cup
was to colour pastry and confectionery, and it is still used for this purpose in some parts of the country (notably Cornwall).

One grain of saffron rubbed to powder with sugar and a little water imparts a distinctly yellow tint to ten gallons of water. This colored water is due to the presence of safranal, which is a compound whose chemical formula appears to be $C_{24}H_{18}O_6$, and which may be obtained by treating saffron with ether, and afterwards exhausting with water. Under acid it yields the following reaction—

$$C_{24}H_{18}O_6 + 2H_2O \rightarrow 2C_{12}H_{9}O_3 + H_2 + C_2H_2 + CO_2 + 2H_2O$$

Foliclourite. Ciodios. Essential oil. Sugar. Crocin, according to Watts, Dict. of Chem., has a composition of $C_{24}H_{18}O_6$. This crocin is a red colouring matter, and it is surmised that the red colour of the stigmas is due to this reaction taking place in nature.

Saffron is chiefly cultivated in Spain, France, Sicily, on the lowlands of the Apennines, and in Persia. The ground has to be thoroughly cleared of stones, manured and trenched, and the croms are planted in ridges. The flowers are gathered at the end of October, in the early morning, just when they are beginning to open after the night. The stigmas and a part of the style are carefully picked out, and the wet saffron is then scattered on sheets of paper to a depth of 2 or 3 in.; over this a cloth is laid, and next a cloth with a heavy weight. A strong heat is applied for about two hours so as to make the saffron "sweat," and a gentler temperature for a further period of twenty-four hours, the cake being turned every hour so that every part is thoroughly dried. This is known as "baking" saffron to distinguish it from hay saffron, which consists merely of the dried stigmas.

The drug has naturally always been liable to great adulteration in spite of penalties, the severity of which suggests the surviving spirit of its sacred character. Thus in Nuremberg in 1514 saffron inspection was held, and in the 15th century we read of men being burned in the market-place along with their adulterated saffron, while on another occasion three persons convicted of the same crime were buried alive. Grease and butter are still very frequently mixed with the cake, and shreds of beef dipped in saffron water are also used. Good saffron has a deep orange-red colour; if it is light yellow or blackish, it is bad or too old.

SAFFRON WALDEN, a market-town and municipal borough in the Saffron Walden parliamentary division of Essex, England, beautifully situated near the Cam in a valley surrounded by hills, on a branch of the Great Eastern railway, 43½ m. N.N.E. from London. Pop. (1901) 5866. It has a somewhat ancient appearance and possesses a spacious market-place. Of the old castle, dating probably from the 12th century, but in part protected by much earlier earthworks, the keep and a few other portions still remain. Near it are a series of curious circular excavations in the chalk, called the Maze, of unknown date or purpose. The town, of the de Walden, has a ring of great extent; there was a large Saxon burial-ground here. The church of St Mary the Virgin, a beautiful specimen of the Perpendicular style, dating from the reign of Henry VII., but frequently repaired and restored, contains the tomb of Lord Audley, chancellor to Henry VIII. There is an Edward VI. grammar school, occupying modern buildings. The town possesses a museum with good archaeological and natural history collections, a literary institute and a horticultural society. The benvolent institutions include the hospital and the Edward VI. almshouses. There is a British and Foreign School Society's boarding college for mistresses. In the neighbourhood is the fine mansion of Audley End, built by Thomas, 1st earl of Essex, in 1603 on the ruins of the abbey, converted in 1190 from a Benedictine priory founded by Geoffrey de Mandeville in 1136. Brewing, malting and iron-founding are carried on. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 7592 acres.

Saffron Walden (Waledana) was almost certainly fortified by the Britons, and probably by some earlier race. The town corporation grew out of the Guild of the Holy Trinity, which was incorporated under Henry VIII., the lord of the town, in 1514. In 1539 Edward VI., and a charter was obtained for Walden, appointing a treasurer and 14 aldermen and 24 assistants, all elective, who, with the commonalty, formed the corporation. In 1694 William and Mary made Walden a free borough, with a mayor, 4 aldermen and 12 town councillors. The corporation became a local board of health under the act of 1858, and a municipal borough in 1875. The culture of saffron was the most characteristic industry at Walden from the reign of Edward III. until its gradual extinction about 1768.
SAFRANINE—SAGA

SAFRANINE, in chemistry, the azonium compounds of symmetrical diamino-phenazine and containing the ring system annexed:

\[
\text{N} \quad \text{Cl} \quad \text{R} \quad \text{Cl} \quad \text{R}
\]

They are obtained by the joint oxidation of one molecule of a paradiamine with two molecules of a primary amine; by the condensation of para-aminoazo compounds with primary amines (O. Witt, *Ber.*, 1877, 10, p. 874), and by the action of para-nitrosodialkylanilines with secondary bases such as diphenylmetaphenylenediamine. They are crystalline solids showing a characteristic green metallic lustre; they are readily soluble in water and dye red or violet. They are strong bases and form stable monacid salts. Their alcoholic solution shows a yellow-red fluorescence.

Phenosafranine is not very stable in the free state; its chloride forms green plates. It can be readily diazotized, and the diazotium salt when boiled with alcohol yields aposafranine or benzene indoline, \( \text{C}_9\text{H}_5\text{N} \), F. Kehrmann showed that aposafranine could be diazotized and autodissociated into cold concentrated sulphuric acid. The diazotium salt on boiling with alcohol-yielded phenylphenazonium salts. Aposafranine, \( \text{C}_6\text{H}_5\text{N}_2\text{O}_4 \), is formed by heating aposafranine with concentrated hydrochloric acid. These three compounds are perhaps to be represented by the para-phenamines (see papers by F. Kehrmann, O. Fischer and E. Hepp; R. Nitzki and others, *Ber.*, 1893 ed. seq.). The "safranine" of commerce is a toluasfranine. The first aniline dye-stuff to be prepared on a manufacturing scale was safranine, the NCl, which was obtained by Sir W. H. Perkin by heating crude aniline with potassium bichromate and sulphuric acid. It is a N-phenylsafranine (see INDULINES).

SAGA (literally a story committed to writing), a word derived from Icel. *segja*, to say. The term is common to most of the Teutonic languages, where we find Eng. say, Ger. sagen, the O. Eng. seggan, Dan. sige and Swed. segga, all identical in meaning. A saga is a long story or romance, historical or legendary, oral or written, a tale told, in English a saga. But the earliest literature of Scandinavia goes back to an age before writing was invented, and when the legends were first put down they were called sagas because they were things which had been told or repeated from mouth to mouth. The early books speak of sagas which, apparently, had never been written down and were in consequence lost; but, as soon as the art of writing was understood, the word saga began for the future to be used exclusively for written historical books. A volume made up of such histories was known as a sogubók or book of sagas. They were not rigidly historical; any story which was written down, and repeated according to the literary formula, was called a saga. The telling of tales was a recognized form of entertainment at Icelandic banquets, and in *Haraldsaga Harðraða* there are very interesting details regarding these public saga-tellings; the person who repeated or read the tale being known as the sögumálar or saga-man, and being held in high honour at the feast.

The saga was properly a creation of the peculiar conditions under which Icelandic society was constituted in the earliest medieval times. The aristocratic Icelanders had no diversions, except games of strength and skill out of doors and the listening to professional story-tellers indoors. As has been often pointed out, the saga is a prose epic, and in its various kinds it follows strict laws of composition. The lesser epic, in its original form, was the biography of some heroic Icelanders who had lived in the 10th or 11th century. It was composed with great regularity, so as to proceed uniformly from the birth of the hero to his death, and indeed from before the one date until after the other. The style is brief, clear and conversational; the hero was often a distinguished poet, and in that case some of the best of his verses are interwoven into the narrative, being put in his mouth on striking occasions. Alliteration takes a great part in the ornament of the style. The skill with which the poet wisely combines a romantic sense of honor and courage which is displayed, the quick turns of the dialogue, the brilliant evolution of the plot, all these give enduring charm to the more successful and ample of the sagas, and in the earlier examples these qualities are very rarely missing. It is to be remembered, however, that the saga was intended to be listened to, not read, by an audience which was mainly interested in three subjects, namely fighting, litigation and pedigreed. It was illegitimate for the saga-man, in the preparation of his epic, to allow himself to stray for any length of time from one of those three themes; since even love must be considered in the light of an episode.

The period of the saga-age, as it was called, the sögubók or epoch celebrated in the sagas, is now confined between the years 890 and 1250, and opens with the original colonization of Iceland. The deaths in 1030 of two great statesmen, Snorri and Skapti the Lawman, mark its close; almost immediately afterwards, before the end of the 11th century, the actual age of saga-composition is in full action; and lastly comes the rit-ól, or age of writing when the sagas were preserved in their present literary form, the blossoming time of which was the 12th century. According to the definite statement of the great historian, Sturla, the first man who wrote down in the Norse tongue, in Iceland, "histories relating to times ancient and modern," was Ari Froði (1067-1148), who was therefore the earliest of the saga-writers. He, as we know, was the author of three works of history—of the Icelandic settlements and history (see above). These were *Kununga-bók* or the Book of King, *Landnámabók* or the Book of Settlements and *Islendinga-bók* or the Book of Icelanders. The second of these, in which Ari was assisted by Kolsegg Askjarsønsson, survives and is of priceless value. Of the first and third, we possess abbreviations and summaries. It is believed that the admirable style in which the sagas are composed was the invention of Ari, to whose individual genius the form of classic prose tradition is attributed. He has no rival in this respect, and is the true father of the Icelandic saga. The works of Saemund Vigfusson (1056-1135), who succeeded Ari as a writer of the lives of kings, are unfortunately lost.

We now pass to a more critical period, the Greater or Islendinga sagas, which are of a more intense and romantic character than the historical biographies. Among these the greatest is *Njalssaga* (or *Njálse*), which few critics will question to be the most masterpiece of Icelandic literature. There is no clue to the name of the author, who was evidently a lawyer; extensive as is the work, it is evidently written by one hand, for peculiarities and felicitous originalities of style recur throughout the whole saga. It must have been composed between 1230 and 1280. Vigfusson has described *Njálse* as being, *par excellence*, the saga of law, and adds, "the very spirit imparted by Early Latin to the breath through its page," and in which Njal, the Lawman of Jadestad, and peace is maintained in his homestead by his enemies is perhaps the most magnificent passage which has been preserved in the whole ancient literature of the North. The story of *Njálse* is placed at the close of the 10th and the first years of the 11th century. *Eyrbyggjasaga* deals with politics as *Njalssaga* deals with law; it is a precious compendium of history and tradition handed down from heathen times. It has been suggested that it may be, at all events in part, the work of Sturla the Lawman, who died in 1284. Extremely beautiful in its relation to external nature, a matter often ignored in the sagas, is *Laufasagas*, which is also the most romantic and sentimental of the sagas. It was probably written about 1235, but by whom is unknown. The aristocratic spirit of the great Icelandic families finds its most characteristic exposition in *Egilsaga*, a very vigorous tale of adventure, the central figure of which, Egil, is depicted with more psychological subtlety than is usual in the sagas; it probably belongs to about 1230. Into *Grettisaga* there enter biographical and mythical elements, curiously mingled; it is also confused in form, and is probably a recension, made about 1310, of two or more earlier sagas now lost, the finest parts of which it is thought that Sturla may have written. These are the five famous groups of anonymous narrative which are known as the Greater Sagas.

The Minor Sagas must be treated more briefly. *Hemsójaríssaga*, belonging to the south-west of Iceland, deserves attention because of its extreme antiquity; it has been dated 993. *Gunnlaugsaga Ormstunga* (The story of Gunnlaug Worm-
Tongue) is a love-story of great sentimental charm. In Gislasaga the gloom of the Icelandic outlaw-life is strikingly depicted in the adventures of Gisl, who is hunted and killed, and hunted from place to place. A very unusual specimen of the minor sagas is Bandamanansaga, a comic story of manners in the north of Iceland in the 11th century, in which an intrigue of the old families banded against the pretensions of a wealthy parvenu, is told in a spirit of broad humour. The most archaic of the minor sagas is Kormaks saga, the story of the loves of the dark-eyed Kormak and Steingerda; this is, according to Vigfusson, the primitive piece of Icelandic prose writing that has come down to us. Another very ancient and very simple saga is Vattdaladassaga. Among sagas which deal with the earliest history of America in the Viking raids of Greenland and Vinland, a foremost place is taken by Fl condomanns saga, which possesses peculiar interest from its description of the shipwreck of colonists on the coast of Greenland; this belongs to the close of the 10th century. We possess a late (13th century) recension of what must have been equally important as a record of the Greenland colony in the 11th century, Postbraedassaga. Vigfusson formed a class of still shorter sagas than these, thetir or "morsels" of narrative. At the close of the great period of the composition of all these anonymous sagas, of which few can have been written after 1260, a work of enormous length and value was composed, the well-known saga of Iceland. It was written by a poet and historian of great eminence, Sturla Thordssson (1218-1284). Almost sixty years after the year 1270 he began to compile the mass of sagas which is now known by his name as Sturlungassaga. The theory that Sturla was the author of the whole of this bulky literature is now abandoned; it is certain that Hrafn Steinbjornsson, for instance, belongs to an earlier generation, and the same is true of Guomundar Saga Góða. Vigfusson distinguished these and other sagas, which Sturla evidently only edited, from those which it is certain that he composed, and gathered the latter together under the title of Isendingassaga. It is certain that it is to Sturla that we owe almost all our knowledge of Icelandic history from 1200 to 1260. Isendinga is divided into two parts: the former closing in a general massacre of the characters of the story in about 1240, the latter dealing much more minutely with new persons and subsequent events. To Sturla also are attributed two saga-biographies, the Hakonassaga and the Magnusssaga. It is a remarkable fact that while Icelandic saga-literature begins and ends with a definite figure of a writer, all that lies between is wholly anonymous. Ari was the earliest and Sturla the latest of the saga-writers of the classical period, but in the authors of Nyjald and Laxdaela we have nameless writers whose names are greater than that of the pioneer and of the rear-guard of Icelandic literature. Those unknown men deserve a place of honour among the best narrative-writers who have ever lived. The elder brother of Sturla was called Olaf Hvitaskald, or the White Poet (1007-1259); he was a learned man, who worked at the arrangement and compilation of the sagas which form the mass of Sturlunga. In another class are the stories of bishops, Biskupaðgur, which are not sagas in the true sense, but have considerable value as biographical material for reconstructing Icelandic social life in the 12th century. The admirable saga of Bishop Laurence (1166-1331) was composed by his private secretary, Einar Halldisson (1303-1393), who also wrote Ænileik, and is the latest Icelandic biography. After his time a long silence fell on the literature of the country, a silence not broken until the revival of Icelandic learning in the 17th century.

It is evident that a vast number of sagas must be lost; when we consider how many are preserved, we can only express amazement at the fecundity of the art of saga-telling in the classic age. The MSS., on which we have preserved sagas, were written in the Kes and in MSS., and there were no sagas written on paper until the time of Bishop Odd, who died in 1360; there was an enormous destruction of vellum in the dark age. After 1460 it became the practice to make transcripts on paper from the perishing vellum MSS. The best authority on the history of the sagas is the copious prolegomena to Dr Guðbrand Vigfússon's edition of the text of Sturlungassaga, published in 2 vols., by the Clarendon Press at Oxford in 1876. See also the edition of Biskupaðgur, issued by the same author, at Copenhagen, in 1858. Möbius and Vigfusson published the Fischer's Sahich sagas in a large sheet of 56 and all the other work of Vigfusson calls for the closest attention from those interested in this field. In connexion with the descents of Northmen on the shores of Britain particular interest attaches to the four volumes of sagas edited for the "Rollen" series (1887-1903) by W. Morris, who has done much to interpret the spirit of the sagas to English readers, and who published a translation of Grettis saga in 1856, started in 1891 the "Royal Library," in conjunction with Mr E. Magnusson; of this a sixth volume appeared in 1906. Mr Sephton has published editions of several of the purely historical sagas. No account has been given above of the famous Heimskriftla or "Round of the World," of the Sturla series, because this great work, although it contains stories of the kings of Norway, largely belongs to the same class as the biographical sagas of Iceland. The Heimskriftla is purely a storehouse of primitive Norwegian history.

The best systematic work on the subject of Icelandic and Faroese sagas has been done by John F. Ólafsson, Der isländische Literaturhistorien (Copenhagen, 1863-1902); F. W. Horn, Geschichte der Literatur des schandinavischen Nordens (Leipzig, 1879).
monastic church, a medieval town-hall with old cloisters attached, a Roman Catholic gymnasium and a large hospital, named after its founder, the duchess Dorothea (1793-1862), wife of Edmund, duke of Talleyrand-Périgord-Dino. The leading industry of the town is cotton weaving, with wool and flax spinning; there is also some trade in wool and grain.

The mediate principality of Sagona, now forming a portion of the Prussian governmental district of Liegnitz, and formed in 1397 out of a portion of the duchy of Głogów, has several times changed hands by purchase as well as by inheritance. One of its most famous possessors was Wallenstein, who held it for seven years before his death in 1634. Bought by Prince Lobkowitz in 1646, the principality remained in his family until 1787, when it was sold to Peter, duke of Courland, whose descendant, Prince Bozon (b. 1832), son of Napoleon Louis (1811-1896), duke of Talleyrand-Périgord, owned it in 1910. The principality has an area of nearly 300 sq. m. and a population of 65,000.

**SAGAR** or **SAUGOR ISLAND**, an island at the mouth of the Hugli river, in the Twenty-four Parganas district of Bengal. The word means "sea"; and, as being the place where the sacred stream of the Ganges is believed to mingle with the ocean, the island is one of the most frequented places of Hindu pilgrimage in all India, the time for the greatest annual gathering being in January. On the seaward face is a lighthouse, and farther out are the Sandheads, the cruising-ground of the Calcutta pilots.

**SAGASTA, PRAXIDES MATEO** (1827-1905), Spanish statesman, was born on the 21st of July 1827 at Torrecilla de Cameros, in the province of Logroño. He began life as an engineer, and from his college days he displayed very advanced Liberal inclinations. He entered the Cortes in 1854 as a Progressist deputy for Zamora. After the coup d'état of Don Leopold O'Donnell in 1856, Sagasta had to go into exile in France, but promptly returned, to become the manager of the Progressist paper La Lberia, and to sit in the Cortes from 1859 to 1863. He seconded the Progressist and revolutionary campaign of Prim and the Progressists against the throne of Queen Isabella, conspiring and going into exile with them. He returned, via Gibraltar, with Prim, Serrano and others, to take part in the rising at Cadiz, which culminated in the revolution of September 1868, and Sagasta was in succession a minister several times under Serrano and then under King Amadeo of Savoy, 1868-1872. Sagasta ultimately headed the most Conservative groups of the revolutionary politicians against Ruiz Zorrilla and the Radicals, and against the Federal Republic in 1873. He took office under Marshal Serrano during 1874, after the promonciamiento of General Pavia had done away with the Cortes and the Federal Republic. He vainly attempted to crush the Carlists in 1874, and to check the Alphonsoist military conspiracy that overthrew the government of Marshal Serrano at the end of December 1874. Barely eight months after the restoration of the Bourbons in the autumn of 1875, Sagasta accepted the new state of things, and organized the Liberal dynastic party that confronted Canovas and the Conservatives for five years in the Cortes, until the Liberal leader used the influence of his military allies, Jovellar, Campos and others, to induce the king to ask him to form a Cabinet in 1881. The Liberals only retained the confidence of the king by postponing the realization of almost all their democratic and reforming programme, and limiting their efforts to financial reorganization and treaties of commerce. A military and republican rising hastened Sagasta's fall, and he was not readmitted into the councils of Alphonso XII. On the death of that king in 1885, Sagasta became premier with the assent of Canovas, who suspended party hostility in the early days of the regency of Queen Christina. Sagasta remained in office until 1890, long enough to carry out all his reform programme, including universal suffrage and the establishment of trial by jury. A coalition of generals and Conservatives turned Sagasta out in July 1890, and he only returned to the councils of the regency in December 1892, when the Conservative party split into two groups under Canovas and Silvelas. He was still in office when the final rising of the Cubans began in February 1895, and he had to resign in March because he could not find superior officers in the army willing to help him to put down the turbulent and disgraceful demonstrations of the subalterns of Madrid garrison against newspapers which had given offense to the military. Sagasta kept quiet until nearly the end of the struggle with the colonies, when the queen-regent had to dismiss the Conservative party, much shorn of its prestige by the failure of its efforts to pacify the colonies, and by the assassination of its chief, Canovas del Castillo. Sagasta's attempt to conciliate both the Cubans and the United States by a tardy offer of colonial home rule, the recall of General Weyler, and other concessions, did not avert the disastrous war with the United States and its catastrophe. The Liberal party and Sagasta paid the penalty of their lack of success, and directly the Cortes met in March 1899, after the peace treaty of the 10th of December 1898 with the United States, they were dissolved.

Sagasta pursued his policy of playing into the hands of the sovereign whilst keeping up the appearances of a Liberal, almost democratic, leader, skilful in debate, a trimmer par excellence, and abler in opposition than in office. He returned with the Liberals to power in March 1901. His task, however, was beyond the year's. The economic situation was of the gravest. Strikes and discontent were rife. Still, Sagasta held on long enough to witness the surrender of the regency by Queen Christina into the hands of her son, Alfonso XIII., in May 1902. In the following December Sagasta was defeated on a vote of censure and resigned office. Shortly afterwards he fell into ill-health, and died at Madrid on the 15th of January 1903.

**SAGE, RUSSELL** (1816-1900), American financier, was born in Verona township, Oneida county, New York, on the 4th of August 1816. He worked as a farm-hand until he was 15, when he became an errand boy in a grocery conducted by his brother, Henry R. Sage, in Troy, New York. He had a part interest in 1837-1839 in a retail grocery in Troy, and in a wholesale store there in 1839-1857. He served as an alderman of Troy in 1841-1848, and as treasurer of Rensselaer county in 1845-1849. In 1853-1857 he was a Whig representative in Congress. He became an associate of Jay Gould in the development and sale of railways; and in 1863 removed to New York City, where, besides speculating in railway stocks, he became a money-lender and a dealer in "puts" and "calls" and "privileges," and in 1874 bought a seat in the New York Stock Exchange. He gradually accumulated a fortune, which at his death was variously estimated as from $600,000,000 to $850,000,000. On the 4th of December 1891 an attempt was made to assassinate him in his office by one Henry Norcross, who demanded a large sum of money, and upon being refused exploded a dynamite bomb, and was himself killed. Sage died in New York on the 22nd of July 1900. In 1866 he had married Miss Margaret Olivia Slocum (1843), a daughter (1847) of the Troy Female Seminary (now the Emma Willard School). She inherited nearly all of his great fortune, and out of it she gave away a long series of liberal benefactions to various institutions.

**SAGINAW**, a city and the county-seat of Saginaw county, Michigan, U.S.A., situated on both banks of the Saginaw river, about 16 m. from its entrance into Saginaw Bay and about 96 m. N.W. of Detroit. Pop. (1860) 46,322, (1900) 42,345, of whom 13,435 were foreign-born, (1910) 50,310. Saginaw is served by the Grand Trunk, seven divisions of the Père Marquette (which has repair shops here) and four divisions of the Michigan Central railways, by interurban electric railways to Detroit and Bay City, and by steamboat lines to several of the lake ports. The city is built on level ground covering an area of about 13 sq. m. and somewhat more elevated than the surrounding country. In the city are St Vincent's Orphan Home (1875) and St Mary's Hospital (1874) under the Sisters of Charity, a Woman's Hospital (1888) and the Saginaw General Hospital.

---

1 Mr Sage's secretary was also killed, and one of his clerks, W. R. Laidlaw, jr., was badly injured. Laidlaw afterward repeatedly sued Sage for damages, claiming that Sage had used him as a shield at the moment of the explosion, but his suits were unsuccessful. 
SAGITTA—SAGUENAY 1003

(1887); the Hoyt Library and the Public Library; a large auditorium, belonging to the city; an armoury; the Germania Institute, with a kindergarten, a gymnastic school and a German library; and a free bathhouse and manual training school (1903), a part of the public school system. There is an annual music festival in May. The city has parks, including Hoyt Park (27 acres), used for athletic sports, Rust Park (150 acres), occupying an island in the river, and Riverside Park, a pleasure resort. Saginaw is situated in a good farming region with a fertile soil, especially adapted to the culture of sugar beets; other important crops are beans, cabbages, tomatoes, cucumbers, hay, apples and grains. In the vicinity of the city there are salt wells, and Saginaw county is the most productive coalfield in the state—in 1907 its output was 1,047,027 tons, more than half the total for the state. The city is an important distributing center, has a large wholesale trade (especially in groceries, hardware, boots and shoes, and dry goods), and in 1904 in the value of its factory products ($10,493,528, 20-2% more than in 1900) it ranked fifth among the cities of the state. The municipality owns and operates the water-works. The first settlement was made on the west bank of the river in 1815 and was called Saginaw City; the settlement on the east side of the river made in 1849 was called East Saginaw and was financed by Eastern capitalists. East Saginaw in 1855 was incorporated as a village. East Saginaw and Saginaw City each received a city charter in 1859, but in 1890 the two were consolidated as the city of Saginaw, and in 1897 the charter was revised.

SAGITTA ("the arrow" or "dart"), in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, Tycho Brahe and Hevelius, who each described 5 stars. The fable was that this constellation was one of the arrows with which Hercules killed the vulture which gnawed the liver of Prometheus. S. Sagittae is a short period variable, period 8-38 days, range in magnitude 5-6 to 6-4.

SAGITTARIUS ("the archer"), in astronomy, the 9th sign of the zodiac (q.v.) denoted by the symbol $\alpha$ an arrow or dart. It is also a constellation, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.), and catalogued by Ptolemy, 31 stars, Tycho Brahe 14 and Hevelius 22. The Greeks represented this constellation as a centaur in the act of shooting an arrow, and professed it to be Crotus, son of Eupheme, the nurse of the Muse. Several short period variables occur in the constellation, e.g. X 3 Sagittarii, Wc, Sagittarii and Y Sagittarii, having periods of 7-01, 7-59, 5-77 days respectively. Nova Sagittarii is a "new" star, which was discovered by Mrs Fleming in 1890; the nebula M. 17 Sagittarii is an omega or horse-shoe nebula, while the nebula and cluster M. 8 Sagittarii is a splendid irregular nebula associated with a great number of faint stars.

SAGO, a food-starch prepared from a deposit in the trunk of several palms, the principal source being the sago palm (Metroxylon Sagag) (see fig.), a native of the East Indian Archipelago, the sago forests being especially extensive in the island of Ceram. The trees flourish only in low marshy situations, seldom attaining a height of 30 ft., with a thick-set trunk. They attain maturity as starch-yielding plants at the age of about fifteen years, when the stem is gorged with an enormous mass of spongy medullary matter, around which is an outer rind consisting of a hard dense woody wall about 2 in. thick. When the fruit is allowed to form and ripen, the whole of this starchy core disappears, leaving the stem a mere hollow shell; and the tree immediately after ripening its fruit dies. When ripe the palms are cut down, the stems divided into sections and split up, and the starchy material ground into a powder. The powder is then kneaded with water over a strainer, through which the starch passes, leaving the woody fibre behind. The starch settles in the bottom of a trough, in which it is floated, and after one or two washings is fit for use by the natives for their cakes and soups. That intended for exportation is mixed into a paste with water and rubbed through sieves into small grains, from the size of a coriander seed and larger, whence it is known according to size as pearl sago, bullet sago, &c. A large proportion of the sago imported into Europe comes from Borneo, and the increasing demand has led to a large extension of sago-palm planting along the marshy river-banks of Sarawak.

Sago is also obtained from Metroxylon Rumphi as well as from various other East Indian palms such as the Gomuti palm (Arenga saccharifera), the Kittil palm (Caroia urens), the

Sago Palm (Metroxylon Sagag), much reduced.

1. Portion of leaf, $\frac{1}{2}$ nat. size.
2. Portion of female inflorescence in fruiting stage.
3. Branch of male inflorescence.
4. Spike of male flowers.
5. Spike of female flowers.
6. Fruit, $\frac{3}{4}$ nat. size.
7. Section of fruit and seed, $\frac{1}{4}$ nat. size.
1004
SAJGUNTUM—SAHARA

SAJGUNTUM, now Sagunto or Murviedro, an ancient town in a fertile district of eastern Spain (Castellon de la Plana) 20 m. N. of Valencia, close to the coast. Its history comprises one brief flash of tragic glory and a long obscure happiness. At the outbreak of the Second Punic War (219 B.C.) it was a large and commercially prosperous town of native—not Greek—origin. It sided with Rome against Carthage, and drew Hannibal's first assault. Its long and noble resistance, told by the Roman historian Livy in no less noble language, ranks with the Spanish defence of Saragossa in the Peninsular War. Finally in 218 Hannibal took it and passed on into Italy. Then we hear little more of it till the opening of the Christian era it appears as a flourishing Romano-Spanish town with a Latin-speaking population and the rank of municipium. This later prosperity lasted most of the empire through, and is attested by inscriptions and ruins (notably a theatre, demolished by Suchet).

SAHARA, the great desert of northern Africa. The Sahara has an area, according to Dr A. Bhudan's calculation of the areas of African river basins, of 3,459,500 sq. m., made up as follows:

| Drainage or slope to Atlantic | 13,000 |
| Drainage or slope to Mediterranean | 502,000 |
| Drainage inland | 2,602,500 |
| Slope to Niger basin | 224,000 |
| **Total** | **3,459,500** |

This includes Tripoli and Fezzan, which practically belong to the desert zone, but does not include arid portions of the basins of the Nile and Niger, in which the drainage is at most intermittent, and which might with reason be included in the Sahara. The area would thus be brought up to at least 3 million sq. m., about the area of Europe minus the Scandinavian peninsula.

The physical limits of this region are in some directions marked with great precision, as in parts of Morocco and Algeria, where the southern edge of the Atlas ranges looks out on what has almost the appearance of a boundless sea, and, as it were, a bold cost-line, whose sheltered bays and commanding promontories are occupied by a series of towns and villages—Tizgi, Fiqiul, El Aghuat, &c. In other directions the boundaries are vague, conventional and disputed. This is especially the case towards the south, where the desert sometimes comes to a close as suddenly as if it had been cut off with a knife, but at other times merges gradually and irregularly into the well-watered and fertile lands of the Sudan. While towards the east the valley of the Nile at first sight seems to afford a natural frontier, the characteristics of what is usually called the Nebian desert are so identical in most respects with those of the Sahara proper that some authorities extend this designation to the shores of the Red Sea. The desert, indeed, does not end with Africa, but is prolonged eastwards through Arabia towards the desert of Sind. As the Nebian region is described under Sudan: § Anglo-Egyptian, the present article is confined to the country west of the Nile Valley, the Libyan desert inclusive. Its greatest length, along the 20th parallel of north latitude, is some 3200 m.; its breadth north to south varies from 800 to 1400 m.

The sea-like aspect of certain portions of the Sahara has given rise to much popular misconception, and has even affected the ideas and phraseology of scientific writers. Instead of being a boundless plain broken only by wave-like mounds of sand hardly more stable than the waves of ocean, the Sahara is a region of the most varied surface and irregular relief, ranging from 100 ft. below to 5000 and 6000 ft. above sea level in massed inselbergs rising 3000 ft. above the sea-level, and, besides sand-dunes and oases, countless numbers of rocky plateaux, vast tracts of loose stones and pebbles, ranges of the most dissimilar types, and valleys through which abundant watercourses must once have flowed.

In the centre of the Sahara is a vast mountain range known as the Ahaggar (Hoggar) Taissil or plateau. The culminating peaks of this plateau. Mounts Wateljen and Hilmaa, are about 900 m. in a straight line almost due S. of the city of Algiers and about 1200 m. due N. of the mouth of the Niger. They also occupy, speaking roughly, a central position between the Atlantic and the Nile.

The Ahaggar plateau is not inferior to the Alps in area, but its highest peaks do not greatly exceed 8000 ft. They are believed to be volcanic like those of Auvergne. Upon their summits snow is often seen and ice lies (from April to July) on the edges of the main plateau, and partly filling the valley between the Ahaggar plateau and the Tasili of the Asjel (see infra), are the Anahel mountains. To the north the valley is again contracted by the Iwman massif.

Besides this central group of mountains, sometimes spoken of as the Atakor-'n-Ahaggar (Summits of the Ahaggar), there are various smaller ranges in the south of the Sahara. In the north lies the Ahaggar, and separated from it by a wide plain, is the Muidir plateau, which extends nearly east and west 200 m. North-east of the Ahaggar (in the direction of Tripoli) is the Taissil Suda, a region probably 4000-5000 ft. above sea level. South-east of the Taissil of the Asjel is a range of hills known as the Tummo (or War) mountains. Still farther south is the mountainous region of Tibesti (or Tu), with an average height of some 7000 ft., the easternmost peak reaching a height of 8800 ft. Towards the south and east the Tibesti highlands are connected with the lower ranges of Borku and Ennedi, which merge into the plains of Wadai and Darfur. The slopes are bare and from the Berber word for dunes. In part it runs parallel with the Atlas mountains. Eastward it is continued, south of Algeria and Tunisia, by the Western Erg and Eastern Erg, separated by a narrow valley at Golea. South of the Eastern Erg (called the Haruj to the south as far as the Gafsa depression (q.v.)) the transition of the sandy tract is entirely broken by the Hammada-al-Homra (or Red Rock Plateau), but to the south of this lies the Borku plateau, a vast plain of 3,459,500 ft., which, with slight interruptions, extends to Murzuk in Fezzan. South of the southernmost peak of the dunes of Murzuk stretch south-east. This series of plateaus may be called the northern zone of the Sahara; it forms a kind of bow, the arch of southernmost extreme, as the Mediterranean and Atlantic and the Libyan desert and its apex in the south of Tunisia. The southernmost range is the Juf (depressions), covering a vast area to the south-east of the middle portion of the Igidgi, another area between the Adghaf plateau and the Ahaggar, and a third between Air and Tibesti. The Juf or depressions are not, except in rare instances, below sea-level. In the Libyan desert a vast region of dunes of unascertained limits; the characteristics of the Libyan desert being thought typical of the whole of the Sahara originated the idea of "a sea of shifting sand" as descriptive of the entire desert. Here a region of over 500,000 sq. m. extending east from the Tibesti mountains to the eastern edge of the Nile, bounded south by Wadai and Darfur and north by the Western and Eastern Erg, is relatively low and more or less covered by dunes. There is only one known route through this dreadful wilderness—one running north and south through the valley of Kufra—of the relations of Kufra, also lie in its expanse. These dunes in the Libyan desert, so far as is known, run N.N.W. and S.S.E. In the Eastern Erg the dunes also lie in long lines in a N.N.W. and S.S.E. direction, presenting a gradual slope to windward and an abrupt slope to the lee. The general result of the movement is the formation of a vast area of sand-dunes, upon which the vegetation is entirely absent, and which are subjected to a rate of comparative equilibrium that their topographic distribution may be considered as permanent, and some of them, such as Gern (Peak) and Gern of the Erg Adal-Kader, to the south of Golea, have names of their own. The popular stories about caravans and armies being engulfed in the moving sands are regarded as apocryphal (save perhaps in some instances in the Libyan desert), but there is abundant
SAHARA

The Sahara is a vast desert occupying a large portion of northern Africa. It is the largest hot desert in the world and is known for its extreme dryness, high temperatures, and lack of vegetation.

### Geographical Features

- **Climate**: The Sahara is known for its extremely hot and dry climate. Temperatures can reach 54°C (130°F) during the day, and drop to 0°C (32°F) at night. Annual precipitation ranges from 0 to 100 mm (0 to 4 inches).
- **Vegetation**: Due to the extreme dry conditions, vegetation is sparse, consisting mostly of hardy shrubs, cacti, and succulents. Some areas, like the oasis of Aïr, support more vegetation.
- **Topography**: The desert is characterized by flat plains, sand dunes, and occasional rock formations. The highest point in the Sahara is the Jbel Akkakou, reaching 1,234 meters (4,042 feet).
- **Waters**: The Sahara is home to a few permanent water bodies, including the Wadi Tamegroute and the Wadi Chabbi, which are fed by underground water sources.

### Historical and Cultural Significance

- **Ancient Civilizations**: The Sahara has been inhabited for thousands of years, with evidence of early human settlements. The Berbers, who are the original inhabitants, have been living in the region for over 5,000 years.
- **Nomadic Cultures**: Many ethnic groups, such as the Tuaregs and the Sahrawis, have migrated across the desert for centuries, following the routes of trade and water to sustain their way of life.
- **Modern Impact**: The Sahara is a source of conflict, with disputes over water rights and territorial boundaries. The desert's vastness also makes it a key area for national security and surveillance, with extensive military operations and geopolitical strategies.

### Environmental Considerations

- **Desertification**: Due to climate change and overgrazing, the Sahara is facing increased pressure from environmental degradation. This has led to a decrease in vegetation and an increase in soil degradation.
- **Protection Efforts**: International organizations and governments are working to protect the desert, promote sustainable development, and raise awareness about the importance of preserving the Sahara's biodiversity and cultural heritage.

The Sahara is a unique and diverse region, characterized by its extreme environmental conditions, rich cultural history, and ongoing challenges related to sustainability and conservation.
of the "Mediterranean" and the "Tropical" floras which have accommodated themselves to the peculiar climatic conditions. The line of demarcation between the two floral areas, almost coincides with the "Tropic of Cancer" and the "30° S." dipping south towards the meridian of Chad Lake, assigns by far the greater portion of the area to "Mediterranean" influences. Uniformity, in spite of differences of altitude and soil, is the characteristic, which prevails. The vegetation of the oases consists mainly of plants with a tufty, dry, stiff habit of growth. The oases are the special home of the date-palm, of which there are about 1,000,000 in the Algerian oases alone. In spite of this abundance, the interest of the travel with this tree, without which life in the Sahara would be practically impossible, are apricots, peaches, oranges, citrons, figs, grapes, pomegranates, &c. From December to March wheat, barley and other annual grain crops are successfully cultivated, and the hotter season rice, dukhn, darru and other tropical products. Altogether the oasial flora has considerable variety; thirty-nine species are known from the Kufra group, forty-eight from the Aujila group. Zoologically the Sahara is also partly Mediterranean, partly Tropical. Apart from the domestic animals (camels, asses, &c., and very noticeably a black breed of cattle in Adrar), the list of fifteen mammals comprises the jerboa, the hirax or fox, the jackal, the sand rat (Psammomys obesus), the hare, the wild ass and three species of antelope. In Borku, Air, &c., baboons, hyenas and mountain sheep are not uncommon. Without counting migratory visitants, about eighty species of birds have been registered, and the large and powerful Cassivelaunus and the smaller Aquila clanga, which inhabit the oases of Algeria, where cultivation has been extended by means of artesian wells, the conditions of the Sahara oases is far from prosperous. Prior to the French occupation, a feeling of insecurity had been engendered by the marauding habits of the nomad tribes; cultivation had become more restricted; and the decline of the caravan trade had brought ruin to certain centres, such as Murzuk. The most important are the oases of the Tuat region, especially Insiach; those of Ghat and Ghadames on the route from Tripoli to Zinder; and of Kufra, in eastern Sahara, which was incorporated in Cyrenaica. The various confederations of the Tuareg, in the central Sahara, comprise several groups of the Tuareg. The most important are the Amellimden, on the left bank of the Middle Niger; and the Kel-Ui, grouped around the mountainous districts of Air or Asben; the two northern confederations, those of the Ahaggar and Asjer, being less powerful. Much information respecting the Amellimden confederation was obtained during the voyage down the Niger, in 1856, of Lieutenant Hourst of the French Navy, who was much struck with its powerful organization under the chief Madidu. North-west of Timbuktu in the district of "Kingdom" of Biru is the oasis and town of Sankirta, a "sankirta" or agglomeration settlement. Other mountainous districts in which a certain amount of agriculture takes place, and which contain a population above the average for the Sahara, are Tiastet and Borku, in the east centre, and Adrar in the west. Tiastet and Borku are peopled by Tibbus; the western Adrar by Moors (Berbers). The northern portions of the Sahara are inhabited by nomad Arabs. Attempts have been made by many explorers and writers to trace in certain of the existing inhabitants the remnants of an aboriginal race of negro affinities, which inhabited the Sahara before the arrival of the Berbers and Arabs. E. F. Gautier,writing in 1858, maintained that the evidence available (for the central Sahara) rendered probable the hypothesis that at a period perhaps as recent as the Roman conquest of North Africa the Sahara was still neolithic and peopled by a race of agricultural negroes, who extended to the confines of Algeria. Negro influence is undoubtedly seen in various parts of the Sahara, but it may date from a much more recent period than has been supposed. For example, the connexion between many of the place-names in Fezzan and the language of Bornu is attributable to the northward extension of the influence of the Bornu-Kanem empire between the 11th and 14th centuries a.d. The allusions by classical writers to Ethiopians as inhabitants of the Sahara prove little, in view of the very vague and general meaning attached to the word. The physical characteristics, and especially the dark colour, of many of the Saharan populations is apparently a stronger argument, but even this is capable of another explanation. Caravans of negro slaves from time immemorial passed northwards along the main desert routes, and it is just in the oases on these routes that the dark element in the population is chiefly found. It may therefore be attributed to the intermarriage of the original lighter inhabitants of the oases with such slaves. The Tibbu (q.v.) or Tebu, once thought to be almost pure negroes, proved, when examined by Gustav Nachtigal in Tibesti, where they are found in greatest purity, to be a superior race with well-formed features and figures, of a light or dark bronze rather than black. Their language is related to that of the Kanuri in Bornu, but it appears they have derived theirs from the Tibu, not the Tibu from the Kanuri. Physically, they appear to resemble somewhat the Tuareg, and there is little doubt that they are a Hamitic, not a negro, people.

The commerce of the Sahara is not inconsiderable. Among the more important trade routes are (1) from Morocco to Cairo by Insalahl and Ghadames, which is followed by the pilgrims of western Africa bound for Mecca; this route has been largely superseded by the sea route from Tangier to Alexandria; (2) from Kuka (Lake Chad) to Murzuq and Tripoli; (3) from Kano and Zinder to Tripoli by Air and Ghat; (4) from Timbuktu to Insalahl, Ghadames and Tripoli; (5) from Timbuktu to Wargla and thence to Algeria; and (6) from Timbuktu to Morocco. The Senussi movement brought into prominence the desert routes between Wadai and Jalo and Benghaz in the north, which partially superseded some of the older routes. Other causes tended to reduce the importance of the old routes. The long-established route from Darfur to the Kharga and Dakhila oases fell into disuse on the closing of the eastern Sudan by the Mahdist troubles. The great route leading from Tripoli via Ghadames and Ghat, to Zinder, Kano, and other great centres of the Hausa States maintains its importance, while the opening of trade from the south of the Niger by the British in the southern Sahara of the 20th century has added to its value. The route across the western Sahara to Timbuktu is less used than formerly, owing to the establishment by the French of a route from Senegal via Nioro to the Upper Niger. The old route, however, retains some importance on account of the salt trade from the Sahara, which centres at Timbuktu. Salt and date palms are the chief products of the Sahara. The principal sources of the salt supply are the rock-salt deposits of the Jufi (especially Tahadieni), the lakes of Kufra and the rock salt and brine of Bilma (q.v.). The hope of an eventual commercial exploitation of the Sahara rests mainly on the possible existence of mineral wealth. To supply easy communication between Algeria and Nigeria the construction of a railway across the desert has been proposed. Two such railway plans have been suggested, the one taking an easterly line from Biarcaria through Wargla to Air (Agades) and Zinder—generally, the route followed by Foureau (see below); the other starting from Timbuktu in the most westerly railway already existing, and reaching Timbuktu via Igli and the Tuat oases. A third suggested route is one from Igli to the Senegal, still further west.

Reference may also be made to the proposal, strenuously advocated in the 1870s and 1880s by the imperial parties of the north of Algeria and Tunis by the construction of an inland sea. According to Colonel François Roudaire (1836-1888), the success of this scheme, deceptively styled the "flooding of the Sahara," it was possible, if not easy, to create an inland sea with an average depth of 78 ft, and an area of 3100 sq. m., or about fourteen times the size of the Lake of Geneva. A French commission of 1877 had declared that the extension of the sea by the new canal would not be difficult. It is suggested that in spite of silting-up processes the canal when cut would at last 1000 to 1500 years. Ferdinand de Lesseps, Roudaire's principal supporter, visited the district in 1883 and reported that the canal would cost five years' labour and 150,000,000 francs. The scheme (which fell into abeyance on the
Sahara

The Sahara, a vast desert located in North Africa, has a long and complex history. It was known to the ancient Egyptians as Shat-al-saheb, and later by the Roman empire as Tharros. The desert was a major stopping point for trade routes, including the Trans-Saharan trade route, which connected North Africa and West Africa.

Politically, the Sahara is divided into different regions, including Western Sahara, which was under Spanish control until 1975, and then administered by Morocco. Currently, Western Sahara is a disputed territory where both Morocco and the Polisario Front claim sovereignty.

The Sahara is not just a desert, but also a region of great cultural and historical significance. It was home to various civilizations, including the Berbers and the Tuaregs, who have a rich history and culture. The Sahara is also known for its unique landscape, including dunes, ergs, and oases, which attract visitors from around the world.
SAHARANPUR—SAIGA

SAHARANPUR, a city and district of British India, in the United Province, on a stream called the Damnaud Nadi, 907 ft. above sea-level, 998 m. by rail from Calcutta. Pop. (1901) 66,254, of whom more than half are Mahomedans. It is an important junction of the North-Western railway with the Oudh and Rohilkhand line. The government botanical gardens were established in 1817. There are railway workshops, and a large industry is pursued in wood-carving.

The District of SAHARANPUR has an area of 2228 sq. m. It forms the most northerly portion of the Doab, or alluvial tableland between the Ganges and Jumna. The Siwalik hills rise precipitously on its northern frontier, and there are two mountainous tracts, one round Kandhm, and the other round the coast, with much forest and jungle. Cultivation generally in this part is backward, the surface of the country being broken by ravines. South of this tract lies the broad alluvial plain of the Doab, with fertile soil and good natural water-supply. This portion of the country is divided into parallel tracts by numerous streams from the Siwaliks, while the Eastern Jumna and Ganges canals cover the district with a network of irrigation channels. The annual rainfall averages about 37 in. The population in 1901 was 1,049,920, showing an increase of 4.3% in the decade. The principal crops are wheat, rice, pulse, millet, and maize, with some sugar-cane and cotton. The district contains the towns of Roorkee and Hardwar.

During the later years of the Mogul empire, Saharanpur suffered much from the perpetual raids of the Sikhs, but in 1785 the district under Ghulam Kadir enjoyed comparative tranquillity. On his death the country fell into the hands of the Marathas. It was afterwards again overrun by the Sikhs, remaining practically in their hands until their defeat at Chharaon November 1804, when it passed under British rule. Several disturbances subsequently took place among the native chiefs; but from 1824 to 1857 nothing occurred to disturb the peace of the district.

SAHEL (Arabic for "shore"); a common-people name in countries where Arabic is the dominant language. By sahel any coast belt may be indicated, but the name has become the definite designation of certain districts, e.g. the Tunisian coast between the gulf of Hammamet and Gabes. Another region so called is that part of the Sahara south of the Atlantic. The name is also used to designate the territory under French jurisdiction west of Timbuktu and north of the Senegal. Sahel thus understood comprises regions which form the inter-

mediate zone between the fertile lands of the Sudan and the desert. In its plural form, Swahili, the word has become the tribal name of the natives inhabiting the coast strip opposite Zanzibar.

SAHIB, a title of respect in India, specially used to designate Europeans. The word is Arabic, and originally means a companion. It is generally fixed to the titles of men of rank, as Khan Sahib, Nawab Sahib, Raja Sahib, and is equivalent to master. The proper feminine form is sahiba; but the hybrid term memsahib (from madam and sahib) is universally used in India for European ladies.

SAHOHS, or Sirohus, Africans of Hamitic stock living to the W. of Massawa. Some authorities regard them as true Abyssinians, but more probably they are akin to the Gallas and Afars. They are for the most part Mahomedans, but some few are Christians.

SAHYADRI, a mountain range of India. The term, which is Sanskrit rather than vernacular, is applied to the entire system of the Western Ghats (q.v.) from the Tapti river to Cape Comorin, but more especially to that part of the system in the Bombay Presidency. In this restricted sense the Sahyadri hills begin in Khandesh district, and run S. as far as Gao.

In the territory of the Nizam of Hyderabad, the cross range forms the watershed between the river systems of the Tapti and the Godavari, is locally known as Sahyadri Parbat.

SAIDAPET, a town of British India, administrative head-quarters of Chingleput district, Madras, on the South Indian railway, 5 m. S.W. of Madras city, from which it is separated by a line of tanks. Pop. (1901) 14,254. The government teachers' college has a hostel or boarding-house for Brahmans, opened in 1897. The agricultural college, originally (1865) a model farm, has been transferred to Coimbatore.

SAID PASHA (c. 1380— ), surnamed Kuchuk, Turkish statesman, was at one time editor of the Turkish newspaper Jeride-i-Haudeis. He became first secretary to Sultan Abd-ul-Hamid II. shortly after his accession, and is said to have contributed to the realizations of his majesty's design of concentrating power in his own hands; later he became successively minister of the interior and Vett of Brussa, reaching the high post of grand vizier in 1879. A Turkish statesman of the old school, he was regarded as somewhat bigoted and opposed to the extension of foreign influence in Turkey. He was grand vizier four times under Abd-ul-Hamid. In 1866 he took refuge at the British embassy at Constantinople, and, though then assured of his personal liberty and safety, remained practically a prisoner in his own house. He came into temporary prominence again during the revolution of 1908. On the 22nd of July he succeeded Ferid Pasha as grand vizier, but on the 6th of August was replaced by Kamil Pasha, a man of more liberal views, at the instance of the young Turkish committee.

SAID PASHA KURD (1834-1907), Turkish statesman, son of Hussein Pasha, was born at Suleimanii. After holding various administrative posts he became governor-general of the Archipelago (1881), minister for foreign affairs (1882), ambassador at Berlin (1883) and again foreign minister in 1885. He was afterwards president of the Council of State, an office which he held till his death on the 20th of October 1907.

SAIGA (Saiga latarica), the native designation of a desert-dwelling antelope, easily recognized by its extraordinary swollen and puffy nose, in which the apertures of the tubular nostrils are directed downwards. The ringed lyrate horns of the males are peculiarly pronounced in this antelope and are visible on the head. There is a small gland on each side of the face below the eye, and the ears are remarkable for their short and rounded form. The colour is whitish in winter and sandy in summer. It is the sole representative of its genus. At the present day the headquarters of this antelope are the Kirghiz Steppes, but a century ago its range extended as far west as Poland. During the latter part of the Tertiary period the saiga was much more widely distributed, fossilized remains having been obtained from many parts of Western Europe, including Britain.
SAIGON—SAILCLOTH

SAIGO, TAKAMORI (1823—1877), Japanese patriot, was born in Satsuma in 1823. From early youth he took a prominent part in the politics of his clan, and owing to his extreme opinions with regard to the expediency of Cochin-China (now theotech), he was banished (1858) to the island of Oshima (Satsuma), where he attempted unsuccessfully to commit suicide. Ultimately he rose to high rank in the newly organized imperial government, but in 1873 he retired from the cabinet by way of protest against its decision not to take armed action against Korea. Thenceforth he became the rallying point of a large number of men dissatisfied with the new administration, and in 1877 he headed a rebellion which taxed all the resources of the central government. After several months of desperate fighting, Saigo and a small remnant of his followers made a swift retreat with the loss of Kagoshima, and fell fighting (September 14) within sight of their homes. Saigo's patriotism and his great services in the cause of the restoration of the administrative power to the throne were so fully recognized that his son was raised to the peerage with the title of marquess, and his own memory was honoured by the erection of a bronze statue in Tokyo.

SAIGON, a town of French Indo-China, capital of the colony of Cochin-China, on the right bank of the river Saigon, 34 m. from the sea. Pop. (1905) 54,745, of whom 37,429 were French (exclusive of troops), 152 Europeans of other nationalities, about 30,000 Annamites, 14,000 Chinese. The town is enclosed by the river Saigon on the east, the Chinese Arroyo on the north and the Arroyo of the Avalance on the north, on the west it extends towards the neighbouring town of Cholon. Double rows of trees give shade in all the streets, the width and uniformity of which, together with the beautiful gardens (including the zoological gardens), make Saigon one of the finest towns of the Far East. It is lighted chiefly by electricity and its water-supply is secured by a filtering reservoir. The chief public buildings are the government house, the palace of the lieutenant-governor of Cochin-China, the law courts, the theatre, the post-office and the cathedral. The commercial port, at the mouth of the Chinese Arroyo, carries on a large rice trade. The naval harbour comprises an arsenal and has a repairing dock.

Saigon is the seat of two chambers of the court of appeal of French Indo-China, of tribunals of first instance and of commerce, and of the vicar apostolic of Cochin-China. Its municipal council consists of eight French and four native members elected by universal suffrage. This body elects a mayor and two assistants.

Before the French conquest, Saigon, then known as Gia-dinh-thanh, was the capital of Cochin-China, which consisted of the "six southern provinces" of the Annamese empire, and constituted a vice-royalty under the government of a khinhluoc. In 1836 it was fortified for the emperor Gia Long by Colonel Ollivier. The city was captured it in 1859, and it was part of the territory ceded in 1862.

SAIL, the English equivalent of the common Teutonic word for one of the two universal means of propulsion of a vessel through the water, the other being the oar (q.v.). For the various types of sail see Rigging, and for the textile material used see SAILCLOTH below. The origin of the O. Eng. segél or segél and its cognates, e.g. Dutch zeil, Dan. zeil, Ger. Segel, etc., is not known; it is certainly not connected with the Indo-European roots sakh, seen in Sanskrit sakha, endure, the idea being of that which bears up against or resists the wind.

SAILCLOTH, now more commonly called canvas (q.v.), usually a double warp, single weft fabric of the same structure as bagging (q.v.), although it is sometimes made with single threads of hemp, flax and ramie are occasionally used in the manufacture of this cloth, but flax and cotton are the chief fibres employed. Many of the sails of fishing smacks and similar vessels are made entirely of cotton—the fabric sometimes retaining its natural colour, but more often dyed or stained tan. Since most of the largest vessels are now driven by steam, the quantity of cloth used for sails is comparatively small. A large quantity of cloth, however, is used on steamships for covers, and for coal bags, sail-cloth buckets, &c.

The very best kind of sailcloth is made from long flax, as this fibre possesses flexibility, lightness and strength combined. The number of threads per inch of warp varies from 14 double threads to 48 double threads, and from 12 to 36 shots per inch of weft, while the usual widths are 18, 24, 30 and 36 in. Cotton canvas has for its limits about 26 to 54 threads of warp per inch, and 15 to 46 shots per inch; the warp yarn for cottons may be 2, 3 or several ply.

Great care has to be exercised in the manufacture of canvas for the British Admiralty. The yarns must be made wholly from long flax, well and evenly spun, and free from foreign matter. They must also be free from blacks, and be twice boiled in order to remove all injurious matter. From the grey state to the cleaned state the yarn must lose 10% of weight, and no deleterious substance whatever must be used in any stage. The mill washing and first boiling reduce the weight about 8%, while about 2% is removed during the second boiling. Finally, the yarn is thoroughly washed to remove all traces of alkali. The successive processes which the yarn is subjected to remove all impurities, and leave the yarn in the best condition for weaving. The yarn is given different qualities: the heaviest is No. 6660, then follow Nos. 4, 9, 11, 12. Of these sixteen varieties Nos. 1 to 8 are mostly in use. Nos. 1, 2, 4, 6 and 7 are used for royal navy canvas, and Nos. 4 and 6 for the merchant navy. The canvas for the Admiralty is 24 in. wide, and the pieces, termed bolts, should be as nearly as practicable 40 yds. of legal measure in length, and to be completely manufactured—particular attention being given to the weaving; the selvages to be evenly and well manufactured, the thur to be left on each end of the bolt, and to be made as nearly as possible in the proportion of weights given below.

The breaking tests for red and grey canvas are 5% below those for white canvas.

Sailmaking is a very ancient industry, but it is, naturally, much less important than it was before the introduction of steamships. The operations of the sailmaker may be stated as follows. The dimensions of mast and yards and sail plan being supplied, the master sailmaker is enabled to determine the dimensions of each sail—allowance for stretching—in terms of cloth and depth in yards—if a square sail, the number of cloths in the head, number in the foot and the depth in yards; if a fore-and-aft sail (triangular), the number of cloths in the foot and the depth in yards; if the sail is to stand and of less or after-keeled; if a fore-and-aft sail (trapezium form), the number of cloths in the head, number in foot, and the depth of mast or luff and of after-keeled. These calculations are obtained, the sail is got out, spread out, and the padding (or hemming, so to speak) is turned in and finished off with about 72
SAINTFOIN—SAINT

stitches to a yard. Strengthening pieces or “linings” are affixed where considered necessary, in courses and top-sails such pieces as reef-bands, middle-bands, foot-bands, lee-chinings, butt-line clothes in top-sails (only), a top-line cloth and a lanyard; and other and lining pieces as such pieces as mast-lining cloth and head, tack and corner pieces; holes, such as head, reef, stay (luff), mast, cringle, bust-line, &c., are also made where required, a grommet of line of suitable size being worked in there so as to prevent their being laced through. The workmanship to be done is to secure the edges of the sail. Bolt-ropes, a comparatively soft laid rope made from the finer hemp yarn (Italian) is used for this purpose; in the British navy it ranges from 1 in. in size by quarter inches up to 8 in. inclusively; it is then neatly sewn on with roving twine specially prepared, the needle and twine passing between and clear of every two strands of the rope in roving. Where slack sail has to be taken in, it is the practice to leave it in the care of the sailmaker, but where possible it is better to set up the rope by means of a tackle to a strain approximate to what it will have to bear when in use, and whilst on the stretch mark it off in yards, as also the edge of the sail in yards, so that by bringing the marks together in roving the sail will stand flat. In the British navy the largest size of rope sewn on to a sail is 6 in. above this size are used for foot and clew ropes of top-sails and courses, being first wormed, parcelled (that is, wound round with strips of worn canvas), tarred and served over with spun yarn; the foot of the sail is then secured by it being marled in. Where two sizes of bolt-ropes used in roving a sail have to be connected, it is effected by roving a splice. Cringles (similar to the handle of a maund) formed by a strand of bolt-ropes, mostly having a galvanized iron thimble in them as a protection, are then stuck where necessary, as at the corners, sails or leeches, mast or luff; they are formed either by stitching a stationary or hauling "taut" by tackle or otherwise certain parts of the sail when in use. Fore-and- aft sails, such as spankers, gaff-sails and storm try-sails, are reduced in size by reef-points made of stout line (4 to 20 lb.) and laid in the middle, a number of loops being pierced through each sail; one-half of the point is passed through and the crowfoot sewn firmly to the sail; the number of reefs depends upon the size of the sail, and these reefs are placed alternately to the foot. The sails—now finished in respect of making—have to be fitted, that is, such ropes have to be attached to each of them as are necessary for proper use; such ropes may be summarily stated as follows: head-earings, roils related or reefed; needles of various sizes, that for seaming being the smallest; and fids, splicing, serving, closing, stretching knife, rubber, sail - hook, bobbin for twine, and sundry small articles. (T. Wo.)

SAINTFOIN (Onobrychis sativa) in botany is a low-growing perennial plant with woody rootstock, whence proceed the stems, which are covered with fine hairs and bear numerous long pinnate leaves, the segments of which are elliptic. The flowers are borne in close pyramidal or cylindrical racemes on the branches of long stalks. Each flower is about half an inch in length with lanceolate calyx-teeth shorter than the corolla, which latter is papilionaceous, pink, with darker stripes of the same colour. The indiscernent pods or legumes are flattened from side to side, wrinkled, somewhat sickle-shaped and crested, and contain a single olive-brown seed shaped like a small bean. In Great Britain the plant is a native of the calcareous districts of the southern counties, but elsewhere it is considered as an escape from cultivation. It is native throughout the whole of Central Europe and Siberia; but it does not seem to have been cultivated in Great Britain till 1651, when it was introduced from France or French Flanders, its French name being retained. Alphonse de Candolle (Origin of Cultivated Plants, p. 194) considers that the cultivation of sainfoin originated in the south of France as late perhaps as the 15th century. It is grown as a forage plant, being especially well adapted for dry limestone soils. It has about the same nutritive value as lucerne, and is esteemed for milch cattle and for sheep in winter. Besides the common form, a second known as giant sainfoin is met with in cultivation, being more rapid in its growth.

SAINT (lat. sanctus, "holy"), the term originally applied, e.g. in the New Testament and in the most ancient monuments of Christian thought, to all believers. In this sense it is still used by those modern Christian sects which profess to base their Church on the Bible (Of Miscellaneous (e.g. the Bible) and its Sermone or "Latter Day Saints"). In ancient inscriptions it often refers to those who are enjoying eternal happiness, or the martyrs. Thus we find inscriptions in the Catacomb such as visus inter sanctos, re johns cum spiritu santo, and people were buried ad sanctos. For a long time, too, sanctus was an official title, particularly reserved for bishops (v. Analecta Bollandiana, xviii. 410-411). It was not till almost the 6th century that the word became a title of honour specially given to the dead whose cult was publicly celebrated in the churches. It was to the martyrs that the Church first began to pay special honour. We find traces of this in the 2nd half of the 2nd century, in the Martyrium Polycarpi (viii. 3) in connexion with the meeting to celebrate the anniversary of the martyr's death. No other passage in the same document (xvii. 3) shows clearly that this was not an innovation, but a custom already established among the Christians. It does not follow that it was henceforth universal. The Church of Rome does not seem to have inscribed in its calendar its martyrs of an earlier date than the 3rd century. The essential form of the cult of the martyrs was that of the honours paid to the illustrious dead; and these honours were officially paid by the community. They consisted in a gathering at the martyr's tomb on the anniversary of his death. St Cyprian, speaking of himself in 249, says that he was buried in prison, wrote to his priests, "Denique et dies eorum, quibus ultimam, ad memoriam reverentium eorum inter memorias martyrum celebrare posse intelleximus" (Epist. xii. 2). The list of anniversaries of a church formed its Martyrology (g.v.). In the early days each church confined itself to celebrating its own martyrs; but it was not long before it became customary to celebrate the anniversaries of martyrs of other churches. In the oldest Roman ferial we already find festivals of Carthaginian martyrs, and similarly, in the Carthaginian calendar, Roman festivals, while Wright's Syriac Martyrology contains numerous traces of this exchange of festivals. From the 5th century onwards certain celebrated saints were honoured almost universally; St Augustine (Sermo, 276, § 4) says that the festival of St Vincent was celebrated throughout the whole of the Christian world. The same was the case of the festivities of St Stephen, St James and St John, and St Peter and St Paul, as is shown by the liturgical documents, but these festivals were held in connexion with that of Christmas (26th, 27th and 28th December), and were not strictly speaking anniversaries.

The calendars at first included only martyrs, but their scope was gradually widened. The first to find a place in them were the bishops. Apparently they were at first arranged in a series of anniversaries separate from that of the martyrs, as seems to be shown by the existence at Rome of the Deposito episcoporum side by side with the martyrikon. The two lists seem to have been combined, as in the calendar of Carthage, which includes the dies natalicerum martyrum et depositiones episcoporum. Some of the most famous bishops also ended by passing from one calendar into the other. Finally, the ascetics came to share in the honours paid to the martyrs, and we see in the Historia religiosis of Theodoret how quickly this
ST AFFRIQUE - ST ALBANS, EARL OF

assimilation took place. In times of persecution the martyrs were buried among the rest of the faithful, but one can understand that their tombs, at which gatherings took place at least on the day of their translation and eventually the feast day, must have retained a sign. When the peace of the Church permitted it, they were enshrined in chapels and often in sumptuous basilicas. In the West these buildings, which also existed in the East, were sanctuaries, but in the East there was no hesitation in disturbing the graves of the saints and removing the bodies to a basilica built to receive them. It is in this way that the relics of St Babylas were placed in the sanctuary which was the basilica of St Babylas, the first basilica which was dedicated to the Virgin Mary. The purpose of this practice was not, as some have suggested, to preserve the relics from the East, but it was a practice which was perfectly legitimate in the East, and it was the same in the West. The practice of placing the relics in a basilica built to receive them was perfectly legitimate, and it was the same in the West.

As to the belief in the efficacy of the prayers of the saints for those still living on earth, and similarly in the efficacy of the prayers addressed to the saints, St Cyril of Jerusalem indicates in the following words the advantages of the invocation of the saints: "Then we make mention also of those who have fallen asleep before us, first of patriarchs, prophets, apostles, martyrs, that God would at their prayers and intercession receive our supplication" (Cat. Myst. v. 9). It is difficult to understand a much-discussed passage of Origen (De oratione, 14), except as applying to prayer addressed to the saints.

The first creation of an earl of St Albans was in 1660, when Henry, Baron Jermyn, was made an earl under this title; but again it became extinct on his death in 1684.

The dukedom of St Albans was created in 1684 in favour of CHARLES BEAULCER (1670-1726), a natural son of Charles II. by Nell Gwynne. Born in London on the 10th of May 1670, Charles was named William, son of Sir Edward Burford, sometime a captain in the army of the papacy, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone.

ST ALBANS, EARLS AND DUKES OF.

The English title of earl of St Albans was first borne by Richard Bourke, or de Burgh, 4th earl of Clancaride (d. 1635), who was lord president of Connaught from 1604 to 1616 and governor of Galway in 1616. In 1624 he was made Baron Somershill and Viscount Tunbridge in the English peerage, and in 1628 earl of St Albans, Baron Imnanny and Viscount Galway. He became the third husband of Frances, dowager countess of Essex, whose first husband had been Sir Philip Sidney, and his English titles became extinct on the death of his only son, Ulick, 2nd earl of St Albans and marquess of Clancaride, in 1666.

The second creation of an earl of St Albans was in 1660, when Henry, Baron Jermyn, was made an earl under this title; but again it became extinct on his death in 1684.

The dukedom of St Albans was created in 1684 in favour of CHARLES BEAULCER (1670-1726), a natural son of Charles II. by Nell Gwynne. Born in London on the 10th of May 1670, Charles was named William, son of Sir Edward Burford, sometime a captain in the army of the papacy, and they all lay emphasis on the fact that the saints are not looked upon as gods by the Christians, and that the honours paid to them are of quite a different kind from the adoration reserved to God alone.

France, where he continued to act as her secretary. In the same year he was made governor of Jersey, whence he conducted the Prince of Wales to Paris. He conceived the idea of ceding the Channel Islands to France as the price of French aid to Charles against the parliament; and in other respects also he meddled with foreign politics, his great influence with the queen being a continual embarrassment to royalist statesmen, especially after the execution of Charles I. When Charles II. went to Breda, Jermyn remained in Paris with Henrietta Maria, who persuaded her son to create him earl of St Albans in 1660. Gros was of the same opinion as Jermyn, but which is supported by no real evidence, asserted that Jermyn was secretly married to the widow of Charles I. At the Restoration St Albans became lord chamberlain, and received other appointments.

He supported the policy of friendship with France, and he contributed largely to the close secret understanding between Charles II. and Louis XIV., being instrumental in arranging the preliminaries of the treaty of Dover in 1669. In 1664 he obtained a grant of land in London near St James’s Palace, where Jermyn Street preserves the memory of his name, and where he built the St Albans House, a large and fine mansion. The Institute of Regent Street and Waterloo Place. The earl, who was a friend and patron of Abraham Cowley, died in St James’s Square, for the building of which he had provided the plan in January 1684. St Albans being unmarried, the earldom became extinct at his death, while the barony of Jermyn of St Edmundsbury passed by special remainder, together with his property, to his nephew Thomas Jermyn, and after the latter’s death to Thomas’s brother Henry Baron Dover (q.v.).

ST ALBANS, a city, municipal borough, and market-town in the St Albans parliamentary division of Hertfordshire, England, on the main line of the Midland railway and on branches of the London & North-Western and the Great Northern lines, 20 m. N.W. of London. Pop. (1891) 12,898; (1901) 16,619. St Albans became the seat of a bishop in 1877; the diocese covering the greater part of Essex and Hertfordshire, with small portions of Cambridgeshire, Bedfordshire and Buckinghamshire. The great cathedral, or abbey church, is finely situated on the steep hill, above the small river Ver, on which the central part of the city is placed.

Shortly after the martyrdom of St Albans probably in 303 a church was founded on the spot where St Alban’s plain, and in 350 the bishopric of Mercia, who professed to have discovered the relics of the martyr, founded in his honour a monastery for Benedictines, which became the chief Benedictine abbey and monastic centre of Mercia, and was the site of the famous school called the Mercian College, which existed for centuries. The abbots, Ealdred and Ealmer, at the close of the 10th century began to break up the ruins of the old Roman city of Verulamium for materials to construct a new abbey church; but work was delayed till the time of the Norman Conquest, when, after the death of Caen, a relative of Archbishop Lanfranc, was in 1077 appointed abbot. The cathedral at Canterbury as built by Lanfranc was almost a reproduction of St Stephen’s, Caen; but Paul, while adopting an extensive model for it, added to it a polychromatic style which extended the cathedral, and was completed in 1115.

The church was consecrated in 1115, but had been finished some years before. Of the original Norman church the principal portions now remaining are the eastern bays of the nave, the tower and the transepts, but the main outlines of the building are still those planned by Paul. It is thus one of the most important specimens of Norman architecture in England, with the special characteristics of the first stage of the English Romanesque style. All the portions are peculiarly bare and stern. The western towers were pulled down in the 13th century. About 1155 Robert de Gorham repaired and beautified the early shrine and rebuilt the chapter-house and part of the cloister; but nothing of his work remains except part of a very beautiful doorway discovered in recent times. About 1200 Abbot John de Cella pulled down the west front and portions of the north and south aisles. He began the erection of the eastern portion of the church, and enriched and adorned his work was continued by his successor William de Trumpington in a plainer manner. In 1257 the eastern portion was pulled down, and between the ancient and the new was placed the heel of the 13th-century sanctuary, ante-chapel and lady chapel were added, all remarkably fine specimens of the architecture of the period. In 1332 two great columns on the south side suddenly fell, and this necessitated the replanning of the eastern part of the church. Various incongruous additions were made during the Perpendicular period, and much damage was also done during the dissolution of the abbeys to the finer work in the interior. Structural dangers gave rise to an extensive restoration in 1579, and in 1659 to the direction of Sir Gilbert Scott, and completed in 1894 by Lord Grimthorpe, some of whose work was, and remains, the subject of much adverse criticism. The abbey’s extreme length outside is 550 ft., which is exceeded by Winchester by 6 ft. The nave (292 ft.) has a choir and south transept, and is nearly 220 ft. wide. The length of the transepts is 175 ft. inside. The monastic buildings have all disappeared except the great gateway. St Michael’s church, within the site of Verulamium, was originally connected in the 12th century, but all but the fine tower and the north door of the Norman building remain. The church contains the tomb of Lord Chancellor Bacon. St Stephen’s church, dating from the same period, contains some good examples of Norman architecture. St Peter’s church has been in great part rebuilt, but the Early Perpendicular nave remains. The restored clock-house in the market-place was built by one of the abbots in the reign of Henry VIII. There are 16th-century Perpendicular buildings are the corse church, the court-house, the prison, the public baths, a technical school and the public library. There are two hospitals (one for infectious diseases), a dispensary and almshouses founded in 1734 by Sarah, duchess of Marlborough. The principal industries are the manufacture of silk, straw-plaiting, brush-making, letterpress and chromo-lithographic printing. There are also breweries and iron-foundries. A public park of 24 acres was opened in 1894, and a recreation ground in 1898. The increase in population is largely due to the growth of a residential district on the outskirts, owing mainly to the convenient proximity to London. The city is governed by a mayor, 4 aldermen, and 12 councillors. Area, 99 acres.

To the south-west of the present city of St Albans stood the ancient Verulamium (q.v.), one of the oldest towns in Britain, on Watling Street. The ruins served as a quarry not only to the builders of the Abbey, but also for the other churches and the monastic buildings of St Albans, and Roman bricks are found even in the fabric of the churches of neighbouring villages, as at Sandridge, 2½ m. N.E. After being burnt by Boadicea, Verulamium revived, and its church was famous early in the 5th century. The origin of the royal castle of Kingsbury is variously assigned to the 6th or 7th centuries. In the 9th and 10th centuries the abbots enlarged their residence, which was converted to them as a borough by Henry II. In 1253 a charter gave borough jurisdiction to the good men of St Albans; but the borough court was, apparently, discontinued for about 200 years after the rebellion of 1381. A charter of 1533, confirmed in 1553 and 1559-1566, incorporated the mayor and burgesses. Charters of 1663, 1664 and 1685, and the Municipal Corporation Act of 1833, altered the form of the corporation; and in 1877 St Albans became a city. Two burgesses were returned to the parliament of 1366-1367, and to others, until, after 1336, such right fell into abeyance until its resumption in 1553. Its abolition, as a result of the Reform Act of 1867, was the subject of much public debate.

During Wat Tyler’s insurrection the monastery was besieged by the townspeople, many of whom were executed in consequence. At St Albans the Lancastrians were defeated on the 1st of May 1455, their leader, the duke of Somerset, being killed, and Henry VI. taken prisoner; here, too, Queen Margaret defeated the earl of Warwick on the 17th of February 1461. During the civil war the town was garrisoned for the parliament. On a printing press, one of the earliest in the kingdom, set up in the abbey the first English translation of the Bible was printed. The Victoria County History, Herts, vol. ii.; Peter Newcome, The History of the Abbey of St Albans (London, 1793); and Chronica monasterii S. Albani, edited by H. T. Riley for the Rolls series (1863-1870).

ST ALBANS, a city and county-seat of Franklin county, Vermont, U.S.A., 57 m. by rail N.N.W. of Montpelier. Pop. (1900) 6239, including 1209 foreign-born; (1910) 6381. St Albans is served by the Central Vermont railway, which has general offices and shops here, and by an electric line connecting with Lake Champlain at St Albans Bay and with Swanton, 9 m. N. The city is built on a plain less than 3 m. from Lake Champlain and about 500 ft. above it; surrounding hills (Aldis and Bellevue) rise still higher and command charming views of the Green Mountains, Lake Champlain and the Adirondacks. Among the prominent buildings are a U.S. customs-house, the city hall, the court house, a public library, an hospital (1883), the Warner Memorial, the Battle Windsor, the Northern High School (1881), two Roman Catholic parochial schools and two convents. There are also in the vicinity, but the surrounding country is devoted largely to dairying. St Albans has a large creamery, manufactures condensed milk and ships large quantities of butter.
The first permanent settlement here was established in 1786; the township of St Albans (pop. in 1900, 1715) was incorporated in 1859, and the larger part of it was chartered as the city of St Albans in 1897. On the 19th of October 1864 Lieut. Bennett H. Young led from Canada about twenty-five un-uniformed Confederate soldiers in a raid on St Albans. They lootd three banks, wounded several citizens, one mortally, and escaped to Canada, where Young and twelve others were arrested and brought to trial. But they were never punished, and even the $75,000 which had been taken from them in the town was returned posthumously. The Canadian government refunded this amount to the banks. In 1866 and again in 1870 the Fenians made St Albans a base for attacks on Canada, and United States troops were sent here to preserve neutrality.

SAINT ALBIN—ST. AMAND-LES-EAUX

The life of Saint Albin (died in 303), also known as St Ambrose, is the subject of a poem by the Dutch writer and statesman, Jacob van Marwijk, who was born at Brussels, the son of Jacob van Marwijk, baron of Potten. He studied theology under Calvin and Beza at Geneva and, returning to the Netherlands in 1560, threw himself energetically into the cause of the Reformation, taking an active part in the compromise of the nobles in 1565 and the assembly of St Trond. He made himself conspicuous by issuing a pamphlet in justification of the iconoclasts who devastated Flanders in 1566, and on Alva's arrival next year had to flee the country. After spending some time in Friesland and in the Palatinate he was in 1570 taken into the service of William, prince of Orange, and in 1572 was sent as his representative to the first meeting of the States-general assembled at Dordrecht. In 1573 he was taken prisoner by the Spaniards at Maaslantels, but was exchanged in the following year. He was sent as the representative of the insurgent provinces to Paris and London, where he vainly attempted to secure the effective assistance of Queen Elizabeth. In 1578 he was at the diet of Worms, where he made an eloquent but fruitless appeal for aid to the German princes. Equally vain were his efforts in the same year to persuade the magistrates of Ghent to cease persecuting the Catholics in the city. He took a conspicuous part in arranging the Union of Utrecht, and in 1583 was chosen burgomaster of Antwerp. In 1585 he surrendered the city, after a 13 months' siege, to the Spaniards. Violently attacked by the English and by his own countrymen for this act, he retired from public affairs and, save for a mission to Paris in 1590, lived henceforth in Leiden or on his estate in Zeeland, where he worked at a translation of the Bible. He died at Leiden on the 15th of December 1598.

Saint Aldegonde, or Marnix (by whose name he is very commonly known), is celebrated for his share in the great development of Dutch literature which followed the emancipation represented by the writings of the poet and historian Pieter Hooff. Of his works the best known is the Roman Bee-kive (De roomsche byen-korf), published in 1569 during his exile in Friesland, a bitter satire on the faith and practices of the Roman Catholic Church. This was translated or adapted in French, German, and English. As a poet, St Aldegonde is known for a very beautiful equestrian poem, called the Vermählung der vier Pferde, in which the 42 psalms are used, and where he was listened to as the 13th psalmist. His complete works, edited by Lowand and Quinet, were published at Brussels in 7 vols. (1855-1899), and his religious and theological writings, edited by Van Turenbergen, were in Paris, in 3 vols. (1871-1891).

ST. ALDEGONDE, MARQUIS DE ST ALDEGONDE (Paris, 1854): Juste, Vie de Marnix (The Hague, 1858); Frédéricq, Marnix en zijn nederlandsche geschreven (Gent, 1882); Tjalma, Philips van Marnix, heer van Sint-Aldegonde (Amsterdam, 1896).

ST. ALDWYN, MICHAEL EDWARD HICKS BEACH, 157 VISCOUNT (1837- ), English statesman, son of Sir Michael Hicks Beach, 8th Bart., whom he succeeded in 1854, was born in London in 1837, and was educated at Eton and Christ Church, Oxford, where he graduated as a first class in the school of law and modern history. In 1864 he was returned to parliament as a Conservative for East Gloucestershire, the county in which his estates of Williamstrip Park were situated; and during 1868 he acted both as parliamentary secretary to the Poor Law Board and as under-secretary for the Home Department. In 1874 he was made chief secretary for Ireland, and was included in the Cabinet in 1877. From 1878 to 1880 he was secretary of state for the colonies. In 1885 he was elected for West Bristol, and the Conservative party having returned to power, became chancellor of the exchequer and leader of the House of Commons. In 1887 he was in the Cabinet. From 1886 he entered Lord Salisbury's next Cabinet again as Irish secretary, making way for Lord Randolph Churchill as leader of the House; but troubles with his eyesight compelled him to resign in 1887, and meanwhile Mr Goschen replaced Lord Randolph as chancellor of the exchequer. From 1888 to 1892 Sir Michael Hicks Beach returned to active work as president of the Board of Trade, and in 1895—Mr Goschen being transferred to the Admiralty—he again became chancellor of the exchequer. In 1899 he lowered the fixed charge for the National Debt from twenty-five to twenty-three millions—a reduction of forty-six required, apart from special reasons, by the difficulties found in redeeming Consols at their then inflated price. When compelled to find means for financing the war in South Africa, he insisted on combining the raising of loans with the imposition of fresh taxation; and besides raising the income-tax each year, up to 1s. 3d. in 1902, he introduced taxes on sugar and exported coal (1901), and in 1902 proposed the reimposition of the registration duty on corn and flour which had been abolished in 1869 by Mr Lowe. The sale of his Netheravon estates in Wiltshire to the War Office in 1898 occasioned some acrid criticism concerning the valuation, for which, however, Sir Michael himself was not responsible. On Mr Gladstone's retirement in 1902 Sir Michael Hicks Beach also left the government. He accepted the chairmanship of the Royal Commission on Ritualistic Practices in the Church, and he did valuable work as an arbitrator; and though when the fiscal controversy arose he became a member of the Free-food League, his parliamentary loyalty to Mr Balfour did much to prevent the Unionist free-traders from precipitating a rupture. When Mr Balfour resigned in 1905 he was raised to the peerage as Viscount St Aldwyn.

ST. AMAND-LES-EAUX, a town of northern France, in the department of Nord, at the junction of the Scarpe with the Scarpe, 22 m. S.E. of Lille by rail. Pop. (1906), town, 10,195; commune, 74,454. The town has a communal college and a school of drawing, and carries on iron-founding and the manufacture of porcelain, hosiery, chains and nails, but is better known for its mineral waters and mud baths. There are five springs; the water (65° to 75° F.) contains sulphate of lime and sulphur, and deposits white gelatinous threads without smell or taste. The mud baths are of benefit to patients suffering from rheumatism, gout and certain affections of liver and skin. Though from the discovery of statues and coins in the mud it is evident that these must have been frequented during the Roman period, it was only at the close of the 17th century that they again became of more than local celebrity. Of the abbey there remain
an entrance pavilion serving as town hall and the richly decorated façade of the church, both dating from the 17th century.

St Amand owes its name to St Amand, bishop of Tongres, who founded a monastery here in the 7th century. The abbey was laid waste by the Norrois in the 8th, and burnt at Hainaut in 1340. The church was restored by Mary of Burgundy in 1477, by the count of Ligne, Charles V’s lieutenant, in 1521, and finally in 1667 by the French. In 1793 St Amand was the headquarters of General Dumourier’s French army against the Austrian Government.

ST-AMAND-MONT-ROND, a town of central France, capital of an arrondissement in the department of Cher, 39 m. S. by E. of Bourges on the railway to Montluçon. Pop. (1906), 7711.

The town stands at the foot of the hill of Mont-Rond on the right bank of the Cher, at its confluence with the Marmande and on the canal of Berry. A church of the period of transition from the Romanesque to Gothic style and several old houses are the more interesting buildings. The beautiful château of Melleant, built from 1500 to 1530 by the admiral Charles of Amboise, is 5½ m. from St Amand; and the abbey of Noirac, a fine type of Cistercian abbey with a 12th-century church, is 2½ m. from the town.

The town grew up round a monastery founded by St Amand, a follower of St Columban, in the 7th century. Its ruined stronghold, on the hill of Mont-Rond, was of importance in the middle ages, and in 1450, when it was between the hands of the great Condé, occupied the centre of resistance to the royal troops, by whom it was taken after a siege of eleven months in 1652. It was for a time the property of Sully, who retired to it under the regency of Marie de’ Medicis.

SAINT-AMANT, MARC ANTOINE DE GÉRAD, SIEUR DE (1594-1661), French poet, was born near Rouen in the year 1594. His father was a merchant who, according to his son’s account, was a sailor and had commanded for 22 years une escadre de la reine Élisabeth—a vague statement that lacks confirmation. The son obtained a patent of nobility, and attached himself to different great noblemen—the duc de Reiz and the comte d’Harcourt among others. He saw military service and sojourned at different times in Italy, in England— a sojourn which provoked from him a violent poetical attack on the country, Albion (1643)—in Poland, where he held a court appointment for two years, and elsewhere. Saint-Amant’s later years were spent in France; and he died at Paris on the 20th of December 1661.

Saint-Amant has left a not inconsiderable body of poetry. His Albion and Rome ridicule set the fashion for the burlesque poem, a form in which he excelled by his follower Paul Scarron. In his Romanesque he bartered subjects to the French for an epic, Moïse sauvé (1653). His best work consists of Racchanlian songs, his Débauche being one of the most remarkable convivial poems of its kind.

SAINT ANDRÉ, ANDRÉ JEANBON (1749-1813), French revolutionist, was born at Montauban (Tarn-et-Garonne) on the 25th of February 1749, son of a fuller. Although his father was a Protestant, St André was brought up by the Jesuits at Marseilles and took orders. He turned Protestant, however, and became pastor at Castra and afterwards at Montauban. The declaration of liberty of worship made him a supporter of the revolutionary party, and he was sent as deputy to the Convention by the department of Lot. He sat on the Mountain, voted for the death of Louis XVI. and opposed the punishment of the authors of the September massacres. In July 1793 he was president of the Convention, entered the Committee of Public Safety the same month and was sent on mission to the Armies of the East. On the 20th of September 1793 he obtained a vote of one hundred million francs for constructing vessels, and from September 1793 to January 1794 reorganized the military harbours of Brest and Cherbourg. In May 1794 he took part with Admiral Villaret de Joyeuse in a fight with the English. Finally, after a mission in the south, which lasted from July 1794 to March 1795 and in which he showed great moderation, he was arrested on the 28th of May 1795, but was released by the amnesty of the year IV. He was then appointed consul at Algiers and Smyrna (1798), was kept prisoner by the Turks for three years, and subsequently became prefect of the department of Mont-Tonnerre (1801) and commissary-general of the three departments on the left bank of the Rhine. He died at Mainz on the 10th of December 1813.

See Lévy-Schneider, Le Conventionnel Jeanbon St André (Paris, 1901).

SAINT ANDRÉ, JACQUES D’ALBON, SEIGNEUR DE (c. 1595-1661) French soldier and favourite of Henry II. of France. He was made marshal of France, governor of Lyonnais and ambassador in England. He served with great bravery against the emperor Charles V. in 1552. In 1557 he was taken prisoner at the battle of Saint Quentin, but was released the following year, and took part in negotiating the peace of Cateau-Cambrésis. After the death of Francis II. he formed in 1561 with the constable de Montmorency and Francis, duke of Guise, an alliance known as “the triumvirate” against the Protestants and the queen-mother. He perished at the battle of Dreux by the hand of a private enemy.

ST ANDREWS, a county and parish, university town and seaport of Fifeshire, Scotland. Pop. (1901), 7621. It is situated on a bay of the North Sea, 12½ m. S.E. of Dundee by the North British railway, via Leuchars junction. It occupies a plateau of sandstone rock about 50 ft. high, on the north breaking off in precipitous cliffs in which the sea has worn numerous caves. The Eden enters St Andrews Bay to the north-west of the links; and Kinness Burn, skirting the south side of the town, flows into the harbour. Almost the whole activity of St Andrews is centred in education and golf. There are a few small businesses, however, such as brewing, tanning, shipping and fishing. The harbour, which is somewhat difficult of access, is protected by the town pier 6½ ft. long. It was named “the Links of Golf,” partly because the Royal and Ancient Golf Club, founded in 1754, is the legislative authority of the game, and partly because its beautiful links—acquired by the town in 1804 and containing three courses—rank amongst the finest in the world. For the sake of the game, the bracing air and the bathing which the sandy beach of its bay affords, visitors are attracted to St Andrews in great numbers. The chief modern buildings include the town hall, the Templars’ Hall, the Volunteer Hall, the Gibson Hospital, the Memorial Cottage Hospital, the Marine Biological Station (erected by Dr C. H. Gatty and opened in 1896), the Library and the Golf Club House, erected in 1853. The city was never surrounded by walls, and of its ancient gates the West Port only remains. The Martyrs’ Memorial, erected to the honour of Patrick Hamilton, George Wishart, and other martyrs of the Reformation epoch, stands at the west end of the Scores on a cliff overlooking the sea.

The cathedral originated partly in the priory of Canons Regular founded by Bishop Robert (1122-1150). At the end of the 12th century the church of the priory buildings were sufficiently large to contain the remains of others existed, but nearly all traces have now disappeared, except portions of the priory wall and the archways, known as the Pends. The wall is about three-quarters of a mile long, and bears turrets at intervals. The 3rd marquis of Bute undertook the restoration of the priory, but the work was interrupted by his death in 1900. The cathedral was founded by Bishop Arnold (1150-1162), to supply more ample accommodation afforded by the church of St Regulus. Of this church in the Romanesque style, probably dating from the 10th century, there remain the square tower, 108 ft. in height, and the choir, of very diminutive proportions. On a plan of 1590, about 150 ft. by 120 ft., appears, and on seals affixed to the city and college charters there are representations of other buildings attached. The cathedral was constructed in the form of a Latin cross, the total length inside the walls being 355 ft., the length of the nave 200 ft., of the choir and lateral aisles 62 ft. and of the lady chapel at the eastern extremity 50 ft. The width at the transepts was 166 ft. and of the nave and choir 62 ft. The building was finished in the time of Bishop Lambert in 1291 and was dedicated on the 5th of July 1318, the ceremony being witnessed by Robert Bruce. When entire it had, besides a central tower, six turrets, of which two at the east and one of the two at the west were formerly to a height of 100 ft., remaining as single. The building was partly destroyed by fire in 1378, and the restoration and further embellishment were completed in 1440. It was stripped of its altars and images in 1550. It is believed that about the end of the 16th century the central tower was carried on by the walls. Afterwards large portions of the ruins were taken away for building purposes, and nothing was done to preserve them until 1826. Since then it has been tended with scrupulous care, an interesting feature being the cutting of the ground-plan in the turf. The principal portions extant, partly Norman and partly Early English, are the
east and west gables, the greater part of the south wall of the nave and the west wall of the south transept.

The town church, formerly the church of the Holy Trinity, was originally founded in 1112 by Bishop Turgoat. The early building was largely of wood and thatch, but the close of the 15th century, the whole, with the exception of little else than the square tower and spire, was re-erected in a plain and unadorned style. In this church John Knox first preached in public (May or June 1547), and in it, on July 10, he delivered the famous speech in the consistory of the xxii. 12, 13, which led to the stripping of the cathedral and the destruction of the monastic buildings. The church contains an elaborate monument in white marble to James Sharp, archbishop of St Andrews (an estimate 1679). In South Street stands the lovely ruin of the north transept of the chapel of the Blackfriars monastery founded by Bishop Wishart in 1274; but all traces of the Observantine monastery founded about 1450 by Bishop Kennedy have disappeared, except the well.

The great university of St Andrews owes its origin to a society formed in 1410 by Lawrence of Lindores, abbot of Scone, Richard Cornwall, archdeacon of Lothian, William Stephen, afterwards archbishop of Dunblane, and a few others. A charter was issued in 1411 by Bishop Henry Wardlaw (d. 1440), who attracted the most learned men in Scotland as professors, and six bulls were obtained from Benedict XIII. in 1413 confirming the charter and constituting the society a university. The lectures were delivered in various parts of the town until 1430, when Wardlaw allowed the lecturers to use a building called the Paedagogium, or St Salvator's College, which was founded for the use of the clergy by Bishop Kennedy in 1426; twenty years later it was granted the power to confer degrees in theology and philosophy, and by the end of the century was regarded as a constituent part of the university. In 1512 St Leonard's College was founded by Prior John Hepburn and Archbishop Alexander Stewart on the site of the buildings which at one time were used as a hospital for pilgrims. In the same year Archbishop Stewart nominally changed the original Paedagogium into a college and annexed to it the parish church of St Michael of Tarvet; but its actual erection into a college did not take place until 1537, when it was dedicated to the Blessed Virgin Mary of the Assumption. The outline of the ancient structure is preserved, but the general character has been materially altered by various restorations. It forms two sides of the quadrangle, the library and principal's residence being on the north and the lecture rooms and the old dining-hall on the west. The University library, which now includes the older college libraries, was founded about the middle of the 17th century, rebuilt in 1764, and improved in 1829 and 1889-1890. The lower hall in the older part of the building was used at times as a provincial meeting-place for the Scottish parliament. When the constitution of the colleges was remodelled in 1570 St Mary's College was set apart for theology; and in 1748 they were named St Salvator and St Leonard and were formed into the United College. The buildings of this college and its predecessors are now occupied as a school for girls.

The college chapel is in ruins. The United College occupies the site of St Salvator's College, but the old buildings have been removed, with the exception of the college chapel, now used as the university chapel and the parish church of St Leonard's, a fine Gothic structure, containing an elaborate tomb of Bishop Kennedy and Knox's pulpit; the entrance gateway, with a square clock tower (152 ft.); and the janitor's house with some class-rooms above. The modern building, in the Elizabethan style, was erected between 1827 and 1847. University College, Dundee, was in 1850 affiliated to the university of St Andrews. This arrangement was set aside by the University of St Andrews in 1845, but a reaffiliation took place in 1897. In 1887-1888 a common dining-hall for the students was established; in 1892 provision was made within the university for the instruction of women; and for the board and residence of women students a permanent building was opened in 1896. To the south of the library medical buildings, erected by the munificence of the 3rd marquess of Bute, were opened in 1890. It was during the principalsip of Dr James Donaldson, who succeeded John Tulloch (1823-1886), that most of the modern improvements were introduced.

Madras College, founded and endowed by Dr Andrew Bell (1755-1832), a native of the city, is a famous higher-class school.

The town, which is governed by a council, provost and bailies, gives its name to the district group of burghs for returning one member to parliament, the other constituents being the two Anstruther, Crail, Cupar, Kirkcaldy and Pittenweem.

Four miles N.W. is Leuchars (pop. 715), the church of which, founded in 1100, contains a lovely ruin, the nave being modern. It was in this church that Alexander Henderson (1883-1946) heard the sermon that led him to give up Episcopacy. At Guard Bridge (pop. 715), so named from a tower that is lost, is a church built by Bishop Wishart in 1456, the middle of the nave is built of the wall of the Stane, and the western part of the present day, and the name of the church was changed to St Andrews, the saint soon afterwards (1247) being the patron-saint of Scotland (but see ANDREW, St). St Andrews is said to have been made a bishopric in the 9th century, and when the Pictish and Scottish churches were united in 908, the primacy was transferred to it from Dunkeld, its bishops being thereafter known as bishops of Alcanb. It became an archbishopric during the primacy of Patrick Graham (1466-1478). The town was created a royal burgh in 1124. In the 16th century St Andrews was one of the most important ports north of the Forth and is said to have been a place of northern habitants, but it has little trade to-day. It was captured by the English in 1630, and when he saw it one-sixth of its houses were ruined and the sea had so encroached on the harbour that it was never likely to be restored; but the slight improvement in trade and public spirit which Bishop Poolee seems to have set in 1700 continued throughout the 19th century.

SAINT ARNAUD—ST AUGUSTINE

The University of St Andrews: an Historical Sketch (1878): Annual Register of St Andrews University.

SAINT ARNAUD, JACQUES LEROY DE (1801–1854), marshal of France, was born at Paris on the 20th of August 1801. He entered the army in 1837, and after ten years of garrison service, which he varied by gambling and wild courses, he still held only the lowest commissioned grade. He then resigned, led a life of adventure in several lands and returned to the army at thirty as a sub-lieutenant. He took part in the suppression of the Vendée émeute, and was for a time on General (Marshall) Bugeaud’s staff. But his debts and the scandals of his private life compelled him to go to Algeria as a captain in the Foreign Legion. There he distinguished himself on numerous occasions, and after twelve years had risen to the rank of maréchal de camp. In 1838 he was placed at the head of a brigade during the revolution in Paris. On his return to Africa, it is said because Louis Napoleon considered him suitable to be the military head of a coup d’état, an expedition was made into Little Kabylia, in which St Arnaud showed his prowess as a commander-in-chief and provided his superiors with the pretext for bringing him home as a general of division (July 1851). He succeeded Marshal Magnan as minister of war, and a few weeks later he undertook the military operations of the coup d’état of the 2nd of December (1851) which placed Napoleon III. on the throne. A year later he was made marshal of France and a senator, remaining at the head of the war office till 1854, when he set out to command the French in the Crimea, his British colleague being Lord Raglan. He died on board ship on the 29th of September 1854 shortly after commanding at the battle of the Alma. His body was conveyed to France and buried in the Invalides.

ST ARNAUD, a town of Kara-Kara county, Victoria, Australia, 138 m. by rail N.W. of Melbourne. Pop. (1901), 3796. It is a flourishing town, the English school in 1877, a school of mines and the court house, in which sitting of the supreme court are held. There are tanneries, chaff and wood yards, and flour and bone-mills in the town, which lies in a gold-mining, pastoral and agricultural district, the mining being chiefly quartz. To the N.W. is some of the finest agricultural land in the colony.

ST ASAPH, a cathedral city and a contributory parliamentary borough of Flintshire, N. Wales, on the Rhyl-Denbigh branch of the London & North-Western railway, about 6 m. from each of these towns. Pop. (1901), 1788. Its Welsh name, Llandaf, is derived from the English between which stands and the Clwyd it stands. Asaph, to whom the cathedral (one of the smallest in Great Britain) is dedicated, was bishop here after Kentigern’s return hence to Glasgow, and died in 596. The small, irregularly built town has also a parish church (Anglican), remains of a Perpendicular chapel near Ffynnon Fair (St Mary’s Well), a bishop’s house, grammar school (1882) and almshouses for eight poor widows, founded in 1678 by Bishop Barrow. The hill on which St Asaph stands is Bryn Paulin, supposed to have been the camping-ground of Suetonius Paulinus, on his way to Anglesey. The early cathedral, of wood, was burned by the English in 1247 and 1282, and that built by Bishop Anian in the 13th century (Decorated) was mostly destroyed during the war of Owen Glendower in 1400; Bishop Redman’s building (c. 1480) was completed by the erection of the choir about 1770. During the Civil War the Parliamentarians did not spare the building. The choir and chancel were restored, from designs by Sir Gilbert Scott, in 1867–1868, the nave in 1875. The church is plain, cruciform, and in style chiefly Decorated but partly Early English, with a square tower; it has a library of nearly 2000 volumes (some rare); memorials to Bishop Dafydd ab Owain (d. 1502), to Bishop Luxmore (d. 1830), to the poetess Felicia Hemans, a resident near St Asaph (d. 1835); and Perpendicular oak choir stalls. In the neighbourhood is the modern mansion of Bodewydyan, of which the estate was bought by Sir W. Williams, speaker of the House of Commons in Charles II.’s time.

ST AUGUSTINE, a city and the county-seat of St John’s county, Florida, U.S.A., in the N.E. part of the state, about 36 m. S.E. of Jacksonville. Pop. (1900) 4727, including 1723 negroes; (1910) 5494; many of the native whites are descendants of those Minorcans who were settled at New Smyrna, Florida, by Andrew Turnbull in 1769, and subsequently removed to St Augustine. St Augustine is served by the Florida East Coast railway and by the Florida East Coast Canal, an inland waterway from the St John’s river to the Florida Keys.

The city stands on a narrow, sandy peninsula, about 12 ft. above the water, formed by the combination of the river and ocean, and is separated from the ocean by the northern end of Anastasia Island. St George, the chief street in St Augustine, is only 17 ft. wide, and Treasury Street is, at the eastern end, an unbroken line of two storey clapboard houses. There are many old houses, some of which have balconies projecting above the streets. At its northern end is the old fort of San Marco (now renamed Fort Marion in honour of General Francis Marion), a well-preserved specimen of Spanish architecture, begun, it is supposed, about 1656 and finished in 1756. The St Francis barracks (now the state arsenal) occupy the site of the old Franciscan convent, whose walls still remain as the fort storey. In the military cemetery are buried a number of soldiers who were massacred by the Seminoles near the Great Wahoo Swamp on the 28th of August 1835. At the end of St George Street and near Fort Marion is the City Gate (two pillars, each 20 ft. high), and opposite is a line of huge log buildings which forms the northern end of the peninsula. In the centre of the city is the Plaza de la Constitucion, in which are an obelisk erected in 1813 to commemorate the Spanish Liberal Constitution of 1812, and a monument to the citizens who died in the Confederate army. Of this square are the market (built in 1840, partly burned in 1887, and afterwards rebuilt), often erroneously spoken of as “ the slave market”; a Rotunda built by an Englishman named Townshend in 1791, burnt in 1832 (rebuilt and enlarged in 1887–1888); Trinity church (Protestant Episcopal); and the post office (once the Spanish government building). In the western part of the city is the beautiful Memorial Presbyterian Church, built in 1889 as a memorial to his daughter, by Henry M. Flagler. Facing King Street (the Alameda) is the magnificent Hotel Ponce de Leon (Spanish Renaissance), of shell-concrete, also by Flagler. The Alacazar (with a large swimming pool fed by a sulphur spring), of Moorish style, with a magnificent terrace (with a large sun parlour), formerly the Cordova Hotel, designed and built by Franklin W. Smith, in the Hispano-Moorish style, are also famous hostilities. In an old building (restored) is housed the collections of the St Augustine Institute of Science and Historical Society, organized in 1884. St Augustine is the seat of the state school for the deaf and blind.

At St Augustine are car and machine shops of the Florida East Coast railway. Oyster canning and fishing are engaged in to some extent, and cigars are manufactured, but the city is important chiefly for tourists who visit the place nearly 20 a year. The climate is delightful, the mean temperature for the winter months being about 58° F. and for the entire year about 70° F.

St Augustine is the oldest permanent settlement of Europeans in the United States. It was founded by Spanish colonists under the leadership of Pedro Menendez de Avilés, who sighted land here in 1565, on the 28th of August, St Augustine’s day, whence the name. On the 6th of September he landed and began his fortifications. St Augustine’s colonial history is almost identical with the history of Florida (q.v.) under Spanish dominion. In 1586 it was burned by Sir Francis Drake, who captured the fort, and in 1665 it was pillaged by Captain John Davis, an English freebooter. There were frequent conflicts with the English settlers, in 1718, 1740, and 1758. After the Spanish stopped flitting, beginning in 1681 with an attack by the Spanish on Port Royal, South Carolina. In 1702 Governor James Moore of South Carolina captured St Augustine, but not the fort; and there were subsequent expeditions under General James Edward Oglethorpe (see Georgia). When Florida was ceded to England in 1763, nearly all the Spanish inhabitants of St Augustine went to Cuba. Under English control the city prospered; but when in 1783 Florida was re-ceded to Spain, nearly all the English inhabitants left for the Carolinas, Georgia or the West Indies, and it became merely a military post. In 1821 St Augustine, with the rest of Florida, passed under American sovereignty. Since then St Augustine has not been abandoned. In January 1861, three days before Florida passed her Ordinance of Secession, the small United States garrison was compelled by a state force to evacuate; but on the 11th of March 1862 the fort was
ST AUSTELL—ST BERNARD PASSES

recaptured without bloodshed by a Federal force, and was held by the Federals until the close of the Civil War.

See also R. Fairbanks, The History and Antiquities of the City of St Augustine, 1831; B. R. Sanders, Old St Augustine (St Augustine, 1885); and D. Y. Thomas, "Report upon the Historic Buildings, Monuments and Local Archives of St Augustine," in vol. i, pp. 333-352 of the Annual Report (1893) of the American Historical Association.

ST AUSTELL, a market town in the St Austell parliamentary division of Cornwall, England, 14 m. N.E. of Truro, on the Great Western railway. Pop. of urban district (1901) 3340. It is pleasantly situated on a steep slope 2 m. inland from St Austell bay on the south coast. To the north the high ground culminates at 103 ft. above the sea in Henshaw Down, so-called from a barrow standing at the loftiest point. The church of the Holy Trinity is Perpendicular, with Decorated chancel, richly ornamented in a manner unusual in the county. The town is the centre of the productive china clay (kaolin), about 400,000 tons being annually exported by sea to the potteries of Staffordshire and to Lancashire, when it is used in the calico-working for sizing. The deposits of clay became important about 1763, and Josiah Wedgwood acquired mines in the neighbourhood. Mines were previously worked for tin and copper, and in some cases after being exhausted of ore continued to be worked for clay. The Carclaze mine to the north-east is notably rich; it is a shallow excavation of great superficial extent, which appears to have been worked from very early times. Close to St Austell is a good example of an ancient baptistery, called Menacudelle Well, the chapel being Early English.

ST BARTHOLOMEW, or ST BARTHELEMY, an island in the French West Indies. It lies in 15° 55' N. and 65° 60' W., about 130 m. N.W. of Guadeloupe, of which it is a dependency. It is shaped like an irregular crescent, the horns, enclosing the bay of St Jean, pointing to the N.; its surface is hilly, culminating near the centre of a limestone hill 1003 ft. high. It is 8 sq. m. in area, and devoid of forests, and water has often to be imported from the neighbouring island of St Kitts. The surrounding rocks and shallows make the island difficult of access. Despite the lack of water, sugar, cotton, cocoa, manioc and tobacco are grown. The capital, Gustavia, on the S.W. coast, possesses a small but safe harbour. Lorient is the only other town. The inhabitants, mainly of French and negro descent, are English-speaking, and number about 3000. St Bartholomew was occupied by France in 1649 and ceded to Sweden in 1784. In 1877 it was again acquired by France at the cost of £11,000.

ST BARTHOLOMEW, MASSACRE OF, the name given to the massacre of the Huguenots, which began in Paris on St Bartholomew's day, the 24th of August 1572. The initiative for the crime rests with Catherine de' Medici. Irritated and disquieted by the growing influence of Admiral Coligny, who against her wishes was endeavouring to draw Charles IX. into a war with Spain, she proposed to her husband that he should have him assassinated. The blow failed, and the admiral was only wounded. The attempt, however, infuriated the Huguenots, who had flocked to Paris for the wedding of Henry of Navarre and Marguerite de Valois. Charles IX. declared that the assassin should receive condign punishment. Catherine then conceived the idea of killing at a blow all the Huguenot leaders, and of definitely ruining the Protestant party. After holding a council with the Catholic leaders, including the duke of Anjou, Henry of Guise, the marshal de Tavannes, the duke of Nevers, and René de Biron, the keeper of the seals, she persuaded the king that the massacre was a measure of public safety, and on the evening of the 23rd of August succeeded in wringing his authorization from him. The king himself arranged the manner of its execution, but it is scarcely probable that he fired upon the Huguenots from a window of the Louvre. The massacre began on Sunday at daybreak, and continued in Paris till the 17th of September. Once let loose, it was impossible to restrain the Catholic populace. From Paris the massacre spread to the provinces till the 3rd of October. The duc de Longueville in Picardy, Chabat-Charny (son of Admiral Chabot) at Dijon, the comte de Matignon (1525-1597) in Normandy, and other provincial governors, refused to authorize the massacres.

François Hotman estimates the number killed in the whole of France at 50,000. There were many illustrious victims, among them being Admiral Coligny, his son-in-law Charles de Téligny and the logician Peter Ramus. Catherine de' Medici received the congratulations of all the Catholic powers, and Pope Gregory XIII. commanded bonfires to be lighted and a medal to be struck.

See H. Bordier, La St Barthélemy et la critique moderne (Paris, 1879); H. Baumgarten, Von der Bartholomänsäuber (Strassburg, 1882); and H. Mariéjol, La Réforme et la Ligue (Paris, 1904), in vol. i, pp. 321-322 of the Histoire de France de l'E. Laviolle, which contains a more complete bibliography of the subject.

ST BENOIT-SUR-LAIRE, a village of north-central France, in the department of Loiret, on the right bank of the Loire, 22 m. E.S.E. of Orleans by road. St Benoit (Lat. Floriacum) possesses a huge basilica, the only survival of a famous monastery founded in the 7th century to which the relics of St Benedict were brought from Monte Cassino. Of great importance during the middle ages, owing partly to its school, the establishment began to decline in the 16th century. In 1562 it was pillaged by the Protestants and, though the buildings were restored by Richelieu, the abbey did not recover its former position. The basilica was built between c. 1025 and 1218. Its narthex has a second storey supported on columns with remarkable carved capitals; there are two sets of transepts, above which rises a square central tower. In the interior are the tomb of Philip I., stalls of the 15th century, and, in the crypt, a modern shrine containing the remains of St Benedict, which still attract many pilgrims.

ST BERNARD PASSES, two of the best-known passes across the main chain of the Alps, both traversed by carriage roads. The Great St Bernard (8111 ft.) leads (53 m.) from Martigny (anc. Octodurus) in the Rhone valley (Switzerland) to Aosta (anc. Augusta Praetoria) in Italy. It was known in Roman times. The hospice on the pass was founded (or perhaps refounded) by St Bernard of Menthon (d. about 1081), and since the 12th or early 13th century has been in charge of a community of Austin canons, the mother-house being at Martigny. Annually the servants of the canons, and the famous dogs, save many lives, especially of Italian workmen crossing the pass. In May 1800 Napoleon led his army over the pass, which was then traversed by a bridle road only. The Little St Bernard (7170 ft.) also was known in Roman times, and the hospice refounded by St Bernard of Menthon, though it is now in charge of the military and religious order of SS. Maurice and Lazarus. The pass leads (39 m.) from Bourg St Maurice in the Isère valley (French department of Savoie) to Aosta, but is much less frequented by travellers than its neighbour opposite.

(W. A. B. C.)

There is no certain mention of the road over the pass of the Great St Bernard (Alpis Poenina, Poeninus Maior) before 57 B.C. when Julius Caesar sent Servius Galba over it. "because he wished that the pass, by which traders had been accustomed to go at great risk and with very high transport charges, should be opened." But even in Strabo's time it was impassable for wheeled traffic; and we find that Augusta Praetoria originally had but two gates, one opening on the road towards the Little St Bernard (Alpis Graia), the other towards Epopedia (Ivrea), but none towards the Alpis Poenina. But the military arrangement of the German provinces rendered the construction of the road necessary, and it is mentioned as existing in A.D. 69. Remains of it cut in the rock, some 123 ft. in width, still exist near the lake at the top of the pass. On the plain at the top of the pass is the temple of Jupiter Poeninus (Penninus), remains of which were excavated in 1890-1893, though objects connected with it had long ago been found. The oldest of the votive-tablets which can be dated belongs to the time of Tiberius, and the temple may be attributed to the beginning of the empire; objects, however, of the first Iron age (4th or 5th century B.C.) were also found1 and many Gaulish coins. Other buildings, probably belonging to the post station at the top of the pass, were also discovered. Many of the objects found then and in previous years, including

1 So Not. degli scavi (1891), 81; but the statement is contradicted, ibid. (1894). 44.
many votive-tablets, are in the museum at the hospice of the Great St Bernard.

See Notizie degli scavi, passim, especially E. Ferrero (1890), 294; C. Promis, Antichità di Aosta (Turin, 1862).

The Little St Bernard was known to the Romans as Alpis Graia. It derived its name from the legend that Hercules, returning from Spain with the oxen of Geryon, crossed the Alps by this route, though the legend rather suits the route through the Maritime Alps. According to many modern scholars, Hannibal passed over this way, the Alps, though the question has been much discussed (see art. Hannibal, and Partsch in Paulay-Wissowa, Realencyklopadie 1, 1604). In any case it was the principal pass over the Alps into Gallia Comata until the pass of the Alpis Cottia (Mont Genèvre) was opened by Cn. Pompeius in 75 B.C., and became the principal route, though the road was only completed under Augustus by Cottius in 3 B.C. Various remains of the road are visible, and those of a building (possibly a temple of Jupiter) have been found on the summit of the pass.

See Notizie degli scavi (1883), 7 (1894), 46; and C. Promis, Antichità di Aosta (Turin, 1862), 115 sqq.

ST BERTRAND-DE-COMMINGES, a village of south-western France at the foot of the Pyrenees in the department of Haute-Garonne, about 26 m. S.W. of Toulouse by road and rail. St Bertrand and stands about 1 m. from the left bank of the Garonne on the slopes of an isolated hill crowned by its celebrated cathedral of Notre Dame. The façade of the church with its square tower and the first bay with its aisles are Romanesque, and belong to a church begun about the end of the 11th century by Bishop Bertrand (1075-1123), afterwards canonized. The nave with its side chapels and the choir, in the Gothic style, date from the first half of the 14th century and were chiefly the work of Bertrand de Got, bishop from 1295 to 1299 and afterwards Pope Clement V. The choir screen, rood-loft and altar, which form an enclosure was in the 18th century overpainted with Renaissance woods-carvings, and also supplied the choir stalls. The church contains several tombs, the most interesting of which are the fine white marble tomb of Bishop Hugh of Châtillon (d. 1352), and the mausoleum of St Bertrand (both of the 15th century), whose relics are preserved in the treasury. On the south side of the church there is a ruined cloister of Romanesque architecture.

ST Bertrand-de-Comminges (Lugdunum Converanum) was founded in 72 A.D., and before the end of the 6th century became the seat of a bishopric suppressed at the Revolution. The town was destroyed towards the end of the 6th century by Guntrum, king of Burgundy, after it had served as a refuge to Gondowald, pretender to the crown of Aquitaine.

SAINT-BON, SIMONE ARTURO (1823-1892), Italian admiral, was born at Chambray on the 20th of March 1823. Leaving the Naval Academy in 1847, he attained the rank of commander in 1860, and that of vice-admiral in 1867. He took part in the Crimean war, distinguished himself in 1860 at the siege of Ancona, and was decorated for valour at the siege of Gaeta. At the battle of Lissa, in 1866, his vessel, the “Formidabile,” forced the entrance of the port of San Giorgio and silenced the Austrian batteries, for which exploit he received a gold medal. In 1873 he was elected deputy, and appointed by Minghetti to be minister of marine, in which position he revolutionized the Italian navy. Insisting upon the need for large battleships with high powers of attack and defence, and capable of fighting as single units, he introduced the colossal types of which the “Duilio” and the “Dandolo” were the earliest examples. Falling from power with the Right in 1876, he resumed active service, but in 1891 was again appointed minister of marine. He died on the 26th of November 1892, while still in office. He is remembered in Italy as the originator of the modern Italian fleet.

ST BRIEUC, a town of western France, capital of the department of Côtes-du-Nord, 61 m. N.W. of Rennes by the railway to Brest. Pop. (1906) town 15,270; commune 23,041. It stands 290 ft. above the sea, between 1 and 2 m. from the English Channel and less than a mile from the right bank of the Gouët, at the mouth of which is its seaport, Le Légué. St Brieuc is the seat of a bishopric in the province of Rennes, and has a cathedral dating from the 13th century, but partially rebuilt in the 18th, and afterwards extensively restored. In the interior the tombs of the bishops and a Renaissance organ-loft deserve mention. The oldest part of the episcopal palace date back to the 16th century. The hôtel-de-ville contains a museum and picture gallery. An Ursuline convent serves as barracks. There are numerous houses of the 15th and 16th centuries, in one of which James I., king of England, is said to have lodged in 1689. A celebrated lodge of the orders of Sun and Moon, which serves as a residence of the bishop, is situated on the principality on the north, and there is a statue of Du Guesclin.

The industries include wool-spinning, timber-sawing, iron and steel-working, and the manufacture of brushes and agricultural implements.

St Brieuc owes its origin and its name to the missionary St Briocus, who came from Wales in the 5th century, and whose tomb afterwards attracted crowds of pilgrims. The place was defended in 1376 by Olivier de Clisson against the duke of Brittany, and again attacked by the same Clisson in 1394, the cathedral suffering greatly in both sieges. In 1592 the town was pillaged by the Spaniards, in 1601 ravaged by the plague, and in 1628 surrounded by walls of which no traces remain. Between 1602 and 1768 the states of Brittany several times met at St Brieuc. During the Reign of Terror Chouans and Republicans carried on a ruthless conflict with each other in the vicinity. The ancient fort of Péran, built of vitrified granite, is about 5 m. S. of St Brieuc.

ST CATHARINES, a city of Ontario, Canada, and the capital of Lincoln county, on the Welland Canal and the Grand Trunk, and St Catharines and Niagara Central railways, 35 m. S. of Toronto, with which it has steamer connexion. Pop. (1901) 11,477. It is connected by electric tramways with the neighbouring towns and villages, and is in the midst of a fine fruit-growing district. Its excellent water-power provides motive force for numerous industries, among which are flour-mills and factories for the manufacture of edge tools and agricultural implements. Bishop Ridley College, under Anglican control, is an important residential school. There are several springs which are much visited by invalids.

ST CHAMOND, a manufacturing town of east-central France, in the department of Loire, 73 m. E.N.E. of St Étienne, on the railway from St Étienne to Lyons. Pop. (1906) 14,147. The town lies in a small basin surrounded by mountains at the confluence of the Jaron with the Gier, an affluent of the Rhone. It has coal-mines forming part of the Rive-de-Gier basin. The milling of raw silk, the manufacture of ribbons and laces of every kind, dyeing and the construction of naval and railway material are its foremost industries. There are also metal-foundries, manufactories of nails, heavy iron goods, looms and other industrial establishments.

St Chamond, founded in the 7th century by St Ennemond or Champwain, archbishop of Lyons, became the chief town of the Jarret, a little principality formed by the valley of the Gier. Silk-milling is carried on in the midst of the town, and the country enjoyed by Gayotti, a native of Bologna. Remains are found at St Chamond of a Roman aqueduct, which conveyed the waters of the Jaron along the valley of the Gier to Lyons.

ST CHARLES, a city and the county-seat of St Charles county, Missouri, U.S.A., situated on the N. bank of the Missouri river, about 20 m. above its mouth, and about 23 m. N.W. of St Louis. Pop. (1910) 9437. It is served by the Wabash and the Missouri, Kansas & Texas railway systems, and by an electric railway to St Louis. A great steel bridge, 6535 ft. long (built 1868-1871), crosses the river and gives entry to the Wabash railroad from St Louis. It has three spans of 305 to 321 ft., which at the time of their construction were the longest of their kind in the world. A highway bridge also crosses the river, and is the only wagggon bridge between Jefferson City and the mouth of the river. At St Charles are a Presbyterian school for women (Lindenwood College); St Charles Military College (Methodist Episcopal, 1837), the Academy of the Sacred Heart (1818); St Joseph’s Hospital, and a Catholic Asylum for Epileptics. St Charles has important car works (among the largest in the United States), a large shoe factory, flour mills, brick and tile yards and breweries. St Charles county is very fertile, and its yield of wheat is especially large. At the sand works at Klondike, in the southern part of the county, large quantities of silica are blasted, crushed, bolted and shipped.

A French settlement was begun at St Charles in 1769, and soon
thereafter a Spanish official was placed in residence. St Charles was organized as a village under territorial law in 1809, and in 1849 was chartered as a city. It was the first capital of the state (1820–1826).

SAINT CLAIR, a borough of Schuylkill county, Pennsylvania, U.S.A., on Mill Creek, 3 m. N. of Pottsville, and about 40 m. by rail N.N.W. of Reading. Pop. (1910) 6455. Saint Clair is served by the Pennsylvania and the Philadelphia & Reading railways. It is engaged chiefly in the mining (very largely surface-stripping) and shipping of anthracite coal, and in the manufacture of miners’ supplies. Saint Clair was settled in 1815 and was incorporated as a borough in 1830.

ST CLAIR, a lake and river of North America, forming part of the boundary between the state of Michigan, U.S.A., and the province of Ontario, Canada. The lake is 29 m. long and 20 broad. It contains numerous islands, receives from the Canadian side several rivers, the largest of which is the Thames, and is drained into Lake Erie by the Detroit river. At its foot are the cities of Detroit (Michigan) and Windsor (Ontario). On the north it receives the St Clair river, the outlet of Lake Huron. The shores of both lake and river are flat, and their waters shallow, but, owing to the enormous traffic which passes through, they have been in great part canalized, and can accommodate the largest vessels.

ST CLAUDE, a town of eastern France, capital of an arrondissement in the department of Jura, 42 m. S.S.E. of Lons-le-Saunier by rail. Pop. (1906) 9558. The town is beautifully situated 1300 ft. above sea-level at the western base of Mont Bayard, among the heights of the eastern Jura at the confluence of the Bienne and the Tacon. The latter river is crossed by a fine suspension bridge. The cathedral of St Pierre, once the abbey-church, a building of the 14th to the 18th centuries, contains fine 15th-century stalls and a reredos of the Renaissance period. The town is the seat of a bishop, suffragan of Lyons, and of a sub-prefect. St Claude has been noted since the close of the Middle Ages for its manufacture of brass, iron, cutlery, ivory, &c., and there are manufactories of briar-root pipes. Diamond-cutting and lapidary work and the manufacture of measures are also prosperous industries.

The town derives its name from that of an archbishop of Besançon who died in the 7th century in the monastery founded here in the 5th century. This monastery subsequently acquired almost independent sovereignty in the locality, and held its retainers in a state of servitude till the Revolution. Voltaire pleaded the cause of the serfs, though unsuccessfully, before the parlement of Besançon, and in memory of his services a statue was erected to him in 1887. St Claude was constituted a bishopric in 1762. The abbey-buildings and most of the town were destroyed by fire in 1790.

ST CLOUD, a town of northern France, in the department of Seine-et-Oise, on the left bank of the Seine, 2 m. W. of the fortifications of Paris by road. Pop. (1906) 7316. Picturesquely built on a hill-slope, St Cloud overlooks the river, the Bois de Boulogne and Paris; and, lying amid the foliage of its magnificent park and numerous villa gardens, it is one of the favourite resorts of the Parisians. The palace of St Cloud, which had been a summer residence for Napoléon I., Louis XVIII., Charles X., Louis Philippe and Napoléon III., was burned by the Prussians in 1870 along with part of the village. In spite of the data on the park at the same period its magnificent avenues and ornamental water still make it one of the pleasantest spots in the neighbourhood of Paris. Every year in September, at the time of the pilgrimage of St Cloud, a fair lasting four weeks is held in the park. Within its precincts are situated the national Sèvres porcelain manufactuary and the Bretell pavilion, the seat of the international commission on the metre. St Cloud possesses a modern church in the style of the 18th century with an elegant stone spire; and here, too, is established the higher training college for male teachers for the provincial training institutions.

Clovis I., grandson of Clovis, adopted the monastic life and left his name to the spot where his tomb was discovered after the lapse of 1200 years, in a crypt near the present church. He had granted the domain to the bishops of Paris, who possessed it as a fief till the 18th century. At St Cloud Henry III., and the king of Navarre (Henry IV.) established their camp during the League for the siege of Paris; and there the former was assassinated by Jacques Clément. The castle was at that time a plain country house belonging to Pierre de Gondi, archbishop of Paris; in 1668 it was acquired by the duke of Orleans, who was the originator of the palace which perished in 1870. Peter the Great of Russia was received there in 1717 by the regent, whose grandson sold the palace to Marie Antoinette. It was at St Cloud that Bonaparte executed the coup d'état of 18th Brumaire (1799); after he became emperor the palace was his favourite residence, and there he celebrated his marriage with Marie Louise. In 1857 it was the scene of the signing of the capitulation of Paris; and in 1830 from St Cloud Charles X. issued the orders which brought about his fall. Napoleon III. was there when he received the senatusconsult which restored the empire in his favour (1st December 1852). Seized by the Prussians at the beginning of the investment of Paris in 1870, St Cloud was sacked during the siege.

ST CLOUD, a city in Stearns, Benton and Sherburne counties, Minnesota, U.S.A., and the county-seat of Stearns county. About 65 m. N.W. of Minneapolis, on both the Mississippi and, above it, a sea-level. Pop. (1900) 8663, of whom 1907 were foreign-born (1719 U.S. census). It is served by the Great Northern and the Northern Pacific railways. It is the seat of one of the State Normal Schools (1866), and of the Minnesota State Reformatory (1887). In the city are a Carnegie library, a Federal building, a Roman Catholic cathedral, St Raphael’s Hospital (Roman Catholic), St Clotilda’s Academy of Music and two business colleges. The Mississippi has a considerable fall here, and provides valuable water-power. Among the manufactures are flour, barrels, bricks, and foundry and machine-shop products—the Great Northern maintains a large yard for the repair of locomotives and rolling stock. In 1905 the value of the city’s factory product was $1,994,476, an increase of 27-8% since 1900. There are large lumber yards, and excellent grey and red granites (St Cloud is called “the Granite City”) from neighbouring quarries are exported. The city lies in a large grain-growing and stock-raising district. St Cloud was settled in 1852, platted in 1834, incorporated as a village in 1868, and chartered as a city in 1889. Until reached by the Great Northern railway, St Cloud was the Hudson’s Bay Company’s terminus for the unloading of furs from the Hudson’s ox-boxes (Red River) cattle. ST CROIX or Sota Croix, the largest island in the Danish West Indies. It lies 65 m. S.E. of Puerto Rico, in 17° 40’ N. and 64° 14’ W., is 22 m. long, varies in breadth from 1 m. to 6 m., and has an area of 84 sq. m. Pop. (1901) 18,590. Parallel with the western coast is a range of hills, culminating in Mount Eagle (1164 ft.). The narrower western part is also hilly, but on the S. shore there are marshy tracts with lagoons of brackish water. Sugar is the staple product, and near Christiansvær there is a central factory conducted by the government. The planters are mostly English, and their language predominates. The capital, Christiansvær (locally known as “Bassin”), is situated at the head of an inlet on the N. coast, but its harbour is to a large extent choked with mud. It is a picturesque town, and the seat of the Danish government during the half year. The only other town, Frederickstjärn, stands on an open roadstead on the W. coast. It is locally known as “West End,” and part of the town, wrecked by the blacks in 1878, lies in ruins. The climate is healthy, the mean annual temperature being 74°F. and the average rainfall 45-7 in. per annum.

St Croix was discovered in 1493 by Columbus, and was owned in turn by the Dutch, British and Spanish. In 1653 it was taken by France, and two years later was given to the Knights of Malta by Louis XIV. In 1733 it was purchased by Denmark. Slavery was abolished in 1848 after a violent insurrection which had broken out among the slaves.

SAINT-CYRAN, a French Benedictine abbey in the province of Berry, now comprised in the department of the Loiret. From 1620 to 1643 it was held by the famous Jansenist reformer, Du Vergier (q.v.), who is consequently often spoken of by French writers as the saint of La Cyre. Its preservation is due to the sale of some of its lands being made by the monks. The abbey was the scene of the famous Council of 1540 (q.v.), at which 108 bishops of the realm were present.

SAINT-CYR-L'ÉCOLE, a town of northern France in the department of Seine-et-Oise, 3 m. W. of Versailles at the end of the old park of Louis XIV. Pop. (1906) 2696. Its importance is due to the famous military school (école spéciale militaire) in which officers for the cavalry and infantry are trained. It was established in 1808 in the convent which Madame de Maintenon founded for the education of noble young ladies in poor circumstances. Racine's Esther and Athalie were first acted here, having been written expressly for the pupils. Madame de Maintenon's tomb is still preserved in the chapel. The convent was suppressed at the Revolution, and the gardens are now partly transformed into a parade-ground.

ST DAVIDS (Tidydeu), a cathedral town of Pembrokeshire, Wales, situated near the sea to the S.E. of St David's Head, the most westerly promontory of South Wales. Pop. (1901) 1710. St Davids is 10 m. distant from the station of Letterston on the Great Western railway, and about 16 m. from Fishguard to the N.E., and 16 m. from Haverfordwest to the E. The little town, locally known as "the city," stands in a lofty position east of the Cathedral Close, and consists of five streets, which converge on an open space called the Cross Keys, formerly used as a market-place and distinguished by its High Cross, a stone tablet erected in 1677 to the memory of six dead soldiers who fell in the war in 1672. From the cross a lane leads westward to the Tower Gate, flanked by two ancient towers in a ruinous condition. From this point is obtained a superb view of the close with the cathedral and ruined palace in the valley of the Alun below, to which the rocky outline of Carn Lidi forms an imposing background.

The cathedral church of St. Andrew and St. David, in spite of centuries of neglect and ill-assiduous alterations, remains the largest and most handsome of ecclesiastical foundations in Wales. It is largely built of a beautiful purple-hued sandstone, which is quarried locally. Its proportions are: length (exclusive of the Trinity and Lady chapels), 236 ft.; breadth of nave and aisles, 46 ft.; breadth of transepts including tower, 116 ft.; and height of central tower, 116 ft. In spite of the antiquity of its foundations, the earliest and main part of the existing fabric was erected under Bishop Peter de Leta (1176-1180) in the transitional Norman-English style. Bishop David Martyn (1290-1328) built the Lady Chapel; Bishop Henry de Gower (1328-1347), one of the greatest of ecclesiastical builders in Wales, made many additions in his time, including the rood-screen between the nave and choir; and Bishop Edward Vaughan (1509-1522) erected the Trinity Chapel between the choir and Lady Chapel. Under the last-named prelate the magnificence of St Davids reached its height, but the benefactions and disquisitions during the latter part of the 16th century, being scapularly capacitated of Bishop William Barlow (1536-1548) the fabric suffered severely; nor was it spared later during the Civil Wars, when the Lady Chapel, the aisles of the presbytery, and even the transepts were unequally and partially dismantled. In 1793 the cathedral was repaired by Thomas Nash, who rebuilt the western front in a debased Perpendicular style. The work of much-needed restoration was carried out throughout the latter half of the 19th century, especially between 1862 and 1869, when Sir Gilbert Scott strengthened the building at a cost of £43,000. In 1873 Nash's incongruous work was replaced by a new façade intended to harmonize with the other buildings in the Principality. The nave, aisles, and transepts, occupying the sites of the buildings of the 13th century, were reconstructed in the early Perpendicular style, and the east end now forms a perfect specimen of English Gothic architecture.

The cathedral is the burial place of one of the most famous of Welsh historians, Llywelyn ap Glyndwr, the father of Welsh independence, who was buried in the cathedral of St Davids in 1413.

Of these there is no trace; and all the brasses have disappeared. In the presbytery stands prominent the altar tomb with monochrome brasses inserted of Edmund Tudor, Earl of Richmond (d. 1456), father of King Henry VII. Among the other surviving monuments, all mutilated or injured and defaced, are the tombs of Bishop Gower and several bishops of St Davids; the canopied effigies popularly but erroneously attributed to Prince Rhys (d. 1316) and his son Rhys; the stone base of the destroyed shrine of St David; a priest's effigy defaced to be that of the celebrated Giraldus Cambrensis; and the large Jacobean monument of Treasurer Thomas Lloyd (d. 1612). To the north of the cathedral is to be seen the ruined shell of the beautiful chapel with an adjoining tower, forming part of the college of St Mary, founded by John of Gaunt and Bishop Adam Houghton in 1377.

On the west bank of the Alun stands the splendid and indeed unique tower of the episcopal palace erected by Bishop Gower (c. 1328). Built for the purposes of courtly ceremonies rather than for defence, Bishop Gower's ecclesiastical mansion is "essentially a palace and not a castle; and it is hardly too much to affirm that it is altogether unsurpassed by any existing English edifice of its kind." Built upon vaulted cellars, the palace occupies three sides of a quadrangle 120 ft. square, and though roofless and deserted for nearly three hundred years it retains most of its principal features. The great hall, 90 ft. by 33 ft., possesses a transecd wheel-window; the chief portal is still imposing; and the chapel retains its curious bell-turret; while the peculiar but singularly graceful arched parapet of the roof extends intact throughout the whole length of the nave. Partially occupied since 1630 as a summer residence for the Cardinal-Marshal, the half-ruined palace was occasionally occupied by succeeding bishops prior to the Civil Wars, and in 1633 a chapter was held within its walls by Bishop Fisher.

The Close, 18 acres in extent and extra-parochial, contains the deanery and other residences of the cathedral clergy, mostly occupying the sites of ancient buildings. It formerly owned four gateways, over the southern or South Gate adjoining the village of Fishguard, an ugly and bleak but picturesque neighbourhood of St Davids teems with legendary and historical associations, and cromlechs and ruined chapels are numerous, amongst the latter the chapels of St Sebastian (Capel Stinian) and St Non being the most remarkable.

History.—At some unknown period in the 6th century the celebrated patron saint of Wales, Dewi or David, removed the church of St David of South Wales to the coastal hamlet of Menapia (Mynyw), which is traditionally reported to have been the saint's birthplace. The site chosen for this new foundation was the marshy valley of the Alun—the Vallis Rosina of medieval historians—and this spot became known henceforth as Tidydeu or St Davids.

The dree of an imminent Anglo-Saxon invasion of Gwent, the determination to remove his monastic clergy from court influence, and the desire of opening closer communication with the sister Churches of Ireland, are among the various reasons suggested for David's remarkable policy, which made St Davids the leading religious centre in South Wales for nearly two hundred years. And from the 7th to the 11th centuries the successors of St David occupied the bishopric of South Wales and, even over all land west of the Severn, and the character and extent of these ancient claims have frequently been made the subject of speculation or controversy among historians, some of whom have not hesitated to designate the early Celtic holders of the see by the title of "archbishop."

These ill-defined claims were destroyed by St Anselm's forcible appointment of the Norman monk Bernard to the bishopric in 1115, from which date to the present time St Davids has ranked as a suffragan see of Canterbury; nor has its ancient independence been seriously asserted; save by the intrepid Gerald de Barri (Giraldus Cambrensis) who in 1199 to 1203 to induce Pope Innocent III. to acknowledge the power of the cathedral chapter to elect its own bishops without reference to English king or primate. St Davids early became popular as a place of pilgrimage, and amongst the many suppliants who visited St David's shrine were William the Conqueror, Henry II. and Edward I. with Queen Eleanor. Probably with a view to conciliate the native clergy for Anselm's unpopular policy in Wales, Henry I. obtained from Pope Calixtus II. the canonization of St David about 1120, and in local esteem two pilgrimages to St Davids were vulgarly supposed to be equivalent to one journey to the holy city of Rome itself: a sentiment preserved in the curious monkish hexameter:

"Roma semel quantum his dat Menevia tantum."

From 1115 to the Reformation the see was held by prelates
ST DENIS—ST DIZIER

St Denis, the ancient *Cardinalium*, was a town of no pretensions till the foundation of its abbey, which became one of the most powerful in France. The rebuilding of the church, begun in the 12th century by Suger, was completed in the 13th century. Among the many domains of the abbey was the French Vexin. It was held during the dispute between the French kings and vassals of the abbey, and to this fact is due the adoption of the oriflamme or red banner of St Denis as the royal standard. St Louis caused mausoleums to be erected with figures of the princes already buried in the abbey; and from his time to that of Henry II. every monarch in succession had his monument. St Louis XIV. reduced the abbey to the rank of a priory; and at the Revolution it was suppressed, the tombs being violated and the church sacked (1793). Two years later all the remains that could be recovered were placed in the museum of the Palais de l’Assemblée, and the bronze tombs had been melted down. The stained-glass windows shattered, and a large number of interesting objects stolen or lost. Louis XVIII.

caused all the articles belonging to St Denis to be brought back to their original site, and added numerous other monuments from the suppressed abbey. But it was not till after 1848 that, under the direction of Viollet-le Duc, the basilica recovered its original appearance. St Denis, which was the key of Paris on the north, was more than once pillaged in the Hundred Years’ War, suffering especially in 1358 and 1460. A sanguinary battle, in which the Catholic leader Constable Anne de Montmorency found victory and death, was fought between Huguenots and Catholics in the neighborhood on the 10th of November 1567.

ST DIE, a town of eastern France, capital of an arrondissement in the department of Vosges, 38 m. N.E. of Epinal by rail. Pop. (1906) town, 16,783; commune, 22,336. St Die is situated on the Meurthe in a basin surrounded by well-wooded hills. The town, part of which was laid out in a uniform style after the fire of 1757, is the headquarters of a struggle for the possession of a certain area between the French and the Spanish. Its cathedral has a Romanesque nave (12th century) and a Gothic choir; the portal of red stone dates from the 13th century. A fine cloister (13th century), containing a stone pulpit, communicates with the Petite-Eglise or Notre-Dame, a well-preserved specimen of Romanesque architecture (12th century). The hôtel-de-ville contains a theatre, a library with some valuable manuscripts, and a museum of antiquities. There is a monument by Mercier to Jules Ferry, born in the town in 1832. St Die is the seat of a bishop and of a sub-prefect. The town benefited from the immigration of Alsations after the Franco-German War of 1870–71, and its industries include the spinning of cotton, bleaching, wire-drawing, metal-founding, and the manufacture of hosiery, wooden ware of various kinds, machinery, iron goods and wire-gauge.

St Die (Deodatus, Theodota, S. Deodati Fanum) grew up round a monastery founded in the 7th century by St Deodatus of Nevers, who gave up his episcopal functions to retire to this place. In the 10th century the community became a chapter of canons; among those who subsequently held the rank of provost or dean were Giovanni de’ Medici, afterwards Pope Leo X., and several princes of the House of Lorraine. In 1357 the canons of St Die were ejected by the latter of them under the pretext that they were in the service of coin minting. Though they co-operated in building the town walls, the canons and the dukes of Lorraine soon became rivals for the authority over St Die. Toward the end of the 15th century one of the earliest printing-presses of Lorraine was founded at St Die. The institution of a town council in 1628, and the establishment in 1777 of a bishopric which appropriated part of their spiritual jurisdiction, contributed greatly to diminish the influence of the canons; and with the Revolution they were completely swept away. During the wars of the 15th, 16th and 17th centuries the town was repeatedly sacked. It was also partially burned in 1665 and 1777. Funds for the rebuilding of the portion of the town destroyed by the last fire were supplied by Stanislas, last duke of Lorraine.

ST DIZIER, a town of north-eastern France, in the department of Haute-Marne, 45 m. N.N.W. of Chaumont by rail, on the Marne and the Haute-Marne canal. Pop. (1901) town, 10,516; commune, 18,520. The town is a very important centre of the iron trade, with foundries, forges and engineering

(many of them natives of Wales) who did much to enrich and beautify the vast group of ecclesiastical buildings in the Close. But with the partial destruction of the palace and the removal of the episcopal residence to Aberglw, it was not long before St Davids sank into a mere monument of its former splendor and importance. In 1539 Bishop Barlow even petitioned Thomas Cromwell for permission to remove the see itself to Carmarthen, a request which tradition declares Henry VIII. refused to grant solely out of respect for the memory of his grandfather Edmund Tudor, whose tomb had recently been taken from the suppressed priory of Grey Friars at Carmarthen and set up before the high altar of the cathedral. During the 17th and 18th centuries all the ancient buildings of the Close, except the cathedral (which served also as a parish church for the village of St Davids), were allowed to fall into hopeless ruin. Among the 175 bishops who have held the see since its foundation by St Davids may be mentioned Aser, the friend of King Alfred (d. 906); Samson (10th century), honoured by the Welsh chroniclers with the proud title of "Archbishop of the Isle of Britain"; Rhyddimarch (d. 1096), the first biographer of St David; Henry de Gower (d. 1347), the munificent patron of art; Robert Ferrar, burned at Carmarthen in 1555 under Queen Mary; Richard Davies (d. 1581), patriot and translator of the Welsh Book of Common Prayer; Archbishop William Laud, bishop of the see between 1621 and 1627; George Bull, divine (d. 1710); and Connop Thirlwall, schoolmaster and historian (d. 1873). The official title of the Bishop of St Davids is Episcopus Diocesis Cambrensis.

ST DENIS, an industrial town of northern France, capital of an arrondissement in the department of Seine, 5 m. N. of Paris. Pop. (1906) 52,323. St Denis, an important junction on the northern railway, stands in a plain on the right bank of the Seine, which is here joined by the canal of St Denis. It has numerous metallurgical works, where railway material, naval engines and the like are constructed, distilleries of spirits, glassworks, potteries and manufactories of drugs, chemical products, oils, nickel plate and pianos. The name and fame of the town are derived from the abbey founded by Dagobert I. on the spot where St Denis was slain by the Saracens, and from the buildings, occupied by a school for daughters of members of the Legion of Honour, founded by Napoleon I., date from the 18th century.

The church exhibits the transition from the Romanesque to the Gothic style. The west front was built between 1137 and 1140. The right-hand tower is almost pure Romanesque; that on the left was Gothic, and its spire was carried to a height of 280 ft., but it was burned down in 1538 by order of Francis I. It was reconstructed in a manner that it had to be reduced to the level of the roof of the nave. The rose window, now occupied by a clock face, dates from the 13th century. Under one of the three rows of arches above the transepts is an insertion from the Romanesque church by Abbot Suger (985), minister of Louis VI., with abbatial funds and its consecration in 1140. The porch formed by the first three bays of the church contains some remains of the basilica of Fippi in the Short and Charlemagne, by whom the church was rebuilt. The nave proper (235 ft. long and 57 wide) has seven bays, and dates, as well as most of the choir and transepts, from the reign of St Louis. The secondary apse (rondpoint) and four semicircular chapels (consecrated in 1144) are considered as the first perfected attempt at Gothic. The transepts have fine façades, the north of the 12th, the south of the 13th century, each with two unfinished towers. The nave is about 250 ft. wide and has five bays. The towers besides a central spire in lead. The church contains a series of tombs of the kings and princes of the royal houses of France. The most remarkable are those of Louis XII. and Anne of Brittany, excavated from 1513 to 1532; of Henry II. and Catherine de Medici, a masterpiece by Germain Pilon (1564–1583); of Louis of Orleans and Valentine of Milan, from the old church of the Celestines at Paris (1302–1315); of Francis I. and Claude of France, one of the most important monuments of the end of the 16th century, exclusive of the mausoleum, placed at the direction of Philibert Delorme (1550–1560); and that of Dago-bert, which, though considerably dilapidated, ranks as one of the most curious of medieval (13th-century) sculpture of any period. The crypt is partly of the 10th and 11th century. In the centre is the vault where the coffin of the king used to lie until, to make room for that of his successor, it was removed to the final resting place provided by the coffin of Louis XVIII., the last sovereign whose body was borne to St Denis. Besides fine statues, the crypt contains the Bourbon vault, in which among other coffins are deposed the remains of Louis XVI. and Marie Antoinette.
works, and has trade in grain and timber. It dates from the 3rd century, when the relics of Bishop St Didier (whence the name of the town) were brought thither after the destruction of Langres by the Germans. It sustained a memorable siege against Charles V. in 1544.

**STE ANNE DE BEAUPRÉ**, a post-village of Montmorency county, Quebec, Canada, at the junction of the Ste Anne river with the St Lawrence, and on the Quebec, Montmorency & Charlevoix railway, 22 m. below the city of Quebec. It is a rolling rural country, with hills in the background; and near by, on the Ste Anne river, are beautiful falls and excellent fishing. For over two centuries Ste Anne has been known as a Roman Catholic place of pilgrimage, and many miracles are still said to be performed through the intercession of the saint, the mother of the Virgin. In the basilica, an over-ornate building, are ever-increasing piles of crutches and other aids, cast aside by the cured. The resident population is about 1,500, chiefly composed of hotel-keepers and members of religious orders, but throughout the year many pilgrimages are made, and on such days as the feast day of Ste Anne (26th of July) 35,000 people are often present. The total number of pilgrims in 1905 was 170,000. In addition to the basilica the village contains numerous religious edifices, the chief being the Scala Santa, built in imitation of the Holy Stairs at Rome.

**SAINTE-BEUVE, CHARLES AUGUSTIN** (1804-1860), French critic, was born at Boulogne-sur-Mer (No. 16 Rue du Pot d'Étain) on the 23rd of December 1804. He was a posthumous child, his father, a native of Picardy, and controller of town-dues at Boulogne, having married in this same year, at the age of fifty-two. The father was a man of literary tastes, and used to read, like his son, pencil in hand, his copy of the Elzevir edition of Virgil, covered with his notes, was in his son's possession, and is mentioned by him in one of his poems. Sainte-Beuve's mother was half English, her father, a mariner of Boulogne, having married an Englishwoman. The little Charles Augustin was brought up by his mother, who never remarried, and an aunt, his father's sister, who lived with her. They were poor, but the boy, having learnt all he could at his first school at Boulogne, persuaded his mother to send him, when he was near the age of fourteen, to finish his education at Paris. He boarded with a M. Landry, and had for a fellow-traveller, Émile de Nanteuil, afterwards a member of Oriel College and member of parliament for the city of Oxford. From Landry's boarding-house he attended the classes, first of the Collège Charlemagne, and then of the Collège Bourbon, winning the head prize for history at the first, and for Latin verse at the second. In 1823 he began to study medicine, attending lectures on anatomy and physiology and walking the hospitals. But meanwhile a Liberal newspaper, the *Globe*, was founded in 1827 by Paul François Dubois, one of Sainte-Beuve's old teachers at the Collège Charlemagne. Dubois called to his aid his former pupil, who, now quitting the study of medicine, contributed historical and literary articles to the *Globe*, among them two, which attracted the notice of Goethe, on Victor Hugo's *Odes et ballades*. These articles led to a friendship with Victor Hugo and to Sainte-Beuve's connexion with the romantic school of poets, a school never entirely suited to his nature. In the *Globe* appeared also his interesting articles on the French poetry of the 16th century, which in 1828 were collected and published, and followed by a second volume containing selections from Ronsard. In 1829 he made his first venture as a poet with the *Vie, poésies, et pensées de Joseph Delorme*. His own name did not appear; but Joseph Delorme is a portrait of Jacobin and medical student,*1 as Guizot called him, was the Sainte-Beuve of those days himself. About the same time was founded the *Revue de Paris*, and Sainte-Beuve contributed the opening article, with Boileau for its subject. In 1830 came his second volume of poems, the *Consolations*, a work on which Sainte-Beuve looked back in later life with a special affection. To himself it marked and expressed, he said, that epoch of his life to which he could with most pleasure return, and at which he could like best that others should see him. But the critic in him grew to prevail more and more and pushed out the poet. In 1831 the *Revue des deux mondes* was founded in rivalry with the *Revue de Paris*, and from the first Sainte-Beuve was one of the most active and important contributors. He brought out his novel of *Volup't* in 1834, his third and last volume of poetry, the *Pensées* (with an *Empire*), in the same year. He himself thought that the activity which he had in the meanwhile exercised as a critic, and the offence which in some quarters his criticism had given, were the cause of the less favourable reception which this volume received. He had long meditated a book on Port-Royal. At the end of 1837 he quitted France, accepting an invitation from the academy of Lausanne, where in a series of lectures his work on Port-Royal came into its first form of being. In the summer of the next year he returned to Paris to revise and give the final shape to his work, which, however, was not completed for twenty years. In 1846 Victor Cousin, then minister of public instruction, appointed him one of the keepers of the Mazarin Library, an appointment which gave him rooms at the library, and, with the money earned by his pen, made him for the first time in his life easy in his circumstances, so that, as he afterwards used to say, he had to buy rare books in order to spend his income. A more important consequence of his easier circumstances was that he could study freely and largely. He returned to Greek, of which a French schoolboy brings from his *lycée* no great store. With a Greek teacher, M. Fantasides, he read and re-read the poets in the original, and thus acquired, not, perhaps, a philological scholar's knowledge of them, but a genuine and invaluable acquaintance with them as literature. His activity in the *Revue des deux mondes* continued, and articles on Homer, Theocritus, Apollonius of Rhodes, and Menander were fruits of his new Greek studies. He wrote also a very good article in 1844 on the Italian poet Leopardi; but in general his subjects were taken from the great literature which he knew best, that of his own country—its literature both in the past and in the contemporary present. Seven volumes of *Portraits*, contributed to the *Revue de Paris* and the *Revue des deux mondes*, exhibit his work in the years from 1832 to 1848, a work constantly increasing in range and value. In 1844 he was elected to the French Academy as successor to Casimir Delavigne, and was received there at the beginning of 1845 by Victor Hugo. He settled there, but his death from the illness which followed the revolution of February 1848 dislodged him. In March of that year was published an account of secret-service money distributed in the late reign, and Sainte-Beuve was put down as having received the sum of one hundred francs. The smallness of the sum would hardly seem to suggest corruption; it appears probable that the money was given to cure a smoky chimney in his room at the Mazarin Library, and was wrongfully entered as secret-service money. But Sainte-Beuve, who piqued himself on his independence and on a punctilious delicacy in money matters, was indignant at the entry, and thought the proceedings of the minister of public instruction and his officials, when he demanded to have that matter set at rest, and they concluded his post at the Mazarin and accepted an offer from the Belgian government of a chair of French literature in the university of Liège. There he gave the series of lectures on Chateaubriand and his contemporaries which was afterwards (in 1866) published in two volumes. He liked Liège, and the Belgians would have been glad to keep him; but the attraction of Paris carried

2 Sainte-Beuve was at this time a devoted Catholic and a little later for a very short period a disciple of Lamennais. But he gradually separated from his Catholic friends, and at the same time coldness grew up between him and Victor Hugo. He became the lover of Madame Hugo, and a definite separation between the former friends ensued in 1834.
3 Chateaubriand et son groupe littéraire sous l'Empire.
him back there in the autumn of 1849. Louis Napoleon was then president. Disturbance was ceasing; a time of settled government, which lasted twenty years and corresponds with the second stage of Sainte-Beuve's literary activity, was beginning. Dr Véron, the editor of the Constitutionnel, proposed to him that he should supply that newspaper with a literary article for every Monday; and thus the Causeries du lundi were started. They at once succeeded, and "gave the signal," as Sainte-Beuve himself says with truth, "for the return of letters." Sainte-Beuve now lived in the small house in the Rue Montparnasse (No. 11), which he occupied for the remainder of his life, and where in 1850 his mother, from whom he seems to have inherited his good sense, tact and finesse, died at the age of eighty-six. For three years he continued writing every Monday for the Constitutionnel and, with a similar contribution, to the Moniteur. In 1857 his Monday articles began to be published in volumes, and by 1862 formed a collection in fifteen volumes; they afterwards were resumed under the title of Nouveaux lundis, which now make a collection of thirteen volumes more. In 1854 he was nominated to the chair of Latin poetry at the college of France. His first lecture there (in 1853) was received with interruptions and marks of disapprobation by many of the students, displeased at his adherence to the empire; at a second lecture the interruption was renewed. Sainte-Beuve had no taste for public speaking and lecturing; his frivolités, he said, made him for it under the Empire, but he was not going to carry on a war with a party of turbulent students; he proposed to resign, and when the minister would not accept his resignation of his professorship he resigned its emolument. The Étude sur Virgile, a volume published in 1857, contains what he had meant to be his first course of lectures. He was still a titular official of public instruction; and in 1858 his services were called for by Gustave Rouland, then minister of public instruction, as a lecturer (maître de conférences) on French literature at the École Normale Supérieure. This work he discharged with assiduity and success for four years. In 1859 he was made commander of the Legion of Honour, and twice previously to 1848 refused the cross. During the years of his official engagement his Monday contributions to the Moniteur had no longer been continuous; but in 1862 an arrangement was proposed by which he was to return to the Constitutionnel and again supply an article there every Monday. He consented, at the age of fifty-seven, to try this last pull, as he called it, this "dernier coup de colleur"; he resigned his office at the École Normale and began the series of his Nouveaux lundis. They show no falling off in vigour and resource from the Causeries. But the strain upon him of his weekly labour was great. "I am not a moniteur nor a gentleman," he writes in 1864, "but a man at the end of the hour. I look upon myself as a player forced to go on acting at an age when he ought to retire, and who can see no term to his engagement." He had reason to hope for relief. Except himself, the foremost literary men in France had stood aloof from the empire and treated it with a hostility more or less bitter. He had not been hostile to it: he had accepted it with satisfaction, and had bestowed on its official journal, the Moniteur, the lustre of its literature. The prince Napoleon and the princess Mathilde were his warm friends. A senatorship was mentioned; its income of £1600 a year would give him opulence and freedom. But its coming was delayed, and when at last in April 1865 he was made senator, his health was seriously compromised. The disease of which he died, but of which the doctors did not ascertain the presence until his body was opened after his death—the stone—began to distress and disable him. He could seldom attend the meetings of the senate; the part he took there, however, on two famous occasions—when the nomination of Ernest Renan to the college of France came under discussion in 1867, and the law on the press in the year following—provoked the indignation of the great majority in that conservative assembly. It delighted, however, all who "belonged," to use his own phrase, "to the diocese of free thought"; and he gave further pleasure in this diocese by leaving the Moniteur at the beginning of 1869, and contributing to a Liberal journal, the Temps.1 His literary activity suffered little abatement, but pain made him at last unable to sit to work, and to the diocese of which he had only once or twice seen the façade, perhaps only a single month, that the Moniteur at the beginning of 1869, and contributing to a Liberal journal, the Temps.1 His literary activity suffered little abatement, but pain made him at last unable to sit to work, and to the diocese of which he had only once or twice seen the façade, perhaps only a single month, that the

1 This course of action definitely separated him from the Bonapartist and led to a quarrel with Princess Mathilde.—[Ed.]
following this, and written only four years later, in 1885, is the article on the Dictionnaire, a review of those works of objection, seizes the weak side of Victor Hugo's poetry, how much it has of what is "creux," "sonore," "artificiel," "voulu," "chiflard," "violent," as distinctly as the author of the Dictionnaire could seize it. "The Frank, energetic and subtle, who has mastered to perfection the technical and rhetorical resources of the Latin literature of the decadence," is a description never to be forgotten of Victor Hugo as a poet, and Sainte-Beuve launches it in this article, written when he was thirty years old, and still a painter of "portraits de jeunesse" only.

He had thus been steadily working and growing; nevertheless, 1848 is an epoch which divides two critics in him of very unequal value. When, after that year of revolution and his stage of seclusion and labour at Liége, he came back to Paris in the autumn of 1849 and commenced in the Constitutionnel the Causeries du lundi, he was astonishingly matured. Something of fervour, enthusiasm, poetry, he may have lost, but he had become a perfect critic—a critic of measure, not exuberant; of the centre, not provincial; of keen industry and curiosity, with "Truth" (the word engraved in English on his soul) for his motto; moreover, with gay and amiable temper, his manner as good as his matter—the "critique souriant," as, in Charles Monselet's dedication to him, he is called.

The root of everything in his criticism is his single-hearted devotion to truth. What he called "fictions" in literature, in politics, in religion, were not allowed to influence him. Some one had talked on his being tenacious of a certain set of literary opinions. I hold very little, he answers, "to Literary when he literary opinions occupy very little place in my life and in my thoughts. What does occupy me seriously is life itself and the object of it." "I am accustomed incessantly to call my judgments in question anew, and to re- cast my opinions the moment I suspect them to be without validity." "What I have wished" (in Port-Royal) "is to say not a word more than I thought, to stop even a little short of what I believed in certain cases, in order that my words might acquire more weight as historical testimony." To all exaggeration and untruth, from whatever side it proceeded, he had an antipathy. "I turn my back upon the Michelets and Quinetes, but I cannot hold out my hand to the Veuillots;"

But Sainte-Beuve could not, have not been the great critic he was, had he not had, at the service of this his love of truth and measure, the conscientious industry of a Benedictine. "I never have a holiday. On Monday towards noon I lift up my head, and breathe for about an hour; after that the wicket shuts again and I am in my prison cell for seven days." The Causeries were at this price. They came once a week, and to write them Sainte-Beuve devoted the whole week that he was indeed a week's work. The "irresponsible indolent reviewer" should read his notes to his friend and provider with books, M. Paul Chérion of the National Library. Here is a note dated the 3rd of January 1853: "Good-day and a happy New Year. To-day I set to work on Grimm. A little dry; but after St François de Sales (his Monday article just finished) one requires a little relief from rows. I have of Grimm the edition of his Correspondence by M. Taschereau. I have also the Memoirs of Madame d'Épinay, where there are many letters of his. But it is possible that there may be notices of him mentioned in the bibliographical book of that German whom I have often mentioned. I should like too, to have the first editions of his Correspondence; they came out in successive parts." Thus he prepared himself, not for a grand review article once a quarter, but for a close paper review once a week.

His adhesion to the empire caused him to be represented by the Orleanists and Republicans as without character and patriotism, and to be charged with baseness and corruption. The Orleanists had, in a great degree, possession of the higher press in France and of English opinion—of Liberal English opinion more especially. And with English Liberals his indifference to parliamentary government was indeed a grievous fault in him; "you Whig," as Croker happily says, "are like quack doctors, who have but one specific for all constitutions." To him either the doctrine of English Liberals, or the doctrine of Republicanism, applied absolutely, was what he called a "fiction," one of those fictions which "always end by obscuring the truth." Not even on M. de Tocqueville's authority would he consent to receive "les hypothèses dites les plus honorables"—"the suppositions which pass for the most respectable." All suppositions he demanded to sift, to see them at work, to know the place and time and men to which they were to be applied. For the France before his eyes in 1849 he thought that something "solid and stable"—"un mur," "a wall," as he said—was requisite, and that the government of Louis Napoleon supplied this wall. But no one judged the empire more independently than he did, no one saw and enounced its faults more clearly; he described "this empire as being, in his own single person, "the gauche of the empire," and the description was just.

To these merits of mental independence, industry, measure, lucidity of criticism and the merit of happy temper and disposition. Goethe long ago noticed that, whereas Germans reviewed another as enemies whom they hated, the critics of the Globe reviewed one another as gentlemen. This arose from the higher social development of France and from the closer relations of literature with life there. But Sainte-Beuve has more, as a critic, than the external politeness which once at any rate distinguished his countrymen: he has a personal charm of manner due to a sweet and humane temper. He complained of un peu de dureté, "a certain dose of hardness," in the new generation of writers. The personality of an author had a peculiar importance for him; the poetical side of his subjects, however latent it might be, was always attracted him, and he always sought to extricate it. This was because he had the moderate, gracious, amiably human instincts of the true poetic nature. "Let me beg of you," he says in thanking a reviewer who praised him, "do not make an over or two expressions at any rate. I cannot bear to have it said that I am the first in anything whatever, as a writer least of all; it is not a thing which can be admitted, and these ways of classing people give offence." Literary man and loyal to the French Academy as he was, he can yet write to an old friend after his election: "All these academies, between you and me, are pieces of childishness; at any rate the French Academy is. Our least quarter of an hour of solitary reverie or of serious talk, yours and mine, in our youth, was better employed; but, as one gets old, one falls back into the power of these nothings; only it is well to know that meanings they are."

Perhaps the best way to get a sense of the value and extent of the work done in the last twenty years of his life by the critic thus excellently endowed is to take a single volume of the causeries du lundi, to look through its list of subjects, and to remember that with the qualities above mentioned all these subjects are treated. Any volume will serve; let us take the fourth. This volume consists of articles on twenty-four subjects. Twenty of these are the name of Victor Hugo, Amyot, Maistre, Madame de Lambert, Madame Neecker, the Abd Maury, the Duc de Launay of Louis XVI.'s reign, Marie Antoinette, Buffon, Madame de Maintenon, De Bonald Amyot, Mallet du Pan, Marmontel, Chamfort, Ruffièere. Almost every person is French, it is true; Sainte-Beuve had a maxim that the critic should prefer subjects which he possesses familiarly. The great place of France in the world is very much due to her eminent gift for social life and development; and this gift French literature has accompanied, fashioned, perfected, and continues to reflect. And nowhere shall we find such interest more completely and charmingly brought out than in Sainte-Beuve's Causeries du lundi and the Nouveaux libris. As a guide to bring us to a knowledge of the French genius and literature he is unexcelled. (M. A.)
