For the administration of justice there is a High Court with two judges having civil and criminal jurisdiction. There are seven magistrate’s courts throughout the territory. For the administration of native affairs there are appointed a secretary for native affairs, two chief native commissioners, twenty-eight native commissioners and six assistant native commissioners. Natives suffer no disabilities or restrictions which do not equally apply to Europeans except in respect of the supply of arms, ammunition and liquor. Native commissioners may exercise jurisdiction in native affairs not exceeding that exercisable by magistrates. The company has to provide land, usually termed Native Reserves, sufficient and suitable for occupation by natives and for their agricultural and industrial requirements.

Revenue.—The administrative revenue of Southern Rhodesia was at first much less than the cost of administration. The figures for 1899–1900 were: revenue, £328,824; expenditure, £702,000. Since that date revenue has increased and expenditure decreased, and from 1905–6 (in which year the revenue exceeded £500,000) the cost of administration has been met out of revenue. For 1909–10 the revenue was approximately £600,000, the two main items being customs duty, £190,000, and native tax, £200,000. The native tax is £1 per head for every adult male and 10s. for every woman and child.

Education.—Besides a few private schools, there were in 1909 34 schools for Europeans, 26 of which were wholly financed by the government, the remainder being aided. The aided schools are as a rule connected with some religious body, and aid is given to the extent of half the salaries of the teachers and half the cost of school requisites. Loans are also given to assist in school building. A system of boarding grants has been instituted to enable children in the various districts to attend school. Education is free except for poor children, but the fees in government schools do not exceed 10s. a year. In 1910 several schools had reached the stage of preparing pupils for the entrance examination at the Cape University and similar examinations. The number of pupils in 1909 in European schools was 1212, being more than double what it had been four years previously. The education of natives is in the hands of various mission stations, but financial aid is given by government to native schools which comply with certain easy conditions. In 1909, 80 native schools with an enrolment of 7622 pupils earned grants.

Military Forces.—The military force in Southern Rhodesia is styled the British South African Police, and numbers about 40 officers, 400 non-commissioned officers and men, and 550 native police. The force is under a commandant-general, who, with the subordinate officers, is appointed by the secretary of state, and is under the direct control and authority of the high commissioner. The commandant-general is paid by the British parliament. The offices of commandant-general and resident commissioner were combined in 1905.

The Southern Rhodesia Volunteers, in two divisions, eastern and western, under command of colonels, number altogether 86 officers and 612 non-commissioned officers and men.

Medical.—There are, including cottage hospitals, ten hospitals in towns and乡镇ships, and thirteen district hospitals have been established.

Archaeology.—Between the Zambezi and the Limpopo, and extending from the coast to at least 29° E., may be found the traces of a large population which inhabited Southern Rhodesia and Portuguese East Africa in bygone times. Apart from numerous mines, some of which are being successfully re-worked at the present day, ruins of stone buildings have been found in several hundred distinct places. Few of these have been explored systematically, but investigations in 1905, though confined to a small number of sites, determined at least the main questions of date and origin. The fanciful theories of popular writers, who had ascribed these buildings to a remote antiquity, and had even been so audacious as to identify the founders with the subjects of King Solomon or of his contemporary the queen of Sheba, are now seen to be untenable. J. T. Bent’s Ruined Cities of Mashonaland (1892) is now interesting only for its illustrations, and his theories are obsolete. Positive archaeological evidence demonstrates that the “Great Zimbabwe” itself, the most famous and the most imposing of the misnamed “Ruined Cities,” was not built before medieval times, and that the earliest date which can be assigned to any of the sites explored is subsequent to the 11th century A.D. Moreover, the complete identity of custom, revealed no less by the details of the dwellings than by the type of the articles found within them, proves that the tribe that built these structures was one closely akin to if not actually identical with the present Bantu inhabitants of the country.

These ruins, even when stripped of their false romance, are of extreme interest; but their nature and appearance have been much misunderstood, and the skill and intelligence required for their erection have been grossly overestimated. It should be clearly stated, therefore, that the methods of the old Rhodesians evince their complete ignorance of all the devices employed in the architecture of civilized peoples. They have not attempted to solve the problems of supporting weight, and pressure by the use of pillar, arch or beam, but the ingenuity of the builders goes no further than the dexterous heaping up of stones. Indeed, their most finished and elaborated work must be compared with nothing more ambitious than the dry-built walls which serve to enclose the fields in certain parts of England. The material is the local granite or diorite obtainable in the immediate neighbourhood. Stone-hewing has not been practised; and was unnecessary, since the natural flaking of the boulders provides an abundance of ready-made slabs which need only be detached from the parent rock and broken to the required size. At most the blocks thus obtained have been very roughly trimmed with one or two blows, and any apparent regularity in the fitting has been obtained merely by judicious selection. Mortar has seldom been used; the courses are never laid with any approach to exactness; walls merely abut on one another without being bonded, and the same line often varies greatly in thickness at different parts.

The main principle of the ground plan is invariably circular or elliptical, though it is carried out with a conspicuous lack of symmetry or exactness. Straight lines are unknown, and even accidental approximations to an angle are rare. This is eminently characteristic of the Bantu, whose huts are commonly built in circular form. Indeed, it is the round Bantu hut which has been the original model for even the finest of these stone constructions. The connexion between the two, however, goes beyond mere resemblance. The stone walls are always accompanied by huts; they are mere partitions or ring-fences enclosing and structurally inseparable from platforms of clay or cement on which stand the remains of precisely the same dwellings that the Makalanga make at the present day. Buildings such as those at Dho Dho, Nanatal and Khami in Matabeleland, or at Zimbabwe in southern Mashonaland, are merely fortified kraals; remarkable indeed as the work of an African people, but essentially native African in every detail, not excepting the ornamentation. The best-known and the most attractive of the Rhodesian ruins are those situated in the more central and southern region. In the north-east, however, the remains are even more numerous, though the single units are less remarkable. Over the whole of Inyangwa and the Mazoe region are distributed hill-forts, pit-dwellings and intrenchments which are more primitive in character though of the same generic type as those found farther south. The inhabitants of these northern districts were occupied more in agriculture than in gold-mining, and one of the most striking features of their settlements is the
irrigation system. There are no aqueducts such as Europeans or Arabs might have built, but water furrows have been carried on admirably calculated gradients for miles along the hill-sides. The amount of labour which has been expended on the great villages between Inyanga and the Zambezi is astounding. On one site, the Nicker Ruins, an area of fully 50 sq. m. is covered with uninterrupted lines of walls. It is an interesting question which may be solved by future explorations whether these settlements do not extend north of the Zambezi. Intrenchments like those of the Nicker Ruins have been reported from the south-east of Victoria Nyanza, and Major Powell Colin has published a photograph from the Nandi country which exhibits a structure precisely similar to the hill forts of Inyanga. (See also ZIMBABWE; MONOMOTAPA.)

(D. K.-M.)

History.—There is evidence that from the 16th or 17th centuries onward the lands now forming Rhodesia were inhabited by Bantu-negroes who had made some progress towards civilization and who traded with the Arab settlements at Sofala and elsewhere on the east coast (see Archaeology above). From the 17th century, if not earlier, until about the close of the 18th century, a considerable part of this area was ruled by a hereditary monarch known as the Monomotapa, whose simbabve (capital) was, in the earlier part of the period indicated, in what is now Mashonaland. Some of the Monomotapas during the 16th and 17th centuries entered into political and commercial relations with the Portuguese (see Monomotapa and ZIMBABWE). The Monomotapa “empire” included many vassal states, and probably fell to pieces through intertribal fights which greatly reduced the number of inhabitants. In the early years of the 19th century the tribes appear to have lost all cohesion. The people were mainly agriculturists, but the working of the gold-mines, whence the Monomotapas had obtained much of their wealth, was not wholly abandoned.

The modern history of the country begins with its invasion by the Matabele, an offshoot of the Zulus. Mosilikatze, their first chief, was a warrior and leader who served under the Zulu despot Chaka. Being condemned to death by Chaka, Mosilikatze fled, with a large division of the Zulu army. About 1817 he settled in territories north of the Vaal, not far from the site of Pretoria; and in 1820, when Tolschikov was put down, he entered into with him by the governor of Cape Colony. In the same year a number of the “trek Boers” had crossed the Vaal river, and came in contact with the Matabele, who attacked and defeated them, capturing a large number of Boer cattle and sheep. In November 1837 the Boers felt themselves strong enough to assail Mosilikatze, and they drove him and his tribe north of the Limpopo, where they settled and occupied the country subsequently known as Matabeleland. In 1858 Mosilikatze died. Kuruman, son and recognized heir of the old chief, then disappeared years before, and though a Matabele war chief was claimed to be the missing heir was brought from Natal he was not acknowledged by the leading indunas, who in January 1870 invested Lobengula, the next heir, with the chieftainship. Those Matabele who favoured the supposed Kuruman were defeated in one decisive battle, and thereafter Lobengula, whose kraal was at Bulawayo, reigned unchallenged. At this time the Matabele power extended north to the Zambezi, and eastward over the land occupied by the Mashona and other Makalanga tribes. North of the Zambezi the western districts were ruled by the Barots (Q.R.), while the eastern portion had been overrun by other tribes of Zulu-Xosa origin, among whom the Agoni were the most powerful. The explorations of David Livingstone, Thomas Baines (1820-1875), Karl Mauch and other travellers, had made known to Europe the general character of the country and the existence of great mineral wealth. Lobengula was approached by several “prospectors” for the grant of concessions; among them two Englishmen, Baines in 1871 and Sir John Swinburne in 1872, obtained cessions of mineral rights, but little effort was made to put them in force. In 1882 President Kruger, who was then bent on extending the boundaries of the Transvaal in every direction, endeavoured to make a treaty with Lobengula, but without success. The Warren expedition of 1884 to BechuanaLand (q.v.), while it checked for a time the encroachments of the Transvaal Boers, and preserved to Great Britain the highway to the north through BechuanaLand, also served to encourage colonists to speculate as to the future of the interior. At this time, too, the struggle between the nations of western Europe for the unappropriated portions of Africa had begun, and while the Boers, foiled in Matabeleland, endeavoured to get a footing in Mashonaland, both Portuguese and Germans were anxious to secure for their countries as much of this region as they could. In 1887 a map was laid before the Portuguese cortes showing the territories in Africa claimed by Portugal. They stretched across the continent from sea to sea, and included almost the whole of what is now Rhodesia, as well as the British settlements on Lake Nyassa. To the claim of a transcontinental domain Portugal had succeeded in gaining the assent of Germany and France, though Germany, which had not been in South-West Africa, still dreamed of establishing her sway over Matabeleland. By the instructions of Lord Salisbury, then foreign secretary, the British representative at Lisbon informed the Portuguese government that except on the seacoast and on portions of the Zambezi river there was not a sign of Portuguese authority or jurisdiction in the districts claimed by them, and that the British government could not recognize Portuguese sovereignty in territory not effectively occupied by her.

This protest, so far as southern Rhodesia is concerned, might have been ineffective save for the foresight, energy and determination of Cecil Rhodes, who had been instrumental in saving BechuanaLand from the Boers, and who as early as 1873 had conceived the idea of extending British influence over central Africa. At this time gold prospecting was being feverishly undertaken all over South Africa as a result of the discoveries at Barberton and on the Rand, and Lobengula was besieged for all sorts of concessions by both Portuguese and Boers, as well as by other adventurers from all parts of the world. If the country was to be secured for Britain immediate action was necessary. Sir Sidney Shipard, who had succeeded Rhodes as commissioner in BechuanaLand and who shared his views, kept up a friendly correspondence with Lord Lobengula. On the 11th of February 1887, Sir John S. Moffat was British resident. At the end of 1887 Sir Sidney urged the high commissioner, Lord Rosmead (then Sir Hercules Robinson), to allow him to conclude a treaty with Lobengula, but unavailingly, until Rhodes, by taking upon himself all pecuniary responsibility, succeeded in obtaining the required sanction. On the 11th of February 1888, Moffat and Lobengula signed an agreement, whereby the Matabele ruler agreed that he would refrain from entering into any correspondence or treaty with any foreign state or power without the previous knowledge and sanction of the British high commissioner for South Africa. Shortly after the conclusion of this treaty, several of the influential syndicates directed by Rhodes, in which Alfred Beit and C. D. Rudd were large holders, were sent, with the knowledge of the British government and the high commissioner, to negotiate with Lobengula, and on the 30th of October of the same year he concluded an arrangement with Messrs Rudd, Rochfort Maguire and F.R. Thomson, by which, in return for the payment of £100 a month, together with 1000 Martini-Henry rifles and 100,000 rounds of ammunition, he gave the syndicate complete control over all the metals and minerals in his kingdom, with power to exclude from his dominions “all persons seeking land, metals, minerals or mining rights therein,” in which action, if necessary, he promised to render them assistance. The position of the envoys was one of considerable danger, as Lobengula had around him many white advisers strongly antagonistic to

1See article “BechuanaLand” by Sir Henry Shipard in British Africa (London, 1899).
Rhodes's scheme. The arrival at Bulawayo of Dr. L. S. Jameson, who had previously attended Lobengula professionally, and who strongly supported Rudd and his companions, appears to have been the factor which decided Lobengula to sign the concession. This concession once obtained, Rhodes proceeded with rapidity to proseute his great enterprise. He extinguished the claims of earlier concessionaires by purchase (giving, for instance, £10,000 for the Baines and Swinburne grants), and united all interests in the British South Africa Company, with a share capital of £1,000,000.

Following the example of Sir George Goldie in West Africa and of Sir William Mackinnon in East Africa, Rhodes determined to apply to the British government for a charter for the newly formed company, whose original directors were, in addition to Rhodes and Beit, the duke of Abercorn, the duke of Fife, Lord Gifford, Albert (afterwards 4th earl) Grey and George Cavston. In applying for a charter (in April 1889) the founders of the company stated their objects to be the following: (1) To extend northwards the railway and telegraph systems in the direction of the Zambesi; (2) to encourage emigration and colonization; (3) to promote trade and commerce; (4) to develop and work minerals and other concessions under the management of one powerful organization, thereby obviating conflicts and complications between the various interests that had been acquired within these regions, and securing to the native chiefs and their subjects the rights reserved to them under the several concessions. In making this application the boundaries in which they proposed to work were purposely left somewhat vague. They were described to be the region of South Africa lying immediately north of British Bechuanaland, north and west of the South African Republic, and west of the Portuguese dominions on the east coast. The government, having ascertained the substantial nature of the company's resources and the composition of the proposed directorate, and also that they were prepared to begin immediately the development of the country, granted the charter, dated the 29th of October 1889. From this date onward the company was commonly known as "the Chartered Company."

A few points in the charter itself deserve to be noted. In the first place, it gave considerable extension to the terms of the original concessions by Lobengula. In short, it transformed the rights of working minerals and metals, and preventing others from doing so, into rights to working the regions in which the company's activity was to be employed. This right was the crown granted directly itself, not merely confirming a previous grant from another source. By Article X the company was empowered to make ordinances (to be approved by the secretary of state), and to establish and maintain a force of police. A strict supervision was provided for, to be exercised by the secretary of state over the relations between the company and the natives. The British government reserved to itself entire power to repeal the charter at any time that it did not consider the company was fulfilling its obligations or endangering duly to carry out the objects for which the charter was granted. The sphere of operations of the company was not strictly limited, but it was indicated the application of the charter; but by agreements concluded with Germany in 1900, with Portugal in 1891 and with the Congo State in 1894, the international boundaries were at length defined (see Africa, § 5). The agreements, while they took the British sphere north to Lake Tanganyika, disapproved Rhodes in that they prevented the realization of the scheme he had formed by the time the charter was granted, namely, for securing a continuous strip of British territory from the Cape to Egypt—a scheme which was but an enlargement of his original conception as formulated in 1878.

Much, however, had happened before the boundaries of the British sphere were fixed. While the railway from Cape Town was being continued northward as rapidly as possible, the determination was taken to occupy immediately part of the sphere assigned to the company, and Mashonaland was selected as not being in actual occupation by the Matabele but the home of more peaceful tribes. A pioneer force was sent up in June 1890 under Colonel Pennefather, consisting of five hundred mounted police and a few hundred pioneers. Accompanying this force as guide was the well-known traveller, F. C. Selous. The work of transport was attended with considerable difficulty, and roads had to be cut as the expedition advanced. Nevertheless, in a few months the expedition, without firing a shot, had reached the site of what is now the town of Salisbury, and had also established on the line of march small forts at Tuli, Victoria and Charter. Archibald Ross Colquhoun was chosen as the first administrator. He had not long been in office when, in May 1891, difficulties arose with the Portuguese on their north-west frontier, both parties claiming a tract of territory in which a Portuguese trading station had been established. The result was a skirmish, in which a small company of British South Africa police were victorious. In 1891 Dr. Jameson, who had joined the pioneer force, was appointed administrator in succession to Colquhoun. The Boers for several years had been planning a settlement north of the Limpopo, and they now determined, in spite of the Moffat treaty and the British occupation, to carry out their object. An expedition known as the Banyasild Chinese Company was organized under the leadership of Colonel Ferreira, and two large parties of Boers proceeded to the banks of the Limpopo. Information of the intended trek had been conveyed to Cape Town, and Sir Henry (afterwards Lord) Loch (the high commissioner) at once sent a strong protest to-President Kruger, informing him that any attempt to invade the Chartered Company's territories would be an act of hostility against the British Crown; and Kruger issued a proclamation forbidding the trekkers to proceed. Meanwhile, however, a party had already reached the Limpopo, where they were met by Jameson in command of the British South Africa Company's forces. He told them that they would not be allowed to proceed except as private individuals, who might obtain farms on application to the Chartered Company. Colonel Ferreira was arrested and detained for a few days, and the expedition then broke up and dispersed.

The pioneers, who were granted farms and mining claims, having been settled in Mashonaland, Rhodes recognized the extreme importance of giving the country a port nearer than that provided by Cape Town. On his initiative proposals were made to Portugal, in the summer of 1891, and on the result of a mission sent to Portugal by Great Britain and Portugal provided that a railway might be built from Beira in Portuguese territory to Salisbury, on condition that Portugal received a duty not exceeding 3% on the value of the goods imported. The treaty further stipulated for the free navigation of the Zambezi and the construction of telegraphs. Prospecting operations were at once started, and various gold mines were discovered containing traces of old workings. Fresh gold reefs were also opened up. The prospects of the country seemed promising, and although a good deal of fever occurred in the low-lying valleys under the conditions of camp life, the health of the community soon improved as the Matabele habitations were deserted. By 1893 the year a white population of 3000 people had settled in the newly opened country.

Though the company was now free from international rivalry it was soon faced by serious native trouble. The first pioneers had deliberately chosen Mashonaland as their place of settlement. Ever since the advent of Missilutzake north of the Limpopo the unfortunate Mashonas had been the prey of the Matabele; they therefore readily accepted the British occupation. The Matabele, however, were loth to abandon their predatory excursions among the Mashonas, and in July 1893 a large impi (native force) was sent into Mashonaland, and only managed to cross the river and enter the territory. But the year a large force of 5000 people had settled in the newly opened country.

RHODESIA

a proud and fearless race of warriors; the men of that generation had never come in conflict with Europeans, and had never been defeated in their conflicts with native foes. Jameson's forces were slender, and Rhodes, on being consulted, urged him by telegram to "Read Luke fourteen, thirty-one." On obtaining a Bible, Jameson read the words: "Or what king, going to make war against another king, sitteth not down first, and consulteth whether he be able with ten thousand to meet him that cometh against him with twenty thousand?" He telegraphed in reply: "All right. I have read Luke fourteen, thirty-one." The position, though dangerous, admitted of no delay, and Jameson determined to risk an expedition with the forces at his command. His success on this occasion notably weakened German ambitions. In the one and less fortunate one. The force available consisted of about 700 volunteers and 225 British Bechuanaandal police, with some 700 natives. Jameson determined to march to Bulawayo, the headquarters of Lobengula and the capital of Matabeleland. The force was divided into two columns, and was to be met by a further column of Bechuana marching from the south under Khama, the most influential of the Bechuana and a loyal friend of the British. The first engagement took place on the Shangani river, where the two columns which had started from Fort Charter and Fort Victoria were both engaged. Majors Forbes and Allan Wilson commanded both these engagements; and after a hot contest with between 4000 and 5000 Matabele, the latter were repulsed, machine guns being used with terrible effect upon the enemy. On the 1st of November a second fight occurred on the high ground, in which it was estimated that 7000 of the Matabele attacked the larger of the two columns. The oldest and most tried regiments of Lobengula dashed right up to the muzzles of the guns, but were swept down before the modern rifles and machine guns with which the invaders were armed. Meanwhile the column of Khama's men from the south had reached the Tati, and won a victory on the Singuezi river on the 2nd of November. On the 3rd of November, Lobengula was rattled, and the columns from Mashonaland, accompanied by Jameson and Sir John Willoughby, entered the town, Lobengula, and his followers being in full flight towards the Zambezi. An endeavour was made to induce Lobengula to surrender; but as no replies were received to the messages, Major Forbes, on the 13th of November, organized a column and started in pursuit. The pursuing party were delayed by difficult roads and heavy rains, and did not come up with Lobengula until the 3rd of December. Major Allan Wilson, in command of thirty-four troops, crossed the Shangani river in advance, and bivouacked close to Lobengula. In the meantime the laager was raised, and a hot contest made open to white settlers. Close to the site of Lobengula's kraal the new town of Bulawayo was founded, and rapidly grew in importance. Among the new settlers were many Dutch farmers. The Roman-Dutch law was chosen as that of the new colony, a land commission was established and commissioners appointed to look after the interests of the natives.

Considerable development in the part of the company's territory north of the Zambezi had meantime taken place. Between 1889 and 1891 a large number of tribes in the region between lakes Nyasa and Tanganyika and the Zambezi had entered into treaty relations with the company, and a settlement named Abercorn had been founded at the south end of Tanganyika. This work was undertaken by the company's small German action, as before the signature of the agreement of July 1890 German agents entertained the design of penetrating west of Lake Nyasa to the Congo State frontier. The company further acquired the property of the African Lakes Company— which had done much to secure British predominance in the Nyasa region—and on the organization of Nyasaland as an imperial protectorate the South Africa Company contributed £10,000 a year for three years (1891-92-93) towards the cost of the administration, the imperial commissioner during this period acting as administrator for the adjacent territories belonging to the company (see British Central Africa). Farther west, Lewanika, the king of the Barotse, signed, on the 27th of June 1890, a treaty placing his country under the protection of the Chartered Company, which, while obtaining all mineral rights, undertook not to interfere in the internal administration of Barotseland. In securing a position thus early in Barotseland, Rhodes' aim was to prevent the farther extension eastward of the Portuguese province of Angola. The subsequent development of Barotseland had little direct connexion with the events in other parts of Rhodesia (see Barotse and Lewanika). The growth of territory and the outbreak on Matabeleland led to a great increase of expenditure, and the capital of the company was raised to £4,000,000 in November 1893, and to £5,500,000 in July 1895.

In every step taken by the company the guiding hand was that of Cecil Rhodes, a fact which received recognition when, by a proclamation of the 3rd of May 1895, the company's territory received officially the name of "Rhodesia." During this year there was great activity in exploiting Matabeleland. "Stands" or plots were sold at extraordinary prices in Bulawayo; 530 fetched a total of £153,312, about £282 a stand. In within nine months Bulawayo had a population of 1900 whites, and in the various goldfields there were over 2000 Tanganyikan workers. The construction of railway telegraphs proceeded with rapidity and by the end of 1895, 530 m. of new lines had been constructed, making about 1500 in all. A new company, the African Transcontinental Company, had been founded under the auspices of Rhodes, with the ultimate purpose of connecting the Cape with Cairo. By the end of 1895, 133 m. of these lines had been laid. At this time too, the railway from Cape Town had passed Mafeking and was approaching the Rhodesian frontier, while on the east coast the line to connect Salisbury with Beira was under construction.

In November 1895 the crown colony of British Bechuanaaland was annexed to Cape Colony, and the Chartered Company desired to take over the administration of the Bechuanaaland protectorate, which stretched between the newly annexed portion of Cape Colony and Matabeleland, and through which the railway to Bulawayo had to pass. The British government consented, and arrangements were made for the transfer. The company's police were moved down to a camp in the protectorate at Potlogi. It was from this place that on the 29th of December Jameson crossed the Transvaal border and marched on Johannesburg, in his disastrous attempt to upset President Kruger's administration. The "Jameson Raid" put an end to the proposed transfer of the protectorate to the Chartered Company, and caused a serious crisis in its affairs. Rhodes resigned his position as managing director, and Alfred Beit...

retired from the directorate in London. Jameson was, on the 9th of January 1896, officially removed from his office of administrator of the company's territories, and was succeeded by Earl Grey. Just at this time rinderpest made its appearance in southern Rhodesia, carrying off large herds of cattle, and this was followed in March 1896 by a revolt of the Matabele, while in June the Mashona also rebelled. The occasion, but not the cause, of the Matabele rising was the withdrawal of the greater part of the company's force to take part in the Jameson Raid. The Matabele had various grievances, chiefly that after the war of 1893 they were treated as a conquered people. All able-bodied young men were required to work for the white farmers and miners in a certain number per annum at a fixed rate of pay—a most irksome regulation, enforced, on occasions, by the native police in a tyrannical fashion. Another grievance was the seizure by the company, after the death of Lobengula, of the cattle of the Matabele— their chief source of wealth. Not only was there a first confiscation after the war, but subsequently there was a periodical taking away of cattle in small numbers—the company acting under the belief that nearly all the cattle in Matabeleland belonged to the king and were therefore lawfully theirs. However, before the end of 1895 the company had settled the question in agreement with the indunas, two-fifths of the cattle paid to the company and the remainder to become the absolute property of the natives. But it was neither the action of the company in the confiscation of cattle, nor the labour regulations, that induced the mass of the people to rebel; they were induced to act by chiefs who chafed under their loss of power and position and imagined themselves strong enough to throw off the yoke of the conquerors. In the manner customary among savages the Matabele began hostilities by the murder of defenceless white settlers—men, women and children. Bulawayo was threatened, and soon all the country south of the Zambezi was in a state of rebellion. Imperial troops under Sir Frederick Carrington were hurried up to the assistance of such police as the British South Africa Company still had at its command. Volunteers were enrolled, and much fierce fighting followed. Rhodes hastened to Bulawayo, and after conferences with the military and other authorities he determined to go, with Dr Hans Sauer and Mr J. Colenbrander, a well-known hunter and pioneer intimately acquainted with the natives, and interview the chiefs. They went (September 1896) unarmcd into the heart of the Matoppo Hills, and there arranged terms of peace with the indunas. The interview involved grave danger to the emissaries, and depended for its success entirely upon Rhodes's personality and influence over the native races, but it terminated what promised to be a long and disastrous native war. The Matabele, whose legitimate grievances were acknowledged and met, ceased the war after the indaba with Rhodes; the Mashona revolt continued, and was not finally crushed until October 1897, though all danger to settlers was over six months previously. At this time the rinderpest had carried off nearly all the cattle in the country—a disaster which, together with the destruction of grain during the war, had brought the natives almost to starvation—and steps had to be taken to supply their needs. Many of the white settlers too were reduced to sore straits and required assistance. The rebellions had cost the company fully £2,000,000, and to meet the debt incurred an additional capital of £1,500,000 was raised in 1898. At the meeting of the company in April 1898, at which this step was taken, Rhodes was re-elected a director.

The events of 1896—the Jameson Raid and the rebellions—caused the imperial government to remodel the constitution of Rhodesia. The armed forces of the company had already been placed under the direct control of the crown, and on the 20th of October 1898 an order in council was passed providing for the future regulation of the country. An imperial resident commissioner was appointed, who was also to be ex officio a member of the executive and legislative councils; and there was to be a legislative council, consisting of five nominated and four elected members. The first meeting of the newly appointed council took place at Salisbury on the 12th of May 1899. Other changes, in the direction of giving more power to the non-official element, were made subsequently (see above, Administration).

While these political changes were being made the company and the settlers set to work to repair the losses by war and plague. In particular the policy of railway development was pushed forward, and in November 1897 the line from Cape Town reached Bulawayo. The Mashonaland railway connecting Salisbury with Beira was completed in May 1899. In the same year gold-mining on a considerable scale began, the output for the year being over 65,000 oz. In the early part of 1899 Rhodes visited London and Berlin in furtherance of his schemes for the transcontinental telegraph extension from Cape Town to Cairo, and the transcontinental railway. He endeavoured to obtain from the British Government the guarantee of a loan for extending the railway, to be raised at 3% but was unsuccessful. He received, however, the support of various companies in Rhodesia, who amongst them subscribed £252,800 at 3% for the immediate extension of the railway for 150 miles; and in May he stated, at a meeting of the Chartered Company, that the Rhodes Railways Limited would raise another £5,000,000 at 4%, to be guaranteed by the Chartered Company. In this way he hoped that the remaining 1050 miles of railway from Bulawayo to the frontier of German East Africa might be constructed. In Berlin, Rhodes had an interview with the German Emperor, when arrangements were arrived at for the passage of telegraph lines over German territory, and also in certain contingencies for the continuation of the transcontinental railway through German East Africa.

In many respects the country recovered rapidly from the disasters of 1896, one of the most important measures taken being the compulsory inoculation for rinderpest, which finally stamped out the disease in 1899. By the last balance-sheet issued by the company previous to the outbreak of the Boer War it would appear that the revenue of Rhodesia for the year ending the 31st of March 1898 amounted to £260,516 net, of which amount the sale of land plots accounts for £63,628; stamps and licences, £69,658; and posts and telegraphs, £46,745; so that the machinery of civilized life was already in full activity where eight years previously the only white inhabitants had been a few missionaries, hunters and traders. The government buildings were estimated in March 1898 to be worth £65,672, and the assessed value of the town property at Bulawayo was £2,049,000, and that at Salisbury £1,259,000. (Both these towns had been granted municipal government in 1897.) Education was arranged under the supervision of government inspectors, and various religious communities were also engaged in educational work. The country appeared indeed in 1899 to be starting on the road to industrial and agricultural prosperity, but an almost complete stop to progress resulted from the outbreak of the Boer War in October of that year. The company could point with satisfaction to the fact that Rhodesia contributed nearly 1500 men to the forces serving in the war, 12½% of the European population. Rhodesia itself was not subjected to invasion, but the withdrawal of so large a number of able-bodied men seriously interfered with the development of the country, the war not ending until June 1902. Throughout this period the natives, with few exceptions, remained peaceful and gave the administration no serious trouble.

Before the war ended, Cecil Rhodes, whose chief work during the period since the Raid had been the building up of the country which bore his name, was dead (26th of March 1902). Alfred Beit, who had in 1898 refused to rejoin the directorate, now consented (June 1902) to return to the board of the Chartered Company, on which he remained until his death in July 1906. The loss of Rhodes's guiding mind and inspiring personality was, however, manifest, and among the Rhodesians there arose
RHODIUM 

268

a feeling of discontent at the company's conduct of affairs. The company was willing on proper terms to hand over the administration to the colonists, and they secured the services of Sir George Goldie to examine the situation and report on what terms the transfer could be made. Sir George visited Rhodesia in 1903-4, and drew up a scheme which included the taking over by Rhodesia of the administrative liabilities incurred by the company, which would thus become a public debt. After consultation between leading Rhodesians and the directors of the company the scheme was abandoned, the Rhodesians considering the financial burden proposed too great for an infant colony. The company therefore continued the administration, devoting attention to the development of agriculture and mining. The two railway systems were linked together by a line from Bulawayo to Salisbury, and several short lines to mining properties were built. From Bulawayo the main line was continued to the Wankie coalfields, thence to the Zambezi, bridged in 1905 just below the Victoria Falls. From the Zambezi the line went north-east, so as to render accessible the mineral wealth of Barotseland and that of Katanga on the Rhodesian-Congo frontier. Although Rhodesia was affected by the commercial depression which prevailed in South Africa for some years after the close of the war, its industries showed considerable vitality. In 1906 the gold output exceeded 500,000 oz., and in the financial year 1905-6 the revenue of Southern Rhodesia slightly exceeded the expenditure.

Only once (1895-96) in the first fifteen years following the settlement of the country had the company's annual revenue exceeded the amount expended in the same period. As a commercial undertaking, the company therefore was during this period of no pecuniary advantage to the shareholders. This was due in part to unforeseen and unavoidable causes, but it is also true that the founders of the company had other than commercial aims. Rhodes's chief ambition was to secure the country for Britain and to open it up to the energies of her peoples, and he succeeded in this aim. He acted more quickly, and in many ways more effectively, than the imperial government would have been able to act had it at the outset taken over the country. To the sturdy colonists Rhodes made available a land rich not only in gold, but in coal and other minerals, and with very great agricultural and pastoral resources, and who were determined to govern themselves as near as the imperial exchequer. Despite all drawbacks, an area (reckoning Southern Rhodesia only) considerably larger than that of the United Kingdom had in less than twenty years been endowed with all the adjuncts of civilization and made the home of thousands of settlers.

The progress made by the country in the five years 1906-10 demonstrated that the faith Rhodes and his colleagues had placed in it was not ill-founded. Although the white population increased but slowly, in all other respects healthy development took place, the element of speculation which had characterized many of the first attempts to exploit the lands being largely eliminated. In 1907 Lord Selborne (the high commissioner) visited Rhodesia. He inquired into the various grievances of the settlers against the Chartered Company; held an indaba with Matabele indunas in the Matoppos Hills, and at Bulawayo had a conference with Lewanika, the paramount chief of the Barotses. In 1907 Dr Jameson and other directors of the Chartered Company travelled through Rhodesia, and the result was to clear up some of the matters in dispute between the settlers and the company. Southern Rhodesia had become self-supporting, and the essentially temporary nature of the existing system of government was recognized. But the company held that the time was now ripe for Southern Rhodesia to become a self-governing colony. The directors, however, adopted a more liberal land policy, the increased attention given to agriculture being a marked and satisfactory feature of the situation. Mining and railway development were also pushed on vigorously.

The movement for the closer union of the British-South African colonies excited lively interest in Southern Rhodesia. The territory, not possessing self-government, could not take part in the national convention which met at Durban in October 1906 on equal terms with the delegates of the Cape, &c. It was, however, represented by three delegates on the understanding that Rhodesia would not, for the time being at least, be included in any agreement which might be reached. The union as finally established (October 30, 1910) was subject to a new section of the Union Act, and the two provinces of the Union, the High Court of another government of the Cape, Transvaal, Natal and Orange River colonies. The position of Rhodesia with respect to the Union was set forth in the South Africa Act 1909. It provides that "the king, with the advice of the Privy Council, may on addresses from the Houses of Parliament of the Union admit into the Union the territories administered by the British South Africa Company on such terms and conditions as to representation and otherwise in each case as are expressed in the addresses and approved by the king."

In Rhodesia itself at this time there was a widespread feeling that there was an urgency as to the territory joining the Union, and the opinion was held by many that a separate existence as a self-governing community would be preferable. A section of the settlers were content for the present to remain under the government of the Chartered Company.

RHODIUM [symbol Rh; atomic weight 102-9 (0=16)], in chemistry, a metallic chemical element found, associated with the other elements of the platinum group, in crude platinum ore, wherein it was discovered in 1803 by W. H. Wollaston (Phil. Trans., 1804, p. 419). It may be obtained from the residues of platinum ore after treatment with aqua regia and by electrolysis of the solution. Other liquors are decomposed by treatment with metallic iron, the precipitate obtained being warmed with concentrated nitric acid and heated in an iron crucible with concentrated caustic potash. The residue thus obtained is mixed with salt and

1 Unless otherwise stated, the place of publication is London.
heated in a current of chlorine, any iodine present being converted into its chloride by treatment with nitric acid and precipitated by ammonium chloride, whilst rhodium ammonium chloride goes into solution with its characteristic rose-red colour (C. E. Claus, Jour. prakt. Chem., 1843–1845). For other methods of extraction see Gibbs, ib., 1851, 84, p. 65; 1865, 94, p. 10; T. Wilm, Bull. soc. chim., 1880 (4), 34, p. 679; E. Frémy, Comptes rendus, 1854, 38, p. 1068, &c.). It is somewhat resemble aluminium in colour; its specific gravity varies 11 to 12; and its specific heat is 0.95527 (V. H. Regnault, Ann. chim. phys., 1851, 63, p. 15). It is less fusible than platinum. It oxidizes superficially when heated, and may be distilled in the electric furnace. It is insoluble in acids, but forms a soluble sulphate when fused with potassium bisulphate (a reaction which distinguishes it from the other metals of the platinum group). It oxidizes when fused with potassium hydroxide and potassium carbonate, to potassium chlorate and potassium oxide. It absorbs oxygen by boiling. Rhodium black is obtained by reducing rhodium salts with formic acid; by alcohol in the presence of alkali; or by precipitation with zinc and iron. A colloidal rhodium may be prepared by reducing the sesquischiorhodochloride with hydrozine hydrate. Rhodium salts may be recognized by their characteristic reaction with freshly prepared sodium hypochlorite solution. A yellow precipitate is obtained, which on shaking for some time with acetic acid gradually dissolves into an orange-coloured solution. This solution after a short time deposits a grey precipitate, and the supernatant liquid becomes azure blue in colour (E. Demargay, Comptes rendus, 1885, 101, p. 951).

Several oxides of rhodium are known. The monoxide, RhO, formed when the hydrated sesquischiorhodochloride is heated (Clauss, loc. cit.), is a finely divided rhodium is heated in a current of air (Wilm), is a grey powder which is insoluble in acids. The sesquischiorhodochloride, RhO₂, is a black insoluble powder, formed when the corresponding hydrate is heated. An oxide, RhO₂₂, is obtained as a yellow powder, by decomposing rhodium salts (not the sulphate) with dilute solutions of the caustic alkalies. It is soluble in acids, and in the moist condition is also soluble in concentrated alkalis. A hydrated rhodium dioxide, RhO₂₂₂HO, is formed when chlorine is passed into a solution of the sesquischiorhodochloride in concentrated caustic potash, or by adding an alkaline hypochlorite to a concentrated alkaline solution of rhodium and sodium chlorides. It is a greenish-black powder, insoluble in most acids, but dissolves in solutions of potassium cyanide. The hydrated form Rh₂Cl₆₂H₂O is obtained by heating the hydrated sesquischiorhodochloride in hydrochloric acid, by the action of hydrofluoric acid on potassium rhodium chlorite, and by the action of chlorine on rhodium in the presence of sodium chloride. In the last method the product is dissolved in a dilute hydrochloric acid (1:1), and the solution saturated with hydrochloric acid gas at 0°C, allowed to stand for some time, and then evaporated to dryness in a current of dry, vacuous air (Boulebauche, Ann. chem., 1876, 16, p. 579). It is a dark-coloured powder which is insoluble in acids and other solvents. It loses all its sulphur when heated in air. The sesquischiorhodochloride, Rh₂S₃, is prepared by heating to a red heat rhodium chlorite, RhCl₃, in a current of sulphurised hydrogen at 350°C, or by passing the gas into a boiling solution of the chloride. It is a black powder which is insoluble in acids and in alkaline sulphides. It decomposes with very little evolution of gas by heating with hydrochloric acid, by oxidizing the sulphide, by fusing the metal with acid potassium sulphate, or by the action of concentrated sulphuric acid on an alloy of rhodium and lead, or on the hydrated sesquischiorhodochloride. It is a red powder which decomposes when heated or when boiled with much water. It forms alums (Leidé, Comptes rendus, 1888, 107, p. 234). Rhodium potassium alum, Rh₃(SO₄)₂·K₂SO₄·2H₂O, is obtained by dissolving the sesquischiorhodochloride in sulphuric acid and adding a solution of potassium alum. The weight of the precipitate is calculated amount to the weight of rhodium in the solution (A. Piccin and L. Marino, Zeit. anorg. Chem., 1901, 27, p. 62). It crystallizes in cubes. Rhodium cyanide, Rh₃(CN)₁₈, is a carmine-red precipitate formed when the sesquischiorhodochloride is boiled with acetic acid. Rhodium potassium cyanide, KrH₂(CN)₉₃, is formed when the sesquischiorhodochloride is dissolved in caustic potash and an excess of hydrocyanic acid added gradually, the solution then evaporated to dryness. It is a colourless, crystalline solid soluble in water, and isomorphous with the corresponding iron, cobalt, chromium and manganese compounds. The rhodium ammonia salts correspond almost with the similar cobalt compounds and may be divided into three series, readily, hexamine salts (luto-salts), [Rh(NH₃)₆]X₂; aquopentamine salts (roseo-salts), [Rh(NH₃)₅]X₂; and pentammine salts (purpureo-salts), [Rh(NH₃)₄X₂]. (See S. F. Jorgensen, C. W. Blomstrand, Jour. prakt. Chem., 1887, loc. cit, sec. 269.

The atomic weight of rhodium has been determined by S. F. Jorgensen (Jour. prakt. Chem., 1883, 27, p. 486), by the analysis of rhodium chloroformic chloride, the mean value obtained being 103; whilst K. Seurbert and K. Kobbé (Ann., 1890, 260, p. 314), by analysis of the double chloride and sulphate, obtained as a mean value 102.85.

RHODOCHROSITE, a mineral species consisting of manganese carbonate, MnCO₃, crystallizing in the rhombohedral system and isomorphous with calcite. It usually occurs as cleavable, compact or botryoidal masses, distinct crystals being somewhat rare; these often have the form of the primitive rhombohedral, parallel to the faces of which there are perfect cleavages. When pure, the mineral contains 47.7% of manganese, but this is usually partly replaced by varying amounts of iron, and sometimes by calcium, magnesium, zinc, or rarely cobalt (cobalt-manganese-spar). With these variations in chemical composition the specific gravity varies from 3.45 to 3.60; the hardness is 4. The colour is usually rose-red, but may sometimes be grey to brown. The name rhodochrosite, from the Greek ριθος xρος: (rose-coloured), has reference to the characteristic colour of the mineral: manganese-spar and dialogite are synonyms. It is found in mineral veins with ores of silver, lead, copper, &c., or in deposits of manganese ore. Crystals have been met with in the mines at Kapnik-Banya and Nagyad near Deva in Transylvania and at Diez in Nassau, but by far the best specimens are from Colorado. The mineral is used to a limited extent in the manufacture of spiegelien and ferromanganese.

RHODODENDRON. Classical writers, such as Dioscorides and Pliny, seem, from what can be ascertained, to have known the oleander (Nerium oleander), but the modern name is applied to a large genus of shrubs and trees belonging to the order of heaths (Ericaceae). No adequate distinction can be drawn between this genus and Azalea (q.v.)—the proposed marks of distinction, however applicable in particular cases, breaking down when tested more generally. The rhododendrons are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually complete, the calyx being more or less reduced. The foliage of the different species is so much so much so much so similar to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, ripening into a long woody pod which splits from top to bottom by a number of valves, which break away from the central placenta and liberate a large number of small bram-like seeds provided with a membranous wing-like appendage at each end. The species are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay Archipelago and New Guinea, but not hitherto found in South America and Australia. None are native of Britain. Rhododendron (Suum) is a large genus the species of which are being pungent with minute leaves and tiny blossoms, while some of the Himalayan species are moderate-sized trees with superb flowers. Some are
epiphytal, growing on the branches of other trees, but not deriving their sustenance from them. The varieties grown in gardens are mostly grafted on the Pontic species (R. ponticum) and the Virginian R. catawbiense. The common Pontic variety is excellent for game-covert, from its hardness, the shelter it affords, and the fact that hares and rabbits rarely eat it. The writer has been associated in hybridizing the species first named, or their derivatives, with some of the more gorgeously coloured Himalayan-American varieties. In many instances this has been done without sacrifice of hardihood.

Some of the finest hybrids for the open air, especially in favoured spots, are altaderense (scarlet); Harrisii (rosy crimson); Keewensee (rose); Laveenium (crimson); Laveenlight (white); nobleanum (crimson), one of the first to flower after Christmas; pajsbergi (rose-purple); and Shilseni (crimson). There are almost countless colour variations of these, but one of the most exquisite of late years is that known as Pink Pearl, with large clear rose-pink blossoms of great purity. What are termed greenhouse rhododendrons are derivatives from certain Malayan and Javanese species, and are consequently much more tender. They are characterized by the possession of a cylindrical (not funnel-shaped) flower-tube and other marks of distinction. The foliage of rhododendrons contains much tannin, and has been used medicinally. Whether the honey mentioned by Xenophon as poisonous was really derived from plants of this genus as an ancient question. Cultivation—The hardy evergreen kinds are readily propagated by seed, by layers, and by grafting. Grafting is resorted to only for the propagation of the rarer and more tender kinds. Loamy soil containing a large quantity of peat or vegetable humus is essential, the roots of all the species investigated being associated with a fungus partner (mycorrhiza). An excess of lime or chalk in the soil proves fatal to rhododendrons and their allies sooner or later—a fact overlooked by many amateurs. The hardy deciduous kinds are valuable for forcing, and withstand cold-storage treatment well. The tender Malayan and Javanese species thrive in warm greenhouse temperature, but are difficult to cultivate where the water is very alkaline.

RHODONITE, a member of the pyroxene group of minerals, consisting of manganese metasilicate, MnSiO₃, and crystallizing in the anorthic system. It commonly occurs as cleavable to compact masses with a rose-red colour; hence the name, from the Greek pivos (a rose). Crystals often have a thick tabular habit; there are perfect cleavages parallel to the prism faces with an angle of 87° 31'. The hardness is 5-6, and the specific gravity 3.4-3.68. The manganese is often partly replaced by iron and calcium, which may sometimes be present in considerable amount; a variety containing as much as 20% of calcium oxide is called "bustamite"; "fowlerite" is a zinciferous variety containing 7% of zinc oxide. Rhodonite is a mineral liable to alteration, with the formation of manganese carbonate, hydrous silicate or oxides. The compact material, which is cut and polished for ornamental purposes, is often marked in a striking manner by veins and patches of these black alteration products. At Syedelnikova, near Ekaterinburg in the Urals, compact material of a good colour occurs in a clay-slate and is extensively quarried: boulders of similar material found at Cummings in Massachusetts ("cummingstonite") have also been worked as an ornamental stone. In the iron and manganese mines at Pajseg near Filipstad and Längban in Värmland, Sweden, small brilliant and translucent crystals ("pajsegkerite") and cleavage masses occur. Fowlerite occurs as large, rough crystals, somewhat resembling pink felspar, with franklinite and zines ores in granular limestone at Franklin Furnace in New Jersey.

RHOEUS, a Samian sculptor of the 6th century B.C. He and his son Theodorus were especially noted for their work in bronze. Herodotus says that Rhoeus built the temple of Hera at Samos. In the temple of Artemis at Ephesus was a marble figure of night by Rhoeus. His name has been found on a fragment of a vase which he dedicated to Aphrodite at Ne克拉图斯。His son Theodorus and Telecles made a statue of the Pythian Apollo for the Samians.

RHONDDA (formerly YSTRADFODYDD), an urban district and parliamentary division of Glamorganshire, South Wales. It is 12 m. long by 42 m. across at its widest part, and comprises two main valleys, named after their respective rivers, Rhondda Fawr (9½ m.) and Rhondda Fach, or the lesser (6½ m.), running S.E. and S.W. respectively till their junction at Porth, and thence the single valley for upwards of a mile farther down the boundary of the Pontypridd urban district at Trehafod.

The valleys are narrow and tortuous, and their lateral boundaries are formed by steep hills varying in height from about 500 ft. to 900 ft. The valley of Trehafod to the S.E. of the N.E. of Maedy in the lesser Rhondda and 1½ m. on the S.W. of Treherbert in the main valley, while the mountains at the upper end of the latter valley culminate in Carn Moesin (1950 ft.). The two valleys are separated by the steep ridge of Cefn-rhomdda, which ranges from 600 ft. high above Porth to 1690 ft. near the upper end of the district. There are a few tributary valleys of which Cwmparc, Clydach Vale and Cymmer are the chief. Though the urban district measures 23,884 acres, the area built upon is generally a narrow strip on either side of each river except at Trehony and Ton, where the valley of the Rhondda Fawr opens out a little. In 1879 the ancient parish of Ystradyfoddw (with the omission of the township of Rhigos, which lies beyond the mountains to the north) was formed into an urban district bearing the parish name, the area having previously been part of a rural district under the Pontypridd rural sanitary authority. In October 1879, portions of the parishes of Llanwonno and Llanlissant, comprising over 5000 acres, were added to the urban area, the whole being consolidated in 1884 into one civil parish. In 1897, the name of the urban district was changed into Rhondda. The Taff Vale railway runs up each of the two valleys from a junction at Porth (16 m. N.W. of Cardiff), and has five stations in the main valley and four in the lesser one. From the lower end of Pontypridd to Pontypridd stations, there is communication with Cardiff, Barry and Newport. The Rhondda and Swansea Bay railway (authorized in 1882, opened in 1890, and now worked by the Great Western) connects the upper end of the main valley, where it has a station, Blaen-rhondda, with Port Talbot, Neath and Swansea (31 m. distant) by means of a line which has a tunnel 3443 yds. long.

The district occupies almost the centre of the eastern division of the South Wales coal-field, and its coal, upon which the inhabitants are almost entirely dependent, is unsurpassed for its steam-raising properties. In common with other East Glamorgan coal it became commercially known as Cardiff coal and was at first its only export shipment. The development of the Rhondda coal-field was later in date than those of Aberdare and Merthyr, and it received its chief impetus from the American Civil War. Thus the population of the parish (excluding Rhigos), which was 527 in 1811, 951 in 1851 and 3035 in 1861, increased to 16,914 in 1871. When the boundaries of the district were extended in 1879 the population of the enlarged area was calculated by the registrar-general to be 23,950 in 1871, but it reached 55,652 in 1881, and 113,752 in 1901, showing an increase of 104%/ in the previous twenty years. In 1901, 35.4% of the population of three years of age and upwards spoke English only, 17.4% spoke Welsh only, the remaining being bilingual.

Ecclesiastically the parish of Ystradyfoddw was an ancient chapelry dependent on Llanrissant. The old parish church at Trecynon (in substitution for which a new church was built in 1893-94) served the whole parish till the middle of the 19th century. In 1851 and 1861 there were 1859 and 2176 persons (excluding Rhigos) was divided into seven ecclesiastical parishes, the six new ones being Llwyn-y-pia (1879), Tylorstown (1887), Ynys Hir (1887), Treherbert (1893), Cwmparc (1898) and Ferndale (1900). The additional area belonging to the urban district in 1879 comprises two other ecclesiastical parishes, Cymmer and Porth (1894), and Dinas and Penygraig (1901). These nine parishes, comprised in the urban district, have twenty churches and eighteen mission-rooms, with chapels. There are fire pumps for all the urban district. The roads are well metalled with gravel, and with Pontypridd, Glyntaff and Llanwonno, form the rural deanery of Rhondda in the archdeaconry and diocese of Llandaff. There were at the end of 1865 over one hundred and fifty nonconformist churches and chapels, and mission and other preaching places, with accommodation for about 1000 persons, of which provision nearly two-thirds was in chapels with Welsh services. There is a Roman Catholic church at Tonypandy. The public buildings include the council house and offices of the district council, erected in 1883-84 for the local board of the booksellers and workmen's institutes at Ystrad (1895), and Cymmer
RHONE

(1893), Maerdy (1905), Dinas (1893), and Ferndale public halls, the property of a private company at Treherbert (1872), and Tonypany (1891) and a county intermediate school at Pontypridd. By means of a tunnel about 2100 yds. long, water is obtained for the greater part of the main valley from the lake of Llyn Fawr on the North side of the mountain range which shuts in the valley on the north. This lake has been diminished to about 167 ft. above s.l., and has a gallon capacity. The rest of the district is supplied from the Pontypridd Water Company’s works above Maerdy in the lesser valley.

The ancient parish (excluding Rhigos) was formed into a parliamentary constituency with one member in 1885. The present urban district substantially corresponds to the ancient territorial limits of Glynde-rhonda, one of the four commotes of the cantred of Penychen, and subsequently, in Norman times, one of the twelve “members” of the lordship of Glamorgan. Its Welsh lords enjoyed a large measure of independence and had their own courts, in which Welsh law was administered down to 1535, when the lordship was fully incorporated in the county of Glamorgan. On the ridge of Cefn-rhonda between the two valleys was the Franciscan monastery of Penrhys, famous for its image of the Virgin and for its holy well which attracted large pilgrimages. It was dissolved about 1415, probably owing to its being used as a stronghold by Glyndwr in his rebellion. Edward II. came here from Neath Abbey and was captured on the 16th of November 1326, either at Penrhys, or between it and Llantrisant.

RHONE (Fr. Rhône, Lat. Rhodanus), one of the most important rivers in Europe, and the chief of those which flow directly into the Mediterranean. It rises at the upper or eastern extremity of the Swiss canton of the Valais, flows between the Bernese Alps (N.) and the Lepontine and Pennine Alps (S.) till it expands into the Lake of Geneva, winds round the southernmost spurs of the Jura range, reaches at Lyons its principal tributary, the Saône, and then turns southward through France till, by many mouths, it enters that part of the Mediterranean which is rightly called the Golfe du Lion (sometimes wrongly the Gulf of Lyons). Its total length from source to sea is 594½ m. (of which the Lake of Geneva claims 45 m.), while its total drainage area in 37,798 sq. m., of which 2772 sq. m. are in Switzerland (405 sq. m. of the Swiss portion being composed of glaciers), and its total fall 3808 ft. Its course (excluding the Lake of Geneva, q.v.) naturally falls into three divisions: (1) from its source to the Lake of Geneva, (2) from Geneva to Lyons, and (3) from Lyons to the Mediterranean.

1. From its source to the lake the Rhone is a purely Alpine river, flowing through the great trench which it has cut for itself between two of the loftiest Alpine ranges, and which (save a bit at its north-west end) forms the Canton of the Valais. Its length is 105¼ m., while its fall is 4670 ft. It issues as a torrent, at the height of 5900 ft., from the great Rhone glacier at the head of the Valais, the recent retreat of this glacier having proved that the river really flows from beneath it, and does not take its rise from the warm springs that are now at some distance from its shrunken snout. It is almost immediately joined on the left by the Mutt torrent, coming from a small glacier to the S.E., and then flows S.W. for a short distance past the well-known Gletsch Hotel (where the roads from the Grimsel and the Furka Passes unite). But about half a mile from the glacier the river turns S.E. and descends a long fast torrent to the more level valley, bending again S.W. before reaching the first village, Oberwald. It preserves this south-westerly direction till Martigny. The uppermost valley of the Rhone is named Goms (Fr. Conetsk), its chief village being Münster, while Fiesch, lower down, is well known to most Swiss travellers. As the river rolls on, it is swollen by mountain torrents, descending from the glaciers on either side of its bed—so by the Geren (left), near Oberwald, by the Eginen (left), near Urielen, by the Fiesch (right), at Fiesch, by the Binna (left), near Grenchiols, by the Massa (right), flowing from the great Aletsch glaciers, above Brieg. At Brieg the Rhone has descended 3678 ft. from its source, has flowed 30 m. in the open, and is already a consider- able stream when joined (left) by the Saltine, descending from the Simplon Pass. Its course below Brieg is less rapid than

before and lies through the alluvial deposits which it has brought down in the course of ages. The valley is wide and marshy, the river frequently overflowing its banks. Further mountain torrents (of greater volume than those higher up) fall into the Rhone as it rolls along in a south-westerly direction towards Martigny: the Visp (left), coming from the Zermatt valley, falls in at Visp, at Gampel the Lonza (right), from the Lötschen valley, at Leuk the Dala (right), from the Gemmi Pass, at Sierre the Navizen (left), from the Einfisc or Anniviers valley, at St. Sion, the capital of the Valais, the Borgne (left) from the Val d’Hérens; soon the Rhone is joined by the Morenas (right), flowing from the Sanetsch Pass, and the boundary in the middle ages between Episcopai Valais to the east and Savoyard Valais to the west, and at Martigny by the Dranse (left), its chief Alpine tributary, from the Great St Bernard and the Val de Bagnes. At Martigny, about 50 m. from Brieg, the river bends sharply to the N.W., and runs in that direction to the Lake of Geneva. It receives the Salanfe (left), which forms the celebrated waterfall of Fissevache, before reaching the ancient town and abbey of St Maurice (93 m.). Henceforward the right bank is in the canton of Vaud (conquered from Savoy in 1356), and the left bank in that of the Valais (conquered similarly in 1356), for St Maurice marks the boundary of the Lower Valais. Immediately below that town the Rhone rushes through a great natural gateway, a narrow and striking defile (now strongly fortified), which commands the entrance of the Valais. Beyond, the river enters the wide alluvial plain, formerly occupied by the south-eastern arm of the Lake of Geneva, but now marshy and requiring frequent “correction.” It receives at Bex the Avançon (right), flowing from the glaciers of the Diablerets range, at Monthey the Vièze (left), from Champéry and the Val d’Illiez, and at Aigle the Grande Eau (right), from the valley of Ormonts-dessus. It passes by the hamlet of Port Valais, once on the shore of the lake, before expanding into the Lake of Geneva, between Villeneuve (right) and St Gingolph (left). During all this portion of its course the Rhone is not navigable, but a railway line runs along it from Brieg in about 72 m. to either Villeneuve or Le Bouveret.

2. On issuing at Geneva from the lake the waters of the Rhone are very limpid and blue, as it has left all its impurities in the great settling vat of the lake, so that Byron might well speak of the “blue rushing of the arrowy Rhone” (Childe Harold, canto III. stanza 71.). But about half a mile below Geneva this limpidity is disturbed by the pouring in of the turbid torrent of the Arve (left), descending from the glaciers of the Mont Blanc range, the two currents for some distance running mingled. The distance from Geneva to Lyons by the tortuous course of the Rhone is about 124 m., the fall being only about 689 ft. The characteristic feature of this portion of the course of the Rhone is the number of narrow gorges or cluses through which it rushes, while it is forced by the southern spur of the Jura to run in a southerly direction, till, after rounding the base of that spur, it can flow freely westwards to Lyons. About 12 m. S. of Geneva the Rhone enters French territory, and henceforth till near Lyons forms first the eastern, then the southern boundary of the French department of the Ain, dividing it from those of Haute Savoie and Savoie (E.) and that of the Isère (S.). Soon after it becomes with the river Rhuses furiously through a deep gorge, being imprisoned on the north by the Crédon and on the south by the Yuache, while the great fortress of l’Ecluse guards this entrance into France. The railway pierces the Crédon by a tunnel. In the narrowest portion of this gorge, not far from Bellegarde at its lower end, there formerly existed the famous Perte du Rhône (described by Sausser in his Voyages dans les Alpes, chapter xvii.), where for a certain distance the river disappeared in a subterranean channel; but this natural phenomenon has been destroyed, partly by blasting, and partly by the diversion of the water for the use of the factories of Bellegarde. At Bellegarde the Rhone forms a great bend in its southerly direction, from which the great gorge had deflected it for a while. Some way below Bellegarde, between Le Parc and Pyrimont, the
Rhône becomes officially "navigable," though as far as Lyons the navigation now consists all but wholly of the floating of flat-bottomed boats, named rigues, laden chiefly with stone quarried from the banks of the river. Above Seyssel (11 m. from Bellegarde) the Usse (left) joins the Rhône, while just below that village the Fier (left) flows in from the Lake of Annecy. Below the junction of the Fier the hills sink on either side, the channel of the river widens, and one may say that it leaves the mountains for the plains. At Culox (414 m. by rail from Geneva) the railway from Geneva to Lyons (105 m.) quits the Rhône in order to run west by a direct route past Ambérieu. The Rhône continues to roll on southwards, but no longer (as no doubt it did in ancient days) enters the Lac du Bourget, of which it receives the waters through a canal, and then leaves it on the east in order to run along the foot of the last spur of the Jura. It flows past Yenne (left) and beneath the picturesque fortress (formerly a Carthusian monastery) of Pierre Châtel (right) before it attains the foot of the extreme southern spur of the Jura, at a height of 666 ft., not far from the village of Corden, and just where the Guiers flows in (left) from the mountains of the Grande Chartreuse. This is nearly the last of the cluses through which the river has to make its way. The very last is at the Pont du Saut or Saut, a little S. of Lagnieu. The river now widens, but the neighbouring country is much exposed to inundations. It receives (right) its most important tributary in this part of its course, the Ain, which descends from the French slope of the Jura and is navigable for about 60 m. above its junction with the Rhône. Farther down the Rhône meanders for a time with shifting channels in a bed about 2 m. broad, but it gathers into a single stream before its junction with the Saône, just below Lyons. The Saône (q.v.), which has received (left) the Doubs, is the real continuation of the Rhône, both from a geographical and a commercial point of view, and it is by means of canals branching off from the course of the Saône that the Rhône communicates with the basins of the Loire, the Seine, the Rhône and the Moselle. In fact, up to Lyons, the Rhône (save when it expands into the Lake of Geneva) is a huge and very unruly mountain torrent rather than a great European river.

3. Below Lyons, however, the Rhône becomes one of the great historical rivers of France. It was up its valley that first Greek, then Latin civilization penetrated from the Mediterranean to Lyons, as well as in the 10th century the Saracen bandits from their settlement at La Garde Freinet, near the coast of Provence. Then, too, from Lyons downwards, the Rhône serves as a great medium of commerce by which central France sends its products to the sea. Its length from Lyons to the sea is some 230 m., though its fall is but 530 ft. But during this half of its course it can boast of having on its left bank (the right bank is very poor in this respect) such historical cities as Vienne, Valence, Avignon, Tarascon and Arles, while it receives (left) the Isère, the Drôme and the Durance rivers, all formed by the union of many streams, and bringing down the waters that flow from the lofty snowy Dauphiné Alps. The Ardèche is the only considerable affluent from the right. Near Arles, about 25 m. from the sea, and by rail 1752 m. from Lyons, the river breaks up into its two main branches, the Grand Rhône running S.E. and the Petit Rhône S.W.; they enclose between them the huge delta of the Camargue, which is cultivated on the banks of the river only, but elsewhere is simply a great alluvial plain, deposited in the course of ages by the river, and now composed of scanty pasturages and of great salt marshes. Between Lyons and the sea, the Rhône divides into branches on its right bank (Rhône, Loire, Ardèche and Gard) from as many as its left bank (Isère, Drôme, Vaucluse and Bouches du Rhône).

RHÔNE, a department of south-eastern France, formed in 1793 from the eastern portion of the department of Rhône-et-Loire, and comprising the old districts of Beaujolais, Lyonnais, Franc-Lyonnais, Forez and a small portion of Dauphiné. Pop. (1906) 858,907. Area, 1104 sq. m. Rhône is bounded N. by the department of Saône-et-Loire, E. by Ain and Isère and S. and W. by Loire. The Saône and the Rhône form its natural boundary on the east. The department belongs almost entirely to the basin of the Rhône, to which it sends its waters by the Saône and its tributary the Auzergues, and by the Gier. The department (which is only slightly hilly) consists of a broad plain, with the watershed between the Rhône and the Loire, and from north to south form four successive groups—the Beaujolais Mountains, the highest peak of which is 3320 ft.; the Tarare group; the Lyonnais Mountains (nearly 3000 ft.); and Mont Filat, the highest peak of which belongs to the department of Loire. The lowest point of the department (466 ft. above sea-level) is at the egress of the Rhône. The meteorological conditions vary greatly with the elevation and exposure. Snow sometimes lies in the mountains from November to April, while at Lyons and in the valleys the mean temperature in winter is 36°F. and in summer 70°F., the annual mean being 55°F. The average rainfall is somewhat higher than is general over France owing to the amount of the precipitation on the hilly region.

Good agricultural land is found in the valleys of the Saône and Rhône, but for the most part the soil is stony and only moderately fertile. Wheat, oats, rye and potatoes are extensively cultivated, but their importance is less than that of the vine, the hills of the Beaujolais on the right bank of the Saône producing excellent wines. Fruit trees, such as peaches, apricots, walnuts and chestnuts, grow well, but the wood in general is little more than copse and brushwood. Good pasture is found in the valleys of the Auzergues and its affluents. Mines of iron-pyrites and coal and quaries of freestone are worked. The production of silk fabrics, the chief branch of manufacture, that of chemicals and machinery, together with most of the other industries of the department, are concentrated in Lyons (q.v.) and its vicinity. Tarare is a centre for the manufacture of muslin and embroidery. Oullins has large railway workshops belonging to the Paris-Lyon-Méditerranéenne railway, and there are important glass works at Givors. Cotton-spinning and weaving are carried on in several localities. The products of its manufactures, together with wine and brandy, form the bulk of the exports of the department; its imports comprise chiefly the raw material for its industries.

It is served by two railways, the Paris-Lyon railway, by which the Saône and in the extreme south the canal of Givors are its navigable waterways. Lyons the capital is the seat of an archbishop and of a court of appeal and centre of an educational division (académie). The department is divided amongst the districts of the VII., VIII., XII., XIII. and XIV. army corps. There are two arrondissements (Lyons and Villefranche) subdivided into 29 cantons and 269 communes. The principal places besides Lyons are Givors, Tarare and Villefranche, which receive separate treatment.

RHÔNEGEBIRGE, or DRE RöHN, a mountain-chain of central Germany, running in a north-easterly direction from the Bavarian province of Lower Franconia to the Prussian province of Hesse-Nassau and the grand duchy of Saxe-Weimar, and divided by the Werra from the Thuringian Forest on the N. The other sides are bounded by the Fulda on the W. and the Sinn and Frankish Saab on the E. and S. Its length is 50 m., breadth 5-7 m., and its mean elevation 1900 ft. This district is divided into three groups—the southern, the high (Hohe) and the nearer (Vordere) Röhn. Of these the southern, a continuation of the Spessart, consists largely of flat conical masses and reaches its highest point in the Heiliger Kreuzberg (1900 ft.). The Hohe Röhn, beginning immediately to the north-west of the High mountain, is a rough mountainous country, covered with fens and basalt peaks. It is a wild, dreary, inclement tract of country, covered with snow for six months in the year and visited by frequent fogs and storms. It is said of it that whoever desires to experience a northern winter can spare himself a journey to the North Cape or Siberia, and find it in its native Röhn. There is little vegetation, and the inhabitants eke out a scanty sustenance from the cultivation of potatoes.
RHOXOLANI—RHUBARB

and flux. The highest inhabited place is Frankenhausen, lying at a height of 2350 ft. with 6383 inhabitants (1900). The nearer (Vorderhe) Rhön, forming the northern side of the range, is more attractive, with forests and deep and fertile valleys.

See Lenk, Zur geologischen Kenntniss der südlichen Rhön (Würzburg, 1887); Scheidweiler, Die Rhön und ihre wirtschaftlichen Verhältnisse (Frankfort, 1887); and Daniel, Deutschland (5th ed., Leipzig, 1878).

RHOXOLANI, a Sarmatian tribe defeated in the Crimea by Diophantus, general of Mithradates, c. 100 B.C., and by the Romans on the lower Danube c. A.D. 60, and also under M. Aurelius. They seem to have finally succumbed to the Goths.

RHUBARB. This name is applied both to a drug and to a vegetable.

1. The drug has been used in medicine from very early times, being described in the Chinese herbal Pen-king, which is believed to date from 2700 B.C. The name seems to be a corruption of Rheum barbarum or Reu' barbaram, a designation applied to the drug as early as the middle of the 6th century, and apparently identical with the πηρον or παρα of Dioscorides, described by him as a root brought from beyond the Bosphorus. In the 14th century rhubarb appears to have found its way to Europe by way of the Indus and Persian Gulf to the Mediterranean, via the Red Sea and Alexandria, and was therefore described by “East Indies rhubarb” alone by way of Persia and the Caspian to Syria and Asia Minor, and reached Europe from the ports of Aleppo and Smyrna, and became known as “Turkey” rhubarb. Subsequently to the year 1653, when China first permitted Russia to trade on her frontiers, Chinese rhubarb reached Europe chiefly by way of Moscow; and in 1704 the rhubarb trade became a monopoly of the Russian government, in consequence of which the term “Russian” or “crown” rhubarb came to be applied to it. Uraga was the great depot for the rhubarb trade in 1719, but in 1728 the depot was transferred to Kiachtä. All rhubarb brought to the depot passed through the hands of the government monopolists, of whom there were in Russian times—rhubarb was invariably good and obtained a remarkably high price. This severe supervision naturally led, as soon as the northern Chinese ports were thrown open to European trade, to a new outlet being sought; and the increased demand for the drug at these ports resulted in less care being exercised by the Chinese in the collection and curing of the root, so that the rhubarb of good quality offered at Kiachtä rapidly dwindled in quantity, and after 1820 Russian rhubarb ceased to appear in European commerce. Owing to the expense of carrying the drug across the whole breadth of Asia, and the difficulty of preserving it from the attacks of insects, rhubarb was formerly exported at a cost so high that it was statements of price by the Chinese, in English price list bearing date of 1657 it is quoted at 16s. per lb, opium being at that time only 6s. and scambony 12s. per lb.

The dose of rhubarb is anything from 1/2 up to 30 grains, according to the action which is desired. The British Pharmacopoeia contains seven preparations, only one of which is of any importance. This is the Pulvis Rhemi Compositus, or Gregory's powder, which is composed of 2 parts of rhubarb, 6 of heavy or light magnesia and 1 of ginger. Digested in water and used in small doses 1/4 to 2 gr.—as an astringent tonic, since it stimulates all the functions of the upper part of the alimentary canal. In many cases of torpid dyspepsia it is very efficient when combined with the substantia bismuthi and the bicarbonate of soda. The more characteristic action of rhubarb, however, is purgation, which it causes in doses of 15 gr. and upwards. The action occurs within seven or eight hours, a soft, pulpy motion of a sentive character being produced to the chymotonic action of the liver. The drug is apt to cause colic, and should therefore never be given alone. The preparation of a powder is an unpleasant consequence of the aperient properties of rhubarb. The drug is peculiar in that the purgation is succeeded by definite constipation, said to be due to the rheotanic and the oxyuric constituents. It is obviously worse than useless in the treatment of chronic constipation, which it only aggravates. On the other hand, it is very valuable in children and others, where diarrhoea has been caused by an unsuitable diet. The drug removes the indigestible substances from the alimentary canal, the bowel contents being excreted somewhat in an indurated state. The drug is also useful in the weaning of infants, since it is partly excreted in the maternal milk, and gives it a bitter taste which the baby dislikes.

Sodium rhubarb is absorbed and is excreted in the urine, which it slightly increases and colours a reddish brown. The colour is discharged by the addition of a little dilute hydrochloric acid to the urine.

The botanical source of Chinese rhubarb cannot be said to have been as yet definitely cleared up by actual identification of plants observed to be used for the purpose. Rheum palmatum, R. officinale, R. palmatum, var. tanguticum, R. colomum and R. chischki, which are variously stated to be it, but the roots produced by these species under cultivation in Europe do not present the characteristic network of white veins exhibited by the berries mentioned of the Chinese drug.

Chemistry.—The most important constituent of this drug, giving it its purgative properties and its yellow colour, is chrysarobin, C₂₇H₂₄O₂, formerly known as rhein or chrysophan. The rhubarb of China is also rich in oxalic acid, a di-ozythymic acid, a anhydroquinone, C₇H₆(OH)(OH), of which chrysarobin is a reduction product. Nearly 40% of the drug consists of calcium oxalate, which gives it the characteristic grittiness. There is also present in the rhubarb a characteristic acid, the rhotannic acid, and numerous other constituents, such as emodin, C₂₇H₂₄O₆, mucilage, resins, rheumatic acid, C₃₀H₄₆O₂, aporphine, &c.

Production and Identification. The Chinese rhubarb is produced in the four northern provinces of China proper (Chih-li, Shantung, Shensi and Honan), in the north-west provinces of Kan-suh, formerly included in Shensi, but now extending across the desert of Gobi to the Volga, and thence to the Volga, Koko-nor, and the districts of Tungang, Sianf and Turfan, and in the mountains of the western provinces of Sze-chuan. Two of the most important centres of the trade are Sining-fu in the province of Shantung, and Kiachtä in Sze-chuan. From Shensi, Kan-suh and Sze-chuan the rhubarb is forwarded to Hankow, and thence carried to Shanghai, whence it is shipped to Europe. Lesser quantities are shipped from Tien-tsin, and occasionally the drug is reported from Foochow and other ports.

Very little is known concerning the mode of preparing the drug for the market. According to Mr. Bell, who on a journey from St Petersburg to Peking had the opportunity of observing the plant in a

European Rhubarb.—As 1608 Prosper Alpinus of Padua cultivated the true rhubarb a plant which is now known as Rheum raphanicum, a native of southern Siberia and the basin of the Volga. This plant was introduced into England through Sir Matthew Lister, physician to Charles I., who gave seed obtained by him in Italy to the botanist Parkinson. The culture of this rhubarb for the sake of the sake or the sake of the better root in Oxfordshire, by an apothecary named Hayward, the plant of powder being raised from seed sent from Russia in 1762, and with such success that the Society of Arts awarded him a silver medal in 1777. The first successful cultivation in England was that of the rhubarb in the gardens of the University of Oxford, in the form of powder, which is of a finely yellow colour than that of Chinese rhubarb. The Banbury rhubarb appears to be a hybrid between R. rhaponticum and R. undialium—the roots, which are distinguished by the typical microscopic structure of the former. More recently very

1 According to Mr F. Newcombe, Med. Press and Circ., Aug. 2, 1882, the Chinese esteem the Shen-se rhubarb as the best, that coming from Kanchow being the most inferior. This rhubarb has a roughly cut leaf, with an add to little flavour, and brings only about half the price; Chung-chi rhubarb is also greatly valued, while the Chi-chuang, Tai-huang and Shan-huang varieties are considered worthless.
RHYL—RHYME

good rhubarb has been grown at Banbury from Rheum officinale, but these two varieties are not equal in medicinal strength to the Chinese article, yielding less extra—Chinese rhubarb afford-
ing, 58%; English rhubarb 21%, and R. officinale 17%. In France the cultivation of rhubarb was commenced in the latter half of the 16th century—R. compactum, R. palmatum, R. officinale, and R. undulatum, being the essential cultivations. This cultivation has, however, now nearly ceased, small quantities only being prepared at Avignon and a few other

localities.

The culture of Rheum compactum was begun in Moravia in the beginning of the present century by Prikol, an apothecary in Austerlitz, and until about fifty years ago the root was largely exported to Lyons and Milan, where it was used for dying silk. As a medicinal plant it is regarded as one of the most valuable of Chinese rhubarb. Rhubarb root is also grown at Ausitz in Moravia and at Ñilitz, Kremsitiz and Frauenkirchen in Hungary; R. emodi is said to be

cultivated for the same purpose in Silesia.

Rhubarb is also prepared for use in medicine from wild species in the Himalayas and Java.

2. The rhubarb used as a vegetable consists of the leaf stalks of R. rhaponticum and its varieties, and R. undulatum. It is known in America as pie-plant. Plants are readily raised from seed, but strong plants can be obtained in a much shorter time by dividing the roots. Divisions or seedlings are planted about 3 ft. apart in ground which has been deeply trenched and manured, the crowns being kept slightly above the surface. Rhubarb grows freely under fruit-trees, but succeeds best in an open situation in rich, rather light soil. The stalks should not be pulled during the first season. If a top-dress-
ing of manure be given each winter a plantation will last good

for several years. Forced rhubarb is much esteemed in winter and early spring, and forms a remunerative crop. Forcing under glass or in a mushroom house is most satisfactory, but open-
ground forcing may be effected by placing pots or boxes over the roots and burying in a good depth of stable litter and leaves. Several other species, such as R. palmatum, R. officinale, R. nobile and others, are cultivated for their

fine foliage and handsome inflorescence, especially in wild

gardens, margins of shrubbery and similar places. They exceed in most soils, but prefer a rich soil of good depth. They are propagated by seeds or by division.

RHYL, a watering-place and urban district of Flint, N.

Wales, practically equidistant by rail from Bangor (263 m.) and Chester (250 m.), and 100 m. from London on the London & North-Western railway. Pop. (1901) 8473. It is situated near the mouth of the Clwyd. Formerly, like Llandudno, a small fishing village, the town has now all the appointments of a popular resort. In winter the gales often fill the streets to the depth of several feet, with drifts of sand from the sur-
rounding dunes, which, however, are noted in summer for the dry and bracing air. The neighbouring country is interest-
ing from its scenery and antiquities. Among the institu-
tions of the town may be mentioned the Queen Alexandra Hospital (1902), and several hydrophatic establishments and convalescent homes. The estuary harbours coasting vessels, and some shipbuilding is carried on. On the beach towards

Prestatyn can be seen the remains of a submerged forest.

RHYME, more correctly spelt RIME, from a Provencal word rim (its customary English spelling is due to a confusion with rythm), a literary ornament or device consisting of an identity of sound in the terminal syllables of two or more words. In the art of versification it signifies the repetition of a sound at the end of two or more lines in a single composition. This artifice was practically unknown to the ancients, and, when it occurs, or seems to occur, in the works of classic Greek and Latin poets, it must be considered to be an accident, the natural tendency of the writer of verse unconsciously to repeat a sound, however, is shown by the fact that there have been discovered nearly one thousand lines in the writings of Virgil where the final syllable rhymes with a central one, thus—

Bella per Emathios plus quam civilis campo.

It is more than doubtful, however, whether the difference of stress would not prevent this from sounding as a rhyme in an antique ear, and the phenomenon results more from the contingencies of grammar than from intention on the part of the poet. Conscious rhyme belongs to the early medieval periods of monkish literature, and the name given to lines with an intentional rhyme in the middle is Leonine verse, the invention being attributed to a probably apocryphal monk Leoninus or Leonius, who is supposed to be the author of a history of the Old Testament presented to the University of Paris. This "history" is composed in Latin verses, all of which rhyme in the centre. Another very famous poem in Leonine rhyme is the "De Contemptu Mundi" of Bernard of Cluny, which was printed at Bremen in 1595. Rhy

me exists to satisfy the ear by the richness of repeated sound. In the beginnings of modern verse, alliteration, a repetition of a consonant, satisfied the listener. A further ornament was discovered when assonance, a repetition of the vowel-sounds, was invented. Finally, both of these were combined to procure a full identity of sound in the entire syllable, and rhyme took its place in prosody. When this identity of sound occurs in the last syllable of a verse it is the typical end-
rhyme of modern European poetry. Recent criticism has been inclined to look upon the African church-Latin of the age of Tertullian as the starting-point of modern rhyme, and it is probable that the ingenuity of priests, intended to aid wor-
shippers in hearing and singing long pieces of Latin verse in the ritual of the Catholic church produced the earliest conscious rhymes in rhyme. Moreover, not to give too great importance to the Leonine hexameters which have been mentioned above, it is certain that by the 4th century a school of rhymed sacred poetry had come into existence, classical examples of which we still possess in the "Stabat Mater" and the "Dies Irae."

In the course of the middle ages, alliteration, assonance and rhyme held the field without a rival in vernacular poetry. There is no such thing, it may broadly be said, as medieval verse in which one or other of these distinguishing ornaments is not employed. After the 14th century, in the north of Europe, and indeed everywhere except in Spain, where asson-
ance held a powerful position, end-rhyme became universal and formed a distinctive indication of metrical construction. It was not until the invention of Blank Verse (q.v.) that rhyme found a modern rival, and in spite of the successes of this instrument rhyme has held its own, at all events for non-

dramatic verse, in the principal literature of Europe. Certain forms of poetry, e.g., the minstrelsy, iambus, etc., have been produced by rhyme. In many cases, efforts have been made to compose rhymeless sonnets, but the result has been, either that the piece of blank verse produced is not in any sense a sonnet, or else that by some artifice the appearance of rhyme has been retained. In the heyday of Elizabethan literature a serious attempt was made in England to reject rhyme altogether, and to return to the quantitative measures of the ancients. The prime mover in this heresy was not a poet at all, but a pedantic grammarian of Cambridge, Gabriel Harvey (1545-1630). He considered himself a great innovator, and for a short time he actually seduced no less melodious a poet than Edmund Spenser to abandon rhyme and set up a system of accented hexameters. Spenser even wrote largely in those measures, but the greater portion of his experiments in this kind, of which The Dying Pelican is supposed to have been one, have disappeared. From 1576 to 1579 the genius of Spenser seems to have been obscured by this error of taste, but he shook it off completely when he composed The Shepherd's Calendar. Harvey considered Richard Stonyhurst (1547-1618) the most loyal of his disciples, and this author published in 1582 four books of the Aeneid translated into rhymeless hexameters on Harvey's plan. The result remains, a portent of ugliness and cacophony. A far greater poet, Thomas Campion (1599-1620), held to the attack, and an tract published in 1602 advocated the remission of rhyme from lyrical poetry. He, by dint of a prodigious effort, produced some unmuffled odes which were not without charm, but the best critics of the time, such as Daniel, repudiated the innovation, and rhyme continued to have no serious rival except blank verse.
There have, from time to time, been made experiments of a similar nature, notably by Tennyson, but rhythm has retained its sway as an essential ornament of all English poetry which is not in blank verse. There have been not a few poems composed, principally in the last century, in rhythm and alexandrines, and even the elegiac couplet has been attempted. The experiments of Longfellow, Clough, Kingsley and others demand respectful notice, but it is more than doubtful whether any one of these, even the mellifluous and harmonious of the last-named writer, is really in harmony with the national prosody.

In Germany a very determined attack on rhyme was made early in the seventeenth century, particularly by a group of aesthetic critics in the Swiss universities. They attacked rhyme as an artless species of song-song, which deadened and destroyed the true movement of melody in the rhythm. The argument of this group of critics had a deep influence in German practice, and led to the composition of a vast number of works in unrhymed measures, in few of which, however, is now found a music which justifies the experiment. Lessing recalled the German poets to a sense of the beauty and value of rhyme, but the popularity of Klopstock and his imitators continued to exercise a great influence. Goethe and Schiller, without abandoning rhyme altogether, permitted themselves a great liberty in the employment of unrhymed measures and in imitation of classic metres. This was carried to still greater lengths by Platen and Heine, the rhymeless rhythm of the last of whom was imitated in English verse by Matthew Arnold and others, not without an occasional measure of success. In France, on the other hand, the empire of rhyme has always been triumphant, and in French literature the idea of rhymeless verse can scarcely be said to have existed. There the rime pleine ou riche, in which not merely the sound but the emphasis is perfectly identical, is insisted upon, and a poet who rhymed as Mrs Browning did, or made "flying" an equivalent in sound to "Zion," would be deemed illiterate.

In French, two species of rhyme are accepted, the feminine and the masculine. Feminine rhymes are those which end in a vowel, the first of which, the Alexandrine, which is the classical metre in French, is built up on what are called as rimes croisées, that is to say a couplet of masculine rhymes followed by a couplet of feminine, and that again by masculine. This rule is unknown to the medieval poetry of France.

In Italian literature the excessive abundance and facility of rhyme has led to a rebellion against its use, which is much more reasonable than that of the Germans, whose strenuous language seems to call for an emphatic uniformity of sound. But it was the influence of German aesthetics which forced upon the notice of Leopardi the possibility of introducing rhymeless lyrical measures into Italian verse, an innovation which be carried out with remarkable hardihood and success. The rhymeless odes of Carducci are also worthy of admiration, and may be compared by the student with those of Heine and of Matthew Arnold respectively. Nevertheless, in Italian also, the ear demands the pleasure of the full reiterated sound, and the experiments of the eminent poets who have rejected it have claimed respect rather than sympathy or imitation. At the close of the 18th century, particularly in France, where the rules of rhyme had been most rigid, an effort to modify and minimise these restraints was widely made. There is no doubt that the laws of rhyme, like other artificial regulations, may be too severe, but there is no evidence that the natural beauty which pure rhyme introduces into poetry is losing its hold on the human ear or is in any real danger of being superseded by accent or rhythm.

See Joseph B. Mayer, A Handbook of Modern English Metre (Cambridge, 1893); J. Müller, Neuachodschrittsche Metrik (Strasbourg, 1893), and B. Schlesinger, Versuch einer Theorie des Rhymes in Inhalt und Form (Magdeburg, 1802).

RHYNNEY, an urban district in the western parliamentary division of Monmouthshire, England, on the borders of Glamorganshire, 22 m. N. by W. of Cardiff, on the Rhymney, the London & North-Western, and the Brecon & Merthyr railways. Pop. (1901), 7915. The Rhymney river, in the upper valley of which this town lies, forms almost throughout its course, to the estuary of the Severn near Cardiff, the boundary between England and Wales (Monmouthshire and Glamorganshire). In its upper part the valley, like others adjacent and parallel to it, is populous with mining townships, and the town of Rhymney owes its importance to the neighbouring coal-mines and to its iron and steel works, which employ nearly the whole population. The works of the Rhymney Iron Company, including blast furnaces and rolling mills, are among the largest of the kind in England.

RHYOLITE (Gr. ῥύόειν, to flow, because of the frequency with which they exhibit fluxion structures), the group name of a type of volcanic rock, occurring mostly as lava flows, and characterized by a highly acid composition. They are the most siliceous of all lavas, and, with the exception of the dacites, are the only lavas which contain free primary quartz. In chemical composition they very closely resemble the granites which are the corresponding rocks of plutonic or deep-seated origin; their minerals also present many points of similarity to those of granite though they are by no means entirely the same. Quartz, orthoclase and plagioclase felspars, and biotite are the commonest ingredients of both rocks, but the quartz of rhyolites is always of glass enclosures and the potash felspar is pellucid sandine, while the quartz of granite contains dust-like fluid cavities of very minute size and its potash felspar is of the turbid variety which is properly called orthoclase. The granites also are holocrystalline, while in the rhyolites there are usually porphyritic crystals floating in a fine ground-mass. Rhyolites have also been called liparites because many of the lavas of the type contain glassy particles. These are excellent examples of this group. Above all rocks they bear a distinct family likeness and where confused they crystallize with great difficulty. Hence it has long baffled experimenters to produce rhyolite synthetically by fusion; it is stated that these difficulties have now been overcome, but geologists believe that the presence of steam and other gases in the natural state expedites crystallization. In crucibles these cannot be retained at the temperatures employed; when the rocks are melted the gases escape and on cooling a pure glass is formed. The vitreous forms of rhyolite are known as obsidian, perlite and pumice (qq.v.).

The minerals of the first generation, or phenocrysts, of rhyolite are generally orthoclase, oligoclase, quartz, biotite, augite or hornblende. The felspars are usually glassy clear, small but well-developed crystalline form; the potash felspar is sanidine, usually Carlsbad twinned; the soda-lime felspar is almost always oligoclase, and like the orthoclase is a SiO₂-rich variety. The felspar is the most abundant, and is the only one which may be corroded and irregular in their outlines; their cleavage and twinning then distinguish them readily from quartz. Glass enclosures, sometimes rectangular with small immobile bubbles, are characteristic of rhyolites. The quartz crystals are often doubly terminated, and may be columnar or even to a few crystals as a whole showing the quartz to be doubly terminated. Its glass enclosures are many and nearly always rounded or elliptical in section. No proper cleavage is seen in the quartz, though arculate (conchoidal) fractures are often noticed. A quadrangular cleavage may have been produced by strain on cooling. Phenocrysts of microperthite are known in some rhyolites; they may have the shape of felspar or of quartz crystals; in the former case Carlsbad twinning is common, but in other cases three-hemisphere structure is very conspicuous. Biotite is always deep brown or greenish brown, in small hexagonal tablets, generally blackened at their edges by magmatic corrosion. Muscovite is not known in rhyolites. Hornblende may be green or brown; in the quartz-pantellerites it sometimes takes the form of strongly pleochroic brown cosparite. Like biotite it is eumorphic but often corroded in a marked degree. Augite, which is equally common, sometimes more common. Of the other ferro-magnesian minerals, is always green; its crystals are small and perfectly shaped, and corrosion phenomena are very rarely seen in it. Zircon, apatite and magnetite are always present in rhyolites, the crystals being often beautifully perfect though never large. Olivine is a normal ingredient, but occurs in the hollow spherulites or lithophysae of some rhyolites with garnet, tridymite, topaz and other minerals which indicate a felspathitic rock. Certain less common accessory minerals of the rhyolites are cordierite in crystals which resemble hexagonal prisms but break up under polarized light into six radiating sectors owing to complicated twinning; they weather to green aggregates of chlorite and muscovite (pintle); garnet, sphere and orbite may also be met with in rhyolites.

The ground-mass of rhyolitic rocks is of three distinct types which are stages in crystalline development, viz. the vitreous, the felsitic or cryptocrystalline, and the microcrystalline. Hence some authorities have proposed to subdivide the group.
RHOTYOLITE

into the vitrophyres, the felsophyres and the granophyres, but this is not now in use, and the last of these terms has obtained a significance quite different from that originally assigned to it. Mixtures of the different kinds occur; thus a vitreous rhyolite has often felsitic areas in its ground-mass, and in the same lava flow some parts may be vitreous while others are felsitic. The vitreous rhyolites are identical in most respects with the obsidians, from which they can only be separated in an artificial classification; and in their glassy base the banded or eutaxitic, spherulitic and perlite structures of pure obsidians are very frequently present (see Obsidian; Perlitte). The felsoliparites or liparites with stony ground-mass are especially common among the pre-Tertiary igneous rocks (see Quartz-phyry), as liparite glass is unstable and experiences devitrification in course of time. Many of these felsites have fluxion banding, spherulites and even perlitic cracks, and are strong evidence that they were originally glassy. In other cases a hyaloliparite, obsidian, or pitchstone becomes felsitic along its borders and joint planes, or even along perlitic cracks, and we may assume that the once fibrous rock has changed into felsite under the action of percolating moisture or even by simultaneous decrystallization through the felsites. The felsite is original and represents an incipient crystallization of the vitreous material which took place before the rock was yet cold. The felsite in turn is liable to change; it becomes a fine mosaic of quartz and alkali felspar; and in this way a matrix of the third type, the microcrystalline, may develop. This is proved by the occurrence of the remains of spherulitic and perlite structures in rocks which are no longer felsitic or glassy. Many microcrystalline rhyolites have a ground-mass in which much felsitic matter occurs; but as this tends to recrystallize in course of time, the older rocks of this group show least of all. Whilst no quartz-bearing rhyolites are known to have been erupted in recent years, Lacroix proved that portions of the "dome of the "Rame" or Rame" which rose as a great tower or column out of the crater of Mont Pelée after the eruption in 1906 contained small crystals of quartz in the ground-mass. The rock was an acid andesite, and it was ascribed by Lacroix to the action of steam retained in the rock under considerable pressure. The microcrystalline ground-mass of rhyolites is never micrographic as in the porphyries (granophyres); on the other hand it is often microkolkolithic, consisting of small felspars, often sub-rectangular, embedded in little rounded or irregular plates of quartz.

The ground-mass of rhyolites is liable to other changes, of which perhaps the most important is weathering, which reduces the rock to a sand or silt, and in course of time, the latter, if dry, is likely to be blown away, leaving an exposed surface, that may become monolithic. This is a common process in the Pyrenees, the Alps, and other parts of Europe.

Koaolinitization may be due to weathering, and the stone dull appearance of the matrix of many microcrystalline rhyolites is commonly ascribed to the decomposed state of the felspar grains in them; it is even more developed by the action of acid rain, which replaces the felspars with soft, cloudy white products which belong to a mineral of the kaolin group. Sericitization, or the development of fine white mica after felspar, is usually associated with shearing, and is commonest in the older rhyolites.

Vesicular structure is very common in rhyolites; in fact the pumiceous obsidians have this character in greater perfection than any other rocks (see Pumice); but even the feso-rhyolites are very often vesicular. The cavities are usually lined with opal and tridymite; in the older rocks they may be filled with quartz and augite, and are called millstone porphyries, extensively used in Germany for grinding and polishing. These are porous rhyolites; the abundance of quartz makes them hard, and their rough surfaces render them particularly suitable for this purpose. In some of them the cavities are partly secondary. These rocks are obtained in the Odenwald, Thuringerwald and Fichtelgebirge.

In Britain a pale grey Tertiary rhyolite occurs at Tardree, Antrim (the only British rock containing tridymite), and in Skye. Felsitic rhyolites occur among the Old Red Rocks of Scotland (Pendle Hill, Near Lathom, &c., and also in the Brecon Forest, North Wales). The Carnarvonshire rhyolites are often much altered and silicified; many of them have a nodular structure which is very conspicuous on weathered surfaces. The spheroids may be two or more in number; sometimes they are separated by concentric shells. Rhyolites are also known from Fishguard, Malvern, Westmorland and Co. Waterford. One of the oldest volcanic rocks ("Briisian Porphyry of the Uriconian") is the spherulitic rhyolite of the Lea Rock near Wellington in Shropshire. It shows bright red spherulites in great numbers and is probably an obsidian completely devitrified. Perlite structure is also visible in it. In other parts of Europe rhyolites have a fairly wide distribution though they are not very numerous. In Hungary (Hilinak, &c.), there are many well-known examples of this class. They extend along the margin of the Carpathians and are found also in Sieben- uingen in Austria. In Italy they occur in the Euganean Hills and in the Lipari Islands; the latter being the principal source of pumice at the present day. Rhyolites of Recent age occur in Iceland (Myvatn, &c.), where they are characterized by the frequent absence of felspars and the presence of potash feldspars, and augite.

Some of these rocks have been called trachyte-obsidians, but they seem to be rhyolites which contain an exceptionally large amount of felspar. The older rhyolites, known as soda-felsites (in South Germany, Porphyries, in Germany, are mostly of Permian or Carboniferous age and are numerous in the Voges, Odenwald, Thuringerwald, &c. They are often accompanied by basic rocks (melaphyres). Permian rhyolites are also abundant in South Italy, and they also occur in Asia Minor and the Caucasus, in New Zealand, Colorado, Nevada and other parts of western North America. In the Yellowstone National Park there is a well-known cliff of obsidian which shows perfect columnar jointing; it is composed of the ashes of a volcanic eruption. The rocks of Nevada are exceedingly rich in porphyritic minerals, so that they appear at first sight to be holocrystalline rocks, since the ground-masses are of a very large quantity and incompositional. To this type the name nevadite has been given, but it is rare and local in its distribution. In the island of Pantelleria, which lies to the south-west of Sicily, there are rocks of rhyolitic affinities which present so many unusual features that they have been separated as a distinct type: they contain less silica and alumina and more alkalis and iron than do ordinary rhyolites. Their felspars are of the anorthoclase group, being rich in soda together with potash, and are very variable in composition. They are developed either by the action of weathering, or by the action of ground-water, or by the decomposition of the felspars. The soda-amphiboles are also characteristic of these rocks: dark brown or greenish-mossy or greenish-Bugtail feldspars, but at other times a glass filled with swarms of microspheres, while in certain parts they are a microcrystalline aggregate of quartz and alkali felspar. There are marked distinctions between these rocks and the rhyolites, together with the scarcity of quartz and the prevalence of soda-bearing pyroxenes and amphiboles.

The Palaeozoic volcanic rocks of Germany there is a group of lavas, the quartz-keratophyres, which are of acid composition and rich in alkali felspar. Their dominant alkali is soda; hence their felspars are albite and cryptoperthite, not sanidine as in rhyolites. Quartz occurs sometimes as corroded phenocrysts, but is often scarce even in the ground-mass. Porphyritic biotite or augite are very rare, but occur in the matrix along with felspars and quartz. Micropegmatite is not infrequent in these rocks, and they may be silicified like the rhyolites. As quartz-keratophyres are commonly, occurring in districts where there has been a total of folding, they are often crushed and more or less sericitized. They are best known in the Devonian lavas of North America, but are also found in Queensland, and similar rocks have been described (as soda-felsites) from Ireland. The rocks which they accompany are usually diabases and sills.

A still rarer group of rocks is the alkali felspars and soda pyroxenes and amphiboles are the comendites. They are often porphyritic, with crystals of quartz, sanidine, microperthite or albite; the ground-mass is microcrystalline or rarely micrographic, and is filled with feldspar crystals of different optical orientation. They are known from the recent eruptive districts of East Africa, from Sardinia and Texas, and very similar rocks occur as intrusive masses which may be called rhyolites.

The following analyses show the composition of some of the principal types of rhyolites:

We note in the rhyolites I.—III. the very high silica, with alkalis and alumina also in considerable amount, while lime, magnesia and iron are very low. In the pantellerite, keratophyre and comendite the silica tends to be less abundant, while the alkalis, especially soda, increase; they have less alumina but are richer in iron and magnesia. It is easy to see why the latter types contain less quartz, feldspars often very rich in soda, and feldic minerals which contain iron and alkalis in notable amounts such as aegirine, leibbeckite and arvedsonite.

**RHYTHM** (Greek ῥυθμός, from ῥίνω, to flow), the measured flow of movement, or beat, in verse, music or by analogy in other connections, e.g. "rhythm of life." The early critic of prosody, Aristoxenus, distinguished as the three elements out of which rhythm is composed, the spoken word, ῥήμα, the tune of music and song, μέλος, and the bodily motion, κῦμα σωματικόν. The art of the early Greek poets was devoted to the harmonious combination of these three elements, language, instrument, and gesture uniting to form perfect rhythm. Aristoxenus proceeds to define the rhythm so produced as an arrangement of metrical periods, ρηθήν χρόνον, but other early theorists make not the time but the syllable the measurement of poetic speech. Both music and poetry depend, and have depended from the earliest times, on rhythm. But in music melody and harmony have to be taken into consideration, whereas in poetry the rhythmical value of the tone is modified by the imaginative value and importance of the words themselves. In earliest times the fundamental unity of the two arts was constantly manifest, but as the world has progressed, and they have ramified into countless forms, the difference between them has been emphasized more and more.

*Rhythm in Verse.*—Professor Jakob Minor has adduced a figure, valuable in helping us to realize what poetic rhythm is, when he remarks that to strike a bell twelve times, at exactly equal intervals, is to produce what may be called, indeed, a rhythmic effect, but not to awaken anything resembling the sensation of poetical rhythm. Into the idea of poetic rhythm enters an element of life, of pulse, of a certain inequality of time based upon an equality of tone. Rhythm ceases to be poetic rhythm if it is mechanical, lifeless, Aristole, from whom a definition might be expected, is very vague in dealing with the subject, and most of the old rhetorical writers darken counsel with statements that are obscure or irrational. The fact is that rhythm is an expression of the instinct for order in sound which naturally governs the human ear, and little practical knowledge is gained by following Suidas when he says that rhythm is the father of metre, or Quintillian in his epigram that rhythm is male and metre is female. These definitions arise from a rhetorical desire to measure a delicate instinct by rule of three, and, as a matter of fact, Greek criticism on this subject often lost itself in arithmetical absurdities. It is sufficient to say that rhythm is the law which governs the even and periods of sounds, in harmony with the exigencies of human emotion. For the passions, as expressed in verse, various movements are appropriate. Joy demands that the voice should leap and sing; sorrow that it should move solemnly and slowly; and poetry, which is founded on rhythm, requires that the movement of words should respond to this instinctive gradation of sounds. The finer the genius of the metrist the more exquisitely does his rhythm convey, as upon an instrument, the nature of the passion which burdens his verses. Ecstasy takes a quick, eager, rising movement:—

"Give him the nectar! Pour out for the poet, Hebe, pour free, Quicken his eyes with celestial dew, That Styx the detested no more he may view."

**Mystery and suspense demand a faint, languid and throbbling movement:**

"There is not wind enough in the air To move away the ringlet curl From the lovely lady's cheek— The one red leaf, the last of its clan, That dances as often as dance it can."

An overpowering sadness interprets itself in rhythm that is full and slow and emphatic:—

"My genial spirits fail, And what can these avail To lift the smothering weight from off my breast? It was a vain endeavour, Though I should gaze for ever On that green light that lingers in the west: I may not hope from outward forms to win The passion and the life, whose fountains are within."

The rhythm so produced, intimately linked, almost beyond the disintegrating power of analysis, with human feeling, may depend either on **accentuation or quantity.** The latter forms the principle upon which all classic metre was composed, while the former is dominant in nearly every description of modern verse. Greek and Latin verse depends entirely upon the relation of syllables, long or short. It was a question of time with the ancients, of stress or weight with us. It is an error to say, as is often done, that ancient verse did not recognize accent, and that in modern verse there is no place for quantity. These statements are generally true, but there are various exceptions to both rules. Schiller, in his *Englische Metrik,* specially points out that "long and short syllables have no constant length, no constant relation, but they depend on their place in the verse, and on the context; though they do not determine the rhythm of verse, they still act as regulators of our metre in a very important degree." Pauses take an essential importance in the construction of modern rhythm, of the variety and vitality of which they are the basis. They are introduced for the purpose of relieving the monotony of two equal groups of syllables. The pause often takes the place of a light syllable, and there are instances in the verse of Shakespeare and Milton where it is even allowed to fill up the space of a heavy syllable. But still more often the pause does not imply the dropping of a syllable at all, but simply dictates a break in the sound, equivalent to a break in the sense. The following extract from a "Psalm" in Crashaw's *Steps to the Temple* (1649), in which the pauses are numerous and energetic, will exemplify the variety of this artifice:—

On the proud banks of great Euphrates' flood,  
There we sat! and there we wept:  
Our harps [that] now [no music understood],  
Nodding [on] the willows slept.  
While [we] sang [songs] captive no more,  
Lovely Sion [thought on thee]."

In the blank verse of Milton the free use of pauses constitutes the principal element in the amazing metrical art of the poet, and is the source of the sublime originality of his music. In speaking of rhythm, it is customary to think of the formal rules which govern the fixed cadence of feet in poetry, but there is also a rhythm in prose, which imitates the measured movements of the body in stately speech. According to Renan, the rhythm of the ancient poetry of the Hebrews is solely founded on this prose movement, which differs, in fact, from that of modern European poetry merely in its undefined and indeterminable character.

**Rhythm in Music.**—The rhythm of modern music began to develop through the attempts of learned medieval musicians to adapt the rhythms of spoken language to the necessities of choral singing; but before the process had gone far, certain much more ancient and powerful principles, always manifest in folk-song and dance, gained ascendency, so that even the
simplest classical music has a rhythm for which no criteria of poetic metre can be made adequate. From the musical point of view, the rhythm of speech, whether in prose or verse, is very subtle and almost uniformly fluent. The metrical feet which constitute the details of poetic rhythm are musically very minute; and the exaggerated forms in which music represents them are many and varied. On the other hand, the groups of metrical feet which constitute any one kind of verse are of a uniformity which for music on a large scale would be intolerable. Artistic music is soon compelled to draw upon infinite resources of its own, which preserve an appropriate accentuation of the sense and feeling, while obliterating or hugely exaggerating the poet's rhythmic effects. Musical rhythm cannot be studied on a sound basis unless its radical divergences from speech-rhythm are recognized from the outset.

In the earliest extant musical settings of poetry the treatment of accent and quantity was strictly arithmetical; and purely aesthetic requirements were satisfied by ex post facto inference from the arithmetical laws, rather than treated as the basis of the laws. Accent, when translated into music, is a rhythmic sensation resembling the stress we put on the left foot in walking; while quantity rarely suggests any bodily movement at all, since it can correspond only to variations in the length of steps. Now in modern music a sense akin to that of bodily movement is of overwhelming importance. Changes of *tempo*, and of the grouping of musical beats, are incidents as obvious in their effect as changes in the pace of a running horse. One consequence is that the laws of musical accent are simple and cogent, while the laws of musical quantity, if such exist, are far beyond analysis. Fluent speech and energetic physical exercise cannot be carried on simultaneously by the same person; and hence the laws of quantity belong to speech rather than to dance. Before we could form adequate notions of the musical rhythms of classical Greece, we should need to settle, firstly, how far the dancing in Greek drama included movements other than idealized dramatic gesticulation; secondly, how much bodily energy was involved in all dancing that may have gone beyond this; and lastly, how much dancing of any kind was executed by the singers while singing. What is certain is that ancient Greek musical rhythms were exact translations of verse rhythms, with the quantities interpreted arithmetically.

The extant fragments of Greek music are, whether we have read them correctly or not, undoubtedly very different in rhythm from those which must be subdued to the other arts which developed in the 12th and 13th centuries first developed; but they resemble discant in so far as the modern sense of rhythm is absent and its place is supplied by a sense of the rhythmic expression of unusually slow and emphatic speech. In ordinary speech there is an important difference between long syllables and short; but it is not naturally regulated by an exact rhythm, and the art by which it is organized in verse admits (or indeed demands) considerable freedom on the part of the reciter in varying his pace within such limits as do not destroy the structure of the lines. But when a chorus is made to sing words, it must, if the words are to reach the hearer, sing them slowly; and musical江东 of the passage of the melody must not be left to the imagination but must be played. When the same syllable is sung or spoken in classical music, it can repeat them until they are either understood or dismissed from the mind as a mere pretext for the employment of voices in a merely musical design. In any case, if a chorus is to sing well together, the contrast between short and long syllables must be placed on an arithmetical basis, the simpler the better. Now the sole function of ancient Greek music was to enhance the emotional effect of poetic words by regulating their rise and fall in a musical scale and their length in a metrical scheme; and it was natural and right that its rhythms should, though accurate, have no stronger stress than those of the words. Hence the laws of rigid syllabic forms of rhythm through a musical setting of vocal music would produce an effect as intolerable to a Greek ear as a schoolboy's worst jog-trotting scansion of poetry. We need not, then, imagine that the human sense of rhythm has suffered any mysterious change, when our best attempts at deciphering the extant fragments of ancient Greek music yield us a rhythm which scholars can explain by the structure of Greek verse, but which gives us no musical sense. Neither here nor in such strange harmonic phenomena as our complete inversion of medieval harmonics as to the treatment of "perfect concords" (see Harmony) do we find any principle involved which is not as true at the present day as it ever was. Ancient musical rhythm shared in the general qualities of that "Flatland" in which we know ancient music to have been; modern musical rhythm, like harmony, belongs, as it were, to a three-dimensional musical space with the vast artistic resources of a consistent perspective.

Indeed, we need much the same kind of mental gymnastic in studying the origins of musical rhythm as we need for the much more abstruse subject of harmonic origins. The two subjects soon begin to show interaction. During the period of discant we find metrical conceptions already strongly modified by two purely musical factors. Firstly, the attempt to make voices produce a harmony from different simultaneous melodies (instead of from combinations conceived as disguised unison) brought with it the necessity for differences of length enormously larger than any possible metrical differences. The metrical influence, however, still so predominated, even in the 14th century, as to produce a rhythm based almost exclusively on what would now be called triple time. Secondly, that sense of bodily movement, for which the less clumsy term "dance-rhythm" is far too narrow, gained ground as the only means powerful enough to hold the various rhythms of the new and growing polyphony together. In the later stages of discant the old metrical conceptions struggled against the grain of the polyphony for awhile, only to succumb in a tangle of inextricable technicality: and the new art, which became coherent in the 17th century, disregarded poetic metre, with little or no loss in capacity to interpret words if the composer had leisure or desire to do so; since, after all, poetic rhythm in its highest forms has a subtle freedom which renders mechanical musical translation worse than useless, while the rhythmic swing of the lighter forms of poetry was soon discovered by the composers of the "Golden Age" to be practically identical with the refined dance-rhythm which they in their lighter moments idealized from folk-music.1

By the middle of the 15th century polyphony attained such independence that the only rhythms which would hold the flow of independent melodic voices together were those in which a steadily duple or steadily triple rhythm (either of which might be subdivided or changed on the scale of the measures) could be felt as an absolutely regular musical tread. Such a rhythm is capable of expressing every poetic foot, either by the difference of stress between notes or by a difference in their length. Moreover, emphasis may be obtained by the pitch of the note, or, again, by its harmonic significance. All these forms of emphasis combine and counteract each other in an infinite variety, till the sense of musical movement becomes as remote from crude dance-rhythm as it is from poetic metre. But though the part thus played by accent was already of paramount importance in the "Golden Age" of music, it was not allowed to become evident to the ear except in the lighter forms ofByPrimaryKey music. In the more-genteel forms it was served as soon as the listener was able to lose all crude rhythmic impulses in a secure feeling that the mass of polyphonic harmony was held together by a general grouping of the rhythmic beats in fours or threes; and individual parts were at least as free to indulge in other rhythms across the main rhythm as they are in the most complex modern music, so long as the harmony was held together by the average grouping, or "time," as we now call it. Hence the rhythmic variety of 16th-century

1 It would be interesting and fruitful to consider how far the growing preference, in modern European languages, of accent to quantity, may not only have modified the conception of metrical rhythm, but may itself have been influenced by the melodic tendencies of popular song, which had so great an influence on the learned music of the middle ages. And it can hardly be said that the subject of musical rhythm has yet been so clearly treated on these lines as to shed the light it seems capable of shedding upon many vexed questions in poetic rhythm.
music is exactly like the harmonic variety, and the limitations and waywardness of the one are no more arcaic than those of the other.

When the resources of later music and the treatment of instruments necessitated the publishing of music in score as well as in separate parts, it became necessary to guide the eye by drawing vertical lines ("bars"?) at convenient distances. Hence the term "score" (Ger. Partitur, Fr. partition). These divisions naturally coincided with the main rhythmic groups, and eventually became equidistant. This purely practical custom has co-operated with the great increase of rhythmic firmness necessary for the coherence of those large modern forms whichbreve the shape rather than the texture of the music, until our notions of rhythm may fairly be described as bar-ridden. And, since the vast majority of our musical rhythms absorb the utmost complexity of detail into the most square and symmetrical framework possible, we are taught to regard the "4-bar period" as a normal (or even ultimate) rhythmic principle, instead of contenting ourselves with broader conceptions which treat symmetry and proportion in time as freely as they are treated in space. It cannot be too strongly emphasized that the bar indicates no universal musical principle. The havoc wrought by mechanical teaching on this point is incalculable. The readiness to reject the refinement of mental ideas as to the declaration of words in classical and modern music: ideas which mislead even some composers who might have expected to be known better.

As rhythm is contemplated in larger measures, it becomes increasingly difficult to say where the "sense of rhythm ends and the sense of proportion begins. The same melody that may be felt as a square and symmetrical piece of proportion in four-bar rhythm if it is taken slowly, will be equally rational as a single bar of "common time" (see below) if it is taken very quickly; and between these two extremes there may be intermediate grades. All that can be laid down is that composers are apt to use bars of any continuous piece of music, but long bars will imply smoother rhythms. For example, if the scherzo of Beethoven's Ninth Symphony were written in \( \frac{4}{4} \) instead of \( \frac{2}{2} \) bars, then the passages now marked "Ritmo di tre battute" would have to appear in \( \frac{3}{2} \) time, and so the changes of rhythm would be much more visible on paper. But the tendency to put a strong accent on the first beat of every bar would make this notation an undesirable substitute for Beethoven's, since it would lead to a neglect of the subordinate accents (all of them bar-accents, as Beethoven writes them). The trio of this scherzo shows the opposite case. In the first bar of the trio, in order to indicate a more tranquil flow at the same pace, doubled the quantity contained in a bar, substituting alla breve bars, each equal to two of the preceding \( \frac{2}{2} \) bars. The alteration produced a discrepancy in the metronome marks, which has always caused controversy among conductors, but the facts admit of only one interpretation. It is clear, then, that the only sound theory of musical rhythm will be that in which accent, beat, bar, and even form and proportion are relative terms.

The kinds of time (i.e., rhythmic groups forming, as it were, invariant molecules in the structure of any continuous piece of music) that are used in all music from the 15th century onwards are nowadays classified as \textit{duple} and \textit{triple}, and each of these may be \textit{simple} or \textit{compound}. Simple time is that in which the normal subdivision of its beats is by two, whether the number of the beats themselves is duple or triple. Compound time is that in which the beats are regularly divided by three, which three subdivisions are reckoned as subordinate beats. The beats are in all kinds of time reckoned as halves, quarters, 8ths, 16ths, or even 32nds. A standard note in modern music, the semibreve: and the time-signature placed at the beginning of a piece of music is really a fraction, of which the numerator expresses the number of beats in a bar, while the denominator expresses the size of a beat. Thus \( \frac{3}{4} \) signifies three crotchetts in a bar. Compound time is expressed, not by using normal fractions of a semibreve as main beats and dividing them into triplets, but by using dotted dots. A dot after

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]

a note adds another half to its value, and so not only do we obtain the means of expressing a great variety of \( \textit{rhythmic} \) (i.e., quantitatively adjusted to one another) time, but also the means of expressing a large number of fractions, as the time taken by this means of expression is proportional to the number of dots at the end of the note. Thus

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]

The time taken by the notes in these triplets is \( \frac{3}{4} \) of the time of a note in the whole of the notes, and the time taken by the notes in the last triplet is \( \frac{3}{4} \) of the time of the notes in the first triplet. Thus

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]

The time taken by the notes in these triplets is \( \frac{3}{4} \) of the time of a note in the whole of the notes, and the time taken by the notes in the last triplet is \( \frac{3}{4} \) of the time of the notes in the first triplet. Thus

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]

The time taken by the notes in these triplets is \( \frac{3}{4} \) of the time of a note in the whole of the notes, and the time taken by the notes in the last triplet is \( \frac{3}{4} \) of the time of the notes in the first triplet. Thus

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]

The time taken by the notes in these triplets is \( \frac{3}{4} \) of the time of a note in the whole of the notes, and the time taken by the notes in the last triplet is \( \frac{3}{4} \) of the time of the notes in the first triplet. Thus

\[ 3 \text{ triplets of } \frac{2}{4} \text{ notes } \]
RHYTINA

can dominate the details of the rhythm, and this again depends on the listener's capacity for grasping large and slow rhythms. In any case, the only "ultimate" rhythmic element is the tendency to mark off rhythmic beats into pairs, with a stress on the first of each pair. Where this tendency is resisted, the mind will follow the line of least resistance, which will vary according to the pace and detail of the music. Thus in rapid triple time it is easier to seek duplet rhythm in the grouping of bars than in the details within the bars; but if the groups of bars are also triple, or irregular, the mind will fix on the first recurring salient feature for a secondary beat, regardless of inequality in length; rather than, so to speak, hop on one leg indefinitely. On this principle there is a distinct tendency in moderate and slow triple times to throw a secondary accent on the third beat; or sometimes on the second, as in the springing step of the mazurka, where the spring gives energy to the first beat and the descent from it gives poise to the second.

The tendency of small rhythmic groups to build themselves into large and square ones, such as 8-bar, 16-bar and even 32-bar periods, is doubtless important; but the converse tendency being slight—this is a characteristic of quick rhythms—is far more significant than in the slow periods of the series is far more significant, even since in its most regular forms it not only produces more variety the further it goes, but always increases in obvious effect, until the subdivisions attain the minuteness (and therewith the expression) of speech rhythms. (A crude example of the device is Diabelli's waltz, on which Beethoven wrote his gigantic 33 variations. See VARIATIONS, where the point is illustrated by a diagram.) Regularly expanding rhythm, on the other hand, not only becomes imperceptible as it is carried further, but tends merely to make musical proportions resemble those of a chess-board. In great music the expanding principle is therefore always contrasted with or modified by the tapering principle, which can indeed exist simultaneously with it and with any other. For, to take only three categories, the harmonic changes of a passage may be designed in tapering rhythm while the melodic phrases expand, and the entries of instruments or parts occur on some third principle, regular or irregular. Such interplay need produce no feeling of complexity; indeed, it is an art most neglected by those composers who most rely on the effect of complex rhythm. It is the main discoverable source of that almost dramatic sense of movement that distinguishes the great musical styles from the academic methods which play for safety, and from the anti-academic novelties which end in monotony.

Square rhythms become desirable at climaxes where physical energy dominates thought. Strong final cadences accordingly require that the last chord should fall on an accent; and if the pace is rapid the final chord will probably not be on an accent but on an accented bar. Thus it is quite obvious that there is by a mere oversight one bar too many in the four bars of tremolo quavers at the end of the first movement of Beethoven's Fourth Symphony; for they are followed by an important leading to the last three chords, which chords can only mean (counting bars as beats) "One, two, Three," ("four" being glent and that), for which the tremolo would correct the rhythm in a more vigorous but more vulgar way by bringing the last chord onto "One" of the next imaginary group of four. The former correction is so obviously right that the imagination makes it in spite of the presence of the superfluous bar, which is instinctively ignored as an accidental prolongation of the tremolo. Where the composer writes in bars so short as to be permanently less than the phrases of the piece (as in Beethoven's scherzos), or in bars that are frequently longer than the phrases (as in most of Mozart's movements in slow or moderate common time), it sometimes becomes impossible to construe the music without carefully calculating where the accents come; and this calculation is most easily made on the assumption that the strongest cadences bring the tonic chord on an accent. Thus, in Beethoven's Sonata in E flat, Op. 27, No. 1, the first bar of the second movement must be preliminary and the first accent must come on the second bar, since the piece refuses to make sense in any other way. Indeed, Beethoven has written some notes twice over in order to bring his double-bars and repeat-marks where they will indicate the true rhythmic joints to the eye. (A double-bar is a mere graphic indication of some important sectional division, not necessarily rhythmic or even coincident with a normal bar-stroke.)

Theorists, however, have developed a tendency to assume that all cadences must be strong. More than one critic has told us that the scherzo of Beethoven's Sonata, Op. 28, is in the same predicament as that of Op. 27, No. 13; though it not only makes excellent sense with its cadences in the light and weak form in which they appear, but, when reconstructed on the "strong cadence" theory, entirely fails in its middle portion to uphold that theory or to make any other rhythmic sense. And when Professor Prout tells us that the overture to Figaro begins with a silent bar, and that Schubert's Impromptu in B flat is positively ungrammatical in its cadences unless it is entirely rebarred, and when Dr Riemann turns half the ritornello of a Bach concerto from 3 into 4 time, simply in order to make the sequences coincide with the hardest possible accents; then we can only guess, by invoking musical aesthetics by criteria too crude for the aesthetics of bricklaying. An edition of Paradise Lost, in which the lines were so rearranged to bring all punctuation marks (except perhaps commas) at the end of the line, would be on precisely the same level of ingenious barbarity.

Few technical terms are entirely peculiar to the subject of musical rhythm; but some obvious terms of syntax, such as phrase, period and section are used with varying degrees of system by all writers on music; and the whole terminology of prosody has been annexed—with such success that we are told in Grove's Dictionary (article "Metre") that "the theme of Weber's Rondo brillante in E flat (Op. 62) is in Anapaestic Tetrameter Brachycaletic, very rigidly maintained."

One important term has acquired a special significance in music: viz. Syncopation. It means a cross-accent of such strength as to equal or even suppress the main accent; but the use of the term is generally restricted to cases in which the cross-accent is produced by shifting the notes of a melody or a formula so that they fall between the beats instead of upon them. From what we have said as to the almost physical effect of musical rhythm it is obvious that such a phenomenon is of far greater effect and importance in music than it could possibly be in verse; and, to whichever subject the term may belong by priority, extreme care is needed in extending an essentially musical term to the structure of poetry. (D. F. T.)

RHYTINA, a name applied to the northern sea-cow (Rhytina gigas, or stelleri), a gigantic relative of the manati and dugong, which formerly inhabited Bering and Copper Islands, in the North Pacific, where it was discovered during Bering's voyage in 1741, and subsequently described by Steller, who accompanied that expedition as a naturalist. Bering's half-starved sailors soon reduced the numbers of these comparatively helpless creatures; and it was not long after—probably about the year 1768—that the species, which was the sole representative of its genus, became completely exterminated. The Rhytina was the largest member of the Order Sirenia, attaining a length of nearly twenty feet; and had a very thick, rugged, bark-like skin. The jaws, which are bent downwards to a moderate extent, are unprovided with teeth, but in life carried ridged horny plates. The tail was very deeply forked; and the flippers were short and truncated, lacking apparently the terminal joints of the digits.

When first discovered, this Sirenia was extremely numerous in the bays of Bering Island, where it browsed upon the abundant sea-tangle. Its extirpation is due to the Russian sailors and traders who visited the island in pursuit of seals and sea-otters, and who subsisted on its flesh. Numbers of bones have been recovered from the more or less nearly perfect skeletons that have been reconstructed, so that the osteology of this interesting animal is well represented in most of the largest museums.

(R. L.*)
RIANSARES—RIBADENEIRA

RIANSARES, AUGUSTIN FERNANDEZ MUÑOZ, DUKE OF (1868 or 1870–1873), morganatic husband of María Christina, queen and regent of Spain, was born at Tarancón, in the province of Cuenca, in New Castile. His father was the keeper of an “estanco” or office for the sale of the tobacco of the government monopoly. He enlisted in the bodyguard, and attracted the attention of the queen. According to one account, he distinguished himself by stopping the runaway horses of her carriage; according to another, he only picked up her handkerchief; a third and scandalous explanation of his fortune has been given. It is certain that the queen married him privately, very soon after the death of her husband on the 29th of September 1883. By public law she and Maria Christina would have forfeited the regency; but her relations with Muñoz were perfectly well known. When on the 13th of August 1886 the soldiers on duty at the summer palace, La Granja, mutinied and forced the regent to grant a constitution, it was generally, though wrongly, believed that they overcame her reluctance by seizing Muñoz, whom they called her “guapo,” or fancy man, and threatening to shoot him. When in 1840 the queen found her position intolerable and fled the country, Muñoz went with her and the marriage was published, and on the overthrow of Espartero in 1843 the couple returned. In 1844 Queen Isabel II., who was now declared to be of age, gave her consent to her mother’s marriage, which was publicly performed. Muñoz was created duke of Riensares and made a knight of the Golden Fleece. By Louis Philippe, king of the French, he was created duke of Mont-Morot and Grand Cross of the Legion of Honour. Until his wife was finally driven from Spain by the revolutionary movement of 1854, the duke is credibly reported to have applied himself to making a large fortune out of railway concessions and by judicious stock exchange speculations. Political ambitions he had none, and it is said that he declared the offer of the crown of Ecuador. All authorities agree that he was not only good-looking, but kindly and well-bred. He died five years before his wife at L’Adresse, near Havre, on the 11th of September 1873. Several children were born of the marriage.

RIAZ PASHA (c. 1835–), Egyptian statesman, born about 1835, was of a Circassian family, but said to be of Hebrew extraction. Little is known of his early life save that until the accession of Ismail Pasha to the vice-royalty of Egypt in 1863 he occupied a humble position. Ismail, recognizing in this obscure individual a capacity for hard work and a strong will, made him one of his ministers, to find, to his chagrin, that Riaz was also an honest man possessed of a remarkable independence of character. By publicizing his financial reforms, he compelled him to agree to a commission of inquiry Riaz was the only Egyptian of known honesty sufficiently intelligent and patriotic to be named as a vice-president of the commission. He filled this office with distinction, but not to the liking of Ismail. The khedive, however, felt compelled, when as a sop to his European creditors he assumed the position of a constitutional monarch, to nominate Riaz as a member of the first Egyptian cabinet. For the few months this government lasted (September 1878 to April 1879) Riaz was minister of the interior. When Ismail dismissed the cabinet and attempted to resume autocratic rule, Riaz had to flee the country. Upon the deposition of Ismail, June 1879, Riaz was sent for by the British and French controllers, and he formed the first ministry under the khedive Tewfik. His administration, marked by much ability, lasted only two years, and was overthrown by the agitation which had for figure-head Arabi Pasha (q.v.). The beginnings of this movement Riaz treated as of no consequence. In reply to a warning of what might happen he said, “But this is Egypt; such things do not happen; you say they have happened elsewhere, perhaps, but this is Egypt.” On the evening of the 9th of September 1881, after the military demonstration in Abdin Square, Riaz was dismissed; broken in health he went to Europe, remaining at Geneva until the fall of Arabi. After that event Riaz, subordinating his vanity to his patriotism, accepted office as minister of the interior under Sherif Pasha (q.v.). Had Riaz had his way Arabi and his associates would have been executed forthwith, and when the British insisted that clemency should be extended to the leaders of the revolt Riaz refused to remain in office, resigning in December 1882. He took no further part in public affairs until 1888, when, on the dismissal of Nubar Pasha (q.v.), he was summoned to form a government. He now understood that the only policy possible for an Egyptian statesman was to work in harmony with the British agent (Sir Evelyn Baring—afterwards Lord Cromer). This he succeeded in doing to a large extent, witness the success in initiating the practical abolition of the corvee and many other reforming measures. In August 1889 he was appointed Anglo-Egyptian official as judicial adviser to the khedive, was, however, opposed by Riaz, who resigned in May 1891. In the February following he again became prime minister under Abbas II., being selected as comparatively acceptable both to the khedivial and British parties. In April 1894 Riaz finally resigned office on account of ill-health. Superior, probably, both intellectually and morally to his great rival Nubar, he lacked the latter’s broad statesmanship as well as his pliability. Riaz’s standpoint was that of the benevolent autocrat; he believed that the Egyptians were not fitted for self-government and must be treated like children, and hence that any attempts by others to interfere with his methods must be prevented from injuring themselves. In 1896 he was made an honorary G.C.M.G. A worthy tribute to Riaz was paid by Lord Cromer in his farewell speech at Cairo on the 4th of May 1907. “Little or no courage is now required,” said Lord Cromer, “on the part of a young Egyptian who poses as a reformer, but it was not always so. Ismail Pasha had some very drastic methods of dealing with those who did not bow before him. Nevertheless, some thirty years ago Riaz Pasha stood forth boldly to protest against the maladministration that then prevailed in Egypt. He was not afraid of the cat.”

RIB (from O. Eng. ribb; the word appears in many Teutonic languages, cf. Ger. Rippbe, Swe. reb), in anatomy, the primary meaning, one of the series of elastic arches bones (costae) which form the casing or framework of the thorax (see Skeleton: Axial). The word is in meaning transferred to many objects resembling a rib in shape or function. In architecture, it is thus used of the arches of stone which in medieval work constitute the skeleton of the vault, and carry the shell or web. Although in the Roman vault the rib played an important element in its construction, it was generally hidden in the thickness of the vault and was made subservient to new geometrical forms. The anointment of an Anglo-celtic hand, reversed the process, and not only made the vaulting surface subservient to the rib, but by mouldings rendered the latter a highly decorative feature. The principal ribs are the transverse (arc doubleau), the diagonal (arc ogive) and the wall rib (formele). Those of less importance are the intermediate, the ridge and lierne ribs. The ridge-rib is one first introduced into the vault to resist the thrust of the intermediate ribs between the wall and diagonal ribs; it also served to mark the junction of the filling-in or web of vaults in those cases where the courses dipped toward the diagonal rib. (See VAULT.) A lierne rib (the term is borrowed from the French) is a short rib, introduced into the vaulting in the Early Perpendicular period, which coupled together the transverse and intermediate ribs; in the later period the “lierne” rib becomes one of the chief features of the “stella” vault (see further VAULT).

RIBADENEIRA, PEDRO A. (1527–1611), hagiologist, was born at Toledo on the 1st of November 1527. As a lad he repaired to Rome for study, and there on the 18th of September 1540 was admitted by Ignatius Loyola, in his thirteenth year, as one of the Society of Jesus, which had not yet, received papal sanction. He pursued his studies at Paris (1542) in philosophy and theology. Loyola, in 1555, sent him on a mission to Belgium; in pursuance of it he visited England in
RIBALD—RIBBON-FISHES

1558. A later result of his visit was his Historia Ecclesiastica del scisma del Reyno de Inglaterra (1588-1594), often reprinted, and used in later editions of N. Sanders's De Origen et Progressu Schismatis Anglicani. In 1560 he was made Provincial of the Society of Jesus in Tuscany; thence transferred as Provincial to Sicily in 1563, again employed in Flanders, and from 1571 in Spain. In 1574 he settled in Madrid, where he died on the 10th of September 1611. His most important work is the Life of Loyola (1572), which he was the first to write. In his first edition of the Life, as also in the second enlarged issue (1587), Ribadeneira affirmed that Loyola had wrought no miracle, except the foundation of his Society (thus making his claim parallel with that of Mahomet, whose only miracle, originally, was the Koran). In the process for the canonization of Loyola, a narrative published by Ribadeneira in 1600 exhibited miracles; and these are recorded in an abridgment of the Life by Ribadeneira (published posthumously in 1612) with a statement by Ribadeneira that he had known of them in 1572 but was not then satisfied of their proof. For this change of opinion he is taken to task by Bayle. That Ribadeneira was, though an able, very credulous writer, is shown by his lives of the successors of Loyola in the generalship of the Society, Lainéz and Borgia; and especially by his Flos Sanctorum (1590-1610), a collection of saints' lives, entirely superseded by the labours of the Bollandists. His other works are numerous but of little moment, including his Tratado de la religion (1595), intended as a refutation of Machiavelli's Prince.

See his autobiography in his Bibliotheca Scriptorum Societatis Jesu (1602 and 1608, supplemented by J. Alegambe and N. Sokwell in 1676); N. Antonio, Bibliotheca Hispana Nova (1785); Biographia Universalis (Michaud) (1842-1846). (A. Go.*)

RIBALD, a word now only used in the sense of jering, irreverent, abusive, particularly applied to the uses of low, offensive or mocking jests. It has an interesting early history, of which Du Cange (Gloss. s.v. Ribaldi) gives a full account. It is one of those words, like the Greek ῥίπανας, an unconstitutional ruler, and the Latin latro, a hired soldier, mercenary, later robber, which have acquired a degraded and evil significance. The ribaldi were light-armed soldiers, on whom fell the duty of being first in attack, the enfans perdus or "forlorn hopes" of the army. From their name and tendencies in his contemporary history of the reign of Philip Augustus, for the year 1180, speaks of the Ribaldi . . . qui primos im- petus in expugnationibus munitionibus facere consuerunt. Later we find the ribaldi among the rabble of camp-followers of an army, and Giovanni Villani, in his 16th-century Chronica (11, 139), speaks of ribaldi et i ragguzzi del hoste, and Fioissant of the ribaues as the lowest ranks in an army. Ribaldus (ribaul) was thus a common name for everything ruffianly and abandoned, and Matthew Paris (Ann. 1253) says: Fures, exules, fugitivi, excommunicati, quos omnes Ribaldos Francia vulgariter consuevit appellare. The name (ribaldio or ribald) was particularly applied to prostitutes, brothel-keepers and all who frequent haunts of vice, and there was at the French court from the 12th century an official, known as Rex Ribaldorum, king of the ribalds, changed in the reign of Charles VI. to Prac- positis Hospitii Regis, whose duty was to investigate and hold judicial inquiry into all crimes committed within the precincts of the court, and control vagrants, prostitutes, brothels and gambling-houses. The etymology of the word has been much discussed, and no certainty can be arrived at. The termination —ald—points to a Teutonic origin, and connexion has been suggested with O.H.G. Hriphi, M.H.G. Ribe, prostitute, with Ger. Ribben, rub, or with ruben, rob. Neither Skeat nor the New English Dictionary find any relation to the English "bawd," procuress, pander.

RIBAULT (or RIBAUT), JEAN (c. 1520-1565), French navigator, famous for his connexion with the early settlement of Florida, was born at Dieppe, probably about 1520. Appointed by Admiral Coligny to the command of an expedition to prepare an asylum for French Protestants in America, Ribault sailed on the 18th of February 1562, with two vessels, and on the 1st of May landed in Florida at St John's river, or, as he called it, Rivière de Mai. Having settled his colonists at Port Royal Harbour (now Paris Island, South Carolina), and built Fort Charles for their protection, he returned to France to find the country in the throes of the Civil War. In 1563 he appears to have been in England and to have composed Sieve et Livre de la Discoverie de Floride (Hakluyt Soc., vol. vili.). In April 1564 Coligny was in a position to dispatch another expedition under René de Laudonnière, but meanwhile Ribault's colony had come to an untimely end—the unfortunate adventurers, destitute of supplies from home, having revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up, when they were in the last extremities, by an English vessel. In 1565 Ribault was again sent out to satisfy Coligny as to Laudonnière's management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards, under Menendez de Aviles, though their country was at peace with France, attacked the French ships at the mouth of the river. Ribault set out to retaliate on the Spanish fleet, but his vessels were wrecked by a storm near Matanzas Inlet and he had to attempt to return to Fort Caroline by land. The fort had by this time fallen into the hands of the Spaniards, who had slaughtered all the colonists except a few who got off with two ships under Ribault's son. Induced to surrender by false assurances of safeguard, Ribault and his men were also put to the sword in October 1562. The massacre was avenged in kind by Dominique deourgues (d. 1583) two years later.

See E. and H. Haag, La France protestante (1842-1859); and F. Parkman, Pioneers of France in the New World (new ed., 1894).

RIBBEC, JOHANN CARL OTTO (1827-1898), German classical scholar, was born at Erfurt in Saxony on the 23rd of July 1827. Having held professorial appointments at Kiel and Heidelberg, he succeeded his tutor Ritschl in the chair of classical philology at Leipzig, where he died on the 18th of July 1898. Ribbeck was the author of several standard works on the poets and poetry of Rome, the most important of which are the following: Geschichte der römischen Dichtung (2nd ed., 1894-1900); Die römische Tragödie im Zeitalter der Republik (1870); Scenaica Romaniarum Poetis Fragmenta, including the fragments of the Roman Poets (3rd ed., 1897). As a critical text he was distinguished by considerable range and the tendency to alter, rearrange or reject as spurious what failed to reach his standard of excellence. These tendencies are strikingly shown in his editions of the Epitites and Ars Poetica of Horace (1869), the Satires of Juvenal (1859) and in the supplementary essay Der echte und unechte Juvenal (1865). In later years, however, he became much more conservative. His edition of Virgil (2nd ed., 1894-1895), although only critical, is a work of great erudition, especially the Prolegomena. His biography of Ritschl (1879-1881) is one of the best works of its kind. The influence of his tutor may be seen in Ribbeck's critical edition of the Miles Gloriosus of Plautus, and Beiträge zur Lehre von den lateinischen Partikeln, a work of much promise, which causes regret that he did not publish further results of his studies in that direction. His miscellaneous Reden und Vorträge were published after his death (Leipzig, 1899). He took great interest in the monumental Thesaurus Linguae Latinae, and it was chiefly owing to his efforts that the government of Saxony was induced to assist its production by a considerable subsidy.

The chief authority for his life is Otto Ribbeck: ein Bild seines Lebens aus seinen Brieven (1901), ed. by Emma Ribbeck.

RIBBON-FISHES (Trachysteridae), a family of marine fishes, readily recognized by their long, compressed, tape-like body, with long pointed head, narrow mouth and feeble dentition. A high dorsal fin occupies the whole length of the back; an anal is absent, and the caudal, if present, consists of two fascicles of rays of which the upper is prolonged and directed upwards. The pectoral fins are small, the ventrals composed of several rays, or of one long ray only. Ribbon-fishes possess all the characteristics of fishes living at very great depths. They are
extremely fragile when found floating on the surface or thrown ashore, and rarely in an uninjured condition; the rays of their fins especially, and the membrane connecting them, are of a very delicate and brittle structure. In young ribbon-fishes some of the fin-rays are prolonged in an extraordinary degree, and sometimes provided with appendages (see fig. 2). There are only two genera in the family, Regalecus, the oar-fish, and Trachypterus. In the former the length of the body is about fifteen times its depth. The head is compressed, short, resembling in its form that of a herring; the eye is large; the mouth is small, and provided with very feeble teeth. A long many-rayed dorsal fin, of which the very long anterior rays form a kind of high crest, extends from the top of the head to the end of the tail; the anal and perhaps the caudal fins are absent; but the ventrals (and by this the oar-fish is distinguished from the other ribbon-fishes) are developed into a pair of long filaments, which terminate in a paddle-shaped extremity, but are too flexible to assist in locomotion. The whole body is covered with a layer of silvery epidermoid substance, which easily comes off and adheres to other objects.

Fig. 1.—Trachypterus taenia.

Oar-fishes are the largest deep-sea fishes known, the majority of the specimens observed measuring 12 ft. in length; but some are recorded to have exceeded 20 ft. Their range in the great depths of the ocean seems to extend over all seas, but, however numerous they may be in the depths which are their home, it is only by rare accident that specimens reach the surface. Thus from the coasts of Great Britain only about twenty captures are known in the long space of a century and a half, and not more than thirteen from those of Norway. Oar-fishes have been considered by naturalists to have given rise to some of the tales of "sea-serpents," but their size as well as the facility with which they are secured when observed render this solution of the question of the existence of such a creature improbable. When they rise to the surface of the water they are either dead or in a hopeless and dying condition. The ligaments and cords by which the bones and muscles were held together whilst the fish lived under the immense pressure of great depths have then become loosened and torn by the expansion of the internal gases; and it is only with difficulty that the specimens can be taken entire out of the water, and preserved afterwards. Every specimen found has been more or less mutilated; and especially the terminal portion of the tail, which seems to end in a delicate tapering filament, has never been perfect:—it is perhaps usually lost as a useless appendage at a much earlier period of the life of the fish. Of Trachypterus, specimens have been taken in the Atlantic, the Mediterranean, at Madeira in the Pacific. The species from the Atlantic are known chiefly on the northern coasts, Iceland, Scandinavia, Orkneys and Scotland. It is known as T. arcticus, in English the deal-fish; its Icelandic name is Viskmaer. Its length is 5 to 8 ft. Specimens are usually driven to the shore by gales in winter, and are sometimes left by the tide. S. Nilsson, however, in Scandinavia observed a living specimen in two or three fathoms of water moving something like a flat-fish with one side turned obliquely upwards.

RIBBONISM, the name given to an Irish secret-society movement, which began at the end of the 18th century in opposition to the Orangemen (q.v.), and which was represented by various associations under different names, organized in lodges, and recruited all over Ireland from the lowest classes of the people. The actual name of Ribbonism (for a reason born by its members) became attached to the movement later, about 1826; and, after it had grown to its height about 1835, it declined in force, and was practically at an end in its old form when in 1871 the Westmeath Act declared Ribbonism illegal. See also Ireland: History.

RIBBONS. By this name are designated narrow webs, properly of silk, not exceeding nine inches in width, used primarily for binding and tying in connexion with dress, but also now applied for innumerable useful, ornamental and symbolical purposes. Along with that of tapes, fringes and other small-wares, the manufacture of ribbons forms a special department of the textile industries. The essential feature of a ribbon loom is the simultaneous weaving in one loom frame of two or more webs, going up to as many as forty narrow fabrics in modern looms. To effect the conjoined throwing of all the shuttles and the various other movements of the loom, the automatic action of the power-loom is necessary; and it is a remarkable fact that the self-acting ribbon loom was known and extensively used more than a century before the famous invention of Cartwright. A loom in which several narrow webs could be woven at one time is mentioned as having been working in Dantzig towards the end of the 16th century. Similar looms were at work in Leiden in 1650, where their use gave rise to so much discontent and rioting on the part of the weavers that the States-General had to prohibit their use. The prohibition was renewed at various intervals throughout the century, and in the same interval the use of the ribbon loom was interdicted in most of the principal industrial centres of Europe. About 1676, under the name of the Dutch loom or engine loom, it was brought to London; and, although its introduction there caused some disturbance, it does not appear to have been prohibited. In 1745, John Kay, the inventor of the fly-shuttle, obtained, conjointly with Joseph Stell, a patent for improvements in the ribbon loom; and since that period it has benefited by the inventions applied to weaving machinery generally.

Ribbon-weaving is known to have been established near St Etienne (dep. Loire) so early as the 11th century, and that town has remained the headquarters of the industry. During the Huguenot troubles, ribbon-weavers from St Etienne settled at Basel and there established an industry which in modern times has rivalled that of the original seat of the trade. Creifeld is the centre of the German ribbon industry, the manufacture of black velvet ribbon being there a specialty. In England Coventry is the most important seat of ribbon-making, which is also prosecuted at Norwich and Leicester.
RIBEIRA, a town of north-western Spain, in the province of Corunna, on the extreme south-west of the peninsula formed between the river of Muros y Noya and Arosa Bay. Pop. (1900) 12,218. Ribeira is in a hilly country, abounding in wheat, wine, fruit, fish and game. Its port is Santa Eugenia de Ribeira, on Arosa Bay. The population is chiefly occupied in agriculture and in the rearing of silk-culture.

RIBEIRO, BERNARDIM (1482–1552), the father of bucolic prose and verse in Portugal, was a native of Torrão in the Alemtejo. His father, Damão Ribeiro, was implicated in the conspiracy against King John II. in 1484, and had to flee to Castile, whereupon young Bernardim and his mother took refuge with their relations António Zagalo and D. Ignez Zagalo at the Quinta dos Lobos, near Cintra. When King Manoel came to the throne in 1495, he rehabilitated the families persecuted by his predecessor, and Ribeiro was able to leave his retreat and return to Torrão. Meanwhile D. Ignez had married a rich landowner of Estremoz, and in 1503 she was summoned to court and appointed one of the attendants to the Infanta D. Beatriz. Ribeiro accompanied her, and through her influence the king took him under his protection and sent him to the university of Lisbon, where he studied from 1506 to 1512. When he obtained his degree in law, the king showed him further favour by appointing him to the post of Escribão da Câmara, or secretary, and later by bestowing on him the habit of the military order by São Thiago. Ribeiro's poetic career commenced with his coming to court, and his early verses are to be found in the Cancioneiro Geral of Garcia de Resende (q.v.). He took part in the historic Berço do Paço, or palace evening entertainments, which largely consisted of poetical improvisations; there he met and earned the friendship of the poets Sá de Miranda (q.v.) and Christovão Falcão (q.v.), who became his literary comrades and the confidants of his romance, in which hope deferred and bitter disappointment ended in tragedy. Ribeiro had early conceived a violent passion for his cousin, D. Joanna Zagalo, the daughter of his protectress, D. Ignez; but, though she seems to have returned it, her family opposed his marriage to a singer and dreamer with small means and prospects, and finally compelled her to wed a rich man, one Pero Gato. When the latter met a violent death shortly afterwards, D. Joanna retired to a house in the country, and it is alleged that Ribeiro visited her, and that their amour resulted in the birth of a child. All we know positively, however, is that in 1521 the lady went into seclusion in the convent of St Clare at Estremoz, where she fell a victim to a violent form of insanity, and that she died there some years later. It is further alleged that Ribeiro's conduct had caused a scandal which led the king to deprive him of his office and exile him. But the loss of position and income can have added very little to the poignant grief of such a true lover and profound idealist as Bernardim Ribeiro. He had poured out his heart in five beautiful elegies, the earliest in Portuguese, written in the popular octosyllabic verse; and now, hopeless of the future and broken in spirit, he decided to go to Italy, for a poet the land of promise. He started early in 1522, and travelled widely in the peninsula, and during his stay he wrote his moving knightly and pastoral romance Menina e Moça, in which he related the story of his unfortunate passion, personifying himself under the anagram of "Binnardar," and D. Ignez under that of "Aomi." When he returned home in 1524, the new king, John III., restored him to his former post, and it is said that he paid a last visit to his love at St Clare's convent and found her in a fit of raving madness. This no doubt preyed on a mind already broken, and Ribeiro's health gradually declined, and hastened the decline of his mental powers, which had already commenced. About 1534 a long illness supervened, and the years that elapsed between that year and his death may be described as the night of his soul. He was quite unable to fulfil the duties of his office, and in 1549 the king bestowed upon him a pension for his support; but he did not live long to enjoy it, for in 1552 he died insane in All Saints Hospital in Lisbon.

The Menina e Moça was not printed until after Ribeiro's death, and then first in Ferrara in 1554. On its appearance the book made such a sensation that its reading was forbidden, because, though it contained nothing heterodox, it disclosed a family tragedy which the allegory could not hide. It is divided into two parts, the first of which is certainly the work of Ribeiro, while as to the second opinion is divided, though Dr Theophilo Braga considers it genuine and explains its property from the lack of lucidity and order by the mental illness of the author. The first part has been ably edited by Dr José Pessanha (Oporto, 1891). Ribeiro's verses, including his five elegies, which for their sincerity of feeling, simple chaste and chaste form are unsurpassed in Portuguese literature, were reprinted in a limited edition de luxe by Dr Xavier da Cunha (Lisbon, 1886).

RIBEIRA, GIUSEPPE (1588–1656), commonly known as Lo Spagnoletto, or the Little Spaniard, a leading painter of the Neapolitan or partly of the Spanish school, was born near Valencia in Spain, at Xativa, now named S. Felipe, on 12th January 1588. His parents intended him for a literary or learned career; but he neglected the regular studies, and entered the school of the Spanish painter Francisco Ribalta. Fired with a longing to study art in Italy, he somehow made his way to Rome. Early in the 17th century a cardinal noticed him in the streets of Rome drawing from the frescoes on a palace façade; he took him under his ragged stripsling and housed him in his mansion. Artists had then already bestowed upon the alien student, who was perpetually copying all sorts of objects in art and in nature, the nickname of Lo Spagnoletto. In the cardinal's household Riber was comfortable but dissatisfied, and one day he decamped. He then betook himself to the famous painter Michelangelo da Caravaggio, the head of the naturalist school, called also-the school of the Tenebrois, or shadow-painters, owing to the excessive contrasts of light and shade which marked their style. The Italian master gave every encouragement to the Spaniard, but not for long, as he died in 1609. Riber, who had in the first instance studied chiefly from Raphael and the Caracci, had by this time acquired so much mastery over the tenebroso style that his performances were barely distinguishable from Caravaggio's own. He now went to Parma, and worked after the frescoes of Correggio with great zeal and efficiency: in the museum of Madrid is his "Jacob's Ladder," which is regarded as his chef-d'œuvre in this manner. From Parma Spagnoletto returned to Rome, where he resumed the style of Caravaggio, and shortly afterwards he migrated to Naples, which became his permanent home.

Riber was as yet still poor and inconspicuous, but a rich picture-dealer in Naples soon discerned in him all the stuff of a successful painter, and gave him his daughter in marriage. This was the turning-point in the Spaniard's fortunes. He painted a " Martyrdom of St Bartholomew," which the father-in-law exhibited from his balcony to a rapidly increasing and admiring crowd. The popular excitement grew to so noisy a height as to attract the attention of the Spanish viceroy, the Count de Monterey, and from this nobleman and from the king of Spain, Philip IV., commissions now flowed in upon Riber. With prosperity came grasping and jealous selfishness. Spagnoletto, chief in a triumvirate of greed, the "Cabal of Naples," his abettors being a Greek painter, Belsario Corenzio, and a Naples painter, Gimignani. Having got hold of Caraccio, determined that Naples should be an artistic monopoly; by intrigue, terrorizing and personal violence on occasion they kept aloof all competitors. Annibale Caracci, the Cavalier d'Arpino, Guido, Domenichino, all of them successively invited to work in Naples, found the place too hot to hold them. The cabal ended at the time of Caraccio's death in 1641.

The close of Riber's triumphant career has been variously related. If we are to believe Dominiol, the historian of Neapolitan art, he totally disappeared from Naples in 1648 and

"..."
RIBOT, A. F. J.—RIBOT, T. 285

was no more heard of—this being the sequel of the abduction by Don John of Austria, son of Philip IV., of the painter's beautiful only daughter Maria Rosa. But these assertions have not availed to displace the earlier and well-authenticated statement that Ribera died peaceably and wealthy in Naples in 1656. His own signature on his pictures is constantly "Jusepe de Ribera, Español." His daughter, so far from being disgraced by an abduction, married a Spanish nobleman who became a minister of the viceroy.

The pictorial style of Spagnoletto is extremely powerful.

In his earlier style, founded (as we have seen) sometimes on Caravaggio and sometimes on the wholly diverse method of Correggio, the study of Spanish and Venetian masters can likewise be traced. Along with his massive and predominating shadows, he retained from first to last great strength of local colouring. His forms, though ordinary and partly gross, are correct; the impression of his works gloomy and startling. He delighted in subjects of horror. Salvator Rosa and Luca Giordano were his most distinguished pupils; also Giovanni Do, Enrico Fiammingo, Michelangelo Fracanzani, and Aniello Falcone, who was the first considerable painter of battle-pieces. Among Ribera's principal works should be named "St Januarium Emerging from the Furnace," in the cathedral of Naples; the "Descent from the Cross," in the Neapolitan Certosa, generally regarded as his masterpiece; the "Adoration of the Shepherds" (a late work, 1650), now in the Louvre; the "Martyrdom of St Bartholomew," in the museum of Madrid; the "Pieta," in the sacristy of S. Martino, Naples. His mythologic subjects are generally unpleasant—such as the "Silenus," in the Studj Gallery of Naples, and "Venus Lamenting over Adonis," in the Corsini Gallery of Rome. The Louvre contains altogether twenty-five of his paintings; the National Gallery, London, two—one of them, a "Pieta," being an excellent though not exactly a leading specimen. He executed several fine male portraits; among others his own likeness, now in the collection at Altow Towers. He also produced twenty-six etchings, ably treated. For the use of his pupils, he drew a number of elementary designs, which in 1650 were etched by Francisco Fernandez, and which continued much in vogue for a long while among Spanish and French painters and students.

Besides the work of Dominici already referred to (1840-46), the Diccionario Histórico de Cen Bermudez is a principal authority for the life of works; also, de Lalangé, "Ribera (Histoire de quatre grands peintres)," 1888. (W. M. R.)

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842— ), French statesman, was born at St Omer on 7th February 1842. After a brilliant university at the centre of law, where he was laureat of the faculty of law, he rapidly made his mark at the bar. He was secretary of the conference of advocates and one of the founders of the Société de législation comparée. During 1875 and 1876 he was successively director of criminal affairs and secretary-general at the ministry of justice. In 1877 he made his entry into political life by the conspicuous part he played on the committee of legal resistance during the Broglie ministry, and in the following year he was returned to the chamber as a moderate republican member for Boulouge, in his native department of Pas-de-Calais. His impassioned yet reasoned eloquence gave him an influence which was increased by his articles in the Parlement in which he opposed violent measures against the unauthorized congregations. He devoted himself especially to financial questions, and in 1882 was reporter of the budget. He became one of the most prominent republican opponents of the Radical party, distinguishing himself by his attacks on the short-lived Gambetta ministry. He refused to vote the credits demanded by the Ferry cabinet for the Tonking expedition, and shared with M. Clémenceau in the overthrow of the ministry in 1885. At the general elections of 1886 he was one of the leaders of the opposition. He was returned in the Pas-de-Calais, and did not re-enter the chamber till 1887. After 1889 he sat for St Omer. His fear of the Boulangist movement converted him to the policy of "Republican Concentration," and he entered office in 1890 as foreign minister in the Fraycinet cabinet. He had an intimate acquaintance and sympathy with English institutions, and two of his published works—an address, Biographie de lord Erskine (1866), and Étude sur l'acte du 5 avril 1873 pour l'établissement d'une cour suprême de justice en Angleterre (1874)—deal with English questions; he also gave a fresh and highly important direction to French policy by the understanding with Russia, which was declared to the world by the visit of the French fleet to Cronstadt in 1891, and which subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (February—November 1892), and on its defeat, became himself president of the council, retaining the direction of foreign affairs. The government resigned in March 1893 on the refusal of the chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in January 1895, M. Ribot again became premier and minister of finance. On the 10th of June he was able to make the first official announcement of a definite alliance with Russia. On the 30th of October the government was defeated on the question of the Chemin de fer du Sud, and resigned office. The real reason of its fall was the mismanagement of the Madagascar expedition, the cost of which in men and money exceeded all expectations, and the neglect of the social conditions at home, as indicated by the strike at Carmaux. After the fall of the Ménès ministry in 1898 M. Ribot tried in vain to form a cabinet of "conciliation." He was elected, at the end of 1898, president of the important commission on education, in which he advocated the adoption of a modern system of education. The policy of the Waldeck-Rousseau ministry on the religious teaching congregations broke up the Republican party, and M. Ribot was among the seceders; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check. He actively opposed the policy of the Combes ministry and denounced the alliance with M. Jaurès, and on the 13th of January 1905 he was one of the leaders of the opposition which brought about the fall of the cabinet. Although he had been most violent in denouncing the anti-clerical policy of the Combes cabinet, he now announced his willingness to recognize a new régime to replace the Concordat, and gave the government his support in the establishment of the Associations cultuelles, while he secured some mitigation of the severities attending the separation. He was re-elected deputy for St Omer in 1906. In the same year he became a member of the French Academy in succession to the duchess of Mazarin. At the end of 1899, he was also made a member of the Academy of Moral and Political Science. In justification of his policy in opposition he published in 1905 two volumes of his Discours politiques.

RIBOT, THÉODULE (1823—1891), French painter, was born at Breteuil, in Eure, in 1823, and died at Bois Colombes, near Paris, in September 1891. A pupil nominally of Giaize, but more really of Ribera, of the great Flemings and of Chardin, Théodule Ribot had yet conspicuously his own noble and personal vision, his own intensity of feeling and rich sobriety of performance. Beginning to work seriously at art when twenty, and working for longer years, at twenty-three, he was an extremely old, Ribot crowded into the space of these five years of active practice very varied achievements; and he worked in at least three mediums, oil paint, pencil or crayon draughtsmanship and the needle of the etcher. His drawings were sometimes "complete in themselves," and sometimes fragmentary but powerful preparations for painted canvases. The etchings, of which there are only about a couple of dozen, are of the middle period of his practice; they show a diversity of method as well as of theme; the work in the well-nigh Velasquez-like "Frière"—a group of girl children—contrasting strongly with the pictures almost of outline alone, which ribot retained in the brilliant little group of prints which record his vision of the character and humours of cooks and kitchen-boys. In etching, the method varied with the theme—not with the period. It is quite otherwise with the paintings. Here the earlier work, irrespective of its subject, is the drier
and the more austere; the later work, irrespective of its subject, the freer and broader. But even in that which is quite early there is a curious and impressive intensity of conception and presentation. His visions of elderly women and young girls remain upon the memory. His women, wrinkled and worn, have had the experience of a hard and grinding world; his children, his young girls, are the quintessence of innocence and happy hopefulness, and life is a jest to his boys. His religious pieces, in which Ribera affected him, have conviction and force. Into portraits and into character studies, but more especially into genre subjects, Ribot was apt to introduce Still-life, and to make much of it. Herein, as in his sense of homeliness, he resembled Chardin. But again, Chardin-like, he painted Still-life for its own sake, by itself, and always with an extraordinary sense of the solidity and form, the texture and the hue, and, it must be added also, the very charm of matter.

RIBOT, ThÉodule Armand (1839–1903). French psychologist, was born at Guingamp on the 8th of December 1839, and was educated at the Lycée de St Brieuc. In 1856 he began to teach, and was admitted to the École Normale Supérieure in 1862. In 1885 he gave a course of lectures on “Experimental Psychology” at the Sorbonne, and in 1888 was appointed professor of that subject at the College of France. His thesis for his doctor’s degree, republished in 1882, Héritidé: étude psychologique (4th ed., 1889), is his most important and best known book. Following the experimental and synthetic methods, he has brought together a large number of instances of inherited peculiarities; he pays particular attention to the physical elements of mental life, ignoring all spiritual or non-material factors in man. In his work on La Psychologie angloise contemporaine (1870), he shows his sympathy with the sensationalist school, and again in his translation of Herbert Spencer’s Principles of Psychology. Besides numerous articles, he has written on Schopenhauer, Philosophie de Schopenhauer (1874; 7th ed., 1896), and on the contemporary psychology of Germany (La Psychologie allemande contemporaine, 1879; 13th ed., 1898), also four little monographs on Les Maladies de la mémoire (1881; 13th ed., 1886); De la volonté (1885; 14th ed., 1899); De la personnalité (1885; 8th ed., 1899); and La Psychologie de l’attention (1889), which supply useful data to the student of mental disease.

Other works by him are:—La Psychologie des sentiments (1869); L’Homme et le travail (1869); L’Homme et les industries idées modernes et européennes; Essai sur la profession de l’inventeur créatrice (1900); La Logique des sensments (1904); Essai sur les passions (1906). Of the above the following have been translated into English:—English Psychology (1873); Heredity: a Psychology of the descendents, and the races; Les dérives sociales (1875); Diseases of Memory: An Essay in the Positive Psychology (1882); Diseases of the Will (New York, 1884); German Psychology of to-day, tr. J. M. Baldwin (New York, 1886); The Psychology of Attention (Open Court Publishing Company, Chicago, 1890); Diseases of Personality (Chicago, 1895); The Psychology of the Emotions (1897); The Evolution of General Ideas, tr. F. A. Welby (Chicago, 1899); Essay on the Creative Imagination, tr. A. H. N. Baron (1906).

RICARD, Louis Gustave (1823–1873). French painter, was born in Marseilles in 1823, and studied first under Auber in his native town, and subsequently under Coignet in Paris. The formation of his mastery, distinguished style in portraiture was, however, due rather to ten years’ intelligent copying of the old masters at the Louvre and at the Italian galleries, than to any school training. He was a master of technique, and his portraits—about two hundred—reveal an extraordinary insight into the character of his sitters. Nevertheless, for some time after his death his name was almost forgotten by the public, and it is only of quite recent years that he has been conceded the position among the leading masters of the modern French school which is his due. A portrait of himself, and one of Alfred de Musset, are at the Luxembourg Gallery. Among his best known works are the portrait of his mother, and those of the painters Fromentin, Heilbuth and Chaplin.

RICARDO, David (1772–1823). English economist, was born in London on the 19th of April 1772, of Jewish origin. His father, who was of Dutch birth, bore an honourable character and was a successful member of the Stock Exchange. At the age of fourteen Ricardo entered his father’s office, where he showed much aptitude for business. About the time when he attained his majority he abandoned the Hebrew faith and conformed to the Anglican Church, a change which seems to have been connected with his marriage to Miss Wilkinson, which took place in 1793. In consequence of the step thus taken he was separated from his family and thrown on his own resources. His ability and uprightness were known, and he at once entered on such a successful career in the profession to which he had been brought up that at the age of twenty-five, we are told, he was already rich. He now began to occupy himself with scientific pursuits, and gave some attention to mathematics as well as to chemistry and mineralogy; but, having met with Adam Smith’s great work, he threw himself with ardour into the study of political economy.

His first publication (1809) was The High Price of Bullion a Proof of the Depreciation of Bank Notes. This tract was an expansion of a series of articles which the author had contributed to the Morning Chronicle. It gave a fresh stimulus to the controversy, which had for some time been discontinued, respecting the resumption of cash payments, and indirectly led to the appointment of a committee of the House of Commons, commonly known as the Bullion Committee, to consider the whole question. The report of the committee asserted the same views which Ricardo had put forward, and recommended the repeal of the Bank Restriction Act. Notwithstanding this, the House of Commons declared in the teeth of the facts that paper had undergone no depreciation. Ricardo’s first tract, as well as another on the same subject, attracted much attention.

In 1811 he made the acquaintance of James Mill, whose introduction to him arose out of the publication of Mill’s tract entitled Commerce Defended. Whilst Mill doubtless largely affected his political ideas, he was, on his side, under obligations to Ricardo in the purely economic field; Mill said in 1823 that he himself and J. R. M’Culloch were Ricardo’s disciples, and, he added, his only genuine one. In 1815, when the Corn laws were under discussion, he published his Essay on the Influence of a Low Price of Corn on the Profits of Stock. This was directed against a recent tract by Malthus entitled Grounds of an Opinion on the Policy of Restraining the Free Importation of Foreign Corn. The reasonings of the essay are based on the theory of rent which has often been called by the name of Ricardo; but the author distinctly states that it was not due to him. “In all that I have said concerning the origin and progress of rent I have briefly repeated, and endeavoured to elucidate, the principles which Malthus has so ably laid down on the same subject in his Inquiry into the Nature and Progress of Rent.” We now know that the theory had been fully stated, before the time of Malthus, by Anderson; it is in any case clear that it was no discovery of Ricardo. Ricardo states in this essay a set of propositions, most of them deductions from the theory of rent, which are in substance the same as those afterwards embodied in the Principles, and regarded as characteristic of his system, such as that increase of wages does not raise prices; that profits can be raised only by a fall in wages and diminished only by a rise in wages; and that profits, in the whole progress of society, are determined by the cost of the production of which it is raised at the greatest expense. It does not appear that, excepting the statement of the nature of fundamantal doctrine, as distinct from the special subjects of banking and taxation, is laid down in the Principles which does not already appear in this tract. We find in it, too, the same exclusive regard to the interest of the capitalist class, and the same identification of their interest with that of the whole nation, which are generally characteristic of his writings.
In the *Proposals for an Economical and Secure Currency* (1816) he first disposed of the chimera of a currency without a specific standard, and pronounces in favour of a single metal, with a preference for silver, as the standard.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. The fundamental doctrine of this work is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production,—a proposition not new, nor, except with considerable limitation and explanation, true, and of little practical use, as "amount of labour" is a vague expression, and the thing intended is incapable of exact estimation. Ricardo's theorem of the demand for the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit.

These theorems are too absolutely stated, and require much modification to adapt them to real life. His theory of foreign trade has been embodied in the two propositions: "(1) International values are not determined in the same way as domestic values; (2) the medium of exchange is distributed so as to bring the sum to which it would be in if it were conducted by barter."

A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question; Ricardo develops and criticizes his results. The conclusions at which he arrives are in the main as follows: a tax on raw produce falls on the consumer, but will also diminish profits. A tax on rents the landlord in an honoraria will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist.

In 1819 Ricardo, having retired from business and become a landed proprietor, entered parliament, as member for Portarlington. He was at first diffident and embarrassed in speaking, but gradually overcame these difficulties, and was heard with much attention and deference, especially when he addressed the House on economic questions. He probably contributed in a considerable degree to bringing about the change of opinion on the question of free trade which ultimately led to the legislation of Sir Robert Peel on that subject.

In 1820 he contributed to the supplement of the *Encyclopædia Britannica* (6th ed.) an "Essay on the Funding System." In this besides giving an historical account (based on Dr Robert Hamilton's valuable work *On the National Debt*, 1813, 3rd ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans.

In 1822 he published a tract *On Protection to Agriculture*, which is an able application to controversy of the general principles laid down in his systematic work. Its arguments and conclusions are therefore subject to the same limitations which those fundamental principles require.

In his *Plan for the Establishment of a National Bank*, published posthumously in 1824, he proposes that the issue of the paper currency should be taken out of the hands of the Bank of England and vested in commissioners appointed by the government. The tract describes in detail the measures to be adopted for the introduction and working of the system. A certain step towards realizing the objects of his scheme, though on a different footing, was taken by the Act of 1819, by which the discount business of the bank was separated from the issue department.

Ricardo died on the 11th of September 1823, at his seat (Gatcombe Park) in Gloucestershire, from a cerebral affection resulting from disease of the ear. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1818) that he knew not a better man, and on the occasion of his death published a highly eulogistic notice of him in the *Morning Chronicle*. A lecture ship on political economy, to exist for ten years, was founded in commemoration of him, M'Culloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings as the *Principles*, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was incapable of being a social philosopher in the wider sense, like Adam Smith or John Mill. He had great acuteness, but little breadth. For any large treatment of moral and political questions he seems to have been alike by nature and preparation unfitted; and there is no evidence of his having had any but the most ordinary and narrow views of the great social problems. He shows no trace of that hearty sympathy with the working classes which breaks out in several passages of the *Wealth of Nations*; we ought, perhaps, with Held, to regard it as a merit in Ricardo that he does not cover with a flood of his deficiency in warmth of sentiment. The idea of the active capitalist having any duty towards his employes never seems to occur to him; the labourer is, in fact, merely an instrument in the hands of the capitalist, a pawn in the game he plays.

He first introduced into economics on a great scale the method of deduction from a priori assumptions. The conclusions so arrived at have often been treated as if they were directly applicable to real life, and indeed to the economic phenomena of all times and places. But the truth of Ricardo's theorems is now by his warmest admirers admitted to be hypothetical only. Bagehot seems to have been in believing that the limitations to which his doctrines are subject. Be this as it may, we now see that the only basis on which these doctrines could be allowed to stand as a permanent part of economic science is that on which they are placed by Roscher, namely, as a stage in the preparatory work of the economist, who, beginning with such abstractions, afterwards turns from them, not in practice merely, but in the completed theory, to real life and men as they actually are or have been.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics into which moral ideas (beyond the plain prescriptions of honesty) can scarcely be said to enter, and where the operation of purely mercantile principles is most immediate and invariable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. M'Culloch in 1846. The *Principles* have been edited (with an introduction, bibliography and notes) by E. C. K. Gonner, 1891. See also Letters to H. Trower and Others, ed. J. Bonar and J. H. Holland, 1899; Letters to J. R. M'Culloch, ed. J. H. Holland, 1895; Letters to T. R. Malthus, ed. J. Bonar, 1887. A French translation of the *Principles* by Constanpio, with notes by Say, appeared in 1821; the whole works, translated by Constanpio and Ponteyeraud, form vol. xxi. (1847) of the *Collection des principaux économistes*, where they are accompanied by the notes of Say, Malthus, Sismondi, Rosi, &c. The *Principler* was first "naturalized" in Germany, says Roscher (though another version by Von Schmid had pre- viously appeared) to "Wallraf-Baud-Baert-Bertark in his David Ricardo's *Grundgesetze der Volkswirtschaft und der Besteuerung übersez und erläuter*(1837), which Roscher highly commends, not only for the excellence of the rendering, but for the value of the exposa- tion and criticisms which it contains. The word "capital" was introduced in Germany by J. S. Mill, from Ricardo's *On the Capital", 1817. 

**RICASOLI, BETTINO, BARON (1809–1880). Italian statesman, was born at Broglio on the 19th of March 1809. Left an orphan at eighteen, with an estate heavily encumbered, he was by special decree of the grand duke of Tuscany declared of age, and...**
entrusted with the guardianship of his younger brothers. Interrupting his studies, he withdrew to Broglio, and by careful management disencumbered the family possessions. In 1847 he founded the journal *La Patria*, and addressed to the grand duke a memorial suggesting remedies for the difficulties of the state. In 1848 he was elected Gonfaloniere of Florence, but resigned on account of the anti-Liberal tendencies of the grand duke. As Tuscan minister of the interior in 1859 he promoted the union of Tuscany with Piedmont, which took place on the 12th of March 1860. Elected Italian deputy in 1861, he succeeded Cavour in the premiership. As premier he admitted the Garibaldian volunteers to the regular army, revoked the decree of exile against Mazzini, and attempted reconciliation with the Vatican; but his efforts were rendered ineffectual by the *non possumus* of the pope. Disdainful of the intrigues of his rival Rattazzi, he found himself obliged in 1862 to resign office, but returned to power in 1866. On this occasion he refused Napoleon III.'s offer to send Venetia to Italy, on condition that Italy should abandon the Prussian alliance, and also refused the Prussian decoration of the Black Eagle because Lamarmora, author of the alliance, was not to receive it. Upon the departure of the French troops from Rome at the end of 1866 he again attempted to conciliate the Vatican with a convention, in virtue of which Italy would have restored to the Church the property of the suppressed religious orders in return for the gradual payment of £24,000,000. In order to mollify the Vatican he conceded the *exequatur* to forty-five bishops inmical to the Italian régime. The Vatican accepted his proposal, but its Italian Chamber proved refractory, and, though dissolved by Riccaldi, returned more hostile than before. Without waiting for a vote, Riccaldi resigned office and thenceforward practically disappeared from political life, speaking in the Chamber only upon rare occasions. He died at Broglio on the 23rd of October 1880. His private life and public career were marked by the utmost integrity, and by a rigid austerity which earned him the name of the "iron baron." In spite of the failure of his ecclesiastical scheme, he remains one of the most noteworthy figures of the Italian Risorgimento.

**RICCATI, JACOPO FRANCESCO**, Count (1676-1754), Italian mathematician, was born at Venice on the 8th of May 1676, and died at Treviso on the 15th of April 1754.

He studied at the university of Padua, where he graduated in 1696. His favourite pursuits were scientific, and his authority on all questions of practical science was referred to by the senate of Venice. He corresponded with many of the European savants of his day, and contributed largely to the *Acta Eruditorum* of Leipzig. He was offered the presidency of the academy of science of St Petersburg; but he declined, preferring the leisure and independence of life in Italy. Riccaldi's name is known in connexion with his problem called Riccati's equation, published in the *Acta Eruditorum*, September 1724. A very complete account of this equation and its various transformations was given by J. W. L. Glaisher in the *Phil. Trans.* (1881).

After Riccaldi's death his works were collected by his sons and published (1758) in four volumes. His sons, Vincenzo (1707-1775) and Giordano (1709-1790), inherited his talents. The former was professor of mathematics at Bologna, and published, among other works, a treatise on the infinitesimal calculus. Giordano was distinguished both as a mathematician and an archaeologist.

**RICCI, MATTEO** (1552-1610), Italian missionary to China, was born of a noble family at Macerata in the March of Ancona on the 7th of October 1552. After some education at a Jesuit college in his native town he went to study law at Rome, where in 1571, in opposition to his father's wishes, he joined the Society of Jesus.

In 1577 Ricci and other students offered themselves for the East Indian missions. Ricci, without visiting his family to take leave, proceeded to Portugal. His comrades were Ruperto Acquaviva, Nicolao Spinola, Francesco Pasio and Michele Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit annals. They arrived at Goa in September 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several fruitless attempts had been made by Xavier, and since his death, to introduce the Church into China,—by Melchior Nunes of the Jesuit Society operating from Sanchian in 1555; by Gaspar da Cruz, a Dominican, in that or the following year; by the Augustinians under Martin Herrada, 1575; and in 1579 by the Franciscans led by Pedro d'Alfaro. In 1571 a house of the Jesuits had been set up at Macao (where the Portuguese were established in 1557), but their attention was then occupied with Japan, and it was not till the arrival at Macao of Alessandro Vallignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chow-king-fu on the Si-Kiang or West River of Canton, where the vicerey of the two provinces of Kwang-tung and Kwang-si then had his residence, and by his favour were able to establish themselves there for some years. Their proceedings were very cautious and tentative; they excited the curiosity and interest of even the more intelligent Chinese by their clocks, their globes and maps, their books of European engravings, and by Ricci's knowledge of mathematics, including dialling and the projection of maps. They conciliated some influential friends, and their reputation spread widely in China. This was facilitated by the Chinese system of transfer of public officers from one province of the empire to another, and in the later movements of the missionaries they frequently met with one and another of their old-acquaintances in office, who were more or less well disposed. Eventually troubles at Chow-king compelled them to seek a new home; and in 1589, with the vicerey's sanction, they migrated to Chang-chow in the northern part of Kwang-tung, not far from the well-known Melling Pass.

During his stay here Ricci was convinced that a mistake had been made in adopting a dress resembling that of the boxers, a class who were the objects either of superstition or of contempt. With the sanction of the visitor it was ordered that in future the missionaries should adopt the costumes of Chinese literates and, in fact, they before long adopted Chinese manners altogether.

Chang-chow, as a station, did not prove a happy selection, but it was not till 1595 that an opportunity occurred of travelling northward. For some time Ricci's residence was at Nan-chang-fu, the capital of Kiang-si; but in 1598 he was able to proceed under favourable conditions to Nan-kang, and thence for the first time to Peking, which had all along been the goal of his missionary ambition. But circumstances were not then propitious, and the party had to return to Nan-kang. The fame of the presents which they carried had, however, reached the court, and the Jesuits were summoned north again, and on the 24th of January 1601 they entered the capital. Wan-li, the emperor of the Ming dynasty, in those days lived in seclusion, and saw no one but his women and the eunuchs. But the missionaries were summoned to the palace; their presents were immensely admired, and the emperor had the curiosity to send for portraits of the fathers themselves.

They obtained a settlement, with an allowance for subsistence, in Peking, and from this time to the end of his life Ricci's estimation among the Chinese was constantly increasing, as was also that of his name and the time that the representatives of the Church had had to introduce the new religion to the land. Visitors thronged the mission house incessantly; and inquiries came from all parts of the empire respecting the doctrines which he taught, or the numerous Chinese publications which he issued. This in itself was a great burden, as Chinese composition, if wrong impressions are to be avoided, demands extreme care and accuracy. As head of the mission, which now had four stations

1 The island (properly Chang-chuen) on which the Portuguese had a temporary settlement before they got Macao, and on which F. Xavier died in 1552.
in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. New converts had to be attended to—always welcomed, and never hustled away. Besides these came the composition of his Chinese books, the teaching of his people and the maintenance of the record of the mission history which had been enjoined upon him by the general of the order, and which he kept up to the last. These were long and incessant. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month. His colleague Pantaja applied to the emperor for a burying-place outside the city. This was granted, with the most honourable official testimonies to the reputation and character of Ricci; and a large building in the neighbourhood of the city was at the same time bestowed upon the mission for their residence.

Ricci's work was the foundation of the subsequent success attained by the Roman Catholic Church in China. When the missionaries of other Roman Catholic orders made their way into China, twenty years later, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits, a matter in which Ricci's action and policy had given the tone to the mission in China—though in fact that tone was rather inherent in the Jesuit system than the outcome of individual character, for controversies of an exactly parallel nature arose two generations later in southern India, between the Jesuits and Capuchins, regarding what were called "Malabar rites."  

The controversy thus kindled in China burned for considerably more than a century with great fierceness. 1 The chief points were: (1) The lawfulness and expediency of certain terms employed by the Jesuits in naming God Almighty, such as Tien, "Heaven," and Shang-li, "Supreme Ruler" or "Emperor," instead of Tien-Chu, "Lord of Heaven," and in particular the erection of inscribed tablets in the churches, on which these terms were made use of; 2 (2) in respect to the ceremonial offerings made in honour of Confucius, and of personal ancestors, which Ricci had recognized as merely "civil" observances; (3) the erection of tablets in honour of ancestors in private houses; and (4), more generally, sanction and favour accorded to ancient Chinese sacred books and philosophical doctrine, as not really trespassing on Christian faith.

Probably no European name of past centuries is so well known in China as that of Matteo Ricci, in the form in which the name of Ricci (Ri-cci Mat-teo) was adapted to Chinese usage, and by which he appears in Chinese records. 8 The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's China Illustrata, and also in Abel Rémusat's Nouveaux Mélanges Asiatiques (ii. 213–15). They are said to display an aptitude for clothing ideas in a Chinese dress very rare and remarkable in a foreigner. One of the first which attracted

1 The list of the literature of this controversy occupies forty-one columns in M. Cordier's excellent Bibliographie de la Chine.

3 The name comes forward prominently in the mouth of the emperor Kang-hi, in a dialogue which took place between him and Monsgr. Maigrot, the leader of the anti-Jesuit movement (mentioned in Browning's lines referred to above), at the summer residence in Tartary, August 1706—a dialogue which the Jesuits have reported to the public:

"Emperor, 'Tell me why do the people call me Van-sui (10,000 years).' The Most Reverend (i.e. Maigrot). 'To express their desire for your Majesty's long life. Emperor. 'But you. Your Chinese words are not always to be taken literally. We pay cult to Confucius and to the dead to express our respect for them. How is that inconsistent with your religion? When did it begin to be so? When was the first time that your Emperor's Ly-Mattheu? 'The Most Reverend, turning to P. Parenin, whispers, 'Who's he?' and learning that it was P. Matteo Ricci, . . . answered the emperor: 'I have not read that book.' Emp. 'Ly-Mattheu came here in 1582, and the first time that our intercourse was opened, and before their time China never heard anything of the Incarnate, anything of Tien-chu, who had not become incarnate in this part of the world. Why then, if it was lawful to call God Tien before Ly-Maathieu's time, should it be improper now?' —Epistola de E ventu Apostolicae Legationis, scripta a PP. Missionariis . . . ad Praepositum Generalem S. J., An. 1706, 1 November.

attention and reputation among Chinese readers was a Treatise upon Friendship, in the form of a dialogue containing short and pithy paragraphs; this is stated in the De Expeditione to have been suggested during Ricci's stay at Nan-chang by a conversation with the prince of Kien-ngan, who asked questions regarding the laws of friendship in the West.

In the early part of his residence at Peking, when enjoying constant intercourse with scholars of high position, Ricci brought out the Tien-chu shih-i, or "Veritable Doctrine of the Lord of Heaven," which deals with the divine character and attributes under eight heads. "This work," says A. Wylie, "contains some acute reasoning in support of the propositions laid down, but the doctrine of faith in Christ is very slightly touched upon. The teachings of Buddhism are vigorously attacked, whilst the author tries to draw a parallel between Christianity and the teachings of the Chinese literati."

In 1604 Ricci completed the Erh-shih-wu yen, a series of short articles of moral bearing, but exhibiting little of the essential doctrines of Christianity. Chi-jen shih yen is another of his productions, completed in 1608, and consisting of a record of ten conversations held with Chinese of high position. The subjects are: (1) Years past no [longer ours; (2) Man a sojourner on earth; (3) Advantage of frequent contemplation of eternity; (4) Preparation for judgment by such contemplation; (5) The good man not desirous of talking; (6) Abstinence, and its distinction from the prohibition to take life; (7) Self-examination and self-reproof inconsistent with inaction; (8) Future reward and punishment; (9) Prying into futurity hastens calamity; (10) Wealth with covetousness more wretched than poverty with contentment. To this work is appended a translation of eight European hymns, with elucidations, written in 1600.

Some of the characteristics thus indicated may have suggested the bitterness of attacks afterwards made upon Ricci's theology. An example of these is found in the work called Anecdotes sur l'Estat de religion dans la Chine (Paris, 1733–35), the author of which (Abbe Villers) speaks of the Tien-chu shih-i in this fashion: "The Jesuit was also so ill versed in the particulars of the faith that, as the holy bishop of Canon, Monsgr. Maigrot, says of him, one need merely read his book on the true religion to convince oneself that he had never imbued the first elements of theology."

Ricci's pointed attacks on Buddhism, and the wide circulation of his books, called forth the opposition of the Buddhist clergy. One of the ablest who took their part was Chu-hang, a priest of Hang-chow, who had abandoned the literary status for the Buddhist cloister. He wrote three articles against the doctrine of the missionaries. These were brought to Ricci's notice in an ostensible tone of candour by Yu-chun-he, a high mandarin at the capital. This letter, with Ricci's reply, the three Buddhist declamations and Ricci's confutation, were published in a collected form by the Christian Sen-Kwang Ke.

Another work of Ricci's which attracted attention was the Hsi-kuo fa, or "Art of Memory as practised in the West." Ricci himself was a great expert in memoria technica, and astonished the Chinese by his performances in this line. He also wrote or edited various Chinese works on geography, the celestial and terrestrial spheres, geometry and arithmetic. And the detailed history of the mission was drawn out by him, which after his death was brought home by P. Nicolas Trigault, and published at Augsburg, and later in a complete form at Lyons under the name De Expeditione Christiana apud Sinas Suecicis, ab Soc. Jesu, Ex. Mat. Ricci ejusdem Societatis Commentariis, ab ult. habito, adding many interesting notes on China and the Chinese.

Among the scientific works which Ricci took into China was a set of maps, which at first created great interest, but afterwards disgust when the Chinese came to perceive the insignificant place assigned to the "Middle Kingdom," thrust, as it seemed, into a corner, instead of being set in the centre of the world like the gem in a ring. Ricci, seeing their dissatisfaction, set about constructing a map of the hemisphere on a great scale, so adjusted that China, with its subject states, filled the central

XXIII. 10
area, and, without deviating from truth of projection, occupied a large space in proportion to the other kingdoms gathered round it. All the names were then entered in Chinese calligraphy. This map obtained immense favour, and was immediately engraved at the expense of the viceroy and widely circulated.

In the accompanying cut we have endeavoured to portray this map. The projection adopted is a perspective of the hemisphere, as viewed from a point at the distance of one diameter from the surface, and situated on the production of the radius which passes through the intersection of 11° E. long. (Greenwich) with 30° N. lat. Something near this must have been Lima-tea’s projection. With a vertex much more distant the desired effect would be impaired, and with one nearer neither of the poles would be seen, whilst the exaggeration of China would have been too gross for a professed representation of the hemisphere.

The chief facts of Ricci’s career are derived from Trigault; some contemporary works on the rites controversy have also been consulted; in the notice of Ricci’s Chinese writings valuable matter has been derived from Notes on Chinese Literature by A. Wylie (London and Shanghai, 1867). A number of Ricci’s letters are extant in the possession of the family, and access to them was afforded to Giuseppe La Farina, author of the work called La China, considerata nella sua Storia, &c. (Florence, 1843), by the Marchese Amico Ricci of Macerata, living at Bologna. La Farina’s quotations contain nothing of interest. There is a curious Chinese account of Ricci published by Dr Breitstecher in the China Review, iv. 391 sq.

RICCIARELLI, DANIELE (1599-1660), Italian artist, generally called, from the place of his birth, DANIELE DA VOLterra, studied painting under Sodoma and Peruzzi. Settling in Rome, he received abundant encouragement. His constant friend, Michelangelo, recommended him on all possible occasions, and he was commissioned to beautify with works of art a chapel in the church of the Trinità, to paint in the Farnese Palace, to execute certain decorations in the Palazzo de’ Medici at Navona, and to begin the stucco work and the pictures in the Hall of the Kings. Towards the close of his life he turned his attention to statuary. His last work was a bronze horse intended for an equestrian statue of Henry II. of France. He died in 1656. The principal extant works of Ricciarelli are at Rome. These are a “St John the Baptist” in the picture gallery of the Capitol, a “Saviour bearing the Cross” in the Palazzo Rospigliosi, and a “Descent from the Cross,” his masterpiece, in the church of Trinità de Monti. There is also an “Elijah” at Volterra.

RICCOBONI, MARIE JEANNE (1714-1792), whose maiden name was Laboras de Mézières, was born at Paris in 1714. She married in 1735 Antoine François Riccoboni, a comedian and dramatist, from whom she soon separated. She herself was an actress, but did not succeed on the stage. Her works are Lettres de mistress Fanny Butler (1757); the remarkable Histoire du marquis de Cressy (1758); Milady Juliette Catesby (1759-1760), like her other books, in letter form; Ernestine (1768), which La Harpe thought her masterpiece; and three series of Lettres in the names of Adelaide de Dammarin (comtesse de Sancerre) (2 vols., 1766), Elizabeth Sophie de Vallière (2 vols., 1772), and Milord Rivers (2 vols., 1776). She obtained a small pension from the crown, but the Revolution deprived her of it, and she died on the 6th of December 1792 in great indigence. Besides the works named, she wrote a novel (1762) on the subject of Fielding’s Amelia, and supplied in 1765 a continuation (but not the conclusion sometimes erroneously ascribed to her) of Marivaux’s unfinished Marianne.

All Madame Riccoboni’s work is clever, and there is real pathos in the part. It is among the most eminent examples of the sensibility novel, of which no examples but Sterne’s have kept their place in England, and that not in virtue of their sensibility. A still nearer parallel may be found in the work of MacKenzie. Madame Riccoboni’s is the more interesting an especial offender. They afforded her an immense aid in imposing themselves and the like. The principal edition of her complete works is that of Paris (6 vols., 1818). The chief novels appear in a volume of Garnier’s Bibliothèque encyclopédique (Paris, 1865).

See Julia Kavanagh, French Women of Letters (2 vols., 1862), where an account of her novels is given; J. Fleury, Marivaux et le martheaucrad (Paris, 1881); J. M. Quérard, La France littéraire (3 vols., 1835); and notices by La Harpe, Grim and Diderot prefixed to her Œuvres (9 vols., Paris, 1826).

RICE, EDMUND IGNATIUS (1762-1844), Irish philanthropist, founder of the “Irish Christian Brothers,” was born at Westcourt, near Callen, Kilkenny, on the 1st of June 1762. He entered the business of his uncle, an export provision merchant in Waterford, in 1779 and succeeded him in 1790. In 1796 he established an organization for visiting and relieving the poor, and in 1802 began to educate the poor children of Waterford, renting a school and supporting two teachers. In 1803 he gave up his business and, joined by a number of friends, began to systematize his plans. Others, like-minded, opened schools at Dungravan and Carrick-on-Suir. The little society numbered two in 1799, and in 1817 Waterford took religious vows on behalf of their bishop, assumed a “habit” and adopted an additional Christian name, by which, as by the collective title “Christian Brothers,” they were thenceforth known. Schools were established in Cork (1811), Dublin (1812), and Thurles and Limerick (1817). In 1820 Pope Pius VII. issued a brief sanctioning the order of “Religious Brothers of the Christian Schools (Ireland),” the members of which were to be bound by vows of obedience, chastity, poverty and perseverance, and to give themselves to the free instruction, religious and literary, of male children, especially the poor. The heads of houses were to elect a superior general, and Rice held this office from 1822 to 1838, during which time the institution extended to several English towns (especially in Lancashire), and the course of instruction grew out of the primary stage. Rice died on the 20th of August 1844. The Irish Christian Brothers have some hundred houses in Ireland with 300 attached schools and over 30,000 pupils. There are also industrial schools and orphanages, and the institute has branches in Australia, India, Gibraltar and Newfoundland.

RICE, JAMES (1843-1882), English novelist, was born at Northampton on the 26th of September 1843. Educated at Queens’ College, Cambridge, where he graduated in law in 1867, he was called to the bar at Lincoln’s Inn in 1871. In the meantime (1868) he had bought Once a Week, which proving a losing venture for him, but which brought him into touch with Walter Besant, a contributor [see Besant’s preface to the Library Edition (1887) of Ready-money Mortiboy]. They ensued a close friendship and a literary partnership between the two men which lasted ten years until Rice’s death, and resulted in a large number of successful novels. The first of them, published anonymously, Rice being responsible for the central figure and the leading situation, was Ready-money Mortiboy (1872), dramatized by them later and unsuccessfully produced as a piece entitled My Little Girl (1873); With Harp and Crown (1874); This Son of Vulcan (1876); The Golden Butterfly (1876), the most popular of their joint productions; The Monks of Thelma (1878); By Celia’s Arrow (1878); The Seamy Side (1880); The Chaplain of the Fleet (1881); Sir Richard Whittington (1881), and a large number of short stories, some of them reprinted in The Case of Mr Lucraft, &c. (1876), ‘Twas in Trafalgar’s Bay, &c. (1879), and The Ten Years’ Tenant, &c. (1881).

James Rice died at Redhill on the 26th of April 1882.
The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hillsides. The cultivators make two principal divisions according as the sorts are early or late. Rice has been cultivated from time immemorial in tropical countries. According to Stanislas Julien a ceremonial ordinance was established in China by the emperor Chin-nung 2800 years B.C., in accordance with which the emperor sows the rice himself while the seeds of four other kinds may be sown by the princes of his family. This fact, joined to other considerations, induced Alphonse de Candolle to consider rice as a native of China. It was very early cultivated in India, in some parts of which country, as in tropical Australia, it is, as we have seen, indigenous. It is not mentioned in the Bible, but its culture is alluded to in the Talmud. There is proof of its culture in the Euphrates valley and in Syria four hundred years before Christ. Crawford, in phyleological grounds, considers that rice was introduced into Persia from Southern India. The Arabs carried the plant into Spain. Rice was first cultivated in Italy near Pisa in 1468. It was not introduced into S. Carolina until 1700, and then, it is said, by accident, although at one time the southern United States furnished a large proportion of the rice introduced into commerce. Rice sports into far more varieties than any of the corns familiar to Europeans; for some varieties grow in the water and some on dry land; some come to maturity in three months, while others take four and six months to do so. A very full account of the cultivation of rice in India will be found in Sir George Watt's "Dictionary of the Economic Products of India.

Rice constitutes one of the most important articles of food in all tropical and subtropical countries, and is one of the most prolific of all crops. The rice yields best on low lands subject to occasional inundations, and thus enriched by alluvial deposits. An abundant rainfall during the growing season is also a desideratum. Rice is sown broadcast, and in some districts is transplanted after a fortnight or three weeks. No special rotation is followed; indeed the soil is more suited for rice is ill adapted for any other crop. In some cases little manure is employed, but in others abundance of manure is used. No special tillage is required, but weeding and irrigation are requisite. Rice in the husk is known as "paddy." On cutting across the grain of rice and examining it under the microscope, first the flattened and dried cells of the husk are seen, and then one or two layers of cells elongated in a direction parallel to the length of the seed, which contain the gluten or nitrogenous matter. Within these, and forming by far the largest portion of the seed are large polygonal cells filled with very numerous and very minute angular starch grains. Rice is not so valuable a food as some other cereals, inasmuch as the proportion of nitrogenous matter (gluten) is less. Partially gives only 7% of gluten in rice as compared with 22% in the finest wheat, 14 in oats and 12 in maize. The percentage of potash in the ash is as 18 to 23 in wheat. The fatty matter is also less in proportion than in other cereals. Rice, therefore, is chiefly a farinaceous food, and requires to be combined with fatty and nitrogenous substances, such as milk or meat gravy, to satisfy the requirements of the system.

A large proportion of the rice brought to Europe is used for starch-making, and some is taken by distillers of alcohol. Rice is also the source of a drinking spirit in India, known as arrack, and the national beverage of Japan—sake—is prepared from the grain by means of an organic ferment.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree, Aralia pseudoricea, which grows in the swampy forests of Formosa. The cylindrical core of pith is rolled on a hard flat surface against a knife, by which it is cut into thin sheets of a fine ivory-like texture. Dyed in various colours, rice paper is extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, BARNABE (c. 1549—1617), English author and soldier, was a distant relative of Lord Chancellor Rich. He fought in the Low Countries, rising to the rank of captain, and afterwards served in Ireland. He shared in the colonization of Ulster, and spent the latter part of his life near Dublin. In the interests of his campaigns he produced many pamphlets on political questions and romances. In 1606 he was in receipt of a pension of half a crown a day, and in 1616 he was presented with a gift of £100 as being the oldest captain in the service. He died on the 10th of November 1617. His best-known work is Riche his Farewell to Militarie Profession containing varie pleasant discourses fitted for a peacable yme (1581). Of the eight stories contained in it, five, he says, "are forged only for delight, neither credible to be believed, nor hurtful to be perused." The three others are translations, but in others abundance of manure is used.

The Strange and Wonderful Adventures of an English Gentleman (1584) is written in imitation of Lyly. Among his other romances should be mentioned The Adventures of Brusonas, prince of Hungary (1592). His authenticated works number twenty-four, and include works on Ireland, the troubles of which were, according to him, due to the religion of the people and to the lack of consistency and firmness on the part of the English government. Such are: Allarme to England (1578); A New Description of Ireland (1610); The Irish Hubub, or the English Huet and Crie (1617), in which he also inveighs against the use of tobacco.

See "Introduction", to the Shakespeare Society's reprint of Riche's Farewell (1846); P. Cunningham's "Introduction" to Rich's "Honesty of this Age" (reprinted for the Percy Society, 1844); and the life by S. Lee in the Dictionary of National Biography.
RICH, C. J.—RICH, R.

RICH, CLAUDIUS JAMES (1787-1821), English traveller and scholar, was born near Dijon on the 28th of March 1787. His youth was spent at Bristol. He early developed a gift for languages, becoming familiar not only with Latin and Greek but also with Hebrew, Syriac, Persian, Turkish and other Eastern tongues. In 1804 Rich went to Constantinople, where, and at Smyrna, he stayed some time, perfecting himself in Turkish. Proceeding to Alexandria as assistant to the British consul-general there, he devoted himself to Arabic and its various dialects, and made himself master of Eastern manners and usages. On leaving Egypt he travelled by land to the Persian Gulf, disguised as a Mameluke, visiting Damascus, and entering the great mosque undetected. At Bombay, which he reached in September 1807, he was the guest of Sir James Mackintosh, whose eldest daughter he married in January 1808, proceeding soon after to Bagdad as resident. There he began his investigations into the geography, history and antiquities of the district. He explored the remains of Babylon, and projected a geographical and statistical account of the pashalic of Bagdad. The results of his work at Bagdad appeared first in the Vienna serial Mines de l'orient, and in 1815 in English as the title Narrative of a Journey to the Site of Babylon in 1811. In 1813-14 Rich spent some time in Europe, and on his return to Bagdad devoted himself to the study of the geography of Asia Minor, and collected much information in Syrian and Chaldaean convents concerning the Yazidis. During this period he made a second excursion to Bagdad, and in 1820 undertook an extensive tour to Kurdistan—from Bagdad north to Sulimania, eastward to Sinna, then west to Nineveh, and thence down the Tigris to Bagdad. The narrative of this journey, which contained the first accurate knowledge (from scientific observation) regarding the topography and geography of the region, was published by his widow under the title, Narrative of a Visit to Kurdistan and on the Site of Ancient Nineveh, &c. (London, 1836). In 1821 Rich went to Basora, whence he made an excursion to Shiraz, visiting the ruins of Persepolis and the other remains in the neighbourhood. At Shiraz he died of cholera on the 9th of October 1821. His fine collections of manuscripts and coins was purchased by the British Museum.

RICH, JOHN (1692-1760), English actor, the "father of English pantomime," was the son of Christopher Rich (d. 1714), the manager of Drury Lane, with whose quarrels and tyrannies Colley Cibber's Apology is much occupied. John Rich opened the new theatre in Lincoln's Inn Fields left unfinished by his father, and here in 1716, under the stage name Lan, he first appeared as Harlequin in an unnamed entertainment which developed into an annual pantomime (q.v.). By this departure he made successful headway in his competition with the stronger company at Drury Lane, including Cibber, Wilks and Booth. Rich was less happy in his management of Covent Garden, which he opened in 1733, until Garrick's arrival (1746), when a most prosperous season ensued, followed by a bad one when Garrick went to Drury Lane. During Rich's management occurred the rival performances of Romeo and Juliet—Barry and Mrs Cibber at Covent Garden, and Garrick and Miss Bellamy at Drury Lane—and the subsequent competition between the two rival actors in King Lear. Rich died on the 26th of November 1761. Garrick's lines show that his acting was pantomime pure and simple, without words:

"When Lan appeared, with matchless art and whim, He gave the power of speech to every limb: Thou masked and mute, conveyed his quick intent, And told in frolic gesture what he meant."

RICH, PENELLOPE, LADY (c. 1562-1607), the Stella of Sir Philip Sidney's Astrophiel and Stella, was the daughter of Walter Devereux, 1st Earl of Essex. She was a child of fourteen when Sir Philip Sidney accompanied the queen on a visit to Lady Essex in 1576, on her way from Kenilworth, and must have been frequently thrown into the society of Sidney, in consequence of the many ties between the two families. Essex died at Dublin in September 1576. He had sent a message to Philip Sidney from his death-bed expressing his desire that he should marry his daughter, and later his secretary wrote to the young man's father, Sir Henry Sidney, in words which seem to point to the existence of a very definite understanding. Penelope's great-grandmother was a sister of Anne Boleyn, and she and her brother Robert were therefore distantly connected with Elizabeth. Perhaps the marriage of Lady Essex with the earl of Leicester, which destroyed Sidney's prospects as his uncle's heir, had something to do with the breaking off of the proposed match with Penelope. Her relative and guardian, Henry Hastings, earl of Huntingdon, secured Burghley's assent in March 1581 for her marriage with Robert Rich, 3rd Baron Rich. Penelope is said to have protested in vain against the alliance with Rich, who is represented as a rough and overbearing husband. The evidence against him is, however, chiefly derived from sources as interested as Sir Philip Sidney's violent denunciation in the twenty-fourth sonnet of Astrophel and Stella, "Rich fooles there be whose base and filthy hart." Sidney's serious love for Penelope appears to date from her marriage with Rich. The earlier sonnets are in praise of her beauty, or treat of the conventional topic of the struggle between reason and love, while the later ones are marked by unmistakable passion. The Elizabethan conception of Astrophel and Stella as a historical novel is itself a formula to accept Sidney as a lover. Lady Rich was the mother of six children by her husband when she contracted in 1595 an open liaison with Charles Blount, 8th Lord Mountjoy, a brilliant courtesan and favourite of Elizabeth, to whom she had long been attached. Rich took no steps against his wife during her brother's lifetime, and she nursed him through an illness in 1600, but they obtained a legal separation in 1601, and Mountjoy acknowledged her five children born after 1595. Mountjoy was created earl of Devonshire on the accession of James I., and Lady Rich was in high favour at court. In 1605, however, they legitimized their connexion by a marriage celebrated by William Laud, the earl's chaplain. This second marriage carried out in defiance of canon law, was followed by the disgrace of both parties, who were banished from court. Devonshire died on the 3rd of April 1606, and his wife within a year of that date. Her eldest son by Lord Rich, who became earl of Warwick in 1618, was Robert Rich, 2nd earl of Warwick (1587-1658). The second, Henry Rich, earl of Holland, was beheaded in 1649 for his share in the second Civil War. Her eldest son by Mountjoy, Mountjoy Blount, Baron Mountjoy and earl of Newport (c. 1597-1663) also figured in the Civil War.

See the editions of Astrophel and Stella by Dr A. B. Grosart, E. Pollard and A. W. Pollard; also the various lives of Sir Philip Sidney, and Mrs Aubrey Richardson's Famous Ladies of the English Court (London, 1899). John Ford's Broken Heart has been alleged in 1865 (another ed., 1874). The adventures related by Rich are supposed to have been in Shakespeare's mind when he wrote The Tempest. Another tract by Rich mentioned in the Stationers' Register, Good Speed to Virginia, is unknown.
RICH, BARON—RICHARD OF CANTERBURY

RICH, RICHARD, 1st Baron Rich (1490?–1567), lord chancellor, was born of a Hampshire family about 1490, in the parish of St Laurence Jewry, London. His great-grandfather, Richard Rich, was a wealthy mercer and sheriff of the city of London in 1441. Probably Lord Rich's father was also a mercer, but he sent his son to the Middle Temple, where Sir Thomas More was among his acquaintances. More told him at the time of his trial that he was reputed light of his tongue, a great dicer and gamester, and not of any commendable fame; but he was a commissioner of the peace in Hertfordshire in 1528, and in the next autumn became reader at the Middle Temple. Other preferments followed, and in 1533 he was knighted and became solicitor-general, in which capacity he was to act under Thomas Cromwell as a “lesser hammer” for the demolition of the monasteries and religion. Nevertheless, Rich took part in the sharing of supremacy. He had an odious share in the trials of Sir Thomas More and Bishop Fisher. In both cases he made use in his evidence against the prisoner of admissions made in a professedly friendly conversation, and in More's case the words he had used were misreported and received a misconstruction that could hardly be other than wilful. More expressed his opinion of the witness in open court with a candour that might well have dismayed Rich. Rich became the first chancellor (April 10, 1536) of the Court of Augmentations established for the disposal of the monastic revenues. His own share of the spoils he acquired. It included Leez (Leighs) Priory and about a hundred manors in Essex. He was Speaker of the House of Commons in the same year, and advocated the king's policy. In spite of the share he had taken in the suppression of the monasteries, and of the part he was to play under Edward VI, his religious convictions remained Roman Catholic. His testimony helped the conviction of Thomas Cromwell, and he was a willing agent in the Catholic reaction which followed. Anne Askew stated that the Chancellor Wriothesley and Rich screwed the rack at her torture with their own hands.

Rich was one of the executors of the will of Henry VIII., on which so much suspicion has been thrown, and on the 26th of February 1548 he became Baron Rich of Leez. In the next month he succeeded Wriothesley as chancellor, an office in which he had full scope for the business and legal ability he undoubtedly possessed. He supported Protector Somerset in his subversive reforms in church matters, in the prosecution of his brother Lord Seymour of Sudeley, and in the rest of his policy until the crisis of his fortunes in October 1540, when he deserted to Warwick (afterwards Northumberland), and presided over the trial of his former chief. His daughter had married Warwick's son, and both men were at heart no friends to the new régime. Rich opposed the prosecution of bishops Gardiner and Bonner, and in the harsh treatment accorded to the Princess Mary. Possibly this harshness was exaggerated, for Mary on her accession showed no ill-will to Rich. He retired from the chancellorship on the ground of ill-health in the close of 1551, at the time of the final breach between Northumberland and Somerset. He was now sixty years old, and there is no reason to suspect the sincerity of his plea. There is an improbable story, however, to the effect that Rich warned Somerset of his danger in the Tower, and that the letter was delivered by mistake to the duke of Norfolk, who handed it to Northumberland. Lord Rich took an active part in the restoration of the old religion in Essex under the new reign, and was one of the most active of persecutors. His reappearances in the privy council were rare during Mary's reign, but under Elizabeth he served on a commission to inquire into the grants of land made under Mary, and in 1566 was sent for to advise on the question of the queen's marriage. He died at Rochford, Essex, on the 12th of June 1567, and was buried in Felsted church. In Mary's reign he had founded a chapel in provision for the singing of masses and dinges, and the ringing of bells in Felsted church. To this was added a Lenten allowance of herring to the inhabitants of three parishes. These donations were transferred in 1594 to the foundation of a grammar-school at Felsted for instruction, primarily for children born on the founder's manors, in Latin, Greek and divinity. The patronage of the school remained in the family of the founders until 1830. By his wife, Elizabeth Jenks, he had five children: the eldest son Robert (1537–1581), second Baron Rich, supported the Reformation, and his grandson Robert, third lord, was created earl of Warwick in 1618.

The chief authorities are the official records of the period covered by his official life, calendared in the Rolls Series. See also 13 Rich, England under Protector Somerset (1500); F. Morant, History of Essex (2 vols., 1764); W. Dyonson, History of the Church of England (6 vols., 1878–1902); and lives in J. Sargeant's History of Felsted School (1889), Lord Campbell's Lives of the Lord Chancellors (1845–66), and C. H. & T. Cooper's Athanasia Cantabrigiensis (2 vols., 1855–61).

RICHARD, ST., of Wyche (c. 1197–1253), English saint and bishop, was named after his birthplace, Droitwich in Worcestershire. Educated at Oxford, he soon began to teach in the university, of which he became chancellor, probably after he had studied in Paris and in Bologna. About 1235 he became chancellor of the diocese of Canterbury under Archbishop Edmund Rich, and he was with the archbishop during his exile in France. Having returned to England some time after Edmund's death in 1240 he became vicar of Deal and chancellor of the exiled king for the second time. In 1244 he was elected bishop of Chichester, being consecrated on 10 June next by St. Hugh of Lincoln, the Innocent IV. In March 1245, although Henry III. refused to give him the temporalities of the see, the king favouring the candidature of Robert Passelewe (d. 1252). In 1246, however, Richard obtained the temporalities. The new bishop showed much eagerness to reform the manners and morals of his clergy, and also to introduce greater order and reverence into the services of the church. His term of office was also marked by the favour which he showed to the Dominicans, a house of this order at Orleans having sheltered him during his stay in France, and by his earnestness in preaching a crusade. He died at Dover in April 1253. Great was the sorrow at his death, and miracles were wrought at his tomb in Chichester cathedral, which was long a popular place of pilgrimage, and in 1262 he was canonized at Viterbo by Pope Urban IV. Richard furnished the chronicler, Matthew Paris, with material for the life of Edmund Rich, and instituted the offerings for the cathedral at Chichester which were known later as ‘St Richard's pence.’

His life by his confessor, Ralph Bocking, is published in the Acta Sanctorum of the Bollandists, where a later and shorter life by John de Pezgrave is also given.

RICHARD (d. 1184), archbishop of Canterbury, was a Norman, who became a monk at Canterbury, where he acted as chaplain to Archbishop Theobald and was a colleague of Thomas Becket. In 1173, more than two years after the murder of Becket, it was decided to fill the vacant archbishopric of Canterbury; there were two candidates, Richard, at that time prior of St Martin's, Dover, and Odo, prior of Canterbury, and in June Richard was chosen, although Odo was the nominee of the monks. Objections were raised against this election both in England and in Rome, but in April 1174 the new archbishop was consecrated at Anagni by Pope Alexander III., and he returned to England towards the close of the year. The ten years during which Richard was archbishop were disturbed by disputes with Roger, archbishop of York, over the respective rights of the two sees, and in 1175, at a council held in London, there was a free fight between their partisans. Henry II. arranged a truce for five years between the rival prelates, but Richard was soon involved in another quarrel, this being with Roger, abbot of St Augustine's, Canterbury, whose action also trespassed upon the privileges of the archbishop. Richard was more acceptable to Henry II. than Becket had been; he attended the royal councils, and more than once he was with the king in Normandy. Henry probably preferred him because he insisted less on the rights of the clergy than his great predecessor had done; but the monastic writers and the followers of Becket regarded this attitude as a sign of weakness. Richard died at Rochester on the 16th of February 1184 and was

**RICHARD**

earl of Cornwall and king of the Romans (1200-1272), was the second son of the English king John by Isabella of Angouleme. Born in 1209, Richard was the junior of his brother, Henry III., by fifteen months; he was educated in England and received the cardinal of Cornwall in 1225. From this date to his death he was a prominent figure on the political stage. In the years 1225-27 he acted as governor of Gasony; between 1227 and 1238, owing to quarrels with his brother and dislike of the foreign favourites, he attached himself to the baronial opposition and bade fair to become a popular hero. But in 1240 he took the command of a crusade in order to escape from the troubled atmosphere of English politics. He was formally reconciled with Henry before his departure; and their amity was cemented on his return by his marriage with Sanacha of Provence, the sister of Henry's queen (1243). Henceforward Richard, though by no means blind to the faults of the government, was among the most constant supporters of Henry III.

While affecting to remain neutral in the quarrels of the Welfs and Savoyards, Constance, Richard's sister-in-law, conspired with the king with loans, and thus enabled him to withstand the pressure of the Great Council for reform. In 1259 a bare majority of the German electors nominated Richard as king of the Romans, and he accepted their offer at Henry's desire. He was elected partly on account of his wealth, but also because his family connexion with the Hohenstaufen and his friendly relations with the papacy made it probable that he would unite all German parties. In the years 1257-68 Richard paid four visits to Germany. He obtained recognition in the Rhineland, which was closely connected with England by trade relations. Otherwise, however, he was unsuccessful in securing German support. In the English troubles of the same period he endeavoured to act as a mediator. On the outbreak of civil war in 1264 he took his brother's side, and his capture in a windmill outside Lewes, after the defeat of the royalist army, is commemorated in the earliest of English vernacular satires; he remained a prisoner till the fall of Montfort. But after Evesham he exercised himself, not without success, to obtain reasonable terms for those who had suffered from the vengeance of the royalist party. He died on the 2nd of April 1272. His end is said to have been hastened by grief for his eldest son, Henry of Almain, who had been murdered in the previous year by the sons of Simon de Montfort at Viterbo. The cardinals of the papal court of the Rhineland, led by Richard's eldest son, Henry, king of England from 1286 to 1289. On Edmund's death, in October 1300, it became extinct.

**RICHARD I.** (1157-1199), king of England, nicknamed "Coeur de Lion" and "Yea and Nay," was the third son of Henry II. He was the eldest son of the duke of Aquitaine, and was formally installed in 1172. In his new position he was allowed, probably from regard to Aquitanian susceptibilities, to govern with an independency which was studiously denied to his brothers in their shares of the Angevin inheritance. Yet in 1173 Richard joined with the young Henry and Geoffrey of Britanny in their rebellion; Aquitaine was twice invaded by the old king before the unruly youth would make submission. Richard was soon pardoned and reinstated in his duchy, where he distinguished himself by crushing a formidable revolt (1175) and exacting homage from the count of Toulouse. In a short time he was so powerful that his elder brother Henry became alarmed and demanded, as heir-apparent, that Richard should do him homage for Aquitaine. Richard having scornfully rejected the demand, a fratricidal war ensued; the young Henry invaded Aquitaine and attracted to his standard many of Richard's vassals, who were exasperated by the iron rule of the duke. Henry II. marched to Richard's aid; but the war terminated abruptly with the death of the elder prince (1183). Richard, being now the heir to England and Normandy, was invited to renounce Aquitaine in favour of Prince John. The proposal led to a new civil war; and, although a temporary compromise was arranged, Richard soon sought the help of Philip Augustus, to whom he did homage for all the continental possessions in the actual presence of his father (Conference of Bourgoinlès, 18th of November 1188) In the struggle which ensued the old king was overpowered, chased ignominiously from Le Mans to Angers, and forced to buy peace by conceding all that was demanded of him; in particular the immediate recognition of Richard as his successor.

But the death of Henry II. (1189) at once dissolved the friendship between Richard and Philip. Not only did Richard continue the continental policy of his father, but he also refused to fulfil his contract with Philip's sister, Alais, to whom he had been betrothed at the age of three. An open breach was only delayed by the desire of both kings to fulfil the conditions of the treaty of 1184, by which they had recently taken. Richard, in particular, sacrificed all other interests to this scheme, and raised the necessary funds by the most reckless methods. He put up for auction the highest offices and honours; even remitting to William the Lion of Scotland, for a sum of 15,000 marks, the humiliating obligations which Henry II. had imposed at the treaty of Falaise. It is true that Richard indemnified himself on his return by resuming some of his most important grants and refusing to return the purchase money; but it is improbable that he had originally planned this repudiation of his ill-considered bargains. By such expedients he raised and equipped a force which may be estimated at 4000 men-at-arms and as many foot-soldiers, with a fleet of 100 transports (1191).

Richard did not return to his dominions until 1194. But his stay in Palestine was limited to sixteen months. On the outward journey he wintered in Sicily, where he employed himself in quarrelling with Philip and in exacting satisfaction from the usurper Tancred for the dower of his widowed sister, Queen Joanna, and for his own share in the inheritance of William the Good. Leaving Messina in March 1191, he interrupted his voyage to conquer Cyprus, and only joined the Christian besiegers of Acre in June. The reduction of that stronghold was largely due to his energy and skill. But his advance gave much offence. After the fall of Acre he inflicted a gross insult upon Leopold of Austria; and his relations with Philip were so strained that the latter seized the first pretext for returning to France, and entered into negotiations with Prince John (see John, king of England) for the partition of Richard's realm. Richard also threw himself into the disputes respecting the crown of Jerusalem, and supported Guy of Lusignan against Conrad of Montferrat with so much heat that he incurred grave, though unfounded, suspicions of complicity when Conrad was assassinated by emissaries of the Old Man of the Mountain. None the less Richard, whom even the French crusaders accepted as their leader, upheld the faltering cause of the Frankish Christians with valour and tenacity. He won a brilliant victory over the forces of Saladin at Arsuf (1191), and twice led the Christian host within a few miles of Jerusalem. But the dissensions of the native Franks and the crusaders made it hopeless to continue the struggle; and Richard was alarmed by the news which reached him of John's intrigues in England and Normandy. Hastily patching up a truce with Saladin, under which the Christians kept the coast-towns and received free access to the Holy Sepulchre, Richard started on his return (9th October 1192).

His voyage was delayed by storms, and he appears to have been dissuaded from the safest route. The natural route overland through Marseilles and Toulouse was held by his enemies that through the empire from the head of the Adriatic was little safer, since Leopold of Austria was on the watch for him. Having adopted the second of these alternatives, he was cap-
tured at Vienna in a mean disguise (December 20th, 1192) and strictly confined in the duke's castle of Dürenstein on the Danube. His mishap was soon known to England, but the regents were for some weeks uncertain of his whereabouts. This is the foundation for the tale of his discovery by the faithful minstrel Blondel, which first occurs in a French romantic chronicle of the next century. Early in 1193 Leopold surrendered his prize, under compulsion, to the emperor Henry VI., who, aggrieved both by the support which the Plantagenets had given to the family of Henry the Lion and also by Richard's recognition of Tancred in Sicily, though the detention of a crusader was contrary to public law, Richard was compelled to purchase his release by the payment of a heavy ransom and by doing homage to the emperor for England. The ransom demanded was 150,000 marks; though it was never discharged in full, the resources of England were taxed to the utmost for the first instalments; and to this occasion we may trace the beginning of secular taxation levied on movable property.

Richard reappeared in England in March 1194; but his stay lasted only a few weeks, and the remainder of his reign was entirely devoted to his continental interests. He left England by sea, not by land (as he had done on the previous occasion), and his personal authority was seldom asserted except by demand for new subsidies. The rule of the Plantagenets was still popular in Normandy and Aquitaine; but these provinces were unable or unwilling to pay for their own defence. Though Richard proved himself consistently the superior of Philip in the field, the difficulty of raising and paying forces to resist the French increased year by year. Richard could only stand on the defensive; the keynote of his later policy is given by the building of the famous Château Gaillard at Les Andelys (1196) to protect the lower courses of the Seine against invasion from the side of France. He did not live to see the futility of such bulwarks. In 1199 a claim to treasure-trove embroiled him with the viscount of Limoges. He harried the Limousin and laid siege to the castle of Châlus; while directing an assault he was wounded in the shoulder by a crossbow bolt, and, the wound mortifying from unskilful treatment or his own want of care, he died on the 6th of April 1199. He was buried by his own desire at his father's feet in the church of Fontevrault. Here his effigy may still be seen. Though contemporary, it does not altogether agree with the portraits on his Great Seal, which give the impression of greater strength and even of cruelty. The Fontevrault bust is no doubt idealized, but the most accomplished and versatile representative of his gifted family, Richard was, in his lifetime and long afterwards, a favourite hero with troubadours and romancers. This was natural, as he belonged to their brotherhood and himself wrote lyrics of no mean quality. But his history shows that he by no means embodied the current ideal of chivalrous excellence. His memory is stained by one act of needless cruelty, the massacre of over two thousand Saracen prisoners at Acre; and his fury, when thwarted or humbled, was ungovernmentable. A brave soldier, an experienced and astute general, he was never happier than when engaged in war. As a ruler he was equally profuse and rapacious. Not one useful measure can be placed to his credit; and it was by a fortunate accident that he found, in Hubert Walter, an administrator who had the skill to mitigate the consequences of a reckless fiscal policy. Richard's wife was Berengaria, daughter of Sancho VI., king of Navarre, whom he married in Cyprus in May 1191. She was with the king at Acre later in the same year, and during his imprisonment passed her time in Sicily, in Rome and in France. Husband and wife met again in 1195, and the queen long survived the king, residing chiefly at Le Mans. She died soon after 1230. Berengaria founded a Cistercian monastery at Espau.

AUTHORITIES.—The more important of the general chronicles are: the Gesta Henrici Secundi, ascribed to Benedict of Peterborough (Rolls Series, 2 vols., 1867); the Chronica of Roger of Hoveden (Rolls Series, 4 vols., 1868-71); the Chronicon of Gervase of Canterbury (Rolls Series, 1870); the Chronicon of Ralph of Diceto (Rolls Series, 2 vols., 1876); the Historia Rerum Anglicarum of William of Newburgh (in Chronicles of the Reigns of Stephen, Robert, Henry II., and Richard, Rolls Series, 2 vols., 1879); the Dessins Historiques de l'Angleterre (in the Gesta Philipi Augusti of Richard of Devizes (in Chronicles of the Reigns of Stephen, vol. iii., Rolls Series, 1886); the Chronicon Anglicanum of Ralph of Coggeshall (Rolls Series, 1872); the Flores Historiarum of Roger of Wendover (Rolls Series, 1886); the Gesta Ricardi de Rigord (Société de l'histoire de France, Paris, 1882) and of Guillaume le Breton (op. cit.). A detailed narrative of Richard's crusade is given in L'histoire de la guerre sainte, a rhyming French chronicle (R. Rolls Series, 2 vols., 1884-85) and in the Latin prose version known as the Itinerarium O. Peregrinorum et gesta Regis Ricardi; this last, with some valuable historical letters, is printed in W. Stubbe's Chronicles and Memorials of the Reign of Richard I. (Rolls Series, 2 vols., 1864-65). Of modern works the following are useful: W. Stubbe's preface to vols. iii. and iv. of Hoveden; the same author's Constitutional History of England, vol. i. (Oxford, 1897); Min. Hist. (London, 1894); Hugo of neckingham, Under the Angevin Kings, vol. ii. (London, 1887); Sir J. H. R. Angell, The Barons' Wars (London, 1903); R. Röhricht's Geschichte des Königreichs Jerusalem (1898); W. B. Stevenson's Crusaders in the East (Cambridge, 1907); A. Cartellier's Philippii II. August (Leipzig, 1899).
methods, and when the lords appellant had lost credit, asserted himself constitutionally by dismissing Gloucester's supporters from office, and appointing in their place well-approved men like William of Wykeham. In the next parliament of 1399 the king showed himself ready to act and conclude his subject. The simultaneous return of John of Gaunt from Spain put a check on Gloucester's ambition. For seven years Richard ruled constitutionally and on the whole well. The opposition was quiescent except for two outbreaks by Arundel: the first was a violent attack on John of Gaunt, which rather strengthened Richard's position; the second was a wanton insult to the king at the funeral of his queen.

In January 1383 Richard had married Anne of Bohemia (1366-1394), daughter of the emperor Charles IV. The marriage, though childless, was happy; had Anne lived or borne a son the course of events might have been different. Her death on the 7th of June 1394 was a great shock to Richard, and incidentally had important consequences. Richard sought distraction by an expedition to Ireland, the first visit of an English king for more than two centuries. In his policy there he showed a wise stateanship. At the same time he was negotiating for a permanent peace with France, which was finally arranged in October 1396 to include his own marriage with Isabella, daughter of Charles VI., a child of seven. Gloucester criticized the peace openly, and there was some show of opposition in the parliament of February 1397. But there was nothing to foreshadow the sudden stroke by which, in July Richard arrested Gloucester and his chief supporters, the earls of Arundel and Warwick. The others of the five lords appellant, Henry of Bolingbroke afterwards King Henry IV., and the earl of Nottingham, now supported the king. Richard's action was apparently in deliberate revenge for the events of 1387-88. Gloucester, after a forced confession, died in prison at Calais, smothered by his nephew's orders. Arundel in a packed parliament was condemned and executed; his brother Thomas archbishop of Canterbury was exiled. The king's friends, including Nottingham and Bolingbroke, made dukes of Norfolk and Hereford, were all promoted in title and estate. Richard himself was rewarded for ten years' patience by the possession of absolute power. He might perhaps have established it if he could have exercised it with moderation. But he declared that the laws of England were in his mouth, and supported his court in wanton luxury by arbitrary methods of taxation. By the exile of Norfolk and Hereford in September 1398 he seemed to have removed the last persons he need fear. He was so confident that in May 1399 he paid a second visit to Ireland, taking with him all his most trusted adherents. Thus when Henry landed at Ravenspur in July he found only half-hearted opposition, and when Richard himself returned it was too late. Ultimately Richard surrendered to Henry at Flint on the 10th of August, promising to abdicate if his life was spared. He was taken to London riding behind his rival with indignity. On the 30th of September he signed in the Tower a deed of abdication, wherein he owned himself insufficient and useless, reading it first aloud with a cheerful mien and ending with a request that his cousin would be good lord to him. The parliament ordered that Richard should be kept close prisoner, and he was sent secretly to Pontefract. There in February 1400 he died: no doubt of the rigour of his winter imprisonnent, rather than by actual murder as alleged in the story adopted by Shakespeare. The mystery of Richard's death led to rumours that he had escaped, and an impostor pretending to be Richard was accepted by many, including the Scottish government. But no doubt it was the real Richard who was buried without state in 1400 at King's Langley, and honourably reinterred by Henry V. at Westminster in 1413.

Richard II. is a character of strange contradictions. It is difficult to reconcile the precocious boy of 1381 with the wayward and passionate youth of the next few years. Even if it be supposed that he dissembled his real opinions during the period of his constitutional rule, it is impossible to believe that the apparent indifference which he showed in his fall was the mere acting of a part. His violent outbursts of passion perhaps give the best clue to a mercurial and impulsive nature, easily moved by a mood. The originality of his policy, and the preference which he gave to it over continental adventure, showed a statesmanship in advance of his time. But this, in spite of his lofty theory of kingship, makes it all the more difficult to explain his extravagant bearing in his prosperity. His fall was due to the triumph of national right over absolute government, but it was his personal conduct which made it inevitable. In appearance Richard was tall and handsome, if effeminate. He had some literary tastes, which were shown in fitful patronage of Chaucer, Gower and Froissart. His fancy for splendid dress may have been due to an artistic sense, which found better expression in his great buildings of Westminster Hall and Abbey. Richard's second queen, Isabella (1389-1409), was born in Paris on the 9th of November 1389, and was married to the English king at Calais in October, or November, 1396, but on account of the bride's youth the marriage was never consummated. When Richard lost his crown in 1399 Isabella was captured by Henry IV.'s partisans and sent to Sonning, near Reading, while her father, Charles, duke of Orleans, and she died on the 13th of September 1409.

BIBLIOGRAPHY.—The best contemporary authorities are the Chronicon Angliae down to 1388, Walsingham's Historia Angliacae, the Annales Ricardi II., Knighton's Chronicle (all these in the Rolls Series), the Vita Ricardi II. by a Monk of Evesham (ed. T. Hearne), and the Chronique de la traison et mort (English Hist. Soc.). Froissart wrote from some personal knowledge. A metrical account of Richard's fall, probably written by a French knight called Creton, is printed in Archaeologia, xx. The chief collections of documents are the Rolls of Parliament and the Calendar of Patent Rolls. H. A. Wallon's Richard II. (Paris, 1864) is the fullest life, though now somewhat out of date. For other modern accounts see W. Stubbs, Constitutional History, and C. W. C. Oman, The Political History of England, vol. iv., and The Great Revolt of 1381, (C. L. K.)

Richard III. (1432-1483), king of England, youngest son of Richard, duke of York, by Cecily Neville, was born at Fotheringhay on the 2nd of October 1452. After the second battle of St Albans in February 1461, his mother sent him with his brother George for safety to Utrecht. They returned in April, and at the coronation of Edward IV. Richard was created duke of Gloucester. As a mere child he had no importance till 1469-1470, when he supported his brother against Warwick, shared his exile and took part in his triumphant return. He distinguished himself at Barnet and Tewkesbury; according to the Lancastrian story, after the latter battle he murdered the young Edward of Wales in cold blood; this is discredited by the authority of Warkworth (Chronicle, p. 138); but Richard may have had a share in Edward's death during the fighting. He cannot be so fully cleared of complicity in the murder of Henry VI., which probably took place at the Tower on the night of the 21-22 of May, when Richard was certainly present there. Richard shared to the full in his brother's prosperity. He had large grants of lands and office, and by marrying Anne (1456-1485), the younger daughter of Warwick, secured a share in the Neville inheritance. This was distasteful to George, duke of Clarence, who was already married to the elder sister, Isabel. The rivalry of the two brothers caused a quarrel which was never appeased. Richard does not, however, seem to have been directly responsible for the death of Clarence in 1478; Sir Thomas More, who is a hostile witness, says that he resisted it openly, however. His influence was so great that he was heartily coveted as king. Richard's share of the Neville inheritance was chiefly in the north, and he resided usually at Middleham in Yorkshire. In May 1480 he was made the king's lieutenant-general in the north, and in 1482 commanded a successful invasion of Scotland. His administration was good, and brought him well-deserved popularity. On Edward's death he was kept informed of events in London by William, Lord Hastings, who shared his dislike of the Woodville influence.
On the 29th of April 1483, supported by the duke of Buckingham, he intercepted his nephew Stony Stratford and arrested Lord Archbishop, the little king's half-brother. It was in Richard's charge that Edward was brought to London on the 4th of May. Richard was recognized as protector, the Woodville faction was overthrown, and the queen with her younger children took sanctuary at Westminster. For the first time the government was carried on in Edward's name, and the 22nd of June was appointed for his coronation. Richard was nevertheless gathering forces and concerting with his friends. In the council there was a party, of whom Hastings and Bishop Morton were the chief, which was loyal to the boy-king. On the 13th of June came the famous scene in which Richard suddenly threw into the witherred arm and accusing Jane was the hearing of sorcery; Hastings, Morton and Stanley were arrested and the first-named at once beheaded. A few days later, probably on the 25th of June, Rivers and Grey were executed at Pontefract. On the 22nd of June Dr Shaw was put up to preach at Paul's Cross against the legitimacy of the children of Edward IV. On the 25th a sort of parliament was convened at which Edward's marriage was declared invalid on the ground of his precontract with Eleanor Talbot, and Richard royal king. Richard, who was not present, accepted the crown with feigned reluctance, and from the following day began his formal reign.

On the 6th of Richard was crowned at Westminster, and immediately afterwards made a royal progress through the Midlands, on which he was well received. But in spite of its apparent success the usurpation was not popular. Richard's position could not be secure whilst his nephews lived. There seems to be no reasonable doubt that early in August Edward V. and his brother Richard (whom Elizabeth Woodville had been forced to surrender) were murdered by their uncle's orders in the Tower. Attempts have been made to clear Richard's memory. But the report of the princes' death was believed in England at the time, "for which cause king Richard lost the hearts of the people." (Carpenter of London, 151), and it was referred to as a definite fact before the French states-general in January 1484. The general, if vague, dissatisfaction found its expression in Buckingham's rebellion. Richard, however, was fortunate, and the movement collapsed. He met his only parliament in January 1484 with some show of triumph, and deserves credit for the wise intent of its legislation. He could not, however, stay the undercurrent of dissatisfaction, and his ministers, Lovell and Catesby, were unpopulous. His position was weakened by the death of his only legitimate son in April 1484. His queen died also a year later (March 16, 1485), and public opinion was scandalized by the rumour that Richard intended to marry his own niece, Elizabeth of York. The feeling in favour of his rival Henry Tudor strengthened. Henry landed at Milford Haven on the 7th of August 1485, and it was with dark forebodings that Richard met him at Bosworth on the 22nd. The defection of the Stanleys decided the day. Richard was killed fighting, courageous at all events. After the battle his body was carried to Leicester, trussed across a horse's back, and buried without honour in the church of the Greyfriars.

Richard was not the villain that his enemies depicted. He had good qualities, both as a man and a ruler, and showed a sound judgment of political needs. Still it is impossible to acquit him of the crime, the popular belief in which was the chief cause of his ruin. He was not a monster; but a typical man in an age of strange contradictions of character, of culture combined with cruelty, and of an emotional temper that was capable of high ends, though unscrupulous of means. Tradition represents Richard as deformed. It seems clear that he had some physical defect, though not so great as has been alleged. John Stow told Buck that old men who remembered Richard described him as in bodily form comely enough. Extant portraits show an intellectual face characteristic of the early Renaissance, but do not indicate any deformity.

BIBLIOGRAPHY: The chief original authorities are Sir Thomas More's History of Richard III., based on information supplied by Archbishop Morton, and therefore to be accepted with caution; the more trustworthy Continuation of the Greville Chronicle in Fulman's Scriptores, the History of Polydore Vergil, written in a Tudor spirit; the Chronicle of London (ed. C. L. Kingsford, 1905), and its biased original; the Quene Elizabeth of the Chronicles of Richard III. and the Historical Monarchs of England, by G. B. Ford, for the言行 Walshe; the Illuminated of the Reigns of Richard III. and Henry VII., ed. J. Gairdner, in Rolls Series. Of later accounts those in Stowe's Annales (preserving some oral tradition) and George Buck's Richard III. of the History of the Popes (2nd ed., 1702), are the most interesting. His contemporaries included the chroniclers Standing, Load, Gairdner, and Walshe, and in particular T. D'Avenant. The best modern account is James Gairdner's Life of Richard III. (2nd ed., 1896). The latest and fullest defence is given in Richard III. and the Life of Richard III. (1906); G. B. Churchill's Richard the Third up to Shakespeare (Palaestra x., 1906) is a valuable digest of material.

RICHARD, FRANCOIS MARIE BENJAMIN (1819-1908), archbishop of Paris, French prelate, was born at Nantes on the 1st of March 1819. Educated at the seminary of St Sulpine he became successively vicar-general of Nantes, bishop of Belley, and in 1875 coadjutor of Paris. In 1886 the death of Archbishop Goulbert was followed by Mgr. Richard's appointment to the see of Paris, and in 1889 he received a cardinal's hat. In January 1900 the trial of the Assumptionists Fathers resulted in the dissolution of their society as an illegal association. Next day an official visit of the archbishop to the Fathers was noted by government as an act of a political character, and Mgr. Richard was officially censured. His attitude was in general exceedingly moderate, he had no share in the extremist policy of the Ultramontanes, and throughout the struggle over the law of Associations and the law of Separations he maintained his reasonable temper. He presided in September 1902 over an assembly of bishops and archbishops at his palace in the rue de Grenelle, a few days after the papal encyclical forbidding French Catholics to form associations for public worship, but it was then too late for conciliation. In December he gave up the archiepiscopal palace to the government authorities. He was then an old man of nearly ninety, and his "eviction" evoked great sympathy. Cardinal Richard died on the 29th of January 1908.

RICHARD, HENRY (1812–1888), Welsh politician, was the son of the Rev. Ebenzer Richard (1751–1837), a Calvinistic Methodist minister, and was born on the 3rd of April 1812. Educated at Llanegheith grammar school, he also studied at a college at Highbury, and in 1835 he became minister of a Congregational church in the Old Kent Road, London, a position which he retained for fifteen years. Richard is chiefly known as an advocate of peace and international arbitration. In 1848 he became secretary of the Peace Society, and in this capacity he helped to organize a series of congresses in the capitals of Europe, and was partly instrumental in securing the insertion of a declaration in favour of arbitration in the treaty of Paris in 1856. He resigned this post in 1853. In 1868 Richard was elected member of parliament for the Merthyr boroughs, and he remained in the House of Commons until his death at Trebor, near Bangor, on the 26th of August 1888. In parliament he was a leading member of the party which advocated the removal of Nonconformists from the established church in Wales; in 1872 he was chairman of the Congregational Union of England and Wales. Among Richard's writings may be mentioned: Defensive War (1846, and again 1890); Memoirs of Joseph Sturge (1864); Letters on the Social and Political Condition of the Principality of Wales (1866, and again 1884); and The Recent Progress of International Arbitration (1884). He also prepared some of the material for the life of his friend and associate, Richard Cobden, which was written by Mr John, now Lord, Morley; and he did some journalistic work in the Morning Star and the evening Star. See C. S. Miall, Henry Richard, M.P. (1888); L. Appleton, Memoirs of Henry Richard (1886); and articles in Cymru Fyd for 1888.

RICHARD OF CIRENCESTER (c. 1335–c. 1401), historical writer, was a member of the Benedictine abbey at Westminster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbott to go to Rome, and in this the abbot gives his testimony to Richard's
RICHARD OF DEVIZES—RICHARD OF ST VICTOR

perfect and sincere observance of religion for upwards of thirty years. In 1400 Richard was in the infirmary of the abbey, where he died in the following year. His only known extant work is Speculum Historiae de Gestis Regum Angliae, 447–1066. The MS. of this is in the university library at Cambridge, and has been edited for the Rolls Series (No. 30) by Professor J. E. B. Mayor (2 vols., London, 1863–69). It is in four books, and at the conclusion of the fourth book Richard expresses his intention of continuing his narrative from the accession of William I., and incorporating a sketch of the Conqueror’s career from the earliest period. The design of the work appears to have carried into effect. The value of the Speculum as a contribution to our historical knowledge is but slight, for it is mainly a compilation from other writers; while even in transcribing these the compiler is guilty of great carelessness. He gives, however, numerous charters relating to Westminster Abbey, and also a very complete account of the saints whose tombs were in the abbey church, and especially of Edward the Confessor. The work was, however, largely used by historians and antiquaries, until, with the rise of a more critical spirit, its value became more accurately estimated. Besides the Speculum, Richard wrote, according to the statement of Woodford in his Answer to Wycliffe (Edward Brown, Pasculius Rerum expenderarum, p. 193), a treatise De Officiis; and there was formerly in the cathedral library at Peterborough another tractate from his pen, entitled Super Symbolum. Of neither of these works, however, does any known copy now exist.

The Speculum affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the De Situ Britanniæ, an elaborate forgery relating to the antiquities of Roman Britain, which first appeared at Copenhagen in the year 1747. It was printed with the works of Gildas and Nennius, under the editorship of Charles Julian Bertram, professor of English in the academy of Copenhagen in the middle of the 18th century, with the following special title: "Richardi Corinensis monachi Westmonasteriensis de situ Britanniae libri duo. E. Codex MS. descripserit, Notaue et Indice adornavit Carolus Bertram." This forgery was accepted as genuine by a well-known antiquary of the 18th century, Dr William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries, including Gibbon and Lingard. On the other hand, critics of a later date gave expression, on various grounds, to a contrary conclusion. All doubt on this point is decided, however, because it has been established that the work was at rest by the masterly exposure of the whole fraud drawn up by Professor Mayor in the preface to the edition above referred to of the Speculum. He has there not only demonstrated, from the evidence of internal evidence alone, the spurious nature of the treatise, but in a collaboration (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical monumental authorities, has also traced out the various sources whence Bertram derived the terminology and the facts which he reproduced in the De Situ. (J. B. M.)

RICHARD OF DEVIZES (fl. 1191), English chronicler, was a monk of St Swithin’s house at Winchester. His birthplace is probably indicated by his surname, but of his life we know nothing. He is credited by Bale with the composition of the Annales de Wintonia, which are edited by Luard in the second volume of the Annales Monasticæ. If this statement be correct, the application of the name Richard to the compiler of the Chronicle of the Reigns of Stephen, Henry II., and Richard I., by J. Stevenson (Eng. Historical Soc., 1838) and by R. Howlett in Chronicles of the Reigns of Stephen, Henry II. and Richard I., vol. iii. (Rolls Series, 1886); the Annales of Wintonia in H. R. Luard’s Annales Monastici, vol. ii. (Rolls Series, London, 1864–69). (H. W. C. D.)

RICHARD OF HEXHAM (fl. 1141), English chronicler, became prior of Hexham about 1141, and died between 1163 and 1178. He wrote Brevis Annotation, a short history of the church of Hexham from 674 to 1138, for which he borrowed from Bede, Eddius and Simeon of Durham. This is published by J. Raine in The Priory of Hexham, its Chroniclers, Endowments and Annals (Durham, 1864–65). More important is his Historia de gestis regis Stephani et de bello Standardari, very valuable for the history of the north of England during the earlier part of the reign of Stephen, and especially for the battle of the Standard. This history, which is a contemporary one, covers the period from the death of Henry I. in 1135 to early in 1150. It has been edited for the Rolls Series by R. Howlett in the Chroniclers of the Reigns of Stephen, Henry II. and Richard I., vol. iii. (1886); and has been translated by J. Stevenson in the Church Historians of England, vol. iv. (1890).

RICHARD OF ILCHESTER (d. 1188), English statesman and prelate, was born in the diocese of Bath, where he obtained his early education. Early in the reign of Henry II. he is found acting as a clerk in the king’s court, probably under Thomas Becket, and he was one of the officials who assisted Henry in carrying out his great judicial and financial reforms. In 1162, or 1163, he was appointed archdeacon of Poitiers, but he passed most of his time in England, although in the next two or three years he visited Pope Alexander III. and the Emperor Frederick I. in the interests of the English king, who was then engaged in his struggle with Becket. For promising to support Frederick against Alexander he was excommunicated by Becket in 1166. Before this event, however, Richard had been appointed a baron of the exchequer, his great industry and exceptional abilities as an accountant being recognized by giving him a special seat at the exchequer table, and from 1168 until his death he frequently acted as one of the itinerant justices. Although totally immersed in secular business he received several rich ecclesiastical offices, and in May 1173 he was elected bishop of Winchester, being consecrated at Canterbury in October 1174. Richard still continued to serve Henry II. In 1176 he was appointed justiciar and seneschal of Normandy, and was given full control of all the royal business in the duchy. He died on the 21st or 22nd of December 1188, and was buried in Winchester cathedral. Richard owes his survival to the fact that Henry II. caused a memorial to be written of him at Ilechester; he is also called Richard of Toclyve.

RICHARD OF ST VICTOR (d. 1173), theologian and mystic of the 12th century. Very little is known of his life; he was born in Scotland or in England, and went to Paris, where he entered the abbey of St Victor and was a pupil of the great mystic, Hugh of St Victor. He succeeded as prior of this house in 1169, and was continually contesting the tyrannical authority of the abbot Ervius. His writings, some of which are still in manuscript, are very numerous, the best known being his mystical treatises: De statu hominis interioris, De praeparatione animi ad contemplationem, De gratia contemplationis, De gradibus caritatis, De arca nuptica, and his two works on the Trinity: De trinitate libri sex, De tribus proprietatis personis in Trinitate. As is the case with all the Victorines, his mysticism was a reaction against the philosophy of the schools of his time, a perpetual justification of contemplation as opposed to logical reasoning. According to him, six steps lead the soul to contemplation: (1) contemplation of visible and tangible objects; (2) study of the productions of nature and of art; (3) study of character; (4) study of souls and of spirits; (5) entrance to the mystical region which ends in (6) ecstasy. His theory of the Trinity is chiefly based on the arguments of Anselm of Canterbury, although a certain deification of the social sense is evident.
His style is most affected, and the influence of the neo-Platonist terminology as well as of the works of the pseudo-Dionysius can be clearly detected. In the "Paradis Dante has placed Richard de St Victor, whose books were much read by his contemporaries, among the greatest teachers of the Church. His writings seem to come into favour again in the 16th and 17th centuries, six editions of his works having been printed between 1566 and 1650.

RICHARDIA, a small genus of the nat. ord. Araceae, native in South Africa, to which the "arum lily" belongs. They are all greenhouse herbaceous plants of handsome appearance, with thick underground stems and large, or more fleshly, long-stalked, arrow-shaped leaves and white or yellow flower spathes. They are readily propagated by division of the shoot, also by seed. Water should be given abundantly at all times, and the soil for potting should be rich and retentive. Potting is best effected in spring, and from the end of June to the end of August, probably in the latter part. They will not withstand frost, and should be wintered in a warm greenhouse. They flower throughout the year.

RICHARDS, ALFRED BATE (1820-1870), English journalist, was born in Worcestershire on the 17th of February 1820, and was educated at Westminster School and Exeter College, Oxford. After taking his degree in 1841 he published, anonymously, Oxford Unmasked, a denunciation of abuses in the university. Between 1845 and 1848 he wrote several dramas and some poetry, and in the latter year became editor of a weekly newspaper, the British Army Despatch. His temperament was strongly Imperialist; he opposed Cレベル and the Manchester school of politicians, and in a volume entitled Britain Redeemed and Canada Preserved predicted, thirty years before the event, the construction of the Canadian Pacific railway. In 1855 he was appointed the first editor of the London Daily Telegraph, and through the medium of that journal strongly urged the formation of volunteer rifle corps. The National and Constitutional Defence Association was established in 1858 to carry out the idea. Richards himself raised a regiment of a thousand working men in London, becoming major and subsequently colonel of the corps. In 1870 he was appointed editor of the London Morning Advertiser, and retained this position till his death on the 18th of July 1875.

RICHARDS, HENRY BRINLEY (1819-1865), English pianist and composer, was born at Carmarthen, and educated at the Royal Academy of Music in London, where later he was a professor. He took much interest in Welsh music and in the Eisteddfod gatherings. He was a prolific composer, but is perhaps principally remembered for writing the song "God bless the Prince of Wales" (1862), which has been adopted as an English national anthem.

RICHARDS, WILLIAM TROST (1833-1905), American marine painter, was born at Philadelphia, Pennsylvania, on the 14th of November 1833. He was a pupil of Paul Weber in his native city, and lived successively in France, Italy and London. He was a member of the Pennsylvania Academy of the Fine Arts, and of the American Water Colour Society. Examples of his work are in the collections of the Pennsylvania Academy of the Fine Arts, Philadelphia, Penn.; the Metropolitan Museum of Art, New York, the Corcoran Art Gallery, Washington, D.C., and the Schaeube Gallery, Hamburg. He died at Newport, Rhode Island, on the 8th of November 1905. His daughter Anna M. Richards (b. 1870) was a pupil of John La Farge and Benjamin Constant.

RICHARDSON, GEORGE, English 18th-century architect and designer. The dates of birth and death of this distinguished contemporary and rival of the brothers Adam are not ascertained, but he is conjectured to have been born about 1730 and to have died in 1817. Richardson spent three years—

and from 1760 to 1763—travelling in Dalmatia and Istria, in the south of France and in Italy. During that period he imbibed the inspiration of a lifetime, and acquired the material for its practical application. He soon began to show remarkable skill in adapting classical ideals to the uses of his time, and in 1765 he won a premium offered by the Society of Arts for a design of a street in the classical manner. Richardson's work is so closely allied to that of the brothers Adam that it is often difficult to distinguish between them, and if it possessed less freedom and variety, and bore to a smaller extent the impress of an original mind, it would stand in the main exceedingly admirable and satisfying. Richardson was an especially successful designer of ceilings and chimney-pieces. He published in 1776 a Book of Ceilings in the Style of the Antique Grecian. Many of its drawings are of exquisite taste. Nor is his fireplace work, as represented by his Collection of Chimney-Pieces Ornamented in the Style of the Etruscan, Greek and Roman Architecture (1781), less attractive. Richardson's chimney-pieces are still to be found in considerable numbers in town and country houses. They are mostly of marble, but examples in wood are not uncommon. He made extensive use of coloured marbles, and the effect is constantly that of the sumptuous balancing the austere and monumental in architecture. Richardson also worked with composition enrichments, and his New Designs in Architecture (1792) contains many drawings of interior friezes and columns to be executed either in this medium or painted to suit the wall hangings. His versatility was considerable, as the titles of his works, a dozen in number, suggest. For many years he exhibited at the Royal Academy as well as in the Galleries of the Society of Arts. Why such a man should have fallen into obscurity in his old age we have no means of ascertaining, but we know that his necessities were relieved by Nollekens.

His principal works in addition to those already mentioned were, in the original or nearly original style: Pembroke College (1774); Iconology (2 vols.), with plates by Bartolozzi and other engravers (1779-1779); New Designs in Architecture (1792); Original Designs for Country Seats or Villas (1792); The New Vitruvius Britannicus, a sequel to Colin Campbell's Vitruvius Britannicus, 2 vols. (1802); Ornaments in the Grecian, Roman and Etruscan Tastes (1816). He also published volumes dealing with vases and tripod, antique friezes and other architectural and decorative details.

RICHARDSON, HENRY HOBSON (1838-1880), American architect, was born in the parish of St James, Louisiana, on the 20th of September 1838, of a rich family, his mother being a granddaughter of the famous Dr Priestley, the English dis-
RICHARDSON, Sir J.——RICHARDSON, S.

who followed him and brought him wide acknowledgment. It is notable that American architects who have studied in Europe, especially in Paris, are apt to drift either into a pathless eclecticism or into the English current. Richardson did neither. The Romanesque that he saw in Europe, especially in the midst of all of France, appealed so strongly to his sense for mass and broad picturesque ness that he soon followed its leading, away from the style he had learned in Paris. His earliest work was modern French in style; his first church, in Springfield, a startlingly independent version of English Gothic. Yet half a dozen buildings made the transition to that derivative of Romanesque to which afterwards in all his buildings he steadfastly adhered. In Trinity church, his first monumental work, perhaps his finest, he broke away absolutely from the prevailing English Gothic fashion. Instead of the long Latin cross with aisles and transepts, he made a wide cross almost Greek in plan, with short arms fifty feet broad and aisles that are only passages, a narthex flanked by two western towers, a nave of one double bay, an eastern arm prolonged into a great apse of the full width of the crossing, over which sits a massive square tower. The arms of the church are barrel-vaulted in wood; under the great tower is a flat coffered ceiling a hundred feet above the floor. The style, though mixed, shows his surrender to the attraction of the churches in Auvergne, which have furnished the material for the design of the apse. The central tower is a reminiscence of the noble lantern of the old cathedral of Salamanca, but the square outline is insisted on instead of the polygonal, and the forms are in other ways much changed. The alteration of the Capitol at Albany, half a dozen years later, shared with Leopold Eidlitz, was a compromise in style, and so lacks the sure handling of his best work, except in that part of the interior in which he was untrammeled, the Senate Chamber and the great staircase. In the buildings at Pittsburg, on the other hand, he was free from interference, and these satisfied him more than any other of his buildings. His great design for the new cathedral at Albany, an adaptation of the Romanesque forms of Auvergne to a large modern problem, would have displayed his mature manner, and been perhaps his greatest work; but the plan did not lend itself to the tradition or the ritual of the Anglican Church, and it was rejected, to his great disappointment.

At first the breadth of his compositions was offset by a richness of ornament which he afterwards called flamboyant, but there was a continual growth in simplicity. Some of his imitators have abused his example, running into mere baldness and brutality, but his own work never lost the fineness of quality with which he began, nor the adequacy of its detail.

Richardson's uncommon personality so embodied itself in his works that it cannot be overlooked. He had an inexhaustible energy of body and mind, an enthusiasm more genial than combative, but so abounding and at times vehement that few men and few bodies of men could resist him. Abounding energy he had, but not health. A serious bodily injury, and later a chronic malady, made his last years a constant struggle with suffering and infirmity, borne with indomitable cheerfulness, but at last fatal.

It is likely that the small number of his designs enhanced their quality. He put twice the labour into his work that the average architect would have given to it, and often twice the time, but the result was apt to be twice as good. He found American architecture restless, incoherent and exuberant; his example did much to turn it back to simplicity and repose. He came as near to establishing a style as it is given to any one man to come; and the tendency of the time was too strong, and the classic styles, reasserting themselves, once more drove out the medieval.

The best known book about Richardson is Mrs Schuyler van Rensselaer's H. H. Richardson and his Works (Boston, 1888).

RICHARDSON, Sir John (1787-1865), British naturalist, was born at Dumfries on the 5th of November 1787. He studied medicine at Edinburgh, and became a surgeon in the navy in 1807. In 1819 he was appointed surgeon and naturalist to Franklin's first arctic expedition (1819-22), and he served in the same capacity to the second (1825-26). The scientific results of these expeditions he described in contributions to Franklin's Narrative, and especially in the four quarto volumes of his Fauna Boreali-Americana (1829-37). He was knighted in 1846, and in the following year was chosen commander of the Franklin search expedition (1848-49), the journal of which he published in 1851 under the title of An Arctic Searching Expedition. In 1853 he retired to Grasmere, where he died on the 5th of June 1865. He also wrote accounts dealing with the natural history, and especially the ichthyology, of several other arctic voyages, and was the author of Icones Pisceanum (1843), Catalogue of a Podial Fish in the British Museum, translated from the German MS. (1856), the second edition of Yarrell's History of British Fishes (1856), and The Polar Regions (1861), expanded from an article with the same title which he wrote for the Encyclopedia Britannica.

A Life by John Maclnith was published in 1868.

RICHARDSON, Samuel (1689-1761), English novelist, is a notable example of that "late-flowering" sometimes applied to Oliver Goldsmith. Born under William and Mary, the reign of the second George was well advanced before, at fifty years of age, he made his first serious literary effort—an effort which was not only a success, but the revelation of a new literary form. He was the son of a London joiner, who, for obscure reasons, probably connected with Monmouth's rebellion, had retired to an unidentified town in Derbyshire, where, in 1680, Samuel was born. At first intended for holy orders, and having little but the common learning of a private grammar school—for the tradition that upon the return of the family to the metropolis he went to Christ's Hospital cannot be sustained—he was eventually, as some compensation for a literary turn, apprenticed at seventeen to an Aldersgate printer named John Wilde. Here, like the typical "good apprentice" of his century, he prospered; became successively compositor, corrector of the press, and printer on his own account; married his master's daughter according to programme; set up newspapers and books; dabbled a little in literature by compiling indexes and "honest dedications," and ultimately proceeded Printer of the Journals of the House of Commons, Master of the Stationers' Company, and Law-Printer to the King. Like all well-to-do citizens, he had his city house of business and his "country box" in the suburbs; and, after a thoroughly "respectable" life, died on the 4th of July 1761, being buried in St Bride's Church, Fleet Street, close to his shop (now demolished), No. 11 Salisbury Court.

To this uneventful and conventional career one would scarcely look for the birth and growth of a fresh departure in fiction. And yet, although Richardson's manifestation of his literary gift was deferred for half a century, there is no life to which the Horatian "quils ab incepto" can be more appropriately applied. From his youth this moralist had moralized; from his youth—nay, from his childhood—this letter-writer had written letters; from his youth this supreme delineator of the other sex had been the confidant and counsellor of women. In his boyhood he was secretary-general to all the love-sick girls of the neighbourhood; at eleven he addressed a horatary epistle, stuffed with texts, to a scandal-loving widow; and whenever it was possible to correspond with any one he was as "corresponding" as even Horace Walpole could have desired. At last, when he was known to the world only as a steady business man, who was also a "dab at an index" and an ink-seller, and in the "patriotic" line, Mr. Rivington of St Paul's Churchyard and Mr Osborn of Paternoster Row, two book-selling friends who were aware of his epistolary gifts, to suggest that he should prepare a little model letter-writer for such "country readers" as "were unable to indite for themselves." Would it be any harm, he suggested in answer, if he should also "instruct them how they should think and act in common cases"? His friends were all the more anxious that he should
set to work. And thus originated his first novel of Pamela; or, Virtue Rewarded.

But not forthwith, as is sometimes supposed. Proceeding with the compilation of his model letter-writer, and seeking, in his own words, “to instruct handsome girls, who were obliged to go out on service...” how to avoid the snares that might be laid for them, Fielding—though he had always been abnormally preoccupied with him—came to recollect a story he had heard twenty years earlier, and had often proposed to other persons for fictitious treatment. It occurred to him that it would make a book of itself, and might moreover be told wholly in the fashion most congenial to himself, namely, by letters. Thereupon, with some domestic encouragement, he completed it in a couple of months, between the 10th of November 1739 and the 10th of January 1740. In November 1740 it was issued by Messrs Rivington & Osborn, who, a few weeks afterwards (January 1741), also published the model letter-writer under the title of Letters written in and for Particular Friends, on the most Important Occasions. Both books were anonymous. The letter-writer was noticed in the Gentleman’s Magazine for January, which also contains a brief announcement as to Pamela, already rapidly making its way without waiting for the reviewers. A second edition, it was stated, was expected; and such was its popularity, that not to have read it was judged “as great a sign of want of curiosity as not to have seen the French and Italian dancers”—i.e., Mme Chateauneuf and the Faucons, who were then delighting the town. In February a second edition duly appeared, followed by a third in March and a fourth in May. At public gardens ladies held up the book to show they had got it; Dr Benjamin Slock of Southwark openly commended it from the pulpit; Pope praised it; and at Slough, when the heroine triumphed, the enraptured villagers rang the church bells for joy. The other volume of “familiar letters” consequently fell into the background in the estimation of its author, who, though it went into several editions during his lifetime, never acknowledged it. Yet it scarcely deserves to be wholly neglected, as it contains many useful details and much shrewd criticism of lower middle-class life.

For the exceptional success of Pamela there was the obvious excuse of novelty. People were tired of the old “mouthy” romances about impossible people doing impossible things; here was a real-life story, which might happen to any one—a story which aroused curiosity and arrested attention—which was not exclusively about “high life,” and which had, in addition, a moral purpose, since it was avowedly “published in order to cultivate the principles of virtue and religion in the minds of the youth of both sexes.” Whether it had exactly this effect, or owed its good fortune chiefly to this proclamation, may be doubted. The heroine in humble life who resists the licentious advances of her master until he is forced to marry her, does not entirely convince us that her watchful prudence and keen eye for the main chance have not, in the long run, quite as much to do with her successful defence as her boasted innocence and purity. Nor is the book without passages which more than smack of an unpleasant pruriency. Nevertheless, in its extraordinary gift of minute analysis; in its intimate knowledge of feminine character; in the cumulative power of its shuffling, loose-shod style, and, above all, in the unquestionable earnestness and sincerity of the writer, Pamela had qualities—which particularly in a dead season of letters—sufficiently account for its favourable reception by the contemporary public.

Such a popularity, of course, was not without its drawbacks. There were hints of anti-Pamela, the caricatures of Pamela and all the spasm of pamphlets which spring round the track of a sudden success, was to be anticipated. One of the results to which its rather sickly morality gave rise was the Joseph Andrews (1742) of Fielding (q.v.). But there are two other works prompted by Pamela which need brief notice here. One is the Apology for the Life of Mrs Shamelia Andrews, a clever and very gross piece of raillery which appeared in April 1741, and by which Fielding is supposed to have preluded to Joseph Andrews. Fielding’s own works contain no reference to Shamelia. But Richardson in his Correspondence, both printed and unprinted, roundly attributes it to the writer who was to be his rival; and it is also assigned to Fielding by other contemporaries (Hist. MSS. Comm., Rept. 12, App. Pt. IX, p. 204). All that can be said is, that Fielding’s authorship cannot be proved. If it could, it would go far to justify the after animosity of Richardson to Fielding—much farther, indeed, than what Richardson described as the “lewd and ungenerous engraving” of Joseph Andrews. The second noteworthy result of Pamela was Pamela’s Conduct in High Life (September 1741), a spurious sequel by John Kelly of the Universal Spectator. Richardson tried to prevent its appearance, and, having failed, set about two volumes of his own, which followed in December, and professed to depict his heroine “in her exalted condition.” But the public interest in Pamela had practically ceased with her marriage, and the author’s continuation, like other continuations—particularly continuations prompted by extraneous circumstances—attracted no permanent attention.

About 1744 we begin to hear something of the progress of Richardson’s second and greatest novel, Clarissa; or, the History of a Young Lady, usually miscalled Clarissa Harlowe. The first edition was in seven volumes, two of which came out in November 1747, two more in April 1748 and the last three in December. Upon the title-page of this, of which the mission was as edifying as that of Pamela, its object was defined as showing the distresses that may attend the misconduct both of parents and children in relation to marriage. Virtue, in Clarissa, is not “rewarded,” but hunts down and outraged. The heroine, no longer an opportunist servant-girl, is a most pure, refined and beautiful young woman, invested with every attribute to attract and charm, while her pursuer, Lovelace, the libertine hero of the book—a personage of singular dash and vivacity, in spite of his worthlessness—is drawn with extraordinary tenacity of power. The wronged Clarissa eventually dies of grief, and her cold-blooded betrayer, whom strict justice would have hanged, is considerably killed in a duel by her soldier cousin. Of the genius of the story there can be no doubt. Nor is there any doubt as to the ability shown in the delineation of the two chief characters, to whom the rest are merely subordinate. The chief drawbacks of Clarissa are its merciless proximity (seven volumes, which only cover eleven months); the fact that (like Pamela) it is told by letters; and a certain haunting and uneasy feeling that many of the heroine’s obstacles are only molchills which should have been readily surmounted. As to its success, accentuated as this was by its piecemeal method of publication, there has never been any question. Clarissa’s sorrows set all England sobbing, and her fame and her fate spread rapidly to the Continent.

Between Clarissa and Richardson’s next work appeared the Tom Jones of Fielding—a rival by no means welcome to the elder writer, although a rival who generously (and perhaps penitently) acknowledged Clarissa’s rare merits.

“Pectus inaniter angit
Irritat, mulcet, falsis terroribus implet
Ut Magus,”

Fielding had written in the Jacobite’s Journal. But even this could not console Richardson for the popularity of the “spurious brat” whom Fielding had made his hero, and his next effort was the depicting of a genuine fine gentleman—a task to which he was incited by a chorus of feminine worshipers. In the History of Sir Charles Grandison, “by the Editor of Pamela and Clarissa” (for he still preserved the fiction of anonymity), he essayed to draw a perfect model of manly character and conduct. In the pattern presented there is, however, too much buckram, too much ceremonial—in plain words, too much priggishness—to make him the desired exemplar of propriety in excelsis. Yet he is not entirely a failure, still less is he to be regarded as no more than “the
condescending suit of clothes” by which Hazlitt unfairly defines Miss Burney’s Lord Orville. When Richardson delineated Sir Charles Grandison he was at his best, and his experiences and opportunities for inventing such a character were infinitely greater than they had ever been before. And he lost nothing of his gift for portraying the other sex. Harriet Byron, Clementina della Porretta and even Charlotte Grandison, are no whit behind Clarissa and her friend Miss Howe. Sir Charles Grandison, in fine, is a far better book than Pamela, although M. Taine regarded the hero as only fit to be stuffed and put in a museum.

Grandison was published in 1753, and by this time Richardson was sixty-four. Although the book was welcomed as warmly as its predecessors, he wrote no other novel, contenting himself instead with indeed interesting works, and with “cautions” and “instructive sentiments” they contained. To these things, as a professed moralist, he had always attached the greatest importance. He continued to correspond relentlessly with a large circle of worshippers, mostly women, whose counsels and fertilizing sympathy had not a little contributed to the success of his last two books. He was a nervous, highly strung little man, intensely preoccupied with his health and his feelings, hungry for praise when he had once tasted it, and afterwards unable to exist without it; but apart from these things, well meaning, benevolent, honest, industrious and religious. Seven vast folio volumes of his correspondence with his lady friends, and with a few men of the Young and Aaron Hill type, are preserved in the Forster Library at South Kensington. Parts of it only have been printed. There are several good portraits of him by Joseph Highamore, two of which are in the National Portrait Gallery.

Richardson is sometimes styled the “Father of the English Novel,” a title which has also been claimed for Defoe. It would be more accurate to call him the father of the novel of sentimental analysis. As Sir Walter Scott has said, no one before had dived so deeply into the human heart. No one, moreover, had brought to the study of feminine sentiment so much prolonged research, so much patience of observation, so much interest and indulgent apprehension, as this twittering little printer of Salisbury Court. That he did not more materially control the course of fiction in his own country was probably owing to the new direction which was given to that fiction by Fielding and Smollett, whose method, rough and speaking, was synthetic rather than analytic. Still, his influence is to be traced in Sterne and Henry Mackenzie, as well as in Miss Burney and Miss Austen, both of whom, it may be noted, at first adopted the episodical form. But it was in France, where the sentimental soil was ready and the dressing, that the analytic process was most warmly welcomed. Extravagantly eulogized by the great critic, Diderot, modified with splendid variation by Rousseau, copied (unwillingly) by Voltaire, the vogue of Richardson was so great as to tempt some modern French critics to seek his original in the Marianne of a contemporary analyst, Marivaux. As a matter of fact, though there is some unconscious consonance of manner, there is nothing whatever to show that the little-lettered author of Pamela, who was also ignorant of French, had the slightest knowledge of Marivaux or Marianne. In Germany Richardson was even more popular than in France. Gellert, the fabulist, translated him; Wieland, Lessing, Herder, all imitated him, and Coleridge detects him even in the Robbers of Schiller. What was stranger still, he returned to England again under another form. Having given a fillip to the French comédie larmoyante, that comedy crossed the channel as the sentimental comedy of Cumberland and Kelly, which, after a brief career of prosperity, received its death-blow at the hands of Goldsmith and Sheridan.

A selection from Richardson’s Correspondence was published by Miss Clara L. Thomson, in six volumes, with a valuable apparatus by Mr. Austin Dobson (“Men of Letters”), 1902. A convenient reprint of the novels, with copies of the old illustrations by Stothard, Edward Burney and the rest, and an introduction by Mrs. E. M. M. MacKenna, was issued in 1901 in ten volumes. (A. M. D.)

RICHIELIEU, ARMAND EMMANUEL SOPHIE SEPTEMBRINE DU PLESSIS, DUC DE (1766-1832), French statesman, was born in Paris on the 25th of September 1766, the son of Louis Antoine du Plessis, duc de Fronzac and grandson of the marshal de Richelieu (1606-1788). The comte de Chinnon, as the heir to the Richelieu honours was called, was married at fifteen to Rosalie de Rochchouart, a deformed child of twelve, with whom his relations were never more than formal. After two years of foreign travel he entered the Queen’s dragoons and next year received a place at court, where he had a reputation for Puritan austerity. He left Paris in 1790 for Vienna, and in company with his friend Prince Charles de Ligne joined the Russian army as a volunteer, reaching the Russian head-quarters near Bender on the Danube. He was present at the capture of Ismailia and received from the empress Catherine the cross of St George and a golden sword. By the death of his father in February 1791, he succeeded to the title of duc de Richelieu. He returned to Paris shortly afterwards on the summons of Louis XVI, but he was not sufficiently in the confidence of the court to be informed of the projected flight to Varennes. In July he obtained a passport from the National Assembly for service in Russia. In the Russian army he obtained the grade of general-major, only to be forced by the intrigues of his enemies to resign. The accession of Alexander I. brightened his prospects. His elevation from the list of émigrés, to which he had failed to secure from Napoleon, was accorded on the request of the Russian government, and in 1803 he became governor of Odessa. Two years later he became governor general of the Chersonese, of Ekaterinodar and the Crimea, then called New Russia. In the eleven years of his administration, Odessa rose from a miserable village to an important city. He commanded a division in the Turkish War of 1806-7, and was engaged in frequent expeditions to the Caucasus.

Richelieu returned to France in 1814; on the triumphant return of Napoleon from Elba he accompanied Louis XVIII. in his flight as far as Lille, whence he went to Vienna to join the Russian army, believing that he could best serve the interests of the monarchy and of France by attaching himself to the headquarters of the emperor Alexander. Richelieu’s character and antecedents alike marked him out as valuable support of the monarchy after its second restoration. Though the bulk of his confiscated estates were lost beyond recall, he did not share the resentment of the mass of the returned émigrés, from whom and their intrigues he had held aloof during his exile, and was far from sharing their delusions as to the possibility of undoing the work of the Revolution. As the personal friend of the Russian emperor his influence in the councils of the Allies was likely to be of great service. He refused, indeed, Talleyrand’s offer of a place in his ministry, pleading his long absence from France and ignorance of its conditions; but after Talleyrand’s retirement he consented to follow him as prime minister, though—as he himself said—he did not know the face of one of his colleagues.

The events of Richelieu’s tenure of office are noticed elsewhere (see France: History). Here it need only be said that it was mainly due to his efforts that France was so early relieved of the burden of the allied army of occupation. It was for this purpose mainly that he attended the congress of Aix-la-Chapelle in 1818. There he had been informed in confidence of the renewal by the Allies of their treaty binding them to interfere in case of a renewal of revolutionary trouble in France; and it was partly owing to this knowledge that he resigned office in December of the same year, on the refusal of his colleagues to support a reactionary modification of the electoral law. After the murder of the duc de Berry and the enforced retirement of Decazes, he again became president of the council (21st February 1821); but his position was untenable owing to the attacks of the “Ultrás” on the one side and the Liberals on the other, and on the 12th of December he again resigned. He died of apoplexy on the 17th of May 1822.
Great part of Richelieu's correspondence with Pozzo di Borgo, Capo d'Istria and others, with his journal of his travels in Germany and the Turkish campaign, and a notice by the duchesse de Richelieu, is published by the Imperial Historical Society of Russia, vol. 54. There is an exhaustive study of his career by L. de Crousaz-Créteil, Le Duc de Richelieu en Russie et en France (1897), with which compare an article by L. Rioult de Neuville in the Revue des questions historiques (Oct. 1897). See also R. de Cisternas, Le Duc de Richelieu, son action et ses discours (Aix-la-Chapelle, 1898), containing copies of documents.

RICHÉLIEU, ARMAND JEAN DU PLESSIS DE, Cardinal (1585-1642), French statesman, was born of an ancient family of the lesser nobility of Poitou. The original name of the family was Du Plessis, but in the 15th century a younger branch obtained by marriage the estate of Richelieu with its strong castle and its possessions, the Despensers of the name of Du Plessis de Richelieu. The family produced not a few turbulent warriors during the Hundred Years' War, and the cardinal's father, Françoys du Plessis, seigneur de Richelieu, began his career by killing the murderer of his elder brother and then fighting through the wars of religion, first as a favourite of Henry III., and after his death under Henry IV. He was a typical fighting gentleman of the period. The mother of the cardinal, Susanne de La Porte, belonged to a family of the magistrature, her father, François de La Porte, being one of the first advocates of the parlement of Paris. Armand was the third son and was born in Paris on the 9th of September 1585. When he was five years old his father died while assisting at the siege of Luçon (on the 10th of July 1590); and his mother was left with five children and the estate heavily in debt. By care and economy, however, aided by generous royal grants, she was enabled to pay off mortgages and to bring up the children in a way befitting their rank. At the age of nine Armand was sent to Paris to the College of Navarre, where he passed with credit the regular courses in grammar and philosophy, and then entered a "finishing academy" which prepared the sons of nobles for the life of a courtier or a cavalier. But his training for a military career was suddenly cut short by the refusal of his elder brother, Alphonse, to accept the office of bishop of Luçon. The right of preemption to that see had been given to the Richelieu family by Henry III., as a reward for the services of Armand's father, and the family drained its revenues for private use. When the cathedral chapter found courage to oppose this and opened suit to recover the ecclesiastical revenues for ecclesiastical purposes, Richelieu's mother proposed to make her second son, Alphonse, bishop. He defeated this scheme, however, by becoming a monk of the Grande Chartreuse, and Armand, whose health was rather feeble in any case for a military career, was induced to propose himself for the priesthood.

In 1606, at the age of twenty-one, Richelieu was nominated bishop of Luçon by Henry IV. As he was almost five years under the canonical age, he was obliged to go to Rome to obtain a dispensation and was consecrated there in April 1607. In the winter of 1608 Richelieu went out to his poverty-stricken little bishopric, and for the next six years devoted himself seriously to his episcopal duties. He became favourably known among the zealous reformers of the church, and it was during this stage of his career that he made a friend of Father Joseph. Meanwhile he was impatiently waiting for an opening to a larger career. This came in 1614 when he was elected by the clergy of Poitou to the last States-general which met before the Revolution. In this he attracted the favourable attention of Marie de' Medici, the queen-mother, and was chosen at his close to present the address of the clergy embodying its petitions and resolutions. After the States-general was dissolved he remained in Paris, and the next year he became almoner to Anne of Austria, the child-queen of Louis XIII. Then, by adroit courtly intrigue and faithful service to Concini, he was appointed in 1616 a secretary of state to the king. But he owed all to Concini, and his taste of power ended with the murder of his patron on the 24th of August 1617.

The reign which Richelieu was to dominate so absolutely began with his exile from the court. He had, however, already shown his ability, his firmness, and his diplomatic skill, and conducted the negotiations on the part of the queen-mother with Luynes, the chief of the Catholic party. Richelieu had personally represented the queen-mother to the king, and had incurred so much of the odium of a creature of Concini to hope for royal favour, he resigned himself to the post of chief adviser to Marie de' Medici in her exile at Blois. Here he sought to ingratiating himself with Luynes and the king by reporting minutely the actions of Marie and by protestations of loyalty. As this ungrateful work brought no reward, Richelieu, in spite of the earnest entreaties of the queen-mother, retired once more to his bishopric. But the king, while approving his conduct, was still suspicious of him, and he was exiled to Avignon, along with his brother and brother-in-law, on the 7th of April 1618. There Richelieu spent twenty years, as Jesuit, as citizen, as friend of the Medici, and took the name of Jean. It was in this little hope of a further political career when the escape of Marie de' Medici from Blois, on the 22nd of February 1619, again opened paths for his ambition. Luynes and the king recalled him to the post at Angoulême with the queen-mother, who received him ungraciously but who soon yielded to his judgment and allowed him to sign the treaty of Angoulême with the Cardinal de la Rochefoucauld, acting for the king. By this treaty Marie was given liberty to live wherever she wished, and the government of Anjou and of Normandy with several castles was entrusted to her. The bishop of Luçon was led to believe that the king would recommend him for a cardinalate, but, if we may trust the evidence, Luynes secretly opposed the request, and it was not until after his death that Richelieu was made a cardinal by Pope Gregory XIV., on the 5th of September 1622. His rank in the church was due to his skill in intrigue with Marie de' Medici.

Luynes's death on the 15th of December 1621 made possible a reconciliation a month later between the king and his mother. Although Louis still distrusted her at heart, and disliked her dominating minister more, he allowed her to take up her residence in the Luxembourg palace in Paris, thus rendering intercourse possible. Richelieu seized his opportunity. He furnished Marie de' Medici with political ideas and acute criticisms of the king's ministry, especially of the Brularts. Marie zealously pushed her favourite towards office, and had gone so far as to absent herself from court for three months on account of the king's persistent refusal, when Charles, Duc de La Vieuville, then head of the council, in need of her aid in his negotiations with reference to the marriage of her daughter Henriette Marie, finally agreed to force Richelieu's appointment to office upon the king, Louis XIII. La Vieuville thought to compromise by forcing the cardinal into a "council of despatches," with merely the privilege of advising the king's council but entrusted with no power. Richelieu raised many objections to such a partial realization of his ambition, but the king ended them in April 1624 by naming him as a member of his council. By August Vieuville's worst fears were realized; he was arrested on the 13th of the month for corrupt practices in office, and the intriguing cardinal who had caused his overthrow became chief minister of Louis XIII. His advent was hailed with joy by both the Catholic party and the patriotic party, eager for the overthrow of Habsburg supremacy in Europe.

For the next eighteen years the biographies of Richelieu is the history of France, and to a large degree that of Europe. His work was directed toward a twofold aim: to make the royal power—his power—absolute and supreme at home, and to crush the rival European power of the Habsburgs. At home there were two opponents to be dealt with: the Huguenots and the feudal nobility. The former were crushed by the siege of La Rochelle and the vigorous campaign against the Duke de Rohan. But the religious toleration of the Edict of Nantes was reaffirmed while its political privileges were destroyed, and Huguenot officers fought loyally in the foreign enterprises of the cardinal. The suppression of the independence of the feudal aristocracy was inaugurated in 1626 by an edict calling for the destruction of all fortified castles not needed for defence against invasion.
The local authorities proceeded to carry this out with a zeal due to long suffering, and the ruined medieval châteaux of France still bear witness to the action of Richelieu. Still there was no serious opposition to the new minister. The first serious conspiracy took place in 1626, the king's brother, Gaston of Orleans, being the centre of it. His governor, Marshal D'Ornano, was arrested by Richelieu's orders, and then his confidant, Henri de Talleyrand, marquis de Chalais and Vendôme, the natural sons of Henry IV. Chalais was executed and the marshal died in prison. The overthrow of the Huguenots in 1629 made Richelieu's position seemingly unassailable, but the cardinal it proved Richelieu's strongest test. Marie de' Medici had turned against her "ungrateful" minister with a hatred intensified, it is said, by unrequited passion. In September 1630, while Louis XIII. was very ill at Lyons, the two queens, Marie and Anne of Austria, reconciled for the time, won the king's promise to dismiss Richelieu. He postponed the date until peace should be made with Spain. When the news came of the truce of Regensburg Marie claimed the fulfilment of the promise. On the 10th of November 1630 the king went to his mother's apartments at the Luxembourg palace. Orders were given that no one should be allowed to disturb their interview, but Richelieu entered by a back door. The power of the cardinal had outlived itself. He had recovered his breath from such audacity she proceeded to attack him in the strongest terms, declaring that the king must choose between him or her. Richelieu left the presence feeling that all was lost. The king gave a sign of yielding, appointing the brother of Marillac, Marie's counsellor, to the command of the army in Italy. But before taking further steps he retired to Versailles, then a hunting lodge, and there, listening to two of Richelieu's friends, Claude de Saint-Simon, father of the memoir writer, and Cardinal La Valette, sent for Richelieu in the evening, and while the salons of the Luxembourg were full of expectant courtiers the king was reassuring the cardinal of his continued favour and support. The "Day of Duplicates," as this famous day was called, was the only time that Louis took so much as a step toward the dismissal of a minister who was personally distasteful to him but who was indispensable. The queen-mother followed the king and cardinal to Compiègne, but as she refused to be reconciled with Richelieu she was left there alone and forbidden to return to Paris. The next summer she fled across the frontiers into the Netherlands, and Richelieu was made a duke. Then Gaston of Orleans, who had fled to Lorraine, came back with a small troop to head a rebellion to free the king and country from "the tyrant." The only great noble who rose was Henri de Montmorency, governor of Languedoc, and his defeat at Castelbrandaia on the 1st of September 1632 was followed by his speedy trial by the parlement of Toulouse, and by his execution. Richelieu had sent to the block the first noble of France, the last of a family illustrious for seven centuries, the feudal head of the nobility of Languedoc; then, unmoved by threats or entreaties, inexorable as fate itself, he11owed all opposition by his relentless vengeance. He knew no mercy. The only other conspiracy against him which amounted to more than intrigue was that of Cinq Mars in 1642, at the close of his life. This vain young favourite of the king was treated as though he were really a formidable traitor, and his friend, De Thou, son of the historian, whose sole guilt was not to have revealed the plot, was placed in a boat behind the stately barge of the cardinal and thus conveyed up the Rhone to his trial and death at Lyons. The voyage was symbolic of Richelieu's whole pitiless career.

Richelieu's foreign policy was as inflexible as his home policy. To humble the Hababurs, he aided the Protestant princes of Germany against the emperor, in spite of the strong opposition of the disappointed Catholic party in France, which had looked to the cardinal as a champion of the faith. The year of Richelieu's triumph over the Huguenots (1629) was also that of the Emperor Ferdinand's triumph in Germany, marked by the Edict of Restitution, and France was then defeated by a united Germany. Richelieu, however, turned against the Habsburgs young Gustavus Adolphus of Sweden, paying him a subsidy of a million livres a year by the treaty of Bärwald of the 23rd of January 1631. The dismissal of Wallenstein, which is often attributed to the work of Father Joseph, Richelieu's envoy to the diet of Regensburg in July and August of 1630, was due rather to the fears of the electors themselves, but it was of double value to Richelieu when his Swedish ally marched south. After the treaty of Prague, in May 1635, by which the emperor was reconciled with most of the German princes, Richelieu was finally obliged to declare war, and, concluding a treaty of offensive alliance at Compàïgne with Ozenstierne, and in October one at Savenay on-mention of Bernard of Saxe-Weimar, he proceeded himself against Spain, both in Italy and in the Netherlands. The war opened disastrously for the French, but by 1642, when Richelieu died, his armies—risen from 12,000 men in 1621 to 150,000 in 1638—had conquered Roussillon from Spain; they held Catalonia, which had revolted from Philip IV. of Spain, and had taken Turin and forced Savoy to allow French troops on the borders of the Milanese. In Germany Torstensson was sweeping the imperialist forces before him through Silesia and Moravia. The lines of the treaty of Westphalia, six years later, were already laid down by Richelieu; and its epochal importance in European history, is a measure of the genius who threw down the anachronistic lines and set in its place the permanent domination of Louis XIV. In European politics was largely due to the statesman who prepared France for his absolutism at home.

The magnitude of Richelieu's achievement grows when one considers his relations with the king. Louis XIII. cordially disliked him, and would gladly have got rid of him if he had not been able to convince the king of the wisdom of everything he did. Thus obliged to assume the unpleasant rôle of tutor when delicate flattery was often most needful, the minister lectured and cajoled his master, always, until towards the last, giving credit to the king for his own successes, and overawing opposition by his imperious presence even when Louis was dabbling in plots against him (as in the case of Cinq Mars) behind his back. The king's consciousness of his weakness was combined with a sense of duty, and it was upon these two chords that Richelieu played. Besides, he was eternally on the alert. Spies in every salon in Paris and every court in Europe kept the grim courtier informed of every change in his master's disposition and every intrigue against himself. The piquant comments of his platonic friend, Madame de Hautefort, upon Richelieu were relished by the king until he was informed of others said to have been made by her upon himself. Then it was easy to supplant her with another favourite, Madame de Lafayette. When this devout maiden began to denounce the ungodly cardinal who was allied with heretics, her confessor—in Richelieu's service—succeeded in inducing her to become a nun. Father Causin, the king's confessor, ventured the same comments, and Louis plotted like a schoolboy to turn his devotions into secret criticisms of state policies. Causin was sent into Brittany, and the judicious and learned Jesuit, Jacques Sirmond, who succeeded him, kept clear of politics. Such was the atmosphere of the court in which Richelieu had to maintain his authority.

His own personality was his strongest ally. The king himself quailed before that stern, august presence. His pale, drawn face was set with his iron will. His frame was sickly and wasted with disease, yet when clad in his red cardinal's robes, his stately carriage and confident bearing gave him the air of a prince. His courage was mingled with a mean sort of cunning, and his ambition loved the outward trappings of power as well as its reality; yet he never swerved from his policy in order to win approbation, and the king knew that his one motive in public affairs was the welfare of the realm— that his religion, 'in short, was "reason of state." A clear conscience, not less than a sense of his own superiority to others at the court of Louis XIII., made the cardinal haughtily above his superiors, and the king shared his belief in himself.

No courtier was ever more assiduous of his prerogatives. He claimed precedence over even princes of the blood, and one-
like Condé was content to draw aside the curtains for him to pass, and to sue for the hand of Richelieu's niece for his son, the "Great Condé." His pride and ambition were gratified by the foundation of a sort of dynasty of his nephews and nieces, whose hands were sought by the noblest in the realm. Like all statesmen of his time, Richelieu made money out of politics. He came to court in 1617 with an income of 25,000 livres from his ecclesiastical benefices. In the later years of his life it exceeded 3,000,000 livres. He lived in imperial state, and his residence in the Rue d'Assas, Bestiaux, and the Palais Royal, in Paris, another at Rueil near Paris, and rebuilding his ancestral château in Poitou. His table cost him a thousand crowns a day, although he himself lived simply. He celebrated his triumphs to the full with gorgeous fêtes in his palace, especially with lavish theatrical representations. In January 1641 the tragedy of Mirame, said to have been his own, was produced with great magnificence. Richelieu was anxious for literary fame, and his writings are not unworthy of him. But more important than his own efforts as an author were his protection and patronage of literary men, especially of Corneille, and Racine. Richelieu's influence upon French literature was considerable and lasting. Hardy less important was his rebuilding of the Sorbonne and his endowments there. When he died, on the 4th of December 1642, he was buried in the chapel of the Sorbonne, which still stands as he built it. His tomb, erected in 1694, though riddled at the Revolution, still exists.

Many writings are attributed to Richelieu, although owing to his habit of working with substitutes and assistants it is difficult to settle how much of what passes under his name is authentic. Théatres, La Grande Pastorale, Mirame, and the other plays, over whose fate he trembled as over the result of an embassy or a campaign, have long been forgotten; but a permanent interest attaches to his Mémoires and correspondence. Mémoire d'Armand Plessis de Richelieu, frère de Louis, écrit de sa main, l'année 1607 ou 1610, alors qu'il méditait de paraître à la cour, edited by Armand Baschet (1880). Histoire de la marine et de la Compagnie de la Marine de Saint-Louis (1870), some of which was attributed to Mézy, published at Amsterdam in 1730 and, under the title Histoire de la régence de reine Marie de Médicis, femme de Louis XIV., at the Hague in 1743; Mémoires sur la régence de Louis XIII., extending from 1610 to 1638, and of which the earlier portion is a reprint of the Histoire de la mère et du fils, published in Pétitot's collection (Paris, 1823 seq.); Testament politique d'Armand du Plessis, cardinal de Richelieu (Amsterdam, 1687 seq.); Journal de 1670-1677 (Paris, 1689); in 1675, Instructions diplomatiques, et papiers d'état," published by G. d'Avenel in Coll. de doc. inéd. (Paris, 1853-77); and "Maximes d'état et fragments politiques," published by G. Hanoutaux in Mélanges historiques et littéraires, in the Bibliothèque Nationale.

See G. Hanoutaux, Cardinal Richelieu (1893), one volume of which is a transcription of the periodical from 1644 to 1693. G. d'Avenel, Richelieu et la monarchie absolue (4 vols., 1890-93). Richelieu's sources are the "Lettres, Instructions diplomatiques, et papiers d'état," mentioned above, and Richelieu's Mémoires (1610-38) may be consulted in Petiot's and J. F. Michaud and J. Poujollet's collections. Innumerable memoirs of the time also bear upon his life, e.g., those of Madame de Motteville, Mathieu Molé, De Brienne, and Bassompierre. In English there are short biographies by Richard Lodge (in the Foreign Statesmen series, 1896) and by J. B. Parkinson in Histories of the Nation (series, 1900).

Richelieu, Louis François Armand de Plessis, Duc de (1606-1648), marshal of France, was a grandson of Cardinal Richelieu, and was born in Paris on the 13th of March 1666. Apart from his reputation as a man of exceptionally loose morals, he attained, in spite of a deplorably defective education, distinction as a diplomatist and general. As ambassador to Vienna (1725-29) he settled in 1727 the preliminaries of peace; in 1733-34 he served in the Rhine campaign. His real public career began ten years later. He fought with distinction at Dettingen and Fontenoy, where he directed the grapeshot upon the English columns, and three years afterwards he made a brilliant defence of Genoa; in 1756 he was taken by the surprised French at the capture of the San Felice fortress; and in 1757-58 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of Petit Père de la Maroade. After the wars he plunged again into court intrigues, favoured the comtesse du Barry and supported his nephew the duc d'Aiguillon. Louis XVI., however, was not favourably inclined to him. In his early days he was thrice imprisoned in the Bastille: in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the regent Orleans. He was thrice married: first, against his will, at the age of fourteen to Anne Catherine de Noailles; secondly, in 1734, by the intrigues (according to the witty Frenchman's own account) of Voltaire, to Marie Elisabeth Sophie, Mademoiselle de Guise; and thirdly, when he was eighty-four years old, to an Irish lady. He died in Paris on the 8th of August 1738. Marshal Richelieu's Mémoires, published by J. L. Soulavie in nine volumes (1796), are partially spurious.

See H. Noel Williams, The Fascinating Duc de Richelieu (1910).

Richpin, Jean (1849— ), French poet, novelist and dramatist, the son of an army doctor, was born at Medea (Algeria) on the 4th of February 1849. At school and at the École normale he gave evidence of brilliant, if somewhat undisciplined, powers, for which he found physical vent in different directions—first as a franc-tireur in the Franco-German War, and afterwards as actor, sailor and stevedore—and an intellectual outlet in the writing of poems, plays and novels which vividly reflected his erratic but unmistakable talent. A play, L'Étoile, written by him in collaboration with André Gill (1840-1885), was produced in 1873; but Richpin was virtually unknown until the publication, in 1876, of a volume of verse entitled Chansons des gueux, when his outspokenness resulted in his being imprisoned and fined for outrage aux mœurs. The same quality has characterized his succeeding volumes of verse: Les Caresses (1877), Les Bloghièmes (1884), La Mel (1886), Mes parodis (1896), La Bombarde (1890). His novels have developed in style from the morbidity and brutality of Les Morts barses (1876), La Glu (1881) and Le Pape (1883) to the more thoughtful psychology of Madame André (1878), Sophie Montier (1884), Césaire (1888), L'Aîné (1893), Grandes amouresses (1896) and Laglaisse (1899), and the more simple portrayal of life in Miakia (1883), Les Bêtes Gens (1886), Truandailas (1890), La Misèregor (1892) and Flamboué (1895). His plays, though occasionally marred by his characteristic prominence to violence of thought and language, constitute in many respects his best work. The most notable are Nana Sahib (1895), Monseign Scopis (1886), Le Fatibustier (1888), Par le grand Chemin (1889), Ver le grand Chemin (1890), and Chien de garde (1898), Les Truands (1899), Don Quichotte (1905), most of which were produced at the Comédie française. He also wrote Miakia (1905), adapted from his novel, for the music of Alexandre Georges, and Le Mage (1897) for the music of Jules Massenet.

His son, Jacques Richpin (b. 1880), the author of La Reine de Tyr (1899), La Cavalerie (1901), Cadet-Roussel (1903) and Falsaff (1904), based on Shakespeare's Henry IV., gave promise of making his mark as a dramatist.

Richerus, monk of St Remi at Reims, and a chronicler of the 10th century, son of Rodulf, a tribune of the Carolingian Chronicle of Nivelon. He started under Gerbert, afterwards Pope Silvester II., who taught him mathematics, history, letters and eloquence. He was also well versed in the medical science of his time, and in 991 travelled to Chartres to consult the medical MSS. there. He was still living in 998, but there is no mention of him after that date. In spite of his violent partisanship,—for Richerus was an ardent upholder of the Carolings and French supremacy,—of great defects of style, and of an utter disregard of accuracy and truth, his Historiae has a unique value as giving us the only tolerably full account by a contemporary of the memorable revolution of 987, which placed the Capets on the throne of France. The four books, begins with Charles the Fat and Eudes, and goes down to the year 995. From 969 onwards Richerus had no earlier history before him, and his work is the chief source for the period. It was first edited in Pertz's Monumenta Germaniae, vol. iii.
Richfield Springs—Richmond, Earls and Dukes of

There are French translations by Guadet (Paris, 1845, Soc. de l'Hist. de France); Poissonnier (Rimis, 1835, pub. l'Academie de Rheims); and a German version by K. Freiherr v. der Osten-Sacken (Berlin 1834). Cf. Molièr, Sources de l'Histoire de France, t. 284 (ed. 1901).

RICHFIELD SPRINGS, a village of Richfield township, Otsego county, New York, U.S.A., about 22 m. S.S.E. of Utica and 2 m. N. of Schuyler (or Candarago) lake. Pop. (1890) 1623; (1900) 1537; (1905, state census) 1684. It is served by the Delaware, Lackawanna & Western railway, and by the Oneonta & Mohawk Valley electric line connecting with the New York Central railway at Herkimer. The village is situated in a farming country, about 1700 ft. above sea-level. Knit goods are manufactured, but the importance of the place is due to the sulphur springs, the waters of which have been adjudged as having medicinal qualities, the treatment of skin diseases, gout, rheumatism, etc., and to the tonic air and fine scenery. In 1908 a Welsh eisteddfod was held here in Earlton Park. The first hotels were built between 1820 and 1830. A post office was established here in 1829, and the village was incorporated in 1861.

RICH HILL, a city of Bates county, Missouri, U.S.A., situated near the Osage (Marais des Cygnes) river, in the west central part of the state, about 75 m. S. by E. of Kansas City. Pop. (1890) 4008; (1900) 4053, of whom 255 were foreign-born. It is served by the Missouri Pacific and the St. Louis & San Francisco railways. The city has two public parks, and is a trading centre for the surrounding fertile farming country. Coal is mined in the vicinity. There are lead and zinc smelters, and a large vitrified brick and tile factory. The municipality owns and operates its waterworks and gas and electric-lighting plants; the city is supplied with natural gas. The original Rich Hill was platted in 1867 somewhat north-west of the site of the present city, which was platted in 1880 by an association that bought out the old settlement. The new settlement was incorporated as a village in 1880, and chartered as a city in 1881.

Richmond, Earls and Dukes of

The title earl of Richmond appears to have been in existence in England a considerable time before it was held in accordance with any strict legal principle. Alan, surmanamed "Le Roux," and his brother Alan (c. 1040-1068), surmanamed "Le Noir," relatives of Geoffrey, count of Brittany, and kinsman of William the Conqueror, took part in the latter's invasion of England; and Le Roux obtained grants of land in various parts of England, including manors formerly held by Earl Edwin in Yorkshire, on one of which he built the castle of Richmond, his possession there being formed into the honour of Richmond, to which his brother Alan Le Noir, or Alan Niger (c. 1045-1093), succeeded in 1068. He was in turn succeeded as lord of the honour of Richmond by Stephen (d. 1137), count of Penthièvre, who was either his son or another brother. These Breton counts, being territorial barons of great importance in England, and lords of the honour of Richmond where their castle was situated, are often reckoned as earls of Richmond, though they were not so in the strict and later sense. The same should perhaps be said of Stephen's son Alan Niger II. (c. 1116-1146), though he was styled earl of Richmond by John of Hexham. This Alan married Bertha, daughter and heiress of Conan, reigning count of Brittany; and his son Conan (c. 1138-1171), who married Margaret, sister of Malcolm IV. of Scotland, asserted his right to Brittany, and transferred it in his lifetime to his daughter Constance (c. 1162-1201). As he left no sons the honour of Richmond and his other English possessions passed to the king in 1171, though Constance is also loosely spoken of as countess of Richmond in her own right. Constance was three times married, and each of her husbands in turn assumed the title of earl of Richmond, in conjunction with that of count, or duke of Brittany. They were: Geoffrey Plantagenet (1158-1186), son of Henry II., king of England; Randolph de Blindeville, earl of Chester (c. 1172-1234), the marriage with whom Constance treated as null on the ground of consanguinity; and Guy de Thouars (d. 1213), who survived his wife for twelve years. The only son of the first marriage, Arthur of Brittany (1187-1203), was styled earl of Richmond in his mother's lifetime and on the death of his uncle, King John, the earldom was resumed by the crown.

By her third husband Constance had two daughters, the elder of whom, Alice, was given in marriage by Philip Augustus, king of France, to Peter de Braine in 1213, after which date Peter was styled duke of Brittany and earl of Richmond till about 1225, when he renounced his allegiance to the king of England and thereupon suffered forfeiture of his English earldom.

In 1241 Henry III. granted the honour of Richmond to Peter of Savoy (1203-1268), uncle of Queen Eleanor, who was thereafter described as earl of Richmond by contemporary chroniclers, though how far he was strictly entitled to the duchy has been disputed. By his will he left the honour of Richmond to his niece, the queen consort, who transferred it to the crown. In the same year (1268) Henry III. granted the earldom specifically to John, duke of Brittany (1217-86), son of Peter de Braine, in whose family the title continued—though it frequently was forfeited or reverted to the crown and was re-granted to the next heir—till 1342, when it was apparently resumed by Edward III. and granted by that sovereign to his son John of Gaunt, who surrendered it in 1372. It was then given to John de Montfort, duke of Brittany, but on his death without heirs in 1390, or possibly some time thereafter, the earldom reverted to the crown. The earldom now became finally separated from the duchy of Brittany, with which it had been loosely conjoined since the Conquest, although the dukes of Brittany continued to assume the title till a much later date. From 1414 to 1435 the earldom of Richmond was held by John Plantagenet, duke of Bedford, and in 1453 it was conferred on Edmund Tudor, uterine brother to King Henry VI., whose wife, Margaret Beaufort, was the foundress of St. John's College, Cambridge, and of the "Lady Margaret," professorships of divinity at Oxford and Cambridge (see RICHMOND and DERBY, MARGARET, COUNTESS OF). When Edmund Tudor's son Henry ascended the throne as Henry VII. in 1485, the earldom of Richmond merged in the crown, and for the next forty years there was no further grant of the title; but in 1525 Henry Fitzroy, natural son of Henry VIII. by Elizabeth Blount, was created duke of Richmond and Somerset and earl of Nottingham, all these titles becoming extinct at his death without children in 1536.

Ludovic Stuart, 2nd duke of Lennox (1574-1624), who also held other titles in the peerage of Scotland, was created earl of Richmond in 1613 and duke of Richmond in 1623. These became extinct at his death in 1624, but his Scottish honours devolved on his brother Esme, who was already earl of March in the peerage of England (see MARCH, EARLS OF; and LENNOX). Esme's son, James, 4th duke of Lennox (1612-1655), was created duke of Richmond in 1641, the two dukedoms as well as the lesser English and Scottish titles thus becoming again united. In 1672, on the death of his nephew Charles, 3rd duke of Richmond and 6th duke of Lennox, whose wife was the celebrated beauty called "La Belle Stuart" at the court of Charles II. (see RICHMOND and LENNOX, FRANCES TERESA, DUCHESS OF), his titles became extinct.

In 1675 Charles II. created his illegitimate son Charles duke of Richmond, earl of March and baron Settrington, and a few weeks later duke of Lennox, earl of Darnley and baron Torbolton. This Charles (1672-1723), on whom his father the king bestowed the surname of Lennox, was the son of the celebrated Louise de Keroualle, duchess of Portsmouth. His son Charles, 2nd duke (1701-1750), added to the titles he inherited from his father that of duke of Aubigny in France, to which he succeeded in 1734 on the death of his grandmother the duchess of Portsmouth; and all these honours are still held by his descendant the present duke of Richmond.

The seven dukedoms of Richmond of the Lennox line have all borne the Christian name of Charles. The 2nd duke, by his marriage with Sarah, daughter of the 1st Earl Cadogan, was father of Lady Caroline Lennox, who eloped with Henry Fox,
and was the mother of Charles James Fox, and of the beautiful Lady Sarah Lennox (1745-1820) with whom George III. fell in love and contemplated marriage, and who afterwards married, first, Sir Thomas Bunbury, from whom she was divorced, and secondly, George Napier, by whom she was the mother of Generals Sir Charles and Sir William Napier.

Charles, 3rd duke of Richmond (1735-1806), was one of the most remarkable men of the 18th century, being chiefly famous for his advanced views on the question of parliamentary reform. Having succeeded to the peerage in 1750, he was appointed British ambassador extraordinary in Paris in 1785, and in the following year he became a secretary of state in the Rockingham administration, resigning office on the accession to power of the earl of Chatham. In the debates on the policy that led to the War of American Independence Richmond was a firm supporter of the colonists; and he initiated the debate in 1778 calling for the removal of the troops from America, during which Chatham was seized by his fatal illness. He also advocated a policy of concession in Ireland, with reference to which he originated the phrase "a union of hearts" which long afterwards became famous when his use of it had been forgotten. In 1779 the duke brought forward a motion for retrenchment of the civil list, and in 1782 he embarked on his special line for parliamentary reform, which included manhood suffrage, annual parliaments and equal electoral areas. Richmond sat in Rockingham's second cabinet as master-general of ordnance; and in 1784 he joined the ministry of William Pitt. He now developed strongly Tory opinions, and his alleged desertsion of the cause of reform led to a violent attack on him by Lauderdale in 1792, which nearly led to a duel between the two noblemen. Richmond died in December 1806, and, leaving no legitimate children, he was succeeded in the peerage by his nephew Charles, son of his brother, General Lord George Henry Lennox.

The 4th duke (1764-1819) and his wife Charlotte, daughter of the Duke of Bute, were the parents of the famous ball at Brussels on the night before the battle of Quatre Bras, immortalized in Byron's "Childe Harold". Their son, the 5th duke (1791-1860), while still known by the courtesy title of earl of March, served on Wellington's staff in the Peninsula, being at the same time member of parliament for Chichester. He was afterwards a vehement opponent in the House of Lords of Roman Catholic emancipation, and at a later date a leader of the opposition to Peel's free trade policy. In 1839, on inheriting the estates of his maternal uncle, the 5th and last duke of Gordon, he assumed the name of Gordon before that of Lennox. On his death in 1876 he was succeeded by his son Charles, 6th duke of Richmond (1818-1903), a statesman who held various cabinet offices in the Conservative administrations of Lord Derby, Disraeli and the marquess of Salisbury; and who in 1876 was created earl of Kinrara and duke of Gordon. These honours in addition to the numerous family titles of more ancient creation passed on his death in 1903 to his son Charles Henry Gordon-Lennox (b. 1845), 7th duke of Richmond and Lennox and 2nd duke of Gordon.

RICHMOND, LEGH (1772-1872), English divine, was born on the 29th of January 1772, at Liverpool. He was educated at Trinity College, Cambridge, and in 1798 was appointed to the joint curacies of Brading and Yaverland in the Isle of Wight. He was powerfully influenced by William Wilberforce's Practical View of Christianity, and took a prominent interest in the British and Foreign Bible Society, the Church Missionary Society and similar institutions. In 1805 he became assistant-chaplain to the Lock Hospital, London, and rector of Turvey, Bedfordshire, where he remained till his death on the 8th of May 1872. The best known of his writings is The Dairyman's Daughter, of which as many as four millions in nineteen languages were circulated before 1849. A collected edition of his stories of village life was first published in 1814 under the title of Annals of the Poor. He also edited a series of Reform biographies called Fathers of the English Church (1807-12). See Memoirs by T. S. Grimshawe (1832); Domestic Pecadillo by T. Fry (1833).

RICHMOND, SIR WILLIAM BLAKE (1842- ), English painter and decorator, was born in London on the 29th of November 1842. His father, George Richmond, R.A. (1809-1896), himself the son of a successful miniature painter, was a distinguished artist, who painted the portraits of the most eminent people of his day, and played an important part in society. At the age of fourteen William Richmond entered the Royal Academy schools, where he worked for about three years. A visit to Italy in 1859 gave him special opportunity for studying the works of the old masters, and had an important effect upon his development. His first Academy picture was a portrait group (1861); and to this succeeded, during the next three years, several other pictures of the same class. In 1865 he returned to Italy, and spent four years there, living chiefly at Rome. To this period belongs the large canvas. "A Procession in Honour of Bacchus," which he exhibited at the Academy in 1869 when he came back to England. His picture, "An Audience at Athens," was exhibited at the Grosvenor Gallery in 1883. He became Slade professor at Oxford, succeeding Rankin, in 1878, but resigned three years later. He was elected an Associate of the Royal Academy in 1879, and was made a Royal Academician in 1883. He became a member of the Royal Academy. Apart from his pictures, he is notable for his work in decorative art, his most conspicuous achievement being the internal decoration and the glass mosaics of St Paul's Cathedral. Sir William Richmond also took a keen interest in social questions, particularly in smoke-prevention in London.

RICHMOND, a city of Bourke county, Victoria, Australia, 2 m. S.E. of and suburban to Melbourne. It is one of the principal manufacturing and commercial centers of suburbs, having numerous parks and public gardens. There are a number of prosperous industries in the city. (Pop. 1901) 37,727.

RICHMOND, a city and the county-seat of Wayne county, Indiana, U.S.A., on the E. branch of the Whitewater river, about 68 m. E. of Indianapolis. Pop. (1890) 16,608; (1900) 18,226, of whom 1467 were foreign-born and 1000 negroes; (1910 census) 22,324. It is served by the Chicago, Cincinnati & Louisville, the Grand Rapids & Indiana and the Pittsburg, Cincinnati, & St Louis railways, and by the Terre Haute, Indianapolis & Eastern and the Ohio electric interurban railways. Richmond has been called the "saddest of streets", several parks, including Glen Miller (130 acres), and handsome public buildings. Its public institutions include the Morrison-Reeves (public) Library (1864), one of the largest (30,000 volumes in 1909) and oldest in the state, an art gallery, the Reid Memorial Hospital, a Home for Friendless Women, the Margaret Smith Home for Aged Women (1888), the Wernle Orphans' Home (1879; Evangelical Lutheran), and the Eastern Indiana Hospital for the Insane (1890). Just west of the city limits is Earlham College (co-educational), opened in 1847, chartered in 1859 and controlled by the Society of Orthodox Friends; in 1908-9 it had 30 instructors, 620 students and a library of 18,000 bound volumes. Richmond was for many years the centre, west of Philadelphia, of the activities of the Society of Friends. It is an important railway and commercial centre,
trade in hardware being especially large. Among its manufacture is agricultural machinery (especially seedling machines) and tools, automobiles, pianos, lawn-mowers, roller-skates, foundry and machine-shop products, furniture, burial caskets, and flour. In 1905 its factory product was valued at $6,731,740, an increase of 41.6% since 1900. Pipe lines supply the city with natural gas. The municipality owns and operates the electric-lighting plant. In 1866 Friends from North Carolina and Pennsylvania settled near here, and Richmond was platted in 1816. Its growth was slow until the opening of the National Road, which entered Indiana near the city, and the construction of railways. Richmond was incorporated as a village in 1818 and chartered as a borough in 1834 and as a city in 1840.

**RICHMOND**, a city and the county-seat of Madison county, Kentucky, U.S.A., about 95 m. S.E. of Louisville. Pop. (1890) 5073; (1900) 4653, of whom 2287 were negroes; (1910) 3340. It is served by the Louisville & Atlantic and the Louisville & Nashville railways. It is situated in the "Blue Grass Region," near the foothills of the Cumberland Mountains. It is the seat of Madison Institute for girls (1836) and of the Eastern Kentucky State Normal School (1860). From 1874 to 1901 it was the seat of Central University, which in the latter year was consolidated with Centre College at Danville, Ky. (q.v.). The surrounding country is devoted largely to the cultivation of tobacco, Indian corn and wheat, and the breeding of fine horses and cattle; and Richmond is an important live-stock market. Among the manufactures are bricks, flour, tobacco and cigars, and carriages. On the 30th of August 1862 a Confederate force of about 7000 men under General Edmund Kirby Smith won a decisive victory here over a Union force of a nearly equal number under Generals Mahlon D. Manson (1820-1895) and William Nelson.

**RICHMOND**, a municipal borough in the Kingston parliamentary division of Surrey, England, 9 m. W.S.W. of Charing Cross, London. Pop. (1891) 26,875; (1901) 31,672. It lies on the right bank of the Thames, which is here crossed by a bridge carrying the road to Twickenham. Through its pleasant situation Richmond has grown into a large residential suburb of the metropolis. The town was anciently called *Syneus* and afterwards *Scheue* and *Sheue* (a name preserved in the village of East Sheen, adjacent on the London side) until the name was in 1500 changed to Richmond by command of Henry VII., who was earl of Richmond in Yorkshire. It grew up round the royal manor house, which became a frequent residence of sovereigns, but of which nothing more than a gateway remains. Edward I. received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III., who died here in 1377. It was frequently used by Richard II., and here his wife Anne of Bohemia died, upon which he cursed the place and "caused it to be thrown down and defaced." By Henry V., however, it was rebuilt, and a great tournament was held here in 1492 by Henry VII., who, after its destruction by fire in 1498 restored it. Henry VIII. gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I. settled it on his son Henry, prince of Wales, who restored and embellished it at great expense. Charles I. added to it the new deer park generally known as Richmond Park, 2953 acres in extent, which is surrounded by a wall 11 m. in length. After the execution of the king, the parliament presented the park to the citizens of London, who again presented it to Charles II. at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager. The garden by James II. it was used as a nursery for the young prince; but gradually falling into decay, was parcelled into tenements about 1720. In the old deer park extending northwards from the site of the palace, Kew Observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V., and a dwelling-house in which Swift for some time resided. The White Lodge was built by George I., and has been a residence of various members of the royal family. To the south-east of the town, at the entrance to Richmond Park, is Richmond Hill, from which is seen a famous view of the Thames with the surrounding country to the west. This view was secured to the public by an agreement, sealed on the 7th of February 1806, between the corporation and the trustees of the Earl of Dysart, by an act of Parliament of 1802, and by the acquisition in the same year, by the London Society of Artists, with the assistance of the borough of Richmond and other interested local authorities, of the Minneapolis estate and other property on the Middlesex shore. The church of St Mary Magdalen is of considerable antiquity, but almost entirely rebuilt; it contains a large number of monuments to celebrated persons. A theatre, first established in 1719, was during his later years leased by Edmund Keen. The town has a Wesleyan theological college, founded in 1834. Richmond, which was incorporated in 1890, is governed by a mayor, 10 aldermen and 30 councillors. The borough includes Ken (q.v.), Petersham and North Sheen. Area, 2491 acres.

**RICHMOND**, a market town and municipal borough in the Richmond parliamentary division of the North Riding of Yorkshire, England, 50 m. N.W. from York, the terminus of a branch of the North-Eastern railway. Pop. (1901) 3837. It is finely situated on the left bank of the Swale, the valley of which is narrow and the banks steep. The interest of the town centres in the castle founded about 1071 by Alan Rufus, a son of Odo, count of Penthièvre in Brittany, who is also said to have rebuilt the town on obtaining from William the Conqueror, among other possessions, the estates of the Saxon earl Edwin, embracing some two hundred manors of Richmond and extending over nearly a third of the North Riding. This tract, comprising five wapentakes, was called Richmondshire at this time, but the date of the creation of the shire is uncertain. When Henry VII. came to the throne these possessions reverted to the crown. Henry VIII. gave them to his son Henry, afterwards duke of Richmond, by a daughter of Sir John Blount, and Charles II. bestowed the title of duke of Richmond on his son by the duchess of Portsmouth. The castle is situated on a perpendicular rock rising about 100 ft. above the Swale, and from its great strength was considered impregnable. Originally it covered an area of 5 acres, but the only portions of it remaining are the Norman keep, with pinnacled tower and walls 100 ft. high by 11 ft. thick, and some other smaller towers. The view from the keep is very fine, extending westwards towards the River Hill and over the hills which wall it, and eastward over the rich plain of the centre of the county. The church of St Mary is transitional Norman, Decorated and Perpendicular, and is largely restored. The church of the Holy Trinity retains only the nave and the detached tower. The building is ancient but was restored to use from ruins. Close to the town are ruins of Easby Abbey, a Premonstratensian foundation by Roald, constable of Richmond Castle in 1152, beautifully situated by the river. The remains, which are considerable, include a Decanted gateway, an Early English chapel and fragments of the transept and choir of the church, with sufficient portions of the domestic buildings to enable the complete plan to be traced. For the free grammar-school founded by Elizabeth a Gothic building was erected in 1850, in memory of the Rev. James Tate, a former master. The tower of a Franciscan abbey founded in 1258 remains. The chief modern buildings are the town hall, market hall and the mechanics' institute. The principal trade is in agricultural produce, but there are a paper mill and an iron and brass foundry. An annual meeting is held on the racecourse in September. In 1889 Richmond became the seat of a suffragan bishop in the diocese of Ripon. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 2590 acres.

The name of Richmond (Richemont, Richemond) has not been traced further back than 1114, but it is certain that there was a settlement on the site of the present town before this date. Probably it was the Hindredage of the Domesday Survey, a place which, although large enough to have a church in 1086, appears to have vanished before the close of the 12th century. As far as is known, the earliest charter was granted in 1145. But a later charter (1146) shows that the burgesses had enjoyed some municipal
liberties at an earlier period. The charter of 1145 gave the burgesses the borough of Richmond to hold for ever in fee farm at an annual rent of 29. Other charters were granted by Edward III (1350), by Edward IV (1470), by Edward II (the first royal grant, 1326), and confirmed in subsequent reigns. A charter of incorporation was granted by Queen Elizabeth under the title of aldermen and burgesses in 1576, and confirmed by Charles II. in 1668. This last, though superseded later, was restored in the reign of James II. and, until the passing of the Municipal Reform Act of 1835, was regarded as the charter of the borough of Richmond. The burgesses resided in a building every Saturday, a market every fortnight for animals and a fair each year on the vigil of Palm Sunday. At one time there appear to have been as many as four annual fairs. There is now only one, which takes place on the 2nd and 3rd of November. The weekly market is still held on Saturday, and there is a fortnightly market for cattle. In the middle ages Richmond had an important market for corn and wool. There is evidence later of trade in lead, and also of a flourishing manufacturing of hand-knitted stockings. As the town possesses the only railway station in Swaledale, the market is still of consequence. But the stocking industry decayed with the introduction of the machine, and the land was turned in this part of the town into the land of Henry II, but otherwise the town owes its importance chiefly to its lords. The honour was a valuable possession in the middle ages, and it was usually in royal or semi-royal hands.

RICHMOND

the capital of Virginia, U.S.A., the county-seat of Henrico county, and a port of entry, on the James river (at the head of navigation), about 100 m. s. by W. of Washington, D.C., and about 125 m. by water from the Atlantic Ocean. Pop. (1850) 27,750; (1860) 37,910; (1870) 51,028; (1880) 63,600; (1890) 81,388; (1900) 93,250, of whom 32,250 were negroes and 63,000 foreign-born. (1910 census) 127,626. Richmond is served by the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, the Southern and the Richmond, Fredericksburg & Potomac railways, and by the Old Dominion, the Virginia Navigation and the Chesapeake steamship lines. The city has a beautiful situation on the hilly ground (maximum elevation, about 250 ft. above sea-level) along the north and east banks of the James, at a bend where the river changes its south-easterly course for one almost due south. It occupies seven hills, from which fact it has been called "the Modern Rome." The western stretch of the river, opposite the city, breaks into rapid streams which have a fall of about 116 ft. in 9 m. and provide abundant water power. Belle Isle (the site of a Confederate prison camp during the Civil War), about ½ m. long by about 2 m. wide, is in part of this part of the river; a little farther downstream are a group of small islands, and opposite the south-easterly boundary of the city is Mayo's Island. Within the city's lines the river is crossed by two bridges (to Manchester) for vehicles and pedestrians, and three railway bridges. The river has been improved by Federal engineers since 1870; in June 1909 (up to which time $1,799,933 had been expended for improvements) there was a channel 100 ft. wide and 18 ft. deep, nearly continuously from Hampton Roads to the Richmond wharf, and the maximum draft at low water was 16-1 ft.

About three-fourths of the city's total street mileage (120 m.) is surfaced or macadamized, and used on the principal thoroughfares. About 637-8 acres are devoted to city parks, among which are William Byrd Park (300 acres), in the western part of the city, Joseph Bryan Park (260 acres), Chimbly Hill (216 acres), North Foreland, Gamble's Hill Park (80 acres), Monroe Square (.75 acres), Jefferson Park (6.3 acres) and Marshall Square (7 acres). The State Capitol Square (10 acres) is not owned by the city. Half a mile of the city is the Fair territory of the Virginia Commonwealth Fair is held annually.

Of Richmond's public buildings, several have great historic interest. St. John's Episcopal church, built in 1740 (and subsequently much enlarged), is noted especially as the meeting-place of the Virginia Convention of March 1775, before which Patrick Henry made a famous speech, ending, "I know not what course others may take, but as for me, Give me liberty, or give me death!" The Capitol (built in 1786 and completed in 1792—the wings were added in 1860) was designed from a model and plans of the Maison Carre', at Nimes, supplied by Thomas Jefferson, while he was in France as U.S. minister. Arlington House was tried for treason and then for misdeemour in this building in 1807, the Virginia secession convention met here in 1861, and during the Civil War the sessions of the Confederate Congress were held here. In its rotunda is Jean Antoine Houdon's full-length marble statue of Washington, provided by the Virginia General Assembly in 1784, and erected in 1796; its base bears a fine inscription written by James Madison. In a niche is a Houdon bust of Lafayette, a replica of the original presented to the city of Paris by the state of Virginia. The Old Stone House (the oldest building in the city) was erected as a residence in 1737, and is now used for a museum. Masons' Hall, whose cornerstone was laid in 1785, is said to be the oldest exclusively Masonic building in the United States. The Executive Mansion of the Confederate States of America, built in 1819, purchased by the city in 1862, and leased to the Confederate government and occupied by President Jefferson Davis in 1862-65, was acquired in 1890 by the Confederate Memorial Library Society, and is now a Confederate Museum with a room for each state of the Confederacy and a general library in the "Solid South" room; it has valuable historical papers, collected by the Southern Historical Society, and the society has published a Calendar of Confederate Papers (1908). The former residence of Chief Justice John Marshall, built in 1795, is still standing; and the Lee Mansion, which was the war-time residence of General Robert E. Lee's family, has been occupied, since 1893, by the Virginia Historical Society (organized 1831; reorganized 1847) as the repository of a valuable library and collection of portraits of historical interest. Libby Prison, which stood on the northern bank of a canal, near the river, in the eastern part of the city, was taken down in 1888-90, and its materials removed to Richmond, where it was reconstructed, as in nearly as possible its original form, and became the Libby Prison War Museum. 1 The Valentine Museum is a house on the Old and Clay Streets, in which Aaron Burr was entertained while he was on trial, and which with $50,000 and his collections was devised to a board of trustees in 1892 by Mann S. Valentine. The museum includes 3300 books, many being of the 15th and 16th centuries, a department of engravings, a Virginia Room with portraits and relics, some tapestries, an excellent collection of casts and valuable American archaeological specimens. The more modern buildings include the City Hall, a fine granite structure (completed in 1853), with a tower 180 ft. tall; the Library building which houses the state library (about 80,000 volumes, with many portraits and a valuable collection of handwritten manuscripts), the State Law Library and also the offices of most of the state officials; the Post-Office and Customs House; the State Penitentiary; the Chamber of Commerce; and, among the religious edifices, the Sacred Heart Cathedral (Roman Catholic), presented to the city by Mr and Mrs Thomas F. Ryan; the Monumental Church, built on the site of the Richmond Theatre, in the burning of which, in 1811, Acting-Governor George W. Smith and fifty-nine others lost their lives; and St Paul's Church, where Jefferson Davis was attending services, on the 2nd of April 1865, when he received news from

1 As built in Richmond in 1845 by Luther Libby, it was a brick structure, three storeys high in front and four in the rear. It had six rooms, each about 100X45 ft. and known as the War-on-board ship-church, was burnt in 1861, and then until the capture of Richmond was used as a prison, chiefly for Federal officers. Frequently it was terribly overcrowded (by as many as 1200 prisoners at a time), the inmates often suffered great privations, and many died or were physically disabled for the remainder of their lives.
RICHMONDS

General Lee that General Grant had broken through the lines at Petersburg and that Richmond must be evacuated. Rosemary Library was given to the city by Thomas Nelson Page in memory of his wife, who died in 1888.

Richmond has many fine monuments and statues of historic interest and artistic merit, the most noteworthy of the former being the Washington Monument, in Capitol Square. In 1859 the commission accepted the model submitted by Thomas Crawford (1814-1857), an American sculptor, the corner-stone of the monument was laid in that year, and the equestrian statue of Washington, with sub-statues of Patrick Henry and Thomas Jefferson, was unveiled on the 22nd of February 1858. Thereafter were added sub-statues of Chief-Justice John Marshall and George Mason (1726-1792) by Crawford, and statues of Andrew Lewis (1750-1811) and Thomas Nelson (1758-1780), and six allegorical subjects, by Randolph Rogers (1825-1892), the total cost of the undertaking being $490,000, at a cost of about $260,000, of which about $47,000 represented private gifts and the interest thereon. The greatest height of the monument is 60 ft., and the diameter of its base is 86 ft. In Capitol Square are also a marble statue of Henry Clay, by Joel H. Hurt (1810-1877), a bronze statue of Stonewall Jackson, by John Henry Foley (1818-1874), an English sculptor,  "presented to the city by English gentlemen" (Hon. A. J. Beresford-Hope and others) and unveiled in 1875; a statue of Hunter Holmes McGuire (1835-1900), a famous Virginia surgeon; and a statue of William Smith (1796-1867), governor of Virginia in 1840-49 and in 1864-65, unveiled in 1881. Another statue is by E. V. Valentine of Brig.-General Williams Carter Wickham (1826-1883) of the Confederate army. Another noteworthy monument is the noble equestrian statue of General Robert E. Lee, surmounting a lofty granite pedestal at the head of Franklin Street. This statue, by Marius Jean Antonin Mercié (b. 1845), was unveiled in 1890. Adjacent is an equestrian statue of General J. E. B. Stuart, by Frederick Moynihan, and at the west end of Monument Avenue is the Jefferson Davis Monument, by W. C. Nowland, in front of which is a statue of Jefferson Davis, by E. V. Valentine. On Libby Hill, in the south-eastern part of the city, is a monument to the private soldiers and sailors of the Confederacy.

In Hollywood Cemetery (dedicated in 1849) are the graves of many famous men, including presidents James Monroe and John Tyler; Jefferson Davis, John Randolph of Roanoke, the Confederate generals, A. P. Hill, J. E. B. Stuart and George E. Pickett; Commodore Matthew F. Maury (1806-1873); James A. Seddon (1813-1865), Secretary of War of the Confederate States in 1862-64; and John R. Thompson (1823-1873), widely known in his day as a poet and as the editor of the Southern Literary Messenger in 1847-59. Here, too, are buried about 16,000 Confederate soldiers (to whose memory there is a marble pyramid of Rosetta granite, 40 ft. sq. at the base and 90 ft. high). In the north-eastern part of the city is the National Cemetery, in which are the graves of about 18,000 Confederate soldiers. Two miles north-east of the city is the National Cemetery, with graves of 6571 Federal soldiers (5700 unknown) most of whom were killed in the actions near Richmond.

Richmond is the seat of Richmond College (opened in 1832, chartered in 1840; and co-educational since 1898), which in 1909-10 had 21 instructors and 341 students, of whom 55 were in the School of Law (established 1870; re-established 1890); the Woman's College (opened in 1854, which in 1909-10 had 26 instructors and 275 students; the Virginia Mechanics' Institute (1866) including a Night School of Technology; the Union Theological Seminary in Virginia (Presbyterian; opened in 1824 and removed to Richmond in 1843); the Marymount Hospital, which had 7 instructors and 80 students; the Medical College of Virginia, (founded in 1838), which has medical, dental and pharmaceutical departments, and in 1909-10 had 50 teachers and 253 students; the University of Richmond, which had 7 instructors and 220 students; the Hartshorn Memorial College (Baptist), for women, and, for negroes, Virginia Union University, founded in 1865.

Many periodicals (including several religious weeklies) are published in Richmond. The principal newspapers are the Times-Dispatch (Democratic; Dispatch, 1850; Times, 1886; consoli-
dated in 1903) and the News-Leader (Democratic, 1899). Among the city's clubs are the Authors and the Confederate and Virginia.

The city's charitable institutions include the Memorial Hospital, Virginia Sheltering Arms (1889) and St Luke's hospitals, the Retreat for the Sick (1877), the Eye, Nose, Ear and Throat Infirmary (1880), the Confederate Home, jointly owned by the state and the city, a Home for Needy Confederate Women (1900), the City Almshouse and Hospital, and several orphanages and homes for the aged.

Richmond is the leading manufacturing city of Virginia, the value of its factory products in 1905 being $28,202,607, an increase of 22.4% since 1900 and nearly 19% of the value of the state's factory products. Richmond is the principal city of the tobacco industry and the manufacture of tobacco for smoking and chewing, snuff, cigars, cigarettes, and of snuff. There are large iron and steel works here, notably the Tredegar Iron Works. Other important manufactures, with an output valued at $120,000,000, include cement, flour, distillers' products, and furniture. Richmond is the port of entry for the District of Richmond; in 1907 its imports were valued at $943,244 and its exports at $158,275; in 1909, its imports at $639,822 and its exports at $24,390. The city has a large jobbing and retail trade. Richmond is governed by a mayor and council and a Board of Aldermen. The mayor is elected for two years and has the powers and authority in criminal cases of a justice of the peace. The city council is composed of a common council (five members from each ward, elected for two years) and of a board of police commissioners (three members from each ward to be elected for four years). Other elective officers are the mayor, city treasurer, city sergeant, commonwealth attorney, city collector, city corporation court judge, and constable, elected for four years; and clerks of the various courts for eight years. The commissioner of the revenue is appointed for a term of four years by the judge of the corporation court. Three justices of the peace are elected from each county for two years. The city council appoints an attorney for the corporation, a city engineer, a city clerk, a police board, a board of fire commissioners, and a board of police commissioners, one from each ward, who have control of the fire and police departments, respectively, and a number of other officers. The city owns its gas works, water works and an electric-lighting plant (1910) for municipal lighting.

The debt limit is set by the city charter at 18% of the assessed value of the real estate and personal property, and the taxable real estate and personal property was valued at $108,663,716, and the city had no floating debt; on the 1st of February 1910, Richmond had 1176,188 worth of bonds outstanding, and the sinking fund was $2,011,857.

An exploring party from Janiestown, under command of Captain Christopher Newport (c. 1565-1617), and including Captain John Smith, sailed the James river in 1607, and on the 3rd of June erected a cross on one of the small islands opposite the site of the present city. The first permanent settlement within the present limits of the city was made in 1609 in the district long known as Rockett's. Later in the same year Captain Smith bought from the Indians a tract of land on the east bank of the river, about 3 m. below this settlement, and near the present falls of the James. This tract he named "None-
such," and here he attempted to establish a small body of soldiers who had occupied a less favourable site in the vicinity; but they objected to the change and, being attacked by the Indians, sought the protection of Smith, who made prisoners of their leaders, with the result, apparently, that the settlement was abandoned. In 1645 Fort Charles was erected at the falls of the James as a frontier defence. In 1676, during "Bacon's Rebellion," a party of Virginians under Bacon's command killed about 150 Indians who were defending a fort on a hill a short distance east of the site of Richmond in the "Battle of Bloody Run," so called because the blood of the slain savages is said to have coloured the brook (or run) at the base of the hill. Colonel William Byrd,1 who owned property along the

1 The Byrds and their ancestors, the Steggs, were conspicuous in the early history of Virginia. The first of the family was Thomas Stegg or Stegge (d. 1651), born in England, who became an Indian trader on the James river as early as 1637, and had his home near what is now called Stein's Tavern, in the village of the Chickahominy tribe. He left his estate to his son Thomas (d. 1670), who settled at the falls of the James in 1661, and was auditor-general in 1664-1670. He was succeeded by his nephew, William Byrd (1652-1704), who was born in London, went to Virginia about 1670, became a successful Indian trader, was a member of the House of Burgesses in 1677-1682, was a supporter of Nathaniel Bacon at the beginning of
James river, at the falls, visited the tract in September 1733, and decided to found there the town of Richmond, at the same time selecting and naming the present site of Petersburg. The name Richmond was suggested probably by the similarity of the site to that of Richmond on the Thames. The settlement was laid out in April 1739 by Major William Mayo (c. 1685-1744), and was incorporated as a town in 1742. The public records of the Province, preserved thither in 1777 from Williamsburg, and in May 1779 Richmond was made the capital. On the 6th of January 1781 the town was partly burned by a force of about 800 British troops under Gen. Benedict Arnold, the 200 or 300 Virginians offering little resistance, and much of the damage being done by Lieutenant-Colonel John G. Simcoe's celebrated Rangers. Richmond was first chartered as a city in 1782, and in 1788 it was allowed a representative in the House of Delegates.

The importance of Richmond during the Civil War was principally due to its having been made the capital of the Confederate States (by act of the Provisional Government on the 8th of May 1861). Its nearness to Washington, the material and manufacturing resources concentrated in it, and the moral importance attached to its possession by both sides, caused it to be regarded as the centre of gravity of the military operations in the east to which the greatest leaders and the finest armies were devoted from 1861 to 1865. (See American Civil War.) The city's system of defences, which began to take form in May 1861, included a line of 17 heavy batteries, completely enclosing it at an average distance of about 2 m., another line of smaller batteries and trenches, from about a mile (or less) to about 2 m. beyond the heavy batteries, and practically unbroken from the north bank of the James (west of the city) to about 1 m. west of that river (south of the city); and the outer works, approximately paralleling the inner line, at distances of from 2 to 3 m. from this line north and east of the city. There was much confusion and lawlessness in Richmond during the earlier stages of the war. The city's police force was unable to cope with the situation created by the influx of soldiers, gamblers and adventurers, and on the 1st of March 1862 President Davis (by authority of a secret Act of the Confederate Congress passed on the 2nd of February) declared martial law in the city and the country within a radius of 10 m., suspended the writ of habeas corpus, and appointed General John H. Winder (1800-1865) to enforce military rule.

General Winder, in his preliminary orders, intimated so vigorously to the citizens that on the 19th of April the Confederate Congress materially modified the law under which he received these powers from the president. The opening of McClellan's Peninsula Campaign (see Yorktown; Seven Days, &c.) in 1862 caused great apprehension in Richmond, and in May 1862 some of the government records were packed up and preparations made to ship them to a place of safety. The approach of the "Monitor" and the Union gunboats up the James river caused a partial and temporary panic; President Davis appointed a day for prayer, and the families of some of the cabinet secretaries and many citizens fled the city precipitately; but confidence, restored by "Bacon's Rebellion," was auditor-general of the colony from 1687 until his death, and was a member of the committee which founded the College of William and Mary. His residence, within the limits of the present city of Richmond, was preserved until about 1850. His son William (1674-1744), the founder of Richmond—and above referred town—was educated in England; returned to Virginia, and succeeded his father as the owner of the colony, and was receiver-general in 1705-1716. In 1727 he was appointed one of the commission (of which William Fitzwilliams and William Dandridge were the other members) for the survey of the northwestern boundary of North Carolina and Virginia, concerning which undertaking he wrote (probably in 1737) The History of the Dividing Line. This with his other publications, A Journey to the Land of Eden and A Present History of Virginia, was published at Cambridge, England, and again (New York, 1901) as The Writings of Colonel William Byrd of Westover in Virginia, edited by John S. Bassett, and including an extended sketch of the Byrd family. Concerning Byrd's style as a writer Professor Bassett says: "It would be hard to find before Franklin a better master of the art of writing clear, forceful and charming English."
time Miss Stewart resisted the king's importunities, though her behaviour was far from modest and "she had no aversion to scandal." She had numerous suitors, including the duke of Buckingham and Francis Digby, son of the earl of Bristol, whose unrequited love for her was celebrated by Dryden. Her beauty appeared to her contemporaries to be only equalled by her childish silliness; but her letters to her husband, preserved in the British Museum, are not devoid of good sense and feeling. The king's infatuation was so great that when the queen's life was despaired of in 1663, it was reported that he intended to marry Miss Stewart, and four years later he was considering the possibility of obtaining a divorce to enable him to marry his wife. This was at a time when Charles feared he was in danger of losing her as his mistress, her hand being sought in marriage by Charles Stuart, duke of Richmond and Lennox. The countess of Cleveland, who was losing her hold on the king's affections, is reported by Hamilton to have led the king to Miss Stewart, and the duke of Richmond observed at midnight when Richmond was elected to the privy council, that "with her, and the duke was immediately expelled from court. In March 1667 the lady eloped from Whitehall with Richmond and married him secretly in the country. The king, who was greatly enraged, suspected Clarendon of being privy to the marriage, and, according to Burnet, deprived him of office for this offence. The duke of Richmond, however, soon returned to court, where she remained for many years; and although she was disfigured by small-pox in 1668, she retained her hold on the king's affections. Her husband was sent as ambassador to Denmark, where he died in 1672. The duchess was present at the birth of the prince of Wales, son of James II, in 1688, being one of those who signed the certificate before the council. She died in 1702, leaving a valuable property to her nephew the earl of Blantyre, whose seat was named Lennoxlove after her.

**RICHTER, ADRIAN LUDWIG** (1802–1884), German painter and etcher, was born at Dresden in 1833, the son of the engraver Karl August Richter, from whom he received his training; but he was strongly influenced by Erhard and Chodowiecki. He was the most popular, and in many ways the most typical German illustrator of the middle of the 19th century. His work is as typically German and homely as are the fairy-tales of Grimm. Richter visited Italy from 1835 to 1836, and his "Thunder-storm in the Sabine Mountains" at the Staedel Institute in Frankfurt is one of the rare Italian subjects from his brush. In 1838 he worked as designer for the Meissen factory, and in 1841 he became professor and head of the landscape atelier at the Dresden Academy. The Dresden Gallery owns one of his best and most characteristic paintings in the "Bridal Procession in a Spring Landscape." He died at Loschwitz near Dresden in 1884.

**RICHTER, ERNST FRIEDRICH EDUARD** (1808–1879), German musical theorist, was born at Grosschönau in Saxony, on the 24th of October 1808. He first studied music at Zittau, and afterwards at Leipzig, where he attained so high a reputation that in 1835 he was appointed professor of harmony and counterpoint at the conservatory of music, then newly founded by Mendelssohn, and in 1847 he became director of the in Meinhard on the 3rd of January 1868, he was elected director of the Thomasschule, which office he retained until his death on the 9th of April 1879. He is best known by three theoretical works—*Lehrbuch der Harmonie, Lehre von Concertpunt* and *Lehre von der Fuge*—valuable textbooks known to English students through the excellent translation by Franklin Taylor.

**RICHTER, EUGEN** (1839–1906), German politician, was born on the 30th of July 1839 at Düsseldorf. After attending the universities of Bonn, Heidelberg and Berlin, he entered the government service, being stationed in his native town. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal opinions, and the government refused to confirm the appointment. He was hereupon transferred to Bromberg, in East Prussia, which to an inhabitant of the Rhine was the worst form of exile, and in consequence he resigned his place in the public service. He now went to Berlin, where he earned his living as a journalist. He was the most consistent advocate of those doctrines of laissez faire and individual liberty which the Germans call *Mancherstium.* He was also keenly interested in the attempts made at that period to create cooperative societies among the working men, and wrote a work on co-operative stores. It was not long before he came into conflict with the government; an electioneering pamphlet published in 1867 was confiscated; he was put on his trial but acquitted. In 1867 he was elected a member of the newly formed Reichstag, and in 1869 of the Prussian parliament. He soon became one of the most influential politicians in Germany.

A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the Freisinnige, he was always in opposition. Next to Windthorst (q.v.) he was Bismarck's most dangerous opponent. After the great change of policy in 1878, for his influence was a great impediment to the government; as a consistent adherent to free trade, he was the leader of the opposition to the introduction of protection, to the new colonial policy, and to State Socialism. It was after 1880 that he wrote the cry *Bismarck muss fort.* He always took a great part in debates on the military and naval establishments, in vain opposing the constant increase of army and navy. It was his refusal to support the government proposals in 1893 for an increase of the army which led to the break up of his party: he was left by only eleven followers; and, except among the middle class of Berlin and some other Prussian cities, the old Radical party, of which he was the chief representative, from that time had little influence in the country. In 1895 he founded the *Freisinnige Zeitung,* which he edited himself; of his numerous brochures the most successful was his attack on Socialism, entitled *Soziodemokratische Zukunftsbilder* (Berlin, 1891), a clever and successful satire on the Socialist state of the future. This has been translated into the English. He also wrote much on Prussian finance, and under the title *Das politische A, B, C* compiled a very useful political handbook for Radical voters. He also published in 1892 reminiscences of his youth (Jugenderinnerungen), and two volumes of parliamentary reminiscences (Im alten Reichstag, 1894–1896).

He died at Jena on the 26th of January 1906.

**RICHTER, HANS** (1843–1922), Hungarian musical conductor, born at Raab on the 4th of April 1843, was the son of the kapellmeister at the cathedral, and of his wife, née Josephine Csaizinsky, who was the first to perform Venus in *Tannhäuser* at Vienna. Young Hans sang either soprano or alto in the cathedral choir, according to requirement, and occasionally played the organ. But his public debut was made as a drummer in Haydn's *Paukenmesse.* In 1853, at the age of ten, he appeared in a concert as pianist in Hummel's *E flat* quintet; and in 1854, after his father's death, went to the choristers' school, the Convikt (where Schubert was educated) in Vienna, and there became chorister in the Court Chapel. For five years from 1860 Richter studied under Heissler and Sechter in the Vienna Conservatorium, and he learnt the horn under Kleinke. A year and a half after his first lesson he became hornist in the old Kärnthnerthor Theatre at 3 a month. Meanwhile he had devoted time to conducting. It was not till August 1868 that Richter made his first appearance as an orchestra conductor, at the Hof-Theater, Munich (where he had just been appointed), in *William Tell,* but in the next year he resigned this post, went first to Paris, then to Brussels, and finally to Tricheschen, where he copied *Der Ring des Nibelungen* for Wagner. In April 1871 Richter took up his new duties as conductor of the Hungarian National Opera at Budapest, where he remained four years, until he began in May 1875 his long connexion with the Vienna Opera, which terminated only with the century. In 1876 Richter
Richter, J. B.—Richter, J. P. F.

directed the rehearsals and performances of Der Ring at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts, which were a revelation to London musical circles of the masterly personality of the conductor, and his influence upon the orchestra; in 1883 he became conductor of the Altenburger Musikverein. He was much missed in his absence from the German musical world.

After his mother's death he went in 1877 to Leipzig, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he was warmly appreciated. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar, as elsewhere, his remarkable conversational powers and his polished style made him a favourite in general society. In 1881 he married Caroline von Dalberg, whom he had known at Birmingham. They lived first at Meiningen, then at Coburg; and finally, in 1884, they settled at Bayreuth. Here Richter spent a quiet, simple and happy life, constantly occupied with his work as a writer. In 1888 he was fortunately delivered from anxiety as to outward necessities by the princely-primate, K. T. von Dalberg, who gave him a pension of a thousand florins. Before settling at Bayreuth, Richter had published his most ambitious novel, Titan (1800–3); and this was followed by Flegeljahre (1864–5), two works which he himself regarded as his masterpieces. His later imaginative works were Dr Kutsenbergs Bludereise (1806), Des Feldpredigers Schmutlise Reise nach Flull (1809), Leben des Fibels (1812), and Der Komet, oder Nikolaus Marggraf (1820–22). In Vorschule der Aesthetik (1804) he expounded his ideas on art; he discussed the principles of education in Loeva, oder Erziehungsfahr (1807); and the opinions suggested by current events he set forth in Friedenspredigt (1808), Dämmungen für Deutschland (1809), and Mars und Phobos Thronwechsel im Jahre 1814 (1814), and Politische Fastenpredigten (1817). In his last years he began Wahrheit aus Jean Pauls Leben, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1881 Richter lost his only son, a youth of the highest promise; and he never quite recovered from this shock. He died of dropsy, at Bayreuth, on the 14th November 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. He was equally unable to resist the temptation to bring in strange facts or notions which occurred to him. Hence every one of his works is irregular in structure, and his style lacks directness, precision and grace. But his imagination was one of extraordinary fertility, and he had a surprising power of suggesting great thoughts by means of the simplest incidents and relations. The love of nature was one of Richter's deepest pleasures; his expressions of religious feelings are also marked by a truly poetic spirit, for to Richter visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It mingled with all his thoughts, and to some extent determined the form in which he embodied even his most serious reflections. That it is sometimes extravagant and grotesque cannot be disputed, but it is never harsh nor vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. Richter's personality was deep and many-sided; with all his wilfulness and eccentricity he was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

Richter's Sämtliche Werke appeared in 1826–28 in 60 vols., to which were added 5 vols. of Literarischer Nachlaß in 1856–58; a complete edition in 24 vols was published in 1860–62 (34 vols.). The last complete edition is that edited by R. Gottschall (60 parts, 1879). Editions of selected works appeared in 1843, 1860 (in Koblenz), and 1861 (Kassel) edited by P. Nerlich, 6 vols., 1884–87). &c. The chief collections of Richter's correspondence are: Jean Pauls Briefe an F. H. Jacobi (1828); Briefwechsel Jean Pauls mit seinem Freund C. Otto und Jean Pauls Briefwechsel mit seiner Frau und dessen Freunde Otto (1897). For further information, see the brief notices in the following works: J. F. v. Herder, Leben des Jean Paul (1837); Jean Pauls Briefwechsel mit seiner Frau und seinem Freund Otto. See further...
RICHTHOFFEN—RICKETS

the continuation of Richter's autobiography by C. Otto and E. Förster (1863); H. Düring, J. P. F. Richters Leben und Charakteristik (1830–32); R. O. Spazier, J. P. F. Richter, ein biographischer Kommentar zu dessen Werken (5 vols., 1843); E. Förster, Dembrowskizhen aus dem Leben von J. P. F. Richter (1863); P. Nerlich, Jean Paul und seine Zeitgenossen (1876); J. Firmery, Étude sur la vie et les œuvres de J. P. F. Richter (1886); P. Nerlich, Jean Paul, sein Leben und seine Werke (1898); F. J. Schneller, Jean Paul Briefe (1900); by the same, Jean Paul und erstes Auftreten in der Literatur (1906). All Richter's more important works have been translated into English, Quintius Fixstein and Schmeldes Reise, by Carlyle; see also Carlyle's two admirable essays on Richter.

RICHTHOFFEN, FERDINAND, BARON VON (1833–1905), German geographer and traveller, was born near Karlsruhe, Silesia, on the 9th May 1833. He was educated at Bonn, and travelled in the Tyrol, subsequently extending them to Transylvania. In 1859 he accompanied as geologist the Prussian diplomatic mission to the Far East under Count von Eulenburg, and visited Ceylon, Japan, Formosa, and Java, subsequently making an overland journey from Bangkok to Moulmein and reaching Calcutta in 1862. No important work resulted from these travels, for much of Richthoffen's records and collections was lost. China was at the time inaccessible owing to the Taiping rebellion, but Richthoffen was impressed with the desirability of exploring it. After a visit to Iceland, Richter's wife, born Margaret, died in 1860 and he returned to the East. In a remarkable series of seven journeys he penetrated into almost every part of the Chinese Empire. He returned home in 1872, and a work comprising three large volumes and an atlas, which, however, did not cover the entire field or complete the author's plan, appeared at Berlin in 1877–85 under the title of China; Ergebnisse eigner Reisen und darauf gegründeter Studien. In this standard work the author deals not only with geology but with every subject necessary to a general geographical treatise. Notably he paid close attention to the economic resources of the country he traversed; he wrote a valuable series of letters to the Shanghai Chamber of Commerce, and first drew attention to the importance of the coalfields of Shantung, and of Kiao-chow as a port. In 1875 Richthoffen was elected professor of geology at Bonn, but being fully occupied with his work in China he did not take up professorial duties till 1879; in 1883 he became professor of geography at Leipzig, and in 1886 was chosen to the same office at Berlin, and held it till his death. His lectures attracted numerous students who subsequently became eminent in geographical work, and in order to keep in touch with them he established his weekly geographical "coloquium." Of his written works, besides that on China, there may be mentioned: "Die Kalkalpen von Voralberg und Nordtirol" in Jahrbuch der geologischen Reichsanstalt (1859–1861); "Die Metallproduktion Kaliforniens" in Petermanns Mitteilungen (1865); Natural System of Volcanic Rocks (San Francisco, 1867); Aufgaben und Methoden der heutigen Geographie (an address delivered at Leipzig, 1883); Führer für Forschungsreisende (Berlin, 1886); Trichotome und Richtungen der Erdbünde in neunzehnten Jahrhundert (address on his election as rector, Berlin, 1903). He was for many years president of the German Geographical Society, and he founded the Berlin Hydrographical Institute. He died on the 16th of October 1905.

RICIMER (d. 472), master of the Roman Empire in the West during part of the 5th century, was the son of a prince of the Suebi and the daughter of Wallia, king of the Visigoths. His youth was spent at the court of Valentinian III., and he won distinction under Aetius. In 456 he defeated the Vandals in a sea-fight near Corsica, and on land near Agrigentum in Sicily, and backed by the popularity thus acquired, Ricimer then gained the consent of the Roman senate to an expedition against the emperor Avitus, whom he defeated in a bloody battle at Piacenza on the 16th of October 456. Avitus was taken prisoner and made bishop of Piacenza, and shortly afterwards sentenced to death. Ricimer then obtained from Leo I., emperor at Constantinople, the title patrician, but in 457 set up Majorianus as his own emperor in the West, and induced Leo to give him his consent. When, however, Majorianus tried to rule by himself, Ricimer forced him to abdicate and caused his assassination on the 7th of August 461. The successor whom Ricimer placed upon the throne was Libius Severus, who proved to be more docile than Majorianus, but had to face the rivalry of Leo in the East and Aegidius in Gaul. Upon his death in 465—said to be due to the poison of Ricimer—this emperor-maker ruled the West for eighteen months without an emperor, and then accepted Leo's candidate Anthemius, diplomatically married his daughter, and for some time lived in peace with him. Before long, however, Ricimer moved to Milan, ready to declare war upon Anthemius. Ricimer was again with an army of Germans, proclaimed as emperor Olybrius, whom Leo had sent to pacify the two enemies, and after three months' siege took the city, on the 1st of July 472. Anthemius was massacred and Rome was a prey to Ricimer's soldiers. He himself, however, died on the 18th of August 472, of malignant fever.

RICINA, an ancient town of Picenum, Italy, 3 m. N.W. of the modern Macerata, on the banks of the river Potenza, in a fertile valley. It was probably a municipality until it was refounded by Pertinax and Septimius Severus, after which it obtained the title of Cosa. The site is now deserted, but considerable ruins of a theatre and remains of baths and other buildings (all in brickwork of the imperial period) still exist; also the fragments of an ancient bridge over the Potenza.

RICKETS, a constitutional disease of childhood characterized chiefly by a softened condition of the bones and by other evidences of perverted nutrition. It was first described in 1849 by Arnold de Boot, a Frisian physician practising in Ireland. Its nature and causation are discussed under METABOLIC DISEASES. The name "rickets" is from the Old English wrickan, to twist; the more technical medical term, rachitis, which comes from Greek ῥαχίς, the spine, was suggested by Francis Glisson in 1650, both from similarity of sound and from the part of the body which is one of the first to be affected. Rickets can seldom be recognized until several months after birth, and it most commonly attracts attention at about the end of the first year. The symptoms which precede the outward manifestation of the disease are marked disorders of the digestive and alimentary functions. The child's appetite is diminished, and there is frequent vomiting, together with diarrhoea or irregularity of the bowels, the evacuations being clay-coloured and unhealthy. Along with this there is a falling away in flesh, the child is too thin but rarely atrophied, and other symptoms present in the early stages, namely, profuse sweating of the head and upper parts of the body, particularly during sleep, with at the same time dry heat of the lower parts and a tendency in the child to kick off all coverings and expose the limbs. At the same time there is great tenderness of the bones, as shown by the pain produced on moving or handling the child. Gradually the changes in the shape of the bones become visible, at first chiefly noticed at the ends of the long bones, as in those of the arm, causing enlargements at the wrists, or in the ribs, producing a knobbed appearance at the junction of their ends with the costal cartilages. The bones also from their softened condition tend to become distorted and misshapen, both by the action of the muscles and by the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow-legged" or "in-kneed" often to an extreme degree. The trunk of the body likewise shows various alterations and deformities owing to curvatures of the spine, the flattening of the lateral curves of the ribs, and the projection forwards of the sternum. The cavity of the chest may thus be contracted and the development of the thoracic organs interfered with as well as their functions more or less embarrassed. The pelvis undergoes distortion, which may reduce its capacity to a
degree that in the female may afterwards lead to serious difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The constitutional conditions of ill-health continue, and the nutrition and development of the child are greatly retarded.

The disease may terminate in recovery, with more or less of deformity and dwarfing, the bones although altered in shape becoming firmly ossified, and this is the common result in the majority of instances. On the other hand, during the progress of the disease, various intercurrent ailments are apt to arise which may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, &c.

An acute form of rickets of rare occurrence (really a form of scurvy, q.v.) has been described by writers on diseases of children, in which all the symptoms are of more rapid development and progress, the result in many instances being fatal.

The treatment of rickets is necessarily more hygienic than medicinal, and includes such preventive measures as may be exercised by strict attention to personal health and nutrition on the part of mothers, especially where there appears to be any tendency to a rickety development in any members of the family. Very important also is the avoidance of too prolonged nursing, which by its weakening effects upon the mother's health is calculated to engender the disease in any succeeding children. At the same time it must be admitted that, when the mother is healthy, her milk abundant, and nursing discontinued before the lapse of the first year, there is no better means of preventing the occurrence of rickets than this method of feeding an infant, the disease, as is well known, being far more frequently met with in children brought up by hand. The management of the child exhibiting any tendency to rickets is of great importance, but can only be alluded to in general terms. The digestive disorders characteristic of the setting in of the disease render necessary the greatest care and watchfulness as to diet. Thus, if the child be not nursed but fed artificially, fresh milk should be almost the only article of diet for at least the first year, and the chief element for the next. While well, as at any time be shown by its appearance as a curd in the evacuations, it may be diluted with water or lime water, or else discontinued for a short time, carefully-made gruel or barley water being substituted. Many of the so-called "infants' foods" which are now so extensively used appear to be well adapted for their purpose, but when employed too abundantly and to the exclusion of the due amount of milk are often productive of digestive and intestinal disorders, probably from their containing a greater amount of starchy matter than can be utilized. From the end of the first year light animal soups may occasionally be given with advantage. The medicinal remedies most to be relied on are those which improve the digestive functions and minister to nutrition, and include such agents as the preparations of iron, quinine, and especially cod-liver oil and phosphorus, and the cautious use of extract of thyroid gland has been advocated by Henoch.

Of no less importance, however, are abundance of fresh air, cleanliness, warm clothing, and attention to the general hygiene of the child and to regularity in all its functions.

When the disease is showing evidence of advancing, it is desirable to restrain the child from walking, as far as possible. But this precaution may be to some extent rendered unnecessary by the use of splints and other apparatus as supports for the limbs and body, enabling the child to move about without the risk of bending and deformity of the bones which otherwise would probably be the result.

The condition formerly known as foetal rickets (achondroplasia or chondrodystrophia foetalis) is now classed as a separate disease. Its chief characteristics are dwarfism with shortening of the limbs and enormous enlargement of the articulations.

RICKMAN, THOMAS (1776-1841), English architect, was born on the 8th of June 1776 at Maidenhead, Berkshire, where he assisted his father (a Quaker) in business as a grocer and druggist until 1797. He was then engaged in various businesses until 1818. All his spare time was spent in sketching and making careful measured drawings, till he gained a knowledge of architecture which was very remarkable at a time when little taste existed for the beauties of the Gothic styles. In 1831 alone he is said to have studied three thousand ecclesiastical buildings. When in 1818 a large grant of money was made by the government to build new churches, Rickman sent in a design of his own which was successful in an open competition; thus he was fairly launched upon the profession of an architect, for which his natural gifts strongly fitted him. Rickman then moved to Birmingham, and by 1830 became one of the most successful architects of his time. He built churches at Hampton Lucy, Ombersley, and Stretton-on-Dunsmore, St George's at Birmingham, St Philip's and St Matthew's in Bristol, two in Carlisle, St Peter's and St Paul's at Preston, St David's in Glasgow, Grey Friars at Coventry, and many others. He also designed the new court of St John's College, Cambridge, a palace for the bishop of Carlisle, and several large country houses. These are all in the Gothic style, but show more knowledge of the outward form of the medieval style than any real acquaintance with its spirit, and are little better than dull copies of old work, disfigured by much poverty of detail. Rickman nevertheless played an important part in the revival of taste for medievalism perhaps second only to Pugin, His Attempts to discriminate the Styles of Architecture in England shows pains-taking research, and ran through many editions. Rickman died at Birmingham on the 4th of January 1841. He was married three times: first to his cousin, Lucy Rickman of Lewes; secondly to Christiana Hornor; thirdly to Elizabeth Miller of Edinburgh, by whom he had a son and a daughter.

RICKMANSWORTH, an urban district in the Watford parliamentary division of Hertfordshire, England; 17½ m. W.N.W. of London by the Metropolitan & Great Central joint railway; served also by a branch of the London & North Western railway from Watford. Pop. (1901) 5627. It lies in a pleasant valley at the junction of the Chess with the Colne, and on the Grand Junction canal. The church of St Mary, with the exception of the tower, was a modern reconstruction, contains some French stained glass of the 16th century. The chief industries are brewing and art-printing. The Colne here holds large trout, which are carefully preserved. The grounds of Moor Park to the south-east are finely wooded, and the mansion, belonging to Lord Ebury, is a good example of the period of George I. The estate counts among its former owners such famous names as the Botelers; George Neville, archbishop of York; John de Vere, earl of Oxford in Henry VII's time; Wolsey in the next reign; Robert Carey, earl of Monmouth, and the duke of Monmouth.

RICOCHET, a military term expressing the rebound of a projectile that strikes on a hard surface. The origin of the French word "ricochet" is unknown. Its earliest known use (14th and 15th centuries) was in the sense of "repetition," e.g. chasson du ricochet, "an oft-told tale." Hence it came to be applied to the rebound of a flat stone skimmed along the surface of water, known familiarly in English as "ducks and drakes," and so finally in the military sense defined above, which found its way into the English language.

The use of the now obsolete "ricochet fire" in war is well illustrated by "ducks and drakes." The shot, striking the ground at a small angle, described for the remainder of its course a succession of leaps and falls. Then this species of fire, usually attributed to Vauban (siege of Ath in 1701), was said to give the greatest influence both on sieges and on operations in the field. In siege warfare, ricochet, especially when combined with enfilade, i.e. when directed along the enemy's line of defence, soon became the principal weapon of the besieger, and the system of parallels (q.v.) gave the attack a superiority so complete that a siege came to be considered as the most
certain operation of war. Enfilade fire by itself was neutralized by traverses (q.v.) in the defences, but by the new method a shot could be so aimed as to skip over each successive traverse and thus to search ground that was immune from direct fire. The application of ricochet fire to operations in the field came somewhat later. In the 18th century field artillery, which was not, before Napoleon’s time, sufficiently mobile to close with the enemy, relied principally upon the ricochet of round shot, which, sweeping a considerable depth of ground, took effect upon several successive lines of hostile troops. But once artillery was able to gallop up to the enemy and to use its far more terrible close-range projectile, case-shot, ricochet fire came to be used less and less, until finally, with the general adoption of shell (which, of course, burst at the first contact with the ground), the round shot disappeared altogether from the battlefield. Similarly in siege warfare, as soon as high-angle fire with short ranges, and its accuracy, there was no further need of round shot and ricochet.

The term “ricochet” is now only applied, in modern rifle shooting, to the graze of a bullet that has struck short. A modern bullet that has ricocheted inflicts a very severe wound, as its nickel or other hard envelope is torn and jagged by its contact with the ground. With its high remaining velocity it is dangerous even after more than one ricochet, except at extreme ranges.

RICOLD OF MONTE CROCE (1242–1320), Italian Dominican missionary, was born at Monte Croce, near Florence. In 1267 he entered the Dominican house of Santa Maria Novella in Florence, and in 1272 that of St Catherine in Pisa. He started for Acre with a papal commission to preach in 1286 or 1287; in 1298 or 1299 he began to keep a record of his experiences in the Levant; this record he probably reduced to final book form in Baghdad. Entering Syria at Acre, he crossed Galilee to the Sea of Tiberias; thence returning to Acre he seems to have travelled down the coast to Jaffa, and so up to Jerusalem. After visiting the Jordan and the Dead Sea he quitted Palestine by the coast road, retracing his steps to Acre and passing on by Tripoli and Tortosa into Cilicia. From the Cilician port of Lajazzo he started on the great high road to Tabriz in north Persia. Crossing the Taurus he travelled on by Sivas of Cappadocia to Erzerum, the neighbourhood of Ararat and Tabriz. In and near Tabriz he preached for several months, after which he proceeded to Bagdad via Mosul and Tekrit. In Bagdad he stayed several years, studying the Koran and other works of Moslem theology, for controversial purposes, arguing with Nestorian Christians, and writing. In 1301 Ricold again appeared in Florence: some time after this he proposed to submit his Confutatio Alcorani to the pope, but did not. He died on the 31st of October 1320. As a traveller and observer his merits are conspicuous. His account of the Tartars and his sketch of Moslem religion and manners are especially noteworthy. In spite of strong prejudice, he shows remarkable breadth of view and appreciation of merit in systems the most hostile to his own.

RICOTTI-MAGNANI, CESARE (1822–1903), Italian general and knight of the Annunziata, was born at Borgo Lavezzaro on the 30th of June 1822. As artillery lieutenant he distinguished himself and was wounded at the siege of Peschiera in 1848, and in 1852 gained further distinction by his efforts to prevent the explosion of a burning powder magazine. After serving from 1856 to 1859 as director of the Artillery School, he became general of division in 1864, commanding the 9th division at the battle of San Martino. In the war of 1866 he led the Borgherose, to open a passage for Chialdini’s army. Upon the death of General Govea in 1867, he was appointed minister of war, and after the occupation of Rome bent all his efforts to army reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,800,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he became a member of the senate in 1890, but took little part in public life until 1896, when, after the battle of Adowa, he was entrusted by King Humbert with the formation of a cabinet. Having constructed his ministry, he made over the premiership to the marquis di Rudini, retaining for himself the portfolio of war, and seeking to satisfy popular demands for the reduction of military expenditure by consolidating the tactical structure of the army without weakening its fighting power. Rudini, however, finding that Ricotti’s ideas, which he himself shared, were not acceptable at court, obliged him to resign office. His prestige as creator of the modern Italian army remained unimpaired, and his views on army consolidation enjoyed a large measure of technical and public favour.

RIDDING, GEORGE (1828–1904), English headmaster and bishop, was born at Winchester College, of which his father, the Rev. Charles Ridding, vicar of Andover, was a fellow, on the 16th of March 1828. He was educated at Winchester and at Balliol College, Oxford. He became a fellow of Exeter College and was a tutor from 1853 to 1863. In 1853 he married Mary Louisa Moberly, who died within a year of her marriage. He was appointed second master of Winchester College in 1863, and on the retirement of his father-in-law, Dr Moberly, he succeeded to the headmastership. During the tenure of this office (1867–1884) he carried out successfully a series of radical reforms in the organization of the school, resulting in a great increase both in its reputation and numbers. In 1884 he became the first bishop of Southwell, and brought his powers of organization and conspicuous tact and moderation to bear on the management of the new diocese. He took an active share in its educational and social work, and was materially assisted in these respects by his second wife, Lady Laura Palmer, daughter of the 1st earl of Selborne. He resigned his see a short time before his death, which took place on the 30th of August 1904.

RIDDLES (A.S. raedan, to interpret), probably the oldest extant form of humour. They spring from man’s earliest perception that there are such things as analogies in nature. Man observes an example of analogy, puts his observations in the form of a question, and there is the riddle ready made. Some Boeotian humorist, for example, detected the analogy between the life of humanity—the child on all fours, the man erect on two legs, old age with its staff—on one side, and on the other the conception of an animal with a varying number of limbs. Put this in a question and it is the riddle of the Sphinx. Another instance is the question, “What we caught would not catch?” Homer is said to have died of vexation at not being able to discover the answer to this riddle, still current on the coast of Brittany, in Germany and in Gascony. After inventing the riddle, men began to use it in a kind of game; bets were staked on the answer and sides were made, each side backing its champion. These sports in Marriner’s time were common in Tonga; they are no less popular among the African Wolofis. Samson’s riddle set to the Philistines is an instance of the sport in a Semitic country. In märcben and ballads, the hero’s chance of
winning his beloved, or of escaping threatened punishment, is often made to turn on his power of answering riddles. It is now made to the artless and primitive character of the riddle that regular popular riddles (Devinettes) are widely distributed, like popular tales, popular songs and popular customs. The Wolof ask, "What flies for ever and rests never?" Answer, "The wind." The Ruman ask, "What is always restless, and yet flies fast and cannot be imprisoned?" Answer, "The voice." The German riddle runs, "What can go in face of the sun yet leave no shadow?" Answer, The wind. In riddles may perhaps be noticed the animistic or personalizing tendency of early human thought, just beginning to be conscious of itself. The person who asked these riddles had the old sense of wind, for example, as a person, yet probably, unlike the bushmen, he would never expect to see the personal wind. He knew the distinction between the personal and impersonal well enough to be sure that his enigma would present some difficulty. The riddle, to be brief, is an interrogatory form of the fable, and like the fable originates among rude people, and is perpetuated in the folklore of peasantry.

Probably the best book on the riddle (a subject less frequently studied than the märchen or the myth) is Eugène Rolland, Devinettes ou énigmes populaires, with a preface by M. Gaston Paris. The power of answering riddles among the people who invented the legend of Solomon and the queen of Sheba seems to have been regarded as a proof of great sagacity. The riddle proper is all but extinct outside folklore and savage life, and has been replaced by the conundrum, which is a pun in the interrogative form.

OLD ENGLISH RIDDLERS—A number of interesting poetical riddles in old English are contained in the Exeter Book, written about A.D. 1000. According to the numbering in the only complete edition (in Grein-Wülker, Bibliothek der Angelsächsischen Poesie, vol. iii., pp. 18-24, &c.), and would be found at the end of the book. The first is the monodramatic lyric Wulf and Eadwacer, which was included among the riddles by a mistake of the first editor of the Exeter Book, B. Thorpe; No. 90 is not in Old English, but in Latin; and several others are more unintelligible fragments. There remain about 85 that have been preserved either entirely or with sufficient approach to completeness for their general drift to be perceived.

The riddles Nos. 2-60 occupy 15 folios in the middle of the MS.; Nos. 62-95 occupy the last 7 folios, and No. 96 a mutilated and divergent copy of No. 31 are placed by themselves among poems of a different kind. Attempts have been made to show that the two main groups are distinguished from each other by special characteristics; but the attribution of different authors to different groups has been abandoned by all, but there seems to be no good reason for attaching any significance to the arrangement of the MS. Some of the riddles almost certainly were written in Northumbria, and early part of the century; a collection of 36, in English, has been preserved in a MS. at Leiden. Whether all the riddles are the work of one author, or whether they belong to different periods and districts, remains a matter of dispute. For the solution of the riddles, CYNEWULF the attribution of the whole collection to that poet, once almost universally accepted, is now no longer tenable; and there is no overwhelming probability that he is the author of any portion of it.

The investigations of F. Dietrich and A. Ebert have established the fact that a few of the riddles are imitated from the Latin enigmata of Symphysis and Aldhelm. No. 36 is a translation of Aldhelm’s riddle De Creatura, and No. 41 is based on the same work, De Creatura. The dependence of the Old English riddles on Latin originals has, however, been greatly exaggerated, especially by A. Fehn (Komposition und Quellen der Rätsel des Exeterbuches, 1868), who has found in Symphysis reminiscences of one or more of the compositions of Symphysis, Aldhelm, Tatwine and Eusebius. The correspondences are all in most cases slight, if not purely fanciful, and it is even doubtful whether the two writers last named were at all to the authors of the vernacular riddles. All the Englishmen who wrote riddles in the 8th and following centuries, whether they wrote in their native dialect or any provincialized Latin, were probably fond of riddles, and their work has many features in common. But except in a few instances the riddles written in Old English are probably not less but more original than those written in Latin. In poetical merit they are not inferior, and anyone versed in the dialectic style may be gained from Mr Stopford Brooke’s spirited (though not minutely accurate) translations of many of them in his History of Early English Literature, vol. i. (1892). Mr Brooke’s interpretation of No. 11 (the Barnacle Goose) is original, and no doubt correct; but in many cases Dietrich’s is certainly right, but in many others his conjectures are strangely perverse, owing to misleading comparisons with supposed Latin originals. Subsequent scholars have been much more successful in relating Dietrich’s explanations than in replacing them by others more satisfactory. The most copious contributor of new interpretations has been Prof. M. Trautmann, in several articles in Anglia, and also in Bonner, Pett, and W. P. (1905); but very few of his interpretations can be considered even plausible, and he sometimes rejects the solutions of his predecessors when they are probably right. One riddle (No. 51, Fire) was independently solved by Prof. Traut- mann, Mr. Herzfeld, and Mr. E. Saxon (Die Sagen und Enigmen, 1890). The articles on the subject by F. Tupper, Jr., in Modern Philology, vol. ii. (1903), and in Modern Language Notes for 1903 and 1906, are extremely valuable, though the author’s original explanations appear to have been mistaken, and his attempt to show that the meaning of a considerable number of the riddles is still uncertain. In some instances this may be due to the corrupt state of the text; in others the terms in which the object is described are vague so that several solutions are equally plausible. (H. B.)

RIDGE, WILLIAM PETT (1864— ), English author, was born at Charnham, near Canterbury, and was educated at Marden, Kent, and at the Birkbeck Institute, London. He was for some time a clerk in the Railway Clearing House, and began about 1891 to write humorous sketches for the St James’s Gazette and other papers. He secured his first striking success, in volume form, with Mord Em'rly (1898), an excellent example of his ability to draw humorous portraits of lower class life. His later books include A Son of the State (1899), A Breaker of Laws (1900), Lost Property (1902), Erb (1903), Mrs Calter’s Business (1906), The Riddle, No. 19 (1906); but very few of his interpretations can be considered even plausible, and he sometimes rejects the solutions of his predecessors when they are probably right. One riddle (No. 51, Fire) was independently solved by Prof. Trautmann, in several articles in Anglia, and also in Bonner, Pett, and W. P. (1905); but very few of his interpretations can be considered even plausible, and he sometimes rejects the solutions of his predecessors when they are probably right. In some instances this may be due to the corrupt state of the text; in others the terms in which the object is described are vague so that several solutions are equally plausible. (H. B.)

RIDGE, a word common to many Teutonic languages, meaning “back,” whether of a man or an animal, cf. German Rücke), the word applied to many objects resembling the projecting line of an animal’s back, such as the strip of soil thrown up by a plough between furrows, the elevations or protuberances on bones which serve for the attachment of muscles or ligaments, &c. In architecture the ridge (Fr. faîte, créte; Gr. First; Ital. asinello) is the highest portion of a roof, which is covered with lead, slate, or tiles, and sometimes decorated with a cresting in terra-cotta or metal-work. The term is also applied to the meeting of the common rafters on each side of a roof, which are sometimes butted against an upright board known as the ridge-piece. For the ridget-see KIN.

RIDING, the art or practice of locomotion on the back of an animal or in a vehicle (the verb to ride originally meant “to travel,” or “go,” as the derived noun road means “a way”). Where no vehicle is specified (e.g., “riding a bicycle”), the word is associated with horseback riding, for exercise or pleasure. The origin of the use of the horse as a means of transport goes back to prehistoric times. The table of the centaurs, if the derivation from kentér, to goad, ra'ss, bull, be accepted (but see CANTER), would indicate that either the original word, cow, or the plural of -a, was in early times an equivalent for cow, as the modern cowboys (of "cow-punchers") or gauchos of North and South America. Archaeological discoveries in India, Persia, Assyria and Egypt show that in the polished stone age quaternary man had domesticated the horse, while a Chinese treatise, the Goei-leaoitse, the fifth book of the Vouking, a sort of military code dating from the reign of the emperor Hoang-Ti (2637 years B.C.), places the cavalry on the wings of the army. The Hebrews understood

1 For the linguistic arguments against Cynewulf’s authorship of the Riddles see especially A. Madert, Die Sprache der altenglischen Rätsel des Exeterbuches und die Cynewulfsfrage (1900).
the use of the horse in war (Job xxxix. 18-23), as did the Persians ( Cyrus at the battle of Thymbra), Greeks and Romans. The Greeks and Romans, respectively, were skilled horsemen, and feats on horseback were a feature of their games. They used no stirrup, but had both bridle and bit. They rode bareback, or on a cloth or skin strapped to the horse.

When roads were poor and vehicles cumbersome horseback was almost the only method of travel for both sexes. With the introduction of steam locomotion and the improvement of roads, however, riding has become to a large extent a sport, rather than a necessity. There are different styles of riding adapted to the different purposes for which horses are ridden—on the road, in the school, hunting, racing, steeple-chasing and in the cavalry service—just as there are different horses more suitable for conformation, breeding and trial. In western civilization there is a traditional difference between the riding of men and women, in this particular, that men ride astride and women on a side-saddle. But in the following observations we deal generally with the more important features of riding as practised astride.

After securing an animal of the right height, weight and disposition, with a saddle of a length of tree and a breadth of seat that fits the rider and that is lined to fit the back of the horse, with a bridle bitted to his mouth, the first step is to mount.

Having taken up the reins, the rider should stand at his horse’s neck, facing in the direction of the tail, and in that position hold the stirrup with his right hand for the reception of his left foot. By standing at the shoulder the rider is out of harm’s way in the event of the horse kicking while he mounts. Ladies generally have the aid of a block or a groom’s or escort’s hand beneath the left foot. But a woman should be able to mount without aid, by lowering her stirrup, so that she can reach it from the ground, and then raising it again when she is seated in the saddle. Riding astride is sometimes recommended for women. The chief argument in its favour—symmetrical development of the figure—is, however, lost if the growing girl be taught to ride on a side-saddle of which the pommels can be shifted to the off side on alternate days.

Having gained the saddle, the necessity arises for **seat and hands**. Here good instruction is imperative at the outset. The great desideratum in a seat on horseback is that it should be firm. A rider with an insecure seat is apt to be thrown by any unexpected movement the horse may make; and, without a firm seat, the acquirement of good hands is well-nigh hopeless, because, when the balance is once disturbed the insecure rider will have to depend on something else for the maintenance of his seat, and this generally takes the shape of “riding on the horse’s mouth,” a practice as cruel as it is ugly.

Having gained the saddle, the rider should adjust the stirrups to the proper length, depending on the kind of riding, the length of his leg and the roughness of the horse’s trot. Sitting well in the middle of the saddle, the thighs turned in, and the heels drawn somewhat back, the stirrup leathers may be let out or taken up until the tread of the stirrup is on a level with the inner ankle bone, and at this length, when the rider stands up, his fork will easily clear the pommel of the saddle. For maintaining his seat the horseman should depend upon his thighs and knees only, and not upon the knee and calf; a proper seat should be a mixture of balance and grip; a man riding by balance only is sure to be thrown, while to grip with all one’s might during an hour’s ride is to undertake as much exertion as should last for a whole day. The position of the foot exercises much influence on the security of the seat; it should be opposite the girth, parallel with the barrel of the horse, with the heels depressed. A good seat on a horse should not be strong merely; it should be graceful; above the loins the body should be loose, so as readily to adapt itself to every motion of the horse, but it should be upright.

Beginners are advised to practise riding with and without stirrups; thus, let the pupil who has ridden half an hour in a saddle with stirrups have a cloth substituted for the saddle for about ten minutes, care being taken to observe the rules already laid down for the position of the legs; in this way the proper seat will be strengthened.

The position of the hand is the next thing to be attended to, and as the management of these depends so much upon the seat being firm and independent of the bridle the acquisition of a firm seat is certainly half-way towards the acquirement of good hands. An excellent way to start a pupil is on a sure-footed horse without bridle, the master governing him by a leading rein until the pupil has acquired a firm seat and can be trusted with reins. Assuming that a double-reined bridle is used, the third finger of the left hand should be first inserted between the snaffle reins; then the little, third and second fingers should be between the curb reins, the two outside reins being the curb, and the two inside ones the snaffle. In this position the rider should hold the reins steadily, so as to yield resistance with every motion of the horse.

The rider sitting in the position described, square to the front, with his shoulders well back, will be riding with fairly long reins, one of the secrets of good hands.

When the horse is in motion the hands should not be held rigid, as the horse’s mouth would thereby become dead, and the horse would lean unpleasantly on the hand; but the rider should give and take, without, however, entirely relaxing the hold.

In order to encourage the horse to walk the head must not be confined, but a light feeling of the horse’s mouth must be kept up. Should the horse, unasked, break into a trot, never snatch at his mouth, but restrain him gently. To trot, press the legs to the saddle, and raise the bridle hand a little, and, after a moment’s sitting close, begin to rise ("pose") in cadence with the action of the horse. The rising to the trot should be performed easily; the legs must not swing backwards and forwards, nor should the hands be jerked up and down. To start the canter, which should always be done from the walk and not the trot, take up the curb rein a little and turn the horse’s head slightly to the right, at the same time pressing the left leg behind the girth; the horse will then lead with the off (right) fore leg, which is generally preferred; but a well-broken horse should lead with either leg at command, and if he be catered in a circle to the left he must lead with the near leg, as otherwise an ugly fall is likely to result from the leg being crossed. Galloping is a pace not to be generally indulged in by road or park riders; when it is, the hands should be kept low, the body thrown back, and an extra grip taken with the knees, as nearly all horses pull more or less when extended.

Hitherto only road or park riding has been considered. When a person has become a fair road rider he has made some progress towards being a hunting man. But if first principles are disregarded, and a follower of hounds believes in the system, "it doesn’t matter how you ride so long as you stick on," he will not only always be a "sight" but a menace in the hunting field. Few self-taught riders attain to excellence; they may keep a good place in hunting, if possessed of plenty of courage, and mounted on a bold and not too tender-mouthered horse, but they never will be riders in the proper sense of the word.

**Hunting and Riding to Hounds.**—For practical purposes the chief difference between a park seat and a hunting seat consists in the shortening of the stirrups some two or three holes. The seat of the hunting man is the most important of any connected with his habit. He must sit firm, as much to be thrown off when his horse leaps, or make a mistake, and he must be able to save his horse under all circumstances, and to make as much of him as possible. As with road riding, so with hunting, the actual
length of the stirrups will depend a good deal upon the shape and action of the horse, but the nature of the animal and the peculiarities of the country ridden over also have something to do with their adjustment. A rider will compel the horse to use his leathers one or perhaps two holes—a course that may also be rendered necessary in a hilly country, for, in going down hill, the stirrup is often used as an ordinary one, and the general speed is made too long. The rider’s body must be always close to the saddle in leaping, for if he were jerked up, the weight of the body only a 10-stone man coming down on the horse a couple of seconds after he has landed, there is sufficient to throw the animal down. Nothing but actual practice with hounds can teach a man how to ride where all kinds of going and obstacles of various sorts, natural and artificial, have to be encountered in a day’s hunting. For example, to be over the highest level spring a horse has to jump hill and down dale, across ridge and furrow, over ground studded with ant-hills (which, unlike mole-hills, are often very hard), over ploughed or boggy land, etc. Each of these requires the feet of every hunter, and nearly every horse will require different handling under similar circumstances. It will therefore be seen that much depends on the rider having good hands. This qualification, though generally understood, is difficult to define. A rider with good hands never depends upon his reins for retaining his seat; nor does he pull at the horse’s mouth so as to make him afraid to go up to his bit; nor again does he ever use more force than is necessary for the accomplishment of what he desires to perform. But besides all this, there is an unaccountable sympathetic something about the man with good hands that cannot be described. Pullers appear to renounce pulling, refusers take to jumping and clearing and agitators become quiet and the horses are content. Though hands can to a great extent be acquired by care and practice, yet in the highest form this is a gift and cannot be learned.

There are different kinds of "fences," as all obstacles are generally called; and the kind of fence that is best for the first two are, nine times out of ten, awkward jumps, as the take-off is either poached by cattle, or else is on the ascent or descent. Hedges vary according to the custom of the country in which they are located. A hedge in the north is low and the field are protected by a ditch on one side, or are planted on a bank with a ditch on one side or sometimes on both. Then again there are such large banks as are found in Wiltshire, Devon, and Cornwall on Laugharne until winding ditches, which are met with in two forms: the water is either within an inch or two of the top of the bank, so as to be about on a level with the field through which it flows, or there may be a space of nine or ten feet from the top of the bank. The negotiation of brooks a bold horse is required, ridden by a bold man. No fence that is ever encountered stops such a large proportion of the field as water; even a clear 6 ft. of it will prove a hindrance to some, while anything over 10 or 12 ft. will in general be crossed only by a very few. Some horses, good performers over any description of fence, will not jump water under any circumstances; while the chance of a ducker deters many from riding at it; and, however bold it may be, it will soon begin to be water if his rider be peremptorily in two minds when approaching it.

The pace at which a hunter should be ridden at his fences depends upon the nature of the fence, and the peculiarities of each individual horse. A good jumper will shoot on, and the good hunter—heads high—must be ridden well. In such horses, slapping back with the heel is rarely done; in others it is necessary to slap or throw with the heel, first to make the horse臻en and then to give the jump. The good hunter—heads up—depends upon the pace, and it is necessary to keep the horse a little behind the pace, and to let him know that his rider is not afraid to take the risk. It is not advisable to jump in a hasty way; it is better to jump in the same way the horse would be ridden on a level ground, and to let him know that his rider is not afraid of the pace. In jumping an ordinary hedge or ditch at moderate speed, there is of course a moment of time during which the horse is on his

RIDINGS are the three districts from which from ancient times Yorkshire has been divided for administrative purposes. Formerly there were similar districts in Lindsey in Lincolnshire. The word riding was originally written as thríðinge or trillion, but the initial th has been absorbed in the final th or t of the words north, south, east and west, by which it was normally preceded. "Ridings" are Scandinavian institutions. In Iceland the third part of a thing which corresponds roughly to an English county was called thríðingr; in Norway, however, the thríðjanger seems to have been an ecclesiastical division. According to the 12th-century compilation known as the “laws of Edward the Confessor,” the riding was the third part of a county (provincia); to it causes were brought which could not be determined in the wapentake, and a matter which could not be determined in the riding was brought into the court of the shire. There is abundant evidence that riding courts were held after the Norman Conquest. A charter which Henry I. granted to the Church of St. Peter’s at York mentions wapentacm, trídange, or thríðingh, but the exceptional form trídangh is a slip of the pen. The practice of riding or hunting may be noticed frequently in the charters of the Norman kings. As yet, however, the jurisdiction and functions of these courts have not been ascertained. It seems probable from the silence of the records that they had already fallen into disuse early in the 12th century.

Each of the ridings of Yorkshire has its own lord lieutenant and commission of the peace, and under the Local Government Act of 1888 forms a separate administrative county. They are distinguished as the north, east and west ridings, but the ancient
RIDLIE—RIEGO NUÑEZ

divisions of Lindsey were known as the north, south and west
ridings respectively.

RIDLEY, NICHOLAS (c. 1500–1553), English bishop and martyr; was descended from an old Northumberland family. The second son of Charles, Constable Ridley of Unthank Hall, near Wilmotnesote, in that county, he was born in the beginning of the 16th century. From a school at Newcastle-on-Tyne, he was sent about 1518 to Pembroke Hall, Cambridge, being supported there by his uncle, Dr Robert Ridley (d. 1556), and specially distinguishing himself in Greek. Having graduated M.A. in 1526, he went to study at the Sorbonne in Paris and at Louvain, and on his return to Cambridge he was appointed junior treasurer of his college. In 1534 he was one of the university proctors, and he signed the decree of the university against the jurisdiction of the pope in England. About this time Ridley, who was now chaplain to the university, began to distinguish himself as an orator and a disputant, and to show leanings to the reformed faith. Having proceeded B.D. in 1537, he was appointed by Thomas Cranmer, archbishop of Canterbury, one of his chaplains, and in April 1538 the same prelate instituted him to the vicarage of Herne in Kent. In 1540 he was chosen master of Pembroke Hall; in 1541 he became chaplain to Henry VIII. and canon of Canterbury. In 1543 he was accused of heretical teaching and practices, but he managed to allay the suspicions of the royal commissioners, although just after his expulsion he finally abandoned the doctrine of transubstantiation.

In 1547 Ridley was presented by his college to the Cambridge-shire living of Soham, and in September of the same year he was nominated bishop of Rochester. Edward VI. was now on the throne and the new bishop was in high favour. He was one of the visitors who were appointed to establish protestantism in the university of Cambridge; in 1548 he helped to compile the English prayer book; and in 1549 he was one of the commissioners who examined Bishops Gardiner and Bonner. He concurred in their deprivation and succeeded Bonner in the see of London. Having signed the letters patent settling the English crown on Lady Jane Grey, Ridley, in a sermon preached at the queen's coronation on the 9th of July 1553, affirmed that the princesses Mary and Elizabeth were illegitimate and that the succession of the former would be contrary to the religious interests of England. When Lady Jane's cause was not, however, he went to Framingham to ask Queen Mary's pardon, but at once he was arrested and sent to the Tower of London. From his prison he wrote in defence of his religious opinions, and early in 1554 he, with Cranmer and Latimer, was sent to Oxford to be examined. He defended himself against a number of divines, but was declared a heretic, and this was followed by his excommunication. He refused to recant, and in October 1555 he was tried for heresy under the new penal laws, being condemned and sentenced to death. With Cranmer and Latimer he met his end at the stake in Oxford on the 16th of October 1555.

Ridley was a voluminous writer, but many of his writings have been lost. The Works of Nicholas Ridley D.D. were edited for the Parker Society by the Rev. Henry Christmas in 1841. His Life was written by Dr Gloucester Ridley in 1573, and there is a memoir of him in the H. C. G. Moule's edition of the bishops' Declaratio of the Lords Supper (1895). See also John Foxe's Acts and Monuments (new ed., 1872); J. Strype's Memorials of Cranmer (new ed., Oxford, 1842); J. A. Froude's History of England (1865); and J. Lingard's History of England (1854–55).

RIDOLFI, or RIDOLFO, ROBERTO DI (1531–1612), Italian conspirator, belonged to a famous family of Florence, where he was born on the 18th of November 1531. As a banker he had business connections with the court, and about 1555 he settled in London, where he soon became a person of some importance, and consorted with William Cecil and other prominent men. During the early years of Elizabeth's reign he began to take a more active part in politics, associating with the discontented Roman Catholics in England and communicating with their friends abroad. In 1570 he set to work on the plot against the queen which is usually associated with his name. His intention was to marry Mary, queen of Scots, to the duke of Norfolk and to place her on the English throne. With the aid of John Lesley, bishop of Ross, he gained the consent of these high personages to the conspiracy, and in 1571 he visited the duke of Alva at Brussels, Pius V. at Rome, and Philip II. at Madrid to explain to them his scheme and to gain their active assistance thereto. His messenger, by name Charles Baillie (1542–1625), was, however, seized at Dover, and in other ways the English government heard of the intended rising. Consequently, Norfolk and Lesley were arrested, the former being condemned to death in January 1572. Ridolfi, who was then in Paris, could do nothing when he heard this news, and his scheme collapsed. Afterwards he served the pope, but much of his later life was spent in Florence, where he became a senator and where he died on the 9th of February 1612.

RIEGER, PHILIPP FRIEDRICH VON (1848–1900), Bohemian politician and publicist, was born on the 18th of December 1818 at Semil in the circle of Jičín, Bohemia. He first came into prominence as one of the Czech leaders in the revolution of 1848. He was returned by seven constituencies to the Reichstag at Vienna, where he was the leader of the Czech party. In 1853 he married a daughter of the historian Palacky. In 1858 he started the Slovín naučky, the Czech national encyclopaedia, the first volume of which was published in 1859, the 11th and last in 1874. He was also instrumental in founding the first Czech political daily newspaper published in Prague, which appeared on the 1st of January 1861, and of which he was for awhile the editor. After the issue of the "October diploma" of 1860, Rieger, with his father-in-law, Palacky, undertook the leadership of the reconstituted Czech party, and after the decision of this party in 1863 no longer to attend the Austrian Reichsrath, he led the agitation in favour of the restoration of the Bohemian kingdom. In 1871 he conducted the negotiations with the Hohenenwarth ministry for a federal constitution of the empire, which broke down owing to his extreme attitude in the matter of Bohemian independence. On the reappearance of the Czechs in the Bohemian diet (1878) and the Austrian Reichsrath (1879) Rieger was one of the leaders of the federalist majority supporting Count Taaffe's government and the chief of the so-called "Old Czechs." On his birthday (December 10, 1888) he received a national gift of 100,000 gulden; but, in spite of this evidence of his popularity, his conservative, his close connexion with the Bohemian nobility and his clerical tendencies brought him into conflict with the growing influence of the radical "Young Czech" party, and in 1891, together with the other "Old Czechs," he was defeated at the poll. In March 1897 he was created a baron (Freiherr) and given a seat in the Upper House. He continued occasionally to interfere in politics; but his influence was now at an end, though when he died on the 3rd of March 1903, his funeral at Prague was made the occasion of a magnificent demonstration of respect.

RIEGO NUÑEZ, RAFAEL DEL (1784–1823), Spanish army officer, who has the melancholy distinction of having begun the long series of political military mutinies—pronunciamientos—in Spain, was born at Santa María de Tuna in Asturias on the 2nd of April 1784. He was educated for the legal profession at Oviedo, and passed the necessary examinations. But in 1807 he enlisted in the guard. When the French invasion began in 1808 he was employed by the junta of Asturias and placed in command of a newly raised battalion. He was taken prisoner at the battle of Estremoz de los Monteros, on the 10th and 11th of November 1808, and was sent to France. During his years of imprisonment he, like many others of his countrymen, was converted to liberalism on the French model. Riego had the good fortune to escape and to reach England after various wanderings in Switzerland and Germany. In England
he was incorporated with other rescued or escaped Spaniards, in a corps equipped by the British government, and was sent to Spain in 1814. He continued in service as a military officer, and was commandant of the second battalion of the regiment "Asturias," which formed part of the army collected at Cadiz to be sent to South America in 1819. Service in America was unpopular with the soldiers, and there was much discontent in the country with the government of King Ferdinand VII. A conspiracy was formed among the officers to use the army for the purpose of forcing the king to grant a constitution. They were betrayed by a general who at first professed to sympathize with them, and many were arrested. Riego was apparently not suspected, and he decided to act on his own account. On New Year’s Day 1820 he made his pronunciamiento with his regiment at the village of Cabezas de San Juan. He proclaimed for the constitution drawn up by the Cortes in 1812, which was unworkable, and which the chiefs of the conspiracy did not propose to restore. He hoped to seize Cadiz, but it was held by a loyal officer, and for a time no popular movement took place. Riego now started on a revolutionary propaganda through Andalusia at the head of his regiment. The country proved hostile or at the best indifferent to the following gradual process of action, and he was about to flee to Portugal when Galicia revolted. The rebellion extended rapidly, and the king was compelled to yield. When the liberals were in possession of power they would gladly have kept Riego in a subordinate place. But he came to the capital, where he was soon the most popular spokesman of the extreme parties. There he discredited himself by his vanity, and shocked even the populace of Madrid by appearing drunk at the theatre. He was at last persuaded to accept the military command in Aragon, which he thought below his merits. He began intrigues and agitations. The government was strong enough to put him under arrest at Lérida. When the new Cortes was elected in 1823, the attacks on the king were continued, and the radicals selected him as president of the chamber on the 17th of February 1823. The unceasing intrigues of the king, the incapacity of the moderate parties and the hysterical excitement of the mob combined to make anarchy worse daily. Riego was the noisiest shouter of all. When the French intervention took place, he helped to carry the king to Cadiz, and he fought a few unsuccessful skirmishes with the invaders. He was at last captured at a farmhouse near Arguillos in the province of Jaen. Unfortunately for him, he fell into the hands of the royalist volunteers, by whom he was carried to the capital. On his way he was repeatedly mobbed and had many close escapes from being torn to pieces. He was hanged at Madrid in the Plaza de la Cebada on the 7th of November 1823. At the end he professed abject repentance for his impiety and disloyalty. The popular revolutionary tune of Spain, the "himno de Riego," is named after him, and his picture is hung in the Cortes, but he was a poor creature, and a bad example of the light-headed military agitators who have caused Spain much misery.

H. Baumgarten, Geschichte Spaniens (Berlin, 1865-1871).

RIEHM, EDUARD KARL AUGUST (1830-1888), German Protestant theologian, was born at Diersburg in Baden on the 20th of December 1830. He studied theology and philosophy at Heidelberg and later at Halle under Hermann Hupfeld, who persuaded him to include Arabic, Syriac and Egyptian. Entering the ministry in 1853, he was made vicar at Durlach soon afterwards, and became a licentiate in the theological faculty at Heidelberg. In 1854 he was appointed garrison-preacher at Mannheim; and in 1858 he was licensed to lecture at Heidelberg, where in 1861 he was made professor extraordinary. In 1862 he obtained a similar post at Halle, and in 1866 was promoted to the rank of professor ordinarius. Throughout his life he followed Hupfeld’s plan in his scientific treatment of the Old Testament—that of reconciling the results of a free criticism with a belief in divine revelations. His practical experience of pastoral work also proved of service to him when he became a professor of theology, for “if there is one quality more striking than another in the writings of Riehm, it is that of sympathy with orthodox believers.” (T. K. Cheyne). In 1865 Riehm was made a member of the commission for the revision of Luther’s translation of the Bible, and became one of the editors of the quarterly review, Theologische Studien und Kritiken. He died on the 5th of April 1888.

His works include: Die Gesetzgebung Moses im Lande Moab (1854), in which the Deuteronomic law book is treated in the second half of the reign of Manasseh; Der Lehrbegriff des Hebräerbriefs (1858-59, 2nd ed. 1867); Hermann Hupfeld, Lebens-und Charakterbild eines deutschen Professors (1867); Die Missionäre Wissagung (1878, 2nd ed. 1883); Eng. trans. (1890); Religion und Wissenschaft (1881); and the well-known Handwörterbuch des biblischen Allurtem (2 vols., 1884-85, 2nd ed. revised by F. Baethgen, 1892-94). After his death in 1885 he published the Einleitung in das Alte Testament (1889, ed. by A. Brandt), in which the date of the Deuteronomic law book is placed earlier than in his book on the legislation of Moses—shortly before or at the beginning of the reign of Hezekiah; and his Alttestamentliche Theologie (1889, ed. by Pabneke). See Herzog-Hauck, Realencyclopädie, and T. K. Cheyne, Founders of Old Testament Criticism.

RIEL, LOUIS (1844-1885), Canadian agitator, son of Louis Riel and Julie de Lagemaundière, was born at St Boniface, on the 23rd of October 1844, according to his own account, though others place his birth in 1847. Though known as a half-breed, or Métis, and though with both Indian and Irish ancestors, he identified himself with the Canadian nation, and in 1864 he declared himself for the cause of the British-Canadian settlers of Manitoba. In January 1866 he issued the Proclamation, in the name of the "free and independent nations.." of Canada. After his defeat in 1867 he published the Einleitung in das Alte Testament (1889, ed. by A. Brandt), in which the date of the Deuteronomic law book is placed earlier than in his book on the legislation of Moses—shortly before or at the beginning of the reign of Hezekiah; and his Alttestamentliche Theologie (1889, ed. by Pabneke). See Herzog-Hauck, Realencyclopädie, and T. K. Cheyne, Founders of Old Testament Criticism.

RIEJMANN, GEORG FRIEDRICH BERNHARD (1826-1866), German mathematician, was born on the 17th of September 1826, in Riel, and died in 1885.
RIEMANN

1826, at Breselenz, near Dannenberg in Hanover. His father, Friedrich Bernhard Riemann, came from Mecklenburg, had served in the war of freedom, and had finally settled as pastor in Quickborn. Here with his five brothers and sisters Riemann spent his boyhood and received, chiefly from his father, the elements of his education. He showed at an early age well-marked mathematical powers, and his progress was so rapid in arithmetic and geometry that he was soon beyond the guidance not only of his father but of schoolmaster Schulz, who assisted in the mathematical department of his training.

In 1840 he went to Hanover, where he attended the lyceum and two years later he entered the Johanneum at Lüneburg. The director, Schmalfuss, encouraged him in his mathematical studies by lending him books (among them Leonhard Euler's works and Adrien Marie Legendre's \textit{Theory of Numbers}), which Riemann read, mastered and returned within a few days. In 1846 Riemann entered himself as a student of philology and theology in the university of Göttingen. This choice of a university career was dictated more by the natural desire of his father to see his son enter his own profession, and by the poverty of his family, than by any of his own genuine inclinations. He attended on the numerical solution of equations and on definite integrals by M. A. Stern, on terrestrial magnetism by Goldschmidt, and on the method of least squares by K. F. Gauss. It soon became evident that his mathematical studies, undertaken at first probably as a relaxation, were destined to be the chief business of his life. He proceeded in the beginning of 1847 to Berlin, attracted thereto by that brilliant constellation of mathematical genius whose principal stars were P. G. L. Dirichlet, C. G. J. Jacobi, J. Steiner and F. G. M. Eisenstein. He appears to have attended Dirichlet's lectures on theory of numbers, theory of definite integrals, and partial differential equations, and Jacobi's of the analytical mechanics and higher algebra. It was during this period that he first formed those ideas on the theory of functions of a complex variable which led to most of his great discoveries. One stirring social incident at least marked this part of his life, for, during the revolutionary insurrection in March 1848, the young mathematician, as a member of a company of student volunteers, kept guard in the royal palace from 9 o'clock on the morning of the 24th of March till 1 o'clock on the afternoon of the following day.

In 1850 he returned to Göttingen and began to prepare his doctor's dissertation, busyng himself meanwhile with \textit{Naturphilosophie} and mechanics of the chemical elements. This double cultivation of his scientific powers had the happiest effect on his subsequent work; for the greatest achievements of Riemann were effected by the application in pure mathematics generally of a method (theory of potential) which had up to this time been used solely in the solution of certain problems that arise in mathematical physics.

In November 1851 he obtained his doctorate, the thesis being \textit{"Grundlagen für eine allgemeine Theorie der Functionen einer veränderlichen complexen Grösse."} This memoir excited the admiration of Gauss, and at once marked its author's rank as a mathematician. The fundamental method of research which Riemann employed has just been alluded to; the results will be best indicated in his own words:—

\begin{quote}
"The methods in use hitherto for treating functions of a complex variable always started from an expression for the function as its definition, whereby its value was given for every value of the argument; by our investigation it has been shown that, in consequence of the extremal character of a function of a complex variable, in a definition of this sort one part of the determining conditions is a consequence of the rest, and the extent of the determining conditions has been reduced to what is necessary to effect the determination. This essentially simplifies the treatment of such functions. Hitherto in order to prove the equality of two expressions for the same function, it was necessary to transform the one into the other, \textit{i.e.}, to show that both expressions agreed for every value of the variable; now it is sufficient to prove their agreement to a far less extent \[\text{[merely in certain critical points and at certain boundaries]}.\"
\end{quote}

The time between his promotion to the doctorate and his habilitation as \textit{Privatdozent} was occupied by researches undertaken for his Habilitationsschrift, by \textit{Naturphilosophie}, and by experimental work. The subject he had chosen for his Habilitationsschrift was the \textit{"Representation of a Function by Means of a Trigonometrical Series,"} a subject which Dirichlet had made his own by a now well-known series of researches. It was fortunate, no doubt, for Riemann that he had the kind advice and encouragement of Dirichlet himself, who was then on a visit at Göttingen during the preparation of his essay; but the result was a memoir of such originality and refinement as showed that the pupil was fully the equal of the master. Of the customary three themes which he suggested for his trial lecture, that \textit{"On the Hypotheses which form the Foundation of Geometry"} was chosen at the instance of Gauss, who was curious to hear what so young a man had to say on this difficult subject, on which he himself had in private speculated so profoundly (see \textit{Geometry, Non-Euclidian}).

In 1855 Gauss died and was succeeded by Dirichlet, who along with others made an effort to obtain Riemann's nomination as extraordinary professor. In this they were not successful; but a government stipend of 200 thalers was given him, and even this miserable pittance was of great importance, so that was working such havoc in his family; and now the income of good fortune was embittered by the deaths of his father and his eldest sister, and by the breaking up of the home at Quickborn. Meanwhile he was lecturing and writing the great memoir (\textit{Borchardt's Journal, vol. liv., 1857}) in which he applied the theory developed in his doctor's dissertation to the Abelian functions. It is amusing to find him speaking jubilantly of the unexpectedly large audience of eight which assembled to hear his first lecture (in 1854) on partial differential equations and their application to physical problems.

Riemann's health had never been strong. Even in his boyhood he had shown symptoms of consumption, the disease that was working such havoc in his family; and now under the strain of work he broke down altogether, and had to retire to the Harz with his friends Ritter and R. Dedekind, where he gave himself up to excursions and \textit{\"Naturphilosophie."} After his return to Göttingen (November 1857) he was made extra-ordinary professor, and his salary raised to 300 thalers. As usual with him, misfortune followed close behind; for he lost in quick succession his brother Wilhelm and another sister. In 1859 he lost his friend Dirichlet; but his reputation was now so well established that he was at once appointed to succeed him. Well-merited honours began to reach him; and in 1860 he received a corresponding stipend. He married Elise Koch in June 1862, but the following month he had an attack of pleurisy which proved the beginning of a long illness that ended only with his death. His physician recommended a sojourn in Italy, for the benefit of his health, and Weber and Sartorius von Waltershausen obtained from the government leave of absence and means to defray the cost of the journey. At first it seemed that he would recover; but on his return in June 1863 he caught cold on the Spilgen Pass, and in August of the same year had to go back to Italy. In November 1865 he returned again to Göttingen, but, although he was able to live through the winter, and even to work a few hours every day, it became clear to his friends, and clearest of all to himself, that he was dying. In order to husband his few remaining days he resolved in June 1866 to return once more to Italy. Thither he journeyed through the confusion of the first days of the Austro-Prussian War, and settled in a villa at Selasca near Intra on Lago Maggiore. Here his strength rapidly ebbed away, but his mental faculties remained brilliant to the last. On the 19th of July 1866 he was working at his last unfinished investigation on the mechanism of the ear. The day following he died. Few as were the years of work allotted to him, and few as are the printed pages covered by the record of his researches, his name is, and will remain, a household word among mathematicians. Most of his memoirs are masterpieces—full of original methods, profound ideas and far-reaching imagination.

The collected works of Riemann were published by H. Weber, assisted by R. Dedekind (8vo, Leipzig, 1876; 2nd ed., 1892).
RIENZI—RIESA

At the end of this volume there is a touching account of his life by the latter.

RIENZI, COLA DI (c. 1315–1354), tribune of the Roman people, was born in Rome, being the son of a tavern-keeper named Lorenzo Gabrini. His father's Christian name was shortened to Rienzo, and his own, Nicholas, to Cola; hence the Cola di Rienzi, or Rienzo, by which he is generally known. His early years were passed at Anagni. Having devoted much time to the study of the Latin writers, historians, orators and poets, and filled his mind with stories of the glories and the power of ancient Rome, he turned his thoughts to the task of restoring his native city to its pristine greatness, his zeal for this work being quickened by the desire to avenge his brother, who had been killed by a noble, a member of the ruling class. He became a notary and a person of some importance in the city, and was sent in 1343 on a public errand to Pope Clement VI. at Avignon. He discharged his duties with ability and success, and although the boldness with which he denounced the aristocratic rulers of Rome drew down upon him the enmity of powerful men, he won the favour and esteem of the pope, who gave him an official position at his court. Returning to Rome about April 1344 he worked for three years at the great object of his life, the restoration of the city to its former position of power. He gathered together a band of supporters, plans were drawn up, and at length all was ready for the rising. On the 10th of May 1347 heralds invited the people to a parliament on the Capitol, and on the 20th, the day being Whit-Sunday, the meeting took place. Dressed in full armour and attended by the papal vicar, Cola headed a procession to the Capitol; here he addressed the assembled crowd, speaking "with fascinating eloquence of the servitude and redemption of Rome." A new series of laws was published and accepted with acclaim, and unlimited authority was given to the author of the revolution. Without striking a blow the nobles left the city or went into hiding, and a few days later Rienzi took the title of tribune (Nicholau, secerus et demens, libertatis, pacis justiciaeque tribunus, et sacre Romane Reipublice liberator).

His authority quickly and quietly accepted by all classes, the new ruler governed the city with a stern justice which was in marked contrast to the recent reign of licence and disorder. In great state the tribune moved through the streets of Rome, being received at St Peter's with the hymn Veni Creator spiritus, while after the poet Petrarch urged him to continue his great and noble work, and congratulated him on his past achievements, calling him the new Camillus, Brutus and Romulus. In July in a sonorous decree he proclaimed the sovereignty of the Roman people over the empire, but before this he had set to work upon his task of restoring the authority of Rome over the cities and provinces of Italy, of making the city again capital mundi. He wrote letters to the cities of Italy, asking them to send representatives to an assembly which would meet on the 1st of August, when the formation of a great federation under the headship of Rome would be considered. On the appointed day a number of representatives appeared, and after some elaborate and fantastic orations of his, Rienzi, as dictator, issued an edict citing the emperor Louis the Bavarian and his rival Charles, afterwards the emperor Charles IV., and also the imperial electors and all others concerned in the dispute, to appear before him in order that he might pronounce judgment in the case. On the following day the festival of the unity of Italy was celebrated, but neither this nor the previous meeting had any practical result. Rienzi's power, however, was recognized in Naples, whence both Queen Joanna and her bitter foe, King Louis of Hungary, appealed to him for protection and aid, and on the 15th of August he was crowned tribune with great pomp, wreaths of flowers being placed on his head. Gregorovius says this "was a fantastic caricature in which ended the imperium of Charles the Great. A world where political action was represented in such guise was ripe for overthrow, or could only be saved by a great mental reformation." He then seized, but soon released, Stephen Colonna and some other barons who had spoken disparagingly of him. But his power was already beginning to wane. His extravagant pretensions only served to excite ridicule. His government was costly, and to meet its many expenses he was obliged to lay heavy taxes upon the people. He offended the pope by his arrogance and pride, and both pope and emperor by his proposal to set up a new Roman empire, the sovereignty of which would rest directly upon the will of the people. In October Clement gave power to a legate to depose him and bring him to trial, and the end was obviously in sight. Taking heart, the exiled barons gathered together some troops, and war began in the neighbourhood of Rome. Rienzi obtained aid from Louis of Hungary and others, and on the 20th of November his forces defeated the nobles in a battle just outside the gates of Rome, a battle in which the tribune himself took no part, but in which his most distinguished foe, Stephen Colonna, was killed. But this victory did not save him. He passed his time in feasts and pageants, while in a bull the pope denounced him as a criminal, a pagan and a heretic, until, terrified by a slight disturbance on the 15th of December, he abdicated and fled from Rome. He sought refuge in Naples, but soon he left that city and spent over two years in an Italian mountain monastery.

Emerging from his solitude Rienzi journeyed to Prague, which he reached in July 1350, and threw himself upon the protection of the emperor Charles IV. Denouncing the temporal power of the pope he implored the emperor to deliver Italy, and especially Rome, from their oppressors; but, heedless of his invitations, Charles kept him in prison for more than a year in the fortress of Raudnitz, and then handed him over to Clement, who had been clamouring for his surrender. At Avignon, where he appeared in August 1352, Rienzi was tried by three cardinals, and was sentenced to death, but this judgment was not carried out, and he remained in prison in spite of appeals from Petrarch for his release. Freedom, however, was at hand. In December 1352 Clement died, and his successor, Innocent VI., anxious to strike a blow at the baronial rulers of Rome, and seeing in the former tribune an excellent tool for this purpose, pardoned and released his prisoner. Giving him the title of senator, he sent him to Italy with the legate, Cardinal Albornoz, and having collected a few mercenary troops on the way, Rienzi entered Rome in August 1354. He was received with great rejoicings and quickly regained his former position of power. But this was of short duration. The tribune, who had been already established in Rome for but a few months, died a martyr. At the request of the people, his body was removed to Florence, where it was interred in the Basilica of Santa Croce, with hymns of praise and eulogies by the men of letters and law of the day, and was worshipped as a saint. His life was closely studied and imitated by the people of Florence for many years, and his memory was kept alive by the poet Petrarch, who wrote a sonnet in his praise.

Rienzi's life and fate have formed the subject of a famous novel by Bulwer Lytton, of an opera by Wagner and of a tragedy by Julius Mosen. His letters, edited by A. Gabrielli, are published in vol. vi. of the Fontis por la storia d'Italia (Rome, 1890). See also Denkmäler Cola di Rienzi (Hamburg, 1841); Aurea, Etude historique sur N. Rienzi (Amiens, 1885); E. Rodolph, Cola di Rienzi (Paris, 1888); Kühn, Die Entwicklung der Bündnis- pläne Cola di Rienzos im Jahre 1347 (Berlin, 1905); A. von Reumont, Die Geschichte der Stadt Rom im Mittelalter, vol. ii. (Eng. trans. by A. Hamilton, 1898).

RIESA, a town of Germany, in the kingdom of Saxony, pleasantly situated on the left bank of the Elbe, 30 m. N.W. of Dresden, on the main line of railway to Leipzig, and at the junction of lines to Chemnitz, Elsterwerda and Nossen. Pop. (1895) 14,073. The river is here crossed by a fine bridge, a
RIESENER—RIESENGEBIRGE

sandstone and iron structure, carrying both railway and road, and replacing the one carried away by floods in 1875. The town contains two Evangelical churches, a castle, formerly a convent and now used as a town hall, and a school of engineering. There is a harbour with quays and a dockyard, also rolling-mills and saw-mills, ironworks and sandstone quarries. Other industries are the manufacture of furniture, beer, soap, carriages and bricks. The most important shipping station on the Elbe in Saxon, Riesa is the landing-place for goods to and from Bavaria, and a mart for herring, petroleum, wood, coal and grain. A constant passenger steamboat communication is maintained with Meissen and Dresden; and, owing to the artillery practice ranges at Zeithain, on the right bank of the Elbe, Riesa has become of recent years one of the chief depots of the Saxon army. Riesa received municipal rights in 1632, and after a period of decay was again raised to the rank of a town in 1854.

RIESENGEBIRGE (Bohemian Krkonoš, or Giant Mountains), a lofty and rugged group on the boundary of Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They form the highest portion of the Sudetic system which separates south-east Prussia from the Austrian empire, and finds its natural continuation towards the N.W. in the Erzgebirge, the Thuringian Forest and the Harz Mountains. Adjoining the Isergebirge and the Lužitsergebirge on the W., and the Eulengebirge and the Adlergebirge on the E. and S.E., the Krkonoše are first run up in the N.W., and are separated from the Bohemian Highlands of the Zacken and the Bober, for a distance of 23 m., with a breadth of 14 m. They cover an area of about 425 sq. m., three-fourths of which is in Austrian, and the remainder in Prussian territory. The boundary line follows the crest of the principal chain or ridge (Riesenkamm), which stretches along the northern side of the group, with an average height of over 4000 ft. The principal peaks are the Reifträger (4430 ft.), the Hohe Rad (4068 ft.), the Great Sturmhaube (4862 ft.), the Little Sturmhaube (4646 ft.), and, near the east extremity, the Schneekoppe or Riesenkoppe (5266 ft.), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley known as the Siebengründe, there extends on the S. a second and lower chain, of broad massive "saddles," with comparatively few peaks. The chief heights here are Kesselkoppe (4708 ft.), the Krkonoše (4849 ft.), the Ziegenrücker and the Brunnenberg (5072 ft.). From both ridges spurs of greater or less length are sent off at various angles, whence a magnificent view is obtained from Breslau to Prague; the lowlands of Silesia, watered by the Oder, and those of Bohemia, intersected by the Elbe and the Moldau, appearing to lie mapped in relief. The summit is crowned by a chapel dedicated to St Lawrence, which once also served as a traveller's shelter. Since 1850 the chapel has been restored to its religious use, and a hotel for the accommodation of tourists is built close by. A remarkable group of isolated columnar rocks are those known as the Aderbacher Felsen in a valley on the Bohemian side of the Riesengebirge, 9 m. N.W. of Braunau.

On its northern side this mountain group rises ruggedly and precipitously from the Hirschberg valley; but on its southern side its slope towards Bohemia is very much more gradual. The scenery is in general bold and wild. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siebengründe. The Iser, Bober, Aupa, Zacker, Quest, and a great number of smaller streams also rise among these mountains or on their skirts; and small lakes and tarns are not unfrequent in the valleys. The Great and Little Schneebrünen—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohe Rad. Nearly the whole of the Riesenkamm and the western portion of the southern chain are granite; the eastern extremity of the main ridge and several mountains to the south-east are formed of a species of gneiss; and the greater part of the Bohemian chain, especially its summits, consists of mica-slate. Blocks of these minerals lie scattered on the sides and ridges of the mountains and delicately conceived, with finer but hardly less vigorous lines. By the time he had been working alone for ten years he had completely embraced the Louis Seize manner—he had, perhaps, sought it first on the Continent. One of the most distinguished of his achievements for the court was the famous flat writing-table now at the Petit Trianon, for which he received only £200. The extent of these royal orders may be gauged from the fact that between 1775 and 1785 Riesener received 500,000 livres from the Garde Meubles, notwithstanding that during the whole of this period Gondoin the architect was the official designer of furniture for the royal palaces. Like so many other artists he was condemned in the end to sacrifice to the false taste of his day, and a certain number of his creations, otherwise delightful, were vitiated by being mounted with panels of Sèvres, Wedgwood and other china. The beautiful little secretaire in the Jones collection in the Victoria and Albert Museum suffers seriously by this lapse.
RIETI

RIETI (anc. Reate), a city and episcopal see of Italy, in the province of Perugia, 23½ m. by rail and 15 m. direct S.S.E. of Terni, which is 70 m. by rail from Rome. Pop. (1901) 14,145 (town), 17,716 (commune). It occupies a fine position 1318 ft. above sea-level on the right bank of the Velino (a torrent subtributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (restored about 1250), its castle, its cathedral (13th and 14th centuries), its episcopal palace (1283), and its various churches and convents Rieti has no small amount of medieval impressiveness, it also displays a wealth of modern activity in vine and olive growing and cattle-breeding. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero. A Roman bridge over the Turano, and the Palazzo Ventigni by Vignola deserve to be mentioned.

Reate was reached from Rome by the Via Salaria (q.v.), which may originally have ended there, and a branch road ran from it to Interamna. While hardly mentioned in connexion with the Via Salaria, Rieti is described as a station of these long contests. Its inhabitants received the Roman franchise at the same time with the rest of the Sabines (290 B.C.), but it appears as a town of Roman foundation from the time of the Augustan dominion. It has never been a colony, though veterans of the Praetorian guard and of the eighth (Augusta) and ninth legions were settled there by Vespasian, who belonged to a Reatine family, and in the ninth century the counts of Reate and the counts of the Reatines with the people of Interamna see Terni. In 1148 the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire it always held with the former; and it defied the forces of Frederick II. and Otho IV. Pope Nicholas IV. long resided at Rieti, and it was there he crowned Charles II. of Anjou king of the Two Sicilies. In the 14th century Robert, and afterwards Joanna, of Naples managed to keep possession of Rieti for a time, returning it to the popes during the time of the Lateran Council of 1311.

About the year 1500, the liberties of the town, long defended against the encroachments of the popes, were abolished. An earthquake in 1758 was in 1799 followed by the much more disastrous village of Rieti by the papal troops for a space of fourteen days.

RIETSCHEL, ERNST FRIEDRICH AUGUST (1804-1861), German sculptor, was born at Pulsnitz in Saxony. At an early age he became an art student at Dresden, and subsequently a pupil of Rauch in Berlin. He there gained an art studentship, and studied in Rome in 1827–28. After returning to Saxony he soon brought himself into notice by a colossal statue of Frederick Augustus, king of Saxony; was elected a member of the academy of Dresden, and thenceforth became one of the chief sculptors of his country. In 1832 he was elected to the Dresden professorship of sculpture, and had many foreign orders of merit conferred on him by the governments of different countries. He died at Dresden in 1861.

Rietschel's style was very varied; he produced works imbued with much religious feeling, and to some extent he occupied the same place as a sculptor that Overbeck did in painting. Other important works by him are purely classical in style. He was specially famed for his portrait figures of eminent men, treated with much idealism and dramatic vigour; among the latter class his chief works were the allegorical statues of Goethe and Schiller for the town of Weimar, of Weibrecht and of Dresden and of Lessing for Brunswick. He also designed the memorial statue of Luther for Worms, but died before he could carry it out. The principal among Rietschel's religious pieces of sculpture are the well-known Christ-Angel, and a life-sized Pietà, executed for the king of Prussia. He also worked a great deal in rilievo, and produced many graceful pieces, especially a fine series of bas-reliefs representing Night and Morning, Noon and Twilight, designed with much poetical feeling and imagination.

For a good biography of Rietschel and account of his works see Apperma, Ernst Rietschel (Leipzig, 1863). (J. H. M.)

RIEU, CHARLES PIERRE HENRI (1892-1902), Swiss Orientalist, was born at Geneva in 1820. He studied at Bonn University, where he received his doctor's degree in 1843. He entered the British Museum in 1847, and after twenty years of service, a new post, that of keeper of Oriental manuscripts, was created for him. He completed in 1871 the second part, dealing with Arabian MSS., of the Catalogue codicum manu- scriptorum orientalium, and had been begun by William Cureton, and he issued a supplementary catalogue of other works. In 1891 he also drew up a Catalogue of the Turkish Manuscripts (1888) and a Catalogue of the Persian Manuscripts (4 vols., 1879-95), the latter being a storehouse of information on the books and their authors. In 1895 he was made professor of Arabic in the university of Cambridge in succession to Robertson Smith. He died in London on the 19th of March 1902.

RIEVAULX, a village in the North Riding of Yorkshire, England, 3 m. W. by N. of the small town of Helmsley, which is served by a branch of the North-Eastern railway. Here, exquisitely situated in a deep wooded valley, are the ruins of Rievaulx Abbey, a foundation by Walter l'Espec in 1132 for Cistercians. The principal remains are those of the cruciform church, mainly Early English in date, and of the finest workmanship. There are considerable fragments of the refectory, and all the important domestic buildings may be traced. A beautiful prospect over the ruins and the valley is seen from the terrace on the eastern flanking hill.

RIFFIANS, the name given to the Berbers of the Rif district of Morocco, the mountain region bordering the north coast from Ceuta eastward nearly to the borders of Algeria and forming part of the Atlas range. The name, it has been suggested, is derived from a Libyoid root *rib*; its most important fact is the change of the Arabic "l" to "r," and this would seem to support this derivation, "b" and "f" being interchangeable through "r." The Riffians are only nominally subject to the sultan of Morocco, against whose authority they are in constant revolt. They are typical Berbers in physique, tall, well made and muscular, with European features and fair skins bronzed by the sun. In morality they are singularly superior to their neighbours. In order to prevent youthful unchastity, marriages are contracted between children of eight years old, the girl being brought home to live with the lad at his parents' home till a child is born, when a separate dwelling is provided for the young couple. They are agricultural. The Riffians understand and speak Arabic very little. They were among the fiercest and most cruel of the pirates of the north coast of Africa. Even now they are entirely untrustworthy in this respect. See further BERBERS, MOROCCO, MOORS, KABYLES, MAZARITES.

RIFLE, a firearm which may be shortly defined as a musket in which, by grooves (cf. Ger. r^feln, to groove) in the bore or otherwise, the projectile is forced to rotate before leaving the barrel. This rotatory motion, maintained during flight, equalizes any irregularities in the form or weight of the bullet, and so lessens the tendency to depart from a straight line, and also gives a measure of accuracy in its aim. The first rifle was invented about 1520, by Gaspard Koller or Kollner, a gunmaker of Vienna, according to some authorities; by August Kottor of Nuremberg, according to others. It has been said...
that at first the grooves were made straight, with the object of admitting a tight-fitting bullet and relieving the effects of fouling, and that the virtue of spiral grooving was subsequently discovered by accident. But this theory is unsupported. The earliest known rifle barrels have spiral grooving. The amount of turn varied in old rifles from a half or three-quarters turn to one turn in two to three feet. The form and depth of the grooves and the number of grooves also greatly varied.

Historical Development of Military Rifles.—For the chief infantry firearms that preceded the modern military rifle, see GUN, ARMS AND ARMOUR (firearms), ARQUEBUS, &c. Rifles were at first used for amusement. There are, however, instances of their occasional employment in war in the 17th and 18th centuries. In 1631 the landgrave of Hesse had a troop of riflemen. Ten years later Maximilian of Bavaria had several troops armed with rifled arquebuses. Louis XIII. armed his bodyguard with rifles. Napoleon withdrew the rifle from those of his troops to whom it had been issued during the wars of the Republic, nor did the French make any considerable use of it again until 1830, when the Chasseurs d'Orléans were armed with it for the invasion of Algeria. The British learnt the value of rifles during the American War of Independence, when the government subsidized continental Jégers armed with rifles to oppose the American riflemen. After the war these corps disappeared, and though they are now represented by the 60th (King's Royal) Rifles, the senior rifle corps in the British Army is the Rifle Brigade, raised in 1800 as the 93rd Regiment and armed with a flint-lock weapon known as "Baker's Rifle," which weighed 9 l. 9 oz. The barrel was 39 ft. long, its calibre 20-bore, with seven grooves making a quarter-turn in its length. A small wooden mallet was at first supplied with this rifle to make the ball enter the barrel, and it was loaded with great difficulty. In 1826 Delvigne, a French infantry officer, invented a breech with abrupt shoulders on which the spherical bullet was rammed down until it expanded and filled the grooves. The objection was that the deformed bullet had an erratic flight. Delvigne's system was subsequently improved upon by Thouvenin, who introduced into the breech an iron stem, upon which the bullet, now of conical form, rested, and was expanded by a sharp blow with the iron ramrod when loading. In William IV.'s reign the Brunswick percussion rifle 1 was introduced into the British rifle regiments. Its weight with bayonet was 17 lb 5 oz.; length of barrel, 2 ft. 6 in., with two grooves making one turn in the length of the barrel; weight of spherical belted bullet, 557 grs.; diameter, .704 in.; charge of powder, 23 drs. This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yds.

In 1835 W. Greener produced a new expansive bullet, an oval ball, a diameter and a half in length, with a flat end, perforated, in which a cast metallic taper plug was inserted. The explosion of the charge drove the plug home, expanded the bullet, filled the grooves and prevented windage. A trial of the Greener bullet in August 1835 proved successful. Its weight with bayonet was 17 lb 53 oz.; length of barrel, 2 ft. 6 in., with two grooves making one turn in the length of the barrel; weight of spherical belted bullet, 557 grs.; diameter, .704 in.; charge of powder, 23 drs. This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yds.

This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yds.

1 The percussion principle, invented by the Rev. Alexander John Forsyth (1768-1843) in 1805, was not accepted for military arms until the introduction of this rifle. A small and belated money grant was made to Forsyth in 1843. See Major-General A. J. F. Reid's memoir of Forsyth (1910).

charge of powder 23 drs., and sighted from 300 to 1000 yds. The form of its barrel was at first conoidal, afterwards changed to cylindro-conoidal, with a hemispherical iron cup. In 1855 the Enfield rifle, having in a series of trials competed favourably with the Minie and Lancaster rifles, was introduced into the British Army; it was used during the latter part of the Crimean war, having there replaced the Minie rifle and the percussion musket, and remained the general weapon of the entire Army until the introduction of the breech-loader in the year 1867. This rifle weighed, with bayonet, 9 lb 3 oz., barrel 30 in.; diameter of bore .577 in.; three-grooved, with one turn in 78 in. It fired a bullet of cylindro-conoidal form with hollow base, weighing 350 grains, made up into cartridges and lubricated as for the Minie rifle, adapted to this rifle by Pritchett, who was awarded £1000 by the Government. This bullet was wrapped in grease paper round the cylindrical part half-way up its length. Short rifles of the same pattern, with five-grooved barrels 2 ft. 9 in. long and a sword bayonet, were supplied to the 60th Rifles and to the Rifle Brigade. Two small carbines of the same principle were at this time introduced for the cavalry and artillery, also a rifle pistol.

In 1854, on the suggestion of General Lord Hardinge, Sir Joseph Whitworth, the first mechanician of the day, began to consider the subject of rifling, and after a long series of experiments the Whitworth rifle was produced with hexagonal bore, .45-in. calibre, and with one turn in 20 in. It was tried at Hythe in 1857, and completely defeated the Enfield rifle up to 1800 yds. upon a fixed rest. This trial and Whitworth's experiments proved the advantages of a sharp twist, a smaller bore, and elongated projectile; but Whitworth's rifle was never adopted into the Government service, probably because the hexagonal rifling wore badly, and owing to the difficulty of equal mechanical perfection in all similar rifles and ammunition. Several improvements were subsequently made in the sighting, grooving and some other details of the Enfield rifle. In 1854 a boxwood plug to the bullet was used.

Between 1857 and 1861 four breech-loading carbines were experimentally introduced in the cavalry—viz. Sharp's, Terry's, Green's, and Wesley-Richards'. Sharp's and other breech-loading carbines and also Spencer repeating carbines were used by the Federal cavalry in the American Civil War. The general adoption of the breech-loading principle may be said to date from 1867. The Prussians were the first to see its great advantages, and about 1841 had adopted the celebrated needle-gun (g.v.), a bolt-action weapon. In 1864 and 1865 committees were appointed by the British War Office to report on breech-loading arms, and after protracted experiments, Jacob Snider's method of conversion of the muzzle-loading Enfield to a breech-loader (fig. 1) was adopted, with the general adoption, as used in the Kaffir War of 1851, and in the Crimea. Its weight with bayonet was 10 lb 8 oz., length of barrel 3 ft. 3 in., with four grooves making one turn in 72 in.; diameter of bore .702 inch;
rifle with metallic cartridge-case, which secured the perfect obturation of the breech. The Snider breech was a hinged block, a type much in favour at the time. The French similarly converted their muzzle-loaders, the converted weapon being known as the Tabatière or snuff-box. Other breech actions on the same principle were the Austrian Werndl and the Bavarian Podewils and Werder rifles. But these were only transitional arms. In 1866 France adopted the bolt-action Chassepôt (q.v.); in 1867 Sweden the Hagtström, and Russia the Carte; in 1868 Italy the Carcano. All these were breech-loaders firing paper cartridges containing their own means of ignition. After further experiments by a fresh committee the Martini-Henry rifle (fig. 2) was definitely adopted by the British

Government in 1871, with the short chamber Boxer-Henry ammunition. This rifle was a combination of Martini's block-action breech mechanism with Henry's barrel of .45-in. calibre, firing a papered bullet of 430 grains from Boxer cases with a wad of wax lubrication at base of bullet, as proposed by Henry. The Henry rifle had seven grooves with one turn in 22 in.; the lands and the centres of the grooves were contained in the same circle. About the same time or a little later the various powers re-armed their infantry with breech-loaders of different patterns and names, all of which were of about 11 mm. (.433 in.) calibre, and nearly all of the bolt-action type.

The next stage in the history of military firearms was the introduction of the repeating or magazine system. The Winchester rifle, an American invention which appeared in 1865, was one of the earliest magazine rifles. This weapon was used by Turkey to some extent in the Russo-Turkish War of 1877-78, but Germany was the first great power to provide its army with a magazine rifle. In 1884 it converted the 1871 pattern Mauser of .443-in. bore into a magazine rifle, holding eight cartridges in a tube magazine in the fore end. In 1885 France followed with the Lebel, which had an enormous advantage in its smokeless powder. In 1886 the question of the best calibre for small arms was reopened in England. In this year, 1886, Austria had adopted a Mannlicher rifle, .433 bore, with a straight-pull bolt. This rifle was the first adopted by any European nation embodying Lee's box magazine, an invention patented in 1879 and 1882, and consisting of a box, in rear of and below the entrance to the chamber, containing the cartridges. Another important improvement, the steel clip loader containing five cartridges, was also introduced with this rifle. In 1888 these rifles were converted to .315 bore, firing black powder cartridges; and in 1890, on the introduction of smokeless powder, the sights were re-graduated. In 1887 the British Small Arms Committee, after experiments with the small-calibre rifle invented in 1883 by the Swiss Major Rubin, director of the Federal laboratory at Thun, recommended the small calibre for adoption into the British service. The essential features of Rubin's system were the employment of a compound bullet with a leaden core in a copper envelope, and the use of a compressed charge of black powder. In 1888 a pattern of .303-in. calibre rifle, rifled on the Metford system and with the improved Lee bolt and magazine, was approved for trial by British troops. The Metford rifle is as follows:—diameter of bore, .303 in. depth of rifling, .004 in.; width of lands, .023 in.; twist of rifling, one turn in 10 in. (left-hand); radial grooves, seven in number. About 1892, and later, W. E. Metford carried out an exhaustive series of experiments on bullets and rifling. He invented the important system of light rifling, with increasing spiral with a hardened bullet. The Metford match rifle was prominent in all N.R.A. competitions from 1871 to 1894. In 1887 he laid down for the Small Arms Committee the proper proportions for the grooving, spiral and cartridge chamber of the .303 military rifle. This weapon proved satisfactory and was adopted by the War Office as the Lee-Metford rifle, Mark I., in December 1888. It had a magazine of eight cartridges. In 1891 the Mark II. pattern was approved, with a ten-cartridge magazine, a simplified bolt, and many minor improvements. A magazine carbine with barrel 27 in. long and a six-cartridge magazine, otherwise identical with the Lee-Metford Mark I., was also approved. The Lee-Metford Mark II. rifle was subsequently further improved in its rifling to resist the wear of smokeless powder, and also in its bolt action, and became known as the Lee-Enfield rifle, and under that name was officially adopted as the rifle of the British army. The number of grooves were reduced from seven to five. Neither the Lee-Metford nor the Lee-Enfield has increasing spiral grooves, which are found inconvenient for military arms from a manufacturing point of view. The L.M. and L.E. carbines are similar to the shorter models of the rifles, but are covered for the whole length of the barrel by a wooden guard and take only short cartridges; the front sights are protected by wings on the nose-cap, and the long-range sights are omitted. These, as also the Martini-Metford and Martini-Enfield carbines (falling-block action small-bores), have practically been replaced by the "short" rifle described below.

The efficiency of the modern small-bore magazine rifle is largely due to the production of smokeless nitro-compound powder. France was the first country to adopt, about 1885, a smokeless powder with the Lebel magazine rifle. It was known as "Vieille" powder, or "Poudre B" (after General Boulanger). Since then smokeless explosives have been universally adopted in all small-bore magazine military rifles. The smokeless explosive known as "Cordite" or "Cordite M.D." (see CANNON) is used for the cartridges of the Lee-Metford and Lee-Enfield rifles and rifle-calibre machine guns.

(Military Rifles of To-day.—About 1900, the various armies were equipped with weapons of nearly equal efficiency. The weights varied between 8½ and 9½ lb., the lengths between 49 and 52 in.; the calibres were .315, .311, .303, with one or two .250. None of the rifles were sighted to less than 2000 yds., and nearly all had a "fixed" or "battle" sight. All were bolt-action rifles, and had a muzzle velocity of about 2000 f.s. (the .250 Mannlichers, about 2500 f.s.). Except France, with the horizontal-box Lebel, Denmark and the U.S.A. with the horizontal-box Krag-Jørgensen, and Great Britain, all nations used multiple-loading by clip or charger. With Lebel and Krag-Jørgensen weapons, multiple-loading is a practical impossibility, but in Great Britain the charger was deliberately rejected. It was desired to use the rifle normally as a

1 Of all modern military rifles, the Italian 1891 weapon alone has an increasing twist.
RIFLE

single-loader, and to reserve the magazine (which held ten cartridges, or twice as many as the multiple-loading Mausers, Mannlicher's, &c.) for emergencies. But from about 1903 this equivalence of infantry weapons began to be disturbed by two new influences: the tendency towards a "short" rifle, and the introduction of the pointed bullet.

In the first, Switzerland took the lead with the short Schmidt-Rubin in 1900. But amongst the greater powers, England and the United States alone have followed her example. At the close of the South African War Great Britain issued 1000 short Lee-Enfield rifles experimentally, and in 1902 the "short rifle" was actually approved and issued generally. Since then it has been improved in details. The barrel was shortened by 5 in., multiple-loading by charger was introduced, and by the Musketry Regulations of 1909 magazine fire was laid down as the normal, single-loading being forbidden. The change met with very considerable opposition, especially from target-shooting experts, who maintained that a long rifle, so perfected in details as to be equal to the short in every point except in length, must be more accurate. The view of the military authorities, which was maintained in spite of criticism, was that for service purposes, and especially for prolonged snap-shooting, the handler weapon was preferable. One important factor in the decision was the desire to give the cavalry a weapon with which, when dismounted, it could fight the infantry rifle on equal terms. A more serious objection than that of want of superfine accuracy in bull's-eye shooting was the loss of 5 in. of reach in bayonet fighting. This objection was met in 1907 by the introduction of a new pattern bayonet with a blade 5 in. longer. In 1908 the long Lee-Enfield and Lee-Metford rifles in store were converted for charger-loading (fig. 3), fitted with safety catches and new sights, and issued to the infantry of the Territorial Force in 1909 and 1910. For target purposes many rifle shots prefer this converted weapon to the short rifle (fig. 4).

FIG. 3.—Charger-loading L.E. (Text Book of Small Arms, by permission.)

FIG. 4.—L.E. Short Rifle. (Text Book of Small Arms, by permission.)

The United States in 1904 replaced the Krag-Jörgensen (hand-loading horizontal magazine) by the short Springfield. A sort of spring bayonet was at first fitted to this rifle, but it was soon replaced by an ordinary sword bayonet.

The pointed bullet ("Spitz-geschoss" or "S") was introduced by Germany in 1905, and her example was quickly followed by France (balle D) and other powers. Its advantage is a considerable flattening of the trajectory chiefly on account of the lessened resistance of the air. This latter allows of a reduction in the sectional density and consequently in the weight of the bullet. Thus velocities up to 2000 foot-seconds are realized, which enables the "dangerous space" to be very greatly augmented (see fig. 20). The "fixed sight" range with the "S" bullet is 700 yds., as against the Lee-Enfield's 500. It was announced in the House of Commons in 1910 that a modified bullet was being experimented with, and that some increase in the fixed-sight range was expected to be obtained, but the relatively weak breech action of the Lee-Enfield—which is due chiefly to the rearward position of the locking lugs—does not allow designers much freedom in the matter of increasing velocities, as the chamber pressure has to be kept low. It will be seen from the table that other rifles are constructed to stand a much higher pressure.

But both the improvements are destined to be eclipsed in importance by the adoption of the automatic rifle. The application of the automatic principle to the modern high-velocity small-arm of precision has been occupying the attention of the small-arms experts of all armies and of numerous private inventors for some years past. These numerous attempts have, in the case of the rifle, been largely doomed to failure because of the necessary limitations of space and weight; although the automatic principle has been successfully applied both to machine guns (q.v.) and to pistols (q.v.). In these weapons the work of extracting the empty cartridge-case, re-loading and re-cocking, is accomplished either by the motive power of the gas or by the operation of the powder, thus enabling a rapid and continuous fire to be maintained to the full capacity of the weapon's magazine. In the case of machine guns the firing also is automatic, but self- firing rifles are not very desirable as infantry weapons and in addition are so heavy as to approach to machine guns.

Of the recoil-operated class of automatic rifles there are two subdivisions, "short-recoil" and "long-recoil." In the former, which is most favoured by inventors, the barrel, body and bolt recoil together for a short distance, about 1⁄4 in., in which space the bolt is unlocked, and the bolt then recoils freely in the body. The bolt is run forward in reloading by the action of the long-recoil, which is the bolt and barrel recoil the whole distance, and the barrel and body are run up by one spring, the bolt by another. Several such rifles have been shown at the N.R.A. meetings at Bisley; the Rexer, Mauser and Woodgate rifles being on the long-recoil, the Hallé on the short-recoil principle. Gas-operated rifles, like the Hotchkiss and Colt machine guns, have fixed barrels and are worked by a portion of the powder-gases which is allowed to escape from the barrel through a small hole near the muzzle, thence entering a cylinder and working a piston in connexion with the breech mechanism. No automatic rifle has as yet (August 1910) been issued as a service weapon by any power, the problem of ensuring certainty in action under service conditions—i.e. with grit and dirt in the working parts—being the principal difficulty.

Great Britain.—There are two principal types of Lee-Metford and Lee-Enfield rifles in service, the "short" and the "chargerloading." The former is carried by all units (cavalry included) of the regular army, by the yeomanry cavalry of the Territorial Force, and by units of the Officers' Training Corps. The latter is used by the infantry of the Territorial Force. There are, however, the older, non-charger-loading Lee-Metford and Lee-Enfield rifles, a few carbines of the same type, and some Martini-Metford and Martini-Enfield carbines which have the 250 bolt-action with the falling-block Martini action. Martini-Henry rifles and carbines, and even Sniders, are still used by local police forces in some of the smaller colonies.

The "long" charger-loading Lee-Enfield is converted from earlier patterns by the addition of a charger guide, the stripping of the bolt-cover, and improvements in the sighting. The action of the breech mechanism 1 is as follows (the breech mechanism of the "short" rifle being practically the same): The breech is closed by a bolt (I) which slides in a bolt-way cut in the body; the bolt-head (Io) abuts against the base of the cartridge when the rifle is loaded, and when the knob is turned down the whole is locked. On the right side of the bolt is a solid rib, and on the left side a lug; these support the bolt on firing by contact with the "resisting shoulder" on the right, and the rear face of the "lug seating" on the left of the body. Underneath the bolt there are two recesses and two studs. The bolt-head is screwed to the bolt and is fitted with an extractor claw. The bolt-head, instead of being rigidly attached to the bolt, is so far independent that it remains stationary when the bolt is thrown open. There is, instead of the conventional arrangement of striker (V) and spring (W), and at its rear end, forming the working connexion between trigger and striker, is the "cocking-piece" (X) which is fitted with a safety-catch (not in the old pattern rifles). It is a long piece of hardwood, long and pointed, and a long tonguing projecting to the front, lying along the under side of the bolt, and the front end of this tonguing (Y), called the "full-bent,"

1 The annexed figures show the old pattern weapon. In both, the existing patterns a safety-catch is fitted, the magazine spring is of a different shape and there is no bolt-cover. But the essential parts of the action remain the same.
engages the nose of the trigger sear when the weapon is loaded (a groove in the tongue, called the "half-bent" (2), serves as a halfcock arrangement, and could be used as a safety-catch if the proper safety-catch were damaged). The trigger sear (K) is a bell-crank lever, the upper long arm of which is put in and out of contact with the "full-bent," and the lower or short arm is connected to the trigger. The magazine holds ten cartridges, which rest on a platform, underneath which is the magazine spring that pushes the platform and cartridges up. A "cut-off" is fitted in the "long" and in some marks of the "short" rifle. This is a sort of lid to the magazine, enabling the magazine to be kept full while the rifle is being used as a single loader. But the present musketry regulations forbid single-loading, and the cut-off is now only closed for special purposes, such as unloading a single cartridge (muzzle-loading, &c.) without unloading the magazine. The magazine is loaded by inserting a charger in the "charger guides" (these, attached to the body, form a sort of bridge over the bolt) and forcing down the strip of cartridges into the magazine (charger guides not shown in diagrams). The action of the mechanism is as follows: Suppose that the rifle has been fired and the magazine is full. On beginning to turn up the knob of the bolt, the latter is revolved, but the cocking-piece (the tongue being held by a groove in the body) and the bolt-head remain stationary. Soon, however, a cam on the bolt comes in contact with a stud on the cocking-piece and the latter is brought slightly to the rear, pulling in the point of the striker and partly compressing the spring. At the same time the lug on the left of the bolt, in contact with the front face of a recess in the body (both being cut slantwise to a screw pitch), forces the bolt and with it the claw of the extractor, which grips the base of the cartridge-case, to slide backwards a little. As the bolt continues to turn the rib on the right of it comes up clear of the body and the whole bolt, with the bolt-head, can thus be drawn back until the bolt-head comes against the resisting shoulder on the right of the body and the extractor attached to it flings out the fired cartridge-case. Another cartridge then comes up from the magazine, and the bolt is moved forward, the trigger rising to the cocked position. At this moment (the beginning of loading) the stud on the cocking-piece has fallen into one of the grooves on the bolt, and as the bolt is moved forward the tongue or full-bent comes against the nose of the trigger sear and brings the trigger mechanism on. Thus between the moving bolt and the fixed cocking-piece the striker spring is further compressed, and when the flaring face of the bolt has the relations of the grooves of the body a last forward push is given to the bolt and the spring is completely compressed, ready to propel the striker forward when the full-bent is released from the nose of the sear. Figs. 5-8 of the older single pull-off of the trigger the "short" rifle, like many Continental weapons, has a double pull-off. This is provided for by suitably shaping the portion of the trigger which is in contact with the sear. The "short" rifle has also a somewhat different pattern of safety-catch. The sights of British service rifles up to 1903 were of a very simple type, the fore-sight a "barleycorn" of triangular shape, and the back-sight a plain leaf with sliding bar into which a V was cut, the tip of the fore-sight seen in the middle of the V being brought on to the mark. In the long charger-loader this form of back-sight has been greatly modified, and in the "short" rifle it has been altogether abolished. The barleycorn fore-sight has been replaced in both rifles by an angular or square form, the latter having two ears or wings, and the V by a U aperture. For elevation the long rifle has still a slide on a vertical leaf, but the movement of this slide is controlled no longer merely by its tight fit but by a clamping screw. This also makes the short rifle larger and a little less convenient in appearance and principle. There is a leaf on it and a slide (controlled by clamping studs) works on a cam-shaped bed, its position on the leaf, affecting the point of contact with the cam-shaped bed, elevates the leaf to the required adjustment of the central U sighting aperture, so as to point the axis of the barrel a little to the left or the right of the line of sight to compensate for wind, error of the sights, etc. Both rifles, on the left side of the stock, is a long-distance sight (graduated to 2800 yds.), which consists of an aperture sight near the bolt and a dial and movable pointer near the hand-guard. The short rifle is also fitted with a bayonet, which is fixed to two metal fastenings, a plug for the ring and a catch for the handle.

**Continental European Rifles.**—These are for the most part of the Mauser and the Mannlicher types. The Mauser is a bolt weapon with box magazine. The bolt is simple, without separate bolt-head, and is held by two bolt-lugs at its front end engaging with recesses in the body (the German Mauser has an extra lug near the rear end). Near the rear end there is a cam-shaped recess, which, engaging with a stud on the cocking-piece, partially forces back the cocking-piece and spring when the bolt is revolved. When the bolt is turned up the bolt begins to revolve, the cocking-piece and bolt plug, which together form the connexion between the bolt and the trigger, do not revolve, but are forced back slightly, so as to begin the compression of the striker spring. Then, the cocking-piece, longer so as to bear against a groove on the body, the bolt comes back a little, and with it the extractor jaw and the empty cartridge-case. Lastly, when the bolt has turned through a right angle, all studs are opposite their slots and ways in the body, and the bolt can be drawn back. At the farthest rearward position of the bolt the cocking-stud on the cocking-piece is well behind the nose of the trigger sear, and is thus held when the bolt is ready to fire before it is fully turned. All Mauser rifles have a safety-catch and a double pull-off. None have cut-offs except the Turkish pattern. All are constructed for clip or charger loading, but the box magazine contains only five cartridges, and is thus loaded as the German Mauser. As the Mauser is perhaps the strongest and least complicated of magazine arms, are used in the German, Belgian, Spanish, Portuguese and Turkish armies, and were also used by the Boers in the South African War. The Mauser is rivalled by the Gewehr 98, adopted by the Germans in 1898, but not worked up to perfection in details only. The German rifle has a long guardless sword bayonet, fixed to the fore-end only and not connected with the body, and a peculiar form of back-sight, which bears some resemblance to the
slide and bed arrangement of the British "short" rifle. The special feature of the Belgian Mauser is a thin steel casing for the barrel, to the change of leverage, power at the commencement and rapidity at the end of the pull. The weapon is a clip loader. The Dutch, Rumanian and other Mannlichers have not straight-pull bolts, but the usual turn-over levers and locking-lugs.

France.—The breech mechanism of this rifle (see fig. 15) calls for no special remark. Its bolt is very similar to that of the British rifle. Its special peculiarity is the once popular tube magazine under the fore-end. This has many defects as compared with the box magazine. It is more cumbersome for the same number of cartridges; its feed and cut-off mechanism is very complicated; the balance of the rifle is altered as the magazine empties; the placing of the cartridges base to point, even when the bullet has a flat point, is not unattended with danger, especially when the magazine is full and the spiral spring strongly compressed; lastly, loading by any form of charger is practically impossible.
"30th year" (1900) and "38th year" (1907) rifles are bolt-action weapons, with no special peculiarities. The Steyr rifle (Schmidt-Rubin) is a remarkable weapon of the straight-pull type, short, and possessing a relatively low velocity.

The Use of the Rifle in War.—
The study of "musketry" as distinct from target shooting may be said to date from the Franco-German War. Previously military students and practical soldiers concerned themselves rather with the tactical question of fire-power—fire versus shock, bullet versus bayonet and so on—

than with the technical question of its application. This was natural enough in the days of short-range fighting. But when bullets began to cause losses at 1000 yds. and more from the firing point, formations that presented the least vulnerable target had to be discovered and tested, aiming grew more difficult as the range increased, and firing by word of command in large units became practically impossible. The very accuracy and range of modern weapons involved new problems. The necessity, in the larger area of effective fire, of setting the sights to the distance of the mark made further demands on fire-discipline and brought up the difficult problem of judging distance. The possibilities of varying the rate of fire conferred by the magazine rifle also demanded close study. Each war, as it came, produced fresh evidence as to what was possible and what was not in matters of fire-control, the best rate of fire for effect, the range at which fire should be opened, and other half-tactical, half-technical problems. Thus, although many points still remain in the region of controversy, certain ideas and principles are almost universally accepted as the basis of service musketry.

The leading idea is that of the "cone of dispersion." A modern rifle, even fired from a fixed rest under good conditions, will not place shot after shot in the same spot, but the shotmarks on the target form a more or less close "group." When to this error of the rifle and the ammunition there is added the personal error of the marksman, the group is larger, and in the collective fire of a squad it is larger still. Now the trajectories of bullets that do not strike in the same place naturally do not coincide, and the group on the target is represented in the air by a cone or sheaf of trajectories. The bullets of this sheaf striking the ground on either side of the target form on the ground a much elongated ellipse. The ellipse containing 90% of the bullets fired is called the "beaten zone." It is usual, however, to calculate from the "effective" zone, or that which contains 75% of bullets. Within the "effective" zone, and at its centre, is found the closely grouped "nucleus" of 50% of bullets. With the British .303 rifle in collective fire, the depths of these zones are:

<table>
<thead>
<tr>
<th>Depth</th>
<th>Nucleus</th>
<th>Effective</th>
<th>Beaten</th>
</tr>
</thead>
<tbody>
<tr>
<td>500 yds.</td>
<td>120 yds.</td>
<td>220 yds.</td>
<td>320 yds.</td>
</tr>
<tr>
<td>1000 yds.</td>
<td>70 yds.</td>
<td>120 yds.</td>
<td>170 yds.</td>
</tr>
<tr>
<td>1500 yds.</td>
<td>60 yds.</td>
<td>100 yds.</td>
<td>140 yds.</td>
</tr>
</tbody>
</table>

The target aimed at and sighted for is at the centre of the zone (see fig. 19). The height of the grouping on a vertical target compared to the depth of the grouping on the ground is of course proportionate to the tangent of the angle of descent; hence, small as is the group on a vertical target at 500 yds., the beaten zone is no less than 320 yds. deep. For the same reason, as the range, and consequently the angle of descent, increases, the beaten zone diminishes in depth. Another factor is the "dangerous space." This is the space between first catch, i.e. the point at which the bullet (in a sheaf, the lowest bullet) comes low enough to catch a man's head, and "first grace," that at which it strikes the ground. The extent of this dangerous space varies of course with the height of the man's head. In the case of a mounted man, at 1000 yds., it is 105 yds., while in that of a sharpshooter lying down, it is only 13 yds. (in addition of course to the beaten zone). As nowadays nearly all targets, on service, are lying or three-quarters concealed figures, the dangerous space as compared with the beaten zone is at such a range too small to count as a factor. It is, however, important at shorter ranges, 500 yds. and under (700 and under with the new-pointed bullets). Here the advantages of flat trajectory make themselves felt. Within this distance the bullet is at no point in its career too high to be dangerous to a standing man or a horseman. A lying figure is in danger at any distance beyond 350 yds. if the sights are set to 500 yds. (front half of effective zone 110 yds., dangerous space 32 yds.). This is the theory underlying the 500 yds. "fixed sight" or "battle-sight," a setting which holds good for all less ranges, and can be put on the rifle instantly and without looking at the back-sight graduations.

These facts, taken in conjunction with the imperfections of the most skilful individual marksmanship and the chances of wrong estimation of distance, are the basis of the musketry training and practice of to-day. At the School of Musketry, Hythe, the standard of judging distance is "not more than
100 yds. wrong at any range.” Now at 1000 yds. an error in judging distance of 13 yds. above or below the true range will cause all the shots of a particular rifle to fall away from the target, and the better the marksman—i.e. the closer his group—the more necessary is perfection in judging distance, a perfection which in reality seems unattainable. The British musketry regulations therefore lay it down that the individual marksman’s fire at service targets is unprofitable at ranges of more 600 yds. Beyond that distance collective fire, controlled and directed by an officer or non-commissioned officer, is the rule. The question as to whether fire is to be opened in any given set of circumstances is decided by the fire-director, who considers first whether the probable error in judging distance is greater than half of the effective zone for the estimated range. If it is so, he must order “combined sights,” i.e. half of the units under his command use one elevation, the rest another, which method artificially increases the dispersion of the bullets and thereby the probability of the target being included in the zone. This, however, makes the fire less effective, and in practice cannot profitably be used by any body of rifles of less than 80 or 100. The commander of only a single section, therefore, however tempting the target, must refrain from opening fire at all. At medium ranges, however, controlled and directed fire is effective, and at such ranges troops should still be sufficiently in hand to execute the fire-director’s orders. Within decisive ranges fire-direction has to give place to fire-control. All that the strongest commander can enforce is the opening and ceasing of fire when he gives the order, and success is sought through making the individual soldier skillful at rapid and snap shooting. Black bull’s-eyes on white targets are now used only to teach men to make uniformly good shooting, which is shown by the closeness of the shot-grouping. The rest of the musketry course is fired against grey-green “head and shoulders” targets or brown silhouettes, and consists of slow, rapid and snap shooting, from behind cover, at disappearing or running targets, &c. In 1009 special attention began to be paid to visual training, both as an aid to judging distance and as an actual ingredient of fire-discipline. A method of indicating targets which originated in the French army was adopted and improved upon, consisting essentially of giving two or three conspicuous “auxiliary marks,” in artillery language, and naming the target with reference to them. Judging distance is generally associated with fire-discipline practices, and men are frequently exercised in locating and ranging upon a hidden skirmisher, 300-600 yds. away. Perhaps the most important modification of musketry training, within recent years, has been the adaption of rapid fire in “bursts” as the normal procedure for infantry, instead of slow continuous fire. The complete cessation of fire at intervals enables the leaders to observe the

N.C. = Nitro-cellulose.

The progress of the engagement, to change their target, to economize ammunition, to select the ground for the next rush and the next burst of fire, and to regain control of the men, whom a prolonged fire-fight hypnotizes and rivets to the ground. The chief use of "slow" fire, which is generally employed by skirmishers working in pairs, is to keep the enemy under; the storm of well-directed "rapid fire" the fire-director should hold in his own hands, ready to release it at the right moment. Slow fire averages 3 rounds a minute, rapid (aimed) 9—12. The configuration of the ground often has a great influence on fire effect. If the target is on a sharp forward slope, the beaten zone is greatly diminished in depth, ranging errors are no longer neutralized by the flatness of trajectory and (the bullets meeting the ground at a steeper angle) the dangerous space is reduced; if, on the other hand, the slope descends gently in rear of the target so that the falling bullets instead of making a pattern upon the ground, skim along parallel to the surface, the zone is increased. For instance, at 1500 yds., if there is a reverse slope of about 5° in rear of the target the depth of the beaten zone is tenfold that of the zone for the same range on level ground. Similarly if the target is on the crest of a hill and the firers below, the "over" half of the cone of fire may graze the reverse slope or pass far above, according as the reverse slope is gentle or sharp with respect to the line of sight.

The normal position for the firing infantryman in action is lying; the kneeling position is used for firing from behind cover, the sitting for firing down hill. Standing, formerly the usual position, is now employed chiefly for firing behind cover with the rifle rested, and for snap-shooting during an advance when it is undesirable to halt and lie down. As regards cover, it may be mentioned that well-covered or intrenched troops generally shoot less accurately than troops in the open, the soldier in security being loth to expose himself long enough to take careful aim. This was particularly noticeable in the Russo-Turkish War, and its effect is to create a zone of unaimed fire behind the assailants' firing line, which sometimes causes serious losses to his supports and reserves. The relation between the cone of dispersion of peace-time experiments, even when these are specially designed to establish that relation (for example, series fired in France by third-class shots, after a long march without food), has never been satisfactorily established. An arbitrary figure of one-tenth or one-twentieth of peace-time effect has generally been assumed as representing war results, but some think that however the normal cone may be multiplied or divided, no relation can be found between peace and war effect, and that in battle the brave men aim and fire as if on the practice range, and the rest fire absolutely at hazard. From a musketry point of view, this brings again into the foreground the question of distance-judging, as, if the sights be wrongly set, the more accurate the fire the less its effect, and a
mistake would nullify even the small amount of aimed fire that can be reckoned upon. Peace-time experiments have their value—and it is very great—in establishing data as to the effect of fire on troops in different formations, the limits of permissible error in ranging, etc., on the principle that of two methods, that which is proved to be better in peace would in much the same proportion be found better in war. (C. F. A.)

See T. F. Fremantle, The Book of the Rifle; W. W. Greener, The Gun and its Development; the British official Text Book of Small Arms (1900); and Musketry Regulations (1900); C. B. Mayne, Infantry Fire Tactics; and Taffin, "Tir de Combat" (Revue d'Infanterie, 1906).

Match or Target Rifle.—The sport or pastime of target shooting has many times changed its character, owing to the steady improvement in the rifle and the different ranges or distances at which shooting is practised. Range usually governs the construction of the target rifle, long-range rifles not being necessarily the best weapons for a short range of, say, 200 yds. Limitations—such as the amount of powder charge, weight of bullet and rifle—are also usually imposed in order to place all competitors on equal terms. The long-range match rifle is not the superior of the military rifle as a weapon, but as a scientific shooting instrument is the best small-arm produced. The ordinary target rifle is a hybrid arm, combining the points of the long-range match, modern military and best sporting rifles. The miniature match rifle is used for short-range practice.

Shooting at fixed marks has been practised continuously in Switzerland from medieval times. A club ("Société de l’Arquebuse et de la Navigation") has existed in Geneva since 1474; and the Zürich "Schiitzen-Gesellschaft" since about the same date. It is not clear at what period rifles were introduced in these clubs. From the beginning of the 19th century up to 1844 the rifle generally used in Great Britain had a polygrooved barrel -630 in. in diameter, with spherical ball, and the arm weighed from 11 to 15 lb. It was not fired in military fashion, but had a handle extending downwards fixed in front of the trigger-guard, which was grasped by the left hand, the left arm being steadied against the body. This method of shooting is still sometimes followed by Swiss and German riflemen. Target shooting as a sport or business was rarely practised in Great Britain until after the formation of the Volunteer Force in 1856. The establishment of the "National Rifle Association of the United Kingdom" opened a new and most important era in the history and development of the rifle. This institution was established "for the encouragement of rifle corps and the promotion of rifle shooting throughout Great Britain. . . . As a national pastime to make the rifle the weapon which was in the days of the Plantagenets, the familiar weapon of those who stand forth in the defence of their country." The first meeting of the N.R.A. was held at Wimbledon in 1860. The first shot was fired by Queen Victoria¹ from a Whitworth rifle on a machine rest, at 400 yds., and struck the bull’s-eye. The Whitworth muzzle-loading rifle won many of the important prizes at this and subsequent meetings prior to 1873. Its most important features, arrived at after exhaustive experiments, were a smaller bore of 0.450 in., and a twisted of rifling of one turn in 20 in., and an elongated mechanically fitting projectile. Long-range rifle construction is also largely indebted to Whitworth for the highly accurate and superior tools and processes introduced by him in this branch of manufacture.

In 1866 and after, Metford's system of hardened expanding bullets and shallow rifling gradually superseded the mechanically fitting system of Whitworth, and the Whitworth rifle gradually lost its position. In 1867, the Henry grooving for a cylindrical bullet, a modification of the Whitworth, first appeared.

In 1864, Rigby, with a five-grooved rifle and a mechanically fitting bullet, tied with the Whitworth rifle in the preliminary rifle trial of the N.R.A. at 1000 yds., and in a subsequent trial took the first place. By 1871 the Whitworth rifle had given place to the Metford system with hardened cylindrical bullets, shallow rifling, and increased its range. In 1875 a breech-loading rifle with a metallic cartridge was first introduced.

The Metford system of rifling greatly assisted its development. In this year Rigby also produced a new model long-range rifle designed on the lines followed by Metford. In 1869 the Henry barrel came to the front. In 1870 the Martini-Henry, the new service arm, won the duke of Cambridge's prize, the extreme range in this competition being 800 yds. In 1871 the Snider breech-loader replaced the Enfield muzzle-loader, and the Martini-Henry replaced the Whitworth in the later stages—800, 900 and 1000 yds.—of the Queen's prize. The Metford barrel was also used in breech-loaders, and the duke of Cambridge's prize—for the first time fired in 1000 yds.—fell to it. During the twenty-three years from 1871 to 1894 the Metford military match rifle only four times failed to win this prize, while it took a preponderating share of other prizes. The years 1872 and 1875 marked a decided advance in the military breech-loader, though for fine shooting the muzzle-loader still seemed hard to equal. In 1875 a team of American riflemen first visited Wimbledon with "army-pattern" breech-loading rifles, which were cleaned out after every shot, and met with considerable success. A feature of their shooting was the "back position," then a novelty. In 1877 the superiority of the cleanable and the modern breech-loader over the increased fouling of the muzzle-loader was clearly demonstrated, though the muzzle-loader did not at once disappear. In 1878 the highest scores ever made with the muzzle-loader in Great Britain were recorded, greater care in cleaning the rifle after every shot being observed. In 1883 the N.R.A. Council altered the conditions, wiping out after every shot was forbidden, but muzzle-loaders were not disqualified. The result was that the American type of rifle disappeared. The poor shooting of the Martini at 1000 yds. induced the Council to take the retrograde step of reducing the maximum range for the Queen's prize to 900 yds. In 1890 the N.R.A. first met at the new ranges at Bisley. This year was notable as the year in which "rifle competitions" by the Gibbs-Metford match rifle, particularly at 1000 yds. The accepted type was .461 calibre; 7 grooves .045 in. in depth; 80 grains of special black powder, and a bullet of 570 grains. In 1892 and 1893 the Lee-Metford .303 rifle with cordite ammunition was first used by the army teams. In 1890 and later the Hon. T. F. Fremantle, Captain Gibbs and some others used Metford's copper-coated bullets in the Gibbs-Metford rifle with success. In 1895 many match rifle shots followed their example. In 1895 and 1896 the .303 was equalled, and in some instances beaten, by the smaller-calibre Mauser rifle. This was partly due to faulty Lee-Metford ammunition. The .303 now proved its superiority to the .450 Martini, especially at the longer ranges. The Bisley meeting of 1896 practically closed the series of contests with both the Martini and the military match rifles. The Volunteers were thenceforth armed with the .303.

The results of the Bisley meetings since 1895 have proved that rifles of the .303 class, the British .303 rifle particularly, are not so good for match rifles pure and simple as the larger bores using black powder. The light bullets are more subject to deflection by the wind at long ranges than the heavier speed-retaining bullets of the larger bores. No nitro-powder used appears to have equalled the black powder in regularity of shooting. At the same time the object of the N.R.A. competitions is to encourage the use of the military service rifle in the first place, and in the case of the "any" rifle competitions to encourage the production of weapons of the highest efficiency for military purposes. Acting on these principles the rifles allowed by the N.R.A. regulations (1907) are classed as follows:—Class I—

Service rifle (S.R.): government pattern .303 magazine rifles;
sights strictly in accordance with service pattern.1 Class II.—Match rifles (M.R.): any breech-loading rifle complying with the following conditions: maximum weight of 34 lb; maximum calibre of .577; maximum weight of any load of .138 lb; for sporting purposes, and without pad or shoe on the heelplate; minimum pull of trigger, 4 lb; sights, of any description. Class III.—Military breech-loading rifles (M.B.L.): any rifle, that is either (a) the regulation military rifle of any country; or (b) a breech-loading rifle complying with the following conditions: maximum weight, exclusive of bayonet, 81 lb; maximum calibre, .315; minimum pull of trigger, 4 lb. Sights may be of any description except telescopic or magnifying, but must be fixed to the barrel and must be strong enough for military purposes. Class IV.—Sporting rifles: calibre, any; minimum pull of trigger, 3 lb; sights, open or such as are required for ‘high velocity’ and ‘short’ range shooting; height and the 细节 addition of fore- or back-sight is permitted. The miniature rifles allowed fall into two classes, “military,” with open sights, only, and “any,” with no restrictions as to sights except that magnifying and telescopic sights are forbidden.

Modern American Target Rifles.—In America, according to some authorities, there are three recognized departments of target shooting—namely off-hand shooting; shooting from a simple rest; and shooting from a machine rest, with telescopic or any other sight. For the first two classes small-bore rifles of .380 calibre or under only are used. The usual weight is from 8 to 10 lb, with 28- or 30-in. barrel. Light charges for the shorter ranges are used. In the .380 bore only 55 grains of powder with a 330-grain bullet is employed. In the second-class contests, from a simple rest, the barrel is longer and the weight increased to just under 12 lb. The bore is generally .380. The usual range is 200 yds. The third-class shooting from a machine rest, generally with telescopic sights, is not much practised. Every kind of rifle is employed, usually of large bore and weighing from 20 to 60 lb. The long-range breech-loading match rifle, with which so much fine shooting was done when wiping out after each shot was allowed, weighed about 10 lb; the breech mechanism, any falling block, as the Sharp, Farquharson, Deely, and Edge or Wiley, that admitted the insertion of the cleaning rod at the breech; length of barrel, 32 to 34 in.; seven or more grooves .003 to .005 in depth with a complete turn in 20 in. A sharp continual spiral and very shallow grooves constituted the feature of the American plan. Rigby’s plan was similar, with one turn in 18 in. and eight grooves, the lands being about half the width of the grooves. In the Wiley the grooves were fewer and wider. The Metford is an increasing twist, starting with one turn in 60 in. and finishing with one in 20, or sharper. The usual bore of the American long-range rifle was .458 or .461; powder, 76 grains of special ‘fouling’ rifle powder; elongated cylindrical bullet of 540 grains. The pull-off was under 3 lb. During recent years smaller-bore smokeless-powder rifles have also been used.

Continental Match Rifles.—The target rifle used by continental marksmen for medium ranges is a modification of the old pattern Swiss rifle, with scroll guard, hollowed butt plate and hair trigger. This latter, a mechanical device to free the tumber from the rear without sufficient pull on the trigger to influence the aim, is disallowed in military arms.

Sporting Rifles.—Prior to 1845 smooth-bore guns with double charge of powder and an ounce spherical ball were generally preferred to rifles for sporting purposes and for large game; 16-bore muzzle-loading rifles were occasionally used by British sportmen in the East Indies before that date, firing .41 drs. of powder with a spherical ounce ball. These rifles were sighted to 200 yds., but the trajectory was high and the penetration weak; they were also difficult to load when foul. The twist of the rifling was also too rapid, causing the bullet to strip with heavy charges of powder. According to Captain Forsyth and others, up to 1860 there was no known rifle suitable

---

1 The term "point-blank range" is often used in this connexion. Strictly speaking, there is no such thing as "point-blank range," the bullet commencing to drop immediately it leaves the muzzle of the rifle. The path or trajectory of the bullet is therefore always a curved line. The higher the muzzle velocity the flatter is this curve. The "fixed-sight," or so-called "point-blank" range, is usually taken at such range, generally 100 yds, when the black powder, with such elevation as render the amount of drop of the bullet or curve of its path practically immaterial for sporting purposes, say a maximum of 45 in. At shorter range this curve would therefore take the bullet so much above the line of fixed-sighting that it would not be allowed for. With the high-velocity small-bore rifle the fixed-sight range can be increased to 200 yds. for the sporting rifle; and for military purposes in the field to 500 yds. and (with pointed bullets) even more.
back Sight on an ivory pyramid with two or three leaves up to 300 yds., and the enamelled bead fore-sight, are the most usual form. The more elaborate Lyman and Beech peep-sights are also popular. One or two varieties of telescope sight, attachable to the barrel, are also made by some leading gunmakers, and have been used with success in the field. Solid-drawn brass cartridge-cases are now always used for sporting rifles, except occasionally for some of the larger bores, in which paper cartridges may be used. The peculiarity of the express bullet is its hollow point, which is intended to ensure the expansion of the projectile on impact. This diminishes its penetration, but translates its velocity or energy into "shock." If greater penetration is needed, the leaden bullet is hardened with mercury or tin, or the military nickel-coated bullet is used. Explosive bullets filled with detonating powder were at one time used in express and large-bore rifles for large game. These are now practically abandoned, owing to their uncertainty of action and the danger in handling them. The use of the large 4- and 8-bore black-powder rifles is restricted to the hunting of large and dangerous game. These are usually double-barrelled. The 4-bore weighs from 14 to 18 lb. with 20-in. barrels, and fires a charge of 12 to 14 drs. of powder, with a spherical bullet of 1510 grs. The great weight of this rifle is against its general adoption. The 8-bore rifle is lighter, but the most common calibres of the rifle and shot-gun are Holland's "Paradox," a smoothbore with the last three inches of the barrel ratchet-ribbed, Lancaster's "Colindian" twisted oval bore, and Bland's "Europa" with "invisible" undulating rifling. All these weapons fire heavy bullets more or less accurately up to 100 yds., and are also used as shot-guns, and are made double- or single-barrelled and of various calibres, 12-bore being the most common. There is also Greener's "under and over," the rifle barrel being topmost (usually 16-bore shot-gun barrel and 4.50 rifle barrel). The Morris tube also enables a shot-gun to be utilized as a small-bore rifle or a large rifle as a saloon rifle. The automatic principle has not yet been applied to sporting rifles.

**Miniature Rifles.**—In 1905 a War Office miniature or cadet rifle for instruction purposes was officially adopted by the British military authorities. The details of this rifle were determined by a committee, upon which the National Rifle Association and the Society of Miniature Rifle Clubs were represented. It is a single-loading bolt-action rifle of .22 calibre with military sights (the aperture sight being barred), shooting a rim-fire cartridge having a 40-gr. bullet propelled by 5 grs. of black gunpowder or its equivalent in some smokeless explosive. It is used at ranges from 25 yds. up to a maximum of 200 yds. The official adoption of such a rifle was largely due to the civilian rifle club movement, which was the outcome of the South African War, and in which the Society of Miniature Rifle Clubs has played an important part. Until the recent official adoption of the miniature rifle, the council of the N.R.A. regarded marksmanship with the service rifle as its main object of encouragement, and the service rifle itself as the orthodox weapon. The Society of Miniature Rifle Clubs, on the other hand, makes the encouragement of the use of low-power rifles its special object, with few restrictions as to type of sights, rifle or ammunition. Numerous civilian rifle clubs have adopted the .22 calibre rifle, in many cases with aperture sights, with marked success, and British rifle-makers were encouraged to cater for this new demand for low-power rifles. Such weapons can be far more widely and generally used than the ordinary service weapon, owing to their smaller cost, cheaper ammunition, absence of recoil, and their convenience for use at short covered ranges in crowded centres of population. In many parts of Great Britain there is practically no alternative between low-power short-range practice and no shooting at all. The N.R.A. has now admitted the miniature .22 calibre rifle upon equal terms with the service rifle. The miniature rifle has, to some extent, taken the place of the Morris tube and "adaptors" previously used for rifle practice at short ranges.1 The Morris tube consists of a small-rifled barrel, usually chambered for the 297/320-bore cartridge, and capable of being fitted inside the barrel of the ordinary service weapon, which thus becomes available as a miniature rifle for short-range practice. The Morris tube has been adopted by the British War Office, and affords an excellent means of training the recruit. "Adaptors" are dummy cartridge-cases fitted into the breech of the ordinary rifle, by means of which a shorter cartridge firing a lighter charge of powder, but with a bullet of the same calibre as the rifle, can be used for short-range practice. One of the first English miniature target rifles was the "Sharpshooters' Club" rifle, on the Martini principle, of .310 calibre, manufactured and regulated by W. W. Greener, and suitable for ranges from 90 to 300 yds. This rifle was adopted by rifle clubs, and in 1901 established a record in the miniature rifle competition at Bisley. Miniature rifle shooting has been much encouraged throughout the United Kingdom by the establishment of the Light Rifle Championship competition under the auspices of the Society of Miniature Rifle Clubs. In 1907 Queen Alexandra presented a cup for this event. (H. S.-K.)

**RIFLEMAN-BIRD,** or RIFLE-BIRD, names given by the English in Australia to a very beautiful inhabitant of that country,2 probably because in coloration it resembled the well-known uniform of the rifle-regiments of the British army, and with its usually quite neat plumage and projecting hypochondriac plumage and shorter tail a further likeness might be traced to the humping pelisse and the jacket formerly worn by the members of those corps. The cock bird is clothed in velvet-black generally glossed with rich purple, but having each feather of the abdomen broadly tipped with a chevron of green bronze, while the crown of the head is covered with scale-like feathers of glistering green, and on the throat gleams a triangular patch of brilliant bluish emerald, a colour that reappears on the whole upper surface of the middle pair of tail-quills. The hen is greyish-brown above, the crown striated with dull white; the chin, throat and a streak behind the eye are pale ochreous, and the lower parts deep buff, each feather bearing a black chavon. According to James Wilson (Ill. Zoology, pl. xii.), specimens of both sexes were obtained by Sir T. Brisbane at Port Macquarie, whence, in August 1823, they were sent to the Edinburgh Museum, where they arrived the following year; but the species was first described by W. Swainson in January 1825 (Zool. Journal, i. 481) as the type of a new genus *Ptiloris,* more properly written *Pilorrhis*,3 and it is generally known in ornithology as *P. paradoxa.* It inhabits the northern part of New South Wales and southern part of Queensland as far as Wide Bay, beyond which its place is taken by a kindred species, the *P. victoriae* of J. Gould, which was found by John Macgillivray on the shores and islets of Rockingham Bay. Farther to the north, in York Peninsula, occurs what is considered a third species, *P. alberti.*

1 In the military forces short-range practice now takes two forms—practice with Morris tube or miniature rifle, and practice with the full-sized rifle and ammunition on specially protected 30-yd. ranges.

2 Curiously enough, its English name seems to be first mentioned in ornithological literature by French—R. P. Lessert and Garrit —in 1828, who say (Voy. "Cgypte," Zoologie, p. 669) that it was applied "pour rappeler que ce fut un soldat de la garnison [of New South Wales] qui le tua le premier—which seems to be an insufficient reason, though the statement as to how the first specimen was obtained may be true.

3 Some writers have amended Swainson's faulty name in the form *Pilorrhis,* but that is a mistake.
very closely allied to and by some authorities thought to be identical with the *P. magnifica* (Vieillot) of New Guinea—the "Promerops" of many writers. From that country a fifth species, *P. wilsoni*, has also been described by Mr Ogden (*Proc. Acad. Philadelphia*, 1875, p. 451, pl. 25). Little is known of the habits of any of them, but the rileman-bird proper is said to get its food by thrusting its somewhat long bill under stones and an inch or more into the holes of trees, along the latter of which it runs swiftly, or by searching for it on the ground beneath. During the pairing-season the male mounts to the higher branches and there display and trim their brilliant plumage in the morning sun, or fly from tree to tree uttering a note which is syllabled "yass" greatly prolonged, but at the same time making, apparently with their wings, an extraordinary noise like that caused by the shaking of a piece of stiff stuff. Verreaux informed D. G. Elliot that he believed they breed in the holes of trees and lay white eggs; but on that score nothing is really known. The genus *Ptilorhiss*, thought by Gould to be allied to *Chlamyctes*, has been generally placed near *Epimachus*, which is now considered, with *Drepomarnis* and *Seleuctes*, to belong to the *Passerine* Passeridae, or birds-of-paradise, and in his *Monograph* of that family all the species then known are beautifully figured by D. G. Elliot. (A. N.)

**RIGA** (Esth. *Ria-Lin*), a seaport of Russia, 366 m. by rail S.W. of St Petersburgh, the capital of the government of Livonia. The Gulf of Riga, 100 m. long and 60 m. in width, with shallow waters of inconsiderable salinity (greatest depth, 22 fathoms), freezes to some extent every year. The town is situated at the southern extremity of the gulf, 8 m. above the mouth of the Dvina, which brings Riga, by means of inland canals, into water communication with the basins of the Dnieper and the Volga. Below the town the river divides into several branches, among islands and sandbanks, receiving before it enters the sea the Boldera river, and expanding towards the east into wider lacustrine basins. Having direct railway communication with the fertile parts of southern and south-eastern Russia, Riga has become the second port for foreign trade on the Baltic, ranking next after St Petersburgh. The port freezes on an average 127 days every year. The larger ships cannot reach Riga, and are unloaded at *Ust-Dvinsk* (formerly Dunamünde). No means all the trade with the interior is transported by the railways; no inconsiderable portion of the goods is carried by water.

Riga consists of four parts—the old town and the St Petersburgh and Moscow suburbs on the right bank of the Dvina, and the Mitau suburb on the left bank, the two sides being connected by a floating bridge, which is removed in winter, and by a viaduct, 820 ft. long. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, flanking the narrow, winding streets. The only open spaces are the market-place and two other squares, one of which, facing the citadel, is adorned with a granite column erected (1818) in commemoration of the defeat of Napoleon I. in 1812. The suburbs, with their broad and quiet boulevards on the site of the former fortifications, are steadily growing. The St Petersburgh suburb is the seat of the German aristocracy and merchant community.

Few antiquities of the medieval town remain. The oldest church, the Dom (St Mary's), founded in 1215, was burned in 1547, and the present building dates from the second half of the 16th century, but has been thoroughly restored since 1883. Its organ, dating from 1883, is one of the largest in the world. St Peter's church, with a beautiful tower 412 ft. high, was erected in 1496-9. The castle, built in 1404-1515 by the master of the Knights of the Sword, Walter von Plettenberg—a spacious building, often rebuilt—is the seat of the Russian authorities. The "House of the Black Heads," where several branches, among foreign merchants, was founded in 1330, and subsequently became the meeting-place of the wealthier youth of the place. Of the recent erections, the polytechnic, the exchange, the monument of the German writer, Johann Gottfried von Herder, who lived at Riga towards the end of the 18th century, the gymnasiums (schools) of Lomonosov and Alexander I. and the large bonded warehouse are worthy of notice. The esplanade (where a Greek cathedral built in 1877-84 now stands), the Wöhrmann Park and the Imperial Park are much visited. Riga gives name to an archiepiscopal see of the Orthodox Greek Church and to an episcopal see of the Roman Catholic Church, and is the headquarters of the XX. army corps. In the environs, Dubcln and the sea-bathing resorts of Bilderingshov and Majorenhoj have numerous visitors in summer.

The population, which was 162,990 in 1867, increased to 168,726 in 1881 and to 282,943 in 1897, so that Riga now ranks seventh in the empire in order of population; 47% of the inhabitants are Germans, 25% Russians and 23% Lets, with a small Slavic population. The city has a commercial school (1893), a municipal library, the Dom museum, art gallery with picture gallery (1904-5), technical and theological middle schools and a pilot and navigation school. Industrial activity has developed and includes railway-carriage works, works for the manufacture of machinery, oil mills and breweries. Owing to its communication by water and rail with the forests of White Russia and Volhynia, Riga is a great mart for timber. Flax and linned sea-oats also occupy a prominent place, Riga being the chief Russian port for the extensive flax-producing region of north-west Russia.

Owing to the great railway which crosses the country from Riga to St Petersburg, afterwards dividing into two branches, to Orenburg and Tatarstyn on the southern and respectively the western railway line, the port is a place of export for hemp coming by rail from west central Russia, and for corn, Riga merchants sending their buyers as far as Stockholm. On the other hand, exterminants, oilcake, hides, tallow, leather, tobacco, rugs, feathers and other articles are considerably to the total value of the exports, which in 1898 amounted in money 5 m. more than the imports in 1901-5. The imports, consisting chiefly of salt, fish, wine, cotton, metals, machinery, coal, oils, fruits and tobacco, are also rapidly increasing: whereas in 1851-60 they were valued at about 1,000,000 sterling, in 1905 they reached 6-11 millions sterling.

**History.**—Riga was founded in 1158, as a storehouse at the mouth of the Dūna (Dvina), by a few Breton merchants. About 1150 the Augustinian monk Meinhard erected a monastery there, and in 1200-201 Bishop Albert I. of Livonia obtained from Pope Innocent III. permission for German merchants to land at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in connexion with the Teutonic Knights. As early as the first half of the 13th century the young city obtained the right of electing its own magistracy. It speedily enlarged the walls erected during Albert I.'s time. It joined the Hanseatic League in 1243, and became a free town, and assumed the rights of the bishop and the knights. In 1330 it fell once more under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund II., king of Poland, took Riga in 1547, and in 1558 the Russians burned its suburbs and many ships in the river. In 1561 Gotthard Ketteler publicly abdicated his mastership of the order of the Teutonic Knights, and Riga, together with southern Livonia, became a Polish possession; after some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Bathory, king of Poland, recognized the religious freedom of the Protestant population. Throughout the 17th century Riga was a home of contention between Sweden, Poland and Russia. In 1621 Gustavus Adolphus, king of Sweden, took it from Poland, and held it against the Poles and the Russians, who besieged it in 1665. During the Northern War between Sweden and Russia, it was courageously defended (1700), but after the battle of Poltava it succumbed, and was taken in July 1710 by the Russians. In 1751 it was made by Russia the capital of the Riga viceroyalty, but fifteen years later, the viceroyalty having been abolished, it was made the capital of Livonia. In 1812, the approach of the French being apprehended, the suburbs were burned. (P. A. K.; J. T. BE.)

**AUL A. HACIN'THE (1650-1743), French painter, born at Perpignan on the 20th of July, 1650, known as "Aul A. Hacinthe," a pupil of artists. Having early lost his father, he was sent by his mother to Montpellier, where he studied under Pezet and was helped by Rane, then to Lyons, and in 1681 to Paris. There, whilst following the regular course of academical instruction,
Rigaud produced a great number of portraits so good that Le Brun advised him to give up going to Rome and to devote himself wholly to this class of work. Rigaud, although he had obtained the Grand Prix, followed this advice, and for sixty-two years painted at the rate of thirty to forty portraits a year, all carried through with infinite care by his own hand. His portraits, as a rule, of himself, or of the sculptor Desjardins (Louvre), of Mignard and of Le Brun (Louvre) may be cited as triumphs of a still more attractive, if less imposing, character than that displayed in his grand representations of Bossuet (Louvre) and Louis XIV. (Louvre), while his beautiful portraits of his mother, Marie Serre (Louvre), must for ever remain amongst the masterpieces of French art. Rigaud, although the great successes to which he owed his fame were won without exception in portrait-painting, persisted in pressing the Academy to admit him as an historical painter. This delayed his reception, and it was not until January 1700 that he succeeded in obtaining his desire. He presented as his diploma works a St Andrew (Louvre) and the portrait of Desjardins already mentioned, exhibited at the salon of 1704, and filled in turn all the various posts of academical distinction. He died on the 27th of December 1745, having never recovered from the shock of losing his wife in the previous year. He had many pupils, and his numerous works had the good fortune to be reproduced by the greatest of French engravers—Edelinck, Drevet, Wille, Audran and others.

RIGBY, RICHARD (1732–1788), English politician, was the only son of Richard Rigby (d. 1758) of Mistley Hall, Essex, a merchant who made a fortune through his connexion with the South Sea Company. Young Rigby became an associate of Frederick, prince of Wales, and entered parliament in 1745. He is chiefly known to fame through his connexion with John Russell, 4th duke of Bedford, and the “Bloombury gang,” his audacity earning for him the title of the “brazen boatswain” of the “crew.” In 1758 he became secretary to Bedford, who was lord lieutenant of Ireland, and in the following year he was given the sinecure office of master of the rolls for Ireland. Following the political fortunes of the duke he became vice-treasurer of Ireland in 1765, and in 1768 he obtained the lucrative position of paymaster-general of the forces. Rigby often spoke in parliament, and in 1769 he shared in the opposition to Wilkes. In 1784 he was obliged to resign his position as paymaster-general, and he was somewhat surprised and embarrassed when he was requested to pay over the large sum of public money which was in his possession. He left a great fortune when he died at Bath on the 8th of April 1788. A rapacious and unscrupulous politician, Wraxall says Rigby “possessed talents for addressing a popular assembly which were sustained by a confidence that nothing could abash.”

RIGG, JAMES HARRISON (1821–1909), English Nonconformist divine, was born at Newcastle-on-Tyne on the 16th of January 1821. His father was a Wesleyan minister and sent his son to the Old Kingswood School, Bristol, where he subsequently became an assistant teacher. In 1845 he entered the Wesleyan ministry, and during the agitation of 1849–52 wrote successfully in exposition and defence of the polity of Methodism. In 1857 he published Modern Anglican Theology, an acute criticism of the writings of Coleridge, Hare, Maurice, Kingsley and Jowett. The book was timely and well received, and though Kingsley at first resented the criticism he afterwards became a cordial friend of the writer. Rigg had now become a leading figure in his own church, and in 1868 he was appointed Principal of the Westminster Wesleyan Training College for downtown classes. He held this post and that of the secretaryship of the society for 18 years. In 1870 he was elected on the first School Board for London, one of the most remarkable assemblies of modern times, and took an important part in providing the syllabus of religious instruction and framing the religious settlement for teachers.

In 1873 he wrote National Education in its Social Conditions and Aspects. A resolute opponent of secular education, he maintained that the state ought not to compete with the churches, but welcome their aid in the work of national education. He was also strongly against the adoption of a rigid universal code. In 1886 he sat on the Royal Commission on Education, was brought into close association with Matthew Arnold, and with Stanley, Bishop Temple and other Anglican prelates, who held him in high esteem. In 1877 he became chairman of the second London district of Methodism, and for fourteen years helped to make the history of his church in the home counties. In 1878 he was elected president of conference—and again in 1892. From 1881 he was ministerial treasurer of the Wesleyan Missionary Society, taking an active part in its work. He resigned his principalship in 1903 and died at Brixton on the 17th of April 1909. Dr Rigg was universally honoured as the Nestor of Wesleyan Methodism, in the development of which he had taken a foremost part for over 60 years. His Convivial Economy is a standard work, and his Living Wesley a most discriminating study of the character and work of its subject. His Oxford High Anglicanism (1895) showed how keenly he followed modern developments in the Church of England. His lifelong principle was that Methodism is “a church friendly to all, but owing allegiance to none.” See Life by John Telford (London, 1909).

RIGGING (A.S. weblog or weblog, to clothe), the general term, in connexion with ships, for the whole apparatus of spars (including both masts and yards), sails and cordage, by which the force of the wind is utilized to move the hull against the resistance, and with the support, of the water. (See also SAIL and SPARS.) Rigging is often used as meaning the cordage only, but this is a too limited, and even an irrational, use of the term. A ship is not rigged until she is provided with all the spars, sails and cordage required to move and control the hull. The straight or curved pieces of wood or metal, called davits, from which the boats carried along the bulwarks are hung, belong to the rigging. All are fastened directly or indirectly to the hull, and all are required to complete her “clothing.” Vessels of all classes, from the smallest sailing-boat up to the largest ship, are classed according to the particular combination of their spars, sails and cordage. “Cutter,” “brig,” or “ship,” are only convenient abbreviations for “cutter-rigged,” “brig-rigged,” or “ship-rigged.” They are of such or such a “rig.” It is strictly correct to speak of the rigging of a mast or a yard, or of a boom, when all that is meant is the special set of ropes, of whatever size or material, required to keep them in their place, or to withdraw them from it, when they have to be moved in the ship. In such cases the part is looked upon as a whole, and is mentally abstracted from the total of the vessel’s rigging.

The basis of all rigging is the mast (q.v.), whether it be composed of one or of many pieces of wood or metal. The mast is held up and controlled by ropes, which are classed together as the “standing rigging,” because they are “that part (of the whole rigging) which is made fast, and not hauled upon” (Admiral Smyth, Sailor’s Word-Book). This must be understood subject to the restriction that in the case of a mast composed of several parts, including topmast and topgallant mast, these subdivisions may be, and often are, lowered. The backstays, and other ropes which keep the top and topgallant masts in place, are therefore only “comparative fixtures.” The bowsprit, though it does not rise from the deck but projects from the bow, is in fact a mast. The masts, including the bowsprit, support all the sails, whether they hang from the “yards,” which are spars slung to the mast, or from “gaffs,” which are spars projecting from the mast, or, as in the case of the bowsprit, is a spar. The word is often used in the sense of “travelling on ropes called ‘stays,’” which go from the foremost to the bowsprit and suspended by halliards. The bowsprit is subdivided like other masts. The bowsprit proper corresponds to the lower fore-, main- or mizzen-mast. The jib-boom, which is movable and projects beyond the bowsprit, corresponds to a topmast; the flying jib-boom, which also is movable and projects beyond the jib-boom, answers to a topgallant mast. The whole body of ropes by which the yards, booms and sails are manipulated

1. bowsprit; 2. bobstays, three pairs; 3. spritsail-gaffs, projecting on each side of the bowsprit—the ropes at the extremities are jib-guys and flying jib-guys; 4. jib-boom; 5. martingale stay, and below it the flying-jib martingale; 6. back-ropes; 7. flying jib-boom; 8. fore-royal stay, flying jib-stay and halliards; 9. fore-topgallant-stay, jib-stay and halliards; 10. two fore-topmast stays and fore-topmast staysail halliards; 11. the fore-top-bowlines, stayed into the top and two fore-stays; 12. two fore-tacks; 13. fore-truck; 14. fore-toproyal stay, yard and lift; 15. topgallant mast, yard and lift; 16. fore-top mast, top-sail-yard, lift and reel-tackle; 17. foretop, fore-lift, and top-sail-sheet; 18. foremast and fore-shrouds, nine pairs; 19. foresheets; 20. fore-gaff; 21. fore-topmast backstays and top-sail tyee; 22. royal and topgallant backstays; 23. fore-topgallant stays and main-topgallant-stay; 25. standing parts or fore-topgallant-braces and main-topmast-stays; 26. hauling parts of fore-topgallant-braces and main-top-mast-stays; 27. main-tacks; 30. main-truck; 31. main-royal-braces; 32. braces and mizen-topgallant-braces; 34. standing parts of braces; 35. mizen-topmasts; 36. mizen-topgallant-braces; 37. main-braces and mizen on each gaff; 38. standing part of peak halliards; 39. vangs, similar boat's davits; 41. one of the davit topping-lifts and wind-sail; 44. quarter, main-yard-tackle; 45. a bull-rope.

During historic times, however, the prevailing materials have been hemp or esparto grass (*Machrocloa* or *Stipa tenacissima*), and in recent days chain and wire. As the whole of the rigging is divided into standing and running, so a rope forming part of the rigging is divided into the "standing part" and the "fall." The standing part is that which is made fast to the mast, deck or block. The fall is the loose end or part on which the crew haul. The block is the pulley through which the rope runs. "Standing" in sea language means "fixed"—thus the standing part of a book is that which is attached to block, chain or anything which is to heave the book up, with a weight hanging to it; the part opposite the point "fall" (Smyth, *sub voce*). "Tackle" is the combination of ropes and blocks; the combination of cables and anchors constitutes the "ground tackle."

The function of all cordage may be said to be to pull, for the purpose either of keeping the masts in their places, or of moving spars and sails. The standing rigging which supports the masts must be adapted to resist two kinds of pressure, the longitudinal, whether applied by the wind or by the motion of the vessel when pitching (i.e. plunging head and stern alternately into the hollow of the sea), and the lateral, when the wind is blowing on the side and she is rolling. The longitudinal pressure is counteracted by the bobstays, stays and backstays. A reference to fig. 1 will show that the bobstays hold down the bowsprit, which is liable to be lifted by the tug of the jibs, and of the stays connecting it with the fore-topmast. If the bowsprit is lifted the fore-topmast loses part of its support. In the case of a small vessel, the lifting of a bowsprit would wreck her whole system of rigging in an instant. If fig. 1 is followed from the bow to the mizzenmast, it will be seen that a succession of stays connect the masts with the hull of the ship or with one another. All pull together to resist pressure from in front. Pressure from behind is met by the backstays, which connect the topmasts and topgallant masts with the sides of the vessel. Lateral pressure is met by the shrouds and breast-backstays. A temporary or "preventer" backstay is used when great pressure is to be met. Seamen have at all times had recourse to special devices to meet particular dangers. When Dundonald, then captain of the "Pallas" frigate, was chased by a French squadron in stormy weather, he fortified his masts by ordering "all the hawser" (large ropes a little less strong than the cables which hold the anchor) "in the ship to be got up to the mast heads, and hove taut," i.e. made fast to the side. Thus she was able to carry more sail than would have been possible with her normal rigging. The running rigging by which all spars and sails are hoisted, or lowered and spread or taken in, may be divided into those which lift and lower—the lifts, jeers, halliards (haulyards)—and those which hold down the lower corners of the sails—the tacks and sheets. A
long technical treatise would be required to name the many combinations of cordage and spars which make up the total rigging. All that is attempted here is to give the main lines and general principles or divisions.

The vessel dealt with here is the fully rigged ship of three or more masts. But she includes all the others and the principles are the same. The simplest of all forms of rigging is the dipping lug, a quadrangular sail hanging from a yard, and always hoisted on the side of the mast opposite to that on which the wind is blowing (the lee side). When the boat is to be tacked so as to bring the wind on the other side, the sail is lowered and rehoisted. One rope can serve as halliard to hoist the sail and as a stay when it is made fast on the weather side on which the wind is blowing. The difference between such a craft and the fully rigged ship is that between a simple organism and a very complex one; but it is one of degree, not of kind. The steps in the scale are innumerable. Every sea has its own type. Some in eastern waters are of extreme antiquity, and even in Europe vessels are still to be met with which differ very little if at all from the ships of the Norsemen of the 9th and 10th centuries. For a full account of these varieties of rigging the reader may be referred to Mast and Sail in Europe and Asia (London, 1906), by H. Warington Smyth.

When the finer degrees of variation are neglected the types of rigging may be reduced to comparatively few, which can be classed by the shape of their sail and the number of their masts. At the bottom of the scale is such a craft as the Norse herring boat (fig. 2).

![Fig. 2.—Norse Herring Boat.](image)

She has one quadrangular sail suspended from a yard which is hung (or slung) by the middle to a single mast which is placed (or stepped) in the middle of the boat. She is the direct representative of the ships of the Norsemen. Her one sail is a "course" such as is still used on the fore and mainmasts of a fully developed ship; a topsail may be added (as in fig. 3) and then we have the beginning of a fully clothed mast. A very similar craft called a Humber keel is used in the north of England. The lug sail is an advance on the course, since it is better adapted for sailing on the wind, with the wind on the side. When the lug is not meant to be lowered, and rehoisted on the lee side, as in the dipping lug mentioned above, it is slung at a third from the end of the yard, and is called a standing lug. A good example of the lug is the Chinese junk (fig. 4). The lug is a "lifting sail," and does not tend to press the vessel down as the fore and aft sail does. Therefore it is much used by fishing vessels in the North Sea. The type of the fore and aft rig is the schooner (fig. 5). The sails on the masts have a gaff above and a boom below. These spars have a prong called "the jaws," which fit to the mast, and are held in place by a "jaw rope" on which are threaded beads called trucks. Sails of this shape are carried by fully rigged ships on the mizen mast, and can be spread on the fore and main. They are then called try-sails and are used only in bad weather when little sail can be carried, and are hoisted on the try mast, a small mast attached to the great one. The Lateen (Latin) sail (fig. 6) is a triangular sail akin to the lug, and is the prevailing type of the Mediterranean. These original types, even when unmodified by mixture with any other, permit of large variations. The number of masts of a lugger may vary from one to five, and of a schooner from two to five or even seven. A small lug may be carried above the large one, and a gaff topsail added to the sails of a schooner. A small-masted fore-and-aft-rigged vessel may be a cutter (fig. 7) or sloop. But the pure types may be combined, in topsail schooner, brigantines, barquentines and barques, when the topsail, a quadrangular sail hanging from and fastened to a yard, slung by the middle, is combined with fore and aft sails. The lateen rig has been combined with the square rig to make such a rigging as the xebec—a three-masted vessel square rigged on the main, and lateen on the fore and mizen. Triangular sails of the

same type as the jibs can be set on the stays between the masts of a fully rigged ship, and are then known as staysails. But it can only be repeated that the variations are innumerable. Studding-sails are pieces added to increase the breadth (spread) of sails, and require the support of special yards, booms and tackle.

The development of the rigging of ships is a very obscure subject. It was the work of centuries, and of practical men who wrote no treatises. It has never been universal. A comparison of the four-masted junk given above with the figures of ships on medieval seals shows at least much similarity. Yet by selecting a few leading types of successive periods it is possible to follow the growth of the fully rigged ship, at least in its main lines, in modern times.

Fig. 8 gives the sail plan of the "Santa Maria," the flagship of Columbus. It is a modern reconstruction, made in 1893 in Spain at the Carraca arsenal, but is based on good authority. She has only the fixed bowsprit, with a yard and a sail hanging from it, the spritsail yard and sprit sail. The foremost has one course, the mainmast a course and topsail, the mizen a lateen sail. Fig. 9 is the "Sovereign of the Seas," a British warship of 1637. She still has only the fixed bowsprit, but a small upright mast has been erected at the end, which serves to spread a sprit topsail. In some cases at least a sprit topgallant sail was used. The mizenmast still carries a lateen sail, but topsails have been added, and the whole rigging has multiplied and developed. Between the "Sovereign of the Seas" and the fully developed ship given in fig. 1 the most apparent differences are in the rigging of the bowsprit and the mizzenmast. The sprit topmast has disappeared, and is replaced

FIG. 9.—The "Sovereign of the Seas."
by the jib-boom. The square spritsail, which could not be trained fore and aft, and was of feeble effect in keeping the ship's head from turning to windward, has been replaced by the jib. The spritsail yard was found to be too long, and a use was found for the jib boom, which had been replaced by the spritsail gaff, two fixed spars which slope downwards and help to support the "jib-guys," the lateral supports of the jib, which are fixed spars. For this reason it is said that in recent times the topsails of merchant ships have been divided into upper and lower, with a great loss of beauty, but an increase of convenience. To the same end, the wish to economize in the size of the crew, is to be attributed. The yard belonged to the mainmast, and was graduated from the deck, which is also an easier and a safer process than going aloft to red them by hand. In a general way it may be said that the development of the rigging has been towards establishing a fair number of points, men to handle the rigging, and a number of men to attend to the sails.

The jib was invented in the 18th century, a ship which was sailing on the wind was subject to a disproportionate pressure aft. If she was at all given to "gripping"—that is to say, inclined to turn head to wind (and all ships are liable to have ways and manners which are mysterious in origin and not seldom incurable), the mizen-sail could not be used, for if it had been she would have never been "out of the wind." Therefore when close-hauled (sailing with the wind on the side and somewhat from before her centre) she lost the use of part of her sail. The spritsail which could not be trained fore and aft was no use "on the wind."

A few words may be added concerning the tops. In the earlier form of ships the top was a species of crow's nest placed at the head of the mast to hold a look-out, or in military operations to give a place of advantage to archers and slingers. They appear occasionally as mere bags attached to one side of the mast. As a general rule they are round. In the 16th century there were frequently two tops on the fore- and main-masts, one at the head of the lower, another at the head of the topmast, where in later times there have only been the two traverse beams which make the crosstrees. The upper top dropped out by the 17th century. The form was round, and so continued to be till the 18th century when the quadrangular form was introduced. In quite recent times the military tops of warships have resumed the circular form.

AUTHORITIES.—The present writer is indebted to Admiral Sir Cyprian A. G. Bridge, G.C.B., whose practical acquaintance with the older type of sailing ship as well as with the modern steamship "out of the wind." Therefore when close-hauled (sailing with the wind on the side and somewhat from before her centre) she lost the use of part of her sail. The spritsail which could not be trained fore and aft was no use "on the wind."

RIGORD—RIMBAUD

for the betterment of society. Similar declarations were attached to the constitution of 1793 and to that of the year III.

See E. Blum, La Déclaration des droits de l'homme et du citoyen, text with commentary (Paris, 1902); L. Bourgeois and A. Metin, Déclaration des droits de l'homme et du citoyen, 1789 (Paris, 1901); G. Jellinck, Poèmes et Confessions (Leipzig, 1853). This study has been translated into English by Rudolf Tombo (New York), and has aroused considerable controversy; see E. Boutmy, "La Déclaration des droits de l'homme et du citoyen of 1793," in Les Monnaies des siècles (1904), published 1891, marked a new beginning.

The American principle, several "I assemble," et, Hải Tombo, and wards for the 15th of July 1902; also É. Walsh, La Déclaration des droits de l'homme et du citoyen and l'assemble constituent, Travaux préparatoires (Paris, 1903).

RIGORD (c. 1150-c. 1200), French chronicler, was probably born near Alais in Languedoc, and became a physician. Afterwards becoming a monk he entered the monastery of Aucun, and was known as Denis, and described himself as regis Francorum chronographus. Rigord wrote the Gesta Philippi Augusti, dealing with the life of the French king, Philip Augustus, from his coronation in 1179 until 1206. The work, which is very valuable, was abridged and continued by William the Breton (q.v.). The earlier part of the Gesta speaks of the king in very laudatory terms, but in the latter part it is much less flattering in its tone. It is published in tome xvii. of Dom Bouquet's Recueil des historiens des Gaules et de la France (Paris, 1736-1786); and with introduction by H. F. Delaborde (Paris, 1882-83). A French translation of the Gesta, xi. of G. F. von der Colleion des monuments relatifs à l'historie de France (Paris, 1822). Rigord also wrote a short chronicle of the kings of France.

See A. Potthast, Bibliotheca historica (Berlin, 1896); and A. Mollinier, Les Sources de l'histoire de France, tome iii. (Paris, 1903).

RIGORISM (Lat. rigor, stiffness, firmness), a philosophical term applied by Kant specially to those moralists who take up an anti-hedonist or ascetic standpoint. In general the term is opposed to "lattitudinarianism" or "indifferentism,"—respectively a morality of compromise and a morality of pure indifference,—and signifies insistence upon the strictest interpretation of a principle, rule or criterion. Thus, in Roman Catholic theology, a rigorist holds that in cases of conscience the proper course is to adhere to the strict wording of the law in question.

RILEY, JAMES WHITCOMB (1853— ), American poet, was born in Greenfield, Indiana, in 1853. He spent several years as an itinerant sign-painter, actor and musician. During this vagabond experience he had opportunities to revive plays and compose songs, and was brought into close touch with the rural folk of Indiana, becoming familiar with their life and speech. About 1873 he first contributed verses, especially in the Hoosier dialect, to the papers, and he soon became local editor of the Anderson (Ind.) Democrat. In August 1877, over the initials "E.A.P.," he printed in the Kokomo (Indiana) Dispatch a poem, Leonainie, in the manner of Poe. The press throughout the country copied the poem, and many critics of acknowledged authority believed it to have been actually written by Poe, until the hoax was explained by the paper in which it first appeared. To the Indianapolis Daily Journal Riley contributed many poems, the best known being a series in dialect which purported to have been written by one "Benjamin F. Johnson, of Boone," a farmer. These he published in book form, under the same pen-name, as The Old Swimmin' Hole and 'Leven More Poems (1883). He wrote short stories and sketches, some of unusual merit, but is known almost exclusively as a poet. Of his poems some are in conventional English, many others in the Hoosier dialect of the Middle-West. His materials are the homely incidents and aspects of village and country life, especially of Indiana, and his manner is marked by delicate imagination and naive humour and tenderness.

The bulk of his work appeared in The Boss Girl and Other Sketches (1886), republished in 1891 as Sketches in Prose; Afterwhites (1887); Pipes o' Pan at Zekesbury (1888); Rhymes of Childhood (1890); and The Old Swimmin' Hole and Other Poems (1891), a fantastic blank verse drama; Green Fields and Running Brooks (1892); Poems Here at Home (1893); Armazindy (1894), which contains the poem "Leonainie"; A Child-World (1896), reminiscent of his own boyhood; The Ruddy Kid (1897); By Home Folks (1900); The Book of Joyous Children (1902); His Pa's Romance (1903); A Defective Samia Claus (1904); and in several books of selections, such as Old Fashioned Roses (1896), published in England; Old Child Rhymes (1896); Love Lyrics (1899); The Golden Year (1899), published in England; Farm Rhymes (1901); An Old Sweetheart of Mine (1902); Out to Old Aunt Mary's (1904); Songs o' Cheer (1905); Morning (1907); and Songs of Summer (1908).

RIMBAUD, JEAN ARTHUR (1854-1891), French poet and adventurer, was born at Charleville, in the Ardennes, on the 20th October 1854. He was the second son of a captain in the French army, who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of the poems which now appear in his works belong to his fifteenth year. Before he was sixteen, in consequence of a violent quarrel with his mother, the boy escaped from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home Rimbaud escaped again, into Belgium, where he lived for a time as a tramp, almost starved, but writing verses with feverish intensity. In February 1871 he left his mother for a third time, and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he beguiled his way back to Charleville.

There he wrote in the same year the extraordinary poem of Le Bateau ivre, which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement in French literature in all its forms. He sent it to Verlaine, who encouraged the boy of seventeen (whom he supposed to be a man of thirty) to come again to Paris. Rimbaud spent from October 1871 to July 1872 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for thirteen months, after the fall of the Commune, through England and Belgium, where in 1873 he published the only work which he ever printed, Une Saison en Enfer, in prose; in this he gives an allegorical account of his extravagant relations with Verlaine, which ended at Brussels by a double attempt of the latter to murder his young companion. On the second occasion Rimbaud was dangerously wounded by Verlaine's revolver, and the elder poet was imprisoned at Mons for two years. Meanwhile Rimbaud, deeply disillusioned, determined to abandon Europe and literature, and he ceased at the age of nineteen to write poetry. He settled for a while at Stuttgart, studying German, and in 1875 he disappeared. He set out on foot for Italy, and after extraordinary adventures found employment as a day-labourer in the docks at Leghorn. Returning to Paris, he obtained a little money from his mother, and then definitely vanished. For sixteen years nothing whatever was heard of him, but it is now known that he embarked as a Dutch soldier for the Sunda Isles, and, presently deserting, fled to Sumatra and then to Java, where he lived for some time in the forest. Returning to Europe, after a vagabond life in every capital, he obtained in 1880 some menial employment in the quarries of Cyprus, and then worked his way to Aden and up into Abyssinia, where he managed to get several thousand francs from a commercial adventurer. Here he settled, at Harrar, as a trader in coffee and perfumes, to which he afterwards added gold and ivory; for the next eleven years, during which he led many commercial expeditions into unknown parts of northern Africa, Shoa and Harrar were his headquarters, and he lived almost entirely with the natives, and as one of themselves. From 1888 to 1891, having prospered greatly as a merchant, he became a sort of semi-independent chieftain, intriguing for France, just

The poem was accompanied by a statement from the editor of the paper that it was "from the gifted pen of the erratic poet, Edgar Allan Poe," and by a circumstantial story to the effect that the poem had been found written on the fly-leaf of an old Latin-English dictionary then owned by "an uneducated and illiterate man" in Kokomo, who had received it from his grandfather, in whose tavern, near Richmond, Va., it had been left by "a young man who showed plainly the marks of dissipation."
outside the borders of civilization. From documents which were first produced in 1902 it appears that from 1883 to 1889 Rimbaud was in close relations with the Ras Makonnen and with Menelek, then only king of Shoa. At the death of the Negus John, in 1888, he was concerned in the formation of the empire of Harrar, and intrigued with the French government in favour of Menelek and against Italy. Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems, under the title of Les Illuminations, and they had created a great sensation in Paris. In this collection appeared the sonnet on the vowels, attributing a different colour to each: "A noir, E blanc, I rouge, U vert, O bleu voyelles." But the author, in his Abyssinian bath of palm-leaves, was, and remained, quite unconscious of the fact. In March 1891 a tumour in his knee obliged Rimbaud to leave Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on the 10th of November 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his character and adventures, have given to Rimbaud a remarkable fascination. His life has been written by M. Paterné Berrichon (1897), and valuable reminiscences by his sister, Mlle Isabell Rimbaud. His Œuvres were collected in 1898 by M. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville.

RIME ROYAL, the name given to a strophe or stanza-form, which is of Italian extraction, but is almost exclusively identified with English poetry from the fourteenth to the early seventeenth centuries. It appears to have formed out of the stanza called Ottawa rima (q.v.), by the omission of the fifth line, which reduces it to seven lines of three rhymes, arranged ababcc. It was earliest employed with skill, if not, as seems probable, invented, by Chaucer, who composed his long romantic poem of Troilus and Cressida in rime royal, of which the following is an example:

And as the new-abashèd nightingale,
Thist stincht first when she beginneth sing,
When that she heareth any herdè tale,
Or in the hedges any wight stirring,
She dight, or deth her voice-spring, ring—
Right so Cresseyda, when her drede stint,
Opened her heart, and told all her intent."

The "Prioress' Tale," in the Canterbury Tales, offers another particularly beautiful proof of Chaucer's skill in the use of the rime royal. In the fifteenth century this stanza was habitually used, in preference to heroic verse, by Hoccleve and Lydgate, and, with more melody and grace, by the unknown writer of The Flower and the Leaf. In the sixteenth century, rime royal was chosen by Hawes as the vehicle of his Pastime of Pleasure (1506) and by Barclay in his Ship of Fools (1509); it was now regarded as the almost exclusive classical form for heroic poetry in England, and it had long been so accepted in Scotland, where The King's Quair of King James I., the Fables of Henryson and The Thistle and the Rose of Dunbar had closely followed Chaucer's pattern. The greater part of that huge poetic miscellany, The Mirror for Magistrates (1550-1610), was written in rime royal, Sackville's momentous Induction among the rest. The ease and grace of this stanza began to go out of fashion with the revival of Elizabethan poetry, but we find it still used in Spenser's Hymn of Heavenly Beauty, Shakespeare's Lucrece and the Orchesta of Sir John Davys. After the first decade of the seventeenth century rime royal went out of fashion. Since then it has been occasionally revived, but not in poems of great length or particular importance. Rime royal should always be written in iambic metre, and be formed of seven lines of equal length, each containing ten syllables.

RIMINI, a town and bishop's see of Italy, in the province of Forli, Emilia, on the Adriatic coast, 69 m. S.E. of Bologna by rail. Pop. (1901) town, 18,022; commune, 46,801. The city is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprosa, now called Ausa, on the east and the river Marecchia on the west. It stands on a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Mons Titanicus, crowned by the towers of the republic of San Marino. Rimini attracts numerous visitors for the sea-bathing at Porta Marina. It has mineral springs, and the industries comprise fisheries, ironworks and foundries, sulphur furnaces, silk-mills, rope walks, match factories, brickworks, flourmills and furniture. Its main interest, however, is historical. Apart from the ancient buildings, &c., referred to below, Rimini can boast of a good public library, founded by the jurist Gambalunza in 1617, a municipal picture gallery, an archaeological museum, a technical school (1882) and a bronze statue of Pope Paul V. The ancient city of Sigismundo Malatesta, now derelict, has been recently rediscovered. The museum, built by Riccardo Aymonini, is notable for the, few megaliths in the vicinity, the Doric temple at Tana, the Etruscan tombs of the city and the sepulchres of the Malatesta family. The principal church of the town is the cathedral, which was begun by Malatesta and is a monument to his family. It is a fine example of the Romanesque style, with a large central tower and a circular dome. The façade is decorated with sculptures representing the virtues of the Malatesta family. The interior is richly decorated with frescoes and mosaics, and contains many fine works of art, including the famous "Madonna of the Harpies" by Benvenuto di Giovanni. The town is also noted for its beautiful gardens, which were once the private property of the Malatesta family. The most famous is the Parco della Riminese, which was created in the 17th century by the architect Giustini. The park is now a public park and is open to the public. It is noted for its beautiful gardens and for its extensive views of the Adriatic coast. Another notable garden is the Villaforcing, which was once the private property of the Malatesta family. The garden is now a public park and is open to the public. It is noted for its beautiful gardens and for its extensive views of the Adriatic coast.

History.—Rimini is the ancient Ariminum (q.v. for its early history and remains). During the middle ages the history of Rimini has no importance. Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in A.D. 538. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterwards fell into the power of the Longobards, and then of the Franks, who yielded it to the pope, for whom it was governed by counts to the end of the 11th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities.

In the year 1216, Rimini, being worsted by Cesena, adopted the desperate plan of granting citizenship to two members of the powerful Malatesta tribe, Giovanni and Malatesta, for the sake of their aid and that of their vassals in the defence of the state and the conduct of the war. This family quickly struck root in the town and gave birth to future tyrants; for in 1233 Giovanni was named podestà, and this office was the first step towards the sovereign power afterwards assumed by his descendants. Meanwhile, Rimini was torn by the feuds of Guelf and Ghibelline. The latter were the dominant party in the days of Frederick II., although very unpopular on account of the grievous taxes imposed by the empire. Accordingly, the majority of the urban nobles joined the Guelfs and were driven into exile. But before long, as the Swabian power declined in Italy, the Guelf party was again predominant. Then followed a long period of confusion, in which, by means of conspiracies and crimes of every kind, the Malatesta succeeded in becoming masters of the town. Giovanni Malatesta, who had died in 1247 and been succeeded by his son Malatesta, born in 1212, and surnamed Malatesta da Verrucchio. This chieftain, who lived to be a hundred years old, had ample time to mature his ambitious designs, and was the real founder of his house. Seizing the first suitable moment, he placed himself at the head of the exiled Guelfs, and restored them to Rimini. Then, as the empire acquired fresh strength in Italy, he quietly bided his time and, on the descent of the Angevins, again assumed the leadership of the Guelfs who now had the upper hand for a long time. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Nor was he contented by this. Pope Boniface VIII. was fully aware of the rights and traditional pretensions of the Holy See, but preferred to keep on good terms with one who had so largely contributed to the triumph of the Guelfs in Romagna. Accordingly he not only left Malatesta unmolested, but in 1299 conferred on him fresh honours and estates, so that
his power went on increasing to the day of his death in 1312.

Four sons had been born to Malatesta—Malatestino, Giovannino the Lame, Paolo the Handsome, and Pandolfo; but only the oldest and youngest survived him. Giovannino the Lame (Sciaccato), a man of a daring impetuosity only equalled by his ugliness, had proved so useful a general to Giovanni da Polenta of Ravenna as to win in reward the hand of that potentate’s beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovannino, were murdered by him on the spot (1283). This episode of the story of the Malatesta has been immortalized in Dante’s Inferno.

Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo.

Pandolfo died in 1326, leaving two heirs, Malatesta and Galeotto. The former was nicknamed Guastafamiglia, because, although at first willing to let his brother share his power, he rid himself by violence and treachery of other kinsmen who claimed their just rights to a portion of the state. His intent was to become sole lord and to aggrandize his tiny principality. But the reigning pope, Innocent VI., despatched the terrible Cardinal Albornoz to Romagna, and it was speedily reduced by fire and sword. In 1335 the Malatesta shared the fate of the other potentates of the land. Nevertheless, it was the cardinal’s policy to let existing governments stand, provided they promised to act in subordination to the papal see. Thus he granted the Malatesta brothers the investiture of Rimini, Pesaro, Fano and Fossombrone, and they arranged a division of the state. Guastafamiglia took Pesaro, which was held by his descendants down to the brothers Carlo and Galeazzo.

The former of these, who died in 1430, was father to the Pariolina beheaded in Ferrara, whose tragic love story has been sung by Byron. The latter won the title of “l’Inetto” (the Incapable) by the foolish sale of his rights over Pesaro to the Sforza in 1447.

Galeotto, on the other hand, retained the lordship of Rimini, ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena and Bertinoro to his states. Dying in 1385 at the age of eighty, he left two sons—Carlo, who became lord of Rimini, and Pandolfo, who had Fano for his share. Carlo (1364–1420) was energetic, valiant and a friend of the popes, who named him vicar of the church in Romagna. He was a patron of letters and the arts, and during his reign his court began to be renowned for its splendour. As he left no issue, his inheritance was added to that of his brother Pandolfo, and Fano was once more united to Rimini.

Pandolfo (1370–1427) had led the life of a condottiere, taking a prominent part in the Lombard wars following on the death of Galeazzo Maria Visconti, and held rule for some time in Brescia and Bergamo. He left three natural sons who were declared legitimate by Pope Martin V. The eldest, Galeotto (1411–1432), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigismondo Pandolfo. The third son, Novello Malatesta (1418–1453) ruled over Cesena.

Sigismondo (1417–1468) is the personage to whom Isotta owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of fifteen, had already given proofs of valour in the field. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. To him is due the erection of the church of St Francis, or temple of the Malatesta, one of the rarest gems of the Renaissance and the greatest of Rimini’s treasures (see below for description).

Of so dissolute a life that, although married, he had children by several mistresses at the same time, he gave vent to all his passions with a ferocity that was bestial rather than human.

And—as the crowning contradiction of his strange nature—from his youth to the day of his death he remained the devoted lover of the woman for whose sake he became a poet, whom he finally made his wife, and whom he exalted in every way, even to the point of rendering her almost divine honours. Yet this love never availed to check his excesses. On assuming power in 1432, Sigismondo was already affianced to the daughter of Count Carmagnola; but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement, under the pretext that it was impossible to marry the child of a criminal. In fact, he aimed at a higher alliance, for he espoused Ginevra d’Este, daughter of the duke of Ferrara, and his entry into Rimini with his bride in 1434 was celebrated by splendid festivities. In 1437 a son was born to him, but died within the year, and in 1440 the young mother followed it to the grave. Everyone one declared that she died by poison administered by her husband. This, however, was never proved. The duke of Ferrara remained his friend, nor is it known what motive Sigismondo could have for wishing to get rid of his wife. Two years afterwards he married Polissena, daughter of the famous condottiere Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion that endured to his death. The lady succeeded in gaining an absolute ascendancy over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Such being the nature of the man, it is not astonishing that, as his arbour for Isotta increased, he should have little scruple in ridding himself of his second wife. On the 1st June 1450 Polissena died by strangling, and on the 30th of the same month Isotta’s offspring were legitimated by Nicholas V.

It is only just to record that, although Malatesta’s intrigue with Isotta had long been notorious to all, and he had never sought to conceal it, no one ever accused her of either direct or indirect complicity in her lover’s crimes. Isotta’s history, however, is a strange one, and opens up many curious questions. She was of noble birth and seems to have attracted Sigismondo’s notice as early as 1438, for at the age of twenty he produced verses of some merit in praise of her charms. She was indeed widely celebrated for her beauty and intellect, culture, firmness and prudence; and even Pope Pius II. proclaimed her worthy to be greatly loved. When Sigismondo was absent she governed Rimini wisely and well, and proved herself a match for the statesmen with whom she had to deal. The leading poets of the court dedicated to her a collection of verses entitled Isotta, styled her the muse of the court, and the choicest of the arts of love perpetuated her features on canvas, on marble and on many exquisite medals, one of which has a closed book graven on the reverse, with the inscription “Elegia” in allusion to poems she was said to have written. Nevertheless, Yriarte, in his book on the Malatesta and Rimini, asserted that there was documentary evidence to prove that Isotta was unable to sign her own name. But it is not at all surprising that Isotta should have her letters written and signed by another hand, when such was by no means an uncommon practice among the princes and nobilities of her day. Lucrezia Borgia, for instance, frequently did the same. It is besides simply incredible that a woman of the Italian Renaissance of Isotta’s birth, standing and reputation should have been unable to write.

Her marriage with Malatesta did not take place until 1456; but of the ardent affection that had long bound them together there are stronger proofs than the lover’s juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St Francis has served to transmit to posterity the history of their loves. Malatesta decided on building this remarkable church as a thankoffering for his safety, during a dangerous campaign undertaken for Pope Eugenius IV. about the year 1445.

The first stone was laid in 1446, and the work was carried on...
with so much alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to Leo Battista Alberti, who had just returned from a sojourn in a sixth-century Franciscan church. The original edifice being left intact, it was a difficult question how to deal with the windows and the Gothic arches of the interior. Alberti solved the problem with marvellous skill, blending the old architecture with the new style of the Renaissance, and giving it variety without destroying its unity of effect.

Being eager to adorn his temple with the most precious marbles, Sigismondo's veneration for antiquity did not prevent him from pillaging many valuable classical remains in Rimini, Ravenna and even in Greece. Such was the zeal with which Alberti pursued his task that the exterior of the little Rimini church is one of the finest and purest achievements of the Renaissance, and surpasses in beauty and elegance all the rest of his works. But it is much to be deplored that he should have left the upper part of the façade unfinished. Alberti came to Rimini, made his design, saw the work begun and then left it to be carried out by very skilful artists, on whom he impressed the necessity of faithfully preserving its general character so as "not to spoil that music."

The internal decorations, especially the enormous quantity of wall ornaments, consisting chiefly of scrolls and bas-reliefs, were executed by different sculptors under the personal direction of Malatesta, who, when engaged in war, sent continual instructions about their work. It is difficult to give an idea of this extraordinary church to those who have no personal acquaintance with it. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblems, or on baskets of fruit held by children. The surface of the pilasters is divided into compartments encrusted with bas-reliefs of various subjects and styles. Everywhere—the balustrades closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant's second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St Francis and the God of the Christians it was dedicated—and that while Sigismondo's second wife still lived—to the glorification of an unhallowed attachment. Nature, science and antiquity were summoned to celebrate the tyrant's love for Isotta. The bas-reliefs of one of the chapels represent Jupiter, Venus, Saturn, Mars and Diana, together with the signs of the zodiac. And these subjects are derived, it appears, from a poem in which Sigismondo had invoked the gods and the signs of the zodiac to soften Isotta's heart and win her to his arms. The pageants of Mars and Diana seem to have been suggested by the Tryon of Petrarch. Elsewhere we see prophets and sibyls, personifications of the theological virtues and of the sciences. The delicate bas-reliefs of botany and medicine, history and astronomy, have been judged by some writers to be Grecian, on account of the ancient appearance of their marble, their inscriptions in Greek and Latin, and others that have never been deciphered. But a moment's examination of the sculpture is enough to destroy this hypothesis. Besides, some of the inscriptions are very easily read and record "Apollo Arimineus" and "Jupiter Arimineus."

In the first chapel on the left is the family tomb of the Malatesta, with sculptured records of their triumphs and of their alleged descent from Scipio Africanus. Better worthy of notice is the third chapel to the right, known as that of the Angels, on account of the angels and children carved on its pillars. It is nominally dedicated to the archangel Michael, whose statue is enthroned in it; but the figure has the face of Isotta, the ruling deity of this portion of the church. For here is the splendid and fantastic tomb erected to this lady, during her lifetime, by the tyrant himself. So vast is the amount of marbles that no monument, be it remarked, is raised over the burial-place of Ginevra and Polissena. The urn of Isotta's sarcophagus is supported by two elephants, and bears the inscription, "D. Isottae Ariminemis B. M. Sacrum, MCCCCI." The "D." has been generally interpreted as "Divae" and the "B. M." as "Beatae Memorie." But some, unwilling to credit such profanity, allege that the letters stand for "Bonae Memoriae." Nevertheless, all who have seen the church must admit the improbability of similar scruples.

The numerous artists employed on the interior of the church were under the direction of the "prote-coachio" Matteo de Pasti the celebrated medalist. And indeed the peculiar and fantastic character of the sculptures in this chapel frequently recalls the designs of his famous works. All this decoration is in strong contrast with the grandly austere simplicity of the façade and outer walls of the church. There no ornament disturbs the harmony of the lines. The frieze beneath the cornice, reproducing the lovers' initials and the Malatesta ensigns, is in such very low relief that it only enhances the perfection of "that music" produced by the marvellous skill of Alberti. Also the colour of the stone, a soft creamy white, adds to the general beauty of effect. And everything both within and without the church points to its ancient age, and each time it is visited it is Sigismondo's purpose to impress on the Christian church. On each of its outer walls are seven arched recesses, intended to contain the ashes of the first literati and scientists of his court. In the first, to the right, is the urn of the poet Basino, one of his pensioners, in the second that of Giusto de' Conti, author of some rhymes on the Bella Manto, while the third bore the more famous name of Gemisthus Pletbo. This well-known Byzantine philosopher was the diffuser of Platonism in Florence during the time of Cosimo de' Medici, and had faith in the revival of paganism. Returning to his own people, he had died in the Morea. Sigismondo, having gone there in command of the Venetian expedition against the Turks, exhumed the philosopher's bones as holy relics, and brought them to Rimini for worthy sepulture in his Christian pantheon. All this is solemnly recorded in the inscription, which is dated 1465. The fourth sarcophagus was that of Roberto Valturio (d. 1489), the engineer, author of De Re Militari, who had been Sigismondo's minister and had aided him in the construction of the castle of Rimini. The other urns on this side were placed by Malatesta's successors, and the arches on the left wall remained untenanted.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb-shells, and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He began his military career in 1432 in the service of Eugenius IV.; but, when this pope doubted his good faith and transferred the command to another, he sided with the Venetians against him, though at a later date he again served under him. On the decease of Filippo Maria Visconti in 1447 he joined the Aragonese against Venice and Florence; but, presently changing his flag, fought valiantly against Alphonso of Aragon and forced him to raise the siege of Piombino. In 1454 he accepted a command from the Sienese; but suddenly, after his usual fashion, he made peace with the enemies of the republic, and had to save himself by flight from arrest for his perfidy. It was then that the letters from Isotta were confiscated. After this he began scheming to hasten the coming of the Angevins, and took part in new and more hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered; for the cause of Anjou was hopelessly ruined in Italy. He was therefore driven to make his submission to the pope, but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived.
and eagerly confirmed. He was pronounced guilty of rape, incendiarism, incest, assassination and heresy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a public example.

This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. But the pope marked the intensity of his hatred by causing the dummy to be carved and dressed with such lifelike resemblance that he was almost able to persuade himself that his hated enemy was really consumed in the flames. Malatesta could afford to laugh at this farce, but he nevertheless prepared in haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino and his own brother Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated by them at Fian di Marotta, he was driven to Rome in 1463 to again make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. The once mighty tyrant of Rimini found himself reduced to penury with a state chiefly composed of a single town. He therefore took service with the Venetians, and in 1464 had the command of an expedition to the Morea. Here his movements were so hampered by the interference of the commissioners of the republic that, with all his valour, he could achieve no decisive success. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed, the latter offered to give him Spoletto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, on purpose to kill the pope. But, being forewarned, Paul received him with great ceremony, and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees and implored forgiveness. His star had now set for ever. For sheer subsistence he had to hire his sword to the pope and quell petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on the 7th of October 1468, aged fifty-one years.

He was succeeded, according to his desire, by Isotta and his son Sallustio. But there was an illegitimate elder son by another mother, named Roberto Malatesta, a valiant and unscrupulous soldier. Befriended by the pope, this man undertook to conquer Rimini for the Holy See, but came there to further his own ends instead (20th October 1469), and, while feigning a desire to share the government with Isotta and her son, resolved, sooner or later, to seize it for himself. This aroused the pope’s wrath, and Roberto instantly prepared for defence. Finding an ally in the duke of Urbino, whose eyes were now opened to the aggressive policy of the church, he was able to repulse its forces. Paul II. died soon after, and was succeeded by Sixtus IV. Roberto’s position was now more secure, and in order to strengthen his recent alliance he betrothed himself to the daughter of the duke of Urbino. The next step was to dispose of his rival kindred. On the 8th of August 1470 Isotta’s son was found murdered in a well belonging to the Marcheselli family; and a bloodstained sword, placed in their courtyard by Roberto, made it appear as though they had been guilty of the crime. Towards the end of the same year Isotta died also, apparently of a slow fever, but really, it was believed, by poison. Another of her sons, Valerio, born in 1453, still lived, but he was openly put to death by Roberto on a trumped-up charge of treason. In 1475 the new tyrant celebrated his nuptials with the duke of Urbino, a union of daughter and brother, again taken into favour by the pope, victoriously defending him in Rome against the attacks of the duke of Calabria, and died there in 1482 of the hardships endured in the war. His widow was left regent during the minority of his son Pandolfo, who was nicknamed Pandolfinaccio on account of his evil nature. Directly he was of age, he seized the reins of government by killing some relations who had plotted against him, and crushed another conspiracy in the same way. A daring soldier, he distinguished himself at the battle of the Taro against the French; but his tyranny made him hated by his subjects. In 1500, when Cesare Borgia fell on Romagna with violence and fraud, this Malatesta shared the fate of other petty tyrants and had to fly for his life. After the fall of the Borgia he returned, but, being bitterly detested by his people, decided to sell his rights to the Venetians, who had long desired to possess Rimini, and who gave him in exchange the town of Cittadella, some ready money, and a pension for life.

This arrangement was naturally disapproved by Rome, and especially by Julius II.; he therefore contrived the league of Cambray on purpose to ruin the Venetians, who were crushingly defeated in 1509. Thereupon the pope, having accomplished his own ends, made alliance with the Venetians, who were now prostrate at his feet, and, with them, the Spaniards and the Swiss, fought against the French at Ravenna in 1512. Here the French were victors, but owing to their heavy losses and the death of their renowned leader, Gaston de Foix, were compelled to retreat. Thus Julius became master of Rimini and the other coveted lands. Malatesta made more than one attempt to win back his city, but always in vain, for his subjects preferred the papal rule, and in 1528 Pope Clement VII. became definite master of the town. Thus, after two hundred and fifty years, the sway of the Malatesta came to an end, and Pandolfo was reduced to beggary. He died in 1534, leaving a daughter and two sons in great poverty. The elder, Sigismondo, after various military adventures, died at Reggio d’Emilia in 1543; and Malatesta, the younger, went to fight in the Scotch and English wars, and was never heard of again. Sigismondo had left male heirs who made another attempt to regain Rimini in 1555, but Pope Paul IV. declared them deposed in perpetuity in punishment of Pandolfinaccio’s misdeeds.

From that time the Malatesta became citizens of Venice; their names were inscribed in the Golden Book, and they were admitted to the grand council. With the death, in 1716, of Christina Malatesta, the wife of Niccolo Boldu, the Rimini branch of the family became extinct. The descendants of Giovanni, brother of Malatesta da Verrucchio, who married one of the Sogliano, were known as the Sogliano-Malatesta. The representatives of this branch settled in Rome.

The history of Rimini practically ends with its independence. It fell into obscurity under the rule of the popes, and was not again mentioned in history until, in 1831 and 1845, it began taking a prominent part in the revolutionary movements against papal despoticism and in favour of Italian independence.

RIMMER, William (1816–1870), an American artist, was born in Liverpool, England, on the 20th of February 1816. He was the son of a French refugee, who emigrated to Nova Scotia, where he was joined by his wife and child in 1818, and who in 1826 removed to Boston, where he earned a living as a shoe-maker. The son learned the father’s trade; at fifteen became a draughtsman and sign-painter; then worked for a lithographer; opened a studio and painted some ecclesiastical pictures; after 1840 made a tour of New England, painting portraits; lived in Randolph, Mass., in 1845–55 as a shoe-maker, for the last years of the decade practising medicine; practised in East Chelsea and received a diploma from the Suffolk County Medical Society; and in 1855 removed to East Milton, where he supplemented his income by carving busts from blocks of granite. In 1860 he made his head of St Stephen (now in the Boston Athenaeum) and in 1861 his “Falling Gladiator” (since 1880 in the Boston Museum of Fine Arts), which Truman H. Bartlett calls “the most remarkable
work of sculpture that has yet [1883] been produced in this country... powerful, wonderful, but not alluring." Rimmer's sculptures, except those mentioned and "The Fighting Lions" (now in the Boston Art Club), "A Dying Centaur" (in the Boston Museum of Fine Arts), and a statue of Alexander Hamilton (made in 1865 for the city of Boston), were soon destroyed. He worked in clay, not modelling but building up and chiselling; almost always without models or preliminary sketches; and always under technical disadvantages and in great haste; but his sculpture is anatomically remarkable and has an "early-Greek" simplicity and strength. He published Elements of Design (1864) and Art Anatomy (1877), but his great work was in the class-room, where he illustrated Kostchei the Blackbird on blackboard sketches. His studies in line suggest William Blake in their imaginative power. He died on the 20th of August 1879.

RIMSKY-KORSAKOV, NICOLAS ANDREIEVICH (1844–1908), Russian composer, was born at Tikhvin, Novgorod, on the 18th (N.S.) of March 1844. He was one of the musical amateurs who, with Borodin, Cui and Moussorgsky, gathered round Balakirev in St Petersburg in the days when Wagner was still unknown. By 1865 he had written a symphony (in E minor) which in that year was performed—the first by a Russian composer—under Balakirev's direction, and in 1873 he definitely retired from the navy, having been appointed a professor in the St Petersburg Conservatoire. The same year witnessed his marriage to a talented pianist, Nadejda Pourgold, and the production of his first opera, Pskovitanka. This was followed by May Night (1878), The Snow Maiden (1880), Midday (1892), Christmas Eve (1894), Sadko (1895), Mozart and Salieri (1898), The Tsar's Bride (1899), Tsar Soltan (1900), Servilia (1902), Kotsichei the Immortal (1902), Kites (1902). But his operas attracted less attention abroad than his symphonic compositions, which show a mastery of orchestral effect combined with a fine utilization of Russian folk-melody and a happy feeling for "programme music," his writing being peculiarly individual and distinctive in its restraint and avoidance of violent methods. Notable among these works are his first symphony, his second (Op. 9) Antar, his third (Op. 32), and his orchestral suites and overtures, his Spanish Capriccio (1897) being particularly appreciated. He also wrote a number of beautiful songs, pianoforte pieces, &c., and he eventually took Balakirev's place as the leading conductor in St Petersburg, never sparing himself in assisting in the musical development of the Russian school. He died there on the 20th of June 1908.

Rinderpest (German for cattle-plague, which is the English synonym), one of the most infectious and fatal diseases of oxen, sheep, goats, camels, buffaloes, yaks, deer, &c.; a virulent eruptive fever which runs its course so rapidly and attacks such a large percentage of ruminants when it is introduced into a country, that from the earliest times it has excited terror and dismay. It is an Asiatic malady, and has prevailed extensively in south Russia, central Asia, China, Indo-China, Burma, India, Persia, Ceylon and the Malay Archipelago. Thence it has at times been carried into Europe, and towards the end of the 19th century into South Africa. It appeared in Egypt in 1844 and 1885, Abyssinia in 1890, Japan in 1892, and the Philippines in 1898. It has been noted that its irruptions into Europe in the earlier centuries of our era always coincided with invasions of barbarous tribes in the east of Europe; and even at a later period the disease accompanied the events of war, when troops with their commissariat moved from the east towards the west, or cattle, when they were carried in the same direction. One of the earliest recorded irruptions of cattle-plague into western Europe was in the 5th century after the sanguinary invasion of the Huns under Attila, the expulsion of the Goths from Hungary, and the fierce internece wars of the whole Germanic population. The disease appears then to have been carried from Hungary through Austria to Dalmatia, while by Brabant it obtained access to the Low Countries, Picardy, and so on to the other provinces of France. In the curious poem De Mortibus Animae written by St Severus, who lived at that period, the cause and destructiveness of the disease are specially alluded to. Many invasions of Europe are described, and in several of these Britain was visited by it—as in 809–10, 986–87, 1223–25, 1543–14, and notably in 1713, 1745, 1774, 1790. In 1865 and 1872 it was imported direct from Russia. In 1870–71 it destroyed 70,000 cattle in France, 30,000 in Alsace-Lorraine, and 10,000 in Germany. In England an outbreak occurred in 1877, when it was imported from Germany, where the disease continued until 1879.

The infective agent has not been positively identified, but it is presumed to exist in all the various secretions and excretions, in the flesh, blood and various organs of the body. Contagion may be direct or indirect, and the disease may be conveyed to healthy cattle by contaminated fodder, litter, water, clothing, pasture, sheds, railway wagons, hides, horns and hoofs. Attendants, cats, dogs, birds, vermin and flies may spread the infection. Definite symptoms of the disease may not be recognized until the expiration of three to six days after exposure, the period of incubation.

Symptoms.—Like some other general diseases, this does not offer any exclusive or pathognomonic symptoms, but is rather characterized by a group of functional and anatomical alterations. An exact knowledge of its symptoms and necropsical appearances is of the utmost importance, as its extension and consequent ravages can only be arrested through its timely recognition and the immediate adoption of the necessary sanitary measures. Intense fever, diarrhoea or dysentery, croupous inflammation of the mucous membranes in general, sometimes a cutaneous popular eruption, and great prostration mark the course of the affection, which is frequently most difficult to diagnose during life, especially if its presence is not suspected. Its introduction and mode of propagation can, in many instances, be ascertained only at a late period, and when great loss may already have been sustained. In the majority of cases the examination of the carcase of an animal which has died or been purposely killed is the best way to arrive at a correct diagnosis.

Indeed, this is practically the only certain means of concluding as to the presence of the malady, as there are considerable variations in the chief symptoms with regard to their intensity as well as in the secondary symptoms or epiphenomena.

Among cattle indigenous to the regions in which this malady may be said to be enzootic the symptoms are often comparatively slight, and the mortality not great. So much is this the case that veterinary surgeons who can readily distinguish the disease when it affects the cattle of western Europe, can only with difficulty diagnose it in animals from Hungary, Bessarabia, Moldavia, or other countries where it is always more or less prevalent. In these the indications of fever are usually of brief duration, and signs of lassitude and debility are, in some instances, the only marks of the presence of this virulent disorder in animals which may, nevertheless, communicate the disease in its most deadly form to the cattle of other countries. Slight diarrhoea may also be present, and a cutaneous eruption, accompanied by gastric disturbance, running at the eyes, and occasional cough. In the more malignant form the fever runs high, 106° to 107° Fahr., and all the characteristic symptoms are well marked: dulness, sunken eyes, eruption on the skin, discharges from eyes, nose and mouth, shivering fits, difficult breathing, dry, harsh cough, miliary eruptions on the gums, accumulation of bran-like exudate within the lips, fetid breath, with certain nervous phenomena, and dysenteric dejections. Death generally occurs in four or five days, the course of the disorder being more rapid with animals kept in sheds than with those living in the open, and in summer than in winter. The post-mortem appearances are most marked in the digestive canal, and comprise red spots and erosions on the palate, lips, tongue and pharynx; intense congestion of the lining of the fourth stomach, which in places is covered with a grey or reddish pustulaceous deposit, under which the membrane is deeply
ulcerated. Similar lesions are seen in the small intestine, caecum and rectum. The membrane lining the air passages is congested throughout, and the lungs are emphysematous.

In recent years much has been done in Russia and India towards the prevention of rinderpest by inoculation and the use of immunizing sera. In South Africa the bile method (or the injection of bile obtained from cattle dead of rinderpest), discovered by Koch, in 1896; bile with admixture of glycerine, recommended by Edlington; the simultaneous injection of serum and rinderpest blood, introduced by Turner and Kolle in 1897, and repeated injection of fortified serum alone, have been employed, more or less successfully, in conferring immunity. But elsewhere the main line of action has been in the direction of preventing the introduction of the disease by prohibiting the importation of cattle from infected countries.

RING (O.E. hring; a word common to Teutonic languages, and probably cognate with the Lat. circus, Gr. ὅρκος or ὅχκος, Skt. chakra, wheel, circle, cf. also "harangue ";) in art, a band of circular shape of varying sizes, made of any material and used for various purposes, but, particularly, a circular band of gold, silver or other precious or decorative material used as an ornament, not only for the finger, but also for the ear (see EARRING), or even for the nose, where it is still worn by certain races in India and Africa. The word is also used of many objects which in structure take the shape of a circle or hoop, such as the tracheal rings, the circular-shaped bands of cartilage in the walls of the windpipe, the "annual rings," or concentric layers of wood produced each year in the trunks of trees, &c. In transferred senses "ring" it is also applied to an enclosed space, whether circular, oval or otherwise: hence to the arena of a circus or hippodrome, the enclosure for a boxing contest, or to the place on a racetrack reserved for the bookmakers for the purpose of betting. A particular application in a transferred sense is that to a combination of persons in trade for the purpose of controlling markets, prices, etc.

In the art sense (see also GEMS), the English and German "ring" corresponds to the Gr. δακτύλιος, Lat. annulus, Fr. anneau. The enlarged part of a ring on which the device is engraved is called the "bezel," the rest of it being the "hoop." To decorate the human finger with a ring, if possible with one combining beauty, value and a distinctive character, was a widely spread natural impulse. At an early period, when the art of writing was known but very few, it was commonly the custom for men to wear rings on which some distinguishing sign or badge was engraved (ἐνδείκνυσιν), so that by using it as a seal the owner could give a proof of authenticity to letters or other documents. Thus, when some royal personage wished to delegate his power to one of his officials, it was not unusual for him to hand over his signet ring, by means of which the full royal authority could be given to the written commands of the subordinate (cf. Gen. xli. 47; Esth. viii. 2). Among the Battas of Sumatra rings of a certain form are used to this day as passports.

The earliest existing rings are naturally those found in the tombs of ancient Egypt. The finest examples date from about the XVIIIth to the XIXth Dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber and hard stones, such as carnelian. Another form of ring used in the XIXth and subsequent dynasties of Egypt was a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

1 "To ring," in the sense of to make a bell sound, is a different word. It also appears in various Teutonic languages and is probably of onomatopoetic origin, and may be akin to Lat. clangor.

In ancient Babylonia and Assyria finger rings do not appear to have been used. In those countries the signet took a different form, namely, that of a cylinder cut in crystal or other hard stone, and perforated from end to end. A cord was passed through it, and it was worn on the wrist like a bracelet. This way of wearing the signet is more than once alluded to in the Old Testament (Gen. xxxvii. 18, R.V., and Cant. viii. 6).

Within the limits necessarily imposed by its purpose the finger ring assumed a considerable variety of form, according to its date and place of origin.

In the Cretan and Mycenaean periods a characteristic form of ring had a broad flat bezel, not organically connected with the hoop, and having an incised design in the gold. The use of insect stones hardly occurs, but rings from Enkomi and Aegina of the late Mycenaean period have inset paste decorations.

The Phoenician type of ring was primarily intended to carry a scarab or scarabaeoid, usually in a box setting on a swivel, called for by the fact that the flat base of the scarab would be wanted for sealing purposes, but in wear would be most conveniently turned inwards. Strength being necessary, the hoop became massive. A similar arrangement of the signet-scarab is found attached to a twisted ring, which, from its shape, must have been meant to be suspended, and which is shown thus worn on some of the Cypriote term-cottas.

The Greek ring of an early period has a characteristic flattened bezel, for an intaglio design in the gold. Such engravings attained great freedom and beauty in the 5th and 4th centuries B.C. An alternative form was a swivel ring for a scarab or scarabaeoid, imitating the Phoenician shape. When the stone was flat and inset the bezel became a mass of metal to hold it securely.

Among the Greeks signet rings were very largely worn. In Sparta a sumptuary law was passed at an early time to forbid any substance more valuable than iron to be used for signet rings; but in other parts of the Hellenic world there appears to have been no restriction of this sort.

In some of the numerous tombs of Etruria and Kerch (Panticapaeum) in the Cimmerian Bosphorus gold rings of great magnificence have been discovered, apparently of the finest Greek workmanship.

**Fig. 1.**

Fig. 1 shows a ring from the Crimea with a finely engraved scarabaeus in gold, with an intaglio design on the base.

**Fig. 2.**

Fig. 2, also from the Crimea, has a cornelian carved in lion form in place of the scarab, and has an intaglio figure on the base of a running lion.

**Fig. 3.**

Fig. 3 shows a Greek ring with an incised design in a plain bezel.

**Fig. 4.**

Fig. 4 is a ring from which the idea of a signet is entirely wanting.

Figs. 1-6, 8 and 9 are from Dr Robert Forrer's Reallexikon, by permission of W. Spemann, Berlin and Stuttgart.
The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phoenician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian, which are a link between the art of Egypt and that of Greece, the design cut on the flat side being Hellenic in style, while the back is shaped like the ordinary Egyptian scarabaeus beetle. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with a lion of heraldic character. An alternative type of Etruscan ring (as in fig. 5) has an incised design on the gold bezel, or a flat stone set in the case the Etruscan rings tend to extravagance in size and elaboration.

The Romans appear to have imitated the simplicity of Lacedaemonia. Throughout the republic none but iron rings were worn by the bulk of the citizens, and even these were forbidden to slaves. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites and all the chief officers of state received the *jus annuli aurei*. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactylithecæ* was dedicated in the temple of Apollo Palatinus by Augustus's nephew Marcellus (Pliny, *H.N.* xxxviii. 5). This temple of Concord in the Forum contained another; in this collection was the celebrated ring of Polykrates, king of Samos, the story of which is told by Herodotus; Pliny, however, doubts the authenticity of this relic (*H.N.* xxxvii. 2).

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings in the case of those who were not of free descent (Pliny, *H.N.* xxxii. 8); Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *jus annuli aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

In the rings of the Roman period the decoration is no longer an accessory of the bezel alone. It modifies the form of the hoop, which may be polygonal or angular (see fig. 6). The ring here figured is set with an eye, as an amulet, capable of turning on a swivel.

In the 3rd and 4th centuries Roman rings were made engraved with Christian symbols. Fig. 7 shows two silver rings of the latter part of the 4th century which were found in 1881 concealed in a hole in the pavement of a Roman villa at Fifhead, Dorset. Fig. 8 is a choice example of a gold key-ring of the Christian period, with good wishes inscribed in pierced gold work—*accipe dulcis, multis annis* (Brit. Mus.).

**Part of Fig. 9.**

![Part of Fig. 9.](image)

Fig. 9 is a gold ring from Smyrna (Brit. Mus.) with seven incised intaglio medallations, with a figure of Christ on the bezel. Assigned to the 5th century.

Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of very pure gold, often penannular in form—with a slight break, that is, in the hoop so as to form a spring. They are often of gold wire formed into a sort of rope, or else a simple bar twisted in an ornamental way. Some of the quite plain penannular rings were used in the place of coined money.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial and private matters. The episcopal ring was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the earliest references to rings worn by bishops, there is nothing to distinguish them from other signet rings. In A.D. 610 the first mention has been found of the episcopal ring as a well-understood symbol of dignity. It is clear that it was derived from the signet. It was only in the 12th century and onwards that it was brought into mystical connexion with the marriage ring. In the time of Innocent III. (1194) the ring was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly kept. Owing to the custom of burying the episcopal ring in its owner's coffin, a great many fine examples still exist. Among the splendid collection of rings formed by the distinguished naturalist Edmund Waterston, and now in the South Kensington Museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alastair, bishop of Sherborne from 824 to 867 (see fig. 10). In many cases an antique gem Fig. 10.—Ring of Bishop Alastair.

was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the pagan figure. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St Oswald by adding the legend *CAPT S. OSWALDI*. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning—as, for example, a magnificent gold ring found in the coffin of Seffrid, bishop of Chichester (1125-1151), in which is mounted a Gnostic intaglio. Another in the Waterston collection bears a Roman cameo in plasma of a female head in high relief; the gold ring itself is of the 12th century. More commonly the episcopal ring was set with a large sapphire, ruby or other stone cut en cabochon, that is, without facets, and very magnificent in effect (see fig. 11). It was

worn over the bishop's gloves, usually on the forefinger of the right hand; and this accounts for the large size of the hoop of these rings. In the 15th and 16th centuries bishops often wore three or four rings on the right hand in addition to a large jewel which was fixed to the back of each glove.

The papal "Ring of the Fisherman" (annulus pistorius) bears the device of St Peter in a boat, drawing a net from the water. The first mention of it, as the well-understood personal signet ring of the pope, that has been found, occurs in a letter of Clement IV. in 1265.

After the middle of the 15th century it was no longer used as the private seal of the popes, but was always attached to briefs. After the death of a pope the ring is broken. A new ring with the space for the name left blank is taken into the clavicle, and placed on the finger of the newly elected pontiff, who thereupon declares what name he will assume, and gives back the ring to be engraved (see Waterton, Archaeologia, 40, p. 138). The so-called papal rings, of which many exist dating from the 15th to the 17th centuries, appear to have been given by the popes to new-made cardinals. They are very large thumb rings, usually of gilt bronze coarsely worked, and set with a foiled piece of glass or crystal.

On the hoop is usually engraved the name and arms of the reigning pope, the bezel being without a device. They are of little intrinsic value, but magnificent in appearance.

The giving of a ring to mark a betrothal was an old Roman custom. The ring was probably a mere pledge, pignus, that the contract would be fulfilled. In Pliny's time conservative custom still required a plain ring of iron, but the gold ring was introduced in the course of the 2nd century. This use of the ring, which was thus of purely secular origin, received ecclesiastical sanction, and formulae of benediction of the ring exist from the 11th century. The exact stages by which the wedding ring developed from the betrothal ring can no longer be traced.

Gemel or gimmel rings, from the Latin gemellus, a twin, were made with two hoops fitted together, and could be worn either together or singly; they were common in the 16th and 17th centuries, and were much used as betrothal rings.

Posy rings, so called from the "posy" or rhyme engraved on them, were specially common in the same centuries. The ring of "posy" does not occur earlier than the 16th century. A posy ring inscribed with "Love me and leave me not" is mentioned by Shakespeare (Mer. of Ven., act v. sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as ZEAM, ZANF, KAHN, or toto mei Claudia vives.

In the Middle Ages many rings were inscribed with words of cabalistic power, such as ana, sa, or Caspar, Melchior and Balthasar, the supposed names of the Magi. In the 17th century they were largely used as wedding rings, with such phrases as "Love and oblige," "God above the seas, my love," or "Muler viro subjesta esto."

In the same century memorial rings with a name and date of death were frequently made of very elaborate form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

Cramp rings were much worn during the Middle Ages as a preservative against cramp. They derived their virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings were not uncommon, especially in the 15th century; these were so called from their having ten knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine aves and a paternoster. In some cases there are only nine knobs, the bezel of the ring being counted in, and taking the place of the gaudé in a rosary. The bezel of these rings is usually engraved with a sacred monogram or word.

In the 15th and 16th centuries signet rings engraved with a badge or trademark were much used by merchants and others; these were not only used to form seals, but the ring itself was often sent by a trusty bearer as the proof of the genuineness of a bill of demand. At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Other fine gold rings of this period have coats of arms or crests with graceful lambrequins.

Poison rings with a hollow bezel were used in classical times; as, for example, that by which Hannibal killed himself, and the poison ring of Demosthenes. Pliny records that, after Crassus had stolen the gold treasure from under the throne of Capitoline Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately. The medieval anello della morte, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel a hollow point made to work with a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a way that the murderer could give the fatal scratch while shaking hands with his enemy. This device was probably suggested by the poison fang of a snake.

A very large and elaborate form of ring is that used during the Jewish marriage service. Fine examples of the 16th and 17th centuries exist. In the place of the bezel is a model, minutely worked in gold or base metal, of a building with high gabled roofs, and frequently movable weathercocks on the apex. This is a conventional representation of the temple at Jerusalem.

Perhaps the most magnificent sets of rings from the beauty of the workmanship of the hoop are those of which Benvenuto Cellini produced the finest examples. They are of gold, richly chased and modelled with cartouches and grotesque figures, and are decorated with coloured enamels in a very skilful and elaborate way. Very fine jewells are sometimes set in these magnificent pieces of 16th-century jewellery.

Thumb rings were commonly worn from the 14th to the 17th century. Falstaff boasts that in his youth he "scored enough to buy an elderman's thumb ring" (Shakes., Hen. IV., Pt. I., act ii. sc. 4).

The finest collections of rings formed in Britain have been those of Lord Londesborough, Edmund Waterton (now in the Victoria and Albert Museum) and the collection in the British Museum, which was greatly augmented in 1878 by the bequest of the late Sir A. W. Franks.

"Anneaux"; articles of Waterton in Archaeologia and Archaeological Journal.

RING-GOAL, a game for two persons played on a ground, or indoor rink, 78 ft. long by 10 ft. wide, with a ring of split cane about 7½ in. in diameter and weighing about 3 oz., which is propelled in the air by means of two sticks, resembling miniature billiard-cues, which are held inside the ring. The goals consist of two uprights 8 ft. high and 10 ft. apart, from which a net is stretched on an incline, so that its base will be a few feet behind the goal-line, and the object of the game is to drive the ring into these goals. Each player may be accompanied by another as "shadows" in the ring must be expelled by the server and caught by his opponent, on one or both of his sticks, if he can, and so returned alternately, and a point is scored for either player if it be stopped by his opponent in any other manner. A point is also scored for the receiver if the server, who begins the game, throw the ring so that it falls to the ground before it returns.

The celebrated ring given to Essex by Queen Elizabeth was meant to be used for a similar purpose. It is set with a fine cameo portrait of Elizabeth cut in sardonyx, of Italian workmanship.
the receiver can catch it between the creases, which are lines drawn across the court 6 ft. from the goal-lines, or the ring be driven out of court. Eleven points constitute a game. Ring-goal was invented by an undergraduate of Keble College, Oxford, about 1885, and was played at Oxford, but without attracting any wide popularity.

RINGWOOD, a market town in the New Forest parliamentary division of Hampshire, England, 1034 m. S.W. by W. from London by the London & South-Western railway. Pop. (1901) 4629. It lies pleasantly on the river Avon, which here divides into numerous branches, flowing through flat meadow land. The church of St. Peter and Paul, which was almost entirely reconstructed in 1854, the town hall and corn exchange are the chief buildings. A large agricultural trade and manufactures of agricultural implements, linen goods and woollen gloves are carried on.

RINGWORM (or Tinea tonsurans), a disease of the scalp (especially common within the tropics); it consists of bald patches, usually round, and varying in diameter from half an inch up to several inches, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. In scrofulous subjects matter is sometimes produced, which forms crusts, or glues the hair together, or otherwise obscures the characteristic appearance. The disease is due to a parasite, Trichophyton tonsurans, which exists mostly in the form of innumerable spores (with hardly any mycelium), and is most abundant within the substance of the hairs, especially at their roots. If a piece of the hair near the root be soaked for a time in dilute liquor potassae and pressed flat under a cover-glass, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size, and each bearing a nucleus.

The same fungus sometimes attacks the hairs of the beard, producing a disease called "syssosis." Sometimes it invades the hairless regions of skin, forming "tinea circinata"; circular patches of skin disease, if they be sharply defined by a margin of papules or vesicles, may be suspected of depending on the tinea-fungus. Interesting varieties of tinea are found in some of the Pacific and East Indian islands. Among the best remedial agents are various mercurial preparations. But in modern practice much success has been found in X-raying the patch in order to remove the dead and diseased hairs, thus leaving a free channel for the passage of antiseptic applications to the follicles. The exposures are followed by inunction of a mercurial preparation or of a lotion of tincture of iodine with methylated spirit.

RINTOOL, ROBERT STEPHEN (1787-1828), British journalist, was born at Tibbermore, Perthshire, in 1787, and educated at the Aberdalgie parish school. After serving his apprenticeship to the printing trade he became the printer and subsequently the editor of the Dundee Advertiser. In 1826 he came to London, and in July 1828, with the assistance of friends, founded The Spectator. In it Rintool strongly supported the Reform Bill, and to him was due the catchphrase "The bill, the whole bill, and nothing but the bill." After conducting The Spectator for more than thirty years, he sold it shortly before his death, which occurred on the 22nd of April 1858.

RIOTTO, GIANNI BATTISTA (1592-1653), archbishop of Fermo, was born in Fermo on the 15th of September 1592, being the son of a senator. He studied at several Italian universities, became chamberlain to Pope Gregory XV., and in 1625 was made archbishop of Fermo. His participation in Irish politics, which is his chief title to fame, began during the later stages of the Civil War when Ireland was the scene of universal disorder. In 1645 Pope Innocent X. despatched him to that country as papal nuncio; he landed at Kenmare with arms and money in October 1645, and took up his residence at Kilkenenny. Before this time the Roman Catholics had banded themselves together for defence. Called the Confederate Catholics, they had set up a provisional government, and when the nuncio reached Kilkenny they were engaged in negotiating for peace with the lord lieutenant, the marquess, afterwards duke, of Ormonde. Rinuccini took part in the proceedings, but as his demands were ignored he refused to recognize the peace which was concluded in March 1646, and gaining the support of the Irish general, Owen Roe O'Neill, he used all his influence, both ecclesiastical and political, to prevent its acceptance by others. To a large extent he succeeded. Meeting at Waterford, the clergy condemned the treaty and several towns took up the same attitude. The nuncio's most pliant helper was now Edward Somerset, earl of Glamorgan, afterwards marquess of Worcester, who had been sent to Ireland by Charles I., and who had entered into communication with Rinuccini when the latter first arrived in that country. Glamorgan bound himself to carry out all the wishes of the nuncio, who intended that he should supplant Ormonde. In September 1646 Rinuccini took over the conduct of affairs. He imprisoned his opponents on the council and tried to arrange for an attack on Dublin. But there was no harmony among his subordinates, his military plans failed and soon all parties were tacitly ignoring him. Leaving Kilkenny he stayed for some time in Galway, and in February 1649 he left Ireland. After visiting Rome he returned to Fermo in 1650 and died on the 5th of December 1653.

See G. Aiauzzi, La Nunziatura in Irlanda (Florence, 1844), English translation as The Embassy in Ireland, by A. Hutton (Dublin, 1873); and S. R. Gardiner, History of the Great Civil War, vols. iii. and iv. (1895).

RIOBAMBA or ROYABAMBA, a town of Ecuador, capital of the province of Chimborazo, on the railway between Guayaquil and Quito, about 85 m. E.N.E. of the former. Pop. (1900, estimate) 12,000. It stands in a barren, sandy basin of the great central plateau, drained by the Chamo, a tributary of the Pastaza, on the old road running southward from Quito into Peru, 9039 ft. above sea-level, and in full view of the imposing heights of Chimborazo, Carahuairazo (Carguairazo), Carabuairazo and Achipa, 12,000 ft. lower than Quito, its climate is considerably colder, owing, perhaps, to its more exposed situation and the vicinity of so many snow-clad peaks. It is a town of unusually wide streets and one-storeyed abode houses, being so laid out and built because of earthquakes. It has very little importance as a commercial or industrial centre, having only a small trade and a few unimportant industries. The present town dates from 1797, when the great earthquake of that year destroyed the old town then situated 12 m. W., near the existing village of Cajabamba. The ruins of the old town indicate that it was much larger and finer than its successor.

RIO CUARTO, a town of Argentina in the province of Cordoba, 159 m. S. of the city of that name, and about 500 m. N.W. of Buenos Aires. Pop. (1904, estimate) 12,000. It stands 1440 ft. above sea-level and about half-way across the great Argentine pampas, on the banks of a river of the same name which finds an outlet through the Carcaralá into the Parana near Rosario. The town is built on the open plain and is surrounded with attractive suburbs. It is the commercial centre of a large district and has a large and lucrative trade. Its geographical position gives it great strategical importance, and the government maintains here a large arsenal and a garrison of the regular army. The surrounding country belongs to the partially arid pampa region and is devoted to stock-raising—cattle, horses, sheep and goats. Irrigation is employed in its immediate vicinity. Previous to 1872 this region was over-run by the Ranqueles, a warlike tribe of Indians, but the vigorous reprisals of General Ivanovski in that year, supplemented by the tactful intervention of the Franciscan missionaries, who have a convent in this town, put an end to these hostile forays and gave full opportunity for the industrial development of the country. There are some manufacturing industries in the town. The National Andine railway passes through Rio Cuarto, and branch lines connect with the Buenos Aires and Pacific line—all of which give railway communication
with Buenos Aires, Rosario, Tucumán, Cordoba, San Luis and Mendoza.

**RIO DE CONTAS**, or VILLA DE CONTAS, a town of Brazil in the state of Bahia, 230 m. S.W. from the city of Bahia, on the Brumado (Contas-Pequeño), a head stream of the Rio de Contas (Jussâpe), which rises on the eastern slope of the neighboring hill, the Atumã, and joins E. and S. to the Atlantic coast at Barra do Rio de Contas. Pop. (1890), exclusively rural districts, 17,318. The surrounding country is fertile and produces sugar, cotton, mandioca and tobacco, but has lost much of its prosperity through the droughts that have devastated the interior of the state, and because of the costs of transporting produce to market. Stock-raising was at one time an important industry here. The town was founded in 1715 by some "Paulistas" who discovered gold there in the sands of the river. It became a "villa" in 1724, but was soon afterward moved down the river 5 m. to a more convenient site on the high road between Bahia and Goiás.

**RIO DE JANEIRO**, a maritime state of Brazil, bounded N. by Minas Geraes, E. by Espírito Santo and the Atlantic, S. by the Atlantic, and W. by São Paulo. It is one of the smaller states of the republic and has an area of 26,635 sq.m.; pop. (1900) 926,585. The state is traversed longitudinally by the Serra do Mar, which divides it into a low, narrow, irregular coastal zone, and a broad elevated river valley through which the Parahyba flows eastward to the Atlantic. The eastern part of this valley widens out into a great alluvial plain on which to be found some of the richest sugar estates of Brazil. The central mountainous region is heavily wooded, the coast region is hot and in places malarial, but the valleys are fertile and well watered. The Parahyba valley has long been celebrated for its fertility, and was for many years the centre of the coffee-producing industry. The exhaustion of the soil and antiquated methods of cultivation have caused a great decline in this industry, and many of its coffee plantations are now either abandoned or are producing but a fraction of earlier crops. Stock-raising has been slowly developing since the abolition of slavery (1888) and the decline in coffee production, and the state now possesses large herds of cattle and droves of swine.

The state's agricultural and pastoral products are coffee, sugar, rum, Indian corn, mandioca (both bitter and sweet), cotton, tropical fruits (bananas, mangoes, guava), rice, coffee beans, butter, cheese, fresh milk and lard. The state is well watered by the Parahyba and its tributaries and by numerous short streams flowing from the Serra do Mar to the coast. Manufacturing has been developed largely because of the cataracts supplied by the mountain streams, and among the manufactures are cotton, woolen, silk and jute fabrics, brick, tile, and rough pottery, sugar, rum, vehicles, furniture, beer and fruit conserves. The state is well provided with railways, which include the Central do Brasil, Leopoldina, Melhoramentos and Rio do Ouro. The Central line runs from the city of Rio de Janeiro N.N.W. across the Serra do Mar to the Parahyba valley, where it divides into two branches at the station of Barra do Pirahy, one running westward to São Paulo, and the other eastward and northward into Minas Geraes. Besides these there are a number of short railways called the Theressopolis, União Valenciana, Rio das Flores, Bananal, and Vassouras lines. The total extension of these railways in the state in 1907 was 1445 m. Other than Niterói, the ports of the state are São João do Barra, Macaé or Imbituba, Cabo Frio and Paraty, but they are visited only by the smaller coastal vessels.

The capital of the state is Niterói on the E. side of the Bay of Rio de Janeiro, and other cities and towns, with their populations in 1890 except where otherwise stated, are: Campos (estimate, in 1907, 35,000), on the lower Parahyba in the midst of a rich sugar-producing region; Rio Bonito (19,321); Itaborahy (17,817); Barra Mansa (14,449), on the upper Parahyba; Resende (14,370), in a fertile district of the upper Parahyba; Petrópolis (27,611), a coffee district of the Serra do Mar; Paraty (10,760), a small port on the W. side of the bay of Angra dos Reis; Valença (11,665); Vassouras (6666); São Fidelis (11,770), a river port on the lower Parahyba having steamboat communication with Campos; Macaé (about 7000 in 1900), an old port on the eastern coast of the state at the mouth of the Macaé river whose original anchorage has been filled with silt, and that of Imbituba, in the vicinity, with which it is connected by tramway, is now used by vessels both for the town and the Macaé and Campos railway; Barra do Pirahy (7750), an important station and junction of the Central do Brasil railway on the N. side of the Serra do Mar, with large manufacturing and commercial interests; Parahyba do Sul (7345), in a fertile, long-settled district in the N.E. part of the state; Maricá (10,373); Cabo Frio (10,382); Pirahy (10,429); Saquarema (12,489); Nova Friburgo (9857); and Araruama (9087).

**RIO DE JANEIRO** (in full, SÃO SEBASTIÃO DO RIO DE JANEIRO, colloquially shortened to Rio), a city and port of Brazil, capital of the republic, and seat of an archbishopric, on the western side of the Bay of Rio de Janeiro, or Guanabara, in lat. 25°34′23″ S., long. 43°8′34″ W. (the position of the Observatory). The city is situated in the S.E. angle of the Federal District (Distrito Federal) formerly known as the Neutral Municipality (Município Neutro), an independent district or commune with an area of 538 sq. m., which was detached from the province of Rio de Janeiro in 1834. The city stands in great part on an alluvial plain formed by the filling in of the western shore of the bay, which extends inland from the shore-line in a north-westerly direction between a detached group of mountains on the S. known as the Serra da Carioca, and the imposing wooded heights of the Serra do Mar on the N. The spurs of the Carioca range project into this plain, in some places, closely up to the margin of the bay, forming picturesque valleys within the limits of the city. Some of the residential quarters follow these valleys up into the mountains and extend up their slopes and over the lower spurs, which, with the hills covered with buildings rising in the midst of the city, give a picturesque appearance. At the entrance to the bay is the Sugar Loaf (Pão de Açucar), a conical rock rising 1312 ft. above the water-level and forming the terminal point of a short range between the city and the Atlantic coast. The culminating point of that part of the Carioca range which projects into and partly divides the city is the Corcovado (Hunchback), a sharp rocky peak 2345 ft. high overlooking the Botafogo suburb and approachable only on the wooded N.W. side. These spurs are covered with luxuriant vegetation, excepting their perpendicular faces and the slopes occupied by the suburbs. Considerably beyond the limits of the city on its S.W. side, but within the municipality, is the huge isolated flat-topped rock known as the Gavea, 2575 ft. high, which received its name from its resemblance to the square sail used on certain Portuguese craft. The sky-line of this range of mountains, as seen by the approaching traveller some miles outside the entrance to the bay, forms the rough outline of a huge reclining figure called "the sleeping giant," the facial profile of which is also known as "Lord Hood's nose."

The entrance to the bay, between the Sugar Loaf on the W. and the city on the E., with fortress of Santa Cruz on one side and the fort of São João on the other, is about a mile wide and free from obstructions. Almost midway in the channel are the little island and fort of Lage, so near the level of the sea that the spray is sometimes carried completely over it. On the W. is the semicircular bay of Botafogo, round which are grouped the residences of one of the richest suburbs; on the E., the almost land-locked bay of Jurujuba (see Niterói). The bay extends northward nearly 160 nautical miles, with a maximum breadth of 11 m. and a minimum, between the arsenal of war (Fonse da Colombo) and the opposite Fonse da Gravatá, of 1000 ft. Its outline is irregular, and has been modified by the construction of sea-walls and the filling in of shallow bays. Close to the shore are the islands of Villegaignon (occupied by a fort), Cobras (occupied by fortifications, naval storeshouses, hospital and dry docks), Santa Barbara and Enxadas, the site of the Brazilian naval school. A small island just above the lower anchorage, which is occupied by port officials, was once known as Rat island, and is now called Ilha Fiscal. There is one lake.
within the urban limits, the Lagoa de Rodrigo de Freitas, near the Botanical Garden, separated from the sea by a narrow sand beach, which is being gradually filled in. Several small streams from the hills are conspicuous only in times of heavy rains.

The oldest part of the city, which includes the commercial section, lies between Castle and Santo Antonio hills on the S. and São Bento, Conceição and Livramento hills on the N., and extends inland to the Praça da República, though the defensive works in colonial times followed a line much nearer the bay. This section during the past century has extended southward along the bay shore in a string of suburbs known as the Cattete and Botafogo, with that of Lavradio behind the Cattete in a pretty valley of the same name, and thence on to the coast. The Old town is a group of independent streets and alleys, such as the major thoroughfares in the South city, Gavea, the last including the Botanical Garden. The greatest development has been northward and westward, where are to be found the suburbs of Cidade Nova, São Cristóvão, Engenho Novo, Praia Formoso, Pedregulho, Villa Isabel, Tijuca, and a number of smaller places extending far out on the line of the Central railway. The extreme length of the city along lines of communication is little less than 20 m.

**Streets.**—Some of the most modern streets on the plain have borrowed their names from Spanish-American popularities, but the greater part seems to have sprung into existence without any plan. Most of the streets of the old city are parallel and cross at right angles, but they are narrow and enclose blocks of unequal size. Few of them are independent streets, and the greater part is built up on the ground permits, and crooked ones where the shore-line or mountain contour compels. Since the beginning of the 20th century large sums have been borrowed and expended on new avenues. The widening and straightening of old streets, and the improvement of the water-front between the Passeio Público and the southern extremity of the Praia de Botafogo by the construction of a grand boulevard, partly on reclaimed land. One of these improvements consists of a central avenue cut across the city from a point on the water-front near the Passeio Público northward to the Saúde water-front. The shore-line boulevard, called the Avenida da Beira Mar is about 44 m. long, the wider parts being filled in with gardens. It was undertaken in 1903, during the administration of President Rodrigues Alves, as part of a vast scheme to improve the sanitary and traffic conditions of the city, including the construction of a new shore-line and filling in the shallow parts of the shore, which had long been considered one of the prime causes of the unhealthy state of the city. Another improvement was the completion and embellishment of the Mangue arterial road, regarded as an entrance to the city from the boats plying on the bay, but now destined for drainage purposes and as a public pleasure ground. This canal, as completed, is nearly 2 m. long, enclosed with stone walls, crossed by a number of bridges flanked by palm trees, and lined with royal palms. The most famous street of the old city is the Rua do Ouvidor, running westward from the market-place to the Largo de São Francisco de Paula, and lined with retail shops, cafés and newspaper offices. It was formerly a fashion parade of the ladies. The famous Rua de São Bento Hill fills an important part in the social and political life of the city. The principal business street is the Rua Primeiro de Março, formerly called Rua Direita, which extends from the Praça 15 de Novembro northward to São Bento Hill. All these old streets, excepting the last, are narrow and paved with squared granite blocks, and have their vehicle traffic regulated to go in one direction only. The side walks are very narrow, and the gas lamps are attached to the walls of the buildings. The streets and suburbs are served by five groups of tramway lines—Jardim Botânico, Santa Tereza, São Cristóvão, Villa Isabel, and Carris Urbanos—all using electric traction but the last. It has the cut-away system.

**Water Supply and Sewage Drainage.**—The water supply is derived from three sources: the small streams flowing down the mountain sides which serve small localities; the old Carioca aqueduct, dating from colonial times, which collects all the supply water from the mountainous area of the Serra da Carioca and brings it into the city through a channel which once crossed the gap between Santa Tereza and Santo Antonio hills on two ranges of stone arches (now used as a viaduct by the Santa Tereza Tramway Company); and the modern Rio do Ouro waterworks, which brings in an abundant supply from the Serra do Tiniquá, N.W. of the city—the length of the iron mains being 33 m. between the principal collecting reservoir and the main distributing reservoir at Pedregulho, near the Ponta do Cajú. There are three other distributing reservoirs in different parts of the city, and the supply, which has been augmented since the works were inaugurated in 1885, other areas are supplied with water by reservoirs constructed by the City Improvements Co., an English corporation, which initiated the work in 1853; and a separate system of rain-water drains. The Leicester system is used because the greater part of the sewers are below sea-level, and it is necessary to use powerful pumps.

**Climate.**—The climate of Rio de Janeiro is hot, humid and debilitating, the temperature ranging from 50° to 99° F. in the shade, with an average for the year of 74°, and the rainfall being about 44 in. The greater part of the city is only 2 or 3 ft. above sea-level, is surrounded by mountains, and has large expanses of water-swept beach in its vicinity. But the city is sheltered from the unhealthy winds of the marine, and is unhelathens of Rio de Janeiro in part. The sudden change from hot to cool, from unhealthiness to sanitary conditions and not to the climate. Yellow fever, whose first recorded appearance was in December 1849, was for many years almost a regular yearly visitant, and the mortality from it has been terrible. Smallpox also is practically endemic, owing in great part to negligent sanitary supervision. Since 1900 there have been several mild outbreaks of bubonic plague. These dangerous diseases are slowly disappearing as sanitary conditions are improved. The death-rate from tuberculosis, however, is high, and apparently shows no abatement. This is undoubtedly due to constitutional weakness among the inhabitants, who have no real native blood, and the city is now a mixture of Europeans and Indians in insanitary and congested districts. Malarial fevers are also common, and diseases of the digestive organs, in great part easily preventable, figure among the principal causes of death. According to official returns for the five years 1900–1905, the average number of deaths was 15,026, or 204 per 1000. Among the deaths 2780 were from tuberculosis, 1200 from smallpox, 778 from malarial diseases, 331 from la grippe, and 106 from beri-beri. There were no unusual epidemics during those years, and the rate given may be considered normal.

**Buildings.**—There remain many public edifices and dwellings of the colonial period, severely plain in appearance, with heavy stone walls and tile roofs. The old city palace facing upon Praça 15 de Novembro, once the residence of the fugitive Portuguese sovereign Dom João VI, is a good example. The 19th century brought no important modifications until near its close, when French and Italian styles began to appear, both in exterior decoration and in architectural design. The new Praça do Commercio (Merchants’ Exchange) and Post Office on Rua 1° de Março, and the national printing office near the Largo da Carioca, are notable examples. Since then exterior ornamentation and architectural features have been lightened, and the city is now a mixture of the plain one-storey and two-storey buildings of the Portuguese type, and fanciful modern creations, embellished with stucco and overtopping the others by many stories. Although a metropolitan see, Rio has no cathedral, the old imperial chapel facing the Praça 15 de Novembro being used for that purpose. The foundations were once laid for a great cathedral on the Largo de São Francisco de Paula, where now is the Municipal opera house, and for the Portuguese national theatre, and the foundations were afterwards used for the Polytechnic School. The most noteworthy church is the Candelária church, in the commercial district, whose twin towers and graceful terraces are a model of the new style of city church. It was begun in 1775, but was not finished until near the end of the 19th century. Its fine proportions, however, are concealed by commercial buildings and by the narrow streets. Among many other churches, usually plain and bare of interior decoration, are the popular São Francisco de Paula church, on the square of that name; the Carmo church in Rua 1° de Março; the Cruz dos Múrcia churches in the same street; the Rosário church in the
the name, belonging to a fraternity of negroes and once occupied by the episcopal chapter; and the pretty situated octagonal Church of São Pedro de Alcântara is situated on a hill over the lower bay. Another church of the same name faces on the Largo do Machado and shows the peculiar combination of a Greek temple surmounted by a modern spire. The British residents have an unpretentious little chapel on the Praca de D. Pedro II., which is the more modern structure on the Largo do Cattete and the Presbyterian a chapel near Praca Tiradentes. There is religious toleration in Brazil, but down to the organization of the republic no non-Catholic, and the chapel was intended to have a spire or other outward symbol of a place of worship.

Among public buildings of an official character the following are noteworthy. The old City Hall facing to Praca 15 de Novembro dates from 1743 and was the residence of the royal governors and Dom João VI., but is now used by the national telegraph offices. The São Cristóvão palace, in the suburb of that name, was the residence of the Emperor Dom Pedro II. It is a rambling structure now occupied by the National Museum. The Cattete palace, on the street of that name, originally a private residence, is now officially the residence of the President, richly decorated within and partly surrounded by a handsome park. The Flamârhy palace near the Praca da Republica, a typical private residence of the better class, was purchased for and occupied by the first presidents and is now occupied by the ministry of foreign affairs. The palace of justice, on Rua Dom Pedro II., is one of the finest edifices in the city, and the ministry of industry and public works, on the south side of the Praca 15 de Novembro may be noticed. The ministry of war has its seat in a handsome sawn-stone building on the north side of the Praca da Republica, and the ministry of marine in the naval arsenal at the foot of São Bento Hill. The ministry of finance is in the Treasury building on Rua do Sacramento—an immense structure in no special architectural line, but with a magnificent façade in the French Renaissance style. Bull-fights have never been popular in Rio de Janeiro, but horse-racing is a favourite sport, and the huge Hippodrome de Chacrinha maintains the same Xavier suburb. Other notable buildings are the ornate Monroe palace at the intersection of the Central and Beira-Mar avenues, the Praca do Commercio (Commercial Exchange) on Rua 1 de Março, the Faixa da Aramada on the Avenida Central, the custom-house with its extensive warehouses, the terminal station of the Central railway at the N.W. angle of the Praca da Republica, and the library building of the Gabinete Portuguez da Leitura with its elaborate façade of marble and granite.

Education.—Although much money is given to hospitals and asylums, Rio de Janeiro has no great educational institutions either public or private. The Medical School may be considered the only distinctively professional school in the city. The Polytechnic School, occupying an interesting old building on the Largo de São Francisco de Paula, is chiefly devoted to civil engineering. The Gymnasia Nacional, formerly the Collegio D. Pedro II., is a boys' college of a high school grade, located on Rua Floriano Peixoto, with an internato or boarding-school in Rua de S. Francisco Xavier. The college dates from 1735, when it was founded as an asylum for orphan boys destined for the Church. In 1837 it became a state institution and took the name of the Emperor Dom Pedro II. One of the most noteworthy schools of the city is the Lyceu de Artes e Officios, located on Rua 13 de Maio, opposite the opera-house; it dates from 1858 and has been the means of giving instruction to a multitude of clergies, artisans and others, through its night classes. Another important school, partly of this class, is the Instituto Benjamin Constant, located in a fine new edifice on the Praca da Saudade, Botafogo. The public schools of Rio de Janeiro are defective both in organization and administration; the non-attendance of children from the higher classes, and the antagonism of the Church to schools under purely secular administration, must be held responsible for the backwardness of these schools. The episcopal seminary on Castle Hill, called "Seminario Episcopal de São José," founded in 1730 and devoted exclusively to the education of priests, is the best classical school in the city. There are a number of charitable institutions devoted to the education of orphans, the blind and the deaf and dumb, which are admirably equipped and administered. Among other educational institutions are a conservatory of music, school of fine arts, normal school, a national library with upwards of 260,000 volumes and a large number of manuscripts, maps, medals and coins, the national observatory on Castle Hill, the national museum now domiciled in the São Christovão palace in the midst of a pretty park, a zoological garden in the suburb of Villa Isabel, and the famous Botanical Garden founded by Dom João VI. in 1808 and now a horticultural and botanical station.

Hospitals, &c.—Rio de Janeiro is well provided with hospitals, asylums and benevolent institutions. Chief of these is the Misericordia Hospital, popularly known as the "Santa Casa," belonging to a religious brotherhood dating from 1591. In addition to a large number of charitable hospitals, the São Sebastião hospital is a large building with a convent for the reception of the inmates in port. Other public hospitals are a lepers' hospital in São Cristóvão, the military and naval hospitals, the São Sebastião hospital and the isolation and contagious diseases hospitals in Jurujuba. There are also a number of private hospitals maintained by church brotherhoods and charitable associations; among them are the Portuguese hospital in Rua de Santo Amaro and the Strangers' Hospital (American and British) in Botafogo. Most prominent among the asylums is the Hospicio Nacional for the insane, on the Praia da Saudade, Botafogo, which was erected 1842-52, and is one of the most celebrated asylums in the world. The other hospital for the insane is on the island of Paquetá. The ministry of finance, while certain of the vessels, both river and ocean-going, are doubtless owned by the British colony being on a hill overlooking the Gamaa shore-line.

Harbour, Communications and Commerce.—The port and harbour of Rio de Janeiro are the largest and most important in the republic. The entrance is open to vessels of the largest draught, and there is sufficient deep-water anchorage inside for the navies of the world. The lower anchorage, where the officers of health visit vessels, is below Ilha Fiscal, and the upper, or commercial anchorage, is in the broad part of the bay above Ilha das Cobras, the national coasting vessels occupying the shallower waters near the Saúde and Gamaa districts. The commercial quays are built in deep water and permit the mooring alongside of the largest vessels. The total length of the commercial quays is about 3800 yds. Railway and tramway connexions are provided and both electric and hydraulic power are available. Special surtaxes are levied on imports to meet the interest and redemption charges on the loans raised for the execution of these important works. Another improvement is the extension of the sea-wall southward from the ferry-slips (Praca 15 de Novembro) to the Ponta do Calabouço (war arsenal), providing protected basins for the arsenal and enclosing small reclaimed areas. With the completion of these improvements the water-front of the city will consist entirely of deep-water walls from Botafogo to the Ponta do Caú, with the exception of a short section between the Ponta do Calabouço and the Avenida Central. The port is in regular communication with the principal ports of Europe and America. The coastwise service is good, though rates are high. Railway communication with the interior is maintained by the Central do Brazil (formerly the Dom Pedro II.), Lepoldina and Melhoramentos lines, besides which there is a short passenger line up to the Corcovado about 25 m. long, an electric line to Tijuca, and a narrow-gauge line running out to the Rio de Ouro waterfalls. There is also a narrow-gauge line running out to the coast of the bay from the head of the bay and thence by rail up the serra. Ferry-boats cross the bay to Niteroi at intervals of 20 minutes, and smaller craft provide communication with the islands of Gobernador and Paqueta.
Rio de Janeiro is the seaport for a large area of the richest, most productive, and thickly settled part of Brazil, comprising the states of Rio de Janeiro and Minas Geraes and a small part of eastern Sao Paulo. Its exports include coffee, sugar, hides, cabinet woods, tobacco and cigars, tapioca, gold, diamonds, manganese, and other small products. Rio is also a distributing center for the coastal trade, and many imported products, such as jerked beef, hay, flour, wines, &c., appear among the coastwise exports, as well as domestic manufactures. The total exports were valued in 1907 at $2,062,268 of 60,555,185 kilogrammes, each officially valued at about $27,846,000. The coffee-producing area tributary to this port is slowly expanding, and the concentration of the soil and the greater productivity of Sao Paulo has taken the lead. The exports of coffee from Rio in 1908 amounted to 3,042,628 bags of 60 kilogrammes each, officially valued at about $27,846,000. RIO DE ORO—RIO GRANDE DO SUL

RIO DE ORO, a Spanish possession on the N.W. coast of Africa. It is bounded W. by the Atlantic, E. and S. by Saharan territory under French protection. The northern frontier, where the protectorate adjoins the territory of the semi-independent tribes south of Morocco, is undefined. The most northerly point claimed by Spain on the coast is Cape Bojador. The southern and eastern boundaries were defined by a Franco-Spanish convention in 1900. The frontier traverses the middle of the Cape Blanco promontory, then runs eastward along the parallel of 21° 26' N. till it meets the meridian of 13° W., whence it turns first N.W. and afterwards N.E., meeting the tropic of Cancer at 15° N. and thereafter the African coast. A small part of the Sahara, Rio de Oro is nearly waterless. Oases are few. The sparse population consists almost entirely of nomad Arabs and Berbers. They are Mahomedans. In the south is the hilly country called Adrar Suttuf, not to be confounded with Adrar Temur (see Adrar and Sahara). The estimated area of the protectorate is 70,000 sq. m.

The peninsula of Rio de Oro, where is the principal Spanish settlement, occupies the central part of the coast-line in 23° 50' N., 16° W., and is united to the mainland by a sandy isthmus. Its length is 23 m., its breadth 12 to 2 m. and it is on an average about 2 m. deep. The bay between peninsula and mainland—the so-called Rio de Oro—sends out a broad, navigable river, five broad, navigable over two-thirds of its extent, with good anchorage in most of the channel, but the bar at its mouth is not always easy to pass in rough weather. The peninsula has very sparse vegetation, except in its southernmost part near Cape Durnford. At the head of the bay is a small island—Ilha Herne.

The climate is generally temperate, and not unhealthy except in the autumn. Esparto grass and manzanilla are grown in many places, but European plants are not easily acclimatized. On the peninsula and in the neighbouring country there are many wolves, foxes, hyenas, gazelles, lizards, hares, pelicans and large crows. The natives rear cattle, sheep, camels, and have but few horses. In one part of the coast the sand, brought in by the Atlantic on the coast of Rio de Oro abounds in fish, especially cod. The fishing industry is in the hands of the Canary Islanders and of the French.

The estuary between the mainland and the peninsula was taken by its Portuguese discoverers in the middle of the 15th century for a river, and, obtaining there a quantity of gold dust from the natives, they named it Rio d'Ouro (Gold River), Rio de Oro being the Spanish form. At a spot about 50 m. inland from the head of the estuary a Portuguese trading station was established, of which ruins exist, but the activity of the Portuguese was before long transferred to the true auriferous regions of the Gulf of Guinea.

The port in the Saharan coast dates from the 13th century, but was particularly directed to that part nearest the Canary Islands, a strip of coast over which she now exercises no sovereignty. The site of the fort of Santa Cruz de Mar Pequena, established in 1476, though not identified, was north of Cape Bojador. The protection of the Canary Islanders engaged in the fisheries south of that point occasioned, however, the presence of Spanish warships in these waters, and small trading stations were formed at Rio de Oro, Cape Blanco and elsewhere. To preserve the interests thus acquired, Spain in January 1885 took the territories on the coast between capes Blanco and Bojador under her protection. The year before the Hispanic-American Company had built a trading station on Rio de Oro peninsula, but in 1885 it was destroyed by the natives. The company renewed its operations, but subsequently ceded its rights to the Transatlantic Company of Barcelona. The extension inland of Spanish influence was opposed by France, which claimed a protectorate over the Sahara. The conflicting claims of the two powers were finally settled by the convention of 1900, which fixed the frontier in the manner stated. The administration is carried on under the control of the captain-general of the Canary Islands.

RIO GRANDE, a North American river, which rises in the San Juan Mountains of southern Colorado, flows S.E. and S. in Colorado, S. by W. and S. E. through New Mexico, and S.E. between Texas and Mexico to the Gulf of Mexico. Its length is approximately 1200 m., and for about 1300 m. it forms the international boundary between the United States and Mexico. It presents many features of a complex physiographic type, being first a river of the Rocky Mountains, then of the interior deserts and then of the Atlantic Coastal Plain. It also presents a complicated geological history, as it includes what were originally several distinct streams. The Mexicans call it the Rio del Norte in its upper course, the Rio Bravo in the "Big Bend," from the mouth of the Conchas river to the mouth of the Devils river, and the Rio Grande only in its course through the Coastal Plain. From its headwaters, 12,000 ft. above the sea, it rushes rapidly down a mountain canyon to San Luis Valley, in Colorado. It flows with moderate speed through this broad valley, enters a long canyon with a maximum depth of 400 ft., about 4 m. above the boundary between Colorado and New Mexico, and is hemmed in between canyon walls rising as high as 1000 ft. or between the sides of narrow mountain-valleys throughout its course through New Mexico. It passes through a series of picturesque canyons, some of them 1750 ft. in depth, in the "Big Bend," and becomes a silent, clear stream with a shifting channel in its passage through the Coastal Plain. Except in the flood season of May and June, the quantity of water which, for irrigation and urban consumption, is taken from the Rio Grande below its entrance to the San Luis Valley and the mouth of the Conchas, is greater than that received, and as a consequence it is an intermittent stream in this region. The flow of the Conchas is constant, and in the "Big Bend" the volume of the Rio Grande is enhanced by springs which break out in the bed. The total flow of the Rio Grande is ten times greater in some years than in others, and when its waters have been highest there have been great floods in its lower course and so much shifting of its banks as to cause important complications. Even in its course through the Coastal Plain the river is not entirely free from sand bars that it has little importance for navigation. As the increasing diversion of the water of the upper Rio Grande for irrigation in Colorado and New Mexico resulted in a scarcity of water for this purpose in Mexico, that country complained, and to remedy the evil the Reclamation Service of the United States proposed the construction by the United States of a storage dam across the river near Engle, New Mexico, which would form a storage reservoir having a capacity of 2,000,000 acre-feet and from which Mexico should be furnished with 60,000 acre-feet of water annually. Mexico agreed to this proposal and a treaty covering the matter was proclaimed in January 1907.

The principal towns and cities on the former are: Brownsville, Texas; Matamoros, Mexico; Laredo, Texas; El Paso, Texas; and Ciudad Juarez, Mexico.

RIO GRANDE DO SUL, a southern frontier state of Brazil, bounded N. by the state of Santa Catharina, E. by the Atlantic, S. by Uruguay and W. by Uruguay and Argentina—the Uruguay river forming the boundary line with the latter. Area, 91,333 sq. m. Pop. (1900) 1,140,070, an increase of 251,615 since 1890. The northern part of the state lies on the southern slopes of the elevated plateau extending southward from São Paulo across the states of Paraná and Santa Catharina, and is much broken by low mountain ranges whose general direction across the trend of the slope gives them the appearance of escarpments. A range of low mountains extends southward from the Serra do Mar of Santa Catharina and crosses the state into Uruguay. West of this range is a vast grassy plain devoted principally to stock-raising—the northern and most elevated part being suitable in pasturage and climate for sheep, and the southern for cattle. East of it is a wide coastal zone only slightly elevated above the sea; within it are two great tide-water lakes—Lagôa dos Patos and Lagôa Mirim—which are separated from the ocean by two sandy, partially barren peninsulas. The coast is one great sand beach, broken only at one point—that of the outlet of the two lakes, called the Rio Grande, which affords an entrance to navigable inland waters and several ports. There are two
distinct river systems in Río Grande do Sul—that of the eastern slope draining to the tide-water lakes, and that of the La Plata basin draining westward to the Uruguay. Fully one-third of the state belongs to the La Plata drainage basin. The larger rivers of the eastern group are the Jacuí, Sinos, Cachy, Gravatahi, and Camaquã, which flow into the Lagôa dos Patos, and the Jaguarió which flows into the Lagôa Mirim. All of the first named, except the Camaquã, drain one of the two vast estuaries opening into the northern end of Lagôa dos Patos, which is called the Rio Guabuya, though in reality it is not a river. It is broad, comparatively deep and about 35 m. long, and with the rivers discharging into it it affords upwards of 200 m. of fluvial navigation. The Jacuí is one of the most important rivers of the state, rising in the ranges of the Cordillera (Cuchilla) Grande of the North and flowing S. and E. to the Guabuya estuary, with a course of nearly 300 m. It has two large tributaries—the Vaccacahy from the S. and the Taquary from the N.—besides many small streams. The Jaguarió, which forms part of the boundary line with Uruguay, is navigable 26 m. up and beyond the town of Porto Alegre, the many streams flowing northward and westward to the Uruguay, the largest are the Ijubiyaguassu, of the plateau region, the Ibicuhy, which has its source in the central part of the state, near Santa Maria, and flows westward to the Uruguay a short distance above Urugayana and the Quaraquã, or Quaraquã, which forms part of the boundary line with Uruguay. The Uruguay river itself is formed by the confluence of the Rio das Canas and Rio Pelotas in about long. 50° 30' W. With its southern confluence, the Rio Pelotas, which has its source in the Serra do Mar, on the Atlantic coast, it forms the northern and western boundary line of the state down to the mouth of the Urugayana. In addition to the Lagôa dos Patos and Lagôa Mirim there are a number of small lakes on the sandy, swampy peninsulas that lie between the coast and these two, and there are others of a similar character along the northern coast. The largest lake is the Lagôa dos Patos (Lake of the Patos—an Indian tribe inhabiting its shores at the time of the discovery), which lies parallel with the coast-line, N.E. and S.W., and is about 133 m. long exclusive of the two arms at its northern end, 25 and 35 m. long respectively, and of its outlet, the Rio Grande, about 24 m. long. Its width varies from 22 to 36 m. The lake is comparatively shallow and filled with sand banks, making its navigable channels tortuous and difficult to navigate. The Lagôa Mirim occupies a similar position farther S., on the Urugayana frontier, and is about 168 m. long by 6 to 22 m. wide. It is more irregular in outline and discharges into Lagôa dos Patos through a navigable channel known as the Rio São Gonzalo. A part of the lake lies in Urugayana territory, but its navigation, as determined by treaty, belongs exclusively to Brazil. Both of these lakes are evidently the remains of an ancient depression in the coast-line shut in by sand beaches built up by the combined action of wind and current. They are of the same level as the ocean, but their waters are affected by the tides and are brackish only a short distance above the Rio Grande outlet.

Rio Grande lies within the South Temperate zone and has a mild temperate climate, except in the coastal zone where semi-tropical conditions prevail. There are only two well-marked seasons, though the transition periods between them (about two months each) are sometimes described as spring and autumn. The winter months, June to September, are characterized by clear, dry days and very cold nights, with temperatures sometimes falling to the freezing point, especially in the mountainous districts. Snow is unknown, but ice frequently forms on inland waters during cold winter nights, or even freezes on the surface of the rivers during storms. Summer is a distinctly dry season, light rains are common, northerly and easterly winds prevail, and the temperature rises to 95° in the shade. Cases of insolation are not rare. Malaria is unusual and the state has a high reputation for healthiness, though insanitary conditions are responsible for various diseases in large communities.

The principal industry of the state is stock-raising, especially on the southern plains, where large estancias (ranchoes) are to be found. This industry originated with the Jesuit missions on the Uruguay early in the 17th century, and its development here has been much the same as in Argentina and Uruguay. No general effort was made before the 20th century to improve the herds by the importation of better breeds. After the close of the 19th and the beginning of the 20th century many vigorous efforts were made to purchase good stock from Argentine and Chile. The state of decay until higher tariff rates were imposed on imported carne seca (jerked beef) toward the end of the 19th century. The export of live-stock is insignificant, the practice being to sell to the states of Santa Catarina, Espirito Santo, and Minas Gerais and only for the production of tallow, 6,174,189; and large quantities of leather, horns, hoofs, bone-ash and preserved meats. Horses, mules, sheep, goats and swine are also raised; the raising of sheep being fostered by the building of woolen factories, and that of swine by the higher prices on imported pork and lard. In some parts of the state agriculture claims much attention, especially in the forested districts of the north where colonies of foreign immigrants have been established. The principal products are wheat, Indian corn, rice, beans, peas, onions, garlic, farinha de mandioca (cassava flour), potatoes, tomatoes, cabbage, fruit, tobacco and peanuts—all of which find a ready market on the coast. Grapes are grown in several localities (São Leopoldo, Alegrete, Bagé, &c.) for wine-making, and the industry has become important—the export in 1905 being 2,932,417 litres. The forest products include heres mate or Paraguay tea (Ilex paraguariensis), timbó (Piptadenia piperacea) and guarana (Paullinia cupana). Coal of an inferior quality is mined at São Jeronimo, on a small tributary (Arruio dos Ratos) of the Jacuí river, and has been discovered in other localities. Lime is burned at Caçapava, and whole other products can be produced, but are not much considered. Cotton, tobacco, and sugar have been cultivated, but to a small extent, and the potato is the only vegetable very extensively raised. The horse is the only domesticated animal in large numbers in the state, and the sheep are lax in distribution. There are a large number of oxen, horses, and cattle in the state. The animal statistics were made in 1899, at the end of the year, and the following were the results: Horses, 28,048; mules, 40,000; sheep, 1,100,000; cattle, 30,000,000; swine, 3,000,000; poultry, 300,000. The cattle are used for the production of beef, fat, butter, cheese, and leather. A large number of families in the north and the south have farms, and the grain is raised in all parts of the state. The surface of the state is about 150,000 square miles, of which 90,000 are under forest, 50,000 cultivated and 5,000 inlaid with plantations. The state has a narrow strip of land on the Atlantic and on the Pacific, and about 230 miles of the Urugayana Coast. The climate is very healthy, and the temperature is from 65° to 75° during the summer months. The state has a large number of springs, lakes, and rivers, and the water is abundant and of good quality. The state has a large number of tributaries, and the finest lake in the state is the Lagoa do Itaquy, which is 20 miles long and 5 miles wide, and is an excellent source of water for the city of Porto Alegre. The state has a large number of lakes and rivers, and the water is abundant and of good quality. importance on the Quaraim river opposite the Uruguayan town of Santo Eugenio, and surrounded by a rich grazing country which supports one of the largest saladeros in the state; São Leopoldo; Santa Maria da Bocca do Monte; and Uruguaiana.

The territory was first settled along the Uruguay river by the Jesuits when they were compelled to abandon their missions on the upper Paraguay. Between 1632 and 1707, they founded on the E. side of the Uruguay seven missions—under Spanish jurisdiction—which became highly prosperous, and at the time of their transfer from Spanish to Portuguese rule by a treaty of 1750 had an aggregate population of about 14,000, living in villages and possessing large herds of cattle and many horses. A joint effort of the two powers in 1753 to enforce the treaty, remove the Indians to Spanish territory, and mark the boundary line, led to resistance and a three years' war, which ended in the capture and partial destruction of the missions. On the coast the first recognized settlement—a military post at Estreito, near the present city of Rio Grande—was made in 1737. Before this, and as early as 1680, according to some chroniclers, the region S. of Santa Catharina was occupied by settlements, or penal colonies, of degradados (banished men) and immoral women from Santos, São Vicente and São Paulo, and was known as the “Continente de São Pedro.” In 1738 the territory (which included the present state of Santa Catharina) became the Capitania d’El Rei and was made a dependency of Rio de Janeiro. Territorial disputes between Spain and Portugal led to the occupation by the Spanish of the town of Rio Grande (then the capital of the capitania) and neighbouring districts from 1750 to 1756, when they reverted to the Portuguese. The capture of Rio Grande in 1763 caused the removal of the seat of government to Viamão at the head of Lagôa dos Patos; in 1773 Porto dos Cazaes, renamed Porto Alegre, became the capital. In 1801 news of war between Spain and Portugal led the inhabitants of Rio Grande to attack and capture the seven missions and some frontier posts held by the Spaniards since 1753; since 1801 the boundary lines established by treaty in 1777 have remained unchanged. The districts of Santa Catharina and Rio Grande had been separated in 1766 for military convenience, and in 1807 the latter was elevated to the category of a capitania-geral, with the designation of “São Pedro do Rio Grande,” independent of Rio de Janeiro, and with Santa Catharina as a dependency. In 1812 Rio Grande and Santa Catharina were organized into two distinct comarcas, the latter becoming an independent province in 1822 when the empire was organized. In 1835 a separatist revolution broke out in the province and lasted ten years. It was reduced more through the use of money and favours than by force of arms; but the province had suffered terribly in the struggle and did not recover its losses for many years. An incident in this contest was the enlistment of Garibaldi for a short time with the forces of the separatists. In 1865 a Paraguayan army invaded the state and on the 5th of August occupied the town of Uruguaiana. On the 18th of September following, the Paraguayan general (Estigarribia) surrendered without a fight—an unusual occurrence in the remarkable war that followed. Political agitations have been frequent in Rio Grande do Sul, whose people have something of the temperament of their Spanish neighbours, but no important revolution occurred after the “ten years’ war” (1835-45) until the presidency at Rio de Janeiro of General Floriano Peixoto, whose ill-considered interference with the state governments led to the revolt of 1892-94, under Guimens-Indio. To struggle the revolutionists occupied Santa Catharina and Paraná, capturing Curitiba, but were eventually overthrown through their inability to obtain munitions of war. An incident in this struggle was the death of Admiral Saldanha da Gama, one of the most brilliant officers of the Brazilian navy and one of the chiefs of the naval revolt of 1893-94, who was killed in a skirmish on the Uruguayan frontier at the close of the war.

RIO GRANDE DO SUL, or SÃO PEDRO DO RIO GRANDE DO SUL (sometimes SÃO PEDRO and commonly RIO GRANDE), a city and port of the state of Rio Grande do Sul, Brazil, on the western side of the Rio Grande (as the outlet of the Lagoa dos Patos is called), about 6 m. from its mouth and nearly 780 m. S.W. of Rio de Janeiro, in lat. 32° 7’ S., long. 52° 8’ W. Pop. (1890) of the municipio (area, about 656 sq. m.) 24,653; of the city, including its suburbs, 20,103; (1900, estimate) of the city, 22,000, and of the city and its suburbs, 30,000. Rio Grande is the seat of the Archdiocese of Porto Alegre. The town of Grande Rio Grande unusually now forms part of the railway system of the state leased to the Belgian Compagnie Auxiliaire de Chemin de Fer au Brasil. Some of the principal streets are served by tramways, and the Rio Grande to Bagé railway has an extension to its shipping wharf called “Estação Marítima” (1/4 m.), a branch to some points on the river (1/2 m.), and a branch to Costa do Mar, on the ocean coast (1 m.). The city is a port of call for several steamship lines, and has direct communication with European ports. The bar at the mouth of the river, however, restricts traffic to vessels of light draught, not exceeding 12 to 15 ft. Extensive improvements, at an estimated cost of about 150 millions of dollars, were undertaken in 1908 for deepening the bar to admit vessels of 30 ft. draught.

The city is built on a low sandy peninsula, barely 5 ft. above sea-level, formed by two arms of the Rio Grande projecting westward from the main channel, the peninsula being part of a large sandy plain extending southward along the coast to Lagôa Mirim. The level of the plain is broken by ranges of sand dunes, some of which rise not far from the city on the south and south-east. The openness of the surrounding country and the richness of the city in salt water give Rio Grande unusually healthy conditions, which, however, are largely counteracted by defective sanitary arrangements. Not infrequently the deaths exceed the births, and epidemics of contagious diseases make deadly inroads upon the population. The city has been developed irregularly, but the streets are for the most part broad, and the principal ones are well paved. Gas lighting was introduced about 1871, and in 1908 acetylene was used for public lighting. In one of the public squares is a shaft commemorating the abolition of slavery, and said to be the only monument in Brazil of that character. There is a notable scarcity of shade trees in the streets and squares, though flowers, shrubbery and some kinds of fruit trees are grown. In pleasing contrast to the drifting sands which surround the city is the fertile Ilha dos Marinheiros (Sailor’s Island) lying directly in front of the port; it is highly cultivated and supplies the market with fruit and vegetables. The water-front has been improved by substantial stone walls, which permit the mooring of light-draught vessels alongside.

Among noteworthy public buildings and institutions are the municipal palace, the parochial church of St. Pedro, national from the 18th century, the modern church of N.S. de Bomfim, the beautiful Protestant Episcopal church (Gothic), the public hospital (Hospital de Caridade), the hospital of the Beneficencia Portuguesa, the public library (Bibliotheca Rograndense), created and maintained by private effort and containing about 30,000 volumes, the old custom-house and the quartel-geral (military barracks). Rio Grande is wholly a commercial and industrial city. Its exports include salted jerked beef (carne secada or xarau), preserved meats, tongues, hides, horns, hoofs, woollen fabrics, Paraguay tea, beans, onions, fruit, flour, farinha de mandioca (cassava flour), lard, soap, candles and leather. Its manufactures include salts, leather, tobacco, men’s and ladies’ clothes, cotton, sugar, tobacco, beer, artificial drinks, boots, shoes and sandalas (alpergatas), soap and candles, fireworks, ice, earthenware, hats, cast-iron and leather. The pioneer woolen factory in Brazil, and one of the largest in the country, is in Rio Grande.

Rio Grande was founded in 1737 by José da Silva Paes, who built a fort on the river near the site of the present city and called it Estreito. In 1745 the garrison and settlement was removed by Gomes Freire d’Andrade to its present site, which became a “villa,” in 1751, with the name of São Pedro do Rio Grande, and a “cidade” (city) in 1807. It was the capital of the captaincy down to 1753, when it was captured by a Spanish force from Buenos Aires under the command of its governor, Don Pedro Zeballos, the seat of government being then removed to Viamão at the northern end of Lagoa des
RIOJA and RIOT

RIOJA, a territory of Argentina lying between the Colorado river and the 42nd parallel S. lat., within the geographical area formerly known as Patagonia, bounded N. by the territories of Neuquen and La Pampa, E. by the province of Buenos Aires and the Atlantic, S. by the territory of Chubut and W. by Chile and Neuquen. Area, about 75,924 sq. m.; pop. (1895) 9241; (1904, estimate) 18,648. That part of it lying between the Colorado and Negro rivers has much of the formation and characteristics of the "stere pampas," but with irrigation the greater part of it can be utilized for agriculture and grazing.

South of the Negro the country is arid, barren and lies in great shingle-covered terraces sloping eastward to the Atlantic; its larger part is practically uninhabitable, only the river valleys and the foot-hills of the Andes having a regular water supply. The rivers of the territory are the Colorado, which forms a part of the southern boundary, and the Negro, formed by the confluence of the Limay (which forms part of the western boundary) and Neuquen on the boundary between Río Negro territory and the territory of Neuquen. These rivers have no tributaries of importance within the territory, but the Limay receives some small streams from the Andean slopes. Lake Nahuel-Huapi lies partly in this territory (see NEUQUEN), and there are several small lakes scattered over the shingly steppes. The Atlantic coast-line of the territory has one deep indentation—the Gulf of San Matías—but, owing to the arid surroundings, there are no ports or towns upon it. The only industry of importance is grazing, the few sheep raised for export to Chile and a few in their own use.

The capital is Vielma (pop. in 1893, estimate, 1500), on the right bank of the Río Negro, 22 m. from its mouth and opposite Carmen de Patagones, a town and port of Buenos Aires. There are other small settlements on the Río Negro, which is navigable up to the Neuquen frontier (about 450 m.), but the only place of importance is General Roca (about 2300), a military and supply station situated a few miles below the confluence of the Limay and Neuquen rivers and connected with Bahia Blanca and Buenos Aires by a branch of the Great Southern railway.

RIO PARDO (formerly Villa do Río Pardo), a town of Brazil in the state of Rio Grande do Sul, on the left bank of the Jacuy at its confluence with the Pardo. Area (of the municipality) 17,377 sq. m. Pop. (1890) of the municipality, 19,346; (1908, estimated) of the town, 3500. The town is about 80 m. due west of Porto Alegre, with which it is connected by rail and steamer. The Jacuy is navigable by small steamers to this place, which was once an important military station and commercial centre. Its military importance has considerably declined through railway extension. The surrounding districts are fertile but only slightly cultivated, and stock-raising is its chief industry. The town had its origin in a frontier fort built at this point by the Portuguese in 1751, but did not reach the dignity of a "vila" until 1809.

RIOT (O. Fr. riots; of uncertain etymology), the gravest kind of breach of the peace, short of treason, known to the English law. It consists in a tumultuous disturbance of the peace by an assemblage of three or more persons who, with intent to help one another against any one who opposes them in the execution of some enterprise, actually execute that enterprise in a violent and turbulent manner, to the terror of the people. It is not necessary that violence should be used to any person or damage done to any property. Whether the enterprise itself is lawful or unlawful is not material, the gist of the offence lying in the mode in which the enterprise is carried out. (The Treffalon Square Riots, 1883, 16 Cox. Cr. Cas. 427; Stephen, Dig. Crim. Law, 6th ed., art. 77.) Nor is it material whether the enterprise is of a private or a public nature, though in the latter case the rioters may also be guilty of sedition or treason. An assembly in its inception perfectly lawful may become a riot if the persons assembled proceed to form and execute a common purpose in the manner above stated, although they had no such purpose when they first assembled. Riot differs from "Affray" in the number of persons necessary to constitute the offence, from an "Unlawful Assembly" in that actual tumult or violence is an

Patos. The city was occupied by the national forces in the ten years' war which began in 1835, and in 1834 it was unsuccessfully besieged by a small insurgent force that had attempted to overthrow the government at Rio de Janeiro. It is in the Lima province of Argentina, bounded N. by Catamarca, E. by Catamarca and Cordoba, S. by San Luis and San Juan and W. by San Juan and Chile. Area, 34,546 sq. m. Pop. (1895) 69,520; (1902, estimate) 82,090. The province is traversed from N. to S. by eastern ranges of the Andes and is separated from Chile by the Cordillera itself. The western part of the province is drained by the Bermejo, which flows southwards into the closed lacustrine basin of Mendoza. The eastern side of the province is arid, but in the extreme N. some small streams flow northward into Catamarca. The scanty waters of these streams are used for irrigation purposes. The principal industry of the province is that of mining, its mineral resources including gold, silver, copper, nickel, tin, cobalt, coal, alum and salt. Its best known mines are those of the Sierra de Famatina, 16,400 ft. above sea-level, where an aerial wire line is used for transportation to Chilcote in the valley below. The development of mining industries is seriously hindered by lack of water. For the same reason, agriculture is in a very backward condition. The climate is hot and dry, and there is no cultivation of the soil except in the valleys of the Cordillera and a few other places where irrigation is possible. Under these conditions, there are grown wheat (a limited extent), grapes, oranges, olives and tobacco. Alfalfa is grown to a considerable extent and is used for feeding the herds of cattle driven across country to Chile. The capital of the province is La Rioja (pop., 1904, about 6000), on the eastern flank of the Sierra de Velasco, about 1770 ft. above sea-level and near the gorge of Sanagasta, through which a small stream, also called Rioja, flows northward and affords water for the gardens, vineyards and orchards that surround it. The wines of Rioja are highly esteemed and are an important source of income for the district. The town is connected by rail with Cordoba and Catamarca. It was founded in 1591 by Velasco and in 1894 was destroyed by an earthquake from which it has only partially recovered. The most important town in the province is the mining centre of Chilcote, or Villa Argentina (pop., 1904, about 4000), about 2950 ft. above sea-level near the Famatina mines.

RIOM, a town of central France, capital of an arrondissement in the department of Puy-de-Dôme, 8 m. N. by E. of Clermont-Ferrand by rail. Pop., town, 7839; commune, 10,627. Riom is situated on the left bank of the Ambène, on an eminence rising above the fertile plain of Limagne. It is surrounded with boulevards and has wide streets, but the houses, being built of black lava, have a sombre appearance. Some belong to the 15th and 16th centuries, and have turrets and carved stonework. The church of St Amable, of Romanesque and early Gothic architecture, dates from the 12th century, but has been restored in modern times. It has fine carved woodwork of the 17th century. The church of Notre-Dame du Marthuret (15th century) has a well-known statue of the Virgin at its western entrance. The Sainte-Chapelle of the 14th and 15th centuries is a relic of the palace of Jean de Berry, duke of Auvergne, and contains fine stained glass. Near it stands a statue of the chancellor Michel de l'Hôtel, who was born near Riom. The rest of the site of the palace is occupied by the law courts. Other interesting buildings are the belfry of the 16th century and a mansion of the same period known as the Masion des Consuls. The town possesses numerous fountains, some of which are of Renaissance period.

Riom is the seat of a court of appeal, a court of assizes and a sub-prefect, and has tribunals of first instance and commerce and a communal college. It has a state manufactory of tobacco, and carries on the preparation of fruit preserves. Trade is in grain, wine, vegetables, fruit, nut-oil and Volvic stone.

Riom (Ricomagus or Ricomum of the Romans) was long the rival of Clermont. Along with Auvergne it was seized for the crown by Philip Augustus, and it was the capital of this province under the dukes of Berry and Bourbon.
RIOT

essential element, and from "Rout," which may be described as a beginning or endeavour to create a riot. It was considered as early as the 14th century that the English common law gave an insufficient remedy against riot. In 1360 the statute of 34 Edward III. gave jurisdiction to justices to restrain, arrest and imprison rioters. In 1393 the statute of 17 Richard II. conferred similar powers on the sheriff and such laws. Numerous other acts extending the common law were passed, especially in the Tudor reigns (see Stephen, History of the Criminal Law, vol. i. p. 202). Both these acts above mentioned are still on the statute book, but the earliest act now in force of real importance as to this offence is the Riot Act (1716), which creates certain statutory offences for riot attended by circumstances of aggravation. That act makes it the duty of a justice, sheriff, mayor or other authority, wherever twelve persons or more are unlawfully, riotously and tumultuously assembled together, to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation: “Our Sovereign Lord the King commandeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the Riot Act, an act of the year of King George for preventing tumultuous and riotous assemblies. God save the King.” It is a felony to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them and those who act under their authority from liability for injuries caused thereby. The punishment for the felony is penal servitude for life or for a term of not less than three years, or imprisonment with or without hard labour for not more than two years. Proceedings for any of the offences against the act must be commenced within twelve months after the offence.

By s. 11 of the Malicious Damage Act 1861 (which is a re-enactment of a similar provision made in 1827 in consequence of the frame-breaking riots), it is a felony for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery or mining plant. The punishment is the same as for a felony under the Riot Act. By s. 12 it is a misdemeanour to injure or damage such building, &c. The punishment is penal servitude from three to seven years, or imprisonment as in the case of the two felonies above described. Under the Shipping Offences Act (1793) a riotous assemblage of three or more seamen, ship’s carpenters and other persons, unlawfully and with force preventing and hindering or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to prevent, &c., is punishable on a first conviction as a misdemeanour by imprisonment from six to twelve months, and on a second conviction as a felony by penal servitude from three to fourteen years. And under the Offences against the Person Act 1861 (s. 40) summary penalties are provided for forcible interference with seamen in the exercise of their lawful occupation.

Besides these enactments there are others aimed at similar offences, such as smuggling, forcible entry and detainery, tumultuous petitioning (1601, 13 Charles II.), holding large political meetings within a certain distance of Westminster Hall during the sitting of parliament (Seditious Meetings Act 1817). For these offences see Stephen, Dig. Cr. Law, 6th ed., arts. 81-87.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling the riot. In this duty he is aided by the common law, and a statute of 1441 (Henry V.), under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the militia, yeomanry and reserve forces for the suppression of riot, and to close public-houses where a riot is apprehended (Licensing Act 1872). It is his duty to keep the peace; if the peace be broken, honesty of intention will not avail him if he has been guilty of neglect of duty. The question is whether he did all that he knew was in his power and which could be expected from a man of ordinary prudence, firmness and activity. The law as thus stated is gathered from the opinions of the judges on the trials of the lord mayor of London and the mayor of Bristol on indictments for neglect of duty at the time of the Gordon riots of 1780 and the Bristol riots in 1831.

In addition to his liability to an indictment at common law, a defaulting magistrate is subject under the provisions of acts of 1411 (Henry IV.) and 1414 (Henry V.) to a penalty of £100 for every default, the default to be inquired of by commission under the great seal. A matter of interest is the extent of the protection afforded by the Riot Act to soldiers acting under the commands of their officers. The question was dealt with by Lord Bowen and his fellow-commissioners in the report on the Featherstone riots (Parr. Paper, 1803-1804, c. 7234). The substance of their views is as follows:

By the law of England every one is bound to aid in the suppression of riot or tumult. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of each riot, for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life can only be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The necessary prevention of such outrage on person or property justifies the taking of the life of the person in the employment against a crowd of even deadly weapons. Officers and soldiers are under no special privileges and subject to no special responsibilities as regards the principle of the law. A soldier for the purpose of establishing civil order is only a citizen armed in a particular manner. He cannot because he is a soldier be exonereated if without necessity he takes human life. The duty of magistrates and peace officers to summon or abstain from summoning the assistance of the military depends in like manner on the necessities of the case. A soldier can act only by using his arms. The weapons he carries are deadly. They cannot be employed against all without danger to life or limb, and in these days of improved arms and perfected ammunition without some risk of danger to distant and possibly innocent bystanders.

To call for assistance against rioters from those who can intervene only under such grave conditions ought, of course, to be the last expedient of the civil authorities. But when the call for help is made and a necessity for assistance from the military has arisen, to refuse such assistance is in law a misdemeanour. The whole action of the military when once called in ought from first to last to be based on the principle of doing, and doing without fear, that which is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to the lives of those at whom it is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under the Riot Act (1761),

1 Reports of these trials will be found in the State Trials, New Series, vol. ii. pp. 1, 11. Most of the important cases of riot are collected or referred to in that series.
but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

The crown cannot charge upon the local rates the expense of maintaining soldiers called into a district by the magistrates to suppress a riot (re Glamorgan County Council, L.R. 1890, 2 Q.B. 536); but the cost of extra police drafted in for the like purpose falls on the rates of the district into which they are drafted (see Police Act 1890, s. 25). Until 1886 persons whose property was damaged by riot had a civil remedy of an exceptional character by action against the hundred in which the riot took place. This remedy was a survival of the pre-Conquest liability of the hundred to guarantee the orderly conduct of its inhabitants. The hundred was made liable in case of robbery by the Statute of Winchester (1285). That and subsequent acts were repealed in the reign of George IV., and their provisions were consolidated by an act of 1827 which gave a remedy against the hundred in the case of felonious demolition of churches, chapels, houses, machinery, &c., being feloniously demolished by rioters. The last instance of the use of this exceptional remedy was in the case of a riot at Worthing, and the remedy was abolished in 1886. When the Piccadilly riots occurred in that year no one knew that the injured shops were in the hundred of Osulston, and difficulties arose in applying the old procedure. So an ex post facto statute was passed (the Metropolitan Police Compensation Act 1886) for a special settlement of the claims, and the old statutes were repealed and replaced by the Riot Damage Act 1886. Under this act compensation is payable where rioters have injured or destroyed houses, shops, buildings, fixed or movable machinery and appliances prepared or used for or in connexion with manufactures or agriculture, or for mines or quarries, or vessels stranded or in distress (see Wreck), or have injured, stolen, or destroyed property in houses, shops or buildings. The compensation is payable out of the police rate for the district in which the damage is done; or if it was done abroad, for the district nearest to the scene of action. The claim is made on the police authority for the district. The time and form for making claims and the mode of fixing the amount of compensation is regulated by rules made by the Home Secretary on the 30th of June 1894 (Stat. R. and O. 1894, No. 630). In adjusting the amount regard is had to the conduct of the plaintiff to prevent or suppress the riot by him, his share, if any, in the riot, or provocation offered to the rioters. Failure to carry out a programme for athletic sports has been held to debar a claimant from compensation for damage done by a riot among the disappointed spectators who had paid to see the sports. The claimant must give credit for insurance money, or any other compensation received in respect of the damage; but the insurers or persons who paid such compensation may file a claim against the police rate for the amount paid by them. Persons dissatisfied with the award of the police authority may sue for the recovery of their claim subject to a liability to pay all the costs if they do not get judgment for more than the amount awarded. The action, if it is not for more than £500, is to be brought in the county court. The remedy is available in the case of stranded ships plundered by rioters (s. 515 of the Merchant Shipping Act 1894).

The Riot Act does not extend to Ireland, but similar provisions are contained in an act of the Irish Parliament passed in 1787 as amended by acts of 1831 and 1842. These acts create a special offence punishable by penal servitude for life, viz. sending notices, letters or messages inciting or tending to riot. Under the Criminal Procedure Ireland Act 1887 (s. temporary act) summary proceedings may be taken against rioters. The civil remedy against the county or borough for malicious injury to property, real or personal, including ships in distress and their cargo, is wider than in England or Scotland, but it includes malicious injury by rioters where

---

1 There is a curious exception still on the Statute-book depriving persons robbed while travelling on the Lord's Day of any right to compensation from the hundred (Lord's Day Act 1677, s. 8).
RIOU—RIPON, 1ST MARQUESSE OF

Britain. Rio Tinto was probably first exploited by the Carthaginians; vestiges of later Roman workings may still be seen. After the Moorish conquest, in 711, it was neglected until 1725, when the mines were leased to a Swede named Wolters. Their modern importance dates from 1872, when a syndicate of London and Midland and Scottish companies purchased them from the Spanish government for nearly £4,600,000.

RIOU, EDWARD (1758?–1801), British sailor, entered the navy at an early age. In 1780 he was promoted lieutenant, and nine years later he was in command of the "Guardian" when that vessel, crowded with convicts, struck a hidden rock off the African coast. Riou, after parting with as many of his men as the boats would hold, not only successfully navigated his half-sinking ship 400 leagues to the Cape of Good Hope, but kept order amongst the panic-stricken convicts, an achievement which had few parallels in naval annals, and won Lieutenant Riou's immediate promotion. He did not long remain a commander and in 1791 he was posted. Under Sir John Jervis he was present at the operations about Martinique and Guadeloupe in 1794, and in the "Amazon" he accompanied the expedition under Sir Hyde Parker to the Baltic in 1801. His frigate led the way through the Channel at Copenhagen, and in the battle he was attached as commodore of a light squadron to Nelson's division. Through the grounding of three ships of the line, Riou and his frigates found themselves opposed to the full force of the great TREKRONER battery. Early in the fight he was wounded, but refused to leave the deck, and, as he was sitting on a gun-carriage and directing his men's fire, he was cut in two by a cannon ball. Nelson, who had not known him before this expedition, had conceived a great affection for Riou, and spoke of his loss as "irreparable." Brenton, the naval historian, declared that he had all the qualities of a perfect officer. Parliament commemorated the memory of the "gallant good Riou" by a memorial in St. Paul's Cathedral.

RIOUW, RHIOUW or BINTANG, an archipelago of the Dutch East Indies, E. of Sumatra, and separated from the Malay Peninsula by the Straits of Singapore. With the Lingga, Karimun, Tambelan, Anambas and Natuna Islands, to the N.E., E. and S., and the territory of Indragiri in Sumatra, it forms the Dutch residency of Riouw and dependencies. The seat of government is at Tanjoung Finaan, a small port of 4000 inhabitants (including 160 Europeans and about 2000 Chinese), on the S.W. coast of the chief island, Bintang or Riouw. The total area of the residency is about 17,550 sq. m., and its population (1905) 112,216, of whom considerably over a quarter are Chinese. These cultivate gambier and pepper successfully in Bintang, and there is a considerable trade in wood. Bintang has an area of about 440 sq. m., and is surrounded by many rocks and small islands, making navigation dangerous. The soil is not fertile, and much of it is swampy. There is an assistant residency of Lingga, to which belongs the island of Singkep, where extensive tin-deposits are worked. Geologically the Riouw and Lingga Islands are appendages of the Malay Peninsula, not of Sumatra. Bintang is mentioned by Marco Polo under the name of Pentam, which is not far from the genuine Malay name Bentan, said to mean a half-moon. After the Portuguese conquest of Malacca (1511), the expelled Mahommedan dynasty took up its residence on Bintang, where it long fostered piracy.

RIPLEY, GEORGE (1802–1880), American critic and man of letters, was born at Greenfield, Massachusetts, on the 3rd of October 1802. He graduated first in his class at Harvard in 1823. From 1826 to 1840 he was pastor of a Unitarian church in Boston, subsequently retiring from the active ministry altogether. It was during those years that there grew up in New England that form of thought and theory known as Transcendentalism. Ripleys prominent, if not the leader, in all practical manifestations of the movement; and it was largely by his earnestness and practical energy that certain of its more tangible results were brought about. The first meeting of the Transcendental Club was held at his house in September 1836. He was a founder and a chief supporter of the magazine, the Dial, which was the organ of the school from 1841 to 1844. Most important of all, however, he was the originator of "The Brook Farm Institute of Education and Agriculture." Until the abandonment of this experiment in 1847, Ripley was its leader, cheerfully taking upon himself all kinds of tasks, teaching mathematics and philosophy in the school, milking cows and attending to other bucolic duties, and after June 1845 editing the daily Harbinger, an organ of "association," which he continued to edit in New York from 1847 until it was discontinued in 1849. The failure of Brook Farm (q.v.) left Ripley poor and feeling keenly the defeat of his project; but the event forced him at last to devote himself to that career of literary labour in which the real success of his life was achieved. In 1849 he joined the staff of the New York Tribune, and in a short time became its literary editor. This position, which, through his steadiness, scholarly conservatism and freedom from caprice as a critic, soon became one of great influence, he held until his death in New York City on the 4th of July 1880.

During the greater part of the time of his connexion with the Tribune, Ripley was also an adviser of a prominent publishing house, an occasional contributor to the magazines, and a cooperator in several literary undertakings. The chief of these was the American Cyclopædia, which as the New American Cyclopædia—so named to distinguish it from Francis Lieber's Encyclopædia Americana—was issued, under the editorship of Ripley and Charles A. Dana, in 1857–63, a revised edition, with the word "new" dropped from the title, being issued under the same editorship in 1873–76. He also issued, in translation, a series of Specimens of Foreign Standard Literature (14 vols., 1858–62). Ripley was twice married, first in 1827 to Miss Sophia Willard Dana (d. 1861), a daughter of Francis Dana and a conspicuous figure at Brook Farm; and second, in 1865, to a young German widow, Mrs Augusta Schlossberger, who survived him and subsequently married Alphonse Pinede.

A biography of Ripley (Boston, 1882), written by the Rev. O. B. Frothingham, forms one of the volumes of the "American Men of Letters" series.

RIPLEY, a market town in the Ilkeston parliamentary division of Derbyshire, England, 10 m. N. by E. of Derby, on a branch of the Midland railway. Pop. of urban district (1901) 10,711. It lies on high ground between the valleys of the Derwent and the Erewash. In the neighbourhood there are extensive collieries, and coke is largely manufactured. Besides iron foundries, blast furnaces and boiler works, the town possesses silk and cotton mills. The charter for the market was granted by Henry III. The district has a large industrial population. To the west of Ripley lies the township of Heage (pop. 2880).

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, 1ST MARQUESSE OF (1857–1900), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of Robert Holurt, 4th earl of Buckinghamshire, was born in London on the 24th of October 1827. The Robinson family was descended from an eminent Hamburg merchant, William Robinson (1522–1616), who represented York in parliament in Elizabeth's reign. His great-grandson was in 1660 created a baronet. Thomas Robinson, 1st Baron Grantham (1695–1770), son of a later holder of the baronetcy, was created a peer in 1767, having been an indefatigable diplomatist plenipotentiary at the peace of Aix-la-Chapelle, and secretary of state. The 2nd Baron Grantham (1735–1786), ambassador at Madrid, and foreign secretary under Lord Shelburne, had two sons. The elder of these—succeeding as 3rd Baron in 1787—was an earl of Derby; the younger earl of Grey, in right of his maternal aunt, and assumed the surname of Grey; he was lord-lieutenant of Ireland (1841–44). The younger, Frederick John (1782–1859), created Viscount Godriche in 1827 and earl of Ripon in 1833, was the well-known "Prosperity Robinson," who was chancellor of the exchequer from 1823 to 1827; as Lord Godriche he became prime minister (and a peculiarly weak one) from August 1827 to January 1828, colonial secretary in 1831 and 1832, lord privy
seal (1833-34), president of the Board of Trade (1841-43), and president of the India board (1843-46). His son, the future marquess, began his political life as attaché to a special mission to Brussels in 1849. In 1851 he married Henrietta Vyner (d. 1907), and their eldest son, afterwards known as Earl de Grey, was born in 1852. Under his courtesy title of Viscount Goderich he was returned to the House of Commons for Hull in 1852 as an advanced Liberal. In 1853 he was elected for Huddersfield, and in 1857 for the West Riding of Yorkshire. In January 1859 he succeeded to his father's title, and in November of the same year to that of his uncle, Earl de Grey. A few months after entering the Upper House he was appointed under-secretary for war, and in February 1861 under-secretary for India. Upon the death of Sir George Cornewall Lewis in April 1863 he became secretary for war, with a seat in the cabinet. In 1866 he was appointed secretary of state for India. On the formation of the Gladstone administration in December 1868, Lord Ripon was appointed lord president of the council, and held that office until within a few months of the fall of the government in 1873, when he resigned on purely private grounds. In 1869 he was created a Knight of the Garter. In 1871 Lord Ripon was appointed chairman of the High Joint-Commission on the Alabama claims, which arranged the treaty of Washington. In recognition of his services he was elevated to a marquessate (1871). In 1874 he became a convert to Roman Catholicism, and this involved his resignation of the office of grand master of the English Freemasons. On the return of Gladstone to power in 1880 Lord Ripon was appointed viceroy of India, the appointment exciting a storm of controversy, the marquess being the first Roman Catholic to hold the viceregal office. He went out to reverse the Afghan policy of Lord Lytton, and Kandahar was given up, the whole of Afghanistan being secured to Abdur Rahman. The new viceroy was also called upon to decide grave questions between the native population and the resident British, and he resolved upon a liberal policy towards the former, among his measures being the repeal of the Vernacular Press Act, the extension of local government and the appointment of an Education Commission. He extended the rights of the natives, and in certain directions curtailed the privileges of Europeans. Several of the viceroy's measures, notably the Inebert Bill of 1883—so named after its author Sir Courtenay Ilbert—irritated the Anglo-Indian population, and it was fiercely assailed. The purpose of this bill was disclosed in the statement that "the government of India had decided to settle the question of jurisdiction over European British subjects in such a way as to remove from the code, and at once and completely, the judicial distinctions which are based merely on racial distinctions," in fact to subject Europeans in certain cases to trial by native magistrates. This announcement raised a storm of indignation among the European community in India, and the government were obliged virtually, though not avowedly, to abandon their measure. Act III. of 1884 was a compromise, which, while subjecting Europeans to the jurisdiction of native district magistrates or sessions judges, reserved to them the right to demand trial by a jury of which at least half should be Europeans. There probably never was a viceroy so unpopular among Anglo-Indians or so popular with the natives. On Lord Ripon's departure from India in November 1884 there were extraordinary manifestations in his favour on the part of the Hindu population of Bengal and Bombay, and more than a thousand addresses were presented to him. On his arrival in England the marquess delivered a number of vigorous speeches in defence of his administration. In 1886 he became first lord of the admiralty in the third Gladstone ministry; and on the return of the Liberals to power in 1892 he was appointed colonial secretary, which post he continued to hold until the resignation of the government in 1895. He was included in Sir Henry Campbell-Bannerman's cabinet at the close of 1905 as lord privy seal, an office which he retained in 1908 when Mr Asquith formed his new ministry, but which he resigned later in the same year. He died at his seat, Studley Royal, near Ripon, on the 9th of July 1909, when his only son, Earl de Grey, who has been treasurer of the queen's household since 1901, became the 2nd marquess. For many years Lord Ripon was president of the Yorkshire College of Science at Leeds, and chairman of the West Riding County Council.

RIPON, a cathedral city and municipal borough in the Ripon parliamentary division of the West Riding of Yorkshire, England, 214 m. N.N.W. from London, on the North-Eastern railway. Pop. (1901) 8230. It is pleasantly situated at the confluence of the streams Laver and Skell with the river Ure, which is crossed by a fine bridge of nine arches. The streets are for the most part narrow and irregular, and, although most of the houses are comparatively modern, a number of them are in the picturesque gables characteristic of earlier times. The cathedral, although not ranking among those of the first class, is celebrated for its fine proportions, and is of great interest from the various styles of architecture which it includes. Its entire length from E. to W. is 266 ft., the length of the transepts 130 ft., and the width of the nave and aisles 87 ft. Besides a large square central tower, there are two western towers. The cathedral was founded on the ruins of St Wilfrid's abbey about 680, but of this Saxon building nothing now remains except the crypt, called St Wilfrid's Needle. The present building was begun by Archbishop Walter (1157-82) and restored in the transitional period belong the transepts and portions of the choir. The western front and towers, fine specimens of Early English, were probably the work of Walter de Grey, archbishop of York (d. 1255), and about the close of the century the eastern portion of the choir was rebuilt in the Decorated style. The nave, portions of the central tower, and two bays of the choir are Perpendicular, having been rebuilt towards the close of the 15th century. Earlier than the rest of the fabric (except the crypt) is part of the chapter-house and the vestry, adjoining the south side of the choir, and terminating eastward in an apse. This is pure Norman style, and there is a crypt of that period beneath, which was formerly filled with unburied bones. There are a number of monuments of historical and antiquarian interest. The diocese includes rather less than one-third of the parishes of Yorkshire, and also a small part of Lancashire. The bishop's palace, a modern building in Tudor style, is situated in extensive grounds about a mile from the town. In the vicinity is the domain of Studley Royal, the seat of the marquess of Ripon, which contains the celebrated ruins of Fountains Abbey (q.v.). The principal secular buildings are the town hall, the public rooms, and the mechanics' institution (1894) where technical and other classes are held. There are several ancient hospitals, including the hospital of St John the Baptist, founded in 1109, but modernized; the hospital of St Anne, founded probably in the reign of Henry VI. by an unknown benefactor; and the hospital of St Mary Magdalene for women. This last was founded by Thurstan, archbishop of York (1114-47), as a secular community, one of the special duties of which was to minister to lepers. In the 13th century a master and chaplain took the place of the lay brethren, and in 1334 a chantry was founded. The chapel remains, with its interesting Norman work, its low side-windows, said to have allowed the lepers to follow the services, and its pre-Reformation altar of stone, a rare example. There is a considerable trade in varnish, and the saddle-trees and other leather goods produced here are in high repute. The borough is under a mayor, 4 aldermen, and 12 councillors. Area, 1809 acres. Ripon (In Rhyppum, Ad Ripam) owed its origin to the monastery founded in the 7th century. A certain king, Alchfrith, is said to have given the site of the town to Eata, abbot of Melrose, to found a monastery, but before it was completed Eata was deposed for refusing to celebrate Easter according to the Roman usage, and St Wilfrid was appointed the first abbot. Another version of the story, however, says that the land was given to St Wilfrid, who himself built the monastery. Ripon is said to have been made a royal borough by Alfred the Great, and King Æthelstan, after his victory at Brunanburh
in 937, is stated to have granted to the monastery sanctuary, freedom from toll and taxes, and the privilege of holding a court, although both charters attributed to him are known to be spurious. At the same time he is said to have given the manor to Wulfstan, archbishop of York. About 950 the monastery and town were destroyed by King Edred during an expedition against the Danes, but the monastery was rebuilt by the archbishops of York, and about the time of the Conquest was changed to a collegiate church. In 1318, when the Scots invaded England, Ripon only escaped being burnt a second time by the payment of 1000 marks. The custom of blowing the wakeman's horn every night at nine o'clock is said to have originated about A.D. 700. It was probably at first a means of calling the people together in case of a sudden invasion, but was afterwards a signal for setting the watch. A horn with a halberd and the motto "except the Lord who is in the city the watchman waketh but in vain" forms the mayor's badge. The archbishops of York as lords of the manor had various privileges in the town, among which were the right of holding a market and fair, and Archbishop John, being summoned in the reign of Henry I. to answer by what right he claimed these privileges, said that he held them by prescription and by the charter of King Æthelstan. Henry I. afterwards granted or confirmed to Archbishop Thomas a fair on the feast of St. Willfrid and four following days. The fairs and markets belonged to the archbishops of York until they were transferred to the Bishop of Ripon in 1837. In 1867, a local board was formed to appoint ecclesiastical commissioners, from whom they were purchased by the corporation of Ripon in 1880. From before the Conquest until the incorporation charter of 1604 Ripon was governed by a wakeman and 12 elders, or aldermen, but in 1604 the title of wakeman was changed to mayor, and 12 aldermen and 24 common councilmen were appointed. The manufacture of cloth was at one time carried on in Ripon, but was almost lost in the 16th century when the town was visited by Leland. The making of spurs succeeded the cloth manufacture and became so noted that the saying "as true as Ripon rowells" was a well-known proverb. This manufacture died out in the 18th century. Ripon was summoned to send two members to parliament in 1705, and occasionally from that time until 1828-29. The privilege was revived in 1553, after which the burgesses continued to send two members until 1867, when they were allowed only one. This latter privilege was taken away by the Redistribution Bill of 1885, and it now gives its name to one of the divisions of the county.

See Victoria County History, Yorkshire; and W. Harrison, Ripon Millenary: A Record of the Festival and a History of the City, arranged under the Wakemen and Mayors from the year 1182-1885.

RIPON, a city and town of the County of the North Riding of the West Riding of the West Riding of the West Riding, Yorkshire, England, situated at the head of the valley of the River Ure, and about 27 miles from York. The town is about 27 miles by rail from London, and is a junction station. It is about 75 m. N.W. of Milwaukee. Pop. (1890), 3528; (1900), 3818, of whom 885 were foreign-born; (1905), 3815; (1910), 3730. Ripon is served by the Chicago & North-Western, and the Chicago, Milwaukee & St. Paul railways. The city has a Carnegie library, which also houses the library of the Ripon Historical Society, and is the seat of Ripon College (non-sectarian, co-educational), which was founded in 1850 as the Lyceum of Ripon, and was named Ripon College in 1862; in 1905 it had 33 instructors and 279 students. There are grain elevators and various manufactories, among the products of which are cheese and other creamery products, flour, knit goods, pickles and canned goods, woodenware, washing machines and gloves.

The site of Ripon was purchased in 1838 by John Scott Horner (1802-1883), of Virginia, secretary and acting-governor of Michigan Territory in 1835, and the first secretary of Wisconsin Territory in 1836-37, who named the village when it was established in 1840 from the seat of his ancestors in Yorkshire. In May 1844 a settlement, named Ceresco or "the Wisconsin Palax", a Frontier community, was organized.

1The charter, granted by the legislature in 1845, contained the following features: (1) property to be held in common; (2) land to be limited to 40 acres for each member of the corporation; (3) a unanimous vote of the managers necessary for admission; (4) an annual settlement of profits on the basis of one-quarter share to dividend stock; and (5) shares to credit the holder three-quarters and labour one-quarter of cost; and (6) complete religious toleration and no involuntary taxation for church support.

in Southport (now Kenosha), had been established in the vicinity. A "Long House," 400 ft. in length, was erected, which contained tenements, an amusement or lecture hall, and a dining-room where all ate at a common table, and where board was provided at cost, sometimes as low as sixty-three cents per week. The "class of useful stock" was divided into three groups, agricultural, mechanical and educational, with such subdivisions as necessity dictated, and an exact account of labour was kept. The community prospered materially from the start. In the second season it consisted of thirty families with property valued at $27,725; in 1846 there were 180 resident members, and the net profit for the year was $9020. Eventually differences of opinion arose as to the division of labour, and the common dining-hall did not prove popular. Rivalry developed with the village of Ripon, and the community gave up its charter at the close of 1850, dividing property valued at $40,000 among the shareholders. On the whole it was one of the most successful experiments in communism ever tried in America. In 1858 Ripon absorbed the village of Ceresco and was chartered as a city. At Ripon started one of the disconnected movements that resulted in the founding of the Republican party.

See D. P. Mapes, History of Ripon (Milwaukee, Wis., 1873); Consul W. Butterfield, History of Fond du Lac County (1880); W. A. Hinds, American Communities and Co-operative Colonies (3rd ed., Chicago, 1908), and F. A. Flower, History of the Republican Party (1884).

RIPPERDA, JOHN WILLIAM, BARON, and afterwards duke of (1680-1737), political adventurer and Spanish minister, was a native of Groningen in the Netherlands. According to a story which he himself set going during his adventures in Spain, his family was of Spanish origin. But there does not appear to be any foundation for this assertion. The name was not uncommon in Groningen, and was borne by several persons of some note in the 16th and 17th centuries, one of whom was a follower of William the Silent. They were people of some position, possessing "lordships" at Jansnia, Poelgast, and other places, and some at least of them were Roman Catholics. John William, if he was, as he asserted, born a Roman Catholic, conformed to Dutch Calvinism in order to obtain his election as delegate to the states-general from Groningen. In 1715 he was sent by the Dutch government as ambassador to Madrid. Saint-Simon says that his character for probity was even then considered doubtful. The fortune of Orry, Alberoni and other foreigners in Spain, showed that the court of Philip V. offered a career to adventurers. Ripperda—who's name is commonly spelt Ripperda by the Spaniards—devoted himself to the Spanish government, and professed himself a Roman Catholic. He first attached himself to Alberoni, and after the fall of that minister he became the agent of Elizabeth Farnese, the restless and intriguing wife of Philip V. Though perfectly unscrupulous in money matters, and of a singularly vain and bustling disposition, he did understand commercial questions, and he has the merit of having pointed out that the poverty of Spain was mainly due to the neglect of its agriculture. But his fortune was not due to any service of a useful kind he rendered his masters. He rose by undertaking to aid the queen, whose influence over her husband was boundless, in her schemes for securing the succession to Parma, Plasencia and Tuscany for her sons. Ripperda was sent as special envoy to Vienna in 1725. He behaved with ridiculous violence, but the Austrian government, which was under the influence of its own fixed idea, treated him seriously. The result of ten months of very strange diplomacy was a treaty by which the emperor promised very little, but and shares to be sold at $25; (2) land to be limited to 40 acres for each member of the corporation; (3) a unanimous vote of the managers necessary for admission; (4) an annual settlement of profits on the basis of one-quarter share to dividend stock, and (5) shares to credit the holder three-quarters and labour one-quarter of cost; and (6) complete religious toleration and no involuntary taxation for church support.
Spain was bound to pay heavy subsidies, which its exhausted treasury was quite unable to afford. The emperor hoped to obtain money. Elizabeth Farnese hoped to secure the Italian duchies for her sons, and some vague stipulations were made that Charles VI. should give his aid for the recovery by Spain of Gibraltar and Minorca. When Ripperda returned to Madrid at the close of 1725 he asserted that the emperor expected him to be made prime minister. The Spanish sovereigns, who were overawed by this quite unfounded assertion, allowed him to grasp the most important posts under the crown. He excited the violent hostility of the Spaniards, and entered into a compromise of intrigues with a French and English government. His career was short. In 1726 the Austrian envoy, who had vainly pressed for the payment of the promised subsidies, came to an explanation with the Spanish sovereigns. It was discovered that Ripperda had not only made promises that he was not authorized to make, but had misappropriated large sums of money. The sovereigns who had made him duke and grandee shrank from covering themselves with ridicule by revealing the way in which they had been deceived. Ripperda was dismissed with the promise of a pension. Being in terror of the hatred of the Spaniards, he took refuge in the English embassy. To secure the favour of the English envoy, Colonel Williamson, Ripperda, several days before, betrayed the secrets of his government. Stanhope could not protect him, and he was sent as a prisoner to the castle of Segovia. In 1728 he escaped, probably with the connivance of the government, and made his way to Holland. His last years are obscure. It is said that he reverted to Protestantism, and then went to Morocco, where he became a Mahomedan and commanded the Moors in an unsuccessful attack on Ceuta. But this story is founded on his so-called Memoirs, which are in fact a Grabstreet tale of adventure published at Amsterdam in 1740. All that is really known is that he did go to Morocco, and that he died at Tetuan in 1737.

See Arnold Ritter von Arneth, Prinz Eugen von Savoyen (Vienna, 1864), for the negotiations of 1725, and Gabriel Syveton, Une Cour et un aventurier au XVIIe siecle (Paris, 1896). His Memoirs were translated into English by J. Campbell, London, 1790.

RISHANGER, WILLIAM (c. 1250-c. 1312), English chronicler, made his profession as a Benedictine at St Alban's abbey in 1271, of which he perhaps became the official chronicler. The most important of his writings is the Narratio de bellis apud Leves et Evesham. Though written many years afterwards and drawn from other sources, it has been startled accounts of baronial war. He is so great an admirer of Simon de Montfort that this work has been called a hagiography. He is credited with the authorship of a chronicle covering the period 1259-1306; this has been disputed, but the work is printed under his name by Riley. Another work of his, of not much importance, is a chronicle entitled Recapitulatio brevis de gestis domini Edwardi, &c. He is probably not the author of other works commonly attributed to him.

RISK, hazard, chance of danger or loss, especially the chance of loss to property or goods which an insurance company undertakes to make good to the insurer in return for the recurrent payment of a sum called the premium (see INSURANCE). The word appears late in English, and in the 17th century in the Fr. form risque or It. risco or risgo, for risico, risgto; cf. Sp. riesgo. The Med. Lat. riscus, rischium, and risicum are found, according to Du Cange (Gloss., q.q.v.), as early as the 13th century. Skeat (Elym. Dict., 1910) accepts Diez's suggestion that the word is originally a sailor's term, and is to be referred to Sp. risco, a steep rock, from Lat. rescere, to cut back, shut off; thus Sp. arriegas, to run into danger, means literally "to go against a rock."

RIST, JOHANN VON (1607–1667), German poet, was born at Ottensen in Holstein on the 8th of March 1607; the son of the Lutheran pastor of that place. He received his early training in Hamburg and Bremen; after studying theology at Rinteln and Rostock, he became in 1633 private tutor in a family of Heide, and two years later (1635) was appointed pastor of the village of Wedel on the Elbe, where he laboured until his death on the 31st of August 1667. Rist first made his name known to the literary world by a drama, Persæus (1634), which he wrote while at Heide, and in the next succeeding years he produced a number of dramatic works of which the allegory Das friedefwünschende Teutschland (1647) and Das friedefsuchende Teutschland (1653) (new ed. of both by H. M. Schwenyer, 1864) are the most interesting. Rist soon became the central figure in a school of minor poets, and honours were showered upon him from every side. The emperor Ferdinand III. crowned him laureate in 1644, ennobled him in 1653, and invested him with the dignity of a Count Palatine, an honour which enabled him to crown, and to gain numerous poets for the Elbschwaben order, a literary and poetical society which he founded in 1656. He had already, in 1645, been admitted, under the name "Daphnis aus Cimbrien," to the literal order of Pegnitz, and in 1647 he became, as "Der Ristige," a member of the Fruchtbringende Gesellschaft. It is, however, as a writer of church hymns (see HYMN) that Rist is best known to fame. Among his chief hymn books are: e.g. O Ewigkeit, du Donnerwort! und Ermut' dich, mein schwacher Geist. Collections of his poems appeared under the titles Musa Teutonica (1634) and Himmlische Lieder (1643).

Selections of Rist's writings have been published by W. Müller in vol. viii. of his Bibliothek deutscher Dichter des 17. Jahrhun. (1822–1878), and by K. Goedecke and E. Goede (1885). See T. Hansen, Johann Rist und seine Zeit (1872); K. T. Gaedertz, J. Rist als niederdtscher Dramatiker (Jahrb. f. niederdtsche Sprache, vol. vii., 1881); and M. von Waldberg's article in the Allg. deutsche Biograph.}

RISTITCH (or RISTICH), JOVAN (1831–1890), Servian statesman, was born at Kragujevats in 1837. He was educated at Belgrade, Heidelberg, Berlin and Paris. After failing to obtain a professorship in the high school of Belgrade, he was appointed in 1861 Servian diplomatic agent at Constantinople. His reputation was enhanced by the series of negotiations which ended in the withdrawal of the Turkish troops from the Servian fortresses in 1867. On his return from Constantinople he was offered a ministerial post by Prince Michael, who described him as "his right arm," but declined office, being opposed to the reactionary methods adopted by the prince's government. He had already become the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he was nominated member of the council of regency, and on the 2nd January 1869 the first Servian constitution, which was mainly his creation, was promulgated. When Prince Milan attained his majority in 1872, Ristitch became foreign minister; a few months later he was appointed prime minister, but resigned in the following autumn (1873). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876–March 1877 and December 1877–March 1878). At the congress of Berlin he laboured with some success to obtain greater advantages for Servia than had been accorded to her by the treaty of San Stefano. The provisions of the treaty of Berlin, however, disappointed the Servians, owing to the obstacles now raised to the realization of the national programme; the Ristitch government became unpopular, and resigned in 1880. In 1887 King Milan (who had assumed the royal title in 1882), alarmed at the threatening attitude of the Radical party, recalled Ristitch to power at the head of a coalition cabinet; a new constitution was granted in 1888, and in the following year the king abdicated in favour of his son, Prince Alexander. Ristitch now became head of a council of regency, entrusted with power during the minority of the young king, and a Radical ministry was formed. In 1892, however, Ristitch transferred the government to the Liberal party, with which he had always been connected. This step and the subsequent
RITCHIE, DAVID GEORGE (1853–1903). Scottish philosopher, was born at Jedburgh, son of the Rev. George Ritchie, D.D. He had a distinguished university career at Edinburgh, and Balliol College, Oxford, and after being fellow of Jesus and tutor of Balliol was elected professor of logic and metaphysics at St Andrews. He was president of the Aristotelian Society in 1898. Among his works are: Darwinism and Politics (1889); Principles of State Interference (1891); Darwin and Hegel (1893); Natural Rights (1895); a translation with R. Lodge and P. E. Matheson of Bluntschli’s Theory of the State (1888); many articles in Mind, Philosophical Review, &c. His Philosophical Studies was edited with a memoir by R. Latta (1903).

RITSCHL, ALBRECHT (1832–1889), German theologian, was born at Berlin on the 24th of March 1832. His father, George’s brother, Benjamin Ritschl (1835–1899), became, in 1851, pastor at the church of St Mary of Leipziger, and from 1827 to 1854 was general superintendent and evangelical bishop of Pomerania. Albrecht Ritschl studied at Bonn, Halle, Heidelberg and Tübingen. At Halle he came under Hegelian influences through the teaching of Julius Schiller (1810–1868) and J. H. Erdmann (b. 1805). In 1845 he was entirely captivated by the Tübingen school, and in his work Das Evangelium Marcions und das kanonische Evangelium des Lukas, published in 1846, he appears as a disciple of F. C. Baur. This did not last long with him, however, for the second edition (1857) of his most important work, Die Lehre Marcions, shows considerable divergence from the first edition (1850), and reveals an entire emancipation from F. C. Baur’s method. Ritschl was professor of theology at Bonn (extraordinarius 1852; ordinarius 1859) and Göttingen (1864; Consistorialrath also in 1874), his addresses on religion delivered at the latter university showing the impression made upon his mind by his enthusiastic studies of Kant and Schleiermacher. Finally, in 1864, came the influence of Rudolf Lotze. He wrote a large work on the Christian doctrine of justification and atonement, Die Christliche Lehre von der Rechtfertigung und Vergebung der Sünden, published during the years 1874 and 1875, in which he attempted a history of pietism (Die Geschichte des Pietismus). His system of theology is contained in the former. He died at Göttingen on the 20th of March 1889.

His son, OTTO RITSCHL (b. 1860), after studying at Göttingen, Bonn and Giessen, became professor at Kiel (extraordinarius) in 1889 and afterwards at Bonn (extraordinarius 1894; ordinarius 1897). He has published, amongst other works, Schleiermachers Stellung zum Christentum in seinen Reden über die Religion (1888), and a Life of his father (2 vols., 1895–96).

Ritschel claims to carry on the work of Luther and Schleiermacher, especially in ridding faith of the tyranny of scholastic philosophy. His system shows the influence of Kant’s critical or constructive criticism of the claims of Pure Reason, recognition of the value of morally conditioned knowledge, and doctrine of the kingdom of ends; of Schleiermacher’s historical treatment of Christianity, regulative use of the idea of religious fellowship, emphasis on the importance of religious feeling; and of Lotze’s theory of knowledge and treatment of personality. Ritschel’s work made a profound impression on German thought and gave a new confidence to German theology, while at the same time it provoked a storm of hostile criticism: his school has grown with remarkable rapidity. This is perhaps mainly due to the bold religious positivism with which he assumes that spiritual experience is real and that faith has not only a legitimate but even a paramount claim to provide the highest interpretation of the world. The life of trust in God is a fact, not so much to be explained as to explain everything else. Ritschel’s standpoint is not that of the individual subject. The objective ground on which he bases his system is the religious experience of the Christian community. The “immediate object of theological knowledge is the faith of the community,” and from this positive religious datum theology constructs a “total view of the world and human life.” Thus the essence of Ritschel’s work is systematic theology. Nor does he painfully work up to his master-category, for it is given in the knowledge

RITCHIE, CHARLES THOMSON RITCHIE, 1st BARON (1838–1906), English politician, was born at Dundee, and educated at the City of London school. He went into business, and in 1874 was returned to parliament as Conservative member for the Tower Hamlets. In 1885 he was made secretary to the Admiralty, and from 1886 to 1892 president of the Local Government Board, in Lord Salisbury’s administration, sitting as member for St George’s in the East. He was responsible for the Local Government Act of 1888, instituting the county councils; and a large section of the Conservative party always owed him a grudge for having originated the London County Council. In Lord Salisbury’s later ministries, as member for Croydon, he was president of the Board of Trade (1895–1900), and home secretary (1895–1900); and when Sir Michael Hicks-Beach retired in 1903, he became chancellor of the exchequer in Mr Balfour’s cabinet. Though in his earlier years he had been a “fair-trader,” he was strongly opposed to Mr Chamberlain’s movement for a preferential tariff (see the articles on Balfour, A. J., and Chamberlain, J.), and he resigned office in September 1903. In December 1905 he created a peer, but he was in ill-health, and he died at Biarritz on the 9th of January 1906.
of Jesus Christ revealed to the community. That God is love and that the purpose of His love is the moral organization of humanity in the "Kingdom of God"—this idea, with its immense range of application—is applied in Ritschl's initial datum.

From this vantage-ground Ritschl criticizes the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. Much of his work is devoted to showing that Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither Hegelianism nor Aristotle is adequate to the task. "God's kingdom" is a category of religious life. Neither conceives "God" as correlative to human "trust" (cf. *Theologie und Metaphysik*, esp. p. 8 seq.). But Ritschl's recital carries him so far that he is left alone with merely "practical" injunctions. If God is active to the "kingdom," but not at all as "self-existent."

His limitation of theological knowledge to the bounds of human need might, historically pressed, run perilously near the factor and the epistemology ("we only know things in their activities") does not cover this weakness. In seeking ultimate reality in the circle of "active conscious sensation," he rules out all metaphysics. Indeed, such is that part of normal Christian faith—e.g., the Eternity of the Son—is passed over as beyond the range of his method. Ritschl's theory of "value-judgments" (*Werttheile*) illustrates this form of agnosticism. Religious judgments of value are ordered in accordance with the logical ordering of spiritual welfare. They imply a lively sense of radical human need. This sort of knowledge stands quite apart from that produced by theoretics and "disinterested" judgments. The former moves in a world of "values," and judges things as they are related to our "fundamental self-feeling." The latter moves in a world of cause and effect. (N.B. Ritschl appears to confuse Max Ehrmann's "sphere of causality." He is not the theologist who has such grave ambiguities, that his theology, which, as we have seen, is wholly based on uncompromising religious realism, has actually been charged with individualistic subjectivism. If Ritschl has clearly shown that judgments of value end in the other types of knowledge, just as the "spiritual man" includes and transcends figures but does not annihilate the "natural man," then within the compass of this spiritually conditioned knowledge all other knowledge is included. It is a fact that all judgments of value are part of the principle: "makes for this purpose." But this principle of the "natural theology" is no value save where it leads on faith. Again, Christ has for the religious life of the community the property of being neither a teacher, nor a scholar. He is the perfect Revelation of God and the Exemplar of true religion. His work in founding the kingdom was a personal vocation, the spirit of which He communicates to believers, "thus, as exalted king," sustaining the life of His Kingdom. His Resurrection is a necessary part of Christian belief (C. Ecke, pp. 198-99). "Divinity" is a predilection applied by faith to Jesus in His founding and redeeming act. We note here that though Ritschl gives Jesus a unique and unapproachable personality in His revelation, in His suffering and death he declines to rise above this relative teaching. The "Two Nature" problem and the eternal relation of the Son to the Father have no bearing on experience, and therefore stand outside the range of theology.

Once more, in the doctrine of sin and salvation, the governing idea is God's fatherly purpose for His family. Sin is the contradiction to that purpose and the misrepresentation from the family's freedom: Redemption, justification, regeneration, adoption, forgiveness, reconciliation all mean the same thing—the restoration of the broken family relationship. All depends on the Mediation of Christ in the fullness of His life and work, and the development of His love to the fellowship of believers. Everything is defined by the idea of the family. The whole apparatus of "holy" ideals (punishment, satisfaction, &c.) is summarily rejected as foreign to God. Ritschl is clearly close to the standpoint of the religious community, that he has nothing definite to say on many inevitable questions, such as the relation of God to pagan races. Of His school, in which C. W. Herrmann, Julius Kaftan and Adolf Harnack are the chief names, emerges from his teaching in many directions; e.g. Kaftan appreciates the mystical side of religion, Harnack's criticism is very different from Ritschl's arbitrary exegetes. They are united on the value of faith-knowledge as opposed to "metaphysics."

See A. Ritschl, *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (3rd ed., 1889); *Uндricht der Christlichen Lehre* (very many editions); and *Theologie und Metaphysik* (2nd ed. of 1889) which give his main philosophical and theological works besides. —E. Bertrand, *Une nouvelle conception de la rédemption*, *La Doctrine de la justification et de la réconciliation dans le système de Ritschl* (1891); H. Schoen, *Les Origines historiques de la théologie de Ritschl* (1953); G. Ecke, *Die theologische Schule. A. Ritschls und die evangelische Kirche der Gegenwart* (1897); James Orr, *The Ritschlian Theology and the Evangelical Faith* (London, 1899; New York, 1902); E. Gilson, *The Ritschlian Theology* (Edinburgh, 1899), in both of which the bibliography of the movement is given. Cf. Otto Pfeiderer, *Development of Theology in Germany since Kant* (1890). The German literature on the subject is very large; see article in *Herzog-Hauck*, vol. xvii.

RITSCHL, FRIEDRICH WILHELM (1806-1879), German scholar, was born in 1806 in Thurania. His family, in which culture and poverty were hereditary, were Protestants who had migrated several generations earlier from Bohemia. Ritschl was fortunate in his school training, at a time when the great reform in the higher schools of Prussia had not yet been thoroughly carried out. His chief teacher, Spitzner, a pupil of Gottfried Hermann, divined the boy's genius and allowed it free growth, applying only so much either of stimulus or of restraint as was absolutely needful. After a wasted year at the university of Leipzig, where Hermann stood at the zenith of his fame, Ritschl passed in 1826 to Halle. Here he came under the powerful influence of Reisig, a young "Hermannian" with exceptional talent, a fascinating personality and a rare gift for instilling into his pupils his own ardour for classical study. The great controversy between the "Realists" and the "Verbalists" was then at its height, and Ritsch naturally sided with Hermann against Boeckh. The early death of Reisig in 1828 did not sever Ritschl from Halle, where he began his professorial career with a great reputation and brilliant success, but soon hearers fell away, and the pinch of poverty compelled his removal to Breslau, where he reached the rank of "ordinary" professor in 1834, and held other offices. The great event of Ritschl's life was a sojourn of nearly a year in Italy (1836-37), spent in libraries and museums, and more particularly in the laborious examination of the Ambrosian palimpsest of Plautus at Milan. The remainder of his life was largely spent in his own garden; when he died, after having gathered and the ideas then conceived. Bonn, whither he removed on his marriage in 1839, and where he remained for twenty-six years, was the great scene of his activity both as scholar and as teacher. The philological seminar which he controlled, although nominally only joint-director with Welcker, became a veritable *officina litterarum*, a kind of Isocratean school of classical study; it in those years trained many of the foremost scholars of the last forty years. The names of Georg Curtius, Ihne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hüblner, Bücheler, Helbig, Beendorff, Riese, Windisch, were all his pupils either at Bonn or at Leipzig, attested his fame and power as a teacher. In 1850 he took the leadership of the venerable Welcker at Bonn, and after a time succeeded in dividing with Ritschl the empire over the philological school there. The two had been friends, but after gradual estrangement a violent dispute arose between them in 1865, which for many months divided into two hostile forces the universities and the press of Germany. Both sides were steeped in fault, but Ritschl undoubtedly received harsh treatment from the Prussian government, and pressed his resignation. He accepted a call to Leipzig, where he died in harness in 1876. Ritschl's character was strongly marked. The spirited element in him was powerful, and to be said to have been overbearing, but his nature was noble at the core; and, though intolerant of inefficiency and stupidity, he never asserted his personal claims in any mean or petty way. He was warmly attached to family and friends, and yearned continually after sympathy, yet he established real intimacy with only a few. He had a great faculty for organization, as is shown by his
administration of the university library at Bonn, and by the eight years of labour which carried to a work of infinite complexity, the famous Priscœ Latinœsa Monumenta Epigraphica (Bonn, 1862). This volume presents in admirable facsimile, with prefatory notices and indexes, the Latin inscriptions from the earliest times to the end of the republic. It forms an introductory volume to the Berlin Corpus Inscriptionum Latinarum, the excellence of which is largely due to the precept and example of Ritschl, though he had no hand in the later volumes. The results of Ritschl's life are mainly gathered up in a long series of monographs, for the most part of the highest finish, and rich in ideas which have leavened the scholarship of the time.

As a scholar, Ritschl was of the lineage of Bentley, to whom he looked up, like Hermann, with fervent admiration. His best efforts were spent in studying the languages and literatures of Greece and Rome, rather than the life of the Greeks and Romans. He was sometimes, but most unjustly, charged with taking a narrow view of "Philolologie." That he keenly appreciated the importance of ancient institutions and ancient art both his published papers and the records of his lectures amply testify. He devoted himself for the most part to the study of ancient poetry, and in particular of the early Latin drama. This formed the central interest of his investigations and the topics of his reports, which his investigations radiated. Starting from this he ranged over the whole domain of pre-Ciceronian Latin, and not only analysed but augmented the sources from which our knowledge of it must come. Before Ritschl the acquaintance of scholars with early Latin was so dim and restricted that it would perhaps be hardly an exaggeration to call him its real discoverer.

To the world in general Ritschl was best known as a student of Plautus. He cleared away the accretions of ages, and by efforts of that real genius which goes hand in hand with labour, brought to light many of the true features of the original. It is infinitely to be regretted that Ritschl's results were never combined to form that monumental edition of Plautus of which he dreamed in his earlier life. Ritschl's examination of the Plautine MSS. was both laborious and brilliant, and greatly extended the knowledge of Plautus and of the ancient Latin drama. Of this, two striking examples may be cited. By the aid of the Ambrosian palimpsest he recovered the name T. Maccius Plautus, for the vulgate M. Accius, and proved it correct by strong extraneous arguments. On the margin of the Palatine MSS. the marks C and DV continually recur, and had been variously explained. Ritschl proved that they meant "Cantum" and "Divertium," and hence showed that in the Roman comedy only the conversations in iambic senarii were not intended for the singing voice. Thus was brought into strong relief a fact without which there can be no true appreciation of Plautus, viz. that his plays were comic operas rather than comic dramas.

In conjectural criticism Ritschl was inferior not only to his great predecessors but to some of his contemporaries. His imagination was in this field (but in this field only) hampered by erudition, and his judgment was unconsciously warped by the desire to find in his text illustrations of his discoveries. But still a fair proportion of his textual labours has stood the test of time, and he rendered immense service by his study of the Plautine metres, a field in which little advance had been made since the time of Bentley. In this matter Ritschl was aided by an accomplishment rare (as he himself lamented) in Germany: the art of writing Latin verse.

In spite of the incompleteness, on many sides, of his work Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his Opuscula collected partly before and partly since his death. The Trinumnum (twice edited) was the only specimen of his contemplated edition of Plautus which he completed. The edition has been continued by some of his pupils—Goetz, Loewe and others.

The facts of Ritschl's life may be best learned from the elaborated biography by Otto Ribbeck (Leipzig, 1879). An interesting and discriminating estimate of Ritschl's work is that by Lucian Muller (Berlin, 1877).

RITSON, JOSEPH (1752–1803), English antiquary, was born at Stockton-on-Tees, of a Westmorland yeoman family, on the 2nd of October 1752. He was educated for the law, and settled in London as a conveyancer when twenty-two. He devoted his spare time to literature, and in 1782 published an attack on Wenton's History of English Poetry. The fierce and insulting tone of his Observations, in which Wenton was treated as a showy pretender, and charged with cheating and lying to cover his ignorance, made a great sensation in literary circles. In nearly all the small points with which he dealt Ritschl was in the right, and his corrections have since been adopted, but the unjustly bitter language of his criticism caused great anger at the time, much, it would appear, to Ritschl's delight. In 1783 Johnson and Steevens were assailed in the same bitter fashion as Wenton for their text of Shakespeare. Bishop Percy was next subjected to a furious onslaught in the preface to a collection of Ancient Songs (printed 1787, dated 1790, published 1792). The only thing that can be said in extenuation of Ritschl's unmannerly acrimony is that he spared no pains himself to ensure accuracy in the texts of ancient songs, ballads and metrical romances which he edited. His collection of the Robin Hood ballads is perhaps his greatest single achievement. Scott, who admired his industry and accuracy in spite of his temper, was almost the only man who could get on with him. On one occasion, when he called in Scott's absence, he spoke so rudely to Mrs Scott that Leyden, who was present, threatened to "throw his neck" and throw him out of the window. Spelling was one of his eccentricities, his own name being an example: Ritsch is short pronunciation for Richardson. As early as 1796 Ritsch showed signs of mental collapse, and on the 10th of September 1803 he became completely insane, barricaded himself in his chambers at Gray's Inn, made a bonfire of manuscripts, and was finally forcibly removed to Hoxton, where he died on the 23rd of the month.

RITTENHOUSE, DAVID (1732–1796), American astronomer, was born at Germantown, Pennsylvania, on the 8th of April 1732. First a watchmaker and mechanician he afterwards became treasurer of Pennsylvania (1777–80), and from 1792 to 1795 director of the U.S. mint (Philadelphia). He was largely occupied in 1793 and in 1799–86 in settling the boundaries of several of the states. He was a fellow of the Royal Society of London, and a member of the American Philosophical Society; and was elected president of the latter society in 1791. As an astronomer, Rittenhouse's principal merit is that he introduced in 1786 the use of spider lines in the focus of a transit instrument. His priority with regard to this useful invention was acknowledged by E. Troughton, who brought spider lines into universal use in astronomical instruments (see von Zach's Monatliche Correspondenz, vol. ii. p. 219), but Felice Fontana (1730–1805), professor of physics at the university of Pisa, and afterwards director of the museum at Florence, had already anticipated the invention in 1775, though no doubt this fact was unknown to Rittenhouse. His researches were published in Transactions of the American Philosophical Society (1785–799). He died at Philadelphia on the 28th of June 1796. See Memoir (1813) by William Barton.

RITTER, HEINRICH (1791–1869), German philosopher, was born at Zerbst on the 21st of November 1891, and died at Göttingen on the 3rd of February 1869. He studied philosophy and theology at Göttingen and Berlin until 1815. In 1824 he became extraordinary professor of philosophy at Berlin, whence he was transferred to Kiel, where he occupied the chair of philosophy from 1833 to 1837. He then accepted a similar position at the university of Göttingen, where he remained till his death. His chief work was a history of philosophy (Geschichte der Philosophie) published in twelve volumes at Hamburg from 1830 to 1853. This book is the product of a wide and thorough knowledge of the subject aided by an impartial critical faculty, and its value is demonstrated by the
fact that it has been translated into almost all the languages of Europe. He wrote also accounts of ancient schools of philosophy, the Ionians, the Pythagoreans and the Megarians. Besides these important historical works, he published a large number of treatises of which the following may be mentioned: Versuch zur Verständigung über die neueste deutsche Philosophie zeit Kant (1853); Die christliche Philosophie bis auf die neuesten Zeiten (2 vols., 1858-59), a work which supplemented the Geschichte; Abriss der philosophischen Logik (1834); Ueber das Verhältnis der Philosophie zum Leben (1835); Histori philo sophischer Graeco-Romanische (in collaboration with Frelle, 1838; 7th ed., 1888); Kleine philosophische Schriften (1839-40); System der Logik und Metaphysik (1856); Encyclopädie der philosophischen Wissenschaften (1862-64); Ernest Renan, über die Naturwissenschaften und die Geschichte (1865); Ueber das Bäse und seine Folgen (1866). Of these latter, the one best known in England is the History of Greek and Roman Philosophy, which, by reason of the excellence of its arrangement and its judicious quotations and notes, is almost indispensable to the student of ancient philosophy.

RITTER, KARL (1779–1859), German geographer, was born at Quedlinburg on the 7th of August, 1779, and died at Frankfort on the Main on the 20th of August, 1859. His father, a physician, left his family in straitened circumstances, and Karl was received into the Schnefenthal institution then just founded by Christian Gottthilf Salzmann (1744–1811) for the purpose of testing his educational theories. The Salzmann system was practically that of Rousseau; conformity to natural law and enlightenment were its watchwords; great attention was given to practical life; and the modern languages were carefully taught, to the complete exclusion of Latin and Greek. Ritter already showed geographical aptitude, and when his schooldays were drawing to a close his future course was determined by an introduction to Bethmann Hollweg, a banker in Hamburg, who arranged that Ritter should become tutor to Hollweg's children, but that in the meantime he should attend the university at his patron's expense. His duties as tutor in the Hollweg family began at Frankfort in 1798 and continued for fifteen years. The years 1814–19, which he spent at Göttingen in order still to watch over the welfare of his pupils, were those in which he began to devote himself exclusively to geographical inquiries. He had already travelled extensively in Europe when in 1817–18 he brought out his first masterpiece, Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen (Berlin, 2 vols., 1817; 1818). In 1820 he became professor of history at Frankfort, and in 1820 professor extraordinarius of history at Berlin, where shortly afterwards he began also to lecture at the military college. He remained in this position till his death. The second edition of his Erdkunde (1822–28) was conceived on a much larger scale than the first, but he completed only the sections on Africa and the various countries of Asia. The service rendered to geography by Ritter was especially notable because he brought to his work a new conception of the subject. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, glaciers, &c., were so many distinct organs, each with its own appropriate functions; and, as his physical frame is the basis of the man, determinative to a large extent of his life, so the structure of each country is a leading element in the historic progress of the nation. Moreover, Ritter was a scientific compiler of the first rank. Among his minor works may be mentioned Vorhalte europäischer Völkergeschichte vor Herodot (Berlin, 1820); Die Stupas ... an der indobrückischen Königsstrasse und die Kolosse von Bamiyan (1838); Eindieung zur allgemeinen vergleichenden Geographie (Berlin, 1852); "Bemerkungen über Veranschaulichungsmittel räumlicher Verhältnisse bei graphischen Darstellungen durch Form u. Zahl," in the Trans. of the Berlin Academy, 1828. After many health selectons from his lectures were published under the title Geschicht der Erdkunde (1861); Allgemeine Erdkunde (1862); and Europa (1863). Several of his works (e.g. the "Palestine" volumes of his Erdkunde) were translated into English. "Karl Ritter" foundations were established in his memory at Berlin and Leipzig, for the furtherance of geographical study.

RITUAL (from Lat. ritus, a custom, especially a religious rite or custom, a term of religion, which may be defined as the routin of worship. This is a "minimum definition": "ritual" at least means so much, but may stand for more. Without some sort of ritual there could be no organized method in religious worship. Indeed, viewed in this aspect, ritual is to religion what habit is to life, and its rationale is similar, namely, that by bringing subordinate functions under an effort- less rule it permits undivided attention in regard to vital issues. This analogy—for it is safer to regard such applications of individual psychology to social phenomena as only analogies—may be carried a step further. Just as the main business of habit is to secure bodily equilibrium in order to allow free use of the intellect, so ritual is to organize the activities necessary to its stability and continuation as a social institution, in order that all available spontaneity and initiative may be directed into spiritual channels. Such organization will naturally affect far more than the forms of worship; but these at least, to judge from the past history of religion, cannot but submit extensively to its influence. The nature of religion, as the sociologist understands it, is bound up with its congregational character. In order that inter-subjective relations should be maintained between fellow-worshippers, the use of one or another set of conventional symbols is absolutely required; for example, an intelligible vocabulary of meet expressions, or (since this is, perhaps, not indispensable) at any rate sounds, sights, actions and so on, that have come by prescription to signify the common purpose of the religious society, and the means taken in common for the realization of that purpose. In this sense, the term "ritual," as meaning the prescribed ceremonial routine, is also extended to observances not strictly religious in character.

But, whilst ritual at least represents routine, it tends, historically speaking, to have a far deeper significance for the religious consciousness. A recurrent feature of religion, which many students of its phenomena would even consider constant and typical, is the attribution of a more or less self-contained and automatic efficacy to the ritual procedure as such. Before proceeding to considerations of genesis, it will be convenient briefly to analyse the notion as it appears in the higher religions. Two constituent lines of thought may be distinguished. Firstly, there is the tendency to pass beyond the purely petitionary attitude which as such can imply no more than the desire, hope or expectation of divine favour, and to take for granted the consummation sought, a deity that answers, a grace and blessing that are communicated. Only when such accomplishment of its end is assumed can efficacy be held to attach to the act of worship. Secondly, there is the tendency to identify such a self-accomplishing act of worship with its objective expression in the ritual that for purposes of mutual understanding makes the body of worshippers one.

The Magical Element in Ritual.—Exactly similar tendencies—to impute efficacy, and to treat the ritual procedure as the source of that efficacy—are typically characteristic of magic, and their reappearance in religion can hardly be treated as a coincidence, seeing that magic and religion would appear to have much in common, at any rate during the earlier stages of their development. In magic a suggestion is made orally, or by dramatic action, or most often in both ways together, and the act is held ipso facto to bring about its own accomplishment. A certain conditionality attaches to the magical operation, inasmuch as each magician is subject to interference on the part of other magicians who may neutralize his spell by a
counter spell of equal or greater power; nevertheless, the intrinsic tone is that of a categorical assertion of binding force and efficacy. Again, in magic the self-realizing force is apt to seem to reside in the suggestional machinery rather than in the spiritual qualifications of the magician, though this is by no means invariably the case. On the whole, however, spells and ceremonies are wont to be regarded as an inheritable and transferable property containing efficacy in themselves. And what is true of magic is equally true of much of primitive, and even of relatively advanced, religion. Dr J. G. Frazer has pronounced the following to be marks of a primitive ritual: negatively, that there are no priests, no temples and no gods (though he holds that departmental, non-individual “spirits” are recognized); positively, that the rites are magical rather than propitiatory (The Golden Bough, 2nd ed. i. 191). If we leave aside the forms of religion, whilst the idea procedure would not be safer to speak of “powers” (to which not a soul-like nature, but simply a capacity for exercising magic, is attributed), this characterization may be accepted as applying to many, if not to all, the rites of primitive religion. Thus the well-known totemic ceremonies of Central Australia afford a striking example of rites of a deeply religious import—in the sense that the purpose they embody is that of consecrating certain functions of the common life (see RELIGION)—yet almost wholly magical in form. They resolve themselves on analysis into (1) direct acts of magical suggestion, and (2) acts commemorative of the magical incident or sacred happenings, the purport of which may be regarded as indirectly and constructively magical, on the principle that in magic to mention a thing’s origin is to control it, to recount another’s wonder-working is to reproduce his power, and so on. It is to be noted, however, that other Australian rites are found, notably those that accompany initiation in the south-eastern region, over which anthropomorphic beings having enough individuality to rank as “gods” undoubtedly preside; but even here, though traces of propitiatory worship may be discernible (the evidence being scanty and conflicting), acts of pure magic are decidedly to the fore. And what is true of the most primitive and unreflective forms of cult remains true of more advanced types which have become relatively self-conscious. There is little or no felt opposition between processes involving control and processes of a propitiatory character in the religion of the Pueblo Indians, which American ethnologists have been so successful in expounding, or, to mount to a still higher level, in the Vedic, Assyrian or Egyptian cults. The leading idea, we may even say, is that expressed so happily by a character in Renan’s Le Frère de Némi: “L’ordre du monde dépend de l’ordre des rites qu’on observe” (cf. A. Lang, Myth, Ritual and Religion, 2nd ed. i. 251). As regards the more obvious forms of religion, whilst the old procedure largely survives unchanged, its original intention is disowned by theologians, though it may be doubted if the popular mind is always strong enough to withstand the appeal of prima facie appearance.

This proneness to impute efficacy to ritual is immensely reinforced by another social proclivity, more or less distinct in its ultimate nature, which causes the rite to rank as a divine ordinance or command. Naturally if the god manifests himself by means of certain forms, if he is reputed to have founded or revealed them, or if he has been known to evince displeasure at departures from them, there is strong reason to think that such forms are efficacious, and that in a sense of themselves, namely, by being what they are. At the sociological level of thought this divine sanction has to be treated as the echo of a social sanction which ratifies and protects religious custom. In early society the influence of what Walter Bagehot (in Physics and Politics, 9th ed. p. 102) calls the “persecuting tendency” in enforcing custom is on the whole not markedly in evidence. The fact is that imitation in a homogeneous group produces such unanimity that, with the help of some education, notably the instruction given at the time of initiation, all non-conformity is nipped in the bud. Of the Central Australian ceremonies we read that they “had to be performed in precisely the same way in which they had been in the Alcheringa (lit. ‘dream-time’ = age of mythical tribal ancestors). Everything was ruled by precedent; to change even the decoration of a performance would have been an unheard-of thing; the reply, ‘It was so in the Alcheringa,’ was considered as perfectly satisfactory. ‘A Way of explanation’” (B. Spencer and F. Gillen, The Native Tribes of Central Australia, 324). Here we perceive the social sanction of public opinion insensibly merging in a supernatural sanction. The tribe is a religious partnership with a divine past with which it would not willingly break. As Mr Lang well puts it, “Ritual is preserved because it preserves luck” (loc. cit.). Given an intrinsic sacredness, it is but a step to associate definite gods with the origin or purpose of a rite, whose interest thereupon becomes to punish omissions or innovations by the removal of blessing (which is little more than to say that the rite loses its efficacy), or by the active infliction of disaster on the community. In the primitive society it is hard to point to any custom to which sacredness does not in some degree attach, but, naturally, the more important and solemn the usage, the more rigid the religious conservatism. Thus there are indications that in Australia, at the highly sacred ceremony of circumcision, the fire-stick was employed after stone implements were known; and we have an exact parallel at a higher level of culture, the stone implement serving for the same operation when iron is already in common use (Spencer and Gillen, ib. 401; cf. E. B. Taylor, Early History of the Metallurgy of Iron, 3rd ed. p. 217). The Interpretation of Ritual.—A valuable and important insight into the late W. Robertson Smith (Religion of the Semites, 17 509.) is that in primitive religion it is ritual that generates and sustains myth, and not the other way about. Sacred lore of course cannot be dispensed with; even Australian society, which has hardly reached the stage of having priests, needs its Okhirabata or “great instructor” (Spencer and Gillen, ib. 303). The function of such an expert, however, is chiefly to hand on mere rules for the performance of religious acts. If his lore included sacred histories, it is largely, we may suspect, because the description and dramatization of the doings of divine persons enter into ritual as a means of magical control. Similarly, the sacred books of the religions of middle grade team with minute prescriptions as to ritual, but are almost destitute of doctrine. Even in the highest religions, where orthodoxy is the main requirement, and ritual is held merely to symbolize dogma, there is a remarkable rigidity about the dogma that is doubtless in large part due to its association with ritual forms many of them bearing the most primeval stamp. As regards the symbolic interpretation of ritual, this is usually held not to be primitive; and it is doubtless true that an unreflective age is hardly aware of the difference between “outward sign” and “inward meaning,” and thinks as it were by means of its eyes. Nevertheless, it is easier to define fetishism (a fetish “differing from an idol in that it is worshipped in its own character, not as the symbol, image or occasional residence of a deity,” New English Dictionary, Oxford, 1901) than it is to bring such a fetishism home to any savage people, the West African negroes not excluded (cf. A. B. Ellis, The Tshi-speaking Peoples of the Gold Coast of W. Africa, 192). It is the magic power, virtue or grace residing in, and proceeding from, the material object—a power the communicability of which constitutes the whole working hypothesis of the magico-religious performance—that is valued in those cases where native opinion can be tested. Moreover, it must be remembered that in the act of magic a symbolic method by way of consciousness pursued, as witness the very formulas employed: “As I burn this image, so may the man be consumed,” or the even more explicit, “It is not wax I am scourging; it is the liver, heart and spleen of So-and-so that I scorch” (W. W. Skeat, Malay Magic, 570.), where appearance and reality are distinguished in order to be mystically reunited. Now it is important to observe that from the symbol as embodying an imperative to the symbol as expressing an optative is a transition of meaning that involves no change of form whatever; and, much as theorists love to contrast the suggestion and the petitionary attitudes,
RITUAL

it is doubtful if the savage does not move quite indifferently to and fro across the supposed frontier-line between magic and religion, interspersing "bluff" with blandishment, spell with genuine prayer. Meanwhile the particular meanings of the detailed acts composing a complicated piece of ritual soon tend to lose themselves in a general sense of the efficacy of the rite as a whole to bring blessing and avert evil. Nay, unintelligibility is so far from invalidating a sacred practice that it positively supports it by deepening the characteristic atmosphere of mystery. Even the higher religions show a lingering predilection for cabalistic formulas.

Changes in Ritual.—Whilst ritual displays an extraordinary stability, its nature is of course not absolutely rigid; it grows along with the endless changes in regards to its growth, is hardly a known tribe without its elaborate body of magico-religious rites. In the exceptional instances where this feature is relatively absent (the Masai of East Africa offer a case in point), we may suspect a disturbance of tradition due to migration or some similar cause. Thus there is always a pre-existing pattern in accordance with which such evolution or invention as occurs proceeds. Unconscious evolution is perhaps the more active factor in primitive times; imitation is never exact, and small variations amount in time to considerable changes. On the other hand, there is also deliberate innovation. In Australia councils of the older men are held day by day during the performance of their ceremonies, at which traditions are repeated and procedure determined, the effect being mainly to preserve custom but undoubtedly in part also to alter it. Moreover, the individual religious genius exercises no small influence. A man of a more original turn of mind than his fellows will claim to have had a new ceremony imparted to him in a vision, and such a ceremony will even be adopted by another tribe which has no notion of its meaning (Spencer and Gillen, ib. 272, 278, 281 n.). Meanwhile, since little is dropped whilst so much is being added, the result is an endless complication and elaboration of ritual. Side by side with elaboration goes systematization, more especially when local cults come to be merged in a wider unity. Thereupon assimilation is likely to take place to one or another leading type of rite—for instance, sacrifice or prayer. At these higher stages there is more need than ever for the expert in the shape of the priest, in whose hands ritual procedure becomes more and more a of a conscious and studied discipline, the naïve popular elements being steadily eliminated, or rather transformed. Not but what the transference of ritualistic duties to a professional class is often the signal for slack and mechanical performance, with consequent decay of ceremonial. The trouble and worry of having to conform with the endless rules of ritual makes people prefer to operate more widely—namely, in the religious society at large—and to produce an endless crop of evasions. Good examples of these on the part alike of priests and people are afforded by Toda religion, the degenerate condition of which is expressly attributed by Dr. W. H. R. Rivers to "the over-development of the ritual aspect of religion" (The Todas, 454–5). It is interesting to observe that a religion thus atomized tends to revert to purely magical practices, the use of the word of power, and so on (ib. ch. x.). It is to be noted, however, that what are known as ritual substitutions, though they lend themselves to purposes of evasion (as in the well-known case of the Chinese use of paper money at funerals), rest ultimately on a principle that is absolutely fundamental in magico-religious theory—namely, that what suggests a thing because it is like it or a part of it becomes that thing when the mystic power is there to carry the suggestion through.

The Classification of Rites.—More than one basis of division has suggested itself. From the sociological point of view perhaps the most important distinction in use is that between public and private rites. Whilst the former essentially belongs to religion as existing to further the common weal, the latter have from the earliest times an ambiguous character, and tend to split into those which are licit—"sacraments," as they may be termed—and those which are considered anti-social in tendency, and are consequently put beyond the pale of religion and assigned to the "black art" of magic. Or the sociologist may prefer to correlate rites with the forms of social organization—the tribe, the phratry, the clan, the family and so on. Another interesting contrast (see how primary a function of religion it is to establish a calendar of sacred seasons) is that between periodic and occasional rites—one that to a certain extent falls into line with the previous dichotomy. A less fruitful method of classing rites is that which arranges them according to their inner meaning. As we have seen, such meaning is usually acquired ex post facto, and typical forms of rite are used for many different purposes; so that the attempt to fit them to a too-composite type clear up. The fact is that comparative religion must be content to regard all its classifications alike as pieces of mere scaffolding serving temporary purposes of construction.

Negative Rites.—A word must be added on a subject dealt with elsewhere (see Taboo, Genna), but strictly germane to the matter in hand. What have the best, if not the sole, right to rank as taboos are ritual interdictions (see M. Mauss in L'Année sociologique, ix. 240). Taboo, as understood in Polynesia, the home of the word, is as wide as, and no wider than, religion, representing one side or aspect of the sacred (see Religion). The very power that can help can also blast if approached improperly, and with wisdom. Thus precautions, abstinence prompted, not by simple dread or dislike, but always by some sort of respect as felt towards that in which other circumstances or in other form has healing virtue. Thus the negative attitude of the observer of taboo involves a positive attitude of reverence from which it becomes in practice scarcely distinguishable. To keep a fast, for instance, is looked upon as a direct act of worship. It must be noted, too, that whereas taboo as at first conceived belonged to the magico-religious circle of ideas, implying a quasi-physical transference of sacredness from what has to it one not fit to receive it, it is very easily reinterpreted as an obligation imposed by the deity on its worshipers. The law observed by a primitive religious community abounds in negative precepts, and if early religion tends to be a religion of fear it is because the taboo-breaker provides the most palpable objective for human and divine sanctions. In the higher religions, to be pure remains amongst the most laudable of aspirations, and, even though the ceremonial aversion of a former age has become moralized, and a purity of heart set up as the ideal, it is on "virtues of omission" that stress is apt to be laid, so that a timorous propriety is too often preferred to a forcible grappling with the problems of life. There are signs, however, that the magico-religious aestheticism has at length come to appreciate the fact that the function of rite in religion as elsewhere is to clear the way for action.

BIBLIOGRAPHY.—A comprehensive study of ritual as such from the comparative standpoint remains yet to be written. Some leading ideas on the subject are struck out by E. B. Tylor, Primitive Culture (1903), ch. 18; and A. Lang, Myth, Ritual and Religion (1889); whilst the whole of J. G. Frazer’s vast collection of facts in The Golden Bough (1900) illustrates ritual, more especially on its magical side; see also W. Robertson Smith, Lectures on the Religion of the Semites (1889). A very valuable work of restricted range but eminent merit is that of Tylor, Primitive Culture; the new edition of which should be studied. S. Lévi, La Doctrine du sacrifice dans les Brahmanas (1899); W. Caland and V. Henry, L’Agnistoma, description complète de la forme normale du sacrifice de Soma dans le culte védique (1906); see also H. Oldenberg, Die Religion der Hethiter (1891); A. Hillebrandt, Ritual Law (1897); F. A. Oppen and Zomer (1896). Admireable descriptions of Australian ritual are to be found in B. Spencer and F. J. Gillen, The Native Tribes of Central Australia (1899) and The Northern Tribes of Central Australia (1901). On Navajo religion, the best account of which exist in C. F. Fletcher, "The Hako: A Pawnee Ceremony," in 22nd Report of Bureau of American Ethnology; see also various papers by the same author in Peabody Reports. Important works on Vaishnavite and Vaishnavite Saiva are J. W. Fewkes, "Tusayan Katchinas," in 17th Rep. of B. of A. Eth. and J. H. B. Hocart, "Hopi Katchinas," in 21st Rep.; M. C. Stevenson, "The Zulu Indians," in 23rd Rep.; cf. F. H. Cushing, "Zulu Fetiches," in 2nd Rep. The following works pay special attention to ritual
RITUAL MURDER—RIVE-DE-GIER

features: L. R. Farnell, The Cults of the Greek States (1896-1907); A. Morot, Le Roi de Judée (1904); and E. Fargues, La Causa degli Ebrei in Egitto (1907). (R. R. M.)

RITUAL MURDER, a general term for human sacrifice in connexion with religious ceremonies. False accusations as to the practice of ritual murder by Jews and Christians have often been made. “The Christians of the second and third centuries suffered severely under them” (Strack). Justin Martyr (150-160) in his Second Apology (ch. 12) vigorously defends the Christian community against this charge; Octavius, Minucius Felix, Tertullian, Origen and other Church Fathers all refer to the subject and indignantly repudiate the atrocious libel that the Eucharist involved human sacrifice. The myth was revived against the Montanists, and in the later middle ages against the heretical Christians. In recent years the accusation has been again levelled against “foreigners” during the disturbances in China. The chief sufferers, however, from the charge were the Jews. The charge was never coherently defined, but a notion prevailed that at the Passover Christian blood was used in Jewish rites. For this belief there is no foundation whatever, as is proved in the classical treatise on the subject by Hermann L. Strack, Regius Professor of Theology at Berlin University. The first occasion on which the medieval Jews were accused of the murder of a Christian child was at Norwich in 1212. In the following century other instances of the charge occurred on the Continent, and by this time (middle of the 13th century) the legend had grown into a belief that “the Jews of every province annually decide by lot” which congregation or town is to be the scene of the mythical murder. It is easy to understand how in ages when the Jews were everywhere regarded with superstitious awe, such stories to their detriment would find ready credence, but the revival of the myth in recent times by the anti-Semitic is a deplorable instance of degeneration. It is only necessary here to refer to the London case (1255), the Trent case (1475) and more recently to the Damascus case (1840); the Tissa-Ezlar affair (1882), the Xanten charge (1891) and the Polna case (1895). All of these charges—sometimes invented by malicious successors from the Jewish fold—were followed by spoliation and tragic persecution of the Jews. On the other hand many Jewish proclivities to Christianity have strenuously defended the Jews from the charge, among them may be particularly named Prof. D. Chwolson (Blutsklage, 1901). In 1840 a protest against the charge was signed by 58 Jewish-Christians, the list being headed by M. S. Alexander, Anglican bishop at Jerusalem. Further testimonies of a similar kind are collected in Strack (op. cit. p. 232). Many of the popes have issued bulls exonerating the Jews (cf. Strack, p. 250); similarly temporal princes have often taken a similar step (ibid. p. 260). Many Christian scholars and ecclesiastics have felt it their duty to utter protests in favour of the Jews. Among them have been the most eminent Christian students of Rabbinism of recent times, e.g. Professors Alexander McCaul, P. Lagarde, Franz Delitzsch, A. Merx, T. Noldke, C. Siegfried, A. Wünsche, G. H. Dalman and J. von Döllinger. A careful examination of the evidence (with a complete acquittal of the Jews) is contained in a notable work by a Catholic priest, F. Frank, Der Ritualmord vor dem Gerichtshöfe der Wahrheit und der Gerichtsbarkeit (1911, 1914). The literature on the other side is entirely antisemitic and in no instance has it survived the ordeal of criticism. The most notorious exponent of the charge was A. Rohling, the worthlessness of whose writings on the subject is exposed by (among many others) Strack (op. cit. pp. 155 seq.).

A list of some of the most important of the cases is given by J. Jacob in the Jewish Encyclopedia, ii. 266–67. (I. A.)

Riva, a fortified district town of Tirol, Austria, near the Italian frontier. Pop. (1900) 7550. It is a lake port and steamship station at the northern extremity of the Lago di Garda. There are two forts on the Monte Brione a little over a mile north-east of the town, and the old castle of La Rocca was reconstructed and extended in accordance with modern requirements in 1850. The Minorite Church (1653), with altar pictures by Guido Reni and other Italian painters, is much frequented as a place of pilgrimage. In addition to its transit trade and the entertainment of visitors, the principal resources of the town are the manufacture of paper, iron wares and pottery, the cultivation of the silk-worm and the olive tree, and a considerable commerce in timber, planks and coal. Riva is connected with the Ledro valley by a picturesque road which passes in a series of tunnels and galleries along the rocky and precipitous west shore of the lake.

RIVAL, one who competes with another, who strives to out-do or excel another or to gain an object or end before another. The Latin rivalis, which was in classic Latin used of a competitor in love, meant by derivation one who used the same brook or stream (rivos) as another, hence a neighbour; thus in the Digest, xili. 20, i. 26, “si inter rivalles, id est qui per eundem rivum aquam ducent, sit contentio de aquae usu.” The term naturally applied more particularly to those who lived on opposite sides of a stream which would be a frequent subject of dispute as to rights.

Rivarol, Antoine de (1753-1801), French writer and epigrammatist, was born at Bagnols in Languedoc on 26th of June 1753, and died at Paris on 11th of April 1801. It seems that his father was an innkeeper but a man of cultivated tastes. The son assumed the title of comte de Rivarol, and asserted his connexion with a noble Italian family, but his enemies said that the name was really Riverot, and that the family was not noble. After various vicissitudes he appeared in Paris in 1777. After winning some academic prizes, Rivarol distinguished himself in the year 1784 by a treatise Sur l’universalité de la langue française, and by a translation of the Inferno. The year before the Revolution broke out he, with some assistance from Chaptal and Champeyret, composed a lampoon, entitled Petit Almanach de nos grands hommes pour 1788, in which some writers of actual or future talent and a great many nobodies were ridiculed in the most pitiless manner. When the Revolution developed the importance of the press, Rivarol at once took up arms on the Royalist side, and wrote in the Journal politique de Antoine Sabatier de Castres (1742-1817) and the Actes des Apôtres of Jean Gabriel Peltier (1770-1825). But he emigrated in 1792, and established himself at Brussels, whence he removed successively to London, Hamburgh and Berlin. Rivarol had had a rival in Emilion, who in sharp conversational sayings. These were mostly ill-natured, and mostly have a merely local application. Their brilliance, however, can escape no one. His brother, Claude François (1762-1848), was also an author. His works include Imsan, ou le fatalisme (1795), a novel; Le Véridique (1827), comedy; Essai sur les causes de la révolution française (1827).

The works of Antoine de Rivarol were published in five volumes (Paris, 1805); selections (Paris, 1858) with introductory matter by Sainte-Beuve and others, and that edited in 1862 (2nd ed., 1880) by M. de Lescure, must be specified. See also M. de Lescure’s Rivarol et la société française pendant la révolution et l’émigration (1882), and Le Breton’s Rivarol, sa vie, ses idées (1895).

Rive-de-Gier, a town of east-central France, in the department of Loire, 14 m. E.N.E. of St Étienne, on the railway to Lyons. Pop. (1900) 15,338. Situated on the Gier and the Canal de Givors, it is principally dependent on the coal industry, giving its name to a coal basin which is a continuation of that of St Étienne. It has glass works, the products of which are celebrated on account of the fineness and purity of the sand found on the banks of

4 Louis René Quantin de Richebourg, Chevalier de Champcenetz (1762-1794), died on the scaffold. He is not to be confounded with Louis Pierre, marquis de Champcenetz, governor of the Tuileries in 1789, who escaped in 1792 through the protection of Mme. Elliott, mistress of the duc d’Orléans.
the Rhone and the Saône. There are also iron and steel works where iron goods and ironmongery of all kinds are manufactured.

Rive-de-Gier is a place of some antiquity, as appears from remains of Gallo-Roman buildings, and mosaics and coins found at various times. In the time of Henry IV. the working of the mines had already given to the locality a measure of importance.

**RIVER**, any considerable stream of water flowing in a defined channel. The origin and subsequent formation of rivers and the valleys along which they flow are considered under Geography, § Principles of Geography, and Geology, § viii. The word "river" is an adaptation of the O.Fr. rivière (mod. rivière), which descends through Med. Lat. rivera, Low. Lat. riparia, in the sense of river-bank and river, from ripa, bank. The Latin for a stream or river is *rivus*, whence *rivularis*, a small stream, Eng. "rivulet," which is, therefore, distinct in origin from "river," though probably the sense of *rivus* influenced the Med. Lat. *rivera*. The etymology of *rivus* and *riparia* is disputed; some scholars refer both to the root *ri-* to drop, flow, others take *riparia* to be from the root seen in Gr. ἐπιρέων, to tear, English "riparian." the sense being a broken cliff or steep bank.

**RIVER BRETHREN**, the name of a group of three Christian communities in the United States of America, descended from Swiss settlers near the Susquehanna river in Pennsylvania in 1750. The first pastor was Jacob Engle, who became head of the community in 1770. Their system is based on literal obedience to the commands of the New Testament, and they have points of similarity both with the Mennonites and with the Dunkards. They practise foot-washing and baptism by trine immersion; are strict Sabbatarians and simple in their manner of life. The three branches are: (1) The Brethren in Christ, who are the most elaborately organized and are numerous in Ohio, Pennsylvania and Kansas; they have also formed churches in New York and in Canada, and missions in South Africa, India and Texas. In 1909 they had 174 ministers, and 65 churches with 3675 communicants. (2) The Old Order, or Yorker Brethren, consists of a small body which separated from the main body in 1843 and maintained more strictly the original practice. They are found specially in York county, Pennsylvania (whence the name "Yorkers"). In 1909 they had 24 ministers, 9 churches, and 423 communicants. (3) The United Zion's Children date from 1853, when a small body left the parent communion on minor questions of administration. They had in 1909 22 ministers and 28 churches with 1400 communicants, all in Pennsylvania.

**RIVER ENGINEERING.** Before undertaking works for the improvement of rivers, either with the object of mitigating the effects of their inundations, or for increasing and extending their capabilities for navigation, it is most important that their physical characteristics should be investigated in each case, for these vary greatly in different rivers, being dependent upon the general configuration of the land, the nature of the surface strata and the climate of the country which the rivers traverse.

**Physical Characteristics of Rivers**

The size of rivers above any tidal limit and their average fresh-water discharge are proportionate to the extent of their basins, and the amount of rain which, falling over these basins, reaches the river channels in the bottom of the valleys, by which it is conveyed to the sea.

**River Basins.**—The basin of a river is the expanse of country, bounded by a winding ridge of high ground, over which the rainfall flows down towards the river traversing the lowest part of the valley; whereas the rain falling on the outer slope of the encircling ridge flows away to another river draining an adjacent basin. River basins vary in extent according to the configuration of the country, ranging from the insignificant drainage-areas of streams rising on high ground very near the coast and flowing straight down into the sea, up to immense tracts of great continents, when rivers, rising on the slopes of mountain ranges far inland, have to traverse vast stretches of valleys and plains before reaching the ocean. The size of the largest river basin of any country depends on the extent of the continent in which it is situated, its position in relation to the hilly regions in which rivers generally rise and the sea into which they flow, and the distance between the source and the outlet of the river draining it.

Great Britain, with its very limited area, cannot possess large river basins, its largest being that of the Thames with an area of 5244 sq. m. Even on the mainland of Europe, river basins augment in extent on proceeding eastwards with the increasing width of the continent; in France the largest basin is that of the Loire with an area of 45,000 sq. m., while the Rhine has a basin of 86,000 sq. m. with a length of 1400 m., the Danube a basin of 312,000 sq. m. with a length of 1700 m., and the Volga a basin of 563,000 sq. m. with a length of 2000 m. The more extensive continents of Asia, Africa and North and South America possess still larger river basins, the Obi in Siberia having a basin of about 1,300,000 sq. m. and a length of 3200 m., the Nile a basin of 1,500,000 sq. m. with a length of over 4000 m., and the Mississippi, flowing from north to south, having a basin of 1,244,000 sq. m. with a length of 4200 m. The vast basin of the Amazon of 2,250,000 sq. m. is due to the chain of the Andes almost bordering the Pacific coast-line, so that the river rising on its eastern slopes has to traverse nearly the whole width of South America at its broadest part before reaching the Atlantic Ocean.

**Available Rainfall.**—The rainfall varies considerably in different localities, both in its total yearly amount and in its distribution throughout the year; also its volume fluctuates from year to year. Even in small river basins the variations in rainfall may be considerable according to differences in elevation or distance from the sea, ranging, for instance, in the Severn basin, with an area of only 4330 sq. m., from an average of under 30 in. in the year to over 80 in. The proportion, moreover, of the rain falling on a larger basin, which actually reaches the river, or the available rainfall in respect to its flow, depends very largely on the nature of the surface strata, the slope of the ground and the extent to which it is covered with vegetation, and varies greatly with the season of the year. The available rainfall has, indeed, been found to vary from 75% of the actual rainfall on impermeable, bare, sloping, rocky strata, down to about 15% on flat, very permeable soils.

**Fall of Rivers.**—The rate of flow of rivers depends mainly upon their fall, though where two rivers of different sizes have the same fall, the larger river has a quicker flow, with its retardation by friction against its bed and banks is less in proportion to its length than that of the smaller river. The fall of a river corresponds approximately to the slope of the country it traverses; and as rivers rise close to the highest part of their basins, generally in hilly regions, their fall is rapid near their source and gradually diminishes, with occasional irregularities, till, in traversing plains along the latter part of their course, their fall usually becomes quite gentle. Accordingly, in large basins, rivers in most cases begin as torrents with a very variable flow, and end as gently flowing rivers with a comparatively regular discharge.

**Variations in the Discharge of Rivers.**—The irregular flow of rivers throughout their course forms one of the main difficulties in devising works, either for mitigating inundations or for increasing the navigable capabilities of rivers. In tropical countries, subject to periodical rains, the rivers are in flood during the rainy season and have hardly any flow during the rest of the year; whilst in temperate regions, where the rainfall is more evenly distributed throughout the year, evaporation causes the available rainfall to be much less in hot summer weather than in the winter months, so that the rivers fall to their low stage in the summer and are very liable to be in flood in the winter. In fact, with a temperate climate, the year may be divided into a warm and a cold season, extending from May to October, and from November to April respectively; the rivers are low and moderate floods are of rare occurrence during the first period, and the rivers are high and subject to occasional heavy floods after a
considerable rainfall during the second period in most years. The only exceptions are rivers which have their sources amongst mountains clad with perpetual snow, and are fed by glaciers; their floods occur in the summer from the melting of the snows and ice, as exemplified by the Rhone above the Lake of Geneva, and the Arve which joins it below. But even these rivers are liable to have their flow modified by the influx of tributaries subject to different conditions, so that the Rhone below Lyons has a more uniform discharge than most rivers, as the summer floods of the Arve are counteracted to a great extent by the low stage of the Saône flowing into the Rhone at Lyons, which has its floods in the winter when the Arve on the contrary is low.

Transportation of Materials by Rivers.—Another serious obstacle encountered in the improvement of rivers consists in the large quantity of detritus brought down by them in flood-time, derived mainly from the disintegration of the surface-layers of the hills and slopes in the upper parts of the valleys by glaciers, frost and rain. The power of a current to transport materials varies with its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders and large stones, which are by degrees ground by attrition in their onward course into shingle, gravel, sand and silt, simultaneously with the gradual reduction in fall, and, consequently, in the transporting force of the current. Accordingly, under ordinary conditions, most of the materials brought down from the high lands by the torrential water-courses are carried forward by the main river to the sea, or partially strewn over flat alluvial plains during floods; and the size of the materials forming the bed of the river or borne along by the stream is gradually reduced on proceeding seawards, so that in the Po, for instance, pebbles and gravel are found for about 140 m. below Turin, sand along the next 100 m., and silt and mud in the last 110 m. When, however, the fall is largely and abruptly reduced, as in the case of rivers emerging straight from mountainous slopes upon flat plains, deposit necessarily occurs, from the materials being either too large or too great in volume to be borne along by the enfeebled current; and if the impeded river is unable to spread this detritus over the plains, its bed becomes raised by deposit, causing the river in flood-time to rise to a higher level. The materials, moreover, which are carried in suspension or rolled along the bed of the river to the sea, tend to deposit when the flow of the river slackens and dies out, brought to rest on encountering the great increase in size of the sea, especially in the absence of a tide and any littoral current, and this is the cause of the formation of deltas with their shallow outlets, barring the approach to many large rivers.

Influence of Lakes on Rivers.—Sometimes a peculiar depression along part of a valley, with a rocky barrier at its lower end, causes the formation of a lake in the course of the river flowing down the valley. The intervention of a lake makes the river, on entering at the upper end, deposit all the materials with which it is charged in the still waters of the lake; and it issues at the lower end as a perfectly clear stream, which has also a very regular discharge, as its floods, in flowing into the lake, are spread over a large surface, and so produce only a very slight raising of the level. This effect is illustrated by the river Rhone, which enters the Lake of Geneva as a very turbid, torrential, glacier stream, and emerges at Geneva as a sparkling, limpid river with a very uniform flow, though in this particular case the improvement is not long maintained, owing to the confluence a short distance below Geneva of the large, rapid, glacial river, the Arve.

The influence of lakes on rivers is, indeed, wholly beneficial, in consequence of the removal of the burden of detritus and the silt to which their flow. Thus the Neva, conveying the outflow from Lake Ladoga to the Baltic, is relieved by the lake from the detritus brought down by the rivers flowing into the lake; and the Swine outlet channel of the Oder into the Baltic is freed from sediment by the river having to pass through the Stettiner Haff before reaching its mouth. The St Lawrence, again, deriving most of its supply from the chain of Great Lakes of North America, possesses a very uniform flow.

RIVER CHANNELS.—The discharge of the rainfall erodes the beds of rivers along the lowest parts of the valleys; but floods occur too intermittently to form and maintain a channel large enough to contain the flow. A river channel, indeed, generally suffices approximately to carry off the average flow of the river, which, whilst comprising considerable fluctuations in volume, furnishes a sufficiently constant erosive action to maintain a fairly regular channel; though rivers having soft beds and carrying down sediment erode their beds during floods and deposit alluvium in dry weather. As the velocity of a stream increases with its fall, the size of a channel conveying a definite average flow varies inversely with the fall, and the depth inversely with the width. A river channel, accordingly, often presents considerable irregularities in section, forming shallow rapids when the river flows over a rocky barrier with a considerable fall, and consisting of a succession of pools and shoals when the bed varies in compactness and there are differences in width, or when the river flows round a succession of bends along opposite banks alternately.

A river flowing over a flat alluvial plain has its current very readily deflected by any chance obstruction or by any difference in hardiness of the banks, and generally follows a winding course, which tends to be intensified by the erosion of the concave banks in the bends from the current impinging against them in altering its direction round the curves. Sometimes also a large river, bringing down a considerable amount of detritus, shifts its course from time to time, owing to the obstruction produced by banks of deposit, as exemplified by the Po in traversing the portion of the Lombardy plains between Casale and the confluence of the Ticino.

Floods of Rivers.—The rise of rivers in flood-time depends not merely on the amount of the rainfall, but also on its distribution and the nature of the strata on which it falls. The upper hilly part of a river basin consists generally of impermeable strata, sometimes almost bare of vegetation; and the rain flowing quickly down the impervious, sloping ground into the water-courses and tributaries feeding the main river produces rapidly rising and high floods in these streams, which soon pass down on the cessation of the rain. The river Marne, draining an impermeable part of the Upper Seine basin, is subject to these sudden torrential floods in the cold season, as exemplified by a diagram of the variations in height of the river at St Dizier from November to March 1903-4 (fig. 2). On the contrary, rain falling on permeable strata takes longer in reaching the rivers; and the floods of these rivers rise more gradually, are less high, continue longer and subside more slowly than in rivers draining impervious strata, as indicated by the diagram of the Little Seine at Nogent during the same period, which has a permeable basin (fig. 1). A main river fed by several tributaries, some from impermeable and others from permeable strata, experiences floods of a mixed character, as shown by the diagram of the same floods in 1903-4 of the Seine at Paris, below the confluence of the torrential Marne and Yonne, where the floods of the gently flowing Upper Seine and other tributaries with permeable basins also contribute to the rise of the river (fig. 3).

High floods are caused by a heavy rainfall on land already sodden by recent rains at a period of the year when evaporation is inactive, and especially by rain falling on melting snow. A fairly simultaneous rainfall over the greater part of a moderately sized river basin is a tolerably common occurrence; and under such conditions, the floods coming from the torrential tributaries reach their maximum height and begin to subside before the floods from the gently flowing tributaries attain their greatest rise. Exceptional floods, accordingly, only occur in a main river when a heavy rainfall takes place at such periods over different parts of the basin that the floods of the various tributaries coincide approximately in attaining their maximum at certain points in the main river.

Mitigation of Floods and Protection from Inundations.—As the size of the channel of a river is generally quite inadequate to carry down the discharge of floods, the river overflows its
banks in flood-time and inundates the adjacent low-lying lands to an extent depending upon the level of the ground and the volume and height of the flood. An enlargement of the bed of the river, principally by deepening it, in order to increase its discharging capacity sufficiently to prevent inundations, is preceded by the cost, and also, in rivers bringing down sediment, by the large deposit that would take place in the enlarged channel from the reduction in the velocity of the current when the flood begins to subside. Where, however, the depth of a tidal river has been considerably increased by dredging for the extension of its sea-going trade, the enlargement of its channel and the lowering of its low-water line have greatly facilitated the passage of land floods from the river above for some distance up, and consequently reduced their height; for instance, the Glasgow quays along the deepened Clyde are no longer subject to inundation, and the lands and quays bordering the Tyne have been relieved from flooding for nearly 10 m. above Newcastle by the deepening of the river from Elswick to the sea (fig. 18).

Sometimes works are carried out in a river valley for diminishing the height of floods by delaying the discharge of part of the rainfall into the main river; whilst others are designed to increase the discharging efficiency of the river channels. In certain cases, moreover, it is very important to restrict or to prevent the inundation of some riparian districts by embankments; and occasionally low-lying lands are so unfavourably situated that pumping has to be resorted to for the removal of their drainage waters.

Works in River Valleys for diminishing Floods.—Rain falling on bare, impervious, hilly slopes rapidly flows into the nearest water-course, carrying with it any loose soil or disintegrated materials met with in its rush down the ravines, thereby intensifying the torrential character of the river, increasing the height of its floods and adding to the sediment obstructing its course to the sea. By encouraging the growth of vegetation and restricting its use for pasturage, and by planting trees on the mountain slopes, which have often been denuded of their natural covering by the reckless clearing of forests, the flow of the rain off the slopes is retarded; the soil, moreover, is bound together by the roots of the plants, and the surface strata are protected from disintegration by the covering of grass and leaves, so that the amount of detritus carried down into the river is greatly reduced.

Diamauls have sometimes been made to reduce the height of floods in rivers and restrict the resulting inundations by impounding some of the flood discharge by the construction of one or more dams across the upper valley of a river, and letting it out when the flood has passed down. This arrangement, however, is open to the objection that in the event of a second flood following rapidly on the first, there might not be time to empty the reservoir for its reception. The cost, moreover, of the formation of such reservoirs could rarely be justified merely for the purpose of reducing the flood-level along an ordinary river valley. Nevertheless, when this provision against floods can be combined with the storage of water-supply for a town, it becomes financially practical. Thus two masonry dams erected across the narrow valley of the river Furen, a torrential tributary of the Loire, form two reservoirs for the supply of the town of St Étienne, in which the water is kept down several feet below the full level in order to provide for the reception of the surplus flood-waters, and thereby protect St Étienne from inundation. Storage reservoirs also, formed solely for water-supply or irrigation, provided adequate compensation water is discharged from them during dry weather, are advantageous, like lakes, in regulating the flow of the river below.

When a river flowing through flat plains has a very small fall, it requires a proportionately large channel to carry away the drainage waters of the valley; and, accordingly, the low-lying lands bordering the river are very subject to inundations if the rainfall over the higher ground is allowed to flow straight down into the bottom of the valley. By intercepting, however, the flow off the high parts of the valley in small channels excavated along the slopes, termed "catch-water drains," the ample fall available from this higher elevation can be utilized for conveying the flow farther down the valley; and the congested river is thereby relieved for a certain part of its length from the rainfall over the higher ground.

**Methods of increasing the Discharging Efficiency of River Channels.**—The discharging efficiency of a river within the limits of its bed depends on the fall and the cross-section of the channel. The only way of increasing the fall is to reduce the length of the channel by substituting straight cuts for a winding course. This involves some loss of capacity in the channel as a whole, and in the case of a large river with a considerable flow it is very difficult to maintain a straight cut, owing to the tendency of the current to erode the banks and form again a sinuous channel. Even if the cut is preserved by protecting the banks, it is liable to produce changes, shoals and a raising of the flood-level in the channel just below its termination. Nevertheless, where the available fall is exceptionally small, as in lands originally reclaimed from the sea, such as the English fen districts, and where, in consequence, the drainage is in a great measure artificial, straight channels have been formed for the rivers; and on account of the importance of preserving these fertile, low-lying lands from inundation, additional straight channels have been provided for the discharge of the rainfall, known as drains in the fen. Except where a town is exposed to inundations, a considerable modification of the course of a river and an enlargement of its channel do not produce a reduction in the damage from its floods commensurate with the expenditure involved.

The removal of obstructions, whether natural or artificial, from the bed of a river furnishes a simple and efficient means of increasing the discharging capacity of its channel, and, consequently, of lowering the height of floods; for every impediment to the flow, in proportion to its extent, raises the level of the river above it so as to produce the additional artificial fall necessary to convey the flow through the restricted channel, thereby reducing the total available fall. Accidental obstructions, brought down by floods, such as trunks of trees, boulders and accumulations of gravel, require to be periodically removed. In the absence of legal enactments for the
conservancy of rivers, numerous obstructions have in many cases been placed in their channel, such as mining refuse, sluice-gates for mills, fish-traps, unduly wide piers for bridges and sole piers, which impede the flow and raise the flood-level. Stringent prohibitions with regard to refuse, the elimination of sluice-ways and the compulsory raising of their gates for the passage of floods, the removal of fish-traps which are frequently blocked up by leaves and floating rubbish, a reduction in the number and width of the piers of bridges when rebuilt, and the substitution of movable weirs for solid weirs, greatly facilitate the discharge of a river, and consequently lower its flood-level.

**Prediction of Floods in Rivers.**—By erecting gauges in a fairly large river and its tributaries at suitable points, and keeping continuous records for some time of the heights of the water at the various stations, the rise of the floods in the different tributaries, the periods they take in passing down to definite stations on the main river, and the influence they severally exercise on the height of the floods at these places, are ascertained. With the help of these records, by observing the times and heights of the maximum rise of a particular flood at the stations on the various tributaries, the time of arrival and height of the top of the flood at any station on the main river can be predicted with remarkable accuracy two or more days beforehand. By telegraphing these particulars about a high flood to places on the lower river, the weir-keepers are enabled to take beforehand the necessary removable weirs for the passage of the flood, and the riparian inhabitants receive timely warning of the impending inundation.

**Embankments along Rivers to prevent Inundations.**—Where portions of a riverside town are situated below the maximum flood-level, or where it is important to protect land adjoining a river from inundations, the overflow of the river must be confined within continuous embankments on both sides. By placing these embankments somewhat back from the margin of the river-bed, a wide flood-channel is provided for the discharge of the river directly it overflows its banks, whilst leaving the natural channel unaltered for the ordinary flow. Low embankments may be sufficient where only exceptional summer floods have to be excluded from meadows. Occasionally the embankments are raised high enough to retain the floods during most years, whilst provision is made for the escape of the rare exceptionally high floods at special places in the embankments, where the scour of the issuing current is guarded against, and the inundation of the neighbouring land is least injurious. In this manner, the increased cost of embankments raised above the highest flood-level of rare occurrence is saved, and the danger of breaches in the banks from an unusually high flood-rise and rapid flow, with their disastrous effects, is avoided. Both the above methods afford the advantage of relieving the embanked channel of some of the sediment deposited in it by the confined flood-waters, when the surplus flow passes over the embankments.

When complete protection from inundations is required, the embankments have to be raised well above the highest flood-level, after allowing for the additional rise resulting from the confinement of the flood within the embankments, instead of spreading over the low-lying land; and they have to be made perfectly watertight and strong enough to resist the water-pressure and current of the highest floods. The system has been very extensively adopted where large tracts of fertile alluvial land below flood-level stretch for long distances away from the river. Thus the fens of Lincolnshire, Cambridgeshire and Norfolk are protected from inundations by embankments along their rivers and drains; a great portion of Holland is similarly protected; and the plains of Lombardy are shut off from the floods of the Po by embankments along each side of the river for a distance of about 265 m., extending from Cornale, 89 m. below Turin, to its outlet.

The system has been developed on a very extensive scale along the alluvial valley of the Mississippi, which is below the high flood-level of the river from Cape Girardeau, 45 m. above Cairo, to the Gulf of Mexico, and has a length of 600 m. in a straight line with a width ranging between 20 and 80 m., and an area of 29,799 sq. m. These embankments, built of earth and made of mud in Louisiana, are called levees, and have a total length of 1490 m. They, however, do not afford complete protection from inundations, for in 1490 this great river, the lowest stage of the river, and tend to increase in height owing to the improved drainage and the extension of the cultivation. Moreover, as they are termed in the United States, resulting from a deficiency in the strength or consistency of the banks, or from their being washed or eroded by the current, produce a sudden rush of the flood-water through the opening which is always more disadvantageous to the land in the neighbourhood of the breach than a gradual inundation. Moreover, the velocity of the outflowing water is increased by the slope of the embankments, and the land on these alluvial plains for some distance away from the river, owing to the raising of the ground nearest the river by the gradual deposit of layers of sediment from the flood-waters when they begin to overflow the river banks. The levees on the Mississippi are breached in weak places every year during the spring floods, and are liable to be destroyed along considerable lengths by the rapid erosion resulting from their being overtopped by exceptional floods at intervals of about ten years; and in places they are undermined and overthrown by changes in the course of the river from the caving-in of concave banks at bends, necessitating reconstruction some distance back from the river at the mouth of the plantations. The threat of more or less serious breach of the flood-level of an adjoining river, like New Orleans on the Mississippi and Szegedin on the Theiss in Hungary, the channel of the river should be improved to facilitate the passage of floods past the town. The embankments, raised above the highest possible flood-level, to obviate the contingency of an exceptional flood, or a gradually raised flood-level, overtopping the protecting bank at a low part, leading to an inevitable breach and catastrophe such as overwhelmed the greater part of Szegedin in March 1879.

**Effect of Embankments in raising the River Bed.**—A most serious objection to the formation of continuous, high embankments along rivers bringing down considerable quantities of detritus, especially near a part where their fall has been abruptly reduced by descending from mountain slopes on to alluvial plains, is the danger of their bed being raised by deposit, producing a rise in the flood-level, and necessitating a raising of the embankments if inundations are to be prevented. Longitudinal sections of the Po taken in 1874 and 1901 show that its bed was materially raised in this period from the confluence of the Ticino to below Caranella, in spite of the clearance of sediment effected by the rush through breaches; and therefore the completion of the embankments, together with their raising, would only eventually aggravate the injuries of inundations they have been designed to prevent, as the escape of floods from the raised river must sooner or later occur.

The periodical devastating floods of the Hwang Ho or Yellow River in China are due to the raising of the bed of its embanked channel by detritus brought down from the hills, followed by the raising of the banks, whereby the river is forced to flow above the level of the plains. When the river was first embanked, a considerable space was left between it and its banks on each side, which allowed for deviations in the channel, and also afforded a fair area for the deposit of detritus away from its bed, and a good width for the discharge of floods. Later, however, in order to appropriate and bring under regular cultivation riparian land by the channel left within the embankments and exposed to every flood, lines of inner embankments were formed close to the river, thereby greatly constricting the flood-water channel, and, consequently, raising the flood-level and the river-bed, besides weakening these channels by undermining by merely a moderate change in position of the river channel. This reckless policy of securing additional land regardless of consequences has greatly contributed to the more frequent occurrence of the very widespread inundations resulting from the bursting of the vast volume of pent-up flood-waters through breaches in the banks, which descend with torrential violence upon the plains below, causing catastrophic destruction and property loss.

The restriction of the floods on the lower Mississippi by the levees, placed about double the width apart of the ordinary channel, has caused the river to enlarge its very soft alluvial bed, resulting in a lowering of the water-level. The water-level at the lowest stage; and this, therefore, anticipated that the further scour by floods when the levees have been made continuous will, in this instance, prevent any material raising of the flood-level by the levees.

**Protection of Vessels during Floods.**—On large open rivers, where vessels during high floods are exposed to injury from
large floating débris and ice floes, shelter can be provided for them in refuge ports, formed in a recess at the side under the protection of a solid jetty or embankment constructed in the river parallel to the bank, these ports being closed against floods at their upper end and having their entrance at the lower end facing down-stream. Many such ports have been provided on several German and North American rivers; where the port, being near a town, is lined with quay walls, it can also be used for river traffic, a plan adopted at the refuge port on the Main just below Frankfurt (fig. 8).

Regulation of Rivers for Navigation.

As rivers flow towards the sea, they experience a considerable diminution in their fall, and a progressive increase in the basin which they drain, owing to the successive influx of their various tributaries. Thus gradually their current becomes more gentle and their discharge larger in volume and less subject to abrupt variations; and, consequently, they become more suitable for navigation. Eventually, large rivers, under favourable conditions, furnish natural important highways for inland navigation in the lower portion of their course, as, for instance, the Rhine, the Danube and the Mississippi; and works are only required for preventing changes in the course of the stream, for regulating its depth, and especially for fixing the low-water channel and concentrating the flow in it, so as to increase as far as practicable the navigable depth at the lowest stage of the water-level. Regulation works for increasing the navigable capabilities of rivers can only be advantageously undertaken in large rivers with a moderate fall and a fair discharge at their lowest stage; for with a large fall the current presents a great impediment to navigation, and there are generally great variations in water-level, and when the discharge becomes very small in the dry season it is impossible to maintain a sufficient depth of water in the low-water channel.

Removal of Shoals.—The possibility of securing uniformity of depth in a river by the lowering of the shoals obstructing the channel depends upon the nature of the shoals. A soft shoal in the bed of a river is due to deposit from a diminution in velocity of flow, produced by a reduction in fall and by a widening of the channel, or to a loss in concentration of the scour of the main current in passing over from one concurvate bank to the convex, on the opposite side. The loss in concentration is by dredging, merely effective in deepening, for it soon forms again from the causes which produced it.

The removal, moreover, of the rocky obstructions at rapids, though high in cost and often beyond the means of many industries, produces a lowering of the river above the rapids by facilitating the efflux, which may result in the appearance of fresh shoals at the low stage of the river. Where, however, narrow rocky reefs or other obstructions block the passage of a river below low-water stage, the obstacles to the erosion by the current of the soft materials forming the bed of the river above and below, their removal may prove a permanent improvement by enabling the river to deepen its bed by natural processes.

The deepening of the bed of a non-tidal river along a considerable length by dredging merely lowers the water-level of the river during the low stage; and though this deepening facilitates the passage of ships in the first instance, it does not constitute a permanent improvement even in this respect, for the deposit of the detritus brought down by the river as the floods abate soon restores the river to its original depth. Moreover, whereas the sand-banks obstruct and divert the low-state channel of a river at its low stage, as in parts of the Mississippi below Cairo, it has been found possible before the river has fallen to its lowest level to form a channel through these sand-banks, with a depth of 9 or 10 ft. by 250 ft. wide, by suction dredgers, aided by revolving cutters or water-jets (see Dredging), which discharge the sand through floating tubes into a part of the river away from the channel; and the navigation can thus be prolonged throughout the dry stage, with a considerable saving of cost. Though, however, these channels across the shoals, connecting the deeper parts of the river, can be easily kept open on the Mississippi till the return of the floods, they are obliterated by the currents in flood, and have to be dredged out again almost every year on the abatement of the floods.

Regulation of the Low-Water Channel.—The capability of a river to provide a waterway for navigation during the summer or throughout the dry season depends upon the depth that can be secured in the channel at the lowest stage. Owing to the small discharge and deficiency in scour during this period, it is important to restrict the width of the low-water channel, and concentrate the flow in it, and also to fix its position so that, forming the deepest part of the bed along the line of the strongest current, it may be scoured out every year by the floods, instead of remaining an undefined and shifting channel. This is effected by closing subsidiary low-water channels with dikes across them, and narrowing the channel at the low stage by low-dipping cross dikes extended from the river banks down the slope, and pointing slightly up-stream so as to direct the water flowing over them into a central channel (figs. 4 and 5). The contraction also of the channel is often still more effectually accomplished at some parts, though at a greater cost, by low longitudinal dikes placed along either side of the low-water channel, some distance forward from the banks but connected with them generally at intervals by cross dikes at the back to prevent the current from scouring out a channel behind them during floods (figs. 4 and 6). By raising these dikes only slightly above the surface of the bed of the river, except where it is expedient to produce accretion for closing an old disused channel or rectifying the course of the river, the capacity of the channel for discharging floods is not affected; for the slight obstruction to the flow produced by the dikes at the sides is fully compensated for by the deepening of the low-water channel in the central course of the river.

This system of obtaining a moderate increase in depth during the low stage of a river, whilst leaving the river quite open for navigation, has been adopted with satisfactory results on several large rivers, of which the Rhine, the Rhone and the Mississippi furnish notable examples. Regulation works were preferred on the Rhine to canalization from Lyons nearly to its outlet, in spite of its large fall, which reaches in some places 1 in 250, on account of the considerable quantities of soil and gravel carried down by the river; the comparative regularity of the discharge, owing to the flow being derived from tributaries having their floods at different times of the year, has aided the effects of the works, which have produced an increase of about 33 ft. in the available navigable depth below Lyons at the lowest water-level. Owing, however, to the unfavourable natural condition of the river, the depth does not exceed 5 ft. at this stage; and the rapid current forms a serious impediment to up-stream navigation. The Rhine is much better adapted for improvement by regulation works than the Rhone, for it has a basin more than double the area of the Rhone basin, and its fall does not exceed 3-1 ft. per mile up at Strassbourg and 2-5 ft. per mile through the rocky defile from Bingen to Kaub, and is much less along most of the length below Strassbourg. These works systematically carried out in wide shallow reaches between the Dutch frontier and Mainz, aided by dredging where necessary, have secured a navigable depth at the low stage of the river of 10 ft. from the frontier to Cologne, 8½ ft. from Cologne to Kaub, and 6½ ft. through the rocky defile up to Bingen, beyond which the same depth is maintained up to Philippinburg 22½ m. above Mannheim.

Works, moreover, are in progress by which it is anticipated that the minimum depth of 6½ ft. will be extended up to Strassbourg by 1916. The Mississippi also, with its extensive basin and its moderate fall in most parts, is well suited for having its navigable depth increased
RIVER ENGINEERING

by regulation works, which have been carried out below St Paul in
shallows and shifting reaches, with the object of obtaining a mini-
mum navigable depth during the low stage of 6 ft. along the upper
river from St Paul to St Louis just below the confluence of the
Missouri, and 8 ft. thence to Cairo at the mouth of the Ohio.

Various materials are used for the regulation works according to
the respective conditions and the materials available in the locality.
On the Rhone below Lyons with its rapid current, the dikes have
been constructed of rubble-stone, consolidated above low water
with a layer of mud or clay; but on the Mississippi the most of earthwork mounds protected by a layer of rubble-stone or pitching
on the face, with a rubble mound forming the toe exposed to the
current; but occasionally fascines are employed in conjunction
with stone or simple rubble mounds. The dams closing secondary
channels on the Mississippi are almost always constructed of fascine
mattresses weighted with stone; but whereas the regulating dikes on
the Rhone are usually similar in construction to the dikes in the
United States consists of two parallel rows of piles filled in between with brushwood or other materials not affected
by water, and protected at the sides from scour by an apron of
fascines and stone. Other forms of dikes sometimes used are
timber cribs filled with stone, single rows of sheet piling, permeable
dikes composed of piles supporting thin curtains of brushwood for
promoting silting at the sides, and occasionally rubble-stone in
places needing special protection.

Protecting and Easing Bends.—Unless the concave banks of a river
winding through wide, alluvial plains are protected from the scour
of the current, the bends become serious impediments to
navigation; sometimes eventually becoming so intensified that the
river at last makes a short cut for itself across the narrow strip of
land at the base of the loop it has formed. This, however, pro-
duces considerable changes in the channel below, or in a more central course
whilst curved longitudinal dikes placed in the channel in front of
cove banks (figs. 4 and 6) are still more effective in keeping the
current away from the banks, which is sometimes still further pro-
moted by dipping cross dikes in front (fig. 5).

Regulation of Depth.—The regulation works at bends, besides
arresting erosion, also reduce the differences in depth at the bends
and the crossings, since they diminish the excessive depth round
the concave banks and deepen the channel along the crossings, by
giving a straighter course to the current and concentrating it
by a reduction in width of the channel between the bends (figs. 4
and 5). Where there are deep pools at intervals in a river, a shallow
are always found above them, owing to the increased fall which occurs in the water line on approaching the pool, to compensate for the
very slight inclination of the water-line in crossing the pool, which serves
for the discharge of the river through the ample cross-section of
this part of the river-bed. These variable depths can be regulated to
some extent by rubble dikes or fascine mattress sills deposited
across the bed of the pool, so as to reduce its excessive depth, but
not raised high enough to interfere with all the navigable depth.
These obstructions in the pool raise the water-line towards its upper
end, in order to provide the additional fall needed to effect the
discharge through the pool with its diminished cross section; and this
raising of the water-line increases the general depth, except at the shallows
above the pool, so that the general depth in these irregular parts of
a river is rendered more uniform, with benefit to navigation.

Canalization of Rivers.

Rivers whose discharge is liable to become quite small at
their low stage, or which have a somewhat large fall, as is
usual in the upper part of rivers, cannot be given an adequate
depth for navigation by regulation works alone; and their
ordinary summer level has to be raised by impounding the
flow with weirs at intervals across the channel (see Weir),
while a lock (see Canal and Dock) has to be provided alongside
the weir, or in a side channel, to provide for the passage of
vessels (fig. 8). A river is thereby converted into a succession of
fairly level reaches, rising in steps up stream, providing a
comparatively still-water navigation like a canal; but it
differs from a canal in the introduction of weirs for keeping
up the water-level, in the provision for the regular discharge
of the river at the weirs, and in the two sills of the locks being
laid at the same level instead of the upper sill being raised
above the lower one to the extent of the rise at the lock, as
usual on canals. Canalization secures a definite available
depth for navigation; and the discharge of the river generally
is amply sufficient for maintaining the impounded water-
level, as well as providing the necessary water for locking.
The navigation, however, is liable to be stopped during the
descent of high floods, which in many cases rise above the locks
(fig. 7); and it is necessarily arrested in cold climates on
all rivers by long, severe frosts, and especially on the break-up of
the ice.

Instances of Canalized Rivers.—Many small rivers, like the Thames
above its tidal limit, have been rendered navigable by canalization,
and several fairly large rivers have thereby provided a good depth
for vessels for considerable distances inland. Thus the canalized
Seine has secured a navigable depth of 10 ft. from its tidal limit
up to Paris, a distance of 135 m., and a depth of 6 ft. up to Mon-
tereau, 62 m. higher up. Regulation works for improving the
river Main, from its confluence with the Rhine opposite Mainz up
to Frankfort, having failed to secure a minimum depth of 3 ft.
the locks, canalization works were carried out in 1883-86 by means of five weirs in the 22 m. between the Rhine and
Frankfort, and provided a minimum depth of 6 ft. (figs. 7 and 8).

This depth was subsequently increased by dredging the shoaler
towards the upper end of each reach, due to the rise of the
river-bed up-stream, so as to attain a minimum depth of 7 ft. just
below the lowest lock, and 7½ to 8½ ft. in the other reaches; whilst
a sixth weir was erected at Offenbach above Frankfort (fig. 7).
The lower Kanawha, Ohio, and other rivers, furnish instances of canalization works in the United States.

Limits to Canalization.—On ascending a river it becomes increas-
ingly difficult to obtain a good depth by canalization in the upper
part, owing to the progressive inclination of the river-bed; thus, even
on the Seine, with its moderate fall, whereas a depth of 10 ft. has
been obtained on the Lower Seine by weirs placed on the average
135 m. apart, on the Upper Seine weirs are required at intervals of
very about 4½ m. to attain a depth of 6 ft. Accordingly, the higher
parts of rivers are only suitable for floating down trunks of
trunks on the hills, or rough rafts of timber, conveying small
loads of produce, which are broken up on reaching their destination.
Moreover, in some cases, the fall could not be made to
necessary to abandon a section of the river and to continue the navigation by
lateral channel.

Small River Outlets exposed to Littoral Drift.

Rivers with a small discharge flowing straight into the sea
an exposed coast are more or less obstructed at their outlet

---

[Diagram and text describing the canalization works and navigation improvements on the Seine and other rivers in the United States.]
by drift of shingle or sand carried along the coast by the waves in the direction of the prevailing winds. When the flow falls very low in dry weather, the outlet of a river is sometimes completely closed by a continuous line of beach, any inland or tidal waters merely trickling through the obstruction; and it is only on the descent of floods that the outlet is opened out. In rivers which always have a fair fresh-water discharge, or a small fresh-water flow combined with a tidal flow and chb, the channel sometimes has its direct outlet closed, and is deflected parallel to the shore till it reaches a weak place in the line of beach, through which a new outlet is formed; or, where the current is strong enough to keep the outlet open, a bar is formed across the entrance by the littoral drift, reducing the navigable depth.

**Jetties at River Outlets.**—The bar formed by littoral drift across the outlet of a river not charged with sediment and flowing into a tideless sea can be lowered by carrying out solid jetties on each side of the outlet across the foreshore, so as to scour the bar by concentrating the issuing current over it. Thus by means of jetties, aided by dredging, the depth at the entrance to the Swine mouth of the Oder has been increased from 22 ft. to 231 ft.; the approach channels to the river Pernau (fig. 9) and other Russian rivers flowing into the Baltic have been deepened by jetties, and the outlet channels of some of the rivers flowing into the Great Lakes of North America have been improved by crib-work jetties and dredging.

Where the littoral drift is powerful enough to divert the outlet of a river, as in the case of the river Yare, which at one time was driven to an outlet 4 m. south of its direct course into the sea at Yarmouth, and the river Adour in France, whose outlet, owing to the violent storms of the Bay of Biscay, was liable to be shifted 18 m. from its proper position, it has proved practicable to fix as well as to deepen the outlet by means of jetties (fig. 10). In such cases, shallow diverging channels, almost devoid of fall, have to force their way in order to convey the fresh-water discharge into the sea (fig. 13). These deltaic channels deposit their burden of sediment in front of their outlets, forming bars which advance with the delta and whose rate of progress seawards and distance in front of each outlet are proportionate to the discharge of the several channels. A channel simply dredged on the bar in front of one of the outlets of a deltaic river is only maintained for a moderate period on account of the large volume of deposit continually accumulating at the outlet. Thus the channel in front of the outlet of the south-west pass of the Mississippi delta, when deepened from 13 ft. to 18 ft. over its bar by dredging many years ago, was soon slitted up again on the discontinuance of the dredging; whilst the depth of the outlet channel of one of the branches of the Volga delta, which was increased from 4 ft. to 8 ft., could only be maintained by regular yearly dredging.

**Parallel Jetties at Delta Outlets.**—In order to procure and maintain for some time an adequate deepening across the bar in front of the outlets of delta channels, recourse has been had to the scour of the issuing current concentrated and extended out to the bar by parallel jetties, forming prolongations seawards of the banks of the channel. The requisite conditions for the success of this system of improvement are a good depth in the sea beyond the bar, allowing of a considerable deposit of alluvium before the increased depth is interfered with, and a littoral current carrying a portion of the alluvium away from the outlet, both of which retard the progression of the delta in front of the outlet and the inevitable eventual formation of a new bar farther out. The rate of advance of a delta depends also on the proportion of solid matter contained in the river water and on the specific gravity and size of the particles of alluvium discharged into the sea; for the heavier and coarser materials, and especially those which are rolled along the bed of the channels, come first to rest. Moreover, as the larger channels of a delta bring down a larger volume of alluvium on account of their larger discharge, and as their bars form farther seawards from their outlets owing to the issuing current being less rapidly arrested in proportion to the volume discharged, the rate of advance of the

**Figs. 11 and 12.—**Jetty Outlet into North Sea: River Maas.

**Deltaic Outlets of Tideless Rivers.**

Large rivers heavily charged with sand and silt, when their current is gradually arrested on entering a tideless sea, deposit these materials as a constantly advancing fan-shaped shoal in front of their mouths, through which comparatively...
delta in front of an outlet is proportionate to the size of the channel, and the length of the jetties required for lowering the bar by scour in front of any channel is proportionate to the discharge of the channel. Consequently, the conditions are more unfavourable for the development of the outlets of larger delta branches than of the smaller ones; though, on the other hand, the larger channels crossing the delta are generally more suitable for navigation on account of their size, and the natural depth over their bars is greater owing to the larger discharge.

The discharge of the main branch of the Rhone, which formerly flowed into the Mediterranean and the Gulf of Fos through six mouths, was in 1852–57 concentrated in the direct eastern channel, in one of which, and in two lateral channels. The entire flow of the river, being thus discharged through the eastern outlets, increased for a time the depth over its bar from 30 ft. to 50 ft., but as the central portion of an alluvial tongue, including an unusually large proportion of sand rolled along the bed of the river, was also all discharged through the one outlet, the bar soon formed again farther out, and naturally advanced with the delta. In front of the outlet more rapidly than formerly when the deposit was distributed through six divergent mouths. Accordingly, the very moderate deepening produced by the embankments was not long maintained, and the average depth over the bar has not exceeded 64 ft. for many years past: the St. Nazaire channel has been constructed to provide a deeper outlet for the navigation.\(^1\) This want of success was due to the selection of an outlet opening on a sheltered, somewhat shallow bay, instead of a southern outlet discharging into deeper water in the Mediterranean and having a deep littoral channel in front of it, as also resulted from the closing of all the other outlets, whereby the whole of the deposit, as well as all the discharge, was concentrated in front of the badly situated eastern outlet.

The southern Roubian branch was reopened in 1893 to prevent the silting-up of the outlet of the St. Louis Canal.

The Danube traverses its delta in three branches, the northern one, which, though conveying nearly two-thirds of the discharge of the river, is unsuitable for improvement owing to its splitting up along portions of its course into several channels, and eventually flowing into the sea through twelve mouths. A small independent delta branch is sometimes annually across a shallow foreshore. The central Sulina branch was selected for improvement in 1858 in preference to the southern St. George's branch, which had a more favourably situated outlet and a better channel through the delta, on account of the much smaller expediture required for carrying out jetties to the bar in front of the Sulina outlet, which was only half the distance from the shore of the bar of St. George's branch, owing to the much smaller discharge on the Sulina branch.\(^2\) The jetties, begun provisionally in 1858 and subsequently consolidated and somewhat extended, were finally completed in 1877. They increased the depth over the bar from an average of about 2 ft. previously to 1858 up to 20 ft. in 1873, which was maintained for many years. In 1893, however, the increasing draught of vessels rendered a greater depth necessary; the wide inshore portion of the jetty channel was therefore narrowed by more reclamation and a portion was taken from the jetty channel and outside, whereby the depth was increased to 24 ft. in 1897, and was fairly maintained up to 1907, when a second dredging was made at a cost of 80,000 crowns. The maintenance of the small ratio of sediment to discharge in the Danube, the fineness of the greater portion of this sediment, its comparatively moderate amount owing to the small proportion of the discharge flowing through the Sulina outlet, the tidal disturbances in the southern branch, the current and wave action, have prevented the rapid formation of a shoal in front of the Sulina outlet. Nevertheless, the lines of soundings are gradually advancing seawards in the line of the outlet channel, and there are signs of the formation of a new bar farther out, whilst the deposit to the south by the current and waves has deflected the deepest channel northwards. Accordingly, a prolongation of the jetties will eventually be necessary, notwithstanding the removal of a portion of the deposit from the outlet channel by dredging.

The selection of the outlet of the south-west pass of the Mississippi delta for improvement by parallel jetties in 1876–79, in spite of the small pass possessing a larger channel and a better depth over its bar, was due, as at the Danube, to motives of economy, as the bar of the south-west pass was twice as far off from the town as that of the Sulina outlet.\(^3\) The mattress jetties, weighted with limestone, and with large concrete blocks at their exposed ends (see JETTY), 2 ft. and 1 ft. long, and curved slightly southwards at their outer ends to direct the sediments more directly towards the angles to the littoral current, increased the depth of 8 ft. off the bar in 1875 up to 31 ft. between the jetties and out to deep water (fig. 14). The prolonged current of the river produced by the jetties has, as at the Sulina, rapidly increased the distance of the bank of the littoral sediment into fairly deep water, so that the greatest advance of the

**RIVER ENGINEERING**

The shoaling, however, in the jetty channel necessitated its reduction in width by mattresses and spurs from 1000 ft. to 600 ft., and also dredging to maintain the stipulated central depth of 30 ft., and 26 ft. depth for a width of 200 ft., out to deep water; whilst the outer channel was deflected to the east and narrowed by the alluvium carried by the littoral current across the head of the jetty outlet. Accordingly, dredging has been increasingly needed to straighten the channel outside and maintain its depth and width; and since the United States engineers took in hand its maintenance in 1901, the available depth of the outlet channel has been increased from 26 ft. up to 28 ft. by extensive suction dredging.

In order to provide for the increasing requirements of sea-going vessels, the dredging of a channel 35 ft. deep and 1000 ft. wide, cut from the large south-west pass outlet to deep water in the gulf, was begun at the end of 1903; and jetties of massive mattresses weighted with stone and concrete blocks have been carried out about 300 ft. and 1000 ft. respectively from the shore on each side of the outlet for maintaining the dredged channel\(^2\) (fig. 15). These works differ from the prior improvement of the south pass in the adoption mainly of suction dredging for the formation of the channel in place of scour alone, so that it will be unnecessary to restrict the width of the jetty channel to secure the desired depth; whilst as the discharge through the south-west pass is rather more than three times the discharge through the south pass, and the bar is double the distance seawards of the outlet, the slightly converging jetties, in continuation of the south-west pass, are placed about 3400 ft. square out from their outer ends, and have been given about twice the length of the south pass jetties. As soon as the dredging of the channel has been completed (which depends on the appropriations granted by Congress) the south pass will be abandoned, and the south-west pass will form the navigable approach. Dredging will be required for preserving the depth of the outlet of the south-west pass; and when the large volume of sand and other alluvium discharged by the pass accumulates in front sufficiently to begin forming a bar farther out, an extension of the jetties will be necessary to maintain the elongated channel free from drift, and extend the scour, especially in flood-time.

**Improvement of Tidal Rivers for Navigation.**

Whereas the size of tideless rivers depends wholly on their fresh-water discharge, the condition of tidal rivers is due to the configuration of their outlet, the rise of tide at their mouth, the distance the tide can penetrate inland, and the space available for its reception. Accordingly, tidal rivers sometimes, even when possessing a comparatively small fresh-water discharge, develop under favourable conditions into large rivers in their lower tidal portion, having a much better natural navigable channel at high tide than the largest deltatic rivers, as shown by a comparison of the Thames, the Humber and the Elbe with the Danube, the Nile and the Mississippi. Tidal water is, indeed, unlimited in volume; but, unlike the drainage waters which must be discharged into the sea, it only flows upwards where there is a channel and space available for its
RIVER ENGINEERING

reception. Consequently, it is possible to exclude the tide by injudicious works, such as the sluices which were erected long ago across the ten rivers to secure the low-lying lands from the inroads of the sea; the tidal influx is also liable to be reduced by acretion in an estuary resulting from training works. The great aim, on the contrary, of all tidal river improvement should be to facilitate to the utmost the flow of the flood-tide up a river, to remove all obstructions from the channel so as to render the scouring efficiency of the flood and ebb tides as great as possible, and by making the tidal flow extend as far up the river as possible to reduce to a minimum the period of slack tide when deposit takes place.

Tidal Flow in a River.—The progress of the flood-tide up a river and the corresponding ebb are illustrated in Fig. 16, which shows a diagram giving a series of simultaneous tidal lines obtained from simultaneous observations of the height of the river Hugli during a high spring-tide in the dry season, taken at intervals at several stations along the course of the river, on a third day after a new moon (fig. 16). The steep form assumed by the foremost part of the flood-tide lines from the entrance to beyond Chinsura, attaining a maximum in the neighbourhood of Konnagar and Chinsura, indicates the existence of a bore, caused by the sand-banks in the channel obstructing the advance of the flood. The height has been sufficiently in height to rush up the river as a steep, breaking wave, overcoming all obstacles and producing a sudden reversal of the flow and abrupt rise of the water-level, as observed on the Severn, the Seine, the Amazon and other rivers. A bore indicates defects in the tidal condition and the navigable channel, which can only be reduced by lowering the obstructions and by the regulation of the river. No tidal river of even moderate length is ever completely filled by tidal water; for the tides, being confined to long stretches of shallow estuaries, the flood-tide has produced high water at the tidal limit, as most clearly shown in the case of a long tidal river by the Hugli tidal diagram. Every improvement of the channel, however, expedites and increases the filling of the river whilst the volume of water admitted at each tide is further augmented by the additional capacity provided by the greater efflux of the ebb, as indicated by the lowering of the low-water line.

Deepening Tidal Rivers by Dredging.—The improvement of tidal rivers mainly by dredging is specially applicable to small rivers which possess a sufficient navigable width, like the Clyde and the Tyne; for such rivers can be considerably deepened by an amount of dredging which would be quite inadequate for producing a similar increase in depth in a large, wide river, with shifting channels. Both the Clyde below Glasgow and the Tyne below Newcastle were originally insignificant rivers, almost dry in places at low water of spring-tides; and the earliest works on both rivers consisted mainly in regulating their flow and increasing their scour by jetties and training works. They have, however, been brought to their present excellent navigable condition almost wholly since 1840 on the Clyde and 1861 on the Tyne, by continuous systematic dredging, rendered financially practicable by the growing importance of their sea-going traffic. The Clyde has been given a minimum depth of about 22 ft. at low water of spring-tides up to Glasgow, and can admit vessels of 27 to 28 ft. draught. In the Tyne (figs. 17 and 18), it was decided in 1902 to provide a minimum dredging depth in the river channel at low water of 25 ft. from the sea to the docks, of 30 ft. to Newcastle and of 18 ft. up to Scotswood, the rise of spring-tides increasing these depths by 1 ft. In 1906 it was determined to make the channel 30 ft. deep at low water of spring-tides to each of the Tyne docks, and in 1911 to deepen the dock channel to 25 ft. at the docks and Newcastle swing bridge from 20 to 25 ft., and also between the swing bridge and Derwenthaugh from 18 to 25 ft. The natural scour of these rivers has been so much reduced by such a deepening of the river channel that considerable amount of dredging will always be required to preserve the depth attained.

Regulation and Dredging of Tidal Rivers.—Considerable improvements in the navigable condition of tidal rivers above their outlet or estuary can often be effected by regulation works aided by dredging, which ease sharp bends, straighten their course and render their channel, depth and flow more uniform. Examples are the Nervion between Bilbao and its mouth (figs. 19 and 20), and the Weser from Bremen to Bremerhaven at the head of its estuary (figs. 21 and 22). These works resemble in principle the regulation works on large rivers with only a fresh-water discharge, previously described; but on tidal rivers the main low-water channel should alone be trained with an enlarging width seawards to facilitate the tidal influx, and the tidal capacity of the river above low water should be maintained unimpaired.

To secure a good and fairly uniform depth on a tidal river, it is essential that the flood and ebb tides should follow the same course, in order to combine their scouring efficiency, and form a single, continuous deep channel. In wide, winding reaches, however, the flood tide in ascending a river follows as direct a course as practicable; and on reaching a bend, the main flood-tide current, in being deflected from its straight course, hugs the concave bank, and, keeping close alongside the same bank beyond the bend, cuts into the shallow projecting from the convex bend of the bank higher up, forming a blind shoaling channel, as clearly indicated near the Moyapur Magazine in fig. 23, and a little below Shipgunj Point in fig. 24. This effect is due to the flood-tide losing its guidance, and consequently its concentration, at the change of curvature beyond the termination of the concave bank, where it spreads out and passes gradually over, in its direct course, to the next concave bend above along the opposite bank. The ebb tide, on the contrary, descending the river, follows the general course of the fresh-water discharge in all rivers, its main current in the Moyapur reach keeping close along the concave bank between Ulabaria and Hiragunj Point, and crossing over opposite the point to the next concave bank below (fig. 23); whilst in the James and Mary reach the main ebb-tide current runs alongside the concave bank in front of Ninan and Nurpur, and crosses over near Hugli Point to the opposite main concave bank below Gowanakhali (fig. 24). The main currents, accordingly, of the flood and ebb tides in such reaches act quite independently between the bends, forming channels on opposite sides of the river and leaving a central intervening shoal. The surveys of the two reaches of the Hugli, represented in figs. 23 and 24, having been taken in the dry season, exhibit the flood-tide channels at their deepest phase, and the ebb-tide channels in their worst and least continuous condition.

In tidal rivers the main ebb-tide current, being reinforced by
the fresh-water discharge, generally forms the navigable channel, which is scoured out during floods. Narrowing the river between the bends to bring the two channels together would unduly restrict the tidal flow; and in a river like the Hugli dependent on the tidal influx for the maintenance of its depth for two-thirds of the year, and with channels changing with the wet and dry seasons, so that deepening by dredging in the turbid river could not be permanent, training works below low water to bring the ebb-tide current into the flood-tide channel, which latter must not be obstructed at all, offer, aided by dredging, the best prospects of improvement.

Works at the Outlet of Tidal Rivers.—Tidal rivers flowing straight into the sea, without expanding into an estuary, are subject to the obstruction of a bar formed by the heaping-up action of the waves and drift along the coast, especially when the fresh-water discharge is small; and the scour of the currents is generally concentrated and extended across the beach by parallel jetties for lowering the bar, as at the outlets of the Maas (figs. 11 and 12) and of the Nervion (figs. 19 and 20). In the latter case, however, the trained outlet was still liable to be obstructed by drift during north-westly storms in the Bay of Biscay; and, except in the case of large rivers, the jetties have to be placed too close together, if the scour is to be adequate, to form an easily accessible entrance on an exposed coast. Accordingly, a harbour has been formed in the small bay into which the Nervion flows by two converging breakwaters, which provides a sheltered approach to the river and protects the outlet from drift (fig. 19), and a similar provision has been made at Sunderland for the mouth of the Wear; whilst the Tynemouth piers formed part of the original design for the improvement of the Tyne, under shelter of which the bar has been removed by dredging (fig. 17).

Training Works through Sandy Estuaries.—Many tidal rivers flow through bays, estuaries or arms of the sea before reaching the open sea, as, for instance, the Mersey through Liverpool Bay, the Tees through its enclosed bay, the Liffey through Dublin Bay, the Thames, the Ribble, the Dee, the Shannon, the Seine, the Scheldt, the Weser and the Elbe through their respective estuaries, the Yorkshire Ouse and Trent through the Humber estuary, the Garonne and Dordogne through the Girondes estuary, and the Clyde, the Tay, the Severn and the St Lawrence through Friths or arms of the sea. These estuaries vary greatly in their tidal range, the distance inland of the ports to which they give access, and the facilities they offer for navigation. Some possess a very ample depth in their outer portion, though they generally become shallow towards their upper end; but dredging often suffices to remedy their deficiencies and to extend their deep-water channel. Thus the St Lawrence, which possesses an ample depth from the Atlantic up to Quebec, has been rendered accessible for sea-going vessels up to Montreal by a moderate amount of dredging; whilst dredging has been resorted to in parts of the Thames and Humber estuaries, and on the Elbe a little below Hamburg, to provide for the increasing draught of vessels; and the Mersey bar in Liverpool Bay, about 11 m. seawards of the actual mouth of the river, has been lowered by suction dredging from a depth of about 9 ft. down to about 27 ft. below low water of equinoctial spring tides, to admit Atlantic liners at any state of the tide.

Some estuaries, however, are so encumbered by sand banks that their rivers can only form shallow, shifting channels through them to the sea; and these channels require to be guided or fixed by longitudinal training walls, consisting of mounds of rubble stone, chalk, slag or fascines, in order to form sufficiently deep stable channels to be available for navigation. The difficulty in such works is to fix the wandering channel adequately, and to deepen it
sufficiently by the scour produced between the training walls, without placing these walls so close together and raising them so high as to check the tidal influx and produce accretion behind them, thereby materially reducing the volume of tidal water entering and flowing out of the estuary at each tide. The high training works in the Dee estuary, carried out in the 18th century with the object of land reclamation, unduly narrowed the channel, and led it towards one side of the estuary; and though they effectively fixed the navigation channel, they produced very little increase in its depth, but caused a very large amount of sand to accumulate in the estuary beyond, owing to the great reduction in tidal volume by the ramifications, and diminished considerably the channel through the lower estuary in width and depth without checking its wanderings. The training of the channel of the Ribble through its estuary below Preston, for improving its depth and rendering it stable, was begun in 1839, and has been gradually extended at intervals; but the works have not yet been carried out to deep water, and a shifting, shallow channel still exists through the sand banks, between the end of the training walls and the open sea. The high training walls adopted along the upper part of the channel enabled the upper end of the estuary on both sides to be reclaimed for a length of 4 m.; whilst the half-tide training walls below, placed unduly close together, have led to considerable accretion at the sides of the estuary and some extension of the sand banks seawards. Moreover, by fixing the channel near the northern shore they have enabled the landowners to carry out large reclamations on the southern shore. These works, however, besides fixing the navigable channel, have increased its depth, especially in the upper part, and augmented the tidal scour along it by lowering the low-water line; and the trained channel is further deepened by dredging. The training works in the Weser estuary have been confined to constructing a single low training wall at the upper end, which forms a trumpet-shaped outlet for the river below Bremerhaven, and to guiding the navigable channel by occasional low dikes at the side and closing minor channels, so as to concentrate the tidal scour and fresh-water discharge in it, whilst additional depth is obtained by dredging (fig. 21). A remarkable improvement has been effected in the navigable condition of the upper portion of the Seine estuary by training works, begun in 1848; for in place of a shallow, intricate channel through shifting sand banks, whose dangers increased by a bore, a stable deep channel has been provided down to about half-way between Berville and St Saviour, rendering access easy to the river above at high

Conclusions about Training Works in Estuaries.—Experience has proved that training works through sandy estuaries, by stopping the wanderings of the navigable channel, produce an increase in its depth, and, consequently, in the tidal scour for maintaining it. This scour, however, being concentrated in the trained channel, is withdrawn from the sides of the estuary, which in its natural condition is stirred up periodically by the wandering channel; and, therefore, accretion takes place in the parts of the estuary from which the tidal scour and fresh-water discharge have been permanently diverted, especially where an abundance of sand from outside, put in suspension by the action of the prevalent winds blowing into the estuary, is brought in by the flood-tide, as in the cases of the estuaries of the Dee, the Ribble and the Seine. This accretion reduces the tidal capacity of the estuary, and, producing a diminution in the tidal volume passing through the outlet, promotes the extension of the sand banks seawards, as indicated by the difference in the outer portions of the longitudinal sections of different dates of the Weser and Seine estuaries (figs. 22 and 26).

To prevent as far as possible the channel for any distance beyond their terminals from being narrowed, it is essential that the training works should not be raised more above low-water level than absolutely necessary to fix the channel; and the rate of enlargement of their width apart should not be less than 1 in 80 at the upper end, and should increase considerably towards the mouth of the estuary so as to form a trumpet-shaped outlet. The loss of scour in the channel resulting from this enlargement must be compensated for by dredging to attain the requisite depth. Training works partially carried out through an estuary have the advantage of reducing the length of shallow channel to be traversed between deep water and the entrance to the deepened river; but as these works produce no influx on the channel for any distance beyond the end of the trained channel and deep water. Accordingly, when training works are started at the head of a sandy estuary, provision should always be made in their design for their eventual development.

prolongation to deep water at the mouth of the estuary, to ensure the formation of a stable, continuous, navigable channel. Experiments with a model, moulded to the configuration of the estuary under consideration and reproducing in miniature the tidal ebb and flow and fresh-water discharge over a bed of very fine sand, in which various lines of training walls can be successively inserted, are capable in some cases of furnishing valuable indications of the resonant effects and comparative merits of the different schemes proposed for works which have often evoked conflicting opinions and have sometimes produced most unexpected results.

(L. F. V.-H.)

RIVER-HOG, a sportman's name for the African wild pig of which the southern representative is known to the Boers as the bosch-vark ("bush-pig"). They constitute a genus, *Potamochoerus*, allied to the typical pigs of the genus *Sus* (see Swines), from which they are distinguishable by the presence in the males of a long horny ridge below the eye; while they are further characterized by their thick coat of bristly and often brightly coloured hair, and by tufts of long bristles at the tips of the elongated and pointed ears. The southern *P. choeropotamus*, of southern and east Africa, is typically a greyish-brown animal, but one of its eastern representatives is orange-red. In north-east Africa occurs the allied *P. johnstonii*, while in Kordofan and Abyssinia this is in turn replaced by *P. hussana*. The most remarkable member of the group is, however, the red river-hog, *P. porcus*, which is a heavy, short-legged species remarkable for its bright red colour, the great length of the ear-tufts and the white rings round the eyes. It is a native of the great forest-tracts, extending from Senegambia, Liberia and Angola on the W., to Monbuttu in the E. Very noteworthy is the occurrence of a small yellow-haired representative of the group (*P. larvatus*) in Madagascar, which evidently must have reached its present habitat from the mainland. (R. L.)

RIVERINA, a large tract of pastoral country between the rivers Murray and Darling in New South Wales, Australia. It gives name to the see of an Anglican bishop who has his seat at Hay. The chief towns are Deniliquin, Hay, Moulamein, Oxley and Booligool. RIVERS, EARL, an English title held in succession by the families of Woodville or Wydeville, Darcy and Savage. In 1490 John Rivers, or de Ripaquis, was summoned to parliament as a baron, and his son John was similarly summoned by Edward II. The earldom was created for Sir Richard Woodville in 1466 and remained in this family until 1491. (For the three ears of his line see below.) As borne by the Woodvilles the title was not derived from the name of a place, but from an ancient family name, Redvers, or Reviers, members of this family, whose arms are quartered on the Rivers shield, having been sometime ears of Devon. From 1626 to his death in 1680 the earldom was held by Thomas Darcy, Viscount Colchester, from whom it descended by special remainder to his grandson John (c. 1610-1654), the son of his daughter Elizabeth (d. 1651) by her marriage with Sir Thomas Savage (d. 1635), who was created Viscount Savage in 1626. John's son Thomas (c. 1626-1694) was the 3rd earl, and his grandson Richard the 4th earl (see below). The title became extinct when John, the 5th earl, died about 1735. A new barony of Rivers, held by the family of Pitt and its later representative, that of Pitt-Rivers, was in existence from 1776 to 1880.

RIVERS, Anthony Woodville, or WYDEVILLE, 2ND EARL (c. 1442-1483), statesman and patron of literature, and author of the first book printed on English soil, was born probably in 1442. He was the son of Richard de Wydeville and his wife, Jacquetta de Luxemburg, duchess of Bedford. His father was raised to the peerage in his son's infancy, and was made earl of Rivers in 1466. Anthony, who was knighted before he became of age, and fought at Towton in 1461, married the daughter of Lord Scales, and became a peer *jure uxoris* in 1462, two years after the death of that nobleman. Being lord of the Isle of Wight at the time, he was in 1467 appointed one of the ambassadors to treat with the duke of Burgundy, and he exalted his office by challenging Anthony, comte de la Roche, the bastard of Burgundy, to single fight in which was one of the most famous tournois of the age (see the elaborate narrative in Bentley's *Excerpta Historica*, 1756-1825). In 1469 Anthony was promoted to be lieutenant of Calais and captain of the king's armada, while holding other honorary posts. His father and brother were beheaded after the battle of Edgecote, and he succeeded in August of that year to the earldom. He accompanied Edward in his temporary flight to the Continent, and on his return to England had a share in the victory of Barnet and Tewkesbury and defended London from the Lancastrians. In 1473 he became guardian and governor to the young prince of Wales, and for the next few years there was no man in England of greater responsibility or enjoying more considerable honours in the royal service. It is now that for the first time we become aware of Lord Rivers's literary occupations. His mother, the duchess, died in 1472, and his first wife in 1473; in 1475 and the following year he went on pilgrimage to the holy places of Italy; from this time forth there was a strong tincture of serious reflection thrown over his character; he was now, as we learn from Caxton, nominated "Defender and Director of the Siege Apostolic for the Pope in England." Caxton had in 1470 rented a shop in the Sanctuary at Westminster, and here had set up a printing-press. The first MS. which he undertook in London was one referred to him by "the most famous and notable lord, Erle of Ryvvers," consisting of a translation "into right good and fayr Englyssh" of Jean de Teonville's French version of a Latin work, "a glorious fair mirror to all good Christian people." In 1477 Caxton brought out this book, as *Didies and Sayengis of the Philosophers*, and it is illustrous as the first production of an English printing-press. To this succeeded the *Moral Proverbs* of Christine de Pisan, in verse, in 1478, and a *Cordial*, in prose, in 1479. The original productions of Lord Rivers, and, in particular, his *Balades against the Seven Deadly Sins*, are lost. In 1479 a marriage was arranged between him and Margaret, sister of King James III. of Scotland, but it was mysteriously broken off. Rivers began to perceive that it was possible to rise too high for the safety of a subject, and he is now described to us as one who "conceiveth well the mutability and the unstableness of this life." After the death of Edward IV., he became the object of Richard III.'s peculiar enmity, and was beheaded by his orders at Pontefract on the 25th of June 1483. He was succeeded by his brother Richard, the 3rd and last earl of the Wydeville family, who died in 1491. Lord Rivers is spoken of by Commynes as "un tres-gentil chevalier," and by Sir Thomas More as "a good nobleman, one of the noblest and most polite in London." His protection and encouragement of Caxton were of inestimable value to English literature, and in the preface to the *Dikes* the printer gives an account of his own relations with the statesman which illustrates the dignity and modesty of Lord Rivers in a very agreeable way. Rivers was one of the purest writers of English prose of his time. "Memoirs of Anthony, Earl Rivers" are comprised in the *Historical Illustrations of the Reign of Edward the Fourth* (ed. W. H. Blach). (E. C.)

RIVERS, Richard Savage, 4th Earl (c. 1660-1712), was the second son of Thomas, 3rd earl; and after the death about 1680 of his elder brother Thomas, styled Viscount Colchester, he was designated by that title until he succeeded to the peerage. Early in life Richard Savage acquired notoriety by his dare-devilry and dissipation, and he was, too, one of the most conspicuous rakes in the society of the period. After becoming Lord Colchester on his brother's death he entered parliament as member for Wigan in 1681 and procured a commission in the Horseguards under Sarsfield in 1686. He was "the first nobleman and one of the first persons" who joined the prince of Orange on his landing in England, and he accompanied William to London. Obtaining promotion in the army, he served with distinction in Ireland and in the Netherlands, and was made major-general in 1693 and
RIVERS, EARL—RIVES

lieutenant-general in 1702. In 1694 he succeeded his father as 4th Earl Rivers. He served abroad in 1702 under Marlborough, who formed a high opinion of his military capacity and who recommended him for the command of a force for an invasion of France in 1706. The expedition was eventually diverted to Portugal, and Rivers, finding himself superseded before anything was accomplished, returned to England, where Marlborough procured for him a command in the cavalry. The favour shown him by Marlborough did not deter Rivers from paying court to the Tories when it became evident that the Whig ascendency was waning, and his appointment as constable of the Tower in 1710 on the recommendation of Harley and without Marlborough’s knowledge was the first unmistakable intimation to the Whigs of their impending fall. Rivers now met with marked favour at court, being entrusted with a delicate mission to the elector of Hanover in 1710, which was followed by his appointment in 1711 as master-general of the ordnance, a post hitherto held by Marlborough himself. Swift, who was intimate with him, speaks of him as an ‘arrant knave’; but the dean may have been disappointed at being unmentioned in Rivers’s will, for he made a fierce comment on the earl’s bequests to his mistresses and his neglect of his friends. In June 1712 Rivers was promoted to the rank of general, and became commander-in-chief in England; he died a few weeks later, on the 18th of August 1712. He married in 1679 Penelope, daughter of Roger Downes, by whom he had a daughter Elizabeth, who married the 4th earl of Barrymore. He also left several illegitimate children, two of whom were by Anne, countess of Macclesfield. Rivers’s intrigue with Lady Macclesfield was the cause of that lady’s divorce from her husband in 1701. Richard Savage, the poet, claimed identity with Lady Macclesfield’s son by Lord Rivers, but though his story was accepted by Dr Johnson and was very generally believed, the evidence in its support is faulty in several respects. As Rivers left no legitimate son the earldom passed on his death to his cousin, John Savage, grandson of the 2nd earl, and a priest in the Roman Catholic Church, on whose death, about 1735, all the family titles became extinct.

RIVERS, RICHARD WOODVILLE, or WYDEVILLE, EARL (d. 1469), was a member of a family of small importance long settled at Grafton in Northamptonshire. His father, Richard Woodville, was a squire to Henry V., and afterwards the trusted servant of John of Bedford, in whose interest he was constable of the Tower during the troubles with Humphrey of Gloucester in 1425. The younger Richard Woodville was knighted by Henry VI. at Leicester in 1426. He served under Bedford in France, and after his master’s death married his widow Jacqueta of Luxembourg. The mésalliance caused some scandal, but Woodville enjoyed the king’s favour and continued to serve with honour in the army of France. He also distinguished himself at jousts in London (Chronicles of London, 146, 148). On the 9th of May 1448 Henry VI. created him Baron Rivers. His associations made him a strong Lancastrian. For some years he was lieutenant of Calais in Henry’s interests. In 1459, when stationed at Sandwich to prevent a Yorkist landing, he was surprised by Sir John Dinham, and taken prisoner with his son Anthony to the earl of Warwick at Calais. He was, however, released in time to fight for Henry VI. at Towton. Early in the reign of Edward IV., Rivers recognized that the Lancastrian cause was lost, and made a peace with the new king. The marriage of his eldest daughter, Elizabeth, to the second son of Sir John Grey of Groby, to Edward on the 1st of May 1464, secured the fortunes of his family. Rivers was appointed treasurer on the 4th of March 1466, and a little later created earl. Elizabeth found great alliances for her younger brothers and sisters, and the Woodville influence became all-powerful at court. The power of this new family was very distasteful to the old baronial party, and especially so to Warwick. Early in 1468 Rivers’s estates were plundered by Warwick’s partisans, and the open war of the following year was aimed to destroy the Woodvilles. After the king’s defeat at Edgecote, Rivers and his second son, John, were taken prisoners at Chepstow and executed at Kenilworth on the 3d of August, the former being a large family. His third son, Lionel (d. 1481), was bishop of Salisbury. All his daughters made great marriages: Catherine, the sixth, was wife of Henry Stafford, 2nd duke of Buckingham (q.v.).

RIVERSIDE, a city of southern California, U.S.A., and the county-seat of Riverside county, situated on the Santa Ana river, in the San Bernardino valley. Pop. (1900) 6683; (1900) 7073 (1525 foreign-born); (1910) 15,212. It is served by the Atchison, Topeka & Santa Fe, the Southern Pacific and the San Pedro, Los Angeles & Salt Lake railways. The city occupies a slope (about 8oo–1000 ft. above sea-level), rising toward the east is beautifully built and is a winter and health resort. In the Albert S. White Park there is a notable collection of cacti; and Huntingdon Park is high and rocky, is well planted with trees and has a finely shaded automobile drive. Magnolia Avenue, bordered with pepper-trees, is 10 m. long and 130 ft. wide; and Victoria Avenue is similarly parked and lined with semi-tropical trees. Riverside is the seat of an important (non-reservation) boarding-school for Indians, Sherman Institute (1903), which in 1908 had 699 students. Riverside is devoted to the cultivation of oranges, lemons and other subtropical fruits, and has a large trade in these products. It is in the centre of the finest orange district of the state; near Huntington Park is the state citrus experiment station (1906), with an experimental orchard of 20 acres. The cultivation of navel oranges was first introduced from Brazil into the United States at Riverside in 1873; the two original trees, protected by an iron railing, were still standing in 1909. The domestic water supply is obtained from arsensal wells. In 1870 the site of the present city, then known as Jurupa Ranch, the name of the old Spanish grant, was purchased by the Southern California Colony Association. The settlement was chartered in 1883 as a city, with limits including about 56 sq. m. Riverside county was not organized until ten years later. From 1895 there were no saloons in the city.

RIVES, WILLIAM CABELL (1793–1868), American political leader and diplomat, was born in Nelson county, Virginia, on the 4th of May 1793. He attended Hampden-Sidney and William and Mary colleges, was admitted to the bar, and practised in Nelson county (till 1821) and afterwards in Albemarle county. In politics a Democrat, he served in the state constitutional convention of 1816, in the House of Delegates, 1817–19, and in 1822, and in the Federal House of Representatives in 1823–29. From 1829 to 1832 he was minister to France; in 1833 he entered the United States Senate, but in the following year resigned. From 1836 to 1845 he again served in the Senate, and in 1849–53 he was again minister to France. In February 1861 he was a delegate to the Peace Conference in Washington; he opposed secession, but was loyal to his state when it seceded, and was one of its representatives in the Confederate Congress during the Civil War. He died at the country estate of Castle Hill, Albemarle county, Virginia, on the 25th of April 1868. Rives was the author of several books, the most important being his Life of General Andrew Jackson (2 vols., Boston, 1828–29), the completion of which was prevented by his death. He was the father of Alfred Landon Rives (1830–1903), an engineer of some prominence, whose daughter, Amélie Rives (1863–1905), became well known as a novelist, her best known book being The

...
Quick or the Dead? (1888); she married John A. Chanler in 1888, and after their divorce married in 1896 Prince Pierre Troubetzkoy of Russia.

RIVET (O. Fr. rivet, from river, to fix, fasten together, of unknown origin; Sketk compares Icel. rifa, to stitch together), a metal pin or bolt used to fasten metal plates together. A rivet, made of wrought iron, copper or other malleable substance, is usually made with a head at one end, the other end being hammered out after passing through the plates so as to keep them closely fastened together. A bolt "differs from a rivet in that one or both ends have screw-threads to hold a nut (see Shipbuilding).

RIVIERA, the narrow belt of coast which lies between the mountains and the sea all round the Gulf of Genoa in the north of Italy, extending from Nice on the W. to Spezia on the E. It is usually spoken of as Riviera di Ponente ("the coast of the setting sun"), the portion between Nice and the city of Genoa; and as Riviera di Levante ("the coast of the rising sun"), the portion from Genoa to Spezia. All this district, being open to the S. and sheltered from the N. and E. winds, enjoys a remarkably mild climate (winter mean, about 49° Fahr.); but the vegetation in many places partakes of a subtropical character (e.g. the pomegranate, agave, prickly pear, date, palm and banana). Large numbers of flowers, especially roses, violets, hycanths, &c., are grown near Nice, Mentone, Bordighera and other towns, and sent to the London and Paris markets. Bordighera is particularly noted for its figs grown of date-palms, one of the few places in Europe where these trees grow. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery,—the steep sea-cliffs, the ruined towers and the range of the Maritime Alps,—attracts thousands of invalids and convalescents to spend the winter in the chain of towns and villages which stretch from the one end of the Riviera to the other, while these resorts are frequented for sea-bathing in summer by the Italians. Proceeding from W. to E. the following are the places to which visitors principally resort: Nice, Monaco (an independent principality), Monte Carlo, Mentone (the last town on the French Riviera), Ventimiglia, Bordighera, Ospedaletti, San Remo, Porto Maurizio, Oleggia, Diane Marina, Alassio, Arenzano, Pegli (in the Riviera di Ponente), and Nervi, Santa Margherita, Rapallo, Chiavari, Sestri Levante, Levanto, Spezia, and San Terenzo (Lerici) in the Riviera di Levante.

The Riviera's labours, however, under the grave drawback of being liable to earthquakes. In the 19th century there were four such visitations, in 1818, 1831, 1854 and 1887, which especially affected the western Riviera. A railway runs close along the shore all through the Riviera, the distance from Nice to Genoa being 176 m., and the distance from Genoa to Spezia 56 m. In the latter stretch the line burrows through the many projecting headlands by means of more than eighty tunnels. The pearl of the eastern Riviera is the stretch (6 to 7 m.) between Rapallo and Chiavari. Lord Byron and Shelley both lived and wrote on the shores of the Gulf of Spezia, and Dickens wrote The Chimes at Genoa.

RIVIÈRE, Jean-Baptiste (1650—1733), English artist, was born in London on the 14th of August 1650. His father, William Riviere, was for some years drawing-master at Cheltenham College, and afterwards an art teacher at Oxford. He was educated at Cheltenham College and at Oxford, where he took his degree in 1677. For his art training he was indebted almost entirely to his father, and early in life made for himself a place of importance among the artists of his time. His first pictures appeared at the British Institution, and in 1887 he exhibited three works at the Royal Academy, but it was not until 1893 that he became a regular contributor to the Academy exhibitions. In that year he was represented by "The Eye of Spain", "James, Third Earl of Arundel, and His Lady," etc. Subjects of this kind did not, however, attract him long; for in 1865 he began, with a picture of a "Sleeping Deerhound," that series of paintings of animal-subjects which has since occupied him almost exclusively. Among the most memorable of his productions are: "The Poacher's Nurse" (1866), "Circe" (1871), "Daniel" (1872), "The Last of the Garrison" (1875), "Lazarus" (1877), "Persepolis" (1878), "In Manus Tuas, Domine" (1879), "The Magician's Doorway" (1882), "Vac Victis" (1885), "Rizpah" (1886), "An Old-World Wanderer" (1887), "Of a Fool and his Folly there is No End" (1889), "A Mighty Hunter before the Lord" (1891), "The King's Libation" (1893), "Beyond Man's Footsteps" (1894), now in the National Gallery of British Art; "Theoeus Apollo" (1895); "Aggravation" (1896); "St George" (1900); and "To the Hills" (1902). He has also painted portraits; and at the outset of his career made some mark as an illustrator, beginning with Punch. He was elected an Associate of the Royal Academy in 1878, and R.A. in 1881, and received the degree of D.C.L. at Oxford in 1891.

RIVINGTON, CHARLES (1685-1742), British publisher, was born at Chesterfield, Derbyshire, in 1688. Coming to London as apprentice to a bookseller, he took over in 1711 the publishing business of Richard Chiswell (1719-1711), and, at the sign of the Bible and the Crown in Paternoster Row, he carried on a business almost entirely connected with educational literature. He also published one of Whitefield's earliest works, and brought out an edition of the Imitation of Christ. In 1736 Rivington founded the company of booksellers who called themselves the "New Conger," in rivalry with the older association, the "Congo," dating from about 1700. In 1741 he published the first volume of Richardson's Pamela. Charles Rivington died on the 22nd of February 1742, and was succeeded by his two sons, John (1720-1792) and James (1724-1802). James emigrated to America, and pursued his trade in New York (see Newspapers, U.S.A.). John carried on the business on the lines marked out by his father, and was the great Church of England publisher of the day. In 1760 he was appointed publisher to the Society for Promoting Christian Knowledge, and the firm retained the agency for over seventy years. Having admitted his sons Francis (1745-1822) and Charles (1754-1831) into partnership he undertook for the "New Conger" Association the issue of a standard edition of the works of Shakespeare, Milton, Locke and other British classics; also Cruden's Concordance. John Rivington died on the 16th of January 1792. In 1810 John and his son Francis were admitted a partners. In 1827 George (1801-1858) and Francis (1805-1882), sons of Charles Rivington, joined the firm. Rivington contracted further ties with the High Church party by the publication (1833, &c.) of Tracts for the Times. John Rivington died on the 21st of November 1841, his son, John Rivington (1812-1888) having been admitted a partner in 1836. George Rivington died in 1858; and in 1859 Francis Rivington retired, leaving the conduct of affairs in the hands of John Rivington and his own sons, Francis Hansard (b. 1834) and Septimus (b. 1840). In 1850 the business was sold to Messrs Longmans, Green & Co., who continued it, and carried on from 1889 to 1903 by Mr Septimus Rivington and Mr John Guthrie Percival, as Percival & Co. This was changed in 1903 to Rivington, Percival & Co.; and in 1897 the firm revived its earlier title of Rivington & Co., maintaining its reputation for educational works and its connexion with the Moderate and High Church party.

See The House of Rivington, by Septimus Rivington (1894); also the Publishers' Circular (15th January 1885, 2nd June 1890).

RIVOLI VERONESE, a village of Venetia, Italy, in the province of Verona, on a hill on the right bank of the Adige, 13 m. N.W. of Verona, 617 ft. above sea-level. Pop. (1901) 1,587. It is the scene of the battle in which, on the 15th of January 1779, Napoleon inflicted a decisive defeat upon the Austrians commanded by Josef Alvintzi, Baron von Barbeck (1735-1810) (see French Revolutionary Wars). A famous street in Paris (Rue de Rivoli) commemorates
the victory, and under the empire Marshal Masséna received the title of duke of Rivoli. The strong positions around Rivoli, which command the approaches from Tirol and the upper Adige into the Italian plain, have always been celebrated in military history as a formidable obstacle, and Charles V. and Prince Eugene of Savoy preferred to turn them by difficult mountain paths instead of attacking them directly. Minor engagements, such as rearguard actions and holding attacks, have consequently often taken place about them, notably in the campaign of 1796–97. An engagement of this character was fought here in 1848 between the Austrian and the Piedmontese troops.

RIXDORF, a town of Germany, lying immediately south of Berlin, of which it practically forms a suburb, though retaining its own civic administration. Pop. (1880) 16,729; (1895) 59,495; (1905) 133,630. It is connected with the metropolis by a railway (Ring-bahn) and by an electric tramway. It contains no public buildings of any interest, and is almost entirely occupied by a large industrial and artisan population, engaged in the manufacture of linoleum, furniture, cloth, pianos, beer, soap, &c.

Rixdorf is chiefly interesting as a foundation of Moravian Brethren from Bohemia, who settled here in 1737 under the protection of King Frederick William I. German Rixdorf, which is now united with Bohemian Rixdorf, was a much more ancient place, and appears as Richardsdorf in 1650 and as Riegenstorp in 1435. Before 1435 it belonged to the order of the Knights of St John.

RIZZO, or Riccio, DAVID (c. 1533–1566), secretary of Mary (q.v.), queen of Scots, was a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. The queen wanted a bass singer, and he entered her service as a musician, becoming also her volet de chambre, and in 1564 private foreign secretary. After her marriage to Darnley in 1565 his influence with Mary became paramount, and he gave himself great airs and affected considerable state, practically superseding Maitland of Lethington as secretary of state. His elevation aroused the active hostility of Darnley and the other nobles, and he was suspected of being the queen’s lover. On the evening of the 9th of March 1566, the ears of Morton and Lindsay, with armed followers, entered Mary’s upper chamber at Holyrood, seized Rizio, hacked him to death with daggers, and threw his body into the courtyard.

See Ruthven’s Narrative of Riccio’s Murder (1836); and the articles on Mary, Queen of Scots, and allied biographies.

ROACH (Leuciscus rutilus), a small fish belonging to the Cyprinid family, the genus Leuciscus having many representatives in Europe, in which the rudd, the chub and the dace are included. It may attain a length of over 12 in., but a roach of 2 lb. is an unusually large one. It is good sport for anglers, but is not esteemed for the table. The general colour is silvery, with reddish fins. It does not occur in Ireland. In America, the “golden shiner” minnow (Abramis chrysoleucus) is sometimes called a roach.

See Grevelle Fennell’s Book of the Roach, 1870.

ROADS AND STREETS. These words embrace the two divisions into which the lines of communication made by man for vehicular and pedestrian traffic between different places may be roughly classified. In current usage “road” is applied as a general term for all broad made ways from place to place, whether with separate side-paths for foot-passengers or not, while “street” is confined to the roads through towns, villages and other inhabited places, more or less lined by houses and other buildings on either side. The present article is confined to the methods adopted in making roads, from the first great roadmakers, the Romans, down to modern times. The roadways of times anterior to the Romans, at least in Europe, were merely the tracks worn by the feet of pedestrians and animals, and the wheels of vehicular traffic.

Etymologically considered, “road” in its current usage is late in its appearance. The first quotation in the New English Dictionary is from Shakespeare (r Henry IV, 2, 1, 16). The true O.E. word was weg, way, common to Teut. languages, and probably allied to Lat. via. The O.E. rād meant the act of riding, and is formed from ridon, to rise, and is thus used of a journey on horseback, and in compounds of a track or course, cf. swanrād, the swan’s track, a poetic word for the sea- or stream-rād, course of a stream, hūndrād, wheel-track, &c. A special use of the word, occurring as early as the Anglo-Saxon Cron. c. 900, was for a hostile foray, an “inroad,” a “raid,” which is the N. Eng. doublet of “road,” and has superseded it in general use. Another use, which still survives, and shows the origin, is that of a space of water where ships may “ride at anchor in security from stress of weather, a roadstead.” “Street” (O.E. strāð) represents the Lat. strāta via, paved way (from sternere, to strew, pave). It is one of the few words adopted in O.E. from the Romans.

The earliest roads about which anything definite is known, so far as construction is concerned, are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. It is consequently possible, with the help of allusions of ancient writers, to follow the ideal mode of construction, though this was not always adopted. Two parallel trenches were first cut to mark the breadth of the road; loose earth was removed until a solid foundation was reached; and it was replaced by proper material consolidated by ramming, or other means were taken to form a solid foundation for the body of the road. This appears often to have been composed of four layers, generally of local materials, though sometimes they were brought from considerable distances.

The lowest layer consisted of two or three courses of flat stones, or, when these were not obtainable, of other stones, generally smaller in size, but of such a thickness as to have formed the majority of smaller stones, or a coarse concrete; the third of a finer concrete, on which was laid a pavement of polygonal blocks of hard stone jointed with the greatest nicety. The four layers are found to be often 3 ft. or more in thickness, but the lower ones were dispensed with on rock, on which the paving stones were sometimes laid almost directly. The paved part of a great road appears to have been about 14 ft. wide, and on either side, and separated from it by raised stone edgings, were unpaved side-ways, each of half the width of the paved road. Where, as on many roads, the surface was not paved, it was made of hard concrete, or pebbles or flints set in mortar. Sometimes clay and marl were used instead of mortar, and it would seem that where local materials were used the road was made higher above the ground and ronder in cross section. Streets were paved with large polygonal blocks laid as above described, and footways with rectangular slabs. Specimens are still to be seen in Rome and Pompeii, while in Britain many of the roads were of hard gravel or had a cobbled surface. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to have been followed to some extent when new roads were constructed about the beginning of the 18th century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by larger stones on edge, which appeared on the surface of the road. In 1764 Trésaguet set the foundation-stones on edge and reduced the thickness of the upper layers, and his method was generally followed until the influence of John Loudon McAdam (1756–1836) began to be felt. A French chaussée with accoutements still retains some resemblance to the old Roman roads.
The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (Hist. c. iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the 19th century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and McAdam brought scientific principles and regular systems of construction and repair. The name Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been in use in France, and the name of McAdam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, McAdam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impermeable surface. The name Telford is more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he effected in road management and maintenance was great and lasting.

Construction of Roads.—A road should be as short as possible between two points to be connected, but straightness must often be sacrificed to avoid difficulties and expense and to secure good gradients. The latter should be as easy as practicable, having regard to the country to be traversed, and it is desirable that there should be a ruling gradient than which none should be steeper. On the level macadamized road in ordinary repair the force which the horse has to put forth to draw a load may be taken as one-thirtieth of the load. But in going uphill the horse also has to lift the load, and the additional force to be put forth on this account is very nearly equal to the load drawn, divided by the rate of gradient. Thus on a gradient of 1 in 30 the force spent in lifting is one-thirtieth of the load, and in ascending a horse has to exert twice the force required to draw the load on a level. In descending, on the other hand, on such a gradient, the vehicle, when once started, would just move of itself without pressing on the horse. A horse can without difficulty exert twice his usual force for a time, and the name ascend gradients of 1 in 30 on a macadamized surface without sensible diminution of speed, and can trot freely down them. These considerations have led to 1 in 30 being generally considered as the ruling gradient to be aimed at on first-class roads, though 1 in 40 has been advocated. Telford adopted 1 in 30 as the ruling gradient on the Holyhead road through North Wales, and there are only two gradients steeper, in places where they were unavoidable. All unnecessary rises and falls should be avoided, but a dead level is unsatisfactory for drainage, and on this account 1 in 100 to 1 in 150 is the flattest gradient that is desirable. Such slight rises and falls are probably rather favourable than otherwise to ease of draught by horses.

In transverse section, roads in the United Kingdom generally consist of a carriage-way, with spaces on each side, on one or both of which there may be a footpath, and fences and ditches. The width of the carriage-way may be from 15 ft., which allows of the easy passage of two vehicles, to 30 or 50 ft. for roads of importance near towns. The side spaces may be from 4 or 5 to 8 or 10 ft. wide; wide sides give the sun and air access to the road, and tend to keep it dry, and also afford space for the deposit of road materials and scrapings. In cuttings or on embankments the transverse section has of course to be modified. The road surface should have just enough convexity to throw the wet off freely, and a very moderate amount is sufficient when a good surface is maintained. On a too convex road the traffic keeps to the middle, and wears ruts which retain the water, so that the surface is not so dry as with a flatter section which allows the traffic to distribute itself over the whole width. Telford used a cross section differing slightly from an arc of a circle in being more convex in the middle than at the sides. J. Walker recommended two straight lines joined in the middle of the road by a curve, and inclined about 1 in 24 towards the sides, the objection to which is that the flat sides are liable to wear hollow. On the whole a curve of the form of a flat ellipse is the best; the rise in the curve from the sides to the centre need not exceed one-fourtieth of the width, and one-sixtieth is generally enough on well-kept roads. It is generally best to obtain the requisite convexity by rounding the formation surface or seat of the road and giving a uniform thickness to the coating of stone. But often, especially in country roads where the traffic is not very heavy and keeps mainly to the centre, the formation is made level and the convexity is obtained by using more road material at the centre than the sides. When there is not a kerb there should be a “shouldering” of sods and earth on each side to keep the road materials in place, and to form with the finished surface the water tables or side channels in which the surface drainage is collected, to be conveyed by outlets at frequent intervals to the ditches. The outlets are open cuts through the sides or drains beneath the road. The side ditches should be deep enough thoroughly to drain the foundation of the road, and cross or mirre drains under the road communicating with the side ditches may be required in wet soil. A thorough drainage of the subsoil is of the greatest importance, and it is economical in the end to go to considerable expense to secure it. In a cutting, or where there are no side ditches, the surface water may be taken off by gratings and under drains beneath the side channels.

Macadam Roads.—The thickness to be given to a road made altogether of broken stone will depend on the traffic it is intended for. On a good well-drained road, 3 in. will make an excellent road for ordinary traffic, and McAdam's opinion that 10 in. of well-consolidated material was sufficient to carry the heaviest traffic on any substratum if properly drained has proved to be generally correct. In a new road the loss of thickness during consolidation must be allowed for, and the materials should be laid about one-half thicker than the coating is intended to be. When the materials are not rolled, a thickness of 3 to 6 in. should be laid first, and when that has partly consolidated under the traffic other coats may be added to make up the full thickness. There is great wear and waste of road materials in consolidating these, and if they are laid too thickly at once. Inferior material is sometimes used in the lower part of the road coating, especially when the surface is to be of granite or other hard expensive stone. Thus flints or gravel may be used for the lower 5 or 6 in. of a road to be coated with 3 or 4 in. of granite. Telford covered the broken stone of new roads with 1 in. of gravel to act as a binding material. McAdam absolutely interdicted the use of any binding material, leaving the broken stone to work in and unite by its own angles under the traffic.

If the ideas of the inventor are strictly followed, macadam, when the fine network of joints in thin macadam with irregular mud worn from the stone, comes near to a perfect surface. But stones that will pass through a ring of a given size may be twice as much in length, and unless their form is about that of a cube not exceeding 1 in. on its longest side, they cannot be rammed or rolled into the regular mosaic characteristic of the true macadam. The best modern roads are of hand-broken stone dressed slightly on the surface with stone chips, while the mass of the road-metal is kept free from any kind of binding. Some roadmakers, however, have found the large irregularly shaped stones from the machine so difficult to consolidate that they have had to reconsider the question of binding. The engineer of Central Park, New York, found that, with the greatest care and attention to rolling, such stones would not
consolidate properly without admixture; indeed they became more intractable the more they were abraded by rolling. G. F. Deacon of Liverpool advocated a binding composed of large chips of trap rock or else of siliceous gravel from the size of three-quarters of an inch down to that of a pin’s head, together with about one-fourth part of macadam sweepings obtained in wet weather. This will enable the roller to consolidate the road-metal in a third of the time required for broken stone alone. The harder materials here suggested differ essentially from the sand and dirt formerly used for binding, since they fill up all the vacant spaces and cannot be washed down.

A new road is preferably finished by rolling, since in that way the materials are consolidated with less waste, and wear and tear of vehicles is saved. A 15-ton steam-roller, 7 ft. wide, giving upwards of 2 tons weight per foot can thoroughly consolidate 1000 to 2000 sq. yds. of newly laid materials per day.

A pitched foundation, as used by Telford, consists of flat stones set on edge in courses across the road with the broader edges down, 3½ yds. (11 ft.) wide, while the stones are attached to the foundation, and small stones and chips must be firmly pinned into the interstices with a hammer, so as to form a regular convex surface with every stone fixed firmly in place. A foundation of cement concrete 6 in. thick was used by Sir J. Macneill on the Highgate Archway (London) road on a hard clay bottom, and common lime concrete was subsequently used elsewhere. A bed of lias lime concrete 12 in. thick was laid as a foundation in Southwark Street and on the Thames Embankment, but it is too expensive for a macadamized road under ordinary circumstances. Foundations of large and rough hard-core should be rolled down to a surface close enough to keep the fine pieces of road-metal from dropping down, so as to create hollows which, though they may escape the roller, will be detected by the laden wheel and by the pounding of the heavy hoof. But there is no foundation equal to sand, which has the property of spreading pressure over an enlarged area. A 12-in. bed of sand rolled down to 8 in. has been recommended, but military engineers have found that a layer of so little as 3 or 4 in. is sufficient as a foundation for macadam in very bad ground that has been rolled, or on an embankment that had time to settle.

**Tar Macadam**—Broken stone mixed with some bituminous composition has been found very suitable for suburban roads, and for towns where the nature of the traffic requires smooth roadways reasonably free from noise and dust. In its simplest form, tar macadam is made from a good hard limestone broken into the usual sizes, the fine chips being used for top-dressing. In a shed a large hearth is formed of stone flagging, under which the flues of a furnace are constructed, and upon the hearth the broken stone is spread in a layer just as thick as the heat may be able to penetrate, to dry off the moisture and make the stones distinctly hot. The load of an ordinary barrow is tipped on an iron plate and gas tar is poured over it (from 8 to 12 gals. per cubic yard), while a couple of men with shovels turn it over exactly as they would turn concrete. No more tar should be used than is required completely to blacken the whole surface of every stone; and when this has been done, the stone can be thrown upon the heat, where it may be kept for one or two months, and then, to allow the volatile oils to evaporate. Fine siftings are treated in the same way. When it has been properly seasoned, the mass should assume a greenish lustre; and when cut into by a shovel, the particles will cling together and creep down slowly so that the heap is said to be “alive.” In that state it may be used. The tar ought to be boiled, and if too thin, a little pitch may be added to it. Though not enough to make the batch too fluid, the mixture of tar with pitch and creosote oil is used by more precise makers, one formula being 12 gals. tar, ½ cwt. pitch and 2 gals. creosote oil to a ton of stone. But these ingredients differ considerably in their chemical composition, and the proportions have to be varied according to experience. Moreover, as regards the tar and pitch used in the manufacture of pave-

ments, the varieties that come directly from a vegetable source are liable to melt in hot and to become brittle in cold weather; coal tar is only moderately proof against these extremes.

Tar macadam must be put down in dry weather. If the material seems too dry, hot tar may be applied as before, but only as an expedient, and with great economy, so that the pavement may not soften in the sun. Upon a well-rolled foundation of hard material a layer of the coarser macadam should be put and rolled, then a layer of the smaller grade. For a road of light traffic a coat of the fine sittings may be put down and heavily rolled to a finished surface. For a road of heavier traffic the second coat should be dressed before rolling with tarred stone of a gauge of three-quarters of an inch to an inch and a quarter, and rolled first with a roller of not more than 10 or 12 cwt., then with one of 30 cwt. After the traffic has been turned on the road for a few days it should again be rolled as heavily as may be necessary to restore any parts that have been disturbed. But such roads are often consolidated by steam-rollers of 10 or 15 tons. For refacing an old road the precast concrete slabs will only lift the old layer. Small depressions may be well tared and levelled up with fine stuff, and the whole surface may be dressed every three years with tar and a fresh coat of fine chips. If the surface of the road is irregular, water will hang upon it, and frost may cause it to become slippery. The lack of affinity between granite and bitumen prevents the use of tar macadam upon roads of heavy traffic.

**Concrete Macadam**—Rocks like granite and syenite may be used in combination with Portland cement. The ingredients are mixed in about the proportion of four parts of broken stone that has first been well wetted, one and a quarter or two parts of clean sharp sand, and one cwt. cement put on in two layers, the second being rolled by hand to the required shape and to a good surface. It should remain for two or three weeks to dry and set. Want of elasticity may be urged against concrete macadam, and it is productive of dust, but in some cases it has proved satisfactory.

**Gravel Roads**—Smooth rounded gravel is unsuitable for roads unless a large proportion of it is broken, and about an eighth part of ferruginous clay added for binding. Rough pit gravel that will consolidate under the roller may be applied in two or more layers, but each must be of similar composition, and the upper stuff will work downwards. A gravel road should be always under inspection, and repairs should be done without delay. A track for equestrian exercise should be made of hoggin or fine gravel, that will remain soft when raked or harrowed and watered. It should be well drained. A foundation of rough hard core will let the hoggin pass down into it, so that the hard core will appear at the surface. The best material is rough chalk sufficiently rolled to stop the gravel while draining off the surface water.

**Stone Pavements**—Early pitched roadways consisted of pebbles or rounded boulders ("cobblestones") bedded in the natural ground or in sand or gravel. The next step in the advance was to employ roughly squared blocks; but the wide and irregular joints admitted the water to the subsoil, and the mud worked up and the stones sank irregularly under the traffic. Telford, who was called upon to report on the street pavements of the parish of Hanover Square in 1824, saw the necessity of cutting off all connexion between the subsoil and the paving stones. He recommended a bed of about 6 in. of clean river ballast, rendered compact by being travelled upon for some time before the paving was laid, but he subsequently considered that nothing short of 12 in. of broken stone, put on in layers 4 in. thick and completely consolidated by carriages passing over them, was the purpose. He recommended paving stones of considerable depth and of from 4 to 6 or 7½ in. in breadth for the greatest thoroughfares, and he pointed out the importance of working the stones flat on the face and square on all sides, so as to joint close and preserve the bed or base as nearly as possible of the same size as the face, and of carefully placing together in the same course stones of equal
ROADS AND STREETS

Many pavements thus laid with stones of considerate breadth still remain, but experience proved that it was a mistake to suppose that broad stones having a larger base would support better than the weight of heavy traffic; on the contrary, a wide stone has a tendency to rock in its bed, and also to wear round on the top and become slippery. To obtain an evener surface and a better foothold for the horses the stones were reduced in width, and in 1840 a granite pavement was laid by Walker on Blackfriars Bridge, which may be considered the first of modern set pavements. The stones were 3 in. broad and 9 deep; they were laid on a bed of concrete 1 ft. thick and were jointed with mortar. The reduction of breadth to about 3 in. was generally followed, but it was some time before a concrete foundation was employed to any great extent, the frequent breaking up to which streets are subject having prevented it. In London a foundation of broken stone has been continued in some thorough-fares, the sets being evenly bedded in gravel upon it and rammed with a heavy wooden rammer. Hard core—a mixture of broken stone, cinder, brick rubbish and old building materials—has also been largely used to form a foundation. In the northern towns of England cinders have been employed, and where the traffic is excessively heavy a pitched foundation of stones on edge has been laid when the sets were not paved upon an old macadamized surface. The concrete for a foundation to a paved street should be made with the best Portland cement, thoroughly mixed in proper proportions with the sand and gravel or other materials used, water being added as sparingly as possible. A thickness of 6 in. of well-mixed cement concrete is sufficient for the heaviest traffic, and it can be cut out in slabs for pipe-laying or repairs and can be relaid and cemented in its place. To obtain the best result a new foundation should not be paved upon for a week. A foundation of bituminous concrete is sometimes used where only a thin bed can be laid, in consequence of there being an old foundation which it is undesirable to disturb. It is made by pouring a composition of coal-tar, pitch and creasote oil while hot over broken stone levelled and rolled into the proper form, and then spreading a thin layer of smaller broken stone over the surface and rolling it in. It has the advantage that it can be paved upon a few hours after it has been laid.

The best materials for pavement sets are the hard igneous and metamorphic rocks, though millstone grit and other hard sedimentary rocks of the same nature are used when the traffic is comparatively light. Excessively hard stone which wears smooth and slippery is objectionable in spite of its durability. Joints simply filled in with gravel are of course pervious to water, and a grout of lime or cement does not make a permanently watertight joint, as it becomes disintegrated under the vibration of the traffic. Grouted joints, however, make a good pavement when there is a foundation of concrete or broken stone or hard core. Where there is not a regular foundation imperviousness in the joints is of great importance. In some of the Lancashire towns the joints have for many years past been made by first filling them with clean gravel, well shaken in by ramming, and then pouring in a composition of coal-tar, pitch and creasote oil, which is allowed to percolate and fill up the interstices, the pavement being finished by covering it with small gravel. Joints so formed are impervious to wet and have a certain amount of elasticity; the foundation is kept dry; and the pavement with bituminous grout of this kind keeps its form well for many years. The objection is made that in hot weather the composition runs from the joints and makes the streets unpleasant for foot-passengers.

A pavement consisting of broad, smooth, well-jointed blocks of granite for the wheel tracks, and pitching between for the horse track, was laid by Walker in Commercial Road (London) for the heavy traffic to the West India Docks in 1825, and similar pavements have been successfully used elsewhere, principally for heavy traffic, in streets only wide enough for one vehicle. In Milan, Turin and other towns of northern Italy tramways of the same sort are extensively used for the ordinary street traffic. The tractive force required is small, while the foothold on the horse track is good; but the tram-stones are slippery for horses to pass over. The rigidity of the roadway renders it more suitable for slow heavy traffic than for light quick vehicles, and the improvement in other pavements has limited the application of this one in ordinary streets.

Brick Pavings.—Since about 1885 brick as a paving for carriage-ways has been adopted to a considerable extent, chiefly in the form of shale bricks, in American cities. The clay is a hydrated silicate of alumina, containing about 24% of alumina with 15% of iron, lime, soda, potash and magnesia. Lime is injurious, but alkalis to the extent of 3% are needed to ensure a slight degree of vitrification. Various tests are used to determine their liability to absorb moisture and to render the surface, but particularly on the angles, which should be tough enough to resist chipping. Comparisons are also made with test pieces of granite that are mixed with the bricks. To guard against chipping, the best-made bricks are pressed over again, and the upper surface rounded to a radius of three-eighths of an inch. Upon a foundation of concrete or well-rolled ballast a cushion or bed of coarse sand from half an inch to 3 in. thick is laid, and on this the bricks are set. They are then laid till level, or are heavily rammed, a plank being interposed between the bricks and the rammer. No channels or courses are used. Pitch is poured in at the joints, but by no means on the surface, as that would make them slippery. Brick roadways have stood well under hard wear for fourteen years. Although in the United Kingdom bricks are produced unequalled for hardness and finish, no serious attempt has been made to introduce a tough brick for roadways that will neither chip nor wear smoothly. In various experiments with bricks that seemed most suitable they stood hard traffic for about a year. Clay of absolutely uniform character, and kilns that will ensure perfect equality in firing, are requisite. Slag bricks, made to interlock in the form of a double hexagon, the surface being grooved to a small pattern, have stood good tests for wear and foothold on a perfectly level surface. Many attempts have been made to use compositions, into which asphalt or cement usually enters, for making blocks or slabs, square or hexagonal, that can be laid down on a concrete foundation. A mosaic of macadam set in an iron frame is fixed by running molten slag into the back of the block. Small square pieces of oak are formed into blocks, end-grain upwards. Staffordshire blue bricks, made with holes to hold wooden plugs, have been used with some success. Broad blocks not fixed laid down usually become loose and tilt when subjected to traffic.

Asphalt Paving.—Asphalt was first used for street paving in Paris in 1854. It was introduced in London in 1860, when Threadneedle Street was paved by the Val de Travers Asphalt Company, and since then it has been extensively used for paving both streets and footways. The material is a hard limestone impregnated with bitumen in the proportion of from 6 to 8% in the Sèvres rock, and from 10 to 12 in that from Val de Travers. Asphalts containing less than the former proportion have not sufficient coherence for street pavements, and those containing more than the latter proportion soften from heat in the summer. Asphalt is employed either as a mastic or compressed. The mastic is previously prepared in cakes and is melted for use in caldrons with a small quantity of bitumen, and for a street pavement is thoroughly mixed with sand or grit. It is spread in one thickness on a concrete foundation, covered with sand, and beaten to an even surface. This material has not proved so successful for street surfaces as compressed asphalt. To produce this, the rock asphalt, previously reduced to a fine powder by mechanical means, is heated in revolving ovens to from about 220° to 250° F., spread while still hot, and compressed into a solid mass by hot
ROADS AND STREETS

disk-shaped rammers, and afterwards smoothed with irons heated to a dull redness. The original rock is thus, as it were, reconstructed by taking advantage of the power of coherence of the molecules under pressure when hot. In heating the powder the moisture combined in the limestone must be driven off without reducing the proportion of the bitumen more than is unavoidable. The powder cools very slowly, and may be conveyed long distances from the ovens; it may even be kept till the next day before use. When laid it should still retain a semblance of from 150 to 200°. It is spread evenly with a rake by skilled workmen for the whole width of the street to a thickness about two-fifths greater than the finished coating is intended to be. Ramming is commenced with light blows to ensure equality of compression throughout, and is continued with increased force until the whole is solidified. The ramming follows up the spreading, so that a joint is required only when the work is interrupted at the end of a day, or from some other cause. In a few hours after it has been laid an asphalt pavement may be used for traffic. When finished, its thickness may be from 1½ to 2½ in., according to the traffic; a greater thickness than the latter cannot be evenly compressed with certainty. The asphalt loses thickness by compression under the traffic for a long time and to the extent, it is said, of one-fifth or one-fourth, but the wear appears to be very small.

The wear-resistant power of the asphalt is due to its elasticity; tracks are made by the wheels at first, but when thoroughly compressed by the traffic the surface retains little or no trace of the heaviest loads. Repairs are easily and quickly made by cutting out defective patches and ramming in fresh heated powder, which can be done in the early morning without stopping the traffic. An unyielding foundation is indispensable; it should be of the best Portland cement concrete, 6 in. in thickness, which must be well set and perfectly dry throughout before the asphalt is laid, or the steam generated on the application of the hot powder will prevent coherence and lead to cracks and holes in the asphalt, which quickly enlarge under the traffic. For the same reason the asphalt should be laid in dry weather. The concrete foundation must be carefully formed to the proper profile, with an inclination towards the sides of not more than 1 in 50, which is sufficient with so smooth a surface. About 1 in 50 is the steepest gradient at which an asphalt pavement can be safely laid. When either dry or wet it affords good foothold for horses, but when beginning to dry it becomes slippery and skins easily. This is said to be due to dirt on the surface, and not to the nature of the material. Sand is strewn over the surface to remedy the slipperiness; it tends, however, to wear out the asphalt, and great cleanliness is the best preventive. An asphalt pavement can be kept cleaner than any other, is impervious to moisture, and dries quickly. While the road is kept clean, a very slight depression is made by the horse-shoe, which for foothold is a great advantage. The noise made on asphalt by horse-traffic is about the same as that made on hard wood, and is not much more than is necessary for the safety of foot-passengers. In American cities asphalt has been adopted in a totally different form. Asphalt pavements are composed of a very large proportion, perhaps five parts in six, of a hard non-bituminous material. In America it is found cheaper to get the purer bitumen of the island of Trinidad, and to procure in the localities the bulky material required for admixture—a coarse angular sand with a little pure carbonate of lime. An asphaltic cement is made from refined asphaltum. Of this, from 12 to 15% is used with 70 to 80% of sand and 5 to 15% of limestone dust. These materials are heated and stirred together into a stiff mastic paste to form the wearing surface of the road. Upon this concrete foundation is laid a layer of fine bituminous concrete called "blinder," ½ in. thick, to unite the wearing surface to the concrete foundation. Upon the blinder the asphalt is laid to a thickness of 2 in., being spread with iron rakes and brought to its finished surface by the steam roller. Obviously this is a process requiring great judgment and experience; but the system has become established in America, to the exclusion of European methods. Its great recommendation is the freedom from slipperiness that is said to result from the admixture of sharp sand, and this freedom is really the one quality in which asphalt pavement is seriously deficient. This system has been introduced into England.

Wood-Paving—Wood pavements were introduced in England in 1839. Hexagonal blocks of fir, 6 to 8 in. across and 4 to 6 deep, were bedded in gravel laid on a foundation previously levelled and beaten. The blocks were either bevelled off at the edges or grooved across the face to afford foothold. Other wood pavements were tried in London about the same time, but they soon got out of order from unequal settlement of the blocks, and most of them lasted but a few years. The "improved wood pavement" was first used in London in 1871. After the foundation was formed to the proper cross-section a bed of sand 4 in. deep was laid, upon which came two layers of inch deal boards saturated with boiling tar, one layer across the other. The wooden blocks were 3 in. wide, 3 deep, and 6 long; they were dipped in tar and laid on the boards with the ends close together, but transversely the courses were spaced by fillets of wood three-fourths of an inch wide nailed to the floor and to the blocks. The joints were filled up with clean pebbles rammed in, and were run with a composition of pitch and tar, the surface being dressed with boiling tar and strewn with small sharp gravel and sand. In this pavement a somewhat elastic foundation was provided in the boards, which were also intended to prevent unequal settlement of the blocks; but the solidity of the pavement depended upon its water-tightness, for, when the surface water reached the sand, as it did sooner or later, settlement and dislocation of the blocks under the traffic arose.

Pavements on this system were laid between 1872 and 1876, and were kept in repair and relaid from time to time, but about 1877 the plank foundation was abandoned for a foundation of cement concrete, which is now generally employed. Australian hard woods have to a large extent supplanted the fir and pine which were at one time used as the materials for wood-paving. The softer woods, which afford reasonably good foothold and are comparatively noiseless, wear rapidly under heavy traffic, and are very liable to decay. Moreover, the wood actually used has been of mixed qualities, and when a block fails, those near it suffer; thus holes are formed, so that the pavement has to be renewed before its natural life is out. Hard woods have been used with varying results; but the Australian woods of the genus Eucalyptus have been most extensively tried, and with the most satisfactory results. Those which are best known are jarrah and kauri, but tallow wood, black-butt, blue-gum, red-gum, and spotted-gum, with others, have been tried. Of these, one or two are too dense and hard to afford foothold, others are not easily procured, but jarrah and kauri are used extensively. When cut from the matured heart-wood they are uniform in quality, hard enough for durability, and rough enough to afford fairly good foothold. A very large quantity of wood has been used in London under the name of American red-gum. In substance it comes between the soft and hard woods above mentioned. Wood blocks for paving must be cut with the utmost precision as to the depth of 5 or 6 in. and the breadth of 3 in. The usual length of 8 or 9 in. should also be kept well enough for bond. A long block is liable to tilt. As to depth, although a slight depression may be of little account, the least projection in a block will be immediately noted as a jolt by the swift-moving wheel. The laying and jointing of wood blocks on concrete is still a matter of experiment. They may be set on a half-inch bed of sand, which is supposed to, though it is doubtful whether it actually does, make the pavement elastic to the touch. If the blocks are not accurately gauged, the sand enables the paviour to adjust them to a uniform surface. But the practice most approved is to pave directly upon the smoothly finished concrete, trusting for elasticity to the wood. On the revival of wood-paving it was thought necessary, for foothold, to leave
wide joints filled with small gravel grouted with cement; but this is mischievous. The cement breaks up, and when the blocks shrink, the filling-in is driven downwards, and when they again get wet, they have less room to expand, the side kerbs are driven back, and the foot-pavements are displaced, so as to require relaying. To guard against this, a space of about 2 in. has been left between the pavement and the kerb, to be temporarily filled with clay or sand, which can be cleared out as the pavement expands. But cement has no affinity for wood, and its use, together with the wide joints that were thought necessary to give foothold, has been abandoned. They permitted the edge of the block to be beaten down below the centre, so as to produce a succession of ridges, having much of the character of a "corduroy" road. Asphalts felt placed in the joints has not succeeded. A method very successfully adopted is to leave the end joints slightly open, and to place strips or laths one-tenth of an inch thick between the courses, so that hot pitch can be poured down to fill the joint and to cover the surface. The roadway is then strewn with fine sharp gravel. Hard-wood blocks so laid expand very slightly; so that a space of an inch and a quarter is sufficient between the kerb and the road, the blocks that are usually laid parallel to it; this, when filled with pitch, is sufficient to allow for the expansion. Paving has been laid with close joints, small vessels of hot pitch being provided, into which each pavement dips the blocks more or less completely before laying them; but wood blocks are more commonly laid dry, a little pitch being brushed over the surface. The gradual abandonment of the wide joints once considered necessary for foothold will be noticed. Soft wood seems to wear under very heavy traffic about five times as fast as hard wood.

Plank Roads.—In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills 15 to 20 ft. long, 12 in. wide and 4 deep are laid longitudinally flatwise 4 ft. from centre to centre, the earth being well packed and rammed to the level of their faces. The joints are not opposite; a short piece of sill is put either under or by the side of each joint. Cross-boards about 8 ft. 3 in. long and 3 in. thick are laid down loosely, so that groups of four boards together will project on alternate sides of the road 3 or 4 in., forming a shoulder to enable vehicles to get on to the track next way. The remainder of the road space is formed as an earthen track, 12 ft. wide, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

Log Roads.—The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads may be made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed. They may be 8 or 9 ft. long, alternate logs being made to project a foot on each side for convenience of driving on and off the track.

Charcoal Roads.—When fuel is available, good roads can be formed of burned materials. Clay is burned into ballast for foundations, or for a temporary track. In American forests charcoal roads have been largely used. Logs from 6 in. to 2 ft. in diameter are piled along the whole route, the stack being 9 ft. broad at the base, 6 ft. high and 2 ft. broad at the top. Dry materials for lighting are intermixed, and the stack is covered up with sods and earth from the ditches. When burned, the charcoal is simply raked down so as to form a 15-ft. road of a well-rounded section. These roads are dry and hard, and otherwise satisfactory.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the mimosa across the track. And in the great plains, where the soil, when dry, would otherwise be made deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the pampas-grass, and covering it with 3 or 4 in. of loam.

Sand Dressing.—In carrying traffic over a clay soil a covering of 3 or 4 in. of coarse sand will entirely prevent the formation of the ruts which would otherwise be cut by the wheels; and if the ground has already been sharply cut up, a fresh bed of sand will so alter the condition of the clay that the ridges will be reduced by the traffic, and the ruts filled in.

Noiseless Roads.—A comparatively noiseless pavement may be formed with bricks made of cork granulated and mixed with fibre and asphalt; they are set in pitch, and seem to be suitable for rather steep gradients. For a perfectly noiseless pavement, such as is specially required where a carriage entrance under bedrooms is used by night, no substance is equal to indiarubber. For this purpose it is made in inch sheets about 3 ft. wide and as long as the width of the roadway; it is fixed in place by means of iron clips to allow for expansion. Paving has been laid with close joints, small vessels of hot pitch being provided, into which each pavement dips the blocks more or less completely before laying them; but wood blocks are more commonly laid dry, a little pitch being brushed over the surface. The gradual abandonment of the wide joints once considered necessary for foothold will be noticed. Soft wood seems to wear under very heavy traffic about five times as fast as hard wood.

Dustless Roads.—The necessity for making roads dustless has been rendered urgent by the advent of the motor-car. The oldest and least efficacious method is to convert the dust into mud by the aid of the watering cart; at the best, however, the improvement is temporary, though attempts have been made to obtain more lasting results by using a solution of some hygroscopic salt such as calcium chloride. Various special preparations of pampas-grass and other oils have been introduced as palliatives, but the most promising treatment for existing macadam roads consists in distributing tar by hand or machine over the surface, care being taken to make the application in fine weather when the roads are dry. The radical solution of the problem, however, is to be sought in the adoption of improved methods and materials for construction, probably with a bituminous binding or matrix.

This same problem of the motor-car, which, by its rapidity of movement, rendered many of the old country roads in England (suitable, or at least tolerable, as they were for slow-moving traffic) positively dangerous for the motor traffic by reason of its narrowness and other defects, &c., has been responsible for the passing by the legislature of a very important measure, the Development and Road Improvement Funds Act 1909. This act, in its second part, deals with the question of road improvement, and establishes a Road Board, making it a body corporate. The Board is given powers to make advances to county councils or other highway authorities for the construction of new roads or the improvement of existing roads, as well as itself to construct and maintain new roads. The expression "improvement of roads" is defined by the act as including the widening of a road, the cutting off corners, levelling, treating a road for mitigating dust nuisance, &c., and is left to the Board to acquire land for the purposes of road improvements. The expenses of the Board are met out of a road improvement grant each year, the greater part of which it was proposed should be provided by diverting the tax on motor spirit and on motor vehicles levied under the Finance Act of 1909-10.

Watering.—On macadamized roads in Great Britain watering is only good for the road itself when the materials are of a very silly nature and in dry weather. With other materials the effect is to soften the road and increase wear. In and near towns watering is intended for the common, the dry, cut-up streets, but it should not be more than enough to lay the dust without softening the road, and the amount required for this may be greatly reduced by keeping the surface free from mud, and by sweeping off the dust when slightly wetted. Pavements are watered to cleanse them as well as to lay the dust, but it must be remembered that both wood
and asphalt are more slippery when wet, and that therefore watering should be as thorough as possible, in order to prevent wheels from getting stuck in the mud. Hydrostatic vanes, by improvements in the distributing pipes and regulating valves, water a wide track uniformly with an amount of water which can be regulated at pleasure. Watering is best done when the hydrant systems are under pressure, street watering can be effected by a movable hose and jet, a method much more effective in cleansing the surface, but using a much larger quantity of water. Another method of watering has been introduced, but not much used, by laying perforated pipe at the back of the kerb on each side of the road, from which jets are thrown upon the surface. The first cost is considerable, and the openings for the jets are liable to choke and give a muddy appearance. The best way of cleansing the roadway is by high pressure, street watering, by which the surface is kept moist, but at the expense of the moisture in the air. Sea water has the same effect in a less degree.

Cleansing.—The principal streets of a town are generally cleansed daily, either by hand-sweeping and hand-scraping or by machines. Sir Joseph Whitworth's machine consists of a series of revolving brooms on an endless chain, whereby the mud is swept up an inclined line, and driven into the cart. A less costly and cumbersome machine consists of a revolving brush mounted obliquely, which sweeps a track 6 ft. wide and leaves the dust or mud on one side to be gathered up by hand. A horse scraping-machine which delivers the mud at the side is also used, the blades of the scrapers being mounted obliquely and covering a width of 6 ft. For general use, more especially in the country, scraping-machines, worked by a man on foot and a horse, are laid on the road, and scraping a width of about 4 ft., are more convenient.

All street surfaces suffer from the constant breaking up and disturbance to which they are subjected for the purpose of laying and renewing the pipes. In all cases, whether under Surf, Surf, or gravel, the nearer it is to the kerbs, in which the pipes may be laid and be always accessible, have often been advocated, and in a few instances have been constructed; but they have not hitherto found general favour.

Footways.—Gravel is the most suitable material for country or suburban footways; it should be bottomed with a coarser material, well drained and should be laid with a roller. The inclination towards the kerb of about half an inch in a foot may be given, or the surface may be rounded, to throw off the water. Where greater cleanliness is desirable and the traffic is not too great a coal-tar composition should be used. The larger kerbs of sandstone or granite chippings over all. Concrete footways require to be carefully made and must be allowed to set thoroughly before they are used.

Concrete has a tendency to crack from contraction, especially when in a thin layer, and it is better to lay a footway in sections, with joints at intervals of about 2 yds. Concrete slabs, especially when silicated and constituting artificial stone, make an excellent footway. The material is laid in layers of crushed or broken-down material, mixed with Portland cement and cast in moulds, and set when saturated with silicate of soda. This paving has proved more durable than York stone flagging, but it is more slippery, especially when wet. Gravel footways, with granite or sandstone mashes, are also suitable. The road-makes a good and economical footway. The coating should be 2 or 3 in. thick, composed of two or three layers each well rolled, the lower layer of materials of about 1 in. gauge, and the upper one, of 3/4 in. to 1 in. A substantial alluvial material, which makes a good and economical footway. The coating should be 2 or 3 in. thick, composed of two or three layers each well rolled, the lower layer of materials of about 1 in. gauge, and the upper one, of 3/4 in. to 1 in. A substantial alluvial material, which makes a good and economical footway. The coating should be almost the same as that described above, but with greater care.

Footways in a street must be retained by a kerbing of granite, York stone, Purbeck or other stone sufficiently strong to stand the blow of the wheels, when and where it is necessary. It should be 3 in. wide and 9 deep and in lengths of not less than 3 ft. A granite kerb is usually about 12 by 6 in., either placed on edge or laid on the flat. When set on edge a kerb is generally bedded on granite chippings or sand, and when laid on the flat, on the top of a bed of concrete. A paved channel consists of flat stones about 1 ft. wide, inclining slightly towards the kerb. Mouled bricks and cements are also used both for side channelling and for kerbing. Such an inclination may be given to the channel as will bring the surface water to gullies placed at proper intervals, and the level of the kerbing and consequently of the footway will depend to some extent on the surface drainage as well as on the levels of adjacent houses. To lay out a street satisfactorily the longitudinal and transverse sections must be considered in relation to these matters as well as to the levels of intersecting streets.

ROANOKE (O. Fr. roan, roane; Ital. roano, roano; perhaps connected with rufus, red), a word applied to a variety of colour in an animal's coat, especially that of a horse, where there is a mixture of grey or white hair with the prevailing tint of bay, chestnut or sorrel. A sorrel when thus modified is either a strawberry-roan or a cream-roan. The term is also used of a soft, flexible kind of leather made of sheepskin, used in bookbinding as a substitute for or in imitation of morocco; but in this sense the origin is doubtful.

ROANNE, a town of east-central France, capital of an arrondissement in the department of Loire, on the left bank of the Loire, 54 m. N.W. of Lyons on the Paris-Lyon railway to Moulins. Pop. (1906) 33,981. The chief buildings are a modern town hall and the church of St. Étienne (1833-1843), built in the Flamboyant Gothic style. The lycée occupies the buildings of the old college dating from the early 17th century. The main line of railway runs through the industrial suburb of Le Côteau on the right bank of the river. The town is the seat of a sub-prefecture, of tribunals of first instance and of commerce, of a chamber of commerce and a board of trade-arbitration, and has lycées for both sexes. Cotton goods form the staple manufacture, and cotton-spinning is also important. The making of knitted woollen articles gives employment to large numbers of women in the town and district. There are besides extensive engineering works, foundries, dye-works, tanneries, pottery and tile-works and other industrial establishments. As the centre of the Roannais coalfield, Roanne has trade in coal and coke. It is also the terminus of the Roanne-Dignin Canal and the real starting-point of the Loire navigation.

Roanne (Rodomna, or Roidomna) was an ancient city of the Segusians and a station on the great Roman road from Lyons to the ocean. In 1447 the lordship of Roanans became the property of the celebrated banker Jacques Cœur, from whom it passed as the result of a law-suit to the family of Gouffier. In their favour the title was raised to the rank of marquisate and in 1566 to the rank of duchy; it became extinct in the first half of the 18th century.

ROANOKE, a river of the South Atlantic Slope, U.S.A. With the Potomac, which rises in the Appalachian Valley in southwestern Virginia, it constitutes one river, and, flowing in a general south-easterly direction, crosses the boundary between Virginia and North Carolina just above the Fall Line and discharges into Albemarle Sound. It is nearly 400 m. long, with a drainage area of 9237 sq. m. The United States government adopted a project in 1871 for clearing a channel with a minimum depth of 5 ft. at low water from its mouth to Weldon, a distance of 129 m., and in 1909, when the project was 86% completed, vessels drawing 4 ft. of water could ascend at low stages nearly to Weldon. The main river and its principal tributary, the Dan, are also navigable, for many miles above the Fall Line, by small boats. In 1829 the Weldon Canal, 12 m. long, was opened to afford a passage around the falls, but it was abandoned in 1850.

ROANOKE, a city in (but administratively independent of) Roanoke county, Virginia, on the Roanoke river, about 55 m. W.S.W. of Lynchburg. Pop. (1890) 16,159; (1900) 21,495, of whom 5844 were negroes; (1910 census) 34,874. Roanoke is served by the Virginia railway, by the main line and the Shenandoah and the Winston-Salem divisions of the Norfolk & Western railway, and by electric railway to Vinton and to Salem. The city is about 900 ft. above sea-level and is surrounded by high hills; it is subjected to occasional dust storms and its nearness to famous mineral springs make it a health resort. On a mountain slope, about 3 m. from the city limits, is the Virginia College for Young Ladies; 7 m. north of the city, at what was
ROARING FORTIES—ROBERT I.

formerly called Botetourt Springs (there is a sulphur spring), is Hollins Institute (1842) for girls; and in the city are the National Business College, the City Hospital (1869), private hospitals, and St Vincent’s Orphan Asylum (1833) for boys, under the Sisters of Charity. Stock-raising, tobacco-growing, and coal and iron-mining are the industries of the district. Roanoke's factory product in 1905 was valued at $5,544,997 (2.7% more than in 1900). Its railway car repair and construction shops, belonging to the Norfolk & Western railway, employed in that year 66.9% of the total number of factory wage-earners; pig-iron, structural iron, canned goods, bottles, tobacco, planing-mill products and cotton are among the manufactures. The municipal water supply comes from a reservoir at Crystal Springs at the foot of Mill Mountain near the city limits. Roanoke was the town of Big Lick (founded about 1832; incorporated in 1874; pop. in 1880, 669) until 1882, when it received its present name; in 1884 it was chartered as a city.

ROARING FORTIES, the name given to the zone in the southern hemisphere, near the 40th parallel of latitude, in which the north-westly-“southeaster,” winds attain their greatest development. Since the belt lies in the Great Southern Ocean (q.v.), and is little intercepted by land, the “planetary circulation” undergoes little modification and barometric gradients are steep. The “brave west winds” are accordingly of great strength, and, as in the corresponding belt of the northern hemisphere, the movement is largely broken up into the low and high pressure vortices known as cyclones and anticyclones.

ROBBEN ISLAND, an island at the entrance of Table Bay, 7 m. N.N.W. of Cape Town. It is some 4 m. long by 2 broad. At its southern end is a lighthouse with a fixed light visible for 20 m. It got its name (robben, Dutch for seal) from the seals which formerly frequented it, but in 1895 the bay is now noted for its leper asylum and its convict establishment. For many years an asylum for lunatics was also maintained here, but in 1900 it was handed over to the main island. The common rabbit, brought from England, abounds, but its introduction to the mainland is prohibited. As early as 1857 criminals were banished to the island by the Dutch authorities at Cape Town; it has also served as the place of detention of several noted Kaafir chiefs.

ROBBER SYNOD, the name given to an irregular ecclesiastical council held at Ephesus in a.d. 449. See EPHESUS, COUNCIL OF.

ROBBERY (from O. Fr. rober, to steal), the unlawful and forcible taking of goods or money from the person of another by the latter or threatened violence. Robbery is larceny (q.v.) with violence. It is a specific offence under the Larceny Act 1861, and is punishable by penal servitude for any term not exceeding fourteen years and not less than three years, or imprisonment for any term not exceeding two years, with or without hard labour. Under the Garrotten Act 1863, whipping may be added as part of the sentence for robbery. In Scots law robbery is termed stoutherf.

United States.—The nature of the offence is practically the same in America as in England, but what constitutes robbery is provided by statute in each state, as is also the punishment. The chief difference between English and American law is that the latter often divides the offences into grades and takes a liberal view of what constitutes force or fear. Train robbery is specially dealt with in some states owing to the prevalence of that species of crime.

Federal Statute.—Congress has made it piracy punishable with death to commit robbery on the high seas or on shore or in any harbour out of the jurisdiction of any state by landing from a prize vessel (U.S. Stat., Tit. 18, § 305). In Alaska it is train robbery to "enter upon or go near to any locomotive, engine, or car, on any railroad and by threats or exhibition of a deadly weapon or discharging a pistol, or gun on or near an engine or car thereby to compel or cause the person in charge thereof to deliver anything of value. It is punishable at the discretion of the jury by death or imprisonment for not less than ten years. Any one who shall impede, or detains any locomotive or car with intent to commit train robbery must be punished by imprisonment for not less than ten nor more than thirty years. Conspiring to commit train robbery is punishable to the same extent (Crin. Code, Tit. 18, § 305). In Arizona, California and Missouri the "fear" may be that of the person robbed or of any relative of his or member of his family or of any one in his company. The punishment is imprisonment for not less than five years.

In Arkansas and Missouri extorting money or property by blackmail is an "attempt to rob"; it is punishable by not less than one nor more than five years' imprisonment. In Georgia larceny from the person is statutory robbery (Hickey v. State (1906), 125, Ga. 145).

Louisiana.—Train robbery is punishable by imprisonment for not less than five nor more than ten years.

Missouri.—Train robbery is punishable by death or imprisonment for not less than ten years. It may consist in placing an obtrusion on the line with intent to rob.

Montana.—Robbery committed when armed with a dangerous weapon, is punishable by imprisonment for life (Rev. L., ch. 207, § 177).

New Mexico.—The extreme penalty for robbery is forty years' imprisonment (L. 1905, ch. 114).

New Jersey.—The extreme penalty is $3,000 fine or twelve years' imprisonment.

New York.—Falsely presenting an officer and by means of arrest extorting money is robbery (Burnside v. State (1907), 102, S.W. Rep. 178).

ROBERT I., "THE BRUCE" (1274-1309), king of Scotland, was the son of the 7th Robert de Bruce, earl of Carrick by right of his wife Marjorie, daughter of Nigel, earl of Carrick, and was the eighth in direct male descent from a Norman baron who came to England with William the Conqueror. After the death of Margaret, the "maid of Norway," in 1290, Bruce's grandfather, the 6th Robert de Bruce, lord of Annandale, claimed the crown of Scotland as the son of Isabella, the second daughter of David, earl of Huntingdon, and great-granddaughter of King David I.; but John de Baliol, grandson of Margaret, the eldest daughter of Earl David, was preferred by the commissioners for Edward I.

The birthplace of Bruce is not certainly known, but was probably Turnberry, his mother's castle on the coast of Ayr. The date is the 11th of July 1274. His youth is said by an English chronicler to have been passed at the court of Edward I. At an age when the mind is quick to receive the impressions which give the bent to life he must have watched the progress of the great suit for the crown of Scotland. Its issue in 1292 in favour of Baliol led his grandfather to resign Annandale to his son, the 7th Robert de Bruce, who either then or after the death of his father in 1295 assumed the title of lord of Annandale. Already on his wife's death in 1292 he had been directed back to his grandfather by the commission to give up any one to deliver up the earldom, and had offered the homage which his father, like his grandfather, was unwilling to render. Feudal law required that the king should take seisin of the earldom before regranting it and receiving the homage, and the sheriff of Ayr was directed to take it on Baliol's behalf. As the disputes between Edward I. of England and Baliol, which ended in Baliol losing his kingdom, commenced in this year, it is doubtful whether Bruce ever rendered homage; but he is henceforth known as earl of Carrick, though in a few instances this title is still given to his father. Both father and son sided with Edward against Baliol. In April 1294 the younger Bruce had permission to visit Ireland for a year and a half, and as a further mark of Edward's favour a respite of all debts owing by him to the exchequer.

In August 1296 Bruce and his father swore fealty to Edward I. at Berwick, but in breach of this oath, which had been renewed
at Carlisle, the younger Robert joined Sir William Wallace, who raised the standard of Scottish independence in the name of Balliol after that king had surrendered his kingdom to Edward in 1296. Urgent letters were sent ordering Bruce to support John de Warenne, earl of Surrey, Edward’s general, in the summer of 1297; but, instead of complying, he assisted to lay waste the lands of those who adhered to Edward. On the 7th of July Bruce and his friends were forced to make terms by a treaty called the capitulation of Irvine. The Scottish lords were not to serve beyond the sea against their will, and were pardoned for their recent violence, in return owning allegiance to Edward. The bishop of Glasgow, James the steward, and Sir Alexander Lindsay became sureties for Bruce until he delivered his daughter Euphemia as a hostage. We have lost the correspondence of the period, maintained the struggle for freedom which the nobles, as well as Balliol, had given up, and Bruce had no part in the honour of Stirling Bridge in September 1297, or the reverse of Falkirk, where in July 1298 Edward in person recovered what his generals had lost, and drove Wallace into exile. Shortly afterwards Bruce appears again to have sided with his countrymen; Annandale was wasted, while he, as Walter of Hemingford says, “when he heard of the king’s coming, fled from his face and burnt the castle of Ayr which he held.” Yet, when Edward was forced by home affairs to quit Scotland, Annandale and certain earldoms, including Carrick, were surrendered to the English, and in the May succeeding it was agreed that Bruce’s followers, Bruce and other earls being treated as waverers whose allegiance might still be retained. About 1300 a regency was appointed in Scotland in the name of Balliol, and a letter of Balliol mentions Robert Bruce, lord of Carrick, as regent, along with William of Lamberton, bishop of St Andrews, and John Comyn the younger, a strange combination—Lamberton the friend of Wallace, Comyn the enemy of Bruce, and Bruce a regent in name of Balliol. Comyn in his own interest as Balliol’s nephew and heir was the active regent; the insertion of the name of Bruce was an attempt to secure his co-operation. For the next four years he kept studiously in the background, waiting his time. A statement of Peter Langtoft that he was at the parliament of Lincoln in 1301, when the English barons repudiated the claim of Pope Boniface VIII. to the suzerainty of Scotland, is not to be credited, though his father may have been there. In the campaign of 1304, when Edward renewed his attempt on Scotland and reduced Stirling, Bruce supported the English king, who in one of his letters to him says, “If you complete that which you have begun, we shall hold the war ended by your deed and all the land of Scotland gained.” But, while apparently aiding Edward, Bruce had taken a step which bound him to the patriotic cause. On the 11th of June, five weeks before the fall of Stirling, he met Lamberton at Cambuskenneth and entered into a secret bond by which they were to support each other against all adversaries and undertake nothing without consulting together. The death of his father in 1304 may have determined his course, and led him to prefer the chance of the Scottish crown to his English estates and the friendship of Edward.

This determination closes the first chapter of his life; the second, from 1304 to 1314, is occupied by his contest for the kingdom, which was really won at Bannockburn, though disputed until the treaty of Northampton in 1328; the last, from 1314 to his death in 1329, was the period of the establishment of his government and dynasty by an administration as skilful as his generalship. It is to the second of these that historians, attracted by its brilliancy even amongst the many romances of history and its importance to Scottish history, have directed most of their attention, and it is during it that his personal character, tried by adversity and prosperity, gradually unfolds itself. But all three periods require to be kept in view to form a just estimate of Bruce. That which terminated in 1304, though unfortunately few characteristics, personal or individual, have been preserved, shows him by his conduct to have been the normal Scottish noble of the time. A conflict of interest and of bias led to contradictory action, and this conflict was increased in his case by his father’s residence in England, his own upbringing at the English court, his family feud with Balliol and the Comyns, and the jealousy common to his class of Wallace, the mere knight, who had rallied the commons against the invader and taught the nobles what was required in a leader of the people. The merit of Bruce is that he did not despise the lesson. Prompted alike by patriotism and ambition, at the prime of manhood he chose the cause of national independence with all its perils, and stood by it with an unwavering constancy until he secured its triumph. Though it is crowded with incident, the main facts in the central decade of Bruce’s life may be rapidly told. The fall of Stirling was followed by the capture and execution of Wallace in 1305; and in 1306 Edward hoped to secure the nobles and gain Scotland by a policy of clemency to all who did not dispute his authority. A parliament in London in September 1305 to which Scottish representatives were summoned, agreed to an ordinance for the government of Scotland, which, though on the model of those for Wales and Ireland, treating Scotland as a third subject province under an English lieutenant, was in other respects not severe. Bruce is reputed to have been one of the advisers who assisted in framing it; but a provision that his castle of Kildrummy was to be placed in charge of a person for whom he should answer shows that Edward was without reason, suspected his fidelity. The cause of his final breach with the English king became somewhat obscure. According to one account, the bond between Bruce and Lamberton was revealed to Edward by Comyn while Bruce was at the English court. Alarmed by a hint dropped by Edward, he left England secretly, and in the church of the Friars Minorite at Dumfries on the 10th of February 1306 met Comyn, whom he slew before the high altar for refusing to join in his plans. So much is certain, though the precise incidents of the interview are variously told. It was not their first encounter, for a letter of 1299 to Edward from Scotland describes Comyn as having seized Bruce by the throat at a meeting at Peebles, where they were with difficulty reconciled by the regents.

The bond with Lamberton was now sealed by blood, and the confederates lost no time in putting it into execution. Within little more than six weeks Bruce, collecting his adherents in the south-west, passed from Lochmaben to Glasgow and thence to Scone, where he was crowned king of Scotland on the 27th of March 1306. Two days later Isabella, countess of Buchan, claimed the right of her family, the Macduffs, earls of Fife, to place the Scottish king on his throne, and the ceremony was repeated with an addition flattering to the Celtic race. Though a king, Bruce had not yet a kingdom, and his efforts to obtain it were disastrous failures until after the death of Edward I. In June 1306 he was defeated at Methven, and on the 11th of August he was surprised in Strathfillan, where he had taken refuge. The ladies of his family were sent to Kildrummy in January 1307, and Bruce, almost without a follower, fled to the island of Rathlin. Edward came to the north in the following spring. On his way he granted the Scottish estates of Bruce and his adherents to his own followers, Annandale falling to Humphrey de Bohun, 4th earl of Hereford. At Carlisle there was published a bull excommunicating Bruce; and Elizabeth his wife, Marjorie his daughter, and Christina his sister, were captured in a sanctuary at Tain, while three of his brothers were executed. In a moment all was changed by the death of Edward I. on the 7th of July 1307. Instead of being opposed to the greatest, Bruce had now as his antagonist the feeblest of the Plantagenets. Quitting Rathlin, he had made a short stay in Arran, and before Edward’s death he had failed to take Ayr and Turnberry, although he defeated Aymer de Valence, earl of Pembroke, at Loudoun Hill in May 1306. After wasting the critical moment of the war in the diversions of court life, the new English king, Edward II., made an inglorious march to Cumnock and back without striking a blow; and then returned south, leaving the war to a succession of generals. Bruce, with the insight of military
genius, seized his opportunity. Leaving Edward, now his only brother in blood and almost his equal in arms, in Galloway, he suddenly transferred his own operations to Aberdeenshire. He overran Buchan either once or twice, and after a serious illness defeated the earl of Buchan, one of his chief Scottish opponents, near Inverurie on the 22nd of May 1308. The crossing to Argyllshire he surprised another body of his enemies in the pass of Brander early in 1309, took Dunstaffnage, and in March of this year held his first parliament at St Andrews.

In 1309 a truce scarcely kept was effected by Pope Clement V. and Philip IV. of France, and in 1310, in a general council at Dundee, the clergy of Scotland, all the bishops being present, recognized Bruce as king. The support given to him by the national church in spite of his excommunication must have been of great importance in that age, and was probably due to the election of Lamberton. The next three years was signaled by the reduction one by one of the strong places still held by the English: Linlithgow towards the end of 1310, Dumbarton in October 1311, Perth, by Bruce himself, in January 1312. Previous to these two latter successes the king had made two raids into the north of England; after which Buittle, Dalswinton and Dumfries were reduced, and Berwick was threatened. In March 1313 his lieutenant Sir James Douglas surprised Roxburgh, and Thomas Randolph surprised Edinburgh. In May Bruce was again in England, and though he failed to take Carlisle, he subdued the Isle of Man. About the same time Bruce took Broughton and laid siege to Stirling, whose governor, Sir Philip de Bowes, had agreed to capitulate if not relieved before the 24th of June 1314.

Bruce's rapidity of movement was one cause of his success. His sieges, the most difficult part of medieval warfare, though won sometimes by stratagem, prove that he and his followers had benefited from their early training in the wars of Edward I. We know that he had been employed by that king to prepare the siege-train for his attack on Stirling in 1304. By the close of 1313 Berwick, Stirling and Bothwell alone remained English. Edward II. felt that if Scotland was not to be lost a great effort must be made. With the wealth available to the feudal lord of England, and a contingent from Ireland, he advanced from Berwick to Falkirk, which he reached on the 22nd of June 1314. After a preliminary skirmish on Sunday the 23rd, in which Bruce distinguished himself by a personal combat with Sir Henry de Bohun, whom he felled by a single blow of his axe, the battle of Bannockburn was fought on Monday the 24th; and the complete rout of the English determined the independence of Scotland and confirmed the title of Bruce. The details of the day, memorable in the history of war as well as of Scotland, have been singularly well preserved, and are found to the credit of Bruce, who had studied in the school of Wallace as well as in that of Edward I. He had chosen and knew his ground, lying between St Ninian's and the Bannock, a petty burn, yet sufficient to produce marshes dangerous to heavily armed horsemen, while from the rising ground on his right the enemy's advance was seen. His troops were in four divisions: his brother Edward commanded the right, Randolph the centre, Douglas the left. Bruce with the reserve planted his standard at the Bore Stone, whence is the best view of the field. His camp-followers on the Gilleis' Hill appeared over its crest at the critical moment which comes in all battles. The plain on the right of the marshes was prepared with pits and spikes. But what more than any other point of strategy made the fight famous was that the Scots fought on foot in battalions with their spears outwards, in a circular formation serving the same purpose as the modern square. A momentary success of the English archers was quickly reversed by a flank movement on the part of Sir Robert Keith. The Scottish bowmen followed up this advantage, and the fight became general; the English horse, crowded into too narrow a space, were met by the steady resistance of the Scottish pikemen, who knew, as Bruce had told them truly, that they fought for their country, their wives, their children, and all that freemen hold dear. The English rear was either unable to come up in the narrow space, or got entangled in the broken ranks of the van. The first rush soon passed into a rout, and from a rout into a headlong flight, in which the English king himself barely escaped. In the career of Bruce, Bannockburn was the turning-point. The enthusiasm of the nation he had saved forgot his tardy adhesion to the popular cause, and at the parliament of Ayr on the 25th of April 1315 the succession was settled by a unanimous voice on him, and, failing males of his body, on his brother Edward and his heirs male, or failing them on his daughter Marjorie and her heirs, if she married with his consent. Soon afterwards she married Walter the steward (d. 1326). As a result of Bannockburn, Bruce's queen was restored to her husband; Stirling was delivered up to the Scots; the north of England was ravaged, and Carlisle and Berwick were besieged.

The last part of Bruce's life, from 1315 to 1320, began with an attempt which was the most striking testimony that could have been given to the effect of Bannockburn, and which, had it succeeded, might have altered the future of the British Isles. This was no less than the rising of the whole Celtic race, who had felt the galling yoke of Edward I. and envied the freedom the Scots had won. In 1315 Edward Bruce crossed to Ireland on the invitation of the natives, and in the following year the Welsh became his allies. In the autumn of 1316 Robert came to his brother, and together they traversed Ireland to Limerick. Dublin was saved by its inhabitants committing it to the flames, and, though nineteen victories were won, of which those of Slane and Limerick were the most famous, the success was too rapid to be permanent. The brothers retreated to Ulster, and, Robert having left Ireland in May 1317 to protect his own borders, Edward, who had been crowned king of Ireland, was defeated and killed at Dundalk in October 1318. On his return Bruce addressed himself to the siege of Berwick, a standing menace to Scotland. While he was preparing for it two cardinals arrived in England with a mission from Pope John XXII. to effect a truce, or, failing that, to renew the excommunication of Bruce. The cardinals did not trust themselves across the border; their messengers, however, were courteously received by Bruce, but with a firm refusal to admit the papal bulls into his kingdom because not addressed to him as king. Another attempt by Adam Newton, guardian of the Friars Minorite at Berwick, had a more ignominious result. Bruce admitted Newton to his presence at Aldcambus or Old Cambus, and informed him that he would not receive the bulls until his title was acknowledged and he had taken Berwick. On his return Newton was waylaid and his papers seized, not without suspicion of Bruce's connivance. In March 1318 the town and soon afterwards the castle of Berwick capitulated, and Bruce wasted the English border as far as Ripon. In December he held a parliament at Scone, where he displayed the same wisdom as a legislator which he had shown as a general. The death of his brother and his daughter rendered a resettle ment of the crown advisable, and it was settled on his grandson, Robert, son of Marjorie and Walter the steward, in case Bruce died without sons, with a provision as to the regency in case of a minor heir in favour of Randolph. The defence of the country was next cared for by regulations for the arming of the whole nation, down to every one who owned the value of a cow, a measure far in advance of the old feudal levy. Exports during war, and of arms at any time, were prohibited. Internal justice was regulated, and it was declared that it was to be done 'poor and rich alike.-Leasing-making—a Scottish term for seditious language—was to be sternly punished. The nobles were exhorted not to oppress the commons. Reforms were also made in the tedious technicalities of the feudal law. In September 1319 an attempt to recover Berwick was repelled by Walter the steward, and Bruce took occasion of a visit to compliment his son-in-law and raise the walls 10 ft.

The king's position was now so strong that foreign states began to testify their respect. Bruges and Ypres rejected a request of Edward II. to cut off the Scottish trade with Flanders. Pope John, who had excommunicated Bruce, was addressed
by the parliament of Arbroath in April 1320 in a letter which compared Bruce to a Joshua or Judas Maccabaeus, who had wrought the deliverance of his people, and declared they fought "not for glory, truth or honour, but for that liberty which no virtuous man will survive." Moved by this language and conscious of the weakness of Edward, the pope exhorted him to make peace with Scotland, and three years later Randolph, now earl of Moray, procured the recognition of Bruce as king from the papal see by promising aid for a crusade. In 1326 the French king, Charles IV., made a similar acknowledgment by the treaty of Corbeil. Meantime hostilities more or less constant continued with England, but, though in 1322 Edward made an incursion as far as Edinburgh, the internal weakness of his government prevented his gaining any real success, while in 1327, his younger brother Bruce again ravaged Yorkshire, defeated the English near Byland, and almost captured their king. Some of his chief nobles—Thomas, earl of Lancaster, in 1321, and Sir Andrew Haldray, earl of Carlisle, in 1322—entered into correspondence with the Scots, and, though Haldray's treason was detected and punished by his death, Edward was forced to make a truce of thirteen years at Newcastle on the 30th of May 1323, which Bruce ratified at Berwick. In 1327 Edward III. became king of England, and one of the first acts of the new reign, after a narrow escape of the young king from capture by Moray, was the treaty of York, ratified at Northampton in April 1328, which was a recognition by Scotland of its ancient bounds in the days of Alexander III., should they be retained. Robert, king of Scots, and his heir free and divided from England, without any subjection, servitude, claim or demand whatsoever. Joanna, Edward's sister, was to be given in marriage to David, the infant son of Bruce, born subsequent to the settlement of 1318 and now recognized as heir to the crown, and the ceremony was celebrated at Berwick on the 12th of July 1328.

The chief author of Scottish independence barely survived his work. He appears to have conducted an expedition to Ireland in 1327, and on his return led a foray into England. His last years were chiefly spent at the castle of Cardross on the Clyde, which he acquired in 1326, and the conduct of war, as well as the negotiations for peace, had been left to the young leaders, Moray and Sir James Douglas, whose training was one of Bruce's services to his country. Ever active, he employed himself in the narrower sphere of repairing the castle and improving its domains and gardens, in shipbuilding on the Clyde, and in the exercise of the virtues of hospitality and charity. The religious feeling, which had not been absent even during the struggles of manhood, deepened in old age, and took the form the piety of the times prescribed. He made careful provision for his soul, instructed his children, and procured from the pope a bull authorizing his confessor to absolve him even at the moment of death. He died at Cardross from leprosy, contracted in the hardships of earlier life, on the 7th of June 1329, and was buried at Dunfermline beside his second wife, Elizabeth (d. 1327), daughter of Richard de Burgh, earl of Ulster, whom he had married about 1304, and who bore him his only son, David, who succeeded him. Of two surviving daughters, Matilda married Thomas Ysaak, a simple esquire, and Margaret became the wife of William, earl of Sutherland. Marjorie, an only child by his first wife, Isabella, daughter of Donald, earl of Mar, had predeceased him. Several children not born in wedlock have been traced in the records, but none of them became in any way famous.

In fulfilment of a vow to visit the Holy Sepulchre, which he could not accomplish in person, Bruce requested Douglas to carry his heart there, but his faithful follower perished on the way, fighting in Spain against the Moors, and the heart of Bruce, recovered by Sir William Keith, found its resting-place at Melrose. When his corpse was disinterred in 1821 the breast-bone was found severed to admit of the removal of the heart, thus confirming the story preserved in the verses of Barbour. That national poet collected in the earliest English poem, written in the reign of his patron-son, the copious traditions which clustered round his memory. It is a panegyric; but history has not refused to accept it as a genuine representation of the character of the great king, in spirit, if not in every detail. Its dominant note is freedom—the liberty of the nation from foreign bondage, and of the individual from oppression. It is the same note which Tacitus embodied in the speech of Galgacus at the dawn of Scottish history. Often heard, it had at least once been significant; if anything, it seldom has it made a more illustrious champion than Robert the Bruce.

HISTORY.—The chief contemporary authorities for the life of Bruce are coloured to some extent by the nationality of the writers. On the Scottish side the Brus, a poem by John Barbour, edited by W. W. Skeat (Edinburgh, 1894), and the Chronicon gestis Scotorum ab anno 1100 (ed. E. C. Skene), vol. ii, are perhaps the most valuable. The Chronicon de Landerston, edited by J. Stevenson (Edinburgh, 1839), is also very important. The English chronicles which may be consulted with advantage are those of John Barbour, Harry of Lancaster, and Sir John Froissart, and of Peter Langtoft, edited by T. Wright (London, 1866-68), and the Tacitronica of Thomas Gray, edited by J. Stevenson (Edinburgh, 1856). For the documents of the time reference should be made to the Calendar of State Papers, which was greatly edited by J. Bain (Edinburgh, 1881-88), Documents and Records illustrating the History of Scotland, vol. i, edited by F. Palgrave (London, 1837); the Royal Scots (London, 1814-19), and the Foederä of T. Rymer, vol. i. (London, 1704). The chief general histories are: Sir D. Dalrymple, Lord Hailes, Annals of Scotland (Edinburgh, 1819); P. F. Tytler, History of Scotland (Edinburgh, 1808-19), Sir H. Barbour, History of Scotland (Hamburg, 1903); A. Lang, History of Scotland, vol. i. (Edinburgh, 1892); R. Pauli, Geschichte von England (Hamburg, 1834-38). See also Sir H. Maxwell, Robert the Bruce (London, 1897).

ROBERT II. (1316-1390), called "the Steward," king of Scotland, was a son of Walter, the steward of Scotland (d. 1326), and Marjorie (d. 1316), daughter of King Robert the Bruce, and was born on the 2nd of March 1316. In 1318 the Scottish parliament decreed that if King Robert died without sons the crown should pass to his grandson; but the birth of a son, afterwards King David II., to Bruce in 1324 postponed the accession of Robert for nearly forty-two years. Soon after the infant David became king in 1329, the Steward began to take a prominent part in the affairs of Scotland. He was one of the leaders of the Scottish army at the battle of Halidon Hill in July 1333; and after gaining some successes over the adherents of Edward Baliol in the west of Scotland, he and John Randolph, 3rd earl of Moray (d. 1346), were chosen as regents of the kingdom, while David sought safety in France. The colleagues soon quarrelled; then Randolph fell into the hands of the English and Robert became sole regent, meeting with such success in his efforts to restore the royal authority that the king was able to return to Scotland in 1341. Having handed over the duties of government to David, the Steward escaped from the battle of Neville's Cross in 1346, and was again chosen regent while the king was a captive in England. Soon after this event some friction arose between Robert and his royal uncle. Accused, probably without truth, of desertion at Neville's Cross, the Steward's dispensation was granted by the king's proposal to make Edward III. of England, or one of his sons, the heir to the Scottish throne, and by David's marriage with Margaret Logie. In 1353 he rose in rebellion, and after having made his submission was seized and imprisoned together with four of his sons, being only released a short time before David's death in February 1371. By the terms of the decree of 1318 Robert now succeeded to the throne, and was crowned at Scone in March 1371. His reign in unimportant. Some steps were taken by the nobles to control the royal authority. In 1358 a war broke out with England, but the king took no part in the fighting, which included the burning of Edinburgh and the Scottish victory at Otterbourne in 1388. As age and infirmity were telling upon him, the estates in 1380 appointed his second surviving son Robert, earl of Fife, afterwards duke of Albany, guardian of the kingdom. The king died at Dunblane on the 13th of May 1390, and was buried at Scone. His first wife was Elizabeth, daughter of Sir Robert Mure of Rowallan, a lady who had formerly been his mistress. By her he had at least four sons, the eldest of whom was his successor, King Robert III., and six daughters. By his second wife, Euphemia, daughter of Hugh, earl of Ross, and widow of Moray, formerly his.
ROBERT III.—ROBERT OF NAPLES

colleague as regent, he had two sons and several daughters; and he had also many illegitimate children.

ROBERT III. (c. 1340-1406), king of Scotland, was the eldest son of King Robert II. by his mistress, Elizabeth Mure, and was legitimized when his parents were married about 1349. In 1360 he was created earl of Carrick, and he took some part in the government of the kingdom until about 1378, when he was disabled by the kick of a horse. It was probably in consequence of this accident that his brother Robert, earl of Fife, and not the crown prince himself, was made guardian of the kingdom in 1389; but the latter succeeded to the throne on his father's death in May 1390. At this time he changed his baptismal name of John, which was unpopular owing to its connexion with John de Baliol, for that of Robert, being crowned at Scone in August 1390 as King Robert III. Although he probably attended several parliaments the new king was only the nominal ruler of Scotland, the real power being in the hands of his brother. He made a journey to France, however, owing to the king's "sickness of the body," his elder son, David, duke of Rothesay, was appointed lieutenant of the kingdom; but this event was followed by an English invasion of Scotland, by serious differences between Rothesay and his uncle, Robert, now duke of Albany, and finally in March 1402 by Rothesay's mysterious death at Falkland. Early in 1406 the king's only surviving son, afterwards King James I., was captured by the English; and on the 4th of April 1406 Robert died, probably at Rothesay, and was buried at Paisley. He married Annabella Drummond (c. 1350-1402), daughter of Sir John Drummond of Stobhall, and, in addition to the two sons already mentioned, had four daughters.

ROBERT I. (c. 865-923), king of France, or king of the Franks, was the younger son of Robert the Strong, count of Anjou, and the brother of Odo, or Eudes, who became king of the western Franks in 888. Appointed by Odo ruler of several counties, including the county of Paris, and abbot in commendam of many abbeys, Robert also secured the office of duke of the Franks, a military dignity of high importance. He did not claim the crown of France when his brother died in 898; but recognizing the supremacy of the Carolingian king, Charles III., the Simple, he was confirmed in his offices and possession of the duchy of the Franks and was excused the threats of the Normans. He took up arms, drove Charles into Lorraine, and was himself crowned king of the Franks at Reims on the 26th of June 922. Collecting an army, Charles marched against the usurper, and on the 15th of June 923, in a stubborn and sanguinary battle near Soissons, Robert was killed, according to one tradition in single combat with his rival. A legend about his grandson, the Franks, and his grandson was Hugh Capet, king of France.

ROBERT II. (c. 970-1031), king of France, was a son of Hugh Capet, and was born at Orleans. He was educated at Reims under Gerbert, afterwards Pope Silvester II. As the ideal of medieval Christianity he won his surname of "Pious" by his humility and charity, but he also possessed some of the qualities of a soldier and a statesman. His father associated him with himself in the government of France, and he was crowned in December 987, becoming sole king on Hugh's death in October. Robert left a son, Hugh the Great, duke of the Franks, and his grandson was Hugh Capet, king of France.

ROBERT (1275-1343), king of Naples, was the son of Charles II., duke of Anjou and king of Naples, and in his youth took part in several expeditions to Sicily with the object of wresting the island from Frederick III. of Aragon. But his efforts, like those of his father and grandfather, proved fruitless, and the Angevins were compelled at last to agree to the peace of Caltagibotta (1302). On the death of Charles in 1309 Robert succeeded to the throne, although his nephew Cariberto (Carlo Roberto), son of his elder brother Charles Naples, Robert himself kept a close oversight over its government, and this was one reason which led to the revolt of his son in 1350. Owing to family quarrels, he could not prevent the kingdom of Burgundy, or Arles, from passing into the hands of the emperor Conrad II., and no serious results followed his interference in Flanders or in Lorraine. Robert added to the royal domains, and was greatly aided by the support of Richard II. and Richard III., dukes of Normandy, the latter of whom was his son-in-law.

His life was written by his chaplain, Helgaud, and this panegyric, Epitoma vitae Roberti regis, is published by J. F. Migne in the Patrologia Latina, tome xlii. (Paris, 1841). See also C. Pléter, Études sur le règne de Robert le Pieux (Paris, 1885); and E. Lavisse, Histoire de France, tome ii. (Paris, 1901).
ROBERT OF NORMANDY—ROBERT GUIiscard

literature, and a generous patron of literary men: he befriended the poet Petrarch, who admired the king so greatly as to express the wish to see him lord of all Italy; while Boccaccio celebrated the virtues and charms of Robert's natural daughter Maria, under the name of Fiammetta. Dante was perhaps too severe on Robert, whom he described as a re da servone (word king), and contemporary critics accused him of covetousness, a fault partly excused by his pressing need of money to pay the expenses of his perpetual wars. In spite of his power and influence, his position as a leader of the Guelphs was greatly shaken during the latter years of his reign, while at home he was never able completely to subjugate his rebellious barons.

See G. Villani, Cronache; M. Murenza, Vita di Roberto d'Angiò, re di Napoli (Naples, 1770); and Archivio storico Sicilliano (1884, viii. 511 seq.).

Robert, the name of two dukes of Normandy.

Robert I. (d. 1035), called Robert the Devil, was the youngest son of Richard II., duke of Normandy (d. 1026), who bequeathed to him the county of Exmes. In 1028 he succeeded his brother, Richard III., whom he was accused of poisoning, as duke of Normandy. His time was mainly spent in fighting against his rebellious vassals. At his court Robert sheltered the exiled English princes, Edward, afterwards King Edward the Confessor, and his brother Alfred, and fitted out a fleet for the purpose of restoring them to their inheritance, but this was scattered by a storm. When returning from a pilgrimage to Jerusalem, he died at Nicaea on the 22nd of July 1035. His successor as duke was his natural son, William, the Conqueror, afterwards king of England. In addition to winning for him his surname, Robert's strength and ferocity afforded material for many stories and legends, and he is the subject of several poems and romances (see Robert the Devil below).

Robert II. (c. 1054–1134) was the eldest son of William the Conqueror. Although recognized in boyhood as his father's successor in Normandy, he was soon dissatisfied with his position, and about 1078, following a quarrel between his brothers and himself, he revolted. He was obliged to fly from his own country, but after a period of exile he returned, raised some troops, and began to harry the duchy, wounding his father during a skirmish at Gerberoi early in 1079. He was, however, quickly forgiven, and passed two or three years in England and in Normandy until 1085, when he entered upon a series of campaigns. When Robert died on September 1087 Robert became duke of Normandy, but not king of England; although he received offers of help, he took no serious steps to displace his younger brother, King William II. In Normandy his rule was weak and irresolute. He lost the county of Maine, which for some years had been united with Normandy, and he was soon at variance with his brothers, the younger of whom, Henry, he seized and put into prison. In 1089 his duchy was invaded by William II., who soon made peace with Robert, the two agreeing to dispossess their brother Henry of his lands in Normandy. This peace lasted until 1094, when occasions of difference again arose and another struggle began, Robert being aided by King Philip I. of France.

This warfare ended in 1096, when Robert set out on the first crusade, having raised money for this purpose by pledging his duchy to William for 10,000 marks. With his followers he journeyed to Constantinople; then he took part in the siege of Nicaea, the battle of Dorylaeum, and the famous battle under the walls of Antioch in June 1098. He shared in the siege of Jerusalem and other exploits of the crusade, while one account says that he was offered and refused the crown of the new Latin kingdom. Having won a great reputation both for valour and for generosity, the duke left Palestine and arrived at Normandy in September 1099.

William Rufus died while Robert was on his wayward way, and in Italy the Norman duke was greeted as king of England; but when he reached Normandy he learned that the English throne was already in the possession of Henry I. In July 1101 he crossed over to England, intending to contest his brother's title, but Henry met him near Alton, in Hampshire, and an amicable arrangement was made between them. Having received presents and the promise of a pension, Robert went quietly home. But the fraternal strife was not allayed. Henry had interests in Normandy in addition to the county of Evreux, which Robert ceded to him about 1102. Visits were exchanged, but no lasting peace was made, and in 1106 the English king agreed to withdraw Robert and his followers to Normandy in extremities. At the battle of Tinchebrai, fought on the 28th of September 1106, Henry took his brother prisoner and carried him to England. For twenty-eight years the unfortunate duke was a captive, first in the Tower of London, and later in the castles of Devizes and Cardiff, but the evidence goes to show that he was not treated with cruelty. He died probably at Cardiff on the 10th of February 1134. Robert had a son, William, called the Clito, and several natural children. He was called Curthose, and also Gambardon, his figure being short and stout. Although wanting in decision of character, he was a skilful and able warrior, and the chroniclers tell many stories, some of them obviously legendary, of his exploits in the Holy Land.

The chief sources for the life of Robert II. are Ordericus Vitalis, William of Malmesbury and other chroniclers of the time. See E. A. Freeman, History of the Norman Conquest (1870–76), and The Reign of Rufus (1882).

Robert Guiscard [i.e. "the resourceful"] (c. 1015–1085), the most remarkable of the Norman adventurers who conquered southern Italy. From 1016 to 1030 the Normans were pure mercenaries, serving either Greeks or Lombards, and then Sergius of Naples, by installing the leader Rainulf in the fortress of Aversa in 1030, gave them their first pied-à-terre and they began an organized conquest of the land. In 1030 there arrived William and Drogo, the two eldest sons of Tancred of Hauteville, a petty noble of Coutances in Normandy. The two joined in the organized attempt to wrest Apulia from the Greeks, who by 1040 had lost most of that province. In 1042 Melfi was chosen as the Norman capital, and in September of that year the Normans elected as their count William "Iron Arm," who was succeeded in turn by his brothers Drogo, "comes Normannorum totius Apulieae et Calabriae," and Humfrey, who arrived about 1044. In 1046 arrived Robert, the sixth son of Tancred of Hauteville. His tall stature, bold piercing and powerful voice are strikingly described by Anna Comnena.

Guiscard soon rose to distinction. The Lombards turned against their allies and Leo IX. determined to expel the Norman freebooters. The army which he led towards Apulia in 1053 was, however, overthrown at Civitate on the Fortore by the Normans united under Humfrey, Guiscard and Richard of Aversa. In 1057 Robert succeeded Humfrey as count of Apulia and, in company with Roger his youngest brother, carried on the conquest of Apulia and Calabria, while Richard conquered the principality of Capua. The Papacy, foreseeing the breach with the emperor over investitures, now resolved to recognize the Normans and secure them as allies. Therefore at Melfi, on the 23rd of August 1059, Nicholas II. invested Robert with Apulia, Calabria, and Sicily, and Richard with Capua. Guiscard "by Grace of God and St Peter duke of Apulia and Calabria and future lord of Sicily" agreed to hold by annual rent of the Holy See and to maintain its cause. In the next twenty years he made an amazing series of conquests. Invading Sicily with Roger, the brothers captured Messina (1061) and Palermo (1072). Bari was reduced (April 1071) and the Greeks finally ousted from southern Italy. The territory of Salerno was already Robert's; in December 1076 he took the city, expelling its Lombard prince Guisulf, whose sister Sikelgaita he had married. The Norman attacks on Benevento, a papal fief, alarmed and angered Gregory VII., but pressed hard by the emperor, Henry IV., he turned again to the Normans, and at Cepane (June 1080) reinvested Robert, securing him also in the southern Abruzzi, but reserving Salerno. Guiscard's last enterprise was his attack on the Greek Empire, a rallying ground for his rebel vassals. He
contemplated seizing the throne of the Basileus and took up the cause of Michael VII, who had been deposed in 1078 and to whose rescue his daughter had been betrothed. He sailed with 16,000 men against the empire in May 1081, and as February 1082 had occupied Corfu and Durazzo, defeating the emperor Alexis before the latter (October 1081). He was, however, recalled to the aid of Gregory VII., besieged in San Angelo by Henry IV. (June 1083). Marching north with 36,000 men he entered Rome and forced Henry to retire, but an émeute of the citizens led to a three days' sack of the city (May 1084), after which Guiscard escorted the pope to Rome. His son Bohemund, for a time master of Thessaly, had now lost the Greek conquests. Robert, returning to restore them, occupied Corfu and Kephalonia, but died of fever in the latter on the 15th of July 1085, in his 76th year. He was buried in S. Trinità at Venosa. Guiscard was succeeded by Roger "Borsa," his son by Sikelgaita; Bohemund, his son by an earlier Norman wife Albereda, being set aside. At his death Robert was duke of Apulia and Calabria, prince of Salerno and suzerain of Sicily. His successes had been due not only to his great qualities but to the "enteinte" with the Papal See. He created and enforced a strong ducal power which, however, was met by many baronial revolts, one being in 1078, when he demanded from the Apulian vassals an "aid" on the betrothal of his daughter. In conquering such wide territories he had little time to organize them internally. In the history of the Norman kingdom it is only the extensive missionary work the hero and founder, as his nephew Roger II. is the statesman and organizer.

ROBERT OF AUXERRE (c. 1156-1272), French chronicler, was an inmate of the monastery of St Marien at Auxerre. At the request of Hilde de Trainel (1155-1200), abbot of this house, he wrote a Chronicon, or universal history, which covers the period between the creation of the world and 1211. For the years previous to 1181 this is merely a compilation from Prosper of Aquitaine, Siegfert of Gembloux and others, but it is an original authority for the period from 1181 to 1211. It is one of the most valuable sources for the history of France during the reign of Philip Augustus, and it also contains information about other European countries, the Crusades and affairs in the East. Molinier, in fact, describes the author as one of the best historians of the middle ages. Robert was evidently a man of great diligence and of sound judgment. Two continuators took the work down to 1228 and it was extensively used by later chroniclers. The original manuscript is now at Auxerre.

The Chronicon was first published by N. Camusat at Troyes in 1608; the best edition is in Band xxvi. of the Monumenta Germaniae historicæ. Scriptores, with introduction by A. Holder-Egger. Robert has been identified, but on very questionable grounds, with a certain Robert Abolant, an official of the monastery of St Marien, who died in 1214. See A. Molinier, Les Sources de l'histoire de France, tomes iii. and iv. (1903-1904).

ROBERT OF COURTENAY (d. 1228), emperor of Romania, or Constantinople, was a younger son of the emperor Peter of Courtenay, and was descended from the French king, Louis VI., while his mother Yolande was a sister of Baldwin and Henry of Hainault, the first and second emperors of Constantinople. When it became known in France that Peter of Courtenay was dead, his eldest son, Philip, marquess of Namur, renounced the succession to the Latin empire of Constantinople in favour of his brother Robert, who set out to take possession of his distracted inheritance, which was then ruled by Cenon of Béthune as regent. Crowned emperor on the 25th of March 1221, Robert, who was surrounded by enemies, appealed for help to the pope and to the king of France; but meanwhile his lands were falling into the hands of the Greeks. Some little aid was sent from western Europe, but soon Robert was compelled to make peace with his chief foe, John Ducas Vatases, emperor of Nicaea, who was confirmed in all his conquests. Robert promised to marry Eudokia, daughter of the late emperor of Nicaea, Theodore Lascaris I., a lady to whom he had been betrothed on a former occasion; however, he soon repudiated this engagement, and married a French lady, already the fiancée of a Burgundian gentleman. Heading a conspiracy, the Burgundian drove Robert from Constantinople, and in 1228 the emperor died in Achaea.

ROBERT OF GLOUCESTER, English chronicler, is known only through his connexion with the work which bears his name. This is a vernacular history of England, from the days of the legendary Brut to the year 1270, and is written in rhymed couplets. The lines are of fourteen syllables, with a break after the eighth syllable. The author gives his name as Robert; the dialect which he uses, and his acquaintance with local traditions, justify the supposition that he was a monk of Gloucester. He describes, from his own recollections, the bad weather which prevailed in the neighbourhood of Evesham on the day of the battle between the Montfortians and Prince Edward (1265). He also alluded to the canonization of Louis IX. of France, which took place in 1297. He probably wrote about the year 1300. The earlier part of his chronicle (up to 1135) may be from another hand, since it occurs in some manuscripts in a shorter form, and with an exceedingly brief continuation by an anonymous versifier. There is no good reason for the theory that this part was translated from a French original; nor does it contain any undoubted borrowings from French sources. The authorities employed for the earlier part were Geoffrey of Monmouth, Henry of Huntingdon, William of Malmesbury, the English Chronicles, and some minor sources; Robert, in making his recension of it, also used the Brut of Layamon. From 1135 to 1250 Robert is still a compiler, although references to oral tradition become more frequent as he approaches his own time. From 1256 to 1270 he has the value of a contemporary authority. But he is more important to the philologist than to the historian. His chronicle is one of the last works written in Old English.

Robert's chronicle was first edited by T. Hearne (2 vols., Oxford, 1724); but this text is now superseded by that of W. Aldis Wright (2 vols., Rolls Series, 1887). Minor works attributed to the author are: a Life of St Alban in verse (MS. Ashmole 43); a Life of St Thomas Becket in verse (MS. Oxford, Bodleian Library, Trin. Coll. MS. C.C.C. Cambridge, 145); and a Life of St Alphege (MS. Cott. Julius D. ix.). A Martyrdom of St Thomas Becket and a Life of St Benedict, both attributed to Robert, were printed by the Percy Society in 1845.

See T. D. Hardy's Descriptive Catalogue of MSS. i. 25, 68, iii. 181-9, 623; K. Brossman, Über die Quellen der Chronik des R. Courtenay (Strasbourg, 1887); W. Ellmore in English Historical Review, i. 1-37, 293-322; H. Strohmeyer, Der Stüt der Reichschronik R. von Gloucester (Berlin, 1891). (H. W. C. D.)

ROBERT OF JUMIÈGES (d. c. 1070), archbishop of Canterbury, was a Norman who became prior of St Ouen at Rouen and then abbot of Jumièges. A close friend of the future king of England, Edward the Confessor, he crossed over to England with Edward in 1042, and in 1044 became bishop of London. In English history Robert appears as the most trusted and the most prominent of the king's friends, and is the only one hostile to the influence of Earl Godwine. In 1051, although the chapter had already made an election, Edward appointed him archbishop of Canterbury. He seems to have been sent by the king on an errand to Duke William of Normandy, and on the return of Godwine from exile in 1052 he fled in great haste from England. He was outlawed and deposed, and he died at Jumièges about 1070. The treatment of Robert by the English was put forward by William the Conqueror as a pretext for invading England.

ROBERT OF TORIGNI (c. 1110-1186), medieval chronicler, was prior of Bec in 1149, and in 1154 became abbot of Mont
ROBERT THE DEVIL—ROBERT, L. L.

St Michel, whence he is also sometimes called Robertus de Monte. He died, according to Potthast, on the 29th of May 1186. He wrote additions and appendices to the chronicle of Sigebert of Genblours, covering the period A.D. 385-1100, and a chronicle in continuation of Sigebert, extending from 1100 to 1186, of great value for Anglo-Norman history. Robert was in a good position to obtain information, for the Mont St Michel was one of the four great centres of pilgrimage in Europe. But he was excessively timid and cautious, and hardly mentions events, like the murder of Becket, which were subjects of controversy. Besides, his style is that of the drier annalist. It is for continental affairs between 1154 and 1170 that his information is especially valuable. His notices of English affairs are slight and sometimes misleading.

The best modern editions are the Chronique de Robert de Torigni, &c, edited by Léonpold Delisle for the Soc. des Histoire de Normandie (Rouen, 1872-1877), and a Continuation of Robert de Torigni, edited, with an introduction, by Richard Howlett (Rolls Series, No. 82, iv. 1889).

ROBERT THE DEVIL, hero of romance. He was the son of a duke and duchess of Normandy, and by the time he was twenty was a prodigy of strength, which he used, however, only for outrage and crime. At last he learnt from his mother, in explanation of his wicked impulses, that he was born in answer to prayers addressed to the devil. He was directed by the pope to a hermit, who imposed on him by way of penance that he should maintain absolute silence, fellmg madness, take his food from the mouth of a dog, and provoke ill-treatment from the common people without retaliating. He became court fool to the emperor at Rome, and delivered the city from Saracen invasions in three successive years in the guise of an unknown knight, having each time been bidden to fight by a celestial messenger. The emperor’s dumb daughter recovered speech to declare the identity of the court fool with the deliverer of the city, but Robert refused the hand of the princess and the imperial inheritance, and ended his days in the hermitage of his old confessors.

The French romance of Robert le Diable is one of the oldest versions of the legend, and differs in detail from the popular tales printed in the 15th and 16th centuries. It was apparently founded on folk-lore, not on the wickedness of Robert Guiscard or any historical personage; but probably the name of Robert and Turpin is a survival of the legend preserved to the terror inspired by the Normans. In the English version the hero is called Sir Gowther, and the scene is laid in Germany. This metrical romance dates from the beginning of the 15th century, and is based, according to its author, on a Breton lay. The metrical had undergone much change before it was used by E. Scrib and C. Delavigne in the libretto of Meyerbeer’s opera of Robert le Diable.

See Robert le Diable, ed. E. Lœseth (Paris, 1903, for the Soc. des anc. textes fr.; Sir Gowther, ed. K. Breul (Oppeln, 1886); M. Terdel, Die Sage v. Robert d. Teufel in neueren deutschen Dichtungen (Berlin, 1900). Breul’s edition of the English poem contains an examination of the legend, and a bibliography of the literature dealing with the subject. The English prose romance of Robert the Devil was printed (c. 1510) by Wynken de Worde.

ROBERT THE STRONG (le Fort) (d. 866), count of Anjou and of Blois, is said by Richerus to have been the son of a certain Witchin, but nothing definite is known about his parentage or early life. Quickly attaining a prominent position among the Frankish nobles, he appears as rector of the abbey of Marmoutier in 852, and as one of Charles the Bald’s missi dominici, in 853; but soon afterwards he was among those who rebelled against Charles, and invited the king’s half-brother to the throne. However, after the peace between Charles and Louis in 856 Robert came to terms with his sovereign, who made him count of Anjou and of Blois, and entrusted him with the defence of that part of his kingdom which lay between the Seine and the Loire, a district which had suffered greatly from the ravages of the Normans and the Bretons. By his conduct in many stubborn fights with these foes, Robert thoroughly earned his surname and gained the confidence of the king, who gave him the counties of Nevers and Auxerre. He was killed in battle at Briisarthe in October 866, leaving two sons, Odo, or Eudes, and Robert, both of whom became kings of the Franks. Robert has been compared to the Maccabees, and the fact that he was the ancestor of the Capetian kings of France has invested him with historical importance.

See V. von Kalckscenstein, Robert der Tapferen (Berlin, 1871); and E. Favre, Eudes, comte de Paris et roi de France (Paris, 1893).

ROBERT, HUBERT (1755-1808), French artist, born at Paris in 1755, desires to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated the subjects he painted. The contrast between the ruins of ancient Rome and the life of his time excited his keenest interest; and, although he had started for Italy on his own responsibility, the credit he there acquired procured him the protection of the minister Marigny and an official allowance. His incessant activity as an artist, his daring character, his many adventures, attracted general sympathy and admiration. In the fourth canto of his L’Imagination Delilie celebrated Robert’s miraculous escape when lost in the catacombs; later in life, when imprisoned during the Terror and marked for the guillotine, by a fatal accident another died in his place and Robert lived. The quantity of his work is immense; the Louvre alone contains nine paintings by his hand and specimens are frequently to be met with in provincial museums and private collections. Robert’s work has more or less of that scenic character which justified his selection by Voltaire to paint the decorations of his theatre at Ferney. Robert died of apoplexy on the 15th of April 1808. His work was much engraved by the abbé Le Non, with whom he had visited Naples in the company of Fragonard during his early days; in Italy his work has also been frequently reproduced by Chatelain, Lénard, Le Vea, and others.

ROBERT, LOUIS LÉOPOLD (1794-1835), French painter, was born at Chaux de Fonds (Neuchâtel) in Switzerland on the 13th of May 1794, but left his native place with the engraver Girardet at the age of sixteen for Paris. He was on the eve of obtaining the grand prix for engraving when the events of 1835 blasted his hopes, for Neuchâtel was restored to Prussia, and Robert was struck off the list of competitors as a foreigner. Whilst continuing his studies under Girardet he had never ceased to frequent the studio of David, and he now determined to become a painter, and only returned to his native country when his master himself was exiled. At Neuchâtel he attracted the notice of Roulet de Mezecar, who enabled him by a timely loan to proceed to Rome. In depicting the customs and life of the people, of southern Italy especially, he showed peculiar feeling for the historical characteristics of their race. After executing many detailed studies of Italian life Robert conceived the idea of painting four great works which should represent at one and the same time the four seasons in Italy and the four leading races of its people. In the “Return from the Fête de la Madonnà dell’ Arco” (Louvre) he depicted the Neapolitans and the spring. This picture, exhibited at the Salon of 1827, achieved undoubted success and was bought for the Luxembourg by Charles X.; but the work which appeared in 1831—the “Summer Reapers arriving in the Pontine Marshes” (Louvre), which became the property of Louis Philippe—established the artist’s reputation. Florence and her autumn vineyards should now have furnished him with his third subject. He attempted to begin it, but, unable to conquer his passion for painting, he set sail for Naples. On his return he was seized with the fever (death of his wife, Robert’s devoted friend), threw up his work and went to Venice, where he began and carried through the fourth of the series, the “Fishers of the Adriatic.” This work was not equal to the “Reapers.” Worn by the vicissitudes of painful feeling, and bitterly discouraged, Robert committed suicide before his easel on the 20th of March 1835, on the tenth anniversary of the melancholy suicide of a brother to whom he had been much attached.

**ROBERT-FLEURY, JOSEPH NICOLAS** (1797–1860), French painter, was born at Cologne. He was sent by his family to Paris, and after travelling in Italy returned to France and made his first appearance at the Salon in 1824; his reputation, however, was not established until three years later, when he exhibited “Tasso at the Convent of St Onophrus.” Endowed with a vigorous original talent, and with a vivid imagination, especially for the tragic incidents of history, he soon rose to fame, and in 1850 succeeded Granet as member of the Académie des Beaux-Arts. In 1855 he was appointed professor and in 1863 director of the École des Beaux-Arts, and in the following year he went to Rome as director of the French Academy in that city. Among his chief works are: “A Reading at Mme. de Sévigné’s,” “Scene of St Bartholomew’s,” “Henry IV, taken to the Louvre after his Assassination” (1836); “Triumphal Entry of Clovis at Tours” (1838), at the Versailles Museum; “Le Colloque de Poissy” (1840), at the Luxembourg Museum in Paris; “The Children of Louis XVI. in the Temple” (1840); “Marino Faliero”; “An Auto-da-fé;” “Galileo before the Holy Office,” at the Luxembourg Museum; “Christopher Columbus received by the Spanish Court” (1847), at the same gallery; “The Last Moments of Montaigne” (1853); and “Charles V. in the Monastery of Yuste” (1857). He died in Paris in 1890.

His son, **TONY ROBERT-FLEURY** (1837– ), French painter, was born in Paris, and studied under his father and under Delacroix and Léon Colgnes. His first picture at the Salon, in 1866, was a large historical composition of the “Warsaw Massacres on April 8, 1861.” In the following year his “Old Women in the Place Navone, Rome” was bought for the Luxembourg Museum, as was also the “Last Day of Corinth” in 1870. In 1880 he painted a ceiling for the Luxembourg, representing “The Glorification of French Sculpture.” Tony Robert-Fleury became president of the Société des Artistes français in succession to Bouguereau. He acquired a great reputation for his historical compositions and portraits; and from his atelier have issued a great number of the best-known painters of our day.

**ROBERTS, DAVID** (1796–1864), Scottish painter, was born at Stockbridge, Edinburgh, on the 24th of October 1796. He was apprenticed by his father, a shoemaker, for seven years to a painter and house-decorator; and during this time he employed his evenings in the study of art. In 1820 he formed the acquaintance of Clarkson Stanfield, then painting at the Pantheon, Edinburgh, at whose suggestion he sent three pictures in 1822 to the Exhibition of Works by Living Artists, held in Edinburgh. In the same year he removed to London, where he worked for the Coburg Theatre, and was afterwards employed, along with Stanfield, at Drury Lane. In 1824 he exhibited at the British Institution a view of Dryburgh Abbey, and sent two works to the first exhibition of the Society of British Artists, of which he was elected president in 1831. In the same autumn he visited Normandy, and the works which were the results of this excursion began to lay the foundation of the artist’s reputation—one of them, a view of Rouen Cathedral, being sold for eighty guineas. His scenes for an opera, The Seraglio, executed two years later, and the scenery for a pantomime dealing with the naval victory of Navarino, and two panoramas executed jointly by him and Stanfield, were among his last work for the theatres. In 1839 he exhibited the “Departure of the Israelites from Egypt,” in which he won a medal; three years afterwards he travelled in Spain and Tangiers, returning in the end of 1833 with a supply of effective sketches, elaborated into attractive and popular paintings. His “Interior of Seville Cathedral” was exhibited in the British Institution in 1834, and sold for £300; and he executed a fine series of Spanish illustrations for the Landscape Annual of 1836, while in 1837 a selection of his Picturesque Sketches in Spain was reproduced by lithography.

In 1838 Roberts made a long tour in the East, and accumulated a vast collection of sketches of a class of scenery which had hitherto been hardly touched by British artists, and which appealed to the public with all the charm of novelty. The next ten years of his life were mainly spent in elaborating these materials. An extensive series of drawings was lithographed by Louis Haghe in Sketches in the Holy Land and Syria, 1849–1850. In 1851, and again in 1853, Roberts went to Italy, painting the “Ducal Palace, Venice,” bought by Lord Lendesborough, the “Interior of the Basilica of St Peter’s, Rome,” “Christmas Day, 1853,” and “Rome from the Convent of St Onofrio,” presented to the Royal Scottish Academy. His last volume of illustrations, Italy, Classical, Historical and Picturesque, was published in 1859. He also executed, by command of Queen Victoria, a picture of the opening of the Great Exhibition of 1851. In 1839 he was elected an associate and in 1841 a full member of the Royal Academy; and in 1858 he was presented with the freedom of the city of Edinburgh. The last years of his life were occupied with a series of views of London from the Thames. He had executed six of these, and was at work upon a picture of St Paul’s Cathedral, when, on the 25th November 1864, he died suddenly of apoplexy.

*LIFE OF ROBERTS,* compiled from his journals and other sources by James Ballantine, with etchings and pen-and-ink sketches by the artist, appeared in Edinburgh in 1866.

**ROBERTS, FREDERICK SLEIGH ROBERTS, EARL** (1832– ), British soldier, second son of General Sir Abraham Roberts, G.C.B., was born at Cawnpore, India, on the 30th of September 1832. Educated at Eton, Sandhurst and Addiscombe, he obtained a commission in the Bengal Artillery on 12th December 1851. In the following year he was posted to a field battery at Peshawar, where he also acted as aide-de-camp to his father, who commanded the Peshawar division. In 1856 Roberts was appointed to the quartermaster-general’s department of the staff, in which he remained for twenty-two years, passing from one grade to another until he became quartermaster-general in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, successively commanded by Colonels Neville Chamberlain and John Nicholson, but, towards the end of June, he joined the Delhi Field Force, and was deputy assistant quartermaster-general with the artillery during the operations against Delhi. He was wounded in the fight of the 14th of July, but was sufficiently recovered in September to take command as a regimental officer of the left half of No. 2 Siege Battery during the siege. He rejoined the headquarters staff for the assault, and took part in the storm and subsequent seven days’ fighting in the city. He then accompanied Colonel Greathed’s column to Cawnpore, and during September and October was present at the actions of Bulandshahr, Aligarh, Agra, Bithur and Kanauj. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on the 6th of December, and the subsequent pursuit and defeat of the Gwalior contingent near Shinarjup. Roberts distinguished himself at the engagement of Khudaganj, on the 2nd of January 1858, by capturing, in single-handed combat, a standard from two sepoys, and also by cutting down a sepoy about to kill a sowar. For these acts of gallantry he was recommended for the Victoria Cross. He was present at the reoccupation of Fatehpur on the 6th of January, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kurai on the 1st of August that month. In the autumn he sent off with his regiment on leave. For his services in the Mutiny he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain, in October 1866, a brevet majority. On the 17th of May 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the viceroy’s camps during the progresses through Oudh, the North-West Provinces, the Punjab and Central India in 1860 and 1861. In December 1863 he took part, under
ROBERTS, EARL

Major-General Garrock, in the Umbelya campaign among the mountains to the north of Peshawar, and was present at the storm of Lala, the capture of Umbelya, and the destruction of Mulka, receiving for his services the medal and clasp.

In 1867 Roberts was appointed assistant quartermaster-general to Sir Donald Stewart’s Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on the 3rd of February 1868, and remained there as senior base staff officer during the four months’ campaign. At its close he superintended the re-embarkation of the whole army. His duties were so well performed that Sir Robert Napier sent him home with his final despatches. He was three times “mentioned,” and received a brevet lieutenant-colonelcy and the war medal. He returned to India the following year as first assistant quartermaster-general. In the autumn of 1871 he made the arrangements for the expedition into Lushai, between south-east Bengal and Burma, fitted out two columns under Commissioner H. A. Brownlow, and himself accompanied the first. A road, 100 m. long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Kholei villages and the action in the Northlant range, and commanded the trains at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became deputy quartermaster-general in Bengal, and in 1875 quartermaster-general and colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the prince of Wales in January 1876, and attended H.R.H. at the manoeuvres. He also superintended the arrangements for the great durbar at Delhi on the 1st of January 1877, when Queen Victoria was proclaimed empress of India.

In 1878 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the formation of three columns to advance into Afghanistan by the Khyber, the Bolan and the Kurram passes, he was given the command of the Kurram Field Force, with the rank of major-general. Concentrating his column at Thal, he reconnoitred the Kurram and the Sarapi passes, and having formed an advanced base there, marched on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of the 1st of December moved part of his force to attack the Spingwa Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingwa Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He reconnoitred the Shutargandan and the Sapari passes, and made a strong reconnaissance through Khost, in which some fighting took place, and at the end of January returned to Hagir Pir, in Kurram, where his force remained in occupation. In July Major Cavagnari, the British envoy to the new amir, Yakub Khan, passed through Kurram on his way to Kabul, and, shortly afterwards, Roberts left his Kurram command and went to Simla to take his seat on the army commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later. While he was at Simla, news arrived on the 5th of September of the murder of C. C. R. Mervis in Madras in October.

The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kurram to take command, as a lieutenant-general, of the Kabul Field Force (7,500 men and 22 guns). By the 10th of September a brigade was entrenched on the Shutargandan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8,000 men blocked the way in a strong position on the heights beyond Charasia, and on the 6th of October Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abdicated on the 12th of October, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to conciliate the tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting around Kabul, the numbers of the enemy were so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the enemy, and early on the 23rd of December was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them, when they broke and dispersed. Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern tribes for the appointment of an amir for the Kabul district only. On the 5th of May Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On the 22nd of July Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kurram route, when news arrived that a British brigade had been totally defeated at Maiwand on the 27th of July, and that Lieutenant-General Primrose was killed in Kandahar. Roberts hastened at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on the 9th of August and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. His services in the Afghan campaigns of 1878 to 1880 are recorded in eight Gazettes, and were recognized by the thanks of both Houses of Parliament, of the Government of India, and of the Governor-General in Council. He was created K.C.B., G.C.B. and a baronet, received the medal with four clasps and the bronze star, and was given the command of the Madras army.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed governor of Natal and commander-in-chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manoeuvres in Hanover as the guest of the German emperor. He declined the post of quartermaster-general to the forces in succession to Sir Garnet Wolseley, and returned to India, and negotiations were carried on with the Boers in September. The following year he visited Burma with the viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Panjdeh incident, in connexion with which he had been nominated to the command of an army corps in
case of hostilities. In July he succeeded Sir Donald Stewart as commander-in-chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defence. At the end of 1856, at the request of the viceroy, he took personal command for a time of the forces in Burmah, and organized measures for the suppression of dacoity. For his services he received the medal, was created G.C.I.E., and promoted supernumerary general. In 1890 he did the honours of the army to Prince Albert Victor at a standing camp at Muridiki, and in 1891 his attention was occupied with the Zob and Hunza Nagar frontier campaigns. On the 1st of January 1892 he was raised to the peerage as Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to be field-marshall in 1893, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a privy councillor. At Queen Victoria's diamond jubilee in 1897 he was created K.P.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg and Colenso, where his only son was killed, Lord Roberts was sent out as commander-in-chief. He arrived at Cape Town on the 10th of January 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and soon changed the aspect of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer general, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5000 men, on the anniversary of Majuba Day, 16th of February 1890. Roberts entered Bloemfontein on the 15th of March, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on the 17th of May, and Pretoria occupied on the 5th of June. The two Boer states were annexed, and the war gradually assuming a guerilla character, Roberts handed over the command to Lord Kitchener and returned to England to fill the office of commander-in-chief of the army in succession to Lord Wolseley.

He arrived in the Solent on the 2nd of January 1901, and the same day, at Osborne, had an audience of Queen Victoria, who handed him the insignia of the Order of the Garter. The noblest present he received at Paddington by the prince and princess of Wales, and drove in procession to Buckingham Palace, where he was entertained as the guest of the queen. He again had an audience of the queen at Osborne on the 14th of January on his elevation to an earldom, the last audience given by her majesty before her death, which took place eight days later. When the German emperor came to London for the queen's funeral, he decorated Lord Roberts with the Order of the Black Eagle. Earl Roberts received the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. In 1905 he resigned his post on the Committee of National Defence, and devoted himself to attempting to rouse his countrymen to the necessity of cultivating rifle-shooting and of adopting systematic general military training and service. As an author he is known by his Rise of Welling- ton (1893), and his Forty-One Years in India (1897), an autobiography which has passed through numerous editions.

ROBERTSON, FREDERICK WILLIAM (1816-1839), English divine, known as Robertson of Brighton, was born in London on the 3rd of February 1816. The first five years of his life were passed at Leith Port, where his father, a captain in the Royal Artillery, was then resident. The military spirit entered into his blood, and throughout his whole life was characteristic of the quintessence of the ideal soldier. In 1821 Captain Robertson retired to Beverley, where the boy was educated. At the age of fourteen he spent a year at Tours, from which he returned to Scotland and continued his education at the Edinburgh Academy and university. In 1834 he was articled to a solicitor in Bury St Edmunds, but the uncongenial and sedentary employment soon broke down his health. He was anxious for a military career, and his name was placed upon the list of the 3rd Dragoons, then serving in India. For two years he worked hard in preparing for the army, but, by a singular conjunction of circumstances and at the sacrifice of his own natural bent to his father's wish, he matriculated at Brasenose College, Oxford, just two weeks before his commission was put into his hands. Oxford he did not find wholly congenial to his intensely earnest spirit, but he read hard, and, as he afterwards said, "Plato, Aristotle, Butler, Thucydides, Sterne, Jonathan Edwards, passed like the iron athorns of the blood into my mental constitution." At the same time he made a careful study of the Bible, committing to memory the entire New Testament both in English and in Greek. The Tractarian movement had no attraction for him, although he admired some of its leaders. He was at this time a moderate Calvinist in doctrine, and enthusiastically evangelical. Ordained in July 1840 by the bishop of Winchester, he at once entered on ministerial work in that city, and during his ministry there and under the influence of the missionaries Henry Martyn and David Brainerd, whose lives he studied, he carried devotional asceticism to an injurious length. In less than a year he was compelled to seek 'relaxation; and going to Switzerland he there met and married Helen, third daughter of Sir George William Denys, Bart. Early in 1842, after a few months' rest, he accepted a curacy in Cheltenham, which he retained for upwards of four years. The questioning spirit was first aroused in him by the disappointing fruit of evangelical doctrine which he found in Cheltenham, as well as by intimacy with men of varied reading. But, if we are to judge from his own statement in a letter from Heidelberg in 1846, the doubts which now actively assailed him had long been latent in his mind. The crisis of his mental conflict had just been passed in Tirol, and he was now beginning to let his creed grow again from the one fixed point which nothing had availed to shift: "The one great certainty to which, in the midst of the darkest doubt, I never ceased to cling—the entire symmetry and loveliness and the unequalled nobleness of the humanity of the Son of Man." After this mental revolution he felt unable to return to Cheltenham, but after doing duty for two months at St Ebbes, Oxford, he entered in August 1847 on his famous ministry at Trinity Chapel, Brighton. Here he stepped at once into the foremost rank as a preacher, and the source was throned with thoughtful men of all classes in society and of all shades of religious belief. His fine appearance, his flexible and sympathetic voice, his manifest sincerity, the perfect lucidity and artistic symmetry of his address, and the brilliance with which he illustrated his points would have attracted hearers even had he had little to say. But he had much to say. He was not, indeed, a scientific theologian; but his insight into the principles of the spiritual life was unrivalled. As his biographer says, thousands found in his sermons "a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom." His closing years were full of sadness. His sensitive nature was subjected to extreme suffering, arising mainly from the opposition aroused by his sympathy with the revolutionary ideas of the 1848 epoch. Moreover, he was crippled by incipient disease of the brain, which at first inflicted unendurable lassitude and depression, and latterly agonizing pain. On the 5th of June 1853 he preached for the last time, and on the 15th of August he died.

Robertson's published works include five volumes of sermons, two volumes of expository lectures, on Genesis and on the epistles to the Corinthians, and an Analysis of "In Memoriam." See Life and Letters by Stopford A. Brooke (1865).

ROBERTSON, GEORGE CROOM (1842-1892), Scottish philosopher, was born at Aberdeen on the 10th of March 1842. In 1857 he gained a bursary at Marischal College, and graduated M.A. in 1861, with the highest honours in classics and philosophy. In the same year he won a Ferguson scholarship of £100 a year for two years, which enabled him to pursue his studies outside Scotland. He went first to University
Robertson, J.—Robertson, W.

College, London; at Heidelberg he worked at German; at Berlin he studied psychology, metaphysics and also physiology under Du Bois-Reymond, and heard lectures on Hegel, Kant and the history of philosophy, ancient and modern. After two months at Göttingen, he went to Paris in June 1863. In the same year he returned to Aberdeen and helped Alexander Bain with the revision of some of his books. In 1864 he was appointed to help Professor Geddes with his Greek classes, but he gave up the vacations to philosophical work. In 1866 he was appointed professor of philosophy of mind and logic at University College, London. This post he retained until ill-health compelled him to resign a few months before his death in 1892. He lectured on logic, deductive systems and psychology and ethics. He left little published work. A comprehensive work on Hobbes was never completed, though part of the materials were used for an article in the Encyclopaedia Britannica, and another portion was published as one of Blackwood's "Philosophical Classics." Together with Bain, he edited Grote's Aristotle, and was the editor of Mind from its foundation in 1876 till 1891. He was keenly interested in German philosophy, and took every opportunity of making German works on English writers known in the United Kingdom. In philosophy he followed mainly Mill and Bain, but he was acquainted with all philosophical literature. He was conversant with the works of his daughter (or Mr Justice Crompton) in many kinds of social work; he sat on the Committee of the National Society for Women's Suffrage, and was actively associated with its president, John Stuart Mill. He warmly supported the admission of women students to University College.

Robertson, Joseph (1820-1886), Scottish antiquary, was born at Aberdeen on the 17th of May 1810, the son of a small shopkeeper. He was educated in Marischal College in Aberdeen and was for some years engaged in literary and newspaper work there and in Glasgow and Edinburgh. In 1839 he helped to found the Spalding Club, organized to publish the historical, genealogical, topographical and literary remains of the north-eastern counties of Scotland, and he edited eight of its thirty-eight volumes. In 1853 he was appointed curator of the historical and antiquarian department of the General Register House, Edinburgh, hitherto a subordinate and unimportant office, but which, in his hands, became of the first consequence to the interests of antiquarian literature in Scotland. His inventories of the personal property and jewels of Mary Queen of Scots, prefixed by a paper of great learning and research, and his essays on Scottish architecture, preceded his greatest work, published by the Bannatyne Club (1866), Concilia Scotiae, Ecclesiæ Scotiaeæ Statuta. In 1864 the University of Edinburgh conferred upon him the honorary degree of LL.D. He died on the 13th of December 1866.

Robertson, Thomas William (1820-1871), English actor and dramatist, was born at Newark on the 4th of January 1829. As a dramatist he had a brief but very brilliant career. The son of a provincial actor and manager, chief of a "circus" that ranged from Bristol to Cambridge, Robertson was familiar with the stage from his childhood; he was the eldest of a large family, the actress Margaret (Madge) Robertson (Mrs Kendal) being the youngest. His success came late. A farcical comedy by him, A Night's Adventure, was produced at the Olympic under Faren's management as early as 1857, but this did not make good his footing, and he remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London, and edited a mining journal to which he contributed a novel afterwards dramatized with the title Shadow Tree Shaft. He was at one time prompter at the Olympic under the management of Charles Mathews. He wrote a farce entitled A Cantab, which was played at the Strand Theatre in 1861. This brought him a reputation in a Bohemian clique, but so little practical assistance that he thought of abandoning the profession to become a tobacconist. Then, in 1864, came his first marked success, David Garrick, produced at the Haymarket with Edward Sothern in the principal character. It was not, however, till the production of Society at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilton, afterwards Mrs Bancroft, that the originality and cleverness of the dramatist were fully recognized. Play-writer and company were exactly suited one to another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing. Although some critics sneered at the "cup-and-saucer comedy," it voted absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Court Road. The play was soon inundated with imitations of the new style of acting and the new kind of play. Robertson, although his health was already undermined, rapidly followed up Society with a series of characteristic plays which made the reputation of himself, the company and the theatre. All his best-known plays (except David Garrick) were written for the old Prince of Wales's under the Bancrofts, and that régime is now an historical incident in the progress of the English stage. Ours was produced in 1866, Cast in 1867, Play in 1868, School in 1869, M.F. in 1870. Unhappily, Robertson enjoyed his success for but a short time. He died in London on the 3rd of February 1874. His early stagecraft, wholesome and generous humour, bright and unstrained dialogue, and high dramatic sense of human character in its theatrical aspects.

See Principal Dramatic Works of Robertson; with Memoir by his son (1889); and T. E. Pemberton, Life and Writings of Robertson (1893).

Robertson, William (1721-1793), Scottish historian, born at Borthwick, Mid Lothian, on the 19th of September 1721, was the eldest son of the Rev. William Robertson. He was educated at the school of Dalkeith and the university of Edinburgh. He was from the first intended for the ministry; in 1743 he was presented to the living of Gladamuir in East Lothian, and two years later he lost both his father and his mother, who died within a few hours of each other. The support and education of a younger brother and six sisters then devolved upon him, though at that time his income was less than £100 a year. Robertson's inclination for study was never allowed to interfere with his duties as a parish minister, and his power as a preacher had made him a local celebrity while still a young man.

His energy and decision of character were brought out vividly by the rebellion of 1745. When Edinburgh seemed in danger of falling into the hands of the rebels he joined the volunteers in the capital. When the city was surrendered he was one of the number who had not been engaged in the service of the rebel army and was allowed to pass safely to London. He had an opportunity of seeing the troops under the command of the rebels, and it fell to his lot to act as an intermediary between the commander of the royal forces and the leaders of the rebels. Such a man could not remain in obscurity, and in 1746 he was elected a member of the General Assembly, where his influence as leader of the "moderate" party was for many years nearly supreme, (see Presbyteryism).

During all this period of prominent activity in the public life of Edinburgh, Robertson was busy with his historical labours. His History of Scotland, begun in 1753, was published in 1759. Till he had finished his book Robertson had never left his native country; but the publication of his history necessitated a journey to London, and he passed the early months of the year 1758 partly in the capital and partly in leisurely rambles in the counties of England. The success of the History of Scotland was immediate, and within a month a second edition was called for. Before the end of the author's life the book had reached its fourteenth edition; and it soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling Castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the university of Edinburgh. In May 1763 he was elected Moderator of the General Assembly, and in August of the same year the office of the king's historiographer was revived in his favour with a salary of £200 a year.

The rest of Robertson's life was uneventful. His History of
the Reign of the Emperor Charles the Fifth occupied ten consecutive years of labour. It appeared in three volumes quarto in 1769. In 1777 he published his History of America and in 1791 his Disquisition concerning the Knowledge which the Ancients had of India, which concluded his historical labours and appeared only two years before his death, which occurred near Edinburgh on the 11th of June 1793. His fame had long been European, and he left no rival in the field of Historical composition save Gibbon alone.

For an adequate appreciation of Robertson's position in British literature, and more especially of his rank as an historian, we have to consider the country and the age in which he was born and his own personal qualities and limits. Considering the small size and poverty of the country, Scotland had made a more remarkable figure in literature in the great age of the Reformation and the Renaissance, and Scottish contributions to British literature in the last half of the 18th century were distinctly superior to those produced in the southern portion of the island.

Of the three great British historians of the 18th century two were Scotsmen. The exact place of Robertson with regard to his two friends Hume and Gibbon, and to such historians as the rest of Europe had to offer, presents a question of some nicety, because it is complicated by extraneous considerations, so to speak, which should not weigh in an abstract estimate, but cannot be ignored in a complete and practical one. If regarded only Robertson's potential historic power, the question is not so much whether he was equal to either of his two friends as whether he was not superior to both. He who wrote the review of the state of Europe prefixed to the History of Charles V., or even the first book of the History of Scotland, showed that he had a wider and more synthetic conception of history than either the author of the Decline and Fall or the author of the History of England. These two portions of Robertson's work, with all their shortcomings in the eye of modern criticism, have a distinctive value which time cannot take away. He was one of the first to see the importance of general ideas in history. He saw that the immediate narrative of events with which he was occupied needed a background of broad and connected generalizations, referring to the social state of which the detailed history formed a part. But he did more than this. In the appendix to the view of Europe called "Proofs and Illustrations" he enters into the difficult and obscure question of land tenure in Frankish times, and of the origin of the feudal system, with a sagacity and knowledge which distinctly advanced the comprehension of this period beyond the point at which it had been left by Du Bos, Montesquieu and Mably. He was well acquainted with the original documents,—many of them, we are told, from the conjecture, not easy to procure in France. It must have been a genuine aptitude for historical research of a scientific kind which led Robertson to undertake the labour of these austere disquisitions of which there were not many in his day who saw the importance. Gibbon, so superior to him for wide reading and scholarship, has pointedly avoided them. Robertson's views are now out of date. But he deserves the honor of a pioneer in one of the most obscure if also important lines of inquiry connected with European history. On the other hand, it must be admitted that he showed himself only too tame a follower of Voltaire in his general appreciation of the middle ages, which he regarded with the mingled ignorance and prejudice common in the 18th century. In this particular he was not at all in advance of his age.

The neglect and gradual oblivion which have overtaken the greater part of Robertson's historical work are owing to no fault of his. He had not and could not have the requisite materials: they were not published or accessible. Justice requires that we should estimate his performance in view of the means at his command, and few critics would hesitate to subscribe to the verdict of Buckle, "that what he effected with his materials was wonderful." His style is singularly clear, harmonious and persuasive. The most serious reproach prophase made against it is that it is correct to a fault and lacks idiomatic vigour, and the charge is not without foundation. But there can be no doubt that, if Robertson's writings are less read than they formerly were, the fact is to be attributed to no defects of style but to the growth of knowledge and to the immense expansion of historical research which has inevitably superseded his initiatory and meritorious labours.

By his wife, Mary Nisbet, whom he married in 1751, Robertson left three sons: William (1753-1839), who in 1805 was raised to the Scottish bench as Lord Robertson; James, who became a general in the British army; and David, who in 1799 married Margaret, sister of Colonel Donald Macdonald and heiress of Kinloch-Moidart, whose surname he assumed.

There are lives of Robertson by Dugald Stewart (Edinburgh, 1809), written by the editor of the third edition of his works; by George Gleig, bishop of Brechin (Edinburgh, 1812); and by Lord Brougham in Lives of Men of Letters, &c. (1845-1846).

ROBERTSON, WILLIAM BRUCE (1820–1886), Scottish divine, was born at Greenhill, St Ninians, Stirlingshire, on the 24th of May 1820, and was educated at Glasgow University and at the Secession Theological Hall, Edinburgh, where he made the acquaintance of Thomas de Quincey, and on his recommendation went to Halle and studied under Thielack. After travelling in Italy and Switzerland he was licensed to preach by the presbytery of Stirling and Falkirk in 1843, and was soon thereafter at the Secession (after 1847, the United Presbyterian) Church in Irvine, Ayrshire. In this charge he remained for 35 years, exercising from his pulpit a truly magnetic influence, not so discernible in his published sermons. From 1871 his health failed, in spite of several visits to Florence and the Riviera. He resigned his charge in 1878 and died at Bridge of Allan on the 27th of June 1886.

He wrote many hymns, among them a version of "Dies Irae"; some of them, together with his sermons, &c., are to be found in the Life by James Brown. A volume containing Robertson's Lectures on Martin Luther and other subjects was published in 1892.

ROBERVAL, GILLES PERSONNE (or PERSONIER) DE (1602–1675), French mathematician, was born at Roberval, near Beauvais, on the 5th of August 1602. His name was originally Gilles Personne, that of Roberval, by which he is known, being taken from the place of his birth. Like René Descartes, he was present at the siege of La Rochelle in 1627. In the same year he went to Paris, where he was appointed to the chair of philosophy in the Gervais College in 1631, and two years later to the chair of mathematics in the Royal College of France. A condition of tenure attached to this chair was that the holder should propose mathematical questions for solution, and should resign in favour of any person who solved them better than himself; but, notwithstanding this, Roberval was able to keep the chair till his death, which occurred at Paris on the 27th of October 1675.

Roberval was one of those mathematicians who, just before the invention of the infinitesimal calculus, occupied their attention with problems which are only soluble, or can be most easily solved, by some method involving limits or infinitesimals, and in the solution of which accordingly the calculus is always now employed. Thus he devoted some attention to the quadrature of surfaces and the cubature of solids, which he accomplished, in some of the simpler cases, by an original method which he called the "Method of indiscernible parts," but he left this to the last of his state he had kept his method for his own use, while Bonaventura Cavalieri published a similar method which he himself had invented. Another of Roberval's discoveries was a very general method of drawing tangents, by means of which he could find the curvatures of given curves, and thence find the resultant of several simpler motions. (See INFINITESIMAL CALCULUS.) He also discovered a method of deriving one curve from another, by means of which finite areas can be obtained from the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Evangelista Torricelli gave the name of Robervallian lines. Roberval was also the first to observe and to have others observe, owing to the jealousy aroused in the mind of the former by the criticism which Descartes offered to some of the methods employed by him and by Pierre de Fermat; and this led him to criticize and examine the conclusions which, in the method of indivisibles, he had entered into geometry about this time. As results of Roberval's labours outside the department of pure mathematics may be noted a work on the system of the universe, in which he supports the Copernican system and attributes a mutual attraction to all particles of matter.
ROBES

and also the invention of a special kind of balance which goes by
his name.

His works were published in 1693 by the Abbé Gallot, in the
Recueil des Mémhes de l'Académie des Sciences.

J. E. Montucla, Histoire des mathématiques (1802).

ROBES (Fr. robe, Late Lat. roba, raupa, meaning (1) spoils,
(2) robe, stuff, cf. Mod. Ital. roba, connected with a Teutonic
root raupa, raub, German rauben and English rob), the name
generally given to a class of official costume, especially as worn
by certain persons or classes on occasions of particular solemnity.
According to Du Cange, the word robe was earliest used, in
the sense of a garment, of those given by popes and princes
to the members of their household or their great officers.
Thus Matthew Paris (Chron. Majora, Rolls Series, V. 38) tells
how, in 1248, the pope gave to some Tatar envoys "vestes
pretiosissimae quas Robin vulgariter appellamus, de scarletu
præelecto, cum pedibus et furfuris," with which Du Cange
compares the "festiva indumenta" given, e.g., by King John
magnatum suorum multitudini at Christmas time (1214, Matt.
Paris, Rolls Series, II. 520) and the raubae paphæ scutiferorum,
and the like, given by the popes to members of their households,
after the fashion of a livery. It would, however, be perhaps
going too far to assume that, e.g., peers' robes were originally
the king's livery, for there seems to be no proof that this was
the case; but it is curious that in most early cases where robes
are mentioned, if not of cloth of gold, &c., they are of scarlet,
furred. A robe is properly a long garment, and the term
"robes" is now applied only in those cases where a long garment
forms part of the official costume, though in ordinary usage
it is taken to include all the other articles of dress proper to
the costume in question. The term "robes," moreover,
connotes a certain degree of dignity or honour in the wearer.
We speak of the king's robes of state, of peers' robes, of the
robes of the clergy, of academic robes, judicial robes, municipal
or civic robes; we should not speak of the robes of a cathedral
verger, though he too wears a long gown of ceremony, and it
is even only by somewhat stretching the term "robes" that
we can include under it the ordinary academic dress of the
universities. In the case of the official costume of the clergy,
too, a distinction must be drawn. The vestimenta sacra are not
spoken of as "robes," a priest is not "robed" but "vested"
for Mass; yet the rochet and chimere of an English bishop,
even in church, are more properly referred to as robes than as
vestments, and while the cope he wears in church is a vestment
rather than a robe, the scarlet cope which is part of his parlia-
mentary full dress is a robe, not a vestment. For the sake of
convenience the official, non-liturgical costume of the clergy
is dealt with under the general heading VESTMENTS and the
subsidiary articles (e.g. COPE).

The coronation robes of emperors and kings, representing as
they do the sacerdotal significance of Christian kingship, are
essentially vestments rather than robes (see CORONATION).
Apart from these, however, are the royal robes of state; in
the case of the king of England a crimson velvet surcoat and
long mantle, fastened in front of the neck, ermine lined, with a
deep cape or tippet of ermine.1

The subject of official robes is too vast for any attempt
to be made to deal with it comprehensively here. All countries,
East and West, which boast an ancient civilization have re-
tained them in greater or less degree, and the tendency in
modern times has been to multiply rather than to diminish
their number. Even in republican France they survived the
Revolution, at least in the universities and the law courts.
But nowhere has custom been so conservative in this matter
as in the United Kingdom, where in this as in other matters
the wise Machiavellian principle has been followed of changing
the substance of institutions without altering their outward
semblance. The present article, then, does not attempt to
deal with any but British robes,2 under the headings of
(1) peers' robes, (2) robes in the House of Commons, (3) robes
of the Orders of Knighthood, (4) judicial and forensic robes,
(5) municipal and civic robes, (6) academic costume.

Peers' Robes.—As early as the end of the 14th century peers
seem to have worn at their creation some kind of robe of honour;
this we may conclude from the description of the investiture
of the earl of Somerset in 1397 (Rot. Parl. iii. 343), which
says: "Le dit Monsieur John fut amené devant le Roy en Parle-
ment entre deux Cortes, c'est assauer Huynytongdon et Mares-
chall, vestuz en un pane (Du Cange; panum = 3. habitus vesti-
mentum) come vesture de honor "; while in accounts of various
creations of about the same time (Rot. Parl. iii. 205, 206) we
are told the words " advenienteque ... prefato Duce honorifice
... togato et ornato." An early illustration of their use is to
be found in an illumination on the foundation charter of King's
College, Cambridge (see fig. 1), which represents the peers as

From the foundation charter of King's College, Cambridge, 1446.

Fig. 1.—Peers spiritual and temporal.

early as 1446 wearing gowns, mantles and hoods of scarlet,
furred with miniver, the mantle opening on the right shoulder
and guarded with two, three or four bars of miniver, in the
form of short stripes high up on the shoulder. The origin of
these is as yet unknown, and it is not certain precisely when
the peers' velvet robe of estate was first used. At the coron-
ation of Henry VI. the king's own parliament robe was of scarlet
and miniver (Gregory's Chronicle, ed. Gairdner, Camden Soc.
pp. 165-70), so the peers' robes were certainly not yet of velvet;
at that of Henry VII. (see Rutland Papers, 1842; " Device
for the Coronation of Henry VII.") the king had a robe of
crimson velvet and ermine, but the "lords temporall" are
only said to have been "in their robes"; at that of Henry VIII.
(see Hall's Chronicle) the king in his progress through the city
wore a crimson velvet robe furred with ermine, "his knights
and esquires for his body" wore crimson velvet, and "all the
gentlemen," &c., scarlet, while we hear of the "lords spiritual
and temporal, and of their costly and rich apparel, of several
devises and fashions," and notably of the duke of Bucking-
ham's robe of gold and needlework (Stow's Annals, p. 813),
which would show that the velvet robe of estate was not yet
worn at the king's coronation. The duke of Richmond at his
creation in 1525 (17 Henry VIII., see Brewer, State Papers,
iv. 639) is described as clad in robes of estate, and the descrip-
tion of the investiture says that "the patent was read, the robe,
sword, cap and circlet put on," and about this time references
are found to the "parliament robes" of peers, implying that
there were others.

An account of the coronation of Anne Boleyn in 1533, in
J. Nichols, Progresses of Queen Elizabeth, vol. i. p. 1, says
that in her progress through the city "all the lordes for the
most part were clothed in crimson velvet," while at

1 For the sovereign's coronation robes, see "The King's Coronation
Ornaments," by W. S John Hope, in The Ancester, vols. i. and ii.,
also L. Wickham Legg, English Coronation Records, 1901. The
"parliamentary robes" used to be of crimson or purple velvet,
furred with ermine. See the above, also the inventories of the
wardrobes of sovereigns, &c.

2 In the United States few save Federal judges wear robes. The
scarlet judicial robes were discarded at the Revolution. Those of
black silk now worn are slightly modified academic gowns. John
Jay, first Chief Justice of the Supreme Court (1787), set the fashion
by sitting in the LL.D. gown granted him by Columbia University.
THE CORONATION ROBES
As worn by His Late Majesty King Edward VII.

The Most Ancient Order of the Thistle.

The Most Illustrious Order of St. Patrick.

The Most Noble Order of the Garter.

The Most Honorable Order of the Bath.

Baron in Coronation Robes.

Baron in Parliament Robes.
Westminster the barons and viscounts wore their parliament robes,1 the earls, marquesses and dukes wearing their robes of estate of crimson velvet "furred with ermins, poudred according to their degrees." This was also the case at the coronation of James I., and in Selden's Titles of Honour (3rd ed., 1672) the illustrations show the baron and viscount in parliamentary robes, the higher ranks in robes of estate. By the time of James II.'s coronation, however, the baron and viscount had the velvet robes of estate (see illustration on p. 188 of Perkins's The Coronation Book, 1902, where the surcoat also appears to have a pointed ruffle edged with white and to be sleeveless). The colour of these seems to have been crimson at first, sometimes varying to purple. They consisted of a long gown or surcoat with girdle, a mantle lined with ermine, a hood and a tippet of ermine, the rows being as follows: for a duke 4, a marquess 3, an earl 3, a viscount 2, and a baron 2.

Till late in the 18th century peers continued to attend the House of Lords in parliamentary robes, with the stars and ribbons of their orders, but robes are now only worn in the House of Lords, e.g. at the opening of parliament, on occasions when the sovereign gives his assent to bills by "royal commission." Persons on ceremonial duties appear in crimson robes, and the lord chancellor also wears his peer's robe of scarlet ermine, and at the introduction of a newly created peer, when the new peer and his two introducers wear their parliamentary robes (over morning dress) during the ceremony of introduction only. The mover and seconder of the Address no longer wear robes, but uniform. On all the above occasions, and when the peers as a body attend church or some other ceremony, the parliamentary robe of scarlet cloth is worn; in the present day it takes the form of a mantle opening on the right shoulder, with a collar of "ermine," and guarded with rows of ermine and gold lace, the right shoulder only according to the rank of the wearer. The modern coronation robes consist of a crimson velvet surcoat and a mantle with a tippet of ermine and rows of ermine as in the parliamentary robes. The surcoat is no longer a gown, but a short sleeveless garment.

For Scotland, an order of James II. (1455) prescribed for earls "mantles of brown granicle colour" open before, lined and faced in front, as far as the girdle, with white fur, and with hoods to match; for the other lords of parliament a red mantle lined with silk or fur, with a furred hood, while James I. (and VI.) in 1606 had to issue an order restraining the Scotch peers from wearing velvet crimson gowns, and confining them to those of scarlet cloth (Miscellany of the Mainland Club, vol. i. p. 147). The robes of the Scottish peers are now, of course, similar to those of the others.

The peersesses' robes at the coronation of Anne Boleyn are also described. The duchess of York, as is mentioned in the "described" train-bearer, was followed by "ladies being lords' wives" in scarlet robes furred with "lettice," while Wriothesley (loc. cit.) adds that the duchess was also in scarlet. The order of the earl-marshals for the decoration of the peersesses' robes at the coronation of James II. (given in J. H. T. Perkins's The Coronation Book, 1902, pp. 202-5) shows that by then all peersesses wore the robes of state of crimson velvet, and minutely regulates all details, such as shape, powderings, length of train and width of the fur edging to the mantle. They have changed very little up to the present day.

**Robes of the Orders of Knighthood.**—The history of the robes of the two oldest orders is given in great detail in Ashmole's Order of the Garter (London, 1672) and Anstis's Order of the Bath (London, 1725); see also G. F. Belz, Memorials of the Order of the Garter (London, 1841), p. 1-111. In each case the robes consisted of a mantle, surcoat and hood. The robes of the Garter were originally of blue woollen stuff, the surcoat and hood being powdered with garters embroidered in silk and gold. In the time of Henry VI. the mantle was first made of velvet, and between the time of Elizabeth and of Charles I. it seems to have been sometimes purple in colour. The surcoat varied in colour from year to year; in the reign of the founder alone, e.g., it was first blue, then black (possibly as a sign of mourning for the plague), then "sanguine in grain." The hood was made of the same material as the surcoat, and when hats began to be worn, was carried hanging over the shoulder. The number of garters embroidered on the surcoat and hood came to be fixed by rank, but after Henry VI. the surcoat seems to have been made of plain velvet. Robes were sometimes granted to ladies in the early days (see Belz, p. cccxxi., for a list of those ladies), in which case the robe and hood were of the colour of the surcoat worn by the knights that year, and powdered with garters. The last lady to receive the robes was Margaret, countess of Richmond, in 1488. At the present day the mantle is of dark blue velvet, of the same colour as the ribbon, lined with this taffeta, and with the star embroidered on the left shoulder. The coronation robe consists of a crimson velvet mantle lined with white taffeta, and with these are worn a doublet and trunk-hose of white satin and a plumed hat (see Lawrence-Archer, The Orders of Chivalry, p. 106).

The robes worn by the knights of the Bath created at the coronation of Henry IV. were green with furred hoods, and a white silk cord hanging from the left shoulder.3 In the various accounts of later creations of knights of the Bath quoted by Anstis, the costume worn before the ceremonial bath seems to have been a priest-like garment of russet or grey, with a girdle and hood; after the bath, was put on a red surcoat and mantle, the latter with a lace of white silk, from which hung a pair of white gloves; and the final costume was a blue (later a purple) velvet or satin gown, with hood furred with miniver (later lined with saranecet), and the white cord hanging from the shoulder, until it should be removed by the sovereign or a lady for some deed of valour. The mantle in the present day is of crimson velvet lined with white over a white satin under-coat and trunk-hose, and a plumed hat and white boots with red tops are worn. The mantle of the Thistle is of dark green velvet over surcoat, &c., of cloth of silver; that of St Patrick azure, with doublet and trunk-hose of white satin; that of St George of scarlet and of white satin lined with scarlet; and that of the Star of India of light blue satin lined with white.

**House of Commons.**—The speaker of the House of Commons wears on state occasions a black damask robe with gold lace and a full-bottomed wig; in the House itself he wears a black silk robe with train and a full-bottomed wig. The clerks at the table wear barristers' gowns and wigs.

**Judicial and Forensic Robes.**—It is frequently stated that judicial robes had their origin in the dress of ecclesiastics. But though ecclesiastics in early days frequently acted as judges, and though, as has been shown, serjeants-at-law "ad instar barberdolts," judicial robes have probably arose from the ordinary civilian dress of the early 14th century. The chief argument for the ecclesiastical origin has been found in the coil (lena, birretum album), a cap of white linen or silk, tied under the chin, and described by Fortescue as "the principal or chief insignia and habit wherewith serjeants-at-law at their creation are decked," which is said to have been used by ecclesiastics to hide the tonsure when in court. This view is disposed of by Pulling (The Order of the Coif, London, 1884). More probably the coif was a head-dress in common use in the 13th century, which survived as the distinguishing mark of men of law.4 As such it is found in a wardrobe-roll of

---

1 These are well described in the account of the opening of parliament by Henry VIII. in 1537 given in Wriothesley's Chronicle of England (2nd ed., 1577, ed. W. C. de la Beche) "all gartered and lordes, all in their Parliament robes of scarlet furred with white, and their hoods about their neckes, which were forty in number; everie duke having lower barres of white furr longest in the right side of their robes, and evene more barres of white furr for everie earle, and everie lord two barres in likewise." 

2 After her followed ladies being lordes' wives, which had cinctures and narrow scarves about their neckes, and behind them, at the right side, barres of pouders according to their degrees, and over that they had mantles of scarlet furred, and every mantle had lettice about the necke like a neckerchief, likewise poudred, so that the paultries of the yeares might be known. Then followed ladies knights' wives in gowmes of scarlet."
ROBES

Richard II. (1391, see Fairholt, ii. 341) in an entry for "twenty-one linen coifs for counterfeiting men of the law in the king's play at Christmas." The serjeant-at-law's "houfe of silk" is also mentioned in Piers the Plowman (latter half of the 14th century) together with his fur-furred cloak. Chaucer, at the same period, describes his serjeant-at-law as wearing a parti-coloured gown and girdle with bars.1

The earliest document quoted by Planche and others with reference to judges' costume is a Close-roll of 20 Edw. III. (1347). See also a wardrobe-roll of 21 Edw. III., and wardrobe accounts of ii Richard II. and iii Henry VI., quoted in Dukinfield, Juridicidotes, from which we gather that the robes of the judges varied in colour, in the 14th and 15th centuries, from scarlet to green or "violet in grain," and that their winter gowns were found with budge or miniver.

For the early 15th century there are more data. Firstly, there is the illumination of the serjeant-at-law in the Ellesmere MS. of The Canterbury Tales (reproduced in Furnivall's 6-text edition for the Chaucer Society), in which he is shown wearing a short, party-coloured rayed gown of red and blue, with white fur, a hood and tipped edges with white fur, and a white coif with two little bands showing below the hood. Secondly, there is a certain number of effigies or brasses of judges in serjeant's robes belonging to the first half of the 15th century. Of judges, an early brass is that of Sir John Cassel (1390) (see fig. 21).

For the second half of the 15th century the authority is Chaucer-Fortescue, who, writing in the reign of Henry VI., describes the dress of the serjeant-at-law as follows: "Roh a longa ad instar sacerdotium cum capicio penaltato circa humeros ejus, et desuper collo librum, cum duobus labellis, qualiter ut solent doctores legum in universitatis quibusdam, cum supra descripsit birreto vestibatur." He was clothed in a long robe, above the fashion of a priest, with a furred cape about his shoulders, and above it a hood, with two bands, such as are used by doctors of laws in some universities, with the coif as described above. (Dr. Laud's MSs Anglo-Cap. ii.) Fortescue continues: "But being once made a justice, instead of his hood, he shall wear a cloak closed upon his right shoulder, all the rest of the other parts remaining; saving that a justice shall wear no party-coloured vesture, as a serjeant may, and his cape is furred with miniver, whereas a justice's coif is of sable or white."

Fortescue's description is borne out by some illuminations from a 15th-century MS. representing the sitting of the four superior courts of the 13th and 14th century, showing the coif worn by both clerks and laymen.

1 Prol. line 210 (ed. Skeat, Clarendon Press): "Jit housè there an hondredt in houfes of silke, seriuntia it seemt that serveden atte barre"; and iii. 293: "Sahl no seraunt for here seryse were a silke housè, Ne no pule in his cloke, for plediing atte barre." 2 Prol. line 382 (ed. Morris, Clarendon Press): "He rood but homely in a mellee cote Girt with a ceint of silke, with barrces smale, of his arraynell telle I no longer tale." The effigy "supposed to represent Sir Richard de Willoughby, chief justice of the king's bench," is in Edward III., illustrated by Fairholt, p. 201, wears a long gown with girdle and skull-cap, no distinctively judicial dress. The figure of Robert Grymbald (temp. Henry II), engraved from his seal by Dugdale, wears the ordinary dress of the time.

4 See also that of Sir Hugh de Holes (1415; see Haines, Brasies, i. 26), and a stone effigy of Sir William Gascogne in Harwood Church, Yorks (c. 1419), seen by Planche, Cyclopaedia, ii. 421. Of serjeants-at-law, an early example is the brass of Nich. Rolle at Chelmorton (c. 1410, see Druitt, Costume in Brasses, p. 221); also that of Thomas Rolle at Gofsdale, Essex (c. 1440, see Haines, p. 85), who wears a gown, tabard, and cap, with hood below the hood, like the Ellesmere MS. figure. The inscription calls Rolle "legi professus," which Haines takes to mean "professor of law." Botkol and Clark (Archaeological Journal, vol. i, pp. 205-4) consider that he is a figure of poetical invention, and point out the likeness of his tabard to that of a Master of Arts, but compares a figure on a 15th-century cope, who also appears to be a serjeant-at-law and wears a tabard. That a tabard sometimes formed part of the dress of a serjeant, can be seen in the extract from the Liber famelicus of Sir James Whitecocke, quoted by Druitt, p. 225, footnote.

5 They were probably originally liveries; see G. R. Corner in Archaeologia, also Pulling, op. cit. pp. 211-12. 6 See an essay by Sir Herbert Stephen in Unwritten Laws and Idols, ed. E. H. Pitcairn (Smith, Elder, 1890), from which the following paragraph is largely condensed.

From a brass in Deenbury church, Gloucestershire.

Fig. 2.—Sir John Casey, chief baron of the Exchequer (c. 1400).

Robes of judges in the 14th and 15th centuries. The party-coloured coif and skull-cap are worn by the judge sitting at left.

The party-coloured coif and skull-cap are worn by judges in the 15th and 16th centuries. The judge sitting at left is wearing a party-coloured coif and skull-cap; the judge sitting at right is wearing a black and white skull-cap.
One of four illuminations belonging to a law treatise, temp. Henry VI, found at Whaddon Hall, Bucks, depicting five presiding judges of the Court of King's Bench, wearing coifs and scarlet robes; below the King's Coroner, Attorney and Masters of the Court; two ushers at table swearing the jury; a tipstaff in charge of a fettered prisoner, two sergeants at law in coif on either side; in foreground six prisoners.

From Archaeologia XXXIX.
dress worn when trying criminal cases, attending church officially, and on "red letter days" in the courts, consists of a scarlet gown, with a broad black belt, a tippet trimmed with white fur, known by courtesy as "ermine" (this is worn only on state occasions), and a scarlet casting-hood, always worn with the scarlet gown, the end of which is passed under the belt. For summer the robes are of thinner stuff, faced with slate-coloured silk instead of ermine. The full-bottomed wig is worn on state occasions; at other times a wig is worn similar to that of barristers, except that it has one vertical curl just above the tail of the wig instead of the three rows of horizontal curls going all the way around.

The judges of the King's Bench Division have also a black gown, trimmed with ermine, which may be worn with the scarlet casting-hood when they sit two or more together. The summer equivalent of the black robes is in thin blue stuff, faced with silk. A costume like that of King's Counsel, namely, a black silk gown, with black cloth court suit, is the dress of judges when sitting alone to try civil actions, and of vice-chancellors and judges of the Chancery Division, but Sir Herbert Stephen remarks that of late years certain of the judges have preferred on grounds of comfort the black or blue gown with scarlet casting-hood. The court dress of the judges of the High Court and of Indian and colonial judges consists of a black damask tufted gown, without train, worn over a black velvet court suit, with full-bottomed wig, lace bands and three-cornered silk hat.1

The Lord Chancellor, when in the House of Lords, and sitting on Appeals, wears a black silk trained gown, over a black cloth court suit, with full-bottomed wig: he has also his peer's robe (see above), and his state robe of black damask, with gold lace, worn over a velvet court suit, with full-bottomed wig, lace bands, &c.; the purse is carried on state occasions when in the royal presence. The state robe of the Master of the Rolls, the Lords Justices of the Court of Appeal, and the President of the Probate, Divorce and Admiralty Divisions is the same, except that they have not the purse, and similar to it is the full-dress gown of the Speaker of the House of Commons, the Chancellor of the Exchequer, &c. The Lords Justices of the Court of Appeal sit in court in a costume similar to that of King's Counsel.

The Lords of Appeal have no official robes, but sit in ordinary gowns and white wigs. On state occasions they wear their peers' robes. The robes of state of the Lord Chief Justice of England are the same as those of the judges of the High Court, except that his are trained, and he wears the gold chain of office, the "collar of SS."

The Scottish judges have two sets of robes, one for Justiciary (i.e. the criminal court), which is also their full dress, and one for civil causes (Court of Session). The dress for the President and Ordinary Lords of Session was fixed in 1610 by an order of James I., and was of purple cloth, faced with crimson satin, with hood to match, the President's gown having crimson velvet instead of satin. The four Extraordinary Sessionaries were dressed in black damask, with gold lace, black velvet, or silk gowns, lined with black. The Lord Justice General wore a scarlet gown lined with ermine and an ermine hood, the Lord Justice Deputy and Lord Justice Clerk black gowns with crimson satin facings and hoods (see Register of the Privy Council of Scotland, vol. viii. p. 612). At the foundation of the High Court of Justiciary (1672) it was enacted "that for the splendour of that court, all the judges sit in red robes, faced with white, that of the Justice Generals being lined with ermine for distinction from the rest" (see Acts of Parliament of Scotland, vol. viii. p. 89). The present full dress of the Lord Justice General is a scarlet silk robe with tippet and hood, the hood falling down the back; the collar is of ermine, with which the tippet, sleeves and gown are edged and the hood lined. The Lord Justice Clerk wears a scarlet cloth robe and hood, and a white silk tippet lined with scarlet, the silk being perforated with small holes to imitate ermine, as also on the sleeves and edges of the gown. In front of the tippet on each side are two crosses in scarlet silk, and on each side of the gown six crosses. The ordinary Lords Commissioners of Justiciary have robes the same as those of the Lord Justice Clerk, except that the satin is not perforated. Instead of the bands worn by English judges, the Scottish judges wear a long fall in front.

The Bar.—There appears to have been no official costume for the bar until the end of the 17th century. Druitt (Costume in Brasses, pp. 232-33) gives a list of several brasses of in gege periti, or apprentici ad legem, most of which wear ordinary civilian costume, occasionally with the addition of a high cap. In the 16th and 17th centuries they wear the false-sleeved gown worn by civilians. Before the 17th century the costume worn by students at the Inns of Court and by "Utter Barristers" consisted of a stuff gown, and sometimes, in term-time, a round cap, which was worn in hall and in church (see Herbert, History of the Inns of Court (1804), p. 230). In Westminster Hall (see Pulling, p. 223) the same costume was worn, Benchers and Readers having a more elaborate gown with facings of black velvet and tufts of silk. Frequent laws were passed in the 17th century and later, forbidding the wearing of swords, cloaks, boots and spurs, &c., in hall, and insisting on the wearing of gowns by students of the Inns of Court when walking in the city. In the 17th century, barristers, like the judges, adopted wigs, the full-bottomed wigs being confined to judges, "King's Counsellors," &c., and ordinary counsellors wearing small wigs.

In Hollar's engraving of the coronation of Charles II. the King's Counsel, the King's Attorney and Solicitor, and the Master of the Rolls wear a laced gown with hanging sleeves. The silk gown, full-bottomed wig and black cloth dress now worn by King's Counsel is generally held to date from the funeral of Queen Mary II., being the mourning dress worn by the wish of King William for a considerable period after the queen's death, and adopted as a convenient costume ever since. There is a well-known jest of Chief Baron Pollock to the effect that "the Bar went into mourning at the death of Queen Anne, and never came out again," which bears out this theory as to the origin of this costume. At the same time barristers wore black stuff gowns, with small wigs having three rows of curls round the head. King's Counsel wear black silk gowns over a cloth court suit (cp. the expression "to take silk," i.e. to become a K.C.); on full-dress occasions they wear a full-bottomed wig, and at court a black damask tufted gown over a velvet court suit. This is also the dress for state occasions of the Attorney-General, Solicitor-General, &c.

Municipal and Civic Robes.—The word "livery," the use of which is now practically confined to the costume of the "livery companies," the dress of men-servants, &c., originally meant an allowance of food or clothing granted to certain persons (Lat. liberala, Fr. lierge). It is still used of the allowances of food made to the fellows of certain colleges. As early as the 13th century, according to Matt. Paris (Chron. Maj.; Rolls Series, III. 337), we find the citizens of London assuming a uniform dress to do honour to some great occasion, as, e.g., when in 1236 a body of them rode out to meet Henry III. and Queen Eleanor, "serics vestimentos ornati, cicidibus auro textis circumdati, excogitatis mutatorius amicit," or when 600 citizens rode out to meet Queen Margaret, wife of Edward I., "in one livery of red and white, with the cognizances of their misteries embroidered upon their sleeves" (see Stow's Survey, ed. 1744, p. 144). It is evident, however, that the first instance of the adoption of liveries by the trades and fraternities. At the celebrations of the birth of Edward III. (see Riley's Memorials, p. 105) the mayor and aldermen were "richly arrayed in suits of robes," while the drapers, mercers and vintners were also "in costume." This need not, however, refer to liveries. G. Unwin (The Gilds of London, 1908) quotes a chronicler who records that by the year 1310 "many of the people

---

1 Minute details of court and levée dress, judicial and legal, will be found in Dress worn at Court (pp. 66-61). Issued with the authority of the Lord Chamberlain, and ed. H. A. P. Treadell, of the Lord Chamberlain's department (London, 1908),—also details of mourning costume.
of the trades of London were arrayed in livery, and an ordinance of 1347 of the fraternity of the Mercers commanding that "all those of the said mystery shall be clothed of one suit once a year at the feast of Easter," and Riley (op. cit. p. 116) quotes an order of 1389 allowing the sheriffs, on grounds of expense, to proceed to Westminster by boat instead of on horseback, "without there being any arraying of men of the trades in like suit for that purpose; except that such men of the trades as should wish to accompany them should walk in such suit of vestments of the livery of their respective trade as they might then have." As to the liveries of the religious fraternities, Chaucer (Proc. of the Soc. of Ant. vol. iii. p. 361) describes—

"An Haberdasher and a Carpenter
A Webbe, a Dyere, and a Tapicer,"
As, "cloathed alle in a livery
Of a solempe and greet fraternitee."

In 1389 there was a petition against the giving of liveries by the fraternities, on the ground that these gatherings were centres of political agitation, but in the statutes of Edward III. and Richard II. against liveries members of guilds were excepted from these prohibitions. However, it was doubtless deemed prudent to make sure of the privilege, and so, when the liveries were incorporated, they took care to have their liveries authorized by their charters.

These liveries consisted of a gown and hood, though the hood only was sometimes given; thus the Grocers' Company had in 1430 55 members in the full livery, 17 in hoods and 42 not in livery. It was also customary for such of the companies as wished to present liveries to outsiders, for instance, to the mayor, should be belong to another company. Thus in 1399 the Tailors gave liveries to the king, the prince and the mayor, and hoods to the sheriffs. But in 1415 and 1423 the mayor and aldermen were forbidden to receive any livery except that of their own company. A similar custom was that by which a member of any company might send to the mayor a certain sum, receiving in return a suit of the livery of the mayor's company. The colours of the various liveries varied very much from time to time. Thus in 1414 the Grocers wore liveries of scarlet and green, which were changed in 1418 to scarlet and black, in 1428 to scarlet and blue and in 1450 to "violet in grain," with party-coloured hoods of violet and crimson. At first both gowns and hoods were party-coloured, but later a party-coloured hood was worn with a gown of one colour. The gowns were also lined and edged with fur. An early illustration of the liveries is to be found on the first charter of the Leathersellers' Company, granted them in 1444 by Henry VI., where the members of the company are depicted kneeling before the king in short party-coloured gowns of red and blue, edged at the neck, wrists and round the bottom with fur and with white girdles (see fig. 4, from a coloured reproduction in W. H. Black's History and Antiquities of the Leathersellers' Co.).

In the reign of Henry VIII., Holbein's picture of the king giving a charter to the Barber-Surgeons' Company shows the members of the latter wearing gowns of which black and black party-coloured hoods, three of the figures also in coats. The form of gown which has survived, practically unchanged, till the present day, may be seen on the second charter of the Leathersellers' Company, granted them by James I. in 1604 (see fig. 5, and for coloured plate see W. H. Black, op. cit.). Here we see them in flat caps, long black furred gowns, with false sleeves, and having on the right shoulder party-coloured hoods of scarlet and black, the end of which is cast over the left shoulder and hangs down nearly to the knee of the gown. As to the liveries of the city companies, and those of the mayor and sheriffs, there was often a special livery adopted by all the citizens on some great occasion, such as a visit of the sovereign to the city. W. St John Hope (Corporation Plate and Insignia, ii. 141) quotes a number of such liveries, showing that the city livery was sometimes green, sometimes blue, sometimes violet, sometimes red and white, the city colours par excellence.

As to the costume of the mayor, aldermen, sheriffs, &c., we have seen above the mayor "richly costumed," and the aldermen "in like suits of robes," at the birth of Henry VII. (loc. cit.) and Riley (op. cit.) gives an order of 1378, that the aldermen are to ride to Westminster in the mayor's coach, "arrayed in a cloak and hood at least, that are party-coloured with red, scarlet and white, the red on the right side;" while he quotes (from Letter-book H. fol. cxvi) the amusing observation of John Webbe, mayor of Eltham, to Sir Edward Soley, for disregarding the order to have his green cloak for the Whitsundite procession lined with green taffeta. Thus before the 15th century the aldermen apparently had not yet their scarlet robes, but on state occasions wore the ordinary city livery. For the early 15th century we have the Liber Albus (written c. 1419; Rolls Series, ed. Riley), where we are told (p. 35) that "The Mayor, Sheriff, Mayor and Aldermen wear livery ceremony, in like suits of robes twice in the year, viz. when the Mayor rode to Westminster to take the oath, and on the day following the feast of SS. Simon and Jude; and this raiment was trimmed with fur as befittting their noble rank; and altogether would be dressed in suits of robes against the feast of Pentecost, these robes having a lining of silk." The scarlet, violet and black robes, still worn by the Lord Mayor, aldermen, &c., were early in use. There is an order of 1417 (8 Henry V.) that the aldermen should use "togis et armillaesia de scarleto," and in numerous accounts of royal receptions and other solemn occasions in the City we are told that the mayor and aldermen were in scarlet (W. St John Hope, in Corporation Plate and Insignia, ii. 141). At first the liveries of provincial mayors, &c., is shown by St John Hope (loc. cit.) to have generally consisted of a scarlet furred gown and cloak, with tippet or scarf of black velvet. The colour was not, however, invariably scarlet, but varied to violet, blue and black, sometimes even for the mayor. An arm of the robes of the modern provincial mayors will be found in St John Hope, p. 11xxx seq., and under the accounts of the various boroughs, passim. Thus when the Lord Mayor first began to wear his robe of estate of crimson velvet, Stowe (see St John Hope, loc. cit.) to have generally consisted of a scarlet furred gown and cloak, with tippet or scarf of black velvet. The colour was not, however, invariably scarlet, but varied to violet, blue and black, sometimes even for the mayor. An arm of the robes of the modern provincial mayors will be found in St John Hope, p. 11xxx seq., and under the accounts of the various boroughs, passim.

Robes
Lord Chief Justice of England in full robes, scarlet and ermine, with collar of S. S.

The Lord High Chancellor of England, in robes of State.

Judge of the Supreme Court of the United States of America.

Lord Mayor of London, in full robes.

Judge of the High Court, England, in black robes.

Alderman of the City of London, in bench robes.

Robes lent by Edw. Son & Ravenscroft, Chancery Lane, London.
St. J. Hope, ii. 144, who quotes the order for these scarlet robes, from which it would appear that the mayor also wore black velvet.

About this period begin to occur notices of the wearing of official robes by the mayors of London. Aldermen and Sheriffs, for instance, have an entry in the corporation records in 1544: "Every alderman that hath not been mayor to prepare for himself and his wife gowns of crimson, and every one that hath been mayor to prepare for himself and his wife gowns of scarlet-furred velvet to be in memory of all principal feasts" (see 14th report, Hist. MSS. Commissions, App. VIII.).

St. John Hope (p. lxxxix) quotes numerous instances in the 16th century, in some of which the husband was liable to a heavy fine in the event of a woman wearing a gown of crimson velvet without the rule.

In 1568 (see Stow, and J. G. Nichols, Account of 55 Royal Processions and Exhibitions, pt. ii. p. 94) first appeared an "Order observed by the Lord Mayor, Aldermen and Sheriffs, for their meetings and wearing the apparel throughout the whole year according as formerly it hath been used," which has been altered and revised from time to time by order of the Corporation, and is still issued under the name of the Handbook of Ceremonials to the officers of the City Corporation. In 1568 we find the aldermen and sheriffs going to Westminster in the Lord Mayor's procession in scarlet-furred gowns "and their cloaks borne with them," and in 1575 Nichols quotes a London citizen's description of the same procession: "they of the livery in their long gowns, with hood on the left shoulder, half black and half red. . . . The Mayor in a long gown of scarlet, and on his left shoulder a hood of black velvet, and with his wife gowns of scarlet and tippets of velvet being listened to by the Aldermen having been mayors with chains of gold, the others with black velvet tippets." The Order of 1629 gives particulars of the various gowns, scarlet velvet for mayors and aldermen. The principal furred, for mayors and ex-mayors, with "amys," for aldermen with "calabre," and scarlet in summer, lined with "changeable taffety" and "green taffety" respectively.

At 1602 the costume of the Lord Mayor can be studied in successive "Orders" or Ceremonial Books, accounts of coronations, &c., and in portraits and statues belonging to the various city companies. Early in the 19th century (1806) the Lord Mayor began to wear on some state occasions a black robe with gold lace, similar to that of the Lord Chancellor. The Ceremonial Book was thoroughly revised in 1864, and the latest edition is that issued in 1906 (Handbook of Ceremonials, &c., "issued under the direction and with the approval of the Privileges Committee of the Court of Aldermen").

At the present day the Lord Mayor has several sets of robes; a special coronation robe (see illustration in Naylor, Book of the Coronation of George IV., 1837), a crimson velvet robe of state like that of an earl, worn with the chain and jell, e.g., in the presence of the sovereign when in the city;1 a black robe of state trimmed with gold, which is worn with the chain and jell, e.g., at the Guildhall on Lord Mayor's Day; the scarlet robes, which are worn, with or without the chain, on most public occasions, such as the service at St Paul's on the first day of the Easter Law Term, audiences of the sovereign, the coronation of the Queen. There is also the Lord Mayor's Robes, Criminal Court, &c.; a violet gown, which is worn, e.g., when the Lord Mayor elect is proposed to the king, when he is sworn in, at the election of sheriffs, &c., and a black gown worn in church on Good Friday, &c. The aldermen wear scarlet on most occasions of ceremony, ex-mayors "having the Cap of Dignity attached to their gown, and being entitled to introduce a sword and mace into their badges." Violet robes are also worn on certain occasions marked in the almanac of the Alderman's Pocket-Book; and black gowns when the Lord Mayor wears his. The sheriffs and recorders2 have scarlet, violet and black gowns, and the members of the common council have deep maroon blue gowns, which seem to have been first prescribed in 1761.

For Scotland an order of James I. and VI. of 1610 (see Register of Privy Council, loc. cit.) ordered that the provosts, aldermen, &c., of every borough should wear, for ordinary occasions, black-furred gowns, the officers of the chief boroughs having also scarlet-furred gowns for Sundays and other solemn occasions, when the provost of Edinburgh was to wear a gold chain.

Academic Costume.—No thorough study has so far been made of early English academic dress as compared with that of the continental universities—a study which ought to throw much light on the subject.3 A vexed question is that of how far academic dress is derived from the ecclesiastical. Anthony Wood's view, that it was derived from the tunica talaris and cucullus of the Benedictines, would not now meet with much support; but many writers seem to be unnecessarily anxious to trace each item of the academic robes to some definite ecclesiastical garment. The medieval scholar was of course a clerk, and had to wear the clerical gown and the tonsure. But the fact that this was the case makes it more difficult to distinguish lower Academy and ecclesiastical dress. Certain terms were adopted, such as the case of brasses and other ornaments of university graduates and dignitaries who were also priests. Another source of difficulty is the variety of names by which the different parts of the academic costume are called in the university statutes and elsewhere, resulting sometimes in inextricable confusion.

The earliest information as to English academic dress is found in the second half of the 14th century. Certain early statutes show that "excess in apparel" had already to be rebuked in scholars (cf. the Constitution of Archbishop Stratford, 1342), while the statutes of certain colleges require of the scholars the tonsure and a "decent habit" suitable to a clerk (cf. Statutes of Peterhouse, 1344, and of Merton Coli., Oxford), i.e. a long gown (toga or tunica talaris), which it is stipulated in some cases must be closed in front. Some colleges had liveryes, prescribed perhaps by the founder of the college and laid down by the statutes. The differences of colour and shape in the undergraduate gowns of most of the Cambridge colleges are supposed to be a survival of this. There was also an ordinance of Richard II. for King's Hall, Cambridge (1379), which fixed the dress of a scholar as the roba talaris, over which, if a bachelor, he should wear a tabard suited to his degree. The undergraduates seem in the early days to have worn a hood, the lower degrees, the toga or tunica talaris, and a "decent hood" suitable to a clerk to do so, until, however, below the rank of a bachelor might wear one.

It is proposed to give here (1) a list of the various parts of the academic dress, with a few remarks on each; (2) a short account of the early costume of the various degrees; (3) a sketch of any changes which have taken place since the Reformation.

The GOWN (toga, roba, or tunica talaris) was worn by all degrees, as befitting clerks. It is hard to determine whether there was at first any difference between the gown of the higher degrees, which in time was the "Master," and that of the lower degrees, the toga or tunica talaris, but it seems improbable. It was frequently fur-lined, but the use of the more costly furs was forbidden to all below the degree of Master, except sons of noblemen, or those possessing a certain income, bachelors using budge (see in Anstey's Munimenta Academica, p. 301, the Hope i. lxxvi-lxxxii. For mayor's and sheriff's caps see ibid. pp. lxix-lxxxiv.

1 Sir G. G. Young in a pamphlet called The Place of the Lord Mayor in proceeding through or within the City of London (1852), quotes various royal visits to the city which seem to show that the Lord Mayor wore his crimson velvet robe on these occasions. Thus in 1638 Charles I., on going to meet Marie de Medicis, was met by the Lord Mayor in scarlet, which was also worn at the entry of Charles II. in 1660. In 1702, when Queen Anne went to a tennis party at St James's Palace, the Lord Mayor wore crimson velvet, with the collar and jewel; but in 1705, at the thanksgiving after Blenheim, he met the queen on horseback, dressed in scarlet. In 1714, at the reception of George I., the Lord Mayor wore crimson velvet, rosy red.

2 The recorders had from an early date annual suits of robes like the mayor, aldermen, &c. See Liber Albus, p. 43: "Habet itaque Estowan couen, non erat tamen splendens, neque parum present, quos etiam Majorem et Aldermaniem cannuit ansamum." The chamberlain, common serjeant, &c., had also gowns (see an order of 1523 in St. J. Hope, ii. 146). For the sword-bearer's cap of maintenance see article Cap and St John

3 Practically the only detailed study of early English academic costumes is a paper on "English Academic Costume (Medieval)" by Dr E. C. Clark, in Archaeologia. Journal, vol. i. pp. 74 seq., 137 seq. and 183 seq., which contains a mass of information, and upon which the present article is to a great extent based. Rashdall (Universities of Europe in the Middle Ages, vol. ii. pt. i.) and Drutt (Ceremonial on Braseras, ch. ii.) each devote a chapter to the subject; Rashdall treats of both the English and continental universities, not very thoroughly, Drutt of English academic dress only, but thoroughly. Clark gives many facts about foreign, as well as the English, costume.
ROBES

statute of 1432 de admissione ad pallium). Students, and even doctors in theology (Mun. Acad. ii. 393), were also restricted to budge, and to sod-coloured habits. The robes of masters were to be flowing and reach to the ankles (see Mun. Acad. p. 212, an order of 1358 to the tailors not to stint the robes, which should be "largae et taliæ," because clerks should be distinguished from the laity).

The cope, worn as part of academic dress over the gown, probably originated in the ordinary cappa clerica, or everyday mantle of the clergy, which had been introduced into general use in England by synods of 1222, 1237 and 1268.\(^1\) This kind of cope, closed in front, and originally black in colour, is generally known as the cappa clausa, and sometimes, for 'convenience' sake, had a slit in front to allow of the passage of the hands. It was worn by Regent Masters when lecturing.

Survived to the present day at Cambridge as the dress worn by the Vice-Chancellor and by Regius Professors of Divinity, Law and Medicine when presenting for degrees. It is now open down the front, but the fur edging only reaches half-way down, marking the place where the slit used to be. At Oxford the so-called "cope" which is the Convocation robe of certain doctors is not a real cope, but is probably derived from the medieval tabard, the out-of-door dress worn by the clergy and others, having become customary by the beginning of the 16th century for Regent Masters to wear the tabard at lectures as more convenient than the cope (Rashdall, II. ii. 639, and Mun. Acad. p. 421, where the pallium is spoken of as an alternative to the cappa clausa. The pallium is most probably to be identified with the tabard).\(^2\) The cappa monastic mentioned in Anstey (Mun. Acad. p. 421, &c.) seems to have been a shorter garment. The cappa manica of the Church of Rome is a short-sleeved gown, and lined with fur, worn by masters and bachelors of arts (see Drutt, p. 134), and a shorter tabard is also occasionally found (Robinson's Taberdum ad medias libras). These are illustrated in fig. 6 from a MS. of the 15th century at New College, Oxford.\(^3\) The D.D.'s wear the cappa clausa, the other doctors tabards (see also pl. iii., xvi. in Archaeologia, where William of Wykeham and all the doctors wear long sweeping tabards, as ample as cope), the Warden a shorter tabard, reaching just below the knees, and the M.A.'s gowns or tabards with false sleeves.

The hood was originally worn by all scholars, as by everybody, and had evidently no academic importance. Sometimes a cap was also worn, the hood being thrown back (Chaucer's "clerk of Oxenford" in the Ellesmere MS. illumination wears a red skull-cap, and a furred tippet and hood, with the hood falling rather back, though not on his shoulders). The liripipe\(^4\) became somewhat elongated, as is seen in the hoods of the so-called M.A. group in the Chandler MS. An early mention of the undergraduate hood is the much-discussed Oxford Statute of 1489 (Mun. Acad. p. 360), which reads: "ut nullus de cetero scholaris non-graduatus (nobili sanguine insigniti &c. exceptis) capitio quovis utatur publice ... nisi lirippium consutum habeat et non contextum, prout antiquus Universitatis laudabilis consuetudo exposcit ..." but the undergraduate hood was worn in the commoner forms.

The hood as an academic dress was, however, gradually replaced by a scalp-cap (fig. 6), which is an article of undergraduate dress. The hood is still worn by Professors of Divinity, Law and Medicine, and in the Divinity School for the purpose of keeping the head warm. It was formerly worn by the Vice-Chancellor, and by Regius Professors of Divinity, Law and Medicine, when presenting for degrees.

The hood was worn over the cappa, or with it, as an alternative, and was more especially worn in the 19th century. It was worn by all scholars, as by everybody, and had evidently no academic importance. Sometimes a cap was also worn, the hood being thrown back (Chaucer's "clerk of Oxenford" in the Ellesmere MS. illumination wears a red skull-cap, and a furred tippet and hood, with the hood falling rather back, though not on his shoulders). The liripipe became somewhat elongated, as is seen in the hoods of the so-called M.A. group in the Chandler MS. An early mention of the undergraduate hood is the much-discussed Oxford Statute of 1489 (Mun. Acad. p. 360), which reads: "ut nullus de cetero scholaris non-graduatus (nobili sanguine insigniti &c. exceptis) capitio quovis utatur publice ... nisi lirippium consutum habeat et non contextum, prout antiquus Universitatis laudabilis consuetudo exposcit ..." but the undergraduate hood was worn in the commoner forms.

The hood as an academic dress was, however, gradually replaced by a scalp-cap (fig. 6), which is an article of undergraduate dress. The hood is still worn by Professors of Divinity, Law and Medicine, and in the Divinity School for the purpose of keeping the head warm. It was formerly worn by the Vice-Chancellor, and by Regius Professors of Divinity, Law and Medicine, when presenting for degrees.

\(^3\) The hood was worn over the cappa, or with it, as an alternative, and was more especially worn in the 19th century. It was worn by all scholars, as by everybody, and had evidently no academic importance. Sometimes a cap was also worn, the hood being thrown back (Chaucer's "clerk of Oxenford" in the Ellesmere MS. illumination wears a red skull-cap, and a furred tippet and hood, with the hood falling rather back, though not on his shoulders). The liripipe became somewhat elongated, as is seen in the hoods of the so-called M.A. group in the Chandler MS. An early mention of the undergraduate hood is the much-discussed Oxford Statute of 1489 (Mun. Acad. p. 360), which reads: "ut nullus de cetero scholaris non-graduatus (nobili sanguine insigniti &c. exceptis) capitio quovis utatur publice ... nisi lirippium consutum habeat et non contextum, prout antiquus Universitatis laudabilis consuetudo exposcit ..." but the undergraduate hood was worn in the commoner forms.

\(^4\) The hood as an academic dress was, however, gradually replaced by a scalp-cap (fig. 6), which is an article of undergraduate dress. The hood is still worn by Professors of Divinity, Law and Medicine, and in the Divinity School for the purpose of keeping the head warm. It was formerly worn by the Vice-Chancellor, and by Regius Professors of Divinity, Law and Medicine, when presenting for degrees.

hood had gone out of use by the end of the 16th century. 1
Bachelors’ hoods were to be lined throughout with fur (Mun.
Acad. p. 361), which we learn from the statutæ de admissione ad pelluram (1432) to have been budge. Masters and noblemen might use miniver, or silk in summer (Mun. Acad. pp. 283, 301).
There were evidently hoods of at least two kinds for masters, sometimes called respectively caputum and epomis, whether corresponding to the distinction between regents and non-regents as we do not know. (See Mun. Acad. p. 638, will of Thomas Bray, M.A., and Robinson loc. cit. In the Oxford Corpus Statutorum of 1768 the epomis is worn with the ordinary gown, the caputum with the scarlet habit.2) At a later date, at Cambridge, a distinction was made between the hoods of non-regents, which were lined with silk, and those of regents, which were lined with miniver.2 Later again the regents wore their hoods in such a way as to show the white lining, while the non-regents wore theirs’ squared,3 so that the white did not show. Hence the name “White Hoods” and “Black Hoods” given to the upper and lower houses of the old Senate respectively. It is not settled when the modern colourings of hoods arose; they may have followed those of the gowns of the faculties, but about the 17th century there is evidence that in the Oxford Proctor still wears a miniver hood. The modern Cambridge hood has preserved the original shape more closely than the Oxford one, being a hood and tippet combined, the hood having square corners. The tippet, which appears as part of the early costume of certain doctors, was probably, like the judges’ tippet, originally the shoulder-cape forming part of the same garment as the hood. Clark and others would derive it from the alnum (qes.), but do not seem to show any definite grounds for so doing. Its place seems to have been taken by the scarf worn by D.D.’s, &c., probably developed from the hood with long Erpice as worn turban-like on the head or as a scarf round the shoulders. It is rather far-fetched to derive the scarf from the two pendants of the alnum.3 (See article VESTMENTS and cp. the mayor’s scarf mentioned above.)
There seem to have been at least three varieties of academic head-dress: firstly, the doctor’s skull-cap with “apex” as illustrated in the Chandler MS. drawings; secondly, the square cap of cloth as prescribed by Laud’s statutes of 1636 for graduates and foundation- men (see Acta Academiae. p. 153 &c.), and the slate-green sleeveless hood of the vice-chancellor in 1598), with its counterpart of velvet worn by doctors; thirdly, a round cloth cap prescribed by the Laudian statutes and Burleigh’s letter for undergraduates who were not found to wear the round cloth cap at court for form’s sake but survives as part of their full dress to the present day. The square cap was adopted at the universities, according to Robinson, after 1590, in imitation of the university of Paris. For the development of the “apex” in the “sleeveless hood” see BURETT. In this connexion should be mentioned the term “tuft-hunting,” i.e. attempting to thrust oneself into the society of one’s social superiors, derived from the gold or tassel worn by noblemen and fellow-commoners on their college caps.
As to the dresses of the different degrees, the drawings from the Chandler MS. give a good idea of the early costume. It is also have been prevented in this improper use as a scarf. But in this case, what is the force of “et non contextum” which only disappeared about the middle of the 16th century, was the little black hood placed round the neck of candidates going in for viva voce in all examinations subsequent to graduation at Oxford. This was a survival of the custom of conferring on sophistici generales, those who had passed the first stage of the exercises for the B.A. degree, a hood of plain black cloth. See A. Clark’s Introduction to the Registers of Oxford University, vol. ii. pt. i. p. 22 (Oxford Hist. Soc., 1887).
2 See Caius’ Statutes (1557), also an account of the entertainments at Cambridge on the visit of Queen Elizabeth, 1564, given in Nichols, Progresses, vol. iii., Theologici Baccalaurae ac non-Regentes, cum tunicis vel caputis suis pellicie albscentibus decorati; tandem Juris Artiumque Baccalaurae suis agnitis braccis consipulis.

well illustrated by brasses.4 Doctors of theology seem to have worn a tippet but no hood. Masters of Arts seem to have worn a gown, over which was a garment with bell-shaped sleeves reaching to the elbow, called tabard, and a hood of green or black and plate facing (p. 136 and 153). 2. The same dress was sometimes worn by B.A.’s (see brass of William Palmer, B.A., D. 1479, New College, Oxford, in Drumit, p. 141), and of law and divinity, the latter being generally already confined to Diaetae. Nor do we know over the hood of the 17th century the dress of the M.A.’s was changed, and they wore a sleeveless tabard reaching to midway between ankle and knee. This costume certainly occurs on brasses, chiefly of the 16th and late 15th centuries, but the change is hard to explain.

Academic dress underwent much inquiry and some revision at the time of the Reformation, chiefly in the direction of sobriety and uniformity, “excess of apparel” being repressed as severely as ever, but not with much more effect.7 Burleigh’s letter to the Vice-Chancellor of Cambridge University (1582), and the statutes of Queen Elizabeth, strictly enforce the wearing of cap and gown by all, and hoods and habits by those entitled to wear them, and similar regulations were made for Oxford by Laud’s statutes of 1633, further details being dealt with by a decree of 1770. Academic dress during the 17th century may be further studied in Bedell Buck’s book (1665, see Appendix plates), the Statutes of the University of Cambridge), and Loggan’s plates of academic costume in Oxonia Illustrata (1675) and Conabrigia Illustrata (1690, ed. W. J. Clark, 1695).

There have been few far-reaching changes since Loggan’s day. Cambridge has of late years inquired into and revised her regulations as to dress, and in the Ordinances (latest ed. 1908, Statute A, cap. VII. p. 303) clear rules are laid down; the Oxford regulations (see Statuta et Decreta Univ. Oxon. 1690).

1 See for doctors’ costume, J. G. and L. A. B. Waller’s Series of Monumental Brasses (London, 1876), vol. i. p. 196, and plate facing p. 196. For from New College, Oxford, who are also illustrated in Drumit, pp. 131, 120, 119; and for M.A.’s and B.A.’s, p. 107 seq. and plate facing p. 136. On the brass of John Lowthe, D.C.L., should be noted the two curious drawings of two men wearing hoods, one of the back of his tabard or hood. It is hard to say what they can be; but the closest parallel is in the two streamers on the back of the living and commoners’ gown, which may be supposed to serve as sleeves. They are said to have given rise to the term “plucking,” i.e., failing in examination, the story being that a man’s creditors might assemble at the conferring of degrees, and by “plucking” at his gown prevent him from going up to his degree.

4 It is just possible that this sleeveless garment may be the capa manisata mentioned in Mun. Acad. p. 421, “nullus regens in artibus... in capa manisata lectiones legat ordinarias, sed in pallio vel capite...”; but, as Burleigh (p. 107 seq.) himself observes, the capa manisata with the tabard, but if, as suggested above, the palum is the tabard, the capa manisata cannot be the same. Braun, Liturgische Gewandung, p. 308, shows that a sleeved cope, called capa manisata, did exist, and at the same time as the mitre, but is not mentioned in the statutes of 1633. At the end of the 17th century, its use being forbidden by various synods. It is possible, then, that the capa manisata may have been worn by non-regents, the tabard (which Haines alleges to have been adopted generally by M.A.’s in the 16th century), or palum, by regents.

5 The essential parts of Laud’s statutes, Burleigh’s letter, &c., with much other matter bearing on academic costume from the 16th century onwards, will be found in C. Wordsworth’s University Life in the 18th Century (London and Cambridge, 1874, p. 485 seq.). To the passages quoted by him may be added the following from Loggan’s Hist. Camdenii, vol. ii. p. 220: “During Elizabeth’s visit to Oxford in 1566 (published in Elizabethan Oxford, ed. C. Plummer, Oxford Hist. Soc., 1887), at one of the disputations Mons. Mr. Campion, M.A., was dressed as follows: Toga illi tum Dalmatica fuit, manicae tunicæ ac largissimæ suæ divinitatis, Huic pallium inductum est unidue consuetum, praeter qua duorum pectore adaptit. Postremo erat humeri superius pallusibus vel tabardibus. Hieque superius pallus, vel tabardus una cum tabardis fuit omnium magistrorum, praeter quod nonnulli, loco palludamentis illius pelliciis, serico utebantur, omne colore variegato.” This points to the wide-sleeved gown, tabard and hood as the “true costume” of the 16th century, though not fixed. For Doctor White, D.C.L., “ei vestis Dalmatica fuerat tabaris, ex electori et clarissima purpura; lato clavo coecino superius inductae, adhibitum postremo humeri paludamentum est.” (“‘Dalmatische.”) For the other is pallus.

6 In the modern costume in the Statutorum, “dalmatica” is not fixed. To the 16th century see Wall-Gunning, Ceremonies observed in the Senate House (Cambridge, 1828).
for 1909, Tit. xiv., de vestiti et habitu, pp. 327-328) have not been revised lately, and some of them are a dead letter.

Doctors of both universities have three sets of robes: firstly, the full-dress gown of the doctor of civil law is a silk or velvet gown of the congregation habit and hood of scarlet (now at Cambridge a cope, at Oxford the so-called "cope"); thirdly, the black gown. The first is worn by all doctors except the doctor of music, and is accompanied by the round cap of velvet. The Oxford D.D. also wears a cassock, sash and scarf. The scarlet gown is of a different and older shape than the M.A. and B.A. gowns. As now worn, it is faced with silk of the same colour as the hood of the faculty. The second, or cope, has now gone almost out of use, but is still worn when presenting for degrees, &c. It is sometimes worn over the black gown. There are several types of black gown, but the tufted gown of Loggan's day has now gone out of use. The M.D. and Mus.D. black gown at Cambridge are now made after the pattern of the L.L.D. gown, with wing-like sleeve and flaps, trimmed with black lace, but the D.D., D.Sc. and Litt.D. wear the M.A. gown, the former with the scarf, the latter with lace on the sleeve, placed horizontally for D.Sc. and vertically for Litt.D.

Some doctors of divinity wear the full-sleeved gown with scarf. The head-dress of a D.D. is the square cap, that of the lay doctors the velvet bonnet with gold cord. At Oxford, too, some doctors wear the M.A. gown, others the doctor's laced gown. The M.A. and B.A. gowns are two varieties of the civilian gown of the 15th and 16th century. The B.A. loose-sleeved gown is no longer worn with the sleeve tucked up round the elbow.

The Oxford sleeveless commoner's gown, though still by statute talaris, now reaches little below the waist, the full-sleeved scholar's gown to the knees. The tufted silk gown of the gentleman-commoner and the nobleman's gold-laced gown are not yet abolished by statute, but have fallen into disuse. Vice-Chancellors have no official costume, but wear the habit of their degree. The Chancellors of the older universities wear a black damask robe with gold lace, and a black velvet square cap with gold tassel or a doctor's velvet bonnet with gold cord; those of the newer universities have robes "created" by the robe-makers, who are nowadays to a large extent the arbiters of academic dress.

For the colours of the hoods of the various university degrees see Universitates ad fin. (C. B. P.)

ROBESPIERRE, MAXIMILIAN FRANÇOIS MARIE ISIDORE DE (1758-1794), French revolutionary, was born at Arras on the 6th of May 1758. His family, according to tradition, was of Irish descent, having emigrated from Ireland at the time of the Reformation on account of religion, and his direct ancestors in the male line had been notaries at the little village of Carvin near Arras from the beginning of the 17th century. His father, being more ambitious, established himself at Arras as an advocate; and his father followed the same profession, marrying Jacqueline Marguerite Carraut, daughter of a brewer in the same city, in 1737. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Deroberespière, as the name was then spelt, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1769. The children were taken charge of by their maternal grandfather and aunts, and Maximilien was sent to the college of Arras, whence he was nominated in 1770 through the bishop of his native town to a bursarship at the college of Louis-le-Grand at Paris. Here he had for fellow-pupils Camille Desmoulins and Stanislas Fréron.

Completing his law studies with distinction, and having been admitted an advocate in 1781, Robespierre returned to his native city to seek for practice, and to struggle against poverty. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent him practising at the bar, and he speedily became a successful advocate. He now turned to literature and society, and came to be esteemed as one of the best writers and most popular dandies of Arras. In December 1783 he was elected a member of the section of the states-general of which he attended regularly; and, like all other young Frenchmen with literary proclivities, he began to compete for the prizes offered by various provincial academies. In 1784 he obtained a medal from the academy of Metz for his essay on the question whether the relatives of a condemned criminal should share his disgrace, the prize being divided between him and Pierre Louis Lacretelle, an advocate and journalist in Paris. An éloge on J. B. L. Grasset (1709-1777), the author of Vert-Vert and Le Méchant, written for the academy of Amiens in 1785, was not more successful; but Robespierre was compensated for these failures by his great popularity in the little literary and musical society at Arras known as the "Rosati," of which Carnot was also a member. There the sympathetic quality of Robespierre's voice, which afterwards did him such good service in the Jacobin Club, always caused his indifferent verses to be loudly applauded by his friends.

In 1788 he took part in the discussion as to the way in which the states-general should be elected, showing clearly and forcibly in his Adresse à la nation artésienne that, if the former mode of election by the members of the provincial estates were again adopted, the new states-general would not represent the people of France. Necker also perceived this, and therefore determined to make the old royal bailliages and sénéchaussées the units of election, which thus took place on the basis of almost universal suffrage. Under this plan the city of Arras was to return twenty-four members to the assembly of the bailliage of Artois, which was to elect the deputies. The corporation claimed the right to a preponderating influence in these city elections, and Robespierre headed the opposition, making himself very conspicuous and drawing up the cahier, or table of complaints and grievances, for the gild of the cobblers. Although the leading members of the corporation were elected, their chief opponent succeeded in getting elected with them. In the assembly of the bailliage rivalry ran still higher, but Robespierre had already made his mark in politics; by the Avis aux habitants de Campagne (Arras, 1789), which is almost certainly by him, he secured the support of the country electors, and, though but thirty years of age, poor and without influence, he was elected fifth deputy of the tiers état of Artois to the states-general.

When the states-general met at Versailles on 5th May 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy: he was a fanatic. As Mirabeau is reported to have said: "That young man believes what he says: he will go far." Without the courage and wide tolerance which make a statesman, without the greatest qualities of an orator, without the belief in himself which marks a great man, nervous, timid and suspicious, Robespierre yet believed in the doctrines of Rousseau with all his heart, and would have gone to death for them; and in the belief that they would eventually succeed and regenerate France and mankind, he was ready to work with unwearyed patience. While the Constituent Assembly occupied itself in drawing up a constitution, Robespierre turned from the assembly of provincial lawyers and wealthy bourgeois to the people of Paris. However, he spoke frequently in the Constituent Assembly, and often with great success, and was eventually recognized as second only to Pétion de Villeneuve—if second to him—as a leader of the small body of the extreme left,—the thirty voices, as Mirabeau contemptuously called them. It is hardly necessary to examine minutely Robespierre's speeches and behaviour before 1791, when the death of Mirabeau left the way clear for the influence of his party; but what is noteworthy, as proving the religious cast of his mind and his belief in the necessity of a religion, is that he spoke several times in favour of the lower clergy and laboured to get their pensions increased. When he instinctively felt that his doctrines would have no success in the Assembly, he turned to the Society of the Friends of the Constitution, known
later as the Jacobin Club, which had consisted originally of the Breton deputies only, but which, after the Assembly moved to Paris, began to admit among its members various leaders of the Parisian bourgeoisie. As time went on, many of the more intelligent artisans and small shopkeepers became members of the club, and among such men Robespierre found the hearers they sought. They did more than listen to him; they idolized him; the fanatical leader had found followers. As the wealthier bourgeois of Paris and deputies of a more moderate type seceded to the club of '89, the influence of the old leaders of the Jacobins (Bar nave, Dupont, Alexandre de Lameth) diminished; and when they themselves, alarmed at the progress of the Revolution, founded the club of the Feuillants in 1791, the following Robespierre dominated the Jacobin Club. The death of Mirabeau strengthened his position in the Assembly; but on the 15th of May 1791 he proved his lack of statesmanlike insight and his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the Constituent could sit in the succeeding Assembly. The flight of the king on the 20th of June and his arrest at Varennes made Robespierre declare himself at the Jacobin Club to be ni monarchiste ni républicain. After the "massacre" of the Champ de Mars (on the 17th of July 1791) he established himself, in order to be nearer to the Assembly and the Jacobins, in the house of Duplay, a cabinetmaker in the Rue St Honoré, and an ardent Declarer of the Jacobin Club. He was living in a single man, but you have to take a resolution on a question of the public safety, and to decide a question of national foresight. It is with regret that I pronounce the fatal truth: Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live." This great question settled by the king's execution, the struggle between Robespierre and the Girondins entered upon a more acute stage, and the want of statesmanship among the latter threw upon the side of the fanatical Robespierre Danton and all those strong practical men who cared little for personal questions, and whose only desire was the victory of France in her great struggle with Europe. Had it been at all possible to act with that group of men of genius whom history calls the Girondins, Danton, Lazare Carnot, Robert Lindet, and even Billaud-Varenne, would have sooner thrown in their lot with them than with Robespierre, whom they thoroughly understood; but the Girondins, spurred on by Madame Roland, refused to have anything to do with Danton. Government became impossible; the federalist idea, which would have broken France to pieces in the very face of the enemy, grew and flourished, and the men of action had to take a decided part. In the month of May 1793 Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his Histoire des Girondins and Brissot démasqué; Maximin Isnard declared that Paris must be destroyed if it pronounced itself against the provincial deputies; Robespierre preached insurrection at the Jacobin Club; and on the 31st of May and the 2nd of June the Commune of Paris destroyed the Girondin party. For a moment it seemed as if France would avenge them; but patriotism was stronger than federalism. The defence of Lyons exasperated the men who were working for France, and the armies who were fighting for her, and on the 27th of July 1793, when the struggle was practically decided, the Convention elected Robespierre to the new Committee of Public Safety. He had not solicited this election, nor even desired this election, yet it marks an important epoch, not only in the life of Robespierre, but in the history of the Revolution. Danton and the men of action had throughout the last two years of the crisis, as Mirabeau had in the first two years, seen that the one great need of France, if she was to end her troubles without the interference of foreign armies, was the existence of a strong executive government. The means for establishing the much-needed strong executive were found in the Committee of Public Safety. The success of this Committee in suppressing the Norman insurrection had confirmed the majority of the Convention in the expediency of strengthening its powers, and the Committee of General
ROBESPIERRE

Security which sat beside it was also strengthened and given the entire management of the internal police of the country. It was not until Robespierre was elected to the Committee that he became one of the actual rulers of France. Indeed, the Committee was not finally constituted until the 15th of September, when the last two of the "great" twelve who held office until July 1794 were elected. Of these twelve at least seven—Lazare Carnot, Billaud-Varenne, Collot d’Herbois, Prieur Duvernois (of the Marne), Prieur (of the Côte d’Or), Jean Bon Saint-André and Robert Lindet—were essentially men of action, and were entirely free from the influence of Robespierre. Of the other four, Hérauld de Séchelles was a professed adherent of Danton, Barère de Vieuzac was an eloquent Provençal, who was ready to be the spokesman to the Convention of any view which the majority of the Committee might adopt; and only Georges Couthon and Saint-Just, devoted to Robespierre, adroitly sustained his policy. It is necessary to dwell upon the fact that Robespierre was always in a minority in the great Committee in order to absolve him from the blame of being the inventor of the Terror, as well as to deprive him of the glory of the gallant stand made against Europe in arms.

After this examination of Robespierre’s position it is not necessary to investigate closely every act of the great Committee during the year which was pre-eminently the year of the Terror; the biographer is rather called upon to examine his personal position with regard to the establishment of the Terror and the fall of the Hébertists and Dantonists, and then to dwell upon the last three months in which he stood almost alone trying to work up an effective counterbalance to the power of the majority of the great Committee. The Terror was the embodiment of the idea of Danton, that it was necessary to have resort to extreme measures to keep France united and strong at home in order to meet successfully her enemies upon the frontier. This idea was systematized by the Committee of Public Safety. With the actual organization of the Terror Robespierre had little or nothing to do; its two great engines, the revolutionary tribunal and the almost absolute power in the provinces of the representatives on mission, were in existence before he joined the Committee of Public Safety, and the laws of the maximum and of the suspects were by no means of his creation. The reason why he is almost universally regarded as its creator and the dominant spirit in the Committee is not far to discover. Robespierre was not conspicuous speakers in the Convention, nor were they the idols of any section of the populace; but Robespierre had a fanatical following among the Jacobins and was one of the most popular orators in the Convention, on which his carefully prepared addresses often made a deep impression. His panegyrics on the system of revolutionary government and his praise of virtue led his hearers to believe that the system of the Terror, instead of being monstrous, was absolutely laudable; his pure life and admitted incorruptibility threw a lustre on the Committee of which he was a member; and his colleagues offered no opposition to his posing as their representative and reflecting some of his personal popularity upon them so long as he did not interfere with their work. Moreover, he alone never left Paris, whilst all the others, except Barère, were constantly engaged on missions to the armies, the navy and the provinces. It has been asserted that Robespierre, Couthon and Saint-Just took upon themselves the direction of "la haute politique," while the other members acted only in subordinate capacities; undoubtedly it would have suited Robespierre to have had this belief, but as a matter of fact he was in no way especially trusted in matters of supreme importance.

After his explanation it may be said at once that Robespierre was not the sole author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the principles of both parties being obnoxious to him. The Hébertists were communists in the true meaning of the word. They held that each commune should be self-governing, and, while admitting the right of a central authority to levy men and money for the purposes of the state, they believed that in purely internal matters; as well as in determining the mode in which men and money were to be raised, the local government ought to be supreme. This position of the Hébertists was of course obnoxious to the Committee, who believed that success could only be won by their retention of absolute power; and in the winter of 1794–1795 it became obvious that the Hébertist party must perish, or its opposition to the Committee would grow too formidable owing to its paramount influence in the Commune of Paris. Robespierre shared his colleagues’ fear of the Hébertist opinions, and he had a personal reason for disliking that party of atheists and sanguinolentis, since he believed in the necessity of religious faith, and detested their imitation of the grossness that belongs to the lowest class of the populace. In 1792 he had indignantly thrown from him the cup of liberty which an ardent admirer had placed upon his head; he had never pandered to the depraved tastes of the mob by using their language; and to the last day of his life he wore knee-breeches and silk stockings and wore his hair powdered. His position towards the Dantonist party was of a different character. After having been established the strong executive he had laboured for, and having moved the resolutions which finally consolidated the power of the Committee of Public Safety in September 1793, Danton retired to his country house. But to his retreat came the news of the means the Committee used to maintain their supremacy. Danton did not believe that this continuous series of sacrifices under the guillotine was necessary, especially since the danger to the country had passed away with the victories of the revolutionary army; hence he inspired Camille Desmoulins to protest against the Terror in the Vieux Cordelier. Where is this system of terror to end? What is the good of a tyranny comparable only to that of the Roman emperors as described by Tacitus? Such were the questions which Camille Desmoulins asked under Danton’s inspiration. This “moderantism,” as it was called, was as objectionable to the members of the Committee as the doctrines of the Hébertists. Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from 13th February to 13th March 1794) from active business in the Convention and the Committee, apparently in good humour; but he came to the conclusion that the cessation of the Reign of Terror would mean the loss of that supremacy by which he hoped to establish the ideal of Rousseau; for Danton, he knew, was essentially a practical statesman and laughed at his ideas and especially his politico-religious projects. He must have considered too that the result of his siding with Danton would probably have been fatal to himself. The result of his deliberations was that he abandoned Danton and co-operated in the attacks of the Committee on the two parties. On the 15th of March he reappeared in the Convention; on the 19th Hébert and his friends were arrested; and on the 24th they were guillotined. On the 30th of March Danton, Camille Desmoulins and their friends were arrested, and on the 5th of April they too were guillotined.

It was not until after the execution of Danton that Robespierre began to develop a policy distinct from that of his colleagues in the Committee, an opposition which ended in his downfall. He began by using his influence over the Jacobin Club to dominate the Commune of Paris through his devoted adherents, two of whom, Fleuriot-Lescot and C. F. de Payan, were elected respectively mayor and procureur of the Commune. He also attempted to usurp the influence of the other members of the Committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderantism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the Committee; and the Convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the Committee,
proposed and carried on the 10th of June the outrageous law of 22nd Prairial, by which even the appearance of justice was taken from the tribunal, which, as no witnesses were allowed, became a simple court of condemnation. The result of this law was that between the 17th of June and the 28th of July, the day of Robespierre's death, no less than 205 victims perished by the guillotine in Paris. It was the bloodiest and the least justifiable period of the Terror. But before this there had taken place in Robespierre's life an episode of supreme importance, as illustrating his character and his political aims: on the 7th of May he secured a decree from the Convention recognizing the existence of the Supreme Being. This worship of the Supreme Being was based upon the ideas of Rousseau in the Social Contract, and was opposed by Robespierre to Catholicism. Jean-Charles Danton, Tallien, Billaud-Varenne and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de Danton qui t'étouffe" showed what was uppermost in the minds of the Mountain. Robespierre tried in vain to gain a hearing, the excitement increased and at five in the afternoon Robespierre, Couthon and Saint-Just, with two young deputies, Augustin Robespierre (younger brother of Maximilien) and Philippe François Joseph Lesbas, the only men in all the Convention who supported them, were ordered to be arrested. Yet all hope for Robespierre was not gone; he was speedily rescued from his prison, with the other deputies, by the troops of the Commune and brought to the Hôtel de Ville. There he was surrounded by his faithful adherents, led by Payan and Coffinhal. But the day was past when the Commune could overawe the Convention; for now the men of action were hostile to the Commune, and its chief was not a master of coups d'état. On the news of the release of Robespierre, the Convention had again met, and declared the members of the Commune and the released deputies outlawed. The national guards under the command of Barras had little difficulty in making their way to the Hôtel de Ville; Robespierre was shot in the lower jaw by a young garde-mai named Meda while signing an appeal to one of the sections of Paris to take up arms for him, though the wound was afterwards believed to have been inflicted by himself; and all the released deputies were again arrested. After a night of agony, Robespierre was the next day taken before the tribunal, where his identity as an outlaw was proved, and without further trial he was executed with Couthon and Saint-Just and nineteen others of his adherents on the Place de la Révolution on the 10th Thermidor (28th July) 1794.

The character of Robespierre, when looked upon simply in the light of his actions and his authenticated speeches, and apart from the innumerable legends which have grown up about it, is not a difficult one to understand. A well-educated and accomplished young lawyer, he might have acquired a good provincial practice and lived a happy provincial life had it not been for the Revolution. Like thousands of other young Frenchmen, he had read the works of Rousseau and taken them as gospel. Just at the very time in life when this illusion had not been destroyed by the realities of life, and without the experience which might have taught the futility of idle dreams and theories, he was elected to the states-general. At Paris he was not understood till he met with his audience of fellow-disciples of Rousseau at the Jacobin Club. His fanaticism won him supporters; his singularly sweet and sympathetic voice gained him hearers; and his upright life attracted the admiration of all. As matters approached nearer and nearer to the terrible crisis, he failed, except in the two instances of the question of war and of the king's trial, to show himself a statesman, for he had not the liberal views and practical instincts which made Mirabeau and Danton great men. His admission to the Committee of Public Safety gave him power, which he hoped to use for the establishment of his favourite theories, and for the same purpose he acquiesced in and even heightened the horrors of the Reign of Terror. It is here that the fatal mistake of allowing a theorist to have power appeared:
Billaud-Varenne systematized the Terror because he believed it to be necessary for the safety of the country; Robespierre intensified it in order to carry out his own ideas and theories. Robespierre's private life was always respectable: he was always eminently a gentleman and man of culture, and even a little bit of a dandy, scrupulously honest, truthful and charitable. In his habitable, man of life he was simple and laconical; he was not a man gifted with flashes of genius, but one who had to think much before he could come to a decision, and he worked hard all his life.

On the family of Robespierre see A. J. Paris in the Mémorl (2nd series, vol. iii.) of the Academy of Arras; the Œuvres de Maximilien Robespierre (3 vols., 1849), published by Laponneraye with preface by Armand Carrel, contain some of his speeches and the memoirs of Charlotte Robespierre on her brothers. The standard work on Robespierre's career is Ernest Hamel, Histoire de Robespierre (d'après des papiers de famille, les sources originales et des documents entièrement inédits (3 vols., 1865-67). After the appearance of the first volume, the publisher refused to proceed for fear of prosecution until compelled to do so by the author. Another edition with a different title appeared in 1878. See also Ch. d'Hericault, La Révolution de Thermidor (2nd ed., 1878); Karl Brunnenmann, Maximilien Robespierre (Leipzig, 1898); F. A. Aulard de l'Assemblée Constituante (1882); M. de Lesure, "Le Roman de Robespierre," in La Société française pendant la Terreur (1882); E. Hamon, Robespierre (Amsterdam, 1895); Hilaire Belloc, Robespierre (1901); and C. F. Warwick, Robespierre and the French Revolution (1900). Many of the books which have been written about Robespierre are most untrustworthy, and the picture of him given by Thomas Carlyle in his French Revolution is unjust.

ROBILANT, CARLO FELICE NICOLIS, CONTE DI (1826-1888), Italian statesman and diplomat, was a native of Turin. He entered the army, and lost his left hand at Novara, where he was aide-de-camp to Charles Albert, king of Piedmont. He fought in 1859, and reached the grade of general in the Austrian campaign of 1866, after which he served on the delimitation commission. He was chief of the Military Academy, and in 1867 was made prefect of Ravenna to suppress political disorder. He was defeated at Turin in the elections for the Chamber in 1870, and was sent in 1871 as minister plenipotentiary to Vienna, where he subsequently became ambassador. He was connected with the Prussian nobility by his mother, and he married an Austrian, a daughter of Prince Edmund Clary-Aldringen. In spite of the active share he had taken in driving Austria from Italy, he was a persona grata at Vienna, and his policy was steadily directed to an alliance between the two powers. This was accomplished by the secret terms of the Triple Alliance in 1882. He was recalled to Rome in 1885 to become minister for foreign affairs in the Depretis cabinet. Robilant's independent attitude as foreign minister secured greater consideration for Italy from her allies, but he did not adapt himself to the exigencies of domestic politics, and his excessive unpopularity contributed to the downfall of the ministry on the 7th of February 1887, consequent on an adverse vote on the Massawa question. Before leaving office, he completed the negotiations for the renewal of the Triple Alliance, and for its extension to cover Anglo-Italian co-operation in the Mediterranean. In the new Depretis-Crispi administration Robilant was included. He was sent to London as ambassador in the next year, but died two months after his arrival, on the 17th of October 1888.

ROBIN HOOD, English legendary hero. The oldest mention of Robin Hood at present known occurs in the second edition—what is called the B text—of Piers the Plowman, the date of which is about 1377. In passus v. of that poem the figure of Sloth is represented as saying—

"I can nought perfily my pater-noster, as the prit syngeth.
But I can rymes of Robyn Hood and Randolf Erle of Cheestre."

He is next mentioned by Andrew of Wyntoun in his Original Chronicle of Scotland, written about 1420—

"Lytil Jhon and Robyn Hude
Waythmen ware commendyd gude;
In Yngliwode and Barnysdale
Thai oysyd all this time [c. 1283] thare trawale."

next by Walter Bower in his additions of Fordun's Scotiachronicon about 1450—

"Hoc in tempore [1266] de exheredatis et bannitis surrexit et caput erexit ille famosissimus sicarius Robertus Hode et Littill Jhon de eorum comitibus, de quibus stalidum vulnus hianter in comediis et tragoeidis pruinerent restum faciant et super ceteras romancias, Armis, ero bardanos cantarectantur."

Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. Just one passage must be quoted as of special importance because closely followed by R. Grafton, J. Stow and W. Camden. It is from John Mair's Historia Majoris Britanniae iam Anglice quam Scotiae, which appeared in 1521—

In the Elizabethan era and afterwards mentions abound; see the works of Shakespeare, Sidney, Ben Jonson, Drayton, Warner, A. Munday, Camden, Stow, Braithwaite, Fuller, &c.

Of the ballads themselves, Robin Hood and the Monk is possibly as old as the reign of Edward II. (see Thomas Wright's Essays on England in the Middle Ages, ii. 174; Robin Hood and the Patten and Robyn and Gandelyn are certainly not later than the 15th century. Most important of all is A Lytell Geste of Robyn Hode which was first printed about 1550 (see A. W. Pollard's Fifteenth Century Prose and Verse, Westminster, 1903). This is evidently founded on older ballads; we read in The Second Fytle, i. 176 and 177—

"He wente hym forth for he fery syngeynge.
As men have told in tale."

In fact, it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances—what in the 6th century n.c. Peisistratus is said to have done for the Homeric poems.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding fast against the Norman conquerors so late as the end of the 11th century (see Augustin Thierry's Norman Conquest, and compare Sir Walter Scott's Ivanhoe). J. M. Gutch maintains that he was a follower of Simon de Montfort. The Rev. Joseph Hunter associated him with the rebel earl of Lancaster of Edward II.'s time. This scholar in a brochure published in 1852 produced evidence from the exchequer accounts and the court rolls of the manor of Wakefield showing that a "Robyn Hod" and a "Robertus Hood" were living in this reign. The series of coincidences to which he points is undoubtedly striking, but had failed to convince most critics. Professor F. J. Child dismisses his inferences as "meaningless."

For our part, we are not disinclined to believe that the Robin Hood story has some historical basis, however fanciful and romantic the superstructure. We parallel it with the Arthurian story, and hold that, just as there was probably a real Arthur, however different from the hero of the trouvères, so there was a real Hood, however now enlarged and disguised by the accretions of legend. That Chalermagne and Richard I. of England became the subjects of romances does not prevent our believing in their existence; nor need Hood's mythical life deprive him of his natural one. Sloth in Langland's poem couples him, as we have seen, with Randle, earl of Chester; and no one doubts this nobleman's existence because he had "rimes" made about him. We believe him to have been the third Randle (see Bishop Percy's Folio MS., ed. Hales and Furnivall, i. 260). And possibly enough Hood was contemporary with that Earl, who "flourished" in the reigns of Richard I., John and Henry III. Wyntoun and Mair, as we have seen, assign him to that period. It is impossible to believe with Hunter that he lived so late as Edward II.'s reign. This would leave no time for the growth
of his myth; and his myth was, as is evident from what we have already said and quoted, full-grown in the first half of the 14th century. Whatever may have been the immediate genesis of the myth—and it may well be sought in the heartless forest laws—it is certain that it was assured by the English love of archery and historical repetition. In the rolls of parishioners of 14th century was listed a certain Robin Hood, a robber who took to the woods like as it had been Robin Hood and his meyné. There are indications that Robin was identified or confused with Robert Locksley, a man-slayer of Bradfield in Hallamshire. The former is said to have been born in "Merry sweet Locksley town.

But whether he lived or not, and whenever he lived, it is certain that many mythical elements are contained in his story. Both his name and his exploits remind us of the woodland spirit Robin Goodfellow and his merry pranks. He is fond of disguising himself, and devoted to fun and practical jokes. These frolics suggest the words, "The first archer," says Mr. H. Bradley, "is ultimately derived from the great Aryan sun-myth. Robin Hood is Hod, the god of the wind, a form of Woden; Maid Marian is Morgen, the dawn-maiden; Friar Tuck is Toki, the spirit of frost and snow."

The name Robin (a French form from Rob, which is of course a short form for Robert) would serve both for "the shrewd and knavish sprite"—the German Knecht Ruprecht (see Grimm's "Teut. Myth. p. 504, trans. Stallybrass")—and for the bandit (see "Roberdes Knaues" in the Prologue of "Piers the Plowman", l. 44, and the note in Warton's "Hist. of Eng. Poets", ii. 95, ed. 1840). "Hood" is a very usual dialectal form of wood; and in his play "Edward the First", George Peele actually alludes to the bandit as "Robin of the Wood." Mr Gutch thus explains the origin of the name. It is still a common enough surname, of which the earlier shape is Odo (see "Houdart," etc., in Larchey's "Dict. des Noms"); notice, too, the name Hudson. But it also reminds one of the German familiar spirit Hudekin, or possibly of the German Witikind (see Wright's "Essays on the Middle Ages", ii. 207). Mr Sidney Lee suggests that Robin was a forest elf so called because elves wore hoods (see "Dict. of National Biography", sub. "Robin Hood"). How certain it is that the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history—its history after the 14th century. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century or late in the 15th. The Friar Tuck and Maid Marian elements have been thought to have been introduced for the purpose of these performances, which were held on May-day and were immensely popular (see Latimer's "Frutefull Sermons", London, 1571, p. 75; also "Paston Letters", ed. J. Gairdner, iii. 80). After 1615, the date of the pageant prepared for the mayorality of Sir John Jollis, draper, by Anthony Munday and entitled "Metropolis Coronata", a peer was imported into it, and the yeoman of the older version whom metamorphosed into the Earl of Huntington, for whom in the following century William Stukeley discovered a satisfactory pedigree! The earl of Huntington was probably a nickname for a hunter. At last, with the change of times, the myth ceased growing. Its rise and development and decay deserve a more thorough study than they have yet received.

What perhaps is its greatest interest as we first see it is its expression of the popular mind about the close of the middle ages. Robin Hood is at that time the people's ideal as Arthur is that of the upper classes. He is the ideal yeoman as Arthur is the ideal knight. He readjusts the distribution of property: he is the friend of the poor. He is an earnest woodsman, a shipper of the Virgin, but a bold and vigorous hater of monks and abbots. He is the great sportsman, the incomparable archer, the lover of the Greenwood and of a free life, brave, adventurous, jocular, open-handed, a protector of women. Observe his instructions to Little John—

"Loke ye do no housbond hearme
That tyleth with his plough;
No more ye shaall no good yeman
That walketh by grene wode shawe;

Ne no knyght ne no squyer
That wolde be a good laewe;
These bysheppes and these archeybysheppes
Ye shall them bete and bynde;
The hyn seryfye of Notynghame
Hym holde in your mynde."

And we are told—

"Robin loved our dere lady;
For doute of dedely synne
Wolde he never do company harme.
That any woman was yyne."

See also Drayton's "Polyolbion", Song xxvi. The story is localized in Barnsdale and Sherwood, i.e. between Doncaster and Nottingham. In Yorkshire, Nottinghamshire and Lincolnshire a host of place-names testify to the popularity of the Robin Hood legend—Robin Hood's Bay; Robin Hood's Cave, Robin Hood's Chase, Robin Hood's Cup (a well), Robin Hood's Chair, Robin Hood's Pricks, and many more.

The best collections of Robin Hood poems are those of Ritson (1806, 1807) and Gutch (2nd ed., 1847), and of Professor Child in the 5th volume of his invaluable English and Scotch Popular Ballads (Boston, 1888). See also Professor F. B. Gummer's "Old English Ballads" (Boston, 1894). In the Percy Folio (edited by Hales and Furnivall, 1867, vol. i.) are unhappily mutilated, but they should be consulted, for they are all more or less unique, and that on "Robin Hood his death" is of singular interest. The literary and artistic value of many of the Robin Hood ballads cannot be pronounced considerable, but eight of them attain the high-water mark of their class. Robin Hood and the Monk and Guy of Gisborne are perhaps the timber trees is, however, real vigour and force in this fragment on the hero's death. The earliest "Garland" was printed in 1670, and in 1678 appeared a prose version which was reprinted by W. J. Thoms in his Early English Prose Romances (vol. ii., 1858). Mr Lee's memoir in the Dictionary of National Biography is extremely erudite, and two valuable articles, contributed by Sir Edward Brobrin to the Antiquary for June and July 1906, might be consulted. See also Stukeley, "Pallatrinographia", No. 1. 1731; Tho. Gage, "Conquête de l'Angleterre" (1830); and J. Hunter's "Great Hero of the Ancient Minstrelsy of England, Robin Hood (1852)."

ROBIN HOOD'S BAY, a seaside resort in the Whitby parliamentary division of the North Riding of Yorkshire, England, 63 m. S.E. of Whitby by a branch of the North-Eastern railway. The bay itself is a shallow indentation of the coast, and is fringed with high picturesque cliffs, breached in places by steep-sided narrow gullies. The old fishing village overhangs the cliffs, while the more modern watering-place is mostly built a little inland. A fine stretch of sandy shore is exposed at low tide.

ROBINIA, or LOCUST-TREE, a genus of about six species native of the United States and Mexico, belonging to the sub-order Papilionaceae of the great family Leguminosae. It was named by Linnaeus in honour of Jean Robin (1529-1639), herbalist to the king of France and his son and successor, Vespasien Robin (1579-1660) by whom the best-known species, Robinia pseudoacacia, was introduced into Europe, in the Jardin du Roi at Paris in 1634. This tree, the bastard acacia, or false acacia, and often called erroneously acacia, is now widely cultivated as an ornamental tree in this country and on the European continent. It grows from 30 to 60 ft. high, and bears long, graceful, compound leaves with 9 to 17 bright green oblong leaflets, and white fragrant flowers in loose pendulous racemes, recalling the laburnum in habitat. There are many varieties in English gardens varying in the method of growth, the presence or absence of thorns (persistent spiny stipules) on the branches and the colour of the flower.

In the eastern United States, where it is native, it grows from 70 to 80 ft. high with a trunk 3 or 4 ft. in diameter. It is one of the most valuable of the American forest. The wood is heavy, very hard, strong, close-grained and durable, and is extensively used in shipbuilding, also for posts and other purposes where durability in contact with the ground is essential.

Like many plants of the same family, the leaves show sleep movement, folding together at night and in dull or wet weather; for this reason it is less injurious than many trees to plants growing in its shade, as the rain is able more quickly to reach the ground beneath.
ROBINS, BENJAMIN (1707-1751), English man of science and engineer, was born at Bath in 1707. His parents were Quakers in poor circumstances, and gave him very little education. Having come to London by the advice of Dr Henry Pemberton (1604-1771), who had recognized his talents, he for a time maintained himself by teaching mathematics, but soon devoted himself to engineering and the study of fortification. In particular he carried out an extensive series of experiments in gunnery, embodying his results in his famous treatise on New Principles in Gunnery (1742), which contains a description of his ballistic pendulum (see CURONNOY). Robins also made a number of important experiments on the resistance of the air to the motion of projectiles, and on the force of gunpowder, with computation of the velocities thereby communicated to projectiles. He compared the results of his theory with experimental determinations of the ranges of mortars and cannon, and gave practical maxims for the management of artillery. He also made observations on the flight of rockets, and wrote on the advantages of filled barrels. His work on gunnery was translated into German by L. Euler, who added some critical remarks to his commentary on it. Of interest nowadays are Robins's more purely mathematical writings, such as his Discourse concerning the Nature and Certainty of Sir Isaac Newton's Methods of Fluxions and of Prime and Ultimate Ratios (1735), "A Demonstration of the Eleventh Proposition of Sir Isaac Newton's Treatise of Quadratures" (Phil. Trans., 1735), and similar works. Besides his scientific labours Robins took an active part in politics. He wrote pamphlets in support of the opposition to Sir Robert Walpole, and was secretary of a committee appointed by the House of Commons to inquire into the conduct of that minister. He also wrote a preface to the Report on the Proceedings of the Board of General Officers on their Examination into the Conduct of Lieutenant-General Sir John Cope, in which he gave an apology for the battle of Prestonpans. In 1749 he was appointed engineer-general to the East India Company, and went out to superintend the reconstruction of their forts; but his health soon failed, and he died at Fort St David on the 29th of July 1751.

His works were published in two volumes in 1761.

ROBINSON, EDWARD (1794-1863), American Biblical scholar, was born in Southington, Connecticut, on the 10th of April 1794, the son of William Robinson (1754-1832), minister of the Congregational Church of Southington. He graduated in 1810 at Hamilton College. In 1821 he came under the influence and teaching of Moses Stuart, the second edition of whose Hebrew Grammar he helped to prepare for the press in 1823, and through whom he was appointed in the same year instructor in Hebrew in Andover Seminary. With Stuart he translated in 1825 the first edition of Winer's Grammar of New Testament Greek; and alone he translated Wahl's Clavis Philologica Novi Testamenti (1823). In 1826-30 he studied in Germany, especially at Halle, under Gesenius, Tholuck and Rüdiger, and at Berlin, under Neander. He was professor (extraordinary) of sacred literature and librarian at Andover in 1830-32. resigning because of dangerous epileptic attacks; and in 1832-35 he edited the Biblical Repository, which he founded and carried on very largely by his own contributions, assisted somewhat by his young German wife, Theresa Albertina Luise (1797-1860), the daughter of Professor Ludwig Heinrich von Jakob of Halle, a linguist of considerable ability, and a writer (in her early years under the pseudonym "Talvi") of essays and stories. In 1837 he accepted the professorship of Biblical literature in Union Theological Seminary, and left America for three years of study in Palestine and Germany, the fruit of which, his Biblical Researches, published in 1841, brought him the gold medal of the Royal Geographical Society. In 1849-50 a second volume of Researches was published. In 1856. His plans to sum up his important topographical studies in a work on Biblical geography were cut short by cataract in 1861 and by his death in New York City on the 27th of January 1863. A great Biblical scholar and exegete, Robinson must be considered the pioneer and father of Biblical geography—his Biblical Researches, supplemented by the Physical Geography of the Holy Land (1869), were based on careful personal exploration and tempered by a thoroughly critical spirit, which was possibly at times too sceptical of local tradition. Of scarcely less value in their day were his Greek Harmony of the Gospels (1845 and often) and his Greek and English Lexicon of the New Testament (1836; revised 1847 and 1850). He established in 1843 and edited for some years the Bibliotheca Sacra (in which the Biblical Repository was merged in 1852), for which he wrote until 1863.

See Henry B. Smith and Roswell D. Hitchcock, The Life, Writings and Character of Edward Robinson (New York, 1863); a biography of Mrs Robinson was published, with a collection of her stories, in Leipzig, in 1874.

ROBINSON, HENRY GRABB (1777-1857), English journalist and darist, the son of a tanner, was born at Bury St Edmunds on the 13th of March 1775. In 1796 he entered the office of a letters and reminiscences in 36 volumes, having inherited a sum of money sufficient to give him a small yearly income, he started in 1800 upon a tour on the Continent, travelling chiefly in Germany and Bohemia. In 1802 he became a student at the university of Jena, where he remained until his return to England in 1805. After vain endeavours to obtain a post in the diplomatic service, he was appointed foreign correspondent for The Times at Altona. His letters, "From the Banks of the Elbe," were published in this newspaper during 1807, and on his return he became its foreign editor. In 1808 at the outbreak of the Peninsular War he was sent out as special war correspondent—an innovation in English journalism—for The Times to Spain. There he witnessed Sir John Moore's retreat at Corunna. After his return to England he read for the bar at the Middle Temple, and from 1813 to 1828 he practised as a barrister, retiring as soon as he had acquired a modest competence. He is remembered chiefly as the friend of Lamb, Coleridge, Wordsworth and Southey. He was a great conversationalist, and his breakfast parties rivalled those of Samuel Rogers. He died in London on the 5th of February 1867.

His Diary of 35 volumes, his Journals of 30 volumes, and his Letters and reminiscences in 36 volumes, having vivid pictures drawn by an acute and sympathetic observer who had exceptional opportunities of studying contemporary celebrities. They are preserved at Dr Williams's Library in Gordon Square, London. Grabb Robinson seems to have intended to publish these for publica tion, but except for a meagre selection edited by Thomas Sadler and entitled The Diary, Reminiscences and Correspondence of H. Grabb Robinson (1869), they have never been reprinted. Grabb Robinson was one of the founders of the Athenaeum Club and of University College, London.

ROBINSON, JOHN (1650-1723), English diplomatist and prelate, a son of John Robinson (d. 1651), was born at Cleasby, near Darlington, on the 7th of November 1650. Educated at Brasenose College, Oxford, he became a fellow of Oriel College, and about 1680 chaplain to the British embassy to Stockholm, and remained in Sweden for nearly thirty years. During the absence of the minister, Philip Warwick, Robinson acted as resident and as envoy extraordinary, and he was thus in Sweden when the Institution of the Swedish Society for promoting Arts and Learning was established. In 1701 he was appointed to the Swedish Embassy, and was first pendletonary he signed the treaty of Utrecht in April 1713. Just after his return to England he was chosen bishop of London in succession to Henry Compton. He died at Hampstead on the 11th of April 1723, having been a great benefactor to Oriel College. Robinson wrote an Account of Sweden:
together with an Extract of the History of that Kingdom. By a person of note who resided many years there (London, 1695).

This was translated into French (Amsterdam, 1712), and in 1738 was published with Viscount Molesworth’s Account of Denmark in 1692. Some of his letters are among the Strafford papers. A member of the same family was Sir Frederick Philipse Robinson (1763-1832), a Virginian soldier, who fought for England during the American War of Independence. On the conclusion of peace he went to England, and in 1813 and 1814 he commanded a brigade under Wellington in Spain.

Robinson was governor of Tobago, and he became a general in 1841. He died at Brighton on the 1st of January 1852.

ROBINSON, JOHN (1755-1862), English Nonconformist divine, was born probably in Lincolnshire or Nottinghamshire about 1755. He seems to have studied at Cambridge, and to have been influenced by William Perkins. He took orders and held a curacy in Norwich, but was attracted by Puritan doctrines, and finally associated himself with a Congregational meeting at Gainsborough (where the “John Robinson Memorial Church” bears witness to his work). In 1666 the members divided into two societies, Robinson becoming minister of the one which made its headquarters at Scrooby, a neighbouring village. The increasing hostility of the authorities towards nonconformity soon forced him and his people to think of flight, and, not without difficulty, they succeeded in making their escape in detachments to Holland. Robinson settled in Amsterdam in 1668, but in the following year returned to England, where he ministered to a community whose numbers gradually grew from one hundred to three hundred. In 1670 a considerable minority of these sailed for England in the “Speedwell,” and ultimately crossed the Atlantic in the “Mayflower”; it was Robinson’s intention to follow as soon as practicable, along with the rest of his flock, but he died before the plan could be carried out, on the 1st of March 1670.

In the early stages of the Arminian controversy he took the Calvinistic side, and even engaged in a public disputation with the famous Episcopius. He bore a high reputation even among his ecclesiastical opponents, and one of them (Robert Bibliot) called him “the most learned, polished and modest spirit that ever that sect enjoyed.” He was large-minded and eminently reasonable in spirit, recognizing parish assemblies where “the pure word and discipline” prevailed as true churches of God. His sound judgment is seen in the way in which he adjusted the relations of elders and church—the most delicate practical problem of Congregationalism.

Amongst his publications may be mentioned Justification of Separation from the Church (1610), Apologia Brownistanum (1619), A Defence of the Doctrine propounded by the Synod of Dort (1624), and a volume of Essays, or Observations Divine and Moral, printed in 1625. His works (with one exception, A Manumission to a Monastic, since published by the Massachusetts Historical Society, ser. iv., vol. 1.), including the memoirs, were reprinted by R. Ashton in three vols. in 1853. A summary of their contents is given in G. Puchard, History of Congregationalism (New York, 1867), and of the literature there cited; also O. S. Davis, John Robinson (Hartford, Connecticut, 1897).

ROBINSON, SIR JOHN BEVERLEY, Bart. (1791-1863), Canadian statesman and jurist, was the son of Christopher Robinson (1764-1798), one of the band named as United Empire Loyalists, who came to Canada at the conclusion of the American Revolution. He was born at Berthier, Quebec, on the 26th of July 1791, and studied under Dr John Street, whom he had grown to resemble. He was much influenced. He served with distinction at the beginning of the war of 1812, and later in the war was appointed acting attorney-general of Upper Canada. In 1815 he visited England and read law at Lincoln’s Inn.

From 1818 till 1829 he was the head of the Tory party in Upper Canada (the so-called “Family Compact”). In 1829 he became chief justice of Upper Canada, which position he held till shortly before his death on the 31st of January 1863. Not one of his decisions was ever reversed on appeal. In 1824 and again in 1839 he strongly advocated a federal union of British North America, and in 1830 opposed in Canada and the Canada Bill the legislative union of the two Canadas proposed by Lord Durham. In 1854 he was created a baronet of the United Kingdom and in 1855 a D.C.L. of Oxford University. His unbridled Toryism rendered him a reactionary in politics, but his bitter opponents admitted his sincerity and patriotism.

Several of his sons rose to eminence, John Beverley Robinson (1820-1890) becoming a member of the Dominion parliament and lieutenant-governor of Ontario (1880-1887). Christopher Robinson (1828-1905) was for many years the acknowledged leader of the Canadian Bar.

His Life, by his son, Major-General C. W. Robinson, C.B. (Toronto and London, 1904), gives a very favourable picture of the fine old colonial gentleman and loyalist. For a less favourable view see J. C. Dent, Canadian Portrait Gallery, vol. iv. (Toronto, 1881).

ROBINSON, JOHN THOMAS ROMNEY (1792-1882), Irish astronomer and physicist, was born in Dublin on the 23rd of April 1792. He studied at Trinity College, Dublin, and obtained a fellowship in 1814; for some years he was deputy professor of natural philosophy, until in 1821 he obtained the college living of Enniskillen. In 1823 he was appointed astro- nomer to the Armagh observatory, with which he (from 1824) combined the living of Carrickmacross of the archdeaconry. He was a member at the observatory, engaged in researches connected with astronomy and physics, until his death on the 28th of January 1882.

Robinson published a number of papers in scientific journals, and the Armagh catalogue of stars (Places of 5345 Stars observed from 1828 to 1854 at the Armagh observatory, Dublin, 1859), but he is best known as the inventor (1849) of the cup-anemometer for registering the velocity of the wind.

ROBINSON, SIR JOSEPH BENJAMIN (1845- ), South African mine-owner, was born at Cradock, Cape Colony, in 1845. At the age of sixteen he started business as a general trader, wool-buyer and stock-breeder, but on the discovery of diamonds in South Africa in 1867 he hastened to the Vaal river district, where, by purchasing the stones from the natives and afterwards by buying diamond-bearing land, notably at Kimberley, he soon acquired a considerable fortune. He was mayor of Kimberley in 1880, and for four years was a representative of Griqualand West in the Cape parliament. On the discovery of gold in the Witwatersrand district in 1886, Robinson purchased the Langlaagte and Randfontein estates. His views as to the westerly trend of the main gold-bearing reef were entirely contrary to the bulk of South African opinion at the time, but events proved him to be correct, and the enormous appreciation in value of his various properties made him one of the richest men in South Africa. As a Rand capitalist he stood aloof from combinations with other gold-mining interests, and took no part in the Johannesburg reform movement, maintaining friendly relations with President Kruger. He claimed that it was as the result of his representations after the Jameson Raid that Kruger appointed the Industrial Commission of 1897, whose recommendations—had they been carried out—would have remedied some of the Uitlander grievances. In 1908 he was created a baronet.

ROBINSON, MARY ["Perdita"] (1758-1800), English actress and author, was born in Bristol on the 27th of November 1758, the daughter of a captain of a whaler named Darby. In 1774 she was married to Thomas Robinson, a clerk in London, where her remarkable beauty brought her many attentions; and after two years of fashionable life, her husband was arrested for debt, she shared his imprisonment. She had been a precocious child, encouraged to write verses, and while in King’s Bench prison she completed the collection published in two volumes in 1775. On her release, thanks to Garrick, she secured an engagement at Drury Lane, making a successful first appearance as Juliet in 1776. On the 3rd of December 1779 she was Perdita in Garrick’s version of The Winter’s Tale, and her beauty so captivated George, prince of Wales (afterwards
George IV.), then in his eighteenth year, that he began a correspondence with her, signing himself "Florizel." She was for about two years his mistress, but he then deserted her, even dishonouring his bond for £20,000 payable when he came of age, and left her to obtain a pension of £500 in exchange for it from Charles James Fox. Owing to the hostility of public opinion, she feared to return to the stage, but she published some more volumes of her writings. There are numerous charming portraits of "Perdita"; two in the Wallace Collection, by Reynolds and by Gainsborough, reveal 'her grave, refined beauty.' Hoppner, Cosway and Romney also painted her.

ROBINSON, THEODORE (1852-1890), American artist, was born at Irasburg, Vermont, in 1852. He was a pupil of J. L. Gréôme and Carolus-Duran in Paris, and worked with Claude Monet. He received the Webb Prize in 1880 for his "Winter Landscape," and the Shaw Fund in 1892 for his "In the Sun," a study of a peasant girl. He became a member (1881) of the Society of American Artists. He died in New York City on the 2nd of April 1890.

ROB ROY (1671-1729), the popular designation of a famous Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, was by descent a Macgregor, being the younger son of Donald Macgregor of Glengyle, lieutenant-colonel in the army of James II., by his wife, a daughter of William Campbell of Glenave. He received the name Roy from his red hair, and latterly adopted Campbell as his surname on account of the acts proscribing the name of his clan. Though in stature not much above the middle height, he was so muscular and thickly set that few were his equals in feats of strength, while the unusual length of his arms gave him an extraordinary advantage in the use of the sword. His eye was keen and piercing, and with his whole expression formed an appropriate complement to his powerful physical frame. He inherited a small property on the Braes of Balquhidder, and at first devoted himself to the rearing of cattle. Having formed a band of armed clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king, and in the autumn of 1691 made a descent on Stirlingshire to carry off the cattle of Lord Livingstone, when, being opposed by the villagers of Kilpen, he also seized the cattle from all the byres of the village. Shortly afterwards he married Helen Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1603 he managed, though not the nearest heir, to get himself acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhidder to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the 1st duke of Montrose, and, being unable to repay it, he was in 1712 evicted from his property and declared an outlaw. Taking refuge in the more inaccessible Highlands, Rob Roy from this time forth supported himself chiefly by depredations committed in the most daring manner on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he did not take an active part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but, having for some time enjoyed the friendship of the duke of Argyll, he obtained, on making his submission at Inveraray, a promise of protection. He now established his residence at Craigroyston, near Loch Lomond, whence for some time he levied blackmail as formerly upon Montrose, escaping by his wonderful address and activity every effort of the English garrison stationed at Inveraray to bring him to justice. Ultimately, through the mediation of Argyll, he was reconciled to Montrose, and in 1722 he made submission to General Wade; he was carried off, and imprisoned in Newgate, and in 1727 was pardoned just as he was to be transported to Barbados. He then returned to Scotland.

According to a notice in the Caledonian Mercury he died at Balquhidder on the 28th of December 1734. He was buried in Balquhidder churchyard.

The best lives are K. Maclean, Historical Memoirs of Rob Roy (1818; new ed., 1881); A. H. Millar, Story of Rob Roy (1883). See also Sir W. Scott's introduction to the novel Rob Roy. An early account, The Highland Rogue, &c. (1723), is ascribed to Defoe.

ROBSART, the maiden name of LADY AMY DUDLEY (1532-1566), wife of Lord Robert Dudley, afterwards earl of Leicester. She was the daughter of Sir John Robsart of Norfolk, and was married to Lord Robert on the 4th of June 1553. The marriage was apparently arranged by the family for business reasons, and there is no ground for supposing that it was a love match, or that she was beautiful. Her attraction lay in her estate, which was a provision for a younger son. During the early years of the marriage her husband was entangled in the rebellion of his family against Queen Mary, and was imprisoned in the Tower. She visited him there, and acted for his interests. After his release she saw little of him. When Elizabeth became queen in 1559 Lord Robert was soon known to be her favourite, and it was thought that she would marry him if he were alive. His wife never came to court, and was never in his company. Stories were set about to the effect that she was suffering from cancer and would soon die. Quadra, the Spanish ambassador, reported to the king of Spain that the queen had repeated this rumour to him. In 1560 she went by her husband's directions to Cumnor Place, a house near Oxford, rented by his agent Anthony Forster or Forrester, member of parliament for Abingdon. Here she was found lying dead on the floor of the hall on the 8th of September 1566 by her servants, whom she had allowed to go to Abingdon Fair. The circumstances of her death never have been, and cannot be, cleared up. A coroner's jury, which her husband did his best to pack and influence, attributed her end to accident. There is no evidence against Dudley, unless it be evidence that he was a most unscrupulous man, and that he was generally believed to have murdered several other persons who stood in his way.

ROBSON, STUART (1836-1903), American actor, whose real name was Robson Stuart, was born in Annapolis, Maryland, on the 4th of March 1836. An unintentionally humorous appearance in a serious part in 1852 showed him that his forte was comedy; and in partnership with W. H. Crane from 1877 to 1889 he was very successful as a comedian, The Henrietta being one of their best productions. He died on the 20th of April 1903. His wife, May Robson, also became well known as an actress.

ROBY, HENRY JOHN (1830- ), English classical scholar and writer on Roman law, was born at Tamworth on the 12th of August 1830. He was educated at St John's College, Cambridge (senior classic, 1853; fellow, 1854). From 1866 to 1868 he was professor of jurisprudence at University College, London, and from 1872 to 1874 commissioner of endowed schools. From 1890 to 1893 he was member of parliament in the Liberal interest for the Eccles division of Lancashire. The book by which he is perhaps best known is his Grammar of the Latin Language from Plautus to Suetonius, a storehouse of illustrative quotations from Latin literature, but his most important works deal with Roman law—Introduction to Justinian's Digest (1884) and Roman Private Law (1902).

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar to every one from the Arabian Nights, was widely spread in the East; and in later times the home of the monster was sought in the direction of Madagascar, whence gigantic fronds of the Raphe palm very like a quill bent in form appear to have been brought under the name of roc's feathers (see Yule's Marco Polo, bk. iii. ch. 33, and Academy, 1884, No. 620). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being
brought to Spain by a merchant from the China sea (Abu Hāmid of Spain, in Damir, s.n.). The roc is hardly different from the Persian shining bird, the bird which figures in Firdausi's epic as the foster-father of the hero Zal, father of Rustam. When we go farther back into Persian antiquity we find an immortal bird, amru, or (in the Mināi-khārid) sinmārū, which shakes the ripe fruit from the mythical tree that bears the seed of all useful things. Sinmārū and sinmūr seem to be the same word. In Indian legend the garudā on which Vishnu rides is the king of birds (Benley, Pantochatana, iii. 98). In the Pahlavi translation of the Indian story as represented by the Syrian Kātig and Dānnag (ed. Bickell, 1876), the sinmūr takes the place of the garudā, while Ibn al-Muʿkaffa' (Cañada et Dimna, ed. De Sacy, p. 126) speaks instead of the anḵāṅ. The later Syriac, curiously enough, has behemoth,—apparently the behemoth of Job transformed into a bird.

For a collection of legends about the roc, see Lane's Arabian Nights, chap. xx. notes 22, 62, and Yule, ut supra. Also see Bochart, Hieros, bk. vi. ch. xiv.; Damiri, i. 414, ii. 177 seq.; Razwini, i. (1492); Ibn Batṭa, iv. 305 seq.; Spiegel, Erzn. Allertumsk. ii. 118.

ROCAMADOUR, a village of south-western France, in the department of Lot, 36 m. N.N.E. of Cahors by roads. Pop. (1906) 296. Rocamadour, a famous place of pilgrimage, is most strikingly situated. Its buildings rise in stages up the side of a cliff on the right bank of the Alzou, which here runs between rocky walls 400 ft. in height. Flights of steps ascend from the lower town to the churches—a group of massive buildings half-way up the cliff. The chief of them is the church of Notre-Dame (1470), containing the wooden figure of the Madonna reputed to have been carved by St Amadour. The church opens on to a terrace called the Plateau de St Michel, where there is a broken sword said to be a fragment of “Durandal,” once wielded by the hero Roland. The interior walls of the church of St Sauveur are covered with paintings and inscriptions recalling the pilgrimages of celebrated persons. The subterranean church of St Amadour (1160) extends beneath St Sauveur and contains relics of the saint. On the summit of the cliff stands the château built in the middle ages to defend the sanctuaries.

Rocamadour owes its origin to St Amadour or Amatuer, who, according to tradition, chose the place as a hermitage for his devotion to the Virgin Mary. The saint is identified with Zacchaeus the publican and disciple of Jesus, who is said to have journeyed to Gaul to preach the gospel. The renown of Rocamadour as a place of pilgrimage dates from the early middle ages.

ROCAMBOLE, Allium Scorodoprasum, a hardy bulbous perennial occurring in a wild state in sandy pastures and waste places throughout Europe, but not common in the south; in Britain it is rare, and found in the north of England and the south of Scotland. Its cultivation does not appear to be of ancient date; it is not mentioned by Greek and Roman authors, and there are only a small number of original common names among ancient peoples (A. de Candolle, Origin of Cultivated Plants, p. 72). The plant is grown for its bulbs, which are smaller and milder than those of garlic, and consist of several cloves chieflly produced at the roots. The cloves are planted about the end of February or in March, and treated like garlic or shallot. When mature, the bulbs are taken up, dried and stored for use.

ROCH, St (Lat. Rochus; Ital. Rocco; Span. Roque; Fr. Roch) (d. 1327), a confessor whose death is commemorated on the 16th of August; he is specially invoked against the plague. According to his Acta, he was born at Montpellier, France, about 1393. He early began to manifest strict asceticism and great devoutness, and on the death of his parents in his twentieth year he gave all his substance to the poor. Coming to Italy during an epidemic of plague, he was very diligent in tending the sick in the public hospitals at Aquapendente, Cesena and Rome, and effected many miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill. He was expelled from the town, and withdrew into the forest, where he would have perished had not a dog belonging to a nobleman named Gothardus supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died on the 16th of August 1327, having previously obtained from God this favour—that all plague-stricken persons invoking him should be healed. His cult spread through Spain, France, Germany, Belgium and Italy. A magnificent temple was raised to him at Venice, where his body is believed to lie, and numerous brotherhoods have been instituted in his honour. He is usually represented with a dog, and in the figure of the former, with a wound in his thigh, and with a dog near him carrying a loaf in its mouth.

ROCHAMBEAU, Jean Baptiste Donatien de Vimeur, Comte de (1725-1807), French soldier, was born at Vendôme (Loir-et-Cher) on the 1st of July 1725. He was originally destined for the church and was brought up at the Jesuit college at Blois, but after the death of his elder brother he entered a cavalry regiment, served in Bohemia and Bavaria and on the Rhine, and in 1747 had attained the rank of colonel. He took part in the siege of Maastrict in 1748, became governor of Vendôme in 1749, and after distinguishing himself in 1756 in the Minorca expedition was promoted brigadier of infantry. In 1757 and 1758 he fought in Germany, notably at Crefeld, received several wounds in the battle of Clostercamp (1760), was appointed maréchal de camp in 1761 and inspector of cavalry and was frequently consulted by the ministers on technical points. In 1780 he was sent, with the rank of lieutenant-general, in command of 6000 French troops to help the American colonists under Washington against the English. He landed at Newport, Rhode Island, on the 10th of July, but was held here inactive for a year, owing to his reluctance to abandon the French fleet which was blockaded by the British in Narragansett Bay. At last, in July 1781, Rochambeau's force was able to leave Rhode Island and, marching across Connecticut, joined Washington on the Hudson. Then followed the celebrated march of the combined forces to Yorktown, where on the 22nd of September they formed a junction with the troops of Lafayette; as the result Cornwallis was forced to surrender on the 19th of October. Throughout, Rochambeau had displayed an admirable spirit, placing himself entirely under Washington's command and handling his troops as part of the American army. In recognition of his services, Congress voted him and his troops the thanks of the nation, and presented him with two cannon taken from the English. These guns, which Rochambeau took back to Vendôme, were requisitioned in 1792. On his return to France he was loaded with favours by Louis XVI. and was made governor of Picardy. During the Revolution he commanded the Army of the North in 1790, but resigned in 1792. He was arrested during the Terror, and narrowly escaped the guillotine. He was subsequently pensioned by Bonaparte, and died at Thoré (Loir-et-Cher) on the 10th of May 1807.

A statue of Rochambeau by Ferdinand Hamar, the gift of France to the United States, was unveiled in Lafayette Square, Washington, by President Roosevelt on the 24th of May 1902. The ceremony was made the occasion of a great demonstration of friendship between the two nations. France was represented by her ambassador, M. Cambon, Admiral Fournier and General Brugère, a detachment of sailors and marines from the warship "Gaulois" being present. Representatives of the Lafayette and Rochambeau families also attended. Of the many speeches perhaps the most striking was that of Senator Henry C. Lodge, who, curiously enough in the circumstances, prefaced his eloquent appreciation of the services rendered to the American cause by France by a brilliant sketch of the way in which the French had been driven out of North America by England and her colonists combined. General Brugère, in his speech, quoted Rochambeau's words, uttered in 1781: ""En theu res,
ROCHDALE—ROCHEFORT, H.

entre nous, à la vie, à la mort." A "Rochambeau fête" was held simultaneously in Paris.

The Mémoires militaires, historiques et politiques, de Rochambeau were published by Luce de Laval in 1809. Of the first volume a part, translated into English by M. W. E. Wright, was published in 1824 under the title of Memoirs of the Marshal Count de R., relative to the War of Independence in the United States. Rochambeau's correspondence during the American campaign is published in H. Doutin, Histé de la participation de la France à l'Establissement des États-Unis d'Amérique, vol. 2 (Paris, 1893), and in "Autour de Rochambeau" in the Revue des facultés catholiques de l'ouest (1898-1900); E. Gachot, "Rochambeau" in the Nouvelle Revue (1902); H. de Ganniers, "La Dernière Campagne du maréchal de Rochambeau" in the Revue des guerres historiques (1901.

ROCHDALE, a municipal, county and parliamentary borough of Lancashire, England, on the river Roch, 10½ m. N.E. from Manchester and 196 m. N.W. by N. from London, on the Lancashire & Yorkshire railway. Pop. (1891) 76,161; (1901) 83,114. By means of the Rochdale canal and canals it has water communications in every direction. The site rises sharply from the Roch, near its confluence with the Spodden, and from the high-lying public park of Rochdale fine views of the picturesque neighbourhood are obtained. Several interesting old houses remain in the vicinity of the town. The parish church of St. Chad is built on the site of a church erected in the 12th century, but itself retained so portion of a cathedral nave as to indicate its previous importance. In the churchyard is buried John Collier (1708-1786), a local author, artist and caricaturist, who was among the first to recognize and utilize in writing the humour of the Lancashire dialect, and attained considerable fame under the pseudonym of Tim Bobbin. The town hall is an elaborate and extensive structure in the Decorated style, with a tower. Of educational charities the principal is the Archbishop Parker free grammar school, founded in 1565. There are also technical and art schools; and a large Roman Catholic orphanage. Among other public institutions are the public library, the infirmary, the literary and scientific society, and a conservatoire of music. The borough is divided into 14 wards, and the mayor is elected by the borough council, which consists of a mayor, 10 aldermen and 30 councillors. The county borough was created in 1888. The parliamentary borough, which has returned one member since 1832, falls between the Middleton and Heywood divisions of the county. Area of municipal borough, 6,446 acres.

Rochdale (Rachden, Rachadem, Rachedal) takes its name from the river on which it stands. A Roman road passed the site, and a Saxon castle stood in Castleton, one of the component parts of the town. In Edward the Confessor's reign most of the land was held by Gaimel the Thane, but after the Conquest the manor probably came into the hands of Roger de Poictou, from whom it passed to the Lacy family and like their other lands became merged in the duchy of Lancaster. From 1462 to 1625 the crown seems to have leased it to the Byron family. In 1625 Charles I. conveyed the manor in trust for the earl of Holderness, and in 1638 it was sold to Sir John Byron, afterwards Baron Byron of Rochdale, whose descendants held it till 1823 when it was sold to the Deardens. Manor courts are still held periodically. Henry III. in 1240-41 granted by charter to Edmund de Lacy the right to hold a weekly market on Wednesday and an annual fair on the feast of SS Simon and Jude (28th October). Early in George III.'s reign the market day was changed to Monday. Two of the early industries, cutlery and hat-making, date from about the middle of the 16th century. The woollen industry is generally, but erroneously, said to have been introduced by Flemish immigrants in Edward III.'s reign; but, with the cognate trades of dyeing and fulling, its importance only dates from the early part of the 17th century. It was not till 1795 that a cotton mill was built here, and in the latter half of the 18th century the town was famed for its woollen, not its cotton manufactures.

See H. Fishwick, History of the Parish of Rochdale (1889).

ROCHE, SIR BOYLE, BART. (1743-1807), Irish soldier and politician, famous for his "bulls," came of a branch of the family of the Viscounts Fermoy. He served in the American War, and sat in the Irish parliament from 1777 onwards, being created a baronet in 1782 for his loyalty to the government. He supported the Union, and one of his recorded "bulls"—many, however, being only fastened on him—was his declaration that he would have "the two sisters" (England and Ireland) "embrace like one brother." Sir Boyle Roche was a characteristically witty and genial Irishman, and was master of the ceremonies at Dublin Castle.

ROCHEFORT, HENRI, MARQUIS DE ROCHEFORT-LUCAY (1820-1905), French politician, was born in Paris on the 30th of January 1820. His father was a Legitimist noble who as the 2nd Viscount Byron. He was well known as a writer of vaudeville and his mother's favourite son. He became, after some experience as a medical student, a clerk at the Hôtel de Ville, a playwright and a journalist, he joined the staff of the Figaro in 1863; but a series of his articles, afterwards published as Les Français de la Décadence (3 vols., 1866-68), brought the paper into collision with the authorities and caused the termination of his engagement. In collaboration with different dramatists he had meanwhile written a long series of successful vaudevilles, which began with the Monseur bien mis at the Folies Dramatiques in 1856. On leaving the Figaro Rochefort determined to start a paper of his own, La Lanterne. The paper was seized on its eleventh appearance, and in August 1868 Rochefort was fined 10,000 francs with a year's imprisonment. He then published his paper in Brussels, whence it was smuggled into France. Printed in French, English, Spanish, Italian and German, it went the round of Europe. After a second prosecution he fled to Belgium. A series of duels, of which the most famous was one fought with Paul de Casagnac a propos of an article on Joan of Arc, kept Rochefort in the public eye. In 1869, after two unsuccessful candidatures, he was returned to the Chamber of Deputies by the first circumscription of Paris. He was arrested on the frontier, only to be almost immediately released, and forthwith took his seat. He published his own newspaper, starting a new paper, the Marseille, as the organ of political meetings arranged by himself at La Villette. The staff was appointed on the votes of the members, and included Victor Noir and Pascal Grousset. The violent articles in this paper led to the duel which resulted in Victor Noir's death at the hands of Prince Pierre Bonaparte. The paper was seized, and Rochefort and Grousset were sent to prison for six months. The revolution of September was the signal for his release. He became a member of the government of National Defence, but this short association with the forces of law and order was soon broken on account of his openly expressed sympathy with the Communards. On the 12th of May 1871 he fled in disguise from Paris. A week earlier he had resigned with a handful of other deputies from the National Assembly rather than countenance the dismemberment of France. Arrested at Meaux by the Versailles government, he was detained for some time in prison with a nervous illness before he was condemned under military law to imprisonment for life. In spite of Victor Hugo's efforts on his behalf he was transported to New Caledonia. In 1874 he escaped on board an American vessel to San Francisco. He lived in London and Geneva until the general amnesty permitted his return to France in 1880. In Geneva he resumed the publication of La Lanterne, and in the Parisian papers articles constantly appeared from his pen. When at length in 1886 the general amnesty
permitted his return to France he founded *L'intransigent* in the Radical and Socialist interest. For a short time in 1835–86 he sat in the Chamber of Deputies. In 1837 he had a great opportunity next year for his talent for inflaming public opinion in the Boulangist agitation. He was condemned to detention in a fortress in August 1889 at the same time as General Boulanger, whom he had followed into exile. He continued his polemic from London, and after the suicide of General Boulanger he attacked M. Constans, minister of the interior in the Freemont cabinet, with the utmost violence, in a series of articles which led to an interpellation in the chamber in circumstances of wild excitement and disorder. The Panama scandals furnished him with another occasion, and he created something of a sensation by a Paris in his *Figaro* that he had met M. Clemenceau at the table of the financier Cornélius Herz. In 1895 he returned to Paris, two years before the Dreyfus affair supplied him with another point d'appui. He became a leader of the anti-Dreyfusards, and had a principal share in the organization of the press campaign. Subsequently he was editor of *La Patrie*.

Besides his plays and articles in the journals he published several separate works, among them being: *Les Petits Mystères de l'Hôtel des Ventes* (1862), a collection of his art criticisms; *Les Dépravés* (Geneva, 1872); *Les Vagues* (1876); *L'Étoile* (1883); *Napoléon dernier* (3 vols., 1884); and *Les Aventures de ma vie* (5 vols., 1896).

**ROCHEFORT,** a small town of Belgium, situated on the Lomme, a tributary of the Lesse, in the S.E. of the province of Namur close to the Ardennes. Resident pop. (1904) 3,068, which in July and August is doubled. It is of ancient origin, its position at the point where the river at St Hubert crossed from Liège to Bouillon having made it at all times a place of some importance. The ruins of the old castle, which gave the place its name and a title to a long line of counts who had the right of coining their own money, still exist. This castle underwent many sieges and attacks, but, especially at the hands of Marshal de Chatillon in 1636, Rochefort is noted for its healthiness, and is a favourite place of residence. It also attracts every summer a large number of visitors and tourists, who visit it on account of the remarkable grottoes in its neighbourhood. One of these is situated in the town itself and is known by its name. This grotto contains six halls or chambers, the largest of which is called the Sabat, and is remarkable for its great height. But the most famous are the grottoes of Han, situated three miles from Rochefort at Han sur Lesse. Here the river Lesse passes by a subterranean and undiscovered passage under the hill called Boëme or Boigne. The endeavour to trace the course of the river led to the discovery of the grottoes, which consist of fifteen separate halls, connected by passages more or less short and emerging on the river in a dark and extensive cavern forming a sort of side creek or bay. Except in flood-time, when the exit has to be used, the entrance is near the point where the river disappears at what is called the gap or hole of Belvaux, and the exit is made by boat from the cavern last described, which leads out to the open river. A beautiful effect is afforded by the passage from the complete darkness of this cavern into the light. The finest stalactites are in the three halls called the Mysteries, the Vigneron and the Draperies. In the last-named is the "tomb," which looks as if chiselled out of white marble. The central hall—called the Salle d'Armes—is immense, and one of the river channels flows through it. Electric light has been introduced. Near Rochefort are the famous red marble quarries of St Remy, and the old Cistercian abbey of that name is now a Trappist seminary.

**ROCHEFORT,** a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 20 m. S.S.E. of La Rochelle on the State railway from Nantes to Bordeaux. Pop. (1906) town, 31,433; commune, 36,694. It is situated on the right bank of the Charente, 9 m. from the Atlantic, and is built partly on the side of a rocky hill and partly on an old marshland. The town is laid out with great regularity, the streets being wide and straight and centring round the Place Colbert, in the middle of which is a monumental fountain of the 18th century. The public institutions of Rochefort comprise the sub-prefecture, tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce, a lycée for boys, a college for girls and schools of drawing and architecture. The fortifications are slight. Below Rochefort the Charente is crossed by a pont transbordeur, the carrier of which is suspended at a height which admits of the tallest ships passing underneath at any time. There are both a naval and a commercial harbour. The former has the advantage of deep anchorage well protected by batteries at the mouth of the river, and the roadstead is perfectly safe. The windings of the channel, however, between Rochefort and the sea, and the bar at the entrance, are hazardous. Rochefort is capital of the fourth maritime arrondissement, which stretches from the bay of Bourgneuf to the coast of Spain. The naval harbour and arsenal, separated from the town by a line of fortifications with three gates, contain large covered building yards, repairing docks and extensive timber basins on both banks of the river. The arsenal has also a ropewalk dating from 1668, a school of navigation and pilotage, the offices of the maritime prefecture, the navy commissariat, a park of artillery and various boards of direction connected with the navy. Of the numerous establishments at Rochefort are barracks for infantry, artillery and marines; the naval hospital and school of medicine. In the grounds of this last institution is an artesian well, sunk in 1852–1866 to a depth of 2,000 ft., and yielding water with a temperature of 100° F. The commercial harbour, higher up the river than the naval harbour, has two small basins, a third basin with an area of 15 acres and a depth at nip-tide of 25 ft., at spring-tide of 30 ft., and a dry dock 110 yrs. long. Besides shipbuilding, which forms the staple industry, flour- and saw-milling, sailcloth, &c., are among the local manufactures. At the ports of Rochefort and Tonnay-Charente (4 m. higher up) there entered, in 1905, 285 vessels (166 British), with a tonnage of 192,537.

The lordship of Rochefort, held by powerful nobles as early as the 11th century, was united to the French Crown by Philip the Fair early in the 14th century; but it was alternately seized in the course of the Hundred Years' War by the English and the French, and in the Wars of Religion by the Catholics and Protestants. Colbert having in 1665 chosen Rochefort as the seat of a repairing port between Brest and the Gironde, the town rapidly increased in importance; by 1674 it had 29,000 inhabitants; and when the Dutch admiral Tromp appeared at the mouth of the river with seventy-two vessels for the purpose of destroying the new arsenal, he found the approaches so well defended that he gave up his enterprise. It was at Rochefort that the naval school, afterwards transferred to Brest, was originally founded. The town continued to flourish in the latter part of the 17th century. In 1690 and in 1703 the English made unsuccessful attempts to destroy it. Its fleet, under the command of Admiral la Gallisonnière, a native of the place, defeated Admiral Byng in 1755 and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Île d'Arès, the preference accorded to the harbours of Brest and Toulon and the unhealthiness of its climate seriously interfered with the prosperity of the place. The convict establishment, founded at Rochefort in 1777, was suppressed in 1852.

**ROCHESTER, JOHN WILMOT, 2ND EARL OF** (1647–1688), English poet and wit, was the son of Henry Wilmot, 1st earl. The family was descended from Edward Wilmot of Witney, Oxfordshire, whose son Charles (c. 1570–c. 1644), having served with distinction in Ireland during the rebellion at the beginning of the 17th century, was president of Connaught from 1616 until his death. In 1621 he had been created an Irish peer as Viscount Wilmot of Athlone, and he was succeeded by his only surviving son, Henry (c. 1622–1658). Having fought against the Scots at Newburn and been imprisoned and expelled from
the House of Commons for plotting in the interests of the king in 1641, Henry Wilmot served Charles I. well during the Civil War, being responsible for the defeat of Sir William Waller at Roundway Down in July 1643 and at Cropredy Bridge in June 1644. In 1643 he was created Baron Wilmot of Adderbury. When the last minute on the ground of ill-health the king's friends and advisers, including Prince Rupert, and in 1644 he is reported to have said that Charles was afraid of peace and to have advised his supercession by his son, the prince of Wales. Consequently he was deprived of his command, and after a short imprisonment was allowed to cross over to France.

He was greatly trusted by Charles II., whose defeat at Worcester and subsequent wanderings he shared, and during this king's exile he was one of his principal advisers, being created by him Earl of Rochester in 1652. In the interests of Charles he visited the emperor Ferdinand III., the duke of Lorraine, and the elector Palatine in 1655 he was in England, where he led a feebly attempt at a rising on Marston Moor, near York; on its failure he fled the country.

Born at Ditcheley in Oxfordshire on the 10th of April 1647, John Wilmot, who succeeded his father as 2nd earl in 1658, was educated at Wadham College, Oxford, and in 1661, although he was only fourteen years of age, received the degree of M.A. On leaving Oxford he travelled in France and Italy with a tutor who encouraged his love of literature, and moreover advocated principles of temperament which, however, bore little fruit. He returned in 1664, and at once made his way to Charles II.'s court, where his youth, good looks and wit assured him of a welcome. In 1665 he joined the fleet serving against the Dutch as a volunteer, and in the following year distinguished himself by carrying a message in an open boat under fire. This reputation for courage was afterwards lost in private quarrels in which he seems to have shirked danger. He became gentleman of the bedchamber to Charles II., and was the confidant of his various exploits. According to Anthony Hamilton, banishment from court for lampooning the king or his mistresses was with Rochester an almost annual occurrence, but his disgrace was never of long duration. Charles seems to have found his company too congenial to be long dispensed with, and Pepys says that all serious men were disgusted by the complaisance with which he passed over Rochester's insolence (Diary, 17th Feb. 1669). In order to restore his rapidly vanishing fortune he became a suitor to Elizabeth Malet. In spite of the king's support of Rochester's suit, Miss Malet refused to marry the earl, who thereupon had her seized (1665) from her uncle's coach. Rochester was pursued, and Charles, who was very angry, sent him to the Tower. Miss Malet, however, married him in 1667.

Not content with making or unmaking the reputation of the maids of honour and the courtiers by his squibs and songs, Rochester aspired to be a patron of poetry and an arbiter of taste, but he was vain and capricious, tolerating no rivals in his capacity of patron. Dryden dedicated to him his Marriage à la Mode (1672) in a preface full of effusive flattery, at the close of which, however, occurs a passage that may be taken to indicate that he already had misgivings. "Your lordship has but another step to make," he says, "and from the patron of wit, you may become its tyrant; and oppress our little reputations with more ease than you now protect them." Dryden had another patron in Lord Mulgrave (afterwards duke of Buckingham and Normanby), to whom he dedicated (1675) Aurengzebe. Mulgrave had engaged in a duel with Rochester, who had refused to submit to what he considered a base treachery. Dryden and Mulgrave allowed this story to spread, and Rochester, who apparently thought him too dangerous an opponent, revenged himself on Dryden as Mulgrave's protégé by setting up as his rivals, first Elkanah Settle, and then John Crowne. By his influence Settle's Emperor of Morocco was played at Whitchall, and Crowne was employed, in direct infringement of Dryden's province as laureate, to write a masque for the court. Both these poets were discarded in turn for Nathaniel Lee and Thomas Otway. In 1679 Mulgrave began to circulate his Essay on Satire in which Rochester was singled out for severe criticism.

Rochester chose to pretend that this was Dryden's work, not Mulgrave's, and by his orders a band of roughs set on the poet in Rose Alley, Covent Garden, and beat him. He obviously felt no shame for this infamous attack, for in his "Imitation of the First Satire of Juvenal" he says, "Who'd be a wit in Dryden's company?" and he is reported to have said that his health was already undermined, and in the spring of 1680 he retired to High Lodge, Woodstock Park. He began to show signs of a more serious temper, and at his own request was visited (July 20th to July 24th) by Bishop Burnet, who attested the sincerity of his repentance. He died, however, two days after the bishop left him. When his son Charles, the 3rd earl, died on the 12th of November 1681, his titles became extinct.

As a poet Rochester was a follower of Abraham Cowley and of Boileau, to both of whom he was considerably indebted. His love lyrics are often happy, but his real vigour and ability is best shown in his critical poetry, in satires. Two in particular are notable for their fierce exposure of Charles II.'s weakness, his ingratitude, and the slavery in which he was held by his mistresses. They show that Rochester had it in him to be a very different man from the criticising courtier and the "very profitable wit" who figures in contemporary memoirs.

Bibliography.—Poems on Several Occasions by the Right Honourable John Wilmot, Earl of Rochester, 1672, 1673, 1674, 1723, reprinted in London. Other issues, slightly varying in title and contents, appeared in 1685, 1691 and 1696. Valentinian, A Tragedy, adapted from Beaumont and Fletcher, was printed in 1685; a corrected copy on the play shows that the licentious couplets, Sodom, was printed in 1684, and is supposed, in spite of Rochester's denial, to have been chiefly his work. No copy of this is known, but there are two MSS. extant. The complete edition of Rochester's Works, The Poetical Works of the Earl of Rochester (1781-1783) was expurgated collections are to be found in Johnson's, Anderson's and Chalmers's edition of the British Poets. His Familiar Letters were printed in 1686, 1697 and 1699. His Political Satires are available, with those of Sir John Denham and Andrew Marvell, in the Bibliotheca Curiosa (Some Political Satires of the Seventeenth Century, vol. i., Edinburgh, 1885). Contemporary accounts of Rochester are to be found in the memoir by Saint-Evremond prefaced to the edition of 1705, and in the Memoires du Comte de Gramont, in the funeral sermon preached by Robert Parsons (1680), and in Bishop Burnet's Some Passages in the Life and Death of John, Earl of Rochester (1680) reprinted in Bishop Wordsworth's Ecclesiastical Biography (vol. i.).

ROCHESTER, LAWRENCE HYDE, EARL OF (1641-1711), English statesman, second son of Edward Hyde, earl of Clarendon, was born in March 1641. After the restoration of Charles II. he sat as member of parliament, first for Newport in Cornwall and afterwards for the university of Oxford, from 1660 to 1679. In 1661 he was sent on a complimentary embassy to Louis XIV. of France, while he held the court post of master of the robes from 1662 to 1675. In 1665 he married Henrietta (d. 1667), daughter of Richard Boyle, earl of Burlington and Cork. When his father was impeached in 1667, Lawrence joined with his elder brother, Henry, to defend him in parliament, but the fall of Clarendon did not injuriously affect the fortunes of his sons. They were united with the royal family through the marriage of their sister, Anne, with the duke of York, afterwards James II., and were both able and zealous royalists. In 1676 Lawrence Hyde was sent as ambassador to Poland; he then travelled to Vienna, whence he proceeded to Nijmegen to take part in the peace congress as one of the English representatives. Having returned to England, he entered the new parliament, which met early in 1679, as member for Wotton Bassett; in November 1679 he was appointed first lord of the treasury; and for a few years he was the principal adviser of Charles II. In April 1681 he was created Viscount Hyde of Kenilworth, and in November following earl of Rochester. He was compelled to join in arranging the treaty of 1684, by which Louis XIV. agreed to pay a subsidy to Charles, at the very moment when he was imploring William, prince of Orange, to save Europe from the ambitions of the French monarch. The conflict between his wishes and his interests may have tended to sour a temperament never very equable; at all events the earl made himself so unpleasant to his colleagues that in August 1684 he was removed from the treasury to the
more dignified, but less influential, post of president of the council, a process which his enemy Halifax described as being "kicked upstairs." Although appointed lord lieutenant of Ireland, Rochester did not take up this position; he was still president of the council when James II. became king in February 1685, and he was at once appointed to the important office of lord treasurer. But in spite of their family relationship and their long friendship, James and his treasurer did not agree. The king wished to surround himself with Roman Catholic advisers; the earl, on the other hand, looked with alarm on his master's leanings to that form of faith. In January 1687 he was removed from his office of treasurer, being solaced with a pension of £4,000 a year and a gift of Irish lands.

After the revolution of 1688 Rochester appeared as a leader of the Tories, and he opposed the election of William and Mary as king and queen, raising his voice for the establishment of a regency on behalf of the exiled James. But he soon reconciled himself to the new order, perhaps because he could not retain his pension unless he took the oaths of allegiance. After this he was quickly in the royal favour and again a member of the privy council. He advised the queen in ecclesiastical matters, and returned to his former position as the leader of the High Church party. From December 1700 until February 1703 he was lord lieutenant of Ireland, although he did not spend much time in that country, and the concluding years of his public life were mainly passed in championing the interests of the Church. In 1710 he was again made lord president of the council. He died on the 2nd of May 1711, and was succeeded by his only son, Henry (1672-1758), who in 1724 inherited the earldom of Clarendon. When Henry died without issue on the 10th of December 1758 all his titles became extinct.

Lawrence Hyde had some learning and a share of his father's literary genius. The main employment of his old age was the preparation for the press of his father's History of the Rebellion, to which he wrote a preface. Like most of the men of his time, he drank deeply, and he was of an arrogant disposition and had a violent temper. In Dryden's satire of Absalom and Achitophel he is "Husheil," the friend of David in distress.

The correspondence of Rochester with his brother the earl of Clarendon, together with other letters written by him, was published with notes by S. W. Singer (1828). Other authorities are G. Burnet, History of his Own Time, edited by A. Airy (Oxford, 1897-1902); J. Evelyn, Diary, edited by H. B. Wheatley (1879); and Macaulay, History of England.

ROCHESTER, a city, municipal and parliamentary borough of Kent, England, on the river Medway, 33 m. E.S.E. of London by the South-Eastern & Chatham railway, contiguous to Chatham and Sittingbourne, within the county borough of the city on the same bank of the river, while Strood is opposite on the left bank, being connected with Rochester by a railway bridge and by an iron swing bridge, the latter occupying the site of a bridge which spanned the Medway before the Conquest. The cathedral church of St Andrew was originally founded by Augustine in 604, for whom Ethelbert built the church. It was partially destroyed by the Danes, but was rebuilt, with a long choir and square east end, by Bishop Gundulph, the second Norman bishop (1077-1106). Gundulph at the same time (1086) established an order of Benedictine monks here. Bishop Pelham (1152-54), who as prior of Canterbury and abbot of Peterborough had already distinguished himself as a builder, completed and also renovated the church, lengthening it by two bays eastward; the old chapter-house remains. The beautiful Norman west front was built about 1225-30, and in 1180 the new cathedral was consecrated About 1201 a baken, William of Perth, while on a pilgrimage was murdered near Rochester by robbers. He was buried in the cathedral and was canonized, his shrine becoming a famous resort of pilgrims, who brought much wealth to the monastery. The edifice suffered from fire in 1357 and in 1371. During the whole of the 13th and a part of the 14th century a gradual rebuilding, or sometimes mere recasing, of the church was effected from east to west. The work included an extended choir by William de Hoo (1227), enlargement of the main transepts, the building of piers for a central tower, and treatment of the nave to the third bay. About 1352 a low central tower was built, to which a spire was added in the next century. Towards the end of the 15th century St Mary's chapel was added, the Norman clerestory was rebuilt, and a great west window inserted. Though a comparatively small building, being only 306 ft. in length and 65 ft. in breadth at the nave, the cathedral is of much architectural interest, and exhibits a variety of styles from Norman to Perpendicular. The rich and varied decoration of the Norman nave (especially the triforium) is very notable, as is also the chapter-house doorway, a fine example of decorated work. The Early English portion of the building is less successful. The ruins of Gundulph's Tower are detached from and are earlier than the church; this tower was built by Bishop Gundulph probably as a defensive work for the eastern boundary of the city. The crypt beneath the choir is of special interest, showing early Norman work in the western part. The remainder is Early English, and there are traces of mural painting. The cathedral contains many interesting monuments, including a plain slab assigned to Gundulph, and several tombs of bishops of the 13th century, among them that of Bishop Walter de Merton, founder of Merton College, Oxford (d. 1277). The library attached to the modern chapter-house contains, among various valuable relics, the Textus Rotensis, being records of the cathedral compiled in the time of Bishop Ermull. The old episcopal palace is partly converted into dwelling-houses. Portions of the wall of the priory dormitory and the refectory doorway may also still be seen. Among various restorations of the cathedral in the 19th century the earliest was that of Lewis Cottingham (1825-27), who erected a Decorated central tower unsuited to the general character of the building. Bishop Hamo de Hythe (1319-52) had erected a tower with short spire of timber and lead, and of this the general design is reproduced in the part of the building which Mr C. H. Fowler, begun in 1904 under Dean Hole, who, however, did not survive to see its dedication on St Andrew's day at the close of the same year.

The parish church of St Nicholas was built in 1421, and restored after a fire in 1862. In Saxon times the cathedral was the parish church, but after the establishment of a monastery here, monks and parishioners quarrelled as to their rights, and a new parish church was built.

On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the old defensive remains of the Norman castle, part of which was built by Bishop Gundulph at the order of William Rufus towards the close of the 11th century. The castle was besieged by King John, by Simon de Montfort in the reign of Henry III., and in the reign of Richard II. by a party of rebels during the insurrection of Wat Tyler. It was repaired by Edward IV., but soon afterwards fell into decay, although the massive keep is still in good preservation. This, one of the finest relics of its kind in England, is considered to be the work of William de Corbeil, archbishop of Canterbury, to whom the castle was granted in 1126. It is a quadrangular four-storeyed structure, flanked by turrets, with an extreme height of 125 ft. Remains of the 12th-century walls which once surrounded the city also exist. Gad's Hill, above Strood, to the north-west, is famous as the residence of Charles Dickens. At Borstal, south-west of Rochester, is a large convict prison. Among the principal public buildings of secular character in the city are the town hall (1687), the corn exchange with free library and a museum, the county court offices, and the Richard Watt's almshouses (1579). Besides these almshouses there are a number of other charities, among which the almshouse of St Catherine originated in 1376 as a leper's hospital. A picturesque Elizabethan mansion was acquired by the corporation for a museum as a memorial of Queen Victoria's Diamond Jubilee. The principal schools are the cathedral grammar-school or King's School, founded in 1544, and the Williamson mathematical school (1794), formerly
ROCHESTER

for the sons of freemen, but now open to all. Rochester has an oyster fishery of some importance, and there is a considerable shipping trade, a quay and landing-place having been erected by the corporation. There is a large steam-engine manifold. In Strood, which is a ward of the borough of Rochester, there are oil-mills, and brick and cement works. The dockyards and government works of Chatham employ many inhabitants of Rochester. The parliamentary borough returns one member. The city is governed by a mayor, six aldermen, and eighteen councillors. Area, 2933 acres.

History.—Its situation on the Roman way from the Kentish ports to London, as well as its strategic position on the bend of the river Medway, near the point where the Rother (Dubrana or Rochester or Rochester) flows into the Medway (Durobrivae) during the Roman period) is an early importance. It was a walled Roman-British town (though of no great size), and the original bridge across the Medway probably dated from that period. The church of St Andrew was founded by King Æthelbert, who made Rochester a bishop’s see. Rochester was a royal borough in the time of William I., who raised a castle here, probably on Boley Hill. Richard I. granted the citizens quittance of passagium from crusaders in the town of Rochester. In 1277 Henry III. granted them an exemption at the free rent of £25; he also granted them a geld merchant, the right to be impeached only within the city walls, and other liberties. The charters were confirmed by subsequent successors down to Henry VI., who in 1446 incorporated the city by the title of the bailiff and citizens, and granted them the power of admiralty and many privileges. Edward IV. by his charter of 1461 altered the form of the corporation. In 1462 and citizens, and a charter was granted in successive reigns down to Charles I., whose charter of 1669 remained the governing charter until 1835. A fair on the 18th, 19th and 20th of May was granted to the citizens by Henry VI., and another fair was formerly held in December by prescription. At the present time fairs are held on the 18th of May, in the first week of June, and the last week of August. A "formarket" was granted in the second charter of Henry III.; the market days were formerly Tuesdays and Fridays. Corn and cattle markets are now held on Tuesday.

ROCHESTER, a city and the county-seat of Olmsted county, Minnesota, U.S.A., on the Zumbro river, about 70 m. S.E. of St Paul. Pop. (1890) 5321; (1900) 6843; (1905, state census) 7233 (1905 foreign-born); (1910 census) 7844. It is served by the Chicago & North-Western and the Chicago Great Western railways. The city has a public library (1863), and is the seat of St John’s School and the Academy of Our Lady of Lourdes (both Roman Catholic). Olmsted county maintains a state hospital for the insane (1858), originally planned (1877) as an inebriate asylum, liquor dealers being taxed for its erection, and of St Mary’s Hospital (1889), a famous institution founded and maintained by the Sisters of St Francis. There is valuable water-power, and the city has grain elevators and various manufactures. Rochester was first settled in 1854, and was chartered as a city in 1858.

ROCHESTER, a city of Strafford county, New Hampshire, U.S.A., on the Cocheco and Salmon Falls rivers, about 30 m. E. by N. of Concord. Pop. (1890) 7396; (1900) 8466, of whom 1651 were foreign-born; (1910 U.S. census) 8868. Area, about 34 sq. m. Rochester is served by four lines of the Boston & Maine railroad. The rivers furnish excellent water-power for various manufactures. Rochester, named in honour of Lawrence Hyde, earl of Rochester, was incorporated as a town by a royal charter in 1722, but part of the original town was made here until 1728. From parts of the original town Farmington and Milton were erected in 1708 and 1822 respectively, and in 1846 part of Rochester was annexed to Barrington. It was the birthplace of John Parker Ilac. Rochester was chartered as a city in 1891.

See F. McDuffie, History of the Town of Rochester, New Hampshire (1884).

ROCHESTER, a city and the county-seat of Monroe county, New York, U.S.A., about 70 m. E.N.E. of Buffalo and about 230 m. W. of Albany, on the Genesee river, 7 m. above where it empties into Lake Ontario. Pop. (1880), 86,366; (1890), 133,896; (1900), 162,608, of whom 40,748 were foreign-born (including 15,685 Germans; 7746 English-Canadians; 5599 Irish; 3909 English; 1777 Russians; and 1278 Italians) and 601 were negroes; (1910, census) 218,140. Rochester is served by the Erie, the Pennsylvania (two divisions), the Lehigh Valley, the West Shore, the Buffalo, Rochester & Pittsburgh (two divisions), and the New York Central & Hudson River (five divisions) railways. The Genesee river, which cuts through the centre of the city in a deep gorge whose banks vary in height from 50 to 200 ft., is navigable for only 13 m. from a point about 200 ft. below the city; the Erie Canal runs through the heart of the city and is carried across the river on a stone viaduct of seven arches, 850 ft. long, and has a channel 45 ft. wide. Several lines of freight and passenger steamboats connect with Buffalo, Oswego and other lake ports, and there are daily passenger steamboats to Toronto, Canada, 70 m. distant across the lake. Electric railways connect with neighbouring cities and lake-side resorts on Lake Ontario (Ontario Beach) and Irondequoit Bay, an irregular arm of the lake 5 m. long 2 m. E. of the city limits. Rochester is on high plateaus on either side of the Genesee river at a general altitude of about 400 ft., and is 350 ft. above sea-level. It occupies an area of 2013 sq. m. Within the city limits are the famous Falls of the Genesee, three cataracts of 66, 26 and 83 ft. respectively, the banks above the first fall, which is in the heart of the city, rising to a height of fully 200 ft. above the river. From the city limits the river falls 263 ft. in its 7 m. course to the lake. Ten bridges, road and railway, connect the two sides of the river.

Rochester is an attractive city, with many fine avenues. East Avenue is perhaps the most beautiful street in the city, and Plymouth, West and Lake Avenues are other prominent residential streets. The park system of Rochester, planned by Frederick Law Olmsted, was 1264 acres in extent in 1906. The largest park is Eastman-Durand (512 acres) and a zoological garden; Highland Park (75 acres) and eleven other smaller parks. In Washington Park there is a soldiers’ monument surmounted by a statue of Lincoln, and a statue (1868) by S. W. Edwards of Frederick Douglass, the negro orator and editor, who lived in Rochester in 1847-70, stands at the approach to the New York Central & Hudson River railway station. The principal cemeteries are the Mount Hope, the Holy Sepulchre, and Riverside. The Powers Building, a 7-storey stone and iron structure surmounted by a tower 204 ft. high, was one of the first office buildings in the United States to be equipped with elevator service. The Monroe County Court House (of New Hampshire granite) on West Main Street is in the Renaissance style, and contains a law library of about 25,000 volumes. The City Hall (of grey sandstone) has a tower 175 ft. high. Among the other prominent buildings are the Post Office, the Chamber of Commerce, the Lyceum Theatre, the Temple Theatre, the Masonic Building, the Buffalo, Rochester & Pittsburg office building, the Sibley building, the Duffy-McInnerny building, and the Young Men’s Christian Association building. The churches are architecturally noteworthy: the Central, the First and the Third Presbyterian, the Brick Presbyterian, St Patrick’s Cathedral (Roman Catholic), the Cornhill and the Asbury (Methodist Episcopal), the First Baptist, St Paul’s (Protestant Episcopal), and the First Unitarian. Rochester is the see of a Roman Catholic bishop. In Rochester are the Western New York Institution for Deaf Mutes, the Monroe County Penitentiary, a State Arsenal, a State Hospital for the Insane, the Protestant Episcopal Church Home, Rochester City Hospital (1864), and others, including the Rochester Municipal Hospital (1903) for contagious diseases and consumption.

Rochester is an important educational centre. Its best-known institution is the University of Rochester (Baptist, 1850; co-educational since 1900), having in 1908-9 28 instructors, 352 students (231 men and 121 women), and a library of 49,000 volumes. It occupies a tract of 24 acres

1 From the top of the upper falls (96 ft. high), in the centre of the city, Sam Patch (1807-1829) jumped and was killed in November 1859; he had formerly made the same leap, had jumped half the depth of Niagara, and was planning to go to London and jump from London Bridge—he was to go by sailing packet to Liverpool and jump from the yard-arm every fair day.
ROCHET on University Avenue in the eastern part of the city. With it is connected the Ward Museum, containing the valuable geological and zoological collections of Henry Augustus Ward (1834–1906), an American naturalist, professor of natural sciences here in 1860–75, who had in Rochester a laboratory for the manufacture of plaster-casts of fossils, and who prepared natural history cabinets for many museums. Much of the success of the university was due to Martin Brewer Anderson (1815–1890), president from 1853 to 1888, and David Jayne Hill (b. 1839), who was president from 1888 to 1896, and subsequently was assistant secretary of state in 1898–1903, and minister to Switzerland in 1903–5 and to the Netherlands from 1905 to 1907, when he was also ambassador to Germany. Rochester Theological Seminary (1820) is also under the control of the Baptist Church, but has no organic connexion with the city. Its library of 35,000 volumes includes the valuable collection (6500 vols.) of the German church historian, Johann August Wilhelm Neander. Other educational institutions include St Bernard’s Theological Seminary (Roman Catholic; 1893); Wagner Memorial Lutheran College (German); Academy of the Sacred Heart (Roman Catholic), &c. One of Rochester’s most noteworthy institutions is the Athenaenum and Mechanics’ Institute (an outgrowth of the Rochester Athenaeum; founded in 1829); it was founded in 1885 by Henry Lomb, of the Bausch & Lomb Optical Co., a large building, the gift of George Eastman (b. 1854), of the Eastman Kodak Co. It has an endowment of $650,000, and more than 60 instructors, and in 1907–8 more than 5000 students were enrolled. Since 1907 public school buildings have been used as club-houses for community civic clubs with libraries and gymnasiums; and in 1909 a League of Civic Clubs was organized. Besides the law library and the libraries of the educational institutions mentioned above, Rochester has the Reynoldis (Public) Library, containing more than 65,000 volumes in 1910.

The Falls of the Genesee provide a valuable water-power, early utilized by the flour-milling industry, of which, owing largely to the nearness of the fertile wheat-fields of the Genesee Valley and the transportation facilities furnished by the Erie Canal and Lake Ontario, as well as to the water-power, Rochester was for many years the most important centre in the country. Flour-milling is now represented by seven great mills and six small ones, but Rochester is high among the great manufacturing cities of the country, holding third rank in this as in population in New York state, and is remarkable for its manufacture and output of its manufacturing plants, which are the largest of their sort in the United States and the world. In 1905 the value of the city’s factory products was $88,747,379, an increase of 35.7% since 1900. In value of products the order of importance of the various branches of the industry is: 1. Flour-milling; 2. Manufacture of men’s clothing stood first; the value of the product was $14,948,703, or more than 18% of the total value of all the city’s manufactures; and 20% of the factory wage-earners in the city were employed in this industry. The second industry in 1905 was the making of boots and shoes, of which the value was $8,620,011, an increase of 24.3% since 1900. In the value of clothing and in the value of boots and shoes manufactured Rochester ranked seventh among the cities of the United States in 1905. In the manufacture of photographic apparatus and materials and optical goods Rochester easily holds first place in the world, and it has the largest establishment for the manufacture of cameras (the Eastman Kodak Co.) and the largest manufacturers of telescopes, opera and field glasses (Bausch & Lomb Optical Co.). The total value of the photographic apparatus in 1905 was $2,886,071, which represented 82.9% of the value of the product of the photographic apparatus manufactured in the entire United States, and was 177.1% more than in 1900. Photographic materials amounted in value to $4,528,582, 47.4% of the total value of the product of the photographic industry in the United States, and was 402.6% more in 1905 than in 1900. Another remarkable increase was shown in the value of electrical machinery and apparatus, which was only $15,000 in 1900, but in 1905 was $2,675,368. Flour and milling products in 1905 at $8,641,992 stood at 14.3%, of which Rochester is an immense refinery of lubricating oil, and the oil product more than doubled in value between 1900 and 1905. Other important manufactures, with the value of their product in 1905, are as follows: Clocks and watches, $1,792,000; furniture, $2,361,839; tobacco, cigars, snuff, &c., $2,724,531; malt liquors, $2,173,707; commissioning, $1,512,611; lumber and planing mill products, $1,495,239; carriage and wagons, $1,229,570; and stationery goods, $1,170,873. Rochester is also the nursery-
ROCHFORD, EARL OF—ROCK, D.

vestment. In the Roman Catholic Church the rochet is a tunic of white, and usually fine linen or muslin (battiste, null) reaching about to the knee, and distinguished from the surplice by the fact that its arms are narrow and tight-fitting. The lower edge and the sleeves are usually garnished with lace, lined with violet or red silk in the case of prelates, or—more rarely—with embroidered borders.

The rochet is proper to, and distinctive of, prelates and bishops: but the right to wear it is sometimes granted by the pope to others, especially the canons of cathedral churches. It is not a vestis sacra, and cannot therefore be used as a substitute for the surplice, e.g. in the administering of the Sacraments (Decree of the Congregation of Rites of Jan. 10, 1852).

None the less, since it is used at choir services and is ordered to the wear of the clergy, it is thought by some that it is the proper dress for the church. Though it is rarely worn, it is by no means unknown to modern prelates, and may still be seen at Fotheringhay and Longleat. It is not, however, used by the clergy in the United States.

Though it is rarely worn, it is by no means unknown to modern prelates, and may still be seen at Fotheringhay and Longleat. It is not, however, used by the clergy in the United States.

ROCHFORD, EARL OF, an English title borne by the family of Nassau de Zulestein from 1605 to 1830. William Henry Nassau de Zulestein (1645-1709) was born at Zulestein, near Utrecht, his father being Frederick Nassau de Zulestein (1608-1679), a natural son of Henry Frederick, prince of Orange, and his mother an English lady, Mary Killeigrew. One of the most trusted companions of his kinsman, William of Orange, Zulestein was sent to England in 1687 and again in 1688 to report on the condition of affairs, and later in 1688 he sailed with the prince on his famous expedition. After the Revolution he was naturalized and served the king in the field, being created a Knight of the Garter in 1688. Rochford, however, was succeeded by his son William (1681-1710), who was killed at the battle of Almenara, and then by another son Frederick (1682-1733).

Frederick's son, William Henry, the 4th earl (1711-1781), was a diplomatist and a statesman. Having gained experience as envoy at Turin from 1740 to 1753, he was ambassador at Madrid from 1763 to 1766 and at Paris from 1766 to 1768. From 1768 to 1775 he was one of the secretaries of state. This earl left no children when he died on the 28th of September 1781, and his nephew, William Henry, the 5th earl (1754-1830), dying in September 1830 the earldom became extinct.

The estates of the earls of Rochford were in Suffolk and Essex, their principal residence being St Osyth Priory in the latter county.

ROCHFORD, a town in the south-eastern parliamentary division of Essex, England, 39 m. E. by N. from London by the Southend branch of the Great Eastern railway. Pop. (1901) 1829. It lies on the small river Roach, near the head of a long estuary. The town has a Perpendicular church (St Andrew), a corn exchange and some agricultural trade. Rochford Hall, a picturesque gabled mansion of various dates, belonged once to the Boleyns, and it has been stated that Anne Boleyn, the unfortunate queen of Henry VIII., was born here, but this is in no way proved. Near Rochford the Lawless or Whipping Court, a remarkable survival of unknown origin, is held by a manorial tenure on the Wednesday following Michaelmas Day, beginning at midnight. No light is permitted, nor may voices be raised above a whisper. Nearly 3 m. N.W. from Rochford is Ashington. This is generally accepted as the scene of the fight of Assandun in 1016 between Canute and Edmund Ironside, in which the English were defeated through treachery in their ranks. Earthworks, of this or an earlier date, remain.

ROCK, DANIEL (1799-1871), English Roman Catholic priest and ecclesiologist, was born at Liverpool on the 31st of August 1799, and educated at St Edmund's College, Ware, Herts, and at the English College, Rome. He was ordained priest in 1834 and successively appointed chaplain to the 16th earl of Shrewsbury at Alton Towers, Staffordshire, and priest in charge of the Roman Catholic congregation at Buckland, near Faringdon in Berkshire. After the re-establishment of the Roman Catholic hierarchy in England, in which he had taken an active part, Rock was elected a canon of St George's Cathedral, Southwark. He was greatly interested in medieval art, and, having gone to live at South Kensington in 1864, in order to be near the museum, was of great assistance to the authorities there. He died on the 28th of November 1871.
ROCK—ROCKET

Rock (Ger. roke, Sp. roca, Ital. roccia; possibly from a Lat. form rupis, rupera, rock), in geology a mass of mineral matter of which the crust of the earth is composed (see Petrology and Geology). In more general usage a "rock" is a large mass of this mineral matter, as distinguished from smaller pieces which are termed "stones."

From this word must be distinguished the verb "to rock," to swing an object to and fro, particularly of a cradle in which a child is rocked to sleep, the original meaning. The O.Eng. word is roccian, and is cognate with many words in Teutonic languages, e.g. Du. rukken, Dan. rykke, Ger. rücken, to pull, tug, push.

ROCK-CRYSTAL, a colourless and transparent variety of quartz (g.) used as an ornamental stone. It usually occurs as crystals lining cavities in quartz veins, which often run through granite, gneiss and crystalline schists. The limpidity of the crystal, its coldness to the touch and its common occurrence in rocks among Alpine glaciers, led to the ancient belief that it was a kind of congelated water, whence the name crystal, from Gr. χρυσόν. In the Swiss Alps the "Strahler" or crystal-gatherer, searches the rocks at much personal risk, and is often led to a drusy cavity by tracing narrow veins, or strings of quartz on the mountain-side. A remarkable druse, or Krystrakelt, discovered at Zinkenstock in the Bernese Oberland, in 1719, yielded about 20 tons of crystal, a single specimen weighing 8 cw. The famous discovery of the Galenstock, in 1867, furnished magnificent crystals, but they were dark brown or smoky quartz. La Gardette, near Le Bourg d'Oisans, in the Alps of Dauphiné, is a notable locality for fine specimens of rock-crystal. The Alps and India probably furnished the ancients with their supplies.

Rock-crystal has been used for ornamental purposes since the Mycenean period. By the Romans under the name of "fervest infra," it was highly valued, and carved into vases and goblets, in some cases elaborately engraved. Lenses or globes were used for kindling the sacred vestal fire and for cauterizing the flesh, whilst ladies carried balls of crystal in order to cool their hands during the heat of summer. The artists of the Early Renaissance greatly favoured the use of rock-crystal, and executed beautiful carvings in this material. In modern times the use of rock-crystal has been largely superseded by that of glass, and it is notable that flint-glass is known in France as "crystale," probably from its resemblance to limpid quartz, or perhaps from the fact that powdered rock-crystal has been used as a source of silica in the manufacture of the finest glass of the day. Rock-crystal is still cut as a faceted stone for personal decoration, but, though not without brilliancy it lacks the "fire" of many gemstones. It is often known locally by such names as Bristol diamond, Cornish diamond, Isle of Wight diamond, Briançon diamond, Marmaros diamond, Lake George diamond, &c. Rock-crystal is also carved into seals, paper-weights and other trivial objects, and into spheres for divination by crystal-gazing. Japanese balls being specially noteworthy. In Japan the crystal has been used for centuries from the granitic districts around Kimpū-san, in the province of Kōfu. Probably the most valuable application of rock-crystal is in the engraving of American seal stones, where the blanks are gradually brought to a mirror finish by the expert hand of the engraver, and are then filled with opaque colors. These colors are usually inks, pastes and paints, but they are sometimes glass, cut and set in mosaic, or are mixtures of salts of metals such as silver, copper, &c. Rock-crystal is often used as a gem in jewelry, and is distinguished from quartz by its conchoidal fracture and by the fact that it contains iron, which gives it a purple tinge.

ROCKFELLER, JOHN DAVIDSON (1839- ), American capitalist, was born in Richford, Tioga county, New York, on the 8th of July 1839. In 1855 his family removed to Ohio, living after 1857 in Cleveland, where Rockefeller had begun to work as a bookkeeper in 1855 and where in 1868 he went into the oil-refining business. His firm, Clark & Rockefeller, in 1862 invested in an oil refinery, planned by Samuel Andrews, and in 1865 Rockefeller sold out his share to his partner Clark, bought for $72,500 a larger share in another refinery, and formed the partnership of Rockefeller & Andrews. At about the same time another refinery was started by Rockefeller's brother William (b. 1841), but in 1867 Rockefeller & Andrews absorbed this business, and Henry M. Flagler was added to the partnership. In 1870 the two Rockefellers, Flagler, Andrews and a refiner named Stephen V. Harkness, formed the Standard Oil Company, with a capital of $1,000,000 (increased in 1872 to $2,500,000 and in 1874 to $3,500,000), of which John D. Rockefeller was president. This great corporation gradually established itself in practical control of the oil production in America, by means of business methods and financial operations which have been severely criticized, but which brought immense wealth to those concerned. Its capital was further increased in 1882, when separate companies were organized in each state; and in later years, as the first great American "trust," the Standard Oil Company was both attacked and supported during the anti-trust movement (see Inter-State Commerce). In the midst of this question it is impossible to enter here. Rockefeller himself retired from active business in 1895; he had for a time large interests in mines and oil companies in Texas, New Mexico and Pennsylvania, which he sold to the United States Steel Corporation, and his personal wealth was probably greater than that of any other man in the country. In private life he was a devoted member of the Baptist church, and his benefactions were numerous. To the "University of Chicago "founded by John D. Rockefeller" (in 1892) he had given, up to 1910, $24,809,666, while to the General Education Board he had given $43,000,000; he founded (1901) and supported the Rockefeller Institute for Medical Research in New York City; he gave large sums to Rush Medical College in Chicago, to Johns Hopkins Hospital in Baltimore, to Barnard College in New York City and to the Baptist Missionary Society; and in 1909 he gave $1,000,000 to endow a medical commission to investigate the nature of the hook-worm and to suppress the hook-worm disease.

See Ida M. Tarbell's History of the Standard Oil Company (New York, 1903), a severe attack on the Trust; also his own Random Reminiscences (1909).

ROCKET. (1) The name (Fr. roquette, Lat. erucis, a kind of cabbage) of two species of plants. The one, Eruca vesicaria, is a cruciferous annual with white flowers veined with purple; the leaves have a sharp flavour and are used in southern Europe for salads. The other is a hardy perennial herbaceous plant, of the genus Hesperis, of which Hesperis matronalis is the most familiar species (see Horticulture).

(2) A cylinder of paper, pasteboard or metal, filled with an explosive mixture. This word, which appears in many forms in various languages, is from the It. rocchetta, diminutive of rocca, a distaff, the obsolete English "rock."; the application

been derived from quartz-veins in thegneiss and pegmatite. In India rock-crystal has been worked at many localities, and the bolt of the palace of Delhi, Calcutta, and various ornaments carved in this material. At the present day it is cut and polished at Vellum in the Tanjore district in Madras, and is known as Vellum stone. The deposit of the numerous localities in the United States which yield rock-crystal mention may be made of a Herkimer Co., New York State, whence the Lake George crystals are obtained; and it is probable that some of the Herkimer quartz encloses bituminous matter. Mokelumne Hill, California, has furnished some remarkable rock-crystal. In Europe the localities are very numerous, the most important being those in the Alps. Very fine crystals remarkable for pelliculosity though not of large size occur in cavities in the principal marble of Calabria; and remarkably hollowed crystals are known from Porretta near Bologna in Italy. The finest rock-crystal in Great Britain occurs at Tintagel and Delabole slate quarry in N. Cornwall; and at Snowdon in N. Wales. (F. W. R.)
is due to a resemblance in shape. Rockets are used in pyrotechny for purpose of display, scattering showers of stars, coloured balls, &c., on bursting (see Fireworks). They are also used in signalling, and especially as a part of life-saving apparatus for wrecks (see Lifeboat and Life-Saving Service).

Large and heavy rockets, of which the head formed a projectile, had too a considerable vogue in the early part of the 19th century for war purposes. They were invented by Sir William Congreve (q.v.) and employed by him both afloat in coast operations and in field operations. Brought to the notice of all armies by the fact that a rocket battery of the Royal Artillery served in the allied army in the Leipzig campaign, war rockets were introduced in many armies, being sometimes issued as an additional portion of the equipment of ordinary field batteries, sometimes reserved for special rocket batteries. The Congreve rocket was in use in the British army as late as 1860. There were four natures—3-pounder, 6-pounder, 12-pounder and 24-pounder. The case was of sheet-iron, on to which was screwed a cylindro-conoidal head forming the projectile. The head was made hollow and could be filled with a bursting charge if a shell effect was desired, a base fuze being provided. The iron case contained the rocket composition, and was closed at the rear end by a metal plate with five holes or vents, and on the centre a bush into which the stick was screwed. These rockets were fired from rocket tubes on tripods, the tubes being provided with a tangent sight. Against masses of troops within easy range, the war rocket was considered an efficient engine; it was used also to set fire to buildings, but was always deficient in accuracy. Eventually the Congreve rocket was superseded by the Hale, of which two patterns were in use, the o-pounder and the 24-pounder, for field and fortress warfare respectively. These had no sticks, and were centred by the arrangement of the vent, the gases, as they emerged from the vent, impinging upon a screw-formed tail, to which they imparted the necessary rotation. These rockets were fired from a trough. The maximum effective range of the o-pounder Hale rocket was about 1200 yards. The use of these engines was discontinued in the British service about 1885. On the continent of Europe they had disappeared more than twenty years before. Austria, the last power to use them, broke up her rocket batteries in 1867.

ROCKFORD, a city and the county seat of Winnebago county, Illinois, U.S.A., on the Rock river, in the northern part of the state, about 85 m. N.W. of Chicago. Pop. (1860) 23,584; (1900) 31,951, of whom 9337 were foreign-born (6600 Swedes); (1910 census) 45,401. Area, 8-91 sq. m. It is served by the Chicago, Burlington & Quincy, the Chicago & North-Western, the Chicago, Milwaukee & St Paul, the Chicago, Milwaukee & Gary (“Rockford Route”) and the Illinois Central railways, and is connected by interurban electric railway with Chicago and Freeport, Illinois, and Janesville, Wisconsin. The city has a Memorial Hall, erected in honour of the soldiers and sailors of Winnebago county, and in charge of the Grand Army of the Republic; a soldiers' memorial fountain; a Carnegie library, containing 51,340 volumes in 1900; and the Veile Museum of natural history. Rockford College (non-sectarian), for the higher education of women, is ranked by the United States Commissioner of Education as one of fifteen women's colleges of the highest grade in the country; it was opened in 1840 as Rockford Seminary, and was named Rockford College in 1892. In 1908-9 it had 106 students. Rockford is the see of Rockford diocese, bishop. In, and near the city, there are two hospitals and three sanatoriums. Manufacturing is facilitated by good water-power, supplied by a dam across the Rock river about 800 ft. long, constructed in 1844. Among the manufactures are furniture, hosiery and knit goods, agricultural implements, foundry and machine-shop products, saddlery and harness, &c. The total value of all factory products in 1905 was $15,726,120 (38-6% more than in 1900). The municipality owns and operates its waterworks; the water supply is obtained from artesian wells. Rockford was first settled in 1834, and was chartered as a city in 1852. More than one-fourth of its area has been annexed to the city since 1880.

ROCKHAMPTON, a town of Livingstone county, Queensland, Australia, on the Fitzroy river 43 m. from its mouth, 333 m. in a direct line N.W. of Brisbane. It has a beautiful situation, and its climate, in spite of heat, is healthy. It is the port of a wide agricultural district, which also produces gold, copper and silver. Much of the trade is carried on through the ports of Alma and Broadmount, near the mouth of the river, both available for ocean steamers. Rockhampton has a large trade in frozen meat, and there are factories for extract and meat preserving. Rockhampton is the terminus of the Queensland Central railway and the seat of an Anglican and a Roman Catholic bishop. Population of the municipality (1901), 15,401; within the 5 m. radius, 16,691; of the separate municipality of North Rockhampton, 2865.

ROCK HILL, a city of York county, South Carolina, U.S.A., 88 m. by rail N. of Columbia. Pop. (1890) 2744; (1900) 5485 (1706 negroes); (1910) 7216. Rock Hill is served by two lines of the Southern railway. It lies at an elevation of about 670 ft. above the sea. Among its buildings and institutions are the Federal Government Building, the City Hall, the Carnegie Library and the Winthrop Normal and Industrial College (chartered in 1891 and opened in 1894), a state institution for white girls. Cotton is the most important product of the surrounding country. The Catawba river, 5 m. distant, furnishes good water-power, and in a large power-plant electricity is generated for the city's manufactories. Among the manufactures are cotton goods, cotton-seed oil, yarn, wagons and carriages, foundry and machine-shop products; and there are cotton gins, marble and stone works. The growth of the city has been almost entirely since the Civil War. Rock Hill was incorporated as a village in 1879, and was chartered as a city in 1892.

ROCKINGHAM, CHARLES WATSON WENTWORTH, 2nd Marquess of (1730-1782), twice prime minister of England, was the son of Thomas Watson Wentworth (c. 1690-1750), who was created earl of Melton in 1733 and marquess of Rockingham in 1748. The family of Watson was descended from Sir Lewis Watson (1584-1653), son and heir of Sir Edward Watson (d. 1616) of Rockingham Castle in Northamptonshire. For his services to the king during the Civil War Sir Lewis was created Baron Rockingham in 1645. His grandson Lewis, the 3rd baron (1655-1724), was created earl of Rockingham in 1714, and was succeeded by his grandson Lewis (c. 1709-1745), whose brother Thomas, the 3rd earl, died unmarried in February 1746, when the earldom became extinct. The barony of Rockingham, however, descended to a cousin, Thomas, father of the prime minister, a grandson of Edward, the 2nd baron (1630-1686), who had married Anne, daughter and heiress of Thomas Wentworth, 1st earl of Strafford. The vast estates of the Wentworths had passed to Edward’s son, Thomas, who took the additional name of Wentworth, and then to his son, the 1st marquess of Rockingham.

Charles Watson Wentworth was born in 1730 on the 10th of March (according to some, the 13th of May), and was educated at Westminster school and St John’s College, Cambridge. He showed his spirit as a boy by riding across from Wentworth to Carlisle in 1746 to join the duke of Cumberland in his pursuit of the Young Pretender. He was created earl of Melton in the peerage of Ireland in September 1750, and succeeded his father in the earldom as 2nd marquess of Rockingham in December of the same year. In 1753 he was appointed lord lieutenant of the North and East Ridings of Yorkshire and a lord of the bedchamber, and in 1760 was made a knight of the Garter. After George III. had begun his policy of dividing the great Whig families, those Whig noblemen and gentlemen who did not choose to join the sections headed by the Grenvilles, the duke of Bedford, or any other great noblemen, selected as their chief the young marquess of Rockingham. In 1762 the king's favourite,
the earl of Bute, became first lord of the treasury, and the marquess of Rockingham was amongst those who in the following year were dismissed from their lord-lieutenancies. The opposition now grew so strong that Lord Bute resigned in April 1763, and the king, true to his policy, appointed George Grenville to be his successor. But Grenville's section of the Whig party was not strong enough to maintain him in power long, and in July 1765 Lord Rockingham formed his first administration with General Conway and the duke of Grafton as secretaries of state. The cabinet seemed stronger than it really was, for it was divided by intestine quarrels, and the earl of Chatham refused to have anything to do with it. Nevertheless, Rockingham recovered his lord-lieutenancies and won reputation as a good administrator. In May 1766 the duke of Grafton, a far ableer man than Rockingham, though neither so conciliatory in his manners nor so generally popular, succeeded from the government, and in August 1766 he succeeded his former chief as first lord of the treasury and prime minister. Then followed many years of fruitless opposition to the king's personal authority, as exhibited through his ministers, but at last, on the 27th of March 1782, Lord Rockingham again became prime minister with Fox and Shelburne (afterwards marquess of Lansdowne) as secretaries of state. This time he enjoyed office for but a few weeks, for he died on the 1st of July 1782. He left no issue, and his property went to his nephew, the 2nd Earl Fitzwilliam, his titles becoming extinct. A few words from his epitaph by Burke deserve quotation as giving the reason of the predominance of such an ordinary man as Lord Rockingham over a party abounding in men of great abilities: A man worthy to be held in esteem, because he did not live for himself. . . . He far exceeded all other statesmen in the art of drawing together, without the seduction of self-interest, the concurrence and co-operation of various dispositions and abilities of men, whom he assimilated to his character and associated in his labours."

See Memoirs of the Marquis of Rockingham and his Contemporaries, by George Thomas, earl of Albemarle (2 vols., 1832); Horace Walpole's Memoirs of the reign of George III., edited by G. F. R. Barker (1894); and the other letters, papers and diaries of the time.

ROCK ISLAND—ROCKPORT

flour, glass, stoves, carriages, soap, &c. In 1905 the value of the factory product was $5,333,697. Some coal is mined in the county.

Flux of the Rock river, 3 m. from its mouth, there was a large summer village (sometimes called Sautenauk) of the Sauk Indians, built about 1730 and destroyed in 1831; and near the mouth of the Rock river is a bluff called "Black Hawk's watch-tower." A settlement on the island was made in 1816, when the fort was built; the first settlement on the mainland was made in 1826. In 1841 the town of Rock Island was formed by the consolidation of two small settlements named Stephenson and Farnhamsburg and was incorporated; it received a city charter in 1849. Upon the west end of the island the United States government in 1816 built Fort Arm strong, where on the 21st of September 1832, at the close of the Black Hawk War, a treaty of peace was signed by General Winfield Scott and Governor John Ryndons of Illinois and by the chiefs of the Sauk and Foxes, and where, six days before, General Scott and Governor Reynolds had made a treaty with the Winnebagos. The fort was abandoned in 1836 and was burned in 1855; a monument now marks its site. The Rock Island armory and arsenal, under an act of 1862, were built in 1863, when a number of captured Confederate soldiers were confined on the island.

ROCKLAND, a city and the county-seat of Knox county, Maine, U.S.A., on Rockland Harbor, Penobscot Bay, 86 m. by rail E.N.E. of Portland. Pop. (1900) 8150; (1910) 8174. It is the eastern terminus of a branch of the Maine Central railway, and is served by an interurban electric line and by steamboat lines to Portland, Boston, Bangor, Bar Harbor and other coast ports. The harbour is protected by a breakwater nearly 5000 ft. long. The principal buildings are the United States Government Building and the County Court House. Granite and limestone are quarried in the vicinity. The granite (biotite, biotite-muscovite and quartz-monzonite) is of fine quality, and has been used extensively in the United States for building and monumental purposes; and the burning of lime is by far the most important industry of the city. The shipbuilding industry is also important. The total value of the city's factory products in 1905 was $1,822,501 (46.5% more than in 1900). Lobsters and fish in considerable quantities are shipped from the city. Rockland was settled in 1760, but its growth began with the establishment of the lime industry in 1795. It was a part of the township of Thomaston (pop. 2688 in 1900), from 1777 to 1848, when it was incorporated as a separate township under the name of East Thomaston. Two years later the present name was adopted, and in 1854 Rockland was chartered as a city.

ROCKLAND, a township of Plymouth county, Massachusetts, U.S.A., about 20 m. S. of Boston. Pop. (1850) 5213; (1900) 5377; (1910 U.S. census) 6928. Area, about 10 sq. m. It is served by the New York, New Haven & Hartford railway, and by interurban electric railway. Among its manufactures are boots and shoes and tacks. There is a public library (1878). Rockland was erected into a township in 1874, having been previously a part of Abington.

ROCKPORT, a township of Essex county, Massachusetts, U.S.A., on the N.E. end of Cape Ann, on the Atlantic Ocean, north-east of Gloucester, and about 35 m. north-east of Boston. Pop. (1890) 4087; (1900) 4592; (1910, U.S. census) 4211. Rockport is the southern terminus of the Gloucester branch of the Boston & Maine railway, and is served by an electric railway extending from Gloucester through Rockport and around the cape. Off Sandy Bay, a rendezvous of the Atlantic squadron of the U.S. navy, the Federal government began in 1894 a harbour of refuge, with an area of 1664 acres, to be protected from north and north-east winds by a breakwater, 117 ft. wide at a depth of 12 ft. below mean low water, rising 22 ft. above mean low water, and 9000 ft. long. In the township are the North Village or Pigeon Cove and the South Village or Rockport. Rockport is a summer resort, and there are many summer residences at Andrews Point and at the South
ROCKVILLE—RÔD, É.

End and Headlands. There are large granite quarries along the coast, especially in Pigeon Cove; and there are two varieties of granite, called commercially “grey” and “green,” both very hard, the former the more valuable. It has been used in building the great breakwater off Sandy Bay and various large buildings. Granite for paving-stones is quarried. Like many of the Maine quarries those of Rockport owe much of their development to their nearness to deep water transportation. Isinglass, glue, tools, parts for automobile engines, and copper paint are among the manufactures. Fishing was formerly of importance, but quarrying has displaced it. Sandy Bay, the fifth parish of Gloucester, first settled about 1697, and Pigeon Cove, part of the third parish, were set off from Gloucester and were incorporated as the township of Rockport in 1830. The Bennett & Mackay transatlantic cable was landed in Rockport in 1885.

ROCKVILLE, a city of Tolland county, Connecticut, U.S.A., in the N.E. part of the state, on the Hockanum river, about 15 m. N.E. of Hartford. Pop. (1890) 7772; (1900) 7287, of whom 2548 were foreign-born, many being Germans and Poles; (1910) 7077. It is served by the New York, New Haven & Hartford railway and by electric lines. It is in the township of Vernon (pop. in 1890, 8688; in 1910, 9087; area, 19 sq. m.), which was separated from Bolton township in 1868, and contains the villages of Vernon, Vernon Centre, Dobsonville and Talcottville. In the city are the George Maxwell Memorial Library and the Sykes Manual Training School. The river, by a series of falls, makes a descent of 280 ft. here, and furnishes power for large manufacturing establishments. The principal manufactures are woolen, silk and cotton goods, envelopes, and silk fish-lines. In 1841 fancy cassimeres, probably the first manufactured in the United States, were made here. At the Hockanum Mills (established 1809) worsted for men's clothing was first made (about 1870) in the United States. The first settlement here was made about 1726. Rockville was chartered as a city in 1839.

ROCKY MOUNTAIN GOAT, or WHITE GOAT (Oreamnos montanus), a North American hollow-horned ruminant of the family Bovidae, distinguished by its white colour. It is, in fact, the only ruminant, with the exception of the white Alaskan wild sheep, which is entirely white at all seasons of the year; and cannot, therefore, be mistaken for any other animal, and its description may consequently be brief. In the winter coat the hair is long and pendent, elongated into a short beard on the sides of the lower jaw behind the chin; and it is also longer than elsewhere on the neck and the chest; at the base of the long hair is a thick growth of short and woolly under-fur. In summer the coat becomes comparatively short. The muzzle is hairy, the ears are of moderate size, and the tail is short, and partially buried among the long hair in the rump. There are no glands on the face; but there is a large globular one at the base of each horn of the size of half a small orange. The black horns, which are ringed in their basal portion, are comparatively short and not unlike those of the Asiatic serows in general characters, being subcylindrical, and curving slightly backwards. They taper, however, much more rapidly than those of the serows, and diverge much more widely from the middle line. The lateral hoofs are well developed. Although commonly described as white, the hair has a more or less decided tinge of yellow, which appears to be more marked in the summer than in the winter coat. The cannon-bones are remarkably short and wide, and in this respect differ from those of all allied ruminants, except the Tibetan takin. The general shape of the animal is ungainly, owing to a huge hump on the withers, at which point the height is about 3 ft.

The head of a white goat obtained in 1900 from the mountains at the mouth of Copper river, opposite Yukon Island, has been described as a species apart. In addition to certain details in the conformation of the skull, the horns are much more slender than in the ordinary white goat, and instead of bending regularly backwards till near their tips, curve widely outwards from their bases. Their length is nearly equal to that of the longest pair of the ordinary form hitherto recorded, while the tip-to-tip interval is nearly double that of any other known specimen. This animal can scarcely be regarded as more than a local race, and should be styled Oreamnos montanus koyukon.

The affinities of the white goat (which is really a member of a group intermediate between goats and antelopes) are probably with the Asiatic serows and takin, and hence perhaps with the musk-ox.

ROCCO, or ROCAILLE, literally “rock-work,” a style of architectural and mobiliary decoration popular throughout the greater part of Europe during the first half of the 18th century. In France it was especially characteristic of the regency and the reign of Louis XV. A debased style at the best, essentially fantastic and bizarre, it ended in extravagance and decadence. A meaningless mixture of imitation rock-work, shells, scrolls and foliage, the word came eventually to be applied to anything extravagant, flamboyant or tasteless in art or literature. The very exuberance of the rocco forms is, indeed, the negation of art, which is based upon restraint. There is something fundamentally Italian in the bravura upon which the style depends; yet Italy has produced some of the worst examples of what in that country is called the “Jesuit style,” in allusion to the supposed lack of directness in Jesuit policy. Everything, indeed, in the rocco manner is involved and tortured, though before a superb example of Jacques Cassiery, such as the famous commode in the Wallace Collection, it is impossible not to admire the art with which genius can treat even the defects and weaknesses of a peculiarly mannered fashion. The best French work possesses a balance and symmetry which are usually entirely absent from its imitations. Spain and Italy produced many monstrous travesties—it is impossible to imagine anything more grotesque than the flamboyant convections of the monumental Roman style of the third quarter of the 18th century. In Germany, weak and lifeless imitations were as popular as might be imagined in a land which was content to take its art, especially its bad art, from France. England did not escape the infection, and Chippendale and his school produced examples of rocaille work and coquillage which were quite foreign to their own sentiment, and rarely rose above respectable mediocrity.

ROCROI, a town of northern France, capital of an arrondissement in the department of Ardennes, 22 m. N.N.W. of Charleville by rail, and within 2 m. of the Belgian frontier. Pop. (1906) town, 706; commune, 2116. As a fortified place it commands the Ardennes plateau between the valley of the Meuse and the head-waters of the Oise. The present fortifications, constructed by Vauban, form a pentagon and entirely close the town, which has regularly built streets converging on a central square. Overlooking the latter is the church, a florid building of the 18th century. Rocroi is the seat of a sub-prefecture and has a tribunal of first instance.

The place, originally called Croix-de-Rau or Rau Croix, was fortified in the 16th century and besieged by the imperialists in 1555. Invaded by the Spaniards in 1643, it was relieved by Louis II., the duke of Enghien (afterwards the Great Condé), after a brilliant victory. Captured in 1658 by the same duke, then in the Spanish service, it was not restored to France till the treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged for a month by the allies.

ROD, ÉDUARD (1857-1910), French-Swiss novelist, was born at Nyon, in Switzerland, on the 31st of March 1857. He studied at Lausanne and Berlin, and in 1878 found his way to Paris. In 1881 he dedicated his novel, Palmyre Veulard, to Zola, of whom he was at this period of his career a faithful disciple. A series of novels of similar tendency followed. In 1884 he became editor of the Revue contemporaine, and in 1887 succeeded Marc Monnier as professor of comparative literature at Geneva, where he remained till 1893. La Course à la mort (1885) marks a turning-point in his career; in it he
forsook the so-called naturalistic novel for the analysis of moral motives. He is at his best in presenting cases of conscience, the struggle between passion and duty, and the virtues of renunciation. Le Sens de la vie (1886), one of his most famous books, is in the nature of a complement to La Cours à la mort. It was followed by Les Trois cœurs (1890), La Sacrifice (1892), La Vie privée de Michel Teissier (1893), translated as The Private Life of an Eminent Politician (1893); La Seconde Vie de Michel Teissier (1894), Le Silence (1894), Les Roches blondes (1895), Le Dernier Refuge (1896), Le Ménage du pasteur Naudet (1898), a study of Protestant France; L'Eau courante (1900), L'Inувilе Effort (1903), Un Vainqueur (1904), L'Indicible (1905), and L'Incendie (1906). M. Rod's books of literary criticism include Les Idées morales du temps présent (1897), an admirable Essai sur Goethe (1898), Stendhal (1902), and some columns of collected essays. He published L'Affaire J. J. Rousseau in 1906, and in the same year he drew from an episode in the life of the philosopher a play in three acts, Le Réformateur, which was produced at the Nouveau Théâtre. He died in January 1910.

ROD (O.E. rod, probably related to Norw. rudda, stick, rodda, stake), a twig or shoot of a tree or bush, especially a straight slender stick or wand used as an instrument of punishment, as a symbol of office, or as an implement, usually composed of several joints, for angering or fishing. The term is thus applied to a metal bar, slender in proportion to its length, used as a tie, brace or connecting shaft between different parts of a machine. It is familiar in the titles, showing the colour of their wands of office, of the gentlemen ushers of the three principal British orders of knighthood, the ushers of the Garter and St Patrick being "Ushers of the Black Rod," and of the Thistle "Green Rod." The use of a rod as a measuring implement has given rise to the use of the word for a measure of length = 1/3 yds. or 16 ft.; this length is also named a pole or perch, the origin of the application being the same as in "rod"; as a measure of area, a rod = a square pole or perch, 30 1/4 square yds. = 272 1/4 square ft., 160 rods = 1 acre.

RODBERTUS, KARL JOHANN (1805-1875), German socialist, was born at Greifswald on the 12th of August 1805, his father being a professor at the university there. He studied law at Göttingen and Berlin, thereafter engaging in various legal occupations; and, after travelling for some time, he bought the estate of Jagezow, where he lived the remainder of his life. In 1836 he settled on this estate, and henceforward devoted his life chiefly to economic and other studies, taking also some interest in local and provincial affairs. After the revolution of March 1848 Rodbertus was elected member of the Prussian national assembly, in which body he belonged to the left centre; and for fourteen days he filled the post of minister of public worship and education. He sat for Berlin in the second chamber of 1849, and moved the adoption of the Frankfort imperial constitution, which was carried. When the system of dividing the Prussian electorate into three classes was adopted, Rodbertus recommended attention from voting. His only subsequent appearance in public life was his candidature for the first North German diet, in which he was defeated. His correspondence with Lassalle was an interesting feature of his life. At one time Rodbertus had some intention of forming a "social party" with the help of the conservative socialist Rudolf Meyer and of W. Hasencler, a prominent follower of Lassalle; but no progress was made in this. Rodbertus was neither disposed nor qualified to be an agitator, being a man of a quiet and critical temperament, who believed that society could not be improved by violent changes, but by a long and gradual course of development. He warned the working men of Germany against connecting themselves with any political party, enjoining them to be a "social party" pure and simple. He died on the 8th of December 1875.

The general position of Rodbertus was "social, monarchical and national." He held the purely economic part of the creed of the German social-democratic party, but he did not agree with their methods, and had no liking for the productive associations with state help of Lassalle. He regarded a socialist republic as a possible thing, but he cordially accepted the monarchical institution in his country and the idea of the German nation. He undertook the rôle of a social emperor. The basis of the economic teaching of Rodbertus is the principle laid down by Adam Smith and Ricardo, and insisted on by all the later socialists, that labour is the source of all wealth and income, that it is the measure of the value of all things. The result of the theory is his position that the possession of land and capital enables the landholders and capitalists to compel the workmen to divide the product of their labour with those non-working classes, and in such a proportion that the workers only obtain as shares what is necessary to support them in life. Thus the iron law of wages is established. Hence also Rodbertus deduces his theory of commercial crises and of the development of the commercial relations of mankind.

A fundamental part of the teaching of Rodbertus is his theory of social development. He recognized three stages in the economic progress of mankind: (1) the ancient heathen period in which property in land and human beings is the exclusive property of the state or the individual; (2) the middle period, in which private property in land and capital is developed and dividing the product of the wages of labour being paid out of capital; wages is only that part of the national income which is received by the workmen, of a national income which they have themselves entirely produced. The wages fund is thus seen as a means of hastening the development of the national economy, and the result of the theory is his position that the possession of land and capital enables the landholders and capitalists to compel the workmen to divide the product of their labour with those non-working classes, and in such a proportion that the workers only obtain as shares what is necessary to support them in life. Thus the iron law of wages is established. Hence also Rodbertus deduces his theory of commercial crises and of the development of the commercial relations of mankind.

Form temperament, culture and social position Rodbertus was above all a materialist and a utilitarian; in the measures which he recommends for making the transition towards it, he showed a scrupulous regard for the existing interests of the capitalists and landholders. He proposed that those two classes should be left in possession of their part of the national income, but that the workers should reap the benefit of the increasing production. To secure this increment of production, he proposed that the state should fix a "normal working day" for the various trades, a normal day's work, and a legal wage, the amount of which should be revised periodically, and raised according to the increase of production, the better workman receiving higher wages than the poorer. He believed that the state in order to correct the evils of competition, would Rodbertus seek to make the transition into the socialist era.

The economic work of Rodbertus is an attempt made in a temperate spirit and scientific spirit to elucidate the evil tendencies inherent in the competitive system, especially as exemplified in the operation of the iron law of wages. The remedy he proposes is a state management of production and distribution, which shall extend itself more and more, and lead to what he regards as "scientific socialism," and all based on the principle that as labour is the source of value so labour should be entitled to all wealth. It is therefore an attempt to place socialism on a scientific basis; and he is certainly entitled to be regarded as one of the founders of "scientific socialism."
hoofed) feet, clivides or collar-bones (occasionally imperfect or rudimentary), no canine teeth, and a single pair of lower incisors, opposed by only one similar and functional pair in the upper jaw.

In all rodents the upper incisors resemble those in going uninteruptedly from persistent pulps, and (except in the hare group, Duplicidentata) agree with them in number. The premolars and molars may be rooted or rootless, with tuberculate or laminated, and are arranged in an unbroken series. The orbits are always open behind, never being surrounded by bone. The condyle of the lower jaw is antero-posteriorly elongated. The intestine (except in the dormice or Gliridac) has a large cæcum. The testes are inguinal or abdominal. The uterus is two-horned, with the cornua opening separately into the vagina or uniting to form a corpus uteri. The placenta is discoidal and deciduate. It is the smooth hemispheres of the brain do not extend backwards so as to cover any part of the cerebellum.

Rodents include by far the greater number of species, and have the widest distribution, of any of the orders of terrestrial mammals, being in fact cosmopolitan, although more abundant in some parts, as in South America, which may be considered their headquarters, than in others, as in Australasia and Madagascar, where they are represented only by members of the mouse-group, or Myoidae.

All rodents are vegetable-feeders, and this uniformity in their food and in the mode of obtaining it, namely by gnawing, has led to that general uniformity in structure observable throughout the group; a feature which renders their classification difficult. Indeed, despite the fact that they present much diversity of habit—some being arboreal, as the squirrels, many of which are provided with expansions of skin or parachutes on which they glide from tree to tree; some, cursorial, as the hares; others jumpers, as the jerboas; others fossorial, as the mole-rats; and others aquatic, as the beavers and water-rats—no important structural modifications are correlated with such diversity of habit.

Anatomy.—The rodent skull is characterized by the great size of the premaxillae, which completely separate the nasals from the maxillae; by the presence of zygomatic arches; and by the wide unoccupied space existing between the incisors and the cheek-teeth; and (except in the Duplicidentata) by the antero-posteriorly elongated glenoid cavity for the articulation of the lower jaw. Post-oral processes of the frontals exist in squirrels, marmots and hares; but in all other genera they are rudimentary or altogether absent; and the zygoma seldom sends upwards a corresponding process, so that the orbit is more or less completely continuous with the temporal fossa. The lacrimal bone of the incisivi is always within the orbital margin; and in many species the infra-orbital foramen is very large (in some as large as the orbit itself) and transmits part of the masseter muscle. The zygomatic arch is variously developed, and the position of the jugal or zygomatic process of the maxilla is stated as the character for grouping the families. The nasal bones are few exceptions, large, and extend far forward in the skull. The teeth are usually rootless, and either cusped or formed of parallel plates, this diversity of structure often occurring in the same family. Where there are more than three check-teeth, those which precede the last three have succeeded milk-teeth, and are premolars. In some species, there are three cuspilum patellae at the base, and the apical portion is generally covered with small thread-like papilae, some of which in the porcupines become greatly enlarged, forming toothed spines. The stomach varies in form; from the simple oval bag of the squirrels to the complex ruminant-like organ of the lemmings. In the water-rat and agoutis it is constricted between the oesophagus and pylorus; while in the dormouse the oesophagus immediately before entering the stomach is much dilated, forming a large egg-shaped bag with thickened glandular walls; and in certain other species, as in Lophiomys and the beaver, glandular masses are attached to and open into the cardiac or pyloric pouches. All rodents, with the exception of the dormice, have a caecum, often of great length and sacculated, as in hares, the water-rat and porcupines; and the long colon in some, as the hamster and water-rat, is spirally twisted upon itself and forms the largest part of the alimentary canal in the agoutis, with which it is subdivided in different species (in Capromys they are divided into minute lobules); and the gall-bladder, though present in most, is absent in a few. In most species the penis (which is generally provided with a bone) may be more or less completely withdrawn within the fold of integument surrounding the vent, and lie curved backwards upon itself under cover of the integument, or it may be carried forward some distance in front of the anal orifice, from which, as in voles and marmots, hemispherical bony swellings at the back of the skull (fig. 1, Per), in these genera and the hares the meatus auditorius being tubular and directed upwards and backwards. The lower jaw is characterized by its abruptly narrowed and rounded front part supporting the pair of large incisors, as well as by the small size of the coronoid process, and the great development of the lower hind, or angular, portion. The dental formula varies from i, c, p, m, (total 26) in the hares and rabbits to 2, 2, p, 1, m, (total 12) in the Australian warrigals; but in the great majority of species it presents striking uniformity, and may be set down typically as i, c, p, 1 or m, 1.

In the Duplicidentata only is there more than a single pair of incisors, and in this the additional pair is small and placed behind the middle pair. In this group the enamel extends partially to the back of the incisors, but in all the rest it is restricted to the front surface, so that, by the more rapid wearing away of the same, a chisel-shaped edge is maintained. Both upper and lower incisors are regularly curved, the upper ones slightly more so than the lower; and, their growth being continuous, should anything prevent the normal wear by which their length is regulated—as by the loss of one of them, or by displacement owing to a broken jaw or other cause—the unopposed incisor may gradually curve upon itself until a complete circle or more has been formed, the tooth. The liver is divided in the usual manner of the animal's head. The cheek-teeth may be either rooted or rootless, and either cusped or formed of parallel plates, this diversity of structure often occurring in the same family. Where there are more than three check-teeth, those which precede the last three have succeeded milk-teeth, and are premolars. In some species, there are three cuspilum patellae at the base, and the apical portion is generally covered with small thread-like papilae, some of which in the porcupines become greatly enlarged, forming toothed spines. The stomach varies in form; from the simple oval bag of the squirrels to the complex ruminant-like organ of the lemmings. In the water-rat and agoutis it is constricted between the oesophagus and pylorus; while in the dormouse the oesophagus immediately before entering the stomach is much dilated, forming a large egg-shaped bag with thickened glandular walls; and in certain other species, as in Lophiomys and the beaver, glandular masses are attached to and open into the cardiac or pyloric pouches. All rodents, with the exception of the dormice, have a caecum, often of great length and sacculated, as in hares, the water-rat and porcupines; and the long colon in some, as the hamster and water-rat, is spirally twisted upon itself and forms the largest part of the alimentary canal in the agoutis, with which it is subdivided in different species (in Capromys they are divided into minute lobules); and the gall-bladder, though present in most, is absent in a few. In most species the penis (which is generally provided with a bone) may be more or less completely withdrawn within the fold of integument surrounding the vent, and lie curved backwards upon itself under cover of the integument, or it may be carried forward some distance in front of the anal orifice, from which, as in voles and marmots,
in the breeding-season, it is separated by the prominent testicular mass. The testes in the pairing-season form projections in the groins, but (except in the Duplicidentata) do not completely leave the cavity of the abdomen. Prostate glands and, except in the Duplicidentata, seminal vesicles are present in all. The male may be double, each division opening by a separate os udder into a common vagina, as in Leporidae, Sciuridae, and Hydrochoerus, or two vaginas, as in Caviarines, which vary in number from one from a single abdominal pair in the guinea-pig to six thoraco-abdominal pairs in the rats; while in the Octodontididae and C apromyidae they are placed high up on the sides of the body.

The general vertebral column (thirteen thoracic and six lumbar), the form of which varies in different genera; in the cursorial and leaping species the lumbar transverse processes are generally very long, and in the hares there are large compressed intervertebral foramina. The usual two groins, and even three, are present, and the pelves have developed a rudimentary condition in the guinea-pig to a great size in the jumping-hare and prehensile-tailed porcupines. The scapula is usually narrow, with a long acromion; the clavicles may be altogether absent or imperfect, as in porcupines, cavies and hares, but in most species are well developed. The humerus has no supra-condylar foramen, and the forearm bones are distinct; and in most species the fore foot has five digits with the phalanges normally developed, the first toe being but rarely rudimentary or absent. The pelvis has large ischia and pubes, with a long and usually bony symphysis. The femur varies considerably in form, but generally has a well-developed neck. In the cursorial species the intercondylar fossa of the tibia and fibula are distinct, but in rats and hares they are united, often high up. The hind foot is more variable than the front one, the digits varying in number from five, as in squirrels and rats, to eight, as in the porcupines; the hairs on the heels and soles of the toes are often especially prominent. In the Jaculidae the metatarsals are greatly elongated, and in some of the species, as jerboas, they are welded together.

The mouth is divided into two cavities communicating by a narrow posterior one, separated by the tongue. The teeth, excluding the incisors, are divided into the molar group of four molars, posterior the molars, the hairy skin of the face being continued forwards behind the incisors. This evidently prevents substances intended for food getting into the mouth, as when the animal is engaged in gnawing through an obstacle. In hares and porcupines the inside of the cheeks is hairy; and in some species, pouched rats and hamsters, there are large internal cheek-pouches lined with hair, which open near the angles of the mouth and extend backwards behind the ears. In the New World pouched rats (Geomyidae) the pouches open externally on the cheeks.

The peculiar odour evolved by many rodents is due to the secretion, usually from the prepuce, but sometimes from the mouth in Mus, Microtus and Cricetus, or into the rectum, as in Arctomys and Thryonomyys, or into the passage common to both, as in the beaver, or into pouches opening near the vent, as in hares, agoutis and jerboas.

The skin is generally thin, and the panniculus carnosus muscle rarely much developed. The fur varies exceedingly in character,—in some, like the chinchillas and hares, being fine and soft, while in others, as in the spiny rats and porcupines, the fur is thick and coarse. The under-fur is short, as in spiny rats and porcupines; these spines in several genera, as Xerus, Arctomys, Patascanthus, Echinosirus, Lancheres and Eutamias, are so large, that they have a purely structural function, and peculiarities are noticeable in the comparatively small size of the temporal muscles, and in the great double masseters (fig. 2), which are the principal agents in gnawing. The digastric muscles are similarly remarkable for their well-defined central tendon, and in many species their anterior bellies are united between the two halves of the lower jaw. The clido-mastoid generally arises from the basis-occipital, and the pectoralis major is connected with the latissimus; in porcupines and hares the tendons of the flexor digitorum longus and flexor hallucis longus are connected in the foot, while in the rats and squirrels they are separate, and the flexor digitorum longus is generally inserted into the metatarsal of the first toe.

Classification.—Some diversity of view obtains among naturalists with regard to the classification of the order; the scheme here followed being the one adopted (with some modifications of nomenclature) by Professor Max Weber in his Stégotherie. The number of genera is so great that only the more important can be noticed. All authorities are agreed in dividing rodents into two great sections or sub-orders, the one, Duplicidentata, comprising only the hares, rabbits and picanos, and the other, Simplicidentata, all the rest. In the latter there is only one pair of incisor teeth in the upper jaw, in which the enamel is confined to the frontal surface. The incisive foraamina of the palate are moderate and distinct; the fibula does not articulate with the calcaneum; and the testes are abdominal, and descend periodically only into the inguinal canal.

Squirrels.—The first family is represented by certain peculiar North American rodents known as squirrels, constituting the genus Haplodon (or Aplodon) and the family Haplodontidae and section Haplodontoida. In common with the next three sections these rodents have the angular process of the lower jaw (fig. 4) arising from the inferior surface of the socket of the incisor. The masseter muscle does not pass through the narrow infra-orbital canal. An alisphenoid canal may be present on the palatal aspect of the skull; but there is always a transverse canal. The malleus and incus of the inner ear are separate. The humerus often has a foramen (antepatryondal) on the inner side of its lower end; the fibula and cuboid may be separate or united; but the scaphoid and lunar of the carpus are also united, while the centrale is free. The stomach is simple.

Squirrels are medium-sized terrestrial rodents, with no post-orbital process to the skull, which is depressed in form, and rootless cheek-teeth, among which the premolars number 1, the first in the upper jaw being very small. The build is stout and heavy, the limbs and tail short, the ears moderate, the eyes moderate and the feet five-toed and plantigrade. Haplodon is represented by a small number of species in America west of the Rocky Mountains, and of which H. furfus is the longest known. They are burrowing, and, in some cases at any rate, partially aquatic rodents.

Squirrel Group.—The Sciuroidea, which include the great group of squirrels, soulikes, marmots, &c., all comprised in the single family Sciuridae, differ from the sewellels in having large post-orbital processes to the skull (figs. 4, 5, 6); and, with one exception, have rootless cheek-teeth, the premolar-formula being 3:4:3. The infra-orbital foramen is also narrower, and the tympanic bulla is cellular. In both groups the tibia and fibula are separate.

The Sciuridae is divided into three sub-families, the first of which is the Sciurinae. In this the crowns of the molars are more or less shortened, with their cusps either arranged in longitudinal lines, or forming four upper and three lower more or less distinct oblique ridges, with five post-orbital processes of the frontal jugal are widely sundered, and the former may even be small (Xerus). The expanded anterior root of the zygomatic process has its front border obliterated. According to modern views the sub-family is broken up into a large number of genera.

The first of these is Rhizklosurus, represented by one large species (R. notatus) from Borneo, characterized by its finely grooved incisors (see Groove-Toothed Squirrel). The second genus, Heliosciurus, includes arboreal African squirrels, typified by H. stangeri, allied in the characters of their skulls to the undermentioned Xerus, and with a very large pre-orbital foramen in the more typical forms. The third, Paniurus, of which P. pyrrhopus is a well-known example, is also African and allied to Xerus, but has a still longer skull and soft fur. In Xerus itself, which is represented by the terrestrial African spiny squirrels, the cara are short, there are only two teats, and that spines are mingled with the fur; while the skull, and more especially the frontals, is elongated, with a very short post-orbital process, and the crowns of the molars are taller than usual (see Spiny Squirrel). The well-known Indian palm-squirrel, Funambulus palmarum, typifies an Indo-Malay genus allied to Xerus in skull-characters but with molars more like those of Sciurus. In contrast to these small species are the giant squirrels of the same group, such as Katula indica and R. bicolor, which are very brightly coloured rodents, with Sciurus-like skulls (fig. 5) but extremely short-crowned molars, and only one pair of upper premolars. Next comes the typical Sciurus, including the great bulk of the entire group, and ranging over Europe, Asia, North Africa and America. The skull is short and broad, especially as regards the frontals, with large post-orbital processes (fig. 5), and generally two upper premolars, making a total of five pairs of upper cheek-teeth, which have crowns of medium height. The teats are either four or six. Squirrels of this and the other arboreal groups have the bodily form slender and agile, the tail long and bushy, the ears well developed, pointed and often tufted; the feet adapted for

Fig. 4.—Skull of the American Marmot (Arctomys monax). The projection at the right-hand lower corner of the figure is the infra-orbital foramen

Rodentia
RODENTIA

Beavers.—The second section, Castoroida, of the present group includes only the family Castoridae, represented by the beavers, which are the largest existing rodents, characterized by their skulls, devoid of post-orbital processes, with the angle of the lower jaw rounded, the molars rootless or semi-rooted, with re-entering enamel-folds, and one pair of premolars above and below. The upper incisors are sharply conical and the lower are nearly square-ended. The dental formula is 3/3, 1/1, 3/3, 1/1; the total number of teeth is 28. The dental formula follows: I 3/3, C 1/1, P 3/3, M 1/1.

Pouched Rats.—The American pouched rats, or pocket-gophers, constitute a third section. They are characterized by an external pocket or pouch, often large; the skull is also flattened and narrow. In the infra-orbital foramen narrow. The single existing genus comprises the European beaver, Castor fiber, of Europe and North America, and the North American C. canadensis. The upper incisors are sharp, the lower are nearly square-ended. The dental formula is 3/3, 1/1, 3/3, 1/1; the total number of teeth is 28. The dental formula follows: I 3/3, C 1/1, P 3/3, M 1/1.

Scaly-tailed Squirrels.—The next section, according to Prof. Max Weber's arrangement, is that of the Anomaluridae, typified by the rodents commonly called African flying-squirrels (Anomaluridae), but better designated scale-tailed squirrels, or simply "scaly-tails," since one member of the family has no parachute. To this group Prof. H. Winge affiliates the African jumping-hares (Pedetidae), a view which is adopted by Prof. Weber, although Mr McIlwraith regards these as belonging to the family of the porcupines. In the more extended sense, the Anomaluridae are recognized as follows: In the skull the infra-orbital foramen (or canal) is large, the lachrymal foramen placed high up, and no transverse process of the malar margin below the level of the eye. In the cranium the scaphoid and lunar bones are united. There is a single pair of premolars in each jaw.

The Anomaluridae are characterized by having rooted cheek-teeth with short transverse roots. Of these, the two halves of the lower jaw movably articulated in front, very small post-orbital processes to the skull, and the presence of two rows of scales on the under surface of the base of the tail (figs. 7 and 8), which is cylindrical and thickly haired. The family is confined to the equatorial forest-tract of Africa, where it is most numerously represented on the west side. The majority of the species belong to the typical genus Anomalurus (fig. 7), which is provided with a parachute supported by a cartilaginous process which arises from the base of the ulna, and has well-developed ears and a moderately long tail. Several of the species are considerably larger than an ordinary field mouse, as, for instance, those of the genus Anomalurus (figured in the article FLYING-SQUIRREL), is a mouse-like form, with very small ears and an extremely long tail. The third genus, Zenkerella (Aethrus), which is also West African, has no parachute (fig. 8).

Jumping-Hares.—The grounds for referring the African jumping-hares (Pedetidae) to the Anomaluridea rest largely on the evidence of certain Tertiary rodents from Europe, such as Issodoromys. The jumping-hares are represented by members of the family Procavia, which is as large as a hare, and the smaller East African P. surdarius. In general habits and appearance these animals recall large jerboas, from which group they are, however, distinguished by the four rooted cheek-teeth, the premolars being as large as the molars, and the latter having one outer and one inner enamel-fold. The hind-limbs are elongated, with four toes, of which the metatarsals are separate; the tibia and fibula are welded in old age; the calcaneum and astragalus of the tarsi are elongated; and there is a perforation on the inner side of the lower part of the humerus (see JUMPING-HARE).
Dormice.—The next three sections of the order, namely, the Myoxoidae, or dormice, Dipodoidea, or jerboas, and Myoidea, or the mouse group, have the following characteristics in common. The appearance of the pigmy squirrels (Nannosciurus), which in some degree connect the family with the Muridae. (See House Mouse.)

Jerboa Group.—The Dipodoidea, or jerboa-group, which likewise includes only a single family, Jaculidae (or Dipodidae), is characterized by the presence of not more than one pair of premolars in the upper jaw, which, however, may be wanting; by the rooted cheek-teeth, which have a transverse enamel-fold, and the absence of a transverse canal in the skull, and of a horny layer in the stomach. The family is divisible into two sub-families, of which the first, carpenterinæ, is represented only by the genus Smiithius, containing a few species which range from Denmark to Persia, Asia, Auckland, and China. They are small rat-like rodents, with one pair of upper premolars, which are mere pins, as is the last molar, and the two pairs of lower premolars of normal length, with the metatarsals separate; the infra-orbital opening in the skull being triangular and widest below, while the incisel foramina in the palate are elongated. The European S. tubillus has a black dorsal stripe bordered with yellow.

The Dipodidae, on the other hand, are leaping rodents, with the metatarsals elongated, a small upper premolar present or absent, and the crowns of the molars tall. Various degrees of specialization occur in the adaptation for leaping. The least specialized genus is Lapus, containing the jumping-mice of North America, with one outstanding Siberian species, in which the five metatarsals are free, as are also the cervical vertebrae, the small upper premolar being retained. (See Jerboa.)

In the other genera, so far as known, the three central metatarsals of the hind foot are fused into a cannon-bone, of a type unique among mammals and comparable to that of birds. Some of the cervical vertebrae are also united in at least the better-known genera. The tail and ears are generally very long; while, in correlation with the size of the latter, the auditory bullae of the skull are also large. In the typical jerboas, Jaculus (or Dipus), ranging from North Africa to Persia, Russia and Central Asia, there are only three hind toes, the incisors are grooved, and the premolars are generally wanting. The other genera have five toes, of which only the middle three are functional, and smooth incisors. Euscoereles, with one Yarkand species, has premolars, enormous ears and a long nose. Alactago, ranging over Russia and Western and Central Asia, inclusive of Persia and Baluchistan, has smaller ears and a shorter nose; by some naturalists it is taken to include the North African A. tetradactylus, which is separated by others as Scartius. The Turkestan Platycreomys (or Pygeremus) has a lancet-shaped tail and no premolars; while Ctenodactylus, of the Nan-shan district of Central Asia has a similar type of tail, but short ears and a peculiarly triangular skull. (See Jerboa.)

Mole-Rats.—The mole-rats (Spalacidae) bring us to the mouse-like section, or Myoidea, in which there are no premolars and the molars may be occasionally reduced to ; these teeth being either rooted or rootless, with either cusps, or enamel-folds, and the first generally larger than the second. In the skull the two sides of the maxilla, while the infra-orbital foramen is mostly large, and there are no post-orbital processes. Although sometimes short, the tail is generally long, sparingly haired and scaly. The cardiac portion of the complex stomach has a horny layer, and there is a caninus.

The Spalacidae are burrowing types, allied apparently to the ancestral Jaculidae, and characterized by the second and third third and fourth front toes over the other two. All these "rodent- the Spalacidae are therio" are thoroughly adapted to a subterranean life, the eyes are small and rudimentary, as is also the tail; while the body is cylindrical in form, and the incisors being large and powerful. The incisors are very large; and the palate of the skull is narrow. The typical representative of the group is the great mole-rat (Spalax (Syphax) of Eastern Europe and North- East Africa, which, together with a few closely allied species, has the eyes completely buried in the skin, and the head much flattened.
RODENTIA

In the bamboo-rats, Rhiomys, from the Indo-Malayan countries, China and Tibet, as well as in the closely allied East African Tuckeyryctes, the eyes are, however, functional, and the head is rounded. (See Mole-Rat.) According to the arrangement here followed, the burrowing zokors may be placed in this family, although they have teeth like those of the vole group in the Muridae. The first representative of this sub-group is the genus Siphneus (or Myotalpa), of which some five central and North Asiatic species are known. They are characterized by the mole-like form and long, powerful, front claws (fig. 10). In the true zokors (Ellobius), on the other hand, the claws are short and the general form more vole-like. Of three named species, one extends from South Russia to Siberia, while two others are respectively from Kurdistan and Afghanistan. A third type, Hemilepis, from the Caucasus, is represented by species of the size of a small water-rat, chestnut-brown in colour, with lighter feet, and the minute eyes covered with skin. The teeth are nearest to those of the true zokors (Ellobius). The single example was taken under flowering anemones.

Malagasy Rats.—On account of certain structural peculiarities, the rats of Madagascar, which have a dentition like that of the cricetine Muridae, are separated as a distinct family, Nesomyidae. They are the only rodents in that island. Of these, Hypogeumayas is a large, long-tailed, fawn-coloured rat, with large ears and feet; Nesomys is a red species, with long hair; Brachytyomys is short-footed and long-tailed, with velvety fawn fur; Halomys has elongated hind feet, and has also Microtomonys Gymnomyomys is naked-tailed; and several species of Ellomys are dormouse-like.

Mouse Tribe.—The characteristics of the Muridae are those of the Myoidea generally, as given above under the heading of the Spalacidae. With the exception of Madagascar, the family, which may be divided into six sub-families, has a cosmopolitan distribution, and some genera are so numerous that only some of the most important can be even mentioned. The first group is that of the hamsters, or cricetines (Cricetinae), in which the molars are rooted and tuberculated, with the cusps of the upper ones arranged in two longitudinal rows (fig. 13, B); in the upper teeth, the outer cusps and in the lower the inner ones are the higher, and when worn the crown surfaces show oblique dentine-areas; in shape the third molar is like the second, but it is smaller. The infra-orbital foramen is generally narrow, and the tympanic bullae hollow. The humerus has a foramen at the lower end. The tail is short. The group is typified by the European hamster (Cricetus vulgaris or C. cricetus), to which a separate article is devoted (see Hamster); the genus includes a number of species ranging under several sub-genera, such as Mesocricetus, Cricetus, and Urocricetus, widely spread in Western and Central Asia, the last-mentioned, which extends to Tibet, being distinguished by its relatively long tail. The hamsters all possess cheek-pouches, which are, however, absent in many of the following genera. Africa claims only a single representative of the group, Mystromys, with one southern and one eastern species. Peromys is the home of Calomys (with white-tipped tail), a near relative of the American Peromyscus. In America, where the more typical kinds are known as white-footed, or deer, mice, the cricetines absolutely swarm, and include a host of genera, the majority of which are North American, although others are peculiar to Central and South America. Among these may be named Onychomys, Peromyscus, Rhipidomys, Holochucus (which is South American and includes the largest species), Sigmodon (typified by the North American rice-rat, S. hispidus), Oryzomys, Rhyzomys, with grooved incisors, Ichthyomys and Anomomys (fish-eating, aquatic forms, from the mountains of South America), Acomodon, and the North American wood-rats, or Neotoma, in which the molars have a structure simulating that of the under-mentioned Microtinae. A distinct sub-family, Lophiomyomys, is represented by the Central African arboreal spiny rats, Lophiomys, of which there are two or three species. Although agreeing with the Cricetine in the hollow tympanic bullae, they have the clavicles imperfect, the first front toe opposite to the rest, the temporal region of the skull roofed with bone, and the crowns of the molars with cusps arranged in rows but eventually covered by a layer of enamel.

The third sub-family is that of the Microtinae, or voles, which are distributed all over Europe, Northern Asia and North America, and are characterized by the tympanic bulla of the skull being filled with honey-combed bony tissue, the small size of the infra-orbital foramen, and the deep pterygoid fossa on the palatal aspect. The humerus lacks a foramen at the lower end; and the molar teeth, as explained and illustrated in the article Vole (q.e.), consist of two longitudinal rows of triangular alternating vertical prisms, and may be either rootless or rooted. Voles, as typified by the water-rat and the furred field-mouse, are stouter built and shorter-nosed rodents than the typical rats and mice, with smaller ears and eyes and shorter tails; all being good burrowers. In the circumpolar Etomomys (represented in England by the red-backed field-mouse) and the nearly allied North American Phenacomys, the voles develop roots in old age; but in Microtus (which includes the water-rat, and is circumpolar) they are rootless throughout life, the genus being one of the largest in the mammalian class (see Vole). The—musicrats—is a North American aquatic type (see Muskrat), characterized by the compression of the tail. Synaptomys is also North American, and characterized by the grooved upper incisors and the presence of distinct enamel-loops on the outer side of the lower molars. The circumpolar lemmings of the genera Lemmus and Dicrostonyx are noticed in the article Lemming. Ellomys, which many naturalists place in this group, has been mentioned among the Spalacidae.

From Milne-Edwards. Fig. 11.—African Spiny Rat (Lophiomys immatus).

From Milne-Edwards. Fig. 12.—The Australian Brown-footed Rat (Mus fasciatus).
The typical rats and mice, together with their nearest relatives, constitute the sub-family Murinae, which is represented by more than three hundred species, distributed over the whole of the Old World except Madagascar. The molars (fig. 13, A) are rooted and have three cusps or tubercles forming three longitudinal rows in those of the upper jaw, and only two distinct ones in those of the lower jaw. By this structure the Murinae are broadly distinguished both from the Cricetinae (fig. 13, B) and the Micronycteridae. In the Cricetinae the incus is a flat bone, while in the Murinae it is a large, pterygoid fossa shallow and the zygomatic arch slender, with a rudimentary jugal bone. The tail is long and scaly (fig. 12).

The genus *Neotoma* is a species, and with the incisors and molars toothed in the transverse laminae of the latter, its definition is broad. This genus contains a widespread and clumsy built rats spread out from Southern Asia to Formosa, and from Kashmir to Ceylon (see *Banding-Rat*). Among other important genera are *Cricetomys* and *Eosaccomys* (fig. 13), which possess the possession of cheek-pouches: *C. gambianus* being a very large species. The Javan *Pithecius* has the thumbable, while the Papuan *Chirudromys* has the tip of the tail naked above and prehensile. Among *Rattus* of Western Asia, Cyprus and Africa, take their name from the fur being almost entirely replaced by flattened spines, and are further distinguished by the rudimentary coronoid process of the lower jaw. *Doxysmys* is an allied African genus, while *Arctomys* includes the so-called *Murina* (M. fasciatus) of western and southern Australia (fig. 12). The genus *Neotoma* is a species, and with the incisors and molars toothed in the transverse laminae of the latter, its definition is broad. This genus contains a widespread and clumsy built rats spread out from Southern Asia to Formosa, and from Kashmir to Ceylon (see *Banding-Rat*). Among other important genera are *Cricetomys* and *Eosaccomys* (fig. 13), which possess the possession of cheek-pouches: *C. gambianus* being a very large species. The Javan *Pithecius* has the thumbable, while the Papuan *Chirudromys* has the tip of the tail naked above and prehensile. Among *Rattus* of Western Asia, Cyprus and Africa, take their name from the fur being almost entirely replaced by flattened spines, and are further distinguished by the rudimentary coronoid process of the lower jaw. *Doxysmys* is an allied African genus, while *Arctomys* includes the so-called *Murina* (M. fasciatus) of western and southern Australia (fig. 12). The genus *Neotoma* is a species, and with the incisors and molars toothed in the transverse laminae of the latter, its definition is broad. This genus contains a widespread and clumsy built rats spread out from Southern Asia to Formosa, and from Kashmir to Ceylon (see *Banding-Rat*). Among other important genera are *Cricetomys* and *Eosaccomys* (fig. 13), which possess the possession of cheek-pouches: *C. gambianus* being a very large species. The Javan *Pithecius* has the thumbable, while the Papuan *Chirudromys* has the tip of the tail naked above and prehensile.
RODENTIA

than one pair of premolars, and the original ridges of all the cheek-teeth have become obscured and complicated by the development of secondary enamel-folds. The majority of these rodents, many of which are of large size, are terrestrial, but a few are burrowing, others arboreal and two or three aquatic.

The Old World porcupines, constituting the family Hystricidae, are terrestrial, stoutly built rodents, with limbs of subequal length in front and behind, and the skin covered with strong spines. The upper lip is cleft, the jugal lacks an inferior angle, the fore part of the skull is short and broad; the cheek-teeth are partially rooted, with external and internal enamel-folds, the soles of the feet are smooth, there are six pairs of teats, the clavicles are imperfect and the tail is not prehensile. In the typical genus Hystrix, which is represented in all the three great continents of the Old World, and extends as far east as Flores and Celebes, the skull is swollen and convex, the spines are cylindrical, and the tail is short and covered with spines and slender-stalked open quills. In Atherura fasciculata of the Malay Peninsula the spines are flattened, and the tails long and scaly, with a tuft of compressed bristles. A closely allied species, A. africana, inhabits Western Africa. The third genus is Trichys (see Porcupine).

Atherurus. — All the New World porcupines, representing the family Erethizontidae (or Caviidae) are arboreal in their habits, and have the upper lip undivided, the cheek-teeth rooted, the clavicles complete, the soles of the feet tuberculated and three pairs of teats. Erethizon dorsatum, the opossum, is distributed all over the forest regions of North America; Synatherus (or Coendu) prehensitis, the prehensile-tailed porcupine of South America (fig. 15), represents a genus in which the whole upper surface of the body is protected by long white-tipped spines; Chaetomys subspinatus is clothed with strong wavy bristles. In the last two genera the feet have four toes, in place of the five of Erethismin (see Porcupine).

Cavy Group.—In the family Caviidae, typified by the cavies (or guinea-pigs), may be included a large number of South and Central American rodents, among which the agoutis and paca's are often ranked as a family (Dasyproctidae) by themselves. The Caviidae, in the present more comprehensive sense, include the rodents of the giant order. Many of them, like ungulates, are specialized for swift running, and have unusually long limbs, with ridges developed on the articular surfaces of the lower bones; the clavicles are more or less reduced; the thorax is more compressed than usual, with a narrow internal breadth, and there is a marked tendency to the reduction or loss of the lateral toes, more especially in the hind limb. Since these rodents walk more or less entirely on their toes, in such a manner that the edges of the claws or nails come in contact with the ground, these toes are apt to assume somewhat of a hoof-like character; while the foot-pads are more or less hairy. The tail is generally very short, and its basal vertebrae are often fused with the sacrum. In the skull the lachrymal bone is large, the par-occipital process is directed vertically downwards and the tympanic bulla is hollow. In the soft parts the caecum is very large, the penis is armed with a pair of barbed horny clasps and the scrotum is spiny.

Special interest attaches to the most aberrant member of the family, the Peruvian Dinomys, known for more than thirty years only by a single specimen taken in a house in Lima, and only lately rediscovered. It is a small rodent, not more than the paca-rana, or false paca, in allusion to the resemblance of its coloration to that of the true paca, from which it differs by its well-developed tail, the absence of cheek-pouches, the full development of the limbs and toes and a condition of the incisors which may be adopted as the popular title of the species. Dr. E. Goeldi states that the paca-rana is a rodent of phlegmatic and gentle disposition, with a short, light, and slender body, and is perfectly at ease in its native home, which is probably the extensive shrubbery and tablelands of the Bolivian and Peruvian foot-hills bordering on Brazil, inclusive of the headwaters of the Purus, Acro and Junua rivers. The true paca, Erethizon, has a white-tipped tail (or Agouti). C. pacos has a short tail, and both the first and fifth digits of the hind-foot are much inferior in size to the other three. The most remarkable feature of the genus is, however, the extraordinary development of the zygomatic arches, which are strongly tuberculated and bear, on the lower side of each, a globe-shaped and expanded structure, with a horizontal row of six to seven white-tipped spines. The paca-rana, is, therefore, a porcupine, in which every part of the body is reduced or entirely wanting, and which is adapted to life in an elevated country, and its name is well chosen.
RODENTIA

The hutia (Capromys pilorides) is nearly as large, arboreal in habits, and a native of Cuba, where it is the largest indigenous mammal. Other species occur in Cuba, Jamaica and the Bahamas, while a Vairon’s hutia, which is represented by a single specimen in the British Museum, is said to be peculiar to Hayti. The African cane-rats, Thryonomys (or Abrocoma), are large terrestrial rodents, ranging from the centre of the continent to the Cape, easily recognized by their deeply fluted incisors (see Cricetidae, p. 444). The next species of the sub-order differs from the preceding family by the tympanic bulla being filled with cellular bony tissue and by the par-occipital process curving beneath it, while the cheek-teeth are almost or completely conical. These rodents are represented in Australia, New Zealand, and South America, but otherwise may be absent.

The more typical members of the family are rat-like burrowing rodents, living in communities. The typical genus is represented by the degu (Octodon degus) and several nearly related species; other genera being Cenomys, Octodontomys (Neotodon), Acomys, Spalacopus and Abrocoma; the latter taking its name from its unusually soft fur. Among these, the tuco-tuco (Ctenomys) are characterized by their burrowing habits, almost rudimentary ears, small eyes, short tails and the kidney-shaped grinding-surfaces of their cheek-teeth. They take their name of tuco-tuco from their cry, which resembles the blows of a wind-mill, and many of these rodents move in their burrows, generally formed in sandy soil. In some districts the ground is undermined by these burrows, in which stores of food are accumulated. The species of Octodon has a tufted, wavy, black or white mohair-like hair, the two incisors indented by plates of enamel; they are chiefly found in hedgerows and bushes, where they burrow. In Abrocoma the tail has not the same large rosettes, and the fur is generally absent.

Acomys is an allied Chilean genus in which the enamel-folds meet across the molars. Several of these rodents live in the Andes, where the ground is covered for miles by tussocks of grass. The second incisor of the genus Lonercheres, Dactylomys, Echinothrix, Proechimys and a few others, the members of which are rat-like rodents, with long scaly or furry tails, and frequently flattened spines muffled with the fur of the knuckles. These rodents are characteristically marked with black, white and yellow, or brown and white, and in some the lighter tints extend on to the sides, shoulders and head, communicating a coloration somewhat like that of a guinea-pig (see Cricetidae, p. 439). Clerodos (Cercodontomys) and Cl. vali are the types of an African family, which also includes the genera Massotteria, Pectinater and Petromys. In the gundi the two inner toes of the hind-foot are furnished with a horny comb and bristles for the purpose of cleaning the fur, and the tail is very short; but in Pectinater the tail is longer. Petromys has a still longer and more bushy tail, and no comb to the hind-feet. The gundi is a diurnal species, inhabiting rocky districts, and having habits very similar to that of the hutia. Of these genera probably only the first has the incus and malleus of the internal ear, the free ibula and the almost rootless cheek-teeth. The premolar is very small, thus showing an approximation to the family Cricetidae. In other respects Petromys appears to approximate to the Hystriidae.

Picas and Hares.—The remaining rodents, which include two families, are the Picae (Leporidae) and the Hares (Lepus). The first constitute a second sub-order, the Duplicidentata, differing from all the foregoing groups in possessing two pairs of incisors in the upper jaw (of which the second is small, and placed directly behind the first pair), the enamel of which extends round to their posterior surfaces. At birth there are three pairs of incisors, but the outer one is soon lost. The incisive foramina are large and usually confluent; the bony palate is very narrow from before backwards; there is no alisphenoid canal; the ibula is welded to the tubia, and articulates with the calcaneum; and the testes are permanently external. All are terrestrial, and in many cases burrowing, in their habits, and some of them are of great size. Of the two genera, the rock-rabbit (Ochotona) and the snow-rabbit (Lagomys), which includes all the pikas, or moun-terraces. They are small rodents with complete and equal incisors, and long incisors and hind-teeth; the external tails and short ears. Skull depressed, fronsals contracted and without post-orbital processes; p. 1½; molars rootless, with transverse enamel-fold. In some cases the molar-formula is almost obliterated, and there are no incisors. The rock-rabbit, inhabiting chiefly the mountainous parts of Northern Asia (from 11,000 to 14,000 feet), one species only being known from South-east Europe and several from the Rocky Mountains and the Aleutian Islands.

From the picae the hares and rabbits (Leporidae) are distinguished by the imperfect clavicles, the more or less elongated hind-limbs, short recurved tail (absent in one case) and generally long ears. They are all characterized with long-rhinar and without post-orbital processes (fig. 10); p. 3½. With the exception of Australasia, the family has a cosmopolitan distribution; and its numerous species resemble one another more or less closely in general external characters. In all the fore-limbs have five and the hind four digits; and the soles of the feet are densely clothed with hairs similar to those covering the outer surface of the cheeks, being bristly. Although the family has a such a wide distribution the great number of species are restricted to European and central Asia and North America; South America having very few. Till within the last few years the majority of naturalists have followed the practice of including all the members of the family in the genus Lepus. It is true that Mr E. Blyth long ago proposed the name Caprotinae for the remarkable spiny rabbit of the western Himalaya, which has a spiny tail; but the generic name Oryctolagus was suggested later for the rabbit, and Sylvilagus for the American "cotton-tails"; but none of these was accorded general acceptance. Of late years, however, it is proposed to split the two genera, as the outer subdivisions of the Leporidae are advisable.

In 1899 Dr Forsyth Major proposed a classification of the family in which a number of species were grouped with the spiny rabbit in the genus Caprotinae, the type of which was Oryctolagus, and another group with the cotton-tails, or wood-rabbits, of North and South America as members of the genus Sylvilagus, by themselves, which includes the Brazilian and Paraguay hares, and appears to be chiefly distinguished by a certain feature in the parietal region of the skull. Under the name of Oryctolagus cuniculus, the rabbit is considered to be the only species of its genus. Alternatively, the incisors and the skull are longer and the hairs of the ear and hind-teeth. The swamp-rabbit (L. palustris) and water-hare (L. aquaticus) of the southern United States form the group Lipotragus, characterized by the harsher fur, the shorter ears and the shorter, even though pointed, post-orbital process (which is so distinct in the typical hare) with the adjacent parts of the skull, so that neither notches nor perforations are developed. These animals range from the United States (Brachylagus idahoensis) is the sole member of a group allied in general characters to the typical Lepus, but distinguished by the unusually short tail. Another group is Pronogamus, typified by the Cape thick-tailed hare, the so-called Lepus crassicaudatus, which is externally similar to Lepus proper, but has the skull and teeth of the general type of the next group. The tailless rabbit of Mount Popocatépetl, Mexico, originally described as a distinct generic type, under the name of Romerolagus diazi, is widely distinguished by the large absence of the tail, and the short ears and hind-teeth, its general form being like that of the Lii-Kiu rabbit, while in the latter, in the lateral, post-orbital process of the skull is small, and represented only by the hinder half. Next come three remarkable rabbits from the Indo-Malay countries, all closely allied, although regarded as representing three generic types. One of these is Caprotinae, Caprotus and Penolateus. In all three the skull is of the type of Romerolagus. The first is represented by the Sumatran rabbit, the so-called N. nitscheri, which apparently differs from the spiny rabbit mainly by the pattern of the cheek-teeth, which are larger and more elongated, and the incisors and hind-teeth, which are longer. The second is the Hawaiian rabbit, separated from Lepus by Blyth in 1845 under the name of Caprotus hispidus, is an inhabitant of Assam and the adjacent districts, and distinguished by its harsh, bristly fur and short ears and tail. In the Lii-Kiu rabbit (Pomolechus) the body of the coat is equally harsh, but the ears and hind-feet are shorter, and there are only five (in place of the usual six) pairs of upper cheek-teeth. In the loss of the last upper molar, the Lii-Kiu rabbit approximates to the picae, which does not have the tailless rabbit in the appendage. Mr Lyon's scheme seems to be the best attempt to explain the affinities of the members of the group. Whether all his genera be adopted, or all the species be included in Lepus, must largely be a matter of individual opinion.

FIG. 16.—Skull of the Common Hare (Lepus europaicus).
RODERICK—RODEZ

If the latter course be followed, Mr. Lyman's genus must be reduced to the rank of sub-generic and the divisions of Lepus and Sylvilagus ignored. (See Hare and Rabbits.)

EXTINCT RODENTS

Among extinct rodents, only a few of the more important types may be noticed. As to the origin of the order, we are still in a great extent in the dark; and even the relations of the Diplidicentata to the existing families is not yet sufficiently known. To the latter point, it is, however, considered probable that both are branches of a common stock, which diverged from each other before all the typical rodent characters were acquired. As to the accommodations of the order, it has been represented by certain Lower Eocene European and North American mammals, at one time regarded as primitive Primates. In Europe these include Plesiadapis and Protodipodos, and in North America Micromys, Platygnathus, and Nuculanus, representing the family Miozoodae. Possibly the European forms, in which the dental formula has been as 4 3 3 3, 1, 1, and there is a gap between the incisors and the cheek-teeth, are more nearly related to modern rodents than the American types, and may indeed belong to the same order. On the other hand, the American forms, which have one pair of large chisel-like incisors in the lower jaw also possess a lower canine, and show many characters of the cheek-teeth, nor any indication of the characteristic rodent backwards movement of the lower jaw. On these grounds, while admitting that they are allied to the rodents, it has been pointed out by many that they are probably to be included in the order Proglares in consequence proposed for their reception.

Whatever may be the true affinities of these problematical mammals, undoubted rodents, of the order Rodentia, are known from the Lower Eocene of Europe and from North America. In Europe these form the genus Ischyromys and the family Ischyromyidae, and have premolars 3, and all the cheek-teeth low-crowned, with simple cusps of ridges. The name is derived from the Greek. In America these rodents, with transversely ridged molars, are allied; and the European Sciuromys should perhaps find a place in the same neighbourhood. A more advanced phase is represented in the European Lower Oligocene by a genus, called Pseudolestes, with the genera Mesolestes, Trechomys, Theridomys, &c., in which part of the masseter passes through the broad infra-orbital canal, and the premolars are 3; the molars being low-crowned, many-rooted and either cusped or ribbed. The American families appear to be akin to the European, and it is partly on their evidence that the family Pedetidae is placed next to the latter. Here it may be mentioned that Leithia, from the Pleistocene of Maryland, resembles in its characters the genus Mesolestes, and its type, Mesolestes, has a large canine on the lower jaw, with its first premolar. The American Oligocene Cricetodon and Eumys in America are the earliest known forerunners of the cricetine Muridae; while at the same time primitive beavers appear in the form of Stenomys, to be succeeded in America by Castoridae and Tragulidae.

The still larger North American Pleistocene Castoridae, known by one species of the size of a bear, and the allied West Indian Amblyrhina, appear to be specialized bears, although bearing many characters of the American Cricetidae. Near akin is the North American Miocene family Mygalaxidae, typified by Mygalaxus, but including Megagale and Protogaleus. Although showing some similarity to Lepus, incumbent buccal loops, and then by the modern Ochotonidae, these rodents are regarded as allied to the Castoridae, although forming an isolated type. The prominent feature, writes Mr. E. S. Riggs, is the unusual development of the premaxilla to the exclusion of the posterior teeth. Associated with this is the strength and sharpness of the lower jaw, the prominence and anterior position of the masseteric ridge, and the depth of the ramus from the alveolar line to the angle. These indicate unusual capacity for crushing or grinding; while the last premolar is a crushing implement, which has reached the highest degree of specialization known in Rodentia. It is suggested that these teeth may have been employed for cracking nuts or hazel nuts, while the only aquatic bear of which any knowledge is at hand, is the modern Ochotonidae. The American Cricetodon is a large long bearded bear, with a large lopping ear, and, from the character of some of the species, as it is the Chinese, and from the character of some of the species, it is supposed to be related to the family Cricetidae.

The American Cricetodon is a large long bearded bear, with a large lopping ear, and, from the character of some of the species, it is supposed to be related to the family Cricetidae. To this order belong the Ochotonidae and the Primates with large ears and long tails, like the Japanese field rat, Apodemus, and the water vole, Arvicola, which is the type of the family Arvicolidae.

RODERICK, or RYARD (d. 1168), king of Connaught and high king of Ireland, was the son of Turlough (Toirdelbach) O'Connor, king of Connaught, and the grandson of Niall again, king of Ireland, and the grandson of Niall of the Nine Hostages. On the death of his father, the king of Leinster, in the battle of Maghach Cnoc in 1151, but again in 1154 through the rise of Dermot O'Lochlaigh in Ulster. Roderick succeeded to Connaught in 1156, and after ten years' fighting won back the title of high king. His ill-advised persecution of Dermot (Diarmait MacMurchada), king of Leinster, furnished the pretext for the Anglo-Norman invasion of Ireland. Roderick endeavoured to expel the invaders, but was driven behind the Shannon. He delayed his submission to Henry II until 1175, when a treaty was concluded at Windor. Roderick, under this agreement, held Connaught as the vassal of England, and exercised lordship over all the native kings and chiefs of Ireland; in return he undertook to pay homage to the Angevin king. The treaty did not put an end to the wars of the Norman adventurers against Connaught and Roderick's dependants. He held out till 1180; but then, weary of strife, retired to the cloister. He died in 1188, the last of the high kings of Ireland.

RODEZ, a town of southern France, capital of the department of Aveyron, 51 m. N.N.E. of Albi by rail. Pop. (1906) town, 11,076; commune, 15,502. Rodez is situated on the southern border of the Causee of Rodez, on an isolated plateau bordered on the E. and S. by the river Aveyron. The cathedral was built between 1277 and 1535. A great Flamboyant rose-window and a gallery in the same style are the chief features of the principal façade, which is flanked by two square towers and has no portal. Each transept has a fine Gothic doorway. On the north side of the building rises a tower (1510-1526) of imposing height (253 ft.). The three upper stages are richly decorated, and the whole is surmounted by a colossal statue of the Virgin. In the cathedral are four rood-lofts, some good wood-carving and the tombs of several bishops. Other interesting buildings are the episcopal palace (17th and 19th centuries), flanked by a massive tower, relic of an older palace; the church of St Amans, of Romanesque architecture, restored in the 18th century; and, among other old houses, the hotel d'Armagnac, built in the Renaissance period on the site of the old palace of the counts. The ruins of a Roman amphitheatres still exist in Rodez, which is supplied with water by a Roman aqueduct. About 6 m. to the north of Rodez is the chasm of Tindoul de la Vayssière, leading to a subterranean river issuing in the springs of the picturesque village of Salles-la-Source.

The town is the seat of a bishop, a prefect and a court of assizes, and has tribunals of first instance and commerce, a chamber of commerce, a branch of the Bank of France, a lycée training college for both sexes and an ecclesiastical seminary. The industries include wool-spinning and the weaving of wooden goods.
RODGERS—RODNEY

Rodin, called Segaudum under the Gauls, and Ruthena under the Romans, was the capital of the Rodthani, a tribe allied to the Arverni, and it was afterwards the principal town in the district of Rouergue. In the 4th century it adopted the Christian faith, and St Amans, its first bishop, was elevated to the diocese of Alcoron and then to the D'Albrets. Henry IV. finally annexed it to the crown of France.

RODGERS, JOHN (1771-1838), American sailor, was born in Harford county, Maryland, on the 11th of July 1771. He entered the United States navy when it was organized in 1798. He was second in command to Commodore James Barron (1769-1831) in the expedition against the Barbary pirates, and succeeded him in the command in 1805. In this year he brought both Tunis and Tripoli to terms, and then returned to America. In 1811 he was in command as commodore of the U.S. frigate "President" (44) off Annapolis when he heard that an American ship had been "pressed" by a British frigate off Sandy Hook. Commodore Rodgers was ordered "to protect American commerce," but he may have had verbal instructions to retaliate for the impressment of real or supposed British subjects out of American vessels, which was causing much ill-feeling and was a main cause of the War of 1812. On the 16th of May 1811 he sighted and followed the British sloop "Little Belt" (22), and after some hailing and counter-hailing, of which very different versions are given on either side, a gun was fired, each side accusing the other of the aggression, and an action ensued in which the "Little Belt" was cut to pieces. The incident, which was represented as an accident by the Americans, and believed by both parties, and deliberate aggression by the British navy, had a share in bringing on the war. When hostilities broke out Rodgers commanded a squadron on the coast of America, and was wounded by the bursting of one of his guns while pursuing the British frigate "Belvedere." He was subsequently President of the Board of Navy Commissioners in 1815-1824 and in 1827-1837, and acting secretary of the navy in 1823 for two weeks. He died in Philadelphia on the 1st of August 1838.

His brother, George Washington Rodgers (1785-1832), a brother-in-law of Commodore Perry, served in the War of 1812 and was wounded at the battle of "Putnam" (154). Rear-Admiral John Rodgers (1812-1882), a son of Commodore George Rodgers, served in the Union navy and in 1877-1882 was superintendent of the Naval Observatory at Washington. G. W. Rodgers had two sons who were naval officers, Christopher Raymond Perry Rodgers (1819-1892) and George Washington Rodgers (1822-1886).

RODIN, AUGUSTE (1840-1917), French sculptor, was born in 1840, in Paris, and at an early age displayed a taste for his art. He began by attending Barye's classes, but did not yield too completely to his influence. From 1864 to 1870, under pressure of necessity, he was employed in the studio of Carrier-Belleuse, where he learnt to deal with the mechanical difficulties of a sculptor. Even so early as 1864 his individuality was manifested in his "Man with a Broken Nose." After the war, finding nothing to do in Paris, Rodin went to Brussels, where from 1871 to 1877 he worked, as the colleague of the Belgian artist Van Rasbourg, on the sculpture for the outside and the carvings for the interior of the Bouz, besides exhibiting in 1875 a "Portrait of Garnier." In 1877 he contributed to the Salon "The Bronze Age," which was seen again, cast in bronze, at the Salon of 1880, when it took a third-class medal, was purchased by the State, and is now in the museum of the Luxembourg. Between 1882 and 1885 he sent to the Salons busts of "Jean-Paul Laurens" and "Carrier-Belleuse" (1882), "Victor Hugo" and "Dalou" (1884), and "Antonin Proust" (1885). From about this time he chiefly devoted himself to a great decorative composition six metres high, which was not finished for twenty years. This is the "Portal of Hell," the most elaborate perhaps of all Rodin's works, executed to order for the Musée des arts décoratifs. It is inspired mainly by Dante's Inferno, the poet himself being seated at the top, while at his feet, in under-cut relief, we see the writhing crowd of the damned, torn by the frenzy of passion and the anguish of despair. The lower part consists of two bas-reliefs, in their midst two masks of terrified faces. Round these run figures of women and centaurs. Above the door three men cling to each other in an attitude of despair. After beginning this titanic undertaking, and while continuing to work on it, Rodin executed for the town of Domvilliers a statue of "Bastien-Lepage;" for Nancy a "Monument to Claude le Lorrain," representing the Chariot of the Sun drawn by horses; and for Calais "The Beggars of Calais" surrendering the keys of the town and imploring mercy. In this, Rodin, throwing over all school tradition, represents the citizens not as grouped on a circular pilast, but walking in file. This work was exhibited at the Petit Gallery in 1885. At the time of the secession of the National Society of Fine Arts, or New Salon, in 1890, Rodin withdrew from the old Society of French Artists, and exhibited in the New Salon the bust of his friend "Pavis de Chavannes" (1892), "Contemplation" and a "Caryatid," both in marble, and the "Monument to Victor Hugo" (1897), intended for the gardens of the Luxembourg. In this the poet is represented nude, as a powerful old man extending his right arm with a sovereign gesture, the Muse standing behind him. In 1898 Rodin exhibited two very dissimilar works, "The Kiss," exhibited again in 1900, a marble group representing Paolo Malatesta and Francesca da Rimini, and the sketch in plaster for a "Statue of Balzac." This statue, a commission from the Society of Men of Letters, had long been expected, and was received with vehement dissensions. Some critics regarded this work, in which Balzac was represented in his voluminous dressing-gown, as the first-fruits of a new phase of sculpture; others, on the contrary, declared that it was incomprehensible, if not ridiculous. This was the view taken by the society who had ordered it, and who "refused to recognize Rodin's rough sketch as a statue of Balzac," and withdrew the commission, giving it to the sculptor Falguière. Falguière exhibited his model in 1899. In the same Salon, Rodin, to prove that the conduct of the society had made no change in his friendship with Falguière, exhibited a bust in bronze of his rival, as well as one of "Henri Rochefort." In 1900, the city of Paris, to do honour to Rodin, erected at its own expense a building close to one of the entrances to the Great Exhibition, in which almost all of the works of the artist were to be seen, more especially the great "Portal of Hell," still quite incomplete, the "Balzac," and a host of other works, many of them unfinished or mere rough sketches. Here, too, were to be seen some of Rodin's designs, studies and water-colour drawings. He has since executed a great many etchings and sgrafitti on porcelain for the manufactory at Sévres. His best-known etching is the portrait of Victor Hugo. Many of Rodin's works are in private collections, and at the Luxembourg he is represented by a "Danaid" (in marble), a "Saint John" (in bronze, 1880), "She who made the Helmet" (bronze statue), the busts of "J. P. Laurens" and of "A Lady" and other works. In the Musée Galliera is a very fine bust of Victor Hugo. Rodin's "Hand of God" was exhibited in the New Gallery, London, in 1905. In 1904 Mr Ernest Beckett (Lord Grimthorpe) presented the International Society of Sculptors, Painters and Engravers, in succession to James McNeill Whistler. See SCULPTURE (Modern French); also Geffroy, La Vie artistique (Paris, 1892, 1893, 1899, 1900); L Maillard, Rodin (Paris, 1899); La Plume, Rodin et son œuvre (Paris, 1900); Alexandre, Le Balzac (Paris, 1898). RODNEY, GEORGE BRIDGEY RODNEY, BARON (1718-1792), English admiral, second son of Henry Rodney of
Walton-on-Thames, was born in February 1718. His father had served in Spain under the earl of Peterborough, and on quitting the army served as captain in a marine corps which was disbanded in 1713. George was sent to Harrow, being appointed, on leaving, by warrant dated the 21st of June 1723, a volunteer on board the "Sunderland." While serving on the Mediterranean station he was made lieutenant in the "Dolphin," his promotion dating the 15th of February 1739. In 1742 he attained the rank of post-captain, having been appointed to the "Plymouth" on the 9th of November. After serving in home waters, he obtained command of the "Eagle" (50), and in this ship took part in Hawke's victory off Ushant (14th October 1747) over the French fleet. On the 17th of February he gained his first laurels for gallantry, under a chief to whom he was in a measure indebted for subsequent success. On the 9th of May 1749 he was appointed governor and commander-in-chief of Newfoundland, with the rank of commodore, it being usual at that time to appoint a naval officer, chiefly on account of the fishery interests. He was elected M.P. for Saltash in 1751, and married his first wife, Jane Compton (1730-1757), sister of the 7th earl of Northampton, in 1753. During the Seven Years' War Rodney rendered important services. In 1757 he had a signal success in the expedition against Rochefort, commanding the "Dublin" (74). Next year, in the same ship, he served under Boscawen at the taking of Louisburg (Cape Breton). On the 15th of May 1759 he became a rear-admiral, and was shortly after given command of a small squadron intended to destroy a large number of flat-bottomed boats and stores which were being collected at Havre for an invasion of the English coasts. He bombarded the town for two days and nights, and inflicted great loss of war-material on the enemy. In July 1760, with another small squadron, he succeeded in taking many more of the enemy's flat-bottomed boats and in blockading the coast as far as Dieppe and Ambleteuse, and in driving the French fleet to Ushant. In 1761, he was promoted to rear-admiral. In the autumn of that year appointed commander-in-chief of the Leeward Islands station, and within the first three months of 1762 had reduced the important island of Martinique, while both St Lucia and Grenada had surrendered to his squadron. During the siege of Fort Royal (now Fort de France) his seamen and marines rendered splendid service on shore. At the peace of 1763 Admiral Rodney returned home, having been during his absence made vice-admiral of the Blue and having received the thanks of both houses of parliament.

In 1764 Rodney was created a baronet, and the same year he married Henrietta, daughter of John Clies of Liscane. From 1765 to 1770 he was governor of Greenwich Hospital, and on the dissolution of parliament in 1768 he successfully contested Northampton at a ruinous cost. When appointed commander-in-chief of the Jamaica station in 1771 he lost his Greenwich post, but a few months later received the office of rear-admiral of Great Britain. Till 1774 he held the Jamaica command, and during a period of quiet was active in improving the naval yards on his station. Sir George struck his flag with a feeling of disappointment at not obtaining the governorship of Jamaica, and was shortly after forced to settle in Paris. Election expenses and loss at play in fashionable circles had shattered his fortune, and he could not secure payment of the salary as rear-admiral of Great Britain. In February 1778, having just been promoted admiral of the White, he used every possible exertion to obtain a command, to free himself from his money difficulties. By May he had, through the splendid generosity of his Parisian friend Marshal Biron, effected the latter task, and accordingly he returned to London with his children. The debt was repaid out of the arrears due to him on his return. The story that he was offered a French command is fiction.

Sir George was appointed once more commander-in-chief of the Leeward Islands late in 1779. His orders were to relieve Gibraltar on his way to the West Indies. He captained a Spanish convoy off Cape Finisterre on the 8th of January 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St Vincent, taking or destroying seven ships. On the 17th of April an action, which, owing to the carelessness of some of Rodney's captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable Dutch island of St Eustatius on the 3rd of February 1781. It had been a great entrepôt of neutral trade, and was full of booty, which Rodney confiscated. As large quantities belonged to English merchants, he was entangled in a series of costly lawsuits.

After a few months in England, recruiting his health and defending himself in Parliament, Sir George returned to his command in February 1782, and a running engagement with the French fleet on the 9th of April led up to his crowning victory off Dominica, when on the 12th of April with thirty-five sail of the line he defeated the comte de Grasse, who had thirty-three sail. The French inferiority in numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours' fighting. This important battle saved Jamaica and ruined French naval prestige, while it enabled Rodney to write: "Within two little years I have taken two Spanish, one French and one Dutch admirals." A long and wearisome controversy exists as to the originator of the manoeuvre of "breaking the line." In this battle, but the merits of the victory have never seriously been affected by any difference of opinion on the question. A shift of wind broke the French line of battle, and advantage was taken of this by the English ships in two places.

Rodney arrived home in August to receive unbounded honour from his country. He had already been created Baron Rodney of Rodney Stoke, Somerset, by patent of the 19th of June 1782, and the House of Commons had voted him a pension of £5000 a year. From this time he led a quiet country life till his death, which occurred on the 24th of May 1792, in London. The House of Commons voted him the sum of £6000, and George (1753-1802), from whom the present baron is descended.

Rodney was unquestionably a most able officer, but he was also vain, selfish and unscrupulous, both in seeking prize money, and in using his position to push the fortunes of his family. He made his son a post-captain at fifteen. He was accused by his second-in-command, Hood, of sacrificing the interest of the service to his own profit, and of showing want of energy in pursuit of the French on the 12th of April 1782. It must be remembered that he was then prematurely old and racked by disease.

See General Mundy, Life and Correspondence of Admiral Lord Rodney (1890); David Hannay, Life of Lord Rodney: letters in 9th Report of Hisat. MSS. Comm., pt. iii.; "Memoirs," in Naval Chronicle, i. 353-93; and Charnock, Biographia Navalis, v. 203-28. Lord Rodney published in his lifetime (probably 1789) Letters to His Majesty's Ministers, by a Foreigner, etc., of which there is a copy in the British Museum. Most of these letters are printed in Mundy's Life, vol. ii., though with many variant readings.

**RODOMONTADE, or RHODOMONTADE, a term for boastful, extravagant language or any inflated bragging speech.** The word refers to the brave but boastful Saracen leader Rodomonte in Ariosto's Orlando Furioso. The name (in the form Rodomonte) appears earlier in Boccardo's Orlando Innamorato. It is supposed to represent a compound of rodare, to roll, and monte, mountain.

**RODOSTO (Turkish, Tekir Dagh), a town of European Turkey, in the vilayet of Adrianople, on the coast of the Sea of Marmora, 78 m. W. of Constantinople. Pop. (1905) about 35,000, of whom half are Greeks. The picturesque Bay of Rodosto is enclosed by the great promontory of Combos, a spur about 2000 ft. in height from the hilly plateau to the north. The church of Panagia Rheumatocratissa contains the graves, with long Latin inscriptions, of the Hungarians who were banished from their country in 1686 by the imperialist captors of Buda. Rodosto was long a great depot for the produce of the Adrianople district, but its trade suffered when Dédagatch became the terminus of the railway up the Maritta, and the town is now
RODRIGUEZ-ROE, E. P.

449

dependent on its maritime trade, especially its exports to
Constantinople. It is the administrative centre of a district
(sanjajb) producing and exporting barley, oats, spelt and canary
seed, and sugar-planting with mulberry trees, on which silkworms
are fed. We next go to the Mascarene Islands in the Indian
Ocean (394 cwt). In 1901, silkworms' eggs to Russia and Persia
Rodosto is the ancient Rhoadesmen or Bisamile, said to have been
founded by Samians. In Xenophon's Anabasis it is mentioned as
in the 5th century B.C. the Thracian prince Scuthes. Its restoration
by Justinian in the 6th century, however, rests on an ancient.
In 813 and again in 1206 it was sacked by the Bulgarians, but it
continues to appear as a place of considerable note in later
Byzantine history.

RODRIGUEZ (officially RODRIGUES), an island in the Indian
Ocean in 19° 47' S., 63° 32' E.; the most important dependency
of the British colony of Mauritius, from which it is separated by
a narrow channel. It is the nearest island to the coast of Africa.
It is a station on the ' all-British ' cable route between
South Africa and Australia, telegraphic communication with
Mauritius being established in 1902. With a length of
13 m. E. and W., and a breadth of 3 to 6 m. N. and S., it has an
area estimated at 425 sq. m. On all sides it is surrounded by a
fringing reef of coral, studded with islets. This reef, only
100 yds. wide at the eastern end of the island, extends westward
3 m., and both N. and S. forms a flat area partly dry
at low water. Two passages through the reef are available for
large vessels, respectively to-Port Mathurin on the N. coast and to Port Saocor on the S. coast.

The island was at one period believed to consist of granite over-
laid with limestone and other volcanic strata, and its supposed
formation caused it to be regarded as a remnant of the hypothetical
continent of Lemuria. The investigations made by an expedition
sent by the British government in 1867, however, proved that
island is a mass of volcanic rock, mainly a dolerite lava, rich in
olivine. The land consists largely of a series of hills. The main
ridge, which runs parallel to the longest diameter, rises along
the east, more gradually on the west, where there is a wide plain
of coralline limestone, studded with caves, some stalactitic.
Of several peaks on the main ridge the highest is Mt. Limon, 1300 ft.
above the sea. The island is covered with a wild growth of
which show successive belts of lava separated by thin beds of
cinders, agglomerate and coloured clays. In places the cliffs rise
300 ft. and exhibit twelve distinct lava flows. The climate is like
that of Mauritius, but Rodrigues is more subject than Mauritius
to hurricanes during the north-west monsoon (November to April).

Flora and Fauna.—When discovered, and down into the 19th
century, Rodrigues was clothed with fine timber trees; but goats,
cattle and bush-fires have combined to denude the greater part
of the old vegetation, and the indigenous plants have in many cases
been ousted by intrusive foreigners. Parts are, however, still
well wooded by native pines, casuarinas, sweet potato, manioc, maize, millet, the sugar-cane, cotton, coffee and rice grow well.

Tobacco is also cultivated. Wheat is seldom seen, mainly because of the parakeets and the Java sparrows which have been introduced. In 1903, 54,710.

of the imports for the same period, £45,710. The island is administered by a magistrate
appointed by the governor of Mauritius, and the laws are
regulations issued by the governor in executive council.
The revenue, some £1,000 a year, is about half the expenditure incurred, the balance being furnished from the Mauritian<br>

Economy.

The government maintains a hospital and schools, and pays the salary of a Roman Catholic priest.

Rodriguez's Voyage, edited by Capt. P. Oliver, forms vols. 82 and 83 of the Trans., Vols. 171-173 (1901), which contains, in addition, a chapter on Rodrigues and the neighbourhood.

ROEDER, EDWARD A. (1838-1888), American novelist, was
born in Moodna, Orange county, N.Y., on the 7th of March
1838. He studied at Williams College and at Auburn Theologi-

cal Seminary; in 1862 became chaplain of the Second
New York Cavalry, U.S.V., and in 1864 chaplain of Hampton
Hospital, at Hampton, Virginia. In 1866-74 he was pastor
of the Presbyterian Church at Highland Falls, N.Y. In 1874 he
removed to Cornwall-on-the-Hudson, where he devoted himself
to the writing of fiction and to agriculture. He died on the
10th of July 1888. During the Civil War he wrote weekly
letters to the New York Evangelist, and subsequently lectured on the war and wrote for periodicals. Among his novels were *Barriers Burned Away* (1872), which first appeared as serials in *The Evangelist* and made him widely known; *What Can She Do?* (1873), *Opening of a Chestnut Burr* (1874), *From Jest to Earnest* (1875), *Near to Nature's Heart* (1876), *A Knight of the Nineteenth Century* (1877), *A Face Illumined* (1878), *A Day of Fate* (1880), *Without a Home* (1881), *Nature's Serial Story* (1884), *A Young Girl's Wooing* (1884), *An Original Belle* (1885), *He Fell in Love with his Wife* (1886), *The Earth Trembled* (1887) and *Miss Lou* (left unfinished, 1888). He wrote also *Play and Profit in My Garden* (1873), *Success with Small Fruits* (1881) and *The Home Acre* (1887). His novels were very popular in their day, especially *The Most Innocent Man*, which was translated into several European languages. Their strong moral and religious purpose, and their being written by a clergyman, did much to break down a Puritan prejudice in America against works of fiction.

See E. P. Roe: *Reminiscences of his Life* (New York, 1890), by his sister, Mary A. Roe.

**ROE** (or Row), SIR THOMAS (c. 1581–1644), English diplomat, son of Robert Roe, and of Elinor, daughter of Robert Jermy of Worstead in Norfolk, was born at Low Leyton near Wanstead in Essex, and at the age of twelve (1593) matriculated at Magdalen College, Oxford. Shortly afterwards he joined one of the Oxford gentry, and was made page of the Queen, Elizabeth. He was knighted by James I in 1605, and became intimate with Henry, prince of Wales, and also with his sister Elizabeth, afterwards queen of Bohemia, with whom he maintained a correspondence and whose cause he championed. In 1610 he was sent by Prince Henry on a mission to the West Indies, during which he visited Guiana and the river Amazon, but failed then, and in two subsequent expeditions, to discover the gold which was the object of his travels. In 1614 he was elected M.P. for Tamworth, and in 1621 for Cirencester. His permanent reputation was mainly secured by the success which attended his embassy in 1621–18 to the court at Agra of the Great Mogul, Jahangir, the principal object of the mission being to obtain protection for an English factory at Surat. Appointed ambassador to the Porte in 1621, which he even then describes as being “irrevocably sick,” he distinguished himself by further successes. He obtained an extension of the privileges of the English merchants, concluded a treaty with Algiers in 1624, by which he secured the liberation of several hundred English captives, and gained the support, by an English subsidy, of the Transylvanian Prince Bethlen Gabor for the European Protestant alliance and the cause of the Palatinate. Through his friendship with the patriarch of the Greek Church, Cyril Lucaris, the famous Codex Alexandrinus was presented to James I, and Roe himself collected several valuable MSS. which he subsequently presented to the Bodleian library. In 1629 he was again successful in another mission undertaken to arrange a peace between Sweden and Poland. Subsequently Roe negotiated treaties with Danzig and Denmark, returning home in 1630, when a gold medal was struck in his honour. In January 1637 he was appointed chancellor of the Order of the Garter, with a pension of £200 a year. Subsequently he took part in the peace conferences at Hamburg, Regensburg and Vienna, and used his influence to obtain the restoration of the Palatinate, the emperor declaring that he had “scarcely ever met with an ambassador till now.” In June 1640 he was made a privy councillor, and in October was returned to parliament as member for the university of Oxford, where his unrivalled knowledge of foreign affairs, commerce and finance, together with his learning and eloquence, gained for him in another sphere considerable reputation. He died on the 6th of November 1644. He had married Eleanor, daughter of Sir Thomas Carr of Stafford, Northamptonshire. Roe was a distinguished and most successful diplomatist, an accomplished scholar and a patron of learning, while his personal character was unblemished.

His *Journal of the mission to the Mogul*, several times printed, has been re-edited, with an introduction by W. Foster, for the Hakluyt Society (1899). This is a valuable contribution to the history of Indian diplomacy. A number of his letters are published in *Transactions* in his *Embassy to the Ottoman Porte* (1621–28), vol. 1, published in 1740, but the work was not continued. Other correspondences, consisting of letters relating to his mission to Sultan Rahim Adolphus, and his correspondence with Lord Carew in 1615 and 1617 by Sir F. Maccan for the same society in 1860. Several of his MSS. are in the British Museum collections. *A True and Fained Relation of the happening of the Death of Sultan Osman* .. 1622; a translation from Sarpi, *Discourse upon the Resolution taken in the Valletta* (1628); and in 1613 Dr T. Wright published *Quatuor Colloquia*, consisting of several dialogues of general disputations. A poem by Roe is printed in *Notes and Queries*, iv. Ser. v. 9. The *Swedish Intelligencer* (1632–33), including an account of the career of Gustavus Adolphus and of the negotiations for peace (Regensburg), is attributed to Roe in the catalogue of the British Museum. Several of his speeches, chiefly on currency and financial questions, were also published. Two other works in MS. are mentioned by Wood: *Compendious Relation of the Proceedings of the Imperial Diet* at Ratisbon and *Journal of Several Proceedings of the Order of the Garter*.

**ROEBLING, JOHN AUGUSTUS** (1806–1860), American civil engineer, was born at Mülhausen, Prussia, on the 6th of June 1806. Soon after his graduation from the polytechnic school at Berlin he removed to the United States, and in 1831 entered on the practice of his profession in western Pennsylvania. He accompanied William Henry Harrison to the west when the latter started for the war against the Indians in the Ohio Valley in May 1814. He completed his first important structure, a suspended aqueduct across the Allegheny river. This was followed by the Monongahela suspension bridge at Pittsburgh and several suspended aqueducts on the Delaware & Hudson Canal. Removing his wire factory to Trenton, New Jersey, he began, in 1831, the erection at Niagara Falls of a long span wire suspension bridge with double roadway, for railway and carriage use (see Bridges), which was completed in 1855. Owing to the novelty of its design, the most eminent engineers regarded this bridge as foredoomed to failure; but, with its complete plans, constructed by use, the suspension bridges rapidly multiplied, the use of wire-ropes instead of chain-cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, with a clear span of 257 ft., added to Roebling’s reputation, and his design for the great bridge spanning the East river between New York and Brooklyn was accepted. While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, on the 22nd of July 1860. The bridge was completed under the direction of his son, Washington Augustus Roebling (b. 1837), who introduced several modifications in the original plans. Several of his speeches, chiefly on currency and financial questions, were also published. Two other works in MS. are mentioned by Wood: *Compendious Relation of the Proceedings of the Imperial Diet* at Ratisbon and *Journal of Several Proceedings of the Order of the Garter*.

**ROEBOURNE, a settlement of De Witt county, Western Australia, 8 m. from the N.W. coast, on the Harding river, 920 m. direct N. of Perth. It is the centre of one of the richest and most varied mineral districts in the colony; gold, silver, tin, lead, copper, diamonds and other precious stones are found. There are extensive pearl fisheries off its port at Cassack Bay.**

**ROEBUCK, JOHN** (1718–1794), English inventor, was born in 1718 at Sheffield, where his father had a prosperous manufacturing business. After attending the grammar school at Sheffield and Dr Philip Doddridge’s academy at Northampton, he studied medicine at Edinburgh, where he was imbued with a taste for chemistry by the lectures of William Cullen and Joseph Black, and he finally graduated M.D. at Leiden in 1742. He started practice at Birmingham, but devoted much of his time to chemistry, especially in its practical applications. Among the most important of his early achievements in this field was the introduction, in 1746, of leaden condensing chambers for use in the manufacture of sulphuric acid. Together with Samuel Garbett he erected a factory at Prestonpans, near Edinburgh, for the production of the acid in 1749, and for some years enjoyed a monopoly; but ultimately his methods became known, and, having omitted to take out patents for
them at the proper time, he was unable to restrain others from making use of them. Engaging next in the manufacture of iron, he in 1760 established the ironworks which still exist at Carron, in Stirlingshire. There he introduced various improvements in the methods of production, including the conversion (patented in 1762) of cast iron into malleable iron "by the action of a hollow pit-coal fire" urged by a powerful artificial blast. His next enterprise was less successful. He leased a colliery at Bo'ness to supply coal to the Carron works, but in sinking for new seams encountered such quantities of water that the Newcomen engine which he used was unable to keep the pit clear. In this difficulty he heard of James Watt's engine and entered into communication with its inventor. This engine, then at an early stage of its development, also proved inadequate, but Roebuck became a strong believer in its future and in return for a two-thirds share in the invention assisted Watt in perfecting its details. His troubles at the colliery, however, aggravated by the failure of an attempt to manufacture alkali, brought him into pecuniary straits, and he parted with his share in Watt's engine to Matthew Boulton in return for the cancellation of a debt of £500 which he owed the latter. Subsequently, although abandoned by Watt in the Bo'ness works, he continued to manage them and to reside at the neighbouring Kinneil House, where he occupied himself with farming on a considerable scale. He died on the 17th of July 1794.

ROEBUCK, JOHN ARTHUR (1801-1879), British politician, was born at Madras on the 28th of December 1801. After the death of his father, a civil servant, his mother's second marriage transferred him to Canada, where he was chiefly brought up. He came to England in 1824, was called to the bar (Q.C. 1843), became intimate with the leading radical and utilitarian reformers, was elected M.P. for Bath in 1831, and took up that general attitude of hostility to the government of the day, be it what it might, which he retained throughout his life. At all times conspicuous for his eloquence, honesty and recalcitrancy, he twice came with especial prominence before the public—in 1838, when, although at the time without a seat in parliament, he appeared at the bar of the Commons to protest, in the name of the Canadian Assembly, against the suspension of the Canadian constitution; and in 1855, when, having overthrown Lord Aberdeen's ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over its proceedings. In his latter years his political life was more localised, but with one interruption he retained his seat for Sheffield, which he had won in 1839, until his death in London on the 30th of November 1879.

ROEBUCK, the smallest of the British deer (a full-grown buck standing not more than 27 in. high at the shoulder), the typical representative of a genus (Capreolus) in which the antlers lack a brow-tine and belong to what is characterized as the forked type, while the tail is rudimentary (see DEER). The antlers are short, upright and deeply furrowed, the beamforking at about two-thirds of its length, and the upper prong again at a few inches from the root. The coloration of the coat is foxy red above and white below; in winter this changes to a greyish fawn, with a white rump-patch. The roe-buck or roe-deer (Capreolus capre, or C. capreolus) inhabits southern and temperate Europe as far east as the Caucasus, where, as in Syria, it is probably represented by another race or species. It frequents woods, preferring such as have a large growth of underwood and are in the neighbourhood of cultivated ground. The latter it visits in the evening in search of food; and where roe are numerous the damage done to growing crops is considerable. Pairing takes place in August, but the fawns are not born till the following May. According to one theory, the germ dies in the December, when it begins to develop; but it is now believed that this long gestation is due to slow rather than arrested development. Roe were formerly abundant in all the wooded parts of Great Britain, but were gradually exterminated, till a century and a half ago they were unknown south of Perthshire. Since then the increase of plantations has led to the partial restoration of the species in the south of Scotland and the north of England; and it was reintroduced into Dorset early in the 19th century. These deer take readily to the water, and they have been known to swim across lochs more than half a mile in breadth. The Siberian roe (C. pygargus), which is common in the Altai, is larger and paler than the type species, with shorter and more hairy ears, a larger white rump-patch, and small irregular snags on the inner border of the antlers. The Manchurian roe (C. manchuricus) is about the size of the European species, with antlers of the type of those of the Siberian roe, but more slender, the coat shorter. Although described in 1889 as a local variety of the Siberian species, the Manchurian roe really appears, both as regards stature, hairiness and the black and white markings on the muzzle, much more nearly related to the European animal. This is the more remarkable seeing that the habitats of the two are separated by such an enormous tract of country.

ROEDERER, PIERRE LOUIS, COMTE (1754-1833), French politician and economist, was born at Metz on the 15th of February 1754, the son of a magistrate. At the age of twenty-five he became councillor at the parliament of Metz, and was commissioned in 1787 to draw up a list of remonstrances. His work advocating the suppression of internal customs houses (Suppression des douanes intérieures), published the same year, is an elaborate treatise on the laws of commerce and on the theory of customs imposts. In 1788 he published Délégation aux États généraux, a pamphlet remarkable for its bold exposition of liberal principles, and partly on the strength of this he was elected deputy to the states-general by the Third Estate of the bailliage of Metz. In the Constituent Assembly he was a member of the committee of taxes (comité des contributions), prepared a scheme for a new system of taxation, drew up a law on patents, occupied himself with the laws relating to stamps and assignats, and was successful in opposing the introduction of an income tax. After the close of the Constituent Assembly he was elected, on the 11th of November 1791, procureur général syndic of the department of Paris. The directory of the department, of which the duc de la Rochefoucauld was president, was at this time in pronounced opposition to the advanced views that dominated the Legislative Assembly and the Jacobin Club, and Roederer was not altogether in touch with his colleagues. Thus he took no share in signing their protest against the law against the non-juring clergy, as a violation of religious liberty. But the directory did not long survive. With the growing anarchy of the capital many of its members resigned and fled, and their places could not be filled up. Roederer himself has left in his Chronique des cinquante jours (1832) an account of the pitiable part played by the directory of the department in the critical period between the 20th of June and the 10th of August 1792. Seeing the perilous drift of things, he had tried to get into touch with the king; and it was a piece of advice that he offered to the king that produced the call for Roederer to come into the Assembly. His conduct arousing suspicion, he went into hiding, and did not emerge again until after the fall of Robespierre. In 1796 he was made a member of the Institute, was appointed to a professorship of political economy, and founded the Journal d'économie publique, de morale et de législation. Having escaped deportation at the time of the coup d'état of 18 Fructidor, he took part in the revolution of 18 Brumaire, and was appointed by Napoleon member of the council of state and senator. Under the Empire, Roederer, whose public influence was very considerable, was Joseph Bonaparte's minister of finance at Naples (1806), administrator of the grand duchy of Berg (1810), and imperial commissary in the south of France. During the Hundred Days he was created a peer of France. The Restoration government stripped him of his offices and dignities, but he recovered the title of peer of France in 1832. He died on the 17th of December 1835. His son, Baron Antoine Marie Roederer
ROEMER, F. A.—ROGATION DAYS

(1782–1869), was also a politician of some note in his day.

Among P. L. Roederer's writings may be mentioned Louis XII. (1820); François I. (1825); Comédiens historiques (1827–30); L'Esprit de la révolution de 1789 (1831); La Première et la deuxième année du royaume de Bonaparte (1804); Chronique des dix-huit jours, an account of the events of the 10th of August 1792; and Mémoire pour servir à l'historie de la société polie en France (1835).

ROEMER, FRIEDRICH ADOLPH (1800–1869), German geologist, was born at Hildesheim, in Prussia, on the 14th of April 1800. His father was a lawyer and councillor of the high court of justice. In 1845 he became professor of mineralogy and geology at Clausthal, and in 1862 director of the School of Mines. He first described the Cretaceous and Jurassic strata of Germany in elaborate works entitled Die Versteinerungen des Norddeutschen Oolithen-gebirges (1856–60), Die Versteinerungen des Norddeutschen Kreidegebirges (1840–1841) and Die Versteinerungen des Harzgebirges (1843). He died at Clausthal on the 25th of November 1860.

His brother, CARL FERDINAND VON ROEMER (1818–1897), who had been educated for the legal profession at Göttingen, also became interested in geology, and abandoning law in 1840, studied science at the university of Berlin, where he graduated Ph.D. in 1842.

Two years later he published his first work, Das Rheinische Übergangsgebirge (1844), in which he dealt with the older rocks and fossils. In 1845 he paid a visit to America, and devoted a year and a half to a careful study of the geology of Texas and other Southern states. He published at Bonn in 1849 a general work entitled Texas, while the results of his investigations of the Cretaceous rocks and fossils were published three years later in a treatise, Die Kreidebildungen von Texas und ihre organischen Einschlüsse (1852), which included also a general account of the geology, and gained for him the title "Father of the geology of Texas."

Subsequently he published at Breslau Die Sittische Fauna des westlichen Tennessee (1860). During the preparation of these works he was from 1847 to 1853 "privat-docent" at Bonn, and was then appointed professor of geology, palaeontology and mineralogy in the university of Breslau, a post which he held with signal success as a teacher until his death. As a palaeontologist he made important contributions to our knowledge especially of the invertebrata of the Devonian and older rocks. He assisted H. G. Bronn with the third edition of the Lethaea geognostica (1851–56), and subsequently he laboured on an enlarged and revised edition, of which he published one section, Lethaea palaeozoica (1876–1883). In 1862 he was called on to superintend the preparation of a geological map of Upper Silesia, and the results of his researches were embodied in his Geologie von Oberschlesien (3 vols., 1870).

As a mineralogist he was likewise well known, more particularly by his practical teachings and by the collection he formed in the Museum at Breslau. He died at Breslau on the 14th of December 1891.

ROEMER, OLE (Latinized OLAUS) (1644–1710), Danish astronomer, was born at Aarhus in Jutland on the 25th of September 1644. He became in 1662 the pupil and amanuensis of Erasmus Bartholinus at Copenhagen, and assisted J. Picard in 1671 to determine the geographical position of Tycho Brahe's observatory (Uraniborg on the island of Hveen). In 1672 he accompanied Picard to Paris, where he remained nine years, occupied with observations at the new royal observatory and hydraulic works at Versailles and Marly. On the 2nd of November 1675 he read a paper before the Academy on the successive propagation of light as revealed by a certain inequality in the motion of the first of Jupiter's satellites. A scientific mission to England in 1679 made him acquainted with Newton, Halley and Flamsteed. In 1681, on the summons of Christian V., king of Denmark, he returned to Copenhagen as royal mathematician and professor of astronomy in the university; and from 1688 he discharged, besides, many important adminis-
the first Council of Orleans ordered that the three days preceding Ascension Day should be celebrated as rogation days with fasting and rogations. All work was to be suspended that all might join in the processions. Leo III. (pope 795-816) introduced rogation days, but without the fasting, at Rome. St Augustine had earlier introduced the custom into the English Church, learning it on his way through Gaul. The Council of Cloveshio in 747 confirmed Augustine's injunction, and ordered that the rogation days be kept up "according to the way of our fathers." The place-name "Gospel Oak," which occurs in London and elsewhere, is a relic of these rogation processions, the gospel of the day being read at the foot of the oak. The custom was reintroduced at the Reformation and gradually ceased to be ecclesiastical in England, and are now practically secularized in the perambulation of the parish boundaries on or about Ascension Day.

See also Procession and Litanies.

**ROGER I.** (1031-1101), ruler of Sicily, was the youngest son of Tancred of Hauteville. He arrived in Southern Italy soon after 1057. Malaterra, who compares Robert Guiscard (see Guiscard, Robert) and his brother to "Joseph and Benjamin of old," says of Roger: "He was a youth of the greatest beauty, of lowly birth, and already in his mind cool and clear. He was far-seeing in arranging all his actions, pleasant and merry all with men; strong and brave, and furious in battle." He shared with Robert Guiscard the conquest of Calabria, and in a treaty of 1062 the brothers in dividing the conquest apparently made a kind of "condominium" by which either was to have half of every castle and town in Calabria. Robert now resolved to employ Roger's genius in reducing Sicily, which contained, besides the Melones, numerous Greek Christians subject to Arab princes who had become all but independent of the sultan of Tunis. In May 1061 the brothers crossed from Reggio and captured Messina. After Palermo, which Robert had just captured, Roger, in January 1062, sallied out of Capua, suzerain, invested Roger as count of Sicily, but retained Palermo, half of Messina and the north-east portion (the Val Demone). Not till 1085, however, was Roger able to undertake a systematic crusade. In March 1068 Syracuse surrendered, and when in February 1091 Noto yielded the conquest was complete. Much of Robert's success had been due to Roger's support. Similarly the latter supported Duke Roger, his nephew, against Bohemund, Capua and his rebels, and the real leadership of the Hautevilles passed to the Sicilian count. In return for his aid against Bohemund and his rebels the duke surrendered to Palermo in 1085 his share in the castles of Calabria, and in 1091 the half of Palermo. Roger thus ruled Sicily more real than Robert Guiscard's in Italy. At the enfeoffments of 1072 and 1092 no great undivided fiefs were created, and the mixed Norman, French and Italian vassals owed their benefits to the count. No feudal revolt of importance therefore troubled Roger. Politically supreme, the count became master of the insular Church. While he gave full toleration to the Greek Churches, he created new Latin bishoprics at Syracuse and Gergioli and elsewhere, nominating the bishops personally, while he turned the archbishopric of Palermo into a Catholic see. The Papacy, favouring a prince who had recovered Sicily from Greeks and Moslems, granted to him and his heirs in 1098 the Apostolic Legateship in the island. Roger practised general toleration to Arabs and Greeks, allowing to each race the expansion of its own civilization. In the cities the Moslems, who had generally secured such terms of surrender, retained their mosques, their kadis, and freedom of trade; in the country, however, they became serfs. He drew from the Moslems the mass of his infantry, and St Anselm visiting him at the siege of Capua, 1098, found "the brown tents of the Arabs innumerable." Nevertheless the Latin element began to prevail with the Lombards and other Italians who flocked into the island in the wake of the conquest, and the conquest of Sicily was decisive in the steady decline from this time of Mahomedan power in the western Mediterranean.

1 See Chalandon, *La Domination normande*, vol. i. p. 200. Roger, the "Great Count of Sicily," died on the 22nd of June 1101 in his seventieth year and was buried in S. Trinità of Mileto. His third wife, Adelaide, niece of Boniface, lord of Savona, gave him two sons, Simon and Roger, of whom the latter succeeded him.

**ROGER II.** (1093-1154), king of Sicily, son of the preceding, began personally to rule in 1112, and from the first aimed at uniting the whole of the Norman conquests in Italy. In June 1127, William, duke of Apulia, grandson of Robert Guiscard, died childless, having apparently made some vague promise of the succession to Roger. In any case Roger declared at once, not only all the Hauteville possessions, but also the overlordship of Capua, for which Richard II. in 1098 had sworn homage to Duke Roger. The union of Sicily and Apulia, however, was resisted by Honorius II. and by the subjects of the duchy itself, averse from any strong ducal power, and the pope at Capua (Dec. 1127) preached a crusade against the claimant, setting against him Robert II. of Capua and Ranulf of Allie, or Avellino, brother-in-law of Roger, who proved himself the real leader of the revolt. The coalition, however, failed, and in August 1129 Honorius invested Roger at Benevento as duke of Apulia. The baronial resistance, which was backed by Naples, Bari, Salerno and other cities, whose aim was civic freedom, also gave way, and at Melfi (Sept. 1129) Roger was generally recognized as duke by Naples, Capua and the rest. He began at once to enforce order in the Hauteville possessions, where the ducal power had long been falling to pieces. For the binding together of all his states the royal name seemed essential, and the death of Honorius in February 1130, followed by a double election, seemed the decisive moment. While Innocent II. fled to France, Roger, with deep design, supported Anacletus II. The price was a crown, and on the 27th of September 1130 a bull of Anacletus made Roger king of Sicily. He was crowned in Palermo on the 25th of December 1130.

This plunged Roger into a ten years' war. Bernard of Clairvaux, Innocent's champion, built up against Anacletus and his "half heathen king" a coalition joined by Louis VI. of France, Henry I. of England and the emperor Lothar. Meanwhile the forces of revolt in South Italy drew to a head again. The rebels under Ranulf shamefully defeated the king at Nocera on the 24th of July 1132. Nevertheless, by July 1134 his terrific energy and the savagery of his Saracen troops forced Ranulf, Sergius, duke of Naples, and the rebels to submit. But in 1138 Roger again unjustly defeated the king, but in April 1139 Ranulf died, leaving none to oppose Roger, who subdued pitilessly the last of the rebels.

The death of Anacletus (25 Jan. 1138) determined Roger to seek the confirmation of his title from Innocent. The latter, invading the kingdom with a large army, was skillfully ambushed at Galuccio on the Garigliano (22 July 1139). This secured the king's object; on the 25th July the pope invested him as "Rex Sicilie ducatus Apuliae et principatus Capuanae." The boundaries of the regno were finally fixed, by a truce with the pope in October 1144, at a line south of the Tronto and the Terracina and of the Metaurus. Roger, now become one of the greatest kings in Europe, made Sicily the leading maritime power in the Mediterranean. A powerful fleet was built up under several "admirals," or
Robert, a worldly prince, beheld the Western world remodelled completely. He was a harsh and mighty monarch, and his members were the clergy of Canterbury, Howden, and the distinction of the army was of the highest order. He was a man of science, both in the arts of war and diplomacy. When the empire fell, he did not give way to despair, but with unquenchable fire in his heart, he set to work to defend his Basileus by firing arrows against the palace windows. The attack on the empire had, however, no abiding results. The king died at Palermo on the 26th of February 1154, and was succeeded by his fourth son William.

Personally Robert was of tall and powerful body, with long fair hair and full beard. "He had," says Romuald of Salerno, "a lion face, and spoke with a harsh voice." With little or none of Robert Guiscard's personal valour, and living at intervals the life of an eastern Sultan, he yet showed to the full his uncle's audacity, diplomatic skill and determination. It is Roger II's distinction to have united all the Norman conquests into one kingdom and to have subjected them to a government scientific, personal and centralized. The principles of this are found in the Assizes of the kingdom of Sicily, promulgated at Ariano in 1140, which enforced an almost absolute royal power. At Palermo Robert drew round him distinguished men of various races, such as the famous Arab geographer Idrisi and the historian Nilo Duxopatrus. The king's active and curious mind welcomed the learned; he maintained a complete toleration for the several creeds, races and languages of his realm; he was served by men of nationality so dissimilar as the Englishman Thomas Brun, a kaid of the Curia, and, in the fleet, by the renegade Moslem Christodoulos, and the Antiochene George, whom he made in 1132 "amiratus amatorum," in effect prime vizier. The Capella Palatina, at Palermo, the most wonderful of Roger's churches, with Norman doors, Saracenic arches, Byzantine dome, and roof adorned with Arabic scripts, is perhaps the most striking product of the brilliant and mixed civilization over which the grandson of the Norman Trancred ruled.

Contemporary authors are: Falco of Benevento, Alexander of Telse, Romuald of Salerno and Hugo Pulpachus, all in the Serilirii et conscripti napoletani, ed. Del Re, vol. i. See also E. Casamari, Die Ambitionen des Roger bei der Gründung der normannisch-sicilischen Monarchie (Innsbruck, 1904).

Roger (d. 1159), bishop of Salisbury, was originally priest of a small chapel near Caen. The future King Henry II, who happened to hear mass there one day, was impressed by the speed with which Roger read the service, and enrolled him in his own service. Roger, though uneducated, showed great talent for business, and Henry, on coming to the throne, almost immediately made him chancellor (1101). Soon after Roger received the bishopric of Salisbury. In the Investitures controversy he skillfully managed to keep the favour of both the king and Anselm. Roger devoted himself to administrative business, and remodelled it completely. He created the exchequer system, which was managed by him and his family for more than a century, and he used his position to heap up power and riches. He became the first man in England after the king, and was in office, if not in title, justiciar. He ruled England while Henry was in Normandy, and succeeded in obtaining the see of Canterbury for his nominee, William of Corbeil. Duke Robert seems to have been put into his custody after Tinchefrai. Though Roger had sworn allegiance to Matilda, he disliked the Angevin connexion, and went over to Stephen, carrying with him the royal treasure and administrative system (1135). Stephen placed great reliance on him. On his nephews, the bishops of Ely and Lincoln, and on his son Roger, who was treasurer. The king declared that if Roger demanded half of the kingdom he should have it, but chafed against the overwhelming influence of the official clique whom Roger represented. Roger himself had built at Devizes the most splendid castle in Christendom. He and his nephews seem to have secured a number of castles outside their own dioceses, and the old bishop behaved as if he were an equal of the king. At a council held in June 1139, Stephen found a pretext for demanding a surrender of their castles, and on their refusal they were arrested. After a short struggle all Roger's great castles were sequestrated. But Henry of Winchester demanded the restoration of the bishop. The king was considered to have committed an almost unpardonable crime in offering violence to members of the church, in defiance of the scriptural command, "Touch not mine anointed." Stephen took up a defiant attitude, and the question remained unsettled. This quarrel with the church, which immediately preceded the landing of the empress, had a serious effect on Stephen's fortunes. The moment that the fortune of war declared against him, the clergy acknowledged Matilda. Bishop Roger, however, did not live to see himself avenged. He died at Salisbury in December 1139. He was a great bureaucrat, and a builder whose taste was in advance of his age. But his contemporaries were probably justified in regarding him as the type of the bishop immersed in worldly affairs, ambitious,avaricious, unfettered by any high standard of personal morality.

Roger's nephew Alexander (d. 1148), who became bishop of Lincoln in 1123, was a typical secular ecclesiastic of the middle ages, wealthy, proud, ambitious and ostentatious. He founded monasteries, built castles at Newark, Sleaford and Banbury, and restored his cathedral at Lincoln after the fire of 1145. He followed the policy of Roger, whose imprisonment he shared, and died after a visit to Pope Eugenius III. at Auxerre, early in 1148.

Roger (d. 1181), archbishop of York, known as Roger of Pont l'Evêque, was a member of the household of Theobald, archbishop of Canterbury, where he quarrelled violently with another future archbishop, Thomas Becket. In 1148 he was appointed archdeacon of Canterbury, and soon afterwards chaplain to King Stephen, who sent him on an errand to Rome in 1152; then in October 1154 he was consecrated archbishop of York in Westminster Abbey. When Henry II. entered upon his great struggle with Becket over the immunity of clerks to the jurisdiction, he managed to secure the support of Roger, and having been appointed papal legate in England, the archbishop visited Pope Alexander III. and the French king, Louis VII., in his master's interests. In June 1170 he crowned the king's son Henry, in spite of prohibitions from the pope and from Becket, and for this act he was suspended. One authority declares that Roger, who was then with Henry II. in Normandy, instigated the murder of the rival archbishop, but he swore he was innocent of this crime. He quarrelled with Richard, the new archbishop of Canterbury, about the respective rights of the two archiepiscopals sees, until 1176, when the king arranged a truce between them; after this he was constantly endeavouring to assert his supremacy over the Scottish church. The archbishop died at York on the 21st of November 1181. He was always loyal to Henry II., to whom he was very useful during the great rising of 1174; but he has been accused of avarice, and he was certainly not lacking in ambition.

Another English prelate of this name was Roger, bishop of Worcester, a younger son of Robert, earl of Gloucester, and thus a grandson of the English king Henry I. In 1163 his cousin Henry II. the young, who was appointed him bishop of Worcester, but almost alone of the English bishops he supported Thomas Becket and not the king during the quarel between them in 1166. In 1167 he left England to share Becket's exile, but he soon returned to court, although he appears to have remained on friendly terms with the archbishop. He died at Tours in 1179.

Roger of Howden, or Howden (fl. 1174-1201), English chronicler, was, to judge from his name and the internal evidence of his work, a native of Howden in the East Riding of Yorkshire. But nothing is known of him before the year 1174. He was then in attendance upon Henry II., by whom
he was sent from France on a secret mission to the lords of Galloway. In 1175 he again appears as a negotiator between the king and a number of English religious houses. The interest which Hoveden shows in ecclesiastical affairs and miracles may justify the supposition that he was a clerk in orders. This, however, did not prevent him from acting, in 1189, as a justice of the forests in the shires of Yorkshire, Cumberland and Northumberland. After the death of Henry II., it would seem that Hoveden retired from the public service, though not so completely as to prevent him from drawing on the royal archives for the history of contemporary events. About the year 1192 he began to compile his Chronicle, a general chronicle of England from 732 to his own time. Up to the year 1192 his narrative adds little to our knowledge. For the period 732-1148 he chiefly drew upon an extant, but unpublished chronicle, the Historia Saxonum sive Anglarum post obitum Bedae (British Museum MS. Reg. 13 A. 6), which was composed about 1150. From 1148 to 1170 he used the Melrose Chronicle (edited for the Bannatyne Club in 1835 by Joseph Stevenson) and a collection of letters bearing upon the Becket controversy. From 1170 to 1192 his authority is the chronicle ascribed to Benedictus Abbas (q.e.), the author of which must have been in the royal household at about the same time as Hoveden. Hoveden's period was one in which Hoveden had many opportunities of making independent observations, he adds little to the text which he uses; except that he inserts some additional documents. Either his predecessor had exhausted the royal archives, or the supplementary searches of Hoveden were languidly pursued. From 1192, however, Hoveden is an independent and copious authority. Like "Benedictus," he is sedulously impersonal, and makes no pretense to literary style, quotes documents in full and adheres to the annalistic method. His chronology is tolerably exact, but there are mistakes enough to prove that he recorded events at a certain distance of time. Both on foreign affairs and on questions of domestic policy he is unusually well informed. His practical experience as an administrator and his official connexions stood him in good stead. He is particularly useful on points of constitutional history. His work breaks off abruptly in 1201, though he certainly intended to carry it further. Probably his death should be placed in that year.

See W. Stubbs's edition of the Chronica (Rolls Series) and the introductions to vols. i. and iv. This edition supersedes that of Sir H. Savile in his Scriptores post Bedam (1796). (H. W. C. D.)

ROGER OF WENDOVER (d. 1236), English chronicler, was probably a native of Wendaro in Buckinghamshire. At some uncertain date he became a monk of St Albans; afterwards he was appointed prior of the cell of Belvoir, but he forfeited this dignity in the early years of Henry III., having been found guilty of wasting the endowments. His later years were passed at St Albans, where he died on the 6th of May 1236. He is the first of the important chroniclers who worked in the scriptorium of this house. His great work, the Flores Historiarum, begins at the creation and extends to 1235. It is of original value from 1202. Some critics have supposed, but on inconclusive evidence, that Wendaro compiled, up to 1189, an earlier compilation, the work of John de Celes, the twenty-first abbot of St Albans (1192-1214). Wendaro's work is known to us through one of 13th-century manuscripts in the Bodleian library (Douce MS. 207), a mutilated 14th-century copy in the British Museum (Cotton MS. Otho B. v.), and the edition prepared by Matthew Paris which forms the first part of that writer's Chronica Majora (ed. H. R. Luard, Rolls Series, 7 vols.). The best edition of Wendaro is that of H. O. Coxe (4 vols., London, 1841-42); there is another (from 1154) in the Rolls Series by H. G. Hewlett (3 vols., 1886-89). Wendaro is a copious but inaccurate writer, less prejudiced but also less graphic than Matthew Paris. Where he is the sole authority for an event, he is to be used with caution.

See Luard's prefaces to vols. i., ii., iii. and vii. of the Chronica Majora; and the Monumenta Germaniae Historica, Scriptores, Band xxviii. pp. 3-20. (H. W. C. D.)

ROGERS, HENRY (1866-1872), English Nonconformist divine, was born at St Albans on the 18th of October 1866, and was educated privately and by his father, a surgeon of considerable culture. Rogers was meant to follow his father's profession, but the reading of John Howe turned him to theology, and after qualifying at Highbury College he accepted a call to the Congregational Church at Poole in 1829. In 1832 he was appointed lecturer in logic at Highbury, in 1836 professor of English at University College, London, and in 1839 professor of English, mathematics and mental philosophy at Spring Hill College, Birmingham. In 1836 appeared his Life and Character of John Howe, and in 1837 The Christian Correspondent, a collection of some religious letters "by eminent persons of both sexes." His contributions to the Edinburgh Review began in 1839 and were collected in volume form in 1850, 1855 and 1874. His most famous book, The Eclipse of Faith, or a Visit to a Religious Skeptic, was published anonymously in 1852 and went through six editions in three years. It drew a Reply from F. W. Newman, which Rogers answered in a Defence (1854). Two volumes of imaginary letters, Selections from the Correspondence of R. E. H. Greyson (an anagram for his own name), appeared in 1848. The same volume of his essays, ascribed to the Lancashire Independent College, where he edited the works of John Howe (6 vols., 1862-63) and wrote for the British Quarterly. He retired in 1871, and died at Macynleith, on the 21st of August 1877. Rogers was widely read, and as a Christian apologist carried on the traditions of the 18th century as illustrated by Butler.

See Memoir by Dr R. W. Dale, prefixed to the 8th edition of The Supernatural Origin of the Bible inferred from Itself (the Congregational Lecture for 1873 delivered by Rogers).

ROGERS, HENRY DARWIN (1806-1860), American geologist, was born at Philadelphia on the 3rd August 1806. At the age of twenty-one he was chosen professor of chemistry and natural philosophy at Dickinson College, Pennsylvania. After holding this post for three years, he went to Europe and took up the study of geology. Subsequently he was engaged for twenty-two years in the State surveys of Pennsylvania and New Jersey, his Reports on which were published during the years 1836-41. In 1842 he and his brother WILLIAM BARTON ROGERS (1805-1882), who had been similarly occupied in Virginia (his Reports were published in 1838-41, and he wrote also on the connexion between thermal springs and antifilarial axes and faults), brought before the Association of American Geologists and Naturalists their conclusions on the physical structure of the Appalachian chain, and on the elevation of great mountain chains. The researches of H. D. Rogers were elaborated in his final Report on Pennsylvania (1858), in which he included a general account of the geology of the United States and of the coal-fields of North America and Great Britain. In this important work he dealt also with the structure of the great coal-fields, the method of formation of the strata, and the changes in the character of the coal from the bituminous type to anthracite. In 1857 he was appointed professor of natural history and geology at Glasgow. One of his later papers, On the glacial roads of Lochaber (Glen Roy), the origin of which he attributed to a vast inundation. He died at Glasgow on the 20th of May 1866.

ROGERS, JAMES EDWIN THOROLD (1833-1890), English economist, was born at West Meon, Hampshire, in 1833. He was educated at King's College, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained, and was for a few years a curate in Oxford. Subsequently, however, he resigned his orders. For some time the classics were the chief field of his activity. He devoted himself a good deal to classical and philosophical tuition in Oxford with success, and his publications included an edition of Aristotle's Ethics (1865). Simultaneously with these occupations he had been diligently studying economics, with
the result that in 1839 he was appointed professor of statistics and economic science at King's College, London, a post which he filled till his death. From 1862 to 1867 he also held the position of Drummond professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his History of Price and Prices in England, dealing with the period 1259-1400, a minute and masterly record of the subject, and the work upon which his reputation mainly rests. Two more volumes (1401-1532) were published in 1882, a fifth and sixth (1533-1701) in 1887, and he left behind him at his death copious materials for a seventh and eighth. In 1868 he published a Manual of Political Economy, and in 1869 an edition of Adam Smith's Wealth of Nations. In 1875 he collected and edited the Protests of the Lords. An intimate acquaintance with Cobden and John Bright led Rogers to take an active part in politics; he represented Southwark in parliament from 1885, and Bermondsey from 1885-86, as an advanced Liberal. In 1888, on the death of Professor Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post, and held it till his death. Previously (in 1883) he had been appointed lecturer in political economy at Worcester College, Oxford. His latter years were mainly spent at Oxford, where he died on the 12th of October 1890. He was celebrated as a caustic wit and humorist. Of his miscellaneous economic and historical writings, which were numerous, the most noteworthy is his Six Centuries of Work and Wages, published in 1884. As an economist, Thorold Rogers did much to promote the historical study of his subject. He was, however, apt to be guided too frequently by political prejudice, and the value of his work suffered from his aggressively contentious spirit.

ROGERS, JOHN (1627-1666), English preacher, second son of Nehemiah Rogers, a royalist and Anglican clergyman, was born at Messing in Essex, and became a servant and student of medicine at King's College, Cambridge. When still a youth the violence of his religious despair led him to attempt suicide and ended in his joining the extreme sect of the Puritans. Deprived of his home in 1642, he walked to Cambridge, and found the college establishment broken up; he nearly starved, but obtained in 1643 a scholastic post in Lord Brudenel's house in Huntingdonshire, and subsequently at St Neot's free school. He became known as a preacher, received Presbyterian ordination in 1647, married a daughter of Sir Robert Payne of Midloe in Huntingdonshire, and obtained the living of Purleigh in Essex. Subsequently he came to London, joined the Independents, became lecturer at St Thomas Apostle's, and attracted attention by the violence of his political sermons. He was appointed preacher to Christ Church Cathedral in Dublin by the parliament in 1651, and while there served in the field, returning in 1652 to St Thomas Apostle's on account of religious dissensions. In 1653 he left Purleigh, where he had hitherto managed to retain the living, successfully proceeded against him for non-residence. In the quarrel between the army and the parliament Rogers had naturally sided with the former, and he was one of the first to join the Fifth Monarchy movement. He approved of the expulsion of the Long Parliament, and addressed two letters to Cromwell on the subject of the new government to be inaugurated, but the establishment of the Protectorate at once threw the Fifth Monarchy men into antagonism. Rogers addressed a warning letter to Cromwell, and boldly attacked him from the pulpit on the 9th of January 1654. Thereupon his papers were searched and his papers seized, and Rogers then issued another denunciation against Cromwell, Mene, Tekel, Perez; a Letter lamenting over Oliver Lord Cromwell. On the 28th of March, on which day he had proclaimed a fast for the sins of the rulers, he preached a violent sermon against the protector, which occasioned his arrest in July. He confronted Cromwell with great courage when brought before him on the 5th of February 1655; and was imprisoned successively at Windsor and in the Isle of Wight, being released in January 1657. He returned to London, and, being suspected of a conspiracy, was again imprisoned by Cromwell in the Tower from the 3rd of February 1658 till the 16th of April. On the protector's death and the downfall of Richard Cromwell, the ideals of the Fifth Monarchy men seemed nearer realization, and Rogers, and many of his political associates, were engaged with Prynne and became a source of embarrassment to his own faction, which endeavoured to get rid of him by appointing him "to preach the gospel" in Ireland. On the outbreak of Sir George Booth's royalist insurrection, however, he became chaplain in Charles Fairfax's regiment, and served throughout the campaign. He obtained a lectureship at Shrewsbury in October and was in Dublin in January 1660, being imprisoned there by order of the army faction and released subsequently by the parliament. At the Restoration he withdrew to Holland, studied medicine at Leiden and Utrecht, and obtained from the latter university the degree of M.D. in 1662. He returned to England the same year and resided at Bermondsey, was admitted to the degree of M.D. at Oxford in 1664, and is supposed, in the absence of further record, to have died soon afterwards.

Besides the pamphlet already cited, Rogers wrote in 1653 Ode or Betshemesh, a Tavernacle for the Sun, in which he attacked the Presbyterians, and Sagra, or Doomsaday drawing nigh, from his new standpoint as a Fifth Monarchy man, and was the author of Chalal, the Sea of the Babylonish Captives (1655); St Joseph (1655); The Bridegroom going forth for his Bride... (1653); Prison-born Morning Beams (1654); Jegas Sahadukha... (1657); Mr Prynne's Good Old Cause stated and stouted in Year ago... (1660); Disputatio, a Controversy of Mr. Prynne's... (1659); A Vindication of Sir H. Vane (1659); Disputatio Medico Inauguralis (1662).

ROGERS, JOHN (c. 1500-1555), English Protestant martyr, was born in the parish of Aston, near Birmingham, and was educated at Pembroke Hall, Cambridge, where he graduated B.A. in 1526. Six years later he was rector of Holy Trinity, Queenhithe, London, and in 1534 went to Antwerp as chaplain to the English merchants. Here he met William Tyndale, under whose influence he abandoned the Roman Catholic faith, and married an Antwerp lady. After Tyndale's death Rogers pushed on with his predecessor's English version of the Old Testament, which he used as far as 2 Chronicles, employing Coverdale's translation (1535) for the remainder and for the Apocalypse. Tyndale's New Testament had been published in 1526. The complete Bible was put out under the pseudonym of Thomas Matthew in 1537; it was printed in Antwerp, and Richard Grafton published the sheets and got leave to sell the edition (1500 copies) in England. Rogers had little to do with the translation, but he contributed some valuable prefaces and marginal notes. His work was largely used by those who prepared the Great Bible (1539-40), out of which in turn came the Bishop's Bible (1568) and the Authorized Version of 1611. After taking charge of a Protestant congregation in Wittenberg for some years, Rogers returned to England in 1548, where he published a translation of Melanchthon's Considerations of the Augsburg Interim. In 1550 he was presented to the crown livings of St Margaret Mouses and St Sepulchre in London, and in 1551 was made a prebendary of St Paul's, where the dean and chapter soon appointed him divinity lecturer. He courageously denounced the greed shown by certain courtiers with reference to the property of the suppressed monasteries, and defended himself before the privy council. He also declined to wear the prescribed vestments, donning instead a simple round cap. On the accession of Mary he preached at Paul's Cross commending the "true doctrine taught in King Edward's days," and warning his hearers against "pestilent Popery, idolatry and superstition." Ten days after (16th August 1553), he was summoned before the council and bidden to keep within his own house. His emoluments were taken away and his prebend was filled in October. In January 1554 Bonner, the new bishop of London, sent him to Newgate, where he lay with
ROGERS, J.—ROGERS, S.

John Hooper, Laurence Saunders, John Bradford and others for a year, their petitions, whether for less rigorous treatment or for opportunity of stating their case, being alike disregarded. In December 1554 parliament re-enacted the penal statutes against Lollards, and on January 22nd, 1555, two days after they took effect, Rogers with ten others came before the council at Gardiner's house in Southwark, and held his own in the examination that took place. On the 28th and 29th he came before the commission appointed by Cardinal Fole, and was sentenced to death by Gardiner for heretically denying the Christian character of the Church of Rome and the real presence in the sacrament. He awaited and met death (on the 4th of February 1555 at Smithfield) cheerfully though Edward, his eldest son, had an interview with his wife. Noailles, the French ambassador, speaks of the support given to Rogers by the greatest part of the people: “even his children assisted at it, comforting him in such a manner that it seemed as if he had been led to a wedding.” He was the first Protestant martyr of Mary's reign, and his friend Bradford wrote that “he broke the ice valiantly.”

The following divines of the same name may be distinguished:—

John Rogers (1572–1603), Puritan vicar of Dedham, Essex, “one of the greatest preachers of his age.”—John Rogers (1610–1680), ejected vicar of Croglin, Cumberland, and the founder of Congregational churches in Teesdale and Weardale, where he evangelized the lead miners.—John Rogers (1679–1729), one of George II.'s chaplains, famous for his share in the Jacobite controversy (1719), his Vindication of the Civil Establishment of Religion (1725), and his Persuasions to Conformity, addressed to Dissenters (1730) and to Quakers (1747).—John Rogers (1740–1814), leader of the Non-conformist groups, minister of the Newington Chapel in London (1778–1856), rector of Mawman, Cornwall, and the owner of the Penrose and Helston estates; a good botanist and mineralogist, and a distinguished Hebrew and Syrian scholar.

ROGERS, JOHN (1829–1904), American sculptor, was born at Salem, Massachusetts, on the 30th of October 1829. In 1848 he became an apprentice in a machine shop at Manchester, New Hampshire, and remained there for about ten years. During the latter part of this time he had done some modelling in clay in his leisure hours, and, having decided to become a sculptor, he spent eight months in Rome and Paris in 1858–59. Becoming discouraged, he returned to America and obtained employment as a draughtsman in the office of the city surveyor of Chicago; but soon afterwards, owing to the favourable reception of his group of small figures, “The Collector Players,” he resumed sculptural work, confining himself to these small figures, known as “Rogers Groups,” which had an enormous popular success and were extensively reproduced. The Civil War in America gave him patriotic themes that increased his vogue and prosperity, and in 1863 he became a National Academician. His subjects were familiar scenes and incidents of home life known to the masses, and the reproductions of his groups were sold in the most remote districts as well as in the larger cities. He executed several life-sized statues, including “General John F. Reynolds” and a seated figure of Lincoln, both in Philadelphia; but it is by his statues that he is best remembered, and these were characterized by sentiment and human interest rather than any genuine artistic feeling. He died at New Haven, Connecticut, on the 27th of July 1904.

ROGERS, ROBERT. (1727–1784?), American frontier soldier, was born of Irish parentage in 1727, probably at Methuen, Massachusetts, whence his father, James Rogers (often confused with James Rogers, an early settler of Londonderry, N.H.), removed in 1750 to Starktown (now Dunbarton), New Hampshire. During the Seven Years’ War he raised and commanded a force of militia, known as Rogers’ Rangers, which won a wide reputation for its courage and endurance in the campaigns about Lake George. He took part in Wolfe’s expedition against Quebec, and on the 4th of October 1759 he destroyed an Abnaki Indian village on the St Francis river near its mouth and killed about 200 of its inhabitants. After the Montreal campaign of 1760, in which he served, he was sent by General Amherst to take possession of the north-western posts, occupied Detroit on the 29th of November, and later returned to the east. In 1765, during the Pontiac uprising, he accompanied the relief expedition under James Dalystell to Detroit and took part in the battle of Bloody Bridge on the 31st of July (see Pontiac). Soon after this he went to England, and in 1765 published in London a Concise Account of North America, containing a Description of the Several British Colonies . . . also an Account of the Several Nations and Tribes of Indians (new edition, Albany, 1883). In 1766–68 he was commandant of Michilimackinac. He spent the next few years in England, and after 1772 was in the service of the duy of Algiers. At the beginning of the War of Independence he returned to America, and in spite of his protestations of patriotism was considered by Washington and others a Loyalist spy. He was arrested by agents of Congress, but was paroled. His arrest he considered a favor from his patron, and in December he joined the British, and under a commission from General Howe organized a regiment of Loyalists which was known as the Queen’s Rangers, and which after his return to England in 1776 was commanded by Capt. John G. Simcoe. In 1779 he was commissioned to raise a regiment to be called the King’s Rangers, and he returned for a short time to America; but the command of the Rangers, which soon became a part of the garrison of St John’s, Quebec, was taken by his brother James (d. 1792), who had formerly served under Robert. Rogers died in London probably in 1784.

In addition to the Concise Account of North America, he published his Journals (London, 1765), and is supposed to have written, at least in part, Pontouch, or the Savages of America, a Tragedy (London, 1760). See also his Journal in the Diary of the Siege of Detroit in the First Year of Pontouch, (Albany, 1860; new edition, 1872), edited by F. B. Hough; and Francis Parkman, Montcalm and Wolfe (2 vols., Boston, 1884).

ROGERS, SAMUEL (1763–1855), English poet, was born at Newton Green, London, on the 30th of July 1763. His father, Thomas Rogers, was the son of a Stourbridge glass manufacturer, who was also a merchant in Cheapside. Thomas Rogers had a place in the London business, and married Mary, the only daughter of his father’s partner, Daniel Radford, becoming himself a partner shortly afterwards. On his mother’s side Samuel Rogers was connected with the two well-known Nonconformist divines Philip and Matthew Henry, and it was in Nonconformist circles at Stoke Newington that he was brought up. He was educated at private schools at Hackney and Stoke Newington. He wished to enter the Presbyterian ministry, but at his father’s desire he joined the banking business in Cornhill. In long holidays, necessitated by delicate health, Rogers became a diligent student of English literature, particularly in Johnson, Gray and Goldsmith. Gray’s poems, he said, he had by heart. He had already made some contributions to the Gentleman’s Magazine before 1786 he published a volume containing some imitations of Goldsmith, and an “Ode to Superstition” in the manner of Gray. In 1788 his elder brother Thomas died, and Samuel’s business responsibilities were increased. In the next year he paid a visit to Scotland, where he met Adam Smith, Henry Mackenzie, the Piozzis and others. In 1791 he was in Paris, and enjoyed a hurried inspection of the art collection of Philippe Égalité at the Palais Royal, many of the treasures of which were later on to pass into his possession. With Gray as his model, Rogers took great pains in polishing his verses, and six years elapsed after the publication of his first volume before he printed his elaborate poem on The Pleasures of Memory (1790). This poem may be regarded as the last embodiment of the poetic diction of the 18th century. Here is carried to the extreme pitch the theory of elevating and refining familiar themes by abstract treatment and lofty imagery. In this art of “raising a subject,” as the 18th-century phrase was, the Pleasures of Memory is much more perfect than Thomas Campbell’s Pleasures of Hope, published a few years later in imitation. The acme of positive praise for the fashionable serious poetry of the time was given by Byron when he said, “There is not a vulgar line in the poem.”

In 1793 his father’s death gave Rogers the principal share in the banking house in Cornhill, and a considerable income.
ROGERS, W.—ROGIER

He left Newton Green in the same year and established himself in chambers in the Temple. In his circle of friends at this time were "Conversation" Sharp and the artists Flaxman, Opie, Martin Shee and Fuseli. He also made the acquaintance of Charles James Fox, with whom he visited the galleries in Paris in 1802, and whose friendship introduced him to Holland House. In 1835 he moved to 22 St James's Place, where for fifty years he entertained all the celebrities of London. Flaxman and Stothard had a share in the decorations of the house, which Rogers had almost rebuilt, and now proceeded to fill with pictures and other works of art. His collections at his death realized £50,000. An invitation to one of Rogers's breakfasts was a formal entry into literary society, and his dinners were even more select. His social success was due less to his literary position than to his powers as a conversationalist, his educated taste in all matters of art, and no doubt to his sarcastic and bitter wit, for which he excused himself by saying that he had such a small voice that no one listened if he said pleasant things. Above all, he seems to have had a genius for benevolence. "He certainly had the kindest heart and unkindest tongue of any one I ever knew," said Fanny Kemble. He helped the poet Robert Bloomfield, he reconciled Moore with Jeffrey and with Byron, and he relieved Sheridan's difficulties in the last days of his life. Moore, who refused help from all his friends, and would only be under obligations to his publishers, found it possible to accept assistance from Rogers. He procured a pension for H. F. Cary, the translator of Dante, and obtained for Wordsworth his sincere as distributor of stamps.

It is difficult to realize the length of time that Rogers played the part of literary dictator in England. He made his reputation by The Pleasures of Memory when Cowper's fame was still in the making. He became the friend of Wordsworth, Scott and Byron, and lived long enough to give an opinion as to the fitness of Alfred Tennyson for the post of poet laureate. Alexander D Bryce, from the time of his first introduction to Rogers, was in the habit of writing down the anecdotes with which his conversation abounded. From the mass of material thus accumulated he made a selection which he arranged under various headings and published in 1856 as Recollections of the Table-Talk of Samuel Rogers, to which is added Portraits, Rogers and a Sketch of a Conversation of many of his distinguished friends—Charles James Fox, Edmund Burke, Henry Grattan, Richard Porson, John Horne Tooke, Talleyrand, Lord Erskine, Sir Walter Scott, Lord Grenville and the duke of Wellington. They were published by his nephew William Sharpe in 1859 as Recollec tions by Samuel Rogers; and Reminiscences and Table-Talk of Samuel Rogers, Banker, Poet, and Patron of the Arts, 1763–1835 (1903), by G. H. Powell, is an amalgamation of these two authorities. Rogers held various honorary positions: he was one of the trustees of the National Gallery; and he served on a commission to inquire into the management of the British Museum, and on another for the rebuilding of the Houses of Parliament.

Meanwhile his literary production was slow. A poem of some autobiographical interest, An Epistle to a Friend (Richard Sharp), published in 1798, describes Rogers's ideal of a happy life. This was followed twelve years later by The Voyage of Columbus (1810), and by Jacqueline (1814), a narrative poem, written in the four-verse measure of the newer writers, and published in the same volume with Byron's Lara. His reflective poem on Human Life (1819), on which he had been engaged for twelve years, is written in his earlier manner.

In 1818 Rogers made a tour on the Continent with his sister Sarah. He travelled through Switzerland to Italy, keeping a full diary of events and impressions, and had made his way to Naples when the news of Napoleon's escape from Elba obliged him to hurry home. Seven years later he returned to Italy, paying a visit to Byron and Shelley at Pisa. Out of the earlier of these tours arose his last and longest work, Italy. The first part was published anonymously in 1822; the second, with his name attached, in 1828. The production was at first a failure, but Rogers was determined to make it a success. He enlarged and revised the poem, and commissioned illustrations from J. M. Turner, Thomas Stothard and Samuel Prout. These were engraved on steel in the sumptuous edition of 1830. The book then proved a great success, and Rogers followed it with an edition of his Poems (1838). In 1830, on Wordsworth's death, Rogers was asked to succeed him as poet laureate, but declined the honour on account of his great age. For the last five years of his life he was confined to his chair in consequence of a fall in the street. He died in London on the 15th of December 1855.

A full account of Rogers is given in two works by F. W. Clavicen, The Early Life of Samuel Rogers (1857) and Rogers and his Contemporaries (2 vols., 1896). One of the best accounts of Rogers, containing many examples of his caustic wit, is by Abraham Hayward in the Edinburgh Review for July 1856. See also the Aldine edition (1857) of his Poetical Works, and the Journals of Byron and of Moore.

ROGERS, WILLIAM (1819-1896), English clergyman and educational reformer, was born in London on the 24th of November 1819, the son of a barrister. Educated at Eton and at Balliol College, Oxford, he entered Durham University in 1842, to study theology, and was ordained in 1843. In 1845 he was appointed to St Thomas Charterhouse, where he remained for eighteen years, throwing himself passionately into the work of education of his poor, degraded and often criminal parishioners. He began by establishing a school for ragamuffins in a blacksmith's abandoned shed, and with the generous help of friends he gradually extended its scope until the whole parish was a network of schools. In 1858 he was appointed a member of the Royal Commission to inquire into popular education, and he was returned a representative of the London School Board after the passing of Forster's Act in 1870. In 1863 the bishop of London gave him the living of St Botolph Bishopsgate. Rogers was also made a prebendary of St Paul's, and in 1857 he had been appointed Chaplain in Ordinary to the Queen. Having largely succeeded at St Thomas's the problem of elementary education, at Bishopsgate Rogers tackled the no-less difficult one of middle-class schools. He believed in secular education, leaving doctrinal training to parents and clergy. To the cry against "godless education," Rogers impulsively replied: "Hang the godliness in Newgate! We are only interested in making the study of history and geography 'stuck to him for the rest of his life. The Cowper Street Schools, costing £20,000, were the practical result of his energy. His next great work was the reconstruction of Edward Alleyn's charity at Dulwich. The new college was opened in 1870; new buildings were erected for the lower school, and the lion's share of the work fell upon Rogers. The culmination of his labours was the opening, on his seventy-fifth birthday, of the Bishops gate Institute, including a hall, with accommodation for 500 people and a reference and lending library. On the same day a portrait and gift of plate was made him at the Mansion House, before a distinguished gathering. Lord Rosebery, then Prime Minister, observed in his speech that though bishops and deaneries had not been the rector's lot, there was not a poor Jew in Houndsditch or Petticoat Lane whose face would not brighten when he saw him coming. When he died, on the 19th of January 1896, this might have served as an appropriate epitaph.
"Vaincre ou mourir pour Bruxelles," he obtained arms from a local factory, and marched upon the capital. Here he took his place at once among the leaders of the revolutionary party. His influence saved the town-hall from pillage on 19th September. On the 24th a commission administrative was formed, of which Rogier became president. The energetic measures of this body and of its successor, the gouvernement provisoire, soon freed the greater part of the country from the Dutch troops. Rogier was sent in October to suppress an outbreak among the colliers of Hainaut, and then as delegate of the provisional government to Antwerp, where the citadel still held out for Holland. He succeeded in arranging an armistice, and then, in the exercise of the absolute power with which he was invested, reorganized the entire administration of the city. He sat for Liége in the National Congress, voted for the establishment of a hereditary monarchy, and induced the congress to adopt the principle of an elective second chamber. In the long-drawn debates on the toil of the crown he ranged himself on the side of Louis Philippe: he first supported the candidature of Otto of Bavaria, and on his rejection declared for the duc de Nemours. Finally, when Louis Philippe declined the crown on behalf of his son, Rogier voted with the majority for Leopold of Saxe-Coburg. In June 1831 he was appointed governor of the province of Antwerp, a post rendered exceptionally difficult by the continued presence of Dutch troops in the citadel. In October 1832 he was made minister of the interior in the Goblet-Devaux cabinet. In the following June he intervened in a quarrel in the chamber of deputies between Devaux and the Opposition leader, Alexandre Gendebien, claimed a prior right to give satisfaction, and fought a duel, in which he was severely wounded. During his term of office he carried, in the teeth of violent opposition, a law that established in Belgium the first railways on the continent of Europe, and thus laid the foundation of her industrial development. Owing to dissensions in the cabinet, he retired in 1834, together with Lebeau, and resumed the governorship of Antwerp. On Lebeau's return to power in 1840, Rogier became minister of public works and education. The proposals that he made in the latter capacity were defeated by the determined opposition of the Clerical party, and on the resignation of the ministry in 1841, Rogier gave his support to a compromise on the subject of education, which passed into law in 1842. He led the Liberal party in Opposition till 1847, when he formed a cabinet in which he held the ministry of the interior. He at once embarked on a program of internal and economic reforms. He took a number of steps to remedy the industrial distress caused by the decay of the Flemish linen trade. The limits of the franchise were extended; and as the result of the liberal policy of the government Belgium alone escaped the revolutionary wave that spread over the Continent in 1848. He passed a law in 1850 organizing secondary education under the control of the State, and giving the clergy only the right of religious instruction. The Clerical party, though unable to defeat this measure, succeeded in shaking the position of the cabinet; and it was finally undermined, after Prince Louis Napoleon's coup d'etat of 1851, by the hostility of the French government, which feared renewed political exciles welcomed by the Liberal cabinet at Brussels. Rogier retired in October 1852, but was brought back into office by the liberal reaction of 1857. He again became president of the council and minister of the interior in a cabinet of which Frère-Orban was the most conspicuous member. The important measure passed by the ministry was one for the fortification of Antwerp. In 1860 the idea of French designs on the independence of Belgium led to a movement of reconciliation with Holland, and inspired Rogier to write the only one of his numerous poems that is likely to survive, his national anthem, "La Nouvelle Brabançonne." Some of the ministers resigning in 1861, on the question of recognizing the king of Italy, the king of the Romans exchanged the ministry of the interior for that of foreign affairs. In this capacity he achieved a diplomatic triumph in freeing the navigation of the Scheldt, and thus enabling Antwerp to become the second port on the mainland of Europe. Defeated at Dinant, he sat for Tournai from 1863 till his death. His younger and more energetic colleague, Frère-Orban, gradually overshadowed his chief, and in 1868 Rogier finally retired from power. He continued, however, to take part in public life, and was elected president of the extraordinary session of the chamber of representatives in 1878. From this time his age, his devoted patriotism and the unassuming simplicity of his life made him the idol of all classes. The fiftieth anniversary of the kingdom of Belgium in 1886, and two years later that of his entry into parliament, were the occasion of demonstrations in his honour. He died at Brussels on the 27th of May 1885, and his remains were accorded a public funeral.

See T. Juste, Charles Rogier, 1800-1885, d'après des documents inédits (Verviers, 1885).

ROGUE, a word which came into use about the middle of the 16th century as a slang or "cant" term for a vagrant vagabond, answering to the modern "tramp," and was adopted into English legal phraseology together with "vagabond" in the Statute of Elizabeth 1572, "rogue and vagabond" and "incorrigible rogue" remaining as legal terms for certain classes of person and liable to the law under the Vagrancy Acts (see Vagrancy). The act of Elizabeth defined "rogues, vagabonds and sturdy beggars" as including "idle persons going about and using subtile craft and unlawful games and all persons whole and mighty in body, but having neither land nor master, nor able to give an account how they get their living and all common labourers using loitering and refusing to work for the wages commonly given" (Sir G. Nichols' History of the English Poor Law, ed. 1898 by H. G. Willink, vol. i. 159). The word has now the general meaning of a knave or rascal, though also used (by meiosis) as a term of playful or tender banter and in various special applications (e.g. a "rogue" elephant, one who has been driven out by the herd and lives a solitary life, becoming very savage and destructive. Gardeners also apply the word to a plant which does not come true from seed, showing some variation from the type).

The derivation of the word has been much disputed. It has usually been referred to Fr. rogue, meaning proud, arrogant, which is variously derived from the Icelandic kroke, rook, long-winded talker, or Breton rok, proud, haughty; cf. Irish and Gaelic rucas, pride. The New English Dictionary, however, rejects this derivation, and considers possible a connexion with another early "cant" word "roger," a begging vagabond pretending to be a undergraduate scholar.

ROHAN, the name of one of the most illustrious of the feudal families of France, derived from that of a small town in Morbihan, Brittany. The family appears to have sprung from the viscounts of Porhoët, and claims connexion with the ancient sovereigns of Brittany. Since the 12th century it held an important place in the history of Brittany, and strengthened its position by alliances with the greatest houses in France. It was divided into several branches, the eldest of which, that of the viscounts of Rohan, became extinct in 1527. Of the younger branches the most famous is that of Guéménéé, from which sprang the houses of Montbazon, Soubise and Gic. The marquis de Frontenay, an offshoot of this last branch, inherited by marriage the property of the eldest branch of the house. Hercule de Rohan, duc de Montbazon (1568-1654) served Henry III. and Henry IV. against the League, and was made by Henry IV. governor of Paris and the Isle of France, and master of the hounds. His grandson, Louis de Rohan-Guéménéé, the chevalier de Rohan, who was notorious for his dissolute life, conspired with the Dutch against Louis XIV. and was beheaded in Paris in 1674. In the 18th century the Soubise branch furnished several prelates, cardinals and bishops of Strassburg, among others the famous cardinal de Rohan, the hero of the affair of the diamond necklace. The seigneurs de Gic, a branch founded by Pierre de Rohan (1455-1513), a cadet of the branch of Guéménéé and marshal of France, were conspicuous on the Protestant side during the wars of religion. René de Rohan, seigneur of Pontivy and Frontenay, commanded the Calvinist army in 1570, and
ROHAN, DUC DE—ROHAN, CARDINAL DE

defended Lusignan with great valour when it was besieged by the Catholics (1574–75). His son Henry, the first duke of Rohan, also distinguished himself in the Protestant army. His only child, Marguerite de Rohan, married in 1645 Henri Chabot, a cadet of a great French family. This marriage was opposed by her mother, Marguerite de Béthune, who put forward a rival heir called Tancrede, whom she claimed to be her son by the duke of Rohan. This Tancrede perished in the Fronde in 1649. The property and titles of Henry de Rohan thus passed to the Chabot family, which under the name of Rohan-Chabot produced some distinguished soldiers and a cardinal archbishop of Besançon. The male line of the Rohans is now represented by an offshoot of the Rohan-Guéménée branch.

ROHAN, HENRI, DUC DE (1579–1638), French soldier, writer and leader of the Huguenots, was born at the château of Blain, in Brittany, in 1579. His father was René II., Count of Rohan (1530–86), and head of one of the oldest and most distinguished families in France, which was connected with many of the reigning houses of Europe. He was educated by his mother, who was a woman of exceptional learning and force of character. Rohan was by birth the second son, but his elder brother René dying young he became the heir of the name. He appeared at court and in the army at the age of sixteen, and was a special favourite with Henry IV., after whom, failing the house of Condé, he might be said to be the natural chief of the French Protestants. Having served till the peace of Vervins, he travelled for a considerable time over Europe, including England and Scotland, in the first of which countries he received the not unique honour of being called by Elizabeth her knight, while in the second he was godfather at Charles I.'s christening. On his return to France he was made duke and peer at the age of twenty-four, and two years later (1603) married Marguerite de Béthune, the duc de Sully's daughter. He served in high command at the celebrated siege of Jülich in 1610, but soon afterwards he fell into active or passive opposition to the government over the religious disputes. For a time, however, he abstained from actual insurrection, and he endeavoured to keep on terms with Marie de' Medici; he even, despite his dislike of De Luynes, the favourite of Louis XIII., reappeared in the army and fought in Lorraine and Piedmont. It was not till the decree for the restitution of church property in the south threw the Bernese and Gascons into open revolt that Rohan appeared as a rebel. His authority and military skill were very formidable to the royalists; his constancy and firmness greatly contributed to the happy issue of the war for the Huguenots, and brought about the treaty of Montpellier (1629). But Rohan did not escape the results of the incurable factiousness which showed itself more strongly perhaps among the French Huguenots than among any other of the numerous armed oppositions of the 17th century. He was accused of lukewarmness and treachery, though he did not hesitate to renew the war when the compact of Montpellier was broken. Again a hollow peace was patched up, but it lasted but a short time, and Rohan undertook a third war (1627–29), the first events of which are recounted in his celebrated Memoirs. This last war (famous for the defence of La Rochelle by Soubise, Rohan's younger brother) was one of considerable danger for Rohan. In spite of all efforts he had in the end to sign a peace, and after this he made his way quickly to Venice. Here he is said to have received from the Porte the offer of the sovereignty of Cyprus. It is more certain that his hosts of Venice would have made him a pasha, but he declined the offer, and, not executed owing to the peace of Cherasco (1631). At Venice he wrote his Memoirs; at Padua, Le Parfait Capitaine. But when France began to play a more conspicuous part in the Thirty Years' War Rohan was again called to serve his lawful sovereign, and entrusted with the war in the Valtelline. The campaign of 1633 was completely successful, but Rohan was still considered dangerous to France, and was soon again in retirement. At this time he wrote his Traité du gouvernement des treize cantons. Rohan fought another Valtelline campaign, but without the success of the first, for the motives of France were now held in suspicion. The unfortunate commander retired to Geneva and thence went to the Austrian Netherlands. Succeeded to the peerage of Blain, he received a military appointment at the battle of Rheinfelden on the 28th of February 1638, and died at the abbey of Königsfeld, canton Berne, on the 13th of April. His body was buried at Geneva, and his arms were solemnly handed over to the Venetian government. With his daughter Marguerite the honours of the family of Rohan-Giè passed to the house of Chabot.
ROHILKHAND—ROHTAK

form part of the "affair of the diamond necklace." This story is
disentangled elsewhere (see DIAMOND NECKLACE), and
diverging views are still taken of it. Rohan certainly was led
to rely on the attentions to the queen which welcomed, and
that his arrangement by which she received the famous necklace
was approved. He was the dupe of others, and at the trial
in 1786 before the parlement his acquittal was received with
universal enthusiasm, and regarded as a victory over the court
and the unpopular queen. He was deprived, however, of his
office as grand almoner and exiled to his abbey of Chaise-Dieu.
He was soon allowed to return to Strassburg, and his popularity
was shown by his election in 1789 to the states-general by the
clergy of the bailliages of Haguenau and Weissenburg. He at
first declined to sit, but the states-general, when it became the
national assembly, insisted on validating his election. But as
a prince of the church in January 1791 he refused to take the
oath to the constitution, and went to Ettenheim, in the German
part of his diocese. In exile his character improved, and he
spent what wealth remained to him in providing for the poor
clergy of his diocese who had been obliged to leave France;
and in 1801 he resigned his nominal rank as archbishop of
Strassburg. On the 17th of February 1803 he died at Ettenheim.

See the Mémoires of his secretary, the abbé Georgel, of the
baroness d'Oberkirch, of Beugnot, and of Madame Campan; and
works by W. Schink, Joseph von Rohr, J. G. König, and
ROHILKHAND, a tract in the United Provinces of India.
The name is associated with the Rohilla tribe (q.v.), but in its
historical significance it covers an area almost coincident with
the modern division of Bareilly, for which it is a common
alternative title. This division has an area of 10,720 sq. m.,
and comprises the districts of Bareilly, Bijnor, Budaun, Morad-
dabad, Shahjahanpur and Plilibhit. Pop. (1901) 5,479,688.
Political control over the state of Rampur is exercised by the
commissioner for the division.

ROHILLA (a Pushtu word for "mountaineer"), a tribe of
Afghan marauders, who, towards the beginning of the 18th
century, conquered a district of Hindostan, giving it the name of
Rohilkhanda, which still survives as an alternative title of
the Bareilly division of the United Provinces. The Rohillas
are chiefly noted for their association with Warren Hastings,
which formed one of the main counts in his impeachment.
Having been driven into the mountains by the Mahtrattas,
they had appealed for aid to Shuja-ud-Dowlah, wazir of Oudh,
and ally of the British. The wazir promised to assist them in
return for a sum of money; but when the Mahtrattas were
driven off the Rohilla chiefs refused to pay. The wazir then
decided to annex their country, and appealed to Hastings for
assistance, which was given in return for a sum of forty lakhs of
rupees. Hastings justified his action on the ground that the
Rohillas were a danger to the British as uncouth inhabitants of
Oudh; and while he never involved the company in an unjust
war, neither did he desire an unprofitable one. The Rohillas
were defeated by Colonel Champion in April 1774, and the majority of them fled across the Ganges;
but the charges of destroying a nation, brought against Hastings
by Burke and Macaulay, were greatly exaggerated. The
Rohillas were never a nation, but consisted of a small body of
Mahomedans, who had imposed an alien rule upon a million Hindus; and one of their chiefs was left in possession of a tract
which now forms the state of Rampur (q.v.).

See Charles Hamilton, History of the Rohilla Afghans (1787); and

ROHILFS, FRIEDRICH GERHARD (1831–1896), German
explorer of the Sahara, son of a physician, was born at Vege-
sack, near Bremen, on the 14th of April 1831. After the
ordinary course at the gymnasium of Osnabrück he entered the
Bremen corps in 1848, and took part as a volunteer in the
Schleswig-Holstein campaign, being made an officer after
the battle of Istedt (July 1850). He became a medical student
at the universities of Heidelberg, Würzburg and then Göt-
tingen; but his natural inclination was for travelling, and in
1855 he went to Algeria and enlisted in the Foreign Legion.

He took part in the conquest of Kabylia, and was decorated for
bravery as Chevalier of the Legion of Honour. Having made
himself master of Arabic and gained a thorough knowledge of
native customs, Rohlfis went to Morocco in 1861; presenting
himself as a Mussulman, in 1863 he gained the favour of the emir
Abd el-Wassan, and was thus enabled to travel over the
length and breadth of the country. He then entered the
Sahara and traversed the entire extent of the Wad Draa,
being the second European (the first being René Caillée)
to visit Tafilet. On leaving Tafilet he was robbed by his guides
and left for dead; but two marabouts charitably succored
him and he was able to reach Algeria. When scarcely
recovered from his wounds he started once more for the Sahara
(August 1862) by way of Algeria. Compelled by tribal dis-
urbances to turn back, he went to Tanger and thence in
March (1869) to Tripoli, intending to explore the highlands of
the Ahaggar; being prevented, however, by a war among the
Tuareg, he went from Ghadames to Murzuk, where he spent
five months, and thence across the Sahara to Bornu, mapping
en route the oasis of Kowa. Rohlfis passed through Mandara
and its ancient capital Mora, and struck out for the coast of
the Gulf of Guinea. Then, having crossed the Bunar and the
Bauchi highlands, and descended that river to its confluence
with the Niger, which he ascended to Gobba. Thence he made
his way on horseback to Lagos, reaching Liverpool on the
2nd of July 1867. In the following year he accompanied the
British expedition against Theodore of Abyssinia, and on
his return went once more to Tripoli, whence he traversed
the Cyrenaica, reaching Egypt by way of the oasis of Siwa
(1869). Returning home, he married and settled down in Weimar.
It did not rest long, however, for in 1873–74 he took command
of an expedition sent by the Khedive Ismail into the Libyan
Desert, which made investigations of great value to science.
In 1878 Rohlfis and Dr Stecker were commissioned by the
German African Society to go to Wadiel. They succeeded
in reaching the oasis of Kufra, one of the chief centres of the
Senussites, but being attacked by the Arabs, they were obliged
to retreat, making their way to the coast at Benghazi, reached
in October 1879. In 1880 Rohlfis accompanied Dr Stecker
in an exploring expedition to Abyssinia; but after delivering
a letter from the German emperor to the Negus, he returned
to Europe. In 1883, when the rivalry between the British
and Germans in East Africa was very keen, Prince Bismarck
appointed Rohlfis consul at Zanzibar, which island Bismarck
had just wrested from the Nguzo. Rohlfis, with his usual
enthusiasm, was no match for Sir John Kirk, the British Agent, and
he was soon recalled, and did not again visit Africa. He died at
Rüngsdorf, near Bonn, on the 2nd of June 1896. Rohlfis
visited many regions not before traversed by Europeans, and
the value of his work was recognized in 1868 by the Royal
Geographical Society, which bestowed on him the Patron's
Medal.

Accounts of each of his expeditions, and other works on Africa
were published by Rohlfis, including Mein Erster Aufenthalt in
Marokko (Bremen, 1873; English translation, Travels in Morocco,
London, 1874); Reise durch Marokko (Bremen, 1868); Quer
durch Afrika (Leipzig, 1874–75); Von Triposis nach Alexandrien
(Bremen, 1871); Expedition zur Erforschung der Lübychen Wüste
(Cassel, 1875–76); Kufra: Reise von Triposis nach der Oase
Kufra (Leipzig, 1881); Land und Volk in Afrika (Bremen, 1870);
Quid non ex Africa? (Cassel, 1886). See also a biographical notice
by Dr W. Volkenthauer in the Deutsche geo. Blätter for 1896.

ROHTAK, a town and district of British India, in the Delhi
division of the Punjab. The town, which is of great antiquity,
became the headquarters of a British district in 1824.
Viewed from the sandhills to the south, Rohtak, with its white mosque
in the centre, a fort standing out boldly to the east, is striking
and picturesque. It has a station on the Southern Punjab
ROJAS ZORRILLA—ROLAND, J. M.

Railway, 44 m. N.W. of Delhi. Pop. (1907) 20,323. It is an important trade centre, with factories for ginning and pressing cotton, and a specialty in muslin turbans.

The district of Rohtak has an area of 1797 sq. m. It is situated in the midst of the level tableland between the Jumna and the Sutlej, forming one unbroken plain of hard clay copiously interspersed with light yellow sand, and covered in its wild state by a jungle of scrubby brushwood. The only natural reservoir for its drainage is the Najajgarh jhili, a marshy lake lying within the boundaries of Delhi. The Sahibi, a small stream from the Ajmure hills, traverses a corner of the district, and the northern portions are watered by the Rohtak and Burj branches of the Western Jumna canal; but the southern portion of the central plain, comprising about two-thirds of the district area, is entirely dependent upon the uncertain rainfall. The climate, though severe in point of heat, is generally healthy; the rainfall averages annually about 20 in.

The population in 1901 was 630,672, showing an increase of 6.8% in the decade. The principal crops are millets, wheat, barley, pulses, cotton and sugar-cane. The district is traversed by the line of the Southern Punjab railway from Delhi to Jind, and also touched by the Rewari-Ferozepore branch of the Rajputana Railway. It is peculiarly exposed to drought, suffering in the famine of 1896-97, and yet more severely in 1899-1900, when the highest number of persons relieved was 33,632 in March 1900.

Rohtak was formerly included within the region known as Hariana. The district, with the other possessions of Sindhia west of the Jumna, passed to the British in 1803. Until 1832 Rohtak was under the administration of a political agent, resident at Delhi, but in that year it was brought under the general regulations and annexed to the North-Western Provinces. The outbreak of the Mutiny in 1857 led to its abandonment, when the mutineers attacked and plundered Rohtak, despoiling the villages and烧毁ing several of its temples. After the fall of Delhi that the authority of the British government was permanently restored. Rohtak was then transferred to the Punjab.

ROJAS ZORRILLA, FRANCISCO DE (1667-1688), Spanish dramatist, was born at Toledo; the only circumstance recorded of his life is that he became a knight of Santiago in 1644. The exact date of his death is unknown. His plays were published in 1640-45; the best of his dramatic compositions, Del Rey abajo Ninguno, is not included in the collection and was printed separately under the title of Garcia del Castahor. Of his other pieces, apart from their intrinsic merit, an international interest attaches to No hay gerriones as they were the subject of an address by Mme. les Rois for his Venéscias; to Donde hay agravios no hay salo and the Amo criado, which were imitated by Scarron in his Jodelet Soufflet and Matre Valet; to Entre Bobos anda el juego, the source of Thomas Corneille's Don Bertrand de Cigarral, as well as of Scarron's Don Japhet d'Armenie; to Obligados y ofendidos, from which are derived Les Généruses Ennemis by Boisrobert, Les Illustres Ennemis by Thomas Corneille, and Scarron's Écologiste de Salamanque; and to La tracción busca el castigo, upon which are based Vanburgh's Fals Friend and Le Sage's Traître puni. Rojas Zorrilla's power of conveying a tragic impression is manifest in Garcia del Castahor; his chief defect is his persistent preciosity of diction.

ROKITSANSKY, CARL, FREIHERR VON (1804-1878), the founder of the Vienna school of pathological anatomy, was born on the 19th of February 1804 at Königgrätz in Bohemia. He studied medicine at Prague and at Vienna, graduating at the latter place in 1828. Soon afterwards he became assistant to Johann Wagner, the professor of pathological anatomy, and succeeded him in 1834 as prosector, being at the same time named extraordinary professor. It was not until ten years later (1844) that he reached the rank of full professor. To his duties as a teacher in 1827 he added in 1837 the office of the judicial-anatomist to the city, and from 1863 he filled an influential office in the ministry of education and public worship, wherein he had to advise on all routine matters of medical teaching, including patronage. A seat in the upper house of the Reichsrath rewarded his public labours in 1867, and on his retirement from all his offices in 1874 he was made a commander of the Order of Leopold. He joined the Imperial Academy of Sciences as a member in 1848, and became its president in 1865. He was president also of the medical society of the Austrian capital and an honorary member of many foreign societies. On his retirement at the age of seventy his colleagues celebrated the occasion by a function in the aula of the university, where his bust was unveiled. In his leave-taking speech he said that work had always been a pleasure to him and pleasures mostly a toil. His death at Vienna on 26 July 1878 left Vienna and the province of Lower Austria the loss of a mind imbued with high conceptions of affection and of esteem for his upright character.

Two of his sons became professors at Vienna, one of astronomy and another of medicine, while a third gained distinction on the lyceic stage.

With Rokitansky's name is associated the second great period of the medical school of Vienna, its first success having been identified with the liberal patronage of it by Maria Theresa and with the founder of Van Swieten, the latter of whom was the collaborator of Fremin, who had begun under Wagner while Rokitansky was still a student; but it reached its highest point while the latter was assistant in the dead-house and afterwards professor and director. The enthusiasm for the post-mortem body was the consequence at the outset, in the enormous increase of the death-rate from puerperal fever in the lying-in wards of the general hospital. The difference between the slight mortality in the wards that were afterwards reserved for the training of midwives and the excessive mortality in those set apart for the training of students proved that the cause was the conveyance of infection from the dead-house by the hands of the latter. The precautions introduced by I. P. Semmelweiss in 1847 proved adequate in removing that grave reproach from the study of morbid anatomy, Another and more lasting consequence of the assiduous pursuit of post-mortem study, (contrary to the primitive conception of the subject) was the localization diagnosis, was the loss of faith in the power of drugs to remedy the textural changes—so-called "nihilism" of the Vienna school. The immediate outcome of Rokitansky's close application to the work of the dead-house was his Handbuch der pathologischen Anatomie (1842-46), in 2 vols., of which the first was published last. The value of the work lies in the second and third volumes, of which two-thirds of the visible changes and abnormalities in the several organs and parts of the body. Whenever Rokitansky touched the vital problems of general pathology, as he did in the postponed first volume, he revealed a metaphysical bent, in his discussion of the hunting down of the abdominal organs, and his search for the source of the heart's "natural" rhythm and its "organic" powers of outward observation and accurate description. Being a few years too soon to profit by the microscopic movement which led to the cellular pathology, he endeavoured to reconcile the old morphology with the primitive kind of researches which led to a new meaning into the doctrine of the various dyscrasias. In 1852 he entered into possession of a new pathological institute, in which he found means, for the first time, to display his extensive collection of specimens in a museum. Although he had no direct share in the newer developments of pathology, he was far from indifferent or reactionary towards them; indeed, the laboratories and chairs for microscopic and experimental pathology and for pathological chemistry were warmed by him, and aided by him.

Next to his Handbuch, of which the Syndenham Society published an English translation in 4 vols. (1889-92), his most important work was the four volumes which he delivered to the Vienna Academy of Sciences (on the anatomy of goitre, cysts, diseases of arteries, and defects in the septa of the heart), the last as late as 1875. Other papers of less importance brought up the total of his contributions to the literature of pathological anatomy to thirty-seven, with thirty-four addresses of a medical and historical turn, "Freedom of Inquiry" (1862), "The Independent Value of Knowledge" (1867) and "The Solidarity of Animal Life" (1869).

ROLAND [ROLAND DE LA PLATIÈRE], JEAN MARIE (1734-1793), French statesman, was born at Thivy on the 18th of February 1734. He received a good education, and early formed the studious habits which remained with him through life. Proposing to seek his fortune abroad, he went on foot to Nantes, but was there prostrated by an illness so severe that all thoughts of emigration were forfeited. For some years he was employed in the clerk's office of a mathematician, who situated a bank at Amiens, and he himself speedily rose to the position of inspector. To these two employments may be ascribed those qualities of assiduity and
accuracy, and that familiarity with the commerce of the country, which distinguished his public career. In 1781 he married Manon Jeanne Philon (1754-1793), and the name of Madame Roland is famous in history. She was the daughter of Gratien Philon, a Paris engraver, who was ambitious, speculative and nearly always poor. From her early years she showed great aptitude for business and enthusiasm for spiritual and unassuming talent. She was to a considerable extent self-taught; and her love of reading made her acquainted first with Plutarch—a passion for which author she continued to cherish throughout her life—thereafter with Bossuet, Massillon, and authors of a like stamp, and finally with Montesquieu, Voltaire and Rousseau. These studies marked stages of her development, and as her mind matured she abandoned the idea of a convent which for a year or two she had entertained, and added to the enthusiasm for a republic which she had imbued from her earlier studies not a little of the cynicism and the daring which the later authors inspired. She almost equalled her husband in knowledge, and infinitely excelled him in talent and in tact. Through and with him she exercised a singularly powerful influence over the destinies of France from the outbreak of the Revolution till her death.

For four years after their marriage Roland lived at Amiens, he being still an inspector of manufactures; but his knowledge of commercial affairs enabled him to contribute articles to the Encyclopédie Nouvelle, in which, as in all his literary work, he was assisted by his wife. On their removal to Lyons the influence of both became wider and more powerful. Their fervent political aspirations could not be concealed, and from the beginning of the Revolution they threw in their lot with the party of advance. The Courrier de Lyon contained articles the success of which reached even to the capital and attracted the attention of the Parisian press. They were from the pen of Madame Roland and were signed by her husband. A correspondence sprang up with Brillot and other friends of the Revolution at headquarters. In Lyons their views were publicly known; Roland was elected a member of the municipality, and when the depression of trade in the south demanded representation in Paris he was deputed by the council of Lyons to ask the Constituent Assembly that the municipal debt of Lyons, which had been contracted for the benefit of the state, should be regarded as national debt. He accompanied by his wife, he appeared in the Assembly in February 1791. He remained there until September, frequenting the Society of the Friends of the Constitution, and entertaining deputies of the most advanced opinions, especially those who later became the leading Girondists. Madame Roland took an active part in the political discussions in these reunions.

In September 1791, Roland's mission being executed, they returned to Lyons. Meanwhile the inspectorships of manufactures had been abolished; he was thus free; and they could no longer remain absent from the centre of affairs. In December they again reached Paris. Roland became a member of the Jacobin Club. They had made many and influential friends in Amiens, and Madame Roland's salon soon became the rendezvous of Brillot, Péron, Robespierre and other leaders of the popular movement, above all of Buzot, whom she loved with platonic enthusiasm. In person Madame Roland was attractive though not beautiful; her ideas were clear and far-reaching, her manner calm, and her power of observation extremely acute. It was almost inevitable that she should find herself in the centre of political aspirations and presiding over a company of the most talented men of progress. The rupture had not yet been made evident between the Girondist party and that section still more extreme, that of the Mountain. For a time the whole Left was united in forcing the resignation of the ministers. When the crisis came the Girondists were ready, and on the 23rd of March 1792 Roland found himself appointed minister of the interior. As a minister of the crown Roland exhibited a bourgeois brusqueness of manner and a remarkable combination of political pre-judice with administrative ability. While his wife's influence could not increase the latter, it was successfully exerted to foment and embitter the former. He was ex officio excluded from the Legislative Assembly, and his declarations of policy were thus in writing—that is, in the form in which she could most readily exert her power. A great occasion was invented. The decrees against the emigrants and the non-juring clergy still remained under the veto of the king. A letter was penned by himself to Madame Roland and addressed by her husband to Louis. It remained unanswered. Thereupon, in full council and in the king's presence, Roland read his letter aloud. It contained many and terrible truths as to the royal refusal to sanction the decrees and as to the king's position in the state; but it was inconsistent with a minister's position, disrespectful if not insolent in tone. Roland's dismissal followed. Then he completed the plan: he read the letter to the Assembly; it was ordered to be printed, became the manifesto of disaffection, and was circulated everywhere. In the demand for the reinstatement of the dismissed ministers were found the means of humiliation, and the prelude to the dethronement of the king.

After the insurrection of the 10th of August, Roland was recalled to power, one of his colleagues being Danton. But now he was dismayed by the progress of the Revolution. He was above all a provincial, and was soon in opposition to the party of the Mountain, which aimed at supremacy not only in Paris but in the government as well. His hostility to the insurrectional commune of Paris, which led him to propose transferring the government to Blois, and his attacks upon Robespierre and his friends rendered him very unpopular. His neglect to seal the iron chest discovered in the Tuileries, which contained the proofs of Louis XVI's relations with the enemies of France, led to the accusation that he had destroyed a part of these documents. Finally, in the trial of the king he demanded, with the Girondists, that the sentence should be pronounced by a vote of the whole people, and not simply by the Convention. He resigned office on the 23rd of January 1793, two days after the king's execution.

Although now extremely unpopular, the Rolands remained in Paris, suffering abuse and calumny, especially from Marat. Once Madame Roland appeared personally in the Assembly to repel the falsehoods of an accuser, and her ease and dignity and enthusiasm and frankness and acquittal. But violence succeeded violence, and early on the morning of the 4th June she was arrested and thrown into the prison of the Abbaye. Roland himself escaped secretly to shelter in Rouen. Released for an hour from the Abbaye, she was again arrested and thrown among the horrors of Sainte-Pélagie. Finally, she was transferred to the Conciergerie. In prison she won the affections of the guards, and was allowed the privilege of writing materials and the occasional visits of devoted friends. She there wrote her Appel d'impitoyable postérité, those memoirs which display a strange alternation between self-laudation and patriotism, between the trivial and the sublime. On the 8th of November 1793 she was conveyed to the guillotine. Before yielding her head to the block, she bowed before the clay statue of Liberty erected in the Place de la Révolution, uttering her famous apostrophe—"O Liberty! what crimes are committed in thy name! " When Roland heard of his wife's condemnation, he wandered some miles from his refuge in Rouen; maddened by despair and grief, he wrote a few words expressive of his horror at those massacres which could only be inspired by the enemies of France, protesting that from the moment when I learned that they had murdered my wife I would no longer remain in a world stained with enemies." He affixed it to his breast, and unsheathing a sword-stick fell upon the weapon, which pierced his heart, on the roth of November 1793.

Madame Roland's Mémoires, first printed in 1820, have been edited among others by P. Faugère (Paris, 1864), by C. A. Dauban (Paris, 1864), by J. Claretie (Paris, 1884), and by C. Perraud (Paris, 1905). Some of her Lettres intimes have been published by C. A. Dauban (Paris, 1867), and a critical edition of her Lettres by
ROLAND, LEGEND OF

C. Perroud (Paris, 1900-2). See also C. A. Dauben, "Étude sur Madame Roland et son temps" (Paris, 1864); V. Lamy, Deux femmes célèbres, Madame Roland et Charlotte Corday (Paris, 1884); C. Bader, Madame Roland, d'après les lettres et des manuscrits inédits (Paris, 1895); J. Lambert, Le mariage de Madame Roland, trois années de correspondance amoureuse (Paris, 1896); Austin Dobson, Four Frenchwomen (London, 1890); and articles by C. Perroud in the review La Révolution française (1896-99).

ROLAND, LEGEND OF. The legend of the French epic hero Roland (transferred to Italian romance as Orlando) is based on authentic history. Charlemagne invaded Spain in 778, and had captured Pampeluna, but failed before Saragossa, when the news of a Saxon revolt recalled him to the banks of the Rhine. On his retreat to France through the defiles of the Pyrenees, particulars are related in 873 (Vita Hludovici; Pertz ii. 616), and which purports to be the work of Turpin, archbishop of Reims, who died about 850, but probably dates from the 12th century; (b) Contes de tradition or Gémois, a poem in Latin distichs; and (c) the Chanson de Roland, a French chanson de geste of about 4000 lines, the oldest recension of which is in the Bodleian Library, Oxford (MS. Digby 23). It is in anasonnated tirades, of unequal length, many of them terminated with the refrain Aoi. This MS. was written by an Anglo-Norman scribe about the end of the 12th century, and is a corrupt copy of a text by a French troubadour of the middle of the 11th century. It concludes with the words: "Ci falt la geste, que Turolus declinet." There was a Turolid (d. 1058) who was abbot of Peterborough; another was tutor to William the Conqueror and died in 1035. Even if we could identify this personage, we cannot tell whether he is the author of the poem; but it seems likely that he was merely the scribe. The poem, which was first printed by Francisque Michel (Oxford, 1837), is the finest monument of the heroic age of French epic. In its fundamental features it evidently dates back to the reign of Charlemagne, who is not represented as the capricious despot of the later chansons de geste, but as governing in accordance with Frankish custom, accepting the counsel of his barons, and carrying out the customary procedure of Frankish law. Roland represents the monarchical idea, and was evidently, in its primitive form, written before the feudal revolts which weakened the power of Charlemagne's successors. Its unity of conception, the severity and conciseness of the language, the directness, vividness and sobriety of the narrative, place it far above the chansons of later trouvères, with their wordiness and their loose, episodic construction. With the exception of the small place allotted to Alde, women have practically no place in the story, and the romantic element is thus absent. Roland's master-passions are daring and an exaggerated conception of honour, the extravagance of which is the cause of the disaster. His address to Oliver before the battle is typical of the warlike spirit of the poem:

"Notre empereur qui ses Francs nous laissa,
Tels vingt mille hommes a pour nous mis à part,
Qu'il sait très bien que pas un n'est courant.
Pour son seigneur grands maux sur souffrir,
Terribles roids, grands chaus endurer,
Et de son sang, de sa chair on perdrai,
Brandis ta lance; et moi, ma Durmandul,
Ma bonne épée, que le Roi me donna.
Et si je meurs, peut dire qui l'aura
C'était l'épee d'un très noble vaisseau."

(tr. Petit de Julleville xi. 1114 seq.)

The Story as related in the Chanson de Roland.—Charlemagne, after fighting for seven years in Spain, had conquered the whole country with the exception of Saragossa, the seat of the Saracen king Marsile. He was encamped before Cordova when he received envos from the Saracen king, sent to procure the evacuation of Spain by the Franks through false offers of submission. Charlemagne held a council of his barons, Naimes of Bavaria, Roland, Oliver, Turpin, Ogier, Ganelon and the rest. Roland, the emperor's nephew, was eager for war; the peace party was headed by Ganelon of Mayence. The Franks were weary of campaigning, and Ganelon's counsels won the day. At the suggestion of Roland, Ganelon, who was his stepfather, was entrusted with the embassy to Marsile—a sufficiently perilous errand, since two former envoys had been beheaded by the Saracens. Ganelon, inspired by hatred of Roland and Oliver, agreed with Marsile to betray Roland and his comrades for ten mule-loads of gold. He then returned to Charlemagne bearing Marsile's supposed assent to the Frankish terms. The retreat began. Roland, at Ganelon's instigation, was placed in command of the rear-guard. With him were the famous twelve peers, his companions-in-arms, Oliver, Gérin, Gérier, Oton, Bérengier, Samson, Anésis, Girard

1 It is noteworthy, however, that an Arab historian, Ibn-al-Athir, states that Charles's assailants were the Arabs of Saragossa, by whom he had been originally invited to interfere in Spain.

2 Ganelon may perhaps be identified with Wenilo, archbishop of Sens, whose treason against Charles the Bald is related in the Annales Bertiniani (anno 859).

3 The lists vary in different texts.
de Roussillon, Engelier the Gascon, Ivan and Ivoire, and the flower of the Frankish army. They had nearly reached the summit of the pass when Oliver, who had mounted a high rock, saw the advancing army of the Saracens, 400,000 strong. In vain Oliver begged Roland to sound his horn and summon Charlemagne to his aid. A description of the battle, a series of single combats, follows. Oliver, with his sword Hautecclere, rivets Roland, and Roland cleaves off his head with a single stroke. The division of the pagan army appears, then a third. Roland's army was reduced to sixty men before he consented to sound his horn. Presently all were slain but Roland and Oliver, Turpin and another. Finally, when the Saracens, warned of the return of Charlemagne, had retreated, Roland alone survived on the field of battle. With a last effort he blew his horn once more, and heard before he died the sound of Charlemagne's battlecry of "Montjoie." Charlemagne pursued the enemy, and destroyed their army. The raising of a second army by Balgant, the emir of Babylon, and its defeat by the emperor, who slays Balgant in single combat, is obviously an interpolation in the original narrative. The trouvère then relates the return of the Franks, the burial of the heroes of Roncevaux, and, at great length, the trial of Ganelon at Aix, his execution, and that of his thirty kinsmen, and the death of Alde, Roland's betrothed and Oliver's sister, when she heard the news of Roland's death. The trial of Ganelon is one of the most curious parts of the story, providing, as it does, a full account of the Frankish criminal procedure.

Relations between the Earlier Forms of the Legend.—The Pseudo-Turpin represents a different recension of the story, and is throughout clerical in tone. It was the trouvère of the Chanson de Roland who developed the characters into epic types; he invented the heroic friendship of Roland and Oliver, the motives of Ganelon's treachery, and many other details. The famous fight between Roland and the giant Ferragus appears in the Pseudo-Turpin (chapter xviii.), but not in the poem. The Chanson de Roland presupposes the existence of a whole cycle of epic poetry, probably in episodic form; it contains allusions to many events outside the narrative, some of which can be explained from other existing chansons, while others refer to narratives which are lost. In lines 590-603 of the poem Roland gives a list of the countries he has conquered for Charles, from Cologne to Hungary on the east to Scotland on the west. Of most of these exploits no trace remains in extant poems, but his capture of Bordeaux, of Nobles, of Carcassonne, occur in various compilations. Roland was variously represented by the romancers as the son of Charlemagne's sister Gilles or Berte and the knight Milon d'Angers. The romantic episode of the reconciliation of the pair with Charlemagne through Roland's childish prattle (Berte et Milon) is probably foreign to the original legend. In the Scandinavian versions Roland is the son of Charlemagne and his sister, a recital probably borrowed from mythology. His enforces, or youthful exploits, were, according to Asprayniol, performed in Italy against the giant Euamoto, but in Giraix de Vianoe his first taste of battle is under the walls of Vienne, where Oliver, at first his adversary, becomes his brother-in-arms.

Other Versions.—Most closely allied to the Oxford Roland are (a) a version in Italianized French preserved in a 13th or 14th century MS. in the library of St Mark, Venice (MS. Fr. iv.); (b) the Roulandes Liét (ed. W. Grimm, Göttingen, 1838) of the Swabian priest Konrad (fl. 1111), who gave to Roland, a passage to the whole; (c) the 8th branch of the Karlamagnes-saga (ed. C. Unger, Christiania, 1860), and the Danish version of that compilation.

In the 12th century the Chanson de Roland was modernized by replacing the assonance by rhyme, and by amplifications and additions. Several MSS. of this rhymed recension, sometimes known as Roncevaux, are preserved. In the prose compilations of the story in David Aubert's Conquêtes de Charlemagne (1458) the story kept its popularity and once again was the center of the lexicographers' activity. The story was understood in the original French, and the English romances of Charlemagne (q.v.) are mostly derived from late and inferior Spanish versions. Perhaps the best known of the Spanish versions is that of the Spanish patriotism created a Spanish ally of Marsile, Bernard del Carpio, to be the rival and victor of Roland. It was in Italy that the Roland legend had its greatest fortune: Charlemagne and Roland represent the makeshift of the Paradies and the Paradiso of Dante. The story of Roland and Oliver appear on the doorway of the cathedral of Verona; and the French chansons de geste regularly appeared in a corrupt form. The French Roland legend passed through a succession of revisions and, as the 15th century began, a new version of Charlemagne's castle was in every library of the Catholic world. In 1481, the first complete version was published in Paris, which is considered as the basis of that stage of the story called "original" (Morgante Maggiore, 1481), of Matteo Boarão (Orlando innamorato, 1486), of Ariosto (Orlando furioso, 1516), and of Francesco Berni (Orlando, 1541).

 Authorities.—For a complete bibliography of the editions of the various MSS. of the Chanson de Roland, of the foreign versions, and of the enormous literature of the subject, see Léon Gautier, Les Époques françaises (2nd ed., vol. iii., 1880), and the same author's Bibliographie des chansons de geste (1897). Among the critical editions of the Chanson are those by Wendelin Foerster in the Alltrns. Bibilothek, volks. vi. and vii. (Heilbronn, 1883-86), and by A. Stengel in the Zeitschrift der Preussischen Forschungen in Byzanz (Berlin, 1891). The most popular modern edition is La Chanson de Roland (Paris, 1892; and numerous subsequent editions), by Léon Gautier, with text, translation, introduction, notes, variants and glossary. L. Petit de Julleville published in 1920 a biographical edition with a French text, and an English translation in assonanced verse. There are various other translations in French; in English prose by J. Butler (Boston, Mass., 1904); and a partial English verse translation by A. Way and F. Spencer (London, 1896). Consult further G. Paris, Hist. poét. de Charle- magne (reprint, 1905), and De Pseudo Turpin (Paris, 1865): P. Rajna, Le Origini dell'epopee francesi (Florence, 1884) and Le Fonti delle storie francesi (Bonn, 1900). F. Picco, Roland a Charles Martel e la storia della poesia francese (Milan, 1901), and L. Couran, "La légende de Roncevaux," in Légendes du moyen âge (1903), on the topography of the battlefield.

ROLANDSECK, a village of Germany, in the Prussian Rhine province, delightfully situated on the left bank of the Rhine, 8 m. above Bonn, with a station on the railway Cologne-Coblens. The place consists almost entirely of villas and is a favourite summer resort. Crowning the vine-clad hills behind it lie the ruins of the castle, a picturesque ivy-covered arch, whence a view is obtained of the Rhine valley as far as Bonn. Immediately below Rolandseck in mid-river is the island of Nonnenwerth, on which is a nursing school under the conduct of Franciscan nuns, established in 1850. The convent which formerly stood here was founded in 1122 and secularized in 1802. Tradition assigns the foundation of the castle of Rolandseck to Charlemagne's paladin, Roland. It was certainly built at a very early date, as it was restored by Frederick, archbishop of Cologne, in 1120, and it was a fortress until the end of the 13th century.

ROLL, ALFRED PHILIPPE (1846-- ), French painter, was born in Paris on the 1st of March 1846. Pupil of Gérôme and Bonnat at the École des Beaux Arts, he made his début at the Salon in 1870 with "Environs de Baccarat," and "Evening," and attracted the widest attention in 1875 by his colossal painting of "The Flood at Toulouse" (now at the Havre Museum). All his early work is imbued with the spirit of romanticism under the influence of Gérault, whilst his colour tended to Bolognese heaviness with a strong leaning towards dark shadows in the flesh painting, in which he closely followed Courbet. In 1871 he showed at the Salon the "Fête de Silenus" (now at the Ghent Museum), a painting of such violent colour and expression that all its admirers were scandalized by Jordaens. About this time he began to devote himself to the realistic rendering of modern life, especially among the working classes, and together with romantic subjects he abandoned his earlier heavy colouring, and devoted himself to the study of light. His "Miners' Strike" of 1880 (now at the Valenciennes Museum) placed him in the front rank of modern French painters, and from that date his career was one of continuous and brilliant success. He became "official painter" to the
ROLL—ROLLE DE HAMPOLE

French government, and was entrusted with numerous commissions for the decoration of public buildings and for commemorative pictures, like the "President Carnot at Versailles at the Centenary of the États Généraux" (now at Versailles Palace), and "The Tsar and President Faure laying the Foundation Stone of the Alexandre III. Bridge." For the Hôtel de Ville he executed "The Pleasures of Life" and "The Rosetme of Youth." Besides the pictures already mentioned, a vast number of his works are to be found in the public galleries of France. The museum of the Hôtel de Ville in Paris owns his "National Fête at Paris in 1880"; the Cognac Museum, "The Carac, Works at Suresnes"; the Luxembourg, his "War," and "Manda Lametrie, farm-hand." At Avignon Museum is the "Don Juan and Haley;" at Laval Museum, "Hall!;" at Fontainebleau Palace, "In Normandy;" at Pu Museum, "Rouhey, cementer;" and at the Museum of Geneva, "Marianne Offrey, criuse de vert." In portraiture he is known by his "Yves Guyot," "Coquelin cadet," "Jules Simon," &c., but his greatest success was the group of "Fritz Thaulow and his Wife." In 1905 he replaced Carolus-Duran as president of the Société Nationale des Beaux-Arts, of which he was one of the founders.

ROLL (O. Fr., rolle, roule, mod. rôle, Lat. rotulus, dim. of rota, "something rolled or wound up in a cylindrical form on an axis, or something which "rolls," that is, moves or is moved along by a turning motion. Primarily the word is used of a piece of writing material, such as parchment or paper, rolled up for the purpose of convenient storage, handling, &c. This is the meaning of the Med. Lat. rotulus, defined by Du Cange as "Scheda, charta in speciem rotulae seu rotae convoluta." It was thus the convenient name for any document kept in this form as an official record, and hence for any register, record, catalogue or official list. "The Rolls" was the name of the building where the records of the Chancery Court were kept, that of the Middle Ages was that of the Master (q.v.) of the Rolls, now the title of the third member of the English Supreme Court of Judicature. Other familiar examples of the use of the word in this sense are the list of those admitted as qualified solicitors, whence the phrase "to strike off the rolls," or removal by the court of a solicitor for offences or delinquencies. There are numerous applications of the word to other objects packed in a cylindrical form, such as tobacco, cloth, &c., and particularly to a small loaf of bread rolled over before baking, the crust being thin and crisp and the crumbs spongy.

In architecture a "roll" or "scroll" moulding is a moulding resembling a section of a roll or scroll of parchment with the end overlapping, and the roll or scroll-shaped and cylindrical, or a cylindrical moulding with a square fillet running along the centre of the face (see Label). For the sense of an object that rolls, the word "roller" is more general, but "roll" is frequent in technical usage for revolving cylinders, especially when working in fixed bearings. For the rolling of steel see ROLLING MILL.

ROLLAND, JOHN (fl. 1560), Scottish poet, appears to have been a priest of the diocese of Glasgow, and to have been known in Dalketh in 1555. He is the author of two poems, the Court of Venus and a translation of the Seven Sages. The former, which was printed by John Ros in 1575, may have been written before 1550. The letter was translated from a Scots prose version at the suggestion of an aunt ("ane proper wenche"), who had found his treatment of the courtly allegory involved and uninteresting.

The Court of Venus was edited by Walter Gregor for the S.T.S. in 1884. See W. A. Craigie's long list of corrections of that edition in the Modern Language Quarterly (March 1898). The Seven Sages was short of 1576, and frequently during the earlier decades of the 17th century. It was reprinted by David Laing for the Bannatyne Club (1837). Sibbald, in his Chronicles of Scottish Poetry (iii. 287), hints that Rolland may be the author of the Three Priests of Perth, a facetious poem intended as a subterfuge to escape the taxes of the world, why death is to be dreaded, of doomsday, of the pains of hell, and the joys of heaven, the two latter subjects being treated with uncompromising realism. Rolle wrote in the northern dialect, but southern transcripts are also found, and the poem exists in a Latin version (Stimulus conscientiae). The sources of this work included the De Contemptu Mundi sine de miseria humanae conditions of Pope Innocent III., and Rolle also showed a knowledge of Pliny and Plutarch. Glasgow University possesses a manuscript copy, and its English devotional commentary on the Psalms follows very closely his Latin Expositio Psalterii, which he based partly on Peter Lombard's Caenia. It often agrees with the English metrical Psalter of 1576, but is preserved in the British Museum (Cotton Vesp. D. viii., Egerton 614, and Harl. 1770). Dr R. F. Littledale in his edition (1873) of J. M. Neale's Commentary on the Psalms of the English Royal Society (pp. 748) shows the sources of this short poem. The best collection is by C. Horstmann, Yorkshire Writers; Richard Rolle of Hampole; An English Father of the Church and his Followers.
ROLLE

ROLLE-ROLLIN

(2 vols., 1895-96). In the “Library of Early English Writers.” This includes many English prose treatises by Rolle, some beautiful examples of his lyric poems, and other treatises in prose and verse from the 15th and 16th cent., some of which are attributed to Rolle, and others to his followers. The poems were printed by Wynkyn de Worde in 1506, Rycharde Rolle Hermyst of Hampull in his contemplations of the dreed and love of God . . . and The Remedy against the troubles of every man, which are accepted by Dr Horstmann as Rolle’s work. His Latin treatise, De incendio amoris, the latter one of the most interesting of his works, because it is obviously largely autobiographical, were translated (1844-52) by Richard Huyton, Early English Text Soc., 1896.

The Prick of Conscience was edited (1866) by Richard Morris for the Philosophical Society. His Commentary on the Psalms was written by the Rev. H. K. Bramley (Oxford, 1884). Ten prose treatises by Richard Rolle from the Thoroton Misc. (cf. Lincoln Cathedral Library) were edited by Canon George Perry for the Early English Text Society in 1866. Partial editions of his Latin works are in Paris (1510), Antwerp (1533), Cologne (1535-36), Paris (1618), and in vol. xvi. of the Bibliotheca Patrum Maxima (Lyons, 1677). The office, which forms the chief authority for Rolle’s life, was printed in the York Bibliography, vol. ii. (Surtees Soc., 1882), and in Canon Perry’s edition referred to above.

See also Percy Andrea, who collated eighteen MSS. in the British Museum in his Handschriften der Prick of Conscience (Berlin, 1866); Studien über Richard Rolle von Hampole unter besonderer Berücksichtigung der Psalmenkommentare, by J. M. Middendorff (Magdeburg, 1888), with a list of MSS., sources, &c., in English Studien (Heilbronn, vols. vii. and viii.); A. Hahn, Quellenuntersuchungen zu Richard Rolle’s Englischen Schriften (Halle, 1906); and for his prose, G. Saintsbury, Hist. of English Prose, vol. i.

ROLLE, a very beautiful bird, so called from its way of occasionally rolling or turning over in its flight,1 somewhat after the fashion of a tumbler-pigeon. It is the Coracias garrulus of ornithology, and is widely though not very numerously spread over Europe and Western Asia in summer, breeding so far to the northward as the middle of Sweden, but retiring to winter in Africa. It occurs almost every year in some part or other of the British Islands, from Cornwall to the Shetlands, where it has visited Ireland several times, and is even recorded from St Kilda. But no one has ever observed that it comes, since there is no evidence of its having ever attempted to breed in Great Britain; and indeed its conspicuous appearance—for it is nearly as big as a dove and very brightly coloured—would forbid its being ever allowed to escape a gun. Except the back, scapulars and tertials, which are bright reddish-brown, the plumage of both sexes is almost entirely blue—of various shades, from pale turquoise to dark ultramarine—tinted in parts with green. The bird seems to be purely insectivorous. The genus Coracias, for a long while placed by systematists among the crows, has really no affinity whatever to that family, and was now properly considered to belong to the heterogeneous group of birds known as Coraciidae. In which it forms the type of the family Coraciidae; its alliance to the bee-eaters (Meropidae) and king-fishers (Alcedinidae) (q.v.) is very evident. Some eight other species of the genus have been recognized, one of which, C. leucocephalus or C. abyssinicus, is said to have occurred in Scotland. India has two species, C. indicus and C. annifins, of which thousands upon thousands were to be annually destroyed to supply the demand for gaudy feathers to bedizen ladies’ dresses. One species, C. temmincki, seems to be peculiar to Celebes and the neighbouring islands, but otherwise the rest are natives of either the Ethiopian or Indian regions. Allied to Coracias is the genus Euryzostoma with some half-dozen species, of similar distribution, but one of them, E. pacifica, has a wider range, for it inhabits Australia and reaches Tasmania.

Madagascar has four or five very remarkable forms which have often been considered to belong to the family Coraciidae; and, according to A. Milne-Edwards, no doubt should exist on that point. Yet if any may be entertained it is in regard to one of them.

1 Gesner in 1555 said that the bird was thus called, and for this reason he placed it in the Cassandrae. Neither out of the bird coming from the Rhine, apparently from its harsh note. The French have kept the name Rollir. It is a curious fact that the roller, notwithstanding its occurrence in the Levant, cannot be identified with any species mentioned by Aristotle.

Leptosomus discolor, which, on account of its zygodactylous feet, somewhat resembles the pigeons in the genera 

Brachypteryx and Asturornis present fewer structural differences from the rollers, and perhaps may be rightly placed with them; but the species of the last have long tarsi, and are believed to be of terrestrial habits, which rollers generally certainly are not. These very curious and in some respects very interesting birds, which are peculiar to Madagascar, are admirably described and illustrated by a series of plates in the great work of A. Grandidier and A. Milne-Edwards on that island (Oiseaux, vol. iii. p. 250), while the whole family Coraciidae is the subject of a monograph by H. E. Fresser, as a companion volume to his monograph on the Meropidae.

(427)

ROLLE. For agricultural purposes the roller formerly consisted of a solid cylinder of timber or stone attached to a frame and shafts, but to facilitate the turning of the cylinder revolving on an axe are now generally used. The simplest form has a smooth surface. The diameter of the drum should be as great as possible—36 in. being a good size—because the larger this is the more easily it is pulled (within certain limits), while rollers of small diameter are heavier of draught and do their work less efficiently. The implement is used in spring and summer as an aid in pulverizing and cleaning the soil, by bruising clods and lumps of tangled roots and vegetable matter which the cultivator or other implement has brought to the surface; in smoothing the surface for the reception of small seeds or the better operation of the managers; in consolidating soil that is too loose in texture and presenting it down about the roots of young plants. In the case of young plants the roots are close to the surface, which must therefore be kept moist. This end is attained by the compression by the roller of the top-soil of which the capillary, i.e. the power of drawing water from the sub-soil is thereby increased. On the other hand, when it is desired to conserve the soil-moisture, the roller may be followed by the harrow, which, by pulverizing the sub-soil, breaks the capillarity. Of the variations on the common-standard the clod-driver and the Cambridge roller are the most important. The clod-driver’s combination weight with breaking power. The best-known form was patented about 1841 by Crosskill, and consists of a number of disks with serrated edges threaded loosely on an axle round which they revolve. The Cambridge roller carries on its axle a number of closely packed wheels, the rims of which narrow down to a wedge shape. The tubular roller, instead of drums, has tubes arranged longitudinally, producing a corrugated surface which is reproduced in the condition of the soil after it has been rolled.

ROLLE-SKATING, a pastime which, by the use of small wheels instead of a blade on the skate, has provided some of the pleasures of skating on ice without having ice as the surface (see SKATING). Wheeled skates were used on the roads of Holland as far back as the 18th century, but it was the invention of the four-wheeled skate, working on rubber springs, by J. L. Plimpton of New York, in 1863, that made the amusement popular. Still greater advance was made by the Raymond skate with ball and cone bearings. The wheels or rollers were first of turned boxwood, but the wearing of the edges was a fault which has been surmounted by making them of a hard composition, or of steel. The floor of the rink on which the skating takes place is either of asphalt or of wood. The latter is always used when built on rough masts. The best floors are of long narrow strips of maple. Figure-skating on roller-skates is in some respects easier to learn than on ice-skates, the four points of contact given by the wheels rendering easier the holding of an edge; but some figures, such as loops, are more difficult.

ROLLIN, CHARLES (1661-1741), French historian and educationist, was born at Paris on the 30th of January 1661. He was the son of a cutler, and at the age of twenty-two was made a master in the Collège du Plessis. In 1684 he was the first graduate of the University of Paris, rendering great service among other things by revising the study of Greek. He held that post for two years instead of one, and in 1699 was appointed principal of the Collège de Beauvais. Rollin held Jansenist
principles, and even went so far as to defend the miracles supposed to be worked at the tomb of François de Paris, commonly known as Deacon Paris. Unfortunately his religious opinions deprived him of his appointments and disqualifed him for the rectorship, to which in 1719 he had been re-elected.

It is said that the same reason prevented his election to the French Academy, though he was a member of the Academy of Inscriptions. Shortly before his death (14th December 1741) he protested publicly against the acceptance of the bull Unigenitus.

Rollin's literary work dates chiefly from the later years of his life, when he had been forbidden to teach. His once famous Ancien History (Paris, 1730–38), and the less generally read Roman History, which followed it, were avowed compilations, uncritical and sometimes inaccurate. But they instructed and interested a generation after generation almost to the present day. A more original and really important work was his Traité des édits (Paris, 1736–31). It contains a summary of what was even then a reformed and modern system of education, including a more frequent and extensive use of the vulgar tongue, and discarded the medieval traditions that had lingered in France.

ROLLINAT, MAURICE (1833–1903), French poet, was born at Châteauroux in 1833. His father represented Indre in the National Assembly of 1848, and was a friend of George Sand, whose influence is very marked in young Rollinat’s first volume, Dans les brandes (1877). The volume, however, attracted little attention, and it was with his second publication, very different in manner, that he made his reputation. In Les Natures, with the sub-title Les Ames, Les Lieux, Les Refuges, Les Spectres, Les Ténèbres, he showed himself as a disciple of Charles Baudelaire. He constantly returns in these poems to the physical horrors of death, and is obsessed by unpleasant images. Less out in sentiment are L’Atome (1886), La Nature, and a book of children’s verse, Le Livre de la Nature (1893). He was musician as well as poet, and set many of his songs to music. He lost his reason in consequence of his wife’s death from hydrophobia, and died on the 26th of October 1905.

ROLLING-MILL, a term which includes several types of machines used for producing the sectional forms (fig. 1) in which wrought iron and steel are required for the use of boiler-makers, platers and bridge-builders, and for constructional work generally. The production of wrought iron has been a diminishing industry for many years, while that of steel increases. Though the plant employed for both is alike in essential principles of design, the growth in the use of steel has revolutionized the practice, chiefly on account of the more massive dimensions in which steel sections are rolled. Iron sections are relatively small, and many are produced by piling, i.e. by building up with small portions of malleable puddled metal. There is no limit in reason to the dimensions in which steel sections can be rolled, and they are never piled, however large, but always rolled from solid cast ingots.

When steel ingots are rolled into sectional forms the reduction in transverse dimensions is very great. The work begins at nearly a white heat, and continues until a low red is reached. Obviously the stresses to which the material is subjected are very severe. For this reason the process of reduction has to be effected very gradually, and especially so in those cases where reduction is being done in two directions at right angles with each other, as in channel sections (fig. 6) and joist or beam sections (figs. 7 and 8). It might be thought, since steel is always cast, previously to rolling, that it might be cast at once into the sectional forms required. But sound results could not be obtained in this way, because the gases occluded in the metal form blow-holes which are sources of weakness. The material itself, even in the solid portions, is not homogeneous. By removing the head of the ingot where the blow-holes chiefly congregate and rolling the remainder at a white or red heat, the metal is improved by consolidation, and by the work done upon it. To this practice there is no exception.

Rolling-mills are known as “two-high,” or “three-high,” according as two or three rolls are mounted one over the other

![Fig. 1.—Forms of the Principal Rolled Sections.](image-url)

pass. An alternative is the three-high mill, in which three rolls are used. Here the plate is run through the lower rolls and back through the upper ones, so that there is no reversal of direction of the mill as a whole, but the lower and upper rolls draw the plate in opposite directions (see also Iron and Steel, § 129).

Plate-Mills.—In Great Britain plate-mills are generally two-high reversing mills, in America three-high mills. Another difference is that in British practice two stands of rolls are used, in America one only. In the two-stand design there are two sets of rolls coupled endwise, one set being grain-rolls for roughing, and the other chilled rolls for finishing. Sets of five rollers conduct the plates to and from the separate rolls. The plate-mills proper are those which roll from ½ in. to about 2 in. thick. Armour plate-mills are a special design for massive plates and sheet-mills are for thin plates or sheets having a less thickness than ½ in. Armour plate-mills are of two-high reversing type, with forged steel rolls. They are of immense proportions, the rollers ranging from 10 to 14 ft. in length, by from 3 to 4 ft. in diameter. In sheet-mills, on the other hand, the rolls seldom exceed 30 in. in diameter, and they are chilled. The size of sheet-mills has within the last few years been considerably increased (since the introduction of steel sheets), and all new mills are made from 28 to 50 in. diameter. The rolls are of the two-high type and are almost the only instance of the retention in present practice of the non-reversing mill. It is found more convenient in this case than the reversing or the three-high mills, because two men roll two pieces at once, one handing over a sheet just rolled to his fellow just as the latter has entered a sheet between the rolls on his side. Strip-mills are a smaller but similar type, used for rolling the thin narrow strips required for the hoops of barrels, ties for cotton bales, &c. The details of these mills cannot be described here, nor the numerous arguments in favour of the two systems. English practice retains the two-high reversing mill for all heavy work, the exceptions being those just noted. American practice retains the three-high mill.

Grooved Rolls.—In the mills designed for rolling various sectional forms the same distinction between two-high and three-high remains, but new problems arise. By "sectional forms" is meant all those which are not plates and sheets, such as bars of round and square section, angles, channels, rails and allied sections (fig. 1), for the production of which grooved rolls are required. The shapes and proportions of these grooves are such that reduction is effected very gradually. When metal is squeezed or hammered, one effect is to spread it laterally, since the metal cannot be appreciably squeezed in on itself. But the lateral extension is very much less than...
the longitudinal. The most marked effect of reduction in thickness is extension in length. But as there is some lateral extension, three courses are open; one is to gauge the exact amount of width required for extension; another is to turn a bar over at intervals in order to exercise pressure on the portions extended laterally and obliterate them (open passes); and a third is to allow the extensions to take the form of fin to be cut off subsequently (closed passes). The first is generally impracticable. The second can be illustrated by diagrams representing roll sections.

The work of reduction is generally divided between three sets of rolls. The first are the cogging- or blooming-rolls, as they are termed in America, in which ingots are reduced to blooms with dimensions suitable for rolling the various sections. In these an ingot of say 14 in. square may be reduced to a bloom of 6 in. square. The grooves form rectangular sections (box passes). The top roll being raised, the ingot is passed through the largest groove; then the roll is lowered and it is passed through a second time. Then it is turned round through 90° and re-rolled. Afterwards the same processes are gone through till the last groove is reached. The pass over a plate and a roll, and the cogging-rolls have to be so designed as to produce blooms for various forms. There are three principal forms: the box just noticed, the gothic and the diamond (fig. 4), all open passes. For plates, provision is made in "slabbing" rolls for roughing out, first in a box pass, and then in a broad flat groove, alternating with the square groove for correction of the edges. Gothic passes and diamond passes produce blooms which are subsequently used for various shapes having little resemblance to each other. These shapes are simple, and little difficulty arises in the work of drawing down. The rolls make 40 to 50 revolutions per minute; the difference in the area of the cross section (draught) between adjacent grooves is from 20 to 25%.

The formative rolls for finished sections are of two classes: roughing and finishing. The roughing-rolls approximate much more closely to the finished sections than the cogging-rolls, but the aim is to make them do duty for a wide range of sections, in order to change them as seldom as possible. Thus the gothic pass (fig. 4) will serve alike for rolling square or round bars. Finishing rolls must be changed for every different section, except when slight differences in thicknesses only are made in the webbed portion of a rolled section. With the exception of rounds, sections are usually roughed and finished in closed passes—that is, the bar is wholly enclosed by the rolls. The groove in the lower roll is flanked by collars slightly deeper than the enclosed bar. These enter into grooves turned on the upper roll, and between them the bar is confined (fig. 5). It passes through a succession of these grooves, being diminished in area and extended at each pass. A certain amount of fin is squeezed out, and this is obliterated in the succeeding pass, and more formed, until in the finishing pass the amount of reduction is very slight, a surface finish being the principal result.

Since but a slight amount of lateral extension occurs, it follows that the reduction wholly or mainly in the vertical plane is the most favourable condition. Rounds, squares and flats are wholly reduced in this way and offer no difficulty. The most unfavourable section is the joist or girder, the channels, tees and rails follow, and after these the various angles. In rolling a channel or a girder section (figs. 6, 7, 8), a square bloom is taken, and passed in succession through closed passes. The first produce shallow grooves in the opposite faces, gradually deepening until the sides of the flanges assume a definite slope. The angle of slope becomes gradually lessened, and the thicknesses of web and flanges, and also the radius in the corners, are reduced. At the same time the width over the flanges is being gradually increased. While this is going on, the fibres of the flanges are being strained, because the rolls run at a higher speed at their peripheries than next the body. The metal is being violently bent and drawn; in different ways, so that while economy has to be studied by reducing the number of passes as much as possible, undue stress must be avoided by making the reductions as easy as is practicable. These things cannot be put into a formula, but the roll-turners work by experience and empirical rules gathered by long practice. In order to avoid these deep groovings, and also severe lateral thrusts on the rolls, angle sections are always rolled with the slope of the flanges approximately equalized; so too are zeds (fig. 1, No. 22). The reduction is then effected with the minimum of stress to the metal. Variations are readily made in the thicknesses of rolled sections without changing the rolls, by simply varying the distance between their centres. This is effected by the adjustment of the top roll (fig. 5). Differences in thickness are made in increments of an inch, up to a maximum of about 0.5 in. Another detail of design in closed passes is so to shape the rolls as to make any pass obliterative the fin produced in the previous groove. Sometimes sections are turned over to effect this, but often the bodies of the rolls are turned to suit suitable diameters to produce the result. Guards are required to prevent the bars from becoming wrapped round the rolls ("collaring"). With the same object the upper roll is always made larger in diameter than the lower. Its speed is therefore slightly greater than that of the lower one. This stretches the plate or bar very slightly on the upper side, and so imparts a downward movement to it towards the floor, which is what is required. The difference in diameter varies with circumstances, ranging from 1/8th to about 1 in.

Besides the standard types of mills noticed, the two-high and three-high, there are special mills. The merchant mill simply denotes either one of the above types used for the production of flat bars. The continuous mills are special designs for rolling small rods to be drawn into wire. In these there are several pairs of rolls placed in series, so that the billet is rolled from one stand to others in succession without re-heating. There are a number of different designs, one of which is the Belgian looping mill, so called because the rod is bent backward and forward in the form of the letter S in its passage through adjacent sets of rolls. In another design a flying shear is employed, which automatically cuts off billets from the bar while the latter is travelling at the rate of 6 or 8 ft. per second.

ROLLOCK, ROBERT (c. 1555-1599), the first principal of the university of Edinburgh, son of David Rollock of Powis, near Stirling, was born about 1555. He received his early education at the school of Stirling from Thomas Buchanan, a nephew of George Buchanan, and, after graduating at St Andrews, became a regent there in 1580. In 1583 he was
ROMA—ROMAN ARMY

appointed by the Edinburgh town council sole regent of the “town’s college” (“Academia Jacobi Sexti,” afterwards the university of Edinburgh), and three years later he received from the same source the title of “principal, or first master,” and was engaged in lecturing on philosophy. When the staff of the young college was increased by the appointment of additional regents, he assumed with consent of the presbytery the office of professor of theology. From 1587 he also preached regularly in the East Kirk every Sunday at 7 a.m., and in 1596 he accepted one of the eight ministerial charges of the city. He took a prominent part in the somewhat troubled church politics of the day, and distinguished himself by gentleness and tact, as well as ability. He was appointed on several occasions to committees of presbytery and assembly on pressing ecclesiastical business. He was elected moderator of the General Assembly held at Dundee in May 1597. In 1598 he was translated to the parish of Barnstyle and appointed to the Tolhouse, Edinburgh, and immediately thereafter to that of the Grey Friars (then known as the Magdalen Church). He died at Edinburgh on the 8th of February 1599.

Rollock wrote Commentaries on the Epistles to the Ephesians (1590) and Thessalonians (1598) and Hebrews (1605), the book of Daniel (1591), the Gospel of St John (1599) and some of the Psalms (1599); an analysis of the Epistle to the Romans (1594), and Galatians (1602); also Questions and Answers on the Covenant of God (1596), and a Treatise on Effectual Calling (1597). Soon after his death eleven Sermons (Certaine Sermons upon Several Places of the Epistles of St. Paule) were published and not taken by his students. His Select Works were edited by W. Gunn for the Wodrow Society (1844–1849).

A Life by George Robertson and Henry Charteris was reprinted by the Bannatyne Club in 1826. See also the introduction to the Select Works, and Sir Alexander Grant’s History of the University of Edinburgh.

ROMA, a town of Waldegrave county, Queensland, Australia, 318 m. by rail W.N.W. of Brisbane. It is the centre of a rich pastoral and wheat-growing district, in which oranges and vines are largely grown and much wine is produced. The town was incorporated in 1867. Flour-milling is its chief industry. Pop. (1901) of town, 23,711 of the district, 7,110.

ROMAN, capital of the department of Roman, Rumania, on the main line from Czernowits in Bukovina to Galatz, and on the left bank of the river Moldova, 24 m. W. of its junction with the Sereth. Pop. (1900) 14,016, including 6,009 Jews. The river is here spanned by a fine bridge of iron. Roman has been the seat of a bishop since 401. Its seminary dates from 1402. There are several ancient churches, including a cathedral, built in 1541. Roman has a transit trade in the products of northern Moldavia. A large annual fair is held in August.

ROMAN ARMY. In the long life of the ancient Roman army, the most effective and long-lived military institution known to history, we may distinguish four principal stages. (1) In the earliest age of Rome the army was a national or citizen levy such as we find in the beginnings of all states. (2) This grew into the Republican army of conquest, which gradually subdued Italy and the Mediterranean world. A citizen army of infantry, varying in size with the needs of each year, it eventually developed into a mercenary force with long service and professional organization. This became (3) the Imperial army of defence, which developed from a strictly citizen army into one which represented the provinces as well as Italy, and was a garrison rather than a field army. Lastly, (4) the assaults of the Barbarian horsemen compelled both the creation of a field force distinct from the frontier garrisons, and the inclusion of mounted element, which soon counted for much more than the infantry. The Roman army had been one of foot soldiers; in its latest phase it was marked by that predominance of the horseman which characterized the earlier centuries of the middle ages.

So far as we can follow this long development in its details, it was throughout continuous. So unbroken, indeed, is the growth that many of the military technical terms survived in use from epoch to epoch, unchanged in form though deeply modified in meaning, and ordinary readers often miss the diversity which underlies this unchanged-seeming system. The term legio, for example, occurs in all the four stages above outlined. But in each its significance varies. Throughout, it denoted citizen-soldiers: throughout, it denoted also a force which was chiefly, if not wholly, heavy infantry. But the setting of these two constant features varies from age to age. In the first period legio was the “levy,” the whole host summoned to take the field. In the second period it was not the whole levy, but one of the principal units: and quite often the organization had divided that levy; the “legion” was now a body of some 5000 men—the number of “legions” varied with the circumstances, and the army included other troops besides citizens, though they were for the most part unimportant. In the third or Imperial age there were many legions (indeed, a fixed number) quartered in fixed fortresses; there were also other troops, numerous and important, if not yet so formidable as the legions. Finally, the legions became smaller units, and the other troops of the army, notably the cavalry, became the real fighting-line of Rome (see LACROS).

First Stage.—The history of the earliest Roman army is, as one might expect, both ill-recorded and contaminated with much legend and legal fiction. We read of a primitive force of 300 riders and 3000 foot soldiers, in which the horseman counted for almost everything. But the numbers are clearly artificial and invented, while the pre-eminence accorded to the cavalry has no sequel in later Roman history. We reach firm ground with the organization ascribed to Servius Tullius. In this system the host included all citizens from 17 to 60 years of age, those under 47 for service in the field, those over 47 for garrison duty in Rome. The soldiers were disengaged from their herds by their wealth—that is, their ability to provide their own horses, armour, &c.—into cavalry (18 centuries), heavy infantry, a remainder which it would be polite to call light infantry, and some artificers. The heavy infantry counted for most. Armed with long spears and divided into the three orders of hastati, principes and triarii (the origins and real senses of these names are lost), they formed a phalanx, and charged in a mass, while the cavalry protected the wings. The men were enrolled for a year—that is, for the summer campaign; in the autumn, like all primitive armies, they went home. It has been conjectured that about the time of the fall of the kings the normal Roman army comprised some 8500 infantry under 47 years of age, 5000 seniors, 1000 riders and 500 fabri, &c. The evidence for the calculation is unfortunately inadequate, but the result is not altogether improbable, and it may help the reader to realize what “may have been.” It must be added that this Servian system is closely connected with the political organization (see Rome, History).

Second Stage.—From this Servian army a series of changes which we cannot trace in detail produced the Republican army of conquest. Our ancient authorities ascribe the chief reforms to the half-legendary Camillus (q.v.), who introduced the beginnings of pay and long service, improved the armour and weapons, abolished the phalanx and substituted for it an open order based on small subdivisions (maniples), each containing two centuries.

Whatever the truth about Camillus, some such reforms must at some time have been carried through, to convert the Servian system into the army which was engaged for nearly three centuries (from 350 B.C.) in conquering Italy and the world. This army broke in successive the stout native soldiers of Italy and the inhabitants of Spain, and overthrew the trained Macedonian phalanx. Once only did it fail—against Hannibal (see Punic Wars). But not even Hannibal could oust it from entrenched camps, and not even his victories could permanently break its moral. Much of its strength lay in the same qualities which made the Puritan soldiers of Cromwell terrible—the excellent character of the common soldiers, the rigid discipline, the high training. Credit, too, must be given to the genius of the Scipios and to the more commonplace capacities of many fairly able generals. But the organism
just before this war, in 225 B.C., the total strength of Rome was reckoned at three-quarters of a million, of which about 65,000 were in the field and 55,000 were in a reserve at Rome; of the total, 325,000 were Roman citizens and 443,000 (apparently a rough guess) were either allies or auxiliaries. The battle of Cannae in the circumstances was simple. In the centre stood the legionary infantry; on each side of that was the allied infantry; on the wings the cavalry. The centre had the double charge (and the honour) of the day, it had 100 maniples each, 1000 men each, in line.
time. The real officers of the legion were the 60 centurions, men who (at least in the early Empire) generally served up to the rank of Centurion. The senior of these centurions was the Primus pilus, an especially important officer, and on retirement frequently became praetorius castrorum, "camp adjutant," or obtained other influential positions. The other officers, centuriones, optioes, clerks and the like. The men themselves were recruited from the body of Roman citizens (though we may believe that birth-certificates were not always demanded). During the 1st century B.C. a levy was made for the first time in Menex orin of non-citizen recruits. Augs established units of this kind, and so many sons of soldiers born during service (castrenses) flocked to the army that a military caste almost grew up. The term of service was, in full, twenty years, at least in theory, but recruiting was voluntary, and many others were often discharged. To discharge the ex legionary received a bounty or land; many colonies (municipalities) were established in the provinces by certain emperors (e.g. Augustus). The term was originally set at six years, as a custom of which the first instances occur in the last Republican age. On the whole, the legionary was still the typical "Roman" soldier. If he was no longer Italian, he was generally a member of the part of the army. He was a subject of the Empire and the government was real. Each legion bore a title and a number (e.g. II. Augusta, III. Gallica). The custom of using such titles and numbers can be detected sporadically in the latest Republican period, but the practice could not have been passed on into the Empire with the legions themselves. As Augustus gradually became master of the world, he found himself with three armies, his own and those of Lepidus and Antony; from each, he chose the best legion to form his new army, and he left these with the titles and numbers which they had previously borne, although that concession resulted in three legion numbers IIII, and two numbered IV, V, VI, and X respectively. Similar titles and numbers were given to legions raised afterwards either to fill up gaps caused by disaster or to increase the army. Here, as elsewhere in the Roman and above all in the Augustan system, precedent defined (H) Besides the legions Augustus developed a new order of auxilia. Auxiliaries (as is said above) had served occasionally in the Republican armies since about 250 B.C., and in the latest Republic a good many had been organized as auxiliary forces, extending generals. Thus Caesar in Gaul enrolled a division of native Gauls, free men but not citizens of Rome, which ranked from the first in all but legal status to a legion, the "Alaudae," and thus course was formally admitted to the legionary list (legio V). But this use of non-citizens had been limited in extent and confined in normal circumstances to special troops such as slingers or bowmen. This casual practice Augustus reduced, or rather extended, to system, following in many details the scheme of the Republican socii and veiling the novelty under old titles. Henceforward, regiments of infantry (cohortes) or cavalry (alae), 500 or 1000 strong, were regularly raised on a permanent voluntary basis from the local populations of the provinces and formed a force almost equal in numbers (and perhaps ultimately much more than equal) to the legions. The men who served in these units were less well paid and served longer than those in the legion; they were discharged on a bounty and the Roman franchise for themselves and wife and children. They were commanded by Roman praefecti or tribuni, and were no doubt required to understand Roman orders; they must have generally become Romanized and fit for the citizen service, but they were occasionally (at least in the 1st century A.D.) permitted to retain tribal weapons and methods of fighting and to serve under the command of tribal leaders, who were at once their chiefs and Roman officers. These auxiliaries provided both the whole of the archers, &c., and nearly the whole of the cavalry of the army; they also included many foot regiments. A peculiar arrangement (to be taken up presently) seems to occur in many others, that a cohort of 500 men might include 380 and 120 horse and a cohort of 1000 men and 760 foot and 240 horse (cohors equitata), and an ala might similarly include a proportion of foot (ala pedisata). Each cohort bore its own number and a title, the latter often derived from the officer who had raised the corps (ala Indiaca, raised by one Julius Indus) or, still more often, from the tribe which supplied the first recruits (cohors VII. Gallorum, cohors II. Hispanorum and the like). As the Roman recruiting reached the territories east of the Euphrates after the 1st century, probably, the territorial names meant in most cases very little. The total number of the auxiliary regiments probably varied from time to time and can at present hardly be guessed.

Composition of Armies and Distribution of Troops in the Third Stage. — If the system of legions and auxilia in the early Empire was novel, the use made of them was no less so. The latest Republic offers to the student the spectacle of large field armies, and though it also reveals a counter tendency to assign special legions to special provinces, that tendency is very feeble. Augustus ended the era of large field armies: he could, indeed, leave no such weapons for future pretenders to the throne. By keeping the Empire within set frontiers, he developed the counter tendency. That policy exactly suited the military position in his time. The early Roman Empire had not to face — as Britain or France or Germany might have to face to-day — the danger of a war with an equal enemy, needing the mobilization of all its national forces. From Augustus till A.D. 250 Rome had no conterminous foe from whom to fear invasion. Parthia, her one and dangerous equal, was far away in the East and little able to strike home. Elsewhere, her frontiers bordered more or less wild barbarians, who might often harass, but could not do serious harm. To meet this there was need, not of a strong army concentrated in one or two cantonments, but of many small garrisons scattered along each frontier, with a few stronger fortresses to act as military centres adjacent to these garrisons.

Accordingly, a system grew up under Augustus and his immediate successors whereby the whole army was distributed along the frontiers or in specially disorderly districts (such as N.W. Spain) in permanent garrisons. On the actual frontiers and on the chief roads leading to them were numerous cohorts as well as cohorts of auxilia, garrisoning each its own castellum of 3-7 acres in extent. Close behind the frontiers, or even on them, were the twenty-five legions, each (with a few exceptions of early date) holding its own fortress (castra stativa or hiberna) of 50-60 acres. Details varied at different times. Sometimes, where no Rhine or Danube helped, and where outside enemies were many, the frontier was further fortified by a continuous wall of Roman palisades (as in part of Germany, see Limes) or of earth or stone (as in Britain, see article BRITAIN, ROMAN), or the boundary might be guarded by a road patrolled from forts planted along it (as in part of Roman Africa). The result was a long frontier guard covering Britain, and Europe from the German Ocean to the Black Sea, and the upper Euphrates valley, and the edge of the Sahara south of Tunis and Algeria and Morocco, while the wide Empire behind it was little troubled by the presence of soldiers.

The following table shows the disposition of the legions about A.D. 120 and for many decades subsequently. It would be impossible, even if space allowed, to add the auxiliaries, since the details of their distribution are too little known. But it may be in general assumed that the total number of auxilia in any province was little less, and probably rather greater, than the number of legions, and the sizes of the various provincial armies can thus be calculated roughly. Thus Britain was held probably by 35,000-40,000 men. Each provincial army was commanded either by the governor of the province or (in a few exceptional cases) by the senior legatus of the legions stationed there: —

The total of legionaries may be put at about 180,000 men, the auxiliaries at about 200,000. If we exclude the "household" troops at Rome, the police fleets on the Mediterranean, and the local militia in some districts, the regular army of the Empire at about 400,000 men. This army, as will be plain, was framed on much the same ideas as the British army of the 19th century. It was meant not to fight against a first-class foreign power, but to keep the peace and guard the frontiers of dominions threatened by scattered barbarian raids and risings. Field army there was none, nor any idea. If special danger threatened or some special area was to be conquered—such as southern Britain (A.D. 43) or a small land across the upper Rhine (A.D. 74)—detachments (extillationes) were sent by legions and sometimes also by auxiliaries in adjacent provinces, and a field force was formed sufficient for the moment and the work.

Change from the Third Period to the Fourth.—Two principal causes brought gradual change to the Augustan army. In the first place, the pax Romana brought such prosperity to many districts that they ceased to provide sufficient recruits. The Romans, like the British in India, had more and more to look to uncivilized regions and even beyond their borders. Hence comes, in the 2nd century and after, a new class of numeri or cunei or extillationes who used (like the earlier auxiliaries) their national arms and tactics and imported into the army a more and more non-Roman element. This tendency became vaster, marked in the 3rd century and bore serious fruit at its close.

And, secondly, the old days of mere frontier defence were over. The barbarians began to beat on the walls of the Empire as early as A.D. 160: about A.D. 250 they there and there got through, and they came hencforthward in ever-growing numbers. Moreover, they came on horseback, bringing new tactics for the Roman infantry to face, and they came in huge masses. We may doubt if any military system could have permanently stayed this astonishing torrent. But the Empire did what it could. It enlisted barbarians to fight barbarians, and added freely—too freely, perhaps, if there was any choice—to the non-Roman elements of the army. It increased its cavalry and began to form a distinct field force.

Fourth Period.—The results are seen in the reforms of Diocletian and Constantine the Great (A.D. 284—circa 320). New frontier guards, styled limitanei or riparienses, were established, and the old army was reorganized in field forces which accompanied or might accompany the emperors in war (comitatenses, palatini). The importance of the legions dwindled; the chief soldiers were the mercenaries, mostly Germans, enlisted from among the barbarians. New titles now appear, and it becomes plain even to the casual reader that in many points the new order is not the old. The details of the system are as complicated as all the administrative machinery of that age. Here it is enough to point out that the significance of such officers and titles as the dux and the comes (duke, count) lies ahead in the history of the middle ages, and not in the past, the history of the Roman army itself.

War Office, General Staff.—Under the Republic we do not find, and indeed should not expect to find, any central body which was especially entrusted with the development of the army system or military finance or military policy in wars. Even under the Empire, however, there was no such organization.

The emperor, as commander-in-chief, and his more or less unofficial advisers doubtless decided questions of policy. But the army was so much a group of provincial armies that much was left to the chief officers in each province. Here, as elsewhere in the Empire, we trace love if not for Home Rule, at least for Devolution. There was, however, a central finance office in Rome for the special purpose of meeting the bounties (or equivalent) due to discharged soldiers. This was established by Augustus in A.D. 6 with the title aequarium militare, and had, for receipts, the yield of two taxes, a 5% legacy duty and a 1% on sales (or perhaps only on auction-sales). The legacy duty did not touch legacies to near relations or legacies of small amount.

ROMAN ART. (i) Introductory: History of Recent Research.

The scientific study of ancient Roman art dates from a comparatively recent period. The great artists of the Renaissance, headed by Raphael and Michelangelo, showed a new appreciation for such models as the bas-reliefs of Trajan's Column; and it is sufficient to name Mantegna's "Triumph of Caesar" in order to recall the influence exerted by Roman historical sculpture upon their choice and treatment of monumental subjects; but their eyes were fixed on the Greek ideal, however imperfectly represented by monuments then accessible, and the supremacy of this standard became established beyond challenge. In the 18th century Winckelmann, the founder of the science of classical archaeology, directed the gaze of students and critics towards the glories of classical Greek art, which divested the castles which filled the palaces and museums of modern Rome; and the realization of the extent remains of that art, which began early in the 19th century and still continues, has naturally absorbed the attention of the great majority of classical archaeologists. Nevertheless, towards the close of the 19th century, when the main lines of Greek artistic development had been firmly traced and interest was aroused in its later offshoots, critics were led to examine more closely the products of the Roman period. As early as 1874 Philippi had published a study of Roman triumphal reliefs; but his intention was to show that they were derived from the paintings exhibited on the occasion of triumphs, and that in no way could they be added to the field of genuine Roman art, and not to determine their place in the history of art. In 1893, however, Alois Riegl published a series of essays on the history of ornament under the title of Stilfragen, in one of which he expressed the opinion that "there was in the antique art of the Roman Empire a development along the ascending line and not merely a decadence, as is universally believed." This thesis was taken up two years later by Franz Wickhoff in a preface contributed to the reproduction in facsimile of the illustrated MS. of Genesis in the imperial library at Vienna. Wickhoff contended that, whilst the art of the Augustan period was the culmination of a development which had flourished under the Hellenistic monarchies, it was succeeded by an outburst of genuinely Roman artistic effort, which reached the height of its achievement in the reliefs and portrait-sculpture of the Flavian period, and gave birth in the 2nd century A.D. to the monuments of the "continuous" style of representation exemplified by the imperial columns. Wickhoff's work has become familiar to English readers through Mrs Strong's

1 The eleventh book of Winckelmann's Geschichte der Kunst, which deals with art under the Romans, contains notable proofs of the author's sureness of vision; for example, he divined the true date and affinities of the reliefs in the Villa Borghese, afterwards wrongly attributed to the time of Claudius (see below).

excellent translation, with copious illustrations, which appeared in 1900; in the following year Riegl published the first (which, by reason of his untimely death, remains the only) volume of his Late Roman Industrial Art in Austria and Hungary, in the opening chapters of which he endeavours to show that the later transformations of Roman art in the 3rd and succeeding centuries was a Christ-like transformation to match the Christian advance. On the other hand, the originality of Roman art under the Empire was called into question by Josef Strzygowski, whose first important work on the subject, Orient oder Rom, appeared in 1901. Strzygowski holds that even in the imperial period, Rome was receptive rather than creative; that what is termed “Roman imperial art” is in reality the latest phase of Hellenistic art, whose chief centres are to be sought in Asia Minor, Syria, and Egypt; and that this late Hellenistic art itself gradually transformed by the invading spirit of the East into that Byzantine art which is half Greek and half Oriental, but wholly un-Roman. The problem thus stated will presently be discussed; in the meantime it is to be noted that the principal monuments which fall within our province have been at length rendered accessible to students by a series of adequate reproductions. In sculpture, the reliefs of Trajan’s Column have been published by Cichorius, and those of the column of Marcus Aurelius by Petersen and others; in metal-work, the treasure of Bosco Reale has been published in the Monuments Plat, and that of Hildesheim has been published by the authorities of the Berlin Museum; a series of reproductions, including all the important examples of Roman painting, is issued by the firm of Bruckmann under the supervision of Paul Herrmann; and the ancient paintings preserved in the Vatican library, which include some of the most famous examples of the art, were published and described by Dr. Nagara in 1907. The discussion of the date to be assigned to the Trophy of Trajan at Adam-Klissi in the Dobruja, initiated by Adolf Furtwangler, has led to a closer study of the remains of Roman provincial art; and the discovery of the foundations of the Ara Pacis Augustae at Rome, together with additional remains of its sculptured decoration, has given an impulse to the study of Roman historical monuments. In this field important contributions to knowledge have been made by members of the British school at Rome, which will be noticed below. Finally, the history of Roman sculpture has for the first time been systematically and comprehensively treated by Mrs. Strong in a handbook whose copious and well-chosen illustrations add greatly to its value. Thus the necessary equipment has been furnished for students of the problem presented by Roman art.

(2) National Roman Art; Landmarks of its History.—It is impossible to speak of a specifically Roman national art until we approach the latest period of Republican history. The germs of artistic endowment which existed in the Roman character were not developed until her political institutions were matured and her supremacy in the Mediterranean established. Up to that time such works of art as were produced in, or imported into, Rome were without exception Greek or Etruscan. Both in Etruria and in Latium Greek artists were commissioned to decorate the temples in which wood and terra-cotta took the place of the marble which Greece alone could afford to use. In 496 B.C., according to tradition, two Greek artists, Damophon and Gorgasos, decorated the temple of Ceres, Liber and Libera with paintings and sculpture; when the temple was restored by Augustus their terra-cotta reliefs were carefully removed and framed. But most of the early sculpture of Roman buildings is ascribed to the master of the “antique” school, whose works Pliny? quotes as evidence that there was an art of statuary native to Italy. It is true that Etruscan art was dependent for its motives and technique on Greek models; but in its portraiture—notably in the reclining figures which adorn Etruscan sarcophagi—we can trace the uncompromising realism and close attention to detail which are native to Italian

1H. N. xxv. 154.
2H. N. xxiv. 34; cf. 43; and see Quint. xii, 10, 1.

soil; the fragments of temple-sculptures which have been preserved are of less value, since, if not the work of Greeks, they are entirely Greek in conception. Roman portraiture undoubtedly continues the Etruscan tradition. It was a common custom in Etruria to decorate the urn containing the ashes of the dead with a lid in the form of the human head (such urns are called canopii), and the same desire to record the features of the deceased produced the wooden masks, or images, which were preserved in the houses of the Roman aristocracy. In architecture, too, Roman builders learnt much from their Etruscan neighbours, from whom they borrowed the characteristic form of their temples, and perhaps also the prominent use of the arch and vault. But the stream of Etruscan influence was met by a counter-current from the south, where the Greek colonies in Campania provided a natural channel by which Hellenic ideas reached the Latin race; and Roman architects soon abandoned the purely Etruscan type of temple for one which closely followed western Greek models. The conquests of the later Republic, however, brought them into more direct contact with the art of Greece proper. Beginning from 212 B.C., when Marcellus despoiled Syracuse of its principal statues, every victorious general adorned his triumph with masterpieces of Greek art, whether of sculpture or of painting, and, when Philhellenism became the ruling fashion at Rome, wealthy connoisseurs formed private collections drawn from the Greek provinces—Greek craftsmen, moreover, were employed in the decoration of the palaces of the Roman nobles and capitalists, which scarcely differed from those of the great Hellenistic cities. If kept in portraiture, there was nothing characteristically Roman in the art which flourished in Rome in the time of Caesar and Cicero. But the remains of an altar, preserved partly at Munich and partly in the Louvre (Plate II. fig. 10), which is believed with good reason to have been set up by Cn. Domitius Ahenobarbus shortly before 30 B.C., furnish an early example of the historical, or, to speak more exactly, commemorative art, to whose development the Empire gave so powerful an impulse. On the one face of the altar we find a Greek subject—the marriage of Poseidon and Amphitrite,—on the other a Roman sacrifice, the suetum gloria, with other scenes from the life of the army. Augustus enlised art, as he did literature, in the service of the new order. The remarkable technical dexterity which characterizes all forms of art in this period—silver plate and stucco decoration, as well as sculpture in the round or in relief—is purely Greek; but the form is filled with a new content. For Augustus determined to enlist art as well as literature in the service of the new régime, and this purpose was served not only by public monuments, such as the Ara Pacis Augustae (Plate II. figs. 11-13), but by the masterpieces of the silversmith’s and gem-engraver’s art (Plate VII. figs. 32-37). In the art, as in the literature of the Augustan age, classicism was the dominant note, and the naturalism so congenial to the Italian temperament was repressed, though never extinguished. The result of this was that under the Julio-Claudian dynasty academic tradition filled the place of inspiration, and Roman art failed to discover its vocation. A change came under the Flavian emperors. The painters who decorated with fairy landscapes the walls of Roman palaces, untramelled by the conventions of official art, introduced into Rome a summary method of working, which has much in common with that of the modern impressionist school; and the sculptors of the Flavian period laid to heart the lesson taught by their successful illusionism (to borrow Wickhoff’s term). This was followed up till the time of the Severi, by sculpture, portraiture and decorative ornament; and we are entitled to rank this Flavian art as the specific creation of imperial Rome, whatever may have been the precise nationality of the individual workers who adorned the new capital of the world. But this phase was of short duration; and the Roman spirit, which in harmony with that of Greece had produced such brilliant results, triumphed under Trajan and found its characteristic expression in the “epic in stone” with which his column is adorned. Wickhoff claims the “continuous
style in which the artist recounts the Dacian campaigns of Trajan as a creation of the Roman genius. We shall see that the term is not altogether a happy one; but there is good reason (as will be shown below) for the belief that the designer of the column, however profoundly influenced in his selection of motives and in his composition of individual scenes by Greek tradition, nevertheless worked out his main principles for himself. The realism of the Roman is shown in the minute rendering of details, which makes the reliefs a priceles source of information as to military antiquities. Historical art achieved no less a triumph in the great frieze from Trajan's Forum (Plate II. fig. 16), and in the panels of the arch at Benevento. Imposing as these works are, they suffer from the defects incidental to an art which endeavours to express too much. Overcharged with detail, and packed with meanings which reveal themselves only to patient study, they lack the spacious and reposeful character of Greek art; while, if we regard only their decorative function, we must admit that the excess of ornamental surface mars the effect of the buildings which they adorn. Along the path thus marked out, Roman art continued to progress; it is true that under the influence of Hadrian there was a brief renaissance of classicism which gave birth to the idealized type of Antinous, and to certain epochs which belong to Greek rather than to Roman art; but the historical reliefs were renewed from the Augustan period, and more especially the sarcophagi, which reproduce scenes of Greek mythology with a close adherence to the letter but a fresh artistic spirit, show that the new leaven was at work. The main underlying the changes of the time was the loss of the true principles of plastic art, which even in Hellenistic times had become obscured by the introduction of pictorial methods into relief-sculpture. Colour, rather than form, now took the highest place in the gamut of artistic values. Painting, indeed, so far as our scanty knowledge goes, was not practised with conspicuous success; but the art of mosaic was carried to an extraordinary degree of technical perfection, and in strictly plastic art the choice of material was often determined by qualities of colour and transparency. For example, porphyry, basalt and alabaster of various hues were used by the sculptor in preference to white marble; and new conventions, such as the plastic rendering of the iris and pupil of the eye, were dictated by the ever-growing need for contrasts of light and shadow. This great revolution in taste has been traced, and doubtless with justice, to the permeation of the Graeco-Roman world of the 2nd century by oriental ideas. The East has always preferred colour to form, and richness of ornament to significance of subject; and in art, as in religion, the West was not slow to borrow. Monumental art has continued to produce the historical monuments which the achievements of the time demanded; but the principles of figure-composition were less fully grasped. The reliefs of the Aurelian Column form a less intelligible series than those of the Column of Trajan; and the panels of the Arch of Septimius Severus, with their bird's-eye perspective, have not inaptly been compared to Flemish tapestries. The extravagance and pomp of the dynasty founded by Septimius Severus filled Rome with such works as the art of the time could produce; and the busts of Caracalla show that in portraiture Roman craftsmen retained their cunning. Even during the anarchy which followed masterpieces such as the portrait of Philip the Arabian were produced; and during the reign of Gallienus (A.D. 253-268), which saw the dismemberment of the Empire, there was a noteworthy outburst of artistic activity, whose products are seen in the naturalistic portraits of the emperor and the court. But by the close of the 3rd century a further transformation had taken place, which coincided with the political revolution by which the absolute monarchy of Diocletian succeeded to the principate of Augustus. The portraits of Constantine and his house can no longer be termed naturalistic; they are monumental, both in scale and in conception, and, above all, their rigid "frontality" carries us back at a bound to the primitive art of the East. The classical standard set by the Greek genius had ceased to govern art, although the fund of types which Hellenism had created still furnished subjects to the artist, or was made the vehicle by which the new ideas derived from Christianity were expressed. The Roman spirit was still strong enough to maintain that interest in the human form and the representation of dramatic events which was lacking in the Oriental; but in the monuments of the Constantinian period, such as the narrow friezes of the Arch of Constantine, we can see nothing but the work of artists who had lost touch with true plastic principles, in spite of the ingenious inventions produced by Riegl. If the signs of progress, it must be rather in the domain of architecture, which had never ceased to make advances in dealing with the spatial and constructive problems presented by the great building works of the Empire; it was now called upon to face a fresh task in providing Christians with a fit place for public worship. In the solution of this problem the architects of the 4th century showed a wonderful fertility of resource; but to describe their achievements would be to pass the confines of Roman art in the proper sense of the word.

(2) Individual Arts. (a) Architecture.—This branch of the subject being already dealt with in the article ARCHITECTURE, and illustrations will be found in other articles (CAPITAL; COLUMN; ORDER; TRIUMPHAL ARCH; &c.). Architecture, regarded as a fine art, had been brought by the Greeks to the highest perfection of which it was capable under the limitations which they imposed upon themselves. The Greek temple appeals to the aesthetic sense by the simplicity and harmony of its proportions as well as by the rational correspondence between function and decoration in its several members. On these lines there was no room for progress. It is true that the Etruscans modified the type of the Greek temple and profoundly influenced Roman construction in this respect. The Etruscan temple was not approached on all sides by a low flight of steps, but raised on a high platform (podium) with a staircase in the front; it was broad in proportion to its depth, indeed, in many cases, square; and the temple itself (cella) was faced by a deep portico, which often occupied half the platform. Moreover, as the use of marble for building was unknown in early Italy, wood was employed in construction and terra-cotta in decoration, and this change of material led to a wider spacing of the columns than was possible in Greece. But these alterations in the system of proportions were disadvantageous to aesthetic effect; and the Romans—though they soon ceased (under the influence of the official Greek style, though not in the popular) to build temples of purely Tuscan type—preserved certain of their features, such as the high podium and deep portico (see ARCHITECTURE, fig. 26). Nor can we regard as felicitous the design of certain Roman temples, such as that of Concord overlooking the Forum, and the supposed temple of Augustus (see ROME), which have a broad front (approached in the temple of Concord by a central portico) and narrow sides. The great temples of the Empire were (in general) inspired by Greek models, and need not therefore concern us; but we may notice Hadrian's peculiar design for the double temple of Venus and Rome, with twin cellae placed back to back. To the orders (see ORDER) of Greek architecture the Etruscans added the Tuscan, a simplified Doric, of which an early example has been found at Pompeii, enclosed within the wall of the Casa del Fauno. This column, which can scarcely be later than the 6th century B.C., has a smooth shaft with pronounced entasis, a heavy capital with a scuta between abacus and echinus, and a plain circular base. To the Romans we owe the "Composite" order, so called because it contains features distinctive of the Corinthian and Ionic orders (see ORDER, fig. 14). It is really a variety of the Corinthian, with Ionic volutes inserted in the capital; the earliest known example of its use is seen in the Arch of Titus. The Romans, moreover, made frequent use of the figured capital, which, as

the remains of Pompeii show, was an invention of the later Hellenistic age. Reduced copies of statues are found in the decoration of such capitals in the baths of Caracalla; the capitals with Victories and trophies in S. Lorenzo Fuori also belonged to a building of pagan times.

But the specific achievement of the Roman architect was the artistic application of a new set of principles—those which are expressed in the arch, the vault and the dome. The rectilinear buildings of the Greeks, with their direct vertical supports, gave place to vaulted structures in which lateral thrust was called into play. The aesthetic effect of the curves thus brought into prominence was well understood by the Romans; and they were the inventors of the decorative combination of the Greek orders with the arcade. More than this, the erection of vaults and domes of wide span, rendered possible by the use of concrete, gave to the Roman architect the opportunity of dealing artistically with internal spaces. A simple yet grandiose example of this may be found in the Pantheon of Hadrian. Circular buildings were a common feature in Italian architecture; the temple of Vesta, which doubtless represented the primitive hut or dwelling of the king, always had this form, and the theme was repeated with many variations, from the well-known circular temple in the Forum Boarium to the fantastic structure with broken outlines at Baalbek. But in the Pantheon the artist lays stress, not on the exterior, which possesses no special effect, but on the interior, whose proportions are carefully determined and give a most impressive result. The same may be said of the great halls of the Imperial Thermæ, and as time went on more elaborate architectural schemes were devised to meet the requirements of the Christian Church.

(b) Sculpture.—It was pointed out above that in the late Republican period specifically Roman art was practically confined to portraiture. Of this we have many fine examples, such as the so-called Domitius Ahenobarbus of the Bracco Nuovo (Plate I. fig. 1); and there is a series of busts which possess a special interest in that some of them have been claimed as portraits of Scipio Africanus. The example in the Museo Capitolino (Plate I. fig. 2), with a modern inscription, though executed in the 2nd century A.D., is clearly copied from a famous Republican original. The baldness of the head has been thought to be derived from the technique of the wax model, in which the hair was painted; the presence of a scar above the temple, which has given rise to various theories, merely betokens the unsparing realism of the Republican artist. In monumental sculpture our earliest dateable example is the altar of Domitius Ahenobarbus, already referred to (Plate II. fig. 10). The ceremonial scene of the suovetaurilia fills the centre of the composition; to the left we see the dismissal of veterans for whom diplomata are being prepared; to the right the troops on active service, both horse and foot, are represented. The artist was clearly inspired by statuary and other types of earlier date, which are grouped in a somewhat loose composition. Augustan art is adequately represented by the Prima Porta statue of the emperor, discovered in 1863 in the Villa of Livia and now in the Bracco Nuovo (Plate III. fig. 17). The attitude of the figure is that of an emperor addressing his army; but there is a characteristic blending of the real with the ideal, for the emperor is not only bareheaded but barefoot, and beside him is a tiny cupid riding on a dolphin, which indicates the descent of the Julian house from Venus. We note, too, how the Roman artist—or the Greek artist interpreting the wishes of the Roman—is scarcely more concerned for the total effect of his work than for the significant details of the derek. The sculptor's display, as a central subject, the restoration by the Parthian in 20 B.C. of the standards taken from Crassus at Carrhae (53 B.C.). Not content with this, the artist has added a group of personifications indicating sunrise—Sol, Caelus, Aurora and the goddess of the morning dew—as well as Apollo, Diana, Mars and the earth goddess, and two figures symbolical of the western provinces, Gaul and Spain. It is also to be noted that the statue shows abundant traces of its original polychrome tints—brown, yellow, blue, red and pink. It must have been executed later—probably not much later—than 13 B.C., when Augustus returned from the West, and therefore belongs to the same period as the Ara Pacis Augustae, dedicated January 30, 9 B.C. This altar stood in a walled enclosure with two entrances, measuring 11½ by 10½ metres. The walls, with their plinth, were about 6 metres in height, and were decorated internally with a frieze of garlands and bucrania, and externally with two bands of relief, the lower consisting of conventional scrolls of acanthus varied with other floral motives, and teeming with bird and insect life, the upper showing processions (Plate II. fig. 11) passing from east to west. The most interesting of these is that on the south wall, which included Augustus himself, the flamines and the imperial family. On the western face, towards which the processions are directed, we find a scene of sacrifice, with a landscape background, in which the ideal figures of senate and people appear. To the east front (apparently) belongs the beautiful group of the earth goddess (Tellus) and the spirits of air and water (Plate II. fig. 13). It is impossible to deny the incongruity of this composition with the realistic procession which adjoins it, and we can only suppose that the artist borrowed the group from some Hellenistic precursor and used it in that blend of the real and ideal which, as we saw, was the keynote of the new imperial art.

The lack of public monuments which can be assigned to the Julio-Claudian period is only in part supplied by those of private significance; the most important of these are the sepulchral aepi and other altars, decorated sometimes with figure-subjects, but largely with plant and animal forms rendered with the utmost naturalism. The altar with plane-leaves in the Museo delle Terme (fig. 38), though perhaps not later than Augustus, is typical of the spirit in which vegetable forms were treated under the first dynasty. We may take a female portrait discovered in a 1st-century house on the right bank of the Tiber (Plate I. fig. 3) as an example of the portraiture of this period, which shows great technical merit but a touch of conventionalism.

The sculpture of the Flavian period finds its best-known examples in the reliefs of the Arch of Titus. This has but a single archway; the piers had no sculptured decoration, and the narrow frieze which surmounts the architrave is perfunctorily executed. But the long panels on either side of the passage, which represent the triumph of Titus and the spoils of Jerusalem, have been deemed (by Wickhoff) worthy of a place in the history of art beside the masterpieces of Velasquez—the "Hilanderas" and the "Surrender of Breda"; and
though we cannot subscribe to his view that the artist calculated the effect of natural illumination upon the relief, it remains true that they are eminently pictorial compositions in respect of their depth of focus, yet without sacrifice of plastic effect (Plate II. fig. 14). So far as bas-relief is concerned, the problem of representing form in open space is here solved. Equally admirable in technique, though of less historical importance, are the circular medallions (tondi) which now adorn the Arch of Constantine, but originally belonged (as the present writer has shown) to a monument of the Flavian period, perhaps the "temple of the Flavian passage erected by Domitian. The one shown (Plate III. fig. 18) is remarkable in that the head of the emperor has been replaced by a portrait, not of Constantine, but (in all probability) of Claudius Gothicus (A.D. 268-70), who was the first to divert these sculptures from their original destination.

Flavian portraits, of which two are here figured,—a bust of Vespasian in the Museo della Terme (Plate I. fig. 4) and a bust, now in the Lateran, found in the tomb of the Haterii, which, as is shown by the snake, represents a physician (Plate I. fig. 3)—must rank as the masterpieces of Roman art. The Flavian era only can be said to be due to the fact that the artist, without accumulating unnecessary detail, has contrived to catch the characteristic expression of his subject, and to render it with the utmost technical virtuosity. These portraits differ from the works of the Greek masters, who always subordinated the individual to the type, and therefore gave a less complete impression of reality than the Roman artists.

The same tendency has been noted in ornamental work which may be dated to the Flavian period. Wickhoff selected a pilaster from the monument of the Haterii (Plate II. fig. 15) upon which a column entwined with roses is carved. The flowers are not in fact represented with precise fidelity to nature, but the illusion of reality is no less great than in most accurately worked examples.

Roman sculpture soon passed the zenith of its achievement. We are not able to assign any historical monuments to the earlier years of Trajan's reign, but the portraits of the emperor betray a certain hardness of touch which makes them less interesting than those of the Flavian period. To the latter part of the reign belong a number of monuments which represent Trajanic art at its best. First and foremost come the reliefs, colossal in scale, which appear to have decorated the walls of Trajan's Forum. Four slabs were removed by Crowfoot and published in a small volume of inscriptions under the date A.D. 114, and the shorter sides of the arch of his arch. The first of these (Plate II. fig. 16) shows the victorious charge of the Roman cavalry, with the emperor at its head, against their Dacian enemies. Other fragments of this frieze are extant in the Louvre, and a much-restored relief, wall up in the garden of the Villa Medici, shows a Dacian on horseback swimming the Danube with Trajan's Bridge in the background. The composition of the battle-scene is very fine, and the heads of the Dacians are full of character; but, although details of armour, &c., are carefully and accurately reproduced, we see clear signs of technical decadence, both in the relief itself and in the many copies which are represented as though in full face on heads which are shown in profile, and also in the naive attempt to render several files of troops in perspective by means of superposed rows of heads. The reliefs of the spiral column in the Basilica Ulpia tell the same tale. The designer borrowed certain motives from Hellenistic art; e.g. we find the suicide of the Dacian king Decadratus represented in precisely the same way as that of a Gallic chief on the well-known sarcophagus in the Capitoline Museum representing a battle between Greeks and Gauls; again, the symmetry of the scene in which the fall of Sarmizegetusa (the Dacian capital) is depicted recalls that of Greek monuments—particularly the painting of the fall of Troy by Polygnotus, described by Pausanias at Delphi. But the loving care with which the arms and accoutrements of the Roman troops—both regular and irregular—are rendered betrays the nationality of the artist; and his technical deficiencies, especially in the matter of perspective, point in the same direction. It seems probable, moreover, that the artistic conception of a column ornamented with a band of relief was new, and that the designer had to find his own solution for the problem. We find, in fact, that he tells his story in more than one way: (a) Considerable portions of the narrative, e.g. Trajan's march in the opening campaign, consist in a series of inserted and successive scenes; the divisions are partly marked by some conventional motive, such as the insertion of a tree, or a change of direction in the action. (b) At other times the scenes unfold themselves against a continuous background, and merge almost insensibly into those which succeed them; to this form of narrative the term "continuous style," brought into use by Wickhoff, more properly applies. (c) The direct progress of the narrative is sometimes broken by passages which can only be called "panoramic"; the great composition showing the siege and fall of Sarmizegetusa falls under this head, and the "continuous" narration of Trajan's journey at the outset of the second war is followed by an extensive panorama illustrating the operations in Moesia in A.D. 105.

The reliefs (as already indicated) tell the story of both of Trajan's wars with the Dacians, a formal division between the two narratives being made by a figure of Victory setting up a trophy; and the design of the second series shows a decided advance in artistic and dramatic effect on that of the first. Clearly the artist learnt the laws of composition applicable to his problem in the course of his work.

Before leaving the Trajanic period a word must be said as to the arch erected at Benevento (see TRIUMPHAL ARCH, fig. 2), from which point a new road—the Via Trajana—ran to Brundisium. The arch, which is not very well preserved, was published by Crowfoot in Jahreshefte der Archäologischen Institute, ii. 1899, pp. 173 ff.; a full account will be found in Mrs Strong's Roman Sculpture, ch. 9.

1 Papers of the British School at Rome, vol. iii. pp. 239 ff. Siveking (Röm. Mthl. (1907) pp. 345 ff.) believes that four of the medallions only belong to the Flavian period and the rest to Hadrian's reign.

2 On this subject see Mr Crowfoot's paper in Journal of Hellenic Studies, xx. (1900) pp. 31 ff. A list of examples is given by Mr Wace in Papers of the British School at Rome, vol. iii. pp. 290 ff.

3 Mr Wace has recently identified the reliefs which show an emperor sacrificing before the temple of Jupiter Capitolinus as a part of the frieze (Papers of the British School at Rome, iv. pp. 229 ff.).

4 These features make it clear that the reliefs in the Villa Borghese, formerly supposed to belong to an arch of Claudius, are Trajanic; see Papers of the British School at Rome, iii. pp. 215 ff. (Stuart Jones).
face of the arch we have a series of panels relating to Trajan's work in the provinces. On the attic the gods of the Danube provinces appear to the left, the submission of Mesopotamia on the right; the lowest panels represent negotiations with Germans (left) and Parthians (right); in the centre (as on the other face) we have a military scene (recruiting in the provinces) to left, balancing the foundation of colonies and growth of the 

proles Romana on the right. As the above description will show, this arch is, in respect of its significance, the most important monument of Roman historical art. Technically, the reliefs fall somewhat short of the best work of the Flavian period—the long panels of the archway, which represent a sacrifice offered by Trajan and his benefactions to the municipia of Italy, have not the verve of those from the Arch of Titus, but at least as fine as the works executed for Trajan's Forum.

With the accession of Hadrian—the "Greeklng," as he was called by his contemporaries—a short-lived renaissance of classicism set in. The eclectic modifications of Greek stationary types which it called forth do not fall within our province; but it should be noticed that in portraiture the most important work of this period was the idealized type of Antinous, here represented by a famous example (Plate I. fig. 6) in the Louvre, which invests the favourite of Hadrian with a divinity expressed in the terms of Hellenic art as well as a pathos which belongs to his own time. The historical monumete of this and the following reign are few in number, and lack the pregnancy of meaning and vigour of execution which distinguished those of the Trajanic period; mention may be made of three reliefs in the Palazzo dei Conservatori, one of which represents the apotheosis of an empress, and of the panels in the Palazzo Rondinini shown by the analogy of a medallion of Antoninus Pius to belong to his time. This is also the place to take note of the ideal figures symbolical of the subject peoples of the Empire. Under Trajan Roman sculptors had produced the fine statues of Daedalian captives which now adorn the Arch of Constantine; the Hadraetic period belongs the idealized figures of provincials, classical in pose and motive, several of which are in the Palazzo de Conservatori.1

We pass on to the period of Marcus Aurelius and Commodus, in which Roman art underwent a further transformation. The earliest monument of the time which calls for our attention is the base of the column (now destroyed) erected in honour of Antoninus Pius. Two of its faces are here shown (Plate IV. figs. 21 and 22), and the contrast is remarkable between the classicistic representation of the apotheosis of Antoninus and Faustina, witnessed by the ideal figures of Rome and the Campus Martius (holding an obelisk), and the realistic treatment of the decoratur, a ceremony performed by denizens of the praetorian guard on horse and foot. We note the endeavour of the Roman sculptor to express more than his medium will allow, and his inadequate grasp of the laws of proportion and perspective. Discarding the classical standard and its conventions, the artist disposes his figures like a child's toys, and, when confronted with the problem of the background, waves it aside and reduces the indication of the place of action to a few projecting ledges on which his puppets are supported. The reliefs of the Column of Marcus Aurelius suffer by comparison with those of Trajan's Column. The story which the designer had to tell was doubtless less definite in outline; we cannot trace, as in the former instance, the march of events towards a dramatic climax, and there is some reason to think that, although the two bands of relief, separated (as on Trajan's Column) by a figure of Victory, correspond generally with the "Germanic" and "Sarmatic" wars of Marcus down to A.D. 175, the narrative is not strictly chronological; thus the fall of rain ascribed by Christian tradition to the prayers of the "Thundering Legion" 2

1 It is in the portraits of the Hadraetic period that we first meet with the plastic rendering (in marble) of the iris and pupil of the eye; the significance of this convention see above.
2 On these see Lucas's article in Jahrb. des k. deutschen arch. Instituts (1900), pp. 1 ff., and Mrs Strong, Roman Sculpture, pp. 243 ff. (Plate IV. fig. 24) is represented at a very early stage, whereas our historians place it towards the close of the war. The figures are smaller and at the same time more crowded than those upon Trajan's Column, and the landscape is less intelligently rendered. The type of the rain-god, which is without doubt the creation of the Roman sculptor, is boldly conceived but scarcely artistic. Still the reliefs show that the designers of the time were making vigorous efforts to think for themselves, and for this reason possess a higher value than the more conventional panels now distributed between the attic of the Arch of Constantine and the Palazzo dei Conservatori, which seem to have decorated a triumphal arch set up in or after A.D. 176.3 The portraiture of the time also shows the invasion of new principles. Even before the reign of Marcus we find a tendency to emphasize the contrast between hair and flesh, the face often showing signs of high polish. In the latter half of the 2nd century the contrast is heightened by a new method of treating the hair, which is rendered as a mass of curls deeply undercut and honeycombed with drill-holes; a fine example is the Commodus of the Palazzo dei Conservatori. The aim of the sculptor is to obtain an ornamental effect by the violent contrast of light and dark—an adaptation for the purposes of plastic art of the chiaroscuro which more properly belongs to painting. This tendency may be seen at work in all branches of sculpture. The sarcophagi of the Antonine and later periods, with their crowded compositions and deep shadows, have the same pictorial effect; and in pure ornament the vivid illusionism of Flavian art disappears, and, though plant-forms are lavishly used—from the time of Trajan onwards we note a growing distaste for pure outlines, which are hidden beneath all-pervading acanthus foliage—the interest of the sculptor comes to lie more and more in intricacy of pattern, produced by the complementary effect of lights and shadows. An instance of this may be found in a pilaster now in the Lateran Museum (fig. 39), which Wickhoff justly contrasts with the rose-portal from the monument of the Haterii. It is all important to remember that (as Strzygowski has pointed out)4 it is not true shadow which is contrasted with the high lights in later Roman ornament; if so, the plastic effect of the free members would be heightened, whereas the reverse is actually the case, for even the figures on sarcophagi, worked in the round though they be, do not stand out from the background—which indeed is practically abolished up to, and seems rather to form elements in a pattern. The reason is that pure darkness is set off against the high lights, and the whole surface being thus broken up, there remains no impression of depth.

Under Septimius Severus and his successors, Roman art drifts steadily in its new direction. The reliefs of his arch at the entrance to the Forum represent the emperor's campaigns in the East in a compromise between bird's-eye perspective and the "continuous" style which cannot be called successful; 5

1 This series of panels is discussed in Papers of the British School at Rome, vol. iii. p. 251 ff.
2 Jahrbuch der preussischen Kunstsammlungen (1904), p. 271.

FIG. 39.—Pilaster with Oak Leaf Ornament.
a better example of the art of this period is to be seen in the relief (Plate IV. fig. 29) now in the Palazzo Sacchetti, recently published by Mr A. J. B. Wace, which probably represents the presentation of Caracalla to the senate as the destined successor of his father. The squat figures of the senators, their grouping, which, though not lacking in naturalism and a certain effectiveness, is not in its main lines aesthetic, and the lavish use of deeply drilled ornament, are features which leave no doubt as to the period to which this work should be assigned. Rome, however, could still boast a school of portrait-sculptors, whose work was of no ordinary merit. The bronze statue of Septimius Severus, which passed into the Somzée collection, has been pronounced by Furtwängler to be of much earlier date, except for the head of the emperor, and we cannot therefore feel confidence in using it as a measure of the artistic achievements of Severus’s reign; but the busts of Caracalla, which represent the tyrant in his later years, are masterly both in conception and execution.

In the second quarter of the 3rd century A.D., when the Empire was torn by internal strife, threatened in its very existence by the inroads of barbarism, and hastening towards economic ruin, art could no longer flourish, and monuments of sculpture become scarce, if we except portraits and sarcophagi. The busts of this period are easily distinguished by the treatment of the hair and beard, which seem to have been closely clipped, and are indicated by a multitude of fine chisel strokes on a roughened surface. But, rough as these technical methods may seem, the artists of the time used them with wonderful effect, and the portraits of the emperor Philip (A.D. 244-49) in the Braccio Nuovo, and an unknown Roman in the Capitoline Museum (Plate I. fig. 7), are hardly to be surpassed in their delineation of craft and cruelty. Amongst the sarcophagi of the 3rd century which we select, in preference to those adorned with scenes of Greek mythology, the fine example in the Museo delle Terme (formerly in the Ludovisi collection) decorated with a méle of Romans and Orientals (Plate IV. fig. 23); the principal figure—whose portrait is also to be seen in the Capitoline Museum—has been identified by Mr A. H. S. Yeames as C. Furius Sabinus Aquila Timesheus, the minister and father-in-law of Gordian III. (d. A.D. 244).

Even after the middle of the century, when the Empire was for a time dismembered, portrait-sculpture put forth fresh evidences of life and vigour. Gallienus, who was himself a dilettante and doubtless largely endowed with personal vanity, seems to have called into being a naturalistic school of sculptors, who harked back to the models of the later Antonine period, so that it is not always easy to distinguish the busts of his time from those of a much earlier date. The Louvre bust of the emperor (Plate I. fig. 8) will serve as a type of these works. But this singular renaissance was as short-lived as the eclectic revival of classicism under Hadrian. It is remarkable that the portrait of Gallienus is the last which can be identified by truly individual traits. The period of storm and stress which followed his death has left little or no monumental material for the historian of sculpture; and when the curtain again rises on the art of the new monarchy founded by Diocletian and perfected by Constantine, we seem to move in a new world. The East has triumphed over the West. Just as in Egyptian and, speaking generally, in all oriental art, before the revelation of true plastic principles, which we owe to the Greek genius, the law of "frontality" was universally operative, i.e. the pose of sculptured figures was rigidly symmetrical and without lateral curvature, so the portraits of Constantine and his successors are characterised at glance by their stiff pose and fixed and stony stare. The fact is that the secret of organic structure has been lost; the bust (or statue) is no longer a true portrait, a block of marble made to pulsate with the life of the subject represented, but a monument. It was thus that the absolute monarchs of the Empire, before whom their subjects prostrated themselves in mutter adoration, preferred to be portrayed; and we cannot help recalling Ammianus's description of the entry of Constantius II. into Rome (A.D. 356). The emperor rode in a golden chariot, turning his head neither to the right nor to the left, but gazing impassively before him "tanquam femminam hominis." The description fits such a portrait as that of an unknown personage of the 4th century in the Capitoline Museum (Plate I. fig. 9), which has been identified by Dr Neugebauer in Riegl. It remains to note that the narrow hands of relief on the Arch of Constantine, some of which probably date from the reign of Diocletian, partake of the same monumental character as the single statues of the time. Where the nature of the subject permits, as in the case of the reliefs here represented (Plate III. fig. 19), the frontality of the central figure, and the strict symmetry of the grouping, which imparts an almost geometrical regularity to the main lines of the composition, are calculated for architectonic rather than for plastic effect. The breath of organic life has ceased to inspire the marble.

We have confined ourselves in the above section to tracing the course of development in what we may call official Roman sculpture, represented in the main, as is natural, by the monuments of the capital. The products of local schools cannot here be treated in detail. The difficult problems which they raise are best illustrated by the case of "Trajan's trophy" at Adam-Klisí in the Dobruja. Although the very name of the monument might seem to furnish sufficient evidence of its date, the late Professor Furtwängler stoutly maintained that Trajan did but restore a monument dating from 29 B.C. He called attention to the uniformity in style of the grave-monuments of soldiers from north Italy, serving in the legions of the Rhine and Danube; these date from the early imperial period, and represent (according to Furtwängler) a traditional "legionary style." It may be admitted that they are eminently Italian in their hard realistic character; but the tradition was not extinct in the Trajanic period, so that the analogy between these monuments and its rude carved figures is inconclusive, and the ornament of the trophy, which is far from being homogeneous, contains, as Studniczka has observed, oriental elements which could not possibly be found in sculpture of the 1st century B.C.

Local tradition may also be traced, e.g. in southern France, where the Hellenic influence which penetrated by way of Massilia was still strongly felt under the Julio-Claudian dynasty, as the sculptures of the tomb of the Julii at St Rémy and the triumphal arches of Orange and Carpentras suffice to prove. Gallo-Roman art, on the other hand, has a physiognomy of its own, whose outlines have been traced by M. Salomon Reinach (Antiquités nationales; bronzes figurés de la Gaule romaine, Introduction). In the Rhineland we find, at a later period, a singular school of realistic sculptors at work; the museum at Trier contains a number of their grave-monuments decorated with scenes of daily life. Nor must we omit to mention the Pampyrine sculptures of the 3rd century A.D., whose portrait-statues give us the clue to the origin of the "frontal" style of the Constantinian period.

(c) Painting and Mosaic.—The arts whose proper medium is colour enjoyed a popularity with the ancients and with the Romans, no less than with the Greeks, at least as great as that of sculpture; we need go no further for evidence of this than the statement of Pliny that Julius Caesar paid eighty talents (£20,000) for the "Ajax and Medea" of Timomachus of Byzantium, which he placed in his newly built forum. But we are in a difficult position when we try to

2 His view is accepted by Mrs Strong (Roman Sculpture, p. 99).

to estimate the artistic value of the masterpieces of ancient painting, since time has destroyed the originals, and it is but rarely that we can even recover the outlines of a famous composition from decorative reproductions. For the history of Greek painting we have in Pliny's Natural History a fairly full literary record; but this fails us when we come to Roman times, nor do original works, worthy to be ranked with the monuments of Roman historical sculpture, supply the want.

Painting in Italy was throughout its early history dependent on Greek models, and reflected the phases through which the art passed in Greece. Thus the frescoes which adorn the walls of Etruscan chamber-tombs show an unmistakable analogy with Attic vase-paintings. The neutral background, the use of conventional flesh-tones, and the predominant interest shown by the artists in line as opposed to colour, clearly point to the source of their inspiration; and the fine sarcophagus at Florence\(^1\) depicting a combat between Greeks and Amazons, in which we first trace the use of naturalistic flesh-tints, though it bears an Etruscan inscription, can hardly have been the handiwork of native artists.

Roman tradition tells us of early wall-paintings at Ardea and Lanuvium, which existed "before the foundation of Rome";\(^2\) of these the Etruscan frescoes mentioned above may serve to give some impression. We also hear of Fabius Pictor, who earned his cognomen by decorating the temple of Salus on the Quirinal (302 B.C.); and a few more names are preserved by Pliny on account of the common anecdotes which attached to them. The chief works of specifically Roman painting in Republican times (other than the frescoes which adorned the walls of temples) were those exhibited by successful generals on the occasion of a triumph; thus we hear that in 263 B.C. M. Valerius Messalla was the first to display in the Curia Hostilia such a battle-piece, representing his victory over Hiero II. of Syracuse and the Carthaginians.\(^3\) We may perhaps form some idea of these paintings from the fragment of a fresco discovered in a sepulchral vault on the Esquiline in 1883,\(^4\) which appears to date from the 3rd century B.C. This painting represents scenes from a war between the Romans and an enemy who may almost certainly (from their equipment) be identified as Samnites; the names of the commanders are indicated, and amongst them is a Q. Fabius, probably Q. Fabius Maximus Rullianus, who played a part in the Samnite War. The scenes are simply superposed in tiers; the background is neutral, the colour-scale simple, and there is but little attempt at perspective; but we note the files of superposed heads in the representation of an army, which are found at a later date in Trajanic sculpture.

We pass from this isolated example of early Roman painting to the decorative frescoes of Rome, Herculanenum and Pompeii, which introduce us to the new world conquered by Hellenistic artists. The scheme of colour is no longer conventional, but natural flesh-tints and local colour are employed: the "artist understands," as Wickhoff puts it, how to "concentrate the picture in the hot" instead of isolating the figures on a neutral background; he struggles (not always successfully) with the difficult problems of linear and aerial perspective, and contrives in many instances to give "atmosphere" to his scene; the modelling of his figures is often excellent; finally, he can, when need requires, produce an effective sketch by compendious methods. It must be premised that this style of wall-decoration was a new thing in the Augustan period. In the Hellenistic age the walls of palaces were veneered with slabs of many-coloured marble (crustae); and in humber dwellings these were imitated in fresco. This "incrustation" style is found in a few houses at Pompeii, such as the Casa di Sallustio, built in the first and century B.C. but before the fall of Rome, it had given way to what is known as the "architectural" style. In this the painter no longer content to reproduce in stucco the marble decoration of more sumptuous rooms; by introducing columns and other architectural elements he endeavours to give the illusion of outer space, and this is heightened by the landscapes, people, it may be, with figures, which form the background. We shall take as an example of such decoration one of the "Odyssey landscapes" discovered on the Esquiline in 1849; these may be amongst the more recent works of this school, but can scarcely, from the character of their surroundings, be later than the reign of Claudius. Amongst the remains of a large private house was a room whose walls were decorated to their upper portion with painted pilasters treated in perspective, through which the spectator appears to look out on a continuous background of land and sea, which is diversified by scenes from the voyage of Odysseus. It is clearly to such works as these that Vitruvius refers in a well-known passage (vii. 5) where, in describing the wall-paintings of his time, he speaks of a class of "paintings on a large scale which represent images of the gods or unfold mythical tales in due order, as well as the battles of Troy or the wanderings of Odysseus through landscapes (topia)."

And it is worthy of note that in a chamber discovered in the 2nd century B.C. at Fontanelle outside the city-wall (Perugia, Rome) the tale of Troy seems to have been represented in a very similar manner; drawings of the panel on which the landing of Helen is depicted have been preserved. Of the eight scenes from the Odyssey found on the Esquiline three represent the adventures in the country of the Laestrygones; the third forms a transition from this subject to the visit of Odysseus to Circe, which occupies the fourth and fifth panels;\(^5\) the two last depict Odysseus among the shades. The second of these, which is here reproduced (Plate V. fig. 26), is only half as wide as the others, and was probably next to a door or window. It is, however, typical in style and treatment. The artist is mainly interested in the landscape, which is sketched with great freedom and breadth of treatment. He has clearly no scientific knowledge of perspective, and commits the natural error of placing the horizon too high. His figures are identified by Greek inscriptions, and we see that artistic considerations weigh more highly with him than close adherence to his poetical text; for the group of the Danaids in the foreground has no counterpart in the Homeric description. The conventional distinction of flesh-tints between the sexes is to be observed.

The use of landscape in decoration is expressly stated by Pliny (H.N. xxxv. 116) to have become fashionable in Rome in the time of Augustus. He attributes this to a painter named Stodius, who decorated walls with "villas, harbours, landscape gardens, groves, woods, hills, fish-ponds, canals, rivers, shores," and so forth, diversified with figures of "persons on foot or in boats, approaching the villas by land on donkeys or in carriages, as well as fishers and fowlers, hunters and even vintagers." Vitruvius, too, in the passage above quoted, speaks of "harbours, capes, shores, springs, straits, temples, groves, mountains, cattle and herdsmen"; and existing paintings fully confirm the statements of ancient writers. In the Villa of Livia at Prima Porta the walls of a room are painted in imitation of a park; in the Villa of Fabius Symineus at Bosco Reale we have a variety of landscapes and perspectives; and in the house discovered in the grounds of the Villa Farnesina by the Tiber we find a room decorated with black panels, upon which landscapes exactly conforming to Pliny's description are sketched in with brush-strokes of white. While we have no reason to dispute the accuracy of Pliny's statement, or to refuse credit to the Roman artist for the development of landscape decoration, it is to be noted that the summary methods of impressionist technique which are here employed are probably traceable to Alexandrian influence. Petronius, who puts into the mouth of one of his characters a lament over the decline of art, attributes the decadence of painting to the "audacity of the Egyptians" and their discovery of "a short cut to high art" (lam magnae artis compendiosa). This has been thought to mean no more than the process of fresco-painting, which led to the substitution of

\(^5\) The latter of these is so badly preserved that the subject cannot be precisely identified.
mere wall-decoration for elaborate easel-paintings; but this was no new invention. It has been pointed out by Mrs Strong1 that amongst the wall-paintings of Pompeii we can distinguish a group executed in bold dashes of colour—especially white—according to the principles of modern impressionism. The most striking example of this betrays its source of inspiration by its subject—the ceremony of the evening benediction in front of the temple of Isis (Plate V. fig. 27).

So far the paintings which we have considered can only be regarded as an extremely ingenious and, in the main, tasteful form of wall-decoration; they tell us little of that which we most wish to know—the style and treatment of substantive works of painting. The gap is in some measure filled by the central panels of Pompeian walls, which are usually adorned with subject-paintings, often mythical in subject, clearly marked off from the rest of the wall and intended to take the place of pictures. In the Architectural style these are usually framed in a species of pavilion or aedicula, painted in perspective;2 but this motive gradually loses its importance. In the Third style ("ornate") distinguished by Mau the architectural design ceases to be intelligible as the counterfeit of real construction, and becomes a purely conventional scheme of decoration; and in the Fourth or Intricate style, which again reverts to true architectural forms, however fantastic and bewildering in their complexity, the figure-subjects are plainly conceived with subject-paintings, often mythical in subject, clearly marked off from the rest of the wall and intended to take the place of pictures. In the Architectural style these are usually framed in a species of pavilion or aedicula, painted in perspective; but this motive gradually loses its importance.

In the Third style ("ornate") distinguished by Mau the architectural design ceases to be intelligible as the counterfeit of real construction, and becomes a purely conventional scheme of decoration; and in the Fourth or Intricate style, which again reverts to true architectural forms, however fantastic and bewildering in their complexity, the figure-subjects are plainly conceived with subject-paintings, often mythical in subject, clearly marked off from the rest of the wall and intended to take the place of pictures. In the Architectural style these are usually framed in a species of pavilion or aedicula, painted in perspective; but this motive gradually loses its importance.

The figures of Greek mythology, and it has been argued that in the main we have to deal with reproductions of Hellenistic paintings rather than of contemporary works of art. It is not to be denied that the motives of famous compositions of earlier date may have found their way into the repertory of the Pompeian artists; it is not unnatural, for example, to conjecture that the figure of Medea here reproduced (Plate VI. fig. 30) may have been inspired by the celebrated painting of Timomachus above-mentioned. But there are reasons for thinking that the debt owed by the Pompeian artists to the Greek schools of the Hellenistic age is not so direct as was believed by Helbig, whose Untersuchungen über die komponische Wandmalerei won a general acceptance for the theory. It seems clear that in the central subjects of walls decorated in the Architectural style we are intended to see, not a picture in the strict sense, but a view of the outside landscape, generally with a small shrine or cult-statue as the centre of the piece; and the importance of the figure-subject was therefore at first subordinate. These subjects are, it is true, taken from Greek mythology, but this only proves that that source of inspiration was as freely drawn upon in the art as in the literature of imperial Rome. In the later styles figure-subjects without landscape are extremely common, but it has been shown that, e.g. in the triclinium of the Casa del Vettii, which is decorated with a cycle of mythological paintings, the lighting is carefully calculated with a view to illusionistic effect under the local conditions, so that the conception of an outlook into external space is not given up. We sometimes, as in one of the rooms in the "Farnesina" house, find framed pictures directly imitated, and here the models were clearly of a relatively early period; but this is exceptional. The Pompeian paintings, therefore, may fairly be used as evidence for the methods conceived as art in imperial Rome; and when allowance is made for their decorative character and hasty execution, we must admit that they give token of considerable technical skill—the modelling of figures is often excellent, the colour-scale rich, the "values" nicely calculated. The composition of subject-pictures is somewhat theatrical. Amongst the wall-paintings which have been preserved are some which from their classicistic style have been thought to represent Greek originals; the most famous is the "Aldobrandini Marriage" (Plate V. fig. 29), now in the Vatican library. As a matter of fact, the composition is formed by the juxtaposition of sculpuresque types, after a fashion familiar to Roman wall-painters. Mention may here be made of the combination of ornamental work in plaster with painting which is found at Pompeii, in the work of the Flavian period at Rome, and in tombs of the 2nd century A.D. In the Augustan period we find exquisitely modelled relief-work in plaster, used to ornament vaulted surfaces in the "Farnesina" house; it might seem natural to treat of these under the heading of Sculpture, but in point of fact they are translations from painting into stucco. At a later time both painter and modeller worked in conjunction, with admirable effect; the results are best seen in the tombs on the Latin Way.

Little can be said as to Roman portrait-painting. We know that in this branch of art the technique generally used was that called "encaustic." The colours were mixed with liquified wax and fixed by heat; whether they were applied in a molten state or not has been disputed, but it seems more likely that the pigments were laid on cold, and a hot instrument used afterwards. Several examples of such wax-paintings have been found in Egypt, where it was the custom during the 2nd and 3rd centuries A.D. to substitute panel portraits for the plastic masks with which mummy-cases were adorned; but these cannot be described as works of high art, though they sometimes have realistic merit. A good example in the Berlin Museum (Antike Denkmüller, ii. pl. 13) is executed in tempera on primed canvas. The medium used in ancient as in medieval tempera painting appears from the statements of ancient writers to have been yolk of egg mixed with fig-sap or natural gums.

To the little we know of purely Roman painting something is added by that which we learn from the remains of the sister art of mosaics, which, being less easily destroyed, have survived in large numbers to the present day. It has been estimated by Gauckler that considerably more than 3000 mosaics with figure-subjects have been discovered; and the number is steadily increasing. For the origin of the art reference may be made to the article Mosaiæ, where the reader will also find an explanation of the essential differences of principle between the arts of painting and mosaic. It is to the credit of the Roman artists that they were, generally speaking, alive to this distinction of method, and did not seek to produce the impression of painting executed with a liquid medium by the use of solid materials. Indeed, it seems not improbable that in this respect they had a truer conception of the function of mosaic decoration than their Greek forerunners. Amongst the mosaics of Roman date which employ a large number of exceedingly mosaics in order to produce an illusion akin to that of painting, the most conspicuous are the pavement in the Lateran Museum signed by the Greek Heraclitus, which appears to reproduce the "unseen hall" of Sosos of Pergamum (see MOSAIÆ), and the Mosaic of the Doves from Hadrian's Villa, preserved in the Capitoline Museum, which may be supposed to have been inspired by the "drinking dove" of the same artist. The former of these contains about 120, the latter as many as 160 cubes to the square inch.

As shown in the article MOSAIÆ, a distinctness must be drawn between opus tessellatum, consisting of cubes regularly disposed in geometrical patterns, and opus vermiculatum, in which a picture is produced by means of cubes irregularly placed. The two methods were commonly used in conjunction by the Romans, who recognized that a pavement should emphasize the form of the room to which it belonged by means of a geometrical border, while figure-subjects should be reserved for the central space. A good example is furnished by a mosaic pavement discovered on the Aventine in 1838, and preserved in the Musco delle Terme (Plate VI. fig. 29). Enclosed within a geometrical framework of guilloches and scroll-work, diversified with still-life subjects and scene masks which break its monotony, we find a landscape evidently taken from the banks of the Tiber, as the hippopotamus and crocodile, and as the papyrus and lotus, clearly show. These Egyptian scenes are likewise found

1 The Elder Pliny's Chapters on the History of Art, p. 235.
2 The most striking example is that from the "House of Livia" on the Palatine.
at Pompeii, and the celebrated pavement at Palestrina, with a bird’s-eye view of the Nile and its surroundings, is the finest, as well as the latest, example of the class. The conclusion to be drawn is that the Roman mosaic-workers of the early Empire owed much to Alexandrian models. Their finer works, however, were restricted in size, and formed small pictures isolated in geometrical pavements. Such mosaic-pictures were called *emblemata*, and were often transported from the greatest centres of production to distant provinces, where pavements were prepared for their reception. The subjects of these *emblemata*, like those of the wall-paintings of Pompeii, were, for the most part, taken from Greek mythology, and it is not easy to determine what degree of originality is to be assigned to Roman artists. We note a certain interest in the great figures of literature and philosophy. A subject of which two somewhat different versions have been preserved, commonly known as “The Academy of Plato,” shows us a group of Greek philosophers engaged in discussion. In provincial pavements it is not uncommon to find portraits of poets or philosophers used to fill ornamental schemes of decoration, as in the famous mosaic at Trier signed by Monnus. And it is possible to trace the growth of interest in Roman-literature at the expense of that of Greece. Fig. 31 (Plate VI.) shows a mosaic discovered in the *tablinum* of a villa at Sousse (Susa) in Tunis (the ancient *Hadrutum*). It represents the poet Virgil seated, with a scroll on his knee, upon which is written *Aen.* i. 8; beside him stand the muses of tragedy and history. In one of the side-wings (also) of the *atrium* was a mosaic representing the paring of Aeneas from Dido, and this was no doubt balanced by another scene from the *Aeneid*. It has also been shown that the mythological scenes depicted by the mosaic-workers of the later imperial period are frequently inspired, not by Greek poetry or even Greek artistic tradition, but by the works of Ovid; and the popularity of the legend of Cupid and Psyche is doubtless to be traced to its literary treatment by Apuleius.

The mosaic shown in fig. 31 is notable for the simplicity of its composition; and it may be laid down as a general rule that the later workers in this field preferred such subjects, consisting of few figures on a neutral background, which lend themselves to broad treatment, and are best suited to the genius of mosaic. The finer pavements discovered in the villas of the landed proprietors of the African provinces, Gaul, and even Britain, are distinguished by the excellent taste with which ornament and subject are adapted to the space at the disposal of the artist. Beside a well-chosen repertory of geometrical patterns, the mosaic-workers make use of vegetable motives taken from the vine, the olive, the acanthus or the ivy, as well as conventional figures, such as the seasons, the winds, the months and allegorical figures of all kinds, forming elements in a scheme of decoration which, though often of great richness, is never lacking in symmetry and sobriety.

It is much to be regretted that the destruction, partial or complete, of the great thermes and palaces of the early Empire has deprived us of the means of passing judgment on the *opus musivum* proper (see Mosaic), i.e. the decoration of vaults and wall-surfaces with mosaics in glass, enamel or precious materials. Effective as are the pavements constructed with tesserae of marble or coloured stone, they must have been eclipsed by the brilliant hues of the wall-mosaics. We can form but little idea of these from the decoration of fountains at Pompeii and elsewhere, and must depend chiefly on the compositions which adorn the walls and apses of early Christian basilicas. An attempt has, indeed, been made to prove that one of these—the church of S. Maria Maggiore—is nothing else than a private basilica once belonging to a Roman palace, and that its mosaics date from the period of Septimius Severus; but it is impossible to accept this theory. The earliest monument of the class which we are now considering is the baptistery of S. Costanza at Rome, built by Constantine in the early years of the 4th century A.D. Unfortunately the mosaics of the cupola were destroyed in the 16th century, and we derive our knowledge of them from drawings made by Francesco d’Olanda. The tambour was decorated with a maritime landscape diversified with islands and filled with a crowd of *putti* fishing; and the cupula itself was divided into twelve figures, containing figure-subjects, by acanthus motives and carayatis. The mosaics of the annular vault which surrounds the baptistery are extant, though much restored, and purely pagan in design, showing that the decorative schemes (Eros and Psyche, vine-patterns, medallions, &c.), commonly found in pavements were also used by the *musiarii*. The mosaic-panels of the nave of S. Maria Maggiore already mentioned are (in the absence of earlier examples) very instructive as to the artistic quality of Roman *opus musivum*. Richter and Taylor’s publication of the unrestored portions, which unfortunately form but a small fraction of the whole, serve to show that the *musiarii* had an accurate conception of the true function of mosaic destined to be seen at a distance. Their effects are produced by a bold use of simple means; a few large cubes of irregular shape serve to give just the broad impression of a human face or figure which suits the monumental surroundings and subdued light. Very remarkable is the success with which the atmospheric backgrounds are treated. To seek delicate gradations of tint by elaborate means would be waste of labour for the mosaic-worker, but the artists of S. Maria Maggiore are able to produce sky and cloud effects (cf. Plate V. fig. 25) of great beauty, when seen from the floor of the church, with the aid of broad masses of colour. Their gamut of tones is of the richest; and it is to be remarked that no gold is used except in the restored parts. Doubtless gold was employed in decorative wall-mosaics before the Constantian period; but the Roman *musiarii* knew the secret of making a true mosaic picture with natural tints alone.

(4) Work in Precious Metals. —In the article *plate* the history of this branch of art in ancient times is treated, and it is there shown that it continued to be a living art, capable of producing works of the highest merit, in Roman times. The seminal passage in Pliny’s *Natural History* (xxxiii. 154 sqq.) which treat of *caulaturae*, deal only with the works of Greek artists, and Pliny ends with the statement that, as silver-chasing was in his time a lost art, specimens of embossed plate were valued according to their antiquity; but the extant remains of Roman plate suffice to disprove his statement, and in a previous passage (xxxiii. 139) he names the principal *ateliers* where such works were produced. The famous treasure of Bosco Reale (see Plate) comprises specimens of silver-work belonging to various dates, many of which bear the inscription “Maximae”; this doubtless gives the name of the owner of the objects, whose skeleton was found near the treasure. But some of them had passed through other hands; for example, four “salt-cellar,” probably of pre-Roman date, are also inscribed with the name of “Pamphilus, the freedman of Caesar.” Certain pieces, too, seem older and more worn than others; two ewers, decorated with Victories sacrificing to Athena, are probably of Alexandrian origin—the lotus-flower on their handles most probably points to their Egyptian provenance. On the other hand, the various decorative styles characteristic of Augustan art are well represented,—not merely the elaborate and conventional plant-systems of the Ara Pacis Augustae, teeming with animal life, which adorn two splendid canthari, but also the naturalistic treatment of vegetable forms, of which a cup decorated with sprays of olive furnishes a good example (Plate VII. fig. 32). But the most important pieces in the collection are those which show the silversmith at work on specifically Roman subjects. Amongst the cups with *emblemata* (for the meaning of the term see Plate) were two which originally contained small portrait-busts of the master and mistress of the house to which the collection belonged. One of these became detached, and is now in the British Museum; the other is in the Louvre in its original setting. The lady’s coiffure resembles that of the empresses of the later Julio-Claudian period; but this is not
conclusive as to date, and the style of the male portrait (which recalls the realistic bronze busts found at Pompeii) points rather to an early Flavian date. Amongst the finest pieces of this collection is a large bowl with an *annonce* in high relief (Plate VII. fig. 33), which was at first taken to represent the city of Alexandria, on account of the *sistrum* which appears amongst the attributes of the figure. It seems, however, to be a personification of the province of Africa, and hence conventionally represented with a headdress formed by an elephant's scalp with trunk and tusks. We have in this *annonce* the earliest example of the ideal types which the Roman artists of the Empire called into being to symbolize the subject-countries; the inexhaustible fertility of the African soil is indicated by the cornucopiae and the fruits carried in the bosom of the figure. But there is some trace of that overcharging of symbolism to which we drew attention in discussing the Prima Porta statue of Augustus; and, though the bowl was in a very fine state of preservation, there is little doubt that this was due to the care with which it had been kept—it was of course an ornament reserved for the table or sideboard—and that we should date it to the Augustan period. The same is clearly true of the most important pieces comprised in the treasure—the pair of cups reserved by Baron Edmond de Rothschild and forming part of his collection (Plate VII. figs. 33 and 34). In these we have examples of the *crustae*, or plaques decorated in repoussé, which were mounted on smooth silver cups. The manufacture of these—or at least the designing thereof—was a special branch of *caelatura*, and Pliny mentions an artist named Teucer who achieved distinction therein; we may possibly identify him with the gem-engraver whose signature is read on an amethyst at Florence. Upon one of these (Plate VII. fig. 34), we see a seated figure of Augustus, approached by a processional group on both sides. To the left are three divinities, the foremost of whom presents a statuect of Victory to the emperor; to the right is Mars in full panoply, in whose train follow the conquered provinces, symbolized by female figures, amongst whom we recognize Africa with her elephant headgear (see above). On the other face of the cup we see Augustus again seated, receiving the homage of a group of barbarians ushered into his presence by a Roman commander. The schemes which are here found for the first time, became typical of triumphal art, and hence passed into the service of Christianity to portray the homage of the Moors. The second cup celebrates the glories of Tiberius, whose triumphal procession appears on the one face, and a finely conceived scene of sacrifice on the other. For the occasion various dates have been suggested (12-12 or 8-7 B.C.); but it seems most likely that the return of Tiberius from Dalmatia in A.D. 9 is here commemorated.

The fortunate preservation of the Bosco Reale treasure has enabled us to appraise Roman silverwork at its true value. It also affords some confirmation of the rapid decadence of the art, which Pliny laments. Amongst the cups are two decorated with still-life subjects and signed by an artist who writes a Roman name (Salinus) in Greek characters, which clearly belong to the last years of Pompeii, and are coarser in execution than the earlier pieces. And the simple *emblemata* of the classical period, which stand out against the background of the bowl in which they are framed, give place to such a crowded group as we find on a gold patena found at Rennes and preserved in the Cabinet des Médailles, where the artist has surrounded the central *annonce* with a frieze which detracts from its effect. This and still later specimens of Roman silversmiths' work are described in the articles on *Dinanderie* and *Plaque*.  

(5) Gem-Engraving and Minor Arts.—The art of the gem-engraver, like that of the silversmith, was naturally held in high esteem by the wealthy Romans both of the Republic and the Empire; and the period of its highest excellence coincides almost precisely with that which gave birth to the masterpieces of Roman silver-chasing. By far the greater part of the ancient gems which exist in modern collections belong to the Roman period; and the great popularity of gem-engraving amongst the Romans is shown by the enormous number of imitative works cast in coloured glass paste, which reproduce the subjects represented in more precious materials. Not only were intagli, but the popular demand, but fine cameos were at times cut (not cast) in coloured glass; the most notable example of these is a portrait of Tiberius in turquoise-coloured glass bearing the signature of Herophilus (see below). In the style of Roman intagli we can trace each of the phases through which Roman plastic art has been shown to pass. A black agate in the Hague Museum (Furtwängler, pl. xlviii. 13) supplies a characteristic portrait of the Ciceronian age; the splendid cornelian of the Tyszkievicz collection (Furtwängler, pl. i. 10) with the signature ΠΟΙΗΜΑ ΑΛΒΑΝ— which portrays Augustus in the guise of Poseidon in a chariot drawn by four hippocamps, is doubtless (as Furtwängler showed) to be referred to the victory of Actium; the classicism of the early Empire is exemplified by a sardonyx in Florence (Furtwängler, pl. ix. 11), which probably displays an empress of the Julio-Claudian line with the attributes of Hera; a sardonyx in the hermitage at St Petersburg (Furtwängler, pl. iviii. 1) is noteworthy because the subject is borrowed from painting and occurs on a Pompeian fresco discovered in 1807; the portraiture of the Flavian epoch is seen at its best in the aquamarine of the Cabinet des Médailles signed by Eubodos, which represents Julia, the daughter of Titus (Furtwängler, pl. xlviii. 8). Amongst later gems one of the finest is the "Hunt of Commodus" in the Cabinet des Médailles (Furtwängler, pl. l. 41), which is engraved in one of the stones most popular with the Roman artists—the "Nicolo," a sardonyx with a blush-grey upper layer used as background and a dark brown under layer in which the design is cut. But the masterpieces of Roman gem-cutting are to be found in the great cameos, the finest of which no doubt belonged to the treasures of the imperial house. These were engraved in various materials, including single coloured stones such as amethyst or chalcedony; but the stone most fitted by nature for the purpose was the *comee*, a conch formed of two chief varieties—the Indian, distinguished by the warmth and lustre of its tones, and the Arabian, with a more subdued scale of colour. As examples of these we shall take the two master-works of the art—the "Grand camée de France" (Plate VII. fig. 37), and the "Gemma Augusta" (Plate VII. fig. 36), preserved in the imperial collection at Vienna. The latter is attributed by Furtwängler to Dioscorides, the artist who, as Pliny tells us, enjoyed the exclusive privilege of portraying the features of Augustus. We possess several gems inscribed with his name, as well as with those of his sons and pupils—Eutyches, Herophilus (see above) and Hyllas; and, though several of these were Repositories for the ancient masters, they formed a convenient place for an appreciation of his style. The Arabian sardonyx was amongst his favourite stones, and the Vienna cameo at least represents the work of his school. Blending the real with the ideal, the artist has represented in the upper zone Augustus and Rome enthroned. Behind them is a group of divine figures—the inhabited Earth, Time and Tellus, according to the most probable interpretation; to the left we see Tiberius descending from a chariot driven by Victory, before which stands a youth, probably Germanicus. We seem to have here, as in the Bosco Reale cup, a scene from the triumphal gate of A.D. 187, of which a copy in the Louvre is preserved.  

Works of pure gold have but rarely survived to modern times; but traces of gilding remain upon many of the specimens of plate described above. In the law-books we have mention of cups adorned with golden *crustae.*

The Roman art, arts, which continued to flourish until the breakdown of the imperial system in the 3rd and 4th centuries A.D.

(6) Summary: the Place of Roman Art in History.—Just as the establishment of the Roman Empire gave a political unity to the ancient world, and the acceptance of Christianity by the rulers assured the triumph of a universal religion, so the growth of a Graeco-Roman nationality, due to the freedom of intercourse between the subjects of the emperors, led to a unity of culture which found expression in the art of the time. Yet no sooner was the fusion of the elements which contributed to the new culture complete than the process of disruption began, which issued in the final separation of the Eastern from the Western Empire. In the first, the oriental factors, which produced a gradual transformation in Graeco-Roman art, definitely triumphed; and the result is seen in Byzantine art. But in the West it was otherwise. The realism native to Italy remained alive in spite of the conventions imposed upon it; the human interest asserted itself against the decorative.

The Christian art of the West, therefore, is the true heir of the Roman, and, through the Roman, of the classical tradition. The mosaics of S. Maria Maggiore, already referred to, show how strongly this tradition was at work in the 1st century of the Christian Empire; and monuments of the 5th century A.D., such as the consular diptychs of ivory and the carved doors of S. Sabina at Rome, tell the same tale. As we have seen, Roman art in its specific quality was an historical art; and it was for this reason eminently fitted for the service of an historical religion. The earliest Christian art whose remains are preserved is that of the catacombs; and this is not only devoid of technical merit, but is also dominated by a single idea, which governs the selection of subjects—that of deliverance from the grave and its terrors, whether this be conveyed by scriptural types or by representations of Paradise and its dwellers.

Not until the church's triumph was complete could she command the services of the highest art and unfold her sacred story on the walls of her basilicas; but, when the time came, the monumental art created by the demands of imperial pride was ready to minister ad majorem gloriam Dei.

BIBLIOGRAPHY.—F. Wickhoff's Roman Art (1900), translated by Mrs Strong from the author's Wiener Genesis, is well illustrated and readable, and is indispensable to students. A. Riegl's Spätromische Kunstindustrie in Österreich-Ungarn (1901) also repays close study. The views of Strzygowski are expressed in a large number of monographs and essays; the most important are: Der orientalische Geschmack in Neuland (1906), Byzantinische Kunst (1907), and others.

In summary, the debate raised by these writers will be found in the Quarterly Review, January 1906 (Stuart Jones). The controversy carried on by Furtwängler and Studniczka as to the date of the Trophy of Adam-Kliss is instructive. Furtwängler's articles appeared in the Transactions of the Munich Academy for 1903-4, Studniczka's ("Tropaeum Trajani") in Abhandlungen der sächsischen Gesellschaft der Wissenschaften, xxii. (1904).

Of Roman sculpture Mrs Strong's handbook (Roman Sculpture, 1907), which has a great number of excellent illustrations, gives a general survey. Special branches are treated by E. Courbaud (Le Bas-relief romain à des représentations historiques, 1900), W. Altmann (Hochantiker Grabrelief der Kaiserzeit, 1905), A. J. Wace ("The Evolution of Art in Roman Portraiture," Transactions of the British and American Archaeological Society of Rome, 1906). There has been a frequent discussion of historical monuments in Rome in the Papers of the British School at Rome, the Römische Mitteilungen of the German Archaeological Institute, the Jahrbuch of the Austrian Archaeological Institute, and the Neue Jahrbücher für Altertumskunde und Geschichtswissenschaft. Important modern works are: O. Benndorf (and others), Das Tropaeon von Adamkissi (1895); E. Petersen, Ara Pacis Augustae (1903; further discoveries since this date are discussed by the author in Jahrbücher für Altertumskunde); O. Sieveking (in the Vierteljahresschrift der kgl. preuss. Gesellschaf der Wissenschaften, 1904); F. Petersen, "Die Reliefs der Tropaeeninsel" (1896-1900), criticized by E. Petersen, Trajans dakteirische Erixe (1907).

1 For bronze-work see Willers in Rheinisches Museum (1907), pp. 133 ff.

2 The principle is consistently applied by von Sybel, Christliche Antike (Marburg, 1907).
The government of the Roman Catholic Church being centred at Rome, an elaborate organization has been developed there for the administration of its affairs. At the head of this is the college of cardinals, who are the princes and senators of the Church, the counsellors of the pope, and his vicars in the functions of the pontificate. By those of them who are members of the various Congregations and other offices of the Curia the greater part of the government of the Church is directed. (For accounts of the organization of the Roman Curia the reader is referred to the articles CARDINAL and CURIA ROMANA.) The characteristic note of the Roman Curia is its intense conservatism and its slowness to move, whether in approving or condemning new developments of opinion or action. This is explained by the nature of its organization and by the tradition on which it is based. For, just as the Roman Church as a whole preserves in the spiritual sphere the spirit and much of the organization of the Roman Empire, so the administration of the Curia carries on the tradition of Roman government, with its reverence for precedent and its practice of deciding questions, not on their supposed abstract merits, but in accordance with the rules of law as defined in the codes or by previous decisions. Thus the genius of Rome remains, as it always has been, administrative rather than speculative. The great dogmas of the Christian Church were shaped by the interplay of the subtle wits of the theologians of the Oriental Churches. The new dogmas promulgated by the Holy See from time to time have been the outcome of the slow growth of ages, built up from precedent to precedent, and only defined at last when the accumulated weight of evidence in their favour, or the necessity for precise definition to meet the contradictions of heretics, seemed to demand a decision. This temper and the process in which it finds expression are well illustrated in the case of the dogma of the Immaculate Conception (q.v.) and in the authorization given to the cult of the Sacred Heart (q.v.).

This conservative spirit and extreme reverence for authority pervades the whole Roman Catholic Church in exact proportion to the degree of effective control which the see of Rome has succeeded in obtaining over its branches in various countries. To pretend to an independent judgment in questions of faith or morals is for a Roman Catholic to commit treason against his Church; and even in the wide sphere of questions lying beyond the dogmas defined as de jure a too curious discussion is discouraged, if not condemned. As opposed to the critical and analytical tendencies of the modern world, then, the Roman Catholic Church assumes the function of the champion of moral and intellectual discipline, an attitude defined, in its extreme expression, by Pius IX's Syllabus of 1864 (see SYLLABUS), and the famous encyclical Pascendi of Pius X, in 1907. The development of this attitude, known—in so far as it depends on the full pretensions of the Papacy—as Ultramontanism, since the definition of the Roman Catholic Church by the council of Trent in 1564, will be found sketched in the historical section attached to this article. The earlier history, which is that of the Latin Church of the West, will be found in the articles PAPACY, CHURCH HISTORY and REFORMATION.

Under the supreme authority of the pope the Roman Catholic Church is governed and served by an elaborate hierarchy. This, so far as its potestas ordinis are concerned, is divided into seven orders: the three major orders of bishops, priests, and deacons; the subdeacons, or sub-unitas or posentes (forming two degrees of the ordo sacerdotium), and the four minor orders of acolytes, exorcists, readers, and door-keepers. These various orders do not derive their potestas ordinis from the pope, but from God, in virtue of their direct ministerial succession from the apostles.\footnote{1} So far as jurisdiction is concerned, however, those
members of the hierarchy, known as prelates (patriarchs), who possess this power (pontifices), whether bishops or priests, derive it from the popes.

These jurisdictions are of very varied character, and in most cases are not peculiar to the Roman Catholic Church. They include those of patriarchs, archbishops, metropolitans, and bishops in the first rank of the hierarchy, with their subordinate officials, such as archdeacons, archpriests, deans and canons, &c., in the lower ranks. All of these will be found described under their proper headings (see also Ecclesiastical Jurisdiction).

The basis of the organization of the Church is territorial, the world being mapped out into dioceses or, in countries where the Roman Church is not well-developed—e.g. missions in non-Christian lands—into provinces. The dioceses are grouped in various ways; some are immediately dependent upon the Holy See; some are grouped in ecclesiastical provinces or metropolitanates, which in their turn are sometimes grouped together to form a patriarchate.

According to the official Gerarchia Catholica, published at Rome, there were in 1909 ten patriarchates, with fourteen patriarchal sees (rex; i.e., those Eastern communities which, though in communion with Rome, have been allowed to retain their peculiar ritual discipline). Of these the four greater patriarchates are those of Alexandria (with two patriarchs, Latin and Greek); Antioch (with three patriarchs, Latin, Greek-Melchite, Maronite, and Syriac); Constantinople (Latin) and Jerusalem (Latin). The lesser patriarchates are those of Babylon (Chaldaic), Cilicia (Armenian), the East Indies (Latin), Lisbon (Latin), Venice (Latin), and the Uniate Patriarchate of Warsaw (Latin).

The archiepiscopal sees number 204. Of these 21 are immediately subject to the Holy See, while those of the Latin rite having ecclesiastical provinces number 104. There are 19 of the Oriental rite: 3 with ecclesiastical provinces, viz. Armenian, Graeco-Romanian, and Graeco-Ruthenian; the rest are subject to the patriarchates, viz. 2 Armenian, 3 Graeco-Melchite, 3 Syriac, 2 Syro-Chaldaic, 2 Syro-Malabar, 6 Syrian-Orthodox.

Of episcopal sees of the Latin rite 6 are suburban sees of the cardinal bishops; 63 are immediately subject to the Holy See, and 662 are suffragan sees in ecclesiastical provinces. Of those of the Oriental rite 15 are immediately subject to the Holy See; 9 are suffragan sees in ecclesiastical provinces, viz. 3 Graeco-Romanian and 6 Graeco-Ruthenian; the rest are subject to the patriarchates, viz. 15 Armenian, 2 Coptics, 9 Graeco-Melchite, 5 Syriac, 9 Syro-Chaldaic, 2 Syro-Malabar.

The whole number of these residential sees, including the patriarchates, is 1023. Besides these there are 610 titular sees, formerly called sees in partibus infidelium, the sees of martyrs and bishops who were not subjected to the residence of a bishop. These titles are generally assigned to bishops appointed to Apostolic Delegations, Vicariates, and Prefectures, or to the office of coadjutor, auxiliary, or administrator of a diocese. (See Archbishop and Bishop.)

The dioceses are divided into parishes, variously grouped, the most usual organization being that of deaneries. In the parish, however, the authority of the Church is sought to be transmitted to the individual priest with the daily care of the people. The main duties of the parish priest are to offer the sacrifice of the mass (q.e.), to hear confessions, to preach, to baptize and to administer extreme unction to the dying. It is true to say that in the "cure of souls" the confessional plays a larger part in the Church than the pulpit (see Confession and Absolution). For the official costume of the various orders of clergy see the article Vestments.

The clergy of the Roman Catholic Church are furthermore divided into regular and secular. The regular clergy are those attached to religious orders and to certain congregations (see Congregation). Of these the former are outside the normal organization of the Church, being exempt from the ordinary jurisdiction of the diocesan bishops, while the more recently formed congregations are either wholly or largely subject to episcopal authority. By far the most powerful of the religious orders are the Jesuits (q.e.). The secular clergy, on the other hand, are bound by no vows beyond those proper to their orders. Both regular and secular clergy (those at least in major orders) are under the obligation of celibacy, which, by cutting them off from the most intimate common interests of the people, has proved a most powerful disciplinary force in the hands of the popes (see Celibacy). The more complete isolation of the regular clergy, however, together with their direct relation to the Holy See, has made them, not only the more effective instruments of papal authority; but more obnoxious to the peoples and governments of countries where they have gained any considerable power. Their privileged position, moreover, leads everywhere to a certain amount of friction between them and the secular clergy.

In doctrine the Roman Catholic Church is divided from the orthodox communions of the East mainly by the claims of the papacy, which the Orientals reject, and the question of the "Procession of the Holy Ghost" (see Church History). From the Protestant communities which were the outcome of the Reformation the divergence is more profound, though the central dogmas of the faith are common to Roman Catholics and orthodox Protestants. The difference lies essentially in the belief held as to the means by which the truths defined in these dogmas are to be attained. In the world. It was defined in the canons of the council of Trent, as promulgated by Pope Pius IV. in 1564, in which the main theses of the Reformers as to the character of the Church, the sufficiency of Holy Scriptures, the nature of the sacraments, and the like were finally condemned (see Trent, Council of).

The Roman Catholic Church is by far the most widespread, numerous and powerful of all the Christian communions. It is the dominant Church in the majority of European states, in South and Central America and in Mexico; it is the largest single religious body in the United States of America, and in certain Protestant countries, e.g. Prussia and the United Kingdom, it has great religious and political influence. Any statistics of its membership, however, must necessarily be misleading. Those published are generally based on the principle of deducting the Protestant from the general population of "Catholic" countries and ascribing the rest to the Roman Church. This may be possible in Germany and other countries where there is a religious census; but it is, at best, a rough-and-ready method where, as in Italy or France, besides the class of "political" or "non-practising" Catholics, large numbers of the people are more or less actively hostile to Christianity itself. (For Roman Catholic missionary work see Missions.)

The Uniat or United Oriental Churches.—The overwhelming majority of the adherents of the Roman Catholic Church throughout the world belong to the Latin rite, i.e. follow the usages and traditions of the Western Church. Ever since the schism of East and West, however, it has been an ambition of the papacy to submit the Oriental Churches to its jurisdiction, and successive popes have from time to time succeeded in detaching portions of these Churches and bringing them into the obedience of the Holy See. This has only been possible owing to the temper of the Oriental mind and the inelasticity tenaciously to its rites, values dogma only in so far as it is expressed in rites. The popes, then, or at least the more politic of them, have been content to lay down as the condition of reunion no more than the acceptance of the distinctive dogmas of the Roman Catholic Church, especially the supremacy and infallibility of the pope; the ritus of the Uniat Oriental Churches—liturgies and liturgical languages, ecclesiastical law and discipline, marriage of priests, beards and costume, the monastic system of St Basil—they have been content for the most part to leave untouched. The attempts of Pius IX., who in 1862 established the Congregatio de propaganda fide pro neglectis ritis orientalibus, to interfere in a Romanizing sense with the rites of the Armenians and Chaldaeans (by the bulls Reversus of 1867 and Cum Ecclesia of 1869) led to a schism; and Leo XIII., who more than all his predecessors interested himself in the question of reunion, reverted to and developed the wiser position of the Latin rite of the Orientals. The ritus of the Church of Rome is the ritus of the Latins, and the ritus of the Eastern Churches is of the Rumanians and Greeks (see Eastern Rite).

1 The Latin word *ritus* covers not only the only ordinary meaning of the modern English word "rite," i.e. "a formal procedure or act in a religious or other solemn function," or any "custom or practice of a formal kind"; it is a word of the same Latin root as *absolvere* in England—except in the religious connotation here used—of "the general or usual custom, habit or practice of a country, people, class of persons, &c." (New English Dict. s.v.). For the liturgies of the Latin and Oriental Churches see Liturgy.
principle of not aiming at any assimilation of rites, but only at "the full and perfect union of faith" (Encyclical Praeclara gratulationis of June 1894). This principle has even been carried to the extent of recognizing several bishops having jurisdiction over the adherents of various rites in the same see; thus there are three Unit patriarchs of Antioch (Graceo-Melchite, Maronite, and Syrian). Exact statistics of the membership of the Churches of the Oriental rite are almost impossible to obtain; the numbers of their adherents, moreover, are apt to vary suddenly with the shifting currents of political forces in the East, for political factors have always played a considerable part in these movements towards reunion or the reverse. In 1908 their numbers were estimated at approximately 5,500,000. The Churches of the Oriental rite fall under four main divisions: Greek, Armenian, Syrian, Coptic; and—with the exception of the Armenian—these are again subdivided according to nationality or to peculiarities of cult or language. The Churches may be further grouped according to the character of their constitution, i.e. (1) those having their own rite only in a restricted sense, since they have no hierarchy of their own but are subordinate to Latin bishops, i.e. the Greeks in Italy (Italogaecri), the scattered Bulgarian Uniates, the Abyssinians, some of the Armenians and the "Christians of St Thomas"; (2) those having their own bishops and sometimes their own metropolitans, as in Austria-Hungary; (3) the Eastern patriarchates.

Geographically, the Uniat Churches may be grouped as follows:—

(A) EUROPE, where their association with the Roman Church is at once the oldest and the most intimate.

(1) The Italogaecri. These are distributed in scattered groups throughout Italy, in Slovenia and Croatia, and in a number in all some 50,000. They are under the jurisdiction of the Latins, the only exception being the Uniate Church of Latina in Austria, which numbers, about 50,000, adherents, and is divided, under the patriarch, into 11 dioceses (see Nestorians).

(2) The Coptic (Patriarchatus Alexandrinus Coptorum). This was founded on the 26th of November 1895 by Pope Leo XIII. The patriarch, who was given two suffragan bishops, has his seat at Cairo. The number of Uniat Copts is nominal.

(B) THE PARTIALLY AUTOPOSTOLIC CHURCH

This has scarcely any adherents. Such as there are are under the authority of a vicar apostolic residing at Keren.

(6) The Christians of St Thomas (Malabar coast). For these Leo XIII. established in 1898 three special vicariates apostolic (Vicariatus apostolicus Syro-Malabaronis); the vicars apostolic are Latins, but have the right to pontificate and to confirm according to the Syrian rite. The number of Christians of St Thomas in the obedience of Rome is said to be about 100,000.1

1 This account of the Uniat Churches is largely condensed from the excellent article "Unierte Orientalen," by F. Kattenbusch in Herzog-Hauck Realencyklopädie (3rd ed., Leipzig, 1908), where numerous authorities are given.

The term "Romish Catholique" is as old as the days of Queen Elizabeth. It is not happily chosen, for catholic means universal, and what is universal cannot be peculiar to Rome. But the term is inoffensive to Roman Catholics, since it advertises their claim that communion with the see of Rome is of the essence of Catholicity, and to Protestants, since it serves to emphasize the fact that the religion of modern Rome differs widely in many important respects from that of the undivided medieval Church. The change has brought both good and evil. Protestant controversialists have some show of reason on their side when they argue that Luther saved the Roman Church by forcing it to put an end to many intolerable abuses. On the other hand, under stress of his revolt the papacy could not but develop in a strongly anti-Protestant direction, laying exaggerated emphasis on every point he challenged. The more fiercely he denounced infidelity, the confessional, the sacramental system, the larger these things bulge.
notice at Rome. The popes of the Renaissance were profoundly uninterested in theology; they were far more at home in an art gallery, or in fighting to recover their influence as temporal Italian princes, gravely shattered during the long residence of the papal court at Avignon in the 14th century. But these secular interests came to an end with the so-called sack of Rome in 1527, when Charles V took his arms against Clement VII., and made the pope a prisoner in his own capital. Thenceforward there was no more thought of territorial aggrandisement.

The popes, as the phrase went, became Spanish chaplains, with a fixed territory guaranteed to them by Spanish arms; apart from the addition of Ferrara and one or two petty principalities on the extinction of the reigning house, its boundaries remained unchanged till Napoleonic times. Under Clement's successor, Paul III., a new state of things began to dawn. Hitherto the way had been blocked by a horde of protonotaries, daturas and other officials—purveyors of indulgences, dispensations and such-like spiritual favours—to whom reform spelt ruin. Even the Reformation did not move them; if less money came in from Germany, that was all the more reason for leaving things unchanged in France and Spain. But among Paul's cardinals were three remarkable men, the Italians Contarini and Sadolet, and the Englishman Reginald Pole, afterwards archbishop of Canterbury under Mary. All three were disciples of Erasmus, the great apostle of a new, tolerant, scholarly religion very different from the grimy pedantry of the medieval doctors. It was better, he said, to be weak in Duns Scotus, but strong in St Paul—than to be crammed with all the learning of Durandus, and ignorant of the law of Christ. Men trained in this school were not likely to be tender towards vested interests in darkness, least of all when they stood in the way of a reconciliation with the Protestants: for the cardinals thought that the strength of the Reformation lay much less in the attractiveness of Luther's doctrines than in his vigorous denunciations of the vices of the clergy. Once root out abuses with a firm hand, and they believed that a few timely concessions on points of doctrine would tempt most Protestants back within the Roman pale. This belief was shared by Charles V. Together they persuaded the unwilling pope to call a general council. It met in December 1545, at the Tirolese city of Trent, with Pole as one of the three presidents (see Trent Council of).

As a means of reconciliation the council was a signal failure. The Protestants refused to attend an assembly where even the most conciliatory prelate could hardly condescend to meet them on equal terms. Nor was Pole allowed to use the only possible means of overcoming their reluctance. He had wished to begin by reforming abuses before proceeding to sit in judgment on doctrinal errors. But this arrangement was cried down as a revolutionary departure from all established precedent; and he had much ado to secure the compromise that doctrines and practical reforms should be simultaneously discussed. But in the midst of its labours the council was prorogued (March 1547) in consequence of a quarrel between the pope and emperor. In 1551 it met again, only to be again prorogued in 1552. Ten years later it met again for a third and final session, lasting throughout 1562 and 1563. During those ten years great changes had taken place. Charles V. had followed Pole and his peace-loving colleagues to the grave; in his place stood his son, Philip II. of Spain, while the intellectual leadership of the council fell to Jaime Laynez, general of the newly founded Society of Jesus. There was no longer any question of reconciliation with the Protestants. North Germany, England, Scotland and certain parts of France and Rome had rebelled against Roman religion. The war of religion had broken out in France. Clearly the one hope was to enter into a desperate struggle for the possession of such countries as still hung in the balance; and that could best be done by striking at the heart of the Reformation—Protestantism centred—or was by Catholics supposed to centre—in a mysterious "right of private judgment"; the council accordingly retorted by hymning the praises of obedience, of submitting to authority and never thinking for oneself. To wavering, it held up an absolutely sure and uniform Rule of Faith, contrasting impressively with the already multitudinous variations of the Protestant Churches. Moreover, thanks to Laynez, it accomplished this task without running the obvious danger of tying itself hand and foot to the past. When old-fashioned theologians talked about the canons and councils of antiquity, Laynez answered that the Reformation was not more infallible at another; the Holy Ghost spoke through the decrees of Trent quite as plainly and directly as through the primitive Fathers. Thus the council's authority became at once peremptory and elastic. But the real gain was the pope. Hitherto infallibility had been thought of as the supreme weapon of the Church's armoury, destined only for use at some extraordinary crisis; hence it was naturally conceived of as residing only in the extraordinary authority of a general council presided over by the pope. Since the outbreak of the Reformation, however, extraordinary crises calling for immediate decisions might arise at any moment. It was no longer possible to wait for the assembling of a general council; stronger and stronger grew the tendency to ascribe infallibility to the pope alone, as being always on the spot.

Doctrine and discipline once settled at Trent, the work of counter-reformation could begin. Rebels were won back by force wherever force could be applied. In Spain the Inquisition soon snuffed out the few Reformers. In Italy, though declared Protestants were few, there was widespread sympathy with some of Luther's ideas; a committee of cardinals at Rome accordingly organized into an Inquisition, with branches at the chief Italian towns. For half a century trials were many at Venice and elsewhere, but actual executions were only common at Rome; the most illustrious victim was the philosopher Giordano Bruno, burnt in 1600. In the imperial dominions, however, there could be no recourse to the stake. The peace of Augsburg (1555) forbade the German princes to persecute, though it recognized their right to determine to what religion their subjects should belong, and to banish nonconformists. At first this compromise had worked in favour of the Reformation, but presently the Catholic princes began to turn it against their Protestant subjects. "Governments learned to oppress them wisely, depriving them of church and school, of pastor and schoolmaster; and by those nameless arts with which the rich used to coerce the poor in the good old days. Fervent preachers came amongst them, widely differing in morality, education, earnestness and eloquence from the parish clergy, whose deficiencies gave such succour to Luther. Most of those who, having no taste for controversy, were repelled by scandals were easily reconciled. Others, who were conscious of disagreement with the theology of the last thousand years, had now to meet disputants of a more serious type than the adversaries of Luther, and to meet them unsupported by experts of their own. Therefore it was by honest conviction, as well as by calculated but not illegal coercion, that the Reformation was driven back." (Acton, Lectures on Modern History, p. 123).

This system was not an unmixed success; for its extension to Bohemia early in the 17th century brought about the Thirty Years' War. But it obliged the authorities to pay anew attention to the training of the clergy. The "seminary system" came into being—that is, the custom of obliging candidates for ordination to spend several years in a theological college, where they lay influences one time than another excluded. But ecclesiastical learning or a wider type—e.g., Gregory XIII. (1572-85) and Sixtus V. (1585-90) dreamed of making Rome once more the capital of European culture. Gregory reformed the Calendar, and founded the university that bears his name. Five years of power were enough for Sixtus to reform the central government of the Church and the administration of the Papal States, to set on foot the Vatican press and issue an official edition of the Vulgate. Their efforts bore fruit in many quarters. In Rome arose Cardinal Baronius, first of
modern Church historians; Spain produced Suarez, most philosophical of divines. A generation later the French Oratory became the home of Malebranche and of Richard Simon, father of Biblical criticism. Mabillon and his Benedictines of Saint-Maur paved the way for the systematic investigation of historical records. The Flemish Jesuit Bolland brought the light of criticism to bear on the legends of the saints (see BOLLANDISTS). His French colleague, Petau, better known under his latinized surname of Petavius, opened still wider floodgates when he taught that theological dogmas, like everything else, have a history. Lastly, the Jansenist "hermitage at Port Royal contributed the historian Tillemon, whose bigotry Edward Gibbon declares to be overbalanced by his erudition, veracity and scrupulous minuteness. Other such communities and "congregations"—semi-monastic bodies standing in closer touch with the world than did the medieval orders—undertook the diffusion of knowledge. Wherever they went the Jesuits opened grammar-schools, which had the double advantage of being excellent and cheap. An Italian sisterhood, the Ursulines, was founded for the higher instruction of girls; late in the 17th century a French priest started the Christian Brothers, pioneers of elementary education. Other communities again devoted themselves to parochial work. Such were the Oratorians of St Philip Neri, founded to evangelize the middle classes of Rome. Such, again, were the Lazarists of St Vincent de Paul, whose duty was to preach in neglected country districts. But the most interesting of all these new foundations was the Sisters of Charity, also founded by St Vincent de Paul. This admirable body represents a significant departure from medieval ideals. The old-fashioned nun had spent her time behind high walls in prayerful contemplation; the one object of the Sister of Charity was the service of her neighbour.

Not that medieval ideals were by any means dead; they never burned more brightly than in the Spain of St Teresa (1515-82). Her first idea had been to combat alike the heresies and the worldliness of her time by a return to the austerities of a more heroic age. With this object she founded her order of "Discalced" or barefooted Carmelites; it presently became the refuge of Louise de la Vallière and many another penitent of rank. But mere bodily rigours were not enough for Teresa; she felt the need of rising to a state of complete detachment from all earthly interests and ties. Her whole theology centres in the lines—

"The love of God flows just as much
As that of ebbing self subsides;
Our hearts have their sanctity in their,
Bear not the conflict of these rival tides."

How, then, subdue the rivalry? Teresa turned to the mystical writers, and learnt from them how to root out the last relics of self-love from the mind by a long discipline of mystical trance and "contemplation." These ideas, in a very modified form, were introduced into France by the great devotional writer, St Francis of Sales; in the latter half of the 17th century they were pushed to the extravagant length known as Quietism by Fénelon, and especially by Madame Guyon and Michel de Molinos. Meanwhile, the leading conception from which St Teresa started had developed along characteristically different lines in the mind of her compatriot and contemporary, Ignatius Loyola. He quite agreed that self-will was the enemy; but was there no quicker way of checkmating it than an interminable course of ecstasies and austerities?

The Jesuits.

The thoughts of the converted soldier flew back to the military virtue of obedience. In the long-run no self-imposed hardships could prove quite as disagreeable as always being under the orders of some one else. Obedience accordingly became the typical virtue of Ignatius's society (see JESUITS). The individual Jesuit obeyed his superior, who obeyed the rector, who obeyed the provincial, who obeyed the general, who obeyed the pope; who took his orders straight from God Almighty. Such a theory was of untold practical value to the Church of Rome, more especially during the era of the Reforma-

The Jesuits. Laynez at the council of Trent has given one signal instance of its working, but its operations were by no means confined to the abstract field of dogma. If men were really to be made obedient, it could only be by stopping them from thinking for themselves about the everyday problems of conduct; and the best way to do this was to furnish them beforehand with a ready-made code of answers to such problems, warranted to meet all needs. Hence casuistry and the confessional loomed large on the Jesuit horizon. The casuist's duty was to apply the general precepts of the Church to particular cases. He explained, for instance, when a man was strictly bound to tell the truth; when he might avail himself of the mild licence of an equivocation; and when the Church placed at his service the greater indulgence of a mental reservation. The confessor brought the casuist's principles to bear on the conscience of his penitents, and thus saved them from the danger of acting on their own responsibility (see CASUISTRY).

In its origin this system was a perfectly honest attempt to widen the sphere of obedience by making morality wholly objective and independent of the vagaries of the individual conscience. But what was begun in the interest of obedience was carried on in those of laxity. Experts provably differ, and the casuists were no exceptions to the rule. But when great authorities were at variance, it ill became an average priest or penitent to decide. Whatever a grave doctor said must have some solid reasons behind it—"alia quita niti probabilitate—and humble lay-folk could act upon it without a twinge of conscience. Thus arose lax casuists of the type of Antonio Escobar (1589-1669), the central figure of Pascal's Provincial Letters. Their whole business was to hunt through the older authorities in search of "benign" decisions. Their temptation is easy to understand. Half Europe was full of wavering between Protestantism and Catholicism tolerably certain to decide for the Church that offered them the cheapest terms of salvation; and even in wholly Catholic countries many, especially of the upper class, might easily be scared away from the confessional by severity. Thereby their money and influence would be lost to the Church, and their souls robbed of the priceless benefit of priestly absolution. On the other hand, these "Escobarine morals" by no means passed unchallenged; ever since the foundation of the society the aims and methods of the Jesuits had called forth lively opposition in many parts of Catholic Europe, and not least in Loyola's native land of Spain. But the most effective protest against them was a movement which began when Michel de Bay, a professor at the Flemish university of Louvain, put forward certain theories on grace and free-will in the latter part of the 17th century. In the first place, an essay of the same ideas appeared in a posthumous treatise on the theology of St Augustine from the pen of Cornelius Jansen, also a Louvain professor (see JANSENISM). Into the technical detail of the controversy there is no need to enter. It is enough to say that two rival doctrines of grace and free-will were struggling for mastery in the Roman Church. One theory emphasized the necessity of grace; having been put together by St Thomas Aquinas, it was known as Thomism, and was especially championed by the Dominicans. The other laid the chief stress on free-will; it was known as Molinism from its inventor, the Jesuit Louis de Molina, and was in great favour with the society. The two orders came into violent collision at Rome between 1588 and 1666. But the quarrel, known as the controversy de auxilis gratiae, was brought to an end by Pope Paul V., who closed the debates and adjourned his decision sine die.

At first sight this abstract question seemed endlessly remote from the practical policy of Escobar; really there is a close connexion between the two. The whole system of the Jesuits rested on a basis of free-will. Their quarry was the average man; and the best way of impressing the average man is to set before him duties that he feels himself fully capable of performing. Then he will really feel morally responsible if he leaves them undone, hence the necessity of free-will. On
the other hand, as Jansen pointed out, free-will tends to make the average man’s estimate of his own powers into the supreme criterion of all that is good and right. God must performe be satisfied with whatever common sense thinks it fair and reasonable that He should expect. Jansen accordingly denounced free-will as dishonouring to God, and destructive of the higher interests of morality. But, if men threw over common sense, what was to be their guide in life? Jansen answered with his doctrine of Irresistible Grace. This was simply a curious way of saying that God awakens in the righteous heart an intuitive faculty of discerning right from wrong. “This holy taste or relish,” says a follower of Jansen, “distinguishes between good and evil without being at the trouble of a train of reasoning; just as the nature and tendency of a heavy body, let fall from a height, shows the way to the centre of the earth more exactly in a moment than the ablest mathematician could determine by his most accurate observations in a whole day.” That being so, the Jansenist obeyed his Inner Light, and paid little heed to the earth-bound standards of unregenerate common sense. Nor was he more respectful towards the official standards of the Church. Why should he consult a casuist rather than his Inner Light? Thus the Jesuits saw themselves menaced by a grave revolt. What would become of the confessional if penitents were allowed to act on what they fondly took to be a heaven-sent inspiration? In a twinkling they would be off to some spiritual Wonderland, where no confessor could bring them to book. On the other hand, only preach to them a strong doctrine of free-will, and all these dangers vanished. They would feel bound to disregard their spurious intuitions, and act only for reasons that would be clearly set out in black and white. Their past performances could then be checked, and their future actions forecast by the priest; and there was small danger of their straying beyond the limits marked out by authority.

Thus within the spiritual sphere free-will led up to Jesuit obedience. But in the secular world this paradox failed to obtain; there free-will was only too ready to come into conflict with the Church. The 15th and 16th centuries had seen the final break-up of the medieval system of reverence for authority and tradition. In art and learning, morals and government, the old walls came crashing down; in the general bankruptcy of authority men were forced to depend on themselves. And the contemporaries of Machiavelli soon learned to take the fullest advantage of this liberty to pursue their own best interests in the way that pleased them best. But if individuals might be guided by self-interest, why should that privilege be denied to associations of men? On the ruins of a medieval Christendom, hierarchically organized under the pope, grew up the “new monarchies,” or modern state, owning no law but its own will. Yet the popes laid aside none of their traditional汪雄s.

In 1606 Paul V. laid Venice under an interdict, on the ground that the republic had infringed the immunities of the clergy; the doge replied by threatening with death any one who took any notice of the papal thunders. Thenceforward the thunders continued chiefly on paper. In 1625 Catholic Europe was scandalized by the De Schismate of the Jesuit Santarelli, in which he claimed for the pope an absolute right to interfere in the concerns of secular princes, whenever he chose to declare that the interests of religion were in any way concerned. He could dictate their policy at home and abroad, revise their statutes, and appoint their confessors. If they refused to listen he could punish them in any manner he thought fit; in the last resort he could release their subjects from allegiance and head a crusade of Catholic powers against them. These pretensions voused a special burst of indignation in France. There, on the divisions of the wars of religion, had followed an irresistible reaction towards patriotism and national unity. France had suddenly grown to her full stature; like the contemporary England of John Milton, she was become a “noble and puissant nation, rousing herself like a strong man after sleep.” Even the clergy were swept away by the current, and meant to be patriots like every one else. “Before my ordination,” said the eminent theologian Edmond Richer, “I was a subject of the king of France: why should that ceremony make me a subject of the pope? Subjection to the pope implied an Italianization of French religion; and most Frenchmen looked on the Italians as an inferior race. Why, then, should the right to decide ecclesiastical disputes be taken away from their own highly competent fellow-countrymen, and reserved for a set of incapable judges in a foreign land? Germany and Spain might let themselves be bitted and bridled if they chose, but for centuries France had prided herself that, thanks to her Gallican liberties, she stood on a different footing towards Rome.

The Liberties in question were certain ancient rights, whose origin was lost in the mists of time. One forbade papal bulls to be published in France without the consent of the crown. Another exempted French subjects from the jurisdiction of the Inquisition and other Roman tribunals—such as the Index of Prohibited Books. In the 15th century such immunities were all the more valuable since French statesmen found themselves in an awkward position. The great aim of Henry IV. and Richelieu was to exalt France at the expense of Vienna and Madrid. But Madrid and Vienna were the official champions of the papacy; hence to make war on them was indirectly to make war on the pope. This was enough to trouble the consciences of many excellent men; and it became necessary to devise a compromise that should set their minds at rest, by showing them that they could be at once good citizens and good Catholics. This compromise is known as Gallicanism. In the hands of Bossuet and other eminent divines it was developed along both theological and political lines. Theological Gallicanism refused to recognize papal decisions on questions of doctrine, until they had been ratified by the bishops of France. Political Gallicanism maintained that lawful sovereigns held their power directly from God, and not mediately through the pope. Hence no amount of misgovernment, or neglect of Catholic interests, could justify Rome in interfering with the affairs of France. In other words, Bossuet only stood on the divine right of kings. However, this dogma by no means scandalized the subjects of Louis XIV., for the worship of the sovereign was one of their most cherished instincts. And Louis’s ecclesiastical policy flattered their national pride. He introduced no theological novelties; all he did was to insist that, in matters of administration, he would be master in his own house. He supported pope and bishops so long as they took their marching orders from him. If they refused he was perfectly ready to make war on the one and send the others to the Bastille. It is eminently characteristic of his methods that, just at the same time as he was turning loose dragons on his Protestant subjects after the revocation of the edict of Nantes (1685), he was employing other dragons to invade the papal territory at Avignon, to punish Innocent XI. for having refused institution to some of his nominees to bishoprics.

The revocation of the edict of Nantes owes quite as much to the dream of political absolutism, inherited from Richelieu, as to religious bigotry. In the words of Saint-Simon, the Huguenots were a sect that had become a state within the state, dependent on the king no more than it chose, and ready on the slightest provocation to rebel. “What could be more calculated to offend an ambitious prince than an princed that could be controlled?...” So long as they were powerful, the crown had treated with them; but when once their power began to dwindle, it was certain that the crown would crush them. But during Louis’s latter years, when the War of the Spanish Succession had brought a rain of disasters thickly upon him, bigotry got the upper hand. The broken old man became feverishly anxious to propitiate offended Heaven, and save himself another Blenheim or Malplaquet, by exterminating the enemies of the Church. And his Jesuit confessors had no doubt...
that the first and foremost of those enemies were the Jansenists. Not only did their doctrine of grace defy the favourite Jesuit principle of obedience to authority, but it bade fair to set aside the whole Catholic machinery of infallibility and sacraments. If God spoke directly to the individual conscience, what was the use of intermediaries? Led by his Jesuits, Louis wrung from the unwilling Clement XI. the Bull Unigenitus (1713), which was intended to deprive believers in individual inspiration of all possible foothold within the Roman Church. The bull caused a violent uproar. Fénélon, although personally an admiral, admits that public opinion credited it with "condemning St Augustine, St Paul, and even Jesus Christ," and that the few Jansenist bishops appealed and "re-appealed" against it. But the government was inexorable; in 1730 the Unigenitus became part and parcel of the law of the land. Still, to make a law is one thing; to get it administered is quite another. The parlement of Paris was a strongly Gallican body, and had many grievances to avenge on Louis XV. and his ministers. To annoy them, it put every possible difficulty in the way of an execution of the bull. Under the fostering care of the judges, a belief sprung up that to call oneself a "Jansenist," and oppose the Unigenitus, was to show oneself a lover of civil and religious liberty. This feeling was increased by the opposition of the clergy. The bull was a blow against the Jesuits, its authors. For the Society, as befitting the great exponent of authority and the keeper of the consciences of many kings, had always been on the side of political autocracy; and therefore it became increasingly unpopular, when once the tide of French intelligence began to set in the direction of revolutionary reform. Nor were the Jesuits in much better odour among other nations. Their perpetual meddling in politics, and even in speculation and finance, stank in the nostrils of every government in Europe; while their high-handedness and corporate greed in the matter of ecclesiastical privileges and patronage alienated the clergy. There was also more than once discussed; and death alone prevented Benedict XIV. (1749-58), the most remarkable of the 18th-century popes, from taking some very stringent measures. A year after Benedict's death the first bull fell. Pombal, the great reforming minister in Portugal, expelled them from that country on a charge of having conspired against the life of the king. Two years later the Paris parlement had its chance. La Valette, superior of the Jesuit missions in Martinique, had set up as a West-India merchant on a large scale. His enterprises were unsuccessful; in 1761 he became insolvent, and the Society refused to be responsible for his debts. The French government were Frenchmen, and the Jesuits were aliens, and the excuse for a general inquiry into the Society's constitution, and ended by declaring its existence illegal in France, on the ground that its members were pledged to absolute obedience to a foreigner in Rome. Louis XV. now proposed that the French Jesuits should be placed under some special organization, less obnoxious to his parlement. The general only made the famous reply: "Sint ut sunt, aut non sint." Thereupon Louis let the judges have their way. In 1762 the Society was suppressed in France; in 1767 it was also declared illegal by Spain, Naples and other Italian powers. Pressure was now put on Clement XIII. to dissolve the Society altogether. He refused; but his successor, Clement XIV., was more pliable, and in 1773 the Jesuits ceased to be.

In France the philosophes and the quarrels over the Unigenitus had effectually killed the spirit of religion; nor was the Christianity of other countries at a much higher ebb. Spain was utterly dull; Italian fervour could only boast the foundation of two small orders of popular preachers—the Passionists (1737), and the Redemptorists, instituted in 1732 by St Alfonso Liguori (q.v.), who also won for himself a dubious reputation on the unsavoury field of casuistry. German Catholicism was still in a very raw, unsophisticated state. It is characteristic that, while Paris had its Bossuet and Bourdaloue, Vienna was listening to Abraham a Sancta Clara, the punning Capuchin whom Schiller, regardless of dates, introduces into the opening scene of his Wallenstein. However, from Germany was to come a serious attempt at reform. There the vision of a reunion with the Protestants had haunted many Catholic brains ever since Bossuet and Leibniz had corresponded on the subject. Faithful to the ancient tradition of Contarini and Pole at Trent, these good men persisted in supposing that the Reformation was nothing more than a protest against practical abuses: remove the abuses, and the rest would follow of itself. And, inasmuch as they held that most abuses were due to the slippery and procrastinating greed of Roman officials, the first step should be ruthlessly to control the power of Rome and extend that of local Churches. Such was the theme of a book, De statu Ecclesiae, ad reuniones discidentes in religione Christianos compositus, published by one Justinus Febronius in 1763. The author was Johann Nikolaus von Hontheim (q.v.), suffragan in paribus to the elector-archbishop of Treves. Hontheim's theories could not but prove attractive to the local Churches, more especially when they were governed by bishops who were also temporal great lords. The three ecclesiastical electors and the prince-archbishop of Salzburg met in congress at Ems in 1786, and embodied Hontheim's proposals, though in a very modified form, in a document known as the Constitution of Ems (see Febronianism). Meanwhile, their overlord, the emperor Joseph II. (1780-90), was dealing with the question of a much more radical spirit, and actually abolishing abuses wholesale. The reign of "Brother Sacrament," the nickname given to Joseph by Frederick the Great, was one continual suppression of superfluous abbeys, feast-days, pilgrimages. More dignified were his attempts to broaden the minds of the clergy. Instead of being brought up in diocesan seminaries, centres of provincial narrowness, candidates for ordination were to be collected into a few large colleges set up in university towns. Still, Joseph only touched the surface; his brother, the grand-duke Leopold of Tuscany, aspiring to cut deeper, and provoke a religious revival on the lines of Jansenism. His plans, which made a great stir at the time, were outlived at a synod held at Pistoia in 1786 (see PISTOIA, SYMPOD).

Three years later, however, the world had more important things to think of than Leopold's ecclesiastical reforms. At first the French Revolution was by no means anti-Catholic—though the Constituent Assembly remembered too much of the quarrels about the Unigenitus not to be bitterly hostile to Rome—and its great aim was to turn the French Church into a purely national body. Hence it decreed the "civil constitution of the clergy." Bishops were to be elected by their priests with the approval of the state, and all priests were required to take an oath of fidelity to the government: those who refused the oath rendered themselves liable to banishment. Three years later the triumph of the Jacobins brought with it the "abolition of Christianity," and a spell of violent persecution, which gradually slackened under the Directory (1795-99). In 1799 Napoleon became First Consul, and at once set himself to deal with the ecclesiastical problem. There must clearly be a Church, and the small success of the Civil Constitution made clear that public opinion would not put up with a Church practically detached from Rome. On the other hand, Napoleon quite agreed with Louis XIV. in wishing to be master in his own house, and to turn the clergy into a supplementary police. Accordingly, in 1801 he negotiated with Pius VII. a Concordat, which remained in force till 1905 (see CONCORDAT). The state undertook to pay the bishops and parochial clergy; it was directly to appoint the one, and to have a veto on the appointment of the other. But for the religious orders no provision was made; and Napoleon refused to tolerate the presence of unqualified clerics on whom the government had no hold. When his fall brought about the restoration of Louis XVIII. (1815), this restriction was relaxed, and the "congregations" returned in large numbers to France. But the Bourbon government had no intention of encouraging them
too much; it clung as closely as Napoleon himself to the idea of a State Church, taking its orders from the government. In this way Gallicanism, which had once stood for what was national and progressive, now came to mean subservience to a feeble autocracy already tottering to its fall. "A free Church in a free State" became the motto of the group of brilliant men, led by Lamennais, Montalembert and Lacordaire, who started up as soon as the July Revolution of 1830 replaced Charles X. by Louis Philippe. They felt that Catholicism was strong enough to stand alone, without artificial support. For the Revolution had not "abolished Christianity" even among the educated classes, quite so thoroughly as it imagined. Many were only kept back from going to church by the fear that their neighbours would think them superstitious or narrow-minded. But in 1802 Chateaubriand had published his epoch-making *Génie du Christianisme*, in which he declared that of all religions Christianity was "the most poetical, the most human, the most favourable to freedom, art and letters." If that were so, no one need be ashamed to profess it; and the younger generation of Frenchmen began to gravitate back to the Church. Meanwhile, Germany was being profoundly influenced by the great Christian movement known as the Romantic Movement, which began with the worship of medieval art and literature, and ended with the worship of medieval religion. And even Italy and Spain presently began to play their part in the Christian reaction. Rosmini in one country, and Balmes in the other, "brought piety to the learned, and learning to the pious."

These writers, however, only touched the few; and the great aim of Lamennais and his friends was to reach the mass of the people. Immediately after the accession of Louis Philippe they started their famous newspaper, *L'Avenir*, hoping thereby to reconcile the Church with democracy, and make the pope the leader of the party of progress. But all this was hazardous, since democracy had hitherto brought nothing but ill to Rome. In 1798 French troops had entered the papal states, proclaimed a republic in Rome, and kept Pius VI. a prisoner till his death (1799). In 1808 Napoleon arrested his successor, Pius VII., threw the papal states into his new Italian kingdom, and dragged Pius about from prison to prison till the eve of his own fall in 1814. When the congress of Vienna gave the pope back his dominions, the one thought of the broken old man was to restore, as far as possible, the ancient order of things. But the traditional methods of Roman administration were hopelessly broken. On the accession of Gregory XVI. (1831-46), the powers presented a memorandum strongly urging reform. Some reforms of detail were introduced; but Gregory declared that to grant a constitution to the States of the Church would be incompatible with the principle of the papacy. Such a man was hardly likely to listen to the plans of Lamennais. In 1832 the *Avenir* was condemned, and the disgusted Lamennais left the Roman Church. Lacordaire and Montalembert, however, continued their democratic campaign, by no means without success; for the revolution of 1834, which drove Louis Philippe from the throne, was far less hostile to Catholicism than that of 1830. Under the short-lived Second Republic (1848-52) the position of the Church grew even stronger, for the introduction of universal suffrage brought to the polls great masses of new voters strongly clerical in sympathies. In 1850 was passed the *Loi Fouloux*, which broke down the Napoleonic idea of a state-monopoly of teaching, and allowed the opening of voluntary schools. Of this concession the religious orders took full advantage.

Meanwhile in Rome things had gone from bad to worse. Gregory XVI.'s refusal to grant a constitution called forth a series of sporadic outbursts, inspired by Mazzini and the "Young Italian" party. Between 1832 and 1838 these were put down by French and Austrian arms, with the result of focusing the hatred of Young Italy on the pope. One last attempt was made to save him. In 1843 the Piedmontese priest Gioberti brought out a remarkable book, in which he urged his countrymen to combine into an Italian confederation with the pope at its head. For a moment it seemed as though Gioberti's dream was about to translate itself into reality. In 1846 Gregory died, and was succeeded by Pius IX., one of the youngest of the cardinals, and well known for his popular sympathies. He at once granted an amnesty to political prisoners, of whom the Roman gaols were full; two years later (March 1848) he issued a constitution to the papal states, and seemed about to throw in his lot with the forces making for Italian independence. But the first step thereto was deliverance from the Austrian yoke; and Pius, the Italian prince, was notoriously ashamed of his position as head of the Church. How could a pope make war on Austria, the one power that had never faltered in its allegiance to the Church? Accordingly Pius soon drew back, and his popularity waned. In the autumn the revolutionary fever, which had swept through all Europe earlier in the year, spread to Rome. The pope's prime minister, Count Rossi, was murdered, and Pius himself, escaping to Gaeta, threw himself under Neapolitan protection. In Rome Mazzini proclaimed a republic. Once more France and Austria intervened; in 1850 Pius went back to Rome, and ruled there from a French garrison. Meanwhile the Second Republic had come to an end in France; in 1852 the prince-president, Louis Napoleon, was elected emperor. At first he greatly needed the support of the clergy to secure him on his precarious throne. But, as he grew stronger, his desire for their good opinion paled before an overmastering propensity to meddle in the affairs of foreign nations. He allied himself with Victor Emmanuel, and marched into Italy in 1850, with the object of expelling the Austrians from the peninsula. This expedition led directly up to the unification of Italy. Two years later Victor Emmanuel was master of the whole country, except Venice and the "Patrimony of St. Peter." This last— the executive of the papal states—was all that was left to Pius; and even this was only held for him by French troops. When Napoleon withdrew his garrison in 1866, Garibaldi immediately raised a body of volunteers to march on Rome; and Napoleon was obliged to send back his troops. Three years later, the outbreak of the Franco-Prussian War (July 1870) led to their recall. In the following September, ten days after the final collapse of Louis Napoleon at Sédan, the troops of Victor Emmanuel entered Rome; and the temporal power of Pius came to an end.

Pius might no longer rule over the papal states; but there was consolation in the thought that, within the realm of conscience, his power had increased by leaps and bounds.

The whole history of the 19th century is one vast conspiracy to exalt the importance of the papacy. At its opening both the intellectual and administrative guidance of the Church was entirely in French and Italian hands; and the first instincts of those countries is to lean on an all-sufficing government. The French Revolution had supposed itself to be fighting for the "rights of man"; really it was trying to replace an autocratic Kingship by an equally autocratic "general will" of the multitude. And it failed because no general will can make its voice rise above the conflict of particular inclinations. Thankfully did men bow before Napoleon, who undertook to relieve them of the responsibility of having to make up their minds. Nor did the emperor's fall by any means entail the fall of his ideas; Count Joseph de Maistre, the great orator of ultramontanism, did little more than transplant them on to the ecclesiastical domain. Bossuet and the old-fashioned divines had believed in an elaborate system of checks and balances—popes, councils, bishops, temporal sovereigns each limiting and controlling the other—just as Montesquieu and Alexander Hamilton had believed in a careful separation of the executive from the legislative power. Napoleon swept away the checks and balances, and made the will of a single man the one and only sanction of government. In like manner de Maistre proposed to sweep away the ecclesiastical checks and balances, and vest the whole of the Church's authority in
the pope. That would bar out for ever all risk of a conflict of clerical wills. Fortune favoured his enterprise. The French bishops of the age of Bossuet had been a powerful estate of the realm, able in some degree to make their own terms with the king himself; their successors in the 19th century were a mere group of sinecure public officials. Still more significant changes took place across the Rhine. An appreciable part of the Holy Roman Empire had been in the hands of clerical rulers. At their head stood the electors of Cologne, Mainz and Treves, temporal princes of no mean rank, usually chosen from the cadets of royal houses. But in 1803 electors and prince bishops came to an end. Their domains were secularized, and divided up among their lay neighbours, Prussia securing the lion’s share. Thereafter the German bishops became mere officials, as in France, and Rome had no cause to fear the opposition of another Febrius.

Still remoter was the danger of another Louis XIV. or Joseph II. The time had gone by when sovereigns could decide what particular shade of Catholicism their subjects should assume. Everywhere there was a growing belief that a man’s religious tenets were his private affair, with which the state had nothing to do; and that a government only made itself ridiculous if it attempted to lay down which creeds were true and which were false. Hence the clergy were left to do as they pleased, so long as they respected the law of the land; and most of the modern collisions between Church and State have occurred on the debatable ground where their respective spheres overlap, was over questions concerning education or the marriage-laws. Noticeable among these quarrels were the so-called Kölntische Wirren of 1837–40, when the archbishop of Cologne defied the Prussian government over the question of “mixed marriages,” and paid for his rashness by a long imprisonment. Such conflicts did much to increase the power of the pope, by encouraging local Churches to turn to him as their protector. To ride rough-shod over individual bishops was nothing to Prussia; but to quarrel mortally with Rome was a serious matter for a sovereign reigning over millions of Catholic subjects. Even more successful were the papal incursions on to a more ethereal domain. Ever since the time of Kant and Goethe, the intellectual leadership of Europe had been slowly passing into the hands of the Germans, and Catholic theology shared the lot of other branches of learning. But the German divines were much more in touch with the world at large than were their brethren in Italy or France; and more than one interesting attempt was made to bring theology into line with modern schools of thought. Joseph von Görres read the medieval mystics in the light of the newer mysticism of Schelling. Hermes of Bonn defended Catholicism from the standpoint of Kant and Fichte. Continuing his work on a bolder scale, the Viennese priest Günther undertook to show that the articles of the Christian creed are only a rough-and-ready popular statement of the conclusions of philosophy. Of more enduring value have been the researches of the historical school, founded by John Adam Möhler (1796–1838), whose famous Symbolik (1832) was perhaps the heaviest literary blow ever dealt at the Reformation. On his early death his mantle fell on to the shoulders of Ignatius Döllinger (1799–1890). This school claimed that its methods, unlike those of Herses and Günther, avoided all danger of speculative caprice. Catholicism was considered as an organic growth, developing from certain seminal principles in accordance with certain laws. The business of a sound theology was to discover and apply those laws, not to patch up fleeting compromises with the intellectual fashions of an age. On the other hand, the Historical School found but little favour at Rome. “Truth,” as Malebranche quaintly says, “always has a few hairs on her chin”; and the conclusions of sound learning must needs be slow, fragmentary and tentative. But Italian taste was all for bold, highly-coloured, slashing statements, that any one could understand; what it wanted was a method that should be at once intellectually impressive, and free from the usual clouds that beset the scholar’s path. It found what it asked for, when the Jesuits, whom Pius VII. had recalled to life (1814), revived the methods of Aquinas and the medieval Schoolmen. Under the fostering care of Pius IX., this “neo-Scholasticism” spread from Italy to the German Catholic universities, and especially the seminaries of France. The secret of its power was that it gave scope for an immense amount of intellectual subtlety, and at the same time saved men from all danger of independent thought. Although a metaphysic, it was not, and did not pretend to be, an unbiased search for truth. It admittedly started by taking the truth of Catholicism for granted; and its only object was to make intelligible to reason the dogmas that faith already accepted. Thus the whole neo-Scholastic movement played straight into the hands of authority. So comprehensive were its methods, so self-confident its bearing, that those who had been under its spell would never need to doubt or hesitate again. They knew exactly what to think on every conceivable subject; and there was small danger of their suspecting that there might be things in heaven and earth undreamed of in its philosophy.

To the learned Rome might serve up authority with a garnish of neo-Scholastic metaphysics; for average mankind authority pure and simple was enough. Terrified out of their lives at the way in which science and criticism were taking one theological citadel after another, the more militant section of the clergy declared war on thought itself. Not only was faith made independent of reason, but it was considered that all the purer, the less it owed to any kind of mental process. If it was a merit to believe without evidence, it was a shining virtue to believe in the teeth of evidence. Credo, quia absurdum was applied, notably by the popular writers of the French Second Empire, in a fashion grotesquely literal enough to scandalize Tertullian himself. “There had always existed in France, as elsewhere, those who loved traditional stories of a marvellous nature, and tended to multiply the number which were presented as facts rather than legends. The existence of this school has always been inseparable from the element of pious belief which enters so much into popular devotion. But in pre-Revolution days there had also been the critical school of the Maurists, which offered an alternative to minds averse from implicit reliance on tradition. This had passed away, and was not yet replaced. The Acta sincera Martyrium by Ruinart was replaced by the thoroughly uncritical and inexact Actes des martyrs of Guéranger. Church history was allowed to be represented by such men as the Abbé Darras; and many French Catholics were ready to accept without question what the Bollandist Père de Smédi has not hesitated to call the historical errors and lies of Charles Barté- lémy. Incredible and unsupported stories in history, and extravagances in dogma were the order of the day. Those traditions or dogmas which were most ungenial to the modern world were placed in strong relief; and the disparage- ment of the individual intellect was extended to the disparage- ment of scientific research itself” (Wilfrid Ward, Life of W. G. Ward, vol. ii. p. 110). The faithful were encouraged to drown all tendency to thought in an ever-increasing flood of sensual emotionalism. In thirty years Pius IX. canonized more saints than all his predecessors together for a century and a half. In 1854 he gave a great impulse to the cultus of the Virgin by proclaiming her Immaculate Conception a dogma of the Church (see IMMACULATE CONCEPTION). In the following year he imposed on Catholicism at large a special “devotion” to the Heart of Mary Immaculate. Next year he added a similar devotion to the Sacred Heart of Jesus (see SACRED HEART).

That these things only widened the breach between the Church and the outside world was of no account to Pius. Ever since his return from Gaeta, he had made up his mind to a policy of no surrender; and the curtailment of his own dominions in 1860 only made him the keener to denounce the impieties of other rulers. In 1864 appeared the encyclical Quanta Curar,

Catholic developments in Germany.

Rome and the “Historical School.”
together with a Syllabus of eighty of the most important “errors of our time” (see Syllabus). These two documents caused an excitement nowadays hard to understand. Apart from some fulminations against such modern pests as “socialism, communism, secret societies, Bible societies, clerico-liberal societies,” the Syllabus says nothing that the papacy had not been saying for hundreds of years. Its real object is to attack such professedly Catholic governments as have fallen in with modern ideas—as for instance, by allowing freedom of worship to their Protestant subjects, or by refusing to punish brawling in Catholic churches more severely than other breaches of the peace. In other words, Pius utterly rejected the whole principle of toleration, and declared that the Church would still impose itself by force, whenever it got the chance to do so. However, any hopes he may have had of finding another Philip II. were dashed by the events of 1860. On October the 5th, the French troops crossed the frontier into Italy. The next day the Syllabus was published. The Council of Trent of 1864 broke the bond of the old alliance between the Papal States and France. The first Syllabus of 1854 had been only a protest against the use of the word “infallible” in the concordat of 1851. The new Syllabus was a pronouncement of the Papal infallibility.

Definition of the dogma of papal infallibility.

But even the moderate believers in the pope’s infallibility maintained that it was merely negative, a heaven-sent immunity against falling into error. But Pius and his immediate circle argued that this was not enough. The great need of the age was authority; and authority was most likely to strike the imagination of the faithful if it found a vivid concrete embodiment in the person of the pope. He must not simply be immune from error; truth must stream down on his head from heaven, and on his head alone. “We all know only one thing for certain,” wrote the great Catholic pamphleteer, Louis Veuillot, “and that is that no one knows anything, except the man with whom God is for ever, the man who carries the thoughts of God.” But this view was too extreme for the council; the most Pius could hope for was to be declared immune from error, instead of positively inspired. Even this negative infallibility was stoutly contested by the French and German bishops during the eight months that the council lasted (December 1869 to July 1870). But they were richer in talents than numbers: out of six hundred prelates they only commanded eighty votes. Most left Rome before the final session; only two—one from Naples, one from the United States—continued their protest up to the end. On the 15th of July the pope’s decrees were declared “irrefutable of themselves, irrespectively of the consent of the Church,” always provided that they dealt with doctrines of faith and morals, and were delivered ex cathedra—that is, with the intention of binding the consciences of all Catholics. These limitations were the work of the moderate infallibilists, but the real hero of the day was Pius. Theologians might draw their fine-spun distinctions between realms where the pope was actually infallible and realms where he was not; but Pius knew well that loyal Catholic common sense would brush their technicalities aside and hold that on any conceivable question the pope was fifty times more likely to be right than any one else (see Vatican Council and Infallibility).

So absolute became the papal sovereignty over conscience that more than one government took alarm. While the council was still sitting the Bavarian minister, Prince Chlodwig zu Hohenlohe-Schillingsfürst, suggested to Bismarck that the powers would do well to bring its deliberations to an end; and immediately after the publication of its decrees Austria notified the pope that so vast an extension of the Church’s claims would necessitate a revision of the concordat. And when the excommunication of Döllinger and other anti-infallibilist divines (1871) led to the formation of an independent Old Catholic Church (see Old Catholics) Bavaria, Switzerland and other countries gave it a warm welcome. So also did Berlin. The new German empire, consolidated through wars with Catholic Germany and Catholic France, was of all countries least likely to tolerate Roman attempts to dictate to its subjects. Tension was increased by the fact that the Centre, or Catholic, party in the Reichstag was led by Windhorst, formerly prime minister to the dispossessed king of Hanover, and thus naturally became identified with the opposition of the smaller German states to the supremacy of Prussia. The quarrel began in 1871 when the Prussian government supported some teachers in state-aided Catholic schools whom the bishops wished to dismiss on account of their anti-infallibilist opinions. A year later, under the ministry of Falk, it developed into what the great scientist, Rudolf Virchow, called a Kulturkampf, or conflict of civilizations. The famous May laws (1873) were a determined attempt to bring the literary education, appointment and discipline of the clergy under state control, and to regulate the use of such spiritual penalties as deprivation and excommunication. When the bishops refused to obey, Falk fell back on force. The Jesuits were banished from the German Empire, and most of the other orders from Prussia. The archbishop of Gnesen and Cologne and many minor dignitaries were imprisoned (1874); and the so-called “Bread-basket Law” was passed to coerce the parish clergy by suspending the salaries of the disobedient. The result of these severities was exactly the opposite of what Falk intended. He had meant only tolop off a few ultramontane extremists; he succeeded in sending Catholics of every shade and colour pell-mell into the arms of Rome. And the effect remained long after the cause had died away. On the death of Pius IX. (February 1878) his successor, Leo XIII., at once set about the work. He was a man of calm, deliberate judgment, little likely to yield to the promptings of his monsignori. He was a polished scholar of the old-fashioned type; early in his reign he threw open the Vatican Archives to the students of the world. Having spent his youth in the papal diplomatic service—he was nuncio at Brussels from 1843-46—he had a certain knowledge of the workings of parliamentary institutions, while the years immediately before his accession had been spent as archbishop of Perugia, so that he was not closely identified with any of the Vatican parties. The results of a change of master were soon seen; Pius IX. had died at war with almost every country in Europe. He had quarrelled with Austria; Russia was persecuting its Catholic subjects; France was under the spell of Gambetta and his doctrine that clericalism was the enemy; Spain and Belgium followed France; even Switzerland was waging a Kulturkampf on a small scale. In a few years Leo had made peace with Austria, pacified Switzerland and Belgium, opened up negotiations with Russia; while his elevation of Newman to the cardinalate (1879) made a great impression in Great Britain. About 1886 hopes even ran high that he was on the eve of a reconciliation with King Humbert at the Quirinal. These hopes were vain. Leo was absolutely convinced that a territorial sovereignty was required to
ensure the moral independence of the papacy; and he believed that the new Italian kingdom was a mushroom growth, that might fall in pieces at any moment. Hence he followed in the steps of Pius IX. and refused to recognize the existence of the de facto government in any way whatsoever; he would not accept the subsidies it offered him, or allow Catholics to take any part in political life. During the earlier years of his reign he undoubtedly had hopes of recovering his lost dominions with the help of Germany, and Bismarck was not the man to discourage such expectations. They were suddenly blasted when Germany, Italy and Austria entered into a Triple Alliance at the end of 1887. Thereafter Leo turned to France. Already in 1884 he had warned the French clergy against meddling in royalist intrigues; in 1892 he issued a much more stringent exhortation to French Catholics to rally to the Republic. An idea got abroad that he was looking to the time when the old dream of Lamennais and Goberti might become a reality, and Italy would split up into a number of republics, amongst which the temporal power of the pope might find a place.

Certainly his public pronouncements took on an increasingly democratic tone. From the first he had shown great interest in social questions; and his encyclicals deal much less with theology than with citizenship, socialism, labour, the marriage-laws. Under his influence a Christian Socialist movement sprang up in France and Belgium, and soon spread to Italy, Germany and Austria. It had undoubtedly done much to awaken interest in social problems, and to call forth philanthropic zeal; but the movement soon travelled far beyond the limits that Leo would have set to it. In Germany, in particular, it has grown into a political party connected with the Social Democrats; nor have the democratic socialists been slow to exploit their Christian allies for their own ends. And in other countries the attempt to bring religion into politics has sometimes had the effect of lowering religion, rather than ennobling politics. In an age of universal suffrage public men cannot afford to appeal to pure reason, or even to pure sentiment. Christian socialism becomes a real force when it translates itself into anti-Semitism; and anti-Semitism is at its strongest when it is pursuing one particular Jewish captain in the French artillery. Much on the same lines stands the Italian Catholic attempt to show that the Freemasons threaten the real foundations of the Church, and to take the field against them with the help of Léon Taxil and "Diana Vaughan." And, quite apart from their political colouring, such attempts to meet the devotional tastes of the masses as the miracles of Lourdes, or the modern French religious press, lie well within the range of criticism. Nor have they even had the dubious merit of success. Dying in 1903, Leo XIII. was spared from seeing the failure of his policy of reconciliation with the French Republic; for the "declaration of the concordat" (December 1905) and consequent separation of Church and State took place under his successor, Pius X. What results this measure may have on France it must be left to the future to decide. Nor is it yet possible to forecast the result of the only other sensational event that the reign of Pius X. has yet produced—his condemnation in 1907 of the complex movement known as Modernism. This began as an attempt to break loose from the neo-Scholasticism so ardently patronized both by Pius IX. and Leo XIII., and to supplant the critical methods of the medieval doctors by those of modern scholarship; and its leaders have won special distinction in the fields of Biblical criticism and ecclesiastical history. But Modernism is only the beginning of a phase in which the modes of thought and methods characteristic of the latter-day Vatican; its motto is that Catholicism is the strength of popery, but popery the weakness of Catholicism. By "popery" must here be understood the belief that spiritual doctrines always lend themselves to a precise embodiment in black and white, and can thereafter be dealt with like so many clauses of an act of parliament. Modernists deny that the spirit of religion can be thus imprisoned in an unchangeable formula; they hold that it is always growing, and therefore in continual need of readjustment and restatement. On the otherhand, they maintain that the present always has its roots in the past, and therefore they are opposed to any violent change; they consider, for instance, that northern Europe would have done better to listen to Erasmus than to Luther. But progress can leave little room to individual initiative, if it must always show little sympathy with Protestantism. The core of their creed is a fervid belief in the infallibility of Catholic instinct, if only Catholic theology can be induced to leave it to develop in peace. Hitherto the theologians have shown small disposition to hold their hand; and several of the leading Modernists have been excommunicated (see especially the article Loisy, A. F.), while the whole movement was condemned in bitter and scathing language by Pius X.'s encyclical (Pascendi gregis) against the Modernists. But ideas are difficult to kill, and it is possible that the Modernist movement may yet prove to be the opening chapter of a mighty revolution within the Church of Rome.  

BIBLIOGRAPHY. — The literature on the Roman Catholic Church is, of course, vast. Many works will be found in the lists of authorities appended to the articles to which cross-reference is made above, notably PAPACY. Here it is only possible to give a few outstanding books of reference. The most comprehensive of all works of reference on the subject, though partly antiquated, is the Encyclopédie théologique of the Abbé Migne (1844-66), Ser. I. 50 vols., Ser. II. 52 vols., Ser. III. 66 vols. of articles by eminent theologians, and contains Fr. Périnée's Dictionnaire de bibliographie catholique, 5 vols. (Paris, 1858-60). A useful systematized bibliography is also given in the Subject Index of the London Library (1906), pp. 945-51. Other encyclopaedias are Warzer and Welter's Kirchenlexikon, 13 B. (2nd ed., Hergenröther, &c., 1882-1903), Roman Catholic (there is a French translation of the 1st edition, ed. T. Gieseler, 1870); Herzog-Hauck, Realencyclopaedie für Protestantische Theologie und Kirche (3rd ed., Leipzig, 1896-1900), Protestant; but containing articles of universally recognized scientific authority on many aspects of the Roman Catholic Church; the Catholic Encyclopaedia (London and New York, 1907 fl.); invaluable as an authoritative handbook for Roman Catholic Churches in all lands, and a clue to the Modernist phases, by eminent Catholics of all nations. All these encyclopaedias are also bibliographies. (St C.)

The Church in England.  

The origin of the English Roman Catholics as a community separated from the National Church is generally held to date from the accession of Queen Elizabeth in 1558. In the following year was passed an Act of Supremacy, whereby all public officials, clerical and lay, were required to acknowledge the supremacy of the queen "as well in spiritual things or causes as temporal." This declaration all the existing bishops, with two exceptions, refused to make; some fled the country, some were imprisoned, others simply deprived and placed under surveillance. To the parish clergy the declaration was not systematically enforced; of those deprived of their livings a large number were allowed to remain on as chaplains in private families. From laymen, unless they happened to hold some public office, no declaration was expected; and during the earlier years of Elizabeth's reign most of them continued to attend at their parish church. In the subsequent reigns it could not always be said that the queen ruled as of old. Mary I. raised Elizabeth from her throne (1559); thenceforward her government looked on every Catholic as a potential rebel. Already it had passed a severe act against the Catholics in 1562; this was followed by other measures in 1571, 1580, 1584, 1585, 1593. During the forty-five years of Elizabeth's reign, however, only about 180 persons suffered death—less than half the number of those whom the Catholic zeal enlivened.  

1 For a criticism of the modern tendencies of the Roman Catholic Church from an outside point of view see Ultramontanism.  
2 From the Roman Catholic point of view the ancient English history seems to end with the death of Thomas Goldwell, some time bishop of St Asaph, at Rome on the 3rd of April 1585. Some six months previously Thomas Watson, formerly bishop of Lincoln, had died in prison in England.  
3 Not as heretics, by burning, but as traitors, by hanging, drawing and quartering. But, since to say or hear mass was constructive treason, the distinction was, in many cases, without a difference.
of her sister, Queen Mary, had burnt in one-ninth of the time. Under James I, an attempt was made to distinguish between the loyal and disloyal Catholics, the latter comprising all those who maintained the pope's right to depose sovereigns from their throne. This led to a violent division among the Catholic party. Many forswore the depositing power; the majority, acting under imperative orders from Rome, refused to deny it. The government retorted by adding several new penal laws to the statute-book, though less than thirty Catholics were brought to the scaffold during James's reign. Under Charles I, the position of the Catholics was greatly improved, largely owing to the king's marriage with a French princess. Although not actually repealed, the penal laws were seldom put in force, and mass was openly celebrated in London and elsewhere. On the outbreak of the Civil War the Catholics naturally sided with the king, and a great many fell fighting for the royalist cause. The town of Lewes was unexpectedly merciful. Very few were put to death, though a number of estates were confiscated. Under Charles II, came a new period of prosperity; two Catholics, Lords Arlington and Clifforf, were admitted to the inner circles of the government. Protestant suspicion was excited; in 1673 was passed the Test Act, obliging all office-holders to receive the sacrament in the Established Church, and to declare their disbelief in transubstantiation. Five years later (1678) popular exasperation found a more savage outlet, and greedily swallowed the tales of Titus Oates about a mythical "popish plot." A number of Catholics were brought to the scaffold, and Catholics were declared incapable of sitting in either house of parliament. James II, however, was utterly indifferent to the feelings of his subjects. He packed the privy council, the army and the universities with Catholics, and tried to legalize the exercise of their religion by an utterly unconstitutional Declaration of Indulgence. Three years were enough to convince the nation that he was "endeavouring to subvert and extinguish the Protestant religion, and the laws and liberties of this kingdom"; and on his deposition in 1688 Roman Catholics, or persons married to Roman Catholics, were declared incapable of succeeding to the throne. A new oath of allegiance was imposed on all holders of civil or military office; they were required to swear that no foreign prelate had, or ought to have, any jurisdiction, whether civil or ecclesiastical, within the realm. Further, a number of statutes were passed with the object of putting every possible obstacle in the way of Catholics educating their children in their own creed, or of inheriting or buying land. That they remained so long "utterly disabled from bearing any public office or charge" was due to the participation of many of their number in the Jacobite revolts of 1715 and 1745. After Culloden, however, it was seen that all serious danger of a Stuart restoration was passed, and in 1755 Catholics who adhered the Pretender and denied the civil authority of the pope were relieved from their most pressing disabilities. A proposal to extend this measure to Scotland led to violent agitation in that country. Feeling soon spread to England, and culminated in the Gordon riots of 1780. Meanwhile, however, strenuous efforts were being made by the Roman Catholics to obtain relief by establishing a reasonable modus vivendi with the government. Within the Catholic body itself there was even at this time a more or less pronounced anti-Roman movement, a reflection of the Gallican and Febronian tendencies on the continent of Europe, and the "Catholic Committee," consisting for the most part of influential laymen, who had been forced to negotiate with the government, was prepared to go a long way in repudiating the extreme claims of the Holy See, some even demanding the creation of a national hierarchy in merely nominal dependence on Rome, and advocating the substitution of English for Latin in the services. This attitude led to a somewhat prolonged conflict between the Committee and the vicars apostolic, who for the most part represented the high ultramontane view. The outcome of the Committee's work was the great Protest, signed by 150 bishops and leading laymen, in which the loyalty of Catholics to the crown and constitution was strenuously affirmed and the ultramontane point of view repudiated in the startling declaration, "We acknowledge no infallibility in the pope." As the result of the negotiations preceding and following this action, the government in 1791 passed a bill relieving from all their more vexatious disabilities those Roman Catholics who rejected the temporal authority of the pope; and during the rest of the 19th century a series of attempts was made to abolish Catholic disabilities altogether. To this, however, George III. and his successors were bitterly opposed; only in 1830 did George IV. give way, and allow the passage of the Catholic Relief Act. This virtually removed all restrictions on Catholics, except that it left them incapable of filling the offices of Regent, Lord Chancellor, or Lord Lieutenant of Ireland; and it expressly debarred their priests from sitting in the House of Commons.

Ecclesiastical Administration.—During the reign of Elizabeth this was necessarily in a chaotic state. As the Marian clergy died out, their place was taken by priests trained at theological colleges established for this purpose at Douai, Rome, Valladolid, and other places. These were the "seminary priests," objects of great suspicion to the government. About 1580 Jesuit missionaries began to come, and soon became involved in bitter quarrels with the secular missionaries already at work. Mutual jealousies were only increased when the seculars were grouped together under an arch-priest in 1599. Nor were matters much bettered when the papacy took advantage of the presence of a Catholic queen in England, and sent over in 1623 a vicar-apostolic—that is, a prelate in episcopal orders, but without the full authority of a deaconship. He was soon compelled to withdraw, and the direction of affairs fell to an intermittent series of papal nuncios accredited to Henrietta Maria or Catherine of Braganza. On the accession of James II. a new vicar-apostolic—John Leyburne, bishop of Adrumetum in paribus—was at once appointed (1685); three years later England was divided into four districts—the London, Midland, Northern and Western—each under a vicar-apostolic. This arrangement lasted till 1839, when the number of vicarates was doubled by the addition of the Welsh, Eastern, Lancashire and Yorkshire districts. In 1850 came the "restoration of the hierarchy" by Pope Pius IX.; when England was mapped out into an archbishopric of Westminster and twelve suffragan sees, since increased to fifteen (sixteen including the Welsh see of Menevia). This "papal aggression" caused great excitement at the time, and an Ecclesiastical Titles Act was passed in 1851, though never put in force, forbidding Roman Catholic prelates to assume territorial designations.

* They were described in the first draft of the bill as "Protesting Catholic Dissenters," but this was changed, in deference to the "strenuous remonstrances of the vicars-apostolic, into "Roman Catholics."

* Richard Smith, bishop of Chalcedon in paribus (d. 1655).

* Cardinal Wiseman (g.v.) was the first archbishop of Westminster. It was on his advice that Pope Gregory XVI. increased the number of English vicariates-apostolic in 1839, and from 1840 onward, as vicar-apostolic first of the Midland and afterwards of the London district, he was mainly instrumental in bringing the English Roman Catholic Church into closer touch with "the spirit of the age." The Roman Church and the English Catholic Church. The present bishop of Westminster, the Right Reverend John Henry Newman, the principal author of the "Instrumentum Novum," the Roman formulary for the English pre-Reformation use hitherto followed in the services, while English Roman Catholicism became increasingly ultramontane in tenor, a tendency much strengthened under Cardinal Wiseman.

* The titles of the sees could not by law be the same as those of the Established Church. In several cases, however (e.g. Birmingham, Liverpool, Southwark, Newcastle), sees have since been created by...
Roman Catholic Church

Population.—No trustworthy figures are forthcoming as to the numbers of the English Roman Catholics at the different stages of their history. At the accession of Elizabeth they undoubtedly formed a large body. In the Commonwealth, of which the Roman Catholics were a part, there was an attempt to reduce their numbers, and the decrease continued throughout the 17th century. A return made with some apparent care soon after the accession of William III. estimates their total number at 30,000.

During the 18th century they began to increase; a return presented to the House of Lords in 1780 estimates their number at nearly 70,000. Joseph Barington, himself a distinguished Catholic proprietor, contesting that this number was a little below the truth, he reports that his co-religionists were most numerous in Lancashire and London; next came Yorkshire, Northumberland and Staffordshire. In many of the southern counties there were scarcely any Catholics at all. Even in Berkshire, however, there was a certain tendency to increase; and the great number of conversions that followed the Relief Act of 1771 was a stock argument of opponents of the Act. Of the total number, it is perhaps not unfair to say that the Catholic Movement within the Established Church, the number of converts has been much increased; for some time past it has averaged about 8000 souls a year. But a far more potent factor in swelling the numbers of the Catholics in the last generation has been the immigration from the Irish, which began earlier in the 19th century, but was enormously stimulated by the famine of 1846. In 1870 Mr Ravenstein reckoned the total number of Roman Catholics in England as slightly under a million, of whom there were 80,000 Irish, and 500,000 foreigners. By 1910 the general total is considered to have risen to about a million and a half.

Authorities.—Alphonse Bellesheim, Cardinal Allen and the English Catholics (3 vols., London, 1858); Moritz, Catholic Church in Ireland (Mainz, 1886; translated and enlarged by D. O. Hunter-Blair, O.S.B., Edinburgh, 1887); Joseph Barington, State and Behaviour of the English Catholics (1780); Charles Butler, Historical Memoirs respecting the English, Irish and Scottish Catholics (London, 1819); T. F. Knox, The Decay of Dioceses (1818); Price, The Missionary Priests (1842); W. Allen, Catholics of England in Modern Times (1892); T. Murphy, Catholic Church in England during the Last Two Centuries (1892); W. J. Amherst, History of Catholic Emancipation (2 vols., London, 1886); F. C. Hamilton, Life and Letters of Bishop Rawlinson (1862); W. H. Maiden, Life and Times of Cardinal Wiseman (2 vols., London, 1897); E. S. Purcell, Life of Cardinal Manning (2 vols., London, 1895); Bernard Wall, Dioceses and Religious Orders in England, 1776-1823 (2 vols., 1900). For the sufferings under the penal laws see, for general reference, R. Stanton, A Monology of England and Wales (with supplement, London, 1892), and Bishop Challoner's Missionary Priests (1741 ff.), which still remains the standard work on the subject.

English Law relating to Roman Catholics.—The history of the old penal laws against Roman Catholics in the United Kingdom has been sketched above and in the article on History.1 The principal English acts directed against "popish recusants" will be found in the list given in the acts repealing them (7 & 8 Vict. c. 102, 1824; 9 & 10 Vict. c. 59, 1846). The principal Scottish act was 1700, c. 3; the principal Irish act, 2 Anne c. 3. Numerous decisions illustrating the practical operation of the old law in Ireland are collected in G. E. Howard's Cases on the Popery Laws (1775). The Roman Catholic Emancipation Act 1829 (10 Geo. IV. c. 7), although it gave Roman Catholic citizens in the main complete civil and religious liberty, at the same time left them under certain disabilities, trifling in comparison with those under which they laboured under before 1829. Nor did the act affect in any way the long series of old statutes directed against the assumption of authority by the Roman see in England. The earliest of these which is still law is the Statute of Provisors of 1351 (25 Edw. III. st. 4). The effect of the Roman Catholic Charities Act 1832 is to place Roman Catholic schools, places of worship and education, and charities, and the property held therewith, under the laws applying to Protestant nonconformists. The Toleration Act 1715 (14 Geo. II. c. 9) does not apply to Roman Catholics, but legislation of a similar kind, especially the Relief Act of 1771 (31 Geo. III. c. 32), exempts the priest from parochial offices, such as those of churchwarden and constable, and from serving in the militia or on a jury, and enables all Roman Catholics scrupling the oaths of office to exercise the office of churchwarden and some other offices by deputy. The priest is, unlike the nonconformist minister, regarded as being in holy orders. He cannot, therefore, sit in the House of Commons, but there is nothing to prevent a peer or canon from being a deputy of the House of Lords. If a priest becomes a convert to the Church of England he need not be re-ordained. The remaining law affecting Roman Catholics may be classed under the following heads:—

1 No penalty.

(1) Office.—There are certain offices still closed to Roman Catholics. By the Act of Settlement a papist or the husband or wife of a papist cannot hold any office. The act provides that nothing therein contained is to enable a Roman Catholic to hold the office of guardian and justice of the United Kingdom, or of the Crown, or of any office in the Church of England or Scotland, or in the ecclesiastical courts, or in the establishment of the Queen of Great Britain or Ireland, or in the office of lord chancellor of the United Kingdom, or of any office in the Church of England or Scotland, or in the ecclesiastical courts, or in the establishment of the Queen of Great Britain or Ireland. The Lord Chancellor of England is now a Roman Catholic, who is the head of the Home Office, and the Home Secretary, the Attorney General, the Solicitor General, and the Lord Chief Justice of the Common Pleas are all Roman Catholics. The act provides that no Roman Catholic may be created a peer or knight, or be appointed to any office of state, or be made a justice of the peace or a high sheriff, or be made a regent or deputy regent. If any Roman Catholic holds or exercises any office of state, being a Roman Catholic, he is guilty of a misdemeanour and liable to punishment by fine and imprisonment.

(2) Religious Orders.—It was enacted by the act of 1829 that "every Jesuit and every member of any other religious order, community or society of the Church of Rome, or other sect or establishment, whether the same be called by the name of monastic or monastic religious vows was, within six months after the commencement of the act, to deliver to the clerk of the peace of the county in which he resided a notice or statement in the form given by the Act in such manner and form as the principal court of record before which his name was registered, or in such other manner or form as the court shall direct, that no part of such religious order coming into the realm after the commencement of the act shall be guilty of a misdemeanour and should be banished from the United Kingdom for life (with an exception in the case of natural-born subjects of the United Kingdom). If any person of any such religious order who is actually residing in the United Kingdom, whether or not such place was the seat of an archbishopric, bishopric or deanery. This act was, however, repealed in 1867, but the provisions of the act of 1829 are still in force.

(3) Superstitious Uses.—Gifts to superstitious uses are void both as against the law and as against the conscience of the giver. Gifts are to be regarded as gifts to superstitious uses. Like contracts contrary to public policy, they depend to a great extent for their illegality upon the discretion of the court in the particular case. The act of 23 Hen. VIII. c. 10 makes void any assurance of the use of lands having been added to the tenancy for ever, or for threecrore or fourscore years. The act of 1 Edw. VI. (more especially directed to the suppression of chantries) vests in the crown all money paid to the subterfuge, without regard to the finding or maintenance of any priest, or any anniversary or obit or other like thing, or of any light or lamp in any church or chapel. The land or property so obtained will not be retained if the annuity shall be still of value in the construction of old grants, and in affording examples of what the legislature regarded as superstitious uses. Gifts which the courts have held void on the analogy of those mentioned above, are frequently, we think, really void. The popularity of the theory of the soul of the testator, a bequest to certain Roman Catholic priests that the testator may have the benefit of their prayers and masses, a bequest in trust to apply a fund to circulate a book teaching the supremacy of the Pope, and similar bequests, the act of 31 Geo. III. c. 77, which created a taper for evermore before the image of Our Lady. The court may
compel discovery of a secret trust for superstitious uses. Since 2 & 3 Will. IV. c. 115 gifts for the propagation of the Roman Catholic faith are not void as made to superstitious uses. It should be noted that the law of 1539, which there is not cited respecting the Roman Catholic religion, though the question has generally arisen in the case of gifts made by persons of that religion. The Roman Catholic Charities Act 1860 enables the court to separate a lawful charitable object from a part of the use or provision therein made to a trust or provision deemed to be superstitious. It also provides that in the absence of any written document the usage of twenty years is to be conclusive evidence of the application of charitable trusts.

(5) Patronage.—A Roman Catholic cannot present to a benefice, prebend, or other ecclesiastical living, or collate or nominate to any free school, hospital or donative (3 Jac. I. c. 5). Such patronage is by the act vested in the sovereigns, (now the Crown by virtue of the City of London and twenty-five counties in England and Wales, mostly south of the Trent, Cambridge the remaining twenty-seven. The principle is affirmed in subsequent acts (1 Will. and Mary, sess. 1. c. 25; 12 Anne, st. 2. c. 14; 11 Geo. II. c. 17). If the right of presentation to an ecclesiastical benefice belongs to any office under the crown, and that office is held by a Roman Catholic, the archbishop of Canterbury exercises the right, or the time being Geo. IV. c. 5. s. 171. No Roman Catholic may advise the crown as to the exercise of its ecclesiastical patronage (Ibid. s. 18). A Roman Catholic, if a member of a lay corporation, cannot vote in any ecclesiastical appointment (Ibid. s. 19). Grants and devises of advowsons, &c., by Roman Catholics are void, unless for valuable consideration to a Protestant purchaser (11 Geo. II. c. 17, s. 5). Where a quaere impedit is pending before any court, the court may compel the patron to take an oath that there is no secret trust for the benefit of a Roman Catholic. (J. W.)

The Church in the United States.

The history of Roman Catholicism in the New World begins with the Norse discoveries of Greenland and Vinland the Good. In the former the bishopric of Gardar was established in 1112, and extinguished only in 1490. To the latter the coast of New England, the Northerns during the same period made "temporal visits for timber and peltries, or missionary voyages to evangelize for a season the natives." Beyond these facts, the Norse sagas and chronicles contribute little that is certain (cf. "The Norse Hierarchy in the United States," Amer. Cath. Quart. Review, April 1890). Although a bishop was appointed by the pope for the vaguely defined territory of Florida so early as 1528, the oldest Catholic community in what is now the United States dates from 1565, when the Spanish colony of St Augustine was founded. Hence the aboriginal tribes of the South were evangelized. In 1582 the missions of New Mexico were undertaken, and former Spanish colonies were made use of by the Pacific coast, especially in California. Early in the 17th century trading posts and mission centres were established on the coast of Maine, and during the same century French priests laboured zealously in northern New York, along the entire coast of the Mississippi from Wisconsin to Louisiana, and around the Great Lakes. Their principal concern was for the savages, whom they acquired an extraordinary influence. Political jealousies, human avarice and treachery arrested the progress of most of their missions.

The English colony of Maryland, planned by the Catholic Cecil George Calvert (1st Lord Baltimore), and founded (1634) by his son the Catholic Cecilus Calvert (2nd Lord Baltimore), and Pennsylvania, founded (1681) by the tolerant Quaker William Penn, first permitted the legal existence of Catholicism in English-speaking communities of the New World. It is from these centres that it spread during the 18th century. In 1784 the Rev. John Carroll was appointed prelate-apostolic for the Catholics of the English colonies hitherto dependent on the vicar-apostolic of London. In 1790 Father Carroll was made bishop of the see of Baltimore, and given charge of all the Catholic interests in the United States. There were in the year 1790 24,500 Catholics in the land, of whom number 15,800 were in Maryland, and 700 in Pennsylvania, 200 in Virginia and 1500 in New York. In 1807 they had grown to 150,000, with 80 churches. In the following year Baltimore found itself the first metropolitan see of the United States, with New York, Philadelphia, Boston and Bardstown as suffragans.

The growth of the Catholic population by decades since 1820 was calculated by a competent historian, the late John Gilmary Shea, as follows:

<table>
<thead>
<tr>
<th>Year</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1820</td>
<td>244,500</td>

</table>

The number in 1906 was 12,979,142 (U.S. Census, Special Report, 1910). The main source of this growth has been immigration. Originally the Irish and the Germans furnished the greater quota. Later the French-Catholics, who furnished about 12,000, and the Bohemians, who furnished about 15,000, were the chief contributors. Of the number; an appreciable percentage of Oriental Catholics is also found,—Greeks, Syrians, Armenians, &c. Natural increase, especially among the first Catholic immigrants, and a certain percentage of conversions from Protestantism, are contributory sources. Being under the protection of the constitution, and enjoying the advantages of the common law, Catholicism could not meet with any official opposition; such few outbursts of fanaticism as there had been were but temporary or local, and did not represent the true feelings of the country. As to the future of the Church in the United States, Catholicism is in accord with Christ's revelation, with American liberty, and is the strongest power for the preservation of the Republic from the new social dangers that threaten the United States as well as the whole civilized world. She has not grown, she cannot grow so weak and old that she may not maintain what she has produced—Christian civilization."

Internally, Catholicism in the United States has been free from any noteworthy schisms or heresies that might impede its development,—its doctrinal history offers nothing of importance. The discipline differs little from that of the other churches of the Catholic Church. The unity of doctrine, liturgy and moral ideals is preserved by an intimate union with the see of Rome. The general canonical legislation of the Church, the legislation by papal rescript and the Congregation of the Propaganda, the decisions of the Apostolic Delegation at Washington, and a certain amount of immemorial custom and practice, form the code that governs its domestic relations. Decennially each bishop of the United States is expected to pay a visit to Rome (Ad Limina Apostolorum), and to make a report of the spiritual condition of religion within his diocese. In addition a system of synods provides for local unity among the other Catholic bishops. Under the laws of 1825 and 1833, which have since been modified, no bishop is diocesan until he is 30 years of age, and is chosen by all the diocesan priests and bishops of the diocese. The number of bishops elected by popular vote is limited by the law to one. The Church's general and private charity: no diocese is without one or more such establishments. The actual government of the Church in the United States is represented by one cardinal, 14 archbishops, 83 bishops, 11,135 diocesan clergymen, the number of religious orders subject to episcopal supervision—in all 15,093 clergymen. There are 8072 churches with resident priests, and 4076 mission churches—in all 22,000 churches, at which number 179,000 students, are received. The weekly publications are printed in English and foreign tongues, to minister to the needs of the Catholic population. There exist also several literary and educational magazines and reviews of a high order of merit.

The principal religious events in the recent history of the Church were the holding of the Third Plenary Council of Baltimore (1884),...
of romance. Nor are they absent from the few specimens of ancient prose fiction which we possess. If the romantic form was ever more than a mass of fragments, it was certainly a romance, though one much mixed with satire, criticism and other things; and the various Greek survivals from Longus to Eustathius always and rightly receive the name. But two things were still wanting which were to be all-powerful in the romances proper—Chivalry and Religion. They could not yet be included, for chivalry did not exist; and such religion as did exist lent itself but ill to the purpose except by providing myths for ornament and perhaps pattern.

A possible origin of the new romance into which these elements entered (though it was some time before that of chivalry developed) has been suggested by K. J. Sauer. He called attention to the fact that the speculations above referred to in the hagiology or "Saint's Life," which arose at an early though uncertain period, developed itself pretty rapidly, and spreading over all Christendom (which by degrees meant all Europe and parts of Asia) provided centuries with their chief supply of what may be called interesting literature. If the author of On the "Saint's Life." Zenobia, there is no doubt that examples both sacred and profane of the kind of "fiction" ("imitation" or "representation") which he deprecated were multiplying close to, perhaps even before, his day. The Alexander legend of the pseudo-Callisthenes is supposed to have seen the light in Egypt as early as A.D. 200, and the first Greek version of that "Vision of Saint Paul," which is the ancestor of all the large family of legends of the life after death, is pretty certainly as old as the 4th century and may be as old as the 3d. The development of the Alexandrian was to some extent checked or confined to narrow channels as long as something like traditional and continuous study of the classics was kept up. But hagiology was entirely free from criticism; its subjects were immensely numerous; and in the very nature of the case it allowed the tendencies and the folklore of three continents and of most of their countries to mingle with it. Especially the comparative sobriety of classical literature became affected with the Eastern appetite for marble and unhesitating acceptance of it; and the extraordinary beauty of many of the central stories invited and necessitated embroidery, continuation, episode. Later, no doubt, the adult romance directly reacted on the original saint's life, as in the legends of St Mary Magdalene most of all, of St Eustace, and of many others. But there can be very little doubt that if the romance itself did not spring from the saint's life it was fostered thereby.

Proceeding a little further in the cautious quest—not for the definite origins which are usually delusive, but for the tendencies which avail themselves of opportunities and the opportunities which lend themselves to tendencies—we may notice two things very important to the subject. The one is that as Graeco-Roman civilization began to spread North and East it met, to appearance which approaches certainty, matter which lent itself gladly to "romantic" treatment. The gathering of matter. That such matter was abundant in the literature and folk-lore of the East we know: that it was even more abundant in the literatures and folk-lore of the North, if we cannot strictly be said to know, we may be reasonably sure. On the other hand, as the various barbarian nations (using the word in the wide Greek sense), at least those of the North, became educated to literature, to "grammar" by classical examples, they found not a few passages in these examples which were either almost romances already or which lent themselves, with readiness that was almost insistence, to romantic treatment. Apollonius Rhodius had made almost a complete romance of the story of Jason and Medea. Virgil had imitated him by making almost a complete romance of the story of Aeneas and Dido: and Ovid, who for that very reason was to become the most popular author of the middle ages early and late, had gone some way towards romancing a great body of mythology. We do not know exactly who first applied to the legendary tale of Troy the methods which the
pseudo-Callisthenes and "Julius Valerius" applied to the historical wars of Alexander, but there is every reason to believe that it was done fairly early. In short, during the late classical or semi-classical times and the whole of the dark ages, things were making for romance in almost every direction.

It would and did follow from this that the thing evolved itself in so many different places and in so many different forms that only a person of extraordinary temerity would put his finger on any given work and say, "This is the first romance," even putting aside the extreme chronological uncertainty of most of the documents that could be selected for such a position. Except by the most meteoric flights of "higher" criticism we cannot attain to any opinion as to the age and first developed form of such a story as that of Weland and Beadohild (referred to in the Complaint of Deor), which has strong romantic possibilities and must be almost of the oldest. The much more complicated Volsung and Nibelung story, though we may explore to some extent the existence backwards of its Norse and German forms, baffles us beyond certain points in each case; yet this, with the exception of the religious element, is romance almost achieved. And the origin of the great type of the romance that is achieved—that has all elements present and brings them to absolute perfection—the Arthurian legend, despite the immense labours that have been spent upon it and the valuable additions to particular knowledge which have resulted from some of them, is, still more than its own Grail, a quest unachieved, probably a thing unachievable. The longest and the widest inquiries, provided only that they be conducted in any spirit save that which determines to attain certainty and therefore concludes that certainty has been attained, will probably acquiesce most resignedly in the dictum that romance "grew"—that its birthplace is as unknown as the grave of its greatest representative figure.

But when it has "grown" to a certain stage we can find it, and in a way localize it, and more definitely still analyse and comprehend its characteristics from their concrete expressions.

Approaching these concrete expressions, then, without at first too hard and fast requirements in regard to the validation of the claims, we find in Europe about the 11th century (the time is designedly left loose) divers classes of what we should now call imaginative or fictitious literature: nearly all (the exceptions are Scandinavian and Old English) in verse. These are: (I) the saints' lives; (ii) the Norse sagas, roughly so-called; (iii) the French chansons de geste; (iv) the Old English and Old German stories of various kinds; (v) perhaps the beginning of the Arthurian cycle; (vi) various stories more or less based on classical legend or history from the tales of Alexander and of Troy down to things like Apollonius of Tyre, which have no classical authority of either kind, but strongly resemble the Greek romances, and which were, as in the case named, pretty certainly derived from members of the class; (vii) certain fragments of Eastern story making their way first, it may be, through Spain by pilgrimages, later, by the Crusades.

No, without attempting to fence off too rigidly the classical from the romantic, it may be laid down that these various classes possess that romantic character, to which we are, by a process of netting and tracking, slowly making our way, in rather different degrees, and a short examination of the difference will forward us not a little in the hunt.

With i. (the saints' lives) we have least to do: because by the time that romance in the full sense comes largely and clearly into view, it has for the most part separated itself off—the legend of St Eustace has become the romance of Sir Isumbras, and so forth. But the influence which it may, as has been said, have originally given must have been continually re-inforced by the romantic-dynamic suggestion of such stories as those of St Mary of Egypt, of St Margaret and the Dragon, of St Dorothy, and of scores of others, is quite unmistakable. Still, in actual result, it works rather more on drama than on narrative romance, and produces the miracle plays.
operation. But neither exhibits in any considerable degree the element of the marvellous, or the religious element, and the love interest itself is, even in *Horn*, simple and not very dramatically or passionately worked out. In the later *roman d'adventures*, of which the 13th century was so prolific (such as, to give one example out of many, *Amadas and Idoine*), these elements appear fully, and so they do in the great Auchinleck collection in English, which, though dating well within the 14th, evidently represents the meditation and adaptation of French examples for many years earlier.

The last of our divisions, however, exhibits the whole body of romantic elements as nothing else does. It is not our business in this place to deal with the Arthurian legend generally as regards origin, composition, &c., nor as an article, to look at it except for a special purpose and in connexion with and contradistinction to the other groups just surveyed. Here, however, we at last find all the elements of romance, thoroughly mixed and thoroughly at home, with the result not merely that the actual story becomes immensely popular and widely spread; not only that it receives the greatest actual development of any romantic theme; but that, in a curious fashion, it attracts to itself great numbers of practically independent stories—in not a few cases probably quite independent at first—which seem afraid to present themselves without some backing on (it may be of the loosest and most accidental description) to the great polycentric cycle, the stages of which gather round Merlin, the Round Table, the Grail and the Guinevere-Lancelot-Mordred catastrophe. All the elements, let it be repeated, are here present: war, love and religion; the characteristic extension of subject in desultory adventure-chronicles; the typical rather than individual character (though the strong individuality of some of the unknown or half-known contributors sometimes surmounts this); the admixture of the marvellous, not merely though mainly as part of the religious element; the presence of the chivalrous ideal. The strong dramatic interest of the central story is rather superadded to than definitely evolved from these elements; but they are still present, just as, though more powerfully than, in the weakest of miscellaneous *romans d'adventures*.

A further step in the miscellaneous and historical exploration of romance may be taken by regarding the character-and-story classes round which it instinctively groups itself, and which from the intense community of medieval literature—the habit of medieval writers not so much to plagiarize from one another as to take up each after each the materials and the instruments which were not the property of any—is here especially observable. Prominent above everything is the world-old motive of the quest; which, world-old as it is, here acquires a predominance that it has never held before or since. The object takes pretty various, though not quite infinitely various, forms, from the rights of the disinherited heir and the hand or the favour of the heroine, to individual things which may themselves vary from the Holy Grail to so many hairs of a sultan's beard. It may be a friendly knight who is lost in adventure, or a felon knight who has to be punished for his trespasses; a spell of some kind to be laid; a monster to be exterminated; an injured virgin or lady, or an infirm potente, to be succoured or avenged; an evil custom to be put an end to; or simply some definite adventure or exploit to be achieved. But quest of some sort there must almost certainly be if (as in *Sir Launfal*, for instance) it is but the recovery of a love forfeited by misbehaviour or mishap. It is almost a *sine qua non*—the present writer, thinking over scores, nay hundreds, of romances, cannot at the moment remember one where it is wanting in some form or another.

It will be observed that this at once provides the amnest opportunity for the desultory concatenation or congregation of incident and episode which is of the very essence of romance. Often, nay generally, the conditions, localities and other circumstances of the quest are half known, or all but unknown, to the knight, and he is sometimes intentionally led astray, always liable to be incidentally called off by interim adventures. In many (perhaps most) cases the love interest is directly connected with the quest, though it may be in the way of hindrance as well as of furtherance or reward. The war interest always is so connected; and the religious interest commonly—almost universally in fact—is an in-separable accident. But everything leads up to, involves, eventuates in the fighting. The quest, if not always a directly warlike one, always involves war; and the endless battles have at all times, since they ceased to be the great attraction, continued to be the great obloquy of romance. It is possible no doubt that reports of tournaments and single combats with lance and sword, mace and battle-axe, might be as tedious to the great mass of football match connoisseurs as to others. It is certain that the former were as satisfactory in former times to their own admirers as the latter are now. In fact the variety of incident is almost as remarkable as the sameness. And the same may be said, with even greater confidence, of the adventures between the fights in castle and church and monastery, in homestead or hermitage. The actual stories are not much more alike than those who have read large numbers of modern novels critically know to be the case with them. But the absence, save in rare cases, of the element of character, and the very small presence of that of conversation, show up the sameness that exists in the earlier cases.

This same deficiency in individual character-drawing, and in the conversation which is one of its principal instruments, brings out in somewhat unfair relief some other cases of apparent sameness—the "common forms" of story and of character itself. The disinherited heir, the unfaithful or wronged wife, the wicked stepmother, the jealous or wrongly suspected lover, are just as universal in modern fiction as they are in medieval—for the simple reason that they are common if not universal in nature. But the skeleton is more obvious because it is less clothed with flesh and garments over the flesh; the texture of the canvas shows more because it is less worked upon. Some of these common forms, however, are more peculiar to medieval times; and some, though not many, allow excursions into abnormalities which, until recently, were tabooed to the modern novelist. Among the former the wickedness of the steward is remarkable, and of course not difficult to account for. The steward or seneschal of romance, with some honourable exceptions, is as wicked as the baronet of a novel, but here the explanation is not metaphysical. He was constantly left in charge in the absence of his lord and so was exposed to temptation. The extreme and almost Ephesian consolability of the romance widow can be equally rationalized—and in fact is so in the stories themselves—by the danger of the fief being resumed or usurped in the absence of a male tenant who can maintain authority and discharge duties. While such themes as the usually ignorant incest of son with mother or the more deliberate passion of father for daughter come mostly from very popular early examples—the legend of St Gregory of the Rock or the story of Apollonius of Tyre.

The last point brings us naturally to another of considerable importance—the singular purity of the romances as a whole, if not entirely in atmosphere and situation, yet in language and in external treatment. It suited the purposes of the Protestant controversialists of the Renaissance, such as our own Ascham, to throw discredit upon work so intimately connected with Catholic ceremony and belief as the *Morte d'Arthur*; and it is certain that the knights of romance did not even take the benefit of that liberal doctrine of the *Cursor Mundi* which regards even illicit love as not mortal unless it be with spouse or sib. But if in the romances such love is portrayed freely, and with a certain sympathy, it is never spoken of lightly and is always punished; nor are the pictures of it ever coarsely drawn. In a very wide reading of romance the present writer does not remember more than two or three passages of romance proper.
ROMANCE

(that is to say before the later part of the 15th century) which could be called obscene by any fair judge. And the term would have to be somewhat strained in reference even to these. The contrast with the companion divisions of fabliaux and farces is quite extraordinary; and nearly as sharp as that between Greek tragedy on the one hand and Greek comedy or satiric plays on the other. It is brought out for the merely English reader in Chaucer, of course, but in him it might have been studied. In the immense corpus of known or unknown French and English writers (the Germans are not quite so particular) it comes out with no possibility of deliberation and with unmistakable force.

The history of the forms in which romance presents itself follows a sufficiently normal and probable course. The oldest are always—save in the single case of part of the Arthurian division, in which we probably possess none of the actually oldest, and in some of the division of Antiquity which had a long line of predecessors in the learned languages—the shortest. They become lengthened in a way continued and exemplified to the present moment by the tendency of writers to add sequels and episodes to their own stories, and made still more natural by the fact that these poems were in all or almost all cases recited. “Go on!” is the most natural and not the least common as well as the most complimentary form of “Bravo!” and the reciter never seems to have said “no” to the compliment. In not a few cases—Huon of Bordeaux, Ogier the Dane, Guy of Warwick, are conspicuous examples—we possess the same story in various stages; and can see how poems, perhaps originally like King Horn of not more than a couple of thousand lines or even shorter in the 13th century, grew to thirty, forty, fifty thousand in the 15th. The transference of the story itself from verse to prose is also—save in some particular and still controverted instances—regularly traceable and part of a larger and natural literary movement. While, also naturally enough, the pieces become in time fuller of conversation (though not as yet often of conversation that advances the story or heightens its interest), of descriptive detail, &c. And in some groups (notably that of the remarkable Amadis division) a very great enlargement of the proportion and degradation of the character of the marvellous element appears—the wonders being no longer mystical, and magical only in the lower sense.

And so we come to the particular characteristics of the kind or kinds in individual examples. Of these the English reader has a matchless though late instance in the Morte d’Arthur of Malory, a book which is at once a corpus and a pattern of romance, in gross and in detail. The fact that it is not, as has been too hastily or ignorantly asserted, a mere compilation, but the last of a singular series of rehandlings and redactions—conducted with extraordinary thoroughness for the most part indistinctly traceable instinct of genius—which makes it to some extent transcend any single example of older date and more isolated composition. But it displays all the best as well of some of the less good characteristics of most if not all. Of the commonest kind—the almost pure roman d’aventures itself—the Gareth-Beaumains episode (for which we have no direct original, French or English, though Lybius Disonius and Iomedon come near to it in different ways) will give a fair example; while its presentation of the later chapters of the Grail story, and the intertwined plot and continuing catastrophe of the love of Lancelot and Guinevere, altogether transcend the usual scope of romance pure and simple; and introduce almost the highest possibilities of the romance medium in every way in which Malory or his immediate authorities have extruded the tedious wars round the “Rock of the Saxons,” have dropped the awkward episode of the false Guinevere, and have restrained the uninteresting exuberance of the continental wars and the preliminary struggles with the minor kings, keeps the reader from contact with the duller sides of romance only. Of the real variety which rewards a persistent reader of the class at large it would be impossible to present even a miniature hand-index here; but something may be done by sample, which will not be mere sample, but an integral part of the exposition. No arbitrary separation need be made between French and English; because of the intimate connexion between the two. As specially and symptomatically noteworthy the famous pair—perhaps the most famous of all—Guy of Warwick and Bevis of Hampton, should not be taken. For, with the exception of the separation of Guy and Felise in the first, and some things in the character of Josiane in the second, both are somewhat spiritless concoctions of stock matter. Far more striking than anything in either, though not consummately supported by their context, are the bold opening of Blanchandie et l’Orguilleuse d’amour, where the hero begins by kissing a specially proud and prudish lady; and the fine scenes of fight with a supernatural foe at a grave to be found in Amadis et Idoine. Reputation and value coincide more nearly in the charming fairy story of Parthenopey de Blois and the Christian-Saracen love romance of Flore (Florence and other forms) et Blanchefleur. Few romances in either language, or in German, exhibit the pure adventure story better than Christian de Troyes’s Chevalier au Lyon, especially in its English form of Gawain and Gawayne; while the above-mentioned Lybius Disonius (Le Beau Disonius) makes a good pair with this. For originality of form and phrase as well as of spirit, if not exactly of incident, Gawayne and the Green Knight stands alone; but another Gawain story (in French this time), Le Chevalier aux deux épées, though of much less force and fire, exceeds it in length without sameness of adventure. Only the poorest romances—those ridiculed by Chaucer in Sir Thopas—which form a small minority, lack striking individual touches, such as the picture of the tree covered with torches and carrying on its summit a heavenly child, which illuminates the huge expanse of Durnart le Galois. The various forms of the Seven Wise Masters in different European languages show the attitude of the Western to the Eastern fiction interestingly. The beautiful romance of Emard is about the best of several treatments of one of the exceptional subjects classed above—the unnatural love of father for daughter, while if we turn to German stories we find not merely in the German variants of Arthurian themes, but in others a double portion of the mystical element. French themes are constantly worked up afresh—as indeed they are all over Europe—but the Germans have the advantage of drawing upon not merely Scandinavian traditions like those which they brought into the Nibelungen Lied and Gudrun, but others of their own. And both in these and in their dealings with French they sometimes show an amount of story-telling power which is rare in French and English. No handling of the Tristan and Isolde story can compare with Gottfried’s; while the famous Der arme Heinrich of Hartmann von Aue (the original of Longfellow’s Golden Legend) is one of the greatest triumphs and most charming examples of romance, displaying in almost the highest degree possible for a story of little complexity all the best characteristics of the thing.

What, then, are these characteristics? The account has now been brought to a point where a reasoned résumé of it will give as definite an answer as can be given.

Even yet we may with advantage interpose a consideration of the answer that was given to this question universally (with a few dissentients) from the Renaissance to nearly the end of the 18th century and not infrequently since; while it is not impossible that, in the well-attested revolutions of critical thought and taste, it may be given again. This is that romance on the whole, and with some flashes of brilliant originality, is capable of infinite variety, and of ill-told stories, combining sameness with extravagance, outraging probability and the laws of imitative form, childish as a rule in its appeal to adventure and to the supernatural, immoral in its ethics, barbarous in its aesthetics, destitute of any philosophy, representing at its very best (though the ages of its lowest appreciation were hardly able even to consider this) a necessary stage in the education of half-civilized peoples, and embodying some interesting legends, much curious folklore and a certain amount of distorted historical evidence. On
the other hand, for the last hundred years and more, there have been some who have seen in romance almost the highest and certainly the most charming form of fictitious creation, the link between poetry and religion, the literary embodiment of men's dreams and desires, the appointed neophyte of more sophisticated ages as it was the appointed pastime of the less sophisticated. Between these opposites there is of course room for many middle positions, but few of these will be occupied safely and inexpugnably by those who do not take heed of the following conclusions.

Romance, beyond all question, enmeshes and retains for us a vast amount of story-material to which we find little corresponding in ancient literature. It lays the foundation of modern prose fiction in such a fashion that the mere working out and building up of certain features leads to, and in fact involves, the whole structure of the modern novel (q.v.). It antiques (by a sort of gradual "taking for granted") the classical assumption that love is an inferior motive, and that women, though they "may be good sometimes" are scarcely fit for the position of principal personages. It helps to institute and ensure a new unity—the unity of interest. It admits of the most extensive vagueness in plot to the imagination which exceeds that of any known older literary form. It best fits the new or Christian morality, if not in a Pharisian yet in a Christian fashion, and it establishes a concordat between religion and art in ways more than this. Incapable of exact definition, inclining (a danger doubtless as well as an advantage) towards the vague, it is nevertheless comprehensive for all its vagueness, and, informal as it is, possesses its own form of beauty—and that a precious one. These characteristics were, if perceived at all by its enemies in the period above referred to, taken at their cost; they were perceived by its champions at the turn of the tide and perhaps exaggerated. From both attacks emerged that distinction between the "classic" and the "romantic" which was referred to at the beginning of this article as requiring notice before we conclude. The cruder, but it must be remembered the most intentionally crude (for Goethe knew the limitations of his saying), is that "Classicism is health; Romanticism is disease." In a less question-begging proposition of single terms, classicism might be said to be method and romanticism energy. But in fact sharp distinctions of the kind do much more harm than good. It is true that the one tends to order, lucidity, proportion; the other to freedom, to fancy, to caprice. But the attempt to reimpose these qualities as absolutely distinguishing marks and labels on pastic works is almost certain to lead to confusion and clutter, and there is more than mere irony in the perspicuous who defines romance as "Something which was written between an unknown period of the Dark Ages and the Renaissance, and which has been imitated since the later part of the 18th century." What that something really is is not well to be known except by reading more or less considerable sections of it—by exploring it like one of its own forbidden countries. But something of a sketch-map of that country has been attempted here.

"Illustrate and reinforce the above, see in the first place articles on the Romance national literatures, especially French and Icelandic; as also the following:—

Classical or Pseudo-Classical Subjects.—Apollonius of Tyre; Longus; Heliodore; Apuleius; Troj; Renaut de Montauban; Julius; Alexandre the Great; Hercules; Jason; Oedipus; Virgil.

Arthurian Romance.—Arthur; Gawain; Perceval; Lance-Loth; Merlin; Tristan; Round Table; Grail; and the articles on romance writers such as Malory, Wolfram von Eschenbach, Chrétien de Troyes, Gottfried of Strassburg, &c.

French Romance.—Charlemagne; Guillaume d'Orange; Doon of Barony; Heloise; Th尔is; Roland; Renaud de Montauban; Auban (Quatre fils Aymon); Huon of Bordeaux; Girart de Roussillon; Amiset Amiles; Macaire; Partonopeus of Blois; Roland the Fils; Flore and Blanchefleur; Garin le Loheran; Raoul de Camelie; Guillaume de Palerne; Adene le Roi; Benoit de Sainte-Mere, &c.

Anglo-Norman, Anglo-Danish, English Romance.—Bevis of Hamp- ton; Horn; Havelok; Guy of Warwick; Robin Hood; Maid Marian.

German.—Nibelungenlied; Ortlin; Dietrich of Bern; Wolfi; Dietrich; Heldenhuch; Waltharius; Gudrun; Hildebrand; Lay of; Roodlier; Northern.—Siegurd; Wayland; Hamlet; Edda.

Spanish.—AMADIS de Gaula; Various.—Reynard; Roman de la Rose; Gresilda and kindred stories; Geneviève de Brabant; Gesta Romanorum; Barlaam and Josaphat; Seven Wise Masters; Maeldune, War of.

Authorities.—The first modern composition of importance on romance (putting aside the dealings of Italian critics in the 16th century with "the narrom art, classical union") is the very remarkable dialogue De la Lecture des vieux romans written by Chapelain in mid-17th century (ed. Feillet, Paris, 1870), which is a surprising and thoroughgoing defence of its subjects. But it is after that appeared a little more elaborate and mostly quite ignorant depreciation. The sequence of really important serious works almost begins with Hurd's Letters on Chivalry and Romance (1762). In succession to this may be con- censed on the general subject (which alone can here regarded) the dissertations of Percy, Warton and Ritson; Sir Walter Scott, "Essay on Romance" in the supplement to the Encyclopaedia Britannica (1816-24); Dunlop, History of Fiction (1816, to be usefully supplemented and completed by its latest edition, 1888, with very large additions by H. Wilson); Wolff, Allgemeine Geschichte des Romans (Jena, 1841-50); Ward, Catalogue of Romances in the British Museum (vol. i. 1835, vol. ii. 1849) (the most valuable single contribution to the knowledge of the subject); G. Saintsbury, The Flourishing of Romance and the Rise of Allegory (Edinburgh, 1867), and its companion volumes in Periods of European Literature (ed. P. Ker, London, 1878-81); The Mid-Twelfth Century (1899); Gregory Smith, The Transition Period (1900); Hannay, The Later Renaissance (1898); W. P. Ker, Epic and Romance (1897).

(G. S.)

ROMANOE LANGUAGES, the name generally adopted for the modern languages descended from the old Roman or Latin tongue, acted upon by inner decay or growth, by dialectic variety, and by outward influence, more or less marked, of all the foreign nations with which it came into contact.

During the middle ages the old Roman Empire of the Latin-speaking world was called Romania, its inhabitants Romanists (adj. Romanicis), and its speech Romanicum, Vulgar Romanico, Italian Romanico, from Romance loquor—to speak Romance; in Old French nominative romans, objective roman(i), Modern French roman, "a novel," originally a composition in the vulgar tongue. In English some moderns use Romanic (like Germanic, Teutonic) instead of Romance; some say Neo-Latin, which is frequently used by Romance-speaking scholars. By successive changes Latin, a synthetic language, rich in inflexions, was transformed into several cognate analytical tongues of few inflexions, most of the old forms being replaced by new. The Latin words. As the literary language of the ancient Roman civilization died, as the written language of the barbarism of the middle ages, all the forms of the old classical language being confounded in the most hopeless chaos, suddenly new, vigorous and beautiful tongues sprang forth, ruled by the most regular laws, related to, yet different from, Latin. How was this wonderful change brought about? How can chaos produce regularity? The explanation of this mystery has been given by Dizé; the great founder of Romance philology. The Romance languages did not spring from literary classical Latin, but from popular Latin, which, like every living speech, had its own laws, not subject to the changing literary fashions, but to the slow process of phonetic change and dialectic variety. It is interesting to observe that this is handed down to us in the oldest Latin literature (notably in the vocabulary) reappears in the most recent phase of Latin—the Romance languages. Thus, a verb nivere, "to snow," is known to Pacuvius, but does not again appear until the time of Venantius Fortunatus, and then with a change of conjugation —nivere, while it has now a new term of life in French and Rhaeto-Romantic dialects. It is obvious that there was no break of continuity—in the vulgar language, for if in the later imperial ages a verb had been formed from nivis, nivis, it must have been nivere, et niviere (Fr. neiger). Here especially the words of Horace come true:—

"Multa renascentur, quae jam ceciderunt, cadentque
Quae nunc sunt in honore vocabula, si volet usus,
Quem penes arbitrium est et jus et norma locundi."
The present article, embracing all the Romance languages, aims at tracing on the one hand their common origin and their common development, on the other hand at pointing out the peculiarities of the individual languages and the possible explanations of the growth of these peculiarities. Their common development may be marked out under Latin language. The relation of the early vulgar Latin to the language, the spread of Latin following the spread of Roman rule, the prevalence of Latin over Osco, Umbrian, Etruscan, and late Iberian and Gallic—all these matters concern rather the history of Latin than of the Romance languages. But we may say broadly that the language spoken throughout the Roman Empire at the time of Augustus was fairly uniform, and that differentiations took place (varying according to regions) which were not, however, strongly marked, and which even tended to be obliterated in later times.

The main causes of these variations were twofold. (1) The process of Romanizing the various districts took place at epochs far remote from one another, and hence the late epoch itself was modified. (2) We have the reaction on Latin of the languages of the pre-Roman peoples, which will be discussed later.

Applying this first point of view, we should find that the oldest form of Latin (oldest, that is, for our present purposes) was introduced into Sardinia (256 B.C.); next comes Spain (197 B.C.), Illyria (167 B.C.), and Gaul (150 B.C.), Dacia (147 B.C.), and Raetia (15 B.C.). And we can actually trace some of the results of these differences in date, chiefly perhaps in the vocabulary and morphology of the Romance languages. When, for example, we compare the Latin words *adest* and *ad* with the Osco-Umbrian *ad* (26), *ad* with *ador* with French *avant* and Italian *prima* we may infer that it was unknown to the Latin introduced there, and conversely that Latin still used the ancient *cova* (Sp. *cova*, "cava") and not the more recent *cava* (Ital. *cava*), also *domus* or *gumia*, which we only know from Lucilius, Sp. *dema*, *goma*.

We may be justified in assigning to these historic causes the breaks and the divergences from the original uniformity. Neither active intercourse, nor the displacement of tribes and nations brought about by the exigencies of military or colonizing enterprise, ever effected a complete fusion of these divergences. To this we must add the differentiations, etc., of later times.

To begin with, we seem to find in Italy itself, among the Italic population in country districts, the survival of isolated forms which had been discarded by the literary language with its levelling tendencies, and in consequence also by what may be called "Averaged Latin" (Durchschnittlatein). In early Latin *d* becomes *r* before labials, e.g. *ar me advenias* occurs in Plautus; *arveor, arger* from *asper are the ancient forms. Only *arbor* has survived as a word of the language of commerce and business (Bocce of Verona, etc.). *Arger* was displaced by *advenio* in Abruz. *Arbor* has become *arborius*, *gese arveniarii*; *Arbuz, armuri*; *to put out the fire*, represents Lat. *armoris* instead of *adormirius*; *arbukdo* is found beside *Italian obsolete.*

All these forms are only attested in Italy, and they may by reason of their prefix be classed as Umbrian, since in Umbrian *ar* for *ad* is even commoner, cf. the name-places *Arlesfaile* in Molise, which in Latin would be *ad* *stabile*, save that the limitation to the cases that are in line with the Latin rule prove precisely that this is not a case of Umbrian influence, but of a preservation of ancient and popular forms. Beyond the limits of Italy *arger* has been preserved, e.g. Sp. *arcan*, and not only Ital. *argere;* further *armissarius*, *stallion,* in the Lex Salica and in Rum. *armesori*; perhaps Sp. *almuerzo*; *breakfast,* for *armuzo* beside Lat. *adormirius.*

In the second place we have, especially in Italy, clearly Umbro-Osco forms. Contrary to Latin use, these two dialects, the most important in ancient Italy, have *f* between vowels from an early *bh*, *d*, as against Latin *b*, *d,* and Umbrian, Paelignan, &c., *b*, *d,* from an early *ei*, *oi,* as against Latin *i,* *e,* *o,* as against Latin *i,* *e,* *o,* in the (en)glosses, as against Latin *cribrat,* is both by right of its vowel and consonant, an Umbrian form. And with this we must compare Ita. *cabuliosus*, "to eat;" Lat. *tabulari,* tenso,* horsely,* beside Lat. *tabunus;* bialo, beside Lat. *cabulios.* Further, Neap. *Otufre,* "October," *mortendere,* *eye-teeth,* Lat. *mordente,* &c. There is a special interest in cases like the French *marais,* "marsh," for the Ita. *marais,* "marsh," and its Roman, *marais,* "marsh," as *manphrus,* which is not Greek, its *ph* notwithstanding, but which owing to its *f* we must take to be Osco-Umbrian; while the corresponding Latin form would be *mardar.* The Latin supplies the French, the Osco-Umbrian the Italian form. As to the other

In this way we might amplify examples, and it should not escape notice that we have to deal chiefly with substantives, with few adjectives and hardly any verbs.\(^1\)

In precisely the same way the Spanish vocabulary must have been extended by the Romans in Spain. The process of elimination took place more rapidly and thoroughly in this case, so that the number of Iberian or Celtic-Iberian words that have resisted time and change is much larger than in the whole Romance language. A Latin inscription from Spain indicates that the language of the Romanized people of the region, \(\textit{Punic}^2\), and probably of the later Iberian,\(^3\) in this sense. As the Iberian does not know the sound \(p\), the word cannot be Iberian, and must be Celtic.

This distinction is a hard one, and it is often difficult to assign a word to one family or another. It is often necessary to identify a word, as Sp. and Port. \textit{baja} prove—doubtless an Iberian word, since Fr. \textit{baie} and Ital. \textit{baja} are forms quite recently borrowed from Spanish. This \textit{baja} is perhaps somewhat connected with the place-name \textit{Bayona}, a Latin name of uncertain derivation; \(\textit{bayon}^2\) and \(\textit{lebayon}^2\), the names of two towns in France and Spain, are of Iberian and not Celtic origin.\(^4\)

Later we find this same change throughout the whole of south and central Italy, and even in Rome, whereas it is not observed in Tuscany, north Italy and other Roman countries. We may therefore say that this has influenced the whole fabric of the Oscan-Umbrian dialects. Similarly it is in accordance with Umbrian pronunciation to convert breathed plosives into voiced after nasals, \(\textit{spina} = \textit{L. spinae}^4\); and similarly we have \(\textit{d}^4\) in \(\textit{lusca}^4\), Italian name of the fish of the same name. This may be due to influence of the ancient Osco-Umbrian languages. But in even this particular the change affects not only the regions of ancient Umbria, but also those of the Oscans and Messapians, though again influence from the Latin and other early Romance dialects of the Latinized part of the ancient Messapians was. And finally, we find the \textit{Latin} \(d\) represented in Umbrian between vowels by a sound which has a separate sign in the national alphabets and which has not been represented as \(d\). But \(d\) is a new sound which is a combination of two, and probably this combination we may say with certainty.

It has always been maintained that French \(u\) (pronounced as German \(\textit{a}\)) derived from \(i\), is due to the influence of Gallic. The \(i\) of some cases of the Latin is identified with the whole area of the French language except part of the Wallon, part of French Switzerland, and Piedmont, Genoa, Lombardy, the Grisons, Tirol and the northern part of the Emilia, but not Friuli, Venetia and Istria. Hence, in the language of Gallic, the \(i\) which \(u\) must be regarded as an intermediary step, that may therefore have existed in Gallic. But in the first place we must observe that Greek writers always render the Gallic \(i\) by \(e\), never by \(u\); that the Romans too render \(i\) by \(e\) never by \(u\); that the \(u\) in such cases is identified almost exclusively with the whole area of the ancient Gallic languages.

And since the preliminary stage of the Fr. \textit{fait} from \textit{factum}, \textit{nuit} from \textit{noscere}, is likewise \(ch\) it is natural to suppose a relation between these facts, and the more so because the Iberian Peninsula, in the course of its development, came to take the position which the Latin took in the western provinces and the Latin character of the Gaulish became evident. Hence, the \(i\) was a definite characteristic of the Gallic Romance of Italy to the peculiarities of the Gallic accent. It is assumed that there was a decided stress-accident, which brought about an over-emphasis of the stressed syllable, and that the vowel in the accented syllable was of a marked weakening of the unaccented vowels, and particularly of those following the stressed syllable. Here again we can only say that Gallic itself affords no evidence for this assumption, and that, on the contrary, this peculiar accentuation may be due to other reasons, unknown to us. To turn to morphology, the method of enumerating—as we find it, for example, in Fr. \textit{quatre-vingts}, etc.—was apparently to Gallicize.

But even if we admit certain regional variations, all these were overlaid by an \textit{Average Latin} which presents a number of essential features uniformly throughout the area, and which differed only in degree. These of course are not limited to the \textit{have} sequence) are as follows: (1) Loss of final \(m\) in polysyllabic words (which we find exemplified in the very oldest inscriptions); (2) loss of final \(j\) which outside the town was of great antiquity \(\textit{cf.}\) \textit{anser}, and at the beginning of imperial times was fairly common; (3) loss of \(b\) before \(s\) coupled with the lengthening of the vowel, for which Varro is evidence in his alternations of \(\textit{bius}\) and \(\textit{bisus}\) (\textit{L. bisus, O. Fr. bisus, Mod. Fr. \textit{dessus}}). Toward the end of the Roman empire it is lost before \(e\) and \(i\) in \textit{vice}, \textit{viris} instead of \textit{viris}, \textit{ratae} instead of \textit{ratae} (Ital. Sp. \textit{rio}, \textit{anticus} instead of \textit{antiquus} (Italian \textit{antico}).

In the first century B.C. became \(r\) between vowels, thus merging itself into the latter sound, so that in examining the Romance languages it is impossible to decide whether the original was \(r\) or \(l\). And this change spreads in sentences to the singular, the number of inscriptions being much more limited. We have the case of \(d\) and \(t\)—e.g. \textit{veulus} (Ital. \textit{vecchio}, Fr. \textit{veau}), \textit{pricius} (Ital. \textit{prizio}, Fr. \textit{pris}), etc. Here we may see that the reduction of \(d\) before vowels, of \(s\) before \(e\) and \(t\), and of \(z\) to a single sound, \(j\), or rather \(dj\), in consequence of which we have \textit{disurnum} (Ital. \textit{giorno}, Fr. \textit{jour}), \textit{juventis} (Ital. \textit{giovane}, Fr. \textit{jeune}); \textit{ger} (Ital. \textit{germanico}, Fr. \textit{germain}) as \textit{zelosus} (Ital. \textit{geloso}, Fr. \textit{jalousie}), all represented by the same form.

To turn to vowels, we must first notice that, according to Varro, \(ae\) was pronounced \(a\) in the country, but that in the cities the pronunciation changed to \(e\) and \(i\). This change was first only admitted during the course of the 1st century A.D. If this is an instance of an early spreading of a rustic pronunciation, we have in another case a victory for that of the bourgeoisie and aristocracy. For the class \(a\) began to lose its identity, which explains why Appius Claudius Pulcher changed his name to Clodius when he deserted the patricians and went over to the plebeians. The 1st century A.D. also witnessed the change of the inscriptions of the Empire for \(au\) to this day with little or no change (cf. Rum. \textit{au}, Prov. \textit{ausir}, Port. \textit{ausir}), the change from \(au\) to \(ch\), where the \(ch\) could only have arisen before \(a\), not \(e\), so that one may assume that the \textit{Average Latin}, always preserved the \(au\).

Then, without entering into detail, we must mention the phenomenon of the}
The vowel-system that developed in course of time is thus as follows:—

\[
\begin{array}{c|c|c|c}
& \text{I} & \text{E} & \text{I} \\
\hline
\text{I} & \text{E} & \text{I} & \text{I} \\
\text{E} & \text{E} & \text{I} & \text{I} \\
\text{I} & \text{I} & \text{I} & \text{I} \\
\end{array}
\]

\[\text{U}\]

In the department of flexion we find less radical changes. The genitive was the first case to disappear. In general its functions were usurped by the preposition de. But for the possessive sense the greater renovation was done by the archaistic fem. magister, in an inscription from Gaul. The accusative serves for the case after prepositions under all circumstances, and therefore even in places where the older language used the ablative, e.g. magister cum suis *did not accept*:

Nouns of the third declension with monosyllabic nominative, e.g. lens, stips, ars, &c., form a disyllabic nominative, e.g. lentis, stiperis, &c., but the fem. stiperis is frequent, especially in the *accented* form, stiperi, stilis, fem. stilias, stilis, are found in several inscriptions, but do not belong to the common language, since, as we have already said, they are not at home in the Iberian peninsula. On the other hand, all the Romance languages show that *are* took the place of *o*. The use of *ille* as personal pronoun, and also of *ipse*, and of both these forms as articles, dates from ancient times. We find a parallel to the weakening of these demonstratives in the combination in the singular, e.g. cubitus instead of cubitum, and there are converse cases. The absorption of the fourth declension by the second is almost complete. In the few nouns that remain, e.g. *pupillus*, *pupilla*, the frequent use of *infinitive* is a frequent and deverbal formation, the explanation of the phenomenon in both cases being psychological rather than formal. Populare language is not familiar with the future, and the present—by *present*, I mean the strictly present, a vulgar person deals only with the present or the past. The case of the passive is similar. The transposition of active into passive is too complicated a process for the simple mind. The objective, the action remains the object; when the subject is present the action is not known, they resorted to the indefinite third person plural, e.g. vendunt *casam* is the popular mode of expressing *domus venditur*. And further, the perfect *amatas* was replaced by *averat* or *averat*.* sine loco* a perfect and could only be found in the combination of the future and the passive, over the function of a present. For the moment, all other tenses and moods of the verb were preserved, only of the infinitive forms, the gerundive, perfect infinitive, and the two perfects. Of the gerundive, all tenses remained but the subjunctive and optative. In compensation, however, we soon find a form *habbo cantatam* springing up beside *cantari* in use as perfect, e.g. *litteras scriptas habo* meant in the first instance, I possess letters, with whom I communicated letters; but later this usage is limited to cases where the owner is also the originator of the state of things expressed in the participle, and thus it attains to the force of a perfect.

There is little change in the formation of individual verb-forms. It is natural that the infinitives *esse*, *velle*, *posse*, being exceptional, should have been brought into line with all the rest. This was done by simply adding *-re* on to *esse* (Ital. *essere*, Fr. *être*), while the other two were constructed from the forms of the verb whose ending was *-er*, or from the perfect, e.g. *vadebam* *potestam*, *volui*, *potui*, gave rise to: *volere*, *potere*, on the analogy of *dociem* *docui*, *montaem*, *montu*, *novebam*, *noveui*, &c.; with *noveri*, *noverit*, *noverit*, the *noveri* *noverit*, Sp. and Port., *noverit*, *noveri*, was added. In other infinitives there is much confusion, especially as between *-ere* and *-ire* formed, noticed by the Latin grammarians themselves: we have evidence, too, that at that early stage of the formation of an *-er* and *-ire* derived from a *-a* and *-air* as the initials, e.g. *Plautus has mortire (Ital. morire, Fr. monirir, Sp. morir, Rum. murit)*; Lucretius has *suprire*; Cato has *fordire*.

For the rest we should observe three important points: first, without *-u*, as *asisti*, *asiti*, *arunt*, infected the first person singular, e.g. *-eri* instead of *-ervi*. A new type in *-iri* arose on the model of *-erd* and then affected other verbs in *-erde*, e.g. *descendendi* (in Gellic *prendendii*). This last, in reducing the general verbs of the third conjugation. But its spread was slow, so that it can scarcely be said to have been common to all the languages.

In the formation of words the popular or vulgar language probably had far greater freedom in the written language. We find not only a marked preference for diminutives in *-ulus* and *-ulus*, but many other types are established, or new ones created. And as the chief ones we must mention the post-verbals introduced out of verbs. Thus *pugnare*, being itself derived from *pugna* (see above), the pattern and these formations soon became extremely common, and not only in *-e* verbs, but also in *-ere* verbs, it ending with *g* (not to be confused with the later *-er* *dolus, -ere, -ere* (Rom.), *dux, -er* (Rom.), *nux, -er* (Rom.), *ducil, -er* (Rom.), *deaev*, *-er* (Rom.). As examples of other types we have *-gra* beside *-er*, which we can trace back to *ardere*, a contamination of *order* and *arsara*, which extended to *farsara*; also to *sirtire* before *-are* as an attempt to conjugate, which also had separated both in form and in meaning from the verbal-system and had become adjectives, whose *t* was left to be part of the stem. Another feature of the verb in the gradual regrowth of the individual forms from the participle, e.g. *comiare*, *adjuvare*, *suorre*, &c., in *-omare, -are*; *comiare, adjuvare, aurae*, *adjuvare, adjuvare, adjuvare*, &c., for denominatives *-iare* and the Gr. *-iare* (Ital. *aggiare, Fr. -e*, *-er*, Sp. *-er, *-yer*). But the latter particle spread most rapidly, and soon took precedence over the other conjunctions, not only in the cases just mentioned, but in introducing object-, subject- and final-casuses.

Among points of syntax we may single out the replacing of the infinitival sentences (following verbs of seeing, feeling, hearing, wishing) by clauses with *ut, quod, or ea*, while in the Vestal 

2. C. M. Bartoli, "Das Dalmatische" (1906), (Schriften der Balkan-Kommission der K. Akademie der Wissenschaften, Abteilung, Bd. iv. and v.)
In Dalmatian e before e are always preserved as velars, and in south Sardinian and in Rumanian the palatalization is more recent, and secondary. The preservation of the tenues between vowels as distinguished from the fortis b has appeared in the Rhonian, or their sound was rounded as a consequence of the loss of Sardinian used breathes lenes in their place, while the dialect of Nuoro, in Sardinia, preserved the fortis, we have every ground for assuming that central nuoro is an isolated form, the form of the dialects of Nuoro is a form not preserved a few centuries earlier. Moreover, south Italy, Sicily and a large part of central Italy as far as the Apennines replace the old Latin tenues either with breathed fortis or breathed lenes, in contrast to the region of Dalmatian, which we are still in existence. All these phenomena may perhaps be explained in conjunction with two historical events. By the abandonment of the province of Dacia (in a.D. 270), Rumanian lost its close touch with the Latin, and its consequent period of contact with the spoken, under Diocletian and Constantine necessarily entailed a linguistic division. At that epoch the linguistic conditions were roughly as follows:

The principal changes in the vowel-system, especially the development of qualitative beside quantitative variations, had been accomplished, but there was still a difference between i and u, a and o.

The old future had disappeared, and no tendency to produce a substitute had as yet appeared. The Latin pluperfect subjunctive still maintained its old usage, probably also the imperfect subjunctive and the future perfect. In declensions the type membra, s, had been lost, and that at a time when every trace of a group under Diocletian and Constantine necessarily entailed a linguistic division. The former epoch the linguistic conditions were roughly as follows:

On the given basis the various languages carried on their various developments, influenced partly by the origin of other idioms, partly by causes unknown to us. Among neighbouring idioms, Greek had by right of its degree of civilisation and its political power great influence in giving Rumanian and South Italian a similar character, and that in time when every trace of a group under Diocletian and Constantine necessarily entailed a linguistic division. Graphical connexion between these two language-groups had long vanished. Thus, the placing of the construction "I will come" by "I will that I come" took its rise in Greece and was passed on to Rumania and Apulia. The rise of the new future form cantasi, I will sing," in Rumanian is probably due to Greek influence. In Latin itself both ille caballus and caballus ille are found, the position depending on the accentual conditions of the sentence. The loss of r made room for the form cabal[Id] the with a victory for the inverted order. In Rumania alone this was the actual process, under the influence of the surrounding speech—Illyrian or Bulgarian, whose accent of copper was, still existing in the South Italian and Rumanian, on the other hand, were so closely connected with the languages that preserved and therefore prefixed the article ille or the ille, that the result was the same in both.

This is not the place to show how the Rumanian vocabulary and the structure of words was permeated markedly by elements from Slav, less markedly by elements from Turkish, Mod. Greek and Hebrew, which gave the language an alien appearance in point of vocabulary. In its consonants, and, as far as one can judge, in its morphology, Dalmatian has preserved the stamp of antiquity. But in its vowel-system there are marked changes, especially in the substitution of diphthongs for close vowels, e.g., changing a to e, u through the u stage to e, i to e. Diphthongs as they appear also in Istrian and Abruzzian, so that we must presuppose some sort of connexion.

It may be that Sardinian took another course of development because (A.D. 458) the island was rented from Rome and incorporated in the Byzantine Empire. In the early part of the 19th century, the sympathies of Sardinia were alienated from Italy, and turned on the one hand towards Africa (and unfortunately we have no information as to the "latinity" of this region), on the other towards Italy. But later we find Genoa and Pisa fighting at intervals for supremacy in Sardinia, their organization being in many points identical with that of the island. On the whole, this new combination has not been left without its traces in the Rumanian and its language. The name of the vowels of the rhymation of the anatolic and palatalization of the Sardian is the most archaic of the Romance languages. Owing to its retaining s, it has failed to extend the membra-tempora types of formation, indeed it has almost rejected them entirely. It has retained the imperfect subjunctive as the imperfect subjunctive, and the imperative as the imperative, and the imperative.

And though every Romance language has a number of Latin words that are not common to the rest, yet in this language the number of such words is rather small. It is also noteworthy that these have here survived such common expressions as domo, "house," manus, "great," with other examples.

The East-Rumanian group (closely with Sardina) finds its continuation in the Moldavian region proper, the present part of Bucovina, the Iberian peninsula, and north Italy. This group contains a considerable number of fundamental peculiarities in phonology, morphology and vocabulary which prima facie lead us to assume a foreign origin.

The chief of these peculiarities is the final change of the vowel-system, i.e., the loss of the distinction between o and i, between 0 and i; then the change of breathed plosives and fricatives between plosives and fricatives respectively; the use of the pluperfect subjunctive instead of the imperfect subjunctive (ital. cantasse, Fr. que je chantasse, Sp. caniaste, Port. caniaste), the formation of a new future from the infinitive of the verb and the present, or (as the case may be) the imperfect or perfect of habere, e.g. ital. canto, cantare, Fr. je chanterai, chanteraiter, Sp. cantar, cantar. If it is safe to assume that this latter formation had its origin in the South Italian and Rumanian, or at least in the nearest of the two to the North of France. For it is only there that both elements in the formation are inseparably connected from the beginning of our record. In the old Provengal the two constituent parts of the perfect, the imperfect, are sometimes found in different branches; that is to say, the perfect from cantare habeo to cantabo belongs to the time when the three great groups were still in close contact, and the evidence of the Latin text falls into line with this view, showing the construction well established from the second half of the 4th century.1 In the vocabulary we must note, among other things, the introduction of Germanic words, e.g. elmo, Fr. hameau, Sp. yelmo, "helmet"; ramos, Fr. armes, Sp. armas, Port. armas; meed," which is found in Antinus and Isidore, but disappears later (Cf. Fr. mias, "meed"); diafanian, Ital. guadagnare, Fr. gagner, Sp. guadajar, and many more.

It is on further steps both of the first and of differentiation were conditioned by the breaking up of the Roman empire by the great migrations. The establishment of the rule of the Franks in north Gaul, of the Visigoths in south Gaul and the Iberian peninsula, loosed old ties, created new nations and in consequence new and independent groups of languages.

The Iberian group was marked primarily by a striking simplicity in its vocabulary. The majority of the derivatives are given up at an early stage, even in prehistoric times, and has lost its original form. Owing to the preservation of s the type membra was doomed to perish, and thus we find, from the beginning of our record and probably from the time of its formation, the use of the s perfect. 1 The prevalence in the nouns of the following simple rule: sing. -s, -o, -a; plur. -es, -as, -as. The loss of the dative may have some connexion with the fact that the form filla for the 3rd personal possessive in Latin is not common, and the uniformity may have ousted the nominative of o-stems. There are analogues in the conjugation. The pluperfect indicative was preserved, and even (largely) with a Latin significance, but in the region of flexion much simplification took place, e.g., uniformity of accentuation in the three conjugations, marked reduction of the s perfect and a perfect forms and a great reduction in the number of personal pronouns.

The vocabulary is characterized by certain archaisms, and still more by the fact that a series of common ideas are rendered by new words limited in use to the Iberian peninsula. Thus we have guadagnare (ixdiarticale), instead of the Iberian languages, which use manere; callar (deriv. uncertain) for lacere; hablar (fabulare), "to speak"; ilegar (plicare), "to arrive"; dejar (?) instead of laverare, &c. Furthermore, we may perhaps mention the preference of tenere to takeare in old Iberian. 2 But these archaisms, this uniformity of accentuation in the three conjugations, marked reduction of the s perfect and a perfect forms and a great reduction in the number of personal pronouns.

The present day there are three great groups, running almost

1 See Thielmann, in Archiv f. lat. Lexikogr. ii. 48 seq.
parallel from N.E. to S.W., e.g. Catalanian on the coast of the Mediterranean, akin to Provençal, and Galician-Portuguese on the Atlantic. From the historical point of view one part might be called Gothic-Romance, the other Suevo-Romance. But the national and linguistic history of the times and countries we are dealing with are more complex than this. At any rate, considering the two idioms chiefly one of phonetics, while in their morpho-
logy and vocabulary they do not greatly differ. Spanish may be described as formed, for the left hand, on the skeleton of the consounds, and which therefore shows, more than other Romance languages, a weakening even of initial consonants. It changes voiceless stops first to fricatives, then to mere noises or "burr's" which are conditioned by the preceding vowel. A central consonant finally, becomes \( h \) (through a middle stage \( j \)) and is finally lost. The preferential treatment of vowels, however, entailed not a single change except that \( l \) was changed to the diphthong \( ie, o, u \) to \( u; \) all other vowels, however, are retained.

The second large group of Romance languages, the unaccented vowels are weakened, as finals almost to vanishing point. It shows further a fusion of nasals with the preceding vowel, so as to form a nasal vowel, and this new nasality takes the colour of the following vowel, e.g. in %. Frequently, before the preceding vowel, \( u, o, a, e, i \), otherwise before a vowel the nasal finally disappears; \( ch \) and \( ch e \), from \( pien, \) similar. Similarly \( l \) was lost between vowels, e.g. in the case of Portuguese and Rumanian the final consonants (dental) are lost, \( aler, ca \), ca do (calis). Voiced plosives have a weak pronunciation between vowels, and these are sometimes made fricatives. In relation to the somewhat careless articulation we noted a marked reaction on accented vowels by the nasalisation of the interaction of initial sounds and finals being very striking. Devoiced has a plosive \( d, a, \) a devoiced has a fricative: \( i t a s \) has a breathed \( -s \), but \( i s u s, \) "thou art in heaven," has a voiceless the case of \( x e, \) \( be, \) has a reduced \( a, d, \) an unvoiced \( n, a, n, \) but \( x e, o n e, \) is pronounced \( x o, o, n, \) with an open \( o \) from \( a, o, o, \)&c.

The separation of Gaul took place likewise in the second half of the 5th century. The Visigoths settled down in the south, the Burgundians in the east, and the Franks in the north. The type of language that was evolved here is distinct from Spanish primarily and principally in the loss of final vowels except \( o, a, \) or, when the preceding vowel is \( e, i; \) only finally between words is the weakening to \( e. \) On the other hand, the declension is more conservative. Nowhere are the old case-endings so clearly preserved as in this region, e.g. \( reis, ^* \), "king," but la rei fille (regis filia), "the king's daughter" or her. This differential treatment of the first and second declension, \( genit, \) \( dat \), \( regi, \), \( ros, \) \( real \) (with \( l \) in the forms of \( r \) in the same case) is the mode of expression, and they last till far into the literary period. But at an early stage there was a breach between the Franks of the north and the Burgundians in the south. For the latter (the Visigoths) retained the old system of accented vowels, the former changed \( e \) to a diphthong \( ie, o,\) as \( so, \) and after \( i, m, \) changed \( ei, \) or \( x e, \) or \( a, e, \) or \( e, d, \) became \( e, d, \) or \( e, u; \) a was changed to \( a, \) assuming that these vowels were in accordance with the later Latin pronunciation, e.g. —

<td>mola</td>
<td>prat</td>
</tr>
</tbody>
</table>

The northern group, moreover, weakened the consonants still further. \( d \) and \( g, \) secondary consonants from \( l, e, \) disappear, like the fricative \( l \); and, among the semi-vowels, the prænasale, \( pr, \) advocate, becomes \( ovus, \) S. Fr. avgatus; a secondary \( p \) (from \( b \)) becomes \( v, \) as we see by the form which replaces \( nepos \) above. If we are right in ascribing to this the characteristic of the loans at the expense of the other constituents of the word, we may take this to be connected with the weakening of a where final, and between two accented syllables, e.g. N. Fr. aime from \( amit, \) as against S. Fr. \( am \); or \( ricche armure \) (Mod. Fr. armure) in the case of armature.

Parallel to the preservation of \( s, t, \) on the one hand, and the close following of the old flexions on the other, we find the type membra preserved at first largely in Visigothic and Lombard. In the verb the variety in Latin perfect forms is still fairly well preserved, though there is a distinct extension of the \( s,\) imperfect and the \( d, \) perfect. As we might expect, the vocabulary of Romance, so far as it is determined by Germanic elements of Frankish, Burgundian and Gothic origin.

The Raetic dialects, in their prehistoric phase, are less clear than others with regard to contact. Nevertheless, the Carinthian dialects of the French of the south-east in Valais seems to have caused a similar process of growth, especially as they change \( e \) into \( o \) and \( o \) into the diphthongs \( ei \) and \( eu, \) leaving at the same time the consonants moving toward a final degeneracy. In Lombardy, the Northern nations cut off Raetia from the Po valley, and the pressure of the German tribes severed its union with the Romance-speaking nations.

Thus isolated it was free to follow its own course. This language also preserves a trisyllabic, e.g. membra, the latter being developed later freely in use as a collective plural. But its further development was checked by the Lombards and the Visigoths.

But the most difficult problems are those that arise in Italy. Though one may say generally that the dialects of the region of the Po, and those of Liguria, belong to the types of north and western Romance, the are the most numerous, the Lombard dialects became voiced, yet they approach the typically Italian groups by their loss of \( s. \) This means that when the whole Italian peninsula was separated from Gaul as well as from Iberia (after the close of the 5th century) and became again one homogeneous whole, the forms without \( s \) found their way into the north of Italy only slowly, so that \( s \) has remained in the West, i.e. in Piedmont, in mono-

sylables, Germanic words, found their way first into the language of the camp, and thence into the vulgar language generally. And at that stage perhaps many words may actually have been imported, which were, partly at any rate, lost again later.

Roman and Latin words, as found in the W. and N. of Italy, are not identical, e.g. orgon, \( " \) Germanic \( " \) It., engon; and the vocabulary of Romance, including terms belonging to warfare, e.g. bondum, "

standard," used by Procopius, which still continues in the form of O. Fr. bas, Ital. bandiera, Spp. \( bandera, \) where the stress frequently in inscriptions, may date from the period of camp life, but for the rest it is retained only in Fr. bru, and in Friuli and Dalmatia. On the other hand, we find clearly a Latin formation, \( e, x o, \) which carries us back to the same sphere. Other old words express ideas of culture, or names of animals which the Romans learned to know in the German-speaking north, e.g. gaita, "wild goose" (in Pliny), O. Fr. gante, prov. gaitz; or lazo, "badger," Ital. tassone, Fr. laisson, Sp. tejon. But the impression made was not pronounced until the age of the Germanic invasions, and then we find a great variety in the various Romance countries. In Italy we have two invasions to consider—by the Goths, and by the Lombards. But the destruction of the rule of the Lombards by Charlemagne, and the introduction of Frankish elements con-
sequent upon it, shook the Gothic language. The Franks may themselves have been a Romance-speaking tribe. Goths as well as Lombards have left a trail as noticeable in the language as elsewhere. Thus we find in several instances formations as base as \( e, x, \) in the case of go-for the words borrowed from Germanic, e.g. banca and pance, balla, the forms with \( b \) being Gothic, those with \( p \) Lombardic. Or again recare, " to bring up," goes back to Gothic rikian, roap, or to Lombard rize; ro, or roe, "flash." Where the vocabulary shows impartially an impress of both nationalities, the Lombards have left their stamp unmistakably on the proper names. Speaking generally, Italy as well as the rest of the world, names of persons are either "Christian" (in the strict sense) and therefore of Hebrew or Greco-Roman origin, or on the other hand Germanic. Roman names that are not all Christian seem to have been given in the 5th century, and while on the contrary the Germanic are not represented at all in Dalmatia. One of the characteristics
of Gothic is the change of ë to i, so that it has names ending in -mir. Of these we find no trace whatever in Italian, on the contrary we find many words from Latin and French, e.g. Gaudioso, Albizdo, etc. which are distinctly Lombardic; but not Gothic ones in -la. There is no parallel to all this in the Iberian peninsula. As we have already said, the Gothic contribution is very small. The Gothic influence in Italian is in tizzo, e.g. Gaudioso, Albizdo, etc., which are distinctly Lombardic; but not Gothic ones in -la.

And lastly, France possesses the largest number of Germanic elements in its vocabulary, Gothic in the south, Frankish in the north (though it is often impossible to ascertain to which class the word belongs). We find many Old Norse words, and again Anglo-Saxon and northern ones, more particularly those connected with shipping and the sea. These Germanic elements cover nearly all branches of human activity. Thus bidi, Frankish *bidii, English "shirt"; or binda, Old Nordic "to bind," English "to bind," etc. The personal names offer a rich field of study, e.g. Leinonen, English "bird," and Ribemond, English "ribbons" from binda with guide, "waid," and other colouring matters, whence we have elnion, English "blue," etc.

But while the vocabulary has had its accesses drawn from various races, the proper names show the same rules as in Italian, i.e. Frankish gains the sole supremacy. We find, it must be admitted, some Gothic names, and south-east-in the main against which they were not maintained as late as the Roman period, such was the influence of the victorious northern race.

Even after political and literary independence had enabled the individual Romance languages to grow as separate entities on their own basis, they retained their interconnexion and were open to mutual influence. But this influence is only partial, i.e. it affects nothing but the vocabulary, and has a certain relation to vocabulary. As the development of civilisation under this head the most important point is the really enormous influence which France (both south and north) has exercised on all the Romance countries, just as she has on the Germanic—a language which has hitherto been not only recognized. (The first traces go back to the invasions of Charlemagne already mentioned. To instance only one, we have schiavo, "justice, alderman," which cannot be derived directly from the Germanic, as is shown by the 

The second important period is the age of chivalry and the literary tendencies centring round it. A word like budiere, "herald," is derived from Fr. baudrier, not directly from Germanic Burde, which comes back to Old North, and to Old Norse, binda; It. giallo is not from gialbus but from O. Fr. jaune (Mod. Fr. jaune), derived from that word. And it seems that in one of the prehistoric periods the Tuscan vocabulary was strongly influenced, that is to say the Tuscan-Gallic-Romance-in the peninsula, in Sardinia, in south Italy, Rumania and Rhaetia dies survives, in O. Fr. di has been almost completely ousted by jour, but in Tuscan and the Italian literary language we find giono and gionna and the Italian language. This in fact is the case, and the O. Fr. di became the old effare more and more back towards the south. The most recent layer was introduced in the prologue of the Book of Anjou chiefly in south Italy and Sicily, and kept itself from being swept away in spite of the Sicilian Vespers, e.g. Sic. vucciari, "butcher," from Fr. boucker.

The Iberian peninsula can likewise bear witness as to French influence, e.g. O. Sp. fonta, "shame," is not from Goth, *bangila, but from O. Fr. hon; O. Port. saurar not from Lat. salutare, but O. Fr. saluer. On the whole, Portuguese seems to possess more of these Gallician elements, history supplying a simple explanation.

Italy too yielded its contributions, especially in the 15th and 16th centuries, many military terms (noble and ignoble), e.g. French carnege and concasse; parigaud, "dagger," from It. tegnale, instead of Fr. tegneau, come from the French language, and many others that have become common property. But the influence of the Iberian peninsula on the contrary was not so strong as to be more than sporadic; the Sicilian and Neapolitan language is more Italian, and this is easily explained on the ground of their political and commercial relations.

As to the Romance languages beyond Europe we have but little distinctive origin, the Germanic languages being made between the northern and the Romance and the Slav and genuine Romance. Belonging to the latter we have the French of Canada, the Spanish of Central and South America, the Portuguese of the Brazils. Speaking generally we may say that the particular languages retained the terms from the languages of the 9th and 10th centuries, that is to say that of the time of the immigration, and that they developed along the lines already established.

Thus in Mexican Spanish the loss of d, g, between vowels, of a before consonants and as a final, has been carried further than in the Romance languages. This is due to the influence of the languages of the natives of the Americas.

LITERATURE.—The real founder of scientific Romance philology and linguistics in Friedrich Diez, in his Grammatik der romanischen Sprachen (2 vols., 1853), Einführung in die romanische Sprachwissenschaft (2d ed., Heidelberg, 1873). The principles of his Growth of the language are given, in his Zeitschrift für romanische Philologie (ed. Gröber; since 1877), for the Early Romance Literature (ed. Gröber; since 1877), and for the Early Romance Literature (ed. Gröber; since 1877), etc., and he also edited the Romance Literature (ed. Gröber; since 1877), etc., and he also edited the Romanische Forschungen (ed. Vollmiller; since 1885), etc., etc., and he also edited the Romanische Forschungen (ed. Vollmiller; since 1885), etc., etc., etc., etc.

Among the modern works of the dead, we may mention, e.g. Paris and F. Meyer, F. Meyer in France; G. I. Ascoli (d. 1905), and F. d'Ovidio in Italy.

(W. M. L.)

ROMAN DE LA ROSE, a French poem dating from the 13th century. The first part was written about 1230 by Guillaume de Lorris (q.v.), whose work formed the starting-point, about forty years later, for the more extensive section written by Jean de Meun (q.v.). The former is also considered as the prototype of the latter, possibly of an adventure of his own, which is an artistic and beautiful presentation of the love philosophy of the troubadours. In a dream the Lover visits a park to which he is admitted by Idleness. In the park he finds Pleasure, Delight, Cupid and other personages, and at length the Rose. Welcome grants him permission to kiss the Rose, but he is driven away by Danger, Shame, Scandal, and especially by Jealousy, who entreats the Rose and imprisons Welcome, leaving the Lover disconsolate. The story, thus left incomplete by its inventor, was finished in 15,000 lines by Jean de Meun, who allows the Lover to win the Rose, but only after a long siege and much discourse from Reason, the Friend, Nature and Genius. The length of the work and its heterogeneous character proved no bar to its enormous popularity in the middle ages, attested by the 200 MSS. of it which have survived.

The Roman de la Rose was translated into English by Chaucer (see the prologue to the Legende of Good Women), but the English language was not, except in parts, the medium of the work, which has come down to us (see an edition by Dr Max Kaluza, Chaucer Society, 1889), is generally admitted to be by another hand. For a list of books on the vexed question of the authorship of the English translation see G. Körting, Grundriss der engl. Lit. (Münster, 1905, 4th ed. p. 184). A Flemish version by Hein van Akon appeared during Jean de Meun's lifetime, and at the beginning of the 14th century a free imitation, in the form of a series of sonnets, H. Floré, was written in Italian by the Tuscan poet Durante. Three editions of the Roman de la Rose were printed at Lyons between 1473 and 1490; two by Antoine Verard (Paris, 1490 and 1496), one by Pierre de la Perrière (Paris), and a third by Michel le Noir (Paris, 1509 and 1519). In 1503 Jean Molinet produced a prose version. Morot altered and modernized the text (1526), and his corrections were followed in subsequent editions. Modern editions are by Mön (4 vols., 1813), by Francisque Michel (2 vols., 1864), by Croissandet (pseudonym for Pierre Marteau), with a translation into modern French (Paris, 3 vols., 1875–80), and a critical edition by E. Langlois, author of Origines du roman de la Rose (1893). A modern English version by F. S. Ellis (Temple Classics, 3 vols., 1909).

ROMAN EMPIRE, LATER. The reign of Constantine the Great forms the most deep-reaching division in the history of Europe. The external continuity is not broken, but the principles which guided society in the Greek and Roman world are replaced by a new order of ideas. The emperor-worship, which expressed a belief in the ideal of the earthly empire of Rome, gives way to Christianity; this is the outward sign that
a mental transformation, which we can trace for 300 years before in visible processes of decay and growth, had reached a crisis.

Besides the adoption of Christianity, Constantine's reign is marked by an event only second in importance, the shifting of the centre of gravity of the Empire from the west to the east by founding Byzantium as a capital, a second Rome. The foundation of Constantinople (p. 350) determined the subsequent history of the state; it established permanently the division between the eastern and western parts of the Empire—a principle already introduced—and soon exhibited, though not immediately, the preponderance of the eastern half. The eastern provinces were the richest and most resourceful, and only needed a Rome in their midst to proclaim this fact; and further, it was eastward that the Empire fronted, for here was the one great civilized state with which it was in constant antagonism. Byzantium was refounded on the model of Rome, had its own senate, and presently a praefectus urbi. But its character was different in two ways: it was Christian and it was Greek. From its foundation New Rome had a Christian stamp; it had no history as the capital of a pagan empire. There was, however, no intention of depressing Rome to a secondary rank in political importance; this was brought about by the force of circumstances.

The Christian Roman Empire, from the first to the last Constantine, endured for 1130 years, and during that long period, which witnessed the births of all the great modern nations of Europe, experienced many vicissitudes of decline and revival. In the 5th century it lost all its western provinces through the expansion of the Teutons; but in the 6th asserted something of its ancient power and won back some of its losses. In the 7th it was brought very low through the expansion of the Saracens and of the Slavs, but in consequence of internal reforms and prudent government in the 8th century was able before the end of the 9th to initiate a new brilliant period of power and conquest. From the middle of the 11th century a decline began; besides the perpetual dangers on the eastern and northern frontiers, the Empire was menaced by the political aggression of the Normans and the commercial aggression of Venice; then its capital was taken and its dominions dismembered by Franks and Venetians in 1204. It survived the blow for 250 years, as a shadow of its former self.

During this long life its chief political rôle was that of acting as a defender of Europe against the great powers of western Asia. While it had to resist a continuous succession of dangerous enemies on its northern frontier in Europe—German, Slavonic, Finnic and Tatar peoples—it always considered that its front was towards the east, and that its gravest task was to face the powers which successively inherited the domination of Cyrus and Darius. From this point of view we might divide the external history of the Empire into four great periods, each marked by a struggle with a different Asiatic power: (1) with Persia, ending c. 630 with the triumph of Rome; (2) with the Saracens, who ceased to be formidable in the 11th century; (3) with the Seljuk Turks, in the 11th and 12th centuries; (4) with the Ottoman Turks, in which the Roman power went down.

Medieval historians, concentrating their interest on the rising states of western Europe, often fail to recognize the position held by the later Empire and its European prestige. Up to the middle of the 11th century it was in actual strength the first power in Europe, except in the lifetime of Charles the Great, and under the Comneni it was still a power of the first rank. But its political strength does not express the fulness of its importance. As the heir of antiquity it was confessedly superior in civilization, and it was supreme in commerce. Throughout the whole period (to 1204) Constantinople was the first city in the world. The influence which the Empire exerted upon its neighbours, especially the Slavonic peoples, is the second great rôle which it fulfilled for Europe—a rôle on which perhaps the most speaking commentary is the doctrine that the Russian Tsar is the heir of the Roman Caesar.

The Empire has been called by many names—Greek, Byzantine, Lower (Basæempire), Eastern (or East-Roman). All these have a certain justification as descriptions, but the only strictly correct name is Roman (as recognized in the title of Gibbon's work). The continuity from Augustus to Constantine XI. is broken; the emperor was always the Roman emperor; his subjects were always Romans. "Thrusting out Greek and Latin, "Constantine (Later is preferable) marks the great actual distinction in character between the development before Constantine (Haut-empire) and after his adoption of Christianity." Byzantine sums up in a word the unique Graeco-Roman civilization which was centred in New Rome. Eastern is a term of convenience, but it has been used in two senses, not to be confused. It has been used, loosely, to designate the eastern half of the Empire during the 1400 years or so (from 395) when there were two lines of emperors, ruling formally as colleagues but practically independent, at Rome and Constantinople; but though there were two emperors, as often before, there was only one Empire. It has also been used, justifiably, to distinguish the true Roman Empire from the new state founded by Charles the Great (800), which also claimed to be the Roman Empire; Eastern and Western Empire are from this date forward legitimate terms of distinction. But between the periods to which the legitimate and illegitimate uses of the term "Eastern Empire" apply lies a period of more than 300 years, in which there was only one Empire in any sense of the word.

A chronological table of the dynasties will assist the reader of the historical sketch which follows.

Succession of Emperors arranged in Dynasties.

Emperors: (founder of dynasty, Constantius I., 306-306); Constantine I. (306, sole emperor since), 324-337.

In west—Constantine II., 337-340; Constans, 337-355.

In east—Constantius II., 337-

Sole emperors: Constantius II. 350-361; Julian, 361-363.

Emperors: (Leo the Thracian, 364-369; Gratian, 367-383; Valens, 367-378; Valentinian II., 375-382; Constantius II. 395-408; Theodosius I., 395-399).

Emperors: (Theodosius I. (379), 392-395.

In east—Arcadius, 395-408; Theodosius II., 408-450; Marcian, 450-457.

In west.—Honorian, 395-423; Constantius III. 422; Valentinian III. 425-435; (non-dynastic) Maximus, 455; Avitus, 455-456.

Emperors: (Leo I. 457-474; Leo II. 474; Zeno, 474-491; Anastasius I. 491-518).

In west—non-dynastic, Majorian, 457-461; Severus, 461-465; Leo I. (sole emperor, 465-467); Anthemius, 467-472; Zeno, 472; Eutychius, 473-474; Julius Nepos, 474-480; ( usurper, Romulus Augustus, 475-476).

Emperors: Justin I., 518-527; Justinian I., 527-565; Justin II., 565-578; Tiberius II., 578-582; Maurice, 582-602.

Emperors: Heraclius, 610-641; Constantine III. 641; Heraclonas, 641-642; Constans II. 642-668; Constans II. (going to Exile, 668-685); Justinian II. (Rhinotmetus), 685-695; (non-dynastic) Leontius, 695-696 and Tiberius III. (Aspamir), 695-705; Justinian II. (restored), 705-711.

Emperors: Leo III. 717-741; Constantine V. (Copronymus), 740-775; Leo IV. (Khazar), 775-780; Constantine VI., 780-797; Irene, 797-802.

8. Phrygian or Amorian Dynasty.—A.D. 802-867.

Emperors: Michael II. (Stammerer), 802-829; Theophilus, 829-842; Michael III. (Drankevich), 842-867.

Emperors: Basil I. (Macedonian), 867-886; Leo VI. (philosopher) and Alexander, 886-912; Constantine VII.
(Porphyrogenetos), 912-959; Romanus I. (Lecapenus), 920-944; Romanus II., 959-963; Basil II. (Bulgaroctonus) and Constantine VIII., 963-1025; (non-dynastic) Nice-who usurpation; the non-dynastic), 1143-1180; Batatzes), magister weak protect tion, of the Empire, of Moesia, 1025-1028; Romanus III. (Argyros), 1028-1034; Michael IV. (Paphlagonian), 1034-1041; Michael V. (Calaphates), 1041-1047; Constantine IX. (Monomachus), 1042-1054; Theodora, 1054-1056; Michael VI. (Stratioticus), 1057-1057.

INTER-DYNASTY.—Isaac I. (Comnenus), 1057-1059; Constantine X. (Ducas), 1059-1067; Michael VII. (Parapinaces), Andronicus and Constantine XI. (Porphyrogennetos), 1067-1077; Roman IV. (Diogenes), 1077-1076; Michael VII., alone, 1071-1078. Nicephorus III. (Botaneiates), 1078-1081.

INTER-DYNASTY.—Alexius V. (Murtzaphius), 1204. Capture of Constantinople and dismemberment of the Empire by the Venetians and Franks, A.D. 1204-1205.

12. PALEOLOGIAN DYNASTY.—A.D. 1261-1453. Emperors: Michael VIII. (Paleologus), 1261-1282; Andronicus II. (Ducas), 1282-1328; Alexius II. (Angelus), 1328-1341; John V., 1341-1341; (non-dynastic), John (Cantacuzenus), 1347-1355; Manuel II., 1301-1342; John VI., 1342-1415; Constantine XI., or XII. (Dragases), 1415-1438.

Historical Sketch.—Dioctian's artificial experiment of two Augusti and two Caesars had been proved a failure, leading to twenty years of disastrous civil wars; and when Constantine the Great (q.v.) destroyed his last rival and restored domestic peace, he ruled for the rest of his life with undivided sway. But he had three sons, and this led to a new partition of the Empire after his death, and to more domestic wars, Constantine having divided the Empire, the eldest of his sons, Constans II. (466-471), recognized his son as sole ruler of the west, to be in turn destroyed by Constantius II., who in 350 remained sole sovereign of the Empire. Having no children, he was succeeded by his cousin, Julian the Apostate (q.v.). This period was marked by wars against the Germans, who were pressing on the Rhine and Danish frontiers, and against Persia. Julian lost his life in the eastern struggle, which was then terminated by a disadvantageous peace. But the German danger grew graver, and the battle of Adrianople, in which the Visigoths, who had crossed the Danube in consequence of the coming of the Huns (see Gorists and Huns), won a great victory, enveloped the empire in a state of great peril; and announced that the question between Roman and Teuton had entered on a new stage. Theodosius the Great saved the situation for the time by his Gothic pacification. The efforts of a series of exceptionally able and hard-working rulers preserved the Empire intact throughout the 4th century, but the dangers which they weathered were fatal to their weaker successors. On the death of Theodosius the decisive moment came for the expansion of the Germans, and they took the tide at the flood. There were three elements in the situation. Besides the Teutonic peoples beyond the frontier there were dependent people who had settled within the Empire (as Visigoths in Moesia, Vandals in Pannonia), and further there were the semi-Romanized Germans in the service of the Empire, some of whom had risen to leading positions (like Merobaudes and Stilicho). A Germanization of the Empire, or part of it, in some shape was inevitable, but, if the rulers of the 5th century had been men of the same stamp as the rulers of the 4th, the process might have assumed a different form. The sons of Theodosius were both incapable; and in their reigns the fate of the state which was divided between them was decided. The dualism between the east (under Arcadius) and the west (under Honorious) developed under the rule of these brothers into an antagonism verging on hostility. The German danger was averted in the east, but it led in a few years to the loss of many of the western provinces, and at the end of ninety years the immediate authority of the Roman Emperor did not extend west of the Adriatic. The reign of Honorius saw the abandonment of Britain, the establishment of the Visigothic kingdom in Aquitaine, the occupation of a great part of Spain by Vandals and Sueves (Suebi). Under Valentinian III. the Vandals founded their kingdom in North Africa, the Visigoths shared Spain with the Sueves, the Burgundian kingdom was founded in S.E. Gaul. The last Roman possession in Gaul passed to the Franks in 486 (see Gothi; Vandals; Franks). It is significant that the chief defender of the Empire against the Germans who were dismembering it were men of German race. Stilicho, who defended Italy against Alaric, Attilus, whose great work was to protect the imperial possessions in Gaul, and Ricimer. It was also a German, Fravitta, who played a decisive part in suppressing a formidable Gothic movement which menaced the throne of Arcadius in 399-400. It was characteristic of this transformation of Europe that the Germans, who were imbued with a profound reverence for the Empire and its prestige, founded their kingdoms on Roman soil in the first instance as federates of the Emperor, on the basis of formal contracts, defining their relations to the native provincials; they seized their dominions not as conquerors, but as subjects. The double nature of Attilus himself, as both king of the Visigoths and a magister militum of the Empire is significant of the situation.

The development of events was complicated by the sudden growth of the transient empire of the Huns (q.v.) in central Europe, forming a third great power, which, reaching from the Rhine to the Caucasus, from the Danube to the Baltic, might be compared in the extent of its nominal supremacy, but in nothing else, to the empires of Rome and Persia. The Huns, whose first appearance had precipitated the Germans on the Empire, now retarded for some years the process of German expansion, while they failed in their own attacks upon the Empire. The double nature of Attilus (q.v.) and his German vassals (Ostrogoths, &c.) founded important kingdoms on its ruins.

After the death of Valentinian III., the worst of his house, the Theodosian dynasty expired in the west, and the authority of the western emperors who succeeded him in rapid succession reached little beyond Italy. For most of this period of twenty years the general Ricimer, of German birth, held the scales of power in that peninsula, setting up and pulling down emperors. After his death the western throne was no longer tenable. First there was a usurpation; the general Orestes set up his child ROMULUS AUGUSTUS; the reign was important for the last, and his German vassals (Ostrogoths, &c.) founded an Italian kingdom under the nominal supremacy of the emperor at Constantinople, who, however unwilling, recognized his position (after the death of Julius Nepos).

The escape of the eastern provinces from the fate of the western illustrates the fact that the strength of the Empire lay in the east. These provinces were more populous and presented greater obstacles to the invaders, who followed the line of least resistance. But it was of immense importance that throughout this period the Empire was able to preserve a practically unbroken peace with its great eastern rival. The struggle with Persia, terminated in 364 by the peace of Jovian, was not renewed till the beginning of the 6th century. It was of greater importance that the rulers pursued a discreet and moderate policy, both in financial administration and in foreign affairs; and the result was that at the end of a hundred years the diminished Empire was strong and consolidated. Theodosius II. was a weak prince, but his government was ably conducted by Anthemius, by his sister Pulcheria and by the eunuch Chrysaphius. His reign was important for the Armenian question. Theodosius I. had committed the error of consenting to a division of this buffer state in the Roman and Persian spheres of influence, Persia having much the larger. The
Sassanid government tried to suppress the use of the Greek language. But the government of Theodosius II. officially supported the enterprise of translating the Bible into Armenian (Mesrob had just invented the Armenian alphabet), and this initiated the production of an abundant literature of translations from the Greek, which secured the perpetual connexion of Armenia with European culture, and not with Oriental. This reign is also distinguished by the building of the great landwalls of Constantinople, by the foundation of a university there and by the collection of the imperial laws in the Codex Theodosianus, which is a mine of material for the social condition of the Empire. It reveals to us the decline of municipal liberty, the decay of the middle classes in the West, the evils of the oppressive fiscal system and an appalling paralysis of Roman administration which had once been so efficient; it shows how the best-intentioned emperors were unable to control the governors and check their corruption; and discloses a disorganization which facilitated the dismemberment of the Empire by the barbarians.

In the reign of Zeno it seemed probable that an Ostrogothic kingdom would be established in the Balkan peninsula, but the danger was diverted to Italy (see Gorri the). The kingdom which Theodoric founded there was, in its constitutional aspect, a continuation of Odoacer’s régime. He, like Odoacer and Alaric, held the double position of a German king and a Roman official. He was magister militum as well as rex. His powers were defined by capitulations which he arranged with the emperor Anastasius and laudably observed. The right of legislation was reserved to the emperor, and Theodoric never claimed it; but for all practical purposes he was independent.

In the 6th century the emperor Justinian, whose talents were equal to his ambitions, found himself, through the financial prudence of his predecessors, in a position to undertake the reconquest of some of the lost western provinces. The Vandal power had declined, and Africa was won back in one campaign by Belisarius in 533. The conquest of Italy was far more difficult. Begun by Belisarius in 535, it was not completed till 554, by Narses. A portion of southern Spain was also won from the Visigoths, so that the Romans again commanded the western stearts. Justinian, possessed by large ideas and intoxicated with the majesty of Rome, aspired to be a great conqueror, a great lawyer, a great pontiff, a great diplomatist, a great builder, and in each of these spheres his reign holds a conspicuous place in the annals of the Empire. His legal work alone, or the building of Santa Sophia was enough to ensure him immortal fame. But deep shadows balance the splendour. The reconquest of Africa was thoroughly justified and advantageous, but Italy was bought at a ruinous cost. In the first place, the Persian empire was at this time more formidable than it had been in the reigns of Chosroes I. (q.v.), who was far from peacefully inclined. Justinian was engaged in a long Persian and a long Gothic war at the same time, and the state was unequal to the strain. In the second place, it was all-important for his western policy to secure the goodwill of the Italian provincials and the Roman bishop, and for this purpose he involved himself in an ecclesiastical policy (see below) which caused the final alienation of the Syrian and Egyptian provinces. The reconquest of the West was purchased by the disunion of the East. Thirdly, the enormous expenses of the Italian and Persian wars, augmented by architectural undertakings, caused a policy of financial oppression which hung as a cloud over all the brilliance of his reign, and led to the decline which ensued upon his death. Nor is it to be forgotten that he had at the same time to fulfil the task of protecting the Danube against the Germans, Slavs and Bulgarians who constantly threatened the Illyrian provinces. He spared no expense in building forts and walls. Justinian’s name will always be associated with that of the gifted Theodora, an actress of doubtful fame in her early life, who shared his throne. Their mosaic portraits are preserved in the contemporary church of San Vitale at Ravenna. She possessed great political influence, and the fact that she was a heretic (monophysite), while Justinian was devoted to orthodoxy, did not mar their harmony, but only facilitated the policy of extending secret favour to the heretics who were publicly condemned, and enabled the left hand to act without the knowledge of the right. The events of the half-century after Justinian’s death exhibited the weakness to which his grandiose policy had reduced the Empire. It was attacked on the north and on the east, and at all points was unequal to coping with its enemies. (1) Italy fell a victim to the Lombards (q.v.), and in a few years more than half of the peninsula had passed under their sway. (2) The Avars, a Hunnic people who had advanced from the Caspian, took possession of Pannonia and Dacia, and formed an empire, consisting of Slavonic and Bulgarian subjects, which endured for about sixty years. Their chief occupation was to invade the Illyrian peninsula and extort tribute and ransoms from the emperors. So far as the Avars themselves were concerned, these incursions had no permanent significance, but the Slavs who overran the provinces did more than devastate. These years saw the beginning of the Slavonic settlements which changed the ethnical character of the peninsula, and thus mark the commencement of a new period. Slavs occupied Moesia and a large part of Macedonia, even close to Thessalonica, which they besieged; they penetrated southward into Greece and made large settlements in the Peloponnesus (see GREECE, History, “Roman period,” ad fin.). They occupied the north-western provinces, which became Croatia and Servia, as well as Dalmatia (except some of the coast towns). In the northern part of the peninsula the Slavonic element remained dominant, but in Greece it was assimilated to the Greek (after the 9th century) and has left little record of itself except in place names. (3) The Empire was simultaneously engaged in the perennial strife with Persia. A short interval of peace was secured when the emperor Maurice assisted Chosroes II. to dethrone a usurper, but after Maurice’s death (602) the final and mortal struggle began (see PERSIA, History, section viii. “The Sassanian Empire!”). Throughout the incompetent reign of Phocas the eastern provinces were overrun by the Persians, as the Illyrian were overrun by the Slavs. The unpopular rule of this cruel usurper was terminated in 610 by the intervention of the governor of Africa, whose son Heraclius sailed to Constantinople and, welcomed by an influential party, met with little resistance. Phocas, murderer of Maurice, was murdered by the people, and the victor was crowned emperor to find himself in presence of a desperate situation. Antioch, Damascus and many other great cities were captured by the Persians; and in 614 Jerusalem was destroyed and the Holy Cross, along with the patriarch, carried off to Ctesiphon. This event produced a profound sensation in Christendom. In 616 Egypt was conquered. The army had fallen into utter disorder and was also defeated in 617 by Heraclius near Antioch. The Saracen raids extended through Syria and Palestine, and threatened Constantinople that he thought of transferring the imperial capital to Carthage. But the extreme gravity of the situation seems to have wrought a moral change among his subjects; the patriarch Sergius was the mouthpiece of a widespread patriotic feeling, and it was not least through his influence that Heraclius performed the task of creating a capable army. His efforts were rewarded in a series of brilliant campaigns (622–28), which, in the emphasis laid on the contrast between Christianity and fire-worship and on the object of recovering the Cross, had the character of crusades. Heraclius recovered his provinces and held Persia at his mercy (decisive battle at Nineveh, end of 627).

This war is remarkable for the attempt of the Persians to take Constantinople (626) in conjunction with the Avars and Slavs. Soon afterwards the Avar power began to decay, and the Slavs and Bulgarians shook off their yoke. It seemed as if the Roman government would now be able to regain the control in the Illyrian lands which it had almost entirely lost. It seems probable that Heraclius came to terms with the Slavs—Croats and Servians—in the north-west; their position was regularized, as vassals of the Empire. But fate allowed no breathing-time to do more; the darkest hour had hardly passed when a new storm-cloud, from an unexpected quarter, overspread the heavens.
At this point we have to note that the Hellenic element in the state had definitely gained the upper hand before the end of the 6th century, so that henceforward the Empire might be described as Greek. Justinian's mother-tongue was Latin, and he was devoted to the Latin traditions of Rome, but even he found it necessary to publish his later laws in Greek, and from his reign Greek was the official language.

Many of the Latin official terms were already represented by Greek equivalents (ἐκκλησία = κοινοφθαλμία, εὐθύγραμμος = πραγμάτωμα, &c.), but they were occasionally used in great numbers, transliterated and often corrupted (e.g. κόμως, κύριοςτρόπος, δοκήσεις = ασερία, κατακκλάρως, προσπάθεια, κολώττως = γιακτιστής, σωκρονώς, προσκόπος, διακίνησις = διακίνησις). Yet, regarding the matter of barbarian names, Babylon was reserved as the emperor (but also applied to the Persian king). In military drill many Latin words of command continued to be used.

It is to be noted that the year 630 marks the beginning of a period of literary (and artistic) sterility in the Greek world (see GREEK LITERATURE, section Byzantine).

With the rise of Islam (see CALIPHATE; MAHOMET) two universal religions, for the first time, stood face to face, each aspiring to win the universe. The struggle therefore which then began was not only a new phase of the "Eternal Question," the strife between Europe and Asia, but was one in which the religious element was fundamental. Fire-worship was only a national religion and did not present the danger of Islam. The creation of the political power of the Mahomedans was so sudden that it took the world by surprise. Bostra, the fortress of Roman Arabia, fell into their hands in 634, and before the death of Heraclius in 641 they had conquered Syria and Egypt (except Alexandria) which opened its gates to them in 642. The religious alienation of the Syrian and Egyptian peoples from Constantinople, expressing as it did a national sentiment antagonistic to the Greeks, was an important political factor in the Mahomedan (as in the previous Persian) conquest. Thus the Mahomedans definitely cut the Empire short in the East, as the Germans had cut it short in the West; Egypt was never recovered, Syria only for short periods and partially, while the integrity of Asia Minor was constantly menaced and Cilicia occupied for many generations. By their conquest of Persia the Caliphs succeeded to the position of the Sassanids; this led to the conquest of Armenia (c. 654); while, in the West, Africa was occupied in 647 (though the conquest was not completed till the capture of Carthage and other strong places in 688). Thus within twenty years from the first attack the Empire was girt about by the new aggressive power from the precincts of the Caucasus to the western Mediterranean.

Fortunately Constans II., grandson of Heraclius, was a man of eminent ability and firmness. The state owed to him the preservation of Asia Minor, and the creation of a powerful fleet (see below) which protected the Aegean coasts and islands against the naval power which the Mahomedans created. He was responsible for completing a new, efficient military organization, which determined the lines of the administrative reforms of Leo III. (see below). In his last years he turned his eyes to Italy and Africa. He dreamed of restoring Old Rome as the centre of the Empire. But he did not succeed in recovering south Italy from the Lombards (Duchy of Beneventum), and having visited Rome he took up his residence in Syracuse, where he was assassinated, having lost two fleets which he sent against the Arabs of Africa. The strain lasted for another fifty years. Constantine suffered two great sieges, which stand out as crises, for, if in either case the enemy had been successful, the Empire was doomed.

The first siege was in 673-77, under the caliph Moawiyah; his fleet blockaded the capital for five years, but all efforts were frustrated by the able precautions of Constantine IV.; "Greek fire" (see below) played an important part in the defence; and the armada was annihilated on the voyage back by storms and calms. The second siege was at the accession of Leo III., when the city was besieged by land and sea by Suleiman, for a year (717-18), and Leo's brilliant defence, again aided by Greek fire, saved Europe. This crisis marks the highest point of Mahomedan aggression, which never again caused the Empire to tremble for its existence.

The Heraclian dynasty, which had fallen on evil times and rendered inestimable services to the Empire, came to an end in anarchy, which was terminated by the elevation of the Syrian (commonly called Isaurian) Leo III., whose reign opens a new period. His reforming hand was active in every sphere of government, but the ill-fame which he won by his iconoclastic policy obscured in the minds of posterity the capital importance of his work. His provincial organization was revolutionary, and his legislation departed from the Roman tradition (see below). From his reign to the middle of the 10th century the continuous warfare by land with the Caliphs consisted of marauding expeditions of each power into the other's territory, captures of fortresses, guerilla fighting, but no great conquests or decisive battles. The efficiency of the army was carefully maintained, but the neglect of the navy led to the losses of Crete (conquered by Moslem adventurers from Spain 826) and Sicily (conquered by the Saracens of Africa), Panormus taken 852, Syracuse 878 (see SICILY). The Africans also made temporary conquests, including Bari, in south Italy. This period saw the loss of the exarchate of Ravenna to the Lombards (759), the expansion of the Frankish power under Pipin and Charles-magne in Italy, and in close connexion therewith the loss of Old Rome.

The iconoclast emperors pursued a moderate foreign policy, consolidating the Empire within its contracted limits, but under the "Macedonian" dynasty, which was of Armenian descent, it again expanded and became the strongest power in Europe. The 9th century also witnessed a partial learning and culture which had been in eclipse for 200 years. The reign of Basil I. was marked by an energetic policy in South Italy, where his forces co-operated with the western emperor Louis II. The Saracens were expelled from their strongholds, Bari recovered, Calabria saved, and the new province (Theme) of Longibardia formed. This secured the entrance to the Adriatic, and the increase of dominion here at the expense of the Lombards was a compensation for the loss of Sicily. Leo VI. did much for reorganizing the navy, but his reign was not fortunate; Saracen pirates plundered freely in the Aegean and, under the able renegade Leo of Tripolis, captured Thessalonica and carried off countless captives (954). But a great tide of success began fifty years after his death (989), with the exarchate of Moravia again united to the Empire, the great victories of Romanus II., and then as emperor recovered Cilicia and North Syria (with Antioch) 968. Cyprus was also recovered. The tide flowed on under his equally able successor, John Zimisces (of Armenian race) and under Basil II.; these reigns mark the decisive victory of the Empire in the long struggle with the Saracens, whose empire had been broken up into separate states. The eastern frontier was strengthened by the active policy of Basil II. in Armenia, which was more fully incorporated in the Empire under Constantine IX.

The reign of Basil II. marks the culmination of the power of the Eastern Empire, for it also witnessed the triumphal conclusion of another conflict which had lasted almost as long. In the reign of Constantine IV. the Bulgarians (see BULGARIA) had founded a kingdom in Lower Moesia, reducing the Slavonic tribes who had occupied the country, but less than two centuries sufficed to assimilate the conquerors to the conquered, and to give Bulgaria the character of a Slavonic state. The reign of Constantine V. was marked by continuous war with this enemy, and Nicephorus I. lost his life in a Bulgarian campaign. This disaster was followed up by Prince Krum, who besieged Constantinople in 815. His death was followed by a long peace. Prince Boris was converted to Christianity (reign of Michael III.), and most of the Bulgarians were baptized, including the patriarch of Constantinople; and the civilization of the Bulgarians, and beginnings of their literature, were entirely under Byzantine influence. The conversion was contemporaneous with the work of the two missionaries Cyril and Methodius, who (while the field of their personal activity was in Great Moravia and
Pannonia) laid the south-eastern Slavs under a deep debt by inventing the Glagolitic alphabet (based on Greek cursive) and translating parts of the Scriptures into Slavonic (the dialect of the Slavs of Macedonia). The most brilliant period of the old Bulgarian kingdom was the reign of Simeon (903–927), who extended the realm westward to the shores of the Adriatic and took the title “Tzar [i.e. Caesar] of Bulgaria and autocrat of the Romans.” The aggression against the Empire which marked his ambitious reign ceased under his successor Peter, who married a daughter of Romanus I., and the Bulgarian Patriarchate founded by Simeon was recognized at Byzantium. But the Byzantine rulers only waited for a favourable time to reduce this formidable Slavonic state. At length Zimisces subjugated eastern Bulgaria and recovered the Danube frontier. But while Basil II. was engaged in contending with rivals, the heroic Samuel (of the Shishmanid family) restored the Bulgarian power and reduced the Serbs. After a long and arduous war of fourteen years Basil (called the “Bulgur-slayer”) subdued all Bulgaria western and eastern (1018). He treated the conquered people with moderation, leaving them their political institutions and their autochthonous church, and to the nobility their privileges. Some Bulgarian noble families and members of the royal house were incorporated in the Greek nobility; there was Shishmanid blood in the families of Comnenus and Ducas. Greek domination was now established in the peninsula for more than 150 years. The Slavs of Greece had in the middle of the 9th century been brought under the control of the government.

In the reign of Basil II. the Russian question also was settled. The Russian state (see RUSSIA) had been founded before the middle of the 9th century by Norsmen from Sweden, who were known in eastern Europe as Russians ("Rуси"), with their centres at Novgorod and Kiev. They did for the eastern Slavs what the Bulgarians had done for the Slavs of Moesia. The Dnieper and Dniester gave them access to the Dnieper, and the Empire was exposed to their maritime attacks (Constantinople was in extreme danger in 860 and 941), which recall the Gothic expeditions of the 3rd century. In 945 a commercial treaty was concluded, and the visit of the princess Olga to Byzantium (towards the end of the reign of the learned emperor Constantine VII., Porphyrogennetos) and her baptism seemed a pledge of peace. But Olga's conversion had no results. Sviatoslav occupied Bulgaria and threatened the Empire, but was decisively defeated by Zimisces (971), and this was virtually the end of the struggle. In 988 Prince Vladimir captured Cherson, but restored it to the emperor Basil, who gave him his sister Anna in marriage, and he accepted Christianity for himself and his people. After this conversion and alliance, Byzantium had little to fear from Kiev, which came under its influence. One hostile expedition (1043) was indeed recorded, but it was a failure. Much about the same time that the Russians had founded their state, the Magyars (see HUNGARY; the Greeks called them Turks) migrated westward and occupied the regions between the Dnieper and the Danube, while beyond them, pressing on their heels, were another new people, the Petchenegs (Patzinaks). The policy of Byzantium was to make use of the Magyars as a check on the Bulgarians, and so we find the Romans (under Leo VI.) and the Magyars co-operating against the tsar Simeon. But Simeon played the same game more effectively by using the Petchenegs against the Magyars, and the result was that the Magyars before the end of the 10th century were forced to move to western Russia in their present country, and their place was taken by the Petchenegs. From their new seats the Magyars could invade the Empire and threaten the coast towns of Dalmatia. The conquest of Bulgaria made the Petchenegs immediate neighbours of the Empire, and during the 11th century the depredations of these irreclaimable savages, who were accustomed to電視sion in their own country, was an ever-present danger. In 1064 they were driven from the Dniester regions into Little Walachia by the Kumans (or Polovtsi), a people of the same ethnical group as themselves. They were crushingly defeated by Alexius Comnenus in 1091, and exterminated by John Comnenus in 1123.

In the Macedonian period a grave domestic question troubled the government. This was the growth of the large estates of the rich nobles of Asia Minor, at the expense of small properties, to an excess which was politically and economically dangerous. The legislation against the evil began under Romanus I. and was directed to the defence of the poor against the rich, and to protecting the military organization which was based on holdings of land to which the obligation of military service was attached. There was also danger in the excessive influence of rich and powerful families, from which the great military officers were drawn, and which were extensively related by alliances among themselves. The danger was realized in the struggle which Basil II. had to sustain with the families of Sclerus and Phocas. Various kinds of legislation were attempted. Under Romanus I., alienation of property to the large landowners was forbidden. Nicephorus Phocas, whose sympathies were with the aristocracy to which he belonged, holding that there had been enough legislation in favour of the poor, sought to meet the difficulty of maintaining a supply of military lands in the future by forbidding further acquisitions of estates by the Church. Basil II. returned to the policy of Romanus, but, with much greater severity, resorting to confiscation of some of the immense private estates; and he endeavoured to keep down the aristocrats of Asia Minor by very heavy taxation. Through the recovery of the Balkan provinces he gained in Europe a certain political counterpoise to the influence of Asia Minor, which had been preponderant since the seventh century. Asia Minor meant the army, and opposition to its influence expressed itself in the 11th century in a fatal anti-military policy, which is largely responsible for the conquests of a new enemy, the Seljuk Turks, who now entered into the inheritance of the Caliphate (see CALIPHATE AD SIN. AND SELJUKS).

Constantinople was haunted by the dread of a military usurpation. An attempt of the military hero George Maniaces (who had made a remarkable effort to recover Sicily) to wrest the crown from Constantine IX. had failed; and when Isaac Comnenus, who represented the military aristocrats of Asia Minor, ascended the throne, he found himself soon compelled to abdicate, in face of the opposition. The reign of Constantine X., of the rival family of Ducas, marked the culmination of this antagonism. The senate was filled with men of the lower classes, and the military budget was ruthlessly cut down. This policy reduced the army and stopped the supply of officers, since there was no longer hope of a profitable career. The emperor thought to meet dangers from external enemies by diplomacy. The successes of the Seljuks (after the fall of the great Armenian fortress of Ani in 1064) at length awoke the government from its dream of security. The general Romanus Diogenes was proclaimed emperor. He had to create an army and to train it; he did not spare himself, but it was too late. He was defeated and captured by Alp Arslan on the decisive field of Manzikert (1071). Released by the sultan, who honoured his bravery, he was deposed in favour of Michael Ducas, and falling into the hands of his enemies, was blinded. The east and centre of Asia Minor were thus lost; the Seljuk kingdom of Rûm was founded; Nicea was captured by the Turks in 1080. The provinces which escaped the Seljuk occupation were thoroughly disorganized, a prey to foreign and native adventurers and usurpers (see SELJUKS). Thus in the seventies of the 11th century the Empire seemed through incompetence and frivolity to have been brought to the verge of dissolution. The disorder was terminated by the accession of the extraordinarily able statesman Alexius Comnenus (1081), who effected a reconciliation with the rival family of Ducas, established a strong government and founded a dynasty. He had to deal with three great dangers—the Seljuks, the Petchenegs (see above), and in the west the Normans. The Normans had wrested from East Rome its possessions in South Italy (1041–71; see NORMANS)—succeeding where German emperors had failed—and throughout the Comnenian period
the Empire was threatened by their projects of conquest beyond the Adriatic, projects which aimed at Constantinople itself.

Four great attempts against the Empire were made by the Normans; they were unsuccessful, but they heralded the Western conquest of 1204, (1) Expedition of Robert Guiscard, 1081-85, repelled by Alexius with help of Venice; (2) Bohemond’s expedition, 1105-07, foiled by the able strategy of Alexius; (3) the invasion of Greece by Roger of Sicily, 1147; Venice supported Manuel Comnenus, and the Normans were driven from Corfù, 1149; (4) the expedition of William II. of Sicily, 1185, who succeeded in capturing Thessalonica; the invaders were defeated at Demetrias, but they gained the islands of Cephallenia and Zacynthus.

The two most important events in the reign of Alexius were the price of the wealth which he paid for help against his enemies. (1) He was obliged (1084) to grant to Venice (which had become independent of the Empire in the 9th century; see Venice), in return for her naval aid against the Normans, commercial privileges which practically made the Empire commercially dependent on the Republic. (2) He sought auxiliary forces in western Europe to help him against the Seljuk; the answer of the pope and Latin Christendom was the First Crusade—a succour very different from that which he desired. Through his tact and discretion, the state was safely steered through the dangers with which the disorderly hosts of barbarous allies multimana were threatened. In immediate parts of Asia Minor, including Nicaea, were restored to the Empire, which was thus greatly strengthened in the East while the Turks were weakened (see Crusades). But for this help Byzantium might not have recovered the transient strength and brilliance which it displayed under Manuel. In Asia Minor the crusaders kept the terms of their agreement to restore to the emperor what had belonged to him; but on capturing Antioch (1098) they permitted the Norman Bohemond to retain it, in flagrant violation of their oaths; for to capturing Antioch if to any place the emperor had a right, as it had been his a few years before. This was in itself sufficient to cause a breach between Byzantium and the Latin Kingdom of Jerusalem (founded 1099). But otherwise the new political situation created by the Crusade was dangerous, ultimately fatal, to the Empire. For its lands and seas became a highway from western Europe to the Latin colonies in Syria; the Byzantine government was forced to take precautions to protect itself against the crusading expeditions which travelled to the Holy Land; and these precautions were regarded by the western powers as a hindrance to the sacred objects of the crusades. The bitter religious antagonism between the Greek and Latin Christians increased the mutual distrust and the danger.

The history of the new relations between East and West dating from the First Crusade is closely connected with the history of the futile attempts at bringing about a reunion between the Greek and Latin Churches, which had severed communion in 1054 (see below). To heal the schism and bring the Greek Church under the dominion of Rome was a principal object of papal policy from Gregory VII. onward. The popes alternated between two methods for attaining this, as circumstances dictated: namely, a peaceful agreement—the policy of union; or an armed occupation of the Empire by some western power (the Normans)—the policy of conquest. Their views varied according to the vicissitudes of their political situation and their struggles with the western emperors. The eastern emperors were also constantly preoccupied with the idea of reconciliation, constantly negotiating with a view to union; but they did not care about it for its own sake, but only for political advantages which it might bring, and their subjects were bitterly opposed to it. Manuel Comnenus during the first part of his reign was the close friend and ally of the western emperor Conrad III., but after Conrad’s death, he formed the ambitious plan of realizing in Europe a sovereignty like that of Justinian, and hoped to compass it in conjunction with Rome, the enemy of the Hohenstaufen. His forward policy carried war into Italy; he seized Ancona. But his strength was unequal to such designs. His Latin sympathies, no less than his financial extravagance, made him highly unpopular at home; and the national lack of sympathy with his Western policy was exhibited—after the revolution which overthrew his son Alexius and raised his cousin Andronicus I. to the throne—by the awful massacre of the Latin residents at Constantinople in 1182, for which the expedition of William of Sicily (see above) and the massacre of the people of Thessalonica was the revenge. The short reign of the wicked and brilliant Andronicus was in all respects a reaction, prudent, economical and popular. His fall was due to the aristocracy against whom his policy was directed, and the reign of Isaac Angelus undid his efforts and completed the ruin of the state. Oppressive taxation caused a revolt of the Bulgarian and Walachian population in the East; and in the west, the work of Zimisces and Basil was undone, and a new Bulgarian kingdom was founded by John Asen—a decisive blow to the Greek predominance which the Macedonian emperors seemed to have established.

In the fatal year 1204 the perils with which the eastward expansion of western Christendom (the Crusades, and the commercial predominance and ambitions of Venice) had long menaced the Empire, culminated in its conquest and partition. It was due to a series of accidents that the cloud burst at this moment, but the conditions of such a catastrophe had long been present. Isaac Angelus was dethroned by his brother and his son escaped (1201) to the west, where arrangements were being made for a new crusade, which Venice undertook to transport to the Holy Land. The prince persuaded Philip of Swabia (who had married his sister) and Boniface of Montferrat to divert the expedition to Byzantium, in order to restore his father and himself to the throne, promising to furnish help to the Crusade and to reconcile the Greek Church with Rome; Venice agreed to the plan; but Pope Innocent III., the enemy of Philip, forbade it. Isaac and his son, Alexius IV., were restored without difficulty in 1203, and the crusading forces were prepared to proceed to Palestine, if Alexius had performed his promises. But the manner of this restoration, under Latin auspices, was intensely unpopular; he was unwilling, but he was unable, to fulfil his pledges; and a few months later he was overthrown in favour of one who, if an upstart, was a patriot, Alexius V. Then the Crusaders, who were waiting encamped outside the city, resolved to carry out the design which the Normans had repeatedly attempted, and put an end to the Greek Empire. The leaders of the Fourth Crusade must be acquitted of having formed this plan deliberately before they started; it was not conceived before 1204. They first arranged how they would divide the Empire amongst themselves (March); then they captured the city, which had to endure the worst barbarities of war. In particular, the Empress Eirene, mother of the conquerors, the guiding mind was the Venetian leader, the blind doge, Henry Dandolo. He looked to the interests of Venice from the narrowest point of view, and in founding the new Latin Empire, which was to replace the Greek, it was his aim that it should be feeble, so as to present no obstacles to Venetian policy. The Latin Empire of Romania was a feudal state like the kingdom of Jerusalem; the emperor was suzerain of all the princes who established themselves on Greek territory; under his own immediate rule were Constantinople, southern Thrace, the Bithynian coast, and some islands in the Aegean. But he was hampered from the beginning by dependence on Venice, want of financial resources, and want of a fleet; the feudal princes, occupied with their separate interests, gave him little support in his conflict with Greeks and Bulgarians; at the end of ten years the worthless fabric began rapidly to decline, and the efforts of the popes, for whom it was the means of realizing Roman supremacy in the East, were unavailing to save it from the extinction to which it was doomed in its cradle.

The original Act of Partition (which gave ¼ of the Byzantine territory to the future emperor, ¼ to Venice, the remaining ¼ to the Crusaders) could hardly have been carried out strictly, as the territory was still to be won. The most important vassal state was the kingdom of Thessalonica, including Thessaly, which was assigned to Boniface of Montferrat. But it was conquered by the Greeks of Epirus in 1222. The chief of the territories taken by Venice
was Crete. For the Latin states in Greece and the Aegean see GREECE. The first Latin emperor, Baldwin of Flanders, was captured and put to death by the Bulgarians in 1205. He was succeeded by his brother Henry, an able statesman, after whose death (1216) the decline began.

Three Greek states emerged from the ruin of the Roman Empire. A member of the Comnenian house had founded an independent state at Trebizond, and this empire survived till 1461, when it was conquered by the Ottomans. A relation of the Angeli maintained in Europe an independent Greek state known as the Despotate of Epirus. But the true representative of the imperial line was Theodore Lascaris, who collected the Byzantine aristocracy at Nicaea and was elected emperor in 1306. He and his successors advanced surely and rapidly against the Latin Empire, both in Europe and Asia. It was a question whether the Latin power would fall to the Walachio-Bulgarians or to the Greeks. But an assassin attempt at Constantinople, by the emperor Michael Palaeologus, captured it in 1326. His object was to recover all the lost territory from the Latins, but he was menaced by a great danger through Charles of Anjou, who had overthrown the rule of the Hohenstaufens in the two Sicilies, and determined to restore the Latin kingdom of Romania. To avert this peril, Michael negotiated with Pope Gregory X.; he was ready to make every concession, and a formal union of the Churches was actually brought about at the council of Lyons in 1274. The emperor had the utmost difficulty in carrying through this policy in face of clerical opposition; it aroused disgust and bitterness among his subjects; and it was undone by his successor. Meanwhile the pressure already assumed a menacing aspect, and verging to dissolution, and it was menaced by the rising power of Bulgaria. But more than once before (in the 7th century and in the 11th) it had recovered its strength when it was weak and in dire peril; and, considering what the emperors of Nicaea and Michael VIII. accomplished, it seems probable that, if there had been no Fourth Crusade, it might have so revived and consolidated its forces in the course of the 13th century, as to be able to cope successfully with the first advances of the Ottomans. The true statement is that the Fourth Crusade was only an incident (not in itself decisive) in a world-movement which doomed the Eastern Empire to extinction—namely, the eastward movement of western Europe which began in the 11th century with the rise of the Normans and the First Crusade. Henceforward the Empire was a middle state, pressed between expanding forces on the east and on the west, and its ultimate disappearance was inevitable.

Church and State.—In making the state Christian, Constantine made the Church a state institution, and therefore under imperial control. Caesaro-papism was the logical consequence. The sacerdotium was united with the imperium in the person of the monarch as in the pagan state. The Church acquiesced, and yet did not acquiesce, in this theory. When a heretical emperor sought to impose his views, champions of ecclesiastical independence never failed to come forward. At the very beginning Athanasius fought for the independence of the Church against the emperor Constantius. But the political principle which Constantine had taken for granted, and which was an indispensable condition of his adoption of Christianity, was fully recognized under Theodosius I., and, notwithstanding protests from time to time, was permanent. It is significant that Constantine, which had become a second Rome politically, with its senate and capitol, became then a second Rome ecclesiastically, and that the elevation of the see of Constantinople to patriarchal rank next to the Roman see was due to Theodosius (385), who gave a permanent form to the dualism of the Empire. The patriarch became a state minister for religion. The character of the Church as a state institution is expressed above all in the synods. The general councils are not only summoned by the emperor, but are presided over by him or by his lay deputies. The order of the proceedings is modelled on that of the senate. The emperor or his representative not only keeps order but conducts the deliberations and intervenes in the theological debates. It has been erroneously thought that at the council of Chalcedon (451) the legate of Pope Leo presided; but the
acts of that assembly teach us otherwise; the privilege which the Roman legates possessed was that of voting first (the right of the princeps senatus). The first general council at which a churchman presided was the seventh (at Nicaea, 382), at which the emperor (or empress) deputed, not a layman, but the patriarch, Tarasius to preside. The resolutions of those ecclesiastical state-councils did not become the law of the Empire till they were confirmed by imperial edicts.

The emperors, in their capacity as heads of the Church, did not confine themselves to controlling it by controlling the councils. They soon began to issue edicts dealing with theology, by virtue of their own authority. It has been said that the council of Chalcedon closed an epoch of "parliamentary constitutionalism"; a general council was not summoned again for more than one hundred years, though the Empire during that period was seething with religious disunion and unrest. The usurper Basiliscus in his short reign set an example which his successors were not slow to follow. He issued an edict quashing the decision of Chalcedon. Zeno's Henotikon (see below) a few years later was the second and more famous example of a method which Justinian largely used, and of which the Edict of Heraclius, the Type of Constans II. and the iconoclastic edicts of Leo III. are well-known instances. It was a question of political expediency (determined by the circumstances, the intensity and nature of the opposition, &c.) whether an emperor supported his policy or not by an ecclesiastical council.

The emperor was always able to control the election of the patriarchs, and through him directed the Church. Sometimes emperor and patriarch collided; but in general the patriarchs were docile instruments, and when they were refractory they could be deposed. There were several means of resistance open to a patriarch, though he rarely availed himself of them. His participation in the ceremony of coronation was indispensable, and he could refuse to crown a new emperor except on certain conditions, and thus dictate a policy (instances in 812, Michael I.; 669, John Zimisces). There was the power of excommunication (Leo VI. was excommunicated on account of his fourth marriage). Another means of resistance for the Church was to invoke the support of the bishop of Rome, who embodied the principle of ecclesiastical independence and whose see admittedly enjoyed precedence and primacy over all the other sees of the Eastern Church. But the emperor was a subject of the emperor, and some emperors exerted their ecclesiastical control over Rome by drastic measures (Justinian and Constans II.). But after the conquest of Italy by Charles the Great, the pope was outside the Byzantine domination; after the coronation of Charles in 800 he was associated with a rival empire; and when ecclesiastical controversies arose in the East, the party in opposition was always ready to appeal to him as the highest authority in Christendom. Under the iconoclastic emperors the image-worshippers looked to him as the guardian of orthodoxy.

As to the ecclesiastical controversies which form a leading feature of Byzantine history, their political significance alone concerns us. After the determination of the Arian controversy in 381 new questions (as to the union of the divine and human elements in the person of Christ: one or two natures?) arose, and it may seem surprising that such points of abstruse theology should have awakened universal interest and led to serious consequences. The secret was that they masked national feelings; hence their political importance and the attention which the government was forced to bestow on them. The reviving sense of nationality (anti-Greek) in Syria and in Egypt found expression in the 5th century in passionate monophysism (the doctrine of one nature): theology was the only sphere in which such feelings could be uttered. The alienation and dissenison which thus began had fatal consequences, smoothing the way for the Saracen conquests of those lands; the inhabitants were not unwilling to be severed politically from the Empire. This ultimate danger was at first hardly visible. What immediately troubled the emperors in the first half of the 6th century was the preponderant position which the see of Alexandria occupied, threatening the higher authority of Constantinople. The council of Chalcedon, called by Marcian, an able statesman, was as much for the purpose of ending the domination of Alexandria as of settling the theological question. The former object was effected, but the theological decision of the council was fatal: it only sealed and promoted the disunion. The recall of the spirit of Syria and Egypt forced Zeno, thirty years later, to issue his Henotikon, affirming the decisions of previous councils but pointedly ignoring Chalcedon. This statesman-like document secured peace in the East for a generation. Rome refused to accept the Henotikon, and when Justinian resolved to restore imperial supremacy in the Western kingdoms, conciliation with Rome became a matter of political importance. For the sake of this project, the unity of the East was sacrificed. The doctrine of Chalcedon was resserted, the Henotikon set aside; New Rome and Old Rome were again hand in hand. This meant the final alienation of Egypt and Syria. The national instinct which had been alive in the 5th century grew into strong national sentiment in the 6th. One of the chief anxieties of Justinian's long and busy reign was to repair the mischief. Deeply interested himself in matters of dogma, and prepared to assert to its fullest extent his authority as head of the Church, he has been called "the passionate theologian on the throne"; but in his chief ecclesiastical measures political considerations were predominant. His wife Theodora was a monophysite, and he permitted her to extend her protection to the heretics. He sought new formulae for the purpose of reconciliation, but nothing short of repudiation of the Chalcedon acts would have been enough.

The last great efforts for union were made when the Saracens invaded and conquered the disdiant provinces. A new formula of union was discovered (One Will and One Energy). This doctrine of monothelism would never have been heard of but for political exigencies. The Egyptians and Syrians would perhaps have accepted this compromise; but it was repudiated by the fanatical adherents of Chalcedon. Heraclius sought to impose the doctrine by an edict (Eetheus, 638), but the storm, especially in Italy and Africa, was so great that ten years later an edict known as the Type was issued by Constans forbidding all discussion about the number of wills and energies. Constans was a strong ruler, and maintained the Type in spite of orthodox opposition. But the document of this period was for him, this was a subject of the emperor, and some emperors exerted their ecclesiastical control over Rome by drastic measures (Justinian and Constans II.). But after the conquest of Italy by Charles the Great, the pope was outside the Byzantine domination; after the coronation of Charles in 800 he was associated with a rival empire; and when ecclesiastical controversies arose in the East, the party in opposition was always ready to appeal to him as the highest authority in Christendom. Under the iconoclastic emperors the image-worshippers looked to him as the guardian of orthodoxy.
(753). Iconoclasm was supported by the army (i.e. Asia Minor), and a considerable portion of the episcopate, but it was not destined to triumph. When the Athenian Irene, wife of Leo IV., came to power after her husband's death, as regent for her son Constantine VI., she secured the restoration of the worship of icons. The Iconoclastic Council was reversed by the 7th Ecumenical Council of 787. The iconoclastic party, however, was not yet defeated, and (after the neutral reign of Nicephorus I.) came again to the helm in the reigns of the Armenian Leo V. and the first two Phrygian emperors, Michael II. and Theophilus. But the Empire was weary of the struggle, and on the death of Theophilus, who had been rigorous in enforcing his policy, icon-worship was finally restored by his widow Theodora (842). The question was never reopened. This was a triumph for the Greek element in the Empire; the "Sunday of orthodoxy" on which iconoclasm was formally condemned is still a great day in the Greek Church.

The ablest champions who wielded their pens for the cause of icons, defending by theological arguments practices which really had their roots in polytheism, were in the early stage John of Damascus and in the later Theodore (abbot of the monastery of Studium at Constantinople). The writings of the iconoclasts were promoted by the triumphant party, so that we know their case only from the works of their antagonists.

In this struggle the Greeks and Latins were of one mind; the image-worshippers had the support of the Roman see. When the pope resisted him, Leo III. confiscated the papal estates in Sicily and Calabria; and the diocese of Illyricum was withdrawn from the control of Rome and submitted to the patriarch of Constantinople. But when iconoclasm was defeated, there was no question of restoring Illyricum, nor could there be, for political reasons; since the iconoclastic schism had, with other causes, led to the detachment of the papacy from the Empire and its association with the Frankish power. By the 7th of the 9th century (800) the pope had definitely become a subject of another state.

No sooner had the iconoclastic struggle terminated than differences and disputes arose between the Greek and Latin Churches which finally led to an abiding schism, and helped to foster the national self-consciousness of the Greeks. A strife over the patriarchal chair between Ignatius (deposed by Michael III. and supported by Rome) and Photius the learned statesman who succeeded him, strained the relations with Rome; but a graver cause of discord was the papal attempt to win Bulgaria, whose sovereign Boris had been baptized under the auspices of Michael III. (c. 865), and was inclined to play Old Rome against New Rome. Photius stood out as the champion of the Greeks against the claim of the Roman see, and his patriarchate, though it did not lead to afinal breach, marks the definite emancipation of the Greeks from the spiritual headship of Rome. This is the significance of his encyclical letter (867), which formulated a number of differences in rite and doctrine between the Greek and Latin Churches, differences so small that they need never have proved a barrier to union, if on one side there had been no question of papal supremacy, and if the Greek attitude had not been the expression of a tenacious national instinct. There was no rival Roman Empire, but the Churches were really estranged, and the open and ultimate breach which came in 1054, when the influence of the Cluniac movement was dominant at Rome (Leo IX. was pope and Michael Cerularius patriarch), sealed a disunion which had long existed. Subsequent plans of reunion were entertained by the emperors merely for political reasons, to obtain Western support against their foes, or to avert (through papal influence) the aggressive designs of Western princes. They were doomed to futility because they were not seriously meant, and the Greek population was entirely out of sympathy with these political machinations of their emperors. The Union of Lyon (1274) was soon repudiated, and at the last attempt, the Union of Florence in 1439, was equally hollow (though it permanently secured the union of the Rumanians and of the Ruthenians). Part of the historical significance of the relations between the Greek and Latin Churches lies in the fact that they illustrate, and promoted by way of challenge, the persistence of Greek national self-consciousness.

The emperors legislated against paganism and 'against heresy, not merely under ecclesiastical pressure, but because they thought religious uniformity politically desirable. Theodosius the Great, a Spaniard, with no sympathy for Hellenic culture, set himself the task of systematically eradicating pagan institutions and customs. Though his persecution accomplished much, paganism was far from being extinct either in the East or in the West in the 5th century. Not only did heathen cults survive in many remote districts, but the old gods had many worshippers among the higher classes at Rome, Constantinople, Athens, and elsewhere.

The most distinguished Greek literati of that period were non-Christian. Justinian, who united theological enthusiasm with belief in the ideal of uniformity and, like Theodosius, was out of sympathy with Hellenism ("Hellen" now came to mean "pagan"), persecuted polytheism more earnestly and severely than his predecessors. His measures created a panic among the higher classes at Byzantium, of whom many, as they suspected, were addicted to the ancient religion. He instituted a regular inquisition, exacted oaths of orthodoxy from all officials and teachers, and closed the philosophical schools of Athens. Missionaries (and it is remarkable that he employed monophysite heretics) were sent to abolish the old heathen worship which survived in many parts of Asia Minor where Christianity had hardly penetrated. By the end of the 6th century formal paganism had practically disappeared.

In Asia Minor, especially in the east, there were many dissident communities which asserted independence of the Church of Constantinople and of all ecclesiastical traditions, founding their doctrines directly on the Bible. Most important of these heresies were Monophysites (e.g.), a dualistic sect whom the Church regarded as Manichaean.

The Autocracy and its Constitutional Forms.—With Diocletian the Principate of Augustus had become undisguisedly an absolute monarchy, and this constitution prevailed to the end. There is virtually no constitutional history in the proper sense of the term in the later Roman Empire; for there was neither evolution nor revolution. The monarchical system remained in all its essential points unchanged, and presents a remarkable example of an autocracy of immense duration which perfectly satisfied the ideas of its subjects. No attempt was made to alter it,—to introduce, for instance, a limited monarchy or a republican government; all revolts and conspiracies were aimed at the policies of particular autocrats, not at autocracy itself; generally they only represented sectional antagonisms and personal ambitions.

The emperors inherited a deeply rooted instinct of legality as a tradition from Old Rome; and this respect for law which marked their acts, along with the generally good administration of justice, was a palladium of the monarchy. They were supreme in legislation, as well as in the administrative and judicial departments (pp. 427-433), and this power, which they vested in the whole moderate in wielding legislation as an instrument of policy.

There were, however, recognized constitutional principles which it would have been impossible for the emperor to override.

(i) The elective principle, inherited from the Republic, was never changed. A new emperor had to be elected by the senate and acclaimed by the people. The succession never became automatic. But even Augustus had indirectly introduced the dynastic principle. Theodosius the Great, by causing his two sons, Arcadius and Honorius, to be elected Augusti in their infancy, practically elevated the dynastic idea into a constitutional principle; henceforward it was regarded as in the regular course that the son born to a reigning sovereign should in his infancy be elected Augustus. Thus the election, though always an indispensable form, was only a reality when a dynasty came to an end.
(2) When the position of Christianity was assured by the failure of Julian's reaction, it was evident that profession of that religion would henceforward be a necessary qualification for election to the throne. This was formally and constitutionally recognized when the coronation of the emperor by the patriarch was introduced in 457, or perhaps in 450.

(3) The emperor was now regent and not territorial. In this respect it always retained the character which it had inherited as the offspring of a Roman magistracy. Hence no Roman territory could be granted by the emperor to another power. For instance, the Western emperor Conrad III. could promise to hand over Italy to Manuel Comnenus as the dowry of his wife, but it would have been constitutionally illegal for Manuel to have made such a promise to any foreign prince; an Eastern emperor had no right to dispose of the territory of the state. Tendencies towards a territorial conception begin indeed to appear (partly under Western influence) in the time of the Palaeologi, especially in the custom of bestowing appanages on imperial princes.

(4) While the senate of Rome generally lost its importance and at last became a mere municipal body, the new senate of Constantine preserved its position as an organ of the state till the fall of Constantinople. For the imperial elections it was constitutionally indispensable, and it was able sometimes to play a decisive part when the throne was vacant—it only opportunity for independent action. The abolition, under Diocletian's system, of the senatorial provinces deprived the senate of the chief administrative function which it exercised under the Principate; it had no legislative powers; and it lost most of its judicial functions. It was, however, still a judicial court; it tried, for instance, political crimes. In composition it differed from the senate of the Principate. The senators in the 4th century were chiefly functionaries in the public service, divided into the three ascending ranks of clarissimi, spectabiles, illustres. The majority of the members of the senatorial order lived in the provinces, forming a provincial aristocracy, and did not sit in the senate. Then the two lower ranks ceased to have a right to sit in the senate, which was confined to the illustres and men of higher rank (Patricians). The senatorial order must therefore be distinguished from the senate in a narrower sense; the latter finally consisted mainly of high ministers of state and the chief emperors of the palace. It would be a grave mistake to underrate the importance of this body, through an irrelevant contrast with the senate of the Republic or even of the Principate. Its composition insured it great influence as a consultative assembly; and its political weight was increased by the fact that the inner council of imperial advisers was practically a committee of the senate. The importance of the senate is illustrated by the fact that in the 11th century Constantine X., in order to carry out a revolutionary, anti-military policy, found it necessary to alter the composition of the senate by introducing a number of new men from the lower classes.

(5) The memory of the power which had once belonged to the populus Romanus lingered in the part which the inhabitants of New Rome, and their representatives, played in acclaiming newly elected emperors, and in such ceremonies as coronations. In the 6th century the factions ("demes") of the circus, Blues and Greens, appear as political parties, distract the city by their quarrels, and break out in serious riots. On one occasion they shook the throne ("Nika" revolt, 532). The emperors finally quelled this element of disturbance by giving the factions a new organization, under "delegates" ("representants") and assigning them a definite quasi-political status in the public ceremonies in the palace and the capital. The duty of providing panem et circenses was inherited from Old Rome; but the free distribution of bread cannot be traced beyond the 6th century (had the loss of the Egyptian granary to do with its cessation?), while the spectacles of the hippodrome lasted till the end. Outside the capital the people took little interest in politics, where theology was concerned; and it may be said generally that it was mainly in the ecclesiastical sphere that public opinion among the masses, voiced by the clergy and monks, was an influence which made itself felt.

The court ceremonial of Constantinople, which forms such a market contrast to the ostentatiously simple establishments of the Principate, and the ceremonies and the imposing charac-
teristic importance of the period, was mainly due to two causes. First, when the state had been shaken to its foundations by the predominance of the military element and the dependence of the emperor on the soldiers. It was the object of Diocletian to make the government of the empire dependent on some other element than the army than to any other element in the state; the royal court and the inaccessibility of the ruler were calculated to promote this object. The etiquette and ceremonies were greatly elaborated and impressing right and influence and majesty magnificently displayed.

The public functions, which included processions through the streets to various sanctuaries of the city on the great feast-days of the Church, supplied entertainment of which the populace never wearied; and it did not escape the wit of the rulers that the splendid functions and solemn etiquette of the court were an effective means of impressing the imagination of foreigners, who constantly resorted to Constantinople from neighbouring kingdoms and dependencies, with the majesty and power of the Basileus.

The imperial dignity was collegial. There could be two or more emperors (imperatores, basili) at the same time; elections were by acts of the people in their own names. Through the period of dualism, in the 4th and 5th centuries, when the administration of the Eastern provinces was generally separate from that of the Western, the imperial authority was also collegial. In the 6th century this period of dualism came to an end and was never renewed. There was frequently more than one emperor, not only in the case of a father and his son, or of two brothers, but also in the case of a minority, when a regent was elected emperor (Romulus I.; cf. NIcholas II. and John Zimisces). But one colleague always exercised the sole authority, was the real monarch, the "great" or the "first" Basileus; the others were his assistants and sleeping partners. Under the Comneni, a new nomenclature was introduced; a brother, e.g., who before could have become the formal colleague of the ruler, received the title of Sebastocrator (Sebastos was the Greek equivalent of Augustus).

Legislation.—The history of the legislation of the Eastern Empire is distinguished by three epochs associated with the names of (1) Justinian, (2) Leo III., (3) Basil I. and Leo VI.

(1) The Justinianean legislation (see JUSTINIAN) is thoroughly Roman in spirit, and inspired by pious adhesion to the traditions of the past; but it admitted modifications of the older law in accordance with tendencies which had been long since making themselves felt: consideration is accorded to principles of humanity basing the law on natural rights, but not neglecting any interest in the laws relating to things. Justinian not only sanctioned changes which time had brought about, like the mitigation of the strict patria potestas and the greater independence of wives, but also undertook a revolution in the law of property, abolishing inheritance by agnatio or relationship through males, and substituting inheritance by blood relationship whether through males or females.

Justinian's reign was followed by a period in which juristic studies decayed. The seventh century, in which social order was profoundly disturbed, is a blank in legal history, and it would seem that the law of Justinian, though it had been rendered into Greek, almost ceased to be studied or understood. Practice at least was modified by principles in accord with the public opinion of Christian society and influenced by ecclesiastical canons. In a synod held at Constantinople in the reign of Justinian II., rules were enacted, differing from the existing laws and based on ecclesiastical doctrine and Mosaic principles, and these were sanctioned as laws of the realm by the emperor. Thus Church influence during the reign of Romanus I., when the system predominantly Greek, determined the character of the ensuing legislative epoch under the auspices of Leo III., whose law book (A.D. 740), written in Greek, marks a new era and reflects the changed spirit of the times. This code of law, known communally as "Institutiones" and generally as the Ecloga, may be described as a Christian law book. In regard to the patria potestas increased facilities were given for emancipation from patria potestas. In that age comes to years of duration and the paternal is to a certain extent replaced by a parental control over minors. The law of guardianship is considerably modified. The laws of marriage are based under the influence of the Church on the theories of matrimony; the institution of concubinitas is abolished. Impediments to marriage on account of consanguinity and of spiritual relationship are multiplied. While Justinian regarded marriage as a contract, and therefore, like any other contract, dissoluble at the pleasure of the parties, Leo III. accepted the Church view that it was an indissoluble bond. Ecclesiastical influence is written
large in the criminal law, of which a prominent feature is the substitution of suspension of a penalty for the capital law. Death is retained for some crimes, such as murder and high treason; other offences were punished by amputation (of hand, nose, &c.).

This idea is emphasized in the passage in the New Testament, "If thine eye offend thee," &c.; the eye had a step in the direction of leniency; and it may be observed that the tendency to avoid capital punishment increased, and we have today the practice of Georgia (but with many reserves and restrictions), which was granted to Christian churches and is admitted without exceptions in the Edicta.

In the sixth century legislative activity under Basil I. and Leo VI. represents a reaction, in a certain measure, against the Edicta and a return to Justinian. The Edicta had met practical needs, but the Isaurian and Phrygian emperors had done nothing to revive legal study. To do so was the aim of Basil, and the revival could only be based on Justinianian law books or their Greek representatives. These books were now treated somewhat as Justinian and his lawyers had treated their own predecessors. A handsomely written Digest of Justinian (published 859, under John X. = 879) (δικαίωμα αὑτοῦ, "the law as it is"), to fulfill somewhat the same function as the Institutes. Then a collection of all the laws of the Empire was prepared by means of two codification, one of them the Hexamilia and the other the Basilita. In many points (in civil, but not in criminal, law) the principles of the Edicta are set aside in favor of the older jurisprudence. Thus the Justinianian ordinances on the subject of divorce were revived, and there remains, therefore, a contradiction between the civil and the canon law.

After this there was no legislation on a grand scale; but there was a great revival of legal study under Constantine IX, who founded a new law-school, and there were many learned specialists who wrote important commentaries, such as John Xiphilin (11th century), Theodore Balsamon (12th century), and Theodorus Metochites (12th century), who published the civil law in a codification of Byzantine law; and modern Greece, although in framing its code it took the Napoleonic for its model, professes theoretically to base its civil law on the edicts of the emperors as contained in the Hexabiblos of Harmonius.

Administration.—Three principles underlay the administrative of Diocletian: the separation of civil from military functions; the formation of small provincial units; and the scalar structure which deepened on the interposition of the vicar of a diocese and the praetorian prefect between the provincial governor and the emperor. This system lasted unchanged for three and a half centuries. The few unimportant alterations that were made were in harmony with its spirit, until the reign of Justinian, who introduced certain reforms that pointed in a new direction. We find him combining some of the small provinces into large units, undermining the scalar system by doing away with some of the dioceses and vicars, and placing in some cases military and civil authority in the same hands. The chief aim of Diocletian in his general reform had been to secure central control over the provincial governments; the object of Justinian in this particular reforms was to remedy corruption and oppression. These changes, some of which were soon cancelled, would hardly in themselves have led to a radical change; but they prepared the way for an administrative revolution, brought about by stress of external necessities. In the 7th century all the energies of the Empire, girt about by active enemies, were centered on war and defence; everything that gave way to military purposes was abandoned. The new and stronger systems gradually introduced which led ultimately to the abolition of the old. The change began in Italy and Africa, at the end of the 6th century, where operations against the Lombards and the Berbers were impeded by the friction between the two co-ordinate military and civil authorities (masters of soldiers, and praetorian prefects). The military governors were made supreme with the title of exarchs, "viceroys"; the civil authority was subordinated to them in case of collision, otherwise remaining unaltered. The change is an index of the dangerous crisis through which these provinces were passing. In the East similar circumstances led to similar results. The Saracen danger hanging imminent over Asia Minor imposed a policy of the same kind. And so before the end of the 7th century we find the Empire divided into six great military provinces, three in Europe and three in Asia: (1) Exarchate of Africa, (2) Exarchate of Italy, (3) Strategia of Thrace, (4) County of Op sekion (= obsequium), (5) Paphlogonia, parts of Helles- pontus and Phrygia, (6) Strategia of the Anatolian, or west and central Asia Minor, (6) Strategia of the Armeniakos, eastern Asia Minor. In addition to these there was a naval circumcissio, (7) the Strategia of the Karabisiabon (from κάραβος, a vessel), including the southern coastland of Asia Minor, and the Aegean (see below under Nery).

The lands of the old prefecture of Illyricum were not included in the system, but, because this part of the Empire was then regarded as a lost position. On the contrary, here military powers were connected to the Prefect of Illyricum, whose actual sphere extended little beyond Thessalonica, which was surrounded by Slavonic tribes.
